Contract theories capture deeply rooted moral intuitions about the dignity of every human individual. They provide us with reasons why the good of some people must not be sacrificed for a greater social good. In this respect, they are superior to utilitarian theories that often lead to counterintuitive results in cases in which the rights of minorities are at stake. But a utilitarian might object that this strength of contract theories implies a symmetrical weakness, as such theories seem to be silent on questions of how to weigh the interests of different individuals in moral dilemmas in which *some* sacrifices are unavoidable. Should not a moral theory provide us with some guidance on what to do in such cases? As we have seen, Scanlon's moral theory tries to include consequentialist arguments *within* a contractualist framework, which seems to be a move by which he might win over a utilitarian. But there is a price to be paid for Scanlon's inclusive approach: one might ask whether his pluralist notion of reasons is not too unspecific, comprising too many different things. Scanlon would maybe reply that *no* moral theory can do with a certain degree of judgment and that we should not expect to be able to use such a theory as one would use a pocket calculator – entering the variables and waiting for the correct solution to appear on the screen. Nevertheless, it is an open question whether the attempt to capture utilitarian modes of thinking within a contract theory can be successful.

A feature that contract theories share with utilitarianism, but which differentiates them both from other moral theories (e.g., a divine command theory), is that they are metaphysically unassuming; as has already been noted, this makes them suitable for pluralist societies. This holds in particular for the contractarian variety, where the only assumption about individuals is that they pursue their own interests, whatever these are, without caring about the interests of others. An advantage of this position is that it can be put in dialogue with naturalist approaches in other disciplines, for example, with evolutionary biology (see e.g., [2], p. 187ff). A weakness, however, seems to be that it is either overly general – anything can count as a person's "interest" – or, if it

tells us more clearly what is meant by “interest,” that it might leave out factors that are indeed crucial for how we perceive moral phenomena: “soft” factors such as cultural preconceptions or linguistic conventions that influence how people *define* their interests. By assuming that people have well-defined “interests” or follow some abstract ideal of moral “reason” (as in the contractualist version), crucial questions about how these things are *acquired* are left out of the picture. Contract theories seem to start with idealized adult human beings; questions about cultural influences, education, and socialization are hardly ever mentioned.

The starting point of contract theories is in fact ridden by a puzzle. The question is whether a reductionist approach of morality, as Gauthier, in particular, has tried to develop, can be successful. Can you really “cook up” morality from nonmoral ingredients? A suspicion against contract theories that deserves to be taken very seriously is that it “comes too late” as a theory: it has to start with people who are already fully developed and able to keep promises, otherwise the construction of the contract seems futile. But, one might ask: Should not theoreticians focus on how people acquire this basic ability first? More generally, where do the “ingredients” of the contractual situation come from?

The problem can be made particularly clear in the case of Scanlon’s theory and its focus on the formula about principles that “cannot be reasonably rejected.” Everything hinges on the notion of “reasonableness.” But how do people acquire the ability to tell good from bad reasons? Does it really tell us a lot that we should follow principles that cannot be “reasonably rejected”? Does not everything that is theoretically interesting happen before Scanlon’s theory gets started? Scanlon provides us with an account of the metaethical status of “reasons” and defends this notion against a number of charges, but he does not tell us a lot about how children, for example, are socialized into a world that distinguishes good from bad reasons.

A parallel point can be made about people’s motivation to follow certain standards. Contract theories are here faced with a dilemma, which has been discussed by Jean Hampton with regard to Hobbes’ contract theory, but which can be generalized to all contract theories (see [1]). Either moral reason and the willingness to obey its precepts are already presupposed (the *contractualist* variety). Then we can ask how much work the construction of a contract really does. Or one starts from an assumption of amoral self-interest (as in the *contractarian* versions). Then, there are two possibilities. Either people are still purely self-interested after they have entered the contract – then, it is questionable whether their motives can be described as *moral* rather than self-interested in an enlightened way and whether the situation can be stable in the absence of massive coercive enforcement. Or there needs to be some fundamental change in human dispositions that turns self-interested human beings into moral human beings: But how would this change happen? Gauthier’s distinction between straightforward and constrained maximization is an attempt to come to grips with this problem. What his theory only mentions in passing, and many

other contract theories do not mention at all, is the crucial role that habituation and socialization play for a successful moral life. It is here that individuals learn what it means to be rational, or reasonable, and to respect one another's dignity. Contract theory has often understood itself as describing the crucial bones of morality or political justice, but there is also a "flesh" to a moral community or political unit, which deserves more consideration than contract theory has given it so far.

Critics have also objected that the metaphor of contract has been used to justify the exclusion of certain groups, for example, women, nonwhite people, children, elderly, or disabled people, as the parties to the contract have often been assumed, implicitly or explicitly, to be white male citizens.⁴ At one level, this is simply a problem about whom to include in initial bargaining situation and can in principle be solved, even if this has not always happened in the past. As we have seen, Scanlon tries to integrate even the "interests" of animals and the natural environment by the notion of "trustees." Contract theories need to be very careful about potential exclusions and biases in the initial situation, but by making suitable amendments one can in principle meet this challenge. But at another level, there is a deeper question here: Can we really capture all that is relevant for moral considerations in terms of contractual relationships? Could relationships between men and women, or between the members of a family, not be of a deeply noncontractual nature, having to do much more with one's understanding of what a flourishing life is than with a quid-pro-quo exchange? Or, to take a negative example, can certain subtle kinds of discriminations continue to exist, although in a formal sense there are equal rights and opportunities?

Scanlon's move to recognize that "what we owe to each other" may not be all that morality is about seems wise, as it avoids overcharging contract theory with expectations it cannot fulfill. But it also raises the fundamental question whether contract theories should be seen as basic theories of what morality or justice really *is*, and as a *justification* for certain norms – or whether they should be seen as devices for *indicating*, *giving evidence for*, or *illustrating* what morality or justice demand.⁵ They might be seen, for example, as illustrations for deep intuitions about the "moral point of view," in which one abstracts from one's own particular desires and interests and takes into account the desires and interests of all parties concerned (cf. [10]).

But this does not mean that contract theories could not be useful and illuminating. Their starting point from – more or less – rational adult individuals makes them particularly suited for problems that have to do with moral and political relationships between independent adults. For example, one can take some notion of basic rights (e.g., human rights) as given and ask how rational individuals who all have these rights can come to an agreement in certain situations of conflict. Rawls's approach, in particular, has been very successful in this respect and has also led to intense debates about questions of *international* justice. But contractual thinking does not have to be confined to questions about the most basic political structures.

It can also be applied to different fields of “applied” ethical and political theory. One such field is business ethics, as the next chapter by Christoph Luetge discusses.

Abstract

This chapter discusses two major approaches to business ethics which rest on the foundation of social contract theory: the contractualist position of Integrative Social Contracts Theory (ISCT) and the contractarian position of Order Ethics. Both are summarized and analyzed critically. It turns out that Order Ethics might remedy some defects of ISCT.

Introduction

Contractarianism has been a major position in political and social philosophy at least since the days of Thomas Hobbes. This has been extensively shown and covered in the chapters of W. Kersting and L. Herzog (in this volume; more work on contractarian business ethics has been done by [12, 14, 21, 32, 34, 40]). What remains to be dealt with is the way in which contractarianism can act as a foundation of business ethics.

Contractarianism, as understood here, is a philosophical position which regards the consent of actors as its only normative criterion. In particular, it assumes that actors are self-interested and give their consent to norms or rules only if they regard this as beneficial for themselves. This is different from a position that takes the consent of actors *after deliberation* as its main starting point.

As Oosterhout, Wempe, and others [20, 34, 39] highlight, contractarianism can be distinguished from contractualism: Contractualism presupposes an internal morality of contracting: It assumes that contracting parties must have certain moral capabilities in order for the contracts to work. Moreover, contractualism usually

C. Luetge
Peter Löscher Chair of Business Ethics, Technische Universität München, Lothstr. 17, Munich, Germany
e-mail: christoph@luetge.de

regards actors not as predominantly self-interested, but rather as being embedded in a more general frame of commitments (In this sense, contractualism is at least in some regards closer to discourse theory and discourse ethics).

Contractarianism does not deny the presence of such commitments. However, it does not regard them as necessary presuppositions of (economic or other) contracts. Contracts can be negotiated and fulfilled in many ways. Commitments may help here, but without incentives and sanctions in place, commitments will tend to erode, particularly in dilemma situations like the prisoner's dilemma. The concept of Order Ethics elaborated here proceeds systematically from the idea of dilemma situations. (However, I find the line between a *moral* and a *political* contractarian approach is rather blurry, and therefore this distinction will not be of importance here).

Contractarianism is attractive as a philosophical foundation of business ethics for a number of reasons: First, it requires only comparatively weak normative presuppositions. Contractarians do not assume special capabilities like a "rational motivation" (as in discourse ethics), a "sense of justice" (as Rawls), virtues, or common values of the actors. Rather, only self-interest is needed – which of course needs to be spelt out in detail (cf. [28]). Weakening the normative presuppositions is certainly good for implementing business ethics in the globalized world, where pluralism and diversity play an important role and where a good manager must be capable of adequately dealing with people from very different backgrounds, both within a corporation and regarding its external stakeholders.

Second, deriving morality from interests (and, in a theoretical sense, with the help of economics) is a project that is especially fit for an ethics of modern *business*. As the philosopher of economics Wade Hands put it: "For economists, unlike for most others in modern intellectual life, the ubiquitousness of narrow self-interest in science or elsewhere, does not necessarily initiate a wringing of hands or lamentations about lost utopias; it only initiates a conversation about proper prices, compatible incentives and binding constraints" [15]. In the same vein, contractarians, rather than lamenting interest-driven societies, would prefer channeling those interests via rules and the order framework.

A fully fledged contractarian business ethics, in this sense, does not exist yet, but only elements of it. I will give an overview of some of these elements and then proceed by outlining the approach of Order Ethics, which tries to spell out the idea of a contractarian business ethics. Some preliminary remarks are necessary for this task, however.

First, the concepts of utility, benefits, and advantages must be seen as "open" concepts in the sense that they are not limited to narrow "economic," material, or monetary utility, benefits, and advantages, but rather as including – in the sense of G. Becker [3] – all that actors *regard* as utility, benefits, and advantages.

Second, a successful contractarian approach to business ethics should meet or at least be able to answer the criteria that Wempe [40, 41] outlined, according to which a social contract model, when applied to "the domain of corporate morality," should be (1) "self-disciplined, i.e., not aspire to results beyond what the contract

model can realistically establish,” (2) “argumentative, i.e., provide principles that are demonstrative results of the contractarian method,” (3) “task-directed, i.e., it should be clear what the social contract thought-experiment is intended to model,” and (4) “domain-specific, i.e., the contractarian choice situation should be tailored to the defining problems of corporate morality.” I will address these criteria in the last section of this chapter.

Integrative Social Contracts Theory

The internationally most well-known approach to business ethics that makes use of social contract theory is the *Integrative Social Contracts Theory* (ISCT) of T. Donaldson and T. Dunfee [13, 14]. Donaldson and Dunfee are dissatisfied with the general ethical theories offered by philosophy and therefore develop a theory of their own which takes its origin not from abstract philosophical problems but from concrete problems of business. Like Order Ethics, they see contractarianism as avoiding several problems that standard theories of ethics face.

These concrete problems lie mainly in the nature of contracting which, in the globalized world, is subject to many different standards and norms. ISCT is meant to explicitly allow for such a variety of norms – within limits however. The contractarian idea is used to conceptualize both of these intentions, in the following way:

First, the authors conceive a *macrosocial contract* which all boundedly rational human beings would consent to. This contract is to regulate the process of norm-finding on lower levels. According to Donaldson and Dunfee, the contractors on the macro level will – implicitly more often than explicitly – consent to a contract that allows for significant “moral-free space” on the lower levels of communities, corporations, and individual actors.

Second, *microsocial contracts* are generated within the framework of the macrosocial contract, between (mostly smaller) communities and corporations. Here, communities can accept quite different norms and standards, and immediately the question arises whether *any* such norms and standards can be ethically acceptable. Donaldson and Dunfee (try to) solve this problem by using the concept of *hypernorms*: Hypernorms are meant to be universal, overarching ethical principles which “are sufficiently fundamental that they serve as a source of evaluation and criticism of community-generated norms, and may include not only rules specifying minimum behavior, such as the rule against the killing of innocents, but imperfect duties such as virtue, beneficence and decency” ([13], p. 96). Hypernorms are to express principles “so fundamental to human existence that one would expect them to be reflected in a convergence of religious, political and philosophical thought” ([13], p. 96). They are not explicitly seen as being subject to a contract themselves. Rather,

they are to set the boundaries of the moral-free space, together with the consent required from the members of the community and certain rules of thumb for dealing with the inevitable norm conflicts between communities. These “priority rules” are the following:

1. Transactions solely within a single community, which do not have significant adverse effects on other humans or communities, should be governed by the host community’s norms.
2. Existing community norms indicating a preference for conflict of norms should be utilized, so long as they do not have significant adverse effects on other individuals or communities.
3. The more extensive or more global the community that is the source of the norm, the greater the priority that should be given to the norm.
4. Norms essential to the maintenance of the economic environment in which the transaction occurs should have priority over norms potentially damaging to the environment.
5. Where multiple conflicting norms are involved, patterns of consistency among alternative norms provide a basis for prioritization.
6. Well-defined norms should ordinarily have priority over more general, less precise norms. ([14], Chap. 7)

Critics have highlighted the vagueness inherent to these priority rules. However, ethical theories are not meant to provide ready-made recipes, but yardsticks – and as such, the priority rules certainly are good candidates to start with.

The theoretical discussion on ISCT has been continued by authors like Wempe, Oosterhout, and Heugens [32, 42], who especially highlight the concept of “extant social contracts” and reconstruct ISCT as spelling out the details of the (necessary) internal norms of contracting. In this sense, ISCT is a contractualist rather than a contractarian approach. Boatright has criticized this enterprise by arguing (among other points) that while such an internal normativity might be desirable and even profitable, however, contracting is not necessarily dependent on it and can take place without it (if less amicably) ([8], cf. also the response [33]). Moreover, morality cannot be deduced from internal norms, but would have to be derived from other reasoning.

I agree with this criticism, in principle, and find ISCT – at least in this regard – theoretically unsatisfying. To start a contractarian business ethics merely from an internal morality of contracting would be quite limiting. In particular, it would disregard the moral benefits produced not by individual corporations or individual actors but by the entire system of the market economy (within rules and institutions). Order Ethics takes up this idea and uses it to derive the internal morality of contracting in a more systematic way, employing the concept of incomplete contracts.

Nevertheless, ISCT is a major and fruitful approach to a contractualist business ethics. It allows for pluralism of ethics, it is closely oriented on business problems, and it takes empirical issues seriously, such as the “extant social contracts.” Some of its systematic deficits may, however, be cured by the approach discussed in the next section.

Order Ethics

I argue here that there is a theoretical position that fulfills the criteria Wempe has been calling for. Moreover, it also finds a place for more *political philosophy* in business ethics, which Heath et al. [19] demand. While Heath et al., however, mainly have a Rawlsian position in mind – which is certainly one of the most prominent positions in contemporary political philosophy – there are other, if related, approaches, too. The conception I will present here is *Order Ethics* (cf. [22, 23, 26, 29, 35]).

Order Ethics (“Ordnungsethik”) can be regarded as the complement of the German conception of “Ordnungspolitik,” which stresses the importance of a regulatory framework (“Ordnung”) for the economy. From a philosophical point of view, Order Ethics relies heavily on contractarianism, taking up its basic idea that society is a cooperation for mutual self-interest. The rules of a society, and of its economy, are agreed upon by the participants, in a situation like Rawls’ *original position*. In accordance with Rawls’ principles of justice, it will be in the mutual interest of all to devise rules that will improve everyone’s position and, in particular, that of the least well-off. This idea is taken up in Order Ethics: The order framework of a society is regarded as a means for implementing ethics.

I will present the basic logic of the Order Ethics approach, starting with its account of modern, competitive societies. Second, I will explicate the distinction between action and rules, and third, the role (mutual) advantages play in its treatment of ethical norms.

Competition as a Social Condition

Order Ethics takes its start not from an aim to achieve, but rather from an account of the social conditions within which ethical norms are to be implemented: Modern societies differ strongly from premodern ones. Premodern societies were “zero-sum societies” (the term has been made popular in a slightly different sense by [38]), in which people could only gain significantly at the expense of others. This view is concisely expressed in the words of the successful fifteenth-century Florentine merchant Giovanni Rucellai, written around 1450: “By being rich, I make others (which I might not even know) poor.”

Modern societies, by contrast, are societies with continuous growth, made possible by the modern competitive market economy. In this system, positive-sum games are played. Many types of ethics, however, are still stuck with the conditions of premodern societies and lag behind: They ignore win-win situations when distinguishing sharply between self-interest and altruistic motivation, and when requiring people to be moderate, to share unconditionally and to sacrifice. These attitudes, which make self-interest something evil, would have been functional in a zero-sum society, but they are inadequate for modern societies.

In a situation of zero-sum games, it was necessary to call for temperance, for *moderate* profits, or even for banning interest. But in a modern society, self-interest in combination with the order framework promotes morality in a much more efficient way: Morality is implemented on the level of the order framework which governs the market. Via competition on the market, the position of each individual can be improved, resulting in win-win situations. These are of economic as well as of ethical value, which is visible in the form of innovative products at good value for money, of jobs, of income, of taxes, or in the promotion of diversity and pluralism [30, 31]. Within the positive-sum games of modern societies, the individual pursuit of self-interest is compatible with traditional ethical ideas like universal solidarity.

Competition is central to this conception: Order Ethics emphasizes the importance of competition in a modern society, which fosters innovation [18], the spreading of new ideas, and the tendency of (unjustified) positions of power to erode (e.g., those of former monopolists).

Competition, however, has negative aspects, too: In competitive situations, morality is constantly in danger of getting crowded out. The prisoners' dilemma and the stag hunt game are classic models for such situations which can be detrimental to morality if the incentives set by the rules thwart what is deemed ethical ([2], for the systematic use of the stag hunt game cf. [4, 5, 6]). As an example, if corruption is seen as unethical, then rules which allow for corruption (e.g., allowing bribes to be deducted from tax) will promote unethical behavior – no matter how many public calls for morality are being launched. Therefore, Order Ethics aims at changing the order framework of a society rather than at appealing to moral behavior. This does not imply that people cannot behave ethically, but rather that ethical behavior should not get punished by (counterproductive) incentives. The role of rules will be made more explicit in the following section.

Actions and Rules

Order Ethics distinguishes between actions and rules. Most traditional ethical theories focus on actions and call for direct changes in individual behavior. Within premodern societies again, this made sense, as the predominant type of social interaction was face to face: In face-to-face interactions, individual behavior is closely monitored by one's fellow citizens. The implementation of norms or standards was unproblematic. Modern societies, however, consist largely in anonymous interactions. Therefore, rules and institutions, to a large extent, must fulfill the tasks that in premodern times were fulfilled by moral norms.

Morality must be incorporated within incentive-compatible rules in order to avoid the erosion of moral behavior. More precisely, there are three problems here: First, only changes in rules can change the situation for all participants involved *at the same time*. Second, only rules can be enforced by sanctions – which alone can change the *incentives* in a *lasting* way. Third, only by incorporating morality in the rules can competition be made productive. This mirrors Adam Smith's classic idea of the market promoting the interests of all people: If the rules

are set adequately, self-interest as the dominant motive in actions can bring about the ethically desired results [37].

This way of framing the central problem of business ethics is also related to J. Boatright's [7] distinction between a *moral manager model* and a *moral market model*: While the first one focuses on making individuals (managers, officials, trade unionists, etc.) more moral, the second one – which is analogous to Order Ethics – aims primarily at changing the institutional framework and indirectly inducing ethical behavior.

For business ethics, an important lesson is that rules and actions should be prevented from getting into opposition with one another. Moral behavior on the level of actions can only be expected if there are no counteracting incentives on the level of rules. In the classic model of the prisoners' dilemma, the prisoners cannot be expected to cooperate, because the conditions of the situation are set in a way so that cooperation is punished by defection on the part of the other player. The actors are permanently faced with the possibility of being "exploited" by others if behaving cooperatively, and therefore they stop cooperating themselves preemptively. This leads to a situation where rational, self-interested actors end up with a result that leaves all worse and no one better off: Morality gets crowded out. But rules are designed to prevent this from happening.

The rules themselves are subject to meta-rules, rules of higher order, in particular, constitutional rules. These rules must be accepted with higher degrees of consent, as J. Buchanan and others maintain (cf. [9] and [10]; for the ethical dimension of Buchanan's work cf. [27]). Ultimately, Order Ethics thus differentiates the normative criterion of consent, i.e., the central criterion of contractarianism, into several degrees or dimensions.

Implementation and Advantages

Order Ethics does not require people to *abstain* completely from pursuing their own self-interest. Actors will abstain from taking (immoral) advantages only if their behavior can be seen as an investment, yielding ultimately greater benefits in the longer run than defection in the particular single case. By adhering to ethical norms, an actor may become a reliable partner for others, which may open up new forms or ways of cooperation and of win-win situations. So an ethical norm that constrains one's actions may simultaneously expand one's options in *interactions*.

While not requiring people to abandon their self-interest, Order Ethics rather suggests *improving* one's calculation, by calculating in a longer run rather than in the short run and by considering the interests of others (e.g., the stakeholders of a company), as one depends on their cooperation for future interactions, especially in the globalized world.

Order Ethics therefore does not equate altruism with moral behavior nor egoism with immoral behavior. The demarcation line lies elsewhere, between unilaterally and mutually beneficial action: In order to act in an ethical way, an actor should be pursuing his/her advantage in such a way that others benefit as well.

Order Ethics and Incomplete Contracts

Order Ethics does not deal only with those rules that are incorporated in the law, but with rules on other levels as well. This includes, in particular, agreements at branch level and also self-constraining actions of individual corporations and leads into the area of corporate citizenship and corporate social responsibility (CSR) [11]. The underlying idea of mutual advantages, however, stays the same: to aim for a win-win situation.

Corporations are in fact doing much more than merely maximizing their profits within the order framework: They are providing social welfare; they are engaging in environmental protection, or in social, cultural, and scientific affairs. The stakeholder approach explains these observations by insisting that a corporation has to take into consideration not only shareholders, but other groups as well. From an Order Ethics perspective, however, one has to justify why the claims of stakeholders, which are already incorporated in the formal *rules* – as taxes, salaries, interest rates, and environmental and other restrictions – should be incorporated a second time in the *actions* of corporations. This is not to say that corporations should not account for stakeholder interests at all, but rather that the *justification* given is not strong enough.

A suitable justification for a greater political role of corporations can be developed along the lines outlined in the rest of this section. It is consistent with the conception of Order Ethics, especially in view of two points: Ethical norms (1) must be implemented in an incentive-compatible way and (2) should be built on (expected) advantages and benefits.

Order Ethics proceeds by extending the concept of “order” to other, less formal orders. It therefore introduces another contractarian element: the theory of *incomplete contracts*.

In reality, contracts are most often not completely determined by rules. They are not entirely fixed in terms of quality, date, or content, for any possible circumstances in the future, and they are not resistant to any difficulties in enforcing these contracts. In more detail, it can be said that incomplete contracts are contracts in which one or several of the following conditions apply (cf. [16, 17]):

1. The obligations of each party resulting from the contract are not specified exactly, in view of changing conditions such as flexible prices of raw goods.
2. It is difficult and/or expensive to determine whether the contracts have been fulfilled. External consultants have to be employed.
3. The enforcement of the contract is very difficult, very expensive, or even downright impossible, due to insufficient systems of law in a number of countries.

The globalized world is full of such incomplete contracts, like work contracts, long-run cooperation contracts, insurance contracts, strategic alliances, and many others. In dealing with these contracts, there is a major problem of interdependence of the partners' actions: A partner that is honest and fulfills her part of the contract cannot automatically be sure that the other partner does the same. The other one might point to gaps within the contract, may propose differing interpretations, or it may be too expensive to enforce a claim.

A rational actor faced with these kinds of contracts would rather not sign them, especially when being risk averse. However, if these contracts promised high benefits, the actor could try to rationally deal with the incompleteness.

Making incomplete contracts complete is no way to go: Not only is it impossible to specify all scenarios in advance, but this would also greatly reduce the flexibility which is the main advantage of the incompleteness. Incomplete contracts can be made quite productive, as the parties involved can adapt their agreements to different frameworks more easily. In order to exploit the benefits of incomplete contracts, however, trust, fairness, integrity, and goodwill are needed, in short, ethics. If contracts are becoming increasingly incomplete, both an ethics for the interior relations of the company (workers and management) as well as an ethics for the exterior relations to customers, banks, suppliers, and the public become a necessity. It is rational for a company to *invest* in these ethical categories, as it contributes to the company's success in a way that directly affects shareholders.

So if rules are incomplete or if there are no rules for a specific situation, contractarianism suggests relying on substitutes: Corporations, as partners in interactions, have the opportunity to commit themselves to certain policies, to mechanisms of trust and fairness, for example. This commitment must be made credible through organizational measures and must be signaled to others. In this way, actors create by themselves the very reliability that would normally be expected from formal rules. They create a *reputation*, which especially under conditions of globalization is a necessary prerequisite for success in the long run. This commitment must be signaled and, thus, becomes an asset for the company.

So from a theoretical perspective, Order Ethics provides an integrative contractarian view on both situations, those with well-established and those with incomplete rules. In both cases, incentives and sanctions are key issues. In the first case, incentives are set by formal rules, while in the second case, this role is taken up by informal rules in the shape of "soft" factors like ethics and reputation.

Philosophical Elements in Order Ethics

The main philosophical elements of Order Ethics can thus be summarized as follows:

First, Order Ethics is a consequentialist ethics. It aims for mutual benefits and win-win situations. Unlike many versions of utilitarianism, however, it regards the individual actors as the only source of normativity: The consent of all people involved is a contractarian legacy which makes Order Ethics differ strongly from utilitarian ethics. In this way, Order Ethics avoids a number of problems which keep riddling other consequentialist theories, in particular, utilitarianism: It avoids the anti-individual consequences and the danger of suppressing minorities.

For a contractarian business ethics, these ideas imply that business ultimately has to fulfill the needs of the individuals and that economic efficiency cannot be a stand-alone criterion. In the modern globalized world, there is a good chance that competition, the market, and other international actors like NGOs will help considerably in achieving this aim.

Corporations should, in this picture, not be seen primarily as collectives with no responsibilities beyond the responsibilities of their members. Rather – as recent work in analytical philosophy [25] suggests – can organizations be regarded as having duties in their own right, provided they fulfill a number of criteria, such as being sufficiently structured for meeting their responsibilities.

Second, Order Ethics can be seen as a naturalistic variant of ethics, as it makes extensive use of the methods and results of other disciplines (this is the version of naturalism espoused by P. Kitcher and others, cf. [24]). In particular, economic theory is a major resource for Order Ethics: For identifying incentive-compatible rules, economic analyses are pivotal, both on the macroeconomic as well as on the company or branch level. Beyond economics, evolutionary biology and game theory are becoming key resources for ethics, too (cf. the work of Binmore, [4, 5, 6]).

Third, Order Ethics can give an answer, if not meet the criteria that Wempe [41] proposed:

1. It is *self-disciplined* in the sense that it aims for the *implementation* of ethical norms and does not claim to answer all questions of normative *justification*.
2. It is *argumentative* as it aims at argumentatively deriving rules from the normative criterion of consent of the involved actors and as it, with regard to specific problems, argumentatively tries to show how win-win improvements are feasible (for examples cf. [26] or [35]).
3. It is *task-directed* in that it is directed toward the modern situation of normativity under pluralistic conditions, where consent is the only remaining normative criterion and where specific agents can design rules adequate for their specific interactions, i.e., large corporations, NGOs, and local governments (cf. [35]).
4. It is *domain-specific* at least when being applied to questions of corporate morality, as it makes use of the theoretical element of incomplete contracts (and also of others like “orthogonal positioning,” cf. the articles in [22]) as specific tools designed for answering questions of corporate morality.

Finally, ethics is starting to develop an experimental branch, too: While preeminent philosophers like Appiah [1] and (to some extent) Singer [36] have been advancing the role of experiments within ethics for some time, others go a step further and actually do experiments themselves. This might become an important method for business ethics in the future, too.

Conclusion

Several conceptions have approached the idea of a contractarian business ethics. First, Integrative Social Contracts Theory has been presented here, which has, however, raised criticism concerning its normative foundations and its

theoretical coherence. Second, I have presented the conception of Order Ethics, which is linked closely both to the contractarian philosophical tradition as well as to fundamental theories of economics. This model of interdisciplinary cooperation should prove fruitful in developing a systematic and coherent theory of business ethics, with contractarianism as its basis.

Part 9

Sen's Capabilities, Poverty and Economic Welfare

Jesús Conill

Abstract

This chapter presents (a) the capabilities approach as a real freedom perspective through the connections with the ethics of Aristotle and through its eleutheronomic foundation in Adam Smith, Immanuel Kant, and Karl Marx; (b) the contributions of the impartial spectator as open impartiality to the idea of justice; and (c) a broader conception of rationality.

Introduction

The capabilities approach is an economic and philosophical focus with foundations lying in the line of thought stemming from the economics of Aristotle and Adam Smith, who set this in the domain of practical philosophy and categorize it as Political-Ethical Economics. The philosophical foundations of the new capabilities approach, which have since Amartya Sen brought about a transformation in contemporary economic thought, could be summed up in three basic conceptions: capabilities as real freedom, justice as satisfaction of needs and open impartiality, and an evaluative rationality in the realm of public reason.¹

Freedom, Justice, and Rationality

The Capabilities Approach as a Real Freedom Perspective

The capabilities approach is commonly referred to as if it were philosophically linked to Aristotelian ethics. Other connections can nevertheless be found for

J. Conill

establishing the philosophical (ethical-political) foundations of the capabilities approach.² The notion of “capability” is not only related with Aristotelian *dynamis* but also with the modern (enlightened) understanding of this as “freedom,” as this was conceived by Adam Smith and Immanuel Kant, connected in turn with Marx (From each according to his ability, to each according to his needs!) and with Rawls (Equal Liberty!). This is because both schools are committed to a capability which should be understood as freedom with effective guarantees (either in the socialist or social-liberal version). This outlook ties in with the real freedom conception of van Parijs [9], drawing inspiration in turn from Marx and Rawls (and not from Aristotle, because the principle of freedom in the modern sense is threatened in the latter).³

The Connection with Aristotle

Sen himself resorts to Aristotle to explain the philosophical foundations of the capabilities approach: “the most powerful conceptual connections would appear to be with the Aristotelian view of the human good. (. . .) The Aristotelian account of the human good is explicitly linked with the necessity to ‘first ascertain the function of man’ and it then proceeds to explore ‘life in the sense of activity.’”⁴ Sen himself, nevertheless, also straight away points out that there are “substantial differences” between the way functionings and capabilities are tackled in his own approach and in Aristotle’s. There are also some very significant differences between the versions of the capabilities approach put forward by Sen and Nussbaum.

From Aristotle’s standpoint (and this is supported by Nussbaum [12]), it would be possible to determine “one list of functionings (. . .) that do in fact constitute human good living.” Sen does not consider that this opinion is inconsistent with his approach, but asserts that it is “*not*, by any means, *required* by it.” He prefers not to eliminate “the ‘incompleteness’ of the capability approach” since the Aristotelian route is not the “*only*” way to see human nature, because the capabilities approach instead allows “other routes” to be taken. Aristotle is useful insofar as he contributes to a certain “*general* argument” in favor of the capabilities approach, but according to Sen, different specific theories of good and value may be consistent with the capability approach, because the point is actually to open up a common “evaluative space” ([10], p. 49).

Why did Sen choose the term “capability” for his new approach? Did its relations with Aristotle have anything to do with this choice? Sen explains that he chose the expression “capability” to represent “the alternative combinations of things a person is able to do or be – the various ‘functionings’ he or she can achieve” ([10], p. 30). This occurred at the Tanner lecture (“Equality of What?”) given at Stanford University in May 1979 (published in 1980). Although the original reason for using the capabilities approach was the context of the question “Equality of What?,” the use of the approach has however not been restricted to the matter of equality, instead helping to extend the horizon of the consideration of individual opportunities and advantages in terms of capabilities. Starting from the initial use in the analysis of inequality, Sen has therefore extended the horizons for application of his new viewpoint, displaying its potential for analyzing other social issues, such as well-being⁵ and poverty, liberty and freedom, living standards and development, justice, and social ethics.

Hence, as Sen explicitly acknowledges, he did not grasp the Aristotelian relations when he first proposed the capability approach. It would seem to have been Nussbaum who later on “aroused him” from that unawareness and made him see the connection with Aristotle, writing a number of studies on this relationship. Since then, Sen has taken this form of interpretation into consideration and even partly incorporated this. For example, he points out that the Greek word “*dynamis*,” used by Aristotle to deal with one aspect of the human good, and which has been translated by “potentiality,” can also be translated as the “capability of existing or acting.”

Nonetheless, as I see it, the best Aristotelian contribution to Sen’s thought lies in steering the economic approach toward the capability of living as we would like to live. The basic standpoint provided by Aristotle is not of dealing with economic wealth, but dealing with the life that we could live: “wealth is evidently not the good we are seeking; for it is merely useful and for the sake of something else” [11]. Sen’s construal of this Aristotelian approach considers that the main thing is what we can “do” with greater wealth; hence, income and wealth are not desirable for their own sake, but are means to have *more freedom* with which we can lead the kind of lives we have reason to value ([13], pp. 13–14).

The decisive thing is the concern for the conditions of life and the ability to function. What is at stake, according to Sen, are the freedoms generated by goods. Neither utilities nor goods, but *substantive freedoms*, the capabilities to choose the life that we have reason to value. According to Sen, it is the concept of “functions” which has clearly Aristotelian roots. On the other hand, “capability” is the substantive freedom to obtain different combinations of functions, the freedom to attain different lifestyles ([14], p. 75). The main center of axiological attention will not be the “functional outcomes” (which could be the same, as in the much-repeated paradigmatic example distinguishing between “fasting” and “starving”). It will be the “set of capabilities,” the effective *power* to decide (being able to dispose). This second evaluative area constitutes the most radical level of the meaning of “capability.” Rather than the Aristotelian one of functions, it is I feel connected with the Kantian one of *freedom* (the area of eleutheronomy). This is why Sen has gradually, and increasingly insistently, drawn up his capabilities approach as “the perspective of freedom.”

The domain of what was in Aristotle a hierarchy of goods up to the supreme good, or a relationship between means and ends, as far as the ultimate end, in respect of which everything else is an instrument (means), is increasingly construed in Sen with greater clarity from the standpoint of freedom: here the *good life* is presented in a version of *free life* (as opposed to poverty and tyranny).

Another aspect of Aristotle which could be used in greater depth is that of certain philosophical concepts such as that of “*dynamis*” (“power”), which requires a more careful examination of Aristotelian texts. Several rewarding interpretations contribute to this, such as the one provided by a Spanish line of philosophy from Ortega y Gasset [15, 16]: “power insofar as this is actuality,” “the act becoming its own power, actuality insofar as this is power,” dynamism which progresses toward itself, an act of energy (*enérgeia*).

Modern Context of the Capabilities Approach

The Perspective of Freedom (from Adam Smith to Karl Marx)

In spite of its references to Aristotelian thought, both Sen and Nussbaum place the capabilities approach in a modern setting. The modern connections are inescapable, indispensable, and indeed, the decisive ones, in my opinion. Sen preferably draws from Aristotle the spirit of his practical philosophy, his focus on real, concrete life. Nussbaum, on the other hand, feels herself forced to adopt a liberal interpretation of Aristotle, in later versions perfectly classifiable within Rawls' political liberalism. The modern connections in Sen's socioeconomic thought, which in my opinion lie basically in Smith, Kant, Marx, and Rawls, thus need to be established.

The main basis of Sen's economic thought can be found in Adam Smith. Sen himself explicitly acknowledges this when he describes his book *Development as Freedom* as "having an intense 'Smithian' character," since his economic thought has roots in practical philosophy, concerned with real life, with life's "needs" and conditions. The influence of Marx⁶ can also be seen in this approach of focusing on needs and conditions of real life. There are several themes from Smith to which Sen returns, but the most radical question that Sen already finds in either Smith or Marx would seem to me to be that of freedom in relation with "need" and "capability." For example, Smith was concerned with the capability to function conceived as "the ability to appear in public without shame" ([13], p. 73). What is considered as being a "need" in a society depends, in a Smithian analysis, on what is required to attain certain minimally necessary needs, such as the "ability to appear in public without shame" or to participate in community life. Needs involve essential goods for living with a certain decorum, so as not to feel humiliated. These are ultimately the freedoms which are generated by goods, not the goods in themselves, but insofar as they constitute the real condition of freedom: freedom in effective conditions.

The Eleutheronomic Foundation of the Capabilities Approach

In my opinion, the implicit foundation of the capabilities approach, especially as this is put forward in *Development as Freedom*, can be found in Kantian *eleutheronomy*. This is not a mere "Kantian component" (Crocker), nor only a matter of "convergence with Kantian strategy" (O'Neill), but the recognition of a fundamental order, a basic unconditional principle, which is why Sen gives this intrinsic value and regulatory power in its own right.

The question is, as in other contemporary neo-Kantian approaches (Rawls and discursive Ethics), that the affirmation of freedom defended by Sen's capabilities approach is also complemented with the analysis of consequences in an integrated framework. The moment, which is called "deontological," is determined through the perspective of freedom: in its normative facet, in its intrinsic value, understood as an end, according to Sen's own expressions. This aspect nevertheless needs to be combined with concern for the consequences in the framework of a "new ethics," which would as I see it have the nature of an *ethics of responsibility* in a strict sense, one which without relinquishing principles (or convictions) is able to make these effective in the complexity of reality, through the relevant mediation and situations.⁷

The crux of the matter is the notion of “capability.” If, as is diversely, but convergently asserted by Nussbaum and Sen, it is true that this constitutes the “modern equivalent of the Aristotelian term *dynamis*”⁸ and which actually means in most cases something like “the condition pursuant to which something can be done,” then one can also understand that the notion of “capability” should be introduced “to refer to the extent of freedom that people have to pursue valuable activities or valuable functionings” [18]. *Capability* consequently really means, even more markedly in the modern context, *freedom in conditions, real freedom* (effective power). This means that it exceeds the merely “liberal” concept of freedom (which always tends to be understood as “noninterference”), and stresses the positive, empowering, fulfilling side of freedom, which requires conditions of equality and justice. This therefore opens up a more favorable horizon for freedom, socially conditioned with justice, also in economic life.

Capability as Freedom

This sense of capability as the constituent freedom of the human being is found throughout Sen’s work and particularly in *Development as Freedom*. Extending freedom is the basic aim, which is why the analysis of the mechanisms and social institutions has to be measured according to how they contribute to making individuals’ freedom effective. This is *real freedom* and thus what has to be eliminated are the sources of deprivation of freedom, i.e., poverty and tyranny.

According to Sen, freedom is fundamental, both for “the evaluative reason” and for “the effectiveness reason,” although the fundamental aspect for Sen’s thought is not effectiveness but freedom. As regards the market, for example, instead of evaluating this from such a commonly used standpoint as its contribution to economic growth, Sen insists above all on “the direct significance of the freedom to interchange” ([13], p. 6). When he examines the demographic problem, furthermore, Sen relies on the contribution of freedom to moderate fertility rates, instead of “economic compulsion.” For this reason he would back Condorcet’s approach rather than Malthus’, based on his perspective of freedom. Sen explicitly understands this, when he uses the development approach which is in favor of freedom as an example of the debate between the defense of freedom against need, asserting that “the solution of the population problem calls for *more* freedom, not less” ([13], pp. 226). More examples of his fundamental standpoint could be given: a “freedom-centered understanding of economics and of the development process,” which is to a large extent sustained on the concept of “agent” ([13], p. 11).

This perspective of freedom shifts the center of attention of standard economic thought, which tends to focus more on “utilities” (income and wealth) than on freedom, when the meaning of modern economics is freedom [19]. Sen provides us with a very fruitful distinction to understand the value of the dynamic capability of freedom in economic life: the one that exists, in his opinion, between “*culmination outcomes*” and “*comprehensive outcomes*”; the first term does not take into account the process (the possible exercising of freedom); the second takes into account the processes. This distinction helps us to understand

the reasons for the separation of and confrontation between two aspects which should be coordinated in the economy (properly understood): placing the value of freedom over that of utilities.

Freedom is so radically important that in the debate on the evaluative question between the changes introduced by modern processes and tradition, the “basic value” consists in the fact that individuals freely decide on the traditions that they wish to maintain or not, because the basic aim is the extension of freedom and the main means is also freedom. Freedom thus has both a “constituent role” and an “instrumental role.” Freedom has intrinsic importance as a preeminent objective of development, a value that must be distinguished from instrumental effectiveness.

The Idea of Justice

Information Bases for a Different Approach to Justice

The capabilities approach proposal brings up a different approach to justice, with an information basis involving individual freedoms (not utilities): a “capability approach to justice.” This angle is the most helpful one for focusing attention on the *real life* achieved by individuals, on the *real freedom* to choose and accomplish the life that we have reason to value (satisfaction of basic needs, “levels of life”). In his *Critique of the Gotha Programme*, Marx defended the distribution of goods according to needs, as a requirement of justice, as opposed to the persistence of the narrow “bourgeois law,” which defends remuneration according to the product of labor [20, 21]. What lies at the heart of this requirement of justice is the defense of “positive freedom” – in my opinion, of radical freedom – which not only goes beyond utility and efficiency, but even surpasses certain formulations of rights in the liberal tradition. This is why Marx, for example, rejected “the so-called human rights” and radicalized the importance of positive freedom (what some have considered his revolutionary “ethics of freedom”).⁹

When it comes down to it, Sen’s whole position has a universalist presumption which he himself expresses as follows: “this book [*Development as Freedom*] is informed by a belief in the ability of different people from different cultures to share many common values and to agree on some common commitments. Indeed, the overriding value of freedom as the organizing principle of this work has this feature of a strong universalist presumption” ([13], p. 244). Sen shows that in different cultures, in all cultures, there has always been a clamor for freedom, disagreement, and dissident opinions which are the expression of freedom.

Sen adopts this perspective of freedom as a “normative approach” from which he puts forward the “foundations of justice” [23]. One of the different aspects of the *eleutheronomic* version of Sen’s capabilities in relation with justice deserving mention is what Crocker has rightly called the “small mercies argument” [2] and Gustavo Pereira has analyzed as “adaptive preferences” [24], because in this issue he very clearly expresses the deeper sense of freedom in conditions and of being deprived of this through poverty and/or tyranny.

When Sen explains the limitations of the utilitarian perspective of justice, his reflection leads us to the domain of freedom. Thus, if concentrating one's focus only on mental characteristics (such as pleasure, happiness, desires) can be extremely limiting when making *interpersonal* comparisons of well-being and deprivations, calculating utility can be very unfair for the perennially underprivileged, the usual underdogs, oppressed minorities. This is because the destitute tend to come to terms with their deprivations due to the need to survive, tending to relinquish their courage to demand a radical change and, even meekly tend to adapt their desires and expectations to what they consider feasible. Hence, persistent deprivations gradually stifle and silence the destitute, for as long as the conditions are not met for those people to have real opportunities to freely choose the type of life that they would like to live ([25], pp. 62–63).

Resignation to persistent (structural) deprivation and even gratefulness for “small mercies” is fairly commonly found among the poor or people subject to different forms of tyranny, insofar as these adapt their aspirations and wishes to the little that is affordable or feasible for them ([26], p. 309). The deprived have “mental reactions (which) often reflect defeatist comprises with harsh reality induced by hopelessness” ([26], p. 512). Due to the low level of aspirations and high level of regular misfortune, a person may be grateful for any small “mercy,” in spite of the persistent deprivations to which they are subject. They experience deprivation with some satisfaction and the deprivations are silenced and dampened, in spite of the suffering, due to the need to survive. Nevertheless, from the perspective of an eleutheronomic ethics, such as the one entailed by Sen's capabilities approach, which has to be very attentive – with hermeneutic meaning – to each specific situation,¹⁰ possible relative satisfaction is not the measure of justice because in this case one is not living freedom as a capability to choose the type of life that one considers valuable.

“The utility calculus can be deeply unfair to those who are persistently deprived: For example, the usual underdogs in stratified societies, perennially oppressed minorities in intolerant communities, traditionally precarious sharecroppers living in a world of uncertainty, routinely overworked sweatshop employees in exploitative economic arrangements, hopelessly subdued housewives in several sexist cultures. The deprived people tend to come to terms with their deprivation because of the sheer necessity of survival, and they may, as a result, lack the courage to demand any radical change, and may even adjust their desires and expectations to what they unambitiously see as feasible” ([25], pp. 62–63).

Consequently, what justice demands is to foster the creation of conditions for individuals to have real “opportunities to judge the type of life that they would like to live.” To create these conditions, there need to be social and economic factors, such as basic education, healthcare, and secure work, which are important to provide individuals with the “opportunity to face the world with courage and freedom.” This requires a basis of information (more extensive than that of utility-based welfare), concentrating its focus on “individuals' ability to choose the life that they have reason to value.”

The Idea of Justice as Open Impartiality Critique of the Social Contract and of the Original Rawlsian Position

In his work *The Idea of Justice* Sen's conception of justice takes a new angle as he presents a critique of the social contract and of the Rawlsian original position.¹¹ In his opinion, using the social contract as Rawls does restricts the search for justice of the members of a community or "people" to a group similar to that of the national state:

"It is the contractarian framework of 'justice as fairness' that makes Rawls confine the deliberations in the original position to a politically segregated group whose members 'are born into the society in which they lead their lives'" ([27], p. 127). Sen points out that this contractualist framework does not offer the procedure for reviewing "local prejudices," nor for "opening up the reflections in the original position to the eyes of mankind" ([27], pp. 127–128).

Sen also blames Rawls for having formulated a closed program of the "original position," since the "veil of ignorance" in the "original position," does not guarantee an open scrutiny of local and parochial values, in Sen's view. On the other hand, Sen refers to Smith's procedure as going beyond local presuppositions, separating us from "our own natural station," of seeing local presuppositions "at a certain distance from us." Smith's procedure insists on exercising an open impartiality, because "we can do this in no other way than by endeavoring to view them with the eyes of other people, or as other people are likely to view them" [28].

Sen defends a sense of justice – which does not mix up with mere humanitarianism – going beyond the bounds of sovereign states and which will be formulated by means of the notion of "open impartiality," because "our sense of identity" is not confined within the frontiers of the state ([27], p. 129), but instead crosses national frontiers, which is why certain demands of justice come up. Sen insists on the fact that "the world beyond a country's borders cannot but come into the assessment of justice in a country," since the actions of certain countries affect life in other countries very seriously, not only by means of wars, but by means of all kinds of exchanges, for example, trade. Hence, if one takes for granted this multiple reciprocal influence on the real life of people from other countries, Sen asks whether the voices of affected people elsewhere should not count in some way in determining what is just or unjust in a society's organization, in view of the effects brought about by the interaction in life of people from other societies. This means that the voices from all origins should not be ruled out, because, according to Sen, "objectivity demands serious scrutiny and taking note of different viewpoints from elsewhere, reflecting the influence of other empirical experiences" ([27], p. 130). Different points of view bring up questions, which help to overcome parochialisms and localisms, made up of fixed beliefs and specific practices. Considering others' reasons "can be an effective way of determining what objectivity demands."

In short, for Sen, "assessment of justice demands engagement with the 'eyes of mankind'" ([27], p. 130), because this is how the local community is surpassed, one becomes aware of how our own actions may affect others' lives and because other standpoints may help to overcome particularism. That is why Sen stresses

several limitations of the “original position” ([27], pp. 138 ff) which are connected with a closed form of impartiality, and advocate an open impartiality through the impartial spectator.

Rawls himself brought up the question of justice in the present context of the growing interaction between different countries with his proposal of the “law of peoples,” which suggests a second original position between the representatives of different peoples.¹² The Rawlsian form of tackling the problem implies invoking another “original position,” which this time involves representatives of different “peoples.” The two original positions may be called “*intranational*” and “*international*,” but Sen considers that this involves “closed impartiality” in both cases. For when Rawls says in his later work, *The Law of Peoples* (1999), that “at some point, a political conception of justice must address the just relations between peoples, or the law of peoples,” what actually occurs is that what Rawls considers to be “just relations between peoples” is, according to Sen, “an altogether different issue from the need for an open scrutiny of the values and practices of any given society or polity, through a non-parochial procedure” ([27], p. 128).

As well as Rawlsian procedure, Pogge has proposed a “cosmopolitan” version of the original position through a comprehensive practice of impartiality. This idea of a global practice of the social contract for the whole world population nevertheless appears to Sen to be “deeply unrealistic” and he thus considers that “there is an institutional lacuna here” ([27], p. 141). So Sen considers that Nagel’s skepticism [29] on global justice is also relevant for the proposal of a cosmopolitan social contract and that it is therefore useful to resort to the route of open Smithian impartiality, since the cosmopolitan social contract depends more on global institutions than Smith’s less rigid and demanding approach.¹³

Contributions of the Impartial Spectator

By resorting to the impartial spectator Smith indicates that relevant judgments on justice can come from outside the standpoints of the agents in contractual negotiations: they can in fact come from “any just and impartial spectator,” as the proper procedure is to listen to the expressions of others’ viewpoints, which can help to reach “a fuller – and fairer – understanding” ([27], p. 131).

In spite of the “contractualist” form of the Rawlsian theory of justice, the social contract is not the only tool that Rawls brings into play in his particular understanding of justice. According to Sen, there is an imaginary “background” in the original position, which turns out to be a reflexive exercise prior to the congregation of the people’s representatives in the original position. The “veil of ignorance” can be seen as a procedural demand of impartiality attempting to constrain someone’s political and moral reflections, whether a contract is invoked or not. According to Sen, in the use of the “veil of ignorance,” “the parties (that is, individuals under this veil) would already agree with each other when the point comes to negotiate a contract.” This is why Rawls asks whether a contract is

required, “since there is already a precontract agreement.” This means that part of Rawlsian reasoning involves precontractual reflections and this would to a certain extent be in parallel to the Smithian procedure of just arbitration. Rawls therefore resorts to a “public framework of thought,” which is not merely equivalent to demanding a “contract,” but presupposes that “we share a common viewpoint with others” [30, 31].

Sen nevertheless stresses certain differences between Rawlsian theory and the Smithian approach of the impartial spectator: (1) Smith’s insistence on what Sen calls “open impartiality,” which accepts the legitimacy of the “enlightenment relevance” (and not only of “membership entitlement”) of others’ opinions; and (2) the comparative direction taken by Smith’s research (pursued by an alternative enlightened tradition, in which he places Condorcet, Wollstonecraft, Bentham, Marx, and Mill), going beyond the search for just institutions and concerned with social accomplishments ([27], p. 134). He points out a similarity between this alternative tradition (interested in comparing different ways in which people can steer their lives, people’s real behavior and social interactions) and the ancient Indian tradition of justice as *nyaya* (referring to comprehensive results), as opposed to *niti* (reduced to schemes and institutions). Pursuing this enlightened tradition comes out into the theory of social choice, concerned with the evaluative comparisons on social accomplishments, which is why Sen includes the analytical and mathematical discipline of the “social choice theory” (from Condorcet to Arrow) in this line of research. If properly adapted, this approach may represent a substantial contribution to the treatment of matters concerning the improvement of justice.

The Smithian impartial spectator is a recourse for critical scrutiny and public discussion. He does not need to seek unanimity or total agreement as this is demanded by the institutional straitjacket of Rawls’ theory of justice ([27], p. 135) nor base himself on contractualism or utilitarianism ([27], p. 137) but the impartial spectator can, with open impartiality, “enlighten without being *either* a social contractor, *or* a utilitarian in camouflage” ([27], p. 138). Open impartiality allows more distant and closer opinions to be heard in the construal of justice, avoiding parochialism. Hence, from Smith’s standpoint, a “public framework of thought,” which crosses borders, can be invoked according to Sen ([27], pp. 134 and 141).

What occurs to Sen is that by resorting to the figure of Adam Smith’s “impartial spectator” to sustain a conception of “open impartiality,” he is referring to a notion of “public reason” which comes increasingly close to that of Habermas and of the later Rawls. This is because what Sen is actually opposing is a particularist (parochialist) contractualism, which is unable to open up to universalism. However, the universalism to which he resorts now seems to be the possible universalism of public reason, which perhaps proves convergent with the universalism of freedom (which he already made use of from the capabilities approach),¹⁴ given that public reason is a domain of freedom, in whose scenario the demands of justice are debated.¹⁵

Conclusion

A New Conception of Economic Rationality

It appears to Sen that the distancing of the economy in respect of ethics “has brought about one of the major deficiencies of contemporary economic theory” [37]. Economic rationality can be made more productive, if it pays greater attention to ethical considerations determining human behavior and judgments. For example, the case of egotistic behavior in conventional economy has prevented the analysis of highly significant relations. It is furthermore known that “there is neither evidence for the claim that self-interest maximization provides the best approximation to actual human behavior nor that it leads necessarily to optimum economic conditions” ([38], p. XI). Since, according to other economic studies, there are economies in which other forms of behavior (based on duty, loyalty, goodwill, etc.) have become highly relevant to accomplish economic efficiency.

The supposition of “rational behavior” needs to be questioned because, although rationality tends to be identified with the “maximization of self-interest,” according to Sen, “universal selfishness as *actuality* may well be false, but universal selfishness as a requirement of *rationality* is patently absurd” ([38], pp. 16 and 17). Adam Smith already realized and explained that there is *aplurality of motivations* in human behavior, reaching beyond the maximization of self-interest. This is not the only aspect involved in exchange, and far less so in the other economic activities and functions. A single motivation is thus not enough to explain human behavior, not even presumed economic rationality.

What is ultimately at stake are the ethical foundations of economic rationality. As opposed to the utilitarian perspective and “economic efficiency” in the sense of Pareto optimality, Sen has proposed a new approach to ethical economics from the rationality of freedom. The value of real freedom, the importance of the “agency aspect” of people constitutes the real foundation of the economic rationality proposed by Sen as an alternative to the conventional sort. The gradual surmounting of the impoverishment of the economy as its ethical root is rediscovered “may shake the foundations of conventional economic theory” and the growing need for a “systematic ethical assessment” may help to extend the horizon of rationality and enrich the suppositions of the analysis of human behavior.

The rationality of freedom that Sen proposes from the economy surpasses the utilitarian approach, just as Rawls managed to exceed this in the sphere of ethical-political thought. In his work *Rationality and Freedom* [39] and in *The Idea of Justice* he pursues this normative approach to the rationality of freedom and justice,¹⁶ for this innovative line of economic thought shows that the “monist” method in which the standard economy is stuck is inappropriate, because it does not allow a consideration of evaluative plurality, which is what really ties in with the freedom approach.

New economic analysis integrates the technical and ethical sides of economics in its rationality. Indeed, consequential reasoning may cover what Sen calls

the “position relativity” in the assessment of social states and the differences in agents’ sensitivity in moral valuations, that is, the plurality of points of view in interpersonal relations and in social life ([38], p. 77). The important thing about Sen’s stance is the fact that has been able to go from economic thought to combining the type of “consequential reasoning” with the perspective of “intrinsic value” that an activity may have. Having to deal with instrumental value does not rule out any possible intrinsic value and the same thing applies the other way round – the intrinsic value of an activity does not have to lead to ignoring the consequences of the action. In short, one contribution made by Sen, in my opinion, consists of the fact that he integrates the “intrinsic value” and the “instrumental function,” starting from economic thought.

Sen illustrates several types of possible evaluative rationality in the economic-ethical analysis of the bases of information by means of the Annapurna parable,¹⁷ which tells that she wants to have her garden cleared and three unoccupied workers want to get the job. The most important thing involved in deciding is to realize the type of evaluative rationality acting in each case and to perceive the decisive importance of information bases of the different types of evaluative rationality which come into play in the different approaches: for example, in the egalitarian one (focusing on the lack of income), the utilitarian one (focusing on measuring pleasure), and that of the quality of life (focusing on the types of life that each of the three persons can lead). The decision is based on the information which is made to carry greatest weight, because each evaluative rationality is in relation with an information base.

Georges Enderle

Abstract

The article attempts to make the capability approach fruitful for corporate ethics (i.e., the ethics of business organizations) in two parts. The first part presents the capability approach. After a short historic overview of its development advanced by Amartya Sen and Martha Nussbaum, the question about an adequate informational basis for interpersonal comparisons is raised, and traditional answers of the utility-based and resource-based approaches are criticized. Against this backdrop, the essential elements of the capability approach, common to Sen and Nussbaum, are highlighted, and some foundational implications of Sen's capability approach in particular are explained, followed by a few considerations on the limitations of the capability approach. The second part discusses the application of the capability approach to corporate ethics. Beginning with three basic assumptions on corporate ethics, the application includes a critique of "value-free" economics and other business disciplines and an enrichment of the notion of rationality. It stipulates a sensitivity to issues of poverty and distribution and elaborates on the focus on functionings and capabilities. The article ends with a few concluding remarks.

Introduction

If one blind person guides another, both will fall into a pit. (Matthew 15:15)

Guidance without adequate informational basis is misleading and can have catastrophic consequences. This holds true for entire societies as for personal lives, for economies as for business organizations.

G. Enderle
Department of Marketing, Mendoza College of Business, University of Notre Dame, Notre Dame, IN, USA

Over a long period of time, increasing concerns have been raised about the adequacy of current measures of economic performance, especially those based on GDP figures. Furthermore, there are broader concerns about the relevance of these figures as measures of societal well-being, as well as measures of economic, environmental, and social sustainability. Therefore, the Commission on the Measurement of Economic Performance and Social Progress, initiated by the French government, was created in early 2008 in order to address these concerns. Under the leadership of Professors Joseph E. Stiglitz, Amartya Sen, and Jean-Paul Fitoussi, the commission published its final report on Sept 14, 2009. There it states:

The whole Commission is convinced that the crisis is teaching us a very important lesson: *those attempting to guide the economy and our societies are like pilots trying to steering a course without a reliable compass* (emphasis added). The decisions they (and we as individual citizens) make depend on what we measure, how good our measurements are and how well our measures are understood. We are almost blind when the metrics on which action is based are ill-designed or when they are not well understood. For many purposes, we need better metrics. Fortunately, research in recent years has enabled us to improve our metrics, and it is time to incorporate in our measurement systems some of these advances. There is also consensus among the Commission members that better measures may enable us to steer our economies better through and out of crises. ([21], p. 9)

After discussing “classical GDP issues,” the report addresses the conceptualization and measurement of “quality of life” and “sustainable development and environment.” For the purpose of this article, we focus on the capability approach that prominently figures as one of the approaches to capture quality of life, besides the approaches based on the notions of subjective well-being and fair allocations. As is well-known, the capability approach has been developed by Amartya Sen and Martha Nussbaum and represents today a coherently elaborated body of knowledge, which has served as the basis for numerous public policy issues at the national and international levels. Suffice it to mention the annual *Human Development Reports* published by the United Nations Development Program since 1990.

One might, therefore, ask how the capability approach can be made fruitful for business and economic ethics. For those familiar with Sen’s work, there is no doubt that Sen has made seminal contributions to lay new foundations for business and economic ethics, ranging from opening economics to ethical considerations, to enriching motivations for economic behavior, and assessing economic and social achievements in terms of freedoms and capabilities. Throughout his professional career, Sen has paid close attention to these foundational issues, documented in numerous publications, for instance, in Sen [22, 24–27], [31], and [35] (see also [14]). On various occasions, he also has spoken on business ethics, for example, at the International Conference on the Ethics of Business in a Global Economy, held in 1992 in Columbus, Ohio [30], and at the First World Congress of Business, Economics, and Ethics in 1996 in Tokyo [32]. Moreover, he writes extensively on capitalism and business ethics in *Development as Freedom* [31]. Thus, he can rightly be called a pioneer and trailblazer of contemporary business and economic ethics.

Nevertheless, it is fair to say that until now the capability approach has been used only rarely in “business ethics” (or corporate ethics) understood as the ethics of

business organizations, which differs from individual ethics and the ethics of economic systems. Therefore, it appears appropriate to explore the potential and limitations of the capability approach for corporate ethics. Thereby, Sen's foundational work will also be considered insofar as it relates to this question.

This article includes two parts. The first part presents the capability approach. After a short historic overview of its development advanced by Amartya Sen and Martha Nussbaum, the question about an adequate informational basis for interpersonal comparisons is raised, and traditional answers of the utility-based and resource-based approaches are criticized. Against this backdrop, the essential elements of the capability approach, common to Sen and Nussbaum, are highlighted, and some foundational implications of Sen's capability approach in particular are explained, followed by a few considerations on the limitations of the capability approach. The second part discusses the application of the capability approach to corporate ethics. Beginning with three basic assumptions on corporate ethics, the application includes a critique of "value-free" economics and other business disciplines and an enrichment of the notion of rationality. It stipulates a sensitivity to issues of poverty and distribution and elaborates on the focus on functionings and capabilities. The article ends with a few concluding remarks.

The Capability Approach and Its Foundational Implications

A concise summary of the capability approach can be found in the Stiglitz-Sen-Fitoussi Report:

This approach [to measuring quality of life] conceives a person's life as a combination of various "doings and beings" (functionings) and of his or her freedom to choose among these functionings (capabilities). Some of these capabilities may be quite elementary, such as being adequately nourished and escaping premature mortality, while others may be more complex, such as having the literacy required to participate actively in political life. The foundations of the capability approach, which has strong roots in philosophical notions of social justice, reflect a focus on human ends and on respecting the individual's ability to pursue and realise the goals that he or she values; a rejection of the economic model of individuals acting to maximise their self-interest heedless of relationships and emotions; an emphasis on the complementarities between various capabilities; and a recognition of human diversity, which draws attention to the role played by ethical principles in the design of the "good" society. ([21], p. 42)

Before discussing the features, strengths, and limitations of this approach in detail, a short historic overview of its development advanced by Sen and Nussbaum is presented. Sen (see [15, 18]) began to focus on capability in his Tanner Lecture at Stanford University in 1979 in the specific context of evaluating equality ("Equality of What?" in [24], pp. 353–369). In *Poverty and Famines* [23], the term of capability is not yet mentioned (while the concepts of entitlements and the ability to command enough food play a key role). Shortly after, the notion of capability gained much attention and elaboration: in the context of development, well-being and poverty, liberty and freedom, living standards and development, gender bias and sexual divisions, and justice and social ethics. Among the numerous

publications, one might mention *Commodities and Capabilities* [26], *Inequality Reexamined* [28], and “Capability and Well-Being” ([17], pp. 30–53). In *Development as Freedom* [31], the capability approach takes a center stage and is, again, masterly presented in *The Idea of Justice* [35].

Nussbaum connected the capability approach with Aristotelian ideas in the 1980s and jointly edited the book *The Quality of Life* [17] with Sen. She has made pioneering contributions to the development of this approach and has published numerous books and articles, documented in her most recent book *Creating Capabilities* [16], which is a lucid masterpiece on capabilities and human development.

The capability approach starts from the experience that “all over the world people are struggling for lives that are worthy of their human dignity” ([16], p. 1). As there is an enormous diversity of lives, many plagued by poverty, disease, disabilities, and violence, the search for a better world and more just societies appears inescapable. The question then arises how these lives can be compared – or what “informational basis” is adequate – in order to reduce injustices and advance good societies.

Critique of Utility-Based and Resource-Based Approaches

This question is of paramount importance for empirical and theoretical studies as well as for ethical evaluations and public policies. If one chooses an informational basis that does not allow for interpersonal comparisons, one cannot, strictly speaking, make social judgments. This outcome was famously demonstrated by Kenneth Arrow’s “Impossibility Theorem” [1].

Also, “the new welfare economics,” spearheaded by Lionel Robbins in the 1930s, rejects interpersonal comparisons of utility and uses only one criterion of social improvement, namely, the “Pareto criterion.” This accounts only for the utilities of each person *separately*. Accordingly, the situation x of a group (or a country) is better than the situation y of this group (or country), if at least one person has more utility in x than in y and everyone has at least as much utility in x as in y . A situation is then described as “Pareto optimal” or “Pareto efficient” if and only if there is no other feasible situation that is superior to it in terms of the Pareto criterion. This means that Pareto optimality ignores the issue of the distribution of utilities and does not account for anything other than utilities (such as freedoms, rights, or opportunities). It goes without saying that, in comparing situations of men and women, ethnic groups, and entire nations, this criterion would generate bizarre results.

Because interpersonal comparisons are necessary for investigating and assessing social states of affairs, one may ask for the appropriate informational basis of comparisons. Broadly speaking, two influential sets of approaches can be distinguished. The first set is based on subjective feelings of persons and has been advocated, historically and most prominently, by utilitarianism with its different versions: the hedonistic view of utility as pleasure, utility as desire fulfillment, and utility as preference satisfaction. More recently, studies of subjective

well-being (i.e., about whether people are “happy” and “satisfied” with their lives) have been undertaken, and these studies show that it can be made amenable to systematic quantification (see [21], pp. 145–151).

The second set of approaches is based on “objective” resources such as income and wealth, which are discussed as “primary goods” in John Rawls’s *A Theory of Justice* [20]. Moreover, in the economics field, the welfare economics tradition and the theory of fair allocation have developed ways to include nonmarket aspects of quality of life into a broader measure of well-being ([21], pp. 153–155).

While Sen acknowledges the legitimacy and usefulness of subjective and objective approaches to quality of life, presented in the report, for certain purposes, he strongly criticizes the utility-based and the resource-based approaches. The utility-based approaches suffer from two fundamental flaws. First, they aggregate the utilities simply by summing them together (an arithmetic addition), which is called “sum-ranking.” Therefore, the distribution of the utilities of individuals becomes irrelevant. Second, utilities are subjective, mental entities, which are shaped by the environments to which individuals have been exposed for a long time.

The utilitarian calculus based on, say, happiness can be deeply unfair to those who are persistently deprived, such as the traditional underdogs in stratified societies, oppressed minorities in intolerant communities, precarious sharecroppers living in a world of uncertainty, sweated workers in exploitative industrial arrangements, subdued housewives in deeply sexist cultures. The hopelessly deprived people may lack the courage to desire any radical change and often tend to adjust their desires and expectations to what little they see as feasible. They train themselves to take pleasure in small mercies. The practical merit of such adjustments for people in chronically adverse positions is easy to understand: this is one way of making deprived lives bearable. But the adjustments also have the incidental effect of distorting the scale of utilities. ([34], pp. 18–19)

Sen’s critique of the resource-based approaches (particularly Rawls’s notion of primary goods) is based on a differentiated understanding of the relation between goods and persons and the fundamental value of a person’s real freedoms. He distinguishes different categories that are involved in the relation between a good (say, a bike) and a person (see [24], p. 30):

Goods	>>> Characteristics	>>> Conversion into:	>>> Functioning	>>> Capability
(e.g., a bike)	(e.g., transport)		(e.g., moving)	(e.g., able of moving)

“Characteristics” are qualities of goods, whereas “functioning” relates to a person’s *use* of those characteristics, for example, *a bike* provides transport while *a person* moves and can move with it. The crucial point in this relation is that the goods with their characteristics are means to achieve the ends of the person. They are not identical with, but *converted* into, the functionings and capabilities of the person. This conversion of goods in general and primary goods in particular depends on the characteristics of the person.

For example, a person who is disabled may have a larger basket of primary goods and yet have less chance to lead a normal life (or to pursue her objectives) than an able-bodied person with a smaller basket of primary goods. Similarly, an older person or a person more prone to illness can be more disadvantaged in a generally accepted sense even with a larger bundle of primary goods. ([31], p. 74)

Against Rawls's use of primary goods, Sen insists that the conversion problem that affects significantly disabled people should be addressed by choosing the informational basis with the focus on functionings and capabilities. After all, "the magnitude of the global problem of disability in the world is truly gigantic. More than 600 million people – about one in ten of all human beings – live with some form of significant disability" ([31], p. 258).

Sen's emphasis on finding an adequate informational basis for comparing human lives can be explained by his lifelong concern for the poor and his search to engage ethics and economics into productive interdisciplinary communication. On the one hand, the informational basis must reach the lives and freedoms of people; on the other hand, it has to be objective enough to allow for interpersonal comparisons. Moreover, it must include all people and hence be globally applicable. Thereby, both commonalities and diversities of human lives have to be taken into account, avoiding ethical imperialism as well as ethical relativism. Finally, the informational basis should allow sufficient room for multiple ethical theories.

Essential Elements of the Capability Approach

Having discussed the importance of an adequate informational basis for interpersonal comparisons and criticized different prominent approaches, we ask: What can the capability approach offer? What are its essential elements? As Nussbaum writes, the key question for an adequate informational basis is "What is each person able to do and to be?":

The approach takes *each person as an end*, asking not just about the total or average well-being but about the opportunities available to each person. It is *focused on choice or freedom*, holding that the crucial good societies should be promoting for their people is a set of opportunities, or substantial freedoms, which people then may or may not exercise in action: the choice is theirs. It thus commits itself to respect for people's power of self-definition. ([16], p. 18)

The importance of each person as an end, with his and her choice or freedom, and the claim to be respected, has universal validity and holds for all people in all cultures and religions. It is noteworthy that the concentration on capabilities of persons does not imply "methodological individualism" which assumes that individuals with their thought, choice, and action are detached from the society in which they exist. "The capability approach not only does not assume such detachment, its concern with people's ability to live the kind of lives they have reason to value brings in social influences both in terms of what they value (e.g., 'taking part in the life of the community') and what influences operate on their values (e.g., the relevance of public reasoning in individual assessment)" ([35], p. 244). In other words, it would be "a significant mistake" (Sen) to interpret the capability approach in an individualistic sense.

A further feature of the capability approach is a pluralist understanding of value:

The approach is resolutely *pluralist about value*: it holds that the capability achievements that are central for people are different in quality, not just in quantity: that they cannot without distortion be reduced to a single numerical scale; and that a fundamental part of understanding and producing them is understanding the specific nature of each. ([16], pp. 18–19)

To illustrate, it does not make sense to curtail to one single indicator among the following capabilities: being adequately nourished, escaping premature mortality, reading, calculating and writing, doing “decent work” (that includes many substantive elements), and having leisure time. It is noteworthy that the Stiglitz-Sen-Fitoussi Report, too, emphasizes a range of features in people’s lives “that are important either intrinsically, as objective expressions of a good life, or instrumentally, to achieve valuable subjective states or other objective goals. Some of these features may be conceived as referring to particular functionings (i.e., descriptions of people’s doing - e.g. working, commuting - and beings - e.g. being health ore educated) while others may be conceived as freedoms in particular domains (e.g. political voice and participation)” ([21], p. 156).

Finally, Nussbaum emphasizes the value perspective of the capability approach:

The approach is *concerned with entrenched social injustice and inequality*, especially capability failures that are the result of discrimination or marginalization. It ascribes an *urgent task to government and public policy* – namely, to improve the quality of life for all people, as defined by their capabilities. ([16], p. 19)

While the capability approach offers an adequate informational basis for inter-personal comparisons in general, it is particularly apt to shed light on poverty and inequalities and to guide public policies to address these issues. This does not require an all-encompassing theory and policy. But a focus on a limited set of issues – or what Sen calls a “partial ordering” – suffices (see Sen’s extensive discussion of his view of how to approach justice in [35]).

These essential elements of the capability approach, outlined above, are shared by Sen and Nussbaum (and many other scholars). However, there are also differences between the two authors, which may be indicated briefly, but not pursued further in this article. Nussbaum calls her approach “Capabilities Approach,” pointing to the plurality and qualitative distinctness of the most important elements of people’s quality of life (see [16], Chaps. 2 and 4; also [33], pp. 157 and 160). She explicitly grounds her theory of fundamental political entitlements in human dignity and employs a specific list of ten “central capabilities.” They constitute a minimal threshold level that a political order must at least secure to all citizens: life; bodily health; bodily integrity; senses, imagination, and thought; emotions; practical reason; affiliation; other species; play; and control over one’s environment, politically and materially. In line with Rawls’s political liberalism, her capability-based theory of justice refrains from offering a comprehensive assessment of the quality of life in a society. But it also comprehends the capabilities of nonhuman animals.

In contrast, Sen abstains from establishing a specific list of (basic) capabilities, leaving its specification to public reasoning (although he thinks some capabilities, e.g., health and education, are particularly important). A main concern of his has been to identify capability as the most pertinent space of comparison for purposes of quality-of-life assessment, which can be the basis for a comprehensive quality-of-life assessment in and between nations and other groups (see [21]). Such a project, in turn, goes beyond the deliberately limited aims of Nussbaum's political liberalism. Sen, however, develops a theory of justice in a very broad sense. "Its aim is to clarify how we can proceed to address questions of enhancing justice and removing injustice, rather than to offer resolutions of questions about the nature of perfect justice" ([35], p. ix). Moreover, Sen does not extend his theory to nonhuman animals' capabilities.

Some Foundational Implications of Sen's Capability Approach

In order to better understand the capability approach and its application to corporate ethics, it is helpful to explore some foundational implications of Sen's approach. As economist and philosopher, Sen has never accepted the strict separation of both disciplines, but persistently aimed at relating ethics and economics in fruitful dialogue. This has led to a lucid critique of core neoclassical assumptions in economic theory and considerably enriched the paradigm of economics, which he calls an "ethics-related approach" as distinct from the "engineering approach" to economics ([27]; also [11]). The latter primarily focuses on logistical issues in a "value-free" manner: what means should one choose in order to achieve as efficiently as possible, under very simple behavioral assumptions, goals that are given from elsewhere? The ethics-related approach, however, going back to Aristotle, involves a broader understanding of economics and other business disciplines. It also comprehends problems of human motivation and the judgment of social achievements that cannot be disconnected from the ethical question of the good and just: how should one live and how should we foster a good and just society?

For Hilary Putnam, Sen's approach demonstrates successfully how the false dichotomy of "facts" and "values" can be overcome. There are no "value-free facts" in juxtaposition to (subjective) value judgments because both facts and values are subject to value judgments, the first to epistemic value judgments and the second to ethical value judgments ([19], pp. 46–78). This means that the "engineering approach" in general and the neoclassical theory in particular are not "value-free." For example, the choice of a particular informational basis for interpersonal comparisons (say utility or income) depends on epistemic value judgments, which, in turn, are influenced by ethical value judgments. Other examples are the notions of rationality and economic behavior, the role of self-interest, and profit maximization.

Sen criticizes the economic model of individuals acting to maximize their self-interest heedless of relationships and emotions (see also [18]). First, it is a bad description of how people actually behave. Second, it does not respect how individuals may value what to do and to be. Third, it disqualifies all other-regarding

motivations as irrational. Fourth, it fails to motivate for the production of public goods (as distinct from private goods). Fifth, it excludes respect for and fair dealing with disabled people. Finally, as a core assumption in social contract theories based on cooperation for “mutual advantages,” it limits the people included to those who can make contributions and excludes those in need.

With regard to judging social achievement (i.e., the goodness and justice of societies), Sen’s long-standing concern for poverty and inequalities has given him a sharp heuristic perspective to examine prevailing philosophical and economic approaches. Neither purely subjective (e.g., utility) nor merely objective criteria (e.g., income) nor any single numerical scale is adequate to capture the plight of the poor in particular and the achievement (or nonachievement) of the whole society in general. The capability approach offers a way to avoid these impasses. It places the persons’ lives at the center: what matters is what they do and they are (functionings) and their freedoms to choose among these functionings (capabilities). Thus, “human development” is defined as “a process of expanding the real freedoms that people enjoy” ([31], p. 3). The expression “the real freedoms that people enjoy” epitomizes the concepts of functioning and capability. Clearly, it is not about any freedoms, but about the freedoms (a) that people value, (b) that they have reason to value, and (c) that stand the test of public scrutiny.

Three implications are to be mentioned briefly. Poverty as capability deprivation is measurable and requires value judgments, which need to be enforced by public policies. Sensitivity for distributions of functionings and capabilities can be enhanced by statistical documentation and opened up to public reasoning. In its reach, the capability approach is global across cultures and religions and comprehends all human beings.

Limitations of the Capability Approach

As Sen readily admits, the capability approach also has its limitations. For instance, it cannot pay adequate attention to fairness and equity involved in procedures (i.e., the process aspect of freedom) that have relevance to the idea of justice ([35], pp. 295–298; this point, though, is criticized by [16], p. 67). Moreover, capabilities are not, like human rights, moral claims that involve duties ([33] and [35], pp. 370–376).

Another limitation – and a critique to some extent – has to do with the notion of wealth. Sen agrees with Aristotle that “wealth is evidently not the good we are seeking; for it is merely useful and for the sake of something else” ([31], p. 14; also [35], p. 253). Wealth is not something we value for its own sake. It is only an “admirable general-purpose means for having more freedom to lead the kind of lives we have reason to value” ([31], p. 14).

This notion of wealth seems to be understood in a narrow, material sense, reflecting a certain underestimation of the material world and the “bodiliness” of the human person. According to Jacob Viner, “Aristotle . . . insisted that wealth was essential for nobility, but it must be inherited wealth. Wealth was also an essential need of the state, but it should be obtained by piracy or brigandage, and by war for

the conquest of slaves, and should be maintained by slave-workers” ([39], p. 39). If the material world is considered inferior and merely instrumental, wealth cannot but share these qualities and is likely to be undervalued. If it has no intrinsic value, it is not a place where deeper meaning can be searched and found.

It is therefore suggested to enrich the notion of wealth ([7, 8], and [9]). This notion is consistent with the ethics-related approach, integrates the capability approach, and adds a more specific purpose of business and economics within the overall purpose of “expanding the freedoms that people enjoy.” Thus, the purpose of business and economics is conceived as “wealth creation” in a comprehensive sense that goes beyond profit maximization and adding value. Wealth is more than financial capital by including physical (i.e., natural and produced), human (in terms of health and education), and “social” capital (as trust relations in Robert Putnam’s sense). Wealth encompasses not only private but also public wealth, both influencing each other in multiple ways. Because the process of wealth production inescapably involves distributive patterns, the productive and the distributive dimensions of wealth creation, strictly speaking, cannot be separated. Wealth is not merely material, but also has a spiritual side, which ennobles its creation to a truly noble human activity. By placing wealth creation in the time horizon of sustainability enriched by Sen’s capability approach, one overcomes an exclusively short-term view and integrates an intergenerational justice perspective. The emphasis on creating as distinct from possessing and acquiring highlights the need for innovation in both private and public wealth creation and requires “mixed” motivations (i.e., self- and other-regarding) to overcome the exclusive and thus insufficient motivations of either self-interest or collective interests.

Obviously, this rich concept of wealth creation is influenced by Sen’s work in several respects: his capability approach incorporated in human capital and the sustainability perspective; the important role of public goods; the rejection of self-interest as the only rational motivation and the indispensability of other-regarding motivations; and the concern for distribution and poverty as capability deprivation. Moreover, the Stiglitz-Sen-Fitoussi Report discusses different types of capital, namely, physical, natural, human, and social capital, and emphasizes the crucial role of wealth as stock for assessing the sustainability of the standard of living over time.

Application of the Capability Approach to Corporate Ethics

As discussed in a previous section, the capability approach offers an informational basis for public policy, which is more adequate than utility-based and resource-based approaches. It is decidedly people-centered and provides theoretically sound and specific guidance for governments and international agencies such as the World Bank. In principle, it can be applied to any decision-making situation, be it of an individual, an organization, or in a systemic context (see Three-Level Conception of Business Ethics in [6]).

In the following, the focus is on the ethics of business organizations: what guidance can the capability approach provide to corporate ethics? So far this

question rarely has been addressed, and also Sen has ventured on this complicated field only on a few occasions (e.g., [30] and [32]). Therefore, what follows is an attempt to explore some important features.

When addressing issues of corporate ethics, it is important to keep in mind the enormous variety of business organizations operating in multiple industries and hugely diverse cultures and countries. In addition, there are many different definitions of the purpose of business and business organizations such as making money, maximizing profit, surviving competition, providing goods and services, and improving society. However, it does not lie within the scope of this article to discuss this diversity of organizational forms and motivational views. Suffice it to state three basic assumptions for our exploration:

1. Business organizations have some space of freedom to set their own goals and implement their strategies while constrained by laws and regulations, market forces, and social and cultural factors. Thereby, the extent of responsibility is a function of the extent of freedom: the bigger their spaces of freedom, the bigger their responsibilities.
2. Large, formal organizations such as corporations are understood as “moral actors”: as collective entities, they act with intention (or at least exhibit intentional behavior) to achieve their goals and impact on society and nature, often to a large extent. Therefore, they can be held responsible for their acts in a moral sense. But they are not moral persons because they are not ends in themselves and thus cannot claim the rights of human beings.
3. The general purpose of the business organization is defined as the creation of wealth in a comprehensive sense as outlined in the previous section.

Sen’s capability approach with its foundational implications contributes to a better understanding of corporate ethics in several respects.

Critique of “Value-Free” Economics and Other Business Disciplines

By refusing to address the questions of human motivations and social achievements in a serious manner, the engineering approach dismisses a large part of business reality as irrelevant for understanding business challenges and conduct. Business models based on mechanistic assumptions cannot account for human agency and may have grossly negative consequences. It is not possible to search for and find meaning in business itself. Ethical values and norms are extraneous to business and can only guide its culture, policy, and behavior, at best, from outside. Therefore, the ethics-related approach that explicitly incorporates human motivations and the judgment of social achievements opens economics and other business disciplines to fruitful communication with normative-ethical perspectives of corporate ethics.

The Notion of Rationality

If rationality is defined exclusively as instrumental rationality, rational business aims to instrumentalize everything: the relations with customers, the treatment of employees, and the dealing with other stakeholders. Human capabilities are not respected for their intrinsic values. Similarly, if self-interest and profit maximization are supposed to be the only rational motivations in a market economy,

other-regarding motivations and goals (such as service to the company and the country) are disqualified as “irrational.” Such a narrow understanding of rationality is highly questionable on theoretical grounds and fails to underpin the realities of long-term business success and the production of public goods. Thus, the notion of rationality needs to be extended beyond instrumental rationality, self-interest, and profit maximization, which is indispensable for sound corporate ethics. Of course, this does not mean that instrumental rationality, self-interest, and the pursuit of profit are unimportant.

Sensitivity to Poverty and Distribution

Growing out of a deep concern for the plight of the poor and glaring injustices, the capability approach has provided a powerful perspective to better understand poverty and inequalities in and between societies. Moreover, it can guide businesses to evaluate and possibly improve their distributional structure and impact within and outside their organizations. For instance, businesses may critically assess the distribution of salaries and other benefits among employees or the distributional impact of corporate policy on different social groups. The capability approach is particularly apt at guiding companies in the global context because it provides universal standards on the one hand and great flexibility for cultural and national adjustments on the other hand. For an increasing number of global corporations, the alleviation of mass poverty has become a key corporate objective (see, e.g., [40]). Furthermore, businesses around the world are called upon to be part of the solution in addressing poverty and gross inequalities by joining the United Nations initiatives of the UN Millennium Development Goals (www.un.org/millenniumgoals) and the Global Compact (www.globalcompact.org) (see, e.g., [41]). Needless to say, the capability approach can be of invaluable guidance.

The Focus on Functionings and Capabilities

By taking each person as an end and focusing on real opportunities or substantial freedoms, the capability approach is decisively people-centered. People are not just “factors of production” or “human resources” as many theories in economics and management hold (for a critique of “human resource management,” see, for instance, [4]). Because functionings and capabilities are measurable, the approach can show whether the slogans such as “putting people first,” “empowering the workforce,” “employees are our most important assets” and “the customer is king” are supported by facts or are merely lip service.

In evaluating the business organization’s performance in terms of functionings and capabilities, four considerations deserve particular attention. First, there are multiple and interdependent functionings and capabilities. The functioning of working in a company may generate the capabilities of connecting with other people and being well respected in the community. Moreover, it can create the capability to be loyal to the company’s mission and the functioning of being promoted. Or take the example of micro-lending at the Grameen Bank: micro-loans improve the capability of (mostly) women to be productive. This increases

their functioning of earning a higher household income. It also expands the capabilities of the household members to be better nourished and the children's capabilities to enjoy basic education instead of working in factories. The women's capability to be self-confident increases and leads to their capability to participate in political debates and elections, which may result in the functioning of being elected.

Second, Sen refrains from establishing a special list of capabilities and accords an important role to public reasoning in order to identify context-related relevant capabilities. As the stakeholder theory stipulates for corporate ethics, the company should engage in dialogue with its stakeholders (see [12]). In such a way relevant capabilities may be determined for employees in terms of health and training, for consumers in terms of safe products, for investors in terms of transparency, and for the community in terms of keeping jobs. As public reasoning is crucial for setting relevant capabilities in societies at large, so is the stakeholder dialogue crucial for fixing them in business relations.

Third, Sen and Nussbaum both see a close link between capabilities and human rights ([33] and [35], pp. 355–387; [16], pp. 62–68). The promotion of human development in terms of capabilities and the fulfillment of human rights share a common motivation. The combination of the two perspectives also contributes something that neither can provide alone. The human rights approach links the human development approach to the idea that others have duties to facilitate and enhance human development (human rights as entitlements to capabilities), and human development helps to augment the reach of the human rights approach (capabilities as potential contents of human rights).

Moreover, the United Nations Framework for Business and Human Rights, developed under the leadership of John Ruggie since 2005, incorporates human rights into corporate responsibility and provides guiding principles for the implementation of the framework [38]. Although the framework does not mention the capability approach, it prominently refers to “fundamental freedoms” (General Principles [a]). It covers all human rights, civil, political, economic, social, and cultural rights, including the right to development – in total 29 rights [37]. These rights can easily be translated into capabilities with the claim of duties to people and institutions.

The UN framework is a groundbreaking and very helpful contribution to the clarification of corporate responsibility (or corporate ethics) with regard to human rights (see [10]). This responsibility includes the following components: (1) Transnational corporations and other business enterprises have to “respect” all human rights worldwide. This means they must not cause directly, or be involved as accomplices directly or indirectly in, human rights violations. (2) In order to perceive and fulfill these responsibilities, the companies have to exercise “due diligence” (i.e., to be committed) to examine, on a regular basis, their corporate strategies and activities with regard to all potential and actual (causal) impact on human rights and to make sure that all human rights are “respected” (3). Therefore, companies are not responsible for all types of human rights violations, but “only” for “respecting” them, though in their entirety.

Based on the UN framework, a set of capabilities can be determined that defines the moral minimum corporations have to “respect.” Beyond this minimal set, the capability approach can help identify other obligations and even ideals, depending on the particular nature, mission, and environment of the business organization. In other words, the identification of capabilities as guidance for corporate ethics draws on both the norms of human rights and the principle of stakeholder dialogue.

Fourth, in the last few years, several well-thought-out metrics for economic, social, and environmental performance have been developed, in particular: the sustainability performance indicators for business and other organizations by the Global Reporting Initiative (its fourth generation in the making; www.globalreporting.org); the ISO 26000 – Guidance on CSR (or corporate social responsibility) for any type of organization by the International Organization for Standardization (promulgated in 2010; www.iso.org/iso/social_responsibility); and, regarding entire societies, the Report on the Measurement of Economic Performance and Social Progress mentioned earlier [21]. These metrics cover a fairly comprehensive range of issues through which business organizations may affect people. Hence, the capability approach can strengthen the focus on people rather than on things and on the quality of life rather than on simple indicators of material well-being. The Stiglitz-Sen-Fitoussi Report adopts this focus and deals with this challenge from a broad, societal perspective. It is suggested that GRI sustainability reporting and ISO 26000 may also benefit from the capability approach in their organizational perspectives. In addition, the various indicators can serve as heuristic devices in the stakeholder dialogue to identify the relevant capabilities in the specific contexts.

Conclusion

As stated in the introduction, there is a serious disorientation among those attempting to guide the economy and our societies. They are “like pilots trying to steering a course without a reliable compass.” When this happens, the blind end up falling into a pit, as Matthew warns in the New Testament. Responding to this strong statement, this article attempts to provide solid guidance with the help of the capability approach. As it has been very fruitful for public policy, it can also enlighten and strengthen business and economic ethics in general and corporate ethics in particular. By focusing on real opportunities (functionings) and substantial freedoms (capabilities) the people have reason to value, the shortcomings of utility-based and resource-based approaches to interpersonal comparisons can be overcome, and the people’s power of self-definition can be respected. The foundational implications of the capability approach enlarge the paradigm of economics and other business disciplines, enrich the notion of rationality, and sensitize decision makers for poverty and inequalities. Based on the UN Framework for Business and Human Rights, a minimal normative set of capabilities for corporate ethics can be determined. Beyond this minimum, the metrics of the GRI sustainability performance indicators and the ISO 26000 – Guidance on CSR provide heuristic devices for identifying, through stakeholder dialogue, context-relevant functionings and capabilities. For the question of the

purpose of business and ennobling business activity, it is crucial to overcome the merely instrumental understanding of business by also placing intrinsic value in business itself as a human activity. This can be achieved by defining the purpose of business as wealth creation in a comprehensive sense. It is an innovative, interrelated process of production and distribution, aiming at the creation of not only financial but also physical, human, and social capital.

Abstract

A chapter on the importance for the business world of both the demands made by human rights and the connection between these rights and the capability approach cannot fail to be included in any handbook of business ethics published in the early twenty-first century. This chapter attempts (1) to specify the relationship between the capability approach and the human rights approach, because both put forward global imperatives and thus seem to cover the same area of justice, (2) to present both discourses as complementary, because each of these has advantages missing in the other, but at the same time there are great coincidences between them, (3) to present the necessary interaction between people's capabilities and social recognition of human rights and (4) to specify the kind of obligations that the demand to empower basic capabilities in relation to human rights creates for companies¹.

Introduction**Basic Capabilities and Human Rights: Two Approaches for Constructing a Global Justice**

In his recent book *The Idea of Justice*, Amartya Sen states that his capability approach “was initiated by my search for a better perspective on individual advantages than can be found in the Rawlsian focus on primary goods” in works such as “Equality of What?” and *Commodities and Capabilities*, amongst others.² Different answers to the question “equality of what?” were put forward,

leading to a lively debate: Rawls would reply that a minimum of justice demands equality in primary goods; authors such as Streeten thought it necessary to attain equality in the satisfaction of basic human needs; Dworkin would propose equality of resources; a large number of authors, such as Thomas Pogge, understand that the minimum equality demanded requires all human beings' rights to be respected, referring to human rights, whereas Sen understands that primary goods or resources will be taken advantage of by people according to each person's capability, interpersonal comparisons thus needing to be taken into account. In the context of the debate on equality, Sen proposed that equality in the basic capabilities of all human beings should be attained as a demand of justice, and was backed by Nussbaum, Crocker, Alkire, Comim and Pereira, amongst others, in this bid.

In Sen's work, this basic capability criterion would turn into the informational focus, which would act as a basis to decide which features of the world we should concentrate on in judging a society and in assessing justice and injustice. This informational focus is the one that has been used to measure the level of human development in the United Nations Development Programme programmes, precisely because human development will be understood as the empowerment of people's basic capabilities to carry out the plans for life that they have reason to value. Poverty will be identified with the lack of substantive freedoms, with "being poor" meaning suffering a lack of the capabilities and functionings required to carry out the type of life that the person has reason to value.³ Sen would affirm that "Development is indeed a momentous engagement with freedom's possibilities"[13]. This will not mean ceasing to take into account other variables for measuring societies' quality of life nor resorting only to capability for proposing plans for human development. It is sometimes necessary to also take *basic human needs*, resources or rights into consideration, but the focal variable will be capability.⁴

From the first works in which he puts forward his capability approach, Sen clearly debates with other proposals dealing with the subject of equality, but at the same time explains that he feels he is particularly close to Rawls's approach and to the basic needs approach, although he also finds fault with these. As for Rawls, Sen considers that primary goods can partly be understood as resources which do not take differences between people into account. As regards the basic needs approach, Sen acknowledges that he agrees with Streeten in that "first things first" must be applied in cases of radical poverty, and the first thing involves meeting basic human needs [14]. Sen nonetheless considers the capability approach to be preferable for at least two reasons, if the situation is not so radical: because through taking into account interpersonal differences, developed countries cannot be satisfied with appeasing their conscience by sending goods to developing countries, but have instead to take the differences between people very much into consideration; furthermore, because empowering people's capabilities implies reinforcing their agency, helping them to be subject-agents of their lives, whereas mere satisfaction of needs can convert them into passive beings, patient-subjects.⁵ The target of the capability approach is to empower people, to reinforce their agency.

Over time Sen would nonetheless be obliged to specify very particularly the relationship between the capabilities approach and the human rights approach, because these are very similar from a certain angle: they put forward global demands and global imperatives and thus seem to cover the same area of justice.

The United Nations Universal Declaration of Human Rights in 1948 was indeed the result of a fascinating story, through which human beings have gradually discovered rights extending to all humankind, rights which are not possessed through being a member of any particular political community. These are first- and second-generation rights, followed by third- and even fourth-generation rights, such as Internet access, which has just been declared a human right by the United Nations. The demands implied by these rights go beyond national frontiers and generate obligations which in turn cross the boundaries of national states, and even go beyond international agreements. In spite of authors such as Nagel considering that it is impossible to establish global justice, because it is only possible to practise the lawful coercion demanding compliance of obligations in nation states, many others, such as Pogge and Beitz, consider that human rights bring up moral demands of justice which make a claim for a global and not just international justice to be set up [16–19].

To some extent, nevertheless, this is also the case with the capability approach because if it is a demand of justice for the basic capabilities of all human beings to be empowered, then this approach also requires establishment of the structures of a global justice, the institutions and lifestyles which make it possible to empower these capabilities. This might well raise the question of whether the capability approach can take the place of the human rights approach. That is, can the demands entailed by human rights be replaced by the demands entailed by the empowerment of basic capabilities?

Does the Capability Approach Replace the Human Rights Approach?

One might think that the answer to this question is affirmative, amongst other reasons because the capability approach seems to involve the advantage of being transcultural, i.e., of not being linked to Western traditions, which is one of the accusations often made against the discourse of human rights: that of its Westernism. The history of human rights seems to be linked to the West, and even first-generation rights are closely bound to liberal traditions. On the other hand, at least *prima facie*, everyone, in all cultures, seems to wish to have their capabilities empowered.

The capability approach does not, however, seek to replace the human rights approach – these are instead two complementary approaches. Sen himself affirms that “human right” and “basic capability” are two concepts which relate to each other well on condition that neither of them sets out to invade the other’s territory, because the capabilities approach does not explain the process, an aspect which is indeed included in human rights.⁶ In her *Frontiers of Justice*, Nussbaum points

out: “The capabilities approach, as should by now be evident, is closely allied to the human rights approach. Indeed, I regard it as a species of the human rights approach.”⁷ To what extent is this true? What relationship can exist between human rights and basic capabilities?

Two Complementary Approaches

Both Sen and Nussbaum consider that the basic capability approach and the human rights approach are complementary because each of these has certain advantages not found in the other. The main disadvantage with the human rights approach is claimed to be its ambiguity, which can be specified in the following points, according to Sen and Nussbaum.

Firstly, the human rights discourse involves a lack of foundations, because it does not indicate the basis on which the defence of these rights is claimed. Throughout history different authors have stressed specific characteristics of human beings, maintaining them to be the aspects distinguishing humanity as a species and which, through being superior to those of other species, make humans worthy of a set of rights. The most highly valued traits are the ability to reason, self-consciousness, self-sufficiency, the ability to have second-order beliefs – that is, beliefs about beliefs – and the ability to reflect, to imagine different possible futures or to make long – term plans [26]. However, as has often been seen in the debate on animals’ rights, it turns out that not all the beings that we call “human” meet these characteristics and make use of them. This problem leaves us with two options: either to go on sustaining that these beings lacking the specific traits of human beings are persons in any event because they belong to the human race, or to recognise that they are not persons and act accordingly. The most commonly held position is the former, and this stance is criticised as being “speciesist” (For the debate about animal’s rights see [27].) As such, the discourse of rights therefore lacks foundations.

At this point, Sen and Nussbaum would claim that the capabilities approach manages to overcome this lack of foundations because it does indeed offer a basis for the demands of justice, which is the equal dignity of human beings.

In my view, this assertion is nevertheless disconcerting. The 1948 Universal Declaration of Human Rights proclaims precisely this: that dignity is the foundation of human rights. This is not, however, meant to provide a philosophical foundation, but still leaves open the question “why do human beings have dignity?” – a question to which the capabilities approach does not provide any convincing reply, thus displaying a very considerable lack of philosophical foundations.

As I see it, this is where both the capability approach and the human rights approach have a lack of foundations. What the capabilities approach does indeed provide, in Nussbaum’s version, is an interesting complementation: if it is taken for granted that human beings are endowed with dignity through the characteristics of their species, then all the beings belonging to the human race have dignity, whether they can currently exercise these capabilities or not, because the rights are not based

on present capabilities but on the basic capabilities characteristic of the human species norm. This is an assertion which deserves some discussion, but which, as I see the matter, explains why any being in the human race must be socialised in a human community [28].

A second difficulty involved in the discourse of rights, according to Sen and Nussbaum, consists in those of the first generation, above all, being closely linked to liberal traditions. According to these traditions, in order to ensure that a right has been recognised, it is enough for there to be negative liberty; that is, it is sufficient for the state not to interfere. The capability approach, on the other hand, considers that recognising a right is an affirmative task: guaranteeing a right to political participation or to free practice of religion implies actively making it possible for people to be able to practise the relevant capabilities for this, not only for there to be no interference. A right is effectively recognised when there are effective measures for people to be able to really act on the political level, from both the material and the institutional standpoints ([28], p. 287).

Thirdly, the human rights discourse does not expressly link together the rights of different generations, which is why they seem to be independent of each other, whereas the capability approach openly recognises the interdependence of first- and second-generation rights. It does not take much thought to realise that in countries in which first-generation rights are protected it is hard to envisage there being any starvation, lack of health care and lack of education. Neither is it hard to see that when the right to education, to healthcare or to work is lacking, basic freedoms are also curtailed. And if it is considered impossible to defend second-generation rights in some cases, through a lack of funds, the solution does not consist in saying that since there is no possibility of complying with the obligation, neither is there any right, as Onora O'Neill puts it, but that the right continues to exist and the relevant institutions to protect this must be created [29].

Fourthly, the capability approach focuses on what people are really able to do and be, which is why it is useful to discover the inequalities which women suffer in the family setting in many parts of the world and to compensate for such inequalities by empowering their capabilities. This cannot be done in the same way by the discourse of rights.

Lastly, as already mentioned, the discourse of rights has been stated to be above all Western, whereas that of capabilities can be seen as transcultural. It is true to say that even defenders of the capabilities approach qualify this assertion and remind us that there are roots of human rights in other cultures, as is the case of China and India, but it is also true that they point out that talking of capabilities means that any discussion about the possibility of ethnocentrism can be avoided, because the ideas of activity and capability are to be found in all cultures [30].

Nonetheless, the defenders of the capabilities approach also admit that the discourse of rights has at least three advantages. This focus first of all enjoys high standing worldwide, and has managed to arouse widespread agreement. Secondly, it has great rhetorical power, because it insists on being an urgent claim based on justice. Saying that people have a right means that they are legitimated to demand this urgently, which does not occur with the capability approach. To say, "Here's

a list of fundamental rights” is more rhetorically direct than to say “Here’s a list of things that people ought to be able to do and to be.” Thirdly, the language of rights places emphasis on people’s choice and self-sufficiency ([30], pp 100–101).

Everything that has been said leads to the conclusion that the most appropriate solution is to present both discourses as complementary, because each of these has advantages missing in the other, and at the same time there are great coincidences between them: both enable building a partial theory of social justice, which brings up demands of justice, because the discourse of central human capabilities sustains that these are not only desirable social objectives, but are *entitlements* based on justice, putting forward urgent claims which address national states, but also the international community. Nussbaum, specifically, identifies ten basic capabilities and a minimum threshold which the worldwide community should attempt to attain, whereas Sen leaves the decision on capabilities and rights for open public deliberation ([28], pp 290 and 291, [31], pp 290 and 291).

The capabilities approach is thus not a rival to the human rights approach, but is a specification of the latter, a necessary specification, because it stresses the need for affirmative action in the public domain and also emphasises the interdependence between freedom and good economic order.

All this does not actually amount to much, however. In my opinion, there needs to be an explanation of the connection between basic capabilities and human rights going further than the idea of complementation proposed by Sen and Nussbaum.

The Necessary Interaction Between People’s Capabilities and Social Recognition of Human Rights

In theory, from Sen’s perspective, “human rights are ethical claims constitutively linked with the importance of human freedom, and the robustness of an argument that a particular claim can be seen as a human right has to be assessed through the scrutiny of public reasoning, involving open impartiality”[32]. At least three conclusions can be drawn from these statements.

Firstly, in the discussion as to whether human rights are legal or moral rights, Sen openly declares that he is in favour of the second option: going on in the Hart tradition, human rights are moral rights, moral claims [33]. They are not in this case “children of law,” as Bentham would have it, but are “parents of law,” in the approach taken by Hart. Their nature is not even exhausted in being something rather like “laws pending positivisation,” but, whether these are positivised or not, they continue to be valid as moral demands. This is precisely the reason why they can be defended through different channels, such as the “legislative route,” but also the “declarative route,” that is, the route of “declarations,” which has enormous power, and also the “agitation route.”

Secondly, the *content* of a human right is made up of an ethical affirmation on the critical importance of certain freedoms and the correlative need to accept certain social obligations safeguarding these freedoms ([32], Chap. 17). This is an essential point. Recognising a right implies recognising the obligation to protect it at the

same time, which is why two facets have to be considered in the case of human rights: freedoms are primarily characteristics of people, whereas rights imply demands made of society. This point, as we will see, is made explicit with greater clarity by Paul Ricoeur.

Thirdly, as far as *viability* is concerned, a human right is proclaimed when it is considered that its content will survive well-informed scrutiny. To carry out this scrutiny, Sen thinks it is useful to resort to practising that “open impartiality” which Adam Smith talked about and also to a public reason, whose practice enables one to discern when the proclamation of a right as being a human right does not come up against any obstacles, or should not do so.

This is, in my view, still an insufficient way to conceive of the interaction between rights and capabilities, one which needs to be enriched with other contributions, such as that of Paul Ricoeur and the one I myself would like to add.

In his latest writings, Ricoeur proposes articulating basic capabilities and human rights through a notion that Sen never mentions, which is the Hegelian notion of mutual recognition [34]. In Ricoeur’s opinion, capabilities belong to the level of recognition that people have of themselves, that is, to the level of self-recognition, whereas the concept of rights belongs to the level of mutual recognition. A person is aware of having capabilities and expresses this self-recognition in terms such as “I can” or “I think I can,” from which it follows that this person also recognises that he or she is responsible for his or her actions and that these actions are attributable to him or her. But as Hegel said, the development of freedom is a social, not merely individual, endeavour, and people recognise their freedom from the point where society recognises their legal personality. Whereas the term “capability” belongs to the vocabulary of human action, to the power of making something happen, the term “right” comes into play when a person recognises that his or her actions are attributable to him or her and thus that if he or she acts badly he or she has to accept the social consequences, which may consist in making amends for damage or being punished. This would be the threshold of the subject of law, and the mark for crossing this would be the capability of accepting responsibility for acts and their consequences. The responsibility of moral agents provides the anthropological foundation for characterising human actions in terms of validity, of *Gültigkeit*.

We should nevertheless add on our own behalf that not all human capabilities require society to protect them, recognising that practising these is a right. There have to be two factors between the recognition of capability and the recognition of right: the recognition that the capability is valuable for that person’s development and the recognition that society is obliged to safeguard the development of that capability because the person is worthy of this. In this approach, Deneulin understands capability as being a person’s ability to perform valuable acts or reach valuable states of being [35]. Charles Taylor is right in this matter with his “antiatomist” thesis: “self-sufficiency” is not the same thing as “survival,” and it is possible to survive without belonging to a political community, but it is not possible to develop all characteristically human capabilities without that community [36]. When we recognise people as having human rights, we are doing so

thinking of the development of capabilities which we respect, which we recognise as being valuable and whose development we consider to be good for this reason.

In my view, the notion of capabilities has precisely gained such particular significance through having become the informational focus for assessing the level of human development by the United Nations programmes, thus taking for granted that the capabilities whose evaluation is important are the ones promoting *human development*, the ones which are valuable for people to develop them. This means that there is already a list of capabilities, however basic these might be, considered to belong to any human being, a list of capabilities which have to be promoted to foster a person's development. If it is in any way useful to link these valuable capabilities with human rights, it is because we are persuaded of the existence of these valuable common capabilities whose practice requires a global justice to be set up.

Throughout history, human rights have indeed gained strength and become bonded with the idea of valuable capabilities, whose development must not only be respected but also promoted. A being only develops all its potentials in a community of its species, which requires not only that it should be left to act in this community but also that it is empowered to act. A bond is therefore formed between two sides of the same coin: the notion of capabilities belonging to people and the notion of rights demanding social recognition that society is obliged not to hinder the development of these capabilities and to promote this. The question is how to lay bridges between these facets, because it does not follow from the fact that a being can develop certain capabilities either that one has the duty to develop these or that others have the obligation to help that being to do so. These capabilities have to be valuable in some way for their realisation, and society has to have some reason for both allowing the being to act and for helping the being to develop them. This is where the notion of recognition becomes vital, because it is this which demands the construction of institutions protecting the right to develop capability and the obligation to empower this. These institutions will give the process stability and durability.

Capability can thus become the cornerstone of a normative theory of social relations, a partial theory of justice, which demands the institutional facet of human rights. What kind of obligations does the demand to empower basic capabilities in relation to human rights create for companies?

Basic Capabilities, Human Rights and the Business World

It is well known that in 1999, at the Davos Economic Forum, Kofi Annan, the Secretary-General of the United Nations at that time, invited companies, trade unions and civic organisations to join a Global Compact designed with the intention of making the benefits of economic globalisation reach all humankind. Any organisations that freely wished to join had to accept a commitment to respecting nine principles, two of these referring to human rights, the following four to employment rights and the last three to respect for the environment. The first six principles were

thus actually linked to respect for human rights. Later, a tenth principle was added, that of “working against corruption in all its forms, including extortion and bribery,”

Annan’s speech presenting the compact was heartening: “Let us choose to unite the power of markets with the authority of universal ideals. Let us choose to reconcile the creative forces of private entrepreneurship with the needs of the disadvantaged and the requirements of future generations.” This was how Annan expressed his conviction that the economy is not a blind mechanism, but is a human activity, in which it is possible to choose, and that this ability to choose should follow a direction, that of putting the power of markets to work for the ideals of modernity, that of harnessing the economy’s creative capacity to serve the most underprivileged and future generations.⁸ We cannot relinquish our moral ideals, and have instead to place the enormous technical and economic progress at their disposal. This was the sign under which the first decade of the new millennium was to start.

In January 2011, as the second decade began, the new Secretary-General of the United Nations, Ban Ki-moon, launched a new shared leadership initiative, under the theme of “sustainability.” It is, however, impossible to forget that in 2003 the United Nations deemed it necessary to pass “Responsibilities of Transnational Corporations and Other Business Enterprises with Regard to Human Rights.” In 2005 the United Nations Human Rights Commission requested the appointment of a special representative on human rights, and in August 2005 John Ruggie was elected to that post. The decision was passed with the vote of 49 countries out of 53, and with the opposition of the USA. Why was it so vital to get an *explicit sphere* of reflection and action on human rights under way in the business world?

The memory of catastrophes such as the Union Carbide disaster in Bhopal (India) in 1984, when leakage of a toxic substance caused the death of thousands of people and made nearly 200,000 ill, the exploitation conditions in which people work in factories and plantations in different parts of the world, the consequences of pharmaceutical patents in deaths from AIDS and other diseases, the restriction in some southern countries of freedoms such as those of expression and association, and the suffering of native populations who helplessly have to watch their lands being snatched away from them help to give a forthright response to this question.

Situations like these mean that it is not enough for companies to accept the invitation to respect the ten principles of the Global Compact, nor to voluntarily assume their corporate responsibility and draw up a triple economic, social and environmental balance sheet. Respecting human rights, trump cards which should be enough to prevail over any other possible strategy, is an obligation of basic justice, not a voluntary option.

As if this were not enough, in a globalised world when there are gaping loopholes in the law in a large number of southern countries which prevent their inhabitants from being defended from the inhuman activities of certain local but also transnational companies, it becomes necessary to go further than the voluntarily assumed Global Compact and corporate social responsibility, and to open up a specific sphere referring to business and human rights.

This was the context in which Ruggie recommended promoting a *new international normative framework*, focussing on three pillars: the state's duty to protect human rights, the obligation of corporations to respect these, and the promotion of mechanisms to remedy violations. "Protecting, respecting, remedying" is the new framework which has to be assumed by states and businesses of any size and degree of complexity, but especially transnational ones, because the greater the power, the greater the responsibility.

This is where capability again comes into play, because it openly asks who is obliged to protect those human rights which in turn make it possible for people to be able to practise their basic capabilities and functionings. A list of basic capabilities may be put forward, as Nussbaum does, or like Sen, one may understand that there are indisputable minimums, but no complete list. In Sen's opinion, any list must be drawn up by means of an open discussion, taking into account Scanlon's affirmation "thinking about right and wrong is, at the most basic level, thinking about what could be justified to others on grounds that they, if appropriately motivated, could not reasonably reject"[38]. Giving a closed list would be tantamount to cutting down democracy's power and also to forgetting the specific context for which that list was conceived and to which it must be applied.

But whether the list of basic valuable capabilities is open or closed, the question of who is obliged to empower them by defending respect for the corresponding rights still remains.

Nation states and institutions belonging to the United Nations are, of course, bound to do this, but what about businesses? Are they also obliged to help to empower people's basic capabilities and to have their human rights respected?

In 2000, George F. DeMartino proposed taking the capability approach as a candidate for internationalist ethics which would enable the degree of justice of the economy to be evaluated from the following perspective: "a regime will be deemed just if and to the degree that it promotes harmonisation of capabilities to achieve functionings at a level that is sufficient, universally attainable and sustainable."⁹ To reply to the question properly, it is nevertheless not only necessary to move from internationalist ethics to global ethics, but also to distinguish between duties of perfect obligation and duties of imperfect obligation, as Sen and Nussbaum do, following Kant's distinction in *Groundwork of the Metaphysics of Morals* and above all in *Metaphysics of Morals*.

Ethical Corporations as Public Assets. Not Harming, but Actually Benefiting People: Duties of Perfect and Imperfect Obligation

In his *Metaphysics of Morals*, Kant distinguished between two types of duties: perfect duties, which are the obligatory sort with no exceptions, whose fulfilment is clearly understood, and imperfect duties, given this name because two maxims of duty come into conflict in this situation and it is thus the subject who has to decide in specific cases which of the duties is to be given preference and how these should be complied with. This is not in the least a matter of a moral maxim and an immoral

one coming into conflict, because there is no doubt in such a situation, but involves two moral maxims coming into conflict. The example used by Kant is enlightening: what should one do if the duty of universal love for one's neighbor and the particular duty of paternal love come into conflict? In this case it is the subject who has to decide which one to opt for and to what extent [41]. It can be inferred from what was stated above that perfect duties entail obligatory compliance.

When this assertion is applied to the case of human rights, it must be recognised that not violating these is a perfect duty: no one is legitimated to violate human rights and to actively prevent the development of people's basic capabilities, and what can be said of anyone similarly applies to corporations. In spite of the Global Compact being presented as an invitation, refraining from violating human rights and hindering the development of basic capabilities is a demand of justice, not merely an invitation. That is why it is urgent to integrate respect for human rights in the hard core of corporations, to identify which aspects of business activity affect basic rights, to design respectful practices, to adopt indicators to evaluate these and for companies to submit to control of internal and external audits. All of this makes up an *ethos*, a character of the company, which has to be assumed from inside the firm.

If corporations do not carry out this task, the rights of three generations are at stake, from the right to life, in cases such as that of the Union Carbide disaster in Bhopal, weapons manufacturing and trade, patents, the price of food and so many others, including the free expression of complaints, free association, non-discrimination, a decent salary for keeping a family, child or adult exploitation, and safety, as far as the right to development. It will be impossible to make any progress in the always deferred Millennium Development Goals if corporations do not join in this task. Neither should one forget that the requirements of these goals are minimum demands of justice.

Companies are not authorised to violate human rights anywhere in the world, nor can they allow their partners to infringe these either through their work or through the consequences of their work. This is a duty whose compliance involves serious risks in a globalised world, in which there is enormous asymmetry between economic movements and the moral and legal ability to control these. The legal loopholes found in developing countries represent a temptation to act with one yardstick in developing countries and another in developed ones. Respect for human rights nevertheless prohibits violating these anywhere in the world. This is not a matter of invitation, but is a demand. That is why it is vital to apply a "remedy" when people have been harmed, and to compensate for the harm done as far as possible.

Recognition of rights does not, however, demand that anyone – or, in the present case, any company – anywhere in the world has to help to avoid any violation whatever may happen. This is where we start to head into the world of imperfect duties, in the Kantian sense, in which it is the company which must decide how far it is obliged to go. To this end, Sen at least provides a guideline for action: if a company is in a position enabling it to do something effective to prevent a violation, then it has the obligation to consider doing this. Imperfect obligations

are ethical demands which go beyond the duties marked out as perfect obligations which certain people have, to do particular things, but demand that anyone who is in a situation in which one can reasonably help someone whose right is endangered should give serious thought to this. According to Sen, the difference between perfect duties and imperfect ones does not lie in there being a duty associated with an obligation in the first type of duties, and this not being the case in the second type, it instead lies in the nature and the form of the obligation [42].

Hence, human rights generate reasons for acting in the case of agents who are in a position to help to safeguard or promote freedoms, in the case of both perfect obligations and imperfect ones. The latter are correlative to human rights as much as the former are, and accepting them goes beyond any voluntary charity or elective virtues.

To clear up this point it would in my opinion be useful to remember that perfect duties are nevertheless usually associated with negative duties and imperfect ones are usually associated with positive ones. The former are expressed imperatively with a “you shall not,” of which the Ten Commandments is an excellent example. Three of the Ten Commandments are expressed positively (“you shall love God above all else,” “you shall remember the Sabbath day,” “you shall honour your father and your mother”), whereas the remaining seven are expressed negatively. In the case of positive mandates it is impossible to specify how far the obligation has to be complied with, whereas the negative ones are very precise.

As regards corporations, of course they have the negative duty not to harm, but they also have the positive one to benefit people. In theory, any business activity is a benefit by creating wealth in different countries, giving people work, transferring technology, training professionals, creating tangible and intangible wealth and acting as a source of innovation. But furthermore, above all in the case of big companies, by taking advantage of their ability to influence governments in order to attempt to fill in the legal loopholes where there are any: firstly, by breaking the vicious circle of corruption and bad practice and establishing the virtuous circle of good practice, fostering compliance with contracts in different countries, displaying that it is possible and useful to involve all the workers in the running of the company and taking into account all the stakeholders. The company that works in this way is creating a new culture, taking advantage of its “moral resources” and thus benefiting its setting [43, 44]. As Sen so rightly says, an ethical company is a public asset [45, 46].

On the other hand, to go even further, sometimes companies have a broad sphere of influence in the countries in which they work and can use that influence to fill in any gaps in the law and to encourage governments to change the rules of play in order to make it possible for the rights of each and all human beings to be institutionally respected and for their basic capabilities to be empowered. Of course the question that always remains open for discussion is why they should do so. Sen’s reply, as already mentioned, is that there is a certain obligation for whomsoever has the power to do so, and to illustrate this affirmation he brings up two

religious examples: that of Buddha and the gospel story of the Good Samaritan ([32], pp 205–207). In the example of Buddha, there is a line of reasoning in the Sutta-Nipata according to which if someone has the power to produce a change that he or she considers will reduce the injustice in the world, there is a powerful reason for he or she to do so. The gospel story of the Good Samaritan is a parable of a man accursed in the country in which he is travelling because of his being a Samaritan who helps an injured Jew, takes him to an inn and pays the innkeeper to care for him. Jesus of Nazareth's question, as Sen reminds us, is not "Which of the men who saw the injured man acted correctly?," but "Who was his neighbour?" His neighbour was the one who helped him, thus founding a new neighbourhood ([32], pp 170–172, [47]).

Conclusion

The capability approach and the human rights approach are complementary, because each of these has advantages missing in the other, and at the same time there are great coincidences between them: both enable a partial theory of social justice to be built, which brings up demands of justice, because the discourse of central human capabilities sustains that these are not only desirable social objectives, but are *entitlements* based on justice, putting forward urgent claims which address national states, but also the international community. The capabilities approach is a necessary specification of the human rights approach, because it stresses the need for affirmative action in the public domain and also emphasises the interdependence between freedom and good economic order.

But in order to explain the connection between basic capabilities and human rights, it is necessary to go further than the idea of complementation proposed by Sen and Nussbaum. Throughout history, a bond is formed between two sides of the same coin: the notion of capabilities belonging to people and the notion of rights demanding social recognition that society is obliged not to hinder the development of these capabilities and to promote this. The bridge between these facets is the notion of social recognition, because it is this which demands the construction of institutions protecting the right to develop capability and the obligation to empower this. These institutions will give the process stability and durability.

Capability can thus become the cornerstone of a normative theory of social relations, a partial theory of justice, which demands the institutional facet of human rights. What kinds of obligations do companies have regarding this relationship between basic capabilities and human rights?

Corporations have negative duties not to harm, but they also have positive duties to benefit people. Any business activity is a benefit by creating wealth in different countries, but furthermore, above all in the case of big companies, by taking advantage of their ability to influence governments in order to attempt to fill in the legal loopholes where there are any. The company that works in this way is creating a new culture, taking advantage of its "moral resources" and thus benefiting its setting. It is a public asset.

Abstract

The capability approach is a normative framework for welfare assessments. The concept of capability, understood as freedom to achieve the goals that someone appreciates, is the one which articulates the impact of Sen's contributions to the discussions about justice, poverty, and development. The development of the capability approach can be reconstructed from two features that appear early and consistently in Sen's work; one of them is the integration of moral rationality in social explanation and the other is the sensitivity to vulnerability. Both features determine the high sensitivity to interpersonal variability of the capability approach, which differentiates it from other proposals that have shaped the discussions about justice, poverty, and development. The development of the capability approach has benefited from theoretical contributions of philosophers and economists who have expanded and strengthened Sen's original view, while it has become a normative guide for government agencies to adopt multidimensional measures for poverty and development, or design suitable social policies.

Introduction

Sen's capability approach is a normative framework for the assessment of well-being. From this framework, it is possible to determine when a person is in a better or worse social position, what poverty is, what the best ways are for development, or what measures should be taken to realize justice. The growing importance this perspective has taken comes largely from Sen's remarkable participation in the debate on distributive justice that started after the publication of *A Theory of Justice*¹ by John Rawls. In this discussion, the capability approach introduced

a dimension to the processing of interpersonal evaluations called “capability,” whose distinctive feature is to be highly sensitive to interpersonal variability.

The concept of capability is assimilated by Sen to the freedom someone has to achieve the goals that they set and value. In consequence, in assessing how well a person is or what should be done to support anyone in the pursuing of their life plan, the emphasis must be moved from means, such as income, to the meaning these means carry for the individual. Means are essential for anyone to realize their life plans, but the capability approach will evaluate their impact on individual freedom. From this perspective, poverty becomes less dependent from the means someone has and is rather associated with the absence of sufficient freedom to achieve the goals that are considered valuable. As a result, various circumstances such as the education that someone has received, their propensity to disease, or how the values of their community affect their decisions will determine the extent of their freedom.

The sensitivity to the different circumstances that affect the lives of each person is the greatest virtue of Sen’s proposal, and such radical sensitivity is based on two concepts that can be reconstructed to perceive the conceptual road that he has gone through (see ► [Chap. 32, “The Philosophical Foundations of the Capabilities Approach”](#) in this book): these concepts are moral rationality and vulnerability. They will be presented below as characteristic features of the capability approach.

Moral Rationality and Vulnerability

A first feature that Sen’s proposal has is that it distances itself from a methodological assumption that has had an enormous influence on economics, philosophy, and social sciences. This assumption considers subjects as rational egoists, and from this assumption, rational action is conceptualized in terms of the adequacy of the means to the ends that someone aims at. On this basis, the subjects are exclusively considered as self-interested, and in pursuing their own interest, they are supposed to operate under such strategic logic. As regards the different proposals of distributive justice, the influence of this position is evident in utilitarianism (see ► [Chap. 14, “Utilitarianism”](#) in this book) and libertarianism; in both cases, subjects are assumed as self-interested, maximizing their personal welfare, whose individual preferences are given and work as a kind of raw material for choice. Against these conceptions, Sen, along with other philosophers like Rawls and Dworkin, presents the limitations of establishing the satisfaction of personal welfare as the only motivation for rational action because in the explanation of practical rationality, it should at least be taken into account that there are multiple reasons for the choices that lead to action, of which personal welfare is only one.

Sen’s explanation of rational action can be seen at its best in his book *Rationality and Freedom*,² although its main features can be traced back to his article of the 1970s, “Rational Fools” [3]. Both studies distinguish between three main dimensions of rational behavior: the first is the dimension of self-interest, in which the individual is guided exclusively by the pursuit of maximizing their utility. The second dimension is the one referred to as sympathy, according to which

someone gets satisfaction or pain from the satisfaction or pain experienced by others. In this case, the action based on sympathy will be guided by the consideration of others, but the increase in personal welfare produced by such actions is its main motive, so it ultimately is self-interested behavior. The third dimension postulated by Sen is called commitment, and it is distinctive for establishing a gap between personal choice and welfare because actions based on commitment break the assimilation between choice and welfare that take place in the other two dimensions and may even lead to a choice that goes against one's own welfare. Such actions are those in which someone acts directed by duty, but the particularity of this type of behavior is that such action is not chosen to avoid the regret that a failure to act that way would cause but is motivated by duty itself ([3], p. 329). In this case, the subject prioritizes a certain choice because it is considered valuable, whereas in the case of a choice focused exclusively on satisfaction, value is the satisfaction of the preference at stake.

Sen's contribution can be understood as an expansion of the rationality of means to ends present in positions structured from the perspective of rational egoism, and it also integrates the possibility to act based on values and norms, which is a distinctive feature of what is known as agency or personal autonomy. The most suitable term to explain this process is expansion because self-determination is not an alternative to strategic rationality but is part of a more comprehensive version of practical reason. Therefore, this expansion of rationality can contribute to issues such as the pursuit of justice or the promotion of development, by incorporating a normative component that will influence the agents that promote those issues, such as institutions, social organizations, or companies (see ► [Chap. 33, "The Capability Approach as Guidance for Corporate Ethics"](#) in this book).

A second characteristic of Sen's capability approach is a high sensitivity to vulnerability, which leads him to argue that arbitrary circumstances affecting someone's life should be counteracted. In this respect, he coincides with the position taken by Rawls [1, 4] and Dworkin's³ egalitarian liberalism, although it should be noted that Sen's recognition of vulnerability goes deeper. In the case of egalitarian liberalism, such recognition leads to postulating the need to ensure certain resources that are essential for anyone to carry out his/her plan of life, and in that regard, basic liberties, opportunity, access to education and health, and a certain minimum income should also be ensured. However, egalitarian liberalism is blind to facts such as that someone may have preferences that are the result of a process besieged by marginalization and injustice, and, based on such preferences, he/she may make decisions that place them in an unfavorable situation.⁴ This type of preferences, called adaptive preferences, becomes the best indicator of the limitations of liberal justice.

In the case of the capability approach, recognition of vulnerability is considerably higher, and this perspective⁵ allows for explaining circumstances that are not perceived by other approaches, such as the stated adaptive preferences. The latter makes Sen's approach the most appropriate one for conceptualizing poverty and development, as it not only expands the strictly instrumental rationality present in the main stream of economy but also assumes a significant vulnerability that makes

his proposal highly sensitive to the influence of circumstances on the possibility of achieving the goals that someone finds valuable and seeks.

In short, these are the two main features in the capability approach: (a) the expansion of rationality in terms of moral rationality and (b) sensitivity to vulnerability. These features allow for conceptualizing, on the one hand, the orientation of action by norms and values and, on the other hand, our being fragile and needy. This results in the explicit presentation Sen makes of what is probably the most notable feature of his proposal, i.e., sensitivity to interpersonal variability, embodied in the concept of capability. On the next pages, I shall present the main characteristics of this concept and its relevance for justice and development.

Capability, Functionings, and Development

The capability approach was initially developed by Sen, but at this point, there are several contributions that enhance the proposal, maintaining a strong coincidence in the main concepts as well as a divergence in what might be called secondary issues of the proposal. To develop the core concepts, it is necessary to remember that Sen's intention has been to provide a normative framework that allows for the evaluation of people's welfare. To this aim, he intends to overcome the risks of subjectivism that trying to find a suitable design of this concept can entail: as it is possible that in categorizing what is valuable for a person, all his/her preferences should be included with equal value. This occurs in the case of welfarist theories, which assign equal weight to whatever preferences the persons have, and as a consequence, someone's preference for a cruise around the Caribbean and another person's preference to satisfy hunger are both equally relevant [10]. Sen distances himself from this risk and intends to build an objective criterion of well-being.⁶ In this task, he agrees with Rawls and Dworkin's proposals in principle but differs from them in avoiding the risk of fetishising means, such as Rawls' primary goods or Dworkin's resources, because it is possible that by concentrating on means as a measure of justice, the importance of interpersonal variability for issues of justice is not perceived ([8], pp. 39–42). In constructing a normative criterion to process interpersonal comparisons, Sen distances himself from these two risks, welfarist subjectivism and overrigidity of means, and proposes the concept of capability that will establish a specific evaluative space in which to make moral evaluations: the one of capability. The concept of capability is meant to capture the differences people have in means conversion, such as income into well-being ([8], pp. 83–86). For example, for a perspective concerned with assigning an objective set of means, two people would be treated equally if they had equitable access to the same material resources; however, if one of those two people has a chronic illness or very basic education while the other is healthy and has gained a higher level of education, their chances to turn means into well-being will be significantly different. In terms of distributive policies, this represents a shift of emphasis from means such as commodities or income, to what they mean for humans; therein lies one of the main contributions of the capability approach.

Capabilities, in turn, are manifested in different functionings, i.e., beings and doings that reflect someone's achievement. Thus, Sen argues that life can be conceived as a set of functionings, where a person's achievement can be understood as the vector of his/her functionings, covering elementary things like being "adequately nourished," "in good health" or "avoiding escapable morbidity," and complex achievements like "taking part in the life of the community" ([8], p. 39). Functionings constitute a person's being, and the evaluation of someone's well-being depends on the evaluation of these elements. The idea of capability represents the various combinations of functionings that someone can achieve, and hence, the capability of a person reflects his/her freedom to pursue a wider or narrower set of life plans ([8], p. 14). On this basis, the capabilities can be actualized through a set of vectors of functionings, the subject being responsible for such actualization; the freedom of a person, as such, is under the scope of the capabilities' potential to materialize through different functionings. Therefore, according to Sen's proposal, individual positions should not be assessed by the resources that the persons have, but by the freedom they have to choose between different ways of life. This freedom is represented by a person's capability to obtain alternative combinations of functionings.

From this perspective, the task of establishing what development consists of should build on the informational basis of the capability. The concept of informational basis establishes what information is considered relevant to comparing which persons are positioned better and worse. This specification leaves out a set of information that is not relevant to the theory from a normative point of view and is excluded or regarded as secondary ([8], pp. 73–74). The informational basis of the capability, whose main virtue is being extremely sensitive to interpersonal variability and vulnerability, excludes development conceptions structured around concepts such as income per capita through GNP, i.e., average measures that are far from pointing out how capable of carrying out a life plan persons are. Besides this, Sen places himself in direct opposition to the view which holds that development is a process that demands sacrificing, in the first place, a series of social protections to the most disadvantaged, only to restore them once wealth has reached society as a whole. His position understands development as a less traumatic process, which, instead of delaying the social protections, is to be articulated with them. In this sense, it is presented as a process of expanding the real freedom that people enjoy, which in turn arises from the development of the affected people's elementary capabilities. Hence, this expansion of freedom is posited as the primary end and principal means of development ([12], pp. 36–38).

In this way of understanding development, the primary purpose or end cannot be restricted or delayed by any social arrangements and shapes what Sen calls the constitutive role of freedom in development; this designation takes a faithful representation of the importance of freedom in enriching human life through the development of elementary capabilities that allow a person, for instance, to be free from starvation, undernourishment, or premature mortality ([12], p. 36). The constitutive role of freedom in development also takes place through the political

freedoms that allow for the exercise of the corresponding capabilities that enable participation in community life (see ► Chap. 37, “Agency, Welfare, Equality, and Democracy” in this book). In turn, freedom understood as a means explains the instrumental role assigned to it by Sen ([12], pp. 38–40) because not only does it operate as an end in itself but it is also the best way of achieving development. This is due to the fact that the development of elementary capabilities is a highly effective contribution to economic progress. The instrumental role of freedom determines the way in which rights, opportunities, and social protection contribute to the expansion of freedom and hence to the promotion of development. Political freedoms, economic and social opportunities, transparency guarantees, and social security, all collaborate, through their interconnection, with the expansion of freedom that a person has to carry out his/her plan of life.

From Sen’s formulation of the idea of development, a significant interconnection can be seen occurring between the concepts of development and poverty because both are formulated from the expansion of capabilities or their impairment. As in certain circumstances such concepts refer to each other, it can be said that development understood as the expansion of freedom is the real way to combat poverty. In his explanation of some successful development strategies, Sen insists that sustained investment in education with long-term expectations is what best explains the development of Asian countries in recent decades. This type of investment which coincided with the formulation of Sen’s concept of development has the effect of expanding, in the first instance, people’s elementary capabilities, in such a way that provides them with greater opportunities to carry out their life plan. In turn, the development of capabilities through education contributes to economic growth, as it allows for more qualified human resources. Finally, it ensures effective participation of citizens in decision-making processes that affect them. Therefore, development can be seen as a comprehensive process built around the development of the persons’ elementary capabilities, also involving social institutions and various actors such as civil society organizations or companies.

Development of the Capability Approach

The capability approach has had a relevant impact on discussions about distributive justice, poverty, and development. One of the most significant indicators of this impact has probably been the fact that it has become the theoretical background for the concept of human development implemented by the United Nations to measure the progress of societies. With regard to the measurement of poverty, it has also had an increasing influence leading various governments and government agencies to start adopting multidimensional measurements as a way to provide more precise diagnoses of the social situation of many societies. In the case of Mexico, since 2008, there has been an adaptation of this methodology to the measurement of multidimensional poverty⁷ and to the selection of the beneficiaries of the well-known program of conditional cash transfers, *Progresal/Oportunidades*. Nicaragua

is also considering using this index for the income transfer program *Red de Protección Social*. Besides, Chile has used Sen's approach to justify the inclusion of variables not related to income for the selection of beneficiaries in the program *Chile Solidario*.⁸

In the field of theoretical discussions about justice, the impact of Sen's proposal has stood out in the debate conducted during the 1980s and 1990s. However, his recent work *The Idea of Justice*⁹ presents a series of theoretical positions that have hardly had an impact comparable to the one of the introduction of the concept of capability in the debate. Sen maintains a sharp distinction between theoretical formulations and application, which leads him to reject the postulation of normative principles or criteria for guiding the application. He shows a strong concern for application, but he relies only on factual consensuses which deprive his approach of an accurate policy guidance for the interventions in social reality.

Due to the growing influence the capability approach has had, Sen's early work has been considerably strengthened by a group of philosophers and economists. Their versions show how Sen's original proposal of the capability approach can be enriched and projected. Someone who has contributed to the development of the capability approach to the point that she has developed her own different version is Martha Nussbaum.¹⁰ Nussbaum's work coincides with Sen's central arguments, but she moves away from his perspective in very important aspects. Among the points to be highlighted is Nussbaum's defense of a list of capabilities, as well as her intention to propose a theory of justice. Both positions have been explicitly rejected by Sen and have been central to the discussion between them.¹¹ As for the list of capabilities, Sen is afraid of losing the transcultural character of the capability concept by postulating functionings. Meanwhile, defenders of the lists state that their intention is to keep its transcultural character by proposing capabilities which can be locally translated into functionings. In addition, they point out that the lists' great practical use as guides for application must not be ignored. In turn, Sen's rejection of the possibility to build a theory of justice is confronted by the prospect of combining theory and application, clearly chosen by Nussbaum.¹²

The sensitivity of the approach to interpersonal variability makes it a very appropriate perspective for meeting the demands of justice from the gender point of view and has, therefore, incorporated a number of developments on this subject.¹³ The relevance of Sen's proposal to development has also allowed his perspective to be enriched by others which, in spite of their autonomous development, are converging with the focus on capabilities. Examples are Des Gasper's development ethics¹⁴ and Stewart's explanation of conflict in social dynamics.¹⁵

Philosophers who incorporate the capability approach into more comprehensive theories are to be noted as well; they have also considerably expanded not only the core concepts of the proposal but also its scope. Nussbaum again has a high prominence at this point since her projection of the scope of the capability approach means integrating it or coexisting with a rational theory of emotions.¹⁶ At this point, James Bonham¹⁷ also plays an important role by integrating Sen's concept of capability into his proposal of public reason. Spanish philosophers Jesús Conill and Adela Cortina must also be highlighted. Based on Sen's proposal, Cortina¹⁸ has established a set of

capabilities required to ensure a subject of dialogue which serves as a normative criterion for justice; in this way, along with others,¹⁹ she has created a fertile combination of the capability approach and the various versions of discourse ethics. In turn, Conill²⁰ has introduced a highly original interpretation of the capability approach, as Sen's strong emphasis on freedom allows connecting it to a Kantian perspective that greatly strengthens its normative dimension.

Application, as has been pointed out, is one of Sen's major concerns, and its importance becomes evident in the numerous contributions that have been made in different parts of the world. One of the difficulties the capability approach must confront is the possibility to make it operational and therefore turn it into an effective tool for measuring poverty and development. In this regard, the work developed from different perspectives²¹ has been aimed at overcoming one of the greatest challenges to the approach because if it is not practicable, its conceptual precision may die in theoretical discussions.

In Latin America, the influence of the capability approach is growing and has a high incidence in the study of poverty and inequality. Particularly in Uruguay, Andrea Vigorito has led a team of economists who have had a high impact on public discussion on poverty and inequality.²² They have also played the role of technical advisors to the implementation of one of the government's most important social policies which, through income transfer and the implementation of compensatory measures, aimed at reducing extreme poverty in Uruguay. In Brazil, Flavio Comin, by working from UNDP,²³ has led a process by which the binding values of the Brazilians have been identified, and which helped to determine what the irreducible normative dimension raised by the capability approach means to the Brazilian society. Such products are useful for further development of social policies, as their acceptance and their success will depend on whether such policies fit into the values of the target population.

Conclusion

As has been pointed out, the capability approach is remarkably vital in contemporary discussions. The innovations it proposes in the field of economics and in the discussions on justice and development are the main reasons for its ongoing popularity. The idea of freedom that reflects the persons' capability to carry out the ends they consider valuable operates as a keystone of the conception of development and poverty in the capability approach. Development is understood as an expansion of freedom, while poverty is seen as a lack of such freedom. In both cases, the capability approach has generated multidimensional valuations as a tool to allow for more precision and efficiency in the task of overcoming poverty through development and justice. The conceptual potential of the capability approach enables two possible ways of projection. The first is related to the immediate connection between the approach and its application so that the approach can have a direct impact on the issues considered in theory. The second possibility is its fecundation with other perspectives. It is likely that the possible connections with other approaches such as discourse ethics and the Rawlsian justice will allow for theoretical growth that can follow its founder's original intentions even better.

Business Contribution to Human Development from the Capabilities Approach Standpoint

36

Domingo García-Marzá

Abstract

The necessary business contribution to human development is analyzed from the capabilities approach standpoint. The important, but rarely acknowledged, role of business ethics in development theories is explained, a role that can help us understand companies as institutional actors that must be accountable for their actions and aware of their responsibility for development.

The capabilities approach, in this case from an institutional level, is proposed for this role of the company as an agent of (in)justice, using a reformulation of Kant's principle of publicity applied to the company.¹

Introduction

As with any institution, companies require social legitimacy and must inspire trust in order to function properly. Their social credibility is always dependent on what they contribute to society and the social response they provide. Their contribution to development is an important part of this social response, and is a key factor in lending credibility to and justifying their activities, particularly in the case of transnational corporations. Nowadays, contribution to human development is an indisputable cornerstone of what we know as corporate social responsibility.

However, the responsibility that large corporations actually assume is not on a par with the power they hold, or their capabilities, to influence human development and the improvement of real freedoms of all those involved in or affected by their activity. Despite this asymmetry of power and responsibility, development theory does not often reflect systematically on the idea of companies as agents of development and, particularly, on what type of institutional design would help

redress this imbalance of power and responsibility. One reason why so little attention has been paid to this question lies in the common misconception of the company as a kind of “black box,” a complete, immovable institution that cannot be changed or transformed. This is clearly illustrated by the negligible organizational changes the current global crisis has engendered in firms operating in the financial markets; for example, initiatives to eliminate their lack of transparency.

The aim of this chapter is to put forward some ideas to further our understanding of the contribution to human development that companies, as institutional actors, can and should make. I base my argument on a business ethics perspective which explains the underlying capabilities of the company as a socioeconomic institution, capabilities that must be actualized if companies are to attain legitimacy and the trust society deserves. To this end, Amartya Sen’s capability approach offers an excellent theoretical basis, not only to evaluate the impact of corporate behavior – its corporate responsibility – but also to justify and develop the normative principles that must guide all institutional design and redesign in the company.

In short, I will attempt to outline the basic ideas that enable us to apply the capability approach to the company as an institutional actor. The important, but rarely acknowledged, role of business ethics in development analysis will be explained, a role that can help us understand companies as actors that must be accountable for their actions, thus contributing to breaking the moral immunity behind which today’s transnational corporations attempt to operate.

Agents of Justice? The Distribution of Responsibility

The process of globalization has given civil society and its component institutions a greater role to play. This increased protagonism does not, however, mean that the state no longer has maximum responsibility for social and economic rights; nor does it mean that corporate responsibility is in any way a substitute for the legitimate role of governments. It only means that in today’s global context other actors now also shoulder some of this responsibility and form part of what we call civil society, or better, global civil society [1]. In this sense, globalization represents, rather, the end of a way of thinking in which public responsibility is confused with state responsibility. Or as O’Neill has it, states are no longer obviously the sole “agents of justice” in the sense we are concerned with here, of taking responsibility for development [2].

One of the actors directly involved in development – understood as an extension of real freedoms of individuals – is the company, particularly multinational or transnational corporations, major players in the globalization process. The activities of these transnational corporations now go beyond the legal scope of the state, and they are often more powerful than many, particularly weak or failed states. At the same time, because of their leading role at an international level, the social expectations invested in their activities are also higher, and with that comes an increased need for their legitimacy.

Global corporations pursue some of this legitimacy by cultivating an image of themselves as a conduit through which the benefits of globalization flow to developing countries. Their activities are expected to improve the living standards of the communities in which they operate; by creating jobs, thereby reducing poverty; by transferring technology and training; by raising awareness about the importance of the environment, etc. But the real picture is quite different, and all too frequently the results contrast starkly with these expectations.

Although no one denies that global corporations are capable of playing this role, even their most benevolent critics admit that the results have been modest, and that corporations could do much more than they actually do. The prevailing public concern, however, is not only how much of an impact they have, but rather, that the problem lies in the very nature of transnational corporations. Their immense power turns them into an authentic counterweight to the whole development process, as clearly shown by the persistence of poverty and the relentless deterioration of the environment. The social legitimacy of transnational corporations is measured in terms of two major challenges facing globalization: poverty and the environment. The truth is that they do not come out of it very positively.

Despite their huge power and their more than dubious contribution to development, global firms have managed to keep a low profile in development theory. Put another way, they have managed to uncouple their need for legitimacy from their role in development. It was assumed that their rise of power could only be justified by their contribution to human development, since any defense of huge economic profits for a few, gained at the expense of the misery and exploitation of others, cannot be spoken about publicly. But when we consider the need for a truly just development, the real value of their economic influence or their power is not seen clearly. This invisibility of transnational corporations' power within development theory is closely linked to the absence of any international regulation, but also to their very institutional design, or perhaps more accurately, the institutional reforms they urgently require ([1], p. 268).

Rather than an institutional agreement requiring social legitimacy, transnational corporations seem more like a natural fact in which we cannot intervene. On this point, critics and defenders of the present role of global corporations tend to agree. The bottom line is always the supposed risk attached to any attempt to redefine their institutional design, since the pursuit of equality might destroy efficacy, innovation, and motivation, and in the end, the characteristic value creation of this institution [3]. Faced with this threat, we have no option but to resign ourselves to accepting the social and environmental consequences of a company model based solely on maximizing profits for its shareholders. In the end, we are forced to recognize as inevitable externalities what in fact are simply the consequences of a certain way of understanding and managing the global corporation [4].

The concept of corporate social responsibility was introduced precisely to break this unresponsive company model and to account for the wide degree of freedom that companies have, and their capabilities for acting [5]. The concept implies the acceptance of a broad notion of corporate responsibility that includes not only shareholders and managers, but also workers, suppliers, clients, etc., and the social

and environmental context in which they operate. It always refers to the company's voluntary commitment to behave ethically and to contribute positively to development by improving the quality of life of its workers and their families. Its essential premise is that the company's success depends on these interests being recognized as an integral part of the company, and acknowledging that economic benefit is inseparable from the social and environmental benefits of all those involved and affected by its actions.

The corporate social responsibility movement was therefore born out of the need to account for the wide degree of freedom that companies have, but its use quickly became twisted. Today, corporate social responsibility seems to be used exclusively to clean up the image of transnational corporations, an image that is increasingly tainted by their scant, if any, contribution to development. Global corporations are aware of how decisive social and environmental factors are to their potential – and necessary – legitimacy and social credibility. They have reacted by incorporating this extension of their economic responsibility into their marketing and communication departments in order to “whitewash” their bad practices. The conclusions drawn by the latest United Nations reports are very clear: in its present form, corporate social responsibility does not respond to development goals.

Despite this fraudulent use, I believe the concept of corporate social responsibility still provides a good way of reporting the company's contribution to development, as long as the concept of corporate social responsibility and its various manifestations are included in an ethics framework that enables us to distinguish between a moral use and an instrumental use, between a corporate commitment and a commercial strategy. Business ethics can provide that framework, as it understands social responsibility as part of the ethics or character of the company, and not only as a set of possible social responses [7]. In what follows, I will outline the contribution to development that we can expect from the business ethics perspective.

Beyond Prudence: Moral Resources in the Company

By providing an ethics framework for corporate social responsibility, business ethics can be of enormous help in making the company's power visible, and therefore, grounding its contribution as an agent of development. This is the idea Sen defends when he clearly and forcefully advocates business ethics as a factor of economic development, as a productive asset; in his words, “in the analysis of development, the role of elementary business ethics thus has to be moved out of its obscure presence to a manifest recognition” ([1], p. 113). Business ethics rests on a basic fact: our behavior is influenced by values and priorities that are not limited to the pursuit of self-interest. These values, moral values for example, can and do influence business conduct.

To this end, we must start from the social and economic role of business ethics; that is, as Sen states, from the position that business ethics must be considered in “functional terms.” In my view, this means that moral knowledge fulfills a basic

social function as an action coordination mechanism, which is also necessary for economic relations, for the functioning of the market and its institutions, the case of the company. To give two well-analyzed examples, no one can question the role of trust in the efficient workings of agreements and contracts, nor the role of corporate reputation in today's global contexts. In both cases, moral behavior plays a crucial role, since we must know, or at least presume, that the company is going to act in the way we expect it will [8]. Indeed, Sen lists the advantages for development deriving from a commitment to ethical behavior, namely: increased production and economic efficiency; development of trust and cooperation in the market; prevention of corruption and irregularities; protection of the environment and sustainability; strengthening of human rights and the eradication of poverty; prevention of institutionally backed crime and violence [9].

Referring to business ethics as a productive asset for the economy and for society does not imply falling in line with utilitarian approaches. It does not mean the moral dimension has to be subordinate to economic profitability; indeed, the opposite is implied. It means acknowledging that the company is not amoral, that it has a degree of freedom and therefore a responsibility, and that fulfilling this responsibility is a decisive part of its economic success. Economic profitability is linked to ethical behavior, to meeting our expectations – what we have a right to expect – from the company. Following Sen, the lack of ethics in a company can harm its own interests. For example, a company that treats its employees badly, that has no regulations, that fails to pay its suppliers or breaks its contracts, etc., will earn a bad reputation that damages the company's interests ([9], p. 44).

It is not, however, a question of a merely strategic action following the mandates of prudence. The difference between acting from a position of prudence and acting from a moral perspective is clearly seen in the differentiation Sen makes between three types of motivation for the action: self-interest, sympathy, and commitment. From the work of Adam Smith, the maximization of utilities differentiates between *sympathy*, where a person derives satisfaction from helping another, and *commitment*, which “is concerned with breaking the tight link between individual welfare and the choice of action” [10]. In the case of commitment, it is neither personal interest nor sentiment that moves us to act, but rather respect for values and norms that we are rationally convinced we should follow. Commitment thus becomes an action-coordination mechanism, capable of impeding or strengthening business cooperation and interrelationships.

In previous works, I have proposed the term “moral resources” to refer to these underlying mechanisms of commitment that allow us to act beyond prudence. They are *resources* because they allow us to carry out actions, in this case interactions, and coordinate our plans for action with other actors, whether individuals or institutions. They are *moral* because they refer to our practical reason, to our capacity to be guided by moral values and norms, to take on responsible commitments and act accordingly [11]. In contrast to legal and judicial resources, which are legitimate but always based on external pressure and coercion, moral resources work because we are convinced we should act in that way, because from our position of freedom and autonomy we want to act in accordance with moral values

and norms. Sen tells us that the sense of justice is one of the factors that can and does move the will of the individual. His understanding of this “moral power” is stated clearly: “Space does not have to be artificially created in the human mind for the idea of justice or fairness – through moral bombardment or ethical haranguing. That space already exists, and it is a question of making systematic, cogent and effective use of the general concerns that people do have” ([1], p. 261).

From the moment these moral resources allow us to establish interactions, the real opportunities that each one of us possesses are opened up. They become capabilities when we are able to feel sure they will be actualized, when they allow us to instigate an action or bring about a state that we have reasons to value. Business ethics is concerned with highlighting and managing this moral knowledge inherent to the trust placed in the company. Its objective is to turn resources into capabilities; in short, to promote the use of moral resources in companies.

Although the capabilities approach is conceived in accordance with the lives and freedoms of the people involved, and human development is concerned with the real liberties of the individual, Sen does not ignore the institutional level of his analysis when he turns to the company’s contribution to development. In other words, he does not confuse the institution of the company with the individuals that form it, be they shareholders, employees, managers, etc. Sen repeatedly insists that institutions are necessary to further our objectives and our value commitments, since they can either impede or strengthen individuals’ real freedoms, as well as providing the reasons that allow us to value and choose one way of life or another. As we have seen, this institutional analysis does not have to be limited to the state as the only institution committed to defend and promote real freedoms. I now turn to explore how the capabilities approach can be used at this institutional level.

Transparency and Publicity: Business Ethics in Institutional Design

In *The Idea of Justice*, Sen again highlights the importance of institutions as a means of empowering individuals’ capabilities. Moreover, he argues that any plausible analysis of justice must give a significant role to institutions, and that development is dependent on the way institutions are structured and the right choice of institutions. In sum, institutions play a “significant instrumental role in the pursuit of justice” [12]. As stable social agreements, institutions restrict or encourage individual action and, in the end, people’s real freedom.

However, Sen does not leave this instrumental character behind when referring to the role of institutions for fear of falling into what he calls *institutionalist fundamentalism*. By this he aims to avoid the mistake which is fairly common in economics of regarding “institutions as themselves manifestations of justice,” thus shifting from necessary stability to dangerous inalterability. His concern lies in the fact that the institutionalist approach does not sufficiently separate institutional agreements from the real consequences they generate. It is therefore better to regard institutions as a means to improvement, to advance justice. In his words: “There is

evidently considerable attraction in assuming institutions to be inviolable once they are imagined to be rationally chosen by some hypothetical just agreement, irrespective of what the institutions actually achieve” ([12], p. 84).

Although Sen is right to accuse many institutional approaches of being “empty – even if acknowledged to be ‘well-meaning’ – rhetoric,” current transcendental institutional design theories do not commit the same error ([12], p. 26). Dialogical business ethics, for instance, is based on a clear differentiation between the level of grounding, the normative principles that must govern the agreement so that it is made in free and equal conditions, and the level of application, which demands public deliberation, with comparative analyses and the most accurate calculations possible of the real achievements made [11].

For these approaches, the basic question about the contribution of institutions to development is also how justice should be promoted, but this question is inseparable from that which asks about the conditions in a certain institutional context, the company, for example, that allow free and equal public dialogue among all those affected and involved in the business activity. Without criteria of moral validity on these symmetrical conditions for reaching agreements, we cannot explain the dynamic character of institutions that, as collective learning processes, must always be considered as partial social agreements that can be revised against the horizon of the idea of justice.

If development is measured by the spread of real individual freedoms, only agreement between individuals can determine the justice or injustice of an institution. Of course, the agreement is, and cannot be otherwise, on the real consequences, and the good that the institution contributes. But we must learn to separate the conditions of possibility of the agreement from the possible calculation of the consequences. The choice of effective institutions for development must have both, since only those involved and/or affected can decide what is real and what is not.

The capabilities approach can provide a theoretical basis, rich in nuances, from which to think about an institutional redesign for the company. On the one hand, we can use Sen’s proposal to evaluate the impact of corporate behavior through its processes and results. Our objective is to use the capabilities approach as a base for a proposal to determine and justify corporate responsibilities. This would give us an information base that “offers consistent cross-cultural or universal standards, adaptable, at the same time, to different socioeconomic and cultural situations.” This proposal consists of combining the five sets of instrumental freedoms with a concept of the company that can achieve a balance between its economic, social, and environmental outcomes. We would thus have an ethical framework for corporate social responsibility that could respond not only to *what* we can expect of the company, but also to *why* we can expect this.

On the other hand, I believe that the capabilities approach can also be used in a previous stage to design – in the sense of identifying and justifying orientations – normative principles that reveal the capabilities the company, as an institution, uses in its contribution to development. The company’s capabilities are understood as the way in which it deploys its set of resources as a whole.

Our objective is to come up with an institutional redesign that anchors the contribution to development firmly within the institutional structure itself. The proposal once again uses the five instrumental freedoms as a base from which to consider different principles for the institutional design. It is not a question, at this juncture, of evaluating the company's impact on development, but of how to come up with an institutional configuration that provides for free and equal agreement among all the parties – stakeholders – involved in these outcomes, and that, in principle, guarantees that those involved and/or affected will be those who calculate and define their reality.

Although this is ongoing research, we can offer an example of this proposal to apply Sen's theory by taking the guarantee of transparency as one instrumental freedom. Our starting point can be no other than, in the words of Sen: "The development of the financial crisis in some of these economies has been closely linked with the lack of transparency in business, in particular the lack of public participation in reviewing financial and business arrangements. The absence of an effective democratic forum has been consequential in this failing" ([1], p. 185).

The guarantee of transparency is, for Sen, an instrumental freedom, since it allows social interactions to take place and thus improves individuals' general capabilities, their freedom. Sen starts from the idea that any social interaction demands a minimum level of trust, and this trust, in turn, rests on the mutual interplay of expectations: individuals' interrelationships are based on what they suppose they will be offered and on what they can expect to obtain. What is required, therefore, is the guarantee of the clear and maximum possible disclosure of the information necessary for this interplay of expectations to take place. In the absence of information about what we can expect and how far the expectation will be met, doubts and mistrust arise, and the interaction finally breaks down.

The shift from the individual to the institutional level is easy to make since, as we have seen, the same happens in institutions. We base the trust we deserve on the knowledge, intuitive to a greater or lesser extent, that the institution is complying with what is expected of it, that it is accountable for its activities. We know what we can expect to gain from the company as an institution, and on the basis of these expectations, and how far they are met, we explain the unequal sharing out of burdens and benefits that it entails. The company should therefore be designed so that this guarantee of transparency forms an integral part of its institutional structure, and it is not an isolated, one-off occurrence; in other words, separate from its own character or ethics as an institution [14].

For business ethics that not only aims to define a criterion of justice that can be applied to the company, but that also sets out to ensure its proposal can function, this guarantee of transparency brings back the basic meaning of *responsibility*, namely, the capability of the company to answer to society for its actions, or lack of actions. We have no yardstick that tells us how responsible a company is in each concrete case; this always depends on the social and economic contexts and specific conditions. But we can design mechanisms of communication and participation that give us a "rational basis" on which to place our trust or mistrust in business activities.

What is decisive in defining a responsible company is that this guarantee of transparency provides for public forums in which all involved parties can

participate, together with all the information necessary for dialogue and subsequent agreement. This capability of public justification now forms part of the moral contract on which the company's credibility is grounded; in other words, its responsibility. It is not simply a question of being disposed towards frankness or openness, but that this disposition takes on the status of a *public institutional commitment*. This is the only way that responsibility can become a business asset, a moral resource with which to generate trust.

This idea of public justification is nothing new. Just as a person worthy of trust is someone who exposes himself or herself to the continual and scrupulous examination of others, the same happens in institutions. The proposal to use transparency to show good will was first systematized by Kant as a *principle of publicity*, understood as the requirement to "make public," so that all the information is available to those potentially involved or affected. One must ask if the company could do what it does if the reasons underlying its decision were in the public domain. In its negative form, this principle states, "All actions that affect the rights of other human beings, the maxims of which are incompatible with publicity, are unjust" [15]. Hence, now in Sen's terms, the need for participation and public scrutiny.

It is this condition of publicity that establishes the difference between a good and a bad use of social responsibility by the company. We can only speak of responsibility as a moral resource under these conditions, and avoid the criticism of instrumentalization and deception. Hypocritical action cannot withstand the demand for publicity. Indeed, a company based on these principles eliminates mistrust and provides sufficient meaning to motivate support for and trust in its decisions and policies.

From this idea, the guarantee of transparency is systematized as a principle of publicity that can be required in all institutional design, able to improve the capabilities of the company in that it broadens its degree of freedom. This principle might be formulated as follows: *trust is directly proportional to the capability of companies to make public and justify, through discourse, their actions, strategies, and policies.*

However, continuing Sen's concern to avoid the pitfall of institutionalist fundamentalism, business ethics must specify this principle in organizational proposals that embed the principle in the institutional structure itself. Although it may be given different forms and labels, this demand for publicity must distinguish three stages in applying the publicity principle (for discussion on the development of these mechanisms, see [16]):

1. *Ethics code*, as an explicit manifestation of the company's commitments to the promotion of real freedoms for all parties; that is, as a definition of its position on social and environmental responsibility. Sen is aware of the value of ethics codes as a first step, but never on their own or as a final step, in generating trust: "A basic code of good business behavior is a bit like oxygen: we take an interest in its presence only when it is absent" ([1], p. 264).
2. *Corporate responsibility report/ethics audit*, as tools for evaluation and analysis of the company's response to the expectations it generates; that is, the fulfillment of its responsibility. Internationally accepted methods are now available – such

as the Global Reporting Initiative – for this process of accountability and for the scrutiny and public control of corporate responsibility [17].

3. *Ethics and Corporate Responsibility Committee*, as a “public space” within the corporation, a place for participation and public deliberation involving analysis and debate on the corporation’s concrete objectives for development and the conflicts that concern the satisfaction of general interests, or the legitimate expectations at stake. Corporate social responsibility is thus taken out of the marketing and communication departments.

Conclusion

In summary, transnational companies can become agents of justice, so long as we stop regarding them as immovable institutions and come up with an institutional design that guarantees the development of their capabilities from the perspective of their contribution to development. The guarantee of transparency, interpreted as a principle of publicity, is a necessary step in this direction. What is at stake is the balance between equality and efficacy, a balance that, if the company wants to generate trust, cannot be defined without including those who suffer the consequences of its actions. Business legitimacy is not, and cannot be, an issue external to those who are affected by and involved in the business activity. It is therefore necessary to secure their participation and to have the information necessary for public debate on their contribution to development.

David A. Crocker

Abstract

This chapter argues that when properly and normatively understood, trade policy, poverty reduction, and democratic progress are related in a “virtuous circle.” With the right sorts of policies and institutions, poor (and rich) countries can produce and export in ways that, on the one hand, reduce poverty and inequality and, on the other hand, broaden and deepen democracy. Improved standards of living and democratic quality, in turn, result in more economic productivity and better trading opportunities.

Introduction

In this chapter, I argue that when properly and normatively understood, trade policy, poverty reduction, and democratic progress are related in a “virtuous circle.” With the right sorts of policies and institutions, poor (and rich) countries can produce and export in ways that, on the one hand, reduce poverty and inequality and, on the other hand, broaden and deepen democracy. Improved standards of living and democratic quality, in turn, result in more economic productivity and better trading opportunities.

Globalization is neither an unqualified good nor an unmitigated evil. Even poor and developing countries can “leverage” or “manage” globalization (economic integration) to serve their own people and promote democratization. As international political economist Dani Rodrik puts it, “We can retain much of the benefit of economic globalization while endowing national democracies with the space they need to address domestic objectives ([1], p. 9)”. The result will be

e-mail: dcrocker@umd.edu

a “virtuous circle” of trade policy, economic opportunities, and democratic governance, but one very different than the dream of the globalizers.

In this chapter, I propose how we should normatively understand our three variables and how they can and should be related to produce a “virtuous circle.” The aim is to redefine and bring together three concepts – and their related literatures, policies, and experiences – that are unfortunately often kept in academic and professional isolation, for example, in separate governmental ministries. The normative understandings and linkages that I propose aim not (merely) to clarify concepts and their ethical assumptions but also to remind ourselves of ideals to which we are committed in the world of economic productivity, personal well-being, and social-political participation. I conclude by drawing out the implications of this “virtuous circle” and suggest that regional and local democratic bodies offer a promising institutional embodiment of the normative ideals.

Reconceiving Trade Policy, Poverty Reduction, and Democracy

Ideas matter, and the concepts we use to understand and improve globalization are no different. In what follows, I offer a way of conceiving a nation’s trade, poverty alleviation, and democratization in relation to the ideal of “development as freedom.” In this approach, whose most prominent proponent is Nobel Laureate economist-philosopher Amartya Sen, beneficial economic and social change is conceived not as economic growth, although it may be a means, but as both the removal of what Sen calls “unfreedoms” and the promotion of freedoms or capabilities that individuals and communities have reason to value.¹ Of central importance in this approach to development – variously called “human development” or the “capability approach” – is the individual and communal freedom to run one’s own life rather than be controlled by others – such as authoritarian governments – or the impersonal force of circumstances, such as some forms of globalization. This freedom of self-determination or, as I shall call it following Sen, “agency,” is the freedom to decide on, prioritize, and trade off other freedoms (and other values, such as efficiency and stability).² From this agency-focused human development approach, how should we understand the concepts of trade, poverty, and democracy?

Trade. Two individuals trade, as I shall use the term, when they exchange goods or services or one buys goods or services from the other. International trade takes place when individuals, enterprises, or governmental entities in one country engage in trade with their counterparts in another country. A nation’s trade policy consists of those laws or policies that regulate exports, the selling of goods and services to other countries, or imports, the buying of goods and services from other countries. The aim of exporters is to profit from the transaction; the aim of importers is to profit from willing consumers. The aim of trade policy has been understood in different ways.

In classical economics, such as the work of David Ricardo, the theory of comparative advantage captured the idea that the consumers of all countries

would be better off if each country produced only those goods made from its own raw materials (or other favorable conditions) and then traded with other countries for goods that they in turn produced to their comparative advantage. If England produces shoes more efficiently and cheaply than does Portugal, but Portugal has a comparative advantage over England with respect to wine, then both the English and the Portuguese will be better off by trading shoes for wine (and vice versa) than each country producing both shoes and wine. On this classical view, the purpose of trade policy – for example, tariffs on quotas on imports or exports and subsidies for exports – was to maximize national and individual well-being.

Dani Rodrik argues that under the influence of free market liberalism (and its emphasis on unregulated trade), the aim of the World Trade Organization and the trade ministries of many countries has been to invert classical trade policy. Instead of viewing trade policy as a means to nontrade and ethical ends, neoliberalism trumpets market access as an end in itself. Rodrik advocates a return to viewing trade policy as a means to further ends, but instead of advocating the utilitarian end of maximized well-being, Rodrik endorses an international trading regime that “enables nations around the world to pursue their own values and development objectives ([1], p. 228)”.

Although Rodrik himself identifies those “development goals” that countries have reason to value as “prosperity, stability, freedom, and quality of life” and as including “political freedom, civil liberties, and human rights,” he also emphasizes that in a justified trading regime, and in good national development, a country decides its development goals for itself.

Poverty. If trade and trade policy can best be understood in relation to a country’s deciding on its own development goals, how should we understand the second of our three themes – poverty (and poverty reduction)? From the standpoint of an agency-focused capability approach, poverty is not ultimately a lack of income or commodities but rather a lack of freedom and agency.³ Income and commodities are important but as means rather than as ends in themselves. Someone can be income poor yet rich in opportunities and self-determination because she lives in a community in which she can take care of her basic needs or in which she has decided to live an austere aesthetic life. The hunger striker lacks food and nourishment but – should she decide to end her protest – has the freedom to be well fed. Someone can be income rich but be sickly and friendless (and be unable to remedy her plight).

From this perspective, economic growth, like international trade discussed earlier, is important only as a means and not as an end in itself. When economic growth increases peoples’ valuable capabilities, it is developmentally important. When it decreases these substantive freedoms or increases them for only a minority, it is developmentally deficient. For the agency-focused capability approach, poverty (and maldevelopment) is the lack of freedoms that we humans have reason to value.

It follows that when we investigate whether a nation’s international trade openness causes (or is caused by) a reduction of poverty, we should examine not (only) whether income-poverty decreases but (also) whether there is an

increase – especially in those previously unfree in the sense of having enforced poor health, ignorance, unemployment, and disenfranchisement. A trade policy friendly to human development (and not just economic growth) would enhance people’s capabilities and agency, especially of those most deprived. A trade policy inimical to human development would fail to expand or would contract human opportunities and autonomy.

Democracy. The third variable in our triumvirate is that of democracy.⁴ Like trade and poverty, democracy is defined in various ways for various purposes. For purposes of assessing the impact of trade policy, it is best to begin with the idea that democracy is “rule by the people” in contrast to rule by “guardians” or experts, whether religious leaders, philosophers, economists, political scientists, or politicians. We progress beyond this vague starting point by arguing that democracy is a complex notion with at least four dimensions. A trade policy may score well on some of these dimensions and not so well on others.

Rule by the people may be more or less *broad*. In ancient Athens and the early USA, citizenship was not extended to women, the landless, or slaves. In no democracy do children vote, and in many democracies, convicted felons and immigrants either do not vote or vote in restricted ways. One important decision for a democracy to make at its founding or later stages is who should be counted as citizens. Although globalization may bring many immigrants – seeking work or political asylum – to a country and they may eventually become citizens, a new trade policy as such is unlikely to affect the breath of a nation’s democracy.

In addition to being more or less broad with respect to the “who” rules, democracies differ with respect to *range* – the scope of the questions that the people decide. Although democracy in ancient Athens was narrow with respect to the number of its inhabitants, it was extensive with respect to the issues that citizens decided. By lottery or rotation, citizens served in many decision-making positions, such as that of judges and jurors. The Athenian Assembly made decisions about war and peace, tax policy, and trade policy with other city-states. Members in the 500-man council, elected by their demes or districts, decided which questions would be taken up by the Assembly.⁵

In contrast to this wide-ranging Athenian democracy, citizens in modern democracies, whether in developed or developing countries, typically decide no questions other than who is going to represent them in local, regional, or national bodies. And many who rule – judges, bureaucratic officials, and public servants – are not elected by the people but are appointed by those who the people elect. Trade policy may have a not insubstantial impact on the range of democracy in that such policy may empower citizens to participate in trade policy decisions in various venues and in various ways. Citizens, as we shall see, may play a limited or robust role in trade policy decisions and in export groups’ strategic decisions.

The last point suggests that range concerns not only the questions that the people decide but the institution in which they decide them. We tend to think of democracy as only one type of governance, one that contrasts with “government by the few,” such as aristocracy, autocracy, or theocracy. But democratic decision making also takes place in some nongovernmental institutions such as civil society associations,

nongovernmental groups, and educational institutions. Even some religious communities, families, and business enterprises conduct their affairs democratically. In fact, some democratic thinkers, such as North American philosopher John Dewey, have gone so far as to advocate that democracy is a “way of life” that should be embodied in all social institutions [3, 6]. Whether we go all the way with Dewey or not, the range dimension of democracy is very relevant for our exploration of the “virtuous circle” of trade, poverty reduction, and democracy. For example, exporting groups, decentralized throughout a country like Peru, hold great promise as being venues for and schools in democracy. Insofar as exporting groups consist of partnerships with national, regional, and local governments, these hybrid groups also extend the range of democratic governance – at least when the governmental structure is itself democratic along one or more of our four dimensions.

Suppose a democracy is fairly inclusive with respect to who rules and the people who rule decide on many questions in many governmental and nongovernmental venues. Yet, society’s democratic quality may be deficient on a third dimension, namely, *depth*. In a shallow democracy, the people rule by voting for officials, if indeed they vote. In a deep democracy, the people do much more than vote. They attend meetings, petition, write letters, remonstrate, march in protest, engage in work stoppage, take part in public discussion of public norms and policies, and meet with fellow citizens and representatives to bargain, negotiate, or deliberate about what ought to be done. This depth dimension of democracy will have important relevance for our study. Exporting groups, of course, might have little if any democratic depth. An autocratic leader (*jefe máximo*) or managing elite, especially of big producers, might call the shots. Even if an exporting group included small producers, governmental officials, and representatives of women’s, environmental, and antipoverty groups, these group members might participate in such minimal ways as merely attending meetings, rubber stamping the elite’s decisions, expressing their preferences to deciders who ignore them, or implementing policies decided by others. In contrast, a deliberative exporting group would be one in which group members – freely and equally – engage in a critical give and take of proposals and counter proposals until the group forges a policy or decision with which at least a majority can agree. If voting is necessary at all, and sometimes it is, balloting would do more than merely aggregate member preferences. Voting, in contrast, would bring to a close a deliberative process that transforms preferences. In a thin democracy, voting is the main thing. In a deliberative democracy, what happens before (and after) balloting is equally or more important.

The people who “rule” in a government or other group might be many and diverse. They might tackle a wide range of questions in many institutions. And they might do so in a robustly deliberative manner. Yet, the group’s decision might have little if any impact. An effective democracy would be one in which the group’s decision made an important difference to the group’s members, the group itself, or the wider society. In contrast, in a weak democratic group, decisions would have no “uptake” or would be hijacked or overridden by some other institution or social force. Democratic exporting groups might be democratic on our first three dimensions and yet not be in control of their own destiny.

In summary, we should keep in mind these conceptions of trade, poverty, and democracy when we examine whether trade policies contribute to poverty reduction and democratization, whether democratization alleviates poverty and enhances employment-generating exports, and whether alleviation of multidimensional poverty contributes to better commerce and a higher quality democracy.

Normative Assumptions

How might these ideal conceptions of trade, poverty, and democracy be justified? One method would be simply to look at what actually exists with respect to trade practices and policies, poverty and efforts to reduce it, and democratic practices. This empirical approach, however, is incomplete. Although it will tell us about what is actual, it does not – by itself – disclose what is ideal or desirable. Many current trade, poverty-reducing strategies, and so-called democratic institutions and processes fall far short of the ideals or represent competing ideals. As David Hume saw in the eighteenth century, you cannot simply deduce an “ought” from an “is.” That said, what is actual and factual is not irrelevant for our ideals, for an impossible dream may cause people to become cynical when reality comes crashing in. An ideal should be pitched high enough to inspire us to improve the actual state of the world but not so high as to be unattainable. It follows that empirical research can be normatively important insofar as it brings to our attention concrete cases that more or less realize the proposed ideal. One of the responsibilities of the international development ethicist is to “keep hope alive” (Denis Goulet) by showing that our most defensible ideals have, in fact, been more or less embodied in actual institutions and that striving for further realizations is not unrealistic utopianism. Certain Peruvian exporting groups are beginning to approximate the ideals of developing friendly international trade that positively affects (and is positively affected by) both capability enhancement and more robust democratic institutions [7].

A more appropriate way to justify the above conceptions of trade (policy), poverty, and democracy is to show that these conceptions are supported by certain reasonable ethical values or normative principles. In what follows, I clarify three ethical principles, which, I claim, can be marshaled to defend our conception of each of the three variables in our “virtuous circle.” In this chapter, I have little space to defend the three principles themselves.⁶

Agency. The first principle is that of agency. This term, perhaps unfamiliar to many in a development context, has to do with individuals and communities running their own lives, being in the driver’s seat of their own affairs. Other terms that point in the same direction are “*protagonismo*,” “autonomy,” or “self-determination.” The meaning contrasts radically with the principal/agent distinction in institutional economics, for in this latter view an agent should not decide for himself or herself but rather do the bidding of the principal. In contrast, in my view, individuals and communities are agents to the extent that they scrutinize reasons for various courses of action, decide for themselves, act, and have an impact on the

world. Although human beings are often constrained, coerced, or conditioned by the actions of others or the force of circumstances, they sometimes have the opportunity, provided by their environment, to decide for themselves and make a difference on the world. As Sen explains:

In terms of the medieval distinction between “the patient” and “the agent,” this freedom-centered understanding of economics and of the process of development is very much an agent-oriented view. With adequate social opportunities, individuals can effectively shape their own destiny and help each other. They need not be seen primarily as passive recipients of the benefits of cunning development programs. There is indeed a strong rationale for recognizing the positive role of free and sustainable agency—and even of constructive impatience. ([2], p. 11)

One way to defend agency is to affirm its intrinsic importance, apart from whatever good consequences it might have, by appealing to our considered judgments. British philosopher Isaiah Berlin does just that in the following passage:

I wish to be the instrument of my own, not other men’s, acts of will. I wish to be a subject, not an object.... I wish to be a somebody, not nobody; a doer—deciding, not being decided for, self-directed and not acted on by external nature or by other men as if I were a thing, or an animal, or a slave incapable of playing a human role, that is, of conceiving goals and policies of my own and realizing them. [8]

Although we may not agree with someone’s choice to be nonreligious or religious (or what sort of religion to espouse), we believe it is intrinsically important that each person decide the matter herself (and for herself) rather than either unthinkingly conform to custom or be coerced by others.

Another way to defend agency is to show that agency has a number of good consequences. When people or communities are in charge of or have ownership over their own enterprises, they are more apt to be responsible for them, invested in them, and benefit from them. Hence, as quoted above, Rodrik connects people attaining “greater control over their lives” with their “lifting themselves out of poverty” and improving their standard of living. An agency-oriented perspective stands in stark contrast to “assistentialism,” where external aid givers see people, in Sen’s memorable locution, “primarily as passive recipients” of the aid giver’s “cunning development programs.” A commitment to agency does not condemn all aid programs but insists such aid normally should help people sustainably help themselves rather than be dependent on others. Similarly, drawing on the agency principle, Rodrik argues that a “development-friendly” international trading regime does not exclusively focus on a developing country’s access to developing world markets but “enables poor countries to experiment with institutional arrangements and leaves room for them to devise their own, possibly divergent solutions to the development bottlenecks that they face ([1], p. 215)”.

Opportunities for Well-Being. Our second principle is that of individual development or well-being. Not only is it good that individuals and communities are authors of their own lives but also that they have opportunities or freedoms to live lives they have reason to value. As we have already seen, among the freedoms that reasonable people would choose are those of good health, education, adequate

nutrition and accommodation, and meaningful work. One reason why exporting groups are important is that we have good reason to believe that they will improve employment opportunities and, hence, other aspects of well-being.

Equality. In nondemocratic societies, only a few people have decision-making or agency freedom and significant opportunities for well-being. Hence, for our normative vision to be relevant for a democratizing society, we must also affirm a principle of equality.⁷ Here, equality does not mean that everyone is made strictly the same in income. Rather, by equality, we mean that people have roughly equal freedom to exercise (if they so choose) their agency and genuine opportunities to get over a basic level of well-being. One implication of this principle is that the family in which you are born should not be your destiny. Instead, basic health and educational opportunities should be available to everyone. Another implication is that the region of the country (or the world) in which you are born should not condemn you to powerlessness, voicelessness, or destitution. Hence, one role of centralized political and economic power is to promote decentralized political and economic opportunities, including that of broad-based exporting groups that practice deliberative democracy. By “broad-based,” I mean groups that include micro, small, and medium producers (as well as big producers) and give voice to marginalized or discriminated groups such as women, subsistence farmers, and indigenous peoples. (Many of these groups, of course, would benefit from that sort of capacity building that would enable them to be more competitive producers and deliberative partners.) A final implication of the equality principle is that each country’s right to forge democratically its own institutional arrangements entails that it must respect the equal agency of other countries and not impose its own model on them. The same applies to the rights and responsibilities of subnational regions, for instance, Lima in relation to other Peruvian departments and Santiago in relation to other Chilean provinces.

A Virtuous Circle

Given normative conceptions of trade policy, poverty reduction, and democracy and the three normative assumptions, how can and should trade, poverty reduction, and democratization be related in such a way that they reinforce each other? With a developmentally friendly trade policy, trade can promote development as the expansion of agency and well-being for all. Regional exporting groups can seek export strategies – whether in mining, agriculture, crafts, textiles, leather goods, and so forth – that not only identify a competitive comparative advantage but also engage in decision-making various micro, small, and medium producers, as well as other regional groups, such as representatives of women and indigenous people.

Conclusion

Six concluding remarks are in order. Nothing we have said implies specific trade policies or detailed institutional designs. Such policies and institutional details are up to regional participants in their inclusive democratic bodies. We can say, however, that markets themselves will not solve the problems of development

and that institutions are needed because, as Rodrik puts it, “markets are not self-creating, self-regulating, self-stabilizing, or self-legitimizing ([1], p. 154).”

Second, we can affirm in a general sense the importance of inclusive, wide-ranging, deep, and effective democracy at all levels. The specific form of these economic and democratic institutions will depend on both democratic will and sensitivity to local constraints and opportunities ([1], p. 6). Rodrik aptly calls democracy “a metainstitution for building good institutions” ([1], pp. 155, 166–168) for, argues Rodrik, “participatory political systems are the most effective mechanism for processing and aggregating local knowledge ([1], p. 8).” I would add that democratic bodies not only process and aggregate local knowledge but also transform preferences about what ought to be done. Rodrik does at one point call for trade and development decisions to be made by “coordination and deliberation councils ([1], p. 113)”.

Third, this chapter in no way denies the importance for enterprises in general and regional exporters in particular to make substantial profits. But profit-making and inclusive and deep democratic decision can go hand in hand.

Fourth, many countries are seeking ways to extend, increase the range, and deepen their democracies as well as make them more efficacious. Much discussed, for example, are Brazil’s municipal participatory budgeting processes (*presupuesto participativo* – PP) and health councils.⁸ Proponents of both kinds of decentralization are aware of benefits that come from the right kind of centralization. One advantage of regional democratic export councils over participatory budgeting, however, is that the former bodies *produce* as well as distribute wealth while the latter do only the latter.

Finally, as Rodrik claims, just as bottom-up experimentation (in conjunction with governmental agency-respecting assistance) should replace top down dominance, so each country (and region) should seek its own export and institutional solutions rather than slavishly imitate others ([1], pp. 4–5). Yet cross-cultural communication and exchange of ideas and experience may be useful in surmounting old impasses and forging a better future ([1], pp. 8, 165).

In their most recent book on India, *India: Development and Participation*, Jean Drèze and Amartya Sen set forth lessons they believe one can learn from the “developmental challenges faced in India”:

There are, we have argued, rich lessons here, which cannot be seized without taking interest in the ends and means of development in general and in the intrinsic value, constructive role, and instrumental importance of public participation in particular. The basic approach involves an overarching interest in the role of human beings – on their own and in cooperation with each other – in running their own lives and in using and expanding their freedoms. [13]

I have treated trade policy, poverty reduction, and democratization, ideally conceived, and the ways in which they might contribute one to the other in a “virtuous circle.” I have suggested that the development, democratic, and privatization challenges that Peru’s regional export councils are facing are rich lessons for a freedom-focused way to respond to the constraints and opportunities of globalization.

Part 10

Justice and Business Ethics

Geert Demuijnck

Abstract

In this section we analyze the role, if any, of principles in distributive justice in business ethics. The business world is often criticized in morally condemning terms, many of them somehow related to the issue of distributive justice. Traders are accused of receiving indecently high bonuses; CEOs benefit from shockingly high packages upon dismissal – the “golden parachutes”; the announcement of a massive layoff boosts share value on the stock markets; and multinationals are said to exploit supplier companies and, indirectly, their workers in emerging countries. The list of complaints is endless. However, justice, more particularly distributive justice, is a complex issue. Moreover, the scope and the relevance of the different principles of distributive justice in the business world is not obvious.

Introduction

This chapter introduces a general discussion of business ethics and justice. The aim is to clarify which duties of justice we may legitimately attribute to corporations taking into account that they function within a competitive market system. Throughout the chapter, we use the terms “corporation” and “company” as a black box: We do not make any inference on a firm’s ontological status or whether we ought to attribute intentional or moral agency to the firm. Firms are populated by real people with moral agency, and it would be unreasonable that these people would be allowed to violate others’ rights simply because it is corporate policy or the expected culture within their firm. Corporate decisions are *de facto* moral decisions because they are made by human beings who have a moral sense.¹ The task is to spell out the scope of the duties of justice, that *a priori* operate as

e-mail: Geert.DEMUIJNCK@edhec.edu

side constraints, against the background of market mechanisms, as well as the fiduciary duty that executives have toward their shareholders.² The fact that markets are competitive implies that moral rules are, like in sports, specific, but they do not dispense economic agents, in Aristotle's broad definition of distributive justice, from "giving to each his or her due" [3, 13].

In this chapter, we will not discuss the broader issue of social justice. A market economy unavoidably leads to unequal outcomes. Egalitarian thinkers, like Rawls, have argued in favor of principles of justice that should underlie the basic political institutions so that citizens can consider themselves as free and equal. A just society will most likely, given the unequal outcomes of the market economy, imply that there should be mechanisms of redistribution. The degree to which redistribution is needed and the mechanisms that are appropriate to do so are issues for political philosophy; our scope is related to corporate duties related to justice.

This chapter develops the general framework of the discussion, ► [Chap. 39, "Executive Compensation and Distributive Justice"](#) by Luc Van Liedekerke will focus on executive compensation.

The Market as a Morally Free Zone

To begin, when we ask ethical questions about duties of justice within the context of business, we implicitly assume that business, or better, the institutional structure within which people do business, i.e., the market, is not morally questionable as such. Whatever the ethical shortcomings of capitalism, and whatever market behavior we ultimately reject on moral grounds, the starting point of business ethics is that we at least accept the legitimacy of the market economy – just as historically the long outdated discussions about what it meant to be a good slaveholder or a bad one presupposed the legitimacy of slavery as such.

A framework of business ethics does not accept the market economy unconditionally though. There might be moral constraints on markets, limits of corporate activities and reach in these markets, as well as constraints on what business leaders may do within their own organizations. The aim of this chapter is to examine whether the set of conditions that make the capitalism morally legitimate includes that the main actors, i.e. corporation, should respect specific principles of justice.

Before we turn to moral restrictions and duties of justice in a business context, let us first spell out what makes business transactions *prima facie* morally defensible.

From an ethical viewpoint, the market systems have been defended on both consequentialist and deontological grounds [30]. The deontological argument is formulated in terms of liberty and in terms of self-ownership [21]. Every human being is born free and no one owns me. As a consequence I own my bodily strength and my talents which constitute my abilities to engage in the workforce. I also own whatever I produce, under the conditions that I do not monopolize the resources I need for this production (the Lockean proviso). Since I fully own these products, I am free to trade them with other free people who like to buy them. A nice consequence (but not a justification) of the fact that market transactions are free

is that, in principle, they lead to a Pareto-improvement: Buyer and seller are better off and no one is worse off, since no one will accept an exchange that makes him or her worse off. Again, the libertarians who defend this line of argument – we are free to trade stuff that we fully own – will accept a limit here: I am free to produce and to trade if these actions do not harm someone else.

In comparison, the consequentialist argument is that the free market leads to an overall outcome that is Pareto-superior compared to a state-run economy. This point needs some further explanation, also because the explanation will be useful to spell out the duties of justice. The market economy means that the major decisions about the production of goods and services are taken by the market, i.e., indirectly, by an innumerable amount of individual decisions to sell or to buy. As a decentralized decision mechanism it maximizes the subsidiarity principle, and thus also individual liberty. The price mechanism equilibrates offer and demand on the different markets. Markets are places where preferences meet. In fact, prices are the result of the expression of personal preferences. The price mechanism equilibrates offer and demand on the different markets. The motivation of the economic agent is to maximize their utility. For consumers this comes down to making the best deal with a given budget; for employees to get the highest wage that potential employers are willing to offer; and for investors to receive the highest return on equity. The market system combines the following key elements: private property of resources, voluntary exchanges, and the motivation to make profit. This motivation for profit (or higher wages or cheaper prices) leads to competition, which is actually the motor of the entire market mechanism. The combination of all these elements leads to efficiency, i.e., the maximal output with the minimal input of resources. Therefore, not only is the market a marvelous mechanism on a micro-level of individual transactions that make both buyer and seller better off, it is also wonderful on the macro-level.

The reason is that, in a “planned” economy, investment and production decisions, as well as the price of products are based on imperfect information, and therefore suboptimal. To illustrate this point, take the example of a competitive market: taxis in Yaoundé (Cameroon). Taxi drivers are continuously picking up and dropping off passengers. Passengers are on the side of the roads and yell their destinations toward the driver: “Mvog-Ada,” “Nkolbisson,” “Hôpital Central,” which are the names of neighborhoods. The drivers pick up as many as five passengers, who each pay 200 Francs. But if the destination is quite far, passengers have to raise the stakes and yell, typically: “Nkolbisson 400” to the driver. Inversely, if they try to find a taxi for a very short distance, they will add “100” to their destination. Drivers make frequent and rapid “economic man” decisions: They optimize in function of a complex set of parameters in order to decide whether or not to pick up a yelling passenger. Influences include the destination of the passengers already in the car; the likelihood of traffic jams on the way to the requested destination; the money passengers are offering for the ride (in order to limit gas consumption); the likelihood or knowledge that there will be police control on the way (police control means that drivers have to pay a fine, in any case); the expectation that they will find enough passengers on the way back to the

city center; and the likelihood that there will be competition from too many other taxis on the same road, etc. In other words, these taxi drivers are practicing a day-long “tâtonnement”: By aiming at maximizing their income, they create a very efficient and cheap transportation system.

One can immediately see that it would be impossible to plan a transportation system with the same efficiency, simply because no one knows beforehand which people will move to which destination. There may be some trends of course, but the permanent adjustment between offer and demand, made by the thousands of drivers who, individually, try to optimize, would be impossible. In his paper “The Use of Knowledge in Society” [12], Hayek writes: “What is the problem we wish to solve when we try to construct a rational economic order? On certain familiar assumptions the answer is simple enough. *If* we possess all the relevant information, *if* we can start out from a given system of preferences, and *if* we command complete knowledge of available means, the problem which remains is purely one of logic. [. . .] This, however, is emphatically *not* the economic problem which society faces. And the economic calculus which we have developed to solve this logical problem, though an important step toward the solution of the economic problem of society, does not yet provide an answer to it. The reason for this is that the “data” from which the economic calculus starts are never for the whole society “given” to a single mind which could work out the implications and can never be so given.”³

If free and voluntary exchanges, based on profit seeking, really the self-interest of the economic agents, lead to an optimum, there appears *a priori* no room for worries about ethical wrongdoing or injustice in business transactions. This is why David Gauthier [10] calls the market a “morally free zone.” Gauthier identifies morality with constraints on individual self-interested behavior that allows a cooperative surplus. As a consequence, when no such surplus is feasible, i.e., when the individuals’ pursuit of advantages leads to a Pareto-optimum, as it is the case in perfect market transactions, all constraints are out of place.

However, one should be careful when interpreting Gauthier’s slogan “Were the world such a market, morals would be unnecessary” ([10], p. 13). Gauthier is well aware that a perfectly competitive market presupposes a moral framework: “The morally free zone created by the market can arise only within a deeper moral framework” ([10], p. 102). He explains this framework, first of all, by pointing at the condition of mutual unconcern (in contrast with a moral framework based on affective ties), but also by mentioning that the market requires that a lot of rules which are commonly considered to be respected, for example, mutual respect of property.

Morals would be unnecessary in the *limited* sense that we would not need to think about an impartial division of benefits and burdens of collective actions. According to Gauthier, in perfectly competitive markets, impartiality is guaranteed to the extent that market interactions reflect each person’s freedom. In other words, echoing Adam Smith’s invisible hand, Gauthier shows that in the market, we do not need any moral motivation on behalf of economic agents *for their market transactions*: Sheer self-interest leads to a morally acceptable outcome.

However, there are issues. A perfectly competitive market is largely an idealization that has conditions that are never fully met. Yet, while a functional market is

the most efficient and fair distribution device, there are indeed cases in which the market fails. Market failure is identified by Gauthier with situations in which self-interested interactions do not lead to a Pareto-efficient outcome because of the presence of *externalities*. When an action, either of consumption, production, or exchange, affects the utility of people not involved in this action, economists call this effect an externality. Externalities may be positive or negative, i.e., beneficial or harmful. A standard example of a negative externality is the pollution of the environment by a firm: Part of the production costs of the goods this firm produces are displaced on other persons. Public goods, in the sense in which economists use this term, for example, street lighting, are characterized by positive externalities that cannot be internalized: People who did not contribute to their creation cannot be excluded from the beneficial effect.

The absence of negative externalities is an essential assumption of the perfectly competitive market. The coincidence of equilibrium and optimality is no longer guaranteed when there are externalities. The reason is obvious: Externalities upset the marginal matching of supply and demand. Goods with negative externalities will be oversupplied and public goods will be undersupplied ([10], p. 88).

The presence of externalities not only disturbs the harmony between rationality and optimality, it also disturbs the coincidence of equilibrium and impartiality, even if the starting point is impartial, in the sense of respecting the proviso. Related to both kinds of externalities, Gauthier defines his two types of immoral behavior: the free-rider and the parasite: “A freerider obtains a benefit without paying all or part of its cost. A parasite in obtaining a benefit displaces all or part of the cost on to some other person” ([10], p. 96). According to Gauthier, the aim of moral rules is the elimination of free-ridership and parasitism ([10], p. 113). Morality thus finds its rationale in market failure ([10], p. 84). Rational people will find a solution in order to reconcile impartiality and optimality. That solution is a new mode of interacting: cooperation, which implies a constraint on straightforwardly maximizing ([10], p. 117).

We will now use Gauthier’s argument as a starting point for the question whether or not it makes sense to impose duties of justice on companies. Two complementary points have to be made before, though. First, Gauthier focuses on externalities in his discussion of the implications of market failure. There are other forms of market failure with very similar implications with respect to the combination of optimality and impartiality, and therefore, in terms of the moral evaluation of market exchanges. Lack of competition (monopoly, oligopoly) and asymmetric information are the best known. To elaborate, let us return for a moment to the market of taxis in Yaoundé. The taxi market in Yaoundé is nearly perfect with regards to competition. Unlike in Paris where there is a rationing of taxis due to a limited number of operating licenses in order to keep the business very profitable, in Yaoundé there is a very low entrance barrier. One must purchase a second hand car, paint it in the required yellow paint, then pay a bribe to the administration in order to get the required stamps on the documents, and then one is a taxi driver. If entrance barriers are higher, suppliers of the desired product or service gain market power, which allows them to charge prices above market clearing levels. It is then

likely that overall efficiency decreases with a diminishing level of competition, resulting from high entrance barriers. Secondly, on the taxi market in Yaoundé, both clients and drivers know the distances, the usual prices, the gas price, the traffic problems, etc. All this information is common knowledge. Rarely is it possible for a taxi driver to take advantage of an ignorant tourist. However, in many other markets, there is information asymmetry that enables one party to take advantage of another one.

Gauthier's second point is that people, insofar they are rational, will restrain the maximizing of their interest on a voluntary basis. The question is whether this assumption makes sense in a competitive environment. In the next section we will look at how to cope with market failures and the possible injustices that may follow from them.

Against this background of a perfect competitive market that *prima facie* combines an optimal outcome, in terms of efficiency, with distributive fairness because the freedom of the exchanges implies their impartiality, we have now a framework that allows us to see how different questions about justice and possible duties of justice for corporations can be interrelated.

We will first ask whether or not, and if so, to what extent, corporations have duties of justice with respect to injustices that follow from market failures. Secondly, we will ask whether there is really no room for unjust transactions even in the absence of market failures: We will ask whether it is ultimately not possible that corporations behave in an unjust way, even if markets are perfectly competitive. More particularly, we will ask whether some corporations are not exploiting people. Finally, we will ask whether there may be duties of justice for corporations in a competitive market, if the unjust nature of the transactions is not caused by the immoral behavior of the corporations, but by the moral failure of other economic agents. In other words, the question is: To what extent may companies be complicit with injustices caused by others?

The State and the Market: Regulation Versus Self-Regulation

What are the remedies for injustices that are possibly created by market failures? The most obvious answer is *regulation*. Legal rules to resolve problems caused by market failures are paramount. Let us look at the way in which societies cope with externalities, with the lack of competition, and with asymmetric information.

The textbook example of negative externalities is pollution. In almost all countries there are legal norms that constrain companies to respect environmental norms. Implementation, control, and punishment in case of transgression are exerted by government officials. Especially when the pollution harms the immediate neighborhood surrounding the factory, companies that violate norms are often condemned to compensate the victims. The crucial duty of justice in these cases seems to be that the corporation should respect the prevailing legislation, *even if they could disregard it*.⁴ The underlying moral justification is that we all have an equal claim on a sustainable planet. Therefore, we may collectively limit or prohibit

actions that threaten the sustainability of our planet. Even if the normative foundation of environmental regulation seems unquestionable, there are huge implementation problems. For example, because of growing transnational economic activity we collectively face the problem of gaps in the international environmental legislation, despite a rapidly increasing number of international agreements. Some authors argue in favor of universal jurisdiction of national states with respect to environmental crimes, similar to the international rules with respect to maritime piracy in the high sea [28]. At this stage, though, from an ethical viewpoint, corporations should at the very minimum respect international norms.

The fundamental question here, though, is whether companies, for reasons of justice, should go *beyond legal constraints* in terms of sustainability. We believe that this is not the case, because a corporation would find itself in a prisoner's dilemma situation. We can compare it with the dilemmas that we all, as consumers, face every day. We know that driving our car contributes somehow to the deterioration of the environment. We could take public transportation or our bicycle, but it is raining, and, finally the well-being we gain by *our use of our car* does not weigh up against the infinitesimal contribution of our car to climate change. Individually, we do not have a large impact, but collectively we do. Similarly, the immediate gains of the company's *not investing* in less polluting technology (beyond legal requirements) trump the small long-term contribution to ecological damage. It is obvious that this typical prisoner's dilemma problem cannot be overcome by market mechanisms alone. As Joe Desjardins [6] has pointed out, "When the costs of market failure are as irreversible and permanent as global climate change and species extinction, we have strong reasons not to trust the market" ([6], p 61). Just like we cannot trust consumer choices to combat climate change.

Many business ethicists have stressed the responsibility of corporations for the natural environment. Environmental scandals like the Exxon Valdez or the catastrophe with the Erika are often used to illustrate unethical behavior of corporations.⁵ However, if we look more closely at these examples, they basically turn on either not respecting or circumventing legal norms, or problematic situations on the political level (corrupt governments, loopholes in the legislation, short-term economic priorities). Except environmental militants, no one is really scandalized by the observation that a company pollutes in a way that is compliant with the legal rules of a democratically governed country.

And yet, many companies take environment-friendly initiatives. During the last decades, many corporations have been proud to mention in their Corporate Social Responsibility (CSR) reports that they have taken steps to limit their environmental footprint *beyond* what is required by the law. In some cases, their declarations can be unmasked as "green-washing." In other cases, there may be good economic reasons for justifying their behavior. It even may happen that a corporation, i.e., its executives and its shareholders, is genuinely moved by concern for the natural environment. But whatever the underlying reasons or motives are, it seems difficult to require – as a duty of *justice* – that companies, in a competitive environment in which production costs matter, go further than what is legally enforced if measures

to pollute less are expensive. At most, we could claim that companies should make an effort to diminish their environmental impact, but rather as an *imperfect duty*, i.e., corporations should do it if it is reasonably possible, just like we consumers should take care of the planet.

Admittedly, we can make a convincing “business case” for sustainability. Nonrenewable resources will become more expensive over time, so companies that invest in currently expensive substitutes will unavoidably become profitable at one point. Consumers will expectedly become more aware of the bad consequences of climate change and be willing to pay more for environment-friendly products, etc. Desjardins underlines the massive opportunities of sustainable business with the following example of the potential automotive market in emerging countries like China and India. If corporations approach these markets with their current business model (cars with gasoline motors) in these densely populated regions, poorly equipped with roads, the result will be disastrous in terms of traffic congestion and pollution. A creative move toward more sustainable transportation by the automotive industry could, according to Desjardins ([6], pp. 90–91), lead to a competitive advantage. He refers to other eco-efficient moves by companies that have turned out to be profitable. We do not deny that there are market niches for eco-friendly products, and we agree that eco-efficient moves will undoubtedly become profitable one day, but it is wishful thinking that transition to eco-efficient products is always profitable here and now. Meanwhile, corporations who do business as usual, thereby respecting the law, cannot be blamed in terms of injustice. For example, automotive corporations who sell the same cars, currently driven by those in the West, to the Chinese and the Indians who can afford them, cannot be morally condemned because they should take the planet more into consideration as a duty of justice.

A last point has to be mentioned in this context. Big corporations are influential economic agents, unlike individual consumers. Therefore, although they should not, they do have political power to some extent. They can lobby, meet competitors of their sector of activity, and take initiatives to make the regulatory framework evolve in the direction of a framework that will make all of us better off. And they often do.⁶ In this sense we may blame companies, especially big ones, for not actively contributing to a better regulatory framework.

A second type of market failure, lack of competition, is opposed with antitrust and competition legislation. Again, paradoxically, entrepreneurs who usually praise the market economy and the benefits of competition enjoy situations in which they have market power, i.e., the possibility to fix prices above average cost. Mergers are made to gain market share but also in order to cut fixed costs. The latter has to do with scale effects. It may be the case that smaller units of production are less efficient than bigger ones. An extreme case is a situation of a natural monopoly: this is a situation in which it is most efficient (involving the lowest long-run average cost) for production to be concentrated in a single firm. The textbook examples here are the distribution of utilities like electricity and water. Since the distribution network is fixed and costly, it would not make economic sense to develop two or three parallel distribution networks for water or electricity. In such cases, “market

forces” cannot play their role, and, without a solution, monopolists can limit the output in order to maximize their profit, at the expense of the consumers who would pay too much for their energy. However, procedures have been invented which make it possible to realize part of the positive effects of competition in such a situation: A system of concessions for a fixed period of time negotiated with a regulatory agency (which defends the public interest and fixes the consumer price) is a second best solution. The regulation mechanism which is now generally considered to be the next best alternative to mirror market competition is called price cap regulation. The regulator fixes a price and a possible price evolution, which is determined by the inflation minus the average productivity gain in the sector. Price cap regulation is sometimes called “CPI – X”, based on the formula employed to set price caps. This formula indicates how the rate of inflation, measured by the Consumer Price Index (CPI), is taken into account – the underlying assumption is that the cost of electricity production follows, *ceteris paribus*, the general price evolution – but, on the other hand, the expected efficiency savings (X) should also be taken into account. If other electricity producers are able to increase productivity, there is no reason to suppose that the company which exploits the concession could not. Therefore, this formula, in which an expected efficiency gain is subtracted in the calculation of the accepted monopoly price, gives an incentive to the company to seek productivity gains, just like the market forces when there is no monopoly.⁷ Efficiency gains beyond the predicted rate X can increase the dividend paid to shareholders, at least until the price caps are next reviewed.

This second best solution is only one example to answer the lack of competition due to a lack of regulation. The division of labor between the government and publicly funded agencies on the one hand and private corporations is not always clear cut as in the stylized textbook examples. There are many variations and combinations of different forms of regulation (concessions, subsidies, public-private partnerships, etc.). Nonetheless, the example should make clear that the way in which the problem is solved is based on intelligent market regulation and not evoking duties of justice on behalf of corporations. The concern of justice is rather on the side of the policy makers.

The third type of market failure (we leave the other ones aside in this chapter), due to asymmetric information, is more complex. Here again, regulation is paramount. There are numerous regulations on mandatory information and disclosure that are a legal condition for the validity of market transactions, in many sectors of the economy: The pharmaceutical industry and the housing market are but two. The underlying ideal is that a fair and efficient market is one where there is as much information as possible available for everyone. As a consequence, every transaction in which there is asymmetric information would be unjust. It has been pointed out – in the context of the debate on insider trading [8, 18] – that this principle is not always relevant. For example, a journalist who discovers an interesting piece of news will not share it with his colleague and rather outmaneuver them in competition. In fact, there are many situations in which informational advantages are not only considered to be fair but even at the very

heart of the market economy. For instance, a doctor is charging for his services and earns money on the basis of an informational advantage but is not acting unfair. The very question is rather to find out when an informational advantage is used in an unfair way.

The example of the doctor suggests a crucial element. The doctor is allowed to charge the patient for the use of his informational advantage, but this use is limited to what is ultimately in the patient's interest. In other words, as a professional, a doctor has a *fiduciary duty* with respect to his patient. We can find many similar examples in other business, for instance, the financial industry or the consultancy sector. These sectors are plagued with conflicts of interest. For example, the investment advisor may get a high fee selling an investment that does not fit in with the risk profile of his client. The difficulty in such cases is that external control is extremely difficult and costly to implement and monitoring by the client is impossible. It is obvious that in these cases, the corporations and the professionals who work for them are definitely duty bearers. Professional standards should guide them in the fulfillment of their duties of justice. Market failures related to information asymmetry have therefore to be dealt with by a combination of regulation and self-regulation. As we all have noticed during the financial crisis of 2008, this is a delicate equilibrium.

To conclude, market failures may destroy the combination of efficiency and fairness that characterizes ideal market exchanges. As we will see in a moment, there may be other reasons why market exchanges are not ideal. The solution is regulation in the first place, and the duty of companies is to comply with this. However, there are two stronger duties that we may legitimately attribute to companies. First, especially if they are large corporations with influence on decision making, they should positively contribute to better regulation that is more efficient and fairer, thereby preserving a level playing field. Secondly, they should comply with the rules, also if monitoring by clients or external control is difficult to implement. It may be naïve to think that all corporations will respect this duty of justice, but that does not mean that it does not exist.

Justice and Exploitation

Can market transactions, in the absence of market failures like the ones discussed above, be unfair? There is a long-standing tradition of moral indignation about specific market transactions. Some indignation concerns the particular nature of some goods; their uniqueness, so it is argued, should not be distributed according to market principles. Examples are the sale of organs or other body parts (kidneys), education, friendship, etc., but for the purpose of this chapter we will leave this issue about moral limits to the market aside [31]. Other indignations, however, focus on the unfairness of the transaction as such, independent of the nature of the product. A transaction is judged to be unfair if one party exploits the other one. The most common example concerns very low wages when there is little opportunity for the worker to find other work, or to request a living wage.

The debate surrounding capitalism and the exploitation of labor goes back at least to Karl Marx. In chapter 18 of *Das Kapital*, Marx argues that the owners of the capital pay a wage per hour that does not correspond to the value that is created during that hour by the laborer. The price of labor includes a certain amount of unpaid labor, which, ultimately, constitutes the source of profit for the capitalist ([17], p. 572). Marx himself did not argue in terms of justice. He merely points out that the exchange is unequal, even if, according to Marx, neither the capitalist nor the laborer is fully aware of the inequality of the exchange. We leave aside here the question of whether or not the notion of justice is fundamental in Marxism, and focus on the question of whether very low market clearing wages can be unjust because they are exploitative, and, as a consequence, whether corporations have a duty, based on the notion of justice, to pay wages that are higher than market clearing wages, in order to avoid exploitation.

Prima facie, it is not obvious to pinpoint what exploitation means, since wages are agreed upon, in principle, by consenting, rational, and free adults. We may suspect that people will not spontaneously agree to an unfair deal, and, since people are rational, they will quickly become aware of its unfairness if they did not notice it from the start. Therefore, the first question is whether an exchange between labor and salary must be, by necessity, totally equal in terms of value. First of all, Marx did not take into consideration that a capital investor would have risks that require a risk-premium as a rewarding. Yet, more fundamentally, what were the point of hiring anyone if the net contribution for the company were zero? What matters is that *both* parties take advantage of the exchange, the worker as well as the capitalist. Marx's equal value criterion seems therefore not a viable outcome in a market economy.

However, a possible reason why rational and informed people would consent to an exploitative contract is that they are indeed "forced" to do so, perhaps not due to a gun pointing to their head, but then at least because there are no real alternatives. Although there is no coercion in a strong sense, if the "choice" is one between starving and accepting extremely harsh conditions, we no longer have a genuine choice. But limiting the concept of exploitation to cases in which people have no alternative at all seems too limited, since extremely harsh situations in which people would have only slightly different options would not count as exploitation, which hurts our intuitions.

John Roemer [26] has an interesting reformulation of Marx's concept of exploitation. Roemer argues that firstly, the equal value approach of exploitation does not fit in with our intuitions (for reasons other than those I advanced above), and that secondly, the approach in terms of coercion also misses the point. According to him, the underlying reason why we consider some exchanges as exploitative is related to the "initial" distribution of assets (capital). If the initial distribution of assets is very unequal, exchanges may become exploitative even if there is no strict coercion. The following example is adapted from [27]. Two people have a very unequal amount of assets. Ron has a big machine and Maggie has a small one. Maggie can barely survive with what she produces with the small machine used at capacity. However, she wants to consume a bit more, and she is hired by Ron to work for a number of hours using his big machine. Her pay is very low which allows

Ron to make a handsome profit. In this case there is no strict coercion and yet we could say that the very unequal initial distribution of assets limits Maggie's output, affecting her bargaining power in relation to her contract with Ron. This situation allows Ron to take advantage of her labor.

According to Roemer the baseline should be an initial distribution of equal shares of total assets. However, this is problematic, as the combination of free exchanges and different effort and luck will disturb this initial equality over time. Moreover, requiring total equality of assets as a background condition for nonexploitative exchanges seems too demanding again, because it would undermine the very incentive to start business. Notwithstanding the limits of a radical interpretation of Roemer's criterion, the background condition of extremely unequal assets, which makes people vulnerable, as a fundamental difficulty for the concept of "free" exchanges makes sense.⁸ This is all the more important to the extent that capitalism, as [21] demonstrates, upsets all schemes, and, as a consequence, may create enormous inequalities.

In the light of these considerations, let us look at the debate about decent labor conditions in so-called sweatshops. Some authors have argued for many years that we should not rely on market forces to determine wages and labor standards in supplier companies of multinational companies, particularly those based in developing countries. Market clearing wages are shockingly low and barely support survival. Multinational companies as well as their suppliers should pay, at least, a "living wage" [4] or some other minimal standard [7]. As both authors have pointed out, the background conditions of high unemployment and extreme poverty leave these workers without any alternative and without any bargaining power. Human rights activists and NGOs have, during the last decades, severely criticized the situation and many initiatives have been taken in order to establish international norms or to put pressure on companies so that they would only trade with suppliers that respect the ILO norms.⁹

However, it is not obvious to fix the notion of a "living wage," and even with it, inequalities may remain embarrassingly high. How could one possibly justify, in terms of justice, huge discrepancies in the standard of living between equally qualified "colleagues" in different subsidiaries of the same multinational company? Even if one were willing to pay a living wage, one should be careful and not overambitious. Maitland [16] has pointed to empirical evidence – that has even become more evident – that has to be taken into account. Admitting the validity of many points that the critics of sweatshops make, he underlines that, in general, multinational companies apply standards relating to wages, conditions of work and safety and health that exceed those of local firms. Secondly, we observe that the countries with large output created in sweatshops have high growth rates and experience sharp increases in living standards. Raising the wages too quickly might slow down foreign investments, diminish employment in the formal sector, and, as a consequence, depress the wages of the most vulnerable workers in the informal sector.

A major conclusion of the preceding discussion is that market exchanges may become problematic, from the perspective of justice, in a situation of extreme inequality. Some markets may tend to be exploitative – even if it seems difficult

to draw an exact line defining exploitative behavior – leaving companies to face the problem that the market clearing price of labor may be unjust.

However, situations of extreme poverty can also create other problems for justice besides exploitation. For example, they may lead to the emergence of markets that should not exist or at least be severely regulated for moral reasons, for example, the black market for kidneys. Another configuration is that some products that could increase well-being cannot be introduced to the markets, because they are not economically viable, and cannot get off the ground. An interesting example here is the appalling story of the eflornithine molecule. Eflornithine was initially developed for the treatment of colon cancer at Merrell Dow Research Institute in the late 1970s. It was not very effective but, a random effect – patients in coma unexpectedly woke up – was that it was found to be highly effective in the treatment of African sleeping disease. In 1995 Aventis (now Sanofi-Aventis), the company that had acquired Merrell Dow, stopped producing the drug, whose main market was African countries, because the drug would not be profitable. The eflornithine injections turned out to be too expensive for the African population. NGOs, especially *Médecins sans Frontières*, were horrified upon learning of the scandal. Around 2000, another pharmaceutical company, Bristol Myers Squibb, found a new, this time lucrative use for eflornithine. This molecule was found to be very effective as an ingredient in hair-removing cream, produced under license from Aventis, with the brand name Vaniqa. Under pressure to correct the situation – the life-saving drug based on eflornithine not being produced whereas the cosmetic application was – Aventis and the WHO formed a 5-year partnership in 2001. During this time more than 200,000 bottles of eflornithine were produced by Sanofi-Aventis, to be given to the WHO and distributed by *Médecins sans Frontières*.¹⁰

What is the problem here is that a company is blamed for not producing a good that the clients can simply not afford to pay. In other words, can we blame the baker for not delivering bread to starving people without resources? It is implausible to qualify the current situation of global inequality as just. And yet, it seems unfair to attribute duties of *justice* to companies with respect to extreme poverty.

The absence of a duty of justice, however, does not imply that we cannot hold corporations morally responsible for this situation from another perspective. Werhane et al. [35] have recently published a book about profitable partnerships between private for-profit companies and NGOs that have contributed to the alleviation of poverty: forms of social entrepreneurship, or corporations that enter into so-called Base of the Pyramid markets. They argue in favor of the involvement of for-profit corporations in developing economies, but not in the name of justice. They refer rather to “moral imagination,” defined as “a necessary ingredient of moral judgment [. . .] the ability to discover, to evaluate and act upon possibilities not merely determined by a particular circumstance, or limited by set of operating mental models, or merely framed by a set of rules” ([34], p. 93). The moral duties here are basically benevolence and altruism, mobilized to develop an open mindset that is alert to explore possibilities that may create well-being.

All things considered, doing business with people in vulnerable situations is, in Maitland words, a matter of “painful trade-offs.” It is difficult to fix, *a priori*, normative standards for deciding which business is exploitative or which one is

ultimately profitable for both parties. The fundamental duty of justice in this area might well be the obligation, for business leaders, to open their minds to “moral imagination.”

Complicity with Injustices

A last set of injustices are neither related to the market structure, nor to initial inequalities of assets, although they may be indirectly related to these issues. In some situations, corporations may be blamed because of their complicity with injustices *committed by others*. Two typical examples will be discussed: the omission to combat seriously discrimination (sexism, racism, etc.) when many of the clients have discriminatory preferences, and (2) doing business in a country with a political regime that violates human rights. In these cases, I will argue, companies are not committing acts that blatantly violate someone’s rights, but they may be “complicit” with such violations due to their behavior, or lack of it.

The duty of justice that we may attribute to corporations concerning discrimination is not about intentional discrimination. Discrimination is illegal – and even anti-constitutional in many countries – and the first duty of corporations is simply to respect the law. However, in this domain enforcement by law is extremely difficult to implement. For one thing, the burden of proof is on the side of the person who is the victim of discrimination. In practice, it is hardly ever the case that two applicants are identical except for an “irrelevant” discriminatory characteristic. It is easy for an employer to pretend to the victim of discrimination that he judged another applicant as more qualified with respect to a relevant aspect for the job, even if that was not the real reason. Secondly, discrimination is often unconscious. People, including militant antiracists, may be influenced by subtle and unconscious prejudices. The phenomenon is similar to what often happens with men who are convinced by feminist claims: they nevertheless “spontaneously” divide tasks according to traditional roles. In social psychological literature, many different theories have been advanced to explain unconscious negative attitudes and behavior toward members of an outgroup (for example, blacks or Muslims). We will not present these here but simply mention that it is a phenomenon based on the cognitive principle of implicit association. People with the right intentions may act on the basis of unconscious, racially biased cognitive categories. This is widely referred to in the literature within the context of employment discrimination.¹¹ This implicit form of discrimination, also called subtle, unconscious, or automatic ([2], p. 59), may bedevil even Human Resource Managers who try to do their jobs according to high ethical standards. Whether or not people endorse the validity of such associations is irrelevant to the existence of biases and the prediction of individual behavior. They play a role in decision making without one being aware of it. It is important to add, however, that we are not completely helpless. We can decide whether or not we should take our spontaneous associations into account. Although implicit or automatic processes operate outside of conscious awareness, and are therefore much more difficult to correct, it is not impossible. The

first step is to become aware of the stereotypes that impact our judgments. Secondly, this awareness will lead to greater suspicion about one's own "spontaneous" reactions [19]. In fact, once Human Resources staffs are made aware of their unconscious biases, they are able to overcome their influences. Kalev et al. (2007) have shown that, under specific conditions, diversity training has an impact.

Against the background of the limited impact of legislation and the prevalence of implicit discrimination, we can see there is a big difference between, on the one hand, not pleading guilty for intentional discrimination and, on the other hand, proactively anticipating possible unintentional forms of discrimination. As a consequence, a corporation may be unknowingly complicit to factual discrimination. A duty of justice, so it seems, especially for big corporations with formalized procedures of hiring and internal promotion, consists in systematically combating current forms of discrimination, including the unconscious ones. This requirement of justice is justified insofar as a genuine nondiscrimination policy is absolutely not expensive and, therefore, does not lead to competitive disadvantages.¹²

A second case of complicity with injustice concerns activities in countries where the local government violates human rights. Obvious examples are the activities of oil companies in Equatorial Guinea or Myanmar (Burma), or mining companies in Congo [24, 32]. Since multinational corporations play an important role in these countries, and because of the economic importance as employers and tax payers, even if they stay away from politics, they may *de facto* be contributing to the persistency of human rights violations. This issue has led the United Nations to nominate a Special Representative of the Secretary-General, John Ruggie, on the issue of human rights and transnational corporations and other business enterprises (SRSG). Ruggie has recently published the "Guiding Principles on Business and Human Rights" for corporations that are active in regions where nation-states fail to protect human rights through adequate legal enforcement. The "Principles" make a clear distinction between the state's duty to protect its citizens and the corporate responsibility to respect human rights. The duty of corporations consists, according to these principles, basically in (1) issuing a "policy commitment," (2) implementing "human rights due diligence," and (3) providing remedial action ([29], principle n° 15). The key issue is, of course, to define clearly what due diligence means. First of all, it consists of seriously considering the risk that the corporation might be involved in human rights violations in one of its subsidiaries, or via one of its suppliers, etc. Ruggie and his team make further on a distinction between "causation of," "contribution to," and a "direct link with' human rights violations." Unsurprisingly, it is unacceptable that corporations should cause or contribute to the violation of human rights. In these cases they should withdraw from the country and remediate for the harm they caused. The tricky issue is the "direct link." In this case, corporations should decide to remediate the situation or for instance, to leave the country or not depending on "how crucial the relationship is to the enterprise, the severity of the abuse, and whether terminating the relationship with the entity itself would have adverse human rights consequences" ([29], p. 18). In some situations, it may be pointless for a company, in terms of consequences, to leave a problematic country if it is immediately replaced by an even less scrupulous competitor. However, from

a deontological viewpoint, ongoing direct links remain an issue. The all-things-considered judgment about what would ultimately be the best for the oppressed population in a particular situation is an issue for casuistry. In general, we can, like Ruggie, refer to general principles like “due diligence.” But there is an important assumption, not really mentioned and rather occult in Ruggie’s document. Unless business leaders are strongly committed to the moral principles that underlie human rights, there may be a bias, not to say a slippery slope, in the direction of giving more weight to economic interests to the detriment of human rights holders. We will come back to this point in the conclusion.

Conclusion

In a paper on equality of opportunity, Janette Richards-Radcliffe [25] compares two different situations. In both situations some people, for whatever reason, lack shoes. The first situation is a cold winter, the second a race. In the first case, there is no point in taking the shoes away from the people who have them to achieve equality; but in the case of the race, it would seem better that everyone should run without shoes, to make sure the expected outcome (i.e., to see who is the best runner) is not influenced by mitigating factors. In other words, fairness matters particularly if there is something at stake. The more unequal the outcome of a competition is, the more we will be concerned with just rewards and fair procedures. By extension, the market is a competitive environment which creates unequal outcomes. Even if inequalities are mitigated to some extent, by political institutions, the unequal outcome of the competition implies that norms of justice are important. Notwithstanding unequal outcomes, society as a whole benefits from fair and efficient markets; and companies, as major players in the market, fundamentally have a duty of justice to act in such a way that the market, as an institution, works correctly.

In this chapter, we have tried to sketch the scope of the duties of justice for corporations. We began by describing a stylized perfect market under ideal background conditions, in which no economic agents are extremely vulnerable and all transactions are made by informed, rational, and self-interested economic agents. With this background as a starting point, we explored three different configurations. First, we examined the cases in which the market mechanism fails; second, we considered the case in which the background conditions of free economic agents were not fulfilled because of extreme poverty; and third we questioned duties of justice in cases where injustices are caused by other actors and are unrelated to economic mechanisms or background conditions. The purpose was to evaluate to which extent corporations may accept complicity in human rights violations.

We have argued that the duties of justice may vary according to the specific settings of the three configurations. In general, it would be unfair (if one accepts the profit motive and the ethical legitimacy of the mechanism) to exaggerate the moral responsibilities, which include duties of justice, of corporations. Nevertheless, this set of duties is not an empty box. First and foremost, the main duty of justice is to comply with regulations. However, we have seen that there are

areas where justice should play a role in corporate decision making, especially in areas in which regulation should be implemented in principle, but where effective control and legal enforcement is difficult. Justice puts limits on what companies can and should do. Insofar as it seems impossible to have a perfectly regulated market – one of the duties, we argue, is that companies should contribute to its improvement – as well as promoting an airtight control system. In the end, a morally defensible market economy ultimately relies in part on human beings who take their ethical obligations seriously.

Luc Van Liedekerke

Abstract

From the 1990s onwards, the rise of executive pay is remarkable and clearly linked to the introduction of the agency model into the analysis of the role of managers. We point out that this need not be the only possible role model for managers and demonstrate that executive pay is not closely linked to performance. This is, from a distributive justice point of view, the main reason for public outrage against executive pay. Several studies indicate that unjust pay can also create havoc in the workplace. Unjust pay is also the feeding ground for political action against unlimited pay packages.

Introduction

In 1929, Eugene Grace, the president of Bethlehem Steel, caused a public outcry when it was revealed that he had received a base salary of \$12,000 and a bonus of more than \$1.6 million. That amounts in today's dollars to \$150,000 salary and a bonus of nearly \$20 million ([6], p. 3). Public anger over excessive payment is clearly nothing new. In fact, already in 1933, the American congress decided to create transparency in payment of top executives and demanded that every corporate income tax return include a list of salaries for top managers. When this list was made public in the following year, it provoked angry political reactions that mimic today's reactions. "For the captains of industry to be drawing down large salaries is unconscionable and unpatriotic," declared Sen. Burton Wheeler, "The practice must be curbed by legislation, through taxation and publicity ([6], p. 3)."

Executive pay is a sensitive issue, inside the corporation as well as for society at large. Deep seated feelings about distributive justice pop up easily and eventually

translate themselves into legal rules. The U.S. Treasury and the Federal Reserve have introduced new rules for executive pay, particularly in firms that have received government assistance during the financial crisis. At EU level, the European Commission issued several recommendations that, among other things, advocated a shareholder vote on the remuneration policy, prior approval of stock option plans by the shareholders, the establishment of a remuneration committee as well as concrete guidelines on its composition and its role, and the publication of a remuneration statement with information on remuneration levels, remuneration instruments, performance criteria, etc. Member states were asked to translate these recommendations into their national regulatory contexts.¹ It is clear that over the past decade, suspicion and anger over executive pay have risen and resulted in, among other things, an avalanche of regulation (both in terms of hard and soft law). Unfortunately, so far, none of these initiatives succeeded in banishing extreme pay packages or eliminating public anger over executive pay.

In this contribution, I concentrate on the roots of the executive pay problem which can be traced back to two different views on the role of a manager, a continental view that is defended by (among others) Walter Rathenau and an Anglo-Saxon view, usually ascribed to Berle and Means. We go back to the basics of the agency problem as the root cause for a different philosophy about executive compensation and demonstrate weaknesses of this model. This brings us to the basic challenges that executive pay poses from a distributive justice point of view.

Two Models of Managerial Duty

After the First World War, Walther Rathenau published a trilogy about the new society which was to emerge from war in which he pondered the changed role of the corporation in twentieth century Germany.² Corporations like his own AEG (a huge industrial concern) had grown so large that their fate was intimately linked to the fate of the nation. At the same time, because of the increasing size of the company, a new class of workers emerged: the managers. They did not belong to what was still very much family capital or to the blue collar workers making up the bulk of the labor force. For Rathenau, their very existence was a blessing. A blessing because in between the shareholders and the company a different group of people formed who were well placed to take an objective look at the well-being of the firm, and by doing this, they at the same time took care of the nation since, as already mentioned above, these large firms were up (to a great extent) equal to the nation. It was clear to him that the fate of the firm had to be separated from the fate of its shareholders. This possibility was opened up by this new class of top managers.

The rising separation between ownership and control of the firm was clear to many of Rathenau's contemporaries and did not go unnoticed at the other side of the ocean. The seminal text in the USA is of course Berle and Means, "*The modern corporation and private property*." In this work, they state: "[T]he separation of ownership from control produces a condition where the interests of owner and of ultimate manager may, and often do, diverge, and where many of the checks which

formerly operated to limit the use of power disappear." ([3], p. 25). With this, the agency problem was born. For Berle and Means, the separation was a challenge and needed to be undone by installing the right incentives. For Rathenau, it was a blessing. Managers, in his perspective, could be conceptualized as a kind of Weberian bureaucrat, duty driven, with a clear mission to take care of the firm which might or might not coincide with the interests of the controlling families. Like any other civil servant, he would be paid a salary that reflected his position and responsibility.

Although it would be an exaggeration to say that in Europe, managers of large companies equaled civil servants, there was from a certain point of view not too much of a difference. And even if the salaries were high, they were until recently mainly salaries, not bonuses nor stock option plans. Remarkably enough, and despite the Berle and Means analysis, the situation was not much different for the large British or US companies. Big companies everywhere resembled administrations with their managers acting like bureaucrats and even being paid as such. That was precisely the diagnosis put forward by Michael Jensen and Kevin Murphy in their 1990 seminal contribution: "*CEO incentives – it is not how much you pay, but how* [11]." In this article, they calculated that for every 1,000 dollar increase in shareholder wealth, CEO wealth increased by only \$3.25. It provoked the following conclusion: "On average, corporate America pays its most important leaders like bureaucrats. Is it any wonder then that so many CEOs act like bureaucrats rather than the value-maximizing entrepreneurs companies need?" ([16], p. 138).³ Jensen and Murphy were instrumental in persuading shareholders and boards of directors to tie compensation more closely to performance by means of stock options and to accept high compensation as the price for creating greater shareholder value. With this, the wage rally of the 1990s had begun. At every bonus round wild stories reached the press. Public outrage organized itself in websites like "paywatch,"⁴ and politicians as well as academics started to take a closer look at the issue. Agency theory was and still is the dominant paradigm to analyze the issue of executive pay.⁵ We introduce the basics of this model in the next section.

The Agency Problem

Agency theory finds its roots in a view upon the firm as a nexus of contracts [30]. Agency problems can pop up with respect to any of these contracts, not just the contracts for top executives, but a lot of attention has been given to top executives basically because they are considered to be the strategic apex of the firm, bearing ultimate responsibility for resource allocation, market entry, acquisitions, product development, etc. Following standard economic theory, agents as well as principals are considered to be rational, self-interested, and risk averse. Once the split between management of the firm and ownership is a fact (usually connected to the evolution towards larger corporations), shareholders (the principals) will delegate decision making to a selected group of managers (the agents). This immediately invokes the possibility of misuse of this position for one's own advantage (remember that

self-interest is the only motivator). In order to limit misuse, the principal sees herself obliged to install control mechanisms, and these constitute the agency cost connected to the principal agent relation. The main instrument for controlling the agent is the contract; designing an optimal contract to limit agency costs is therefore a central concern of agency theory. Two elements of control are considered crucial for the building of an optimal contract: a monitoring system and an incentive system. Monitoring involves the direct or indirect observation of the agents' efforts and uses instruments like reporting (inside and outside), transparency rules, budgets, etc. The monitoring can be done by different agents, for example, co-managers, auditors, security analysts, and even the labor market for executives. In general, one presupposes that monitoring will not work well when ownership is highly dispersed (the US situation). At that moment, the share owners-principals have to fight a free rider problem whereby principals all look at each other to start up the costly monitoring system, and in the end, no or not enough monitoring takes place. This problem disappears in the case of concentrated ownership (Asia, Europe situation), and we see (also empirically) much stronger monitoring systems in place when ownership is concentrated. If monitoring is not functioning well, our dispersed owners-principals have a second option, which is to develop an incentive system that eliminates the need for close monitoring. It is here that we find executive remuneration as one possible option to incentivize managers to act in the interest of the shareowner-principal. An outcome-based contract makes the executive's remuneration contingent upon the performance of the firm. In general, there are two types of incentives available: cash bonuses that concentrate on the short-term, accounting-based value of the firm, and a share and stock option plan that mainly looks at the long-term, market-based value of the firm. Other elements in the pay package are the base salary, employee benefits, and perks (pension plan, life insurance, health insurance, company car, house, etc.). The variable part of the pay package (bonus and share or stock option plans) is the preferred instrument to incentivize the agent, and therefore the relative weight of this part of the compensation has to increase.⁶ This happened almost everywhere over the last two decades. The American market stands out, but the European and even the Asian market followed suit. Clementi and Cooley [5] estimate that in 2006, for every \$1,000 increase in shareholder wealth CEO wealth increased by \$34. That is more than 10 times higher compared to what Jensen and Murphy reported in 1990. Company boards have taken the Jensen-Murphy lesson at heart and dollar incentives clearly have increased. Whether this created more performing managers or better-run companies is however another matter.

One effect of this evolution that stands out and grasps the public eye is the opening up of the wage differential between workers and managers. The AFL-CIO, a federation of 56 US and international trade unions states that: "The chief executive officers of large U.S. companies averaged \$10.8 million in total compensation in 2006, more than 364 times the pay of the average U.S. worker, according to the latest survey by the United for a Fair Economy." Clementi and Cooley [5] report that the average compensation of CEOs of publicly traded US companies in 2006 was actually much higher than \$10.8 million (around 43.4 million).

This places the wage gap at an incredible 1.456, yet at the same time, one should realize that this figure is not very informative. The compensation distribution for top executives in the USA is so skewed that looking at averages is not revealing since they are so strongly determined by the outliers at the top. Much more informative is it to look at median earnings of CEO's and that stood at \$4.76 million in 2006, less than half of the average earnings reported by trade unions. The wage differential for most workers in the USA is thus much lower than the reported 364. But although the exact figures are under discussion, there is consensus that we have witnessed a staggering evolution in the wage gap compared to the pre-1990 situation when a wage gap of around 20 was much more common (this is also the wage gap between the American president and average wages in the USA).

A second effect of this evolution that is hardly ever reported in media is that the new pay system implies new risks for managers. Given that long-term variable pay (share and option plans) makes up the bulk of CEO compensation (at least in the USA), this creates of course the risk that CEO income will plunge with stock markets. Clementi and Cooley [5] look at yearly changes in executive wealth. For 2006, a year in which the S&P 500 index rose by more than 9%, as many as 264 CEO's saw their compensation dive. Losers were, among others, the bosses of Yahoo (-33%), Amazon (-20%), and Ebay (-30%), and though these losses do not necessarily materialize (the executive is not obliged to sell stock at that moment or she can hedge against these losses), the figures involved are so huge that they necessarily create unrest. We will argue later on that this is not unimportant from a psychological point of view.

Pay Without Performance?

From an agency point of view, the fact that executive salaries skyrocket is in itself not a problem; on the contrary, it helps to push managers towards a more risk-taking, more entrepreneurial style of management. Before the agency revolution salary was largely based on firm size, and bonuses were tied to accounting profits. Kevin Murphy [22] demonstrated that this pay practice discouraged, for instance, downsizing or in general any painful restructuring even if this was in the interest of shareholders. "Steady as she goes" was the slogan. Precisely, because of this relatively conservative, bureaucratic management style, opportunities opened up for company raiders in the 1980s. Companies were taken over, sometimes in a very aggressive way, split up, and sold again with huge profits for shareholders (though not necessarily for workers). If companies did not move, capital markets would. Jensen and Murphy wanted to give the initiative back to the company. By granting stock options to executives, they hoped for a radical change in management style which could, according to them, only profit shareholders. But precisely, this last point is hotly debated. After more than 20 years of stock options, it is far from clear whether more variable and higher CEO compensation equals increased shareholder wealth. Was the pay accompanied by performance?

Some studies support this link. Gabier and Landier [12] for instance show that although executive compensation increased sixfold between 1980 and 2003, this rise was completely matched by the sixfold increase in the capitalization of large US corporations over the same period. Others deny the link almost completely. Tosi et al. [28] for instance state that firm performance accounts for less than 5% in the variation of CEO remuneration. The most critical voice was undoubtedly Bebchuk and Fried [2] who published a book that carries the title of this section. For them, executive compensation is an unfulfilled promise and basically boils down to self-dealing. It is interesting to follow their main argument somewhat more closely. Executive remuneration is essentially a contract between shareholders and executives. Shareholders will not negotiate this contract themselves; they delegate this authority to the board of the company. Financial economists start out from the hypothesis that the board operates at arm's length from the executives and is thus capable to take an objective stance when it comes to rewarding top management. But that is precisely what Bebchuk and Fried challenge. Coming from a law and economics tradition, they tend to rely much more on actual observations of functioning boards and dismiss the idea that these boards operate at arm's length. Despite all the corporate governance initiatives, the problem remains that top management has too much influence on the board. To put it somewhat bluntly, we are confronted with a contracting process in which one side of the market (the shareholders who pay for the contract) is actually absent. All we have is top management and their slavish representatives in the board who decide how much they will get. Small wonder that compensations skyrocketed. The book continued to provoke reactions, and many financial economists have looked for adaptations of the agency model that allows one to take the anomalies suggested by Bebchuk and Fried on board.⁷ Despite the debate over the book, there is at the same time a general recognition that board independence is a challenge. Jensen and Murphy [17] for instance acknowledge the problem of board independence. They actually frame it as another agency problem. While the original agency problem concentrated on the relationship between executives and shareholders, they now acknowledge that there is a second agency problem opening up between shareholders and the board where the board essentially does not sufficiently represent or defend the interests of shareholders. And that in turn opens up the possibility of excessive remuneration. Again, this situation is linked to highly dispersed share ownership, but despite the fact that Europe and Asia have a different capital structure, the problem is definitely also present over there. This time, the victim is not so much the reference shareholder but rather the small shareholders who have little or no say in the contracting process with executives.

An interesting way to synthesize the relationship between performance and pay is offered by Clementi and Coley [5].⁸ Particularly revealing is the following graph (Fig. 39.1):

The scattered plot above shows net shareholder gain in billions of 2005 dollars (the horizontal axis) against total compensation for nine top executives of the firm (data gathered by the SEC) in millions of 2005 dollars (the vertical axis) and this for all sectors excluding finance, insurance, and real estate, collectively known as

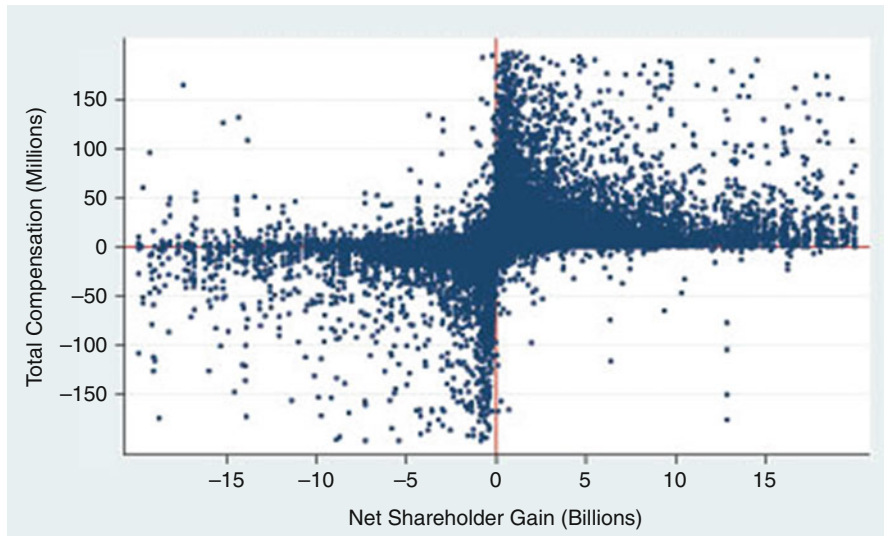

Fig. 39.1 Total yearly compensation and shareholder gain. All executives excluded FIRE – 2005 dollars

FIRE. If payment is strongly correlated with the creation of shareholder wealth (the goal of the agency approach), we would need to find all observations in the lower left and upper right quadrants, which by and large is the case. Observations in the upper left quadrant constitute the stories that make media headlines. Here, executives are being rewarded when shareholders are losing. Cooley identifies at least one observation from the top left, that is, the case of Douglas Ivester, the CEO of Coca-Cola Co. from October 1997 to February 2000. During the 1999 fiscal year, Coca-Cola’s shareholders lost about 14%, or about 22.5 billion dollars, while Mr. Ivester made about 74 million dollars ([6], p.12). Though the number of observations in the upper left quadrant is limited, it is not restricted to one or two occasional mistakes. From the point of view of shareholders, these observations are of course an outrage. Just as problematic, but this time from the executives point of view, are observations in the lower right corner. Here, shareholder value is created, but executives are punished instead of rewarded again going against the fundamental idea behind the agency model. Remarkably, these cases are far less covered in media. Cooley insists that despite both “mistakes” on the whole, the incentive system seems to work well, generating losses for managers when the company loses and generating profits when the company wins.

There is however another aspect of the plot that he fails to point out. If we isolate one vertical segment in the plot, say at that point where net shareholder gain reaches around \$13 billion, we find that this result can be connected with an executive pay package ranging from \$150 million gain to \$150 million loss! And reversely, if we

take a horizontal segment, we can observe that a marginal increase in executive pay of \$1 million can lead to an increase in company value of \$15 billion as well as a decrease of \$15 billion. That is quite bizarre and illustrates well the often repeated observation that company performance explains only 5% of variation in executive pay. To conclude, there is clearly a link between executive pay and company performance (the mass of the observations is in the lower left and upper right quadrant). However, it is not at all clear how much one has to pay in order to create shareholder value. In fact, strangely enough, one might even diminish the executive pay package and still produce shareholder value. In this sense, this plot is in no way a support for the extreme wages that have been paid over the past years. It also does not say anything about the alignment of managers' and shareholders' interests with those of employees, society, or taxpayers.

Distributive Justice and Executive Pay

We are now at a point that we can start a reflection on the relation between executive pay and distributive justice. I will not dive into the many distributive justice theories; suffice it to say that for academics as well as for the public at large, there are three fundamental criteria popping up in distributive justice problems: desert, need, and equality.⁹ We take a closer look at the first criterion. When my students work hard, they deserve a good mark. Effort in other words seems to entitle people to compensation. This immediately poses the problem, what is to count as effort (the index problem)?¹⁰ Should we measure the effort put into the job by the number of hours worked on the job? Clearly, this cannot be an instructive measure for top managers. We probably need to consider output figures, but precisely, what kind of output? The revenue of the company? Its market share? The satisfaction of employees or customers? The impact on the CSR record of the firm? Or can we simply look at shareholder value created? These are difficult questions tackled from many different sides by pay consultants. Academics devise all kinds of complicated systems in order to measure effort in a reliable way. There is no simple answer to this question, but so far in capitalistic societies, the impact on the final value of the firm (usually tracked as (phantom) stock value) seems to play a big part.

The Basic Problem: When Effort and Reward are Not Connected

As indicated above, the data so far do not support a strict, linear relation between executive pay and company value. Higher pay does not necessarily result in more shareholder value. The more explicitly we can demonstrate that pay is not connected to performance (the upper left quadrant), the more this challenges one of our deepest seated intuitions about distributive justice, and the more people will be scandalized by the practice.

Shareholder value is certainly not the only measure that people use in order to form an idea about whether the company is doing well or not. One of the most

visible signs of the state of the company is restructuring and layoffs. Shareholders might be pleased when deep cuts are announced, but in general, the employees and the public at large will associate massive layoffs with a badly performing company. Layoffs are a tangible picture of suffering, and it is therefore not surprising that outrage is at its deepest when a CEO receives an elaborated compensation package while the company is firing people.

Remarkably enough, these restructuring periods are for many CEOs the toughest periods in their career. It is at such moments that great personal efforts are being made. But how to explain to employees and the general public that a CEO deserves an extra bonus because he succeeded in eliminating 1,000 jobs? This is the tragic reality in which top executives find themselves. If the company is in a downturn, work can become particularly stressful yet you will not be rewarded for the extra effort; on the contrary, employees will expect a sign of solidarity and co-suffering, and executive pay might drop significantly (see lower left quadrant). Conversely, when the company thrives and pay packages are high, this does not necessarily reflect personal effort of top management; they might simply be lucky or profit from a prolonged bull market (as happened during the 1990s). Nevertheless, shareholders and public opinion will find it far less problematic to reward top executives in such circumstances. We connect top executives with the fate of the company like we connect top politicians with the fate of the nation. Effort is measured by external signs, for example, hiring new people or a growing economy for the nation, not by the personal efforts of the CEO or the prime minister. If executive pay follows company success, the paycheck seems to be justified from a distributive justice point of view.

Distributive Justice Inside the Organisation

The question whether executive pay is justified plays an increasing role inside organizations. Wade et al. [29] point out that perceived inequity between CEO pay and the pay of lower managers increases turnover among lower level managers. And if these managers cannot leave the firm (e.g., because the economy is in a downturn), counterproductive workplace behavior pops up in order to restore the justice balance. Examples of such behaviors include decreases in performance, failure to comply with organizational rules, stealing from the employer, taking excessively long breaks or loafing, frequent absenteeism, and interfering with the work of others ([18, 19]).¹¹ Employees are aware of and, for the most part, tolerate the large gap that exists between CEO pay and the pay of rank and file employees, but like everybody else, they have their limits. A highly publicized event, such as a large pay increase for a CEO combined with deep cuts in personnel, may call attention to the gap and create injustice perceptions.

Over the past years, two evolutions have increased the likelihood of such an event occurring. The first is an increased public and media attention for the topic of executive pay, and the second is the new availability of information on executive pay, mainly due to transparency regulation around executive pay. As

a consequence, employees are now far better informed. This increases the likelihood that employees will select executives as a referent when evaluating the fairness of their own pay.

Executive pay can also influence the relation between trade unions and management. A classical US example is negotiations at American Airlines when this company was in crisis in 2003. Large pay cuts were demanded from employees yet at the same time, top management were offered large retention bonuses. Daniel [7] points out how this situation determined the actions of the trade unions and influenced the attitude and behavior of their members. This type of “communication mistakes” is unfortunately no exception.¹²

Negative outcomes may be mitigated by paying attention to procedural justice considerations (fairness of process) and trust in top management. Effective communication of information related to how executive pay is precisely determined can help but is no assurance. If executive pay shows total disregard for the economic suffering of other employees in the firm, the reaction is likely to be revolt and outrage. People ask recognition from superiors for their effort.

Ressentiment Versus Mutual Cooperation

Revolt and outrage are not exclusive to the members of the organization; they are to be found in society at large. Especially in times of crisis, stories about bank bonuses sell well. The psychological mechanisms that drive reactions inside the organization also play their part in society. Extreme cases, where top management seems to profit from the suffering of low-rank employees, invoke strong feelings of injustice. But that is not the end of story. Even a very successful CEO who clearly benefitted the company, its employees, customers, and the shareholder but is compensated with what is considered to be an outrageously high reward will feature in the press. The height of the reward itself invites strong reactions. Many academics are suspicious of these public reactions. Harris [15], for instance, states that critiques of executive compensation should, in fact, focus on issues related to fairness and effectiveness concerns rather than sensationalizing the size of their pay packages. But when a public reaction keeps returning, it is hard to dismiss it as a simple “mistake.” The anger might have its reasons after all.

From a sociobiological point of view, such reactions can be related to the permanent battle for status that characterizes all social animals. Executive pay can, in this respect, be interpreted as a positional good sending a strong status signal to the rest of the group. This does not go unnoticed and provokes reactions that can be hostile as well as admiring. Some people will try to associate themselves with the winning person like one associates with the winning football team. Others will condemn this all too visible signal.

From a Nietzschean point of view, the critical reaction could be described as pure “ressentiment.” In a society in which the symbolic meaning of money and income has become all important, this signal exposes the failure of those who do not succeed in earning such an amount of money. The frustration, sense of weakness,

inferiority, and jealousy that it generates cause a rejection of the source of frustration. For Nietzsche, this resentment justifies itself through the creation of a (Christian) leveling morality that does not allow the strong to emerge.¹³ We talk about injustice, but in reality it is the revenge of the sheep against the birds of prey. The ego creates an enemy in order to insulate itself from admitting failure.

At the other end of the explanatory spectrum, we can refer to John Rawls *Theory of Justice* in order to understand the criticism. In his *Theory* and later on in *Political Liberalism*, Rawls makes a fundamental assumption about the nature of society. He believes society, or at least “the well-ordered society,” should be understood as a “cooperative venture for mutual benefit.” In the words of Philip Pettit: “Society is cast as an active association of people with a common goal and common resources of action. It is an association in which members recognize or should recognize a common goal – the cooperative advancement of their individual interests – and in which they can take jointly organized steps to promote that goal.”([24], p. 2). With their lavish compensation packages, executives seem to place themselves outside the scheme of mutual cooperation. One should not underestimate the long-term impact this can have on the reputation of business in society. Political pressure towards more regularity structure for executive pay thrives on this kind of strong emotional reactions.

Conclusion

Executive compensation has risen considerably almost everywhere in the world but especially in the USA. In 2006, the median total compensation of the top 150 US CEOs was \$10.1 million [8]. This is 314 times the \$32,142 earned by the median full-time private industry worker in the USA in 2006 (Bureau of Labor Statistics, 2007). Framing the problem from an agency perspective was clearly instrumental in the rise of executive compensation. This agency model is connected to an evolution in the ideal type of manager. From a Weberian type bureaucrat, she had to become a risk-taking entrepreneur. Increasing the weight of variable pay (mainly share and stock options) was considered to be the ideal instrument to push this transformation. There is some controversy whether this transformation succeeded, and it is not at all clear whether the transformation increased firm value. For a long time, any anomalies showing up (e.g., back dating of stock options) were considered the consequence of a non-optimal contract [14], and financial economists as well as pay consultants spend an enormous amount of energy devising better contracts in order to capture the right incentives. Others are convinced that the agency model itself is defective and should be replaced.¹⁴ What has remained constant over all these years is public outrage over executive pay. Looked upon from a distributive justice point of view, the “scandal” of executive pay is perfectly understandable when the pay is not connected to performance. Inside the organization, a failure to justify pay through performance can cause considerable disruption in the functioning of the organization. But also in society at large, such scandals provoke strong condemnation from the public and politicians and drive new regulatory efforts. Much more complex from a distributive justice point of view is a critical reaction to pay that is clearly connected to

performance but is simply considered indecently high. From a normative point of view, it is unclear whether these reactions are justified. A range of explanations are possible here. One can frame them as pure resentment at one end of the spectrum or, alternatively, as breaking up the fundamental scheme of social cooperation that characterizes society at the other end of the spectrum. This last explanation resembles very much the critique heard in 1933 when large salaries were considered “unpatriotic.” It just shows how little has changed when you look upon executive pay from a justice point of view.

Notes

1. There were EU recommendations in 2004 (2004/913/EC) and 2005 (2005/162/EC) and again in 2009 (2009/3177). This last recommendation focused explicitly on the design of executive remuneration, more specifically variable remuneration (e.g., types of variables to be included, deferral of pay-out), share-based remuneration (e.g., vesting period, vesting criteria) and severance payments (i.e., limits on such payments). The financial crisis focused once again attention on executive pay and led to the introduction of new regulation and monitoring systems that specifically targeted the financial sector. For an overview of European soft and hard law initiatives in the EU and most of its member states see ([1], pp. 311–366).
2. Walther Rathenau was a German industrialist (leader of AEG), a minister of foreign affairs after the First World War, a German nationalist and a Jew. It was this last part that cost him his life as he was assassinated in 1922, as a minister of foreign affairs. The brutal murder was for Jewish intellectuals like Stefan Zweig a sign of things to come. The trilogy consisted off: *Der Neue Staat, Die Neue Wirtschaft, Der Neue Gesellschaft*.
3. The argument whether the ideal executive should be a bureaucrat or rather a risk seeking entrepreneur was recently revived by Englander and Kaufman [10] and Frey and Osterloh [11]. They argue in favour of the bureaucrat because the distant neutrality that characterizes him prevents conflicts between teams inside the organisation. Boatright [4] argues against this team production view.
4. <http://archive.afcio.org/corporatewatch/paywatch/>
5. Financial economists almost exclusively concentrate on the agency model. But even in general management journals the agency model is still the dominant way to look upon executive pay. Baeten [1] for instance follows three managerial journals for the period 1980–2010 and looks at publications on executive compensation or CEO compensation. He finds 48 contributions out of which 33 concentrate on the agency problem. As the anomalies around the agency model accumulated (mainly the missing link between performance and pay cfr. infra) other explanatory models, driven by a socio-psychological or a more institutional approach gained ground.
6. It is in principle of course possible to use fixed pay to incentivise managers. However, at least for the American market salary and even bonus pay account for a very small fraction of compensation and their cross sectional variation is very limited, indicating that this is not the preferred instrument to incentivise managers. It is stock and option grants that create the bulk of the compensation and also the variability in the dataset (see among others Clementi and Cooley [5]).

7. For a good overview of the extensive literature in financial economics that tries to capture the Bebchuk and Fried anomalies see Edmans and Gabaix [9].
8. Clementi and Cooley [5] use data from the EXECUCOMP database, maintained by Standard & Poor's. EXECUCOMP gathers data from 1992 to the present on the compensation of up to nine executives of all US companies whose stocks are traded on an organized exchange. The sources for the database are companies' filings with the Securities and Exchange Commission. The information about executives' securities holdings and their compensation packages is contained in the DEF14A forms (or Schedule 14A), filed annually by Corporations pursuant Section 14(a) of the Securities Exchange Act of 1934. Cooley restricts his attention to the years 1992 through 2006, and has a final sample of 31,587 executives, employed by 2,872 companies, for a total of 33,896 company–executive matches and 167,822 executive–year observations.
9. A good overview of distributive justice theories can be found in Miller [21]. Chapters 3 and 4 of the book gives a survey of socio-psychological research on public opinions about distributive justice.
10. General opinion will for instance look upon innate talent as a personal achievement (e.g., the talented footballer) and allow compensation for talent. Rawls and many other philosophers would disagree.
11. Over the past years the field of “organizational justice” has expanded dramatically. It is now used to explain a large number of attitudes and behaviours in the workplace [13, 23].
12. In the case of American Airlines the mistake was strengthened because the company had a strong cooperative culture. In cooperative enterprises the group feeling and thus also group solidarity is supposed to be high. When crisis strikes this solidarity is often invoked to support painful restructurings. However, when it became clear that the compensation arrow pointed in two different directions, depending on your hierarchical position it became painfully clear to employees that management was not very serious about the cooperative nature of the enterprise.

Part 11

Jewish Foundations of Business Ethics

Aaron Levine*

Abstract

Imitatio Dei (lit., imitation of God) is a behavioral ideal in Judaism to emulate God's attributes of mercy in our interpersonal conduct. This chapter demonstrates that the legal and ethical rules Judaism prescribes for the marketplace find their philosophical basis in *imitatio Dei*. Illustrations of that proposition presented here are Jewish law's approach to price fraud, monitoring employees' personal e-mails in the workplace, and consumer product warranties.

In a society governed by Jewish law, *imitatio Dei* is a mandate for government as well as the individual. The government must therefore foster a moral climate that promotes *imitatio Dei* conduct and minimizes opportunities to engage in veiled misconduct. One application of this mandate is for the government to play a vigorous role in enforcing a ban on insider trading.

By establishing the appropriate legal and regulatory framework, the government can advance *imitatio Dei* initiatives more effectively than could an individual. In particular, the financial limitations Jewish law sets for fulfilling the *imitatio Dei* imperative will be less of a constraint for the government than the individual because the government can spread the cost of an *imitatio Dei* expenditure over a large number of taxpaying households. Examples of such expenditures presented here relate to whistle-blowing and performance appraisal in the workplace.

Introduction

In Judaism, the duties and obligations relating to interpersonal conduct are set forth in the codes of Jewish law. Those prescriptions are, in turn, based on legal and

*Deceased

A. Levine*
Yeshiva University, New York, NY, USA

ethical rules laid out in the Written Law and the rabbinic amplifications of those rules described in the Talmud.

According to Orthodox Jewish tradition, when God revealed the Pentateuch to Moses at Sinai, He concomitantly revealed to him the Oral Law, which provided a detailed interpretation of the Written Law.¹ The Written Law and the Oral Law together constitute the Torah.

Our purpose here will be to show that the legal and ethical rules the Torah prescribes for the marketplace find a philosophical basis in *imitatio Dei* (lit., imitation of God). *Imitatio Dei* is a behavioral ideal in Judaism to emulate God's attributes of mercy, described in the Scripture, as the guidepost for conduct and attitudes in our interpersonal relationships.

We will also show the central role that *imitatio Dei* plays in both setting the moral tone of the marketplace and formulating Judaism's approach to government regulation of the marketplace.

Parameters of *Imitatio Dei*

We begin with an exposition of what the *imitatio Dei* principle denotes for interpersonal conduct, recorded in the Talmud at *Sotah* 14a:

"After the Lord your God shall you walk" [Deuteronomy 13:5]. [R. Hama b. Hanina asks]: Is it then possible to "walk after" the Divine Presence? Has not Scripture already said, "For the Lord your God is a devouring fire" [Deuteronomy 4:24]? But it means: Walk after the attributes of the Holy One. Even as He clothes the naked [clothing Adam and Eve with the garments of skins (Genesis 3:21)], so must you provide clothes for the naked. The Holy One visited the sick [appearing to Abraham after his circumcision (Genesis 18:1)], so must you visit the sick. The Holy One consoled the bereaved [blessing Isaac after Abraham's death (Genesis 25:11)], so must you console the bereaved. The Holy One buried the dead [interring Moses (Deuteronomy 34:6)], so must you bury the dead.

Sifrei, an early rabbinic Midrash, further explicates the concept of *imitatio Dei* in a comment to Deuteronomy 10:12:

"To walk in all His ways" [Deuteronomy 10:12]. These are the "ways of the Lord," as it is written, "The Lord, the Lord, God, merciful and gracious, long-suffering and abundant in goodness and truth, keeping mercy unto the thousandth generation, forgiving iniquity, willful transgression and sin, and cleansing" [Exodus 34:6–7].

These Divine qualities cited by *Sifrei*, enumerated at Exodus 34:6–7, are referred to in the Jewish tradition as the "Thirteen Attributes of Mercy" (*yud-gimmel middot ha-rahamim*). A similar formulation of these attributes is found at Micah 7:18–20.²

Sifrei then continues its discussion of *imitatio Dei* with an exegesis of a passage from Joel 3:5:

"And it shall come to pass that whosoever shall call in the name of the Lord shall be saved" [Joel 3:5]. Is it then possible for a man to be called by the name of the Holy One? But this means: Just as He is called "merciful and gracious," so must you be merciful and gracious and give of your gifts freely to all; just as the Holy One is called "righteous," so must you be righteous. The Holy One is called "loving," so must you be loving. That is why it is said:

“And it shall come to pass that whosoever shall call in the name of the Lord shall be saved.” And it also is said: “Everyone who is called by My name, and whom I created for My glory, I formed him, yea, I made him” [Isaiah 43:7]. And it also is said, “The Lord has made everything for His own purpose” [Proverbs 16:4].

Given that the Pentateuchal verses cited above prescribe the parameters of *imitatio Dei*, what do the verses from the Prophets and the Hagiographia add to our understanding of the *imitatio Dei* imperative? Throughout the ages, the rabbis have offered various insights.

According to R. Naftali Tzvi Yehudah Berlin (*Netziv*, Russia, 1816–1893), the proof texts from Isaiah 43:7 and Proverbs 16:4 make *imitatio Dei* not merely a matter of nobility of spirit, but a God-given duty, the fulfillment of which is the very goal of creation. Moreover, as a behavioral imperative, *imitatio Dei* extends beyond a duty to emulate those aspects of God’s mercy explicitly enumerated at Exodus 34:6–7. By the exegesis of Joel 3:5, a duty to emulate *every* manifestation of God’s mercy is established.³

In R. Joseph B. Soloveitchik’s (New York, 1903–1993) thinking, *imitatio Dei* imposes specific conduct and sets a standard for character. The Talmud at *Sotah* 14a directs man to engage in *imitatio Dei* conduct. *Sifrei*, however, sets a standard for human character. Not only should man’s conduct be God-like, but he must nurture a God-like character, becoming worthy of being called by the name of God.⁴

Legal Principles and *Imitatio Dei* – Two Sides of the Same Coin

Let us now move to our proposition that the specific rules Jewish law prescribes for the marketplace are in general terms consistent with the *imitatio Dei* principles explicated above.

We begin with Nahmanides’ (*Ramban*, Spain, 1194–1270) discussion of the legal principle of price fraud (*ona’ah*). We then turn to the issue of monitoring employees’ personal e-mails in the workplace and the prohibition in Jewish law against misappropriating property (*oshek*) as it applies to warranty law.

Price Fraud (*Ona’ah*)

The law of *ona’ah* says that if a good is sold in a competitive marketplace, the sale may be overturned or the price terms adjusted if the price at which the deal was concluded diverged from the competitive norm. Based on that ethical norm, both the buyer and seller may have an *ona’ah* claim (See generally [1]).⁵

Since an *ona’ah* transaction falls within the category of *gezel* (theft),⁶ the parties must educate themselves about the competitive norm *before* the transaction to avoid committing price fraud unwittingly.

The notion that educating oneself about the marketplace is not just an exercise in self-interest, but must be done for the benefit of one’s counterparty, expands considerably in the case of the law of *mekah ta’ut* (transaction made in error). This law says

that if a transaction dashes the reasonable expectations of one of the parties regarding a material matter, the transaction may be canceled at the option of the disappointed party.⁷ Nahmanides avers that if a transaction is canceled on the basis of *mekah ta'ut*, the offending party violates the prohibition against price fraud.⁸

Nahmanides' comment makes the following business practice unethical: Einhorn runs an online men's sweater business and advertises that sweaters are available in red, brown, azure, purple, and blue. In fact, Einhorn has no azure sweaters in stock. If he receives an order for an azure sweater, he plans to send the customer a blue sweater instead. If the customer complains that he ordered an azure sweater but received a blue sweater, Einhorn plans to respond that he cannot fill the order. If the customer returns the blue sweater, Einhorn intends to refund the full purchase price.

Einhorn justifies his policy based on a judgment that blue is close enough to azure. Consequently, a disappointed customer will find that it is not worth his while to return a blue sweater to get a refund. In Einhorn's mind, his policy does not constitute price fraud because it is unlikely that a customer will demand a refund if he receives the wrong color and, in any event, Einhorn is willing to refund the full purchase price upon return of the blue sweater.

From the standpoint of Jewish business ethics, Einhorn's policy is unethical because it deliberately dashes the legitimate expectations of his customers. His policy of advertising azure sweaters for sale when that color is not available entails a misrepresentation regarding a material matter, with the intention to make amends only if and when the misrepresentation is discovered. Based on the law of *ona'ah* and Nahmanides' understanding of the principle of *mekah ta'ut*, Einhorn's policy constitutes price fraud, even though Einhorn intends to provide a refund if a customer complains.

Since *imitatio Dei* is the philosophical underpinning of Jewish business ethics, we must reject Einhorn's policy because it violates our duty to emulate God's attributes of mercy in our interpersonal conduct. The attribute that is violated here is the *raham* principle. *Rahem* is the aspect of God's mercy that spares us from a specific experience of suffering or disappointment, as opposed to relieving us of the suffering once it is already upon us.⁹

Monitoring Employees' Personal E-Mails

Let us now move to another illustration of our proposition that a particular legal principle in Jewish business ethics and a corresponding *imitatio Dei* principle are just two sides of the same coin. Our issue is under what circumstances may an employer monitor the personal e-mails of his employees. Elsewhere, we have taken up this issue and demonstrated a significant difference in approach between secular law and Jewish law with respect to this matter [2].

Diminished Expectation of Privacy

In examining the difference between secular law and Jewish law regarding whether an employer (*E*) may monitor the personal electronic communications of his

worker (*W*), let us note that *E* can easily create a diminished expectation of privacy in the workplace. For example, *E* may periodically announce that he is happy to grant his workers the privilege of sending personal messages over the company's e-mail system. At the same time, however, *E* warns his employees not to abuse that privilege by engaging in sexual harassment via e-mail or sending out e-mails containing racial slurs. Based on those warnings, *W* should conclude that *E* may monitor his personal e-mails.

Moreover, even if *E* is silent about the firm's policy for monitoring *W*'s personal electronic messages, *W* should reasonably expect that his personal e-mails will be monitored in some way. Why? Consider that *W*'s electronic communications are stored on the company's server. *W* should therefore anticipate that if a security breach occurs, a *bet din* (Jewish court) might allow *E* to examine *W*'s electronic records to ferret out the culprit. This theoretical right for *E* must exist. Without it, the personal e-mail privilege *E* confers upon *W* would create an opportunity for *W* to engage in veiled misconduct by leaking confidential information. Specifically, all *W* would need to do to leak confidential information is to send it in an e-mail marked "personal."

Based on the diminished expectation of privacy described above, American courts do not regard *E* as guilty of wrongful discharge if he dismisses *W* based on *W*'s electronic communications, even if *E* promised not to monitor *W*'s communications.

The oft-quoted case here is *Smyth v. The Pillsbury Company*, 914 F. Supp. 97 (E.D. Pa. 1996). In that case, an employee of Pillsbury, Michael A. Smyth, and his supervisor exchanged personal e-mails over Pillsbury's e-mail system. Pillsbury had repeatedly assured its employees that e-mails sent over its e-mail system would remain confidential. Despite those assurances, the company intercepted Smyth's e-mails and fired Smyth and his supervisor for transmitting "inappropriate and unprofessional" comments. Smyth sued Pillsbury on the grounds that his termination was based on a violation of his common law right to privacy.

The court rejected Smyth's claim. In support of its holding, the court presented two rationales. First, the e-mails were sent over an e-mail system that the entire company used. Consequently, any reasonable expectation of privacy was lost, despite the company's prior assurances of privacy. Second, even if Smyth had a reasonable expectation of privacy, that right was not absolute. Instead, the company was entitled to balance its employees' right to privacy against the company's interest in preventing inappropriate and unprofessional comments and illegal activity. The court held that a reasonable person would not consider the interception of Smyth's e-mails to be a substantial and highly offensive invasion of his privacy. As a result, the company's interest to prevent inappropriate conduct was considered paramount.

From the perspective of Jewish privacy law, *E* violates *W*'s privacy rights if he intercepts *W*'s e-mail. The relevant prohibition is R. Gershom b. Judah Me'or ha-Golah's (*Rabbeinu Gershom*, France, ca. 960–1040) edict against reading another person's mail without permission. The basis of that edict, according to R. Jacob Hagiz (Jerusalem, 1620–1674), is the admonition: "You shall not go as

a talebearer among your people” (Leviticus 19:16). That Biblical verse prohibits the bearing of someone’s private information, whether for self-consumption or to reveal it to someone else.¹⁰

While the workplace is a setting for a diminished expectation of privacy, R. Gershom’s dictum should still apply. This is so because R. Gershom’s prohibition against reading someone else’s mail applies not only when the message is contained in a sealed envelope but also when the message is written on a postcard.¹¹ If the edict applies to reading a postcard addressed to someone else, a diminished expectation of privacy is not enough to suspend the prohibition. What is needed is no less than an explicit or implicit waiver by both the sender and receiver of the private message.

***Imitatio Dei* and Monitoring of Personal E-Mails in the Workplace**

In his treatment of *imitatio Dei*, R. Norman Lamm notes that both the Jewish philosophic and mystical traditions speak of two aspects of Divinity. One is God’s knowability and the second is His unknowability, i.e., His transcendence. God’s transcendence is the aspect of His essence that will remain forever unknown to man. Those two zones of disclosure and concealment co-exist within God without contradiction [3].

But if this is true of the Creator, it is true of His human creatures as well. As God reveals and conceals, so too man withholds and discloses. Human privacy manifests itself with a desire to remain unknown, puzzling, and enigmatic.

The above analysis leads R. Lamm to assert that it is man’s duty not to be an open book. Instead, man must maintain a private side.

R. Lamm’s proposition that man has a duty to maintain a private side finds expression in Jewish law’s treatment of charitable giving. In Maimonides’ (*Rambam*, Egypt, 1135–1204) ranking of the levels of charitable giving, anonymity is given a premium, with the highest ranking achieved when the donor does not know the identity of the recipient and the recipient does not know the identity of the donor. But Maimonides also says that charity in its most noble form consists of preventing an individual from falling into the throes of poverty. The position of such a person must be stabilized, with his dignity preserved, by conferring a gift upon him, extending him a loan, or entering into a partnership with him. The most noble form of anti-poverty efforts is thus when the benefactor prevents the recipient from falling into the throes of poverty and conceals his identity from the recipient.¹²

Recall that from the standpoint of Jewish law, the diminished expectation of privacy in the workplace does not give an employer a license to monitor his workers’ personal e-mail correspondence. While the workplace is a setting for diminished expectations of privacy, R. Gershom’s dictum should still apply to that setting because the dictum is operative not only when a message is contained in a sealed envelope but also when it is written on a postcard.

Similarly, R. Lamm’s analysis shows that *W* should not readily agree to any policy *E* imposes on him for monitoring his e-mails. Guarding his privacy requires *W* to insist that any monitoring of his e-mails should be done in a manner that is maximally respectful of his privacy and be motivated by the purpose of preventing inappropriate employee conduct or disclosure of confidential information.

***Oshkek* and the Law of Warranty**

One more example of how *imitatio Dei* provides the philosophical basis for a particular legal principle in Jewish business ethics is the law of *oshek*.

Oshkek entails the misappropriation of property that comes into one's possession with the consent of the owner of the property. This objectionable conduct occurs, for example, when a creditor (*C*) attempts to collect a loan due to him from his debtor (*D*) but cannot recover it because *D* is overbearing and hard-hearted. The Biblical verse prohibiting such conduct is "You shall not oppress your fellow" ("*lo ta' ashok et re' akha*") (Leviticus 19:13).¹³

While decisors are in agreement that *D* violates *oshek* on a Biblical level only if he is overbearing or hard-hearted in resisting *C*'s efforts to obtain what is lawfully his, *oshek* is violated on a rabbinical level even if *D* resists *C*'s demands by telling him to go away and return. This rabbinical prohibition is alluded to in the verse: "Say not to your neighbor, 'Go and come back (*lekh va-shuv*), and tomorrow I will give you when you have [it] with you'" (Proverbs 3:28).¹⁴

The law of *oshek* finds a ready counterpart in American law in a consumer's rights in the purchase of a good under warranty. Under the Uniform Commercial Code (UCC), if *S* is a merchant and offers a written warranty for a good, he automatically guarantees that the good would "pass without objection in the trade" and is "fit for the ordinary purposes for which such goods are used."¹⁵ This guarantee is referred to as the implied warranty of merchantability. For example, if *S* sells an oven to *B*, *S* implicitly promises that the oven will bake food at controlled temperatures that *B* specifies [4]. If the oven fails to heat, or heats at the wrong temperature, *S* has breached his implied warranty of merchantability. Similarly, if *S* sells a water glass to *B*, *S* implicitly warrants that the glass will hold water. If *B* discovers that water leaks from the glass, *B* has a right to return the glass based on a breach of the implied warranty of merchantability.¹⁶

Under the UCC, *S* also provides an implied warranty of fitness for a particular purpose when *B* relies on *S*'s advice that a product can be used for a particular purpose.¹⁷ For example, if *B* specifically requests a washing machine that can handle 15 pounds of laundry in one load and *B* buys that model on the strength of *S*'s expressed recommendation that it can handle the load, *S* has made a warranty of fitness for a particular purpose. If the model that *S* recommended proves unable to handle 15-pound loads, *S* has breached his warranty of fitness for a particular purpose, even if the machine washes 10-pound loads well (See note [4]).

Whenever a good is sold under a warranty, a customer can potentially be victimized by *oshek*. One industry in which *oshek* is prevalent is the automobile industry. The widespread practice of abuse in this industry has led to the passage of state lemon laws. To illustrate, in the sale of an automobile, the seller owes his customer, at the very least, a duty to hear out a complaint. A customer who seeks relief under the lemon law, however, will at times encounter a runaround. For example, the customer may get shuffled back and forth between the manufacturer's customer service department and the dealership that sold the car. If the customer correctly sticks with the dealership to lodge a complaint, the dealer may respond

with an assortment of lies, such as claiming that the problem is not covered by the lemon law or that the state has no lemon law. Alternatively, the dealer's representative may promise to call back, but never does ([5], pp. 67–72).

The complaint may entail a demand for a repair job covered by the warranty, or if the customer is convinced that he bought a lemon, a demand for a refund or replacement vehicle. Stonewalling or responding to the complaint with dilatory tactics withholds from the customer a repair job or refund to which he may be entitled. Those tactics therefore violate the *oshek* interdict.

Another frustration a typical dissatisfied automobile customer encounters is when a dealer deflects a complaint about a flaw by producing a Technical Service Bulletin (TSB) issued by the manufacturer that claims that the flaw is trifling and cannot be corrected. As an example, Vince Megna, a prominent lemon law attorney, cites an official General Motors TSB stating that its power engineering department determined that engine knocking on cold starts “is not detrimental to the performance, reliability, or durability of the engine” ([5], p. 73).

In Jewish law, a dealer has no right to dismiss a customer's complaint by producing a TSB that says that a defect is trifling and irreparable. Rather, what constitutes a defect and therefore qualifies for a price reduction or a refund is determined by establishing the consensus of the users of the product.

Let us now show that the type of conduct the law of *oshek* prohibits also proceeds from the *imitatio Dei* duty. Let us focus on the Divine attribute of *emet* (truth). To understand how the attribute of *emet*, which ordinarily evokes the notion of strict, uncompromising justice, provides a guidepost for kindness in interpersonal relationships, it is necessary to see that mercy is an aspect of God's attribute of *emet*. R. Solomon b. Isaac (*Rashi*, France, 1040–1105) provides the key here by telling us that *emet* in the context of the Divine attributes of mercy means “to pay a good reward to those who perform His will.”¹⁸ *Rashi*'s interpretation clarifies the mercy element in *emet*. Preliminarily, consider that God endows humankind with free will. This means that neither virtue nor the avoidance of sin is for us compelling. If doing God's will would be compelling, we would not deserve a reward for virtue or for resisting sin.¹⁹ The reward God promises us for doing His will, i.e., “so that you will benefit and you will live long” (Deuteronomy 22:7), is infinite and offers us a delight beyond human imagination, a reward that one can experience only in the infinite world of the afterlife [6].²⁰

We note that in several instances, the Torah does promise that adherence to the Divine commandments will be rewarded with physical and material recompense and disobedience will be followed by punishment in this world. However, these material and physical rewards and punishments, according to Maimonides, are not for compliance and disobedience. Rather, if we desire with gladness to perform God's will, God will remove all obstacles to the performance of the commandments. These obstacles include war, disease, and poverty. If we fail to perform the commandments with alacrity, we may not merit to have these obstacles removed. The reward for performing God's will and the punishment for disobedience remain infinite and are therefore reserved for the world of the infinite.²¹

But it is undeniable that human beings have a positive time preference: We are quite willing to trade off an indefinitely deferred reward, even an infinite one, for a lesser reward that we can enjoy here and now. Our eagerness and even desperation to make this trade-off, however, are the result of our ignorance of the nature of the infinite reward that is awaiting us. Here, God displays His mercy element in *emet* and does not accept our willingness to trade our reward in the afterlife for an immediate reward. Instead, God is faithful in fulfilling His promise. Everyone who performs God's commandments will get his or her due in the form of an infinite reward.

What we have just said in theological terms about the mercy element of truth can be formulated in economic terms. Man's plea to God to trade at least part of his infinite reward in the afterlife for a lesser reward here and now is a situation of asymmetric information. God knows the nature of the infinite. We, by contrast, have no comprehension of the nature of this reward. Because we proffer our bargain out of foolishness and ignorance, God rejects our plea. In other words, God refuses to exploit our ignorance.

Recall that if *S* is remiss in his disclosure or fails to honor his implied warranty, he is guilty of theft and price fraud. The implication of these prohibitions is to require *S*, if he is an employer, to organize his business so that these prohibitions are not violated. The *imitatio Dei* imperative frames these duties in positive terms rather than as prohibitions.

***Imitatio Dei* and Economic Public Policy**

In this section, we will demonstrate that for Jewish law, *imitatio Dei* is the philosophy behind economic public policy and the regulation of the marketplace.

While the source texts cited above all relate to *imitatio Dei* in connection with interpersonal conduct, this behavioral imperative, according to Maimonides, applies not only to the private citizen but also to the ruler. Preliminarily, let us take note that Maimonides adopts this position without citing a source for it. Specifically, in his discussion of the monarch's criminal justice system, Maimonides says that the system should not be based on the passion of the moment but rather on a careful consideration of equity with the aim of promoting social welfare. Since the sovereign must perforce be involved in the administration of justice, *imitatio Dei* requires him to mete out punishment in the manner in which God metes out punishment [7]. As a private citizen, however, man is bidden to emulate only God's attributes of mercy. A private citizen is therefore prohibited from taking upon himself the role of meting out punishment, even if he uses *imitatio Dei* as his model (See [8]).

Supporting the proposition that *imitatio Dei* includes a social component is Abba Saul's dictum, expressed by his exposition of the verse "*zeh Ke'li ve-anvehu*" ("This is my God and I will glorify Him") (Exodus 15:2). Abba Saul understands *ve-anvehu* as consisting of two words, *ve-ani ve-hu* (and I, and Him), meaning that "I will be like Him; just as He is *raham* (merciful) and *hanun* (gracious), so too will I be merciful and gracious" (*Shabbat* 133b).

In light of the *imitatio Dei* lesson derived from Exodus 34:6–7, Abba Saul’s exegesis appears superfluous. Closer examination of the dictum, however, reveals that Abba Saul adds a social component to the principle of *imitatio Dei*. This follows from the consideration that the circumstance that inspired the Jewish people to proclaim *zeh Ke’li ve-anvehu* was the miracle of the splitting of the Red Sea. No one was singled out to experience the miracle. To the contrary, God wrought this miracle for the Jewish people in its entirety. Unlike the manna, whose benefit manifested itself on different levels according to individual merit,²² the miracle at the Red Sea benefited the Jewish people as a whole,²³ without distinguishing between the deserving and the undeserving [9].²⁴ Hence, Abba Saul expands the application of *imitatio Dei* beyond the interpersonal sphere by making it man’s duty to incorporate God’s attributes of mercy into the community’s social fabric and legal environment.

***Imitatio Dei* and the Moral Climate**

One aspect of God’s mercy is the weakening of the powers of the evil inclination, which He effects for those who strive for moral betterment. Expressing this dimension of God’s mercy, Reish Lakish states that “if one wishes to defile himself [with sin], the door is merely opened for him; but if one comes to purify himself, he is assisted.”²⁵ Divine assistance is triggered not only by great human initiative. An unexceptional act of spiritual striving also merits Divine assistance and so too, perhaps, does an unarticulated spiritual search. Evidencing this is the dictum that the Almighty demands only that we present to Him an opening of repentance no bigger than the eye of a needle. If we can manage this, God promises us that He will respond by expanding our opening so wide that even wagons and carriages can pass through it.²⁶

The immense degree of compassion inherent in God’s assistance in our battle against the evil inclination is expressed by Reish Lakish in the following dictum recorded in the Talmud at *Kiddushin* 30b:

The evil inclination renews its attack on man with increasing force every day, trying to kill him, as it says: “The wicked one watches for the righteous and seeks to execute him” [Psalms 37:32]. Were it not for God’s assistance, no man could survive the onslaught, as it says: “But God will not forsake him to his power, nor let him be condemned in his judgment” [Psalms 37:33].

The seductive power of the evil inclination is greatest when man is thrust into a setting involving either a conflict of interest or an opportunity to engage in hidden misconduct. It is here that cunning and shrewdness can often camouflage deceitful and fraudulent conduct and at the same time enable the perpetrator to avoid both legal consequence and social outrage.

To be spared the challenge of a test of piety is regarded in Jewish religious doctrine as ideal. Witness both the warning of the Sages not to deliberately enter into a situation that would involve us in a test of piety²⁷ and the plea we make to God in our daily prayers not to thrust us into a test of piety.²⁸

As private citizens, we are very limited in what we can do to assist our fellow man in his battle against the evil inclination. But *imitatio Dei* is a mandate for government too, and government can accomplish much in this area. The governmental duty here is to ensure that society's legal environment minimizes settings for hidden misconduct.

Support for the thesis that the government in a Torah society must be concerned with the elimination of hidden wrongdoing is R. Menahem b. Solomon Meiri's (*Meiri*, Perpignan, 1249–1316) interpretation of R. Judah's dictum recorded at *Sanhedrin* 43b:

"The secret things belong unto the Lord our God, but the things that are revealed belong unto us and to our children forever" [Deuteronomy 29:28]. Why are the words *lanu u-le-baneinu* [unto us and to our children] and the [letter] *ayin* of the word *ad* [forever] dotted? To teach that God did not punish for transgressions committed in secret until the Israelites had crossed the Jordan. This is the view of R. Judah. Said R. Nehemia to him: Did God ever punish [all Israel] for crimes committed in secret; does not Scripture say "forever"? But just as God did not punish [all Israel] for secret transgressions [at the time], so too did He not punish them [corporately] for open transgressions until they had crossed the Jordan.

Meiri rules in accordance with R. Judah's view. The practical implication of this view, he says, is that society's judges, sages, and leaders must do more than simply address the issues presented to them. They must also search out hidden wrongdoing and take measures to remedy any misconduct they discover. Failure to search out hidden wrongs makes the entire community vulnerable to punishment for the sins of evildoers.²⁹ It follows that government has the duty of ensuring that society's legal environment minimizes settings for invisible misconduct.

***Lifnei Ivver* and Legislation**

Another aspect of the government's responsibility for the moral climate is the prohibition against the enactment of laws that inherently generate settings for veiled misconduct. An analysis of the following dictum by Rav, recorded at *Bava Metzia* 75b, bears out this prohibition:

Said R. Judah in the name of Rav: Whoever has money and lends it without witnesses violates the prohibition of "Do not place a stumbling block before the blind" (*lifnei ivver lo titen mikshol*) [Leviticus 19:14]. Reish Lakish said: He brings a curse upon himself, as it is written, "Let the lying lips be out to silence, which speak grievous things proudly and contemptuously against the righteous" [Psalms 31:19].

When a loan is concluded without the formality of witnesses, the borrower can eliminate his debt by denying that the transaction took place. Consequently, lending money without witnesses is prohibited. To do otherwise, explains *Rashi*, would effectively tempt the debtor to repudiate his lawful debt and result in the lender violating the interdict against *lifnei ivver*.³⁰

Commenting on *Rashi's* remarks, R. Joel Sirkes (*Bah*, Poland, 1561–1640) and R. Joshua b. Alexander ha-Kohen Falk (*Sema*, Poland, 1555–1614) understand

Rav's dictum to be rooted in the concern that the debtor will *willfully* repudiate a debt that he knows to be lawful.

If the debtor is a rabbinical scholar (*talmid hakham*), the above concern does not exist. Therefore, lending money to a rabbinical scholar without the formality of witnesses does not violate the *lifnei ivver* interdict. The latter action is, nonetheless, prohibited by Reish Lakish's dictum. The concern here is that the scholar's preoccupation with his studies might cause him to forget his indebtedness and consequently lead him to deny the creditor's claim. Given the stature of the rabbinical scholar, his denials will find credence and the public will curse the lender.³¹

Disputing the preceding opinions, R. Abraham b. Moses de Boton (Salonika, ca. 1560–ca. 1605) and R. Jacob b. Moses Lorberbaum (Lisa, 1760–1832) understand Rav's dictum to be rooted in the concern that the debtor might forget the loan and consequently deny the debt, all along convinced that the creditor's claim is false. This rationale applies regardless of whether the debtor is a rabbinical scholar.³²

In defending his position that the concern for willful repudiation cannot stand at the basis of Rav's dictum, R. Boton invokes the Talmudic principle that exhortations are never directed at those who are predisposed to violate them willfully (*atu be-reshi'ei askinan*). The basis of the application of the *lifnei ivver* interdict to the making of an unwitnessed loan must therefore be the concern that the debtor might come to forget his obligation and consequently be led to deny it.³³

A narrower understanding of *atu be-reshi'ei askinan*, however, follows from *Rashi* et al. Given the inherent futility of exhorting the willfully evil who do not care if their misconduct is discovered, the Torah never ascribes this character trait to the subjects of its exhortations. This is what is meant by the Talmudic phrase *atu be-reshi'ei askinan*. The Torah does, however, direct its exhortations to the willfully evil who want to avoid social disapproval by covering up their misconduct. Witness that the phrase *ve-yareta me-Elokekha* ("and you shall fear your God") is employed by the Torah specifically in connection with those of its prohibitions that man convinces himself he can violate without detection.³⁴ In particular, the Torah uses the phrase in connection with the duty to bestow honor upon a rabbinical scholar (Leviticus 19:32), and the prohibitions against offering ill-suited advice (Leviticus 19:14), causing someone needless mental anguish (Leviticus 25:17), charging interest on a loan between Jews (Leviticus 25:36), and working an Israelite slave oppressively (Leviticus 25:43).

Supporting the narrow interpretation of *atu be-reshi'ei askinan* is the connection the Talmud makes between this phrase and the *ve-yareta me-Elokekha* exhortation employed in relation to the duty to give deference to a rabbinical scholar by standing up for him as he approaches.³⁵ Invoking *atu be-reshi'ei askinan*, the Talmud rejects the possibility that *ve-yareta me-Elokekha* adjures against closing our eyes and pretending that the scholar is not in our presence. Rather, *ve-yareta me-Elokekha* forewarns against closing our eyes just before the scholar arrives. Here, the willful sinner might be tempted to show the rabbinical scholar disrespect and yet imagine that by claiming that he simply did not notice his presence, he will escape social outrage for the misconduct. Thus, the Torah forewarns that the Almighty knows man's true circumstances and true intentions.³⁶

Proceeding from the concept of *atu be-reshi' ei askinan* is the following refinement of Rav's dictum: Lending money without the formality of witnesses is prohibited because it generates for the debtor a setting for hidden misconduct. Since denying the debt outright brands the debtor an ingrate, there is no concern that the debtor will adopt this tactic. Such a brazen approach is unthinkable by dint of the principle of *atu be-reshi' ei askinan*. Rather, the concern is that the unwitnessed transaction may lead the debtor to shrewdly evade payment by pleading ignorance of the indebtedness. By taking an oath affirming his ignorance of the debt, the defendant avoids the stigma of being branded an ingrate and at the same time escapes payment.

We see an application of Rav's dictum in the Torah's prohibition against enacting a law that inherently generates a setting for veiled misconduct.

Let us illustrate this proposition by drawing out the implications of R. Naftali Tzvi Yehudah Berlin's insight mentioned earlier. Recall R. Berlin's comment that *imitatio Dei* extends beyond the duty to emulate those aspects of God's mercy explicitly enumerated at Exodus 34:6–7. Instead, by the exegesis of Joel 3:5, a duty to emulate every manifestation of God's mercy is established.

Now, if *imitatio Dei* is a mandate only for private conduct but has no relevance to public policy, opportunities to affirmatively assist a fellow who seeks to take the correct moral path in his commercial interactions would be limited. The previous discussion regarding warranties illustrates this point. To be sure, educating himself and sharing the information with the customer generates goodwill for the salesperson, but it also increases the cost of doing business for his firm. Who will know of the salesman's plight and who will encourage him to thoroughly educate himself about the law of warranties and act on this information appropriately with his customers? However, *imitatio Dei* is a mandate for public policy as well as for an individual. Accordingly, the government can require that employers assure that their salespeople are conversant in the law of consumer product warranties. Insofar as economies of scale exist here, the government is well situated to facilitate the most effective and least-cost method of running these programs.

Legislation and *Imitatio Dei*: Insider Trading

One important consequence of making *imitatio Dei* a mandate for government as well as the individual is that the moral factor becomes a criterion in considering legislation. The best illustration of that contention is the debate in the economic literature over whether insider trading should be legalized. Let us examine the debate and show how *imitatio Dei* applies in this context.

Economic Debate over Legalization of Insider Trading

In the early literature of economics and law, economists hotly debated the issue of whether insider trading should be legalized.

Efficient Managerial Incentives

The chief advocate for legalizing insider trading was Henry Manne. Manne's argument was that insider trading was an indispensable method of compensating entrepreneurs. What makes this compensation scheme attractive is that it allows managers to profit from their efforts on behalf of the firm without having to negotiate with the owners of the firm. When managers believe that their entrepreneurial activities will enhance the value of the firm, they can invest in their company's shares at their discretion. Having acquired an interest in the future course of their firm's share price, managers will concentrate their efforts on behalf of the firm to ensure that its programs will succeed and the resulting enhanced performance be disclosed [10].

One major objection that this compensation scheme faces is that insider trading does not reward efficient managers as such. Rather, it rewards the *possessors* of confidential information, regardless of whether the information is favorable to the corporation's prospects.

Moreover, this compensation scheme gives insiders as much of an incentive to destroy a firm as to revolutionize it or to reduce earnings as much as to increase them. One can imagine cases where managers would have an incentive to accelerate the demise of their firm. Managers would be motivated to manipulate the disclosure of information about the firm in a manner calculated to produce sharp, if temporary, spurts in the price of the firm's stock. Their energies would be deflected from managing the firm to maximize its present worth to managing publicity about the firm to maximize the volatility of its stock [11].

In light of the extensive criticism leveled against Manne's argument that insider trading is an efficient means to compensate managers, Manne himself abandoned the argument close to 40 years after he first presented it. He then offered a new argument in defense of insider trading. In Manne's recent view, insider trading is a useful way to improve the flow of information to corporate decision-makers and thereby signal to them whether the proposals they are considering are good or bad ideas. Manne acknowledged, however, that his new argument was not founded on direct empirical or even anecdotal evidence [12].

Price-Efficiency Effects

Another facet of the economic case for legalizing insider trading is the price-efficiency argument. That argument emphasizes the importance to the economy of directing financial capital to those places where society values it most. Stock prices are considered to be at their true values when they reflect as accurately as possible the prospects of the corporate issuers. If a firm's value is underrepresented by its share price because, for example, the firm has strategic reasons for not divulging information about a valuable discovery, marketing strategy, or expansion or acquisition plan, it will be more costly than it otherwise would be for that firm to raise capital in the equity markets. The firm, therefore, will not engage in the optimal amount of investing, and resources will not flow to those uses that society values most.

Advocates for legalizing insider trading believe that insider trading moves share prices toward their true value more quickly than if insider trading were banned [13].

In a related argument, Jonathan Macey posits that insider trading can be more effective than whistle-blowing in signaling to the capital markets that wrongdoing is afoot [14].

The thesis that insider trading promotes efficiency in the capital markets faces several difficulties, however. One difficulty is that the empirical evidence regarding the price-efficiency effects of insider trading is mixed. Although some empirical studies conclude that illegal insider trading has a significant effect on stock prices (See, e.g., [15]), other studies reach the opposite conclusion. For example, a 1989 study that examined 172 successful tender offers concluded that a significant portion of the run-up in the stock prices of the target companies before the announcement of the tender offers could be explained by two legally available influences on pre-bid trading—media speculation and the bidder's foothold acquisition in the target [16]. A more recent empirical study also suggests that stringent regulation of insider trading, rather than legalization of insider trading, promotes stock price efficiency (See [17]).

Another criticism of the price-efficiency rationale for insider trading is that permitting insider trading may delay or distort the transmission of valuable information to the market. This would occur if insiders at lower echelons of management concealed information from their superiors to avoid the danger of an early price run-up that would diminish their gains and leave them with too little time to arrange financing for their trades. It might also occur if members of the firm deliberately released false information to take advantage of profits available from resulting price swings [18].

Transaction Costs

Another consideration in evaluating the thesis that insider trading promotes efficiency in the capital markets is an analysis of the transaction costs that arise from insider trading. A rule permitting insider trading can be expected to put into motion two opposing forces affecting transaction costs.

On the debit side, legalizing insider trading can be expected to cause an adverse selection problem for the specialist [19]. By maintaining an inventory of various stocks, the specialist provides continuous trading opportunities for investors. In a legal environment that permits insider trading, the specialist faces the risk that his opposite number may be an insider. Given the increased risk factor, the specialist can be expected to reduce his bid price or increase his ask price. Thus, a rule permitting insider trading would increase the spread between his bid and ask prices. The result for firms is that the cost of using the market for financing rises, thereby altering the proportions of the funds they choose to derive from debt and equity [20].

Counteracting somewhat this negative effect on transaction costs is that a rule permitting insider trading reduces duplicative information gathering in the marketplace. This follows from the proposition that the presence of insiders in the market exerts a disincentive for outsiders to engage in information gathering. Since insiders can capture gains from changes in market value associated with new information before outsiders, outsiders will be discouraged from engaging in information

gathering. Thus, insider trading reduces the overall amount of money that society spends to achieve an adjustment in share prices because it reduces the cost to society of duplicative information gathering by outsiders [21].

Insider Trading and Jewish Law

From the perspective of Jewish law, considering whether insider trading should be legalized based only on whether the practice promotes economic efficiency is misguided because it totally ignores the ethical dimensions of this issue.

Jewish law's approach to insider trading is generally consistent with the "misappropriation theory" applied by the U.S. Supreme Court in *United States v. O'Hagan*, 521 U.S. 642 (1997). In that case, James O'Hagan, a partner in the law firm of Dorsey & Whitney, learned that a client of his firm, Grand Metropolitan PLC (Grand Met), planned to launch a tender offer for the Pillsbury Company. O'Hagan then began purchasing call options on Pillsbury's stock, as well as shares of the stock. Following Dorsey & Whitney's withdrawal from the representation, Grand Met publicly announced its tender offer. The price of Pillsbury's stock rose dramatically, and O'Hagan sold his Pillsbury call options and stock at a profit of more than \$4.3 million.

An investigation by the Securities and Exchange Commission (SEC) culminated in a 57-count indictment alleging that O'Hagan defrauded his law firm and his client, Grand Met, by misappropriating material, nonpublic information for his own trading purposes. A jury convicted O'Hagan on all counts, and he was sentenced to prison. On appeal, the Eighth Circuit reversed all the convictions.

On further appeal, the Supreme Court reversed the Eighth Circuit on the basis of the misappropriation theory. Under that theory, the Court held that a company's confidential information qualifies as property to which the company has a right of exclusive use. Accordingly, misappropriation of that information in breach of a fiduciary duty owed to the source of the information constitutes fraud akin to embezzlement.

Jewish law's analog for the misappropriation theory is R. Yose's dictum, recorded in the Mishnah at *Bava Metzia* 3:2, that prohibits one from conducting business with another's property. Talmudic decisors follow R. Yose's dictum.³⁷

Application of R. Yose's dictum to insider trading is clear-cut. Given that inside information about a company is the property of all the shareholders of the company, no one may trade on this information. Doing so amounts to doing business with someone else's property. Disgorgement of the profits earned would therefore be required.

Moreover, legalizing insider trading would do violence to the *imitatio Dei* ideal. By opening the door for compensation schemes that allow employees to trade on inside information, deregulation creates opportunities for managers to profit from their own sloth, ineptitude, and destructive behavior. This drives a wedge between the interests of the managers and the interests of the shareholders of a firm.

Judge Frank H. Easterbrook explains how conflict of interest can be expected to become widespread under a rule permitting insider trading. Let us suppose that Firm A allows its employees to engage in insider trading, but Firm B contractually forbids insider trading. Given the absence of government involvement in the enforcement of a ban on insider trading, Firm B will find it very costly to enforce its prohibition. Most importantly, it will be very costly to detect an insider's trades because he can hide his trading activity. For example, an insider can buy stock in street name or through a nominee, or route orders through a chain of brokers to make tracing difficult—the list of evasive devices is long.

About the only thing a firm can do by itself to reduce the costs of enforcing compliance with a policy against insider trading is to prohibit all ownership of stock by its employees. This drastic approach would not prevent managers from passing tips to friends or family, or secretly trading through nominees. If a ban were enforceable, however, its costs might far exceed those of insider trading because stock ownership is very useful in aligning managers' incentives with those of other shareholders.

In Judge Easterbrook's assessment, an unenforceable ban on insider trading at Firm B will cause dishonest employees to drive out the honest employees at the firm. Dishonest employees will find employment with Firm B especially attractive because they will receive their salaries and will also be able to engage in insider trading with impunity. These dishonest employees will therefore be overcompensated relative to the honest employees who adhere to the firm's policy against insider trading. To avoid overcompensating its dishonest employees, Firm B will be forced to reduce salaries across the board. As a result, the honest employees will be underpaid and will leave. To attract honest employees, Firm B will have no choice but to rescind its unenforceable ban on insider trading [22].

Left to its own devices, the private sector would be bedeviled with difficulties in enforcing prohibitions against insider trading. Thus, in a society governed by Jewish law, the government's mission to suffuse the legal environment with *imitatio Dei* conduct requires that the government play a vigorous role in enforcing a ban on insider trading.

In an effort to rectify the ineffectiveness of the enforcement remedies available to the SEC for insider-trading violations, Congress enacted the Insider Trading Sanctions Act of 1984 (ITSA). Congress designed the ITSA to impose a severe monetary civil penalty as the primary means of deterring violations of insider trading. Under that legislation, the SEC has the authority to seek, and the courts have the power to impose, a penalty of up to treble damages for insider-trading violations subject to the ITSA.³⁸

In 1988, Congress passed the Insider Trading and Securities Fraud Enforcement Act (ITSFEA). That law significantly increased the maximum criminal penalties for insider-trading offenses. One provision of the ITSFEA empowered the SEC to award bounty payments to persons who furnish information leading to the imposition of civil penalties for insider trading. Without being subject to review, the SEC was empowered with broad discretion concerning the bounty payments.³⁹

In 2010, the Dodd-Frank Wall Street Reform and Consumer Protection Act created a new and broader program for bounty payments. Under the new program, the SEC is authorized to make awards to persons who provide the SEC with information regarding a violation of the federal securities laws that leads to the enforcement of a judicial or administrative action resulting in monetary sanctions in excess of \$1 million. Awards may range from 10% to 30% of the amounts collected as monetary sanctions.⁴⁰

These congressional enactments in the area of insider trading would be very much applauded by Jewish law.

Financial Limitations on *Imitatio Dei*

While the *imitatio Dei* mandate for government assures that this imperative will play a robust role in society, the financial limitations set by Jewish law for both the individual and government in fulfilling their religious obligations must be considered.

Preliminarily, let us note that in Jewish law, obligatory religious duties dichotomize into positive commandments (*mitzvot aseh*) and negative commandments (*mitzvot lo ta' aseh*). The extent of financial obligation inherent in each category is a matter of dispute. R. Moses Isserles (*Rema*, Poland, ca. 1525–1572) formulates the rule as follows: “To fulfill a *mitzvat aseh*, an individual is required, if necessary, to expend up to one fifth of his net worth. To avoid violation of a *mitzvat lo ta' aseh*, an individual must lose, if necessary, his entire net worth” (See also [23]).⁴¹ Disputing R. Isserles’ claim, R. Moses Sofer (*Hatam Sofer*, Hungary, 1762–1839) argues that the stringency for the *lo ta' aseh* category applies only when the negative commandment would be violated in an active manner (*kum va-aseh*); to avoid a passive violation (*shev ve-al ta' aseh*), the one fifth rule applies.⁴²

These wide-ranging financial obligations do not apply, however, to the *imitatio Dei* duty. *Imitatio Dei* mandates that we emulate the various forms of kindness described in the Jewish tradition regarding God’s compassion and mercy in His dealing with humankind. But the general rule is that the obligation to engage in acts of kindness, as opposed to fulfilling the charity duty to the needy,⁴³ extends only to the exertion of toil and effort, not to monetary expenditure.⁴⁴ The only exception is that when the expenditure is trifling, it is improper to take no action.⁴⁵ Consequently, there is a difference between acts of kindness performed by the government and those performed by the private person or business. Specifically, an amount that is substantial for a single household is often immaterial when shared by all taxpayers. For example, in the United States, which has a progressive income tax, the cost of an *imitatio Dei* measure could be spread equitably over approximately 80 million taxpaying households.⁴⁶

Since the financial limitations of the *imitatio Dei* imperative present less of a constraint for the government than the individual, the government is uniquely well situated to promote *imitatio Dei* conduct. We offer below two illustrations of how the government can foster *imitatio Dei* conduct more effectively than could an

individual: precluding the need for external whistle-blowing as a means to correct wrongdoing and mandating performance appraisal in the workplace.

External Whistle-Blowing

External whistle-blowing is an attempt by a current or former member of an organization to disclose wrongdoing in or by the organization to the media or the government. This practice is a phenomenon that causes much discord and disharmony in the workplace. Even when whistle-blowers have credible evidence to support their allegations, harm to the firm could have been minimized had the whistle-blowers reported the damaging information only within the firm and relied on management to take corrective measures and publicly disclose the wrongdoing, if necessary. Studies consistently show that whistle-blowers are regarded by co-workers and superiors as pariahs and, without government protection for their disclosures, may face blackballing from job opportunities for life.

In his treatment of whistle-blowing, Professor Michael Davis presents a number of ideas relating to organizational structure and the incentive system of the firm that are designed to encourage employees to report wrongdoing through internal channels. With respect to organizational structure, Davis recommends that the firm build invitations into its everyday routine to encourage employees to report bad news. One way to implement this idea is to include a space for “disadvantages” and “risks” in reporting forms that employees routinely complete. Along the same lines, the firm could schedule review meetings to identify problems.

Another idea is for the firm to create alternative channels for relating bad news so that no one in the firm is in a position to block its flow upward. One way to accomplish this objective is for the firm to submit to a regular outside audit. Another way is to adopt an “open door” policy that allows subordinates to approach senior officials directly. Still another method is to give employees routine access to more than one superior in the organization. These types of arrangements give a manager reason to be thankful that he has heard the bad news from a subordinate rather than from a superior and to respond in a way likely to satisfy the subordinate. At the same time, the subordinate has saved the manager from being “blindsided.” These arrangements would help correct the underlying problems and minimize the occurrence of external whistle-blowing.

Establishing the appropriate incentives for managers to accept bad news and to act upon it appropriately would help minimize external whistle-blowing and promote greater moral commitment from members of the firm. To achieve those objectives, the firm should hold a manager responsible for what he or she does on the job, even if the consequences of those actions occur in a time frame beyond the manager’s “watch.” Assigning responsibility in this way will incentivize a manager to encourage his or her subordinates to report bad news about a predecessor’s work as soon as they learn of it [24].

In theological terms, Davis’ thesis recognizes the moral weakness of members of a firm, particularly subordinates, to question, dissent, or speak out against what

appears to them as wrongdoing in the firm. Organizational structure and the proper incentive system can work, however, to make all members of the firm more committed to doing the right thing. Based on the principle of *imitatio Dei*, innovations that promise to fortify the moral fiber of the members of an organization should be implemented.

Professor Richard T. De George addresses the issue of precluding the need for whistle-blowing. One suggestion he makes is that a firm should establish the position of ombudsman. The purpose of the ombudsman would be to hear complaints or moral concerns of employees. The ombudsman would also participate in the formulation of company policy and recommend the appropriate course of action for the firm from a moral standpoint [25].

There can be no doubt that the Davis and De George ideas of how to preclude whistle-blowing are consistent with both specific Jewish legal principles and *imitatio Dei*.

Let us first take up the issue from the standpoint of legal principles. One aspect of the Biblical command of “And you shall love your fellow as yourself” (Leviticus 19:18) is the imperative “Seek out peace and pursue it” (Psalms 34:15). Indeed, without a proactive stance toward peace, Judaism’s ideal to achieve harmonious relations would be very elusive.

One implication of a proactive stance toward peace for the employer is implementation of Davis’ and De George’s ideas. But implementation of these proposals, particularly the hiring of an ombudsman, entails an expense for the firm. Consider “And you shall love your fellow as yourself” is a guidepost for the duty to perform deeds of loving-kindness, which does not operate under the stringencies of the one fifth net worth rule. Accordingly, if the expense is more than nominal, Jewish law would not require implementation of the policy.

Again, what stretches expenditures on policies indicated by *imitatio Dei* is that the imperative is a mandate not just for the individual but also for the government. Accordingly, the government, acting in the interest of society as a whole, can mandate that a firm hire an ombudsman when the firm reaches a certain size.

Performance Appraisal in the Workplace

Performance appraisal in the workplace is a labor policy for evaluating worker performance to help management decide whether to retain, promote, dismiss, or discipline a worker. The system begins when the worker is hired. The first step is to specify the firm’s expectations for the worker over the immediate time period and update the expectations in advance for each succeeding time period. The next step is to give the worker feedback on how successfully he or she completed the tasks and goals set out in advance. In the final step, if the worker failed to correct any issues identified in the previous feedback session, grounds for dismissal have been established.

Undoubtedly, without a performance appraisal system, the workplace would be riddled with dashed expectations and discord. Implementation of a performance

appraisal system would therefore go very far in eliminating needless mental anguish in the workplace. Accordingly, the textual analysis discussed above from which we derived the duty for an employer to set up his workplace to preclude the need for external whistle-blowing also supports the duty for an employer to implement a performance appraisal system.

Moreover, a basis in Jewish law for requiring a performance appraisal system can be derived from the Biblical interdict of “*Lo tonu ish et amito*” (Leviticus 25:17) (i.e., “Do not cause your fellow needless mental anguish”). If a performance appraisal system is not implemented, dashed expectations among members of the firm are inevitable.

Invoking Leviticus 25:17, as opposed to Leviticus 19:18, puts the obligation for implementing a performance appraisal system on a much firmer footing. Why? Because in contrast to the command at Leviticus 19:18 to love one’s fellow as oneself, which is a duty in the category of a deed of loving-kindness, the prohibition against causing someone needless mental anguish (*ona’at devarim*) at Leviticus 25:17 is a condemnation of an outright wicked act. As a result, the prohibition against causing someone needless mental anguish is an absolute prohibition to which the one fifth net worth rule applies. If failure to implement a performance appraisal system is considered a violation of that prohibition, an employer would presumably be required to implement the system even if it entailed a considerable expense.

Consider, however, that all the examples of causing someone needless mental anguish enumerated in the Mishnah, such as the prohibition against pricing an article with no intention of buying it,⁴⁷ entail affirmative and direct actions of wicked conduct rather than a failure to remove a condition of *ona’at devarim* that one is in a position to remove. Now, if implementation of a performance appraisal system falls only within the category of a deed of loving-kindness because it involves only the removal of a condition of *ona’at devarim*, the rule that an employer need not expend more than a nominal sum to achieve the desired goal appears to present a considerable obstacle to implementation of performance appraisal systems.

Recall that *imitatio Dei* is a mandate not just for the private citizen but for the government as well. What is an obstacle from the standpoint of an individual is not necessarily an obstacle from the *imitatio Dei* perspective of the government. The government need only mandate performance appraisal for the workplace. To be sure, one size does not fit all, and the system will require adjustments for different industries. But mandating performance appraisal for each and every industry should not result in a more than nominal cost for all parties involved. Indeed, the private sector might even enjoy a net economic benefit from the implementation of performance appraisal systems. Moreover, for countries such as the United States, where the employee-at-will doctrine is steadily eroding in the face of public policy concerns, the performance appraisal policy would benefit employees enormously. Specifically, if a worker is fired without validation from a performance appraisal form that the worker was performing below par, the firm would find little justification for firing the worker and the courts would probably order reinstatement of the worker.

Conclusion

In various Scriptural verses, the Torah lays out the notion of *imitatio Dei* (lit., imitation of God). This chapter has demonstrated that *imitatio Dei* is the philosophical underpinning of Jewish business ethics.

The import of having one's conduct fall within the ambit of *imitatio Dei* is to transform what some may consider a dry, legalistic set of rules and routines into the lofty and majestic realm of performing Divine-like actions.

While *imitatio Dei* and the corresponding legal or ethical requirement to undertake a particular action are, in a sense, two sides of the same coin, the determination of whether an action is obligatory and whether failure to perform that action carries with it certain punishments must be made by reference to Judaism's legal code. Similarly, resort to the code must be made to determine whether the action is a deed of loving-kindness and therefore not subject to the one fifth net worth rule or is an absolute obligation implicating that rule.

Imitatio Dei is a mandate for government as well as the individual. A number of consequences follow from this. First, if *imitatio Dei* were a duty only for the individual, undertaking this type of conduct would be entirely a matter of individual conscience. Moreover, conscience can be triggered only if one is well schooled in the duty by dint of one's educational background. Given the widespread ignorance in this area, how far would a system of voluntarism go? The outlook is entirely different, however, when *imitatio Dei* conduct becomes a matter for legislation. Within this milieu, the government must promulgate at least the minimum required duty for particular circumstances. With such legislation in place, performance of specific duties would not be entirely dependent on the individual's educational background or inspirational drive.

Relatedly, while the *imitatio Dei* imperative carries with it only a duty to exert toil and effort to accomplish the indicated deed, and the stringency of the one fifth net worth rule does not apply, one has no license to abandon the duty if only a trifling expenditure is needed to fulfill it. Herein lies another difference between the application of *imitatio Dei* to the government and to the individual. Unlike the individual, the government can spread the cost of an *imitatio Dei* expenditure over a large number of taxpaying households. Without forcing the economy to spend more than nominal sums per capita, the government thus has the power to make the practice of *imitatio Dei* much more pervasive and vibrant than it would be if it were left to a matter of voluntarism.

Part 12

Christian Foundations of Business Ethics

Traugott Jähnichen

Abstract

The chapter approaches the question of the significance of the Bible for business ethics, with two main emphases. First, it attempts to present an introduction to the hermeneutics of the Scripture based on a historically adequate understanding of the Bible. Second, it discusses some ways in how far the Scripture may enrich business ethics, considering four different levels of significance of biblical writings.

Introduction

Self-reassurance in the biblical tradition is essential for all Christian confessions, even though its importance is assessed differently, especially as it relates to ethics. Roman Catholic social teaching considers itself as “an integral part of Christian anthropology,”¹ so that the Christian idea of the human person provides the foundation of ethical reflections. As a consequence, human beings possess in their very nature certain inalienable rights, as they find their expression in natural law. “Natural Law as part of the general moral law is ultimately rooted in the Creator’s ‘eternal law’ (*lex aeterna*) and binds the conscience,”² as the requirements of the law are written by God “into the hearts” of all human beings (Rom. 2:15). As a rule, the distinction is made between primary natural law, such as the right to life, which is universally valid independent of the fall of humankind, and secondary natural law, such as private property, which is seen as a result of the fall and can be found in the general law of all people (*ius gentium*).

For Protestant traditions, on the other hand, a more direct reference to biblical traditions is characteristic, even though important representatives such as

Melanchthon and – with reservations – Luther as well as Calvin acknowledged natural law as well. The principle of “*sola scriptura*” is one of the keystones of Protestant self-understanding, even though its range and importance have remained controversial since the time of the Reformation. This is true especially for the importance of the Bible for ethics, as the controversial discussions among the Reformers’ use of the law (*usus legis*) prove. While Luther did not attribute any decidedly normative function to the biblical legal texts besides the recognition of sin (*usus theologicus*) and an orientation for social living (*usus politicus*), which is understood according to natural law, Melanchthon and the Reformed tradition made use of the biblical law as a guideline for a Christian way of living (*tertius usus legis, usus in renatis*) [1].

Against this background, this chapter will discuss as a first step some basic lines of theological references to the traditions of biblical law. In particular, the problem of the “historical gulf” between biblical times and our present experiences – that is, the challenge of historicity of social orders – must be addressed. In a second, larger chapter, several examples of biblical orientation in the field of social and business ethics will be discussed in terms of their relevance for the present.

Theological and Hermeneutical Reflections on the Relevance of Biblical Ethics

The question of the relevance of biblical ethical instructions is a special challenge for Reformation theology as it programmatically relies upon the principle of “*sola scriptura*” in contrast to the Roman Catholic appreciation of the ecclesiastical traditions. Thus, “in accordance with scripture” is a central criterion for the meaning of theological and ecclesial comments, like the so-called Denkschriften (memoranda) of the Protestant Church of Germany (EKD).³ What is specifically meant by the concept “in accordance with scripture” is, however, controversial among Protestant theologians as well as in other denominations.

In this context, a distinctive difference between Catholic as well as Reformed traditions and Luther is the latter’s theological critique of the law: To be sure, the law is appreciated as a “good gift from God”; however, it constitutes an “obstacle” [2] on the way to salvation because the human person either despairs of his/her failure to meet the demands of the law or because he/she is lulled into a false sense of self-confidence. Only the way of humility, to which a person is led by the preaching of the law, will refer to grace. As a consequence, a Christian may totally depend upon the fulfillment of the law by Jesus Christ and is no longer under constraints of the law. Rather, the Christian is free to act spontaneously in the spirit of love and thus does everything necessary and helpful for his/her neighbor.

Luther specifies these thoughts with regard to the laws of the Old Testament, which were given to the people of Israel and not to the “heathen.” Therefore, these laws do not bind Christians, and consequently, “Moses does not concern me” [3]. However, Luther emphasizes that Moses’ commandments should be taken as “voluntary standards” (see [3], p. 375) whenever they display good judgment and

can be generally and convincingly founded. In this context, it is interesting that Luther lists mainly social and business ethical rules as examples of Moses' commandments which Christians should voluntarily put into practice. Thus, he holds tithing, the prohibition of high interest rates or the provisions of the so-called Jubilee year (cf. Lev. 25:10ff) as worthy of imitation, and he proposes their acceptance for the economic circumstances of his time. These rules are convincing because of their fairness and reasonable order, but theologically, they do not possess a specific relevance.

In addition to this interpretation of the law, the instructions of the Mosaic commandments are obligatory for Christians if they are in accordance with natural law, which applies to all humans. In these cases, the criterion is the consideration whether or not those commandments can be accepted as generally "natural," as for example, Luther's concept of the protection of marriage. Here, Luther makes use of the classical perception of the ancient and medieval theology and at the same time interprets the Ten Commandments innovatively by explaining the prohibitions primarily in the sense of positive commandments or rules, and therefore considers them as concrete instructions of ethics in the spirit of love. According to his perspective, Christian action is basically determined by the commandment of love, and therefore may be necessary as well as possible to establish "new Ten Commandments."

In certain manifestations of the Reformed tradition, Old Testament ethics is considered more with regard to its particular content rather than as a general foundation of Christian ethics. Here, the biblical guidelines were usually applied in a more immediate and obligatory fashion for the respective presence, as the ban on images or the sanctification of the Sabbath (Sunday) show. This basic position left an impact on the organization of Reformed churches until this very day and had repercussions on societies as exemplified by the strict observance of Sunday as it was especially practiced up to the nineteenth and even the twentieth century by the Reformed in the Netherlands.

According to Luther, the commandments of Jesus, especially those of the Sermon on the Mount, must be distinguished from these considerations. Jesus' commandments do not apply to the general public, and therefore, they do not apply to politics either. They help, on the one hand, to recognize one's own sinfulness (*usus theologicus*), and they function, on the other hand, as examples for acting in the spirit of love within one's private life. Thus, the individual Christian may lend money from his/her private earnings even to the point that he/she may not have a chance to get any return, but with regard to the public, the Christian must engage for the protection and security of private property. The foundation of these considerations is the Reformation doctrine of the two kingdoms, which among other things accounts for the distinction of the Christian as an official person and as a private person [4]. The Roman Catholic tradition argues differently as it concentrates the relevance of the Sermon on the Mount on the spiritual and monastic life, whereas for Christians in everyday life, the Ten Commandments with their natural morality serve as a rule. The confessional plurality of the interpretations of the Sermon on the Mount can be further

exemplified by taking the Protestant free churches into consideration, which in some manifestations, such as the Mennonites, committed themselves directly to the ethos of the Sermon on the Mount and therefore decline to swear or to take up arms, for example.

These divergent references to the biblical ethos within the different Christian confessions indicate that an absolute formal authority of the biblical commandments in sense of their biblicistic relevance can hardly be claimed in a meaningful way. The Protestant principle of “sola scriptura” fulfills indeed a central role in Protestant theology within the framework of differentiated hermeneutic considerations, but not as a direct impulse for action derived from isolated biblical texts, as is the case in some free churches and in Christian fundamentalism (especially in the USA).

Such a reference to biblical ethics is highly problematic and does not do justice to the biblical texts. This can be demonstrated with the help of an analysis of the differentiation and the plurality of New Testament statements concerning ethical problems, which result from their “situational setting” [5]. In the New Testament, it is possible to distinguish a spontaneous situational ethics which is guided by the commandment of love (in this way, the ethics of the Gospel of John can be described), an ethics of Christian freedom that is fundamentally based on love and marked by a criticism of the law (this is Luther’s theological interpretation of Paul’s ethics), an ethical approach which is marked by casuistic elements in the synoptic Gospels (especially Matthew), or the ethics of the Epistle of James which refers to the Jewish piety of the poor. Therefore, a theological hermeneutic of biblical ethics must face the task to orientate itself within this diversity of New Testament ethics. The challenge consists in determining convincingly the unity, the differentiations, and, finally, the limits of the pluralism of biblical ethics.

The fundamental principle and therefore the unifying perspective of biblical ethics in all New Testament traditions is the commandment to love one’s neighbor, which is not simply mentioned as one commandment among others but is understood as the sum of the entire biblical ethos. Therefore, this commandment is the basis of all Christian ethics and must be understood as a fundamental attitude of the manner of living, including thoughts and actions (see [5], pp. 73–92). It is closely related to the “golden rule,” which classically expresses reciprocity and includes an ethics of solidarity to each other: “In everything do to others as you would have them do to you” (Matt. 7:12). The commandment to love one another, especially in its radical application to love even one’s enemies (cf. Matt. 5:44), and the “golden rule” should be reciprocally related to each other because the requirement to love one’s enemies serves as an incentive to overcome a merely utilitarian interpretation of the “golden rule.” This perspective is meant by the demand of a “better righteousness” (cf. Matt. 5:20) [6]. Consequently, the ethos of reciprocity of the “golden rule” must not be limited to “solidarity among friends” but also includes the other, even the enemy.

The fundamental direction of the New Testament ethos can thus be clearly elucidated, while at the same time, important differentiations must be made in

view of some distinctions within the New Testament which disclose a specific ethos. The different exhortations and commandments must be distinguished according to their degrees of obligation and specifications. As examples, one could think of the obligation to keep the Sabbath or the problem of eating meat that had been sacrificed to idols. The intensity of the New Testament controversies surrounding these issues can be explained by the fact that both were classic Jewish identity markers.

Even with regard to these problems, the plurality of ethical convictions within the New Testament can easily be demonstrated by taking the example of meat sacrificed to idols. A strict prohibition (e.g., Rev. 2: 14) and Paul's interpretation of Christian freedom (cf. 1 Cor. 8:4 ff.) can be found side by side. Both positions cannot be harmonized and can hardly be communicated together; yet even here, a critical boundary of plurality must be mentioned: Whenever through the eating of such meat the conscience of a Christian experiences a deep conflict, one has to refrain from demonstrative consumption because, otherwise, the Christian fellowship would, in fact, be denounced (cf. Rom. 14:1ff; 1 Cor. 8). For this reason even Paul marks a clear boundary of plurality in this regard. However, a strictly negative and a more open approach to this issue coexists within the New Testament, so that, theologically, the appropriateness of possible positions must be decided. Paul's interpretation may demand greater importance (see [5], pp. 198–201) as an expression of Christian freedom and is in line with the preaching and practice of Jesus, even though the solution of Rev 2 may be more convincing in a particular context. This New Testament way of dealing with controversial ethical perspectives can help to overcome ethical conflicts in today's Christian churches as well.

A biblically founded ethical decision cannot be reached by simply referring to particular words and letters of scripture in an authoritarian way but in detecting the direction of its impulses in processing different traditions and in handling concrete problems. Time and again, Christian ethics is faced by the challenge to clarify its specific profile which is mainly derived from Paul's interpretation of the Christ event. A fundamental criterion of its orientation will be the "peculiar freedom of Jesus" [7] regarding tradition and even regarding Scripture itself. It is of importance for the present time to interpret Christian freedom, based upon Jesus' unique freedom as a child of God, with regard to the individual's manner of life as well as the design of social institutions.

This perspective is also evident in recent theological and ethical publications that especially try to come to terms with the consequences of an historical approach to the Bible. To avoid an immediate use of particular words of Scripture for ethical decisions, it is necessary to remember a key result of the historical-critical research: "Biblical statements are to be understood first of all in their historical context" [8]. The immediate use of biblical texts would mean to declare the historical context also as binding which apparently would be very difficult, if not absurd. As a consequence of historical criticism, therefore, any reference to a particular biblical commandment does not constitute an argument for current theological ethics as the conditions of understanding as well as the social circumstances of ethical behavior have totally changed [9].

Modern societies are characterized by functional differentiation, that is, they are driven by mostly independent capital markets, by a modern economy and by science and technology. Thus, modern societies differ in a fundamental way from living conditions in biblical times. Most recent social-historical exegesis reflects more clearly than before the social and economic contexts of the biblical statements and helps to understand some specific biblical, especially Old Testament, regulations of the economy in their mode of functioning in ancient societies. Nevertheless, the relevance and meaning of these rules must be made clear in a most reflective manner. The assertion of an enduring relevance of the biblical regulations of economy [10] remains superficial, even when indicating some parallels between the beginnings of an emerging market economy in ancient times and today's social and economic situation.⁴ The agricultural production-centered, patriarchal and family-structured *oikos* economy in ancient times differs extremely in their modes of operation from the capitalist-organized global market economy of the present. Therefore, the biblical economic and social regulations can hardly be directly applied to today's problems, although one should ask for their potential of giving impulses or new ideas. The specific biblical regulations may also stimulate research of their meaning, their intentions, and their consequences regarding the conditions of social life within their contemporary context.

Therefore, Christian ethics is faced with the task to ask for biblically based standards of behavior beyond a mere "love ethic of pure spontaneity" [11], without relativizing the historical transformation of social orders and values. To achieve this end, one has to ask for the particular relevance of biblical texts; in other words, different levels of importance of biblical traditions must be established (see differences and similarities with [9], p. 213).

Of special importance are the basic texts of a Christian understanding of the world and the human condition which interpret the world as creation and the human person as a creature that is alienated from its Creator. The hope of overcoming this alienation is expressed in the message of the Kingdom of God, which Jesus proclaimed and which has already begun in his life, death, and resurrection. The hope of the Kingdom of God motivates and encourages Christians for a life in the spirit of love. This includes a responsibility for making the world a better place aiming at fragmentary realizations of the Kingdom of God.

In this perspective of Christian faith, the human person as created in the image of God is endowed with an inalienable dignity which finds expression in basic human rights as well as in a common responsibility for human life. The meaning of human rights and common responsibility is based on fundamental biblical norms such as individual freedom, solidarity as a form of love of one's neighbor, and justice as rule of organizing social institutions. In this sense, individual, social, and cultural human rights are inextricably linked. Furthermore, human rights can be specified with the help of biblical basic principles, as reflected in the Ten Commandments (cf. Ex. 20; Deut. 5) and other lists of rules (Ex. 22:24ff; Lev. 19:10, 33ff; Deut. 15:7ff; Amos 8:4ff; cf. Proverbs 23:10f et al.) [12]. These basic principles protect on the one hand the material and social life of the free, land-owning population – this is the primary function of the Ten Commandments – and on the

other hand protect the people with minor rights, the marginalized and underprivileged: in biblical times especially widows and orphans, strangers, or physically impaired people such as the deaf or the blind. The fundamental norms and the basic principles form together a kind of constitution of community life. These fundamental norms and rules are to be regarded as a kind of “basic law” of life together: the basic norms are constitutive, and the basic rules are to be looked at as a first level of specification under the conditions of ancient societies.

On a second level of importance of biblical traditions, one can find exemplary regulations for particular areas of social life of ancient societies. Especially the social and economic regulations of the Old Testament are to be remembered in this perspective. They can neither claim absolute importance in a theological sense nor should they be transferred directly to the present for reasons of their historical distance. However, according to Luther’s point of view, these regulations are to be considered as good examples for organizing the society. Thus, one can ask about the intentions of these rules. If one can argue that they are sensible and if their intentions may serve as a model under current conditions, one could search for social and economic parallels today.

Furthermore, on a third level, the Bible includes a variety of instructions concerning individual behavior. These instructions can claim importance under certain conditions for individual people. Thus, the invitation to the rich young man to sell all his possessions and give the money to the poor (Mk. 10:21) is not to be understood as a universal call for a complete renunciation of property or for leading an ascetic life. Rather, such an appeal must be interpreted as an exemplary result of the Christian attitude, which shows in a specific situation – as the historical example of Francis of Assisi demonstrates – a “freely chosen renunciation” [13] as an alternative way of living.

Finally, the Bible transmits normative statements which for reasons of theological criticism, or because of the complete change of social conditions, or because of new scientific evidence cannot be considered relevant today. This concerns the broad field of purity and dietary laws, polygamous marriage law, or large parts of martial law in the Old Testament, such as the request for enforcement of the ban. New Testament arguments can be found that criticize the relevance of these statements. On the basis of such theological insights and in view of totally different social structures, some normative statements regarding gender or sexual ethics must equally be changed. Whether certain statements of biblical writings should be subject to criticism or whether their normative importance should be accepted are debatable questions. Many controversies among Christian denominations concerning the role of women or sexual ethics show the urgency of this problem.

As result of these hermeneutical reflections, it is to emphasize that “any use of the Bible as a methodological starting-point for Christian Ethics, or a source of self-authenticating raw material, is impossible to maintain in theory and in practice is bound to impoverish both the Bible and Christian Ethics” [14]. Nevertheless, theologians should try to integrate Biblical insights into contemporary moral debates by a “relaxed and imaginative approach” because the Bible “might have the potential of enriching our ethical imagination in unexpected ways”.⁵

The following chapter is an attempt to discuss in this way biblical basic norms, principles, and statements on issues of social and economic ethics and their theological relevance and meaning in contemporary societies.

Biblical Perspectives for the Organization of Social and Economic Life

Fundamental Norms of the Biblical Tradition for Economic Behavior

According to the four levels of biblical ethical traditions and their claims to importance, it is now the task to specify those with regard to social and economic questions. On the level of the fundamental Christian view of human persons and the world, the question of the relevance of the commandment to love one's neighbor concerning economic behavior shall first be discussed. This central thought of New Testament ethics is often portrayed as opposed to a capitalistic economic system. While in the NT, the point of departure seems to be the need of the other, the modern economic system is characterized by a problematic principle, that is, the pursuit of self-interest. Self-interest is frequently identified with self-love or even with egoistic greed and is understood as contrary to the love of one's neighbor [16].

This contradiction is, however, too simple and does not do justice either to the principle of self-interest or to the commandment to love one's neighbor. Self-interest must not be equated with following one's aims in a ruthless manner; it rather presents an incentive for successful economic behavior, which may secure one's way of life and may lead, at the same time, to economic progress and a growing common economic wealth. Only an excess of self-interest is disqualified as unethical, so the classical voices of economic theory say, and must be restrained by the ethical principle of goodwill and sympathy on the one hand and by public laws and sanctions on the other hand (see [16], pp. 56–61). Also, the commandment to love one another may not be interpreted as pure altruism; it aims at integrating self-love and a behavior that may lead to overcoming the other person's poverty. Self-love "must not be suppressed, but serve as a basis for further action. Not its denial is the program, but its compensation" [17]. However, in biblical perspective, the love of one's neighbor does not serve one's own perfection like in Stoicism, but it is instead focused on the well-being of the other.

The theologian Paul Tillich took up this intention of the commandment to love one's neighbor by appreciating the individual search for self-integration while simultaneously emphasizing that "the other self [means] the ultimate limit for one's own wish to assimilate the whole world" and that "the experience of this limit [marks] the experience of the moral imperative" [18]. Through this integration of self-reference and orientation on the other person's need, the human gains a "mature relation to him/herself" (see [18], p. 270). Regarding economic behavior, this means that the "care for one's own life (self-interest) and love of one's neighbor do not exclude each other" [19]. The EKD memorandum "Common Good and Self-Interest" pointedly took up these considerations and demanded that there is the need

to develop “forms of intelligent self-interests as intelligent love of one’s neighbor” (see [13], p. 47), so that the care for one’s own life is connected with the care for the other and with respect to the common life of all humankind.

From these general considerations, ethical consequences may be derived for the economic behavior of market participants. The transaction on markets corresponds to a particular ethos of formal legality because – following Max Weber’s description of a “market community” – the exchange partners “have an interest in the continuation of the exchange relationships in the future, be it with the current partner or with other exchange partners, so that they adhere to given commitments and refrain at least from flagrant violations of mutual trust and faith” [20]. Thus, the actions on markets which are dominated by self-interests do not take place in an “a-ethical area” but require an ethical attitude, which is characterized by fairness and the will to cooperate. In the Bible, appropriate standards of behavioral norms can be found, in particular the demand of correct weights and measures: “You shall not cheat in measuring length, weight, or quantity. You shall have honest balances, honest weights, an honest ephah, and an honest hin: I am the Lord your God, who brought you out of the land of Egypt” (Lev. 19:35f). The mutual trust in economic transactions is based on mutual fairness which was in ancient times mainly realized through “honest” weights and measures. This attitude of reliability of mutual agreements finds an expression in the traditional German merchant rule “Auf Treu und Glauben” (“in good faith”) even at present. To support this attitude, one can refer to the commandment of the love of one’s neighbor and especially to the “golden rule” (Matt. 7:12), which have proven to be fundamental, especially for economic behavior.

Equally fundamental as the commandment to love one’s neighbor are in an ethical perspective the biblical considerations about the importance of human labor and the protection of property.

According to biblical understanding, labor is the mandate of the creative God to the people whom he created in his own likeness (Gen. 1:26f). God himself is described as active, when, for example, he puts the stars in the sky (Gen. 1:16f). The mandate to work is a fundamental characteristic of human life and corresponds to the acting and actively engaged God: humankind receives the mandate to have dominion over the world (cf. Gen. 1:28 f.) and to till and keep the Garden of Eden (Gen. 2:15). As trustees, humans are supposed to take tender care of God’s creation while they remain dependent upon the blessings of the Creator. God’s blessing makes the plants grow for humans and animals; both are under the direct blessing of God’s promise (Gen. 1:22 and 28). Even after the expulsion from Paradise, which entails the curse of the land (Gen. 3:17), humanity remains under the blessing of the Creator’s promise (Gen. 9:1), although now labor is experienced in the tension between blessing and curse. Thus, the ambivalence of human labor is accurately expressed because it is commonly experienced by individuals in the tension of hardship and burden on the one hand (cf. Ps. 90:10 “toil and trouble”) and of self-development and success on the other hand. With regard to the social effects of labor, there is the ambiguity of successfully shaping the world and of problematic world destruction. That caring for the world may have destructive results is shown

in the Bible through its critical perspective on megaprojects of the ancient world (cf. Gen. 11:1 ff. “tower of Babel”; Ex. 1:11ff “ruthless Egyptians”).

The biblical appreciation of human labor as told in the creation accounts corresponds to the biblical images of hope for the fulfillment of creation: Unlike in ancient utopias that tell the hope of the liberation of humankind from work all together (as, e.g., Virgil), the biblical images of hope describe the liberation of human work from the curse, that is, from subjugating coercion and exploitative structures. Fulfillment means that people can work without coercion and enjoy the fruits of their labor.

In biblical perspective, all human activities which are performed in the service of common human life according to the mandate of dominion are expressions of the divine mandate, regardless of their degree of compensation. The blessing of God and the labor of humans are closely related to each other, as the parables of Jesus show. Although labor cannot adduce or ensure the identity of human beings, it nevertheless is part of the fundamental fact of their existence and remains “as a target-oriented activity in dealing with the gifts of nature fundamental for his own well-being in this world” [21]. Hence, labor is a necessary human action, from which no one who can actually work shall withdraw. This duty to work is underlined in many passages of the New Testament (2. Thess. 3:10; 1 Thess. 2:9; Acts 20:35; 1 Cor. 9:3 ff. et al.) in order to enable individual and collective human life.

In addition to the dignity of human labor, its limits must also be emphasized, as it is already discussed in the first creation account, where the limit finds its expression in the commandment of the Sabbath. In this perspective, labor and rest are a unity: On the seventh day, God rested from all the work that he had done in creation, and so he completed his works (Gen. 2:2). Labor and rest are not considered as contradictory in themselves – as the strict opposition of leisure and labor in the Greek tradition assumes – but as complementary. Resting can be described as completion of labor; labor without resting would be incomplete and would prevent the fulfillment of work. In a historically unique way, the biblical tradition protects the Sabbath resp. Sunday and the holiday because these interruptions of the working rhythm enable the experience that humans are more than their work; at the same time, labor finds its “measure and order” (see [13], p. 115) through the Sunday.

It is one of the basic assumptions of the biblical tradition that the work which humans must perform in order to fulfill the Creator’s command is to be totally distinguished from slave or compulsory labor. At the beginning of the Exodus tradition, the experience of suffering through slave labor is mentioned, which is overcome through divine intervention (Ex. 3:7ff). Consequently, the Exodus motif which is fundamental for the Old Testament tradition must be interpreted as essentially a liberation from the “slave house of Egypt,” literally “from the work-house” of Egypt.

Labor is the basis for the formation and growth of private property, and in this assessment, the biblical perspective is similar to modern thinking. If there are just social conditions, the workers will enjoy the fruits of their labor, and they will enlarge their possessions. The Bible perceives this as an effect of divine blessing.

The biblical statements on property must be interpreted under the assumption that there is no abstract concept of property but that there is a linguistic distinction between the ownership of animals, land, household, goods, etc. The basic forms of property are the property of animal and of land, which is the reason why most of the statements in the Old Testament refer to these two forms of ownership. Today, the significance of these forms of ownership is limited; nevertheless, the biblical statements are widely applicable to a theological understanding of property.

The fundamental presuppositions of the Old Testament's considerations on property are theological confessions. The confession of God as the Creator implies that heaven and earth and all that is therein belongs to him (cf. Deut. 10:14f, Ps. 24:1, etc.). God is the ultimate owner of all of his creation. This faith in God as creator sets limits as far as the human control over creation is concerned as it is explicitly mentioned by reference to the independent right of wildlife (cf. Job 38f, Ps. 104). In this respect, an absolute right of property as expressed in the Roman "*ius utendi et abutendi*" is considered inappropriate. Property, especially private property, is always to be understood in relation to God and to one's neighbor.

The specific regulations at that time (see section "[Exemplary Social Regulations in the Biblical Traditions Within the Context of Ancient Societies and Their Meaning Today](#)") have today to be seen and to be appreciated as exemplary implementations of this thinking in ancient society. The basic intention of the Old Testament concept of property can best be described by referring to the postulates of social obligation and of ecological sustainability [22].

Under the condition that an absolute understanding of property is theologically relativized, the protection of property is widely discussed in the biblical scriptures. Beginning with the oldest collection of laws in the Book of the Covenant (Ex. 21–23), a large section is devoted to property crimes (Ex. 21:37–22:16). Essentially, the indemnification for stealing and the compensation of property are listed, and especially ownership of livestock is put under protection (Ex. 21:37ff). In a fundamental way, the protection of property is referred to in the Ten Commandments, and in two of the Commandments, this protection is mentioned explicitly. In Exodus 20:15 (par. Deut. 5:19), the verb "stealing" is used without an object, so that any form of stealing is prohibited as a violation of the legal order. Any unlawful damage to one's neighbor's property is thus excluded so that the basis of one's existence is safeguarded. The protection of property is reinforced in Ex. 20:17 (par. Deut. 5:21), where even the "desire" of basic forms of ownership of one's neighbor is explicitly prohibited. "Desire" in Ex 20:17 means not so much an envious disposition but – in accordance with the original Hebrew word – a planned and executed attack on someone's property. Only the later version Deut. 5:21 takes a strong desire also into account. As all the possessions are listed in this commandment, any possible attack on any property of one's neighbor is thereby totally excluded (see [12], pp. 72f, 75–78).

Property is no less protected in the New Testament. The prohibition of stealing is reiterated by Jesus; in Luke 10:19, it is expressed very pointedly and mentioned twice with differing wordings. However, the effort to maximize one's wealth (cf. Lk. 12:16–21) and the constant efforts to ensure one's wealth (Mt. 6:19) are

condemned with a noticeable ironic undertone as a wrong attitude toward one's life. Jesus clearly warns against the deceitfulness of riches (cf. Mk. 4:19) and the problematic orientation of one's lifestyle around "earthly treasures" (Math. 6:19–21). This idea is put straightforward in Math. 6:24: "No man can serve two masters: for either he will hate the one, and love the other; or else he be devoted to the one and despise the other. You cannot serve God and mammon." From this insurmountable contrast, it is evident that in the relationship to possessions, both the human condition and the service humans owe to their creator are at stake. When money and property turn into Mammon and therefore to the ultimate point of reference of the human person, access to the Kingdom of God is impossible (Mark 10:25).

Exemplary Social Regulations in the Biblical Traditions within the Context of Ancient Societies and Their Meaning Today

The basic rules of biblical social and business ethics were concretely realized through a variety of exemplary regulations within the context of their time. Because the social and economic situation has since been completely changed, these practical arrangements are no longer applicable today. However, it is important to understand their intentions and to look for equivalents in the present.

The land, that is, in particular the ownership of soil and other forms of real estate, is a hereditary gift from God (cf. Deut. 4:38.) that secures the material basis of Israel's existence, especially of the tribes and their families. As a peasant's private property (the so-called patrimonium), it was to be held in permanent possession, that is, the free sale of this property was limited by the right of preemption, and clan members had the duty to buy it back in case of indebtedness (cf. Jer. 32:6f). These regulations are in insoluble tension to the modern idea of private property. It was the intention of these regulations to secure the land permanently for the families and clans as it was then the determining factor of an independent and autonomous way of living. Today, this is realized through access to paid work. In order to realize the intention of the biblical regulation today, it would be imperative to qualify people for the job market and, at the same time, to open up possibilities of jobs for those who have at times or permanently been out of work. Such an attempt could possibly be realized through publicly funded employment programs.

Another biblical feature is the relativizing of private property as the following example from Deut. 23:24f shows: "If you go into your neighbor's vineyard, you may eat your fill of grapes as many as you wish, but you shall not put any in a container. If you go into your neighbor's standing grain, you may pluck the ears with your hand, but you shall not put a sickle to your neighbor's standing grain." This regulation amounts to a criticism of Roman rights of property. Anyone is allowed to take fruits for the immediate need because the vineyard and the grain field of the neighbor are part of God's gift. In modern times, a reflection of this regulation is the approval of the theft of food by starving people. Today, however, this is no longer a natural right, as in the Old Testament, but an exception for which good reasons must be found.

Besides, the religious and socially motivated tax practice makes the meaning of property in the Old Testament clearer. The starting point is the ritual visit of the temple three times a year for the great festivals which are determined by the harvest seasons (see Ex. 23:14–17; 34, 18, and 22ff; Deut.16:16.): The feast of unleavened bread at the beginning of the grain harvest, the Feast of Weeks at the end of grain harvest, and the Feast of Tabernacles. It was obligatory to participate in these festivals, and it is written three times in the Old Testament (Ex. 23:15; 34:20 and Deut. 16:16): “One should not appear before my face empty-handed.” Thus, the idea was institutionalized that everyone had to return parts of the land and its fruits to God.

A further development which in historical perspective can hardly be overestimated is the practice of tithing. Since the times of monarchy, the “Tenth” was originally in Israel a kind of tax on the yields of the harvest; it may well have been both a state tax for the royal family and a gift for the temple cult. This institution was considerably changed by the Deuteronomist Reform in the sixth century BC. From then on, for 2 consecutive years, the “Tenth” of the harvest was to be consumed at the temple in Jerusalem. Thus, it was no longer a state tax but totally devoted to financing the festivities at the holy temple (cf. Deut. 14:22ff). During the third year, the “Tenth” should be spent for strangers, widows, and orphans (the socially most vulnerable groups in ancient societies) at their homes, as well as for the landless Levites (cf. Deut. 14:28 f.). In addition a significant development of the Deuteronomist Reform must be mentioned. Even for the temple feasts, all people began to be invited, especially widows, orphans, and even slaves and strangers. Therefore, the religiously motivated “Tenth” was not only a return to God or to serve the maintenance of the royal family and the cult personnel, but it also became a regular and expected gift for helping underprivileged groups. For this reason, this rule is in world history the first traceable social tax and a proof of the social responsibility of property in biblical times [23].

In addition to these regulations, further regulatory mechanisms can be found in the Old Testament which underline the attitude that private property carries with it a social responsibility. Especially the Jubilee year at the end of seven cycles of Sabbatical years must be mentioned. In the Jubilee which would regularly occur and was therefore predictable for creditors and debtors alike, all debts were to be canceled. In ancient economies, the problem of indebtedness was often dramatic and must be seen as a major threat to an autonomous way of living. Frequently after bad harvests, people had to ask creditors for help with the dire consequence of total financial dependency which could result in the creditor’s sons and daughters or the creditor himself being forced into slavery (cf. Neh. 5:1–5). Accordingly, the discussions concerning indebtedness and its cancellation played a central role in ancient societies.

The regulations of the Old Testament pointed a way out of this often inescapable cycle of indebtedness and enslavement by developing the old institution of the Sabbatical. The Sabbatical, initially a year in which the land was required to be left fallow, was extended to the rapidly escalating problems of indebtedness and

slavery. Slaves – although only Hebrew slaves as members of the people of Israel and thus as true “neighbors” – had to be released in the seventh year. They were to receive some basic supplies to help them start a new life (cf. Ex. 21:2ff). Later, this regulation was to include Hebrew slaves who were to be treated like indentured servants and also set free during the seventh year.

Furthermore, the attempt was made to solve the issues of indebtedness and slavery with the help of a 7-year cycle: “Every seventh year you shall grant a remission of debt. And this is the manner of the remission: every creditor shall remit the claim that is held against a neighbor, not exacting it of a neighbor, who is a member of the community, because the Lord’s remission has been proclaimed” (Deut.15:1 f).

That this remission of all obligations was put into practice in Israel, at least in certain times, can be derived from Neh. 10:32 as well as from Deut.15:9: “Be careful that you do not entertain a mean thought, thinking, ‘The seventh year, the year of remission, is near’, and therefore view your needy neighbor with hostility and give nothing; your neighbor might cry to the Lord against you, and you will incur guilt.” Obviously, the willingness to lend money declined rapidly shortly before the appointed Jubilee, so that this particular admonition was thought necessary. In view of this situation, Deuteronomy calls upon creditors to grant a loan even within a short period before the seventh year so that the necessities of life can be obtained. The reason for this attitude is as follows: “Give liberally and be ungrudging when you do so, for on this account the Lord your God will bless you in all your work and in all that you undertake” (Deut.15:10). The blessing of God, the giver of all gifts, is based directly on the willingness to help the impoverished neighbor. Once again, the close connection between theological statements of belief and social practice becomes evident (see [23], pp. 262–268).

Finally, the regulations in Leviticus 25 must be discussed; it is one of the youngest texts of the Old Testament with specific economic regulations. Based on the regulations of the Sabbatical years, rules are laid down for a great Jubilee in verses 8–34. In essence, the aim of the Jubilee is a periodic restitution: Everyone shall return to his property and to his family after seven times 7 years. The institution of a Jubilee is to grant every person a chance for a new beginning every 49 years. This idea that every person is given a periodically recurring opportunity for a new beginning is obviously determined by the social postulate of an egalitarian society.

The specific formulation of these regulations is rooted in an economically comprehensible argument: The amount of money for buying and selling is guided by the great Jubilee. Buyer and seller must include in their negotiations the expected Jubilee: “When you buy from your neighbor, you shall pay only for the number of years since the jubilee; the seller shall charge you only for the remaining crop years. If the years are more, you shall increase the price, and if the years are fewer, you shall diminish the price; for it is a certain number of harvests that are being sold to you” (Lev. 25:15 f.). Interestingly, urban residential buildings are exempt from the rules of the

Jubilee (cf. Lev. 25:30), so that the biblical text clearly reflects the difference between agricultural and urban conditions of living [24].

Whether or not these regulations were ever realized is unknown. The information given in Neh. 5:11 could be a one-time restitution in the perspective of Lev. 25. As there are no other examples, the idea of a periodic restitution probably remains a mainly utopian ideal. Jesus included in his inaugural sermon in Nazareth (Luke 4:19) the announcement of a great Jubilee as found in Isaiah 61:2. This is part of his proclamation of the Kingdom of God. Therefore, the idea of a Jubilee is deeply rooted in the biblical tradition, although there are no demands for its concrete realization in the New Testament.

If one interprets the regulations of the Jubilee – as indicated above – in the sense of a right to a new beginning, the question may be asked if this could be applied today and new institutional arrangements could be found. One example would be the German “Privatinsolvenzrecht” (a law to help insolvent consumers), which has been in effect for about 10 years. Faced with a dramatic increase of heavy indebtedness of private households in the Federal Republic of Germany, this regulation was instituted to help “the honest debtor” after a time of good behavior “to get rid of his remaining liabilities” (§ 1 Insolvency Act). Similar to the Old Testament rules, this law is to enable heavily indebted individuals to begin a new economic and social life. It can be understood as a modern implementation of the intentions of the biblical law.

Finally, some surprisingly interesting information on the relationship between ecology and economy can be found in the Bible. A difficult passage in the Book of Job (31:38–40) says that the “land cried out” against its owner and refused to bear fruits, if it is not treated properly. Here, one finds the idea that a part of the economic product should be redirected to nature as a basis for future products. Furthermore, the sermon of God in the Book of Job (Job 39f) and Psalm 104 indicates that not all creation is made for the benefit of human beings [25]. In this perspective, for example, the creation of the Leviathan (Job 40:25ff, Psalm 104:26) defies the principle of rationality or the principle of human usability. Instead, these biblical texts clearly mark the limits of human power over creation. Based on this idea, one should discuss and set limits to the human use of nature today.

Individual Case–Related Demands of the Biblical Ethos

In contrast to section “[Exemplary Social Regulations in the Biblical Traditions Within the Context of Ancient Societies and Their Meaning Today](#)”, where historic regulations of the Old Testament, their intentions, and their present meanings were discussed, other demands can also be found in the Bible that apply only to specific situations or to individuals. A typical example is the story of the “rich young man” (cf. Mk. 10:17ff), whom Jesus asks to sell all his possessions and give the money to the poor. This demand is based on the specific situation of the “rich young man,” who only through this act can prove the seriousness of his desire for discipleship. However, the story of the conversion

of Zacchaeus shows another way of being a disciple of Christ. He paid back four times as much to those whom he defrauded and gave half of his possessions to the poor (Luke 19:8). Therefore, a basic principle of the biblical message is the willingness to support the poor or the congregation and to behave correctly in everyday business life. An ascetic way of living is not necessarily connected with the discipleship of Christ, but in individual cases, it can be a freely chosen way as exemplary form of Christian existence. Even the situation in the early church in Jerusalem may serve as a proof of this thesis. Their community of goods was not caused by a general obligation to get rid of all possessions. Ananias and Sapphira were not punished because they held back some of the proceeds when they sold a piece of property but because they lied in front of Peter and the church (cf. Acts 5:1 ff).

If taken together, Christians understand material goods as an expression of God's blessing. However, these goods do not guarantee the promised fullness of life (see Mark 8:36). On the contrary, the orientation of life around material goods is seen as a great danger because one may forget the needs of the others (cf. Luke 12:13ff). More generally, greed is criticized as a root of all evil (cf. 1 Tim. 6:10) or as idolatry (see Col. 3:5; Eph. 5:5, etc.). To overcome these dangers of private property and wealth, Christians have to be prepared in their private lives to help others in time of need without thinking of their own interests first; this is the meaning of Luther's fundamental distinction between the life of Christians in public office and as a private person. Some of the demands of the Sermon on the Mount must thus be understood, that is, to give freely to those who are in need (cf. Matthew 5:42; 6:19) or to lend money without charging interest (see Luke, 6:34). These options are not general rules but individual ways of living as a disciple of Christ.

The Prohibition of Interest in Ancient Societies and Changed Economic Conditions Since Early Modernity

The increasing importance of money marked a new level of economic activity in ancient societies which led to increasing social inequality. In view of this situation, specific regulations were introduced into the Old Testament codices of law with the express aim to limit structures of power and dependency caused by a monetary economy. In ancient times, interest rates could often be as high as 50% or 60%, and, therefore, the prohibition of interest was a method to avoid extreme poverty and indebtedness.

In the Book of the Covenant (Exodus 21–23), it is prohibited to take any interest from the poor: "If you lend money to my people, to the poor among you, you shall not deal with them as creditor; you shall not exact interest from them" (Ex. 22:25). This text explicitly refers to the connection between poverty, which necessitates the borrowing of money or seed, and the tightening of the plight through usury, which was frequently to follow. The later codices of law in the books of Deuteronomy and Leviticus no longer speak of the "poor" as recipients

of loans but, in general terms, of the “brother” as another Israelite (cf. Deut.23:19). By the prohibition to charge interest, citizens in distress should be given the opportunity to rectify their situation. However, it should be noted that the range of this prohibition was limited to people of Israel (cf. Deut. 23:21) (see [23], pp. 217–219, 232).

The prohibition to charge interest was theologically justified. Lev. 25:38 reminded the people that God had brought them out of the land of Egypt and given them the land of Canaan. This liberation from slavery was not to be reversed by economic indebtedness. Deut. 23:21 combines the blessing of God – that is, a good harvest or farming year – with the prohibition of charging interest. Those who hope for the blessing of God may not lead their neighbors into economic dependency.

Prohibition to charge interest was a concrete expression of the social obligation of property in ancient times. The right of the economically stronger person was to be limited with regard to the right of existence of the poor. In the preaching of Jesus, the prohibition to charge interest is taken for granted; even the lending of money without expecting anything in return is proclaimed (cf. Lk. 6:34 f).

In church history, following both the biblical tradition and the Aristotelian philosophy, the prohibition to charge interest was strictly enforced up to the late Middle Ages. Gradually, however, because of scholastic theology and Luther’s thinking, the situation was changed. A new level of discussion was achieved through John Calvin, who approved taking interest under certain conditions. Calvin argued against Aristotle that the taking of interest is clearly not “against nature” since money was not unproductive, as Aristotle had claimed, but “that one could make very lucrative business with money” [26]. Calvin unconditionally accepted the possibilities of productive dealings with money and authorized the charging of interest as an economic incentive for improving the general supply of commodities. Thus, money can generate money; money, not least, is necessary for people to find employment so that they can earn their living.

In his opinion, the biblical prohibition to charge interest was to protect “poor people,” but “the taking of interest is well permitted, when one does business with wealthy people” (see [26]). Thus, Calvin differentiates between the social basis of the prohibition to charge interest in the Old Testament and the economic situation of his time. Interest can be understood as a proper share in a business profit using other people’s money.

According to Calvin, the best way to arrange the interest rate is by referring to the “golden rule,” so that creditors and debtors are newly challenged every time they enter into a contract to examine the situation in detail and to evaluate the appropriateness of interest rates. Calvin’s intention was to distinguish interest rates from all forms of usury. Therefore, the interest rate must never exploit the misery of others. Given the complexity of the circumstances and the risk of misuse, the distinction between the legitimate interest and usury remains a problem. This distinction must be clarified time and again and remains a task of permanent moral education of the economically active person.

To limit the dangers of misuse, a maximum interest rate was fixed in Geneva during Calvin's lifetime and possibly approved by himself at 5% which was increased in 1557 to 6.66%. In Geneva, efforts for moderate interest rates were generally made; they differed significantly from officially prohibited, yet, in reality, very high interest rates in other communities. Calvin supported lowest possible interest rates since his fundamental concern was the idea of a social balance between creditors and debtors to avoid a social gap between the rich and the poor. Through the approval and state regulation of interest rates, Calvin's ethical demands are, in the words of Josef Bohatec, "not just an effective step towards the liberation of economic life from traditional inhibitions, but also a way to open business life for new moral standards" [27].

Gradually, an "interest economy" was approved in Europe since the early modern period. This led, in effect, to moderate interest rates; thereby, the intention of the Bible and of church tradition which both remarkably condemn usury was better realized than by a strict prohibition to charge interest rates. This may serve as a good example of how a repeal of biblical rules, in this case the prohibition to charge interest rates, maintains precisely its intentions and enables successful economic activities.⁶

Conclusion

In order to summarize the meaning of biblical foundations of economic ethics, it is helpful to distinguish at least four levels of importance: The basic principles (see section "[Fundamental Norms of the Biblical Tradition for Economic Behavior](#)") express the biblical view of human life, which can be made plausible today. Besides, there are regulations that are derived from these basic principles but clearly apply only to a particular time and context. They either have heuristic value (see section "[Exemplary Social Regulations in the Biblical Traditions within the Context of Ancient Societies and Their Meaning Today](#)") or they should be removed provided that good reasons can be given and that their original intentions are taken into account (see section "[The Prohibition of Interest in Ancient Societies and Changed Economic Conditions Since Early Modernity](#)"). Finally, there are claims for specific situations and individuals, which may be accepted case by case (see section "[Individual Case-Related Demands of the Biblical Ethos](#)").

In addition to the biblical regulations of business ethics, there is a broad field of problems that could not be within the scope of biblical authors. Thus, no direct input of biblical regulation can be found for many questions of modern business ethics. Therefore, it must be discussed how far the basic principles of biblical ethics may serve as normative guidelines for Christian ethics. It is the task of theological reflection to relate this perspective to current questions of social and business ethics. Therefore, "Scripture alone is never the final court of appeal for Christian ethics." But its "understanding of God and his purposes, of man's condition and needs, of precepts, events, human relationships . . . do provide the basic orientation toward particular judgments" [28].

Abstract

This chapter discusses the contribution of Christian metaphysics to the concept of business ethics and puts forward the following theses: (1) Christian metaphysics supports the *ontological* assumption that there is a God, and reasonable theistic ethics has the concept of God, which is the ideal observer regarded as actual (“moral realism”). Despite this moral realism in theistic ethics, *epistemically* the point of “moral realism” does not obviate the need for rational deliberation about ethical issues. (2) We have to distinguish between the level of *justification*, the level of *application*, and the level of *implementation*. The business of comprehensive doctrines like Christian metaphysics is primarily located on levels of justification and application. (3) There always has been, and there still is, a certain, limited impact of religion(s) on the economic sphere. As a result, the global economic system has become “pluralistic capitalism.” (4) If these effects of religion(s) on the economy are (economically) productive ones, their impact on business activities becomes “spiritual capital.”

Introduction

Religions are comprehensive worldviews which involve the notion of an ultimate reality. This stands in contrast to the “ultimate reality” of the natural sciences, where the “[u]ltimate reality [. . .] is the reality described by chemistry and physics” [1], the “ultimate reality” of religions – whether it is God in the theistic religions or nirvana in Buddhism – is an evaluative concept: “In full-fledged religions, the ultimate reality with which harmony is desired is explicitly conceived to be *holy* or *sacred*” ([2], p. 12; [3]).¹ According to religious worldviews, the evolution of the

e-mail: schramm@uni-hohenheim.de

universe is not just a succession of bare facts, because there is an ultimate reality, which is conceived as the holy soul of the world and which qualifies “the world as a realm of adjusted values, mutually intensifying or mutually destructive” ([3], p. 59; [4]).²

Because this idea of an ultimate or divine reality is an evaluative concept, all contemporary world religions contain certain *ethical* belief systems. And it is this feature of the religious worldviews in which their relevance for the construction of social institutions in modern societies, including the institutions and organizations of the economy, is founded.

Modern Christian Metaphysics

There are two reasons why it is reasonable for religions to generate a rational metaphysical system to justify their beliefs:

- One reason is a *theological* one: Religions need a theology to validate the theological and philosophical reasonableness of their assumptions. “Thus rational religion must have recourse to metaphysics for a scrutiny of its terms” ([3], p. 79).
- And the other reason is a *political* one: Modern societies are inevitably pluralistic societies. And in view of the fact that there is a variety of different and incompatible worldviews and religious, philosophical, and moral values, we need a political conception for social coexistence that is supported by these different worldviews. As John Rawls put it in his concept of “political liberalism”: We need an “overlapping consensus,” which is affirmed by the different “comprehensive doctrines” (e.g., religious worldviews) (cf. [5]). And it is pretty clear that only rational religious worldviews, backed by a reasonable metaphysics – in Rawls’ words: only “reasonable comprehensive doctrines” – are capable of supporting this modern “overlapping consensus” (cf. [5], p. xvi f.). “A modern democratic society is characterized not simply by a pluralism of comprehensive religious, philosophical, and moral doctrines but by a pluralism of incompatible yet reasonable comprehensive doctrines. No one of these doctrines is affirmed by citizens generally. Nor should one expect that in the foreseeable future one of them, or some other reasonable doctrine, will ever be affirmed by all, or nearly all, citizens. Political liberalism assumes that, for political purposes, a plurality of reasonable yet incompatible comprehensive doctrines is the normal result of the exercise of human reason within the framework of the free institutions of a constitutional democratic regime. Political liberalism also supposes that a reasonable comprehensive doctrine does not reject the essentials of a democratic regime. Of course, a society may also contain unreasonable and irrational, and even mad, comprehensive doctrines. In their case the problem is to contain them so that they do not undermine the unity and justice of society” (cf. [5], p. xvi f.). So, only rational religions are able to make a constructive contribution to the stable flourishing of modern societies – and therefore, rational metaphysics is needed.

Metaphysics

There is no way to escape “metaphysics.” There are, of course, some philosophers who are in favor of a “post-metaphysical thinking” or a “post-metaphysical culture” (cf. [6]; [7]), but they use the term “metaphysics” in a different way than I do. For them, “metaphysics” is a premodern and idealistic matrix for one’s thinking, a tendentially totalitarian and therefore outdated worldview, in which everybody and everything has to fit in. In contrast to these philosophers, I am using the term “metaphysics” in a strictly *epistemological* sense. In this context, Karl Popper’s philosophy of science distinguishes three types of theory: “*First*, logical and mathematical theories. *Second*, empirical and scientific theories. *Third*, philosophical or metaphysical theories” [8]. It is the empirical falsifiability which distinguishes scientific theories (natural sciences) from metaphysical theories: “According to this view [. . .] a system is to be considered as scientific only if it makes assertions which may clash with observations” ([8], p. 256). While theories of natural sciences are therefore empirically falsifiable, it is the characteristic of metaphysical theories that they are not falsifiable empirically: “[N]on-testable theories [. . .] may be described as metaphysical” ([8], p. 257). According to Popper, “philosophical theories or metaphysical theories will be irrefutable by definition” ([8], p. 197).

But that does not mean that they are senseless or useless. Quite contrary to any positivistic rejection of metaphysical statements, Popper considers them as very important: “But metaphysical hypotheses are important for science in at least two ways. First of all, in order to have a general picture of the world we need metaphysical hypotheses. Secondly, in the actual preparation of our research we are guided by what I have called ‘metaphysical research programmes’” [9]. Popper regarded even Darwinism not as a testable scientific theory, but as a metaphysical research program: “And yet, the theory is invaluable. I do not see how, without it, our knowledge could have grown as it has done since Darwin. In trying to explain experiments with bacteria which become adapted to, say, penicillin, it is quite clear that we are greatly helped by the theory of natural selection. Although it is metaphysical, it sheds much light upon very concrete and very practical researches. It allows us to study adaptation to a new environment (such as a penicillin-infested environment) in a rational way: it suggests the existence of a mechanism of adaptation, and it allows us even to study in detail the mechanism at work” [10].

Popper explicitly showed that the God hypothesis (“There is a God.”), which he calls “the arch-metaphysical assertion” ([8], p. 275), “can be constructed as a well-formed or meaningful sentence” ([8], p. 275) – although this “arch-metaphysical formula cannot be submitted to any scientific test: there is no hope whatever of falsifying it [. . .]. For this reason I describe it as metaphysical – as falling outside the province of [*natural*] science” ([8], p. 276). But a nonscientific theory (a theory that does not belong to the realm of *natural* sciences) need not be irrational: “[E]very rational theory, no matter whether scientific or philosophical, is rational in so far as it tries to solve certain problems. A theory is comprehensible and reasonable only in its relation to a given problem-situation, and it can be rationally discussed only by

discussing this relation” ([8], p. 199). And may be this, “the arch-metaphysical assertion” – the theological God hypothesis – is a rational and metaphysical research program, too, because it is capable of solving certain problems much better than other metaphysical systems. For materialistic philosophies, say – which are other examples of “metaphysical” doctrines – the ontological status of numbers is a more or less unsolvable problem. As philosopher Reuben Hersh declares: “Ideal entities independent of human consciousness violate the empiricism of modern science” [11]. But numbers *are* “ideal entities” – and at the same time there is a metaphysical necessity to assume the objective existence of numbers. As philosopher Colin McGinn puts it: “Abstract things exist necessarily. [. . .] In every possible world it seems like numbers have to exist and logic has to exist [. . .]. There’s got to be logic and numbers. Because they have that kind of completely necessary existence everywhere. Every world contains numbers” [12]. So, despite the fact that, with regard to mathematical objects, materialistic metaphysics has run out of steam, Quine is affirming an exceptional existence of numbers simply on the basis of his “indispensability argument”: “Physicalism [. . .] is materialism, bluntly monistic except for the abstract objects of mathematics” [13]. But how is it possible for numbers to exist in a materialistic universe? Quine “clarifies” this problem with the following “explanation”: “Physical objects in this generous sense constitute a fairly lavish universe, but more is wanted – notably numbers. Measurement is useful in cookery and commerce, and in the fullness of time it rises to a nobler purpose: the formulation of quantitative laws. So we assume abstract objects *over and above* the physical objects” [14]. Because it is not reasonable to accept an “explanation” this flabby, process philosopher Alfred N. Whitehead introduces the God hypothesis into the metaphysical interpretation of the universe: “Everything must be somewhere [. . .]. Accordingly the general potentiality of the universe must be somewhere [. . .]. This ‘somewhere’ is [. . .] the primordial mind of God” ([15], p. 46).

So, on the one hand, metaphysics is inevitable – we need metaphysical hypotheses; on the other hand, we always have to ask if the metaphysics in question is reasonable, that is, if it is really problem-solving. Precisely in this sense, Alan Greenspan, former Chairman of the Federal Reserve of the United States from 1987 to 2006, used the term “ideology” for a mental framework that is meant to solve certain problems in the area of modern economy (respectively financial markets) – and that can fail dramatically. In October 2008, Greenspan declared (“Greenspan’s Confession”): “[A]n ideology is [. . .] a conceptual framework with the way people deal with reality. Everyone has one. You have to exist, you need an ideology. The question is whether it is accurate or not. And what I’m saying to you is, yes, I’ve found a flaw [. . .] a flaw in the model that I perceived as the critical functioning structure that defines how the world works, so to speak. [. . .] That’s precisely the reason I was shocked, because I had been going for 40 years or more with very considerable evidence that it was working exceptionally well” (See, e.g., [16]). In addition, “Greenspan’s Confession” reminds us of a serious danger of any “ideology” or “metaphysics”: “The defect of a metaphysical system is the very fact that it is a neat little system of thought, which thereby over-simplifies its expression of the world” ([3], p. 50, p. 79). Without doubt, this applies to every religious metaphysics, too. Despite the fact that religions in particular often gave in to the temptation to

imagine that their dogmatic worldviews are infallible (usually referring to revelations), it is important to realize that all the attempts to create Christian metaphysics are hypothetical and refutable constructs.

Christian Metaphysics and Theistic Ethics

Christian metaphysics supports the ontological assumption that there is a God and therefore an objective moral order, too. Nevertheless, even religious metaphysics has to concede that this moral order is not in plain view. There may be moral facts, but epistemically it is up to us to put forward some ideas about this moral truth. And indeed, Christian metaphysics represents some crucial suggestions about the divine and moral structure of the universe.

Christian religion involves a *theistic* view of the world and therefore supports the *ontological* assumption that there is a God. And because this God is seen as the epitome of goodness, the ultimate reality of the universe embodies a moral order. Contrary to this theistic conjecture, most modern worldviews assume that there are no objective values. As physicist Steven Weinberg put it trenchantly: “It is wrong to torture children. And the reason it is wrong to torture children is *because I say so*. [...] I mean that not only I say so, [...] probably most of us say so. But it is *not a moral order out there*. It is something *we impose*” [17]. The world as such is seen – in Max Weber’s words – as “ethically irrational” ([18], p. 122). So, there is a broad consensus among nontheistic philosophers that the universe as such contains no moral order. For example, John L. Mackie declared clearly: “There are no objective values. [...] [V]alues are not part of the fabric of the world” ([19], p. 15). The ethical distinction between right and wrong is an invention, made by humans. As John Rawls put it: “Apart from the procedure of constructing the principles of justice, there are no moral facts” [20]. The *ontological* assumption that there are no objective values implies the *epistemical* conclusion that there can be no such thing as “moral realism”: “there are no moral facts, no moral truths, and [therefore] no moral knowledge” [21]. From an atheistic point of view things could not be different, because only “if the requisite theological doctrine could be defended, a kind of objective ethical prescriptivity could be thus introduced” ([19], p. 48).³

If Christian religion encourages – in contradiction to this view of the world’s ethical irrationality – a morality-supporting cosmology, of course the problem of moral *heteronomy* immediately arises. The two background problems are Plato’s famous dilemma and the notorious “is-ought” problem:

- Plato’s argument consists in the dilemma that theistic ethics either has to say that the good is good merely because God wills it – this would make the good arbitrary, or that God wills the good because it is good in itself – then the good would be independent of God.
- If theistic ethics would make, first, an *is*-statement about the will of God, and would then declare that everybody *ought* to obey this will of God, then “we would still need an independent argument that we ought to obey the will of God” ([2], p. 314).

Modern Christian ethics has to be very clear about this issue: This independent argument has to be a genuine *ethical* argument, because if the only reason why we ought to obey God's will would be to gain heavenly rewards or to avoid eternal punishment, then on the one hand God would be nothing but a blackmailer, and on the other hand we would, morally, be "a sorry lot indeed" [22]. So, it is fairly clear that "Theistic Ethics without Heteronomy" [23] is needed. The moral order which is embodied in the ultimate reality of the universe (God) cannot be arbitrary.

An answer to this (alleged) "dilemma" can be given in terms of the ethically pertinent "ideal observer theory" or the theory of the "impartial sympathetic spectator": "The main idea [of this 'ideal observer theory'] is that ethical terms should be defined after the pattern of the following example: 'x is better than y' means 'If anyone were, in respect of x and y, fully informed and vividly imaginative, impartial, in a calm frame of mind and otherwise normal, he would prefer x to y'"[24]. This theory was endorsed by Adam Smith or David Hume and is still presupposed by all major contemporary ethical concepts. For example, the "original position" with its "veil of ignorance" (in Rawls' theory of justice or in Harsanyi's utilitarianism) is actually an equivalent of this "ideal observer" (see [25], pp. 185–192).⁴ Although the ethical validity of this theory does not, therefore, depend on the actual existence of a real ideal observer (or "ideal feeler" ([2], p. 314, p. 316)), theistic ethics holds, *ontologically*, the "notion of God, which is simply the ideal observer regarded as actual" ([2], p. 314, p. 314f.). So, in a theistic universe, God is the actual representation of the moral ideals ("moral realism").

But despite this moral realism in a theistic ethics, *epistemically* there is no difference to any other ethical approach. Religions are not providing any privileged access to truth. Human knowledge is always irreducibly hypothetical (or conjectural). So, the point of "moral realism" does not obviate the need for *rational* deliberation about ethical issues.

Although Christian metaphysics always has to be open for cooperative reasoning and theological progress, there are some crucial points which can be described as theologically corroborated:

1. The central hypothesis of Christian religion about God is that "God is love" (1 John 4:8). So, according to Christian metaphysics, the ultimate reality of the universe is love. Metaphysically, this notion of divine love implies the conjecture of a "social structure of existence": "This is the social structure of existence. The primacy of love-means that there is no possible value that any being could have simply in and by itself, or simply by its own decision" ([26], p. 45). If the structure of existence is indeed a social one, then the Christian God of love cannot be totally immutable. On the contrary, God has to be conceived as the "soul of the universe" and the universe as God's "body" ([26], p. 59: "God, the World Soul"). Given this metaphysical description, God's goodness or love is not logically contingent (Contrary to: [27]; [28]); for the God of love is not just an "ideal observer" but also an "ideal feeler" ([2], p. 314, p. 316). This is "the philosophic-theological vision of cosmic mind as cosmic love" ([29], p. 86).
2. The notion of a "social structure of existence" leads to the Christian injunction to *love our neighbors* as we love ourselves: "Thou shalt love thy neighbour as

thymself” (Matthew 22:39). This request is not a mere moral injunction but a matter of the successful self-realization of all human beings. But obviously we are not living in a world of universal neighborly love. And it is at this point that the problem of evil arises: The history of mankind is worlds apart from this vision of cosmic love. So, Jesus’ religious vision of a reality of cosmic love (the “kingdom of God”) is the inversion of these mundane circumstances: “But I tell you: Love your enemies and pray for those who persecute you” (Matthew 5:44). The rule of love is extended even to enemies. As a result, Christian metaphysics takes the view that without any exception *all* men are “neighbors” and are therefore deserving of respect.

3. The religious vision of cosmic love which leads to the ideal image of mankind shaped by mutual love in order to attain the successful self-realizations of all human (or living) beings also has consequences for the institutional framework of human societies: “*The sabbath was made for man, and not man for the sabbath*” (Mark 2:27). Social institutions are not an end in itself, but a means to another end – and this end is man.

Religions are worldviews with an impact on people’s *identity*: “You use arithmetic, but you *are* religious” ([3], p. 15, p. 79). In modern societies, there is a plurality of such worldviews, a market of nonreligious and religious comprehensive doctrines. But only “*reasonable* comprehensive doctrines” (Rawls) are capable of providing people with “*semantics of identity*” that does not undermine the unity of modern society. With respect to the Christian religion, rational Christian metaphysics is needed to make sure that Christian religion is such a “*reasonable* comprehensive doctrine” which is useful for a stable and flourishing coexistence. The three points mentioned above are theologically corroborated and therefore (probably) reasonable. So, in this sense, Christian metaphysics forms part of a useful moral culture of society.

Christian Metaphysics and the Modern Economy

Modern societies are characterized by a functionally differentiated structure (cf. [30]; [31]). Christian religion has to face the fact that, in contrast to medieval societies, there is no such thing as a primacy of religion over politics or the economy. The modern economic system is governed by an *economic* code (“to pay or not to pay”) and not (directly) by any religious view. So, in a second step, we have to ask: What is the possible contribution of religion or Christian metaphysics for modern societies or modern economies?

Applied Ethics and Christian Metaphysics

In order to specify the possible contributions of Christian metaphysics to the business ethics debates, it is useful to distinguish three different levels of ethical reasoning (Table 42.1).

Table 42.1 Three different levels of ethical reasoning

Justification level	Ethical principles (dignity, solidarity, justice, ...)	Ideal
Application level	Flexible justice	Real
Implementation level	Economics	Actual
	Law	
	Ethics	
	...	

On a first level, we can formulate certain basic ethical goals or fundamental principles. This level of moral argumentation (the “discourse of *justification*”) is about the justification of a certain moral norm in principle (e.g., “You shall not lie”). The norms or values formulated on this level function as *ideal* aims which a society or a community actively pursues as ethical goals, for example, dignity of men, justice, or honesty. So, on this level, we (can) define some “ideal” or fundamental ethical principles, which are setting the agenda for solving the greatest and most urgent problems of society (“heuristics”).

But on a second level, we often have to face the fact that in certain local situations there might be a conflict between different ethical goals (values). So, a “discourse of *application*” is needed: This is a discussion about the appropriateness of conflicting moral norms in a certain local situation, for example, the inhibition to lie versus the protection of life: It is not appropriate to tell a killer truthfully where he can find his victim; in this conflict the protection of life is the higher value. Or, to give another example: On the one hand, ultimately, there should not be any exploitative child labor (justification discourse I: the principle of humanity), but on the other hand the children and their families need the wages in order to survive (justification discourse II: the value of being alive). So, with regard to a local situation a mixed solution – for example, children in India working in the morning and going to school in the afternoon – is the ethically more appropriate option (application discourse). A distinct application discourse is needed to argue about the question of which option might be the most ethically “realistic” norm for a certain local situation (= “flexible justice”).

Both of these discourses (“discourse of justification” and “discourse of application”) are *ethical* ones (cf. [32]).⁵ The problem is: Moral norms may be ethically justified (justification level) and appropriate in a certain local situation (application level). However, this valid ethical justification and application only establishes a *moral reality* (a mere moral existence), but not yet an actual existence in the “physical” world we live in. By the term “reality,” a potential but achievable existence is designated, something that *could be* ([15], p. 46, p. 214f.). Reality is something that *can* become actual. On the one hand, this moral reality of moral norms is (more or less) independent from the actual status quo, and actuality cannot wipe this moral reality out of existence. On the other hand, this moral reality of justified and appropriate moral norms alone does not bring about their implementation in the actual world. And the reason for this is the poly-dimensionality of the world we live in.

This leads us to the third level: the “level of implementation.” The world we live in (= the “actuality”) is a polydimensional one: It might not only be the moral point of view that matters, but also the economic point of view or juridical conditions and so on. Concerning usual, profit-oriented business companies, the most important point of view is surely the economic one. So, if we want certain ethical claims to become actual, it is surely not sufficient to indicate only the moral point of view, since the economic code is crucial, especially in business. The implementation of a justified and ethically appropriate goal is a polydimensional process, which always has to take several aspects into account, moral aspects as well as economic or juridical ones. Usually, the implementation of an appropriate ethical goal becomes more likely if we succeed in bringing the moral claims and the economic aspects into a closer alignment. Shirley Chisholm was surely right in saying: “When morality comes up against profit, it is seldom profit that loses.”

1. *Justification Level: Christian Metaphysics as an Optional Heuristics.* In order to rethink the question about the possible contributions of Christian metaphysics to the business ethics debates, in the light of this distinction between three levels of ethical reasoning, it seems pretty clear that the business of comprehensive doctrines like Christian metaphysics is primarily located on the justification level: “The justification of morals takes place in the philosophical and theological discourse. It appears to be the function of moral philosophy [*and theology*] to provide the society with tenable justifications for moral propositions” [33]. Every society needs a sufficient supply of moral values which function as ideal ethical goals. “Without these achievements a cooperative society cannot exist, and to render these services is an autonomous task of theology and philosophy” [33]. The general justification of reasonable moral rules and values is an essential part of the moral culture of any well-ordered society. In every modern society, there exists a pluralistic “market” for those theological or philosophical justifications. And Christian metaphysics is one of these offers that can function as a guiding heuristics.
2. *Application Level: Ethical Discourses and “Flexible Justice.”* A separate application level is needed, because we are faced, in many local situations, with the existence of a conflict between *different* justified ethical goals. So, a cooperative rational deliberation concerning the question of which of these justified reasonable moral values is appropriate in this particular situation is inevitable. This unavoidable search for justice on the application level is an explicit feature of the Christian view: “But *seek* first the Kingdom of God and his righteousness” (Matthew 6:33). As a result, the understanding of justice in Christian metaphysics can be termed as “*flexible justice*” (or “local justice”). There is no such thing as *the* one and only path to justice, because different situations require different solutions: “[L]ocal justice is above all a very messy business. To a large extent it is made up of compromises, exceptions, and idiosyncratic features” [34]. According to Amartya Sen, this is “the problem of the non-existence of an identifiable perfectly just social arrangement” ([35], p. 15). Christian metaphysics agrees: Theology always emphasizes the point that perfect justice is simply not feasible here on earth. So, what is needed on the application level are *flexible* rankings “of [*ethical*] alternatives that can be realized” ([35], p. 17).

3. *Implementation Level: Actual Business Transactions.* Business transactions are *multidimensional* processes. Invariably, the economic dimension is crucial in business, but other dimensions matter, too. Many years ago, John R. Commons put this poly-dimensionality of (business) transactions in a nutshell: “Thus the ultimate unit of activity which *correlates law, economics and ethics* must contain in itself the three principles of conflict, mutuality, and order. This unit is a transaction” [36]. To get a more realistic view of actual business transactions, it would be completely inadequate to reduce this *multidimensionality* exclusively to the economic aspect. But exactly this reduction was, for example, made by Oliver Williamson. In his Nobel lecture, Williamson quoted Commons, but dropped the aspects of law and ethics: “John R. Commons, who was a leading institutional economist during the first half of the twentieth century, formulated the problem of economic organization as follows: »The ultimate unit of activity . . . must contain in itself the three principles of conflict, mutuality, and order. This unit is a transaction« (Commons 1932, 4)” [37]. Williamson believes that economic transactions are in fact “mono-dimensional,” because under economic circumstances an actor would behave in a purely economic (self-interested) or “opportunistic” way: “The upshot is that personal/trust relations and commercial/calculative relations differ in kind” [38]. If Williamson was right, then this would be the end of any business ethics.

Another (and well-known) attempt to shrink Commons’ poly-dimensionality of business transactions to an economic one-dimensionality is Milton Friedman’s claim that within a free market system or capitalism a business company cannot have any other corporate social responsibility than simply making money: “That responsibility is to conduct the business in accordance with their desires, which generally will be to *make as much money as possible*” [39]. But this is nothing but a sleight of hand, because Friedman continues the quotation above in the following way: “. . . to make as much money as possible *while conforming to the basic rules of the society*, both those embodied in law and those *embodied in ethical custom*” [40]. Friedman is smuggling in this “ethical custom” – without making clear what he means, precisely, by “ethical custom.” But the entire business ethics consists of this question, and we are faced with this question because actual business transactions are *not* just economic operations, but *multidimensional* processes. The moral dimension is empirically relevant in business transactions, and therefore there is the possibility that the moral beliefs of Christian metaphysics can be an appreciable issue on the actual level of implementation.

Pluralistic Capitalism: The Impact of Religions

Unquestionably, the modern economic system is not governed by religion, but by an *economic* code (“to pay or not to pay”). But there always was – and is – a certain, limited impact of religion(s) on the sphere of economy.

Religious Beliefs, Moral Cultures, and Different Types of Capitalism

Since Max Weber published his groundbreaking studies in economic sociology, the evidence for cultural influences of world religions on the economy is almost irrefutable. Weber examined the cultural causes for the different ways various societies developed, and recognized that religions belong to the core forces which shape men's behavior and the emergence of institutions. For example, he satisfactorily showed the impact of the Protestant Ethic on the Spirit of western Capitalism ("money-making mentality") or the effects of Confucianism on the Chinese economy [41, 42]. According to Weber's theoretical reconstruction of the paths by which these religious "world images" are influencing the domain of economies, these "ideas" are determining the "interests," which are guiding men's decisions directly: "Not ideas, but material and ideal interests, directly govern men's conduct. Yet very frequently the 'world images' that have been created by 'ideas' have, like switchmen, determined the tracks along which action has been pushed by the dynamic of interest" ([18], p. 280). So, religions shape economies only in a mediated way [43].

Religious worldviews are *one* of several factors in the cultural environment of economic institutions. "Economic institutions do not exist in a vacuum but rather in a context of social and political structures, cultural patterns, and indeed, structures of consciousness (values, ideas, belief systems). An economic culture then contains a number of elements linked together in an empirical totality" [44]. Religious belief systems are part of the specific (moral) culture that is capable of framing the shape of economic institutions and business activities. These belief systems belong to the realm of *informal* institutions: "In the modern Western world, we think of life and the economy as being ordered by formal laws and property rights. Yet formal rules, in even the most developed economy, make up a small (although very important) part of the sum of constraints that shape choices; a moment's reflection should suggest to us the pervasiveness of informal constraints. In our daily interaction with others, whether within the family, in external social relations, or in business activities, the governing structure is overwhelmingly defined by codes of conduct, norms of behavior, and conventions. Underlying these informal constraints are formal rules, but these are seldom the obvious and immediate source of choice in daily interactions" [45]. This impact of culture and religion on the economy must be taken into account: "If the propositions of economic science are to be useful in drawing normative inferences concerning the constitutional-organizational structure of society, cultural parameters that describe the behavioral attitudes of participants must be taken into account. In this sense, there is indeed an Economics that must be culture bound" [46].

Since Max Weber's groundbreaking studies further research delivered abundant evidence for the (mediated) impact of religious belief systems on the economic performance and institutions at the level of the individual, group, or nation (cf. [47]; [48]). As a result, the world of global capitalism is a *pluralistic* one: There is not only the Anglo-American type of capitalism, but also the German "social market

economy” (based on the economic philosophy of Ordoliberalism) or the Chinese network (guanxi or crony) capitalism. So, we are living in a world of a *pluralistic capitalism*.

Religious Beliefs, Ethical Integrity, and Management

After many years in which “religion and spirituality have been literally exorcised from modern forms of institutional organization” [49], in recent years, there has been a rise in interest in the impact of religion and spirituality on individual behavior and the organizational structure of business companies. However, the results are contradictory:

- Some empirical research could *not* find a considerable positive relationship between religious beliefs on the one hand and moral behavior on the other [50].
- Whereas the results of other studies indicate a *significant* relationship between religion and higher ethical standards: “[B]usiness professionals who considered their religious faith to be highly important to them are significantly less accepting of ethically questionable behavior” [51].

So, there is a need for further innovative and interdisciplinary empirical research. “Overall, there is good reason to think that religiosity does influence ethical behavior in [*business*] organizations, but also good reason to think that creative and interdisciplinary research will be needed to discover just what that relationship is” [52].

Homo Oeconomicus Culturalis (HOC)

To reconstruct the impact of religious worldviews on business behavior, we need a theoretical rationale that is taking the different interests of real people into account. Concerning this, it is appropriate to draw on the economic approach by Gary S. Becker: “Unlike Marxian analysis, the economic approach I refer to does not assume that individuals are motivated solely by selfishness or material gain. It is a *method* of analysis, not an assumption about particular motivations. Along with others, I have tried to pry economists away from narrow assumptions about self-interest. Behaviour is driven by a much richer set of values and preferences. The analysis assumes that individuals maximize welfare *as they conceive it*, whether they be selfish, altruistic, loyal, spiteful, or masochistic. [...] [T]hey try as best as they can” ([53], pp. 385–386).

- In this statement, Becker takes a plurality of substantially *different* interests into account (“a much richer set of values and preferences”) and does *not* claim that, say, moral interests are ultimately economic interests.
- He then correlates his methodological assumption of “Homo Oeconomicus” to the rational pursuit of these different interests only (“maximize welfare as they conceive it,” “try as best as they can”).

However, the trouble is that Becker lumps together personal interests (self-interests) on the one hand and moral or religious interests on the other. In his approach, there is no content-related differentiation of these distinct interests.

Table 42.2 Different interests and homo oeconomicus

Different interests (preferences)	Self-interests		Moral interests religious interests . . .
	Monetary interests	Nonmonetary (self-)interests	
Pursuit of these different interests	Homo oeconomicus		

Because of this fault, the model misses the point, namely, to predict human behavior – because a person with narrow monetary interests will behave differently from a person whose identity is shaped by the Christian love (love of neighbor) or – because “[r]eligion is by no means necessarily good. It may be very evil” ([3], p. 17, p. 79) – by the delusions of religious fundamentalisms. So, an adequate model of Homo Oeconomicus and his *different* interests would look like in Table 42.2.

Three additional remarks on this subject:

- (a) It is empirically important to *differentiate* these various interests substantially. John C. Harsanyi is completely correct in doing this. He draws a principal distinction between at least two kinds of preferences: “[E]ach individual has two sets of preferences. One consists of his *personal* preferences, defined as his *actual* preferences, which will be typically based mainly on his own personal interests and on the interests of his closest associates. The other consists of his *moral* preferences, defined as his *hypothetical* preferences that he *would* entertain if he forced himself to judge the world from a moral, i.e., from an impersonal and impartial, point of view. Mathematically, an individual’s personal preferences are represented by his *utility function*, whereas his moral preferences are represented by his *social welfare function*” [54]. In addition to Harsanyi’s distinction, we should add the possibility of other interests, for example, religious or aesthetic interests, which are usually influencing moral interests.
- (b) All kinds of interests are *attractive* for the person equipped with certain interests. If the desire comes to fulfillment, the person is feeling the warm glow of satisfaction. This is also true for moral interests. So, it would be a misconception to locate moral interests only on the side of (opportunity) costs.
- (c) A third remark is concerned with the problem of *rationality* in pursuing these different interests. Gary S. Becker is right in saying: “[T]hey *try* as best as they can” ([53], p. 386 (emphasis mine)). Behavioral Economics has shown sufficiently that human behavior is often not rational, but “predictably irrational” [55]. So, humans are not *doing* the best they can, they only *try*.

To sum up, there is a wide range of different interests that can shape individuals’ behavior. And among those, religious interests can play an empirically relevant role.

Spiritual Capital: Business Ethics and Modern Christian Metaphysics

In human life, different interests matter – economic and political interests as well as scientific or aesthetic, moral, and religious interests. As the Dalai Lama

briefly put it: “Everybody loves *money*, including myself. In order to live you need money. Without money you can’t work. [. . .] [*But:*] Beside money, there are *other values*” [56]. Surely, it is legitimate to pursue economic interests, but there are legitimate moral or religious interests, too. All of these interests really matter. The *different* problems of human life cannot be solved by drawing on only *one* of these interests. Humans are *multidimensional* beings.

This plurality of different values is inescapable – not only in individual lives, but in society, too. And in modern societies, the *structural* way of dealing with this plurality of key interests is called *functional differentiation*. To satisfy each of these interests in an efficient way, modern societies have differentiated several distinct social “systems,” which are working strictly according to their very own code. So, the code of the economic system (\pm pay) is an adequate frame for economic transactions (e.g., shopping or business decisions), but this code would not be adequate for political purposes (e.g., the decision who is going to be the president of the USA).

But, and this is the point here – there are adequate and less adequate ways to satisfy these interests. For example, there is every indication that market competition is a (much) more useful way to satisfy *economic* interests and create economic values than a centrally planned economy. And democracy is an adequate means for *political* ends, whereas dictatorship is not. Quite the same applies to *religious* interests: Modern societies contain not only reasonable religious doctrines, but unreasonable, irrational, or mad ones, too. And if there is an impact of religion on the sphere of business, then we have to face the fact that religion can have productive or counterproductive effects in economy. So, only in the case that these effects are (economically) productive, the impact of religion on the economy or on business activities becomes “spiritual capital.” In this case, religion pays (or: spirituality pays). Religion becomes a beneficial contribution to prosperity. “Spiritual capital” is the title of a research program which investigates the question, under which conditions religious worldviews are capable of being such a productive factor in business or society. Below, I designate three features of a rational Christian metaphysics, which have the potential to be such “spiritual capital.”

The Difference Between God and the World

The “arch-metaphysical assertion” ([8], p. 275) of Christian metaphysics is the God hypothesis: There is a God, and this “God is love” (1 John 4:8). The flipside of this proposition is the cognition that the world is not God, that the love of humans is always a fragmentary one. “The consciousness which is individual in us, is universal in him [*God*]: the love which is partial in us is all-embracing in him” ([3], p. 79, p. 152). On the one hand, the metaphysical concept of God implies an essential relationship between God and the world, but on the other hand it leads to the distinction of God and the world: “God and the World are the contrasted opposites” ([15], p. 46, p. 348). Insofar, this theological distinction between God and the world

leads to a nonutopian or realistic view of all mundane things: Everything in the world is *imperfect*. And this imperfection applies to ourselves as humans as well as to all the social institutions we are creating (e.g., markets). In other words, the God-world-differentiation makes it clear that the world as a whole, and everything in it, is a *contingent* fact. The function of the theological distinction between God and the world consists in a fundamental “opening up of contingency.” It keeps things open, or should – in contrast to religious fundamentalism – keep things open.

The Imperfection of Humans

To err is human. In contrast to the methodological model of Homo Oeconomicus, recent research in the field of behavioral economics found overwhelming evidence for the fact that real humans are imperfect and frequently irrational beings (See, e.g., [55]). The theological view on this imperfection enters into the equation when (business) people claim a godlike (= perfect) status for themselves. Two examples:

- Jeff Skilling, former COO and CEO of the American energy company *Enron*, claimed to be the right hand of God: “It wasn’t a job – it was a mission [. . .]. We were changing the world. We were doing God’s work” [57].
- Similarly, Lloyd C. Blankfein, CEO of the American Investment Bank *Goldman Sachs*, stated in 2009 (*after* the misery of the financial crisis!): “We’re very important. [. . .] We help companies to grow by helping them to raise capital. Companies that grow create wealth. This, in turn, allows people to have jobs that create more growth and more wealth. It’s a virtuous cycle. [. . .] We have a social purpose. [. . .] I’m just a banker doing God’s work” [58].

In cases like these, the core concern of Christian metaphysics is the criticism of such economic “replacement theologies.” Whenever people are claiming a godlike status for themselves, society will have to pay dearly for the conceit. And so, the job of a rational religious metaphysics, namely, to criticize any pseudo-theological pretentiousness, can be a beneficial contribution to prosperity.

The Imperfection of Markets

There is no doubt that free markets are a very useful and efficient instrument to create wealth. The reason for this is the fact that markets are functioning as “discovery procedures,” as Friedrich August Von Hayek famously put it: “[C]ompetition systematically [*is*] [. . .] a procedure for discovering facts which, if the procedure did not exist, would remain unknown or at least would not be used” [59]. As a result, modern capitalism made technological innovations and material possible, as well as social progress of a kind never seen before. But that is only half the story. Unfortunately, it is the same market competition that can force companies to ignore ethically desirable goals: The cost pressure may force companies to discount the problem of child labor or ecological production. And so, it is nothing but another economic “replacement theology” when the same Friedrich August Von Hayek puts the critique of some effects of market freedom under a taboo: “A successful defense of freedom must therefore be dogmatic and make no concessions to expediency; even where it is not possible to show that, besides the known beneficial effects, some

particular harmful result would also follow from its infringement” [60]. It seems to me that the opposite is the case: Concerning markets, everything is a question of expediency. If markets fail to produce the socially desired results, a change of market rules is indicated. Von Hayek’s dogmatic divinization of contingent market processes is another case of a mistaken “replacement theology,” which has to be criticized – by any rational theology.

Humans as the End of the Economy

Markets are useful, but they are not an end in itself. They are only a means to another end – and this end is man: “[I]ndividual human beings are the foundation, the cause and the end of every social institution” [61]. This is a key point of any Christian ethics. Markets are made for men – and in Christian metaphysics, this means *all* men, without exception. This is the Christian answer to the question of “solidarity”: *All* men are “neighbors” and deserving of respect, *everybody* belongs to the community of solidarity of mankind. And therefore, the construction of social institutions has to take the interests of *all* these humans into account.

Concerning this matter, there is a systematic difference between the understanding of “solidarity” in Christian metaphysics on the one hand and, for example, the ethical approach of John Rawls on the other. Famously, Rawls defines “society” as “a cooperative venture for mutual advantage” ([25], p. 4). But his “original position” is *not* open for everybody. In fact, he restricts the access to the “original position” to parties “within the normal range” (cf. [5], p. 25). Rawls justifies this decision as follows: “[S]ince the fundamental problem of justice concerns the relations among those who are full and active participants in society, and directly or indirectly associated together over the course of a whole life, it is reasonable to assume that everyone has physical needs and psychological capacities within some normal range” (cf. [5], p. 272, fn. 10). As a result, the interests of other people are *not* taken into account: “Thus the problem of special health care and how to treat the mentally defective are aside” (cf. [5], p. 272, fn. 10). The admitted parties of the “original position” are capable of active contributions to this “cooperative venture for mutual advantage.” Rawls’ construction of the original position resembles a working meeting of the cooperative venture “market society”; this economic approach shapes the design of the problem and its solutions (See [62]). In this respect, the concepts of Rawls and James Buchanan are very similar, because Buchanan is concerned exclusively with gains from cooperation: “[T]he political economist’s task is completed when he has shown the parties concerned that there exist mutual gains ‘from trade’” [63]. Both Rawls and Buchanan are advocates of a conception of ethics in which moral rules are just an investment in mutual cooperation gains. But this reduces the moral point of view to productive exchanges, that is, to “business.” Contrary to this reduction, Christian metaphysics maintains that access to the “original position” should be granted for *all* human beings, because *all* men are seen as “neighbors,” deserving of the same respect. Therefore, the interests of *all* humans should be taken into account.

Markets Beyond Vulgar Capitalism: The Metaphysics of Different Interests

In contrast to the differentiated sciences which are usually focusing on (only) *one* research perspective in reconstructing social problems (e.g., “opportunity costs” in economics), it is a central feature of metaphysics that it has to deal with the broad variety of ontologically *different* interests in human life: A complete metaphysics is a system of ideas which brings the religious and moral interests into relation with those concepts of the world and of society which have their origin in natural or social sciences (See [15], p. xiii).⁶

As already said above, doubtlessly free markets are a very efficient instrument to create wealth. But capitalistic systems tend to reduce the variety of different interests, which are important for human flourishing, to one single type: *monetary* interests. As a result, human beings tend to degenerate into money-making robots, which are ignoring other important values of human life. An example of this is the statement which was made by Richard Fuld, former CEO of *Lehman Brothers*, in an internal video tape. In 2007, Fuld said that *Lehman* is going to “squeeze some of our shorts [*short-sellers*], and squeeze them hard. Not that I want to hurt them. Don’t get that, please, cause that’s just not who I am. I’m soft, I’m lovable. But what I really want to do is that I want to reach in, rip out their heart and eat it before they die” [64]. This is some kind of one-dimensional “vulgar capitalism,” which has forgotten all other values, in this case especially moral values. The insights of neuroeconomics cast some light on the fact that such a slipping into “vulgar capitalism” happens faster than we can think (literally): “the neural activity of someone whose investments are making money is indistinguishable from that of someone who is high on cocaine or morphine” [65].

Religions as such represent other values than money. As a contemporary religious leader, the Dalai Lama, briefly stated: “Everybody loves money, including myself. [...] Beside money, there are other values” [56] – namely, moral and religious values. So, naturally, religions are functioning as a counterpart to any reductionist form of capitalism (“vulgar capitalism”). No question – economic values are very important in human life, but they are not the only ones. Human nature is a polydimensional thing. Muhammad Yunus declares: “The biggest flaw in our existing theory of capitalism lies in its misrepresentation of human nature. In the present interpretation of capitalism, human beings engaged in business are portrayed as one-dimensional beings whose only mission is to maximize profit. [...] [*But:*] [H]uman beings are not money-making robots. The essential fact about humans is that they are multidimensional beings. Their happiness comes from many sources, not just from making money” [66]. So, in the end, everything comes back to the philosophical and theological endeavor to capture the essence of human nature. The religious awareness of a transcendent ultimate reality can save us from “vulgar capitalism,” which has forgotten that there are other values besides money.

Conclusion

(Reasonable) religions are a part of the moral culture of society. There has always been a certain cultural impact of religion(s) on the economic sphere. If the effects of religion(s) on the economy are both *economically* productive ones and *ethically* a contribution to the project of building up a humane global economy, their impact on business activities becomes “spiritual capital.”

Abstract

The term and the function of the entrepreneur were, for a long time, disregarded in Christian Social Ethics. Nevertheless, Christian Social Ethics has already dealt, on the basis of its understanding of the human being as a person, endowed with freedom and dignity, and the social principles that follow from this, with questions such as private property, freedom of contract and fair wages, as well as market and competition within its own tradition. The entire development of the social proclamation of the Church and of academic Social Ethics points toward a market economics order. Specifically with regard to business ethics, primary approaches can be found as early as in the 1960s, which remain interesting to the present day. Under Pope John Paul II, and also Benedict XVI, the function and significance of the enterprise and the entrepreneur are also honored in the social proclamation *expressis verbis*. With the central aspects “human being first,” social responsibility of the entrepreneur and a regard for that which is beyond the market, Christian Social Ethics can make an important contribution in the present societal and academic debate.

Introduction

An article on Christian Social Ethics in a Handbook of the Philosophical Foundations of Business Ethics – this may seem surprising to some, and for twofold reasons: firstly because one wonders why the Church and theology comment on questions like these at all, and why they feel entitled to do so, and secondly because

Platz der Universität 3, Freiburg, Germany
e-mail: ursula.nothelle-wildfeuer@theol.uni-freiburg.de

at *classical* Christian Social Ethics it seems obsolete, as it ignores, seemingly at least, the person of the entrepreneur, the institution of the enterprise, and with that, business ethics in the strict sense of the word.

The first question will not be dealt with extensively in this article; the following points only are significant, which are presented in summary.

Considering the question of economy in a Christian life and in the thoughts of theology is not done to express a sort of “clerical” claim to power. The Church and its theology is not concerned with getting involved in political or economic matters which do not pertain to her expertise and would thus be presumptuous. Her statements are, rather, based in the genuine care for the well-being and the salvation of humankind. The realization of the salvation which the Church proclaims to the people happens, after all, not in a separate or parallel world, but in *this* world under its conditions. This is why the respective socioeconomic conditions play a not so insignificant role and need to be shaped by a Christian spirit. For this, however, it is necessary to have reliable parameters on which people can base their decision, for one, but which is also capable of offering alternative viewpoints for shaping just conditions in society and also in the economic system. Christian Social Ethics sees, in this, its contribution to shaping society in a humane way. This is why it thinks itself entitled to – as something that follows from the core of the Christian message – and also sees its duty to comment on questions of society and economics, and takes the individual dignity of the person as its measure on which everything is centered.

According to this differentiated position, there is another important aspect: “[T]oday Christian intellectuals have at their disposal a more subtle and realistic approach to economic life – at the same time that economic specialists exhibit more openness to the importance of culture, morality, and religion than at any other time in the last century” ([1]; cf. too [2]).

The following article shows, as an initial step, what the intention and the content of (classical) Christian Social Ethics, or teaching, is. A second part will deal more closely with the central topoi of the statements of Christian Social Ethics, while the third part specifically addresses the questions of business ethics. Finally, a short conclusion will be given at the end.

Intention and Fundamental Approaches of Christian Social Ethics and Ecclesial Proclamation on Social Questions

The title of the article uses the term “Christian Social Ethics.” To avoid a Babylonian confusion of languages with regard to this term, a short clarification of usage will form the start of the following paragraph.

Christian Social Ethics is a term which is correct from a philosophy of science point of view and has, by now, become usual to describe the ethical discipline within the range of subjects of Protestant and Catholic theology which reflect systematically on the question of the justice of institutions of human society and their contribution to the conditions for a successful, good life for each individual.

In the Catholic tradition, there are still synonymous terms such as Christian Social Studies or Catholic social doctrine. This term includes, in many instances, in addition to the theological discipline, the pastoral and magisterial social teaching of the Church, which constitutes a fundamental point of reference for the academic reflection of the respective topics. These are the social encyclicals and writings of the Popes which are relevant too, and which deal – to put it briefly – “with basic questions of the order of life in society” [3] while looking at concrete economic, political, or social situations. The social proclamation as well as classical social teachings is to be considered in the following with their respective positions.¹

The Social Question as a Question of Social Justice

Christian Social Ethics or Social Studies developed in the nineteenth century when the Church dealt with the social question, that is, the question of the workers in the context of the industrialization and the social problems that stand in its wake, with which the Church was confronted – at first without having a defined social ideal – and the solution of which she strived for. The impulse for the manifold and concrete reflections was the frightening conditions of the working class, which were marked by poverty, exploitation, and lack of rights, as Pope Leo XIII commented in his first social encyclical *Rerum novarum* 1891 [5].² In his passionate plea for conditions worthy of human beings in work relationships, he does not only speak up for the interests of defenseless workers but also shows options for building a more just society. This is why this social encyclical becomes, in the further course of development, the point of departure for a large number of publications that continue and further this topic.

On a more abstract level too, the social question can be said to be the material object of Christian Social Ethics; the Nestor of Catholic social teaching, Oswald von Nell-Breuning, defined the term as “social criticism put into questions” (This quote could not be verified in the original, which is why it is quoted, here, according to Stieglitz et al. [6]).

Only as a consequence of the modern focus on the subject did it become obvious that societal institutions and structures are not necessarily elements of an unchangeable divine order but were open to human design and responsibility. Due to this, it becomes clear why the question of shaping a just social order becomes a (quantitatively and qualitatively) dominating problem in the statements of the Catholic Church only from the nineteenth century onward.

The definition of the social question was broadened quickly to go beyond equating it with the question of workers: The social question “was already seen, before the turn of the century, as a question of economic and social order as a whole by social criticism that was open to reality. It had, thus, entered its second stadium. The industrial economy had negative consequences, one after the other, for almost all groups of society.” In the third stadium, during and after the Second World War, it “experienced a global expansion, as it is from this that a smouldering fire originates, which troubles, worries and scares peoples all over the world . . .” [7].

Social criticism is evoked by the fact that the respective real societal conditions are in contrast to the ideal of a reasonable order of society, one that is justifiable to reason, and which gives a fair share in material and immaterial goods to all people. The social question is thus the question of social justice of any societal structure, procedures, and areas of life, which is, in turn, tied back to the human being as “individual human beings are the foundation, the cause and the end of every social institution” [8].

The plural that has, by now, become usual, that is, talk of “the new social questions,” sets the signal that, within a framework of a very complex and many-layered open society, there is, in contrast to the nineteenth century, not just one social problem but a variety of aspects which cannot, in turn, be analyzed in isolation. Problems that are discussed at the moment that have relevance to business ethics are, among others, the restructuring of the welfare state, stabilizing social security systems, a more transparent and more just shaping of the tax system, the shape of family politics, the creation of new work places, and the politics of education (cf. [9]). These are questions and topics, the challenge of which does not lie, for Christian Social Ethics, in technical aspects concerning the labor market, tax political or social security rights aspects, which are specific to a certain subject; they are tasks for the experts in these fields. Christian Social Ethics is neither willing nor able to provide “technical revolutions” [10] for the urgent economic and social problems. It is pursuing, instead, the aim, while taking into account the “autonomy of earthly affairs” [11], that is, the autonomy and the individual value of the different areas, to establish its competence chiefly regarding the “real, ‘concrete’ and ‘historical’ man” [12] and to raise attention to the moral foundations of the life of society.

In trying to do this, Christian Social Ethics does not only appeal to Christians, or just Catholics, but since the encyclical *Pacem in terris* of 1963, “all Men of Good Will” are addressed too all who subscribe to the same central intention, namely, the creation of structures which serve human dignity and the development of human freedom.

Christian Understanding of Humans and Social Principles

“From the knowledge that everything that exists can be a *matter* of ethical acts, but that only humans can be the *subject* of ethical acts, the special importance of the concept of humanity for all ethics results” [13]. This prerequisite of all Christian Social Ethics is to describe now as a basic orientation.

“This teaching rests on one basic principle: individual human beings are the foundation, the cause and the end of every social institution. [...] this basic principle [...] guarantees the sacred dignity of the individual” ([8], no 219f). The central norm, on which all is built, the human being as a person (cf. also [14]), as creature and image of God, serves as the short formula for any description of the Christian concept of humans. In this, however, this short formula is not meant to describe one single firm image of person, but it is exactly the specific case which shapes the Christian concept of humanity so that certain indispensable dimensions of the Christian concept of humanity can be shown.

It is important to state that it is not necessary to believe in God to be able to recognize that every human being is a person with her unalienable dignity. Immanuel Kant has, in his seminal work on the metaphysics of morals, with the derivation of his Formula of the End In Itself of his Categorical Imperative, practically provided a secular reasoning for this concept of humanity: “Act in such a way that you treat humanity, whether in your own person or in the person of any other, always at the same time as an end and never merely as a means to an end” ([15], p. 36). Since Kant, a differentiation between two forms of value is relevant with regard to this, too: “In the kingdom of ends everything has either a price or a dignity ([15], p. 40). Whatever has a price can be replaced by something else as its equivalent; on the other hand, whatever is above all price, and therefore admits to no equivalent, has a dignity.” It is, accordingly, the human being which does not have a price, no equivalent, but a dignity, which demands recognition without any conditions, and respect.

Concern about structures of society which do justice to the dignity of the human being, about the realization of social justice, has led, in the tradition of Christian Social Ethics, to the formation of some central social principles (cf. [16]), which allow for a critical observation of conditions and ideologies as they are and which form signposts for the right direction.

For Catholic social teaching, the principle of the common good has held central significance since its beginnings in the nineteenth century, but in the later Social Ethics it is sometimes subsumed in the principle of solidarity. In its classical definition, the common good is understood as the epitome of the means and chances, structures, institutions, and social systems which have to be provided in social cooperation so that “the individuals, the families and social groups” can attain their own values and aims “more fully and quickly” ([11], no. 74; 26; as well as [7], no. 65; PT 58 and [17]). This is not only about the perfection of each individual but also about the different groups in society. The common good does not contain the sum of *all* values, but only of those values that are a prerequisite for a situation where everyone can realize *their* individual values. Specifically for the area of economy, this means, for example, that the fundamental civil rights and liberties are granted and codified, but also that a corresponding infrastructure is made available so that people can make use of their economic and entrepreneurial freedom (cf. [18, 19]).

The principle of solidarity should also find mention, which starts with the equality in terms of being, and equal value of all people at the same time as them being, in reality, unequal. The point of departure is the social dimension of being a person, which is the mutual relatedness of people to each other and to society as a whole, which then means that there is a mutual obligation to be with each other. The principle of solidarity does not only concern acts with others, but fundamentally the directedness to the good of all, the common good. John Paul II defines solidarity, accordingly, as “a firm and persevering determination to commit oneself to the common good; that is to say to the good of all and of each individual, because we are all really responsible for all” ([10], no. 38). Solidarity means, accordingly “the will, motivated from shared prerequisites, to do what one owes one another” [20]. Showing solidarity is, thus, the duty that is based on one’s humanity, to realize the common good or social justice.

The field of the principle of subsidiarity, which was, for the first time, explicitly mentioned in the social encyclical *Quadragesimo anno* of 1931 in no. 79 by Pope Pius XI, in the face of the ideologies that were threatening freedom and personal rights and which were establishing themselves in the European context, has enjoyed, in the recent years, a societal renaissance: It is no longer seen as a typically Catholic principle, but representatives of different positions used it in their reasoning – in debates concerning economy, social matters, but also European politics.

According to the original conception, the principle of subsidiarity has a twofold content; the reduction of which, if only on one side, leads to a misdevelopment of societal and social order. Its most significant feature is that it clarifies responsibilities in society. Its negative or critical side stresses – addressed to the bigger unit – the law of noninterference, which is the right of individuals and social groups to be able to manage and order their own affairs within the framework of their actual potential. The recognition of competence is articulated for this: Those who are immediately involved have a primary competence, for example, the private initiative in economies, with the state only determining a framework. In this regard, the principle of subsidiarity aims to fight off any interference of bigger units, especially of the state, with the liberties of smaller units or individuals. This right of self-determination corresponds to a duty of responsibility for oneself. The positive or constructive side of the principle of subsidiarity has a thrust toward strengthening the freedom of the individual and of social groups, or of enabling them to develop: Where their powers are insufficient, the bigger societal units – again, in many cases, ultimately, the state – are charged with helping and supporting. The primary aim of this “subsidiary assistance” (L. Schneider) is to enable the individuals or smaller units, in the sense of helping to help oneself, to be able, where possible, to take care of affairs themselves (again) – which implies the duty for the bigger unit to pull out again after successful assistance. It is possible, accordingly, to call the principle of subsidiarity a principle of enabling freedom.

In Christian Social Ethics, the principle of sustainability becomes more established as a further new social principle. “The methodological key of the concept of sustainable development lies in the connected perspective which understands social balance, ecological sustainability and economic efficiency as mutually determining factors” [21]. The paradigm of sustainability has developed into an integrative concept which assumes that the entire development toward the future should be in accordance with the needs of today’s generation, without at the same time endangering the options of future generations. The decisive social-ethical point of departure is, above all, intergenerational justice, which is widened, chronologically, to include future generations as well as, geographically, to include all people. From this perspective, a lot can be said for the understanding of the concept of sustainability as a widening of the principle of solidarity by a diachronic dimension and to integrate it, thus, into the classic trio of social principles.

Central Statements on Institutions of a Just Economic Order in the Social-Ethical Tradition

On the background of the thoughts on dignity and freedom of human beings as well as on the principles that make it more concrete, it follows, almost inevitably, that the Social Ethics of the Church, in its tradition, mainly envisage a market economy, and thus, a liberal order (cf. to this debate, e.g., [22]). In the following, three fundamental aspects of a market economy that is just and human will be shown. In this, the focus is to be especially on the corresponding statements in the social proclamation.³ To conclude, the relationship between Christian social teaching and social market economy will be examined.

The Institution of Private Property and Its Social Function

The institution of private property is a fundamental principle in classic Christian social teaching (cf. [23]), as, with this, not only is a person's possession of a thing acknowledged but also, fundamentally, the status of individual acts within the overall structure of economic decisions is strengthened and, with that, finally the meaning that has to be assigned to the freedom of the individual in this economic system.

In the first social encyclical *Rerum novarum* of 1891, Pope Leo XIII placed the question of property at quite an exposed place, namely, the beginning of the document and did, thus, stress the particular importance of this institution with regard to the solution of the social question. The confrontation with the position of Marxism, in particular, which saw private property as the root of all evil and expected a diffusion of all problems by the state taking over all private property⁴ in capital goods, formed the central focus of the conflict at the time.

The understanding of property of Karl Marx had to be seen, however, first and foremost as a reply to the liberal concept of property which rested mainly on the thoughts of John Locke (cf. [24], the question of property is being dealt with in the second treatise) which were later taken over by Adam Smith. According to Locke, private property has to be justified by human work, and it is the task of the state to protect the order of property that developed in this way as an unalienable and holy right.⁵

As Marxism now framed a decisive counter position to this theory of property, it was not only met by criticism from the liberal side but also from Catholic social teaching. This was because, for the Church, abolishing private property was not a solution for the social question but rather a way to cause more unrest in society, as Thomas Aquinas, in particular, had framed it as early as the Middle Ages (cf. [25]).

Based on the foundation that all goods of the earth are there for all people (*destinatio communis*), Thomas Aquinas makes a distinction between the use of the outer goods (*usus*) and the right of use (*potestas*). Regarding the use, "the person may not see the outer goods as private property, but as common property, by sharing them generously with people in need" ([26], p. 54). Thomas thus expressly stresses the social duty that comes with private property.

Matters are different for the right of use of certain things. Thomas makes a case, here for individual allocation, for three reasons: *firstly* regarding the strengthening of self-responsibility of people, *secondly* with regard to avoiding disorder within the social sharing of life, and *thirdly* because of the peacemaking effect of property.

Overall, it can thus be stated that “In the face of the *conditio humana* which is shaped by Original Sin, and which is imperfect, the private order of property is unavoidable and necessary for the common good” ([26], p. 55), which means that the right of property is merely a decision of purely human agreement. It is in accordance with this that Thomas subsumes the order of private property under *ius gentium*.

When framing the encyclical *Rerum novarum*, Pope Leo XIII did adopt primarily the thoughts of Thomas Aquinas, while the Pope did, however, stress the individual function of private property more strongly than Thomas. As the Pope also stressed the meaning of work as the means of acquiring property, thoughts relating to liberal conceptions of property also found their way into this Papal encyclical: Through work, the person gave the matter worked on, as it were, the “impress of his personality” ([5], no. 9).

The connection that was made, in the encyclical, between these two traditions led to the misunderstanding. Some workers got the impression that the Church was legitimizing the current conditions of property distribution. However, it was true, in the words of Nell-Breuning, “that Leo XIII. did not ‘sanctify’ the property of the owners, but the claim of the have-nots to property” [27].

It is not least this clarification which expresses what, in addition to the dimension of *private* property, has the same meaning and is constituted equally in the Christian concept of property: the dimension of social duty. Pope Pius XI also stated again, expressly, particularly regarding the social dimension of the right to property, in his encyclical 1931 the “twofold character of ownership, called usually individual or social according as it regards either separate persons or the common good” [28].

This connection to the common good which is fundamental to the position of Christian Social Ethics can be found very clearly in the last social encyclical of the last Pope John Paul II *Centesimus annus* of 1991 in which he explains that “ownership of the means of production, whether in industry or agriculture, is just and legitimate if it serves useful work.” In contrast, “[i]t becomes illegitimate, however, when it is not utilized or when it serves to impede the work of others.” All of this leads, according to John Paul II, to the consequences of the “breaking of solidarity among working people. Ownership of this kind has no justification, and represents an abuse in the sight of God and man” ([12], no. 43).

The basic disagreements on the question of property are not carried out any more, today, with equal ideological sharpness in Catholic social teachings. They do, however, remain of great importance for reflections on Social Ethics, particularly because new questions arose, for example, because of the change and the further differentiation of the meaning of property.

Thus, a particular form of property relationship is entered into the conversation again and again, namely the so-called capital wages, that is, “a part of the gained

from the work [is] not being paid out, but used to create capital, thus invested” [29]. In this way, workers share in the productive capital, ideally in their own company – John Paul II speaks, in his first social encyclical *Laborem exercens*, which is seminal for the whole field, of the fact that workers can thus “be aware, at the same time, that they are working in their own company” [30], but investment funds are also a possibility. With capital wages, the stark contrast between the capital owner and the employee is diffused, and is giving the employee the chance to get a share of the productive capital (of an economy) and to come, thus, to a “for a more just and equitable distribution of property” [31]. Overall, this option connects back to a demand of Catholic social teaching that was already made in the encyclical *Quadragesimo anno*, namely, the aim of “the work-contract be somewhat modified by a partnership-contract” ([28], no. 65). The Evangelical Church in Germany sees the “share of the workers in the capital, and particularly in the profit” firstly with regard to the entrepreneurs, then with regard to the “fairer distribution of wealth”, but does, finally, also warn of the “high risks for the employed” ([32], no. 66).

A different aspect which has to be taken into account regards the manner of property itself. “It is the ownership of knowledge, of technical details and of ability. The wealth of the industrial nations rests on this sort of property to a far greater extent than on natural resources” (CA 32). The fact that a sort of unjust “distribution of property” can develop in a society if people are deprived of educational opportunities because of a lack of financial resources shall only be hinted at.

The Principle of Freedom of Contract and the Care for a Just Wage

In the beginnings of Catholic social teachings, the question of the legitimacy of a wage working contract was an important topic. The background to this was the following.

One of the core tenets of “liberal freedom rights” was, undoubtedly, also the unlimited freedom of contract as condition sine qua non of the liberal system of economics.

The problem with this liberal maxim was unveiled in confrontation with the reality at the time, for example, with regard to the legal shape of the (working) relationship between entrepreneur and worker. So the worker, normally without any funds, had to make sure that his daily needs were met, and thus he had to accept any working conditions, no matter how bad they were. Exploitation of workers was thus very easily possible, even if the work contracts were, by purely formal standards, certainly valid. But the formal validity does not say anything about the material legality of such a contract. This has to fundamentally fulfil the demand for natural justice in accordance with *Rerum novarum* and is valid independently of the free will of the people making the agreement (cf. [5], no. 45). With regard to this, the wage workers of the early time of the industrialization were exposed to the power of the entrepreneurs without any protection.

In the face of such conditions, the social proclamation makes its position very clear. The principle of the wage contract is not seen, by the ecclesial magistrate as “unjust of its own nature” ([28], no. 64), but at the same time, the demand is made for limitations on the freedom of contract to protect workers from merciless exploitation. It says in *Rerum novarum*:

If we turn not to things external and material, the first thing of all to secure is to save unfortunate working people from the cruelty of men of greed, who use human beings as mere instruments for money-making. It is neither just nor human so to grind men down with excessive labor as to stupefy their minds and wear out their bodies. Man’s powers, like his general nature, are limited, and beyond these limits he cannot go. ([5], no. 42)

Overall, in this encyclical, the most urgent demand is for an extension of employee protection laws – something that is asked of the state – to improve the situation of workers.

But it is not only the conditions of work that have to be exempt from a limitless freedom of contract but also certain conditions have to be met when shaping the wage: In reality the wage was determined by the market law of supply and demand alone. Because there was an oversupply of people looking for work, a very good market position came about for the employees so that lower wages – and, with that, widespread poverty – came to determine the living conditions of the workers. It is necessary to also see the so-called iron wage law (Ferdinand Lassalle) in this context, namely, that the wage for workers should be determined by what the worker needs as a necessity for himself and his family so that his physical existence is not destroyed, but not according to criteria that are mentioned in *Rerum novarum* as decisive for a just wage: “Let the working man and the employer make free agreements, and in particular let them agree freely as to the wages; nevertheless, there underlies a dictate of natural justice more imperious and ancient than any bargain between man and man, namely, that wages ought not to be insufficient to support a frugal and well-behaved wage-earner” ([5], no. 45).

With regard to the aim of a “just amount of pay” ([28], no. 66), there is a need to balance the interests: The situation of the employer is to be taken into account, but primarily, there is a different criterion, namely, the criterion that the wage has to be enough to ensure a living for the worker and his family (cf. [28], no. 71).

In the Second Vatican Council, in addition to the criterion of being able to shape one’s “own material, social, cultural, and spiritual life and that of his dependents,” there is, also, the aspect of “the function and productiveness of each one, the conditions of the factory or workshop, and the common good” ([11], no. 67). The decisive factor is that, over and above the criteria that have been named already, the principle of the common good is focused upon.

Additional aspects are being taken into account by the Papal social proclamation too, which limit the freedom of contract, and thus lower the principal superiority of the employer against the individual employee at least in part. To this end, intervening with the individual freedom of contracts is justified, while nowadays it is not only actions of the legislator that are asked for, but, in the context of free collective bargaining, the social partners are also assigned definite duties.

The Institution of the Market and the Competition

“The free market [seems] the *most effective tool* for the use of resources and the best gratification of needs” ([12], no. 34; emphasis by U. N.-W). This sentence, which gives a short description of the coordinating functions of the market, may not be something unusual for a student of economy, but it does mean a significant step forward for the field of Christian social teachings, in particular for ecclesial social proclamation, and a clarification that was not given until the point in time in 1991 when the text was published, regarding the question of market economy order. This is because recognition of competition as the central instrument of shaping this market order goes hand in hand with this statement. This does not mean that, in the tradition of Papal social proclamation, free competition was ever wholly rejected, but in earlier versions, this principle is, mostly, judged to be very ambivalent: “Destroying through forgetfulness or ignorance the social and moral character of economic life, it held that economic life must be considered and treated as altogether free from and independent of public authority, because in the market, i.e., in the free struggle of competitors, it would have a principle of self direction which governs it much more perfectly than would the intervention of any created intellect. But free competition, while justified and certainly useful provided it is kept within certain limits, clearly cannot direct economic life” ([28], no. 88).

The main focus of the criticism does not, however, lie on the meaning of competition within a certain mode of economics, but primarily on the question of the societal relevance and consequence of the principle of competition. And on this level, competition as “the unlimited freedom of struggle among competitors has of its own nature produced, and which lets only the strongest survive; and this is often the same as saying, those who fight the most violently, those who give least heed to their conscience” ([28], no. 107). This does, finally, describe a social Darwinism that has nothing but contempt for human beings, an image of economy which certainly had a degree of plausibility in the nineteenth century social reality, and makes it understandable why the ecclesial social proclamation registers quite so strong an objection to the principle of freedom of competition. This is because, from the point of view of the magisterium, the human being may not become an object of economic interests. This also corresponds to a further classical tenant of Catholic social teaching, the principle “work before capital,” which – as clarified by John Paul II – is synonymous with the “principle of the primacy of the person over matter.”

In *Quadragesimo anno*, a solution for this misinterpretation of understanding competition to be the highest principle of socioeconomic relations is, however, also offered: “Therefore, it is most necessary that economic life be again subjected to and governed by a true and effective directing principle. [. . .] it [i.e., the freedom of competition. U. N.-W.] is a headstrong power and a violent energy that, to benefit people, needs to be strongly curbed and wisely ruled. But it cannot curb and rule itself” ([28], no. 88).

To attain this goal – in the end, this is about a humane form of economics – it does not only need the freedom of competition but also the “higher and more noble

powers,” which “give a strict and wise discipline to it”: There is talk, in this regard, of “social justice and social love” ([28], no. 88). Freedom is, with this, embedded in an understanding of the human being that is an individual and a social being; freedom is not understood “in the sense of an individual autonomism, which only corrects the misuse of human freedom after the fact” ([33], p. 165; cf. as well [34]). Even when a representative of the Freiburg school says that, “competition is the means, not the final end” [35], it becomes clear that, with regard to the fundamental thought of a “wise steering” of economy and the critique of the social consequences of a limitless liberal economy, a connection can be made between Christian Social Ethics and the model of a social market economy, especially through the direction of this market economy toward the target of the common good.

The present Pope Benedict XVI continues the market-positive attitude of his predecessor, but does accentuate it in his own manner.

He pays tribute to the market place, in his first proper social encyclical *Caritas in Veritate* of 2009: “the market place is, if there is mutual and general trust, an economic institution which makes it possible for people to meet, which, as actors of the economy, regulate their relationship by contract and exchange goods and services which can be set off against each other, to satisfy their needs or wishes” [36]. The satisfaction of needs or wishes is, quite clearly, given as the aim of economic acts; the market development is not just grudgingly tolerated, but is paid tribute to as an institution. This positioning is a fundamental condition for judging the consequences of the most recent crisis of economics and financial markets in a way that does justice both to the human and the factual side and makes it possible to deal with recent developments in a differentiated manner.

It is important, for the ethics of economy approach of the Pope, that the economic life “[has] to be directed towards the attainment of the common good, which the political community, too, has to take care to achieve, and especially so” ([36], no. 36,1). The market is not everything; there is a “beyond the market”, without which, however, the market cannot be imagined, and without which it cannot work either. That means that there are areas and problems which are related to the market, but which cannot be left to market forces. Particular mention should be made of the people who are weak and passive in the market, the people who do not have the ability to participate in the events of the market, so particularly, the (long term) unemployed, those who have few qualifications, and those who are hard to place. Social justice and the justice of distribution are part of the aims which the market alone cannot realize. The state has the duty, here, to give the framework pertaining to a constitutional and social state that is needed to solve the problem. The dimensions of human life, on the other hand, which are not directly covered by possibilities of the market, but which have at least an indirect influence on it, should also be mentioned, for example, the passing on of values, the human longing for meaning and home, for an aim to life that goes beyond this reality.

Finally, the “beyond of the market” is, directly, as influential as the market itself. To achieve precisely its own aims, the market may not – as says Benedict XVI – “only be left to the principle of the equivalence of the exchanged goods” because then, according to the Pope, the market is “unable to create the social

cohesion that it needs, however, to work well” (CiV 35). What people hold to be significant virtues in the rest of their lives does not have to remain on the outside of this, but is, in the Pope’s approach, connected with the events of the market at the very core: “Without a type of behaviour that is shaped by solidaric and mutual trust at its core, the market cannot fulfil the economic function which is its own” (CiV 35). Particularly, the dimension of trust, which seems to have been lost in many places during the latest finance market and economic crisis, gains central significance in this context.

It is also necessary to integrate ethical aspects into the market economy order itself. The fact that the Pope – knowing full well the meaning of the laws of the market and the logic of the exchange – promotes the altogether different logic of the gift (cf. CiV 37) and the principle of the unpaid for so strongly set different accents in many places. It is the civil society which, according to Benedict XVI, introduces this dimension of the unpaid for. “In the times of globalisation economic events cannot be without matters that are unpaid for, which nurtures and spreads the solidarity and the feeling of responsibility for justice and the common good in its different subjects and actors” (CiV 38). The Pope knows that this element of the unpaid for cannot be ordered to happen. He does, however, stress with great clarity that the market as well as politics need people who are prepared to provide this unpaid for element – particularly in the age of globalization.

Catholic Social Teaching, Neoliberalism, and Social Market Economy

The system of social market economics has already been mentioned in a number of places above, as a reference value. In theory as well as in the concrete implementation, this system describes a way which could lead to a closer connection between Christian Social Ethics and economy.⁶ There are many commonalities – Joseph Höffner says that “Catholic social teaching [...] [holds] market economics [to be] the right basic form of the economic order” [37] under the condition that it is given a “humane orientation” [37].

A more precise synopsis does however also show divergences, which led, particularly at the beginning of social market economics, to some serious disagreements.⁷

Nell-Breuning does, as well, not argue with the success of the rebuilding of postwar Germany that was achieved by the economic system of social market economics; he also talks, positively, of a “certainly welcome general affluence” ([39], p. 227); most of all he criticizes is the use of the attribute “social”: the market forces, he explains, still had “entirely free range; this is only meant to be secured by the fact that they are not allowed to have alliances with each other or to start a conspiracy to enable them to evade competition” ([39], p. 227). According to his opinion, the “social” does not have to imply a correction, after the fact, of individual, personal emergencies, but can mean, more broadly, a “different game of the market forces” with a “distribution of income and funds that is more just from the outset” ([39], p. 227). Finally, it is important to him that “economics are not just a pure market process, but, in the fullest sense of the word, a social process.” It was

social cooperation he was talking about, “the participation not in the result, but in the process of the economy” ([39], p. 229; cf., also, on this argument [40]). Competition is then not enough either as a principle of order or as an instrument to make sure that the economics is working. Economy has to, rather, be shaped on the basis of a “multidimensional world of values” [41] and corresponding politics of order.

Joseph Höffner engages in a different manner, but also intensively, with neoliberalism and social market economics. One of his central critical questions aims at the “neoliberal thesis of free competition as the regulative principle of economics” and its compatibility with “Catholic business ethics” ([42], p. 193). The material end of the economy consists, according to him, “in a permanent and secured creation of those material prerequisites that render possible a development worthy of man, for the individual and the social structures” [43]. To reach this target, freedom and self-determination of the individual are needed as well as the social orientation of society. As Höffner does not see the economy as something automatic, but very much as a “cultural process,” it has to be shaped; it is “possible and necessary to steer it” ([42], p. 193). For this, however, according to his conviction, “neither the pure freedom of market economy nor the monopolistic creation of power” ([42], p. 193) is adequate. He states, in this way, that “the target of the economy [...] does not automatically equal the sum of the individual interests” ([42], p. 193) and so defines a clear contrast to the liberal position. The will to order of the human being was, rather, necessary; the necessary principle to give an order to competition too has to be the common good. The social market economy (which should not automatically be equated with neoliberalism) carried the term “social” correctly if a decision as to which means and interventions were needed and appropriate for the market in a “politics of economics” sense was made based on the principle of the common good.

In the social proclamation of the Church, it was the social encyclical of 1991, *Centesimus annus*, which perceived and judged the economic form of “capitalism” in a more differentiated way. Pope John Paul II voices the following scheme of assessment: “If by ‘capitalism’ is meant an economic system which recognizes the fundamental and positive role of business, the market, private property and the resulting responsibility for the means of production, as well as free human creativity in the economic sector, then the answer is certainly in the affirmative [...] But if by ‘capitalism’ is meant a system in which freedom in the economic sector is not circumscribed within a strong juridical framework which places it at the service of human freedom in its totality, and which sees it as a particular aspect of that freedom, the core of which is ethical and religious, then the reply is certainly negative” (CA 42). The social proclamation of the Church does, definitely, give its blessing to a market economy, but it demands at the same time that the market is ordered, by a framework of the constitutional and social state, so that it focuses on humanity and the common good because it cannot achieve this on its own. This understanding corresponds, roughly, to the basic tenants of the concept of social market economics, while in the encyclical *Centesimus annus* this model itself

is, however, not directly mentioned. With this, the social proclamation remains true to its principle of not preferring certain programs, but it speaks instead – less specifically – of “business economy” or also of “free economy” (cf. [12], no. 42).

Development of Specific Aspects of a Business Ethics as the Subject of Christian Social Ethics

The term that has just been used, “business economy,” taken from the encyclical *Centesimus annus*, puts the focus on the question about the central figure of the market economics order and also of business ethics, namely, the entrepreneur or the central institution, the enterprise.

Entrepreneurs and Enterprise as Forgotten Factors of Social Ethics

It is, at first glance, not consequent, and not understandable, that these were largely disregarded in the social proclamation of the Church until the third social encyclical of Pope John Paul II *Centesimus annus* of 1991, when taking into consideration how close, otherwise, the tradition of Christian social teaching is to liberal and socially responsible market economics. The Council of the Protestant Church in Germany, too, said in its memorandum of 2008 that, in the face of economic development and to “be able to cope with increasing global social and ecological problems,” it was necessary that “the Protestant Church, too, specified its relationship to entrepreneurial acts” ([32], no. 13). In the academic field within Christian business ethics, there are at least a few interesting approaches.

Johannes Messner, for example, voices the following criticism in 1968: “In the social teaching of the Church the entrepreneur in the proper sense is not mentioned, she just talks of employers, one partner in the employment contract” ([44], p. 6). When looking for an explanation of this deficit, he lists different aspects: for one, social teachings are, in this, a mirror image of the general development of economic theories, which only discovered the entrepreneur before the First World War and, in the time following this, still did not do justice to his function entirely. Secondly, economics generally, and with that the “entrepreneur [as the] primary mover of the economic process” ([44], p. 13) especially “in Catholic thought” ([44], p. 12) and because of the “social ideology of Catholic associations” ([44], p. 10) had been completely underestimated for a long time. Lastly, the social teachings of the Church had always primarily dealt with the *social* question, in the context of which considerations came out of a contemplation of the employment contract – and, with that, of the two factors involved here – the conditions of work. Joseph Höffner identifies “three slogans against entrepreneurs”: “profit-driven exploitation” – “enslavement to the machine” – “undignified heteronomy”, which led to the understandable, but regrettable “distorted image of the entrepreneur” ([45], p. 107).

Company Ethos and Elements of Entrepreneurial Ethics

Höffner was looking, as early as in the 1960s, distancing himself from the distorted image, for the “true character of the entrepreneur” or for the typically “entrepreneurial.”⁸ For the professional ethos of the entrepreneur, he stresses central characteristics: (1) “professional excellence” ([47], p. 406); (2) the “readiness to serve” ([47], p. 407), which articulates itself in the concern for the own employees and their security as well as in the creation of new work places but also for human relationships; as well as (3) the “concern for the common good” ([47], p. 410) – an aspect which, in the debate of the moment, is dealt with under the buzz word “Corporate Social Responsibility” or “Corporate Citizenship” (cf. [48]). Finally, a last point deserves mention: Höffners “warning of the ‘total’ entrepreneur” ([45], p. 411), that is, of the entrepreneur who allows himself to be completely subsumed under his – in the purely economic sense – entrepreneurial role and does not have any time left over for the higher values such as family, the beautiful and the religious, leisure, and finally God. Concern for a sense of direction based on these values is, for Höffner, in a wide sense an important aspect of the service of the (Christian) entrepreneur. Taking into account the “beyond of entrepreneurial acts” is what first leads entrepreneurial acts toward their full sense.

In the more recent social-ethical debate, the question about the meaning of the ethos and the individual (virtuous) morals has been an important aspect. Karl Homann, who had a significant influence on Christian social-ethical thinking, states, again and again, that the ethics of order were now taking the place of the previous model of virtue ethics (cf. [49]); he defines economics as a continuation of ethics with other (read: better) means (cf. [50]). The experiences of the most recent finance market and economical crisis however have, at the latest, made it very clear that economics alone with morals that are incorporated into the framework cannot work, in addition to all economic laws and institutions, a consciousness of values and a corresponding attitude of the individual form a significant part of the equation. A memorandum of the EKD, regarding current developments, makes the following criticism: “If, in actual fact, less and less is invested into the innovation and the future of an enterprise because high profits have to be achieved quickly and dividends have to be paid out, the values of great entrepreneurial figures such as Robert Bosch, Ernst Werner von Siemens or Carl Zeiss are left behind. If only companies that already exist are taken over to get as much money out of them as possible for the short term, the responsible entrepreneurial ethos dissolves” ([32], no. 26). Individual morals, however, will not replace the structural ethical aspects or the relevance of the de facto context of economics: “A system of morals that thinks that it can pass over the technical knowledge of economic laws is not moral, but moralizing, and thus the opposite of a moral system. A factualness which thinks that it can survive without the ethos misunderstands the reality of human beings and becomes, thus, unfactual” [51].

Typical Entrepreneurial Elements and Aspects of Structural Ethics

Höffner makes an important contribution to localizing and determining entrepreneurial elements in the context of structural ethics: While the social conflicts in Germany were carried out, for a long time, as if “economics only had the two aspects of capital and of work,” it was important to stress the third aspect, namely, the one who leads the enterprise, directs the development, “and [brings] resources and executing work into the best technical, commercial and personnel-related balance” ([47], p. 404).

Johannes Messner refers (also as early as 1968), in his treatment of the concept of the entrepreneur in Catholic social teachings, to a talk given to Christian entrepreneurs in Italy by Pope Paul VI in 1964. In it, a “celebration of the service of entrepreneurs” ([44], p. 20) by the magisterium can be found that had, up to that point, been unheard of. Paul VI deals, at the same time, critically with the “capitalist” system and its defects. Messner stresses, as the central position of the Pope and the tradition as a whole, that the accent lies on the social aspect of the question of the entrepreneur in favor of the economic one (cf. [44], p. 21), or that the ranking had to be the following: “The human being first, then everything else” ([44], p. 21). This is quite similar to Pope Benedict’s sentence, “that the *primary capital to be safeguarded and valued is man, the human person in his or her integrity*” ([36], no. 25). From the perspective of the fundamental principle, Messner arrives at some interesting, constructive insights and new evaluations with regard to the development of the economic system: (1) Power and egoism (of interest) are, according to him, not located, solely on the side of the entrepreneurs (cf. [44], p. 21), and in addition, the creation of interest groups in a liberal society were precisely a consequence and an expression of exactly this freedom. Conflicts of interests were, because of this, unavoidable in an entrepreneurial society and should even be seen as positive, as a motor of social and economic progress, if all groups involved saw the common good as their target. (2) The principle of the “precedence of work over capital” did not mean, simply, the precedence of the employer, but was valid for all participants in the economic process, insofar as all work always also served the development of the personal values of each individual (with reference to [11], no. 67). Thirdly, the role of the entrepreneur, which means the concern to “make the process of production more productive” ([44], p. 26), was not limited to the leadership of the company alone, but actively involved all participants in the enterprise at the place “where something can be achieved for the productivity of the company” ([44], p. 26); Messner speaks, here, of an “entrepreneurial social partnership” ([44], p. 28), which needed an effort from both sides (with reference to [11], no. 68). This aspect of the entrepreneurial at all levels of the company can be taken as a point of departure for the debate about the development of a company culture today.

For Messner, this also implies that the solution of the social problem of the industrial society has to be found in codetermination. Codetermination, in turn – this is the result of Messner’s analysis – did not mean interfering with the

ability to make decision of the management, but to give employees “by entrepreneurial engagement the possibility of the creative development of life and personality” on all levels of the company.⁹ With this distinctive intensification of the principle of Christian Social Ethics “person first” for the area of companies, Messner, in particular, showed a new horizon for the debate of the social question, which had always been seen, primarily, as a question of distribution.

For present-day Social Ethics from a Catholic perspective, the diagnosis regarding approaches of entrepreneurial ethics is still “speechlessness” – “the ethical orientation of, and in, companies is a little explored sideline of Christian Social Ethics” ([52], p. 3). This is true, according to Habisch, for the academic discourses (exceptions prove the rule (cf., e.g., [53] and [54])) as well as for the institutionalized dialogue between Church and economy (cf. [52], p. 3f.). Habisch himself posits companies, within a working market order, as a decisive factor of the order of society: For him, it is “only the entrepreneurial achievement of innovation in the context of a competitive order” which makes “possible, in the long term, an enormous raise in living standards especially, too, for workers in industrial countries. This is because opportunities for personal development replace fixed roles and status relationships” ([52], p. 5). It is only in the context of such an order that the solidarity system became possible, with people from families that are weak socially having opportunities for education and participation.

Companies, Their Economic Functions, and Social Responsibility

It was only a quarter of a century later, close, chronologically, to the failure of the communist system, that the Polish Pope John Paul II first grappled with the question of companies from the perspective of social proclamation. He makes the positive role of the company a decisive criterion for the assessment of “capitalism” (cf. [12], no. 42,2). The economic aspects of a company are of great importance – the “Church acknowledges the rightful *role of profit* as an indicator for the good state and running of a company” ([12], no. 35). This is, of course, not about dealing uncritically with economic processes. It is not solely profit which is an indication of the good state of a company; a company was able to be efficient in the long term only if “humans, which are the most valuable asset of the company” ([12], no. 35) were treated according to their dignity. If he addresses, here, mainly “the legitimacy of the effort of the workers, [...] the full respect for their dignity and the option to gain more participation in the life of the company” (43), this evokes the understanding, developed by Messner, of the entrepreneurial element in all levels of a company. The Church does not develop her own model for managing a company, but she does want to give guidelines for arrangements in the concrete situation with her central ethical statements.

Pope Benedict XVI pays attention to the question of the responsibility of businesses in particular against the background of the crisis of the finance market and the economy. Knowing full well of the processes of structural change that are to come for many globally acting businesses and, at the same time, of the

opportunities of the international capital market, he stresses, in the same breath, the “social responsibility” ([36] no. 40) of the entrepreneur. The so-called stakeholder approach is a consequence of this perspective which can be found where Benedict stresses the social responsibility of the entrepreneur for “the employees, the customers, the suppliers of different elements of production, the corresponding community” ([36], no. 40), an approach which is of great importance at the moment in the business ethical debate and exploration of the shareholder-value approach. A fundamental guideline is, here, the common good, and the direction toward it. Taking into account the global development of today, it remains to be seen whether the companies/entrepreneurs hold a “co-responsibility in political order terms, and, if the answer is positive, in which way are companies to participate actively in shaping global frameworks?” [55].

The point of departure for Pope Benedict XVI is, when thinking about the responsibility of entrepreneur, not the classical demonization of capitalism, of profit, and similar, but the clear thesis that “*an investment always has a moral meaning in addition to an economic one*” ([36], no. 40). No direct instruction to act a certain way follows from this, but a differentiated consequence: Investments in foreign countries are definitely seen as a chance to “do good”; work and technical knowledge were needed everywhere. At the same time, the Pope urges the use of criteria of justice: “The demands that follow from justice have to be fulfilled, while also taking into account how this capital was formed and which damage is done to people if it is not used in the place where it was created” ([36], no. 40). This makes it clear that the securing of the long-term company assets and the use of the real economy are deciding factors for justice, but, in the same context, the “care for the appropriate and convenient support of economic initiatives in developing countries” ([36], no. 40) is mentioned. It is obvious that speculating with a view to a short-term gain alone is condemned in this context.

Let us go back, here, to the aspect of social responsibility of businesses: Pope Benedict XVI speaks, in his encyclical, of the fact that “in addition to private profit-oriented businesses and the different kinds of state enterprises, [...] production communities who strive for mutual and social targets [should] be able to find a place and act” ([36], no. 38). It is precisely from these “social entrepreneurs” that he hopes for a tangible influence “on a *civilising of economics*” ([36], no. 38). With this, too, the Pope refers to a current debate on company and society ethics: the one about entrepreneurs in the social sector, social entrepreneurs, who develop “innovative forms of solving problems, e.g. in the area of international health provision, the societal integration of children and teenagers, the creation of better opportunities for education for wide swathes of the population etc.” [56]. If these entrepreneur personalities, in the space of the civic society, fight for the humanizing of living and working conditions of people with their entrepreneurial potential, and thus give impulses for innovation in the field of social politics (cf. [57], pp. 76–78), they realize exactly that which the subsidiary and solidarity principles intend.¹⁰

The memorandum of the EKD also takes up the question of the voluntary taking on of responsibility in the field of social politics, which is outside the direct purpose of the company. The text stresses, however, at the same time, that this activity of the

entrepreneur and of the enterprise benefit, in turn, the image of the company. The term “Corporate Social Responsibility,” which has become international, deserves mention and should be understood as a “form of dialogue which each company has to engage in with its societal surroundings, to be able to perceive and realise its needs” ([32], no. 105). The memorandum does, however, also rightly point out that the engagement as defined by CSR is not a *carte blanche* for misbehavior in the narrower area of the duties that relate to the business (cf. [32], no. 105).

Conclusion

Johannes Messner was not wrong in his article from 1968: The classical Social Ethics of Catholic and Protestant provenance has only made progress toward a clarification of its relationship to entrepreneurs and business ethics, as far as it focuses on this term and this function, in recent times. With the encyclical *Centesimus annus* at the latest, a significant step was made – as shown – toward acknowledging an order of entrepreneurial economics by the Papal social proclamation. The memorandum of the EKD also takes up a relevant position. For Catholic social teaching, these undoubtedly important learning processes mean that finally the undifferentiated talk of “capitalism” comes to an end, and, at the same time – even if it is not mentioned *expressis verbis* – the model of social market economics, especially regarding its anthropological and ethical foundation, has become much more well founded (cf. [33]). That does not mean, by any means, that Christian Social Ethics has not dealt with elements that are fundamental to social market economics: Central elements such as the understanding of (private) property and the question of liberty of contract and fair wages as well as market and competition belong to the central *topoi* and fundamental statements of the Christian tradition of Social Ethics, and it is thus possible to state, on this background, that a turning of Christian Ethics toward a market economics order did not only happen very recently. This position of Christian Social Ethics is rather the result and the logical consequence of the Christian understanding of human beings, who are endowed, as the image and creature of God, with dignity and freedom, and need, because of this, freedom for their development in the market, and thus the entrepreneurial. At the same time, the understanding of humans implies a focus of the individual on the community, which, again, has clear consequences for the order of economics, for example, the social accountability of property or an understanding of the labor market which has to be surrounded, for the sake of the human being, by a corresponding order of a social and constitutional state and cannot just be left to the law of supply and demand. The rule is always the human being first! The meaning of this needs to be concretized with regard for the situation in each case. The tradition of Christian social teaching does, however, point clearly toward a socially responsible market economics order.

With the rule “the human being first,” the obligation of the entrepreneur for “social responsibility,” and with including this which is “beyond entrepreneurial acts,” Christian Social Ethics has developed a clear program regarding

economics and business ethics, a contrast position to the position of Milton Friedman's "Business of business is business." The business of the entrepreneur does not focus, in the Christian perspective, on short-term maximum profit, but on the running of the business while taking into consideration all people involved (stakeholders). Particularly, taking into account the most recent crisis of the finance market and economics, it has become increasingly clear how much an understanding of economics which, without regard for people, solely focusing on profit, is obsolete. This is why Christian Social Ethics, especially the ethics of economy, is suitable and prepared for the dialogue that is to happen in the face of the great challenges of economy and society; it can make, with its positions, an important contribution to the foundation and implementation of a humane socially responsible model of economics.

Notes

1. Protestant social ethics cover a wide area, which is not contained by specific definitions or magisterial proclamation. For the Protestant field, this means that "it is difficult to reconstruct an ecclesiastic social ethics or social teachings. Individual Protestants and individual groups and clubs of Protestants were those who made a very special contribution to the questions of business ethics and the shape of a social state with their work on concepts and their practical socio-political work" [4]. Although the following does not claim to speak for both confessional theologies, aspects of Protestant social ethics will be included where this is possible.
2. Texts of the social proclamation are quoted with paragraphs, not page, numbers. In this early document, the numbers do not belong to the official text version, so they may be different in the several versions.
3. As this part is essentially about an exploration of social *proclamation*, it is obvious that, here, fundamentally, only the Catholic perspective can be portrayed.
4. Private property is defined here, primarily, as the ownership of capital goods. The right of owning goods for consumption was never seriously doubted even in socialist states.
5. No particular social duties were associated with this understanding of property.
6. Overall, it is mostly the problems discussed within the context of the economy which have to remain undiscussed here, which result in detail from the target of a social market economy, especially the question whether, within this concept, the "social" is just an "annex" of free market economics, or whether the attempt to achieve an integration of both elements can really be successful. From the perspective of Catholic social teaching and its concept of humanity, it is, however, absolutely necessary to try and achieve a synthesis.
7. A detailed synopsis of both positions can be found in [38].
8. On this terminological distinction between entrepreneurial ethics and the ethics of enterprises, cf. [46].
9. Messner [44] refers to the speech of the Pope given to Italian Christian entrepreneurs and, among others, to GS 68. Interestingly, the memorandum of the EKD goes back, again, to the topic of codetermination for creating a "capital of trust" ([32], no. 61–65).
10. Even if the debate about social entrepreneurs and the reflection about their contribution to society is fairly recent, this is not true for the idea of the social entrepreneur in general because

even that which many members of the Christian social movement in the nineteenth century achieved as an innovative solution to social problem can be understood as the origin in of this idea. As an example, the entrepreneur from Mönchengladbach, Franz Brandts, should be mentioned here (cf. [57], p. 70–74).

Part 13

Islamic Foundations of Business Ethics

Jawed Akhtar Mohammed

Abstract

The ethical system in Islam is presented in light of *Shariah* – the Islamic social/legal system. According to Islam, whatever leads to welfare of the individual or society is morally good and whatever is injurious is morally bad. The ethical system prescribed in Islam is eternally divine and forms the foundation of an Islamic society. Islamic ethics prescribe its followers to zealously guard their behavior, words, thoughts, and intentions and observe certain norms and moral codes in their family affairs; in dealings with relatives, neighbors, and friends; in their business transactions; in their social affairs; and in private and public life. The unique feature of the Islamic ethical system is that it permeates all spheres and fields of human life. Islam also has its own distinctive value-based ethical system for business dealings. It prescribes certain specific guidelines governing business ethics, which are dictated primarily by the notion of *halal* (lawful or permitted) and *haram* (unlawful or prohibited) as per Islamic jurisprudence (*fiqh*). This chapter explores the ethical system in Islam, which is essentially a reflection of the divine commandments and guideline for the right and wrong and enumerates the general ethical rules of business conduct.

Introduction

This study seeks to explore the ethical system of a major world religion – Islam – and how it influences business and socioeconomic life. Indeed, values and principles that have been central to Islam since the time of the holy Prophet Mohammed (peace be upon him)¹ 14 centuries ago may serve as a foundation for ethical norms

J.A. Mohammed

Faculty of Business & Enterprise, Swinburne University of Technology, Mail H23, PO Box 218, Hawthorn, Melbourne, Victoria, Australia

and behavior. For example, the holy *Qur'an* has enjoined that the economic success of business will flourish if it is underpinned by morality and businesses are reminded to “. . . give full measure when you measure, and weigh with a balance that is true. . .” [1]. Thus, the convergence between Islam’s focus on morality and the economic orientation of business is very apparent.

There is almost a general consensus among human societies about certain fundamental ethical or moral values. However, the main problem is how to operationalize and implement them and to decide what kind of force could be used for promulgating them. Islam offers its own solution to this problem. It prescribes certain specific guidelines for governing businesses based on the legality of transactions as per Islamic jurisprudence (*fiqh*) of lawful (*halal*) and unlawful (*haram*) activities. It identifies ethically desirable forms of business, specifies the undesirable modes of transactions, and enumerates the general ethical rules of business conduct.

Much of the business ethics movement, however, draws on a humanist tradition, concerned with respect for the dignity of man, and writing in the field of moral philosophy more generally rather than religion. Those involved with moral and ethical issues in Muslim countries cannot ignore the contributions of the Islamic traditions. Laura Nash [2] has described good business behavior as “ethics without the sermon” [2], but perhaps there is a case for including the sermon.

Islam has laid down some universal fundamental rights for humanity as a whole, which are to be observed and respected under all circumstances. To achieve these rights, Islam provides not only legal safeguards but also a very effective ethical system. According to Islam, whatever leads to welfare of the individual or society is morally good and whatever is injurious is morally bad.

The concept of ethics or morality has been the foundation of an Islamic society since its advent in the seventh century. The holy Prophet Mohammed (PBUH) exemplified the principles of morality and ethics embedded in the holy *Qur'an* through his practices (*Sunnah*) in personal as well as public life to establish a social system that was just and harmonious and, thus, ethical. These principles that permeate every aspect of a Muslim’s life also govern Islamic business and commercial practices and have been present for the last 14 centuries.

Islam places the highest emphasis on moral values in human life. In a way, Islam is basically a moral code of conduct for human life. The holy Prophet Mohammed (PBUH) said:

I have been sent only for the purpose of perfecting good morals. [3]

Moral codes and ethical norms discernible from the verses of the holy *Qur'an* and the teachings of the Prophet (PBUH) are numerous, far reaching, and comprehensive. Islamic teachings strongly stress the observance of moral principles and ethical codes in human behavior. They are repeatedly stressed throughout the holy *Qur'an* that says:

You are the best nation that has been raised up for mankind;
you enjoin right conduct, forbid evil and believe in Allah. [4]

The above verse implies (1) faith, (2) doing right, being an example to others to do right and having the power to see that the right prevails, and (3) eschewing wrong, being an example to others to eschew wrong and having the power to see that wrong and injustice are defeated. Islam therefore lives not for itself but for humanity and lays out a clear guideline for Muslims to be righteous and, thus, socially responsible through their actions in life [5].

Thus, the ethical system prescribed in Islam is eternally divine and forms the foundation of Islamic society, placing great emphasis on social responsibility and justice. Given the comprehensive nature of Islamic morality and the principles governing it, it would be beyond the capacity of one study to fully discuss the subject. In the following pages, the effort will be to confine the discussion to some specific principles of ethics in Islam that relate to business practices.

This study will highlight the presence of a rich vein of ethical values and principles according to *Shariah* the sacred law of Islam derived from the holy *Qur'an* (book of divine revelation), *Hadith* (sayings and deeds of the holy Prophet Mohammed [PBUH]), *Ijma* (consensus), *Qiyas* (reasoning by analogy), and *Maslaha* (public interest). The purpose of the Islamic social/legal system (*maqasid al Shariah*) is material as well as spiritual. The goal of an Islamic social/legal system is based on *hayat tayyibah* (good life) and *falah* (human well-being), both of which stress brotherhood and socioeconomic justice, as well as a balance between the material and spiritual requirements of all human being that is necessary to preserve and enrich faith, life intellect, posterity, and wealth ethically.

The Islamic Ethical System

Ethics is an age-old discipline that has been considered as one of the four branches of philosophy along with logic, metaphysics, and epistemology. Defining ethics in general terms is relatively simple. Ethics may be defined as a set of principles of right conduct or a theory or system of moral values. It may also be defined as the study of the general nature of morals and of specific moral choices to be made by a person (moral philosophy), or as the rules or standards governing the conduct of a person or the members of a profession, for instance, medical ethics [6–10].

From an Islamic point of view, there is no direct translation or meaning of ethics or ethical behavior. The term most closely related to ethics in the holy *Qur'an* is "*Khuluq*." Depending on the translation, this could be interpreted as "character" (Abdullah Yusuf Ali – English translator of the holy *Qur'an*). The *Qur'an* mentions *Khuluq* in Sura Al-Qalam:

...and thou (standest) on an exalted standard of character. ... [11]

Mohammed Asad [12] rendered the same *Qur'anic* verse as

...for, behold, thou keepest indeed to a sublime way of life...

Asad [12] states that the term *Khuluq*, rendered a "way of life," describes a person's "character," "innate disposition," or "nature" in the widest sense of

concepts as well as “habitual behavior.” Identification of *Khuluq* with “way of life” is based on the explanation of the above verse by Abd Allah ibn Abbas (as quoted by Tabari in *Hadith*), stating that this term is here synonymous with “*din*” and one must remember that one of the primary significances of the latter term is “a way or manner of behavior” or “of acting.” Moreover, there are several well-authenticated traditions in the *Hadith*, according to which the widow of the holy Prophet – Aisha (Allah be pleased with her) speaking of the Prophet Mohammed (PBUH) many years after his death – repeatedly stressed that Mohammed’s (PBUH) “way of life (*Khuluq*) was the *Qur’an*. . .” [12].

However, the *Qur’an* uses many terms to describe the concept of goodness or good behavior, all of which contribute to the formation of character: *Khayr* (goodness), *birr* (righteousness), *qist* (equity), *adl* (equilibrium and justice), *haqq* (truth and right), *ma’roof* (known and approved), and *taqwa* (piety). Allah (the most exalted) describes people who attain felicity or success in life as those:

. . .inviting to all that is good, enjoining what is right, and forbidding what is wrong. . . [13]

This verse suggests that Allah (TME) enjoins all Muslims to learn the difference between right and wrong, good and bad, and righteousness and loathsomeness and to do good work throughout the life. Allah (TME) also warns:

O you who have attained to faith! Do not devour one another’s possessions wrongfully in vanities – but let there be amongst you traffic and trade based on mutual agreement – and do not destroy (or kill) one another: for behold, God is indeed a dispenser of grace unto thee! And as for him who does this with malicious intent and a will to do wrong – him shall We, in time, cause to endure (suffering through) fire: for this is indeed easy for God. [14]

Interpreting the preceding verse reveals profound meaning pertaining to ethical conduct. It asserts that all the property or wealth one possesses is in trust, whether it is in one’s own name or belongs to the community, or to people over whom one has control. To waste it is wrong. This verse also cautions against greed. It encourages one to increase property or wealth by economic use (traffic and trade), recalling Christ’s parable of the talents (Matt.xxv. 14-30), where the servants who had increased their master’s wealth were promoted and the servants who had hoarded were cast into darkness. This verse also warns that violence leads to self-destruction (“do not destroy or kill one another. . .”). One must be careful of theirs as well as other people’s lives. Violence is strongly abhorred. Violence is preposterous as Allah (TME) has loved and showered His mercies on all His creatures [15].

It must be stressed that ethical behavior in management of a household, corporate enterprise, or nation comes from the examples set at the top [16]. As Muslims, one only has to look to the example set by the holy Prophet Mohammed (PBUH) as the means and method to garner respect and don the robes of leadership. He led by example and his people followed out of respect for the man, first and foremost, and respect for the message he was chosen to deliver. Without that respect, he surely would have had difficulty convincing his fellow Arabs to follow. He was respected for many qualities but most importantly for his integrity and honesty. Integrity and honesty is the cornerstone of ethical behavior. For in this state, one stands in

the “exalted standard of character” – the exalted character of Mohammed; may Allah (TME) deliver His blessings upon him.

Many writers believed that by studying either the scripture or nature, man would become ethically aware. Islam takes a different approach. The Islamic ethical model places its emphasis on the Creator of the Worlds – Allah (TME) – because Allah (TME) is perfect and omniscient. Muslims have a code that is neither time-bound nor biased by human intervention. Basing himself on the *Qur’anic* verses 96:1–5; 68:1–2; and 55:1–3, Jabir Al ‘Alwani [17] concludes that humankind has been enjoined by Allah (TME) to perform two different kinds of readings simultaneously: a reading of Allah’s (TME) revelation (the holy *Qur’an*) and a reading of the natural universe [17]. Those who undertake only the first become ascetics. Sometimes, such a reading makes them imbalanced and incapable of independent thinking. Those who stress only the second reading are powerless to answer the “ultimate” questions and generally dismiss everything beyond their abilities to perceive by means of the senses as supernatural. Thus, the knowledge from both types of readings must be complementary rather than contradictory.

There is a general consensus among different societies about certain fundamental ethical values. However, as a result of the knowledge from both divine and natural sources, the Islamic ethical system substantially differs from those of others. Islam does not advocate withdrawal from the world by stressing piety and meditation, but stresses active participation in the world through the struggle of this life [18]. While participating in this life, a Muslim must remember to be consistent in both acts of worship and other dealings in daily life. Observing the five pillars of Islam (*Imaan*, faith in one God; *Salat*, obligatory prayers; *Zakat*, Islamic tax; *Saum*, fasting in the month of *Ramadhan*; and *Hajj*, pilgrimage to Makkah) is not enough; one also needs to conform to the Islamic code of ethics in daily life, which stresses on the social responsibility and justice to be maintained under all circumstances.

According to Islamic ethics, Muslims have to zealously guard their behavior, words, thoughts, and intention. Islam asks its believers to observe certain norms and moral codes in their family affairs; in dealings with relatives, neighbors, and friends; in their business transactions; in their social affairs; and in private and public life.

The unique feature of the Islamic ethical system is that it permeates all spheres and fields of human life. Adherence to ethical behavior is part of *Imaan* (faith) itself, and as such, social responsibility and justice is considered as an offshoot of a Muslim belief system. It provides a strong internal sanctioning and enforcing authority for observing social standards. The concept of ethics in Islam is not utilitarian and relative; rather its principles are eternal and absolute. This ethical code of conduct also applies equally to the commercial aspects of human life.

Islamic Ethics: Implications for Business Practices

Islam, through the example of the holy Prophet (PBUH) and the rightly guided Caliphs, acknowledges the importance of trade or business. The holy Prophet (PBUH)

himself was a merchant involved in international trade prior to his divine duty. The first three rightly guided Caliphs were Abu Bakr (Allah be pleased with him), who ran a cloth business; Umar (Allah be pleased with him), who had a corn trading business; and Uthman (Allah be pleased with him), who also ran a cloth business. The Ansars (people of Yathrib, now Madina al Munawwara in Saudi Arabia, who gave shelter to Prophet (PBUH) and his companions and were among the first communities to accept and convert to Islam) engaged in farming. In fact, except for trades that have been prohibited, Islam encourages Muslims to get involved in all sorts of business and commerce.

Islam fully recognizes the desirability of engagement in business activities. It is a religion that is pro-business. The *Qur'an* states:

Allah has made business lawful for you. [19]

It does not denounce business or other worldly activities as such. According to Islam, there is nothing wrong in fair trade and commerce. In fact, a businessperson who performs his business operations with honesty and in accordance with the commands of Allah (TME) deserves to be rewarded by Allah (TME) in the life hereafter (*Akhirah*). Business activities can become a part of worship and obedience (*Ibadah*) of Allah (TME) if the same are performed in accordance with the commands of Allah (TME) in line with the Islamic code of conduct. One can even engage in business during the pilgrimage (*Hajj*) which is the highest form of worship in Islam. Thus, there is no inherent conflict between fair business and Islam. Islam declares that the search for one's livelihood through fair business is like the pursuit of the blessing of Allah (TME).

Islam has its own distinctive value-based ethical system for business dealings. It prescribes certain specific guidelines governing business ethics. It

1. Enumerates the general ethical rules of business conduct
2. Identifies ethically desirable forms of business
3. Specifies the undesirable modes of transactions

These guidelines are dictated primarily by the notion of *halal* (lawful or permitted) and *haram* (unlawful or prohibited). Material pertaining to this subject (of *halal* and *haram*) can be found scattered throughout various chapters in several books of Islamic jurisprudence (*fiqh*) and between the lines in the commentaries on the *Qur'an* and *Hadith*. A brief discussion of the concept of the lawful (*halal*) and unlawful (*haram*) behavior in Islam that is the foundation of any business transaction according to *Shariah* will follow as a precursor to an examination of the precepts of business transactions in Islam, to be discussed in the following chapter.

Ethical Conduct: The Lawful (*Halal*) and Unlawful (*Haram*) Behavior in Islam

The *halal* and *haram* are significant parts of the total legal system in Islam – *Shariah* – a system whose primary objective is the good of humankind. Its principles are designed to protect man from evil and to benefit him in all aspects of life.

They are also designed to benefit everyone in the community and the wider society in every period of time throughout the succeeding generations. Thus, morality in Islam is authorized by divine decree [20].

In describing the ethical code of Islam, it is important to understand that actions can be categorized according to their degree of lawfulness (*halal*) and unlawfulness (*haram*). The basic philosophy is that the things which Allah (TME) has created and the benefits derived from them are essentially for man's use and, hence, are permissible (*halal*). Nothing is prohibited (*haram*) except what is prohibited by a sound and explicit verse of the *Qur'an* or a clear and authentic *Sunnah* (practice or saying) of the Prophet Mohammed (PBUH). In Islamic jurisprudence (*fiqh*), five such classes are identified:

1. *Fardh* (required) – represents the class of actions that are mandatory on every person claiming to be a Muslim, such as *salat* (prayers), *sawm* (fasting during the month of Ramadhan), and *zakat* (Islamic tax).
2. *Mustahabb* (recommended) – describes the class of actions that are not obligatory but highly recommended of Muslims, such as supererogatory fasting beyond Ramadhan, praying *nawafil*, etc.
3. *Muhab* (indifferent) – these actions are neither mandatory nor forbidden, such as having personal preference for one type of *halal* (permissible) food over another, or a Muslim may like to garden.
4. *Makruh* (reprehensible) – these actions are not absolutely forbidden, but are detested. The *makruh* is less in degree than *haram* (prohibited), and the punishment for *makruh* is less than for those acts which are *haram*, except when done in excess. For example, smoking is not expressly forbidden (like drinking alcohol), though it is in itself an action that is *makruh*. It should be noted, however, that there are many *ulemas* (religious scholars) that regard smoking as *haram*.
5. *Haram* (prohibited) – actions are unlawful and prohibited and committing them is a major sin, such as murder, adultery, drinking alcohol, etc.

The boundaries between the five mentioned categories are not absolute. For example, what is *haram* (prohibited) under one set of circumstances may become *halal* (permissible) under others. For example, a Muslim is not allowed to eat pork. However, should he fear death from starvation and nothing but pork is available, he is allowed to eat pork in that specific situation. In Islam, the sphere of prohibited items is very small, while that of the permissible is extremely vast. There are only a small number of sound and explicit texts concerning prohibitions, while whatever is mentioned in the *Qur'an* and *Hadith* as being lawful or unlawful falls under the general principle of the permissibility of things and within the domain of Allah's (TME) favor [21].

Based upon this categorization and principles, a first rule to be observed is: that which is lawful (*halal*) is wholesome and pure, and what is unlawful (*haram*) is harmful or can hurt. For example, Islam has long discouraged Muslims from drinking alcohol. It is only recently that childbirth studies have revealed that any amount of alcohol consumed during pregnancy may harm the unborn fetus. The most severe of these is *fetal alcohol syndrome* (FAS), a combination of physical and mental birth defects [22] and [23]. Implicitly, what is lawful is also moral, and what is unlawful is immoral. As such, adultery is both unlawful and immoral. A second

rule is that what leads to an unlawful action is also unlawful. Hence, pornography is unlawful and immoral because it may lead to adultery.

Furthermore, Allah (TME) gives a clear warning in the *Qur'an*:

Say: The things that my Lord hath indeed forbidden are: shameful deeds whether open or secret; sins and trespasses against truth or reason. . . . [24]

The forbidden things mentioned in the above verse can be interpreted in four categories [25]:

1. What is shameful or unbecoming: The sort of things which have also legal and social sanctions, not of a local but of a universal kind, may be called offenses against society.
2. Sins against self and trespasses or excesses of every sort: These are against truth and reason which include indiscipline, failure in doing intangible duties not clearly defined by law, and being selfish and self-aggrandized, which may be condoned by custom and not punished by law, etc.
3. Erecting fetishes or false Gods: This is treason against the true God.
4. Corrupting religion by superstitions, etc.

In mapping out one's ethical behavior, it is important for Muslims both to avoid *haram* (unlawful) and to avoid making *haram* (unlawful) as *halal* (lawful), and vice versa. Allah (TME) Himself says in the holy *Qur'an*:

Say: Have you ever considered all the means of sustenance which God has bestowed upon you from on high – and which you thereupon divide into “things forbidden” and “things lawful”? Say: Has God given you leave (to do this) – or do you, perchance, attribute your own guesswork to God? [26]

Muslims should not make unlawful what Allah (TME) has labeled lawful. For example, a buffalo may be an endangered species. One may stop hunting it in order to allow its herds to grow back, but one cannot say it is forbidden to eat buffalo meat or to trade in buffalo skins. The holy *Qur'an* states in this regard:

O ye who believe! Forbid not the good things, which Allah hath made lawful for you, and transgress not. Lo! Allah loveth not transgressors. [27]

To elaborate on the above verse from the *Qur'an*, in the pleasures that are good and lawful, the crime is excess. There is no merit merely in abstention or asceticism, though the humility or unselfishness that may go with asceticism may have its value. In verse 82 of the 5th chapter of the *Qur'an* (Sura Al-Maidah), Christian monks are praised for their particular virtue, though here and elsewhere monasticism is disapproved. Allah (TME) encourages mankind to use His (TME) gifts of all kinds with gratitude, but Allah (TME) does not approve of excess as evident from the above verse of the holy *Qur'an*.

Allah (TME) has set the boundaries (*Hudood*) very clearly in the holy *Qur'an*. Everything that is *haram* (prohibited) is clearly stated, and everything else is *halal* (permissible), except in matters of worship. It has defined all aspects of human life in great detail, leaving no aspect without guidelines. Similarly, business practices in Islam are based on this concept of the lawful (*halal*) and unlawful (*haram*).

Conclusion

The ethical system in Islam, which is essentially a reflection of the divine commandments and guideline for the right and wrong, permeates every aspect of an Islamic society, including business and commerce, and guides them to be socially responsible and deal with justice.

Accordingly, business dealings in Islam must be carried out in adherence to the Islamic social/legal system – *Shariah*. The motive of a Muslim businessperson should not be only profit but also to be useful to the environment he/she operates in by being socially responsible in all aspects of society. This is well embedded in the ethical system of Islam as demonstrated throughout this chapter. The concept of *halal* (lawful/permissible) and *haram* (unlawful/prohibited) must be strictly adhered to in all business dealings. The following chapter will further enumerate ethical business transactions according to the business precepts of Islam.

Business Precepts of Islam: The Lawful and Unlawful Business Transactions According to Shariah

45

Jawed Akhtar Mohammed

Abstract

The lawful or permissible (*halal*) and unlawful or prohibited (*haram*) transactions in Islamic jurisprudence (*fiqh*) are presented in this chapter. The rationale behind all of these tenets of business practices in Islamic economic system is bound by the fact that everything that is good and beneficial for the society is lawful and permissible and anything that causes harm or menace to the society is unlawful and prohibited. This is the foundation of Islamic business precept and quintessentially forms the ethical system in Islam. Some of the general rulings regarding the tenets of business transactions will be discussed in light of the *Shariah* – Islamic social/legal system and the basis for such decrees.

Introduction

The ethical system in Islam was discussed in the preceding chapter, which provided an overview of the divine decree pertaining to the ethical code of conduct in Islam. As the ethical system in Islam permeates every aspect of human lives, this chapter will further discuss the business transactions according to Islamic jurisprudence (*fiqh*).

The concept of the lawful (*halal*) and unlawful (*haram*) has been known to every people since ancient times. However, people have differed in defining the scope, variety, and causes of taboos and prohibitions, most of which were a product of their primitive beliefs, superstitions, and myths. Then came the divinely revealed religions, with their laws and injunctions concerning the lawful (*halal*) and

J.A. Mohammed

e-mail: jmohammed@swin.edu.au

unlawful (*haram*), uplifting the human being from the level of superstition, myth, and tribalism to the level of dignity which befits a human being [1].

However, in the religions revealed prior to Islam, there were some prohibitions and permissions which were legislated for temporary period in relation to the specific conditions of the people and their environments. For example, Allah (the most exalted)¹ prohibited some good things to the Children of Israel as a punishment for their rebellious attitude. Thereafter, Jesus (peace be upon him) told the people that he had come. . .

. . .confirming the truth of what was before me of the Taurat and to make lawful to you some of what was prohibited.... [2]

Finally, when mankind had reached the stage of intellectual maturity and was ready to receive the last message from Allah (TME), Islam came with its complete, comprehensive, and eternal *Shariah* – Islamic social/legal system for the whole of mankind. Concerning this, after mentioning what He (TME) has prohibited as food, Allah (TME) says in the Qur’an:

. . .This day I have perfected your religion for you and have completed My favour upon you, and have chosen Islam for you as the religion.... [3]

The Islamic view of the lawful (*halal*) and unlawful (*haram*) is very simple and clear. They are part of the total social/legal system of Islam, its *Shariah*, a system whose primary objective is the good of mankind. The Islamic *Shariah* removes from society harmful, burdensome customs and superstitions, aiming to simplify and ease the business of day-to-day living. Its principles are designed to protect man from evil and to benefit him in all aspects of his life. They are designed to benefit everyone in the community – the rich and the poor, the rulers and the ruled, the men and the women – as well as to benefit the whole of humanity throughout the earth in various countries and climes, with its multitude of groupings, and in every period of time throughout succeeding generations.

This chapter will highlight some of the Islamic tenets concerning business transactions and the rationale for their legitimacy (*halal*) or illegitimacy (*haram*).

Islamic Tenets Concerning Business Transactions

Islam demands a certain type of behavior from economic agents – the consumers and the producers. The behavior prescribed for the economic units of the society is so devised as to lead to a happy state of affairs, which is the ultimate goal of Islam. An Islamic market is characterized by certain norms that take care of the interests of both the buyer and the seller. There are a number of rules of ethical discipline in Islamic commercial transactions without which business contracts would be regarded as lacking perfection in light of the code of good manners, decency, and ethical excellence. They are all pursuant to the concept of lawful (*halal*) and unlawful (*haram*) and reflect features of ethics and social responsibility in every aspect of the transactions (see [Table 45.1](#)).

Table 45.1 List of lawful (*halal*) and unlawful (*haram*) business transactions in Islam

<i>Halal</i> business transactions	<i>Haram</i> business transactions
Keeness to earn legitimate (<i>halal</i>) earnings	Interest (<i>riba</i>)
Trade through mutual consent	Dealing in prohibited (<i>haram</i>) items
Truthfulness	Sale of <i>Al-Gharar</i> (uncertainty, risks, speculation)
Generosity and leniency	Arbitrarily fixing the prices
Trustworthiness	Hoarding of foodstuff
Honoring and fulfilling obligations (<i>Uqud</i>)	Exploitation of one's ignorance of market conditions
Fair treatment of workers	Cheating and fraud

Although there are numerous rulings on Islamic business transactions, a number of them are listed in Table 45.1 in context of this study. A brief discussion of each follow to provide the basis for such decrees.

Keeness to Earn Legitimate (*Halal*) Earnings

Islam places great emphasis on the ethical code of lawful (*halal*) and unlawful (*haram*) in business transactions. The holy Prophet Mohammed (peace be upon him) endorsed the importance of legitimate ways of earning in the following words:

Asked what form of gain is the best? The Prophet (PBUH) said, a man's work with his hands, and every legitimate business transaction. [4]

From the above statement, it is clear that a Muslim trader must be determined to earn only through legitimate means. He should not only avoid illegitimate means in earning his provisions and livelihood but also distance himself from matters dubious and doubtful. The Prophet (PBUH) is also reported to have said:

Leave what makes you doubt for things that do not make you doubt. [5]

Things legitimate and illegitimate are clearly defined in Islam, and in between them are doubtful things which should be avoided. A true Muslim businessman should be wary of the doubtful things in order to keep himself clear in regard to his faith and his honor because one who falls into doubtful matters is sure to fall into that which is unlawful (*haram*). A tradition of the Prophet (PBUH) states:

A time will come upon the people when one will not care as to how he gets his money whether legally or illegally. [6]

Therefore, earning money through *halal* trade is vastly preferred in an Islamic society. Begging is strongly abhorred in Islam. This principle is emphasized in the following Hadith:

A man of the Ansar came to the Prophet (PBUH) and begged from him. The prophet asked, "Have you nothing in your house?" He replied, "Yes, a piece of cloth, a part of which we wear and a part of which we spread (on the ground), and a wooden bowl from which

we drink". The Prophet (PBUH) said, "Bring them to me". He then brought these articles to him and the Prophet (PBUH) took them in his hands and asked, "Who will buy these?" A man said, "I shall buy them for one Dirham". He (PBUH) said twice or thrice, "Who will offer more than one dirham?" A man said "I shall buy them for two Dirhams".

He (PBUH) gave these to him and took two Dirhams and giving them to the Ansari, the Prophet (PBUH) said, "Buy food with one dirham and hand it to your family, and buy an axe and bring it to me". He then did and asked for. The Apostle of Allah (PBUH) fixed a handle on it with his own hands and said, "Go and gather firewood and sell it, and do not let me see you for a fortnight". The man went away and gathered firewood and sold it. When he had earned ten Dirhams, he came to the Prophet (PBUH) and bought a garment with some of them and food with others.

The Apostle of Allah (PBUH) then said, "This is better for you than that begging should come as a spot on your face on the Day of Judgment. Begging is only for three kinds of people: one who is in grinding poverty; one who is seriously in debt; and one who is responsible for compensation and finds it difficult to pay". [7]

Agriculture and farming has always been regarded as legitimate (halal) forms of work. Allah (TME) describes in the *Qur'an* (55:10-13) the process underlying agriculture and farming – how He (TME) sends rain down and how it flows throughout the earth, making it fertile and ready for cultivation; how the winds play a role in scattering seeds; and how crops grow. This *Qur'anic* verse and many others (7:19-20; 80:24-8; 15:19-22) provide motivation for agricultural work. Besides agriculture, Muslims are encouraged to develop proficiency in industries, crafts, and professions that are instrumental to the survival and betterment of the community. In fact, development of these skills represents *Fardh Kifaya* (responsibility). Imam al Ghazzali (n.d.) [8], a renowned Islamic philosopher, stresses this point:

Sciences whose knowledge is deemed Fardh Kifayah comprise every area which is indispensable for the welfare of the world. [9]

Many professions that are ordinarily looked down upon have been given dignity in Islam. For example, the Prophets of Allah – Moses (PBUH) worked as a hired hand for 8 years to gain the hand of his future wife, and Jesus (PBUH) and Mohammed (PBUH) also worked as shepherds for several years.

In general, Islam looks on work, which fills a legitimate (*halal*) need in a society as good provided that the person performs it in a legitimate (*halal*) manner conforming to the norms of the Islamic way of earning.

Trade Through Mutual Consent

Mutual consent between the parties is a necessary condition for the validity of a business transaction. It, therefore, follows that a sale under coercion is not acceptable in Islam. A sale transaction is to be regarded as legal only if it is made through the mutual consent of the parties concerned. Taking advantage of someone's plight and charging high prices are also forms of pecuniary exploitation and as such are forbidden in Islam. The Holy *Qur'an* says:

O you who believe! Eat not up your property among yourselves in vanities: but let there be amongst you traffic and trade by mutual goodwill: nor kill [or destroy] yourselves: for verily Allah has been to you Most Merciful. [10]

Thus, two key elements of the general theory of contract are endorsed emphatically in these verses: mutual consent and gainful exchange. One can also find the importance of mutual consent for the legality of a business deal. The Prophet (PBUH) is reported to have said:

A sale is a sale only if it is made through mutual consent. [11]

Further, in order to avoid any future misunderstanding, Allah (TME) has enjoined them to put contractual obligations in writing:

O you who believe! When you deal with each other in transactions involving future obligations in a fixed period of time, reduce them to writing. [. . .] Let him who incurs the liability dictate, but let him fear his Lord Allah, and not diminish aught of what he owes. [12]

Commercial morality is here on the highest plane and yet in the most practical manner, both as regards the bargains to be made, the evidence to be provided, the doubts to be avoided, and the duties and rights of scribes and witnesses. Probity even in worldly matters is to be not a mere matter of convenience or policy, but a matter of conscience and religious duty. Even everyday transactions are to be carried out as in the presence of Allah (TME).

Truthfulness in Business Transactions

Honesty and truthfulness are qualities which a Muslim businessperson should develop and practice. Truth, for example, has a self-reinforcing effect. The holy Prophet Mohammed (PBUH) said:

Truthfulness leads to righteousness, and righteousness leads to Paradise.

A man continues to tell the truth until he becomes a truthful person.

Falsehood leads to al fujwr (i.e. wickedness, evil-doing), and al fujwr (wickedness) leads to the fire of Hell. [13]

The holy Prophet (PBUH) has also exhorted the believers to strictly adhere to truthfulness in business transactions. He (PBUH) said:

The seller and the buyer have the right to keep or return the goods as long as they have not parted or till they part; and if both the parties spoke the truth and described the defects and qualities (of the goods), then they would be blessed in their transaction, and if they told lies or hid something, then the blessings of their transaction would be lost. [14]

Islam encourages truthfulness in business transactions and raises the status of a truthful merchant so much so that he will be at par with the holy warriors and martyrs, in the Hereafter. The Prophet (PBUH) is reported to have said:

The truthful merchant (is rewarded by being ranked) on the Day of Resurrection with prophets, veracious souls, martyrs and pious people. [15]

The tradition implies that Allah (TME) blesses business dealings if both the buyer and the seller are true to each other. Telling lies and hiding facts will result in the loss of divine blessing.

Trustworthiness in Business Transactions

Trustworthiness is one of the most important principles of ethical discipline in commercial transactions. Trust is a moral virtue and duty incumbent on a Muslim in the performance of his affairs. It demands sincerity in work and purity of intention from every believer. A true Muslim trader will not, therefore, barter his *Akhirah* (hereafter) for worldly gains. He will avoid fraud, deception, and other dubious means in selling his merchandise. The sense of mutual trust demands that the pros and cons of the commodity be revealed to the buyer so that he purchases the commodity in full satisfaction. The holy *Qur'an* states in this regard:

O you believers! Do not betray the trust of Allah and the Messenger nor misappropriate knowingly things entrusted to you. [16]

A detailed commentary of this verse in the *Qur'an* [17] suggests that trust may be of various kinds: for instance, property, goods, credit, etc.; plans, confidences, secrets, etc.; knowledge, talents, opportunities, etc., which are expected to be used for one's fellowmen. Men may betray the trust of Allah (TME) and His Prophet (PBUH) by misusing property or abusing the confidence reposed in them or the knowledge or talents given to them. On that special occasion, when the plans for the protection of Allah's (TME) worshippers against annihilation were of special importance, the holy Prophet Mohammed's (PBUH) trust and confidence had to be guarded with special care. Occasions for scrupulously respecting the trust and confidence of one's fellow men occur everyday in one's life, and few can claim perfection in this respect, hence the special distinction of the Prophet of Allah (PBUH), who earned the title *Al-Amin* (trustworthy), the one who was true to every trust reposed in him.

Generosity and Leniency in Business Transactions

One should be lenient and generous in business transactions. For instance, whoever demands his debt back from the debtor should do so in a decent manner. The Prophet (PBUH) invokes Allah's (TME) mercy thus:

May Allah's mercy be on him who is lenient in his buying, selling and in demanding back his money (or debts). [18]

The Prophet's exhortation to Muslims means that a creditor should be lenient and generous in demanding back his money. The debtor, in turn, should also give

back the debt to the creditor on time with due thanks and politeness. The Prophet (PBUH) was the best of all people in repaying the debts.

Abu Rafi reports that the Prophet (PBUH) took a young camel on loan. When camels came to him in charity, he asked *Abu Rafi* to give the creditor a young female camel. *Abu Rafi* pointed out that there was no young camel except for a 4-year-old camel of a very good quality. The Prophet (PBUH) said:

Give him the best one, for the best amongst you is he who repays the rights of others handsomely. [19]

Honoring and Fulfilling Business Obligations (*Uqud*)

Islam attaches great importance to the fulfillment of contracts and promises. Islamic teachings require a Muslim trader to maintain his trusts, promises, and contracts. The basic principles of truth, honesty, integrity, and trust are involved in all business dealings. The Holy *Qur'an* emphasizes the moral obligation to fulfill one's contracts and undertakings. A verse thus states:

O you who believe! Fulfil (your) obligations. [20]

A tradition of the Prophet (PBUH) states:

The Muslims are bound by their stipulations. [21]

Another tradition condemns promise breaking as the hallmark or trait of a hypocrite:

If he makes a promise, he breaks it, and if he makes a compact he acts treacherously. [22]

In order to safeguard the interest of both the buyer and the seller, it is desirable, according to the Islamic teachings, to clearly define all the necessary details concerning the business deal. Each business contract should clearly specify the quality, the quantity, and the price of the commodity in question. Thus, in a business contract, the offer and acceptance should be made between the parties concerned on a commodity which is with the buyer and which he is able to deliver. Any commodity that is nonexistent or not deliverable is not allowed to be transacted. A contract must be explicit with regard to the rights and obligations of the parties concerned so that it does not lead to disputes and disagreements between them.

Fair Treatment of Workers

Islam puts certain conditions and restrictions to obviate the chances of bitterness between the employer and employees. Islam encourages and promotes the spirit of love and brotherhood between them. According to the Islamic teachings, it is

the religious and moral responsibility of the employer to take care of the overall welfare and betterment of his employees. Fair wages, good working conditions, suitable work, and brotherly treatment should be provided to the workers. The last Prophet (PBUH) of Allah (TME) has explained this principle in the following words:

Allah has placed them (workers) under you. Those are your brothers. So, if anyone of you has someone under him, he should feed him out of what he himself eats, clothe him like what he himself puts on, and if that be the case, let him not put so much burden that he is not able to bear, then lend your help to him. [23]

The holy Prophet (PBUH) also said:

I will be foe to three persons on the Day of Judgement
one of them being the one who does not give him his due when he employs a person
who has accomplished his duty. [24]

The holy Prophet (PBUH) is also reported to have said:

The wages of the labourers must be paid to him before
the sweat dries upon his body. [25]

Thus, all of these quotations from the *Hadith* provide an example of Islam's emphasis on the type of treatment of employees, which is a significant part of the social responsibility and justice and forms part of the overall ethical system in Islam.

Prohibited (*Haram*) Matters in Business Transactions

So far, one aspect of the business ethics has been focused on guidelines prescribed by Islam for conducting lawful or permissible (*halal*) business transactions. Another aspect of business transactions according to Islam is the various forms of unlawful or prohibited (*haram*) business practices Muslim businesspersons must avoid. Discussion of some of these prohibited and undesirable business practices follow.

Interest (*Riba*)

Foremost among the unacceptable business practices strongly condemned in Islam is interest earned on money (*riba*). *Riba* by definition is the extra sum the money-lender charges from the borrower for deferred payment. While earlier there was a debate as to whether *riba* relates to interest or usury, there now appears to be consensus of opinion among Islamic scholars (*Ulemas*) that the term extends to all forms of interest [26, 27]. Islam has forbidden all forms of interest (*riba*) since it involves both oppression and exploitation, violating the norms of social responsibility and justice. Islam strictly forbids this form of tyrannical dealings and condemns it in severe terms. The holy *Qur'an* says:

...Allah has permitted trading and forbidden *riba*. ... [28]

It further states:

O you who believe! Fear Allah and give up what remains of your demand for usury if you are indeed believers. If you do it not, take notice of war from Allah and his Messenger: but if you turn back you shall have your capital sums; deal not unjustly and you shall not be dealt with unjustly. [29]

A detailed commentary of the above verse clarifies that the threat of war in the above verse is not war for opinions. It is an ultimatum of war for the liberation of debtors unjustly dealt with and oppressed [30]. In another verse of the holy *Qur'an*, Allah (TME) commands:

O ye who believe! Devour not *riba* doubled and multiplied. . . [31]

The *Sunnah* is equally emphatic in denouncing *riba*. The holy Prophet (PBUH) is reported to have said:

May Allah send down His curse on the one who devours *riba* and the one who pays it and on the two witnesses and on the person writing it. [32]

These and many other verses of the *Qur'an* and traditions of the Prophet (PBUH) clearly demonstrate that all those business transactions, which involve interest in one form or other, are unlawful (*haram*) in the sight of Islam. According to the *Qur'anic* teachings, there is a clear distinction between genuine business profits and interest; while the former is recommended and desirable, the latter is hated and undesirable.

In banning interest (*riba*), Islam seeks to establish a society based upon fairness and justice. A loan provides the lender with a fixed return irrespective of the outcome of the borrower's venture. It is much fairer to have a sharing of the profits and losses. Fairness in this context provides the supplier of capital a right to reward, but this reward should be commensurate with the risk and effort involved and thus is governed by the return on the individual project for which funds are supplied. Hence, what is forbidden in Islam is a predetermined return. The sharing of profit is legitimate, and that practice has provided the foundation for Islamic banking.

Dealing in Prohibited (*Haram*) Items

Dealing in unlawful items such as carrion (dead meat), pigs, intoxicants, and idols are strongly prohibited in Islam. Dead meat would mean the flesh of any bird or animal dead from natural causes, without being properly slaughtered in an Islamic way. A Muslim, therefore, will not eat the flesh of such an animal or bird. Flesh of an electrocuted animal, or of an animal killed by the blow of a blunt weapon, and of the strangled one is also proscribed in Islam. Also forbidden is the flesh of the animal that has been killed or slaughtered in ways other than Islamic. A verse of the holy *Qur'an* says:

. . .Forbidden to you (for food) are: dead meat, the blood, the flesh of swine and that on which name of other than Allah has been mentioned. [33]

The scholars of Islamic jurisprudence (*fiqh*) work out the details of the above verse with great elaboration. However, the purpose here is to present general principles and not technical details. Carrion or dead meat and blood as articles of food would obviously cause disgust to any refined person. So would swine's flesh where the swine live on offal. Where swine are fed artificially on clean food, the objections remain: (1) that they are filthy animals in other respects, and the flesh of filthy animals taken as food affects the eater; (2) that swine's flesh has more fat than muscle-building material; and (3) that it is more liable to disease than other kinds of meat, for example, trichinosis, characterized by hairlike worms in the muscular tissue. As to food dedicated to idols or false Gods, it is obviously unseemly for the Children of Unity to partake of it [34].

It is, therefore, not permissible for a Muslim to trade in dead meat. Likewise, trading in pork or intoxicants (e.g., alcohol) and sale of idols and statues are not permitted in Islam. The Holy *Qur'an* also says:

O you who believe! Intoxicants and gambling (dedication of) stones and (divination by) arrows are an abomination of Satan's handiwork: so avoid it in order that you may prosper. [35]

The Prophet (PBUH) is reported to have said:

Allah and His Messenger made illegal the trade of alcoholic liquors dead animals, pigs and idols. [36]

The Prophet (PBUH) also said:

If Allah makes something unlawful, he makes its price also unlawful. [37]

Thus, incomes from the sale of such illegitimate transactions are also unlawful (*haram*) and must not be part of a Muslim's earning or business transactions.

Sale of *Al-Gharar* (Uncertainty, Risks, Speculation)

In Islamic terminology, this refers to the sale of a commodity or good which is not present at hand; or the sale of an article or good, the consequences or outcome of which is not yet known; or a sale involving risks or hazards where one does not know whether at all the commodity will later come into existence. Such a sale is strictly prohibited in Islam because the quality, whether good or bad, is not known to the buyer at the time of the deal and there is every possibility that the contract may give rise to disputes and disagreements between the concerned parties.

The Prophet (PBUH), therefore, prohibited the sale of what is still in the loins of the male, or sale of whatever is in the womb of a female camel, or sale of birds in the air, or the sale of fish in the water and any transaction that involves *Gharar*. (i.e., anything that involves deception). He also forbade the sale of fruits before they look healthy and also the sale of crops until the grain hardens. Nevertheless, such advance sales would be acceptable if the element of *Gharar* does not exist and the quality and the quantity of the goods are well known and predictable.

In contemporary financial transactions, the two areas where *Gharar* most profoundly affects common practice are insurance and financial derivatives [38]. Jurists often argue against the financial insurance contract, where premiums are paid regularly to the insurance company and the insured receives compensation for any insured losses in the event of a loss. In this case, the jurists argue that the insured may collect a large sum of money after paying only one monthly premium. On the other hand, the insured may also make many monthly payments without ever collecting any money from the insurance company. Since “insurance” or “security” itself cannot be considered an object of sale, this contract is rendered invalid because of the forbidden *Gharar*. Conventional insurance also suffers from prohibition due to *riba* since insurance companies tend to invest significant portions of their funds in government bonds, which earn them interests (*riba*) [39].

Arbitrarily Fixing the Prices

Islam grants absolute freedom to traders provided they adhere to the ethical code of lawfulness. It does not, therefore, encourage the practice of price-fixing and leaves the traders to earn the profits from each other within the lawful limits. As a matter of principle, public authorities are not allowed to fix the prices of commodities by force. This is because rise and fall in the prices are linked to various factors other than the greediness of the traders and fixing the prices may endanger both public and private interests.

It is reported that on one occasion prices increased dramatically during the period of the holy Prophet (PBUH). The people asked the Prophet (PBUH) to fix the price for them. Thereupon the Messenger of Allah (PBUH) said:

Allah is the One Who fixes prices, withholds, gives lavishly, and provides and I hope that when I meet Allah, none of you will have any claim on me for an injustice regarding blood or property. [40]

However, the role of public authorities comes into play if it becomes absolutely essential, especially in order to prevent exploitation and other unjust practices in the market. Thus, if a trader adopts unfair means, charges unjust prices, and indulges in undercutting with a view to doing harm to the smaller traders, public authorities have the right to intervene in the market. They can and should take steps to fix or control the prices so as to eliminate injustice from the market and allow the trader to earn reasonable profits and the buyer to pay a just and equitable price.

Hoarding of Foodstuff

The Arabic word for hoarding is *Ihtikar*. It means storing foodstuffs or withholding them in expectation of a rise in their prices. Sometimes, a handful of traders operating in the market may buy the entire quantity of an item, rice for example, and store it up with the object of selling it later at a time of scarcity to draw

maximum profit. The consumers are left with no choice but to purchase the article concerned from the one who hoards as he is the only one in the market who holds it. At other times, a trader may collude with suppliers who will only sell their merchandise to him. As a result, he holds the entire stock of the essential items that other traders do not possess. He is, therefore, in a position to dictate his terms in the market and sell them at an exorbitantly high price to the needy people. This is an unjust practice and a clear case of exploitation and deservedly condemned by Islam. The Prophet (PBUH) is reported to have condemned the hoarders when he said:

No one hoards but the traitors (i.e. the sinners). [41]

The Messenger of Allah (PBUH) also said:

The importer (of an essential commodity) into the town will be fed (by Allah), and the hoarders will have (Allah's) curse upon him. [42]

Exploitation of One's Ignorance of Market Conditions

One of the most common unethical practices in modern business is to exploit one's ignorance of market conditions. Sometimes it may happen that a buyer arrives in a town with objects of prime and general necessity. A local trader may persuade the newcomer to transfer all of the goods to him so that he will sell them on his behalf in the market. He obtains the commodities on a price that is lower than market price and then sells them at a high or exorbitant price. Islam condemns this act of intermediary intervention, which involves exploitation of one's ignorance of market conditions. The practice was prevalent in pre-Islamic society. The Prophet (PBUH) has prohibited this practice through a number of instructions. A tradition reads:

A town dweller should not sell the goods of a desert dweller. [43]

Cheating and Fraud in Business Transactions – Trickery (*Al-Najsh*)

The traders and businessmen generally have a tendency to induce customers by adopting fraudulent business practices. Islam strongly condemns all such practices in business transactions. The Messenger of Allah (PBUH) has commanded the believers not to indulge in cheating and fraudulent practices in business transactions. The term *Al-Najsh* means an action in which a person offers a high price for something without intending to buy it but just to cheat or defraud another person who really means to buy it. The person practicing it may collaborate with the seller to offer high prices merely as a means to cheat other buyers. This type of fraudulent transaction is totally prohibited in Islam. The holy Prophet (PBUH) is reported to have said:

Do not harbour envy against one another; do not outbid one another (with a view to raising the price); do not bear aversion against one another; do not bear enmity against one another; one of you should not enter into a transaction when the other has already entered into it; and be fellow brothers and true servants of Allah. [44]

It is clear from the preceding *Hadith* that Islam also forbids the practice of sale over sale and purchase over purchase. This means that it forbids someone to offer a higher price for a commodity after the deal has been accomplished between the parties. Obviously he is offering a higher price in order to spoil the agreement reached between the parties. As a result of this offer, the buyer may feel tempted to cancel his contract to sell it at a higher price. It may give rise to disputes and disagreements between brothers and thus is unethical. Hence, it is strictly prohibited in Islam.

Similarly, dubious and vague transactions, manipulating the prices, selling the items belonging to a desert dweller by a townsman, false eulogy, and concealment of defects are all examples of cheating and fraud (*Al-Ghashsh*). The Prophet (PBUH) has strongly condemned all such practices in a number of traditions and instructed the faithful to abstain from them. The Prophet (PBUH) is reported to have said:

The seller and the buyer have the right to keep the goods or return them as long as they have not parted. He also said that if both the parties have spoken the truth and described the defects as well as the merits thereof (the goods), they would be blessed in their deal. If they have told lies or concealed something, then blessings of their transaction would be lost. [14]

Another form of deceit is to manipulate weights and measures. It refers to the act of taking full measures from others and giving them short measures in your turn. Giving short measures was a common malaise plaguing the pre-Islamic days. The community of the Prophet *Shu'ayb* (PBUH) was known for practicing it with impunity. Consequently, they were destroyed for their persistence in deceit and disbelief in Allah (TME) and His Messenger (PBUH). Allah (TME) the almighty has repeatedly commanded exactitude in weights and measures. One of the verses in the holy *Qur'an* says:

And give full measure when you measure, and weigh with a just balance.
That is good and better in the end. [45]

As can be seen in the above verse of the holy *Qur'an*, a balanced transaction is also equitable and just. *Qur'an* uses the term "*adl*" (equilibrium) in this sense. Giving just measure and weight is not only right in itself but is ultimately to the best advantage of the person who gives it as he fulfils his social responsibility according to the will of Allah (TME).

Conclusion

This chapter highlighted the important matters which are permissible/lawful (*halal*) or prohibited/unlawful (*haram*) pertaining to the tenets of business transactions in Islam, especially those matters which people neglect or consider insignificant due to their ignorance of the reasons behind a prohibition or

permission. The rationale behind each divine decree discussed shows the deep wisdom of Islamic Shariah in its legislations concerning the *halal* and *haram*, so that anyone can observe that Allah (TME) is not arbitrary in His commandments, neither permitting things in order to be indulgent to people nor prohibiting them in order to make their lives miserable. Rather, He has legislated for them what is in their own best interest, safeguarding their lives, intellect, property, morals, and honor and guiding them toward success in this world and in the Hereafter by being ethical.

This is what Muslims around the world believe concerning what Allah (TME) has made *halal* and *haram* and what He (TME) has legislated in relation to every aspect of human life, including business transactions. He therefore accepts it with a convinced mind, a contented heart, and with a strong determination to implement it. Indeed, a Muslim believes that his happiness in this world and his success in the Hereafter depend entirely upon his observing the limits set by Allah (TME), following His injunctions and observing His prohibitions. In order to secure happiness and success in both the worlds, therefore, a Muslim must restrain himself from transgressing these limits.

Abstract

This chapter introduces a set of axioms that systematize and summarize the concept of ethics in Islam. The fundamental ethical axioms of *unity*, *equilibrium*, *free will*, and *responsibility* are discussed in detail in light of the holy *Qur'an* and *Hadith*. Propositions and business expectations/applications based on the ethical axioms have been presented to elaborate a possible conceptual framework of business ethics in Islam.

The axiom of *unity* forms the foundation of Islamic faith. Belief in one and only Allah (the most exalted) and submitting to His will is the essence of the Islamic belief system. This creates a relationship between the Creator and the creation where Allah (TME)¹ through His mercy, provides everything on earth for the benefit of mankind and assigns them as His vicegerent (*Khalifah*) on earth. However, mankind holds these resources in trust (*amanah*) and is obliged to utilize them responsibly in accordance to Allah's (TME) will.

The axiom of *equilibrium* is the horizontal dimension of Islam. It can be a sense of balance among the various aspects of a man's life to produce the best social order. God has created everything in the universe with a balance to maintain the equilibrium. As a vicegerent of God on earth, mankind is supposed to reflect His qualities and, thus, (ideally) must maintain a balance in every aspect of socioeconomic behavior.

The axiomatic principle of *free will* gives mankind the freedom to choose between the right and the wrong, the knowledge of which is clearly provided in the divine commandments in the holy *Qur'an* and *Hadith*. As a trustee (*al 'amin*)

of Allah's (TME) resources on earth, mankind can utilize them in accordance to the divine commandments or misuse them as Allah (TME) has given them the freedom to choose. Although mankind is free to do whatever they wish, Islam provides this freedom to mankind with elements of discipline and dignity to reflect man's vicegerency (*Khalifah*) of Allah (TME). A Muslim's free will to choose is guided by the will of Allah (TME) and His divine commandments.

The final ethical axiom of *responsibility* is logically related to *free will*. Freedom must be counterbalanced by responsibility and having opted for the power to choose between good and evil, man must endure its logical consequences. Since he/she is responsible for all that he does, man must be accountable for his actions.

The four axioms, which are foundation of the Islamic ethical framework, are based on *Qur'anic* injunctions and provide clear guidelines for an ethical system in Islam.

Introduction

The effort in the two preceding chapters has been to present the Islamic perspective of ethical system and its implications on business practices. The fundamental codes of moral behavior, e.g., truthfulness, trustworthiness, generosity and leniency, adherence to business commitments and contracts, fair treatment of workers, and avoidance of evil practices such as interest (*riba*), fraud, cheating, deceit, hoarding of food stuff, exploitations, giving short measures, etc., in accordance to the Islamic jurisprudence (*fiqh*) concerning the lawful (*halal*) and unlawful (*haram*) are essential elements of ethical system in Islam and are part of the overall Islamic faith. Observing them will not only lead to a happy state of affairs in this world but also holds the promise of manifold returns in the hereafter (*Akhirah*).

Islamic morality or ethical codes thus create a sense of responsibility and accountability in the mind of the believers. This is consistent with the purpose of the Islamic system – *maqasid al Shariah*, which is based on *falah* (human well-being) and *hayat tayyibah* (good life). The discussion in the preceding chapters demonstrates that there are many elements of ethical code of conduct within Islam. However, these elements remain scattered, incoherent, and unsystematic. The task therefore is to elaborate a higher-order framework to organize and systematize these elements, thereby constructing a more coherent statement of the ethical system in Islam that may be considered more properly as a conceptual framework of business ethics in Islam.

This chapter will introduce a set of axioms that will systematize and summarize the concept of ethics in Islam. The fundamental ethical axioms of *unity*, *equilibrium*, *free will*, and *responsibility* will be discussed in detail in light of the holy *Qur'an* and *Hadith*. Propositions and business expectations/applications based on the ethical axioms will be presented to elaborate a possible conceptual framework of business ethics in Islam.

Fundamental Ethical Axioms in Islam

The Islamic ethical system as illustrated in the preceding chapter is multidimensional, far-reaching, comprehensive, and all encompassing. Islam encourages humankind to experience *tazkiyah* (spirituality/morality) through active participation in this life. By behaving ethically in the midst of the tests of this world, Muslims prove their worth to Allah (the most exalted). Ethics or morality is repeatedly stressed throughout the holy *Qur'an* and *Hadith* as a guideline in all spheres of life including business and financial dealings.

Much of the Islamic ethical behavior is concerned with elements of social responsibility and justice. In order to determine the efficacy of these elements and systematize them in a coherent framework, it is important to first establish the foundational elements. This foundation will form the basis of the conceptual framework of business ethics in Islam that will address not only the nature of the ethical elements but also the rationale behind them.

The Islamic view of life processes is unique not only for its predominant emphasis on ethical norms but also due to its being “complete.” In addition, since this view is internally consistent, it can form the basis of scientific generalizations about an Islamic economy. However, to turn it into an operational tool of scientific analysis, an ethical philosophy must be reduced to a set of axioms, which can then serve as a point of departure for making logical deductions with respect to valid rules of social and economic behavior according to Islamic precepts.

Thus, an axiom system that reflects the Islamic view of ethics needs to be constructed as an essential first step in determining the rules of social and economic behavior in an Islamic society. Syed Nawab Haider Naqvi [1], in his book *Ethics and Economics: An Islamic Synthesis*, tendered a theory of Islamic economics in which he addresses the need for an Islamic economic system and how it can be generated from the ethical statements in the *Qur'an* and *Hadith* [1]. He presents the four ethical axioms – *unity*, *equilibrium*, *free will*, and *responsibility* – that together form such a logical system and argues that from these four axioms, all statements regarding Islamic society and economics can be generated.

As Naqvi is one of the few scholars who address the foundational issue of theory building in Islamic economics, this study will use his axiomatic principles, along with some other scholars' work, to elaborate the conceptual framework of business ethics in Islam (see Table 46.1). Based on the description of each of the ethical axioms, propositions will be developed, and expectations/applications in business practice arising out of them will be discussed in this chapter to present a coherent ethical foundation representing a potential framework.

Naqvi [1], in his investigation of the basic principles of Islamic economic and social life, identified four fundamental elements to be key pointers to the unique perspective of Islam – *unity*, *equilibrium*, *free will*, and *responsibility*, as presented in the above table. He explains that the concept of *unity* is derived from the belief in one God. *Equilibrium* represents social ideals and justice. *Free will* is individual freedom, and *responsibility* is the obligation each individual has toward God,

Table 46.1 Axioms of Islamic ethical philosophy [1]

Axiom	Definition
Unity (<i>tawhid</i>)	Related to the concept of <i>tawhid</i> . The political, economic, social, and religious aspects of man's life form a homogeneous whole, which is consistent from within, as well as integrated with the vast universe without. This is the vertical dimension of Islam
Equilibrium (<i>al 'adl</i>)	Related to the concept of <i>al 'adl</i> . A sense of balance among the various aspects of a man's life mentioned above in order to produce the best social order. This sense of balance is achieved through conscience purpose. This is the horizontal dimension of Islam
Free will (<i>ikhtiyar</i>)	Man's ability to act without external coercion within the parameters of Allah's (TME) creation and as Allah's trustee on earth
Responsibility (<i>fardh</i>)	Man's need to be accountable for his actions

oneself, and the wider society. These axioms are meant to be the basis of all Islamic ethical concepts, forming the foundation of any socioeconomic theory in Islam.

Unity (*Tawhid*)

The source of all Islamic ethical notions comes from the faith in the unity (*tawhid*) of God – Allah (the most exalted). All other axioms of Islamic ethics and principles of theology, according to Naqvi [1] originate from this concept of unity (*tawhid*).

Islam's ethical system, which encompasses man's life on Earth in its entirety, resides eternally prefigured in the concept of unity, which, in an absolute sense, relates only to Allah (TME). The fundamental belief that *there is no God but Allah (TME) and none is worth worship except Him* is the foundation of Islam and the essence of *the divine message* sent to mankind through various Prophets of God from Adam, Noah, Moses, and Jesus to Mohammed (peace be upon all of them). In accordance to this belief, a Muslim surrenders unconditionally to the will of Allah (TME):

... the decision rests with Allah only, Who hath commanded you that ye worship none save Him. [2]

The foundation of Islamic faith is belief in one God – Allah (TME), which is in line with the divine commandment mentioned above. Everything else follows from this belief. This will become a crucial point because if the entire system of Islamic socioeconomic should rest on the concept of unity (*tawhid*) as a fundamental principle, then one needs to see how faith in one God – Allah (TME) – entails the principles that follow from it.

Faith in only one, the almighty God is at the top of the goal of *Shariah*, for in Islam, faith is crucial for human well-being (*falaha*). Faith in God provides a proper basis for relations with others, allowing human beings to act in a respectful and

caring manner. Faith in God also provides a moral filter, necessary for the allocation and distribution of resources based on brotherhood and socioeconomic justice. Further, faith in Islam is a motivation for equitable need fulfillment and wealth distribution [3].

On the plane of human existence, this concept also provides a powerful integration principle, for all mankind is united in submission to Him. The unity of Allah (TME) not only reiterates His qualities of being all-powerful and all-knowing but also reflects man's submissive relation to Allah (TME):

Say: Truly, my prayer and my service of sacrifice, my life and my death are all for Allah, the Cherisher of the Worlds. [4]

Mankind has been united not only in submission and the knowledge of Allah (TME) but also in man's knowledge of one another. Indeed, the two modes of knowledge are facets of the common pursuit of the ultimate truth:

O mankind! We have created you from a single (pair) of male and female, and have made you into nations and tribes, that ye may know one another. . . . [5]

This verse in the *Qur'an* is addressed to all mankind and not only to the Muslim brotherhood, though it is understood that in a perfect world (in an Islamic vision), the two would be synonymous. As it is, mankind is descended from one pair of parents – (Adam and Eve). Their tribes, races, and nations are convenient labels by which one may know certain differing characteristics. Before Allah (TME), they are all one, and he gets most honor who is most righteous. This is further stressed in the holy Prophet Mohammed's (peace be upon him) last sermon during his farewell pilgrimage (*Hajj*) where he declared:

All mankind is from Adam and Eve, an Arab has no superiority over a non-Arab, nor does a non-Arab have any superiority over an Arab. Also a white has no superiority over a black nor does a black have any superiority over a white – except by piety and good actions. [6]

The holy Prophet (PBUH) set an example of this message by giving the most honorable job of calling people to pray (*Adhan*), for the first time in the newly established mosque (*Masjid-e-Nabawwi*) in Madinah to a black person – Bilal (may Allah be pleased with him) – who used to be a slave in the immediate past. This was an exemplary example of social justice in society, as during those days, black slaves were looked down upon in a derogatory manner in Arab society. This implies that Islam considers all human beings to be equal, except in righteousness in the eyes of God. These features of unity strongly reflect the concept of social responsibility and justice in Islam.

The concept of unity has been well portrayed by Iqbal [7] in his most famous work in Urdu, *Shikwa and Jawab-i-Shikwa* translated by Khushwant Singh in 1981 [7]. The excerpt from this work illustrates the unity of God and unity of mankind in God's worship (Urdu poem – English transliteration followed by translation):

Aa gaya ain larhai mein agar waqt-e-namaz
Qibla- ruh ho ke zamin-bos hui qaum-I-Hijaz
Ek hi saf mein kharhe ho gaye Mahmud o ayyaz

Na koi banda raha, aur na koi banda nawaz
 Banda-o-sahib-o-muhtaj-o-ghani ek huey
 Teri sarkar mein jo pahunche toh sabhi ek huey.

Translation

In the midst of raging battle if the time came to pray,
 Hajazis turned to Makkah, kissed the earth and ceased from fray.
 Sultan and slave in single file stood side by side,
 Then no servant was nor master, nothing did them divide.
 Between serf and lord, needy and rich, difference there was none.
 When they appeared in Your (God) court, they came as equals and one.

Worshipping one God by Muslims in congregational prayer during *salat* (prayers) five times daily exemplifies the concept of unity. Through this unison in worship, Muslims demonstrate that Islam rejects all manner of prejudices, oppression, and discrimination, instead championing the cause of social responsibility and justice in accordance to the divine will. This concept lays the foundation of universal brotherhood in Islam. An example of the concept of universal brotherhood is demonstrated at the time of the annual pilgrimage (*Hajj*) in Makkah – Saudi Arabia, where nationality, race, color, wealth or status, etc., play no role – whatsoever. All mankind is submissive in unison before Allah (TME) exemplifying universal brotherhood.

In a deeper sense, the concept of unity constitutes the vertical dimension of Islam. It integrates, along a vertical line, the political, economic, social, and religious aspects of man's life into a homogeneous whole, which is consistent from within as well as integrated with the vast universe without. Within the compass of one immaculate, divinely revealed vision, unity shows the interrelatedness of all that exists. The relationship between the Creator and the created is based on this concept. Allah (TME) has put humankind at the helm of everything He created. Accordingly, man occupies the central place in the universe. He is not just one element in the vast expanse of God's creation but provides the *raison d'etre* for all that exists. The holy *Qur'an* states:

See ye not how Allah hath made serviceable unto you whatsoever is in the skies and whatsoever is on the Earth. ... [8]

Interpreting the above verse (commentary in the holy *Qur'an*, p. 1,216), everything created by Allah (TME) has a purpose. Allah's (TME) creation is independent of man. But Allah (TME), in his infinite mercy, has given man the faculty to subdue the forces of nature and to penetrate through high mysteries with his powers of reason and insight. But this is not merely a question of power. For in His universal plan, all are safeguarded. But man's destiny is noble to the highest degree of being responsible toward others. It is this purpose which gives meaning and significance

to the existence of the universe. Allah (TME) further assigns mankind with the task of being his vicegerent (*Khalifah*) on earth and to use the resources provided responsibly:

It is He (Allah) Who hath made you inheritors of the earth. ... [9]

Inheritors in the above verse imply vicegerency (*Khalifah*) of Allah's (TME) resources on earth. This element in Islamic ethics establishes a connection between the infinite and perfect being (Allah-TME) and the finite (mankind) and imperfect world. By uniting man's social, political, and economic aspects, his life becomes consistent and it contributes to a universal brotherhood.

Chapra [3] points out that universal brotherhood is a direct result of the fact that everyone is a *Khalifah* (vicegerent) of Allah (TME). He maintains that the principle of *Khalifah* (vicegerency) follows directly from the concept of unity (*tawhid*) in that it describes man's purpose and behavior of maintaining social responsibility and justice as an essential part of faith [10]. The model of interaction is that of mutual sacrifice and cooperation to fulfill the basic needs of all, to develop the entire human potential, and to enrich human life.

Chapra [3] further posits that all the resources provided by Allah (TME) are a "trust" to mankind and man should utilize them equitably, in the spirit of the purpose of the Islamic social system (*maqasid al Shariah*) that is based on *falah* (human well-being) and *hayat tayyibah* (good life), both of which stress universal brotherhood and socioeconomic justice [10]. The notion of *Khalifah* introduces meaning and mission to mankind. The meaning is provided by the conviction that mankind has not been created in vain, but rather to fulfill a mission. The mission is to act in accordance with divine tenets commanded by Allah (TME). This is what is implied by worship (*ibadah*) in the Islamic sense (Qur'an, Sura Az Zariyat-51: 56) – an invariable imperative of which is fulfilling one's obligations/responsibility toward other human beings (*huquq al ibad*), to promote their well-being and to actualize the *maqasid al Shariah*.

A second corollary of *Khalifah* is that man is the trustee (*al 'amin*) of Allah's (TME) resources. Chapra [3] explains that this trusteeship does not entail the negation of private property. However, it does alter the relations that individuals have with each other and with property [10]. The holy Qur'an authenticates this and states:

...to Allah belongeth the dominion of the heavens and the earth. ... [11]

The above verse suggests that mankind only owns material wealth or property temporarily during their short life here on earth. So all gifts of Allah (TME) to mankind are in trust only (*amanah*). They ultimately revert to Allah (TME), to Whom belongs all that is in the heavens and on earth [12].

Chapra ([3]:207) further outlines the following implications of trusteeship [13]:

1. Resources should be utilized and allocated equitably, as they are for everyone's benefit, not just the benefit of a few individuals who have more "rights" about the property.

2. Resources must be acquired honestly, in the manner indicated by the *Qur'an* and *Sunnah* (the lawful – *halal* earnings).
3. Resources must not be destroyed.

The third corollary of *Khalifah* is the humble lifestyle. One's lifestyle should not reflect arrogance, pomp, and grandeur or moral laxity because it unnecessarily drains resources and promotes inequality.

The fourth implication of *Khalifah* is human freedom. Although Allah (TME) is the owner, humans still have freedom, and it is up to them to decide how to exercise it. However, this freedom is qualified by the rules of the *Shariah*. Humans are thus free only within the bounds of *Shariah*. Therefore, any economic system that either subjugates human beings to a situation of serfdom or slavery, or allows excessive rights that contradict the limits imposed by the *Shariah*, cannot contribute to the social system in Islam. Thus, *Khalifah* is a direct implication of unity, which results in human freedom and the trusteeship status of man. Humans are considered as trustee of Allah's (TME) wealth on earth and should use it accordingly fulfilling their moral and social obligation toward fellow creatures. Thus, the concern for ethical fulfillment results in the individual raising one's level of consciousness to a higher plane.

In summary, the axiom of unity forms the foundation of Islamic faith. Belief in one and only Allah (TME) and submitting to His will is the essence of the Islamic belief system. This creates a relationship between the Creator and the creation where Allah (TME), through His mercy, provides everything on earth for the benefit of mankind and assigns them as His vicegerent (*Khalifah*) on earth. However, mankind holds these resources in trust (*amanah*) and is obliged to utilize them responsibly in accordance to Allah's (TME) will.

Proposition

Based on the axiom of unity, there is only one God – Allah (TME) – and everything in the heavens and on earth belong to Him. Man is considered to be the vicegerent (*Khalifah*) of Allah (TME) on earth and thus trustee (*al 'amin*) of Allah's (TME) resources as everything bestowed upon mankind by the Almighty is held in trust (*amanah*).

Expectation/Application in Business of the Axiom of Unity

The expectation here is that a faithful will be trustworthy and truthful, will not hoard his wealth avariciously, and will not discriminate in any form. This is consistent with Allah's purpose for creating mankind. As Islam prescribes a unified code of behavior – both individually and collectively, this code is equally applicable to corporations adhering to Islamic business precepts.

A Muslim businessperson will not be coerced into unethical practices, since he has only Allah (TME) to fear and love. He follows the same, unified code of

behavior whether he is in the mosque, earning a living or acting out other aspects of one's life. He will be content in his submission to Allah's will:

“Say: Lo! My worship and my sacrifice and my living and my dying are all for Allah, Lord of the Worlds” [4].

Accordingly, a Muslim businessperson will not discriminate among his employees, suppliers, buyers, or any other stakeholder on the basis of race, color, sex, or religion. This is consistent with Allah's (TME) purpose for creating mankind mentioned earlier in this chapter:

O mankind! Lo! We have created you male and female, and have made you nations and tribes, that you may know one another. [5]

Beekun [14] contends that the general principle of unity (*tawhid*) applies to all aspects of relationship between a firm and its employees [14]. Muslim businessmen should not treat their employees as though Islam is inconsequential during business hours. For example, Muslim employees should be given time off for prayers, should not be coerced into acting against the Islamic moral code, should be given respite if they are sick and cannot perform, and should not be harassed sexually or otherwise. This principle is reflected in the fair treatment of workers discussed in the previous chapter.

Similarly, many ethical issues characterize the relationship of the employee to the firm, especially with respect to honesty, secrecy, and conflicts of interest. Thus, an employee must neither embezzle the funds of the company nor reveal company secrets to outsiders. Another unethical practice occurs when managers add false charges for meals and other services to their company expense accounts. Some of them cheat because they feel underpaid and wish to restore equity. At other times, it is pure greed. For example, Albert Miano who embezzled \$1 million from his employer admitted that his primary motivation was greed [15]. For Muslim employees, Allah (TME) gives them a clear warning in the *Qur'an*:

Say: The things that my Lord hath indeed forbidden are: shameful deeds whether open or secret; sins and trespasses against truth or reason. [16]

This is again consistent with the tenets of trustworthiness and truthfulness concerning business transactions discussed in the previous chapter. Muslim employees, cognizant of the above verse in the *Qur'an*, should never intentionally act in unethical manner as it is clearly prohibited (*haram*) to be dishonest according to Islamic jurisprudence (*fiqh*).

Similarly, the faithful Muslim will not hoard his wealth avariciously consistent with the principle of hoarding. The concept of *amanah* or trust is of critical importance because any worldly merit is transient and must be used wisely. A Muslim is not solely guided by profits and is not seeking to accumulate wealth at any cost. He realizes, in accordance to the commandments of Allah (TME), that:

Wealth and sons are allurements of the life of this world;
but things that endure - good deeds - are best in the sight of your Lord,
as rewards, and best as (the foundation for) hopes. [17]

Al Qaradawi further points out that the market system is free in Islam and is allowed to respond to supply and demand [18]. However, Islam does not tolerate interference in the market system by hoarding or other forms of price manipulation. Allah's (TME) Messenger Mohammed (PBUH) said:

He who hoards is a sinner. [19]

In cases where businessmen are engaging in hoarding and other forms of price manipulation, Islam allows price control in order to meet the needs of the society and to provide protection against greed. However, if a commodity is being sold without any hoarding and its price rises because of natural shortages or scarcity or an increase in demand, then this circumstance is due to Allah (TME). Businessmen cannot then be compelled to sell at a fixed price.

Buyers, on the other hand, should expect to receive goods that are in working conditions and priced fairly. They should also be notified of any deficiencies. Islam prohibits any kind of fraudulent transaction whether during a purchase or a sale. The Muslim businessman must be truthful and trustworthy at all times. The following *Hadith* exemplifies how the Islamic moral code views deceptive business practices:

The Messenger of Allah (PBUH) happened to pass by a heap of eatables (corn). He thrust his hand in that heap and his fingers were moistened. He said to the owner of the heap of eatables (corn), "What is this?" Messenger of Allah (PBUH), these have been drenched by rainfall.' The Holy Prophet (PBUH) remarked, "Why did you not place this (the drenched part of the heap) over other eatables so that the people could see it? He who deceives is not of me (is not my follower)." [20]

A similar situation took place when the second caliph of Islam, Umar ibn al Khattab (may Allah be pleased with him), punished a man who was selling milk diluted with water. Umar spilled the man's milk not because it was unfit for consumption but rather because the buyer would not know the relative quantities of milk and water [21]. Hence, Islam encourages Muslim businessmen to be forthright and reveal any defects prior to the sale. Should either party then decide that they do not wish to participate in the contract, they may do so.

In summary, the axiomatic concept of unity (*tawhid*) creates a sense of social responsibility and justice in mankind due to its vicegerency (*Khalifah*) of Allah's resources on earth. This makes them trustee (*al'amin*) of all the resources which he holds in trust (*amanah*). This concept, thus, raises certain expectations/applications in business practice – trustworthiness, truthfulness, and avoidance of hoarding and other dishonest means in business. Adherence to these principles of business practice will fulfill the purpose of the Islamic social system (*maqasid al Shariah*), which is to create a harmonious society by means of maintaining social responsibility and justice. The next axiom of equilibrium will further discuss the ways in which this harmony can be achieved in line with the divine commandments.

Equilibrium (*Al 'Adl*)

The axiom of equilibrium (*al'adl*) corresponds to the axiomatic concept of unity. In addition to the vertical dimension of the axiom of unity (*tawhid*), equilibrium (*al'adl*), which in a deeper sense denotes a balance of forces, constitutes the horizontal dimension of Islam. This dimensional characterization of Islam is briefly noted, but in a different context by Frithjof [22]. He notes that “it is the aim of Islam to combine the sense of the absolute with the quality of equilibrium” [22].

At the absolute level, equilibrium is the supreme attribute of Allah (TME). In fact, its denial constitutes a denial of God Himself. It follows that, at the relative level, the quality of equilibrium must also characterize all its creation, which must reflect all His qualities. Accordingly, the Islamic view of life is derived from a divine perception of an all-pervading harmony in the universe:

He who created the seven Heavens, one above another: No want of proportion wilt thou see in the creation of the most Gracious. So turn thy vision again: Seest thou any flaw? Again turn thy vision a second time: (thy) vision will come back to thee dull and discomfited, in a state worn out. [23]

The implication of the above verse is that Allah (TME) has created everything impeccably with a balance. All this is possible because Allah (TME) is almighty and can perfectly carry out His will and purpose, which are love, mercy, and goodness to His creatures. As a vicegerent (*Khalifah*) of Allah (TME), man must replicate these qualities and fulfill his obligation through social responsibility and justice in order to maintain equilibrium in the society. Indeed, divine perfection, reflected in the quality of equilibrium, exists in the very order of the universe that hangs together in a delicate balance, as the holy *Qur'an* states:

It is not for the sun to overtake the moon, nor doth the night outstrip the day. They float each in an orbit. [24]

From an Islamic perspective, various elements of life must be equilibrated to produce the best social order:

. . .He hath created everything, and hath meted out for it a measure [25]

and also

Lo! We have created everything by measure. [26]

Various *Qur'anic* commandments suggest that Allah (TME) has created the universe with a balance to maintain equilibrium in nature. Mankind, as vicegerent (*Khalifah*) of Allah (TME) on earth should be conscious of this balance and act accordingly. The concept of equilibrium is at the heart of the following *Qur'anic* verse:

And thus have We willed you to be a community of the middle way, so that (with your lives) you might bear witness to the truth before all mankind, and that the Apostle might bear witness to it before you. [27]

Interpreting the preceding verse [28], “community of the middle way” can also be interpreted as “middlemost community,” i.e., a community that keeps an equitable balance between extremes and is realistic in its appreciation of man’s nature and possibilities, rejecting both licentiousness and exaggerated asceticism. This balanced attitude, peculiar to Islam, flows directly from the concept of God’s oneness and, hence, of the unity of purpose underlying His creation.

To avoid confusion, it should carefully be noted that the word “equilibrium” has been used in this context in a very special sense denoted by *al’adl*. It is interesting that another meaning of *al’adl* is justice and equity [29]. To the possible objection that *al’adl* means “justice” and not “equilibrium,” there is a simple answer: if justice is introduced everywhere, which is what Islam would insist upon, then a delicate balance that is equilibrium – will hold throughout such a society.

Social equilibrium (*al’adl*) is a crucial element of an Islamic system, as one cannot conceive a Muslim society where justice does not prevail. Furthermore, it is justice that gives the notion of brotherhood its meaning. The holy *Qur’an* addresses the role of justice and the elimination of all forms of injustice as the primary mission of all God’s Messengers [30].

Thus, equilibrium represents a social ideal of the virtues of legal, political, and economic institutions in Islam. This must be based on the principles of social justice in accordance to the will of Allah (TME). The holy *Qur’an* states:

Verily, God has enjoined justice and kindness. [31]

In the economic sphere, the concept demands that the configuration of production, consumption, and distribution activities be based on social equilibrium, in particular, with the clear understanding that the needs of all the least privileged members in society constitute the first charge on the real resources of society [32]. Thus, social equilibrium could be defined as being concerned with both improving the economic lives of the least privileged members of the community and them being worthy of all of the resources of the society. In order to further understand this concept, the meaning of the antonym of *al’adl*, which is *zulum*, needs to be examined. Naqvi explains *zulum* to denote a social disequilibrium in the sense that the resources of the society flow from the poor to the rich [33]. This is not permitted in Islam because of the following verse in the holy *Qur’an*:

...so that it (i.e. wealth) does not concentrate in the hands of those who are rich among you... [34]

This verse combined with the earlier one from *Sura An Nahl* (16:90) (see [31]) demands that in a state of disequilibria, it is societal responsibility to ensure that equilibrium is reached and maintained and wealth and income are distributed fairly. Thus, the concept of equilibrium includes both the goal of equilibrium and the process, the reordering of production, consumption, and distribution of wealth and income so that the basic requirements of the least privileged are met. Although moral discussions often take an air of absolutism, the proper application of equilibrium requires an awareness of the actual circumstances.

Four elements of the Islamic system pertaining to equilibrium, Chapra suggests, are relevant for this discussion [10]:

1. Need fulfillment
2. Respectable source of earning
3. Equitable distribution of income and wealth
4. Growth and stability

Chapra [10] holds that from the importance of brotherhood and the trustee nature of ownership, it follows that resources must be utilized for the needs of all members of society and provides a standard of living that is humane and respectable. The Islamic notion of need fulfillment is not based on a Western economic concept. Rather, it has a place in Islamic jurisprudence (*fiqh*), and as jurists maintained, it was a collective duty (*fardh kifayah*) for the Muslim society to provide the minimum needs of the poor. This point has been accepted unanimously by modern Muslim scholars [35].

Furthermore, there is a personal obligation (*fardh al ayn*) for each individual to provide for himself/herself and his family. Without this, he cannot fulfill his devotional duties. Therefore, there is a collective obligation on a Muslim society to provide equal opportunities to earn an honest living in keeping with members' ability and effort. If individuals cannot support themselves due to being handicapped or any other inability, there is a collective obligation to fulfill their needs. The responsibility goes first to a family and friends or altruistic organizations. The state comes in as a last resort. This is consistent with the Islamic tenet of keenness to earn legitimate (*halal*) earnings discussed in the previous chapter (*Business Precepts of Islam. . .*).

Chapra [10] explains that inequalities are permitted in an Islamic society, as long as they are the result of differences in skill, initiative, effort, and risk [10]. However, this can be criticized in a contemporary context, for instance, considering the following situation where at time $t = 0$, an Islamic economy has been successfully generated and the only inequalities that exist are due to differences in skill, initiative, etc. What happens after several generations at time $t = 150$? Clearly in most societies today, if one's parents suffered economic inequality due to one or more of the above circumstances, then it is often passed on to the children through deficiencies in accommodation, nourishment, and education.

In an Islamic economic system, this cannot be allowed for two reasons: first, the inequalities experienced by the children are not due to the lack of certain qualities, but instead, they would be due to the hardships of the parents; second, the basic needs of the poor must always be provided. In order to combat this, an Islamic system requires a continuous process of redistribution in order to avoid the problem of inequalities being passed from one generation to the next. Thus, although economic inequalities resulting from skill and initiative may exist, an Islamic social system would still bring all individuals to a minimum standard of living.

Chapra further contends that gross inequalities in wealth will lead to the destruction of brotherhood [10]. It is the general opinion of Muslim scholars (*ulemas*) that if the social behavior pattern and economy are restructured in accordance with Islamic precepts, there cannot be extreme inequalities of income and wealth in

a Muslim society. It is crucial to notice that what Chapra [10] is talking about to maintain equilibrium in a society is a restructuring of the economy and behavior.

In order to achieve the objectives of the Islamic economy, a high level of efficiency and a high rate of growth are needed. Economic stability would reduce the inequalities of distribution that is normally brought about by recession and inflation. The realization of an optimum rate of economic growth and minimization of economic instability would be necessary to fulfill the implications of *Khalifah* (vicegerency) and *al'adl* (social justice).

In summary, the axiom of equilibrium is the horizontal dimension of Islam. It can be a sense of balance among the various aspects of a man's life to produce the best social order. God has created everything in the universe with a balance to maintain the equilibrium. As a vicegerent of God on earth, mankind is supposed to reflect His qualities and, thus, maintain equilibrium in society through social responsibility and justice to produce the best social order. A middle path must be maintained in all the socioeconomic affairs of a Muslim society. Accordingly, none should discriminate socially and must avoid miserliness and spendthriftiness economically, as all are condemned in Islam. Adherence to this principle will create social harmony, which is consistent with the purpose of an Islamic social system (*maqasid al Shariah*) that emphasizes human well-being (*falah*) and good life (*hayat tayyibah*).

Proposition

Based on the ethical axiom of equilibrium, in an Islamic society, various elements of life must be equilibrated to produce the best social order, which is an aggregation of natural and social forces creating social harmony.

Expectation/Application in Business of the Axiom of Equilibrium

The foregoing suggests a faithful must practice distributive justice within the socioeconomic environment. Equilibrium in business as per the Islamic precept must be practiced by means of fair competition in an open market, treating others fairly and maintaining fairness in wage distribution.

The principle of equilibrium or balance applies both figuratively and literally to business. For example, Allah (TME) admonishes Muslim businessmen to:

Give full measure when you measure and weigh with a balance that is straight: that is the most fitting and the most advantageous in the final determination. [36]

As can be seen in the above verses of the *Qur'an*, a balanced transaction is also equitable and just. The *Qur'an* uses the term *al'adl* in this sense. Overall, Islam does not aim to create a society of martyr-like merchants, doing business for purely philanthropic reasons. Instead, Islam wants to curb man's propensity for

covetousness and his love for possessions. As a result, miserliness and a spendthrift mode of conduct have both been condemned in the *Qur'an* and *Hadith*.

Beekun notes that Islam promotes equal treatment of all living beings [37]. For example, in hiring, promoting, or any other decision where a manager is evaluating one person's performance against another's in an organizational setting, fairness and justice are a must. Allah (TME) directs to do so:

Allah commands you to render back your trusts to those whom they are due; and when you judge between man and man that you judge with justice. ... [38]

Furthermore, in relation to the privacy of an employee, Beekun [37] suggests that as per Islamic principles, if an employee has a physical problem, which prevents him or her from performing certain tasks, or if an employee has committed a blunder in the past, the employer must not publicize it. This would breach the privacy of the employee [37]. The holy Qur'an further authenticates this:

Whether you publish a good deed or conceal it or cover evil with pardon verily Allah doth blot out (sins) and hath power (in the judgment of values). [39]

Ibn Taymiyah further suggests that an employer is under obligation to pay a fair remuneration to his employees [40]. Some employers may take advantage of a worker and underpay him or her because of their need for profit. Islam is against such exploitation. If the wage level is too low, the individual may not feel motivated to put in an adequate amount of effort. Similarly, if the wage level is too high, the employer may not be able to make a profit and keep the business going. In an Islamic organization, wages must be set in an equitable manner both with respect to employees and the employer. Although both the employer and employee can willfully cheat each other behind each other's back, they are both accountable for their actions in front of Allah (TME). For example, the holy Prophet Mohammed (PBUH) never used to withhold the wages of any person [41].

On the Day of Judgment, the holy Prophet Mohammed (PBUH) said that:

He will be a witness against one who employs a labourer and gets the full work done by him but does not pay him his wages. [42]

The emphasis on wage equity, Beekun [37] suggests, has permeated Islamic history for centuries. During the time of the four rightly guided caliphs and until the advent of Western colonialism, the institution of the *Hisbah* was developed to uphold the public law and order and oversee the relationship between buyers and sellers in the market. The mission of the *Hisbah* was to safeguard right conduct and guard against dishonesty. The *Hisbah* was under the guidance of the *Muhtasib* who was responsible for the maintenance of public morality and economic ethics [43]. One of the duties of the *Muhtasib* was to arbitrate in disputes over wages. In such cases, the *Muhtasib* would often propose the *ujrat al mithl* (wage acceptable for a similar work by others) as an equitable wage [44]. This is an example of the principle of equity or justice at work again in an Islamic society. All the above examples demonstrate the notion of social responsibility and justice in Islam.

Another example of a just and equitable Islamic society is the prohibition of *riba* or interest. Islam encourages businesspersons to augment their capital through trade; it explicitly prohibits them from capital expansion through lending on interest. The size of the rate of interest charged is inconsequential; *riba* or interest is absolutely prohibited. The lender is making money without any fear of loss. Further, since the lender is likely to be wealthy and the borrower poor, *riba* or interest simply increases the gap between the rich and the poor, causing disequilibria in society. However, Islam encourages the circulation of wealth through trade. The holy *Qur'an* states:

Those who devour usury will not stand except as stands one whom the Evil one by his touch has driven to madness. That is because they say: "Trade is like usury," but Allah has permitted trade and forbidden usury. . . . [45]

Benevolence (*al 'ihsan*) is another quality of Allah (TME), which man as His vicegerent (*Khalifah*) is expected to mirror in his everyday life so that he is just and equitable. This has been elaborated in detail in the preceding chapter. The principle of benevolence (*al 'ihsan*) should permeate the relationship between business and employee. At times, the business may not be doing well, and the employee may have to endure a temporary reduction in his wages for the same amount of work hours. This is authorized in the *Qur'an*:

. . . Help you one another in righteousness and piety,
but help you not one another in sin and rancour. . . . [46]

At the same time, Islam encourages debtors themselves not to procrastinate in repaying their debts. This is especially true in the case of wealthy debtors. The holy Prophet (PBUH) has proclaimed the procrastination (delay) in paying debts by a wealthy man as an injustice. If the businessman himself has incurred some debt in financing his business, he needs to repay them. In Islam, repayment is so important that all the sins of a martyr are forgiven except for his unpaid debt [47].

Another aspect of benevolence is not to place undue pressure on employees to conform blindly to unethical business practices. For instance, a survey of 1,227 Harvard Business Review readers revealed that superiors often placed pressure on their subordinates to sign false documents, disregard superiors' mistakes, and conduct business with friends of their bosses. When faced with pressure from above, employees feel compelled to compromise their integrity [48]. This is not permitted in Islam.

To foster equity and balance and thus maintain equilibrium, non-Muslim employees' beliefs should also be similarly respected. The *Qur'an* specifically points out to the virtue of justice in the following verse:

Allah forbids you not, with regard to those who fight you
not for (your) faith nor drive you out of homes, from dealing kindly and justly with them:
For Allah loves those who are just. [49]

Thus, the property of equilibrium is more than a characteristic of nature; it is a dynamic characteristic that each Muslim must strive for in his or her life.

Allah (TME) stresses the need for balance and equilibrium when He labels the Muslim *Ummah* as *Ummatun Wasatun*. To maintain a sense of balance between those who have and those who have not, Allah (TME) stresses the importance of giving and condemns the practice of conspicuous consumption:

And spend of your substance in the cause of Allah,
and let not your own hands throw you into destruction;
but persevere in doing good: behold, Allah loves those who do good. [50]

In summary, the axiomatic principle of equilibrium admonishes selfishness and a Muslim society (ideally) must maintain a balance in every aspect of socioeconomic behavior and thus maintain social harmony. The next axiom of free will further elaborates on freedom of choice in Islam – either to act in accordance to the divine commandments or otherwise.

Free Will (*Ikhtiyar*)

One of the most original contributions of Islam to social philosophy is the concept of a “free” man. Only God is absolutely free, but, within the limits of His scheme of creation, man is also relatively free. Being relative in no way diminishes the quality of human freedom. As Frithjof has profoundly pointed out, God alone has absolute freedom, but human freedom, despite its relativity, in the sense that it is relatively absolute, is nothing other than freedom any more than a feeble light is something other than light [51].

Free will (*ikhtiyar*) is an element that each individual has, and it provides humankind with the ability to make choices in situations where there may be opposing issues involved. Naqvi maintains that the individual’s freedom is “unrestricted and voluntary”; therefore, it is possible to make wrong choices, even though it is an individual’s best interest to make the right choice [33]. The *Qur’an* states:

Say: O mankind! Now hath the truth from your Lord come unto you. So whosoever is guided is guided for the good of his soul, and whosoever is erreth, erreth only against it. ... [52]

The holy *Qur’an* also states that:

... Verily God does not change the state of people till they change their inner selves. ... [53]

Interpreting the above verses in detail highlights the free will of man within God’s scheme of freedom for humankind. Allah (TME) is not intent on punishment. He created man virtuous and pure; He gave him intelligence and surrounded him with all sorts of instruments of His grace and mercy. If, in spite of all this, man distorts his own will and goes against Allah’s (TME) will, yet Allah’s (TME) forgiveness is open to him if he will take it. It is only when he has made his own sight blind and changed his own nature or soul away from the beautiful mold in which Allah (TME) formed it that Allah’s (TME) wrath will descend on him and

the favorable position in which Allah (TME) placed him will be changed. Thus, an individual's blessings are conditional upon making the right choice. The basis of one's freedom is his or her ability to make the right choice [54].

Islam teaches a person not to be the slave of his or her desire. A person has been endowed with a free will to make his or her own choices, thereby making his or her own way of achieving success in this life and salvation in the hereafter. These outcomes are not mutually exclusive. Islam teaches its followers to make such supplication to Allah (TME):

Our Lord! Give us in this world that which is good and
in the Hereafter that which is good. ... [55]

Naqvi further explains that very much related to one's ability to make the right choice is man's role as Allah's (TME) vicegerent (*Khalifah*) on earth [33]. This vicegerency is more of virtuality than an actuality. However, it is an individual's goal to act in a manner such that this situation obtains.

Man in Islamic perspective is not chained to predestination in the literal sense. Having been given the faculty to choose, mankind has the freedom either to become Godlike and thus His vicegerent (*Khalifah*) on earth or deny God. This freedom to accept or reject whatever is on earth followed from man's acceptance, even before creation, of a burden, which no one else could endure. As the holy *Qur'an* states:

Lo! We offered the trust unto the heavens and the earth the hills, but they refused to
undertake it and were afraid of it: and man assumed it. ... [56]

Interpreting the above verse [57], trust is something given to a person, over which he has no power of disposition. He is expected to use it as directed or expected, but he has the power to use it otherwise. There is no trust if the trustee has no power, and the trust implies that the giver of the trust believes and expects that the trustee would use it according to the wish of the creator of the trust and not otherwise. Thus, God's omniscience encompasses all man's actions throughout his sojourn on earth, but man's freedom is also God-given.

By accepting to act as the receptacle of God's power of discretion, man has been assigned to the most distinguished niche in the universe. The emphasis on the central importance of the individual, not only in the society but also in the universe, is one of the hallmarks of the teachings of Islam, which makes it the most progressive religion of the world. Sir Mohammed Iqbal has brought out this aspect of Islam in his book: *Reconstruction of Religious Thought in Islam* [58]. His deductions are based on three *Qur'anic* propositions about the place of the individual in the universe:

1. That man is the chosen of God
2. That man, with all his faults, is meant to be the representative of God on earth
3. That man is the trustee of a free personality, which he accepted at his peril

Syed Amir Ali [59] also emphasized this aspect of man. He notes that the Arabian philosophy, nurtured afterward in other cradles, drew its first breath in the school of Madina al Munawwara. The freedom of human will, based on the doctrine that man would be judged by the use he had made of his reason, was

inculcated in the teachings of the Master, along with an earnest belief in a supreme power ruling the universe [59].

It should be emphasized that human freedom applies both to the “individual” and the “collective” man, emphasizing a correct balance between the two. In a non-Islamic setting, the individual’s (almost unlimited) right to private property provides a set of institutions, which can make the maximum contribution to social good. However, Islam does not accord unqualified sanction to an individual’s right to private property, because all property belongs to Allah (TME) and man is only His trustee (*al’amin*) on earth. Hence, an individual does not have an exclusive “natural” right to what he earns and has even less to what he can inherit. Furthermore, the roots of human freedom, according to Islam, cannot be traced to an uncertainty about who knows best, but flows naturally and serenely from a perspective of certainty:

..Allah knoweth, ye know not. [60]

According to Western social philosophy, individuals should be allowed the freedom to choose because no one individual has the exclusive right to reason, and hence, what is best can be discovered only by a process of trial and error [61].

In the classical economic model, this works out through the atomistic market behavior of the individual, each significant, coupled with the institution of private property. The inadequacy of this argument can be shown by pointing out that what the system of free markets can at best achieve is to lead the competing individuals on to the “efficiency locus,” i.e., a configuration of a whole set of points which are consistent with the utility-maximizing behavior of the freely acting individuals. However, not every point on this locus coincides with the best social welfare. To discover the “bliss” point, a social welfare function must be found, representing the preferences of “who knows best” [62].

In the Islamic framework, valid deductions based on the *Qur’an* and the *Sunnah* condition the preferences of those who know best. Thus inevitably, by the sheer logic of Islamic reasoning, ethical constraints delimit the area of choice both for the “individual man” and for the “collective man.” This perspective is basically much more unified and productive of better social results by comparison with the one which affects the marriage of unconstrained selfish interests of the atomistic market agents with those of “who knows best.” It is for this reason that there is no warrant in the Islamic system for fears that conscious attempt to make people equal may lead to “a new form of servitude.” For if human freedom is God-given, and individuals act in accordance with the ethics of this freedom, the element of coercion involved in reconciling private and social interests must be minimal. By the same token, it follows that if such a conflict between private and social interests does exist, then it must be removed to satisfy the preconditions of an Islamic society.

In summary, God’s celestial character, combined with free will, sanctifies in the clearest possible terms the principle of human freedom, which is innate in human nature. The God-given freedom of man not only cannot be taken away from him, but must also be safeguarded through the creation of institutional safeguards that

prevents its desecration by unnatural authoritarianism. Thus, no Magna Carta is required to confer on man his God-given freedom. By the same token, any such attempt to relieve man of the burdens of slavery becomes ennobled in the eyes of God, simply because it constitutes a fulfillment of the divine purpose. It also follows that to deprive man of his natural freedom is to degrade him below his God-given stature, producing disequilibria in society. Any such act is, therefore, a cardinal sin. Thus, in an Islamic framework, although humans are free to choose, he or she is expected to abide by the commandments of Allah (TME) in order to gain His favor and blessings and avoid His wrath by disobeying Him.

Proposition

As a trustee (*al 'amin*) of Allah's (TME) resources on earth, humankind has been given the free will to steer his or her own life. Unlike other creatures in Allah's (TME) universe, humans can choose their behavior to be either ethical or unethical. However, to achieve Allah's (TME) favor and blessings, every believing Muslim must manage his or her free will to act according to the moral code laid out by Allah (TME) in His divine commandments (*Qur'an*).

Expectation/Application in Business of the Axiom of Free Will

In view of the above, a faithful is expected to fulfill all obligations, contribute to the well-being of society, and most important – be benevolent (Godlike) – watching over the welfare of weak and destitute members of society.

Based upon the axiom of free will, businesspersons have the freedom to make a contract and either honor or break it (Islamic tenets concerning business transactions relating to honoring and fulfilling obligations (*uqud*) have been discussed in detail in the preceding chapter). However, a Muslim businessperson, who has submitted to the will of Allah (TME), will honor all contracts in accordance to the divine commandment:

O you who believe! Fulfil (all) obligations. [63]

It is important to note that Allah (TME) is directing the preceding verse explicitly to Muslims. As Yusuf Ali (translator of the holy Qur'an) suggests, the word *uqud* (obligations) is a multidimensional construct. It implies (a) the divine obligations that spring from one's spiritual nature and his or her relation to Allah (TME), (b) one's social obligations such as a marriage contract, (c) one's political obligations such as a treaty, and (d) business obligations such as a formal contract to perform certain tasks or a tacit contract to treat the employees decently, etc., which every man of faith must discharge conscientiously. The man who deserts those who need him and goes to pray in the desert is a coward who disregards his obligations. All these obligations are interconnected. Truth and fidelity are parts of religion in

all relations of life. A Muslim must curb his free will to act according to the moral code laid out by Allah (TME) [64].

From an economic standpoint, Islam rejects the principle of *laissez faire* and the Western reliance on the concept of the “invisible hand” [65]. Since a key part of the makeup of man is the *nafs ammarah* (implying freedom), he is prone to abuse such a system. The examples of Ivan Boesky, Michael Milken and the junk bonds fiasco, the savings and loan scandal in the United States, the BCCI debacle, the corruptive practices of the government and the Mafia in Italy, the *baqshish* (tips) system in the Middle East, the stock market scandals in Japan, etc., all demonstrate the deficiencies in the capitalistic system [37]. *Homo Islamicus*, as presented by Zarqa [62], guided by Allah’s (TME) will consciously chooses to be ethical.

When dealing with suppliers, Islamic business precepts suggest that one should negotiate a fair price and not take advantage of one’s larger size or clout. To avoid any future misunderstanding, Allah (TME) has enjoined to put contractual obligations in writing:

O you who believe! When you deal with each other in transactions involving future obligations in a fixed period of time, reduce them to writing. [...] Let him who incurs the liability dictate, but let him fear his Lord Allah, and not diminish aught of what he owes. ... [66]

According to Beekun ([67]: 43), despite the permissibility of agency in general, merchants are prohibited from interfering with the free market system through a specific type of brokering. This type of brokering may lead to price inflation. An example would be that of a farmer going to the marketplace in a town to sell some of his goods. A townsman may approach the farmer, asking that the goods be left with him until the prices rise. If the farmer had sold the goods without the interference of the townsman, the public would have purchased them at the current lower price. Both the public and the farmer would have benefited. However, when the townsman stores the goods until prices increase and then sells them, the public has to pay more, and the broker makes excess profits. This type of brokering is forbidden in Islam.

Al Qaradawi [35], however, points out that brokerage are generally permissible except when there is interference in the free market system – as in the case just cited. There is nothing wrong with brokers charging a fee for services. This fee may be a fixed amount or proportional to the volume of sales or whatever is agreed among the parties involved.

A businessperson also has a special obligation if he provides essential supplies to the public. For example, the public has a need for farming produce, clothes, and dwellings. Since these are essential commodities, the businessman needs to price fairly. Islam is against the idea of price controls [40] and [35]. The scholars who rule out price control altogether base themselves on the following *Hadith*:

A man came and said, “Apostle of Allah, fix prices.” He said, “No, but I shall pray.” Again the man came and said, “Apostle of Allah, fix prices.” He said, “It is but Allah Who makes the prices low and high. I hope that when I meet Allah, none of you has any claim on me for doing wrong regarding blood or property.” [68]

Ibn Taymiyah [21] points out, however, that this *Hadith* does not discuss a situation where a merchant refuses to make a sale when under obligation to do so or to perform an action legally required of him. He concludes that should the businessman refuse to sell his goods at a fair price, he may be coerced by the Imam (religious leader) to perform and may also be punished for noncompliance.

Any business project which aims at benefiting the individual or society or which removes some evil is righteous, especially if the intention of the investor is righteous a priori. Al Qaradawi [18] points out that such project is blessed by Islam and will receive Allah's (TME) help, based on the following *Qur'anic* commandment:

... Help you one another in righteousness and piety,
but help you not one another in sin and rancour. ... [46]

The Islamic code of ethics requires all partners to be fair and to avoid cheating one another. The Messenger of Allah (TME), Mohammed (PBUH) said:

Allah, most high and exalted, says, "I make a third with two partners as long as one of them does not cheat the other, but when he cheats him, I depart from them." [69]

Another key focus area is the concept of competition, which in Islam is quite distinct in comparison to the Western style of competition. Islam discourages cutthroat competition harming each other in the business world. Although the businesses are free to choose the way of practice according to the code of ethics in a Muslim society, they are also responsible for the well-being of the consumers as well as the business community. A balance needs to be maintained to foster a congenial environment for the stakeholders both within and outside the firm.

Beekun points out that although the West claims to be in favor of market competition, a cursory reading of key business publications will reveal that businesses are constantly seeking to assert themselves over and eliminate their competitors [37]. By eliminating their competitors, firms can then reap above average economic returns through hoarding and monopolistic pricing. As discussed earlier regarding hoarding, Islam strongly discourages monopoly in businesses. One of the four Islamic schools of jurisprudence (the *Hanafi* school) further contends:

It is abominable to monopolize the necessities of life, and food for cattle,
in a city where such monopoly is likely to prove detrimental. [70]

Besides behaving responsibly toward their stakeholders, Muslims and the organizations they work in are expected to care about the general welfare of the society they live in. As mentioned earlier, as part of the community, Muslim businessmen need to watch over the welfare of its weak and destitute members:

And why should you not fight in the cause of Allah and of those who, being weak, are ill treated (and oppressed)? - men, women and children. ... [71]

The reward for taking care of the destitute and the weak is stressed in this *Hadith*:

The Prophet (PBUH) said, "The one who looks after and works for a widow and for a poor person, is like a warrior fighting for Allah's cause or like a person who fasts during the day and prays all night." [72]

On the other hand, if any person spends the night hungry, the community shares the blame because it did not attempt to take care of him [73] and [74]. Thus, Islam strongly emphasizes the social responsibility of businessmen toward the needy in the society in which it operates. Islam encourages donating generously in showing the unity among the faithful and the responsibility toward a fellow human being. Very often, the needy approach a businessman and ask for *sadaqah* or charity. Sometimes, a businessman gives leftovers or spoiled goods that he would never consider using himself. Allah (TME) warns about this type of donation:

O you who believe! Give of the good things, which you have (honourably) earned. And of the fruits of the earth which We have produced for you, and do not even aim at getting anything which is bad, in order that out of it you may give away something, when you yourselves would not receive it. . . . [75]

Hence, Muslim businesses should give to the poor from what is wholesome and earned in a *halal* or righteous manner.

In summary, the axiomatic principle of free will gives mankind the freedom to choose between the right and the wrong, the knowledge of which is clearly provided in the divine commandments in the holy *Qur'an* and *Hadith*. As a trustee (*al 'amin*) of Allah's (TME) resources on earth, mankind can utilize them in accordance to the divine commandments or misuse them as Allah (TME) has given them the freedom to choose. Although mankind is free to do whatever they wish, Islam provides this freedom to mankind with elements of discipline and dignity to reflect man's vicegerency (*Khalifah*) of Allah (TME). A Muslim's free will to choose is guided by the will of Allah (TME) and His divine commandments. Thus, in accordance to the divine law, a faithful is expected to fulfill all obligations, contribute to the well-being of society, and most important – be benevolent (Godlike). These constitute an essential part of the faith contributing to the principles of social responsibility and justice in Islam.

The last of the four fundamental ethical axioms further elaborates this notion of freedom in Islam with the sense of responsibility in line with the fulfillment of their religious obligations.

Responsibility (*Fardh*)

Logically related to free will is the axiom of responsibility (*fardh*). Free will does not go freely, but with responsibility. This sets a limit to what man is free to do since he is responsible for all that he does:

Whosoever interveneth in a good cause will have the reward thereof, and whosoever interveneth in an evil cause will bear the consequences thereof. . . . [76]

Naqvi [32] states that the two axioms (*free will* and *responsibility*) come together as a pair balancing each other. Naqvi [32] further maintains that the concept of responsibility has two elements, the first is the individual's trustee (*al 'amin*) status on earth, and the second is the voluntaristic aspect. The individual should strive to

realize the position of being God's vicegerent (*Khalifah*) on earth. This clearly involves performing actions that improve the welfare of the least privileged in society. The holy *Qur'an* clearly states:

You will never come to piety unless you spend (freely) of things you love. . . . [77]

The test of charity is that does one give something that he or she values greatly. Sacrificing one's life in a good cause is the greatest gift. Personal efforts, talents, skill, and learning come next in degree. Another means of charity is giving away from one's earnings, property, and possessions, for many people love them even more than other things. There are less tangible things, such as position, reputation, the well-being of those one loves, etc. It is unselfishness that Allah (TME) demands, and there is no act of unselfishness, however small or intangible, but is well within the knowledge of Allah (TME) [78].

It is the responsibility of every individual to care for the needy in society. Denial of such responsibility is equivalent to denial of faith:

Have you seen him who denies the Day of Judgement?

It is he who pushes the orphan away, and does not induce others to feed the needy. [79]

By exercising one's responsibility to oneself, God, and society, the individual is securing his or her freedom and exercising faith.

Many Islamic scholars have emphasized this aspect of Islamic ethics, i.e., responsibility. Sir Iqbal derives the position of the individual in the Islamic framework from the consideration that man is the trustee of a free personality, which he accepted at his peril (see [58]). However, Syed Amir Ali [59] in his book *The Spirit of Islam* looks into the complete development of the central importance of the doctrine of responsibility in the Islamic perspective. He contends that the cult of unethical, unbridled individualism is not allowed in Islam. Even pure logic should convince one that unlimited freedom is an absurdity; unlimited freedom implies unlimited responsibility [80]. This is a contradiction because both these statements cannot be true at the same time. Freedom must be counterbalanced by responsibility if only to satisfy the dictates of nature's equilibrium. Man, having opted for the power to choose between good and evil, must endure its logical consequences, as stated in the *Qur'an*:

Every soul is a pledge for its own deeds. [81]

Once Allah (TME) has shown the way, the responsibility for going astray is wholly man's, and he will have to suffer for his wayward behavior:

Say: O mankind! Now hath the truth from your Lord come unto you.

So whosoever is guided is guided only for (the good of) his soul, and whosoever erreth is only against it. And, I am not a warder over you. [52]

Interpreting the above verse [82], the criterion between right and wrong has been sent to mankind from Allah (TME) in the form of *Qur'an*. If one accepts guidance through this divine book, it is not as if one confers favor on those who bring

guidance (the holy Messengers of God). They (the Messengers) suffer unselfishly for the well-being of mankind that they may be guided for their own good. On the other hand, if one rejects the guidance, it is their own loss. Humankind, in Islam, has a certain amount of free will, and the responsibility is his or hers and cannot be shifted to anyone else.

Because of the universal quality of social justice (*al'adl*), every individual must be held responsible for his actions. No one can escape the consequences of his misdeeds just by pointing to a convenient scapegoat:

... Every soul earneth on its own account, nor doth any laden bear another's load. [83]

The above verse reflects the doctrine of personal responsibility again. Every individual is fully responsible for their acts themselves and cannot transfer the consequences to someone else. Nor can anyone vicariously atone for others sins, and man can also be held responsible for the evil that goes around him. Accordingly, man has been forewarned in the *Qur'an*:

And guard yourselves against a chastisement which cannot fall exclusively on those of you who are wrongdoers. ... [84]

This warning against internal discord or tumult was necessary in the civil wars of early Islam and is arguably even more necessary now. It is every individual's responsibility to stop evil in any form. Except for the sick, the children, and women, the rest cannot escape Allah's (TME) retribution on the excuse that they were too weak to stop evil in society. If one cannot do anything about what goes wrong in a particular society, then he is commanded to migrate from that society. The holy *Qur'an* testifies:

Lo! As for those whom the angels take (in death) while they wrong themselves, (The angels) will ask: In what were ye engaged? They will say: We were oppressed in the land. (The angels) will say: Was not Allah's earth spacious that ye could have migrated therein? As for such, their habitation will be hell, an evil journey's end. [85]

The doctrine of responsibility in fact constitutes a dynamic principle in relation to human behavior. It is interesting to note at this point the difference between Muslim scholars (*ulemas*) regarding the dynamic nature of an Islamic society. For instance, Sir Iqbal singles out *Ijtihad* or "the principle of movement" to be the primary dynamic force, as he calls it in the Islamic system (see [58]). However, this is only a partial view. Naqvi contends that the dynamic force instead is the responsibility of the individual to maintain the quality of equilibrium in an Islamic society (see [1]). *Ijtihad* is only one of the means to restore equilibrium on the intellectual plane; the other is *Jihad*, which does this on the social plane, the latter being more basic of the two. In a deeper sense, *jihad* (literally: struggle) includes waging war not only against the infidels but also against the evil both within and without oneself. Indeed, the holy Prophet Mohammed (PBUH) declared that the fight against evil within one's self is a higher form of *jihad* (struggle).

Another important responsibility of every Muslim is acquiring knowledge so that they are aware and able to reason. It is incumbent upon every Muslim (male and female) to acquire knowledge, and thus, there is no room for ignorance. In fact, the first verse of *Qur'an* revealed to the holy Prophet Mohammed (PBUH) was:

Read! In the name of thy Lord and Cherisher, who created. ... [86]

In the above verse, one is commanded to read so that one comes out of darkness (illiteracy) to light (literacy). It is also important to note that it is mentioned to read in the name of God because knowledge without divine morality could lead one astray, as Sutherland [87] states:

Educate men without religion and all you make of them is clever devils. [87]

Islam places great emphasis on systematic enquiry for the pursuit of knowledge. For knowledge is light and power for mankind and must be used for the benefit of all creation and social welfare. Science and technology should be used responsibly for moral ends and serve all legitimate needs of mankind [88]. Businesses should invest in educational projects in society so that individuals benefit from acquisition of knowledge and, thus, reduce all evil in the society.

Thus, a free individual is not one who is insensitive to his environment but one who fulfills his responsibility by contributing to society by his presence. "Each man on his own" is not how Islam looks at human freedom. Hence, there cannot be any contradiction, within the Islamic perspective, between individual freedom and collective freedom. The distance between the two is bridged by the sense of social consciousness and responsibility. Those who are socially conscious have been exalted in the eyes of Allah (TME) over all others who are not so motivated:

And there may spring from you a nation that invites to goodness,
and enjoins right conduct and forbids indecency.
Such are they who are successful. [89]

The ideal Muslim community is happy, untroubled by conflicts or doubts, sure of itself, strong, united, and prosperous. This is because it invites to all that is good and enjoins the right and forbids the wrong. It is incumbent upon every individual to fulfill this responsibility.

In summary, the ethical axiom of responsibility is logically related to free will. Freedom must be counterbalanced by responsibility and having opted for the power to choose between good and evil, man must endure its logical consequences. Since he is responsible for all that he does, man must be accountable for his actions.

Proposition

Every individual is accountable and ultimately responsible for his own actions.

Expectation/Application in Business of the Axiom of Responsibility

This accountability ties in with the propositions arising from the other three ethical axioms – *unity*, *equilibrium*, and *free will* – and holds one responsible for his or her own deeds. According to Islam, every soul is accountable to Allah (TME), and thus, a faithful's actions are motivated by achieving Allah's (TME) favor and blessings. Hence, a Muslim businessman acts responsibly and fulfills the expectations arising out of all the other three ethical axioms.

In an Islamic society, it is the responsibility of an individual as well as businesses to earn a living in a permissible (*halal*) way. Muslim businessmen must be trustworthy and truthful in their transactions. It is their responsibility to trade through mutual consent and fulfill all their obligations. Businesses must treat their employees fairly and deal with generosity and leniency. It is also their responsibility to take care of basic needs of the poor and needy in the society. Furthermore, businesses must be cognizant of the prohibitions in their business dealings in adherence to business precepts of Islam. Accordingly, businessmen must act responsibly, e.g., avoid interest (*riba*) in their financial transactions, avoid dealing in prohibited items, must not hoard resources or wealth avariciously or fix prices, must not be involved in sale of *gharar* (uncertainty, risks, and speculation), must not exploit market conditions, and must avoid cheating and fraud in business transactions. It is incumbent upon every believing Muslim businessperson to adhere to these tenets of business in order to achieve Allah's (TME) favor and blessings.

All the above-mentioned responsibilities of Muslim businesspersons have been discussed in detail both throughout this and the previous chapter.

Furthermore, businesses are required to contribute to society by paying *zakat* (Islamic social tax), which is one of the five pillars of Islam and is part of fulfilling social responsibility. The rich are required to spend their wealth for the benefits of the poor. Wealth, after all, does not belong to them; they are only the trustees – *al 'amin* (as discussed earlier). Redistribution of wealth is, thus, an economic necessity as well as part of a spiritual journey, which a Muslim must fulfill responsibly [90].

Zakat is a proportionately fixed contribution collected from the wealth and earnings of the well to do as per the holy *Qur'an* – Sura Al Baqarah-2: 3, 43, and 83. It is spent on the poor and needy and for the welfare of society. The meaning of the word *zakat* is both “purification” and “growth” in a *Qur'anic* sense. The wealth is held in trust (*amanah*) with humankind from God. This wealth is purified by setting aside a portion and giving it to those who have less or no wealth. It is like the pruning of plants, the cutting back balances and encourages new growth. This payment is compulsory (*fardh*) – fulfilling certain conditions. The payment of *zakat* creates in the mind of the giver the virtue of sharing wealth with others. It uplifts the giver from a life of material pursuits to a life endowed with moral purpose. The payer pays it as an act of worship, while the destitute receives it as a matter of right.

This is how Islam integrates business and commerce with ethics. The holy Prophet Mohammed (PBUH) urged Muslims to be moderate in their lives:

Work for your worldly life as if you were going to live forever, but work for the life to come (Hereafter) as if you were going to die tomorrow. [91]

This balance in human endeavors is necessary to ensure social well-being and continued development of human potential. Islam encourages individual initiative, drive, efficiency, and enterprising attitudes along with a right to make profits and own private properties and businesses; it condemns greed, unscrupulousness, and an attitude of disregard for the rights and needs of others. The individual profit motive is not the chief propelling force [92]. Hence, an excessive personal gain in the form of profit without fulfilling the responsibility of social obligations is discouraged. Society is the primary institution in Islam. Society's interests need to come first. Societies would be better safeguarded if the individuals forming the society perform all their duties in accordance with the frameworks given by Islam.

Thus, the axiom of responsibility forms an essential core value of the conceptual framework of business ethics in Islam. This is demonstrated by its correlation with all the other three fundamental ethical axioms and its application in business.

Summary of the Four Fundamental Ethical Axioms

The distinctive character of Islamic ethics rests largely on its conception of man in relation to God, his own self, the universe, and the society. Through the essential multidimensionality of an integrated personality, Islam points to a responsible man. He must be guided by a conscious purpose, exercising to the full his powers of discretion in a balanced way. In this perspective, human behavior takes on a new character in that it has providentially freed from any sense of "guilt." By virtue of his distinctive qualities, mankind has been aligned with his environment, indeed with the universe at large. As a consequence, within the panoramic Islamic vision, man can neither go adrift by aimlessness nor be alienated from his surroundings. At the same time, his unaltruistic behavior is tempered because Islam requires man to be sensitive to his socioeconomic environment for the betterment of which he bears full responsibility. Furthermore, he is not allowed to be tradition-bound: he has no responsibility for the past in which he had no part to play. Thus, man, in an Islamic perspective, must be forward-looking and dynamic, a quality which derives from his deep consciousness of the decisive nature of his actions and a sense of responsibility.

The four ethical axioms have been summarized in the table below (see [Table 46.2](#)) to present a potential framework of business ethics in Islam.

The four ethical axioms, which are foundation of the Islamic framework, are based on *Qur'anic* injunctions and provide clear guidelines for an ethical social system in Islam. These divine commandments lead to the proposition and further expectations/application of such injunctions in business practice.

Table 46.2 Summary of the fundamental ethical axioms that constitute the conceptual framework of business ethics in Islam

Axioms	Qur’anic injunction	Proposition	Expectation/application in business practice
Unity (<i>tawhid</i>)	“...to Allah belongeth the dominion of the heavens and the earth...” (3:180; 5:17)	There is only one God – Allah (TME) – and everything in the heavens and on earth belongs to Him. Man is considered to be the vicegerent (<i>Khalifah</i>) of Allah (TME) on earth and thus trustee (<i>al ‘amin</i>) of Allah’s (TME) resources	A faithful will be trustworthy and truthful in business transactions, will not discriminate in any form, and will not hoard his wealth avariciously
Equilibrium (<i>al ‘adl</i>)	“Give full measure when you measure and weigh with a balance that is straight...” (17:35)	Various elements of life must be equilibrated to produce the best social order, which is a conglomeration of natural and social forces creating social harmony	Equilibrium must be practiced by means of fair competition in an open market; treating others fairly and maintaining fairness in wage distribution and avoid discrimination in all forms
Free will (<i>ikhtiyar</i>)	“O you who believe! Fulfil (all) obligations” (5: 1).	As a trustee (<i>al ‘amin</i>) of Allah’s (TME) resources on earth, mankind has been given the free will to steer his or her own life. Unlike other creatures in Allah’s (TME) universe, humans can choose their behavior to be either ethical or unethical	A faithful is expected to fulfill all obligations, contribute to the well-being of the society, and most important – be benevolent (Godlike) – need to watch over the welfare of weak and destitute members of the society
Responsibility (<i>faradh</i>)	“Every soul is a pledge for its own deeds” (74: 38).	Every individual is accountable and ultimately responsible for his own actions	This accountability ties in with the expectations arising from all the above three ethical axioms and holds one responsible to fulfill them responsibly

The axiom of unity, as presented in the preceding table, is derived from the concept of trusteeship. Everything on earth and the heavens belong to Allah (TME). He has made mankind His vicegerent (*Khalifah*), entrusting them with His resources. Thus, the expectations of a faithful businessperson will be to act in accordance to the commandments of Allah (TME) – be trustworthy and truthful, not hoard wealth avariciously, and not discriminate in any form.

Similarly, the axiom of equilibrium entails creation of social harmony through aggregation of natural and social forces. This is again based on *Qur’anic* injunctions. The expectations, therefore, are to be fair and nondiscriminatory in business practices. A faithful will adhere to these principles sincerely.

The axiom of free will provides freedom to mankind. The freedom to choose, however, is conditional in Islam. Adherence to divine commandment will lead to Allah's (TME) favor and blessings. Violation of *Qur'anic* injunctions will draw Allah's (TME) curse and retribution. The expectation, therefore, is that a believing Muslim will fulfill all obligations, contribute to the well-being of society, and look after the needy.

Finally, the axiom of responsibility holds every individual accountable and ultimately responsible for his or her own deeds. This again is authorized by *Qur'anic* injunctions. The expectation arising out of this axiomatic concept of responsibility ties in with the other three axioms and their expectations/application in business practice. It is the responsibility of every believing Muslim to fulfill all their duties in accordance with Islamic principles to gain Allah's (TME) favor and blessings.

The fundamental ethical axioms that form the basis of the conceptual framework of business ethics in Islam can also be presented diagrammatically as follows (Fig. 46.1):

The inner circle, in the above diagram, depicts the four ethical axioms, *unity*, *equilibrium*, *free will*, and *responsibility*, which are the core values of an Islamic ethical system. These axioms are the foundation of any Islamic socioeconomic system.

The second circle encompasses those elements of the Islamic ethical system that have evolved from the core values. For instance, the concept of trusteeship is derived from the axiom of unity. Similarly, distributive justice is derived from the axiom of equilibrium, freedom of choice from free will, and accountability derived from the axiom of responsibility. These are more descriptive of the core ethical values.

The outer circle represents the elements of business transactions in accordance with Islamic jurisprudence (*fiqh*). The concept of the lawful (*halal*) and forbidden (*haram*) provides a clear guideline for business transactions in Islamic economics. These are based upon the Islamic ethical system, which is derived from the core values (the four ethical axioms).

All elements of the three circles, presented in the preceding diagram, are interconnected to form a coherent framework of business ethics in Islam. For instance, the concept of trusteeship entails trustworthiness and truthfulness in business transactions. Freedom of choice allows one to be ethical or unethical in business transactions. However, to gain Allah's (TME) favor, a faithful will fulfill all obligations, be generous, and look after the needy. Similarly, prohibition of *riba* (interest) or hoarding is based upon the concept of distributive justice that enables socioeconomic equilibrium in society. Accountability to Allah (TME) in the hereafter drives a Muslim to act in accordance with the divine commandments and adhere to ethical business practices, avoiding the forbidden (*haram*) and practicing the lawful (*halal*). These business tenets have been discussed in detail in the previous chapter.

The conceptual framework diagram illustrates the foundation of an Islamic socioeconomic system that is all encompassing and comprehensive.

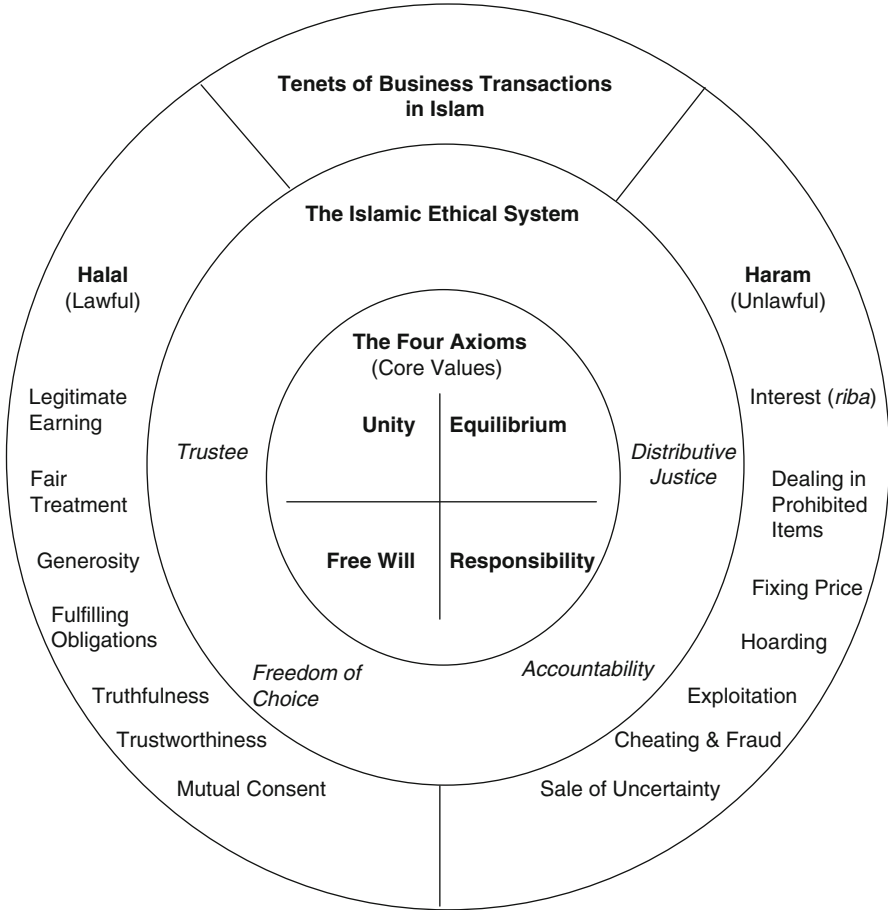

Fig. 46.1 Diagram of the conceptual framework of business ethics in Islam

Implementation of such principles, in adherence to divine commandments, will fulfill the purpose of Shariah (*maqasid al Shariah*) of achieving good life (*hayat tayyibah*) and well-being (*falah*) of society.

Conclusion

Although the four axioms that are the core values and foundation of any Islamic business and society guide day-to-day behavior, they are more descriptive of the ethical philosophy of Islam. The *Qur'an* and *Hadith* of the holy Prophet Mohammed (PBUH) complement these axioms by specifying the degree of lawfulness of key types of behaviors for Muslim businesspersons, as discussed in this as well as the earlier chapter. All of these characteristics of a unique precept in business conduct prescribed by Islam form the foundation of an Islamic business and society and, thus, a concept of ethical system in Islam.

The conceptual framework of business ethics in Islam presented in this chapter provides a systematic representation of what this might look like in an ideal Islamic society.

Part 14

**Eastern Cultural, Philosophical and Religious
Foundations of Business Ethics**

Po-Keung Ip

Abstract

This chapter takes Daoism as a body of philosophical ideas and investigates some of its major implications for business ethics. The major question is: Could Daoism as articulated by Laozi provide a philosophical basis for developing business ethics for today's corporations? The core ideas of Daoism which include *Dao*, *De* and *wu wei*, and its cardinal values are introduced. The Daoist doctrine of statecraft is discussed by invoking the attributes of a sage who serves as an ideal political ruler. A correlated doctrine of ethical firm-craft is constructed as a way to examine how the Daoist ideas would flesh out in business ethics terms in the corporate domain. Whether and how Daoism could ground business ethics will be addressed by examining the Daoist doctrine of *Dao*, ethical organization and management, *wu wei* management, and ethical leadership. The Daoist doctrine pertaining to business ethics is further scrutinized against the backdrop of the environmental crisis in China as a reality test for the ideas. The implications of the *Dao* principle, *wu wei* management, and ethical leadership for business are envisioned.

Introduction

Daoism (道家) (or Taoism) is so popular and entrenched in Chinese culture since its creation that it is fair to claim that without Daoism, there is no Chinese culture as we know it today. *Daodejing* (《道德經》), or *Laozi* (《老子》), the “Bible” of Daoism, is perhaps one of the few most widely known classics in Chinese communities over the globe. Along with its popularity, its text is open to multiple and sometimes divergent

e-mail: pkip@cc.ncu.edu.tw

interpretations, generating different strands of Daoism in part due to its symbolic, abstract, and at times vague, ambiguous, and opaque language. For common folks, Daoism is widely worshipped as a religion, and the truths revealed in *Daodejing* are perceived as fundamental religious truths. For true believers, Laozi, the founder of Daoism, helped unveil the truths about a fulfilled life, a life of freedom, enlightenment, and happiness. For centuries in China and beyond, Daoism as a religion has had a deep appeal to people of all walks of life. Today Daoism, with its multiple variants, stands as one of three major religions in Chinese communities [1–8].

The term “Daoism” was generally used in the West to refer to both the Daoist philosophy and the Daoist religion (*Dao Jiao*) that emerged around the end of the Eastern Han dynasty (25–220 CE). Daoism as a religion inherited elements of *Daodejing* and evolved over time, mixing with doctrines of immortality, deities, Yin-Yang cosmology, the five phases, *qi*, and alchemy, spawning different Daoist strands. Within Chinese culture, Daoism and its religious strands have exerted deep and enduring influences on both Confucian and Buddhist thinking, the two other cultural building blocks of Chinese civilization. For example, the Neo-Confucian thought in the Song (960–1279) and Ming (1368–1644) periods displayed conspicuous Daoist imprints. The Chinese Chen Buddhist contained discernable Daoist ingredients. In light of this, Chinese culture is fairly described as a benign mixture of Confucianism, Daoism, and indigenized Buddhism. For the more intellectually inclined or scholarly oriented, Daoism is esteemed more as a body of philosophical truths than religious creed. As such, Daoism not only provides wise and sober guidance to how one should lead one’s life but also contains wisdoms on how to run a company and to rule a state. What follows in this section is a brief account of Laozi, the founder of Daoism, *Daodejing*, the Daoist classic, the development of Daoism, and a comparison of Daoism with Confucianism.

Laozi the Person

The historical record of Laozi the person (ca. 722–207 BC) is not without controversies. According to the *Shi Ji* (《史記》) (*Records of the Historian*), written by Sima Qian (司馬遷) (145/135–86 BC), the famed Han (202–220) imperial court historian, Laozi was a native of Zhu (now Honan Province in China), family-named Li, with a personal name of Er. As a custodian of imperial archives, Laozi was said to be visited by Confucius (孔子) (551–479 BC) who sought his advice on rituals. Such a view is in line with the view that Laozi was a contemporary of Confucius. However, other scholars date Laozi’s existence to the fourth or even third century BC. Legend has it that he retired to the West and completed *Daodejing* at the suggestion of a gate keeper [9, 10].

Daodejing the Classic

Despite its small size (5,250 words), *Daodejing*, the Daoist classic, has played a pivotal role in defining Daoism and shaping Chinese culture. This remarkable

masterpiece of ancient wisdoms is reportedly said to be the most widely read and translated text besides the Bible. Numerous commentaries were written on it, expanding its meanings or giving the key concepts different and sometimes competing interpretations. Authors in the humanities, social sciences, natural sciences, management, education, *qigong*, and even photography, painting, investment, and many other fields [11–20] have invariably drawn inspirations from it. Partly due to its broad and embracing scope and abstract, vague, and symbolic language which allows for multiple interpretations, *Daodejing* has created within itself contending doctrines and views including theism and atheism, idealism and materialism, naturalism and humanism, mysticism and naturalism, and activism and passivism, adding more complexity and multiplicity to its already rich contents [2–4, 7, 9, 21–29].

Daoism Developed

Daoism is often popularly referred to as the doctrines of Lao-Zhuang, comprising the thoughts of both Laozi and his follower, Zhuangzi (莊子) (399–295 BC). Rather than just a faithful follower of Laozi's ideas, Zhuangzi succeeded in carrying Daoism to a new intellectual level by creatively expanding Laozi's ideas into epistemology, cosmology, among other things, in *Zhuangzi* 《莊子》, the classic [10, 30–34]. In cosmology, Zhuangzi gave Laozi's cosmos much refinement and offered more nuanced distinctions. Laozi's scope of self-transformation applies only to human beings in the social and moral domains, but Zhuangzi transported self-transformation to a large realm. Furthermore, the process of change played a more central role in Zhuangzi's doctrine compared with Laozi's. The cosmos was conceived in some evolutionary fashion within which things are in perpetual transformations and evolution, as well as converging into unity. In the hands of Zhuangzi, the unity of things becomes more complete, resulting in a blurring if not disappearance of differences and contraries in the perceptual world.

Epistemologically, Zhuangzi saw common distinctions like life and death, beauty and ugliness, and right and wrong as the results of different perspectives. The ideal of life, for Zhuangzi, is one of free roaming and wandering in the cosmos with a mind graciously oblivious of human affairs, which strives to immerse and converge with nature. Life is perceived as a play on a stage which is the cosmos. A life worth living is a life that has “the fasting of the mind,” “sitting down and forgetting everything,” and “the body is abandoned, the intelligence is discarded, one is separated from the body and free from knowledge, and one becomes identical with a great penetration.” ([9], p. 22, note [35]). Such a transcendent vision of life coupled with a mindful disengagement from human affairs set Zhuangzi apart from Laozi, whose principal concern remained much on good governance in human society. For Zhuangzi, the good life is a life filled with transcendent and extraordinary experience accessed only by a contemplative and imaginative mind. Despite these contrasts, both share the full embracement of the *Dao* and its consequences. Daoism entered a new phase of its development by assimilating the works of scholars in the Wei-Jin period of the third and fourth centuries [62–66]. Wang Pi's (王弼) (226–249) commentaries on *Laozi*

expanded the original Daoism to take *wu*, nonbeing, as the ultimate reality of the cosmos. Kuo Hsiang (郭象) (252–312), by way of commenting on the *Zhuangzi*, used *ziran*, nature, to replace *Dao*. Wang's and Kuo's ideas helped create Neo-Daoism which subsequently left a lasting impact on Chinese Buddhist thinking in the third and fourth centuries and more in a more pronounced form in the Chen School of Chinese Buddhism in the seventh and eighth centuries. Meanwhile, the footprints of Neo-Daoism are also discernable in the development of Neo-Confucianism in the eleventh century, in particular in the ideas of The Great Ultimate Diagram Explanation of Zhou Dun-I (1017–1073) [1, 9, 35–39].

Daoism Versus Confucianism

To better appreciate Daoism, it is helpful to contrast it with Confucianism, the dominant cultural constituent of Chinese civilization. Striving for a stable and legitimate political and social order and exhorting an active engagement in social and political life is the spirit of Confucianism [10, 40, 67]. Questing for personal freedom, peace and tranquility, and detachment from the mundane and ordinary signifies the ethos of Daoism. These two contrasting ancient wisdoms indeed represent two competing grand visions of life and society for Chinese culture that still resonate today. Confucius devoted his entire adult life to advocate the return of a preestablished political order exemplified by the Zhou dynasty. Laozi went to great length to counsel a revolt from the established social order and championed a life of freedom and tranquility in nature. However, this popular characterization should be understood together with their crucial commonality – both Laozi and Confucius were deeply concerned about political governance and leadership in the human world.

In light of the divergent interpretations of *Daodejing*, two views are presented – one received and one critical – to make sense of Laozi's doctrine. The received view consists principally of well-received and popular interpretations of its key concepts and views prevalent in the literature. The critical view, while accepting some truths of the received view, attempts alternative renditions and critical assessment of ideas and views whenever they are appropriate. It is the view adopted in this chapter. The received view provides more sympathetic and generous interpretations of the text that may support more positive implications in their applications to the real world. This view has the apparent intention of solving puzzles and easing paradoxes in the text, making Laozi's ideas more coherent and comprehensible. The critical view maintains a critical approach to the meanings of the ideas and claims, especially with regard to the connections of these ideas and claims to business ethics.

This chapter takes Daoism as a body of philosophical ideas and examines some of its major implications for business ethics. Our question is: Could Daoism, as articulated by Laozi, provide a philosophical basis for developing business ethics for today's corporations? Whether and how Daoism could ground business ethics will be addressed by examining the Daoist doctrine of *Dao*, *wu wei* management, and leadership.

The Core Ideas of Daoism

Daodejing contains the core ideas of Daoism: *Dao* (道) or Tao, *de* (德), and *wu wei* (無為). It also contains Laozi's views on knowledge and morality, on statecraft, and on the sage as leader. This section gives a brief account of the meanings of the key Daoist elements.

What Is *Dao*?

What is *Dao*? The Chinese word “dao” literally means the way, road, or path. In *Daodejing*, however, the word “dao” has a larger and metaphysical meaning. It refers to the way of the universe or cosmos, which means the nature, process, regularities, laws, and sources of the cosmos [1, 4, 6, 10, 16, 41–44]. *Daodejing* offers some major characterization of *Dao*:

The *Dao* that can be told is not the eternal *Dao*. The name that can be named is not the eternal name. The Nameless is the origin of Heaven and Earth; the Named is the mother of all things. (1)¹

Reversion is the action of *Dao*. Weakness is the function of *Dao*. (40)

Dao produced the One. The One produced the two. The two produced the three. And the three produced ten thousand things. The ten thousand things carry the yin and embrace the yang, and through the blending of the material force they achieve harmony. (42)

The all-embracing quality of the great virtue follows alone from the *Dao*. The thing that is called *Dao* is eluding and vague. (21)

As envisioned by Laozi, *Dao* is invisible, subtle, formless, pervasive, mystical, and the “mother” of all things (1, 52). As well as having a cosmological sense, *Dao* signifies the path, way, principle, truth, among others. Laozi viewed the cosmos as not created and controlled by deities or supernatural forces but existed and operated all by itself, in contrast to doctrines in the Western tradition.

As the source and way of the cosmos, *Dao* permeates and sustains the natural and the human world, material and nonmaterial beings, as well as individuals, groups, organizations, communities, societies, and nations and their respective activities. Noticeably, as the meaning of *Dao* is broad and at times ambiguous and elusive, it often invites multiple and even conflicting interpretations.

Cosmological concern aside, Laozi contemplated the way of good politics and good life. Particularly, Laozi was concerned about the *Dao* of statecraft, or in today's language, the principles and ways of political governance. This is understandable because Laozi, like many of his contemporaries, tried to advocate doctrines to address the pressing social and political problems of his turbulent times, notwithstanding his naturalistic guises.

What Is *De*?

The Chinese word “*de*” literary means virtue. This virtue-sensed word “*de*” occupies a central position in traditional and modern Chinese thoughts. For Confucians,

de principally means human moral virtues. For Daoist, however, *de* includes not only human moral virtues but processes, modes, and states of nature. In *Daodejing*, the word “*de*” is closely associated with the word “*Dao*,” as seen in “The all-embracing great virtue (*De*) follows only solely from *Dao*” (21), for example. This quote suggests that *De* is the embodiment and manifestation of *Dao* and its functions in myriad things of the cosmos. Indeed, *De* is *Dao* that existed, embodied, resided, functioned, operated, and expressed in numerous concrete things, big and small. Thus seen, *De* in the Daoist sense has a much broader meaning than the popular meaning of *de* as human virtues. Laozi’s idea of *De*, alternatively referred to as “treasures,” include deep love, frugality, and “daring not be ahead of the world” (67). These virtues are associated with the virtues of courage, generosity, and leadership (49, 63).

If *De* is the embodiment and realization of *Dao* in myriad things, what is the mechanism involved? Could *De* in things self-realize itself without any external help or intervention? Could human efforts help such a realization? To the extent that *Dao* has a self-transforming nature, things are transforming themselves path the way to the realization of *Dao*, and *De* will ensue. With regard to whether human effort is involved in the process, *wu wei* seems to be the mechanism that helps realize *De* in things. But the problem is: How could *wu wei*, which literally means doing nothing, accomplish the task? How would *wu wei* make the connections between *De* and *Dao*? To answer these questions, one should understand the meaning of *wu wei*.

What Is Wu Wei?

One expressed function of *Dao* is *wu wei*, as stated “*Dao* invariably takes no action, and yet there is nothing left undone” (37). Though literally rendered as “taking no action,” according to the received view, *wu wei* does not mean doing nothing but means taking no artificial action, noninterference, or letting things take their own course naturally [10, 27, 45, 46].

Elsewhere, we are told that *Dao*’s *wu wei* produces these effects: support and nourish things, allow things to transform spontaneously, produce yet not take possession of things, benefit but not compete with things, among others. Thus *wu wei* is best understood as a kind of “action” that is nonpurposive, nonmanipulative, and nondeliberate. *Wu wei* acts are passive rather than active, indirect rather than direct, responsive rather than initiative, nurturing rather than suppressing, receiving rather than delivering, embracing rather than domineering, and nature-following rather than human-induced. Laozi famous claim “Do nothing, and there is nothing that is not done.” (“*Wu wei er wu bu wei*,” “無為而無不為”) makes sense in light of these attributes.

Laozi used water as a symbol to illustrate the attributes and processes of *wu wei*: “The most marvelous things are like water. Water can benefit the 10,000 creatures without competing, and settle in places most people despise. In these ways it is like *Dao*. There is nothing softer or weaker than water. And yet there is nothing better for attacking hard and strong things. For this reason there is no substitute for it.

All the world knows that the weak overcomes the strong and the soft overcomes the hard. But none can practice it” (78).

The nature of *wu wei* is also illustrated through the practices of the sage. The sage is presumably the one who could practice *wu wei* in its perfect form, as he understands fully the true nature of *wu wei* (22). Laozi said, “Therefore the sage manages affairs without action. And spreads doctrines without words. All things arise, and he does not turn away from them. He produces them but does not take possession of them. . . .He accomplishes his task but does not claim credit for it” (2).

The Daoist Cardinal Values

Laozi endorsed a set of values that are in harmony with *Dao*. They include weakness, softness, receptiveness, quiescence, femininity, simplicity, subtlety, and frugality. Their representing symbols are valley, infant, female, and water, which also serve as metaphors for a life that faithfully follows *Dao*. The following are some representative passages:

When Man is born, he is tender and weak. . . All things, the grass as well as trees, are tender and supple while alive. . . . The tender and the weak are companions of life. (76)

The spirit of the valley never dies. It is called the subtle and profound female. The gate of the subtle and profound female is the root of Heaven and Earth. It is continuous, and seems existed all the time, and never feels tired in its action. (6)

Why is weakness valued? For Laozi, feebleness is valuable for life because it helps people to overcome hurdles and difficulties in the long run, just like water that apparently looks soft and feeble yet is capable of attacking and destroying hard and strong things (78). Also, what appeared as weakness on the surface may actually be real strength underneath (45).

Along with affirming these values, Laozi counseled against extremes: the extravagant and the excessive (29). He advised people to scale down their desires (19, 61), to do away with knowledge and competition (3, 8–10, 37), to avoid sensuality (12), and to stay contented (44, 46). Be humble, submissive, and be behind others (7, 61, 67) are the right attitudes and virtues to possess and develop. Far from embracing escapism, the successful practice of these values and virtues produces a life of simplicity, tranquility, and wisdom. And this is a true life of *Dao*.

How to Run a State Sagely

In *Daodejing*, there are more than 20 chapters on ways of ruling a state. As said before, Laozi has a major concern about statecraft, or political governance in today’s parlance. This section gives an account of the Daoist idea of statecraft through the attributes of a sage as ruler and how it is connected with *Dao* and *wu wei*.

Laozi's celebrated metaphor that rulers should "run a big state like cooking a small fish" (60) is often heralded as one of the major Daoist signature dictums on statecraft. The idea is that rulers should handle state affairs the way a seasoned cook would cook a small fish. The experienced cook in order to keep the fish's body intact while bringing out its delicate favor would use the gentlest care and avoid too much handling. Likewise, a ruler should rule the country with great care and avoid excessive interference in order to foster people's well-being. Thus, the small-fish-cooking metaphor signifies a doctrine of statecraft that is based on minimal or noninterference, which is also grounded on the *wu wei* way of governance. The Daoist doctrine of statecraft has several mutually supportive components. They include views on *Dao* and *De*, *wu wei*, self-moral rectification, knowledge, talented and moral people, morality and desires, among others. Furthermore, as good leaders are essential to good governance, overlaps between the Daoist concepts of governance and leadership are to be expected.

Sageliness, *Dao*, and *Wu Wei*

Running a state requires leadership. Laozi's doctrine of statecraft is articulated through the acts and attributes of a sage, who stands as an ideal ruler or leader. Thus, the attributes of good leadership could be glimpsed through the attributes of the sage, extensively described in *Daodejing*. Though the word "sage" is mentioned about 30 times in *Daodejing*, there are also passages about kingly conducts that do not directly use the term "sage" but intend to convey similar sagely conducts and attributes.² The major sagely attributes and acts are as follows:

The sage has not fixed (personal) ideas, he regards the people's ideas as his own. (49)

Therefore the sage desires to have no desires, and does not value rare treasures. He learns to be unlearned, and returns to what the multitude has missed. Thus he supports all things in their natural state but does not take any action. (64)

Leads the people but does not master them. (10)

Do not value rare treasures, so that the people shall not steal. So not display objects of desires, so that the people's hearts shall not be disturbed. Therefore in the government of the sage, he keeps their hearts vacuous, fills their bellies, weakens their ambitions, and strengthens their bones. He always causes his people to be without knowledge (cunning) or desire. And the crafty to be afraid to act. By acting without action, all things will be in order. (3)

By embracing the One, the sage follows *Dao*, and thus becomes the model for others to emulate. By virtue of following *Dao*, the sage understands and acts on the truths that lie behind apparent paradoxes: "To yield is to be preserved whole. To be bent is to become straight. To be empty is to be full. To be worn out is to be renewed. To have little is to possess. To have plenty is to be perplexed" (22).

Following *Dao* is indeed adopting and practicing *wu wei*. Laozi explained why *wu wei* is the effective way of governing: "The more taboos and prohibitions there are in the world, the poorer the people will be. . . . The more cunning and skill man possesses, the more vicious things will appear. The more laws and orders are made

prominent, the more thieves and robbers there will be” (57). In view of these, the sage is mindful of the benign consequences of practicing *wu wei*: “I take no action and the people of themselves are transformed. I love tranquility and the people of themselves become correct. I engage in no activity and the people of themselves become prosperous. I have no desires and the people of themselves become simple” (57).

This set of attributes and acts apparently would also align well with the practice of humility, restraint, embracement, accommodation, passivity, and disengagement. Thus, good leadership is one that would closely follow *Dao*. The idea of *wu wei* would guide rulers to adopt policies and acts that are in compliance with *Dao*. A good leader would restrain from imposing his own will on his people and society and avoid excessive interference in their lives and public affairs of the state.

Knowledge, the Worthy, and Morality

Running a state is a complex, messy, and challenging undertaking. Rulers would need good and knowledgeable people as well as extensive knowledge and morality of governing. However, Laozi’s negative views on talent (“the worthies”), knowledge, and morality apparently raise questions about the coherence of his doctrine. For example, Laozi famously exhorted: “Do not exalt the worthy, so that people shall not compete. . . , He always causes his people to be without knowledge (cunning) or desire” (3) and “In ancient times those who practiced *Dao* well did not see to enlighten the people, but to make them ignorant. People are difficult to govern because they have too much knowledge. Therefore he who rules the state through knowledge is a robber of the state; He who rules a state not through knowledge is a blessing to the state” (65).

Laozi harbored similar scorn for morality and more puzzling, sageliness. He advised people to abandon them: “Abandon sageliness and discard wisdom, then the people will benefit a 100-fold. Abandon humanity and discard rightness, then the people will return to filial piety and deep love. Abandon skill and profit, then there will be no thieves or robbers. . .” (19).

These negative views on the worthies, knowledge and wisdom, morality, and sageliness seem to create confusion and tensions in the Daoist doctrine of statecraft. Why did Laozi advise rulers against exalting those moral and able people who are in positions of authorities? Why did Laozi counsel rulers to keep their subjects in ignorance? Why did he recommend that morality and sageliness to be abandoned?

Semantics matter here. According to the received view, the worthies that Laozi apparently advised to be disregarded were the staunch adherents and practitioners of the existing ceremonies and music of his time. As Laozi did not hold high regard for the conventional ceremonies and music, it is not difficult to understand why he held such a view against the worthies. Keeping people ill-informed or uninformed about public affairs is to make them easily manipulated and controlled. Such a reading is consistent with the legalist doctrine of statecraft. Again, the received view interprets knowledge to mean a kind of “petty intelligence” that often borders on slyness and which is often tainted with ulterior motives. Only by preventing

people from possessing this vulgar cleverness could have people's minds and deeds returned to the way of *Dao*. A similarly sympathetic rendition could be applied to Laozi's negative view on morality. According to the positive interpretation, morality would mean conventional morality practiced by the Confucians that is contrary to *Dao* and therefore should be abandoned. For Laozi, people should follow only true morality that reflects *Dao*. Similarly, the sageliness to be rejected would be the conventional version of sageliness envisioned and endorsed by the Confucians of whom he had little respect. Only by abandoning it could one begin to approach the true sageliness that is the reflection of *Dao*. Only the true sageliness would entail authentic *ren*, *yi*, and knowledge [9, 10]. In sum, much of what Laozi denounced were the conventional and established values, norms, and wisdoms cherished and practiced by the Confucians.

How to Run a Corporation Ethically

Could the Daoist doctrine of statecraft be applicable to the corporate domain, spawning a correlated doctrine of “firm-craft” (the way to run a firm)? Could Daoism provide a foundation of business ethics informed by the Daoist doctrine? What would a Daoist ethical management and organization be like? How would a Daoist firm ethically deal with its major stakeholders, employees, customers, suppliers, partners, community, government, global society, and the environment? What would a Daoist corporate leadership be like? How would a Daoist leader fashion a corporate social responsibility (CSR) policy? These and other issues have to be answered within a Daoist doctrine of ethical firm-craft. Before these issues are discussed, some definitions of business management and business ethics are in order.

What is business management? Business is a social activity that utilizes various resources to produce goods and services to meet social needs while generating profits and creating jobs. Business management is a coordinated and organized way to deploy financial, material, intellectual, and human resources to achieve these goals. Its process and functions include planning, organizing, monitoring, controlling, marketing, sourcing, competing, learning, innovating, and responding to the market as well as societal and environmental needs. Modern business management is generally comprised of a suite of specific management – production, human resources, strategic, marketing, financial, information, stakeholders, supply-chain, and of late, reputation and corporate social responsibility (CSR). Business ethics refers to the ethical aspects of a business organization or firm which include the morality relating to the values, objectives, norms, policies of the organization; the thinking, decisions, acts, and the relationships of its members, as well as how other stakeholders of the organization and the environment are to be treated [47, 48]. Two senses of business ethics are commonly used in the literature. Empirical business ethics concerns the factual aspect of the morality of a firm. Normative business ethics is about the moral rights or wrongs of activities and decision of a firm and their justifications. The normative sense of business ethics is used in this chapter.

Organization and Ethical Management

Ethical management is one that meets the demands and criteria of reasoned morality. What would a Daoist ethical management be like? To understand a Daoist ethical management, one has to understand the *Dao* of management and organization, as Daoists see *Dao* permeate and sustain both the organization and management [19, 49]. What would the *Dao* of organization be like? The *Dao* of organization would refer to the right way of organizing, and the *Dao* of management likewise would mean the right way of managing, where “right way” means “the natural way (of following *Dao*)” or simply “the truth.” “To follow *Dao*” presumably would be the Daoist cardinal principle of organization and management (the *Dao* principle hereafter). However, without using this principle to derive more substantive midrange principles, it would offer little guidance for the right way or the “truth” of organization and management. Is small or large organization the right way of organization? Is hierarchically and rigidly structured organization, or loose and flat, or networked organization the right way?

Before the products to be manufactured or services to be delivered are specified, it seems impossible to determine what would be the right way of organizing. For the modern automobile industry, e.g., a modernized Fordist or Toyota’s “Just-in-time” style organization would be the right way to organize labor and operation. For financial services, loosely connected teams would be the proper way of organizing the business. For internet service providers, a network of well-coordinated small teams with high autonomy would be the right way to operate. Whether a certain form of organization is appropriate depends largely on the industry, the tasks in question and the specific goods and services to be delivered. Thus, simply invoking the *Dao* principle offers little substantive advice on how to structure and run an ethical organization. This applies to management and its ethics. Whether a form of management is right depends much on the nature of the industry or tasks in question. Whether it is ethical further involves the values, norms, acts, and motives of producers; the nature of the goods and services; the process of sourcing, production, and delivery as well as their impact on stakeholders and society; and the environment, among others. Appealing only to *Dao* without articulating its concrete and specific managerial implication is like dosing out vacuous directives that leave much crucial matters undecided. In such a situation, managers would be ill-equipped to comprehend or unpack the complexity of the intensely dynamic business environment, let alone ably perform their strategic and operational tasks. They would need more well-defined and nuanced midrange principles and actionable directives to augment their vision, fashion policies, and aid actions. It means that one would need to define in clear and specific terms what constitutes the *Dao* of ethical organization and management and to articulate the precise meanings of the alleged *Dao*-following policies and actions with respect to specific domains.

***Wu Wei* Management**

Could the Daoist *wu wei* management, based on the famous dictum: *Wu wei er wu bu wei* (“Do nothing, and there is nothing that is not done”), offer the needed

guidance? What would a *wu wei* management be like? What would it mean to execute *wu wei* management in terms of producing policy and action? Could we really get the result as claimed, namely, nothing is left undone when we practice *wu wei*? The received view's reading of the *wu wei* management is that it is not inaction *per se* but invokes actions that are neither purposive and manipulative nor deliberate and intentional. Such a management would rely on actions or policies that are indirect, reactive, nurturing, receiving, and embracing and would shun actions or policies that are direct, active, suppressive, delivering, and domineering.

From the critical perspective, before one could figure out what these actions and policies would mean in the corporate domain, one prior question should be raised, namely, to what extent a *wu wei* management could be possible in the real world? Management is an inherently purposive and deliberate activity and process. From the selecting of goals and objectives, framing strategies and assigning priorities, formulating short-time and strategic plans to the mundane tasks of monitoring, controlling, and operating – management activities are intentional, purposive and deliberate. There is simply no management without a purpose or intention. To the extent that *wu wei* deprives management of purpose or intention, it destroys management. Indeed, much of what *wu wei* advises to embrace and avoid seem to be the opposites of what management should strive to embrace and avoid. If this were the case, one would reasonably ask: Is *wu wei* any good for management? More basically, is *wu wei* management an oxymoron?

To continue this critical approach, we use human resource management as a specific domain to further examine whether and how *wu wei* management makes sense in the real world of management. As discussed earlier, Laozi held a negative view on the worthies and knowledge. He counseled against using the worthies and advised people to abandon knowledge. If we interpret “the worthies” as a proxy for talented people with integrity, what would be the implications of the Daoist view on talents and knowledge for human resource management? The Daoist's advice on human resources management would probably amount to avoid selecting, retaining, and promoting talented people with integrity. And for assessing staff performance, personal integrity and knowledge would be sidelined or downgraded compared to other criteria. But this implication would be absurd and even suicidal to any company in today's knowledge economy simply because talents with integrity and knowledge are the lifeblood of a company. Depriving it of talents and knowledge, a company would not be able to survive. Probably no sane and reasonable manager would believe in such an idea, not to mention adopting it. Furthermore, human resource management and knowledge management are both purposive and deliberate activities. *Wu wei* simply has no place in them, or in any other forms of management. Indeed, had *wu wei* been adopted, chaos, confusion, and aimlessness would have been resulted. In regard to the claimed effects of *wu wei*, were *wu wei* to be practiced, it would be far from clear that “there was nothing that was not done.”

In addition to the Daoist attitudes toward knowledge and talent, it is interesting also to ask how a Daoist would view profit and self-interest of private enterprises. Would a Daoist accept profits and self-interest as natural to business as leaves and

branches to a tree? Or would a Daoist reject them the way he would reject knowledge and talents? The answers to these questions, like other answers discussed earlier, are by no means clear.

Ethical Leadership

What would a Daoist ethical leadership be like? Would the attributes of the Daoist political leadership help shed light on ethical leadership in business? How would a Daoist ethical leader run a company?

Leadership is a complex concept. It refers to leaders and their attributes, their ways of leading, and their relationships with followers. This is the agency sense of the concept. Leadership, in a system sense, means the nature, process, state, and system of leading. Ethical leadership is leadership that is informed, constrained, and guided by conscious moral concerns and choices. These concepts can be used either empirically or normatively. The empirical concept concerns the factual aspect of leadership. The normative notion focuses on the ideal and justifiable aspect of leadership. This section adopts a normative agency sense of the notion. Ethical leaders are persons in leadership position who consciously and consistently base their decisions and actions, as well as build and sustain relationships on reasonable morals and values to which they are committed [50–52].

As discussed earlier, a sagely leader would have major attributes of weakness, softness, simplicity, tacit strength, nurturing, versatility, and adaptability. Good leaders would be committed to *wu wei* in thought and deeds, embrace and comply with *Dao*, as well as behave in ways that are nondomineering, supportive, and noninterfering, among others. How these attributes and actions would play out in the corporate context, especially in business ethics terms, requires further investigation. Presuming that having attributes like nurturing, being simple, nondomineering, supportive, and noninterfering in general makes sense and is beneficial in business, the challenge is to hammer out the precise meanings of these attributes in organization and corporate terms. For example, what would it mean for an ethical leader to lead by *wu wei*? What would it mean for a leader to embrace and follow *Dao*? What would it mean to say a leader possessing water-like qualities in management terms? How would these water-like attributes be translated into ethical leadership attributes? Of particular relevance to today's corporate world, what roles would these attributes play with regard to enhancing a leader to ethically manage issues like corruption, property right, fair competition, supply chain (sweatshop and labor rights), the environment, and climate change?

Would the possession of the Daoist leadership attributes stand as an asset or a burden to a company with respect to business ethics? As an *asset*, leaders having these attributes would lead as enablers, facilitators, enhancers, beacons of the development, and maintenance of ethics within the company and beyond. As a *burden*, in contrast, leaders with these attributes would become obstacles, diverters, defectors, obfuscators and destroyers of the ethics of the firm and society. Whether the roles would be positive or negative has to be worked out in more concrete terms, and the answers cannot be settled in theory.

Daoist Business Ethics in Action

This section uses China as a context to briefly examine in more concrete terms how a business ethics informed by Daoism would play out. This is done by examining how a Daoist ethical leader would address the environmental crisis that is plaguing the country [53–56]. To examine how Daoism would address this problem may also provide insights for understanding how Daoism would be applicable to other cultures.

The Environmental Crisis

China has achieved extraordinary economic growth with double-digit average annual GDP growth over the last three decades. This impressive economic development, while helping to lift hundreds of millions out of poverty, has been achieved at a hefty environmental and human cost. According to an official report on the cost of pollution [56], coal consumption increased by 75% between 2000 and 2005, which exacerbated the already serious air pollution condition. China is now the top SO₂ emitter in the world, emitting nearly 26 million tons of the gas in 2005, a 27% increase since 2000, according to State Environmental Protection Administration. Water pollution is also serious. Between 2001 and 2005, on average, about 54% of the water in the seven main rivers in China was classified as unsafe for consumption, representing a 12% increase since the early 1990s. The economic cost of pollution-related premature mortality and morbidity associated was conservatively estimated at 157.3 billion yuan in 2003, or 1.16% of GDP [55].

How would a Daoist ethical leader respond to the environmental issue? To address this hugely complex and difficult issue requires extensive knowledge, broad and long-term vision to objectively understand the problem in question, as well as the right strategies and workable policies to solve the problem. In addition to having an adequate set of ethical commitments, an ethical leader should be able to identify the ethical aspects of the problem in such a way as to frame appropriate and balanced ethics-regarding policies and actions and be ready to make tough decisions over difficult trade-offs. Furthermore, an ethical leader should also possess the political will to take action and implement policies in spite of anticipated difficulties, resistances, and oppositions, especially from powerful and corrupt vested interests. The solutions provided should not only be effective and practicable but ethically justifiable as well. These could be seen as some of the major prerequisites of an ethical response. Under such prerequisites, what values and visions would an ethical leader have? What would his strategies, policies or actions be like? The following are some conjectural answers to these questions envisaged from the vintage point of a Daoist ethical leader.

Dao, Wu Wei, Leadership

A Daoist leader's first and foremost task would have to correctly understand the nature of the environmental crisis including its causes and consequences, which

would have required the relevant and extensive objective knowledge. This means, in the Daoist parlance, to understand the *Dao* of the problem. Could appealing to Daoist principles suffice to provide the necessary knowledge of the problem? More basically, what would the *Dao* of the problem be like? Obviously, without actively engaging in sustained knowledge-gathering and scientific processes which include identifying problems, gathering data, framing and testing hypotheses, and integrating and interpreting findings, one would never be able to acquire the knowledge about the nature of this complex problem. And these involve intensive and sustained knowledge activities that are goal driven, rational, and deliberative.

Take the case of combating environmental air pollution and global warming as an example. To combat the major air pollution and reduce green-house gas (GHG) emission posed by the extensive consumption of coal, a Daoist leader would have to invent and adopt effective strategies to reduce the emission of the GHS. This would include enhancing energy efficiency or developing and deploying alternative green energy technologies. He would need to redesign and implement new business processes, for example, by implementing a green transportation system or promoting energy efficiency by replacing all compact fluorescent lamps with LED lamps for lighting and illuminations in offices and shops to help reduce the carbon footprints. The question remains whether and to what extent adhering to *Dao* would help produce similar sets of ethical responses. It seems that, without having substantive knowledge of the problem in question, merely appealing to *Dao* would offer little guidance for developing concrete solutions and policies to the problem. As argued earlier, the *Dao* principle of nature following is simply too vacuous, vague, or abstract to inform and generate workable solutions and actions for real world problems.

Ardent believers of *Dao* would insist that the above strategies, policies, and actions are compatible with the *Dao* principle or even are generable from the principle. But this claim is less than convincing. If appealing to *Dao* offered little help in framing concrete responses to the problem, could *wu wei* management provide concrete guidance? To the extent that *wu wei* counsels the avoidance of deliberate and intentional actions, it is doubtful that the managers who adhered to *wu wei* management would be able to envision, design, and implement similar concrete strategies and policies. Lastly, how would a Daoist leader think and act in response to these problems? Would he think or act along similar lines as suggested? Would possessing the sagely attributes make him an ethical leader? How would the values of feebleness, simplicity, femininity, receptiveness, disengagement, frugality, etc., help him to come up with appropriate ethical responses? These questions await answers. Without providing answers to these and other questions mentioned earlier, it is far from clear that the *Dao* principle is compatible with or able to generate effective strategies and policies similar to those listed above.

In addition to the environmental crisis, other problems like endemic corruption [57–60] labor rights, property right infringement, and rich-poor gap also pose daunting challenges to the nation and its future [55, 61]. These problems have serious implications for business ethics as well. How a Daoist business ethics would address these problems is an open question.

Conclusion

We started this chapter with a question: Could Daoism, as articulated by Laozi, provide a good basis for developing business ethics for today's corporations? In light of the discussion above, some concluding remarks are in order. In the realm of business ethics, Daoism has something valuable to offer. The Daoist naturalistic orientation and insights may help to foster corporate values that respect nature and thus are favorable to having policies beneficial to the environment. The *wu wei* management in its best form may prove helpful for solving problems in some situations. The values of simplicity, softness, receptiveness, frugality, and embracement may serve as a counterbalance to the current obsession with unsustainable growth, hurtful competition, wasteful consumption, and mindless materialism, as well as good restraints over corporate greed, extravagance and excesses, and other forms of corporate malfeasance and corruption. The counsel against contentment with conventional knowledge and morality may inspire people to seek for creative knowledge and wisdom. The virtues of the Daoist ethical leader may also be good attributes for business leaders to emulate. Despite the potentially valuable contribution of these ideas, their diverse and sometimes vague and underdefined meanings create conflicting interpretations and understanding. As stated at the start of the chapter, some Daoist doctrines allow for two broadly distinguishable readings. The received view is based on charitable interpretations along the naturalistic line and idealistic expectations and renditions, which may contain more positive implications for business ethics. Whether these positive implications turn out to be real has yet to be tested. One apparent weakness of such a view is that it often fails to establish the connections between the grand ideas and the real world of business with enough rigor and critical input. Supporters of this view apparently take Daoism as timelessly omnipotent and universally applicable to today's reality [18, 20]. Perhaps the vague and loose language often deployed in these elaborative works creates a delusive sense of universal applicability.

The critical view adopted in this chapter is based on critical interpretations of the ideas and rigorous examination of how these ideas are connected to the real world of business ethics. This view prompts one to raise reasonable questions about the precise meanings of major concepts and views, as well as about the applicability of the Daoist ideas to the corporate domain and business ethics. With regard to the applicability aspect, it must be said in general that without deriving more substantive and concrete meanings, vague and abstract ideas – no matter how well-intended – are of little help to business ethics. Equally, first-order principles couched in highly abstract language without correlated midrange principles constructed to guide policies and actions would prove futile in the real world.

With regard to applying ancient wisdoms to modern business world, it is helpful to be mindful of some critical questions: How can these grand ideas developed in the far away ancient context still be relevant to the twenty-first century? In what way are these practical wisdoms applicable to modern business ethics? Could these wisdoms offer us concrete and actionable guidelines for

making intelligent and ethical decisions in response to the major issues of the day? To respond to these questions, scholars should define in precise terms what these ancient wisdoms and ideas amount to in the business context. They should also explain in rigorous terms how these wisdoms and ideas are applicable and what their implications are. These generic questions may equally be applicable to a broad range of issues in business ethics, including leadership, corporate governance, organization, consumer, labor, stakeholder relationships, supply chain, the environment, sustainability, and corporate social responsibility issues, among others.

To be able to fully exploit ancient wisdoms for today's business ethics requires a prudent and honest scholarship buttressed by a rigorous and critical spirit. Shoddy scholarship that uses loose and vague language and employs rather stretched and forced interpretations of the text is counterproductive. Deliberating mainly in abstraction while making no convincing connections to the business reality is futile. Discussions fixated on the ideal and the lofty while oblivious to the harsh reality of the business world are of little value to practitioners. These are some of the major pitfalls scholars should try to avoid in applying ancient wisdoms.

Eike A. Langenberg

Abstract

Business life around the world is embedded in social relationships, and yet personal relationships (*guanxi*) among Chinese people stand out because of their idiosyncratic features and unrivaled pervasiveness. No ethical legitimation may be derived from the sole fact that personal relationships are a dominating force behind Chinese business practices, however. Building upon a precise conceptualization of *guanxi* as a social system, this chapter therefore presents an ethical assessment of the utilization of *guanxi* in a business context. Acknowledging the existence of cultural differences in moral perceptions, its author examines the compliance of such practices with two predominant schools of Chinese and Western thought: Confucian (virtue) ethics and utilitarian ethics. It is found that *guanxi* complies with classic Confucian values, but cannot be justified in terms of utilitarian ethics, which establish morality based upon the creation of social welfare. Evidently, Western firms operating in China, and Chinese firms operating abroad, are confronted with the challenging task of defining their own moral stance. This chapter provides decision-makers with the theoretical foundations needed to master this challenge.

Introduction

Business life is structured along social relationships. This is true for China, as it is around the world: In Italy, interaction within the local communities is largely based

on ties within extended kinship networks; similarly, large parts of Eastern European economies are influenced by familiarism; and Russian business practitioners are said to heavily rely on *blat*, i.e., a traditional system of personal relationships [1]. Although, evidently, the phenomenon of “string-pulling” is found throughout the world, Chinese personal relationships, or *guanxi*, as they are locally known, stand out because of their idiosyncratic features and unrivaled pervasiveness. No ethical legitimation may be derived from the sole fact that personal relationships are a dominating force behind Chinese business practices, however. Rather, a critical assessment is needed on whether or not the utilization of *guanxi* in business complies with moral standards. This chapter provides such an assessment by building upon a precise conceptualization of *guanxi* as a social system and its application in an economic context.

Guanxi is a sociological term that describes a subset of Chinese personal connections between people in which one individual is able to prevail upon another to perform a favor or service [2]. It lies in the skillful utilization of moral imperatives aiming at diffuse and calculated instrumental ends [3]. China’s prime sociologist Fei Xiaotong (1910–2005) has argued that interpersonal connections are the fundamental organizational principle of Chinese society, irrespective of social strata [4]. As a lubricant, *guanxi* gives the course of many events a helping hand: employment issues, school enrollment, lawsuits, medical care, driver’s licenses and plates, academic publications, and so forth. As a means by which personal interests may be advanced, problems solved, and resources obtained, a *guanxi* network usually encompasses individuals on all levels, from employees who control goods in short supply to cadres who decide about government permits. Not surprisingly, the prevalence of *guanxi* is not restricted to informal social interaction, but extends to formal business realms as well. Governing business activity throughout China, *guanxi* affiliations, rather than “arm’s length” principles, are the basis of many transactions.

Despite the fact that the word *guanxi* itself is a relatively new term in the Chinese language—it was not included in the authoritative 1915 *Ciyuan* dictionary of classical Chinese—it is not a modern phenomenon. *Guanxi* has developed from village life, and its rural origins manifest themselves in the custom of exchanging gifts, which has been deeply rooted in Chinese culture for thousands of years [5]. Traditionally, once *guanxi* is established, two individuals may ask each other a favor with the expectation that the debt incurred will be repaid sometime in the future [4]. Such exchanges are characterized by three features: Firstly, the interpersonal linkages in question are essentially motivated by means-ends calculation. People draw on connections in order to secure favors in personal relations. Secondly, attention is given to affection. Among ordinary people, *guanxi* often has a pejorative undertone when the affective component is low, i.e., when no feelings are involved. Thirdly, *guanxi* is usually associated with norms. It implies obligations (e.g., a response to requested assistance) and a long-term attitude.

As will become evident in the course of this chapter, all three features are consistently important in a *guanxi* system. It therefore comes as no surprise that influential political scientist and sinologist Lucian W. Pye defines *guanxi* as “friendship with implications of continued exchange of favors” [6]—implicitly

mentioning instrumentality, affection, and norms. This definition describes the nature of the relationship, and it allows for a demarcation from bribery: While *guanxi* and bribery are actually closely related, it would nevertheless be wrong to treat them as synonyms—first and foremost, because a bribery transaction is motivated by purely economic interests (i.e., a profit-and-loss calculation), while *guanxi* also contains an affective and normative component. Second, *guanxi* is a diffuse, long-term phenomenon, as it requires the establishment and cultivation of a relationship, while illicit exchanges are usually characterized by immediate and specific obligations. In an anecdotal report, a Beijing business consultant clarifies the detachment of *guanxi* and bribery: “Look, if you don’t have *guanxi*, you can’t pay a (. . .) big money bribe (. . .). You have to have *guanxi*” [7].

Judging by the normative framework of how obligations are incurred and reciprocated, it becomes clear that the *guanxi* system is a self-contained exchange system coexisting with China’s market economy and (planned) state economy. It is only within this context that *guanxi* can be assessed in terms of business ethics. Given the significant cultural idiosyncrasies of China and Western countries, a differentiated perspective needs to be taken. Applying the (Chinese) framework of Confucianism on the one hand and the (Western) tradition of consequentialism on the other, this chapter concludes with a comprehensive test of how the utilization of *guanxi* in business conforms to ethical principles.

Chinese *Guanxi* and Business Ethics

Literature Review

The scientific discourse of *guanxi* is cross- or interdisciplinary. Involving multiple fields of research, *guanxi* can be explored with the help of concepts used in sociology, economics, politics, anthropology, history, and psychology as well as from a business perspective such as management theory or marketing. Despite enriching the general understanding of the relevance *guanxi* has, not all disciplines make relevant contributions to its explanation. Focusing on the connection between *guanxi* and business, this chapter concentrates on the field of economic sociology, linking and (re-)integrating sociological theory and economics. As Chinese and international research show significant differences in methodology, they will each be discussed separately.

Although *guanxi* is inherently Chinese, few significant studies on the topic have actually been published in China to date. This does not come as a surprise considering that sociology is a recent field of research that was virtually non-existent before the end of World War II. Sociology was first introduced in China in 1947 when luminary Fei Xiaotong wrote his set of essays, *Rural China (xiang tu zhongguo)* [4]. It did not take the Communist government long to end the academic discourse, however: sociology was banned from 1952 to 1980, when the Institute of Sociology of the Chinese Academy of Social Sciences (*zhongguo shehui kexueyuan*) was founded—by Fei himself. Although Fei’s academic works date

back many decades, they still offer highly relevant insights today [8]. This topicality is due to Fei's finding that Chinese society and its exchange practices must be analyzed with its rural origins in mind—a key tenet that is widely acknowledged by Chinese scholars and was reconfirmed by the Chinese Academy of Social Sciences in 2003 [9].

Influential accounts of the *guanxi* system have been provided by Taiwanese psychologist Hwang Kwang-kuo in *Face and Favor* [10], and *Chinese Relationalism* [11], for instance [10–12]. Seeking to explain the “minor tradition” (*xiao chuantong*) of *guanxi* with the “major tradition” (*da chuantong*) of Confucianism, Hwang analyzes *guanxi*, *renqing*, and *mianzi*. In spite of methodological inconsistencies, his “Model of Confucian Psychology” (*rujiade xinzhixing*) made him a star in *guanxi* research. Even more insightful is Chen Junjie's *Guanxi Resource and the De-ruralization of Farmers* (1998) [13]. Virtually unknown in the West, this book is an exception in that it pays great attention to methodological precision.

While, generally speaking, international researchers in the 1970s and 1980s explained to the West what *guanxi* was, the majority of international studies in the 1990s and 2000s were concerned with the question of why organizations needed *guanxi*. Today, online bookstores are packed with guidelines for managers on how to maximize benefits from establishing and cultivating *guanxi*. Alongside the large number of populist publications, however, Western European and North American social scientists have produced a considerable repertoire of works that international researchers can draw upon.

One of the most extensive Western treatments of *guanxi* is offered by Chinese-American anthropologist Yang Meihui in her classic *Gifts, Favors, and Banquets: The Art of Social Relations in Chinese Society* [14]. Yang focuses on power relationships and their social and symbolic expressions, which have crystallized around the circulation of desirables in the *guanxi* system. In a highly politicized discourse on social relationships, Yang perceives *guanxi* as a set of practices that defines itself against the elements of impersonal money and direct buying and selling, which are those of the commodity economy. This book is an excellent starting point for analyses, although, as acknowledged by the author herself in a later publication [15], it has become largely obsolete in terms of business application because it is based on the assumption of a dominating planned economy where organization of production, planning of social activities, and distribution of the means of subsistence have long been the sole responsibility of the state apparatus.

There are also various other seminal descriptions of the *guanxi* system. Exploring the nature of Chinese business practices, Chung and Hamilton [2] argue that the inter-subjective logic of social relationships provides an institutional foundation for Chinese business transactions. The authors convincingly explain that the rules prescribed by the *guanxi* system increase the calculability of economic outcomes, making decisions more economic rather than less so [2]. Similarly, German scholars Schramm and Taube [16] contrast exchanges in *guanxi* networks with economic practices in the Western legal framework [16]. *Guanxi* networks are

identified as an optimum solution to the problem of institutional arrangements. Charging that the conceptualization of *guanxi* is insufficiently questioned and that there is considerable confusion about its implications for business, Fan [17] analyzes *guanxi* from the perspective of social processes [17]. The most recent major anthology on the institutions, culture, and changing nature of *guanxi* has been published by Gold et al. [18]. Since most of its 14 contributing scholars have a serious research history in the field, *Social Connections in China* [18] delivers an interesting range of assessments; for the same reason, however, the anthology does not contain many new insights regarding the conceptualization and implications of *guanxi*. Langenberg [19] accomplishes the socioeconomic integration of the *guanxi* system and market economy [19]. Developing a theoretical model, he then concludes how successful business strategies must consider *guanxi* and how such strategies are to be interpreted legally and ethically. In *Guanxi or Li shang wanglai* (2010), anthropologist Chang presents her fieldwork in a central Chinese village [20]. She develops the concept of “wanglai,” i.e., a system of reciprocity regulated by morality, emotions, rational calculation, and spiritual beliefs.

Sparked by evidence that management networks often improve companies' performance, *guanxi* has increasingly become the focus of Western management literature. This trend can be illustrated by three publications: Luo (2007) provides a comprehensive guideline for business practitioners [21]. Approaching *guanxi* with cases and examples, he discusses a wide range of social, economic, cultural, and business elements revolving around his concept of *guanxi*. Tsang [22] investigates the relevance of *guanxi* with respect to transaction costs [22]. Taking a resource-based perspective, the Singaporean researcher asks if the *guanxi* possessed by a foreign firm can be a source of competitive advantage when doing business in China and if this advantage is sustainable. Grasping transaction-cost advantages, *guanxi*-based exchanges are recognized as a structural alternative to contract law. Building on Tsang [22], Standifird and Marshall [23] also seek to demonstrate the relevance of *guanxi* in terms of transaction-cost advantages [23]. Their essay, which they see as a complement to—rather than an argument against—social embeddedness and resource-based explanations, concludes that *guanxi* can, indeed, provide firms with an imperfectly imitable resource that gives them a competitive edge.

A number of empirical studies have also been conducted on the topic. It should be noted, though, that in general, the possibility of empirical research into *guanxi* is limited: most people are reluctant to talk about their attitude to *guanxi*, and a great deal of self-deception exists. Researchers in less developed areas of China, in particular, are faced with another major problem, namely that their subjects are likely to have a strong propensity to present the “modern” side of China.

Ethical implications are regularly neglected in the research on *guanxi*, with only a few exceptions. Steidlmeier [24], for instance, assesses the cultural logic and social practices of gift-giving in China. Setting off traditional gift-giving from outright corruption, he formulates a guideline for ethical managers, which builds on the action of reciprocity and the moral intentions of the actors [24]. Lovett et al. [25] take a utilitarian perspective: in order to compare the efficiency of a market

economy and the *guanxi* system, they develop a simple static model that incorporates contracting costs into the market economy and a “preference of old friends” into the *guanxi* system. Their model suggests that the economic efficiency of *guanxi*, and thus its ethical legitimation, depends on particular economic contingencies [25]. Dunfee and Warren [26] advocate a particularistic view. They conclude—albeit without delivering a refined framework—that the legitimacy of *guanxi* should hinge upon its distinct types and how they are used in China’s economic and legal environment [26]. Ip [27] examines the extent to which Confucianism should serve as the basis for business ethics in China. Basing his study on the key elements of Confucianism, he develops the highly insightful notion of a “Confucian firm,” deducing that Confucian virtues do not provide an adequate ethical footing for the challenges that modern corporations face in China [27].

This literature review confirms that the necessity of conducting research on *guanxi* has long been recognized. Significant progress has been made with respect to defining, operationalizing, and measuring the *guanxi* system, in particular in the business field. Further impetus can be expected from Chinese research and in the area of ethical implications.

Conceptualization of the *Guanxi* System

It has been said that the present-day *guanxi* system is an indigenous cultural phenomenon, the exchange patterns of which have long been regarded as necessary and, indeed, appropriate. Hence, it is a commonplace to describe the ubiquity of *guanxi* in modern China by drawing analogies to the social environment two or so millennia ago. Notwithstanding the validity of arguments concerning cultural embeddedness, *guanxi* is “not so much a cultural logic as it is a structural system of repeated interactions based on ongoing (...) exchanges” [2], as Chung and Hamilton—and almost identically Guthrie [28] correctly note. Taking an institutional perspective on society, the emergence of *guanxi* as a major system of social exchange and regulatory policy is best explained with its socio-structural factors.

Among those scholars who approach *guanxi* as a structural system, it is popular to attribute its emergence to a “lack of coherent business laws (...) and formal institutional support” [29] or the “weakness of formal institutional arrangements” [16]. Reflecting a preoccupation with legal systems, the terms “lack” and “weakness” clearly indicate that it is only natural for Western economists to assume the existence of enforceable laws. As Smelser and Swedberg [30] point out, economists often assume that social exchange norms and institutions emerge only to complement imperfect markets. As explained in the introduction to this chapter, however, the *guanxi* system developed from rural exchanges and has asserted itself as an institution in Chinese society that exists parallel to other systems (e.g., the market economy) and is not subordinate to them. Therefore, theory must argue that *guanxi* has evolved as a primary, formal socioeconomic coordination mechanism. And this is exactly what the (new) economic sociology does, by applying the frames of

reference, variables, and explanatory models of sociology to the complex of economic activities [30, 31].

The following conceptualization of *guanxi* is organized in accordance with the structural components that form the basis of any exchange system: resources, actors, network structure, norms, and sanctions [32].

Exchange Resources: *Renqing*, *Ganqing*, and *Mianzi*

It follows from the above that *guanxi* should be defined as a long-term relationship between actors who, based on interest in and control over instrumental, affective, and normative resources, engage in continuous exchanges, which are governed by a set of network-specific norms.

The major exchange resource in the *guanxi* system is referred to by the Chinese as *renqing*. *Renqing* actually has a variety of meanings, the most important denotation of which is an instrumental resource that an individual can present to another person in the course of a social exchange. This term also has two other connotations: it expresses (normal) human feelings and compliance with social norms and rules of etiquette. It is worth noting that this second connotation comes closest to the original meaning of *renqing* in Confucian ethics, namely appropriate social conduct and the fulfillment of promises and obligations. In the following discussion of *guanxi* as a socioeconomic exchange system, however, *renqing* is depicted in a purely instrumental manner; as such, we may distinguish *renqing* in terms of favors and gifts [14].

Favors exchanged by members of the *guanxi* system include the sharing of (classified) information and rendering of assistance. The type of information that might be shared could be about new business opportunities or job vacancies, for instance. Information acquired from *guanxi* members is often felt to be more reliable than documentary media [21]. Some typical examples of assistance are access to scarce items (e.g., scarce train tickets), favorable interest rates, price discounts, and tax benefits.

Besides favors, gifts are exchanged in the *guanxi* system. Most Chinese make use of both happy and unhappy occasions to send gifts to their friends and acquaintances. Presented in a red envelope (*hongbao*), cash is the number-one gift; the amount given varies across regions and also depends on the closeness of the relationship and other factors. Besides cash, a wide variety of gifts are exchanged, e.g., fruits baskets, cigarettes, liquors, and shopping vouchers. Since these all have a material value, such gifts can be exchanged with a clear instrumental goal in mind. The exchange modalities are not optional, but exhibit a significant degree of culturally embedded symbolism.

Despite the preponderance of instrumental concerns that characterizes *guanxi*, *renqing* is not sufficient to build it [33]. Along with *renqing*, actors in the *guanxi* system have control over and/or interests in a second resource: *ganqing*, loosely translated as “sentiment” in a relationship. Clearly, individuals also establish *guanxi* based on affection for a person or a “sense of attachment,” with an emphasis

on genuine warmth, safety, and a considerable degree of emotional concern. Reflecting the qualitative element, good *ganqing* means that two people have a good rapport or considerably deep feelings within a social relationship. The word *ganqing* also describes the quality of a relationship. *Ganqing*, in this sense, is based on a “commonality of shared identification,” as Jacobs denotes the same worldview, taste, habits, and so on [34]. Clearly, the joint pursuit of hobbies (such as playing mahjong) can strengthen *ganqing*.

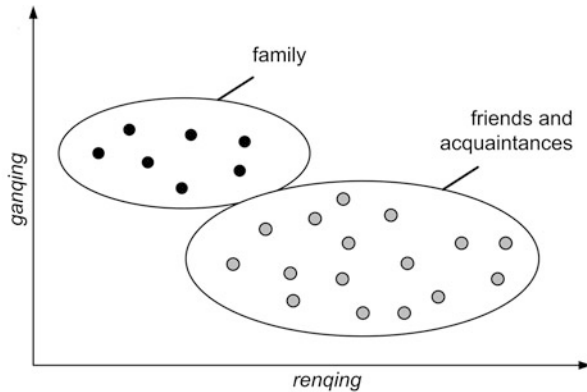

The third resource exchanged in the *guanxi* system is *mianzi*. Literally translated as “face,” *mianzi* actually refers to an individual’s social position and public image [10]. *Mianzi* is different from the other two exchange resources, however, in that it is socially constructed and not directly controlled by the actors. As will be elaborated later, *mianzi* is bestowed by the network upon actors who successfully perform one or more specific social roles that are well-regarded by others within the social network. Therefore, what is actually meant by the expression “to give/lose face” (*gei/diu mianzi*) is that an actor makes the network bestow *mianzi* on another actor or withdraw it from them.

To sum up, in the *guanxi* system “two persons can be close because they are bound by obligations, or because they have strong affection for each other, or because they are instrumentally related to each other,” as Chung and Hamilton assert [2]. The tripartite “resource bundles” of *renqing*, *ganqing*, and *mianzi* cover an instrumental, affective, and normative dimension, and most of the time they are exchanged together as a combination of resources [13].

Actors and Network Structure

The Chinese structure obligations along social positions, and they adopt multiple standards of behavior towards their interaction partners. Fei Xiaotong assumes Chinese society to be organized by what he calls “differential mode of association” (*cha xu geju*), i.e., a system of egocentric networks that place distinctive moral demands on individuals in each tie [4]. In search of a categorical frame of interaction in the *guanxi* system, numerous frameworks, or taxonomies, have been suggested, each with a different focus. Yan [35] highlights a *personal core* of immediate relatives—a *reliable zone* of good friends and more distant relatives who can always be counted on for help—and an *effective zone* of friends in a broader sense [35]. Yang [14] identifies the categories of *family and kinship*, *neighbors and native places*, *non-kin relations of equivalent status*, and *non-kin superior and subordinate status* [14]. Tsang [22] classifies the groups into *blood bases* (i.e., family members, relatives, and clan members) and *social bases* from one’s social life (e.g., acquaintances from school or work) [22]. Irrespective of how systematic such taxonomies may appear, they are arbitrary and represent an ad hoc assumption with no explanatory power. It is imperative for a taxonomy to be based on resources, because exchanges are the result of actors’ interests in and control over resources. This subchapter develops a taxonomy that is derived from the distribution of *renqing* and *ganqing*, which actors control directly.

Fig. 48.1 Clusters of a resource-based actor classification

A traditional family performs various functions covering many of the rather modest needs of rural people, including educating its children and caring for the elderly members. The family, a long-established ideal in Chinese culture, integrates all its members into a single financial unit. Thus, from an instrumental perspective, the family controls *renqing* [36]. Instrumental interests cannot all be satisfied by one's family, however. In fact, in an urban environment, in particular, actors will need to rely on interaction with individuals outside their family in order to satisfy their instrumental needs. As friends and acquaintances represent a large pool of competent and specialized persons, they usually control a large amount of *renqing*.

Most *ganqing* in which individuals are interested is controlled by their family. Affection in consanguine relationships (usually) increases in accordance with how closely people are related. Friends and acquaintances may also control a considerable amount of *ganqing*. This increases as a congenial personality is developed, the emphasis lying on the notion of shared qualities (values, tastes, habits) and experiences that close the hiatus between the inside and outside and fuse identities.

The distribution of *renqing* and *ganqing* resources mentioned above suggests that actors in the *guanxi* system fall into two clusters: family members on the one hand and friends and acquaintances on the other. As shown in Fig. 48.1, family members form the cluster with higher *ganqing* and lower *renqing*. Friends and acquaintances, usually characterized by higher *renqing* and lower *ganqing*, include everyone beyond the immediate kin with whom one has a close relationship: peripheral relatives, co-workers, classmates, fellow villagers, and so forth.

Within this categorical framework of interaction, actors advance their interests by exchanging *renqing* and *ganqing* when individual control over them is simultaneously met by reciprocated interests. These exchanges, however, are characterized by time asymmetries, i.e., actors perform at different points in time: First, one actor (A) hands control over his resource bundle to another actor (B). Upon receipt of the resource bundle, actor B then makes an implicit promise to transfer his resource bundle at a later point in time [37]. In practice, such a promise is implicit in

Fig. 48.2 Structure of a *guanxi* network

statements like “Thank you so much—if there’s anything I can help you with in future, just let me know!” If actor B keeps his promise and hands over control of his resource bundle, as expected by actor A, the exchange yields actor A the expected benefits. This exchange structure, however, creates a temporary imbalance of credits: While the actor who performs last (actor B) always improves his situation because he has already appropriated the benefits, the situation for the first performer (actor A) will only improve if the exchange partner acts as expected; actor A’s situation deteriorates if the partner fails to reciprocate. The uncertainty associated with up-front performance cannot be eliminated, but rational actor A can seek to quantify the probability of reciprocation and include it in his calculation. A risk-neutral actor will make an exchange only if the expected benefits are positive.

Promised resource bundles are person-specific debts. In the *guanxi* system—as in many other non-economic exchange systems—such promises cannot be transferred from one relationship to another, or can only be transferred to a minor extent. Due to the non-transferability of resource-bundle promises, *guanxi* exchanges are restricted to a system of dyads. Much in line with Fei Xiaotong’s assertion that Chinese individuals take an egocentric perspective on their entourage, it follows that each actor maintains his own unique personal network of *guanxi* dyads with other actors [4]. The personal network maintained by each actor can be depicted as a *sociometric star*, and when such networks are combined, they constitute a *guanxi* network (*guanxi wang*). Figure 48.2 shows how the personal networks of five actors (A, B, C, D, and E) add up to a well-connected network in which exchanges of resource bundles take place [38].

It may happen that the interest of a member of a given network is directed at a resource bundle that none of the actors he is connected to controls. A mutual

acquaintance—the so-called *intermediary*—may then introduce the two parties [3]. Preferably, the introduced person will be an insider from the same *guanxi* network. In cases where no insider has control of the resource bundle that is needed, an initially disconnected actor, i.e., an outsider, is integrated into the network. As an intermediary usually vouches for the proper exchange conduct of the outsider, the network expands without increasing uncertainty. Both the increased connectedness of the network and its enlargement are advantageous for its members: with each additional relationship, members gain access to more diverse exchange resources. An extremely complicated structure of social relations may emerge from this simple network expansion mechanism.

Norms and Sanctions

In general, the longer the tradition of any culture, the more differentiated the set of interdependent norms will be. The norms of the *guanxi* system, in all their great complexity and pervasiveness, which Chinese tradition has produced, should not be mystified, though. Rather, they should be approached with the understanding that self-determined actors have consciously created them because they yield benefits, namely reducing uncertainty in resource exchanges.

Uncertainty in the *guanxi* system is reduced by normative provisions and sanctions. An actor who accepts a gift automatically incurs the obligation to reciprocate the gesture (*li shang wang lai*). Actors usually keep records of the resource bundles received and given, particularly at ceremonies. So how does this principle apply to the categorical frame of interaction in the *guanxi* system?

As in most traditional societies, close kin in China are ideally perceived as fulfilling one another's needs without anticipating any reciprocity [39], which is why family members are not expected to keep tabs on any personal debts incurred by other members of the family. This logic applies beyond basic care-giving and also holds for transactions in the *guanxi* system: If a father asks a favor of his traditionally raised son, the son will seek to live up to the father's expectations and not ask him for any reciprocation. As mentioned earlier, family obligations depend on the "thickness" of blood, i.e., they traditionally are strongest between parents and children (and between father and son in particular).

The normative structure of reciprocation among friends and acquaintances is different from, and actually more refined than, reciprocation within the family. In what is termed the "norm of *renqing*" (*renqing faze*), a mandatory surcharge is added to each obligation incurred, requiring friends and acquaintances to return more than they have received [4, 40]. At no point in time are debt and credit accounts in a state of equilibrium. In spite of the difficulty of objectively calculating the value of resource bundles, an attempt to merely pay back the approximate amount received is considered a refusal of the relationship. Leaving actors considerable room to maneuver, the norm of *renqing* neither defines the exact time, nor does it specify the value of the reciprocation [2, 16]; only immediate or no reciprocation is prohibited.

As Gouldner supposes, a convention that inhibits complete repayment induces people to remain socially indebted to each other [41]; the resulting permanent imbalance prolongs their relationship indefinitely. When performed anti-cyclically, such an exchange pattern actually becomes beneficial. By deliberately incurring obligations that do not involve much personal effort—preferably when the gift or favor is of great importance to the recipient—actors can pile up a reserve of resources that may be brought into play in times of need. Similar to an insurance policy, the norm of *renqing* stabilizes the exchange system.

Norms, as beneficial as they may be, will emerge only if they meet a number of conditions [32]. Effective norm enforcement is one such condition. It hence comes as no surprise that surveillance and sanctioning mechanisms play a predominant role in the *guanxi* system. In order to encourage compliance with a norm, the *guanxi* network raises the individual cost of cheating members. This act is termed a *sanction*. Since *guanxi* networks are the result of exchanges based on interests in and control over three resources (*renqing*, *ganqing*, and *mianzi*), sanctions must be defined in terms of their loss. In the next section, the sanctions that exist in *guanxi* networks are presented: withdrawal of *mianzi* and/or network ostracism.

A non-reciprocating actor will be reputed to be an ungrateful person (*wang en fu yide xiaoren*), which means that his *mianzi* will be withdrawn by the *guanxi* network [42]. Due to a lower risk of being cheated, actors generally prefer to make exchanges with those who have attained a large amount of *mianzi*, i.e., they exclude any actors who are low in *mianzi*. When *mianzi* is withdrawn, the cheating actor needs to rebuild his *mianzi* from scratch by making exchanges on the basis of *renqing* and *ganqing* with other actors who have little or no *mianzi* themselves, hence incurring much higher uncertainty. In cases where withdrawing *mianzi* is an insufficient punishment, non-compliance will be sanctioned more harshly by the *guanxi* network, namely through ostracism (*paichi*). Delinquents will be scorned (*buli*) by the network members, and they will no longer be able to engage in any exchanges. Not only does the ousted network member lose all his outstanding *renqing* and *ganqing* (i.e., which other network members have not yet returned), but, most importantly, he also squanders the opportunity to engage in future exchanges within the network.

It can be concluded that the threat of sanctions is sufficient to attenuate the probability that a network member will act opportunistically. Capable of enforcing the obligations incurred from accepting resource bundles, sanctioning in the *guanxi* system is performed by what Malinowski terms “definite social machinery” [43]. From the normative framework of how obligations are made and reciprocated and how actors are sanctioned, it becomes clear that the *guanxi* system is a self-contained *institution* [16] rather than an informal mechanism created unintentionally (*feizhengshi zhidu xingde fangshi*) that would be subordinate to a market economy based on commercial law.

In spite of the prominent role that sanctions play in the *guanxi* system, traditional Chinese societies prefer mediation by human compassion to sanctions. People believe that “harmony in interaction must have primacy” (*he wei gui*), because it is the spiritual state one should aim at [12]. Since the invitation of a third party to

help resolve a dispute may sever the relationship between the two main parties, many Chinese people seek to settle disputes in a one-on-one way (*si liao*) and to straighten out (*li shun*) their relationship themselves. As *guanxi* networks are embedded in Chinese society, it seems safe to state that they actually have the “bite” of efficient sanctioning at their disposal, but its members will only apply sanctions if the ideal of harmony cannot be upheld.

Integration of *Guanxi* in Business

In China, social and business life are closely connected. As Chung and Hamilton note, “a number of studies have shown [that] Chinese businessmen prefer to use *guanxi* as a primary medium for business relationships” [2]. Similarly, Su et al. have empirically observed that *guanxi* is the “cultural way of doing business in China” [44]. In order to understand the effects of *guanxi* on business, its systemic elements must be integrated with the elements of a market economy. This chapter constructs the emerging notion of a hybrid socioeconomic exchange system in which individuals and firms interact. Within this hybrid framework, firms cannot arbitrarily choose to renounce elements of either system when conducting business. At the same time, individuals connect the firms with which they are affiliated, for individuals (in the roles of managers and employees) are “linking agents” within the *guanxi* system.

The impact of *guanxi* on business is best analyzed using the framework provided by *managerial economics*, a branch of the *theory of monopolist competition*. Based on the observation that in many industries, companies’ products are distinct in variables other than price (or quantity), the theory of monopolist competition was developed in the 1920s and 1930s—most prominently by Edward Chamberlin (1899–1967)—as a means of overcoming the classic dichotomy of pure monopoly and perfect competition [45]. Managerial economics explores conflicting cause-effect relations in oligopolistic processes, and firms apply it in an attempt to deactivate competition and thereby increase their performance in terms of market shares and profitability. Roughly speaking, market shares and profitability are determined by a firm’s ability to produce economic value relative to its competitors [46].

Economic value-created represents the difference between the value that resides in the product and its costs. The former, i.e., the value that resides in the product, refers to a particular benefit that consumers perceive for a product. In monetary terms, this value denotes the maximum amount the consumer is willing to pay for one unit. The cost of a product refers to the value of inputs that a firm sacrifices in the process of creating this benefit, i.e., for converting raw materials into components and for assembling components to produce the finished good [46].

Firms offering heterogeneous products compete in terms of prices as well as quality (representing all non-price variables). Since the resources exchanged in the *guanxi* system hold an inherent value for their recipients, they must be considered as independent action parameters that are related to the action parameters of the

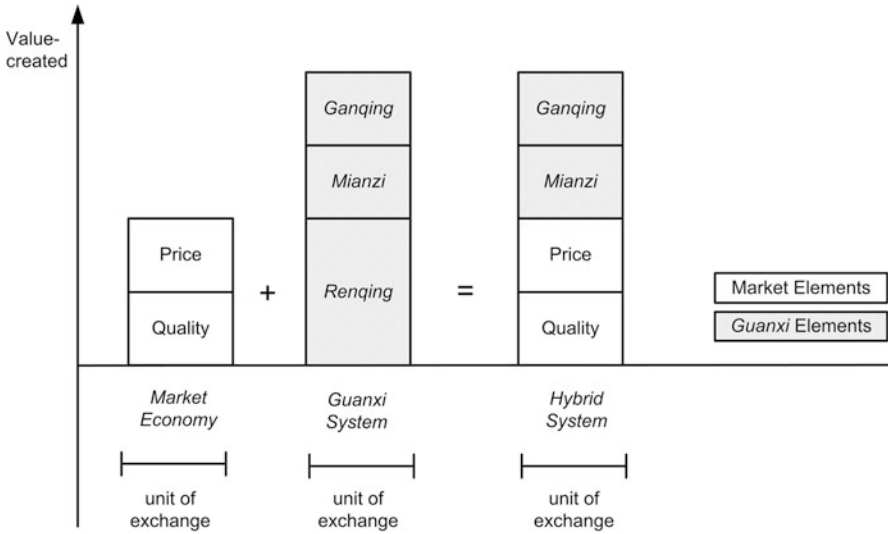

Fig. 48.3 Components of value-created in a hybrid system

market economy. As consumers purchase products in a market economy in order to satisfy their instrumental interests, the market-economy action parameters of *price* and *quality* coincide with (instrumental) *renqing* in the *guanxi* system. The affective and normative value of *ganqing* and *mianzi*, however, is not available through market exchanges; consumers can only appropriate these additional benefits in the course of exchanges in the *guanxi* system. Figure 48.3 elucidates this resulting hybrid exchange system, in which each unit of exchange has four action parameters: price, quality, *ganqing*, and *mianzi*.

For the sake of conceptual clarity and to simplify comprehensiveness, the term *guanxi* will be used in the following discussion to describe the additional resources of *ganqing* and *mianzi* as non-market action parameters. Such contrasting of market and non-market action parameters greatly enhances the precision of the discussion.

Value is created as goods move along the vertical chain, which is therefore referred to as a *value chain*. In his 1985 bestseller, *Competitive Advantage*, Michael E. Porter deconstructs a firm by depicting it as a collection of *value-creating activities*, i.e., physically and technologically distinct elements and tasks executed within the company (e.g., operations, marketing and sales, and human resource management) [47]. The process of value creation is optimal when all the elements and tasks required for a product that meets customer requirements consume a minimum amount of resources. In this case, the gap between consumer benefits and the cost of performing the activities widens, and the profit margin increases.

Considering that the *guanxi* of business managers and employees stretches beyond the boundaries of their firm, the notion of the external must be incorporated into analyses. This step is best achieved by extending Porter’s value-chain model by including three types of external linkages: relationships with suppliers and

customers (*vertical guanxi*), relationships with competitors (*horizontal guanxi*), and relationships with authorities (*lateral guanxi*).

Firms that attempt to develop effective *guanxi* business strategies need to meticulously distinguish these three types of *guanxi* and their impact on primary and supporting value-chain activities (for a detailed analysis, see Langenberg [19]). In order to scrutinize ethical implications, we shall explain the impact of *guanxi* on a firm's business performance, taking one example of *ganqing* in vertical *guanxi* and one example of *mianzi* in lateral *guanxi*.

Consider the following situation of a favorable price paid to a vertical *guanxi* partner: A bootmaker can choose to purchase suede leather from two suppliers who both deliver the same high-quality leather. Supplier A is an international company with a large market share and, due to economies of scale and the resulting advantageous cost structure, is able to supply leather at low prices. Supplier B is an old friend of the family; everyone enjoys spending time together, and *ganqing* is high. His prices, however, are slightly higher than supplier A's. Now, in a market economy, where purchasing decisions are made on the basis of price and quality, the bootmaker would purchase from supplier A. In a hybrid system, the bootmaker will purchase from supplier B, because the benefit of receiving *ganqing* when doing business with a friend overcompensates the slightly higher price.

Consider another very different example now: *mianzi* in lateral *guanxi*. Firms have a vested interest in securing favorable tax treatment on their corporate income tax (CIT). While the standard CIT rate in China is currently at 25%, a preferential tax rate of 15% is levied on the income of high-technology enterprises. Applications are filed with the provincial Technology & Science Committee (*kexue jishu weiyuanhui*), which reviews them in its working groups and approves suitable ones through its committee head. Upon approval, a qualification certificate (*gao xin jishu qiye zige*) valid for 3 years is issued to the applicant, who then files it with the tax authority in charge of the firm's records. In order to qualify as a high-technology enterprise, businesses must have a required minimum of intellectual property rights ownership, research and development (R&D) expenses, and a share of revenues generated from high-tech activities (60%), among other conditions. The rules of what sales revenues are booked as "high-technology revenue" are quite flexible, and the qualification of expenses as "R&D expenses" allows for a degree of interpretation. Hence officials have wide discretionary power regarding the high-technology CIT break (and countless other taxes, for that matter). It is not surprising that lateral *guanxi* therefore plays a major role in tax issues.

Against this backdrop, consider the case of a low-end motor manufacturer located in Qingdao City whose share of revenues generated from high-tech activities is somewhere in the range of 55–60%, depending on the method of calculation. Suppose that the chief engineer of the company is friends with the head of Shandong Province Technology & Science Committee. Both of them went to the same school, and they regularly get together within the same network of friends and acquaintances. As the *guanxi* network clearly expects friends with good *ganqing* to support each other, the Shandong Province Technology & Science Committee applies the share of 60% (rather than 55%) and makes it easier for the motor

manufacturer to obtain the qualification certificate it needs. This exchange showcases the benefits of lateral *guanxi*: the tax break of 10% subsequently granted to the motor manufacturer as a firm; and the increase of the head of the committee's personal *mianzi*, because he abided by the *guanxi* norm of reciprocity.

The above examples corroborate the claim that *guanxi* generates value for the parties involved who have an economic incentive to avail themselves of *guanxi*. Although this finding has already met with wide empirical support, a more differentiated perspective is needed. Firstly, certain firms with particular attributes in terms of their ownership structure, origin, company size, time in business, and technological competitiveness are expected to dampen their performance with *guanxi*-based business strategies (for such exceptions, see Langenberg [19]). Secondly, the costs that managers and employees incur when using their *guanxi* for the purposes of the organization also need to be considered; firms for which *guanxi* makes little economic sense will seek to avoid such strategies.

Implications for Business Ethics

Now that it has been established that using *guanxi* makes economic sense for certain types of companies, just one question remains: Is the application of *guanxi* in business permissible in ethical terms, both from Chinese and Western perspectives?

Generally speaking, business ethics is the application of ethics to business behavior. Although managers and employees are sometimes tempted or even encouraged to apply special or weaker ethical rules to business situations, society does not permit any exceptions. If dishonesty, for instance, is considered unethical in social life, then it is unethical in business as well. It is important to note that ethics are not determined by common practice, but by reflected behaviors rooted in the culture to which actors appeal. This interrelation between culture and ethics inevitably leads to conflicting viewpoints in the ethical understanding of different cultures. In fact, the more ingrained and culturally derived a practice is, the greater is the likelihood of cross-cultural dilemmas occurring [44].

Considering that *guanxi* exchanges are among the most powerful examples of a culturally ingrained practice [26], international firms doing business in China can expect to face ethical quandaries. Chinese business practitioners and scholars who wish to live up to their moral obligations, on the other hand, must be careful not to conveniently accept *guanxi* as being culturally imposed, but rather evaluate critically whether this common practice actually conforms to existing ethical norms in China.

It is useful to distinguish two major views of morality: *deontic theories* and *virtue theories*. The former assess the morality of actions and are divided into two contrasting views: *deontological ethics* and *consequentialist ethics*. Deontological ethics, most prominently advocated by John Locke (1632–1704) and Immanuel Kant (1724–1804), judge acts by the dimensions of rights and duties and hold that certain acts cannot be morally justified, irrespective of how beneficial their outcome might be. An act is therefore considered to be right if it conforms to moral norms

that have to be obeyed by everyone. In stark contrast, consequentialist ethics, the paradigm case of which is utilitarianism, evaluates actions in terms of their outcome. Put forward by John Stuart Mill (1806–1873) and Jeremy Bentham (1748–1832), classical utilitarianism weighs positively against the negative effects on all affected individuals, holding that an action is moral only if it maximizes the good. Unlike deontological and consequentialist ethics, which are obligation- and outcome-based, respectively, *virtue ethics* (or *aretaic ethics*) elaborate on the traits and character that people should try to achieve. Aristotle (about 384–322 BC) and Confucius (about 551–479 BC) were both eminent advocates of virtue.

Confucian Perspective on *Guanxi*

Business ethics has slowly entered the public discourse in China; academic interest in this field of research began in the late 1980s, and the first surveys on Chinese business ethics were conducted as recently as the mid-1990s. Despite this short academic history, many Chinese scholars and business practitioners rarely apply the existing international framework, but believe that only a uniquely Chinese concept (*you zhongguo tese de gainian*) is able to reflect and grasp the fundamental ethos of business ethics. Following the general consensus that the philosophy of Confucius (*Kongzi*) provides for China's most influential moral heritage, the subsequent paragraphs consider *guanxi* exchanges in terms of Confucian ethics. It is worth noting, though, that heterodox cultures, such as Buddhism and Daoism, had an impact on Chinese civilization that is frequently underestimated [48].

A general understanding of the societal context in which Confucius lived is supportive of the appreciation of the role and importance of its moral imperatives. Confucius was born in an “ancient and troubled culture” [49] during the downfall of the Eastern Zhou empire (770–221 BC). This empire had little power and was no longer able to control the semi-autonomous vassal states that had come into being after the removal of the (Western) Zhou dynasty (1050–770 BC). When the hegemony lost their ruling power, there was constant discord between rival kingdoms. In this subperiod of Eastern Zhou, known as the Warring States Era (475–221 BC), state rulers started making use of officials instead of nobles for administrative purposes. The uprooted members of the lower aristocracy, including Confucius, began touring the empire to advise the feudal dukes who had managed to remain in power. Confronted with military warfare, political disorder, and social instability, many of these thinkers began to look for an ideal structure for society.

Eventually, Confucius turned to the teaching of young scholars, thereby fathering the intellectual school that the Chinese refer to as the “School of Ru” (*rujia*). After his death, which marked his near apotheosis, the 77 scholars who are said to have successfully received the Master's teachings completed his philosophy. Although few of his scholars became influential—most of them came from a life in cramped conditions—Confucianism persisted and, indeed, grew dominant during the Han dynasty (206 BC–220 AD), which used knowledge from ancient texts to legitimize its autocracy [50].

Confucius's philosophy did not contain a lot of new ideas. Its integration of rituals, political power, and the worshipping of the ancestors has already been a part of Chinese philosophy since the Shang dynasty, a fact that the Master fully acknowledged: "I transmit but do not innovate; I am truthful in what I say and devoted to antiquity." (*lun yu*) [51].

Still, the search for an incontrovertible framework of Confucian elements has kept sinology scholars busy for over a hundred years. Also, non-sinologists in need of assumptions for grasping Chinese cultural elements for their respective fields of research have made inappropriate suggestions, drawn unwarranted parallels, and jumbled up terms. The next few paragraphs will therefore begin by sketching the structural elements of classic Confucianism based on the seminal accounts [49, 50, 52, 53].

As stated earlier, Confucian ethics belong to the school of virtue ethics. As such, they consider a person's moral character and virtues to prevail over existing rules and duties. This understanding is appropriately illustrated in the following excerpt from the *Analects* (*lun yu*) [53]:

The Master said: The linen cap is what is prescribed by the rules of rituals, but now a silk one is used. It is more economical and I follow the common practice (. . .) The rules prescribe that people bow below the hall, but now the practice is to bow after ascending the hall. That is arrogant. I follow the rule in spite of the common practice.

Harmony is the greatest of all moral virtues (*lun yu*) [51]. Elaborating on its importance, Confucius understood harmony as the ultimate purpose of (social) life. Closely related to harmony is the expression of the senses, i.e., emotions (*qing*). Depending on the extent to which emotions are developed, individuals fall into three categories: while good people have the optimum configuration of emotions and bad people the opposite, most people belong to the middle category, in which some emotions are overdeveloped and others are underdeveloped.

Rites and ritual propriety provide the means to achieve harmony. Confucius assumed the existence of a proper way for humans to behave, and hence for society to be organized. This proper way, *li*, is typically translated as "rites" or "ritual propriety." Confucius changed the original meaning of *li*, i.e., an ancestral offering, to what he believed glued ancient society together: a certain etiquette that humans were supposed to follow. Based on the assumption that individuals are never isolated entities, the Confucian sociocultural structure assigns individuals hierarchical positions that require the performance of ascribed duties (*bu xue li, wu yi li; lun yu*) [51]. Even though specific rituals had long since lost their function, it may have been continued compliance with *li* that instilled Confucianism with its extraordinary persistence.

In a hierarchy of fixed moral positions, which are not questioned in terms of legitimacy, maintaining harmony requires mutual responsiveness. The division between moral positions is complemented by specific concepts that operationalize *li*. The most important of these concepts is *ren*. Because the interpretation of the Master's "love for one's fellow men" (*ai ren; lun yu*) [51] obviously is not very clearly defined, there have been debates concerning what *ren* actually means ever since the time of Confucius. The original meaning of *ren* in the Zhou dynasty—i.e.,

philanthropy—was changed by Confucius to something that can be translated as “benevolence.” In order to attain benevolence, Confucius expected individuals to restrain themselves and thus observe the rites (*ke ji fu li; lun yu*) [51].

As the fundamental basis that gives rise to and instills all virtues, benevolence comprises several principles of behavior in interaction; what is common to these principles is that they are vertically directed and based on positions. In the family sphere, the most imperative demonstration of benevolence is filial piety towards one’s parents, as expressed by the Confucian concept of *xiao*. The character *xiao* already occurs in bronze inscriptions from 1000 BC, indicating the son’s worship of his late father. As it mostly appears in the first two chapters of the Analects, which are more recent, *xiao* might not have been used by Confucius himself, however. Whatever the case, *xiao* came to mean serving the living parents only after the death of Confucius. While the concept of *xiao* addresses economic concerns in a primarily rural society—the authority of the eldest male was vital for the extended family to operate as a unit of production and consumption—it also includes emotional support. Furthermore, its obligations persist even after the death of one’s parents, after which the eldest son was prohibited from holding any official post for a mourning period of 3 years, requiring him to interrupt or even completely abandon his career.

Benevolence and ritual propriety were further elaborated by Mencius (*Mengzi*, 379–289 BC), a philosopher who studied in the academic lineage of Confucius’ grandson. Mencius described them as the cardinal virtues (*de*) of Confucian ethics together with the concepts of appropriateness (*yi*), straightness (*zhi*), and, later, trust (*xin*). These virtues find their application in *wu lun*, i.e., the five relationships to which every individual is assumed to be subjected [54]. *Wu lun* classifies four sets of superior–subordinate relationships, namely father–son (*fu zi*), ruler–subject (*jun chen*), husband–wife (*fu fu*), and elder–younger brother (*zhang you*), as well as an equal relationship between friends (*peng you*). Each relationship is governed by a particular norm: closeness (*qin*) between father and son, justice (*yi*) between ruler and subject, the separation of (gender-specific) spheres between husband and wife (*bie*), proper order between elder and younger brother (*xu*), and trust between friends (*xin*). The attempt to arrange these five potentially competing forces, with a focus on the first and the second relationship, became one of the central doctrines of Confucianism.

Although the word *guanxi* is not found in the Chinese classics, the structure of virtues and obligations in Confucian (or more precisely, Mencian) *wu lun* is highly compatible with the norms of reciprocity in the *guanxi* system, because appropriate conduct is determined by social positions: exchanges among friends are compatible with the Confucian virtue of trust due to the fact that debts and credits—in accordance with the norm of *renqing*—are never balanced. The traditional gift exchange in the “Papaw Story” (*mu gua*) of the Book of Songs (*shi jing*), in which each gift (a quince, a peach, and a plum) is reciprocated with gifts of superior value (three different gems), perfectly illustrates the similarity of the emphasis on reciprocity in Confucian ethics with the norm of *renqing* described in the respective subchapter [55]. It should be noted that the preference for harmony in dispute resolution in *guanxi* networks also largely agrees with Confucian thinking.

Most importantly, Confucian ethics—unlike occidental ethics—accommodate the preference of members of the *guanxi* network (family, friends and acquaintances) to outsiders. Such preference conforms to the Confucian demand that benefits be allocated based on the virtue of benevolence, which depends on the nature of the social relationship [27]. People will feel more compassion for and show more benevolence to close family members than to distant individuals; the notion of equal concern for all people has never been part of Confucian teachings. This is in line with the observation that the Chinese pay great attention to the obligation and responsibilities that go with personal relationships [56]. Evidently, the actors in the above examples of vertical and lateral *guanxi* are acting ethically from a Confucian standpoint.

These findings are particularly insightful in light of the popular claim that Chinese ethics is “situation-specific” [13], i.e., acts are judged by society on a case by case basis rather than universal principles—obviously, this claim may be true in only a loose and trivial sense. Granted, the rules are more complicated than in Protestant ethics, for instance, in which all individuals consider themselves subject to the same set of social norms. However, as demonstrated above, it would be wrong to conclude from these multiple, non-equality standards that Chinese ethics are not based on universal principles: Confucians would hardly have thought that the son’s obedience towards his father should apply in certain situations only. Similarly, the Chinese sense of fairness (*gongping gan*) generally holds that “outsiders are not important” (*wuguan jinyao*), which perfectly explains the common phenomenon that network members ruthlessly take advantage of outsiders. As wrong as it would be to deny Chinese ethics a high degree of casuistry, which makes obligations contingent upon power relations and personal circumstances, it would also be incorrect to argue that no abstract, universal criteria exist. If *guanxi* stands in contrast to the principle-based theory of ethics, this contrast is not as sharp as is often thought.

Western Perspective on *Guanxi*

In spite of the fact that deontological Judeo-Christian morality dominates Western societies, economic systems and actions in the West are mainly evaluated using the consequentialist concept of utility. *Utility*, according to Bentham, is “that property in an object whereby it tends to produce benefit, advantage, pleasure, good or happiness (...) or (...) to prevent the happening of mischief, pain evil, or unhappiness to the party whose interest is considered: if that party be the community in general, then the happiness of the community: if a particular individual, then the happiness of that individual” [57]. The system or action that generates the largest amount of utility (or *social welfare*) for all the actors involved is to be preferred. Certain drawbacks of this approach are acknowledged and accepted, such as the difficulty to accurately measure utility, or the fact that the rights of minorities can be overridden by the majority. The upcoming discussion will follow the utilitarian approach.

The ethical assessment of *guanxi* exchanges from a utilitarian perspective must consider the distribution of control and ownership of exchange resources as well as the economic and institutional environment in which exchanges take place. It will become evident that *guanxi* exchanges are considered ethical (only) if control and ownership of exchange resources coincide and if the environment is characterized by economic and institutional uncertainty. While these institutional conditions may have been prevalent at the time that Confucius lived in, they have significantly changed since then, and so has the ethical assessment of *guanxi*.

If control and ownership of exchange resources coincide, actors will allocate resources in an optimal manner, i.e., each actor will only conduct exchanges that increase his total utility. This is the case in the earlier example of vertical *guanxi* where the bootmaker trades a small gap in *renqing* (profit) for *ganqing*, which increases social welfare in terms of market and non-market resources (price, quality, *ganqing*, and *mianzi*). The opposite result ensues if control and ownership of exchange resources do not coincide: Where the recipient of the benefits (e.g., of higher *ganqing* or *mianzi*) does not coincide with the bearer of the cost (e.g., unfavorable price and lower quality), the so-called *principal-agent problem* arises in which actors only consider the costs that they will need to bear themselves [58]. Such situations commonly occur if a principal (e.g., an organization) charges an agent (e.g., an employee) with the task of executing specific (economic) transactions on its behalf. When dealing with vertical, horizontal, or lateral partners, agents will be tempted to act in their own interests, which often differ from those of the principal. The objectives of the principal and agent are perfectly aligned, and the principal-agent problem is therefore precluded in the case of a self-employed worker or an entrepreneur who is both the owner and manager of his firm.

Since ownership and control of resources never coincide in the case of horizontal and lateral *guanxi*, such *guanxi* exchanges will always produce principle-agent problems, yielding a less than optimal allocation of resources and a loss of social welfare. Against this backdrop, consider the earlier example of the high-technology CIT break: the low-end motor manufacturer as a firm and the head of Shandong Province Technology & Science Committee both benefit from the transaction, while the tax authority (or rather the taxpayers) bear(s) the cost. In horizontal *guanxi*, exchanges also create value only for the parties who are directly involved; the costs of such exchanges are borne by another party, namely the consumers.

Another highly relevant element in the utilitarian assessment of *guanxi* is the level of uncertainty of the economic environment. This is because the *guanxi* system, as a structural alternative to market exchanges under commercial law, yields lower transaction costs than market economies in an uncertain environment, and vice versa [25].

Going back to Coase's seminal work "The Nature of the Firm" [59], and further elaborated by Williamson [60], *transaction costs* describe the cost incurred by actors in making an economic exchange, most importantly search and information costs (to identify a suitable exchange partner), bargaining costs (to negotiate a contract), and policing and enforcement costs (to formulate the contract and enforce the execution of its terms). In an uncertain environment, the consideration

of all relevant contingencies in the negotiation, formulation, and enforcement of a formal contract is very difficult; hence the transaction costs of market exchanges are high. The enforcement of contracts is particularly problematic when the environment lacks coherent commercial laws and effective institutions. *Guanxi* exchanges, on the other hand, do not require any complex formal contracts, because the threat of sanctions by the *guanxi* network is sufficient to attenuate the risk of opportunistic behavior (see the section on “Norms and Sanctions” above). The affective component of the *guanxi* system (*ganqing*) further reduces the incentive to cheat. In addition, *guanxi* members are often able to mediate conflicts in good faith, rather than inviting a third party to help resolve their dispute, which would sever the relationship and incur additional costs for both parties.

The transaction-cost advantages that go with the *guanxi* system are traded off, however, by the significantly higher costs associated with the socializing that is required to cultivate *mianzi* and *ganqing*, and by the opportunity costs from the network’s bias towards old business partners, which produces a delay in allowing new members with specific or superior skills to join the network. Hence, *guanxi* exchanges outperform market transactions in terms of efficiency only in an uncertain environment lacking the formal institutions that enforce contracts based on commercial law. Some scholars have actually explained the remarkable ability of *guanxi* networks to deter and manage non-compliance with the weakness of such institutional arrangements in China [16].

It is important to note that *guanxi* networks and the market in the above analysis are assumed to be mutually exclusive institutions, although they actually exist in parallel. Ethically speaking, when market and *guanxi* exchange systems coexist, gift-giving in return for preferential treatment obviously becomes a relative issue [16]. Notwithstanding this, it seems logical to conclude that, in terms of macroeconomic efficiency, such coexistence is actually worse than the isolated existence of either of them. If actors can arbitrarily select the more favorable institution, for instance in dispute resolution, the efforts made by both institutions to reduce transactional uncertainty are undermined. In theory, it would probably be best to make use of the specific advantages of both institutions in a particular setting, i.e., in solving minor problems using *guanxi* and settling major disputes using the legal system.

As we have shown, *guanxi* exchanges can be considered ethical only if control and ownership of resources coincide and if exchanges take place in an uncertain environment. Interestingly, this scenario resembles the socioeconomic situation during the Warring States Era when Confucius developed his philosophy: In this environment of socio-political instability, China was organized as an “agricultural village society” (*cun luo shehui*), with almost all Chinese people either being farmers or making a living from activities related to the primary sector. Social relationships were primarily based on the “culture of blood relationships” (*qinyuan wenhua*). Rural exchanges mainly took place between a few families (*xiao nong*), the members of which formed the *guanxi* network. The personalistic loyalties and interpersonal obligations at the time had a similar structure to those in the *guanxi* system, and it seems likely that they were not just ethical to Confucians, but would probably have seemed so by utilitarian standards as well.

Today, the environment looks much different: the share of the labor force occupied in agriculture-related areas is much lower and is dropping fast. What's more, the size and complexity of modern organizations requires their owners (e.g., shareholders) to entrust specialized agents (e.g., managers) with control over their resources. Uncertainty in the market exchange environment has also been significantly reduced. China has now spent half a century in peace and relatively high social and political stability. Great progress has been made in terms of law enforcement; arbitration commissions (such as the China International Economic and Trade Arbitration Commission) allow for efficient settlements of trade disputes, and national as well as international quality standards protect customers from hidden defects in products. These developments have certainly rendered *guanxi* exchanges less efficient than market exchanges, and therefore they are not ethically acceptable from a utilitarian perspective today.

Conclusion

This chapter has established that the *guanxi* system is unique in terms of its structural features and ubiquity. Essentially motivated by a means-ends calculation, *guanxi* exchanges are distinct from purely economic transactions in that affection and observance with social norms are required. From the normative framework of how obligations are made and reciprocated, and how non-complying actors are sanctioned, it is apparent that the *guanxi* system is a self-contained institution that coexists with a market economy. By considering the special nature of *guanxi*, the analysis at hand provides local and multinational firms operating in China's socioeconomic system with the theoretical foundations needed to define their moral stance towards the utilization of *guanxi* for business purposes.

Two predominant schools of thought—Confucian virtue ethics and Western utilitarian ethics—yield different conclusions. While *guanxi* meets the ethical terms of Confucianism, it does not comply with Western utilitarian principles. The conflict between both sets of morals can be elucidated with the case of preferential treatment: In Western utilitarian ethics, only those acts are considered moral that maximize the good of all individuals. Preferring a friend in business is unethical, as it undermines functional efficiency; hence such behavior and is associated with pejorative terms like “nepotism.” In Confucian ethics, on the contrary, it is imperative to treat friends and family members better than strangers, and to share information with the *guanxi* network at the expense of out-groups. Exposing a close *guanxi* partner to open competition is considered disloyal, because equal opportunity worsens the situation of friends who perceive a relatively higher chance of success as appropriate.

The above incompatibilities have been empirically surveyed [61, 62]. Based on utilitarian principles, Chinese managers were found to be relatively unethical, while in terms of “human heartedness”—operationalized through the managerial attitude towards group harmony and sympathy for group members—they were more ethical than their American counterparts. This reasoning explains the observation that Chinese businessmen tend to complain that “foreigners have

no human feelings” (*waiguoren meiyou renqing weier*), a complaint that, after all, is analogous to the Western grumble that “[Chinese people] can’t be trusted, because they always help their friends” [25].

The majority of modern businesses, which are run by employed managers and operate in a fairly certain environment, must decide which of the two incompatible schools of thought they should follow. It seems safe to assume that companies operating on their home turf will go with the moral framework that dominates in their own culture. That said, the decision is more complex for Western firms operating in China and Chinese firms operating abroad, respectively. The controversy about how the ethical principles of one cultural region apply to another cultural region is reflected in the popular debate on *ethical relativism* vs. *universal ethics*. Proponents of the former view argue that (conflicting) ethical principles may be right at different locations at the same time. This stance is regularly referred to as the “when in Rome [do as the Romans do]” approach to ethics [63]. Universal ethics claim that morals can be defined in absolute terms. Based on reflection about what is right and wrong, globally, the best concept should be chosen as a general rule. While a general consensus on a universal set of ethics would solve the controversy, it actually seems unlikely that the process of globalization will bring about such an agreement in the near future: many multinational companies and various international institutions (like the OECD and ILO) have long been attempting to agree upon a single code of ethical business conduct that curtails unethical business practices. Not surprisingly, *guanxi* practices have not been included in any of these proposals.

Edward J. Romar

Abstract

This chapter presents the fundamental features of Confucian ethics. Next, it applies Confucian ethics to the business challenges of culture, strategy, customer/supplier relationships, operations, and innovation. It closes with a discussion of how Confucian ethics might have mitigated the collapse of the US financial services industry.

Introduction

There were four things which the Master taught, – letters, ethics, devotion of the soul, and truthfulness. [1]

Over the last few years, few societies have escaped scandalous business behavior. The collapse of the global economy began in the USA with the subprime mortgage crisis. Chinese companies were found incorporating harmful ingredients into human and pet food. Toyota, the benchmark of Japanese quality manufacturing, was forced to recall thousand of automobiles over safety issues long after the company knew of the defects. These are merely some of the examples of poor managerial decision-making and unethical behavior. They also highlight the need for good management and ethical business behavior. This chapter will argue that Confucianism, an ethical system over two millennia old, can contribute to the management of successful and ethical business organizations.

Before we begin the discussion of the applicability of Confucianism to management, it is helpful to briefly suggest why business organizations are important in the

twenty-first century and why ethical business behavior is crucial. The twentieth century witnessed the development of the large business enterprise which played a central role in organizing economies and industries [2]. While there is no question that entrepreneurs play important roles in economic development and innovation [3], the fundamental business dynamic is innovation and growth. If an enterprise does not seek growth, it has a “going out of business strategy.” Therefore, the small business should think big and the large business must defend and advance its economic position. There is no reason to think this process will cease in the twenty-first century, and this dynamic combined with technology-driven globalization will make the business enterprise even more important to economies and societies.

Why Confucianism as a Business Ethic?

Perhaps with the exception of Marxism, which subordinates human behavior to inexorable historical laws, ethical systems demand individual choice. We are offered, for example, systems ranging from Nietzsche’s egoism at the one extreme to theological altruism at the other. In between, we can choose from a variety of ethical systems from virtue ethics to such offerings as Kantianism, Utilitarianism, and the ethics of Rawls and Nozick, to name just a few. They all are attractive in some way. Egoism and Nozick’s libertarianism support the pursuit of unfettered self-interest found in free market capitalism. The application of unfettered egoism, however, has contributed to many of the economic crises throughout the history of capitalism, including the most recent global financial crisis, and a single-minded pursuit of self-interest by individual organizational members can be disastrous to organizational success. Kantianism demands categorical ethical behavior, while business exists in a world of conditions. Rawls identifies general principles of governance leaving local institutions, including business organizations, great freedom in self-organization. Utility requires the consideration of every possible outcome before selecting the one that will provide the best result, creating an impossible standard, since even in the best of circumstances, well-intentioned and well-trained people can find it difficult to anticipate the unexpected.

Businesses are special-purpose organizations characterized by hierarchy, mission, and division of labor requiring cooperative behavior among members. In publically held companies, ownership is held by a diffuse group of shareholders and a professional management group is responsible for day-to-day activities and the overall success of the enterprise. This leadership group determines the mission of the organization, its future direction, strategy, and objectives and identifies and allocates the resources required to achieve them. Lower managerial levels and employees are responsible to carry out the mission and achieve the objectives assigned by senior management. Division of labor is used to rationally divide the organizational tasks into jobs, integrate related jobs into groups or teams, and these into larger organizations designed to accomplish the necessary functions that will ensure firm success. In general, the larger the organization the more complex it is.

A significant managerial challenge is the coordination of a complex entity composed of many different structures and groups composed of numerous employees.

A business must pay attention to both its internal and external environments. A successful business crafts its organization in response to its environment. Well-managed enterprises are inwardly/outwardly focused where the business environment is composed of many entities, including, but not limited to, the various customer segments in its chosen market, competitors, suppliers, other businesses in its industry that are neither competitors nor suppliers, and governmental and social groups interested in its behavior. Management must focus on the resources and activities that will ensure success and minimize risk to the business.

This chapter argues that Confucian ethics is a practical and appropriate ethic for business because its precepts and principles are suited to business organizations and processes and possess the flexibility for application to businesses regardless of size or complexity. The chapter will begin with a discussion of the fundamental aspects of Confucianism and then apply Confucian ethics to the business challenges of strategy, innovation, supplier and customer relationships, and organizational structure and complexity. It will conclude with a brief discussion of how Confucian ethics might have mitigated the recent financial crisis.

Confucian Fundamentals

Confucianism is a social ethic which encourages a lifetime pursuit of moral excellence. Everyone possesses the inherent capability to develop into an autonomous and self-governing person. As Mencius observed:

The heart of compassion is the germ of benevolence; the heart of shame, of dutifulness; the heart of courtesy and modesty, of observance of the rites; the heart of right and wrong, of wisdom. Man has these four germs just as he has four limbs. For a man possessing these four germs to deny his own potentiality is for him to cripple himself; for him to deny the potentialities of his prince is to cripple his prince. If a man is able to develop all these four germs that he possesses, it will be like a fire starting up or a spring coming through. When these are fully developed he can take under his protection the whole realm within the Four Seas, but if he fails to develop them, he will not be able to even serve his parents. [4]

Mencius said, All the ten thousand things are there in me. There is no greater joy for me than to find, on self examination, that I am true to myself. Try your best to treat others as you would wish to be treated yourself, and you will find that this is the shortest way to benevolence. [4]

It requires the individual to develop into a person of character and the person of character, or superior person in Confucian nomenclature, is one who, through study and practice, embodies virtue and applies his/her virtue to the various situations encountered in daily life. The superior person constantly seeks self-improvement because only through self-assessment and improvement can the person of character continue to develop morally. Confucianism recognizes a fundamental truth about morality: only people of character can be good consistently. The petty and mean man according to Confucius may from time-to-time manifest good behavior, but he

is not a person of character because he will demonstrate bad behavior the rest of the time. Since the superior person is morally dependable, this individual is essential to moral and successful relationships, organizations, and societies. Confucianism is not a sanguine morality. It is highly disciplined, understands human foibles and shortcomings, and realizes moral understanding is difficult to achieve. Constant moral behavior is challenging. While it appreciates law and regulations, it understands, more importantly, that law and regulations are ineffective without good people. Being good is both difficult and a conscious choice.

As a social ethic, Confucianism focuses on the individual in the situation within which a person must act. If the person understands moral behavior correctly in the situation, the person should properly understand and execute the appropriate behavior. According to Confucius, there were nine attributes of a superior person:

Confucius said, “the superior man has nine things which are subjects with him of thoughtful consideration. In regard to the use of his eyes, he is anxious to see clearly. In regard to his ears, he is anxious to hear distinctly. In regard to his countenance, he is anxious that it should be benign. In regard to his demeanour (sic), he is anxious that it should be respectful. In regard to his speech, he is anxious that it should be sincere. In regard to his doing business, he is anxious that it should be reverently careful. In regard to what he doubts about, he is anxious to question others. When he is angry, he thinks of the difficulties (*his anger may involve him in*) sic. When he sees gain to be got, he thinks of righteousness.” [1]

The superior person is seeking both internal and external understanding.

We must develop the qualities of the superior person further. The superior person is a thinking and learning individual. Hall and Ames argue that a particular type of thinking is important to individual moral development. Thinking is “a set of interrelated processes associated with “learning,” “reflecting,” “realizing” and . . . living up to one’s word” [5]. Learning is not abstract but practically focused on an effort to understand social values and transmitting them to others. Reflecting requires an individual to understand differences in situations and approach situations knowledgeably and skillfully rather than mechanically. Realizing “refers to the propensity for forecasting or predicting the outcome of a coherent set of circumstances of which the forecaster himself is a constituent and participatory factor” [5]. Living up to one’s word is “the claim that one has the acquired ability, acumen and resources to make real what one says” [5]. Learning, reflecting, realizing, and living up to one’s word are the underpinning of the superior person and the source of the knowledge, self-cultivation, and self-improvement necessary to the proper engagement with the world.

According to the *Great Learning*:

1. What the Great Learning teaches is—to illustrate the illustrious virtue; to renovate the people; and to rest in the highest excellence. . . .
3. Things have their root and their branches. Affairs have their end and their beginning. To know what is first and what is last will lead near to what is taught in *the Great Learning*.
4. The ancients who wished to illustrate the illustrious virtue throughout the kingdom first ordered well their own states. Wishing to order well their states, they first regulated their families. Wishing to regulate their families, they first cultivated their persons. Wishing to cultivate their persons, they first rectified their hearts. Wishing to rectify their hearts, they first sought to be sincere in their thoughts. Wishing to be sincere in their thoughts, they

first extended to the utmost their knowledge. Such extension of knowledge lay in the investigation of things. . . .

5. From the Son of Heaven down to the mass of the people, all must consider the cultivation of the person the root of *everything besides* [1].

The Confucian superior person is also a person of virtue. In Confucianism, the cardinal virtue is *ren*, usually translated as benevolence, humaneness, or sincerity.

1. Fan Ch'ih asked about benevolence. The Master said, "It is to love *all* men." He asked about knowledge. The Master said, "It is to know *all* men."
2. Fan Ch'ih did not immediately understand.
3. The Master said, "Employ the upright and put aside all the crooked;—in this way the crooked can be made to be upright."
4. Fan Ch'ih retired, and, seeing Tsze-hsiâ, he said to him, "A little while ago, I had an interview with our Master, and asked him about knowledge. He said, 'Employ the upright and put aside all the crooked; —in this way the crooked can be made to be upright.'"
5. Tsze-hsiâ said, "Truly rich is his saying!"
6. Shun being in possession of the kingdom, selected among all the people, and employed Kâ-yao, on which all who were devoid of virtue disappeared. T'ang, being in possession of the kingdom, selected from all the people, and employed î Yin, and all who were devoid of virtue disappeared [1].

Benevolence represents a very important attitude toward others and helps shape behavior toward proper social interaction. Benevolence has five important attributes: wanting what is best for yourself and others, self-improvement for everyone, knowledge, moral behavior, and concern for others (what benefits others benefits the individual). The benevolent individual is unselfish, is kind and charitable toward others, and seeks mutually beneficial relationships. Benevolence is empathy, where an individual demonstrates a sincere concern for the welfare of others and exhibits a desire to see that what is best for oneself is afforded others [6]. Integrity and trust are connected and mean that one "lives up to one's word." The benevolent person is also trustworthy and sincere in his/her treatment of himself/herself and others. He/she is a person of stature and respect. Benevolence is manifest not only in individual behavior but also in how the superior person is viewed by others.

Rightness is another important Confucian virtue. Whereas "(b)enevolence is the characteristic element of *humanity*. . . . Righteousness is *the accordance of actions with what is right*. . ." [1]. According to Mencius, "(a) man who mutilates benevolence is a mutilator, while one who cripples rightness is acrippler. He who is both a mutilator and acrippler is an outcast. I have indeed heard of the punishment of the outcast Tchou, but I have not heard of regicide" [4].

Benevolence is an attitude and disposition toward others; righteousness is acting morally. The correct person, therefore, always seeks proper behavior in any given situation. Benevolence helps frame the situation while rightness determines the action. In more contemporary terms, righteousness is concerned with "doing the right thing" by focusing on proper conduct.

For the superior person, the benevolent person, the challenge is proper behavior, the expression of one's benevolence, knowledge, and trustworthiness. Benevolence must be guided by the golden rule. Tsze-kung asked, saying "Is there one word which might serve as a rule of practice for all one's life?" The Master

said, “Is not RECIPROCITY (sic) such a word? What you do not want done to yourself, do not do to others” [1]. Reciprocity is multifaceted. A moral individual must try to place himself/herself in another’s position and understand how he/she would want to be treated if roles were reversed. However, before the situation may be appraised correctly, a moral person must have completed a great deal of learning to comprehend fully the requirements of the situation. Reciprocity implies not only a general knowledge of right behavior but also understanding how right behavior applies in the situation, and how the behavior will contribute to the mutual benefit of each individual directly affected in the relationship.

For Confucians, society is composed of hierarchal relationships governed by the individuals in the highest positions, where each person is expected to fulfill his/her role according to social rules. For Confucius, hierarchy was the correct social order where everyone should exist in mutually beneficial relationships. In the traditional society of Confucius’ time, there were five basic relationships: minister/subject, father/son, husband/wife, older brother/younger brother, and friend/friend. Each of these relationships is denoted by names, where each name is itself a relationship between the requirements of the name and the individual’s preparation, willingness, and skill to fulfill the name. The individual must bring moral knowledge as well as the practical knowledge necessary to fulfill the name properly. For example, a minister must have moral knowledge as well as the knowledge of government and the ability to apply both correctly. One without the other would result in the minister acting improperly.

Fan Ch’ih requested to be taught husbandry. The Master said, “I am not so good for that as an old husbandman.” He requested too be taught gardening, and was answered, I am not so good for that as an old gardener. [1]

Confucius understood that society was composed of specialized roles and relationships and that well-managed organizations – states, families – required everyone to understand how roles must be performed and how roles relate to other roles. Roles are always defined relationally, not individually. The minister/subject role is defined by the two names in a hierarchical relationship, and for the relationship to be correctly implemented, both the minister and the subject must behave correctly toward each other. When these names are performed properly, the relationship should benefit all members and the organization should be successful. The following passages illustrate the importance of names:

...the prince be not a prince, the minister not a minister, the father not a father, and the son not a son. Although I have my revenue, can I enjoy it? [1]

1. Tsz-Lu said, “the ruler of Wei has been waiting for you, in order with you to administer the government. What will you consider the first thing to be done?”
2. The Master replied, “What is necessary is to rectify names...”
5. If names be not correct, language is not in accordance with the truth of things. If language be not in accordance with the truth of things, affairs cannot be carried on to success.
6. When affairs cannot be carried to success, proprieties and music will not flourish. When proprieties and music do not flourish, punishments will not be properly awarded. When punishments are not properly awarded, the people do not know how to move hand or foot [1].

Although becoming moral is a personal journey, it is one that takes place in a social context. As Tu Wei-ming suggests “(f)rom the Confucian point of view, therefore, although one can never be truly human if one fails to be sincere to oneself, one can never delve deeply into one’s genuine self-hood if one refuses to manifest sincerity in the context of human-relatedness” [7]. Rather than withdraw into oneself to become moral, one must manifest one’s morality by engaging the world. Consequently, the Confucian superior person is inwardly/outwardly focused. The moral person continues to develop the germs of virtue, in Mencian terms, while remaining very much a part of society. Only through engaging the world can a superior person manifest his/her virtue, be respected, and show moral leadership. The Confucian superior person is a leader by demonstrating good example and the value of proper behavior.

Social intercourse is governed by the rules of *li*, translated as ritual, rites, propriety, or etiquette. *Li* defines the moral person in relationships with others and “it necessarily involves a relationship or a process by which a relationship comes into being” [8]. We might add that it manifests itself not only in developing but also in maintaining relationships. Several passages from the Analects demonstrate the importance of proper behavior:

The Master said, “Without recognizing the ordinances of *heaven*, it is impossible to be a superior man.” [1]

The Master said, “the superior man, extensively studying all learning, and keeping himself under restraint of the rules of propriety, may likewise not overstep what is right.” [1]

The Master said, “. . . Benevolence is the *characteristic element* of humanity, and the great exercise of it in loving relatives. Righteousness is the *accordance of actions with what is right*, and the great exercise of it is honoring the worthy. The decreasing measures of the love due relatives, and the steps in the honor due to the worthy, are produced by *the principles of propriety*.” ([1], italics in the original)

According to Fingarette,

(Human virtue) *Te* is realized in concrete acts of human intercourse, the acts being of a pattern. These patterns have certain general features, features common to all such patterns of *li*: they are all expressive of ‘man-to-man-ness,’ of reciprocal loyalty and respect. . . (M)en are by no means conceived as being mere standardized units mechanically carrying out prescribed routines in the service of some cosmic or social law. Nor are they self-sufficient, individual souls who happen to consent to a social contract. Men become truly human as their raw impulse is shaped by *li*. And *li* is the fulfillment of the human impulse. . . the specifically humanizing form of the dynamic relationship of man-to-man. ([9], italics in the original)

Ivanhoe makes a similar point that *li* is meant to restrain excessive behavior and keep virtue within its proper bounds [8]. In that sense, *li* is a moderating force. It is “(t)he notion that one must recognize that one’s own desires are not preeminent, that an agreed upon and common set of rules takes precedence, is a prerequisite to participation in *any* kind of cooperative enterprise. . .” ([9], italics in the original).

The attitude and capabilities an individual brings to his/her relationships will determine how correctly he/she fulfills his/her role in the relationship, their name in

Confucian nomenclature. Li, therefore, requires an individual to perform in what we might today call a practice: a practice being a prescribed way knowledge, including specialized knowledge, is applied in a given situation. In addition, li also indicates a process by which something of mutual benefit is accomplished when all members of the relationship perform their roles properly. The key terms are mutual benefit through proper individual behavior.

This leads to a discussion of gain. Confucians understand that humans naturally wish to succeed and prosper and there is nothing inherently wrong with this fundamental part of human nature. Indeed, for most situations faced by individuals, this is not only good but welcome. People should go through life seeking fulfillment, satisfying relationships, and so forth. In Confucian terms, this can be called gain. If a person develops good character, applies virtue in everyday life, fulfills their name properly, they, as well as those with whom they have relationships, should benefit as well. In many respects, this demonstrates an elegant simplicity in Confucian ethics. Good people trying to do good will most often succeed. Gain, therefore, may be defined as that which improves an individual's circumstances, where gain is not limited to money because it covers anything that may improve a person's circumstances. The dilemma for the superior person is to recognize those situations where gain will be at the expense of other members in the relationship. In those situations, the individual must behave properly even if the outcome would affect him/her negatively.

“Your Majesty,” answered Mencius. “What is the point of mentioning the word ‘profit’? All that matters is that there should be benevolence and rightness. If your Majesty says ‘How can I profit my state?’ and the Counsellors (sic) say, ‘How can I profit my family?’ and the Gentlemen and Commoners say, ‘How can I profit my person?’ then those above and below will be trying to profit at the expense of one another and the state will be imperiled...” all that matters is that there should be benevolence and rightness... What is the point of mentioning then word ‘profit’? [4]

Similarly, Mencius argued:

Now if you should practice benevolence in the government of your state, then all those in the Empire who seek office would wish to find a place at your court, all tillers of the land to till the land in outlying parts of your realm, all merchants to enjoy the refuge of your market-place, all travelers to go by way of your roads, and those who hate their rulers to lay their complaints before you. This being so, who can stop you from becoming a true king. [4]

This quotation illustrates names, relations, as well as wealth production. Surely, the merchants expect to make a profit in the marketplace. It also illustrates the critical role leaders play in hierarchical relationships. For Mencius, as well as Confucius, in hierarchies, moral leadership at the top is imperative. As Confucius remarked, “The mind of the superior man is conversant with righteousness; the mind of the mean man is conversant with gain” [1].

Proper action is rightness. When faced with a situation where the individual will benefit at the expense of others, the superior person will avoid this outcome and chose to act in a way that will not harm others, even if it is at his own expense.

This brings us to a discussion of Confucian harmony. In the metaphysical sense, harmony is the alignment of heaven, earth, and man into the “mandate of heaven.”

While there are no stirrings of pleasure, anger, sorrow or joy, the mind may be said to be in a state of EQUILIBRIUM (sic). When those feelings have been stirred, and they act in their due degree, there ensues what may be called the state of HARMONY. This EQUILIBRIUM (sic) is the great root *from which grow all the human actions* in the world, and this HARMONY (sic) is the universal path *which they all should pursue*.

Let the states of Equilibrium and harmony exist in perfection, and a happy order will prevail throughout heaven and earth, and all things will be nourished and flourish. ([1], italics in the original)

In this condition, all relationships are being fulfilled correctly and everything is in its proper balance. It is the condition human beings should strive to achieve. This illustrates the essence of harmony. It is about organizing and bringing different parts into cooperative relationships. Harmony is not only about similarity; it welcomes difference and diversity, so long as the different and diverse seek cooperation for mutual benefit [10].

In the early Confucian Classics, harmony is illustrated by music. Many different instruments playing together are needed to make music. Each instrument makes a different sound and must be played by a skilled musician. In music, difference can be combined to make harmony so long as the musicians understand musical principles and are willing to apply them in a cooperative effort for the mutual benefit of musicians and audience. If we continue this analogy, one musician and instrument can make harmony by playing different musical notes correctly and several musicians and instruments can achieve a similar objective by acting similarly. In life as in music, individuals should strive to behave correctly and seek harmonious relationships for mutual benefit.

However, life is not so simple that in all situations individuals understand and accept an objective and are willing to work together for its achievement. Conflict is a part of human life. Confucians understand this also. Conflict exists and must be managed successfully. Often, Confucianism is presented as favoring harmony above all else. This is a stereotypical interpretation. Although harmony is an important Confucian value, Confucian ethics recognizes disagreement and debate and provides methods of conflict management [11]. Reasonable people often disagree about many things. What is important is an individual’s approach to conflict and disagreement. If disagreement and debate is approached in the spirit of trust, cooperation, and mutual benefit, character traits fundamental to Confucianism, then self-improvement, relationship development, and mutual benefit can emerge in a “dialectal” process of interaction. Harmony, while a significant objective in human relations, must not be achieved by sacrificing benevolence and righteousness, two important Confucian virtues. Nothing, not even harmony, supersedes them. The cardinal virtues of benevolence and rightness are of supreme importance and cannot be superseded by harmony, ever.

Finally, Confucianism is a leadership ethic. A superior person is always a leader. By demonstrating proper conduct, the superior person is a role model and worthy of

emulation, regardless of his/her social status. However, since social relationships are hierarchical, it is critical for those in positions of power and authority to be moral. Confucianism is both an ethical and political philosophy founded upon power and governance. As the Great Learning and the Doctrine of the Mean make clear, harmony is based upon the control of power through the proper governance of the self, the governance of institutions, and the governance of the state. Tue Wei-ming labels this the fiduciary society [12]. A fiduciary society is one governed by proper moral relationships based upon rituals and names which is beneficial for all members. Proper moral preparation and leadership are essential to the success of society and require institutional and political leaders to demonstrate moral behavior through benevolence and rightness. Indeed, it is only within proper moral relationships that a person becomes truly human.

Confucian Ethics and Business

Business ethics based upon Confucianism is a very different view of the way business should perform its economic and social roles than free market capitalism so prevalent in the United States and elsewhere. Fundamentally, free market capitalism requires minimal law and regulation to protect private property and market integrity [13]. It emphasizes market discipline and profit maximization, and its stress on individual liberty increases individual responsibility. While most ethical systems require individual choice, where individuals must solve moral questions according to its precepts, free market capitalism demands that individuals choose their moral system prior to addressing moral dilemmas [14]. So long as everyone accepts the agreement to respect individual liberty, private property, contracts, and the free market, they are free to select any ethical system because the freedom to choose one's desires and ethics is fundamental to liberty. At first blush, this may seem innocuous, yet it may open up numerous opportunities for abuse. If an individual selects personal gain as his/her overriding desire or a firm views customers as merely a source of revenue and profit, excessive behavior may result. If individuals comply with the letter and not the spirit of the law, then it opens a wide area of problematic behavior. It can justify "gaming the system" for personal benefit, and for some, it could allow questionable behavior to become rightness.

A business ethic based upon Confucianism would be radically different from one based upon free market capitalism. Before we discuss the basic characteristics of business, a discussion of organizational culture is important. Louis V. Gerstner, retired chairman of IBM, considers the development of organizational culture as one of the most important managerial tasks [15]. Culture is an all encompassing term denoting the basic beliefs, values, and symbols of an organization. While culture may vary by organization and industry, it represents a fundamental characteristic of an organization and provides guidance for member behavior. In this sense, management is correct to focus on culture. A culture supportive of the firm's mission and activities contributes significantly to success as both a managerial

leadership and controlling tool. Therefore, a business organized according to Confucian principles would develop a culture of ethical behavior based upon self-improvement, the virtues, trust, and the golden rule and encourage mutually beneficial relationships. Moreover, this firm would value employees as more than economic inputs and customers as a source of revenue. Both would be viewed as individuals worthy of moral consideration, respect, and trust. Culturally, it would view these relationships as deserving cultivation and mutual success and would focus on long-term success based upon these key associations.

It is difficult to underestimate senior management's role in the corporate governance. Management is the leadership group that determines the principles at the foundation of the organization. It charts the future direction of the organization, identifies and allocates resources, and shapes the behaviors of employees and others dependent upon the organization for success. Managerial decisions made and behavior displayed send powerful messages about values, expectations, and the role of the organization in industry and society. It is important that management, especially senior management, acts correctly. They should exemplify proper behavior by exhibiting the Confucian virtues and wanting the best for employees, suppliers, and customers.

Business organizations have distinct characteristics. They are hierarchical, mission-focused special-purpose entities. Management applies the principles of division of labor to effectively organize resources to accomplish the business mission. Division of labor requires organizational activities to be separated into specialized tasks, which are then organized into roles, relationships, and functions. Organizations can be understood, therefore, in terms of their mission, skills, and functions (finance, marketing, manufacturing, etc.). Although these are important, organizations are populated by people in relationships, and through relationships, people perform the work that contributes to firm success. Confucianism's focus on mutually successful relationships based upon the virtues of benevolence, reciprocity, trust, and respect is an appropriate foundation for business relationships.

Managerially, relationships can be approached strategically and operationally. Strategy is concerned with the long-term future success of an organization. According to Porter, strategy is about uniqueness and difference, the ability to do different things or the same thing differently in a way that confers competitive advantage [16]. It is based upon the knowledge and understanding of a firm's internal and external environments and how they relate to each other in a way that positions the company for long-term success.

Externally, a firm needs relationships with customers, and this may be the most important relationship since customers justify the firm [17]. Without customers, there is no need for the business. The business/customer relationship should be founded fundamentally on trust and respect. It is also based upon knowledge. Knowledge is important in the contemporary world, and it places the firm in the more influential position in the relationship. Knowledge in one sense is about fulfilling customer needs satisfactorily. It means honesty and a fair offering in quality and price. It means seeking the proper balance so that the interests of the organization do not take precedence over the customers. Perhaps, more

importantly, knowledge places a greater burden on the firm. In most firm/customer relationships, the firm has greater knowledge than the customer. How many passengers know the plane they are about to take is properly maintained? How many customers in supermarkets or restaurants know that their food is handled properly? In many, if not most, consumer relationships knowledge is asymmetrical in favor of the business. Therefore, if the relationship is to be mutually beneficial, the business must be trustworthy and act benevolently and correctly.

In addition to customer knowledge, a firm needs to understand its environment in detail to ascertain information about current trends in areas such as technology, demographics, and competition so it can understand what capabilities it needs for its future success. Strategy is thinking about the future to identify what needs to be accomplished and taking the proper actions to secure it. Success is based upon the ability of the firm through its marketing, product design and development, production, and distribution capabilities to offer competitive products and services. This ability is based upon competencies.

The diversified corporation is a large tree. The trunk and major limbs are core products, the smaller branches are business units, the leaves, flowers and fruit are the end products. The root system that provides nourishment, sustenance, and stability is the core competence. . . . Core competencies are the collective learning in the organization, especially how to coordinate diverse production skills and integrate multiple streams of technology. . . . If core competence is about harmonizing streams of technology, it is also about the organization of work and the delivery of value.

. . .The skills that together constitute core competencies must coalesce around individuals whose efforts are not so narrowly focused that they cannot recognize the opportunities for blending their functional expertise with those of others in new and interesting ways. [18]

Competencies are more than the capabilities of employees to accomplish their assigned tasks in ways that contribute to current and future success. It requires both management and employees to develop into thinking and learning individuals and mentors worthy of emulation in the Confucian sense. Furthermore, management must understand that management is a distinct competency that must be maintained and developed because management by their example sets the character of the organization.

While employee skills are important, competencies transcend individuals who are properly organized into relationships among several people and functions. A successful product, for example, is the result of marketing, product design and development, production, and distribution competencies working in harmony. Each competency is composed of individuals, names, willing to act cooperatively in a series of activities in a prescribed manner. Following Ivanhoe and Tu, li is the process by which these activities come together into mutually beneficial relationships. In business, li should be understood as a practice. A business organization is based upon division of labor where individuals performing related activities work together to achieve something of value to the organization and its customers. Each member is expected to successfully complete his/her tasks correctly so the next person in the sequence of activities can complete his/her work properly. The various tasks must be arranged in such a way so that the overall objective is

achieved efficiently and correctly. To do so, each member must willingly cooperate to perform his/her tasks to the best of his/her ability according to a prescribed method. It is management's responsibility to ensure that the competencies are properly organized. Both management and employees are responsible for maintaining and improving skills so that competencies remain relevant to organizational needs.

Confucian ethics requires individuals to behave cooperatively to secure mutual benefit. In this sense, Confucianism can give ethical meaning and value to the activities of all individuals within the organization and contribute to overall organizational success. Moreover, it can contribute to the understanding of the contemporary idea of empowerment. A Confucian, however, would use the term responsibility instead of empowerment. Fundamental to Confucianism is the idea of responsibility. Individuals are responsible to do their name properly. Responsibility requires preparation, learning, understanding, and keeping one's word. It demands that an individual participates in collective activities in ways that contribute to success for all members in the relationship. In short, individuals are required to fulfill their responsibilities (names) responsibly. In this sense, employees have always been empowered to do their jobs correctly.

Some may see the role of individualism as an issue in Confucianism because Confucianism may be interpreted in a way that reduces individualism. Since Confucianism is based upon roles and relationships, individuals are required to subordinate themselves to organizational objectives to the point where their individualism is completely circumscribed. That is quite possible, especially in those organizations where harmony and obedience to superiors are valued above all else. It need not be and should not be so. Confucianism requires the proper balance in life. All organizations require some subordination of individuals to the needs of the organization in order to achieve collective objectives. This is true regardless of the ethics underpinning any organization, if collective objectives have any chance to be achieved.

Fundamentally, management should want the best from and for their subordinates. This is, perhaps, the essence of benevolence. If management has selected and trained employees properly, they should provide the conditions where the employee can develop and contribute to the success of the organization. This should mean at a minimum that employees should be able to apply their skills and knowledge to the tasks at hand in the context of their personality and individuality. Employees who are comfortable in what they do and satisfied when doing it are more productive and easier to manage. There are times of conflict, however. Conflict and disagreement are commonplace and productive sometimes. Disruptive conflict, such as personality clashes, must be recognized and addressed swiftly so that the smooth functioning of the organization is not damaged. These can be handled through additional training, coaching, or transfer. Disagreements over how business objectives should be achieved are helpful and contribute to organizational success. Discussion and debate over how best to design, produce, or distribute products or what markets to enter should be encouraged. Effective management should elicit ideas from subordinates to improve the business. The absence of disagreement is a false harmony

and a threat to the business. Everyone involved should keep in mind Mencius' admonition to act benevolently and correctly in all they do, including disciplinary actions and business discussions.

Furthermore, a Confucian would consider a discussion of workplace democracy as meaningless. Hierarchical organizations are by their very nature undemocratic. Important business decisions should not be put to a vote. Choosing a mission, strategy, markets, etc., is the responsibility of senior managers. Should management craft an organization which allow employees to develop contribute and participate effectively, surely. To allow employees to run the business would be an abdication of responsibility by management.

External relationships are equally important to business success. The totally integrated firm of the early twentieth century has been replaced by the smaller organization focusing on core competencies. Today, businesses depend upon a supply chain composed of other companies providing critical inputs, whether it is IT services, components, or other critical skills and competencies. The contemporary supply chain, therefore, can be conceived as a dependency chain where each company in the relationship depends upon other companies for success. If mutual benefit and success are to be realized, each member in the relationship must be willing to make the necessary contribution regardless of the organization to which they formally belong. Successful supplier relationships must rest on benevolence, reciprocity, knowledge, trust, and living up to one's word.

Firms have other associations in addition to supplier relationships. They deal with outside civic and issues-oriented groups, governmental organizations, and competitors. While the foundation for successful supplier relationships may seem clear, it is less so for the others. In some situations, the relationship may seem adversarial. Sometimes, issues-oriented groups may disagree with a firm's practices or products, regulators disagree over compliance, and competitors wish to compete successfully. The behavior of all of these will impact the firm. However, similar to internal and supplier relationships, these should be viewed as learning opportunities for everyone in the relationships. In all cases, firms must interact with benevolence and rightness. Business organizations and business people are always leaders, and leaders should show good example. With civic and issues-oriented groups, the situation may require an educational approach or simply to agree to disagree. Confucianism does not require uniformity; it does demand respect. Diversity, including diversity of opinion, is welcome. With regard to regulation, Confucianism expects compliance with both the letter and spirit of the law. If a firm disagrees with a law or regulation, it should present a reasoned disagreement and not one based purely on self-interest. Firms should be expected to make a contribution to the larger society and not pursue self-interest exclusively.

Relationships with competitors are critical, and few business ethicists offer much in the way of ethical analysis of competitor relationships. Competition is a threat, but it is also an opportunity. Competition is necessary to market economies. It is also useful to self-improvement. It is through the competitive process that firms adapt to their environments, new products and innovation are tested, and competitive advantage develops. A Confucian approach can contribute to

competitive success and advantage. Confucianism is a demanding ethic. It requires constant learning and self-improvement. It requires engagement with the outside world and demands benevolence and righteousness in all relationships. If competition and competitors are approached correctly, a firm may be viewed as worthy of emulation by others. More importantly, it will be on the road to long-term competitive advantage. As Michael Porter suggests, effective strategy and long-term competitive advantage are not found in copying others. That is the road to marginal success. Long-term competitive advantage is the result of doing things that are difficult to copy [16]. It is about innovation and being unique. Long-term success is about thinking and learning and executing for success in the marketplace. It is based upon understanding the environment and preparing the firm. It looks externally but prepares internally. If it is done well, the firm will be well along the path to success.

The entrepreneur, whether working alone or within an organization, recognizes opportunity. From the steam engine to the internet, humanity has benefited from the entrepreneur and innovator. According to Schumpeter and other members of the “Austrian School,” entrepreneurial discovery is the mechanism of economic change and new wealth creation [3]. The entrepreneur, through innovation, creates new products, services, or different ways of producing value (e.g., Toyota’s just-in-time manufacturing system). The entrepreneur need not be the rugged individual laboring in the garage to bring a new invention to market. In the contemporary world, while there is still room for some of these individuals, invention and innovation take place within organizations, both large and small. Successful innovation is the result of the disciplined application of knowledge and investigation [19]. For an invention to be an innovation, it must be commercialized and achieve marketplace acceptance, that is, customers see value in the innovation. Innovation can be positive for the innovator, the firm, and the customer. In this sense, all three plus the market and society can be beneficiaries through the process of economic change and wealth creation. Schumpeter labeled this “creative destruction”: the process through which, in a competitive market, new products and processes replace others and create new wealth. The innovator can become wealthy, the organization successful, and the customer better off. In this sense, innovation is positive and presents no moral dilemma.

The introduction of something new may pose moral dilemmas. Some product innovations, while profitable to some, may be harmful to customers and society. Process innovations may cause the elimination of the work of individuals or whole departments. The first one is the less difficult to address from a Confucian perspective. As Mencius admonished the king, one must choose rightness in this case and not harm others for personal gain.

The second dilemma is more difficult. Innovation may be incremental or transformational. Incremental developments are gradual and allow management to adapt and implement change gradually. Transformational change is, perhaps, the most extreme manifestation of creative destruction. These changes often revolutionize processes, industries, and societies [20]. Transformational change is fundamentally different and, as Christensen argues, presents the greatest managerial challenge because it requires management to make fundamental choices about the future

direction of the firm [20]. It may require a fundamental restructuring of the firm and a reevaluation of its position in an industry.

Management, especially senior management, is responsible for the care and feeding and success or failure of the business. Transformational products represent a fundamental threat to the business, whether they have been created in-house or by a competitor. In many respects, this is the innovator's dilemma, when to recognize the challenge, embrace something new, and turn the challenge into an opportunity. If not addressed properly, the situation may result in the inability of the firm to satisfy its customers and be profitable in their chosen market. If that is the case, what it is currently doing is incorrect. The solution, from a Confucian perspective, is for management to rectify the situation and reestablish proper relationships and correct the situation effectively and morally.

There are many ways to address transformation, and a thorough discussion is beyond the scope of this presentation. Fundamentally however, management must understand the situation and apply knowledge properly. To wait too long may be fatal and no self-respecting manager should wish to preside over the failure of the business. The Great Learning provides a good starting point. "Things have their root and their branches. Affairs have their end and their beginning. To know what is first and what is last will lead near to what is taught in *the Great Learning*." To execute his/her name well, the successful manager, when facing management challenges, will be prepared, understand the situation, and be capable of wisely leading the organization. If the need for change is recognized early enough, organizational change will be less traumatic. The longer the situation goes unrecognized or remedial actions postponed, the more painful the process. Indeed, the more upheaval to the organization and its members needed to rectify the situation may indicate managerial failure.

The organizational adjustment necessary to address fundamental change requires hard work, the development of new relationships and commitment to the long-term health of the business. Fundamental change often has negative consequences for some. Sometimes, it requires reassignment into different roles and positions. It may mean having people leave the business. However, the organizational challenges of a growing business are fundamentally different than the ones facing an organization under stress. It is far easier to be benevolent in periods of success than decline. In any event, moral requirements should not change when circumstances do. The correct person is benevolent at all times. This is required of all members of the organization, not just management. Management should separate employees as a last resort. Other options such as transfer and retraining may be available. Layoff is an extreme measure and may be necessary. It should not be used merely to boost profit. Similarly, those who can leave the business without much hardship should be benevolent. These may include employees interested in career change, retirement, or other personal circumstances and desires.

The reader might object that what is presented here is an ideal version of Confucian business ethics. Things can go wrong in a well-managed firm populated by employees with good intentions or as a Confucian might say, the mandate of

heaven is difficult to achieve but lost easily. Markets can be misunderstood and good products can fail. The example of the New Coke comes to mind quickly. Coca Cola, a well-managed firm with good market knowledge, failed to understand customer commitment to Coke Classic when they withdrew the original product with the launch of New Coke. Based on customer reaction, Coca Cola quickly reintroduced the original formula product.

Another objection might be that Confucianism depends too much on individual virtue to the neglect of law and regulation. Indeed, most ethical systems require individual responsibility and morality. Ethical behavior without ethical people is a contradiction. Granted, Confucianism places significant demands on individuals. Even Confucius understood this as the following passages suggest:

The Master said, “The superior man thinks of virtue, the small man thinks of comfort. The superior man thinks of the sanctions of law, the small man thinks of favours (sic) *which he may receive.*” [1]

The Master said, “If the people be led by laws and uniformity sought to be given them by punishments, they will try to avoid the punishments, but have no sense of shame. If they be led by virtue, and uniformity sought to be given them by the rules of propriety, they will have a sense of shame, and moreover will become good.” [1]

Ip raises the important issue of whether virtue alone is sufficient to create ethical firms because of the tendency of leadership to govern in their own interests [21]. This is a significant challenge. Confucians understand the need for law and other mechanisms to regulate human behavior. However, virtue, as Ip recognizes, is a necessary foundation. As the regulatory environment changes through globalization, it may be the best we can get if and until there is a global economic regulatory regime.

One might say that Confucianism places too much responsibility on individuals. Well-managed ethical organizations require well-intentioned employees. This is especially true in contemporary firms dependent on knowledge workers who possess specialized knowledge and skill. To a very large extent, management depends upon these employees to execute their responsibilities correctly.

Employees, can make errors. Error-prone employees, however, must be retrained, reassigned, or removed. Furthermore, Confucius understood that people are not equally capable and have different capacities for acquiring knowledge and assessing situations. As Confucius remarked, “In archery it is not *going through* the leather which is the principal thing;— because people’s strength is not equal” [1]. To address this challenge, management must assess employee capabilities so their strengths are utilized and weaknesses minimized. In addition, there should be a system of redundancies designed to identify errors before products, reports, and other outputs are released as well as procedures to address errors afterward. Toyota, for example, took too long to implement corrective action after the unintended acceleration issue became known. The recall was more expensive, highly publicized, and fines were paid. Prior to this situation, Toyota had a spotless reputation. It is unclear what the future market effect of this management failure will be on the firm.

Furthermore, Confucius was aware of the need for laws, rules, and regulations. There are, for example, many references in the Analects to the rules of propriety. Laws regulate behavior and help make life predictable. Rules and regulations are necessary to the smooth operation of organizations as well as the proper application of specialized knowledge. Professions such as law, medicine, engineering, and accounting have specialized rules and qualifying examinations as well as professional organizations responsible for maintaining the effectiveness and applicability of the rules of professional conduct. Confucius would agree that these are necessary with a very important caveat: for laws to regulate behavior and professional knowledge to be applied correctly, sincere individuals are necessary to good societies and organizations. Good laws require the respect of good people and good people require promulgation of good laws. As (t)he Master said, "In hearing litigations, I am like any other body. What is necessary, *however* is to cause *the people* to have no litigations" [1]. The same may be said of rules and regulation. The effective reduction of these is contingent on the presence of good people.

Two additional objections must be addressed: strategy and innovation. The fundamental responsibility of management is the long-term success of the firm. This demands the development and execution of a successful strategy. Understanding markets and consistently offering successful products are high bars, and history is filled with once successful companies that failed to adapt and perished. This fact does not invalidate the need for good strategy and management. Neither does it absolve management from a sincere effort to offer quality product and services at a fair price. Instead, it makes the point. For argument's sake, understanding that we are actually describing human relationships, we can conceive of the firm as a series of relationships among customers, competitors, suppliers, and employees. The fundamental objective of every firm is long-term market success. Short-term success is possible with shoddy products and limited market knowledge by the firm and customers. Some companies are bottom feeders.

Long-term success requires hard work. At the center is the firm, composed of employee relationships. Connected at one end are the various supplier relationships and at the other are customer relationships. All of these relationships are essential to firm success and must be managed effectively and properly. These are essentially reciprocal relations. The Confucian virtues and the golden rule can provide a solid foundation and effective guidance. These relationships should be approached with sincerity, benevolence, and reciprocity. For example, a firm should approach its supplier relationships with the attitude of improvement – that is, quality, efficiency, and effectiveness – and paying a fair price for supplies. Increasing quality is usually good, and a fair price helps insure a viable supplier. Some firms foolishly demand price reductions that marginalize their suppliers and jeopardize their own well-being. Similarly, customer relations should be sacrosanct for the simple reason that without customers, there is no justification for the firm. Consequently, the firm must understand both current and future customer needs. This requires solid market research to understand the marketplace and the development of products and services designed to address the requirements of the various customer segments.

If this is done correctly, success will follow, if not, failure will ripple through the organization and its supply chain.

A firm should approach the market and its customers with the virtues of benevolence, sincerity, and reciprocity. If market research and segmentation are executed well and good market knowledge acquired, the firm should develop products and services that meet the wants and needs of its current and potential customers. As Peter Drucker observed almost 60 years ago:

Marketing is so basic that it is not just enough to have a strong sales department and to entrust marketing to it. Marketing is not only much broader than selling, it is not a specialized activity at all. It encompasses the entire business. It is the whole business seen from the point of view of its final result, that is, from the customer's point of view. [17]

If the products and services meet customer needs, they will buy. If a firm's market offerings are based on long-term competitive advantage, the opportunity for success increases and competitive pressures are mitigated.

There is no question that innovation has contributed to firm success and individual well-being. The argument here is that a moral dimension should be added to the economic analysis. To say that an innovation is good simply because it increases wealth seems insufficient. Confucianism may be helpful here. Schumpeter argued that the innovator is entitled to the wealth created by the innovation. By the same token, should the consumer of the innovation expect some benefit also? Furthermore, should the innovator take into consideration the impact of the innovation on others and not focus only on the benefit to himself/herself? If that is the case, the Confucian virtues of sincerity and benevolence as well as the golden rule can provide moral guidance.

Finally, if the fundamental objection is that it is difficult to be a superior person, the Master might respond: Difficult? Difficult, indeed!

The Master said, "In the way of the superior man there are four things, to not one of which I have yet attained—To serve my father as I would require my son to serve me: to this I have not yet attained; to serve my prince, as I would require my minister to serve me: to this I have not yet attained; to serve my elder brother, as I would require my younger brother to serve me; to this I have not yet attained; to set the example in behaving towards a friend, as I would require him to behave to me, to this I have not yet attained." [1]

The Case of the Financial Services Industry Meltdown

The financial services industry crisis demonstrates many of the shortcomings of free market capitalism. A centerpiece of free market capitalism is market discipline where the market will not only discipline those firms which fail whether it is financially, strategically, or ethically, but also serve as a warning to other firms. However, punishment for failure is usually after the fact. The threat of future market discipline may be insufficient to limit behavior that risks the firm. The collapse of the US financial service industry demonstrates the inability of market discipline to curb destructive behavior. Indeed, an argument can be made that

market discipline encouraged risky behavior and when firms were faced with collapse, the government intervened because these businesses were “to big to fail.”

One number alone demonstrates the severity of the collapse of the US financial services industry. According to the Financial Crisis Inquiry Commission:

(n)early \$11 trillion in household wealth has vanished, with retirement accounts and life savings swept away. . . . The crisis was the result of human action and inaction, not Mother Nature or computer models gone haywire. The captains of finance and the public stewards of our financial system ignored warnings and failed to question, understand, and manage evolving risks within a system essential to the well-being of the American public. [22]

The report goes on to argue that a significant portion of the crisis was caused by failures throughout the financial services industry supply chain [22]. As argued earlier, supply chains are dependency chains made up of various relationships among firms who rely upon each other for success. These relationships depend upon individuals to perform their tasks in ways that contribute to the mutual benefit of all members in the relationship.

Many of the innovations from the financial services industry, from no verification statement only mortgage applications through collateralized debt obligations and structured investment vehicles, hid the increasing risks in the derivatives and mortgage-backed securities business. Furthermore, securities rating firms moved from an arm’s length relationship with securities issuers to one where they wanted to please their investment bank customers with the investment ratings they desired – Triple A in many cases. These highly rated investments were purchased by pension funds and others investors, who by law were required to purchase “safe” investments. The investment engineers who created the investment vehicles sought zero correlation, a situation where if one security might fail, other related securities would not. “One obvious flaw of this approach is that nowhere in the process was anyone required to conduct real-world due diligence about the underlying mortgages” [23].

The investment banks approach to business changed during the run-up to the financial crisis. Their business model evolved from placing the customer first to one where they would invest for the house, make investments for customers, and make investments against customers for other customers or the house. The traders made money in any case regardless of the impact on customers.

For the most part, it all began with mortgages. No doubt there were honest applicants and brokers who matched customers to good products. However, the money was made in the numbers of mortgages sold, which would then be placed in structured investments and sold to investors. Since the game was volume, brokers with few scruples placed applicants, especially refinance customers, into unaffordable subprime mortgages. According to BusinessWeek, the process was so corrupt that documents were fabricated and sex and bribes were offered by brokers and wholesalers to secure mortgages [24]. These were then packaged and sold to customers who thought they were obtaining highly rated, low-risk investments.

In the final analysis, the financial crisis is the story of a culture of uncontrolled greed and managerial and employee ethical failure at all levels. Had Confucian

ethics been in place, much was possibly mitigated. While Confucianism cannot prevent the unfolding of the business cycle, the vagaries of the market, and unknown risk, following the precepts of Confucian ethics can assist the management of the firm. Furthermore, applying Confucian ethical prescriptions can reduce the number and mitigate the severity of self-inflicted wounds.

Confucius said, “Listen to this my little ones. When clear the water washes the chin-strap, when muddy it washes the feet. The water brings this difference in treatment upon itself.” Only when a man invites insult will others insult him. Only when a family invites destruction will others destroy it. Only when a state invites invasion will others invade it.

The T'ai chia says,

When Heaven sends down calamities
There is hope of weathering them;
When man brings them upon himself
There is no escape. [4]

In 2002, 8 years before the collapse of the financial services industry, none other than Warren Buffett understood the risks of the new financial innovations. “In our view, however, derivatives are financial weapons of mass destruction, carrying dangers that, while now latent, are potentially lethal” [25]. The financial service crisis was indeed a man-made calamity.

Cultures built on benevolence, trust, and mutually beneficial, reciprocal relationships among all members can help individuals adopt the proper attitudes and behaviors. A focus on customer benefit rather than personal gain would have helped the appropriate execution of responsibilities. Realizing that names denote how tasks and relationship must be fulfilled properly and understanding that individuals and firms must place wealth creation and customer benefit first can point everyone involved to the proper solution. This knowledge might not have prevented everything. It could mitigate the large amount of wealth destruction which resulted from the financial crisis.

Conclusion

Confucian ethics is appropriate for business organizations. Confucian ethics is based upon knowledge, hierarchy, individual responsibility, reciprocity, and virtues of benevolence, trust, and rightness. Confucian ethics fits the fundamental characteristics of business as specialized, wealth-producing, single-purpose entities based upon hierarchical relationships. Confucian ethics when applied correctly can contribute to ethical business behavior and firm success.

Confucian and Legalist Basis of Leadership and Business Ethics 50

Kwang-Kuo Hwang

Abstract

In view of the fact that a company may develop its corporate culture by utilizing the resource of cultural heritage where it is situated, this chapter traced the historical origins of Confucianism and Legalism, discussed their theories of leadership and organization, proposed a conceptual scheme for comparing the five major aspects of Confucianism and Legalism, and used it to interpret the cultural dynamics for some historical episodes. A critical review over findings of pervious research indicated that most issues related to the establishment of business ethics in contemporary Confucian societies can be interpreted in the context of current conceptual scheme.

Introduction

This chapter is aimed to discuss the philosophical foundations of leadership and business ethics in Chinese societies. In their empirical research designed to explore the philosophic foundations of business management, Cheung & Chan [9] interviewed five eminent corporate executive officers (CEOs) in Hong Kong. Their dialogues revealed that the CEOs practice a style of Chinese leadership synthesizing Confucian, Daoist, Mohist, and Legalist doctrines. The Confucian doctrines advocate benevolence, harmony, learning, loyalty, righteousness, and humility. They are the most prevalent tenets that support paternalism and collectivism. The Daoist doctrines emphasize flexibility and reversion (e.g., the principle that the weak can defeat the strong). They bolster the leader's forbearance. The Mohist doctrines underpin thrift and working with the masses, whereas the Legalist doctrines inculcate self-control and innovativeness.

K.-K. Hwang

The contents of those philosophical tenets can certainly not be exhausted by the aforementioned values. When an individual encounters problem in his lifeworld, he may try to seek for adequate wisdom for action from his personal stock of knowledge to solve the problem. Each traditional school of philosophy contains an ideal concept of person, as well as its accompanying wisdoms for action which can be utilized to solve various problems in their lifeworlds. In addition to these traditional philosophies, a Chinese CEO may also use Western knowledge of management to practice the task of business administration.

Viewing from the perspective of social science, the most important cultural tradition that may contribute to the leadership and business ethics in contemporary Chinese society is Confucianism and Legalism. Hence this handbook is designed to elaborate the philosophical foundations of business ethics in various societies over the world, this chapter will begin by a brief biography for Confucius and Hanfei, the founder of these two schools respectively. The foundation of their thoughts will be discussed within the context of their era, special attention will be paid to the interplay of these two philosophical schools in Chinese history. A conceptual scheme will be proposed to expound its influence on leadership and business ethics in contemporary Chinese societies.

Confucius' Era and His School

As a major school of philosophy, Confucianism was emerged and founded in a tumultuous and chaotic age in Ancient China. In the earlier Zhou dynasty, the rights and duties of the ruler and his vassals were clearly defined by a feudal system. During the Western Zhou period (1027–771 B.C.), the sovereign not only commended universal and tribute among his vassals, but also exercised considerable control over their social affairs. He might even punish an offending vassal with armed force. After Zhou capital was invaded by barbarians in 771 B.C., the ruler fled and established his court at Loyang in the East. The power of the Eastern Zhou dynasty waned rapidly, and the rulers of the feudal states were left with increasing freedom to ignore their customary duties to the sovereign and to expend their territories and domains of power.

Confucius' Era

Confucius (551–479 B.C.) was born in the State of Lu (now Shandong province) during the tumultuous period of Spring and Autumn (772–484 B.C.). His father, a mid-rank official, died when he was 3 years old. Confucius worked as a shepherd and as an accountant for a noble family. He was very interested in the rites and institutions that prevailed in earlier period of Zhou dynasty, and devoted himself to study the traditional culture of Zhou. During Confucius' life time, feudal princes were frequently trying to usurp the throne. So he hoped to restore social order by advocating a return to a morality of loyalty and the ethical system of filial piety.

Confucius began his career as a public teacher since his age of 22. His fame gradually increased, and it was said that he attracted 72 disciples and more than 3,000 students, which earned him a good reputation and made him famous [1].

Confucius identified himself as an educator whose mandate was to rectify the world by teaching virtues. In attempting to restore the feudal social order of the early Zhou dynasty, he spent a lot of time researching and recording rites and music for ceremonies and other occasions expressing one's dedication to family, country, and state. He also edited poems and classics collected from various states, including Lu, Zhou, Sung, and Chi. He wrote a history of Lu entitled *Spring and Autumn* and annotated ten supplements to the *I-ching*. All of these were used as materials for teaching his students [60].

Confucian Ethics

In order to restore the feudal social order of the early Zhou dynasty, Confucius advocated an ethical system centered on the concept of benevolence (*ren*). His doctrine was enriched by Mencius (372–289 B.C.) and Shiun-tze (315–226 B.C.), who added the concepts of righteousness (*yi*) and propriety (*li*), respectively. Benevolence (*ren*) in the Confucian tradition is not kindness or goodness directed to all of humanity including strangers, but is defined as favoring people with whom one has a close relationship. Righteousness or appropriateness (*yi*) refers to respect for those whom respect is required by the relationship, and propriety (*li*) is defined as acting according to previously established rites or social norms.

Confucians advocated five cardinal ethics for the five major dyadic relationships in Chinese society. The obligations that accompany the roles of each of these five relationships are fulfilled by practicing different core values:

What are the things that humans consider righteous (*yi*)? Kindness on the part of the father, and filial duty of the son; gentleness on the part of the elder brother, and obedience of the younger; righteousness on the part of the husband, and submission by the wife; kindness on the part of the elders, and deference by juniors; benevolence on the part of the ruler, and loyalty of ministers. These are the ten things that humans consider being righteous. (Li Chi, Chapter 9: Li Yun)

This passage, which does not include a reference to relationships between friends, promotes the idea that social interaction should follow the principle of respecting the superior, particularly in interactions between parents and children and between a king and his loyal subordinates.

When Confucians were contemplating the ontology of the universe, they did not conceive a transcendent creator as did the Christians. Instead, they recognized a simple fact that each individual's life is a continuation of his or her parents' physical lives and the lives of one's descendants are the derivatives of one's own. Therefore, Confucians proposed the core value of filial piety and advocated for the ideal of "kind father and filial son," which was a prototype for arranging the relationship between "benevolent king and loyal minister." A father should run

a family like a feudal ruler reins a state. Parents are obligated to show their kindness by taking good care of their children, while children are expected to fulfill their filial duties by working hard to pursue goals that are highly valued by the whole society.

Confucian Theory of Leadership

Confucius believed that in order to govern others, one must first govern oneself. So he advocated self-cultivation for everybody, proposed the ideal of sage King, and argued that if the King's personal virtue has developed sufficiently, it may spread beneficent influence throughout the kingdom. He claimed that a ruler's own straightness will have an attractive effect to bring obstinate subjects into line and produce obedience to the governing authority. Therefore, he counseled for the ruler to "just desire the good yourself and the common people will be good." (Analects XII, 19)

To govern a nation by virtue, can be compared to the North Polar Star:
it remains in its place, while the other stars wait upon it (Analects II, 1).

Mencius believed human nature to be inherently good. All human beings possess four incipient virtues: commiseration, shame and dislike, respect and reverence, as well as right and wrong. It was these qualities that gave humans the character of being humans. Therefore, a ruler must govern humanely. With the inherently good mind, a sage King should establish government "that could not bear to see the suffering of the people". The practice of humane government will automatically attract support from the common people, who will submit willingly, rather than needing force to enforce obedience. Furthermore, the magnetism of humane government is so strong that it may extend to the people in neighboring states (Mencius, Kung-sun Ch'au, Part II, 5 & 6).

A ruler "who oppresses his people to the extreme will himself be slain and his kingdom will perish." Mencius advocated that a loyal minister is obliged to rectify the king to rule with humanity. In case when a ruler fails to do so Mencius declared that "he who injures humanity is a bandit him." The populace beneath him have a right to rise in resistance of his despotism and overthrow. Since his kingly status is lost, the act of deposing him is not to be named "regicide," but is simply tyrannicide (Mencius, King Hui of Liang, Part II, 8).

Hanfei's Era and His Thoughts

During the end period of Spring and Autumn, the power of the Eastern Zhou dynasty was too weak to control rulers of the feudal states, they not only ignored their customary duties to the sovereign, but also took any opportunity to expand their territories and powers by conquering and merging other weak states.

Gradually, five powerful feudal leaders emerged. They were eager to influence or even to control the Zhou king and to impose their will on the other feudal lords.

Many intellectuals began suggesting ideas to the rulers on how to attain their goals of state. This historical context fostered the formation of the Legalist school.

As a major school of philosophy, Fa Jia (the Legalist school) emerged during the tumultuous and chaotic age of Warring States Period (403–222 B.C.). Its main thoughts were refined against the cultural background of Confucianism, its contents are in direct opposition to Confucianism in many respects.

Hanfei's Era

Hanfei (280–233 B.C.) was a prince from a royal family in the small state of Han during the Warring States Period. The ruling family of Han had formerly been high ministers in the state of Jin, but they gradually usurped power and divided the territory of Jin with two other noble families to create three new states, Han, Jao, and Wei. The domain of Han was small and its territory located in a mountainous area, so they were constantly threatened by their strong neighbors, especially the powerful state of Chin.

Worrying about the dangerous condition of his own native state, Hanfei devoted himself to studying the course of the rise and fall of a state. Because of his stutter, Hanfei was unable to articulate his ideas with eloquence. He repeatedly submitted suggestions to his ruler, but the ruler ignored his advice. So he decided to take another course and wrote them into a book [40].

Legalist Theory of Leadership

Unlike the Confucians, the Legalists had no interest in preserving or restoring the customs or moral values of the past. Their only goal was to teach the ruler how to survive and prosper in a highly competitive world through various measures of administrative reform, such as strengthening the central government, increasing food production, enforcing military training, and replacing the old aristocracy with a team of bureaucrats.

Based on the presumption that all human behaviors are motivated by a ruthless pursuit of self-interest, Hanfei's theory of leadership was constructed around three core concepts, namely, *shih* (power), *fa* (law), and *shu* (management technique). According to Hanfei's theory, a ruler has to occupy the position of leader with substantial power (*shih*) before he is able to use law (*fa*) and management techniques (*shu*) to manipulate his subordinates [27].

To Hanfei, real power means ability of the position-occupier to utilize tactics of influence by meting out reward and punishment, which was termed as “two handles.” Hanfei advocated that a ruler with power should “hold handles while situated in his position” and manipulate his subordinates by *fa* and *shu* (*The two handles*). *Fa* means law or rules of regulation, while *shu* means skills of manipulation that can be used by the ruler to control subordinates to attain organizational goals.

Though Hanfei argued that *fa* (law) should be initiated by the ruler, he did not think that a ruler should establish law at his own will. Just like other Chinese philosophers of his time, Hanfei believed that the *Dao* (the Way) is the origin and fundamental principle of operation for everything in the universe. An enlightened ruler should realize it and use it as a basis for constructing rules to judge right and wrong.

Hanfei believed that natural law can be established with the consensus of all group members. He suggested the ruler to follow “the order of heaven,” “the fundamental principle of nature,” or “the natural way,” and advised that a smart leader should study carefully the principles of nature operating in the state, and use them as the foundation for constituting rules (*The way of the sovereign*). Because “law is used for regulating ordinary operation” of a state, it must be characterized by such important features as: publicity, objectivity, feasibility, enforceability, universality. Furthermore, all rules should be constituted on the basis of equity rule, or *gongdao*. Therefore, people are willing to follow them without complaint (*The principle features of Legalism*).

Based on this concept of *fa*, Hanfei proposed three main techniques (*shu*) for a ruler to manipulate subordinates, namely, assigning competent talent to the right position, following up the project and checking the results, and evaluating contributions and granting rewards accordingly. He said

Shu means assigning the competent talents to right positions of the government, checking results of performance with what had been stated in their proposals, controlling the power of sparing and killing to evaluate competencies of ministers. Those should be held by a ruler. (Deciding between two legalistic doctrines)

Confucianism and Legalism in Chinese Society

During the Han dynasty, Tung Jong-shu (179–104 B.C.) proposed integrating the two systems with the idea of “making judicial sentence by the Confucian classic of Spring and Autumn” and “utilizing Legalism as an instrument to consolidate the Confucian social system” [11]. Rulers of China began to use Legalist methods to defend their power and position and to control people, but retained Confucian doctrine to educate and discipline people. Chinese society became characterized by the feature of “Confucianism in public and Legalism in private.”

Familism and Nepotism

Confucian ethics for ordinary people proposes a principle of favoring intimates as the formula for distributive justice. This principle demands the decision-maker to distribute resources on the basis of *rendao*, i.e., one should adopt the need rule for interacting with family members, and the *renqing* (affective) rule for interacting with acquaintances in one’s network of *guanxi* (relationships) outside the family. The practice of such ethics may result in familism and nepotism in Chinese society.

The Confucian view assumes that an individual's life is inherited from one's parents as well as one's ancestors, and that the lives of one's offspring are continuous with one's own life, so the family is viewed as an inseparable entity. This is the cardinal component of the ideology of East Asian familism, which is dramatically different from the individualism of Western culture originating from Christianity.

In addition to familism, Confucianism also includes a social philosophy encouraging individuals to maintain harmonious relationships with people outside their own families. Viewed from the conceptual framework of *Face and Favor*, when individuals interact with relatives, friends, or acquaintances within the network of *guanxi*, they must be polite and hospitable. According to the rule of *renqing*, when an acquaintance encounters difficulties, one must behave as considerately as possible and do favors for them as far as possible. By the same token, when individuals receive favors from acquaintances, they must remember to try to reciprocate.

The operation of a *guanxi* network might be either beneficial or harmful to the operation of a firm or a state, depending on the nature of resources involved in the *renqing* event. A leader may utilize *guanxi* to solve many problems; in contrast, the *guanxi* network may become a breeding-ground for nepotism, factionalism, and cliquism in an institution.

Struggle Between Confucianism and Legalism

In contrast to Confucianism, Legalism is essentially an organizational theory formulated in the authoritarian culture of Ancient China. It has been used by many rulers in Chinese history to consolidate their power, while China was in a period of order and prosperity, and the emperor's power was strong and stable. But when Chinese society fell into turmoil and disturbance, struggle between Confucianism and Legalism frequently appeared.

Legalist ways of organization are akin to Western ideas of bureaucracy that became widespread after the rise of capitalism. The cultural traditions of Confucianism emphasizing the values of benevolence and affection (*qing*) are constantly in tension with those of Legalism, which might result in dialectical dispute over political, social, or cultural issues between centripetal and centrifugal elites in the societal center. This constitutes the so-called struggle between Confucianism and Legalism in Chinese history, decision makers in power are frequently urged to make a choice between the *renqing* rule and the equity rule. Even in contemporary Chinese society, the struggle between these two value systems is repeated, and may have direct or indirect influence on the operation of a firm or a state.

A Conceptual Scheme

In order to elucidate the essential nature of the struggle between Confucianism and Legalism, Hwang [26] proposed a conceptual scheme to compare five crucial aspects of these two schools of thought: value orientations, norms for regulating

Table 50.1 A comparison between five major aspects of Confucianism and legalism

	Confucianism		
	Ethics for ordinary people	Ethics for scholars	Legalism
1. Value orientation	Familism	Collectivism	Individualism and collectivism
2. Social norm	Particular <i>li</i> (courtesy)	Universal <i>ren</i> (Benevolence)	Universal law (<i>fa</i>)
3. Distributive rule	Need rule	Equality rule	Equity rule
4. Criteria for distribution	Blood relationship	Membership	Contribution
5. Decision-maker	Paterfamilias	Elite (scholar-official)	Ruler

Source: Adapted from Hwang ([26], p. 26).

social behavior, rules for distributing resources, input factors determining the distribution of resources, and the authority who makes decisions (Table 50.1).

Confucianism advocates a kind of status ethics. It has differing expectations of scholars and ordinary people. For ordinary people, it is enough to practice the *ren-yi-li* ethical system within the domain of one's family and acquaintances. The guiding principle for their social organization is familism, the social norm for regulating social behavior is *li* (politeness), and the decision-maker who holds the power of distributing resources within the family is the paterfamilias. When allocating resources to others, the first thing to consider is the blood relation with the recipient. Resources are frequently allocated according to the need rule.

Confucianism sets a completely different expectation for scholars. It expects scholars to contribute to the world with Dao, and requires them to extend the domain for practicing *rendao* from the individual and family level to greater society; the bigger one's domain, the greater one's moral achievement. While the ideal goal of Confucianism is to attain a peaceful, harmonious world, what a scholar can really do is to actualize *rendao* in a community or social organization larger than the family. Therefore the value orientation of scholarly social behavior can be termed collectivism. According to the Confucian ethics for scholars, the norm for social acts in such a collectivity should be *ren*, all important resources of the group should be allocated according to the equality rule by morally educated scholars, and every member of the group is entitled to an equal share.

As stated in the previous section, when a Legalist leader is assessing how to allocate rewards and punishments to subordinates, contributions to the accomplishment of organizational goals, rather than blood relationships or group memberships, should be considered. Therefore, the guiding rule for their social acts comprises both individualism and collectivism. By recognizing the legitimacy of individual interests and by advocating the universality of legal applications, Legalists are individualists. However, Legalists are collectivistic in the sense that they give priority to organizational and national goals rather than to familism and factionism. A delicate combination of parts of both the Confucian and Legalist traditions was created and maintained in the feudalistic society of Imperial China for hundreds of years.

The Manifestation of Cultural Tradition in Contemporary China

The Cultural Revolution

After the Communists took over China in 1949, they began to strive to replace Confucianism with the ideology of Marxism. During the Great Leap Forward beginning in 1958, most families were reorganized into self-sufficient communes on the principle of egalitarianism in the hope that people would transfer their loyalty from the family to the state [44, 51]. During the Cultural Revolution from 1966 to 1976, the Communists proposed the slogan: “denounce Confucianism and raise Legalism.” People were required to follow the precepts of Marxism, and every act had to be in accordance with the teachings of Chairman Mao Zedong. The Communists claimed that the nature of these movements was the struggle between Confucianism and Legalism or the struggle between communism and capitalism [10, 13, 42]. But, if these movements are examined with reference to the conceptual scheme in Table 50.1, it can be seen that in fact they are struggles between Confucian ethics for ordinary people and those for scholars. The Communists attempted to replace the Chinese family system with the new organization of communes, where communist cadres played the role of traditional scholar-officials in promoting production by advocating the orthodox ideology of Marxism and allocating all important resources to members of the commune in an equal way [5]. Viewed from the perspective of Chinese culture, all these efforts can be said to be attempts to replace the Confucian ethics for ordinary people with those for scholars, or to transform loyalty to family and personal *guanxi* into loyalty to the state and the Party. The Great Leap Forward and the Cultural Revolution proved to be monumental failures: Economic productivity declined to an abysmal level, and countless people suffered starvation during these years [44, 51].

In 1978, Deng Xiaoping took over the reins of power, stabilized the political turmoil after cultural revolution, and adopted the policy of Reforms and Openness (*Gaige Kaifang*) to attain the goals of Four Modernizations, those of agriculture, industry, science and technology, and military [12, 21]. Deng’s program of economic reform shifted China’s development strategy to an emphasis on light industry and export-led growth. For the sake of attaining certain foreign funds, market, advanced technologies, and management experiences, China followed the experiences of the East Asian Tigers, and established a series of Special Economic Zones where foreign investment and market liberalization were encouraged [43, 53].

Tension Between Confucianism and Legalism

It is generally agreed that modernization for most Asian countries is essentially a process of exogenous change originating from outside and transmitted to the inside, from the top down, which is different from the endogenous modernization of Christian countries [2, 16]. During the process of transformation, it will encounter genuine struggle between Confucianism and Legalism at both the state and firm

levels, which may influence the operation of the firm as well as the state as a whole. In an industrial/commercial society of organic solidarity, any conflict or struggle occurring at the societal center may interactively influence the operation of a firm at the periphery [16].

Before China decided to adopt the policy of Reforms and Openness, almost all important resources for economic production were under the control of either the government or the state-owned firms.

When China decided to adopt the capitalistic route of national development, the societal center must make every effort to construct economic and legal systems with a high degree of formal rationality to encourage entrepreneurs to utilize state-owned resources to pursue benefit by investing and creating organizations to make products to meet the demands of the market. Ideally speaking, both systems should be designed to create a sociocultural milieu with the characteristics of the Legalistic tradition as described in Table 50.1. The political leaders in power decide to create favorable conditions at the state level, while entrepreneurs make effort to combine all the subsidiary factors for raising production at the organizational level [49, 50].

However, because the legal system has been formulated from top to down, it is usually constructed with some *gray* areas where an administrative office can interpret it flexibly. During the process of transforming a particular public resource to the private sector, a decision-maker in either government or state-owned firms may have the power of allocating at his will the public resource without its ownership.

He may allocate the resource to several petitioners of instrumental ties in accordance with equity rule or *gongdao* without any psychological conflict. Nevertheless, if a petitioner of his acquaintances asks him to allocate the resource in such a way to favor the petitioner, he may experience the tension between Confucian *renqing* and Legalist *gongdao*. In case when two or more groups are involved in striving for a scarce resource, the situation of struggle between Confucianism and Legalism may happen in which the involved parties may utilize various forms of Confucian or Legalist rules as listed in Table 50.1 to defend their own positions or to compete with their opponents.

Two Types of Enterprises

Operating in such a social and political environment, enterprises in China can be differentiated into two broad categories. One category is generally state-owned businesses. They are mainly specialized in doing business with governmental sectors and are subject to major influence by government policies. They maintain close relationships with high-ranking officials in the government and can be termed *relation-oriented enterprises*.

The other category of enterprises is composed mostly of foreign-investment or private businesses that concentrate on selling their products in the domestic or international markets, which are their major sources of interest. They pay more

attention to improving the quality of their products and to developing new markets. They can be termed *market-oriented enterprises*.

This does not mean that a market-oriented enterprise can totally disregard *guanxi* (social relationships). Since the early stage when Chinese society began to transform from planned economy to market economy, maintaining necessary *guanxi* ties with government officials has long been an important strategy for all enterprises to the constantly changing environment. For instance, an empirical research conducted by Peng & Luo [47] indicated that *Guanxi* ties with government officials were paradoxically more important for non-state-owned firms than for state-owned firms.

Rational Calculation

Furthermore, in order to compete with other products in the market, entrepreneurs must maintain not only public relationships with customers, but also specific networks of marketing channels for selling products. Therefore, it was found that *Guanxi* ties are more crucial for firm performance for service than for manufacturing industries and for firms in low than in high growth industries [47], it had greater positive effect on firm performance for new ventures in an environment of higher level dysfunctional competition [39].

Nevertheless, these relationships are established on the basis of rational calculations and equitable exchange, unlike the merchant–politician relationships aimed at apportioning public resources.

Because *guanxi* cultivation needs financial resources, Park and Luo [46] found that *guanxi* utilization achieved sales growth but not profit growth while Shenkar, Luo, and Nyaw [52] found that *guanxi* strategy improved sales revenue but not cost reduction. Most researchers argued that as market-oriented reform deepened and institutional environment became more mature over time, the effect of *guanxi* ties or *guanxi* practices on performance diminished [22, 41, 57].

Two Types of Guanxi

In order to explain the prevalence of *guanxi* usage and *guanxi* strategy in Chinese society, some researchers have proposed several conceptual frameworks for analyzing this phenomenon.

Tan & Snell [56] conducted a study of semi-structured interview with 46 ethnic Chinese managers and 30 non-Chinese expatriate managers in Singapore. They provided evidence of the use of traditional *guanxi-linked morality* as a moral resource by some of the former group in judging workplace ethical dilemmas. The moral reasoning reflects wider cultural heritage, and is not merely a function of corporate culture and individual moral development. While such morality played only a minor role in moral reasoning, it was largely overshadowed by *modernist morality*.

Quanli Guanxi

Nevertheless, what is the *guanxi*-linked morality? Some researchers have tried to define it clearly. For example, Zhang & Zhang [64] classified *guanxi* into obligatory, reciprocal, and utilitarian types at the individual level. Viewing from the theoretical model of *Face and Favor* [25], reciprocity is a universal rule for social interaction. The mixed tie of friendship is composed of both expressive and instrumental components. According to Hwang's [28] analysis of Confucian ethics, when an individual receives a favor from another, he is obligated to repay the favor. Therefore, any *guanxi*-linked event contains utility, reciprocity, and obligation. It is impractical to classify *guanxi* into three clear-cut types of utilitarian, reciprocal, and obligatory.

In an attempt to tease out *guanxi* practices ingrained in the cultural tradition and those adapting to the immature institutional environment, Su and Littlefield [54] proposed two types of *guanxi* practices, namely "*qinyou guanxi*" (personal favor exchanges among family and friends) and "*quanli guanxi*" (exchange between power and interests) and attributed the former to influence of the traditional Chinese culture and the latter to that of the contemporary institutions, mainly that of socialist market economy. They held the former as legitimate means of favor-seeking for common people in navigating through work and life, but the latter as corruptive and rent-seeking by the elite of the power and the wealthy.

Rent-Seeking Guanxi

The so-called favor-seeking *guanxi* means that an individual interact with other party of mixed tie in terms of *renqing* rule. Viewing from the theoretical framework as presented in Table 50.1, there are systems of regulation in any organizational institution. Caused by a variety of reasons, the system of regulations may have some flaws which are called *institutional holes* by Chinese people. In this case, a petitioner may seek for *guanxi* with the resource allocator who has the power of decision-making within the institution, interact with him in accordance with *renqing* rule, and transform their relationship into the so-called rent-seeking *guanxi*. As an alternative definition of economic rent, here rent refers to the returns over and above the costs of employing a monopolistic resource by manipulating government policy [4, 54]. Meanwhile, rent-seeking is synonymous with corruption in imperfect market conditions in which a decision-maker has the power to allocate a resource at a price below the market equilibrium level [58].

Double-Edged Sword of Guanxi

Because social exchange in Chinese society can be distinguished into these two types, *guanxi* can be conceived as a double-edged sword [59], that may have distinct impacts on economic efficiency and the well-being of ordinary Chinese

citizens [15]. On the positive side, favor-seeking *guanxi* has widely been utilized by Chinese businessmen to establish the interpersonal trust in order to maintain the stability and quality of sales and supplies in the market [61]. On the negative side, the process of putting their moral percepts into practice may result in problematic ethical behaviors.

Paradoxical Consequences of Guanxi Practices

Warren et al. [59] conducted two studies to explore the paradoxical (helpful and harmful) consequences of *guanxi* practices to the *guanxi* actor, the organization, and the larger Chinese community. They asked participants to rate the degree of helpfulness and harmfulness of six real life scenarios of *guanxi* practices in Study 1 and to provide actual examples of helpful and harmful *guanxi* practices in Study 2. The majority of the respondents in Study 1 rated *guanxi* practices as always helpful to the focal actor, but sometimes helpful and sometimes harmful to the organization, and most times harmful to the community.

Only one scenario about building loyal customer relationship with no implied violation of organizational or community interests and procedures is viewed as helpful to the self, the organization, and the community. Obviously, when there was conflict of interest, *guanxi* practices were perceived as benefiting self-interests of the *guanxi* user at the expense of either the organization or the community. In the actual examples of *guanxi* practices provided by the respondents, *guanxi* practices were seen as a double-edged sword. On one hand, *guanxi* practices not only enhanced individual actors' social capital, career advancement, and social and financial well-being but also promoted trust, cooperation, harmony, and efficacy in the organization and the community. On the other hand, reinforcing the first finding in the scenario study, the participants provided vivid examples of how *guanxi* practices that benefited individual users also undermined merit- and product-based competitiveness of the organization and damaged the economic, legal, and ethical institutions of the larger Chinese society.

Generally speaking, *guanxi* practices with favor exchanges as the core activities are ethically acceptable or even laudable if contained in the private domains of life where personal and private resources are exchanged. However, to the extent private and public resources are mixed up in *guanxi* exchanges, they become ethically problematic to the extent public resources are used to benefit private interests of the *guanxi* parties in violation of ethical rules or norms of the relevant communities.

Ethically Lax

Zhuang & Tsang [65] defined some ethically problematic marketing activities and techniques used in personal selling in China as gray-marketing. Based on this, they developed a conceptual model of gray-marketing for a particular type of selling in which both the sellers and the buyers exhibit problematic ethics in an exchange.

They found that the respondents have different ethical evaluations of different marketing practices used in personal selling such as giving and accepting gifts, buying and accepting meals, and offering and accepting kickbacks. Some of these practices may not be considered unethical. Considering in terms of ethical assessment, gray-marketing practiced by buying agents is more unacceptable than when practiced by sales agents. Furthermore, a person's ethical evaluation of gray-marketing behavior, empathy for gray-marketing, and belief that gray-marketing has serious consequences, all significantly affect his inclination to use gray-marketing.

Chan, Cheng, & Szeto [6] conducted a comprehensive survey to examine how Chinese executives perceive the role of *guanxi* and ethics played in their business operations. They factor-analyzed 850 valid replies, and identified three distinct ethics-related attitudes and two distinct *guanxi*-related attitudes for Chinese executives. The cluster analysis of the composite scores of these five attitudinal factors further indicates the existence of three distinct groups of Chinese executives that vary in their ethics and *guanxi* orientations, namely, the unethical profit seeker (UPS), anti-governance, *guanxi*-cultivator (AGGC), and apathetic executive (AE). The three groups are also found to be significantly different in such demographic characteristics as age and the ownership structure of the serving organization. Specifically, the intergroup comparison suggests that younger Chinese executives and those working for privately owned firms and joint ventures are more inclined to engage in unethical activities for profits.

Wu [62] studied business ethics practiced by Taiwanese enterprises in Mainland China, Vietnam, and Indonesia. Some 375 valid responses were obtained from Taiwanese owners or senior administrators. Taiwanese enterprises in East Asia were found to be ethically inclined in respect of their local environments and generic human rights, though one-third of participants identified themselves as "ethically lax."

A cross-cultural comparison of US and Taiwanese business practitioners conducted by Cherry, Lee, & Chien [8] indicated that Taiwanese practitioners exhibit lower perceptions of an ethical issue in a scenario based on bribery, as well as milder deontological evaluations and ethical judgments relative to their US counterparts. In addition, Taiwan respondents showed higher likelihood of making the payment.

Adaptation of Foreign-Investment Enterprises

Conceptualizing along the dimension of modernization, Taiwanese society has been exposed to the impact of Western culture to a greater extent than did the Mainland China. Nevertheless, both Taiwan and Mainland China share similar Confucian cultural tradition, the business ethos of Taiwan are also characterized with Confucian familism and crony capitalism [33]; it would not be difficult for Taiwanese-investment enterprises to adjust to the new social environment to other Asian countries including China.

Nevertheless, managers with different cultural backgrounds who know little about the complicated dynamism between Confucian heritage and Legalism may have different views on what is acceptable ethical behavior [7]. Brand & Slater [3] invited 31 Australian managers who had spent on average 8.7 years working in business connected to China to participate in in-depth interviews regarding their business ethics experiences in China. Those managers identified issues relating to a broad spectrum which could be labeled “bribery and facilitation.” Other repeated themes included requests for visa assistance, employee theft, nepotism, and non-adherence to contractual obligations. They identified four key coping strategies from the data: Managers spoke of not compromising their own morals, of attempting to understand the motivation of Chinese colleagues, of talking to others, and of adhering to company policy.

Based on interviews in the China-based operations of 49 UK companies, Millington, Eberhardt, & Wilkinson [45] carried out their research both with senior (often expatriate) staff and with local line managers who were responsible for everyday purchasing decisions and for managing relationships with suppliers. The results suggest that gift giving is perceived to be a significant problem in UK-owned companies in China. Gift giving appears to be associated with illicit payments, corruption, and the pursuit of self-interest. Firms seek to reduce the incidence of illicit transactions by changing staff roles, instituting joint responsibilities, which include the separation of different aspects of sourcing/purchasing, increasing the involvement of senior staff in the process, and through the education of employee and suppliers.

Hierarchical Stakeholder Model

For business of foreign investment, *guanxi* (literally interpersonal connections) is in essence a network of resource coalition-based stakeholders sharing resources for survival, and it plays a key role in achieving business success in China. However, the salience of *guanxi* stakeholders varies: Not all *guanxi* relationships are necessary, and among the necessary *guanxi* participants, not all are equally important. Therefore, establishing necessary *guanxi*, without paying unnecessary costs, becomes a crucial lesson for business of investment to achieve success in China [20].

Su, Mitchell, & Sirgy [55] developed a hierarchical stakeholder model of *guanxi* which dimensionalizes the notion of stakeholder salience, and distinguishes between and among internal and external *guanxi*, core, major, and peripheral *guanxi*, and primary and secondary *guanxi* stakeholders. Guanxi management principles are developed based on a hierarchy of *guanxi* priorities and management specializations. They applied this instrumental stakeholder theory to construct a means for Western business firms in China, to reliably identify *guanxi* partners by employing the principles of effective *guanxi*.

Because business of foreign investment tends to help their managers to improve the way they approach potential ethical situation in China, the ethical performance

of foreign-investment enterprises as measured by various indicators has fared well in comparison to that of the indigenous state-owned enterprises, collectives, and private enterprises [37].

Dynamism for Organizational Change

Balanced Concept of the Firm

Owing to the notable differences between the practice of ethics control mechanisms in foreign-investment and local enterprises, establishing global supply chains of multinational companies in developing countries may institutionalize emergent international ethical standards and practices into this component of the Chinese economy [35]. Some researches indicated that the value profile of Far Eastern students who had lived and studied in USA for a considerable period of time tend to get modified, so as to include the values preferred and desired in the new social environment [36]. They may become agents to initiate social change after they returned to work in their home country.

When corporate social responsibility has become increasingly popular in advanced economics in the West, it is receiving more and more attention by corporations in Taiwan [33] and China [34]. Moreover, because rent-seeking *guanxi* may bring benefits to individuals as well as the organizations they represent, but these benefits are obtained at the expenses of other individuals or firms and thus detrimental to the society [18], a counterforce may emerge to control it from the internal society of China.

Ip [33] examined the challenge of developing a business ethos in China in response to today's increasing demands of corporate social responsibility within the context of recent business scandals, food scare, labor issues, and environmental degradations the country is now experiencing. It seems to me that the efforts of developing business ethics by implementing new rules of regulation against the background of Chinese cultural and ideological heritage can be conceptualized as struggle between Confucianism and Legalism in consideration of Chinese historical context, but it is more adequate to view them as complements between two opposing forces as conceived in Table 50.1. It is an effort to improve the favor-seeking *guanxi* among stakeholders by Confucian wisdom for action, but to suppress the rent-seeking *guanxi* by the Legalist technique of management, so as to assume the corporate's social responsibility. This approach might be called the "*balanced concept of the firm*" [17] which is different from other approaches to corporate ethics in chiefly Western literature such as discussion on "*corporate social responsibility*," *the stakeholder approach*, and *social contract theories*.

Ethical Leadership

In order to explore the effective performance of business ethics and to provide a learned reference, Wu [63] reviewed relevant literature, developed a notion of

“business ethics operation,” and argued that different types of “*ethical leadership*” and “*catalytic mechanism*” precipitated four operations and a swathe of different approaches to business ethics within enterprises across the Taiwan Strait. Huang & Snell [23] studied moral climates through case studies of three state-owned enterprises in a South China City, and built a model of the relationship between moral leadership, institutional superstructure, internal governance and control systems, enterprise moral atmosphere, and performance.

Provis [48] discussed two different types of obligations: personal and social obligations as owed to *guanxi* parties, in contrast to general and abstract moral obligations as owed to impersonal communities or the rational structure of law and administration. The personal obligation lies in personal identification with the particularistic social relationships between *guanxi* parties, whereas the general obligation is independent of any concrete individuals or their specific relationships. Private ethics of *guanxi* exchange such as reciprocity and trust between *guanxi* parties may nevertheless conflict with and violate public ethics of the community and the rule of law, impartiality, and fairness.

Conceiving in terms of the conceptual scheme presented in Table 50.1, Confucian ethics for ordinary people emphasize the importance of personal obligation, while Confucian ethics for scholars advocate the value of practicing one’s general obligation to the organization or the community. Generally speaking, the effective business ethics are initiated by determined moral leaders with Confucian ethics for scholars who decide to create such a corporate culture by the so-called catalytic mechanism for designing the internal governance and control systems. For example, Firth, Mo, & Wong [19] analyzed enforcement actions issued by the China Securities Regulatory Commission against auditors in respect of fraudulent financial reporting committed by listed companies in China. They found that auditors are more likely to be sanctioned by the regulators for failing to detect and report material misstatement frauds rather than disclosure frauds. Further analysis of the material misstatements indicates that auditors are more likely to be sanctioned for failing to detect and report *revenue-related frauds* rather than *assets-related frauds*. Their results suggested that regulators believe auditors have the responsibility to detect and report frauds that are egregious, transaction-based, and related to accounting earnings.

System-Design Variables

Douglas & Wier [14] hypothesized that budgeting system variables and reactions to them are influenced by culture-specific work-related and ethical values. Most organizational and behavioral views of budgeting fail to acknowledge the ethical components of the problem, and have largely ignored the role of culture in shaping organizational and individual values. The data of their research demonstrated the national cultural differences in system-design variables (such as participation, standards tightness, budget emphasis, etc.) which they characterized as the opportunity and incentives to create budgetary slack, and the expected relationship

between incentives (but not opportunity) to create slack and slack creation behavior.

For example, “*Small treasuries*” (*xiaojinku*) are off-book accounts found in many large enterprises in China for the purpose of rewarding managers and their subordinates, building up *guanxi* (personal networks), and even financing the business operations of their *danwei* (work units).

While small treasures can, in some cases, help organizations deal with immediate financial problems, they have negative impacts on organizational performance in relation to the moral hazard of managers, as well as the allocation of organizational resources, in respect of sustainability of strategic advantages and growth, and mismanagement of organizations. Because of the involuntary behavior of managers in Chinese enterprises, Hung [24] proposed that it will require not only organizational controls, but also a fundamental change in these managers’ ideology for solving the problems of small treasuries.

Conclusion

Fan [18] argued that *guanxi* is an inevitable evil under the current political and socioeconomic systems in China. Its role and importance in business life will be diminished as the country moves toward an open market system. In fact, Fan [18] was talking about rent-seeking *guanxi*, but not favor-seeking *guanxi* in his argumentation. Viewing from the theoretical framework of Table 50.1, when the importance of rent-seeking *guanxi* is diminished as a consequence of struggle between Confucianism and Legalism, favor-seeking *guanxi* is still an important cultural tradition in the complementary leadership between Confucianism and Legalism for maintaining the operation of Chinese enterprise.

Indigenous Control Mechanism

Here I would like to emphasize the implications of “struggle” and “complement” between Confucianism and Legalism. In Chinese history, so-called struggle between Confucianism and Legalism means the contradiction of two opposing forces who are insisting on their attitudes about the establishment of control mechanism to regulate the problematic ethical behaviors within the organization (or the state). After the establishment of ethical control mechanism as a consequence of struggle between Confucianism and Legalism, its practice must rely on the ethical leadership from top to down, which is called practicing Confucianism with a supplement of Legalism by Chinese.

Most ethical issues related to China can be understood in terms of this perspective. For example, intellectual property right is one of the major issues of misunderstanding between the West and the various Chinese political entities after decades of heated negotiation. Lehman [38] examined the sources of this problem from the standpoint of traditional Chinese social and political philosophy, specifically neo-Confucianism. He pointed out that the basic assumptions about the nature of intellectual property, which arose during the seventeenth and eighteenth centuries in Europe, are fundamentally at odds with the traditional Chinese view of the role of intellectuals in society. It suggests

that politics which do not take these differences into account, but which attempt to transfer Western legal concepts without the underlying social constructs, are responsible for much of the lack of success in the area of intellectual property rights.

Virtuous Corporations Against Stigma

Viewing from my advocacy for indigenous psychology [28, 29], so long as the underlying social and cultural construct can be identified for constructing indigenous theories of social sciences, it is not difficult to solve such problems as intellectual property or business ethics. There is a widely spread stereotype that Chinese state-owned enterprises are “economic black holes” which swallow everything in their paths. They have been stigmatized with such images as inefficiency, backwardness, resistance to change, conservatism, and bloated bureaucracy. Nevertheless, as a consequence of China’s economic success, more and more state-owned or collective owned enterprises have distinguished themselves by their unique corporate culture as well as their financial performance. Some examples on the name list of “virtuous corporation” are the Weizhi Group, which produces apparel in Xian, Shaaxin province [30], the Haier Group that produces home electrical appliances, the Qingdao Brewery Cooperation, which brews the world-famous Qingdao beer, the Double Star Group, which manufactures in Shangdon province [31], and the Vantone Group, which specializes in reality and financial services in Beijing [32]. Case studies on those “virtuous Corporation” showed that the most prominent features are the strong corporate culture and the leaders which contribute to the business ethics as well as the social capitals of the company. A series of intensive of analysis on those successful cases enabled [32] to conclude that a company can rarely develop its culture without utilizing the culture of the society where it is situated. Corporate cultures of those companies by and large are reflections of their home cultures which, I believe, can only be understood by theoretical framework of indigenous social science.

Abstract

Unlike those who see no unique Chinese business ethics in present Chinese society or see only some simple Confucian and Legalist rules at work in business, this chapter holds that there is an Integrated Confucian Business Ethics in Chinese society today and that it has a rather complex structure as based on the Yijing mode of thinking. Without the Yijing onto-generative cosmic philosophy as a guide there could not be such an interesting integration of philosophical schools in Chinese business ethics, which in essence becomes a practical philosophy for action in business and economics. The process of derivation of such integration is both practical and rational as envisioned by the Yijing way of thinking. In this chapter I analytically describes the process of this integration from Confucian virtue ethics to enhanced Confucian ethics and its business application as enhanced Confucian business ethics. From this, we come to a modernist transformation by way of incorporating duty ethics, utilitarianism and even rights ethics. This is then called the *Integrated Confucian Business Ethics*, which is the powerful tool used by Chinese business and economy leaders today to achieve both economic development and national development at the same time.

Introduction

It is important to know that there is a Chinese Business Ethics at work in China today and also to know how this unique Chinese Business Ethics as a complex structure is derived from both tradition and modernity based on the powerful

C.-Y. Cheng

Department of Philosophy, University of Hawaii at Manoa, 2530 Dole Street, Honolulu, HI, USA

transformational power of the Yijing onto-generative philosophy of change and transformation. The importance of this knowledge and understanding consists in that it illuminates how Chinese business people and their leaders do their businesses in many contexts of negotiation and transactions, which include both domestic and international scenes. It also explains how successes are achieved and how risks have to be confronted and overcome. Hence, we should study the guiding principles underneath this highly complex structure titled Chinese Business Ethics in reference to the Yijing, which in a sense is the Classic of Change and Exchange.

Defining Task of Inquiry with New Concepts of Ethics

The task I set up to do in this inquiry is a highly complex one. It involves defining and understanding how ethics in Chinese philosophy as we know has been formulated under the influence of the Yijing as a cosmological philosophy. This must lead to an inquiry as to how Confucian theory of virtues and virtue ethics are to be defined under such an influence. This means that we cannot just take for granted what has been said about Confucian ethics without such a reference. Once we formulate the Yijing integrative ethics in Confucianism we would then see Confucian ethics as a system of ethics of virtues with special reference to an onto-generative cosmology.¹ This result would then be made available to include insights from the Daoist philosophy, which also stems from the Yijing cosmology as well as to incorporate the Chan Buddhist philosophy of enlightenment which stems from the Daoist philosophy. This complicated structure is then what I would offer as the enhanced and even ideal form of Confucian ethics, which despite its ideality is actually working effectively in combination with other factors as standards in historical Chinese society.²

Given the present new form, it may be regarded as the ideal form or the core wisdom of the Confucian tradition in one way or another operative in the minds of the practitioners of contemporary New Confucianism.

I have no desire to prove this thesis from a social science point of view. I let it stand just as a working hypothesis and titled it *Confucian Ethics in the Enhanced Form* or simply virtue ethics of life and the *dao*. I shall hold that this ethics is the basic model for management in traditional culture whether in the private sector or in the public sector. My next step is to confront Chinese society today as a modern society and even as *a society with mixture of modern and postmodern cultures which respectively advocate universalism of values and particularism of human freedom*. In this hybrid context I introduce and consider a model of ethics which would incorporate the Western ethics of deontology, contract theory, and utilitarianism as irreplaceable modernizing ingredients.

With this understanding I shall inquire how Western ethics can be described justifiably as the union of deontology, contract theory, and utilitarianism. Then I shall incorporate this union into the Enhanced Confucian Ethics to arrive at the modern or *Contemporary Confucian Utilitarianism* or Confucian Business Ethics. But we must also be reminded that in contemporary China, Marxism plays an

essential leadership role in effecting this development which is reflected in the value goals and strategic policies of the central government and state-owned enterprises. In taking this into consideration I come to the final contemporary form of Integrated Confucian Ethics/Business Ethics, which seems to guide all economic reforms, commercial transactions, and business management in China. To recapitulate simply, this ultimate modern form of this ethics is a result of transformation from the Enhanced Confucian Ethics to the *Integrated Confucian Ethics* via incorporation of duty ethics and utility ethics in the traditional enhanced virtue ethics of Confucianism.

In a final move of definition and explanation, I shall simply identify the business ethics and management system as application of the Integrated Confucian Ethics to different functions of economic decisions and management in contemporary corporations as described by my C Theory, which treat corporations as legal persons in some difference from but in association with simply natural persons. The philosophical crux of the conclusion is to indicate that such a model of business ethics and management is intended to be descriptive as hypothesis and prescriptive as a guiding principle in the actual practice of business behavior which is organizational or market oriented or both. Since the basic methodology of totalistic and dynamic onto-generative way of thinking is essentially derived from Yijing philosophy, without which either Confucian ethics, whether enhanced or integrated, or their transformation is not possible. Hence, we have to see both Confucian ethics or Confucian Business Ethics as Yijing spirit imbued and Yijing grounded as well.

Yijing as Creative Source of Cosmological and Ethical Insights

Yijing 易经 as a classic in Chinese philosophy has been often regarded as book of divination. But as early as the time of Confucius in the sixth century BCE, Yijing has emerged also as a book of cosmic insights and ethical wisdom. This great transformation is made possible by inquiring on how Yijing developed as a response to the need for knowing the future and a concern with future changes of nature and with how human beings would confront the changes. This fundamental motive has made Yijing both epistemologically and ethically interesting, because as one can see, without knowing the world from a comprehensive perspective, how could I identify and locate myself in the world?³ Similarly, without our ability to respond to a world situation in terms of proper and fitting actions, how can I warrant my well-being in the future? As future action belongs to future, we have a choice as to which future action we would prefer. Hence, the divinatory interest has to lead to interest in action. It is in confronting the world as we come to know empirically and by observation that we come to know ourselves as capable of choice and capable of effective action, again as testified by our wide experience.

In both knowledge and action we can see how Yijing must transform itself into a book concerning knowledge of cosmic reality and a book concerning human choice and action. This means that one has to see that Yijing is not just a book of divination, but a work presupposing implicit representation of a fundamental view of the cosmos and its changes in the system of symbolic indexes of lines. It is a book

which leads also to the discovery of the cosmic creativity for change, and evolution of different things in nature always suggests a creative force at work. By creative force I mean that power which brings out new things and make many to become one and one to become many possible. In a natural cosmology, laws of nature come into existence when things come into existence and there will be new laws of nature when radical changes among things take place. In the case of man, in so far as we can make a choice and act on our choice, we can be said to have creativity as well. It is also interesting to see how this human creativity is actually deeply rooted in the cosmic creativity as I have indicated, for it is by reflection we come to know we are created from the creative force of cosmos. We are created from the cosmic process in the sense of our being what we are generated and evolved in a process of change and transformation.⁴ Besides, we come to know that we are created in such a way that we can be said to embody the root creativity of the cosmos so that we can explain how we could make choice and action in a creative way as testified by development of civilization and ethical institutions in history.

From this analysis it is quite clear that in so far as the Yijing is concerned with the divinatory issue of knowing future and acting according to our knowledge of the future, it is founded on the basis of a rich presupposition and background which provides the potentiality of transforming it into the most philosophical book. As a matter of fact, this transformation actually is accomplished in two stages: the first stage is where the judgments from past divination became sorted out in a system of *guas* 卦 of symbolic forms of *yin* 阴 and *yang* 阳 lines. The *guas* also became silently named with reference to things we observe in the world. The second stage is where Confucius and his disciples make a full and holistic interpretation of the book and bring out to the open and explicit the hidden cosmology of creativity and change as transformation as we see in the Ten Wings of the Yizhuan 易传. It is not just the hidden cosmology of nature that was brought out, it is also the hidden ethics of powers of choice and action that was also brought out so that we have a basis for developing ethics and cosmology together. It is not just a matter of Confucius giving an ethical interpretation of the Yijing, it is also a matter of the Confucian disclosure of the ethical presuppositions of the Yijing? As we can see, the cosmology is the source of ethical insights and ethics is the cosmology being completed with human reflection on normative action. Yijing in this sense has offered to us a naturalistic axiology, uniting cosmology and ethics into an open creativity of creative development and freedom and achievement.⁵

For the purpose of exhibiting the cosmic spirit of creativity, we may quote the following statement of the Tuanzhuan 彖传⁶ for the hexagram Qian which explain how originative creativity of the cosmos has the virtues of creation (*yuan* 元), prospering (*heng* 亨), facilitating (*li* 利), and persevering (*zhen* 贞). These four virtues are to be inherited by all things created by the originative power:

Great is the originative creativity (*qian* 乾)! It is by it that all things begin their existence and thus the Heaven has the power of production. The clouds flow and the rain falls so that all natural kinds demonstrate their forms. [As the sage comes to understand], the *qian* hexagram shows timely formation of six positions each of which realizes a different function of the heavenly creativity. This means, the way of originative creativity

(*qiandao* 乾道) makes kits creative transformation so that all things acquire their congenital nature of creativity which enable and empower their self-fulfillment. This no doubt is pertinent for persevering and preserving. The sage (as a person who embodies this understanding) stands over all things and would thus induce all-comprehensive peace for all the ten thousand states. (Qian Tuanzhuang 乾象传)⁷

How does the humanity show its creativity? The above quotation has already pointed out that the *human person has to understand the cosmic process of origination and sustainable evolution in his ability to symbolize this understanding in a system of symbols of yin and yang*. This is natural way of showing the cognitive creativity of humanity. But humanity has also to demonstrate how it keeps on the creative function and activity in forming civilization, enhancing community, and settling issues and moves forward for ceaseless creative action of realizing talents and visions of humanity which conforms at the same time to intrinsic virtues and leads to joyful presentation of goodness. Even though the cognitive creativity of humans does not necessarily produce moral good, and is capable of serious destruction and causing great harm, one also could notice that human beings make more positive choices than negative and that the positive choices turn out to be more successful actions. That is why positive and good actions are more often chosen than not and more often successful than not. Therefore positive aspects tend to be recognized and negative ones ignored. That is why ethics in the positive sense is naturally formulated, when it is formulated, it is formulated in the form of self-cultivation for development of harmony within oneself and harmony among people and things in the world. This is the human way of realizing the cosmic creativity just as the humanity is a cosmic way of realizing human creativity. Both creativities are rooted in the same source and form a chain of reciprocating circle of enhancement and uplifting.

The following statements for the Xiang Zhuan 象传⁸ are extremely suggestive and significant:

“The heaven proceeds vigorously. The authentic person shows the same by self-strengthening without cessation”

“The earth poses its creative compliance. The authentic person shows the same by reinforcing his virtue (ability) for holding things”

From these two short remarks, we could come to see how humanity could be developed under the influence of our appreciation and understanding of the cosmic way. Three points could be made: First, it takes deep insight and reflection to see the creativity of the Heaven and Earth and to see it in a way which is congenial and intimate with our own self-understanding; second, we do come to see that the cosmic creativity is the model for awaking our self-understanding and self-knowing toward modeling after the cosmic creativity and what results from this modeling is the human ethics of self-cultivation and care and receptiveness to others, people, and things all included, like what Heaven and Earth have shown.

Third, humanity has also acquired an intrinsic end which defines its worth and dignity, namely, a human being is endowed with a nature which is cosmic and ontogenerative and so to speak, rooted in the profound creativity of the cosmic reality. As this cosmic reality is rooted in an inexhaustible creativity which is unlimited and unconditioned, humanity also has a source which is immanently transcendent and

thus has all the power of achieving himself, enhancing others and refreshing and regenerating this cosmos. From these, we can come to see how Confucianism and Daoism arise and how in both ethics there is a continuation and development of a creative cosmology and thus a representation of the onto-generative metaphysic of life and harmony.⁹

Confucian Virtue Ethics as Embodiment of the Onto-Generative System of the Yijing

In terms of time, it can be said that Yijing has come to embody a cosmological philosophy much earlier than Confucianism as founded by Confucius. But one might also say that it is Confucius who has contributed to the articulation of this cosmological philosophy as indicated above. The methodology throughout this embodiment and articulation is consistent and that is what I have described as comprehensive observation and reflective feeling. The onto-generative cosmology of Yijing is no doubt more a matter of comprehensive observation, whereas the Confucian ethics and philosophy of humanity and ethics is more a matter of reflective feeling on the other hand. But the continuity and resonance between the two require explication which gives coherence and depth to the Confucian position on humanity. First of all, we may have to raise the question on how Confucius initiates his philosophy of humanity in his observation of rites and rituals in his time and how he transforms his concern with *li* into a concern with humanity in the sense of care, benevolence, and feeling for life and creativity.

The order of *li* 禮 or propriety has prevailed in the ancient time as an order of social harmony and political stability. The invention and development of *li* of course is not arbitrary and ad hoc as it is the way in which the human relationships become regulated and the social order become established. For Western philosophers, it is not quite understandable concerning how *li* could be introduced in such a way that it makes trust, respect, and functional interdependence possible among people both known and unknown. From the Western point of view, it should be the law which prescribes the way how people should act or not act. But for *li*, the relationships among humanity is not just a matter of observing external rules of law, the violation of which invokes punishment.

Besides, the law has to be commanded by an authority which reigns over those to which the law applies. A good example is Roman Emperors who dictated laws for obedience by subjects with punishment for disobedience. On the other hand, for the efficacious action of *li*, the authority is invested not in one reigning lord but in the whole community. In this regard, *li* has the consent among people from their own feelings. It might be introduced from a sage but it is founded on initial common feelings among human subjects who throughout their own experience come to appreciate the *li* and even become attached to the *li*. Until we understand this foundation of the *li* we could be misled into thinking of the so-called “magical power” of the *li* as Herbert Fingarette has suggested.¹⁰

Thus understood, it is said in the Analects that “the function of *li* is such that it takes the harmony as the most valuable pursuit.” ([2] 论语, 1.12). By the same token, Confucius even wishes to make the *li* the foundation of the political rule, and he contrasts the rule of *li* with the rule of *fa* or *xing* (punishment) as follows:

Guided by dictate of political authority, and regulated by punishment, people can get by without violating the law but having no sense of shame; Guided by virtue, and regulated by *li*, people will have sense of shame and a standard for personal development. ([2], 2.3)

It is on the basis of understanding of the *li* that Confucius comes to the awakening of the humanity underlying all people. What is notable about this discovery and understanding is that he sees this underlying humanity as also a matter which defines one’s voluntary action and freedom or free will. For he says, “If I wish to have the *ren* 仁, lo, *ren* is right within me.” In other words, the underlying humanity defines not only a general feature of all people, but a general feature which is also a particular recognition of the self-consciousness and self-autonomy in which human will and self-knowledge are equally present. This point is extremely important, for it is through understanding this point that we can see how *ren* comes to transform oneself and the human community into a moral and ethical community.

As we see, the Chinese word *ren* as composed of the two-human-togetherness (仁) has contained a rich repertoire of meaning and implication. It is not only a substantive word referring to the feeling I have concerning the general humanity but also a metaphorical word which requires both imagination and action for realizing the togetherness of the two-human relationship which of course is not limited to the two-human relationship. What I wish to explain here is that the basic ethical principles or codes of Confucianism can be said to be contained and rooted in this root metaphor. I shall explain this in terms of three basic meanings and experiences of *ren* as intended by Confucius;

1. *Ren* is restraining of myself so that I can freely practice the *li* as rules of relationship which reflect human desire for harmony. It is here that in awakening to the *ren* I also recognize the obstruction from my selfish desires and bigotry-based self-interest. These desires could satisfy me only temporarily as a small person, but in order to fulfill myself I have to overcome these desires and embrace the feeling or sentiment of *ren*. We have to come to this understanding by already knowing the reason for *li* observance and therefore come to the formation of new self which is open to *li* and which will preserve the spirit of *li* and lead to natural performance of the *li* as a fitting way of treating others in respect of relationships and situations.
2. *Ren* is the ability of putting myself in the role and position of other people in situations of relationships which we experience and encounter in life. In being able to put myself in the role and position of others I can empathize with other people in their doings and sympathize with them when they have difficulties so that I might come to help and thus exhibit a concern and care for others. This capacity of empathy and sympathy and consequential feeling for care and help must be seen as a high mark of humanity in *ren* and its actualization no doubt

requires that we have developed an insight into the minds and hearts of other people. How this is possible points to the fact that we see others as myself and myself as others and thus we could have the same hearts and minds in terms of their basic capacities.

From the operation of the *ren* in this sense we come to the famous two principles of Confucian ethics:

- (a) Do not do to others what you do not want others do to you
- (b) In wishing to establish myself, establish others as they wish; In wishing to reach for your end, try to enable others to reach for their ends.

These two principles have embodied the most profound wisdom of the Confucian virtue ethics. What I mean by this is that it takes a person of profound self-knowledge and humanity to see that there is deep similarity among oneself and others and that this similarity is also a matter of mutual bonding so that what I regard as harming must be experienced as harmful by others and what I experience as joyful must be experienced as joyful. Hence, I should not impose harms on others as I do not wish harms to be imposed on me; similarly, I should share joys with others as I do wish others to share with me but I have to take initiative to do so. This is also to make one person to be a worthy representative for humanity. It is through the realization of humanity that we come to appreciate others as others and myself as myself.

It is on the basis of this realization of humanity that we can establish both identity and difference between myself and others, for while I can avoid harming people and in addition to try to make people happy, I have still to see other people as different entities with their own peculiarities external and internal to their own selves, I have therefore to respect their identity in terms of their difference and this takes also insight to accomplish. I may use myself as a measure of pain and pleasure, but my experience could be too limited, so that I may not know how to help others to avoid pain and to gain happiness in general. For Confucius, this is the reason why I have to keep an open mind and an open heart so that we may come to learn and make progress of my understanding. Hence, the requirement of self-cultivation and learning from others (三人行必有我师) are important projects for realizing myself in humanity and realizing humanity in myself. For Confucius, the issue of alterity of other minds and hearts raised by Levinas does not exist, because there is the cosmology of knowing by observation and reflection which may be denied by Levinas¹¹. The Confucian ethics is thus seen to be founded on the epistemology and cosmology of the experience of observation and reflection which have an expanding and real use in establishing knowledge of the world and humanity.

In the Analects, Confucius speaks of the way of Zhong Yong 中庸 which is understood as the middle way, but what is a middle way exactly?. Confucius has answered with the statement that “The excessive is just like the deficient in being both unacceptable.” There are many statements which suggest what constitutes excessiveness and deficiency. From these statements, we see that the best and good form of life must consist of a mean which just fits in with the way of the mean which can be applied to situations to generate a desirable state. I take this way of the mean to be that of harmony which is normally achieved by following the *li*. But there are

many circumstances which require us to discover and determine what is the harmonizing factor which actually brings out a harmony among people.¹²

Confucius sees this as a challenge and hardly any people can achieve and hold this principle for long because people may lose sight of the change of circumstances and thus may not regain the way how a universal principle applies to a particular situation. This means that we have to renew our principle of the mean with a new desirable mean to be generated in a holistic situation. What this means again is that we need to continuously learn from experience and renew ourself by cultivation of self-reflection. This means also to continue to keep out vision of the *dao* and follow the *dao* in one's life. This is of course a matter of *ren* or cultivation of *ren* which is regarded is a life-long mission for oneself. It is on this basis that Zisi in Zhong Yong comes to define humanity as a matter of endowment from the Heaven and that we must constantly seek inner feelings of identity in self and illumination of one's nature which embodies the *dao*.

Given the above three points of the *ren*, we may bring out an important point about the nature of the human self: human self is to be defined by one's consciousness of one's identity and one's identity has to be defined from integration of one's experiences of identity of things and people with their differences which I come to see and appreciate. This means that a human being has to be consciously and conscientiously involved in identifying himself as an entity which has achieved a coherence of experiences in his life and which he may be expected to hold in the future. Besides, he would be able to address his responsible actions to others and be trusted by others as parts of his experiences of himself. It is in this sense we may see the person as authentic and respectable because he finds no truth in himself but the truth of his coherence and his ability to preserve and carry out his coherence as informed by his conscious identity and warranted by his ability and willingness to assume his responsibilities and perform his duties in regard to others.

Now the question is how this Confucian ethical understanding of humanity is related to modern business ethics. To answer this questions, three observations could be made:

1. In modern business, we have an organized structure which requires common observance of basic rules of constitution to do with division of labor and consolidation of work. This means that there are *li* rules which must be observed and observed in an external-to-internal way as these rules must be founded on a sense of common purpose and common vision.
2. The ability to feel for others so that one restrains oneself in order to interact with others in a productive manner is a matter of *ren* or considerations for others. Without this understanding it is difficult to work with others whether on superior or inferior ranks. One may not be able to deal with consumers or clients effectively without a sense of *ren* which requires one to look into feelings and responses of others.
3. In business ethics, there is requirement that the managerial authority represents the whole corporation and this implies that the CEO of the business must be well- cultivated in basic virtues of humanity so that he could effectively

communicate with others including his own workers and find ways of solution for any difficult tasks.

With our explanation of *ren* at hand, we may proceed to a fundamental concept of Confucian Business Ethics, namely, the concept of *cheng*. It is on this basis of the authenticity of the human self that we can explain the important virtue of “*cheng* 诚” (literally translated as sincerity, meaning “authenticity”) as singled out in Zhong Yong. *Cheng* is the inner feeling of one’s identity as authenticated by one’s readiness to bring all the mental faculties to bear on one’s action and conduct. In this deeper sense of self-identity, one sees that if there is no moral responsibility, there is no authenticity of the self. We must first recognize that *cheng* is the way to identify oneself on a deep level which will lead oneself to the creative root of oneself. By *cheng* one comes to see oneself as rooted in the creativity of a cosmic source which should give rise to all other self-identities. It is from this deep source that one sees one’s *cheng* as capable of inducing empathy and trust from others.

From this point of view, *cheng* is the action by which one acts out from one’s creative source so that one can be creative as well. The creativity resulting from *cheng* is a sense of affiliation and resonance of oneself with others and even with all things in the world. For one can tell from this authentic understanding of oneself and others that one can initiate, create, and realize oneself in reality just as one can feel how others can initiate, create, and realize others in reality. In fact, one must see that for a society to be maintained in good order this experience of sincerity with its outward demonstration is an indispensable condition for mutual understanding and at the same time the necessary foundation of human empathy and sympathy. In contemporary times, the Confucian idea of a businessman must require this element of deeper identity in one’s ability of self-authentication in the rooting in a creative source.

In sum, the above discussion is to show that *cheng* is an integral part of *ren* which enables us to see that *ren* is both a unique experience of oneself and a universal sentiment of humanity which has the power of moving others as well as realizing one’s own identity.¹³

With *cheng* to be so understood as the source of *ren*, we may now come to see how *ren* leads to other virtues in the Confucian ethical system. I shall specially address the virtues of *yi* 义 and *zhi* 智. First, I shall begin with *yi*. In being truly concerned with other people, a man of *ren* no doubt would recognize what is fitting and appropriate to be done or not to be done in a situation or with regard to a relationship. Whereas *ren* is internal feeling rooted in the inner consciousness of the human person, *yi* can be regarded as the proper way in which people should be treated in a situation where substantial benefits and harms could be involved. In a sense *yi* is the correct presentation of a situation *qua* situation in which harmony and balance must be achieved. In more plain terms, *yi* is the proper share one should receive over a distribution of rights and benefits, duties and responsibilities.

Besides, we have to see that among all the proper ways of treating people there is the most proper way of treating people which we may call the right principle

expressed by the Chinese term *zhengyi* (正义), to be translated in English as justice or justness. The point here is that *zhengyi* is both objective and subjective, both external and internal. We see that *yi* could represent an objective relationship to be recognized by the human mind. It is up to the human heart to require a proper or objective standard for distribution of award and punishment to be applied. This human heart is precisely the *ren* heart of a person. This means that the virtue of *yi* is also a correct attitude which is supported by *ren* and nourished by *ren*. As *ren* is against selfishness, narrow mindedness, arrogance, and bigotry, *yi* must find its place in *ren*. Mencius comes to see the importance of the virtue of *yi* as he recognizes that in the actual world there are many cases of lack of *yi* although those in power may feel complacent about their believing that they have brought good and benefits to people. But whether a ruler loves people or not does not depend merely on his personal feeling of being kind, but rather in his action in bringing benefits to people in the spirit of *ren*. If a ruler is able to care for people in this manner, we must say that he has translated his *ren* heart into the deed of *yi*.

This brings us to the Confucian virtue of *zhi* 智. *Zhi* is to use one's intelligence to understand a situation or event so that one's action will bring out the correct presentation of the situations and event in terms of what is to be done for the *yi* in the situation, namely, what should be done for the equity of the situation. In this sense *zhi* is not mere knowledge of things but knowledge which can generate proper moral action and lead to beneficial results. Confucius does take *zhi* very seriously. He even says that "Even if a person has reached an end by *ren*, if he does not have *zhi*, what he has attained will become lost again" ([2], 15.33). In a sense, we may simply regard *zhi* as practical wisdom or prudence. It is to be derived from reflective understanding and much self-restraint so that one can come to have knowledge of reality and yet see what is valuable and desirable in what prudence has shown. That is, one has to know values and ends in order to be said to have the *zhi*. *Zhi* is knowledge of ends and means toward the ends, and not just knowledge alone. *Zhi* is in this sense close to Kant's practical reason, but not to Kant's theoretical reason. As *zhi* has to develop from one's experience and transaction with people and world, *zhi* is well founded in learning and reflection. With *zhi*, one learns how to live a harmonious life and free oneself from doubts and ignorance. One can thus reach an understanding of the world which can be counted for generating common good or good to oneself without hurting others.

One may wonder why we call *yi* and *zhi* virtues (*de* 德) like the *ren* where *ren* embodies an attitude, an ability, and a feeling. The same can be said regarding *yi* and *zhi*, even though both have to rely on or require objective understanding of people and things and their relevant relationships in various situations of life. They are nonetheless more a matter of cognitive valuation of objective situations rather than projection of the self like *ren*. Besides, they do require *ren* as a root and background so that their coming into being is not groundless. They are actually aspects of the *ren* or humanity whose development requires us to pay attention to them as they would help *ren* to realize itself. The more developed these two virtues, the more they become integrated with *ren* and make *ren* both rationally and

Fig. 51.1 Derivation of main virtues from Cheng

Fig. 51.2 Derivation from Dao to Harmony

emotionally substantiated. In this sense, we see the organic relationships among these basic virtues.

There are other more concrete virtues which we need not bring here. It suffices for us to see how *ren* generates all virtues and specifically the virtues of *yi* and *zhi* as ways in which *ren* can be realized. Similarly, we must say that while *li* leads to *ren*, *ren* is to be realized in *li* which inevitably leads to *yi* and *zhi*. For, in order to have a proper and fitting *li*, one has to appeal to *yi* and *zhi* in order to bring *li* to actuality and its application to a situation. In this sense, we see duality of *li* and *ren*, duality of *ren* and *zhi*, and duality of *ren* and *yi*. Finally, we have to indicate how *xin* 信 is to be developed as a virtue in a Confucian theory of virtues.

What is *xin* 信? *Xin* has two facets which are composed of the subjective feeling of trust and confidence and the objective reference to a state of trustworthiness and desirability for trust. It is clear that, in order to maintain a harmonious world with communication, we have to believe and trust others so that we may be trusted and believed by others. The reciprocity principle of the last topic applies well here. But one may ask how one could have *xin* in these two senses. Again, the answer is that one has to observe the world and see that trust must be based on understanding. One’s self-trust and trust in others will eventually bring trust from others in oneself as one becomes trustworthy. With trust established, one can act on one’s virtues and knowledge with confidence as one will be respected and common good will be pursued in a community by all involved. Hence, Confucius says that “There is no way to establish oneself (as a ruler) without trust from people”. ([2], 12.7) For Confucius there is no better way of life than developing one’s virtues rooted in *ren* in order to be trusted and also to deserve trust and thus become trustworthy.

We may represent the Confucian Ethics of Virtues and hence the Confucian Business Ethics of Virtues in the following diagram (Fig. 51.1): the sign \rightarrow indicates an intrinsic link in terms of experience and concept.

But we should not forget the cosmic factor for the ethics, hence we come to see how *cheng* is rooted in *xing* and *dao* so that we have a richer diagram of the following (Fig. 51.2).

After Han Chinese society to a large measure became Confucianized in the sense that the Confucian virtues become basis for normalization of social conduct and moral behavior

Relevance of Western Ethics and Its Incorporation in the Confucian Ethics

We come to the question on how Western ethics is relevant for the development of Confucian ethics in the modern world. It must be admitted first that the ideal form of Confucian ethics stated in modern terms was neither known nor formulated before the modern and contemporary time. In between the traditional era and modern time there was the May 4, 1919 Cultural Movement, which made the traditional Confucianism the target for devastating attack and rejection. Fortunately, there are early Neo-Confucian efforts made by Liang Shumin and Xiong Shili in aspiring to reignite a renaissance of Confucian philosophy in light of Western philosophical ideas in the latter phase of the May 4 Movement, which would lead to a new interpretation and reconstruction of Confucianism on the philosophical and intellectual levels in post-1949 era Taiwan and Overseas. But again these efforts have not made strong impact on the development of Confucianism as an ethics and management philosophy. The fact is, we cannot ignore the great campaign for Maoism and Marxism from 1921 of last century to 1949 in Chinese Mainland which led to the Great Cultural Revolution in the period 1965–1976. We can see that what has remained as residue of Confucianism was almost wiped out by the destructive force of the Great Cultural Revolution.

But again, as the events turned out, the arrival of the Period of Reform and Open (*gaige* and *kaiifang* 改革与开放) made it possible the slow and yet gradual rehabilitation and retrieval of Confucianism in the contemporary cultural China since 1980. What I have termed the enhanced Confucian ethics is a reflective reconstruction of the implicit Confucian ethical tradition as practiced in traditional China, which became the basis for further development in light of the future era of economic development in China since 1993.¹⁴ But here we have to confront a great difficulty, namely, the difficulty of making sense of opening of the free economy in a socialist country. This difficulty perhaps should be understood and resolved in Deng Xiaoping's call for developing Chinese Socialism with a Chinese Characteristic. What is this Chinese Characteristic? The answer is: It is the socialist idealism which is based on Confucianism.¹⁵ This political reform has made it possible to take a new look on the role of Confucianism and how a modernization of the Confucian ethics could be effected.

The most important thing to register is that economic activities must be recognized and incorporated into the Confucian ethics system in order for it to apply to the sociopolitical situation after 1980. The central idea is to evaluate the worth of economic profit and efforts to be made to get rich and profit. This also means that the socialist economy has to be liberated to embrace many kinds of reform in economic and financial matters. What is most essential for affirmation and promotion is the principle of utility or utilitarianism which takes the consequences of

making profit and developing capitalism (in some important sense) seriously. As a matter of fact, it is not for the first time that China comes to face the demand of economic liberation. The idea has been introduced by Yan Fu (1852–1921) through his translation of Adam Smith and J.S. Mill.¹⁶ With this background, it is not difficult to see how contemporary China could be so easily induced to get into the mode of free market economy even though not all relevant rules of economic games have been established, not to say respected.

Here, the major issue is how Confucianism could be reconstructed to accommodate the utilitarian principle as a principle of guidance of economic and commercial behavior. In my recent article on reconciling equity with self-interest¹⁷ I have articulated and argued for the Confucian position on economic activity and getting wealth with its traditional concern with general equity and social harmony. In this light, we can see how from a Confucian ethical point of view a social utilitarian principle which aims to better the society and state needs to be promoted in so far social benefits for the people are concerned. In this sense, what is to be focused on is a kind of social and political economy which would address issues of increasing social wealth and enhancing well-being of people by using the principle of utility. The real problem is whether the development of market economy could accommodate the Confucian principles of harmony and virtue and whether the latter have to be introduced in the social practice of harmonization in order to warrant not only sustainability of the market economy but also to ease the tension and danger of an overweening capitalistic dominance.

It is in light of these complicated issues which prevail in China today that prompt me to inquire how to moderate and transform the model of Enhanced Confucian Ethics into a new form of ethics and management to be titled Integrated Contemporary Confucian Ethics.¹⁸ Again, my concern is not whether it is explicitly recognized and accepted in the minds of Chinese entrepreneurs or government policy makers, but whether it could provide a normative description as well as a normative guide for the ethics and management development in China. In trying to develop this model, my interest is not only to show that China at the present time needs this model of ethics and management based on the spirit and methodology of Yijing as onto-generative cosmology but to indicate that this model has an aspect which is universalistic at the same time when it is particularistic. For, it provides a way as to how to combine the Confucian tradition with modernity, and how to relate to a global context where ethics and management must embody a human significance which is the original intent of the Yijing onto-generative cosmology and ethics.

Given the development of Western ethics, we see a historical process of ethics developing from virtue ethics of the Greek in antiquity to deontology of Kant in modernity, and then from Kant to rights ethics and utilitarianism in contemporary times.

With the moral intention of the Integrated Contemporary Confucian Ethics for Chinese economic development established, the question is how to achieve the goal and how to determine the goal, these constituting two aspects of moral evaluation. One could then see that one has to claim one's legitimate rights and fulfill one's obligations in the society so that one can freely pursue what is the best interest which would satisfy one's personal needs on the one hand and social needs on the

Fig. 51.3 Integration of duty ethics, rights ethics, and utility ethics on the basis of virtue ethics

other hand. In this manner, I may bring in utilitarianism as the standard for a consequential consideration of my action. In this manner, as I have suggested in my article on integrated ethics,¹⁹ we may not only resolve any possible conflicts among these various theories but using these theories in a necessary and logical way to achieve the best result in terms of an agreed-on conventional good. As we see, this methodology of moral reasoning has already embodied a meta-ethical point of view which is the theory of theories implicit in the Yijing and Confucianism. We can represent this methodology in the following flow chart (Fig. 51.3).

This methodological process is both possible and desirable because we can see that it is also an onto-generative one: namely, this process can be assumed to be rooted in a cosmologically inspired ethics of virtues such as Confucian one and as such it can be seen to change and differentiate into different branches, in answering to different social needs, which eventually yield fruits of action as we have intended.

This should bring us back to a comparison of Confucian ethics with Western ethics which also suggests how we need to integrate the two into a workable contemporary ethical theory fit for explaining and normalizing development of Chinese economy in a global context. It is in this direction that we can construct an ideal form of ethics and management for Chinese economy as well as for the globalized world.

Five Functions of Managerial Powers Under Modernized Confucian Ethics

In my C Theory book, first published in 1993, I have distinguished five levels of managerial considerations which involves control, regulating, implementation of ideas and ideals, and creation of enterprises and creative transformation. The five levels are composed of the level of autonomic and well-coordinated machine use, the level of skill involving human hands, the level of use of systems of knowledge, the level of implementing principles and values, and finally the level of applying wisdom of the dao (the ultimate principle of formation and transformation). These five levels should not be confused with the five levels of the Yijing-based Integrated Confucian ethics, which is proposed here in this paper as basically a normative project that is based on understanding of the philosophy of onto-generative cosmology in Yijing. It is true that as principles of ethics they can still be applied in management as guiding principles as I have argued that *lunli* 伦理 (ethics) and

guanli 管理 (management) are interrelated in terms of substance and function. But the five levels of management described here are intended for general reference to structure of levels of management which inverts the levels of ethics as we can see. In light of this structure of levels of management, I shall first explore how a normative functional theory of management is developed in my C theory.

The ideal modern Confucian model of management and leadership is supposed to result from a critique of Chinese history and Chinese philosophy which gives rise to an ideal of synthetic creativity (*zonghe chuangxin* 综合创新) and which I would myself describe as transcendental integration (*chaorong* 超融), because what is needed is not a synthesis but a synthesis from a macroscopic point of view in the interest of openness, efficiency, and comprehensiveness.²⁰ To see the need and actual formation of such a model one has to see how experience and expediency of history have produced moral lessons for the development and maintenance of political leadership. Without going into details of historical facts, we may simply see development of economic management and political leadership as a matter of meeting changes in society and the world and as a matter of understanding and awareness of the needs and wants of people.

First of all, let us ask what do people really need and want from a modern political leader and CEO in charge of a political economic development? As we come to understand that a modern leadership is for meeting change, refining structures, and instituting reforms so that an adequate form of leadership is to be identified or expected, we can then list the most important factors which learning from history, knowledge of the present, and aspiration toward the future have imposed on the political leadership. In such an imposed burden, one shall find that preservation of one's own important experience and memory, learning from competitors and neighbors, and development of modernization and globalization are equally relevant and demanding. I describe seven such considerations as follows:

- C1 Calculation and Commitment, Chair of the Board
- C2 Constitution and Command, General Manager, CEO
- C3 Competition and Cooperation, Marketing Director, CMO
- C4 Creation by Innovation and Creation by Renovation, Operations of Production
- C5 Communication and Coordination, Human Resources
- C6 Comprehension and Circulation, Stockholders Meeting
- C7 Cessation and Ceaselessness, Reelected Stockholders Meeting

Considering their intergenerative and mutual balancing relationships, we can now represent the basic C model of Management and Leadership in the following diagram (Fig. 51.4).

I take the sign “→” as indicating a normative tendency from a function to give rise to another function, namely, $C_i \rightarrow C_j$ means that C_i would normatively give rise to C_j . Hence, C1 which stands for commitment should give rise to C2 which stands for command. Why so? In an organization, it is required that commitment to a goal leads to actual engagement which is command. Similarly, we can require and argue that command should go to market for competition C3 and competition in marketplace requires or simulate productions C4 which should meet the demand of the consumers which is part of C3. With C4 developed and meeting the challenge of

Fig. 51.4 Integration and circulation of creative management functions based on the C theory

Fig. 51.5 Circulation of five powers based on successive generativity

the market, it feeds back to C5 as a state of human resources taken to be cultivated and developed. Then C5 should have the need to go back to the source and request a reinvigoration and new emergence. These giving rise to and yielding indicates a relation of successive and mutual generation (*xiangsheng* 相生) in the traditional five power theory of Earth/Metal/Water/Wood/Fire, in Yijing-inspired cosmogony whereby we have precisely a corresponding figure (Fig. 51.5) similar to the above one.

Based on the onto-generative cosmology I have indicated an analogical argument in which C1 is compared to Earth, C2 is compared to Metal, C3 is compared to Water, C4 is compared to Wood, and C5 is compared to C5. If this comparison in terms of qualitative suggestiveness generate functions for managerial activities, the traditional five power theory in Fig. 51.2 would lend a heuristic force to the five C Theory in Fig. 51.1. Of course we can illustrate the balance and counterbalance relations of C in light of the same of the five powers theory. We may indeed reconfigure the functions of management as comprising the following concerns and activities (Fig. 51.6).

In light of the embodied integration of the ethical abilities in the functions of the leadership as explained in the seven points of the new model, we may also present the following diagram indicating how these abilities can be represented as a system of integrative ethics for moral leadership which harks back the basic Confucian model of ethical virtues as a based on the Yijing cosmology. But in order to do this, we must see how each generative relationship should become genuinely mutual and hence reciprocal and interactive. This is a very important modification and revision of the original five-power theory so that the whole theory will become more productive and more integrated. In order to do, this for the original theory, we need to recognize the hybrid nature and mediation function of each power.

Thus, we can see how Metal actually may condition and give rise to Earth via a route of Water/Wood/Fire. Similarly, we may see how Water may give rise to

Fig. 51.6 Integration of creative functions of management in business

Metal via route of Wood/Fire/Earth, how Wood could give rise to Water via route of Fire/Earth/Metal, how Fire may give rise to Wood via route of Earth/Metal/Water, and finally, how Earth may give rise to Fire by way of Metal/Water/Water. This mutual generation which allows direct and indirect routes simply takes the whole system of circulation as thoroughly organic and organismic. This is not only physically possible and desirable but necessary and required for an organically integrated management and leadership.

Conclusion

From Original Insights to Philosophical Articulation

In the above I have presented a Yijing-oriented philosophy of ethics which I have described as Integrated Contemporary Confucian Ethics. This system of ethics can be also be described as Integrative Confucian Virtue Ethics of Life and the *Dao*, which has integrated the principles of duty, principle of utility, and principle of rights from the Western tradition. This amounts to a postmodernist reconstruction of the Classical Confucian virtue ethics which is based on Yijing onto-generative cosmology, but which also integrates the values of Daoism and Chan Buddhism both of which are Yijing-inspired²¹. That the incorporation of different types of ethics is possible for the Confucian system is due to the fact that there is the source of Yijing onto-generative cosmology which functions as a creative power of synthesis and comprehensive integration on the ground of experience of humanity which is accumulative and reflective as time advances. For after all, a system of ethics is to be developed for the sole purpose of meeting the challenge of leading a meaningful and desirable life which should be self-fulfilling and creatively productive not just for oneself but for the whole human-kind. With the Confucian virtue ethics of life and the *dao* established, we have then a solid foundation for developing a business ethics in relation to the creation of legal persons in the form of corporations and organizations.

It is taken for granted as a historical fact that economic corporations are created for the purpose of production so that they may compete in an open market place where freedom of transactions and exchange are allowed and fairness of such transaction and exchange is warranted. Hence, there are basic constitutive rules of organization and regulative rules of market transaction to be introduced and to be complied with. I have defined business ethics to be a matter of compliance with constitutive-regulative rules of organization and marketing

competition in such way that it should not violate the first-order ethics of life in community. Whether it may take advantage of the ground rules of ethics of life for improving an organization or for facilitating a market transaction is a matter of the choice for practitioners of business ethics.

With business ethics thus conceived, the management of any corporation or organization and what not is a matter of using powers invested in the functions of management for the purpose of maintaining, sustaining, and promoting and advancing the ends of corporations and transactions. I have distinguished five such powers of management in accordance with my theory developed in *The C Theory* book and have expanded their application and usefulness in close connection with the modernized theory of Confucian virtue ethics of life and the *dao*. In this fashion, the management theory must be considered as derived from or based on virtue ethics of life and its business application. As the Confucian virtue ethics is grounded on the Yijing cosmology of creativity and centralization, by the same token, the corresponding business ethics and management theory are consequently so grounded.

Notes

1. By “onto-generative” I mean whatever exists presupposes a process of origination from some source or root of being and this process will lead to the formation of an object to be conceived as some thing. Hence, the term indicates the natural formation of something from a source, corresponding to the concept of *benti* or root body. This idea of generative being is to contrast with the idea of “being” which is either transcendent or has a status of being without necessarily generatively related with other beings. This is the contrast between Western ontology with Chinese *bentilun* which is generative ontology.
2. After Han Chinese society to a large measure became Confucianized in the sense that the Confucian virtues become basis for normalization of social conduct and moral behavior.
3. People may identify and differentiate themselves in a network of human relationships but that is not the identification and positioning of a person in a large and even comprehensive framework of Heaven, Earth and 10,000 of things as Confucians and Daoists may wish to maintain. Do people need a comprehensive perspective/map to know their place in the world? And the map need not be comprehensive. There must be a world map in which I could find my whereabouts and situation.
4. The immanent generation of human beings from nature is different from the transcendent creation of humans by God. It requires a philosophical mentality to understand such a language. But we need not spend time to argue this point.
5. It is completely wrong to see Yijing as deterministic system as some people using divination believe. On the contrary it is in the nature of divination that Yijing is realized as a book of participation and creative achievement.

6. The Tuanzhuàn is one of the Ten Commentaries on the original texts of the Yijing, which is written under the insightful inspiration of Confucius. The author could be the first generation disciples of Confucius such as Zizi and Zengzi but the actual writing could be considerably later in the fourth century BCE.
7. We may also quote the Tuanzhuàn of the Kun to indicate how the power of receiving and preserving plays a central role in the creativity of *qian* and in fact functions as the other half of the *qian*. It is the power of receptive creativity that nourishes and potentiates so that the power of *qian* could continue and become regenerative.
8. The Xiangzhuàn is one the Ten Commentaries on the original texts of the Yijing which is written under the insightful inspiration of Confucius. The author could be the first generation disciples of Confucius such as Zizi and Zengzi but the actual writing could be considerably later in the fourth century BCE.
9. There lies the crucial distinction between an externally transcendent metaphysics of God and an internally transcendent metaphysics of the Dao. The God takes the image of man and becomes a symbol of absolute perfection whereas the Dao takes no such image of man and remains an absolute source of symbolization without itself being symbolized. The second distinction is that where God is regarded as an external and transcendent power ruling over man like a sovereign, the Dao is regard as an internal awareness not to be separated from the self-cultivating person and there is a self-ruling power for the human person. We may see these two as representing two forms of human development and civilizational development. The Western has followed in general the way and belief of God whereas the Chinese has followed in general the way and understanding of the Dao. The way of God tends to become what we conceive to be a religion as embodied in the Abrahamic religions of the West whereas the way of the Dao becomes what we may conceive to be ethics as embodied in the Confucian and Daoist ethics of China.
10. Because of lack of knowledge of Chinese language and lack of insight into the moral feelings in Confucius, Herbert Fingarette has been misled to speak of the magic of *li* as a network of charm, completely ignoring and unaware of the rich content of feelings and moral reflections in Confucian conception of the human self. (See his *Confucius: Secular as Sacred*, 1972) The consequences are (1) Confucian virtues are merely seen as behaviors; (2) Chinese self is conceived as having no moral mind or no moral self; (3) a psychological reduction of moral behavior to magic takes place; (4) Confucian virtues could not be seen as independently motivated but seen as constituting mere social relations with social roles attached. This doctrine of Confucian ethics unfortunately is seriously misleading. This has led to many sinologists' denial of morality, human self, or human subjectivity in Chinese philosophy. Specifically, it has led to an interpretation of human self as having no interiority of feeling and values but merely a set of ritual relations.
11. Confer *Totality and Infinity: An Essay on Exteriority*. Trans. Alphonso Lingis, Pittsburgh, PA: Duquesne University Press, 1969.
12. Zhong Yong 中庸 is traditionally considered as written by Zisi, the grandson of Confucius. The idea of the mean may not exhaust the meaning of *zhong yong* as an ultimate Confucian virtue for zhong yong has also the meaning of acting from the central-mindedness of a person without bias and equilibrium in natural response to things in the world. It also means to reach for a timely harmony with the dao and at the same time preserving unity with humanity.
13. This virtue of Cheng is implicit in the Analects and it becomes conspicuous in the Zhong Yong.
14. It is very significant to take note of the historical development of China in the year of 1993 when Deng Xiaoping announced and pushed the free market economy development in China which has made tremendous impact on Chinese modernization project for a modernized nation-state in the global world. The year 1993 is also the year in which the International Association for Confucian Studies (国际儒学联合会) was established by the support of the central Government. The ICA founding signified the catch of time of Confucianism in Contemporary China (and vice versa) through my initiation proposal and efforts made in 1989, the eventful year which was the turning point for development of Contemporary China.

15. One cannot argue that the Chinese Characteristic is Chinese Marxism, for Chinese Marxism is basically what Chinese socialism is or should be. Its development in contemporary era is a matter of introducing free market in contemporary China in order to allow people to get rich and have quality of life improved. This latter part is no doubt something to do with the wisdom of the Confucian ethics based on Yijing, which allow the conscious change and transformation (*quanbian* 权变) toward comprehensive promotion of life by human efforts which we find in both Confucius and Mencius.
16. Between 1895 and 1908, Yan Fu translated eight major pieces, among which were T. H. Huxley's *Evolution and Ethics* (1896), John Stuart Mill's *On Liberty* (1899), Adam Smith's *Wealth of Nations* (1900), Spencer's *Study of Sociology* (1903), and Montesquieu's *The Spirit of the Laws* (1905). The net result of these translations is that the Chinese intellectuals and, through them, the Chinese people are made open to the idea of utilitarianism which is required by modernization and evolutionary competition in the modern world.
17. See my forthcoming paper titled "Reconciling Equity and Self-Interest: Toward Implementing the Confucian Principle of Humanity" at the Tenth International East-West Philosophers Conference in Honolulu, May 17–24, 2011 in which I argued that Confucianism is not against economic activities aiming at getting rich but the overall concern with equity and harmonization should be maintained as a check on the liberal development of economic development. See Proceedings of Assembly Papers of the above mentioned conference.
18. In light of the fact that this new form of ethical system has taken into consideration of many enlightened economic reform and open policies we could also title it the Confucian-Marxist-Utilitarian Ethics in certain areas of its application under the name of Chinese Marxism or the name of Socialism with Chinese Characteristics. But since Chinese Marxism has become growingly sinicized or for that matter Confucianized in the recent 15 years, the present title appears to be more apt.
19. I have argued that source of virtue ethics and rights ethics is one. See my paper "Transforming Confucian Virtues into Human Rights: A Study of Human Agency and Potency in Confucian Ethics," in [1].
20. This is precisely what a good scientific theory requires as we know from philosophy of science and any professional scientist working in fundamental areas of modern science. Confer W.V. Quine [3].
21. For saving of space I have not included my explanation of Daoism and Chinese Buddhism including Chan Buddhism, as parts of the expanded Confucian Business Ethics.

Corporations and Fundamental Rights: What is the Nature of Their Obligations, if any?

52

David Bilchitz

Abstract

This chapter seeks to consider the philosophical question whether corporations have obligations for the realization of fundamental rights, and if so, what the nature of those obligations is. It begins with a brief history, aimed at identifying some of the key ideas underlying fundamental rights discourse. These rights, it is argued, flow from certain fundamental features of individuals. As such, they emerge from what is termed the perspective of recipience, namely, of the individual who is being protected. This perspective is often criticized for failing to specify the agents who are to realize these rights. Nevertheless, it is pointed out that what is most important from this perspective is that the rights of the recipient are realized. This entails that no agent may legitimately harm or threaten individuals who possess such rights. Such an entailment applies equally to corporations as well as other business entities. While negative obligations to avoid harming fundamental rights appear to flow logically from the nature of fundamental rights, what remains more controversial is the extent to which corporations bear responsibility for actively taking steps to help realize the fundamental rights of individuals. Some contend that it is the state that must primarily bear such positive obligations.

To answer this question, a brief understanding of the nature and purpose of the corporation is necessary. Some view the corporation as reducible to the individuals lying behind it and its purpose as involving solely the achievement of maximum profit. Contrary to this view, this chapter argues that the corporation must be viewed both from the perspective of individuals investing in it (“the individual perspective”) and the perspective of lawmakers who create

this entity (“the societal perspective”). The societal perspective requires that the corporate entity have a benefit for society. As such, the first key duty is that corporations avoid harming rights. That very obligation, however, when analyzed in more depth, does not simply require noninterference but also significant positive obligations. An argument is presented that requires corporations to assume significant positive obligations on the basis of the harms caused by the private property system within which they are intrinsically enmeshed.

The societal perspective from which the corporation emerges also in a more direct way involves recognizing that corporations are formed not simply for attaining individual profit but for achieving social benefits. Lawmakers are under a stringent obligation to ensure most particularly the realization of fundamental rights. Corporations, it is argued, are thus formed partially for the purpose of contributing to the important social purpose of realizing fundamental rights. Given its distinctive nature, however, and the duality intrinsic to it, there is a need also to draw limits to those very obligations. The chapter thus provides a case for recognizing that corporations are social entities and bound to contribute to the advancement of fundamental rights. The individual perspective on the corporation helps us recognize that they will often fulfill these obligations in a distinctive manner. It also helps us to recognize certain principled limits upon these obligations.

Introduction

The concept of fundamental rights (or often referred to as “human rights”) [1–3]¹ is of central importance in both the moral and legal landscape today. The call for “human rights” has animated struggles for the equal treatment of women, black, and LGBT people as well as uprisings against tyranny such as has recently occurred in the Middle East. It is also increasingly being used as a concept of importance in combating poverty, environmental degradation, and extending decent treatment to animals. There are many difficult philosophical questions that arise in connection with fundamental rights. Some of these problems can be captured by the question: “*Who must do what for whom?*” ([4]; Kuper quotes the views of O’Neill [5]). This composite question raises several problems: Who are the bearers of the obligations for realizing rights? What is the nature of their obligations? Who is entitled to claim the protection of rights or to benefit from the performance of these obligations? In order to begin answering these questions, it is necessary to have some conception of what fundamental rights are and the justification for their existence.

The problem that will be the subject of this chapter relates to the fact that fundamental rights grant entitlements without specifying who bears the obligations for realizing these very entitlements. The more specific focus of this chapter will be on whether corporations have obligations for the realization of fundamental rights and, if so, what the nature of these obligations is. Fundamental rights have been a central feature of ethical discourse and political philosophy for at least 200 years. The focus of the discourse surrounding such rights has, however, been upon the

obligations they place on states and governments. Determining the implications of fundamental rights for the conduct of business and corporations is a relatively recent endeavour. It has nevertheless become a pressing matter, given the growth of corporations and their power to impact upon the fundamental rights of individuals.

The first part of this chapter will consider briefly the history and origins of the concept of fundamental rights. This brief overview will seek to demonstrate that the concept is not fundamentally tied to the relationship between individuals and the state; rather, it is rooted in the idea that these entitlements flow from certain fundamental interests that individuals have. Fundamental rights thus emerge from a particular perspective – what I term the “perspective of reciprocity.” This involves a focus upon the entitlements of the individual being protected. This perspective is often criticized for failing to specify the agents who are to realize these rights. Nevertheless, it is pointed out that what is of key importance from this perspective is to ensure that these rights are realized. Each right, it is argued, involves multiple forms of obligation.

In order to determine whether corporations have obligations in relation to fundamental rights, it is necessary to have an understanding of the nature and purpose of this entity which is the subject of the second part of this chapter. Some view the corporation as reducible to the individuals lying behind it and its purpose as involving solely the achievement of maximum profit. Contrary to this view, I contend that the corporation must be viewed both from the perspective of individuals investing in it (“the individual perspective”) and the perspective of lawmakers who create this entity (“the societal perspective”). The societal perspective requires that the corporate entity has a benefit for society and does not harm individuals in such a society.

The third section of this chapter begins by providing two arguments for why corporations at least have negative obligations to avoid harming fundamental rights. It is argued that these two arguments flow from the societal perspective as well as the very nature of fundamental rights. While negative obligations to avoid harming fundamental rights seem to flow logically from these considerations, what remains more controversial is the extent to which corporations have positive obligations – whether they bear responsibility for actively taking steps to help realize the fundamental rights of individuals. Some contend that it is the state that must primarily bear such positive obligations.

I engage with this controversy in the fourth section and provide two arguments for thinking that corporations do bear positive obligations as well for realizing rights. The first argument is rooted in the duty to avoid harming fundamental rights. That very obligation does not simply require noninterference but also significant positive obligations upon corporations when we take into account the harms caused by the private property system within which they are intrinsically enmeshed. The second argument develops the idea of the societal perspective which involves recognizing that this entity is created for the purpose of achieving social benefits. A plausible conception of social benefit would include at the minimum a contribution towards the realization of fundamental rights. Given the distinctive nature of the corporation, however, and the duality intrinsic to it, there is a need also to draw limits to those very obligations. This chapter thus provides a case for

recognizing that corporations are social entities and bound to contribute to the advancement of fundamental rights. The individual perspective on the corporation helps us recognize certain principled limits to these obligations and that corporations often fulfill them in a distinct manner.

Fundamental Rights

Brief History and Origins

Ideas that have some relationship to the notion of fundamental rights can be found in many cultures and date back to antiquity. In the Western tradition, these related notions can be traced back to ancient Greece and Rome as well as Judaism and Christianity (See some of the material in [6]). Several authors also argue that related ideas have been present in African moral theory (See, for instance, [7]) and Asian philosophy [8]. The social contract tradition, in the notable writings of Thomas Hobbes and John Locke, provides some of the first overt references to certain fundamental interests and rights that individuals possess. For Hobbes, humans fundamentally have an interest in self-preservation and security which ultimately leads to the need to form a sovereign power. The interest in self-preservation remains even after the state is formed and can form the basis of civil disobedience [9]. For Locke, human beings have certain “fundamental natural rights” to life, liberty, and property. The deficiencies of the state of nature lead to these rights being insecure and thus provide a foundation for the state whose end involves significantly the realization of these fundamental rights ([10], p. 271 and pp. 350–353). Already with these theorists, it is important to note that fundamental interests or natural rights are not fundamentally linked to the state itself and are present in the state of nature. The most important legal development that arose from the influence of the social contract tradition was the French Declaration of the Rights of Man and Citizens, enacted in 1789, with the advent of the French Revolution. This began the process of the legal entrenchment of fundamental rights in the constitutions of particular states. Another notable example from that time is the United States Constitution. The French Declaration roots natural rights in the idea that “Men are born and remain free and equal in rights” [11]. The Declaration was clearly aimed at controlling the legislative and executive power of the state. With the reign of terror following the revolution and the rise of Napoleon, there was much disenchantment with the French Revolution. In the decades following its passing, the Declaration elicited heated debates concerning the existence and nature of fundamental rights (For some of these critiques, see [12]).

The utilitarian tradition in the 19th century began as rather hostile to the notion of fundamental rights with Jeremy Bentham describing them as “nonsense upon stilts” [13]. John Stuart Mill, however, famously sought to reconcile utilitarianism with the notion of rights. Mill importantly connects the idea of justice with the concept of moral rights: he states, “[j]ustice is a name for certain classes of moral rules, which concern the essentials of human well-being more nearly, and are therefore of more

absolute obligation, than any other rules for the guidance of life; and the notion which we have found to be of the essence of the idea of justice, that of a right residing in an individual, implies and testifies to this more binding obligation” [14]. These ideas identified by Mill remain central to the notion of fundamental rights, namely, that they impose binding obligations upon individuals and that these obligations relate to the most important elements of the well-being of individuals.

One of the most significant legal developments to occur was the movement of fundamental rights from the realm of moral philosophy and the constitutions of specific states to becoming one of the central normative bases for the international legal order after the Second World War [15]. The horrors of the Holocaust saw the complete devaluation of the lives of particular groups such as the Jews and Roma. In reaction to this, in 1949, the United Nations General Assembly recognized the Universal Declaration of Human Rights. This important document begins in article 1 by recognizing that “[a]ll human beings are born free and equal in dignity and rights. They are endowed with reason and conscience and should act towards one another in a spirit of brotherhood” [16]. In 1966, the International Covenant on Civil and Political Rights and the International Covenant on Economic, Social and Cultural Rights also recognized that fundamental rights emerge from the “inherent dignity of the human person” [17, 18].

The focus on dignity and reference to reason has suggested to some a Kantian philosophical foundation for the rights in the Declaration and Covenants. Famously, Kant distinguishes between that which has a price and a dignity. That which has a price is replaceable and is, in general, important for a particular purpose; that which has a dignity cannot be replaced and has an inner worth ([19], p. 84). The idea of dignity is also often linked with Kant’s second formulation of his categorical imperative which enjoins individuals to “[s]o act that you use humanity, whether in your own person or in the person of any other always at the same time as an end, never merely as a means” ([19], p. 80).

The Kantian and contractarian trends within the philosophical underpinning of fundamental rights are developed importantly in the second half of the 20th century in the work of John Rawls. Rawls argues that the principles of justice emerge from a suitably constructed procedure he terms the “original position.” The original position essentially is a construct whereby we imagine what free and equal people would decide were they to have to agree on principles of justice with one another. To avoid power differentials from entrenching the privileges of those already well-off, and to ameliorate the unfair effects of talents being unevenly distributed naturally, Rawls asks us to imagine individuals behind a “veil of ignorance.” This effectively means that we do not know which position we occupy in society nor any facts about our gender, race, sexuality, talents, and much else. To enable people to make a choice in these circumstances, they require some information that can be the basis of such a choice. Rawls employs the idea of primary goods for this purpose, which are “the necessary conditions for realizing the powers of moral personality and are all-purpose means for a sufficiently wide range of final ends” [20]. The primary goods include natural primary goods such as food, water, and housing as well as social primary goods that include basic rights and liberties, freedom of movement,

income, wealth, and the social bases of self-respect. Rawls argues that people in the original position would choose his two principles of justice. For the purposes of this chapter, it is the first principle that is most important which Rawls formulates as follows in *Political Liberalism*: “[e]ach person has an equal right to a fully adequate scheme of equal basic liberties which is compatible with a similar scheme of liberties for all” [21]. Thus, the outcome of a procedure for determining the principles of justice, according to Rawls, will lead to the protection of certain basic rights and liberties. These flow from an understanding of certain vital interests of individuals that are the necessary conditions they require in order to realize a conception of the good.

More modern theories of fundamental rights build on these ideas in differing ways. In the early 21st century, Martha Nussbaum outlined a capability view of fundamental rights that is rooted in Rawlsian, Kantian, Marxist, and Aristotelian insights. Her theory builds on her work with Amartya Sen on the capability theory which understands value in individual life in terms of functionings and capabilities: “we ask not only about the person’s satisfaction with what she does, but about what she does and what she is in a position to do (what her opportunities and liberties are)” ([22], p. 70). The central question of the capability approach is whether a person is capable of being or doing X. Nussbaum outlines two distinct thresholds which delineate the value of functionings and capabilities to human beings. The first threshold concerns functionings that are particularly central in human life: their presence or absence is typically understood to be a mark of the presence or absence of human life. The second threshold delineates functionings that characterize a flourishing human life, one that is “worthy of a human being” ([22], p. 11). Nussbaum uses these notions to develop a list of central human functionings and capabilities that determine what is of fundamental importance to human beings and how well-off they are. Using the Kantian idea of treating everyone as an end in themselves, Nussbaum argues that individuals are entitled to have their capabilities developed and to be placed in a position whereby they can live a truly human life. In later work, she also argues that this may apply beyond the human species to all creatures that have a capacity to flourish [23].

My own work seeks to build on the work of Nussbaum and Rawls to provide a more satisfactory foundation for fundamental rights. It outlines a different conception of value in the life of individuals which resides in their ability to have conscious experiences of the world as well as the ability to achieve their purposes. The theory then distinguishes between two thresholds: the general necessary preconditions for being free from threats to survival and the general necessary preconditions for the fulfillment of purposes. The thresholds are distinguished on the basis of the “urgency” of the former in comparison with the latter, which it is contended is of importance in determining what must be done for individuals. Instead of focusing on either capabilities or primary goods, the theory also uses the insights of both to help develop an attractive conception of individual interests. The theory then defends the idea that society must in its background rules treat the lives of all beings as having equal importance. In specifying what this means, it is argued that a society is not required to realize the particular goods of beings; rather,

treating individuals with equal importance involves recognizing that every member of society must be provided with the enabling conditions to live lives of value to them. “To do so requires guaranteeing to each individual the necessary prerequisites for realizing a life of value” [1]. This ultimately requires recognizing each individual’s basic entitlements both to “freedom rights” (civil and political rights) and “resource rights” (socioeconomic rights) [24].²

Rights, Obligations, and Agents

I have thus far gone through a brief history of fundamental rights, some key legal developments, and engaged with some of the recent justifications for these rights. The purpose of this overview has not simply been to introduce the notion of fundamental rights but also to identify certain important features of the discourse of rights and their foundations which have implications for the obligations of corporations in this regard.

The history and philosophical foundations of fundamental rights demonstrates that these entitlements are usually held to flow from certain fundamental interests that individuals have. For Locke, this is life, liberty, and property; for Mill, it is certain essentials of well-being. Later theories include the interest in being able to pursue and revise a conception of the good and the necessary prerequisites for doing so. Different theories may thus give differing accounts of what is of value in individual life and the interests individuals have; theories of rights, however, share a notion that these entitlements flow from significant features of individuals which require protection.

Flowing from these roots, it follows that fundamental rights offer particularly strong entitlements and protections for these very basic, foundational interests of individuals. However, these protections are not absolute: most moral and legal systems recognize circumstances in which they can be limited. Nevertheless, their strength is reflected, for instance, in the way in which such rights cannot easily be overridden: as Dworkin puts it, if a fundamental right exists, the government may not act “on no more than a judgment that its act is likely to produce, overall, a benefit to the community. That admission would make his claim of a right pointless, and would show him to be using some sense of ‘right’ other than the strong sense necessary to give his claim the political importance it is normally taken to have” [25].

These features of fundamental rights allow us to understand that they flow from what may be termed the “perspective of recipience.” This effectively means that fundamental rights are focused on the individuals who have the entitlements and to whom obligations are owed. This perspective can be contrasted with the “perspective of agency”: here, the focus is on the agents that are responsible for performing particular actions. Some have argued that the focus on those to whom entitlements are owed is a weakness of rights discourse: the failure to focus on the agents who must realize these rights provides a recipe for empty promises. The obligations that rights impose are underspecified, and there is no allocation of responsibility to specific agents for the fulfillment of these rights [26].

However, it can be responded plausibly that the perspective of agency – while clearly of importance – does not perform the same role as a theory of rights. A theory of rights draws our attention to the most urgent interests of beings and recognizes the importance of strong protections for these interests. Such a theory does not lack action-guiding consequences; indeed, the importance of fundamental rights is that they involve a claim that the urgent interests of individuals must be protected, no matter the agents that may threaten them. These urgent interests provide the very reasons for many of our duties to others. Talk of duties alone fails to indicate that it is our connection to others who have fundamental interests that is of critical importance and which imposes obligations upon us.³

The importance of this discussion of the perspective of recipience is the fact that the theories of rights that we have come across, in various ways, articulate the need to protect the fundamental interests of individuals *without* specifying a particular agent that has the obligations to ensure they are protected. Instead of being a weakness, it can be argued that this is a strength of rights discourse which provides it with an inherent flexibility. Indeed, the context of much historical discussion of fundamental rights is very much on the harms that states cause to individuals through repressive actions. If the focus historically had simply been on agents and their obligations, it is likely that those obligations would have been focused on the actions of the state. In our current world, that may still be relevant as states still hold significant power; nevertheless, other agents also possess the ability to cause significant harms to individuals. The logic of fundamental rights, as we have seen, pushes us towards imposing obligations on all agents who pose a threat to fundamental rights. This allows us to allocate such obligations according to their power and ability to affect the realization of such rights. This means that, despite the historical focus, if nonstate actors are increasingly able to impact significantly upon fundamental rights, then we need to grapple with how to ensure that they play a positive (and not harmful) role in ensuring their realization. Thus, the very openness of fundamental rights discourse concerning the agents responsible for their realization allows for an inherent flexibility in allocating these obligations on a basis that will ensure the effective realization of these rights.

The feature of fundamental rights that is being described – namely, that it includes an implicit requirement that there be effective implementation thereof – has a number of other implications. First, it requires us to recognize the limits of individual action alone and the need for cooperation and engagement between persons to work together towards the realization of rights. Secondly, it can require a limit to be placed on the burdens imposed upon any specific individual. Placing overly onerous obligations on individuals may be counterproductive as they may become overwhelmed, apathetic, despondent, and resentful.⁴

Thirdly, it requires us to move beyond a purely abstract understanding of the correlative obligations of rights and to develop a more concrete specification thereof. Some have argued, for instance, that certain types of rights – often termed civil and political rights – simply impose obligations not to interfere with the rights of others (“negative obligations”), while other types of rights – often termed socioeconomic rights – impose obligations to take active steps to provide people

with goods (“positive obligations”). Henry Shue has sought to highlight the mistaken nature of this view by demonstrating that “the complete fulfillment of each kind of right involves the performance of multiple kinds of duties” [27]. He demonstrates that rights which have traditionally been classified as “negative” in nature – such as a right to security – also impose positive obligations on certain others, while rights that primarily are supposed to impose positive obligations – such as a right to subsistence – in fact also impose negative obligations on others. Every right, he claims, involves three correlative duties: duties to avoid depriving, duties to protect from deprivation, and duties to aid the deprived. Thus, the right to adequate food, for instance, contains three duties: a duty not to eliminate an individual’s only available means of acquiring food (the duty to avoid depriving), a duty to protect individuals against deprivation of their only available means of subsistence by third parties (the duty to protect from deprivation), and a duty to provide the food for those unable to do so themselves (the duty to aid the deprived). Shue’s analysis thus demonstrates that each kind of right involves both negative obligations (to refrain from interfering with a person’s enjoyment of a right) as well as positive obligations (to take active measures to realize a right).

The next section of this chapter seeks to consider the implications of these ideas for the obligations of corporations in relation to fundamental rights. The focus is upon the corporation given that it is the dominant structure through which business is conducted today. In order to gain an understanding of whether corporations should have obligations flowing from fundamental rights and, if so, what the nature of these obligations is, it is important first to understand the nature and function of the corporate entity itself. The next section addresses this question.

The Nature and Function of Corporations

The Nature of the Corporation

We can start by recognizing that there are no naturally existing corporations. Corporations are structures created by law: it is thus necessary to consider in a little more detail the key legal properties of a corporation. One of the key purposes of all forms of commercial activity involves individuals trading in goods or services and seeking to make a profit thereby. Commercial activity is conducted through a range of legal forms. Some vehicles for conducting business are simply reducible to the individuals underlying them: the sole proprietor and partnership are examples of such forms. The corporation has become the dominant structure in the modern world at least in part because, in law, it is regarded as not being completely reducible to the individuals underlying it. The major distinctive feature of the corporation has been its “separate legal personality” which allows the company to be a bearer of rights and liabilities in its own right ([28]; and also [29]).⁵ Conceiving of a corporation as a separate legal person has a number of legal advantages, foremost of which is the notion of limited liability [30]. The corporate form separates out shareholders from bearing full responsibility for the fate of the

company, and thus “the risk carried by the contributors of capital extends no further than the loss of the amount which they have contributed to the venture as capital” [31].

The very defining characteristic of the corporation in law thus clearly gives expression to an irreducibility thesis: the properties of the composite entity – the corporation – can differ from those of the individuals that either invest in it or manage it. In brief, several considerations support this thesis. First, the identity of the corporation is not affected by changes in the individuals who lie behind it. Indeed, one of its key advantages is the fact that it continues to exist beyond the lifetime of particular individuals who invest in it or manage it: this is known as the benefit of perpetual succession. Secondly, individuals who lie behind the corporation may bear responsibility only for those particular decisions that they take or are involved with. If a director could not reasonably be expected to have known about a decision taken by another director, he/she will often not bear personal liability for it. The corporation, however, bears liability for all decisions by individuals empowered to act on its behalf. In most legal systems, corporations may thus bear independent civil and/or criminal liability for acts that are attributed to it.

A third and related point involves the difficulty of attributing particular actions to individuals. In the case of corporations with a simple structure, it may be easier to identify the individuals responsible for a particular decision. Even here, however, individuals may claim that the very purpose of the entity and the expectations it creates involves recognizing that acts they performed for the sake of the corporation should not be attributed to them in their personal capacities. In corporations with more complex decision-making structures, the collective nature of the enterprise may render it extremely difficult to attribute particular actions to specific individuals or to decide upon whom individual responsibility is to be pinned. Fourthly, the corporation may, as a separate entity, wield more power than the individuals who make it up do collectively. For instance, a large multinational corporation when it lobbies a government to adopt a particular position may have more bargaining power than the individuals who form it do even when they act together. Finally, the separate legal personality of a corporation may facilitate and concentrate the accumulation of wealth.

It is important, however, not to take this argument too far. Clearly, the notion of separate legal personality in some sense appears to be a construct: the corporation cannot in reality act other than through the individuals who are the intelligent entities behind it. Every decision taken will be a decision of an individual or a complex collection of individuals who are tasked with representing the corporation. The property holdings of a corporation will, when it is founded, be invested by the individuals who form the company. While corporate activity may build upon such resources in various ways and the ownership be diffused (through listing on a stock exchange), ultimately, it will be individuals with a shareholding in the corporation who are entitled to the profits from its activities. These considerations taken together point to the fact that the very legal nature of the corporation requires us to see that it has a complex relationship to the individuals underlying it: it cannot be reduced to those very individuals while in some sense it is fundamentally

dependent upon them. The relation of “supervenience,” often employed to describe the relationship between the mind and the body in philosophy of mind, may well assist in giving us a sense of the relationship between a corporation and the individuals underlying it.

The Purpose of the Corporation

This understanding of the complex nature of the corporation has an impact on how we understand its purpose. It is important to distinguish between two perspectives in this regard: the point of view of the collective social structures (and particularly the lawmakers) who create and regulate the structure of the corporation in law (I shall refer to this as the societal point of view) and the point of view of the individuals underlying the corporation [32, 33].⁶

Individuals have a calculated economic motivation in forming a corporation: usually, they would have determined that the best way to conduct business for them is through the vehicle of a corporate structure. Their reasons for doing so must involve attaining certain commercial advantages. For example, individuals may wish to insulate themselves from the risk of personal insolvency should the corporation fail and to ensure the benefits of perpetual succession are obtained. Some therefore tie the purpose of the corporation very closely to the individual perspective [34].

The corporate form is, however, a legal structure, and the perspective from which such a vehicle is created in law is not equivalent to the perspective of any particular individual who invests in it. Decent lawmakers who pass laws on behalf of a society are required to adopt a more impersonal perspective that seeks to advance the interests of all individuals in society and to ensure that every individual is treated with equal importance [35]. Thus, in deciding whether to pass a law that brings corporations into legal existence, lawmakers must not simply consider the benefits for individuals with an interest in creating such a structure. They must rather seek to determine whether that very structure will be of benefit to *all* members of society and determine in what respect it can either hinder or advance the purpose of treating each individual with equal importance.

This societal perspective gives us a clear reason to reject the notion that the purpose of the corporation solely involves the maximization of profit for individuals. For any lawmaker would need to ask the further question why an entity focused on the maximization of profit would be beneficial to society and advance the goal of equal importance. The maximization of profit cannot therefore be an end in itself from the societal perspective; rather, the justification for the corporate structure must be rooted in the social advantages it would bring about.

Traditionally, there is indeed a capitalist justification for the corporate structure that makes reference to social benefit. The corporation can be said, for instance, to encourage people to take more risk, stimulate innovation, and provide a catalyst for greater competition. These benefits in turn often lead to the stimulation of growth in the economy and thus greater wealth in the society. More jobs can be created which in turn, ultimately, improves the quality of life for individuals. Importantly, many

of these advantages are only achievable if corporate structures are designed by lawmakers with a recognition of the particular perspective of individuals who lie behind the corporation – namely, that it is a structure that can allow them to attain commercial advantages and achieve profit. There are thus good reasons for lawmakers from their societal perspective to adopt an understanding of the purpose of a corporation that also takes into consideration the perspective of individuals who will utilize the corporate structure.

This section has thus sought to establish that a corporation, given its nature as a structure that is both irreducible to the individuals underlying it as well as fundamentally dependent upon them, must be considered from the two perspectives of the individuals who invest in it (and manage it) as well as from the perspective of society (acting through its lawmakers) that enables such a structure to exist. The former perspective places the focus on maximizing profit; the latter perspective is concerned with the social benefits of the corporate structure (This discussion is largely taken from [36]).

Corporate Obligations to Avoid Harming Fundamental Rights

Negative Obligations

An understanding of the nature and function of the corporation and the two perspectives from which it may be viewed is of crucial importance in understanding whether they have obligations for the realization of rights and, if so, the very nature of these obligations. As we have seen, fundamental rights each entail multiple forms of obligation. I will first start by asking whether corporations bear traditional “negative obligations” to avoid harming the fundamental rights of individuals (Shue’s duty to avoid depriving). I shall present two arguments as to why they do have such obligations.

The first argument begins from the perspective of lawmakers, which it has been argued must proceed from the premise that the corporate form is created for the purpose of attaining social benefits for all in a political community. The same perspective would clearly require that a diligent lawmaker should refuse to create such an entity if its formation would lead to grave social harms. However, it may be that the picture is less clear-cut: the corporate structure may itself offer the possibility of strong social advantages yet be accompanied by the possibility of grave social harms. In such circumstances, the diligent lawmaker would need to devise a regulatory framework that strengthens the likelihood of realizing the advantages while guarding against the realization of those harms. From its inception, it has been clear that the core advantage of the corporation from the perspective of individuals – its separate legal personality – can lead to social harms through insulating shareholders and directors from bearing full responsibility for their actions. The mix of self-interest and impunity that can result from the corporate form has led some to view it as “a structure which is pathological in the pursuit of profit” [37]. Corporate law has evolved largely to ensure that the benefits of the

corporate structure are obtained while the economic risks, attendant upon this entity, do not materialize [38]. The focus of corporate law has, however, been on economic risks; the wider social impacts of the corporation have largely not been the focus of legislative engagement. Given that fundamental rights protect the most basic interests of individuals, the violation of these rights by corporations would be amongst the most serious social impacts for lawmakers to be concerned about. The fact that the corporate structure itself can create grave risks of harm to fundamental rights would thus provide a clear normative basis for lawmakers to impose strong negative obligations upon the corporation to avoid harming individual rights.

The second argument proceeds from the very logic of fundamental rights. As was discussed in the first section of this chapter, such rights are rooted in the protection of important interests of individuals who must be treated as having “dignity” or “equal importance.” Individuals are deserving of such protections no matter who threatens them. Rights require obligations to be imposed upon all agents who can threaten their realization. Given that corporations are very powerful today and have the capacity to harm the fundamental rights of individuals, it is necessary to recognize that they have obligations to avoid doing so. Thus, the very logic of what it is to have a fundamental right would require that all agents – whether the state, a corporation, or individuals – may not harm the rights of other individuals.

I have thus made two arguments why corporations should have “negative” obligations to avoid depriving individuals of fundamental rights. Such an obligation is not only recognized at the normative level but has also recently been recognized in the Ruggie framework. This framework was developed by a special representative to the Secretary General of the United Nations, Prof. John Ruggie, who was given the task of developing an understanding of the responsibilities of businesses in relation to fundamental rights. In 2008, he released his framework which recognizes corporations bear a “responsibility to respect” fundamental rights, which essentially means that they must avoid harming the fundamental rights of individuals [39]. He has developed guiding principles for the implementation of this framework which have recently been accepted by the United Nations Human Rights Council [40]. Though there is no binding treaty declaring the position in international law, it can be said that, at the international level, there is now broad recognition that corporations have a responsibility not to harm fundamental rights. There have also been several voluntary initiatives whereby international bodies and corporations themselves have acknowledged that they bear an obligation to avoid harming fundamental rights ([41]; also see [42]).

Positive Obligations that Flow from Negative Obligations

Much more controversial is the question as to whether corporations have a duty to take positive steps to realize rights. This would involve going beyond ensuring that their ordinary activities do not harm rights but require them actively to take particular steps to help realize rights. Different types of positive measures can be distinguished, some of which are more controversial than others.

John Ruggie, in the framework that he outlines, states that “doing no harm” can require that positive steps be adopted to ensure that negative consequences do not result from corporate action ([39]; [43], p. 517).⁷ The example Ruggie uses is important in helping to understand this point: a workplace antidiscrimination policy, he claims, might require that a company adopt specific recruitment and training programs ([39], para 55). If we try to draw out what he could mean by this statement, presumably, the training component of such programs would be designed to shift discriminatory attitudes within a firm. Recruitment programs would, it seems, at least have to be based upon equal opportunity principles and could perhaps also involve some form of affirmative action to redress past discriminatory practices. This example, however, highlights the fact that positive steps may be necessary to ensure that a corporation avoids harming the rights of others: in the example Ruggie gives, the violation would involve avoiding the infringement of equality rights through discriminatory practices. The positive duties of a company in this context simply flow from its general “negative” obligation to avoid violating rights and essentially are designed to guard against any such violations.

Corporate obligations for Ruggie are also not simply confined to taking positive steps to avoid violating rights through its own actions. In the due diligence enquiry that he proposes, Ruggie supports the position that a corporation must also consider how it could contribute to human rights violations through the abuses of third parties. He is clear that the corporate responsibility to respect rights would involve avoiding “complicity” which “refers to the indirect involvement by companies in human rights abuses – where the actual harm is committed by another party, including governments and non-State actors” ([39], para 73). His views here seem to imply that corporations also have a responsibility to *protect* individuals against abuses by third parties with whom they have some form of contact (This section and analysis is taken from [44]).

The positive obligations recognized thus far are all connected to the purpose of avoiding harming fundamental rights. Ruggie, however, does not go further and recognize an obligation upon corporations to help “fulfill” rights (actively to contribute towards the realization of fundamental rights). This could involve, for instance, an obligation upon pharmaceutical companies to provide drugs (or lower the price of drugs) for those suffering from life-threatening illness or an obligation upon legal corporations to provide pro-bono legal services for the poor.

Ruggie argues against extending corporate obligations further by claiming that while corporations may be “organs of society,” they are “specialized economic organs,” not “democratic public institutions” ([39], para 53). The differing nature of corporations and states thus means that corporate “responsibilities cannot and should not simply mirror the duties of States” [39]. Consequently, Ruggie asserts, “by their very nature, therefore, corporations do not have a general role in relation to human rights like states but a specialised one” [45]. Ruggie thus attempts in his framework to identify the “distinctive responsibilities of companies in relation to human rights” [39]. The claim that corporations have only a responsibility to respect reflects his attempt to capture the particular role they should play in relation to fundamental rights. Ratner, too, contends that corporations only have negative

duties in relation to fundamental rights or, at most, responsibilities to take positive measures clearly necessary to effect these negative duties. To go further than this, he claims, “would effectively ignore the functional differences between states and businesses; it would thereby ask too much of the corporation, especially at this stage of the international legal process, when the broad notion of business duties in the human rights area is just emerging” ([43], p. 517).

Underlying this view is an understanding of the function of the corporation that sees it essentially as part of the “private” realm. Individuals investing in corporations are seen to have a fundamental economic aim to maximize profit while limiting their own risk. This leads to a view of the function of the corporation that was most famously articulated by Milton Friedman: “there is one and only one social responsibility of business – to use its resources and engage in activities designed to increase its profits so long as it stays within the rules of the game, which is to say, engages in open and free competition, without deception or fraud” [34]. The rules of the game for Ruggie and Ratner would go further than those envisaged by Friedman and involve respecting human rights. Nevertheless, the social role Ruggie articulates for the corporation is similar: it is ultimately an economic entity focused on profit maximization which is required to avoid causing significant social harms.

Two types of responses may be made to this argument. The first response accepts the vision of the corporation offered by these theorists but contends that, nevertheless, it has positive obligations for the realization of rights; the second response challenges the conception of the corporation underlying this argument, suggesting a better view would recognize positive obligations to realize fundamental rights. I shall outline both types of responses and arguments in turn (I have dealt with these arguments in [3]).

Positive Obligations for Realizing Rights

A Libertarian Argument for Positive Obligations

The first argument seeks to build on the duty to avoid harming fundamental rights. This may initially appear only to involve a corporation having to conduct its ordinary activities without infringing on people’s rights. Yet, this very duty, it can be argued, can also entail rather extensive positive actions being required on the part of corporations actively to help realize rights. To understand why this is so, it is necessary to go back to an understanding of the purpose of the corporation and the harms that it can cause in relation to individual rights. At its core, the corporation is deeply connected with the process of accumulating wealth and thus operates in the realm of acquiring and transferring property. Empirically, it is important to take note of the fact that corporations are the owners of some of the largest concentrations of wealth in the world.

As it is currently instantiated in the world, the private property system, while clearly having a number of advantages, also creates a number of severe harms for individuals. In practice, this idea can be understood through considering the fact

that a mining corporation's ownership of minerals prevents others from exploiting those minerals. A pharmaceutical company's patent over medicines prevents others from producing them or individuals from being able to access them if they lack sufficient funds to buy them. Ownership of land prevents other individuals from having access to that land without the owner's permission. Indeed, in a world where all property is owned (as is largely true of our world) and such ownership confers rights to exclude others from such property, individuals can be left in a position where all the resources necessary to meet their basic needs are owned and they have insufficient income to acquire such resources. Private ownership can lead to a world where individuals may be excluded from having access to such basic goods as a place to stay, life-saving health care, food, and water.

Locke famously defended private property rights, claiming that one acquired such rights by mixing one's labor with a particular object. Yet, he placed a crucial qualification on the acquisition of these rights: it would only be fair to appropriate a resource for Locke and, consequently, for an acquisition to be legitimate where "there is enough and as good left in common for others" ([10], at p. 289). This would effectively have ensured that individuals were not left in a destitute position without any possibility of acquiring the crucial resources they needed to live and exercise their autonomy. Robert Nozick famously sought to develop Locke's account of how property rights are acquired, and his theory outlines a strong conception of property rights. Nevertheless, he also recognized a proviso on the acquisition of property rights which, while weaker than that of Locke, still required any just acquisition to leave "as much and as good" for other people to use. For Nozick, what is key is "whether the appropriation of an unowned object worsens the situation of others" ([46], p. 175). Nozick provides an example of an appropriation that would worsen the position of others: an individual, he claims, could not appropriate the only water hole in a desert from which individuals can drink and exclude all others from being able to drink such water (or even charge prices which they cannot afford) ([46], at pp. 179–180).

The important point about the Nozickian proviso and the example he provides is that it embodies a recognition of the harm that property rights can cause. Property rights in the hands of some can deprive others of the opportunity to benefit from a resource; indeed, they create the real possibility that individuals may be prevented from having their most basic needs met. The proviso also importantly places a strong condition on the very legitimacy of property holdings themselves. If one cannot own or purchase the only water hole in a desert and thus exclude other needy individuals, then surely this implies that individuals cannot be left in a position where all resources necessary to meet their basic needs are owned and they have insufficient income to acquire such resources. Thus, in a world where everything is largely owned and many are in dire poverty (as is the case in many developing countries), even a libertarian such as Nozick must recognize limitations on the property rights of owners.

These limitations at least require that the property rights in question must not exclude individuals from having the most basic resources to survive and exercise their autonomy. Since the private property system as it currently exists prevents poor individuals from taking resources from others, the duty would have to be on

the beneficiaries of the private property system – owners – to ensure that their holdings do not deprive others of access to such goods. Indeed, in a Lockean (or Nozickian) account of property rights, the very legitimacy of their holdings depends upon their meeting the terms of this proviso. Thus, we reach the conclusion that the private property system itself can cause severe harms to individuals which must be precluded if property holdings are to be legitimate; in order to avert such harms, owners – who play a part in creating these harms through holding resources exclusively for their use – need actively to provide individuals with at least the resources they require to realize their most basic interests in survival and the exercise of their autonomy.

A related argument recognizes that those who are the beneficiaries as well as causal agents of the harms of the property system must play a part in ensuring that those harms do not eventuate. In a property system based on excluding nonowners from using resources, this argument would require owners actively to assist nonowners to gain access to such resources. Such an obligation would be founded essentially in a duty to compensate individuals for the harms caused by private property system within which owners are deeply embedded [47].⁸

How does all this relate to corporations and their positive obligations for the realization of fundamental rights? The argument provided above is clearly a general one that is applicable both to the corporation and individual owners. Nevertheless, it has particular application in relation to corporations: for these entities are specifically created by law for the purpose of attaining social benefits and must be designed so as to minimize social harms. The very economic focus of corporate entities embeds them in the process of acquiring resources and property rights. Indeed, since their inception, as has been mentioned, these entities have been the sites of accumulation of large amounts of wealth. Property rights have certain harms attendant upon them which in turn forms the basis of duties to avert those harms on the part of those who wish to claim such rights. The qualifications on property rights also give expression to certain conditions that must be met in order for them legitimately to be held. An entity that has, amongst its key purposes, the possession and accumulation of wealth must thus have duties to ameliorate the harms caused by the very system of property rights that enables it to achieve this purpose. In societies where many individuals are deprived of even very limited property holdings, it is necessary to protect their fundamental rights that are threatened by private property rights. The very economic purpose of corporations and their success in accumulating wealth thus highlights their crucial role in the property system. This provides the basis for recognizing an obligation upon them to make a contribution to alleviating at least the worst effects of such a system: the exclusion of individuals from having the resources necessary to realize their fundamental interests.

A Social Vision of the Corporation

The second argument I shall provide for recognizing positive obligations upon corporations is not rooted in the duty to avert harm. It is based in the dual purposes

I have outlined of the corporation: from the individual perspective, it is a vehicle for attaining profit and limiting risk; from the social perspective, it is designed by lawmakers around the creation of social benefits. Of great importance here is a deeper elaboration upon this societal perspective and the notion of social benefit. Where lawmakers are tasked with creating laws for an entire society in a democratic system, they are not expected to make such laws with the view of privileging particular individuals. The rules governing a society are by their very nature designed to regulate the distribution of benefits and burdens to a group of individuals ([1], p. 60). As such, a key element of the societal perspective is the idea of impartiality: no one individual must be privileged over others. Indeed, the notion that each individual is of equal importance is central to most political and moral theories [48].⁹ Lawmakers thus must go about their task through adopting an impersonal perspective that requires every individual to be treated with equal importance.

The next important claim to establish is that the principle of equal importance should plausibly be construed to give rise to a requirement that individuals have fundamental rights that must be protected and realized by a society. I have already shown in section one how several accounts of fundamental rights are rooted in such a principle of equal importance. Though, a detailed defense cannot be offered here, it suffices to say that there is a plausible case that a society committed substantively to treating individuals with respect for their worth must guarantee each individual the necessary prerequisites for realizing a life of value. This entails protection for an array of civil and political rights as well as socioeconomic rights ([1], at p. 64–65).

How does this all relate to the obligations of corporations? As has been argued, the corporation is an artificial institution created by lawmakers who must adopt a societal perspective towards what they do. That societal perspective requires them to advance the equal importance of individuals in the institutions and legal rules they create. In turn, the principle of equal importance is best interpreted as giving rise to the requirement that the fundamental rights of individuals be protected and realized. Thus, a key criterion from the societal perspective against which to assess the social advantages brought by a particular structure such as the corporation is the impact that it can have upon fundamental rights.

Lawmakers will adopt different strategies to achieve their goals in this regard. One possible approach would be to create certain structures of the state to advance the realization of fundamental rights in a direct way. Other strategies can include creating structures such as the corporation which are designed to contribute towards the realization of rights in a more indirect manner. The traditional arguments in favor of the corporation stress its role in encouraging entrepreneurial risk taking and stimulating innovation which in turn can lead to an increase in economic growth. These benefits may themselves have important implications for rights in society. If the corporate structure would, for instance, encourage greater employment, this would help realize the socioeconomic rights of employees by enabling them to meet their own needs. Some innovations produced by corporations may also have implications for rights: for instance, a new medical treatment could help advance the right to health care of individuals. Part of the very underlying justification for

a structure such as the corporation is thus the argument that it can help to harness the creativity and productivity of individuals in such a way as to have significant benefits for the realization of rights. Lawmakers would, from their perspective, need to consider these benefits as an important justification for the creation of the corporate structure.

Lawmakers would, however, also have cause to recognize that the indirect manner in which these positive consequences for the realization of rights are obtained means that they will not necessarily result from corporate structure. Careful regulation will be necessary to ensure that the corporation in fact achieves the wider social advantages it is designed to realize. This point can be illustrated by considering the patenting of medication by a corporation, for instance, which could lead to a monopoly over its production. This could lead to high prices being charged for the medication, with access being confined to those who are able to afford it. The supposed benefit of the corporate structure – innovation – would here fail to advance the interests of all individuals in society with some being unable to enjoy those very benefits. If we understand, however, that the corporate structure was in fact designed partially to help advance the realization of the fundamental rights of individuals equally, there is a strong case for recognizing that those benefits attendant upon the structure (particularly in areas that impact upon fundamental rights) must be made accessible to all. Legal regulation would thus need to ensure that the medical innovations that result from corporations contribute to the realization of the right to health care of all individuals. If only one corporation had the capacity at a particular time to produce such drugs, a positive obligation could be imposed upon it to ensure that the benefits of its innovation are made accessible to those who cannot afford them. Understanding the implications of the societal perspective that lawmakers must adopt in designing the corporation – which is focused around a particular understanding of social advantage – thus leads to the recognition that such a structure should have positive obligations to contribute to the realization of rights.¹⁰

Limits on Obligations of Corporations for Realizing Fundamental Rights

I have thus far sought to establish that there are strong arguments for recognizing that corporations have both positive and negative obligations for realizing fundamental rights. However, the question may arise as to whether there are any limits on the obligations that they have? Clearly, fundamental rights against the state are not absolute, and there are legitimate circumstances in which they may be limited. The principles and processes of reasoning concerning the limitation of rights in the case of the state are now delineated in the constitutional law of many states. In relation to corporations, however, given the rather recent discussion of their responsibilities in this regard, they remain rather underdeveloped.

The key notions of proportionality and balancing of interests will probably have an important role to play. This would require the violation of a fundamental right to

be balanced against the reasons for the violation by a corporation. The process of proportionality traditionally requires that a right may only be limited if there is a legitimate purpose that is to be achieved thereby; the limitation is suitable for realizing the purpose; and the limitation is necessary (not overly intrusive of the right in comparison to readily available alternatives) [49, 50].¹¹ These tests could be adapted to determine whether the limitation of a right by a corporation is justifiable. Thus, the right to free speech would not bar a company from penalizing employees for speech that “insults a company, lures away employees or gives away trade secrets, since these actions impinge on core interests of the company. In general, however, it would bar a company from taking disciplinary measures against an employee for his speech critical of the government” ([43], p. 514).

Importantly, an understanding of the dual purpose of the corporation is important in developing an adequate account of the limits of corporate obligations. The two perspectives I have outlined involve recognizing that the corporation is itself an intermediate structure between individuals and the state. One needs to take account both of the individual desire for an optimal vehicle through which to conduct commercial activities and achieve profits, and the importance of achieving social benefits from the structure.

These two perspectives can be drawn together through recognizing that the corporation will largely achieve social benefits in a distinctive indirect manner, through harnessing the benefits of its commercial activities (and the individual perspective) for social ends. Importantly, this could require explicit regulation to ensure that the corporation’s commercial activities do not only advance the economic interests of the individuals who invest in the corporation. Nevertheless, the distinctive nature of the corporation must be recognized through taking adequate cognizance of the individual perspective. This means that the corporation cannot be treated simply as an extension of the state – with all its resources being available to assist in the realization of rights – without any recognition being given to its commercial purpose.

Importantly here, a distinction must be drawn between the maximization of profit and the achievement of profit. From the individual perspective, it would be rational to achieve the greatest amount of profit possible. The corporation nevertheless remains valuable to individuals even if it facilitates the achievement of profit short of the maximum capable of being attained. From the perspective of society, however, this distinction is important: to reduce a corporation to a loss-making entity would be to fail to respect its commercial purpose from the point of view of individuals. On the other hand, in seeking to advance the realization of rights, it may be necessary to require that corporate profits be reduced. Thus, for instance, pharmaceutical companies may be required to reduce the price of drugs to ensure they are affordable to the poor and legal firms may need to accept reduced working hours from their staff who are required to devote some of their time to providing legal representation to those who lack it pro bono.

These examples demonstrate that positive obligations upon corporations could be realized through a corporation’s commercial activities though this could legitimately reduce the profits that are achievable by such corporations. Nevertheless,

it is possible to retain the attractiveness of a corporation from the individual perspective by ensuring that these social obligations do not impose such a burden that they prevent individuals from attaining profit from their activities. Thus, one clear-principled limit on the positive obligations upon corporations must involve not reducing corporations to loss-making entities. This is clearly not the only principle to determine the extent of corporate obligations but represents one constraint upon what may be done. Further normative principles are clearly required in order to provide guidance concerning the exact ambit and extent of the positive obligations of corporations, and this is an interesting matter that requires future research and discussion.

Conclusion

This chapter has sought to consider the question whether corporations have obligations for the realization of fundamental rights, and if so, what the nature of those obligations is. From a brief history of the ideas underlying fundamental rights, it was shown that these rights flow from certain fundamental features of individuals. The perspective of reciprocity places emphasis on the rights holder and ensuring that their rights are realized effectively. This in turn requires the allocation of obligations in a manner that will ensure the effective implementation of fundamental rights. To determine such an allocation, it was necessary to have an understanding of the nature and purpose of the corporation. Of importance here was recognizing both the importance of corporations as vehicles for individuals to conduct business as well as for attaining social benefits.

Given the power of the modern corporation and its capacity to harm rights, it was argued that this leads in a logical manner to a clear obligation upon corporations to avoid harming the fundamental rights of individuals. What remains more controversial, however, is whether corporations have positive obligations actively to help realize rights. Some contend that the particularities of the corporate entity mitigate against recognizing such positive obligations. I provided two arguments against this view. The first involved analyzing in more detail the obligation to avoid harming rights. When the harms caused by the private property system – within which corporations are deeply embedded – are properly understood, such an obligation could entail significant positive action being required by corporations actively to assist in the realization of rights. The second argument develops the very idea of the social advantages of the corporate structure to recognize such positive obligations.

The two perspectives identified in this chapter provide a conception of the corporation as an integral part of society that is required to make a social contribution. This significantly involves contributing towards the foundational social justice project of realizing the fundamental rights of all. The dual nature of the corporation requires us to realize that it will make such a contribution often in a distinctive manner and within the limits that enable it still to function as an entity with a commercial purpose that must seek to give expression to the interests of the individuals underlying it. There remains a need for the development of a more detailed understanding of the exact ambit of corporate responsibilities in this

regard. Nevertheless, corporations today cannot be viewed simply as entities focused on the maximization of profit; they must be rather be seen as structures with the dual goals of being appropriate vehicles through which individuals can realize their commercial interests and assist in the realization of the most pressing challenges in society, namely, the realization of the fundamental rights of all.

Notes

1. I use the term fundamental rights to leave open the question whether such rights extend beyond the realm of the human species which I believe to be the case. This chapter draws on and utilizes aspects of the following previous work of mine: Bilchitz [1–3].
2. For the full theory, see [1] [Chaps. 1–3](#). A recent theory that is also of interest is by Griffin [24].
3. Bilchitz D (note [1–3] above) p. 73.
4. Bilchitz D (note [1–3] above) pp. 89–90.
5. The most important contribution of corporate law has been said to be the creation of a legal person, “a contracting party distinct from the various individuals who own or manage the firm, or are suppliers or customers of the firm”: see Hansmann and Kraakman [28] and also Stephens [29].
6. This distinction is inspired in some measure by the distinction Nagel makes between the personal and the impersonal perspective in his book [32]. It also can be seen to connect with the distinction made by Sigwick [33] between the point of view of the universe and the point of view of individuals (the point of view of the universe here being replaced by the point of view of society or law-makers). See [Chap. 2](#) of Bilchitz (note [1] above 57–62) for more on this distinction in the context of a theory of fundamental rights.
7. Ruggie Framework (note [39] above) at para 24. See also Ratner [43] who is also prepared to allow that positive measures may be required to give effect to negative duties.
8. This argument is similar to one made by Thomas Pogge in relation to world poverty see Pogge [47] and for an adaptation of this argument to the particular context Bilchitz, D [3] p. 15.
9. See, for instance, Dworkin [35], p. 1 and Sen [48].
10. Both of the arguments for positive obligations are taken from Bilchitz, D [3] 11–16 and 19–23.
11. Alexy [49] provides a rigorous analysis of the various elements of a proportionality enquiry. See also my critical engagement with this framework in Bilchitz [50].

Corporate Human Rights Violations: A Case for Extraterritorial Regulation

53

Surya Deva

Abstract

This chapter highlights why the current territorial model of regulating corporate human rights abuses is inadequate to deal effectively with modern violations of human rights by companies that operate at a transnational level. It is contended that a case can be made for extraterritorial regulation without doing too much violence to the well-established principles of international law. Therefore, states, especially the home states of multinationals, should show the required political will in introducing suitable extraterritorial measures to enhance corporate compliance with their human rights responsibilities. By doing so, they would be fulfilling a collective goal agreed upon by the international community.

Introduction

It is generally accepted that companies can violate a range of human rights in diverse circumstances: acting alone, through their business partners or in complicity with state organs. However, the human rights framework is still predominantly state centric and vertical (see [1], p. 1385), though some inroads have been made in it in recent times. This paradoxical situation raises a number of questions in relation to the sources of human rights obligations of non-state actors such as companies and the means of enforcing such obligations against them. Various kinds of laws at the municipal level deal with human rights obligations of companies (see, e.g., [2], pp. 39–52). Since this model suffers from serious limitations, there has been a push for (as well as the corporate resistance to) the identification of corporate human rights obligations at the international level.

As far as the enforcement of human rights obligations is concerned, several attempts have been made to regulate corporate actors so as to provide victims an access to effective remedy. However, so far, no robust mechanism is in sight to hold accountable multinational corporations (MNCs), which are considered difficult regulatory targets ([3], p. 401; [4], p. 193). The trick may lie in employing multiple regulatory techniques at various levels in an integrated manner [5]. This chapter aims to explore one regulatory option, that is, extraterritorial regulation of corporate conduct by states. It is argued that although this is not an ideal regulatory tool, states can still take resort to extraterritorial measures under principles of international law. I begin in Part II by providing a definition of extraterritorial regulation and unpacking the potential sources as well as nature of such regulation. Part III then highlights the mismatch that exists between modern forms of corporate human rights violations and old regulatory tools. Part IV suggests the legal basis and justifications for states to regulate the human rights violations of companies through extraterritorial measures. Some notable concerns that arise from exerting extraterritorial jurisdiction over companies are dealt with in Part V of this chapter.

Extraterritorial Regulation: What Does This Mean and Entail?

At the outset, let me encapsulate what extraterritorial regulation means in the context of controlling corporate human rights abuses. Extraterritorial regulation refers to laws enacted, or other regulatory measures taken, by states beyond their territorial boundaries ([6], p. 201). This implies that the basis of jurisdiction would be a non-territorial variable ([7], p. 7). Two aspects of the extraterritoriality should be considered: *source of regulation* and *nature of responsibility*. In terms of the source of regulation, there are two broad possibilities: “home state extraterritoriality” and “host state extraterritoriality”. Although a number of factors (such as shareholding, location of registered main office, the principal place of business, and nationality of directors) can be used to determine the “home” of a company, for the purpose of this chapter, incorporation is taken as determinative of the home of a company. So, home state extraterritoriality would mean that a state extends its laws to overseas subsidiaries of (parent) companies incorporated therein ([8], p. 169). On the other hand, host state extraterritoriality would imply a reverse scenario: the host state of a subsidiary applying its laws to the overseas parent company ([8], p. 169).

Out of home state extraterritoriality and host state extraterritoriality, it is the former that is more common ([7], p. 34), perhaps because extraterritorial regulation by a host state is not only more complex but also more susceptible to failure than regulation by a home state ([8], p. 177). But this should not be a reason for too much worry. As I have argued previously, it is the home state extraterritoriality that offers more potential to make companies accountable for human rights violations (especially those that take place in weak governance or conflict zones) ([9], pp. 50–51). Even if only a few home states enact extraterritorial laws, this should have a ripple effect on the current situation of corporate impunity for human rights abuses.

As far as the nature of responsibility flowing from extraterritorial regulation is concerned, there are several possibilities (see [10], pp. 140–42). States can of course enact an extraterritorial law specifying human rights standards applicable to overseas subsidiaries or overseas operations of local companies and prescribing civil, criminal or administrative sanctions for non-compliance. Furthermore, there exists the possibility of a given state extending a civil remedy (akin to the US Alien Tort Claims Act of 1789) ([11], pp. 21–54; see also [12]) to overseas victims, but without imposing any direct duty on local or overseas companies. States may also impose disclosure requirements on local parent companies in relation to their overseas subsidiaries.

One may ask whose interest a state seeks to protect when it acts extraterritorially: the interests of its own people or the interests of non-nationals? States are of course duty bound to respect, protect, and fulfill the human rights of people living in their territories ([13], p. 184). However, in view of extensive cross-border migration of people, this duty of states cannot be confined to their respective territorial boundaries. Furthermore, the realization of human rights is a collective goal shared by all states, and the responsibility assigned to each state to accomplish this goal within their territories is only one way to achieve the said goal. States should thus have extraterritorial obligations too [14]. Therefore, it can be said that when states act extraterritorially, they seek to safeguard human rights not only of their own people but also of people living in other states. It is though likely that a given extraterritorial measure might benefit one category of people more than the other category.

Mismatch Between Modern Human Rights Violations and Old Regulatory Tools

Before moving on to examine the legal basis and justifications for extraterritorial regulation, one should answer the question related to the need for such regulation. Companies operated beyond municipal borders in old times as well. The operations of the British East India Company, for example, extended to several countries of South Asia and South East Asia [15, 16]. What then is the difference between the British East India Company and MNCs of the modern time? One key distinction is that the former operated at the transnational level without any subsidiaries, because companies at that point of time were not allowed to establish subsidiaries without the express and specific grant of charter by the sovereign. On the other hand, MNCs today can establish subsidiaries at their will by just complying with the requirements stipulated by relevant corporate laws. One crucial implication of this distinction is that whereas the British government could exercise effective jurisdiction over the British East India Company wherever it operated, states now generally struggle to exert jurisdiction over foreign subsidiaries of companies incorporated within their territory.

This struggle is a direct result of regulatory tools and legal principles lagging behind the modern forms of business. In the area of corporate human rights violations, the current regulatory framework is predominantly territorial.

This territorial model of regulation, in which all states are expected to regulate the conduct of companies within their respective territories, apparently suffers from serious limitations when dealing with modern human rights violations (see, for instance, the case studies discussed in [14]). This section highlights some of the shortcomings in the current model of territorial regulation of corporate behavior.

The first limitation of territorial regulation stems from the extraterritorial operations of modern companies. Companies now operate at a transnational level through a complex web of subsidiaries, joint ventures, and supply chains. Such a *modus operandi* of business necessarily means that some direct or indirect human rights violations by companies would take place outside the territorial boundary of a state in which a given company is incorporated. Out of numerous past case studies, alleged human rights violations related to Shell's operations in Nigeria, Unocal's joint venture in Myanmar, and the manufacturing factories of Apple and Nike in Asia exemplify this point well. In such cases, even if the state in question would like to fix responsibility for human rights violations, it is likely to experience technical or procedural obstacles related to the exercise of effective jurisdiction over the legal entity that actually/physically committed those violations.

Another limitation arises from the fact that some states are unwilling or incapable to act robustly against corporate actors that disregard their human rights responsibilities. The unwillingness, especially of developing countries, is primarily rooted in the apprehension that acting tough against MNCs might impair their competitiveness to attract foreign investment much needed for development (see [17]). Then, there are some states with authoritarian or oppressive regimes, which pay scant respect to the collective goal of promoting human rights. Besides, developed countries might be unwilling to hold companies incorporated therein accountable for overseas violations because doing so might put their companies at a competitive disadvantage *vis-à-vis* other companies [18]. Incapacity of states, on the other hand, is often the result of a number of factors such as an undeveloped legal regime, weak enforcement of laws, economic hardships, corruption and non-independent courts. One can also not ignore the problem posed by inferior environmental or labor standards prevailing in developing countries (see [19], pp. 136–141). These factors may undermine the capacity of a given state to establish a robust regulatory mechanism at the municipal level even if it has the political will to do so.

Moreover, unlike human rights abuses involving states, no international regulatory mechanism is in sight to make MNCs accountable for human rights violations. Such attempts have failed in the past because of the lack of political will on the part of states and strong resistance of companies and their representative organizations to such regulatory proposals. The most recent example of such a failure was the tragic and premature burial of the UN Human Rights Norms, first by the Commission on Human Rights [20] and then by the UN Secretary-General's Special Representative on human rights and transnational corporations (see [21], paras 56–59). This situation again suggests that extraterritorial regulation may be a viable option, at least until we have an international mechanism in place to deal effectively with transborder violations; otherwise, the current regulatory black hole would continue to exist.

These factors indicate an asymmetry between modern forms of doing business and the old legal principles governing regulation and exercise of jurisdiction. This asymmetry should be rectified. One option may be extraterritorial regulation of corporate behavior by states ([10], p. 136). This option has in fact been attempted in the last decade on several occasions. For instance, specific attempts were made in the USA, the UK, and Australia to enact an extraterritorial law to regulate the conduct of overseas subsidiaries of companies incorporated therein (the Dutch government had also considered a similar law, see [22], p. 469). In June 2000, Cynthia McKinney presented the Corporate Code of Conduct Act in the US House of Representatives [23]. This was soon followed by the introduction of a similar Corporate Code of Conduct Bill 2000 in the Australian Senate on September 6, 2000 [24]. Then in 2003, the Corporate Social Responsibility was introduced in the UK Parliament [25]. All these three bills attempted to adopt the home state model of extraterritorial regulation. Although none of these attempts unfortunately proved successful (see [9, 26]), they at least buttressed the perceived need for extraterritorial regulation to redress corporate impunity for human rights violations.

One can also interpret the cases filed in the US courts under the Alien Tort Claims Act – from environmental pollution¹ to beating, arbitrary arrest and detention, torture, and execution²; drug experimentation without informed consent³; forcible displacement and aiding/abetting genocide⁴; Holocaust war crimes⁵; participation in, or abetting, the regime of apartheid⁶; forced dislocation, torture, forced labor, murder, and rape⁷; and extrajudicial killings and war crimes⁸ – as a sign of victims looking to the legal systems of developed countries where a great majority of MNCs are incorporated. It should be noted that unlike the three bills mentioned above, the Alien Tort Claims Act is a fusion of both home state extraterritoriality and host state extraterritoriality: for example, one could sue in the US courts the French subsidiary of a US-based MNC as well as the US subsidiary of a French-based MNC.

At the international level, the Guiding Principles on Business and Human Rights [27], which were endorsed by the Human Rights Council in June 2011, acknowledge the possibility of extraterritorial regulation of corporate conduct by states. Principle 2 provides that states “should set out the expectations that all business enterprises domiciled in their territory and/or jurisdiction respect human rights throughout their operations.” The commentary on Principle 2 states the following (see also [28], paras 42–49):

At present States are not generally required under international human rights law to regulate the extraterritorial activities of businesses domiciled in their territory and/or jurisdiction. Nor are they generally prohibited from doing so, provided there is a recognized jurisdictional basis. Within these parameters some human rights treaty bodies recommend that home States take steps to prevent abuse abroad by business enterprises within their jurisdiction.

Principle 2 and commentary appended to it undoubtedly brought extraterritorial regulation to the business and human rights debate. It is, however, arguable that Principle 2 does not go far enough in that it does not expressly require (or even recommend) states to enact extraterritorial laws to regulate overseas human rights

abuses by companies incorporated in their jurisdiction. It gives states very wide amplitude in setting out clear “expectations” in this regard – something that can be achieved by simply issuing a policy statement and without enacting any obligatory laws or regulations. Moreover, the term “throughout their operations” is quite vague and prone to different interpretations; companies may, for example, adopt the position that operations of their overseas subsidiaries are not part of their operations. Critics have also pointed out that the commentary on Principle 2 does not truly reflect the actual legal position under international human rights law, as states are expected to take extraterritorial measures in order to fully discharge their human rights obligations under some treaties like the International Covenant on Economic, Social and Cultural Rights (ICESCR) (see, e.g., [29]; see also [30] and [31]). Scholars have also argued that such an extraterritorial obligation of states is more general in nature rather being limited to the ICESCR:

A state can be found to be in violation of this obligations under international human rights treaties for actions taken by it extraterritorially, in relation to anyone within the power, effective control or authority of that state, as well as within an area over which that state exercises effective overall control. ([18], p. 605)

Basis and Justifications for Extraterritorial Regulation

Basis for Exercising Jurisdiction

Scholars have already made a case for states to exercise extraterritorial regulation under certain circumstances [13, 32, 33]. Jurisdiction is not identical to territory, so if a state has some substantial and bonafide non-territorial connection with, or interest in, an issue, an extraterritorial regulation may be justified (see [34], p. 309). There are a number of well-established principles to ascertain such connection or interest outside one’s territorial boundary (see [12], pp. 170–71; [19], pp. 146–47; [35], pp. 4–5; [36], pp. 123–41). States can rely on the nationality principle to regulate the conduct of its nationals irrespective of the territory where the wrong conduct took place. The same principle allows states to protect their nationals from the conduct of external actors. In addition, the protective principle enables states to safeguard key national interests against threats emanating from outside their territorial boundaries, irrespective of the nationality of the wrongdoer. On the other hand, under the universality principle, states can deal with wrongs or crimes of universal concern.

These principles can also be used in support of the extraterritorial regulation of human rights violations of corporations. Considering that corporations are not physically visible in the same way as natural beings, this requires some jurisdictional connection for states to regulate their activities on the basis of the nationality principle. Apart from nationality of corporate owners and the place from which control is exercised (see [10], pp. 147–49), “incorporation” has been employed as one of the devices to determine the nationality of a corporation. However,

incorporation as a principle to enable jurisdiction over companies was premised on the assumption that companies would be operating within the territorial boundaries of a given state. This assumption does not hold true at this point of time when MNCs operate, and can move, across borders. Moreover, in view of the transnational character of companies, they can have – similar to people having multiple citizenships – more than one nationality based on the nationality of shareholders or other factors (see [34], pp. 408–09; [37], pp. 524–25). In short, incorporation is not an adequate basis to invoke the nationality principle against MNCs that have in effect become “stateless” (see [10], p. 146) or “denationalized” (see [38], p. 8).

The control theory may provide a legitimate justification to exercise jurisdiction over foreign subsidiaries in certain circumstances (see [7], p. 92). Dine makes a persuasive argument that for human rights purposes, the place where the actual control over a corporation is exercised should be the locus of control for that corporation. She argues that it “would not be extraordinary to accept that the locus of control for the purpose of regulating its impact on human rights is the place where the control was actually exercised” ([39], p. 87, and generally pp. 84–89). Therefore, if an overseas subsidiary is controlled by a company incorporated in the home state, the home state can regulate such subsidiary through its local parent company to ensure that the former respects human rights.

An aspect related to control is causation. In a particular case, human rights violations may be directly attributable to an overseas subsidiary operating in X state at a *superficial physical level*. However, at a *deeper intangible level*, it is very much conceivable that some policies or decisions that led to such violations were taken by the parent company incorporated in Y state. In such a scenario, it is arguable that Y state has an obligation to ensure that the parent company does not export or outsource human rights violations to overseas territories. The failure to recognize such an extraterritorial duty on states would mean that states can allow their companies to do to overseas people what they cannot do to the people living within their territories. This would amount to giving different value to lives of people based on their geographical locations.

As far as the protective principle is concerned, it is plausible to contend that states can pursue an overseas company that is impinging on basic human rights of its people through a local subsidiary or otherwise. Overseas companies may, for example, threaten the right to health by exporting and selling hazardous products or by conducting human trials of unsafe drug. For analogical purposes, one can draw on criminal law under which states can exercise jurisdiction over a crime even if only one of the constituent elements of a given crime was committed within their territory (see [7], p. 86). This largely uncontroversial principle of criminal law shows that one does not require “all” the connecting elements to exercise jurisdiction over a particular conduct or entity (see [19] p. 146). So, even if the foreign company is not a national of a given state, it can exert jurisdiction over such a company on account of other connecting variables, for example, the effect of company’s operations within the territory.

States have relied on the universality principle in relation to certain *jus cogens* wrongs such as slavery, genocide, piracy and torture (see [40], pp. 43–80; see also [41]).

Several precedents exist to support the application of this principle in relation to human rights violations by natural persons, and there is no apparent reason why the same principle should not extend to violations done by legal entities. In addition, there is an expanding list of common concerns – for example, drugs, bribery ([42], pp. 3–8), terrorism [6], slavery ([43], pp. 306–307), and child sex trafficking [35] – in which states have resorted to extraterritorial regulation. Therefore, there is nothing to prohibit states from meeting the challenge of human rights abuses by MNCs through extraterritorial regulation, especially in cases involving violations of core human rights that are uncontroversial.

Justifications for Extraterritorial Regulation

Extraterritorial regulation of MNCs is not only legally defensible under principles and practices of international law but is also justifiable on policy grounds ([9], pp. 46–50). During the colonial period, extraterritoriality had a different and negative connotation, reflecting imperialistic and non-participatory extension of laws to colonies. However, these concerns are not valid now in an interconnected and interdependent world, especially if extraterritorial laws are made in furtherance of collective goals agreed upon by states. After reviewing international human rights jurisprudence, Salmon concludes that “international cooperation for ensuring human rights constitutes an essential component of the obligations of states” ([13], p. 109). In fact, one can notice such cooperation – which is indispensable to governance in today’s globalized world – in action in non-human rights areas as well, for example, facilitating free trade, establishing peace, or overcoming economic/fiscal crisis.

Despite some differences among states and implementation-related problems, human rights – more than anything else – represent a common understanding toward certain values at international level (see [44], p. 70). Under the Universal Declaration of Human Rights 1948, states have made a pledge to promote “universal respect for and observance of human rights.” Therefore, even when states take steps at municipal level to respect and protect human rights, they are also striving to fulfill this collective objective. It is arguable that when a given state fails to perform this duty persistently for political or economic reasons or the situation involves egregious human rights violations, then the duty of other states to fulfill the common objective (including by acting extraterritorially) may be triggered. In relation to the right to food, the former Special Rapporteur on the Right to Food noted: “. . . the principal obligation to guarantee the right to food is incumbent on the national Government, *but if other States, have available resources, they have a complementary obligation to help the national State when it does not have the resources to realize its population’s right to food*” ([45], para 33 (emphasis added)). In sum, extraterritorial measures are legitimate and justified in that they seek to promote internationally recognized human rights (see [10], pp. 151–60; [46], p. 77).

If human rights are universal, then corresponding duties should be universal too, otherwise it would mean that people living in some states enjoy a superior claim to have their human rights realized as compared to people of some disempowered or impoverished states. For historical and pragmatic reasons, international law conferred on states the authority to fulfill these human rights duties within their respective territories. This should not, however, be taken to mean that states can act the way they like within their territorial boundaries or that states cannot exercise jurisdiction outside their territories under no circumstances. If considered necessary by the collective will of international community, international law is capable to devise additional means to enforce universal human rights obligations. In this context, it is possible to conceive, as Reinisch does, extraterritorial laws “as a form of decentralised enforcement of international law” ([47], pp. 58–61).

Alternatively, one can see extraterritorial regulation as complementary to municipal regulation. This is non-controversial that states have a duty to protect human rights, which includes an obligation to ensure that all entities within their territory or control comply with human rights standards [48]. But does this due diligence obligation extend extraterritorially? McCorquodale and Simons have answered this question in affirmative ([18], p. 618). In other words, a law with some degree of extraterritorial operation would be necessary to fulfill this obligation of states ([49], p. 664), because, otherwise, companies could easily bypass the mandate of municipal law by transferring or relocating their business operations offshore where human rights obligations are less stringent. In fact, if every state is obliged to ensure that corporations incorporated within its territories do not violate human rights of people outside its territory (see [18], p. 600), this would result in a better protection of human rights overall. For example, if X state tries to ensure that its companies do not indulge in human rights violate while operating in Y state and Y state does the same vis-à-vis X state, such extraterritorial measures would assist both X and Y states in fulfilling their threefold duties within their respective territorial boundaries. In other words, extraterritorial regulation should be seen as complementary (rather than antagonistic) to territorial regulation. Salomon notes: “[W]hile it is the state acting domestically that has the primary responsibility for the realization of human rights when it comes to the people within its territory, this does not weaken what is essentially a complementary duty of the international community to remedy the violation of minimum essential levels of economic, social and cultural rights” ([13], p. 184).

Jean Ziegler, the former Special Rapporteur on the Right to Food made the following observation, which is relevant beyond the right to food: “The obligation to respect is a minimum obligation which requires States to ensure that their policies and practices do not lead to violations of the right to food in other countries. The obligation to protect requires States to ensure that their own citizens and companies, as well as other third parties subject to their jurisdiction, including transnational corporations, do not violate the right to food in other countries” ([45], para 34; see also [30], pp. 766–71).

Implications of Exercising Extraterritorial Jurisdiction

The exercise of extraterritorial jurisdiction over foreign subsidiaries of companies incorporated in a given state is likely to raise multiple concerns from other states competing to exert jurisdiction on such subsidiaries – from breach of sovereignty to Western imperialism and interference in municipal policy matters ([7], pp. 132–33). One could point out resultant conflict between laws or applicable standards too. Then there would be issues concerning collection of evidence and enforcement of judgments in overseas jurisdictions. Some other conceptual or procedural issues would also have to be overcome. For example, companies (both parent and their subsidiaries) might rely on the principle of separate legal personality to contest the exercise of extraterritorial jurisdiction. Similarly, the doctrine of *forum non conveniens* (which in essence means that a case must be heard in the most appropriate judicial forum) can be employed to seek dismissal of legal proceedings from the courts of a jurisdiction where the cause of action arose only partially.

These are legitimate but undesirable implications arising out of extraterritorial regulation. However, it is not impossible to overcome these concerns. Let us consider how that is possible. Non-intervention in domestic matters and territorial sovereignty are important principles of international law. Nevertheless, these principles are neither absolute nor rigid. Many instances exist where states have acted individually and/or collectively to intervene in apparently domestic matters if the circumstances justified such an intervention. Similarly, in relation to potential conflicts arising from extraterritorial regulation, it can be said that the differences between laws do not necessarily result in conflict ([50], pp. 143–44). Conflicts ordinarily arise when the host state proscribes what the home state prescribes or vice versa. For example, hardly any host state would mandate (though it may acquiesce to) a corporation employing child or forced labor, or manufacturing potentially harmful substances, or paying less than living wages, or polluting the environment – something which the home state's extraterritorial law may prohibit ([9], p. 61). So long as it is possible for a company to comply with laws of both home and host countries, extraterritoriality should not result in a direct conflict.

As far as the separate legal personality is concerned, states may rely on the enterprise principle – which considers all companies of a group as one enterprise – to regulate activities of overseas subsidiaries extraterritorially ([8], pp. 168–97). Picciotto argues that “the law need not be blind to business reality. Obligations that extend to the worldwide activities of the firm can be placed on the parent company and its directors, to the extent that these activities are under the parent company's de facto control” ([51], p. 148). States thus have authority under international law to regulate the conduct of overseas subsidiaries of local companies ([18], pp. 616–17).

In common law countries, the doctrine of *forum non conveniens* can undermine the efficacy of extraterritorial regulation, in that the courts can dismiss legal proceedings against a company on the ground of the availability of a more appropriate forum. The litigation that has unfolded in the US courts under the Alien Tort Claims Act provides a glimpse of this possibility ([52], pp. 91–96). How could this hurdle be overcome? There have been some positive developments in some jurisdictions to

limit the corporate misuse of this doctrine. For instance, the approach adopted by Australian courts – rather than asking if the alternative forum is more appropriate, one should ask if the courts in Australia are “clearly inappropriate” forum to try a given case – is considered more favorable to victims than to companies [53]. There have also been judicial decisions in the UK that allowed victims to pursue cases in the UK even if the alternative forum was more appropriate, because the victims might not be able to secure justice there⁹. The decision of the European Court of Justice in *Owusu v Jackson* (2005) 2 WLR 942 is also significant in that the Court held that the dismissal of a suit by a European Union member state on the ground of *forum non conveniens* will be incompatible with Article 2 of the Convention on Jurisdiction and Enforcement of Judgments in Civil and Commercial Matters 1968 (Brussels Convention).

In short, although extraterritorial regulation of corporate conduct is likely to raise several complex issues, it is not impossible to overcome those issues, if the required political will is there. If states can show such political will in relation to dealing with economic matters (e.g., securities, taxation, and antitrust) and serious crimes (e.g., terrorism, sex trade, and torture), there is no sound reason why that cannot happen in the area of *universal* human rights.

Conclusion

In this chapter, I have tried to demonstrate that extraterritorial regulation – either by home or host states – of human rights violations of corporations is a viable (albeit not an ideal) option to deal with the current situation of corporate impunity for human rights abuses. This regulatory strategy alone would not suffice, but it should still be useful as part of a wider regulatory framework to confront difficult regulatory targets such as MNCs. It is high time that new legal principles are developed and invoked to respond to the modern forms of human rights abuses by companies that operate in disregard to geographical boundaries. In the area of extraterritoriality, such new principles should provide clearer and stronger basis for states to adopt extraterritorial measures in appropriate cases to promote a better realization of human rights.

Abstract

Institutional investors have a significant role to play in enforcing international human rights standards. Simply by choosing whether or not to invest in corporations and by imposing investment conditions, institutional investors have the ability to influence multinational corporations to comply with international human rights and environmental standards. Institutional investors are thus a potential regulator themselves in the absence of effective state control. Many institutional investors already take factors relating to a corporation's social responsibility into account when making investment decisions. But what happens when they do not? Where institutional investors overlook these factors and invest in corporations that commit human rights violations, the following questions must be asked: Are such investors complicit in the harmful actions of the multinational corporations that they fund? Do institutional investors have a legal obligation under international human rights law to take steps to help prevent the violation of human rights by the corporations in which they invest? Is it lawful for institutional investors to make a profit from the operations of multinational corporations that are complicit in, or commit, human rights violations? Given the significant power of institutional investors globally, especially in developing world investment, it is interesting to note that relatively little attention has been paid to this actor in the international law debates regarding human rights and business.

Introduction

Many corporations – and the institutions that finance them – now exercise as much power as governments [1, 2]. Similarly to governments, corporations have been found to be complicit in, or directly responsible for, grave human rights breaches [3]. Generally, the behavior of a corporation is regulated by the laws of the country in which it is established. In theory, every state controls its own corporations and regulates their activities. Increasingly, however, corporations are operating outside the jurisdiction of the countries in which they are incorporated or have their primary place of business (“home states”). As a result of the globalized marketplace, corporations have become multinational, operating on a transnational, cross-border basis [3]. Such corporations often operate in foreign jurisdictions in the developing world (“host states”). In many cases, such jurisdictions are characterized by impoverished communities and unstable or emerging democracies and offer a combination of cheaper labor and weak governance structures. These ingredients translate into low overheads for corporations and are an attractive cocktail for many corporations which have moved their operations “offshore” of their home state. At both the level of the home state and the host state, there is a dearth of regulation of such multinational corporations [4, 5].

The global nature of this problem has attracted the interest of the international community which is considering, among other things, how international law can be used to regulate multinational corporations in the absence of effective state regulation. In 2005, the Secretary-General of the United Nations (“UN”) appointed a special representative to investigate how multinational corporations impact on human rights (through notions of “complicity” and “sphere of influence”) and how this should be addressed in international law [6].

To date, the UN’s work on business and human rights engages three entities: the home state, the host state, and the multinational corporation. Generally, the legal question asked is which of these three entities has an obligation under international law for the violations of human rights by multinational corporations. There is, however, an important subject which is underdiscussed in the emerging theory of international law, business, and human rights, and which I explore in this article. This is the role of the institutional investors, who invest in and help fund the operations of multinational corporations.

Proposal

This chapter considers the role of institutional investors in the activities of multinational corporations and the extent to which their investment activities can influence corporations to comply with international human rights standards. I analyze the role of major institutional investors in the activities of multinational corporations and the economies of developing countries [7].

There are several voluntary initiatives (global, regional, and national) to integrate human rights considerations into the investment policies of institutional

investors. There is a question as to whether these initiatives are sufficient and effective. I also consider national measures that have been adopted to integrate human rights into the investment decisions of institutional investors.

I propose that institutional investors have a significant role to play in enforcing international human rights standards. Simply by choosing whether or not to invest in corporations and by imposing investment conditions, institutional investors have the ability to influence multinational corporations to comply with international human rights and environmental standards. Institutional investors are thus a potential regulator themselves in the absence of effective home state and host state control [8–10].

Many institutional investors already take factors relating to a corporation's social responsibility into account when making investment decisions. But what happens when they do not? Where institutional investors overlook these factors and invest in corporations that commit human rights violations, the following questions must be asked: Are such investors complicit in the harmful actions of the multinational corporations that they fund? Do institutional investors have a legal obligation under international human rights law to take steps to help prevent the violation of human rights by the corporations in which they invest? Is it lawful for institutional investors to make a profit from the operations of multinational corporations that are complicit in, or commit, human rights violations? Given the significant power of institutional investors globally, especially in developing world investment, it is interesting to note that relatively little attention has been paid to this actor in the international law debates regarding human rights and business.

Institutional Investors as Human Rights Regulators

In this part of the chapter, I examine the power of institutional investors to compel multinational corporations to respect and protect human rights. I briefly describe the history of institutional investment and human rights protection, concentrating on the influence of institutional investors during apartheid. I then look at the different methods by which institutional investors compel multinational corporations to comply with international human rights standards. Finally, I engage the business case argument, namely, that monitoring human rights standards is not only altruistic but also good for business.

The Meaning of Institutional Investment

Institutional investment refers to group investment on a large scale. Institutional investors are highly specialized institutions, such as banks, insurance companies, retirement or pension funds, hedge funds, and mutual funds who invest large sums of pooled money in companies or financial instruments. Institutional investors include corporations, universities, hospitals, foundations, insurance companies, nonprofit organizations, churches, synagogues, mosques, and other religious institutions [11].

The most well-known form of institutional investment is the investment of pension fund contributions by trustees or fund managers in large, lucrative – and often multinational – corporations. For reasons which I discuss further below, I focus on pension funds in this article as the long-term objectives of pension funds make responsible investment reform much more feasible.

This is so for several reasons. In theory, at least pension funds are (1) based less on quarterly performance than on long-term stability; (2) less susceptible to “hot money” issues (the quick flow of money out of underperforming funds and into strongly performing funds), allowing somewhat more flexibility if a responsible investment underperforms for a few cycles; (3) by their very nature (and execution), pension funds are less actively managed than mutual funds, so they tend to favor investments that they can “buy right and sit tight” (to quote Vanguard’s founder Jack Bogle) [12]. The fact that pension funds are supervised by a highly specialized corporate trustee has given rise to fewer hidden agency costs with pension funds. This means that there are fewer purchases and sales, resulting in more of an emphasis on long(er)-term commitments; and (4) pension funds have a large aversion to tracking errors and thus pursue their given benchmark vehemently.

Managing mass accumulation of wealth makes institutional investors dominant players in global financial services. In general, institutional investors require their portfolio companies (i.e., corporations in which they invest) to comply with the main objective of profit maximization (and, depending on the investment scheme, good governance). This power, however, also places institutional investors in a position to require their portfolio companies to ensure that their activities do not cause human rights violations, either directly or indirectly. In the past, therefore, institutional investors have been called upon to engage with, or disinvest from, portfolio corporations, which have been accused of complicity with human rights violations. Investors usually experience this pressure when a portfolio company either commits human rights violations directly or supplies goods or services to government regimes with poor human rights records.

The Meaning of Responsible Investment

This approach is commonly referred to as “socially responsible investment” or “SRI.” This label originated in the environmental call for sustainable development ([8], p. 2 and [11]). Today, it generally reflects the notion that investors’ operations are “friendly” or sensitive to the environmental, human rights and good governance practices of their portfolio companies. These considerations are often encapsulated in the catchphrase “environmental, social, and good governance” considerations or “ESG” [13]. There are many interpretations and definitions of SRI, but in general, it can be said to entail two broad concepts. The first is the notion of using investment power to generate change in a particular human rights or environmental context. This is also known as impact investment. The most common forms of impact investment are microfinance, social housing, and clean technology. The second concept is to ensure that any and all investment activities avoid funding corporate

activities, which are harmful to the environment, human rights, or other social considerations. The core objective of this type of investment is to reconstruct investment priorities: whereas traditionally investors look only at the profit an investment might yield, responsible investment turns the investor's mind – in addition to profit – to the activities of corporations which might violate human rights and environmental standards.

SRI should be distinguished from ethical investment. The latter generally occurs when investors invest according to religious beliefs or moral considerations. In one form or another, SRI refers to “a broad constellation of interests campaigning for socially, ethically, and environmentally responsible financing” ([8], p. 1).

Increasingly, activists and investors are using the simple, all encompassing phrase, “responsible investment.” I use this term to capture the notion of investment practices that are responsible as regards profitability but also responsible as regards the protection of human rights. The important conceptual dominator is how the mass accumulation of money controlled by institutional investors can be used in a way that mitigates corporate harm, boosts corporate compliance with environmental human rights and good governance standards globally, and continues to make a profit for shareholders. It should be noted that the “S” in ESG has received relatively little attention and expansion. The imposition of good governance mechanisms and the measuring of environmental standards have received increasing attention. In contrast, the social component, and specifically the attention to human rights, has not been developed in nearly the same manner and “is lagging behind as a component of SRI. While human rights, for example, are considered to be an important component of an investment proposition, in practice, it is hard to secure reliable data on production methods at plant or factory level. More subtle aspects of social impact may not feature or be provided to inform an SRI fund manager's investment decisions.” This component, therefore, requires attention and development.

The History of Institutional Investment and Human Rights

The idea that investors should consider the impact of their investment on the well-being of others is not new. Responsible investment is rooted in the notion of “ethical investment,” which was often practiced by religious groups, which were committed to particular ideological principles. Organizations such as the Quakers, Methodists, and the Church of England refused to invest their finances in companies which made profits out of alcohol, gambling, or tobacco [11]. Over time, however, some jurisdictions began to impose restrictions on so-called ethical investment. There was concern that a religious-based approach to investment reflected nonlegal, nonfinancial considerations that are overly subjective and inconsistent with the two tenets of investment, namely, profit maximization and the protection of shareholders' interests [14].

With the advent of international human rights law after the Second World War, the religious characteristic of “ethical” investment began to change. Human rights

lobbyists began to pressurise institutional investors to disinvest from companies that were connected with environmental damage or human rights violations. In the last few decades, investors have been called upon to use their economic influence in portfolio companies to oppose political tyranny (the divestment campaign during apartheid) and genocide (the ethnic killing in Darfur) by extracting their funds from businesses operating in such countries.

Perhaps, one of the most well-known examples of engaging investor power to advance human rights is the divestment campaign during South Africa's apartheid regime. During apartheid, anti-apartheid activists urged institutional investors to disinvest from their portfolio companies operating in South Africa. This pressure led investors to engage with their portfolio companies operating in South Africa to ensure that they opposed the discriminatory practices of the apartheid regime. The UK, for example, (and other EC member states) adopted regulatory schemes requiring UK companies with more than 50% shareholding in a South African subsidiary to report annually to the UK government on steps taken to implement a code of conduct and to report on discriminatory employment practices [15]. The most dramatic and well-known response to institutional investment in apartheid South Africa emanated from the United States (USA).

In the USA, Reverend Leon Sullivan created the Sullivan Principles of corporate investor responsibility, which included the obligation to disinvest money from corporations that engaged with or supported the apartheid regime. The Sullivan Principles articulated the notion that trading with an oppressive government “constitutes a tacit endorsement of that regime and its racist policies” [16]. The Sullivan Principles did not only call for divestment. They also called for engagement. Corporations operating in apartheid South Africa were called on to ensure that the black South African workers they employed were treated equally and according to the same standards of equal protection in operation in the USA. The campaign behind the Sullivan Principles led to the Comprehensive Anti-Apartheid Act of 1986 [17]. This movement “laid the foundation for the global principles and evolving law that corporations have human rights responsibilities overseas to vulnerable peoples within their influence” [16].

More recently, NGOs and transnational organizations have employed similar mechanisms to raise awareness of and trigger divestment from oppressive regimes. Organizations have been calling for the divestment from Darfur and Burma/Myanmar for example [18]. As already mentioned, the power of institutional investors has also been harnessed with some success by the environmental sector. This sector has recognized the role of institutional investors in impacting on the environment through the allocation of capital to businesses operating in environmentally sensitive industries, such as mining and agriculture.

Today, institutional investors have the potential to play a powerful role in the protection and development of human rights on the part of multinational corporations. By requiring a level of human rights compliance in the activities of their portfolio companies, institutional investors are perhaps some of the most powerful regulators in the arena of international law, human rights, and business.

As is clear from the Sullivan Principles, there are a number of ways in which institutional investors can influence the behavior of their portfolio companies. I now turn to consider the methods available to institutional investors to compel multinational corporations to protect and respect human rights.

Methods of Influence by Institutional Investors

There are a number of ways in which investors can influence their portfolio corporations to commit to the protection of human rights and economic development of the people living in the countries in which they operate. This can be done without compromising healthy profits for the ultimate beneficiaries of the investments.

The first mechanism is that of divestment. Usually investors divest if the corporation fails to perform financially. Investors may also be pressured to divest where a corporation is complicit in the violation of human rights, such as war crimes, crimes against humanity, genocide, severe environmental degradation, or severe impact on global health. The Sudan divestment campaigns, for example, led investors to threaten to divest from the oil company Talisman unless it ceased operations in Sudan's oil fields [19]. The second method of investment control is the use of screening. Investors may require corporations to demonstrate environmental, social, and good governance standards *before* investing, as a precondition in return for their business. The third mechanism is engagement. Also known as "active ownership," institutional investors can engage with their portfolio companies to monitor their compliance with human rights standards. Recommendations from powerful shareholders turn a corporation's "mind" toward human rights considerations, thereby limiting the negative fallout from poor governance, lax safety standards, or climate change. Finally, some investors are now turning to litigation. For example, Lothian pension fund is suing BP for the damage to its investment after an oil spill, which it said was caused by BP's negligence [20].

Divestment is an extreme form of investment reaction to the commission of human rights violations by a portfolio company. Divestment based on human rights violations comes with significant responsibility as the withdrawal of an investor from a major corporation can affect that corporation's global share price. The Norwegian Sovereign Wealth Fund's Council on Ethics, for example, was accused of improperly casting a "stain" on Wal-mart when it publically divested from that corporation.

The least severe, and arguably quite effective, method of influence is engagement. For this reason, many activists and policymakers emphasize engagement with portfolio companies to ensure that they comply with international human rights standards, including the avoidance of poor governance, lax safety standards, and collusion in conflict zones and doing business with unstable and unreliable regimes.

Having identified these mechanisms of shareholder control, the natural question is "why"? Why would an institutional investor *want* to control the human rights standards of its portfolio companies? Some argue that business entities are

members of society, created to further the broad good of society and, as such, have an obligation to comply with social (including human rights) standards [21]. Another answer that is often proffered is because responsible investment makes good business sense.

The Business Case for Responsible Investment

In many quarters, the call for responsible investment is met with resistance, if not in fact disdain, on the part of many institutional investors. At the core of the investment, communities' resistance to regulation is the concern that responsible investment practices are incompatible with a low-cost scheme and the freedom to make quick, effective investment decisions which will yield the maximum profit. Responsible investment, however, is not necessarily inconsistent with profit maximization. Some argue that responsible investment practice is not only consistent with, but is actually a precursor to, a long-term, stable, and valuable fund [22, 23]. I discuss some of the arguments of profitability below, but it is important to note that there is some inconsistency between the theoretical profitability of responsible investment and empirical evidence. This is due to several factors, including the lack of a clear definition of responsible investment and a proper analysis of shareholder activism. For the moment, the jury, so to speak, is still out. The reality, however, is that responsible investment has the potential to be a *better* investment option and at least not an investment option that penalizes profits and returns. This is so for a number of reasons.

The first proposed benefit of responsible investment is its tool as a helpful indicator of the stability and long-term value of a corporation. The examination of ESG principles may unearth important information regarding investment returns and risk management, and for this reason, it has been argued that SRI represents a financial benefit, rather than a financial cost [24]. The European Commission confirms this:

Socially and environmentally responsible policies provide investors with a good indication of sound internal and external management. They contribute to minimizing risks by anticipating and preventing crises that can affect reputation and cause dramatic drops in share prices. [25]

It has been argued that the 2008 drop in the value of UK and US pension funds was due in part to a lack of transparency about corporate practice and an irresponsible reliance on market trends with little or no independent analysis [26]. This is compounded by the emphasis on quarterly returns as a barometer for successful investment. Many institutional investors, especially pension funds, rely heavily on index trackers, which, put simplistically, follow a predetermined pattern of investment. Some investors rely on a computer model with little or no human input in the decision as to which financial instruments are purchased or sold. The lack of active management usually gives the advantage of lower fees and lower taxes in taxable accounts. But apart from the fact that this has its own financial risks

(known as “tracking errors” or informally “jitters”), tracking usually covers very short periods (usually 3 months) and obviously does not consider the human rights impact of the portfolio company.

The performance of a company over a 3-month period is very different from the performance of a company over a 20-year period. It is possible that an activity that is profitable in the short term – for example, due to cheap labor – may have negative impacts on the wider portfolio in the longer term – for example, due to reputational costs or poor quality service (both hallmarks of cheap labor). Therefore, pension fund managers need to be more concerned with the performance of a company over a much longer period and should be encouraged to rely less on short-term tracking of corporate performance.

The interests of pension funds and their members are best served by longer-term valuation of companies, given that most people’s pensions will be invested for decades before they are paid out. In general, pension fund managers need to be encouraged to look beyond quarterly results as short-term thinking can lead to lower total returns over a longer period. This is especially relevant to long-term investments such as pension funds, which are designed to make and sustain profits over a long-period of time. This requires careful and transparent practices on the part of portfolio corporations which reduce the risk of investment loss. Short-term profit analysis therefore is not only antithetical to the profit maximization of a long-term pension fund; it also compels an analysis of market trends that is superficial, compromising an in-depth analysis into a corporation’s profitability.

Responsible investment practices are also useful tools in prying open information sources of corporations and ensuring that all aspects of corporate activity are in accordance with best, and safest, practices. An example of this is the Co-operative Society’s ethical fund, which had one of the best performances of any all-shares funds in recent times [27]. Mainstream investment can, by contrast, make catastrophic mistakes. These mistakes might well have been avoided had there been greater scrutiny of the corporate governance of those companies.

The practices of responsible investment also act as a mechanism to measure the health of a corporation’s reputational component. There has been a dramatic increase in the financial value of corporations’ reputations, which inevitably in the longer term will affect their profitability. For example, the reputational capital of Coca-Cola is said to be \$52 billion and of Gillette \$12 billion [28]. Naturally, investors may look to the reputational value of their portfolio corporations when making investment decisions about their profitability. Reputational value is particularly relevant for many consumers and members of the public. Today, consumers increasingly are concerned about the environmental, social, and good governance practices of corporations, and poor ESG practices by companies are one of the causes of serious reputational and therefore financial harm. For example, the oil spill in the Gulf of Mexico – and the threat of litigation – has had an unprecedented impact on the share price of BP [20]. Tesco, a leading British supermarket chain, came under significant pressure when the NGO, ActionAid, released information about the low wages being paid by Tesco to small-scale farmers and women workers in poor countries [29].

An example of this is the historic Ford Pinto Memo, which revealed that the Ford Motor Company knew that the Pinto vehicle had design flaws that could result in a fuel tank explosion when the vehicle was subject to a rear-end collision. Ford decided, based on a cost-benefit analysis, that it would be cheaper to settle the legal claims of those who suffered death and disability as a result of the design flaw rather than to recall all Pinto models. When this information became public, it took Ford decades to recoup its reputational – and financial – losses [30].

A counterexample is Johnson & Johnsons' Tylenol crisis in 1982 when seven people in the Chicago area in the USA died after ingesting Extra Strength Tylenol medicine capsules which had been laced with potassium cyanide poison. Johnsons & Johnsons recalled every package of Tylenol worldwide. This show of honesty – and Johnson and Johnsons' invention of the first inherently tamper-proof, enrobed capsule – restored the company's reputation and enabled Johnson and Johnson to recoup the 92% of capsule segment sales lost to product tampering [31].

Institutional investors clearly have considerable power to compel multinational corporations to respect and protect human rights. And in many ways, responsible investment is itself a mechanism to ensure profitability. This type of investment practice, however, is still ad hoc and intermittent [32]. The question is whether these regulators themselves should be regulated. Is there a need to regulate institutional investors' activities to ensure the protection of human rights? To a certain extent, the industry has started a soft form of global self-regulation through the adoption of an array of international voluntary mechanisms. At national levels, certain states are taking steps to engage ESG principles. This is a very specific type of regulation that effectively operates extraterritorially. In the next section, I consider these voluntary mechanisms and national regulations.

Regulating the Regulators: Voluntary and Legal Standards

Voluntary Standards for Institutional Investment and Human Rights

Recognizing the importance of responsible investment, institutional investors have formed voluntary coalitions around ESG principles. The largest coalition consists of the signatories to the United Nations Principles on Responsible Investment (the UN principles). The UN principles are a set of voluntary and aspirational principles that are based on the industry's recognition of the need to mainstream ESG considerations into their investment decisions (cf. [33]).

The development of these principles began in 2005 when the UN Secretary-General coordinated a group of 20 institutional investors and members of the governmental and nongovernmental sectors. The objective of this group was to create a set of core principles that would guide institutional investors and investment managers in responsible investment, particularly for institutional investors who run long-term, diversified portfolios. The process, which was coordinated by the United Nations Environment Programme Finance Initiative and the UN Global Compact (another voluntary initiative around multinational

corporations and human rights), resulted in a “menu” of possible actions or ways institutional investors can integrate ESG considerations into their investment decisions. At the date of writing, there are 928 signatories comprising 237 asset owners (such as pension funds and insurance or reinsurance companies), 527 investment managers, and 164 professional service partners (organizations that offer products or services to asset owners and/or investment managers). It is estimated that the UN principles apply to \$15 trillion of assets under management [34].

The UN principles are evidence of the influence that institutional investors can have on the human rights and environmental impact of the multinational corporations in which they invest. The UN principles are also evidence of the recognition in the industry that global standards are needed to regulate institutional investors.

Other voluntary mechanisms include the principles developed by the Organization for Economic Co-operation and Development (“the OECD”), namely, the OECD 1976 Declaration and Decisions on International Investment and Multinational Enterprises. The instrument on International Investment Incentives and Disincentives provides for efforts among member countries to improve cooperation on measures affecting international direct investment. These guidelines are nonbinding principles and recommendations articulated by member governments to multinational corporations operating in or from adhering countries. The principles include recommendations relating to human rights, environmental, and anticorruption standards. As regards human rights standards, the OECD Guidelines aim to enhance respect by multinational corporations for the human rights of those affected by their activities consistent with the host government’s international obligations and commitment. The OECD structure includes National Contact Points, which are quasi-judicial entities that “promote the Guidelines and act as a forum for discussion of all matters relating to the Guidelines” (article 10).

The revised OECD Guidelines contain more robust and explicit provisions regarding human rights [35]. Part IV of the revisions to the OECD Guidelines contains injunctions to have a policy commitment to respect human rights; carry out human rights due diligence as appropriate to their size, the nature and context of operations, and the severity of the risks of adverse human rights impacts; and provide for or cooperate through legitimate processes in the remediation of adverse human rights impacts where they identify that they have caused or contributed to these impacts. These provisions are based on the principle that every business enterprise, including institutional investors, regardless of their size, sector, operational context, ownership, and structure, should respect human rights wherever they operate. Respect for human rights is the global standard of expected conduct for enterprises independently of States’ abilities and/or willingness to fulfill their human rights obligations and does not diminish those obligations. The revised guidelines contain a clear call to investors, noting that where an enterprise contributes or may contribute to a human rights impact, “it should take the necessary steps to cease or prevent its contribution and use its leverage to mitigate any remaining impact to the greatest extent possible. Leverage is considered to exist where the enterprise has the ability to effect change in the practices of an entity that cause adverse human rights impacts” [35]. As regards

human rights policies, the revised guidelines note that business enterprises should express their commitment to human rights “through a statement of policy that (1) is approved at the most senior level of the enterprise; (2) is informed by relevant internal and/or external expertise; (3) stipulates the enterprise’s human rights expectations of personnel, business partners, and other parties directly linked to its operations, products, or services; (4) is publicly available and communicated internally and externally to all personnel, business partners, and other relevant parties; (5) is reflected in operational policies and procedures necessary to embed it throughout the enterprise” [35].

Other “soft law” or voluntary principles include instruments or policies developed by the International Finance Corporation (a World Bank institution) which provides, *inter alia*, investment advice to emerging markets [36]; the Equator Principles, which relate to social and environmental risks in project financing, are a credit risk management framework for determining, assessing, and managing environmental and social risk in project finance transactions [37]; and the Global Compact, which is a UN initiative for “businesses that are committed to aligning their operations and strategies with ten universally accepted principles in the areas of human rights, labour, environment and anti-corruption” [38]. The IFC is one of the leading investor agencies in respect of developing robust principles for responsible investment. The IFC’s Performance Standards on Social and Environmental Sustainability engage the following: social and environmental assessment and management; labor and working conditions; pollution prevention and abatement; community health, safety, and security; land acquisition and involuntary resettlement; biodiversity conservation and sustainable natural resource management; indigenous peoples; and cultural heritage [39]. These themes encompass performance standards that investee corporations (or clients) are obliged to meet throughout the life of an IFC investment. They are, in other words, conditions of a loan. The regulatory potential is clear.

These voluntary guidelines are useful. They set industry standards and aspire toward a form of business practice that is in harmony with human rights, environmental sustainability, and development. They are, however, voluntary and depend almost entirely on the integrated factors of goodwill and reputational concern (for discussions of the advantages and disadvantages of voluntarism in business, see [40]). According to a recent UN report, consultants and asset managers tend to treat the UN principles as items to be ticked off “rather than an issue of substance which needs to be measured and appraised” ([23], p. 10).

Relying on voluntary codes of conduct or so-called commitment to nonbinding principles often amounts to a contradiction in terms. The notion of voluntarism is problematic for many reasons, not least of all because of the lack of enforcement. Voluntarism in the corporate sector generally is linked to reputation – corporations comply with voluntary principles in order to enhance their reputation in the eyes of their target market. Often voluntarism relies ultimately on consumers in the developed world dictating which rights and under which circumstances such rights must be respected by multinational corporations. We have to question whether the

regulation of multinational corporations should be determined by the purchasing decision of a person in a supermarket in the United Kingdom, for example, or whether we should be more robust in the legal standards for corporations and their investors.

There are jurisdictions that have started to integrate responsible investment into their legal and financial frameworks. In the next section, I discuss the developments in Norway, South Africa, and the UK to demonstrate some of the methodology in advancing responsible investment in national legislative frameworks. I select Norway and South Africa as representing robust and leading development in this field and, in the case of the UK, as a country which still requires development in its regulation of financiers and investors.

Regulation of SRI in National Legal Systems

Most national jurisdictions do very little to regulate the investment decisions of major institutional investors. In this section, I consider three jurisdictions as examples of legislative reform in this regard, namely, Norway, South Africa, and the UK. The purpose of this analysis is twofold. It brings out some of the practical ways that the recommendations I make in this paper may be implemented. It also demonstrates, at least in the case of Norway, the potential success of careful regulation.

Norway

Norway and the Scandinavian countries are often cited as examples of successful regulatory jurisdictions when it comes to the enforcement of SRI standards. The Norwegian Government Pension Fund (“the Norwegian Fund”) is a sovereign wealth fund that invests surplus wealth produced by Norway’s petroleum sector. It is the second largest sovereign wealth fund with an average holding of 1% in equities worldwide. Initially created in 1990 as the Petroleum Fund, it invests Norway’s excess oil revenues in international stocks and bonds on behalf of the country’s future pensioners ([9], p. 577).

The Norwegian fund managers exercise what is commonly known as “active ownership” ([11], p. 312, [53]). This is the notion that trustees actively engage with the corporations in which they invest with a view to securing both profitability and compliance with international standards regarding environmental and human rights protection. The fund managers of the Norwegian Government Pension Fund practice active ownership through voting, filing shareholder proposals and investor expectations documents, and engaging directly with management. Norway’s finance ministry engages in screening and screens out or rejects companies that “produce weapons or pose a risk of human rights violations, such as child labour, violation of individuals’ rights in war or conflicts, severe environmental damages, gross corruption, other serious violations of fundamental ethical norms, and tobacco companies” [41]. The ministry has excluded nearly 50 companies from the fund’s investment portfolio, including Wal-Mart.

In 2004, the Council on Ethics was created to advise the Norwegian Fund managers on how to avoid Norwegian complicity with harmful corporate conduct ([9], p. 589). The Council on Ethics submits recommendations to the Norwegian Ministry of Finance which will then make a final decision on whether to exclude a company from the Norwegian Fund's portfolio ([9], p. 589). From 2004, the Council on Ethics has been making decisions on the human rights, environmental, and good governance standards of portfolio companies.

There are two important "take-home" points regarding the Norwegian Fund. The first is that the Norwegian Fund's decisions evince discernable principles by which to make investment decisions based on ESG considerations. These factors are not vague and indeterminable. The second point is that responsible investment is neither overly expensive nor incompatible with profit maximization, as is evident from the strength of the Norwegian Fund's returns. Norway is a stellar example of a regulatory response to responsible investment practices. South Africa is an example of a developing world jurisdiction that is taking the regulation of investment practices to a new level of enforcement and compliance.

South Africa

From July 1, 2011, South African institutional investors are required to take into account the long-term sustainability of investments, in particular considering the impact of ESG aspects [42]. This requirement was enacted in Regulation 28 of the Pension Funds Act 1956 [43]. Regulation 28 is designed to "align retirement fund regulation with our government policy objectives like socially responsible investments and transformation" [43]. The Preamble highlights the fiduciary responsibility of investors "to invest members' savings in a way that promotes the long-term sustainability of the asset values when taking into account environmental, social and governance (ESG) issues" ([43], p. 7). This principle applies across all asset classes and categories.

The regulations are not voluntary. They require funds explicitly to consider their approach to ESG issues when making investments. Investors are required to have an investment policy statement, which, *inter alia*, describes a fund's general investment philosophy and objectives. Subregulation 2(c) requires funds "at all times" to apply a range of principles, such as the education of the board with respect to pension fund investment, governance, and other related matters and due diligence to determine the risks of the investment. One of the most important principles, setting South Africa apart (and ahead) in terms of SRI, is subregulation 2(c) (ix) which provides as follows:

Before making an investment in and while invested in an asset consider any factor which may materially affect the sustainable long term performance of the asset, including, but not limited to, those of an environmental, social and governance character.

There are a number of important factors in this provision. The first is that it applies across all asset classes and categories. Generally, institutional investors tend to designate one "ethical" or "socially responsible" fund without

mainstreaming these considerations into all investment decisions. Regulation 28 is clear: these principles apply “at all times” and “across all assets and categories of assets” [42]. The second relevant factor is that the application of ESG principles applies both *prior* to investment (“before making an investment”), which means that investors must take ESG principles into account when screening potential investments, and during the currency of the investment (“while invested in an asset”), which means investors must engage with target investments on ESG matters. Finally, the regulations are a clear commitment to long-termism in investing. The short-term assessment will no longer be acceptable in the determination of investing. The regulations are based on the principle that “Prudent investing should give appropriate consideration to any factor which may materially affect the *sustainable long-term* performance of a fund’s assets. . .” [42].

This regulatory framework is new and, as yet, untested. It is unclear to what extent trustees and fund managers will note this obligation and, if they fail to do so, to what extent it will be enforced. This uncertainty notwithstanding Regulation 28 has put South Africa at the head of responsible investment regulation. This is underscored by developments in the voluntary sector.

On July 19, 2011, the Minister of Finance of South Africa launched the Code for Responsible Investing (CRISA) [44]. This is a voluntary code which requires institutional investors to disclose the policies underpinning their investment decisions and actions. CRISA contains five key principles for responsible investing. The first principle requires institutional investors to “incorporate sustainability considerations, including environmental, social, and governance, into its investment analysis and investment activities as part of the delivery of superior risk-adjusted returns to the ultimate beneficiaries” [45]. Institutional investors are encouraged to develop a policy to achieve the goal of incorporating “sustainability considerations, including ESG,” into their investment analysis and activities [45]. Interestingly, principle one of this Code speaks to not only the substantive considerations but also the methodology of the investor’s method of monitoring and ensuring compliance with their sustainability policy [45]. The second principle highlights the “ownership responsibilities” of institutional investors, including mechanisms of intervention in their portfolio corporations when concerns relating, *inter alia*, to their social practices are raised. These include “means of escalation of activities as a shareholder if these concerns cannot be resolved” [45]. The third and fifth principles relate to the implementation of CRISA. The fourth principle requires institutional investors to recognize the circumstances and relationships that hold a potential for conflicts of interest and to prevent and manage these conflicts [45].

A more tentative approach is evident from the recent legislative developments in the UK.

UK

In the UK, there is very little effective regulation of institutional investment and human rights ([13], p. 37; [46]). British-based institutional investors are bound by

common law principles of fiduciary duties to (1) act in the best interests of their beneficiaries and (2) be prudent in their financial evaluation of investments, looking for the highest rate of return at the lowest risk [28]. Part of these duties is the requirement in respect of pension schemes to retain a diverse portfolio for the purposes of spreading risk as widely as possible [28].

Although a large part of the UK pension industry has subscribed to responsible investment in name, human rights are rarely considered when making an investment decision ([11], p. 320). Until recently, there was uncertainty in the UK law regarding the extent to which investors' fiduciary duties actually allowed them to take into account additional factors, such as human rights, when making investment decisions. As a result of long-standing and narrowly interpreted case law, it was generally accepted in the UK that all other considerations – including human rights – were extraneous to investors' legal powers. In many instances, institutional investors were concerned that they would be in breach of their fiduciary duties if they took human rights into account in their investment decisions.

The legal position was clarified by Lord McKenzie during the passage of the UK's Pensions Act 2008, confirming that:

There is no reason in law why, in making investment decisions, trustees cannot consider social, ethical and environmental considerations, including sustainability, in addition to their usual criteria of financial returns, security and diversification. [47]

The UK government has indicated principled support for SRI with an improvement in the position regarding SRI. Investors can now feel more confident in considering corporations' human rights impact. These considerations, however, are still entirely optional, and mostly vague.

This is so notwithstanding the existence of some statutory provisions which attempt to incorporate responsible investment into UK law. Section 244 of the Pensions Fund Act 2004 requires trustees of a scheme to prepare a written statement of principles governing their investment decisions. Subordinate regulation (the Pension Protection Fund (Statement of Investment Principles) Regulations 2005) requires pension funds' statement of investment principles to cover "the extent, *if at all*, to which social, environmental or ethical considerations are taken into account in the selection, retention and realisation of investments" [48] (emphasis added).

The Pension Protection Fund (Statement of Investment Principles) Regulations 2005 is really the only statutory instrument that refers to "social" and "ethical" considerations. There is no statutory duty that *requires* UK institutional investors to prevent or even consider the human rights impact of their investment decisions. In practice, most UK institutional investors tend to include reference to social (or human rights) considerations in their statement of investment principles. Very few, however, actually engage their portfolio companies on human rights issues.

Conclusion

The status quo can be summarized as follows. Institutional investors play a pivotal role in the global activities of multinational corporations. Their decisions to invest and disinvest place institutional investors in a powerful position to compel compliance with environmental, human rights, and good governance practices. This power is reflected in the voluntary mechanisms of pension funds and other types of institutional investors. In addition, several municipal governments are turning their attention to the regulation of these actors. For the most part, however, institutional investors are developing their own standards for and compliance with responsible investment principles. Often, this compliance is reticent, loose, and ad hoc. It is on this basis that I turn to consider *how* institutional investors could adopt an approach to responsible investment.

The mechanism of responsible investment is in large part about exercising effective due diligence. The UN Guiding Principles on Business and Human Rights [49] envisages a due diligence process of multinational corporations that involves three stages. The same approach, I propose, could apply to institutional investors.

The due diligence approach envisages a three-step process. The first step requires the multinational corporation to analyze the country context in which it intends to operate to highlight specific human rights challenges. So for example, if an investor is considering investing in a corporation with operations in Saudi Arabia, the institutional investor should consider the context of Saudi Arabia and its compliance, or noncompliance, with international standards regarding human rights. In this investigation, it is likely that an institutional investor would find that the laws of Saudi Arabia are not consistent with international human rights law regarding the rights of women to political and economic participation (see, for example, [50]). The second step the investor would have to take is to determine the impact, if any, its own activities may have on the peoples' human rights in that country. At this stage in our example, the investor would have to determine whether its proposed activities in Saudi Arabia might have an impact on the violation of human rights, and presumably, in what way such activities might exacerbate the already precarious situation of women's protection in the country. Finally, the investor should assess whether it might contribute to the obvious human rights violations through the relationships connected to their activities. Once again, in our example, the investor would have to determine whether its portfolio company's relationship with local supply chains might exacerbate the violation of women's rights. If all three stages of the due diligence process throw up red flags, it is likely that that investment might have a negative effect on the human rights of women in Saudi Arabia. The investor ideally then should engage with the portfolio corporation to determine what steps, if any, it is taking to ensure that it does not contribute to the violation of women's rights in Saudi Arabia.

The formulation of the due diligence process of course is far simpler than its implementation. The detail of this approach presents enormous difficulties. But they are not insurmountable difficulties. The key principle is that it is not acceptable for an institutional investor to enjoy the profits of corporate activity that is mired in exploitation and harm. The due diligence process requires simply that the investor takes steps that an ordinarily reasonable and prudent person would take to become aware of, and adequately manage, existing or potential risks to people's fundamental rights [51, 52].

Part 16

Gender Issues and Business Ethics

Lindsay J. Thompson

Abstract

The establishment of the Convention on the Elimination of All Forms of Discrimination Against Women (CEDAW) as a normative, cross-cultural framework for understanding global gender issues represents decades of ongoing, and in some respects, unresolved, dialogue and debate about theory, policy and practice in economic development, human rights, and feminism [19]. The CEDAW framework, both as a United Nations Convention ratified in 1979 and as an ongoing committee inaugurated in 1982, unequivocally asserts gender equality as a human right. The opening chapter of this section on global gender issues traces this discursive evolution of gender equality by discussing:

- Feminist first principles as a moral foundation for gender equality
- The role of multilateral actors in shaping global discourse on gender
- Contested gender narratives as they have evolved in global economic development discourse
- Relative merits of CEDAW as a framework for examining gender issues

These discussions conclude to acknowledge CEDAW as a workable framework for understanding global gender issues in business and economics, not simply as a codification of universal norms for gender equality but, more importantly, as a widely legitimated and accessible global public discursive space where a multiplicity of values and views about gender equality are expressed, clarified, and negotiated. While gender equality may be of limited use for understanding gender relations in specific cultures or groups that do not aspire to share in the mainstream of global political, cultural, or economic life,

CEDAW provides a robust theoretical and practical framework for addressing gender issues. As economic relationships grow more complex and involve more hybridized business models across cultures, markets, and sectors, business leaders should be prepared for dialogue, discernment, and decision-making practices to address contested gender values in developing cross-cultural business partnerships. The inclusion of women as full partners in business and economic development is vital for building a global society of peace, justice, and prosperity for all.

Introduction

Grounded in the liberal enlightenment tradition of universal human rights, gender equality has been an established principle of the global multilateral regime since the founding of the United Nations in 1945. The Convention on the Elimination of All Forms of Discrimination against Women (CEDAW) is now endorsed by over 186 of the 193 UN member nations, making it second only to the Rights of the Child as the most ratified human rights treaty of the United Nations [12].

The CEDAW framework of gender equality informs ambitious global projects such as the United Nations Millennium Development Goals and the World Economic Forum Gender Gap Report that focus sustained attention on the status of women [10, 20]. Yet, despite its normative claims, gender equality as an ethical concept remains problematic for various reasons. It can be perceived as almost invariably diminishing women with assumptions about what they lack rather than about how they are fully actualized; successful and powerful women – as highly visible presidents and Nobel laureates or as quietly engaged citizens and householders – are less frequently the subject of gender equality inquiry and analysis than the (literally) billions of women who, whether they know it or not, are understood to be excluded or marginalized from the mainstream of business and economic life. CEDAW also asserts normative political and economic views of that presume individualism, autonomy, and rationalism as privileged modes human actualization that can be perceived as embedded western bias; there are divergent interpretations and expectations of gender relations that presume communal structures of identity and political will. Moreover, nations that have endorsed CEDAW in fact appear to ignore or violate those principles in practice, illustrating a pervasive ambivalence toward fulfilling the promise of gender equality.

The establishment of the Convention on the Elimination of All Forms of Discrimination Against Women (CEDAW) as a normative, cross-cultural framework for understanding global gender issues represents decades of ongoing, and in some respects, unresolved, dialogue and debate about theory, policy and practice in economic development, human rights, and feminism. The CEDAW framework for global gender issues establishes normative assumptions about women and gender as well as about the economic role and human rights of women in global society. The opening chapter of this section on global gender issues traces this discursive evolution of gender equality by discussing:

- Feminist first principles as a moral foundation for gender equality
- The role of multilateral actors in shaping global discourse on gender
- Contested gender narratives as they have evolved in global economic development discourse
- Relative merits of CEDAW as a framework for examining gender issues in business ethics

This chapter concludes that CEDAW serves as a working framework for understanding global gender equality in business and economics, but it may be of limited use for understanding gender relations in specific cultures or groups that do not aspire to share in the mainstream of global political, cultural, or economic life. As business relationships grow more complex and involve more types of hybrid enterprise across cultures, markets, and sectors, business leaders should be well prepared for dialogue and discernment practices that sensitively address contested gender values in developing cross-cultural business partnerships.

Feminist First Principles

Feminism is part of a global intellectual and political human rights movement seeking to understand and promote the full flourishing of humanity that now includes distinct regionally and culturally individuated feminist voices throughout the world [9]. Feminist discourse is notably diverse, representing a range of distinct standpoints, goals, and strategies. Despite this diversity, however, the moral claims of feminist first principles, echoed to some degree in most feminist discourse, constitute a core ethic of gender equality based on the human dignity and rights of women [18]. These first principles are:

- Women are fully human.
- Social structures and practices that devalue, marginalize, and subordinate women are unjust because they impede women in realizing their full humanity.
- Social structures and practices of gender injustice should be corrected.

The first principle, that women are fully human, is uncontested among feminists and largely acknowledged by many who are not feminists, but that does not mean it is unproblematic [16]. The assertion of women's full humanity is subject to varied feminist interpretations, from gender theorists who regard the social construction of gender roles as distinct from biological sex to essentialist theorists who believe that biology informs distinctly gendered ways of being. In the modern human rights tradition, full equality for men and women has come to mean rights of inclusion, participation, and access that necessarily reconfigure gender relations at all levels of society. Some critics of this tradition argue that the gendered ontology of modern "full humanity" exacts conformity to predefined male-referenced norms as the price of equality. Others argue that women and men achieve their full humanity in distinctly differentiated but equally valuable ways. Ultimately, the liberal human rights ethic of full humanity is lived out subjectively by individual women whose intentional choices, falsely conscious or not, are to be respected even when they limit personal horizons.

The second principle, asserting the gender injustice of social structures and practices that devalue, marginalize, and subordinate women has actually become more problematic and contested as women have become more fully integrated into business, economic, and social life. While devaluation, marginalization, and subordination of women is not regarded as morally defensible among feminists, there is argument about (1) whether and (2) the extent to which social structures and practices pose barriers for women in realizing their full humanity. Proponents for structural analysis of gender inequity assert that a theoretical understanding of the breadth and depth of inequity combined with knowledge of consequences that result in devaluing, marginalizing, and subordinating specific women in concrete ways is the only way to make visible the barriers women face in fulfilling their human potential. On the other hand, some feminists resist the notion of social structures as impediments, pointing out that these very structures provide support and protection for women to pursue their goals in a way that preserves their unique relational roles in their families and communities. Others believe that the focus on social structure as the root cause of gender injustice diminishes the autonomy and agency of individuals who not only are morally responsible for their own destinies, but are the most resourceful and imaginative in devising effective ways to navigate those structures in their own interests.

The third principle, that social structures and practices of gender injustice should be corrected, is the most controversial and contested, both among feminists and more broadly. Arguing that the gender impact of social structures should be scrutinized, monitored, evaluated, and changed in order to achieve full equality for women and men, advocates for structural change insist that women, men, and society as a whole will benefit from more authentic relational structures based on the real capabilities and choices of individuals rather than the inauthentic structure of collective gender-based attribution of presumed capabilities and preferences. Radical feminists argue that the entire structure of society is patriarchal and must be radically restructured, beginning with gender relations within the family, to create a more just society. Other advocates of more moderate structural change believe that mechanisms such as the Millennium Development Goals, the *Gender Gap Report*, or the Human Development Index in OECD reporting are sufficient and appropriate measures to provide information and benchmarking metrics for both institutional and individual actors to make more conscientious choices that will lead to greater gender equality. These assertions are countered by ecofeminists, cultural traditionalists, and others who see such measures as inadequate, impractical, or wrong because they fail to empower women in envisioning and actualizing their full humanity from their own experience either as women or as agents of social, political, and economic communities distinct from but not necessarily outside the mainstream of modern free market democracies.

All three of the feminist first principles form a philosophical and ethical foundation for the gender equality platform of CEDAW, the global economy, and international business. While CEDAW does not claim the full force of international law, it does function effectively in many ways as a mechanism of global governance, particularly as a mechanism for mediating contested gender values

and norms [4, 7, 11]. There is evidence to support its influence in a worldwide movement toward greater gender equality, although it could be argued that a worldwide trend toward gender awareness of inequality is responsible for the emergence of CEDAW and changing gender demographics. Gender issues and the normative claims of gender equality and women's empowerment have become mainstream concerns. Economic and business literature, business media, and international corporations regularly address gender issues and trends in ways that reflect the ethics of feminist first principles, although these principles remain controversial and contested in many areas of the world.

The Role of Multilateralism in Shaping Gender Discourse

The United Nations' role in developing and promoting an agenda for gender equality reflects the emergence of a global network of voluntary self-governance among sovereign states working in partnership with civil sector actors, multinational corporations, and advocacy groups. The character and effectiveness of multilateralism is widely discussed and evaluated in the arena of international relations and politics. Some view the influence of multilateral actors as crucial in promoting a global regime of peace and prosperity; the resources and flexibility of multilateral actors complement the role of sovereign states in mediating the ideas and values of global conscience, priorities, and political will. While this global multilateral network is not the primary subject of this chapter, it has been instrumental in the development and diffusion of global discourse on gender and, in turn, shaping a global agenda of gender equality motivated by urgent economic and human rights goals that often are laden with intractable value conflicts [5, 12].

As a leading multilateral actor, the United Nations has been active in promoting women's rights as human rights since its foundation in 1945. In 1946, the UN Economic and Social Council (ECOSOC) established the Commission on the Status of Women (CSW). In the wake of Second Wave feminism, the CSW 25th anniversary was marked by declaring 1972 as International Women's Year in the hope of extending the resurgence of focus on women's status and rights in Europe and North America to the rest of the world. For the next 20 years, the CSW led a UN initiative to develop a global agenda for women under the aegis of the 1976–1985 UN Decade for Women, convening global conferences of women in Mexico City (1975), Copenhagen (1980), and Nairobi (1985). These conferences created an unprecedented and unique global forum for women's voices and values, linked through the United Nations to the interests of sovereign states, but also supported by the UN's gender equality principles in articulating views critical of gender bias in the law, policy, and practice of those states.

The creation of a worldwide forum and agenda for women was sustained in the permanent policy and organizational structure of the UN. In 1979, shortly before the Copenhagen conference, the United Nations ratified the Convention on the Elimination of All Forms of Discrimination against Women (CEDAW) which is

now endorsed by over 186 of the 193 countries represented in the United Nations. The UN gender equality “mega-strategies” of gender-balanced decision-making and gender mainstreaming now highlighted on the UN Women website (“The UN Entity for Gender Equality and the Empowerment of Women” at <http://www.un.org/womenwatch/daw/beijing/fwcwn.html>) were produced in 1995 by a fourth conference for women in Beijing in a Platform for Action outlining 12 strategic objectives. The Beijing conference, with a view toward the millennium milestone, was positioned to establish a women’s agenda for the next century in “action for equality, development, and peace.”

Fueled by a rapidly globalizing political economy that linked the equality of women to economic competitiveness, many states and multinational institutions have been quick to affirm the Beijing Platform for Action in hopes of mobilizing the economic power of women. This enthusiasm was evident in the Millennium Summit of 2000, when the largest gathering of world leaders in history committed their nations to a global partnership for human development known as the Millennium Development Goals (MDGs) to be achieved by 2015. The MDGs set forth concrete, numerical benchmarks for tackling human deprivation in its many dimensions, establishing a framework for the entire international community to collaborate in cutting world poverty by half, saving tens of millions of lives, and bringing billions more people into the global economy as productive participants. To benchmark progress and evaluation, the eight MDGs are buttressed by 21 quantifiable targets measured by 60 indicators. (UN Millennium Development Goals: <http://www.un.org/millenniumgoals/>)

- Goal 1: Eradicate extreme poverty and hunger
- Goal 2: Achieve universal primary education
- Goal 3: *Promote gender equality and empower women*
- Goal 4: Reduce child mortality
- Goal 5: *Improve maternal health*
- Goal 6: Combat HIV/AIDS, malaria, and other diseases
- Goal 7: Ensure environmental sustainability
- Goal 8: Develop a global partnership for development

The formulation of the MDGs was highly influenced by the CEDAW agenda, with two of the eight goals directly involving women (gender equality and improved maternal health) and the remainder involving them indirectly by addressing issues that disproportionately affect women, both as persons and as family caregivers. Since the 2000 launch of the MDG initiative, the UN has taken an active leadership role in monitoring and motivating progress toward achieving the goals. The impact of war, violence, and the 2008 global recession on women and the poor has served in some ways to galvanize multilateral efforts to strengthen the position of women as economic and social anchors of families, communities, and nations.

The heightened visibility of gender issues in the global arena has spurred the growth of hundreds of new multinational actors, many with regional or local roots, seeking to foster prosperity, peace, and human flourishing by empowering women through economic development, social innovation, and leadership initiatives. These

efforts are examined in later chapters of this section on gender issues. Many of these organizations and initiatives are identified via the UN Women website at <http://www.unwomen.org/> and a list of international women's websites is included at the end of this chapter. Powerful multilateral actors such as the World Bank Group and the World Economic Forum have adopted gender equality and women's empowerment as strategic priorities.

Moving beyond traditionally small-scale women's initiatives, the World Bank has begun to invest in making vital economic infrastructure sectors of energy, transportation, water and sanitation, agriculture, private sector development, and finance work effectively for women. The World Bank launched a Gender Action Plan in 2007 under the banner of "Gender Equality as Smart Economics," with an interactive web monitoring and reporting feature accessible to online inquirers. In implementing the Gender Action Plan, Bank President Robert B. Zoellick committed to boosting women's share of the Bank's rural and agricultural projects to at least half by 2010, expected to total US\$800 million, and channeling at least US\$100 million through IFC toward women entrepreneurs by 2012. These initiatives were enhanced by increased International Development Association (IDA) investments for gender equality and innovative engagements with foundations and the private sector to strengthen women's economic power.

The World Economic Forum (WEF) published the first annual *Global Gender Gap* report in 2006, drawing attention to gender equality throughout the world [10]. The *Global Gender Gap Report* index assesses 134 countries on how fairly they divide resources and opportunities between male and female populations to measure gender inequality in four areas:

- *Economic participation and opportunity* – Outcomes on salaries, participation levels, and access to high-skilled employment
- *Educational attainment* – Outcomes on access to basic and higher level education
- *Health and survival* – Outcomes on life expectancy and sex ratio
- *Political empowerment* – Outcomes on representation in decision-making structures

In 2010, the WEF expanded gender gap reporting in the *Corporate Gender Gap Report*, illuminating women's economic participation and opportunity gap among the world's largest companies. Benchmarking 600 companies in 20 countries against well-established gender equality and empowerment policies and best practices, the report found that leading companies fail to capitalize on the talents of women.

The World Bank and World Economic Forum initiatives mark a shift in the global discourse on gender issues occurring during the first decade of the twenty-first century; the voices urging gender equality and women's empowerment were no longer primarily those of women, women's advocates, or obscure journals, but powerful institutional voices with far-reaching influence. Acknowledging that gender equality was still an unrealized goal, the CEDAW goal of mainstreaming gender equality and women's empowerment as a global issue was substantially achieved.

Contested Gender Narratives: WID, WAD, GAD

The mainstreaming of gender issues in global economic and development discourse does not signify universal agreement on the issues of gender equality or the way they are framed and understood. Contested gender narratives have been a constant feature within feminism and in global economic development. A synopsis of these contested narratives in this chapter will be contained to those narratives that shaped the development discourse that emerged as the dual agenda of *gender equality* and *empowerment of women* that now drives global development policy and programs designed to address the concerns of women on a global scale. Those who wish to explore the scope of gender narratives in greater detail should seek other sources [15, 17].

Early multilateral initiatives to address the concerns of women date back to the early twentieth century following the achievement of political and legal rights achieved through first wave feminist movements in the United Kingdom and North America. The Women's International League for Peace and Freedom (WILPF), for example, was founded during the throes of World War I in 1915 at the Congress of Women held at The Hague in the belief that women were instrumental in the foundation of a peaceful global society. WILPF founders, Aletta Jacobs, Jane Addams, Alice Hamilton, and others, were European and American activists already working to address women's welfare and rights issues as well as promoting the role of women in broader arenas of social change and public affairs. Protesting against "the madness and the horror of war, involving as it does a reckless sacrifice of human life and the destruction of so much that humanity has labored through centuries to build up," they envisioned women as empowered architects of peace and harmony within and among nations [6]. The interdependent themes of social welfare, justice, and empowerment as constant feminist themes in multilateral women's initiatives have been an enduring source of confusion and contention as ensuing generations struggled for consensus on a global women's agenda.

The history of this struggle can be described broadly in phases as WID (Women in Development), WAD (Women and Development), and GAD (Gender and Development) that reflect the influence of various streams of feminist thought in an evolving narrative that now informs CEDAW as an identifiable voice of and for women in the global development agenda. The WID approach to development generally is understood as the integration of women into the global process of economic, political, and social modernization and growth without a critical questioning of the value or desirability of these ends. The WAD approach applies a Marxist critique to view women as a class who need to be emancipated from dependency on an economic system of power relations (which would include the WID approach) that exploits their work within and beyond the household. The GAD approach applies a critical, deconstructionist lens to gendered power relations, linking the devaluation of women's roles in production and reproduction as the structural root of women's subordination and the key to reconstructing a more equitable distribution of power between women and men.

Women in Development. The WID approach to development evolved from the widely held economic development assumption of the mid-twentieth century that modernization was the key to development. As decolonized and traditional societies succeeded in transforming themselves into analogues of industrialized western states and acquired modern institutional, intellectual, and social infrastructure, world leaders and international development planners assumed that women would share the resulting benefits of economic growth. The growing influence of the United States, particularly after World War II with the creation of Bretton Woods institutions and US-dominated economic thought, made it a model of the successful nation state to which all nations would presumably aspire. In this vein of thinking, the material, legal, and social status of women would improve as societies improved their access to health care, education, employment, and markets. In the WID approach, there was little attention to the underlying structural gender inequalities of both traditional and modern societies that posed almost insurmountable barriers to women [17].

From a feminist perspective, the WID approach was rooted in a liberal feminism that sought to extend modernity's Enlightenment ideals of human freedom, rights, equality, and human progress to women. Although liberal feminists have never been uniform in their thought, they are generally comfortable with modernity and less questioning of its ideals or whether the historic conceptualization of a modern liberal social order by men might be incomplete without the inclusion of women's unique perspective in its development. Rather, women's equality is seen as an expression of human progress inherent in the values and ideals of modernity.

Women and Development. As second wave feminists began to turn their analysis toward the situation of women across the world, more robust feminist theories of power relations illuminated the structural nature of women's subordination [1, 8, 14]. A more structural understanding of women's subordination fueled a growing critique of development efforts for their failure to achieve greater equality and advancement not only for women, but for other disadvantaged groups in nations outside the economic mainstream [3]. Women's advocacy groups and feminist theorists began strategizing for and achieving a more active, direct role in the policy and practice of both public and private development agencies in staff, advisory, and governing roles. While the modernization orientation of development continued, the inclusion of women in key institutional and multilateral policy roles greatly expanded the range and depth of critical attention to women's issues, not only in identifying, measuring, and evaluating the impact of development programs and policies on women, but also in creating a more woman-friendly culture and policy context in international development. Governments and international agencies increasingly attuned to the importance of women in their development agendas created a legion of official and quasi-official women's commissions, committees, and task forces all over the world under the prevailing WID conflation of modernization and westernization. The 1975 United Nations Conference on Women launched the UN Decade for Women under the thematic umbrella of "Equality, Development, and Peace" and a global action plan for integrating women more fully into the development process.

The Decade for Women saw a burgeoning of diverse grassroots organizing, local consciousness-raising, issue advocacy, research, theory, and coalition-building among feminists and women's groups outside the development mainstream that were largely ignored by the official government, multilateral, and NGO apparatus. Among these were feminist theorists from both industrialized and nonindustrialized countries who applied Marxist principles and critical theory to develop a more radical analysis of women as an oppressed class and Third World women, in particular, as doubly oppressed in a global economic system that created and perpetuated dependency for the benefit of rich, capitalist nations and the men who governed them. Dependency theorists and radical feminists shared skepticism toward the possibility of full equality in a system of unequal power relations coupled with a belief in separatist organizations and institutions that would strengthen marginalized groups and protect them from cooptation.

The election of Margaret Thatcher in the UK (1979) and Ronald Reagan in the US (1980) signaled a growing political conservatism coupled with market liberalism among western governments and the still western-dominated multilateral and NGO communities. Responding to a global recession triggered by oil and international debt crises, global leaders were urged by free market economists and advocates at the IMF, World Bank, and leading academic policy research centers to reign in social welfare spending and incentivize fiscal discipline among debtor nations through structural adjustment of their economies. These structural adjustment programs, eventually known as the Washington Consensus, disrupted local economies with severe and protracted consequences for the most vulnerable members of poor nations – with disproportionate impact on women and children – and threatened progress toward women's equality goals. Social welfare advocates were widely critical of structural adjustment policies and Marxist feminists regarded these events as evidence of sinister western-induced dependency.

Against a backdrop of a shifting global economic and political climate and widening tensions regarding the status and role of women in society, the diversity and strength of women's voices increased during the Decade for Women. At the second (Copenhagen, 1980) and third (Nairobi, 1985) United Nations conferences on women, still under the banner of "equality, development, and peace," governments were able to agree on pressing global priorities for women's development. At Copenhagen, there was widespread agreement regarding the factual disparity between the legal rights of women and their capacity to exercise those rights. The focus of the development agenda recommendations, therefore, was to promote equal access for women to education, employment opportunities, and adequate health care so that women would gain essential capabilities for understanding and exercising their rights. When the Nairobi conference convened in 1985, with 10 years of history to evaluate following the 1975 first conference on women in Mexico City, it was clear that the impact of the past decade of development efforts focused on women had been limited. Believing that women's full equality would not be achieved by focusing on women and their needs in isolation, conference participants urged a broader perspective, viewing women as stakeholders and participants in all spheres of human endeavor.

The forward-looking Nairobi agenda for women's development focused on overcoming obstacles to women's full participation in society: constitutional and legal measures, equality in social participation, and equality in political participation and decision-making.

Gender and Development. By the time the Beijing conference was being planned for 1995, the global framework of women's issues had radically changed since the first conference only 20 years before. While the liberal feminist WID approach and the Marxist WAD approach still had their proponents, there was a much more widespread understanding of how structures such as gender, sexuality, class, race, and ethnicity were socially constructed [2]. The quickening pace of globalization and change had introduced a more complex dynamic to the discourse of both economic development and of feminism. Emerging ideas and methods in humanities and social sciences (e.g., postcolonialism, deconstructionism, constructivism, and postmodernism) offered new lenses and hermeneutics for understanding culture, gender, and power as social arrangements rather than as ontologically determined destinies. The extension of this analysis to power relations not only between women and men, but in the construction of structurally gendered institutions offered new ways of envisioning equality and empowerment for women [13].

These ideas were not universally welcomed. Some traditionalists saw such attempts to "politicize gender" as an affront to beliefs that anchored the stability of a social order already threatened by globalization and modernization. Delegates and conveners of the Beijing conference fielded arguments not only from WID, WAD, and GAD perspectives, but from traditionalists, such as Pope John Paul II, whose letter to Gertrude Mongella, Secretary General of the Conference, reasserted the reproductive role of women as the foundation of their human dignity. Nevertheless, representatives from 189 countries endorsed a new Beijing Platform for Action that affirmed the longstanding goals of "equality, development, and peace" espoused in previous conferences by identifying 12 critical areas of global concern: (UN website: <http://www.un.org/en/development/devagenda/gender.shtml>)

1. Women and poverty
2. Education and training of women
3. Women and health
4. Violence against women
5. Women and armed conflict
6. Women and the economy
7. Women in power and decision-making
8. Institutional mechanisms for the advancement of women
9. Human rights of women
10. Women and the media
11. Women and the environment
12. The girl child

The Beijing Platform for Action amplified the 12 critical concerns with strategic objectives and specific measures to be adopted by Governments, the international community, nongovernmental organizations, and the private sector.

The CEDAW Framework

The United Nations has maintained its commitment to women's equality and empowerment through the CEDAW, which consists of both the original CEDAW Convention (or Treaty), and the CEDAW Committee on the Elimination of Discrimination against Women, a body of experts on women's issues from around the world, established in 1982 with a very specific mandate to monitor the progress for women made in those countries that are parties to the 1979 CEDAW Convention. According to UN rules, countries ratifying or acceding to a Convention accept a legal obligation to act in accordance with its terms and to work with the Committee's in monitoring progress in fulfilling that legal obligation.

The CEDAW Convention is a blueprint for promoting basic human rights and overcoming barriers of discrimination against women and girls, while recognizing that each country should determine how to implement its principles. (UN Office of the High Commission on Human Rights, 1979) CEDAW provisions include:

Article 1: Definition of Discrimination. Defines discrimination against women to cover all facets of human rights and fundamental freedoms.

Article 2: Country duties. Countries must eliminate discriminatory laws, policies, and practices in the national legal framework.

Article 3: Equality. Women are fundamentally equal with men in all spheres of life. Countries must take measures to uphold women's equality in the political, social, economic, and cultural fields.

Article 4: Temporary special measures. Countries may implement temporary special measures to accelerate women's equality.

Article 5: Prejudice. Countries agree to modify or eliminate practices based on assumptions about the inferiority or superiority of either sex.

Article 6: Trafficking. Countries agree to take steps to suppress the exploitation of prostitution and trafficking in women.

Article 7: Political and public life. Women have an equal right to vote, hold public office, and participate in civil society.

Article 8: International work. Women have the right to work at the international level without discrimination.

Article 9: Nationality. Women have equal rights with men to acquire, change, or retain their nationality and that of their children.

Article 10: Education. Women have equal rights with men in education, including equal access to schools, vocational training, and scholarship opportunities.

Article 11: Employment. Women have equal rights in employment, including freedom from discrimination on the basis of marital status or maternity.

Article 12: Health. Women have equal rights to affordable health care services.

Article 13: Economic and social life. Women have equal rights to family benefits, financial credit, and participation in recreational activities.

Article 14: Rural women. Rural women have the right to adequate living conditions, participation in development planning, and access to health care and education.

Article 15: Equality before the law. Women and men are equal before the law.

Women have the legal right to enter contracts, own property, and choose their place of residence.

Article 16: Marriage and family. Women have equal rights with men in matters related to marriage and family relations.

Articles 17–30: Administrative provisions.

As part of the UN Commission on Women (established in 1946) the work program of the CEDAW Committee is informed by its mandate to monitor progress toward achieving goals of gender equality and women's empowerment articulated in the action agendas of the Conferences on Women. Since the 1995 Beijing conference, the Committee has produced regular country reports and a 10-year and 15-year progress report that ensure continuous scrutiny, both globally and locally, of concrete manifestations of and obstacles to gender equality and women's empowerment.

Conclusion

The CEDAW Convention and Committee has become widely regarded as a global discursive space for identifying, clarifying, and addressing women's and gender issues. By virtue of its continuous presence on the global stage, its standing as a United Nations entity, and its practice of welcoming diverse standpoints in resolving contested issues while remaining firmly committed to gender equality as a human right, CEDAW spans a range of global actors unmatched by others identified with specific geographic or political locations. While the gender equality and women's empowerment framework of CEDAW serves as a workable foundation for understanding global gender issues in business and economics, it may be of limited use for understanding gender relations in specific cultures or domains that do not aspire to share in the mainstream of global political, cultural, or economic life. In asserting its feminist principles, the CEDAW Committee has demonstrated sensitivity and responsiveness to the concerns of women in every social condition and circumstance. Although the goals of CEDAW are far from achieved, women around the world are claiming their right to equality and power in an increasingly interconnected world. As business relationships grow more complex and involve more types of hybrid enterprise across cultures, markets, and sectors, the CEDAW framework is useful for business leaders as a context for dialogue and discernment practices that sensitively address contested gender values in developing cross-cultural business partnerships that create sustainable value.

Abstract

Beginning in the 1980s, a groundswell of feminist theorists and philosophers challenged many of the assumptions surrounding traditional Western moral theory through what came to be known as “care ethics.” Accounting for context, valuing emotions, and emphasizing the concrete over the abstract, care ethics is a relational approach to morality that transcends traditional philosophical divisions of ethics, epistemology, and ontology. In many ways, care ethics engages in different “work” than other ethical theories because although it has a normative dimension – answering the question, “what is the right thing to do?” – it also has significant implications for how we know one another and who we are. In this respect, care ethics is not an alternative moral theory but a different way of framing or thinking about ethics. Care ethicists do not reject rules, rights, or consequences but believe that such methods do not capture the full scope of morality. Furthermore, care ethics arose out of women’s experience and feminist theory, but it is not a “woman’s morality.” Although sometimes characterized as such, care ethics does not reinforce gender essentialism. Today, feminist and nonfeminist theorists have made care ethics into a robust field of research and publication.

This chapter introduces care ethics and discusses its place and potential in business ethics. In the process, the chapter addresses some of the myths about care ethics – that it is a “touchy-feely” personal morality – by discussing practical applications in business institutions. In particular, this chapter offers a brief overview of care ethics and a review of the discussions of care ethics within the business ethics literature. The potential role of care in business decisions, corporate culture, and the management of diversity is addressed.

The chapter concludes with an analysis of what business education might be like if care ethics were taken seriously.

Introduction

“Care ethics” or an “ethic of care” was first identified in the early 1980s through the analysis of Carol Gilligan who while working with famed developmental psychologist Lawrence Kohlberg noticed a missing “voice” in what constituted moral maturity [20]. Kohlberg was collecting data on moral development using a rubric employing the ethical hallmarks of the Western tradition: Kantian rule-based ethics and consequentialism. Gilligan observed that Kohlberg’s methods valued complex rational thought in solving a moral dilemma. However, the rubric undervalued relational, imaginative, creative, and contextual thinking. In 1982, Gilligan wrote *In A Different Voice: Psychological Theory and Women’s Development*, which gets credit for starting a revolution in ethical thinking, but in reality, a number of theorists had come to the conclusion that care was significant for moral theory [39, 45, 54].

There was a gendered dimension to Gilligan’s identification of care ethics because she found that caring was predominantly, although not exclusively, an approach employed by women. Gilligan acknowledged that women have historically been socially reinforced to value connection and relationship and this valorization was playing itself out in their moral thinking as well. Like many aspects of women’s experience, care as moral thinking has been undervalued in Western ethics, just as it had been in Kohlberg’s rubric [54]. Unfortunately, commentators, the popular press, and even subsequent textbooks have emphasized the gendered aspect of Gilligan’s findings over the breakthrough in ethical thinking Gilligan had made – one that she may not have realized the magnitude of [28]. Although it is true that women’s experience and feminist analysis gave rise to care ethics, the crucial discovery was a new way of framing morality. Care ethics is not a “woman’s morality” nor is it exclusively the purview of women, although research continues into gender differences in business decision making [4]. Another myth perpetuated by superficial understandings of care ethics is that the early work of Gilligan defines the field. Not only has Gilligan written several books and articles since *A Different Voice* that serve to clarify and develop her ideas, but many theorists from a variety of fields have weighted in on care ethics to create a robust field of study. No one has been more important to the evolution of care ethics than philosopher Nel Noddings. For Noddings, care ethics “involves attention, empathetic response, and a commitment to respond to legitimate needs” [47]. Noddings, who has written prolifically on care ethics, views care as an antidote for formulaic and analytic approaches to morality that treat ethics as abstract manipulations of principles or consequences.

Although care ethics received its modern label in the work of feminist theorists of the 1980s, some trace a genealogy of care-like thinking throughout the history of philosophy. Among philosophers who contemporary scholars identify as having

protocare ideas are Confucius [36, 50], David Hume [3], Adam Smith [65], Jane Addams [24], Simone de Beauvoir [1], and Gandhi [35].

So what is care ethics? In many ways, care ethics is one of the most challenging ethical approaches to define, partially because its definition is still being negotiated but also because its definition cannot be truncated like a categorical imperative or the utilitarian maxim, “maximize happiness for the most number of people.” Caring entails a disposition toward others but action on behalf of others as well. Daniel Engster defines care as “everything we do to help individuals to meet their basic needs, develop or maintain their basic capabilities, and live as much as possible free from suffering, so that they can survive and function at least at a minimally decent level.” [13]. Engster’s definition is one among many, each with its own emphasis. In general, care can be characterized as a relational approach to ethics that values emotion, context, and connection in a manner that integrates epistemological and metaphysical considerations with ethics.

Care is intimately tied to epistemology because knowledge is required for caring. Many care ethicists stress the kind of attention to others necessary to generate rich understanding. Noddings refers to this as “engrossment” [45]. Similarly, Selma Sevenhuijsen describes care as involving “attentiveness, responsibility and the commitment to see issues from differing perspectives” [55]. In other words, knowledge is a necessary condition of care but not a sufficient condition of care. Furthermore, care rests on a different metaphysical premise of human ontology than do Kantian ethics or consequentialism. In answering the normative question, “what is the right thing to do?” traditional moralities assume autonomous individuals making free decisions. Although care has normative implications, it assumes that human beings are fundamentally social beings that exist in a web of relationships that cannot easily be bracketed out. Finally, care ethics is ultimately measured by actions taken. Joan Tronto describes care as a labor [62] and Virginia Held characterizes care as “both a practice and a value. As a practice, it shows us how to respond to needs and why we should. It builds trust and mutual concern and connectedness between persons. It is not a series of individual actions, but a practice that develops, along with its appropriate attitudes” [30]. Because in many ways it does a different kind of work than traditional moral categories, care ethics is not an alternative or substitution for traditional ethical approaches, but it does contend that rules, rights, and consequences do not exhaust the moral domain. Held, for example, suggests that care ethics is a precondition for other ways of framing morality: “I am coming to the view that care and its related considerations are the wider framework – or network – within which room should be made for justice, utility, and the virtues” [31]. For care ethicists, rules, rights, and consequences may be helpful guides for moral behavior, but they are not a substitute for the challenging thinking through relationships and contexts for both short- and long-term implications. In this manner, care is particularist and lacks ideology in the sense of absolute principles. The caring response is not always predicated in advance but often emerges from the particular situation.

Before addressing the relationship of care ethics and business ethics, it may be beneficial to address several myths surrounding an ethic of care. First, care is other directed, but it is not altruism. One of the early criticisms of care ethics came from feminists who were concerned that women have always been asked to be the caregivers in the family, sometimes at the expense of their own well-being [66]. They were afraid that care ethics would be another tool of exploiting women into further acts of selflessness. Care is demanding in its call for us to think, feel, and act on behalf of others but not to the extent of sacrificing self-care [60]. As those in helping professions know, one is of no use to others without engaging in a measure of caring for self. Another myth is the idea that care ethics is a personal ethic and has little to offer or is too naïve an approach to provide insight for social or political contexts. In fact, this is the area of greatest growth in research and publication on care ethics. A number of theorists, feminist and nonfeminist, have come to the conclusion that institutions in society can benefit from care ethics [14, 21, 23, 46, 48, 53, 55]. Finally, care is not simply a vague notion that liking others or taking an interest in others will solve ethical dilemmas. Care ethics, as feminist and nonfeminist theorists have developed the term, engages cognitive and affective skills to address concrete issues. Noddings explains, “Contrary to the odd idea that *caring* can be described as a nice, fuzzy feeling, ethical caring requires a high degree of skill in critical thinking, but the required thinking is directed at the situations and practices of real life, not merely at the perfection of theory” [47].

Some have suggested that the ambiguity of care ethics is part of its strength and gives it a liminal quality that makes it more flexible and avoids modernist categorical limitations such as a particular understanding of normativity. Others have endeavored to fit care ethics into existing categories such as suggesting that we have a duty to care [43] or that care is essentially a virtue ethic [61]. These efforts reveal how unique care ethics is when compared to traditional approaches. Whatever care’s disposition, it does appear to capture an essential aspect of morality that cannot be ignored in business organizations. In what follows, the relationship of care ethics to business ethics is more directly explored.

Care Ethics and Business Ethics

Historically, business ethics has not embraced care ethics as quickly or as deeply as other fields such as nursing ethics. However, there is a long-standing, albeit limited, application of care in the business ethics literature. R. Edward Freeman and Jeanne Liedtka characterized the “Care Proposition” as one of the viable forthcoming approaches to business ethics in 1991, less than a decade after the term “an ethic of care” was coined. Although not referring specifically to feminist care ethics, Freeman and Liedtka described businesses in rather striking terms: “Corporations are places where both individual human beings and human communities engage in caring activities that are aimed at mutual support and unparalleled

human achievement” [17]. A few years later, Thomas J. Donaldson further suggested that caring was intrinsic to the morality of business activity in general: “business consists of the existing practices and institutions through which men and women coordinate their activities to create goods and services. And I wish to add the moral claim that business fails unless it enhances the quality of human life, the equality of human worth and the extent of human caring” [11]. Other theorists contend that care ethics offers a significant imaginative dimension to business ethics because it is more flexible than strict rule adherence [18, 52] and less susceptible to game playing or legalism [25].

A number of contemporary business theorists engage in care ethics, but few have done so in a sustained or systematic manner. Sheldene Simola, who has written articles addressing the efficacy of care in crisis management [56] and for global enterprise [57], suggests that care ethics provides superior resources for business ethics than normative systems because it offers more than decision-making insight, promoting moral awareness and action as well. Simola describes how care ethics can alert individuals to ethical issues before they happen: “care ethics, with their emphasis on attentiveness to and responsive engagement with the subjective, particular and concrete feelings and needs of others can enhance our sensitivity to and (early) recognition of emergent ethical issues” [58].

Silke Machold, Pervaiz K. Ahmed, and Stuart S. Farquhar contend that care ethics provides a method for reconceptualizing corporate governance. They view contemporary assumptions about corporate governance as guided by competition and self-interest. Care ethics offers a means for reframing management in a more relationally sensitive. They speculate:

Individuals within governance relationships, for example board members and employees, engage in a continuous process of care with the aim towards empowerment of each other. That involves, for example, managers learning about the background and identity of those within their immediate care, understanding the individual’s need for job satisfaction or a work-life balance and empathising with it [38].

Machold, Ahmed, and Farquhar are careful to couch the move to caring governance in realistic and pragmatic terms because they recognize that care remains a term of suspicion in business.

Liedtka views care as a flexible enough approach to ethics so as to address moral concerns as well as presenting market-based advantages for businesses. For example, Liedtka describes a caring relationship with customers as attending to their needs:

To say that I care about my customers or my employees would place them as particular others and the capabilities that they represent at the center of my attention, and to work with them to realize those capabilities. The customer, for instance, is seen here as having a set of needs and possibilities to which, as a care-giver, I must attend. It is these needs, rather than the organization’s prepackaged solutions, that drive my response in a process that is part of an on-going relationship, rather than a transaction [37].

Liedtka does not find care ethics at odds with the profit motive, but it does entail a genuine concern for the other rather than a superficial appearance of care.

Although rethinking corporate relationships is a major aspect of applying care ethics to business, care labor or care work has been identified as a source of analysis for feminist scholars [42, 34]. There are commercial services for which the primary activity involves care. Nursing, childcare, hospice work, human services, and social work are a few of the fields for which care is a central component. Not surprisingly, these fields have been historically populated by women and, not coincidentally, undervalued in the marketplace [32]. For example, many question the low pay of child care workers in the United States given how important and yet vulnerable children are in society. This low pay exemplifies the low value placed on care in our society. Similarly, hospitality is a form of care that has become highly commercialized in the modern service economy [26]. Hospitality as care raises questions about the ethical nature of relationships with unknown others whether the guests are strangers or customers.

In the following sections, three aspects of care and business are considered: care and corporate culture, care and business decisions, and care in the management of diversity. An institution's culture represents its system of shared meaning including language, symbols, metaphors, and values. Caring may be addressed explicitly or implicitly, as a part of corporate culture, but those who come into contact with it will know whether care is valued or not. Corporate culture is the subject of the next section. Culture and decision making are interrelated and affect one another. Caring decisions and policies attend to those affected in meaningful ways. Caring choices by a business do not entail receiving favorable outcomes in every instance. Just as a caring friend does not do everything that a friend may want, a caring business engages in a degree of self-care in preserving profit and sustainability over against the needs and wants of various constituencies. Finally, management of diversity represents an ethical reality in the business world. Rule-based or consequentialist ethics assumes interchangeable moral agents [5] with similar approaches to rational decision making – an assumption that is less and less viable in the global economy.

Care as Inquiry: Corporate Culture

As mentioned earlier, care is predicated on knowledge. The attentiveness to the other entailed in caring necessitates the building of understanding that has propositional aspects (knowledge of facts) but also felt aspects (affective knowledge). Such knowledge can be explicit and thus articulated and attended to (i.e., the names of an employee's partner and children) or tacit and thus unarticulated (i.e., how to demonstrate concern for someone when they are revealing important personal information). Because care responds to particular circumstances and contexts, it relies heavily on knowledge development to facilitate moral imagination and thus empathy. Such knowledge consists of explicit propositional knowledge as well as tacit knowledge held by the body in the form of muscle memory and is expressed as habits or skills [10, 22].

Since the early 1990s, knowledge management has been a key concept in business [12]. Fueled by economic changes, technological developments, issues of scale, increasingly complex processes, and the emergence of the internet, knowledge management is a crucial and strategic corporate function [41]. Although human resource information systems can manage enormous amounts of personal data, little attention has been given to nonpropositional knowledge or the affective and tacit knowledge that engages care. Part of the challenge is that care blurs the line between ends and means or subject and object. People care about individuals and ideas that if effectively aligned with company goals can be a powerful motivator for productivity and fulfillment. However, care is also a disposition that can be fostered in culture. Corporations are ultimately systems of relationships, and those relationships can take on different characters. Caring is one possibility [27].

Management theorists Georg von Krogh, Kazuo Ichijo, and Ikujiro Nonaka argue that sharing tacit knowledge is the first step in knowledge creation [64]. Krogh, Ichijo, and Nonaka contend that a corporate culture in which caring is highly prized includes five dimensions: mutual trust, active empathy, access to help, lenience in judgment, and courage [63]. When these elements are present to a strong degree, then the potential for what Krogh, Ichijo, and Nonaka refer to as “indwelling” or living with a concept together is operant:

When care runs high in an organization, the individual member works in a context in which colleagues show genuine interest in her progress. She can trust her colleagues and will receive active help. She can access expertise whenever required and can afford to experiment. She knows her colleagues will welcome such courage and judge the outcome of open ended knowledge creation leniently. When colleagues are supportive, individual participants are more likely to articulate their knowledge spontaneously, using new metaphors and analogies. . . . This process of mutual bestowing leads to the kind of social knowledge creation that is the source of radical innovations: indwelling [64].

Note that Krogh, Ichijo, and Nonaka are not conceptualizing care as warm fuzzy relationships or that all employees have to be close friends. Nevertheless, care entails a disposition of understanding, respect, and flexibility that can lead to personal growth and productive knowledge creation.

Enron is a counterexample of a caring culture – a caring dystopia. In the year 2000, the energy conglomerate Enron was a celebrated Wall Street darling with 22,000 employees and alleged revenue of over \$100 billion. By the end of 2001, Enron’s name became synonymous with accounting fraud and its illegal activity had repercussions that shook the US economy. Much of the attention among business ethicists has been on the illegal activity that brought down Enron, but those acts were the outgrowth of a culturally toxic environment. The documentary film, *Enron: The Smartest Guys in the Room* [19], based on the best-selling book of the same name [40], graphically portrays the cutthroat corporate culture at Enron. It is this hypercompetitive culture that fueled an atmosphere that made unethical and illegal activity possible. Even without the specific indictable acts, the environment was immoral in how it compelled employees to treat one another. Armstrong, Williams, and Barrett capture how many variables lead to an unhealthy corporate culture: “it is the impact of many small organizational factors that contribute to the overall health

and morality of an organization. It seems too simplistic to conclude that Enron and Worldcom problems are based wholly on greed and not the integration of organizational factors” [2]. Enron’s culture can be described as the antithesis of caring, with its strong emphasis on self-interest and individual advancement.

The company’s compensation structure contributed to an unethical work culture, too – by promoting self-interest above any other interest. As a consequence, the team approach once used by Enron associates deteriorated. Performance reviews were public events and poor performance was ridiculed (or employees were fired through a “rank and yank” process) [59].

Enron is an extreme example to be sure. Nevertheless, the Enron scandal reveals the need for integrating care ethical analysis into business ethics. Traditional moral approaches are very good at identifying the immorality of specific acts such as the fraud that Enron engaged in. There were clear violations of principles or rules of morality. However, such approaches are less well equipped to view the working relationships of the Enron culture as unethical. There is nothing immoral about competitiveness and ambition, but when it evolves into disregard for well-being and results in the suffering of others, it cannot be considered moral activity by care ethicists. An uncaring culture is doubly troubling: The lack of care in a corporate culture is not only ethically problematic on its own; it is ethically problematic because it makes other unethical activity more possible.

Care and Business Decisions

One of the dominant metaphors used to understand business – sometimes explicitly and sometimes implicitly – is that business is a game. It is true that business has many game-like qualities including competition, goals, and rules. Of course, there are many game and sports metaphors employed within business activity including notions of winning, losing, and teamwork. In isolation, game and sports metaphors are ethically neutral. In fact, some classic works of business ethics contend that game metaphors are particularly appropriate to describe business [6]. However, game metaphors have their limitations. If morality is reduced to the status of the rules of the game, then one can attempt to “game” the situation or “play games” with the ethical rules. For example, a strict rule-based morality can lead to interpreting rules or locating loopholes or finding alternative rules that gives one an advantage. In such cases, real morality takes a backseat to a kind of legalistic manipulation. The abstract nature of traditional morality – rules or consequences – makes such manipulation more possible, even when the moral framework is established with the best of intentions. Justification of immoral activity is made more possible in a context where ethics is defined by which principle trumps the other or what projection of consequences is most compelling. Care ethics is not immune from abuse, but because it is a relational approach to morality, caring is experienced in the relationship between people and not determined by outside imposition of an abstract set of principles. Accordingly, care is not a notion familiar in business contexts, but it is much needed as a corrective to traditional metaphors. Georg von Krogh, Kazuo Ichijo, and Ikujiro Nonaka describe the shift in metaphor: “Although corporate cultures have changed over the

past three decades, the language of the war room or a sporting event is still more familiar than that of caring or enabling” [64].

One of the hallmarks of contemporary business ethics, stakeholder theory, can be thought of as an effort to integrate relational considerations in a manner consistent with care ethics. As Daniel Palmer and Mary Lyn Stoll describe “just as stakeholder theories of corporate obligations are articulated in terms of a web of relationships, so too an ethics of care focuses primarily upon relationships that give rise to moral obligation” [49]. Although the genealogy of stakeholder theory can be traced to the 1960s, R. Edward Freeman’s *Strategic Management: A Stakeholder Theory* articulated the widely accepted understanding of the approach as “any group or individual that can affect or is affected by the achievement of a corporation’s purpose” [16]. Relationality is central to the stakeholder approach, transforming the corporation from an autonomous agent engaging in isolated decision making to one that finds itself in a web of relationships that includes customers, employees, suppliers, competitors, the community, etc. In other words, stakeholder theory shifts the ontology of the corporation from an atomistic position to one embedded in relationships – a shift analogous to that of care ethics over and against traditional ethics. In this respect, care ethics and stakeholder theory have much in common. In terms of normative decision making, care implies that businesses understand and consider the interests of stakeholders – not to the abandonment of profit but integrated into corporate interests. Care ethics cannot offer definitive rules of stakeholder consideration, but it can ask whether stakeholders are experiencing care. Palmer and Stoll suggest that care ethics has much to offer stakeholder theory including a richer articulation of the relationships. They describe, “An ethic of care would demand. . . that a full moral phenomenology of the kinds of relationships involved be articulated before considering the nature of the stakeholder obligations involved” [49]. Political theorist Daniel Engster contends that among other things, care ethics can sharpen the definition of who qualifies as a stakeholder. Engster argues that “stakeholders may be defined as any groups or individuals whose ability to care for themselves or others is directly dependent upon a firm’s actions or decisions” [15]. In this manner, care, specifically self-care, becomes the stake that various constituencies have in corporate decision making. The ascendancy of stakeholder theory in business ethics is a corollary to the rise of care ethics in their shared need to focus on business relationships.

Sometimes, the power and potential of care is understood even when the term is not explicitly invoked. In his 1989 documentary, *Roger and Me*, Michael Moore did not attempt to engage in rational arguments to dispute then General Motors CEO Roger Smith’s decision to close manufacturing plants in Flint, Michigan. Instead, Moore endeavored to bring Smith to Flint to meet the stakeholders impacted by the closures. Moore wanted to make sure that Smith had affective, proximal knowledge of the former employees rather just data and statistics. According to Moore, “My mission was a simple one: To convince Roger Smith to spend a day with me in Flint. . . and meet some of the people who were losing their jobs” [44]. Moore failed. His documentary recounts the personal stories of many of the residents of Flint who worked at General Motors, but he did not prevent any plant closings or

affect any corporate decisions. Moore never brought Smith to Flint. He did have one brief encounter with Smith:

Michael Moore: Mr. Smith, we just came down from Flint, where we filmed a family being evicted from their home the day before Christmas Eve. A family that used to work in the factory. Would you be willing to come up with us to see what the situation is like in Flint, so that people...

Roger Smith: I've been to Flint, and I'm sorry for those people, but I don't know anything about it, but you'd have to...

Michael Moore: Families being evicted from their homes on Christmas Eve...

Roger Smith: Well, I'm... listen, I'm sure General Motors didn't evict them. So, you'd have to go talk to the landlord.

Michael Moore: They used to work for General Motors, and now they don't work there anymore.

Roger Smith: Well, I'm sorry about that.

Michael Moore: Could you come up to Flint with us?

Roger Smith: I cannot come to Flint, I'm sorry [44].

Moore's efforts are an acknowledgement of the potential of care. Moore's assumptions were that Smith had considerable knowledge of the facts of the situation and was heavily invested in his fiduciary responsibility to stockholders to maximize profits. However, Moore believed that if he could get Smith to care about the Flint employees by meeting some and witnessing their circumstances, perhaps the affective connection might motivate Smith to seek other more imaginative choices.

Care and Management of Employees: Transcending Difference

One of the realities of the modern work environment is the heterogeneity of employees. A manager can no longer assume shared backgrounds, values, or systems of meaning among employees, if they ever could. Care ethics may offer some of the tools to transcend differences among individuals to help build camaraderie and solidarity. A strength of care ethics is that it endeavors to foster responsive and reciprocal relationships between people. For a relationship to be caring, one needs to be attentive to the other, including their needs, and act accordingly. In this manner, care ethics addresses the philosophical challenge of alterity or the problem of other minds. For individuals to care about someone other than themselves, they have to transcend their physical difference to gain some measure of understanding of the other. There are strong disagreements regarding whether the understanding is empathy – shared feelings – or sympathy – a knowledge of other people's feelings – but this discussion will not be entertained here. In either case, imagination (sometimes referred to as moral imagination) plays a role in being able to traverse differences between individuals. A manager who takes the time and effort to attend to employees lays the foundational knowledge that can fuel the imagination to better understand those employees.

Although not addressing care ethics specifically, Patricia Werhane argues for the essential role of the moral imagination for modern managers. In analyzing a number of case studies, Werhane finds that many businesses have sufficient ethical policies

and procedures in place, yet ethical questionable activities and scandals persist. Her conclusion is not that business managers are immoral but that they lack sufficient imagination development to deal with moral dilemmas in innovative and creative ways. Werhane claims managers “lack a sense of the variety of possibilities and moral consequences of their decisions and the ability to imagine a wide range of issues, consequences, and solutions” [65]. Caring is inherently an imaginative exercise, as one has to imagine what others are going through and imagine helpful interventions. Caring activity that is not well thought out or for which the imagination is truncated, as in stereotypes for example, can be misguided or lack efficacy.

Naming the previously unnamed is an important aspect of feminist analysis. Kimberle Crenshaw coined the term “intersectionality” to recognize the complexity of identity [8]. Specifically, intersectionality suggests that no single category of identity – gender, race, class, sexual orientation, ability – is a sufficient analytical frame for capturing identity. Human experience is too complex for easy categorization. This is particularly true in the analysis of social marginalization and oppression. Not only is one’s identity too rich and complex to be captured by a single category, but also multilayered selves are not simply *additive*. One cannot understand the experience of African-American lesbians simply by adding racism to sexism to homophobia. Oppressions interact and impact one another to create unique experiences. The development of the term intersectionality was particularly motivated by a need to problematize the category of “woman” in feminist theory as a recognition of the absence of universal women’s experience. Since Crenshaw first used the term, intersectionality has become a focal point of analysis in critical race theory and feminist social theory. Because care is about relationship, caring results in change for both parties of the relationship. International relations scholar Fiona Robinson describes “the ability to care about others involves not only learning how to be attentive and patient, how to listen and respond, but also how to rethink our own attitudes about difference and exclusion by locating that difference within relationships, thus dispelling the claim that any one person or group of persons is naturally and objectively ‘different’” [53]. For corporate managers, care ethics can be an essential tool for building the imaginative resources needed in creating a productive and caring environment across highly differentiated employee identities. Oliner and Oliner describe “diversifying” as “deliberate effort to connect with groups different from our own for the purpose of seeking mutual understanding” [48]. For Oliner and Oliner, this is an essential process in creating institutions.

Conclusion

In summary, this chapter has provided an overview of care ethics and some of its potential applications to how we think about business including the impact of an ethic of care on corporate culture, decision making, and the management of diversity. Born from women’s experience and feminist analysis, care ethics is a relatively new approach to ethical thinking given the history of traditional moral approaches such as virtue ethics and rule-based moralities. Nevertheless, there is a robust scholarship among feminists and nonfeminists developing the field of care ethics. Although there are a number of articles that have addressed the

application of care ethics to business, business ethicists have been relatively slow to engage an ethic of care.

Care in corporations is not a utopian ideal – it is being exemplified today. Oliner and Oliner mention many examples of caring from the corporate world. These examples encompass different circumstances. One aspect of their research was into corporate codes of ethics [48]. Although these tended to focus on legal and unethical practices, some addressed relational concerns. For example, the multinational health and pharmaceutical company Johnson & Johnson has a Credo that not only addresses healthy business practices but includes its relationship to employees and communities in a manner that goes beyond stakeholder theory to address dignity and respect. The Johnson & Johnson Credo has much in common with care.

Furthermore, if business is going to take care ethics seriously, exposure will have to begin with business schools. Although scholars forge ahead with new and progressive ideas, as feminist philosophers have done with care ethics, undergraduate textbooks and teachers steeped in traditions are slower to adopt change. Care ethics has not made a substantial impact on business ethics textbooks and business school curriculum as of yet. Too often the ethic of care is marginalized in texts through a brief mention or, worse, a caricature of care ethics is offered that fails to address the robust literature developed. As early as 1997, in a study of business school courses, Michelle DeMoss and Greg McCann claimed that it was important to expose business students to a care orientation as part of their ethics curriculum [9].

In *A League of Her Own*, Tom Hanks' character famously claimed, "there is no crying in baseball." Of course there is nothing in the rules of baseball regarding crying or not crying. However, baseball has been socially constructed along a particular masculinist model, which informally does not allow the display of certain emotions like crying although certainly displays of anger are quite acceptable. Similarly, business has been socially constructed according to a particular masculinist model of extreme competition with little room for caring. This model reflects modernist mutually exclusive categorical thinking which proffers that competition and caring cannot coexist. Several contemporary theorists and business professionals have rethought ethical and epistemological exclusions of emotions [7, 33, 48]. Care ethics represents one avenue of feminist effort to challenge social values. Virginia Held describes: "A feminist future in which feminist moral inquiry and culture reshape the organization of society will require fundamental reorderings and rethinking of existing practices and theories. The changes will be enormous, but there are many reasons to think both women and men will swim in them rather than drown" [29]. Business is one area of society ripe for "reordering and rethinking." However, it is not just feminists who are recognizing the moral centrality of care. Ethicist Warren Reich, for example, declares, "care is a precondition for the whole of moral life" [51]. If care is indeed so important to moral life, it needs to be a central aspect of business ethics.

Women's Work: Global Trends and Demographics of Wealth and Employment

57

Kristen Abatsis McHenry

Abstract

Around the world, women's work is undervalued and underpaid. Wage gaps along gender lines are linked to how cultures and societies understand women's gender and work roles. Gender norms and expectations shape what we see as "women's work." In turn, this has a direct effect on the types of occupations women choose. Gender occupation segregation pushes women into some of the least valued jobs in society. This practice leads to pay inequity and other discriminatory practices. In addition, gender disparities in terms of who owns most of the world's wealth and property do not correspond with the amount of paid and unpaid labor women do in society. Women in the paid labor force face several barriers such as sexual harassment, the glass ceiling, and the sticky floor, all in addition to pay inequity. However, women are speaking out and actively trying to improve employment conditions and advance opportunities for women. This chapter provides a global perspective of women's employment and wealth trends. This chapter identifies patterns and current issues regarding women's employment as well as identifies progress and future work to be done for gender equality in the workplace.

Introduction

In today's world, many women engage in both paid and unpaid labor. The types of occupations women find themselves in are often related to their gender. This gender-based occupation segregation plays a key role in the wage gap between women and men. In many countries around the world, women face employment issues: pay discrimination, sexual harassment, and glass ceilings. Government

policies affect women disproportionately because many women are caretakers of families and children. In addition to paid labor, most women also work in unpaid household labor. Unpaid labor combined with the issues women face in paid employment results in a tremendous burden placed on women in the world. The United Nations Development Fund for Women [1] states it is estimated women do two thirds of the world's work. This double burden many women face reveals a gender disparity in work performed. Cultural understandings of what counts as "work" create barriers for women. Oftentimes, women's work is seen as natural and is not valuable.

Women engage in the paid workforce at higher rates than ever before. According to the Organization for Economic Co-operation and Development (OECD) [2], women's participation in the paid labor force has increased significantly. As of 2005, 61.5% of women engaged in paid labor. Even though women's participation in the paid labor force has increased steadily, women still face a myriad of issues in the workforce. This chapter will outline several issues women face such as discrimination and pay inequity as well as explain patterns in women's labor. While women have made enormous strides in the workplace, much work remains to be done and inequalities persist. For example, a United Nations press release in 2011 asserts women currently do 75% of the world's work, earn 10% of the world's wages, and only own 1% of the world's property. This reveals a vast disparity between the work that women perform for society and the economic rewards provided to women. These statistics reveal women are routinely underpaid and significant barriers prevent women from being property owners and building wealth.

Gender Occupation Segregation

This section discusses current trends in global women's labor. Work in most countries is divided and segregated by gender. Women constitute a majority in types of occupations that are categorized as women's work or "pink collar" jobs. Ellen Bravo [3] states "Nearly three-fifths of women workers are employed in service, sales, and clerical jobs" ([3], p. 25). Service, sales, and clerical jobs are often the lowest paid and least valued jobs in the United States and often correlate to the cultural views of women. Another example is the global nursing industry, where women constitute 82% of the profession ([4], p. 88). This may be a result of attitudes regarding femininity and social attitudes that view women as a "nurturing" sex. Besides gender, occupation is also divided and segregated by race and class. In the United States, for example, poor women and women of color are frequently found in the least valued jobs. Typically, more women work in the service industry than men. This is true in the United States and the European Union, where 52% of women are employed in the service industry ([5], p. 106). In addition, women make up a significant portion of those employed in agricultural work and often in a part-time capacity and on a short-term basis. Women working in the agricultural industry face specific forms of discrimination. Many employees use

mandatory pregnancy tests and then fire women who are found to be pregnant ([5], p. 106). While some countries consider industrial work to be men's domain, there are many countries where women perform industrial work. For example, women are often found working in manufacturing companies where they are paid low wages and work in less than ideal conditions. The majority of employees in sweatshops and industrial factories are young women. Women working in sweatshops are often subject to numerous abuses and human rights violations such as being forbidden to use the bathroom. Around the world, women are clustered into employment that is not only low paying but also low skilled. This phenomenon is called the sticky floor. The sticky floor refers to the fact that many women are limited to low-wage jobs with little job mobility.

More so than ever, women from around the world must migrate for work. Ehrenreich and Hochschild [6] argue that third-world women migrate to industrialized nations to be employed in "women's work" such as nannies, maids, and sex workers [6]. Women are more likely to be migrant workers than men, and it is essential to reveal the power dynamics between privileged women, men, and female employees. Ehrenreich and Hochschild state "So, strictly speaking, the presence of immigrant nannies does not enable affluent women to enter the workforce; it enables affluent men to continue avoiding the second shift" ([6], p. 9). In other words, women in affluent countries are already participating in the paid labor force. Female immigrant nannies allow affluent women to reduce their unpaid labor. In conclusion, this keeps patriarchal family structures in place because it merely displaces unpaid labor onto other women. Women who migrate for work are forced to leave their own children behind to send money back home and sustain their families, thus creating a "global care chain." In "State of the World Population," UNFPA defines the "global care chain" as "an international system of care giving stratified by class and, often, ethnicity" [7]. Female migrant workers face significant employment issues such as low wages, poor conditions, coercion, and often violence and harassment ([6], p. 281).

Women often make up the informal labor sector. In "Gender and Macroeconomic Policy," the World Bank defines the informal labor sector including employment on a small scale, likely unregistered and unregulated such as households [4]. The UN document "Progress of the World's Women" states that "in developing countries over 60% of women workers are in informal employment outside of agriculture – far more if agriculture is included. The exception is North Africa, where 43% of women workers, and a slightly higher percent of men workers, are informally employed" [8]. When women work in the informal sector, they are particularly vulnerable to abuses and discrimination.

Women make up a large majority of the part-time labor force. We see this in countries such as Japan, where "40.9% of the part-time workforce is female; in the Netherlands that number is 59.7%" ([5], p. 106). Many women work part-time jobs for various reasons including the fact that women are often mothers and family caretakers [2]. Part-time jobs offer women flexibility and ability to fulfill their other familial roles and the *unpaid labor* associated with it. Because women constitute a large proportion of part-time employees, their wages are often less, and in some

countries, part-time status makes them ineligible for health benefits. In “The Price of Motherhood,” Ann Crittenden skillfully argues women pay an economic penalty when they choose to become mothers. Socially constructed gender roles and beliefs about femininity and motherhood often lead women to be the primary caretakers of children. Women are, therefore, forced to take time out of the paid labor force. This can affect women’s salary, promotions, and advancement in the workplace [9].

Unpaid Labor

Women spend more time on unpaid labor than men do. Unpaid labor women perform can include duties such as preparing food, washing clothes, cleaning the home, raising children, fetching water, and caring for pets and elderly. The majority of this domestic labor goes unpaid and undervalued. In many cultures around the world, women’s work is seen as “natural.” In fact, women’s housework is often perceived as doing nothing. Despite that, this labor is crucial to the functioning of society and the economy. The amount of time spent on unpaid labor affects women’s lives in many ways including reducing time for leisure and rest. According to the American Bureau of Labor and Statistics, in 2009, women spend more time on housework than men and men have considerably more leisure time than women [10]. Many women work paid jobs and then go home to complete domestic labor in the home. This is commonly called the double burden or the second shift of labor [11].

Wage Gap

A *wage gap* persists for women around the world. The wage gap refers to the phenomenon where women are paid less for their labor than men are. In “Employment, Social Affairs and Inclusion,” the European Commission reports that in 2008, women in Europe earned on average 17.5% less than men [12]. The country a woman resides in substantially affects the extent of the wage gap. For example, the European Commission reports women in Italy have a wage gap of 4.9%, whereas Estonia has a 30.9% gap [12]. Comparatively, as of 2007, in the United States women earn 78 cents for every dollar earned by a male, meaning women earn an average of 22% less than men [13]. In the United States, the wage gap is even greater for women of color and women with disabilities, with African-American women earning 69 cents and Latina women earn 59 cents on the dollar [13]. However, for women under the age of 30, who work full time and are childless, the wage gap is less. Perry and Gunderson [19] argue “Drilling further into the data, age group comparisons show a startling trend for gender comparisons of pay. Women earned 93% of men’s pay for workers 16–24 years old and 89% among workers 25–34 years old. This earning’s gap balloons for the age group 35 years and older showing women earning only 75% of a man’s pay” (Bureau of Labor Statistics 2009). “Young women begin work and are paid closer to their gender

equal counterparts while older female workers show the greatest wage disparity with men” ([19], p. 153). Because men and women often work in different types of jobs, laws and policies insisting on equal pay for equal work is not able truly to ensure the elimination of a gender-based wage gap. In other words, laws must find a way to address pay inequity that occurs in comparable work. There are many complex reasons that explain the wage gap. Some of the wage gap is a result of overt gender-based discrimination. However, there are many other factors that contribute to the wage gap such as gender occupational segregation, women's unpaid labor in the home, and women's prevalence for engaging in part-time work. The wage gap is a result of complex, direct, and indirect factors. Ellen Bravo argues that the wage gap is in small part a result of the fact that women work fewer hours than men. However, Bravo goes on to argue that “Researchers conclude that no more than half this differential can be attributed to actual number of hours worked” ([3], p. 22). Bravo argues that not only do women make less money than men, they make very low wages in general. Bravo states, “More than 90% of long-term low earners among prime-age adults are women” ([3], p. 24).

While many countries have laws in place to prevent pay discrimination, often these laws are ineffective or not enforceable. For example, in Japan, the Labor Standards Act of 1946 only ensured equal pay for the same work, as opposed to equal pay for comparable work ([5], p. 110). Japan has since followed up with other employment laws attempting to eradicate the wage gap, but as Hendersen and Jeydel argue, these laws have been symbolic and have not translated into real enforcement of equality for women in the workplace ([5], p. 111). Some countries such as the United States have recently taken notable strides for women's employment rights. The passage of the Lilly Ledbetter Fair Pay Act in 2009 was a momentous victory for working women to ensure that women have a fair time frame to sue after learning of their pay discrimination. However, the Lilly Ledbetter Fair Pay Act does not address the true causes of pay discrimination and is therefore a largely symbolic piece of legislation.

Discrimination and Barriers to Women's Advancement

Glass Ceiling

Women in the paid labor force have made considerable strides in terms of entering occupations previously blocked to women. For example, there are female fire-fighters, CEOs, police officers, engineers, and other professions that had previously been overwhelmingly occupied by men. In addition, many women have found themselves to be achieving increasingly rigorous roles in the corporate structure as well as running their own businesses. While some women have been able to realize leadership positions in their paid jobs, the majority of women have faced significant barriers toward advancement. The *glass ceiling* is a phenomenon that refers to the often invisible barriers to women's advancement in the workplace. Jeydel and Henderson state “women account for less than 15% of board directors,

less than 16% of executive officers, and only 2.7% of chief executives of Fortune 500 companies” ([5], p. 106). Women of color face barriers due to racism and sexism and, therefore, face a “concrete ceiling.” Jeydel and Henderson argue these statistics show us women are grossly underrepresented in top-level positions in the private sector. In part, the glass ceiling is a result of the ways women’s behavior is perceived and stereotyped in the workplace. The same behavior exhibited by a male worker versus a female worker might be interpreted remarkably different. For example, when a woman behaves assertive in the workplace, she may be perceived as being pushy and aggressive. In contrast, a man’s assertiveness is seen as effective leadership and appropriate behavior.

Sexual Harassment

Sexual harassment remains a significant issue women face in the paid labor force, regardless of the country they reside in or chosen occupation. Sexual harassment includes unwanted remarks, requests, and physical advances. When rejected, the individual perceives their workplace to be hostile and unacceptable. The perpetrator can be a coworker, subordinate, or boss and may be a male or female [14]. Sexual harassment is about power and control. Women are more often victims of sexual harassment than men in the workplace. Sadly, sexual harassment is an exceedingly common occurrence. The United Kingdom reports that 54% of women report they experience sexual harassment ([5], p. 129). Often, *sexual harassment* is viewed as an unimportant issue and trivialized in many ways. For example, when women are the victims of sexual harassment, they are told to “lighten up” or “learn how to take a joke.” This mentality perpetuates the notion that sexual harassment is not a serious offense. Despite many laws protecting the victims of sexual harassment, it still happens to a majority of women around the world. This can profoundly impact a woman’s emotional well-being as well as her ability to do her job well, which in turn may affect her ability to advance at work and receive raises. Sexual harassment can make a woman feel embarrassed, ashamed, powerless, victimized, and afraid. It is difficult to come forward about sexual harassment and can be equally difficult to prove. While many countries do have laws to protect against sexual harassment, and prosecute offenders, it has not been sufficient to end sexual harassment in the workplace. France is one country which has legally made *quid pro quo* sexual harassment and hostile work environment a criminal issue that can result in fines and imprisonment.

Maternity and Family Leave Policy

According to the International Labour Organization (ILO), most countries do not provide adequate protection for pregnant women and women on maternity leave. Currently in the United States, under the Family Leave and Medical Act passed in 1993, women are entitled up to 12 weeks of unpaid leave in which their jobs are

protected. The Family and Medical Leave Act allows women and men protection when they need to take leave due to childbirth, pregnancy, and bonding during adoption. A nation's family leave policy has a significant impact on women's lives. Typically, women are the caretakers for sick children and elderly relatives as well as ones who take time off for childbirth and adoption. This phenomenon is known as the "sandwich generation," referring to many working women who are simultaneously caring for a child under the age of 18 while caring for an elderly relative. For the "sandwich generation" of women, paid sick leave is a crucial issue. Otherwise, women are forced to take unpaid sick days at their jobs. This can affect their overall earnings and job evaluations. Therefore, a nation's family and maternity policy may affect them in different ways than men. The United States offers a particularly inadequate maternity leave policy for women when compared to other countries. However, there are many US corporations that offer paid maternity leave and some even offer paternity leave and parental leave for adoption purposes. According to the Institute for Women's Policy Research, as of 2010 only 10% of paid employees in the private sector of the United States had paid leave [15]. The ILO [16] reports that globally there has been some progress in terms of adequate maternity policy. The ILO [16] cites Nicaragua and Panama as exemplary examples in which women are provided paid leave for miscarriage, stillbirth, and other conditions related to pregnancy ([16], p. 24). In addition, some countries such as Finland, Slovenia, and Kenya are pursuing paternity leave legislation ([16], p. 24). However, despite some advances, pregnant women are often discriminated against in the workplace. Women are discriminated against through the denial of maternity leave, fired for being pregnant or nursing, denied adequate space to nurse at work, and denied promotions during pregnancy.

Gender Disparities in Wealth

In this chapter, we discussed the wage gap, which results in lost earnings for women. This can add up to significant amounts of money in a woman's lifetime. As a result, the wage gap affects women's ability to produce and maintain wealth. In addition, a government system's policies on retirement have a significant impact on women's lives and wealth. In the United States as of 2003 "women's average monthly retirement benefit was \$798, compared to \$1,039 for men" ([5], p. 130). One of the many reasons for this is women often spend less time in the paid labor force. They spend less time in the paid labor force due to childbirth and maternity leave. The result is that, as women age, they are much more likely to live in poverty. In "Equality at Work," the ILO [16] reports "829 million women live in poverty worldwide, while the equivalent figure for men is 522 million" ([16], p. xi). The global feminization of poverty has enormous impacts on other areas of women's lives such as poverty, reproduction, health status, and education.

In "Progress of the World's Women," UNIFEM [8] states women make up half of the world's population, yet they only own 1% of the world's wealth. Women's employment status often affects their ability to receive loans. UNIFEM [8] reports

75% of the world's women do not receive bank loans due to a lack of permanent and regular jobs, combined with a lack of property to use as collateral [8]. Patriarchal property laws are a contributing factor in women's wealth. Property laws often prevent women from increasing their wealth. In countries where it is legal for women to own property, discrimination and patriarchal norms where husbands make financial decisions still often prevent women from obtaining loans and credit.

The current global economic crisis has had a significant effect on women as a group and increased their overall vulnerability. According to the ILO, the economic crisis has led to millions of unemployed women. In "Facts and Figures on Women, Poverty and Economics," the ILO estimates 22 million more women are unemployed, which would mean that women have a higher rate of unemployment than men [17]. In addition to unemployment, the economic downturn has pushed many women into vulnerable and unsafe jobs according to the United Nations Annual Report [18]. The global economic crisis has set many of the advances women have made in employment back.

Models of Economic Empowerment

It is clear that to achieve gender equity, women's employment experience must improve. In addition, achieving economic empowerment for women requires increasing their access to credit and finance. In "Gender and Macroeconomic Policy," it is reported that women in Bangladesh save less because of the patriarchal norm requiring women to turn savings over to their husbands. Despite this fact, poor women are more likely to save than men are ([4], p. 60). Encouraging women to own their own businesses and take control over their finances are key areas of women's empowerment and gender equity. Around the world, women are forming their own credit unions and savings groups to give women increased economic opportunities. Typically, women use their personal and or family savings to start businesses. Additionally, in an examination of women entrepreneurs in Tanzania, only 3.9% of women used bank credit and .8% used credit from a moneylender to start their businesses ([4], p. 129). Therefore, improving opportunities for women to obtain credit from moneylenders is of foremost importance. Many NGOs and state governments are encouraging women's economic empowerment. For example, in Kenya, the Women Economic Empowerment Consort offers savings, loans, and business training to women ([4], p. 130). Globally, examples and strategies similar to Kenya are increasing. Therefore, there is hope that women's opportunities to build wealth may improve in the future.

Conclusion

Women constitute a growing proportion of the world's paid labor force. It is necessary to consider the point that most women around the world work in some type of paid labor. In addition to engaging in paid labor, women are often still expected to complete much of the unpaid domestic labor in the home. Socially constructed gender roles play a determining factor in the occupations women are

employed in and the way they are perceived and treated in the paid labor force. Around the world, women are making impressive strides to increase their wealth, reduce the wage gap, and fight gender-based discrimination in the workplace. However, much work needs to be done to ensure that women are ensured equal opportunity, equal pay, and equal treatment in the workforce. This chapter has attempted to identify key patterns in women's employment such as gender-based occupation segregation, migration for employment, part-time labor, and informal sector labor. This chapter has also outlined common aspects of gender-based discrimination in the workplace such as the glass ceiling and sexual harassment. Social change, in addition to strong government policies and international programs aimed at women's economic empowerment, is necessary to improve women's status around the world and their employment conditions.

Abstract

The importance of women's entrepreneurial work and its socioeconomic context has ethical import as a theoretical concern. The entrepreneurial endeavor of women involves gendered ethical issues of equality, access, and capability for women seeking to develop private enterprise in many marketplaces. The practice of entrepreneurship marks a segregation of work roles for individuals, but more so for women, due to gender identity in the market and a lack of available market, economic, and political networks. Further, gendered market and business identity estrangement induces a crucial challenge – social segregation based on both gender and socially constructed entrepreneurial roles. The role of women as entrepreneurs is examined in this chapter from a multifaceted economic class and social construction of gender framework. Moreover, women's agency and access to opportunities to develop business and market capabilities have theoretical underpinnings in ethical and economic concepts. Further, this chapter will explore a brief analysis of the ethical implications of the dialectic in gender relations pervasive in the economic and political power of women entrepreneurs.

Introduction

The concept of business is predicated on the private enterprise, or entrepreneurship, of individuals in communities. Individuals may seek the opportunity to expose their ideas in the form of a new process, product, good or service, market or technology to others in those or other communities [1, 2, 91]. However, the theoretical notion of

e-mail: dk@sfsu.edu

entrepreneurship is based in “the scholarly examination of how, by whom, and with what effects opportunities to create future goods and services are discovered, evaluated, and exploited. . . [and] involves the study of sources of opportunities; the processes of discovery, evaluation, and exploitation of opportunities; and the set of individuals who discover, evaluate, and exploit them” ([3], p. 218). Therefore, private enterprise has theoretical foundations that guide the practice of the entrepreneur.

Moreover, entrepreneurship is the enterprise of human practice to create value and economic return, and it results in new organizations [4]. Thus, entrepreneurship creates new “context-dependent, social and economic process[es]” in the marketplace ([4], p. 20). Entrepreneurship is the historical root of business enterprise, and as such, research has been undertaken to study the ethics of internal and external entrepreneurial practices (e.g., Morris et al. 2002). Likewise, the practice of entrepreneurship has been studied based on demographic effects on the choice and pursuit of individually owned business enterprise. Harvey [5] investigated entrepreneurial business choices of women, finding that owning one’s own business is “a gendered choice in that it allows them to balance the demands of work and family. The desire to balance work and family is an important factor that often distinguishes women’s motivations for entrepreneurial activity from men’s” ([5], p. 795). Other research has also pursued similar demographic investigations [67, 69, 70, 71, 73, 75, 82, 87–89]. The environment of entrepreneurial endeavors is inclusive of external market decisions regarding access, inclusiveness versus exclusiveness and interpretations of value, which bear ethical implications. This chapter focuses on gender issues related to the environment of entrepreneurship.

Gender and Entrepreneurship

Theoretical underpinnings. Kantian thinking is useful in understanding the ethical foundations of the entrepreneurial work of women. This conception of work is the culmination of the engagement of individuals in labor processes as sole practitioners engaging various stakeholders (i.e., supply chain relationships) in the self-development of products and services offered in a marketplace. Therefore, the entrepreneurial convention involves ethical considerations of equality, access, and capability, which are cornerstones of Kant’s studies of ethics in relation to historical aspects of human nature and nurture. His views of ethical practice reflect an evolution of the development of moral behavior and the growth of social institutions based on universal codes of conduct in relationships between individuals [6]. Kant’s concern with ethical progress in the conduct of everyday human endeavors is predicated on differentiated human work as progress, rather than what he calls the “bustling folly” of haphazard nonstrategic goals ([6], p. 140/82) or perfunctory actions of mere survival (e.g., animal species actions). In other words, entrepreneurial endeavors are manifestations of his view that “a moral character in humanity” is omnipresent in human endeavors as a mode of thinking that

distinguishes the human characteristic of “hope for progress toward the better” ([6], p. 144/85). In addition, the concept of human capacity has been delineated using utilitarian and other thinking in Sen’s [84] work on institutions’ social responsibilities to human well-being [7]. Further, the moral determinations of market decision-makers is argued to be a duty to considerations of all human worth, dignity, and rights as regards to what ought to happen in human relationships among all rational beings, as found in Kant’s *Foundations of the Metaphysics of Morals* ([8], p. 5, 46/429).

Kant’s concept of duty involves “good will” in commerce, or a practice of honesty and elimination of seeking an advantage, toward customers and other market participants ([9], p. 9–10/397). The entrepreneurial work of women is predicated on unfettered access to the marketplace and the advancement of development and capability to do so regardless of gender. Kantian thinking supports the role of humanity toward all rational beings. On his view, people not only hold the duty to their own development of “capacities for greater perfection” in the “preservation of humanity as an end in itself” but, as importantly, hold responsibility toward “further[ing] the purposes of others” ([8], p. 47/429, 430; 51: 434). In other words, Kantian thinking includes the concept of equity between rational beings, which supports the dignity of women in entrepreneurial endeavors based on the “intrinsic worth” of respect for their autonomous labor ([8], p. 53/436).

In 1797, Kant’s arguments in *The Metaphysics of Morals* turned toward the idea of duty as an incentive to individuals to treat others with respect, to keep promises, and to bestow benevolence toward others ([9], p. 220). Further, Kant argues that “the concept of autonomy is inseparably connected with the Idea of freedom, and with the former there is inseparably bound the universal principle of morality” ([8], p. 70/453). Moreover, moral conduct requires rational applications of “negative” rights – the freedom “of not being constrained to action by any sensible determining grounds” ([9], p. 226). Therefore, in Kant’s view, ethics is a system involving the moral imperative that categorically binds individuals to respect the freedom others have as a right to develop their capacities for an end “of their own making” (i.e., personal economic development) as a matter of human dignity ([9], p. 381). Therefore, gender should not be a limiting factor in one’s pursuit of private enterprise for economic or self-sufficiency.

Sen argues that economics is comprised of two problems: (1) how a human “should live” and (2) how they are to be judged of “social achievement” ([84], p. 3, 4). The interpretation of these two human choices is related to the ethical consideration of individual freedom necessary to human well-being [7]. Moreover, persons are conceptualized “in terms of agency. . . and in terms of well-being” ([84], p. 41). Agency has to do with “recognizing and respecting his or her ability to form goals, commitments, values” ([84], p. 41). On Sen’s view, women’s direct access to the market system is a moral freedom that has been historically denied in developed and developing nations. Moreover, this denial is a “violation of women’s liberty and gender equity. The absence of [market] freedom militates against the economic empowerment of women” and, thus, hinders their agency and well-being ([7], p. 115) ([84], p. 41). The prime hindrances to the well-being of women have

been the historical preclusion of their access to education, safety, distribution of income and credit, and self-respect. Furthermore, the social and economic evaluation of a person's agency and well-being is the measure of her market achievement ([84], p. 47). In other words, women have been seen as passive recipients of the market system, rather than as agents of economic development [7]. Sen's agency theory is based on individual freedom: "someone who acts and brings about change, and whose achievements can be judged in terms of her own values and objectives" ([7], p. 19). The right to obtain these characteristics of any economy is what Sen terms as *capacity* [7]. In other words, the access to a "capability set" for women entrepreneurs results in inclusion in entrepreneurial endeavors based on "self-goal choice" ([7], p. 73) ([84], p. 81).

The market system is made up of many individuals who have not only the understanding of the opportunities to exercise their capacities but also the abilities to "take note of other people's goals" due to the concept of "mutual interdependence" ([84], p. 85). Moreover, Adam Smith's moral theories of the market stipulate that human self-interest and ambition include admirable, ethical qualities, such as "prudence and justice" ([10], p. 245). His later treatise on the market economy is specific to the economic and ethical value of trade based in "mutually advantageous (explicit or implicit) contracts" ([84], p. 25). Further, Smith was keen on defining employment and labor based on the type of work function, rather than the specifics of the person engaging the work process, in what is called the *equalizing differences* ([11], Chap. X). More recently, Smith and Dubbink extend the moral obligations of business agents to *understand* what steps to take "to improve the well-being" of market participants ([12], p. 221). Furthermore, the notion of capacity includes the Kantian universal adherence to the concept of freedom as an ethical duty of society to not constrain or diminish personal endeavors based on gender. Therefore, market correction is needed to counteract the hindrance of women in the free access to develop their capabilities to self-labor of their own choosing of functioning as entrepreneurs and, thus, potential achievement in the marketplace.

Interpretations of work and gender. The interpretations of entrepreneurship have ethical import in the historical literature of the meaning of work, power, access to respect for one's life projects, and its application to gender. Work is the result of hopes and dreams in the search for daily meaning in life. These ideals are acknowledged by textile factory workers, service-oriented personnel, corporate staffers, and entrepreneurs. Yet, the pursuit of one's avocation can, although rarely, fulfill this objective. For example, in the film *Work*, Studs Terkel [13] illuminates an initial misconception that work is just work and little more than that. Both Adam Smith and Karl Marx addressed peoples' attitudes and behaviors and how these take shape out of the experiences individuals have in their work. The importance of Karl Marx' *Economic and Philosophic Manuscripts of 1844* [14] to the foundation of the concept of labor is represented in notions of power and struggle. I include Marx' thoughts on labor because of his keen observation of the structure of gendered employment in the cotton mills of Western Europe and his methodology in developing his theory of labor and capital using an analysis of the demographics of

gender, power, and the balance of employment among the skilled and unskilled workers in these mills. Marx' thesis is further formulated from a critique of capitalist enterprise and struggle that developed in the industrial centers of Europe, then extrapolated to other Western bases of urban labor endeavor. The human endeavor of labor within a capitalistic economy becomes the struggle for human dignity [86]. Entrepreneurship is exemplified by a search for dignity in one's own right as both owner and worker – thereby mitigating the estrangement of workers not only from the product of their labor and the owners of production since these entrepreneurs are one and the same.

On another view, Applebaum [15] integrates a number of nineteenth- and twentieth-century thinkers' analyses of “the issue of work [as] central to all societies because we must still produce our means of subsistence and survival,” as well as derive respect for human endeavor ([15], p. 459). In so doing, he provides empirical analysis to elucidate the “dignity of labor” as a theoretical perspective entailing capability and influence ([15], p. 461, [86]). An entrepreneur who has access to developing and using their influence through their own labor and product attains an aspect of power over their own economic and noneconomic means. Etzioni [16] categorizes three sources of power in business endeavors: *coercive* (physical resources of force, violence or restraint), *utilitarian* (material or financial resources), and *normative* (symbolic resources) that serve to either empower or decimate business endeavors on a global basis ([17], p. 239).

For example, the United Nations (UN) has addressed the global aspects of work, defined more broadly as employment. On this basis, being “employed” comprises any and “all persons above a specified age who during the short reference period either worked for pay or profit, or contributed to a family business (farm) without receiving any remuneration (i.e., were unpaid)” ([18], p. 76). A comprehensive definition of women's entrepreneurship needs to be inclusive of their entrepreneurial endeavors as employed work in any market system, regardless of gender or other inherited human trait that is representative of an individual's identity.

Identity and estrangement. The “private sphere” of women's lives has served to identify and estrange women from active participation in market systems, thereby “eclipsed by ideologies of total domesticity [and unpaid work] and dependence” ([19], p. 303). The ways in which an institution is structured forms peoples' sense of themselves and their possibilities. Arendt uses Marxist terms and a biological grounding of the notion of the human body as it labors and establishes a material consequence of human work in organizations, which dehumanizes the individual. Arendt proposes three “fundamental human activities – labor, work, and action” which provide identity for people ([15], p. 491). In this respect, corporations are “people-producers” ([20], p. 3) and product producers. Organizational structure is a problem when private enterprise transforms into collective endeavors known as corporations – decisions about public ownership, how to divide labor, accessing the availability of power and opportunity, and distributing people across tasks ([20], p. 7). Further, workers for impersonal organizations feel disconnected from the products they assist in manufacturing. In other words, some laborers lack an opportunity for individual choice about their work endeavors.

The concept of entrepreneurship is decidedly about the freedom of choice about how and where one's labor may be expended. Kant [21] argues that every individual has natural drives for survival, among these are "for enlarging our cognition" ([21]: 6:215). In this respect, one's choice of pursuits in life should be unfettered, regardless of personage and circumstance, which is a human moral imperative. The concept of business and property ownership has proven challenging for women across the globe, with historical hindrances evident in virtually every nation. As a private right, Kant [21] argued that moral law requires an a priori requirement that "everyone may acquire and own property" (xiii). There is no ownership of one's economic outcome in a corporate setting, only remuneration for services rendered. However, entrepreneurial enterprise is the manifestation of property ownership – of intellectual properties, processes, product, and real estate. Kant argues that these are forms of property, which are "in common," but also that individuals may "need the help of other people, and that in turn may require business contracts with them" according to Sullivan ([21], pp. xiii–iv). Entrepreneurial endeavors are "people-identifiers" because one's work and product characterize the individual and their capabilities as uniquely their own.

Women entrepreneurs are in a "dual-identity" social construct of both gender and business activity that challenges identity conflicts. Male business owners do not face the challenges and the same specific gendered hindrances or complements (see also [17] for the dual identity challenges of family businesses). "Masculine ethic" ([20], p. 22) elevates traits such as tough-minded approaches to problems, analytic abilities to abstract thinking and planning, having capacity to set aside subjective issues such as personal or emotional considerations, and space to use cognitive superiority in problem-solving and decision-making. These traits lend well to impersonal bureaucracy in management theory that includes motivation of a "machine" approach, as found in the scientific theories of management ([20], p. 23). Feminist theory has emphasized a cooperative, consensus-building team approach in Western work endeavors and project management systems ([20], p. 25). But, more theoretical feminist development needs to be done in relation to gendered entrepreneurial endeavors based on the concept of "women's work" in private enterprise [68, 72, 76, 77, 79, 83].

In Western, developed countries (USA, France, Germany, Italy, UK, and Finland), the Organisation for Economic Cooperation and Development (OECD) [22] reports that "gender differences in time use are significant" ([23], p. 128). In each of these countries, the study determined that men spent more of their time engaging in paid work than women in these same countries. Further, women spent more time engaging in unpaid work, such as family and household duties that are not accounted for in real time or economic pay. Despite the amount of paid work time, men in these countries were able to engage in greater time and variety of leisure activities than women in these countries. "The implication is that women provide household services, but other members of the household benefit" ([23], p. 128). One further indication that gender differences are significant in traditional organizational work settings is found in the statistics of rank and power in business:

“Only 13 of the 500 largest corporations in the world have a female Chief Executive Officer” according to UN’s *The World’s Women 2010: Trends and Statistics* [18].

Self-interest and entrepreneurial endeavors. The literature on entrepreneurship that I am aware of lacks full gender investigation as a genre. Eleanor Burke Leacock’s introduction to Frederick Engels’ *Origin of the Family, Private Property and the State* examines the persistent division of labor and its gendered application in the workplace in the nineteenth century versus the capitalist empowerment over labor and family concerns in Western societies. The notion and acquisition of private property fosters this division of labor, illustrating the dependence, rather than complement, of the family division of labor along gendered lines in a patriarchal structure. As capitalist “wealth increased it made the man’s position in the family more important than the woman’s” ([24], p. 41). Sen [7] sees more divisive issues related to equity and social estrangement in the gendered and socioeconomic holding of private property. On his view, private property can serve to spur self-interest and economic expansion of market sectors, but he tempers the outlook with the concern that “unconstrained” growth and inequitable access to the acquisition of private property can serve to further issues related to poverty among those historically prevented access to ownership (i.e., due to disability, gender, ages, etc.) ([7], p. 61). Historically, Kanter [20] notes that workers in the nineteenth and twentieth centuries were expected to perform their assigned labor based on the utilitarian notion of collective efficiency in productive processes to reach aggregate achievement, rather than individual self-fulfillment. In other words, family and small business endeavors gave way to capitalized industry and the corporation [20]. Therefore, the growth of entrepreneurial enterprise dwindled among those lacking significant capital to invest in private property or compete against monolithic enterprises.

In contrast, an entrepreneur’s actions include individualized “symbolic behaviors” [25, 26] and “networking styles” [27] in work-related relationships. Further, an entrepreneur’s intentions to develop and instigate their own business endeavor has economic consequences based on forming discrete social ties to others – as consumers, certainly, but also as part of the supply chain to bring the product or service to the market. Vissa [25] has investigated the “ties” to others that entrepreneurs must develop and what these particular ties mean for individualized entrepreneurial economic consequences. Moreover, in creating economic exchanges with market agents, entrepreneurs rely on a variety of symbiotic networks of individuals and organizations. Many studies of the theoretical and methodological aspects of US entrepreneurial economic endeavors exist, but fewer studies of the socioeconomic impacts of demographic characteristics have been done. Vissa [25] investigates “social similarity” in entrepreneurial tie formations in India based on the sociodemographic characteristics of ethnicity and caste, language, and occupation. McPherson et al. [28] include gender, as well as other inherited traits, in analyzing entrepreneurial behaviors in the USA, but the use of homophily theory has scant research to ascertain the particular gender characteristics that matter regarding access to and engaging in entrepreneurial activities. Further, Vissa [25, 27] and others have not investigated whether gender has a role in tie formation [29] related to social similarity, or

“homophily,” for entrepreneurs seeking complementary tasks in their respective market exchanges in various countries. The Vissa [25] study used a small sample of 75 entrepreneur participants in India, of which only three were women.

Ruef et al. [30] determined that homophily is based on “mutual attraction and trust” (Vissa 139) and that monoethnic ties held together more new entrepreneurial business ventures than multiethnic ties. Moreover, Vissa’s findings of significance demonstrated that while language positively impacts the intention for and the resulting tie relationship with market others, task complementarity also has a significant influence ([25], p. 155). However, caste only had significant impact on tie intentions but not on the actual exchange relationship formation ([25], p. 155). In other words, research is needed on how dissimilar ties, specifically on gender differences, might be reflected in intentions for, access to, and development of entrepreneurial endeavors in various countries. Further, investigation is warranted on the percentage subsets of successful reciprocated target exchanges with other individuals of same and dissimilar gender. Research needs to determine how gender differentiates, if at all, strategic initiatives by women versus men as entrepreneurs. McPherson et al. [28] focus on entrepreneurs who “connect to socially similar others because similarity fosters attraction” and trust versus socially dissimilar contacts who complement them. Moreover, “entrepreneurs often convert interpersonal ties into economic exchange ties” [31], which these latter ties “are crucial for venture growth and survival” [25] and form a “networking style” [27]. A research question could be formulated about whether economic support, product/service development, and exchange trust formation are similar or dissimilar globally as a result of market perceptions about gender roles. How are valuable entrepreneurial resources [25], such as business advice [32], “seed stage funding” [33], and supply chain confidence [34] equitably available regardless of gender?

Self-employment, “marketplace transactions,” and networks. The global economic role of women has been researched using a number of indices, such as the Gender, Institutions and Development Data Base (GID-DB) promulgated by the OECD using 161 economies of populations numbering generally more than one million individuals [23]. Gender equality is considered, among other factors, in women’s access to resources, such as education and economic status based on the role of women and their respective economic activity rate [35]. By definition, “wage employment is the most common form of employment, but own-account work and contributing family work are more prevalent in parts of Africa and Asia” ([18], p. 85). Moreover, working for oneself has attained a fuller definition by the United Nations (UN) in their most recent analysis of working individuals to take account of “persons in self-employment include those who during the reference period were: (a) ‘at work’ – i.e., performed some work for profit or family gain, in cash or in kind, or (b) had an enterprise, such as a business or commercial enterprise, a farm or a service undertaking, but were temporarily not at work for any specific reason” ([18], p. 85). In consideration of the importance of entrepreneurship worldwide to economic development and poverty impacts for developing nations, the UN also included “employers, working on their own account or with

one or several partners, hold self-employment jobs and have engaged on a continuous basis one or more persons to work for them in their businesses as employees” ([18], p. 85). The analysis of varied work forms is extended further to include “own-account workers, working on their own account or with one or several partners, hold self-employment jobs and have not engaged any employees on a continuous basis” in measuring the levels of women’s economic work activity in each country ([18], p. 85).

A number of avenues exist for entrepreneurial endeavors on a domestic and global basis, but the critical aspect of a woman’s right of entry to the economic pursuit of privately developed and owned business ventures is financial support (i.e., particularly microcredit, low interest, and no collateral structures for small entrepreneurial endeavors by women in developing countries) and market access (education and business knowledge attainment). Microcredit lending, with low interest rates and no collateral offered to women in Bangladesh and other developing economies to support their entrepreneurial endeavors, has been a vanguard of financial support in the last 15 years with significant advances made by economist Yunus and his development of the Grameen Bank [36, 37]. The repayments of these microcredit, small loans to women, which are “seed funding” for cottage industries, have been in the mid-90 percentiles.

Credit and market access are two features of entrepreneurship that have been and continue to be more difficult for women. Access to education and work experience has been hindered in both developed and developing countries, although the latter significantly impedes gender equality due to a lack of women’s empowerment on social, legal, and ethical bases. In much of the developing world, women have not had access to public space or political empowerment and, thus, have been denied the ability to develop market networks due to a lack of public education, economic market contacts and socialization, and legal aptitude. Business enterprise is built on relationships and networks – with suppliers, financiers, producers, distributors, and consumers – for success.

Social segregation and social responsibilities. Gender polarization and segregation are facts of US and global occupations in traditional business organizations [20]. The loss of identity is a crucial consideration in feelings of social segregation based on both gender and work roles, and work roles are made available because of education, circumstances, and imagination [72]. These obstacles highlight the alienation of many of the US workers portrayed in the film *Working* [13]. However, the statistics for US businesses show increased incidence of entrepreneurship among women, who own almost half of all “privately held U.S. businesses” with at least 51% ownership of the firm ([38], p. 32; [39]). This figure is reflective of the increased status of women in business in the USA, with women comprising 50.8% of the population [40] and 28.7% of all US nonfarm businesses in 2007 (compared to 28% in 2002). Women-owned firms employed 7.6 million persons (6.4% of total US employment) and generated \$1.2 trillion in receipts (3.9% of all receipts) according to the 2007 Survey of Business Owners [41]. Further, “business ownership is defined as having 51% or more of the stock or equity in the business,” according to the 2010 US Census definition [41].

In analyzing industry sectors, the US Census Bureau's Survey of Business Ownership 2007 reports the following statistics: 31.9% of women-owned US firms were in the repair, maintenance, personal, and laundry services sector (NAICS 81) and the health care and social assistance (NAICS 62) sectors [40]. An investigation of the number of women-owned companies by various states finds that California had the largest number of women-owned US firms (1.0 million or 13.3% of all women-owned US firms), with Texas and New York following in prominence. The cities of New York, Los Angeles, and Chicago, in that order, had the largest number of women-owned businesses. Further, 6.9 million women-owned US firms had no paid employees and were solo-run in 2007. These companies are reported as *nonemployer* firms, yet they generated \$182.3 billion in receipts and accounted for 88.3% of the total number of women-owned US firms per the 2007 Survey of Business Ownership [41]. While these statistics show gains in gender issues related to work and entrepreneurship in the USA, there are still obstacles to both domestic and, particularly, global women-owned business experiences.

The US economic market system has been socially stratified by gender. As a result, a number of behavioral and social constructs have been investigated regarding the access to, practice in, and success of the economic market and its constituents. Women-owned businesses have a number of similar challenges reflected in family businesses due to market access, economic and credit access, and recognition. For example, Mitchell, Agle, Chrisman, and Spence [17] examined the ranking of business stakeholder importance, or salience, to market participants based on a number of factors (*legitimacy, power, urgency*) for family firms in the USA. Stakeholder salience is also a critical determinant in gendered entrepreneurial endeavors for developing a woman's authenticity as a business owner, empowerment in the market, and market timing.

- *Legitimacy*. In Western cultures, legitimacy bears a number of definitions, including validity, acceptability, and legality. Legitimacy may be derived from "inheritance, primogeniture, vassalage, homage and fealty, mutual obligation, fiefs and subinfeudation... inheritance and privilege" ([17], p. 243). These characteristics of property ownership are representative of historical gendered legal characteristics of a "chain of legitimacy," or legacies, of male domination and power. These attributes represent opportunities, as well as obstructive challenges, for not only family-owned businesses but also women entrepreneurs. What is similar for entrepreneurs and family-owned businesses is the pursuit of passing an enterprise across generations that could result in "transgenerational sustainability," which provides ongoing family and community opportunities, continuity, and legitimacy ([17], p. 244). Further, socioemotional ties support continuation of community bonds and social capital for women entrepreneurs, as well as gender well-being. The ethical issues related to equity in entrepreneurship opportunities are not merely related to economic goals but also to the "non-economic goals and socioemotional wealth" ([17], p. 247) that are also characteristic of innovative, legitimate business structures.
- *Power*. For women-owned business, as is similar to family firms, power is derived from not only access to market participation and realized economic

wealth but also moral characteristics of a Smithian, free market system: collective community benefits, reciprocity, and long-term commitments from valued stakeholder relationships ([17], p. 248). An analysis of ethics in family firms (see [42]) is scarce in the entrepreneurial literature; this genre is even less available on gender ethics in entrepreneurship [80]. Two avenues for ethical theory application are apparent: virtue ethics, or the development of individual virtuous character and practice as a source of power, and duty-based obligations to oneself and one's community that builds influence and capacity through ally-building [43]. Among the characteristics of ethical power are those that readily apply to entrepreneurial endeavors: "integrity (honesty sincerity, socially-responsible, trustworthy),... courage (ambitious, achievement-oriented, leading, competent),... and zeal (exciting, innovative, imaginative, spirited)" ([42], p. 260).

- *Urgency*. Mitchell et al. [44] define urgency as a "call for immediate action" and a state requiring "time sensitivity and criticality" to the way in which we rank stakeholder claims (p. 867). Entrepreneurship is based on "being well connected" ([25], p. 137), which is an interminable, closely honed skill that needs development over time and space that may not be realized in a sense of urgency. Or, the lack of a sense of exigency may result in lost opportunities for needed market connections and entrance. The "structure and quality of entrepreneurs' *existing* interpersonal ties shape information access and thereby influence outcomes" ([25], p. 137). Vissa [25] points to outcomes such as capability acquisition [45], venture launch [46], and venture growth [92]. Some studies have assumed that entrepreneurs are "nonstrategic actors" and start their venture in a vacuum, absent particular strategic initiatives, or urgency [47]. However, if a market system hinders urgency for some entrepreneurs based on ethnicity, age, disability, gender, or other inherited trait through structural or institutional constructs (i.e., access to credit or business knowledge), then equity of access to the market by a woman entrepreneur becomes an ethical claim.

This chapter further traces a number of brief historical markers and contemporary literature in this author's defining of the challenges of gender and ethics in entrepreneurship endeavors. These definitions necessarily require interpretative analyses of existing theoretical and descriptive analyses of work, private enterprise, and market access.

Gender Issues

Glass ceilings and glass walls. The access to finance, supply chain, and economic market resources are hindered for many women throughout the world. Many of these issues and challenges have been experienced in the USA for both paid organizational work for women as well as for domestic women entrepreneurs. The hindrances to access for intraorganizational progress have been classified as glass ceilings (obstacles to job promotion, increased levels of hierarchal responsibility, and upward mobility in firms) and glass walls (containment within gender-segregated

work roles and/or impediments to lateral job acquisition, training, or development that would enhance upward promotion abilities). Moreover, “horizontal and vertical job segregation has resulted in a persistent gender pay gap everywhere” according to the UN World’s Women report ([18], p. ix). Further, “of the 500 largest corporations in the world, only 13 have a female chief executive officer” ([18], p. x).

The analysis of global statistics illustrates similar constructs of glass ceilings and glass walls that hinder the equitable mobility of work endeavors for women in many countries, particularly those considered to be developing national economies. For example, women comprise 52% of the global workforce, a figure essentially unchanged since 1990 based on the statistics of 196 countries or areas with a population of at least 100,000 as of 1 July 2010 [18]. However, “Northern Africa, Southern Asia and Western Asia remain the regions where women comprise a small [er] share of the labor force – 30% or less” ([18], p. 78). A number of researchers and theorists have explicated the barriers to women in developing nations, particularly due to a lack of economic access, educational capacity, ethical respect for gender, and human dignity.

Division of labor. Yelvington [48] argues that cross-cultural, transgender relations equally comport the nature of power and resistance between the economic classes and between the social divisions within the working class. The ethnic composition is interwoven with the gendered divisions of labor, overlaid on the classic notion of the division of labor within a factory system. Past colonial enfranchisement in Trinidad, for example, and contemporary enterprises of development schemes in Third World and “developing” economy countries have resulted in larger issues of how women are integrated and affixed in socioeconomic roles based on historical colonial functions on plantations and within the context of imputing gendered economic value. The dialectic of the struggle between enfranchisement and autonomy of women seeking economic well-being through paid work endeavors is reflected in the class distinctions of Trinidad.

Moreover, in Eastern and Western Africa, some 47% of women are own-account workers versus paid employees. At first glance, this may be observed as viable entrepreneurial endeavors, but these women are largely engaged in agriculture, where “own-account work and contributing family work are the prevalent forms of employment for women” ([18], p. 86). While own-account employment “allows more flexibility for women, who often have to combine family responsibilities with income-earning activities,” these women face higher economic risks because they do not have safety nets such as credit, property ownership, or access to market networks to build social or market capital; thus, unemployment and lack of socioeconomic support loom large ([18], p. 85).

Women’s agency, access, capability, and social change. The notion of *cultural entrepreneurship* provides identity and legitimacy for women entrepreneurs, and it has direct import on the measure of women’s access and agency in the market. Lounsbury and Glynn [1] investigated what entrepreneurs tell about themselves to others, with findings that “stories function to identify and legitimate new ventures, thus mediating between extant stocks of entrepreneurial resources and subsequent

capital acquisition and wealth creation” (p. 546). In other words, the stories women tell about their entrepreneurial goals, agency, and outcomes serve to familiarize them with venture capitalists and institutional investors, such as banks, NGOs, and foundations who seek to fund individual enterprises. Moreover, the Organisation for Economic Cooperation and Development (OECD) provides one measure of analysis of gender equality that includes the influences of culture on gender access, capability, and social change as these relate to economic development in cross-country comparisons [23, 35]. Further, the World Bank (WB) ([49]), International Labour Organization (ILO), and United Nations (UN) each analyze a variety of data to assess indicators of gender equality, access, and agency. For example, the UN’s Gender-related Development Index (GDI) and the Gender Empowerment measure (GEM) were replaced with the Gender Inequality Index (GII) in 2010, the twentieth anniversary of the Human Development Report of the United Nations Development Program [50]. Therefore, ongoing analysis is determining greater access and needs-approaches to facilitate women’s roles as workers and entrepreneurs through publication of the lack of agency, access, and economic gaps based on gender disparities in each country.

Global Issues

Challenges – fiscal, political, and social. The Council of the European Union put forth a series of binding articles that address the issues and challenges regarding gender bias in business and global economic development: “redressing gender disparities and enhancing the role of women are crucial for social justice and the effectiveness of development efforts” ([51], p. 5). These articles specify what constitutes gender barriers to market entry and the specific remedies to these barriers.

The Economic Commission for Europe (ECE) promotes women’s agency in entrepreneurial endeavors. For instance, a number of UN policies and strategies have resulted in action programs to address specific areas of economic intervention to assist women entrepreneurs, including the Inter-Agency Network on Women and Gender Equality. An analysis of the gender access and equality policies and strategies of specialized agencies was updated June 2, 2011 to include gender mainstreaming, women’s empowerment and income-earning capacity, and entrepreneurial endeavors [52]. In this respect, specific focus is placed on “area of trade, industry and enterprise development (subprogramme 6), [with] the objective. . . to support women’s access to entrepreneurship, particularly in transition economies” [53]. Moreover, the ECE held its 2001 Forum of Women Entrepreneurs in Geneva with over 300 participants representing 39 countries to create and develop a cybermarket of on-line networks of women entrepreneurs. The outcome was to broaden the global digital economy with technological access and inclusion of women [53].

The Gender Empowerment Measure (GEM) “is a measure of agency” and how women’s economic capabilities assist in achieving well-being [54]. In other words,

GEM “evaluates progress in advancing women’s standing in political and economic forums. . . examines the extent to which women and men are able to actively participate in economic and political life and take part in decision-making” [54]. In contrast, the GDI focuses on the expansion of women’s economic capabilities. The Gender Inequality Index (GII) replaced these two measurement tools to refine the data for greater application of collected knowledge about gender and socioeconomic inequalities. Moreover, “gender inequality varies tremendously across countries – the losses in achievement due to gender inequality (not directly comparable to total inequality losses because different variables are used) range from 17% to 85%” according to the Gender Inequality Index [55]. Further, this index measures three areas because “women and girls are discriminated against in health, education and the labor market – with negative repercussions for their freedoms” to fully pursue access and achievement in the economic market [55]. For example, the largest losses due to inequalities in society to women are in South Asia and Arab States, with measurements demonstrating a loss of gender educational and political involvement empowerment of 35% and 33%, respectively, plus 15% and 23% labor market economic achievement losses due to gender inequality in those two regions [55]. Therefore, women are hindered in developing business skills and political empowerment early in life and, therefore, lack necessary business development access to the market.

Access to credit is hindered, particularly for women: CARE and its microfinance impetus have created a “third wave, a market-based approach to economic development seeking to provide sustainable entrepreneurial business endeavors in developing nations,” such as Kenya. Microfinance involves small-amount loans at very low interest rates and no collateral to qualifying, low-income individuals seeking to create an entrepreneurial endeavor, which is considered high risk and therefore generally shunned by traditional and large financial lending institutions. To note, by lending to women in small network groups, defaults have been extremely low ([56], p. 5). Further, development indices fail to account for market trade status indicators, i.e., “micro-entrepreneurs, with their limited resources, can be among those most vulnerable to trade shifts,” which has a more significant effect on women entrepreneurs due to other socioeconomic inequalities related to education, literacy, knowledge, and hindered access to market information ([50], Chap. 2/55). The ownership rights challenge: women’s access to bank loans and credit for entrepreneurial support, their “right to acquire and own land” or other property ([35], p. 70) present insurmountable challenges in many global markets.

The powerlessness of women entrepreneurs is evident. Women lack access to “economic entitlements, effective enfranchisement, or sources of information” ([19], p. 320). Statistical measures of socioeconomic inequalities based on gender may reflect the distribution of economic resources on *average*, but not the nonmonetary, other quality of life, and access aspects to the individual mechanisms for economic distribution that leads to the “growing gap” between women and men worldwide (i.e., educational knowledge, literacy, and math skills that may determine credit requirements) ([23], pp. 54–56). The relationships between a variety of quality of life factors need clearer accounting, which the United Nations’ Human

Development Index [57] has sought to address for socioeconomic human well-being for life expectancy and educational attainment and income. But, more investigation is needed to analyze gendered results of entrepreneurial endeavors on a global basis [78, 81]. For example, gender inequality is greater in Sub-Saharan Africa, South Asia, and Arab States, thus adversely affecting women's ability to engage in entrepreneurial endeavors.

Gender inequality in economic markets is prevalent; and, due to the inequitable opportunities and gender discrimination for many women in developing and developed countries, the Convention on All Forms of Discrimination against Women (CEDAW) and the international negotiations that produced the Beijing Platform for Action of the 1995 UN Fourth World Conference on Women furthered awareness to address market opportunity challenges ([50], Chap. 2/57). Women's entrepreneurship is constrained by the "the disproportionate burden of unpaid work which they carry. That limits their choices and the time they have to generate income" [58]. Further, the "unpaid work is perhaps the biggest contribution that women make to the economy, even though their access to the paid labor market continues to rise," much more needs to be researched on the development, achievement, and empowerment of women's "own account" production and services, as well as entrepreneurial market endeavors ([50], Chap. 2/58; [23], pp. 128–131). Moreover, health issues of women, their children, and family members prevent continuity of women's private work projects due to lack of access and money for health care – such as the devastation that has resulted from the HIV epidemic in a number of developing African countries.

Further challenges in many countries are the lack of equitable legal remedies and protections for women, some of which also allow banks to require a male-signatory for any woman seeking to open a bank account or line of credit. Moreover, women do not have the right to own land and property in many countries nor are they permitted to inherit assets based on legal and social norms. These obstructions deny women the equal opportunity and status in their societies to develop and operate their own business, or the ability to have a public "voice" in community affairs. These aspects of economic independence are *critical for economic empowerment* [58].

Cottage industries. The "cottage industry" of many women has not been recognized as eligible for paid economic endeavor in many countries, but rather has been subsumed as part of overall household (unpaid) support and not recognized in many indices as business endeavors (i.e., selling milk from the family goat herd, woven fabric for clothing, etc.). In fact, index measurements have lacked measurement for these factors, and "household production could be given a market valuation if an equivalent product is offered on the market" and/or cottage industries' producers found wider market presence for their products ([23], p. 128).

Could cottage industries and women entrepreneurial endeavors reverse some of the most intractable challenges of poverty in developing communities? Poverty eradication and gender equality are among the UN Millennium Development Goals (MDGs) for the twenty-first century. Research conducted by the UN agencies and international organizations establishes close interlinks between the two concepts and indicates that gender inequalities limit economic development [35]. In other

words, human well-being includes equity in the marketplace to allow all individuals access to develop their capabilities as human beings regardless of gender and country of location [35].

Education, circumstances, and imagination. The “gender divide” in women’s access to technology is another challenge, which is linked to hindrances in education and attainment of literacy and math skills, among others. The global economy is technology-driven. Therefore, women entrepreneurs risk becoming marginalized without equal access to education and technological innovations that connect them to the market [74]. As critical, tech connections can “perpetuate existing gender-based inequalities. . . [unless access to] opportunities and resources that significantly contribute to the economic, political, and social empowerment of women” are made available ([59], p. 4). Further, ([35], pp. 72–73) argue that the “modernization-neoclassical thesis of gender inequality. . . suggests that a reduction of inequalities in the process of economic development” holds where developed, high-income countries have lower instances of gender inequalities related to market access and human well-being development. In other words, the lack of access to asset and property ownership for women or the ability to “independently leave the house” to obtain education or market participation results in gender inequality in the labor market, inclusive of entrepreneurial endeavors ([35], p. 73).

The Global Gender Gap Report Index measurements demonstrate that “Nordic countries Iceland (1), Norway (2), Finland (3) and Sweden (4) continue to demonstrate the greatest equality between men and women,” socially, economically, and legally, while the USA has reached 19th (its highest ranking in 5 years due to improved gender wage gaps and political leadership access for women) out of the 134 countries analyzed [60]. In the report, the “most comprehensive measure of gender equality” uses an analysis of how well these countries “divide resources and opportunities amongst male and female populations, regardless of the overall levels of these resources” ([35], p. 78). The report measures the size of the gender inequality gap in four areas:

- Economic participation and opportunity – outcomes on salaries, participation levels, and access to high-skilled employment
- Educational attainment – outcomes on access to basic and higher-level education
- Political empowerment – outcomes on representation in decision-making structures
- Health and survival – outcomes on life expectancy and sex ratio ([35], p. 78)

From another perspective, the UN has reported that “while Western Europe and North America have experienced a steady and continuous upward trend in women’s employability (see [61]), there had been serious setbacks in women’s labor market positions in countries of Eastern Europe, Central Asia and the Caucasus during the years of GDP decline and restructuring in the early 1990s, with women experiencing disproportionate cuts in employment, loss of job security, increasing wage differentials and cuts in social benefits” [62]. These markers of socioeconomic well-being are particularly crucial for women entrepreneurs.

Therefore, rising job uncertainty may lead to increased innovative mechanisms for paid work endeavors, such as atypical working arrangements, outsourcing some

areas of production, and self-employment as mechanisms for women to develop stable income for themselves and their dependent families. Entrepreneurial endeavors headed by women “tend to be smaller than men’s and are more likely to be in low-growth sectors” [62]. Historically, women have had greater barriers than men in developing their own viable businesses due to nonexistent or inconsistent access to credit, market information and networks, viable economic markets, and educational and vocational training. However, some progress is observed in institutional support for women’s individual business development through organizations such as the Women Entrepreneurs Support Association. For example, in Kyrgyzstan, “free legal consultations about property ownership and land rights to women interested in becoming self-employed, including people in remote areas” have been established [62].

Conclusion

Directions in entrepreneurship. The gender equality goal of the United Nations’ Millennium Development mission (MDG) for 2015 is based on women’s empowerment in the economic market using a number of measurements, such as the GII [58, 63]:

Women’s economic empowerment is central to gender equality and to MDG achievement. Supporting women to start their own businesses, or expand existing ones, empowers them, reduces inequality, and stimulates economic growth. [58]

In order for women to succeed as entrepreneurs, innovative microcredit, financial services, educational opportunities, and employment internships need to be developed further for women to freely access their desired market pursuits. Estimates indicate that in Africa, women “receive less than 10% of all credit going to small farmers and only 1% of the total credit for the agricultural sector,” yet they are a majority of the agricultural labor workforce [58]. However, despite the challenges, UNDP has developed and continues to support efforts to provide empowerment to across national boundaries by providing crucial access to equity and credit to finance entrepreneurial endeavors, some of which are formed in partnership with the private sector. Some examples are as follows:

- In Kenya, UNDP partnered with Equity Bank, UNIDO, ILO, and the Ministry of Finance to establish the Fanikisha Initiative. It enables women to access credit and provides entrepreneurial skills training;
- In Timor-Leste, UNDP supported an initiative for vocational and enterprise development training, micro credit, and job placement services. It reached more than 10,000 people, 77 per cent of whom were women; and
- In Nepal, a major UNDP microfinance programme helped create over eight thousand new entrepreneurs, of whom 68 per cent were women [58].

The goal of human development that is inclusive of creating space for women entrepreneurs of both developed and developing nations is to foster gender equality of education and access, economic empowerment, and civic participation as the goal of all “civil society, communities, local action networks, social entrepreneurs, local authorities, parliamentarians and corporations” [50].

Further research needs. Women's participation and access to the market are not delineated by entrepreneurial endeavor and compared for market access and inclusion in the entrepreneurial literature the author has noted in this chapter. This is an area ripe for research development as a further index of economic access and well-being of gender equality in entrepreneurship. The outcomes of gender equality in entrepreneurial endeavors may be similar to, but require further research on, women entrepreneurs acting as "stewards" rather than "agents" in the marketplace based on their own experience challenges and opportunities ([42], p. 262; [64, 65]). Market identity-factor and social controls may have an influence on women entrepreneurial ethics, which research may demonstrate the effects, if any, of gender on engagement in corruption, bribery, etc. [80].

This chapter suggests a need for a theoretical perspective of gender in entrepreneurship to understand the gendered actions and structures of women's individual enterprise in the global market. Long and Mathews [66] investigated the ethics in family firms, positing use of the social exchange theory to mark the interactions within and outside of these businesses. However, women entrepreneurs may be solo, in partnership, or part of a gendered collective. Therefore, social exchange theory only partially addresses the entrepreneur's intentions, schemas, and interactions with her stakeholders. Similar to Payne [42] and Long and Mathews' approach to family versus nonfamily firms' ethical culture and practices, this chapter explored some of the reasoning behind a woman entrepreneur who seeks to "create, maintain, and remain committed to the reciprocal social and moral obligations" of being a private business owner ([42], p. 289). Individual business owners and women entrepreneurs exemplify Adam Smith's moral theory of the market and its workings in communities – women seeking to be a baker, a shoemaker, or whatever capacity she has a capacity to provide.

The practice of entrepreneurship marks a segregation of work roles for individuals, but more so for women, due to women's gender identity in the market and the lack of available market, economic, and political networks to facilitate business growth and sustainability.

Abstract

Gender greatly impacts access to opportunities, potential, and success in corporate leadership roles. We begin with a general presentation of why such discussion is necessary for basic considerations of justice and fairness in gender equality and how the issues we raise must impact any ethical perspective on gender in the corporate workplace. We continue with a breakdown of the central categories affecting the success of women in corporate leadership roles. The first of these includes gender-influenced behavioral factors, such as the requirements and expectations of gendered verbal and nonverbal communication styles as well as appearance. We move on to address the impact of family on corporate leadership opportunities and success, discussing the asymmetrical evaluation of an individual's potential, authority, and competence based on gender stereotypes of familial obligations and expectations. Finally, we address how gender impacts access to networking and sponsorship opportunities and the long-term effects of systematic limitations on women's inclusion in the upper echelons of corporate leadership. We conclude with a summary of the questions and issues raised by our discussion and direct individuals to consider how different ethical systems and moral requirements might influence their interpretations of gender and leadership in the corporate workplace.

Introduction

The glass ceiling, the glass elevator, the labyrinth, the leaky pipeline, the broken pipeline – all of these phrases have been used in business literature and popular media to describe the startling absence of women in positions of senior management and corporate leadership. Title VII of the US Civil Rights Act of 1964 prohibits sex (and/or gender) discrimination in hiring decisions, while the Equal Pay Act of 1963 requires that men and women be paid equally for substantially equal work. Yet, it seems that these legal requirements fail to obviate gender as a very real – and very problematic – element in the US corporate workplace.

Gender bias is a prominent and pressing issue within corporate leadership today. This bias includes denying equal opportunity to certain positions because of gender,¹ but it also includes negatively altering our treatment and expectations of individuals based on their gender and its associated stereotypes. When one's gender changes the expectations and assumptions about job performance and potential, questions of justice and fairness arise, creating a clear concern for ethical business practice. The disparity between the percentage of women in the workforce and the percentage in upper management is shocking. In the past 10 years in the United States, women have comprised approximately 46% of the workforce [1] and approximately 50–51% of management [2, 3]. Yet in 2009–2010, women only held 13.5% and 14.4% of executive officer positions [4, 5]. Women held a slightly higher percentage of executive officer positions in Fortune 500 companies (15.7% in 2002, 16.4% in 2004, then dipping down to 15.4% in 2006 and rising back to 15.7% in 2008) [6–8]. Women have made some progress in their representation on corporate boards: in 2001, women held only 12.4% of corporate board seats on Fortune 500 boards. In 2010, women held 15.7% of corporate board seats [4–8]. This trend is not limited to the United States: the nonprofit organization Catalyst tracks the status of women in the workforce in Canada, Europe, Australia, Japan, and other countries and reports similar statistical trends: the percentage of women in senior management and on corporate boards is remarkably smaller than the overall percentage of women in the workforce.²

The issues of gender equity in corporate leadership are of serious ethical concern to legitimate business practice and can be articulated as issues of fairness and justice. If we take seriously the claim that all persons (both men *and* women) are worthy of moral consideration, then all humans deserve fair and just treatment. If one gender is systematically and unfairly preferred, then moral standards have been violated. Here, we argue that with regard to corporate leadership positions, women face assumptions and treatment that is not fair or just. This treatment explains what has been termed the “leaky” or “blocked” pipeline of women in management: though women represent approximately half of all employees and half of management, they comprise only a small percentage of upper management.

In this chapter, we present a discussion of the central issues concerning how gender impacts access to opportunities, potential, and success in corporate leadership roles. We begin with a general presentation of why such discussion is necessary for basic considerations of justice and fairness in gender equity and how the issues

we raise must impact any ethical perspective on gender in the corporate workplace. We continue with a breakdown of the central categories affecting the success of women in corporate leadership roles. The first of these includes gender-influenced behavioral factors, such as the requirements and expectations of gendered verbal and nonverbal communication styles, including appearance. We move on to address the impact of family on corporate leadership opportunities and success, discussing the asymmetrical evaluation of an individual's potential, authority, and competence based on gender stereotypes of familial obligations and expectations. Finally, we address how gender impacts access to inner networking and mentorship opportunities and the long-term effects of systematic limitations on women's inclusion in the upper echelons of corporate leadership. We conclude with a summary of the questions and issues raised by our discussion and direct individuals to consider how different ethical systems and moral requirements might influence their interpretations of gender and leadership in the corporate workplace.

Behavioral Expectations

One central element of concern regarding the treatment of women in corporate leadership can be considered under the heading of "behavioral factors." By behavioral we mean such factors as verbal and nonverbal communication styles, including the specific nonverbal element of appearance. Women are faced with a number of mixed messages in the corporate and professional workplace: do not look sexy but dress in a skirt, do not make yourself stand out but always wear makeup, do not make an issue of your sex but do not show up without your panty hose [9]. If a woman looks too masculine, she is treated with contempt, but if a woman appears too beautiful, she is treated as a sex object. Women are also presented with conflicting messages in negotiating and speech. Many claim to explain the disparity in pay, for example, as a failure of women to perform well in initial salary negotiations [10]. Yet when women take up strategies in negotiating viewed as "masculine," they are consistently labeled as domineering, unfriendly, and "bitchy." In fact, in one study where women were directed to present a script of precisely the same wording as their successful and favorably viewed male counterpart, women were evaluated negatively, and potential employers indicated that they would prefer not to work with women presenting similar personality traits.

When considering the role of gender in decisions, expectations, and evaluations of corporate leadership potential and success, it is important to recall that women constitute more than 50% of the population (as of 2009, 50.7% of the overall US population) [11]. Yet the "standard" in corporate environments is consistently based on a masculine or male prototype. The measure of a woman's performance is whether she is "as good as" her male counterpart, she will be accepted as legitimate if she can compete with *him*, and she will be allowed access to his networks and opportunities if she can erase from notice those attributes that mark her as feminine. When those markers are impossible to erase, however, such as in the case of general appearance (breasts, hips) or pregnancy, the focus on how to

present oneself professionally, as a woman, can become not only difficult to negotiate but embarrassing, humiliating, and damaging to self-esteem.

Historically, women have been underrepresented in many workplace environments in leadership roles. Instead, women have largely been present as secretaries, or, in more current terms, “executive assistants.” There are many stereotypical representations of women in these roles, and those stereotypes often include the sexualized role of the submissive and the feminine. Women have therefore been expected to conform in dress and appearance, as well as in behavior and speech. The film noir picture of the sexy secretary, or the more contemporary image of the sexual submissive, permeates our cultural expectations for women and their role in the workplace. This image, however, is clearly at odds with holding leadership positions in a largely male-dominated environment. It also creates confusion over how women *ought* to behave, dress, and speak.

Christina Binkley of the Wall Street Journal, for example, addresses the role of appearance in the business world, explaining that, unlike their male counterparts, women have not held a long-time tradition in the corporate workforce. She notes how women are admonished to dress in a way that shows that they are women, but not in a way that might be construed as less serious, more serious, less professional, more professional, or threatening to their male colleagues. As if these vague requirements were not already confusing, women executives also are warned not to appear interested in fashion, and there are generally no written policies or guidelines about how they should dress. Binkley explains, “According to unwritten rules, their appearance at work should be attractive but not alluring, feminine but not girly, strong but not severe. In both politics and the executive suite, they face hazier, harder-to-meet style standards than men” [12].

Female executives, then, are charged with a daunting task: to look female but not overly feminine; to appear powerful, but not *too* powerful; and to look conservative and authoritative without appearing overly masculine or intimidating. Binkley writes, “The attention brought to clothing is a two-edged sword for authoritative women everywhere. A style misstep can be career-limiting. Yet paying too much attention to one’s appearance risks accusations of frivolity – which is equally career-limiting” [12].

This confusion that women ubiquitously experience is often referred to as the “double bind”: the behavioral equivalent of “damned if you do, damned if you don’t.” In corporate America, no matter what women do, they just cannot seem to win [13]. When women are authoritative and assertive, like the men that they compete with (as they are often encouraged to be [14, 15]), they are perceived as “bitchy” and intimidating. Yet if they behave in the expected, “feminine” manner, that is, deferential, accommodating, and nonconfrontational, they will be bowled over and forgotten, dismissed as vapid and treated as furniture. Deborah Tannen [16] and Carol Gilligan [17] both discuss this phenomenon in their well-known work on gendered linguistics and gendered moral psychology, respectively. This devaluation of women’s linguistic styles and the dismissal of stereotypically “female” reasoning approaches are strong forces hindering the success of women in corporate leadership roles [13].

Women, therefore, are less likely to self-promote for fear of backlash – from both men *and* women. Unfortunately, to succeed in roles of authority (a stereotypically male domain), one is required to set oneself apart, promote oneself, and speak with confidence and certitude. These are all traits that inspire hatred, ostracism, and disdain when demonstrated by women [18], but they are also instrumental in securing the attention and merit required for promotion to the upper ranks of corporate leadership. The presence, then, of this paradoxical set of expectations leads women to back off from overstepping their linguistic authority. Women managers are more likely to utilize a linguistic form of requests, for example, asking, “Can you prepare the presentation for tomorrow at one?” rather than demanding, “You will present your findings tomorrow at one” [13, 16].

This approach has been documented as useful, to some extent, specifically when combined with “appropriately” framed appeals to authority. Bowles and Babcock in their recent work discuss the accumulated research appraising the effect that a woman’s gender has on how her behavior and communication choices will be interpreted in the workplace [10]. They cite numerous studies documenting the impact of gender on how one’s speech and actions are perceived, and demonstrate the previously cited “double bind” that women face in the workplace. They go further, however, moving beyond the gloomy picture this research paints in order to test potential strategies women can use to mitigate the negative impact their gender has on access to leadership roles, equitable compensation, and respect. They conclude that:

To improve both negotiation and social outcomes, we propose that women combine these two strategies [maintaining femininity and presenting a compelling case] by accounting for their negotiating behavior in inherently relational terms. We refer to this approach as using a “relational account,” a strategy that makes female negotiators appear more relational (i.e., gender stereotype congruent) while simultaneously making their compensation requests seem more legitimate [10].

Research such as this is very timely and extremely helpful to women “in the field.” It does, however, bring us to question the ethical and conceptual implications for the *necessity* of such work. Should we, for example, be focusing on finding ways for women to survive the system? Or, as we suggest here, should we move beyond this preliminary stopgap and consider ways to *change* the conditions that make it necessary for women to tiptoe around the paradoxical demands on women wishing to achieve success as corporate leaders? Recognizing that the way we treat one another is an ethical *choice*, rather than a “fact of nature,” reminds us that we can choose to change the conditions for our workplace, question our assumptions about *who* ought to behave *how*, and move toward a more equitable environment that allows all of us – women and men, both – to engage our talents.

Family

The McKinsey report “Unlocking the full potential of women in the U.S. economy” outlines four barriers that women face against advancement: structural obstacles, lifestyle issues, imbedded (sic) institutional mindsets, and imbedded (sic) individual

mindsets. Of these, lifestyle issues and imbedded institutional and individual mindsets are greatly affected by what has traditionally been seen as women's role in the family.

There is an assumption in society that women are more focused on their families than men. When men have a family, they are seen as more stable and thus more responsible, which lends support to their claims on management positions. Women, on the other hand, are thought to be distracted and thus less able to do difficult and demanding work once they have families. In their careers, then, men will be more likely to seek advancement and will not worry so much about work/life balance. It is assumed that women will not seek and should not be put in positions that would compromise work/life balance and the time they have to spend with their families.

The major assumption from the lifestyle standpoint, then, is that women do or will have families, and they will not want to undertake demanding work positions because such positions jeopardize their time with their families. Such assumptions influence those who make decisions on behalf of institutions (companies) and are reflected in the biases of some individuals. These individuals include professionals in human resources and hiring managers, who make decisions about which individuals get interviews, are hired, and are worthy of promotion. This bias shows up in the current family status of women in executive offices: 41% of women in these offices do not have an intimate partner at the time of appointment, and 40% do not have children [19].

Even more concerning is the recent research [20] suggesting that high-skilled women in general are disproportionately affected by child rearing with respect to their low-skilled counterparts. Whereas the low-skilled women will "have wages that are 12% lower than their counterparts after 10 years, high scoring women have pay that is 35% lower".³ These results are interpreted to indicate a bias against women that is long ranging, however, rather than immediately observable, and the difference is *not* explained by reduced work experience, greater time off, or changes in profession or company. Researchers conclude that many studies overlook or downplay such disturbing trends in the long term economic success of high-skilled women and that the true economic cost of being a mother who is educated and highly skilled is even more striking than previously surmised.

The assumption that a woman who works and has a family has extra demands on her time is not unwarranted. As Michael S. Kimmel points out in *The Gendered Society*, it is true that in the United States, women, even mothers who work full time, continue to do more of the housework and child care than men do [21]. For working women, this is often referred to as "the second shift." But this does not affect women's desire to take more demanding jobs: both women and men are influenced by their family status in their choice of positions as well as in choosing additional responsibility. According to a survey done by McKinsey and Co. in February of 2011, a similar percentage of both men and women who have children said they would not consider taking a job with more responsibilities if it would upset work/life balance: 63% of women and 51% of men with one child said they would only pursue a job if it allows for good work/life balance, while 67% of women and 58% of men with more than one child said they would only pursue a job if it allows for good work/life balance [22]. The assumption that women cannot do

a certain job because they would have difficulty balancing their work with their families is also inconsistent with the reality of actual businesswomen. Of the few women in corporate leadership, many do have families, and they find a way to balance their corporate responsibilities with their family responsibilities.

Women in prominent organizations are aware of the inherent institutional bias against putting women with families in positions of corporate leadership. Women who have children see their opportunities for advancement decreasing, while men see their opportunities for advancement increasing: 78% of women with no children believe they have the opportunity to advance, while only 74% of women with one child and 70% of women with more than one child believe they have the opportunity [22]. In contrast, men with children see their opportunities to advance as *increasing*: 69% of men with no children believe they have an opportunity to advance, while 77% of men with one child and 80% of men with more than one child see the same opportunity [22].

Making assumptions about an individual's abilities and professional commitment based on gender and perceived familial responsibilities has a disproportionately negative impact on women and is unfair. When we fall back on social expectations about what groups *should* want, rather than what an individual has demonstrated she is pursuing, her choices are limited and in some cases she is denied meaningful work without legitimate reason. Though it is clear that some women do choose to limit their professional lives so that they have more time available for family, making an assumption that this is what a woman *ought* to choose, or that this is what a woman *will* ultimately choose, is at odds with fair and ethical treatment of employees and coworkers. Additionally, the assumption that family obligations and a robust family life are incompatible with a strong and ambitious career in corporate leadership may be unfounded.

As corporate climates evolve and as the landscape of our workplace changes, we may see corporate culture alter as well. Though not the standard, there are alternative corporate models that encourage a more balanced life for their employees and reconceptualize what it means to be a successful worker and leader [23]. As we discuss elsewhere here, the instinctive expectation that for women to survive and thrive in the corporate world they must adapt to the current system and the assumption that in order for women to be successful they must learn to be successful in the traditional society of men are both shortsighted. Both women *and* men frequently desire to have families and to experience and influence their family's day-to-day life [24, 25]. It is increasingly clear that as social roles in the family shift, the sustainability of the traditional corporate hustle will need to shift as well – not just to accommodate women, but to respond to the changing desires of men as well [26].

The outdated assumption that women are ill suited to the boardroom is also a problem from a business standpoint: Rebecca Blumenstein, for example, explains that the lack of women in corporate leadership positions is “becoming a competitive issue for the U.S. and its growth potential, according to economists, because many developing countries such as China and India are making rapid strides in how effectively they utilize women, which is helping fuel their growth rates” [27].

The fact that denying women equal opportunity to be corporate leaders is unfair is enough of a moral reason to change the practice in itself. But since such a practice also creates a competitive disadvantage for the companies where it exists, it is not clear why such denials occur in the first place.

Networks and Sponsors

An old adage says that when it comes to getting a job, “It’s not what you know, but who you know.” This still holds true in corporate America. “Networking” was a popular buzzword – people attend formal networking events to meet others who are in their industry or who are also looking to make social connections that will lead to corporate advancement. But networks can also be informal, consisting of individuals one meets on the job or with whom one went to school.

These networks often do result in new positions and corporate advancement. In response to this, companies and informal groups set up networking opportunities in their companies that are designed specifically for women in an effort to give women the same chances to advance in their careers as men. These efforts, however, are not working, in part for two reasons: first, the necessity of sponsors, not networks, and second, the criteria for promotions.

Although networking has been seen as the avenue for advancement, part of the problem is who attends the networking events. Many networking events are aimed at connecting people at similar career stages or with similar goals. Others are aimed at helping individuals find mentors. But in both of these cases, there are not many (if any) criteria that are used to screen people who want to take advantage of these events. Patricia Davis, JP Morgan Chase’s global diversity officer, was quoted as saying that these events “are great because they build a lot of goodwill in the system. . .and that makes the place feel smaller. . .But anybody can participate—you can be the worst performer or the best performer. It’s feeding the masses” [28]. Mentorship can be similarly problematic – mentors often give career advice but do little to actively promote their mentees.

In terms of advancing into corporate leadership positions, sponsors are more important than individuals met while networking and mentors. Sponsors are individuals who actively work to promote the careers of the individuals they sponsor. Sponsorship is extremely important as one moves up the levels of corporate management. As Chief Diversity Officer for Intel Rosalind Hudnell stated, “When you get to the level where decisions are made about your career that are not just up to an individual manager, feedback from other leaders becomes crucial. . .Having a sponsor who can provide that endorsement is critical” [29]. Sponsorship programs for women at JPMorgan, for example, are starting to show results for those women seeking senior-level management positions: women hold 54% of mid-level management positions and 23% of senior-level roles [28]. Yet men are 46% more likely to have a sponsor than women [28]. Even women who realize the importance of cultivating these relationships are sometimes hesitant to do so because of the popular assumption that a powerful man with a female protege

is receiving sexual favors from her [29]. Additionally, some women believe that all they need to do in order to be promoted is to work hard and be successful; eventually, someone will notice and promote them based on their success. This is partially true: women do tend to be promoted based on success. But the same metric is not applied to men: men tend to be promoted based on their *potential*, not on their proven success [30].

The members of the Women in the Economy task force also recognize the importance of having a sponsor: “Improving Sponsorship and Mentoring programs” was one of their top five recommendations for how to increase the number of women in corporate leadership [31]. But in finding sponsors, women face another challenge: there simply are not many women higher up in organizations who could serve as sponsors or even as role models [30].

The issues of sponsorship are not as straightforward as they may seem, though. While it is true that women who want to enter positions of corporate leadership need sponsors, most of these sponsors end up being men simply because there are more men in these positions. So, men who can act as sponsors must realize the importance of sponsoring promising women. This is where the importance of institutional and individual mindsets again limits women’s ability to advance. According to Barbara Annis, the CEO and founder of Barbara Annis and Associates, a consultancy firm that specialized in gender intelligence and inclusive leadership, the problem is that in many companies, “[w]hen a company has a challenge involving women, they tend to put the emphasis on women to fix that challenge” [31]. Instead, men and women need to understand the role that gender bias plays in promotions and hiring, particularly in corporate leadership positions levels. This is necessary to counteract the attitudes that diversity officers often find in both male and female hiring managers, who justify hiring men over women for certain positions for reasons including the following: “Everybody ‘knows’ you can’t put a woman in that particular slot” [31], “That job could be never be done part-time” [31], and “If you promote a woman and she goes out on leave, we won’t make our numbers” [32].

In addition to lacking sponsors, and in conjunction with differing standards for promotions (performance for women, potential for men), women often are not in the right kinds of jobs for promotion to corporate leadership positions. Women’s career paths tend to be less linear than men’s, prompting a comparison to “off-ramps and on-ramps” and “labyrinths” when discussing women’s careers [33, 34]. According to the McKinsey report on women in the US economy, “62% of women are in staff jobs that rarely lead to a CEO role” [30]. To counter this, the Wall Street Journal Task Force recommends that women take on roles and positions that will directly affect the profit and loss statement for the company, providing them with a necessary set of skills for entering corporate leadership positions.

Conclusion

At the core of these issues, however, we find a central problem: when considering the topic of “gender,” what we really seem to mean is “women.” When phrased this way, it can seem to many that the “problem” of women in corporate leadership is really just a “women’s issue.” Why, after all, should everyone else

care about the problems that women face? And if women really were as good as men at “business,” would they not rise to the top on “their own merits”? In fact, when we put it this way, the conversation seems very familiar; these questions are often strikingly similar to those asked in the context of minority concerns in the corporate workforce.

While the specifics of the difficulties for women succeeding in upper management are particular to the psychological and structural undergirdings of gender, the effects – and the arguments used to rationalize them – are closely related to those observed for other disadvantaged groups. Though women are a distinct *majority* in the overall population, they are a remarkable minority in corporate leadership roles. This has been true historically, and, as we have discussed here, the systemic and structural facts about our culture and political society are significant contributors to this reality. As such, women constitute a disadvantaged group. When a group is politically and socially disadvantaged, that group becomes the proper subject of ethical concern and social justice.

Our discussion of how gender impacts our expectations and interpretations of coworkers and employees demonstrates how the status quo is outdated and disproportionately harmful to women. The clear existence of a double bind requiring that women behave more masculinely, while at the same time negatively impacting our appraisal of them when they do, points to some very deeply ingrained biases held by both men and women. The paradoxical set of expectations that women must navigate in order to succeed as corporate leaders requires that women deftly avoid the pitfalls of self-sabotage that these conflicting demands can easily produce. The added pressure that women experience, and the additional scrutiny that they must constantly succeed under, is inequitable, unfair, and in need of change. As Deborah Rohde, a notable figure in discussions of gender in the workplace explains, “Despite considerable progress over the last quarter century, women workers are still frequently perceived as less competent than men. . . Even where male and female performance is objectively equal, women are held to higher standards, and their competence is rated lower” [35]. While a great deal of work has been accomplished in efforts to aid women wishing to succeed within the confines of the male-dominated and stereotypically masculine environment of corporate America, we suggest there are strong moral grounds for a call to reenvision what we mean by “corporate leader” and how we should expect her to behave.

As discussed in the section on family, assumptions about women’s desire to have families and their roles in their families negatively impact women who seek corporate leadership positions. Women who are seeking corporate leadership positions are aware of the demands of the job. Assuming that they do not realize the time commitment and that they would be unwilling to make such a commitment or that they should not make such a commitment if they have a family denies women equal opportunity to those positions. Further, assuming that all women want families and denying them access to positions of corporate leadership on those grounds is also problematic. This denial makes the treatment of women unfair.

Additionally, as Davis, Yoo, and Baker report, many of the boards and corporate leadership positions at large companies in the United States are comprised of an interlocking network, that is, many boards and corporations are run by a small group of elite individuals [36]. As discussed earlier, the McKinsey report states that women have limited access to the informal networks and sponsorships which often help boost individuals into corporate leadership. This lack of access shows that positions of corporate leadership are not open to all because they are not open to individuals who are not part of these informal networks or who do not have sponsors advocating for them.

Given the barriers that stand in the way of women reaching the upper echelons of corporate leadership, it is no surprise that the percentages of women in corporate leadership positions are so low. The issue is not that corporations lack women with the talent and skill to take on these positions – rather, the problem is that the barriers that stand in the way often lead women to believe that there is no real opportunity for advancement [30]. This is both a practical problem for business and a moral problem that requires attention. The issue, though, is the pervasiveness of the barriers. If we are to have real gender equity in corporate leadership, change must occur not only within the higher levels of corporations themselves but all the way down through the ranks, including the mindset of the employees' direct supervisors [30]. As we have suggested here, gender bias is an insidious force in corporate America and has a striking effect on the treatment and relative success of women in corporate leadership. Though it is not always obvious or intentional, gender bias has a very real influence on which individuals we choose to run our businesses and how we perceive those individuals. The ethical issues raised by the presence of gender bias in corporate leadership, therefore, should be of concern not just to women but to us all.

Notes

1. It is not the only inequality; other inequalities, such as race and class, are present as well. These can often intersect with gender, but can stand alone, as well. In this chapter, our focus is on gender, specifically.
2. Though the present levels of women in corporate leadership around the globe are problematic, the experience of women today trying to enter the

- ranks of corporate leadership differs from the experience of women who were attempting the same feat over a generation ago. Similarly, older women today have a different experience when they work to attain high-level positions of corporate leadership. Though the differences between the two groups are important and worthy of research, they are not the main focus of our work here.
3. “Low skilled” is determined here by performance on the Armed Forces Qualification Test resulting in placement within the bottom third of NLSY respondents. High skilled respondents are identified as those falling within the top third of test takers. Wilde, 2010, p.16.

Abstract

Some provisions of the UN's Convention on the Elimination of Discrimination Against Women (CEDAW) are clearly important from the perspective of business ethics, particularly those calling for equal rights for women to employment and financial security. Some other provisions of CEDAW are equally as important for ethical business practices and Corporate Social Responsibility (CSR), but are frequently overlooked because of the presumption that they are not strictly business concerns: the rights of women to participation in public life, marriage, and family rights; the rights of rural women to adequate living conditions; and general rights to equality. This chapter will discuss the conceptual commitments that underlie the assumption of a clear demarcation between work and life concerns, and examine the criticisms of this assumption made by feminism. It will, in particular, be interested in:

- The public/private distinction
- The meaning of "work" or "labor"
- The relationship between CSR and care ethics
- Fostering a broader understanding of the family or familial relations
- Examining the connection between fair wages and work/life integration

These discussions suggest that the ability for businesses worldwide to uphold the tenets of CEDAW is dependent upon a reconsideration of the character of the Ideal Worker and a nuanced understanding of the effects of workplace policies on the wider communities in which businesses operate. In particular, though work/life integration is not strictly speaking a "women's issue," the ethical and policy considerations addressed herein currently have disproportionately negative effects for women; thus, addressing them is crucial for achieving the aims of gender equality.

Introduction

When taking the provisions of the United Nations' Convention on the Elimination of Discrimination Against Women (CEDAW) as a guideline for approaching gender issues in business ethics, it is clear that some provisions – such the declaration that women have equal rights to employment, and should not be discriminated against on the basis of marital status or maternity, and the claim that women have equal rights to full participation in economic life – are of obvious concern for anyone interested in ethical business practices. Indeed, employment law in many countries reflects a concern with the prohibition of such discrimination, and public discussion of sexism in business practices tends to focus exclusively on this form of discrimination, particularly in hiring practices. One might be left with the impression, then, that as long as barriers to women's employment are eliminated, one's business practices can be assured to be fully ethical. However, it is important to notice that CEDAW provisions with implications for business ethics extend beyond prohibitions against employment discrimination. In fact, other provisions of CEDAW – including the right to full participation in public life, equal rights within marriage and family life, and rights to adequate rural living conditions – have significant implications for ethical business practices. Because workers, whatever their genders, are always also members of families and communities, there are important connections between concerns that we have often understood as strictly divided between one's "work" life and one's "private" life. Moreover, workplace policies not sufficiently attuned to these connections have disproportionately negative impacts on the lives of women workers.

Though attending to concerns about work/life integration is fairly new in the business world, the insight that work life and private life cannot be thoroughly disentangled is not a new one for feminists. If this is so, why have discussions of ethical business practice so infrequently included policy changes supporting better work/life integration, or practices fostering gender equality beyond employment discrimination? Feminist philosophers have pointed out that there are important conceptual commitments underlying our collective failure to notice the many respects in which our approaches to business ethics and workplace policy have strongly gendered effects. This chapter will discuss the conceptual commitments that underlie the assumption of a clear demarcation between work and life concerns, and examine the criticisms of this assumption made by feminism. It will, specifically, address the public/private distinction, the meaning of the notion of "work" and women's work, particularly in an age of globalization, the relationship between care ethics and the idea of Corporate Social Responsibility, the concept of "family," and the implications of the idea of a fair wage. Throughout, its aim will be to shed light on the various aspects of business practice that must be considered when taking CEDAW as a central feature of business ethics, particularly when taking seriously the insights of feminist philosophy.

The Public/Private Distinction

The vast majority of thinking about ethics, whether in philosophy, or in policy discussions, focuses its attention on what we typically understand as public life. In, for example, classical contract theory, the question of right living is the question of the citizen's obligations to other citizens and to the State, and concomitantly, the citizen's rights with respect to each of these. Similarly, in contemporary thought about global justice, the question of ethics is the question of how universal human rights are to be reconciled with our obligations to others the world over, regardless of citizenship status. In each case, the subjects of ethical concern are neutral and interchangeable (insofar as their social status is understood to be ethically irrelevant), and thus as fundamentally non-private. The so-called private sphere – that of the home, the family, the marriage, and so on – might perhaps become an object of moral order (if, for example, we choose to stipulate what forms of marriage relationship or treatment of children are ethical), but this is typically thought of as a separate realm of inquiry, and certainly not the one of paramount importance for ethics. The secondary status of the “private sphere” in this public/private distinction is implicit, as feminists have pointed out, in its omission from the majority of philosophical discussions of “justice,” as well as in the comparatively recent development of laws prohibiting violence within the home or marriage. Only by presuming a sharp division between the public life of the neutral citizen, and the private life of the family, does the standard approach to ethics become intelligible.

This public/private distinction is implicit, moreover, not only in standard approaches to business ethics, but also in typical workplace policies. In many cases, for example, workplace policies (and employment law) depend upon the assumption that the employer-employee relationship may be considered in isolation or abstraction. On this view, policies regarding absenteeism, tardiness, or benefits may (or must) be determined solely with reference to the workplace relationship. Thus, each employee functions as an analog to the neutral citizen of standard contract theory: as an autonomous agent to be treated as equal under the rules of the workplace – or, minimally, as bound by the same rules as others of her or his status – and whose life beyond that workplace is irrelevant to those rules.

It is in view of this implicit distinction that work/life integration becomes a problem to be dealt with, as it is at the root of what Joan Williams ([18], p. 2) calls the “Ideal Worker norm.” The Ideal Worker is the figure assumed by many workplace policies, the employee who “works at least 40 h a week year-round,” who does not need time off for caring for sick children, maternity leave, or taking aged parents to doctor's appointments. The Ideal Worker, in short, is the worker whose “private” life outside of the workplace makes no encroachment or demands upon the “public” life within the workplace.

It is important to ask, however, whether a clear public/private distinction is truly viable from the perspective of business ethics. For, while it is certainly true that a business full of Ideal Workers might make for greater profits, feminists and feminism offer many reasons to question the viability of the public/private distinction

and the Ideal Worker norm. Indeed, whether coming from liberal democratic, critical theory/Marxist or transnational critical perspectives, feminists have important criticisms of the public/private distinction to consider.

Writing from a feminist perspective on liberalism, Susan Moller Okin argues [10] that the public/private distinction is unsustainable for several reasons. First, Okin suggests, the family itself is necessarily a political space insofar as it is shot through with differential distributions in power – which are themselves reinforced by women’s legal and economic vulnerabilities, and thus hardly contained within the “private” realm. Moreover, Okin points out, “the domestic sphere is itself created by political decisions” ([10], p. 127), both through phenomena like the legal recognition of particular domestic relationships via marriage, and through extra-legal policy decisions (as we will see in later sections). Thus, even if we subscribe to the liberal view that de jure regulation of family relations is unacceptable, social realities entail that the family, and the rest of the private realm, will necessarily be significantly shaped by public life, political and policy decisions.

Feminists working from within the tradition of Critical Theory (which has roots in Marxism) also question the strict demarcation between public and private spheres, but at the same time raise doubts about the standard liberal feminist view. Nancy Fraser, for example, points out that the notion that there is just one public sphere – everything that is not the private home – and that women have been wrongly excluded from it, “turns out to be ideological; it rests on a class- and gender-biased notion of publicity, one which accepts at face value the bourgeois public’s claim to be *the* public” ([2], p. 116). On the contrary, there have always been multiple publics, according to Fraser; it is simply that the public of the dominant ruling class purports to be the most important one, and thus becomes the one that feminists become concerned with integrating. Thus, while Fraser would agree that “private” relations of gender pervade our public interactions, she would suggest that it is mistaken to assume that this means we all are, or ought to be, part of a singular public, our claims to privacy notwithstanding.

In her book *Feminism Without Borders*, Chandra Talpade Mohanty offers further reasons to question the public/private distinction, particularly within the age of globalization, which has seen a “massive incorporation of Third World women into a multinational labor force and into domestic service” ([8], p. 71). Mohanty, like other scholars of globalization, points out that Third World women play a hugely significant role in the global economy, through employment in “world market factories, sweatshops and home work” ([8], p. 74). However, unlike some economists who might be inclined to see this fact as purely innocuous, Mohanty argues that the overwhelmingly female demographics of such business ventures is telling, as multinational corporations deliberately recruit Third World women in an effort to avoid paying fair wages or having to document employees for tax purposes. In doing so, Mohanty suggests, such corporations both exploit *and* contribute to a sexist and racist stereotype of Third World women as passive or controllable, as well as a strictly gendered division of labor – which are then blamed on the “backward” customs of the Third World country. Thus, in both transnational and local cases,

we see public and business policies as both drawing on and contributing to supposedly private gender arrangements.

With these criticisms of the public/private distinction in mind, the notion of the Ideal Worker, whose work life is clearly distinct from his private life, is increasingly untenable. The Ideal Worker is therefore, as Williams points out, not a neutral concept at all, but “framed around the traditional life patterns of men,” and “excludes most women of childbearing age” ([18], p. 2). The notion of the Ideal Worker – along with the dominant notion of “professionalism,” which demands “a way of life devoted to work perceived as one’s calling” ([11], p. 79) – thus depends upon and reinforces the assumption that work in the public sphere is done by men unencumbered by responsibilities in the private or “home” sphere (which must, on this logic, be attended to by someone else, usually a woman).

This is not to say that any use of a public/private distinction is illicit, nor that we may not, for certain purposes, distinguish between our private lives and our public or professional ones. It is, however, to insist that we take seriously the connections between the two, particularly where business ethics and policy are concerned – taking care, for example, to avoid practices that presume Ideal Workers whose lives in the workplace are abstracted or isolatable from their lives outside of it.

Domestic Labor and the Value of Women’s Work

Closely connected to the assumption of a clear demarcation between public life and private life is, as the previous section implies, the presumption that domestic labor, or labor done within the home, is not “work” as such. Indeed, the assumption that “the workplace” is fundamentally opposed to “the home” is rooted in the notion that labor done in the home is not labor at all. Typical domestic labor – such as cooking, cleaning, washing, caring for children – is still disproportionately done by women, even when both partners in a heterosexual relationship hold jobs outside the home ([9], p. 1134). As feminists have pointed out, while this situation results in a kind of “second shift” for many women, this work is not understood to be work, but instead simply “what moms (or wives) do.” This means both that women are disproportionately affected by changes to work/life integration policies, and also that women’s work is frequently assumed not to be as important, or as valuable, simply because it is done by or associated with women.

The gendered division of labor that results in (particular forms of) domestic work being reserved for women has additional effects in work outside the home. As Marina Prieto-Carrón points out, paid work outside the home often reflects gender divisions and hierarchies of “private” life, as “men occupy virtually all managerial positions in manufacturing, and the principle of gender divisions established in families is reproduced on the factory floor,” such that women are directed to lower-paying positions, based on “the belief that women are more suited to jobs that are similar to domestic skills at home” ([12], p. 6). This gendered division of labor in nondomestic work has significant consequences both for women’s career advancement and for their

earning potential: Once particular jobs become feminized or associated with women (i.e., secretarial work), they lose status, leading to lower wages ([16], p. 18).

There thus appears to be a kind of chicken-or-egg problem for women's work and domestic labor: Is women's work or domestic labor devalued because women are the ones doing it, or are women pushed into domestic labor and/or feminized jobs because these jobs are less valuable or lucrative? The answer to such a question is likely not straightforward. Further complicating this picture, moreover, is the fact that women of color do (and have done, for some time) a disproportionate amount of the world's domestic work, particularly in the industrialized first world. Because domestic workers – especially in the United States and Europe – are and historically have been overwhelmingly women of color [1], it is crucial to take seriously the extent to which particular forms of work are devalued or discounted in part because of the influence of racist and sexist oppression. Moreover, this oppression is so thoroughly pervasive that even well-meaning persons may remain ignorant of it without constant vigilance – as is evident in the too-frequent presumption that “working women” or “mothers working outside the home” is a new phenomenon. Women of color, as Angela Davis points out [1], have been working outside their homes (often caring for the homes of others) for hundreds of years, only to be ignored by mainstream feminist efforts to bring about better workplace policies on family leave. It is thus crucial to remember that the problem of work/life integration is not a new problem; nor is it a problem reserved for “professional” women.

Another important consideration, when approaching the question of women's work and work done in the home, is that labor done within the home is not limited to labor done for the family or domicile. Indeed, many rural and Third World women participate in global supply chains through work based in their homes [12], especially for the textile industry. While such arrangements for home-based work might have the appearance of fostering a well-integrated work/life relation, however, this is not necessarily the case. In practice, such arrangements can mean less safe working conditions and less job security for women who engage in it, since such arrangements are often excluded from the same Corporate Codes of Conduct adopted for factory-based work. This results in greater instability of income and even physical danger to many rural and Third World women, thus failing “to deal with deeply embedded structures of inequality, such as low wages and the segmentation of women into the lowest paid and more insecure jobs” ([12], p. 13). It is, then, important to stress that, if we are to adopt business practices in line with the goals of CEDAW, it is not enough to merely allow workplace arrangements that permit women to spend more time at home. Rather, the devaluation of women's work and the presumed public/private distinction must be addressed in more fundamental ways.

Corporate Social Responsibility and Care Ethics

Another important concern for a feminist approach to business ethics, which itself depends upon a troubling of the public/private distinction and a revaluation of labor typically thought of as “women's work,” is the ethical approach known as care

ethics. Care ethics is an approach to ethical philosophy pioneered by feminists, which is centrally concerned with rethinking the autonomous, isolated subject at the center of most theorizing about morality. Such abstracted figures are, according to feminist care ethics, at the heart of the majority of ethical and moral theory, and (at least in part) account for the centrality of the value of “justice” in these accounts. In contrast, advocates of care ethics suggest that this exclusive focus on justice as *the* virtue par excellence distracts from the development of the moral value of caring. Human beings, according to care ethicists such as Virginia Held, are fundamentally relational creatures, dependent upon others: “Every human being has been cared for as a child or would not be alive” ([5], p. 3). For this reason, ethical approaches that presume isolated, autonomous subjects as the agents of ethical living are unable to provide a rich picture of the good life, insofar as they cannot account for the “moral value and importance of relations of family and friendship,” or “the value of caring relations in such contexts as these” ([5], p. 12) and how those values can be encouraged or developed. Because persons only become ethical agents insofar as they have been cared for – as infants, as children, as students, and as dependent upon communities for their sustained existence – any ethical approach that does not recognize “care” as an indispensable human value is seriously remiss.

This insight of care ethics is important to take seriously from a business ethics perspective, particularly in light of the recently renewed interest in Corporate Social Responsibility. Because the outlook of CSR is interested not merely in compliance with the law, but also frequently in “address(ing) important social and economic issues” ([21], p. 458), CSR would, from a feminist perspective, involve instituting policies and practices that foster the virtue of caring in the community – or, minimally, do not inhibit the cultivation of this virtue by its members.

Unfortunately, however, many workplace policies inhibit the cultivation of care as a value in the way that care ethics would suggest. Indeed, as our discussion of the public/private distinction indicates, the Ideal Worker norm presupposed by many workplaces severely curtails the abilities of many people to engage in the kind of caring many feminists would advocate – and the cultural devaluation of caring leads care-related jobs to be among the lowest paying ([5], p. 109). Moreover, the negative implications of this fact are not limited to its effects on women, or care workers. As Joan Williams points out, dominant workplace policies, combined with a persistently gendered division of labor, result in a situation in which men are actually harmed by being deprived of the opportunity to cultivate this important aspect of their characters [20]. Though business practices are, of course, not the singular cause of this deprivation of men – the wider cultural intransigence of strictly delimited gender roles is surely at work – official policies can and do play a part. Williams points to a particularly dramatic example of this in “Knussman v. Maryland, in which a Maryland state trooper was told that he could not take parental leave after the birth of his child ‘unless [his] wife [was] in a coma or dead’” [19]. The widely held presumption that only one partner must be responsible for child care is, through such policies, enforced – with the result that conventional social arrangements, even those that may not be desirable, are rendered effectively obligatory.

Still, the reasons for many men's failure to cultivate the sort of characters that care ethics would encourage are complex. Ironically, as Katharine Silbaugh points out, "nothing has disserved men more than employment and educational discrimination in their favor (!)" [15]. A long history of wage discrimination, through which men have consistently been paid higher salaries for doing comparable work to women, even when men had fewer educational credentials, has given rise to a situation in which men are now more concerned with taking time off or changing jobs to accommodate the needs of their families. That is, sexist discrimination has meant that men have more to lose in altering their current careers, both in terms of wages, and in terms of job security – insofar as women now are statistically outpacing them in terms of education [15], and efforts to mitigate the effects of discrimination are now becoming more widespread. The point here is not to suggest that men are unfairly oppressed by being the beneficiaries of sexism, but instead to claim that our complex sets of social and business practices have wider-ranging effects than we may initially suspect, and to offer reasons for rethinking their value.

In short, if we take seriously the notion that Corporate Social Responsibility involves the imperative to implement business practices that are sustainable within the community, and minimally, do not harm a great number of its members, it is necessary to take seriously the claims of care ethics. As Gregory Guitián puts it, "CSR...should include work/family conciliation policies as a normal component of the social sustainability or social responsibility policy of the firm, in as much as they constitute a clear contribution to 'human ecology' of society in both short term and long term" ([4], p. 518).

Expanding the Notion of Family/Kinship

Much of the discussion of work/life integration policy, including (to a certain extent) this chapter, assumes a particular model of family life: a nuclear family headed by two parents – typically, a couple in a heterosexual marriage – with children. While this model is the overwhelmingly dominant one in many parts of the world (particularly for the privileged classes of the United States), assuming it when discussing work/life policy or the ethics of those policies can be extremely problematic. It is problematic both because many people in the world do not operate within such a strictly delimited nuclear family setup (living, instead, with some assortment of extended family members, several of whom may be responsible for tasks like child care and domestic labor), and because many other people live in families or kinship arrangements that are not structured by heterosexual marriage. Ignoring the existence of these non-normative living arrangements is a problem, moreover, not only because the ethical theorizing or policy making that results remains unable to deal with a significant segment of the human population, but also because this exclusion perpetuates the privileging of those in the dominant arrangement at the expense of persons in non-normative ones.

The reason for this (perhaps unintended) consequence is similar to one we encountered in the previous section – policies may often have the effect of sanctioning dominant social arrangements, thereby implicitly reinforcing their legitimacy over against the (tacit) illegitimacy of others. That is, should we understand the ethical problem of work/life integration to be primarily about providing parents time off to care for their children, and institute policies providing for this specifically, we “promote and encourage child rearing provided primarily by parents” ([13], p. 727). And while this may in fact be a good thing (though it is unclear that it is necessarily better than, say, the promotion of childcare by extended kinship networks, or the promotion of government-sponsored childcare by professionals), it also often has the additional consequence of lending legitimacy to the nuclear, heterosexual family model while leaving workers with other life models in the lurch. As Gowri Ramachandran rightly points out, if the right to take advantage of family leave policies applies “only to those workers who conform to traditional gender and family-structure norms – those whose obligations are to their children and spouses, as opposed to their siblings, grandchildren, close friends, domestic partners, or some broader group in need – then we will have transferred wealth from social nonconformists to social conformists” ([13], p. 728). Thus, it may not be enough, from a feminist viewpoint, to simply allow workers flexible schedules to care for their families, particularly when the dominant social model of “family” disadvantages so many people.

Particularly pressing, from a feminist perspective, are policies that explicitly restrict the familial or kinship relations eligible to receive benefits to those structured by heterosexual marriage or common-law relations. Because homosexual workers are not afforded the same legal protections as heterosexual workers in the vast majority of the world (insofar as only a handful of countries offer the legal benefits of marriage to homosexual persons, and firing, harassing, and sometimes even killing people on the basis of homosexuality remains legal in many locations), a feminist perspective on business ethics would demand that, at a minimum, benefits for fostering better work/life integration not exclude same-sex domestic partners. This could be accomplished, moreover, in ways that are in line with CEDAW’s directive to respect and value cultural differences: As Ramachandran points out, “a more universal type of benefit would help to remake the workplace” by including “a right to refuse overtime shifts, not only for child-care reasons, but for *any* reason; timeoff options that are available whether the person uses that time for family-related reasons or other reasons. . .” ([13], p. 731). While such a shift in policy would likely result in some increase in expenses, it is important to keep in mind that its benefits are crucial from a CSR perspective, insofar as it would contribute to greater inclusivity, as well as providing a way to work toward greater involvement in care by men.

The Importance of Fair Wages

A final consideration when approaching business ethics from a feminist perspective is the indispensability of fair wages for workers. As CEDAW suggests, full human

flourishing requires financial stability. Unfortunately, all too often, women's work is devalued – this is the case both in the lower valuation of labor typically done by women, and in a persistent wage gap, through which women are consistently paid less than their male counterparts for doing the same jobs [17]. As Susan Moller Okin [10] has pointed out, this financial disadvantage makes women uniquely vulnerable in multiple respects, insofar as it often makes them dependent upon men, and may even make it more difficult for them to leave abusive relationships. If a woman in such a relationship is unable to support herself or her children alone as a result of low wages, her options in the face of abuse (or even unhappy marriage) are quite few. Moreover, women who do not earn a sustainable living wage are at a significant disadvantage when it comes to their abilities to maintain good living conditions and to participate fully in public life, each of which CEDAW suggests are crucial to promote in order to achieve gender equality and women's human rights. Beyond the benefits that most saliently benefit women, however, fair wages promote better work/life integration for all workers, insofar as they improve living conditions and make workers' employment situations less precarious – thus addressing some of the care-related issues from our previous sections.

Of course, what constitutes a fair wage is an open question, and indeed a point of significant disagreement among feminists and business ethicists. On the one hand, theorists working from a Marxist perspective would suggest that no wage paid under a capitalist system is fair, insofar as capitalism requires, for its sustained existence, that workers are paid less than the value of the goods or services they produce. Because the capitalist's aim is to make a profit, he or she necessarily pays workers as little as possible, while charging as much as possible for the products resulting from their labor. And, because the capitalist owns the materials necessary for that production, workers who want to survive are faced with no choice but to work for whatever wage the capitalist(s) will pay –thus effectively consigned to the position of wage slavery [6]. On the other hand, theorists working in the liberal democratic tradition would suggest that there is nothing inherently unfair about differences in income or wage-dependence – though the majority of today's liberals would suggest that this does not mean that *every* distribution of wealth is equally fair. Following John Rawls' influential account, most liberals today would likely suggest that, for an income distribution to be fair in the moral sense, it would have to be of the sort that provides some minimum standard of living for those least well off, such that anyone who did not know her actual place in society could agree to its income distribution, bearing in mind the notion that she might in fact be among the least well off [14]. Because the vast majority of income disparity depends upon factors that are accidental and thus not morally relevant (we are not in control of many such factors, i.e., our intelligence, physical abilities, etc.), moral fairness of income distribution requires that anyone, regardless of situation, be able to agree to it. While this notion of fair wage is rather different than the one currently in place in most parts of the world today, it is also quite distinct from the Marxian notion of fairness.

Whatever our answer to the question of fair wages, it is crucial, from a feminist perspective, that policy changes aimed at making work/life integration more feasible must *not* be understood as a substitute for fair wages. That is, whether we believe that

fairness would require strictly equitable distribution or merely distribution to which we could all agree, even if not equitable, the fact remains that some minimum wage that provides from a sustainable living is necessary for upholding the tenets of CEDAW. Indeed, as Domenec Melé points out, “paying unjustly low wages is another way of violating family independence. . . If real pay is insufficient to bring up a family, then a basic right is trampled under foot which, to a large extent, conditions all the rest” ([7], p. 653).

The importance of fair wages suggests that some businesses’ methods of dealing with economic difficulties may be problematic from an ethical perspective. Specifically, some businesses have begun using flextime as a new feature of “total rewards” to compensate for stagnating wages during the economic downturn [3]. While the use of flextime is in a certain sense welcome, from a feminist perspective on work/life integration, there are legitimate reasons to be concerned about this practice. Most pressingly, if the feminist approach to business ethics and CSR is correct, such accommodations as flextime should not be understood as “special” benefits that would offset lower wages, but normative features of ethical business practice that should be available to all workers.

Conclusion

Ethical business practice and CSR in the case of work/life integration requires, from a feminist viewpoint, rethinking some major animating business concepts and changing our practices accordingly. They demand, specifically, a reimagining of the Ideal Worker and a willingness to recognize the linkages between public and private life, a recognition of the value of caring in the wider community and the importance of fostering such care, and a willingness to expand the dominant, restrictive notion of family life. They require, moreover, the change of corporate policies while still paying the kind of fair wages that allow for the life of flourishing that CEDAW recognizes as crucial for upholding women’s human rights.

Part 17

Free Markets, Morality and Business Ethics

Tibor R. Machan

Abstract

Let me offer just a few words about the relationship between morality and ethics. The two terms are often used interchangeably but there is a subtle, not unimportant difference in what they mean.

“Morality” refers to a system of *interpersonal* guidelines of human conduct, of how people ought to treat each other, what are their duties and obligations *to* each other. “Ethics” refer to a system of personal guidelines for adult human beings, answering the question “How ought I to act or conduct myself?” Ethics is more basic and comprehensive.

There are some interesting philosophical reasons for using these different terms and they have some substantive importance. With the emergence of morality in the modern era, in the works of such philosophers as Thomas Hobbes, there had been an understanding that concerning personal, private behavior, human beings will do what they are innately motivated to do, by their passions, drives, or instincts, so there is no reason to wonder how they *ought to act* because they *will act* as they must so as to fulfill these passions or instincts. Putting it another way, the *virtue* of prudence was relegated to an innate drive instead of being treated as a moral character trait in the modern philosophical era. What emerged in its stead was the profit *motive*.

Yet, when it comes to fields such as professional, including business, ethics, the issue is precisely how one ought to conduct oneself not only *vis-à-vis* others but in relation to one’s professional commitments. It is this topic that the rest of this chapter addresses.

Introduction

Ethics concerns how one ought to conduct oneself in life, with the basic standards of proper conduct, with how one ought to act. It assumes people need answers to this question because they lack instincts or hardwiring to guide them as other living beings do.

Business ethics is about how to do the right thing as one carries out business objectives, as one practices one's profession of "wheeling and dealing." Other fields like medicine, engineering, farming, the arts, sciences, etc., also have special questions about how to pursue their own objectives. All these rest on the idea that we have no innate knowledge about how to do the right thing.

Business faces the additional problem of having a bad reputation. Indeed, in some societies practicing business is a crime but in many, including those in the West, doing business tends to be demeaned, morally, not like working in education or science or the arts.

Is this view correct? Is business inherently morally defective or corrupt? Business ethics assume that it is not. So the issue of how to do the right thing and avoid doing the wrong is very germane for business professionals. The moral principle supporting business is prudence, taking reasonable care of oneself in life, including economically. Business is the profession that emerges from this, just as medicine emerges from the prudential care for one's health – health care and wealth care, one might say.¹

On the Assumptions Underlying Ethics

Ethics assumes that we have free will and that there are stable enough standards of right conduct. Both are controversial. The first is doubted mainly because it looks like science rules out free will; because the law of causality makes everything predictable, because we cannot detect free will with the use of our senses; because if God knows all, He surely knows what we will do; and because free will seems odd compared to the rest of nature.

In response to the first set of doubts it can be pointed out that (1) science, contrary to the skeptic's view, may not *impose* requirements on what exists in the world. Science has the task of discovering and identifying what exists and if it turns out that free will exists, science may not say "That cannot be?" Metaphysics can – "no contradictions can exist" – but science is to report and examine, not set limits or rule out. Also, (2) the law of causality is universal, that is true (just as metaphysics would hold) but what *kind of causes* can exist depends upon what *kind of beings* there are. And if a being can cause its own behavior or conduct, this would mean there could be *agent causality* (not simply *mechanical causality*). There is prima facie evidence of agent causality – one knows about oneself that one causes things to happen or not happen. And even in the animal world, there appears to be causation by animal agents – beavers build dams, for example, bees construct hives, etc. (3) As to whether free will can be observed, here it needs to be noted that not

everything known to exist is known by observation – an example is black holes, which absorb all light that would make them observable, yet we know they exist by *inferring* their existence from surrounding evidence. This is, also, how people's intentions, motives, feelings, pains, etc., are known, not by direct observation, and this is how free will might be known (its existence is inferred from other things we know, such as the immense human diversity we see around the world and in history). (4) God's knowledge, in turn, is not like yours and mine, so when one says, "God knows what you will do," this is by no means something straightforwardly clear. It is, rather, very likely to be mysterious. So, not much can be inferred from it about free will. Finally, (5) there is also the fact that there are myriads of things and types of things in nature, a great variety of them, so something with free will would not be all that strange, given that moving from the simplest to the more complex entities there emerge things with quite unusual attributes. Free will would just be one more of the vast variety of them.

The above suggests that free will may be *possible* – so moral responsibility *could* exist – but why believe that it *does* exist?

First and most importantly, knowledge is impossible without free will – without the human mind being unconstrained, unprejudiced, and independent as one seeks to understand the world. This is why juries and scientific researchers, among others, can be trusted yet there is no guarantee they will be right.

Second, there is the determinist's dilemma: In advocating determinism, the determinist assumes others have free will and so can change their minds based on thinking through his arguments. Also, third, introspection is often trusted, so when one introspects – recalls by self-examination or memory – one's having freely made decisions, choices, and so forth, this supports the idea that one has free will enabling one to frequently act as one will.

Finally, scientists – some psychophysicists and neuroscientists, for example – have shown that the higher human brain – the cortex – enables one to exercise self-control, self-governance, or self-determination (sovereignty), which accounts for why we can restrain and discipline ourselves in the face of objectionable inclinations, desires, impulses, etc. So, free will seems quite plausible. When the cortex is damaged, impulsiveness goes unrestrained.

The second assumption, that stable and lasting – "universal" – ethical or moral standards exist, is doubted because (1) ethical claims seem not to be verifiable, provable; because (2) one cannot deduce a moral claim from factual claims; because (3) there seem to be endless different ethical systems; and because, (4) again it is odd that human beings would be the only ones with a developed moral nature.

The brief response to these skeptical objections goes as follows: (1) As to moral standards, knowing what is right and wrong is not exactly like knowing things like there is a tree there or a car just turned the corner; it is like medicine – it requires a theory of what is the human good (as in what is good health) and then inferring what are good actions and what are bad ones; (2) when we reach moral conclusions via reasoning, we are not engaged in deduction but induction or inferences, so the same rules do not apply – in fact, in all practical fields we do this, as in medicine or

engineering, reach conclusions on the basis of theories; (3) the great variety of moral opinions concern details, specific ways of acting in different circumstances, but there could well be basic principles that apply to all human beings just because they are human (like “Pay attention”); finally, (4) as with free will, morality may well be (nearly) unique to human life – and, after all, there is much that is only found in human life, such as science, marriage, culture, art, criminal procedures, etc.

Let me add to this discussion of the assumption of free will as necessary for a *bona fide* moral life that this is also one major reason for supporting a classical liberal/libertarian polity and free market economy. Without a sphere of personal authority in one’s life, one cannot conduct oneself in morally significant ways. Initiative is necessary for ethics – those who are not free to choose cannot be or be held responsible for what they do; they cannot reasonably be praised or blamed, other than in the fashion of being egged on or discouraged, the way animals are prodded by their trainers. Here is the most fundamental source of the human requirement for freedom.

Assumptions of Business Ethics and Ethical Theories

As noted before, there are also two assumptions that underlie business and business ethics as such: (1) the right to private property and (2) the moral virtue of prudence (of looking out for oneself and one’s loved ones). Business ethics – in its most developed, unsullied version – presupposes a free marketplace wherein commercial and business life is conducted by free human beings.

Commercial and business endeavors, from the simplest to the most complex, are part of what human beings may undertake on their own initiative, as sovereign agents whose actions are not subjugated by others (monarchs, majorities, parliaments, etc.) but flow from their own judgments and may only be interfered with when they violate the rights of others.

This is the condition of a community wherein business may be carried out freely instead of being directed from above by supposedly superior governors. (It is a peculiar idea, from this perspective, that some men and women ought to have the authority to, for example, legally impose regulations on the business conduct of other men and women – it assumes, misguidedly, that the former are innately more ethical or virtuous and knowledgeable. Only if it has been proven that a crime has been committed may government interfere with business conduct. More about this in the discussion of government regulation of business and other professions.)

1. *The right to private property.* For business to exist as a practice or institution in a society, individuals in that society have to be free to own, acquire, part with, exchange, give away their resources, etc., including their time, skills, and labor (or even what they have come to buy through sheer good fortune). If this were not the case, business or commerce could not transpire. This is controversial because many object to ownership by individuals. Many believe only the public or government can own things – varieties of communists and socialists hold this

view. Commerce or business, to the extent there is any of it in such societies, amounts to acting with the permission of the people or government to, as it were, feign a market process, a permission that may be revoked anytime. In a commercial or business society, however, one takes part in the exchange system as a matter of a basic right, the right of ownership.

2. *The virtue of prudence.* Prudence is the moral or ethical virtue that requires one to take decent care of oneself. Insofar as one is a natural, living being, this means one ought to prosper to some extent. Commerce or business (the professional arm of commerce) is an ethically decent undertaking because it is prudent for a living human being to make good deals when the opportunity for them arises – it promotes one’s prosperity. This, too, is controversial because many object that attempting to prosper distracts from more lofty (important or noble) undertakings, such as preparing for the afterlife with prayer and penance. If these people are right, seeking prosperity could be sinful, morally wrong. (As we well know, there are those who renounce commerce or business to the point of physically attacking those who are engaged in it, e.g., those who worked in the World Trade Center on September 11, 2001, reportedly on the grounds that they were being materialistic.)

Before proceeding to the discussion of business ethics topics, here is a brief outline of prominent and contending ethical systems. These have been in competition, as it were, from time immemorial and continue to be offered to us as candidates for answering the basic question of ethics, namely, “How ought I to act?”

1. Ethical hedonism is the view that everyone ought to seek to obtain as much physical pleasure in life as possible. This has appeal because physical pleasure is an easily recognized value, something that we can all accept as good, so it is easily verified, and that in turn makes it appeal to the scientific mentality that is so widespread in our age. (Jeremy Bentham is a most prominent ethical hedonist.)
2. Utilitarianism is the view that everyone ought to seek to promote the greatest happiness of the greatest number of (i.e., most) mainly people but perhaps animals, too. Two types of utilitarianism have been advocated – act and rule – but only rule utilitarianism is popular. It requires that one identify a set of rules or principles to guide one’s conduct, with the goal of promoting the greatest happiness of the greatest number (which is often referred to as the public or common or humanity’s interest or welfare). (John Stuart Mill is the most prominent defender of utilitarianism.)
3. Altruists hold that we ought to advance the well-being of others first and foremost – mainly other people but perhaps also animals. Two versions have been advocated – subjective and objective altruism. The first identifies what will benefit someone by reference to that person’s desires or preferences, the second by reference to various facts about the person. (Auguste Comte is a famous advocate of altruism.)
4. Ethical egoism is the view that we ought all to promote our own well-being, first and foremost. Some egoists are subjectivists, others objectivists – the first, as with altruism, identify what is good for oneself by reference to one’s desires or

preferences, the second by reference to one's thorough knowledge of oneself, one's needs, talents, and anything else important. (Max Stirner is a famous subjective ethical egoist and Ayn Rand is well known as an objective ethical egoist.)

Some less prominent schools of ethics include Stoicism, asceticism, the various religious schools of ethics, and so on. Stoics promote detachment as the way to live, the ethics of self-denial, etc.

Subjectivism, Relativism, and Consistency

As a part of a discussion of the moral responsibility of business managers, we need to briefly ask whether ethical subjectivism and relativism be compatible with ethical judgments about the conduct of business professionals. Why and why not? What implications are there of ethical subjectivism and relativism?

Basically, ethics cannot be subjective or relative all the way down, as it were, for then, of course, unethical conduct would simply be conduct that differs from what many support. Crime too assumes some firm, universal standards of proper interpersonal standards of conduct.

Also, as a last preliminary matter, is being inconsistent or contradicting oneself about right versus wrong a problem? Is there anything really wrong with it? Why or why not? How does this relate to a prominent issue of our time, multiculturalism?

Essentially, the answer is that there are certain basic principles bearing on how adult human beings ought to act, simply by virtue of their common humanity, throughout history and the globe. These promise to provide the foundations of ethics and professional (such as business) ethics, although once serious differences emerge within human communities, differences will also become evident in how people should conduct themselves – fathers versus bachelors, parents versus grand-parents, farmers versus engineers, artists versus scientists, for example, may find that different subsidiary principles will guide their proper conduct.

No decision is going to be defended here as to which ethical system is the right one for people to follow. However, it is evident that a version of ethical egoism or eudemonism is most hospitable to the institutions of commerce and business. Unless prudence is indeed a moral virtue, areas such as medicine, business, nutrition, and the like could not have moral standing, for each is focused on improving life for human beings.

A Selection of Business Ethics Topics

I will consider a few select areas of human economic life and explore what are morally proper ways of guiding them. For now, all that can be done is to see how common sense morality would help with understanding these areas. A detailed discussion would have to include a determination of which ethical system should be the ultimate guide for ethical human conduct.

Ethical Elements of Employment

The employment relationship exhibits the assumptions on which business ethics rests by (1) every prospective employee owns his or her own labor (skill and time) and every prospective employer owns the resource from which to pay employees; and (2) each normally strives to enhance his or her own lot through the relationship. The first shows the right to private property, the second the motivation of prudence.

How can employment go wrong? Remember it is undertaken and involves a commitment or promise to achieve a purpose, namely, to enhance the value of the enterprise (to make it profitable, to have it prosper) through some craft, profession, or service (making cars, selling real estate, fixing tires, helping someone with psychological problems, curing a disease, etc.). Thus, the call for applicants is for these purposes – make a profit by way of a skill. And acceptance of a job also involves this.

If this call is betrayed by invoking some irrelevant criteria on either side – race, national background, gender, sexual orientation, age, height, etc. – the relationship is corrupted. Nepotism, for example, is trade that aims to enhance family members' welfare because they are family members, not because they are fitted to do the job well, so it is (usually) a violation of business ethics. Sexism, racism, and other kinds of discrimination qualify as well.

There can be reasons, however, why some normally irrelevant considerations would be justified – as when a family obligation overrides business goals (usually in privately owned firms, not in publicly held companies, since the discretionary authority does not ordinarily, unless called for in a stockholders' election, exist in the latter).

Special workers' rights, a type of positive rights, are grounded on the belief that workers as a class are vulnerable to exploitation in the marketplace, that they lack bargaining power.

All human beings have basic, negative rights – for example, to life, liberty, the pursuit of happiness, property, and so forth. These are what the US Declaration of Independence lists, as well as the Bill of Rights. They are negative in that they prohibit people from intruding upon others. Murder, robbery, kidnapping, assault, and similar crimes involve violation of these basic negative individual rights. Government is supposed to secure or protect these rights for all citizens.

Positive rights are entitlements to being provided with resources or services, such as the right to education, health care, unemployment compensation, a minimum wage, health and safety provisions at work, and so on. They rest on the view that all persons in need are owed some support from others and government must secure this support.

Because working people are supposed to lack bargaining power – they lack wealth that enables them to call the shots in dealing with employers – it is argued they have these positive special workers' rights.

It is often noted that negative and positive rights coexists uneasily because to respect and protect the former the latter must be sacrificed, or vice versa. It is also argued that their coexistence undermines the rule of law because judges or

bureaucrats must decide which of the two kinds of rights deserve more vigilant protection. The rule of law is the idea that some set of principles, not judges or bureaucrats, would help in deciding the law.

Advertising

To advertise is to promote goods and services in impersonal ways, with the aid of gimmicks and other attention-getting devices. The idea is that without such promotion one's works would not come to the attention of potential trading partners. So, it is prudent to advertise.

Ads contain but do not focus on disseminating or spreading information. So, it is wrong to criticize ads for failing to tell the whole truth – all the truth customers can use. Customers need to obtain the information that will enable them to make prudent purchases.

Ads can go wrong by relying on stereotyping, being offensive, being tasteless, or simply failing to be effective. While ads are not about providing information, if they contain factual claims, these must be true. But they can contain much embellishment, ornament, humor, and such so as to call attention to what one has to offer. Ads are, in essence, part of trying to make a living for those whose wares they promote. (Even junk mail or telemarketing should be so understood.)

A criticism of ads is that they create desires in us that we then must satisfy and doing so leads to dependence on the producers (JK Galbraith, Vance Packard), so they are instruments of exploitation and manipulation. This view calls into question the sovereignty of consumers; it treats impulse buying as the norm, not a consumer failing but something one cannot resist engaging in. In response, it can be argued that ads do create desires but we are capable of governing our desires; we can choose to resist them, channel them, etc. (FA Hayek). This debate calls to mind the earlier-covered dispute between determinists and advocates of free will.

Moral Responsibility of Corporate Managers

Two major theories about the moral responsibility of corporate managers dominate business ethics discussions – shareholder and stakeholder. The former states shareholders hire managers of the firms in which they own a share or have an investment and these managers owe it to them to manage the firm in a profitable way, the make it prosper. The latter states corporate managers are morally responsible to advance the well-being of all who may be affected by the management of the corporation.

Another version of this dispute involves three theories – that of Milton Friedman, of Ralph Nader, and of Miller-Ahrens-Machan. Friedman advances the exclusivist position – company managers should focus solely on the bottom line, make the firm profitable, period, nothing else (within the rules of the game). Otherwise they get involved in matters that should be dealt with by the

public authorities (what public projects to support, etc.). Nader holds that since corporations were originally created by the government (the king or royal court), they are arms of public policy and now this means economic democracy, with managers doing what the majority of voters want them to do. Miller-Ahrens-Machan argue that the primary obligation of managers is to make the firm profitable and once that has been addressed, there can be other matters with which managers should also be concerned – the quality of the community, employee satisfaction, the arts and sciences, the environment, and what have you. This is the view that profit should dominate but not be the exclusive concern of business managers.

Depending on which of these views is right, different policies follow for various, more particular issues, such as insider trading, hostile takeovers, outsourcing, and so forth.

Corporate Governance: Stakeholder Versus Shareholder Ways

Three issues that are prominent in discussions of corporate governance are (1) hostile takeovers, (2) outsourcing, and (3) insider trading.

Hostile takeovers involve a group of aspiring managers offering to unseat current managers by offering shareholders greater value (improving earnings, generally managing the firm more successfully, etc.). It is deemed hostile because current management tends to oppose the effort. But it could also be viewed as friendly, at least to shareholders. Local authorities often oppose such takeover attempts because they could involve relocating the firm, etc.

The policy of outsourcing involves obtaining labor from places where it is less expensive than around the existing workplace – such as India, Pakistan, and South Korea – so as to reduce cost and improve profits. Stakeholder theorists object this too on the grounds that the bottom line should not be the main consideration in management decisions.

Insider trading involves making use of information about companies that have not been made public (although they need not have been obtained wrongfully). Objections to such trade rest on the belief that it is unfair, yet so are journalistic scoops that are, in contrast, usually praised and rewarded. Sometimes special organizations, such as the New York Stock Exchange, will ban insider trading, but there may not be any general ethical justification for the ban; it is only that the organization deems it to be a good policy.

Government Regulations

Two legal principles give federal government regulation of business legal justification in the USA. They are the interstate commerce clause and the police power of government. It is possible, however, that they are not consistent with business ethics since they may depend on a legal tradition that is morally and politically problematic.

There are four *ethical* arguments for government regulation: the creature of the state argument, advanced by Ralph Nader and his followers; two types of market failure argument invoked by, among others, John Stuart Mill and John Kenneth Galbraith; positive rights to provisions argument advanced by such political philosophers as Alan Gewirth and John Rawls, and the judicial inefficiency argument proposed by the Nobel Laureate economists Kenneth J. Arrow.

Creature of the state: The first argument states that corporate commerce is a creature of government itself – it was brought into existence by acts of the British mercantilist government so as to enhance the wealth of the country. Since government created them, it is authorized to and indeed ought to regulate them to accord with the public purpose. Clearly, morally, if one has created something, one is responsible for it and may do with it what is reasonable, responsible.

Market failures: Although the free market is generally a good provider of goods and services, sometimes it is inefficient. For example, this happens when public services, such as the provision of electricity or water, are involved. There competition involves duplication and, thus, inefficiency in the use of resources. So companies should be made into monopolies or taken over by the state. Throughout the world, this view has led to the abolition of free markets in some industries and the institution of extensive government regulation of prices, wages, labor relations, etc.

Others have gone further and said government must correct the unwillingness or inability of markets to provide certain values – for example, public libraries, which the market will not furnish. Government regulation, then, is but the legitimate effort of a government to remedy what the market ought to but fails to achieve. We know what these are through the vote. The underlying idea here is utilitarianism – the central obligation of the state is to secure the greatest happiness of the greatest number and when the market fails to achieve this, government must step in with its remedial regulatory policies.

The positive rights argument: Some hold that we have basic human rights not only to not be killed, assaulted, or robbed (i.e., to life, liberty, and property) but also to be provided with various goods and services from other persons around us. The positive rights to health care, social security, public education, unemployment compensation, or safety and health protection at the workplace are examples. Government is established among us to secure all these rights, and government regulation must be instituted so as to adjust private endeavors so that these provisions will be forthcoming. The argument is really dependent for its force on the theory of positive rights.

Judicial inefficiency: Some social problems that privatization cannot solve, namely, some kinds of pollution. When A pollutes the air mass and B suffers as a result of this, neither can A find B so as to secure permission, nor B find A to launch lawsuit. So, there is neither a market nor a judicial solution available to the parties. Ergo, government must take over and regulate the sphere of judicial inefficient human endeavors. (This is not so much an argument for government regulation of business as one for government administration of what some view as unavoidably public spheres.)

There are certain reasons why government regulation of business – or anything else that is peaceful – is objectionable, including the very likely incompetence of regulators, the regulators' usually close link to the regulated, the delay of products reaching the market (e.g., in medicine), and the often overlooked public choice issue (which shows regulators to be interested mainly in pursuing their own agendas and not the public interest which is, in any case, very elusive; but the most severe objection comes from jurisprudence).

In the classical liberal tradition of jurisprudence, where one is deemed *not guilty* and thus not subject to penalties or punishment unless one has been convicted via due process of law, any imposition of burdens on suspects or the accused amounts to *prior restraint*. This is unjust since it subjects such individuals to burdens they have not been shown to deserve and amounts to ruling or governing them without their consent.

So then, by the standards of a *bona fide* free society, government regulations are unjustified and impermissible, whereas regulations established by private sector agencies, such as insurance companies – that may, for instance, prohibit walking up at drive-up bank windows for their clients – is entirely legitimate. By this line of reasoning, government regulations of commerce are impermissible while setting standards of professional practices via the private sector are not. (The topic is discussed in detail in [4]).

Business Abroad

Doing business in cultures other than one's own poses the problem of whether the same basic ethical principles apply. Since, however, every culture, however different, is populated by human beings, some *basic* ethical principles would indeed apply (if ethics is in fact an aspect of human life). For example, forced labor is unethical and should be illegal anywhere.)

Business ethics derives from some such basic principle(s). If business is being conducted in any culture, ethics will require certain types of conduct and forbid others from all business professionals and those engaged in commerce. Yet, there will also be special requirements based on the cultural characteristics that prevail.

Basically, in no circumstances may people in business engage in the violation of human rights – especially the right of free association or freedom of trade (something that would involve relying on conscripted labor, stolen property, etc.). Less basic principles of business ethics may vary from culture to culture – based on, for example, the prevailing religious practices or economic conditions (e.g., widespread veganism would cancel business in meat, severe poverty may make child labor permissible). If firms do business with other firms – or governments – that do violate basic human rights, they would escape guilt only by providing some kind of support for abolishing the institutions and practices (e.g., slavery, apartheid, conscription) that violate these basic rights.

Friendship and Commercial Life

In many academic institutions, you will find professors of this and that proclaiming that commerce is a dehumanizing institution. It makes people treat one another as objects or, at most, as means to various ends, not as full persons.

The doctrine is called “commodification” – making people into commodities, things for nothing other than to be purchased. The charge is that in a fully capitalist, free market society, the system would encourage everyone to treat all others as a mere useful product, like one’s chair or automotive tires. For this reason, the argument goes – and it had got its biggest boost from Karl Marx, in the nineteenth century, when he took capitalism to task very influentially for doing all kinds of nasty things to people – the free market, with its capitalist economic system, is not really good for human beings at all. But it is something conservative critics also maintain, e.g., Richard Weaver.

At first sight this may sound like a credible point to make against capitalism. When you go to the grocery store, for example, you tend to treat the cashier or the manager as no more than means to your ends of walking out of the place with what you need at home. You do not much socialize with these people, not at least initially. They are just functionaries to you. If they were machines and could do what you need from them, that would be perfectly fine. Or so it can seem, from a superficial examination of what happens in markets. Your broker, doctor, auto-mechanic, shoe repairer, and the rest, they are not your personal friends. They are instruments used to satisfy important needs of yours but they could easily be replaced with someone else or some tool. (Nowadays, you can even check out by using auto-scanners, with no need for a person at all.)

Trouble is that to focus on this element of the market – that it is mostly impersonal on a certain level – betrays a narrow vision. As if people would leave it at that, except in the most unusual circumstances, for example, when they are in a hurry and need to get done with shopping as fast as possible. But normally that is not how it is at all.

Thus, Neera K. Badhwar argues instead – in her “Friendship and Commercial Societies,” *Politics, Philosophy, and Economics*, August 2008, V. 7, No. 3, 301–326 – that commerce is actually where much of our intimate social life gets its start. And anyone can check this out easily enough.

Just consider that wherever one works, one has colleagues with whom one has near-fraternal relationships. In fact, sometimes places of work become virtual “homes away from home,” where people not only meet and talk and grow close but get involved quite seriously in each other’s lives. Kids are discussed, as are spouses and extended families. Close friendships, or at least palships, develop frequently. Some colleagues become lovers and in time even marry.

The myth that market transactions are impersonal is just that, a myth, and it comes from shallow, superficial reflection on what goes on in markets. It may be no accident that the idea is so popular in the academy, where there is often a kind of isolation among faculty, with few becoming close with one another, although there

is enough exception to this that it should raise doubts in the minds of those who spread the myth. Even down at the grocery store, or the pet shop or car dealer, customers and vendors frequently depart from their initial reason for coming together and start discussing sports, ethnic food, music, or family troubles. And from that now and then full-blown, genuine friendships emerge. What the critics do not appreciate is how well people can multitask in life, that while they do business they can also address the arts, sciences, education, family affairs, and the rest.

Karl Marx was wrong – the free market is by no means only what he called “a cash nexus,” wherein everyone thinks only of the bottom line. That is because it would be entirely unnatural for human beings to be that way and because the bottom line is itself a *bona fide* human concern.

Political Economies Very Briefly

From the particulars of the several areas of business ethics it is important to move to a consideration of the broader area of political economy, the general framework of socioeconomic affairs in human communities. We will here take a brief look at several such frameworks.

Feudalism

The feudal system involves a hierarchical social structure, usually with a monarch or other supreme ruler, or family, in charge, and various layers of nobility in gradually descending order of importance, with the serfs or people of equivalent position comprising the bottom. It was the predominant type of order of Europe and, indeed, much of the world, and many of the legal features of contemporary societies can be traced to it (e.g., the police power).

This system of political economy derives largely from historical events and certain prominent ideas advanced in various philosophical and theological systems, including the notion that some people are naturally or by divine edict superior in moral and other respects to the rest and ought, therefore, to have a paternalistic relationship to them. A form of elitism – the entrenched superiority and often rule of the select few – is usually at the center of the feudal ideal, including aristocracy (although since this means the rule of the best, there is some ambiguity about whether it can support anything that is entrenched, static, since who the best are could change drastically over time).

In a feudal system the royal family usually directs, from above, the major social institutions – commerce, religion, the arts, property holdings, and professional positions. Accordingly, the economic system of *mercantilism* is closely linked to feudalism, as is the institution of a state church. (Although, often the prevailing church authorities can be separated from the state and this can give rise to complex dilemmas of spiritual and political leadership.)

It is fair to say that the idea of a constitution arose, in part, in opposition to feudal rule, so we will consider it next.

Constitutionalism

The term “constitution” derives from “to constitute.” This means “to be the basic structure for something.” Constitutionalism could be connected with a monarchy or with a democracy. (A parliamentary system is also a form of partly decentralized rule by council via the participation of political representatives from various regions of a country.) Usually, constitutions will list basic principles of decision making and of the limits of power or authority of the governing administration. In the USA, for example, the federal constitution has within it a Bill of Rights that provides a list of limits on the government’s authority and scope.

Such a system is usually recommended because of the predictability of the rules that govern the lives of people within a given geographical area. Yet, since there is no way to predict for the long range what problems will face people, the constitution usually needs to be interpreted to apply to topics that were not in evidence when it was originally drafted. A great deal of controversy surrounds just how this process should be implemented. The USA has the system of judicial review. If the legislatures or other law-making bodies proposed policies that some see to be in conflict with the constitution, the matter can be brought to the attention, ultimately, of the US Supreme Court and a judgment could then be forthcoming as to whether this measure accords with or violates the constitution – whether it is legal.

Another source of controversy about constitutionalism is whether it is ultimately democratic, whether it does justice to the idea that government must be by the people. A constitution projects the ideas of the drafters or framers way into the future, past their own lives and citizenship.

Socialism

Socialism is actually a system focused on the nature of human life as a whole. Socialists see the human being as part of a large whole, society, or even humanity. As Marx claimed, “the human essence is the true collectivity of man,” meaning that a human being is a specie being, the kind that is fully aware of belonging to “the organic body” of humanity.

The stress in socialism is laid on the health of society or humanity as a whole, although this cannot be separated from the well-being of the constituent parts, namely, the individual human beings who compose society or the species.

What in particular needs to characterize a good or just human community is cooperation, as opposed to competition or rivalry, in all realms of life – economic, scientific, political, and athletic. In that most important realm, the economic, socialism proposes the collectivization of the administration of all production and distribution of value (although such administration does not preclude subjecting some spheres of economic life to limited competition, a policy that is dubbed “market socialism”). So while socialists do not necessarily embrace the idea of central microeconomic management and planning, they do favor the supervision of society’s economic affairs from the viewpoint of the public at large with private initiative taking a subservient role.

Socialism can take several forms. Some claim that at least at the beginning of a socialist society there must be central planning by those who understand the need

for socialism, helping thereby to upgrade those who are lagging behind in their awareness of this need. Some would want a more democratic socialism whereby members of the community set priorities for the whole, in a kind of ongoing conversation about the priorities. Some others, as already suggested, see only a limited need for socialization of economic and other matters, albeit one that is vital (mostly as far as the satisfaction of basic human needs is concerned).

Just like human language, so human life in general is to be seen as a social process and the idea that we can make a significant difference to our lives as individuals is just as much of a mistake as the idea that we can invent our own language. That is perhaps one of the key reasons for claiming that socialism is the proper form of human social life.

Communism

In general, communism is a system of sharing whatever is of value among members of human communities, with no private life or individual ownership in play. In Karl Marx's version, communism is the final, mature stage of humanity's development, when all will have been fully emancipated. (History is the process of humanity's development toward its maturity, with earlier systems, such as tribalism, feudalism, capitalism, and socialism as developmental stages.)

In communism there will have emerged a "new man," one that has overcome the drive of selfishness and has embraced a full public spiritedness whereby love of all is the norm and work is always for the love of it, never for private gain. Government will have become moot, unnecessary, other than for minor administrative purposes.

Fascism

This form of government relies on inspired or charismatic leadership. It has no theoretical base, no framework other than the idea that some may be invested with enormous trust to lead a society to success. Fascists have been socialists, capitalists, welfare statists, communitarians, and the like – there is no necessary link between fascism and any of these political economics systems. What does matter is that someone of great insight and fortitude lead the society akin to how a captain leads a team or military unit.

Capitalism

This is the economic system in which the institution of the right to private property – that is, for any individual or any group of them, to own anything of value (not, of course, other human beings, who are themselves owners) – is officially protected.

There is dispute about the label, mostly because its definition is often a precondition of having either a favorable or unfavorable view of the system. Put differently, "capitalism" is the term used to mean that feature of a human community whereby citizens are understood to have the basic right to make their own (more or less wise or prudent) decisions concerning what they will do with their labor and property, whether they will engage in trade with one another involving nearly anything they may value or spend their lives withdrawn from the marketplace.

Thus, capitalism includes freedom of trade and contract, the free movement of labor, protection of property rights against criminal and foreign aggression as well as government intervention, as well as the freedom to abstain from market transactions (John Locke, Adam Smith, M. Friedman, F. A. Hayek, and Ayn Rand).

Welfare Statism

The welfare state or, from the economic viewpoint, the mixed economy, may be understood as a combination of the principles of capitalism and socialism. Sometimes the emphasis in this system is placed not so much on economic as on certain moral considerations. Basically, the welfare state consists of a legal system that aims at securing for everyone the negative right to liberty and the positive right to well-being.

The welfare state balances the two values that together seem to its advocates to be the bedrock of a civilized society. No one ought to have his or her sovereignty seriously compromised; nor should anyone be permitted to fall below a certain standard of living.

This idea is difficult to uphold because at different times one or another of these objectives will probably take priority and in mostly democratic systems political leaders will vacillate between giving more support to one or the other. The right to strike, for example, which is the negative liberty to quit one's job in an effort to gain respect for one's terms of employment, may conflict with the positive right to be provided with various services, for example, health care, mail delivery, or education.

It is indeed a prominent feature of the welfare state that both (what are referred to as) negative and positive rights receive legal protection. Negative rights involve respect for a person's life, liberty, and property, that is, everyone is by law supposed to abstain from interfering with these. Positive rights in turn involve respect for a person's basic needs, that is, everyone who is unable to secure the requirements of survival and even flourishing is supposed to have those provided by way of the appropriate public policy (e.g., taxation, mandated services, public education, national health care). (Negative rights were the subject matter of John Locke's political philosophy, while positive rights were the concern of T. H. Green, among others.)

The moral underpinnings of the welfare state can be utilitarianism, altruism, or certain intuitively held moral precepts. Utilitarianism requires that all pursue the general welfare, and whatever public policies to facilitate this were needed would be justified. Although many utilitarians believe that the general welfare is best achieved in a largely laissez-faire system, they do not oppose government intervention if without it many in a society may fail to achieve a decent and prosperous form of life (see, e.g., Keynes). Altruists often hold that to make certain that people fulfill their primary obligation to help others, it is necessary to introduce public measures so as to secure such help. Finally, there is the claim that by our common intuitions it is evident that both a measure of personal liberty and social welfare must be guaranteed to all, lest the quality of life in society fall below what it should be.

While people object to the welfare state from several other perspectives, its supporters regard it as the most stable modern political orders. Although it is characterized by much dispute and controversy, in the long run, its supporters maintain, the system seems to be overall satisfactory and just (John Rawls, James P. Sterba).

Communitarianism

Communitarianism is positioned between the collectivist system of socialism and the individualist one of capitalism. Roughly, it rests on the view that human beings are necessarily or essentially parts of distinct human groups, communities, with their diverse values, histories, priorities, practices, laws, cultures, etc.

Some communities can be Spartan, others Stoic, yet others bohemian and so forth. Each can have its peculiar way of life without implying any objective condemnation of some alternative form. Yet, participation in the community's form of life is not a matter of individual consent.

Communitarians often unite in their criticism of bourgeois society or liberal capitalism because of the emphasis in these latter on individuality, privacy, personal freedom, consent, competition, etc. Communitarians believe that the view of human nature underlying such liberal capitalist views is seriously flawed. They are convinced also that the central idea of liberal capitalism is what has come to be known as *homo economicus* or "economic man." That idea figures heavily in economic analysis and views individuals as autonomous entities who enter the world fully formed, ready to make choices in the market, and self-sufficient. While there are other conceptions of the human individual that might support liberal capitalism, it is this that has occupied the attention of communitarians and it is in contrast to this view that they have advanced their position (C. Taylor, M. Sandel).

Conclusion

Business ethics is possible in the Western semi-capitalist economic context because the profession of business itself is mostly welcome in the type of legal infrastructure that developed societies possess, ones wherein private property rights and free trade are reasonably secure. But this claim needs to be qualified.

Nowadays, because of numerous precautionary government restrictions, people in the commercial sphere lack full sovereignty. For example, governments prohibit buying or selling labor at a price cheaper than the minimum wage, even if an upstart company requires cheap labor to enter the market at all. The terms of trade between willing parties have thus been coercively constrained by a third party. The government has restrained trade even though the traders have done no wrong, have committed no crime, nor been identified as likely to do as (as clear and present dangers to the peace). (What public policy justification may be offered in support of such restraint of trade is irrelevant here. That issue belongs within debates about political economic systems.)

There are lots of impediments to free enterprise even in the developed nations, arguably the freest in the history of the world. In various parts of the globe, once one is hired, the employer becomes legally obligated to take care of one's security for just about the rest of one's life. That is one reason that unemployment is unusually high in such regions. It is much more expensive and risky for entrepreneurs to hire under the burden of such an involuntary open-ended liability; they know they will be legally unable to lay off employees even when economic pressures would rationally require that they do so. One cannot make a rational business decision in such a situation. Given people's changing

preferences, innovations, and all sorts of factors that can influence business, a firm must have flexibility, must have the freedom to act. It must be able to say, “Look, we can no longer do business, so we must part.”

Of course such a situation is also quite unjust for another reason, insofar as the employee is not bound to the firm in the way the firm is to the employee. This is not to suggest that a “fair” solution would be to shackle both parties equally! (This is akin to how employers are – but customers are not – prohibited to discriminate unjustly, are not as free as are their counterparts in the employment relationship.)

In a fully capitalist system, employees and employers would each be free to trade with each other either directly or through representatives. Without that flexibility, which is what private property rights make possible – giving one as much freedom to remove one’s labor as to provide it – the dynamism of the marketplace is stifled. At the very least, it is an unnecessary difficulty standing in the way of pursuing what market agents take to be their best economic opportunities and to take best advantage of them.

So the institution of private property rights is one of the fundamental prerequisites of business and of business ethics. In order to pursue your economic well-being, you have to own stuff, including your own time, resources, and labor. You can then trade them. Free trade means that nobody can dictate the terms under which you trade what is yours. Nobody puts a limit on it. (The only prohibition would be against theft and fraud, which are not cases of bona fide trade to begin with. You have not gotten the consent of someone from whom you steal, and thus you are violating the sine qua non of free trade.)

Pro-Market Versus Anti-Market Approaches to Business Ethics

62

Nicholas Capaldi

Abstract

Within the field of business ethics there is a conflict or at least a tension between those who have a favorable attitude toward business and those who exhibit an adversarial attitude toward business. More precisely, we summarize *the conflict between pro-market and anti-market approaches to business or commerce*.

Introduction

A *market economy* is one in which (a) there is private property, (b) there is no central allocation of resources, and (c) prices are determined competitively by supply and demand. Pro-market is here understood as favoring a market economy, wherein the role of government is to protect property rights, enforce contracts, and provide for contractual dispute resolution. Pro-market approaches generally assume that the norms of a market economy are either primary or at least consistent and coherent with the norms of other institutions (government, law, family, religion, etc.). One can be pro-market without being pro-business; that is, one could be a supporter of the norms of a market economy without being an apologist for every practice of every business precisely because some business people will engage in practices that undermine the market economy.

Anti-market approaches are critical of markets either because they see internal contradictions in a market economy or they allege that market norms are in conflict with more fundamental norms (social, political, religious, etc.). Anti-market writers rarely identify themselves as anti-market; such self-designation would be fatal to employment in a business school. Nor do such writers even see themselves as

anti-market. On the contrary, some of them such as Edward Freeman and Tom Donaldson insist that they are pro-market. What makes these writers anti-market is (1) their opposition to the policy that the primary object of business is to make a profitable product or service; (2) their insistence that business should achieve or help to achieve “other” overriding goals; (3) their identification of something as a business ethics “problem” because of a conflict between profitability and other goals; (4) their insistence that the alleged problems require resolution through nonmarket structures such as government regulation or a restructuring of corporate governance—in essence, the insistence that businesses function not like economic institutions but more like political, religious, or even academic institutions; (5) their appeal to abstract concepts drawn from a wide variety of disciplines other than economics.

No one questions whether there are other goals besides making profitable products and services. What is at issue is: (a) What are these other goals? (b) How are these goals to be prioritized? (c) How are these other goals related to the goal of producing profitable products and services?¹ Clearly, there is no consensus on answering these three questions. There is a background debate which can be characterized as a debate between rival visions of political economy [2].

The origins of Business Ethics, a relatively new field coming into prominence in the 1980s, clearly reflect its anti-market bias. “The field of business ethics was destined to be economically and politically liberal. . . . The field’s business school roots can be traced back to the University of California-Berkeley in the 1960s, where many of the first leaders of the nascent Business and Society field worked or were trained. Early research in this area focused on corporations’ ‘social responsibilities’ and sought economic reforms to assuage the inequalities perceived to be inherent in capitalism. These liberal scholars, resident in business schools’ Management departments, helped to establish the broader ‘social issues in management’ field that later spawned the more specialized area of business ethics” [3].

The Academic Context of Business Ethics

If one were to take an intellectually unbiased approach to any practice one would ask the practitioners what are the inherent norms of that practice. In addition, one could note that commerce has been around for centuries so one could ask the historical question of how those norms have evolved over time. Or, one could ask if the norms vary with place or culture and describe how various present-day cultures instantiate various normative frameworks. In the first instance one could consult business persons; in the second instance one might consult historians; in the third instance one might study comparativists. None of this was done in the specific field of business ethics. Instead, business ethics immediately became an academic discipline, but of a peculiar type.

During the 1960s and 1970s, the public (or those who claim to speak on its behalf) underwent an important sea change. Deliberation about ethical matters and initiation into ethical decision making had largely been left to centers of cultural authority that operated quite independently of the academy: religion, the family, the professions, and other intermediate institutions. For a variety of reasons, these traditional centers of authority were discredited and institutional leaders were persuaded that there were “ethical experts” [4]. The question is where does one find ethical experts?

By 1980, business schools had already become “professionalized.” In 1959, the Ford Foundation [5] and the Carnegie Foundation [6] had completed studies urging that (a) business education in general become more academic and less tied to practitioners and (b) there be the implementation of a “management science” based on the application of theory to practice [7]. The Management discipline is the primary locus of the field of business ethics in American business schools. The people who teach business ethics largely come from two backgrounds: philosophy and management.

Let us examine management first. Most of the PhDs in Management have a social science background. Traditionally, the social sciences have encouraged empirical studies, and to engage in such a study with regard to ethics would involve such things as an analysis of how business-people make moral decisions much the same way as marketers study consumer preferences. This purely traditional approach does not challenge the status quo of current ethical decision making; nor does it by itself reflect a normative management science – something that professionals could authoritatively teach business practitioners. Something more is needed – what that is will reflect developments in philosophy. In short, it will be the evolution of intellectual developments in philosophy that made the idea of normative management science tenable.

Prior to 1970, professional philosophy had treated ethical issues in an unpromising fashion: either professional philosophers had construed their task as meta-ethical (clarification of ethical discourse) or they were content to point out the difference between facts and values in a way that precluded a normative science of ethics. All of that changed during the 1970s and is best represented in the work of John Rawls, who published *A Theory of Justice* in 1971 [14]. From then on, philosophers felt themselves empowered to engage in normative work. Medical ethics and business ethics became the two growth subfields in philosophy. Utilitarians, Kantians, and virtue ethicists (Aristotle) developed elaborate methodological terminologies and did not hesitate to apply these conceptual schemes to the resolution of a whole host of public policy issues. During the 1970s, social scientists in general and management specialists in particular focused on methodological concerns and were quick to borrow from the discipline of philosophy the idea that they too could engage in normative work.

What accounted for this vast sea change? The intellectual answer is the domination of the culture by the belief in the existence of an authoritative and viable social technology. This belief is an expression of the Enlightenment

Project (EP) [8]. *The Enlightenment Project is the attempt to define, explain, and control the human predicament through the use of scientific technology.* The argument went something like this: Since Galileo and Newton, among others, physical science has been successful in explaining, predicting, and controlling the physical universe. There must be an analogous social science that will enable us to explain, predict, and control the human and social world, that is, produce a social technology, and thereby solve all human problems and bring about a utopia, a heaven on earth. Speaking of heaven, Christianity had been continuously embarrassed by claiming that certain scientific views were illegitimate (e.g., Galileo's trial and Darwin), only to find that we now live in a post-Christian or secular society. The new EP social science even claimed to explain how religious belief was a form of pathology. The long march of the EP from eighteenth century French intellectuals to nineteenth century positivism to complete domination of the universities in the twentieth century was aided by the spectacular scientific (e.g., "Sputnik" and the conquest of space in the 1960s) and technological advances (e.g., triumph of pharmacology in psychiatry) post World War II. Almost everyone now went to college, and no one could be taken seriously in any field without a college degree, and colleges and universities trained all the professions including opinion makers in the clergy and media. Universities controlled the commanding heights of communication.

What the EP does is to explain both how there can be management science and how social scientists and philosophers can engage in normative theorizing and education. We can not only explain what ought to be done but even educate students to do the "right" thing – after all education could be conducted scientifically. *Exactly how does the EP accomplish this?*

There are two versions of explanation in physical science: elimination and exploration. In *elimination* we substitute new ideas for older ones. An example of elimination is the replacement of Ptolemy's geocentric view of the universe with Copernicus' heliocentric view of the universe. This is useless in the social sciences because social theorists, at least on the surface, claim, initially, to be explaining our values, not immediately replacing our values.

In *exploration*, we begin with our ordinary understanding of how things work and then "explain" what is behind those workings. In time, we change our ordinary understanding. The new understanding does not evolve from or elaborate the old understanding, but replaces it by following out the implications of some hypothetical model. The replacement "explanation" appeals to underlying structures. An example from physical science is the atomic theory to explain chemical behavior or the behavior of gases.

Exploration is the preeminent mode of explanation in social science. By alleged analogy with physical science, social scientists seek out the hidden structure behind the everyday understanding of social activities. Marx and Freud are historically prominent examples of social scientists who sought to reveal a hidden structure behind everyday activities. Exploratory explanations seek the formal elements underlying the everyday world rather than believing that the everyday world can constitute its own level of understanding.

The problem with both elimination and exploration is that there is no way to confirm or disconfirm an elimination or exploration in the social sciences, that is, we never reach a structural level that is observable with advanced technology. Instead, one fashionable terminology replaces another. It is an intellectual carrousel on which the riders and the tunes change, but there is no progress. There are no formal criteria and no consensus that helps us to choose among competing explorations. Social theorists are obliged to appeal to informal criteria or intuitions about which hidden structure hypothesis “better” captures our ordinary understanding. There is, of course, no independent way of establishing this. The prominence of Richard Rorty and his view that philosophy is an interminable conversation of incommensurable voices reflect this situation.

Nevertheless, exploration became the preeminent mode of explanation in contemporary philosophy, and eventually in business ethics. An example is utilitarianism. Utilitarianism begins with the hypothesis that utility maximization is the underlying structure of our ordinary moral judgments. This is supplemented by the further hypothesis that there is a timeless and transcultural biological substructure to such judgments, namely, maximizing pleasure and minimizing pain. The substructure claims such explanations exhibit realism, causality, deductivity, and empirical verifiability. Although the ordinary moral judgments remain epiphenomena that do not exhibit law-like behavior, the underlying substructure allegedly permits scientific exploration.

There are two objections to exploratory philosophical theories. We will use utilitarianism as an example, but this applies to all so-called philosophical theories. First, some will deny that utility is a principle sufficient to capture our ordinary moral intuitions; this reflects what moral intuitions a specific theorist takes to be part of the core and what the theorist takes to be peripheral. Substantive moral disagreements will always lead to disagreements about hidden structure. Second, some will deny that there is a transcultural and timeless substructure. To an outsider it begins to appear as if the hidden structure hypothesis is no more than a rationalization for a private agenda. In any case, there is no external way to confirm or disconfirm any hypothesis and no way to choose among rival hypotheses. What this reflects is that the theorist is offering a “higher”-level exploratory hypothesis about other people’s exploratory hypotheses. But choosing among competing “higher”-level explorations involves us in an infinite regress.

Faced with this impasse, some, like Foucault, have been led to argue that the process is simply a power struggle. A recent development is the appearance of an anti-market approach drawn from Continental European philosophical sources. There is now an International PhD program at Lund University, Sweden, called Critical Management Studies. Critical management studies problematize the status quo. They focus on the “darker” side of business and organizations. Critical theory includes the Frankfurt School and related authors and lines of thought such as Foucault, critical poststructuralism, certain versions of feminism, and so on.

What we are left with is the following. Not only are there significant moral disagreements, most of these controversies cannot be resolved through sound rational argument. Either we have different foundational commitments or we

have different rankings of the good. Resolution is not possible without begging the question, arguing in a circle, or engaging in infinite regress. Neither can we appeal to consequences without knowing how to rank the impact of different approaches with regard to different moral interests, nor appeal to preference satisfaction unless we already grant how we shall correct preferences and compare rational versus impassioned preferences, as well as calculate the discount rate for preferences over time. Any appeal to disinterested observers, hypothetical choosers, or hypothetical contractors also fails. Disinterested deciders will choose nothing. Intuitions will always be met with contrary intuitions.² There is no good reason to believe that these debates can be brought to closure in a principled fashion. As Alasdair MacIntyre put it, “There seems to be no rational way of securing moral agreement in our culture” [10]. The partisans of any position find themselves embedded within their own discourse, unable to step outside of their own respective hermeneutic circles without embracing new and divergent premises and rules of inferences.

Note should be taken of an alternative not subject to the dysfunction of exploration, namely, the form of reflection (not theorizing) we call “explication.” All reflection is ultimately reflection on primordial practices that existed prior to our theorizing about them. Explication is a mode of understanding social practices which presupposes that all such practices function with implicit norms. To explicate a practice is to make explicit the implicit norms. The closest analogue to explication is case law in Anglo-American jurisprudence. In explication we try to clarify that which is routinely taken for granted in the hope of extracting from our previous practice a set of norms that can be used reflectively to guide future practice. We do not change our ordinary understanding but rather come to know it in a new and better way. Explication is a way of arriving at a kind of practical knowledge that takes human agency as primary; it mediates practice from within practice itself. Explication is inherently pro-market because it takes the market economy as the given to be explained in its own terms.³

Many failed to grasp the implications of this impasse; others promised in a variety of ways to overcome it [13]. Needless to say, there is no consensus either inside or outside the discipline of philosophy. None of this deterred professional philosophers and others from engaging in normative pronouncements.

Under the guise of ethical “theorizing” many contemporary philosophers and others employed concepts from classic famous philosophers such as Aristotle, Kant, or Mill. The liability of this mode of generic theorizing is that it begins with very abstract principles and then seeks to apply them to specific ethical issues. It is a liability because in the application the theorist must make additional assumptions so that the original abstract principle can be used to arrive at any and all conclusions. In the case of Aristotle, for example, one can reinterpret Aristotle through a specific version of “Thomism,” as MacIntyre does, and end up with a quasi-Marxist critique of market economies; or, as Robert Solomon did, reinterpret Aristotle as a communitarian; or in the case of Elaine Sternberg, Douglas Den Uyl, and Douglas Rasmussen, we arrive at an admittedly neo-Aristotelian

but pro-market view. John Hasnas can be described as a pro-market Kantian. There are also philosophers, like Machan and Mack, who use the clearly pro-market position of Ayn Rand (itself a version of Aristotle) as a starting point for business ethics.

The predominance of exploration in the field of business ethics is best exemplified by the influence of Rawls. John Rawls offered an exploration in his book *A Theory of Justice*. He does not start with an explication of existing practice but with an imaginary original position. He is not interested in where we are and how we got there but where we ought to be. In the hypothetical “original position” we choose principles of justice “behind a veil of ignorance,” without knowledge of “[one’s] place in society, his class position or social status; nor does he know his fortune in the distribution of natural assets and abilities, his intelligence and strength,” even one’s sex [14].

Rawls is anti-market in the following senses: he is an egalitarian⁴; he asserts that we should never be tempted to exploit our differences⁵; he rejects “excessive” inequalities of wealth; “[s]ocial and economic inequalities” are to be to the greatest benefit of the “least advantaged” (*Difference Principle*),⁶ a response to socialist concerns about equality; finally, he specifically attacks Nozick’s libertarianism because it does not guarantee all citizens sufficient means to make full and effective use of their basic liberties. The influence of Rawls on business ethics can be seen prominently in the work of Thomas Donaldson [15, 16] and Christopher McMahon [17]. Starting from a hypothetical contract, Donaldson argues that Corporations acquire social responsibilities beyond the creation of wealth and jobs. McMahon advocates codetermination that requires legally binding boards of directors to be composed in equal parts of representatives of employees and investors. McMahon’s work is cited by Denise Rousseau [18] who has a political agenda that is to be superimposed on management: “democracy is the power of the people and is manifest in ways. . .that promote participation in and influence over the decisions affecting their everyday lives.”⁷

The Predominance of Anti-market Approaches

There are pro-market explorations in contemporary philosophy. Robert Nozick in *Anarchy, State, and Utopia* (1975) also offers an exploration, but it is pro-market. Nozick postulates a Lockean state of nature without a contract. Primarily focused on the insecurity of individual rights in a free market, human beings are led by an *invisible hand* to join in protective associations with the state emerging as the dominant protective association. The major obligation of the state is to provide protection against force, theft, and fraud and to enforce contracts.

One might expect the field of business ethics then, or at least the philosophical oriented part, to be roughly divided between pro and anti-market explorations. That turns out not to be the case. “Although Nozick’s negative rights theory is now

often noted briefly in textbooks' overviews of rights theory, it is virtually never used as a basis for ethical argument in the business-ethics literature."⁸ On the contrary, business ethics explorations are overwhelmingly anti-market. Why is that the case?

First, since the nineteenth century [19], intellectuals [20] in general and academics [21–24] in particular have been highly critical of markets and market-oriented cultures and societies.

Second, many contemporary intellectuals see themselves in an adversarial position to an alleged market-society which they insist upon characterizing as being run by a conspiratorial and dangerous "establishment." C. Wright Mills, in his 1956 book, *The Power Elite*, described the establishment as follows:

The power elite is composed of men...in positions to make decisions having major consequences.... [T]hey are in command of the major hierarchies and organizations of modern society. They rule the big corporations. They run the machinery of the state and claim its prerogatives. They direct the military establishment. They occupy the strategic command posts of the social structure, in which are now centered the effective means of the power and the wealth and the celebrity which they enjoy [25].

In his book *Biz-War and the Out-of-Power Elite*, Jarol Mannheim [26] argues that intellectuals who followed Mills have built a shadow counterpower structure and are actively engaged in a "social network" war against business. The counter-structure consists in (a) infiltrating and redirecting⁹ philanthropy (contrary to donor intent) to (b) sponsoring tax-exempt foundations that support the conducting of research in universities and left-leaning think tanks, which in turn (c) provide the intellectual legitimation to alter public opinion through influence on the media which eventuates in (d) changes in the law that limit markets.

We cite as an example of this ingrained hostility a statement by George Brenkert, long-time editor of *Business Ethics Quarterly* in an essay on Entrepreneurship:

The argument for entrepreneurship and an entrepreneurial society is for a society in which some sub-set will provide leadership...the entrepreneurs will be the spark plugs, as it were, of this economy and society. Instead, then, of a Platonic society, which looked to its philosopher kings, our entrepreneurial society will look to its entrepreneur bosses [27].

Third, Schools of Business are mostly housed within universities, and universities are dominated by the political left [28, 29]. This domination reflects in part both the general adversarial attitude of intellectuals to commerce and the EP which encourages the belief in a social technology overseen by academic experts.

While schools of business in general are more centrist, business ethics programs in particular are housed within the management area. Management personnel, and to a less extent marketing faculty, are generally much further to the left than faculty in accounting and finance. Given their social science background and proclivity with its focus on alleged institutional structures, management faculty focus on the structure of highly centralized and large organizations like major corporations; this, despite the fact that the overwhelming majority of business school graduates will never work for such organizations.

I cite two writers who call attention to this anti-market bias. First, Marianne Jennings [30] argues that the AACSB (American Association to advance Collegiate Schools of Business) guidelines on curriculum and instruction contain little in the way of substance and reflect the sort of bias against the market economy that prevails elsewhere in the university. Second, James Hoopes [32] has given a broad but critical historical overview of the management literature of the twentieth century, a review in which he documents the unwillingness of management gurus to see profit as legitimate unless subordinated to another goal.

One specialty within business ethics is the subfield of Corporate Social Responsibility (CSR). Pro-market approaches to CSR link various kinds of business philanthropy to its contribution to the bottom line. This is routinely dismissed by anti-market writers as not really CSR [31].

Anti-market approaches to CSR are dominant. This hostility is fueled by a traditionally leftist understanding of the social world and its problems: going back to Rousseau's critique of Locke, the present world allegedly reflects an unfair bargain in which the haves (as perceived by some) have imposed an unfair system on the self-perceived have-nots. At the same time, the post-1989 left has become understandably disenchanted with Government planning and control of markets. It is now much more favorably inclined to democracy, while at the same time being mindful of how democratic governments are corrupted by special interest groups and collusion between big government and "big business". This anti-market version of CSR appeals to a kind of triangulation in which civil society is the dominant element. Civil society allegedly is represented by NGOs, that is, so-called nongovernmental organizations (foundations, think tanks, philanthropies, charities, overtly activist organizations, etc.). NGOs will presumably solve social problems through a redistribution of wealth and power carried out within a market society and through market mechanisms. The market mechanisms here are large and usually multinational corporations. They focus on big corporations both because these private organizations have substantial financial resources and because, going back to the classic of Berle and Means, there is recognition and exploitation of the insight that managers are not owners. NGOs seek to drive a wedge between stockholders and stakeholders and exploit the agency problem on behalf of various selected stakeholders. NGOs expect managerial cooperation for three reasons: managers are worried about bad publicity, litigation, and the threat of outside agitation; there is a new kind of celebrityhood available to managers who are cooperative or enablers; and they fully expect to train future managers (not entrepreneurs) to become compliant and in turn this will increase the power, prestige, and rewards of business school faculty and law school faculty. In all of this, there is a new and rising ruling class: NGOs staffed by intellectual leftists (academics and law school graduates primarily) who offer to mediate the relation of corporations with each other and government and all other institutions. The best example of this is Peter Drucker who placed his final hope in a society "where nonprofits rather than corporations will create a morally legitimate system

of management”.¹⁰ Anti-market advocates of CSR never specify an overall program, but remain a loose federation freed of the burden of providing a comprehensive alternative program.

Specific Issues in Business Ethics

Nature and Purpose of the Publicly Traded Corporation

This is the fundamental issues: *almost everything follows from this, and that is why the Friedman versus Freeman debate is crucial.*¹¹

Pro-market: *the major function of such a corporation is to make a profitable product or service (thereby creating both wealth and jobs).* Corporations (or firms) are to be understood as enterprise associations within a larger civil association. A corporation is an enterprise association, that is, individuals are voluntarily involved in the pursuit of a common substantive purpose, specifically a productive undertaking: “. . .interminable engagement in the continuous promotion or protection of an enduring interest. The response sought. . .[is] that of others not thus associated as a productive enterprise seeks buyers or consumers. . .” [35]. The common purpose cannot be “equality” or “fulfillment,” etc., because these are not substantive purposes. As an enterprise association, a corporation cannot have two or more discrepant purposes; if there are multiple purposes, then they must be prioritized or systematically related. *From this it follows that economic efficiency trumps all other considerations.* For market advocates, this issue was decided long ago (1918) in US Corporate Law by *Dodge v. Ford Motor Co.* The primary fiduciary responsibility of managers is to their shareholders. “[I]n the United States and the United Kingdom the vast majority of managers (76 percent and 71 percent, respectively) took the view that the corporation belonged to the shareholders. In sharp contrast, in Germany 82.7 percent of senior managers thought their company belonged to all of the stakeholders. France was not much different with 78 percent. . . . In Japan an astonishing 97 percent of managers thought that the company belonged to all stakeholders” [36].

This is not to say that making a profit is the only thing that matters; nor does it say that one must make a profit not matter what, or that the end justifies the means. As Friedman put it, “to make as much money as possible while conforming to the basic rules of the society, both those embodied in law and those embodied in ethical custom.”¹²

Anything which contributes to the bottom line is OK, otherwise not. So, for example, discrimination works against efficiency and is therefore bad; certain forms of corporate philanthropy might contribute to the bottom line and are therefore good; others do not. Surely this will vary with the individual industry, company, etc.

Advocates of the market see the potential of an infinitely expanding economy (Simon) powered by private property and competition among individuals and individual corporations in a market where sellers try to satisfy buyers. The market

does not have an overall goal; it exists to satisfy the self-defined interests of the participants. In a true market, there will be winners and losers, but the interests of all concerned will be maximized over time. By maximizing the creation of wealth, the market provides both the maximization of present and future economic opportunity for all and the resources with which private individuals and other institutions can address other nonmarket issues.

Social problems are to be addressed primarily by other institutions. Once another objective(s) is added to the bottom line then the question of the relation or prioritization of that objective becomes relevant. As the Business Round Table put it:

The weakness of the stakeholder model is the absence of an overall objective function which implicitly or explicitly specifies the tradeoffs from expenditures on various items, including each of the firm's stakeholders. This in turn implies that the top managers of such organizations cannot be held accountable for their decisions because without an overall objective function, there is no way to measure and evaluate their performance. . . it would leave the board with no criterion for resolving conflicts between interests of stockholders and of other stakeholders or among different groups of stakeholders.¹³

Anti-Market advocates want the USA to be more like the EU and Japan. The Corporation *should* be viewed as a social entity [37–39]. This is exemplified in Freeman's focus on the stakeholder. To date, different and sundry anti-market authors do not offer a comprehensive account of what the other objectives should be or how the list of other objectives is to be prioritized.

Absent such a comprehensive account, we suggest that anti-market advocates need to provide an account of the economy in which it would have an overall (collective) goal to which the interests of individuals and individual corporations are subordinate. This does not have to be a planned economy but a highly regulated one in which conflicting interests are continually adjusted through nonmarket mechanisms. Anti-market critics do not have a clear and coherent alternative, only a laundry list of aspirations. They know what they are against but not what they wish to substitute for it.

With regard to growth, anti-market writers either deny (e.g., finitude of resources or transformation of the environment, discussions of "sustainability") or eschew the possibility of infinite growth. They maintain either that growth is finite and therefore should be subject to government control and rationing on grounds of fairness, or that growth *should* be limited in order to achieve other more worthy social objectives.

Relation of Government to the Corporation (Regulation, Environment, Globalization, and Property Rights)

Pro-market: The major purpose of the government is to protect property rights and punish the use of force and fraud. Injuries to third parties can be handled through negotiation and litigation (torts). Most if not all government regulations are counterproductive. Globalization is the gradual (and grudging) acceptance of the USA and UK model of free markets, limited government, the rule of law, and a culture that promotes individual initiative.

Anti-market: The best argument on why regulation fails was written by Cass Sunstein [40] (Obama's regulatory Czar), but Sunstein thinks we can learn from this how to make regulation work! The Environment (notice the capital "E") is a global ecological responsibility which cannot be adequately addressed by either markets or individual nation-states. The Environment requires that we conceive of the world as an enterprise association (collective goal) requiring either world government with world regulatory authority or the modified view of civil society discussed earlier under CSR. Globalization is the world as enterprise association. Property rights may be overridden in the new globalization [41]. The same argument for an implicit world government is used with regard to multinational corporations. Generally speaking, anti-market writers like to invoke the notion of universal human rights as embodied in the UN Universal Declaration of Human Rights [42]. What we witness here is the replay of the argument of the perceived "have-nots" against the perceived "haves".

Responsibility of Management to Employees

Pro-market: Employment at will is a good thing because it encourages entrepreneurs to take the risk of starting new businesses and it allows employees to find better positions. Affirmative Action is a good thing if it seeks out the best employees, but it's a bad policy if it requires that hiring, promotion, and firing be done to achieve other social objectives. In the latter sense it is actually illegal. Sexual harassment is illegal and counterproductive. Workers in foreign countries should not be abused, but they should be paid market wages in their country. Finally, executive compensation should be determined by market forces – supply and demand.

Anti-market: Employment at will is bad; workers should be granted a form of tenured job security. Firing would have to be justified at an "official" (expensive) hearing. On this, see P. Werhane who consistently takes the anti-market line [43]. Affirmative action as something akin to quotas should be the policy. Both affirmative action and sexual harassment get redefined as diversity. The expression "sweat shop" is expanded to cover not only inhumane treatment but paying wages on a local scale rather than home-based scale.

With regard to executive compensation, anti-market writers maintain that either (a) present compensation is the result of force and fraud or (b) there is no true market because of the existence of unequal bargaining power, that is, present distribution of resources is the result of historical accident and not a market. These writers may opt for (a) starting over or (b) constant regulatory oversight. What we witness here, again, is the replay of the argument of perceived "have-nots" against the perceived "haves".

Responsibility of Employees to Management

The extant literature is almost wholly anti-market. There is rarely any discussion of what employees owe management. Most of the literature focuses on when

employees should blow the whistle or whether there should be insider trading. Pro-market writers favor inside trading (on economic efficiency grounds); anti-market writers oppose it (on grounds of fairness).

Market “Failure”

Pro-market advocates maintain that (a) free markets do not fail, (b) part of a market’s functioning is to eliminate through competition less efficient or fraudulent entities, and (c) inevitably government regulation or agendas provide the distortion or incentive for “bad” behavior.

Anti-market advocates trace everything back to the original conception of a market as a place where individuals are encouraged to pursue their self-defined interest. Milton Friedman is cited as the author of an amoral ideological management theory that frees students from any sense of moral responsibility [44]. There is, of course, no empirical evidence to substantiate this claim [45], but this is not about evidence but ideological perspective. Anti-market writers generally subscribe to some version of environmental determinism (an essential component to the idea of a social technology based on social “science”). Hence there is a tendency to attribute many problems to advertising. Pro-market writers think that consumers should exercise some responsibility for choices and that parents should be responsible for monitoring that to which children are exposed (social problems to be addressed by other institutions and not the market). Curiously, there is little discussion of what it means to be a fit participant in a market economy. Anti-market writers, again on the assumption of environmental determinism, never consider it a failure on the part of the participant – the blame is always placed on institutional structures – that is, the market.

Teaching Business Ethics

Pro-market proponents take as their major responsibility explaining how markets operate, what the norms of market activity are, and how those norms relate to other nonmarket norms. If those proponents think market norms are fundamental to all norms, they need go no further. If some of those proponents believe that other norms are more fundamental but that market norms are consistent and coherent with the fundamental nonmarket norms, they can present such a case.¹⁴ Getting students to take the whole package seriously and to internalize those norms is a more complicated task and involves the whole educational system.

Anti-market proponents take as their major responsibility the exposure of the “failure(s)” of markets (pro-market writers would describe this as “business bashing”). It would also be part of their responsibility to advocate market reforms and actively lobby for those reforms in the classroom. Anti-market proponents are not merely scholars and teachers but consider themselves as participants in a larger drama – to teach business students is to get them to internalize anti-market norms.

Conclusion

Table 62.1

Issue	Pro-market	Anti-market
Narrative	Liberty	Equality
Politics	Civil association ¹⁵	Enterprise association ¹⁶
Legislation	Equality of opportunity	Equality of result
Law	Rule of law	Distributive justice (fairness)
Role of the government	Protect property rights; enforce contracts; resolve contractual disputes (litigation)	Regulation for common good; protect third parties
Corporation	Nexus of contracting individuals [46]	Social entity
Purpose of publicly traded corp	Profitable product or service (economic efficiency)	Serve the common good
Board of Directors	Technical expertise for advice and consent	Represent all stakeholders
Role of management	Primary fiduciary responsibility is to creditors and shareholders	“Multi-fiduciary” duty to stakeholders within the social good; priority of distribution over production
Relation of management to Employees	(a) Contractual autonomy; (b) hierarchy; (c) internal entrepreneurship	Democratic participation
employees	(a) Employment at will; (b) right to work; (c) meet contractual obligations	(a) Collective bargaining; (b) whistle-blowing
Insider trading	Yes – enhances market efficiency	No – incompatible with fairness
Foreign outsourcing	Yes – improves productivity	No – “sweatshops”
Executive compensation	Supply and demand	Fairness
Affirmative action	To improve productivity	To improve fairness and diversity
CSR and philanthropy	If it contributes to bottom line	Serve the common good

Stephen Hicks

Abstract

Much of the current business ethics literature takes *corporations* and *social responsibility* as its key operative concepts. Meanwhile, much of the business and economics literature is moving to seeing *entrepreneurship* as a foundational activity. In this chapter I argue that business ethics should be refocused away from corporations and the social and toward entrepreneurs and the individual.

Introduction to Entrepreneurial Ethics

Ethics is about values and virtues. What things in life are worth pursuing – are health, wealth, love, beauty, creativity, and so on, *values*? And what character traits are necessary to achieve those good things – are honesty, courage, perseverance, a commitment to fairness, and so on, *virtues*?

In the past generation, while more attention is being given to entrepreneurship as an economic phenomenon, entrepreneurship has received little attention as an ethical phenomenon.

Yet entrepreneurship is a value-laden enterprise. As a business activity, entrepreneurship demands resourcefulness and resilience, risk tolerance and courage, and it can be a vehicle for achieving exalted financial goals.

In this introductory chapter, we sketch entrepreneurial ethics and explore its implications for the foundations of business ethics.

The Values of Entrepreneurship

What could it mean to see entrepreneurship as an ethical phenomenon?

Let us approach the question by first asking: Why do we work? “Because I have to,” say some. “Because I want to,” say others. Unless one is born into wealth or wins the lottery, making a living is foundational to life. Yet, beyond making a bare living, work can be a means of achieving many goals – financial security, creative expression, sociability, and even adventure. Many of those who do not have to work often find their work to be a vehicle for pursuing those goals.

One basic work choice is to go to work for an existing business, that is, to become an employee, or to go into business for oneself, that is, to become an entrepreneur.

So let us ask, secondly: Why do many people choose entrepreneurship over working for others? Their reasons can be negative – there may be no employment opportunities available so entrepreneurship is the best available option. Or their reasons can be positive – they believe that as entrepreneurs they can achieve greater wealth, autonomy, and self-expression.

Wealth: Entrepreneurs typically have ownership positions in their businesses and thus a chance at greater earnings than salaried or hourly employees. That wealth in turns means a chance at greater financial security and all the good things that money can buy.

Autonomy: Entrepreneurs are deciders and initiators. Consequently, they have greater power over their thoughts and actions and more flexibility in the use of the time than most employees. Expressed negatively, autonomy means not having to take orders from bosses, being more easily able to avoid bureaucracy, office politics, and so on.

Self-expression: Entrepreneurs build businesses from the ground up, typically generating the idea and making it happen. As a result, entrepreneurs typically experience stronger psychic ownership of their businesses. Their business is *my idea done my way*. Put negatively, entrepreneurs do not experience their work life as being a cog in someone else’s machine.

Entrepreneurship, accordingly, is a vehicle for the pursuit of several important physical and psychological human values: wealth, autonomy, and self-expression. Of course, working as an employee can realize those values, yet entrepreneurship makes them central and more likely to be realized.

Further, entrepreneurs *trade* with others when purchasing raw materials, when selling to customers, and when they hire employees to help grow the business. Entrepreneurs create new networks of voluntary traders, and they enter into and maintain already existing networks. Trading networks are also of great human value, and they are based upon mutual commitments to deal with each other on the basis of voluntary exchange, rather than, say, on the basis of treating the other as an object of charity or plunder.

Accordingly, entrepreneurship is based upon several value commitments: the importance of autonomy, self-expression, voluntary trade, and the creation and enjoyment of wealth.

The Virtues of Entrepreneurship

If entrepreneurship is a *value*-oriented enterprise, what *virtues* make that enterprise successful?

Let us consider a typical entrepreneurial process. It begins when someone has a *new business idea*. The entrepreneur is *ambitious* and exhibits *guts* in taking *initiative* in developing the idea into a new enterprise. Typically, through *experimentation* and *perseverance*, the entrepreneur *produces* something of value. The entrepreneur then becomes a *leader* convincing customers of the new product's value and in teaching new employees how to make it. The entrepreneur and the customers and the entrepreneur and the employees *trade to win-win* results. The entrepreneur has achieved a measure of *success* and then is able to *enjoy* the fruits of his or her achievement.

What does this sketch of the entrepreneurial process have to do with virtue? Virtues are action-guiding character traits that aim at good results.

If we cash out the above italicized entrepreneurial-process traits in terms of *virtues* – that is, in terms of character traits and commitments that enable and constitute good action – then we make the following connections:

The entrepreneur's *generating new business idea* connects to the virtue of *rationality*. Rationality is the commitment to the exercise of one's capacity for reason. The entrepreneur's coming up with a business idea, evaluating it, and planning to make it real require the exercise of rationality.

The entrepreneur's *ambitious* drive for success connects to the virtue of *pride*. Pride can be based upon past accomplishments, but it can also be future oriented – wanting to be the best one can be and not settling for less. The entrepreneur's ambition is his or her taking pride in the business part of his or her life.

Entrepreneurial *initiative* connects to the virtue of *integrity*. Integrity is a commitment to acting on the basis of what one believes to be true and good. If the entrepreneur believes a business idea to be good, then the activity of making the idea a reality integrates thought and action.

The risk of failure is a feature of entrepreneurship, and fear is a natural response to the possibility of failure. So the *gutsiness* that entrepreneurial action involves connects to the virtue of *courage*. Courage is acting to achieve what one thinks is good even when aware of the risk of failure.

The entrepreneur's working through *experimental* process of product development connects to the virtue of *objectivity*. To be objective means judging based on one's awareness of the facts, being open to new data (including unwanted negative data). An element of objectivity is the virtue of intellectual *honesty*, that is, a commitment to recognizing the facts of the matter for what they are.

The entrepreneur's *perseverance* through difficulties, disapproval, and self-doubts connects with the virtue of *independence*. Independence is the virtue of trusting one's own judgment and acting on the basis of one's best judgment despite frustrations, distractions, or the disagreeing opinions of others.

The entrepreneur's *productivity*, that is, his or her sticking to it until the job is done, connects to the virtue of *productiveness*. Productiveness is a commitment

Table 63.1 Entrepreneurial success traits and moral virtues

<i>Entrepreneurial traits</i>	<i>Moral virtues</i>
New ideas	Rationality
Ambition	Pride
Guts	Courage
Initiative	Integrity
Perseverance	Independence
Experimentalism	Objectivity (including honesty)
Productivity	Productiveness
Leadership	Leadership
Win-win trade	Justice
<i>Entrepreneurial consequences</i>	<i>Moral values</i>
Experiencing success: wealth, autonomy, self-expression	Self-esteem, happiness, flourishing

to creating value, to being self-responsible for bringing into existence that which one needs or wants.

The network of traits that make for effective *leadership* are complex and variable. Yet, through whatever individual capacities and personality traits, entrepreneurs have to show others the value of the new business's products or services, convince customers and investors to commit funds, and teach employees how to perform the business's functions. Entrepreneurship necessarily involves a commitment to *leadership*.

The entrepreneur's *trading to win-win results* with customers and employees connects to *justice*. The virtue of justice entails a commitment to evaluating and interacting with others according to merit. In a business context of voluntary deals, justice means that each party judges the merits of trade independently and agrees voluntarily to the terms of the trade, and follows through accordingly.

And finally, the entrepreneur's *achieving and enjoying success*, both the physical and psychological rewards that business achievement can bring, connect to the general *moral values of flourishing, happiness, and fulfillment*. As the entrepreneur's business life is a component of his or her overall life, the entrepreneur's engaging in the actions that lead to flourishing in business is a component of an overall flourishing life. In Aristotelian terms, the entrepreneur's actions both constitute and lead to a life that is fully realized.

Summarizing all of the above in a table [3], we get the following (Table 63.1).

Entrepreneurial Ethics as a Business Ethics Code

The virtues constituting the table's right column embody *an entrepreneurial code for business ethics*. That set of virtues describes entrepreneurial activity abstractly. Conversely, the success traits of entrepreneurs in the table's left column are particulars of a general set of virtues that can be applied in all walks of life.

Relevant questions then for the business ethics of entrepreneurship are:

- (a) What are the values of entrepreneurship, upon which all successful business is based?
- (b) What are the character virtues of entrepreneurship that enable successful business?
- (c) How do we teach and inspire those values and virtues in students and business professionals?

Now for some implications.

One implication is that approaching business ethics via entrepreneurship connects business to ethics positively and organically. The virtues and values embedded in the practice of entrepreneurship sets a foundation for a business ethic based on the assumption that successful business practice has *within* it the resources to develop an ethic. That approach contrasts to the assumption often made that ethics is alien to business and must be grafted on or imposed from without.

Another implication of an entrepreneurial ethic is that business ethics should focus first on creativity, productivity, and trade. That is, it should not take those elements take them for granted or as amoral givens. If the basis of business is creative productivity and trade, then the basic focus of business ethics should be upon that which enables individuals to be or become creative producers and traders.

A third set of implications emerge when we contrast an entrepreneurial business ethics to the dominant model of business ethics for the past half-century, that is, “corporate social responsibility” (CSR).

Entrepreneurial Ethics Contrasted to Corporate Social Responsibility

Corporate Social Responsibility’s three constituent words indicate its three framing assumptions as a model of business ethics:

1. The first tells us that *corporations* are our model of business practice to analyze and prescribe to.
2. The second word tells us that the *social* is our focus.
3. In the literature, *responsibility* is usually cashed out in terms of *avoiding harm* and *distribution to others*. Or it is interpreted conjunctively with the second word to mean *social* responsibility.

On corporations as the standard model. The vast majority of examples in business ethics focus on large, well-known corporations – Wal-Mart, Microsoft, Exxon, McDonald’s, and so on, and much of the business governance literature focuses upon corporate governance, with its hierarchical structure.

Yet, the corporation is not the only business type or even the most plentiful type. Firms can be organized as sole proprietorships, partnerships, and corporations, and the US Census Bureau data indicate that large corporations are a fraction of overall business activity: “About three quarters of all U.S. business firms have no payroll.

Most are self-employed persons operating unincorporated businesses” [4]. Further, in 2007, there were 27,757, 676 firms in the US, but the number of firms with more than 100 employees was approximately 126,000, which is about one-half of one percent.

What these numbers suggest is that the business ethics literature’s focus on the mature, large corporation obscures the reality of the business environment most people experience. Most businesses are small businesses and closer to their entrepreneurial roots.

Further, every corporation *starts* as an entrepreneurial venture. Many such ventures perish, a few go on successfully; a very few become large. But there is a value to understanding businesses causally. The basic principles of business – buying and selling, hiring, firing, and quitting – including its moral principles, are in place from the beginning. So, a focus on entrepreneurship enables us to articulate those moral principles and then see how they develop as the business grows in size and complexity.

On the social focus: CSR typically assumes, as in the following example from the Committee on Economic Development, that business exists to serve social purposes, often top-down social purposes: “business functions by public consent and its basic purpose is to serve constructively the needs of society – to the satisfaction of society”[2]. Such formulations do not mention individuals and assume that the society has priority over the individual.

Yet, it is not clear that this is the reality or importance of business. The basic business transaction is that between a buyer and a seller: two individuals come together, each bringing value to the transaction, and they go their separate ways after to enjoy the results of the transaction. Before buyers and sellers can trade, each has to engage in productive work, and productive work is basically individual. An individual wakes up in the morning, decides to get out of bed and go to work. He or she makes dozens of decisions and performs hundreds of particular actions in the course of a day. At work, those actions add up to productivity, the results of which enable the person to become a buyer or a seller.

Entrepreneurial ethics highlight this individuality of business: entrepreneurial activity is primarily *individual*. It starts with an individual’s idea, an individual’s productive efforts, and then develops into a social network of value-adding individuals producing and trading with each other. What we call firms, markets, and other relevant social groupings are associations of individuals adding value together. Such social groupings are formed bottom-up and remain in existence as long as they serve mutually the interests of the individuals involved.

So, while social interaction is an important part of business ethics, it is consequent. A business ethic based on entrepreneurialism makes issues of individuality primary and issues of sociability secondary.

On responsibility as avoid-harm and distribution: In CSR, the broad concept of *responsibility* is typically given two sub-meanings. One meaning is avoiding harm to others – for example, not engaging in fraud, not damaging others’ property, and so on. The other is to engage in charitable or redistributionist activities – for example: “Traditionally in the United States, CSR has been defined much more

in terms of a philanthropic model. Companies make profits, unhindered except by fulfilling their duty to pay taxes. Then they donate a certain share of the profits to charitable causes. It is seen as tainting the act for the company to receive any benefit from the giving” [1].

While there certainly are places for anti-harm and philanthropic principles in ethics, from an entrepreneurial perspective this concept of responsibility is narrow and secondary. CSR typically makes no explicit mention and certainly does not emphasize the priority of productivity as a moral responsibility.

By contrast, the focus of entrepreneurs first and foremost is upon production, not philanthropy; and entrepreneurs are focused upon creating value, not avoiding harm. The entrepreneur’s operative question is: *How can I create value?* Or in other words: *How can I be more productive?* or *How can I make money?* (with an emphasis upon *make*). Creating, producing, and making are primary.

One reason for this is that causal production comes before distribution. Before we can ask the distribution question of *Who gets what?*, the *what* has to be brought into existence. That is the basic responsibility. Before one can make a distribution claim on the value a business has created, one must have productively contributed to the creation of that value. The issue of distributive justice falls out of the productivity: A fair determination of who gets how much depends upon each person’s productive contribution.

While entrepreneurial ethics make our responsibilities to be creative producers primary, CSR’s emphasis on distributive responsibilities, especially charitable distributions, overlooks productive responsibilities.

The same point about moral priorities applies to the avoidance of harm. Part of successful productivity is not harming the legitimate interests of others while achieving one’s own goals, but the focus is on the positive creation not the non-harm. By analogy, if one’s goal is to travel from New York to Los Angeles, one’s focus is upon successful transportation; one’s primary focus is not upon not harming Nebraskans along the way.

To summarize in abstract terms, the avoid-harm principle says that we should *not* engage in win-lose interactions with others, and the redistribution principle says that we *should* engage in lose-win interactions. What is missing is the great moral import of making possible win-win interactions.

Entrepreneurial ethics make first our responsibilities as individuals to be productive traders. The dealings of productive traders are neither harmful (win-lose) nor charitable (lose-win). Instead, they are win-win.

The morality of productiveness is prior to the morality of distribution. So business ethics should be focusing first and predominantly on self-responsible productiveness and the social conditions that foster it.

Conclusion

While entrepreneurship is beginning to receive attention in the business ethics literature, it has the potential for refocusing our attention on business fundamentals. The questions, in the contrasts between traditional CSR and entrepreneurial ethics, are:

Should we focus first upon start-ups and innovative firms, or upon mature corporations?

Should we focus upon individuals first, or upon the social?

Should we focus upon production and trade first, or upon harm-avoidance and charity?

What entrepreneurial ethics suggests is: Do not start business ethics with corporations. Do not start with the social. And do not start with philanthropic accounts of responsibility. Start by making morally foundational productive individuals who engage in win-win trade, and build from there to the increasingly complex social structures the business world creates.

Making Room for Business Ethics: Rights as Metanorms for Market and Moral Values

64

Douglas B. Rasmussen and Douglas J. Den Uyl

Abstract

In this chapter, we argue that certain political/legal conditions need to be met for business to have an appropriate ethical environment. In addition, we indicate why the moral principles that define those conditions are not the same as those that would constitute the nature of business ethics itself.

Introduction

A social system is a set of moral-political-economic principles embodied in a society's laws, institutions, and government, which determine the relationships, the terms of association, among the men living in a given geographical area. . . *Capitalism is a social system based on the recognition of individual rights, including property rights, in which all property is privately owned.*

Ayn Rand, "What is Capitalism?" *Capitalism: The Unknown Ideal*

We are probably all familiar with the hackneyed remark: "‘Business ethics,’ there's an oxymoron for you." Sometimes it is even said that "profit" is a four-letter word.¹ Indeed, much of what passes for business ethics today is really a case of business bashing.² *But does business ethics have to be business bashing?* We think not. Yet, in order to see how this is possible we need to realize that many of the criticisms of business activity that we find in our culture (and in business ethics literature) are not criticisms of particular persons and firms for conduct that violates basic canons of morality. They are not criticisms of where people lie or cheat; give up on personal

integrity, or any personal responsibility; or simply forgo the pursuit of excellence in any form. Rather, these criticisms are systemic in nature – that is, they aim to analyze the very institutions that define and sanction business activity.³ We find here criticisms of such institutions as private property, the sanctity of contracts, free exchange, and the pursuit of profit.

There is, of course, nothing sacrosanct about these institutions. They can be and ought to be examined. Yet, the point is that once this sort of analysis begins, it should be recognized that one is engaging in a critique that is not so much concerned with the particular practices of persons and firms but with the system itself. It is a critique that properly speaking belongs to the realm of political philosophy.

Now this may seem a trivial observation, because it is quite common for texts on business ethics to have discussions on questions of justice and for there to be some selections from representative views of justice – for example, selections from Rawls, Nozick, and usually some communitarian or socialist-leaning thinker. Furthermore, there is usually some discussion of basic approaches to questions of normative ethics where we find consequentialist, deontological, and sometimes virtue-ethics approaches outlined. However, the problem here is that, generally, there are some important differences being ignored. Particularly, it is seldom noted whether one is talking of justice for persons or for institutions. Moreover, there is hardly ever any consideration of what kinds of institutions are involved and how that might be important to not only the answers that are offered but to determining the questions that need to be asked. Indeed, there is generally a failure to discuss the differences between justifying and evaluating the political/legal institutions that define and sanction business activity and justifying and evaluating the conduct of people and organizations that work within their orbit.⁴

Moral Foundations

If one is to properly assess the morality or ethics of business activity, then one needs to understand and appreciate the ethical basis of the political/legal institutions in which they function.

We do not regard this thesis as particularly controversial, but we do think that what it involves has not been fully appreciated by either the critics or the defenders of business activity. To appreciate the importance of this thesis, it must be made clear what is meant by that most abused word, “capitalism.” To begin with, we understand it to refer to an economic and social system that is defined in terms of the institutions of private property, sanctity of contract, free exchange, and the pursuit of profit. Yet, there is more to understanding capitalism than this – one needs to consider the particular sort of ethical norm that underlies and supports these institutions. We will illustrate with three examples.

1. Even though there might be a large demand for this service and thus, a great opportunity for profit, “Murder Incorporated” is not regarded in a capitalistic system as a legitimate business firm. It is considered criminal, and it is not allowed to operate legally.

2. The term “profit” does not mean merely a return on an exchange that is over costs. It involves a free exchange. The gunman’s offer, “Your money or your life” is not considered a free exchange – even though most of us would prefer remaining alive to losing our money. Making such offers is regarded as criminal and legally prohibited.
3. If Mary obtains William’s property through an exchange but knowingly and willingly plans or refuses to fulfill the terms of the exchange, then Mary’s possession of William’s property is a taking of William’s property without William’s consent, because Mary possesses William’s property on terms other than to what William agreed. Such actions on Mary’s part are viewed as criminal fraud and are legally prohibited.

Clearly, Murder Incorporated, the gunman, and Mary are behaving not only in a morally wrong manner, but they are also engaging in activities that fail to qualify as examples of capitalist activities. They fail to represent what Nozick called the “capitalist acts between consenting adults” ([14], p. 163). But even more, they are engaging in activities that destroy the very institutions that define a capitalist socioeconomic system.

There is, then, an ethical dimension to understanding capitalism *as the particular type of socioeconomic system it is*. Moreover, it is an ethical dimension that gives paramount and fundamental importance to the legal protection of the institutions of private property, free exchange, sanctity of contract, and the pursuit of profit. The most powerful way to express this ethical dimension is to say that the activities of Murder Incorporated, the gunman, and Mary are violating the *rights* of the persons with whom they are involved. Rights define and sanction the central institutions of capitalism. *For the purposes of this chapter, we will say, then, that ideally speaking the ethical norm that defines what kind of activities may legally function in a capitalist socioeconomic system is individual rights.*⁵

The concept of individual rights is complex, but it can be expressed as follows: Individual human beings have a basic, negative, moral right to liberty. The term “right” is used here to refer to a claim or entitlement that individuals have on how others will treat them. “Moral” means that this treatment *ought* to exist but need not necessarily exist. “Negative” refers to the type of treatment that others owe to individuals – that is, they may *not* use individuals without their consent. Specifically, persons are prohibited from initiating, or threatening to initiate, physical force in any or all its forms against other persons. This right is considered *basic* in the sense that it is not founded on any other right and is the source for other, derivative rights – that is, rights that flow from the exercise of this basic right.

An individual’s basic right to liberty is also understood to entail two corollary basic rights: the right to life and the right to private property. The former is the right to live one’s life according to one’s own choices, and not to be physically compelled or threatened. The latter fundamentally involves not the right to an object, but the right to an action and consequence of producing or earning that object. So understood, this implies that the lives and resources, as well as conduct, of individuals may *not* be used or directed to purposes to which they have not consented.

These rights apply to every human person, but they also require a legal system for their actual implementation.

Further, given that individuals have such basic rights, they may not be coercively prohibited from doing what is morally wrong. People ought to be free to *choose* the morally wrong course of action. Physical compulsion and coercion – the boundaries of which are determined by individual rights – may be used ultimately only in defense against, or in response to, the exercise of physical force or coercion, which is generally understood to include extortion and fraud.

These rights, on the one hand, provide wide legal latitude for individuals to exercise their lifestyle choices. Economically, Nozick expressed this idea when, as already noted, he talked of “capitalist acts between consenting adults,” but this general idea also extends well beyond the economic arena to the choices of people to hold false moral and religious beliefs and to engage in morally wrong activities. On the other hand, since these rights only require that others refrain from initiating or threatening to initiate physical force in any or all of its forms, this means that those who do not approve of the beliefs and activities of others are free to disassociate themselves from them. They have the freedom to refuse to not only support these beliefs and activities but also to criticize them and to attempt to persuade people to change their ways. Individual rights thus require toleration, but they do not require support, approval, or acceptance of *what* people choose to believe or do. They only require acceptance of their right to choose – that is, not to have their lives, conduct, or resources nonconsensually used or directed.⁶

A Liberal Order

*Capitalism is not only an economic and social system; it is also a certain type of political/legal order. It is a liberal order.*⁷

As we noted at the beginning of these remarks, much of the criticism of business activity is systemic and amounts to the type of criticism that usually takes place in political philosophy. Therefore, it is important to be clear regarding just what the basic issues of political philosophy are and in what the justification for individual rights consists. However, a full analysis of these issues and the argument for individual rights is far beyond what can be achieved in an essay of this size. So, in what follows we will make extensive use of the analysis and argument that was developed in our book, *Norms of Liberty* [15], and refer the reader to that work for a more complete account and defense of what is said here.

Accordingly, the basic issues of political philosophy may be expressed in two questions:

Is there a connection between the ethical and the political/legal orders, and if so, what is the nature of the connection between them?

If there is no ethical basis for a society’s political/legal order, then, its legitimacy is, to say the least, dubious. Of course, it might be the case that there can be no

morally legitimate political/legal orders. Yet, even if it is granted that there is some connection between the two orders, it certainly should not be assumed at the outset that there is a direct or isomorphic relation between the two, much less an identity. To say that some activity X is morally right or good and that it ought to be done does not, by itself, imply that doing X ought to be politically/legally required. Further, to say that doing X is morally wrong and ought not to be done does not, by itself, imply that doing X ought to be politically/legally prohibited. Further, these claims are obviously not semantically equivalent. Indeed, Aquinas implies that there is a difference between demands of justice that are morally binding and demands of justice that are morally *and* legally binding [1, II-II, q. 23, a. 3, ad 1, and II-II, q. 80, a. 1] [1]. Thus, it cannot be simply assumed that politics is ethics writ large.

There needs to be something that connects the ethical and the political/legal orders. Indeed, this is, *de jure*, the fundamental *datum explanandum* of political philosophy, and it is incumbent on the political philosopher to show what justifies moving from one order to the next. This cannot merely be assumed. Because of the *prima facie* difference between moral and political claims that was noted above, the onus of proof is on the person who seeks to move from the ethical to the political/legal. Without such proof, there is then no ethical justification for a political/legal order.⁸

Determining the nature of the connection between the ethical order and the political/legal order is a question that has had different answers throughout the history of political philosophy. Broadly speaking, there have been two traditions of answers: an ancient and a modern one. The ancient tradition, working with the idea of a “polis” and a more or less monistic understanding of the human good, does not distinguish between the ethical order and political/legal order. Statecraft is primarily a version of soulcraft – that is to say, the function of political is “to make men moral.”⁹ The modern tradition, working with the idea of a society that extends far beyond that of a “polis” as well as a more pluralistic view of the human good, rejects the idea that statecraft is soulcraft and makes securing peace and liberty the primary aim of the political/legal order ([15], Chaps. 2 and 3).

Liberalism belongs to the modern tradition of political philosophy. Indeed, what both the critics and proponents of liberalism do not often realize is that the essential uniqueness of liberalism as a political theory is its divestment of substantive morality from politics. Liberalism stands in direct opposition to how politics has been conceived since Plato, as the effective institutionalization of the ethical. Liberalism’s true uniqueness is its endeavor to *distinguish* politics from morality in the same way it is generally recognized to have done with respect to theology.

The reasons for liberalism distinguishing politics from ethics are complicated and more than we can discuss at this time. Moreover, many of liberalism’s proponents have not adequately considered all that is involved in justifying this distinction. Nonetheless, a good way to get an accurate understanding of liberalism is to consider a task or problem that has seldom been considered by any other political tradition. Thus, this task is called “liberalism’s problem” because liberalism

has been, mostly, the only political tradition to appreciate its fundamentality and importance. This problem is expressed as a set of interrelated questions. We have expressed this as follows:

How is the appropriate political/legal order – the order that provides the overall structure to the social/political context – to be determined? What is its ethical basis? Since the structure provided by the political/legal order will rule over all equally, how can the universalism of political/legal structural principles square with the pluralistic and self-directed character of human well-being? Hence, how is it possible to have an ethical basis for an overall or general social/political context – a context that is open-ended or cosmopolitan – that will not require, as a matter of principle, that one form of human well-being be preferred to another? How, in other words, can the possibility be achieved that various forms of well-being will not be in *structural* conflict? ([15], p. 271, emphasis added and minor changes made).

Clearly, this problem presupposes the following: That society is not (and should not be confined to) simply a “polis.” That there is a great degree of diversity to be found in the well-being of different persons and that much of this comes from their communities and cultures. That there can be conflicts between forms of well-being. That self-direction is fundamental and crucial to the activity of human well-being or moral activity. That the aim of the political/legal order is to have principles that apply to all equally, and that any conflicts between forms of well-being should not be a structural feature of any social system. All these claims are quite plausible. Nonetheless, they require support, and such support can be found in *Norms of Liberty*.

The reason it is not necessary for us to provide such support here is because our task is not so grand. We want merely to show that *if* one takes liberalism’s problem as a fundamental and crucial one, then it becomes possible to see not only how liberalism can distinguish the political/legal order from the ethical but also how individual rights are a different type of ethical norm. This conclusion will in turn make a difference to how we understand and defend the institutions that define capitalism and provide the context for business activity. Finally, it will make a difference to how we conceive “business ethics.”

Assuming that liberalism’s problem is both fundamental and crucial, then how does one find the ethical basis for its solution? The criteria¹⁰ that need to be met to determine the ethical basis for a solution to liberalism’s problem are as follows:

1. It must not *structurally* prejudice the overall social context more toward some forms of human well-being than others.
2. It must be universal or equally applicable to all forms of human well-being – that is, it must be social in the open-ended or cosmopolitan sense.
3. It must be *concretely* present in any and every form of human well-being – that is, it must be grounded in some common critical element that runs through any and all forms of human well-being (or its pursuit).
4. It must appeal to some aspect of human well-being in which every person has a necessary stake.

Together these conditions do *not* constitute the basis for an ethical norm that offers guidance to individuals in seeking human well-being or in fulfilling obligations to others. Particularly, they do not constitute a basis for norms that one would

employ primarily in evaluating people and institutions *within* a capitalist system. Rather, they constitute the basis for an ethical norm that regulates conduct so as to establish conditions that secure and maintain the *possibility* of individuals pursuing their own form of well-being and engaging in moral activity among others.

Such a norm is an ethical principle whose function is primarily political or legal. This ethical principle is *not* used to guide conduct in pursuit of well-being or moral activity, because it does not consider the particular situation, culture, or nexus¹¹ of persons. Rather, this ethical principle's function is to provide the structural framework (or backdrop) that provides *the* general social context for the *pursuit* of one's well-being. Such a principle is an ethical *metanorm*.

Simply put, *liberalism is a political philosophy of metanorms*. Yet, this claim is seldom understood or appreciated. One recent author tells us that liberalism is a "normative political philosophy, a set of moral arguments about the justification of political action and institutions" ([9], p. 9). Another writer tells us that there is an "opposition . . . between liberal individualism in some version or other and the Aristotelian tradition in some version or other" ([12], p. 259). In both cases, we see liberalism treated as an ethical philosophy to be contrasted with other ethical philosophies.¹²

Herein lies much of the problem. Norms are not, in fact, all of one type differentiated by subject or thinker alone. It may be that some norms regulate the conditions under which moral conduct may take place, while others are more directly prescriptive of moral conduct itself. In light of this possibility, it is not appropriate to say that liberalism is a "normative political philosophy" in the usual sense. As said, liberalism is a political philosophy of metanorms. *It seeks not to guide individual conduct in moral activity, but rather to regulate conduct so that conditions might be obtained where moral action can take place*. To contrast liberalism directly with alternative ethical systems or values is, therefore, something of a category mistake. Such a move assumes an isomorphic relationship between the ethical and the political which is precisely what liberalism is trying to alter.¹³

Rights as Metanorms

Individual rights are metanorms, and the political/legal institutions of capitalism – that is, the institutions of private property, sanctity of contract, free exchange, and the pursuit of profit – are their real-world manifestations.

As we argue in *Norms of Liberty*, seeking to protect the possibility of self-directed action – that is, protecting the possibility of exercising *practical reason* – in a social context is the only thing that satisfies the criteria for solving liberalism's problem. By establishing the political/legal structural conditions that protect the possibility of self-direction,¹⁴ we

1. do not structurally favor or prejudice one version of human well-being over any other, because it is the exercise of practical reason that is being protected, not the achievement of its object;

2. protect something that is not only common to, but also required by, every form of human well-being. Every form of human well-being or moral activity involves the exercise of practical reason;
3. protect something that is concretely present in every form of human well-being. It is through the exercise of practical reason that generic goods and virtues achieve reality, determinacy, and value for an individual, and it is through the agency or self-direction of the individual that practical reason functions;
4. protect an aspect of human well-being in which every individual has a necessary stake. Every form of human well-being necessarily involves exercising practical reason; and
5. recognize that each and every individual ought to pursue and achieve their own form of well-being and not act in self-sacrificial ways.

Protecting the possibility of the exercise of practical reason in a social context is not central for normative ethics, because normative ethics is concerned with the right or appropriate use of practical reason, but it is vital in solving liberalism's problem. The questions that constitute liberalism's problem are different from the questions that constitute normative ethics, and so the ethical principles that are required for solving liberalism's problem are not reducible to the ones that are required for solving the issues faced in normative ethics. Protecting the possibility of self-direction in a social context is, then, the ethical basis for solving liberalism's problem.

Self-directed action cannot exist when some persons direct others to purposes to which they have not consented. Moreover, since the initiation of physical force is the single most basic and threatening encroachment upon self-direction, the purpose of the individual right to liberty is to forbid legally such activity in all its forms. The individual right to liberty allows each person a sphere of freedom – a “moral territory” – whereby self-directed activities can be exercised without being invaded by others. This translates socially into a principle of compossible *and* equal freedom for all.¹⁵

The freedom must be equal, in the sense that it must allow for the possibility of diverse modes of human well-being, and, therefore, must not be biased structurally in favor of some forms of well-being over others. The freedom must be compossible, meaning that the exercise of self-directed activity by one person must not encroach upon or reduce that of another. Thus, a theory of individual rights that protects the self-direction of persons can be used to create a political/legal order that will not necessarily require that the well-being of any person or group be sacrificed to any other.

It is important to realize that the individual right to liberty is not directly concerned with the promotion of human well-being itself, but only the condition for its possibility. It is, thus, not the consequences per se that determine when someone's liberty is violated. What is decisive is whether the action taken by one person toward another secures that other's consent or is otherwise a function of that other's choices. For one might violate another's rights and produce a chain of events that lead to consequences that could be said to be to that other's apparent or real benefit. Alternatively, one might not violate another's rights and produce

a chain of events that lead to one's apparent or real detriment. Yet, since the purpose here is to structure a political principle that protects the condition for the possibility of human well-being among others – *as understood in terms of "liberalism's problem"* – rather than leading to human well-being itself, the consequences of actions are of little importance (except insofar as they threaten the condition in which rights were designed to protect in the first place). The concern here is not with how acts will turn out, but rather with setting the appropriate foundation for the taking of any action in the first place.

It must be emphasized that the right to liberty – and individual rights in general – are not norms in the sense of guiding us toward the achievement of human well-being or moral excellence. And contrary to appearances, they are not ordinary interpersonal normative principles either. Individual rights express a type of moral principle that must obtain if we are to reconcile our need for sociality in its widest sense with diverse self-directed forms of human well-being. In other words, we need a robust social life, but we also need to succeed as individuals approaching a particular form of well-being.

Norms and obligations that specify how to live, both with respect to achieving one's own goals and with respect to living among others, are one thing; norms that define the setting for such interactions and obligations are quite another. The "obligations" one has to another in the latter case are due to a shared need to act in a peaceful and orderly social/political context. These are metanorms. The obligations one has in the former case are a function of what is needed to live well and cannot be generated apart from the particular actions, context, culture, traditions, intentions, and practices in which one finds oneself acting. Those actions and contexts call forth evaluative norms by which success, propriety, and merit can be measured and judged in particular cases. Individual rights are metanorms. They are not, however, *called upon* by the progress of a culture or an individual, but rather *depended upon*. As such, individual rights are politically and legally primary.

Business Ethics

Business ethics is not business bashing, and providing ethical support for the institutions that define business activity does not imply that there is no such thing as business ethics.

Individual rights may be metanorms that provide the ethical support for the institutions that provide the context for business activity. Nevertheless, the very point of speaking of metanorms is to provide the context for the application of the insights from normative ethics. Therefore, there is plenty of room for the discussion of ethics in business even if there is ethical support for the institutions that define business activity.

One effect of our foregoing remarks has been to suggest that in a world where rights are not understood as metanorms and where "liberalism's problem" is not at the center of one's understanding of political philosophy there is very little room for

something distinctively called “business ethics.” We make this claim because only where political philosophy allows for a distinction between norms and metanorms is it possible to have a sphere of moral understanding distinct from the political. As it stands now, business ethics is little more than a slightly specialized version of political philosophy, and the basic theories of political philosophy inform almost completely the various approaches to business ethics. This traditional or usual approach to business ethics is applicable to both ideologies of the “left” and the “right.” The propensity to adopt a framework of free markets and stockholder supremacy may be as much informed by the same mistake as an approach which advocates governmental control and stakeholder theories. That basic mistake is to assume that all norms have the same ontological and functional status differing only in degrees of “priority.” We define this position elsewhere [15, 16] as “equinormativity.” Both the left and the right may accept equinormativity, thus essentially reducing business ethics to a single sort of moral problem – namely, what set of normative principles should govern social life? The “right” answers with something like maximal liberty, while the “left” answers in terms of equality or fairness. Business ethics is then understood in terms of, and measured by, its contributions to one of these political philosophical frameworks.

By contrast, if we see political philosophy as essentially concerned with recognizing the centrality of liberalism’s problem, making political philosophy a matter of considering the appropriate metanorms, then it is conceivable that business ethics could be a normative field quite distinct from questions of metanormativity (and thus political philosophy) and containing its own set of problems, principles, and normative conclusions. The framework in which business ethics (and any institutional ethics) would operate would, of course, be the metanormative, but its concerns would be entirely different, and discussions of business ethics could not be reduced to issues of metanormativity. If, on the other hand, one’s posture toward political philosophy is to deny the centrality of liberalism’s problem and to embrace equinormativity,¹⁶ then finding a distinctive domain for business ethics becomes increasingly problematic.

For the preceding reason, we believe that our approach “makes room” for business ethics. Yet, if there is something distinctive about business ethics, it would have to be connected to what is distinctive about business as an activity. Strangely enough, many texts on business ethics simply proceed as if everyone understands what business is (e.g., it somehow concerns “corporations”). When business is defined, the definitions simply presuppose the approach to political philosophy we have rejected above. In one text, for example, business is said to be “a complex fabric of human relationships – relationships between manufacturers and consumers; employers and employees; managers and stockholders; and members of corporations and members of the communities in which those corporations act” ([8], p. 1). Besides giving us no clue as to what links all these paired relations together,¹⁷ the “definition” is so open-ended and inclusive as to incorporate the whole of society, thus making business ethics simply a species of political or social theory. We have little doubt that the authors of this way of looking at business were quite pleased with such a result, but it merges business ethics into social ethics making business ethics an example, and not a separate subject area.

In another text, we were told that “the question on ‘what business per se is, and what its proper concern is?’ is a social question that must be answered in a social context . . . Business is a social enterprise. Its mandate and limits are set by society” ([5], pp. 10–11). Like the previous example, this definition either begs all the important questions in political theory or is simply platitudinous. Of course, we cannot beg the question either, but the earlier parts of this chapter are meant, as we noted, to address the main points of political philosophy. To say that “society” defines “business” (or any other activity) is simply to say that it is nothing in itself and could be defined in any way. That is little help in identifying a special subject of business ethics. Now that we have opened up the possibility for the distinctive subject area of business ethics, how can we define “business” in such a way that we can begin to properly think about an ethics in relation to it?

On this score, we need not make any claims to originality. The best definition we have found is the one offered by Elaine Sternberg: “the defining purpose of business is to maximize owner value over the long term by selling goods or services” ([18], p. 32). What this definition may imply by way of an ethics is well worked out by Sternberg in her book, *Just Business* [18]. Our task in closing our remarks here is to say a few things about the salient features of this definition.

One, first of all, realizes that this definition does not cover everything one might do. It is not so connected with everything in one’s social environment that we must leave it up to “society” to tell us which among our activities qualifies as “business.” One’s charitable or family activities are not covered by this definition. Indeed, not even all of one’s commercial activities are covered, for the definition does not apply to one as a consumer. At the very least, then, we can carve out an area for business ethics that is not reducible to a version of political philosophy and may have some uniquely specifiable norms connected with it.¹⁸ The first main term to focus upon after realizing these general characteristics is to “maximize.” Let us skip over that term for just a moment and focus first upon “owner.” Owner is a complicated term carrying with it notions of property and proprietary relationships. In this respect, it is likely to be tied into various legal and social relations that define specific rules for determining when one is an owner or the agent of an owner. Whatever those specific rules and relations may be, the point here is that one *owns* something, even if all that one owns is one’s own labor. The implications of an ability to exclude and to dispose freely are contained in the idea of ownership. Given that, we can say very fundamentally that *business ethics is addressed primarily and essentially to owners.*

Going back now to the first term, we learn that business is about maximizing something. This in itself suggests that whatever is being pursued is not being pursued in a partial or deferential way. We might expect, therefore, that norms calling for such limitations on the pursuit of value would rather be contrary to the nature of business. Of course, what is being maximized here is “owner value.” Because we are talking about ethics, this is the term in the definition that might be called the “responsibility locator.” In the definitions cited above, the responsibility locator was essentially the “society,” whereas here responsibility falls squarely on the shoulders of owners. This locus of responsibility suggests that the risks and the burdens – as well as the benefits – are to be borne by the owners. They may solicit

others in the pursuit of their ends, but the ultimate spring of responsibility is the individual owner.

The owner is also doing something in particular, and this definition suggests that the principle thing the owner is doing is “selling.” One may think that owners also buy, and while that is true, it is a derivative and instrumental function. If owners buy, they do so in order finally to sell. That in part is what differentiates a business person from a consumer. Consumers buy. They may also sell, but they do so in order to buy more. Consumers and business persons are both “traders,” which explains why the term “trader” is too broad for this definition. Of course, to other sellers a given seller (business person) may look like (and is) a buyer (consumer). That is a matter of perspective. But again, the responsibility locator tells us that the perspective we need to take here is that of the owner. The owner as a business person is a seller.¹⁹ One other thing to notice is that the owner/seller is making offers “over the long run.” We understand the point here to be that the owner/seller is making iterated trades. One exchange to maximize value for an owner does not a business make. We recognize this when we speak of someone being *in* business.

That seller/owner is offering something, and as the definition specifies, the seller/owner is offering “goods or services.” The “or” in “goods or services” may be either inclusive or exclusive, but the main point is that something is offered to others that the owner’s hope will be of value to them and from which value will be returned to the owner. What is sold may be tangible (e.g., a product) or intangible (e.g., advice), but what is offered is offered with the expectation of a return of value greater than any alternative use of the resources that go into the offering itself. If the owner had another better alternative, but chose this one, then the owner would not be maximizing. Any fiduciaries to owners must, therefore, also consider what would maximize for the owner they represent. That is what it means to be a fiduciary. It is important to note, however, that the returned value to an owner need not always be in monetary form. Because of the “place holder of value” nature of money, money is the preferred medium of the return of value since it does not define the end to which it is put. Moreover, its objective properties make it easiest for all parties to work with in calculating value. But it is conceivable that owners may take less money for some offering if they are gaining more of something else they might value, for example, the approbation of their peers, the excitement of the deal, or an initial investment in the anticipation of a greater gain later. The point, though, is that those calculations belong to the owner and no one else.

Each of the terms of the Sternberg definition, as well as the definition as a whole, will raise interesting questions about the appropriate ethical norms and guidelines. In a world where business relationships are intricate and multi-faceted, some of the issues may become very complex. While the approach we have taken here may rule out in principle any calls for the sacrifice of the owner’s pursuit of maximal value to others or to society, it does not thereby mean that the owners are exempt from *paying* for services they receive from others (or society); nor does it mean that owners need not be concerned about broader social issues than simply the “bottom line.” As we noted, however, our concern here is not with these issues. Our concern has been to define a specific sphere of inquiry within which we can explore the sorts of obligations

and recommendations that a business person might need to consider. In doing this, we have made a simple assumption: knowing what a business *is* is necessary for understanding the ethical obligations and recommendations appropriate to it.

Conclusion

We “make room for business ethics” by first understanding what essentially characterizes its subject matter. The other thing one needs to do, and which we did in the earlier parts of this chapter, is to provide a context in which business ethics can be understood in its own unique way. With these preliminaries, then, one is now ready to launch into an investigation of business ethics.

Notes

1. This chapter has been taken, with minor changes, from [13].
2. Tibor R. Machan and James E. Chesher discuss this phenomenon and differentiate business bashing from business ethics (See [10], p. xii; and see also [11]).
3. Many texts on business ethics (see, for example, [2, 6, 7, 17]) are filled with criticisms that are systemic in character, for instance: a capitalist system of private property and free exchange fails to embody the ideals of “economic” or “social” justice; capitalism fails to promote the common good or reflect our most important social values; the function of business activity ought *not* to be simple to make a profit; the job-market in capitalism fails to provide fulfilling (or non-alienating) work; and the ethos of capitalism promotes (or allows for) moral mediocrity. Indeed, Machan and Chesher observe that “most texts do not concern so much the occasional difficulties that arise in business but discuss its very essence, such as making profits, owning shares, employing workers, and trading on the stock market” ([10], p. xi). (For some particularly egregious examples of this systemic critique, see [4, 6]).
4. We illustrate and discuss this tendency below, when we discuss equinormativity.
5. We are aware, of course, that there has been for some time a growing movement away from this understanding of capitalism and that even in the United States what passes for a capitalist socioeconomic system now is but really an instance of the mixed economy where many business interests routinely seek, obtain, and use government coercion for their own advantage (See [3], p. 3). Recently, this mixed system has been called by the media “crony capitalism.”
6. The most basic way by which one’s life, conduct, and resources are used or directed without one’s consent is through the use of physical force ([15], p. 89 n15).
7. Of course, we mean “liberal” in the classical sense – as expressed, for example, by John Locke or Frederic Bastiat.
8. These last two paragraphs are taken with minor changes from *Norms of Liberty* ([15], p. 85).
9. Aquinas distinguishes between the two orders, but ultimately this is not based on some principled difference between them but simply the practical difficulties in achieving the common good of the political community.

10. This is only part of the list developed (See [15], p. 272).
11. The term “nexus” refers to that set of circumstances, talents, endowments, interests, beliefs, and histories that descriptively characterize the individual.
12. Of course, nothing could be further from the truth than saying that liberalism and Aristotelianism are necessarily opposed. MacIntyre is right, however, to the extent that the “opposition” would be greater without the metanormative distinction.
13. These last two paragraphs are taken from *Norms of Liberty* ([15], pp. 33–34).
14. Self-direction is “the act of using one’s reason and judgments upon the world in an effort to understand one’s surroundings, to make plans to act, and to act within or upon those surroundings” ([15], p. 89).
15. This paragraph and following four are adapted from *Norms of Liberty* ([15], pp. 89–92).
16. Equinormativity assumes that all ethical norms are of the same type and have the same function.
17. Hoffman and Moore go on to mention the relations as being “economic” but then immediately mention that they are moral as well, leaving open the possibility of an infinite number of characterizations and thus, no specialized way to group the named relations.
18. Sternberg outlines a number of the general normative parameters right after offering the cited account of what it means to be a business.
19. Sternberg notes that “selling” includes leasing, renting, and the like ([18], p. 217).

Part 18

Property Rights: Material and Intellectual

Robert W. McGee

Abstract

This chapter compares and contrasts utilitarian ethics and rights-based ethics. It discusses the structural flaws of utilitarian ethics and suggests using rights-based ethics as an acceptable alternative.

Introduction

Utilitarian ethics is the dominant ethical system for economists and certain other policy makers. Yet it has structural flaws that cannot be remedied if one wants to stay within the utilitarian paradigm. Remedying the structural flaws causes one to go beyond utilitarian ethics and into rights theory. However, applying rights theory can only identify unethical conduct. It cannot tell us whether non-rights-violating activity is ethical or unethical. Any activity that violates rights is *prima facie* unethical, but activities that do not violate rights may or may not be unethical, depending on the particular activity.

Competing Ethical Systems

The initial issue to be addressed is which ethical system is to be applied to the analysis of property rights. Although various ethical systems often reach the same result when applied to particular cases, sometimes the results differ, depending on which set of ethical principles is applied.

R.W. McGee

School of Business and Economics, Fayetteville State University, 1200 Murchison Road,

e-mail: bob414@hotmail.com

Baron, Pettit, and Slote [1] identified and discussed three different ethical systems: Kantian ethics, consequentialism, and virtue ethics. Graham [17] subdivided ethical systems into eight categories: egoism, hedonism, naturalism and virtue theory, existentialism, Kantianism, utilitarianism, contractualism, and religion. Broad [6] split ethical theories into five categories. Other scholars have used different classification systems [15, 27, 51, 57]. However, when boiled down to their essentials, most rational systems of ethics are based on some form of utilitarianism or rights theory, or some combination thereof.

Kantian ethics addresses issues of duty and rights and asks questions such as “What if everyone did it?” the underlying premise being that the act would be good if the result were human flourishing or a positive result [22–26, 49]. Consequentialism [17, 42, 43, 48, 51, 52, 54] asks, “What are the consequences?” of a particular act or policy, the underlying assumption being that the act is ethical if the end result is good, or as Shakespeare [47] would say, “All’s well that ends well.” It is basically a utilitarian approach.

Utilitarian ethics is about comparing the good and bad. If the good outweighs the bad, the policy or act is good. Otherwise, it is bad [5, 36, 53]. Virtue ethics holds that a policy or act is good if the result is human flourishing, which is basically utilitarian, although rights are not always ignored. Egoism and hedonism both incorporate utilitarian concepts, such as maximizing pleasure and minimizing pain. Religion, while basically irrational, does incorporate both utilitarian theory and rights theory. “Thou shalt not kill” and “thou shalt not steal” are forbidden both because they violate rights and because they result in negative-sum games, although the reason religionists give is “because God says so.”

Since most rational ethical systems are based on either utilitarianism or rights theory, we will limit our discussion to these two basic approaches without getting into the fine distinctions that separate one branch of ethical theory from another.

One must examine utilitarian ethics if for no other reason than because it is the dominant ethical system among economists and many other policy makers, legislators, and philosophers. Failure to examine utilitarian approaches would result in an incomplete analysis. However, there are major structural deficiencies with utilitarian approaches that cannot be overcome by massaging. Thus, it will be necessary to go beyond utilitarianism to provide a complete and comprehensive analysis of ethical issues.

The other approach we shall examine is the rights approach. Rights theory was chosen because a proper application of rights theory overcomes most of the deficiencies of utilitarian ethics, as we shall see.

The two approaches might be summarized by the following flowcharts (Figs. 65.1 and 65.2).

The basic premise of utilitarian ethics is that an act or rule is ethical if the gains exceed the losses. The basic premise of rights theory is that an act or policy is unethical if someone’s rights are violated. However, rights theory does not answer questions such as whether an act or policy is ethical if no one’s rights are violated. For example, victimless crimes such as prostitution, polygamy, and ingesting

Fig. 65.1 Utilitarian ethics

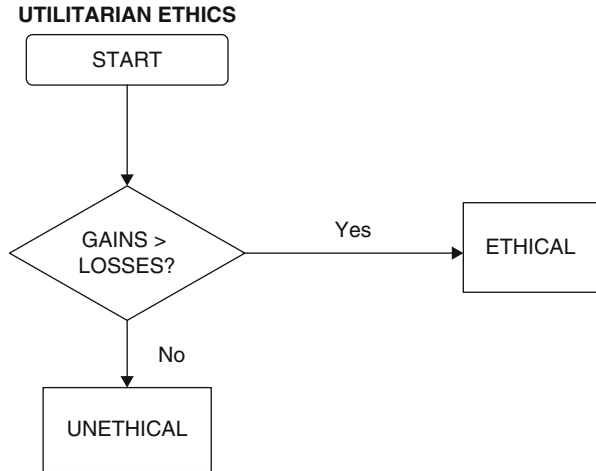

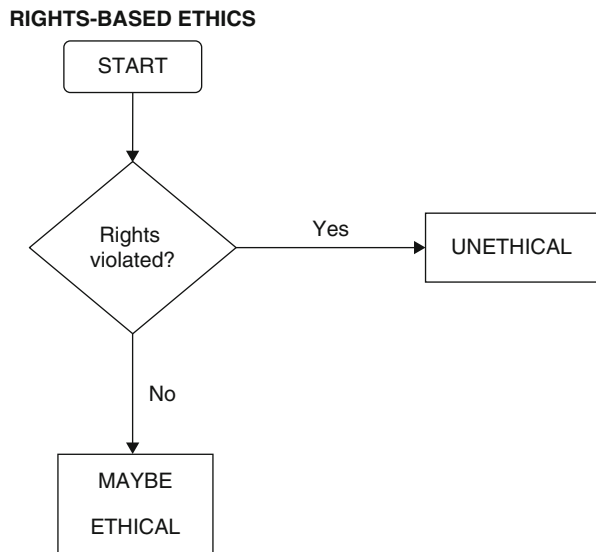

Fig. 65.2 Rights-based ethics

marijuana or hard drugs does not violate anyone’s rights, but rights theory cannot be used to determine if those acts are ethical. All that can be concluded is that such acts should not be illegal because making them illegal violates the rights of the participants. Sometimes, applying utilitarian ethics and rights theory to a particular case will reach the same result, but sometimes the results will be different.

Utilitarian Ethics

According to classical utilitarian ethical theory, an act is ethical if the result is the greatest good for the greatest number [5, 36, 50]. On the surface, it is a statement that is difficult to quibble with. What is the alternative, to do something that does not result in the greatest good for the greatest number?

However, there are a number of flaws with this approach. One flaw, although perhaps not obvious, is the fact that it is mathematically impossible to maximize more than one variable at the same time ([18, 55], p. 11). One may attempt to achieve the greatest good or one may attempt to better the lot of the greatest number of people, but one may not do both at the same time.

Another criticism of utilitarian ethics is that one tends to forget those who are not benefitted. What happens to those who do not gain from a particular act or policy? Are they in the same position as before or are they made worse off? If so, by how much? Are they made just a little worse off or do they suffer major worseoffness? There is no way to accurately measure gains and losses [45, 46] because all costs are subjective [7]. Thus, it is also impossible to compare interpersonal utilities, which are discussed below.

Another question that might be asked is whether an act or policy is ethical if a small minority benefit a great deal while the vast majority of people are harmed just a little. Questions such as this must be addressed whenever a protectionist economic policy is being considered. If a proposed tariff on the importation of foreign textiles results in increasing the price of all shirts sold within the country by \$5, is adopting the tariff a good policy if it saves 5,000 jobs in the domestic textile industry, even though it also increases the price that 300 million consumers must pay for each shirt or blouse? What if the cost increases by \$8? Or \$2? What if the number of jobs saved is 30,000? Or 200? [33]. A utilitarian might reach a different conclusion, depending on what the numbers are in a particular case. It is impossible to measure the gains and losses precisely, of course, but estimates may be made.

This brings us to the next problem – measurement of gains and losses. In the example given above, the cost per shirt and the number of jobs saved were both given, but in the real world, such numbers are not readily apparent. Someone must make estimates, which are nearly always different than the final figures. After the fact, it might be possible to look back and see what the actual result was and what the actual price change and jobs saved were. Or maybe it would not be possible to measure gains and losses even after the fact because price changes and job gains and losses are caused by more than just a change in tariff policy.

Another inherent problem with utilitarian approaches is that it is not always easy, or even possible, to identify all individuals and groups that are affected by a particular act or rule. Frédéric Bastiat (1801–1850), a French political economist, gave perhaps the best illustration of this weakness in his essay, *What Is Seen and What Is Not Seen* ([2], pp. 1–50). In the opening paragraphs of that essay, Bastiat states what has become a classic quote:

There is only one difference between a bad economist and a good one: the bad economist confines himself to the *visible* effect; the good economist takes into account both the effect that can be seen and those effects that must be foreseen. ([2], p. 1)

He goes on to illustrate this point using an example that has come to be known as the *Broken Window Fallacy*. The story begins when a young boy breaks a pane of glass. A crowd gathers and begins to discuss what they have seen. Someone points out that something good has resulted from this event. Such accidents keep glaziers in business. Broken windows are good for the glass business. Without such happenings, glaziers would be out of work. If the glazier charges 6 francs to replace the glass, he is 6 francs ahead.

A bad economist would end the analysis at that point and would conclude that it is good to break glass because doing so keeps glaziers in business. It stimulates the glass business.

One might think such a conclusion is impossible, a view that no one would espouse, but modern day economists (if you can call them that) continue to reach such conclusions. In August 2011, for example, some economists and politicians asserted that Hurricane Irene, which caused billions of dollars of damage up and down the east coast of the United States, helped to stimulate the US economy because the damage caused to houses and other buildings had to be repaired, causing an increase in demand for housing and other real estate and thus was a source of job creation. Another modern example is the view that war is good for the economy because it stimulates certain sectors of the economy, most notably those sectors that supply the military.

That is what is seen. What is not seen is what would have happened in the absence of the broken glass, the hurricane, or the war. Raising the question of what is not seen is what makes Bastiat's example of enduring value. In his broken window example, he points out that since the owner of the broken glass must spend 6 francs to replace it, he now has 6 francs less to spend on other things, such as a new pair of shoes or a book. Rather than having both a window and a book, he now has just a window. If the bad economist takes this fact into consideration, he might conclude that the breaking of the pane of glass resulted in a zero-sum game, since the glazier's gain is exactly offset by the glass owner's loss.

But that is not the end of the story. There are two losers and only one winner. The glazier wins, while the owner of the pane of glass loses, along with the book seller or the cobbler. We cannot identify who the second loser will be, since the owner of the pane of glass never had the opportunity to decide whether he would use the 6 francs to buy a book or a pair of shoes. Thus, all we know is that there are two losers, although we cannot identify who the second loser is.

All we can conclude is that destruction of property results in a negative-sum game because the losers exceed the winners. That conclusion is valid whether it is a broken pane of glass, a war, or a hurricane. One of the structural weaknesses of utilitarian ethics is that it is not possible to identify all the winners and losers.

Another weakness of utilitarian approaches is that it is not possible to compare interpersonal utilities [9, 16, 21, 37, 38, 40, 41, 46], a topic that entire books have

been devoted to [13]. That is one of the structural deficiencies of utilitarian ethics, a deficiency that some economists continue to either ignore or gloss over [19, 29, 32].

Value scales of each individual are purely ordinal, and there is no way whatever of measuring the distance between the rankings; indeed, any concept of such distance is a fallacious one. Consequently, there is no way of making interpersonal comparisons and measurements, and no basis for saying that one person subjectively benefits more than another. ([46], p. 258)

It cannot be said that a dollar has more value to a poor man than to a rich man. Such a statement misapplies the law of diminishing marginal utility. If the rich man and the poor man both find a dollar lying on the sidewalk and both decide to use it to purchase a candy bar, it cannot be said that the poor man derives more pleasure from consuming the bar than does the rich man. In some cases, the rich man might actually gain more pleasure, especially if he is hungry and the poor man has just finished dinner.

But interpersonal utilities cannot be compared even if both men have just finished dinner, so it cannot be said that transferring wealth from the rich to the poor will increase overall utility in society. What can be said with a high degree of certainty is that a policy of wealth redistribution from the rich to the poor will likely have a long-run effect of decreasing wealth in society, since it will take away the incentive for rich people to continue to produce wealth and it will reduce the incentive of poor people to work, since they are getting something for free, without the necessity of working for it.

All of these deficiencies of utilitarian ethics make it an imperfect tool for arriving at ethical decisions. However, these deficiencies pale when compared to the one deficiency that makes utilitarian ethics fatally flawed – the total disregard of rights [34, 35].

A true utilitarian would totally disregard rights when performing a utilitarian analysis. All that counts is whether the winners exceed the losers or whether the result is a positive-sum game. Some utilitarians even deny that rights exist. Jeremy Bentham is a classic example of this view.

...there are no such things as natural rights – no such things as rights anterior to the establishment of government. . . *Natural rights* is simple nonsense: natural and imprescriptible rights, rhetorical nonsense, – nonsense upon stilts. ([4], pp. 52–53) [56].

Fyodor Dostoevsky (1821–1881) provides a classic example in the literature of the application of utilitarian ethics. In *The Brothers Karamazov* [12], he asks the question of whether it would be permissible to torture one small baby to death if the result would be eternal happiness for everyone else. A utilitarian would be quick to respond that such an act would be justified, since it would prevent much greater suffering by many millions of people. One need not measure the precise extent of the gains and losses to arrive at such a conclusion, since the gains so far exceed the losses. How could one possibly conclude, on utilitarian grounds, that the baby should not be tortured to death?

In *The Devil and Miss Prym* Paulo Coelho [8] raises a similar question when the villagers of a poor, declining village are given the opportunity to greatly improve their lot when all they have to do is murder one of their members. The loss of one murdered villager, who happens to be old and in ill health anyway, is more than offset by the gains to the other members of the community. If one were to apply utilitarian ethics, the clear choice would be to murder the villager.

The Property Rights Approach

The Dostoevsky and Coelho examples are outrageous but they serve to illustrate the strict application of utilitarian ethical principles. The rights of the baby and villager are totally ignored in this utilitarian calculus. All that is considered in their regard is the amount of suffering they would have to endure, which is then compared to the benefits to the rest of the community that would result if they were tortured or murdered.

The strength of the property rights approach is that the deficiencies of utilitarian ethics can be circumvented. There is no need to try to maximize one or more variables using some kind of mystical utilitarian calculus. There is no need to attempt to measure gains and losses, which cannot be done anyway, since interpersonal utilities cannot be compared. There is no need to identify which groups would be affected or how they would be affected. The only question that needs to be asked is whether someone's rights are violated. If the answer is *yes*, the act or policy is automatically unethical. If the answer is *no*, then the act or policy should not be prohibited whether it is ethical or not.

Before continuing, we must make two digressions to elaborate on some points that might not be readily apparent. The first digression has to do with determining the ethics of a situation where no one's rights are violated by a particular act or policy. Rights theory does not answer this question for us. An act or policy that does not violate rights may be ethical or unethical, but we cannot apply rights theory to determine the ethical nature of the event.

For example, smoking marijuana does not violate anyone's rights. Therefore, in a just state that allows individuals to do whatever they want so long as they do not violate anyone's rights, smoking marijuana should be allowed. But it cannot also be said that smoking marijuana is either ethical or unethical unless we go beyond rights theory and apply some other principles to determine the ethical nature of the act.

Some religionists would be quick to assert that smoking marijuana is unethical because it defiles the body, which is a temple of the Holy Spirit. Mormons and some other religious groups use this argument to dissuade their members from consuming coffee, Coca-Cola, and other caffeine products (I do not know what their policy is on chocolate but, to paraphrase Socrates, a life without chocolate is not worth living).

Others might argue that smoking marijuana is an ethical act because it reduces pressure in the eyes, which benefits glaucoma victims, or that it reduces blood

pressure or reduces tension, which have positive health benefits. Perhaps the consumption of marijuana could be either ethical or unethical, depending on the facts and circumstances. If smoking it causes one to be lethargic and lazy and less capable of productive work, the argument could be made that it constitutes an unethical act if one begins with the premise that one has an ethical duty to “do something with your life.”

One might examine other victimless crimes along the same lines to try to determine the ethical implications of doing something that harms no one except perhaps yourself. If one begins with the premise that doing things that are life affirming is ethical and doing things that are harmful is unethical, then one might conclude that smoking cigarettes is unethical even if done in the privacy of one’s own home, even if children or others are not present to inhale the secondary smoke, because smoking is harmful to the person who smokes. Ayn Rand might dispute this line of reasoning, at least in her precancer days.

Hiring the services of a prostitute is widely considered to constitute immoral conduct, but doing so does not violate anyone’s rights, whereas outlawing the practice does violate the contract and property rights of at least two people, the prostitute and his or her client. If a pimp (broker) and brothel owner are involved, their rights are also violated by the prohibition. Applying utilitarian ethics to the issue would lead one to conclude that the practice is ethical, since there are at least two winners and no losers, but applying rights theory does not lead us to an answer regarding the ethics of the act.

One may examine a number of other victimless crimes along the same lines. Bigamy and polygamy are widely considered to be unethical acts these days, although they were approved of in the Bible and there may be valid economic reasons for entering into such relationships. Applying utilitarian ethical principles to the issue leads us to conclude that these acts are ethical, since all parties agree to enter into the relationship, thus making all participants winners, with no losers. Applying rights theory to the issue leads us to conclude that the act should not be prohibited, since no one’s rights are violated, although rights theory cannot help us to determine whether such a relationship is ethical. We must look beyond property rights to make that determination.

The second digression requires us to discuss the concept of harm. It is often asserted that we must not do anything to harm anyone else. Such a position seems obviously valid on the surface, but a closer examination of the concept of harm soon reveals that the matter may not be resolved so easily.

For example, let us say that a large grocery chain decides to open a location across the street from a mom and pop grocery store. The chain store plans to offer a wider range of products at lower prices and will stay open 24 h a day. Mom and pop cannot compete on price because their small volume precludes them from taking advantage of quantity discounts. They cannot offer the same large variety of products the chain store offers and they cannot stay open 24 h a day because they need to sleep and take a few days off now and then.

There is no doubt that the chain store will harm mom and pop’s business. It may even drive them out of business. However, no one’s property rights are violated as

a result of opening the chain store across the street. Thus, the application of rights theory would lead us to conclude that the chain store should be permitted to open across the street.

Applying utilitarian ethical principles might also lead us to this conclusion, since the general public would benefit by a wider variety of goods that are available 24 h a day at lower prices. The only people who would not benefit are mom and pop, compared to everyone else in the neighborhood, although it might be pointed out that mom and pop would be harmed severely whereas each other member of the community would benefit just a little bit. One problem of this utilitarian calculus is that mom and pop's loss cannot be compared to the gains of the rest of the relevant community because it is impossible to compare interpersonal utilities.

If some zoning board or other community group or government prevented the chain store from opening across the street from mom and pop, the property and contract rights of the store owners (the shareholders) would be violated. What is less obvious is that the property and contract rights of each member of the community would also be violated, since they would be prohibited from entering into contracts with the chain store and trading the property they have (cash) for the property they want (e.g., groceries).

Two Kinds of Rights

Since we are talking about rights, it might be worthwhile to elaborate on what kind of rights we are talking about. So far, the discussion has focused on negative rights. But negative rights are not the only kind of rights. The other kind of rights is called positive rights. There is a big difference between these two categories of rights.

Simply stated, negative rights come before government, whereas positive rights come from government. Property existed before governments [3, 10, 11, 14, 28, 30, 31, 39]. Indeed, the main reason why governments were formed was to protect property rights, as well as other negative rights, such as the right to life and liberty. Stated negatively, these rights constitute the right not to be deprived of life, liberty, or property. It was more efficient to form groups to protect these rights than to have each individual protect them individually.

As Bastiat [3] pointed out, a group of individuals cannot morally do anything that an individual cannot do. An individual can protect property. So can a group of individuals. Merely forming a group of individuals into a government does not create any mystical rights that individuals do not themselves possess. Groups of individuals can delegate the rights they have to some organization, such as a government, but they cannot give that organization any rights they themselves do not possess.

A government has no moral authority to confiscate property unless the individuals who formed the government also have this right. A group of individuals cannot morally justify the forcible taking of property by voting just because they have formed a government. For example, two wolves and one sheep who vote on what to have for lunch might decide that it is the sheep that will be the main course, but such a vote violates the rights of the sheep, thus making the vote invalid. The fact that the majority voted to deprive the sheep of its rights is irrelevant.

Rent control is one example of this supposed mystical transformation of rights that would allow groups to have rights that individuals do not possess. Landlords have the right to do with their property as they see fit. They have the right to charge whatever they want for rent. If they attempt to charge more than the market rate, they will have vacancies.

If one tenant tries to force the landlord to reduce the rent from \$1,200 to \$700 a month at the point of a gun, the landlord's rights are violated by the tenant. If 20 tenants get together and try to force the landlord to reduce the rent to \$700 a month at the point of a gun, the landlord's rights are violated. If those tenants form a government or capture the government and pressure the government into forcing the landlord to reduce their rent to \$700 a month, the government is violating the landlord's property rights. The fact that it is some government rather than one or more individuals that is holding the gun to the landlord's head does not change the ethics of the situation. One person's right to use his own property as he sees fit (the landlord) must be violated so that others (tenants) can enjoy this positive right to the rent subsidy.

All positive rights regimes are of the same nature. The right of one party must be sacrificed or violated so that someone else can exercise some right that would not exist in the absence of some government creating the right. Positive rights are created by governments and such so-called rights always violate someone's negative rights.

These positive rights regimes are not new. They go back to the days of the guilds, if not before. The button-making guild in seventeenth century France prohibited button makers from making more than a certain number of buttons and prevented button makers from making any new designs unless they received prior approval from the guild [20, 44]. Those who dared to be creative and exercise their brains to create something new stood to be punished or even jailed if they tried to sell their newly created property to the public. In those days, it was not even possible to become a button maker unless the guild approved that person for membership. One person's right to earn a living was prohibited by some governmentally approved group that wanted protection from competition.

The right of restaurant owners to refuse to serve anyone they want for any reason they want is violated by the governmentally created right not to be discriminated against on the basis of race, gender, sexual preference, age, etc. The right to earn a living by supplying accounting, legal, or medical services is violated by laws that protect members of the American Institute of Certified Public Accountants, the American Bar Association, and the American Medical Association from competition.

Governments can create positive rights only by violating the negative rights of others. Exercising a negative right, on the other hand, does not violate the rights of anyone. My right to property does not violate your right to property. My right to enter into contracts does not violate your right to enter into contracts. Thus, the only rights regime that is ethical is a negative rights regime. That does not mean that all exercises of negative rights constitute ethical acts. Ingesting marijuana, caffeine, cocaine, or other drugs might constitute unethical conduct but they do not violate anyone's negative rights.

Conclusion

Although utilitarian ethics is the dominant ethical system for economists and certain other policy makers, it is a fatally flawed ethical system. Applying rights theory overcomes many of utilitarianism's basic flaws but does not tell us whether a non-rights-violating activity is ethical. All that rights theory tells us is that any activity that violates rights is automatically unethical.

Abstract

This chapter discusses the body as property doctrine and then applies it to a variety of topics and issues, including the justification for taxation, victimless crimes, dwarf tossing, prostitution, suicide and assisted suicide, taking drugs, regulating access to certain foods, selling and renting body parts, occupational licensure laws, polygamy, gay marriage, and sexual acts between consenting adults.

Introduction

The body is perhaps the most basic kind of property. Everybody owns one – their own. Or do they? You can own your own body only if no individual or group of individuals prevents you from using it as you see fit. If some individual, group of individuals, or government prevents you from doing with your own body as you see fit, you are no longer a complete owner. You are sharing ownership with those who place limits on your use of your own body. To the extent that someone else has a property interest in your body, you are a slave.

This chapter reviews the body as property doctrine and applies it to some cases where governments have taken a partial ownership interest in the bodies of the citizenry.

The Body as Property

Though the Earth, and all inferior Creatures be common to all Men, yet every Man has a *Property* in his own *Person*. This no Body had any Right to but himself. The *Labour* of his Body, and the *Work* of his Hands, we may say, are properly his. Whatsoever then he removes out of the State that Nature hath provided, and left it in, he hath mixed his *Labour* with, and joyned to it something that is his own, and thereby makes it his *Property*. It being by him removed from the common state Nature placed it in, it hath by this *labour* something annexed to it, that excludes the common right of other Men. For this *Labour* being the unquestionable Property of the Labourer, no Man but he can have a right to what that is once joyned to, at least where there is enough, and as good left in common for others. [50]

The body as property doctrine begins with the premise that the body is property. It is a reasonable premise since all alternative premises are untenable. John Locke [50] provided one of the earliest comprehensive discussions of the topic. Others have built upon his work [25, 41, 49, 52, 60, 71–73, 77].

An extension of this premise is that my body belongs to me and your body belongs to you. Such a premise might seem obvious, but this view is not the only one that has been accepted throughout history. In slave societies, going back to biblical times, one person's body was sometimes considered the property of another person.

Your male and female slaves are to come from the nations around you; from them you may acquire slaves. You may also acquire some of the temporary residents living among you and members of their clans born in your country, and they will become your property. You can will them to your children as inherited property, and can make them slaves for life . . . (Bible: Leviticus 25: 44–46)

In the former Soviet Union and other totalitarian societies, a person's body belonged to the state. One reason why people in the former Soviet Union were not permitted to leave was because of the belief that the state had an investment in them (education, etc.). In a conversation I had with a Cuban immigrant, she told me that when she told the Castro government she wanted to leave Cuba and come to the United States, they told her she could leave but only after reimbursing the Cuban government \$35,000 for the value of the education they provided to her. Rather than pay, she waited until she was in Costa Rica (as a member of the Cuban National Ballet), where she deliberately broke her own leg, which enabled her to stay in a local hospital rather than return to Cuba. She used the opportunity to escape to the United States.

The slave ownership concept and the state ownership concept have not been totally eradicated in modern societies. They are still with us to a certain extent.

The military draft is one example [34, 37, 87]. In governments that require compulsory military service, the underlying premise is that the state owns the bodies of the citizenry and has the moral authority to compel individuals to do certain things, such as serve in the military and risk their lives in what at times amounts to unjust wars or foreign follies. One policy that the US President George W. Bush and others have advocated is a year or more of compulsory civilian service to the government or to some organization on the government's approved list. *The Universal Service Act of 2003* is only one example to force people to give up 2 years of their life to the state. Luckily, it did not pass, but the idea is alive and well.

Fig. 66.1 Relationship of the individual to the state

There are basically just two views of the relationship between the individual and the state. According to one view, the state is the master and the people are the servants. The other view holds that the people are the masters and the state is the servant. Totalitarian regimes believe in the first view, whereas liberal democracies believe in the second. However, it would not be correct to say that liberal democracies totally believe in the view that the people are the masters and the state is the servant, as indicated by policies like mandatory military or civilian service.

These two extreme relationship possibilities may be viewed as a continuum where most relationships between the government and the people fall somewhere in between. The range of relationships may be depicted as follows (Fig. 66.1).

Just because a country elects its representatives does not mean that it is a just regime. Both Hitler and Mussolini came to power through the democratic process [38, 85]. And it should not be overlooked that a group of people can be tyrants as well as individuals. James Madison warned us about untrammelled majoritarianism in *The Federalist* [35]. The French Revolution is one example of mob rule that could be given. The Cultural Revolution in China is another example of mob mentality [13, 48].

Democratically elected representatives are also capable of treating the citizenry like slaves. Any elected official who advocates compulsory community service or compulsory military service falls into this category.

Individuals are free to the extent that they can do with their bodies as they see fit. To the extent that they cannot, they are slaves, either of a traditional slave owner or of some government.

Some forms of government slavery are not as obvious as others. To the extent that prostitutes are punished for renting out their bodies, the government owns their body. The same goes for a woman who is punished for renting her womb for surrogacy purposes or someone who is arrested for selling their blood or other body parts [25, 77]. If they cannot use their bodies for these purposes, then they do not own their body. The government owns it.

Fabry [25] raises an interesting as well as scary issue. While harvesting the body parts of a recently deceased person may sound reasonable to the average person, how about harvesting the vital body parts of a person who is still living so that the lives of two or more other individuals can be saved? Applying utilitarian ethics to this case would lead one to conclude that such an act would be ethical since two or more people are saved, whereas only one person dies. Such examples serve to illustrate the deficiency of utilitarian analysis.

An extension of the body as property doctrine is the belief that individuals own the fruits of their labor. John Locke spoke about this concept several centuries

ago [50]. Harvard philosopher Robert Nozick [60] spoke about it more recently. Both Locke and Nozick took an entitlement approach. They would agree with the position that my body belongs to me and that I have a superior claim to it. No one else has a claim to my body that is superior to mine.

Likewise, I am entitled to keep the fruits of my labor. If I mix my labor, either mental or physical, with land or other assets, the result, whatever I have created, is mine and no one else's. I am free to consume this property, sell it, save it, give it away, rent it to others, or destroy it, and it is no one's business but mine. I am more entitled to the fruits of my labor than is anyone else.

Frederick Douglass, a former slave who became a great orator and abolitionist, related a story about his former slave master, who had sent him to work in the Baltimore shipyards. After working for a full week alongside freemen, he had to return to his slave master and turn over all of his earnings to him:

I was living among *freemen*, and was in all respects equal to them by nature and attainments. *Why should I be a slave?* There was *no* reason why I should be the thrall of any man. Besides, I was now getting, as I have said, a dollar and fifty cents per day. I contracted for it, worked for it, collected it; it was paid to me, and it was *rightfully* my own; and yet upon every returning Saturday night, this money – my own hard earnings, every cent of it – was demanded of me and taken from me by Master Hugh. He did not earn it; he had no hand in earning it; why, then, should he have it? ([21], p. 634)

Douglass was espousing the entitlement theory. It seems obvious that people are entitled to the fruits of their labor and that their claim is superior to those of everyone else. However, philosophers, politicians, and economists over the centuries have managed to obscure this simple rule of moral philosophy by arguing that if some people have too much, there is somehow a moral obligation to give some of their assets to others, and if they will not do it voluntarily, then some government should do it at the point of a gun. British philosopher Gerald Cohen [14] was one exponent of this view. John Rawls takes a slicker approach, arguing that individuals are basically entitled to keep the fruits of their labor, except in cases where someone might be made worse off as a result of the exercise of their property rights [69]. In such cases, governments are justified in confiscating one person's wealth and redistributing it to someone else.

Bertrand de Jouvenel [44] wrote an entire book on the ethics of this position, titled *The Ethics of Redistribution*, which disputes this view. Antony Flew's book, *The Politics of Procrustes* [27], also challenges the view that government somehow has the moral authority to confiscate the property of some and distribute it to others for no other reason than the fact that some people have more than others. Murray Rothbard [73] provided a more succinct analysis in his essay, *Egalitarianism as a Revolt Against Nature*.

Walter Williams addresses the view that social justice requires redistribution of wealth as follows:

But you might say, if government didn't do all that it's doing we wouldn't have a *just* society. What's *just* has been debated for centuries but let me offer my definition of social justice: I keep what I earn and you keep what you earn. Do you disagree? Well then tell me how much of what I earn *belongs* to you – and why? ([91], p. 62)

Frédéric Bastiat (1801–1850), a French political economist, calls forced redistributions plunder. He tells us how to identify this cancer on the body politic as follows:

But how is this legal plunder to be identified? Quite simply. See if the law takes from some persons what belongs to them, and gives it to other persons to whom it does not belong. See if the law benefits one citizen at the expense of another by doing what the citizen himself cannot do without committing a crime.

Then abolish this law without delay, for it is not only an evil itself, but also it is a fertile source for further evils because it invites reprisals. If such a law – which may be an isolated case – is not abolished immediately, it will spread, multiply, and develop into a system. ([5], p. 21)

We have now reached this stage. Such legalized plunder (redistribution) is all around us. Many politicians, philosophers, and economists who advocate redistributionist policies begin with the underlying premise that the government is entitled to 100% of the fruits of your labor but graciously allows you to keep some of those fruits. They believe that the government has the first claim on your assets but graciously allows you to keep whatever they decide not to take [59].

Tax Slavery

Robert Nozick ([60], p. 168) views redistribution of wealth as a “violation of people’s rights.” He states that “taxation of earnings from labor is on a par with forced labor” ([60], p. 169). He points out that taking x hours worth of earnings is like taking x hours from a person’s life. It is the equivalent of forcing a person to work for x hours. However, whereas a slave does not have a choice as to what work to do, wage earners do have a choice. They can work as laborers, doctors, lawyers, or certified public accountants. They can also choose not to work. Thus, wage slavery is not quite the same as the kind of slavery that existed in the United States (and other places) prior to the freeing of the slaves.

However, these are distinctions without a difference. The fact that wage earners get to choose their employment does not mean that they are not wage slaves. If they choose to work, they must cede a portion of their lives to some government. If they can avoid payment of tax by choosing not to work, they must be content with living at a subsistence level, which is not a very desirable option.

“The central core of the notion of a property right in X ... is the right to determine what shall be done with X ” ([60], p. 171). If some government forcibly takes property from Peter and redistributes it to Paul, who has done nothing to earn it, that is a violation of Peter’s property rights. The fact that the forcible taker is some government does not change that basic fact. What makes matters worse is the fact that governments are formed to protect property rights, not to disparage them. To the extent that a government engages in forcible redistribution of wealth, it is illegitimate and need not be obeyed:

Seizing the results of someone’s labor is equivalent to seizing hours from him and directing him to carry on various activities. If people force you to do certain work, or unrewarded work, for a certain period of time, they decide what you are to do and what purposes

your work is to serve apart from your decisions. This process whereby they take this decision from you makes them a *part-owner* of you; it gives them a property right in you. ([60], p. 172)

The tax system of most countries begins with the premise that the government is somehow more entitled to a portion of the fruits of your labor than you are. In the United States, some politicians, philosophers, and economists have been whining that the rich do not pay their fair share of taxes and that they should be forced to pay more. Some billionaires, including Warren Buffet and Bill Gates, also espouse this view. They never define what fair share is, however, which is understandable, since there is no objective way to determine what fair share is.

Those who pay little or no taxes likely believe that the rich should pay more than they are currently paying, whereas those who actually pay taxes often believe that they are being forced to pay more than their fair share, especially if they feel that they are not getting their money's worth from government. It is difficult to justify the statement that those who pay more than one million dollars in taxes each year are getting an equal amount of benefits from the government. It would be easier to justify the statement that they are getting ripped off since they receive relatively few benefits compared with what they are forced to pay. In many cases of high-income taxpayers, the government probably does more *to* them than it does *for* them since high-income people probably own a business and have investments. They stand a higher probability of being audited, and their businesses are forced to comply with burdensome and costly regulations [17], in addition to their tax burden, which mere wage earners do not have to worry about. The Internal Revenue Service has been known to abuse its power and confiscate assets without probable cause or due process. Some individuals have even committed suicide as a result of IRS harassment and abuse [10, 36].

Studies by the Tax Foundation have found that in some years, the top 1% of the US taxpayers paid more in individual income taxes than the bottom 95% [66, 81]. That being the case, it is difficult to make the argument that the rich are not paying their fair share and that they should be forced to pay more, especially if they are already paying more for government than what they are receiving in services. Kantian ethics would point out that they are being used as a means or a resource rather than being treated as ends in themselves, which Kantians would conclude is unethical [46].

Table 66.1 below lists the top marginal federal individual income tax rates in the United States from its inception in 1913 to 2011. Because the US tax system has graduated rates, some of the income individuals earn is taxed at lower rates.

The percentages listed in Table 66.1 do not reflect the total tax burden, however. The table reflects just the top marginal tax bracket for the federal income tax. The federal government also assesses Social Security and Medicare taxes as part of the payroll tax system. Individuals also pay a plethora of other taxes in addition to the federal income tax. Most states and some municipalities also assess an income tax. The federal and state governments assess a gasoline tax. Municipalities assess real estate taxes, which can take more than 20% of an individual's income in some cases. Most states and some municipalities also assess a sales tax. Both the federal

Table 66.1 Top marginal individual income tax rates in the United States 1913–2011

Year	Rate	Year	Rate	Year	Rate
2003–2011	35	1964	77	1925–1931	25
2002	38.6	1954–1963	91	1924	46
2001	39.1	1952–1953	92	1922–1923	58
1993–2000	39.6	1946–1951	91	1919–1921	73
1991–1992	31	1944–1945	94	1918	77
1988–1990	28	1943	88	1917	67
1987	38.5	1941–1942	81	1916	15
1982–1986	50	1936–1940	79	1913–1915	7
1965–1981	70	1932–1935	63		

Source: Tax Foundation [80, 82]

government and most states also tax corporations on income that will be taxed again if and when distributed in the form of dividends. The federal government also taxes the estates of the deceased, and some states have an inheritance tax that is similar to the federal estate tax. Thus, the figures in Table 66.1 grossly underestimate the total tax burden.

The most outrageous confiscations occurred in 1944–1945, when the top rate was 94%. Those rates only reflect the liability for the federal income tax. When the Social Security tax and state and local income taxes are added, it is likely that some individuals had to pay more than 100% of marginal income in taxes, a rate that cannot be justified on any moral ground. Such individuals become total slaves of government at that point. For the super rich, they might earn enough income in January to qualify for the top tax bracket, which means they are total slaves of the government for the last 11 months of the year when one adds the other federal, state, and local taxes to the federal income tax liability. They are well beyond the point where there is a moral duty to pay.

The total tax burden in the United States is difficult to calculate especially since each of the 50 states has its own tax system and structure. However, overall calculations are made by the Tax Foundation [83], an organization that estimates the day each year when taxpayers are no longer required to pay taxes and can keep the fruits of their labor.

Table 66.2 shows the Tax Freedom Day for selected years for the United States [82]. In 1900, the extent of slavery to government was less than 6%. In recent decades, that percentage has been increasing. In the year 2000, the average individual had to work for the government for 4 months before being free to work for himself.

As can be seen, the extent of tax slavery has increased greatly since 1900, rising from less than 6% to as much as 33%.

Scholars have picked up on this notion and have calculated Tax Freedom Day for some other countries. The Adam Smith Institute [1] calculates Tax Freedom Day in the UK. The Fraser Institute [61, 85] calculates it for Canada. Wikipedia [90] summarizes the calculations for a number of think tanks in various countries and updates the statistics periodically. However, different countries and scholars calculate the percentage using different methodologies so that statistics presented

Table 66.2 Tax freedom day: the United States – selected years

Year	Tax freedom day	All taxes as a percentage of income (% slave of government)
1900	January 22	5.9
1910	January 19	5.0
1920	February 13	12.0
1930	February 12	11.7
1940	March 7	17.9
1950	March 31	24.6
1960	April 11	27.7
1970	April 19	29.6
1980	April 21	30.4
1990	April 21	30.4
2000	May 1	33.0
2010	April 9	26.9
2011	April 12	27.7

Source: [84] (data in the first two columns of [Table 66.2](#))

below are not strictly comparable. [Table 66.3](#) summarizes the results for some of those countries.

Cyprus is the country with the least degree of tax slavery, followed closely by India, although it must be pointed out that the statistic for India is much older than the statistics for most of the other countries. Countries with the highest degree of tax slavery are generally European Union countries.

Some Objections

Some readers may raise objections at this point. Those who worship the state would be quick to assert that all taxes are completely legitimate, especially if the government is democratically elected, since our elected representatives represent us and do our bidding. They may even go on to say that we consent to be taxed, and if we think that taxes are too high, we can reduce them through our elected representatives. Then, there is the argument that we receive benefits from taxes and that taxes are needed in order to keep our freedom and protect our other rights [40], which has a grain of truth to it.

Another possible objection might be, “What would happen to the poor if government did not take care of them?” or “How would we educate our children if the government did not provide schools for them?” or “How would people be provided with health care or pensions if the government did not do it?” These are fair questions. Let us examine them.

A good place to start might be a story about Davy Crockett (1786–1836), an American folk hero, frontiersman, and member of the US Congress. Walt Disney made a television series about him in the 1950s.

The story involves a speech he gave on the floor of the House of Representatives to address a pending bill to provide relief for the widow of a distinguished naval

Table 66.3 Tax freedom day: selected countries

Country	All taxes as a percentage of income (% slave of government) (%)	Year	Country	All taxes as a percentage of income (% slave of government) (%)	Year

officer. When he rose to begin his speech, most members of Congress thought he was going to support the pending legislation. Instead, he pointed out that the Congress did not have the constitutional authority to make such a payment. The gist of the speech was that the Constitution enumerates the various functions of government and that providing charity is not one of those enumerated powers. While individuals are free to contribute whatever they want to private charitable causes, Congress does not have this authority. Funds that are used for charity constitute misappropriations. Basically, what he said was that the money appropriated by Congress for this or other charitable acts was not theirs to give.

His speech has become known as the “Not Yours to Give” speech. It was reprinted in a book [24] and has been reprinted many times since. It is on the internet, both in print form and as a YouTube video.

This process of the government giving money that is not theirs (government is a mere fiduciary) has a name. It is called false philanthropy. While there is nothing wrong with spending your own money on charitable causes, there is nothing charitable about spending someone else’s money on causes that you deem to be charitable. It amounts to little more than theft. It is a misappropriation of funds and a betrayal of the public trust. Frédéric Bastiat (1801–1850) wrote about

this concept of false philanthropy in the 1840s. It is not a new concept, although it appears to be an unknown concept in the halls of the US Congress and all other welfare states:

Here I encounter the most popular fallacy of our times. It is not considered sufficient that the law should be just; it must be philanthropic. Nor is it sufficient that the law should guarantee to every citizen the free and inoffensive use of his faculties for physical, intellectual, and moral self-improvement. Instead, it is demanded that the law should directly extend welfare, education, and morality throughout the nation. ([5], p. 25)

... legal plunder is based partially on philanthropy, even though it is a false philanthropy. ([5], p. 28)

The mission of the law is *not* to oppress persons and plunder them of their property, even though the law may be acting in a philanthropic spirit. Its mission is to protect persons and property ... if the law acts in any manner except to protect them, its actions then necessarily violate the liberty of persons and their right to own property. ([5], p. 68)

Another point worth mentioning, one I find especially amusing, is that many of the arguments advanced to justify taxes are based on non sequiturs. The part I find most amusing is that it is often philosophy professors, some of whom teach courses in logic, who advance these arguments. They feel perfectly comfortable teaching about the methodological flaws of non sequiturs on Monday morning and then spend the afternoon justifying one or another tax policy by using non sequiturs to support their arguments. The cynical among us might call it an open and shut case of philosophical malpractice.

Let us take an example. A commonly heard argument is that we must support free public (government) education, the underlying premise being that if we did not, the young would not be educated, or perhaps only the children of the rich would be educated, which would ultimately lead to the decline of civilization and a return to barbarism, where life is nasty, brutish, and short, to borrow a phrase from Hobbes [39]. Anyone who objects to public education must be insane, selfish, rich or a racist, or some combination thereof.

However, upon closer examination, one finds a number of moral problems with supporting government education. But first, let us finish the discussion of the non sequitur arguments. When placed in the proper grammatical structure, the advocacy of free public (government) education might be stated as follows: Children must be educated; therefore, the government has to do it.

One may challenge the statement that children need to be educated. The Amish and other religious groups believe that only basic education is needed just enough so that children can do figures and read the Bible. Some Muslims believe that the only education needed is to read and memorize the Koran. Let us not go down that path. Let us concede the point and assume that it is an extremely good idea that children be educated.

Just because children need to be educated does not mean that the government has to do it. There are several other options. Individual parents could perform this task or could retain the services of one or more teachers to do it, either individually or as part of a private school. Those who are too poor to pay for the education of their children can rely on charitable or nonprofit organizations to educate them, or they

can do it themselves through home schooling, although someone who is poor might not have sufficient talent to educate a child. If they had any smarts, they probably would not be poor.

Before the advent of free government schools in the United States, local communities found ways to educate children well and economically even if they could not afford to pay. There is no reason why the private and nonprofit sectors cannot use those same methods, which have been proven to work in the past [8, 9, 16, 30, 31, 70, 89].

The point is that assigning government the job of educating children is only one of several options, and it is generally not the best option, since governments are notorious for doing a relatively poor job of just about everything. The private sector has shown that it can do a higher quality job at a lower cost for a wide range of activities [20, 26, 62]. Thus, if one takes the utilitarian position that the most efficient way to do something is the only ethical way to do it [7, 63–65, 78], then allowing governments to educate our children is unethical.

There are other reasons why allowing government to educate our children is inherently unethical. Such a practice must necessarily violate someone's property rights and is also inherently unfair. It is unfair that childless couples (or individuals) should be forced to pay for the education of other people's children. It is also fundamentally unfair to force people who pay for the education of their own children to also have to pay for the education of other people's children. Why should Jews have to pay for the education of Christian children and vice versa? Why should anyone have to pay for the education of Muslim children, especially if they receive educational vouchers to send their children to Muslim schools?

At this point, one may hear the argument that there is an obligation to pay for the education of future generations. The previous generation paid for your education; therefore, you have a moral obligation to pay for the education of the next generation. There are several problems with this line of reasoning. For one, it is a non sequitur. One might just as easily argue that "Since John, age 70, was forced to pay for your education, you have a moral obligation to pay for the education of Sally, age 7, who is not related to either you or John." Such arguments are completely untenable.

Another point that could be made is that the statement is not true. It is not always true that "the prior generation" paid for your education. Perhaps your parents paid for it or perhaps you paid for it or perhaps you received scholarships or funding from some charitable or nonprofit organization. There are so many flaws in the argument that we have an obligation to pay for the education of other people's children that I find it incredible that the argument continues to be advanced and believed. Any such forced payments must necessarily violate someone's property rights. It is a forcible taking of the fruits of someone's labor, an example of tax slavery where the government is the slave master and the taxpayer is the slave.

Now let us examine the main arguments that have been advanced to support the belief that there is a moral duty to pay taxes. These arguments are discussed and analyzed in more depth elsewhere [55], but a brief discussion is called for here.

One of the favorite arguments pro-tax advocates make is that taxes are the price we pay for civilization. This statement, or one like it, was made famous by Oliver Wendell Holmes (1841–1935), an eminent American jurist ([29], p. 71). Holmes and Sunstein [40] elaborated on this view by pointing out that taxes are needed to pay for the protection of our lives, liberty, and property.

Their line of reasoning is good as far as it goes. Even if we concede the point that taxes are needed to fund the governmental functions that protect our lives, liberty, and property, it does not address the rationale for being forced to pay for government programs that merely redistribute wealth from those who have earned it to those who have not. Such redistributions actually disparage property rights rather than protect them. If we begin with the premise that the only legitimate function of government is to protect life, liberty, and property, then justifying the funding of other governmental functions becomes untenable since doing so necessarily disparages property rights.

An argument that is related to the Holmes argument is the “government couldn’t exist without taxes” argument. The underlying assumption here is that it is desirable for government to exist. Again, even if we concede the point that government is necessary for the protection of life, liberty, and property, in some cases, it does not follow that government is the only provider of these services. What if some individuals or group of individuals (like a homeowners’ association) decide that it would prefer to provide its own protection rather than availing itself of the protection provided by the local government? Do members of the homeowners’ association have a moral obligation to pay taxes to support the local police even if they have waived their right to use their services? In effect, forcing them to pay taxes to support others but not themselves cannot be justified on any moral grounds. It is an example of false philanthropy. The same might be said for Social Security, Medicare, education, or any other program where it is possible to opt out. (At present, it is usually not possible to opt out of these governmentally provided programs in the United States, which is unfair to those who want to opt out.)

The point is that practically, any service that is currently provided by some government can be provided better and cheaper by the private sector or by some nonprofit organization. Study after study has shown this to be the case [20, 26, 62, 67]. Since that is the case, why is government forcing people to pay for inefficient services that they do not want, and why should taxpayers be forced to pay for these inefficient programs?

Another problem with the “government couldn’t exist without taxes” argument is that taxation is not the only form of funding governments receive. They also get funding from user fees, lotteries, and donations (e.g., Ted Turner donated one billion dollars to the United Nations). Prior to the adoption of the income tax in the United States in 1913, the federal government existed quite well without the income tax. Thus, history has shown that it is possible for governments to exist without taxes. The argument that government cannot exist without taxes is therefore patently false. What is true is that the large, bloated redistributionist welfare states cannot exist without taxes.

Another argument to justify taxes is the “what if everybody did it (evaded taxes)” argument. It is a form of the Kantian Categorical Imperative [45, 46]. This argument raises some interesting issues. Of course, if everyone evaded all taxes, governments could no longer exist in their present bloated welfare state form.

But is that a bad thing? If governments limited their funding to user fees, lotteries, and donations, they would be confined to their more legitimate functions of the protection of life, liberty, and property and would no longer be able to violate property rights and take the fruits of people's labor by force. Tax slavery would end. They would not have the ability to redistribute wealth, which is inherently unethical (false philanthropy), and they would be far less likely to engage in foreign military adventures that destroy lives and dissipate national treasure.

If people only evaded *unjust* taxes, it would not be long before there would be no unjust taxes and more justice, which is a good thing. If people refused to pay taxes to oppressive and corrupt governments, soon there would be fewer oppressive and corrupt governments. If people refused to pay taxes for wasteful spending, soon there would be less wasteful spending.

Another argument that has been used throughout the millennia to justify taxation and to brand tax evasion as unethical is the argument that "the law is the law" [15]. The underlying premise here is that one must obey the law regardless of what the law is, whether it is just or unjust, a view that Gandhi, Martin Luther King, Henry David Thoreau, and others would disagree with.

Dietrich Bonhoeffer, a German theologian who was killed at the direct command of Hitler, preached that we have an affirmative duty to resist evil. "Not to speak is to speak. Not to act is to act." Or as Edmund Burke has said: "All that is necessary for evil to triumph is for good men to do nothing." Thus, in some cases, there is a moral duty to evade taxes not only because doing so prevents the theft of the fruits of people's labor but also because cutting off the funding to evil regimes reduces the amount of evil that can be done.

The "We have a duty to others to pay taxes" argument also falls apart upon closer examination. The *others* who are usually included in this argument might be other taxpayers or other members of some ethnic or religious group.

There is a strain of thought within the Jewish literature that one Jew must never do anything to disparage another Jew [15]. If one Jew evades taxes, it makes all Jews look bad; therefore, no Jew should ever evade taxes. But what if Hitler were the tax collector? Do Jews have a duty to pay taxes to Hitler? This question was asked on a number of surveys. In many cases, it was the strongest of 18 arguments to justify evading taxes. However, a survey of Orthodox Jews [56] found that even Orthodox Jews had some problem with totally justifying tax evasion in such a case. Their hesitancy to fully endorse evading taxes paid to Hitler was because of "the law is the law" and "never disparage another Jew" arguments.

Another variation of this *we have a duty to others* argument is the view that if we pay less, others must pay more. This statement may or may not be true. Since governments often spend more than what they collect in the form of taxes, it is entirely possible that one person's evasion may not result in others paying more, since the entire deficit is financed, either by issuing government bonds or by the printing press. There is often little relationship between what is spent and what is collected.

Another weakness with this line of reasoning is that it is not always unethical to evade taxes even if others have to pay more. For example, if an armed robber comes into a restaurant and demands that the clientele collectively raise \$100 to fund his

bus ticket to Mexico, and that they decide how much each must give based on the ratio of the money they have on them, it is not unethical for someone to fail to report the \$20 he has hidden in his shoe. There is no duty to turn money over to a thief, even if the other people being robbed have to pay more. It is the thief who is acting immorally, not those who hide their own property so it will not be confiscated. Likewise, it is not unethical for a Jew living in Nazi Germany to evade taxes even if non-Jews have to pay more as a result.

The ability to pay argument has been used for centuries to justify taxing some people more than others [18]. Karl Marx advocated it in his *Critique of the Gotha Program* [51]. There are a number of weaknesses with this line of reasoning. The underlying assumption is that some people have a moral right to live at the expense of others. Taxing the rich more than the poor is a form of exploitation. A Kantian would be quick to assert that it treats individuals as resources or a means to an end rather than as ends in themselves, which is inherently unethical. It is also redistributionist since it involves the forcible taking from those who have earned the income and distributing it to those who have not.

The *majority rule* argument has also been used to justify taxation and to disparage tax evasion. This argument has several underlying assumptions that suffer from fatal weaknesses. It cannot be said that any taxes imposed are automatically fair just because *we consent to be taxed*. Some of us may consent to be taxed, but it cannot be said that all of us consent to be taxed. Some of us do not consent to be taxed, and many of us do not consent to be taxed at current levels.

While it is true that in a democracy the majority rules, it does not follow that if a majority decides to exploit some segment of the population (the rich), it has a moral right to do so. The recognition of property rights takes precedence over the opinions of any majority.

A related underlying assumption is that our elected representatives represent us, and thus, if they decide a tax should be imposed, they do so with our consent. They do not. The Public Choice School of Economics has spent several decades discrediting this belief [86]. Our elected representatives represent a collection of special interests which, in many cases, do not represent the will of their constituencies. It should also be pointed out that the individual members of any constituency do not all think alike. Perhaps 51% hold one view and 49% hold a diametrically opposed view. That being the case, all that can be said is that some elected representatives might represent the views of some portion of their constituency some of the time.

It cannot be said that some tax is just merely because a majority of representatives have voted for it. More is needed to justify taxation. Majorities can be wrong, and elected representatives are often wrong because they vote the way special interests want them to vote or because they vote the way some misguided constituency wants them to vote.

Lysander Spooner states:

... no man can be taxed without his personal consent ... Taxation without consent is as plainly robbery, when enforced against one man, as when enforced against millions ... If the government can take a man's money without his consent, there is no limit to the additional tyranny it may practise upon him. ([79], p. 222)

Another commonly heard argument to justify taxation is the *I receive benefits, therefore I must pay* argument. John Rawls has replied to this line of reasoning as follows:

There is no more justification for using the state apparatus to compel some citizens to pay for unwanted benefits that others desire than there is to force them to reimburse others for their private expenses. ([69], p. 283)

While there may be some duty to pay for benefits you actually receive and benefit from, it is not possible to justify the view that there is a moral obligation to pay for benefits that you do not use. It also cannot be said that there is a moral duty to pay the full price for the benefits that some government provides. For example, if some local government runs a garbage monopoly and requires you to pay \$30 a month for picking up your garbage, it cannot automatically be said that you morally owe the government \$30 since its monopoly on garbage collection legally prohibits private garbage companies from competing and charging \$20. While there might be a moral duty to pay \$20, it cannot be said that there is a moral duty to pay the full \$30 because the government is running an inefficient monopoly that is costing you an extra \$10 a month while violating the property and contract rights of private sector garbage providers who are prohibited from competing for your business.

What Rights Do Tax Slaves Have?

There is no moral obligation to obey a slave master. To argue otherwise is completely untenable. Frederick Douglass [21] was quite articulate in pointing out this fact in his autobiography. To the extent that some government passes laws or regulations that result in making you its partial or total slave, there is no moral duty to obey.

But that is not the end of the story. What rights do these partial or total slaves have? In the pre-Civil War United States, a strong argument could be made that slaves possess the moral right to kill their slave masters, especially if their master beats them; rapes them, their wife, or their children; or takes away their children to sell to another slave master. A slave that attempts to escape is justified in making the attempt and is justified in killing the slave master or any of the slave master's employees who would try to prevent the escape.

The rights of the slave to kill the slave master become less clear where the slave master is some government and where the individual is only partially enslaved. It becomes a matter of degree. At some point, the homicide becomes justifiable, but it is difficult to draw the line. The spectrum of choices may be depicted as in (Fig. 66.2).

It is more justifiable to kill a slave master who confiscates 100% of your income than one who confiscates just 1%. But what about the slave master who confiscates 20% of your income and gives you some benefits (that you did not ask for) in return? Would a mere 20% slave be morally justified in killing the slave master?

Fig. 66.2 When does killing a slave master constitute justifiable homicide?

If killing would not be justified, how about a punch in the nose? Applying the theory of justifiable homicide to the collection of taxes presents some other interesting questions as well.

If someone were in the 94% marginal tax bracket from July 1 to December 31, a strong case could be made that killing the government slave master would be justifiable for the last 6 month of the year but would be much less justifiable in January or February, when the wage earner is in a lower marginal tax bracket and therefore less of a slave.

The issue becomes even more complicated when one considers the fact that we are talking about more than just one slave master. The federal government of the United States, for example, is not the only taxing jurisdiction. The states and local governments also impose taxes, and they are imposed on more than just income. There are also property taxes, sales taxes, Social Security and Medicare taxes, and a wide range of taxes other than income taxes. What if the total taxes taken amount to 94% of income but no individual slave master takes more than 10%? Does that make any particular slave master's killing less morally justifiable? Is it morally justifiable to kill only those slave masters who confiscate more than a certain percentage of income? What line of moral reasoning can we use to determine that minimum justifiable percentage? These questions have not been raised in the literature. Perhaps it is time to start a debate on this issue.

Some taxes are more justifiable than others. Taxes like a gasoline tax might be justified if 100% of the proceeds are used to maintain the roads, but it becomes less justified if part of the tax is either used for other purposes, such as funding education, or is used for social engineering purposes such as to reduce gasoline consumption.

Another complicating factor is that killing the slave master may not solve the problem if the slave master is the government. If a plantation slave in the 1850s was to kill his slave master and successfully escape from the plantation, the slave would be free, but such cannot be said for killing an IRS agent or a member of Congress who has voted in favor of tax slavery. Tax slaves would not be free even if they managed to kill a dozen of the government's tax collectors. All that would happen is that the tax slave would be either killed or imprisoned. Thus, killing the agents of the government slave master is not a viable solution to the problem of tax slavery even if the killing might be morally justified.

One solution would be to move to a jurisdiction that imposes lower taxes, but that would not totally solve the freedom issue; it would merely reduce the percentage of income that is confiscated and thus the degree of tax slavery. It might also be pointed out that jurisdictions that impose low or no taxes usually have limited job opportunities, unless you work in the banking, casino, or tourism industry.

Another option would be to refuse to pay, which would increase anxiety, perhaps lead to health problems, and perhaps expensive lawsuits and incarceration. Of course, one could kill tax collectors and rely on a jury to save you, but that is a risky proposition, and you would have to incur high legal fees and would probably be in jail pending the outcome of the trial. The bottom line is that there is no easy solution in trying to protect your property rights from the slave masters. All that can be said is that there is no moral duty to pay some taxes and that protecting your property rights is morally justifiable.

Victimless Crimes

The body as property doctrine includes much more than just tax slavery. It can be applied to many acts that are illegal where there are no identifiable victims. Such victimless crimes might include dwarf tossing (my favorite), prostitution, taking illegal drugs, selling (or renting) body parts, suicide, assisted suicide, polygamy, eating fatty foods, smuggling, and occupational licensure laws. Again, the underlying premise is that individuals own their own bodies, and any government that prevents individuals from using their bodies as they see fit necessarily violates their property rights. A corollary is that there is no moral duty to obey such laws.

Dwarf Tossing

For philosophical reasons, dwarf tossing is my favorite example to illustrate the body as property doctrine. In 1993, I published an article in the *American Journal of Jurisprudence*, titled “If Dwarf Tossing is Outlawed, Only Outlaws Will Toss Dwarfs: Is Dwarf Tossing a Victimless Crime?” [53]. That article generated a lot of commentary and heat, including hate mail from dwarfs. It later became the basis for a module in a Harvard University philosophy course. I just learned a few minutes ago while searching the internet for recent publications on this topic that the practice has been banned by the UN Human Rights Committee [88].

For those who have never heard of dwarf tossing, let me give you a brief summary. It is (or was) a sport. Originated in Australia, it consists of a dwarf or midget being picked up and thrown. Whoever throws the dwarf the farthest wins. Australian bars used to have dwarf tossing contests and awarded prizes for those who could throw the dwarf the farthest.

It was a safe sport, at least compared to midget wrestling, in terms of injuries. The injury rate was far less for dwarf tossing than for midget wrestling. One reason for the reduced injury rate was because the dwarf generally wore a football helmet and pads and was tossed into a mattress. They usually wore a harness so that the tosser could get a firm grip.

A variety of do-gooders got together to put pressure on various legislatures and local councils to ban the practice. The usual arguments for banning the sport were because it demeans all dwarfs or it exploits little people or for the sake

of propriety. Brigham Fordham [28] discussed these various reasons and expanded the argument to include a wider variety of what has been called freak shows.

The problem with banning dwarf tossing or a freak show is that it violates the right of the dwarf or freak to use their bodies as they see fit, including economic gain. From an economic perspective, dwarf tossing is a win-win situation or positive-sum game. There are more winners than losers. The dwarfs win because they can earn a six-figure income on the dwarf tossing circuit. The spectators win because they would rather pay to see a dwarf tossing event than choose any alternative activity (otherwise, they would not go to a dwarf tossing event). No one's rights are violated by the practice, whereas the rights of the dwarfs, the spectators, and the sporting event sponsors are violated by banning the practice. The fact that dwarfs can no longer use their bodies for tossing purposes means they no longer fully own their own bodies; some government has an ownership interest in their bodies. There is no moral duty to obey such laws, although one must weigh the pros and cons of breaking the law, since there may be penalties.

There is another aspect of this ban that has been more or less neglected in the literature. Davis [19] and McGee [53] are two scholars who have raised the issue, which is whether banning the practice discriminates against people on the basis of size. While bans on dwarf tossing could be worded in such a way that people of all sizes would be prohibited from lending their bodies for this purpose, such laws would have a disparate impact on little people since larger people would not usually participate as tossees in a dwarf tossing event. However, such arguments distract us from the main philosophical question, which is whether any government has the moral authority to prevent dwarfs from allowing themselves to be tossed.

Prostitution

A number of economic studies have been made of the prostitution profession [3, 23, 32, 33, 43, 58]. They tend to analyze economic aspects of the profession without making judgments. Basically, they take a utilitarian ethical perspective, although they do not necessarily come out and say that prostitution is good because the result is a positive-sum game, which is what a pure utilitarian would conclude, since there are two (or more) winners and no losers. Some scholars have gone the extra step and concluded that prostitution is a moral act [25], but space does not permit a discussion of this interesting argument.

This chapter will not explore that particular moral argument. Instead, we will apply the body as property doctrine. Since the body is property, and since self-ownership dictates that individuals have the right to use their body in any way they want, provided they do not violate the rights of others, one must conclude that individuals have the right to rent out their bodies, or parts thereof, for purposes of prostitution. That is not to say that it is moral to do so. All that can be said is that they have the right to do so. A corollary is that anyone who interferes with the exercise of that right is acting immorally since they must necessarily violate the property and contract rights of the prostitute.

One question that has not been asked in the philosophical literature, to the present author's knowledge, is what lengths prostitutes can go to in order to defend this right if someone attempts to deprive them of the right to use their body as they see fit? Certainly, the person who is violating the right does not have a superior claim on the use of force than the person whose property rights are being violated. Thus, at a minimum, we can say that if someone attempts to deprive a prostitute of this right by throwing a punch, the prostitute has the right to throw at least one punch in return, if not more. If the rights violator draws a pistol to deprive a prostitute of this property right, the prostitute also has the right to draw a pistol or perhaps two pistols. This issue has not been addressed in the literature and needs to be explored in more depth, but space constraints do not permit a full analysis at this time.

Suicide and Assisted Suicide

I have lumped suicide and assisted suicide together because they are so closely related that efficiency would dictate that they be discussed together. Again, the body as property doctrine holds that individuals own their own body and that they have a superior claim on it. They have the right to do anything they want with it, provided they do not violate the rights of others. That includes the right to kill it.

Since they have the right to kill it, they also have the right to hire someone to kill it for them. It is a simple application of agency theory. The agent can do anything the principal can do. That does not mean that killing oneself is moral or that someone who is hired to assist in such a killing is acting morally. All that can be said is that anyone who tries to prevent a suicide, whether assisted or not, is acting unethically because such prevention violates someone's property rights and also contract rights in cases where someone is hired to assist.

Various ethical rules or systems can be drawn from to determine whether the practice is moral. Religious doctrine, for example, might hold that suicide and assisted suicide are immoral based on the doctrine that "thou shalt not kill," although in the Christian Bible it also states that there is "a time to kill and a time to heal" (Ecclesiastes 3). It might also be pointed out that killing is glorified in various parts of the Christian Bible, especially if it is done in the name of God. In Deuteronomy (13:12–19), for example, the instruction is given to kill all the inhabitants of the town, including livestock, which includes women and children, although little doggies might escape this fate since they are not considered livestock. Killing is glorified in other passages of the Bible as well (Deuteronomy 2:24–34; Genesis 6:17–23; Numbers 21: 32–35; 25:1–9; Joshua 11:19–20; 2 Chronicles 25:12, to cite a few). The Bible justified Samson's suicide as well as the 3,000 men and women he killed in the process (Judges 16:25–30).

Utilitarian ethics, on the other hand, might hold that suicide is ethical since there is one winner and no losers, thus producing a positive-sum game. If the suicide is assisted, there are two winners since the person who assists also benefits, provided payment is received. The case may be made that the person who assists benefits

even if payment were not received, since the assister has chosen to assist rather than to use that time to do something else, and has thus ranked assisting in the suicide higher than any other competing activity.

Some arguments to prohibit suicide and assisted suicide have been made, which explains why these practices have been made illegal in some jurisdictions. The “interests argument” has been used to prohibit suicide and assisted suicide as well as a number of other activities between or among consenting adults. Let us examine that argument.

In the case of suicide, one might argue that the state has an interest in preventing suicide, for example. In a US Supreme Court case, justices Scalia and Stevens implied that an individual’s right to autonomy might at times have to yield to some nebulous community interest ([54], p. 41).

The problem with this line of reasoning is that only living, breathing individuals can have interests. Yet the argument is often made that there is some public interest to protect or that individual rights must sometimes be circumscribed because of some compelling government interest. Ayn Rand makes the following point in this regard:

Since there is no such entity as “the public,” since the public is merely a number of individuals, any claim or implied conflict of “the public interest” with private interests means that the interests of some men are to be sacrificed to the interests and wishes of others. Since the concept is so conveniently undefinable, its use rests only on any given gang’s ability to proclaim that “The public, c’est moi” – and to maintain the claim at the point of a gun. ([68], p. 114)

The same line of reasoning could be used to dismantle the government’s compelling interest argument. The government has no compelling interest because it has no interest. Government is merely an institution created by men to protect rights. It is not a living, breathing human being, so it cannot have any interests of any kind, let alone compelling interests. If government can ever claim to be legitimate, it can only claim legitimacy to the extent that it protects negative rights, like the rights to life, liberty, and property. If someone wants to relinquish the right to life by committing suicide, it is none of the government’s business.

The argument has been made that government is acting legitimately in prohibiting physician-assisted suicide because it is protecting life. But this argument totally ignores the fact that the individual in question volunteers to give up the right to life by hiring a contract killer. If an individual decides to give up the right to life, government has no legitimate authority to prohibit the transaction. Governments exist to protect the legitimate negative rights that individuals hire them to protect. When they protect rights that the individuals who hire them (taxpayers) do not want to have protected, they cease to act legitimately.

Another aspect of this topic that needs to be addressed is who should be permitted to assist in a suicide where assisting in suicide is permitted? In jurisdictions where assisting in a suicide is permitted, the law generally permits only physicians to assist. Why is that? Why should physicians have a legal monopoly on contract killing? Why should physicians be the only ones who are permitted to legally kill someone who wants to die? [54].

Creating a monopoly constitutes anticonsumer behavior. Monopolies of any kind tend to result in higher prices and lower quality than would be the case in a free market environment. Limiting the eligible pool of death providers to physicians constitutes special interest legislation.

Killing someone does not require 8 or more years of university education. Providers who have only 4 years of university education could do an equally good job at a fraction of the price a physician would charge. High school dropouts could do an effective job for even less, although the quality of the service might not be as high [54].

The point to be made with regard to suicide and assisted suicide is that individuals have a claim on their body that is superior to the claim of any other individual or group of individuals. Whether suicide or assisted suicide is moral is subject to debate and is beside the point. What can be said with certainty is that anyone who interferes with the right of individuals to end their life violates their right to do with their own body as they see fit. Such interventions constitute unethical conduct.

Drugs

If one begins with the premise that individuals own their body, one may proceed logically to conclude that they can put anything they want into their body, even if it is bad for their health or even fatal. Yet this argument is seldom addressed in the literature. Those who advocate making certain drugs illegal do so because of the harm it does to individuals or to *society*, whatever that means. Such a position smacks of nannystatism, the belief that the state has an obligation to make decisions for the citizenry because the people are not capable of making their own decisions.

What is often overlooked is that outlawing certain drugs can also have adverse effects, including death. For example, the Food and Drug Administration (FDA) in the United States routinely bans numerous drugs from importation into the United States even though the drugs have been found to be safe in Europe or elsewhere. Some of those drugs are lifesaving, in the sense that they prevent or reduce the probability of things like heart attacks. According to some estimates, these prohibitions lead to the totally unnecessary deaths of tens of thousands of people a year in the United States [4, 76]. FDAREview.org has published a number of studies that estimate the number of deaths the FDA causes each year because of its regulations.

The above argument regarding drug legalization is utilitarian, of course. I thought I would point that out in case you missed it. Utilitarian arguments look at winners and losers and determine the ethics of a particular act or policy based on whether the winners exceed the losers or whether there is a net benefit.

Milton Friedman, the Nobel Prize winning economist, has used utilitarian arguments to advocate the legalization of drugs [30]. He spews forth very persuasive economics-based arguments to show that legalizing drugs results in net benefits, since the quality of what is available would be increased, leading to fewer overdoses, and the costs would be much lower since the supply would not be crimped. If formerly illegal drugs became legal, drug stores would sell them and

consumers would be able to buy high-quality drugs at such low prices that the criminal element would no longer find selling drugs to be a profitable venture. Thus, the crime rate would also decline.

Various individuals and groups have also pointed out the benefits of certain drugs, such as medical marijuana, which can be used to reduce eye pressure in glaucoma patients and might also reduce blood pressure and perhaps have certain other health benefits. Again, these arguments for the legalization of drugs are all utilitarian-based. They all ignore the basic issue, which is one of property rights. If individuals own their bodies, they therefore have the right to ingest anything they want, even if it kills or harms them.

One might object, perhaps arguing that allowing people to take certain drugs would increase health care costs, which all of us would have to pay for. However, that argument is true only if health care is paid for through taxes. In a privatized health-care system, taxpayers would not be called upon to pay for other people's health-care benefits, and private insurers could charge addicts higher premiums to offset the added cost of taking them on as customers.

Banning Food

Some do-gooders have called for the banning of certain kinds of food or foods that contain certain chemicals or ingredients, such as trans fat, sugar, or certain sugar substitutes [6]. Fast-food restaurants like McDonald's have been castigated for selling high caloric foods, and certain New York state legislators have called for banning table salt in all New York restaurants. Groups of rabid vegetarians have tried to ban meat or at least red meat.

The arguments that have been used to object to these abuses have often been utilitarian-based, arguing that the do-gooders are exaggerating the harm to be done by this or that food or chemical or arguing that anything done in moderation will not harm you. On occasion, some form of rights-based argument might make the six o'clock news. Such arguments generally revolve around the notion that individuals should be able to make their own life choices. The do-gooders counter that banning certain food items will reduce health-care costs or, alternatively, the failure to ban the item will increase health care costs, which all taxpayers must pay for. Again, that argument is faulty, at least in a health-care system that does not force some people to pay for other people's benefits.

The fact that the banning of any food, including poison, violates someone's property and contract rights, is usually not mentioned. Yet that is exactly the case. Since individuals own their bodies, they have the right to ingest whatever they want to ingest. Anyone who prevents them from doing so violates their property rights. If they cannot ingest what they want, the government has an ownership interest in their body and they are part-slave. The fact that the slave master might be doing something that actually benefits their bodily health is irrelevant, as far as the rights issue is concerned.

Those who are prohibited from selling such products as well as those who would enter into contracts to purchase the product have their right to contract violated, another point that is seldom discussed, either in the literature or in debates on the issue. Needless to say, there is no need to obey such laws. Governments that institute such laws are acting illegitimately, beyond the scope of their authority, and there is no moral duty to obey an illegitimate government.

Selling or Renting Body Parts

Many people die needlessly each year because they cannot legally buy the body part they need. The supply of kidneys, livers, lungs, and hearts all would increase if there were a market for these organs. Yet governments often ban their sale, which means that people who need them have to rely on donations [11, 22, 25, 47].

It is a basic law of economics that if the price is artificially kept below the market clearing price, the result will be a shortage. If there is a shortage of certain organs available for transplant, people die. Again, I would like to point out that this line of reasoning is utilitarian-based. The rights aspect of the argument is often ignored.

If individuals own their bodies, they have the right to do whatever they want with their body or body parts, including selling off parts of it, either premortem or postmortem. To the extent that some government prevents them from doing so, it violates their property rights. The government assumes a part ownership role, which means the affected individual becomes part-slave.

Renting one's body is also often illegal. Prostitution has already been discussed, which involves the renting of certain body parts for what some may consider to be immoral activity. But other rental options are also available, such as the renting of a womb for surrogacy purposes. In some jurisdictions, it is illegal to rent a womb for childbearing purposes, although it is legal to become a surrogate and it is legal for the prospective parents to reimburse the renter for certain expenses [42, 57].

The question that needs to be answered is, "Why should it be illegal to rent out a womb when giving away the use of it is perfectly legal?" The oft-given answer is *reasons of public policy*, whatever that means. Some people do not want other people to be able to rent out their wombs for some reason. Maybe it is because of the fear that some black or Hispanic woman who is poor and needs the money might be exploited by some white couple from the suburbs [12], or maybe, it is because some busybody just does not think it is right to rent your womb to someone else. The fact that renting out your womb once or twice might actually make it possible to put food on the table or send your child to a better school is often overlooked. Renting out your womb is a way to escape poverty, at least for awhile. It might be pointed out that renting out a womb meets the utilitarian test since the winners exceed the losers. In fact, there are no losers, only winners.

While a strong utilitarian case can be made for allowing women to rent their womb, the real issue is one of property rights. Women own their wombs. If they are prohibited from renting them out to the highest bidder, their property rights

are violated. To the extent that some government prevents them from using their womb as they see fit, they are a partial slave of government because government has an ownership interest in their body.

Occupational Licensure Laws

People have a right to earn a living. Having a right means there is no need to ask government for permission. If you need government approval to work, you no longer have the right to work. Yet that is exactly what happens when some government requires you to have a license as a condition of performing certain kinds of work. The body is property. Likewise, the fruits of one's labor are property.

Objections may be raised at this point. One oft-heard objection has to do with protecting the public interest. The argument might go something along these lines. The government needs to protect the public from incompetent doctors, dentists, lawyers, accountants, hair stylists, mechanics, manicurists, etc. If it were not for government, the public would be unprotected.

Anyone who is familiar with the way the market economy works can quickly see the flaws in this line of reasoning. It is not a question of regulation versus no regulation but rather who does the regulating, the government or the market. The market, if allowed to function, is usually a very good regulator. Incompetents are forced out of business. Those who are negligent or criminal can be dealt with through the market and the legal system.

Milton Friedman [30, 31] and others [2, 75, 92] have been pointing out the flaws in occupational licensing laws for decades. Studies have shown that occupational licensure requirements often harm the public more than they help [74]. Even with occupational licensure, there is no guarantee that the public will be protected since many incompetent practitioners continue to practice in a number of fields.

These arguments, of course, are utilitarian-based. The point is not so much whether occupational licensure laws produce a positive or negative-sum game but rather whether anyone's property or contract rights are violated, which is always the case whenever some occupational licensure law prevents someone from offering services or products to the public. The body is property, and those who own the body are entitled to the fruits of their labor. No one has a superior claim. Whenever some government prohibits someone from using their body to perform medical, dental, or accounting services, it becomes a part owner in their body, and they become part-slave.

Milton and Rose Friedman have proposed a Constitutional amendment that would protect the right to work without government interference. Their proposed amendment reads as follows:

No State shall make or impose any law which shall abridge the right of any citizen of the United States to follow any occupation or profession of his choice. ([31], p. 305)

Their proposed amendment is good as far as it goes, but it could be improved. As presently worded, it does not protect residents who are not citizens. It also does not prohibit the federal government from violating the right to work.

The federal government has exerted (misused) its authority to regulate professions even if they have a negligible effect on interstate commerce. For example, anyone who transports steel rolls in an Ohio steel mill from one end of the property to the other is required to have a federal driver's license, even if the distance is only a few hundred feet and even if the driver never leaves the company premises.

Polygamy and Gay Marriage

The body is property. As such, the owner has the right to marry it off to anyone who is willing to accept it as a spouse. Yet governments all over the world have made laws that prohibit certain kinds of marriages. In some states of the United States, it was a crime for a person of one race to marry a person of a different race. Unbelievable as that may sound to the present generation, there were such laws on the books even after the passage of the Civil Rights Act of 1964.

Many people also find the possibility of homosexual marriage and marriage to multiple partners to be offensive or disgusting and have pressured governments to prohibit such kinds of marriage, even though no one's rights are violated by the practice. The objection is often raised, at least in the case of marriage between individuals of the same sex, that allowing such a practice will lead to the decline of the family and to the end of Western civilization. The Bible calls homosexuality an abomination, and allowing such abominations to manifest themselves in the local community will corrupt the young, who should only feel horny to have sex with someone of the opposite sex, and only then after they are properly married, preferably by a priest, minister, or rabbi.

The problem with this line of reasoning is that forcing your views on others at the point of a gun must necessarily violate their property and contract rights. Entering into a same-sex marriage does not violate anyone's rights and should therefore be permitted. One might also point out that such marriages are positive-sum games since there are two winners and no losers. One may counter argue that *society* is harmed or that the local community is offended by such a practice, but these are phony arguments. For one, as was pointed out earlier, *society* does not exist. Only individuals exist. If government has any legitimate reason for existing, it is to protect life, liberty, and property, not to prevent people from being offended by acts between or among consenting adults. If some government prohibits you from marrying the individual of your choice, it claims a property right in your body, which makes you part-slave.

One may extend this argument to polygamy, the practice of marrying more than one person. Again, if you own your own body, you have the right to do whatever you want with it, provided you do not violate the rights of anyone else. That includes entering into contracts with more than one person for marriage purposes. Although some people may be offended by such a practice, their rights are not violated.

Marriage should be treated like any other contract between or among consenting adults. Treating marriage just like other contracts could lead to some interesting

possibilities, including term contracts. Employment contracts have definite terms. Why not marriage contracts? Partners in a marriage contract could have 2-year or 5-year term marriage contracts that terminate automatically unless renewed. Such contracts would reduce the need for and expense of divorce. The contract could state how property, children, and pets would be divided at the end of the contract.

The best solution would be for government to get out of the marriage business. The only role of government should be to recognize and enforce whatever contractual terms the parties agree to.

Sexual Acts Between Consenting Adults

The body is property. Perhaps I have mentioned that before. If you own your body, you have the right to do anything you want with it except use it to violate someone's rights. If you are prohibited from using your own body as you see fit, you are a partial slave of whatever government prohibits you from using it as you see fit.

That includes performing any kind of sex act you want, either by yourself or with a consenting adult. Yet some governments prohibit certain sex acts and even treat them like felonies, which mean individuals who perform them can go to prison for more than 1 year or at least that is the rule in the United States.

Sodomy is one such prohibited act that comes to mind. Sodomy can include either anal or oral penetration. Homosexual men are known to engage in various forms of sodomy, but so are heterosexuals and lesbians. To the extent that they are prohibited from doing so, their body becomes partly owned by some government. One might also point out that utilitarian analysis would lead us to conclude that such acts are good since it is a positive-sum game. There are at least two people who benefit while no one is made worse off. But utilitarian analysis is beside the point. What matters is whether you are free to use your body as you want or not.

Conclusion

I hope I have made my point, which is that utilitarian arguments, while interesting, are beside the point. What counts is whether anyone's rights have been violated. That is what the body as property doctrine is all about. To the extent that some government prevents you from using your body as you see fit, you no longer own your body. The government has a property interest in it. To that extent, you are a slave of government. There is no moral duty for a slave to obey a slave master. Thus, all laws that prevent you from using your body as you see fit are illegitimate and need not be obeyed.

Slaves have a right to resist their slave masters. The extent of resistance that is justifiable depends on the facts and circumstances. What complicates the analysis are the cases where the extent of the slavery is less than 100%. More studies need to be done on this issue to establish some ground rules.

Abstract

One of the few legitimate functions of government is to protect property rights. That is one of the reasons why governments have been formed historically. When governments use force or threat of force to confiscate private property or prevent owners from using their property as they see fit, they cease to be legitimate. This chapter explores some instances where governments have abused their power by disparaging property rights and examines some of the ethical issues involved.

Introduction

The state is that great fiction by which everyone tries to live at the expense of everyone else.

([6], p. ix)

The illegitimate use of a state by economic interests for their own ends is based upon a preexisting illegitimate power of the state to enrich some persons at the expense of others.

([50], p. 272)

Through the years, some men have discovered how to satisfy their wants at the expense of others without being accused of theft; they ask their government to do the stealing for them.

([22], p. 19)

One of the reasons governments were formed was to protect property rights. Groups of individuals found that establishing a separate agency to protect life, liberty, and property was a more efficient way of protecting rights than trying to do it individually. In legal terms, one might say that citizens are the principals and governments are their agents. A corollary of this relationship is that the agents possess no powers

R.W. McGee

that the principals do not possess ([6], pp. 2–3). Thus, whenever a government does something that would be a crime for an individual to do, the government is acting without authority.

Let's take a look at some examples. If a US steel manufacturer attempts to forcibly prevent a US auto company from buying foreign steel, the steel manufacturer would be guilty of a crime, but if the steel manufacturer or some steel lobby persuades Congress to forcibly prohibit the importation of foreign steel, it is perfectly legal. Likewise, if a real estate investor uses force to confiscate the home of an elderly widow so that he can use the property to build a parking lot for one of his Atlantic City casinos, it would be a crime, but if he persuades the government to use the eminent domain laws to confiscate the property and sell it to him, it is perfectly legal [37].

This process of using the law to feather one's own nest at the expense of someone else is called rent seeking by economists [14, 66]. In the nineteenth century, Bastiat (1801–1850) called the practice a perversion of the law [6].

This chapter addresses some instances where the government abuses its power and its agency relationship with the citizenry by engaging in activities that would be a crime for an individual and that are violations of property rights. Unfortunately, such practices are widespread.

The ethical aspects of such practices have been almost uniformly ignored in the philosophical and business ethics literature, although there are a few exceptions [11, 18, 60]. It is time that these practices are examined through an ethical microscope.

Antidiscrimination Laws

We are brought up to believe that discrimination is bad, that there is something inherently unethical about it. But that is not at all the case. When a young man chooses to ask the prettiest girl in the room to dance, he is discriminating against all the less pretty girls in the room. There is nothing unethical about that. It is just life. When universities select only the smartest students, they are discriminating against the less smart students. There is nothing ethically improper about that, either. What is unethical is when some university discriminates against whites by choosing less qualified blacks or Hispanics, especially when it is a government-owned university.

The case is less clear when the university is privately owned because private universities are private organizations, and the government has no business interfering in the decisions of private individuals or groups. Individuals should be able to discriminate for or against any individual or group of individuals they want for whatever reason they want. While it may be immoral in some cases to discriminate against certain individuals and groups, no one's rights are being violated, and thus, the practice should not be illegal. Individuals or groups who persuade some legislature to punish employers for exercising their right to discriminate are acting unethically because they are using the force of government, which is constituted to

protect rights, to instead violate the contract and property rights of those who are discriminating.

There is no such thing as the right to a job. If there were, then employers would be obligated to hire people they do not want or need. Thus, employers who discriminate on the basis of skin color, age, sexual preference, percentage of body fat, national origin, or breast size are not violating anyone's rights. If a restaurant like Hooters, which is known for hiring waitresses who have breasts that are considered to be desirable by the local male population, wants to hire only women who have a certain size breast, or who have a certain ratio of waist size to breast size, they should be perfectly free to do so. No one's rights are violated by such hiring practices, and the quality of the restaurant's atmosphere is enhanced by doing so. Having that kind of waitress makes it easier to attract a certain clientele.

The same can be said for all restaurants. It would probably be a good management decision to hire Koreans rather than blacks or Hispanics if you own a Korean restaurant. It adds to the authenticity. It would be better to hire Chinese people if you own a Chinese restaurant. If you own a Jamaican restaurant, it would probably be better to hire Jamaicans than Scandinavians.

The owners have a property right in the restaurants they own. While they may be acting immorally in some cases by hiring only individuals who possess certain characteristics, they are not violating anyone's rights by doing so and thus should not be punished for hiring the individuals of their choice. If some group of individuals persuades the legislature to punish restaurant owners for exercising their property and contract rights, those legislators and individuals are acting unethically. This fact has not been pointed out in the literature.

Antidiscrimination laws may also be harmful to the community in ways that cost lives. For example, if a fire department is forced to hire weaker females who have difficulty carrying a hose up a ladder or an injured person down a ladder, rather than a stronger male who has no difficulty with these tasks, the decision may result in deaths. If a police department is forced to promote a certain percentage of blacks or Hispanics even if they cannot pass the qualification exam, the community will be forced to be served by less qualified individuals. Governments with inferior police forces are abrogating their fiduciary duty to serve their communities.

Using the force of government to prevent life insurance companies from charging whatever rates they choose is another ethical issue that has not been adequately examined. If some antidiscrimination law prohibits life insurance companies from charging different rates to men and women, the property and contract rights of those companies are being violated. In most societies, women live longer than men. Stated differently, insuring a man's life is a higher risk than insuring a woman's life. Since that is the case, it makes sense to charge men a higher premium than women. If insurance companies are forced to charge the same rates for men and women, then women will have to subsidize the rates that men pay for life insurance, which violates their property and contract rights as well.

The same can be said for prohibiting the charging of differential rates on the basis of race. If whites live longer than blacks, it makes sense to charge blacks higher insurance premiums because they pose a higher risk. Being prohibited from

doing so means that whites will have to subsidize blacks, which interferes with the contract rights of whites and violates both the property and contract rights of insurance companies. Legislators who push through such legislation and those who encourage them to do so are acting unethically because their actions violate contract and property rights. The insurance company executives who determine what rates to charge, on the other hand, are not acting unethically. All they are trying to do is manage their risks.

Antismoking Laws

Those who advocate the passage of antismoking laws are missing the point. Ostensibly aimed at promoting health and reducing the risk of cancer, heart disease, and other diseases, such laws always violate property rights and interfere with contract rights as well. Whether individuals should be allowed to smoke in a certain place should be determined on the basis of property rights. If the owner of the property allows people to smoke, they should be able to smoke [60, 69].

For example, if a restaurant or bar owner wants to allow smoking on the premises, smoking should be allowed. If some owners want to prohibit smoking or allow smoking only in certain areas, or only on Mondays, Wednesdays, and Fridays, they should be able to make such rules. Legislators who pass laws to prohibit smoking on private property, and those who encourage them to pass such laws, are acting immorally because they are using the force of government, which is supposed to protect property rights, to disparage those rights instead. To the extent that governments have such laws, they are illegitimate and morally need not be obeyed, although there may be penalties for not doing so.

Employers should also be able to hire only nonsmokers if they want to. Any law that prohibits employers from discriminating on the basis of smoking habits violates the property and contract rights of the people who own the business. Individuals have the right to smoke on their own property and on the property of anyone else who allows them to smoke. They have no right to smoke on property that is owned by someone who forbids smoking.

The argument has been made that health-care costs are increased if people smoke, the underlying utilitarian premise being that preventing people from smoking is a good thing because it is a positive-sum game. A related argument is that smokers are entitled to health care [52], with the underlying premise that the rest of us will be forced to pay for their health-care costs if they are allowed to smoke.

There are flaws with both of these ideas. For one, there is no such thing as a right to health care. Individuals have a right to health care only if they can find someone to provide it and only if that person agrees to provide it. The collectivist argument that everyone is entitled to health care has the underlying premise that someone else must be forced to pay for it and provide it. Peter must be forced to pay for Paul's health care.

Forcing one person to pay for another person's health care is inherently unethical, as well as a violation of the payer's property rights. If someone wants to smoke, that is their right because they own their own bodies and they can ingest substances that harm them, but they must be willing to bear the cost of their decisions without forcing others to subsidize their lifestyles by paying part of the cost of their health care. Insurance companies should be able to charge higher health insurance premiums to smokers, and those who do not smoke should not be forced to subsidize the health-care costs of those who do.

The Food Police

The body as property doctrine begins with the premise that we own our own bodies. If we do not, then our bodies are owned by someone else, most likely some government or some slave master. Yet the food police would dictate what substances we can put into our body. To the extent that they can force their views on us, we no longer own our own bodies. They do.

Certain legislators in New York State, New York City, and elsewhere have tried to ban table salt from restaurants [19]. Foods containing trans fats have been banned in various places [3]. There is a movement to outlaw various foods that are considered to be unhealthy. Coffee was banned in Sweden for 75 years, although it is now legal to drink coffee there. Fast-food restaurants have been sued for making people fat or unhealthy. We have been warned about the dangers of fast foods, artificial sweeteners, red meat, any meat, fish, apples, cranberry sauce, any food that is not organic, pork, chicken, eggs, irradiation, popcorn, cola drinks, alcoholic drinks, and on and on [7].

While there is nothing wrong with warning people about potential evils, whether real or a figment of your imagination, it is wrong to forcibly prevent people from putting whatever substances they want into their own bodies. Individuals who forcibly attempt to prevent someone from putting caffeine or meat into their mouth would be committing a crime, but if some government does it, it is often legal. However, since governments (agents) cannot do anything that individuals (principals) cannot do, any such act on the part of government is illegitimate. Legislators who advocate such acts and those who encourage them to do so are violating the property and contract rights of those who would otherwise engage in such activities.

The Right to Bear Arms

The right to self-defense is perhaps the most basic of all human rights. It is one of the reasons why governments were formed. Yet governments everywhere prohibit individuals from using certain weapons, such as firearms, to defend themselves. It is a clear violation of property and contract rights, yet such violations are almost uniformly ignored.

A number of utilitarian arguments have been made on both sides of the issue. Those who want to prohibit the private ownership of firearms argue that such a prohibition would reduce the number of deaths and other violent crimes [68]. They might even cite statistics to support their arguments.

Those who support the right to own and use firearms argue that allowing the citizenry to defend themselves with firearms reduces crime, and they also cite statistics to support their claims [28, 56]. Both sets of arguments are utilitarian based. If prohibiting firearms is good, it is because the result is a positive-sum game. Likewise, if permitting people to own firearms is good, it is because the result is a positive-sum game. People get caught up in the argument about which position is a positive-sum game. They ignore the basic issue, which is that any prohibition of the right of self-defense is a violation of property rights, and most prohibitions are a violation of contract rights as well since those who want to sell firearms are unable to do so and those who want to enter into contracts to purchase firearms are also unable to do so.

There is no doubt that if the flight attendants on those 9/11 airplanes had been permitted to exercise their right to bear arms, the Twin Towers of the World Trade Center would still be standing. The fact that they were forbidden to carry weapons made it possible for four airplanes to kill nearly 3,000 people and cause more than a billion dollars of property damage. Those crashes also caused the US stock market to fall by about a trillion dollars and led to a number of other events and policies that reduced the freedom of millions of people, such as warrantless searches at airports, the occasional groping of genitals by TSA agents, tapping telephones and e-mail accounts, depriving individuals of the right to attorneys, and keeping people imprisoned without due process, which are some of the powers the US government was given in the so-called Patriot Act and a few other similar pieces of legislation.

What ethical issues are raised by violating this basic right of self-defense? There is nothing inherently ethical or unethical about owning a firearm, just like there is nothing inherently ethical or unethical about owning a pencil. Ethics become an issue when individuals do certain things with those weapons and when other individuals attempt to prevent people from exercising their right to defend themselves with a firearm. Those who attempt to prevent people from having the ability to defend themselves with firearms are acting unethically because they violate someone's property and contract rights. Those who sell the weapons act ethically if they sell weapons to law-abiding citizens and act unethically if they knowingly sell such weapons to criminals or potential criminals.

The Ethics of Rent Seeking

Rent seeking is a term economists use to describe situations where private parties use the force of government to enhance their economic position at the expense of someone else, often the general public [14, 66]. Any kind of protectionist economic legislation would qualify, as would the abuse of many regulations that unjustly deprive someone of their property or contract rights.

Farmers are subsidized for planting some crops and have price supports for others, so they cannot take a loss [12]. The government can subsidize or penalize any industry or even a company within an industry by interpreting an existing regulation a certain way or issuing a new regulation that has the effect of helping or hurting a particular company.

The antitrust laws have been used to prevent competition rather than foster it [1, 63], as have antidumping laws [36, 40, 42, 45]. Occupational licensure laws [58, 70] have been used to prevent competition, ostensibly in the name of protecting the public. Various industries have persuaded legislatures to set rates, which has the effect of pushing out competition [17, 32, 33]. Often it is the large companies that abuse their influence with the legislature to make it difficult or impossible for smaller, more efficient companies to compete.

The airline industry in the United States is at the mercy of the federal government, which can assign or take away landing rights at any airport in the country. Airline executives have partially captured the airline regulators by persuading them to make a rule that prohibits any non-US airline from both taking off and landing in the United States without first making an intermediate stop outside the country. As a result, non-US carriers can land in New York, provided they originated from somewhere outside the United States, or they can fly from New York to some place outside the United States, but they cannot fly direct from New York to Los Angeles. They would first be required to land at an airport outside the United States, such as Vancouver, Canada, before continuing on to Los Angeles. Because of such rules, the domestic US airlines have an oligopoly on air travel between all locations in the United States.

The key to determining whether an act or policy is ethical is to ask the question, "Would it be a crime if I did it as an individual?" If the answer is *yes*, the act or policy is unethical.

The Ethics of Eminent Domain

Eminent domain laws give governments the authority to confiscate private property for public uses [31, 57]. Originally, public uses included things like building a road or constructing a post office. However, that is no longer the case [8, 24, 65]. The idea of takings has been broadened to include cases where the main beneficiary is some private individual or group rather than the general public.

Governments are supposed to pay just compensation to the property owners for the property they confiscate. However, that often does not happen. Property owners are often offered a much lower price than what would be considered fair.

There are at least three problems with eminent domain laws. For one, the compensation that governments pay is not always just. Secondly, some property that is confiscated is taken to benefit private interests rather than the public [8, 24, 46]. Third, governments are supposed to protect property rights; eminent domain laws allow them to disparage such rights.

Let's say that some government confiscates the ancestral home of some 80-year-old widow. The home has been in the family for 200 years. They offer to pay her \$X

because that is the amount some government bureaucrat thinks the house would sell for. The problem is that the ancestral home is worth much more than \$X to the 80-year-old widow. She would not be justly compensated at that amount. Such undervaluations are commonplace with eminent domain [24, 29].

Another problem with determining just compensation is that the market value of the property declines dramatically as soon as some government condemns the property. If the government is only required to pay market value for the condemned property, and if the fact that the property has been condemned greatly reduces the market value of the property, the owners of the property are being ripped off by the government twice, once for artificially reducing the property's value through condemnation proceedings and again by not paying the price that would be fair to the person who owns the property [9].

The other problem with eminent domain laws is that private parties such as real estate developers sometimes use the eminent domain laws to advance their own interests at the expense of the property owner. One example that made the press was the case where Donald Trump, a billionaire real estate developer, convinced the Casino Redevelopment Authority in Atlantic City, New Jersey, to condemn the home of Vera Coking so that Trump could build a parking lot for one of his casinos. She had lived in the home for almost 40 years when she received notice of the condemnation proceedings. The government offered her \$251,250 for the property, which was the appraisal value. However, she had previously turned down an offer of \$1,000,000 by another casino operator, which provides strong evidence that the property was being considerably undervalued ([9], p. 161).

Eminent domain laws and their abuse present a major ethical problem. This kind of legal action also highlights the clash between utilitarian ethics and rights theory. One of the main reasons governments were formed is to protect property rights. Owners of property are entitled to keep, use, and enjoy their property against the whole world. When it comes to rights, it does not matter whether some majority stands to benefit if the property would be put to another use that benefits some local community. Owners are entitled to their property without regard to the local community.

Yet eminent domain laws would deprive owners of their property using utilitarian ethics to justify their actions [25]. Applying utilitarian ethical principles would sometimes lead to the conclusion that private property may be confiscated if the result is more winners than losers or if the community as a whole benefits by the confiscation. Utilitarian ethics totally disregards property rights. That is one of the problems with utilitarian ethics.

Those who use eminent domain laws to abuse property rights are acting unethically. People who fall into this category include real estate developers and the government officials and bureaucrats who do their bidding. How much force are property owners morally allowed to use to protect their property rights is an issue that has seldom been discussed in the literature.

Although more research and discussion are needed on this issue, some guidelines can be given. It seems just that property owners have the right to use at least as much force against those who would confiscate property as the property rights

abusers are prepared to use against the property rights owners. A case could be made that the property owners are morally entitled to use even more force, whatever is necessary to protect their property. If some government is prepared to use guns to confiscate the property, it seems fair that the private owners would also be justified in using guns to prevent the taking. Thus, one may conclude that killing the agents of the government that have been sent to confiscate the property would constitute justifiable homicide rather than murder. The argument that the taking is legal because some government is the perpetrator does not hold up to analysis since governments do not have the moral authority to confiscate private property, even if some government official or legislature gives them the legal authority to do so. Governments are formed to protect property rights. Governments that confiscate property are illegitimate and need not be obeyed.

Zoning Laws

The same line of reasoning that can be applied to eminent domain laws can also be applied to zoning laws. To the extent that zoning laws prevent property owners from doing with their property as they see fit, they constitute a partial taking.

Zoning laws limit the use to which owners can put their property. In some communities, property owners are required to refrain from painting their houses a certain color or are prohibited from using certain building materials or are prohibited from doing certain things with their property just because some zoning board says so.

If some property owner wants to use his property to build a hotel or warehouse or factory and some government prevents him from doing so because of some zoning law, he can no longer use his property as he sees fit. Some government becomes a partial owner, in the sense that the government in question can dictate what the property can be used for. The fact that some government is the perpetrator of such property rights abuses makes matters worse since governments are formed to protect property rights, not to disparage them.

The theory behind zoning laws is utilitarian ethics. It is thought that certain restrictions should be placed on the use of private property if doing so benefits the community. Individuals in some residential community do not want to have a steel mill constructed down the street from them. Thus, the regulator could conclude that prohibiting the steel mill from setting up shop in a certain location is in the community's interest. What is being ignored in such decisions is the property owner's right to do whatever he wants with his own property. The only solution to these systematic property rights abuses is abolition of all zoning laws since that is the only way to protect property rights.

Although some zoning board decisions are made with good intentions, others are made for sinister reasons. For example, if some group of local unions wants to prohibit Wal-Mart, a nonunion shop, from opening a store in New York City, one easy way to accomplish that goal would be to pressure the local zoning board into denying Wal-Mart's application for a building permit. In a just society, no building

permits would be required since property owners would have the absolute right to do whatever they want with their own property. Anyone who uses zoning laws to prohibit property owners from using their property as they see fit is acting unethically.

Protectionism

In every country it always is and must be the interest of the great body of the people to buy whatever they want of those who sell it cheapest. The proposition is so very manifest, that it seems ridiculous to take any pains to prove it; nor could it ever have been called in question, had not the interested sophistry of merchants and manufacturers confounded the common sense of mankind. ([64], p. 461)

Protectionism is not new. Proponents were found in ancient Greece [2, 53]. Plato thought that trading with foreigners would allow undesirable characters to enter the polis, along with gold and silver, all of which corrupt the soul. Aristotle also thought exchanging products for money had a corrupting influence and thought that the best state was one that was self-sufficient, although both Plato and Aristotle recognized the benefits of the division of labor (but not comparative advantage).

The theories supporting protectionism have been refuted for well over 100 years – by Bastiat [4, 5] in France, Cobden and Bright in England, and John Prince Smith in Germany. Adam Smith's refutation, *The Wealth of Nations*, was published in 1776 [64]. Richard Cantillon's contribution to the debate, *Essai sur la Nature Du Commerce en Général* was written in the 1720s and 1730s and published in 1755 [15].

Yet protectionist sentiment remains strong [23, 49, 67]. As Vilfredo Pareto [51] pointed out in 1927, the benefits of protectionism are concentrated, while the costs are diffused.

Even if it were very clearly demonstrated that protection always entails the destruction of wealth, if that were taught to every citizen just as they learn the abc's, protection would lose so small a number of partisans and free trade would gain so few of them that the effect can be almost, or even completely, disregarded. The motives which lead men to act are quite different. ([51], p. 377)

If it is immoral for Ford or General Motors executives to personally prevent a willing US consumer from entering into a contract to buy a foreign automobile from a willing seller, is it any less immoral to ask government to do the job for them? The effect is the same whether the corporate executives physically restrain a consumer from walking into a Toyota or Hyundai dealership or whether they let the government intervene in their behalf by not allowing the automobile into the country in the first place. Also, are corporate executives who ask for government protection not acting immorally because their action denies the right of consumers to exercise their right to property – to choose the product of their choice? Such action is a perversion of the law because it allows some people to exploit the person, liberty, and property of others [6, 59].

Bastiat summarizes the ethics of this phenomenon quite well.

See if the law takes from some persons what belongs to them, and gives it to other persons to whom it does not belong. See if the law benefits one citizen at the expense of another by doing what the citizen himself cannot do without committing a crime ([6], p. 17).

According to this proviso, the welfare state is a perversion of the law, and protectionist measures such as tariffs and quotas are merely examples of one form of welfare – corporate subsidies.

Numerous arguments have been made over the years to support various protectionist policies (summarized in [42]). They are all based on an incomplete utilitarian analysis – utilitarian because they attempt to measure gains and losses and incomplete because they do not include all gains and losses in the utilitarian calculus.

There is no doubt that free trade has winners and losers [30]. Joseph Schumpeter [61] referred to this market phenomenon as creative destruction [20]. In order for new industries to be born, old industries must be permitted to die. In order for assets to be reallocated to their most efficient uses, they must be transferred from less efficient uses, which can entail the loss of jobs by some, so that new jobs can be created elsewhere. Numerous studies have found that free trade regimes create more jobs than they destroy, often by a factor of 2 to 1 or 3 to 1, yet protectionists are the ones who have the ear of the legislature, which is often only too happy to grant the wishes of the protectionists [27, 42].

Although protectionism cannot be justified on utilitarian grounds because the losers exceed the winners, the real issue, which is almost universally ignored, is one of property and contract rights. Individuals have the right to trade the property they have for the property they want. Any law that prevents them from doing so must necessarily violate their contract and property rights. That being the case, anyone who attempts to persuade some legislature to pass any form of protectionist legislation is acting immorally because the result of such legislation is the violation of property and contract rights. Any legislator who supports such legislation is also acting immorally.

Protectionism is a perversion of the law, an illegitimate use of governmental authority. To the extent that a government abuses its authority by violating property and contract rights rather than protecting them, it is illegitimate and need not be obeyed. Those who are having their property and contract rights violated by such perversions of the law have the moral authority to disobey and to resist. In such cases, there is nothing morally wrong with smuggling and ignoring any laws that would violate anyone's contract and property rights.

Outsourcing

Outsourcing has received a lot of bad press. Journalists and pundits would have us believe that it is somehow inherently evil [34]. Yet, outsourcing is just an application of the advice Adam Smith gave in 1776 – do what you do best and trade for everything else.

It does not make sense for General Motors or Ford to make their own tires, mufflers, and steel when other companies can do it better and cheaper. Antitrust laws might prohibit them from even trying, which is another issue. What does make sense is for General Motors and Ford to outsource and have companies that specialize in those products to make them. From a utilitarian point of view, it is more efficient, which makes it ethical ([54], p. 115; [55], pp. 284–285, [62]). I am not saying that what is most efficient is also automatically ethical. All I am saying is that a strain of utilitarian thought takes this position.

If outsourcing is ethical when General Motors and Ford go down the street to get their tires, mufflers, and steel, how can it be unethical if they get these same products from foreigners? While it may be true that American jobs are destroyed when American companies choose foreign producers, one might just as easily say that jobs in foreign countries are destroyed when they choose to do business with American producers. Either way, jobs are created in one place and destroyed in another place [20, 30]. There is evidence to suggest that outsourcing is especially beneficial to developing countries because it increases the rate of economic growth and creates jobs that pay more than the limited other alternatives the local population would otherwise have [26, 35, 38, 48].

It cannot be said that merely destroying someone's job constitutes an immoral act because there is no such thing as the right to a job. If there were, it would mean that someone has a moral obligation to buy whatever it is that you are selling even if they would prefer to buy from someone else, a position that is untenable.

Destroying a job in one country is offset by creating a job somewhere else. As was mentioned above, studies have found that free trade regimes create more jobs than they destroy. Stated differently, protectionist regimes destroy more jobs than they save or create.

Corporate Welfare

Corporate welfare can take many forms, some of which are not readily apparent. Any kind of subsidy is a form of corporate welfare. Tax breaks are considered a form of corporate welfare in some circles, while in others they are considered an incentive to do something or to not do something.

One might define corporate welfare as the transfer of wealth, either directly or indirectly, from some government to one or more corporations, where the transfer is not the result of exchange. Price supports fall into the category of corporate welfare, as do any kind of protectionist measures, from subsidies, price supports, low-interest loans for exporting companies, and loan guarantees to tariffs, quotas, and antidumping laws.

Some commentators use utilitarian arguments to criticize corporate welfare. The Archer Daniels Midland Corporation is a case in point [13]. ADMC is one of the more prominent recipients of corporate welfare. It has cost the American economy billions of dollars as a result of sugar industry protection, subsidies for ethanol and

grain exports, and other items. In some years, up to 43% of its profits have been the result of some kind of subsidy.

The subsidies are highly inefficient. For every \$1 in ethanol profits, the cost to American taxpayers is \$30 [13]. Some of the other products they make also involve subsidies that are inefficient.

Governments sometimes compete to see who can provide the largest subsidies to a particular industry. The Boeing v. Airbus controversy is a case in point. In that case, the US government and the EU were competing to subsidize their aircraft manufacturing industries [16]. Both sides of the dispute tried to claim the moral high ground when in fact that was nothing moral about what they were doing.

In 1994, Secretary of Labor Robert Reich challenged the Cato Institute to construct a list of business subsidies that don't make sense, a challenge it accepted. The result was a report that documented 125 federal subsidy programs that cost American taxpayers more than \$85 billion [47]. The focus was on inefficiencies, which is utilitarian based, although issues of fairness were also discussed.

The federal government is not the only source of corporate welfare. State, county, and local governments also participate in subsidizing corporations. Sports stadiums are one example. The Miami Heat basketball team threatened to leave Miami if the government did not build a new stadium for them, even though the current arena was only 8 years old at the time. The Florida Panthers hockey team also threatened to leave if the government did not build a stadium for them. Miami taxpayers balked at the idea for the Heat, so the Heat had to use its own money to build the stadium, but Broward County politicians were willing to float an issue of tax-exempt bonds to fund the Panthers stadium [10].

There are a number of things wrong with subsidizing sports arenas. For one, all the taxpayers are being forced to subsidize it, even though only a small percentage of them will actually go to the arena to see a sporting event. The argument has been made that building stadiums is good for the economy because it creates jobs, but this is a false argument. If the several hundred million dollars had not been spent on building a stadium that the public does not want, it would flow to some other use that the owners of the funds prefer to spend their money on. Before money can flow into the construction of a new stadium, it first must be sucked out of some other sector of the economy, causing that sector to shrink.

Antitrust laws have been called a form of corporate welfare [21] because they protect established corporations from competition at the expense of newer corporations and the general public. They penalize beneficial and efficient practices. They can and have been used to hobble competitors. Whenever the government hobbles competitors, the available supply of the products they produce decreases and their price increases, which harms the very consumers the antitrust laws were established to protect. Corporate officials who utilize the antitrust laws to hobble their competitors are acting unethically. As Bastiat [9] has pointed out, if the government is doing something that individuals could not do without committing a crime, the law is being perverted. That is exactly what happens when the government enforces an antitrust law. If private individuals tried to do what the

government does in such cases (penalizing or shutting down a competitor by the use of force or the threat of force), they would be guilty of a crime.

Bailing out big banks, small banks, auto companies, insurance companies, or any other company is also a form of corporate welfare. The case of the General Motors bailout is especially disgusting. General Motors had been making cars for years that Americans (and others) didn't want, which caused them to lose billions of dollars, leading to eventual bankruptcy. Yet those same people (taxpayers) were forced to subsidize General Motors by bailing them out, thus forcing the same people who chose not to buy General Motors automobiles to turn over a portion of their incomes so that General Motors employees could continue to receive their bloated wages and pension benefits.

Corporate officers who request a bailout or subsidy are acting unethically because they are using the force of government to confiscate assets from the general public and transfer those assets to their corporation. If they confiscated individuals' assets on their own they would be guilty of a crime, but if the government does the stealing for them, it is just a way to get other people's assets that they are not able to get through voluntary exchange in the marketplace. The politicians who support such subsidies are also acting unethically. Instead of protecting property rights, they are confiscating the property of the citizenry so that it can be transferred to private interests, special interests.

The Ethics of Smuggling

There is nothing inherently ethical or unethical about smuggling. It depends on the facts and circumstances. Prior to the American Revolution, smugglers smuggled untaxed tea into the American colonies. They helped tea drinkers evade the tax that was thought to be unfairly imposed since the American colonists did not have a vote. No taxation without representation was the call of the day. The British were not entitled to the tax, and the smugglers merely helped the colonial tea drinkers obtain the tea they wanted. Since the smugglers were facilitating commerce, creating jobs, and helping people to exercise their contract and property rights, the argument could be made that they were acting ethically by engaging in smuggling.

How about arms smuggling? This kind of smuggling has acquired a bad name over the years. Newspaper reports would have us believe that any kind of smugglers are acting unethically and that arms smugglers are death merchants.

Sometimes that may be true but sometimes it may not. For example, during the various wars that occurred shortly after the dissolution of Yugoslavia, the United States and United Nations imposed an arms embargo on the combatants. The problem was that the Serbs had all the weapons and the Bosnians were practically defenseless, except for a few revolvers here and there. As a result, the Serbs were free to slaughter thousands of Bosnians who were unable to defend themselves. Snipers were placed in the hills above Sarajevo and made a great sport of picking off unarmed men, women, and children. If the Bosnians would have been able to defend themselves, perhaps fewer lives would have been lost.

The argument has a utilitarian taste to it since part of the argument pushes the view that lives could have been saved if the Bosnians would have been able to defend themselves, but the real issue is one of property rights. Individuals have the right to defend themselves, and placing an arms embargo on them violated their very right to life. Arms smugglers performed a valuable service by helping them to defend this right. Thus, a strong argument could be made that that particular group of arms merchants performed a positive service, both from a utilitarian ethical perspective and from a rights perspective. There is no moral duty to obey an unjust law, and prohibiting innocent men, women, and children from defending themselves seems like one of the most unjust laws that could be enacted. There may even be a moral duty to disobey such laws, especially if it is possible to do so without major risk to oneself.

Conclusion

What is the solution? What can individuals do to prevent these violations of their contract and property rights? When it is individuals who violate these rights, victims can often go to court or punch the offenders in the nose to get justice or to protect their rights. But if some government is the rights violator, a solution is not as readily apparent. Victims of these property and contract right abuses cannot avail themselves of the legal system because the system allows governments to commit these rights violations. As Bastiat [6] would say, the law has been perverted.

One solution is to do nothing, to just let government continue to violate your rights. But that is not really a solution because your rights continue to be violated. Another solution would be to shoot the food police as soon as they enter a restaurant and try to take away your table salt, but that might be viewed as too extreme and would subject you to severe penalties, unless you could rely on the jury system (in countries where there is a jury system) to absolve you of liability.

From a moral perspective, victims have at least as much moral authority to defend themselves from such rights violations as do the violators, if not more. If the table salt police are prepared to punch you in the nose once for using table salt in a restaurant, you should at least have the moral right to punch them in the nose once, if not twice. After all, it is your rights that are being violated, not theirs. A case could be made that you have the right to punch them in the nose as many times as it takes until they take their hands off your table salt.

Unfortunately, what is moral and what is legal is not always the same thing. Although the table salt police give up any moral authority when they try to confiscate your table salt, the law is on their side, which allows them to get away with violating your right to table salt. But that does not do anything to alter your moral right to defend your property to whatever extent is necessary to retain your right to use your property as you see fit.

Governments that violate the rights they were instituted to protect lose their legitimacy. Such governments need not be obeyed, although there may be a penalty for not obeying. All that can be said from a philosophical perspective

is that there is no moral duty to obey, even if there may be a legal duty. If the rights abuses get to the point where they become insufferable, as was the case in the 1770s in the United States, the people have a right to secede and form a new government that is more to their liking, or they can join another existing government that will do a better job of protecting their property rights.

For example, if the government of New York State becomes too oppressive, citizens can either secede to form a new government that is more to their liking or they can secede and become part of New Jersey, which is across the Hudson River from New York City. Or they could become part of Hawaii, which is in the Pacific Ocean, thousands of miles away. Just because New York City is not contiguous to Hawaii does not mean it cannot become a part of Hawaii. Alaska is not contiguous to the lower 48 states of the United States, yet it is a state, and Hawaii is thousands of miles from California, separated by water, yet it became a state.

The point is that the people have the right to choose their own government and their own leaders. It is a basic tenet of democracy. If the government they have is not up to the task, and if its leaders cannot be replaced, as is often the case, they have the right to secede and form a new government, just as the American colonies did in the 1770s and the southern states tried to do in the 1860s [39, 41, 43, 44].

Stephan Kinsella

Abstract

The purpose of property rights is to allocate owners of scarce resources to permit peaceful, cooperative, productive use of these resources. For external, non-bodily resources, this allocation is done in accordance with the libertarian-Lockean first-use/first-own homesteading principle. So-called intellectual property rights such as patent and copyright are monopoly privileges granted by the state that dilute and undermine property rights in scarce resources. This chapter explores the nature of property rights and argues that intellectual property is incompatible with genuine private property rights. The chapter also criticizes utilitarian arguments in favor of intellectual property as being fallacious in terms of ethics, methodology, and economics.

Introduction

All libertarians favor property rights, and agree that property rights include rights in physical, material (sometimes referred to as “tangible”) resources. These resources include immovables (realty) such as land and houses, and movables such as chairs, clubs, cars, and clocks.¹

This chapter is based on “Against Intellectual Property,” first published in the *Journal of Libertarian Studies* 15, no. 2 (Spring 2001). See also my article *The Case Against IP: A Concise Guide*, MISES DAILY (Sep. 4, 2009), my blog post “Selected Supplementary Material for *Against Intellectual Property*,” *C4SIF Blog* (Mar. 1, 2012), c4sif.org, and resources available at <http://c4sif.org/resources/>. Further, all libertarians support rights in one's own body. Such rights may be called "self-ownership" as long as one keeps in mind that there is dispute about whether such body-ownership is alienable in the same way that rights in homesteadable, external objects are alienable.² In any event, libertarians universally hold that all material scarce resources – whether homesteadable or created, immovable or movable, or our very bodies – are subject to rightful control, or "ownership," by specified individuals.

As we move away from the material (or corporeal) toward the immaterial (incorporeal), matters become fuzzier. Rights to reputations (defamation laws) and against blackmail, for example, are rights in very immaterial types of things. Most, though not all, libertarians oppose laws against blackmail, and many oppose the idea of a right to one's reputation.³

Also disputed is the concept of intellectual property (herein referred to as IP). Are there individual rights to one's intellectual creations, such as inventions or written works? Should the legal system protect such rights? Below, I summarize current US law on intellectual property rights. I then survey various libertarian views on IP rights, and present what I consider to be the proper view.

Summary of IP Law

Types of IP

Intellectual property is a broad concept that covers several types of legally recognized rights arising from some type of intellectual creativity, or that are otherwise related to ideas.⁴ IP rights are rights to immaterial things⁵ – to *ideas*, as expressed (copyrights), or as embodied in a practical implementation (patents). Tom Palmer puts it this way: "Intellectual property rights are rights in ideal objects, which are distinguished from the material substrata in which they are instantiated."⁶ In today's legal systems, IP typically includes at least copyrights, trademarks, patents, and trade secrets.⁷

Copyright

Copyright is a right given to authors of "original works," such as books, articles, movies, and computer programs. Copyright gives the exclusive right to reproduce the work, prepare derivative works, or to perform or present the work publicly (17 USC §§ 101, 106 *et pass*). Copyrights protect only the *form* or *expression* of ideas, not the underlying ideas themselves.⁸

While a copyright may be registered to obtain legal advantages, a copyright need not be registered to exist. Rather, a copyright comes into existence automatically the moment the work is "fixed" in a "tangible medium of expression," and lasts for the life of the author plus 70 years, or for a total of 95 years in cases in which the employer owns the copyright.⁹

Patent

A patent is a property right in inventions, i.e., in devices or processes that perform a “useful” function (35 USC § 1 *et seq.*; 37 CFR Part 1). A new or improved mousetrap is an example of a type of device which may be patented. A patent effectively grants the inventor a limited monopoly on the manufacture, use, or sale of the invention. However, a patent actually only grants to the patentee the right to exclude (i.e., to prevent others from practicing the patented invention); it does not actually grant to the patentee the right to use the patented invention.¹⁰

Not every innovation or discovery is patentable. The US Supreme Court has, for example, identified three categories of subject matter that are unpatentable, namely “laws of nature, natural phenomena, and abstract ideas” (*Diamond v Diehr*, 450 US 175, 185 (1981); see also 35 USC § 101). Reducing abstract ideas to some type of “practical application,” i.e., “a useful, concrete, and tangible result,”¹¹ is patentable, however. US patents, since June 8, 1995, last from the date of issuance until 20 years from the original filing date of the patent application (35 USC § 154(a)(2)) (the previous term was 17 years from date of issue).

Trade Secret

A trade secret consists of any confidential formula, device, or piece of information which gives its holder a competitive advantage so long as it remains secret.¹² An example would be the formula for Coca-Cola[®]. Trade secrets can include information that is not novel enough to be subject to patent protection, or not original enough to be protected by copyright (e.g., a database of seismic data or customer lists). Trade secret laws are used to prevent “misappropriations” of the trade secret, or to award damages for such misappropriations (See the *Uniform Trade Secrets Act* [UTSA]). Trade secrets are protected under state law, although recent federal law has been enacted to prevent theft of trade secrets (*Economic Espionage Act of 1996*, 18 USC §§ 1831–39).

Trade secret protection is obtained by declaring that the details of a subject are secret. The trade secret theoretically may last indefinitely, although disclosure, reverse-engineering, or independent invention may destroy it. Trade secrets can protect secret information and processes, for example, compilations of data and maps not protectable by copyright, and can also be used to protect software source code not disclosed and not otherwise protectable by patent. One disadvantage of relying on trade secret protection is that a competitor who independently invents the subject of another’s trade secret can obtain a patent on the device or process and actually prevent the original inventor (the trade secret holder) from using the invention.

Trademark

A trademark is a word, phrase, symbol, or design used to *identify* the source of goods or services sold, and to distinguish them from the goods or services of others.

For example, the Coca-Cola[®] mark and the design that appears on their soft drink cans identifies them as products of that company, distinguishing them from competitors such as Pepsi[®]. Trademark law primarily prevents competitors from “infringing” upon the trademark, i.e., using “confusingly similar” marks to identify their own goods and services. Unlike copyrights and patents, trademark rights can last indefinitely if the owner continues to use the mark. The term of a federal trademark registration lasts 10 years, with 10-year renewal terms being available (15 USC § 1501 *et seq.*; 37 CFR Part 2).

Other rights related to trademark protection include rights against trademark dilution (15 USC §§ 1125(c), 1127), certain forms of cybersquatting (15 USC § 1125(d); Anticybersquatting Consumer Protection Act, PL 106–113 (1999); HR 3194, S1948), and various “unfair competition” claims. IP also includes recent legal innovations, such as the mask work protection available for semiconductor integrated circuit (IC) designs (See 17 USC § 901 *et seq.*), the *sui generis* protection, similar to copyright, for boat hull designs (See 17 USC § 1301 *et seq.*), and the proposed *sui generis* right in databases, or collections of information.¹³

In the United States, federal law almost exclusively governs copyrights and patents, since the Constitution grants Congress the power “to promote the progress of science and useful arts.”¹⁴ Despite the federal source of patents and copyrights, various related aspects, such as *ownership* of patents, are based on state law, which nevertheless tend to be fairly uniform from state to state (See [28], and *Chisum on Patents*, § 22.03; 17 USC §§ 101, 201). Federal trademarks, by contrast, not being explicitly authorized in the Constitution, are based on the interstate commerce clause and thus only cover marks for goods and services in interstate commerce.¹⁵ State trademarks still exist since they have not been completely preempted by federal law, but federal marks tend to be more commercially important and powerful. Trade secrets are generally protected under state, not federal, law.¹⁶

Many laymen, including libertarians, have a poor understanding of IP concepts and law, and often confuse copyrights, trademarks, and patents. It is widely, and incorrectly, believed that in the US system, the inventor who files first at the patent office has priority over those who file later. However, until last year, the US system actually had a “first-to-invent” system, unlike most other countries, which have traditionally had a “first-to-file” system for priority.¹⁷ (The America Invents Act, enacted in late 2011, changed the US system to a first-to-file system similar to that of other countries.)¹⁸

IP Rights and Relation to Material Property

As noted above, IP rights, at least for patents and copyrights, may be considered rights in ideal objects. It is important to point out that ownership of an idea, or ideal object, effectively gives the IP owners a property right in *every* physical embodiment of that work or invention. Consider a copyrighted book. Copyright holder *A* has a right to the underlying ideal object, of which the book is but one example. The copyright system gives *A* the right in the very *pattern* of words in the book; therefore,

by implication, *A* has a right to every tangible or material instantiation or embodiment of the book – i.e., a right in *every* physical version of the book, or, at least, to every book within the jurisdiction of the legal system that recognizes the copyright.

Thus, if *A* writes a novel, he has a copyright in this “work.” If he sells a physical copy of the novel to *B*, in book form, then *B* owns only that one physical copy of the novel; *B* does not own the “novel” itself, and is not entitled to make a copy of the novel, even using his own paper and ink. Thus, even if *B* owns the material property of paper and printing press, he cannot use his own property to create another copy of *A*’s book. Only *A* has the *right to copy* the book (hence, “copyright”).

Likewise, *A*’s ownership of a patent gives him the right to prevent a third party from using or practicing the patented invention, even if the third party only uses his own property. In this way, *A*’s ownership of ideal rights gives him some degree of control – ownership – over the material property of innumerable others. Patent and copyright invariably transfer partial ownership of material property from its natural owner to innovators, inventors, and artists. As I have argued elsewhere [32], patent and copyright grant a *negative servitude* in the property of others to the IP holder.

Libertarian Perspectives on IP

The Spectrum

Libertarian views on IP range from complete support of the fullest gamut of IP imaginable, to outright opposition to IP rights. Most of the debate about IP concerns patent and copyright; as discussed below, trademark and trade secret are less problematic. Therefore, this chapter focuses primarily on the legitimacy of patent and copyright.

Pro-IP arguments may be divided into natural-rights and utilitarian arguments. Libertarian IP advocates tend to adopt the former justification.¹⁹ For example, natural-rights, or at least not explicitly utilitarian, libertarian proponents of IP include, from more to less extreme, Galambos, Schulman, and Rand.²⁰ Among precursors to modern libertarians, Spooner and Spencer both advocated IP on moral or natural-rights grounds.²¹

According to the natural-rights view of IP held by some libertarians, creations of the mind are entitled to protection just as material property is. Both are the product of one’s labor and one’s mind. Because one owns one’s labor, one has a

natural law right to the fruit of one’s labor. Under this view, just as one has a right to the crops one plants, so one has a right to the ideas one generates and the art one produces ([50], p. 819).

This theory depends on the notion that one owns one’s body and labor, and therefore, its fruits, including intellectual “creations.” An individual creates a sonnet, a song, a sculpture, by employing his own labor and body. He is thus entitled to “own” these creations, because they result from other things he “owns.”

There are also utilitarian pro-IP arguments. Federal Judge Richard Posner is one prominent utilitarian (although not libertarian) IP advocate [51]. Among libertarians, anarchist David Friedman analyzes and appears to endorse IP on “law-and-economics” grounds,²² a utilitarian institutional framework. The utilitarian argument presupposes that we should choose laws and policies that maximize “wealth” or “utility.” With respect to copyright and patent, the idea is that more artistic and inventive “innovation” corresponds with, or leads to, more wealth. Public goods and free-rider effects reduce the amount of such wealth below its optimal level, i.e., lower than the level we would achieve if there were adequate IP laws on the books. Thus, wealth is optimized, or at least increased, by granting copyright and patent monopolies that encourage authors and inventors to innovate and create.²³

On the other hand, there is a long tradition of opposition to patent and copyright. Modern opponents include Rothbard, McElroy, Palmer, Lepage, Bouckaert, and myself.²⁴ Benjamin Tucker also vigorously opposed IP in a debate in the nineteenth century individualist-anarchist periodical *Liberty*.²⁵ These commentators point out the many problems with conventional utilitarian and natural-rights arguments given to justify IP rights. These and other shortcomings of standard pro-IP arguments are surveyed below.

Utilitarian Defenses of IP

Advocates of IP often justify it on utilitarian grounds. Utilitarians hold that the “end” of encouraging more innovation and creativity justifies the seemingly immoral “means” of restricting the freedom of individuals to use their physical property as they see fit. But there are three fundamental problems with justifying any right or law on strictly utilitarian grounds.

First, let us suppose that wealth or utility could be maximized by adopting certain legal rules; the “size of the pie” is increased. Even then, this does not show that these rules are justified. For example, one could argue that net utility is enhanced by redistributing half of the wealth of society’s richest 1% to its poorest 10%. But even if stealing some of *A*’s property and giving it to *B* increases *B*’s welfare “more” than it diminishes *A*’s (if such a comparison could, somehow, be made), this does not establish that the theft of *A*’s property is justified. Wealth maximization is not the goal of law; rather, the goal is justice – giving each man his due.²⁶ Even if overall wealth is increased due to IP laws, it does not follow that this allegedly desirable result justifies the unethical violation of some individuals’ rights to use their own property as they see fit.

In addition to ethical problems, utilitarianism is not coherent. It necessarily involves making illegitimate interpersonal utility comparisons, as when the “costs” of IP laws are subtracted from the “benefits” to determine whether such laws are a net benefit.²⁷ But not all values have a market price; in fact, none of them do. Mises showed that even for goods that have a market price, the price does not serve as a *measure* of the good’s value.²⁸

Finally, even if we set aside the problems of interpersonal utility comparisons and the justice of redistribution and we plow ahead, employing standard utilitarian

measurement techniques, it is not at all clear that IP laws lead to any change – either an increase or a decrease – in overall wealth.²⁹ It is debatable whether copyrights and patents really are necessary to encourage the production of creative works and inventions, or that the incremental gains in innovation outweigh the immense costs of an IP system. Econometric studies do not conclusively show net gains in wealth. Perhaps there would even be *more* innovation if there were no patent laws; maybe more money for research and development (R&D) would be available if it were not being spent on patents and lawsuits. It is possible that companies would have an even greater incentive to innovate if they could not rely on a near 20-year monopoly (see [57, 86, 87], for further examples of costs of patent and copyright laws).

There are undoubtedly costs of the patent system. As noted, patents can be obtained only for “practical” applications of ideas, but not for more abstract or theoretical ideas. This skews resources away from theoretical R&D.³⁰ It is not clear that society is better off with relatively more practical invention and relatively less theoretical research and development. Additionally, many inventions are patented for defensive reasons, resulting in patent lawyers’ salaries and patent office fees. This large overhead would be unnecessary if there were no patents. In the absence of patent laws, for example, companies would not spend money obtaining or defending against ridiculous patents. It simply has not been shown that IP leads to net gains in wealth. But should not those who advocate the use of force against others’ property have to satisfy a burden of proof?

We must remember that when we advocate certain rights and laws, and inquire into their legitimacy, we are inquiring into the legitimacy and ethics of the use of *force*. To ask whether a law should be enacted or exist is to ask: Is it proper to use force against certain people in certain circumstances? It is no wonder that this question is not really addressed by analysis of wealth maximization. Utilitarian analysis is thoroughly confused and bankrupt: Talk about increasing the size of the pie is methodologically flawed; there is no clear evidence that the pie increases with IP rights. Further, pie growth does not justify the use of force against the otherwise legitimate property of others. For these reasons, utilitarian IP defenses are unpersuasive.

Some Problems with Natural Rights

Other libertarian proponents of IP argue that certain ideas deserve protection as property rights because they are created. Rand supported patents and copyrights as “the legal implementation of the base of all property rights: a man’s right to the product of his mind” ([29], p. 130). For Rand, IP rights are, in a sense, the reward for productive work. It is only fair that a creator reap the benefits of others using his creation. For this reason, in part, she opposes *perpetual* patent and copyright – because future, unborn heirs of the original creator are not themselves responsible for the creation of their ancestors’ work.

One problem with the creation-based approach is that it almost invariably protects only *certain types* of creations – unless, i.e., every single useful idea one

comes up with is subject to ownership (more on this below). But the distinction between the protectable and the unprotectable is necessarily arbitrary. For example, philosophical or mathematical or scientific truths cannot be protected under current law on the grounds that commerce and social intercourse would grind to a halt were every new phrase, philosophical truth, and the like considered the exclusive property of its creator. For this reason, patents can be obtained only for so-called practical applications of ideas, but not for more abstract or theoretical ideas. Rand agrees with this disparate treatment, in attempting to distinguish between an unpatentable *discovery* and a patentable *invention*. She argues that a “scientific or philosophical discovery, which identifies a law of nature, a principle, or a fact of reality not previously known” is not *created* by the discoverer.

But the distinction between creation and discovery is not clear-cut or rigorous.³¹ Nor is it clear why such a distinction, even if clear, is ethically relevant in defining property rights. No one creates *matter*; they just manipulate and grapple with it according to physical laws. In this sense, no one really creates *anything*. They merely rearrange matter into new arrangements and patterns. An engineer who invents a new mousetrap has rearranged existing parts to provide a function not previously performed [90]. Others who learn of this new arrangement can now also make an improved mousetrap. Yet the mousetrap merely follows laws of nature. The inventor did not invent the matter out of which the mousetrap is made, nor the *facts* and laws exploited to make it work.

Similarly, Einstein’s “discovery” of the relation $E = mc^2$, once known by others, allows them to manipulate matter in a more efficient way. Without Einstein’s, or the inventor’s, efforts, others would have been *ignorant* of certain causal laws, of ways matter can be manipulated and utilized. Both the inventor and the theoretical scientist engage in creative mental effort to produce useful, new ideas. Yet one is rewarded, and the other is not. In one recent case, the inventor of a new way to calculate a number representing the shortest path between two points – an extremely useful technique – was not given patent protection because this was “merely” a mathematical algorithm.³² But it is arbitrary and unfair to reward more practical inventors and entertainment providers, such as the engineer and songwriter, and to leave more theoretical science and math researchers and philosophers unrewarded. The distinction is inherently vague, arbitrary, and unjust.

Moreover, adopting a limited term for IP rights, as opposed to a perpetual right, also requires arbitrary rules. For example, patents last for 20 years from the filing date, while copyrights last, in the case of individual authors, for 70 years past the author’s death. No one can seriously maintain that 19 years for a patent is too short, and 21 years too long, any more than the current price for a gallon of milk can be objectively classified as too low or too high.

Thus, one problem with the natural-rights approach to validating IP is that it necessarily involves arbitrary distinctions with respect to what classes of creations deserve protection, and concerning the length of the term of the protection.

Of course, one way to avoid this difficulty is to claim that *everything* is protectable by IP, with perpetual (infinite) terms. Spooner [47, 50, 60], for example, advocated perpetual rights for patent and copyright. Schulman advocates a much

broader concept of creations or ideas protectable by IP. He argues for property rights called “logorights” in any “logos” that one creates. The logos is the “material identity” or identity-pattern of created things. The owner of a logos would own the order or pattern of information imposed upon, or observed in, material substances.

The most radical of all IP proponents is Andrew Joseph Galambos, whose ideas, to the extent that I understand them, border on the absurd.³³ Galambos believed that man has property rights in his own life (primordial property) and in all “non-procreative derivatives of his life” [45, 46]. Since the “first derivatives” of a man’s life are his thoughts and ideas, thoughts and ideas are “primary property.” Since action is based on primary property (ideas), actions are owned as well; this is referred to as “liberty.” Secondary derivatives, such as land, televisions, and other material goods, are produced by ideas and action. Thus, property rights in material items are relegated to lowly secondary status, as compared with the “primary” status of property rights in ideas. (Even Rand once elevated patents over mere property rights in material goods, in her bizarre notion that “patents are the heart and core of property rights” ([29], p. 133). Can we really believe that there were no property rights respected before the 1800s, when patent rights became systematized?)

Galambos reportedly took his own ideas to ridiculous lengths, claiming a property right in his own ideas and requiring his students not to repeat them [45], dropping a nickel in a fund box every time he used the word “liberty,” as a royalty to the descendants of Thomas Paine, the alleged “inventor” of the word “liberty”; and changing his original name from Joseph Andrew Galambos (Jr., presumably) to Andrew Joseph Galambos, to avoid infringing his identically named father’s rights to the name.³⁴

By widening the scope of IP, and by lengthening its duration to avoid making such arbitrary distinctions as Rand does, the absurdity and injustice caused by IP becomes even more pronounced (as Galambos demonstrates). And by extending the term of patents and copyrights to infinity, subsequent generations would be choked by ever-growing restraints on their own use of property. No one would be able to manufacture – or even use – a light bulb without getting permission from Edison’s heirs. No one would even be able to build a house without getting permission from the heirs of the first protohuman who left the caves and built a hut. No one could use a variety of life-saving techniques, chemicals, or treatments without obtaining permission of various lucky, rich descendants. No one would be able to boil water to purify it, or use pickling to preserve foods, unless he is granted license by the originators (or their distant heirs) of such techniques.

Such unbounded ideal rights would pose a serious threat to material-property rights, and would threaten to overwhelm them. All use of material property would by now be impossible, as every conceivable use of property, every single action, would be bound to infringe upon one of the millions of past, accreted IP rights, and the human race would die of starvation. But, as Rand noted, men are not ghosts; we have a spiritual aspect, but also a physical one ([91], pp. 326–27, 467). Any system that elevates rights in ideas to such an extreme that it overrides rights in material things is clearly not a suitable ethical system for living, breathing human beings.

No one living can actually act in accordance with such an unrestricted view of IP. The remaining advocates of IP all qualify their endorsement by limiting the scope and/or terms of IP rights, thus adopting the ethically arbitrary distinctions noted above.

A deeper problem for the natural-rights position lies in its undue emphasis on “creation,” instead of scarcity, as giving rise to property rights, as discussed below.

IP and Property Rights

Property and Scarcity

Let us take a step back and look afresh at the idea of property rights. Libertarians believe in property rights in material goods (resources). Why? What is it about material goods that makes them subjects for property rights? Why are material goods property?

A little reflection will show that it is these goods’ *scarcity* – the fact that there can be *conflict* over these goods by multiple human actors. The very possibility of conflict over a resource renders it scarce, giving rise to the need for ethical rules to govern its use. Thus, the fundamental social and ethical function of property rights is to prevent interpersonal conflict over scarce resources.³⁵ As Hoppe notes:

[O]nly because scarcity exists is there even a problem of formulating moral laws; insofar as goods are superabundant (“free” goods), no conflict over the use of goods is possible and no action-coordination is needed. Hence, it follows that any ethic, correctly conceived, must be formulated as a theory of property, i.e., a theory of the assignment of rights of exclusive control over scarce means. Because only then does it become possible to avoid otherwise inescapable and unresolvable conflict ([93], p. 235 n. 9).

Others who recognize the importance of scarcity in defining what property is include Plant, Hume, Palmer, Rothbard, and Tucker.³⁶

Nature, then, contains things that are economically scarce. My use of such a thing *conflicts* with (excludes) your use of it, and vice versa. The function of property rights is to prevent interpersonal conflict over scarce resources, by allocating exclusive ownership of resources to specified individuals (owners). To perform this function, property rights must be both *visible* and *just*. Clearly, in order for individuals to avoid using property owned by others, property borders and property rights must be objective (intersubjectively ascertainable); they must be *visible*.³⁷ For this reason, property rights must be objective and unambiguous. In other words, “good fences make good neighbors.”

Property rights must be demonstrably just, as well as visible, because they cannot serve their function of preventing conflict unless they are acceptable as fair by those affected by the rules ([93], p. 138). If property rights are allocated unfairly, or simply grabbed by force, this is like having no property rights at all; it is merely might versus right again, i.e., the pre-property rights situation. But as libertarians recognize, following Locke, it is only the first occupier or user of

such property that can be its natural owner. Only the *first-occupier* homesteading rule provides an objective, ethical, and nonarbitrary allocation of ownership in scarce resources.³⁸ When property rights in scarce means are allocated in accordance with first-occupier homesteading rules, property borders are visible, and the allocation is demonstrably just. Conflict can be avoided with such property rights in place because third parties can see and, thus, sidestep the property borders, and be motivated to do so because the allocation is just and fair.

But surely it is clear, given the origin, justification, and function of property rights, that they are applicable only to *scarce* resources. Were we in a Garden of Eden where land and other goods were infinitely abundant, there would be no scarcity and, therefore, no need for property rules; property concepts would be meaningless. The idea of conflict, and the idea of rights, would not even arise. For example, your taking my lawnmower would not really deprive me of it if I could conjure up another in the blink of an eye. Lawnmower-taking in these circumstances would not be “theft.” Property rights are not applicable to things of infinite abundance, because there cannot be conflict over such things.

Thus, property rights must have objective, discernible borders, and must be allocated in accordance with the first-occupier homesteading rule. Moreover, property rights can apply only to scarce resources. The problem with IP rights is that the ideal objects protected by IP rights are not scarce; and, further, that such property rights are not, and cannot be, allocated in accordance with the first-occupier homesteading rule, as will be seen below.

Scarcity and Ideas

Like the magically reproducible lawnmower, ideas are not scarce. If I invent a technique for harvesting cotton, your harvesting cotton in this way would not take away the technique from me. I still have my technique (as well as my cotton). Your use does not exclude my use; we could both use my technique to harvest cotton. There is no economic scarcity, and no possibility of conflict over the use of a scarce resource. Thus, there is no need for exclusivity.

Similarly, if you copy a book I have written, I still have the original (material) book, and I also still “have” the pattern of words that constitute the book. Thus, authored works are not scarce in the same sense that a piece of land or a car is scarce. If you take my car, I no longer have it. But if you “take” a book-pattern and use it to make your own physical book, I still have my own copy. The same holds true for inventions and, indeed, for any “pattern” or information one generates or has. As Thomas Jefferson – himself an inventor, as well as the first Patent Examiner in the USA – wrote, “He who receives an idea from me, receives instruction himself without lessening mine; as he who lights his taper at mine, receives light without darkening me.”³⁹ Since use of another’s idea does not deprive him of its use, no conflict over its use is possible; ideas, therefore, are not candidates for property rights. Even Rand acknowledged that “intellectual property cannot be consumed.”⁴⁰

Ideas are not naturally scarce. However, by recognizing a right in an ideal object, one *creates* scarcity where none existed before. As Arnold Plant explains:

It is a peculiarity of property rights in patents (and copyrights) that they do not arise out of the scarcity of the objects which become appropriated. They are not a *consequence* of scarcity. They are the deliberate creation of statute law, and, whereas in general the institution of private property makes for the preservation of scarce goods, tending . . . to lead us “to make the most of them,” property rights in patents and copyrights make possible the creation of a scarcity of the products appropriated which could not otherwise be maintained.⁴¹

Bouckaert also argues that natural scarcity is what gives rise to the need for property rules, and that IP laws create an artificial, unjustifiable scarcity. As he notes:

Natural scarcity is that which follows from the relationship between man and nature. Scarcity is natural when it is possible to conceive of it before any human, institutional, contractual arrangement. Artificial scarcity, on the other hand, is the outcome of such arrangements. Artificial scarcity can hardly serve as a justification for the legal framework that causes that scarcity. Such an argument would be completely circular. On the contrary, artificial scarcity itself needs a justification ([63], p. 793; see also pp. 797–99).

Thus, Bouckaert maintains that “only naturally scarce entities over which physical control is possible are candidates for” protection by *real* property rights ([63], pp. 799, 803). For ideal objects, the only protection possible is that achievable through *personal* rights, i.e., contract (more on this below).⁴²

Only material, scarce resources are the possible object of interpersonal conflict, so it is only for them that property rules are applicable. Thus, patents and copyrights are unjustifiable monopolies granted by government legislation. It is not surprising that, as Palmer notes, “[m]onopoly privilege and censorship lie at the historical root of patent and copyright” ([61], p. 264). It is this monopoly privilege that creates an artificial scarcity where there was none before.

Let us recall that IP rights give to pattern-creators partial rights of control – ownership – over the material property of everyone else. The pattern-creator has partial ownership of others’ property, by virtue of his IP right, because he can prohibit them from performing certain actions *with their own property*. Author X, for example, can prohibit a third party, Y, from inscribing a certain pattern of words on Y’s own blank pages with Y’s own ink.

That is, by merely authoring an original expression of ideas, by merely thinking of and recording some original *pattern* of information, or by finding a new way to use his own property (recipe), the IP creator instantly, magically becomes a partial owner of others’ property. He has some say over how third parties can use their property. He is granted, in effect, a type of “negative servitude” in others’ already-owned property” (See [32]). IP rights change the *status quo* by redistributing property from individuals of one class (material-property owners) to individuals of another (authors and inventors). *Prima facie*, therefore, IP law trespasses against or “takes” the property of material-property owners, by transferring partial ownership to authors and inventors. It is this invasion and redistribution of property that must be justified in order for IP rights to be valid. We see, then, that utilitarian defenses do not do the trick. Further problems with natural-rights defenses are explored below.

Creation Versus Scarcity

Some inconsistencies and problems with natural-rights theories of IP were pointed out above. This section discusses further problems with such arguments, in light of the preceding discussion of the significance of scarcity.

As noted before, some libertarian IP advocates, such as Rand, hold that *creation* is the source of property rights (See [29, 39, 42, 43]). This confuses the nature and reasons for property rights, which lie in the undeniable fact of scarcity. *Given* scarcity and the correspondent possibility of conflict in the use of resources, conflicts are avoided and peace and cooperation are achieved by allocating property rights to such resources. And the purpose of property rights dictates the nature of such rules. For if the rules allocating property rights are to serve as objective rules that all can agree upon so as to avoid conflict, they cannot be biased or arbitrary (See [93], Chap. 7, esp. p. 138). For this reason, unowned resources come to be owned – homesteaded or appropriated – by the *first* possessor ([93], p. 142; [76], pp. 172–79; and [97], p. 105).

The general rule, then, is that ownership of a given scarce resource can be identified by determining who first occupied it. There are various ways to possess or occupy resources, and different ways to demonstrate or prove such occupation, depending upon the nature of the resource and the use to which it is put. Thus, I can pluck an apple from the wild and thereby homestead it, or I can fence in a plot of land for a farm. It is sometimes said that one form of occupation is “forming” or “creating” the thing.⁴³ For example, I can sculpt a statue from a block of marble, or forge a sword from raw metal, or even “create” a farm on a plot of land.

We can see from these examples that creation is relevant to the question of ownership of a given “created” scarce resource, such as a statue, sword, or farm, only to the extent that the act of creation is an act of occupation, or is otherwise evidence of first occupation. However, “creation” itself does not justify ownership in things; it is neither necessary nor sufficient. One cannot *create* some possibly disputed scarce resource without first using the raw materials used to create the item. But these raw materials are scarce, and either I own them or I do not. If not, then I do not own the resulting product. If I own the inputs, then, by virtue of such ownership, I own the resulting thing into which I transform them.

Consider the forging of a sword. If I own some raw metal (because I mined it from ground I owned), then I own the same metal after I have shaped it into a sword. I do not need to rely on the fact of creation to own the sword, but only on my ownership of the factors used to make the sword.⁴⁴ And I do not need creation to come to own the factors, since I can homestead them by simply mining them from the ground and thereby becoming the first possessor. On the other hand, if I fashion a sword using your metal, I do not own the resulting sword. In fact, I may owe you damages for trespass or conversion.

Creation, therefore, is neither necessary nor sufficient to establish ownership. The focus on creation distracts from the crucial role of first occupation as a property

rule for addressing the fundamental fact of scarcity. First occupation, not creation or labor, is both necessary and sufficient for the homesteading of unowned scarce resources.

One reason for the undue stress placed on creation as the source of property rights may be the focus by some on *labor* as the means to homestead unowned resources. This is manifest in the argument that one homesteads unowned property with which one mixes one's labor *because* one "owns" one's labor. However, as Palmer correctly points out, "*occupancy, not labor*, is the act by which external things become property."⁴⁵ By focusing on first occupancy, rather than on labor, as the key to homesteading, there is no need to place creation as the fount of property rights, as Objectivists and others do. Instead, property rights must be recognized in first-comers (or their contractual transferees) in order to avoid the omnipresent problem of conflict over scarce resources. Creation itself is neither necessary nor sufficient to gain rights in unowned resources. Further, there is no need to maintain the strange view that one "owns" one's labor in order to own things one first occupies. Labor is a type of action, and action is not ownable; rather, it is the way that some material things (e.g., bodies) act in the world.

The problem with the natural-rights defense of IP, then, lies in the argument that because an author-inventor "creates" some "thing," he is "thus" entitled to own it. The argument begs the question by assuming that the ideal object is ownable in the first place; once this is granted, it seems natural that the "creator" of this piece of property is the natural and proper owner of it. However, ideal objects are not ownable.

Under the libertarian approach, *when* there is a scarce (ownable) resource, we identify its owner by determining who its first occupier is. In the case of "created" goods (i.e., sculptures, farms, etc.), it can sometimes be assumed that the creator is also the first occupier by virtue of the gathering of raw materials and the very act of creation (imposing a pattern on the matter, fashioning it into an artifact, and the like). But it is not creation per se that gives rise to ownership, as pointed out above.⁴⁶ For similar reasons, the Lockean idea of "mixing labor" with a scarce resource is relevant only because it *indicates* that the user has possessed the property (for property must be *possessed* in order to be labored upon). It is not because the labor must be rewarded, nor because we "own" labor and "therefore" its fruits. In other words, creation and labor-mixing *indicate* when one has occupied – and, thus, homesteaded – unowned scarce resources.⁴⁷

By focusing on creation and labor, rather than on first occupancy of scarce resources, as the touchstone of property rights, IP advocates are led to place undue stress on the importance of "rewarding" the labor of the creator, much as Adam Smith's flawed labor theory of value led to Marx's even more deeply flawed communist views on exploitation.⁴⁸ As noted above, for Rand, IP rights are, in a sense, the reward for productive work, i.e., *labor*. Rand and other natural-rights IP proponents seem to adopt a mixed natural rights – utilitarian rationale in holding that the person who invests time and effort must be rewarded or benefit from this effort (e.g., Rand opposed perpetual patent and copyright on the grounds that because distant descendants did not create their ancestors' works, they deserve no reward) (See also [38], pp. 388–89).

In addition, in a strange admixture of natural-rights and utilitarian thinking, the natural-rights IP approach implies that something is property if it can hold *value*. But as Hoppe has trenchantly shown, one cannot have a property right in the *value* of one's property, but only in its physical integrity ([93] pp. 139–41, 237 n. 17). Moreover, many arbitrarily defined “things” can acquire economic value if government grants a monopoly over the thing's use, even if the thing is not otherwise a scarce resource (e.g., the Postal Service's monopoly power to deliver first-class letters).

Thus, because ideas are not scarce resources in the sense that physical conflict over their use is possible, they are not the proper subject of property rights designed to avoid such conflicts.

Two Types of Homesteading

What, though, is really wrong with recognizing “new” property rights? After all, since new ideas, artistic creations, and innovations continually enrich us, what is the harm in moving with the times by recognizing new forms of property? The problem is that if property rights are recognized in non-scarce resources, this necessarily means that property rights in material resources are correspondingly diminished. This is because the only way to recognize ideal rights, in our real, scarce world, is to allocate rights in material goods. For me to have an effective patent right – a right in an idea or pattern, not in a scarce resource – means that I have some control over everyone else's scarce resources.

In fact, we can see that IP rights imply a new rule for acquiring rights in scarce resources, which undercuts the libertarian homesteading principle. For, according to Lockean-libertarian homesteading, it is the *first occupier* of a previously unowned scarce resource who homesteads it, i.e., becomes its owner. A late-comer who seizes control of all or part of such owned property is simply a thief, because the property is already owned. The thief effectively proposes a new and arbitrary homesteading rule to replace the first-occupier rule, namely, the particularistic rule “I become the owner of property when I forcibly take it from you.” Of course, such a rule is no rule at all, and is clearly inferior to the first-possessor rule. The thief's rule is particular, not universal; it is not just, and it certainly is not designed to avoid conflicts.

Proponents of IP must also advocate a new homesteading rule to supplement, if not replace, the first-possessor homesteading rule. They must maintain that there is a *second* way for an individual to come to own material property. To wit, the IP advocate must propose some homesteading rule along the following lines: “A person who comes up with some useful or creative idea which can guide or direct an actor in the use of his own material property thereby instantly gains a right to control all other material property in the world, with respect to that property's similar use.” This new-fangled homesteading technique is so powerful that it gives the creator rights in third parties' *already owned* material property.

For example, by inventing a new technique for digging a well, the inventor can prevent *all others* in the world from digging wells in this manner, *even on their own*

property. To take another example, imagine the time when men lived in caves. One bright guy – let us call him Galt-Magnon – decides to build a log cabin on an open field, near his crops. To be sure, this is a good idea, and others notice it. They naturally imitate Galt-Magnon, and they start building their own cabins. But the first man to invent a house, according to IP advocates, would have a right to prevent others from building houses on their own land, with their own logs, or to charge them a fee if they do build houses. It is plain that the innovator in these examples becomes a *partial owner* of the material property (e.g., land and logs) of others, due *not* to first occupation and use of that property (for it is already owned), but due to his *coming up with an idea*. Clearly, this rule flies in the face of the first-user homesteading rule, arbitrarily and groundlessly overriding the very homesteading rule that is at the foundation of all property rights.

There is, in fact, no reason why merely innovating gives the innovator partial ownership of property that others already own. Just because a rule can be proposed does not mean that it is workable or just. There are many arbitrary rules one could dream up by which property rights could be allocated. For example, a racist could propose that any white person can homestead any property already first homesteaded by a black person. Or, the *third* occupier of a scarce resource becomes its owner. Or, the state can homestead all capital goods, even if already first acquired by individuals. Or, by legislative decree, the state can homestead, in the form of taxes, part of the estates that are already owned by private individuals. All such arbitrary homesteading rules, including the IP rule that innovators homestead partial control of all others' material resources, are unjustifiable. They all conflict with the only justifiable homesteading rule, *first occupation*. None of them establish fair, objective rules that avoid interpersonal conflict over scarce resources. Discussions of protecting rights in "ideas," "creations," or "things of value" only serve to obscure the fact that the proponent of IP opposes the unadulterated right to homestead and own private property.

IP as Contract

The Limits of Contract

The law, then, should protect individual rights to one's body, and to legitimately acquired scarce resources (property). There is not a natural right to ideal objects – to one's intellectual innovations or creations – but only to scarce resources. Many opponents of IP rights typically support only *contractual* arrangements to protect ideas and innovations – private contracts between property owners.⁴⁹ Suppose, for example, that *A* writes a book and sells physical copies of it to numerous purchasers $B_1, B_2 \dots B_N$, with a contractual condition that each buyer *B* is obligated not to make or sell a copy of the text. Under all theories of contract, any of the buyers *B* becomes liable to *A*, at least for damages, if he violates these provisions.⁵⁰

But the advocates of the contractual approach to IP are mistaken if they believe that private contract can be used to recreate the same type of protection afforded by

modern IP rights. Patent and copyright are good against *all* third parties, regardless of their consent to a contract. They are *real* rights that bind *everyone*, in the same way that my title to a parcel of land binds everyone to respect my property – even if they do not have a contract with me. A contract, by contrast, binds *only* parties to the contract. It is like private law between the parties.⁵¹ It does not bind third parties, i.e., those not in “privity” with the original parties.⁵²

Thus, if the book purchaser *B* relates to third parties *T* the plot of the purchased novel, these third parties *T* are not bound, in general, by the original contractual obligation between *A* and *B*. If I learn how to adjust my car’s carburetor to double its efficiency, or if I learn of a poem or movie plot someone else has written, why should I have to pretend that I am ignorant of these things, and refrain from acting on this knowledge? I have not obligated myself by contract to the creator. I do not deny that contractual obligations can be implicit or tacit, but there is not even an implicit contract in such situations.

Nor can it be said as a general matter that I have stolen or fraudulently acquired the information, as there are many legitimate ways for individuals to acquire information. Artistic works, by their very nature, typically are made public. Scientific discoveries and innovations likewise can become known beyond the parties to confidentiality agreements. And it certainly cannot be said that my use of my carburetor, or writing a novel using the same plot, physically interferes with the creator’s use of his own material property. It does not even prevent the creator from using his own carburetor idea to improve his own car or others’, or from using that plot.

So, my adjusting my carburetor is not a breach of contract; it is not theft; and it is not physical trespass on the inventor’s material property. Twiddling my carburetor does not violate the inventor’s rights. At most, my use of this idea will diminish its *value* to the inventor by hampering his ability to monopolistically exploit it. As we have seen, however, one cannot have a right to the value of one’s property, but only in its physical integrity ([93], pp. 139–41, 237 n. 17).

Thus, the use of contract only gets us so far. A book publisher may be able to contractually obligate his purchasers to not copy his book, but he cannot prevent third parties from publishing and selling it, unless some contract prohibits this action.

Contract Versus Reserved Rights

Third parties, then, who are not parties to the contract and are not in privity with the contractual obligor and obligee, are not bound by the contractual relationship. For this reason, although an innovator can use contract to stop specified individuals from freely using his ideas, it is difficult to use standard contract law to prevent third parties from using ideas they glean from others. Perhaps sensing this problem, some quasi-IP advocates shift from a purely contractual approach to a “reservation-of-rights” approach in which property rights in material resources are seen as a divisible bundle of rights.

For example, under the standard bundle-of-rights view, a landowner can sell the mineral estate to an oil company while retaining all rights to the surface, except for an easement (servitude) granting passage to a neighbor and a life estate (usufruct) granting use of the surface estate to his mother. Drawing on the bundle-of-rights notion, the “reservation-of-rights” approach holds that a type of “private” IP can be privately generated by creatively “reserving rights” to *reproduce* material items sold to purchasers.

Rothbard, for example, argues that one can grant conditional “ownership” (of “knowledge”) to another, while “retaining the ownership power to disseminate the knowledge of the invention.” Or, Brown, the inventor of an improved mousetrap, can stamp it “copyright” and thereby sell the right to each mousetrap *except for* the right to reproduce it. Like the real rights accompanying statutory IP, such “reservations” allegedly bind everyone, not just those who have contracted with the original seller. Thus, third parties who become aware of, purchase, or otherwise come into possession of the restricted item also cannot reproduce it – *not* because they have entered into a contract with Brown, but because “no one can acquire a *greater* property title in something that has already been given away or sold.” In other words, the third party acquires a material thing – a book or a mousetrap, say – but it is somehow “missing” the “right-to-copy” part of the bundle of rights that “normally” constitutes all rights to the thing. Or, the third party acquires “ownership” of information, from a person who did not own the information and, thus, was not entitled to transmit it to others ([11], p. 123).

But surely something is amiss here. Suppose that A writes a novel and sells a first copy, BOOK₁, without restriction (i.e., without a reservation of rights) to B₁; and a second copy, BOOK₂, to B₂ – but “reserving” the book’s inherent “right to copy.” The two books, BOOK₁ and BOOK₂, appear to third parties to be otherwise identical. Yet they are not: One is incomplete; the other somehow contains more mystical “rights-essence” within its covers. Suppose B₁ and B₂ leave these books on a park bench, where they are discovered by third party T. According to Rothbard, BOOK₂ is “missing” the “right to copy,” much like an electronic toy that is sold “batteries not included.” It is as if there is an invisible, mystical tendril of “reproduction-ownership” stretching from BOOK₂ back to its true owner A, wherever he may be. Thus, even if T finds and homesteads the abandoned BOOK₂, this book simply does not contain “within itself” the right to permit the owner to copy it. It is being continually siphoned away by a rights wormhole which connects the item to owner A. Thus, if T homesteads the book, he still homesteads no more than he acquires. T homesteads only a book without a right to copy “built in,” and, thus, does not have the right to copy BOOK₂. The same is true for subsequent third parties who come to possess the book.

Is such a view really tenable? Can we conceive of property rights working this way? Even if we can, would it really achieve the desired result here – preventing third parties from using the protected ideas? It is difficult to maintain that rights can be reserved in this manner. One function of property rights, after all, is to prevent conflict and to put third parties *on notice* as to the property’s boundaries. The borders of property must necessarily be objective and intersubjectively

ascertainable; they *must be* visible. Only if borders are visible can they be respected and property rights serve their function of permitting conflict-avoidance. Only if these borders are both visible and objectively just (justifiable in discourse) *can* they be expected to be adopted and followed. But think of the two books, BOOK₁ and BOOK₂. How could one tell the difference between them? How could one see the rights-tendrils connected to the latter but not to the former? How can third parties be expected to respect an amorphous, invisible, mystical, spooky, possibly unknown and unknowable property border?

The implications of such a view are troubling. Palmer Writes:

The separation and retention of the right to copy from the bundle of rights that we call property is problematic. Could one reserve the right, for example, to remember something? Suppose that I wrote a book and offered it to you to read, but I had retained one right: the right to remember it. Would I be justified in taking you to court if I could prove that you had remembered the name of the lead character in the book? ([50], p. 853).⁵³

But third parties still pose a problem for this theory. Even if a seller of an object could somehow “reserve” certain use-rights with respect to the sold object, how does this prevent third parties from using *information* apparent from or conveyed in that object? Reserved rights proponents say more than that the immediate buyer B_1 is bound not to reproduce the book; for this result could be obtained by pointing to the implicit *contract* between seller A and buyer B_1 . Let us consider a third party, T_1 , who finds and reads the abandoned book, thus *learning* the information in it. Alternatively, consider third party T_2 , who never has possession of or even sees the book; he merely learns of the information in the book from gossip, graffiti, unsolicited e-mail, and so forth. Neither T_1 nor T_2 has a contract with A , but both now possess certain knowledge. Even if the book somehow does not contain within it a “right to reproduce,” how can this prevent T_1 and T_2 from using their own knowledge? And even if we say that T_1 is somehow “bound” by a contractual copyright notice printed on the book (an untenable view of contract), how is T_2 bound by any contract or reserved right?

Rothbard attempts to address this point as follows:

A common objection runs as follows: all right, it would be criminal for *Green* [the buyer] to produce and sell the Brown mousetrap; but suppose that someone else, Black, who had not made a contract with Brown, happens to see Green’s mousetrap and then goes ahead and produces and sells the replica? Why should *he* be prosecuted? The answer is that . . . no one can acquire a *greater* property title in something than has already been given away or sold. Green did not own the total property right in his mousetrap, in accordance with his contract with Brown – but only all rights *except* to sell . . . a replica. But therefore Black’s title in the mousetrap, the ownership of the ideas in Black’s head, can be no greater than Green’s, and therefore he too would be a violator of Brown’s property even though he himself had not made the actual contract ([11], p. 123).

There are several problems with this reasoning. First of all, Black merely *sees* Green’s mousetrap. He does not see or have access to ideas in Green’s head. Nor does he need to have such access in order to duplicate evident features of the mousetrap.

Further, ideas in one’s head are not “owned” any more than labor is owned. Only scarce resources are owned. By losing sight of scarcity as a necessary aspect of

a homesteadable thing, and of the first occupancy homesteading rule as the way to own such things, Rothbard and others are sidetracked into the mistaken notion that ideas and labor can be owned. If we recognize that ideas cannot be owned (they are not scarce resources), that creation is neither necessary nor sufficient for ownership (first occupancy is), and that labor need not be “owned” in order to be a homesteader, then the trouble caused by these confused notions disappears.

If Black *somehow* comes into possession of the ideas implicit in an item which Brown invented (in Rothbard’s example, he “happens to see” it), it is *irrelevant* that the mousetrap may not have had a “right to copy” built into it. For Black does not need such permission to use his own property as he sees fit. How does “happening to see” the mousetrap make Black a trespasser or violator of Brown’s rights?

All actions, including action which employs owned scarce means (property), involve the use of technical knowledge [114–116]. Some of this knowledge may be gained from things we see, including the property of others. We do not have to have a “right to copy” as part of a bundle of rights to have a right to impose a known pattern or form on an object we own. Rather, we have a right to do *anything at all* with and on our own property, provided *only* that we do not invade others’ property borders. We must not lose sight of this crucial libertarian point. If I own a 100-acres of land, I can prance around naked on it, *not* because the land is imbued with some “right-to-prance-naked,” but because I *own* the land and it does not (necessarily) violate the property rights of others for me to use my property in this fashion.

Similarly, I am entitled to do what I want with my own property – my car, my paper, my word processor – including improving my car’s carburetor or using my ink to print words on my paper. That is, *unless* I have contractually obligated myself to someone else to restrict my actions with respect to my use of this knowledge. I do not have to first find in my property a right-to-use-in-a-certain-way, for all ways of using it, *except* those that cause invasions of others’ property borders, are already encompassed within the general *right to use* my property. In libertarianism, we live by right, not permission. We do not need to find permission to take actions with our own property. Contrary to practice in totalitarian societies, all things that are not forbidden are permitted. The reservation-of-rights view would reverse this by assuming that every use of property is valid only if that particular use-right can be somehow found or located in the property.

Consider the following analogy. Farmer Jed discovers oil under his land. No one for miles around knows about the black gold. Jed plans to buy his neighbors’ property for a song; they will sell it cheap, too, since they do not know about the oil. In the middle of the night, his nosy neighbor Cooter, suspicious over Jed’s recent good spirits, sneaks onto Jed’s land and discovers the truth. The next morning, at Floyd’s barbershop, Cooter spills his guts to Clem and the boys. One of them promptly runs to a pay phone and gives a tip to a reporter at the *Wall Street Journal* (who happens to be his nephew). Soon, it is common knowledge that there is oil in the vicinity. The neighbors now demand exorbitant prices for their land, thus spoiling Jed’s plans.

Let us grant that Cooter can be prosecuted for trespass and harms flowing therefrom. The question is, can Jed’s neighbors be prevented from acting on their knowledge? That is, may they be forced to somehow *pretend* that they do not know

about the oil, and sell their land to Jed for what they “would have” sold it when in ignorance? Of course they may not be forced so. They own their land, and are entitled to use it as they see fit. Unlike material property, information is not ownable; it is not property. The possessor of a stolen watch may have to return it, but so long as the acquirer of knowledge does not obtain that knowledge illicitly or in violation of a contract, he is free to act upon it.

Note, however, that according to the reservation-of-rights view, the neighbors would not be permitted to act upon their knowledge because they obtained it ultimately from Cooter, a trespasser who had no “title” to that knowledge. Thus, they could not have obtained “greater title” to it than Cooter himself had. Note also that others, such as geological surveyors mapping oil deposits, cannot include this information in their maps. They must feign ignorance until given permission by Jed. This imposed ignorance correlates with the unnatural scarcity imposed by IP. There is clearly no warrant for the view that reserved rights can somehow prohibit third parties from using knowledge they acquire.

It is simply not legitimate to restrict the use to which an owner of property can put it unless that owner has contractually obligated himself or has otherwise acquired the information by a violation of the information-holder’s rights. Talk of reserving the right to copy is merely a way to avoid the contractual notion that only parties to a contract are bound by it.⁵⁴

Therefore, as a general matter, purchasers can be bound by contracts with sellers to not copy or even resell the thing. However, once third parties become aware of the ideas underlying the invention or literary work, their use of that knowledge does not, in general, violate any recognizable property rights of the seller.

Given this view of scarcity, property, and contract, let us examine the legitimacy of common forms of IP.

Copyright and Patent

As should be apparent, copyright and patent seek to prevent the owners of material property – scarce resources – from using their own property as they see fit. For example, they are prohibited, under patent law, from practicing patented methods, using their own property, or from shaping their own property into patented devices, even if they independently invent the method or device. Under copyright law, third parties who have not contracted with the author are prevented from copying or profiting from the author’s original work. Clearly, sellers of novel devices or literary works can contract with buyers to prevent these buyers from reproducing, or even reselling, the item. These contractual webs can be elaborate; a novel writer can license his story to a movie studio on the condition that the studio require all movie theaters to require customers to agree not to reproduce the plot of the movie, and so on.

Yet, once third parties not bound by a contract acquire this information, they are free to use it as they see fit. The reserved rights approach does not change this. Thus, it would probably be difficult to maintain anything similar to our present patent and copyright laws using contract alone.

Trade Secrets

Trade secrets are easier to justify than patent or copyright. Palmer argues that they “emerge” from common law-type rights, and are, thus, legitimate ([50] pp. 854–55; [61], pp. 280, 292–93). Trade secret law allows damages to be obtained for, or an injunction to be issued to prevent, acts of “misappropriation” of a trade secret. This can be applied against the person who has improperly acquired the trade secret or who divulges the secret contrary to a contractual obligation, and also against others who know that they are obtaining the secret from such a person.⁵⁵

Suppose employee *A* of company *X* has access to *X*'s trade secrets, such as its secret formula for a soft drink. He is subject to an employment agreement obligating him to keep this formula secret. He then jumps to *X*'s competitor, *Y*. *Y* wants to use the formula it learns from *A* to compete with *X*. Under current law, so long as the secret formula has not been made public, *X* can get a court order to stop *A* from revealing the secret to *Y*. If *A* has already revealed the secret to *Y*, *X* can also get an injunction to stop *Y* from using or publicizing the formula.

Clearly, the injunction and damages against *A* are proper because *A* is in violation of his contract with *X*. More questionable is the injunction against *Y*, because *Y* had no contract with *X*. In the context in which such situations usually arise, however, where the competitor *Y* wants the trade secret and knows the defecting employee is in breach of contract, it could be argued that the competitor *Y* is acting in conspiracy with or as an accomplice of employee *A* to violate the (contractual) rights of trade secret holder *X*. This is because *A* has not actually breached his trade secrecy agreement until he reveals trade secrets to *Y*. If *Y* actively solicits *A* to do this, then *Y* is an accomplice or co-conspirator in the violation of *X*'s rights. Thus, just as the driver of the getaway car in a bank robbery, or the mafia boss who orders an assassination, are properly held liable for acts of aggression committed by others with whom they conspire, third parties can, in narrowly defined cases, be prevented from using a trade secret obtained from the trade secret thief.⁵⁶

Trademarks

Palmer also argues that trademark law is legitimate ([61], p. 280). Suppose some Lachmannian changes the name on his failing hamburger chain from Lachmann Burgers to Rothbard Burgers, which is already the name of another hamburger chain. I, as a consumer, am hungry for a Rothbard Burger. I see one of the fake Rothbard Burger joints run by the stealthy Lachmannian, and I buy a burger. Under current law, Rothbard, the “owner” of the Rothbard Burgers trademark, can prevent the Lachmannian from using the mark Rothbard Burgers to sell burgers because it is “confusingly similar” to his own trademark. That is, it is likely to mislead consumers as to the true source of the goods purchased. The law, then, gives a right to the trademark holder against the trademark infringer.

In my view, it is the *consumers* whose rights are violated, not the trademark holder's. In the foregoing example, I (the consumer) thought I was buying a Rothbard Burger, but instead got a crummy Lachmann Burger with its weird kaleidoscopic sauce. I should have a right to sue the Lachmannian for fraud and breach of contract (not to mention intentional infliction of emotional distress and misrepresentation of praxeological truths). However, it is difficult to see how this act of fraud, perpetrated by the Lachmannian on *me*, violates *Rothbard's* rights. The Lachmannian's actions do not physically invade Rothbard's property. He does not even convince others to do this; at most, he may be said to convince third parties to take an action within their rights, namely, to buy a burger from the Lachmannian instead of Rothbard. Thus, it would appear that, under libertarianism, trademark law should give *consumers*, not trademark *users*, the right to sue trademark pirates.

Moreover, more novel extensions of trademark, such as rights against trademark dilution or against certain forms of cybersquatting, cannot be justified. Just as a trademark holder does not have a right to his mark, neither does he have a right against his mark's dilution. The law against cybersquatting is simply based on an economically ignorant opposition to "scalping" and arbitrage. There is, of course, nothing wrong with being the first to acquire a domain name and thereafter selling it to the highest bidder.

Conclusion

We see, then, that a system of property rights in "ideal objects" necessarily requires violation of other individual property rights, for example, to use one's own material property as one sees fit (See [50], pp. 831, 862, 864–65; [61], p. 281). Such a system requires a new homesteading rule which subverts the first-occupier rule. IP, at least in the form of patent and copyright, cannot be justified.

It is not surprising that IP attorneys, artists, and inventors often seem to take for granted the legitimacy of IP. However, those more concerned with liberty, truth, and rights should not take for granted the institutionalized use of force used to enforce IP rights. Instead, we should reassert the primacy of individual rights over our bodies and homesteaded scarce resources.

Notes

1. Terms like "realty," "personality," and "tangible" are common-law terms; analogous civil-law terms are "immovables," "movables," and "corporeals," respectively. See [1] for further differences between civil-law and common-law terminology. The term "things" is a broad civil-law concept that refers to all types of items, whether corporeal or incorporeal, movable or immovable. A note about terminology: as argued by Hardy Bouillon [2], it is more precise

- to focus on the differences between material and nonmaterial goods rather than between tangible and non-tangible goods, as the touchstone of things subject to property rights. For more on the distinction, see [3].
2. Debate over this issue manifests itself in differences over the issue of inalienability and with respect to the law of contract, i.e., can we “sell” or alienate our bodies in the same manner that we can alienate title to homesteaded property? For arguments against body inalienability, see [4, 5]. For arguments favoring such alienability, see [6]. For further discussion of self-ownership, see [7].
 3. For views in opposition to blackmail laws, see [8, 9]; [10], pp. 53–54; [11], pp. 124–126; [12]. For libertarian views in favor of blackmail laws, see [13, 14]. For libertarian arguments against defamation (libel and slander) laws, see [10], pp. 50–53; and [11], pp.126–128; [15].
 4. In some European countries, the term “industrial property” is used instead of “intellectual property.”
 5. *De La Vergne Refrigerating Mach. Co. v Featherstone*, 147 U.S. 209, 222, 13 S.Ct. 283, 285 (1893).
 6. As one commentator has noted, “intellectual property may be defined as embracing rights to novel ideas as contained in tangible products of cognitive effort.” See [16, 17].
 7. A useful introduction to IP can be found in Arthur R. Miller and Michael H. Davis [18]; see also [19]. For a good introduction to patent law, see [20]. More in-depth treatises with further information on IP law include Donald S. Chisum [21–25]. Useful information, brochures, and pamphlets are available from the United States Copyright Office, <http://lcweb.loc.gov/copyright>, and from the Patent and Trademark Office of the Department of Commerce, <http://www.uspto.gov>. See also [26].
 8. Modern copyright law has superseded and largely preempted “common law copyright,” which attached automatically from the moment of a work’s creation, and which essentially conferred only a right of *first* publication. Goldstein, Copyright, §§ 15.4 et seq.
 9. 17 USC § 302. Due to recent legislation, these terms are 20 years longer than under previous law. See HR 2589, the *Sonny Bono Copyright Term Extension Act/Fairness in Music Licensing Act of 1998*.
 10. Suppose *A* invents and patents a better mousetrap, which has a Nitinol (memory metal) spring for better snapping ability. Now suppose *B* invents and patents a mousetrap with a Nitinol spring covered with nonstick coating, to improve the ability to remove mouse remains while still providing the Nitinol-driven snapping action. *B* has to have a mousetrap with a Nitinol spring in order to use his invention, but this would infringe upon *A*’s patent. Similarly, *A* cannot add the nonstick coating to his own invention without infringing upon *B*’s improvement patent. In such situations, the two patentees may cross-license, so that *A* can practice *B*’s improvement to the mousetrap, and so *B* can use his own invention.

 16. But see the federal *Economic Espionage Act of 1996*, 18 USC §§ 1831–39.
 17. Ayn Rand mistakenly assumes that the first to file has priority (and then she is at pains to defend such a system). See [29], p.133. She also confusingly attacks the strict antitrust scrutiny given to patent holders. However, since patents are government-granted monopolies, it is not unjust to use an antimonopoly law to limit the ability of a patent owner to extend this

monopoly beyond the bounds intended by the patent statute. The problem with antitrust laws is in their application to normal, peaceful business dealings, not to limit real—i.e., government-granted—monopolies. A similar point might be made with regard to Bill Gates, whose fortune has largely been built based on the government-granted monopoly inherent in copyright. Moreover, as Bill Gates is no libertarian, and doubtlessly does not oppose the legitimacy of antitrust laws, one can hardly wring one's hands in pity over his having to lie in the very bed he helped make. On scientism and empiricism, see [77, 78].
On epistemological dualism, see [78–81].
28. Mises states: “Although it is usual to speak of money as a measure of value and prices, the notion is entirely fallacious. So long as the subjective theory of value is accepted, this question of measurement cannot arise” [82]. Also: “Money is neither a yardstick of value nor of prices. Money does not measure value. Nor are prices measured in money: they are amounts of money” [83]; see also [73], pp. 96, 122, 204, 210, 217, and 289.
29. For an excellent survey and critique of the cost-benefit justification for patent and copyright, see [57]. For useful discussions of evidence in this regard, see [61]; [50], pp. 820–821, 850–851; [63], pp. 812–13; [84, 85].
30. [88], p. 43. See also [58], pp. 658–59:

It is by no means self-evident that patents encourage an increased absolute quantity of research expenditures. But certainly patents distort the type of research expenditure being conducted. . . . Research expenditures are therefore overstimulated in the early stages before anyone has a patent, and they are unduly restricted in the period after the

patent is received. In addition, some inventions are considered patentable, while others are not. The patent system then has the further effect of artificially stimulating research expenditures in the patentable areas, while artificially restricting research in the nonpatentable areas. See also [89].

31. Plant is correct in stating that “[t]he task of distinguishing a scientific discovery from its practical application, which may be patentable . . . is often baffling to the most subtle lawyer.” “The Economic Theory Concerning Patents for Inventions,” pp. 49–50. On a related note, the US Supreme Court has noted that “[t]he specification and claims of a patent . . . constitute one of the most difficult legal instruments to draw with accuracy.” *Topliff v Topliff*, 145 US 156, 171, 12 S.Ct. 825 (1892). Perhaps this is because patent law has no moorings to objective borders of actual, material property, and thus is inherently vague, amorphous, ambiguous, and subjective. For the latter reason alone, one would think that Objectivists—ardent, self-proclaimed defenders of objectivity and opponents of subjectivism—would oppose patent and copyright.
32. *In re Trovato*, 33 USPQ2d 1194 (Fed Cir 1994). Recent case law has expanded the types of mathematical and computer algorithms and business methods that can be protected by patent. See, e.g., *State Street Bank & Trust Co. v Signature Financial Group*, 149 F3d 1368 (Fed Cir 1998). However, no matter where the line is drawn between unpatentable “laws of nature” and “abstract ideas” and patentable “practical applications,” patent law still necessarily makes a distinction between the two.
33. See Galambos, *The Theory of Volition*, vol. 1. Evan R. Soulé, Jr., “What Is Volitional Science?” http://web.archive.org/web/20000603162445/http://www.tuspc.com/html/what_is_v-50_.html; Stephan Kinsella, “Galambos and Other Nuts,” *Mises Economics Blog* (Aug. 8, 2006), blog.mises.org/5442; Alvin Lowi, Jr., “On Andrew Galambos and His Primary Property Ideas,” http://www.above-the-garage.com/rblts/primary_property_lowi_1.htm (Mar. 31, 1998).
34. Tuccille, *It Usually Begins with Ayn Rand*, p. 70. Of course, I suppose that any Galambosian other than Galambos himself, having the same type of dilemma, would be unable to change his name as a solution to the problem, because this solution was Galambos’s inalienable, “absolute” idea.
35. The fundamental economic, or catallactic, role for private property rights, along with money prices arising from exchanges of property, is to permit *economic calculation*. See Stephan Kinsella, “Knowledge, Calculation, Conflict, and Law: Review Essay of Randy E. Barnett [92].

37. [93], pp. 140–41.
38. See, on the proper approach to homesteading and the first-user rule (the prior-later distinction), [93], pp. 141–44; [96, 97]. “Once the item is owned by the first-user, others no longer have the option of being its first-user; thus, their preferences at that point in time have no bearing on the Pareto-superior nature of the acquisition by the first-user”; and [76], pp. 172–79. On the ethical justifications of such a property rights scheme, see [93], Chap. 7; [11, 95, 96–99].
39. Thomas Jefferson to Isaac McPherson, Monticello, August 13, 1813, letter, in *The Writings of Thomas Jefferson*, vol. 13, ed. A.A. Lipscomb and A.E. Bergh (Washington, D.C.: Thomas Jefferson Memorial Association, 1904), pp. 326–38. Jefferson recognized that because ideas are not scarce, patent and copyright are not natural rights, and can be justified only, if at all, on the utilitarian grounds of promoting useful inventions and literary works (and, even then, they must be created by statute, since they are not natural rights). See [61], p. 278 n. 53. Yet this does not mean that Jefferson supported patents, even on utilitarian grounds. Patent historian Edward C. Walterscheid explains that “throughout his life, [Jefferson] retained a healthy skepticism about the value of the patents system.” “Thomas Jefferson and the Patent Act of 1793,” *Essays in History* 40 (1998).

40. Rand, “Patents and Copyrights,” p. 131. Mises, in *Human Action*, p. 661, recognizes that there is no need to economize in the employment of “formulas,” “because their serviceableness cannot be exhausted.” On p. 128, he points out:

A thing rendering such unlimited services is, for instance, the knowledge of the causal relation implied. The formula, the recipe that teaches us how to prepare coffee, provided it is known, renders unlimited services. It does not lose anything from its capacity to produce however often it is used; its productive power is inexhaustible; it is therefore not an economic good. Acting man is never faced with a situation in which he must choose between the use-value of a known formula and any other useful thing.

See also p. 364.

41. Plant, “The Economic Theory Concerning Patents for Inventions,” p. 36. Also Mises, *Human Action*, p. 364: “Such recipes are, as a rule, free goods as their ability to produce definite effects is unlimited. They can become economic goods only if they are monopolized and their use is restricted. Any price paid for the services rendered by a recipe is always a monopoly price. It is immaterial whether the restriction of a recipe’s use is made possible by institutional conditions—such as patents and copyright laws—or by the fact that a formula is kept secret and other people fail to guess it.” See also [3].
42. It could also be argued that ideal objects deserve legal protection as property because they are “public goods,” i.e., because of negative externalities which arise if IP is not legally protected. However, the concept of public goods is neither coherent nor justifiable. See [61], pp. 279–80, 283–87; [100]; [96], Chap. 1. As Palmer points out:

the cost of producing any service or good includes not only labor, capital marketing, and other cost components, but also fencing (or exclusion) costs as well. Movie theaters, for example, invest in exclusion devices like ticket windows, walls, and ushers, all designed to exclude non-contributors from enjoyment of service. Alternatively, of course, movie owners could set up projectors and screens in public parks and then attempt to prevent passers-by from watching, or they could ask government to force all non-contributors to wear special glasses which prevent them from enjoying the movie. ‘Drive-ins,’ faced with the prospect of free riders peering over the walls, installed—at considerable expense—individual speakers for each car, thus rendering the publicly available visual part of the movie of little interest. . . . The costs of exclusion are involved in the production of virtually every good imaginable. There is no compelling justification for singling out some goods and insisting that the state underwrite their production costs through some sort of state-sanctioned collective action, simply because of a decision to make the good available on a nonexclusive basis.

Palmer [61], pp. 284–285. There is no way to show that ideas are clearly public goods. Moreover, even if ideas were public goods, this does not justify treating them as property rights, for the same reasons that even wealth-increasing measures are not necessarily justified, as discussed above.

43. Occupancy or taking possession “can take three forms: (1) by directly grasping it physically, (2) by forming it, and (3) by merely marking it as ours.” Palmer [50], p. 838.
44. I also do not need to rely on “ownership” of my labor; strictly speaking, labor cannot be owned, and labor ownership need not be relied on to show that I maintain ownership of my property as I transform it. See also [101].
45. Palmer [50], p. 838 (emphasis added), citing Georg W.F. Hegel [102]. See also [101, 103].
46. Even such advocates of IP as Rand do not maintain that creation per se is sufficient to give rise to rights, or that creation is even necessary. It is not necessary because unowned property can be homesteaded by simply occupying it, which involves no “creation” unless one stretches the concept without limit. It is also not sufficient, because Rand would certainly not hold that creating an item using raw material owned by *others* gives the thief-creator ownership of the

- item. Rand's view even implies that rights, including property rights, only arise when there is a possibility of conflict. Rand, for example, views rights as a social concept arising only when there is more than one person. See [104], p. 321: "A 'right' is a moral principle defining and sanctioning a man's freedom of action in a social context." Indeed, as Rand argues, "Man's rights can be violated only by the use of physical force," i.e., some conflict over a scarce resource. "The Nature of Government," in *Capitalism: The Unknown Ideal*, p. 330. On p. 334, Rand attempts (unsuccessfully) to justify government, the agent that enforces rights, based on the fact that there can be "honest disagreements"—i.e., conflict—even among "fully rational and faultlessly moral" men. So, in Rand's theory, creation per se is neither necessary nor sufficient, just as in the theory of property advocated herein. See also [103].
47. It is for these reasons that I disagree with the creation-centered approach of Objectivists David Kelley and Murray Franck. According to Franck, "Intellectual and Personality Property," p. 7, "although property rights help 'ration' scarcity, scarcity is not the basis of property rights. The view that it is . . . appears to reverse cause and effect in that it sees rights as a function of society's needs rather than as inherent in the individual who in turn must live in society." See also [101].
 48. See, e.g., [105]: "It was, indeed, Adam Smith who was almost solely responsible for the injection into economics of the labour theory of value. And hence it was Smith who may plausibly be held responsible for the emergence and the momentous consequences of Marx." Even otherwise sound thinkers sometimes place undue stress on the importance of labor to the homesteading process and its ability to be "owned." Rothbard himself, for instance, implies that an individual "owns his own person and therefore *his own labor*." Rothbard [95], p. 284, emphasis added; see also Rothbard, *The Ethics of Liberty*, p. 49. It is a misleading metaphor to speak of "owning one's labor" (or one's life or ideas). The right to use or profit from one's labor is only a *consequence* of being in control of one's body, just as the right to "free speech" is only a consequence, or a derivative, of the right to private property, as Rothbard recognized in *The Ethics of Liberty*, esp. [11], Chap. 15. See also [101].
 49. See [50], pp. 821 n. 8, 851–55, 864; [60]; [61], pp. 280, 291–295; [63], pp. 804–805; [106, 107].
 50. See, e.g., [11], Chap. 19; [108–110].
 51. Under the international law meta-rule *pacta sunt servanda* (contracts are to be observed), contracts between sovereigns (states, in the international law context) create a "law of the agreement" between the parties. See [111], Chaps. 2, 5.
 52. For a definition of "privity of contract," see [112], p. 1199. See also, in the IP context, Bouckaert [63], pp. 795, 805.
 53. Palmer also quotes the following illuminating passages.
Hegel argued:
The substance of an author's or an inventor's right cannot in the first instance be found in the supposition that when he disposes of a single copy of his work, he arbitrarily makes it a condition that the power to produce facsimiles as things, a power which thereupon passes into another's possession, should not become the property of the other but should remain his own. The first question is whether such a separation between ownership of the thing and the power to produce facsimiles which is given with the thing is compatible with the concept of property, or whether it does not cancel the complete and free ownership on which there originally depends the option of the single producer of intellectual work to reserve to himself the power to reproduce, or to part with this power as a thing of value, or to attach no value to it at all and surrender it together with the single exemplar of his work. (*Hegel's Philosophy of Right*, p. 55, quoted in Palmer, "Are Patents and Copyrights Morally Justified?" p. 853 n. 138)
- And, as Kant noted:
- Those who regard the publication of a book as the exercise of the rights of property in respect of a single copy—it may have come to the possessor as a [manuscript] of the

author, or as a work printed by some prior publisher—and who yet would, by the reservation of certain rights, . . . go on to restrict the exercise of property rights, maintaining the illegality of reproduction—will never attain their end. For the rights of an author regarding his own thoughts remain to him notwithstanding the reprint; and as there cannot be a distinct permission given to the purchaser of a book for, and a limitation of, its use as property, how much less is a mere presumption sufficient for such a weight of obligation? (Immanuel Kant, “Was ist ein Buch?” in *Die Metaphysic die Sitten*, ed. W. Weischedel [Frankfurt a.M.: Suhrkamp Verlag, 1977], p. 581, translated and quoted in Palmer, “Are Patents and Copyrights Morally Justified?” p. 853 n. 138)

For an alternative translation, see [113].

54. Of course, in anarcho-capitalism, it is difficult to predict what extensive contractual regimes, networks, and institutions will arise. Various enclaves or communities may well require their customers, patrons, or “citizens” to abide by certain IP-like rules. On anarcho-capitalism, see, e.g., [117].

Part 19

**Philosophical Issues of Management and
Corporations**

Jacob Dahl Rendtorff

Abstract

This chapter presents some fundamental concepts of the philosophy of management and corporations by addressing the problem of corporate legitimacy and Immanuel Kant's distinction between theoretical, practical, and aesthetic reason and judgment. This chapter begins with a general definition of philosophy of management and corporations and continues by presenting its ontological and epistemological underpinnings. This approach is used to address the relation between economics, business ethics, and philosophy of management. Finally, ethical and aesthetic judgment is presented as the mediator between theoretical, aesthetic, and practical reason in philosophy of management.

Introduction

The philosophical foundations for business ethics in philosophy of management are built on epistemological and ontological concerns that also support corporate social responsibility and corporate citizenship and manifest in institutional and organizational theory [1]. Fundamental issues in philosophy of management concern how to explain questions like the following: What are the philosophical issues in the ontology and epistemology of management and organizations? What are the challenges of business ethics for corporations confronted with increasing complexity and new social expectations in an age of globalization? What are the philosophical foundations of values-driven management and corporate social responsibility (CSR) that should be used by firms to respond to these challenges? How can

corporate legitimacy be theorized and how should we define the relations between good corporate citizenship and business ethics? [2].

Keeping these questions in mind, this chapter has the following sections: (1) General definition of philosophy of management and corporations, (2) presentation of the ontology and epistemology of philosophy of management, (3) economics and philosophy of management, (4) business ethics and philosophy of management, and (5) judgment as mediator between theoretical and practical reason in philosophy of management.

General Definition of Philosophy of Management and Corporations

General problems of corporate epistemology, ontology, and social legitimacy constitute the fundamental issues of philosophy of management. Philosophy of management reflects the foundation of corporate legitimacy. Following Max Weber's classical perspective on the relation between legitimacy and economic rationality, different theories of management and economics in philosophy of management are impacted by different views of the firm and economic life. Philosophy of management analyzes the implications of the most influential theories of economics and management on the concept of legitimacy. This focus on the philosophical foundations of business ethics can be distinguished from other possible views on the legitimacy of the firm in modern society. Legitimacy is founded on the social community and the human life world, based on views on justice as fairness, protecting rights, and the promoting the common good for society [3]. Thus, according to this concept, responsibility, integrity, and accountability emerge out of the idea of republican business ethics where the license of the firm to operate is predicated on being a good servant of society.

Mark C. Suchman defines legitimacy as an effort to adapt to the internal and external environment of the organization. The discussion of legitimacy has been marked by a tension between a strategic and an institutional definition with very little dialogue between the two theoretical traditions. Legitimacy can be conceived as a "process where the organization justifies to a peer or subordinate system its right to exist" [2]; as a "congruence between the social values associated with or implied by (organizational) activities and the norms of acceptable behavior in the larger social system"; or as a "generalized perception or assumption that the actions of an entity are desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs, and definitions" [2]. What is important in this definition of legitimacy is that corporate legitimacy cannot only be conceived strategically, but must be considered in relation to the social and ethical values that exist in the environment of the organization [4]. Moreover, it is important that strategic action in order to succeed takes into account these preexisting conditions for legitimate social action of the corporation.

Among the many questions of concern to philosophy of management, this issue of legitimacy is an important focus for understanding the philosophical foundations

of business ethics. It is the task of philosophy of management to contribute to the foundation of comprehensive theories of responsibility, ethics, and corporate legitimacy in a globalized society [5]. Today, an important focus of philosophy of management is to clarify the foundations of the idea of corporate citizenship. Philosophy of management may, for example, help to justify a specific approach to values-driven management based on the concept of republican business ethics, including the four ethical principles of protection of the human person: autonomy, dignity, integrity, and vulnerability [6]. It is the task of philosophy of management to help analyze the foundation of normative theorization of business ethics and corporate citizenship, which implies an approach to ethics at different levels (societal, individual, organizational, and market institutions). In order to scrutinize the old saying that “good ethics is good business,” philosophy of management should not only be applied at the level of human personal choice. It is necessary to construct concepts of philosophy of management that analyze organizations and institutions in relation to the opportunistic challenge of economic theories of individualist utility maximization.

A fundamental methodology of philosophy of management can be conceived as critical hermeneutics, which combines an interdisciplinary institutionalist and social science approach to economics. Critical hermeneutics mediates between structural and intentionalist explanations of causality in institutional theory and philosophy of management; however, philosophy of management goes beyond mere institutional analysis and proposes a normative perspective on applied ethics – guiding decision-making and corporate social responsibility in business and economics – and an analysis of ethical argument as the basis for an approach to the foundations of business ethics. At the same time, philosophy of management, epistemology and ontology apply simultaneously at the micro- and macrolevels of organizational behavior, business systems, and market structures and influence the political economy of different societies or states. In addition, philosophy of management and business ethics may be said to imply a critical evaluation of formulations of guidelines and codes of conduct for companies operating in national and international markets.

Philosophy of management may imply a critical evaluation of neoclassical economics of efficiency and utility, leading to a broader interdisciplinary, institutional, and historical perspective on the norms and values of corporations [7]. Although it recognizes the explanatory potential of this tradition, critical hermeneutics in philosophy of management does not posit that descriptive positivist economics is sufficient. We need a discussion about goals and values in philosophy of management, which again raises the question of how normative economics can accomplish the insights of business economics. Philosophy of management therefore agrees in considering normative economics as a “science of conversation” [8] based on theoretical arguments about ethical principles, values, and good business practice.

Integrative business ethics is a concept in philosophy of management that further mediates between ethics, political, and economic rationality [9]. This integrative approach can be considered as the application of republican business ethics and critical hermeneutics as the basis for ethical reflection on the foundations of

economics as a truly value-creating science [10]. From this perspective, philosophy of management integrates the rationalities of law, economics, and politics in order to promote sustainability and the good life of humanity. Integrative business ethics in philosophy of management is not only about external limitations on business activity, but it also implies internal guidance for economic value creation. It implies a deontology of correct business rules, but also an argument for the morality of just institutions in free economic markets ([9], p. 32). Thus, integrative business ethics aims at formulating principles for corporate social responsibility of the good citizen corporation. Philosophy of management is defined as a critical practical rationality integrating ethics in economics and the broader social sciences.

This discussion of economics and ethics from the perspective of philosophy of management involves examining the rationality of values-driven management in business institutions. Since ethics is the foundation of economics, an ethical dimension of economic notions of utility and efficiency should be taken into account. In the new strategies of corporate social responsibility and values-driven management, there is an explicit, yet tense, acknowledgement of this link between ethics and economics. This dialectical relationship, where economics and ethics mutually shape one another, requires external political and legal constraints [11].

The philosophical foundations of business ethics involve many different themes revolving around corporate citizenship, including problems of the relation between philosophy and the social sciences in the study of corporations; issues of interdisciplinary approaches to business ethics that integrate theory and practice; studies of the integrative and multidisciplinary approaches to business ethics; analysis of the foundations of CSR, business ethics, and corporate citizenship in terms of different theoretical approaches and movements; clarification of the relationship between the different disciplines of economics, business ethics, and values in business; clarification of the foundations of corporate citizenship; analysis of the different concept of business ethics and ethical principles in business; and examination of the relationship between business ethics, law, and other social and human sciences.

Ontology and Epistemology of Organizations

There are a number of important questions for investigating the ontology and epistemology of organizations, such as the following: How does organizational metaphysics relate to ontology? How does epistemology relate to theory of science? What are the foundations of empirical science (different concepts, theoretical and factual claims) in management science? Metaphysics refers to the problems in management science that go beyond mere scientific and empirical approaches.¹ The metaphysics and ontology of organizations address basic definitions of specific concepts of organization and scientific approaches within different concepts and theories of management science. Ontological and metaphysical problems of management include questions like: What is organization? How do we define organizational identity or personhood? What are the foundations of different organizational systems?

In contrast to ontology, epistemology relates to the discussion of the status of relevant knowledge in business ethics and philosophy of management. According to Kant's critique of pure reason, epistemology concerns the evaluation of the foundation of knowledge within philosophy of management and business ethics. Epistemology concerns the foundations of a specific scientific approach within management science and conceptions of corporations. In this sense, epistemology of management also functions as the foundation of a specific concept of methodology in business ethics. Epistemology is the analysis of the truth conditions of a specific methodological approach within a specific field of inquiry [12]. This field of inquiry may include dimensions of business ethics within the different social sciences, such as sociology, economics, management and leadership, and so forth. Methodology is important in philosophy of management because some applications of economic considerations within business ethics require strict discussions of the truth conditions and theoretical presuppositions of these specific concepts.

Empirical approaches to business ethics are based on such theories of ontology and metaphysics and corresponding epistemological and methodological considerations. The relation between individuals and collectives (i.e., the problem of personhood and the responsibility of collective action in relation to corporations, known as the problem of methodological individualism) may be mentioned as an example where empirical issues in business ethics relate to the theoretical ontological and metaphysical presuppositions behind a specific concept of the corporation [12].

From the Kantian point of view, epistemology is about the conditions for knowledge, what frames our knowledge, and how we should define "things in themselves" behind the approach to reality as we perceive it. Kant insisted on the fact that we have knowledge of the world through the categories of understanding that are limited to the senses and location in time and space. It is only because human beings have access to the world of ideas beyond the world of categories and senses that we can have metaphysical ideas of moral law, God, or infinity. This means some ideas of organizing, of causality, and of the imaginary of organization are at the limits of our experience and understanding. Such ideas may be defined as important metaphysical presuppositions, but we cannot explain them as empirical categories of organizations. In the Kantian framework, our epistemology can be said to search for analytic and synthetic statements about the world. This means that we need to formulate nontautological conceptualizations of social reality, organizations, and social groups. Analytic statements are logical statements that can be proven, whereas synthetic statements are based on empirical truth conditions in relation to the real world. Synthetic a priori statements are based on the conditions of knowledge of our understanding in categories in time and space and at the same time are able to give us definitive knowledge about the world [12].

In fact, we can say that this analytic synthetic or synthetic a priori approach to the world is the mesolevel foundation for concepts of philosophy of management that we find in institutional theory and in theoretical approaches to organizational analysis. Much institutional and organizational analysis, as well as transaction cost economics in business ethics, is based on presuppositions that combine deductive and inductive approaches [13, 14].² In this sense, the knowledge produced by the

theories of philosophy of management blends theoretical knowledge with empirical observation. Indeed, many approaches in philosophy of management are today based more or less strongly on Kantian paradigms ranging from strict Kantianism (e.g., contract theory inspired by John Rawls) to the social constructivism inspired by Peter L. Berger and Thomas Luckmann. Very few approaches go beyond the concept of constructive institutionalism as the foundation of epistemology in philosophy of management.

A number of specific important concepts in philosophy of management are based on these metaphysical, ontological, and epistemological considerations. In particular, it is important for ontology and epistemology to explain basic concepts like organization, property, social and object relations, concepts of organizational events, causality, and human agency and intentionality in organizations [12].

In organizational theory, there can be definitions of objects or entities as elements and parts of organizations. Philosophy of management clarifies the existence of observation, description, measurement, and evaluation in relation to human behavior in organizations. Accordingly, organizational theory deals with human relations in organizations and institutions and the interactions between organizations and institutions. In a broader sense, the concept of event includes the concept of social movement in organizational theory. We can say that philosophy of management deals with the explanation of specific human action in the organizational context. This includes the formulation of hypotheses about organizational behavior and corresponding falsification or verification of this behavior in empirical terms [12]. Indeed, in terms of metaphysics and in relation to organizational analysis, we can mention the relation between appearance and essence following the Marxist tradition, where the fundamental laws of society (i.e., profit maximization and capital accumulation) lie beneath the appearance of organizations (i.e., the idea that capitalists are offering workers just working conditions, while in reality, they exploit them).

In philosophy of management, an important question is where we can formulate universal laws, as in the natural sciences, about the behavior of organizations or institutions [15].³ Some argue that formulating a universal law of organizations, leadership, management, markets, and human interactions in organizations would contribute to progress in philosophy of management. Unfortunately, it is difficult to formulate social laws for the objects of business and management: individuals, groups, institutions, societies, social customs, and other basic concepts of management philosophy. These objects of philosophy of management cannot be explained solely in terms of natural science; however, in order to deal with this problem, Karl Raimund Popper and Carl Gustav Hempel have developed the deductive-nomological model [15, 16]. This model for the social and human sciences provides a basis for explaining social phenomena and institutions resembling a universal law – though embedded in historical and social conditions – that may be deduced to possess some synthetic a priori validity (i.e., cannot be universally verified, only falsified, if it is formulated sufficiently clearly according to precise truth conditions).

Accordingly, the principles of causality are not the same as in the natural sciences because organizations are human and historical creations and social

phenomena are dependent on human history. In contrast to the natural sciences, management philosophy deals with historical reality, and the knowledge produced by philosophy of management and corporations is also ideographic (i.e., dependent on singular cases) and not only nomothetic (i.e., dependent on universal laws). This is, indeed, an important distinction between the natural and social sciences [12]. While natural science explains universal laws of nature, in the social sciences, we understand the meaning of social phenomena according to fundamental social reality. Indeed, we can say that the starting point of philosophy of management is phenomenological and hermeneutical because philosophy of management is about understanding organizations and human beings in organizations. Although there are elements of explanation by universal laws in management sciences and although we should not forget the great importance of these universal laws for our scientific explanations, we should not forget that in organizational theory, understanding is beneath explanation where universal laws need to be understood in the perspective of a hermeneutics search for meaning in their concrete historical and situational context. On the other hand, as the philosopher Paul Ricœur says, to “explain better is to understand better.” Accordingly, in philosophy of management, we refer to universal laws to clarify our fundamental hermeneutical understanding of social phenomena and organizations and corporations.

Philosophy of Management and Economics

An important aspect of philosophy of management is the relation between ethics and economics and how to define the implied ethics in economics. In fact, looking closely on the concept of welfare economics, we can criticize the focus on a purely economic concept of rationality as the foundation of political economy articulated by neoclassical and neoliberal thought. In contrast to the neoclassical liberal model, which focuses on individual maximization, welfare economics works with macro-economic choices in relation to society as a whole. Welfare economics works with the concept of personal preferences as foundational for economic theories and models. This concept of rationality emerged out of the separation of ethics and economics, which developed with the emergence of modern economic sciences. There is a difference between the concept of economic rationality and the concept of ethics, although we may argue that economic rationality cannot do without ethical scrutiny. Welfare economics constitutes a rational normative theory of maximizing personal preferences in conditions of risk and uncertainty rather than a descriptive theory of factual economic conditions [17]. Economic rationality is a normative concept because it is presupposed that individuals should be rational, but this economic theory does not operate with a substantial theory of rationality. We cannot determine the content of each individual preference, and there may even be irrational preferences that influence individual preference maximization, making them less rational from the point of view of formal economics; therefore, economic theory is based on a formal theory of individual actions as the basis for determining the outcome of economic action.

Daniel Hausman and Michael McPherson argue that an absolute separation between economics and ethics is unnecessary. This is a good example of reflections on economics from the perspective of philosophy of management. In fact, in the end, rational decisions according to preferences are tested according to moral concepts. When economic actors like the World Bank develop economic plans, such as the proposal to dump the garbage from the Western world in developing countries, this is evaluated not only according to economic rationality but also from the point of view of minimal goodness or ethical value. We may argue from the perspective of philosophical reflection on the relation between ethics and economics that it is a presupposition of economic theory that it should be a good thing to satisfy individual preferences. This concept of goodness behind the economic rationality of welfare economics can be illustrated by the concept of Pareto-optimality. An economic situation has achieved Pareto-optimality when it is impossible to improve the condition of one individual with making others worse off. Dumping garbage in developing countries may improve the situation in the Western world, but it does not lead to any improvement of the living conditions in the developing world, and it therefore does not fulfill the conditions of minimal goodness of ethical actions.

However, welfare economics shares the presuppositions of liberal economics by emphasizing that free competition is an important condition of free economic choice by individual actors. The ideal of free competition as the basis of efficient economic action is shared by most welfare economists. Moreover, welfare economics also shares with liberal economics the idea that satisfaction of rational preferences is the foundation of economic decision-making. Indeed, this is also based on the idea of minimal goodness or ethical evaluation of the economic choices as the basis for decisions in macroeconomics. This concept of preferences in national economics may be said to imply that individuals are supposed to be rational and well informed, and their preferences are also supposed to not be odd and totally unethical ([17], p. 64). In this sense, the idea of minimal goodness or ethical acceptability may be conceived to be a condition and a minimal presupposition in the welfare economic conception of individual preferences ([17], p. 66).

We may say that welfare economics must presuppose ethical awareness among economists in order to be theoretically acceptable. The counterargument from neoliberal or neoclassical points of view is that economists are sometimes restrained from acting ethically when such actions would undermine free competition. It is falsely supposed that there is a close relationship between free competition and immorality. On the contrary, it may even be better for a company or public authority to act morally in order to ensure long-term institutional sustainability and limit costs ([17], p. 96). So welfare economists cannot have their theory of rationality without looking at the possible moral limits and consequences of their actions. In this sense, we can argue that ethical evaluation has to be an internal aspect of economic theory in welfare economics.

This does, however, not mean that there is a clear relation between economic rationality and ethics. Rational action may in some cases be moral, but unacceptable in others from an ethical point of view. Complicating the picture further, rational preferences in welfare economics may not always be individual

preferences. The concept of rationality in welfare economics can be based on altruistic concerns. Indeed, it is not necessary to exclude altruism a priori from economic models in welfare economics. Welfare economists have argued that moral norms and virtues have had positive impacts on economic development, for example, a code of ethics in business makes economic action more reliable and contributes to increased economic welfare.⁴ Having said this, there may still be moral norms that are inefficient from an economic point of view. Such as in cases where moral norms are not even justified from an ethical point of view, for example, when we perceive discrimination or suppression of employees, it may be justifiable not to accept these norms within economic theory. From the point of view of welfare economics, moral norms of economic factors may have an impact on economics even though there may be no direct link between conceptions of moral deontology or moral duty and economic efficiency or rationality. This means that although individuals may have metapreferences, which outlaw actual supposed preferences, there is no direct link between economic rationality and ethics ([17], p. 87).

A commonality of neoclassical theory and welfare economics is the idea of a close connection between ethical and economic rationality. Some philosophers of management even argue that there is an internal ethical dimension to economics and that it is possible to define valid ethical behavior out of economic reason [18].⁵ The issue is what economics can help to say about the good life and how economics as a moral science contributes to a better society. According to the Austrian economists, like Karl Menger, Ludwig von Mises, and to some degree Friedrich August von Hayek, economics as a part of philosophy of management may be considered as a kind of praxeology: a normative science of practical reason, based on universal categories of human action helping to realize the human good ([19], p. 120). They proposed a rationalistic and interpretative paradigm of economics in which it was argued that economics could be based on synthetic a priori principles. Since this paradigm views economics as the science of calculation of efficiency, profit, and maximization of personal and common human preferences, there is a strong convergence between utilitarian ethics and traditional views of normative economics.

Still, this is utilitarianism with strong emphasis on personal and egoistic interests, as is the case with neoclassical economics. We have seen how the concept of human beings as self-interested and potentially opportunistic actors has been taken over by theories of economic organization like transaction costs economics and agency theory. Transaction cost economics considers firms as contractual relationships among individuals who seek to maximize self-interest, and the fight against opportunism on the basis of lawful behavior within contracts can be considered as a defense of an ethics of good governance and high performance in efficient economizing market institutions ([20], p. 129). Agency theory focuses on economic property rights as the basis for economic behavior [21]. When we propose an ethics of welfare economics, we are not only looking at the firm in the light of microeconomics but also considering the organization as integrated into larger social and political systems [22]. From this perspective, individual instrumental economic reason only has significance in the framework of ethics subordinating individual goals to the common interest of community.

In opposition to this view, there may be many important aspects of economic principles of self-interest and rational action that can help to shape ethics. Orthodox economists argue that efficient allocation of scarce resources is based on minimal governmental and legal intervention and that free actors know best how to respect the norms of the market and ethical custom of society ([23], p. 210). Major economists like Adam Smith and Milton Friedman, but also John Stuart Mill, believed that the economic rationality of seeking self-interest and profit maximization on economic markets contains an important form of rationality where everyone, by seeking to fulfill their own interest, will contribute to the common good. Philosophy of management cannot ignore this ethics of the market, which can contribute to an economic shape of ethics within the rules of the market economy.

According to what may be called the cost-benefit efficiency view of philosophy of management, free economic action on economic markets is the best way to deal with scarce resources ([23], p. 211). This view has two formulations. One stresses the role of the state in giving dynamics to economics, and the other stresses that the autonomy of the private sector is the most efficient way to allocate scarce resources since economic actors are characterized by responsible and conscious use of said resources. Moreover, organizational action should be profitable. According to economic rationality, we cannot ignore the bottom line of income and expenditures for the success of corporate action. Economics is about creating value and maximization of profits in terms of individual or social wealth and utility. Economics is the science of efficiency and utility for society, and economic action is about ensuring the most efficient way to deal with scarce resources.

Philosophy of management can also consider economics from the perspective of social development, again referring to Pareto-optimality [24]. Welfare economists stress the role of the state in such situations, while libertarians consider that the free market gives the best optimality ([25], p. 145). Economics is thus considered as the science of how to compare and weigh different social goods and allocate scarce resources most efficiently. Economic action is about how to contribute to creating wealth on markets and thereby create wealth in society. It is advisable to contribute to economic goods within the basic rules and ethical principles of society. And it would be unjust to disrespect the laws and principles of economics when acting on economic markets. Economic action based on utility contributes to maximization of efficiency within limits of respect for basic rights.

An important aspect of such a concept of economic ethics is the idea of the invisible hand, coined by Adam Smith, which states that if everyone acts according to his or her own interest respecting the rules of fair competition on economic markets, society will flourish and individual self-interested action will be a contribution to the common good. We also find this idea of the ethical consequences of individual self-interested action in Hayek's philosophy of the spontaneous order of economic and social development. Spontaneous order represents an evolution, based on interaction among self-interested individuals, of those practices that are based on individual freedom and rational choice of the most efficient alternative. These will, in the long run, contribute to social betterment as well as improved legal and moral systems.⁶ In short, an economic system based on

fair competition and healthy economic institutions will contribute to a better society. From this perspective, the idea of competition includes an ethical dimension of fairness and transparency that contributes to the spontaneous order of society.

Conceiving economics as implying a particular ethical rationality, we may therefore consider how economic institutions contribute to ethics. The ethics of economics in institutional arrangements is the promotion of rational self-interest and fair competition as an instrument for economic progress. As John Dienhart acknowledges, the institutional view of economic markets is that they are “ethical engines” ([25], p. 146). The aspect of economizing that we have discussed may very well support this idea; however, the concept of economic rationality is broader and more pluralistic than the view of fair economic markets exclusively based on the pursuit of self-interest.

We can distinguish between an internal and an external approach to ethics and economics in philosophy of management. According to the external approach, economic rationality is based on self-interest, and ethics and economics are completely separated. This is important in the institutional approach ([26], p. 293ff). Economic engines can help us to attain ethical values, but economics as such is neutral; however, as we have seen, there seems to be an ethics implied in economic rationality. We can argue for an internal approach where ethics is considered not only as an external limitation to economics but rather as a part of it. The internal approach does not necessarily rely on a utilitarian and neoclassical concept of economic ethics; rather, it is a pluralistic approach to ethical values that has an impact on economic action. There is an ethical dimension to economic concepts like property, risk-reward structures, information, and competition.

This implies that we should have an institutional approach to economics emphasizing that institutions determine economic action [27]. The constitutive rules and principles of economic markets based on property, risk-reward structures, information, and competition include certain ethical ideas, which are the conditions for development of economic systems. Douglass North has, for example, shown how the act of promising is a condition for good contracts, which in turn condition predictions for future economic action ([25], p. 149).

When we deal with the institutional aspects of property rights, risk-reward structures, information, and competitive relationships, the internal ethics of the economics of fair markets is about how to organize scarce resources in economic systems in a fair way. The foundation of the economic system and a part of fair competition is respect for property rights. Adam Smith and most of the libertarian economists who succeeded him have claimed that property rights should be considered as the foundation of the economic order [25]. We may say that centralizing property rights in our understanding of corporations is based not only on self-interest but rather on a combination of consequentialist and teleological considerations. External intervention is necessary when basic rights are not respected in market transactions. This is the case when we encounter widespread corruption with regard to property rights in economic systems.

Some implicit ethical values are the basis for economic interactions concerning contracts, such as when transaction cost theorists state, for example, that

governance structures should avoid opportunism as well as the fact that confidence and promise keeping matter very much in economic exchange ([20], p. 63). Correct and reliable information is also a condition for trustful relations of economic action on different economic markets. Good contracts are based on reliable information. The principles of fair and healthy competition may indeed also be an important aspect of the ethical principles of competitive markets [28]. It is a widespread belief that monopolistic action is at the limits of economic systems and possible economic behavior on liberal economic markets.

If we analyze the ethics of transaction cost economics from the perspective of philosophy of management, a contract view of the firm is not sufficient to conceptualize the ethical dimensions of organizations. Organizations not only are universes of microcontracts but are based on values that function as organizational goals for corporate behavior. Transaction cost economics addresses ethical problems in organizations by discussing problems of opportunistic behavior with regard to information, agency, and individual liability, but it cannot explain loyal and altruistic behavior in organizations. It may be true that organizations try to control organizational behavior and ensure efficiency in competition by setting up institutional infrastructures based on contracts ([25], p. 177). But the following question remains: Is this really sufficient to understand cases of lack of opportunistic behavior in organizations?

With Herbert Simon, we can argue that transaction cost economics cannot explain why people identify with organizations and feel much more committed that can be explained by self-interest alone [29]. Authority-employee relationships and motivation cannot be understood as incomplete contracts, but are rather based on the goals and values of the organization, which are implicit premises for decision-making. Employee motivation is therefore based not only on economic incentives but also on loyalty to the goals of the organization. Moreover, organizations should be understood not only as micromarkets of competitive contracts but rather as instruments for coordinating and facilitating action on economic markets ([25], p. 180). In such a goal-based view, the rationality of utility based on "economic man" cannot be the only explanation of the function of organizations on economic markets. Goal-oriented and community-based behaviors are much more important aspects of organizational action. Within new institutional theory, we can perceive an orientation towards integration of different aspects of rationality when dealing with economic institutions [26]. It may therefore be possible to find a convergence between a goal-based and a contract-based view of organizations.

From this initiative to deduce ethics out of economics, we may conclude that ethics is not always external but also sometimes implicit in economic rationality. We can say that ethical aspects of economics are based on the values of the basic concepts of economic systems. We can point to organization of market structures and the most important concepts of economic markets: property, risk-reward relationships, information, and competition ([25], p. 182). The systematic organization of these concepts in economic theory is not neutral, but implies ethical values that not only are based on economic efficiency but include a plurality of ethical rationality, reflecting individual goals, and organizational and community values.

Moreover, while the ethical values of economic organizations are not driven solely by self-interested and utility-maximizing individuals, the personal values of individual members are important for determining organizational behavior ([9], p. 28). However, the plurality of values also implies great tension between traditional economic values of utility and self-interest with community values based on an ethical view on the economy.

Business Ethics and Practical Philosophy of Management

Consequently, business ethics argues for critical reflection on economics that is not restricted to the paradigms of efficiency, egoism, and rational utility maximization, but discusses the foundations of economics as a value-creating (moral) science ([9], p. 28); [30]). We should, therefore, not separate economics from ethics, but rather see them as serving the purpose of the good life and justice in social institutions. We can say that the aim of business ethics in institutional analysis is to contribute to evaluating requirements for just institutions in economic life. The problem of moral agency and the responsibility of institutions as a collection of individuals are very important. Institutional actors may be said to reflect a dialectics of what Max Weber calls an “ethics of conviction” (of personal beliefs) on the one hand and an “ethics of responsibility” (consequences of actions) on the other [31]. From this perspective, economic action is based on the vision or aim of the “good life with and for the other person in just institutions” [32]. This vision can be evaluated according to Kant’s ethics of the universal rules of the categorical imperative. Utilitarian welfare analysis is only possible within this framework of deontologically limited action. This is the basis for conceiving rational values-driven management as an outgrowth of “republican business ethics” based on Kant’s philosophy. Business ethics is not only about internal market behavior but also about finding external principles of political governance to regulate economic markets. Accordingly, John Rawls’s concept of “justice as fairness” is important as a proposal for defining the ultimate horizon of business ethics [33].

The analysis of epistemological and ontological foundations of corporate responsibility is an important aspect of philosophy of management. Here we can distinguish between (1) economic responsibilities, (2) legal responsibility, and (3) ethical responsibilities [34–37]; 35], p. 505. We can point to the fact that the relation between the different kinds of responsibilities should be conceived not only as different elements of the same concept of business ethics responsibility [34] but indeed as an integrated concept [35] where the different aspects of corporate responsibility are not isolated to from each other in one single domain. The different responsibilities should be integrated in a common strategy for organizational leadership and governance [35]. With the three-dimensional perspective on business performance, including economic, legal, and ethical (philanthropic) responsibilities, corporate citizenship emerges as a possible reflective administration of the tensions and requirements of the different kind of responsibilities ([35], p. 518).

In relation to business ethics, philosophy of management questions the relationship between different theoretical justifications of corporate ethics. An important topic for analysis is the relation between general business ethics paradigms like rational choice, communitarian, universalistic, integrated contract, and republican theories. Philosophy of management may also deal with other philosophical approaches and their consequences for corporations (i.e., phenomenology and hermeneutics, existentialism, structuralism, post-structuralism, postmodernism, constructivism, Marxism and neo-Marxism, liberalism and neoliberalism, etc.). These different approaches conceptualize business ethics differently and help to clarify corporate social responsibility. This is important because social responsibility and responsiveness is at the forefront of contemporary understandings of the basic function of the firm [38]. This type of analysis helps to explain the relation of the corporation to different stakeholders, where the corporation is involved in public reasoning and deliberative public communication as a part of its interaction with the environment [3, 39]. Here, philosophy of management also deals with the philosophical foundations of the idea of corporate social responsibility considered within a framework of corporate identity and personhood.

In this context, an important debate of philosophy of management is the collectivist and constructivist concept of corporate identity as the foundation of the organizational integrity of the good citizen corporation. At the institutional level, organizational integrity can be considered as a result of efforts to establish successful strategies of values-driven management. This is also the basis for trust and accountability of corporations, and it makes it possible to formulate an institutional and communicative concept of corporate social legitimacy.

The work of the philosopher Peter French started this debate with a proposal to develop an institutional argument for CSR from the perspective of ethical theory ([40], p. 133). His argument rests on the presupposition that it is possible to ascribe intentions and purposeful actions to corporations. The concept of intentionality (see the work of Donald Davidson) is promoted as the foundation for understanding the moralization of the firm. According to this position, intentionality is not a notion of human consciousness, but is rather redefined as planned intentionality. In order to understand action in organizations, the concept of agency is not restricted to human persons, but is extended to institutions, rendering them liable and responsible for their actions [41]. The basis of this argument is that corporations as organizational unities of individuals can be morally dangerous agents that are able to do much more harm than solitary individuals.

Planned intentionality as the foundation for corporate citizenship can be defined by the concept of corporate internal decision-making structure (CID-structure) [40]. This structure may be understood as the unity of value codes, formulated policy statements, and strategies, as well as formal and informal understandings of corporate traditions and cultures. Corporations make many decisions, which are based on routines and habits, but though they sometimes seem arbitrary, this does not mean that they do not originate in the CID-structure. The CID-structure is the totality of meanings and intentions that make up the corporate ethos, and culture constructs the collective identity of a company. The CID-structure defines

the goal of the organization and its level of liability and integrity. It is constituted by the identity and history of the organization.

Against this position, institutional individualism is presented as the idea that it is only individuals, not groups and organizations that can be socially responsible. Only in cases where it is possible to find a direct relation to agents – conceived as flesh-and-blood human beings with freedom and conscience – that we can talk about moral responsibility [42, 43]. Responsibility originates directly in the intentions of an individual human agent, which are executed in a bodily movement. There need not be specific corporate intentionality, which is qualitatively different from the aggregates of individual intentions. When we attribute intentions to groups, we do it in a metaphorical or analogous sense, signifying that corporate intentionality may be determined as an “as if intentionality”: a kind of prescriptive intentionality, where intentions are ascribed to groups, (e.g., their policies and procedures, that is their CID-structures) which are dependent on actions and intentions of individual actors.

In this sense, the moral responsibility of the firm is considered as a kind of group responsibility based on the fact that people work together in corporations with common purpose. Together, they can do much more harm and/or good than solitary individuals. This is the basis for ascribing legal and moral responsibility to groups ([41], p. 146). Concrete practices of purposeful action are the basis for corporate responsibility because we can observe group responsibility for particular corporate actions; however, it is not possible to reduce collective intentionality to individual intentionality.

To ascribe responsibility to the corporation means that in addition to economic and legal duties, it has the capacity to take a moral point of view, making rational and respectful decisions with honesty, integrity, trustworthiness, reliability, and accountability [44]. From the constructivist and institutional sociological and philosophical point of view, it makes perfect sense to evaluate the responsibility of corporations in terms of ethical behavior. Some corporations have been establishing systematic features of ethics and compliance programs and internal monitoring systems, which help them to build their reputation as reliable institutions and to distinguish themselves from other corporations who are behaving in a much less trustworthy manner [44]. In summary, the analysis of business ethics from the perspective of philosophy of management proposes to clarify the foundations of basic concepts of business ethics and corporate social responsibility.

It is, however, important not to delimit philosophy of management and corporations to theoretical and practical reason. Following Kant's philosophy, there is also a study of aesthetics as a critique of aesthetic reason that is important. We can argue that management and aesthetics, art and leadership, and the arts and organizations and corporations are important topics for philosophy of management. In particular, we can deal with creativity and creative action as a field of imagination that contributes to innovation and mediates between theoretical and practical reason and judgment. When we look at the history of creativity, we can see that creativity in Classical Greece and Middle Ages was defined as an imitation of the divine,

where human beings imitate the divine within the order of the universe [45]. In this perspective, organizational aesthetics should search for harmony with nature and the divine. However, with modern times, this changes, and creativity is now defined as a kind of transcendental imagination following the philosophy of Immanuel Kant where creativity is linked to teleology and autopoietic development in the world. Then with existentialism, creativity is transformed into a kind of ironic negativity, implying a search for deep meaning in life and in organizations, and with postmodernity, a whole new field of creativity and aesthetics is opened for the study of philosophy of management. This is, for example, the case with the postmodern experience economy where new conditions of aesthetic legitimacy of the corporation are in question. We can observe the rise of the creative class and of the creative consumer, as proposed by Richard Florida [46]. The sociologist and philosopher Gilles Lipovetsky argues that in the *époque* of emptiness, morality has changed from duty to virtue, and this is particular characteristics of the experience economy where morality is a part of personal self-realization and where we can say that we need morality because we want to “brand” ourselves as a part of the aesthetic economy [47]. This aesthetic condition of the economy is in particular present in the service and experience economy that is about buying and selling experiences, and it tries to make intimate experiences and search for customer satisfaction the driving motor of capitalist economies. Accordingly, philosophy of management needs to address aesthetics because society in postmodernity combines aesthetics and ethics in new social forms.

Business Ethics in the Framework of Reflective Judgment

With these reflections about the foundations of philosophy of management and corporations, we have formulated the general framework for business ethics and corporate citizenship in modern society based on the aim of the good life with and for the other in just institutions. The starting point is the pluralism of ethical values within economic systems, which includes utility and efficiency as predominant values. From this, we can conceive the ethical foundation of economics using the principles of democratic values as the external limits of economic action. Ethics may be conceived as a kind of political theory of market economics, which means we cannot ignore the perspective of the state [48]. Business ethics is not only about the relation between ethics and economics, but it is also about finding the right balance between political governance of market economies with legislation and legal incentives for economic behavior.

Placing the firm in the context of the political economy of society as well as the market means that business ethics and corporate citizenship is about the right values at the microlevel of individual behavior in organizations, but also about the macrolevel. From an ethical perspective, the issue not only is a descriptive and positivist one about the factual values of organizations, individuals, and market systems but also concerns the normative question of which values should be promoted in a broader social and political context.

Thus, business ethics can be conceived as an interdisciplinary approach to the social sciences, integrating views from economics, sociology, political science, law, organizational theory, and ethics in order to discuss the right values and ethical principles to be promoted in business life. From our discussion of the relation between ethics and economics, we have learned that the moderate communitarian approach of Ricœur proposes a concept of “social man” as the foundation for economic anthropology, which is much broader than the limited idea of “economic man.” Utility-maximizing individuals are not guided by absolute principles of utility, but find meaning within the context of a vision (aim) of the good life with and for the others in just institutions [32].

This vision of the good life and universalistic restrictions on acceptable moral action, which should be based on the Kantian categorical imperative, implies a tension between the economic principles of maximizing self-interest and the ethical principles of community and respect for the moral law. Business ethics always has to deal with this tension between narrow economic perspectives of efficiency and utility and broader concepts of social justice in the interests of community and society. We cannot dissolve this tension between ethics and economics, but we can try to search for decision-making and action, which can promote a convergence between ethics and economics.

When we analyze the notion of rational choice and decision-making of the firm, we can perceive how organizational behavior and decision-making is characterized by what we may call impure economic reason. Decision-making does not only follow the ideals of economic man, but it is based on bounded and procedural rationality, which does not exclude ethical and political dimensions of decision-making. These aspects of organizational decision-making represent a documentation of the fact that firms are not isolated economic entities, but should be conceived as social units implying pluralistic concepts of rationality.

Within this view of economic action, rationality in economic theory is based not on rational economic man (*homo economicus*) but on individuals who are integrated in social relations of reciprocity and exchange. This social notion of rationality places the economic actor within ethical community of values, and the firm must therefore be conceived from the perspective of broader institutional and social dimensions ([19], p. 314). It is reciprocity and exchange of social man in community that constitutes the basis for understanding economic action.

From this starting point, philosophy of management posits the aim (vision) of the good life with others in community as the outer determination of economic action. This vision of the good life can be explained as the license of the firm to operate; however, we cannot have the vision of the good life without testing it according to the categorical imperative so that a license to operate should require universalistic foundations. On these foundations, we can then look at economic action from the perspectives of utility and self-interest, and this economic action may contribute to shaping our perception of ethical dilemmas and opportunities for economic action. On this basis, we may take into account the practical reality of economic action as conditioned by time pressures, competition, and resources, which shape the terms of the values of business ethics.

We may say that it is the task of judgment in business ethics to find good and right decisions concerning action in economic affairs. Here, business ethics can learn a lot from the concept of legal and political judgment in philosophy of law [49].

In this analysis of judgment, following Ricœur, we can turn out consideration to Aristotle and Kant [50]. Practical reason assures respect for moral norms and the basic procedural rules in a society, but because of the possible exceptions to the rules and the particularity of situations, practical wisdom and judgment are required to supplement practical reason. Practical wisdom is left alone in exceptional situations of difficult tragic dilemmas where universal norms are difficult to apply. In many cases, concrete judgment is, however, required to intervene in the application of general rules and values. Both faculties of human deliberation contribute to the work of the unfinished mediation between the ideal of the good life, universal principles in relation to concrete situations, and social traditions. Ricœur uses the concept of judgment in Kant's *Kritik der Urteilskraft* (1790), inspired by Hannah Arendt in *Lectures on Kant's Political Philosophy* (1982) [51]. The Kantian understanding of judgment is an effort to consider the formalistic concept of practical reason to the situation and tradition of political community. Ricœur defines legal judgment as a peaceful way of solving social conflict [52]. Here, general understandings and principles of justice are applied to concrete situations. The legal system – autonomous, different from and yet mediated through public debate and political legislation – implies a rational discourse about justice, where minimum mutual respect, human punishment, and the recognition of basic rights (even of those to be punished) replace pure violence.

Accordingly, from the perspective of philosophy of management, judgment is an important faculty to promote in the application of ethical principles to concrete situations of mediating economic decision-making and action [53]. The Kantian concept of judgment extends the Aristotelian idea of practical reason (*phronesis*), which is the capacity of deliberation and reasoning for the good life in community according to the moral sense and habitus of the experienced moral actor. In this context, judgment measures the right place of action, the mean of virtue, and the consistency between extremes. Kant not only considers the importance of the mean for finding the good life but also points to the moral sentiments and common morality of human beings (*sensus communis*) [54]. Moral judgments find universal validity in the appeal to common sense and shared values of human beings.

Determinate judgment is the capacity to apply already established general rules to concrete cases. Reflective judgment is the ability to find rules for new cases where there are no pre-established rules or principles that are intuitively given or self-evident. Judgment in business ethics is only the application of ethical principles to factual cases, but it should also be responsible for mediating between ethics and economics in relation to other social science disciplines, which are important for decision-making and research. Moral imagination and the ability to integrate and weigh judgments from different disciplines and viewpoints in regard to

concrete decision-making are required in reflective judgment. The faculty of judgment – applied to decision-makers in the good citizen corporation – can be said to have two major goals: one is economic efficiency and the other helping society integrate and develop towards the ideal of community.

Although the reflective judgment in Kant's *Kritik der Urteilskraft* primarily concerns aesthetics and natural teleology, one should not forget its significance for the concepts of political rationality and jurisprudence [51, 52]. There is a logical and structural analogy between aesthetic, political, and judicial judgment. The characteristics of judgment are mediation between particularity and universality in a space of intersubjective public deliberation and communication concerning opinion and taste related to particular cases founded on the common understanding of validity and shared values. Judgment as formation of political opinion, legislative act, and concrete legal process can be conceived as an interaction between understanding, imagination, reason, and common sense.

Ricœur emphasizes the distributive character of judgment as a peaceful way to solve conflicts of ownership in a discursive rather than a violent way. It distributes things and goods among individuals and decides conflicts of ownership among individuals taking part in society as a system of exchange of goods, contributing to the delimitation between spheres in society. As a contributor to social peace, judgment presupposes a vision of society as fundamentally cooperative so that the communitarian vision of community as a fragile and vulnerable context of “wanting to live together” (*vouloir vivre ensemble*) is behind the very exercise of judgment to maintain social peace. But conflicts about repartition of the good in different spheres of justice often also transcend shared understandings. Common visions of the good are often realized to be inadequate and must be confronted with universal standards, individual autonomy, and disagreement with state policy that can lead to civil disobedience in the name of divine law. According to Ronald Dworkin's analysis in *Taking Rights Seriously* (1977), an appeal to rights and principles must be seen as the foundation for innovation and reform ensuring legal coherence.⁷

This conception of judgment focuses on the concrete conflicts in society, assuring the right proportion between shared understandings and juridical universality in opposition to ideology and contingent power interests. In *Laws Empire* (1986), Ricœur also adopts Dworkin's hermeneutical-narrative understanding of law as integrity, conceiving political morality and progressive innovation according to the principles of equality, fairness, and impartiality, based on a permanent reinterpretation of constitutionality and emergent legal practice. In describing this movement of universalization, Ricœur comes close to Jürgen Habermas's idea, articulated in *Theorie des kommunikativen Handelns* (1981) and *Faktizität und Geltung* (1992), of founding legal norms in domination-free communication and the interplay between facticity and validity. Although Habermas wants to integrate concrete moral convictions and experiences as basic for the formulation of new moral principles in his philosophy of law, it is difficult to give moral principles any substantial and contextual strength on a purely formalistic and procedural basis. When he proposes the mutual interaction between facts and norms, Habermas also

seems to be aware that an abstract foundation of legal rules is impossible and that universal ideals must be related to contexts of community, where *sensus communis* and shared values determines the concrete processes of legislation between life worlds and reflective ethical justification.

In this case, reflective judgment also constitutes the mediating bridge between microeconomic rationality of free market economics, based on individual economic actors on the one hand and macroeconomic rationality of welfare and rights in political community on the other. Republican business ethics uses the faculty of judgment in order to celebrate the internal ethical dynamics of microeconomics, but also to set external ethical limits on economic actions in order to contribute to social justice in community. This means that business ethics not only operates on the level of ethical behavior of individual rights and ethics in firms but also operates at the level of organizational behavior and more broadly at the level of market institutions. But business ethics goes further and takes the point of view of state regulation and macroeconomic ethics concerning the significance of the organization of market economies for the general development of society.

It is the task of reflective judgment to mediate between these different ethical fields. It is very important to have an integrated perspective on the relations between micro- and macrolevels of ethical reflection [55].⁸ One cannot, therefore, exclusively opt for an ethics of the lonely “moral manager” that is solely for an ethics of the economic market or of the business system as a structural totality nor for an ethics of political welfare economics based on the allocation of goods and services by democratic political authorities. To focus on one of these fields exclusively may lead to negligence of important knowledge; however, even though reflections on basic ethical principles and values of business should integrate these fields, the main focus of the present discussion will be situated at the level of the firm. From this viewpoint, we will discuss problems of tension between economic efficiency and ethics at the other levels of applying reflective judgment [1].

Indeed, the concern for justice as the ultimate horizon for analysis of ethics and values deserves mention. A concern for human realization and freedom may be based on such a concern for ethical aspects of justice. John Rawls’ concept of justice as fairness is an important basis for evaluating values-driven management, which is based in a neoclassical approach to efficiency and utility in economics. This ethical horizon of social justice as optimum equality of the marketplace not only is based on economic concerns for just repartition of marginal utility but also takes the basic social needs of citizens in account by providing an institutional framework for enabling human freedom and the rights of citizens to satisfy their needs for self-respect and dignity.

It is, from the perspective of philosophy of management and corporations, the aim of business institutions to contribute to the realization of the aim and vision of the good life within just institutions and to help to improve fair coexistence in the framework of human community, conceived as a kingdom of ends in themselves respecting human freedom and autonomy.

Conclusion

In this chapter, we have discussed the foundations and basic concepts of philosophy of management and corporations. We have emphasized that the most fundamental question of philosophy of management and corporation is the issue of legitimacy of the corporation in society. In this context, we proposed a preliminary definition of the concept of corporate legitimacy. On such a basis, it is possible to propose a framework of analysis of basic concepts in philosophy of management and corporations in the perspective of the Kantian distinction between theoretical, practical, and aesthetic reason and judgment. With regard to theoretical issues, basic concepts of philosophy and management and corporations include analysis of the ontology and epistemology of organizations and corporations. This also includes issues of different concepts of theory of sciences from different methodological perspectives, i.e., positivism, falsification, critical realism, social constructivism, and other approaches to the philosophy of sciences. An important debate in the tension between theoretical and practical reason is the discussion of the relation between ethics and economics. In this context, an important topic of philosophy of management is to examine the ethical implications of particular conceptions of economics, for example, in neoclassical economics, transaction costs economics, or institutional economics. From this discussion, we can move the problems related to the foundations of practical issues in philosophy of management and corporations. These questions include topics about the foundations of business ethics and corporate social responsibility and issues concerning topics with regard to problems of the foundations of collective action and corporate personhood and intentionality. These topics also include topics of the legitimacy of collective actions in corporations and organizations. With regard to aesthetics, the problem of aesthetic reason must be considered as important for understanding corporations. Here we briefly mentioned issues of art, creativity, and leadership. However, this section also dealt with the topic of judgment and practical wisdom as the foundation of good leadership in organizations. Here we can mention the importance of reflective judgment for good leadership and management in favor of “the good life with and for the other in just institutions” in a society where corporations act as good citizens and contribute to the common good.

Notes

1. This section about the epistemology and ontology of organizations is written in collaboration with Associate professor, Dr. Ocoen Carsten Koch, Roskilde University, Denmark. Carsten Koch provided the basis for the section with his research in the

philosophy on the philosophy and ontology of the firm. The distinctions between ontology and epistemology and falsification and explanation and understanding have been developed on the basis of Carsten Koch's paper, and therefore this section is the result of a joint collaboration even though final editing and rewriting of the section by Jacob Dahl Rendtorff.

2. Carsten Koch emphasizes the importance of transaction cost economics as an approach to philosophy of management. This sort of analysis combines the falsification approach with institutional theory. Also, in recent discussions, the falsification approach by Popper has been criticized by the philosophy of science approach called critical realism, as proposed by Lawson. Critical realism is today an important methodological approach in philosophy of management. Roughly speaking, this position is a statement that recognizes the concept of theory dependence of all other concepts of philosophy of management while at the same time insisting that we can have knowledge of a real from us independent reality through our theories about economics and management.
3. Carsten Koch emphasizes the importance of the covering law model in scientific explanation and in management science. This model focuses on scientific explanation as based on the proposal of universal laws of management. This is the deductive-nomological model that uses universal laws to explain particular behavior in management. With Carsten Koch, we can stress the importance of Anglo-Saxon theory of science to understand the ontology and epistemology of management. In the beginning of the twentieth century, management philosophy was characterized by a positivist-instrumentalist approach where good management science was considered as an empirical investigation of the laws of management. Here, the positivism of the Oxford philosopher Ayer was very important. Later, this point of view was criticized by the theory of falsification stating that a hypothesis cannot really be verified due to the logic of induction, but only falsified in the perspective of deduction from the point of view of a specific theoretical framework. This theory of falsification was proposed by Karl Popper.
4. Daniel M. Hausman and Michael S. McPherson: refer to Kenneth Arrow (1974) for this point of view.
5. John Broom who is one of the strongest proponents of ethics out of economics even thinks that ethics and politics have much to learn from economics; however, he seems to work within the utilitarian tradition of welfare economics, and it is not clear whether he would apt for the neoclassical view of the necessity of a market without legal and political restrictions. Brooms' views seem to impose rather strict limitations on economic markets in comparison with the radical libertarianism of Robert Nozick and Milton Friedman, who both argue for an ethics implicit in economic markets.
6. In fact, there are many arguments for corporate social responsibility and corporate citizenship that rely on economic concepts of self-interest. These arguments are based on the idea of the invisible hand and strategic action of self-interest as leading to the common good. This approach argues that it is possible to use concepts from game theory in order to justify action for corporate citizenship from a strategic perspective. Accordingly, altruistic action for the common good may be justified in terms of satisfaction of egoistic preferences.
7. This is the concept of judgment as formulated by Paul Ricœur with the use of Ronald Dworkin's concept of principles that is proposed as the foundation of decision-making in business ethics. We find it also in our presentation of case examples that can be considered as invitations to exercise practical judgment in business ethics.
8. We can emphasize the importance of moral imagination for ethical judgment in management and business ethics. Moral imagination is the place where judgment confronts ethical dilemmas and is capable of conceiving the possible scenarios of action and decision-making. In business ethics, Patricia Werhane and Johanna B. Ciulla have produced analysis of the function of moral imagination as important for good decision-making.

Abstract

In this chapter, the history of philosophy of management is discussed with a focus on the search for legitimacy in the Judeo-Christian tradition. This is the basis for evaluating modern concepts of the economics of the philosophy of management and corporations. The chapter also presents the neoliberal paradigm of the philosophy of management and the attempt to search for another economy beyond rational individual utility maximization. Here we move toward business ethics, CSR, and corporate citizenship.

Introduction

We can conceive of Protestant ethics as the religious justification for human actions in rational markets, where the aim is to accumulate wealth and profit. The values of Protestantism (e.g., one's "calling," integrity, trust, hard work, and modesty) have traditionally dominated the philosophy of management that emerged out of the historical analysis of the philosophical origins of the norms of the capitalist system. It is the task of analyzing the history of the philosophy of management and corporations to discuss some of the religious presuppositions of Protestant ethics that characterize the values of the modern, secularized, and liberalistic market economy. In particular, it is important to focus on some of the weaknesses of Protestant ethics that have resulted in a legitimacy crisis of this work morality, which first and foremost implies lack of reasons for explaining why human beings work and why work is organized in a liberal free market system. Economic science contributes to this discussion by determining the conditions for performing as

a rational actor in a market while the sociology of religion and theory of legitimacy of corporations in society reveal the conditions for this understanding of the market economy. The contemporary debate about business ethics is deepened when we look at some of the justifications of the firm in the Judeo-Christian tradition, which are continuously criticized by secularists.

Origins in the Judeo-Christian Tradition in American and European History

The success of Protestant ethics as the basis for the free market economy can be explained by the fact that Protestant values were so easy to transmit to a secular society, which detached the economy as a separate system in society. The Puritans, who founded American capitalism as settlers in New England, have been mentioned as striking examples of Protestant ethics [1]. Their “infamous” ideologue Benjamin Franklin emphasized that “time is money” and that work should be used rationally to create welfare. The Puritans stated in their philosophy of management and corporations that one’s personal calling and self-interest are important for obtaining a sign of salvation and a foundation of the common good. The morals of the Puritans were based on this idea of a religious calling, which demands discipline, hard work, moderation, integrity, personal responsibility, trust, accountability, and honesty. The Puritans adopted the idea of the calling from Calvinist theology. The Puritans thought that the calling could be realized through hard work in the economic arena. Moreover, the religious calling was confirmed through this engagement in practical life. The Puritan idea of self-interest as the basis for the common good is one aspect of our secularized conception of utilitarian economic reason as the basis for the market economy [2].

Within the Protestant tradition, the calling of the manager, the employee, or the corporate director is conceived as a contribution to creating value and meaning in the world. Even though it happens on the basis of hard bottom-line reflections and rational calculations of utility and self-interest, Protestantism makes sense of the work of employees, managers, and corporate directors as service to the divine, as long as one follows the virtues of Protestant ethics. Following John Locke’s philosophy, proponents of this liberal current in Protestantism argue that the individual contributes to the enrichment of God’s creation by harvesting the fruits of his or her own work. This religious justification of legitimate work and economics maintains that it is the task of human beings to actively engage with, to contribute to, increase, strengthen, and take care of divine splendor and magnificence on earth [3].

A profound strain of current analysis of the role of self-interest in Puritan ethics argues that in order to really understand self-interest, it cannot be reduced to pure egoism or Darwinist search for survival, but rather, self-interest should be considered as linked to the search for the common good [4]. We must emphasize that Puritan ethics always views the human calling from the perspective of work for community and the common good. Therefore, from a religious perspective,

the economic ethics of the individual should transcend itself and be directed toward community. The Puritans could only justify the rights of the individual from the perspective of the common good. Moreover, notions like property rights and the concern for the common contract were justified from this concern for community.

Adam Smith's liberal philosophy and theory about the invisible hand can be interpreted in the same fashion [5]. Following one's own interest will lead to the common good. As we have already emphasized, the theory of the invisible hand concerns how an economic system functions, but this does not exclude a moral and community-oriented foundation for liberal thought. There does not have to be a contradiction between Adam Smith's two major works: *An Inquiry into the Nature and Causes of the Wealth of Nations* (1776) and his *Theory of our Moral Sentiments* (1759). We can minimize the tension between individual and community if we read Smith's political economy in the light of his moral theory [6]. As suggested by Patricia Werhane, Smith's moral psychology suggests that human beings do not have mere self-directed interest; moral judgment, prudence, and self-command are also important virtues. Adam Smith's conception of moral sentiments represents a moral evaluation of economic action from which Smith argues that human beings have feelings of sympathy and compassion for others that should be considered as primordial and genuine moral feelings [7, 8].¹ From this point of view, the theory of the invisible hand should be conceived from the perspective of the ideal of the justice of the impartial spectator. It implies the economic idea that it is reasonable and rational to follow self-interest in order to promote the common good.

Indeed, Adam Smith is not strongly aware of the significance of collective groups. He only mentions the firm as an institutional unit once in *The Wealth of Nations*. Smith did not think about the relation between workers and managers in large organizations but only isolated capitalists who employ workers to produce as the fundamental premise for understanding work organization. Smith was not really aware that there was a development toward establishing independent and collective units to systematically maximize welfare and reduce costs on the market. This is a weakness of trying to apply Smith to understanding the contemporary implications of Protestant ethics, because most economic units today are large companies and organizations appearing as independent institutions with their own goals, values, and cultures [7, 8].

If we want to understand the role of Protestant ethics for legitimizing the values of modern capitalism, we ought to look not only at the isolated capitalistic individual but also the correlation between workers and management in the broader organizational setting of the firm. Protestant theologians have tried to analyze the firm from a theological viewpoint [3, 9, 10]. In this light, we can consider the corporation as a dimension of the history of salvation of humanity. It is not only a legitimate part of human life on earth, but as a vehicle for achieving wealth and power, it is an important instrument devoted to humanity's submission to God. The effort of the firm to obtain wealth expresses the creative activities of humanity in the worship of God. Moreover, the liberty of private capitalism witnesses human free will and responsibility for ethical action. At the same time, we can conceive the

firm as a part of a circle of creation between life and death, because the firm – in all its vulnerability – strives for survival on the economic market. From the Christian viewpoint, the firm represents a human community, not unlike a congregation: communities of people whose destiny depends on one another and who live together with a common horizon of meaning in historical existence. As in the community of the congregation, the firm operates in a world without safe foundations. The firm must take the risk of belief and conviction when it acts on the economic market [3, 11].

In the light of Protestant theology, the firm appears as an organization that is not only an economic actor but also a moral and cultural institution that cannot avoid acting politically and ethically in society. This is also implied in the idea of a business as a mediating institution contributing to the legitimacy of social systems and values [12]. As representative of the values of Protestant ethics or, indeed, societal values, the corporation contributes to the creation and maintenance of civil society. There is a true entrepreneurial vocation and creativity in business [13]. The values of trust, collaboration, creativity, originality, and so forth are – according to the theological conception – conceived as a manifestation of the conception of human beings as created in the image of God.

As a radical reply to the despair and arrogance of many humanists and theologians toward ordinary materialistic economics, the American theologian Michael Novak argues in his book *Business as Calling* (1996) that businesses can, in close cooperation with others, contribute to community by creating values and goods and earning money, which he considers to be part of the creative display and self-realization of human beings. In his argument, there is no opposition between social engagement and profit maximization ([11], p. 119). This vision of capitalism is in sharp opposition to those capitalists who think that capitalism is only about personal gain, and at the same time this conception reckons with the self-righteous moralists or devoted religious believers, who think that economics and ethics are totally separated and have nothing to do with one another. Critics on the other side maintain that the idea of a religiously, ethically, and value-oriented capitalist is an unbelievable plaster saint, introduced solely as a mask to cover up the economic exploitation in the capitalist economic system.

The famous American billionaire, Andrew Carnegie, embodies the ambiguity of capitalism. Carnegie started life as a poor boy in the steel industry and by the beginning of the twentieth century had become one of the richest men in the world ([11], p. 58). Through hard work, inventiveness, and organizational talent, he developed new methods to manufacture and produce steel. Carnegie writes in his memories that as a young man, he was very egotistical and greedy. A midlife crisis made him revise his calling in life, after which he chose to live according to the principle that a capitalist should not only live to accumulate capital. Indeed, it would be an enormous disgrace for a rich man to die without having given all of his money away for philanthropic purposes ([11], p. 58). In this light, the life of Carnegie is marked not only by egotistical motives but also the search for religious meaning. This meaning led him to a life as a philanthropic contributor to social purposes, funding initiatives in the arts and culture, sciences, etc.

This is very astonishing as an expression of the human striving for meaning in life beyond material self-satisfaction, but the philanthropic attitude is also important because it witnesses an idea of business as much more than a battle place for economic profits. In this value-based conception of capitalism, economic creativity is not necessarily limited to personal gain. It is a well-known triviality for many religious people that money does not make human beings happy. But capitalism is not always a hindrance for morality. The growth and wealth of corporations by necessity leads to philanthropic actions on behalf of the common good of society, which can, for instance, give the poor reason to hope for escape from their misery.

The high esteem and reputation of the firm in public is of great importance for the accountability of the firm. In fact, the economic freedom of corporations is today really only justified from the perspective of their effort to solve the social problems of community. We can say that modern corporations are, like never before, in a search for a calling that unites economic gain with concern for society, where social inequality and difference in income can only be legitimized when it is in favor of the weakest in society so that they all other things being equal will have better conditions with this inequality than without it. From the point of view of this calling, the consciousness of business life is its capacity to overcome poverty, distress, and disease, as long as it serves community through economic creativity. For example, in Francis Fukuyama's conceptualization of good and trustful relations in an economy based on strong social relations, which contribute to the creation of economic growth and help the weakest in society to avoid social exclusion [14].

In *Durable Goods: a Covenantal Ethic for Management and Employees* (1997), the theologian Stewart W. Herman describes the relation between workers and employers in the firm in light of the theological conception of the relation between God and human beings as a "covenantal relation." From this point of view, work is realized as a calling in a historical development in common conflict and necessary collaboration between managers and employees in an organization. A covenantal relation is defined as a way to relate to necessity and to define the conditions of a common life and continued obligations between management and employees ([9], p. 4). The corporation is therefore conceived as a secular version of the Ark of the Covenant between God and human beings as described in the New Testament and Hebrew Bible. We are confronted with a community of destiny constituted by the organization and its internal and external environment, which involves engaging with different stakeholders, including the environment and nature. This communal relationship can be described as one of responsibility between management and employees, which is founded on this mutual covenant.

It is important to emphasize the double relation between conflict and dependence, in the sense that the manager cannot really act without his or her employees because he is fundamentally dependent on the employees. At the same time, the employees are fundamentally dependent on management and they cannot surpass these ties to the firm. The relation between management and employees is based on mutual promises and obligations that create the community in the firm. Protestant ethics

stands here for a realistic position between too excessive beliefs in Christian charity, solidarity, and respect without conflict on the one hand and a continuous labor conflict on the other. This is marked by the hope and aspiration that it should be possible to create a collective moral identity in the firm. This position is critical toward a radical prophetic concept of the firm, for example, Marxist critiques of liberalism as an economic ideology where the owners of production facilities use and oppress employees and other stakeholders.

Instead, when conceived as a covenantal ark, the organizational work relation is carried out by an inner coherence, based on the continuous dependence and mutual understanding of the external and internal vulnerability of the firm ([9], p. 34). This tension between conflict and cooperation is based on the mutual vulnerability that contributes to the feeling of mutual connectedness between employees and managers in the firm. The idea of the covenantal relation expresses the idea that cooperation in the firm, and in relation to stakeholders, not only is an issue of profits but also implies economic value that is wider than concern for the bottom line or for economic necessity.

Accordingly, Protestant work ethics can be conceived as a combination of continued accumulation of wealth in a relation of cooperation. This can, however, also imply a potential conflict between management and employees in a common organization with a common community and history. When one has obtained luxurious wealth, it should not be wasted for personal excess but rather reinvested and used for charity and philanthropy in favor of improving the general wealth of society.

However, not all theologians accept this conception of the firm and its legitimacy in Christian community. There has also been strong criticism of Protestant ethics [15, 16]. Even though it has not been the major purpose of their theological reflections, many theologians in the twentieth century, for example, Karl Barth, Rudolf Bultmann, and Paul Tillich, have been very critical toward reifying aspects of work life and of the lack of Christian love in the greedy search for profits. Capitalists are conceived as self-righteous and money-grasping Pharisees. Many theologians are patronizing toward business life and its material reality. Paul Tillich even went so far as to argue for a Christian socialism, implying that “every true Christian has to be a socialist” [17].

Furthermore, the liberation theology that emerged in the middle of the 1960s, and has had great influence in Latin America and elsewhere, emphasized that capitalist economics is in total opposition to the demands of the Bible to take care of the poor. The result of these opposite points of view is that we have great difficulty in maintaining that the Bible can contribute to the justification of a particular economic system, especially a market economy based on profit maximization. The argument against the unification of capitalism and Protestantism is that the notions of work and profit in capitalism will always be in tension with the golden rule and the command in the Bible “to love one’s neighbor as one’s self.”

Thus, skeptics argue that the theory of Adam Smith about the invisible hand cannot be combined with the Christian conception of solidarity as the foundation of

community. Capitalist profit maximization leads to economic inequality and social injustice that cannot be justified from the perspective of Christian faith. This theology conceives Protestant ethics and its command to accumulate wealth as a great misconception of Christianity. A lived example of this approach can be found in the Franciscan friars – the mendicant monks who live meagerly and ascetically and who refuse worldly wealth as totally un-Christian. Moreover, according to this view, capitalism should be criticized for leading to unacceptable economic prioritization and excessive use of resources.

Even though Protestant ethics has had great influence on the economic system in the Western world, it can still be questioned as the correct interpretation of Christianity. It is very difficult to find a simple and clear justification of a capitalist economic system in the Bible. The Hebrew Bible and the New Testament both contain a passage, which turns everything upside down by defending the poor and demanding economic and political justice. Viewed in light of how liberation theologians read the Bible, Jesus emerges as a Marxist revolutionary who will fight for social revolution against economic profits and against the reduction of workers to productive machines.

Evidence for this thinking can be found among many scriptures in the Hebrew Bible, such as exhortations to help the poor and starving: “Is it not to share your food with the hungry and to provide the poor wanderer with shelter – when you see the naked, to clothe him, and not turn away from your own flesh and blood” (Isaiah 58: 7). Another example is the duty to give everything away, as when Jesus answered a young man who wanted to join him: “If you want to be perfect, go, sell your possessions and give to the poor, and you will have treasure in heaven. Then come, follow me” (Matthew: 19) and later in reply to the surprised disciples: “I tell you the truth, it is hard for a rich man to enter the kingdom of heaven. Again I tell you, it is easier for a camel to go through the eye of a needle than for a rich man to enter the kingdom of God” (Matthew: 19). We can say that God demands identification with the poor and not with the rich. This implies a criticism of Protestant ethics, where we, as human beings, are not called to selfishly gain more financial wealth for ourselves but rather to sacrifice for the weak and contribute to helping the poor, giving to the hungry, and providing food and shelter to the homeless.

Philosophy of Management in Modernity

How do these conflicting interpretations of the Judeo-Christian tradition and its relation to market economics appear in the light of an economic theory of modernity? On the basis of Max Weber’s views, we may argue that there are two classical economic traditions in Western society. The American economist Robert H. Nelson distinguishes between an *optimistic* Catholic tradition and a more *pessimistic* Protestant tradition [18]. The optimistic view on economic values harkens to thinkers like Aristotle, Aquinas, Claude Saint Simon, and John Maynard

Keynes. The pessimistic perspective is based on a sometimes very apocalyptic view, arguing for the alienation of mankind by citing, among others, Plato, Luther, Calvin, and invoking the Puritans and social Darwinism. Nelson argues that these two views have been shaping Western culture and that we still find them in modern economics. The important question is how the values of the different philosophical and religious traditions determine modern economic theories.

Even though many modern economists argue that they are doing value-free research, Nelson's interesting work shows that a deeper sociological and philosophical examination will reveal how values are built into their theories. According to Nelson, even though economists think of themselves as scientists, they cannot avoid being predetermined by certain value systems. They are, therefore, more like priests or theologians, in the sense that they are preaching certain value conceptions about markets and how to organize society [18]. The idea of economic efficiency as one of the most important ideas for modern capitalist societies is not value neutral but dependent on a deeper religious vision and concept of the world. It is possible to show that values cannot be considered as external to modern economic theories and, consequently, in the work of some of the most important representatives of modern economic science. By analyzing these different views beneath the surface, we can see the dimensions of these values. The influences of the two classical economic traditions can also be found in modern economics.

This relation between economic and other values can therefore be described as the "market paradox." Economic action is not situated in mathematically imperfect markets, but rather in real situations, where cultural and social aspects influence economic behavior. This is a restatement of the insight of Max Weber when he analyzed the cultural and social conditions of Protestant ethics, which were necessary for the development of capitalism. But it is also very contemporary when we look at society today, where certain institutional arrangements are necessary in order to provide the basis for well-functioning economic markets, such as the imperative to avoid corruption and bribery. The market paradox concerns the possibilities and limits of emphasizing efficiency and self-interest as the basis for market behavior in economic rationality when confronted with the requirements of society to serve the common good and the interests of community. The problem is to find the right place of the economic work ethic with regard to other religious and cultural values of community. Keeping with Nelson, we can argue that the problem of the market paradox is emphasized by the fact that many economists argue for opportunistic market behavior while they reject similar behavior in politics or in other areas of society ([18], p. 9).

Nelson's approach usefully contrasts economic theory and theology, and this is an important contribution to the philosophy of management and corporations understood as a fundamental metaphysics of organization. By reading economics with the theoretical tools and language of religion and theology, we can manage to clarify the hidden presuppositions of economic theory. Moreover, this analysis gives us a much clearer picture of the implied concepts of social legitimacy within different economic theories. This theological approach to values of economics should, however, not be understood in a purely literal sense, because it is the

metaphorical play of difference and resemblance between economics and theology that constitutes the important basis for conceptual gain and reflective thought [19].² By seeing “economics as theology,” we can be much more clearly aware of the values and visions of legitimacy hidden within economic theories of corporations and society. This provides a metaphysical basis for a philosophy of management and organization that remains faithful to the Weberian perspective.

Historically, the goal of economics has been to assure the best possible distribution of material resources in society. To achieve this goal, economists have offered a specific conception of economic rationality – one that is value neutral – as the foundation of society. Despite this, rationality is not neutral but can be considered as an ethical and religious view of how to realize happiness and freedom on earth. These views cannot be separated from other conceptions of economics and society, and they are in principle as valuable as Weber’s conception of the Puritanical or Calvinist ethos of capitalism. In accord with Nelson, the metaphysics of philosophy of management and corporations may indeed be said to be about “how to reach heaven on earth,” that is, how to structure economic action in a way that will most efficiently increase human welfare and happiness on earth. It is not wrong to describe economists and managerial thinkers as “worldly philosophers” [20].

Given this, modernist economic philosophy and management philosophy in the twentieth century might be viewed as a response to the problems of Protestant ethics. Two of the major schools of modern economics, the Chicago school and the Cambridge school, promote two different responses to the problems posed by the Protestant ethics. Paul A. Samuelson, Nobel Prize winner and author of the most important textbook in modern economics, represents the Cambridge school [21]. His book, *Foundations of Economic Analysis*, has sold more than 5 million copies in more than 15 editions ([21], p. 5).³ The values of Samuelson’s economic project can be considered as progressive in the optimistic tradition from Aquinas and Keynes. This was the project of postwar welfare economics.

The Chicago school of economics can be described as a reaction to the progressive economic project of the Cambridge school. They protested against individual rationality, the state, and of the market of Samuelson and his followers. They promoted a radical libertarian criticism of the welfare state. Moreover, they argued for a very cynical economic view of human nature. The Chicago school includes figures like Richard Knight, Gary Becker, and Milton Friedman.

It is important, from the perspective of the philosophy of management and corporations, to consider Samuelson’s economics of the Cambridge school as a revival and secularization of a Catholic economic project, where the investments in market developments are based on concerns for community and the common good. Accordingly, Samuelson formulated the progressive message of economics as the science of the welfare state. This was based on a combined belief in Keynesian ideas with a belief in market economics and the principles of scientific management. Samuelson argued that the market was very important for good economic development. Although he was critical of a very strong interventionist government, Samuelson still believed that government should keep many of the social functions that were promoted by the Keynesians. Still,

the market was the central focus for the new scientific economics, which was based on mathematical analysis.

In this context, there is a close relationship between the Keynesians and the Marxist message of economic values ([18], p. 30). Marxism is based on a historical vision of social and economic development toward a just and good society. Marx argued that economic laws are replacing natural and divine laws in the development of society toward overcoming material scarcity at the end of history. The Marxist conception of the dialectics between basis and superstructure may be considered as an important inspirational idea for Weber's thesis of the close relationship between economic values and religious values. The values of Keynes can indeed be considered as a more modest vision of the Marxist idea of the possibility of the realization of the good society on earth. Optimistic Keynesians believed in the idea of the realization of a good society with the methods of the strong state and scientific management of society. In this way, the Keynesian economics in the beginning of the twentieth century may be considered as an optimistic reaction to the pessimism of Protestant ethics.

It is important to emphasize – echoing Nelson – that Samuelson took over the progressive message of Keynes. By promoting economics for the common good while arguing for an efficient and free market, Samuelson was open to the Puritan message of Protestant ethics. But at the same time, this message was forgotten in his efforts to develop a scientific and objective basis for economics in mathematics. Samuelson thought it was possible to develop a scientific understanding of modern business organizations while arguing for the importance of democratic institutions. Economic rationality and scientific management should contribute to the construction of a rich and good society; however, this vision was not conceived as based on ideology but rather on the concept of scientific rationality as an objective way to construct a good society with economic tools.

Samuelson argues that economics is based on a fact and value distinction and that ethical values are subjective conceptions [22]. We need to provide the scientific basis for economic development and the management of economic institutions. This approach defends the importance of economic markets but excludes self-interest from other social institutions like government ([18], p. 51). The principal value is the defense of market competition combined with the idea that the creation of monopolies is fundamentally wrong. The market mechanism is essential for determining prices and what should be produced. This is regarded as the most effective way of regulating needs and wants in society. Such welfare economics defends a supply and demand conception of the economic system. The basic goal of society is full employment, and government should act in order to protect and facilitate the free market exchange. Samuelson works with the ideal of the perfect market with zero transaction costs as the basis for his analysis. Moreover, the calculation of economic efficiency is based on the equilibrium of Pareto optimality, according to which an unregulated free market economy is viewed as a learning system moving toward stability ([21], p. 621).

We might say that this view of economics is an attempt to present a secular version of the progressive belief in the invisible hand as modern scientific

economics. The utopia of the free market is, however, based on pure economic analysis. For Samuelson, the only acceptable rationality is economic reason; therefore, he is critical toward religious influences on economics, such as Aquinas's argument that taking interest is unethical. What we need, he argues, is economic enlightenment and scientific measurement of the risks and benefits of economic action. Moreover, Samuelson violently rejects the inefficient use of resources. What is needed is scientific management in a society based on a mixed system between government and private enterprise.

These ideas emphasize that welfare economics could only account for economic development and benefits in economic terms. It is not possible to measure the social, environmental, or psychic dimensions of economic development within this conception of the market, because the only valid costs are those that contribute to economic progress. In this way, Samuelson's message differs significantly from Puritan ethics, which did not have the same materialistic and utilitarian view on life, because they viewed economic activity and work as a means of salvation in another world. For Samuelson, on the contrary, the function of the market is to realize utopia in the present world ([21], p. 622).

The modernist philosophy of management is characterized by this secular dream of realizing paradise for humanity on earth using the instruments of science. The theological interpretation of Samuelson's economics puts emphasis on his political appeal to community and common welfare, which is not present in the same way in the Protestant tradition. Samuelson's political arguments utilize scientific economics to improve public administration for the common good. It was indeed the central task of economics as a science of the market and public administration. Economics could help to calculate the "logic of collective action" and describe the dangers of "free rider problems." With the use of good economic methods in order to create economic growth, poverty and social problems would be eliminated and a higher standard of living would be created for the benefit of the worst off ([18], p. 70). From this perspective, the corporation would have an important mission of being loyal to the common goals of community, even though it would have to behave strictly in accordance with scientific economic rationality.

In addition to the values of integrity, honesty, and accountability from traditional Protestant ethics, we can say that Samuelson lays the foundation of the "good citizen corporation," which has become a central concept of legitimacy in the philosophy of management and corporations, because he emphasizes the social function of economics and the utilitarian aspects of economic development. From the point of view of this welfare economics, corporate social responsibility and values-driven management are important tools for avoiding social exclusion and assuring social integration and coherence as foundations for economic progress.

There is, however, really no agreement about this within the theological interpretation of economic legitimacy. Following Nelson, we can also situate the Chicago school in this context of Protestant ethics. The Chicago school of economics represents an individualistic and libertarian criticism of such a welfare state project ([18], p. 110). And this is also the basis for the skepticism toward collective conceptions of corporate social responsibility. While Samuelson may

have had some technical economic insight, his arguments for a mixed economic system and progressive politics were considered as unscientific with no economic justification ([18], p. 20). The Chicago school draws on arguments for the superiority of the market, which have, since Adam Smith, been important in economics. Combined with a defense of the virtues of *laissez-faire* in social Darwinism, or Herbert Spencer and the natural law theorist's defense of property rights, Chicago economists promote a strong criticism of Samuelson's ideas of the relation between state and market.

According to Nelson, the early twentieth-century economist Frank Knight can be considered as an important founder of the Chicago school. Contrary to the optimistic progressive views of Samuelson, Knight had a much more negative conception of human beings. He saw economics as based on self-interest and human freedom ([18], p. 96; [23]). We might say that he was close to expressing "a classical Christian view of fallen human beings beset by original sin" ([18], p. 121). Knight was a pessimist and realist in the sense that he argued that the existence of the economic market and private property was unfortunate results of the "presence of evil in the world." In this way, Knight represented a Protestant reaction to the communitarian visions of Samuelson and Keynes. From this critical perspective of the Chicago School, mainstream economics could be considered as a continuation of natural law beliefs in community and in the virtues of human nature. Instead of believing in enlightenment and progress, Knight was marked by the pessimistic view of the nature of human beings in Puritanism and Lutheranism ([18], p. 132).

Unlike proponents of the optimistic approach, Knight conceived the market as necessary for social cooperation, not because of the virtues of humanity but because of the evil nature of human beings. The market has a social function of bringing people together, even though they have very different values and conceptions of life. The idea is that the market is without power relations, and it is therefore possible to interact in a situation of radical pluralism ([18], p. 136). On the market, Christians can exchange goods with people of other religious beliefs without compromising with their ethical and religious values, because the exchange is a matter of self-interest and profit. Knight was the teacher of such important second generation Chicago economists as Milton Friedman and George Stigler. They were profoundly marked by the Calvinist thought of sinful humanity, but at the same time they adopted the scientific outlook of modern economics. Milton Friedman presented himself as an economic technician, although he was also very engaged in political debates [24]. Moreover, Friedman seemed to have adopted the belief in the economic progress of modernity. Still, Protestant ethics are present in the writings of Friedman in the sense that he emphasizes the importance of self-interest and the freedom of economic markets. His criticisms of corporate social responsibility further show how committed he is to combining the Puritan ideal with market efficiency. The firm should not promote values other than economic ones, because this would transcend the economic sphere and impose ethics on stakeholders and shareholders. Friedman is very skeptical toward the possibility

of democratic government, because he views strong government as a threat to individual liberty. The market is central for economic activity; the state is only there to regulate the availability of the free market and ensure antitrust regulation. Friedman advocates heavy privatization and he is skeptical toward high taxes, although government might contribute to some redistribution of resources among the poor ([18], p. 149).

This generalization of economic method was followed by the third generation of the Chicago school. Gary Becker and Richard Posner applied economic methods to other social sciences, for example, law and economics (Posner) [25],⁴ or analyzed traditional sociological and anthropological problems from an economic perspective (Gary Becker) [26, 27]. They argued that human action in these fields could be understood from the point of economic utility maximization. These approaches were characterized by a provocative treatment of noneconomic values. Posner and Becker presented a secular version of the Christian concept of sinful human nature. They argued that social agents were determined by self-interest and utility maximization ([18], p. 167). Like Marx, Nietzsche, and Freud, they thought that economic motives, driven by self-interest, were the real basis of human behavior individually and in social interaction.

Individuals act in order to maximize their personal welfare, and Becker thought that this economic behavior affected all dimensions of social life. On this basis, he presented a cynical economic analysis of the family as an economic unity, of discrimination, and of stealing and argued that all these themes could be considered as economic relations, where individuals were maximizing utility in order to increase welfare. Becker, who received the Nobel Prize in 1992, wrote that polygamy in certain conditions would have a rational justification, because the value of women would increase on the market when men could have more wives. Moreover, he thought that marriage was based on implicit calculations of personal gain and that love was just a romantic sentimentalism. Becker also said that even the Nazi killing of the Jews could have an economic justification by increasing the economic gain of Germans. Becker believed so much in the selfish dimensions of human nature that he wanted to explain altruism on the basis of opportunism, which led him to develop his “Rotten kid Theorem.” This theorem postulates that there are situations where individuals help others to be better off because this action will make the other more likely to “transfer parts of the improved welfare” and give back to you ([18], p. 179).

Nelson argues that the Chicago school in this way represents a new secular kind of religion ([18], p. 185). We can say that Becker and Posner helped to articulate the secular value of autonomy, which became fashionable in the USA and Europe. The Chicago school was suspicious of collective unities of any kind. The religion of libertarian values argued that “everything was determined by economic forces and self-interest” ([18], p. 185). One interpretation of the Chicago school is that it did nothing other than promote the libertarian values that emerged as a criticism of the modernist economic project. In the 1970s, the culture of marriage changed into a single lifestyle, and self-determination became the most prominent ideal in a pluralistic secular society.

The Chicago school can be said to continue the Protestant project of rational economics, while abandoning the religious values of faith and belief in the Christian calling. The Chicago school is in conflict with Protestant ethics, because it makes utility and personal wealth maximization into the absolute value. Efficiency and economic progress replace the Christian values of respect for the divine commands with self-regulative prophecies of the market. In this perspective, Nelson argues the Chicago school has secularized Knight's ideas of a fallen humanity ([18], p. 199). It sticks to the Calvinist view of human nature without adapting the religious presupposition of revelation and devotion to the divine cause.

What is interesting about this theological reading of the Chicago school is that this approach to values and economics may be read as an existentialist radicalization of traditional Protestantism. For Becker and Posner, human beings are conceived as projects that are in bad faith if they do not accept the economic reality behind every visible phenomenon [2, 28, 29]. These economists are existentialists in the sense that they detach every meaning from visible reality and reduce it to the material law of economics, based on radical individual choice confronted with the fact of human finitude and the shortage of resources. For these existentialist economists, only the strict laws of supply and demand are real for the lonely and isolated human individual. In this sense, the only things that exist are the economic laws of being in material reality. The goal of life of the isolated individual is to make sense in this life of economic necessity.

In order to understand better the philosophical foundations of this neoliberal economic paradigm that has been so influential, we have to look closer at the foundations of the neoclassical political economics of the neoliberal view of economic rationality and its possible ethical implications. The neoclassical concept of rationality implies an unlimited conception of rationality according to which economic agents have unlimited competencies of decision-making in order to maximize personal self-interest within an exogenous space of possibilities.

According to a liberal like Hayek, free competition among individuals in the market, within ethical custom, is the best condition for human happiness and luck [30, 31]. It may be argued that this perspective diminishes the importance of achieving economic equality. Neoclassical economic thought based on the pursuit of self-interest implies the view of human beings as inherently competitive. Property rights liberalism does not imply any principles of equality as the basis for economic markets because economic freedom is essential to property rights. From this perspective, justice in economic markets appears paternalistic by limiting human freedom. Radical libertarians and some liberals are indeed somewhat critical to the deontological perspective, because it implies moral restrictions on personal liberty.

Hayek links this argument for the unlimited economic rationality of the market with a criticism of the proposal to use the state actively to establish social justice in modern society. Such justice would be somewhat the same as socialism, and Hayek thinks that there is no meaning in the idea of planned social justice [32]. Human beings do not have the perspective of the invisible hand; we are always situated in a culture and history where we learn by trial and error and imitation. Hayek

criticizes the idea of a planned social justice from an epistemological point of view. We cannot rationally construct social rules but are only able to use our faculty of imitation. We can only follow specific patterns by intuitive, tacit, and bodily recognition of meaning in action and by imitating others. Freedom is what the individual does with what society has done with him or her ([33], p. 247). It is the freedom of the situated individual to act in a social condition. Hayek approaches economics and ethics from the point of view of a methodological individualism. Human beings are responsible for their society, but they cannot fully know what the result of their actions will be, and they have no control over the collective level of society, which is much more complex than the level of individual action. Society can, in this context, be conceived as a complex cybernetic system that human beings cannot control. Though created by individuals, it is too complex and contradictory to be conceived of in its entirety.

Hayek views the social order as a spontaneous order that no one really wants. It is a kind of reinterpretation of the idea of the invisible hand. Social order, which is established in balance between natural and artificial forces, is the result of a long evolutionary process similar to that of the natural world, as described by Darwin. There are no general laws of evolution, whether in the natural world or in social systems. In an open society, the society of individual freedom as proposed by Adam Smith – where utility and calculation determine the rules – the market is the essence of the evolution of this spontaneous order. During evolution based on interaction among self-interested individuals, those practices that are based on individual freedom and rational choice of the most efficient alternative will, in the long run, contribute to social betterment. Indeed, better legal and moral systems will be a result of this spontaneous order. In an economic system based on fair competition, healthy economic institutions contribute to a better society. From this perspective, the idea of competition includes an ethical dimension of fairness and transparency contributing to the spontaneous order of society. Hayek seems to want to establish the good and just society on the contingency of social spontaneity and social affairs [31, 33].

In essence, one must leave oneself to the forces of the market and to forget social justice, because society cannot be controlled. This “liberating alienation” is core to the utilitarian justification of liberty and justice in Hayek’s economic theory [31]. The individual is requested to act in conformity with the rules of the spontaneous social order in which he or she is a part. Justice cannot be planned but is a concept that is generated by the spontaneous social order. Because the market is the essence of spontaneous order, markets are effectively rendered morally blind and without ethics. From this view, property rights are personal rights and imitation is the basis for the personal development of individuals and for their social and economic self-regulation. Even though selection out of path dependence plays an enormous role in social evolution, Hayek’s approach to social politics breaks the connection or responsibility between individuals and the market ([31], [33], p. 284).

This is really an argument against any attempt to formulate a rational foundation for the political constraints of actions of individuals and corporations. According to the invisible hand and the idea of the spontaneous order, the market should exist

as a free human institution, because it guarantees the social development of society. Thus, economic action should be based on the supremacy of free individual decision-making and on open economic markets with as little government intervention as possible. The idea that economic rationality should be liberated from ethics and only introduced as an external limitation when it goes beyond the acceptable requirements of economic rationality (e.g., not respecting the rules of fair competition on free and open markets) is the result of the liberal approach.

The ideal of perfect competition in Hayek's thought and neoclassical economics presupposes the right of individuals to make their own rational choices on economic markets. This view of economics is arguable based on the presuppositions of perfect competition, rational independent decision-making, a perfect market, a homogenous product, many competing sellers, and free entry/exit into the market. It is presupposed that the firm consists of one rational individual rather than a group or coalition of individuals. The firm is a category of the individual and a production unit in order to provide goods to be exchanged on economic markets ([30], p. 66, [34]).

Since ethics is regarded as an external limitation to economic rationality, it is not integrated in economic decision-making. The ethics present in this doctrine is, therefore, the one of competition, which is to maximize self-interest and personal preference maximization. A promise of total opportunistic and selfish action is a handshake, as some have characterized this ethics of competition. In this way, ethics seems to be an exogenous element of social action at the limits of economic rationality; however, a presupposition is that the conditions of fair competition and perfect markets should be accepted by all participants in economic competition, which is restricted by the rules of the game, for example, in property rights and contract law. A generous interpretation of the thought of Smith and Hayek may be that the ideas of invisible hand and spontaneous order are attempts to integrate a concept of the common good in liberalism. From this optimistic perspective, liberalism always goes beyond pure egoism because self-interest is supposed to somehow serve the general interest. Although such an interpretation may be closer to the original moral intent of liberal philosophy, it is a point of view that seems to have been more or less forgotten in the economic self-understanding of neoclassical economics, which isolates the concern for the good from the concept of economic analysis.

Recent Developments in the Philosophy of Management

The movement in the direction of corporate citizenship, business ethics, and corporate social responsibility goes to the roots of the problems with the neoliberal approach by showing that the economic subject is not exclusively to be conceived as an atomistic preference maximizer. Importantly, this approach argues for altruistic preferences at the fundamental level of economic anthropology. When we deal with issues of the integrity of managers, the social responsibility of corporations as institutions, and ethical leadership, we are far beyond the neoliberal paradigm and are closer to the social market economy proposed by Samuelsson.

We may say that “economic man” should be replaced by “social man” or rather that individuals are characterized by a structure of double preferences whereby individual preferences are related to other people.

The German philosopher Peter Koslowski has tried to address the difficulties of the concept of economic man in his approach to ethics and economics and philosophy of management. In the book *Principles of Ethical Economy*, he develops an ethical economy that goes beyond the confrontation between the Chicago and the Cambridge schools. According to Koslowski, a comprehensive theory of the economy cannot rely on self-interest alone ([35], p. 1). Ethics and economics must try to unite in a comprehensive theory of rational action. The ethical economy is a development of political action that develops responsible and ethical economic activity at the marketplace. Ethical economy is a more comprehensive term than the concept of business ethics and it is also more than just ethics and economics since it approaches the institutional structures of society and corporations and organizations in order to base economic action on practical rationality beyond economic man ([35], p. 3). In order to develop a new vision of philosophy of management, we need a practical philosophy that integrates economic activity with nature and is built on the respect for and rediscovery of the human person ([35], p. 9). It is important that we work for a “rehumanization” of our postindustrial economy. Ethics aims at installing norms and values in the economy that respect fundamental ethical principles and human beings in the culture and actions of society [36].

The Belgian economic philosopher Christian Arnsperger gives support for this argument by considering the French anthropological tradition of Marcel Mauss and the concept of responsibility in the phenomenology of Emmanuel Lévinas as possible criticisms of the liberal and neoliberal restriction of economic subjects to “atomist monads” of individualist profit maximization ([37], p. 99).

Marcel Mauss’s anthropological concept of exchange helps us to question the liberal concept of economic maximization. This economic concept of exchange must be considered from the perspective of our social life and is limited when we want to understand all the aspects of human motivation. Mauss helps us to formulate a more complex concept of economic exchange, linking economics to altruistic motives and concepts of giving and receiving that tie economic markets to social life. From an ethical point of view, human subjects are always linked to the logic of social integration, which is also an important aspect of economic interaction.

The central insight of Mauss is that economic anthropology cannot solely be based on the concept of individual preference but that economic interactions presuppose a social concern of mutual social interdependence of economic actors. Moreover, this concept of society presupposes a broader conception of the human self than is proposed by neoclassical economics. In fact, the mutual relations of giving-receiving-returning are not external to the market, but rather the real truth of the market, because the market presupposes the interdependence of economic actors [37]. Following Christian Arnsperger, we have learned that it is possible to accomplish methodological *individualism* with a methodological

altruism, which accounts for possible altruistic preferences in the economic subject and furthermore acknowledges the importance of ethical evaluating economic preferences and motives ([37], p. 104). Altruism is based on the essentially social character of the market, involving basic conditions of the exchange relation as described by Marcel Mauss. Instead of being founding by the monadic subject of mathematical, axiomatic economics, we have to acknowledge the relation between economic theories and the moral sciences. Economic theory cannot abstract from the morality of exchange, because exchange is after all a social event.

By focusing on anthropology, Emmanuel Lévinas helps to enlarge the ethical foundation for this altruistic approach to economic anthropology. Lévinas proposes a phenomenology of the intimate encounter of the other human being as the basis for our view of human motivation ([38], [39], p. 159). The encounter of the other human being is an infinite demand of responsibility and self-sacrifice. This concern for the other is the basis for social relations, and the reciprocity with the other should not be defined as a relation of “alter ego,” but rather the other is someone fundamentally different. From the perspective, Lévinas’s respect for the other as other is the foundation and condition of possibility for economic exchange [40]. Therefore, Lévinas says that ethics precedes reciprocity as mutual recognition and altruism as enlarged self-interest.

The criticism of the atomistic economic subject that is revealed by the analysis of Mauss is supported by Lévinas’s ethical anthropology, which situates economic action as secondary to the fundamental human responsibility for the otherness of the other as the innermost purpose of human action [40]. This implies that economic action is embedded in larger social structures and that economic rationality cannot be separated from ethical and political rationality. Christian Arnsperger suggests that Lévinas’s phenomenological description of individual subjectivity shows that the logic of the gift is a possibility of individual choice that precedes “every constitution of subjectivity as purely autonomous” ([37], p. 113). This ethics of otherness could be seen to constitute the fundamental openness and generosity that precedes the economic account for particular preferences. Lévinas emphasizes that responsibility is the most fundamental constitution of subjectivity, which we might extend by arguing that ethical subjectivity is more fundamental than the economic subject of neoclassical and neoliberal economic theory.⁵

This view on the relation between economics and ethics in the philosophy of management helps us to understand that individual rational maximization can never be fully isolated from the idea of ethical subjectivity as fundamentally responsible for other human beings. The ontology of economics and the reach of an economic method based on individual maximization cannot be conceived as all-encompassing and absolute, but economic rationality is in fact secondary to political and ethical reciprocity. From such a point of view, economic decision-making should have external restrictions in the laws of political justice and ethical prescriptions based on fundamental principles of human existence. Economic reason is submitted to responsible subjectivity; when evaluating economic preferences, one cannot avoid asking questions about the ethical

ideas of universal moral rules, the search for justice in political community, and considerations of community welfare.

Following the philosophy of Lévinas, responsibility for the other human being can be viewed as a condition for the legitimacy of economic action. Moreover, political community necessitates that responsibility is not only an intimate relation with the other but should be extended in time and space to society as a whole. This is the argument of the German philosophy Hans Jonas, who thinks that responsibility does not only concern present human activities but should be extended globally in time and space and include the future of humanity [41].

Such an integration of reciprocal ethics and politics is, however, not without a price, because basic economic considerations are considered as relative to ethical principles ([39], p. 168). The values of efficiency, utility, production, demand, consumption, and accumulation are not considered as intrinsic but are only valid insofar as they do not violate basic ethical principles or contradict our moral values. An appreciation of the ethical and political limitations of economic action supposes an ethics of responsibility as the basis for social regulation.

In this context as an extension of the responsible approach to business ethics based on the philosophy of Emmanuel Lévinas, we could propose basic ethical principles as the framework of business ethics. In fact, the four ethical principles of autonomy, dignity, integrity, and vulnerability can have significance as basic ethical principles that are guiding ideas of business ethics [42, 43]. The principles have originally been proposed as principles for bioethics, but these four principles can also be proposed as fundamental principles in business ethics that are very important ethical ideas in order to propose an ethical framework for ethics in organizations. When we apply the principles in business ethics, we are clarifying the meaning of ethical ideas that have an importance for our lives. In doing so, we come to understand the institutional context of the principles been based on the framework of justice, responsibility, and solidarity (equality). Autonomy refers to the freedom of the individual but also to moral self-legislation and responsible behavior at economic markets. Dignity is essential in the respect for human rights and indeed also for the concern and respect for the human dignity of all stakeholders. Integrity means personal integrity, but it can also be defined as organizational integrity as the foundation of good corporate citizenship. Vulnerability signifies the human condition that we are all vulnerable and mortal and it leaves us with the difficult question of how to respect human beings in a competitive market economy [43]. The meaning of vulnerability in business ethics therefore leads to a principle of respect for vulnerability where it seems to be responsibility of business to give the vulnerable a fair treatment, not exploiting their vulnerability but rather in caring and being aware of their dispositions. Responsible managers and salesmen would not exploit vulnerable people but rather support them in a responsible business relation built on dignity, integrity, and trust. The principles function as a concrete application of the ideas of phenomenology of responsibility and republican business ethics, and in this sense they represent a new approach to business ethics moving beyond the confrontation between the Chicago and the

Cambridge schools. They are not limited to individual action, but they should be applied to institutions. The principles should not only create individuals with virtue but also moral markets. The principles are not only theoretical ideas but practical guidelines for business.

Conclusion

What are the consequences for philosophy of management and corporations of this development of the search for legitimacy, moving from Weber to the modernist economic traditions of the Cambridge and Chicago schools and beyond, toward another kind of economy? It becomes clear how the philosophy of management and corporations focuses on the search for legitimacy as conceived as creating a good and perfect firm that aims at realizing the good of humanity through value creation and through perfect interactions between management and employees. The different perspectives on economic legitimacy in society constitute different views of the role of the good citizen corporation in society and of the contribution of the corporation to the good life of its different stakeholders [43].

Notes

1. According to the predominant interpretation of Adam Smith's liberalism, Smith takes over Mandeville's idea that private vices lead to public benefits. A famous remark by Adam Smith from the *Wealth of Nations* has been interpreted in this light: "It is not from the benevolence of the butcher, the brewer, or the baker, that we expect our dinner, but from their regard to their own interest. We address ourselves, not to their humanity but to their self-love, and never talk to them of our own necessities but of their advantages" as Smith says in the *Wealth of Nations*. However, it is important to think carefully about what self-interest really means in this context. It does not mean that Smith wants to base his whole philosophy on egoistic self-interest and private vices. Rather, these self-interests do not have to be selfish, but they can also be said to serve community in the sense that individual work is good for everybody. In this sense, the liberal concepts of utility maximization, individualism, and the market as moral regulator do not capture the concepts of sympathy and justice and equality of treatment that also play a role in Smith's philosophy. Patricia Werhane's reading examines the *Wealth of Nations* in the light of Smith's moral psychology developed in *Theory of Moral Sentiments*. This reading emphasizes the importance of concepts such as sympathy, justice, and equality, as well as the impartial spectator and the importance of legal institutions in Smith's moral and political philosophy in contrast to an emphasis of the atomism and egoism in Smith's economic theory. This reading is very important although there remains a great tension

- between individual and community and that liberal theories do not really avoid this tension. Still, it opens the way toward conceiving the good life as a part of Smith's moral theory.
2. For more about the concept of metaphor as reflective model, one can refer to Paul Ricœur's discussion of the relation between models and metaphors in relation to the sciences. This relation also applies to the relation between economic models and managerial models that also can be considered as metaphors. The cognitive function of metaphor as "seeing as" is profoundly important.
 3. Samuelson defines economics as "the study of how men and society choose, with or without the use of money, to employ scarce productive resources to produce various commodities over time and distribute them for consumption, now and in the future, among various people and groups in society."
 4. Richard A. Posner has become very famous for his economic reading of the law and for his combination of pragmatism, legal theory, and economics.
 5. The critical reader may insist that Lévinas cannot be used in such a way to argue for the primacy of ethics over economics. Such an approach would state that the phenomenology of the other implies a negative reaction to the instrumentalism of economic exchange and an ethics of situational demand on the individual that goes beyond economic exchange. I agree with that, but this is indeed also a good argument for the primacy of ethics in the reciprocal relation of social exchange between human beings. Accordingly, ethical responsibility is a primary constitutive element of human existence.

Jacob Dahl Rendtorff

Abstract

This chapter presents the problem of legitimacy as the central question of the philosophy of management and corporations. This problem is then presented with the economic theory of Adam Smith and with the concept of legitimacy from Max Weber. Further on, the contributions of recent theories to the question of legitimacy of the corporation in the modern world are presented, in particular, a number of American approaches that are related to institutional theory and recent efforts to determine the legitimacy of management and corporations. Finally, we briefly discuss Habermas's concept of legitimacy as the foundation of corporate citizenship.

Introduction

In this chapter, we address the philosophy of management and corporations in relation to the problem of legitimacy of the corporation in modern society.¹ This problem is not solely an economic issue about the efficiency of business organizations to achieve profit maximization or a material question about the economic determination of social development. Rather, the issue of legitimacy is a deeper issue about the relation between economics and politics, which is the foundation of the democratic legitimacy of the economic actions of corporations in society.

When dealing with issues of legitimacy, it is necessary that corporations are aware of their fundamental beliefs and values. This challenge can, in many cases, be confronted on a rational basis with the use of existing theories of philosophy of management, but sometimes, there are also limits to this approach. Still, the

ideological foundations of a corporation's mission statement and fundamental aims are often based on classical ethical and religious visions that affect contemporary strategies and decisions. If we want to approach the issue of the legitimacy of corporations in society, we cannot ignore this religious and cultural dimension of business values [1]. It may even be necessary to draw upon the sociology of religion and theology in order to understand the aims, values, and ethics of business corporations, which also touch upon the meaning, personal ideals, and crises of consciousness of working life.

The Hermeneutics of Normative Foundations

Max Weber helps us to understand these deep normative foundations of capitalist economics and develop the foundations of philosophy of management in his classical investigations in *The Protestant Ethics and the Spirit of Capitalism*, where he looks at the philosophical and sociological foundations of the values and work ethics of modern capitalism [2]. Weber is aware of the necessity to regard the basis of present conceptions of the firm from the perspective of the history of religion. He analyzes the relationship between deep spiritual and religious values and economic organization in the emergence of capitalism in relation to different Protestant communities (e.g., Pietism, Calvinism, Puritanism, etc.). Weber is able to show how the legitimacy of basic notions in the modern market economy – profit, property, work, and organization – have religious and cultural presuppositions based on general aspects of Christianity and the Western cultural tradition.

Weber begins his analysis of Protestant ethics and the spirit of capitalism by distinguishing the particularity of capitalist organization and economic rationality ([2], p. 35). Accumulation of material wealth has existed independently of capitalism. What is unique to capitalist action is the rational organization of work and labor. This is the background of profit-oriented economic exchange on economic markets. Even though we find aspects of capitalist economies in many other historical civilizations, it is only in modern Western society that this mode of production has become fully developed. Contrary to some of his contemporary liberal economic thinkers, Weber was aware of the significance of the corporation in rational economic organization. He emphasizes the importance of economic routines, rational bureaucracies, and calculated administration for the formation of efficient enterprises ([2], p. 24). Weber says that disciplined labor forces and regular investment of capital characterize the modern rational firm. Economic efficiency in terms of increased profits and accumulation of wealth are the ultimate goal of this rational economic organization, but could even further be said to constitute the ultimate purpose of human life on earth.

In contrast to strict determinist and materialist conceptions of economic change, Weber gives a historical and hermeneutic explanation of the origins of the capitalist system. He puts emphasis on the fact that rational economic organization implies a specific moral attitude, or a social and religious legitimacy of the economic system. In this context, capitalism is based on a willingness

to postpone joy. The new Protestant ethics is to earn more and more money without “any eudemonistic or hedonistic admixture” ([2], p. 53). Weber argues that capitalism requires strong moral self-discipline because the entrepreneur is supposed to accumulate and reinvest money rather than use it for pleasure.

Such moral and religious values are found in many of the Protestant sects that emerged after the reformation in Europe. The Lutheran, Calvinist, and Puritan sects emphasized worldly asceticism through the concept of the “calling,” which was central to their religious beliefs ([2], p. 79). According to Weber, the concept of calling signified that it was the moral and religious task of the individual to be a good person and fulfill his or her duty in daily work. In the philosophy of management and corporations, the religious calling and motivation of work in the capitalist system constitute the central core of the function of the economic system. This was a rather new form of legitimization and stands in contrast to Catholic theology, where the calling of the individual had been less significant due to an emphasis on community and the continuous possibility of receiving forgiveness by God. And it implied a stronger sense of duty because only the individual was responsible to the divine for his or her actions in the world.

Weber emphasizes that Calvinism, among the many Protestant sects, contained the dynamism necessary for justifying the rational capitalist organization of the economy. The Calvinist doctrine of predestination posits that some human beings are chosen by God. During life, it may be possible to receive a sign of being selected ([2], p. 98). Weber argues that this had to put pressure on the calling of individuals, giving each of us a deep feeling of “inner loneliness,” implying insecurity regarding salvation. This was the legitimacy of the Protestant spirit of hard work and an ascetic lifestyle, where the self-interested accumulation of wealth was considered as a sign of being selected by God. Even though Weber puts emphasis on Calvinism and did not find that the other Puritan sects sufficiently emphasize the duty of the calling, Protestants share similar moral values that justify rational organization of labor and the accumulation of capital for profit and investment.

Weber’s analysis of Protestant ethics may be viewed as a multidisciplinary approach to economic organization [3]. His views on capitalism are supported by his other studies of history and the sociology of economics and of religion. Protestant ethics was part of a process of rationalization, which is unique to Western societies. In Hinduism, for example, the notion of the calling could not be justified in the same manner, because religious activity is turned inward to establish harmony with the cosmos rather than focusing on worldly activity. Protestantism was based on human instrumental and rational interaction with the world. But, even if the Protestant idea of the calling was a necessary condition for capitalism, many other cultural and economic factors were also important. Weber mentions the professionalization of the firm with modern bookkeeping, the development of the city, the existence of unified legal systems, and the establishment of nation-states with rational bureaucracies as other conditions of modern economic systems ([2], p. 18).

Weber seems to stress that we should, however, not underestimate the power of the concept of the calling to build modern civilization. We should not forget that

rationalization as well as secularization might be intrinsic dimensions of Protestantism because mysticism and immanent religion are replaced by the belief in the inward relation to a transcendent God and the calling of human engagement in the world. If this is the case, we can understand why Weber's views were combined with pessimistic skepticism toward Protestant modernity. Weber thought that the Puritan calling created a worldly asceticism around each human being in which the new work ethics made it impossible to enjoy life. The price of modernity was "specialists without spirit, sensualists without heart," ([2], p. 182) because efficient capitalist economies are not possible without self-discipline in the "iron cage" ([2], p. 181).

Weber's economic sociology is central to understanding the legitimacy of corporations in modern societies, and it therefore provides the conceptual core of the philosophy of management and organization that focuses on legitimacy. Central concepts of this philosophy of management, including the normative and cognitive elements of corporations, find their origins in the cultural values that organize the relations between individuals and organizations and the degrees of motivation, devotion, loyalty, and responsibility of individuals in relation to organizations and their environments. Although today we live in a much more secular society, we cannot deny cultural and historical influences on corporations and their values. Also, the multidisciplinary historical reconstruction of complex processes of development is important for considering the emergence of economic systems as a result of the intersection of many different events and causal chains. However, Weber's interpretations of Protestantism and Calvinism are also controversial, and it has been argued that some versions of Catholicism may be included in the concept of the calling.

Because Weber analyzes the values and work ethics of capitalist economics, this approach to the origins and meaning of capitalism as the central elements of the philosophy of management and corporations helps us understand the close relationship between economics and religion [4]. It is necessary to conceive business and corporate organization from the perspective of the history of religion as the basis for contemporary decisions and conceptions. Weber's description of the origins of capitalist work ethics in the different kinds of Protestant communities shows how the fundamental notions of business economics, like profit, property, work, and organization, have deeper religious and cultural foundations [5].²

The conceptions of legitimacy in the contemporary economic system are based on general cultural relations in the Christian cultural tradition. This is what we learn from Weber's historical perspective on values and work ethics. Looking back on history, we can analyze how the relation of work and culture has changed [6]. In the Greco-Roman world, work was not understood in the same sense as today. For the Greeks, work was not dignified and they emphasized the free and independent life of aristocrats in the public political space. Slaves and women in the private sphere of the home, understood as the real sphere of the economy, did the hard work. In the Hebrew Bible, work is also to some extent conceived as something negative because Adam and Eve are excluded from paradise and forced to work in the "sweat of their face" because they have sinned before God.

Despite this reluctance to work, we can find the basis for modern Protestant work ethics in Christianity [2]. Even though work in antiquity was conceived as a means to gain a result – in itself something meaningless – during the Middle Ages, work became more and more a good in itself. Although work is described negatively in the New Testament, the first Christians did not conceive sweat on their forehead as something negative. They were oriented toward earthly life, and in contrast with the rich Romans, the poor Christians found power in work.

The Danish theologian Jan Lindhardt, together with the economist Lars Uhrskov, has argued that work became integral to the life of Catholic monks in the monasteries in the Middle Ages of Christianity [7]. It is in this context that the origins of the philosophy of management of modern corporations can be located. Work began at that time to be legitimated as an expression of a pious life. The monks wanted to live a life devoted to their belief and in respect of God, so they isolated themselves in monasteries to be as pious as possible. The monks divided their everyday life in exact temporal intervals, and they used work as a way to give meaning to time ([7], p. 32). To keep one's self busy with work was an instrument to avoid sin. The monk had to work in order not to lose himself, and this implied that there was no limit on the duration and amount of work. Work became a kind of therapy to fill the empty time ([7], p. 35). The culture of the monasteries can be considered as an important historical precedent for the work culture of modern corporations.

However, it was only with the Reformation that the work ethics of modern times really began to appear. In the Middle Ages, many secular circles still did not view work as the meaning of life. The great Protestant reformer Martin Luther was certainly critical of the emerging bourgeoisie, and he did not like the idea that people should earn money from their work. Nevertheless, he considered work important for human identity because he argued that work was a calling and that one had a duty to work to help one's neighbor [8].

The Protestant work ethics was not initially based on the idea that one should qualify oneself to deserve eternal life in heaven. Contrary to the Catholics, Luther based his doctrine on the idea that it was faith alone and not one's actions that determined the destiny of each person. It is debatable whether Luther thought that human salvation was predestinated. His idea of the enslaved suggests that this is the case, even though the emphasis of the significance of belief seems to leave more room for the individual's own influence on his or her destiny through good and heroic actions. In any case, a devoted work ethic was common in Lutheran Protestantism because one could live as a pious human being by working and helping one's neighbor and society [9].

The Lutheran idea of the calling was not as dynamic as the Calvinist. Unlike Calvinists, who did not possess the same skepticism toward the emerging market economy, Lutherans conceived of "filthy lucre" as religiously problematic. Weber emphasizes how Calvinism, Puritanism, and pietistic Christianity writ large, apart from being strongly inspired by the strict laws of the Hebrew Bible, were based on the idea that true Christians had to work hard in order to earn salvation, and by becoming rich from the fruit of their work, they could get a sign from God showing

that they were among the selected chosen few destined to reach heaven ([7], p. 40). For those religious groups, it was not a question about spending the earned money, but rather to live as economically as possible and reinvest the money so that their wealth would increase and the sign of salvation would be even stronger.

In this sense, the strong Calvinist and Puritan morals, as described by Weber, are the original basis for the capitalist system. The conceptual foundations of the philosophy of management and corporations emerged from this perspective. Even though the religious argument is hidden behind the modern work ethics and values of capitalism, the close link between work, time, and money is maintained in the capitalist conception of the world. Capitalist work ethics is about working hard, increasing wealth, and living relatively thriftily so that money is not wasted. It is a characteristic aspect of Protestant ethics that work has a value in itself. In the context of secularization, the religious foundation for the strong capitalist work ethics is detached and forgotten. Capitalism, with its particular values, is isolated as an independent system of action and normative behavior, based on mutual expectations and trust of reciprocity and dutiful behavior between trading partners and business colleagues.

How can the capitalist economy continue to exist without explicitly acknowledging its religious foundation? To answer this question, it is important to refer to Weber's analysis of different forms of legitimacy in his major work *Wirtschaft und Gesellschaft* (1903–1917), which can be considered as an explanation of economic behavior. According to Weber, the aim of the study of forms of legitimacy is to determine the relation between economic organization and the implementation of values in society [10]. The explicit religious foundation of economic action can be defined as a traditional way of legitimating economic behavior because it is founded in inherited religious convictions that explain economic organization of society. The detachment of work life and work ethics from Protestant religion signifies, however, that this traditional legitimacy is put to the test.

At the same time, it is difficult to say that the modern economic system is legitimized through the charisma of the personal appearance and capacities of the manager or the personal abilities of the manager to motivate employees to participate in work. The ascetic work ethic is much more down to earth and rational compared to the traditional models of legitimacy. In this sense, Weber's sociology of religion and thinking about economic values is primarily a theory of the rationalization and modernization of economy and work life. Contrary to other religions, for example, Buddhism and Catholicism, Protestantism was not characterized as an escape from the world, but rather it was an appeal to human action in the material world. It is a significant aspect of the current economic system that it is not legitimized by society's cultural tradition or the belief of economic actors in certain inviolable values. The foundation of market economics and of the philosophy of management and corporations is first and foremost rational, and this is an important consequence of the Protestant work ethics. From this perspective of Puritan morals, capitalist economics is best explained as the rational interest of individual actors within the limits of ethics and morality of society and the rational interest of corporations to maximize utility with the aim of earning profits from their economic activities.

Weber shows the important relation between ethics and economics in the sense that he illustrated how rational economic values were dependent on Protestant religious values. What is dangerous is how these ethical foundations for business actions seem to have been forgotten in many modern concepts of economics. When this is the case, economic systems find themselves in a legitimacy crisis. Current reflections about business ethics are an effort to reformulate the values of the capitalistic system in a time when the foundations of economic actions have been hidden and detached from the self-understanding of economic actors. Business ethics is an effort to redefine corporations and business life as “mediating institutions,” places where values and ethics are generated as important foundations for the morality of society [11]. Inquiries into business ethics constitute therefore an effort to restore and reestablish legitimate values of business in situations of legitimacy crisis.

From Protestant Ethics to Classical Theories of Management

Historically, there have been different interpretations of the legitimacy of economics from the perspective of philosophy of management and corporations: traditional Protestant ethics closely links morality and economics; Catholicism corrects Protestantism by emphasizing community in economic progress and welfare economics and the crude existentialist and modernist conception of economic life [12]. In modern society, we can, however, also see that the values of the Judeo-Christian tradition are increasingly facing a general legitimacy crisis in society. In connection with secularization and globalization, society is marked by an increasing fragmentation of work life. This is one of the reasons for the emergence of the crude economic existentialism where the only sense of meaning in life is derived from the laws of the market economy. In technological society, many work functions have become automatic and machines have taken over the work of human beings. Durkheim was aware of this when he argued that a strong division of labor would imply dissolution of the sense of meaning and solidarity with fellow workers and other human beings [13]. The result of this dissemination and fragmentation is the increasing difficulty of making sense of the idea of the calling and the traditional Protestant virtues of devotion, duty, integrity, honesty, and accountability. Human beings have increasing difficulty fashioning their identities through work.

The existential radicalization of the Protestant work ethics sets the stage for different modern theories of management, from Taylor’s theory of scientific management [14]; Weber’s concept of rational bureaucracies; Fayol’s concept of business administration [15]; Barnard’s concept of administrative leadership, the “human relations” school, and human resource management; Selnick’s theory of institutional leadership; to the concepts of open versus closed management theory and concepts of leadership. Moreover, with the theories of cultural management, the learning organization, and cultural management in the 1990s, we can perceive different attempts to respond to the problem of legitimacy in organizations. Different theories of philosophy of management and corporations imply different

attempts to deal with this loss of meaning and try to maintain the calling and the virtues of the Protestant ethics in crisis situations.

Employee motivation is a fundamental problem in the discussion of legitimacy in the philosophy of management and corporations. Secularization and the detachment of economics from spiritual values have left an empty space without meaning. At the same time, Protestant ethics is not sufficient to keep modern firms together. The ongoing debate about business ethics, values, integrity, honesty, and accountability can be considered as an indication of the crisis of Protestant ethics. It is much more difficult for management and employees to consider work as a calling. The mergers of corporations in larger units due to increasing requirements of economic efficiency also imply that it has become more difficult to believe in the Protestant or Catholic version of the firm as a covenant or a community between management and employees. Moreover, due to the existentialist and secularist criticism of secular economics, corporations are not seen as possessing common values or feelings of community that can contribute to creating common identity.

Such feeling of loss of meaning and life without a calling implies several very different efforts to reinstall legitimacy and common values in the firm. Philosophy of management and corporations can be viewed as an effort to find values and meaning in production and economic life. Different theories of management are divided between positive and negative, optimistic and pessimistic views of human nature. If we go back to the classical scientific and bureaucratic concepts of management, we can say that these theories agree with the concepts of Protestant ethics, combining a rational and scientific worldview with the ethical ideals of discipline, integrity, accountability, and trust.

The classical theories of philosophy of management and of corporations formulated at the beginning of the twentieth century represent an effort to make management scientific and to rationalize processes of administration. In this sense, they continued the focus of Protestant ethics on rationality and efficient economic processes, but they also tended to forget the ethical origins of their search for efficiency and rationality. Consequently, Protestant spirituality was soon replaced by a behavioral focus on “economic man.” The engineer Frederick Taylor focused on the possibility of making work more efficient by using rational and functional principles of organization, where management was based on a functional division into particular tasks [10]. As indicated in his theory of bureaucracy, Max Weber described how goal orientation became dominant in rational organization [29]. Another example that will be discussed at length below is Henri Fayol, the originator of the administrative school in organization science. With many years of experience as a manager, Fayol astutely described the rational principles of business administration.

Taylor’s scientific management was an attempt to develop a detached material concept of human motivation at work [15]. This kind of philosophy of management and corporations was conceived as rationalizing production so that workers could produce more efficiently and management could reduce costs and save time. Scientific management recommendations included workforce specialization and better training, but Taylor further argued that a worker could be motivated to work more

effectively if he or she was paid more for higher production. Taylor's argument is based on an appeal to self-interest. A worker who will see rewards for working harder will raise productivity and not question the conditions of work [16]. This material view of production posits that legitimacy is conditioned by the workers' search for wealth. Even though Taylor was criticized for reducing human beings to machines based on a very functional and production-based conception of corporations, he was aware of the importance of management as a science that deals with creating sufficient material living standards, well-being, and increases productivity. Scientific management could be considered as a secularization of the Protestant work; instead of one's religious and moral calling obliging fairness and the desire to do one's best for community, work is seen from a more utilitarian perspective as a self-interested instrument to ensure material wealth.

Some of the same aspects of the rationalization of production can be found in Weber's theory of bureaucracy. Rationalized bureaucracies are important aspects of the kind of organizations that followed the emergence of modern capitalism. In contrast to earlier forms of organizations, these rationalized organizations are based on work discipline, hierarchy, lifetime employment in the same job, and career advancement within the organizations [10]. The legitimacy of authority is no longer charismatic or traditional, but based on rational decision-making from the point of view of formal and functional goal rationality of the bureaucratic system. This bureaucratic concept of organization resembles the application of military forms of organization to public and, to some extent, private organizations. From this point of view, corporate organizations were developed as imitations of military organizations following similar structures of hierarchies, commands, and strategies. Private capitalist organization may contain some part of the same principles of formal and rational organization insofar as they grow into formal bureaucracies. From the point of view of Protestant ethics, it is a characteristic of these kinds of organizations that they have a tendency to slowly emancipate themselves from traditional Protestant values of calling, duty, and devotion to work, while at the same time being somewhat dependent on an unconditional work discipline from their employees.

As a representative of the rational paradigm of organizational studies and philosophy of management, Fayol's major concepts are administration and planning. In his book, *General and Industrial Management* (1949), he defined such concepts as the division of labor, the responsibility of authority, discipline, rational planning of goal orientation, concern for the general interest of the organization, concern for appropriate employee salaries, centralization, hierarchy, order, fairness, stability in the workforce, initiative, and concern for the community (*esprit de corps*). Together with scientific management and rational bureaucracy, this approach to rational administration can be said to represent a concept of management that is supported by the values of the Protestant ethics of responsibility, integrity, and accountability. Moreover, in all cases, management processes are built on concepts of work as a calling and based on dutiful devotion. In this sense, scientific management and rational administration presuppose some of the values of the Protestant ethics while at the same time transcending these concepts by being based on a purely rational paradigm of management and managerial reason.

In contrast to the focus on rationality, the human relations school in the 1920s and 1930s raised awareness of the importance of the worker's quality of life for productivity and motivation. Thinkers in this school did not abandon rational motives, but stressed the combination of rational and normative motives for worker motivation [17, 18]. Accordingly, this approach discovered the importance of normative ethical issues for understanding work life. The human relations school focused on group work, workers' collectivity, and organizational culture as important for increasing productivity. This school of management tried to combine the view of the self as utilitarian and self-maximizing with a broader perspective of motivational psychology regarding management as a method to increase productivity [16]. The famous Hawthorne experiments from 1920 to 1927 may be interpreted in this sense. In these experiments, researchers investigated the performance of workers at the Hawthorne Works of the Western Electric Company. In the beginning, the researchers wanted to investigate the impact of lighting in the workplace; so they changed the light in the room of an experimental group and let the light be constant in the room of a control group [17–19].

To their astonishment, the researchers observed that productivity increased in both groups. After other experiments with a group of female workers, the researchers concluded that changing a worker's interest in their working conditions had an impact on improved productivity. This became known as the Hawthorne effect [16]. Such interpretation was proposed by the social psychologist George Mayo, who analyzed the reaction of the women using Freudian concepts of transference and excitement to understand the reaction of the workers. He concluded that the reason for the growth in productivity could be found in the emotions and feelings of the women who felt that they were part of a team and had a higher mission to accomplish. In this way, the Hawthorne studies represent a combination between values and economics because they show that social values and employee feelings have a great impact on productivity.³

The lesson of the Hawthorne experiments for human relations management and for the philosophy of management and corporations is that productivity increases when people are treated as human beings with autonomy and dignity.⁴ We can argue that the research showed the importance for management of engaging emotion. Following Joanne B. Ciulla, this possibility of community feeling in the corporation, which so inspired Mayo, led Peter Drucker to propose the corporation as a central force in building social relations ([16], p. 100). Later, the social psychologist Kurt Lewin investigated the possibilities of workplace democracy as a kind of response to the search for employee engagement and employee motivation, which was an essential element in the program of the human relations school. Lewin argued that democratic management may be as powerful and efficient as autocratic management. It depends on the ability of the manager to understand and exercise the dynamics of democratic leadership, which, if successful, may lead to greater employee motivation and engagement than autocratic leadership [20].

In his classic work, *The Concept of the Corporation* (1946), Drucker proposed the corporation with motivated and engaged workers as a central force for a socially responsible community ([16], p. 105). Drucker appears to join with those who argue

for the necessity of integrating economic activity in a common social community. He was undoubtedly inspired by the common efforts of American corporations during the war. Nevertheless, his pivotal contribution was not the need to overcome boring work but rather recognizing social interaction as the major force in inspiring worker productivity [21]. People become good citizens when they feel that they really contribute to the welfare of society. According to Drucker, there is a strong correlation between the corporation as a “good industrial citizen” and motivated employees in the firm as “good citizens of society” ([16], p. 107). This is an important affirmation of the importance of corporate citizenship [22].

Chester Barnard, who can be read as a representative of the administrative school of management, was also partly inspired of the human relation school in the sense that he was aware of the importance of formulating a broader theory of organization than the one proposed by the rational and administrative schools. In *Functions of the Executive* (1938), he combines structural and dynamic concepts of organization while reaffirming the importance of collaboration, communication, and work for a common aim or project of organizational development. Barnard combines the search for internal equilibrium with the harmonization of the organizational environment. Organizational systems are systems of collaboration that aim to survive by following a common aim and a common function. Concepts of values and convictions become important elements for developing such organizations, for example, Barnard was well aware of the importance of responsibility and ethics for good corporate leadership and management. Barnard was aware of the importance of personal ideals and values for the motivation and activities of the manager [23]. Real leadership is marked by a sense of personal responsibility of the manager who is able to appear with integrity and inspire respect in the organization for his or her decisions.

Institutional organizational theory, developed by Herbert Simon in collaboration with James March (with later administrative theories of management refined by March and Simon), can be considered in the lineage from Weber to Chester Barnard [24]. As we have already discussed, this approach is characterized as a critical reply to the neoclassical concept of economic rationality. “Economic man” could be said to be replaced by “administrative man,” who is not a perfect utility and preference maximizer, but operates in the context of the possibilities and limits of leadership in informal and formal organizations [24]. Administrative decision-making in organizations is determined by logic of satisfaction of requirements rather than optimal maximization. The manager operates according to the principle of the logic of consequence and according to the appropriate measures of rationality. Simon emphasizes that decisions have both factual and ethical content, but that it is impossible for individuals to act rationally in any ideal sense. Rationality is limited and decision-making can never rationally evaluate all possible outcomes [24]. With this concept of organizational decision-making, we move beyond the closed economic conception of decision-making toward an open concept of decision-making, which may also include values.

In their behavioral theory of the firm, Richard Cyert and James March continue this opening of organizations toward a broader conceptualization of values by

arguing that organizations do not follow any particular goal. *A Behavioral Theory of the Firm* (1963) indicates how goals and aims of organizations are changing and open for reinterpretation [25]. Organizations are considered as political systems constituted by many different interests and individual preferences. Organizational behavior is shaped by the interactions of individuals with each other and with the environment, where goals are shaped in negotiation, formation of coalitions, and confrontations between different roles, values, and other conceptions. This concept of the organization represents a challenge to Protestant ethics because there is no a priori evidence that there is a common goal belonging to all the participants of the organization. We are confronted with a situation where organizational values and ethics are shaped in negotiations and coalitions and in interaction with the values of the institutions of the environment and surroundings of the organization.

The early institutional sociology of organizations, represented by Philip Selznick, focused on the national history of organizations as natural systems in institutional environments. In this context, the analysis of organizations extends to encompass the relation with the environment. Organizational history in interaction with environments contributes to the formation of the values and norms of organizations. This is also the basis for the search of legitimacy of organizations and their formulation of values as the basis for adaptation to the environment. Selznick centralizes the integration of values-driven management in corporate leadership because it is necessary to operate with values in order to conform to the norms of the environment as the basis for adaptation. Moreover, Selznick is aware of the importance of addressing organizational development at the institutional level in the sense that organizations function as institutional systems with their own features of development [26]. With his later interest in organizations as communities, Selznick confirms the implicit criticism of the strict concept of rationality because he argues for the importance of common values, character, and integrity in organizations. This is the case, for example, when Selznick defends the importance of institutional integrity [27, 28]. He belongs to those who argue that the firm should be considered as a community that should be integrated in the larger framework of society.

Institutional theory represents a theoretical approach to the philosophy of management and corporations that analyzes the institutional aspect of social action and the exchange between actors and institutions. With the use of this institutional approach, we aim to apply the concept of critical hermeneutics as the foundation of an interdisciplinary combination of institutional theory and business ethics. We can understand institutional theory as an important theoretical approach for conceiving the role of business corporations in society. Different theoretical approaches are distinguishable within institutional theory that can all be applied to understanding organizations and the interchange between values, ethics, and social responsibility within institutions and organizations. Institutional theory provides the necessary social theory that is necessary in order to analyze the foundations for business ethics in modern corporations. In order to make use of this analysis, we have to present the different conception of values and ethics within different approaches to institutional theory.

The historical and economic institutionalism, sometimes called old institutionalism, goes back to the nineteenth century and was developed by German economists who were inspired by German philosophy [29]. This theory relates to Thorstein Veblen, who analyzed the role of culture in relation to economic development. The theory of historical economic institutionalism emphasizes the historical and cultural factors that determine economic norms. Those factors are also dependent on ethics and values, so it is easy to combine historical economic institutionalism with business ethics theory because of the mutual focus on ethics and on the importance of social relations for economic development.

James March and the political scientist Johan Olsen are typical representatives of political science institutionalism that can also be applied to the philosophy of management and corporations [29]. Institutional political science may be conceived as an extension of the previous historical school of management and economics that was important in the nineteenth century and focused on the cultural and historical dependence of economics and managerial forms. Political science institutionalism is a continuation of the historical school because it emphasizes the importance of institutions for social action [30]. Institutional political science contains theoretical positions that represent a criticism of the historical school because they emphasize that action in institutions is based on individual rationality and the attempt to maximize one's own interests, though another approach within institutional political science criticizes the maximization of utility on a hermeneutic basis and understands institutions as horizons of meaning that should be used to understand the limitations of actions in political institutions. Business ethics may use this approach to conceive the importance of ethical background mentality of sound social norms and ethical horizons of meaning in organizations for understanding ethical choice.

New institutional economics is also an important approach to the philosophy of management and corporations. By analyzing the importance of institutions for economic action, new institutional economics uses the insights from institutional political science to understand economic action. In this context, we can refer to economists like Oliver Williamson and Douglass North [31]. New institutional economics disagrees with the historical school in economic science about the kind of rationality that determines economic development in organizations and in society. New institutional economics is founded on an economic concept of rationality based on utility maximization, and its proponents have a tendency to conceive institutions as a framework for limiting economic action that makes rationally ideal economic action impossible. Ethics is, from this perspective, a kind of transaction cost that limits rational economic action.

Further, we can mention institutional sociology as a method of analysis. This approach begins with the investigation of how the cognition and values of different actors are formed by institutions. Sociologists like Paul DiMaggio and Walter Powell are representatives of this tradition [32]. Institutional sociology represents different approach from institutional economics because it recognizes the importance of institutions for the formation of interpretations and understanding values without being directly based on the economic notion of rationality. Social reality is

rather conceived as a construction based on the implicit expectations and demands of actors. This approach can very well be combined with an emphasis on the importance of history and culture for the development of understanding organizational legitimacy and relationship to the environment. The actions of companies are determined by symbols and contexts of meaning that also frame the point of view of particular actors.

Institutional theory in law and political philosophy should also be mentioned. In fact, this concept of institutions is behind my approach to the good citizen corporation in the sense that we can understand it as the foundation of the other approaches to institutional theory. When political philosophy refers to political institutions in the tradition from Cicero to Hegel, the concept of institution refers to just legal constructions of political order in society. It is somewhat the same concept of the institution that we use when we refer to the idea of the good life with and for the other in just institutions. This is a normative and political concept that sees a close connection between the concept of institutions and ideas of ethics and justice. This is also the approach to institutions that we find in the theories of contemporary philosophers like Habermas and Ricœur. Moreover, this is not exclusively a descriptive and anthropological concept of institution as hidden conditions of action, but rather a constructivist concept of institutions based on conscious and collective human intentional action.

Having briefly sketched some of the leading concepts of institutional theory, it becomes clear that the philosophy of management and corporations is situated between the closed iron cage of the rational concepts of economic efficiency in the early scientific, bureaucratic, and administrative concepts of management on the one hand and conceptualizations of organizations as open systems of interaction with the environment on the other. In modern institutional theory, concepts of organizational complexity and the open perspective on organizations are important supplements to the bureaucratic and administrative concepts of organizations as closed systems [33]. The restricted economic view of organizations is combined with the sociological point of view of organizations as open systems. The institutional concept of organizational theory posits that the legitimacy of organizations is not restricted to its ideal international rationality of efficiency.

In fact, the tension between the open and closed conception of organizations was already present in the confrontation between the human relation school and the administrative and bureaucratic concepts of organizations. It is doubtful whether the great ambitions of the human relations school and dynamic management thinkers had really spread to all companies. Rather, during the 1950s and 1960s, organizations had become more rationalized and bureaucratic and workers felt even lonelier with increasing alienation, fragmentation, and loss of spiritual meaning in their work. The result was stagnation and inflexibility in bureaucratic institutions. With Joanne Ciulla, we can interpret the search for excellence movement in the 1980s as a reaction to this alienation, followed by the emancipation movements of the 1960s and the 1970s. The new management philosophy took up the search for excellence as the start of the movement of values-driven management. This approach adopted elements from Drucker's view of the corporation as an important

innovator for civil society [34]. Moreover, Drucker's concept of "management by objectives" and formulation of goals was viewed as essential for organizational development [35]. In fact, management by objectives is very close to an integration of ethics and values in business because objectives are formulated through mission and vision statements. In this sense, it represents an open system of management integrating broader concepts of values from stakeholders and the organizational environment. Moreover, in Drucker's theory of management, we can also perceive a focus on the importance of change as a driver of management [36].

The management movement of the search for excellence, led by Tom Peters, can be conceived as a new enactment of the importance of values, culture, and motivation for management [37]. These values contribute to the definition of the firm as a community in order to revitalize the motivation and engagement of the workers in the firm, a corporation in search of a soul. The result of this management movement was the emergence of the all-inclusive organization, which integrates everyone in the firm in a team spirit while leaving fundamental power relations between management and employees intact ([16], p. 133). Events like team building, personality development, empowerment, and so forth contributed to the development of the kind of management that relied heavily on all kinds of consultants. Fostering teamwork and uniting workers and management in a common unity became the ideal. The search for excellence can therefore be said to represent a strong expression of a move from bureaucratic organizational concepts toward values-driven organizations.

Johanne Ciulla interprets the instruments of total quality management (TQM) as a culmination of this unification of economics and personal development in the workplace. TQM originated in the 1950s but really came in management fashion in the 1980s and 1990s [38]. TQM centers on quality in all parts of the organization, and it aims at long-term customer satisfaction and seeks to benefit other stakeholders and society. It implies quality considerations in relation to shareholders, customers, and quality of life in general. TQM programs can be considered as the way to motivate workers for total excellence in a customer-oriented system of high productivity. TQM is about increasing satisfaction at lower costs ([16], p. 143), as an integrated strategy integrates ethical values of corporate social responsibility and good corporate citizenship. As in the search for excellence, TQM is about motivating the worker to understand the value of the work and to make him or her strongly committed to the values of the corporation; however, it may be argued that the use of values still depends on the power structures of the firm, implying that ethical relationships between management and employees last as long as employees are motivated contributors to the value creation process of the corporation ([16], p. 146). Furthermore, all the talk of ethics can easily change into a distrustful atmosphere of management by fear if, for example, the firm has to downsize and employees are fired without any other reason than economic problems ([16], p. 162).

A parallel and somewhat different criticism is also to be found in the project of Henry Mintzberg. His management theory can also be considered as a criticism of the bureaucratic, rational, and administrative paradigms of management. In the

1980s, Mintzberg analyzed the possibilities of democratizing business organizations as an alternative to top-down management [39]. In his book, *Rise and Fall of Strategic Planning*, Mintzberg also strongly criticized the application of the concept of planning with management and leadership [40]. The problem is that rationality is never ideal and planning is therefore always without certainty. Reality fits better with an open than with a closed concept of management. In fact, Mintzberg remains very critical to the closed practice of management with a limited concept of rationality. In *Managers Not MBAs: A Hard Look on the Soft Practice of Management and Management Development*, Mintzberg argues for the importance of having a broader view on management education. Strategy and leadership cannot be reduced to “operations management” based on “planning, budgeting, and programming,” that is, based on a concept of the technical production system of the corporation as a closed system without any understanding of management in practice. Instead, management must include broader concepts of ethics and responsibility in order to deal with stakeholders and give more value to shareholders [41]. Management should focus on real problems and deal with the education of leaders as responsible people who take care and listen carefully to employees and stakeholders. Management is not only by economic objectives, but administration must include the social consequences of economic relations in decision-making. Technical know-how should be accomplished by human capacities of management with responsibility and care.

From Institutional Theory to Communicative Action and Stakeholder Management

Accordingly, we can read the developments of management theory and philosophy of management through most of the twentieth century as a movement from closed rational systems, supported by strong external values of the capitalist Protestant work ethic, to a concept of organizations as opens systems that communicate with the environment and integrate values in decision-making. Management science has moved from a very strict definition of management and organization to a broader and more open concept of the relation between organization and legitimate values. From the point of view of religious legitimacy, the process of legitimation has become more open and indicates the efforts of organizations to cope with the requirements and expectations of society. Concepts such as integrity, responsibility, and the ethics of organization are becoming more important as elements constituting the relation of organizational systems to the environment. In particular, integrity is important for good corporate citizenship [42]. This can be read as a movement from the libertarian concept of pursuit of self-interest toward a community- and welfare-oriented economy of the common good.

Today, the main problem of legitimacy is to determine how the values of the firm relate to society, in particular, in terms of dilemmas and conflicts. What philosophy of management and corporations has learned from Max Weber is the need to acquire legitimacy in society. But today, it is another kind of legitimacy that has

replaced the norms that Weber suggested. At all levels of the firm, the perspective of democratic communicative rationality implies critical evaluations of processes and products. Moreover, these values are related to internal and external stakeholders of the firm. From the perspective of communicative and deliberative reason, the firm is an institution that cannot be isolated from a democratic public sphere. As a good citizen corporation, the firm should accept this role and go into dialogue with the public in order to show its democratic concerns for the common good. Codes of ethics and values of different industries and professions are good manifestations of this concern [43].

As Habermas has convincingly argued, Weber's concept of rationality – between convictional, duty-oriented rationality on the one hand and instrumental goal-oriented rationality on the other – is too simple. Looking deeper into the concept of rationality, we may redefine Weber's distinction in terms of *communicative* rationality versus *instrumental* rationality. In the chapter "Was Heisst Universalpragmatik," Habermas replaces the traditional subject-object distinction with a theory of intersubjective meaning [44]. Rationality is based on communicative reason and criteria for validity [44]. This is the basis for Habermas's theory of communicative action: in domination-free dialogue, participants come to agreement about the social and natural world on the basis of mutual recognition and understanding. From this perspective, rationality is based on communicative interaction rather than individual convictions.

This concept of communicative action may be mobilized to contradict Weber's idea of secularization as merely instrumental rationalization. Habermas argues that history implies a development of communicative competency in society [45]. Because of social differentiation and the development of individuality, modernity not only leads to better technology and economic rationality but also an increase in communicative rationality. Accordingly, we have a different theory of rationalization, which allows us to escape Weber's iron cage. Modern society is characterized by different spheres of validity. We may distinguish between system rationality and the communicative rationality of the lifeworld. Due to rationalization of traditional and charismatic ways of legitimacy, modernity implies not only instrumental reason but also a possibility of a postconventional and argumentative foundation of morality. This means that rationalization is a condition for developing critical and reflective reason. Habermas argues that the project of modernity is unaccomplished because postconventional morality implies the need for a noninstrumental legitimacy of social life [45]. Moreover, communicative rationality is prior to instrumental rationality because it is a condition for social interaction. In a postconventional culture, communicative rationality represents a critical evaluation of instrumental reason and strategic interactions. Applying this view of rationality to economic interactions, we may say that Habermas's theory of communicative action provides us with a new foundation for economic rationality. Systemic interactions on markets require a broader social basis. They receive legitimacy as a social institution based on culture and the human lifeworld.

To define philosophy of management as communicative stakeholder dialogue in search for legitimacy is another important dimension of corporate legitimacy as

a good citizen corporation. Deliberative stakeholder dialogue of the firm as participant in a critical public sphere is a basis condition of communicative legitimacy. Stakeholder dialogue is more than strategic calculation of power and profit maximization. It is the basis for relation between the firm and society. In this regard, the work of Edward Freeman and his colleagues is an important development in management philosophy [46]. We need a broad concept of stakeholder dialogue including concerns for the autonomy, dignity, integrity, and vulnerability of stakeholders from the perspective of responsibility, solidarity, and trust [47].

Accordingly, stakeholder relations are defensible as a “normative critical concept.” Stakeholders are critically evaluated according to communicative reason and the norms of civil society [45]. Stakeholder legitimacy is an important outcome of philosophy of management. R.E. Freeman, a pragmatic stakeholder theorist, joins the idea of a communicative foundation of stakeholder theory with his normative-pragmatic approach to stakeholder management where multiple foundations matter for development of the approach [48]. Stakeholders engage in dialogue with normative and narrative visions about the common good and the future of the firm as embedded in society and social relations. Stakeholders care about legitimacy of their corporation, but they also focus on the economic outcome of the activity of the corporation. In this sense, according to Freeman, stakeholder theory is first of all a theory about business where management goes beyond shareholder focus toward stakeholders in order to improve value creation of the business in society by concern for stakeholders.

In this sense, stakeholders are people with “names and faces” who strive to fulfill their dreams [49]. The communicatively justified concerns of stakeholders are recognized as legitimate, even if they have views opposing the values of the firm. The firm evaluates critically different suggestions for strategy and decisions according to the principles of democracy and communicative dialogue and takes into account all involved parties for stakeholder relevant decisions that can be justified as acceptable from the point of view of justice and fairness to stakeholders. It implies recognition of the place of the firm as a participant in a process of public deliberation toward the common good of society. The deliberative stakeholder concept does not reduce stakeholders to objects for instrumentally improving profits; rather, stakeholders are viewed as having legitimate rights. This republican approach may include institutionalization of stakeholder claims as a part of values-driven management and of the formal structures of the firm. Indeed, this kind of business ethics contributes to developing the function of business as a mediating institution in society, where we perceive a tense integration of economics and politics. In this way, values-driven management is not a new strategy of instrumental reason, but represents an institutionalization of corporate responsibility and integrity based on the idea of the good citizen corporation.

An example of an approach to the philosophy of management and corporations from this vantage is Peter Ulrich’s idea of an integrative economic ethics as a way to overcome the challenge of the Weberian concept of modernity. Ulrich argues that we cannot work with purely instrumental reason and we need normative conditions for legitimacy. Business ethics is based on critical reflections on corporate values in

relation to the place of the firm in a democratic society. This is indeed the case of the good citizen corporation. It not only relates to a personal calling or instrumental rationality, but considers corporate activities as a contribution to the common good.

The philosophy of management and organizations deals with the epistemology and metaphysics of management and corporations. Epistemology deals with the basis of true knowledge about and legitimacy of management and corporations, and metaphysics deals with the transcendental conditions for the legitimacy of management and corporations. As proposed by Weber, such analysis integrates the epistemological and metaphysical analysis with the ethics and norms situating business ethics within the research of economics and social sciences.

The object of analysis of the combination of philosophy of management and business ethics is first of all the concept of the firm and how ethical reflections can be applied to corporations. Ethics is about values, and values-driven management is about the ethical norms that should govern corporate decision-making. The object of study is business organizations and firms. It includes both their internal relations and ethics in organizational behavior and the interaction of the organization with different environments, people, and other organizations. Business ethics and philosophy of management and corporations does, however, not stop with the study of international external organizational behavior. It also concerns the level of individual choices and actions in organizations and can be extended from microlevel (e.g., studies of firms and individuals) to macrolevel analysis (e.g., of the role of the corporation in the political economy of a given society or state). Moreover, it includes the study of ethics and the philosophy of business systems and markets structures, which cannot be understood exclusively at the level of the study of individual corporations. Similarly, global efforts to regulate the behavior of international corporations are a macrolevel enterprise.

It is important to stress that the philosophy of management and corporations can be based on a broad array of foundations. Philosophy of management, together with business ethics, can be conceived as a critical reflection versus prevailing technical and economic “conceptual schemes” [50]. It focuses on the impure nature of economic rationality and considers the support of human needs and self-actualization as the basic significance and importance of economics. The philosophy of management looks for a holistic conception of the relationship between human beings and society and considers this as the basis for investigation in economics and ethics. It does not exclude the neoclassical vision of economics based on efficiency and utility, but it includes this perspective in a broad and interdisciplinary social scientific perspective. This view implies an institutional and historical perspective on ethical issues, norms, and values. In this sense, the philosophy of management and corporations includes reflections on the concept of the firm in organizational theory in close relation with the debate about the foundations of economic institutions. From a broader perspective, we can talk about an integrative philosophy of management, drawing together business ethics, economics, and other social sciences in the study of business ethics in practice in organizations. It is in this context that the problem of legitimacy may be defined as the core of the reflections about the philosophy of management and corporations.

Conclusion

So we have now proposed the idea of the good citizen corporation as a way to legitimize the economic behavior of corporations in modern society. How should we conceive this discussion from the perspective of institutional theory? In this context, institutional economics remains on the descriptive level, where a firm should be understood as a more or less formal nexus of contracts among its members. These contracts are based on cultural and historical norms in order to avoid opportunism and to keep society and the market from falling apart; however, institutional economics does not give a definite answer to the question of what values will be most appropriate in this context. Moreover, given the crisis of traditional models of legitimacy, for example, the Protestant and Catholic conceptions, as well the inability of their modern economic followers and many other conceptions of legitimacy, we are confronted with the problem of how to justify the new values for corporations on today's economic markets.

It is in this context that we have argued for the idea of the good citizen corporation, which is based on the ideals of integrity and corporate social responsibility. Although we believe it is the right one, this model could also be criticized as being nothing but a new kind of corporate religion. The argument is that the republican conception of business ethics is not able to overcome the arguments against the progressive secular view (e.g., Samuelson) or the libertarian Puritan view (e.g., the Chicago school), because it represents a version of a religious and spiritualist conception of good values-driven management [51]. In order to address these criticisms, we need to distinguish the reflective-rational conception of corporate citizenship from traditional views of legitimacy.

Notes

1. We may distinguish between different paradigms of legitimacy of the corporation in modernity: (1) Weber's paradigm of Protestant ethics; (2) the Keynes/Samuelson paradigm of the mixed economy; (3) the Friedman/Knight paradigm of libertarian and existentialist capitalism; (4) the paradigm of the closed economic organization; (5) the paradigm of open organization theory based on the legitimacy of the corporation in its environment; (6) the paradigm of spiritual foundations for corporation values; (7) the critical paradigm of corporations as alienators of humanity, where religion is reduced to a strategic instrument of profit

maximization; (8) the paradigm of republican business ethics based on stakeholder management and the idea of the good life with and for the other in just institutions. These different paradigms represent ways to approach the issue of good corporate citizenship. From this, we will argue that the framework of republican business ethics is the most appropriate: (9) the paradigm of the criticism and deconstruction of the metaphysics of the firm in Western philosophy.

2. Deidre N. McCloskey helps to understand the role of the virtues in capitalism in her work on the origins and history of capitalism. Although she goes further back toward Aristotelian and Catholic virtues, there is a similarity with Weber's argument in the emphasis that ethics and virtues are essential for good and well-functioning markets.
3. Although the Hawthorne experiments represented a breakthrough for the theory of humanistic management, they can be criticized from the viewpoint of the ethics of science. The experiment was the background for the so-called Hawthorne effect, which denotes the phenomenon of behavior changes among people when they are subject to research observation. The experiments showed that it is difficult to measure performance objectively. We can mention a number of methodological issues regarding the reliability of the results of the experiments. Maybe the only thing we can learn from the Hawthorne experiments, aside from the Hawthorne effect, is that there was no other lesson to be learned from the experiment. The workers did not have the opportunity to know what the real aim of the experiments was. Facts were concealed from them. Moreover, it can be argued that it is unethical to use people as objects for productivity in experiments. In addition, we can mention a number of methodological issues regarding the reliability of the results of the experiments. It may, for example, be argued that the workers in the experiments faked their productivity because they were watched by the researchers and had a strategic approach to their participation in the experiments. Moreover, there are many similarities between the Hawthorne experiments and the Milgram experiments on disobedience where participants of the research also did not have total access to the results and premises of the experiments. In the Milgram experiments, much of the reason for the strong obedience to obsolete experiments was the respect for the authority of the researcher. A similar research effect may be the case of the Hawthorne experiments.
4. The Hawthorne experiments were important for developing another attitude to the relation between employees and management. It can be said to have spurred one of the first movements toward a conception of corporate citizenship involving concern for improving the life of employees. The different problems with the research and the unforeseen results made researchers realize, however, that it is very difficult to determine how to make work relations better. Despite these difficulties, efforts to democratize corporate culture and to make employees more responsible for production and work organization found good support in the experiments.

Jacob Dahl Rendtorff

Abstract

In this chapter, we examine legitimacy in relation to recent debates on the philosophy of management and corporations that have emerged to deal with the decline of Protestant ethics. On this basis, we discuss the concepts of corporate citizenship and the good citizen corporations as recent efforts to respond to the problem of corporate legitimacy. Finally, we discuss the recent use of the philosophy of Martin Heidegger to propose a critical reading of the search for legitimacy in the Western philosophy of management.

Introduction

In this section, we will review some recent models presented in debates in the philosophy of management to solve the problem of corporate legitimacy [1].¹ With the decline of Protestant ethics, the empty space for a values discussion has created an opening for new conceptualizations of the role of spiritual values in the corporation. In fact, the new management methods of the 1980s, the 1990s, and the 2000s that focus on individual self-realization have also created a move toward a new spiritualization of the corporation. Searching for more freedom and self-realization in the workplace has led to a search for new meaning in work life. Many management consultants and management thinkers have been inspired by the New Age movements to establish this spiritualization as an alternative to the Catholic and Protestant approaches to the ethics of the firm. This spiritualization represents a tradition of management that is heavily inspired by Eastern religions and, as such, represents a severe criticism of the rational worldview of Protestant

ethics as analyzed by Max Weber. This newer emphasis on individual self-realization and spiritualization implies a search for a new meaning of life in the corporation, where the individual can be integrated in the firm at the basis of personal self-realization. In this sense, there has been a perceptible convergence between mystical movements of spiritualization of relations in the firm, inspired by Eastern mysticism, and religions more sympathetic to the neoliberal paradigm of self-management and self-government [2].² At the same time, we can perceive increase focus on concepts of corporate citizenship and corporate social responsibility that are based on the concept of the political firm or a recognition of the political role of corporations in society where modern democracies no longer view the market as neutral but as something that is embedded in interactions between civil society and the state [3].³ Therefore, a shared responsibility between state, civil society, and corporations is required, and the political firm can be seen as response to this tendency. Finally, there has also been strong criticism of the metaphysics of philosophy of management, based on a general criticism of the metaphysics of the West [4].⁴

Emergence of Corporate Religion and the Search for Spirituality

We can describe this phenomenon as an application of New Age spirituality in management theory. Spirituality inspired by Eastern thought and religion has been proposed as a way to achieve good and thoughtful leadership in opposition to technical management. Spirituality and leadership education is viewed as a humanistic response to a technical and rationalistic approach to management [5]. The approach is based on the holism of Gestalt therapy and New Age spirituality, which, after originating as a critical alternative social movement after 1968, has been transformed into instrumental management tools that serve to make companies more efficient. Some kinds of values-driven management are inspired by this search for a new spirituality that has become powerful as a consultancy tool. This approach to management constitutes a new spiritual approach to management where management is inspired by transcendental psychology, depth psychology, and mystical theology. The aim of such a mystical paradigm of corporate religion is to use spiritual and religious values to promote the company.

We can observe that many new forms of management consultancy and coaching use spiritual rhetoric as an instrument of management. Management discourse uses spiritual vocabulary to fill in the empty space of values now that Protestant ethics is no longer acceptable. The spiritual vision of management can be considered as a new ethics for the company that uses religious language and mythical, as well as symbolic figures, to create a meaning for the company. Sometimes, this is also combined with elements from traditional Christianity, such as when the concept of leadership in the Bible, or the consequences for management of the biblical stories, is investigated [6, 7]. Many companies use explicit religious metaphors when they describe their basic values. Values statements can, for example, be referred to as the “ten commandments of the company” [8].

In this sense, the new spiritual management can be considered as a management tool like total quality management or business process reengineering, which have as their aim to give the organization new meaning in response to problems of social legitimacy and employee motivation.

Although few organizations are totally spiritual in the orthodox religious sense, we find many management change projects that integrate new spirituality. This new focus on spirituality can arguably render corporations and their managers more conscious of values. Corporate vision and mission statements are easier to create through the language of collective spiritual values in New Age mythology. In fact, we may argue that this corporate spiritualization is not a return to Weber's traditional mode of legitimation but is rather an integrated part of a modern project of aesthetization and spiritualization of the discourse of management, including a strong focus on personal subjectivity and development of the inner spirituality of the subject. Management is spiritualized in order to be open to the need to make room for personal development and individual self-realization in corporations, in the sense that human beings are not reduced to work machines but taken seriously as spiritually complex beings. From the New Age perspective of Eastern mythology, business ethics and corporate social responsibility should come from within the soul, and each individual should demonstrate the capacity to take responsibility for himself or herself, for their community and for their society.

Karen Lisa Salamon argues that this can easily be integrated into a neoliberal conception of the economy because the starting point is the feelings and emotions of individuals and their spiritual understandings of themselves and their responsibility. Moreover, it is a dogma of the New Age movement in management that personal success is based on the holistic integration of spiritual, private, and professional life. This is why management has become "whole-life management" [9]. Spiritual management is based on a kind of law of karma, where the journey into the self contributes to the enrichment of organizational life. Whole-life management helps to integrate the individual in the cosmos by ensuring a closer relationship between self and the outside world. Whole-life management attempts to integrate personal desire with a sense of community so that the journey into the self will, in the end, be better for the common good ([10], p. 66). In this sense, whole-life management represents an attempt to achieve harmony and balance of self.

Danish marketing writer, Jesper Kunde, provides an example of this kind of whole-life management in his book *Corporate Religion* (1997). Kunde's New Age approach exemplifies an attitude of dissatisfaction with the secularization of business and with the demotivation of workers in bureaucratized environments ([9], p. 122). This work can be conceived as an effort to reckon with the dissolution of Protestant ethics in modern business. Kunde argues that clearly focused strategies based on strong values are essential for corporate survival in a society of value fragmentation. Both employees and customers have to be bonded emotionally to the corporation if the corporation is going to have a chance for survival and growth in a competitive world economy ([10], p. 66).⁵

Kunde argues for a return to a religiously based corporation and a strategy of corporate religion that not only bases its values on rational and economic bottom-line considerations but also grounds strategy and management holistically in the qualitative and emotional values of the corporation. According to this conception, religion is conceived as common vision, ideals, and ideology and is necessary for creating a well-functioning modern corporation. In a number of case studies of corporations such as Microsoft, Coca-Cola, Walt Disney, and Body Shop, Kunde shows how these corporations can be said to operate according to a concept of corporate religion or brand religion, where the corporation is organized around strong common values and the consumer is strongly emotionally related to the its products.

This religious management strategy can be considered as a response to the lack of spirituality in modern technical and rational management strategies, from scientific management to total quality management. It is also a reaction toward the growing fragmentation and dissolution of work life in times where Protestant ethics have been weakened. Without corporate religion, it is not possible to tie together a corporation that encounters many secular and multicultural challenges to the values system of the corporation. In order to cope with the loss of meaning in modern society, Kunde presents strong and very well-formulated values and values-driven management in response to the problems of leadership in corporations. The firm should work with immaterial values in values-driven management by formulating its vision and mission in order to ensure the commitment and action of employees. The conscious religious strategy of values-driven management is about belief, community, strong managers, and commitment and engagement in work. The product of the firm should be branded as something very special so that it is not just another thing to buy but is instead endorsed by consumers as something vital for their identities and existence.

A very classic example is the US motorbike corporation Harley-Davidson, which can be characterized as a corporation with a strong brand that understands the necessity to cultivate the immaterial values of the corporation ([10], p. 66).⁶ Even though it does not necessarily produce superior motorbike products, a Harley-Davidson motorcycle is considered as much more than a simple motorbike. It rather signifies a lifestyle, an identity, the key to freedom, and the American dream. At a time when the corporation was about to go bankrupt, Harley-Davidson invented a new strategy where the firm focused on brand value, or what we may call the religious and emotional image of the corporation. The firm worked actively to link customers and employees emotionally to the firm as a part of the Harley-Davidson community – or perhaps disciples of its congregation.

Kunde draws our attention to the branding and strategy of the cosmetics company Body Shop. Body Shop is a company that has been able to combine a political message with religious content in the image of its products. The Body Shop brand not only represents a company selling cosmetics; it is a knowledge-based enterprise that uses its products to spur environmental consciousness and market a lifestyle among its customers ([10], p. 66). With the concept of “caring cosmetics,” Body Shop has given cosmetic products a specific brand value for

customers, and the firm uses its products as a signal of political values and ideals with a strong emotional content. In this sense, Body Shop turns its green profile into a religion.

We can mention many other examples of companies that have worked to articulate immaterial values in order to increase the emotional significance of their firms and their products for customers and, consequently, have also intensified employee motivation. According to the strategy of corporate religion, it is the task of the firm to link the customers to the corporation religiously by emphasizing that the products of the firm are expressions of attitudes and values. In this context, corporations are organizing events that are also other initiatives to ensure the loyalty and emotional binding of individuals to the firm (e.g., by making slogans that promote an image of the firm that contributes to a lifestyle).

This ideological and strategic concept of corporate religion is based on a number of simple values and mission messages that imbue the organization at all levels. Kunde compares this message with the Bible in order to show how the mission statement of the organization can be understood in analogy with a religious message and mission ([9], p. 122). In the fight to emotionally engage employees and customers in the firm, it is important to work with simple and strong formulations of clear values in order to give the vision and mission of the firm strategic power and weight. Moreover, it is important to emphasize that corporate religion, based on a powerful style of leadership with charisma, is an important condition for realizing the values of the firm. As a strong leader, the manager or CEO must present himself or herself as incarnation and symbol of the values and personality of the totality of the corporation.

The work of William C. Miller and Peter Pruzan in their article “Spiritual-based Leadership: Initial Observations from a Research Program” is another example of the influence of New Age on management science [11].⁷ Spirituality is considered as a way to ensure greater sensibility in management and a stronger responsibility toward employees and other stakeholders of the corporation [5]. By looking into spiritual texts of different religions, managers can be inspired in their personal consciousness and improve their daily decisions. Spiritual leadership is conceived as an alternative to purely technical and rational economic ways of decision-making. Spiritual-based leadership involves both the development of leaders but also employees who are interested in adding a spiritual dimension to their lives. Spiritual-based leadership intends to overcome the conflict between religious people who view business skeptically (where wealth is “filthy lucre”) and business people who argue that it is a solely rational enterprise. As a reaction to Protestant ethics, spiritual leadership has been inspired by Eastern religions, but other religious traditions increasingly play a role in this paradigm of management [12].⁸

This kind of new mysticism corresponds very well to the need for new spiritualization of life, which characterizes many business managers. In the search for meaning in management, business people want to go beyond the extreme rational organization of work life and the workplace. As a reaction to increased instrumentalization of work, they are looking for symbols and holy places in their daily work. They have abandoned Puritan morality and the Protestant work ethic and are

searching for irrational and unnatural spaces in their lives. They invite different types of consultants to help them fill their daily lives with religious and spiritual content. Spiritualization of the workplace is considered a relief in confrontation with the extreme rationality of the Protestant values in the work environment. This new mysticism is by many people understood to function as a dynamic means to reestablish the lost meaning in a boring and uniform life in organizational bureaucracy.

Paradoxically, an existentialist approach to management can be considered as continuing the search for a deeper meaning in business life while at the same time functioning as a very critical attack against the presuppositions of spiritual-based leadership. An origin of existentialism may be found by the French philosopher Henri Bergson who turned to the inner experience of the mind as a reaction to the empiricism and technological instrumentalism of science and industrial society of his time. Bergson combined this with a personalist philosophy that focused on the personal development of the subject and influenced later French existentialists as Mounier and Sartre [13].⁹

As a movement of search for respect for the inner life of the person, existentialism in management is different from corporate religion because it refuses to reestablish a new spirituality as mysticism, but rather the aim is to make the individual existentialist search for meaning the basis for the social legitimacy of the firm. The existentialist approach to business ethics has been proposed recently by a number of authors who are trying to apply existentialist thinking to the relations of management and work life [14–19].¹⁰ From a critical perspective on capitalism, we can ask whether such a thing as an existentialist philosophy of management can exist. Critical authors would state that existentialism and management cannot be combined and that this approach is an indication of an ideological use of existentialism to justify management. They would say that there is no room for singular existence and the search for meaning in the large economic organizations and social systems of our time. It looks very difficult to reestablish the individual meaning of life within modern organizations, and it seems impossible to unite the private search for existential and religious meaning with the requirements of having a specific work function in large organizations. We can, however, identify this existentialist approach as a response to Protestant ethics as the basis for establishing meaning in organizations that recognizes the conditions of economic life in modernity. The existentialist approach refuses spiritualization of the workplace while being critical to the extreme rationalism of the Protestant approach. The existentialist approach asks the question of the meaning of work and of life in broader terms than the focus on efficiency and productivity that characterizes the Protestant ethics.

The work of philosopher Søren Kierkegaard can help illuminate how existentialist thought can form the basis for corporate legitimacy [19]. Kirstine Andersen argues that Kierkegaard contributes a poetic language to our understanding of management and governance ([18], p. 7). Kierkegaard's categories of aesthetics, ethics, and the religious can be used to understand the way managers relate to their work and see their life in relation to their work. Also Kierkegaard's existentialism

can help to analyze relations between personal existential life and the professional role as a manager. In existentialist philosophy, there is a search for dialogue and communication that implies confidence in and engagement with other human beings. Existentialism takes seriously the original signification of being a director as the person in the organization who points toward a direction that has concrete and existential ramifications for lived experience. Managers are confronted with something larger than themselves when they have to make important decisions. Since it is impossible to abstract from personal existence in professional life, professional legitimacy is dependent on the harmony between the personal and private convictions of individuals [18]. Moreover, existential management is about recognizing the importance of human dignity and respect for employees and other stakeholders as human beings with infinite value.

Managers have to come to terms with the fact that their role is an inescapable condition not only of their own lives, but for the people whom depend on them as well. This might be called the existentialist challenge of management. Given this condition of his or her existence, the manager cannot avoid being forced to become someone imbued with character, values, and conceptions of life. Indeed, it is an existentialist requirement not to forget to respect other human beings as “goals in themselves” with dignity and humanity. This fundamental responsibility expresses the fact that the ethical challenge is greater than the individual. The ethics of existentialist management require the manager to take personal responsibility for moral choices. As such, the strategy of legitimacy in existentialism implies a return to the personal conscience and engagement of the individual behind the mask of professional life as the basis for real professional commitment and responsibility. Indeed, existentialism must be in search for an ethics of basic ethical principles like respect for autonomy, dignity, integrity, and vulnerability of the human person [20].

Toward the Political Corporation

The centrality of personal responsibility in existentialism resembles a modern version of Protestant ethics. But at the same time, the kind of existentialism that is proposed is in danger of losing its roots in the critical attitude toward corporate life and becoming a new philosophy of meaning in the corporation, which is based on New Age thinking. Can we really build professional life on personal values? What is personal self-realization in business life? Is it not better to work with strictly separated spheres of values, ethics, law, economics, and religion? [21] In this sense, an existentialist turn in business ethics is dangerous because it moves from formal rules of professional life toward individual emotions and conceptions that are outside the objectivity of professionalism. The counterargument is that you cannot separate personal responsibility from public functions and that government and management are a kind of decision-making that implies great personal responsibility, accountability, and integrity.

These different attempts to deal with secularization and with the crisis of Protestant work ethics cannot be considered independently of the global challenges

on the labor market and the changing role of corporations in society. Although work is still conceived by many people as foundational to their identities and for finding meaning in life, we should not overlook of the displacement of workers by technology, which allows fewer workers to produce more. Society is changed continuously by inventions like biotechnology or information technologies that have fundamentally altered the character and significance of work. Unlike industrial society, there are few routine jobs left. It is the knowledge producer and the knowledge worker, human beings who create their work out of their own professional capacities, who will become the elites of the future global society ([22], p. 123).

The economic organization of this future society will be characterized by the emergence of large economic organizations, multinational companies, and network companies with many knowledge-producing employees who are organized in temporary project groups or who work together over short periods of time with many different colleagues ([22], p. 146). Institutional changes occur alongside changes in the character of capitalism [23]. For example, institutional investors or governments and other stakeholders have emerged to put greater pressure on companies to have policies of ethics and corporate social responsibility in order to improve their social legitimacy. Moreover, our earning potential does not rise with increased production, as in industrial days, but rather through applying knowledge and developing sophisticated technological innovations.

The concept of the political firm is a much better alternative to New Age spirituality and corporate religion. In a globalized knowledge economy, the emergence of the political firm can be described as a way to absorb some of the previously mentioned perspectives on strategies of management. Thus, the political firm is one that works deliberately and explicitly with ethics and values-driven management in order to respond to the search for legitimacy in a postindustrial and postmodern knowledge economy. This search for the political firm can be considered as a response to the new spirit of capitalism in network society [24]. As a kind of political organization, the firm represents an attempt to overcome the lack of morality with the decline of Protestant ethics. In this sense, the political firm, or the expressive organization based on values branding, represents a conscious attempt to respond proactively to societal requirements for corporate legitimacy. The political firm is, therefore, a response to the changed social conditions of corporate activities in global society [20].

When companies are working naively and unreflectively with values and political ideals as part of a mission, strategy, and values statement, they may have a tendency to use values and ethics in a purely emotional sense rather than in a reflective and reasonable sense. The political firm, on the other hand, is often at the moral frontline of social development. With its attention to social issues, this company captures important trends in society and contributes to the change and social betterment of society. What is fascinating is that this does not have to be in opposition to Protestant ethics but can be conceived from the viewpoint of Max Weber's thought. Weber defined legitimacy beyond Protestant ethics to include economic and cultural considerations of the role a corporation plays in social

development. Accordingly, the political corporation is a very good indication of the basic trends of social development [25]. For example, when companies emphasize “soft values,” “love for your fellow employee,” and personal relations as important in the workplace, this reflects the predominant morality of society. It further affects company managers who realize that articulating a morality of soft values is necessary to survive on the global market. It may, however, be a problem of when alternative forms of legitimacy, where firms present themselves as political firms and an alternative to Protestant ethics, that they presuppose old conceptions of organic corporate unity that precede rational economic organization. It is important to be aware of values, ethics, poetics, aesthetics, and irrational dimensions of life in business corporations, but these aspects of economic life should not lead to a return to a naive mythological and ideological conception of the world, ignoring all the complexity in a modern society.

Niels Åkerstrøm Andersen characterizes political firms as an indication of private policy networks [26, 27]. Here, corporations act as political organizations that in addition to their economic activities seek to influence public policy in order to promote their interests in society. As private political actors, corporations use different strategies to obtain legitimacy in society. Therefore, the political firm can be conceived as a means of reconciling “the particular with the universal” ([26], p. 235). Andersen names the political and socially responsible firm as the dream of civil society, where all conflicts between state, market, and society are mediated and solved. In this sense, Andersen can be said to emphasize an organic dimension of the idea of the political firm because he argues that it is a romantic dream dating back to a holistic vision of society from the nineteenth century. Instead, we should be aware of the functional reality of postmodern network society. According to this point of view – inspired by Niklas Luhmann – postindustrial society implies functional differentiation of closed autopoietic subsystems of society. This approach to philosophy of management can be called a system-theoretical analysis of the search for legitimacy in modern corporations ([27], Introduction, [28]).¹¹ In a functionally differentiated society, the firm is reflexive and strategic and aware of the importance of legitimacy in relation to its environment. This firm is characterized by polymorphic organization with many spheres and codes with particular forms and requirements of legitimacy. Andersen mentions spiritualization, pedagogization, aesthetization, intimization (personalization), mediatization, and moralization as expressions of this multitude of codes and forms of legitimacy in modern corporations ([26], pp. 247–248). Corporations are situated in different networks with different strategies of legitimacy. The role of the state is not primarily to ensure law and order and protect rights and welfare but rather to facilitate the possibility of these private firms to have reflective self-regulation with regard to ethical and social issues in these private policy networks.

Andersen’s description of the intimization and moralization of the firm as an actor in private policy network following the dream of harmony between state, market, and society explains how it is possible to conceive the political firm as a kind of reaction to the lack of values after the decline of Protestant ethics. This is unusual because it is normally presupposed that the political firm is not primarily

religious, but a necessary response to the complexity of modern social problems, which require that the firm take social responsibility and includes different stakeholders in the formulation of a corporation's strategy, mission, and values. When dealing with the dream of harmony between state, market, and society, these efforts nearly seem to imply a new value dimension, as when social responsibility, values, and business ethics are promoted as branding and image with a strong emotional content ([26], p. 254).

With regard to political firms, it is therefore important not to conceive values and business ethics as ideological concepts that lead to a mythological and simple understanding of the world, where ethics and values are reduced to propaganda to ensure the image and branding of the firm. The vision of the political firm should *not* be based on corporate religion, but rather we should try to work for the republican concept of the good citizen corporation, which implies a reflective, rational, and democratic conception of management and corporate governance. In fact, we can point to the importance of the global approach to corporate citizenship where corporate social responsibility and corporate governance in a global perspective are emphasized as the most important way to approach the problem of corporate legitimacy in society. Güler Aras and David Crowther from the international corporate social responsibility network propose this point of view, and they see the movement toward global and cosmopolitan business ethics as central to establish a new role of corporations in modern society [29]. This globalization of the corporate citizenship agenda as the most important challenge for modern corporations is also emphasized by the global focus on the UN Global Compact Principles that many corporations subscribe in order to show that they are good citizens [30]. Legitimacy is established by the search for universal ethical norms for corporate citizenship in international society [20, 31].¹²

As a model of legitimacy for the political firm, the idea of the reflective rational model of the corporation may be said to transcend the opposition between Protestant ethics on the one hand and alternative religious and political models of the firm on the other. In *The Human Condition*, Hannah Arendt proposed a sharp criticism of Protestant work ethics. Arendt opposed the ideal of work in Renaissance humanism against the thought of Luther and Calvin. She emphasized that what is important is the creativity of human creativity in opposition to work, utility, and consumption [32]. Creative transformation of human nature lifts humanity beyond biological necessity. In her concept of work, Arendt criticized industrial production and reducing human beings to "animal laborans" or rational engineers like "homo faber" who no longer create cultural works but rely only on work and consumption. True human creations ought to express enduring human conditions of life, going beyond necessity and into the realm of art and freedom, creating the conditions for culture and civilization. In this sense, working creativity expresses what is most noble in human beings and becomes the essence of the active life of humanity [32].

In addition to focusing on the creative dimension of work, the problem is how to replace Protestant ethics. We cannot deny that work ethics are very important in modern society. It is also an important aspect of Protestant ethics that egoism goes beyond the self and is concerned with the common good. The acquirement of

wealth is directed toward social community. Likewise, the idea of the firm as a covenant and a community of destiny based on a common vulnerability in relation to external and internal relations between employees and management seems to capture an essential element of the culture of modern corporations, which is often overlooked in the conflict model of worker management relations. Moreover, it is a characteristic feature of Protestant ethics that it works with a strong distinction between knowledge and belief, reason and mysticism, but this also limits the religious field to an autonomous sphere of belief, which we cannot genuinely know. This is the main reason why Protestant work ethics have been so easy to secularize. This has led to the emancipation of utility – based on profit-maximizing goal rationality in work life – with nihilism as the ultimate consequence. Still, it is not clear that the proposals for other kinds of legitimacy and re-mythologization of work life are correct responses to the crisis of Protestant work ethics.

It is true that there is a need to dissolve rigid rule-based and instrumental bureaucratic reason to the extent that it rules in work life and in other organizational contexts. But this must be possible to realize in another way than returning to an organic religion or to a mystical irrationalism. We need to recognize the value-based aspect of our economic action, but this does not have to imply that we need to give up our critical rationality, capacity of judgment, and reflective attitudes to values and ethics in corporations. A concept of the political firm is needed that, while founded on ethics and values, has nothing to do with the idea of corporate religion.

This is possible by considering business ethics from the perspective of the republican tradition of political theory ([33], p. 289ff).¹³ This approach represents a community-based foundation of legitimacy, respecting the expectations of society and representing a clear alternative to Protestant and traditional models of legitimacy and mythological approaches on the one hand and charismatic models of legitimacy on the other. In republican business ethics, ethical motivation is not deduced by personal self-interest in salvation, but in the duty toward community and the common good, based on respect for individual autonomy and freedom. This model of legitimacy emphasizes rights as an important part of ethics, but these are not exclusively founded on a strategic brand value but rather on concern for the interests of society and respect for the position of singular human beings as legal subjects in a state based on the rule of law, including the legal principles of legality and legitimacy.

According to this concept of corporate legitimacy, the activities of the firm on the market are limited by such a relation to the political community where the firm seeks to be a virtuous participant in society. From this perspective, the task is to ensure that the firm is a good corporate citizen, which takes social responsibility at the individual and institutional levels. As a good citizen corporation, the firm acts consciously to respond to the social demands of political and social justice. This includes values that actively contribute to the betterment of the social and political conditions in society. Legitimate economic activity is conceived as a contribution to a just society ([20], Conclusion). We can mention the strategic focus on economic sustainability, finance ethics, corporate governance, ethical investment, social responsibility for customers and employees, and respect for employee rights,

to creative development and self-realization in the corporation as examples of these values. What is important in this genuine political corporation aiming at corporate citizenship – in opposition to the concept of corporate religion – is that these values are founded reflectively and rationally from the perspective of the self-understanding of the corporation as an active corporate citizen, who takes part in the ethical and political process of discussion in society, based on a critical public opinion in democratic modernity.

Such a model of legitimacy does not exclude religious elements but is open to the significance of religion in light of republicanism. Recognition of the right of individual to privacy and freedom of religion is an essential element in the republican conception, and it includes respect for the individual's right to present his or her own conception of the good life. The firm does not have a right to limit the religious freedom of its employees unless it represents a direct threat to the political community. In this sense, there is room for religious spaces in the firm, but these should not replace a critical reasonable dialogue, based on fundamental ethical rationality ([20], Introduction). At the same time, the employee's rights and duty to independent and critical ethical self-reflection about the actions and norms of the organization, based on critical loyalty, personal consciousness, and responsibility, can have religious elements of justification. Social responsibility of the good citizen corporation is firstly based on its dependence on a democratic political public, where all participants make an effort to respect community and common principles of rights. The ethical principles of respect for the autonomy, dignity, integrity, and vulnerability of stakeholders are an important feature of the values and professional ethics of corporations ([20], Discussion). The democratic approach is therefore becoming an integrated part of the contemporary foundation of the corporation ([33], p. 304). This republican idea of political democracy as a social ideal, with democratic communicative reason, implies the effort to work for democratic public virtues of citizenship and concern for the common good in business life as a regulative ideal for business economics ([33], pp. 27–28).

However, according to skeptics, this quest for values and values-driven management is nothing but a new form of religion. Someone may try to describe business ethics as a kind of psychosocial religious ideal type, using Weber's terms, to indicate a form of religious legitimacy consisting of individuals realizing themselves as good people in the workplace. This is a new modern form of iron cage. Critical voices maintain that we consider modernity as the period of ultimate secularization, and business ethics and values-driven management should rather be analyzed as new ways of justifying the old ideal of the calling of individuals to their work. This is the case when firms emphasize ethics, values, and culture and when they are trying to be socially responsible and self-reflexive in order to reach a harmonious relation with their fellow employees and the stakeholders of the firm.

As previously mentioned, there is the danger that ethics and values-driven management can change the firm into a kind of church where real oppositions and contradictions are falsely concealed. Critical sociology and philosophy are not very open to this conception of good management. Foucault, Gauchet, and Bourdieu would argue that corporate citizenship and business ethics based on

a “covenantal relation” rather than the relation of a contract between workers and employees, emphasizing virtues instead of rights and focused on the spiritual realization of individuals at the workplace, represent a new kind of disciplinary mechanism [34–39].¹⁴ All this talk of business ethics is argued to be nothing but a new method to increase employee productivity in a modern age. Similar to other methods of management, like scientific management, human relations management, total quality management, or the personality-oriented and existentialist visions management, management based on values rather than rules does not represent any kind of rupture with an economics based on maximizing utility efficiency ([40], p. 168).

We can indeed analyze many of the new kinds of management methods in this way. Management approaches that search for perfection and worker autonomy are based on an “ethics of sensibility” in order to cope with change and complexity in the workplace ([40], p. 256ff). Applying Richard Sennett’s concept of flexibility and the new work ethos in the workplace, it is possible to argue that we are in a situation where modern methods of management do not represent a liberation of individuals but represent nothing more than an assimilation of individuals to the new cultural conditions of the West after the legitimacy crisis of modernist values. Focus on personality development and values-driven management are, from this perspective, nothing more than the basis for a new Protestant concept of the calling, where the individual internalizes duties to the corporation through values rather than through orders. This internalization of values as a part of the personality is even more efficient than economic arguments for ensuring individual adaptability to the ideals of the corporation [41]. If we look at the present strategies for other kinds of management, we can even perceive different kinds of spiritual and religious arguments for personal improvement and value development ([40], p. 7).

The different new strategies of searching for legitimacy do not have to be conceived in opposition to the Protestant ethos of modern capitalism. The popularity of all these new kinds of strategies for empowerment, values improvement, and corporate identity and mission formulation may rather be viewed as methods to harmonize and normalize individuals in corporations. Accordingly, new methods of human resource management have understood the necessity to focus on individual morals and values in order to be sure that individuals act in congruence with the ideals of their organizations. The concept of the good citizen corporation that consequently emphasizes personal and organizational integrity is nothing other than a new way of promoting the discipline and power of organizations. The emphasis of the ethical worker, the need for excellence, and the virtues of the stakeholder corporation are, according to this harsh criticism, simply a new kind of ideological justification of basic economic structures and underlying power relations in the firm and community.

This challenge to the philosophy of management regarding corporate citizenship as a new kind of power instrument, a modern iron cage, is very serious; however, it is necessary to differentiate between different theories of values-driven management, corporate social responsibility (CSR), and business ethics. Some approaches to the field may seem fair game for such criticism, for example, theories based on

holistic views on human nature, including very idealistic conceptions of the possible conventional harmony between employees and employers in the firm. Indeed, when such theories are used as quasi-religious legitimacy for corporate power relations, we may say that an ethics of sensibility has replaced the Protestant ethos. This may be the case, but not all efforts to conceive business ethics and values-driven management are similarly vulnerable. Indeed, when we are working with republican business ethics, based on the democratic autonomy of stakeholders, we are very far from a new corporate religion. According to this view, CSR and business ethics are not methods for neutralizing conflict. Rather, they should promote awareness of possible moral dilemmas in the firm [20]. Moreover, personal realization or the quest for employee freedom and autonomy cannot be reduced to a justification for a given economic order but rather defend a pluralistic and polycentric conception of rationality.

Indeed, there is a peculiar common presupposition between modernist and postmodernist critical sociology and Weber's economic sociology. This is a very limited conception of rationality that is shared by the modernist project of economics of the Cambridge and Chicago schools that have been so influential in modern economics. All these theoretical approaches regard economic rationality based on utility maximizing self-interested individuals as dominant in the market system. They see no alternative rationality that can liberate capitalism from the iron cage. The system of market economics is considered as governed by one-dimensional instrumental rationality, and it seems impossible to overcome these limitations of economic markets [42].¹⁵

However, such a presupposition is not shared by the theory of integrative business ethics. This is an approach that integrates ethics and the market. It is recognized that there are institutional conditions for economic markets and that economic action is determined by these conditions. This rationality does not have to be conceived in terms of subjective calling.

It is, therefore, important to be critical of the effort of economic schools like Chicago and Cambridge in addition to different approaches to the philosophy of management that generalizes economic rationality. Moreover, we have to emphasize the openness of organizations to their surroundings as proposed by many recent theories of management. Rules of profit maximization and self-interested behavior on markets need broader social legitimacy. We might say that the justification of profit maximization in modernity is morally conditioned and limited by community-based views on justice and the common good ([33], p. 416).

Consequently, we can propose an alternative view of the legitimacy of business ethics and corporate citizenship that is neither purely instrumental nor purely strategic. The legitimacy of values-driven management cannot be limited to the idea that "good business is good ethics." Business ethics imply something more than marketing or use of human resources in order to improve employee productivity and flexibility. An indication of this is our instinctively critical reaction to the use of values-driven management for the sole purpose of improving the bottom line, but there is no easily harmonious relation between ethics and purely instrumental economic reason ([33], p. 417).

In addition, we can reject a surplus-based conception of business ethics according to which the legitimacy of corporate activities is dependent on the capacity to give away substantial parts of corporate profits and turnovers for good purposes. You cannot justify your instrumental actions ethically by giving the money away. The idea that social responsibility is something luxurious that comes when the firm is rich and famous is not sufficient to justify the activities of the firm from the perspective of community.

Indeed, we cannot propose an external theory of corporate legitimacy by saying that it is enough for firms to be morally legitimate when they practice ethics as practical corrections to specific situations of conflict. Rather, due to the challenge of postconventional morality in modernity, we need a general democratic and republican theory of the legitimacy of corporations ([33], pp. 299–300, [43]).¹⁶

Criticism of the Metaphysics of Management

A recent critical approach to the theory of philosophy of management is based on the philosophy of Martin Heidegger. This approach attempts to go deeper than the preceding concepts by posing fundamental ontological questions about philosophy of management. The problem is that most theories of philosophy and management risk being instrumental, because it is really not possible to combine management and philosophy. It is a problem for the political philosophy of the corporation that there is no democracy in a corporation and therefore a political philosophy of management based on legitimacy risks being purely functional. The critical Heideggerian position argues that attempts to deal with the problems of the search for legitimacy as corporate religion, corporate existentialism, values-driven management, values-based leadership, CSR, and corporate citizenship are based on a kind of metaphysics of the present in Western philosophy that needs to be critically examined and eventually deconstructed. This approach argues that it is impossible for the approach to business ethics and ethics of organization, conceived in the republican approach to business ethics, to not imply an instrumental and technological approach.

It is therefore a task for a Heideggerian to move beyond purely instrumental management. With regard to the meaning of management, legitimacy has to not only be functional but also to be ethical and political. Those who want to criticize the different concepts of philosophy for managers represented this approach. The Danish philosopher and theoretician of leadership, Pia Lauritzen, has argued that mainstream philosophy of management usually consists of four dominant instrumental concepts that address leadership on the ontic and technical level rather than on a more fundamental ontological level of fundamental questions. These positions are (1) the aristocratic concept of leadership based on ancient ethical virtues; (2) related to values-driven management, CSR, and corporate citizenship as efforts to deal with the legitimacy of the corporation; (3) a philosophy of leadership that remains based on a charismatic concept of leadership; and (4) a critical philosophy of management based on post-structuralist and constructivist approaches.

The position of fundamental ontology inspired by Heidegger asks the question whether it is really true that managers are like feudal lords that need virtue, prudence, ethics, and wisdom. This approach seems to include a kind of metaphysical subjectivation of the manager or the leader. Moreover, this approach to philosophy of management seems to ignore the ontology and epistemology of organizations. Indeed, it relates to the virtues and morality of the organization, but philosophy of management could also be extended to include cultural practice and organizational aesthetics. When we deal with philosophy of management as virtue ethics, the ethics of management is about the fiduciary duty of the manager toward the good of the firm. In this context, care prudence and practical wisdom are important in order to understand the function of the firm. When we deal with the aesthetics of an organization, the philosophy of management is about management and cultural philosophy. Here, philosophy of management deals with the institutionalization of values and the human lifeworld in organizations.

Other recent issues in the philosophy of management that may be submitted to criticism by the ontological approach are the concern for CSR and business ethics and also theories that focus on the ethical legitimacy of corporations. According to the ontological approach, we have to focus on the ontology of organizations rather than on ethics and morality.

This approach is also critical toward a philosophy of leadership that focuses on individual leaders and their relations to the cultural environment. This kind of approach becomes a subjectivist philosophy because it focuses on the thoughts and reflections of the individual subjectivities of managers. In this sense, the Heideggerian criticism of the movement of philosophy of management is that it belongs to a kind of metaphysics of the present. Discussions of various kinds of leadership dominate the debate about the philosophical foundations of management [44].¹⁷ In contrast to this focus on the dimensions of metaphysical subjectivity, the Heideggerian philosophy of management tries to move beyond and behind these issues by asking fundamental questions such as: “What is management and leadership?” “What is management and leadership for me?” “What is the culture and meaning of organizations?” This kind of engagement overcomes functionalistic manipulation of employees.

We can also apply this approach of metaphysical questioning to the relation between leadership, management, and employees. According to criticisms of the traditional concept of leadership, leaders tend to create an artificial distinction between the cosmos of the leader versus the chaos of employees ([44], Introduction). Here, the leader or manager sees himself or herself representing reason and rationality in opposition to the irrationality and the nature of the demands of the employees. Different constructions of leadership as based on oppositions between totality and partiality, vertical versus horizontal theories, soft versus hard values, and also propositions of values-driven management as the answer to problems of management can be considered as a part of this kind of metaphysics.

This fundamental questioning may also be considered necessary with regard to our concepts of leadership. Metaphysical readings of contemporary leadership tend to argue that the concept involves hidden metaphysical dimensions. We face, for example, the belief that there is a close connection between leadership and

truth (absolute), leadership and self-realization (circular), leadership and decisions (immediacy), and leadership and complexity (linear). With these presuppositions, it is possible to argue that the philosophy of leadership is not without metaphysical presuppositions but is rather a kind of philosophy that has become a technological and instrumental manipulation of the foundations of management ([4], Introduction).

In order to overcome these presuppositions, it is important that philosophy of management does not end by instrumentalizing philosophy. Instead, according to a Heideggerian approach, new concepts of philosophy of management should be based on the experience of a philosophy of thinking. With this credo, the Heideggerian approach to the philosophy of management provides us with a criticism of the old positions of management theory. The so-called radical leadership philosophy, represented by, among others, Ole Fogh Kirkeby, is indeed marked by this metaphysics of leadership where the subjectivism of a charismatic leader is rendered a fundamental normative truth. This is also the case for approaches for spiritual leadership, as they are dependent on a kind subjectivism of the spirit of the leader as important for management [45]. This is the case even with critical movements of philosophy of management, including post-structuralism and social constructivism, which were supposed to criticize the manipulative dimensions of the value-based, spiritualist, and other approaches to leadership. Theories about power relationships and decision-making and theories about culture, change management, and also values-driven management are characterized by the metaphysical presuppositions that are criticized by the approach of Heideggerian philosophy of management ([4], Conclusion).

With this fundamental criticism of the metaphysics of theories of management, we are faced with the fundamental question whether philosophy really can inspire management. What kind of inspiration can philosophers like Kant and Kierkegaard give us for leadership? On the basis of the criticism of the metaphysics of leadership, we can say that we have to search for the deeper truth in the philosophical theories. We might say that there is a basis for understanding the legitimacy of corporations present in the philosophical theories of leadership. Here, we can refer to the organizational theorist Karl Weick attempt to develop a hermeneutical philosophy of organizations by asking about the meaning of organizational activities. From this perspective, the philosophy of management considers the question of organizational legitimacy as a question of the meaning of organizational behavior [46]. The question of meaning involves asking: "How did I know?" "Why didn't I ask?" "Why didn't I say what I knew?" These questions refer to the fundamental meaning of individual behavior in organizations. Moreover, the philosophy of management as fundamental questioning is characterized by one overarching question: "What is management and leadership?" From this perspective – according to the philosophy of Heidegger – the philosophy of management asks the question of meaning of practices of management. We can draw an analogy to Plato, who asks the question about what is the good, the beautiful, and the just. The philosophy of management asks the question "What is?" which can be conceived as the foundation of the concept of legitimate

leadership, or “What is management?” “What is motivation?” “What is justice?” “What is responsibility?” “What are my foundational values?” “What is meaning?” or “What is good leadership?” We can call this a Socratic approach to leadership where the philosophy of management asks the radical questions.

Important topics for such a philosophy of management include the relations between managers and employees, drawing upon the insights of the great philosophical tradition from Aristotle to Kant and Hegel. Moreover, in this context, we can also elaborate on the problems of institutions and how economic issues relate to social values as discussed by Weber. With the Socratic and Heideggerian approach, ethical, social, institutional, and economic issues are integrated into the fundamental debate about the meaning of management as proposed by Heidegger. When we deal with this approach to philosophy of management, we move beyond the Platonic conception of the philosopher as king. Philosophers should no longer make unrealistic assumptions about the power and virtues of the managers [47]. The philosophy of management must go beyond managerial self-understanding where the manager views himself or herself as a kind of cosmos confronted with chaos. There is no abstract total power, but it is the ability to understand situated meaning and culture that helps good management. Indeed, we must remember that the power relations between leaders, managers, and employees cannot be changed. Instead, we must hope that the leader can be open to the plurality of the organization. It is destructive that today’s philosophy of management makes us forget that management is a question of employee relations.

So this approach to philosophy of management argues that Western philosophy is focused on what is universal and general as opposed to what is concrete and particular. With the new philosophy of management, the idea of what is flexible and values-based has been proposed as a new kind of truth; however, this is marked by a kind of paradox because it will make the singular general and universal. What is conceived as flexible and values-based leadership is experienced as a new kind of truth, but it is important that individuals are involved in the process of defining these new values. They will also have to be a part of the process of defining how to structure this process. With this philosophy of management, managerial practice is analyzed in concrete situations. It focuses on the experience of meaning in practice, which cannot really be captured by post-structuralism or social constructivism, but is still analyzed from the perspective of continental philosophy as an approach to philosophy of management which has recently be developed in details [48].

In this context, we can say that leadership from the Heideggerian approach involves storytelling, but in a deeper hermeneutical sense than is the case with discursive and post-structuralist approaches. In this context, one approach could be to introduce a kind of historical thinking or storytelling that captures the externalization and internalization of the experience of meaning. The basis of this approach could be the hermeneutical philosophy of the Italian thinker Gianni Vattimo. Hermeneutics, in this context, is a kind of analysis of the presuppositions of managers in their daily search for meaning. Here, the presuppositions of good management should be placed in the open. Good management implies loyalty, authenticity, and reason, but this is not only good management. It is the

presupposition of good management. The presupposition of this kind of thinking is that managers can realize themselves and the potentiality of their organizations by looking at themselves and their values as human beings. Still, according to the hermeneutic critique, this is not good management, but rather an example of the metaphysics of “homo economicus,” as suggested by the Italian philosopher Gianni Vattimo ([44], pp. 32–35). Instead, it is our task to wonder about how we could create new modes of thinking and go behind existing dogmas of philosophy of management. Thinking in philosophy of management and of corporations means asking deep reflective questions about the foundations of management and leadership ([44], p. 165). It involves reflection about the foundations of judgment and business ethics, and in this sense, we can say that there is a close relation between fundamental reflections in philosophy of management and reflections according to critical reflective judgment in business ethics.

Conclusion

This critique of the metaphysics of subjectivity and homo economicus within the philosophy of management argues that we need to overcome the implicit metaphysics of many theories and approaches to the philosophy of management. Instead, philosophy of management should be conceived as radical questioning that addresses the social engagement and sense-making within management ([4], discussion on Heidegger). Philosophy of management needs to ask fundamental questions, addressing and focusing on tensions and dilemmas of management, for example, by following the Heideggerian approach of questioning the being and meaning of management ([4], [10], p. 86).

What are the consequences for the problem of legitimacy when we are confronted with this Socratic and Heideggerian critique of the dominant conceptions of legitimacy that have been recently proposed? The answer from the point of view of the philosophy of management that asks fundamental questions about the meaning of management is that the strive for legitimacy remains an open question where it is always possible to go deeper behind any vision of legitimacy and ask more fundamental and critical questions about the accomplishment of corporate legitimacy in society [49].

Notes

1. M.C. Suchmann has given the most important definition of the concept of corporate legitimacy. He defines legitimacy as an effort to adapt to the internal and external environment of

- the organization. In general, we can say that the problem of legitimacy or “why corporations exist and why they are accepted or allowed to exist?” is one of the most foundational issues in philosophy of management. In this section, I deal with some of the recent development in philosophy of management from this perspective. In particular, I draw on some of the recent developments in Denmark where philosophers and social scientists have contributed to the development of the field. A reason for this has been the establishment of the Department of Management, Politics, and Philosophy in the 1990s at Copenhagen, Business School, Denmark.
2. It is difficult to determine the scope of the movement of spirituality in business. It comprises many different concepts of management, and popular management culture with management gurus like R. Stephen Covey may indeed be conceived as an expression of this new spirituality in management. Indeed, the role of spirituality in management is to make room for feelings and deep reflection in management, but in many cases, it remains nothing more than an ideological instrument to link employees to corporations.
 3. Wim Dubbink contributes with an analysis of these new relations between State, civil society, and the economic market where shared responsibility is needed and new partnerships emerge.
 4. Dominik Heil has developed this important point. He proposes to analyze business ethics and philosophy of management and corporations from the point of view of Heidegger’s philosophy. Indeed, Heidegger’s philosophy can be proposed as a critical approach to the metaphysical presuppositions of contemporary philosophy of management that may be viewed as a kind of metaphysics of the subject and of the intersubjectivity of the organization and corporation.
 5. Jesper Kunde argues that corporate religion is nothing but a metaphor for the idea that the company should have a meaning, a direction, and an idea. Employees should learn about this idea through communication from the leader, and this idea sets limits for those who do not want to be a part of the corporation. Companies with strong cultures are characterized by a relation to common values as though they were a religion. Kunde argues that those companies are sometimes regarded by their environments as religious sects and that this should be viewed as a good thing because it shows that it is a company that has a clear idea and that this brand has been communicated efficiently in its environment. Kunde also argues for a concept of corporate religion that is not a cynical or nihilistic concept of religion but rather a loose concept meaning to have values and believe them. We can argue, however, that this concept of corporate religion is still problematic because the metaphor changes the corporation into a kind of religious sect with all the relations of manipulation, domination, and ideology that this implies.
 6. The books about corporate religion, following the ideas proposed by Jesper Kunde, are first of all about marketing and branding of corporations by establishing a strong value-based culture with the creation of a company with a religious soul or spirit. The internal personality of the corporation is conceived as important to create a good image from the outside, as Tom Peters, who uses the work of Jesper Kunde, has said. From the marketing perspective, corporate religion is first of all about creating the illusion that the company has a soul so that the company can appear as a good corporate citizen to the public. The issue of corporate responsibility is important, but this concept of corporate religion seems to address emotions and appearance rather than focus on the real ethical and political issues of the reputation and appearance of corporations in society. Looking at this creation of the soul of the company as a branding instrument, it is tempting to agree with the French philosopher Gilles Deleuze that “si l’entreprise a une âme, ce serait la plus pire des choses,” meaning that it would be an impossible situation if we were to have corporate consciousness without corporate morality. However, as we shall see later, there is a close link between collective action and ethical responsibility.
 7. The essay is a revised version of the paper new models of leadership – spiritual-based leadership: a matter of faith and confidence. Presented at the conference: leading and managing human resources from a strategic perspective: focus on the service sector in India, Sri Sathya Sai Institute of Higher Learning.

8. A further example of such a spiritual turn in business economics is the search for irrational spaces in the daily work activities in the firm. We can call it a new attempt to mystify the relation of work in a criticism of the goal-oriented and utility-based thought that characterizes Protestant ethics. This approach can be found in the work of Danish business economist Martin Fuglsang. In his work which was considered very controversial in Denmark, we find an analysis of the self-understanding of a young biotechnological entrepreneur and of his activities as researcher and innovator. This analysis is characterized by a deep need to reinvent the poetics and passion of the human work life. It is a search for a calling of work after the decline of Protestant ethics, but it is also a search for a calling with a new focus on mysticism and an enchanted world. The book is full of citations of different poets, and it is methodologically based on Martin Heidegger's phenomenology and fundamental ontology combined with the use of insights from social constructivism and research in network analysis. This approach searches for mythical, poetic, and religious elements of work and can therefore be considered as a radical critique of the dry rationalism of traditional Protestant ethics.
9. In this context, we can refer to Luc Bouckaert's work where he shows how the personalism and existentialism in French philosophy can be used to develop a humanistic spiritual approach to philosophy of management.
10. In this context, we can mention the Danish philosopher, phenomenologist, and hermeneutic philosopher Ole Fogh Kirkeby who has published three books that can loosely be characterized as an existentialist approach to management. We can also mention the psychologist Karen Schultz who also in Denmark contributed to develop this existentialist approach to management. And, finally, we can mention some different and very controversial attempts to apply the philosophy of Søren Kierkegaard to philosophy of management.
11. This application of systems theory within philosophy of management as a bridge between philosophy of management and the social sciences represents a very good indication of the recent developments in the Danish context which are quite unique in an international context. In particular, the Danish scholars of systems theory Ole Thyssen, Niels Åkerstrøm Andersen, and Susanne Holmström have contributed to the development of this approach. They show how a corporation can be conceived as a social system that interacts with society and tries to survive in turbulent conditions with CSR and business ethics as possible strategies for this survival in a complex world.
12. Many people have developed the concept of corporate citizenship as essential to the recent developments in philosophy of management. Scherer and Palazzo show that the corporate citizenship agenda at the global level is proposed as a new approach to corporate citizenship. Jacob Dahl Rendtorff proposes a philosophy of corporate legitimacy based on corporate citizenship in his work on responsibility, ethics, and legitimacy of corporations.
13. The Swiss scholar Peter Ulrich was probably one of the first philosophers of management who developed the theory of corporate citizenship and the good citizen corporation in a comprehensive framework with the concept of republican business ethics. However, this work has only been published in English recently, and therefore, it has had limited impact. Jacob Dahl Rendtorff has further developed the concept of the good citizen corporation as essential to determine the citizen responsibilities of the firm.
14. In his theory of organization, Michel Foucault has implicitly emphasized these disciplinary elements of modern organizations. The ideas of self-discipline, self-management, and self-governance are an integrated part of the rationality in modern governmental systems. The rationality of governance of values and ethics can, according to this criticism, be said to represent an internalization of norms that contribute to the self-governance of the individual. Accordingly, for the managerial perspective, management with a focus on ethics and values is much more efficient for control and manipulation than traditional concepts of hierarchical management based on orders and sanctions.
15. In his analysis of Max Weber's theory of rationalization, Jürgen Habermas addresses this problem of the conception of rational modernity. The emergence of positivistic scientific rationality emerged with the secularization of traditional religious worldviews. According to

Habermas, this is the kind of rationality that authors like Weber, Horkheimer, and Adorno agree to call instrumental, and we may also suggest that it is this rationality that locks people in the iron cage. Alternatively, the project of a theory of communicative action tries to overcome this limited concept of rationality by developing the theory of communicative rationality. In fact, this project is also very important for our description of the foundations of business ethics because this other kind of rationality opens for democratic and communicative dialogue within the systems of modern society.

16. We can say that the firm has to work as a good citizen that respects the republican constitution and contributes to the spirit of community. The republican ethics combines this respect for community with the idea of the integrity and autonomy of citizens. We can argue that this idea refers to what Habermas calls “Verfassungspatriotismus” – constitutional patriotism.
17. In this sense, we can propose a critique of dominating positions of philosophy of management as being marked by Western metaphysics of subjectivity and technology. We can mention (1) the Protestant ethics, (2) corporate religion, (3) corporate spirituality, (4) corporate existentialism, (5) systems theory, (6) theories of corporate citizenship and the political corporation, (7) theories of charismatic leadership philosophy as proposed by the Danish philosophy Ole Fogh Kirkeby, and (8) post-structuralist and social constructivist approaches to philosophy of management. All these approaches are according to Lauritzen marked by blindness to the real issues of management because the concern for instrumentalization and technological success of the organization remain hidden presuppositions of these theories that never get to ask radical questions of the fundamental meaning of management and organization.

Part 20

Methodology and Business Ethics

John N. Hooker

Abstract

Rational choice theories assert that human beings behave rationally, either in the narrow sense of rational self-interest, or in the broader sense that decisions are rationally based on preferences. These empirical theories make no direct ethical claims, but they may have relevance to ethics. Social contract theorists have maintained that rational individuals can assent to a social arrangement that promotes general welfare in some sense. A possible consequence is that self-interested business owners can, under the right conditions, rationally consent to regulation. Social choice theorists have argued in a mathematical mode that if we rationally derive social policy from individual preferences, we will adhere to certain ethical norms, perhaps a utilitarian or Rawlsian maximin principle. However, these arguments are based on strong assumptions, particularly with respect to interpersonal incomparability of utilities. Certain rational bargaining procedures, such as Nash bargaining or Raiffa-Kalai-Smorodinsky bargaining, have been shown to lead to outcomes that likewise have ethical content. The former has seen practical application in industry, and the latter results in a minimax relative concession principle similar to that derived by some social contract theorists.

Introduction

Rational choice theories attempt to explain human behavior as resulting from rational choices, particularly in an economic context. They have been a major part of the Western intellectual landscape since the market system replaced

J.N. Hooker

Tepper School of Business, Carnegie Mellon University, 5000 Forbes Avenue, Pittsburgh, PA, USA

a medieval economy. This historical shift is seen as giving rise to *Homo economicus* – economic man – who is driven by self-interested economic calculation rather than a value system of loyalty and honor. Rational choice theories provide the central explanatory principle of much neoclassical economic theory and have generated a vast academic literature.

Rational choice theories are empirical theories of human behavior and, as such, make no ethical claims. However, they are often seen as having implications for ethics. In particular, they may address the question, “Why should I be moral?” If it can be shown that rational behavior results in ethical behavior, then the question has an answer: I should act morally because it is rational to do so. Moreover, if people are already disposed to make rational choices, as rational choice theories assert, then there is reason for optimism that people will tend to be moral by following their proclivity to make rational choices.

A key question for linking rational choice theory with ethics is, therefore, whether rational choices at the individual level are ethical, due to the nature or consequences of rational decision making. This chapter addresses this question, while making no attempt to evaluate the truth of rational choice theories as empirical claims.

“Rational choice” can actually be interpreted in two ways. One identifies rationality with rational self-interest, the traditional motivator for *Homo economicus*. On this definition, rational choice theories subscribe to some form of *psychological egoism* (at least in economic matters), which is the view that humans act solely out of self-interest. Despite the widespread popularity of psychological egoism, the evidence for it is unclear. Again, however, the aim here is not to determine the truth of psychological egoism, but to ask whether self-interested rational choice is ethical. Many argue that it is, on the ground that self-interested choices make everyone better off in the long run. If so, the question “Why should I be moral?” has a more compelling answer: Not only is it rational to be moral, but it serves my interest. Some take this a step further by deducing *ethical egoism*, which asserts that self-interested behavior is ethical not only because of its consequences, but as a matter of principle.

A second interpretation of rational choice does not presuppose self-interest. It assumes only that choices reflect the agent’s preferences in a rational fashion, preferences that could be altruistic as well as self-interested. A great deal of research in economics and social choice theory has examined the logical consequences of supposing that people make rational choices in this sense. Social choice theory is particularly relevant to ethics, because it derives consequences from the assumption that people arrive at social policy in a rational way, and some of the consequences have the flavor of ethical principles – such as a utilitarian or Rawlsian maximin principle (see [1] for a survey). Related research has shown that bargaining in a fashion that might be seen as rational from an individual’s point of view, such as Nash bargaining or Raiffa-Kalai-Smorodinsky bargaining, results in agreements that are fair in some sense. Because of the rigor of this research, much of which rests on mathematical proof, it deserves close examination for its moral implications.

Rational Choice and Deontology

Before examining the above arguments in detail, it is important to distinguish psychological rational choice theory from rational choice theory as it appears in deontological (duty-oriented) ethics. A line of argument characteristic of Kantian ethics, the dominant tradition in deontology, begins with the proposition that choices must be rational because agency itself is rational. The formal properties of rational agency then logically imply that choices must conform to certain moral principles, such as generalizability.

To expand on this argument a bit, agency must be rational in the sense that there must be some way to explain the agent's choices as based on a rationale. This is important because it distinguishes free action of a human from the behavior of, say, a bumblebee, even though both can be explained as the result of physical and chemical causes. Free choices are distinguished by the fact that one can plausibly attribute to the agent a line of reasoning that the agent sees as justifying the choice. But a rationale can be coherent only if it satisfies certain formal properties. In particular, it can justify an action only if it justifies the action for any agent to whom the rationale applies. This means that the reasons for an action must be consistent with the assumption that everyone to whom the reasons apply performs the action. This is the famous *generalization principle* of Kantian ethics. For example, lying merely because it is convenient for listeners to believe the lie violates the principle. If everyone with this reason for lying lied, no one would believe the lie, which is inconsistent with the reason for lying.

Kantian rational choice theory, therefore, differs from empirical rational choice theories in that it makes no claim that people in fact act rationally, but only asserts that if they do not, they are not moral agents. It also expects agents to have a conscious rationale for their choices, while most empirical theories have no such expectation; only the choices themselves matter. Yet there is a point of commonality, in that it may be possible to show that rational choices are ethical choices, whether rationality is as defined by Kantian ethics or by empirical rational choice theories.

Psychological Egoism

As noted earlier, one variety of rational choice theory asserts that human choices are based on self-interest. This is often seen as ethically relevant on the ground that self-interested choices benefit everyone in the long run. Adam Smith is routinely quoted as saying that the butcher, brewer, and baker provide our dinner out of self-interest rather than benevolence. There is also Smith's famous remark that one who acts out of self-interest is "led by an invisible hand to promote an end which was no part of his intention," namely, the welfare of society as a whole [18]. But if self-interested behavior makes everyone better off, then it must be ethical. This gives us a reason to be ethical: ethics coincides with self-interest.

To be fair to Smith, one should note that he explicitly rejected psychological egoism. Following his mentor Thomas Hutchinson, he believed that empathy is an important factor in human motivation and wrote an entire book, *Theory of Moral Sentiments* [17], to elaborate this idea. While he refers to the invisible hand in his book *The Wealth of Nations*, the book views self-interest as a destructive as well as a constructive force in economics and advocates government regulation to tame its excesses.

Nonetheless, if one supposes that individual self-interested actions really do maximize general welfare, one might conclude on utilitarian grounds that self-interest is ethical (even obligatory). People can, therefore, be ethical by following their inclination toward self-interest. A difficulty with this argument is that the connection between self-interest and general welfare is a question of fact that cannot be resolved by ethical or logical analysis. There is by no means agreement on whether the evidence supports such a connection. Even if the connection exists, it does not establish that self-interested behavior is ethical as a matter of principle. That is, it does not imply ethical egoism. Rather, it simply appeals to another ethical principle, utilitarianism, according to which ethical action must maximize total net utility. At best, the argument shows that self-interested behavior happens to be ethical because it happens to maximize utility.

A second argument for ethical egoism might begin with the principle that “ought implies can,” that is, people cannot be obligated to perform acts of which they are incapable. But if people can act only out of self-interest, then they cannot be obligated to act in any other fashion. Self-interested action is, therefore, always ethical.

This argument, like the previous one, fails to establish egoism as an ethical principle, because it rests on a contingent fact of nature that, even if true, could change with time. If self-interested action is ethical as a matter of principle, then it is ethical whether or not people act out of self-interest at any particular time. Ethical principles *judge* how people act, rather than *reflect* how they act.

Social Contract Arguments

One way to connect individual rational action with moral principle is through a social contract argument. The basic idea, which goes back to Thomas Hobbes [11], is that rational individuals will subscribe to a social agreement to behave morally. They will do so because the alternative is anarchy, in which life is “solitary, poore, nasty, brutish, and short.” More importantly, they will continue to comply with the agreement, because (according to Hobbes) they will voluntarily install an authoritarian government that gives them strong incentive to do so.

In a modern economic context, a Hobbesian perspective might see commercial firms as lobbying on behalf of business regulation to avoid the chaos of an unregulated environment. Being aware that business often has an incentive to flout regulations, they advocate substantial penalties and strong enforcement to make sure it is in their interest to comply. This sometimes occurs, but many would deny that it is required by a firm’s rational self-interest.

A social contract argument need not appeal to self-interest. John Rawls, for example, argued in a Kantian vein that it is rational for individuals to agree on a social order that maximizes the welfare of the least advantaged [15]. The argument may be roughly put as follows: If I agree to a particular social order, then I must have reasons for doing so. These reasons must be equally convincing to any rational person who agrees, including those on the bottom of society. But rational individuals can agree with a social order that puts them on the bottom only if no other social order would make them better off. It follows that a rational individual must endorse a *maximin* solution: one that maximizes the welfare of the worst-off. Rawls, unlike Hobbes, makes no claim that it is in an individual's self-interest to comply with the social contract. The only claim is that rationality requires compliance. It is, therefore, rational to be ethical, or at least to conform to a Rawlsian conception of distributive justice. In recent terminology, Rawls is a "contractualist," while Hobbes is a "contractarian."

The contractarian David Gauthier [8] argues that a social contract can be based on self-interest if individuals are "constrained maximizers." This means that, in a social contract setting, they choose dispositions to act rather than individual actions. Individuals enter into a social agreement because everyone gains from cooperation, as in the Hobbesian case, but the agreement entails adopting a "disposition" to comply with it. The problem with social agreements, of course, is that one can often do better for oneself by breaking the rules when others are following them. As a result, everyone breaks the rules, and everyone loses. This is known as a *prisoner's dilemma* situation, due to a famous example of it offered by mathematician Albert Tucker. Gauthier argues, however, that if an individual adopts a disposition to comply with a social contract, and makes the contract only with individuals who seem willing to adopt a similar disposition, then it is in the individual's rational self-interest to honor the contract even in a prisoner's dilemma situation.

One might interpret Gauthier's "disposition" as a mild form of Hobbesian government. Having adopted a disposition to comply does not psychologically compel one to comply, but it somehow provides a rational incentive to do so, much as a government provides an incentive to obey the law. In a business context, adopting a disposition might translate to building a corporate culture that favors compliance with industry self-regulation. This may incentivize compliance if the organizational cost of disrupting corporate culture is higher than the gain of breaking the rules.

The success of Gauthier's argument is a matter of dispute (e.g., [13]), but even if sound it does not serve the cause of morality unless rational individuals (or firms) negotiate a social contract with some kind of moral content. Gauthier maintains that rational individuals will strive to minimize the *relative* concession they must make to obtain an agreement. That is, each individual's concession is measured relative to that individual's sacrifice that would result from no agreement. Bargaining leads to a *minimax relative concession*, an agreement that minimizes the maximum relative concession of the players. This is essentially the Raiffa-Kalai-Smorodinsky bargaining solution which is discussed below. The solution can be viewed as

incorporating a fairness norm, perhaps due to its resemblance to the Rawlsian maximin principle. It will be seen, however, that the solution can be counterintuitive when there are three or more players.

The normative implications of self-interested rational choice continue to be a subject of interest, particularly for political philosophers. Geoffrey Brennan and Alan Hamlin [4], for example, follow Gauthier's example of analyzing the rationality of dispositional choices, while Russell Hardin [9] takes the more traditional approach of analyzing individual choices. A review of recent work along these lines can be found in [5].

Social Choice Theory

Rational choices have been intensively examined in the social choice theory literature, which generally assumes no particular connection between individual self-interest and social welfare. Rather, it carries out a logical analysis of what it means to agree rationally on social policy when individual preferences differ. It then derives structural characteristics that the resulting social policy must have, some of which may resemble ethical principles (see [7] for a survey of these results). One might therefore conclude, on the basis of purely logical analysis, that it is rational to be ethical, or at least to assent to an ethical social policy.

A perennial issue with this employment of social choice theory is how much normative content is already built into the formal properties of rational agreements. If the negotiators are required to be ethical, then there is little surprise if their agreements are ethical. It is impossible to assess this type of objection without examining the actual derivations in some detail, even if this requires a bit of mathematics. Informal derivations of utilitarian and Rawlsian maximin principle are, therefore, given below, followed by derivations of two bargaining rules that seem to have ethical content.

Deriving the Utilitarian Principle

Social choice theory begins with individual preferences, which are defined over a set of possible states that society might assume. Each state x provides utility $u_i(x)$ to individual i , who prefers state x to state y when $u_i(x) > u_i(y)$. Individuals may rank the states differently, which raises the question of how to rank states in a way that takes into account everyone's preferences. This is the problem of designing a *social welfare function* which ranks the states socially by assigning them social utilities. More precisely, if $u = (u_1, \dots, u_n)$ is a tuple of utility functions, one for each individual, then a social welfare function f_u for u assigns a social utility $f_u(x)$ to each state x . Then x is socially preferable to y if the social utility of x is higher, that is, if $f_u(x) > f_u(y)$.

For example, a utilitarian social welfare function sets $f_u(x) = \sum_i u_i(x)$. That is, state x is preferable to y when x generates more utility across the population.

This kind of calculation obviously assumes that the utilities $u_i(x)$ are comparable across persons, at least to the extent necessary to add them up in a meaningful way.

The issue of interpersonal comparability is in fact a central theme of social choice theory [16], and it is analyzed as follows: The key is to ask how the individual utility functions could be altered without changing the social ranking. Suppose, for example, that each individual's utility is multiplied by the same factor $\beta > 0$. One would not expect this to change the social ranking of states, because it simply rescales the units in which utility is measured. Suppose, however, that the units are rescaled and a different constant α_i is added to each person's utility. That is, each individual's utility u_i is changed to $\beta u_i + \alpha_i$. Should this change the ranking of states? It would not alter a utilitarian ranking, because a state x that is socially preferable to y remains preferable after the utilities are altered. That is, $\sum_i u_i(x) > \sum_i u_i(y)$ if and only if $\sum_i (\beta u_i(x) + \alpha_i) > \sum_i (\beta u_i(y) + \alpha_i)$. Thus, a utilitarian ranking is *invariant* under a utility transformation $\varphi = (\varphi_1, \dots, \varphi_n)$ given by $\varphi_i(u_i) = \beta u_i + \alpha_i$ for each i . It is convenient to call this transformation a *translated rescaling*.

This means that full comparability across persons is unnecessary for a utilitarian calculation to be meaningful. In particular, *level comparability* is not required: It need not be possible to compare the absolute level of person i 's utility with that of person j , because a translated rescaling can make either utility larger, depending on the size of the translations α_i and α_j . However, it must be possible to compare utility *differences* across individuals, because these are unaffected by φ . That is, $u_i(y) - u_i(x) > u_j(y) - u_j(x)$ if and only if $\varphi_i(u_i(y)) - \varphi_i(u_i(x)) > \varphi_j(u_j(y)) - \varphi_j(u_j(x))$. This is called *unit comparability*.

Unit comparability makes a utilitarian social welfare function meaningful, but one can ask if there are further conditions under which the social welfare function *must* be utilitarian. There are. If social choice obeys two formal properties that might be associated with rationality, the social welfare function must be of the form $f_u(x) = \sum_i u_i(x)$.

One property is *anonymity*, which says that it makes no difference which utility function belongs to which individual. Thus, suppose that tuple $v = (v_1, \dots, v_n)$ of individual utility functions is obtained from $u = (u_1, \dots, u_n)$ by renaming the individuals. That is, there is a permutation $\pi(1), \dots, \pi(n)$ for which $(v_1, \dots, v_n) = (u_{\pi(1)}, \dots, u_{\pi(n)})$. Then f_u and f_v must define the same social ranking, that is, $f_u(x) > f_u(y)$ if and only if $f_v(x) > f_v(y)$ for all pairs of states x and y .

There is also a *strict Pareto* condition which requires that the states preferred by all individuals be preferred socially. Formally, if $u_i(x) \geq u_i(y)$ for all i , then $f_u(x) \geq f_u(y)$, and if in addition $u_j(x) > u_j(y)$ for some j , then $f_u(x) > f_u(y)$.¹

Given these conditions and unit comparability, the social welfare function must be utilitarian. The essence of the argument may be seen in the two-person case [3], which is graphed in Fig. 73.1. Each state x generates a utility vector $u(x) = (u_1(x), u_2(x))$ that can be plotted as a point on the graph. All states whose utility vectors appear on the same 45° line running from upper left to lower right have the same total utility. It, therefore, suffices to show that all such states are

Fig. 73.1 Derivation of a utilitarian social welfare function for the two-person case

ranked equally, because the strict Pareto condition then implies that x is ranked higher than y if and only if $u(x)$ appears on a higher 45° line, which is precisely the utilitarian ranking. To show this, consider any utility vector $a = (a_1, a_2)$ on a given 45° line as shown in the figure. Let $a' = (a_2, a_1)$, and let m be the midpoint of the line segment from a to a' . Due to anonymity, a and a' must receive the same ranking. Now suppose, contrary to the claim, that m is preferred to a . The transformation $\varphi(u) = u + b - a$ maps a into m and m into a' . Due to unit comparability, this transformation does not change rankings, and a' is preferred to m . By transitivity, this implies that a' is preferred to a , which is a contradiction. Because a is an arbitrary point on the 45° line, all points on the line must be ranked equally with m and therefore, with each other.

Deriving the Maximin Principle

The maximin principle ranks the states according to the utility of the worst-off individual. The social welfare function is, therefore, $f_u(x) = \min_i \{u_i(x)\}$. The ranking is unchanged when the same monotone increasing transformation is applied to each individual utility. That is, it is invariant under a transformation $\varphi = (\varphi_0, \dots, \varphi_0)$ for which $\varphi_0(u_i) > \varphi_0(v_i)$ whenever $u_i > v_i$. This means that the maximin principle requires level comparability, because the monotonicity of φ_0 implies that $u_i(x) > u_j(x)$ if and only if $\varphi_0(u_i(x)) > \varphi_0(u_j(x))$.

To derive the maximin principle, one additional property called *separability* is required, which states that individuals to whom all states look the same play no role

Fig. 73.2 Derivation of a maximin social welfare function for the two-person case

in the social ranking. More precisely, let S be a subset of individuals i such that for any tuple u of utility functions, $u_i(x)$ is the same for every state x . Then f_u and f_v give the same ranking if for any individual i not in S , $u_i(x) = v_i(x)$ for all states x .

The claim is that given level comparability and the above axioms, the social welfare function must be the maximin function. Curiously, however, these premises imply only that the welfare function is maximin or maximax [6]. The latter maximizes the utility of the *best-off* individual, that is, $f_u(x) = \max_i \{u_i(x)\}$. In order to infer a minimax principle, one must rule out the maximax principle on some other ground.

Again the idea of the argument can be conveyed in the two-person case [3], where separability does not play a role. Let $v = (v_1, v_2)$ as shown in Fig. 73.2 be an arbitrary utility vector, and let $v' = (v_2, v_1)$. Divide the plane into regions about the 45° diagonal line as shown in the figure. Then it suffices to demonstrate that one of two situations must obtain: (a) all the points in regions A, B, C and their reflections A', B', C' (shaded area in Fig. 73.3a) are preferable (or indifferent) to v , and all other points are worse than v , or (b) all the points in regions B, C, E and their reflections (shaded area in Fig. 73.3b) are preferable (or indifferent) to v , and all other points are worse. Case (a) ranks points relative to v by a maximin criterion, and case (b) ranks them by a maximax criterion. Because v is arbitrary, the social welfare function must be maximin or maximax.

Consider any point a in the interior of region A in Fig. 73.2. It can be shown as follows that if a is preferable to v , then case (a) obtains. A similar argument derives case (b) if a is worse than v . Point a cannot be indifferent to v , because if it were the argument to be followed then it would imply that all points in A are indifferent to v , which is impossible because some dominate others due to strict Pareto.

Fig. 73.3 Cases (a) and (b) of the derivation of a maximin social welfare function

Fig. 73.4 A monotone increasing invariance transformation that maps v_1 , a_1 , a_2 , and v_2 to v_1 , b_1 , b_2 , and v_2 , respectively

First, show that all points in the interior of A are preferable to v by considering any other point b in the interior of A . Note that $v_1 > a_1 > a_2 > v_2$ and $v_1 > b_1 > b_2 > v_2$. This means that it is possible to design a monotone increasing transformation φ_0 that maps v to itself and a to b (Fig. 73.4). This implies, by level comparability, that a and b have the same ranking relative to v . Thus, all points in A have the same rank relative to v and are, therefore, preferable to v , as claimed. By anonymity, all points in A' have the same ranking relative to v' , and therefore relative to v because v and v' are symmetric. A similar argument shows that all points in E and E' have the same ranking relative to v . To show that v is preferable to

these points, select any point c in A on the 45° line shown. Then the monotone increasing transformation $\varphi_0(u_i) = u_i + v_i - c_i$ (which is the same for $i = 1, 2$) maps c to v and v to c' . By level comparability, v must be preferable to c' and therefore all points in E . Finally, points in B and C are preferable to v by strict Pareto, as are points in B' and C' by anonymity. Similarly, points in D and F and their reflections are worse than v . Points on the boundaries of the regions are dealt with in a similar fashion, and case (a) follows.

Assessment of the Social Choice Arguments

One can now examine the normative assumptions implicit in the rational choice axioms and their role in making the proofs go through. The strong Pareto condition is rather innocuous and probably begs no interesting ethical issues. The anonymity condition, however, clearly has normative content because it implies impartiality toward individuals. Yet Kantian arguments rest on a similar condition by supposing that a rationale justifying one person's action must justify the same action for anyone to whom the rationale applies. It seems to be a basic trait of rational action that it should depend only on reasons, not who has the reasons. Rationality might similarly dictate that rational choice should depend only on the utilities that result, not on who has the utilities. Anonymity, therefore, seems a reasonable starting point.

Yet anonymity is not central to the proofs. One can derive social welfare criteria with a strong utilitarian or Rawlsian flavor without it. For example, unit comparability without anonymity implies a utilitarian criterion with weights: $f_u(x) = \sum_i w_i u_i(x)$. This is basically because all points on the line connecting any two indifferent points can be shown to have equal rank, using the invariance transformation much as before, and $\sum_i w_i u_i$ is constant along the line for appropriate weights w_i . Also, level comparability without anonymity implies a minimax (or maximax) criterion for all states in which a given individual is worse off, using the same invariance arguments as above. In both proofs, the interpersonal comparability assumption is performing most of the work.

It may seem reasonable to assume unit comparability when deriving a utilitarian function, on the ground that unit comparable makes a utilitarian calculation meaningful. However, unit comparability remains if the ranking is invariant only under a proper subset of translated rescalings, while the proof assumes invariance under *any* translated rescaling. In other words, the proof assumes that utilities have unit comparability and *no more* than unit comparability. This strong assumption is already very close to utilitarianism. A Rawlsian, for example, would immediately object to it because it makes the comparison of worst-off individuals meaningless from the start. If the utility vectors are $(u_1(x), u_2(x)) = (1, 1)$ in state x and $(u_1(y), u_2(y)) = (2, 0)$ in state y , the Rawlsian prefers x because of the higher utility of the worse-off individual. However, a translated rescaling maps these vectors to $(0, 2)$ and $(1, 1)$, respectively, in which the Rawlsian preference is reversed. A similar point applies to the derivation of a maximin welfare function from level comparability.

Fig. 73.5 Nash bargaining solution for two persons

Nash Bargaining

Bargaining theories might be regarded as undertaking a rigorous and mathematical analysis of social contract negotiation. They show that under certain rationality assumptions, bargaining among rational individuals results in agreements that have interesting structural characteristics. These characteristics may also result from a certain kind of bargaining procedure. When the characteristics have an ethical flavor, one might say that there is a reason to be ethical: An ethical arrangement is the result of rational bargaining.

The best-known bargaining theory is due to John Nash [14] and yields the *Nash bargaining solution* (which should not be confused with the Nash equilibrium of noncooperative game theory). Figure 73.5 illustrates the Nash bargaining solution for two persons. The point d represents the utility vector $(u_1(x), u_2(x))$ of a *default* position x . This is the state of affairs before bargaining starts, and the state that remains if bargaining fails. The region under the curve represents the *feasible set*, which is the set of possible agreements consistent with available resources. The point a represents the utility vector $(u_1(y), u_2(y))$ after the players arrive at a deal y . The Nash bargaining solution selects a deal y that maximizes the area of the rectangle shown in Fig. 73.5. In other words, it maximizes the product $(a_1 - d_1)(a_2 - d_2)$. If there are n players, the solution selects $a = (a_1, \dots, a_n)$ to maximize $\prod_i (a_i - d_i)$.

The product formula tends to result in near-maximum utility without overly depriving any one player and can, therefore, be seen as enforcing some kind of fairness. It has enjoyed a degree of acceptance in practical application and is, for example, widely used to allocate bandwidth to information packets in telecommunications networks. The motivation is to obtain near-maximum throughput while not excessively discriminating against packets from any one source.

The Nash bargaining solution has been defended on both axiomatic and procedural grounds. One axiomatic argument assumes *cardinal noncomparability*, which requires that the ranking of utility vectors be invariant under the transformation $\varphi(u) = (\varphi_1(u_1), \dots, \varphi_n(u_n))$, where $\varphi_i(u_i) = \beta_i u_i + \alpha_i$. Note that the scaling

factor β_i can be different for each individual, whereas in unit comparability it is the same. The argument also assumes anonymity and a Pareto condition, as well as *independence of irrelevant alternatives*,² which is necessary if the product criterion is to make sense. It requires that if a is the Nash bargaining solution for a given feasible set, it remains the solution if the set is reduced without excluding a .

It is impressive that a product criterion could be derived from these axioms, and the proof is quite interesting. However, the premises are again strong. While much attention is focused on the independence axiom, it is rather innocuous in this context. The strongest premise, and the one that does most of the work in the proof, is the assumption of cardinal noncomparability. It leaves room for very little interpersonal comparability, because the ranking must be invariant under transformations that can destroy any conception of quantity in the utilities. One can ask how a theory can account for distributive justice if it denies the possibility of comparing individual outcomes to this extent.

There are results showing that certain negotiating procedures terminate in a Nash bargaining solution, although none of the results are straightforward or easy to state. John Harsanyi, for example, showed that the following bargaining procedure converges to a Nash solution [10]. Suppose again that d is the default position. Player 1 makes offer a , and player 2 makes offer b . If p_2 is the probability that player 2 will reject a , then player 1 will stick with offer a (rather than make a counteroffer) if his expected utility $(1 - p_2)a_1 + p_2d_1$ of doing so is greater than the utility b_1 of accepting b , that is, if his estimated value of p_2 is less than $(a_1 - b_1)/(a_1 - d_1) = r_1$. Player 2 makes a similar calculation, and she will stick with offer b if her estimated value of p_1 , the probability that player 1 will reject b , is less than $(b_2 - a_2)/(b_2 - d_2) = r_2$. The key assumption is that it is rational for player 1 to make a counteroffer, rather than player 2, if $r_1 < r_2$. That is, player 1 should counteroffer if the conditions under which he would stick with his offer are stricter than the conditions under which player 2 would stick with her offer. Given this, some elementary algebra shows that each step of the negotiation process improves the product criterion. If there is a minimum distance between offers, bargaining converges to a Nash solution. One must, of course, decide whether the key assumption is reasonable.

Binmore, Rubinstein, and Wolinsky [2] derived that under rather complicated conditions, a somewhat different negotiation strategy converges to a Nash solution. An important element of their framework is the time value of utility: a player is willing to accept somewhat less in order to get an agreement sooner. The equilibrium outcome approaches the Nash solution as the time lapse between offers goes to zero.

Results of this kind are difficult to assess but suggest that a Nash solution is not unrelated to a reasonable bargaining procedure. The Nash solution itself, however, has received criticism. The outcome depends heavily on the default or starting position, a subject of much discussion in the literature. If the starting position is already unfair, then the Nash solution is likely to be unfair as well. To this extent, the Nash solution begs the question of rational allocation. However, this is a problem shared to some degree by most bargaining and social contract theories. The Nash solution can also be counterintuitive even when the default position is

Fig. 73.6 Raiffa-Kalai-Smorodinsky bargaining solution

reasonable. One would expect, for example, that if the feasible set is enlarged, then no player's share should decrease in a rational allocation. There are examples in which a Nash solution violates this expectation, which served as a motivation for the development of Raiffa-Kalai-Smorodinsky bargaining.

Raiffa-Kalai-Smorodinsky Bargaining

The Raiffa-Kalai-Smorodinsky (RKS) bargaining solution is defined with respect to an "ideal" outcome in which each player's utility is maximized [12]. Figure 73.6 illustrates the two-person situation. There is again a default position d and a feasible set. The point g represents an ideal outcome in which each player's share is the maximum possible within the feasible set, regardless of the consequences for the other players. The RKS solution is the best feasible point on the line segment from d to g .

The RKS solution can be seen as the result of making proportional allocations to the players. Each player i has a maximum gain $g_i - d_i$. First, allot each player 10% of his or her maximum gain, then 20%, and so on until further allocations are infeasible. It is clear that enlarging the feasible set can never cause a player's allocation to decrease (*monotonicity*).

The axiomatic derivation of the RKS solution again assumes cardinal noncomparability, anonymity, and a Pareto condition. However, it replaces the independence of irrelevant alternatives with the monotonicity property just mentioned [19]. The derivation is problematic for the same reason as the derivation of the Nash solution: Cardinal noncomparability is a very strong assumption that rules out meaningful comparison of utilities as quantities.

A possible bargaining justification is that the RKS solution achieves the mini-max relative concession mentioned earlier. If player i accepts offer a , the player's concession (with respect to the ideal) is $g_i - a_i$. The concession if negotiation fails is $g_i - d_i$, which means that the *relative* concession is $(g_i - a_i)/(g_i - d_i)$. It might be argued that the players will try to minimize their relative concessions and will reach equilibrium when they minimize the maximum relative concession among

Fig. 73.7 Anomalous example for the RKS bargaining solution, which in this case is the default position d . The feasible set is the shaded triangular area, and the Rawlsian minimax solution is r

them. But minimizing the maximum relative concession is algebraically the same as maximizing the minimum relative gain $(a_i - d_i)/(g_i - d_i)$, which is what the RKS point accomplishes.

In the two-player case, the RKS solution resembles the Rawlsian maximin solution, except that it maximizes the minimum relative gain rather than the minimum utility. It might be seen as having ethical content on that basis. However, it leads to some anomalies when there are three or more players (Fig. 73.7). The line segment from d to g leaves the feasible set at d , which means that d is the RKS solution – scarcely a rational outcome. The Rawlsian maximin solution is r .

Conclusion

Although empirical rational choice theories make no ethical claims, they can have ethical relevance. The rational behavior they attribute to humans may lead to ethical choices. If so, rational choice theory suggests that we not only have a “reason” to be ethical – it is rational to be so – but that we will in fact be ethical much of the time.

Some rational choice theories equate “rational” with “self-interested” and assert that people invariably act out of self-interest. If self-interested action contributes to the general welfare, then presumably one can be ethical simply by yielding to one’s inclination to act out of self-interest, although this popular view is difficult to defend empirically. Recent refinements of Hobbesian social contract arguments take a revisionist approach, suggesting that it may be in one’s self-interest to negotiate agreements that are fair in some sense, and to adopt a disposition to comply with them. The agreements themselves may resemble a Raiffa-Kalai-Smorodinsky (RKS) bargaining solution.

If rational choices are not assumed to be self-interested, they may nonetheless be ethical simply by virtue of their formal properties. The logical implications of rational choices have been extensively explored in social choice theory, with some interesting conclusions. If people aggregate their preferences in a manner that satisfies certain axioms, then the resulting social policy will, for example, be utilitarian or Rawlsian, depending on the degree to which it is meaningful to compare utilities across persons. The interpersonal

comparability assumptions, however, are quite strong because they actually limit the degree of comparability. As a result, they already embody more normative content than, say, the rationalistic premises of Kantian arguments.

A rational bargaining framework may also lead to an agreement that seems ethical in some sense, such as the Nash or RKS bargaining solution. The interpersonal noncomparability assumptions are even stronger in this case, but they perhaps can be circumvented by showing that these bargaining solutions are the outcome of a reasonable bargaining strategy. This may provide a “reason” to make agreements that are ethical in some sense: the agreements would result from rational bargaining in any case. Nash and RKS solutions do not necessarily satisfy standard ethical criteria, however, and they can be quite counterintuitive. Also there is no consensus on how to specify or justify a reasonable default position from which to start bargaining.

One might conclude from all this that the ethical implications of rational choice theory are far from straightforward, but very suggestive. They are much too suggestive to abandon the research program, which might even be profitably expanded. For example, the classical rationalistic assumptions of deontological ethics may describe actual human behavior more than is normally supposed. These assumptions are also minimal, requiring only an anonymity axiom: Reasons justify an action for one agent only if they justify it for any agent to whom the reasons apply.

An extremely popular economics game, the ultimatum game, illustrates this point. Half the players receive, say, 100 euros and are given the option of donating any portion of the gift to an anonymous recipient in the other half of the group. If the recipient rejects the donation, both the donor and recipient lose their money. The rationally self-interested choices seem obvious: The donor should give one euro, and the recipient should accept it. However, the average donor gives away about one third of the money, and many give away half. The game is frequently interpreted as showing how irrational human beings can be. However, giving away half the money, and accepting the gift, is the Rawlsian maximin solution. An alternative interpretation of the game is that people are entirely rational but in a different sense: They are rational Kantian agents, and a maximin solution, therefore, seems reasonable.

Homo economicus has invested heavily in the self-interest motive. We train ourselves to respond to it. Our belief in it approaches irrational ideology, as witnessed by the enormous popularity of psychological egoism despite much evidence of its falsehood, and our insistence on quoting such figures as Adam Smith out of context. The business world, in particular, relies on self-interest instinctively. When a manager wants to induce people to work together toward a common goal, personal incentives are the most obvious and most easily manipulated tool at hand.

At the same time, we rely on the inherent rationality of ethical behavior. In the Western world, at least, we tend to obey laws that seem reasonable to us and break those that do not. Because compliance with the law is largely voluntary in any but a police state, we must construct a rationale that justifies legal and ethical

conduct in our minds, and we have been doing so for centuries. Such classic works as Blackstone's *Commentaries on the Laws of England*, and countless closely reasoned judicial opinions, provide a rational basis for law. Ethical philosophy has rested heavily on rational persuasion, not only in the classical works of antiquity and the rationalistic theories of enlightenment thinkers, but in the Christian and Islamic traditions as well. Even in the business world, some wise managers have discovered that convincing workers of the company's positive contribution to society motivates them as strongly as appeals to self-interest.

An alternative to emphasizing self-interest as a primary motivator, and attempting to show that rational self-interest leads to ethical behavior, is to recognize that we are perfectly capable of acting rationally in a broader sense – a sense that is already ethical because of its anonymity assumptions. More importantly, we can cultivate a disposition to be rational, much as we have cultivated a reliance on self-interest. Empirical rational choice theories can explore this possibility and, in so doing, guide our moral development.

Notes

1. An *independence* property is also presupposed, which requires that the ranking of x and y be independent of the utilities of other states. This is implicit in the assumption that one can rank x and y by comparing the values of some social welfare function on x and y .
2. This is not identical to the axiom of the same name used in the proof of Arrow's famous impossibility theorem.

Abstract

The scientific study of morals has been subject to a tremendous change throughout the past decades, eliciting various theoretical models, paradigms, and methodologies from disciplines as philosophy, social and developmental psychology, cognitive science, or anthropology. This chapter reviews some of the main approaches to study human moral judgment scientifically in their chronological order. The review will take off at the rational theories of Jean Piaget and Lawrence Kohlberg, who considered moral judgment to be based on a process of explicit cognitive reasoning [1, 2], and move right through to Elliot Turiel's attempt to distinguish conventional from moral (cognitive) domains [3]. This chapter then pays attention to current approaches, which particularly emphasize on the role of emotions on moral judgment (Jonathan Haidt's Social Intuitionist Model and Joshua Greene's Dual-Process Theory, see [4, 5]), and to the discussion on whether or not moral judgment is based on an innate moral grammar instead of being culturally shaped primarily (John Mikhail's Moral Grammar Theory, [6]). Each approach is reviewed and evaluated by its respective research questions, theoretical model, and specific methodological paradigms. This chapter concludes with current directions in developmental psychology and with a brief discussion of the future of a genuinely interdisciplinary field of research that presumably will have to undergo further changes in attempt to integrate

diverse approaches into one coherent and complex field of research – a field that hopefully will continue evoking novel and exceptional research in both psychology and philosophy.

Introduction

Imagine you agreed to participate in a psychological study. You are therefore calmly sitting in the laboratory waiting for the task you are expected to complete. You then hear that you are asked to judge a story in which a protagonist is confronted with a train that ran out of control and the choice of whether or not it is permissible to turn a switch to prevent killing five people while accepting to kill another person [6]. This – as astonishing as it may seem at a first glance – is one of the typical scenarios scientists make use when attempting to study human moral judgment. The laboratory setting and dilemma may also appear rather artificial to the readers of this chapter. Consider then that you probably use your best endeavor to instruct your children not to harm others, to share resources, or to follow the rules of etiquette at the table – behavior that developmental psychologist may later test in behavioral laboratory studies similar to the one described above. Scenarios such as this one belong to the diverse field of scientific research on morals.

In the past few decades, the attempt to investigate the nature of moral judgment (and of moral behavior), that is, of people's sense of harm, welfare, fairness, altruism, or cooperation, has increased tremendously and has become an area of genuinely multidisciplinary research with insights contributed by disciplines such as philosophy, social and developmental psychology, cognitive science, anthropology, or primatology. The study of morals thus has undertaken a tremendous change, veering away from classical (philosophical) approaches such as thought experiments to systematic experimental research in (psychological) laboratories (see also [7]). This chapter aims at describing this tremendous change in the study of morals, illustrating what merit such a growing and diverse area of research may have to the philosophical study of morals.

Before reviewing the methods and measures attempting to tackle analysis of any human behavior, as a starting point, one certainly first would need a clear definition of the behavior under investigation. Yet, unfortunately so far no clear definition of morality has been unanimously accepted in either psychology or philosophy. By contrast, there is an ongoing debate about what does (and does not) constitute human moral judgment among social psychologists (see [8], for an overview of this process). What at least seems to be modestly agreed upon is that human morality comprises how we evaluate other people or events, and how we treat each other, or care for each other in terms of justice, fairness, and physical and psychological welfare. This thus will serve as – an admittedly sketchy – working definition for the current purpose.

Even though the debate currently shows no sign of emerging consent, it also is an indicator of what an equal opportunity and challenge interdisciplinary research may constitute for an area of research. Besides disagreements about definitions or

terminology, each area also brings along its own methodological approach to the scientific study of morals because research paradigms and measures are depending on the respective definitions of morals and the diverging research questions. The questions, for example, range from whether or not moral judgment is innate and hence universally similar among humans instead of being subject to intense cultural shaping (see, e.g., [5, 9, 10], for overviews on these discussions), whether or not moral judgment is a discrete, domain-specific cognitive ability instead of a subcategory of a more domain-general ability (e.g., [10–12]), to whether or not emotions are a constitutive rather than a modulating part of moral judgment (e.g., [4, 5]). Given these diverging questions and hypotheses, one might easily guess why there are still disagreements and sometimes misunderstandings across the different disciplines (and sometimes even within the same discipline). Yet, every single direction and discipline also contributes to shedding light on an understanding of human morality.

Given the authors' background in cognitive and developmental psychology (and philosophy for one of us), in this chapter, we will attempt to (a) put across an understandable review of the main methodological (i.e., empirical) methods and findings that have been applied in cognitive science and developmental psychology and (b) emphasize on the idea of how these diverse methods and findings may help in understanding human's morality. This chapter, however, cannot provide an exhaustive review of all research agendas that were or currently are investigating this important area. We will therefore constrain our review to the study of human moral judgment, thereby omitting the huge area of research on human moral behavior – and with it especially the area of game theory [13].

This chapter will be structured as follows: Since each approach used its contemporary method and paradigms, we decided to introduce the different approaches in roughly chronological order. That is, we will start by characterizing early attempts to systematically and empirically investigate human moral judgment in developmental psychology, attempts that were highly influenced by the cognitive revolution. We will then turn to research with adults, investigating what role emotions might play in moral judgment (hence called the “emotional revolution” in the study of morals), and will then return to developmental psychology, which recently is recapturing the study of moral judgment to some extent investigating the ontogenetic (and evolutionary) sources of human morality. Where applicable, each approach will be characterized by its initial research question, its theoretical underpinning, its usual main method and paradigm, and its main findings.

Sketching the Scientific Study of Moral Judgment

The Origins of the Scientific Study of Morals: Rational Theories

Piaget's Stage Theory

The scientific study of morals had its beginnings in developmental (and cognitive) psychology when Jean Piaget observed children in free play situations, for

example, when children played marble games together [2]. He found that especially school-aged children actively constructed and defended the rules of their games both, while playing together and when later being interviewed by an adult. Piaget thus considered these play contexts (i.e., “social systems”) as a cradle of human moral judgment. Similarly as postulated for the whole cognitive system and each cognitive domain [14], Piaget then extracted a theory of major conceptual changes that bring about substantial changes in children’s moral judgment from his observations: He claimed that when children begin to reason on moral issues for the first time around the age of 5 years, they take a so-called heteronomous stance and adopt rules from authorities without considering the rules’ justifications or appropriateness. When judging actions, children were understood to merely base their judgments on the outcome and consequences of these actions. After the age of 10 years, however, children achieve what Piaget called an “autonomous” stance that allows them to understand the social constructivist and partly arbitrary nature of rules, which then allows them to consider and question the rules’ qualification and appropriateness. When judging actions, children were then understood to base their judgments more on the initial intention of the actors instead of the mere outcome of these actions. Piaget thus generated his theory of moral judgments from his initial method: observing and interviewing children in their natural play situations, extracting the main consistent characters of children’s interactions and responses in interviews, and integrating them into his general theory of cognitive development [14]. With all the merit he therefore deserves for initiating a systematic and methodological approach to moral judgment, his theory still remained somewhat broad and unspecific.

Kohlberg’s Stage Theory

Method

Piaget’s theory [2] was subsequently refined by one of his own scholars, Lawrence Kohlberg, who extended the rather vague stages of Piaget (including the “pre-moral” stage of children under the age of 5 years) to more consistent and structured stages of cognitive moral judgment. These additionally covered older age groups, that is, adolescents and adults (see [15], for overview, [1]). Similarly to Piaget, Kohlberg attempted to show that moral reasoning is a universal, stage-like developing skill that – based on a general conceptual cognitive change – passed from an egocentric, authority-dependent reasoning in early childhood to a more socially oriented and authority-independent reasoning later on. His method, although inspired by Piaget in that he also relied on subjects’ verbal judgments in interviews, still was more systematic in that participants were presented with hypothetical moral dilemmas they had to judge (as opposed to judging or justifying their own behavior). One of the most famous dilemmas is the “Heinz dilemma” in which a husband desperately seeks to obtain a medication for his seriously ill wife. The dilemma goes as follows (see [1], p. 640ff):

In Europe, a woman was near death from a special kind of cancer. There was one drug that the doctors thought might save her. It was a form of radium that a druggist in the same town had recently discovered. The drug was expensive to make, but the druggist was charging ten times what the drug cost him to make. He paid \$400 for the radium and charged \$4,000 for a small dose of the drug. The sick woman's husband, Heinz, went to everyone he knew to borrow the money and tried every legal means, but he could only get together about \$2,000, which is half of what it cost. He told the druggist that his wife was dying, and asked him to sell it cheaper or let him pay later. But the druggist said, "No, I discovered the drug and I'm going to make money from it." So, having tried every legal means, Heinz gets desperate and considers breaking into the man's store to steal the drug for his wife.

Subjects' task then was to decide whether or not Heinz should steal the medication and to justify their response. The contents of these responses were systematically analyzed according to standardized orientations and concepts such as normative order, utility consequences, (punitive) justice, or fairness.

Theory

From these findings, Kohlberg generated three (by now famous) main moral stages (with two substages, respectively): First is the "preconventional stage" or "concrete individual perspective" ([1], p. 177) in which people (mainly children until the age of 9 years) judge others' and their own actions as orientated on the outcome and consequences of these actions (e.g., impending punishments), on people's personal needs, and on reciprocity (i.e., "tit-for-tat" exchanges). Then follows the so-called conventional stage or member-of-society perspective in which people orient their judgments on the intentions of actions, on social approval, social orders, and on the conventional expectations that together allow for coordinating social systems. This stage was claimed to be reached by most adolescents and adults. The postulated highest stage is the "postconventional stage" or "prior-to-society perspective" in which people reorient from their proximate surrounding to a more distal surrounding of the majority of a whole social system, on human rights, universal ethic principles, or social contracts. According to Kohlberg, this stage is only achieved by some adults after the age of 20 years [16].

Similarly to Piaget [2], Kohlberg generated the core structure of his stage model by empirical data, that is, out of the subjects' responses and justifications of the hypothetical dilemmas. However, the original sample on which Kohlberg based his model was fairly restricted in that male subjects were highly overrepresented. This thus puts his theory on rather shaky grounds. Moreover, findings from longitudinal studies (i.e., studies accompanying and examining the same subjects for a longer period) challenged the originally postulated fixed stage-like hierarchical

development from lower to higher stages with no possibility of regression back to lower stages by a person. In particular, Kohlberg himself found that some adolescents may “regress” from stage 2 back to stage 1 before finally achieving stage 3 [16].

Morals and Conventions: Turiel’s Domain Theory

These findings led some researchers to seriously query Piaget’s [2] and Kohlberg’s [1] also called “rational theories,” particularly their postulated fixed stage-like sequence of development. Among other aspects, these researchers understood human cognitive development not as equating with abrupt changes of the organization of general cognitive concepts but rather as a gradual shift from one concept to a new concept. These changes were conceived as being initiated by new experiences with the environment that challenged already existing concepts. Turiel further attempted to prove that the development of social-cognitive structures is organized by domain-specific areas with moral (and conventional) judgments as special types of “fundamental categories” ([3], p. 20). He and his colleagues dissociated the fixed moral stages (particularly the “postconventional stage”) postulated by Piaget and Kohlberg into differentiated conventional and moral domains (hence the term “domain theory,” see [3, 17–21], for overviews). These domains were considered to develop gradually along specific lines instead of “jumping” qualitatively from one stage to the next; the developmental trajectories were seen as being based on an individual’s reciprocal interaction with the environment. Prescriptions assigned to the moral domain hence are judgments about events that are obligatory, universally applicable, impersonal, and concern the concepts of justice, welfare, or rights. In Turiel and colleagues’ view, these prescriptions are acquired in ontogeny by children interacting with others and are triggered by intrinsic consequences on rights and welfare of others. Prescriptions assigned to the conventional domain, in turn, are similar to Searle’s “constitutive rules” of social organizations [22]. These judgments thus were understood as based on general agreements and rules that are accepted within one social organization by way of knowledge of all members of this organization but that are actually arbitrary and contextual so that they could potentially be different in other social organizations. In Turiel’s view, these conventional rules are acquired by experiencing the specific rules of a given social system in which children are raised [23].

Method and Evidence

For the first time in the scientific study of morals, a theory emerged as a consequence (i.e., as a contraposition) of a previous existing theory (namely, the rational theories).

Turiel’s method, however, resembled those of Piaget [2] and Kohlberg [1] at least to some extent, in that he and his colleagues observed young children’s interactions in their naturalistic surroundings (their schools and playgrounds) and later interviewed the children about previously occurred events. Hence, once the

preschoolers and schoolchildren had witnessed an event (e.g., a transgression against scholar rules), they were briefly interviewed by a trained adult. What the researchers congruently found was that the majority of children judged transgressions of conventional rules as being permissible in different contexts, whereas they judged transgressions of moral rules as barely permissible in any context. For example, children said that if there were no such rule as to be quiet in school yard, it would be admissible to be noisy whereas hitting another student would remain impermissible in all schools because hitting hurts others (e.g., [23, 24]).

Further, in an attempt to assess children's moral and conventional judgment more systematically (i.e., more scientifically), the experimenters presented children with individual standardized and stimulus-driven interviews in which children had to judge pictures or vignettes describing scenarios of supposedly moral or conventional transgressions (e.g., lying toward or hitting someone vs. addressing a teacher with her first name or chewing gum in class). Children's responses were then rated along dimensions such as obligatoriness, universality, relativism, social consensus, or institutional status. Children's justifications of their responses were furthermore classified along categories such as appeal to authority, to custom or tradition, or to others' welfare. They found that even the youngest children tested, 3-year-olds, were susceptible to the assumed difference between the domains (although their comprehension naturally was still rudimentary; [25]). As expected, older age groups were clearer in the conceptual distinction of the two domains [26, 27]. Ensuing this, the findings were replicated in various studies with different age groups and cultures (e.g., [28, 29]), in specific samples such as nontypically developing children with autism [30], children with behavioral misconduct [31, 32], and psychopaths [33, 34].

However, even though the evidence of two domains seems convincing at first glance, recent research challenges the postulated clear distinction between moral and conventional prescriptions and argues that the proposed pattern may have been evoked by a limited set of stimuli that were more or less restricted to Western school yards [5, 35]. Ironically, Turiel's findings and theory now stood on shaky grounds just as Kohlberg's had previously ([1], see above).

Moreover and perhaps more importantly, other areas of psychology and philosophy piped up and claimed that developmental psychology had merely focused on the cognitive aspect of moral judgments. It therewith had undermined the role of emotions and intuitions that may affect moral judgments tremendously (see below). The now called "emotional revolution" had begun.

The Role of Emotions: Haidt's Social Intuitionist Model Theory

Haidt's Social Intuitionist Model (henceforth SIM; [5, 36]) can be illustrated excellently by contrasting it with Kohlberg's rationalist approach. While Kohlberg's [1] research was based on the assumption that subjects reach a moral judgment by applying conscious moral reasoning, Haidt's SIM highlights the role of moral intuitions. Consider the following scenario [36]:

Julie and Mark are brother and sister. They are traveling together in France on summer vacation from college. One night they are staying alone in a cabin near the beach. They decide that it would be interesting and fun if they tried making love. At the very least it would be a new experience for each of them. Julie was already taking birth control pills, but Mark uses a condom too, just to be safe. They both enjoy making love, but they decide not to do it again. They keep that night as a special secret, which makes them feel even closer to each other. What do you think about that?

Was it OK for them to make love?

Most subjects who are presented with this scenario immediately judge the behavior of the siblings as wrong [36]. When asked for the reason of their judgment, they point to the danger of inbreeding or emotional disturbances, for example. Yet, when reminded of the two forms of birth control used and the fact that harm befell neither Mark nor Julie, most subjects eventually arrive at a point where they run out of reasons. However, the majority does not change their moral judgment but rather says something like “I don’t know, I can’t explain it, I just know it’s wrong.” According to Haidt, subjects behavior in this and similar studies can be seen as evidence for the main claim of the SIM, namely, that moral judgments are not caused by moral reasoning but rather by moral intuition.

In order to avoid misunderstandings, it is helpful at this point to spell out how Haidt understands and uses the concepts of moral intuition and moral reasoning. It might stand to reason to equate the difference between moral reasoning and moral intuition with the difference between cognition and affect. However, this is not the difference Haidt has in mind since “affect” often seems to imply that no computation or information processing is involved. Instead, both moral reasoning and moral intuition are considered as forms of cognition. Here are the definitions of these two concepts ([37], p. 998):

Moral intuition refers to fast, automatic, and (usually) affect-laden processes in which an evaluative feeling of good-bad or like-dislike (about the actions or character of a person) appears in consciousness without any awareness of having gone through steps of search, weighing evidence, or inferring a conclusion.

Moral reasoning, in contrast, is a controlled and “cooler” (less affective) process; it is conscious mental activity that consists of transforming information about people and their actions in order to reach a moral judgment or decision.

With these definitions at hand, we are sufficiently prepared to explore the SIM in more detail. As already mentioned, moral intuition plays the crucial role in moral judgment while moral reasoning is subordinated. Compared with rationalist approaches of moral judgment, moral reasoning and moral intuitions have switched roles. According to rationalist approaches, reasoning is, so to say, the master who causes moral judgment. Moral intuition is merely treated as a kind of slave who can sometimes give input in form of evaluative feelings to the reasoning process but who cannot, at least not directly, cause moral judgment (cf. [36], [38], p. 69). Contrary to

that, the SIM considers moral intuition as the master of moral judgment and reasoning as a mere slave whose main task is to support moral intuitions by providing post hoc reasons for the respective judgment (although these reasons have not caused the moral judgment). It is easy to see how this picture can be applied to explain subjects' behavior in the study outlined above. When subjects read about siblings having sex, they immediately had an instant reaction that probably involved a flash of negative affect. This moral intuition caused the moral judgment that the siblings behaved morally wrong. Moral reasoning only comes into play to justify and support the moral intuition with (in this case bad) post hoc reasons. The assistant role of moral reasoning becomes clear at the point when subjects run out of reasons supporting their initial judgment but nevertheless stick to it. According to the SIM, moral judgment has a great deal in common with esthetic judgments (cf. [39]). When making esthetic judgments, we do not really analyze, for example, a painting but rather have an immediate evaluative feeling. Often, we cannot explain why we like or dislike a painting. We just do. We might come up with some reasons, but it is far from clear whether these reasons have caused our esthetic judgment.

As the name of Haidt's Model already suggest, a social component in moral decision making is assumed. The SIM claims that people are highly attuned to the emergence of group norms and, because of this, are often influenced by moral judgments made by their friends, relatives, and so on. This kind of influence is assumed to happen without reasoned persuasion. The mere fact a person A judges an action X as morally wrong might lead person B to believe X to be wrong. In some cases, this social force only elicits outward conformity [40]. However, often, people's moral judgments are directly influenced and shaped by the judgments of others, especially when situations are not unambiguous to interpret [41].

One might wonder at this point whether moral reasoning has any force at all. Haidt would probably answer that reasoning can influence our moral judgment, but that this influence is very limited and only occurs rarely. According to the SIM, moral reasoning causes our moral judgment in only very few cases, primarily when we do not have a strong initial intuition. Moreover, reasoning can indirectly influence our moral judgment. When thinking about an action or situation from another angle, new intuitions, which can in turn override our initial intuition, can be triggered. Of course, by triggering new intuitions, we can change not only our initial judgment but also moral judgments of other people. However, directly influencing a person's moral judgment, that is, without trying to modify an initial intuition or by triggering new intuitions, is virtually impossible according to the SIM.

Kohlberg's rationalist account and Haidt's SIM do not only differ with regard to the question of what determines moral judgment (reason vs. intuition) but also with regard to the purpose of moral reasoning. In order to illustrate the purpose of moral reasoning, Haidt uses the metaphor of an "intuitive lawyer and/or intuitive politician" [5]. This metaphor is, again, very different from the metaphor of the "intuitive scientist" which was often used to describe people during the cognitive revolution (see above). The intuitive scientist analyzes evidence of everyday experience, thereby forming internal representations of the world that become more and more accurate and complete. What the intuitive scientist is searching for is a true picture

of the world. Applied to moral reasoning, the intuitive scientist tries to build a system of moral values, principles, and rules that becomes more and more coherent by thinking hard about moral questions. In contrast to this, the SIM claims that “moral reasoning is like that of a lawyer or politician seeking whatever is useful, whether or not it is true.” Haidt, as a social psychologist, sees a person as a “social agent embedded in a . . . social order, and moral thinking is done in order to help the social agent succeed in the social order” ([5], p. 808).

Method and Evidence

According to the SIM, moral intuitions include an evaluative feeling and play the main role in moral judgment. Hence, it is not surprising that most studies designed to support the SIM deal with (manipulating) participants’ emotions and their effect on moral judgments.

The first study we are discussing was conducted by Wheatley and Haidt [42] and made use of hypnosis in order to manipulate subjects’ emotions. In the first of two experiments, participants took part in small group sessions and were given a posthypnotic suggestion to experience “a brief pang of disgust. . . a sickening feeling in your stomach” whenever they read a certain word. They were then presented with some vignettes about moral transgressions (student selling library books, a congressman taking bribes, etc.). Each vignette was available in two versions: One contained the word supposed to induce disgust, the other one did not. According to the SIM, the transgressions containing the disgust-inducing word will be judged harsher than its “neutral” counterparts. The results were in line with this prediction, that is, subjects actually judged moral transgressions significantly harsher if their descriptions contained the disgust-inducing word.

In the second experiment, a story was added that did not contain a moral transgression. It goes as follows:

Dan is a student council representative at his school. This semester he is in charge of scheduling discussions about academic issues. He tries to take topics that appeal to both professors and students in order to stimulate discussion.

Although this scenario description does not contain any moral transgression, subjects judged Dan’s behavior harsher when the hypnotic word was part of the description. Furthermore, the claimed post hoc nature of moral reasoning was nicely illustrated. For instance, one subject wrote “It just seems like he’s up to something”; another one viewed Dan as a “popularity-seeking snob.”

In the study just described, subjects’ emotions were manipulated by hypnotizing them. Of course there are other, more common, ways to achieve this goal. For instance, sensory stimuli not related to the moral question can cause flashes of affect and were used in several studies.

Further evidence supporting the SIM comes from people with emotional deficits. For instance, research on psychopaths seems to show that their lack of emotional reactions that make nonpathologic people care is the main factor why they do not follow norms and hurt people. It is worth noting that these psychopaths do know most social and moral norms. Moreover, it is not that they do not experience any emotions at all but nonetheless lack the ability to feel the specific set of emotions that normally would make sure that we care about other people (sympathy, shame, guilt, etc.). Schnall, Haidt, Clore, and Jordan [43], for example, showed that subjects who scored high on a scale measuring body consciousness made harsher moral judgments when the moral judgment was made in a bad-smelling environment (implemented by fart spray). Eskine, Kacirik, and Prinz [44] focused on the smell sense and found that bitter-tasting beverages made moral judgments harsher as well. Valdesolo and DeSteno [45] found a way to counteract a harsh moral judgment by letting subjects watch a comedy video immediately before they were asked for their moral judgment.

Discussion

Haidt is to be credited for showing that nonreasoning processes play an important role in moral judgment (cf. [46]). The evidence for this claim is overwhelming. However, there are also some shortcomings in his theory. For instance, the relation between the eliciting situation and the corresponding intuition is rather opaque. This is the reason why the SIM often does not allow inferring on how people will judge a specific action. In order to illustrate this point, consider the following scenario that is one version of the so-called trolley dilemmas, which have their origin in philosophical thought experiments and became also very popular in empirical psychological research ([47, 48], for the philosophical origins; see [49], for this specific version):

On the test ground of a modern railroad property an unmanned speed-train (that normally can be remote-controlled) is out of control due to a technical defect. This speed-train is heading towards three railroad workers that are maintaining the tracks. Since these workers are wearing a novel type of hearing protection, they would not notice the speed-train on time and hence would be run over by it. Carl, an employee of the rail track control center, recognizes the upcoming accident. However, it is not possible to stop the train on time any more.

There is only one possibility to avoid the death of the three workers: Carl could throw the switch and thereby redirect the speed-train from the main track onto a parallel track before it reaches the three workers. On the parallel track the speed-train would collide with a train carrying one worker. The one worker would lose his life in this accident.

Should Carl do the proposed action?

What would the SIM predict with regard to the question of whether Carl should do the proposed action? The answer seems to be nothing because without elaborating the relation between the eliciting situation and the corresponding intuition the theory does not, and cannot, make predictions for such cases.

Furthermore, the claim that intuition is virtually always primary seems to be too radical. Consider, for example, the scenario described at the beginning (siblings having safer sex). Although very strong flashes of disgust are elicited, there were still subjects who judged that the siblings' behavior was okay because they could not find a reason why it should not be okay. It seems plausible to claim that in situations in which weaker flashes of affect are involved, reasoning can often trump initial intuitions [50].

Greene's Dual-Process Theory

Greene's Dual-Process Theory (DPT) of moral judgment can be characterized as steering a middle course between rationalist and intuitionist theories. While both these theories assume that moral judgment is dominated by moral reasoning and moral intuition, respectively, and that the relation of these two processing styles is a dependent one in the sense that the dominated process serves the purpose of the other, Greene's DPT assumes these two kinds of moral processing to be independent of each other and, in some sense, of equal value. According to the DPT, moral judgment is a complex interplay of these two distinct styles of processing, both of which trying to get the upper hand [4, 51, 52]. Although these two styles of processing are called "cognitive" and "emotional," respectively, in the framework of the DPT, they seem to capture the same concepts Haidt had in mind when differentiating between moral reasoning and moral intuition.

Whether emotional or cognitive processes determine moral judgment depends on the properties of the specific scenario. According to the DPT, emotional processing is triggered by scenarios containing a "personal" moral violation while cognitive processes prevail in "impersonal" scenarios. The distinction is made in the following way ([51], p. 2107):

A moral violation is personal if it is: (i) likely to cause serious bodily harm, (ii) regarding a particular person, (iii) of such nature that the harm does not result from the deflection of an existing threat onto a different party.

A moral violation is impersonal if it fails to meet these criteria.

In order to illustrate this difference, we can consider the two most popular trolley dilemmas. The first trolley dilemma is usually called "Bystander" and was already described above (redirecting a train from five persons to one). In this scenario, the third condition is not met because the action is a case of harm resulting from the deflection of an existing threat onto a different party. Hence, the Bystander scenario is an example of an impersonal moral violation. Since an impersonal violation does not trigger emotional processing, cognitive processes entailing comparison of the consequences arise (five persons die vs. one person dies). This, according to the DPT, is the reason why most people find it permissible to act in the Bystander

dilemma (cf. [11]). In the so-called Footbridge dilemma, the only possibility to rescue the five persons is to push a fat man from a bridge in front of the trolley, killing him but rescuing the others. The great majority of subjects judge the proposed action as impermissible (cf. [11]). The reason, according to the DPT, is that the Footbridge scenario entails a personal moral violation that triggers negative emotional responses, causing subjects to judge the action as impermissible.

Greene's research agenda is a good example of how investigating moral judgments can profit from other disciplines as well as it might influence them. For instance, DPT claims that the aforementioned two processing styles have their origin in different brain areas. In two by now well-known studies, Greene and colleagues ([51], see also next paragraph) used functional magnetic resonance imaging (fMRI) to support the DPT. The results of such and other studies also have, as Greene claims, implications for other disciplines than psychology [4]. For instance, Greene argues that the two processing styles and their corresponding brain areas reflect the two dominant moral theories in philosophy: utilitarianism (or consequentialism more general) and deontology. Put in a nutshell, utilitarianism claims that the moral status of an action solely depends on the (expected) consequences, while deontological theories take other considerations (e.g., rights, duties) into account that can make an action wrong although it would lead to the best consequences (cf. [53, 54]). Consider the previously discussed trolley dilemmas. According to utilitarianism, in both scenarios, the action leading to only one death is the right one because one dead person is a better consequence than five dead persons. Deontology, in contrast, might allow redirecting the trolley although this action kills a person. The reason for this is a deontological principle that allows causing harm in cases in which the harm is brought about unintentionally. However, deontological theories would certainly forbid pushing the fat man from the bridge since in this case the killing of the man would be necessary to stop the train, and therefore, it cannot reasonably be claimed that the death was not intended. According to Greene, deontological judgments are based on emotional responses while utilitarian judgments are rather the effect of controlled cognitive processes comparing consequences and inhibiting the impact of emotional responses [4].

Method and Evidence

As already mentioned, Greene and colleagues used functional magnetic resonance imaging (fMRI), a neuroimaging method allowing to measure activities in different parts of the brain. The first study [51] of this kind aimed to explain why subjects find it okay to act in the trolley dilemma but judge the proposed action in footbridge as forbidden, although the numbers of lives at stake do not differ. To prove whether these moral judgments arise due to different degrees in the tendency to engage subjects' emotions, they used a battery of 60 moral dilemmas, divided into moral and nonmoral scenarios. The moral scenarios were then divided into personal and impersonal dilemmas. Subjects had to judge the proposed action in these scenarios while their brain activity was measured. The obtained data revealed that medial portions of Brodmann's Areas (BA) 9 and 10 (medial frontal gyrus), BA 31 (posterior cingulated gyrus), and BA 39 (angular gyrus, bilateral) were significantly

more active in the moral-personal condition than in the moral-impersonal and the nonmoral conditions. These areas have typically been associated with emotions in other functional-imaging studies. In contrast to these areas, BA 46 (middle frontal gyrus, right) and BA 7/40 (parietal lobe, bilateral) were activated less during emotional processing. These brain areas are associated with working memory. No significant differences of activation between the moral-impersonal and the nonmoral condition were found in BA 39 (bilateral), BA 46, and BA 7/40 (bilateral). In summary, the results were in line with the predictions made by the DPT.

DPT claims that brain areas associated with utilitarian judgments normally are responsible for controlled cognitive processes. This claim leads to the hypothesis that cognitive load will selectively interfere with utilitarian judgments. Greene and colleagues [55] therefore used high-conflict dilemmas, that is, dilemmas in which utilitarian principles were in sharp conflict with deontological ones, to test this hypothesis. Here is one dilemma supposed to capture this conflict ([55], p. 1147):

Enemy soldiers have taken over your village. They have orders to kill all remaining civilians. You and some of your townspeople have sought refuge in the cellar of a large house. Outside you hear the voices of soldiers who have come to search the house for valuables. Your baby begins to cry loudly. You cover his mouth to block the sound. If you remove your hand from his mouth his crying will summon the attention of the soldiers who will kill you, your child, and the others hiding out in the cellar. To save yourself and the others you must smother your child to death. Is it appropriate for you to smother your child in order to save yourself and the other townspeople?

Cognitive load was implemented by presenting numbers below the scenario description and giving the subjects the task to push a button every time a “5” appears on the screen. DPT predicts that only utilitarian judgments will be affected by cognitive load. The results of this experiment support this prediction: Only the reaction times for utilitarian judgments under cognitive load increased while there was no such effect for nonutilitarian judgments. Suter and Hertwig [56] found in a related experiment in which the time subjects had to judge a certain action was manipulated that shorter times increased the probability of deontological judgments.

Further evidence comes from studies testing patients with emotional deficits (e.g., [57]). These subjects chose the utilitarian option significantly more often than nonimpaired judgments. Moreover, Moore and colleagues [58] found that subjects with higher working memory capacity were also more likely to approve of utilitarian actions.

Discussion

Greene’s DPT allows both moral reasoning and moral intuition/emotion to play a role in moral judgment. This feature makes the theory pretty flexible and less likely to run into counterexamples. However, the DPT has drawn a number of

critiques. One class of objections claims that there are alternative, sometimes more parsimonious, explanations available that can make sense of the data obtained in the neuroimaging study. Prinz [59] argues that the pattern of brain activation can also be explained by the view that the dilemmas triggered a strong emotional response to harming the innocent bystander and a weaker emotional response to saving the five. Adding the plausible assumption that scenarios differ regarding the salience of harming the innocent bystander versus saving the five, the data is also consistent with Prinz' view. Moll and De Oliveira-Souza [60] also suggest an alternative interpretation of the data. In their view, differential activations of brain areas underlie different prosocial emotions which integrate emotional and cognitive processes rather than putting them in conflict. Furthermore, apart from the more economical explanations just described, there are several other versions of two process theories than Greene's DPT which equally can make sense of the data. Furthermore, the designs and methods of Greene's studies have some flaws that do not allow the inferences Greene's draw. Kahane and Shackl [61], for example, criticize that in many cases Greene's classification of deontological and utilitarian judgments is erroneous. They gave Greene's classification to professional philosophers and found philosophers to agree with Greene's classification in only about half of the dilemmas.

Another point of critique can be made concerning Greene's claims that his research shows that deontological and utilitarian judgments correspond to the emotional and the cognitive area of the brain, respectively. Deontological theories are very diverse and change over time. Therefore, it is not inconceivable that once there might be deontological principles or theories that forbid an emotional judgment but allow a rather cognitive judgment for a selected few instances. Although one might object that normally the deontological judgment is also the emotional judgment, the mere conceptual possibility of deontological judgments being independent from emotional judgments casts doubt on specific brain areas reflecting a normative moral theory.

One point of critique regarding Haidt's SIM was that this theory often does not allow inference on how people will judge a specific action. The same is so far true with regard to the DPT since this theory is not yet elaborated enough as well. Besides Greene seeming to aim to replace ambiguous concepts such as "emotional" with more concrete concepts [62], there is another line of research currently attempting to specify more systematically how and why people judge specific actions, in this case, some (neatly defined) moral dilemmas: The Theory of Moral Grammar.

Mikhail's Universal Moral Grammar Theory

Mikhail's Universal Moral Grammar Theory (UMGT; [6, 63]) does not really fit into the intuition/emotion versus reasoning/cognition classification used so far. His view is inspired by Chomsky's [64] famous syntax theory, according to which we have an innate and universal capacity enabling us to have strong opinions about the grammaticality of sentences (cf. [46]). These intuitions are explained as the output of a complex unconscious system of syntactic rules. Similarly, UMGT claims that

moral judgments about certain actions are the result of an unconsciously working moral grammar that contains moral rules and principles. UMGT holds “that ordinary individuals are intuitive lawyers, who possess tacit or unconscious knowledge of a rich variety of legal rules, concepts, and principles, along with a natural readiness to compute mental representations of human acts and omissions in legally cognizable terms” ([6], p. 29). Following Chomsky, UMGT is assumed to be innate and universal. To characterize Mikhail’s research agenda, one might say that he aims at the development of a moral grammar that is so fine graded that a computer provided with this knowledge would be able to make moral judgments matching the judgments of real people.

Now, how does the UMGT determine the moral status of an action? A first and crucial step is the identification of the underlying causal structure of a moral scenario (e.g., a trolley dilemma). For instance, in the Bystander scenario, the temporally ordered events “throwing a switch,” “turning the train,” and “killing one man” are represented in a causal chain. Analyzing the causal representation allows to acquire knowledge of morally relevant features such as whether the death of a person was a side effect or the means to an end. The causal representation is then converted into a moral representation by assigning evaluations (good vs. bad) to the effects. The moral representation is further converted into a representation of the underlying intentional structure. If an action has both good and bad effects, the default assumption is that the good effect is the intended effect, whereas the (bad) side effect is merely foreseen. If, however, the bad effect is a means to a good outcome, the bad effect is classified as intended since the outcome could not be brought about without it. Finally, the moral status of an action is determined by applying certain deontic rules to the representation of the underlying intentional structure of a moral scenario.

The so-called doctrine of double effect (DDE) is an example of a deontic rule that is assumed to play a major role in moral judgments, especially with regard to trolley cases. Mikhail formulates this principle as follows ([6], p. 68):

The principle holds that an otherwise prohibited action, such as battery or homicide, which has both good and bad effects, may be permissible if the prohibited act itself is not directly intended, the good but not the bad effects are directly intended, the good effects outweigh the bad effects, and no morally preferable alternative is available.

To illustrate the DDE, consider again the Bystander scenario and the Footbridge scenario. According to the DDE, redirecting the train in the Bystander scenario is permissible since the death of the one person is not intended (merely foreseen), the good effects outweigh the bad effects, and there is no morally preferable alternative available. In the Footbridge scenario, however, the act of pushing the fat man from the bridge and killing him is intended since his death is necessary to bring about the good outcome (saving the five persons). Hence, the act of pushing the fat person from the bridge is evaluated as morally forbidden. The DDE can be seen as a principle that specifies the conditions that have to be met in order to be justified to violate another deontic rule, the so-called prohibition of battery and homicide ([6], p. 53) that forbids an agent to purposely cause harm to a nonconsenting victim.

The UMG, however, is still in a developmental stage and so far best suited to explain intuitions in trolley cases. The future will tell whether UMG can be further developed to be applicable for a wide(r) range of moral scenarios.

Method and Evidence

Mikhail designed a battery of trolley cases to test whether moral judgments are universal. He hypothesized, for example, that “Bystander” and “Footbridge” will be judged as permissible and forbidden, respectively, in different nations and cultures. In huge Internet-based studies so far, over 200,000 subjects were presented with different trolley scenarios, and the results indicate that some moral judgments are widely shared as it is the case in Bystander and Footbridge (see, e.g., [65]).

With regard to the claim that moral grammar is innate, Mikhail argues with a version of the so-called poverty of the stimulus argument, according to which the learning input of children cannot explain their impressive moral performance, for example, their ability to differentiate between moral and social transgressions [6].

The claim that an adequate descriptive moral theory must provide an analysis of the underlying causal structure of a scenario is defended by pointing to moral scenarios which are superficial and highly similar but nevertheless judged differently. Consider, for example, the following highly similar scenarios ([6], p. 24–33):

Loop Track: Ned is taking his daily walk near the train tracks when he notices that the train that is approaching is out of control. Ned sees what has happened: the driver of the train saw five men walking across the tracks and slammed on the brakes, but the brakes failed and the driver fainted. The train is now rushing toward the five men. It is moving so fast that they will not be able to get off the track in time. Ned is standing next to a switch, which he can throw, that will temporarily turn the train onto a side track. There is a heavy object on the side track. If the train hits the object, the object will slow the train down, giving the men time to escape. The heavy object is a man, standing on the side track with his back turned. Ned can throw the switch, preventing the train from killing the men, but killing the man. Or he can refrain from doing this, letting the five die.

vs.

Man-In-Front: Oscar is taking his daily walk near the train tracks when he notices that the train that is approaching is out of control. Oscar sees what has happened: the driver of the train saw five men walking across the tracks and slammed on the brakes, but the brakes failed and the driver fainted. The train is now rushing toward the five men. It is moving so fast that they will not be able to get off the track in time. Oscar is standing next to a switch, which he can throw, that will temporarily turn the train onto a side track. There is

a heavy object on the side track. If the train hits the object, the object will slow the train down, giving the men time to escape. There is a man standing on the side track in front of the heavy object with his back turned. Oscar can throw the switch, preventing the train from killing the men, but killing the man; or he can refrain from doing this, letting the five die.

On the surface, these two dilemmas only differ with regard to the heavy object that is present in the second scenario but not in the first. Nevertheless, most subjects find it permissible to throw the switch in the second scenario, whereas the majority judges this action as forbidden in the first scenario. The reason for this is, according to UMG, that the death of the man is a necessary means only in the first but not in the second scenario, and hence, the DDE permits redirecting the train only in the Loop scenario.

Discussion

As mentioned before, the UMG is still in its early stages. However, with regard to its precision and details, it vastly surpasses what Haidt's SIM and Greene's DPT have to offer. At least with regard to trolley cases, the UMG seems to be the only one of the three previously introduced moral theories that would be able to account for different ratings in trolley cases that sometimes only differ with regard to a subtle feature. Consider again the two cases described in the previous section. On a superficial level, they only differ with regard to the heavy object present in one case (Man-In-Front) and absent in the other (Loop Track). We have already seen that it is difficult, if not impossible, to apply Haidt's SIM to trolley cases in general. Thus, it is obvious that this theory cannot explain why people's reactions to these two dilemmas differ. The same is true with regard to the DPT. The personal versus impersonal cannot distinguish between these two cases. For none of the three criteria, the fact that a heavy object is placed behind the potential victim makes a difference. Hence, the DPT in its current version cannot explain people's judgment either.

Although the analysis of structural and causal features of a scenario seems the appropriate way to predict and explain people's moral judgments in trolley cases, it is less clear if the same is true for other domains. Furthermore, it is even questionable whether the DDE really explains people's reactions to trolley cases. There are other plausible theories that seem equally capable to explain people's reactions (e.g., [66]). In addition, it was criticized that some of Mikhail's scenario descriptions contain confounds. For instance, Waldmann and Dieterich [67] claim that the effect of less people affirming the action in "Loop" than in "Bystander" is not caused by the fact that the death of the man in Loop is intended (since it is a necessary means to save the five persons) but due to describing the man in Loop as a heavy object.

There are also some objections to the claims that moral grammar is universal, innate, and comparable with Chomsky's syntax theory. For instance, Rai and Fiske [10]

describe cases that cast doubt on the universality of deontic rules such as the “prohibition of battery and homicide” ([6], p. 53). It is also argued that the fact that people often have no conscious knowledge about moral rules is not sufficient to reasonably claim that these rules are innate (cf. [46]). There is, for example, a large literature on artificial grammar learning which similarly demonstrates judgments in the absence of valid verbal justifications (see [68] for an overview). Dupoux and Jacob [69] claim that the analogy between the UMG and Chomsky’s syntax theory is inaccurate. They argue that it seems questionable to compare grammaticality judgments with permissibility judgments since the former are pretty robust while the latter are extremely context sensitive (see, e.g., [49, 70, 71]).

In summary, it can be said that although many of Mikhail’s claims (e.g., innateness, universalism, DDE) can be doubted, he is nevertheless to be credited for the first attempt to formulate a precise descriptive moral theory which is, at least potentially, capable to account for subtle manipulations regarding certain morally relevant features of a scenario.

Back to the Roots? New Directions in Developmental Psychology

Strangely enough, another currently very active line of research scientifically investigating morals again is Developmental Psychology, which tentatively renews its interest in moral judgment. This time, however, it focuses its research agenda less on the previous debate on whether or not the developmental trajectories are stage-like or gradual or whether or not cognitive or affective elements dominate moral judgment (see above). The current researchers aim at identifying the early indicators of morals and the time in ontogeny in which these indicators emerge. With a whole fan of newly designed methods and particularly nonverbal measures – indispensable when studying young infants and different species – the researchers recently could show that potential precursors of moral judgment such as prosocial behavior, empathy, or deontic reasoning (a) develop early in ontogeny (see below) and (b) may be deeply evolutionarily grounded (e.g., [72–74]), although the genuine ontogenetic path to adult moral judgment (and hence the relation of this area of research to the above-reviewed approaches in adults) is far from being clear yet (see [75] for a thoughtful discussion on this topic). The next section will briefly summarize the main findings of this line of research.

Early Prosocial Behavior

One of the very active lines of research is currently investigating when young infants begin to care for others, be it by selectively preferring social to unsocial characters, by showing empathy with and concern for others, or by instrumentally helping others when necessary. In several series of studies and with the help of ingenious methods and designs, it has now been shown that infants begin to show these types of behaviors surprisingly early in ontogeny. For example, when presenting infants with screen-stories involving characters who act in morally

different ways (i.e., one is helping, the other hindering a protagonist), it was found that infants prefer helping to hindering (and thus morally displeasing) characters even before their first birthday, that is, at an age in which infants barely are able to walk or to talk [76]. Briefly after their first birthday then, infants understand when another person apparently failed to achieve an intended goal and either try to help instrumentally (e.g., by offering objects out of reach, [77]) or show indicators of empathic behavior and try to comfort others (with their own means such as a stuffed animal, [78]). Recent research has even shown that young children are selective in whom to help, helping a victim more often than a transgressor [79]. A tendency to care for others' welfare thus seems to be traceable very early in human ontogeny.

Distributive Justice

Another line of current research investigates when young children begin to adhere to the requirements of altruistic behavior, usually assessed by children's understanding of distributive justice. To investigate this issue, young children are usually presented with paradigms adapted from game theoretical approaches ([13], cross-reference) and then asked to share resources with a (fictive) counterpart or a collaborative partner. As most parents among the readers of this chapter may have guessed, the findings of these studies are rather heterogeneous, especially concerning younger age groups. On the one hand, young children have been shown to orient their sharing behavior on mere self-interest [80]. On the other hand, children have also been shown to rely on heuristics such as 50:50 when asked to distribute resources (e.g., [81]). A very recent study might shed light on these contradicting findings by showing that young children may benefit from assistance in recognizing that and when their counterpart is interested in receiving a share and as a consequence distribute their resources fairly [82]. Older (i.e., preschool and school-aged) children, by contrast, were shown to consistently share fairly and even to take into account the characteristics of the participants when distributing (e.g., the recipient's previous effort on a task, the membership to a same or different social group, or social relationships between distributor and recipient such as friendship or hostility, [80, 83, 84]). By preschool age, children thus seem to have developed an almost adult-like understanding of distributive justice.

Deontic Reasoning

A third line of current research, which is related to the distinction between moral and conventional prescriptions ([20], see above), investigates young children's emerging sense of normativeness and their related developing understanding of deontic rules. Compared to the above-mentioned novel paradigms, these methods are more traditional in that children are asked to judge the permissibility of hypothetical actions or in that young children are expected to react to third-party transgressions of (deontic and/or social) rules, this time, however, not in verbal interviews but in experimental behavioral studies. Similarly to the above-mentioned studies on prosocial behavior or distributive justice, this line of research has shown that even preschool children (i.e., children around the age of 3 years at the latest) are able to understand the bases and consequences of deontic rules and

social conventions [85, 86], allowing them to actively convene to previously established social rules, or even to go as far as trying to rectify third-party transgression of rules [87–89]. Again, the ontogenetic roots – though not understood in the entire extent with all its cognitive and emotional underpinnings – seem to be detectable early in human ontogeny.

Conclusion

In the past decades, the scientific study of morals underwent a tremendous change (if not even revolutions) of scientific approaches, disputes, paradigms, or research questions. All these approaches entailed its specific research methods that varied as tremendously as the original research questions – starting from verbal judgments of (hypothetical) dilemmas that were supposed to reveal people’s rational moral reasoning (Piaget and Kohlberg, [1, 2]), to observing behavior in natural surroundings that had to be evaluated by observers or actors (see Piaget, Smetana, and colleagues, e.g., [2, 90]), over intuitively judging emotionally intense scenarios (after being additionally manipulated by priming or mesmerizing procedures, see, e.g., Haidt, [36]), or assessing brain activity while judging dilemmas (see, e.g., Greene, [52]), to engaging infants in watching scenarios on screens, or to confronting them with needy others (e.g., [76]). In future research, most of these methodologies will certainly still be refined, amplified, or replaced by even more exact and superior methods. In addition to the foreseeable growth of the methodological variety, more factors that supposedly influence human moral judgment probably will be brought up and discussed (as currently is the factor of “social relationships” that are assumed to influence moral intuitions, see [10] for an overview). Yet, where does this go? In what direction does this development take us?

In a recent review, Bryce Huebner [91], himself being familiar with the scientific study of moral judgment by his own research, raised the legitimate question to what extent behavioral methods such as evaluating and judging hypothetical scenarios are suitable for revealing the underlying cognitive processes and mechanisms. He also pointed to the necessity of more specific models simulating the supposedly underlying cognitive procedures and of clearer hypotheses concerning the underlying human brain activity to tackle the cognitive and neural underpinnings of moral judgment. Related to that, when introducing this chapter, we pointed out that so far, there was no consistent definition of what elements human moral judgment contains. In view of the variety of research agendas reviewed above, it seems unlikely that this definition will be found in near future. Characterizing such a rich and complex phenomenon as human morals, which concerns and influences various disciplines (not to speak of human moral behavior), will still be one of the main requirements and challenges to future research. With all the difficulty and challenge it may present to the different disciplines, in the long run, it presumably will be vital to find such a coherent (albeit certainly complex) characterization of moral judgment in order to further elicit ingenious and novel research in such different areas as philosophy and psychology.

Wenceslao J. Gonzalez

Abstract

Regarding scientific research, value ladenness and the value-free ideal represent two poles. At the beginning of the twentieth century, the influential view was science as “value-free” (*Wertfrei*), whereas in the first decade of the twenty-first century the dominant perspective is science as “value-laden.” After considering the historical setting on values in science, the analysis here deals with the characteristics and relations between axiology of research and ethics of science. This involves taking into account the option in favor of holism of values and the alternative in terms of fractional orientations, either in “internal” terms or in “external” ones. Thus, the presence of values in basic science and in applied science is considered. After that, economics as a relevant case study is addressed through the distinction between positive economics and normative economics. There is also a coda with final remarks on the topics analyzed.

Introduction

“Value-free” and “value-laden” are notions that characterize two different approaches to scientific research. In the first case, science is a content that is and ought to be neutral from an axiological perspective, whereas in the second position science is a human activity developed under the direct influence of values. These conceptions can be seen in historical terms as well as in thematic ones. From a historical point of view, the first view was explicitly proposed at the beginning of the twentieth century and with the focus of attention on the social sciences, whereas the second option was increasingly assumed in the last decades of that

century until the present stage, when there is a broad consensus in favor of value-ladenness and within a general perspective (i.e., as a feature that might be, in principle, in any science).¹

From a thematic viewpoint, *value-free* and *value-laden* perspectives summarized two poles of the philosophical analysis on science. They are clearly connected with the possibility, characteristics and limits of axiology of research. But value-free and value-laden outlooks are also linked to ethics of science in a discernible way. Thus, after the historical setting on values in science, the paper deals with the duality “axiology of research”—“ethics of science,” which is followed by the consideration of the main lines of interpretation: holism of values and fractional orientations. Thereafter, the consequences of these observations for basic science and applied science are seen. Then, due to its special interest for this volume, the case of economics is considered through the usual distinction between “positive economics” and “normative economics,” because it involves different kinds of values. A coda adds final remarks in order to complete the analysis made.

Historical Setting of Values in Science

Certainly there is a remarkable difference between the outset of the twentieth century, when Max Weber proposed his philosophical reflections on science as “value-free” (*Wertfrei*), and the recent decades of that century and the first decade of the twenty-first century, when “value-laden” became generally assumed by the philosophers of science.² Thus, nowadays the presence of values is openly accepted in the consideration of the empirical sciences, not only in the social sciences – those of Weber’s concern – but also in the natural sciences and in the sciences of the artificial.³

Max Weber defended that science – in particular, social sciences – was “value-free,” because he understood that the axiological neutrality was a complement needed for objectivity of social sciences (which includes political science) and, therefore, for these disciplines, in order to be “sciences.” Meanwhile, in our contemporary times, the thesis of scientific research as “value-laden” is commonly accepted as compatible with the objectivity in science, including the social science, and so it is generally taken on as a trait of scientific research. This conception is obviously clearer in those thinkers that endorse scientific realism in any of the main kinds (cf. [29] and [39]; an alternative approach is in [54]), but it is also the case of supporters of different versions of pragmatism, including pragmatic idealism.⁴

Weber made it explicit around 1904 that he was in favor of objectivity in social science and social policy (cf. [83]). His view can be seen as a modulation of the famous dichotomy between *Erklären* (explanation) and *Verstehen* (understanding), because he offers his own approach in the historical set of positions on this controversy (cf. [26] pp. 33–50; especially, p. 35). On the one hand, his view adopts a methodological difference between the natural sciences and the social sciences. On the other hand, he moves towards a *Verstehen* that is not linked to a form of methodological relativism (i.e., a *Historismus*),⁵ because he defends the objectivity of social sciences. His position is, then, enlarged with the idea of

the social sciences as an enterprise “value-free” (*Wertfreiheit*) (cf. [84]; on Weber’s approach see [11, 12]).

To be sure, Weber’s approach goes beyond the disciplines that he was interested in (mainly, sociology, political science, and economics) and even the region of social sciences, to get to the general territory of science as a whole. (i) His proposal of objectivity of social sciences (among them, economics) is associated with *Verstehen* as the adequate method, which is different and complementary to the method of *Erklären*. Thus, objectivity in economics could be compatible with a methodological differentiation with respect to natural sciences. (ii) His defense of social sciences as value-free involves a methodological conception in favor of the unity of science: it supposes that economics is “neutral” regarding values in a similar way as is any science which studies nature.

As a matter of fact, during several decades of the last century – from the mid-1920s to the beginning of the 1960s–, the main philosophical tendencies considered science as a content that is or might be objective, impersonal and, in principle, independent of the context. Usually, the logico-methodological approaches – verificationism and falsificationism – assumed this view. They also accepted that the epistemological contents have a special weight in the analysis of the results of scientific achievements. Thus, scientific values, in general, and ethical values, in particular, were not commonly among the contents to be considered philosophically during those decades.

Nevertheless, important thinkers of the “received view” and relevant authors of the critical rationalism made comments on values. Usually, the remarks of logical empiricists were on science as related to human values, such as in the case of Carl Gustav Hempel (cf. [35]), whereas Karl Popper developed his own views on the moral responsibility of the scientist at the end of 1960s (cf. [66]), when he was very much involved in evolutionary epistemology. Later, Popper added some interesting considerations on how the principles of fallibility, rational discussion and approximation to the truth are both epistemological and ethical principles. In this regard, he seems to assume truth as an ethical value.⁶ Other critical rationalists, such as Gerard Radnitzky, explicitly discussed the thesis of the science as “value-free” (cf. [69]; on the analysis of the value-free ideal see [15, 49]).

Nonetheless, the big change in values came with the new emphasis on science as a *human activity* instead of previous insistence on the contents of science. This involves the idea of science as an activity that is oriented to ends, which is context-dependent and so is under social influence. This change happens with the development of the “historical turn” in philosophy of science, which is noticeable after the publication of *The Structure of Scientific Revolutions*.⁷ Thomas Kuhn focuses attention on the scientific communities doing science with the use of wide frameworks (“paradigms”) and within a social milieu.

A few years later, in his *Postscript – 1969*, Kuhn explicitly mentions *values* as an element in the disciplinary matrix: on the one hand, values “are more widely shared among different communities than either symbolic generalizations or models” ([46] p. 184), and, on the other hand, values “do much to provide a sense of community to natural scientists as a whole” ([46], p. 184; Kuhn developed his views on

objectivity, value judgment and theory choice in [47]). Through the analysis of the ideas on values that are shared by scientists and the problems on the application of values, it seems clear that we can think of scientific research as a human activity that can have values regarding ends (the selection of goals is made according to some principles) and values concerning means (there are some criteria that show that some means are more worthy than others).

But it is in the 1980s that the philosophical move in favor of values in science is consolidated. Thus, in 1982 Ernan McMullin presented a paper in the PSA on “Values in Science.”⁸ It was two years before Larry Laudan’s *Science and Values*, a book that stressed the relevance of cognitive values regarding aims of science as well as methodological norms and rules. The volume recognized that “the question of precisely how one distinguishes cognitive values or aims from noncognitive ones is quite complex” ([51], p. xi). At the same time, Laudan accepted the existence of ethical values in science: “Ethical values are always present in scientific decision making and, very occasionally, their influence is of great importance” ([51], p. xii). Since then, the assumption that science is “value-laden” was a common one, although it has not always been understood in the same way.

Axiology of Research and Ethics of Science

Generally, “value” is a term understood with a broad *sense*: as something worthy that should modulate ends and means of scientific research, either internally or externally.⁹ Sometimes value appears as a principle that should regulate scientific activity from the beginning, whereas in other occasions it seems to be one criterion among others that should be taken into account. Thus, value might be used either to orientate scientific research or to reflect something that is going while scientists are doing science. In the first case, value might be understood in terms of “ideal” (i.e., something that should be searched for but will never be actually attained) or in the form of “goal” (i.e., an objective that might be attainable).

Following these positions on the sense of *value*, the distinction between “fact” and “value” is certainly useful,¹⁰ because they are different. Thus, the *reference* of value is not something tangible (i.e., an item of the natural, social, or artificial world) but rather an intellectual content that might be related to a diversity of realms (such as cognitive, methodological, sociological, economic, ethical, esthetical, etc.). The content itself should be worthy, and this worthiness makes it preferable to other possibilities or mere preferences. In this regard, insofar as value connects with human needs, the discussion of the validity of the values can lead us towards objectivity.¹¹

Using these elements of the sense and reference of “value” in science is easier to think of *value-free* and *value-laden* in thematic terms, which is the complementary view to the historical one. In this regard, the study of values in science as a whole has followed thematically two main lines of analysis: (a) the consideration of values in general, or some kind of them with a wide spectrum of possibilities regarding scientific research; and (b) the direction to ethical values, either in science in

general or in a particular science. In this distinction, in the first case the scope is larger than in the second possibility, insofar as it is open to all possible value in science. Nevertheless, the cognitive values commonly have a special role in scientific research, even when the position adopted is a holism of values instead of a fractional orientation on values.

Axiology of research has interest in all kinds of values (cognitive, social, etc.) and embraces the first line of philosophical reflection (see [25, 32, 56]), whereas ethics of science has a more specific range because it is devoted to a kind of values (those connected to moral issues). Thus, it includes the variety of options indicated within the second line of analysis. According to this distinction, axiology of research is a broader area of reflection than ethics of science, insofar as its focus is, in principle, on the whole set of values around scientific research (i.e., internal and external values), even though it might end up working on only a relevant class of them (cognitive, social, economic, ecologic, etc.).

Thus, axiology of research takes care of “internal values” of science (linguistic, structural, epistemological, methodological, ontological, etc.) as human activity and also considers “external values” (sociological, cultural, economic, political, ecological, etc.) related to “scientific progress.” Axiology of research reflects on values regarding ends and means of basic science as well as on goals, means, and outcomes of applied sciences. These values are frequently understood as selection criteria that have a role in the decision-making of the researches and their institutions.

Consequently, axiology of research is the broad study of values in science. It deals with values regarding scientific discoveries as well as with those of scientific justifications. In this regard, it can be accepted that there are values that are “internal” to scientific activity and values that are “external” to that human undertaking. In this analysis, *internal* is those values that belong to the aims, processes and results of scientific research itself, whereas *external* is the values assumed by scientific institutions, private or public organizations related to R + D + i, etc. However, there are values, such as economic ones, that can be internal (e.g., those assumed in scientific designs, such as profitability) and external (e.g., those on the processes seen from the perspective of their social or institutional acceptability in terms of effectiveness, efficiency, etc.) (cf. [31]).

Undoubtedly, the stress might be on internal values, external values, or the attempt for equilibrium between both. Those thinkers of recent decades who are sympathetic to the social concern on science (i.e., the “social turn” in philosophy and methodology of science) have called attention to the external values in science (cf. [28]). At the same time, other philosophers who are aware of the width of this “social turn,” such as Philip Kitcher (cf. [41]), still emphasize the role of “internal values” (such as truth or objectivity) over “external values,” and accord particular weight to contents (semantic, epistemic, methodological, etc.) of science over contextual factors of scientific activity.¹² Even Kuhn, who has had a remarkable influence on the “social turn” in philosophy and methodology of science of recent decades, was also in favor of giving more weight to internal values than to external ones.¹³

When the attention goes directly to ethical values (honesty, carefulness, responsibility, etc.) (cf. [77], Chap. 3, pp. 53–63; see also [6] and [7]), we have “ethics of

science.” From a philosophical viewpoint, its realm of analysis might be diversified in three important directions: (i) ethical values in scientific research as a human activity, when the focus is on the processes involved in discovery and justification of scientific findings; (ii) ethical values in the professional use of scientific findings, insofar as there is a distinction between science (basic and applied) and application of science;¹⁴ and (iii) ethical values in the context of social responsibility of the scientists as citizens (i.e., their contribution to the common good of the society as a whole).¹⁵

Usually, the ethical reflection on science as a human activity includes two different angles to be considered: the *endogenous* perspective and the *exogenous* viewpoint. Thus, the ethical analysis of science can be developed according to these main orientations. In the first case, the presence of values is assumed as an intrinsic part of the scientific activity (aims, processes and results), whereas in the second case a set of contextual ethical values is at stake (social, cultural, historical, etc.), which eventually can end up in the form of legislation (e.g., in biomedical research, particularly in the case of human cloning, or in economic matters with corporate social responsibility) (cf. [58]).

Endogenous ethics is an intellectually feasible task insofar as science is a free human activity. This includes ends and means that might be chosen after deliberation.¹⁶ As with any human undertaking, if science is freely done, then it involves the possibility of an ethical evaluation. Thus, insofar as there is free decision-making in science, ethical categories (good/bad, right/wrong, fair/unfair, responsible/irresponsible, etc.) can be used to evaluate the activities themselves developed by scientists (as individuals or even as a group).¹⁷ So, any scientist – either in basic science or in applied science – is responsible for his or her actions while doing research. When a team makes the research, the team has a collective responsibility for the actions performed in their laboratories or work places.¹⁸

Exogenous ethics is a task that is intellectually clearer than endogenous ethics, due to its components, which are more visible than in the previous case. As a matter of fact, ethical values are more noticeable when they include a social dimension. De facto, the existence of social consequences of scientific research is what commonly matters for citizens as individuals and for society as a whole. This is particularly valid for applied sciences, as can be seen in ethical business¹⁹ or in biomedical ethics,²⁰ and it is even more visible in the case of applications of science (i.e., in the use of science by scientists, where medicine might be the paramount example). Moreover, insofar as the consequences are more manifest for citizens and society as a whole, the legislation (regional, national or international) can show up. This legislation assumes, in principle, some kind of ethical values in order to inspire the norms.

Holism of Values and Fractional Orientations

Both philosophical enterprises on values in science – axiology of research and ethics of science – can be seen from different angles, according to the degree of

generality. In axiology of research the vision might be either from a holistic perspective or from the viewpoint of a particular set of values, those that are considered as the most relevant for scientific research. In ethics of science the focus might be on science, in general, or on a particular science. But again the tendency can be on ethical values as a “system” (a network of relations) or a conception where a value (e.g., responsibility, utility, solidarity, etc.) is central.

Concerning the first option of the axiology of research, the main thread is values understood as a system (i.e., as an interrelation in terms of interdependence), whereas in this second choice, there is a “privilege” kind of values (such as cognitive, social, economic, ecological, . . . values) that offers the key for understanding, interpreting, and applying values to scientific research (mainly in empirical sciences, i.e., in the three branches: natural, social, and of the artificial).

Holism of values is the first option of philosophical analysis, and the orientations upon some values represent the second choice, because fractional accounts work on a part of values conceived as the relevant ones. In the latter, the emphasis can be either on “internal” values (cognitive, methodological, etc.) or on “external” values (social, cultural, etc.). In these perspectives of a fractional orientation, the focus of attention is on some kinds of values instead of the system of values altogether (cf. [68]), and on placing them largely in one of the realms involve (aims, processes or results).

A configuration of values in science from a holistic approach is in Nicholas Rescher, because he thinks that values form a system in science. This view involves values (cognitive, social, economic, etc.) being interrelated within a certain whole and, thus, there are various forms of interdependence of values. Meanwhile, the second choice of fractional orientation, with stress on “internal” values is in Laudan, among others, whereas the prominence on the “external” values is in several conceptions of the “social turn” in philosophy and methodology of science (such as the “strong program,” some views on ethnomethodology, the thesis of finalization in science, etc.) (cf. [29], pp. 9–11).

Rescher has offered a wide framework for the role of values in science, both in terms of the number of values to be considered and in the levels involved. He defends a “holism of values in science,”²¹ where the scientific values could be a matter of distinction (“internal” and “external,” cognitive and social, etc.) but this aspect does not authorize separations. In his view, holism of values follows from the interconnection between scientific goals and other human goals: they can be seen as a “system.” Moreover, he thinks that the distinction between internal and external values of science is a “distinction” but not a separation (cf. [24], p. 22).

For Rescher, there is a set of levels involved in this issue: (1) the structure of human needs and goals is larger than mere human cognition alone. Thus, the aim of controlling reality is only one valid human aim among others. *De facto*, there are many other valid human needs and desiderata. (2) Although knowledge is not an all-sufficient be-all and end-all, it is itself a human need – a situational requisite of ourselves as the sort of creatures that we are – and, certainly, knowledge is particularly relevant in scientific research. (3) The internal values of science (such as consistency, generality, etc.) are what they are because this is necessary to achieve effectively the applicative aims of science (effective prediction and

control), and these aims of science are what they are because they inhere in the large situational requirements of us humans as *homo sapiens*.²²

Hence, Rescher's perspective offers a holism that binds the sphere of values together, and he sees them as a matter of the effective servicing of human needs. *De facto*, he proposes a practical framework for the role of values in science. Within it there is a clear space for different kinds of values (such as economic values), which he conceives that have a role in science as a human project and, consequently, they are values that are related to human needs. Meanwhile, in the fractional orientations, such as that defended by Laudan, there is a dominant class of values for scientific research. Moreover, in his conception, the cognitive values are those that are shaping scientific rationality (cf. [51], p. xii).

Unquestionably, there are values in science, such as cognitive values, which have a singular place within science, in general, and scientific progress, in particular. These values on knowledge, either in themselves or in their methodological consequences, are commonly highlighted both for basic science and applied science. This emphasis on cognitive values can be seen in different authors, such as Laudan, even though he considers them as different from "epistemic values,"²³ and Rescher, who certainly has a broader vision of values, a perspective that is connected to human needs: "the fact that knowledge represents a subordinate (albeit functionally appropriate) need for a creature such as ourselves integrates the values at issue in science (internal and external like) into one cohesive fabric."²⁴

Cognitive values are not alone in scientific research: they are related to other values (social, operative, etc.), because science is a human activity within a complex setting (social, cultural, economic, political, ecological, etc.). This contextual aspect should be present in an articulation of values regarding scientific research. So, the difference in scope in the philosophical approaches – the fractional orientations and the holistic views – is patent when we are discussing scientific research as value-laden.

Laudan insists on cognitive values in science without emphasizing the role of other values (such as economic values or ethical ones), and he places values in the sphere of goals and aims.²⁵ Thus, he proposes an axiology of research with a clear status that it is different from other spheres, such as methodology of science or empirical studies of science, but interconnected with them. Meanwhile Rescher offers an image of values that we can call "transversal," because he explicitly accepts values in several steps: (a) in the case of aims, (b) in the dominion of theory, (c) in the methodological process of constructing science, and (d) in its applications (cf. [72], Sect. 3.6, pp. 93–96).

According to Rescher's holistic line on values in science, it seems that ethical values are a part of the system as a whole. Thus, ethical values are then a set within the total collection of values that have any relevance for science. They accompany the other kind of values within the network of relations of this human activity. In this regard, even though there is a clear connection between both sides involved here – "axiological" and "ethical" –, it seems to me valuable to keep the *philosophical distinction* between axiology of research – the study of values in general – and ethics of science (the analysis of the specific moral values on this human undertaking).

On the one hand, there are practical reasons for this philosophical distinction: ethical values are indeed very important for science as a human activity and as a part of collective life of society. Thus, applied sciences, such as economics and medicine, are taking special care of ethical values in the philosophical analysis.²⁶ On the other hand, there are also theoretical reasons to differentiate the studies, due to the existence of several levels of analysis to be considered: ethical values in scientific research, ethical values in the professional use of scientific findings, and ethical values in the context of social responsibility of the scientists as citizens.²⁷

Even though the distinction between axiology of research and ethics of science is valuable for philosophical reasons, it seems rather obvious that there is an interweaving between ethical values and other kinds of values in science (cognitive, economic, social, ecological, etc.). This can be seen clearly in the philosophical analysis regarding the research made in the field of biomedicine. A good example is given by John Worrall's study of clinical trials and randomization, where ethical values are directly related to epistemological and methodological considerations (cf. [85, 86]).

Values in Basic Science and in Applied Science

Until now it has been emphasized here that values are a *component of scientific activity*. They accompany the other constitutive elements of science, such as language, structure, knowledge, method,....²⁸ In this regard, axiology of research should be considered in the philosophical analysis of science, in addition to other analyses that are more traditional in the field (semantic, logical, epistemological, methodological, ontological, etc.). In this framework, ethics of science is a complementary philosophical subject that deals with the specific values of scientific activity with a moral component (e.g., responsibility, honesty, reliability, respect, etc.).

Scientific activity can follow two main courses: basic science and applied science,²⁹ which might be differentiated in structural terms and in dynamic ones. These differences can be seen from the structural point of view of the models (explanatory and predictive, in the first case, or predictive and prescriptive, in the second one) or from the dynamic perspective of the aims, processes and results.³⁰ Each stage of this sequence is, in principle, under the influence of some kind of values. Initially, these values have a role for the selection of aims or goals of scientific undertakings, which might be crucial (e.g., in the case of cognitive values). But later, the values can go beyond that point, and they can have also a repercussion on the processes as well as on results of scientific activities.

Basic science and applied science, insofar as they involve values in several stages of scientific activity, need an axiology of research. They are under the influence of different kinds of values (cognitive, social, economic, cultural, etc.). In this regard, the whole set of values in science ("internal" and "external," cognitive and social, epistemic and practical, etc.) is studied by *axiology of research*. This is certainly a domain of philosophy of science, and it has been intensively developed in the recent decades. In my judgment, axiology of research is a philosophical domain that accompanies the *main areas* of this field: semantics

of science, logic of science, epistemology, methodology of science, ontology of science, and ethics of science (cf. [31], pp. 85–112; especially, pp. 93–96).

The philosophical analysis of values in basic science and applied science should take into account values in three different stages: aims, processes, and results. (i) In the case of *aims*, values are certainly used to choose the goals of research, either in basic science or in applied science. They could be either descriptive (values related to explanation and prediction, which involve the advancement of knowledge) or prescriptive (values related to solutions of concrete problems, mainly in a practical sphere). (ii) In the realm of *processes*, values play a key role in order to select the adequate means to get scientific progress as well as to choose the adequate undertakings to develop science as a human activity within a social setting and oriented towards the resolution of specific problems. (iii) In the domain of *results*, values are frequently used to assess the outcomes of science as intellectual achievement, as well as a product of the society (cf. [31], p. 93).

These three different stages (aims, processes, and results) should be considered in axiology of research developed from a dynamic angle. This position involves an analysis in three consecutive steps (goals, means, and outcomes), which is larger than previous axiological analyses. Frequently, axiology of research is the philosophical study of science that deals with aims or goals (e.g., in the case of Laudan), whereas the other two kinds of values (those related with processes and results) are usually analyzed through methodology of science and the diverse studies on science, technology, and society, when philosophy is one subject among others.

Yet there is an alternative to axiology of research as devoted primarily to aims or goals, an option that has been proposed by Rescher. He suggests a wider conception of values in science, which is more in tune with my analysis of values of scientific research in terms of aims, processes, and results. He proposes a *broad* axiology of research according to his conviction that sciences are related to values from diverse angles (cognitive, social, etc.). These values in science are related to other human values and rooted in human needs. Furthermore, he sees scientific progress – a central issue of methodology of science – from the viewpoint of “economics of research” (cf. [24], pp. 11–44; especially, pp. 13–27).

This wider conception pays particular attention to the structural role of values in science, both basic and applied. Rescher makes a set of suggestions that can certainly be used as a basis for the new framework of values in science, assuming the idea of value ladenness and the viewpoint of scientific research as a human activity. On the one hand, he offers an overview of scientific values taking into account different aspects of human endeavors (i.e., not only the cognitive one, widely understood); and, on the other hand, he distinguishes diverse kinds of values (mainly, internal and external) of science as a human practice.

There are four main aspects of Rescher’s view of the relation between science and values. (1) Science is a human project devoted to the search for valuable aims, such as *information* and *truth*. (2) Science demands an *economy of means* from the methodological point of view, which involves a set of economic values related to the pattern of cost-benefit.³¹ (3) Science has the characteristics of a *social activity* of science, because it is based on a process of human cooperation. Thus, science includes

attention to human ideals, even though it is a competitive business, because the method and *modus operandi* of any science asks for honesty, veracity, integrity, collaboration, etc. These values are relevant for scientific communities as human groups. (4) Science has *uses and applications* that call for a set of values to evaluate the consequences of every scientific activity (above all, in its technological projection). This task of assessment requires an evaluative rationality which should be able to discern the appropriate and legitimate ends of this human activity (cf. [24], p. 16; in this regard, some aspects might be seen in [5] and [82]).

Obviously, Rescher takes into account basic science as well as applied science, with special interest in natural sciences rather than in social sciences or sciences of the artificial. Thus, in his *broad* axiology of research, he accepts a variety of values around science. They are mainly in four large areas of values: cognitive, economic, social, and operative; implicitly, his approach includes a fifth area: ethical values.³² If this *plurality of values* is seen from the duality internal–external, then it is clear that two of them – cognitive values and economic values – are inserted into a framework basically internal; meanwhile the other two – social values and operative values – are mostly in the external dimension. And, as it has been highlighted here, the ethical values have an endogenous side in addition to an exogenous sphere.

Although basic science and applied science share common values as human activities in a contextual setting (social, historical, cultural, economic, etc.), there might be some differences between the relevance of some values. Basic science seeks the improvement and enlargement of knowledge (mainly in natural, social, and artificial worlds), looking for the possibility of grasping truth (or, at least, truthlikeness). Thus, cognitive values regarding explanation and prediction have an important role. Meanwhile applied science, which seeks the resolution of specific problems in a certain domain, has relevant cognitive values on prediction and prescription. In addition, insofar as it guides social action (e.g., in economics), applied science also gives a more intense role to contextual values than basic science does. This is particularly noticeable in the case of ethical values, when the emphasis on scientific research is not on epistemological contents but rather on practical consequences of research and their repercussion for society as a whole.³³

Positive Economics and Normative Economics

Economics offers a good “case study” for the general remarks on values in basic science and applied science. To some extent, the traditional distinction between “positive economics” and “normative economics” offers an interesting way of considering values in science oriented towards the advancement of science (mainly through explanation and prediction) and values in science conceived as problem-solving procedure in specific domains (including prediction and prescription). This positive economics–normative economics distinction connects with the duality value-free and value-laden.

Positive economics, insofar as it is seen as a “descriptive” task with “factual” contents instead of being a “prescriptive” undertaking with “evaluative” elements,

might be understood as value-free. Thus, it is assumed that positive economics belongs to the sphere of “facts” rather than being connected to “values.” In a relevant sense, this view has links with the tradition in economics in favor of axiological neutrality.³⁴ This conception is, in part, related to the discussion on science and ideology, in order to maintain that economics is “science” in a *sensu stricto*. Besides Weber’s direction of economics as *Wertfrei* or *value-free*, there is a line of economic thought with Joseph Schumpeter’s view of economics as a “technique” (cf. [78], p. 211) and Robert Solow’s interest in ways of doing social sciences as close as possible to the ideal of being value-free (cf. [81]).

Normative economics, insofar as it needs prescription, involves the role of values. They are indispensable in the task of evaluating what is good and bad for microeconomics and macroeconomics, mainly in the sphere of aims, but also in the terrain of processes. This line is followed by Amartya Sen in his criticism of the primacy of prediction in economics: “prediction is not the only exercise with which economics is concerned. Prescription has always been one of the major activities in economics, and it is natural that this should have been the case. Even the origin of the subject of political economy, of which economics is the modern version, was clearly related to the need for advice on what is to be done in economic matters. Any prescriptive activity must, of course, go well beyond pure prediction, because no prescription can be made without evaluation and an assessment of the good and the bad” ([79], p. 3).

These tendencies in favor of positive economics as “value-free,” in one way or another, and normative economics as “value-laden” give us some aspects to be considered. An obvious one is the insistence of economics as being a science that is capable of giving facts without the influence of criteria out-of-science (ideological, political, etc.). In this regard, the autonomy of economics as a science rule by its self-corrective criteria should be assumed. In addition, the responsibility of economists is precisely not to be influenced by values different from those that belong to the actual sphere of scientific activity (i.e., regarding aims, processes and results of scientific undertakings).

Autonomy and responsibility of economists fit with the noble attempt of preserving the scientific character of economics in the domain of basic science. However, this position has sometimes been presented as “value-free,” i.e., avoiding any links between positive economics and values. But positive economics is a human activity developed according to rational procedures (in this case, economic rationality), and there is a constant decision-making by scientists while doing science, either individually or collectively. On the one hand, values might be present in the selection of aims (i.e., evaluative rationality), which is followed by a preference for some procedures (i.e., instrumental rationality). And, on the other hand, it seems clear that “the conduct of inquiry cannot possibly be value-free. Inquiry involves action, and action is driven by values” ([34], p. 296; some aspects connected with these issues can be found in [13, 19, 43]).

If we move from positive economics to normative economics, then there is no doubt that normative economics has deep connections with values. Firstly, it might be said that normative economics shares with positive economics the presence of values regarding aims and processes. Thus, there are values while doing “choices of

what to study” and also values that “influence choices of what methods to employ and consequently of what hypothesis to discard or to pursue” ([34], p. 296). Secondly, normative economics adds something else here: it requires the constant presence of values when dealing with prescriptions after having predictions (cf. [22]). It seems clear that economic policy as a guide on the future possible (in the short, middle or long run) is linked to a set of values.

Indeed, within normative economics there are internal and external values. They are noticeable in the area of prescriptions. “The *internal values* of prescriptions depend, to some extent, on the knowledge provided by economic predictions, because, like any other conception which supposes the direction of human activity, it requires a possible aim that should also be achievable. Thus, some of the components of internal evaluations of economic prescriptions can be the simplicity of the goal, the consistency of means, the adequacy with respect to the agents, the ratio between cost and benefit, . . . Regarding the *external values*, the list is wider: they go from evaluations of ethical and social character (repercussion to social groups, especially the labour dimension – i.e., in terms of employment: social discrimination versus social cohesion; integration in the working place versus emigration; labour dignity versus ‘junk contract,’ etc.–) or of a social and cultural kind (i.e., social settling versus creation of minorities) to components of a different class (political, ecological, etc.)” ([22], p. 336).

Among values in scientific research, ethical values always have a particularly relevant role. They are present in normative economics, as has been pointed out here, but they are also in positive economics. From a general point of view, it seems to me clear that any basic science can be related with ethics if the focus of attention is not directly on the contents themselves (i.e., the scientific knowledge as such) but rather on the human activity of doing science and its consequences (cf. [23]).

Accordingly, it is understandable that, on the one hand, positive economic can have contents regarding “facts” without dependence on ethical concepts (e.g., demand elasticities); and, on the other hand, as Daniel Hausman and Michael McPherson have emphasized, “a good deal of positive economics is unavoidably penetrated with ethical concerns. Ethics has a role within positive economics because ethical commitments affect individual choices and hence economic outcomes, because economic institutions and policies affect ethical commitments, and because the terms in which economists conceptualize and explain individual choices have moral implications” ([33], p. 214; see also [44]).

Conclusion

All things considered, if we look back on the “value-free” ideal and the thesis of “value-ladenness,” the first thing is the recognition of difference between the beginning of the twentieth century and this first decade of twenty-first century, which has been analyzed here both in historical and thematic terms. Even when the preferred option is now the “value-laden” conception, it seems quite reasonable to think of the existence of *limits*, such as Rescher has done. Thus, one of the key values of science as a human cognitive project is “its selflimitation based in a need to recognize that there are limits to the extent to which this project can be realized.”³⁵

Recent decades have shown several fractional orientations on value-ladenness, both on the side of “internal” values (mainly, cognitive ones) and on the side of “external” values (primarily, social ones). But it seems more suitable to think in some form of *holistic view* on values. Thus, scientific goals (mainly, cognitive ones) are related to the rest of our goals (social, cultural, economic, etc.) in a kind of “system.” So, the dynamic character of scientific research should be also considered, with the presence of values in the realms of aims, processes and results. Science is a human undertaking in a contextual setting rather than a purely cognitive project or an isolated doing.³⁶ In other words, science belongs to a human network.

Three are the planes where we can see values in science: (a) in *basic science*, insofar as it is a human activity, which involves values on ends and means; (b) in *applied science*, because scientists take into account values to choose aims, need to select processes and seek results on the specific problems that they are researching; and (c) in the *applications of science*, which are the uses of the results of scientific research in the social and historical context, where we consider values when issues such as risk are at stake. In science, the values are “internal” (cognitive, methodological, etc.) and “external” (social, cultural, etc.). But some values can have a presence in both sides, such as ethical values (endogenous and exogenous) and economic values (cf. [31], pp. 99–106).

Without doubt, economics is a good case study for values in science. The branches of positive economics and normative economics pose the problem of values on the “descriptive” sphere while showing the presence of values on the “prescriptive” area. But economics exemplifies quite well the existence of values in the positive and the normative branches. Thus, although the interest in the “value-free” ideal might be understandable in terms of autonomy of economics and self-correctness instead of extrinsic influence on scientific contents, there are also values in the case of economics when it is focused on doing explanations and predictions.

This presence of values in economics includes ethical ones, insofar as the analysis of economics is made in terms of human activity: (i) the ethical values have a role both in the agents that make the decisions and in the organizations related to economic markets; (ii) economics as a science studies “economic activity” and “economics as activity” (cf. [21]), where there are ethical components concerning ends and means; (iii) the solutions to the specific problems in applied economics involve ethical values on the assessment of prescriptions (i.e., what is going to be implemented); and (iv) the use of the results of applied economics by political institutions commonly involves making choices, and these can also have an ethical component.

11. The objectivity of values is explicitly discussed in connection with human needs in [72], Chap. 3, pp. 73–96. See also [67].
12. However, following a pragmatic approach (sites, products, etc.), he does not see a clear distinction between “science” and “technology” (including “basic research” and technology), cf. [41] pp. 85–91, especially, p. 86.
13. This can be seen in the case of scientific prediction: “Probably the most deeply held values concern predictions: they should be accurate; quantitative predictions are preferable to qualitative ones; whatever the margin of permissible error, it should be consistently satisfied in a given field; and so on” [46], p. 185.
14. On the distinction between “applied science” and “application of science,” see [62], p. 9.
15. According to Imre Lakatos, “Scientists, as citizens, have responsibility, like other citizens, to see that science is *applied* to the right social and political ends,” in [50], p. 258.
16. Cf. [24], pp. 11–44; especially, pp. 22–26.
17. This is also the case in the sciences of the artificial, where there are certainly ethical concerns, for example, in the field of computer sciences. Cf. [17] and [36].
18. On this notion, see [73].
19. This thematic realm is receiving an increasing attention. Cf. [8].
20. The social consequences in this field are visible. See, for example, [40].
21. Cf. Rescher, N, Personal Communication, 27 Aug 1998. His conception is developed in [74]. On his philosophical approach, see [87]. On holism about values see [10] and [61].
22. Cf. Rescher, N, Personal Communication, 27 Aug 1998. Cf. [24], p. 22.
23. For Laudan, “epistemic values” (truth, falsity, ...) can be distinguished from “cognitive values” (scope, generality, coherence, consilience, explanatory, ...), cf. [52], p. 20.
24. Rescher, N, Personal Communication, 27 Aug 1998.
25. Cf. [51], pp. xi–xii, n. 2. The subtitle of his book is very clear: *The Aims of Science and their Role in Scientific Debate*. In his reticular model of scientific rationality, Laudan emphasizes that those values are good enough for the task: “Doubtless a wide range of cognitive goals or values can satisfy the demands laid down here” [51], p. 63.
26. See, for example, [34] and [85].
27. There is usually a tension in the scientist between the defense of his or her autonomy and the need for responsibility, cf. [14].
28. The constitutive elements of science are presented in [28], pp. 3–49; especially, pp. 10–11.

29. On this distinction, cf. [62] and [80].
30. The existence of differences between basic science and applied science can be seen on analyzing the latter, cf. [63] and [64].
31. This means that scientific progress is commonly modulated by an “economics of research.”
32. Cf. [72], Chaps. 7, 8, and 9, pp. 151–203.
33. The repercussion is even more noticeable when technology is involved, cf. [2] and [3].
34. The concept of “neutrality” in science has been analyzed in [1], Chap. III.
35. Rescher, N, Personal Communication, 27 Aug 1998.
36. This kind of approach affects the issue of “intrinsic” versus “extrinsic” values. On intrinsic and relational properties, see [37]. See also [9].

Abstract

Many attempts to study or to modify the democratic governance of science start from the assumption that the relationships between science and society take, at least implicitly, the form of a “social contract.” In the first part of this chapter, we critically examine this idea and put some limits to it. The second part of the chapter is devoted to apply the idea of a “social contract” to an important scientific “institution” in particular: the institution of scientific method.

Introduction

The idea that science is, or should be, regulated by a kind of “social contract” is critically examined. The notion has been more commonly flagged in political proclamations than used in explanatory or descriptive analysis of how science really works or might work. Nevertheless, we defend its value as an analytical tool in the study of science as an institution, both a social and epistemic one. For the main features of this institution can be understood as resulting from an equilibrium in the more or less conflicting interests of different agents (competing or cooperating researchers, industries, citizens, consumers, governments, and so on).

On the Governance of Science and the Idea of a “Social Contract”

There are many diverse approaches to the study of the relations between science and the society in which scientific knowledge is created and applied. However, very often some of these approaches assume a linear causal-explanatory framework to make sense of the relationship between science and society, and particularly between science, society, and technology, the latter understood as a more or less direct outcome of “applied science.” Sometimes the causal-explanatory direction goes from science to society, and other times go the other way around. This underlying explanatory framework allows to understand why the so-called science-technology-society (STS) studies are often viewed as an alternative, even a opposing alternative, to more “traditional” approaches within philosophy of science, which, in general, have concentrated on the “internal” aspects of science, and only marginally about the connection between these aspects (the structure of theories and models, the logical connections between hypotheses and empirical evidence, the dynamics of scientific progress, and so on) with the “outer” society. One particular subject in which most of the dominant paradigms in the philosophy of science (positivism, naturalism, rationalism, realism, empiricism, constructivism, etc.) have failed to capture some essential elements of the entanglement of science and “the social” is their lack of attention to the (relevant) relationships between the individuals that *make* science, and between these individuals and the other members of society: either these paradigms start with a global view of society and study its influence on the scientific procedures or outputs (e.g., how a capitalist society favors some types of scientific theories and practices), or it is the scientific communities and their outputs what are taken as a whole and their effects on the rest of society are investigated (e.g., how some scientific discoveries influence an epoch’s mentality).

On the contrary, we think that pointing toward the processes of *negotiation* between the individuals involved in scientific activities (broadly understood) allows to denounce the fallacious character of traditional dichotomies between the “internal” and the “external,” the “epistemic” and the “social.” The science that is produced within our societies and that gives form to them can be understood in terms of what we suggest to call a “multifactor collective negotiation.” In the first place, there are negotiations among scientists within a specific discipline or community, negotiations that serve to establish or to change the norms according to which scientific research is carried out, i.e., the norms telling what procedures are appropriate, legitimate, etc., within scientific research. In the second place, there are negotiations between different scientific communities or disciplines that serve to establish the relations of mutual dependence and deference, and also to some extent the distribution of resources within science. In the third place, there are negotiations between scientists, or scientific communities, and other social actors (governmental offices, parliaments, industries, commercial firms, associations of consumers, political parties, etc.), which are decisive in order to establish the resources that the whole of society is devoting to an area of research, including not only economic

resources (money, labor, facilities, and so on), but any other kind of social resources or “social capital,” including the “credibility” that a certain field of science or group of scientists is going to have in a particular social context. So, what we suggest is that, in order to understand the functioning of science within our societies, it is promising to consider the outputs of the social relations (both internal to science processes, and those between science and society at large) as the result of a kind of “social contract,” not necessarily in the sense of an explicit and formal agreement, but as the emergent result of a practical process of continuous negotiation (see ► [The Classic Social Contract Tradition](#); ► [The Modern Social Contract Tradition](#); ► [The Idea of a Contractarian Business Ethics](#)).

It is commonplace that science itself is not autonomous of external governance structures (particularly regarding financial aspects, or ethical concerns), so it makes sense to try to study where both the internal process and the “external” issues actually meet. The “internal” questions are about how the science is built and developed by its direct agents, the scientific researchers, but other related issues are how the external, the society in general and particularly, the funding systems (who, what and how much is paying for science and scientific activities), are also structuring to some extent the scientific products and activities, as well as their paths of development. This is particularly true in a time like ours, when a new kind of science is arising, one that is expanding and refurbishing its traditional methods of research, diffusion, transmission, and justification [7]. Sometime those links are referred to as “the social contract of science,” but usually this expression is just used as a convenient metaphor, without analyzing the “negotiating” aspects of the supposed “contract,” which is the aspect we propose to explore.

The famous Vannevar Bush’s report *Science, the endless frontier* [2] is rightly considered as one of the first defenses of something like a “social contract for science,” though the truth is that it does not explicitly contain this expression. The report contained, however, the conceptual basis to formulate what, under the example of the science-military collaboration of the Manhattan project, would later become known as “big science”: the massive involvement of public administration in the gigantic investments demanded for high-technology, large-scale scientific projects [3]. But, as Judith Ramaley [10] says, “Government laboratories and private industry would translate this work (basic research) into something practical. Bush saw the conversion of basic research into practical use as a linear process. In his model, research was kept relatively separate from teaching. The university was still viewed as an ivory tower whose function was to look out upon society and elevate its taste and values through the generation of basic research.” So, for Bush, “basic research is performed without thought of practical ends... it results in general knowledge and an understanding of nature and its laws” and “scientists may work in an atmosphere (universities and research institutes) which is relatively free from the adverse pressure of convention, prejudice or commercial necessity” [10]. Bush’s report was consequential, not because it explicitly formulated a “social contract for science,” but because it puts the finger on the complex relationship between science and government or politics, trying to strengthen

the autonomy of science and the production of “basic research” in a time when politics seemed to be trying to absorb the control of all the scientific process (or so some seemed to fear). In order to justify the autonomy of basic research, Bush assumed what were later to be known as the “linear model” of science development, according to which the resources that the whole society devotes to fundamental research are better freely left in the hands of scientists themselves, who will more or less spontaneously produce thanks to those resources an output of knowledge that, equally spontaneously, will lead to technical innovations in the hands of private firms, one vision that, as it is well known, was later profoundly challenged. Some of the approaches most critical with Bush’s proposals (e.g., Silvio Functowicz on “post-normal science,” [5]) were, nevertheless, basically as “linear” as his, but in the opposite sense: they tried to show that “external” social processes not only determine the funding aspects of research, but also the content and the epistemic assessment of scientific items of knowledge. Even some processes of “social innovation” are considered in these approaches as the substitute of the “old social contract of science.” In this new “contract,” the independence of researchers (particularly of those in basic science) would be replaced for a direct and more or less complex dependence from governments, parliaments, or representatives of the consumers and users of the products of science. Other authors, like David H. Guston or Carl Mitcham [6], have clearly shown, instead, that there has never been something like an explicit social contract in the “old” mode of science production, nor there is something like a “new” contract now, for the relationships between science and society are more complex than what the notion of a “contract” would reflect. This is in line with the diagnostic about contractarian approaches.

Nevertheless, the idea of the “new social contract of science” has tended to be more frequently employed in political-institutional contexts, like the 1999 “World Conference for Science” organized in Budapest by UNESCO, rather than in academic research. And, as it usually happens in these cases, such types of use of the concept usually lack the intellectual depth and definiteness necessary to articulate a, so to say, “scientific” vision of science, and tend to be mere expressions of goodwill, permeated very often by an essentialist view both of science and of society. Obviously we must lean on science in order to solve many of the big problems faced by the humankind, and we must warrant democratic control of scientific activities when they threaten to hinder human development, but one thing is to say this, and a different thing is to articulate a “social contract” that establishes the rights and commitments of each signing part.

Since the old times of logical positivism, and of its distinction between the context of discovery and the context of justification, we have learned a lot about the practices of scientists, both at the more epistemic level, and at the more social or socio-institutional levels. One of the important things that social studies of science have shown is that at both levels there is a permanent need of mutual control between the agents involved, something that in recent times has tended to be called “governance” (cf. [4]). It is possible, hence, to make a distinction between “governance *in science*” (the negotiations and agreements that take place within the scientific communities), and “governance *of science*” (the processes that try

to warrant that scientific activities are in the benefit of citizens); as we shall show, this distinction is useful to understand the notion of a “social contract of science.” Actually, contemporary discussions on “a new social contract for science” tend to point in some way or another toward the idea of a kind of “democratic governance of science,” particularly since, as many have suspected, the old Bushian “contract” has tended to be more influenciabile in the last decades from the power of the market and of for-profit companies, in which the democratic control in the interests of citizens is much more difficult to implement, due in part to the failure of governments of keeping the increase in public research funding at the pace of the growth of other expenditures. Of course, other problems in which the role of science has been relevant (nuclear power, climate change, pandemia. . .) have also add suspicions to the presumed role of the governments as guarantor of the citizens’ interests in the “contract with science,” and to the presumed “impartiality” of scientists, either when setting research agendas, or when acting as experts for public or private institutions. Under these circumstances, the notion of a generic “social contract” becomes particularly suspect, even when we take for granted its essential counterfactual character. For the idea was based in a linear view of the development and application of scientific and technological knowledge, in which application was seen as the way in which researchers “paid back” for the funds that citizens had put on their hands through general taxes. But the fact is that most “knowledge transfer” does not take place through the traditional avenues of R&D, but through what now tends to be called “open innovation” or “social innovation.” As the NESTA 2010 report states:

While R&D is an important source of innovation, it is focused on only a subset of innovative activity. There is a growing recognition that innovation encompasses a wider range of activities and broader metrics are required to reflect this, including investment in intangible assets ([8], p. 7)

Another important fact that has to be taken into account when we talk about any “contract” is the *asymmetry of information* between the people subscribing it, or affected by it. This has been the inspiring idea of the new area of economic science known as “economics of information.” Traditional economic theories were based on the assumption of “perfect knowledge,” i.e., it was assumed that the economic agents (e.g., demanders and suppliers of an economic good) had all the information that was relevant and needed for the problem situation they were facing, and perhaps more importantly, these theories assumed that the distribution of that information was symmetric, in the sense of equally shared by all the agents. Information economics started its development in the 1970s mainly as an attempt to understand the influence that the nonfulfillment of this latter assumption had on the equilibrium the agents’ interactions led to (e.g., George Akerlof’s 1970 paper on “The market for lemons,” Michael Spence’s 1973 paper on “Job market signalling”; for a useful introduction to the economics of information, see Macho and Pérez, [9]): typically, sellers know much more than buyers about the real quality of the goods or services they sell, and this asymmetry can cause the market mechanisms work very inefficiently, though they also create the opportunity for specific institutions (like “contracts”) to evolve that can harmonize the interests of sellers

and buyers. Information economics has tried to take advantage of the sophisticated mathematical tools of game theory which allow them to model the effects in the interaction between actors characterized by differences in the information they possess. One of the essential instruments with which this has been done is known as the *principal-agent model*. The basic version of this model represents an individual or a group, the “principals,” who is or are unable to perform a certain task as efficiently as other individuals or groups, the “agents,” so that the former “hires” the latter to carry out the job; the agents, however, are assumed to be not directly interested in the fulfillment of the task, i.e., they may put too little effort on it, or at least, less effort than what the principal would consider appropriate. The “principal-agent problem,” consists, then, in determining a contract, or an incentive scheme, that both parts are interested in signing, and that warrants to the principal that the agent will perform her task in a satisfactory way. This line of research has led to the development of a successful branch of game theory, known as “mechanism design,” which can be considered the reverse of classical game theory: whereas in the latter the problem was to predict the choices made by the players of a game whose rules were given, the former can be seen as the attempt to design a game (i.e., a set of formal rules) that leads players to choose the outcome that “we” (which usually personalizes the principal) desire. For example, governments and parliaments establish several models of “science laws,” including ways of organizing and managing the resources given to scientists, but usually those laws fall short of their goals because they cannot enter into most of the intricacies of the self-organizing processes that constitute the research activity. In order to create a “well-designed” social contract for the governance of science, it would be necessary, hence, to study the structures of the negotiation processes internal to science, so that the satisfaction of demands and goals of the political body might to be achieved through steps that are coherent with what the internal goals of science dictate. The “social contract of science” should be, hence, the product of an until now nonexistent discipline, that we might call “political microeconomics of science.” This is exactly in the line of the proposals of one of the authors we have quoted:

The scheme for the automatic management of scientific integrity under the social contract for science has been overthrown and replaced by a more formal system of incentives and monitoring, as the principal-agent framework would suggest” ([6], p. 12).

Following some of Guston ideas we can try to articulate the external and internal processes in scientific system as a dual process from the point of view of the “frontier,” or as Guston says, “boundary organizations” between both, like external ethics committees, sociopolitical committees, new peer review processes, etc. As an example of the study of the emergence and functioning of institutions, we also think that it is interesting to point to the fact that a purely rationalistic model (e.g., one based on rational choice models populated by Bayesian agents) would not be useful to capture the fundamental aspects of the behavior of the people who are subjected to normative contexts, and that has in general cognitive limitations, the institutions are designed in part to remedy; models of bounded rationality should, hence, necessarily be employed in the analysis of the social contract of science (e.g., [1]).

The Scientific Method as a Social Contract

As we have stated, the academic analysis of the social structure of science and of the relations between science and society from a contractarian point of view is still a project for the future, and this chapter attempts to be an invitation for the development of such a project. By way of example, in the rest of the chapter we shall try to apply the contractarian intuition to a particular aspect of the “governance of science” which has often been considered as totally alien to the introduction of “sociological” or “political” considerations; we are referring to that set of procedures usually referred to under the rubric of “scientific methodology.” Our starting point would be to assume that scientists are players in a competitive game whose goal is the attainment of a particular kind of social and epistemic reward: being acknowledged as the author of an important discovery. The basic idea is to consider that this game is played according to a system of rules or norms that are not absolutely imposed by a transcendental logic or something of the like, but that can be negotiated by the very same players of the game (i.e., the researchers). The question is, hence, the following: if you were a scientist playing that game, i.e., pursuing recognition for discoveries, “against” other scientists attempting exactly the same, *what scientific norms would you like the game were played by?* (for more details on our proposal, see Zamora Bonilla [11–13]).

Firstly, let us see what *kinds* of norms can be expected to arise in a negotiation among “recognition-seeking” researchers. It seems that three types of them are needed, at least:

1. *Inferential norms*: these tell that, if a researcher has accepted certain propositions, and if another proposition stands in certain specified relation with the former ones, then that researcher will be forced to accept also the later proposition. For example, norms of this type will establish when is a hypothesis “well supported enough” to make its acceptance compulsory. These rules are useful for a “recognition-seeking” researcher because they indicate what statements you have to persuade your colleagues about, *before* attaining the public acceptance of your hypothesis.
2. *Observational norms*: in order to prevent the strategic denial to accept *any* statement that can “trigger” the undesired acceptance of a rival’s theory through the rules of the first type, it is necessary that the commitment about some kinds of propositions is compulsory for reasons different from the previous acceptance of other statements. Typically, observations and experiments (or specific parts of them) are the natural locus of this type of norms, though probably not the only one.
3. *Distributional norms*: these norms govern the allocation of the power to control the resources needed for making research and communicating their results. Obviously, this power is interesting for scientists not only for the ability they confer to increase the probability of getting their theories accepted, but also because many other “private benefits” accrue to them together with that power (We admit that these rules are less appropriately called “methodological”).

Secondly, it is perhaps more important to notice some properties that any “reasonable” system of rules must have. These properties are grounded on the very nature of the negotiation process through which the rules are established:

1. Norms are usually chosen “*under the veil of ignorance*” (to use a Rawlsian expression). It is certainly possible that accepting a norm may be interesting for you on a particular occasion because that norm “supports” the theory you are proposing; but committing to a norm *today* forces you to be committed to it also in the future, and perhaps the same rule makes it that the facts discovered *tomorrow* support some of your rivals’ theories more than yours. In general, it is very difficult for you to predict exactly what theories or hypotheses will you be proposing in the future, and what will its connection be with the accepted facts. So, as long as methodological rules operate as real (and more or less durable) commitments, it is not necessarily a wise strategy to “vote” for the rules that happen to favor your “current” theory.
2. As long as the decision of belonging to a scientific community or exiting and constituting a different one is open for researchers, it makes no sense to talk about “imposing” a rule. A norm is a norm *within a scientific discipline* because it is interesting *for all its members* to adopt it. So, a rule will only be established if it promotes reasonably well the prospects for recognition of every researcher. This does not entail that everyone will have exactly the same probability of success, for scientists less talented and poorly equipped will be content with a lesser probability than their more fortunate colleagues.
3. The two previous properties entail that scientific norms will tend to be *impartial*, because they must offer a fair opportunity to *rival* approaches and theories. If a particular approach is seen as “promising” by the members of a scientific discipline, and some existing norms tend to diminish the chances of success of those following that approach, researchers will be interested in negotiating a change in the norms and will begin to explore the new ideas according to the new rules. On the other hand, it also is true that norms may have some “inertia,” and this can slow down the negotiation process.
4. In many cases, the real effects of a norm on the prospects of getting public recognition will be so uncertain, that scientists will tend to be indifferent between several alternative rules *as long as only recognition is considered*. Think, for example, in a norm indicating that “*ceteris paribus*, the theories with a higher predictive success have to be preferred,” and contrast it with alternative norms, as “*ceteris paribus*, the theories with a lower predictive success have to be preferred,” or “*ceteris paribus*, the theories which have been formulated in Latin verses have to be preferred.” Imagine now that you could negotiate with your colleagues which of these three rules to adopt. It is by no means clear which one of the three maximizes the probability of *your* winning a game of research; perhaps you are much better at Latin than the rest, but in this case it is just this differential ability what will make your competitors abstain from accepting a norm so clearly benefiting you. In any case, it is difficult, if not impossible, to ground your decision about which norm to accept on an estimation of your probability of success. What other criteria will you employ, then?

It seems to be a benevolent assumption that, *ceteris paribus*, researchers will prefer methodological norms which are consistent with the maximization of the *epistemic value* of the theories which happen to win in the game of persuasion. After all, why would they have chosen a *scientific* career as a means of getting public recognition, instead of other kinds of activities, as pop music, sports, or politics, if they *did not worry at all* about the attainment of “knowledge”?

A last important point in connection with this is that, although the contractarian approach to scientific norms leaves some space to the influence of epistemic factors in the choice of the rules (and hence in the justification of scientific knowledge), we cannot interpret this result as a return of the classical view of epistemologists as deciding *a priori* how the pursuit of knowledge has to be. Because it is essential to recall that, even if epistemic values enter into the negotiation of scientific norms, these values *are those of the researchers* who are taking part in it, not those of the philosopher or the “science student” who are observing the process from outside. This is again something that our approach shares with that of many scientific naturalists, though we want to point toward an aspect more specific of the contractarian view: the assumption that an explicit or implicit *agreement* between the members of a scientific discipline is the only legitimate way of “aggregating” the epistemic preferences of all these individual scientists. Nevertheless, it is true that other agents outside the research field or even outside science may have an interest in negotiating the norms according to which the game of research is played, and the study of this interaction can also be an interesting point of contact between the approach defended here and other approaches in the field of social epistemology.

Curiously enough, we do not observe that it exists something like an institutionalized “science police” or “science tribunals”: scientific research seems to be “self-policing,” at least in a higher degree than other kinds of practices. It is true that a large amount of case studies in history and sociology of science have been devoted to showing that scientists are far from being mechanical and systematic in their application of methodological norms, and that they tend to use the existing rules “strategically” or “rhetorically.” But we do not think that this may serve to prove that scientific research is not regulated by those norms. In the first place, the vision of scientific method suggested in the preceding sections is *not* that of a logico-mathematical algorithm: actual methodological rules are usually ambiguous in their application to concrete cases, and they are frequently contradictory in their practical suggestions. So, it is natural that each scientist tries to interpret each norm in the way which is most favorable for his own theory. In the second place, usually not all methodological rules are violated simultaneously by a researcher; rather on the contrary, he must employ some rules in order to *justify* why he has broken others; otherwise, his colleagues will simply not take into account what the former scientist is asserting. In the third place, and more importantly, a “rhetorical” use of a norm only makes sense if one expects that others are going to be persuaded by such a move: if *everybody* employed “just rhetorically” the norms *every time*, no one would have a reason to do it. Appealing *successfully* to rhetorical strategies shows that your audience act according to some *predictable patterns* (at least within certain limits), and these *regular patterns of decision making* are just the *real* methodological norms we are referring to.

The main reason why these patterns are chosen *and followed* is probably because of the nature of the reward pursued by scientists, i.e., recognition. Since what you want is that *others* express a public approbation of your own work, you do not obtain anything directly from *your own* decision about what facts or theories to accept; it only matters to you what facts or theories are accepted *by your colleagues*. So, the only question relevant for you is whether *your colleagues* obey the rules or not: if they do it, you will be rewarded for doing “good research” (“good” according to the accepted norms), and you will get nothing otherwise; if they do not obey the rules, you will get nothing no matter what you do, because they are not going to accept your own theory however much effort you might put in defending it. So, the game of persuasion has two possible equilibria in general: either no one obeys the rules of the game (and this means that no research is done, save perhaps by isolated people), or everybody does (though, in this case, further problems arise when deciding *which* norms to institute). Under the contractarian vision of scientific method we are defending here, the first of these two equilibria would represent something like the “state of nature,” or, to express it in popular Kuhnian terms, perhaps the state of scientific disciplines in their “pre-paradigmatic period.” The emergence of a “paradigm,” as well as its subsequent changes, can then be seen as the outcomes of collective negotiations on a “methodological contract.”

Conclusion

Unfortunately, the argument of the preceding paragraph does not entirely solve the problem stated in this section, for it only works properly with inferential and observational norms, i.e., the rules governing what propositions have to be accepted. Distributional norms, instead, open the possibility of enjoying other types of benefits (income, travels, power, relief from boring activities, and so on), and people who have control over this kind of resources will surely be tempted to use them to their own advantage. It seems that, “under the veil of ignorance,” scientists will prefer that an institutional mechanism is established that guarantees that a closer relation exists between the level of recognition one has reached and the resources and advantages that one can enjoy. Anyway, the design of such a self-enforcing, self-policing mechanism (if actual institutions are not satisfactory) is a difficult problem which offers a promising avenue of research for students of the economics of science.

Abstract

Significance testing is the most widely used statistical tool for quantitative analysis in science and business. We want to explore in what sense significance testing can help in making ethical decisions, and in what sense it may obstruct them. In the section “Ethics and Statistics” of this chapter, we analyze a simplified model of ethical decision-making, showing how consistency in the assignment of probabilities is a prerequisite for any consequentialist justification of our choices. In the section “Two Varieties of Frequentist Statistics,” we provide a short introduction to significance testing and its two main interpretations. In the section “Misuses of Significance Testing,” we point to inconsistencies in the actual practice of significance testing. Finally, we discuss several proposals for a consistent use of statistical tests in practical decision-making.

Introduction

Statistics is a mathematical discipline that provides advice in the making of uncertain choices: For instance, if we want to invest in a company, we would like to see a projection of future prospects before making a decision. There are various statistical tools that we may use to cope with such uncertain choices. In this chapter, we will focus on *significance testing*, the most widely used statistical tool for

quantitative analysis in science and business. We want to explore in what sense significance testing can help in making ethical decisions, and in what sense it may obstruct them.

Statistics is most useful for consequentialist approaches to ethics, where actions are assessed in terms of their consequences. However, not every statistical tool allows us to justify our choices in a consequentialist manner. Statistical tests can either be interpreted behaviorally, as guiding actual decisions that we make, or evidentially, as providing evidence about the truth or falsehood of a particular claim. In daily statistical practice, significance tests are often used for both ends, for inference *and* decision-making. It is this tension between the behavioral and the evidential interpretation that stands at the heart of this chapter. After all, we need to be consistent in our interpretation of statistical methods if we want a proper assessment of the uncertain prospects we face, and a sound consequentialist appraisal of our choices.

In the section [Ethics and Statistics](#) of this chapter, we analyze a simplified model of ethical decision-making, showing how consistency in the assignment of probabilities is a prerequisite for any consequentialist justification of our choices. In the section [Two Varieties of Frequentist Statistics](#), we provide a short introduction to significance testing and its two main interpretations. In section [Misuses of Significance Testing](#), we point to inconsistencies in the actual practice of significance testing. Finally, in section [Conclusion](#), we discuss several proposals for a consistent use of statistical tests in practical decision-making.

Ethics and Statistics

Long before the establishment of mathematical statistics as a discipline, the ethical dimension of uncertain decisions was appraised in an Aristotelian tradition, namely, in terms of their *prudence* [2]: A good choice depended on finding the correct means for the correct goal. According to Aristotle, there was no general rule for dealing with ethical choices under uncertainty. Rather, like ancient medicine, good decision-making was thought of as a craft where one had to apply one's practical wisdom (*phronêsis*). In the same way that we defer to the advice of a medical doctor when we are sick, we should defer to the practically wise in questions of ethical decision-making. His or her voice settles disagreement about what we should do. One of the most salient examples in Greek history was Pericles, the wise manager of the city of Athens in the fifth century BC.

With Kant, almost 2,000 years later, prudential choices are left out of the proper realm of ethics. The highest ethical good does not consist any more in achieving a certain goal, but in the *good will*. Moreover, in sharp contrast to the Aristotelian deference to experts, Kant developed the categorical imperative as a universal rule of action: to act in a way that could be generalized to a general law. This single maxim is to be followed independently of the uncertainty of the alternatives and the practical consequences they yield. For example, we are not allowed to lie, even if as a consequence of our truth-telling, a malevolent dictator will be able to track down

innocent refugees. In such an act of lying, we would use the person that we are lying to as a means to an end, something that is incompatible with Kant's vision of human autonomy and dignity.

Evidently, statistical advice is most relevant for those approaches in ethics that appraise the rightness of our choices in terms of their consequences. Remember that for Kant, we are morally compelled to abide by the categorical imperative: You are not allowed to protect a refugee by lying about her whereabouts. This emphasis on universal maxims and duties is a *deontological* approach. By contrast, a *consequentialist* in the prudential tradition (cf. [30]) would consider such action wrong, given the likely consequences (the refugee being tortured and/or killed), and would have justified lying. Here, a statistical analysis can step in, by weighting the likely consequences of our actions against each other: Maybe the refugee will be able to escape despite our collaboration with the regime, so telling the truth might not be such a bad thing.

Notably, a statistical analysis does not impinge on our goals: These are taken as given. But if our decision depends on the likelihood of attaining these goals, a statistical analysis may evaluate the ethical correction of our decision. For instance, if a hedge-fund manager invests her customers' money on the basis of careless calculations, we will consider her morally blameworthy: We need accurate estimates of the consequences of our investment decisions in order to justify them. Here arises a source of epistemic and ethical concerns: Since the correction of our choice depends on the correspondence between our models and the actual risks we are dealing with, how do we know that our model adequately captures such risks? The gist of Nassim Taleb's [32] best seller *The Black Swan* is that risks in financial markets (as in other domains) are often not adequately described: We mistakenly assume that the real risks can be structured by a simple probabilistic model, such as the Normal distribution. Due to the idealizing nature of such assumptions (e.g., the extremely thin tails of the Normal distribution), we are ill prepared to estimate the real likelihood of high-impact events.¹

The recent financial crisis illustrates that we can rarely apply statistics blindly, as if we had a mechanical algorithm: Statistical analysis depends on a number of assumptions about the data and the proper way to handle them. Intuitively, the decision-maker seems to have the responsibility to check those assumptions. For instance, according to Michael Lewis [20], there were a number of traders who anticipated the 2007 crash of the subprime mortgage market and actually earned significant amounts of money by selling insurance against it. The standard procedure to redistribute the risk of a mortgage defaulting was through a collateralized debt obligation (CDO), a bond in which thousands of loans were gathered in tranches with different levels of risks, under the assumption that they would not all default together. According to Lewis, it took just a simulation of the effects of home price appreciations on these loans to convince an insightful trader (such as Gregg Lippmann) that default rates would violate the CDO assumptions: They could very easily collapse simultaneously.

Should we blame the sellers of CDOs for not conducting such simulations? Before we answer "yes," we need to be aware of what we may legitimately expect

and require from statistics in order to attribute the responsibility for a proper or improper use. In particular, such a responsibility cannot be easily attributed, unless we have a regulative ideal against which to evaluate a particular choice.

The classical regulative ideal in consequentialist decision-making is *Subjective Expected Utility Theory (SEUT)*, developed by, inter alia, Ramsey [27] and Savage [29]. By now, it has become the standard model of decision-making under uncertainty in social science and in moral and political philosophy. The classical justification proceeds by outlining an intuitive axiom system for individual preferences, demanding that they be complete, transitive, respect the sure-thing principle, apply to mixed bundles of goods, and so on. Then, it is shown that such a system of preferences admits a (unique up to affine transformation) representation in terms of a real-valued utility function over the outcomes and a probability function representing the subjective uncertainty of the agent. That is, if a_1, \dots, a_n denote the available actions, $p(\cdot)$ denotes our subjective probability function over states s_1, \dots, s_n , and u_{kl} the utility of action k in state l , then action a_i is better than action a_j if and only if

$$\sum_{k=1}^n p(s_k)u_{ik} > \sum_{k=1}^n p(s_k)u_{jk}. \quad (77.1)$$

In other words, the averaged or expected utility of a_i exceeds the expected utility of a_j with respect to one's subjective probability function, hence the name Subjective Expected Utility Theory.

As a descriptive model of the average economic agent, SEUT is often contested [1, 9]. However, it is often defended on normative grounds [17]. If you are a consequentialist, not taking into account the principles of probability will put you in a difficult position. Take, for example, the representation of uncertainty by a probability function – an essential cornerstone of SEUT. If our degrees of belief violate the axioms of probability, a malicious bookie can set up a gamble (according to our degrees of belief) whose set of odds and bets guarantees a profit for him, whatever the actual outcome [33]. Since degrees of belief are standardly operationalized via betting behavior or judgments on the fairness of bets, non-probabilistic degrees of belief are arguably self-defeating.

Still, even if we are convinced by this “Dutch Book Argument” in favor of coherent probabilities, it has not been demonstrated that we should maximize the *average* expected utility. The standard argument to that end goes that in the long run, acting in accordance with SEUT delivers practical success. In his 1951 essay “Why *should* statisticians and businessmen maximize moral expectation?”, Jacob Marschak tried to derive from the rule of maximizing expected utility the satisfaction of “the rule of long run success”: Under certain assumptions, it will be almost certain that a sequence of strategies maximizing expected utility will outperform any other consequentialist decision rule ([21], pp. 504–505). Unlike the Dutch book argument, Marschak's case was about winning, rather than not losing, appealing

to the practical rationality of businessmen. Still, this argument has, apart from doubts about the plausibility of its assumptions, often been challenged – particularly by the empirical findings of Kahneman and Tversky [18].

Objections put aside for the moment, we see two different consequentialist justifications for SEUT as a standard of rational and ethical choice. If the moral correctness of our decisions depends on an accuracy of their consequences, SEUT contributes to it in two ways. There is, on the one hand, (probabilistic) coherence: Make your choices in a way that it is not self-defeating for your aims. On the other hand, there is success: Make your choices in a way that actually maximizes your chances of attaining your goals. We will, in the remainder, use SEUT as a regulative ideal against which we evaluate different approaches to statistical testing. If we do not apply our statistical techniques consistently, we cannot expect statistics to increase our chances of success. Hence, from a consequentialist perspective, we will lack a proper statistical justification of our decisions. We will be just deceiving ourselves or misleading our audience into the incorrect belief that we have such a justification.

Two Varieties of Frequentist Statistics

Statistics tries to anticipate random events by drawing on the data that have accumulated in our experience. We try to discern a pattern in the random distribution of these data (past, present, and future): We form hypotheses about such distributions and we use statistical tests to check whether our hypotheses are correct. In its simplest form, a hypothesis test compares two hypotheses H_0 and H_1 about an unknown quantity of interest, represented by the real-valued parameter $\theta \in \Theta$. Sometimes we deal with a precise hypothesis about θ , for example, $H_0 : \theta = \theta_0$ – the null hypothesis – and oppose it to an unspecified alternative $H_1 : \theta \neq \theta_0$. It is then tested whether the data are compatible with the null, or whether a significant deviation is present. Such *hypothesis testing* is the prime activity of frequentist inference – inference that shuns subjective assessments of uncertainty and only builds on the probability of events under the tested hypotheses, that is, the sampling distribution.

There are two main approaches to hypothesis testing within frequentists statistics. The first one, devised by Jerzy Neyman, argues that statistical testing is about *making decisions* about the acceptability of a hypothesis. The second one, due to Ronald A. Fisher, claims that statistical tests should only provide an *assessment of the evidence* for or against a particular scientific claim. Both interpretations are often confused in practice. Below, we spell out the difference: Conflation of both approaches goes at the expense of conceptual consistency that we seek in order to make properly informed decisions.

Together with Egon Pearson, Neyman designed a hypothesis test as a proper decision rule, that is, as a function $T : \chi \rightarrow \{\text{accept } H_0, \text{reject } H_0\}$, χ being the sample space. Think, for example, of industrial quality control. Should we accept

a delivery of bulbs which we have sampled for defective elements? The answer will, inevitably, depend on how many elements in our sample have been found to be defective. We might make the wrong decision if, by chance, we pick a nonrepresentative sample, but if the test is properly designed, only a small number of our decisions will be mistaken.

From an epistemological point of view, the Neyman-Pearson approach receives its justification by the associated *error probabilities*. Let the null hypothesis be that in our delivery of bulbs, there are not more than 10% defect elements, and let the alternative posit that there are more than 10% defect bulbs. (Assume that 10% is the highest proportion of defect bulbs at which it is still economically advantageous for us to accept the delivery.) The test statistic T is then so designed that the null hypothesis is rejected in at most 5% of all cases where it is true, that is, where the delivery is acceptable.² This *type I error level* – the probability of an erroneous rejection of the null – can also be chosen to be 10%, or 1%, etc. – the cutoff is purely conventional and reflects how important we find it that the null is not erroneously rejected.

Evidently, there are various tests that satisfy this property. Trivially, even a test that always accepts the null (and the delivery of bulbs) will have a type I error level as low as 0%. While such a test appears desirable in theory, it is practically unsound: The decision does not depend at all on how many defect bulbs are found. In other words, the test is not responsive to the strength of the evidence. Therefore, the acceptance region should be chosen such that, for a type I error level deemed acceptable, say, 5%, the *type II error level* – the *probability of an erroneous acceptance* of the null – is minimized. We say in that case that the *power* of the test, its ability to recognize the alternative when it is true, is maximized conditional on the level of the test being 5%. In this way, both possible types of error are controlled, and the optimal Neyman-Pearson test will rarely lead to a wrong decision:

we shall reject H_0 when it true not more, say, than once in a hundred times, and in addition we may have evidence that we shall reject H_0 sufficiently often when it is false. ([25], p. 291, notational details changed)

Such a behavioral rationale is well suited to inform real decisions with concrete, immediate impact. Neyman's approach emerged from the world of industrial quality control, where every decision has costs and benefits. Statistical tests à la Neyman were aimed at hedging costs, conforming to the consequentialist spirit presented in the previous section. But not every statistician shared such an applied perspective: Many "decisions" in science are just preliminary and subject to further evidence. A behavioral interpretation of statistical testing was considered inferior to an evidential, inferential interpretation, where we assess the truth of a hypothesis, independently of the consequences of a wrong assessment. As R.A. Fisher put it:

In the field of pure research no assessment of the cost of wrong conclusions [...] can conceivably be more than a pretence, and in any case such an assessment would be inadmissible and irrelevant in judging the state of the scientific evidence. ([11], pp. 25–26)

Two arguments are implied here. First, we cannot quantify the utility that correctly accepting or rejecting a hypothesis will eventually have for the advancement of science. The far-reaching consequences of such a decision are beyond our horizon. Second, statistical hypothesis tests should state the *evidence* for or against the tested hypothesis: A scientist is interested in whether she has reason to believe that a hypothesis is true or false, and her judgment should not be obscured by the long-term consequences of working with this rather than that hypothesis. For Fisher, testing a hypothesis requires an assessment of the significance of the evidence against it. By his emphasis on evidence rather than decisions, Fisher departs from Neyman and Pearson's consequentialist reasoning – a change that severely affects the interpretation of those statistical testing procedures.

Significance tests aim at determining whether a perceived effect in the data is real or possibly due to chance. If the discrepancy between data and null hypothesis is large enough, we are entitled to infer to the presence of a significant effect. Suppose we have a precise null hypothesis $H_0 : \theta = \theta_0$ vs. $H_1 : \theta \neq \theta_0$. For measuring the discrepancy in the data $x := (x_1, \dots, x_N)$ with respect to the postulated mean value θ_0 of a population with known variance σ^2 , one canonically uses the standardized statistic

$$z(x) := \sqrt{N} \frac{\frac{1}{N} \sum_{i=1}^N x_i - \theta_0}{\sqrt{\sigma^2}} \quad (77.2)$$

Thus, we may reinterpret Eq. 77.2 as

$$z = \frac{\text{observed effect} - \text{hypothesized effect}}{\text{standard error}}. \quad (77.3)$$

Determining whether a result is significant or not depends then on the distribution of the value of z . Practitioners usually use the so-called *p-value* or *significance level*, the “tail area” of the null under the observed data (see Fig. 77.1), which can be computed as

$$p := P(|z(X)| \geq |z(x)|) \quad (77.4)$$

that is, as the probability of observing a more extreme discrepancy under the null than the one which is actually observed. On that reading, a low significance level indicates evidence against the null since the chance that z would take a value at least as high as $z(x)$ is very small, if the null were indeed true. Conventionally, one says that $p < 0.05$ means significant evidence against the null, $p < 0.01$ very significant evidence, etc. To repeat, p-values serve, in the first place, the purpose of statistical inference, not the purpose of statistically informed decision-making.

Fig. 77.1 The rejection region for testing the mean of a $N(0,1)$ -distributed random variable at the 5% level

Fisher has interpreted significance levels as “a measure of the rational grounds for the *disbelief* [in the null hypothesis] it augments” ([12], p. 43). What is more, Fisher is explicit that some cutoff value for p should be regarded as necessary for speaking about the presence of a scientifically significant effect:

Personally, the writer prefers to set a low standard of significance at the 5% point, and ignore entirely all results which fail to reach this level. A scientific fact should be regarded as experimentally established only if a properly designed experiment rarely fails to give this level of significance. ([11], p. 504)

The possibility of integrating these two approaches to statistical inference into a consequentialist framework is remarkably different. Neyman incorporates an explicit consequentialist dimension: We can justify the acceptance of a hypothesis in terms of the balance between the number of successes and failures we will obtain if we consistently apply our decision rule. If we are willing to bear a mistaken decision about hypothesis in 5 out of every 100 tests, an appropriate hypothesis test provides the statistical tools to ensure this error rate in the long run. In this way, frequentist statistics can be naturally integrated into responsible decision-making.

However, the majority of inferences and decisions in science and business are derived from observed significance levels, in line with Fisher’s evidential approach. Indeed, Fisher’s above quote demonstrates that the borderline between evidence and practical decisions is thin (“ignore entirely all results which fail to reach this [significance] level”). Significance tests do not quantify how often will we succeed or fail if we apply such rules, and leave ample room for interpretation when we try to apply them in practice. As a consequence, they are often misused, without no clear way to attribute responsibility for the failures. The next section illuminates those criticisms in detail.

Misuses of Significance Testing

As mentioned above, significance tests are, although devised as procedures for stating the evidence against the null, frequently used for substantiating practical decisions, for example, the null is either accepted or rejected depending on the strength of the evidence. Is this practice compatible with the regulative ideal of SEUT? Do significance tests give a valid assessment of our uncertainty about the tested hypothesis?

Concretely, we have to ask whether p-values can be meaningfully related to subjective posterior probabilities (that is, probabilities conditional on the observed evidence) that enter the expected utility analysis. While a subjective analysis is often charged with being arbitrary, it cannot be doubted that in some cases, for example, when reasoning in games of chance, subjective probability assignments can be objectively grounded. In these canonical cases, p-values should give a valid cue about subjective posterior probabilities.

However, the analyses of Berger and Delampady [3] and Berger and Sellke [4] have shown that p-values tend to grossly overstate evidence against the null, to the extent that the posterior probability of the null – and even the *minimum* of $p(H_0|x)$ under a large class of prior uncertainty assessments – is typically much higher than the observed p-value. In other words, even a subjectivist analysis that is maximally biased against the null is still less biased than a p-value analysis. This has led statisticians to state that “almost anything will give a better indication of the evidence provided by the data against H_0 ” ([3], p. 330). The main source of the problem is that p-values do not make use of the full information contained in the data – namely, that the observed discrepancy is *equal* to z – but only of the information that the discrepancy is greater or equal to z , cf. Eq. 77.4.

The situation is further complicated if we focus on the justification for using (Eq. 77.4) as a statistic that measures the strength of the evidence against the null. Fisher famously argued that a low p-value, that is, a highly significant finding, means that “either an exceptionally rare chance has occurred, or the theory [= the null hypothesis] is not true” ([12], p. 39). That is, in the face of surprising results, we make an inference to the best explanation, namely, to the falsity of the null. On a superficial glance, this inference rule provides a natural implementation of Popper’s critical rationalist attitude into statistical reasoning. According to that school of philosophy, scientific method consists in the successive testing and refutation of conjectures one comes up with. However, the analogy is superficial. Fisher’s Disjunction can be rephrased as the inference

$$p(\text{Data} \mid \text{Null Hypothesis}) \text{ is low.}$$

$$\frac{\text{Data is observed.}}{\text{Null Hypothesis must be false.}}$$

Many arguments and counterexamples have been raised in order to show that this probabilistic *modus tollens* is invalid [5, 13]. First of all, what is valid in deductive logic need not be valid in probabilistic logic. Second, only with respect

to a well-specified set of alternatives, we can meaningfully say that a certain set of data constitute evidence against a hypothesis. The idea of testing a hypothesis “in isolation,” without consideration of alternatives, has proved to be incoherent [8, 28, 31]. In other words, even for purely evidential purposes, we should not use significance testing without a very careful consideration of the way we frame a hypothesis and the alternatives.³

In actual practice such caution in the use and interpretation of significance testing is often missing. In economics, for instance, the economists Deirdre McCloskey and Stephen Ziliak have launched strong attacks against significance tests in a series of papers and books [23, 24, 36, 37]. Let us give their favorite example.

Assume that we have to choose between two diet cures, based on pill *A* and pill *B*. Pill *A* has an average effect of making you lose 10 lb, with an average variation of 5 lb.⁴ Pill *B* will make you lose 3 lb on average, with an average variation of 1 lb. Which one leads to more significant loss? Naturally, we opt for pill *A*, in spite of the higher variation, because the effect size is so much larger.

However, if we translate the example back into significance testing and identify the null hypothesis with the default claim that there is no effect at all, the order is reversed. Observing a three pounds weight loss after taking pill *B*, with a known standard error of one pound, is stronger evidence for the efficacy of *B* than observing a ten pounds weight loss after taking pill *A*, with a known standard error of five pounds, is evidence for the efficacy of *A*:

$$z_A(10) = \frac{10 - 0}{5} = 2 \qquad z_B(3) = \frac{3 - 0}{1} = 3$$

Thus, there is a notable discrepancy between our intuitive judgment about which pill is effective in making a patient lose weight. This occurs because statistical significance is supposed to be “a measure of the strength of the signal relative to background noise” ([16], p. 58). On this score, pill *B* indeed performs better than pill *A*, and reasonably so because there is quite some noise in the effects of pill *A*. But what really matters, what economists, businesswomen, and policy makers are interested in, is the effect size, not the signal strength/noise ratio captured by significance tests, argue McCloskey and Ziliak. We are not interested in whether we can ascertain the presence of *some* effect, but whether we can demonstrate a *substantial* effect. In other words, we have to state in which currency we measure effects, and what a deviance of one, two, or three standard errors actually means for the intended application.

According to McCloskey and Ziliak, economists and other social scientists frequently commit the fallacy of neglecting this fundamental difference. By scrutinizing the statistical practice in the top journal *American Economic Review*, as well as by surveying the opinion of economists on the meaning of statistical significance, they arrive at the conclusion that most economists are unaware of the proper meaning of statistical concepts.⁵ In practice, “asterisking” prevails: for example, in correlation tables, the most significant results are marked with an

asterisk, and these results are the ones that are supposed to be real, big, of economic importance, whereas other correlations are neglected. This neglects two salient pitfalls: First, an effect need not be statistically significant to be big and remarkable (like pill A); second, a statistically significant effect can be quite small and uninteresting (like pill B).

Even more disconcerting is that according to empirical surveys, many practitioners believe that if a result speaks highly significantly against the null, then it must be wrong [26]. In other words, the null is believed to be highly improbable if a highly significant result is observed. But posterior probabilities of the null hypothesis do not have a place in the frequentist inference framework that we have assumed so far. Even if that particular fallacy is avoided, conflation often reigns: p-values are often perceived as the probability of replicating an effect of at least the same size, as the level of type I error, etc. None of these standpoints are statistically valid.⁶

A main danger of conducting significance tests is thus that misinterpretation is so prolific, distorting the results. Methodologists such as Fidler [10] and Cumming and Finch [7] have therefore suggested to drop significance tests altogether and to report confidence intervals for the parameter of interest instead. Taken together with the more theoretical criticisms of significance tests, it seems that the practice of basing business and science decisions on statistical data is often far from the ideal of ethically responsible and prudential decision-making.

Conclusion

Our analysis has revealed that despite their apparent simplicity, significance tests are difficult to interpret and to practically use in a consistent manner. From a consequentialist perspective, we should not value much decisions that are grounded on misinterpreted significance tests. If our hedge-fund manager had made an investment on the basis of any such test, we may consider him morally blameworthy, but if the confusion is so widespread (as the CDO case seems to point out) no court will declare him guilty.

Therefore, it is not only an epistemological, but also an ethical requirement to publicly agree on standards for consistent statistical practices. As for significance testing, there is much room for improvement. We briefly sketch three possible options within the frequentist paradigm, none of them being entirely unproblematic.

1. Keep significance tests, but interpret them properly, for example, by including effect size and power measures. This proposal by Hoover and Siegler [15, 16] accepts that failure to distinguish between significance level and effect size is a fallacy, but argues that significance testing *does* have an important function in science and particularly economics: namely, to decide whether the error in a statistical model can be regarded as truly random, or whether a systematic bias is present. To our mind, however, pure significance testing without considering explicit alternatives is difficult to embed into a coherent logic of inference.
2. Move to confidence intervals. A solution that has become increasingly popular in psychology and that has, in the meantime, reached out to editorial

policies [34]. Confidence intervals replace significance level by providing 95%/99%/etc. coverage areas for the data, given a particular value of the parameter of interest. It has been argued [6] that they are a much better indicator of *effect replication* than significance levels, and that they are more stable for the purpose of meta-analysis. However, these intervals must *not* be interpreted as credible intervals in the sense that with 95% probability, the parameter is contained in the confidence interval. If scientists already have trouble to distinguish between p-values and posterior probabilities, they may be equally likely to commit the natural fallacy of interpreting confidence intervals along the lines of degrees of belief about the location of the parameter value.

3. Retract to Neyman's behavioral interpretation of statistical tests. That is, statistical tests are not used for finding out whether a hypothesis is right or wrong, but only for supporting a particular decision. This proposal has never found many supporters in practice. One of the most salient reasons is that any statistical analysis would then be highly idiosyncratic, dependent on the interests and the particular loss function of the individual that conducts the analysis. Intersubjective communication of results and conclusions would, as a consequence, suffer. Moreover, the technical problems – how to compute the level and the power of more complicated testing problems, how to avoid the slippery slope to a subjectivist framework – are far from trivial. An intermediate position between Neyman and Fisher is advocated by Mayo and Spanos [22] under the label of *error statistics*.
4. A radically different solution goes back to the grounding of decisions and tests in SEUT. The idea is to conceive of statistical inference as providing the relevant probabilities for what might or might not be the case, and to feed these probabilities into an expected utility analysis. That is, we inform good decisions by means of well calibrating our subjective assessments of uncertainty. The standard way of doing so is via *Bayesian Conditionalization*. If we are revising our degree of belief in hypothesis H in the light of evidence E , our new degree of belief in H can be computed as

$$p_{\text{new}}(H) := p(H|E) = p(H) \frac{p(E|H)}{p(E)}. \quad (77.5)$$

Statistical analysis can thus inform right decisions in the following way: We start with a *prior* probability function $p(\cdot)$ that represents our initial uncertainty, revise it in the light of statistical evidence E by Eq. 77.5, and apply the principle of maximizing expected utility with our new *posterior* probability function $p(\cdot|E)$.

This subjective understanding of statistical inference is called Bayesian inference. It dominates in moral and political theory, decision theory, and game theory. One of its big advantages is its coherence, simplicity, and universality: It is by construction in sync with SEUT. Moreover, while complex applications demand mathematical sophistication, the basic conceptual framework of Eq. 77.5 remains unscathed. Finally, the epistemic and the

ethical/utility-related aspects of the analysis are separated from each other (an advantage vis-à-vis Neyman's approach), and the probabilistic assessment precedes and serves as an input for the actual decision-making.

However, many scientists – in particular those coming from the natural sciences – have problems with the subjective interpretation of probability, or consider it unsuitable for scientific analysis. According to that view, science should deal with objective facts, objective evidence, not with revising subjective (and ultimately arbitrary) degrees of belief. A fortiori, scientific inference must not proceed by Bayesian Conditionalization. The main attraction of the frequentist paradigm is, to repeat, that it eschews degrees of beliefs, builds on the view of probability as relative frequency, and devises statistical methods that fit these parsimonious modeling assumptions. But in the light of the problems that the most popular frequentist testing procedures experience, the Bayesian paradigm may deserve more attention. Indeed, recent developments in statistical methodology support a trend toward increased use of Bayesian methods.

Thus, a responsible decision-maker needs to think carefully about statistical methodology: Too much can depend on choosing an adequate or inadequate interpretation of a statistical test. We believe that striving for ethically sound decisions does not commit oneself to Bayesianism or frequentism; however, the frequentist stance may be loaded with more challenges and pitfalls with respect to applying it consistently.

Notes

1. Frank Knight [19] famously argued that statistical theory could not be applied to business decisions. When a businessman is making a choice between uncertain alternatives, this uncertainty arises from so many particular circumstances that there is no way of telling if such a decision will ever take place again. For Knight, each choice is entirely unique and cannot be made part of a class of similar choices arising from a general decision rule. On the other hand, statistical decision theory is a theory of probabilistic decisions, and at Knight's time, probabilities in statistical inference were usually explicated as relative frequencies. We could

estimate how *risky* a decision rule is by analyzing how frequently it yields successful choices, but if each decision is entirely singular, as Knight argued, we cannot quantify the risk: We are dealing with real *uncertainty*. Modern financial economics assumes precisely the opposite: There are precise mathematical models of the risks involved in most of our economic decisions, and these models allow us to determine which option is best.

2. Mathematically, this is done by assigning the acceptance region a weight of 0.95, that is, $\int_{T=0} P(x)dx = 0.95$.
3. See Hartmann and Sprenger [14] for further discussion of the problems of interpreting significance tests.
4. The concept of “average variation” is intuitively explicated as the statistical concept of standard deviance: for a random variable X , we calculate $\sqrt{E[(X - E(X))^2]}$.
5. Their results are disputed by Hoover and Siegler [15], but reaffirmed in McCloskey and Ziliak [24]. It is fair to say that the discussion of this point is still open. See also Zellner [35].
6. Even sophisticated defenders of significance testing in economics, such as Hoover and Siegler [16], sometimes go wrong, for example, when they call a significance level a “type I error probability.” To recall, error probabilities are pre-experimental characteristic of a decision procedure, significance levels are measures of discrepancy between data and null.
