## INTRODUCTION

Why do You Need this Book?

About this Book

How to use this Book

About the Authors

## SECTION 1 — Action Commands

Array

Break

Chamfer

Copy

Copy — Array Option

Copy — Using Drag

Divide

Erase

Explode

Extend

Fillet

Match Properties

Measure

Measuring Tools and ID Point

Mirror

Move

Move — Using Drag

Nudge

Offset

Rotate

Scale

Stretch

Trim

Undo and Redo

Wipeout

Zoom

## SECTION 2 — Concepts

Model and Layout Options

Model and Layout Tabs

Why Layouts are Useful

Creating Scaled Drawings

Adjusting the Viewport Scale

## **SECTION 3 — Dimensioning**

Dimensioning

Dimension Styles

Creating a New Dimension Style

Creating a Dimension Sub-Style

Editing Dimension Text Values

Editing the Dimension Position

Modify an Entire Dimension Style

Override a Dimension Style

Edit an Individual Existing Dimension

Linear Dimensioning

Baseline Dimensioning

Continue Dimensioning

Aligned Dimensioning

Angular Dimensioning

Dimensioning Arc Lengths

Dimensioning a Large Curve

Dimensioning Diameters

Dimensioning Radii

Flip Arrow

Moving the Origin

Examples of Moving the Origin

## **SECTION 13 — Constraints**

Parametric Drawing

Geometric Constraints

Dimensional Constraints

## **APPENDIXES**

**A** Metric Conversion Factors

**B** Frequently Asked Questions

## **INDEX**

# INTRODUCTION

## Why do You Need this Book?

Refresh your memory or learn something new.

No need to memorize.

Handy size and easy to use.

*"I originally wrote this book for myself. Occasionally I forget commands and 'How to' steps also. Its convenient small size allows me to toss it in my briefcase or set it beside my monitor. No need to memorize anymore."*

*Cheryl Shrock*

## About this Book

The ***AutoCAD Pocket Reference, 7th Edition***, includes all the important fundamental Commands, Concepts, and How to information for the every day use of AutoCAD 2015 or 2016. It is not designed to take the place of larger textbooks but rather to supplement them as a quick reference.

***Note: If you are using AutoCAD 2013 or 2014, please refer to the Sixth Edition of the AutoCAD Pocket Reference.***

## How to use this Book

The information in this book has been organized in 13 sections.

Each section contains related material. For example, if you needed information regarding dimensioning, you would go to:

### **Section 3: Dimensioning**

**AutoCAD** has two color themes, Light and Dark. The Light color theme has been used throughout this book. To change the color theme refer to [Appendix B](#).

## About the Authors

**Cheryl R. Shrock**, is a retired Professor and was Chairperson of Computer Aided Design at Orange Coast College in Costa Mesa, California. She is also an Autodesk® registered author. Cheryl is always trying to think of new ways to make it easy to learn AutoCAD. The Pocket Reference series is the latest in that endeavor.

**Steve Heather** has 30-plus years of experience as a practicing Mechanical Engineer and has taught AutoCAD to Engineering and Architectural students at the college level. He is an authorized AutoCAD beta tester and member of the AutoCAD Customer Council. Steve lives near Canterbury, England, and

welcomes your questions or comments. You can reach him at [steve.heather@live.com](mailto:steve.heather@live.com).

# **Section 1**

## **Action Commands**

## ARRAY

The ARRAY command allows you to make multiple copies in a **RECTANGULAR** or Circular (**POLAR**) pattern and even on a **PATH**. The maximum limit of copies per array is 100,000. This limit can be changed but should accommodate most users. (Refer to the Help menu if you choose to change the limit)

### RECTANGULAR ARRAY

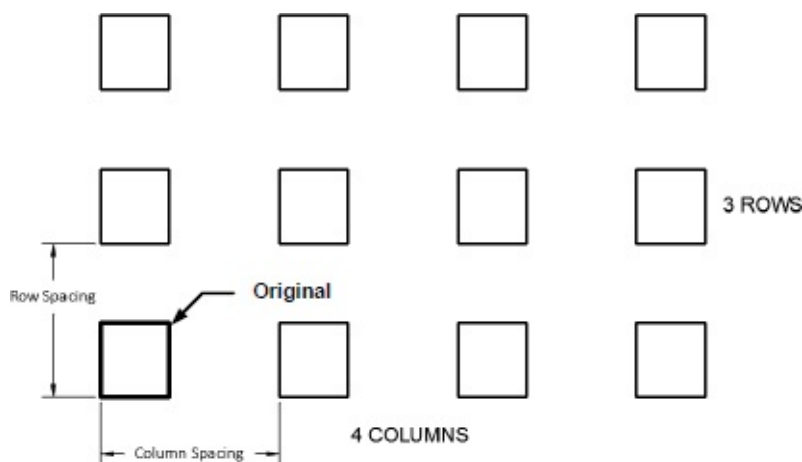

This method allows you to make multiple copies of object(s) in a **rectangular pattern**. You specify the number of rows (horizontal), columns (vertical) and the spacing between the rows and columns. The spacing will be equally spaced between copies.

Spacing is sometimes tricky to understand. **Read this carefully.** The spacing is the distance from a specific location on the original to that same location on the future copy. It is not just the space in between the two. Refer to the example below.

To use the rectangular array command you will select the object(s), specify how many rows and columns desired and the spacing for the rows and the columns.

Refer to step by step instructions on [page 1-3](#).

**Example of a Rectangular Array:**

### How to create a RECTANGULAR ARRAY

1. Draw a **1"** (Inch) Square Rectangle.
2. Select the **ARRAY** command using one of the following:

**Ribbon = Home tab / Modify panel / Array ▼**

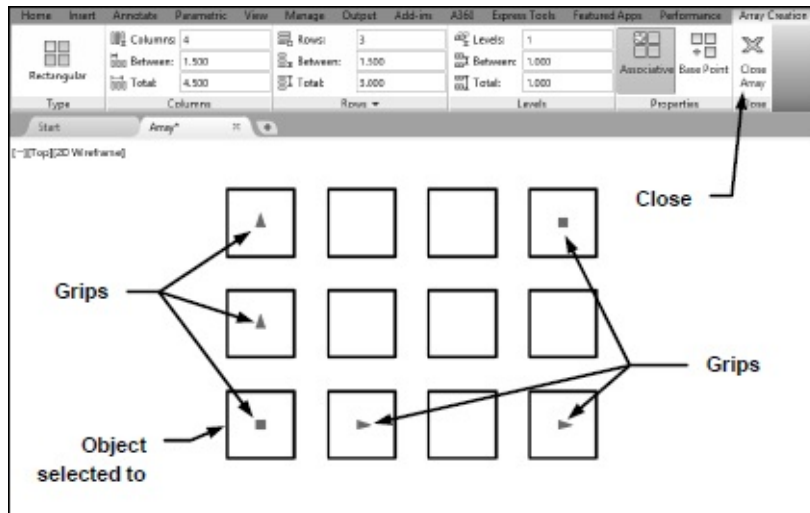

**or**

**Keyboard = Array <enter>**

3. Select **Rectangular Array**.
4. Select Objects: **Select the Object to be Arrayed**
5. Select Objects: **Select more objects or <enter> to stop**

The **Array Creation** tab appears with a **3 × 4** grid array of the object selected.

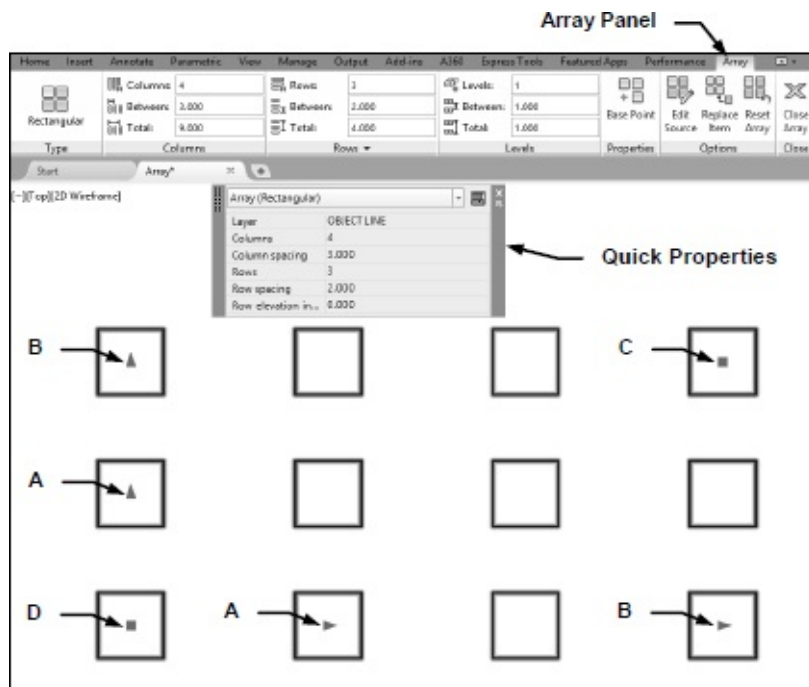

6. Make any changes necessary in the **Array Creation** tab, then press **<enter>** to display any changes.
7. If the display is correct select **Close Array**.

### How to edit a RECTANGULAR ARRAY

1. Select the Array to edit.

The **Array** panel is displayed. (The **Quick Properties** will also be displayed if you have the **QP** button **ON** in the Status bar.)

2. Make any changes necessary in the **Array Creation** tab, then press **<enter>** to display any changes.
3. If the display is correct select **Close Array**.

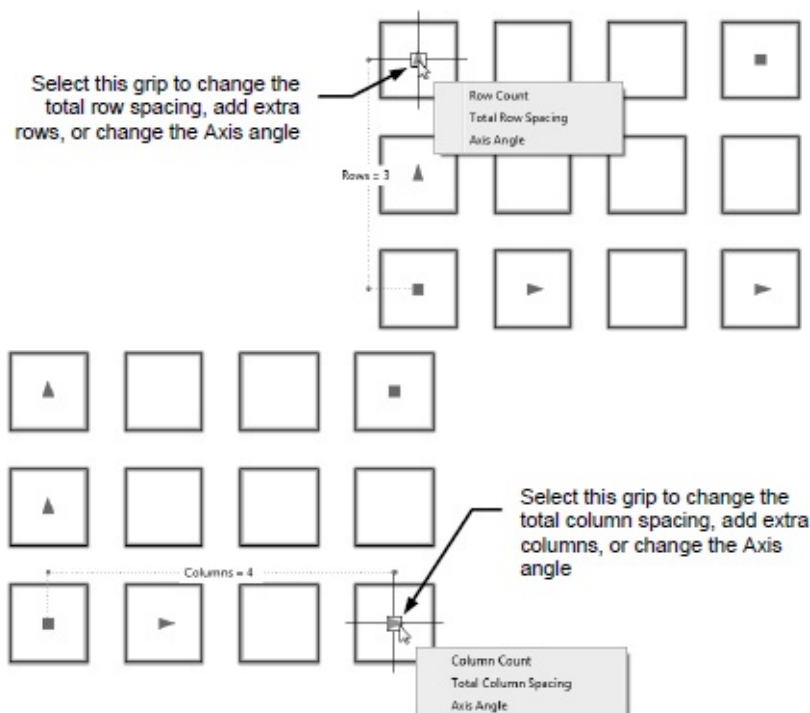

## How to edit a RECTANGULAR ARRAY

### Using Grips to edit.

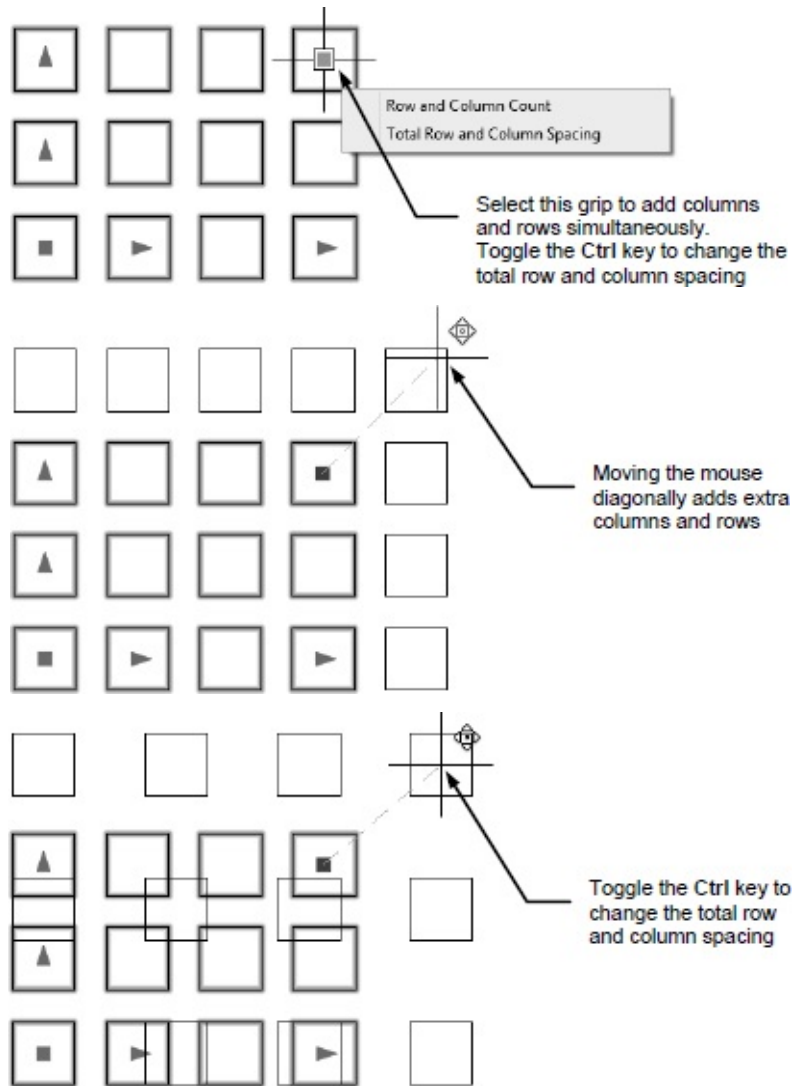

You may also use the Grips to edit the spacing. Just click on a grip and drag.

- The first ► or ▲ allows you to change the spacing between the columns or rows.
- The last ► or ▲ allows you to change the total spacing between the base point and the last ► or ▲ and also to add extra columns or rows, or change the axis angle.
- The ■ allows you to change the total row and column spacing simultaneously, and also to add extra columns and rows simultaneously.
- Use the Base Point grip ■ to **MOVE** the entire Array.

## How to edit a RECTANGULAR ARRAY

### Using Grips to edit.

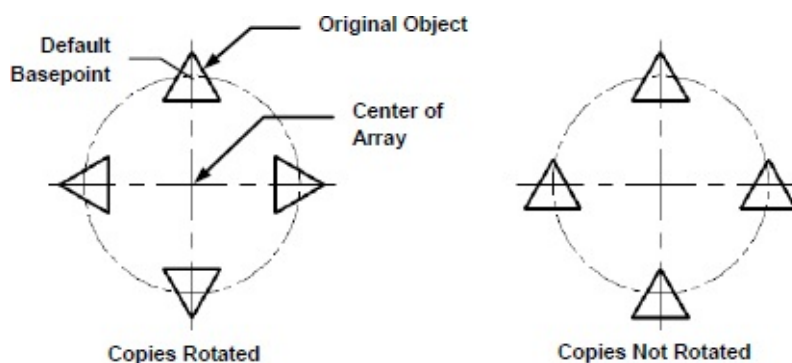

## POLAR ARRAY

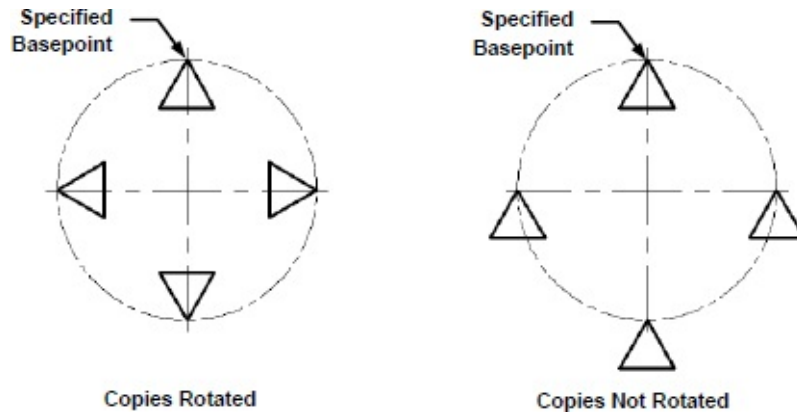

This method allows you to make multiple copies in a circular pattern. You specify the total number of copies to fill a specific Angle or specify the angle between each copy and angle to fill.

To use the polar array command you select the object(s) to array, specify the center of the array, specify the number of copies or the angle between the copies, the angle to fill and if you would like the copies to rotate as they are copied.

### Example of a Polar Array

**Note:** The two examples shown above use the **objects default base point**. The examples below display what happens if you specify a basepoint.

## How to create a POLAR ARRAY

### Using “Number of Items.”

1. Draw a 3” Radius circle.
2. Add a .50 Radius 3 sided Polygon and place as shown.

3. Select the **ARRAY** command using one of the following:

**Ribbon = Home tab / Modify panel / Array ▼**

**or**

**Keyboard = Array <enter>**

4. Select **Polar Array**.
5. Select Objects: **Select the Object to be Arrayed. (Polygon)**
6. Select Objects: **Select more objects or <enter> to stop**
7. Specify center point of array or [Base point / Axis of Rotation] **Select the Center Point of the Circle**

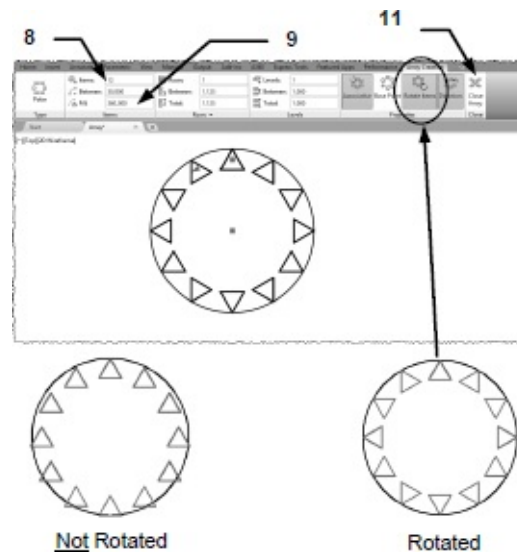

The **Array Creation** tab appears and the array defaults to 6 items.

8. Enter Items: **12**

9. Enter Fill: **360**
10. Press **<enter>** to display the selections
11. Select **Close Array** if display is correct

**Note:**

**12 items were evenly distributed within 360 degrees**

**How to create a POLAR ARRAY**

**Using “Angle Between.”**

1. Draw a 3” Radius circle.
2. Add a .50 Radius 3 sided Polygon and place as shown.

3. Select the **ARRAY** command using one of the following  
**Ribbon = Home tab / Modify panel / Array ▼**

**or**

**Keyboard = Array <enter>**

4. Select **Polar Array**.
5. Select Objects: **Select the Object to be Arrayed. (Polygon)**
6. Select Objects: **Select more objects or <enter> to stop**
7. Specify center point of array or [Base point / Axis of Rotation] **Select the**

## Center Point of the Circle

The **Array Creation** tab appears and the array defaults to 6 items.

8. Enter Items: **6**
9. Enter Between: **45**
10. Press **<enter>** to display the selections
11. Select **Close Array** if display is correct

### Note:

**6 items were copied at each 45 degree ccw**

### How to create a POLAR ARRAY

#### Using "Fill Angle."

1. Draw a 3" Radius circle.
2. Add a .50 Radius 3 sided Polygon and place as shown.

3. Select the **ARRAY** command using one of the following:  
**Ribbon = Home tab / Modify panel / Array ▼**  
**or**  
**Keyboard = Array <enter>**
4. Select **Polar Array**.

5. Select Objects: **Select the Object to be Arrayed. (Polygon)**
6. Select Objects: **Select more objects or <enter> to stop**
7. Specify center point of array or [Base point / Axis of Rotation] **Select the Center Point of the Circle**

The **Array Creation** tab appears and the array defaults to 6 items.

8. Enter Items: **8**
9. Enter Fill: **180**
10. Press <enter> to display the selections
11. Select **Close Array** if display is correct

**Note:**

**8 items were evenly distributed within 180 degrees**

### How to create a PATH ARRAY

1. Draw a Line 6" long at 20 degrees..
2. Add a 0.500" × 0.500" Rectangle as shown.

3. Select the **ARRAY** command using one of the following:

**Ribbon = Home tab / Modify panel / Array ▼**

**or**

**Keyboard = Array <enter>**

4. Select **Path Array**.

5. Select Objects: **Select the Object to be Arrayed. (The small Rectangle)**

6. Select Objects: **Select more objects or <enter> to stop**

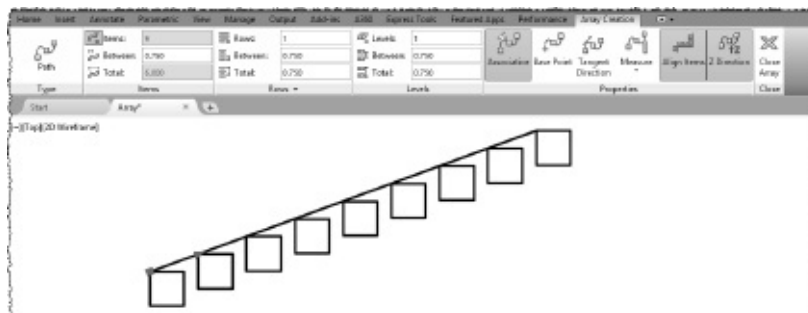

7. Specify Path Curve: **Select the Path. (The angled Line)**

**Note:** The Path can be a line, polyline, spline, helix, arc, circle or ellipse.

The **Array Creation** tab appears and the array defaults to 9 items.

8. Make any alterations and press **<enter>** to display.

9. If correct select **Close Array**.

# BREAK

The **BREAK** command allows you to break an object at a single point (**Break at Point**) or between two points (**Break**). I think of it as breaking a single line segment into two segments or taking a bite out of an object.

## METHOD 1 - Break at a Single Point

How to break one Line into two separate objects with no visible space in between.

1. Select the **BREAK AT POINT** command by using:

Ribbon = Home tab / Modify panel ▼ / 

2. `_break` Select objects: **select the object to break (P1)**.
3. Specify first break point: **select break location (P2) accurately**.

Note:

The single line is now 2 lines but no gap in between the 2 lines.

For example, a 2 inch long line would become two 1 inch lines butted together.

## METHOD 2 - Break between 2 points. (Take a bite out of an object)

Use this method if the location of the **BREAK** is not important.

1. Select the **BREAK** command by using one of the following:

Ribbon = Home tab / Modify panel ▼ / 

or

Keyboard = BR <enter>

2. `_break` Select objects: **select the object to break (P1)**.
3. Specify first break point: **select break location (P2) accurately**.

Note:

- A. Circles break Counter clockwise. (CCW)

B. Circles can't be broken with "1 point."

You must use 2 points.

The following method is the same as method 2 above; however, use this method if the location of the break is very specific.

1. Select the **BREAK** command.
2. `_break` Select objects: ***select the object to break (P1) anywhere on the object.***
3. Specify second break point or [First point]: ***type F <enter>.***
4. Specify first break point: ***select the first break location (P2) accurately.***
5. Specify second break point: ***select the second break location (P3) accurately.***

# CHAMFER

The **CHAMFER** command allows you to create a chamfered corner on two lines. There are two methods: **Distance (below) and Angle (next page)**.

## DISTANCE METHOD

**Distance Method** requires input of a distance for each side of the corner.

1. Select the **CHAMFER** command using one of the following:

**Ribbon = Home tab / Modify panel /**

**or**

**Keyboard = CHA <enter>**

Command: `_chamfer`

(TRIM mode) Current chamfer Dist1 = 0.000, Dist2 = 0.000

Select first line or [Undo/Polyline/Distance/Angle/Trim/mEthod/Multiple]: **select "D" <enter>**

Specify first chamfer distance <0.000>: **type the distance for first side <enter>**.

Specify second chamfer distance <0.000>: **type the distance for second side <enter>**

2. **Now chamfer the object.**

Select first line or [Undo/Polyline/Distance/Angle/Trim/mEthod/Multiple]: **select the (First side) to be chamfered (distance 1).**

Select second line or shift-select to apply corner or [Distance/Angle/Method]: **select the (Second side) to be chamfered (distance 2).**

**Note:** When you place the cursor on the second side, AutoCAD displays the Chamfer and allows you to change the Distances before it is actually drawn. If you choose to change the Distance, select the Distance option, enter new distance values then select the 2nd side.

## ANGLE METHOD

**Angle method** requires input for the length of the line and an angle.

1. Select the **CHAMFER** command

Command: `_chamfer`

(TRIM mode) Current chamfer Dist1 = 1.000, Dist2 = 1.000

Select first line or [Undo/Polyline/Distance/Angle/Trim/method/Multiple]: **type A**  
**<enter>**

Specify chamfer length on the first line <0.000>: **type the chamfer length**  
**<enter>**

Specify chamfer angle from the first line <0>: **type the angle** **<enter>**

2. **Now Chamfer the object**

Select first line or [Undo/Polyline/Distance/Angle/Trim/mEthod/Multiple]: **select the (First Line) to be chamfered. (the length side)**

Select second line or shift-select to apply corner: **select the (second line) to be chamfered. (the Angle side)**

## OPTIONS:

**Polyline:** This option allows you to Chamfer all intersections of a Polyline in one operation. Such as all 4 corners of a rectangle.

**Trim:** This option controls whether the original lines are trimmed or remain after the corners are chamfered. (Set to Trim or No trim.)

**mEthod:** Allows you to switch between **Distance** and **Angle** method. The distance or angle must have been set previously.

**Multiple:** Repeats the Chamfer command until you press **<enter>** or **Esc** key.

# COPY

The **COPY** command creates a duplicate set of the objects selected.

The COPY command is similar to the MOVE command.

The steps required are:

1. Select the objects to be copied.
2. Select a base point.
3. Select a New location for the New copy.

The difference between Copy and Move commands:

The Move command merely moves the objects to a new location.

The Copy command makes a copy and you select the location for the new copy.

1. Select the **Copy** command using one of the following commands:

**Ribbon = Home tab / Modify panel /  Copy**

or

**Keyboard = CO <enter>**

2. The following will appear on the command line:

Command: `_copy`

Select objects: ***select the objects you want to copy***

Select objects: ***stop selecting objects by selecting <enter>***

Current settings: Copy mode = Multiple

Specify base point or [Displacement/mOde] <Displacement>: ***select a base point (P1)***

Specify second point of displacement or <use first point as displacement>: ***select the new location (P2) for the first copy***

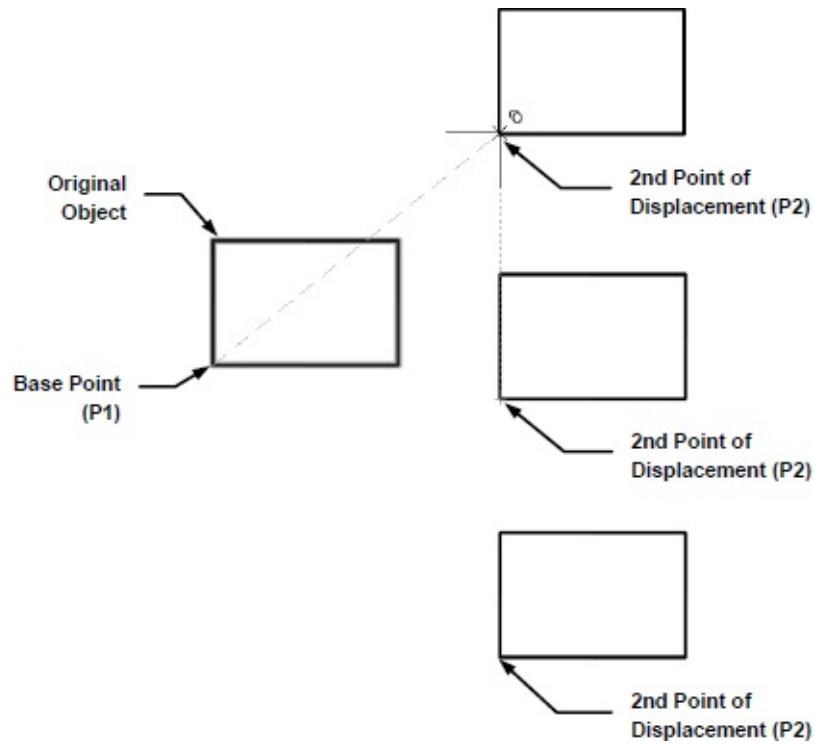

Specify second point or [Exit / Undo] <Exit>: ***select the new location (P2) for the next copy or press <enter> to exit.***

**Note:**

If you select the option **mOde**, you may select Single or Multiple copy mode. The

default setting is Multiple. It is practical to leave the mode setting at Multiple. If you choose to make only one copy just press **<enter>** to exit the Copy command.

**Note:**

The copy command continues to make copies until you press **<enter>** to exit.

## COPY — ARRAY OPTION

The Copy command allows you to make an **Array** of copies.

After you have selected the Base point the following prompt appears:

**Specify second point or [Array] <use first point as displacements>:**

If you select the option **Array**,

1. Enter the number of items to Array: type in **4 <enter>**
2. Place 2nd Point or [Fit]: **Place 2nd point or select F <enter>**

**Note:** The Array option within the Copy command is a quick method to create multiple copies. For more accurate array options use the Array command.

## COPY — USING DRAG

The **Drag** option allows you to quickly **move** or **copy** an object(s).

### Example:

1. Draw a Circle.

2. Select the Circle.

*5 little boxes appear. These are Grips and allow you to edit the object.*

*Grips will be discussed more in future lessons.*

3. Click on the Circle and hold the right hand mouse button down as you drag the Circle to the right.

4. When the dragged Circle is in the desired location release the Right Mouse button and an options menu will appear.

5. Select **Move Here**, **Copy Here**, or **Cancel**.

**Move Here:** The original object selected will move to the new location.

**Copy Here:** The original object will remain in it's original location and a copy will appear in the new location.

## DIVIDE

The **DIVIDE** command divides an object mathematically by the NUMBER of segments you specify. A POINT (object) is placed at each interval on the object.

**Note:** The object selected is **NOT** broken into segments. The **POINTS** are simply drawn **ON** the object.

**Example:**

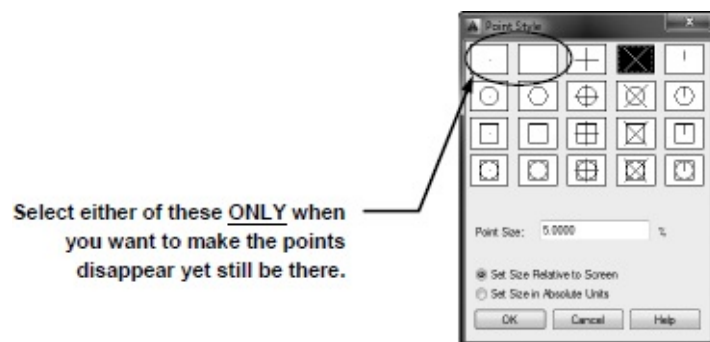

1. First open the Point Style box and select the **POINT STYLE** to be placed on the object.

**Ribbon = Home tab / Utilities Panel / ▼ / Point Style**

**or**

**Keyboard = ddptype <enter>**

2. Next select the **DIVIDE** command using one of the following:

**Ribbon = Home tab / Draw Panel / ▼ / **

**or**

**Keyboard = DIV <enter>**

3. Select Object to divide: ***select the object to divide***
4. Enter the number of segments or [Block]: ***type the number of segments <enter>***

## ERASE

There are 3 methods to erase (delete) objects from the drawing.  
They all work equally well. You decide which one you prefer to use.

### Method 1

Select the **Erase** command first and then select the objects.

#### Example:

1. Start the **Erase** command using one of the following:

**Ribbon = Home tab / Modify panel / **

**or**

**Keyboard = E <enter>**

2. Select objects: ***Pick one or more objects***

Select Objects: ***Press <enter> and the objects selected will disappear.***

### Method 2

Select the Objects first and then the **Delete** Key.

#### Example:

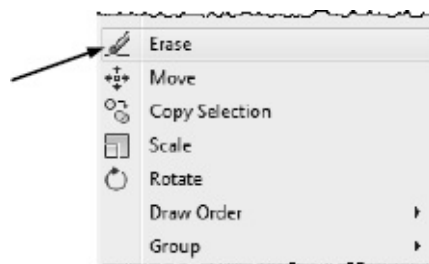

1. Select the object to be erased.
2. Press the **Delete** Key.

### Method 3

Select the Objects first and then select the **Erase** command from the Shortcut Menu.

#### Example:

1. Select the object to be erased.
2. Press the right Mouse button.
3. Select **Erase** from the Shortcut Menu using the left mouse button.

#### Note: Very Important

If you want the erased objects to return, select the **Undo tool**  from the **Quick Access Toolbar**. This will Undo the last command.

More about Undo and Redo later.

## EXPLODE

The **EXPLODE** command changes (explodes) an object into its primitive objects.

**Example:** A rectangle is originally one object. If you explode it, it changes into 4 lines.

Visually you will not be able to see the change unless you select one of the lines.

1. Select the **Explode** command by using one of the following:

**Ribbon = Home tab / Modify panel / **

**or**

**Keyboard = X <enter>**

2. The following will appear on the command line:

Command: `_explode`

Select objects: ***select the object(s) you want to explode.***

Select objects: ***select <enter>***.

Before EXPLODE

One Object  
(Rectangle)

After EXPLODE

4 Objects  
(4 Lines)

**(Notice there is no visible difference. But now you have 4 lines instead of 1 Rectangle).**

### Try this:

Draw a rectangle and then click on it. The entire object highlights. Now explode the rectangle, then click on it again. Only the line you clicked on should be highlighted. Each line that forms the rectangular shape is now an individual object.

Before EXPLODE

After EXPLODE

## EXTEND

The **EXTEND** command is used to extend an object to a **boundary**. The object to be extended must actually or theoretically intersect the boundary.

1. Select the **EXTEND** command using one of the following:

**Ribbon = Home tab / Modify panel /**

**or**

**Keyboard = EX <enter>**

2. The following will appear on the command line:

Command: `_extend`

Current settings: Projection = UCS Edge = Extend

Select boundary edges ...

Select objects or <select all>: ***select boundary (P1) by clicking on the object.***

Select objects: ***stop selecting boundaries by selecting <enter>.***

Select object to extend or shift-select to Trim or

[Fence/Crossing/Project/Edge/Undo]: ***select the object that you want to extend (P2 and P3). (Select the end of the object that you want to extend.)***

Select object to extend or [Fence/Crossing/Project/Edge/Undo]: ***stop selecting objects by pressing <enter>.***

**Note:** When selecting the object to be extended (**P2** and **P3** above) click on the end pointing towards the boundary.

**Fence** Use a "Fence" line to select objects to extend

**Crossing** You may select objects using a Crossing Window

**Project** Same as Edge except used only in "3D."

**Edge** (Extend or No Extend)

In the "**Extend**" mode, (default mode) the boundary and the Objects to be

extended need only intersect if the objects were infinite in length.

In the “**No Extend**” mode the boundary and the objects to be extended must visibly intersect.

**Undo** You may “**undo**” the last extended object while in the Extend command

## FILLET

The **FILLET** command will create a radius between two objects. The objects do not have to be touching. If two parallel lines are selected, it will construct a full radius.

### RADIUS A CORNER

1. Select the **FILLET** command using one of the following:

**Ribbon = Home tab / Modify panel /  Fillet**

or

**Keyboard = F <enter>**

2. The following will appear on the command line:

3. **Set the radius of the fillet**

Command: `_fillet`

Current settings: Mode = TRIM, Radius = 0.000

Select first object or [Undo/Polyline/Radius/Trim/Multiple]: **type "R" <enter>**

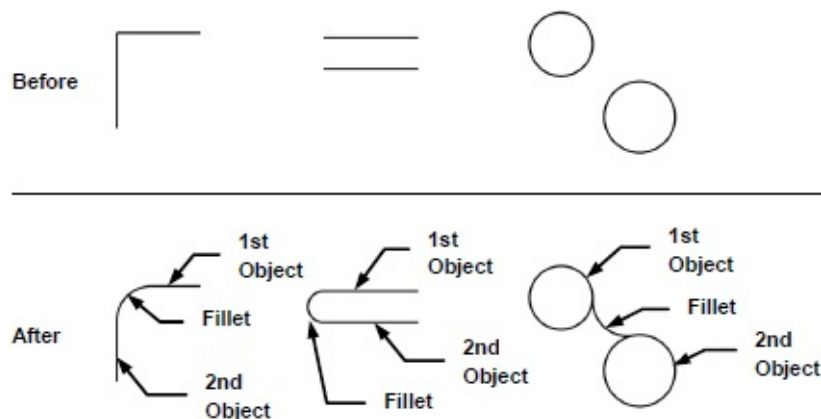

Specify fillet radius <0.000>: **type the radius <enter>**

4. **Now fillet the objects**

Select first object or [Undo/Polyline/Radius/Trim/Multiple]: **select the 1st object to be filleted**

Select second object or shift-select to apply corner or [Radius]: **select the 2nd object to be filleted**

**Note:** When you place the Cursor on the second object, AutoCAD displays the Fillet and allows you to change the Radius before it is actually drawn. If you choose to change the Radius, select the Radius option, enter a new radius value then select the 2nd object.

The **FILLET** command may also be used to create a square corner.

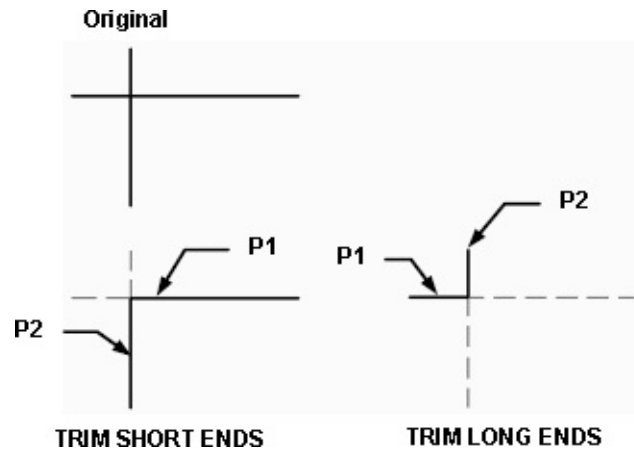

### **SQUARE CORNER**

1. Select the **FILLET** command

2. The following will appear on the command line:

Select first object or [Undo/Polyline/Radius/Trim/Multiple]: ***select the 1st object (P1)***

Select second object or shift-select to apply corner: ***Hold the shift key down while selecting the 2nd object (P2)***

**Note:** The corner trim direction depends on which end of the object you select. Select the ends that you wish to keep.

### **OPTIONS:**

**Polyline:** This option allows you to fillet all intersections of a Polyline in one operation, such as all 4 corners of a rectangle.

**Trim:** This option controls whether the original lines are trimmed to the end of the Arc or remain the original length. (Set to **Trim** or **No trim**)

**Multiple:** Repeats the fillet command until you press **<enter>** or **Esc** key.

## MATCH PROPERTIES

Match Properties is used to “**paint**” the properties of one object to another. This is a simple and useful command. You first select the object that has the desired properties (the source object) and then select the object you want to “paint” the properties to (destination object).

Only one “**source object**” can be selected but its properties can be painted to any number of “destination objects.”

1. Select the Match Properties command using one of the following:

**Ribbon = Home tab / Properties panel /**

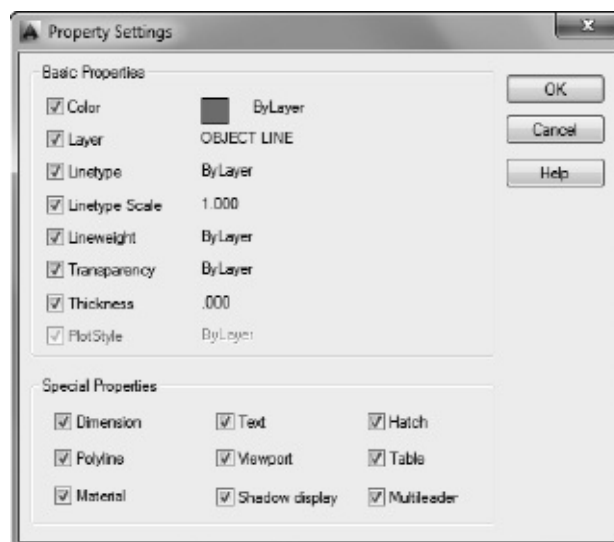

**or**

**Keyboard = MA <enter>**

Command: matchprop

2. Select source object: ***select the object with the desired properties to match***
3. Select destination object(s) or [Settings]: ***select the object(s) you want to receive the matching properties.***
4. Select destination object(s) or [Settings]: ***select more objects or <enter> to stop.***

**Note:** If you do not want to match all of the properties, after you have selected the source object, right click and select “**Settings**” from the short cut menu, before selecting the destination object. Uncheck all the properties you do not want to match and select the **OK** button. Then select the destination object(s).

## MEASURE

The **MEASURE** command is very similar to the **DIVIDE** command because point objects are drawn at intervals on an object. However, the **MEASURE** command allows you to specify the **LENGTH** of the segments rather than the number of segments.

**Note:** The object selected is **NOT** broken into segments. The **POINTS** are simply drawn **ON** the object.

The **MEASURE**ment was started at the left endpoint, and ended just short of the right end of the line. The remainder is less than the measurement length specified.

You designate which end you want the measurement to start by selecting the end when prompted to select the object.

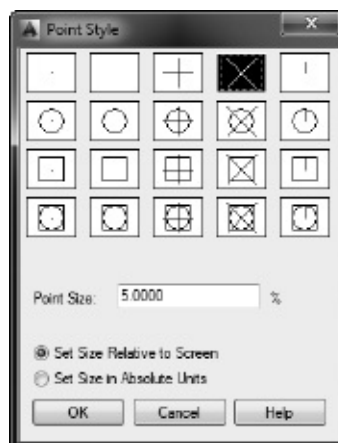

1. First open the Point Style box and select the **POINT STYLE** to be placed on the object.

**Ribbon = Home tab / Utilities Panel ▼ / Point Style**

or

**Keyboard = ddptype <enter>**

(Refer to the **Point** command if you need a refresher on Points)

2. Next select the **MEASURE** command using one of the following:

**Ribbon = Home tab / Draw Panel ▼ /** 

or

**Keyboard = ME <enter>**

3. Select Object to MEASURE: ***select the object to MEASURE***

***(Note: This selection point is also where the MEASUREMENT will start.)***

4. Specify length of segment or [Block]: ***type the length of one segment***  
***<enter>***

## MEASURE TOOLS AND ID POINT

The following tools are very useful to confirm the location or size of objects.

The Measure tools enables you to measure the Distance, Radius, Angle, Area, or Volume of a selected object. The default option is Distance.

1. You may access these tools as follows:

**Ribbon = Home tab / Utilities Panel / Measure ▼**

2. Select one of the tools and follow the instructions on the command line.

---

### ID Point

The ID Point command will list the X and Y coordinates of the point that you select.

The coordinates listed will be from the Origin.

**Ribbon = Home tab / Utilities Panel / ▼**

**or**

**Keyboard = ID <enter>**

1. Select the ID Point command by typing: **ID <enter>**
2. Select a location point, such as the endpoint of a line.

The X, Y and Z location coordinates for the endpoint will be displayed.

### Example:

1. Command: **id<enter>**
2. Snap to the endpoint

3. Coordinates, from the Origin, are displayed.

Command: \* id Specify point: X = 5.474 Y = 0.791 Z = 0.000

## MIRROR

The **MIRROR** command allows you to make a mirrored image of any objects you select. You can use this command for creating right / left hand parts or draw half of a symmetrical object and mirror it to save drawing time.

1. Select the **MIRROR** command using one of the following:

**Ribbon = Home tab / Modify Panel /  Mirror**

or

**Keyboard = MI <enter>**

2. The following will appear on the command line:

Command: `_mirror`

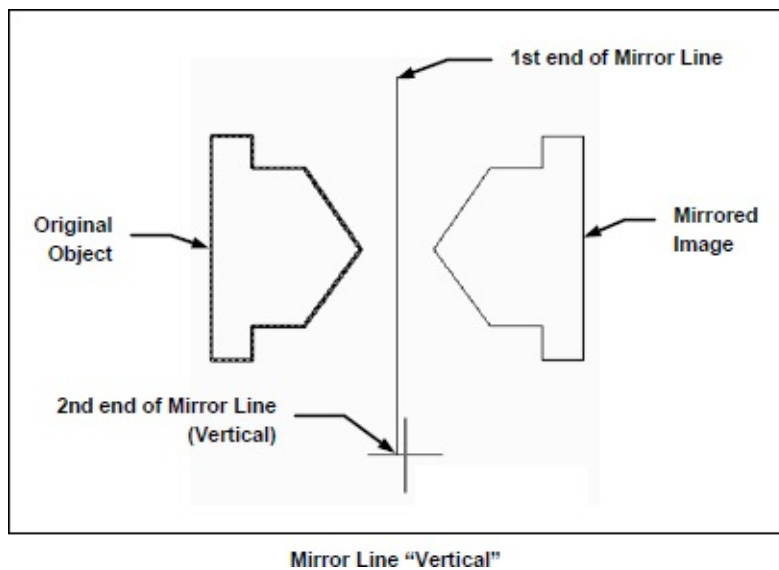

Select objects: ***select the objects to be mirrored***

Select objects: ***stop selecting objects by selecting <enter>***

Specify first point of mirror line: ***select the 1st end of the mirror line***

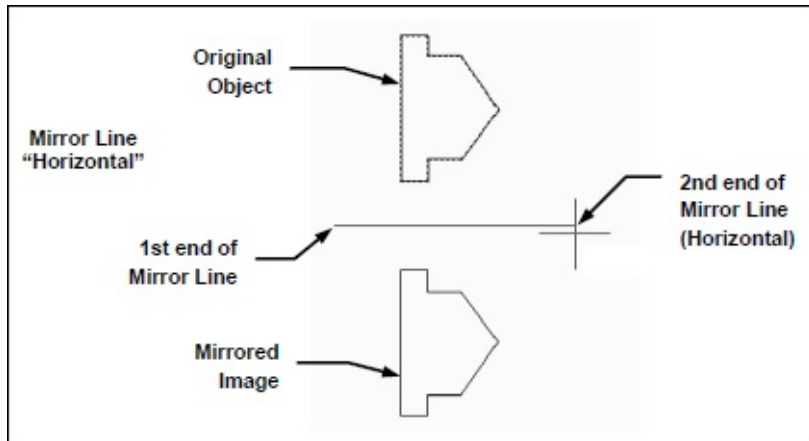

Specify second point of mirror line: ***select the 2nd end of the mirror line***

Erase source objects? [Yes/No] <N>: ***select Y or N***

### Note:

The placement of the **"Mirror Line"** is important. You may make a mirrored copy horizontally, vertically or on an angle. See examples below and on the previous page.

### How to control text when using the Mirror command:

(Do the following **before** you use the mirror command)

1. At the command line type: ***mirrtext*** <enter>
2. If you want the text to mirror (reverse reading) type: **1** <enter>  
 If you do not want the text to mirror, type: **0** <enter>

↑ = 0MIRRTXT SETTING = 0      MIRRTXT SETTING = 0

## MOVE

The **MOVE** command is used to move object(s) from their current location (base point) to a new location (second displacement point).

1. Select the Move command using one of the following:

**Ribbon = Home tab / Modify Panel /  Move**

or

**Keyboard = M <enter>**

2. The following will appear on the command line:

Command: `_move`

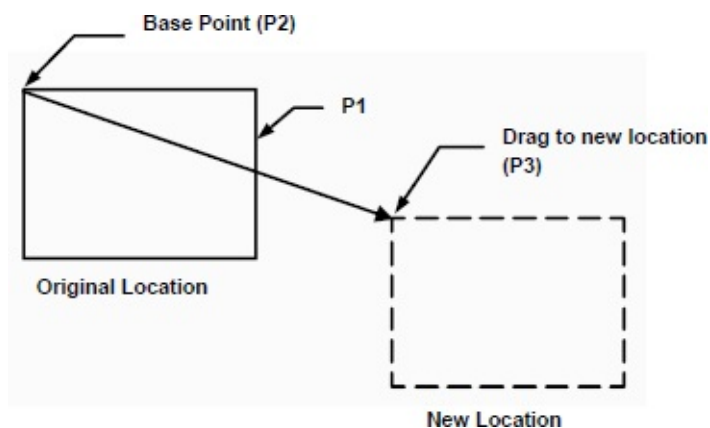

Select objects: ***select the object(s) you want to move (P1).***

Select objects: ***select more objects or stop selecting object(s) by selecting <enter>***

Specify base point or displacement: ***select a location (P2) (usually on the object).***

Specify second point of displacement or <use first point as displacements>: ***move the object to its new location (P3) and press the left mouse button.***

***Warning: If you press <enter> instead of actually picking a new location (P3) with the mouse, AutoCAD will send it into Outer Space. If this happens just select the undo tool and try again.***

## MOVE — USING DRAG

The **Drag** option allows you to quickly **move** or **copy** an object(s).

### Example:

1. Draw a Circle.

2. Select the Circle.

*5 little boxes appear. These are Grips and allow you to edit the object.*

*Grips will be discussed more in future lessons.*

3. Click on the Circle and hold the right hand mouse button down as you drag the Circle to the right.

4. When the dragged Circle is in the desired location release the Right Mouse button and an options menu will appear.

5. Select **Move Here**, **Copy Here**, or **Cancel**.

**Move Here:** The original object selected will move to the new location.

**Copy Here:** The original object will remain in it's original location and a copy will appear in the new location.

## NUDGE

The **Nudge** option allows you to nudge objects in orthogonal increments.

### **Note:**

Snap mode affects the distance and direction in which the objects are nudged.

Nudge objects with **Snap** mode turned **OFF**:

Objects move two pixels at a time.

Nudge objects with **Snap** mode turned **ON**:

Objects are moved in increments specified by the current **Snap** spacing.

### **Example:**

1. Draw a Circle.

2. Select the Circle.

5 little boxes appear. These are Grips and allow you to edit the object.

Grips will be discussed more in future lessons.

3. Hold down the **Ctrl** key and press one of the **Arrow** keys ← → ↑ ↓

### **Remember:**

The distance the object moves depends on whether you have the **Snap** mode **ON** or **OFF**. (Refer to note above)

## OFFSET

The **OFFSET** command duplicates an object parallel to the original object at a specified distance. You can offset Lines, Arcs, Circles, Ellipses, 2D Polylines and Splines. You may duplicate the original object or assign the offset copy to another layer.

### Examples of Offset objects.

### HOW TO USE THE OFFSET COMMAND:

#### METHOD 1

(Duplicate the Original Object)

1. Select the **OFFSET** command using one of the following:

**Ribbon = Home tab / Modify Panel /** 

or

**Keyboard = offset <enter>**

2. Command: `_offset`

Current settings: Erase source=No Layer=Source OFFSETGAPTYPE=0

Specify offset distance or [Through/Erase/Layer] <Through>: ***type the offset distance or select Erase or Layer. (see options on the next page)***

3. Select object to offset or <Exit/Undo>: ***select the object to offset.***
4. Specify point on side to offset or [Exit/Multiple/Undo]<Exit>: ***Select which side of the original you want the duplicate to appear by placing your cursor and clicking. (See options on the next page)***
5. Select object to offset or [Exit/Undo]<Exit>: ***Press <enter> to stop.***

#### METHOD 2

(Duplicate original object but assign the Offset copy to a different layer)

To automatically place the offset copy on a different layer than the original you must first change the “current” layer to the layer you want the offset copy to be placed on.

1. Select the layer that you want the offset copy placed on from the list of layers.

2. Select the **OFFSET** command (refer to previous page)
3. Command: `_offset`  
Current settings: Erase source=No Layer=Source OFFSETGAPTYPE=0  
Specify offset distance or [Through/Erase/Layer] <Through>: ***type L <enter>***
4. Enter layer option for offset objects [Current/Source] <Source>: ***select C <enter>***
5. Specify offset distance or [Through/Erase/Layer] <Through>: ***type the offset distance <enter>***
6. Select object to offset or [Exit/Undo] <Exit>: ***select the object to offset.***
7. Specify point on side to offset or [Exit/Multiple/Undo]<Exit>: ***Select which side of the object you want the duplicate to appear by placing your cursor and clicking. (See options below)***
8. Select object to offset or [Exit/Undo]<Exit>: ***Press <enter> to stop.***

#### **OPTIONS:**

**Through:** Creates an object passing through a specified point.

**Erase:** Erases the source object after it is offset.

**Layer:** Determines whether offset objects are created on the current layer or on the layer of the source object. Select Layer and then select current or source.

(Source is the default)

**Multiple:** Turns on the multiple offset mode, which allows you to continue creating duplicates of the original without re-selecting the original.

**Exit:** Exits the Offset command.

**Undo:** Removes the previous offset copy.

## ROTATE

The **ROTATE** command is used to rotate objects around a Base Point. (pivot point) After selecting the objects and the base point, you will enter the rotation angle from its current rotation angle or select a reference angle followed by the new angle.

A **Positive** rotation angle revolves the objects **Counter-Clockwise**.

A **Negative** rotation angle revolves the objects **Clockwise**.

Select the **ROTATE** command using one of the following:

**Ribbon = Home tab / Modify Panel /  Rotate**

or

**Keyboard = RO <enter>**

### ROTATION ANGLE OPTION

Command: `_rotate`

1. Current positive angle in UCS: ANGDIR=counterclockwise ANGBASE=0  
Select objects: ***select the object to rotate.***
2. Select objects: ***select more object(s) or <enter> to stop.***
3. Specify base point: ***select the base point (pivot point).***
4. Specify rotation angle or [Copy/Reference]<0>: ***type the angle of rotation.***

### REFERENCE OPTION

Command: `_rotate`

1. Current positive angle in UCS: ANGDIR=counterclockwise ANGBASE=0  
Select objects: ***select the object to rotate.***
2. Select objects: ***select more object(s) or <enter> to stop.***
3. Specify base point: ***select the base point (pivot point).***
4. Specify rotation angle or [Reference]: ***select Reference.***
5. Specify the reference angle <0>: ***Snap to the reference object (1) and (2).***
6. Specify the new angle or [Points]: ***P <enter>.***
7. Specify first point: ***select 1st endpoint of new angle.***
8. Specify second point: ***select 2nd endpoint of new angle.***

## SCALE

The **SCALE** command is used to make objects larger or smaller proportionately. You may scale using a scale factor or a reference length. You must also specify a base point. The base point is a stationary point from which the objects scale.

1. Select the **SCALE** command using one of the following:

**Ribbon = Home tab / Modify Panel /  Scale**

or

**Keyboard = scale <enter>**

### SCALE FACTOR

Command: `_scale`

2. Select objects: ***select the object(s) to be scaled***
3. Select objects: ***select more object(s) or <enter> to stop***
4. Specify base point: ***select the stationary point on the object***
5. Specify scale factor or [Copy/Reference]: ***type the scale factor <enter>***

*If the scale factor is greater than 1, the objects will increase in size.*

*If the scale factor is less than 1, the objects will decrease in size.*

### REFERENCE option

Command: `_scale`

2. Select objects: ***select the object(s) to be scaled***
3. Select objects: ***select more object(s) or <enter> to stop***
4. Specify base point: ***select the stationary point on the object***
5. Specify scale factor or [Copy/Reference]: ***select Reference***
6. Specify reference length <1>: ***specify a reference length***
7. Specify new length: ***specify the new length***

**COPY option** - creates a duplicate of the selected object. The duplicate is directly

on top of the original. The duplicate will be scaled. The Original remains the same.

## STRETCH

The **STRETCH** command allows you to stretch or compress object(s). Unlike the Scale command, you can alter an objects proportion with the Stretch command. In other words, you may increase the length without changing the width and vice versa.

Stretch is a very valuable tool. Take some time to really understand this command.

It will save you hours when making corrections to drawings.

When selecting the object(s) you must use a **CROSSING** window.

Objects that are crossed, will **stretch**.

Objects that are totally enclosed, will **move**.

1. Select the **STRETCH** command using one of the following:

**Ribbon = Home tab / Modify Panel /  Stretch**

or

**Keyboard = S <enter>**

Command: `_stretch`

2. Select objects to stretch by crossing-window or crossing-polygon...

Select objects: ***select the first corner of the crossing window***

3. Specify opposite corner: ***specify the opposite corner of the crossing window***

4. Select objects: ***<enter>***

5. Specify base point or [Displacement] <Displacement>:

***select a base point (where it stretches from)***

6. Specify second point or <use first point as displacements>:

***type coordinates or place location with cursor***

BEFORE

AFTER

(Notice which Objects stretched and which objects moved)

## TRIM

The **TRIM** command is used to trim an object to a **cutting edge**. You first select the “Cutting Edge” and then select the part of the object you want to trim. The object to be trimmed must actually intersect the cutting edge or could intersect if the objects were infinite in length.

1. Select the Trim command using one of the following:

**Ribbon = Home tab / Modify Panel / **

or

**Keyboard = TR <enter>**

2. The following will appear on the command line:

Command: `_trim`

Current settings: Projection = UCS Edge = Extend

Select cutting edges ...

Select objects or <select all>: ***select cutting edge(s) by clicking on the object (P1)***

Select objects: ***stop selecting cutting edges by pressing the <enter> key***

Select object to trim or shift-select to extend or

[Fence/Crossing/Project/Edge/eRase/Undo]: ***select the object that you want to trim.***

***(P2) (Select the part of the object that you want to disappear, not the part you want to remain)***

Select object to trim or [Fence/Crossing/Project/Edge/eRase/Undo]: ***press <enter> to stop***

**Note:** You may toggle between Trim and Extend. Hold down the **SHIFT** key and the Extend command will activate. Release the **SHIFT** key and you return to Trim.

**Fence** Use a “Fence” line to select objects to extend.

**Edge** See [page 1-23](#)

**Project** Same as Edge except used only in “3D”

**Crossing** You may select objects using a Crossing Window.

**eRase** You may erase an object instead of trimming while in the Trim command.

**Undo** You may “undo” the last trimmed object while in the Trim command

## UNDO AND REDO

The **UNDO** and **REDO** tools allow you to undo or redo previous commands.

For example, if you erase an object by mistake, you can UNDO the previous “erase” command and the object will reappear. So don’t panic if you do something wrong. Just use the UNDO command to remove the previous commands.

The **Undo** and **Redo** tools are located in the **Quick Access Toolbar**.

### Note:

You may **UNDO** commands used during a work session until you close the drawing.

### How to use the Undo tool.

1. Draw a line, circle and a rectangle.

*Your drawing should look approximately like this.*

2. Next Erase the Circle and the Rectangle.

*(The Circle and the Rectangle disappear.)*

3. Select the UNDO arrow. 

You have now deleted the ERASE command operation.

As a result the erased objects reappear.

### How to use the Redo command:

Select the REDO arrow and the Circle and Rectangle will disappear again.

## WIPEOUT

The Wipeout command creates a blank area that covers existing objects. The area has a background that matches the background of the drawing area. This area is bounded by the wipeout frame, which you can turn on or off.

1. Select the Wipeout command using one of the following:

**Ribbon = Home tab / Draw Panel ▼ / **

or

**Keyboard = Wipeout <enter>**

Command: `_wipeout` Specify first point or [Frames/Polyline] <Polyline>:  
***specify the first point of the shape (P1)***

3. Specify next point: ***specify the next point (P2)***
4. Specify next point or [Undo]: ***specify the next point (P3)***
5. Specify next point or [Undo]: ***specify the next point or <enter> to stop***

## TURNING FRAMES ON OR OFF

1. Select the Wipeout command.
2. Select the “**Frames**” option.
3. Enter **ON** or **OFF**.

**Note:** If you want to move the objects and the wipeout area, you must select both and move them at the same time. Do not move them separately.

## ZOOM

The **ZOOM** command is used to move closer to or farther away from an object. This is called Zooming In and Out.

1. Select the Zoom command by using the following:

**Ribbon = View tab / Navigate 2D panel**

2. Select the ▼ down arrow to display all of the selections.

### Note:

The **ZOOM** commands are located on the **Navigate** panel of the **View** tab and are **off** by default. Select the **View** tab then right-click on any panel and select **Show Panels**, activate the **Navigate** panel.

**The following are descriptions of the most commonly used zoom tools.**

<b>EXTENTS =</b>	Displays all objects in the drawing file, even objects outside of the drawing limits.
<b>WINDOW =</b>	Zoom in on an area by specifying a window around the area.
<b>PREVIOUS =</b>	Returns the screen to the previous display. (Limited to 10)
<b>REAL TIME =</b>	Interactive Zoom. You can zoom in or out by moving the cursor vertically up or down while pressing the left mouse button.

To stop, press the **Esc** key.

**All** = Zooms to drawing limits or Extents, whichever is greater.

**IN** or **OUT** = Zooms in 2X or out 2X

You may also select the **ZOOM** commands using one of the following:

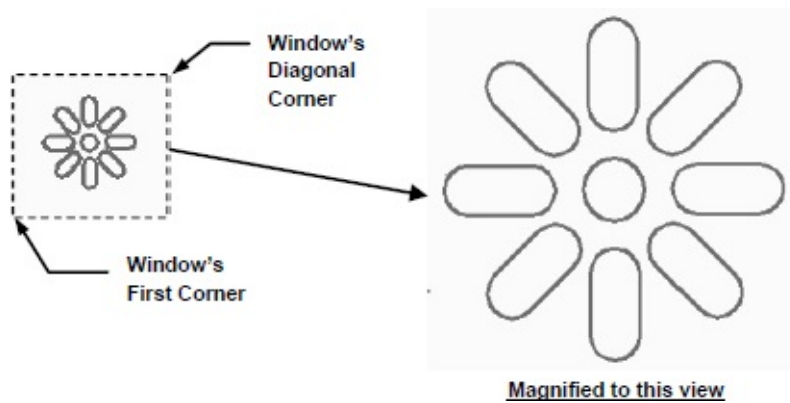

**Right Click and select Zoom from the Short cut menu.**

**Keyboard = Z <enter> Select from the options listed.**

### How to use ZOOM / WINDOW

1. Select Zoom / Window (Refer to previous page)
2. Create a window around the objects you want to enlarge.

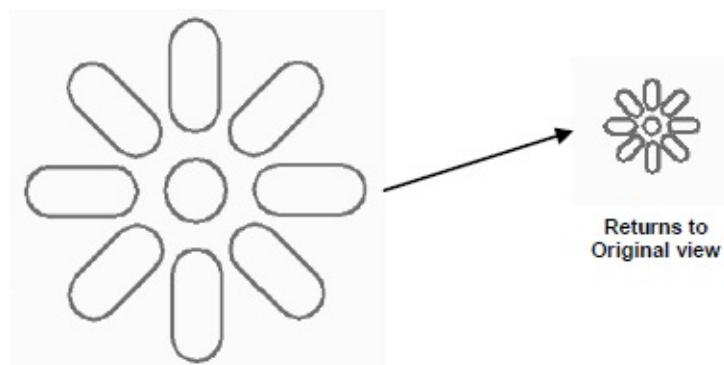

(Creating a “window” is a similar process to drawing a rectangle. It requires a first corner and then a diagonal corner)

**Note:** The objects have been magnified. But the actual size has not changed.

### How to return to Original View

1. Type: **Z <enter> A <enter>** (This is a shortcut for Zoom / All)

Or you can select the “**All**” tool from the panel shown on the previous page.

**Notes:**

## **Section 2**

## **Concepts**

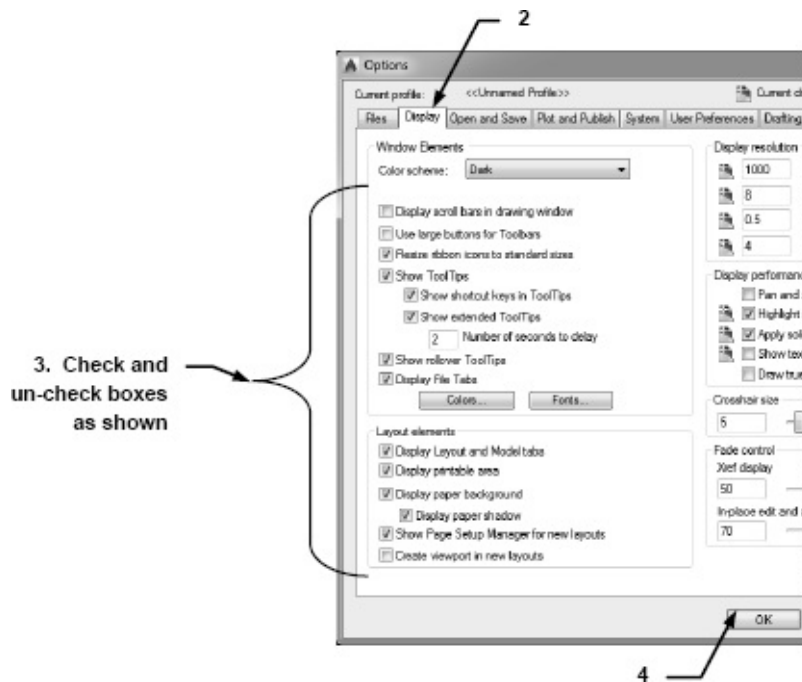

## MODEL AND LAYOUT OPTIONS

Very important:

Before I discuss Model and Layout I need you to confirm **Model and Layout tabs** are displayed.

This will just take a minute.

1. Type: **options** <enter>
2. Select the **Display** tab.

3. Check and un-check boxes as shown.
4. Select the **OK** button
5. The lower left corner of the drawing area should display the 3 tabs, Model, Layout1 and Layout2 and a few tools should be displayed in the lower right corner.

## MODEL AND LAYOUT TABS

**Read this information carefully. It is very important that you understand this concept. More information on the following pages.**

AutoCAD provides two drawing spaces, **MODEL** and **LAYOUT**. You move into one or the other by selecting either the MODEL or LAYOUT tabs, located at the bottom left of the drawing area. (If you do not have these displayed follow the instructions on the previous page.)

### **Model Tab** (Also called ***Model Space***)

When you select the Model tab you enter MODEL SPACE.

Model Space is where you **create** and **modify** your drawings.

### **Layout Tabs** (Also called ***Paper Space***)

When you select a Layout tab you enter PAPER SPACE.

The primary function of Paper Space is to **prepare the drawing for plotting**.

When you select the Layout tab for the first time, the "Page Setup Manager" dialog box will appear. The Page Setup Manager allows you to specify the printing device and paper size to use.

*(More information on this in "How to ....")*

When you select a Layout tab, Model Space will seem to have disappeared, and a blank sheet of paper is displayed on the screen. This sheet of paper is basically in front of the Model Space. (Refer to the illustration on the next page)

To see the drawing in Model Space, while still in Paper Space, you must cut a hole in this sheet. This hole is called a "**Viewport**." (*Refer to "How to ...."*)

**Try to think of this as a picture frame (paper space) in front of a photograph (model space).**

This is what you see when you select the  tab.

You see only Model Space.

This is what you see when you select the  tab with a Viewport.

You see through the Viewport to Model Space.

## WHY LAYOUTS ARE USEFUL

I know you are probably wondering why you should bother with Layouts.

A Layout (Paper Space) is a great method to manipulate your drawing for plotting.

Notice the drawing below with multiple viewports.

Each viewport is a hole in the paper.

You can see through each viewport (hole) to model space.

Using Zoom and Pan you can manipulate the display of model space in each viewport.

To manipulate the display you must be inside the viewport.

## CREATING SCALED DRAWINGS

A very important rule in CAD you must understand is:

***“All objects are drawn full size”***

In other words, if you want to draw a line 20 feet long, you actually draw it 20 feet long. If the line is 1/8" long, you actually draw it 1/8" long.

**Drawing and Plotting objects that are very large or very small.**

What if you wanted to draw a house? Could you print it to scale on an 8-1/2 X 11 piece of paper? How about a small paper clip. Could you make it big enough to dimension? Let's start with the house.

**How to print an entire house on an 8-1/2 X 11 sheet of paper.**

Remember the photo and picture frame example I suggested on page 2-4. This time try to picture yourself standing at the front door of your house with an empty picture frame in your hands. Look at your house through the picture frame. Of course the house is way too big to fit in the frame. Or is it because you are standing too close to the house?

Now walk across the street and look through the picture frame in your hands again. Does the house appear smaller? Can you see all of it in the frame? If you could walk far enough away from the house it would eventually appear small enough to fit in the picture frame in your hands. But...the house did not actually change size, did it? It only appears smaller because you and the picture frame are farther away from it.

**Adjusting the Viewport scale.**

When using AutoCAD, walking across the street with the frame in your hands is called **Adjusting the Viewport scale**. You are increasing the distance between model space (your drawing) and Paper space (Layout) and that makes the drawing appear smaller.

**Example:** A viewport scale of 1/4" = 1' would make model space appear 48 times smaller. But, when you dimension the house, the dimension values will be the actual measurement of the house. In other words, a 30 ft. line will have a dimension of 30'-0".

When plotting something smaller, like a paperclip, you have to move the picture frame closer to model space to make it appear larger. For example, use a viewport scale of  $8 = 1$ .

## ADJUSTING THE VIEWPORT SCALE

The following will take you through the process of adjusting the scale within a viewport.

1. **Open** a drawing.
2. Select a **Layout** tab. (paper space)
3. Cut a new Viewport or unlock an existing Viewport. (See “How to....”)
4. **Zoom / All** to display all of the drawing limits.
5. Adjust the **Scale**.
  - A. You must be in Paper Space. (See below)
  - B. Select the Viewport Frame.
  - C. Unlock Viewport, if locked.
  - D. Select the Viewport Scale down arrow.
  - E. Select the scale from the list of scales.

6. Lock the Viewport.

**Note: If you would like to add a scale that is not on the list:**

1. Type **Scalelistedit**

2. Select **Add** button.

3. Enter Scale name to display in scale list.

4. Enter Paper and drawing units.

5. Select the **OK** button.

**Notes:**

## Section 3

# Dimensioning

## DIMENSIONING

Dimensions can be Associative, Non-Associative or Exploded. You need to understand what these are so you may decide which setting you want to use. Most of the time you will use Associative but you may have reasons to also use Non-Associative and Exploded.

### **Associative**

Associative Dimensioning means that the dimension is actually associated to the objects that they dimension. If you move the object, the dimension will move with it.

If you change the size of the object, the dimension text value will change also.

(**Note:** This is not parametric. In other words, you cannot change the dimension text value and expect the object to change. That would be parametric dimensioning)

### **Non-Associative**

Non-Associative means the dimension is not associated to the objects and will not change if the size of the object changes.

### **Exploded**

Exploded means the dimension will be exploded into lines, text and arrowheads and non-associative.

### **How to set dimensioning to Associative, Non-Associative or Exploded.**

1. On the command line type: ***dimassoc <enter>***
2. Enter the number ***2, 1 or 0 <enter>***
  - 2 = Associative
  - 1 = Non-Associative
  - 0 = Exploded

**Note:** The default factory setting is '**2**' **Associative**.

### **How to Reassociate a dimension.**

If a dimension is Non-associative, and you would like to make it Associative, you may use the **dimreassociate** command to change.

1. Select **Reassociate** using one of the following:

**Ribbon = Annotate Tab / Dimension ▼ Panel / **

**or**

**Keyboard = dimreassociate <enter>**

2. Select objects: ***select the dimension to be reassociated.***

3. Select objects: ***select more dimensions or <enter> to stop.***
4. Specify first extension line origin or [Select object] <next>: ***(an “X” will appear to identify which is the first extension); use object snap to select the exact location, on the object, for the extension line point.***
5. Specify second extension line origin <next>: ***(the “X” will appear on the second extension) use object snap to select the exact location, on the object, for the extension line point.***
6. ***Continue until all extension line points are selected.***

**Note:** You must use object snap to specify the exact location for the extension lines.

### **Regenerating Associative dimensions**

Sometimes after panning and zooming, the associative dimensions seem to be floating or not following the object. The **DIMREGEN** command will move the associative dimensions back into their correct location.

Type: ***dimregen <enter>***

# DIMENSION STYLES

Using the “Dimension Style Manager” you can change the appearance of the dimension features, such as length of arrowheads, size of the dimension text, etc.

There are over 70 different settings. You can also Create New, Modify and Override Dimension Styles. All of these are simple, by using the Dimension Style Manager described below.

1. Select the “**Dimension Style Manager**” using one of the following:

### AutoCAD 2015

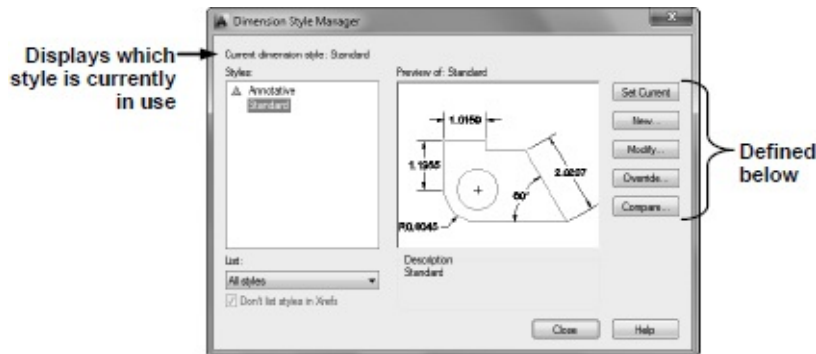

Ribbon = Annotate Tab / Dimension Panel / \

or

Keyboard = dimstyle <enter>

### AutoCAD 2016

**Set Current** Select a style from the list of styles and select the **set current** button.

**New** Select this button to create a new style. When you select this button, the **Create New Dimension Style** dialog box is displayed.

**Modify** Selecting this button opens the **Modify dimension Style** dialog box which allows you to make changes to the style selected from the “list of styles.”

**Override** An override is a temporary change to the current style. Selecting this button opens the **Override Current Style** dialog box.

**Compare**      Compares two styles.

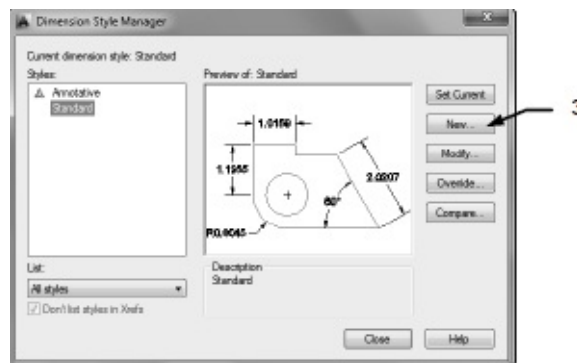

## CREATING A NEW DIMENSION STYLE

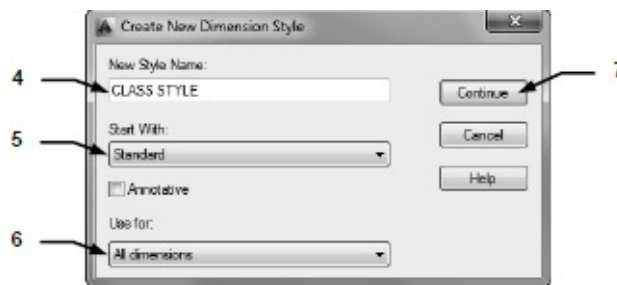

A dimension style is a group of settings that has been saved with a name you assign. When creating a new style you must start with an existing style, such as Standard. Next, assign it a new name, make the desired changes and when you select the **OK** button the new style will have been successfully created.

### How to create a NEW dimension style.

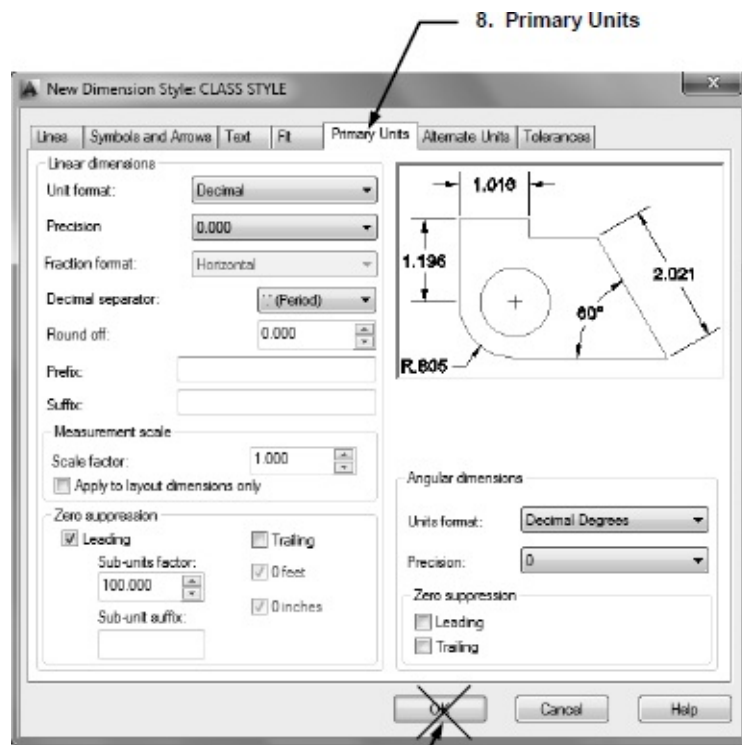

1. Open a drawing.
2. Select the **Dimension Style Manager** command (Refer to previous page)
3. Select the **NEW** button.

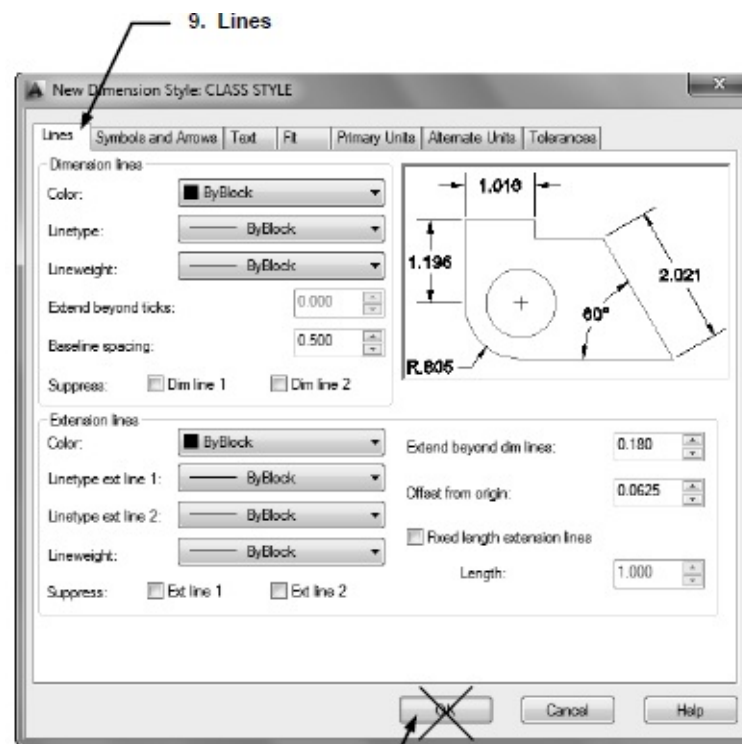

4. Enter **CLASS STYLE** in the “New Style Name” box.
5. Select **STANDARD** in the “Start With:” box.
6. “Use For:” box will be discussed later. For now, leave it set to “All dimensions.”
7. Select the **CONTINUE** button.

8. Select the **Primary Units** tab and change your settings to match the settings shown below.

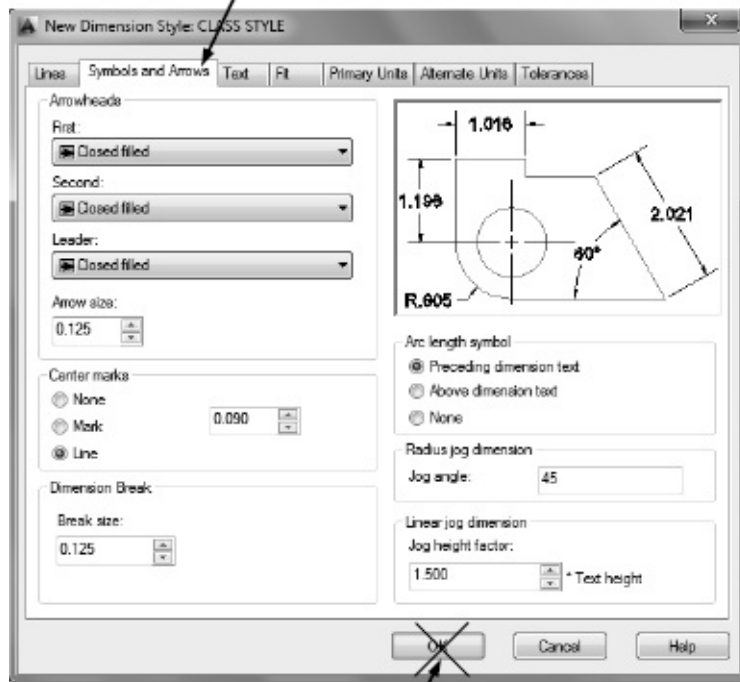

9. Select the **Lines** tab and change your settings to match the settings shown below.

10. Select the **Symbols and Arrows** tab and change your settings to match the settings shown below.

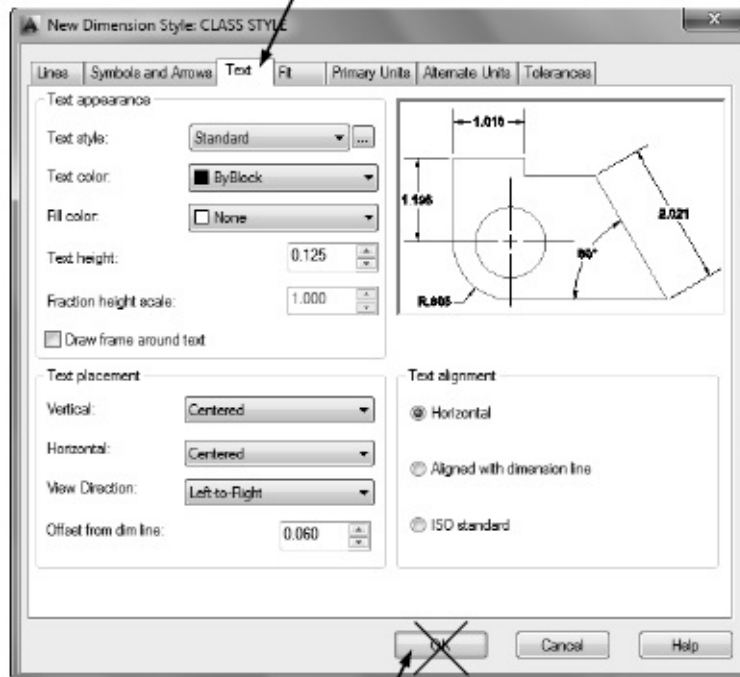

10. Symbols and Arrows

Do not select the OK button yet

11. Select the **Text** tab and change your settings to match the settings shown below.

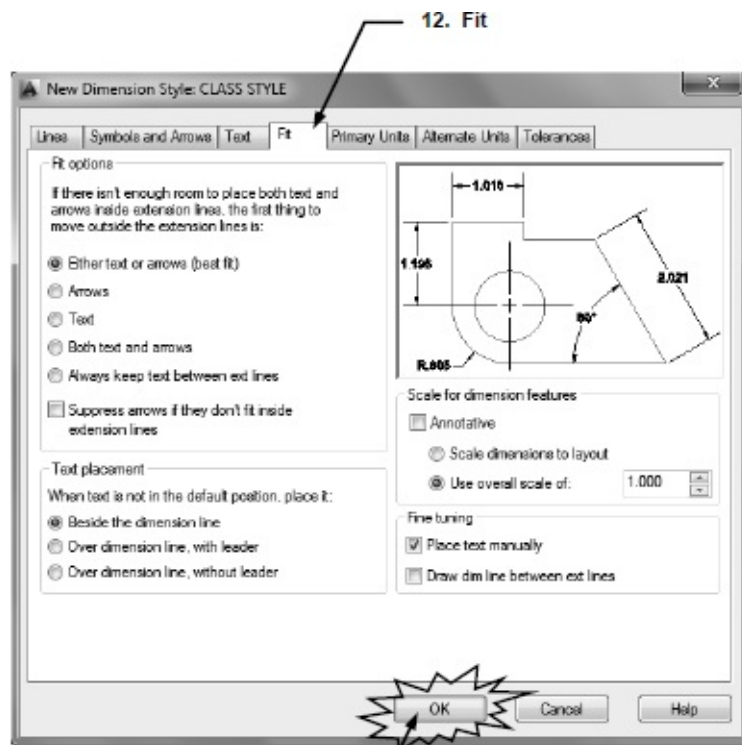

11. Text

Do not select the OK button yet

12. Select the **Fit** tab and change your settings to match the settings shown below.

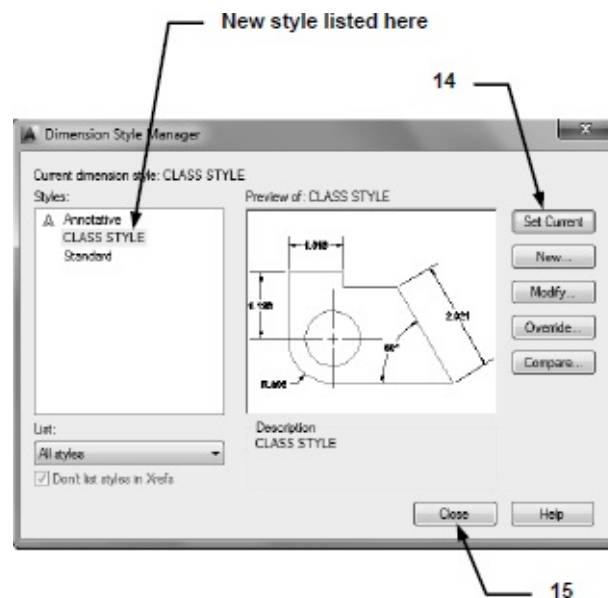

13. Now select the **OK** button.

13. NOW select the OK button.

Your new style “**Class Style**” should be listed.

14. Select the “**Set Current**” button to make your new style “Class Style” the style that will be used.

15. Select the **Close** button.

16. **Important:** Save your drawing again.

**Note:** You have successfully created a new “Dimension Style” called “**Class Style**.” This style will be saved in your drawing after you save the drawing.

It is important that you understand that this dimension style resides only in this drawing. If you open another drawing, this dimension style will not be there.

## CREATING A DIMENSION SUB-STYLE

Previously you learned how to create a Dimension Style named Class Style. All of the dimensions created with that style appear identical because they have the same settings. Now you are going to learn how to create a “**Sub-Style**” of the Class Style.

### Example:

If you wanted all of the **Diameter** dimensions to have a centerline automatically displayed but you did not want a centerline displayed when using the **Radius** dimension command. To achieve this, you must create a “**sub-style**” for all **Radius** dimensions.

Sub-styles have also been called “children” of the “Parent” dimension style. As a result, they form a family.

A Sub-style is permanent, unlike the Override command, which is temporary.

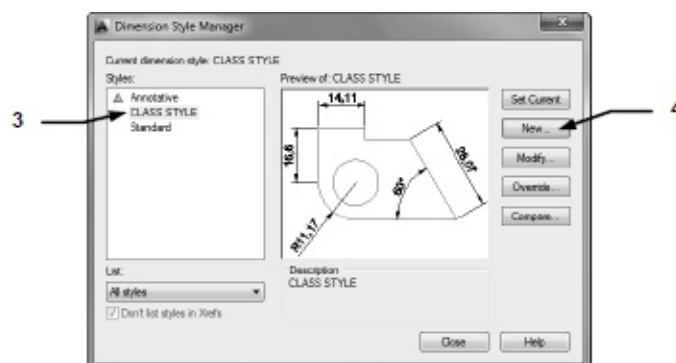

**Note:** This sounds much more complicated than it is. Just follow the steps below. It is very easy.

### How to create a sub-style for Radius dimensions.

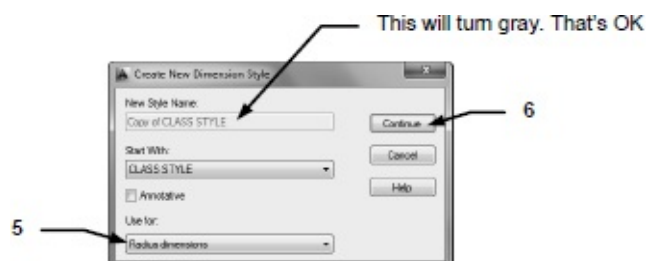

You will set the center mark to **None** for the Radius command only.

The Diameter command center mark will not change.

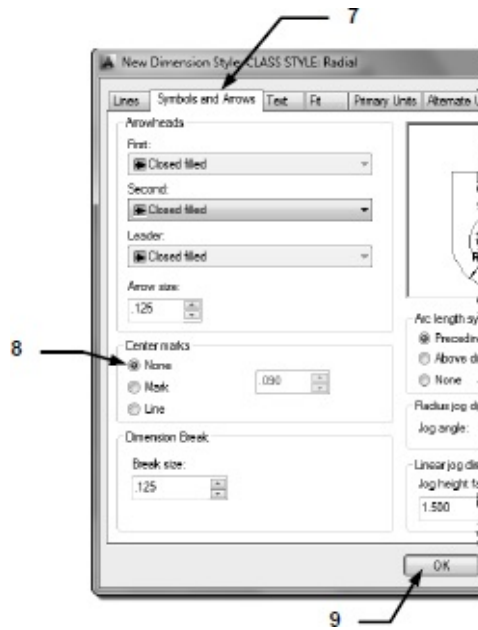

1. Open your drawing.
2. Select the **DIMENSION / STYLE** command. (Refer to [page 3-5](#))
3. Select “**Class Style**” from the Style List.
4. Select the **NEW** button.

5. Change the “Use for” to: **Radius Dimensions**
6. Select **Continue**

7. Select the **Symbols and Arrows** tab.
8. Change the “Center Marks” to **NONE**
9. Select the **OK** button

10. You now have a sub-style that will automatically override the basic “Class Style” whenever you use a Radius command. Diameter dimensions will have centermarks and Radius dimensions will not.

**Note:** If you would like to keep this sub-style re-save the drawing or template.

## EDITING DIMENSION TEXT VALUES

Sometimes you need to modify the dimension text value. You may add a symbol, note, or even change the text of an existing dimension. The following describes 2 methods.

**Example:** Add the word “MAX.” to the existing dimension value text.

### Editing Dimension Text

1. Double left click on the dimension text to be edited.
2. The dimension text will be highlighted inside a text box area the same as Multiline Text.

3. The **Text Editor Ribbon** will appear where you may change things like text height or color, add a symbol or change the text style.

### Associative Dimension

If the dimension is Associative the dimension text will appear highlighted.

— 2.148 — **Before Editing**

You may add text in front or behind the dimension text and it will remain Associative. Be careful not to disturb the dimension value text.

— MAX. 2.148 — **After Editing**

### Non Associative or Exploded Dimension

If the dimension value has been changed or exploded it will appear with a gray background and is not Associative.

4. Make the changes.
5. Select the **Close Text Editor** button or left click outside the dimension text box area.

## EDITING THE DIMENSION POSITION

Sometimes dimensions are too close and you would like to stagger the text or you need to move an entire dimension to a new location. You can achieve this and more, using “**Grips.**”

Grips are great tools for repositioning dimensions.

Grips are small, solid-filled squares that are displayed at strategic points on objects.

You can drag these grips to stretch, move, rotate, scale, or mirror objects quickly.

Grips may be turned off by typing: **grips** <enter> then **0** <enter> .

### HOW TO USE GRIPS

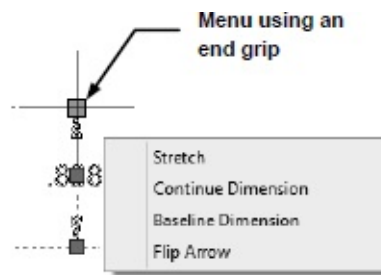

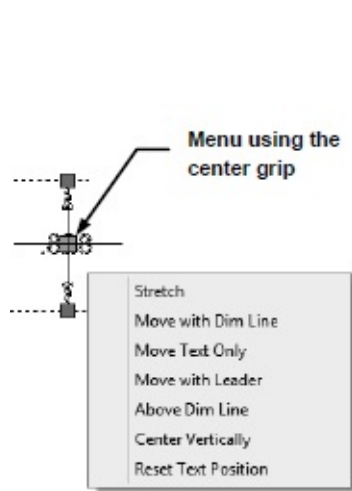

1. Select the dimension to change. (no command can be in use while using grips)
2. Select one of the **blue** grips. It will turn to “**red.**” This indicates that grip is “**hot.**” The “**Hot**” grip is the **basepoint**.
3. Move the hot grip to the new location.
4. After editing you must press the **ESC** key to de-activate the grips.

**The following is an example of how to use grips to quickly reposition dimensions.**

### **ADDITIONAL EDITING OPTIONS USING THE SHORTCUT MENU**

1. Select the dimension that you want to change.
2. Place the cursor on one of the grips shown below. (Do not press the mouse button)
3. Select an option from the short cut menu that appears.

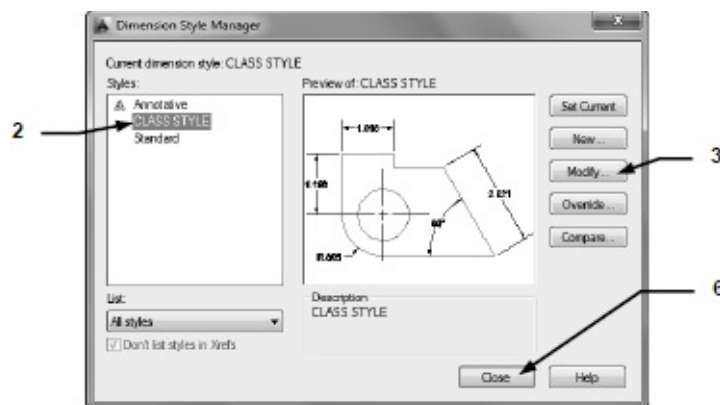

## MODIFY AN ENTIRE DIMENSION STYLE

After you have created a Dimension Style, you may find that you have changed your mind about some of the settings. You can easily change the entire Style by using the “Modify” button in the Dimension style Manager dialog box. This will not only change the Style for future use, but it will also update dimensions already in the drawing.

**Note: If you do not want to update the dimensions already in the drawing, but want to make a change to a new dimension, refer to Override.**

1. Select the Dimension Style Manager.
2. Select the Dimension Style that you wish to modify.

3. Select the **Modify** button from the Dimension Style Manager dialog box.
4. Make the desired changes to the settings.
5. Select the **OK** button.
6. Select the **Close** button.

*Now look at your drawing. Have your dimensions updated?*

**Note:**

**The method above will not change dimensions that have previously been modified or exploded.**

**Note: If some of the dimensions have not changed:**

1. Type: **-Dimstyle <enter>** (notice the (-)dash in front of “dimstyle”)
2. Type: **A <enter>**
3. Select dimensions to update and then **<enter>**  
(Sometimes you have to give them a little nudge.)

## OVERRIDE A DIMENSION STYLE

A dimension Override is a **temporary** change to the dimension settings.

An override **will not affect existing dimensions**. It will **only** affect **new dimensions**.

Use this option when you want a new dimension just a little bit different but you don't want to create a whole new dimension style and you don't want the existing dimensions to change either.

**For example**, if you want the new dimension to have a text height of .500 but you want the existing text to remain at .125 ht.

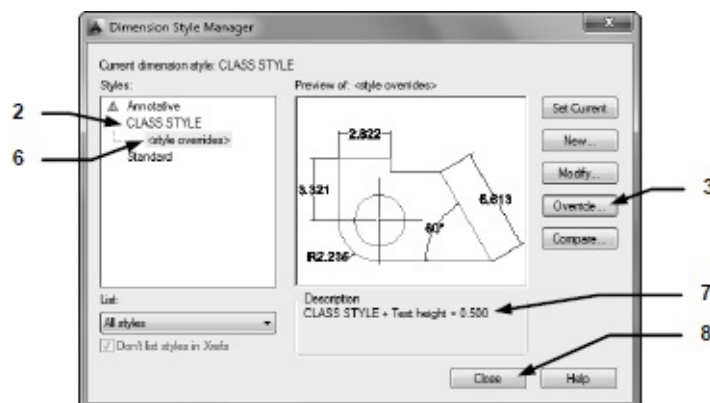

1. Select the **Dimension Style Manager**.
2. Select the "**Style**" you want to override. (Such as: Class Style)
3. Select the **Override** button.
4. Make the desired changes to the settings. (Such as: Text ht = .500)
5. Select the **OK** button.

6. Confirm the Override  
Look at the List of styles.

Under the Style name, a sub heading of **<style overrides>** should be displayed.

The description box should display the style name and the override settings.

7. The description box should display the style name and the override settings.
8. Select the **Close** button.

When you want to return to style **Class Style**, select **Class Style** from the styles list then select the **Set Current** button. Each time you select a different style, you must select the **Set Current** button to activate it.

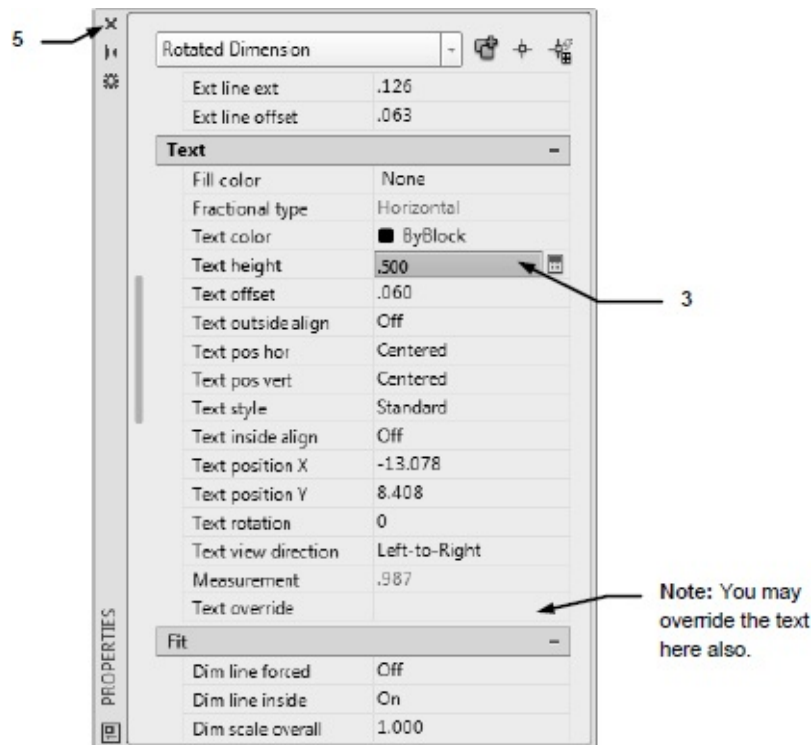

## EDIT AN INDIVIDUAL EXISTING DIMENSION

Sometimes you would like to modify the settings of an individual existing dimension. This can be achieved using the **Properties palette**.

1. Open the **Properties Palette**.
2. Select the dimension to change.
3. Select and change the desired settings.

**Example: Change the dimension text height to .500**

4. Press **<enter>** . (*The dimension should have changed*)
5. Close the **Properties Palette**.
6. Press the **<esc>** key to de-activate the grips.

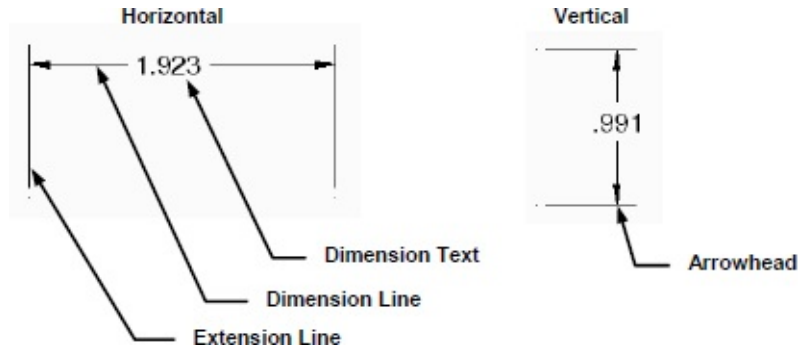

**Note: The dimension will remain Associative.**

# LINEAR DIMENSIONING

Linear dimensioning allows you to create horizontal and vertical dimensions.

1. Select the **LINEAR** command using one of the following:

**Ribbon = Annotate Tab / Dimension Panel /**

**or**

**Keyboard = dimlinear <enter>**

2015

2016

2. Specify first extension line origin or <select object>: **snap to first extension line origin (P1)**.
3. Specify second extension line origin: **snap to second extension line origin (P2)**.
4. Specify dimension line location or [Mtext/Text/Angle/Horizontal/Vertical/Rotated]: **select where you want the dimension line placed (P3)**.

## BASELINE DIMENSIONING

**Baseline dimensioning** allows you to establish a **baseline** for successive dimensions. The spacing between dimensions is automatic and should be set in the dimension style. (See 3-7, Baseline spacing setting)

A Baseline dimension must be used with an existing dimension. If you use Baseline dimensioning immediately after a Linear dimension, you do not have to specify the baseline origin.

1. Create a linear dimension first (**P1** and **P2**).
2. Select the **BASELINE** command using one of the following:

**Ribbon = Annotate Tab / Dimension Panel /**

**or**

**Keyboard = dimbaseline <enter>**

3. Specify a second extension line origin or [Undo/Select] <Select>: **snap to the second extension line origin (P3)**.
4. Specify a second extension line origin or [Undo/Select] <Select>: **snap to P4**.
5. Specify a second extension line origin or [Undo/Select] <Select>: **select <enter> twice to stop**.

## CONTINUE DIMENSIONING

**Continue** creates a series of dimensions in-line with an existing dimension. If you use the continue dimensioning immediately after a Linear dimension, you do not have to specify the continue extension origin.

1. Create a linear dimension first (**P1** and **P2** shown below)
2. Select the **CONTINUE** command using one of the following:

**Ribbon = Annotate Tab / Dimension Panel /**

**or**

**Keyboard = dimcontinue <enter>**

3. Specify a second extension line origin or [Undo/Select] <Select>: **snap to the second extension line origin (P3)**.
4. Specify a second extension line origin or [Undo/Select] <Select>: **snap to the second extension line origin (P4)**.
5. Specify a second extension line origin or [Undo/Select] <Select>: **press <enter> twice to stop.**

## ALIGNED DIMENSIONING

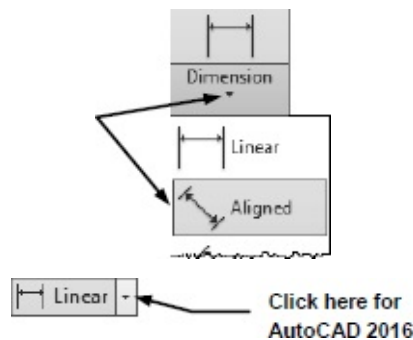

The **ALIGNED** dimension command aligns the dimension with the angle of the object that you are dimensioning. The process is the same as Linear dimensioning. It requires two extension line origins and the placement of the dimension text location. (Example below)

1. Select the **ALIGNED** command using one of the following:

**Ribbon = Annotate Tab / Dimension Panel /**

**or**

**Keyboard = dal <enter>**

2. Specify first extension line origin or <select object>: ***select the first extension line origin (P1)***
3. Specify second extension line origin: ***select the second extension line origin (P2)***
4. Specify dimension line location or [Mtext/Text/Angle]: ***place dimension text location (P3)***

Dimension text = ***the dimension value will appear here***

## ANGULAR DIMENSIONING

The **ANGULAR** dimension command is used to create an angular dimension between two lines that form an angle. AutoCAD determines the angle between the selected lines and displays the dimension text followed by a degree (°) symbol.

1. Select the **ANGULAR** command using one of the following:

**Ribbon = Annotate Tab / Dimension Panel /**

**or**

**Keyboard = dimangular <enter>**

Click here for  
AutoCAD 2016

2. Select arc, circle, line, or <specify vertex>: ***select the first line that forms the angle (P1) location is not important, do not use object snap.***
3. Select second line: ***select the second line that forms the angle (P2).***
4. Specify dimension arc line location or [Mtext/Text/Angle]: ***place dimension text Location (P3).***

Dimension text = ***angle will be displayed here***

Any of the 4 angular dimensions shown below can be displayed by moving the cursor in the direction of the dimension after selecting the 2 lines (**P1** and **P2**) that form the angle.

## DIMENSIONING ARC LENGTHS

You may dimension the distance along an Arc. This is known as the **Arc length**.

**Arc length** is an associative dimension.

**Example:**

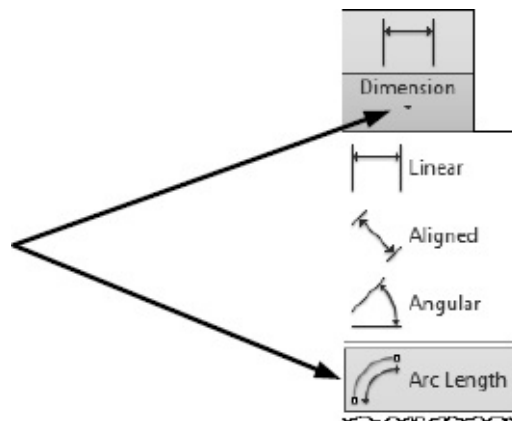

1. Select the **ARC LENGTH** command using one of the following:

**Ribbon = Annotate Tab / Dimension Panel /**

**or**

**Keyboard = dimarc <enter>**

2. Select arc or polyline arc segment: ***select the Arc***
3. Specify arc length dimension location, or [Mtext/Text/Angle/Partial/Leader]:  
***place the dimension line and text location***

Dimension text = ***dimension value will be shown here***

---

To differentiate the Arc length dimensions from Linear or Angular dimensions, arc length dimensions display an arc (∩) symbol by default. (Also called a “hat” or “cap”)

The arc symbol may be displayed either above, or preceding the dimension text.

You may also choose not to display the arc symbol.

**Example:**

Specify the placement of the arc symbol in the **Dimension Style / Symbols and Arrows** tab or you may edit its position using the Properties Palette.

The extension lines of an Arc length dimension are displayed as radial if the included angle is greater than 90 degrees.

**Example:**

The extension lines of an Arc length dimension are displayed as orthogonal if the included angle is less than 90 degrees.

**Example:**

## DIMENSIONING A LARGE CURVE

When dimensioning an arc the dimension line should pass through the center of the arc. However, for large curves, the true center of the arc could be very far away, even off the sheet. When the true center location cannot be displayed you can create a “**Jogged**” radius dimension.

### Example:

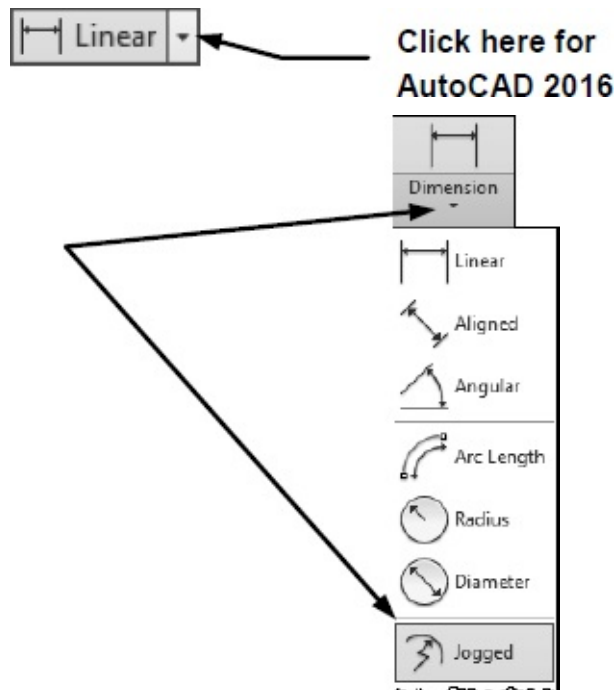

You can specify the jog angle in the **Dimension Style / Symbols and Arrows** tab.

1. Select the **JOGGED RADIUS** command using one of the following:

**Ribbon = Annotate Tab / Dimension Panel /**

**or**

**Keyboard = dimjogged <enter>**

2. Select arc or circle:  
***select the large arc or circle (P1 anywhere on arc)***
3. Specify center location override: ***move the cursor and left click to specify the “fake” center location (P2).***

Dimension text = ***(actual radius will be displayed here)***

4. Specify dimension line location or [Mtext/Text/Angle]: ***move the cursor and left click to specify the location for the dimension text (P3).***

5. Specify jog location: ***move the cursor and left click to specify the location for the jog (P4).***

### **CONTROLLING THE JOG**

You can set the Jog Angle and Height factor in: **Dimension Style / Symbols and Arrows** tab.

The image shows a dialog box with two sections for configuring jog dimensions. The first section, titled "Radius jog dimension", contains a "Jog angle:" label and a text input field with the value "45". The second section, titled "Linear jog dimension", contains a "Jog height factor:" label and a text input field with the value "1.500". To the right of the "1.500" field is a small icon of a dimension line with arrows, followed by the text "Text height".

# DIMENSIONING DIAMETERS

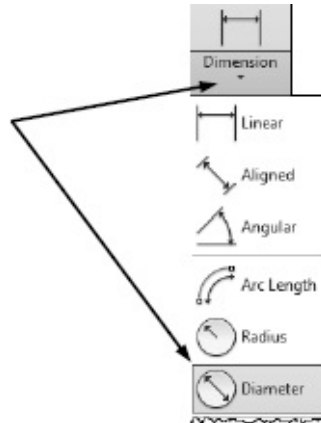

The **DIAMETER** dimensioning command should be used when dimensioning circles and arcs of more than 180 degrees. AutoCAD measures the selected circle or arc and displays the dimension text with the diameter symbol ( $\varnothing$ ) in front of it.

1. Select the **DIAMETER** command using one of the following:

**Ribbon = Annotate Tab / Dimension Panel /**

**or**

**Keyboard = dimdiameter <enter>**

Click here for AutoCAD 2016

2. Select arc or circle: ***select the arc or circle (P1) do not use object snap.***  
Dimension text = ***the diameter will be displayed here.***
3. Specify dimension line location or [Mtext/Text/Angle]: ***place dimension text location (P2)***

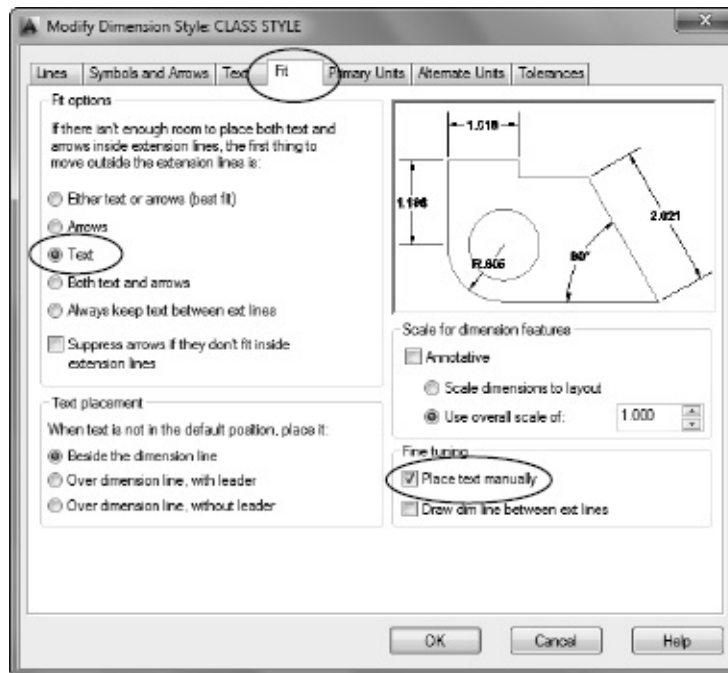

## Note:

Center marks are automatically drawn as you use the diameter dimensioning command. If the circle already has a center mark or you do not want a center mark, set the center mark setting to **NONE** (**Dimension Style / Symbols and Arrows tab**) before using Diameter dimensioning.

## Controlling the diameter dimension appearance.

If you would like your Diameter dimensions to appear as shown in the two examples below, you must change the "**Fit Options**" and "**Fine Tuning**" in the **Fit tab** in your Dimension Style.

## DIMENSIONING RADII

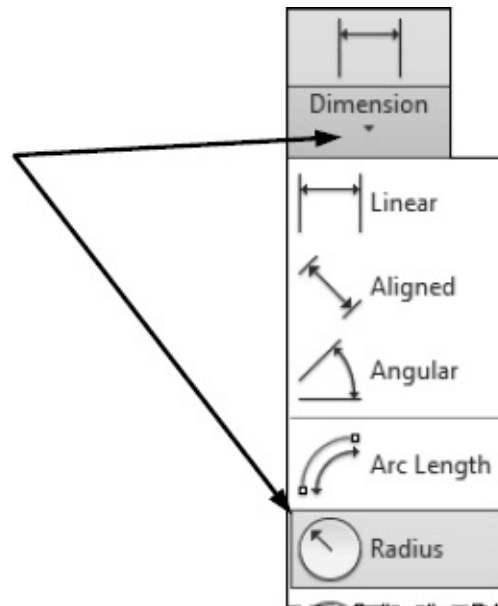

The **RADIUS** dimensioning command should be used when dimensioning arcs of less than 180 degrees. AutoCAD measures the selected arc and displays the dimension text with the radius symbol (**R**) in front of it.

1. Select the **RADIUS** command using one of the following:

**Ribbon = Annotate Tab / Dimension Panel /**

**or**

**Keyboard = dimradius <enter>**

Click here for  
AutoCAD 2016

2. Select arc or circle: ***select the arc (P1) do not use object snap.***  
Dimension text = ***the radius will be displayed here.***
3. Specify dimension line location or [Mtext/Text/Angle]: ***place dimension text location (P2)***

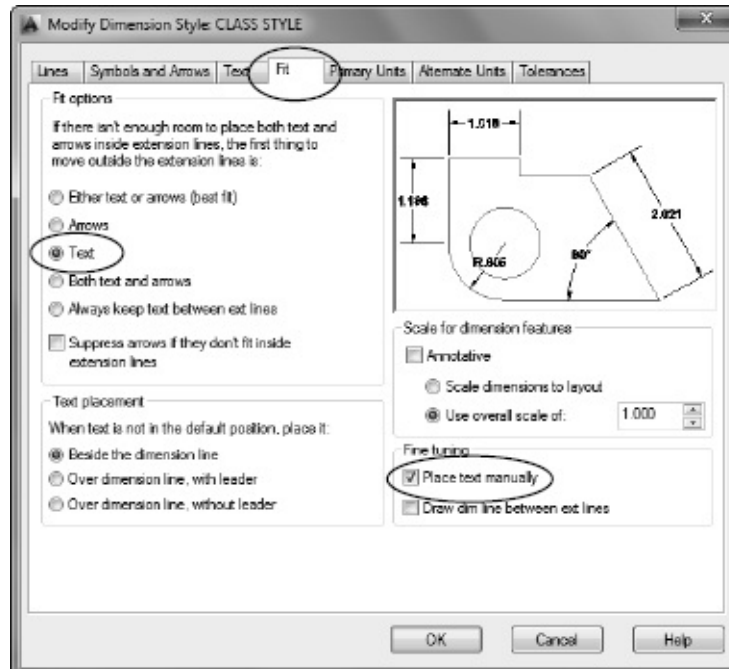

### Note:

Center marks are automatically drawn as you use the radius dimensioning command.

If you do not want a center mark, set the center mark setting to **NONE** (**Dimension Style / Symbols and Arrows tab**) before using Radius dimensioning.

**Controlling the radius dimension appearance.**

If you would like your Radius dimensions to appear as shown in the example below, you must change the “**Fit Options**” and “**Fine Tuning**” in the **Fit tab** in your Dimension Style.

## FLIP ARROW

You can easily flip the direction of the arrowhead using the **Flip Arrow** option.

### How to Flip an arrowhead.

1. Select the dimension that you wish to Flip.

2. Rest your cursor on the arrow grip. (Do not press button, just rest cursor.)

3. Select **Flip Arrow** from the shortcut menu.

4. The arrowhead Flips.

5. Press **Esc** and the grips will disappear. (Do not press <enter>.)

## QUICK DIMENSION

**Quick Dimension** creates multiple dimensions with one command. Quick Dimension can create Continuous, Staggered, Baseline, Ordinate, Radius and Diameter dimensions.

The following is an example of how to use the “Continuous” option. Staggered, Baseline, Diameter and Radius are explained on the following pages.

1. Select the **Quick Dimension** command using one of the following:

**Ribbon = Annotate Tab / Dimension Panel /  Quick**

**or**

**Keyboard = qdim <enter>**

Command: `_qdim`

Associative dimension priority = Endpoint

Select geometry to dimension

2. Select the objects to be dimensioned with a crossing window or pick each object

3. Press **<enter>** to stop selecting objects.
4. Specify dimension line position, or  
[Continuous/Staggered/Baseline/Ordinate/Radius/Diameter/datumPoint/Edit/se  
<Continuous>: **Select “C” <enter> for Continuous.**

STAGGERED

BASELINE

## DIAMETER

1. You can use a crossing window. Qdim will automatically filter out any linear dims.
2. Dimension Line Length is determined by the “**Baseline Spacing**” setting in the Dimension Style. You may stretch it using grips.

## RADIUS

1. You can use a crossing window. Qdim will automatically filter out any linear dims.
2. Dimension Line Length is determined by the “Baseline Spacing” setting in the Dimension Style.

## DIMENSION BREAKS

Occasionally extension lines overlap another extension line or even an object. If you do not like this you may use the **Dimbreak** command to break the intersecting lines. **Automatic** (described below) or **Manual** (described on next page) method may be used. You may use the **Remove** (described on page 3-37) option to remove the break.

### AUTOMATIC DIMENSION BREAKS

To create an automatically placed dimension break, you select a dimension and then use the **Auto** option of the **DIMBREAK** command.

Automatic dimension breaks are updated any time the dimension or intersecting objects are modified.

**You control the size of automatically placed dimension breaks on the Symbols and Arrows tab of the Dimension Style dialog box.**

The specified size is affected by the dimension break size, dimension scale, and current annotation scale for the current viewport.

1. Select the **DIMBREAK** command using one of the following:

**Ribbon = Annotate Tab / Dimension Panel / **

**or**

**Keyboard = dimbreak <enter>**

Command: `_Dimbreak`

2. Select dimension to add / remove break or [Multiple]: ***type M <enter>***
3. Select dimensions: ***select dimension***
4. Select dimensions: ***select another dimension***
5. Select dimensions: ***select another dimension or <enter> to stop selecting***
6. Select object to break dimension or [Auto/Remove] <Auto>: ***<enter>***

### MANUAL DIMENSION BREAK

You can place a dimension break by picking two points on the dimension, extension, or leader line to determine the size and placement of the break.

Dimension breaks that are added manually by picking two points are not

automatically updated if the dimension or intersecting object is modified. So if a dimension with a manually added dimension break is moved or the intersecting object is modified, you might have to restore the dimension and then add the dimension break again.

The size of a dimension break that is created by picking two points is not affected by the current dimension scale or annotation scale value for the current viewport.

1. Select the **DIMBREAK** command using one of the following:

**Ribbon = Annotate Tab / Dimension Panel / **

or

**Keyboard = dimbreak <enter>**

Command: `_Dimbreak`

2. Select dimension to add / remove break or [Multiple]: ***select the dimension***
3. Select object to break dimension or [Auto/Manual/Remove] <Auto>: ***type M <enter>***
4. Specify first break point: ***select the first break point location*** (Osnap should be off)
5. Specify second break point: ***select the second break point location***

The following objects can be used as cutting edges when adding a dimension break: Dimension, Leader, Line, Circle, Arc, Spline, Ellipse, Polyline, Text, and Multiline text.

## REMOVE THE BREAK

Removing the break is easy using the **Remove** option.

1. Select the **DIMBREAK** command using one of the following:

**Ribbon = Annotate Tab / Dimension Panel / **

or

**Keyboard = dimbreak <enter>**

Command: `_Dimbreak`

2. Select dimension to add / remove break or [Multiple]: ***type M <enter>***

3. Select dimensions: ***select a dimension***
4. Select dimensions: ***select a dimension***
5. Select dimensions: ***select another dimension or <enter> to stop selecting***
6. Select object to break dimension or [Auto/Remove] <Auto>: ***type R <enter>***

## JOG A DIMENSION LINE

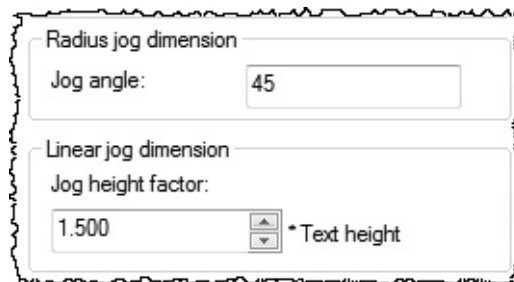

Jog lines can be added to linear dimensions. Jog lines are used to represent a dimension value that does not display the actual measurement.

Before you add a jog, the Jog angle and the height factor of the jog should be set in the **Symbols & Arrows** tab within the Dimension Style Manager.

The height is calculated as a factor of the Text height.

### Example:

If the text height was .250 and the jog height factor was 1.500, the jog would be .375 Formula: (.250 ht. X 1.500 jog ht. factor= .375).

1. Select the **DIMJOGLINE** command using one of the following:

**Ribbon = Annotate Tab / Dimension Panel / **

or

**Keyboard = dimjogline <enter>**

Command: `_DIMJOGLINE`

2. Select dimension to add jog or [Remove]: **Select a dimension**
3. Specify jog location (or press ENTER): **Press <enter>**
4. After you have added the jog you can re-position it by using **Grips** and adjust the height of the jog symbol using the **Properties Palette**.

## REMOVE A JOG

1. Select the **DIMJOGLINE** command

Command: `_DIMJOGLINE`

2. Select dimension to add jog or [Remove]: **type R <enter>**
3. Select jog to remove: **select the dimension**

## ADJUST DISTANCE BETWEEN DIMENSIONS

The Adjust Space command allows you to adjust the distance between existing parallel linear and angular dimensions, so they are equally spaced. You may also align the dimensions to create a string.

1. Select the **ADJUST SPACE** command using one of the following:

**Ribbon = Annotate Tab / Dimension Panel / **

or

**Keyboard = dimspace <enter>**

Command: `_DIMSPACE`

2. Select base dimension: **Select the dimension that you want to use as the base dimension when equally spacing dimensions. (P1)**
3. Select dimensions to space: **select the next dimension to be spaced. (P2)**
4. Select dimensions to space: **select the next dimension to be spaced. (P3)**
5. Select dimensions to space: **continue selecting or press <enter> to stop.**
6. Enter value or [Auto] <Auto>: **enter a value or press <enter> for auto.**

**Note: Auto** creates a spacing value of twice the height of the dimension text.

For example, if the dimension text is 1/8", the spacing will be 1/4".

## Aligning dimensions

Follow the steps shown above but when asked for the value enter **"0" <enter>**.

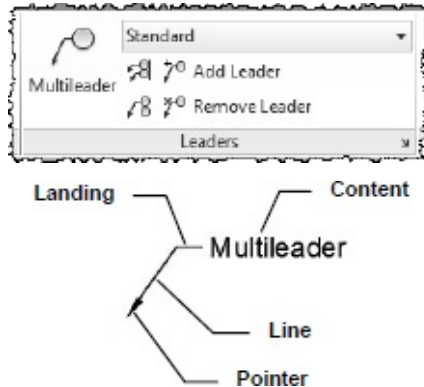

# MULTILEADER

A Multileader is a single object consisting of a **pointer**, **line**, **landing** and **content**. You may draw a Multileader, pointer first, tail first or content first.

To select the Multileader use:

## Annotate tab / Leaders panel

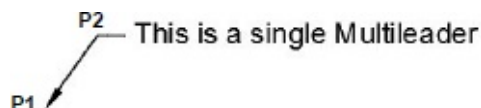

## Create a single Multileader

1. Select the **Multileader** tool

Command: `_mleader`

2. Specify leader arrowhead location or [leader Landing first/Content first/Options] <Options>: **specify arrowhead location (P1)**
3. Specify leader landing location: **specify the landing location (P2)**
4. The Multitext editor appears. **Enter text then select "Close Text Editor"**

## Add leader lines to existing Multileader

1. Select the **Add Leader** tool 
2. Select a multileader: **click on the existing multileader line (P1)**
3. Specify leader arrowhead location: **specify arrowhead location (P2)**
4. Specify leader arrowhead location: **specify next arrowhead location (P3)**
5. Specify leader arrowhead location: **specify next arrowhead location (P4)**
6. Specify leader arrowhead location: **press <enter> to stop**

## Remove a leader line from an existing Multileader

1. Select the **Remove Leader** tool.

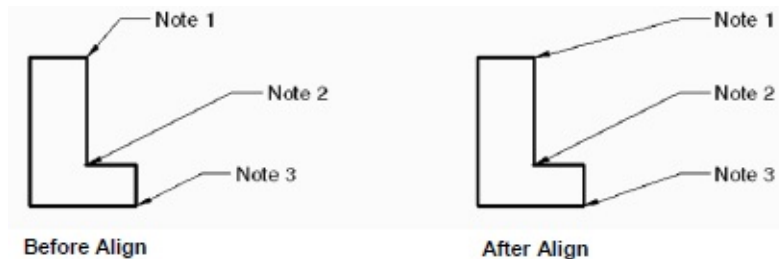

2. Select a multileader: **click anywhere on the existing multileader**
3. Specify leaders to remove: **select the leader line to remove**
4. Specify leaders to remove: **press <enter> to stop**

## **Align Multileaders**

1. Select the **Align Multileader** tool   
Command: `_mleaderalign`
2. Select multileaders: **select the leaders to align (Note 1 and Note 3)**
3. Select multileaders: **press <enter> to stop selecting**  
Current mode: Use current spacing
4. Select multileader to align to or [Options]: **select the leader to align to (Note 2)**
5. Specify direction: **move the cursor and press left mouse button**

**Note: Collect Multileader  works best with Blocks and will be discussed in Section 4.**

## CREATE A MULTILEADER STYLE

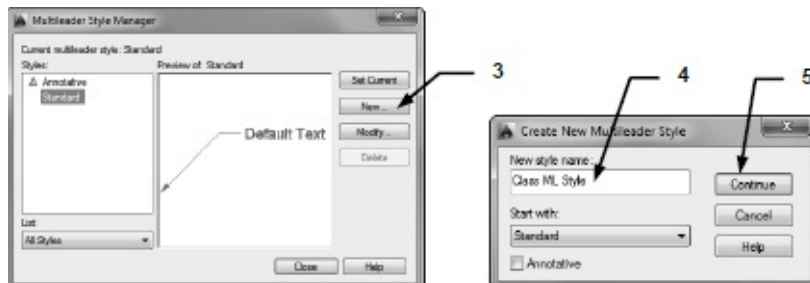

You may create **Multileader styles** to control it's appearance.

This will be similar to creating a dimension style.

1. Open a drawing.
2. Select the **Multileader Style Manager** by selecting the  on the Leader panel.

3. Select the **New** button.
4. Enter the New Style name: **Class ML style**
5. Select the **Continue** button.

6. Select the **Leader Format** tab and change the settings as shown below.

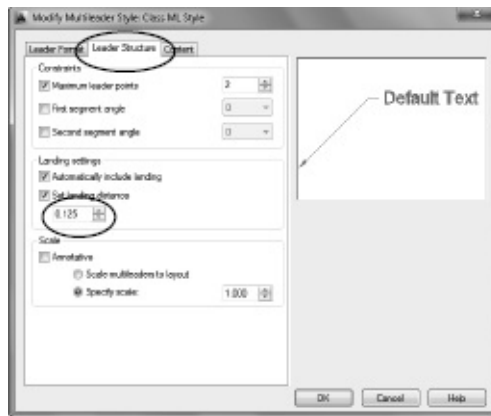

**General** – You may set the leader line to straight or spline (curved). You may change the color, linetype and lineweight.

**Arrowhead** – Select the symbol for the pointer and size of pointer.

**Leader break** – specify the size of the gap in the leader line if Dimension break is used.

7. Select the **Leader Structure** tab and change the settings as shown below.

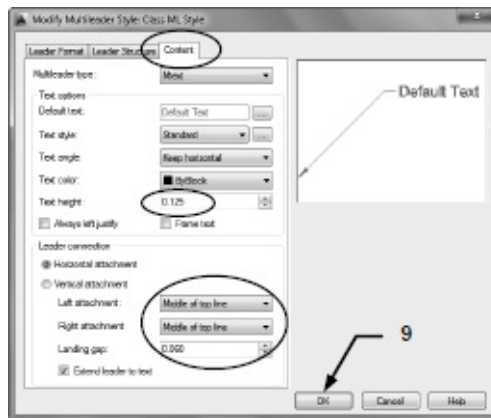

Constraints – Specify how many line segments to allow and on what angle.

Landing Settings – Specify the length of the Landing (the horizontal line next to the note) or turn it off by unchecking the “Automatically include landing” box.

Scale – “Annotation” will be discussed in Section 10.

8. Select the **Content** tab and change the settings as shown below.

Multileader type – Select what to attach to the landing.

Text Options – Specify the leader note appearance.

Leader Connection – Specify how the note attaches to the landing.

9. Select the **OK** button.

The **Class ML style** should be listed in the “Style” area

10. Select **Set Current** button.

11. Select **Close** button.

12. **Save** your drawing again.

Now whenever you use this drawing the Multileader style **Class ML style** will be there.

## IGNORING HATCH OBJECTS

Occasionally, when you are dimensioning an object that has “Hatch Lines”, your cursor will snap to the Hatch Line instead of the object that you want to dimension.

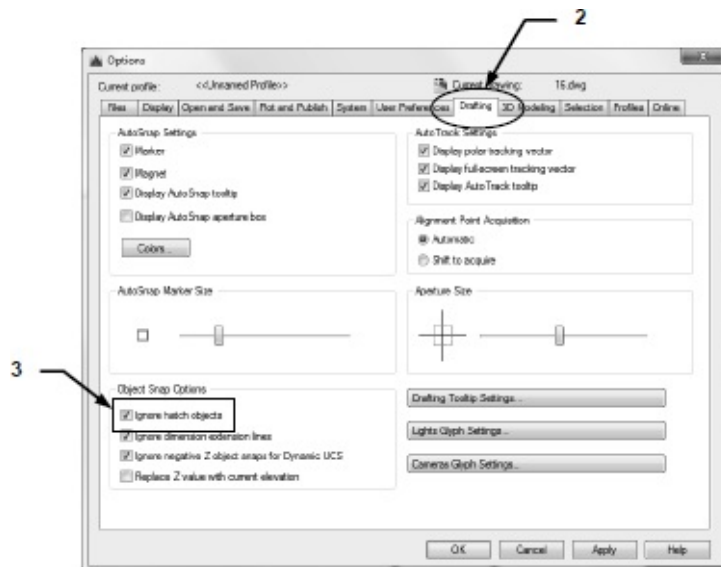

To prevent this from occurring, select the option “**IGNORE HATCH OBJECTS.**”

**Example:**

### How to select the “IGNORE HATCH OBJECTS” option

1. Type: **Options <enter>**
2. Select the **Drafting** tab.
3. Check the **Ignore Hatch Objects** box.

## ORDINATE DIMENSIONING

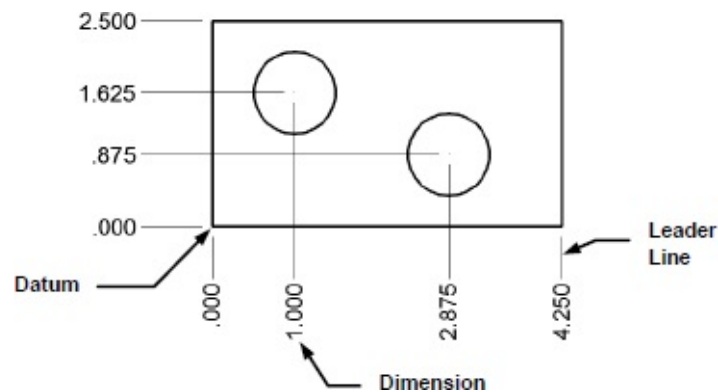

Ordinate dimensioning is primarily used by the sheet metal industry. But many others are realizing the speed and tidiness this dimensioning process allows.

Ordinate dimensioning is used when the X and the Y coordinates, from one location, are the only dimensions necessary. Usually the part has a uniform thickness, such as a flat plate with holes drilled into it. The dimensions to each feature, such as a hole, originate from one “datum” location. This is similar to “baseline” dimensioning.

Ordinate dimensions have only one datum. The datum location is usually the lower left corner of the object.

Ordinate dimensions appearance is also different. Each dimension has only one leader line and a numerical value. Ordinate dimensions do not have extension lines or arrows.

Example of Ordinate dimensioning:

### Note:

Ordinate dimensions can be Associative and are Trans-spatial. Which means that you can dimension in paperspace and the ordinate dimensions will remain associated to the object they dimension. (Except for Qdim ordinate.)

Refer to the next page for step by step instructions to create Ordinate dimensions.

## CREATING ORDINATE DIMENSIONS

1. Move the “Origin” to the desired “datum” location.

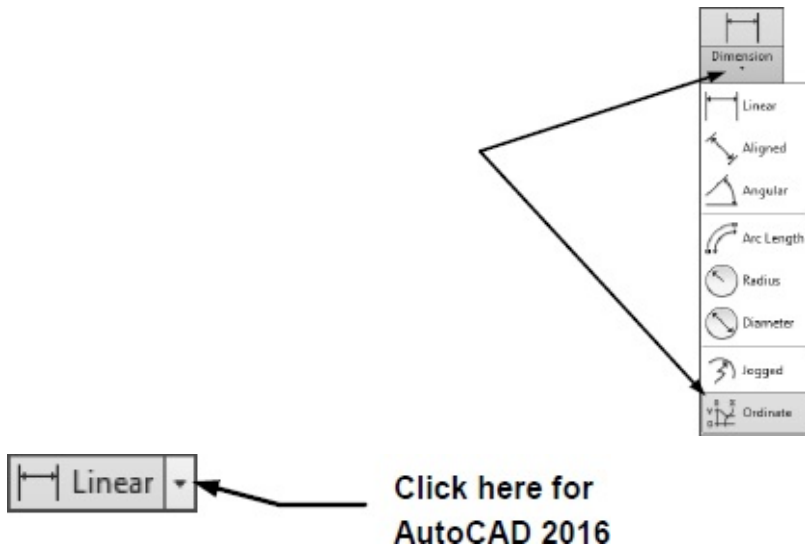

**Note: This must be done in Model Space.**

2. Select the **ORDINATE** command using one of the following:

**Ribbon = Annotate Tab / Dimension Panel /**

**or**

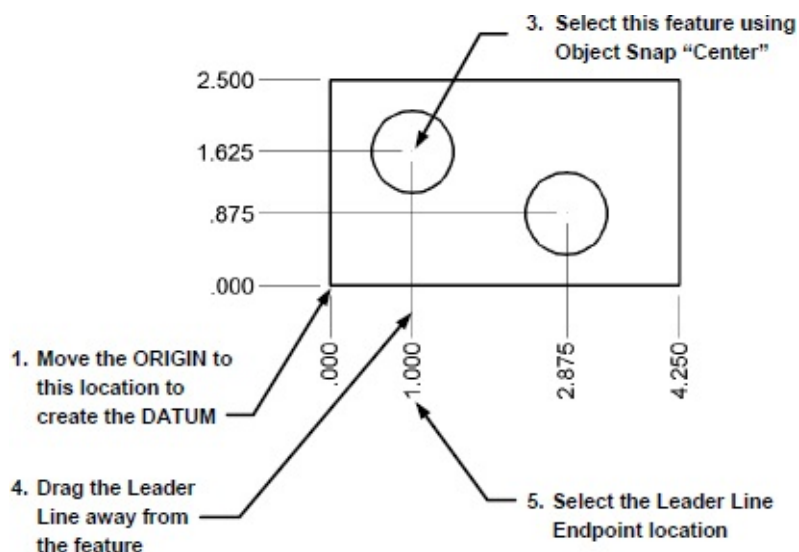

**Keyboard = dimordinate <enter>**

3. Select the first feature, using object snap.
4. Drag the leader line horizontally or vertically away from the feature.
5. Select the location of the “leader endpoint.”

(The dimension text will align with the leader line)

Use “**Ortho**” to keep the leader lines straight.

## JOG AN ORDINATE DIMENSION

If there is insufficient room for a dimension you may want to jog the dimension. To “jog” the dimension, as shown below, turn “**Ortho**” off before placing the Leader Line endpoint location. The leader line will automatically jog. With Ortho off, you can only indicate the feature location and the leader line endpoint location, the leader line will jog the way it wants to.

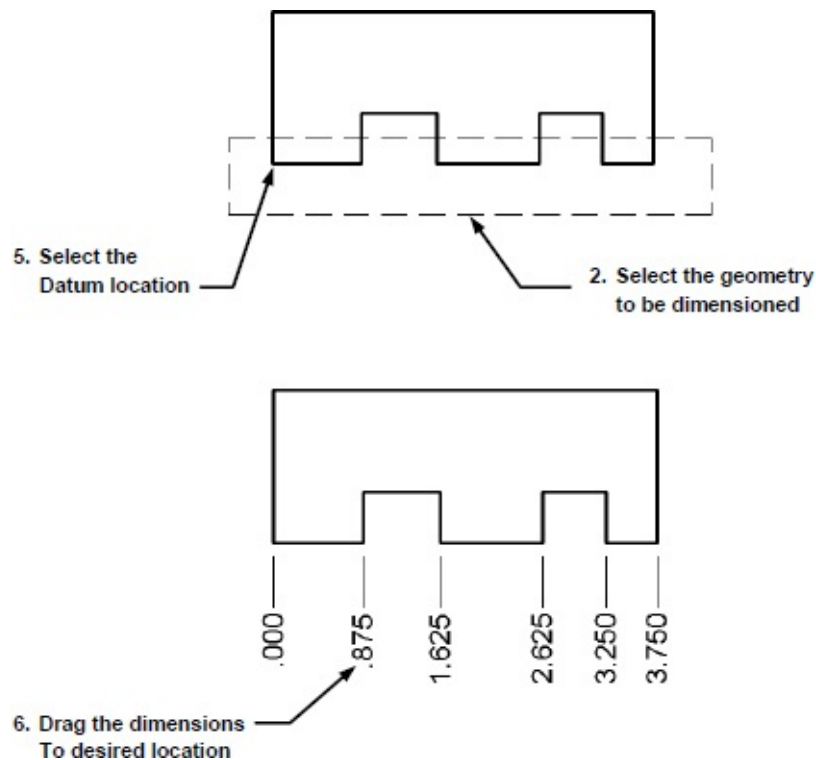

## QUICK DIMENSION WITH ORDINATE DIMENSIONING

(Not available in version LT)

1. Select **DIMENSION / Quick Dimension** (Refer to [page 3-33](#))
2. Select the geometry to dimension then press **<enter>**
3. Type **"O"** **<enter>** to select Ordinate
4. Type **"P"** **<enter>** to select the **datumPoint** option.
5. Select the datum location on the object. (use Object snap)
6. Drag the dimensions to the desired distance away from the object.

**Note: Qdim can be associative but is not trans-spatial.  
If the object is in Model Space, you must dimension in Model Space.**

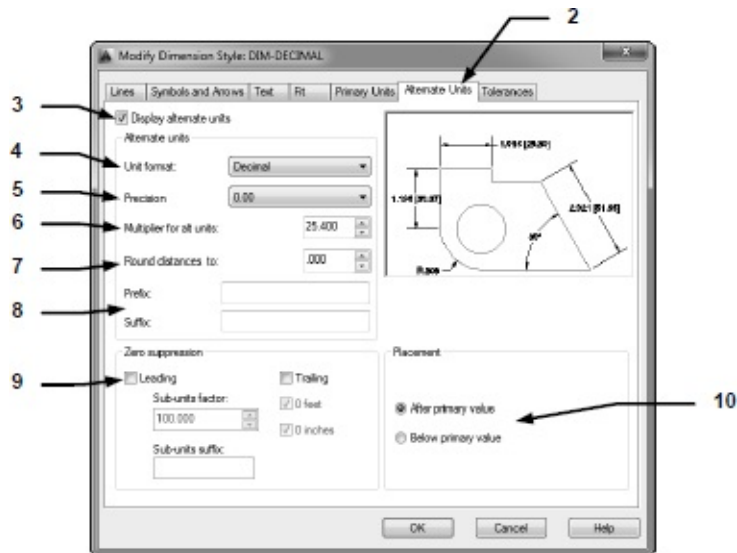

## ALTERNATE UNITS

The options in this tab allow you to display inches as the primary units and the millimeter equivalent as alternate units. The millimeter value will be displayed inside brackets immediately following the inch dimension. **Example:** 1.225" [31.115mm]

1. Select a **DIMENSION STYLE** then the **Modify** button.
2. Select the **ALTERNATE UNITS** tab.

3. **Display alternate units.** Check this box to turn **ON** alternate units.
4. **Unit format.** Select the **Units** for the alternate units.
5. **Precision.** Select the Precision of the alternate units. This is independent of the Primary Units.
6. **Multiplier for all units.** The primary units will be multiplied by this number to display the alternate unit value.
7. **Round distance to.** Enter the desired increment to round off the alternate units value.
8. **Prefix / Suffix.** This allows you to include a Prefix or Suffix to the alternate units. Such as: type **mm** to the Suffix box to display **mm** (for millimeters) after the alternate units.
9. **Zero Suppression.** If you check one or both of these boxes, it means that the zero will not be drawn. It will be suppressed.
10. **Placement.** Select the desired placement of the alternate units. Do you want them to follow immediately after the Primary units or do you want the Alternate units to be below the primary units?

# TOLERANCES

When you design and dimension a widget, it would be nice if when that widget was made, all of the dimensions were exactly as you had asked. But in reality this is very difficult and or expensive. So you have to decide what actual dimensions you could live with. Could the widget be just a little bit bigger or smaller and still work? This is why tolerances are used.

A **Tolerance** is a way to communicate, to the person making the widget, how much larger or smaller this widget can be and still be acceptable. In other words each dimension can be given a maximum and minimum size. But the widget must stay within that “**tolerance**” to be correct. For example, a hole that is dimensioned 1.00 +.06 -.00 means the hole is nominally 1.00 but it can be as large as 1.06 but can not be smaller than 1.00.

1. Select **DIMENSION STYLE / MODIFY**.
2. Select the **TOLERANCES UNITS** tab.

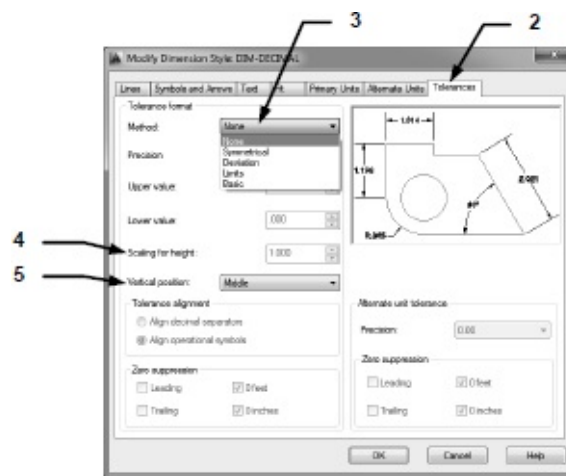

**Note:** If the dimensions in the display look strange, Make sure “**Alternate Units**” are turned **OFF**.

### 3. Method

The options allows you to select how you would like the tolerances displayed. There are 5 methods: **None**, **Symmetrical**, **Deviation**, **Limits**, and **Basic**. (Basic is used in geometric tolerancing and will not be discussed at this time.)

*Refer to the next page for descriptions of the methods.*

4. **Scaling the height.** This controls the height of the tolerance text. The entered value is a percentage of the primary text height. If .50 is entered, the tolerance text height will be 50% of the primary text height.

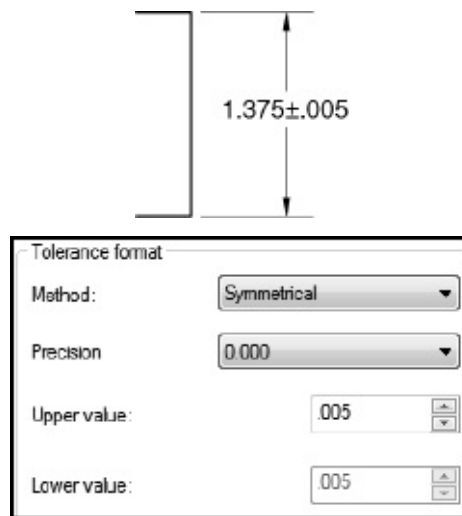

5. **Vertical position.** This controls the placement of the tolerance text in relation to the primary text. The options are Top, Middle and Bottom. Whichever option you select, it will align the tolerance text with the bottom of the primary text.

**SYMMETRICAL** is an equal bilateral tolerance. It can vary as much in the plus as

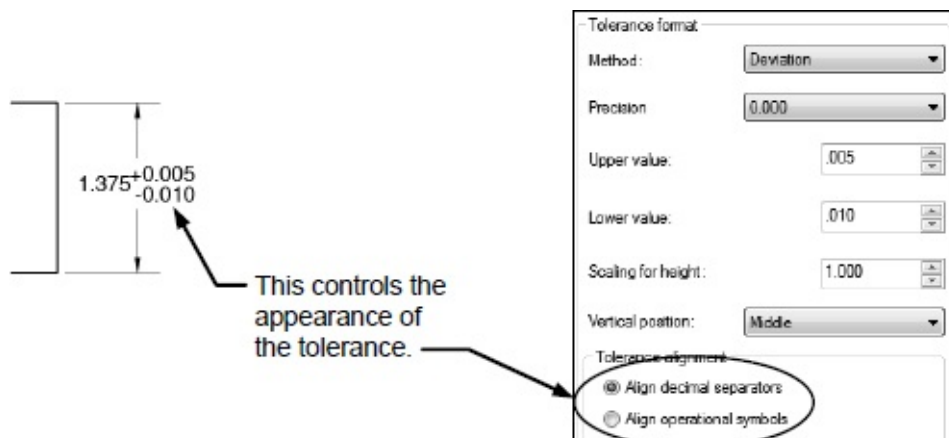

in the negative. Because it is equal in the plus and minus direction, only the “Upper value” box is used. The “Lower value” box is grayed out.

Example of a Symmetrical tolerance:

**DEVIATION** is an unequal bilateral tolerance. The variation in size can be different in both the plus and minus directions. Because it is different in the plus and the minus the “Upper and Lower” value boxes can be used.

Example of a Deviation tolerance:

**Note:** If you set the upper and lower values the same, the tolerance will be displayed as symmetrical.

**LIMITS** is the same as deviation except in how the tolerance is displayed. Limits calculates the plus and minus by adding and subtracting the tolerances from the nominal dimension and displays the results. Some companies prefer this method because no math is necessary when making the widget. Both “Upper and Lower” value boxes can be used.

**Note:** The “Scaling for height” should be set to “1”.

Tolerance format:

Method:

Precision:

Upper value:

Lower value:

Scaling for height:

Vertical position:

Example of a Limits tolerance:

# GEOMETRIC TOLERANCING

Geometric tolerancing is a general term that refers to tolerances used to control the form, profile, orientation, runout, and location of features on an object. Geometric tolerancing is primarily used for mechanical design and manufacturing. The instructions below will cover the Tolerance command for creating geometric tolerancing symbols and feature control frames.

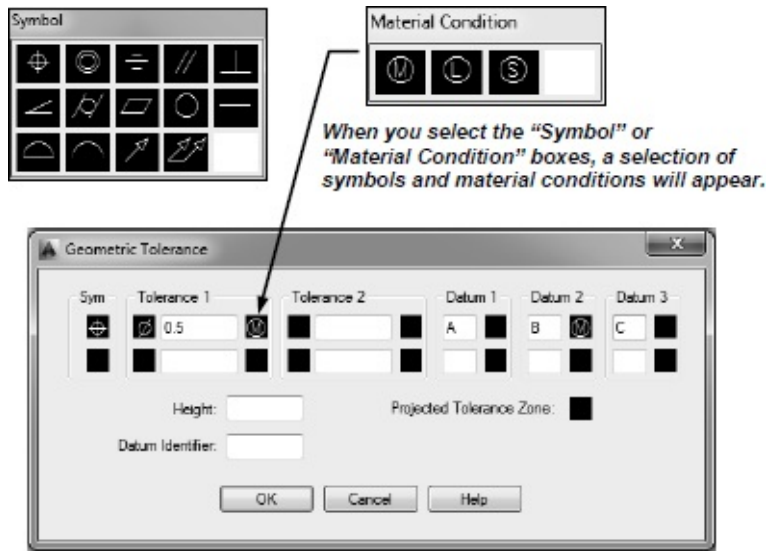

1. Select the **TOLERANCE** command using one of the following:

**Ribbon = Annotate Tab / Dimension Panel ▼ / **

or

**Keyboard = tol <enter>**

*The Geometric Tolerance dialog box, shown below, should appear.*

2. Make your selections and fill in the tolerance and datum boxes.
3. Select the **OK** box.
4. The tolerance should appear attached to your cursor. Move the cursor to the desired location and press the left mouse button.

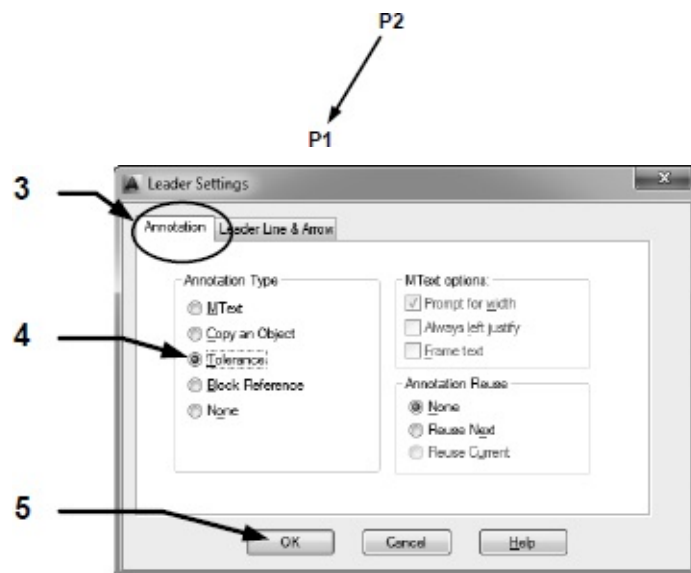

**Note: The size of the Feature Control Frame above is determined by the height of the dimension text.**

## GEOMETRIC TOLERANCES AND QLEADER

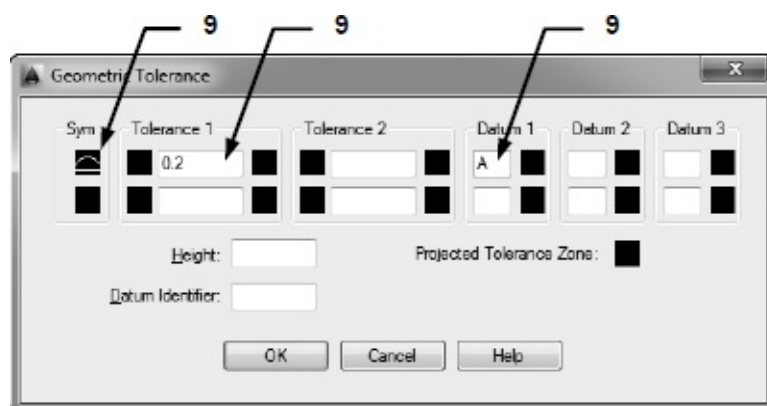

The **Qleader** command allows you to draw leader lines and access the dialog boxes used to create feature control frames in one operation. **Do not use Multileader**

1. Type **qleader** <enter>
2. Select “**Settings**”
3. Select the **Annotation** tab
4. Select the **Tolerance** option
5. Select **OK** button
6. Place the first leader point **P1**
7. Place the next point **P2**

8. Press <enter> to stop placing leader lines.

*The Geometric Tolerance dialog box will appear.*

9. Make your selections and fill in the tolerance and datum boxes.
10. Select the **OK** button.

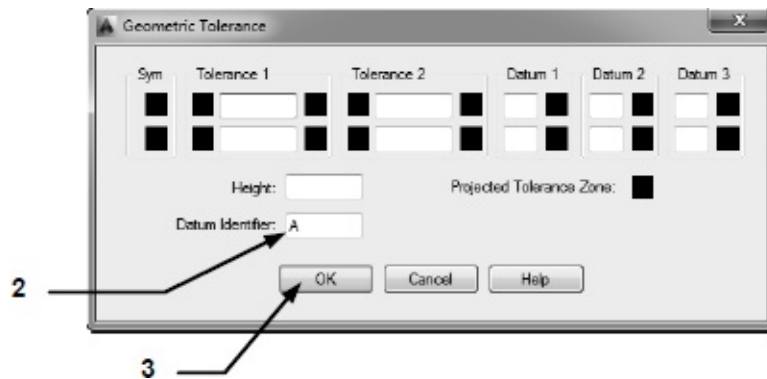

## DATUM FEATURE SYMBOL

A datum in a drawing is identified by a “datum feature symbol.”

To create a *datum feature symbol*: 

1. Select **Annotate Tab / Dimension Panel ▼ /** 
2. Type the “datum reference letter” in the “Datum Identifier” box.
3. Select the **OK** button.

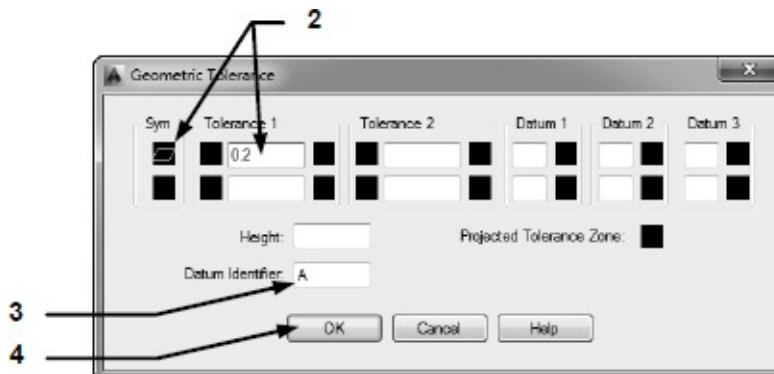

**Note:** The size is determined by the text height setting within the current “dimension style.”

To create a *datum feature symbol* combined with a *feature control frame*:

1. Select **Annotate Tab / Dimension Panel ▼ /**
2. Make your selections and fill in the tolerance.
3. Type the “datum reference letter” in the “Datum Identifier” box.
4. Select the **OK** button.

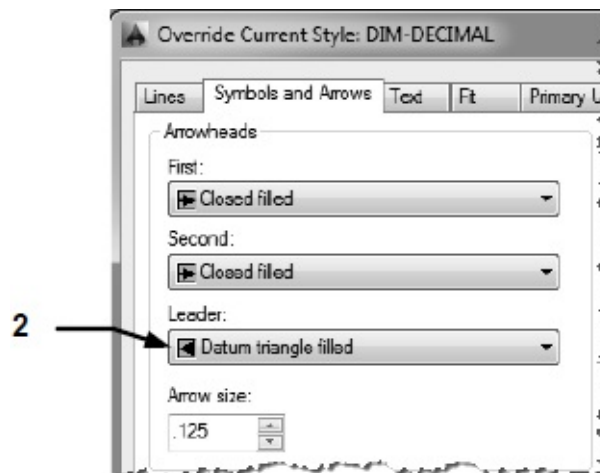

## DATUM TRIANGLE

A datum feature symbol, in accordance with ASME Y14.5-2009, includes a leader line and a datum triangle filled. You can create a block or you can use the two step method below using Dimension / Tolerance and Leader.

1. Select **Dimension Style** and then **Override**.
2. Change the Leader Arrow to **Datum triangle filled**.
3. Select **Set Current** and **close**.
4. Type `qlleader` <enter>.
5. Place the 1st point (the triangle endpoint.)
6. Place the 2nd point (Ortho ON.)
7. Press <enter> **twice**.
8. Select **None** from the options.

*If you were successful, a datum triangle filled with a leader line should appear.*

9. Next create a **datum feature symbol**.  
(Follow the instructions on the previous page.) 
10. Now move the datum feature symbol to the endpoint of the leader line to create the symbol below left.

**You are probably wondering why we didn't just type "A" in the identifier box. That method will work if your leader line is horizontal. But if the leader line is vertical, as shown on the left, it will not work. (The example on the right illustrates how it would appear)**

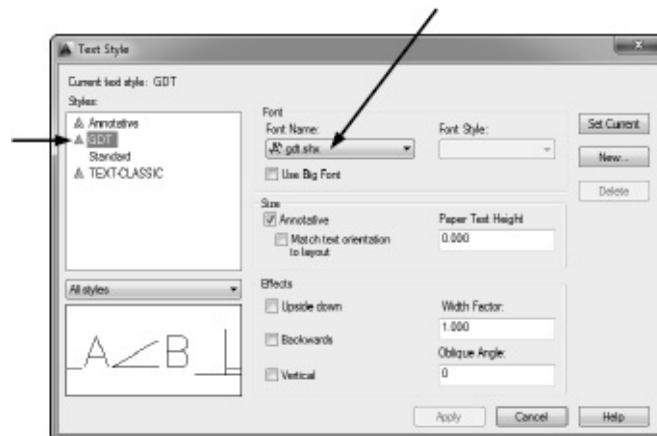

## TYPING GEOMETRIC SYMBOLS

If you want geometric symbols in the notes that you place on the drawing, you can easily accomplish this using a font named **GDT.SHX**. This font will allow you to type normal letters and geometric symbols, in the same sentence, by merely pressing the **SHIFT** key when you want a symbol. **Note:** The **CAPS** lock must be **ON**.

1. First you must create a new text style using the **GDT.SHX** font.

2. **CAPS LOCK** must be **ON**.
3. Select **Single Line** or **Multiline text**.
4. Now type the sentence shown below. When you want to type a symbol, press the **SHIFT** key and type the letter that corresponds to the symbol. For example, if you want the **diameter** symbol, press the **SHIFT** key and the **“N”** key. (Refer to the alphabet of letters and symbols shown above.)

3X Ø.44 □∅1.06 ∇.06

Can you decipher what it says?

(Drill (3) .44 diameter holes with a 1.06 counterbore diameter .06 deep)

# DIM COMMAND

2016  
only

**DIM Command** allows you to automatically create dimensions based on the object you select. After selecting the DIM command you simply hover the cursor over an object to see a preview of the dimension before you create it. DIM Command allows you to create multiple dimensions all within the one command by selecting an object or by using the appropriate prompts on the Command Line. In previous lessons you had to select a command for each dimension you wanted to create.

**Ribbon = Annotate Tab / Dimensions Panel /**

**or**

**Keyboard = dim <enter>**

The following examples show you the previews when creating dimensions for Linear objects.

If you are satisfied with the preview of the dimension required, you simply left click to select the object then drag the cursor to place the dimension in the position you require. Then left click again to accept the position. (**Note:** It is best to turn off **Ortho Mode F8** when using the **Aligned** dimension.)

Examples showing the previews when selecting arcs and circles:

## BASELINE DIMENSIONING

The following is an example of how to use the “**Baseline**” option of the **DIM** command.

1. Select the **DIM** command.

- Left click on the line (**P1**) then drag the cursor down to the position you require for the dimension and then left click again to place the dimension (**P2**).

- Select **Baseline** on the command line or type in **B <enter>**

- DIM** specify first extension line origin as baseline or [Offset]: Left click on the first extension line (**P3**).

- Left click on the endpoints at **P4** and **P5**. (Make sure **Object Snap** is turned **ON**.)

- Press **<enter> <enter> <enter>** to end the **DIM** command.

## CONTINUOUS DIMENSIONING

The following is an example of how to use the “**Continue**” option of the **DIM** command.

- Select the **DIM** command.
- Left click on the line (**P1**) then drag the cursor down to the position you require for the dimension and then left click again to place the dimension (**P2**).

- Select **Continue** on the command line or type in **C <enter>**

- DIM** specify first extension line origin as baseline or [Offset]: Left click on the first extension line (**P3**).

5. Left click on the endpoints at **P4** and **P5**. (Make sure **Object Snap** is turned **ON**.)

6. Press **<enter>** **<enter>** **<enter>** to end the **DIM** command.

## ANGULAR DIMENSIONING

The following is an example of how to dimension **Angles** with the **DIM** command.

1. Select the **DIM** command.
2. Left click on the line (**P1**).

3. Left click on the line (**P2**).

4. Drag the cursor to the position you require for the dimension and then **left click** again to place the dimension (**P3**).

5. Press **<enter>** to end the **DIM** command.

**Note:** You can place the dimension in various positions as shown in the examples below.

## LINEAR DIMENSIONING

You may also wish to dimension the horizontal and vertical distances of an angled line as shown in the example below.

1. Select the **DIM** command.
2. Left click on the line (**P1**) then drag the cursor down and to the left (**P2**). Left click again to place the dimension.

3. Left click on the angled line (**P3**) then drag the cursor up and to the right (**P4**). Left click again to place the dimension.

4. Press **<enter>** to end the **DIM** command.

**Notes:**

## Section 4

### Drawing Entities

# ARC

There are 10 ways to draw an **ARC** in AutoCAD. Not all of the ARCS options are easy to create so you may find it is often easier to **trim a Circle** or use the **Fillet** command.

On the job, you will probably only use 2 of these methods. Which 2 depends on the application.

An **ARC** is a segment of a circle and must be less than 360 degrees.

By default, ARCS are drawn counter-clockwise. You can change the direction by holding the Ctrl key to draw in a clockwise direction. Or in some cases you can enter a negative input to draw in a clockwise direction.

1. Select the **ARC** Command using one of the following:

**Ribbon = Home Tab / Draw Panel /**

**or**

**Keyboard = A <enter>**

2. Refer to the following pages for examples of each method listed below.

### 3 POINT

### START, CENTER, END

**Note:** By default these arcs are drawn counter-clockwise. Hold down the **Ctrl** key to draw in a clockwise direction.

### START, CENTER, ANGLE

**Note:** Positive angles draw the arc counter-clockwise, negative angles draw the arc clockwise.

### START, CENTER, LENGTH

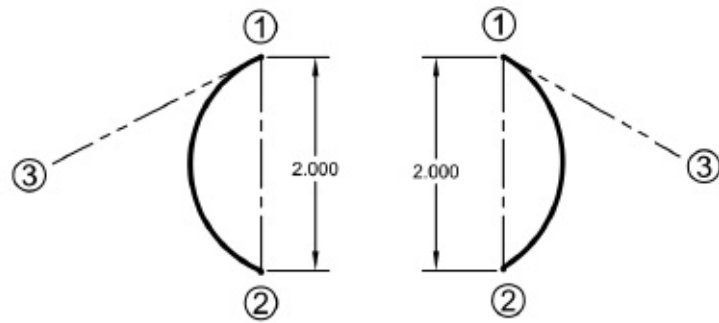

**Note:** Positive Chord length draws the small segment counter-clockwise, negative Chord length draws the large segment counter-clockwise. To reverse the directions hold down the **Ctrl** key.

### START, END, ANGLE

**Note:** Positive angles draw the arc counter-clockwise, negative angles draw the arc clockwise. To reverse the directions hold down the **Ctrl** key.

### START, END, DIRECTION

### START, END, RADIUS

**Note:** Positive radius draws the small segment, negative radius draws the large segment. To reverse the directions hold down the **Ctrl** key.

### CENTER, START, END

**Note:** Draws the arc counter-clockwise. To reverse the directions hold down the **Ctrl** key.

### CENTER, START, ANGLE

**Note:** To reverse the arc directions hold down the **Ctrl** key.

### CENTER, START, LENGTH

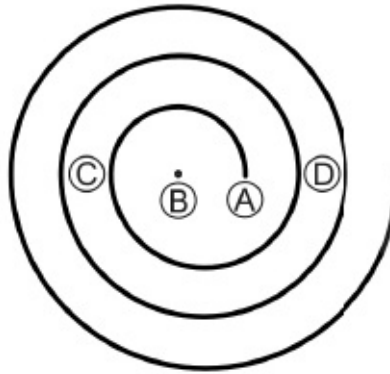

**Note:** Positive Chord length draws the small segment counter-clockwise, Negative Chord length draws the large segment counter-clockwise. To reverse the directions hold down the **Ctrl** key.

## CONTINUE

1. Draw the LINE.
2. Select DRAW / ARC / CONTINUE  
(the arc will automatically attach to the end of the line.)
3. Place the END of the Arc.

## DRAWING A SPIRAL

1. Draw the first ARC.  
using S, C, E. method.  
A = Start  
B = Center  
C = End
2. Press <Enter> twice.
3. Place END of second  
ARC at location D.
4. Repeat steps 2 and 3  
until the Spiral is complete.

# BLOCKS

A BLOCK is a group of objects that have been converted into ONE object. A Symbol, such as a transistor, bathroom fixture, window, screw or tree, is a typical application for the block command. First a BLOCK must be created. Then it can be INSERTED into the drawing. An inserted Block uses less file space than a set of objects copied.

## CREATING A BLOCK

1. First draw the objects that will be converted into a Block.

*For this example a circle and 2 lines are drawn.*

2. Select the **CREATE BLOCK** command using one of the following:

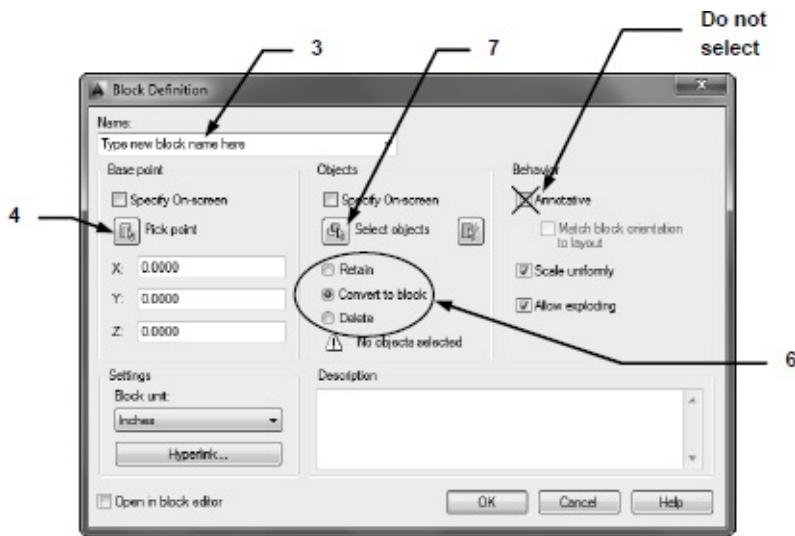

**Ribbon = Insert Tab / Block Definition Panel /**

**or**

**Keyboard = B <enter>**

3. Enter the New Block name in the **Name** box.

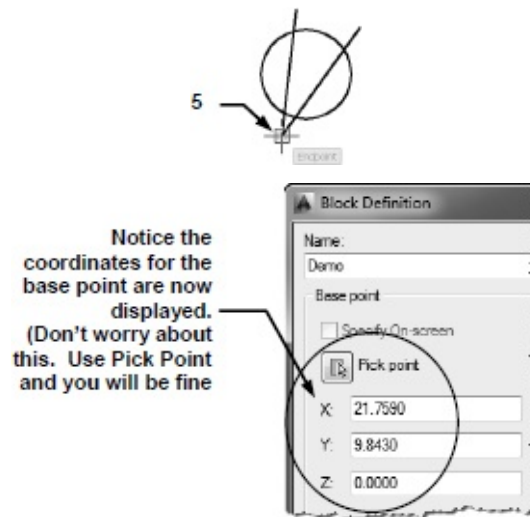

4. Select the **Pick Point** button. (Or you may type the **X**, **Y** and **Z** coordinates.)

*The Block Definition box will disappear and you will return temporarily to the drawing.*

5. Select the location where you would like the insertion point for the Block.

*Later when you insert this block, the block will appear on the screen attached to the cursor at this insertion point. Usually this point is the **CENTER**, **MIDPOINT** or **ENDPOINT** of an object.*

6. Select one of the options described below.

It is important that you select one and understand the options below.

### Retain

If this option is selected, the original objects will stay visible on the screen after the block has been created.

### Convert to block

If this option is selected, the original objects will disappear after the block has been created, but will immediately reappear as a block. It happens so fast you won't even notice the original objects disappeared.

### Delete

If this option is selected, the original objects will disappear from the screen after the block has been created. (This is the one I use most of the time)

7. Select the **Select Objects** button.

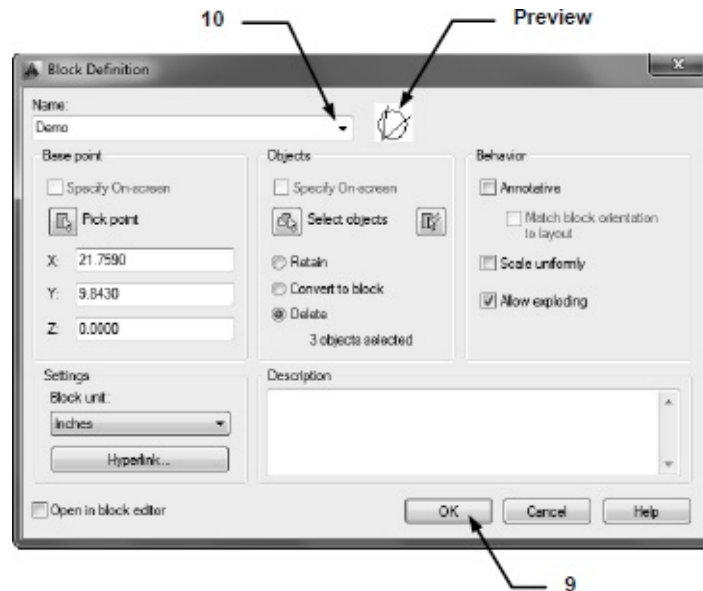

*The Block Definition box will disappear and you will return temporarily to the drawing.*

8. Select the objects you want in the block, then press **<enter>**.

The **Block Definition** box will reappear and the objects you selected should be displayed in the Preview Icon area.

9. Select the **OK** button.

*The new block is now stored in the drawing's block definition table.*

10. To verify the creation of this Block, select **CREATE BLOCK**  again, and select the **Name** (▼). A list of all the blocks, in this drawing, will appear.

## ADDITIONAL DEFINITIONS OF OPTIONS

### Block Units

You may define the units of measurement for the block. This option is used with the “Design Center” to drag and drop with Autoscaling. The Design Center is an advanced option and is not discussed in this book.

### Hyperlink

Opens the **Insert Hyperlink** dialog box which you can use to associate a hyperlink with the block.

### Description

You may enter a text description of the block.

### Scale Uniformly

Specifies whether or not the block is prevented from being scaled non-uniformly during insertion.

### Allow Exploding

Specifies whether or not the block can be exploded after insertion.

## HOW LAYERS AFFECT BLOCKS

### If a block is created on Layer 0:

1. When the block is inserted, it will take on the properties of the current layer.
2. The inserted block will reside on the layer that was current at the time of

insertion.

3. If you Freeze or turn Off the layer the block was inserted onto, the block will disappear.
4. If the Block is **Exploded**, the objects included in the block will revert to their original properties of **layer 0**.

**If a block is created on Specific layers:**

1. When the block is inserted, it will retain its own properties. It **will not** take on the properties of the current layer.
2. The inserted block **will reside** on the current layer at the time of insertion.
3. If you **freeze** the layer that was current at the time of insertion the block will disappear.
4. If you turn **off** the layer that was current at the time of insertion the block will not disappear.
5. If you **freeze** or turn **off** the blocks original layers the block will disappear.
6. If the Block is **Exploded**, the objects included in the block will go back to their original layer.

## INSERTING BLOCKS

A **BLOCK** can be inserted at any location within the drawing. When inserting a Block you can **SCALE** or **ROTATE** it.

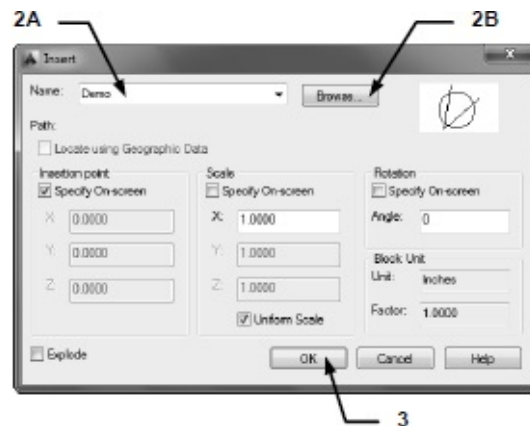

1. Select the **INSERT** command using one of the following:

**Ribbon = Insert Tab / Block Panel /**

**or**

**Keyboard = insert <enter>**

2. Select the **BLOCK** name.

- A. If the block is already in the drawing that is open on the screen, you may select the block from the drop down list shown above
- B. If you want to insert an entire drawing, select the Browse button to locate the drawing file.

3. Select the **OK** button.

***This returns you to the drawing and the selected block should be attached to the cursor.***

4. Select the insertion location for the block by moving the cursor and pressing the left mouse button or typing coordinates.

Command: `_insert`

Specify insertion point or [**Basepoint/Scale/Rotate**]:

**Note:** If you want to change the **Basepoint**, **Scale** or **Rotate** the block before you actually place the block, press the right hand mouse button and you may select an option from the menu or select an option from the command line menu shown above.

You may also "**preset**" the insertion point, scale or rotation. This is discussed

on the next page.

## **PRESETTING THE INSERTION POINT, SCALE or ROTATION**

You may preset the **Insertion point**, **Scale** or **Rotation** in the **INSERT** box instead of at the command line.

1. Remove the check mark from any of the “**Specify On-screen**” boxes.
2. Fill in the appropriate information describe below:

### **Insertion point**

Type the X and Y coordinates from the Origin. The Z is for 3D only.

*The example below indicates the block's insertion location will be 5 inches in the X direction and 3 inches in the Y direction, from the Origin.*

### **Scale**

You may scale the block proportionately by typing the scale factor in the X box and then check the Uniform Scale box. If you selected the “Scale uniformly” box when creating the block this option is unnecessary and not available.

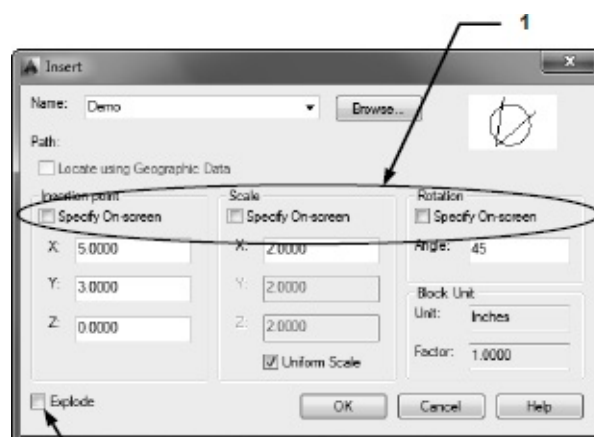

If the block is to be scaled non-proportionately, type the different scale factors in both X and Y boxes.

*The example below indicates that the block will be scale proportionate at a factor of 2.*

### **Rotation**

Type the desired rotation angle relative to its current rotation angle.

*The example below indicates the block will be rotated 45 degrees from its originally created angle orientation.*

Check this box if you want the block to be inserted already exploded

## REDEFINING A BLOCK

How to change the design of a block previously inserted.

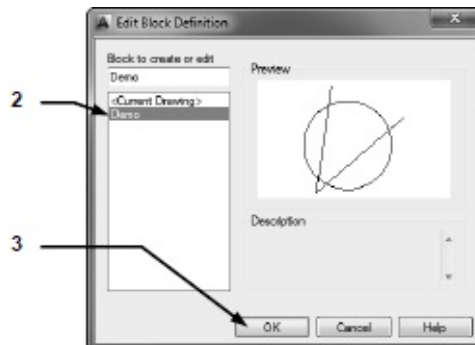

1. Select Block Editor using one of the following:

Ribbon = Insert Tab / Block Definition Panel /

or

Keyboard = bedit <enter>

The **“Edit Block Definition”** dialog box will appear.

2. Select the name of the Block that you wish to change.
3. Select the **OK** button.
4. The Block that you selected should appear large on the screen.

You may now make any additions or changes to the block. You can change tabs and use other panels such as Draw and Modify. But you must return to the **Block Editor** tab to complete the process.

5. Return to the **Block Editor** button if you selected any other tab while editing.
6. Select the **Save block** tool from the **Open/Save** panel.

7. Select the **Close Block Editor** tool.

You will be returned to the drawing and **all previously inserted** blocks with the **same name** will be updated with the changes that you made.

## PURGE UNWANTED AND UNUSED BLOCKS

You can remove a block reference from your drawing by erasing it; however, the block definition remains in the drawing's block definition table. To remove any **unused** blocks, dimension styles, text styles, layers and linetypes you may use the **PURGE** command.

### How to delete unwanted and unused blocks from the current drawing.

1. Select the **PURGE** command using one of the following:

**Ribbon = None**

**or**

**Application Menu = Drawing Utilities / Purge**

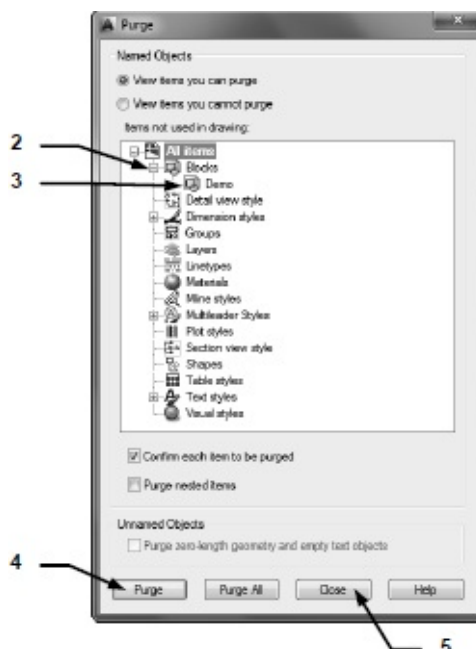

**or**

**Keyboard = purge <enter>**

2. Select the + sign beside **Blocks**.
3. Select the block that you wish to purge.

**Note:** Only **unused** blocks will be listed.

4. Select the **Purge** button.
5. Select the **Close** button.

### WHERE ARE BLOCKS SAVED?

When you create a Block it is saved **within the drawing you created it in.**

(If you open another drawing you will not find that block.)

## MULTILEADER AND BLOCKS

In Section 3 you learned about Multileaders and how easy and helpful they are to use. Now you will learn another user option within the **Multileader Style Manager** that allows you to attach a **pre-designed Block** to the landing end of the Leader. To accomplish this, you must first create the style and then you may use it.

Here are a few examples of multileaders with pre-designed blocks attached:

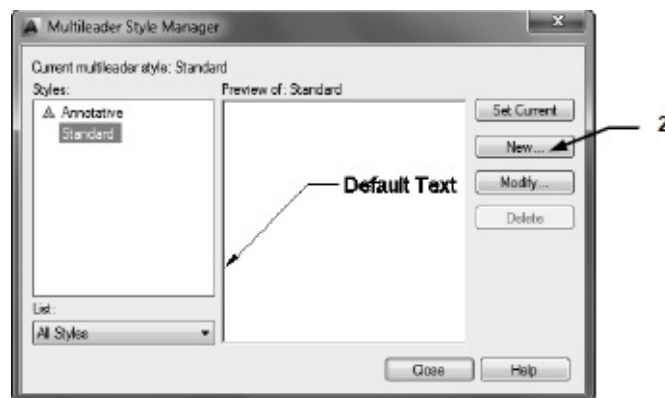

### STEP 1. CREATE A NEW MULTILEADER STYLE

1. Select the **Multileader Style Manager** tool using:

**Ribbon = Annotate tab / Leaders panel / ↘**

2. Select the **New** button.

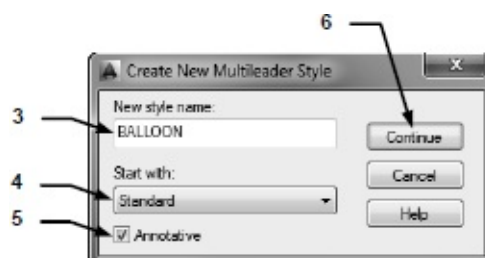

3. Enter **New Style Name**.

4. Select a style to **Start with**:

5. Select **Annotative** box.

6. Select **Continue** button.

7. Select the **Content** tab.

8. **Multileader Type**: Select **Block** from drop down menu.

9. **Source Block:** Select **Circle** from the drop down menu.

**Note:** You have many choices here. These are AutoCAD pre-designed blocks with Attributes.

10. **Attachment:** Select **Center Extents**.

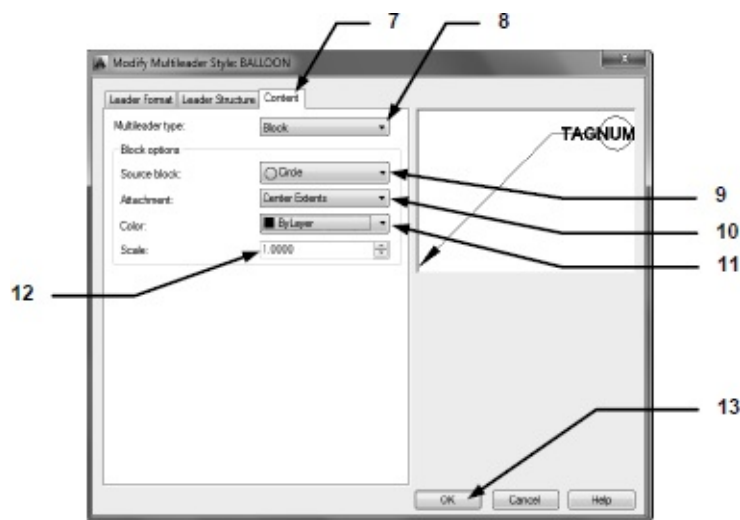

**Note:** This selection works best with Circle but you will be given different choices depending on which Source block you select.

11. **Color:** Select **Bylayer**

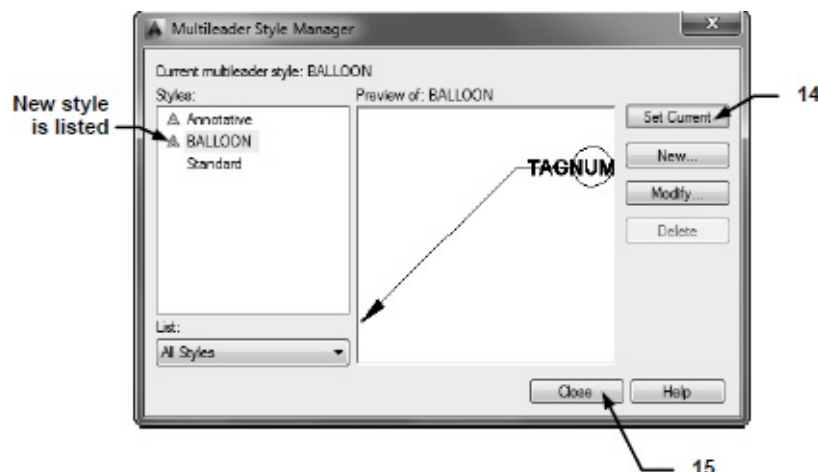

Bylayer works best. It means, it acquires the **color** of the current layer setting.

12. **Scale:** Select 1.0000

13. Select **OK** button.

*Your new multileader style should be displayed in the Styles list.*

14. Select **Set Current**.

15. Select the **Close** button.

## **STEP 2. USING THE MULTILEADER WITH A BLOCK STYLE**

1. Select the **Annotate tab / Leaders panel**.

2. Select the **Style** from the Multileader drop down list.

3. Select the **Multileader** tool.
4. The “**Select Annotation Scale**” box may appear. Select **OK** for now.

5. Specify leader arrowhead location or [leader Landing first/Content first/Options] <Options>: **place the desired location of the arrowhead**
6. Specify leader landing location: **place the desired location of the landing**

***The next step is where the pre-assigned “Attributes” activate.  
Refer to the Advanced Workbook for Attributes.***

7. Enter attribute values

Enter tag number <TAGNUMBER>: **type number or letter <enter>**

## COLLECT MULTILEADER

In Section 3 you learned how to ADD, REMOVE and ALIGN multileaders. Now you will learn how to use the **COLLECT** multileader tool.

If you have multiple Leaders pointing to the same location or object you may wish to **COLLECT** them into one Leader.

**Example:**

### HOW TO USE COLLECT MULTILEADER

1. Select the **Collect Multileader** tool.

2. Select the Multileaders that you wish to combine then press **<enter>**.

**Note:** Select them one at a time in the order you wish them to display.

Such as (1,2, 3, A, B, C, etc)

3. Place the combined Leader location. (**Orthomode** should be **OFF**)

## CENTERMARK

**CENTERMARKS** can ONLY be drawn with circular objects like Circles and Arcs. You set the size and type.

The Center Mark has three types, **None**, **Mark** and **Line** as shown below.

### What does “SIZE” mean?

The size setting determines both, (A) the length of half of the intersection line and (B) the length extending beyond the circle. (See above right)

### Where do you set the CENTERMARK “TYPE” and “SIZE”

1. Select the **Dimension Style** command.
2. Select: **Modify** or **Override**.
3. Select: **Symbols and Arrows** tab.

4. Select the **Center mark type**.
5. Set the **Size**.

### To create a CENTER MARK

1. Select the **CENTERMARK** command using one of the following:

**Ribbon = Annotate Tab / Dimension Panel / ▼ **

or

**Keyboard = dce <enter>**

2. Select arc or circle: ***select the arc or circle with the cursor.***

## CIRCLE

There are 6 options to create a circle.

The default option is “**Center, radius.**” (Probably because that is the most common method of creating a circle.)

We will try the “**Center, radius**” option first.

1. Start the **CIRCLE** command by using one of the following:

**Ribbon = Home tab / Draw Panel /**

**or**

**Keyboard = C <enter>**

2. The following will appear on the command line:

**Command: *\_circle Specify center point for circle or [3P/2P/Ttr (tan tan radius)]:***

3. Locate the center point for the circle by moving the cursor to the desired location in the drawing area (**P1**) and press the left mouse button.
4. Now move the cursor away from the center point and you should see a circle forming.
5. When the circle is the size desired (**P2**), press the left mouse button, or type the radius and then press **<enter>**.

**Note:** To use one of the other methods described below, first select the Circle command, then select one of the other Circle options.

**Center, Radius:** (Default option)

1. Specify the center (**P1**) location.
2. Specify the Radius (**P2**).

(Define the Radius by moving the cursor or typing radius.)

## Center, Diameter:

1. Specify the center (**P1**) location.
2. Specify the Diameter (**P2**). (Define the Diameter by moving the cursor or typing the Diameter.)

## 2 Points:

1. Select the 2 point option.
2. Specify the 2 points (**P1** and **P2**) that will determine the Diameter.

## 3 Points:

1. Select the 3 Point option.
2. Specify the 3 points (**P1**, **P2** and **P3**) on the circumference. The Circle will pass through all three points.

## Tangent, Tangent, Radius:

1. Select the Tangent, Tangent, Radius option.
2. Select two objects (**P1** and **P2**) for the Circle to be tangent to by placing the cursor on the object and pressing the left mouse button.
3. Specify the radius.

## Tangent, Tangent, Tangent:

1. Select the Tangent, Tangent, Tangent option.
2. Specify three objects (**P1**, **P2** and **P3**) for the Circle to be tangent to by placing the cursor on each of the objects and pressing the left mouse button. (AutoCAD will calculate the diameter.)

## DONUT

A Donut is a circle with **width**. You will define the **Inside** and **Outside** diameters.

1. Select the **DONUT** command using one of the following:

**Ribbon = Home Tab / Draw Panel ▼ / **

**or**

**Keyboard = DO <enter>**

2. The following prompts will appear on the command line:

Command: `_donut`

Specify inside diameter of donut: ***type the inside diameter <enter>***

Specify outside diameter of donut: ***type the outside diameter <enter>***

Specify center of donut or <exit>: ***place the center of the first donut***

Specify center of donut or <exit>: ***place the center of the second donut or <enter> to stop***

### Note:

It will continue to create more donuts until you press <enter> to stop the command.

### Controlling the “FILL MODE”

1. Command: ***type FILL <enter>***
2. Enter mode [ON / OFF] <OFF>: ***type ON or OFF <enter>***
3. Type ***REGEN <enter>*** to regenerate the drawing to show the latest setting of the **FILL** mode.

FILL = ON

FILL = OFF

# ELLIPSE

There are 3 methods to draw an Ellipse. You may (1) specify 3 points of the axes, (2) define the center point and the axis points or (3) define an elliptical Arc.

The following 3 pages illustrates each of the methods.

## AXIS END METHOD

1. Select the **ELLIPSE** command using one of the following:

**Ribbon = Home Tab / Draw Panel /**

**or**

**Keyboard = EL <enter>**

2. The following prompts will appear on the command line:

Command: `_ellipse`

Specify axis endpoint of ellipse or [Arc/Center]: **place the first point of either the major or minor axis (P1).**

Specify other endpoint of axis: **place the other point of the first axis (P2).**

Specify distance to other axis or [Rotation]: **place the point perpendicular to the first axis (P3).**

Specifying Major Axis first (P1/P2), then Minor Axis (P3)

Specifying Minor Axis first (P1/P2), then Major Axis (P3)

## CENTER METHOD

1. Select the **ELLIPSE** command using one of the following:

**Ribbon = Home Tab / Draw Panel /**

**or**

Keyboard = EL <enter> C <enter>

2. The following prompts will appear on the command line:

Command: \_ellipse

Specify center of ellipse: **place center of ellipse (P1).**

Specify endpoint of axis: **place first axis endpoint (either axis) (P2).**

Specify distance to other axis or [Rotation]: **place the point perpendicular to the first axis (P3).**

## ELLIPTICAL ARC METHOD

1. Select the **ELLIPSE** command using one of the following:

**Ribbon = Home Tab / Draw Panel /**

**or**

**Keyboard = EL <enter> A <enter>**

2. The following prompts will appear on the command line:

Command: \_ellipse

Specify axis endpoint of elliptical arc or [center]: **type C <enter>.**

Specify center of axis: **place the center of the elliptical arc (P1).**

Specify endpoint of axis: **place first axis point (P2).**

Specify distance to other axis or [Rotation]: **place the endpoint perpendicular to the first axis (P3).**

Specify start angle or [Parameter]: **place the start angle (P4).**

Specify end angle or [Parameter/Included angle]: **place end angle (P5).**

# HATCH

The **HATCH** command is used to create hatch lines for section views or filling areas with specific patterns.

To draw **hatch** you must start with a closed boundary. A closed boundary is an area completely enclosed by objects. A rectangle would be a closed boundary. You simply place the cursor inside the closed boundary or select objects.

## Note:

A Hatch set is one object.

It is good drawing management to always place Hatch on it's own layer.

Use Layer Hatch. You may also make Hatch appear or disappear with the **FILL** command.

## HOW TO PLACE HATCH

1. Draw a Rectangle.

2. Select the **HATCH** command using one of the following:

**Ribbon = Home Tab / Draw Panel / **

or

**Keyboard = BH <enter>**

The "Hatch Creation" ribbon tab appears automatically.

3. Place the cursor inside the Rectangle (a closed boundary).

**A hatch pattern preview will appear.**

4. Press the left mouse button to accept the Hatch.
5. Select **Close Hatch Creation** or press <enter>

# HATCH PROPERTIES

When you select the **Hatch** command the **Hatch Creation** ribbon tab appears automatically. The panels on this tab help set the properties of the Hatch. You should set the properties desired previous to placing the hatch set although you can easily edit an existing hatch set.

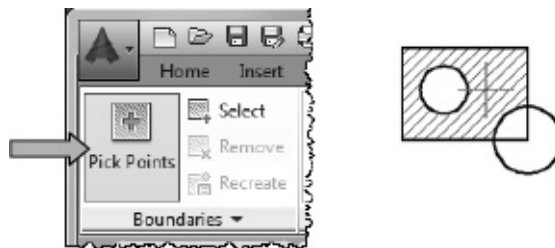

## BOUNDARIES Panel

The Boundaries panel allows you to choose what method you will use to select the hatch boundary.

### Pick Point:

Pick Point is the default selection. When you select the Hatch command AutoCAD assumes that you want to use the Pick Points method. You merely place the cursor in the closed area to select the boundary. The Hatch set preview will appear. Press the left mouse button to accept.

### Select and Remove:

You may select or remove objects to a boundary.

**Note:** Remove will not be available unless you click on **Select**.

## PATTERN Panel

The **PATTERN** panel displays the Hatch swatches that relate to the Hatch Type that has been selected in the Properties panel. Refer to Properties Panel below.

## PROPERTIES Panel

### HATCH TYPE

When you select the drop down arrow ▼ you may select one of the Hatch types: **Solid**, **Gradient**, **Pattern** or **User Defined**.

**Note: Hatch Types will be explained in more detail on pages 4-35 through 4-38.**

When you select a Hatch Type from the drop down list, the Pattern panel displays the related hatch swatches from which to select.

### HATCH COLOR

This color selection is specific to the Hatch and will not affect any other objects.

### BACKGROUND COLOR

You may select a background color for the hatch area.

### HATCH TRANSPARENCY

Displays the selected transparency setting. You may select to use the current setting for the drawing, the current layer setting or select a specific value.

## HATCH ANGLE

**Pattern:** The default angle of a pattern is “0”. If you change this angle the pattern will rotate relative to its original design.

**User defined:** Specify the actual angle of the hatch lines.

## HATCH SCALE or SPACING

If Hatch Type **Pattern** is selected this value determines the scale of the Hatch Pattern. A value greater than “1” will increase the scale. A value less than “1” will decrease the scale.

If Hatch Type **User Defined** is selected this value determines the spacing between the hatch lines.

## ORIGIN Panel

You may specify where the Hatch will originate. Lower left, lower right, upper left, upper right, center or even the at the UCS Origin.

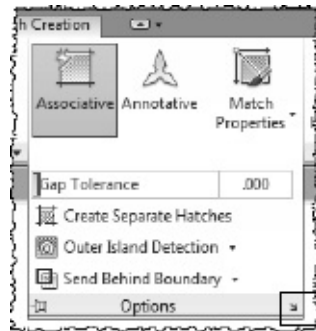

The Origin locations shown on the right are displayed when Hatch type, **Pattern**, **Solid** or **User Defined** are selected.

The Origin location **Centered** is displayed only when Hatch type **Gradient** is selected.

---

## OPTIONS Panel

Opens the Hatch and Gradient Dialog Box. You may choose to use it instead of the Ribbon.

**Associative:** If the Associative option is selected, the hatch set is associated to the boundary. This means if the boundary size is changed the hatch will automatically change to fit the new boundary shape.

**Annotative:** AutoCAD will automatically adjust the scale to match the current Annotative scale.

## MATCH PROPERTIES

Match Properties allows you to set the properties of the new hatch set by selecting an existing Hatch set. You may choose to “use the current origin” or “use the source hatch origin.”

**Use current origin:** sets all properties except the hatch origin.

**Use source hatch origin:** sets all properties including the hatch origin.

## GAP TOLERANCE

If the area you selected to hatch is not completely closed (gaps) AutoCAD will bridge the gap depending on the Gap tolerance. The Gap tolerance can be set to a value from 0 to 5000. Any gaps equal to or smaller than the value you specify are ignored and the boundary is treated as closed.

## CREATE SEPARATE HATCHES

Controls whether HATCH creates a single hatch object or separate hatch objects when selecting several closed boundaries.

## OUTER ISLAND DETECTION

These selections determine how Hatch recognizes internal objects.

## SEND BEHIND BOUNDARY

These selections determine the draw order of the Hatch set.

# HATCH TYPES

## PATTERNS

## PATTERNS

AutoCAD includes many previously designed Hatch Patterns. **Note:** Using Hatch Patterns will greatly increase the size of the drawing file. So use them conservatively. You may also purchase patterns from other software companies.

1. Select the Hatch Type **PATTERN**.
2. Select a Pattern from the list of hatch patterns displayed in the Pattern panel.

3. Select the Hatch Color, Boundary Background Color, Hatch Transparency.
4. **Angle:** A previously designed pattern has a default angle of “0”. If you change this Angle the pattern will rotate the pattern relative to its original design.

It is important that you understand how to control the angle.

**Example:** If the **ANSI31** hatch pattern is used and the angle is set to “45” degrees, the pattern will rotate relative to its original design and the pattern will appear to be “90” degrees.

Original Pattern Design  
Angle = 0

Pattern Design Rotated  
Angle = 45

5. **Scale:** A value greater than “1” will increase the scale. A value less than “1” will decrease the scale. If the Hatch set is Annotative the scale will automatically adjust to the Annotative scale. But you might have to tweak the scale additionally to make it display exactly as you desire.

## USER DEFINED

## USER DEFINED

This Hatch Type allows you to simply draw continuous lines. No special pattern. You specify the Angle of the lines and the Spacing between the lines.

**Note:** This Hatch type does not significantly increase the size of the drawing file.

1. Select the Hatch Type **USER DEFINED**.
2. Notice that the Pattern swatches are not displayed in the Pattern panel. (The

Zigzag is only there because alphabetically it was in the same row as User Defined.)

3. Select the Hatch Color, Boundary Background Color, Hatch Transparency.
4. **Angle:** Specify the actual angle that you desire from “0” to “180”.

**Example:** If you want the lines to be on an angle of “45” degrees you would enter “45”. If you want the lines to be on an angle of “90” degrees you would enter “90”. (This is different from the angle for Patterns.)

Angle = 45

Angle = 90

5. **Spacing:** Specify the actual distance between each of the hatch lines.

**SOLID**

**SOLID**

If you would like to fill an area with a solid fill you should use Hatch type **Solid**.

1. Select **Solid** by selecting the Hatch Type **Solid** on the Properties Panel.

or

Select the **Solid** switch on the Pattern Panel.

2. Select the Hatch **Color**.

**Note:** The Boundary Background Color is not available when using Hatch Type **Solid**.

3. Select **Transparency**.

Transparency = 0

Transparency = 75

4. **Angle:** Not available when using Hatch Type Solid.

5. **Scale:** Not available when using Hatch Type Solid.

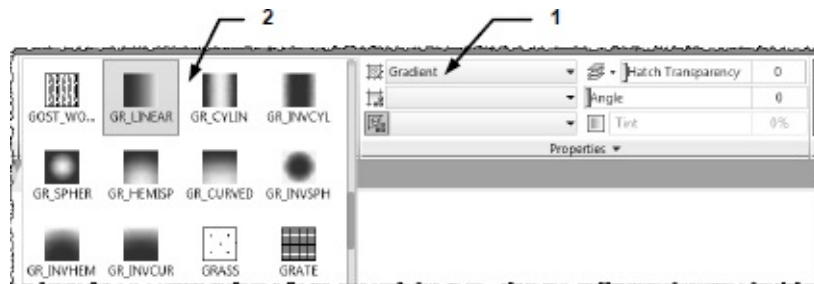

## GRADIENT

### GRADIENT

Gradients are fills that gradually change from dark to light or from one color to another. Gradient fills can be used to enhance presentation drawings, giving the appearance of light reflecting on an object, or creating interesting backgrounds for illustrations.

Gradients are definitely fun to experiment with but you will have to practice to achieve complete control. They will also greatly increase the size of the drawing file.

1. Select the Hatch Type **GRADIENT**.
2. Select a Gradient Pattern from the **9 GR\_ patterns** displayed in the Pattern panel.

3. Select the Hatch **Color**. The Gradient can be one color or two color. If one color you can select the Tint and Shade of that color. (See step 6 below)
4. Select the Hatch **Transparency**.
5. **Angle:** Specify the actual angle that you desire from “0” to “180”. The pattern will rotate the pattern relative to its original design.

Angle = 0

Angle = 45

6. **Tint and Shade:** Tint and Shade is used when you are using only one-color gradient fill. Specify the tint or shade of the color selected in step 3 above.

## EDITING HATCH

### EDITING THE HATCH SET PROPERTIES

Editing a Hatch set properties is easy.

1. Simply select the Hatch set to edit.
2. The Hatch Editor Ribbon tab will appear.
3. Make new selections. Any changes are applied immediately.

### CHANGING THE BOUNDARY

If the Hatch set is **Associative** (See 4-33) you may change the shape of the boundary and the Hatch set will conform to the new shape.

If the Hatch set is **Non-Associative** the Hatch set will not change.

### TRIMMING HATCH

You may trim a hatch set just like any other object.

### MIRROR HATCH

An existing Hatch set can be mirrored. The boundary shape will automatically mirror. But you may control whether the Hatch pattern is mirrored or not.

**To control the Hatch pattern mirror: (Note: Set prior to using the Mirror command)**

1. Type: **mirrhatch** <enter>
2. Enter **0** or **1** <enter>      0 = Hatch not Mirrored      1 = Hatch Mirrored

## DRAWING LINES

A **Line** can be **one segment** or a **series of connected segments**.

But each segment is an individual object.

Start the **Line** command using one of the following methods:

**Ribbon = Home Tab / Draw Panel /**

**or**

**Keyboard = L <enter>**

**Lines** are drawn by specifying the locations for each endpoint.

Move the cursor to the location of the **“first”** endpoint (1) then press the left mouse button and release. Move the cursor again to the **“next”** endpoint (2) and press the left mouse button. Continue locating **“next”** endpoints until you want to stop drawing lines.

There are 2 ways to **Stop drawing a line**:

Press the **<enter>** key or press the **<Space Bar>**

Helpful hint:

To quickly repeat the **Line** command, press the **Spacebar**.

### Horizontal and Vertical Lines

To draw a Line perfectly Horizontal or Vertical select the **Ortho** mode by selecting the **Ortho** button on the Status Bar or pressing the **F8** key.

### Try the following example:

1. Select the **Line** command. (Refer to the previous page)
2. Place the First endpoint anywhere in the drawing area.
3. **Turn Ortho ON** by selecting the **Ortho** button or **F8**. (The “Ortho” button will change to blue when ON.)
4. Move the cursor to the right and press the left mouse button to place the **next endpoint**. (The line should appear perfectly horizontal.)
5. Move the cursor down and press the left mouse button to place the **next endpoint**. (The line should appear perfectly vertical)
6. Now turn Ortho OFF by selecting the Ortho button. (The “Ortho” button will change to gray when OFF.)
7. Now move the cursor up and to the right on an angle (the line should move freely now) and press the left mouse button to place the **next endpoint**.

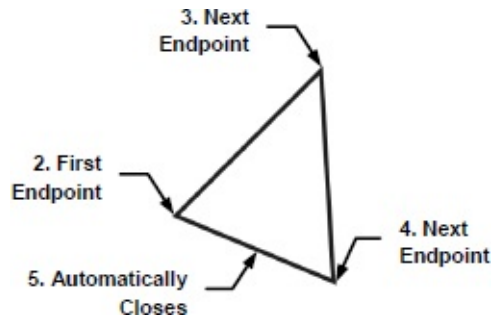

Ortho can be turned ON or OFF at any time while you are drawing. It can also be turned ON or OFF temporarily by holding down the **Shift** key. Release the Shift key to resume.

### Closing Lines

If you have drawn 2 or more line segments, the endpoint of the last line segment can be connected automatically to the first endpoint using the **Close** option.

### Try the following example:

1. Select the **Line** command.
2. Place the **First endpoint**.
3. Place the **next endpoint**.
4. Place the **next endpoint**.
5. Type **C <enter>**  
Or
5. Press the right mouse button and select **Close** from the **Shortcut** menu.

## What is the Shortcut Menu?

The Shortcut menu gives you quick access to command options.

## Using the Shortcut menu:

Press the right mouse button. The shortcut menu will appear. Select an option.

## Using the Dynamic Input down arrow:

You may use the right mouse button or press the down arrow ↓ and the options will appear below the Dynamic Input prompt.

# POINT

**Points** are used to locate a point of reference or location. A **Point** may be represented by one of many **Point Styles** shown below in the **Point Style dialog box**.

The only object snap option that can be used with Point is **Node**.

## HOW TO USE THE POINT COMMAND

1. Select the **POINT** command using one of the following:

**Ribbon = Home Tab / Draw Panel / **

or

**Keyboard = PO <enter>**

2. The following prompts will appear on the command line:

Command: `_point`

Current point modes: `PDMODE=3 PDSIZE=0.000`

Specify a point: *place the point location*

Specify a point: *place another point or press the “ESC” key to stop*

## HOW TO SELECT A “POINT STYLE”

1. Open the Point Style dialog box:

**Ribbon = Home Tab / Utilities Panel ▼ / Point Style**

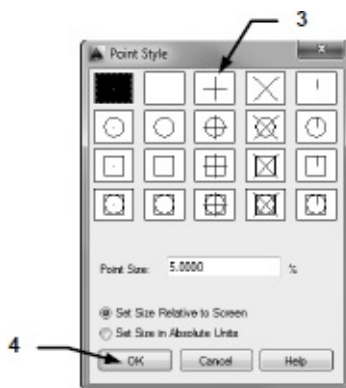

or

**Keyboard = ddtype <enter>**

2. The Point Style dialog box will appear.

3. Select a point style tile.

4. Select the **OK** button.

### Point Size:

#### Set Size Relative to Screen

Sets the point display size as a percentage of the screen size. The point display

does not change when you zoom in or out.

### **Set Size in Absolute Units**

Sets the point display size as the actual units you specify under Point Size. Points are displayed larger or smaller when you zoom in or out.

## POLYGON

A polygon is an object with multiple edges (flat sides) of equal length. You may specify from 3 to 1024 sides. A polygon appears to be multiple lines but in fact it is one object. You can specify the center and a radius or the edge length. The radius size can be specified Inscribed or Circumscribed.

### CENTER, RADIUS METHOD

1. Select the **POLYGON** command using one of the following:

**Ribbon = Home Tab / Draw Panel /**

**or**

**Keyboard = POL <enter>**

2. The following prompts will appear on the command line:

\_polygon Enter number of sides <4>: **type number of sides <enter>**

Specify center of polygon or [Edge]: **specify the center location (P1)**

Enter an option [Inscribed in circle/Circumscribed about circle]<I>: **type I or C <enter>**

Specify radius of circle: **type radius or locate with cursor. (P2)**

#### Note:

The dashed circle is shown only as a reference to help you visualize the difference between Inscribed and Circumscribed. Notice that the radius is the same (2") but the Polygons are different sizes. Selecting Inscribed or Circumscribed is important.

### EDGE METHOD

1. Select the **POLYGON** command using one of the options shown above.

2. The following prompts will appear on the command line:

\_polygon Enter number of sides <4>: **type number of sides <enter>**

Specify center of polygon or [Edge]: **type E <enter>**

Specify first endpoint of edge: **place first endpoint of edge (P1)**

Specify second endpoint of edge: **place second endpoint of edge (P2)**

## POLYLINES

A **POLYLINE** is very similar to a LINE. It is created in the same way a line is drawn. It requires first and second endpoints. But a POLYLINE has additional features, as follows:

1. A **POLYLINE** is ONE object, even though it may have many segments.
2. You may specify a specific width to each segment.
3. You may specify a different width to the start and end of a polyline segment.

Select the **POLYLINE** Command using one of the following:

Ribbon = Home Tab / Draw Panel /

or

Keyboard = PL <enter>

### THE FOLLOWING ARE EXAMPLES OF POLYLINES WITH WIDTHS ASSIGNED.

*Refer to the next page for more polyline options.*

### OPTIONS:

#### WIDTH

Specify the starting and ending width.

You can create a tapered polyline by specifying different starting and ending widths.

## HALFWIDTH

The same as Width except the starting and ending halfwidth specifies half the width rather than the entire width.

## ARC

This option allows you to create a circular polyline less than 360 degrees. You may use (2) 180 degree arcs to form a full circular shape.

## CLOSE

The close option is the same as in the Line command. Close attaches the last segment to the first segment.

## LENGTH

This option allows you to draw a polyline at the same angle as the last polyline drawn. This option is very similar to the **OFFSET** command. You specify the first endpoint and the length. The new polyline will automatically be drawn at the same angle as the previous polyline.

## CONTROLLING THE FILL MODE

If you turn the **FILL** mode **OFF** the polylines will appear as shown below.

**How to turn FILL MODE on or off.**

1. Command: **type FILL <enter>**
2. Enter mode [On / Off] <ON>: **type ON or Off <enter>**
3. Command: **type REGEN <enter> or select: View / Regen**

## EXPLODING A POLYLINE

**Note:** If you **Explode** a **POLYLINE** it loses its width and turns into a regular line as shown below.

The following is an example of how to draw a polyline with Width.

1. Select the **POLYLINE** Command using one of the following:

Ribbon = Home Tab / Draw Panel /

or

Keyboard = **PL** <enter>

Command: `_pline`

2. Specify start point: ***place the first endpoint of the line***  
Current line-width is 0.000
3. Specify next point or [Arc/Halfwidth/Length/Undo/Width]: ***select width option***
4. Specify starting width <0.000>: ***1 <enter>***
5. Specify ending width <0.000>: ***1 <enter>***
6. Specify next point or [Arc/Close/Halfwidth/Length/Undo/Width]: ***select Length option***
7. Specify Length: ***3 <enter>***
8. Specify next point or [Arc/Halfwidth/Length/Undo/Width]: ***select width option***
9. Specify starting width <0.000>: ***2 <enter>***
10. Specify ending width <0.000>: ***.5 <enter>***
11. Specify next point or [Arc/Close/Halfwidth/Length/Undo/Width]: ***select Length option***
12. Specify Length: ***2.75 <enter>***
13. Specify next point or [Arc/Halfwidth/Length/Undo/Width]: ***select width option***
14. Specify starting width <0.000>: ***.5 <enter>***
15. Specify ending width <0.000>: ***1 <enter>***
16. Specify next point or [Arc/Close/Halfwidth/Length/Undo/Width]: ***select Length option***
17. Specify Length: ***2.50 <enter>***
18. Specify next point or [Arc/Close/Halfwidth/Length/Undo/Width]: ***press <enter> to stop***

## EDITING POLYLINES

The **POLYEDIT** command allows you to make changes to a polyline's option, such as the width. You can also change a regular line into a polyline and JOIN the segments.

**Note:** If you select a line that is **NOT a POLYLINE**, the prompt will ask if you would like to turn it into a POLYLINE.

1. Select the **POLYEDIT** command using one of the following:

**Ribbon = Home Tab / Modify Panel / **

or

**Keyboard = PE <enter>**

**Note:** You may modify “Multiple” polylines simultaneously.

2. PEDIT Select polyline or [Multiple]: ***select the polyline to be edited or “M”***
3. Enter an option [Close/Join/Width/Edit vertex/Fit/Spline/Decurve/Ltypegen/Undo/ Reverse]: ***select an Option (descriptions of each are listed below.)***

### OPTIONS

#### **CLOSE**

CLOSE connects the last segment with the first segment of an Open polyline.

AutoCAD considers a polyline open unless you use the “**Close**” option to connect the segments originally.

#### **OPEN**

OPEN removes the closing segment, but only if the **CLOSE** option was used to close the polyline originally.

#### **OPTIONS:**

#### **JOIN**

The JOIN option allows you to join individual polyline segments into one polyline.

The segments must have matching endpoints.

## WIDTH

The WIDTH option allows you to change the width of the polyline. But the entire polyline will have the same width.

## EDIT VERTEX

This option allows you to change the starting and ending width of each segment individually.

## SPLINE

This option allows you to change straight polylines to curves.

## DECURVE

This option removes the SPLINE curves and returns the polyline to its original straight line segments.

## REVERSE

This option reverses the direction. The start point becomes the end point and vice versa.

## RECTANGLE

A Rectangle is a closed rectangular shape. It is one object not 4 lines.

You can specify the length, width, area, and rotation options.

You can also control the type of corners on the rectangle—fillet, chamfer, or square and the width of the Line.

First, let's start with a simple Rectangle using the cursor to select the corners.

1. Start the **RECTANGLE** command by using one of the following:

**Ribbon = Home Tab / Draw Panel /** 

**or**

**Keyboard = REC <enter>**

2. The following will appear on the command line:

**Command: \_rectang**

**Specify first corner point or [Chamfer/Elevation/Fillet/Thickness/Width]:**

3. Specify the location of the first corner by moving the cursor to a location (**P1**) and then press the left mouse button.

The following will appear on the command line:

**Specify other corner point or [Area / Dimensions / Rotation]:**

4. Specify the location of the **diagonal** corner (**P2**) by moving the cursor diagonally away from the first corner (**P1**) and pressing the left mouse button.

**OR**

4. Type **D <enter>** (or click on the blue letter “D”)

Specify length for rectangles <0.000>: **Type the desired length <enter>**.

Specify width for rectangles <0.000>: **Type the desired width <enter>**.

Specify other corner point or [Dimension]: **move the cursor up, down, right or left to specify where you want the second corner relative to the first corner and then press <enter> or press left mouse button.**

**OPTIONS: Chamfer, Fillet and Width**

**Note:** The following options are **only** available **before** you place the **first corner** of the Rectangle.

## CHAMFER

A chamfer is an angled corner. The Chamfer option automatically draws all 4 corners with chamfers simultaneously and all the same size. You must specify the distance for each side of the corner as **distance 1** and **distance 2**.

**Example:** A Rectangle with  $\text{dist1} = .50$  and  $\text{dist2} = .25$

1. Select the **RECTANGLE** command
2. Type **C <enter>** (or click on the blue letter “**C**”)
3. Enter **.50** for the first distance
4. Enter **.25** for the second distance
5. Place the first corner (**P1**)
6. Place the diagonal corner (**P2**)

## FILLET

A fillet is a rounded corner. The fillet option automatically draws all 4 corners with fillets (all the same size). You must specify the radius for the rounded corners.

**Example:** A Rectangle with  $.50$  radius corners.

1. Select the **RECTANGLE** command
2. Type **F <enter>** ( or click on the blue letter “**F**”)
3. Enter **.50** for the radius.
4. Place the first corner (**P1**)
5. Place the diagonal corner (**P2**)

**Note:** You must set Chamfer and Fillet back to “0” before defining the width. Unless you want fat lines and Chamfered or Filleted corners.

## WIDTH

Defines the width of the rectangle lines.

**Note:** Do not confuse this with the “Dimensions” Length and Width.

Width makes the lines appear fatter.

**Example:** A Rectangle with a width of .50

1. Select the **RECTANGLE** command
2. Type **W <enter>** (or click on the blue letter “**W**”)
3. Enter **.50** for the width.
4. Place the first corner (**P1**)
5. Place the diagonal corner (**P2**)

### OPTIONS: Area and Rotation

**Note:** The following options are available **After** you place the **first corner** of the Rectangle.

#### AREA

Creates a Rectangle using the AREA and either a LENGTH or a WIDTH. If the Chamfer or Fillet option is active, the area includes the effect of the chamfers or fillets on the corners of the rectangle.

**Example:** A Rectangle with an Area of 6 and a Length of 2.

1. Select the **RECTANGLE** command
2. Place the first corner (**P1**)
3. Type **A <enter>** for Area. (or click on blue “**A**”)
4. Enter **6 <enter>** for the Area
5. Select **L <enter>** for length option (or click on blue “**L**”)
6. Enter **2 <enter>** for the length

(The width will automatically be calculated)

#### ROTATION

You may select the desired rotation angle **After** you place the **first corner** and

**Before** you place the **second corner**. The base point (pivot point) is the first corner.

**Note:** All new rectangles within the drawing will also be rotated unless you reset the rotation to **0**. This option will not effect rectangles already in the drawing.

**Example:** A Rectangle with a rotation angle of 45 degrees.

1. Select the **RECTANGLE** command
2. Place the first corner (**P1**)
3. Type **R <enter>** for rotation, (or click on blue “**R**”)
4. Enter **45 <enter>**
5. Place the diagonal corner (**P2**)

## CREATING A FREEHAND REVISION CLOUD

When you make a revision to a drawing it is sometimes helpful to highlight the revision for someone viewing the drawing. A common method to highlight the area is to draw a “Revision Cloud” around the revised area. This can be accomplished easily with the “Revision Cloud” command.

The Revision Cloud command creates a series of sequential arcs to form a cloud shaped object. You set the minimum and maximum arc lengths. (Maximum arc length cannot exceed three times the minimum arc length. **Example:** Min = 1, Max can be 3 or less.) If you set the minimum and maximum different lengths the arcs will vary in size and will display an irregular appearance.

Min & Max same length

Min & Max different length

To draw a Revision Cloud you specify the start point with a left click then drag the cursor to form the outline. AutoCAD automatically draws the arcs. When the cursor gets very close to the start point, AutoCAD snaps the last arc to the first arc and closes the shape.

1. Select the **REVISION CLOUD** command using one of the following:

**Ribbon = Annotate Tab / Markup Panel /**

**or**

**Keyboard = revcloud <enter>**

2016

Command: `_revcloud`

Minimum arc length: .50 Maximum arc length: .50 Style: Normal

2. Specify start point or [Arc length/Object/Style] <Object>: **Select “Arc length”**
3. Specify minimum length of arc <.50>: **Specify the minimum arc length**
4. Specify maximum length of arc < 50>: **Specify the maximum arc length**
5. Specify start point or [Arc length/Object/Style] <Object>: **Place cursor at start location & left click.**

6. Guide crosshairs along cloud path...***Move the cursor to create the cloud outline.***
7. Revision cloud finished. ***When the cursor approaches the start point, the cloud closes automatically.***

## CONVERT A CLOSED OBJECT TO A REVISION CLOUD

You can convert a closed object, such as a circle, ellipse, rectangle or closed polyline to a revision cloud. The original object is deleted when it is converted.

(If you want the original object to remain, in addition to the new rev cloud, set the variable “**delobj**” to “**0**”. The default setting is “**1**”.)

1. Draw a closed object such as a circle.
2. Select the **REVISION CLOUD** command using one of the following:

**Ribbon = Annotate Tab / Markup Panel /**

2015

**or**

**Keyboard = revcloud <enter>**

2016

Command: `_revcloud`

Minimum arc length: .50 Maximum arc length: .50 Style: Normal

3. Specify start point or [Arc length/Object/Style] <Object>: **Select “Arc length”**
4. Specify minimum length of arc <.50>: **Specify the minimum arc length**
5. Specify maximum length of arc <.50>: **Specify the maximum arc length**
6. Specify start point or [Arc length/Object/Style] <Object>: **Select “Object”**
7. Select object: **Select the object to convert**
8. Select object: Reverse direction [Yes/No] <No>: **Select Yes or No**

Revision cloud finished.

### Note:

The Match Properties command will not match the arc length from the source cloud to the destination cloud.

## REVISION CLOUD STYLE

You may select one of 2 styles for the Revision Cloud; **Normal** or **Calligraphy**.

**Normal** will draw the cloud with one line width.

**Calligraphy** will draw the cloud with variable line widths to appear as though you used a chiseled calligraphy pen.

1. Select the **REVISION CLOUD** command using one of the following:

**Ribbon = Annotate Tab / Markup Panel /**

**or**

**Keyboard = revcloud <enter>**

Command: `_revcloud`

Minimum arc length: .50 Maximum arc length: 1.00 Style: Normal

2. Specify start point or [Arc length/Object/Style] <Object>: **Select "Style"<enter>**.
3. Select arc style [Normal/Calligraphy] <Calligraphy>: **Select "N or C"<enter>**.
4. Specify start point or [Arc length/Object/Style] <Object>: **Select "Arc length."**
5. Specify minimum length of arc <.50>: **Specify the minimum arc length.**
6. Specify maximum length of arc <1.00>: **Specify the maximum arc length.**
7. Specify start point or [Object] <Object>: **Place cursor at start location & left click.**
8. Guide crosshairs along cloud path...**Move the cursor to create the cloud outline.**
9. Revision cloud finished. **When the cursor approaches the start point, the**

***cloud closes automatically.***

## CREATING A RECTANGULAR REVISION CLOUD

2016  
only

To draw a **Rectangular Revision Cloud** you specify the start point with a left click then drag the cursor to form the rectangular outline. AutoCAD automatically draws the arcs. When you are satisfied with the size of the rectangular shape, left click again to finish the command. **Note: Not available in AutoCAD 2015.**

Min & Max same length

Min & Max different length

1. Select the Rectangular Revision Cloud command using one of the following:

**Ribbon = Annotate Tab / Markup Panel**

**or**

**Keyboard = revcloud <enter>**

Command: `_revcloud`

Minimum arc length: .50 Maximum arc length: .50 Style: Normal Type: Rectangular

2. Specify start point or [Arc length/Object/Rectangular/Polygonal/Freehand/Style/Modify] <Object>: **Select "Arc length."**
3. Specify minimum length of arc <.50>: **Specify the minimum arc length.**
4. Specify maximum length of arc <.50>: **Specify the maximum arc length.**
5. Specify start point or [Arc length/Object/Rectangular/Polygonal/Freehand/Style/Modify] <Object>: **Place cursor at start location & left click.**
6. Specify opposite corner...**Move the cursor to create the cloud outline.**
7. Revision cloud finished. **When you are satisfied with the size of the shape, left click again to finish the command.**

## CREATING A POLYGONAL REVISION CLOUD

2016  
only

To draw a **Polygonal Revision Cloud** you specify the start point with a left click then drag the cursor to form the polygonal outline, using a left click to specify each point of the shape. AutoCAD automatically draws the arcs. When you are satisfied with the size of the polygonal shape, press enter to finish the command. **Note: Not available in AutoCAD 2015.**

Min & Max same length

Min & Max different length

1. Select the Polygonal Revision Cloud command using one of the following:

**Ribbon = Annotate Tab / Markup Panel**

**or**

**Keyboard = revcloud <enter>**

Command: `_revcloud`

Minimum arc length: .50 Maximum arc length: .50 Style: Normal Type: Polygonal

2. Specify start point or [Arc length/Object/Rectangular/Polygonal/Freehand/Style Modify] <Object>: **Select "Arc length."**
3. Specify minimum length of arc <.50>: **Specify the minimum arc length.**
4. Specify maximum length of arc <.50>: **Specify the maximum arc length.**
5. Specify start point or [Arc length/Object/Rectangular/Polygonal/Freehand/Style/ Modify] <Object>: **Place cursor at start location & left click.**
6. Specify next point or [Undo]... **Move the cursor to the next point and left click.**

7. Specify next point or [Undo]... ***Continue to left click for the next points until you are satisfied with the shape.***
8. Specify next point or [Undo]... ***When you are satisfied with the size of the shape, press enter to finish the command.***

## **Section 5**

### **How to....**

# ADD A PRINTER / PLOTTER

The following are step-by-step instructions on how to configure AutoCAD for your printer or plotter. These instructions assume you are a single system user. If you are networked or need more detailed information, please refer to your AutoCAD Help Index.

**Note: You can configure AutoCAD for multiple printers. Configuring a printer makes it possible for AutoCAD to display the printing parameters for that printer.**

A. Type: *plottermanager* <enter>

or **Application menu / Print / Manage Plotters**

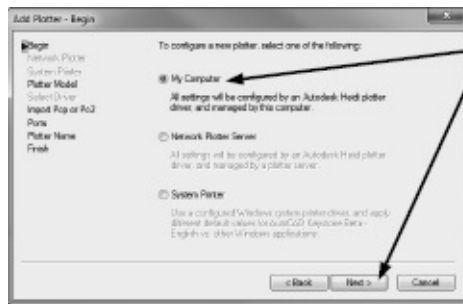

B. Select **"Add-a-Plotter Wizard"**

C. Select the **"Next"** button.

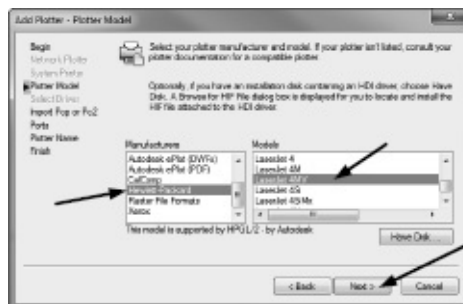

D. Select **"My Computer"** then **Next**.

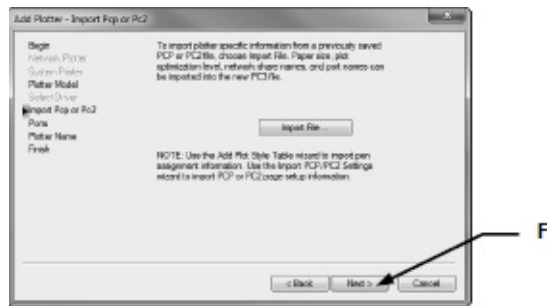

E. Select the **Manufacturer** and the specific **Model** desired then **Next**.

(If you have a disk with the specific driver information, put the disk in the disk drive and select **"Have disk"** button, then follow instructions.)

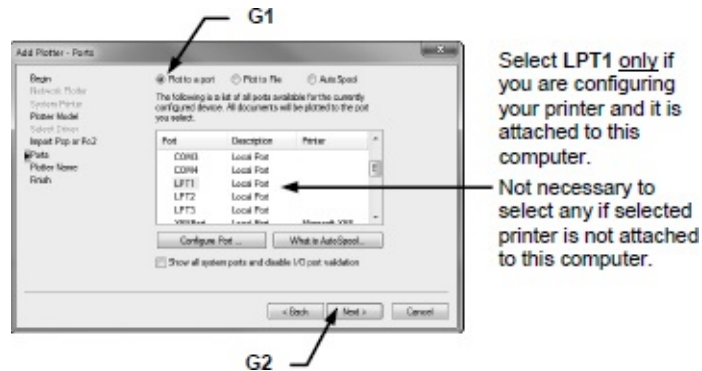

F. Select the “Next” button.

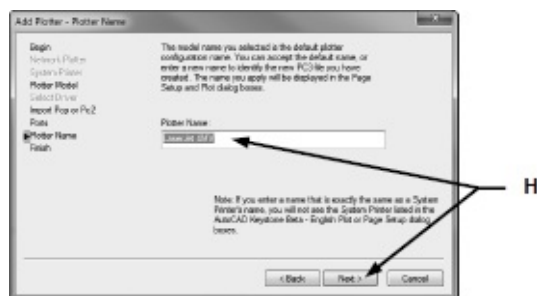

G1. Select “Plot to a port.”

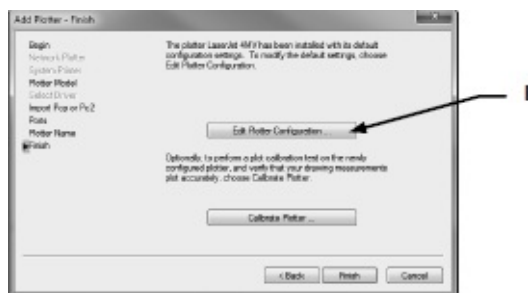

G2. Then select “Next.”

H. The Printer name that you previously selected should appear. Then select “Next.”

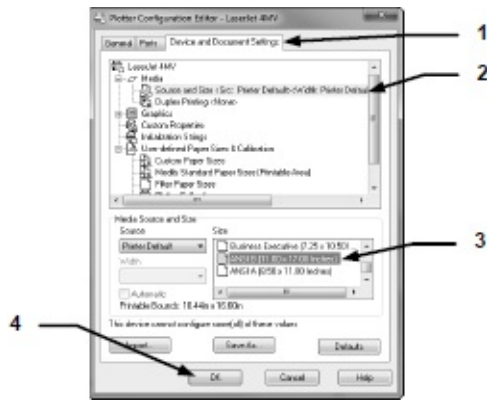

I. Select the “Edit Plotter Configuration...” box.

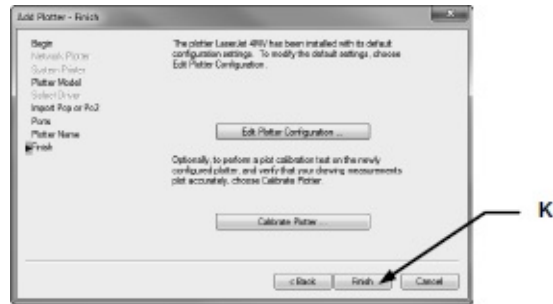

J. Select:

1. Device and Document Settings tab.
2. Media: Source and Size
3. Size: (Select the appropriate size for your printer / plotter)
4. **OK** box.

K. Select **“Finish.”**

L. Type: **Plottermanager** <enter> again.

Is the printer / plotter there?

## CREATE A PAGE SETUP

When you select a layout tab for the first time the **Page Setup Manager** will appear. The Page Setup Manager allows you to select the **printer/plotter** and **paper size**. These specifications are called the “**Page Setup.**” This page setup will be saved to that layout tab so it will be available when ever you use that layout tab.

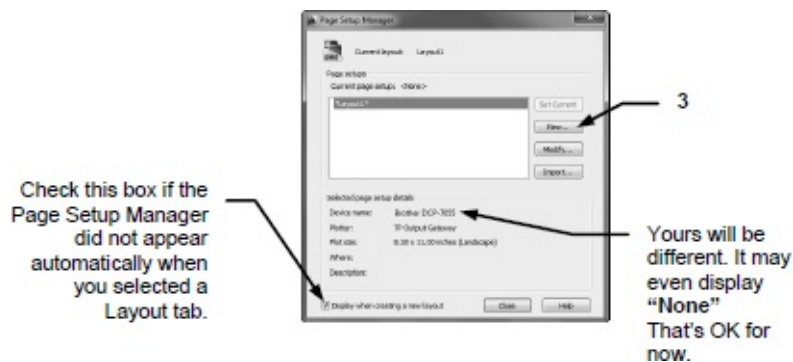

1. **Open** the drawing you wish to plot.

(The drawing must be displayed on the screen.)

2. Select a **Layout tab**.

**Note:** If the “**Page Setup Manager**” dialog box shown below does not appear automatically, right click on the **Layout tab** and select **Page Setup Manager**.

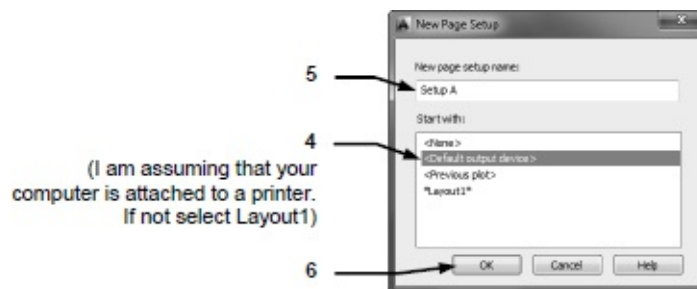

3. Select the **New...** button.

4. Select **<Default output device>** in the **Start with:** list.

5. Enter the New page setup name: **Setup A**

6. Select **OK** button.

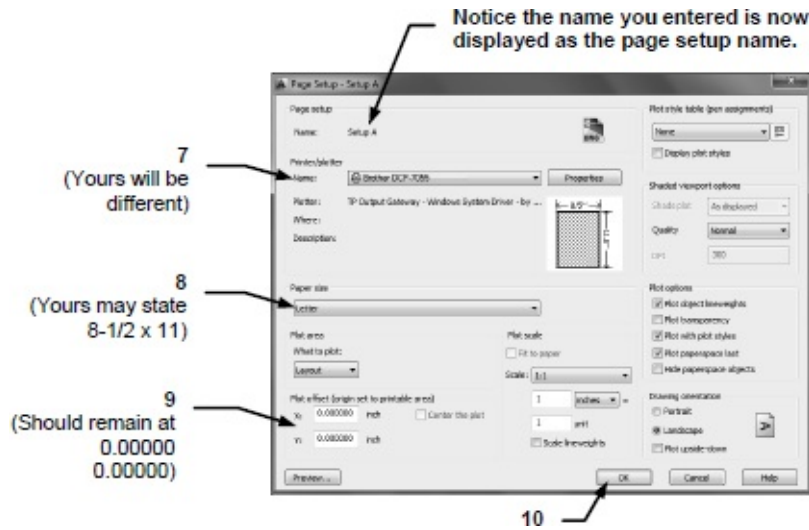

This is where you will select the **printer / plotter**, **paper size** and the **plot offset**.

7. Select the **Printer / Plotter**

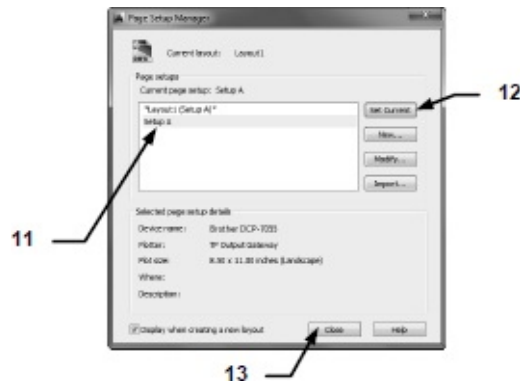

**Note:** Your current system printer should already be displayed here. If you prefer another select the down arrow and select from the list. If the preferred printer is not in the list you must configure the printer. (Refer to [Add a Printer in Section 5.](#))

8. Select the **Paper Size**

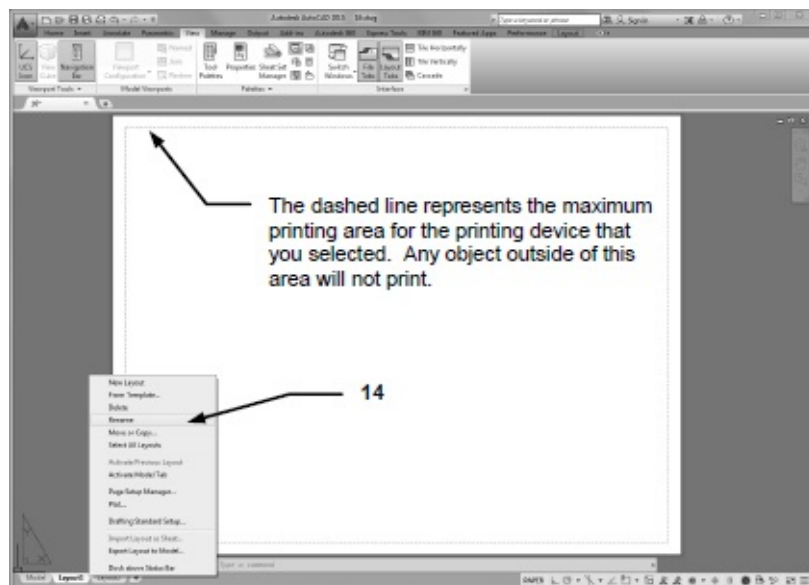

9. Select **Plot Offset**

10. Select the **OK** button.
11. Select the **Page Setup** (Setup A).
12. Select the **Set Current** button.
13. Select the **Close** button.

*You should now have a sheet of paper displayed on the screen.  
 This sheet is the size you specified in the “Page Setup.”  
 This sheet is in front of Model Space.*

**Rename the Layout tab**

14. Right click on the active Layout tab and select **Rename** from the list.

15. Enter the new Layout name: **A Size** <enter>

## CREATE A VIEWPORT

Viewports are only used in Paper Space (Layout tab).

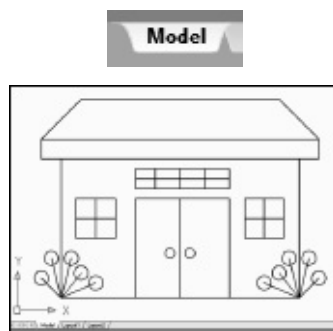

Viewports are holes cut into the sheet of paper displayed on the screen in Paper Space.

Viewports frames are objects. They can be moved, stretched, scaled, copied and erased. You can have multiple Viewports, and their size and shape can vary.

**Note:** It is considered good drawing management to create a layer for the Viewport “frames” to reside on. This will allow you to control them separately; such as setting the viewport layer to “No plot” so it will not be plotted out.

### HOW TO CREATE A VIEWPORT

1. First, create a drawing in **Model Space** (Model tab) and save it.

2. Select the “**Layout1**” tab.

When the “**Page Setup Manager**” dialog box appears, select the **New** button. Then you will select the Printing device and paper size to plot on.

(Refer to “How to Create a Page setup”)

3. You are now in Paper Space. Model Space appears to have disappeared, because a blank paper is now in front of Model Space, preventing you from seeing your drawing. You designated the size of this sheet in the “page setup” mentioned in #2 above. (The Border, title block and notes will be drawn on this paper.)

4. Draw a border, title block and notes in **Paper Space** (Layout).

**Now you will want to see the drawing that is in Model Space.**

5. Select layer “**Viewport**” (You want the viewport frame to be on layer viewport)
6. Select the **VIEWPORT** command using one of the following:

**Ribbon = Layout Tab / Layout Viewports Panel /**

**or**

**Keyboard = MV <enter>**

7. Draw a rectangular shaped Viewport “frame” by placing the location for the “first corner” and then the “opposite corner” using the cursor. (Similar to drawing a Rectangle, but **do not** use the Rectangle command. You must remain in the **MV** command)

You should now be able to look through the Paper Space sheet to Model Space and see your drawing because you just cut a rectangular shaped hole in the sheet.

**Note:** Now you may go back to Model Space or return to Paper Space, simply by selecting the tabs, model or layout.

(Make sure your grids are **ON** in Model Space and **OFF** in Paper Space. Otherwise you will have double grids)

## REACH INTO A VIEWPORT

### Here are the rules:

1. You have to be in Paper Space (layout tab) and at least one viewport must have been created.
2. You have to be inside a Viewport to manipulate the scale or position of the drawing that you see in that Viewport.

### How to reach into a viewport to manipulate the display.

First, select a layout tab and cut a viewport

At the bottom right of the screen on the status bar there is a button that either says Model or Paper. This button displays which space you are in currently.

When the button is PAPER you are working on the Paper sheet that is in front of Model Space. You may cut a viewport, draw a border, title block and place notes.

If you want to reach into a viewport to manipulate the display, double click inside of the viewport frame. Only one viewport can be activated at one time. The active viewport is indicated by a heavier viewport frame. (Refer to the illustration on the previous page. The viewport displaying the doors is active.)

Also, the Paper button changed to Model. 

While you are inside a viewport you may manipulate the scale and position of the drawing displayed. To return to the Paper surface click on the word Model and it will change to Paper.  You may now work on the paper surface.

*Note: Do not confuse the Model / Layout tabs with the MODEL / PAPER button.*

### Here is the difference.

The **Model / Layout tabs** shuffle you from the actual drawing area (model space) to the Layout area (paper space). It is sort of like if you had 2 stacked pieces of paper and when you select the Model tab the drawing would come to the front and you could not see the layout. When you select the Layout tab a blank sheet would come to the front and you would not see model space.....unless you have a viewport cut.

The **MODEL / PAPER button** allows you to work in model space or paper space without leaving the layout tab. No flipping of sheets. You are either on the paper surface or in the viewport reaching through to model space.

## LOCK A VIEWPORT

After you have manipulated the drawing within each viewport, to suit your display needs, you will want to **LOCK** the viewport so the display can't be changed accidentally. Then you may zoom in and out and you will not disturb the display.

1. Make sure you are in **Paper Space**.

2. Click once on a **Viewport Frame**.

3. Click on the **Open Lock tool** located in the lower right corner of drawing area.  
The icon will change to a **Closed Lock tool**.

Viewport Unlocked

Viewport Locked

***Now, any time you want to know if a Viewport is locked or unlocked just glance down to the Lock tool shown above.***

## CREATE A LAYOUT

Now that you have the correct paper size on the screen, you need to do a little bit more to make it useful.

The next step is to:

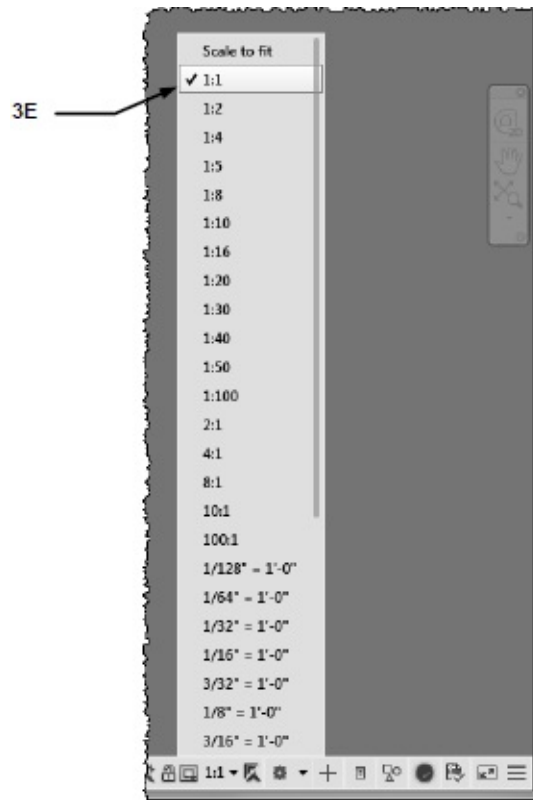

1. Add a Border, Title Block and notes in Paper Space.
2. Cut a viewport to see through to Model Space.

3. Adjust the scale of the viewport as follows.

- A. You must be in **Paper Space**.
- B. Click on the **Viewport Frame**.
- C. **Unlock** Viewport if it is locked.
- D. Select the **Viewport Scale down arrow ▼**.
- E. Select **Scale** (List shown on next page)

#### 4. **Lock** the Viewport.

Now you may **zoom** as much as you desire and it will not affect the adjusted scale.

## CREATE A TEMPLATE

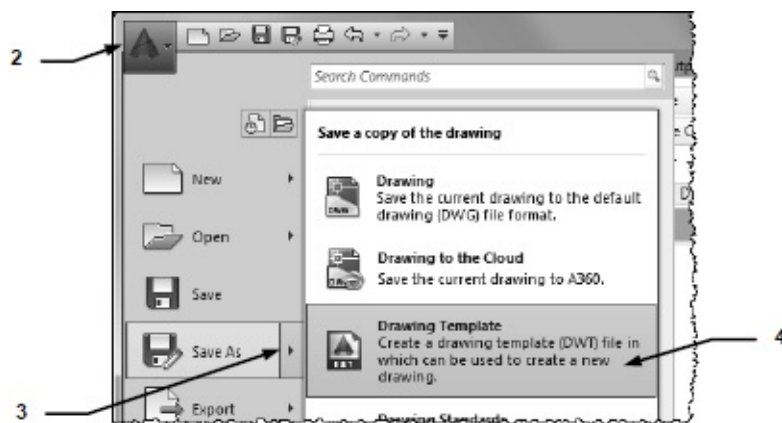

1. Set up the drawing and consider the following:

- **Drawing Limits**
- **Layers**
- **Dimension Styles**
- **Title Blocks**
- **Drawing Units**
- **Text Styles**
- **Layouts**

2. Select and click on the “**Application Menu**” ▼ 

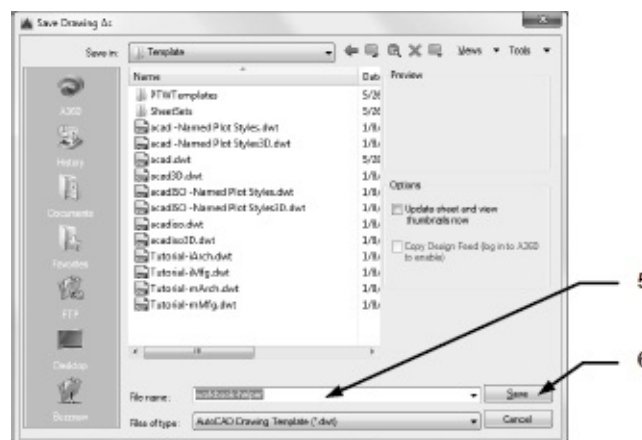

3. Select **Save As / “▶”** (Click on the arrow, not the words “Save As”)

4. Select “**Drawing Template**”

5. Type the new file name in the **File Name** box.

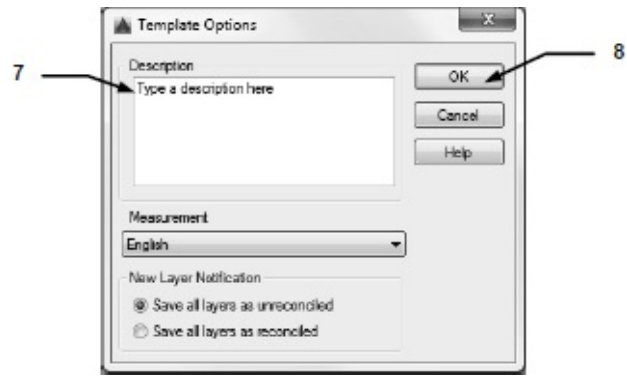

Do not type the extension **.dwt**, AutoCAD will add it automatically.

6. Select the **Save** button.

7. Type a **Description** for the Template.

8. Select the **OK** button.

Now you have a Template to use for future drawings.

Using a Template as a master setup drawing is very good CAD management.

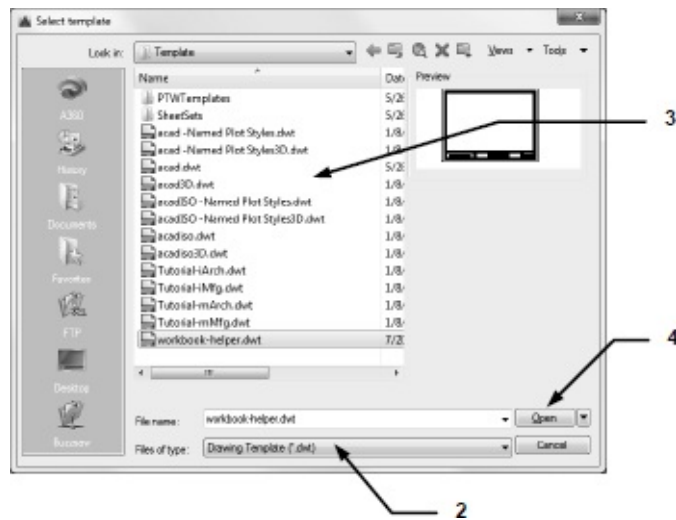

# USING A TEMPLATE

## TO USE A TEMPLATE

1. Select the **NEW** tool from the **Quick Access Toolbar**.

2. Select **Drawing Template (\*.dwt)** from the “Files of type” if not already selected.
3. Select the **Template name** from the list of templates.

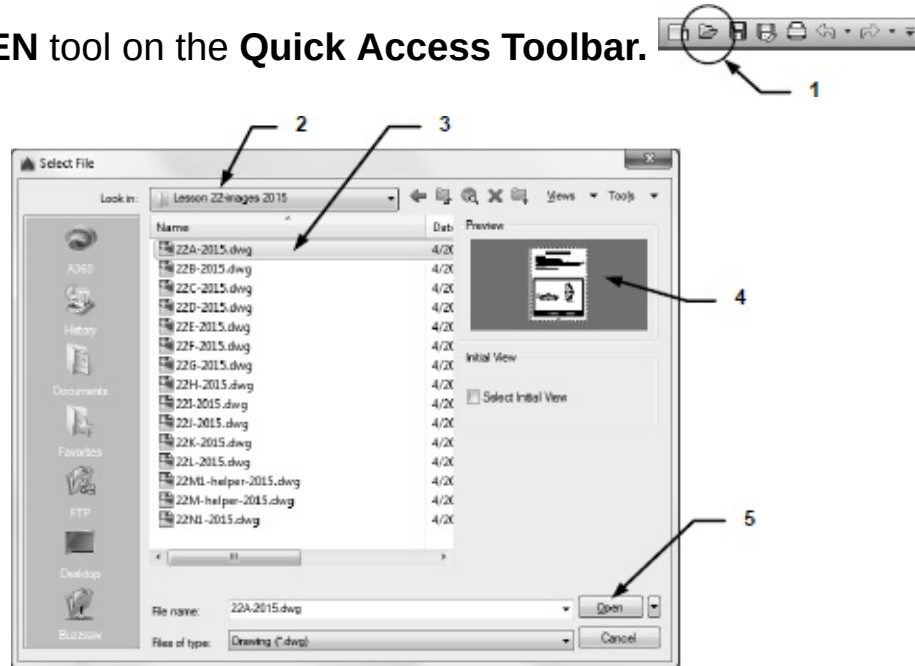

4. Select the **Open** button.

## OPENING AN EXISTING DRAWING FILE

Opening an Existing Drawing File means that you would like to open, on to the screen, a drawing that has been previously created and saved. Usually you are opening it to continue working on it or you need to make some changes.

1. Select the **OPEN** tool on the **Quick Access Toolbar**.

2. Locate the Directory and Folder in which the file had previously been saved.
3. Select the File that you wish to OPEN.
4. A **Thumbnail Preview Image** of the file selected is displayed in the Preview area.
5. Select the **Open** button.

## OPEN MULTIPLE FILES

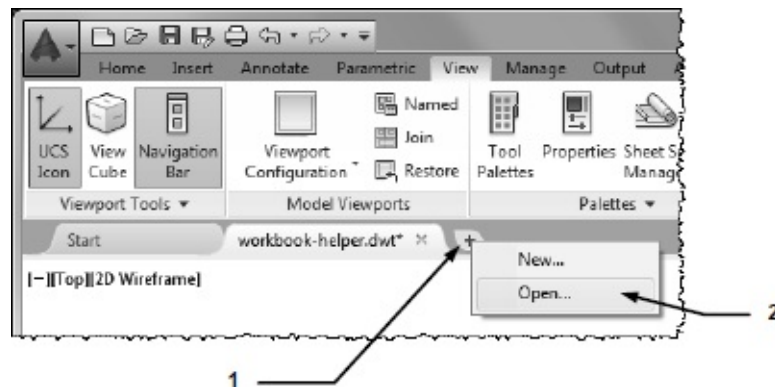

The new **File Tabs** tool allows you to have multiple drawings open at the same time. If the File Tabs tool is switched on, you can open existing saved drawings or create new ones.

The **File Tabs** tool is located on the **Interface** panel of the **View** tab, and is a Neon Blue color when switched on.

### How to open an existing saved drawing from the Files Tab.

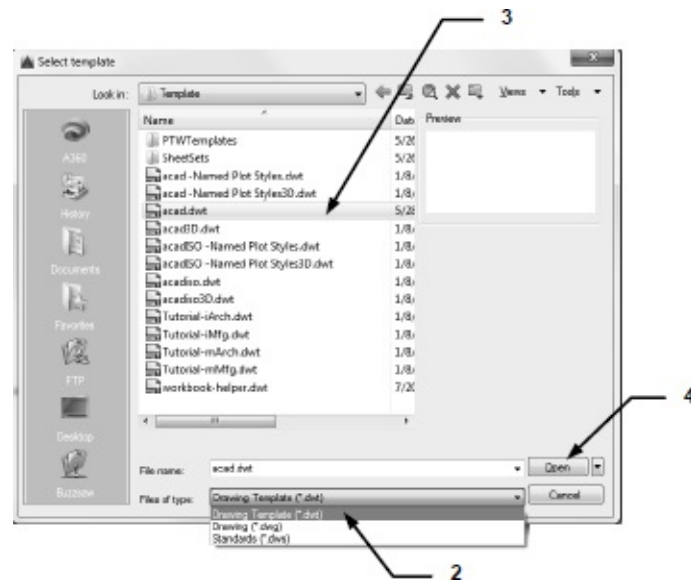

1. Right mouse click on the “+” icon.
2. Select **Open** from the menu.

3. Locate the Directory and Folder for the previously saved file.
4. Select the File you wish to open.
5. Select the **Open** button.

### How to open a new drawing from the Files Tab.

1. Right mouse click on any **File Tab** and select **New** from the menu.
2. Select **Drawing Template (\*.dwt)** from the **Files of type** drop-down list.
3. Select the Template you require.
4. Select the **Open** button.

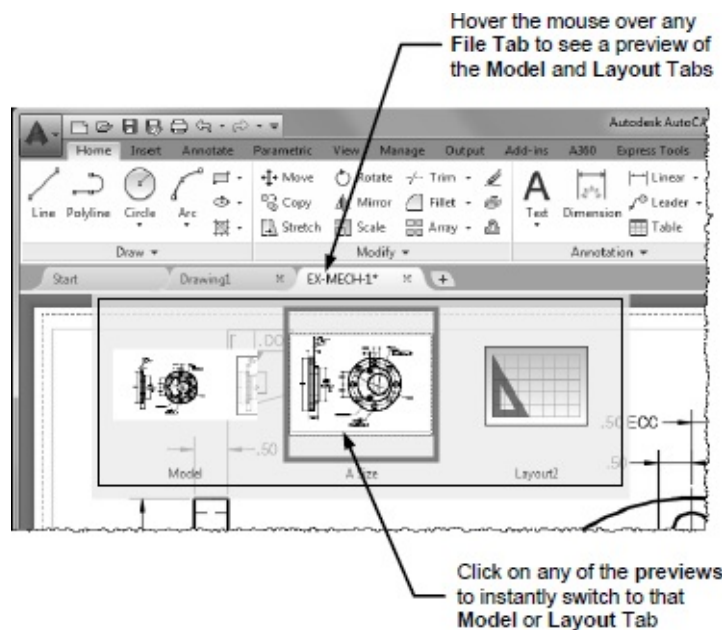

**Note:**  
If you right mouse click on any File Tab a menu appears with various options, including closing all open drawing tabs except the one you just clicked on.

AutoCAD 2016 has slightly different wording but means exactly the same thing.

The **File Tabs** drawing previews allow you to quickly change between open drawings. If you hover your mouse over any open File Tab, a preview of the **Model** and the **Layout** tabs are displayed. You can click on any of the previews to take you to that particular open drawing or view.

If an **asterisk \*** is displayed on a File Tab it means that particular drawing has not been saved since it was last modified. The asterisk will disappear when the drawing has been saved.

These two drawings are showing the asterisk and have not been saved

## SAVING A DRAWING FILE

After starting a new drawing, it is best practice to save it immediately. Learning how to save a drawing correctly is almost more important than making the drawing. If you can't save correctly, you will lose the drawing and hours of work.

There are two commands for saving a drawing: **Save** and **Save As**.

I prefer to use **Save As**.

The **Save As** command always pauses to allow you to choose where you want to store the file and what name to assign to the file. This may seem like a small thing, but it has saved me many times from saving a drawing on top of another drawing by mistake.

The **Save** command will automatically save the file either back to where you retrieved it or where you last saved a previous drawing. Neither may be the correct destination. And may replace a file with the same name. So play it safe, use **Save As** for now.

1. Select the **SAVEAS** command using one of the following:

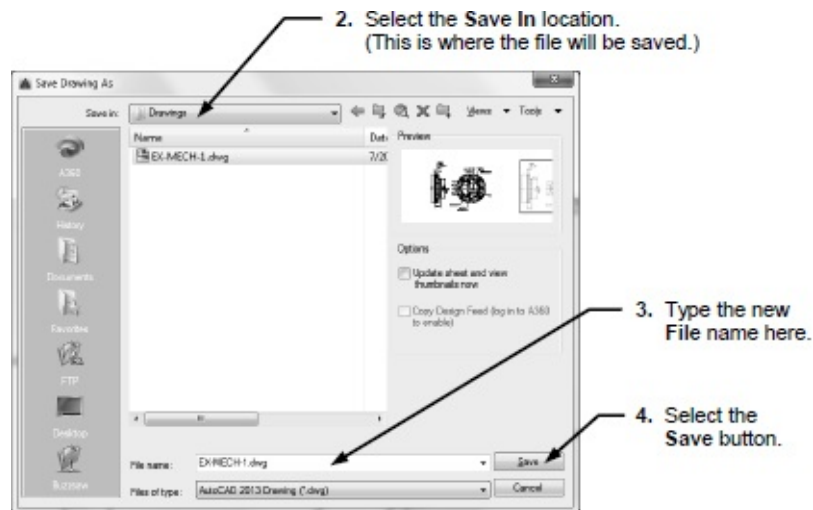

**Quick Access Toolbar** = 

or

**Application Menu** = **Save As / Drawing**

or

**Keyboard** = **SA <enter> Save As**

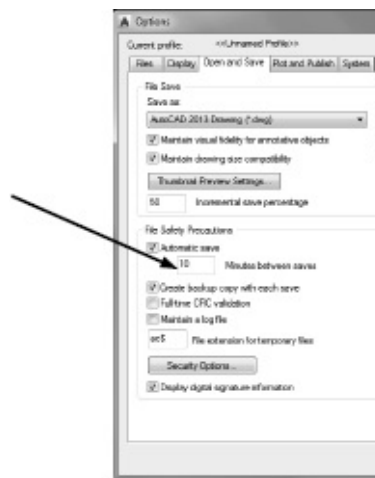

## AUTOMATIC SAVE

If you turn the automatic save option **ON**, your drawing is saved at specified time intervals. These temporary files are automatically deleted when a drawing closes normally. The default save time is every 10 minutes. You may change the save time Intervals and where you would prefer the Automatic Save files to be saved.

### How to set the Automatic Save intervals

1. Type: **options <enter>**
2. Select the **Open and Save** tab.
3. Enter the desired **minutes between saves**
4. Select the **OK** button.

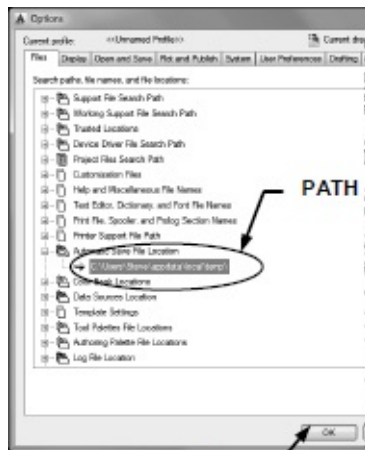

### How to change the Automatic Save location

1. Type: **options <enter>**
2. Select the **Files** tab.
3. Locate the **Automatic Save File Location** and click on the + to display the **path**.
4. Double click on the path.
5. Browse to locate the Automatic Save Location desired and highlight it.
6. Select **OK**.

(The browse box will disappear and the new location path should be displayed under the Automatic Save File Location heading)

7. Select **OK** to accept the change.

7

## BACK UP AND RECOVERY

When you save a drawing file, Autocad creates a file with a “.dwg” extension.

For example, if you save a drawing as **12b**, Autocad saves it as **12b.dwg**.

The next time you save that same drawing, Autocad replaces the old with the new and renames the old version **12b.bak**. The old version is now a back up file.

(Only 1 backup file for each drawing file is stored.)

### How to open a back up file:

You can't open a “.bak” file.

It must first be renamed with a “.dwg” file extension.

### How to view the list of back up files:

The backup files will be saved in the same location as the drawing file.

You must use Windows Explorer to locate the “.bak” files.

### How to rename a back up file:

1. Right click on the file name.
2. Select “**Rename.**”
3. Change the “.bak” extension to “.dwg” and press <enter>.

## RECOVERING A DRAWING

In the event of a program failure or a power failure any open files should be saved automatically.

When you attempt to re-open the drawing the **Drawing Recovery Manager** will display a list of all drawing files that were open at the time of a program or system failure. You can preview and open each “.dwg” or “.bak” file to choose which one should be saved as the primary file.

## STARTING A NEW DRAWING

**Starting A New Drawing** means that you want to start with a previously created Template file

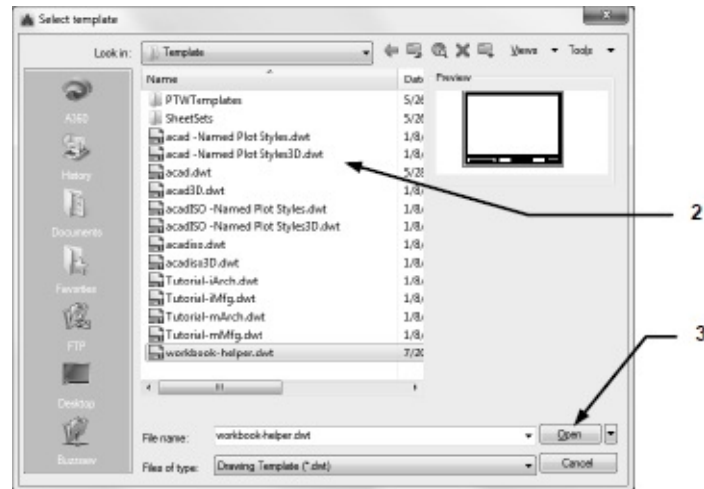

**Note:** Do not use the **New** tool if you want to **open** an **existing** drawing.

### HOW TO START A NEW DRAWING

1. Select the **NEW** tool from the **Quick Access Toolbar**.

2. Select the **Template file** from the list of templates.

3. Select the **Open** button.

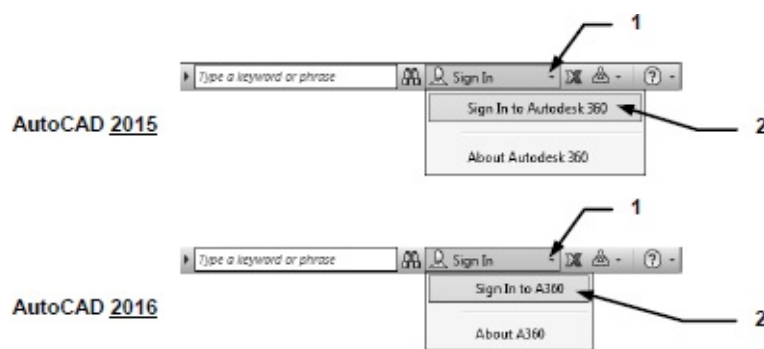

## CREATE AN AUTODESK ACCOUNT

In AutoCAD you can connect directly to the Autodesk 360 Cloud for online file sharing, customized file syncing and more. You can sign into the Autodesk 360 Cloud from the InfoCenter toolbar using your Autodesk single Sign-In account. If you do not yet have an account, you can create one.

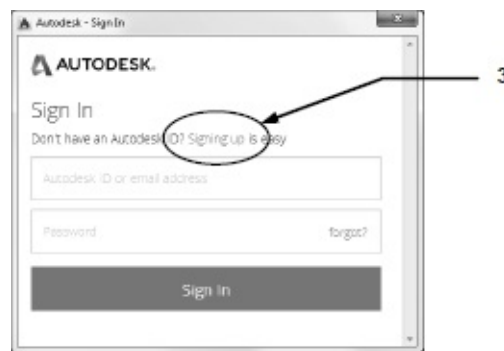

After signing in, your user name is displayed and additional tools are displayed in the drop-down menu including the option to sync your settings with Autodesk 360 Cloud, specify online options, access Autodesk 360 Cloud documents, sign out, and manage account settings.

### CREATE AN ACCOUNT

1. Select the **“Sign In”** drop-down menu on the InfoCenter toolbar.
2. Select **“Sign In to Autodesk 360”** from the menu.

The **“Autodesk - Sign In”** dialog box should appear.

3. Select **“Signing up.”**

The **“Autodesk - Create Account”** dialog box should appear.

4. Fill in all the required fields.

The image shows a screenshot of the Autodesk 'Create Account' web form. The form is titled 'Autodesk - Create Account' and features the Autodesk logo at the top. Below the logo, the text reads 'Get an Autodesk ID' and 'Already a user? Sign In'. The form contains several input fields: 'First name', 'Last name', 'Email address', 'Autodesk ID', 'Password', and 'Confirm Password'. There are also two checkboxes for terms and conditions. At the bottom of the form is a dark grey 'Sign Up' button. A bracket on the right side of the form, labeled with the number '4', encompasses the 'Email address', 'Autodesk ID', 'Password', and 'Confirm Password' fields. An arrow labeled with the number '5' points to the 'Sign Up' button.

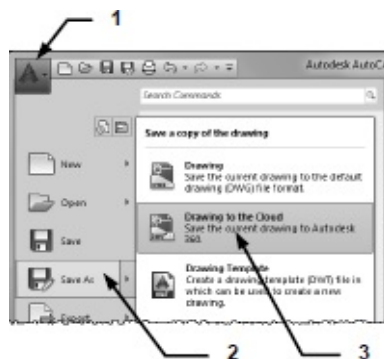

5. Select **“Sign Up”** and then Sign In.

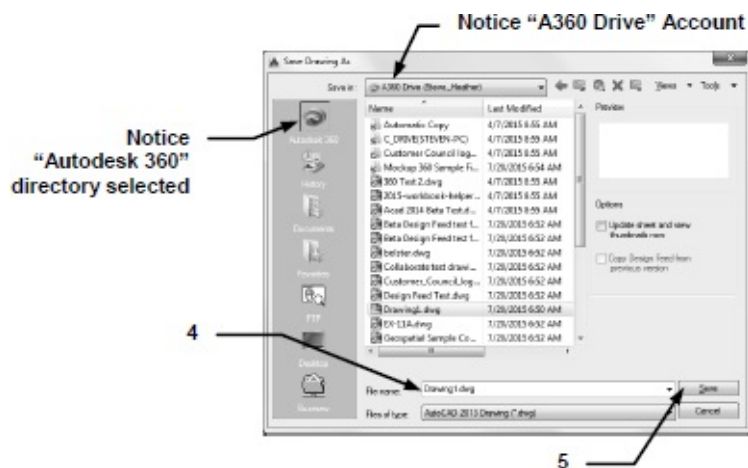

## SAVE A FILE TO A360 DRIVE

1. Select the **Application Menu**.
2. Select **Save As** ►
3. Select **Drawing to the Cloud**.

**Note:** If you are not signed-in to Autodesk 360 the **Sign-In** dialog box will appear.

4. Enter the file name.
5. Select the **Save** button.

The only difference in the **"Save Drawing As"** dialog box between AutoCAD versions 2015 and 2016 is the **Autodesk 360** directory icon, shown below.

AutoCAD 2015

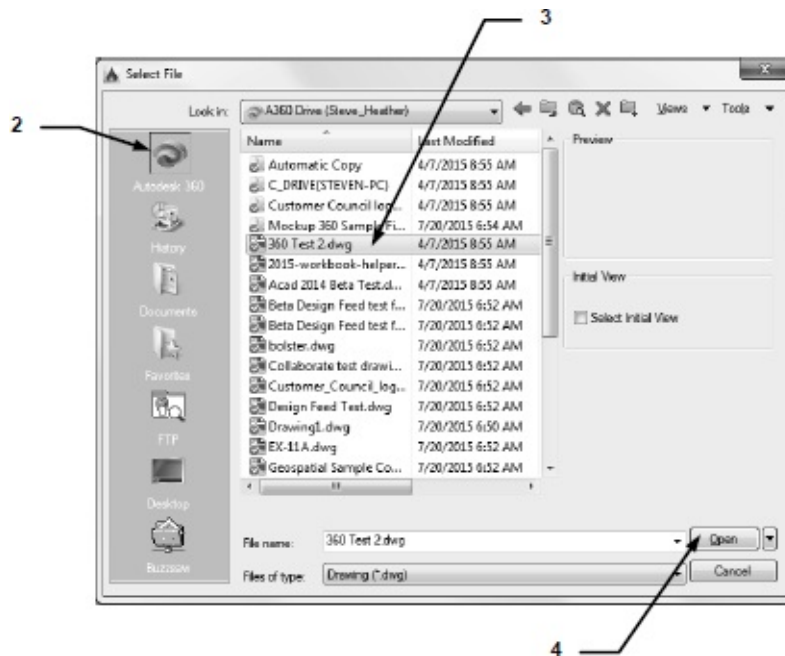

AutoCAD 2016

## OPEN A FILE FROM A360 DRIVE

1. Select **Open**.
2. Select the **Autodesk 360 / A360** directory.
3. Select the **file** to open.
4. Select the **Open** button.

## EXITING AUTOCAD

To safely exit AutoCAD follow the instructions below.

1. **Save** all open drawings.
2. Start the **EXIT** procedure using one of the following.

**Ribbon = None**

or

**Application Menu =**  

or

**Keyboard = exit <enter>**

If any changes have been made to the drawing since the last **Save As**, the warning box shown below will appear asking if you want to **SAVE THE CHANGES?**

Select **YES**, **NO** or **CANCEL**.

# CUSTOMIZING YOUR WHEEL MOUSE

A Wheel mouse has two or more buttons and a small wheel between the two topside buttons. The default functions for the two top buttons and the Wheel are as follows:

**Left Hand** button is for **input** and can't be reprogrammed.

**Right Hand** button is for **Enter** or the **shortcut menu**.

**The Wheel** may be used to Zoom and Pan or Zoom and display the Object Snap menu.

The following describes how to select the Wheel functions. After you understand the functions, you may choose to change the setting.

To change the setting you must use the **MBUTTONPAN** variable.

## MBUTTONPAN setting 1: (Factory setting)

<b>ZOOM</b>	Rotate the wheel forward to zoom in. Rotate the wheel backward to zoom out.
<b>ZOOM EXTENTS</b>	Double click the wheel to view entire drawing.
<b>PAN</b>	Press the wheel and drag the mouse to move the drawing on the screen.

## MBUTTONPAN setting 0:

<b>ZOOM</b>	Rotate the wheel forward to zoom in. Rotate the wheel backward to zoom out.
<b>OBJECT SNAP</b>	Object Snap menu will appear when you press the wheel.

## To change the setting:

1. Type: **mbuttonpan** <enter>
2. Enter **0** or **1** then press <enter>

Command Line

Dynamic Input

## METHODS OF SELECTING OBJECTS

Many AutoCAD commands prompt you to “**select objects.**” This means select the objects that you want the command to effect. There are 3 methods.

**Method 1. Pick**, is very easy and should be used if you only have 1 or 2 objects to select. **Method 2. Window selection**, is a little more difficult but once mastered it is extremely helpful and time saving. **Method 3. Lasso Selection**, is a little more difficult than Window Selection but again, once mastered it is very useful and will save you time. Practice the following examples.

### **Method 1. PICK:**

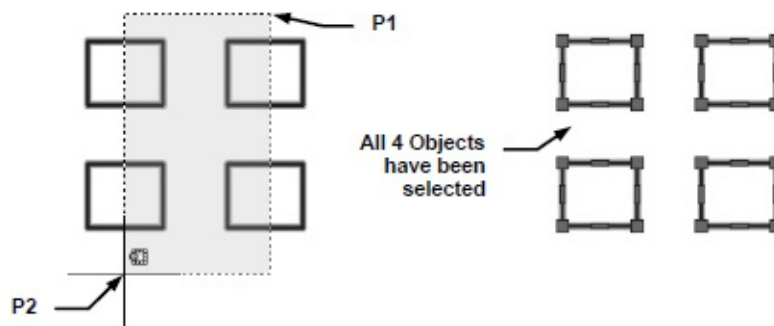

Place the cursor on the object but do not press the mouse button yet. The object will highlight. This appearance change is called “**Rollover Highlighting.**” This gives you a preview of which object AutoCAD is recognizing. Press the left mouse button to actually select the highlighted object.

### **Method 2. WINDOW selection: Crossing and Window Crossing:**

Place your cursor in the area **up** and to the **right** of the objects that you wish to select (**P1**) and press the left mouse button. (**Do not** hold the mouse button down. Just press and release) Then move the cursor **down** and to the **left** (**P2**) and press the left mouse button again. (**Note:** The window will be **green** and outer line is **dashed**.)

**Only** the objects that this window **crosses** will be selected.

In the example above, all 4 rectangles have been selected because the Crossing Window **crosses** a portion of each.

### **Window:**

Place your cursor in the area **up** and to the **left** of the objects that you wish to select (**P1**) and press the left mouse button (**Do not** hold the mouse button down. Just press and release.) Then move the cursor **down** and to the **right** of the objects (**P2**) and press the left mouse button. (**Note:** The window will be **blue** and outer line is **solid**.) **Only** the objects that this window **completely enclosed** will be selected.

In the example below, only 2 rectangles have been selected.

(The other 2 rectangles are **not** completely enclosed in the **Window**.)

### **Method 3. LASSO Selection: Crossing, Window and Fence Crossing:**

Place your cursor in the area **up** and to the **right** of the objects that you wish to select (**P1**) then press and **hold** the left mouse button. (**Do not** release the mouse button.)

Then move the cursor in an anti-clockwise direction until you have crossed the objects you want to select (**P2**) then release the left mouse button. (**Note:** The Lasso window will be **green** and outer line is **dashed**.)

**Only** the objects that the Lasso window **crosses** will be selected.

### **Window:**

Place your cursor in the area **up** and to the **left** of the objects that you wish to select (**P1**) then press and **hold** the left mouse button. (**Do not** release the mouse button.) Then move the cursor in a clockwise direction until you have completely enclosed the objects you want to select (**P2**) then release the left mouse button. (**Note:** The window will be **blue** and outer line is **solid**.) **Only** the objects that this window **completely enclosed** will be selected.

### **Fence:**

With the **Fence** option of the **Lasso** selection you can place the mouse cursor in

any position you choose. For this example place your cursor at **(P1)** then press and **hold** the left mouse button. (**Do not** release the mouse button.) Move the mouse until you see either the green or blue lasso, then press the **Spacebar** until you see just a **Dashed Fence Line**. Move the mouse over the objects you want to select (**P2**) then release the left mouse button. Only the objects that the Fence line **crosses** will be selected.

**Note:** You may have to press the **Spacebar** twice to activate the **Fence Line** option.

# SELECTING STATUS BAR TOOLS

## STATUS BAR

The Status Bar is located on the bottom of the screen. It displays the current settings. These settings can be turned **ON** or **OFF** by clicking on one of the buttons or by pressing a corresponding **Function Key, F2, F3** etc.

When an icon is turned on it will display a **neon blue** in color.

## Status Bar Tools

The status bar provides you with a set of commonly used drawing tools like grid display, snap, object snap and isometric drafting. You can choose to remove some or all of them, or you can choose to add more tools.

There are various methods to enable the status bar tools. You may choose to left click on the icons to turn them on or off, or you may choose to select the **Function Keys** on your keyboard.

**Keyboard Function Keys** and what they are used for.

- F1** - Opens the Help window.
- F2** - Displays an Extended Command History list.
- F3** - Turns the 2D Object Snaps on or off.
- F4** - Turns the 3D Object Snaps on or off.
- F5** - Toggles Isoplanes between Top, Right or Left.
- F6** - Turns the Dynamic UCS on or off.
- F7** - Turns the Grid on or off.
- F8** - Turns Orthographic Mode on or off.
- F9** - Turns Snap Mode on or off.
- F10** - Turns Polar Tracking on or off.
- F11** - Turns Object Snap Tracking on or off.
- F12** - Turns Dynamic Input on or off.

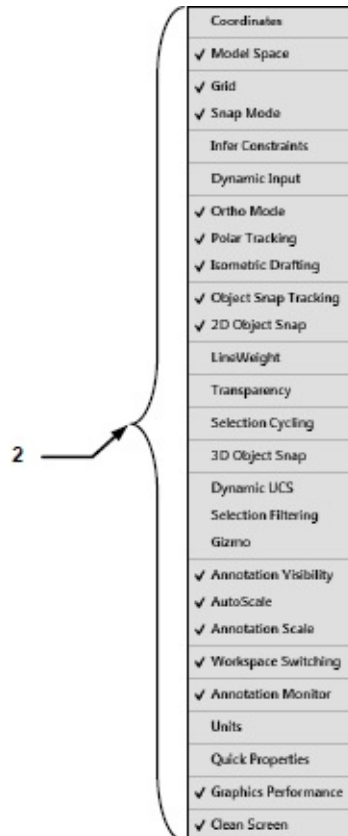

**To Add or Remove Tools from the Status Bar.**

1. Select and click on the **Customization** button.
2. Check or uncheck the tools you want to remove or add from the list.

3. Left click in the main drawing area to close the list.

**Note:** The tools on the status bar may change depending on whether you are in **Model Space** or **Paper Space**.

# CONTROL THE DISPLAY OF TABS AND PANELS

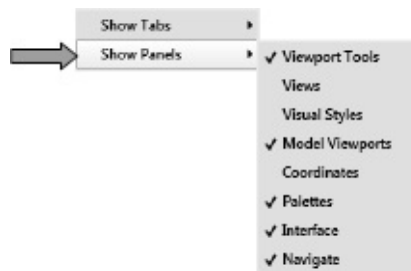

## Control the display of Tabs

Right click on any Ribbon Panel and select **Show Tabs**, then select which **Tabs** you choose to display. The check mark confirms the tab is already displayed.

## Control the display of Panels

Right click on any Ribbon Panel and select **Show Panels**, then select which **Panels** you choose to display. The check mark confirms the panel is already displayed.

# DESIGN FEED PALETTE

The Design Feed palette allows you to enter text messages and attach images which can then be shared online with other users who are sharing your document. You can also use the Design Feed palette to post messages and images on a document that is shared with you by another user.

You can associate a message to an area in the drawing by using a location pin or by specifying a rectangular area.

**To use the Design Feed palette you must first save the drawing to the A360 Drive, you can then tag colleagues to be included in the discussion.**

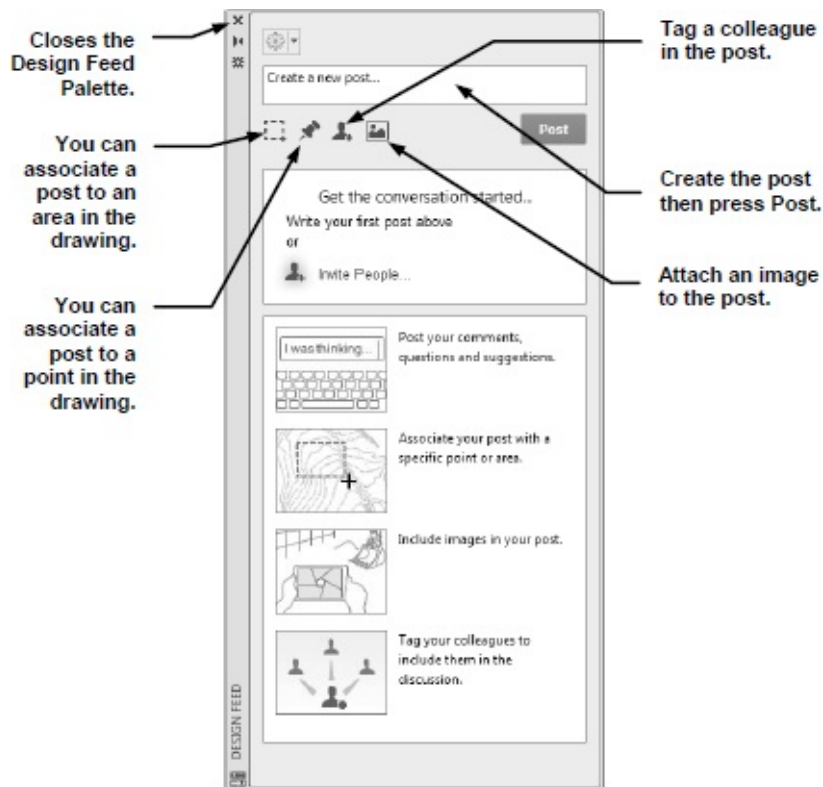

## TO OPEN THE DESIGN FEED PALETTE.

Ribbon = A360 tab / AutoCAD Online panel / Design Feed

or

Keyboard = designfeedopen <enter>

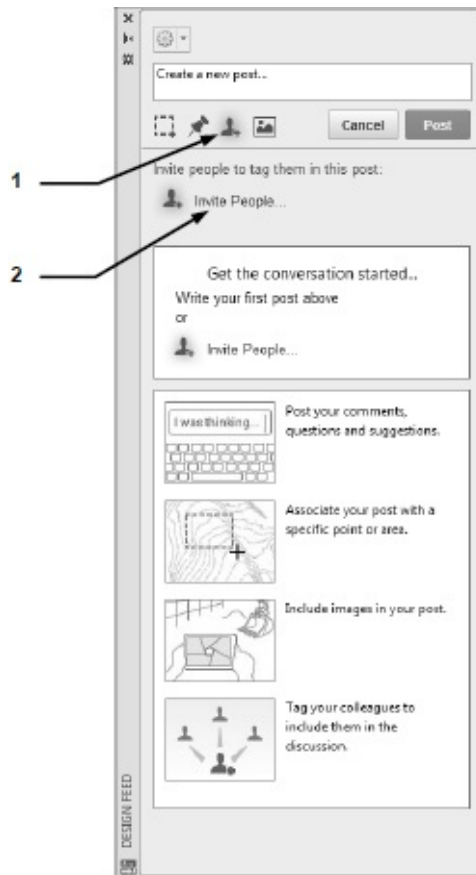

## TAG A COLLEAGUE IN THE DESIGN FEED

You can tag as many people as you want to the Design Feed posts within your document, they will need to have access to AutoCAD or to the online A360 Drive. When you tag a colleague to a post they will be notified by e-mail.

### TO TAG A COLLEAGUE IN THE DESIGN FEED.

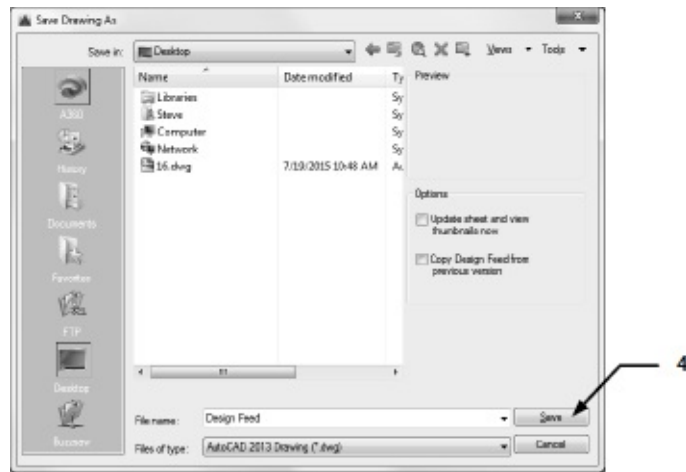

1. In the Design Feed palette, select the **Tag in this post** command.
2. Select **Invite People**.

3. If you have not already saved your drawing the **Design Feed - Save File** dialog box will appear. Click on **Save**.

4. The **Save Drawing As** dialog box will appear. Choose a location to save your drawing then click on **Save**.

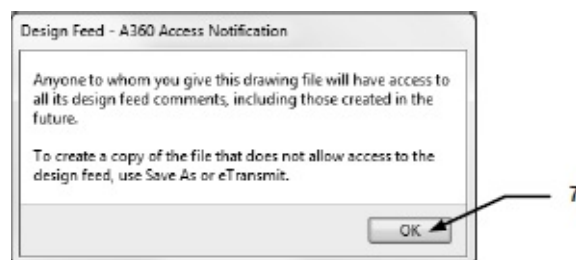

**Note:** If you previously saved your drawing you can skip steps 3 and 4 and go to step 5 on the next page.

5. Enter the **email address** of the colleague to be tagged.
6. Click on **Invite**.

7. The **Design Feed - A360 Access Notification** dialog box will appear. Click on **OK**.

A typical **email notification** that is sent informing a colleague of being tagged in a Design Feed post is shown below.

**Autodesk**  
AutoCAD Design Feed

Steve Heather has shared a design feed for the following file with you:  
C:\Users\Steve\Desktop\Design Feed.dwg

You can access this file at the following location:

C:\Users\Steve\Desktop\Design Feed.dwg

*Just open the drawing in AutoCAD then click the Design Feed button and login to your Autodesk A360 account to access the design feed.*

I would like to invite you to the Design Feed for this drawing. We can post comments, questions, and suggestions about the drawing - all from within AutoCAD!

**About**

Design Feed lets you share questions, comments, and suggestions on your drawings. Learn more at:  
[www.autocad360.com](http://www.autocad360.com)

**Main Features**

Associate your post to a specific point or area  
Include images in your post  
Tag your colleagues to include them in the discussion

Autodesk, Inc.

## **Section 6**

### **Layers**

# LAYERS

A **LAYER** is like a transparency. Have you ever used an overhead light projector? Remember those transparencies that are laid on top of the light projector? You could stack multiple sheets but the projected image would have the appearance of one document. Layers are basically the same. Multiple layers can be used within one drawing.

The example, on the right, shows 3 layers. One for annotations (text), one for dimensions and one for objects.

## HOW TO USE LAYERS

First you select the layer and then you draw the objects.

Always select the layer first and then draw the objects.

It is good “drawing management” to draw related objects on the same layer.

For example, in an architectural drawing, you would select layer “walls” and then draw the floor plan.

Then you would select the layer “Electrical” and draw the electrical objects.

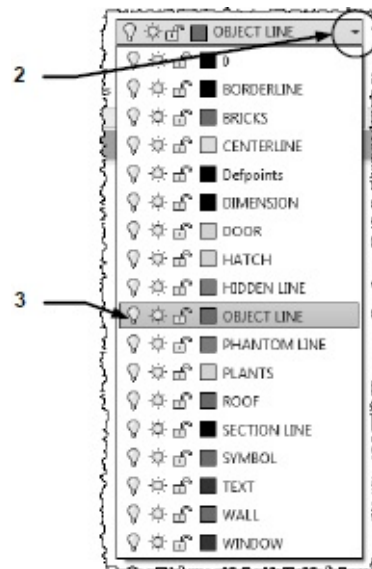

Then you would select the layer “Plumbing” and draw the plumbing objects.

Each layer can then be controlled independently.

If a layer is Frozen, it is not visible. When you Thaw the layer it becomes visible again. (Refer to the following pages for detailed instructions for controlling layers.)

## HOW TO SELECT A LAYER

1. Go to **Ribbon = Home Tab / Layers Panel**
2. Select the drop down arrow ▼
3. Highlight the desired layer and press the left mouse button.

The selected layer becomes the “**Current**” layer. All objects will be located on this layer until you select a different layer.

## CONTROLLING LAYERS

The following controls can be accessed using the Layer drop down arrow ▼

### ON or OFF

If a layer is **ON** it is **visible**. If a layer is **OFF** it is **not visible**.

Only layers that are **ON** can be edited or plotted.

### FREEZE or THAW

**Freeze** and **Thaw** are very similar to On and Off. A Frozen layer is **not visible** and a Thawed layer is **visible**. Only thawed layers can be edited or plotted.

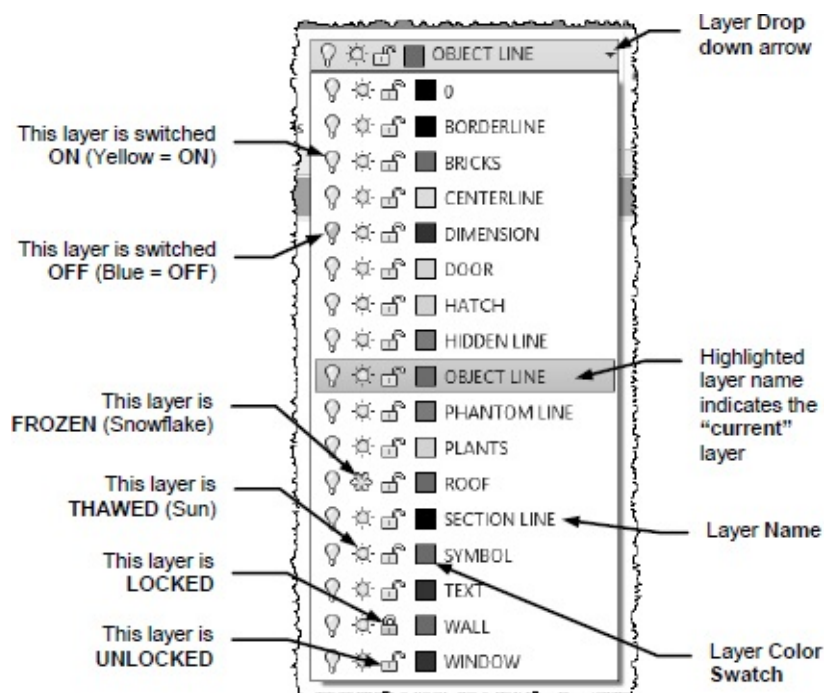

### Additionally:

- A. Objects on a Frozen layer **cannot** be accidentally erased
- B. When working with large and complex drawings, freezing saves time because frozen layers are not **regenerated** when you zoom in and out.

### LOCK or UNLOCK

**Locked** layers are visible but cannot be edited.

They are visible so they **will** be plotted.

To access the following options you must use the **Layer Properties Manager**.

You may also access the options listed on the previous page within this dialog box.

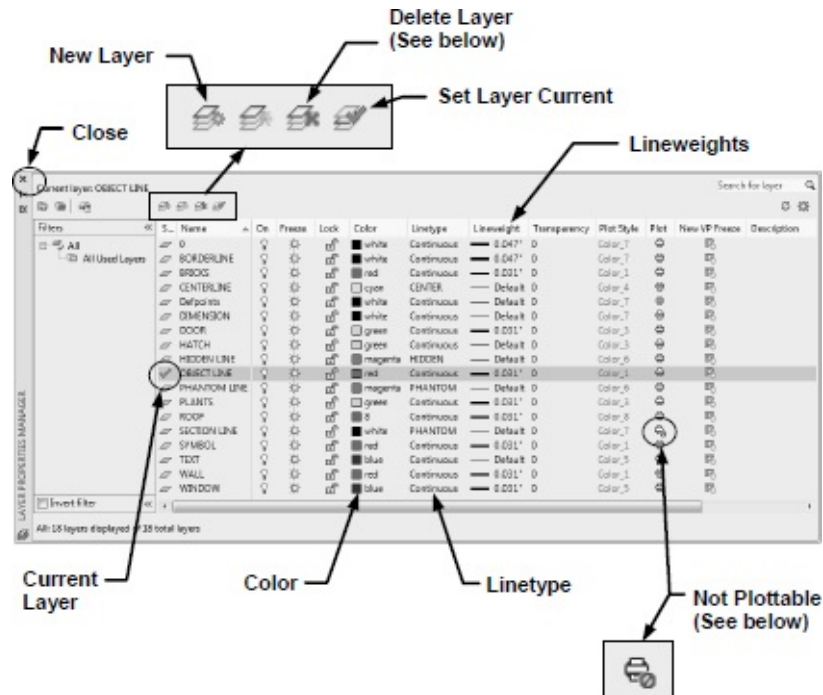

To open the **Layer Properties Manager** use one of the following:

**Ribbon = Home Tab / Layers Panel /**

or

Keyboard = LA <enter>

## HOW TO DELETE AN EXISTING LAYER

1. Highlight the layer name to be deleted.
2. Select the **Delete Layer** tool.

or

1. Highlight the layer name to be deleted.
2. Right click and select **Delete Layer**.

## PLOT or NOT PLOTTABLE

This tool prevents a layer from plotting even though it is visible within the Drawing Area.

A **Not Plottable** layer will not be displayed when using **Plot Preview**.

If the Plot tool has a slash the layer will not plot.

# LAYER COLOR

Color is not merely to make a pretty display on the screen. Layer colors can help define objects. For example, you may assign color Green for all doors. Then, at a glance, you could identify the door and the layer by their color.

Here are some additional things to consider when selecting the colors for your layers.

Consider how the colors will appear on the paper.

(Pastels do not display well on white paper.)

Consider how the colors will appear on the screen.

(Yellow appears well on a black background but not on white.)

## How to change the color of a layer.

1. Select the Layer that you want to change.

2. Select the Color Swatch or word.

3. Select the Color from the Index or primary color strip. (The color name or number will appear in the color box.)

4. Select the OK button.

5. The Color selected will appear on the Layer Line.

Filters	S...	Name	On	Freeze	Lock	Color
All		0	☑	☑	☑	white
All Used Layers		BORDERLINE	☑	☑	☑	white
		BRCKS	☑	☑	☑	red
		CENTERLINE	☑	☑	☑	red
		Defpoints	☑	☑	☑	white

# LINEWEIGHTS

A **Lineweight** means “**how heavy or thin is the object line.**”

It is “**good drawing management**” to establish a contrast in the lineweights of entities.

In the example below the rectangle has a heavier lineweight than the dimensions. The contrast in lineweights makes it easier to distinguish between entities.

## LINEWEIGHT SETTINGS

Lineweights are plotted with the exact width of the lineweight assigned.

But you may **adjust** how they are **displayed on the screen.** (Refer to #4 below)

**IMPORTANT:** Before assigning lineweights you should first select the **Units for Listing** and **Adjust Display Scale** as shown below.

1. Select the **Lineweight Settings** dialog box using one of the following:

**Keyboard = LW <enter>**

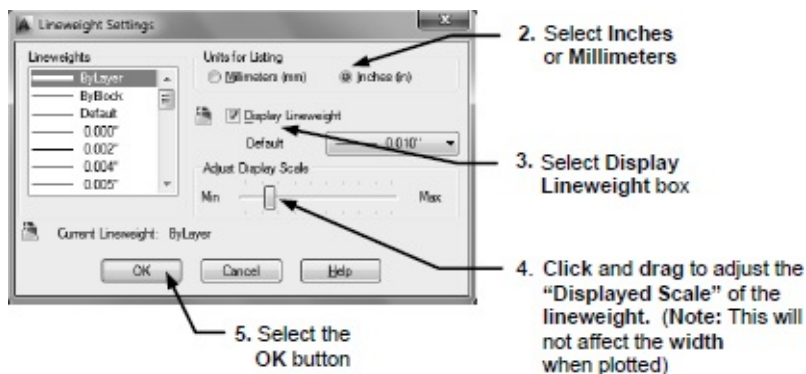

**or**

**Status Bar = Right-Click on the Lineweight button**

**and select Lineweight Settings.**

Lineweight Settings...

**Note:** The **Lineweight settings** will be **saved to the computer not the drawing** and will remain until you change them.

## ASSIGNING LINEWEIGHTS

**Note:** Before assigning **Lineweights** to Layers make sure your **Lineweight settings** (Units for listing and Adjust Display scale) are correct. Refer to the previous page.

### ASSIGNING LINEWEIGHTS TO LAYERS

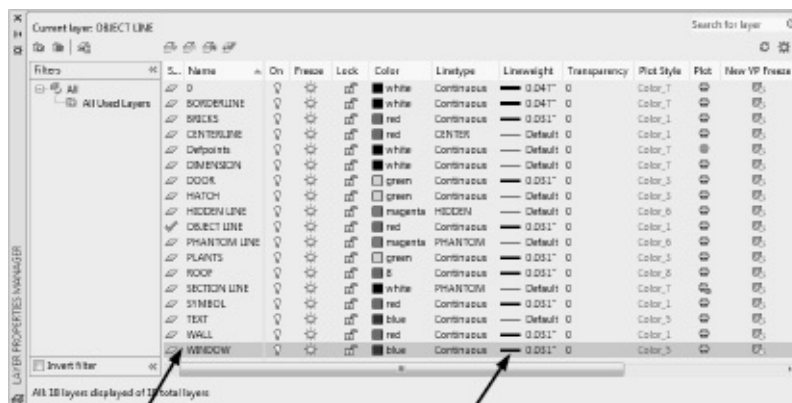

1. Select the **Layer Properties Manager** using one of the following:

**Ribbon = Home Tab / Layers Panel /**

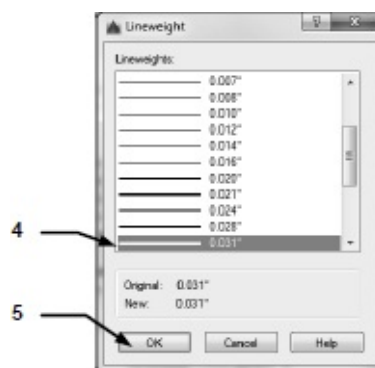

**or**

**Keyboard = LA <enter>**

2. Highlight a Layer. (Click on the name.)
3. Click on the Lineweight for that layer.
4. Scroll and select a Lineweight from the list.
5. Select the **OK** button.

### **Note:**

Lineweight selections will be saved within the **current** drawing and will not effect any other drawing.

## CREATING NEW LAYERS

Using layers is an important part of managing and controlling your drawing. It is better to have too many layers than too few. You should draw like objects on the same layer. For example, place all doors on the layer “door” or centerlines on the layer “centerline.”

When you create a new layer you will assign a **name**, **color**, **linetype**, **lineweight**, and **transparency** and whether or not it should plot.

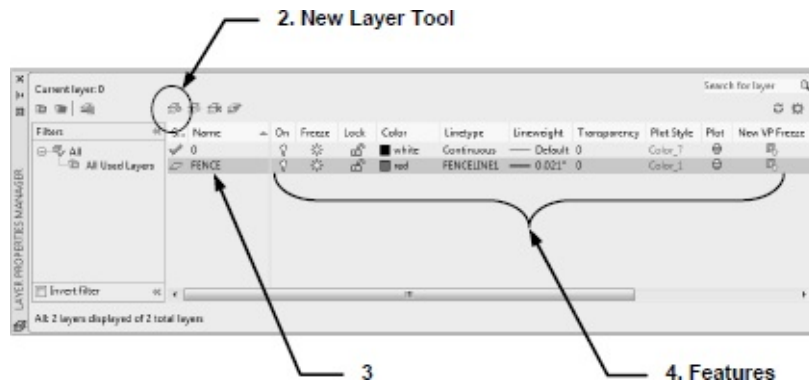

1. Select the **Layer Properties Manager** using one of the following:

**Ribbon = Home Tab / Layers Panel /**

**or**

**Keyboard = LA <enter>**

2. Select the **New Layer Tool** and a new Layer will appear.
3. Type the new **Layer Name** and press **<enter>**
4. Select any of the **features** and a dialog box will appear.

### **Features:**

Refer to the previous pages for controlling and selecting Color and Lineweights.

Refer to the next few pages for Linetypes and Transparency.

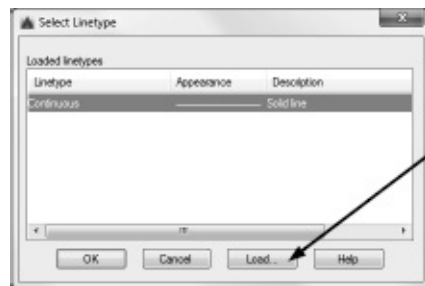

## LOADING AND SELECTING LAYER LINETYPES

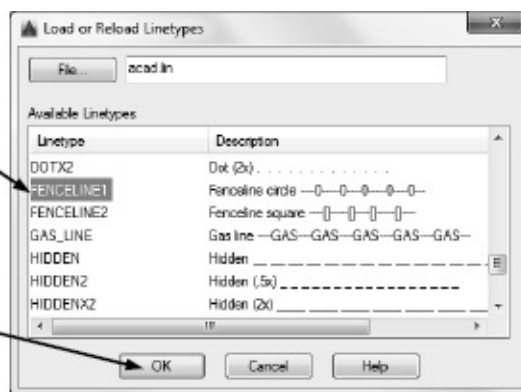

In an effort to conserve data within a drawing file, AutoCAD automatically loads only one linetype called “**Continuous.**” If you would like to use other linetypes, such as “dashed” or “fenceline”, you must **Load** them into the drawing as follows:

1. Select the Linetype

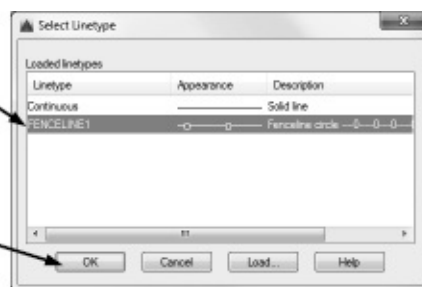

2. Select the LOAD button

3. Select a Linetype

4. Select the OK button

5. Select the Linetype to assign to the Layer

6. Select the OK button

7. The Linetype appears on the Layer line

## LAYER TRANSPARENCY

Each layer may be assigned a transparency percentage from 0 to 90 percent. 0 would not be transparent at all and 90 would be 90% transparent.

### ASSIGNING TRANSPARENCY TO LAYERS

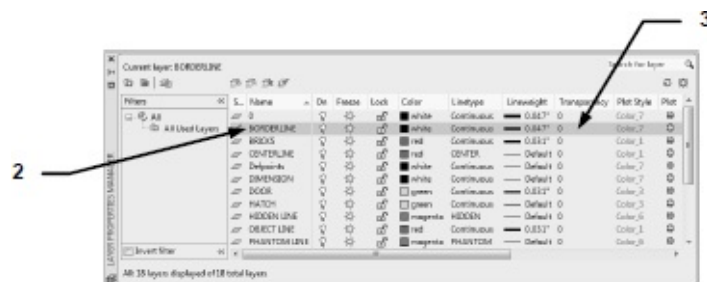

1. Select the **Layer Properties Manager** using one of the following:

Ribbon = Home Tab / Layers Panel /

or

Keyboard = LA <enter>

2. Highlight a **Layer** (Click on the name)
3. Click on **Transparency** for that layer.
4. Select a **Transparency** from the list.
5. Select the **OK** button.

### Controlling Transparent display

You may toggle the display of Transparent objects **ON** or **OFF** by selecting the **Transparency** button on the Status Bar.

**Note:** Refer to [page 5-36](#) For adding Status Bar Tools.

**Note:** Transparency selections will be saved within the **current** drawing and will not affect any other drawing.

### Plotting Transparent Objects

Plotting transparency is disabled by default. To plot transparent objects, check the

Plot transparency option in either the Plot dialog box or the Page Setup dialog box.

## MATCH LAYER

If you draw an object on the wrong layer you can easily change it to the desired layer using the **Layer Match** command. You first select the object that needs to be changed and then select an object that is on the correct layer (object on destination layer).

1. Select the **Match Layer** command using one of the following:

**Ribbon = Home Tab / Layers Panel /  Match Layer**

or

**Keyboard = laymch <enter>**

Command: `_laymch`

2. Select objects to be changed: ***select the objects that need to be changed.***
3. Select objects: ***select more objects or <enter> to stop selecting.***
4. Select object on destination layer or [Name]: ***select the object that is on the layer that you want to change to.***

---

### Note:

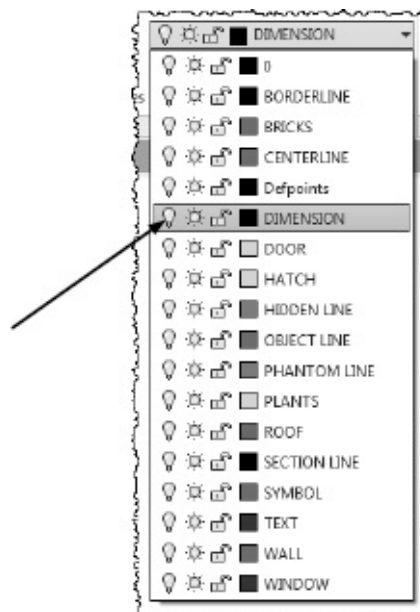

You may also easily change the layer of an object to another layer as follows:

1. Select the object that you wish to change.
2. Select the Layer drop down menu and select the layer that you wish the object to be placed on.

### Example:

If you had a dimension on the **OBJECT LINE** layer by mistake.

1. Select the dimension that is mistakenly on the **OBJECT LINE** layer.
2. Select the **DIMENSION** layer from the drop-down menu.

## Section 7

### Input Options

## COORDINATE INPUT

In this section you will learn how to place objects in **specific locations** by entering coordinates. This process is called **Coordinate Input**.

AutoCAD uses the ***Cartesian Coordinate System***.

The Cartesian Coordinate System has 3 axes, “X”, “Y” and “Z”

The **X** is the Horizontal axis. (Right and Left)

The **Y** is the Vertical axis. (Up and Down)

The **Z** is Perpendicular to the X and Y plane.

(The **Z** axis, which is not discussed in this book, is used for 3-Dimensional drawing.)

Look at the User Coordinate System (UCS) icon in the lower left corner of your screen. The “X” and “Y” are pointing in the positive direction.

The location where the “X”, “Y” and “Z” axes intersect is called the **ORIGIN**.

*The **Origin** always has a coordinate value of  $X=0$ ,  $Y=0$  and  $Z=0$  (0,0,0)*

When you move the cursor away from the Origin, in the positive direction, the “X” and “Y” coordinates are positive.

When you move the cursor in the opposite direction, the “X” and “Y” coordinates are negative.

Using this system, every point on the screen can be specified using positive or negative “X” and “Y” coordinates.

## ABSOLUTE COORDINATES

There are **3** types of Coordinate input, **Absolute**, **Relative** and **Polar**.

### ABSOLUTE COORDINATES

When inputting absolute coordinates the input format is: “**X**”, “**Y**” (that is: X comma Y)

Absolute coordinates come **from the ORIGIN** and are typed as follows: **8, 5**

The first number (8) represents the **X-axis** (horizontal) distance from the **Origin**, and the second number (5) represents the **Y-axis** (vertical) distance from the **Origin**.

The two numbers must be separated by a **comma**.

An absolute coordinate of **4, 2** will be **4** units to the right (horizontal) and **2** units up (vertical) from the current location of the **Origin**.

An absolute coordinate of **-4, -2** will be **4** units to the left (horizontal) and **2** units down (vertical) from the current location of the **Origin**.

The following are examples of Absolute Coordinate input.

Notice where the **Origin** is located in each example.

### Very important:

While working with Absolute Coordinates it is best to **turn off** Dynamic Input.

The Dynamic Input button on the status bar, should be gray.

# RELATIVE COORDINATES

## RELATIVE COORDINATES

Relative coordinates come **from the last point entered**. (Not from the Origin)

The first number represents the **X-axis** (horizontal) and the second number represents the **Y-axis** (vertical) just like the absolute coordinates.

To distinguish the relative coordinates from absolute coordinates the two numbers must be preceded by an @ symbol in addition to being separated by a **comma**.

A Relative coordinate of @5, 2 will go to the right 5 units and up 2 units from the **last point entered**.

A Relative coordinate of @-5, -2 will go to the left 5 units and down 2 units from the **last point entered**.

The following is an example of Relative Coordinate input:

### Very important:

While working with Relative Coordinates it is best to **turn off** Dynamic Input.

The Dynamic Input button on the status bar, should be gray.

## EXAMPLES OF COORDINATE INPUT

### Scenario 1.

If you want to draw a line with the first endpoint “at the Origin” and the second endpoint **3** units in the positive **X** direction.  $0,0$  —————  $3,0$

1. Select the **Line** command.
2. You are prompted for the first endpoint: **Type 0, 0 <enter>**
3. You are then prompted for the second endpoint: **Type 3, 0 <enter>**

#### **What did you do?**

The first endpoint coordinate input, **0, 0** means that you do not want to move away from the Origin. You want to start “**ON**” the Origin.

The second endpoint coordinate input, **3, 0** means that you want to move **3** units in the positive **X axis**. The “**0**” means you do not want to move in the **Y axis**. So the line will be exactly horizontal.

### Scenario 2.

You want to start a line 1 unit to the right of the origin and **1** unit above, and the line will be **4** units in length, perfectly vertical.

1. Select the **Line** command.
2. You are prompted for the first endpoint: **Type 1, 1 <enter>**
3. You are prompted for the second endpoint: **Type @0, 4 <enter>**

#### **What did you do?**

The first endpoint coordinate input, **1, 1** means you want to move **1** unit in the **X axis** direction and **1** unit in the **Y axis** direction.

The second endpoint coordinate input **@0, 4** means you do not want to move in the **X axis** “from the last point entered” but you do want to move in the **Y axis** from the last point entered. (Remember the **@** symbol is only necessary if you are not using **DYN**)

### Scenario 3.

Now try drawing **5** connecting line segments.

(Watch for the negatives)

1. Select the **Line** command.
2. First endpoint: **2, 4 <enter>**
3. Second endpoint: **@ 2, -3 <enter>**

4. Second endpoint: @ 0, -1 <enter>
5. Second endpoint: @ -1, 0 <enter>
6. Second endpoint: @ -2, 2 <enter>
7. Second endpoint: @ 0, 2 <enter> <enter>

**Note:** If you enter an incorrect coordinate, just hold down the **Shift key** and press **U** then <enter>, the last segment will disappear and you will have another chance at entering the correct coordinate.

## DIRECT DISTANCE ENTRY (DDE)

**DIRECT DISTANCE ENTRY** is a combination of keyboard entry and cursor movement.

**DDE** is used to specify distances in the horizontal or vertical axes from the **last point entered**. **DDE** is a **Relative Input**. Since it is used for Horizontal and Vertical movements, **Ortho** must be **ON**.

(**Note:** To specify distances on an angle, refer to **Polar Input**)

**Using DDE is simple. Just move the cursor and type the distance.**

**Negative and positive is understood automatically by moving the cursor up (positive), down (negative), right (positive) or left (negative) from the last point entered. No minus or @ sign necessary.**

Moving the cursor to the **right** and typing **5 <enter>** tells AutoCAD that the **5** is positive and Horizontal.

Moving the cursor to the **left** and typing **5 <enter>** tells AutoCAD that the **5** is negative and Horizontal.

Moving the cursor **up** and typing **5 <enter>** tells AutoCAD that the **5** is positive and Vertical.

Moving the cursor **down** and typing **5 <enter>** tells AutoCAD that the **5** is negative and Vertical.

### Example:

1. **Ortho** must be **ON**. Grid OFF
2. Select the **Line** command.
3. Type: **1, 2 <enter>** to enter the first endpoint using Absolute coordinates.
4. Now move your cursor to the **right** and type: **5 <enter>**
5. Now move your cursor **up** and type: **4 <enter>**
6. Now move your cursor to the **left** and type: **5 <enter> <enter>** to stop

## POLAR COORDINATE INPUT

Previously you learned to control the length and direction of horizontal and vertical lines using Relative Input and Direct Distance Entry. Now you will learn how to control the length and **ANGLE** of a line using **POLAR** Coordinate Input..

### UNDERSTANDING THE “POLAR DEGREE CLOCK”

Previously when drawing Horizontal and Vertical lines you controlled the direction using a **Positive** or **Negative** input. **Polar Input is different.** The Angle of the line will determine the direction.

**Example:** If I want to draw a line at a 45 degree angle towards the upper right corner, you would use the angle 45. But if I want to draw a line at a 45 degree angle towards the lower left corner, you would use the angle 225.

You may also use Polar Input for Horizontal and Vertical lines using the angles 0, 90, 180 and 270. No negative input is required.

### DRAWING WITH POLAR COORDINATE INPUT

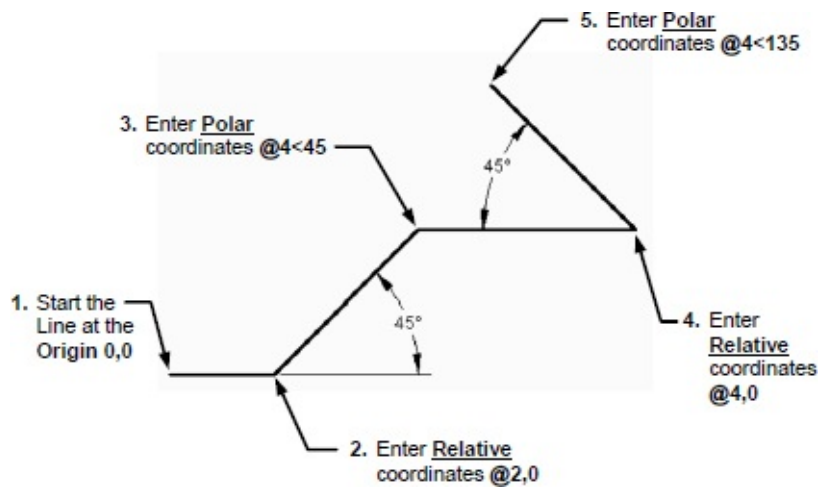

When entering polar coordinates the first number represents the **Distance** and the second number represents the **Angle**. The two numbers are separated by the **less than (<)** symbol. The input format is: **distance < angle**

**Note:** If you are using Dynamic Input refer to the [page 7-11](#).

A Polar coordinate of **@6<45** will be a distance of **6 units** and an angle of **45 degrees** from the **last point entered**.

**Here is an example of Polar input for 4 line segments.**

## POLAR TRACKING

**Polar Tracking** can be used instead of **Dynamic Input**. When Polar Tracking is **“ON”**, a dotted **“tracking”** line and a **“tool tip”** box appear. The tracking line.... **“snaps”** to a **preset angle increment** when the cursor approaches one of the preset angles. The word **“Polar”**, followed by the **“distance”** and **“angle”** from the last point appears in the box.

### HOW TO SET THE INCREMENT ANGLE

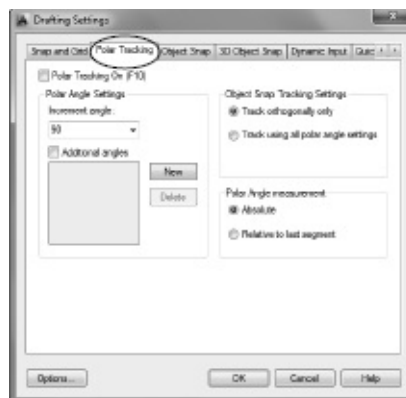

1. Left Click on the **POLAR** button down arrow ▼ on the Status Bar and select **“Tracking Settings”**, or select an **angle from the list**.

### POLAR ANGLE SETTINGS

**Increment Angle:** Choose from the Increment Angle list including 90, 45, 30, 22.5, 18, 15, 10 and 5. It will also snap to the selected angles multiples. For example, if you choose 30, it will snap to 30, 60, 90, 120, 150, 180, 210, 240, 270, 300, 330 and 0.

**Additional Angles:** Check this box if you would like to use an angle other than one in the Incremental Angle list. For example, you could enter 12.5.

**New:** You may add an angle by selecting the **“New”** button. You will be able to snap to this new angle in addition to the incremental Angle selected. But you will not be able to snap to it's multiple. For example, if you selected 7, you would not be able to snap to 14

**Delete:** Deletes an Additional Angle. Select the Additional angle to be deleted and then the **“Delete”** button.

### POLAR ANGLE MEASUREMENT

**Absolute:** Polar tracking **angles** are relative to the **UCS**.

**Relative to last segment:** Polar tracking **angles** are relative to the **last segment**.

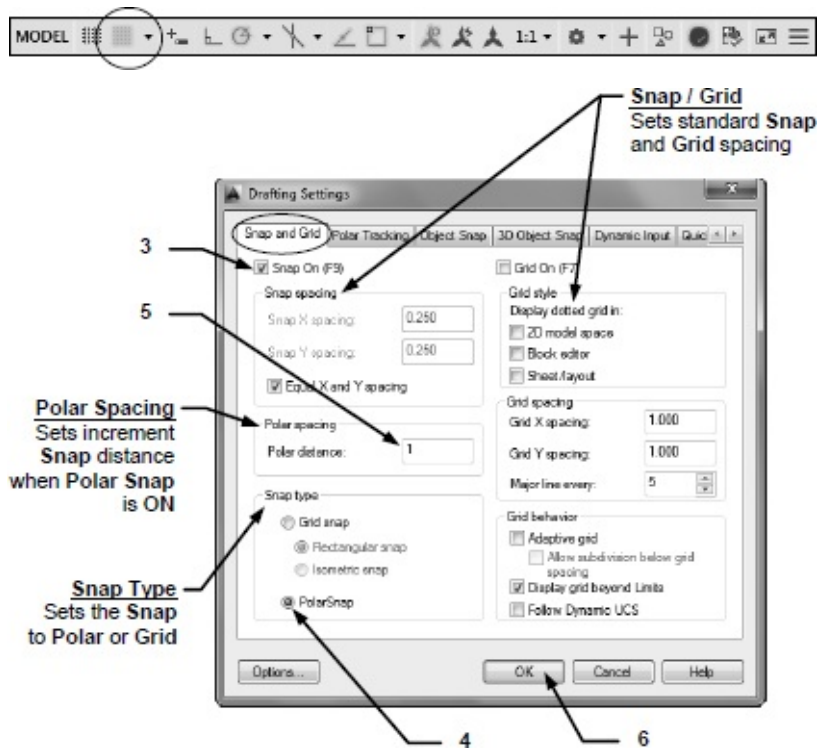

# POLAR SNAP

**Polar Snap** is used with **Polar Tracking** to make the cursor snap to specific **distances** and **angles**. If you set Polar Snap distance to 1 and Polar Tracking to angle 30 you can draw lines 1,2, 3 or 4 units long at an angle of 30, 60, 90 etc. without typing anything. You just move the cursor and watch the tool tips.

## SETTING THE POLAR SNAP

1. Set the **Polar Tracking Increment Angle**.
2. Left Click on the **SNAP** button down arrow ▼ on the Status Bar and select **“Snap Settings.”**

3. Select **Snap ON**.
4. Select **PolarSnap**.
5. Set the **Polar Distance**.
6. Select the **OK** button.

## DYNAMIC INPUT

To help you keep your focus in the “drawing area”, AutoCAD has provided a command interface called **Dynamic Input**. You may input information within the Dynamic Input tool tip box instead of on the command line.

When AutoCAD prompts you for the **First point** the Dynamic Input tool tip displays the **Absolute: X, Y** distance from the Origin.

Enter the **X** dimension, press the **Tab key**, enter the **Y** dimension then **<enter>**.

When AutoCAD prompts you for the **Second** and all **Next points** the Dynamic Input tool tip displays the **Relative: Distance and Angle** from the last point entered.

Enter the **distance**, press the **Tab key**, move the cursor in the approximate desired angle and enter the **angle** then **<enter>**. (**Note:** The @ is not necessary)

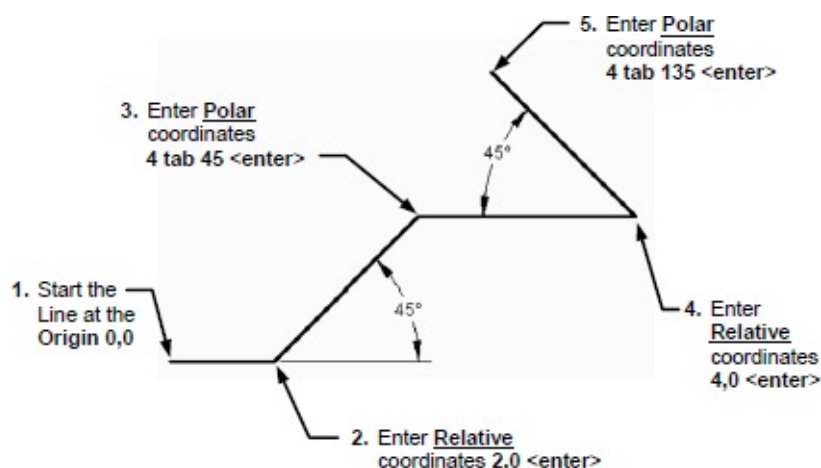

### How to turn Dynamic Input ON or OFF

Select the **DYN** button on the status bar or use the **F12** key.

Here is an example of Dynamic input for 4 line segments.

### To enter Cartesian coordinates (X and Y)

1. Enter an “X” coordinate value and a **comma**.
2. Enter an “Y” coordinate value **<enter>**.

### To enter Polar coordinates (from the last point entered)

1. Enter the **distance** value from the last point entered.
2. Press the **Tab** key.
3. Move the cursor in the approximate direction and enter the **angle** value **<enter>**.

**Note:** Move the cursor in the approximate direction and enter an angle value of 0-180 only.

Dynamic Input does not use 360 degrees.

### How to specify Absolute or Relative coordinates while using Dynamic Input

To enter **absolute** coordinates when relative coordinate format is displayed in the tooltip. Enter # to temporarily override the setting.

To enter **relative** coordinates when absolute coordinate format is displayed in the tooltip. Enter @ to temporarily override the setting.

### Note about Ortho

You may toggle Ortho **ON** and **OFF** by holding down the **shift** key.

This is an easy method to use **Direct Distance Entry** while using Dynamic Input.

# **Section 8**

## **Miscellaneous**

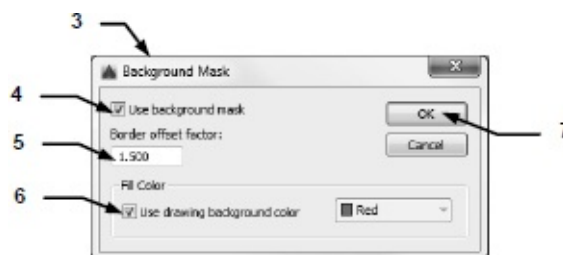

## BACKGROUND MASK

**Background Mask** inserts an opaque background so that objects under the text are covered. (masked) The mask will be a rectangular shape and the size will be controlled by the “**Border offset factor.**” The color can be the same as the drawing background or you may select a different color.

1. Select the **Multiline Text** command.
2. **Right click** in the Text Area and select “**Background Mask**” from the menu.

3. The **Background Mask** dialog box appears.

4. Turn this option **ON** by selecting the “**Use background Mask**” box.
5. Enter a value for the “**Border offset factor.**” The value is a factor of the text height. 1.0 will be exactly the same size as the text. 1.5 (the default) extends the background by 0.5 times the text height. The width will be the same width that you defined for the entire paragraph.
6. In the **Fill Color** area, select the “**Use drawing background color**” box to make the background the same color as the drawing background. To specify a color, uncheck this box and select a color. (**Note:** If you use a color you may need to adjust the “draworder” using Tools / Draworder to bring the text to the front.)
7. Select **OK** when all settings are complete.

No Mask

Mask using the drawing background color

Mask using a different color

## BACK UP FILES

When you save a drawing file, Autocad creates a file with a “.dwg” extension.

For example, if you save a drawing as “12b”, Autocad saves it as “12b.dwg”

The next time you save that same drawing, Autocad replaces the old with the new and renames the old version “12b.bak” The old version is now a **back up** file.

(Only 1 backup file for each drawing file is stored.)

### How to open a back up file:

You can't open a “.bak” file.

It must first be renamed with a “.dwg” file extension.

### How to view the list of back up files:

The backup files will be saved in the same location as the drawing file.

You must use Windows Explorer to locate the “.bak” files.

### How to rename a back up file:

1. **Right click** on the drawing file name.
2. Select “**Rename.**”
3. Change the “.bak” extension to “.dwg” and press **<enter>**.

## RECOVERING A DRAWING

In the event of a program failure or a power failure any open files should be saved automatically.

When you attempt to re-open the drawing the **Drawing Recovery Manager** will display a list of all drawing files that were open at the time of a program or system failure. You can preview and open each “.dwg” or “.bak” file to choose which one should be saved as the primary file.

## GRIPS

**Grips** are little boxes that appear if you select an object when no command is in use. Grips can be used to quickly edit objects. You can copy, lengthen, mirror, move, rotate, scale, and stretch objects using grips.

The following is a brief overview on how to use three of the most frequently used options. Grips have many more options and if you like the examples below, you should research them further in the AutoCAD help menu.

1. Select the object (no command can be in use while using grips).
2. Select one of the **blue** grips. It will turn to **“red.”** This indicates that it is **“hot.”** The **“Hot”** grip is the **basepoint**.
3. The editing modes will be displayed on the command line. You may cycle through these modes by pressing the SPACEBAR or ENTER key or use the shortcut menu.
4. After editing you must press the **ESC** key to deactivate the grips on that object.

### SELECTING A GRIP:

When you select a grip it becomes **“HOT.”**

### MOVING AN OBJECT:

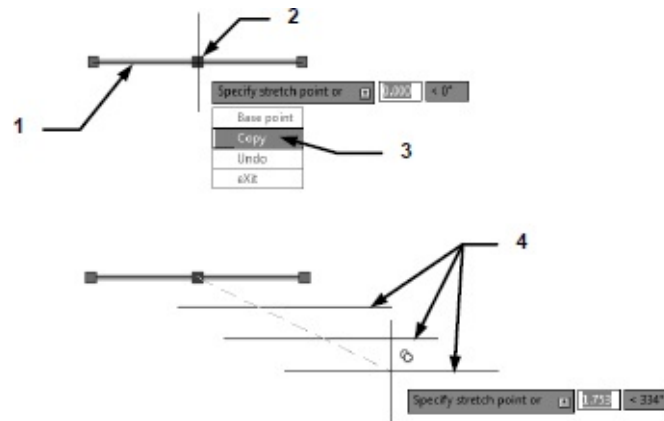

1. Select the object.
2. Left click to select the grip in the middle of the object.
3. Move the cursor to the new location.
4. Left click again to apply the new location.

### COPYING AN OBJECT:

1. Select the object.
2. Select the grip.
3. Select the **COPY** option from the Dynamic Input or Command Line options.
4. Move the cursor to the new location for the copy(s) and left click.

**Note:** Grips will allow you to continue making copies until you press the **ENTER** or **ESC** keys to stop.

### **LENGTHEN AN OBJECT:**

1. Select the object.
2. Hold the cursor over a grip.
3. Select the **Lengthen** option.
4. **Move** the cursor to lengthen the object, then **left click**. Or **type** in the desired size and then press **<enter>**.

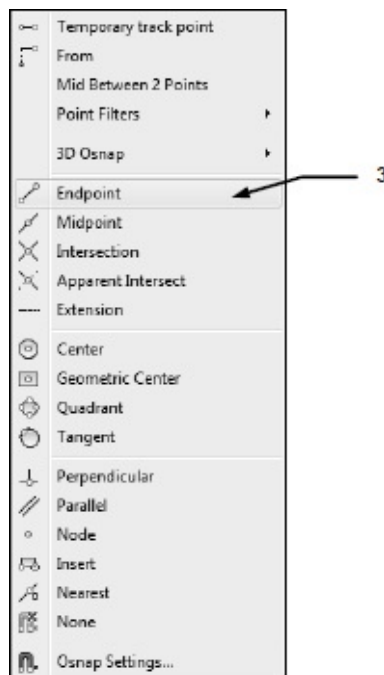

## OBJECT SNAP

**Object Snap** enables you to “**Snap**” to “**Objects**” in very specific and accurate locations on the objects. For example; you could snap to the endpoint of a Line using the “**Endpoint**” snap, or you could snap to the center of a Circle using the “**Center**” snap.

**Note:** You must select a command such as LINE before you can use Object Snaps.

### How to select from the Object Snap Menu

1. You must select a command, such as LINE, before you can select Object Snap.
2. While holding down the **shift key**, press the **right mouse button**. The menu shown below should appear.
3. **Highlight** the required snap and **press the left mouse button** to select.

The following object snaps will be discussed on the next page:

Endpoint, Midpoint, Intersection, Center, Quadrant, Tangent, and Perpendicular.

### Object Snap Definitions:

Object snap is used when AutoCAD prompts you to place an object. Object snap allows you to place objects very accurately.

***A step by step example of “How to use object snap” is shown on the next page.***

**Note:** You may type the **3 bold letters** shown rather than select from the menu.

**ENDpoint**

Snaps to the closest endpoint of a Line, Arc or polygon segment. Place the cursor on the object close to the

end and the cursor will snap like a magnet to the end of the line.

**MID**point

Snaps to the middle of a Line, Arc or Polygon segment. Place the cursor anywhere on the object and the cursor will snap like a magnet to the midpoint of the line.

**INT**ersection

Snaps to the intersections of any two objects. Place the cursor directly on top of the intersection or select one object and then the other and Autocad will locate the intersection.

**CEN**ter

Snaps to the center of an Arc, Circle or Donut. Place the cursor on the object, or at the approximate center location and the cursor will snap like a magnet to the center.

**QUA**drant

Snaps to a 12:00, 3:00, 6:00 or 9:00 o'clock location on a circle or ellipse. Place the cursor on the circle near the desired quadrant location and the cursor will snap to the closest quadrant.

**TAN**gent

Calculates the tangent point of an Arc or Circle. Place the cursor on the object as near as possible to the expected tangent point.

**PER**pendicular

Snaps to a point perpendicular to the object selected. Place the cursor anywhere on the object then pull the cursor away from object and press the left mouse button.

## HOW TO USE OBJECT SNAP

The following is an example of attaching a line segment to previously drawn vertical lines. The new line will start from the upper endpoint, to the midpoint, to the lower endpoint.

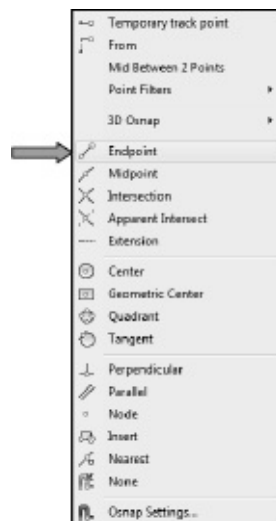

1. Turn Off **SNAPMODE**, **ORTHOMODE** and **OBJECT SNAP** on the Status Bar. (Gray is OFF)

2. Select the **Line** command.
3. Draw two vertical lines as shown below (they don't have to be perfectly straight).

4. Select the **Line** command again.
5. Hold the **shift key down** and press the **right mouse button**.
6. Select the Object snap "**Endpoint**" from the object snap menu.

7. Place the cursor close to the upper endpoint of the left hand line.  
*The cursor should snap to the end of the line like a magnet.*  
*A little square and an "Endpoint" tooltip are displayed.*

8. Press the **left mouse button** to attach the new line to the upper endpoint of the previously drawn vertical line. (**Do not end the Line command yet.**)
9. Now hold the **shift key down** and **press the right mouse button** and select

the “**Midpoint**” object snap option.

10. Move the cursor to approximately the middle of the right hand vertical line.

*The cursor should snap to the midpoint of the line like a magnet.  
A little triangle with a “Midpoint” tooltip are displayed.*

11. Press the **left mouse button** to attach the new line to the midpoint of the previously drawn vertical line. (**Do not end the Line command yet.**)
12. Now hold the **shift key down** and press the **right mouse button** and select the object snap “**Endpoint**” again.
13. Move the cursor close to the lower endpoint of the left hand vertical line.

*The cursor should snap to the end of the line like a magnet.  
A little square and a tooltip are displayed.*

14. Press the **left mouse button** to attach the new line to the endpoint of the previously drawn vertical line.
15. Stop the Line command and disconnect by pressing **<enter>**.

# RUNNING OBJECT SNAP

Selecting Object Snap is not difficult but AutoCAD has provided you with an additional method to increase your efficiency by allowing you to preset frequently used object snap options. This method is called **RUNNING OBJECT SNAP**.

When **Running Object Snap** is active the cursor will automatically snap to any preset object snap locations thus eliminating the necessity of invoking the object snap menu for each locations.

First you must **set the running object snaps**, and second, you must **turn ON the Running Object Snap option**.

## SETTING RUNNING OBJECT SNAP:

1. Select the **Running Object Snap** dialog box using one of the following:

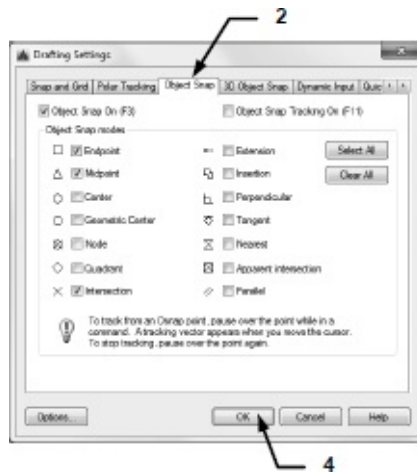

**Keyboard = DS <enter>**

**or**

**Status Bar = Right Click on the OSNAP button and select “SETTINGS”**

2. Select the **Object Snap** tab.
3. Select the Object Snaps desired.

(In the example below object snap **Endpoint**, **Midpoint** and **Intersection** have been selected.)

## Note:

Try not to select more than 3 or 4 running object snaps at a time.

If you select too many snaps the cursor will flit around trying to snap to multiple snap locations. And possibly snap to the wrong location.

You will lose control and it will confuse you.

4. Select the **OK** button.
5. Turn **ON** the **OSNAP** button on the Status Bar. (Blue is ON)

## PAN

After you zoom in and out or adjust the scale of a viewport the drawing within the viewport frame may not be positioned as you would like it. This is where **PAN** comes in handy. **PAN** will allow you to move the drawing around, within the viewport, without affecting the size or scale.

**Note:** Do not use the **MOVE** command. You do not want to actually move the original drawing. You only want to slide the viewport image, of the original drawing, around within the viewport.

### How to use the PAN command.

1. Select a layout tab (paper space).
2. **Unlock** the viewport if it is locked.
3. Click inside a **viewport**.
4. Select the **PAN** command using one of the following:

**Ribbon = View Tab / Navigate Panel /**  Pan

or

**keyboard = P <enter>**

or

**Navigation Bar =**

**Note:** The **Navigate Panel** is off by default. To add Panels and Tabs to the Ribbon, refer to [page 5-37](#).

Consider adding the **PAN** tool to the **Quick Access Toolbar**.

5. Place the cursor inside the viewport and hold the left mouse button down while moving the cursor. (Click and drag) When the drawing is in the desired location release the mouse button.
6. Press the **Esc** key or press **<enter>** to end the **PAN** command.
7. **Lock** the viewport.

*Refer to the Examples on the next page.*

Before PAN

Double Click in the Viewport to activate it.

Use PAN  
(Click, Drag, Release)

After PAN

## PROPERTIES PALETTE

The **Properties Palette**, shown below, makes it possible to change an object's properties. You simply open the Properties Palette, select an object and you can change any of the properties that are listed.

**How to open the Properties Palette:**

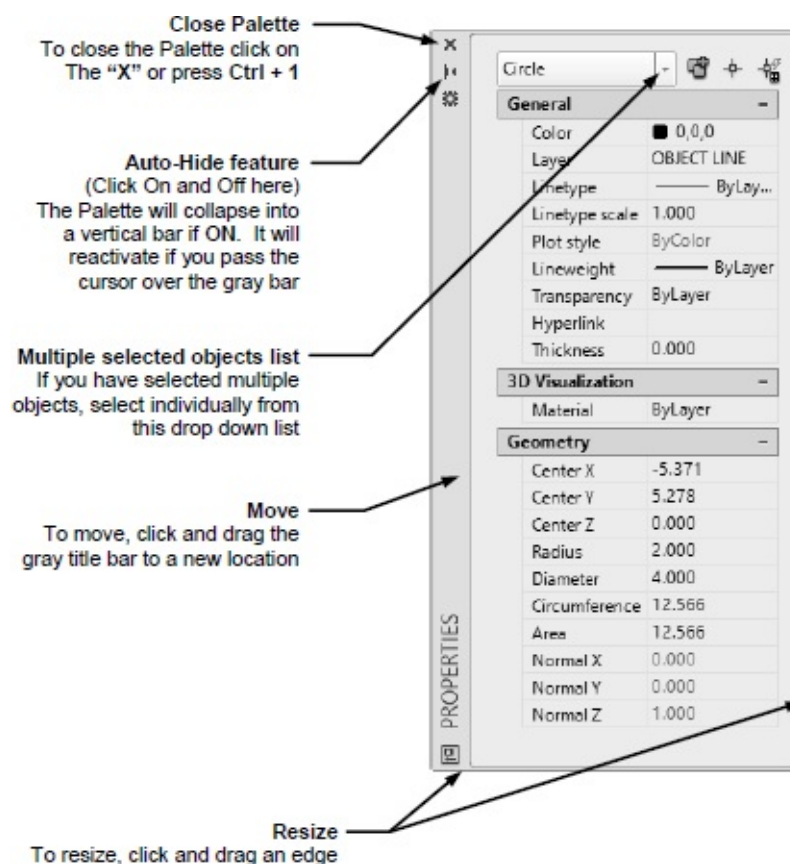

**Ribbon = Home Tab / Properties Panel / ↘**

**or**

**Keyboard = Ctrl + 1**

**(An example of how to use the Properties Palette is on the next page.)**

**Example of editing an object using the Properties Palette:**

1. Draw a **2.000** Radius circle.
2. Open the **Properties Palette** and select the **Circle**. (The Properties for the Circle should appear. You may change any of the properties listed in the Properties Palette for this object. When you press **<enter>** the circle will change.)

3. Highlight and change the “**Radius**” to **1.000** and the “**Layer**” to **HIDDEN LINE** <enter>.

*The Circle got smaller and the Layer changed as shown below.*

## QUICK PROPERTIES PANEL

The **Quick Properties Panel**, shown below, will only appear if you have it set to **ON**. The Quick Properties Panel displays fewer properties and appears when you click once on an object. You may make changes to the objects properties using Quick Properties just as you would using the Properties Palette. (AutoCAD is just giving you another option)

### How to turn Quick Properties Panel On or OFF:

1. Select and turn **ON** the **Quick Properties** button on the status bar.

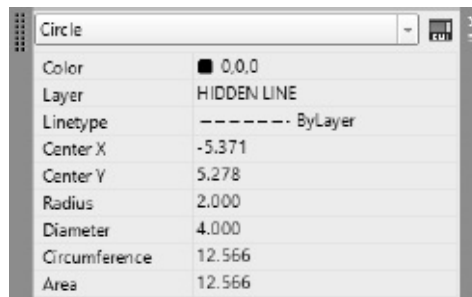

2. Select an object.

3. The **Quick Properties Panel** appears.

**Note:** The list depends on the type of object you have selected, such as; Circle, Line, Rectangle, etc.

Refer to the next page to **“Customize”** the **Quick Properties Panel**.

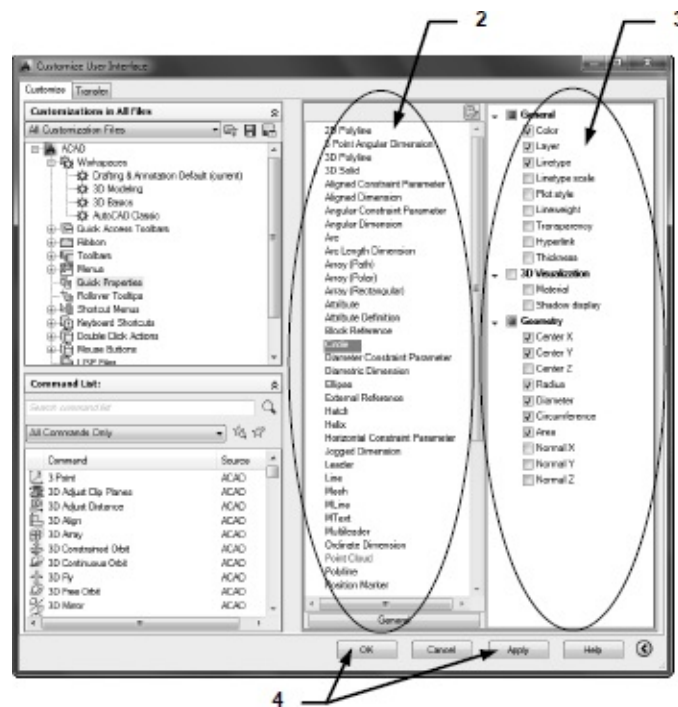

# CUSTOMIZING THE QUICK PROPERTIES PANEL

You may add or remove properties from the **Quick Properties Panel**. And it is easy.

1. Select the **Customize** button.

2. Select the Object, from the list, that you would like to customize.
3. **Check** the boxes for the properties that you **want to appear**.  
**Uncheck** the boxes that you **do not want to appear**.
4. Select **Apply** then **OK**.

**Note:** The customizing is saved to the computer not the drawing file.

## COMMAND LINE ENHANCEMENTS

The Command Line in AutoCAD has been extensively modified to further assist the user in searching for commands.

### AUTOCORRECT

If you mistyped a command in previous versions of AutoCAD, the system would respond with “**Unknown command**”, AutoCAD 2015/2016 will now **AutoCorrect** to the most relevant command.

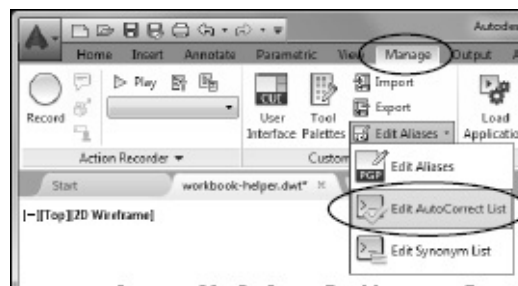

In the example below, if you entered **CIRKLE**, the system will respond with **CIRCLE**, and any other commands that contain the word **CIRCLE**.

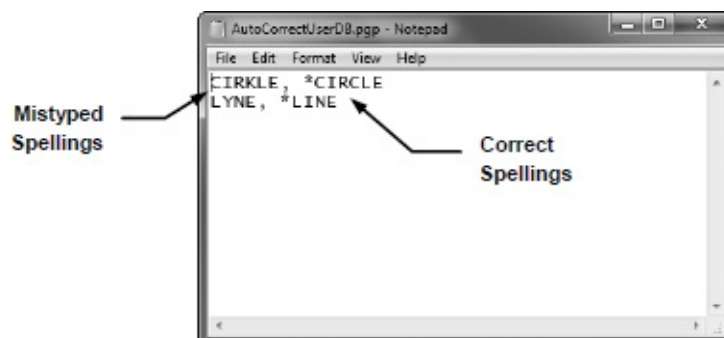

AutoCAD also has a new **AutoCorrect List** which is stored in the system, if you mistype a command three times or more, that mistyped command will be stored in the **AutoCorrect List** along with the correct spelling of the command.

You can access the AutoCorrect List by selecting:

**Ribbon = Manage Tab / Customization Panel / Edit Aliases ▾ / Edit AutoCorrect List**

An example of the **AutoCorrect List** is shown below with two commands that have been mistyped, and with their correct spelling.

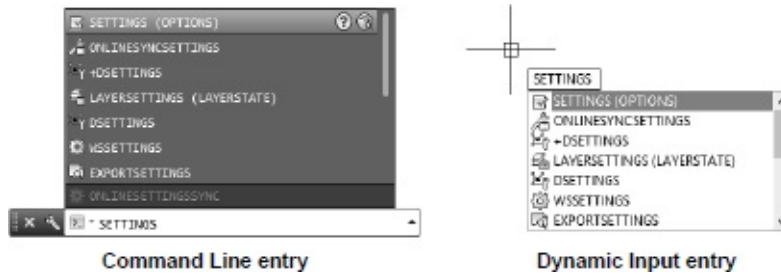

### AUTOCOMPLETE

The **AutoComplete** in AutoCAD has been further enhanced and now supports mid-string searches. In previous versions the AutoComplete only displayed command suggestions beginning with the word you entered, it will now display

command suggestions with the word you enter, anywhere within it.

In the example below, if you enter **SETTINGS**, AutoComplete will respond with various suggestions with the word **SETTINGS** anywhere within a command.

## ADAPTIVE SUGGESTIONS

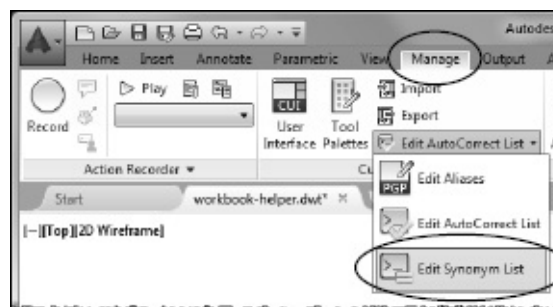

When you first use AutoCAD, commands in the suggestion list are displayed in the order of usage which is based on general customer data. As you use AutoCAD more and more, the commands will be displayed according to your usage, it adapts to your way of working, showing the commands you use most frequently in the suggestion list.

## SYNONYM SUGGESTIONS

The new command line in AutoCAD has a built in **Synonym list**. When you enter a word at the command line, AutoCAD returns a command if it can match it in the synonym list.

For example, if you enter **BREAKUP** at the command line, AutoCAD will return the command **EXPLODE**. Or if you want to type a paragraph of text and enter the word **PARAGRAPH** at the command line, AutoCAD will return the command **MTEXT**.

You can add your own synonym's to the list which can be accessed by selecting:  
**Ribbon = Manage Tab / Customization Panel / Edit Aliases ▾ / Edit Synonym List**

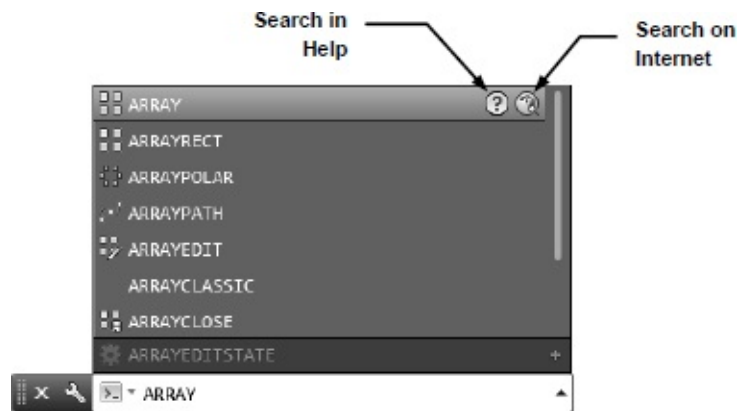

## INTERNET SEARCH

AutoCAD now allows you to search for more information on a command that is displayed in the suggestion list. If you move the mouse cursor over a command in the list, it will display a **“Search on Internet”** icon and a **“Search in Help”** icon.

You can click on either of these two options to get extended help on the command you entered. So for example, if you type in **ARRAY** at the command line and

choose the **Search on Internet** option, your current internet browser will open and show internet suggestions for **AutoCAD ARRAY**.

Whichever command you choose to search for help on the internet, the word **AutoCAD** will always precede it. An example of the search and help icons is shown below.

## CONTENT

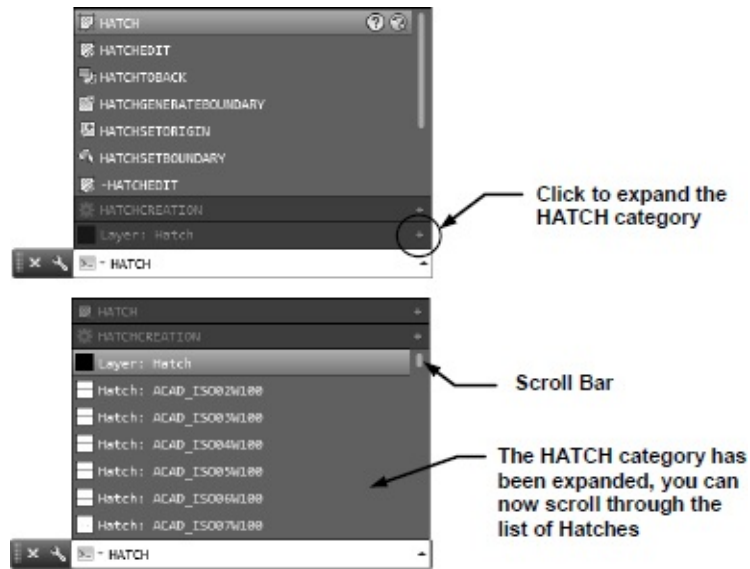

The new Command Line in AutoCAD also allows you to quickly access layers, blocks, hatch patterns/gradients, text styles, dimension styles and visual styles. For example, if you have a drawing open that has block definitions with the name **DOOR**, and you enter **DOOR** at the command line, the suggestion list will display all the blocks with that name in it, so you could then insert that block directly from the command line.

The example below shows the command line suggestion list with block definitions of **DOOR**, you would simply click on the block you needed, and then insert it into your drawing.

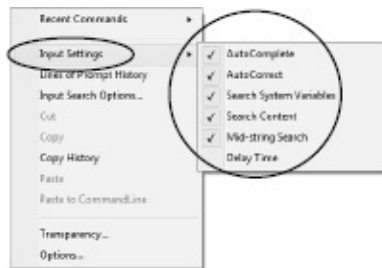

## CATEGORIES

The command line suggestion list is made easier to navigate by organizing commands and system variables into **categories**. To see the results you can expand the category by clicking on the + sign, or you can press the **Tab** key to cycle through each category.

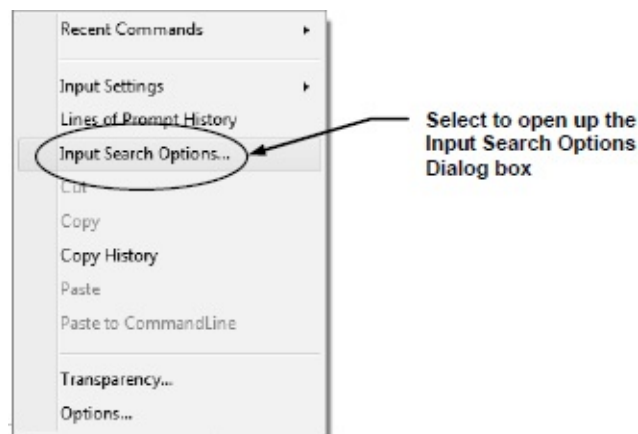

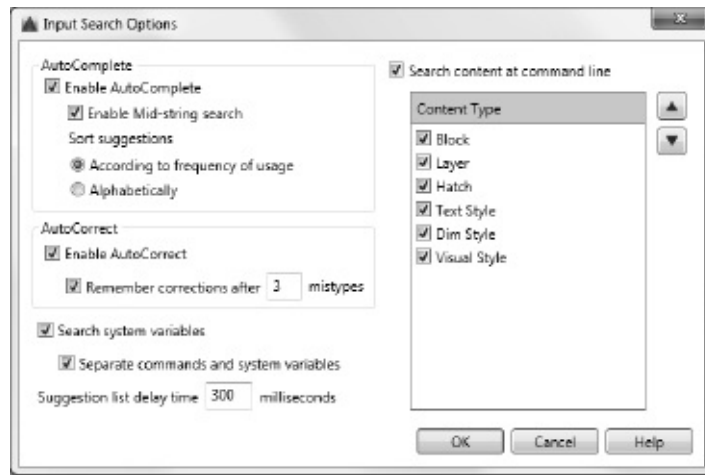

## INPUT SETTINGS

You can choose to turn on or off any of the new command line features by right-clicking on the command line and selecting **Input Settings**, you can choose between **AutoComplete**, **AutoCorrect**, **Search System Variables**, **Search Content**, and **Mid-string Search**.

In addition to the **Input Settings**, you can further refine the settings by right-clicking on the command line and selecting “**Input Search Options.**” This will open the **Input Search Options** dialog box where you can change settings like the amount of times you can mistype a command before it gets entered into the **AutoCorrect List**.

## Section 9

### Plotting

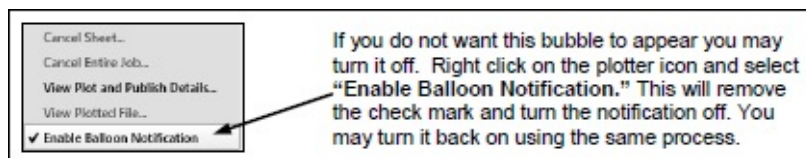

## BACKGROUND PLOTTING

Background Plotting allows you to continue to work while your drawing is plotting. This is a valuable time saver because some drawings take a long time to plot. Or maybe you have multiple drawings to plot and you do not want to tie up your computer.

If you wish to view information about the status of the plot, click on the plotter icon located in the lower right corner of the AutoCAD window.

When the plot is complete, a notification bubble will appear.

If you do not want this bubble to appear you may turn it off. Right click on the plotter icon and select "Enable Balloon Notification." This will remove the check mark and turn the notification off. You may turn it back on using the same process.

When you click on the "Click to view plot and publish details..." , on the bubble, you will get a report like the one shown below. The report will list details about all of the drawings plotted in the current drawing session.

You may turn Background Plotting **ON** or **OFF**.

The default setting is **OFF**.

To turn it **ON** or **OFF**:

**Right Click / Options / Plot and Publish Tab**

# PLOTTING FROM MODEL SPACE

1. **Important:** Open the drawing you want to plot, if it is not already open.
2. Select: **Zoom / All** to center the drawing within the plot area.
3. Select the **Plot** command using one of the following;

**Quick Access Toolbar =** 

or

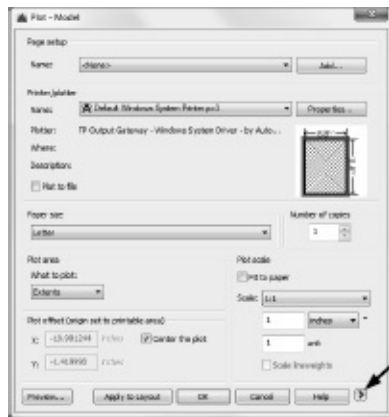

**Ribbon = Output Tab / Plot Panel /** 

or

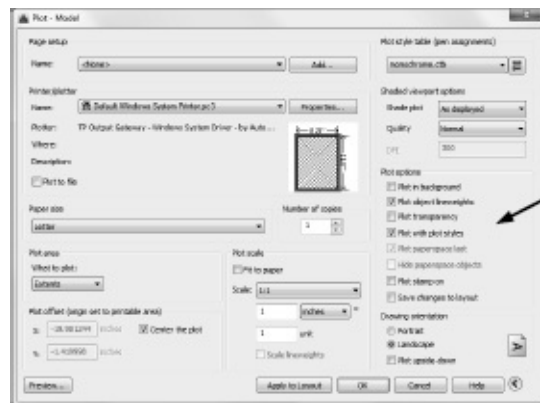

**Keyboard = Plot <enter>**

The **Plot –Model** dialog box will appear.

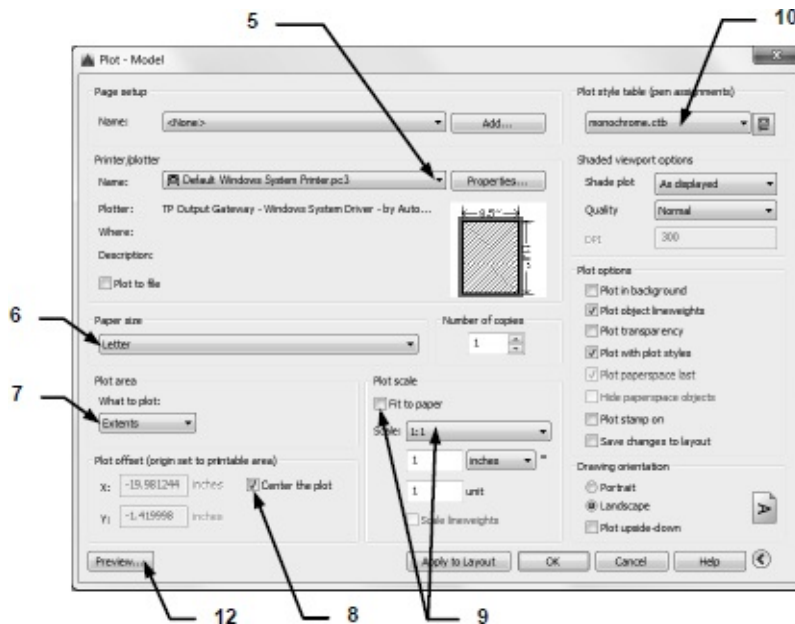

**Note:** Another quick method of selecting the **Plot** command is by Right Clicking on the **Model Tab** and then select **Plot** from the menu.

4. Select the "More Options" button to expand the dialog box.

The dialog box expands to show more options.

5. Select your printer from the drop down list or “*Default windows system printer.pc3*”

**Note:** If your printer is not shown in the list you should configure your printer within AutoCAD. This is not difficult. Refer to [Section 5 - Add a Printer / Plotter](#), for detailed instructions.

6. Select the Paper size such as; **Letter 8.5”x11”**

7. Select the Plot Area; **Extents**

8. Select the Plot Offset; **Center the Plot**

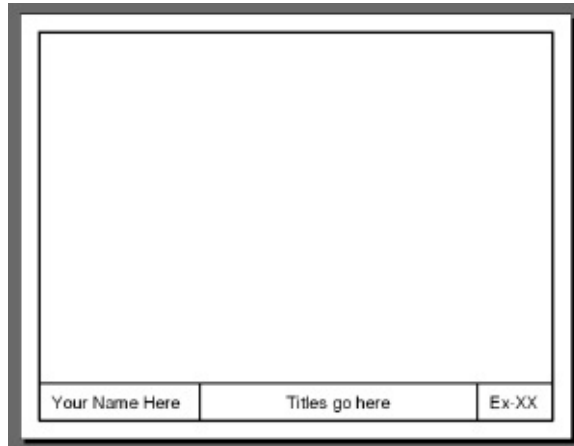

9. Uncheck the “**Fit to paper box**” and select Plot Scale **1:1**

10. Select the Plot Style table; **Monochrome.ctb** (for all black) **Acad.ctb** (for color)

11. If the following dialog box appears, select **Yes**.

12. Select the **Preview** button.

Does your display appear as shown above?

If **yes**, press **<enter>** and proceed to 13.

If not, recheck 1 through 11.

You have just created a **Page Setup**. All of the settings you have selected can now be saved. You will be able to recall these settings for future plots using this page setup. To save the **Page Setup** you need to **ADD** it to the model tab within this drawing.

13. Select the **ADD** button.

14. Type the new Page Setup name such as; **Model-Mono**.

(This name identifies that you will use it when plotting the Model Tab in Monochrome.)

15. Select the **OK** button.

16. Select the **Apply to Layout** button.

17. Select the **OK** button to send the drawing to the printer or select **Cancel** if you do not want to print the drawing at this time. The Page Setup will still be saved.

18. Save the entire drawing again. The Page Setup will be saved to the **Model Tab** within the drawing and available to select in the future. You will not have to select all the individual settings again unless you choose to change them.

# PLOTTING FROM PAPER SPACE

1. Open the **Drawing** you wish to plot.
2. Select the **Layout Tab** you wish to plot.
3. Select the **Plot** command using one of the following:

**Quick Access Toolbar** = 

or

**Ribbon** = **Output Tab / Plot Panel** / 

or

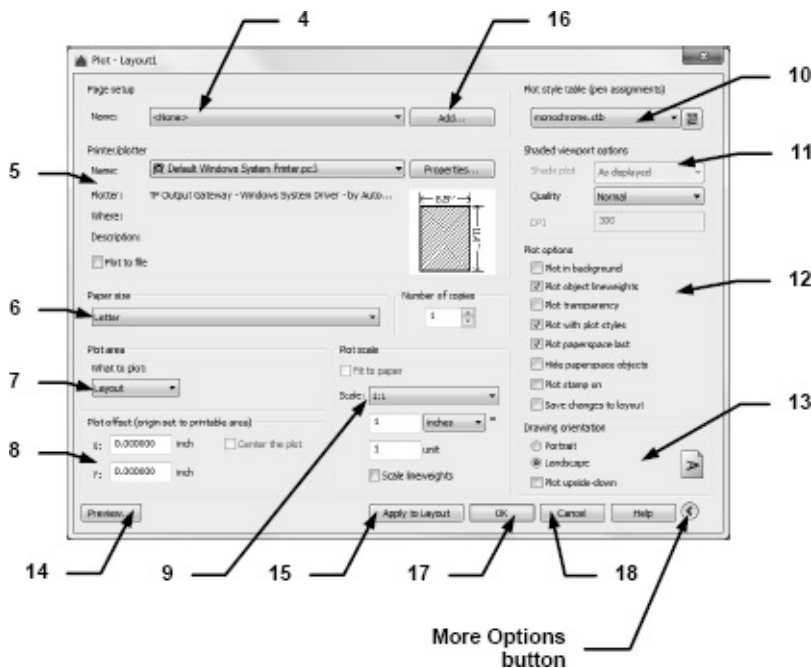

**Application Menu** = **Print / Plot**

or

**Keyboard** = **Plot <enter>**

*The Plot dialog box shown below should appear.*

*Select the “More Options”  button in the lower right corner if your dialog box does not appear the same as shown below.*

## 4. **Page Setup name:**

After you have selected the desired settings you will save the new page setup and it will appear here. If you have previously created a page setup you may select it from the drop down list and all of the settings will change to reflect the previously saved page setup settings.

## 5. **Printer / Plotter:**

Select the Printer that you wish to use. All previously configured devices will be listed here. (If your printer / plotter is not listed, refer to [Section 5 - Add a](#)

## Printer / Plotter.)

### 6. Paper Size:

Select the paper size. The paper sizes shown in the drop down list are the available sizes for the printer that you selected. If the size you require is not listed, the printer you selected may not be able to handle that size. For example, a letter size printer can not handle a 24 X 18 size sheet. You must select a large format printer.

### 7. Plot Area:

Select the area to plot. Layout is the default.

<b>Limits</b>	plots the area inside the drawing limits. (This option is only available when plotting from model space.)
<b>Layout</b>	plots the paper size. (Select this option when plotting from a Layout.)
<b>Extents</b>	plots all objects in the drawing file even if out of view. (This option only available if you have a viewport.)
<b>Display</b>	plots the drawing exactly as displayed on the screen.
<b>Window</b>	plots objects inside a window. To specify the window, choose <b>Window</b> and specify the first and opposite (diagonal) corner of the area you choose to plot. (Similar to the <b>Zoom / Window</b> command.)

### 8. Plot offset:

The plot can be moved away from the lower left plot limit corner by changing the **X** and / or **Y offset**.

(If you have select Plot area “Display” or “Extents”, select “**Center the plot.**”)

### 9. Scale:

Select a **scale** from the drop down list or enter a custom scale.

**Note:** This scale is the Paper Space scale. The Model space scale will be adjusted within the viewport. If you are plotting from a “**LAYOUT**” tab, normally you will use **Plot Scale 1:1**

### 10. Plot Style Table:

Select the Plot Style Table from the list. The Plot Styles determine if the plot is in color, Black ink or screened. You may also create your own.

If you want to print in Black Ink only select **Monochrome.ctb**

If you want to print in Color select **Acad.ctb**

### 11. Shaded viewport options:

This area is used for printing shaded objects when working in the 3D environment.

## 12. Plot options:

**Plot background** = specifies that the plot is processed in the background.

**Plot Object Lineweights** = plots objects with assigned lineweights.

**Plot transparency** = Plots any transparencies

**Plot with Plot Styles** = plots using the selected Plot Style Table.

**Plot paperspace last** = plots model space objects before plotting paperspace objects. Not available when plotting from model space.

**Hide Paperspace Objects** = used for 3D only. Plots with hidden lines removed.

**Plot Stamp on** = Allows you to print information around the perimeter of the border such as; drawing name, layout name, date/time, login name, device name, paper size and plot scale.

**Save Changes to Layout** = Select this box if you want to save all of these settings to the current Layout tab.

## 13. Drawing Orientation:

**Portrait** = the short edge of the paper represents the top of the page.

**Landscape** = the long edge of the paper represents the top of the page.

**Plot Upside-down** = Plots the drawing upside down.

## 14. Select the **Preview** button.

The preview displays the drawing as it will plot on the sheet of paper.

*(Note: If you cannot see through to Model space, you have not cut your **Viewport** yet.)*

If the drawing appears as you would like it, press the **Esc** key and continue.

If the drawing does not look correct, press the **Esc** key and re-check your settings, then preview again.

*(Note: If you have any of the layers set to “**No Plot**” they will not appear in the preview display. The preview display only displays what will be printed.)*

## 15. **Apply to Layout** button:

This applies all of the settings to the layout tab. Whenever you select this layout tab the settings will already be set.

**16. Save the Page Setup:**

At this point you have the option of saving these settings as another page setup for future use on other layout tabs. If you wish to save this setup, select the **ADD** button, type a name and select **OK**.

17. If your computer **is** connected to the plotter / printer selected, select the **OK** button to plot, then proceed to 19.

18. If your computer **is not** connected to the plotter / printer selected, select the **Cancel** button to close the Plot dialog box and proceed to 19.

***Note:** Selecting Cancel will cancel your selected setting if you did not save the page setup as specified in **16** above.*

**19. Save the drawing:**

This will guarantee that the **Page Setup** you just created will be saved to this file for future use.

# Section 10

## Settings

## DRAWING SETUP

When drawing with a computer, you must “**set up your drawing area**” just as you would on your drawing board if you were drawing with pencil and paper. You must decide what **size paper** you will need, what **Units of measurement** you will use (feet and inches or decimals, etc) and how **precise** you need to be. In CAD these decisions are called “**Setting the Drawing Limits, Units and Precision.**”

### DRAWING LIMITS

Consider the drawing limits as the **size of the paper** you will be drawing on. You will first be asked to define where the **lower left corner** should be placed, then the **upper right corner**, similar to drawing a Rectangle. An 11 x 8.5 piece of paper would have a **lower left corner** of **0,0** and an **upper right corner** of **11, 8.5**. (**11 is the horizontal measurement X-axis, and 8.5 is the vertical measurement Y-axis.**)

### HOW TO SET THE DRAWING LIMITS

1. Select the **DRAWING LIMITS** command by typing: **Limits <enter>**.
2. The following prompt will appear:

```
Command: '_limits
Reset Model space limits:
LIMITS Specify lower left corner or [ON/OFF] <0.0000,0.0000>:
```

Displays the current lower left corner coordinates before the change

3. Type the **X,Y** coordinates **0,0 <enter>** for the new **lower left corner** location of your piece of paper.
4. The following prompt will appear:

```
LIMITS Specify upper right corner <12.0000,9.0000>:
```

Displays the current upper right corner coordinates before the change

5. Type the **X,Y** coordinates **11,8.5 <enter>** for the new **upper right corner** of your piece of paper.

**Note:** Visually the screen has not changed. Do the next step and it will.

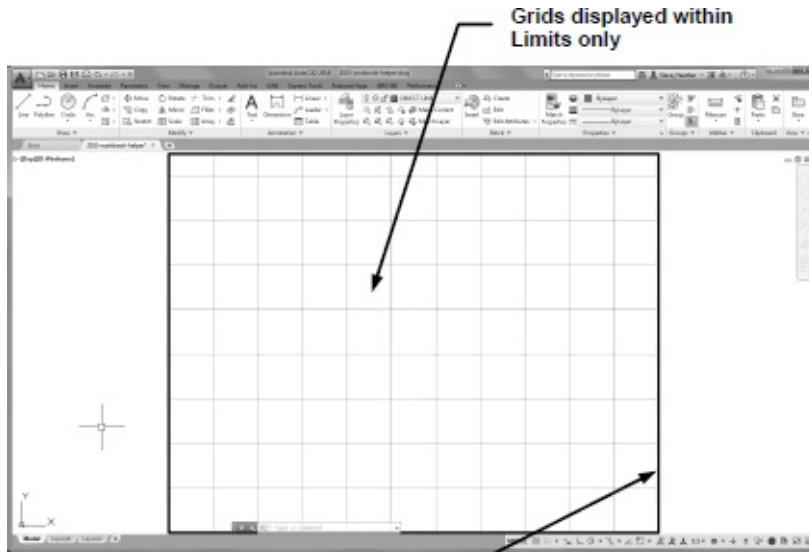

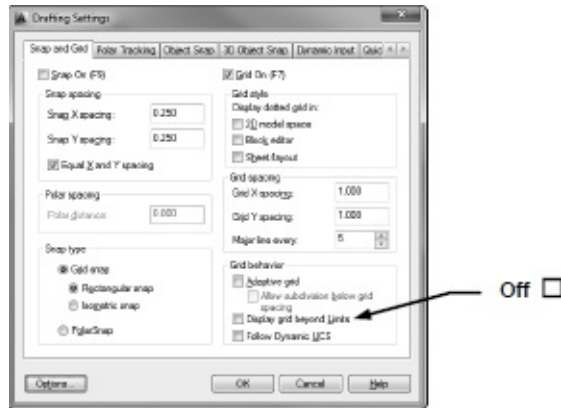

### This next step is important:

6. Type **Z <enter> A <enter>** to make the screen display the new drawing limits. (This is the shortcut for **Zoom / All**.)

### Grids within Limits:

If you have your **Grid behavior** setting  **Display grid beyond Limits** is turned **Off** (no check mark) the grids will only be displayed within the Limits that you

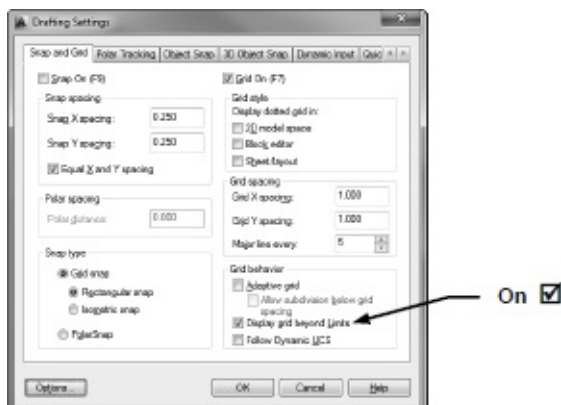

set.

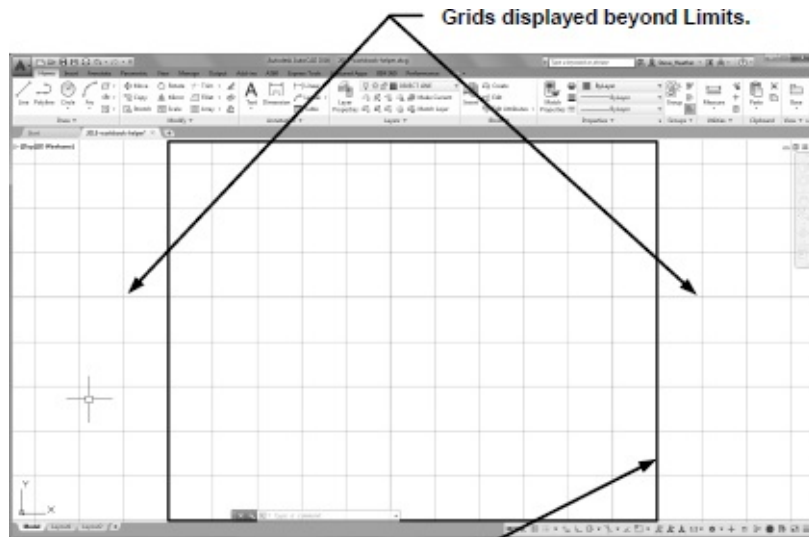

Note: The Rectangular border is to indicate the outline of the limits. It will not appear normally.

### Grids beyond Limits:

If you have your **Grid behavior** setting  **Display grid beyond Limits** is turned **On** (check mark) the grids will be displayed beyond the Limits that you set.

Note: The Rectangular border is to indicate the outline of the limits. It will not appear normally.

## UNITS AND PRECISION:

You now need to select what **unit of measurement** with which you want to work. Such as: Decimal (0.000) or Architectural (0'-0").

Next you should select how precise you want the measurements. For example, do you want the measurement limited to a 3 place decimal or the nearest 1/8".

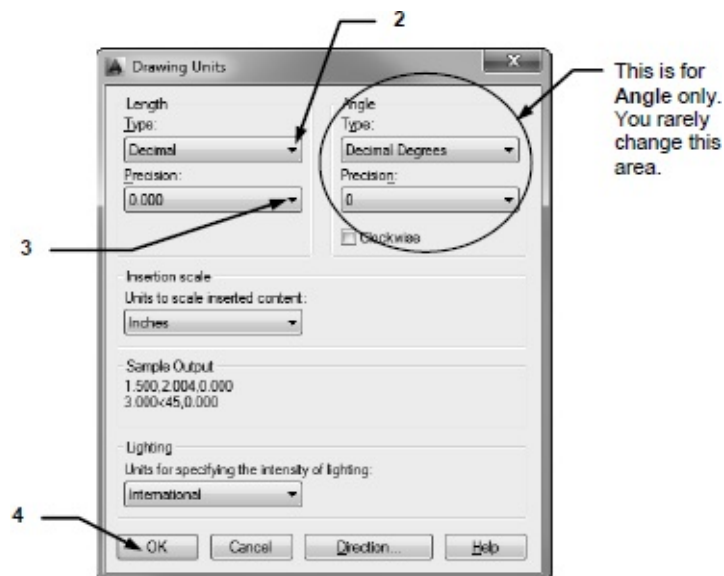

## HOW TO SET THE UNITS AND PRECISION.

1. Select the **UNITS** command using one of the following:

**Application Menu = Drawing Utilities / Units**

**or**

**Keyboard = Units <enter>**

2. **Length Type:** Select the down arrow and select: **Decimals** or **Architectural**.
3. **Length Precision:** Select the down arrow and select the appropriate **Precision** associated with the "type."

Example: 0.000 for Decimals or 1/16" for Architectural.

4. Select the **OK** button to save your selections.

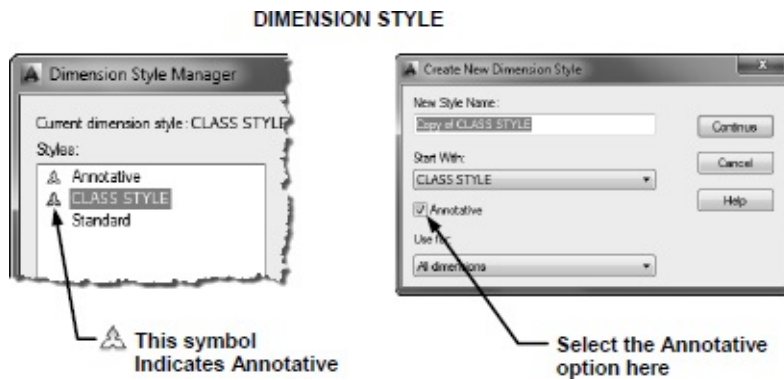

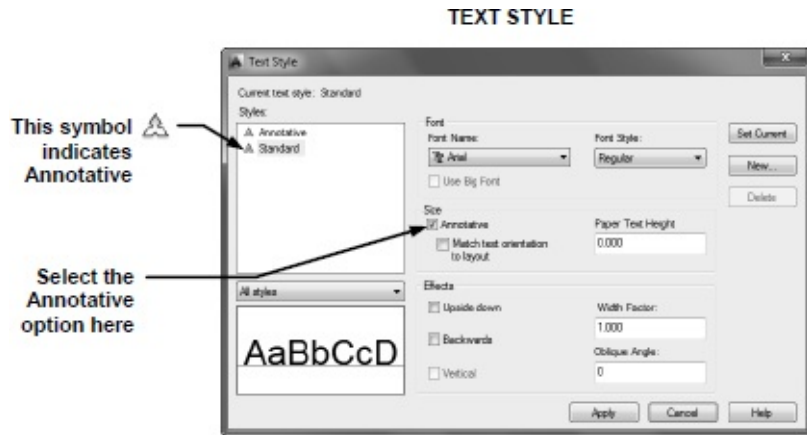

# ANNOTATIVE PROPERTY

The “**Annotative**” property automates the process of scaling text, dimensions, hatch, tolerances, leaders and symbols. The height of these objects will automatically be determined by the annotation scale setting.

You can add an “**Annotative**” property to dimension styles and text styles.

## ANNOTATIVE OBJECTS

You can add the “**Annotative**” property to Text or Dimension Styles simply by placing a check mark in the Annotative box.

The Text style and Dimension Style shown above are now **Annotative**. Notice the Annotative symbol  beside the Style Name. (No symbol by “Standard.”)

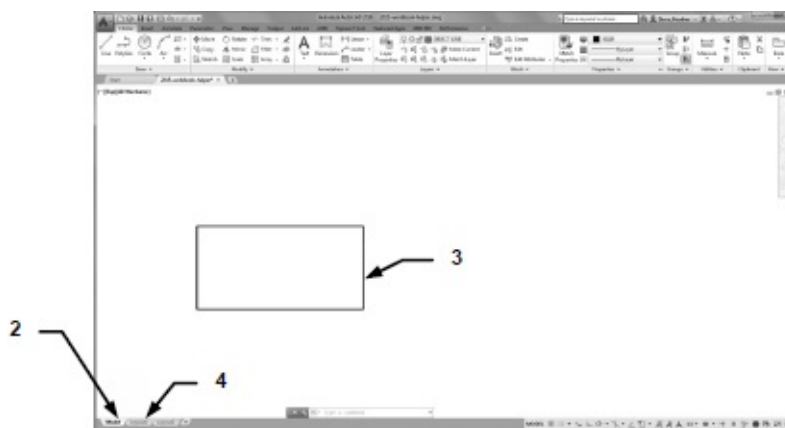

“**Annotative**” Objects are scaled automatically to match the scale of the viewport.

For example, if you want the text, inside the viewport, to print .200 in height and the viewport scale is 1:2 AutoCAD will automatically scale the text height to .400. The text height needs to be scaled by a factor of 2 to compensate for the model space contents appearing smaller.

The easiest way to understand how “**Annotative**” property works is to do it.

**So try this example:**

1. Start a **New** drawing file.
2. Select the **Model** tab.
3. Draw a Rectangle; **3.00” Long X 1.50” Wide**. (**Use a Layer named Object Line.**)

4. Select a **Layout Tab**.
5. **Erase** any existing **viewport frames**.
6. **Cut 2 new viewports** as shown below. (**Use a Layer named Viewport.**)
7. Activate the **left viewport** (double click inside the viewport frame) and do the following:
  - A. Adjust the **Scale** of the viewport to **1:1**

- B. **PAN** to place the rectangle in the **center** of the viewport.
  - C. **Lock** the viewport.
8. Activate the **right viewport** (click inside the viewport frame) and do the following:
- A. Adjust the **Scale** of the viewport to **1:4**
  - B. **PAN** to place the rectangle in the **center** of the viewport.
  - C. **Lock** the viewport.

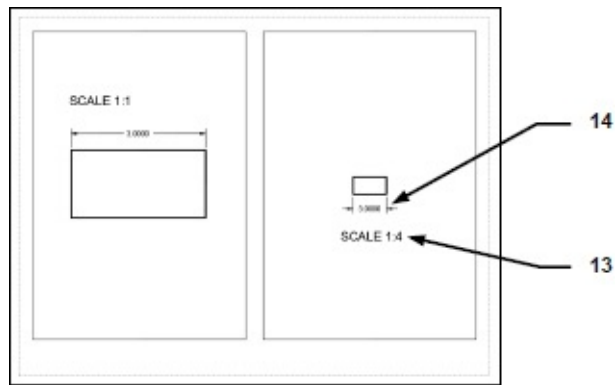

*Your screen should appear approximately like this.*

- 9. Activate the **left hand** viewport. (Double click inside the left hand viewport)
- 10. Create a new **Text Style** and add a **.200"** height text, **Scale 1:1** as shown, on a text layer. (**Note:** Make sure the new Text Style is **Annotative**)
- 11. Create a new **Dimension Style** and add a **.110"** height dimension as shown, on a dimension layer. (**Note:** Make sure the new Dimension Style is **Annotative**)

- 12. Activate the **right hand** viewport. (Click inside the right hand viewport)
- 13. Change current layer to **Text** and add **.200"** height text, **Scale 1:4** as shown using the new text style.
- 14. Change current layer to **Dimension** and add the dimension shown using the new dimension style.

Notice that the text and dimensions appear the same size in both viewports.

15. Now select the **Model** Tab.

**Notice there are 2 sets of text and dimensions.**

One set has the **Annotative Scale** of **1:1** and will be visible only in a **1:1 Viewport**.

One set has the **Annotative Scale** of **1:4** and will be visible only in a **1:4 Viewport**.

But you see both sets when you select the model tab.

16. Place your cursor on any of the text or dimensions. An “**Annotative symbol**”  will appear. This indicates this object is annotative and it has only one annotative scale.

17. Click once on the **Scale: 1:4** text. The Quick properties box should appear. (QP button on the status bar must **ON**.)

**Notice the text height is listed twice.**

**Paper text height = .200** This is the height that you selected when placing the text.

When the drawing is printed the text will print **.200**

**Model text height = .800** This is the desired height of the text (.200) factored by the viewport scale (1:4). The viewport scale is a factor of 4. ( $4 \times .200 = .800$ )

### Summary:

If an object is **Annotative**, AutoCAD automatically adjusts the scale of the object to the viewport scale. The most commonly used Annotative Objects are:

Dimensions, Text, Hatch and Multileaders. Refer to the Help menu for more

## ASSIGNING MULTIPLE ANNOTATIVE SCALES

The previous pages showed you how annotative text and dimensions are automatically scaled to the viewport scale. But in order to have an annotative object appear in both viewports you placed 2 sets of text and dimensions. Now you will learn how to easily assign multiple annotative scales to a single text string or dimension so you need not duplicate them each time you create a new viewport. You will just assign an additional annotative scale to the annotative object.

Again, the easiest way to understand this process is to do it. The following is a step by step example.

1. Use the example from the previous pages. *If you did not complete the example from the previous pages, it is advisable to complete them now.*
2. Make the **right hand viewport active**. (Double click inside the viewport)

3. Erase the text and the dimension in the **right hand** viewport only.

4. Display all annotative objects in all viewports as follows:
  - A. Select the **Annotation Visibility** button located in the lower right corner of the drawing status bar.

4A. Annotation Visibility button.  
Icon should be blue.

 **ON (Blue)** Displays **all** Annotation objects in **all** Viewports. (Example below)

Icon)

 **OFF (Gray)** Displays **only** Annotation objects that have an Annotative Scale that matches the Viewport Scale.  
Icon)

The dimensions and text are now displayed in both viewports. But the annotative scale of the dimensions and text in the right hand viewport do not match the scale of the viewport. (Notice they are smaller) **The scale of annotative objects must match the scale of the viewport.**

*Follow the steps on the next page to assign multiple annotative scales to an annotative object.*

5. Place your cursor near the **dimension** in the right hand viewport. Notice the **single Annotation symbol**. This single symbol indicates the annotative dimension has only one annotative scale assigned to it.

6. Select the **Annotate** Tab.

7. Select **only** the dimension in the **right-hand viewport**.

8. Select the **Add Current Scale** tool on the **Annotation Scaling** panel.

The **Annotative dimension** should have increased in size as shown below.

9. Turn **OFF** the **Annotation Visibility**. (Click on the button. The light should turn gray)

Notice the text in the right hand viewport is no longer visible. When the **Annotative Visibility** is **OFF** only the annotative objects that match the viewport scale will remain visible. The dimension is the only annotative object that has the 1:4 annotative scale assigned to it.

10. Place your cursor near the dimension. Notice **2 Annotation symbols** appear now. This indicates 2 annotation scales have been assigned to the annotative object.

11. Click on the dimension to display the grips and drag the dimension away from the rectangle approximately as shown below. (The dimension was too close to the rectangle) **Notice the dimension in the left hand viewport did not move**. They can be moved individually.

## HOW TO REMOVE AN ANNOTATIVE SCALE

If you have an annotative object such as a dimension, that you would like to remove from a viewport, you must remove the annotative scale that matches the viewport scale. **Do not delete** the dimension because it will also be deleted from all of the other viewports. This sounds complicated but is very easy to accomplish.

**Problem:** I would like to remove **Dimension A** from the right hand viewport but I do not want **Dimension B** in the lower viewport to disappear.

**Solution:** I must remove the **1:4** Annotation scale from **Dimension A**.

(Refer to Step by step instructions below.)

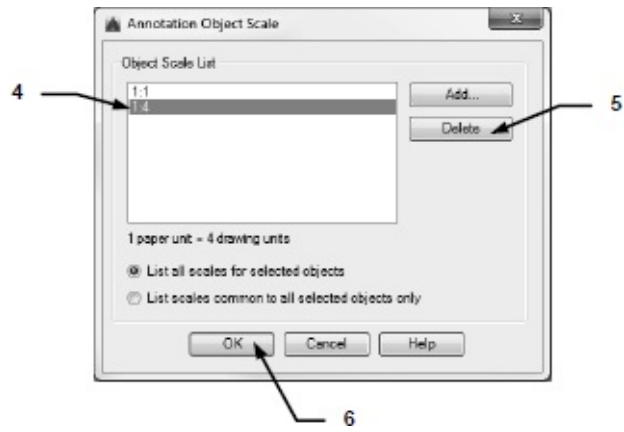

### Step 1:

1. Select the **Annotate** tab on the Ribbon.
2. Select **Dimension A** shown above. (You must be inside the viewport)
3. Select the **Add / Delete Scales** tool located on the **Annotation Scaling** panel.

4. Select the Annotation Scale to remove. (**1:4**)
5. Select the **Delete** button.  
(Remember, you are deleting the annotative scale from the dimension. You are not deleting the dimension. The dimension still exists but it will not have an annotative scale of 1:4 assigned to it. As a result it will not be visible within any viewport that has been scaled to 1:4 )
6. Select the **OK** button.

**Note: Dimension A** has been removed and **Dimension B** remains.

## ANNOTATIVE HATCH

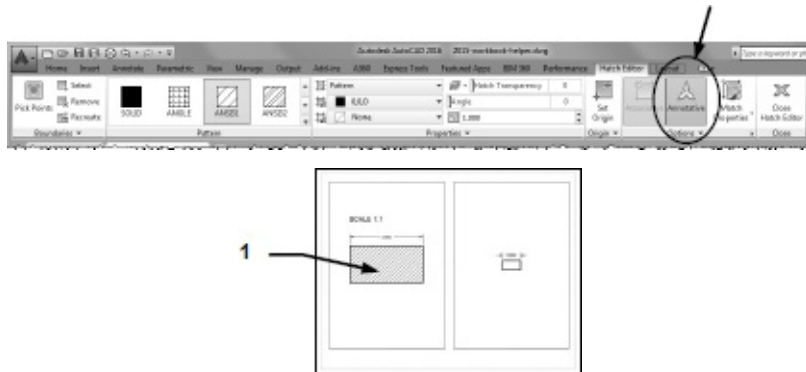

**Hatch** may be **Annotative** also. You may select the Annotative setting as you create the Hatch set or you may add the Annotative setting to an existing Hatch set.

---

### How to select the Annotative setting as you create the Hatch set.

1. Select the **Hatch** command and select the desired settings including **Annotative**.

The Hatch set created will be annotative.

---

### How to change an existing Non-Annotative Hatch set to Annotative.

1. Click on the **existing** Hatch set.

The **Hatch Editor** Ribbon Tab will appear.

2. Select the **Annotative** option.

3. Select **Close Hatch Editor**.

The **Non-Annotative Hatch** is now **Annotative**.

### How to assign multiple Annotative scales to a Hatch set.

1. Draw the hatch in one of the viewports using **Annotative** hatch.  
(Refer to previous page)

2. Turn **ON Annotation Visibility**  (**Blue**) (Refer to [page 10-13](#))

3. Select the **Hatch Set** to change.

4. Select the **Annotate Tab**.

5. Select the **“Add Current Scale”** tool.

6. Turn **OFF Annotation Visibility**  (**Gray**) (Refer to [page 10-13](#))

**Now the appearance of the hatch sets should be identical in both viewports.**

## Section 11

Text

## CREATING NEW TEXT STYLES

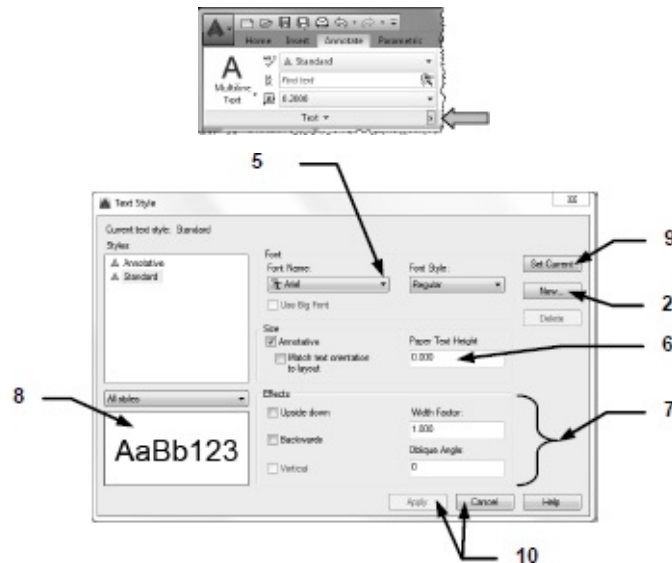

AutoCAD provides you with two preset Text Styles named “Standard” and “Annotative.” You may want to create a new text style with a different font and effects. The following illustrates how to create a new text style.

1. Select the **TEXT STYLE** command using one of the following:

**Ribbon = Annotate Tab / Text Panel / **

**or**

**Keyboard = ST <enter>**

2. Select the **NEW** button.

3. Type the new style name in **STYLE NAME** box.  
Styles names can have a maximum of 31 characters, including letters, numbers, dashes, underlines and dollar signs. You can use Upper or Lower case.
4. Select the **OK** button.
5. Select the **FONT**.
6. Enter the value of the **Height**.

**Note:** If the value is **0**, AutoCAD will always prompt you for a height. If you enter a number the new text style will have a fixed height and AutoCAD will not prompt you for the height.

7. Assign **EFFECTS**.

### **UPSIDE-DOWN:**

Each letter will be created upside-down in the order in which it was typed. (**Note:** This is different from rotating text **180** degrees.)

### **BACKWARDS:**

The letters will be created backwards as typed.

### **VERTICAL:**

Each letter will be inserted directly under the other. Only “.shx” fonts can be used. VERTICAL text will not display in the **PREVIEW** box.

### **OBLIQUE ANGLE:**

Creates letter with a slant, like italic. An angle of **0°** creates a vertical letter. A positive angle will slant the letter forward. A negative angle will slant the letter backward.

### **WIDTH FACTOR:**

This effect compresses or extends the width of each character.

A value less than **1** compresses each character.

A value greater than **1** extends each character.

8. The **PREVIEW** box displays the text with the selected settings

9. Select the **Set Current** button.
10. Select the **Apply** or **Close** button.

## HOW TO SELECT A TEXT STYLE

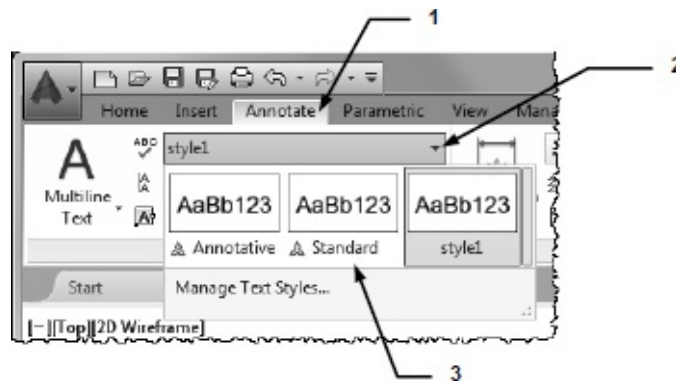

After you have created Text Styles you will want to use them. You must select the Text Style before you use it.

Below are the methods of selection when using **Single Line** or **Multiline text**.

### SINGLE LINE TEXT:

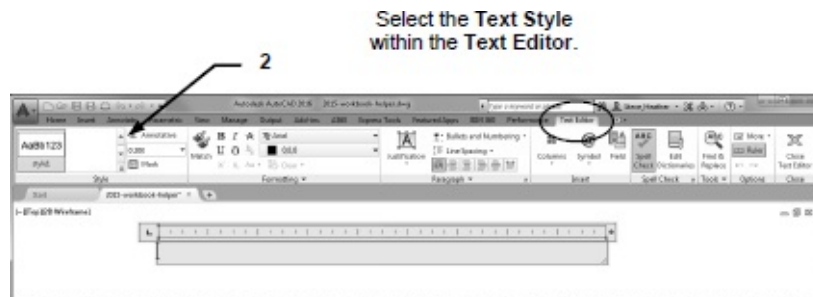

Select the style before selecting the Single Line Text command.

1. Select the **Annotate** Tab.
2. Using the Text panel, select the **style down arrow** ▼
3. Select the **Text Style**.

### MULTILINE TEXT:

1. Select **Multiline Text** and place the **first corner** and **opposite corner**.
2. Find the **Style** panel and scroll through the text styles available using the **up** and **down** arrows.

## DELETE A TEXT STYLE

1. Select the **TEXT STYLE** command using one of the following:

**Ribbon = Annotate Tab / Text Panel / **

**or**

**Keyboard = ST <enter>**

2. First, select a **Text Style** that you do not want to Delete and select the **Set Current** button. (**Note:** You can't Delete a Text Style that is in use.)
3. Select the **Text Style** that you want to Delete.
4. Select the **Delete** button.
5. A warning appears, select **OK** or **Cancel**.
6. Select the **Close** button.

**Note:** Also refer to the **PURGE** command. The **Purge** command will remove any unused **text styles**, **dimension styles**, **layers** and **linetypes**.

## CHANGE EFFECTS OF A TEXT STYLE

1. Select the **TEXT STYLE** command using one of the following:

**Ribbon = Annotate Tab / Text Panel / ↘**

**or**

**Keyboard = ST <enter>**

2. Select the **Text Style** you wish to change.
3. Make the changes in the **EFFECTS** boxes.

### **Note about Vertical:**

Only **“.shx”** fonts can be vertical.

Vertical text will not display in the **PREVIEW** box.

4. Select the **Apply** button. (*Apply will stay gray if you did not change a setting.*)
5. Select the **Close** button.

## MULTILINE TEXT

**MULTILINE TEXT** command allows you to easily add a sentence, paragraph or tables. The Mtext editor has most of the text editing features of a word processing program. You can underline, bold, italic, add tabs for indenting, change the font, line spacing, and adjust the length and width of the paragraph.

When using Mtext you must first define a text boundary box. The text boundary box is defined by entering where you wish to start the text (first corner) and approximately where you want to end the text (opposite corner). It is very similar to drawing a rectangle. The paragraph text is considered one object rather than several individual sentences.

### USING MULTILINE TEXT

1. Select the **MULTILINE TEXT** command using one of the following:

**Ribbon = Annotate Tab / Text Panel /**

**or**

**Keyboard = MT <enter>**

The command line will list the current style, text height and annotative setting.

Mtext Current text style: "STANDARD" Text height: .200 Annotative: No

The cursor will then appear as crosshairs with the letters "abc" attached.

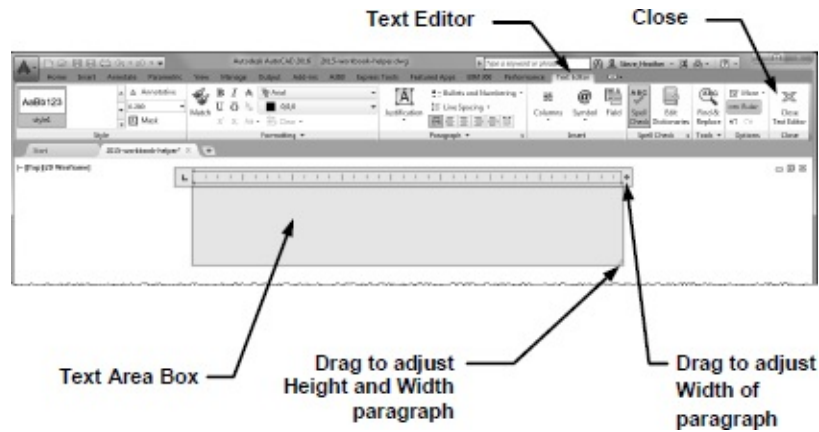

These letters indicate how the text will appear using the current font and text height.

2. Specify first corner: **Place the cursor at the upper left corner of the area where you want to start the new text boundary box and press the left mouse button. (P1)**
3. Specify opposite corner or [Height / Justify / Line Spacing / Rotation / Style / Width / Columns]: **Move the cursor to the right and down (P2) and press left mouse button.**

**The Text Editor Ribbon will appear.**

The **Text Editor** allows you to select the Text Style, Font, Height etc. You can add features such as bold, italics, underline and color.

The **Text Area box** allows you to enter the text, add tabs, indent, adjust left hand margins and change the width and height of the paragraph.

4. After you have entered the text in the Text Area box, select the **Close Text Editor** tool.

### **HOW TO CHANGE THE “abc”, ON THE CROSSHAIRS, TO OTHER LETTERS.**

You can personalize the letters that appear attached to the crosshairs using the **MTJIGSTRING** system variable. (10 characters max) The letters will simulate the appearance of the font and height selected but will disappear after you place the lower right corner (**P2**).

1. Type **MTJIGSTRING <enter>** on the command line or dynamic input box.
2. Type the new letters followed by **<enter>**.

The letters will be saved to the computer, not the drawing. They will appear anytime you use **Mtext** and will remain until you change them again.

# TABS, INDENTS AND SPELLING CHECKER

## TABS

Setting and removing Tabs is very easy.

The increments are determined by the text height. For example, if the text height is 1" you may quickly place a tab at any 1" mark on the ruler.

Set or change the stop positions at anytime, using one of the following methods.

Place the cursor on the "Ruler" where you want the tab and left click. A little dark "L" will appear. The tab is set. If you would like to remove a tab, just click and drag it off the ruler and it will disappear.

## INDENTS

Sliders on the ruler show indentation relative to the left side of the text boundary box. The top slider indents the first line of the paragraph, and the bottom slider indents the other lines of the paragraph.

You may change their positions at anytime, using one of the following methods.

Place the cursor on the "Slider" and click and drag it to the new location.

## SPELLING CHECKER

If you have Spell check **ON** you will be alerted as you enter text with a **Red Line** under the misspelled word. Right click on the word and AutoCAD will give you some choices.

1. Select the text you wish to Spell check. (Click once on sentence)
2. Select **Annotate tab / Text panel /**

The **Check Spelling** dialog box will appear.

3. Select **Start**.

If AutoCAD finds any words misspelled it will suggest a change.

You may select **Change** or **Ignore**.

When finished a message will appear stating "**Spelling Check Complete.**"

# COLUMNS

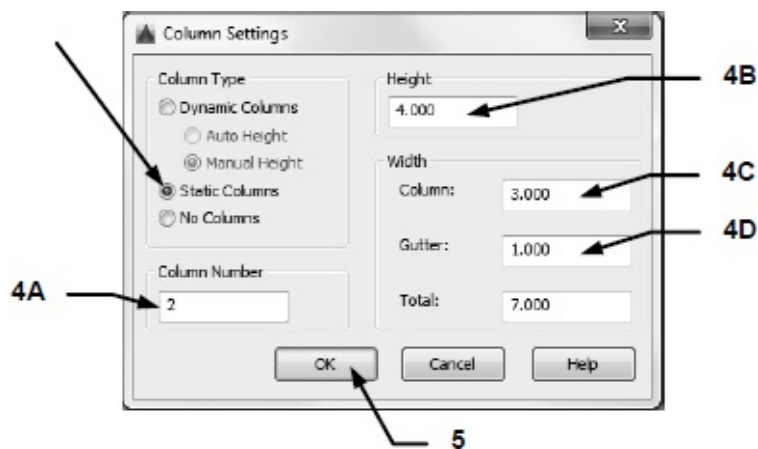

## STATIC COLUMNS

1. Right click in the **Text Box Area** and select **Columns**.
2. Select **Column Settings...**

The **Column Settings** Dialog box appears.

3. Select **Static Columns**.

4. Select:
  - A. Column Number
  - B. Height
  - C. Width
  - D. Gutter
5. Select the **OK** button.
6. The Text Area should appear as shown below with 2 columns divided with a gutter.
7. Start typing in the left hand box. When you fill the left hand box the text will start to spill over into the right hand box.

You may also adjust and make changes to the width and height using the drag tools.

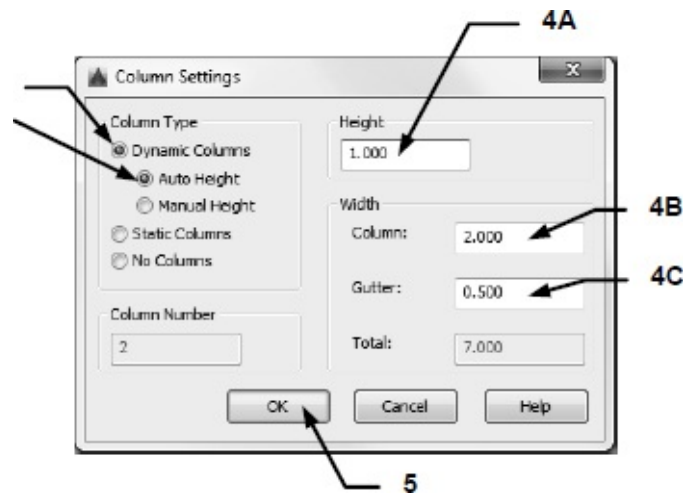

## DYNAMIC COLUMNS

1. Right click in the **Text Box Area** and select **Columns**.
2. Select **Column Settings...**

The **Column Settings** Dialog box appears.

3. Select **Dynamic Columns** and **Auto Height**

4. Select:
  - A. Height
  - B. Width
  - C. Gutter
5. Select the **OK** button.
6. The Text Area will first appear with one column with the width and height you set.

7. When the text fills the first column another column will appear.

When the second column fills another column will appear.  
 You may also adjust and make changes to width and height using the drag tools.

# PARAGRAPHS AND LINE SPACING

## PARAGRAPH and LINE SPACING

You may set the **Tabs**, **Indent** and **Line Spacing** for individual paragraphs.

1. Right click in the **Text Box Area** and select **Paragraph**.

The **Paragraph** dialog box will appear.

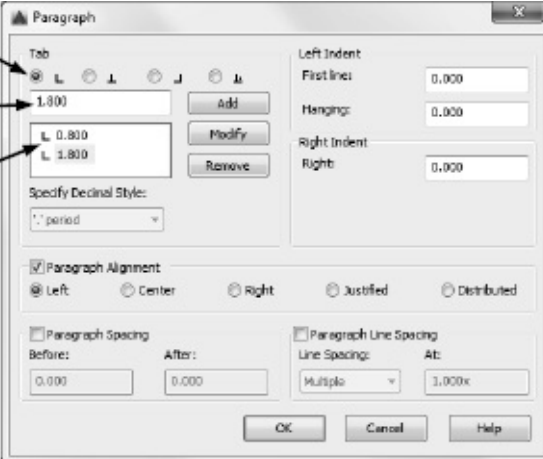

You may add or remove tabs here also.

To Add:

1. Enter the Spacing.
2. Select Add button.

To Remove:

1. Select from the list.
2. Select Remove button.

A screenshot of the Paragraph dialog box. The 'Tab' section has a list of tabs with values 1.000, 0.800, and 1.800. The 'Add' button is highlighted. The 'Remove' button is also highlighted. The 'Paragraph Spacing' section has 'Before' and 'After' fields set to 0.000. The 'Paragraph Line Spacing' section has 'Line Spacing' set to 'Multiple' and 'At' set to '1.000x'. The 'Paragraph Alignment' section has 'Left' selected. The 'Left Indent' section has 'First line' and 'Hanging' set to 0.000. The 'Right Indent' section has 'Right' set to 0.000. The 'Specify Decimal Style' dropdown is set to 'period'. The 'OK', 'Cancel', and 'Help' buttons are at the bottom.

## EDITING MULTILINE TEXT

### MULTILINE TEXT

Multiline Text is as easy to edit as it is to input originally. You may use any of the text options shown on the **Text Editor** tab.

1. Double click on the Multiline text you want to edit.
2. Highlight the text, that you want to change, using click and drag.

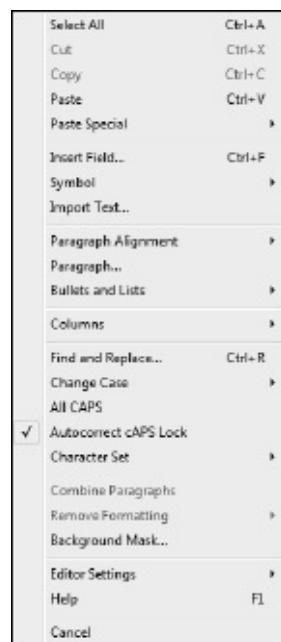

3. Make the changes then select the **Close Text Editor** tool.

**You may also edit many other Multiline Text features.**

1. Double click on the Multiline Text you wish to edit.
2. Right click in the **Text Box Area**.

The **Menu** shown opposite will appear.

## SINGLE LINE TEXT

**SINGLE LINE TEXT** allows you to draw one or more lines of text. The text is visible as you type. To place the text in the drawing, you may use the default **START POINT** (the lower left corner of the text), or use one of the many styles of justification described on the next page. Each line of text is treated as a separate object.

### USING THE DEFAULT START POINT

1. Select the **SINGLE LINE TEXT** command using one of the following:

**Ribbon = Annotate Tab / Text Panel /**

**or**

**Keyboard = DT <enter>**

2. The following prompts will appear on the command line:

Command: `_text`

Current text style: "STANDARD" Text height: 0.200 Annotative: No

Specify start point of text or [Justify/Style]: ***Place the cursor where the text should start and left click.***

Specify height <0.200>: ***type the height of your text <enter>.***

Specify rotation angle of text <0>: ***type the rotation angle then <enter>.***

Enter text: ***type the text string; press enter at the end of the sentence.***

Enter text: ***type the text string; press enter at the end of the sentence.***

Enter text: ***type the next sentence or press <enter> to stop.***

### USING JUSTIFICATION

If you need to be very specific, where your text is located, you must use the Justification option. For example if you want your text in the middle of a rectangular box, you would use the justification option "**Middle.**"

**The following is an example of Middle justification.**

1. Draw a Rectangle **6"** wide and **3"** high.
2. Draw a Diagonal **Line** from one corner to the other corner.

3. Select the **SINGLE LINE TEXT** command.

Command: `_text`

Current text style: "STANDARD" Text height: 0.200

4. Specify start point of text or[Justify/Style]: **type J <enter>**.
5. Enter an option [Align/Fit/Center/Middle/Right/TL/TC/TR/ML/MC/MR/BL/BC/BR]: **type M <enter>**.
6. Specify middle point of text: **snap to the midpoint of the diagonal line**.
7. Specify height <0.200>: **type 1 <enter>**.
8. Specify rotation angle of text <0>: **type 0 <enter>**.
9. Enter text: **type: HHHH <enter>**.
10. Enter text: **press <enter> to stop**.

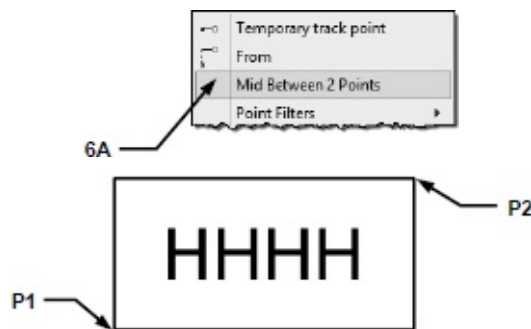

**Note:**

An alternative method of placing the text in the center of the rectangle is by using the “**Mid Between 2 points**” Object Snap. By using this method you will not need to draw the diagonal line, you just simply snap to the 2 diagonal corners.

When you get to **Step 6** replace the method with the following alternative method:

6. Hold down the **Shift key** then **right click**.
  - A. Select “**Mid Between 2 Points**” from the menu.
  - B. Left click on **P1** for the first mid point.
  - C. Left click on **P2** for the second mid point.
  - D. Continue on to **Step 7**.

**OTHER JUSTIFICATION OPTIONS:**

**ALIGN**

Aligns the line of text between two points specified.  
The height is adjusted automatically.

**FIT**

Fits the text between two points specified.  
The height is specified by you and does not change.

**CENTER** HyyHHyyHHyy

This is a tricky one. Center is located at the bottom center of Upper Case letters.

**MIDDLE** HHHHHHHHHH HHyHHyyHH

If only uppercase letters are used **MIDDLE** is located in the middle, horizontally and vertically. If both uppercase and lowercase letters are used **MIDDLE** is located in the middle, horizontally and vertically, but considers the lowercase letters as part of the height.

**RIGHT** HyyHHyyHHyy

Bottom right of upper case text.

**TL, TC, TR** HyyHHyyHHyy

Top left, Top center and Top right of upper and lower case text.

**ML, MC, MR** HyyHHyyHHyy

Middle left, Middle center and Middle right of upper case text. (Notice the difference between "Middle" and "MC.")

**BL, BC, BR** HyyHHyyHHyy

Bottom left, Bottom center and Bottom right of lower case text. (Notice the different location for **BR** and **RIGHT** shown above.

**BR** considers the lower case letters with tails as part of the height.)

# EDITING SINGLE LINE TEXT

## EDITING SINGLE LINE TEXT

Editing **Single Line Text** is somewhat limited compared to Multiline Text. In the example below you will learn how to edit the text within a Single Line Text sentence.

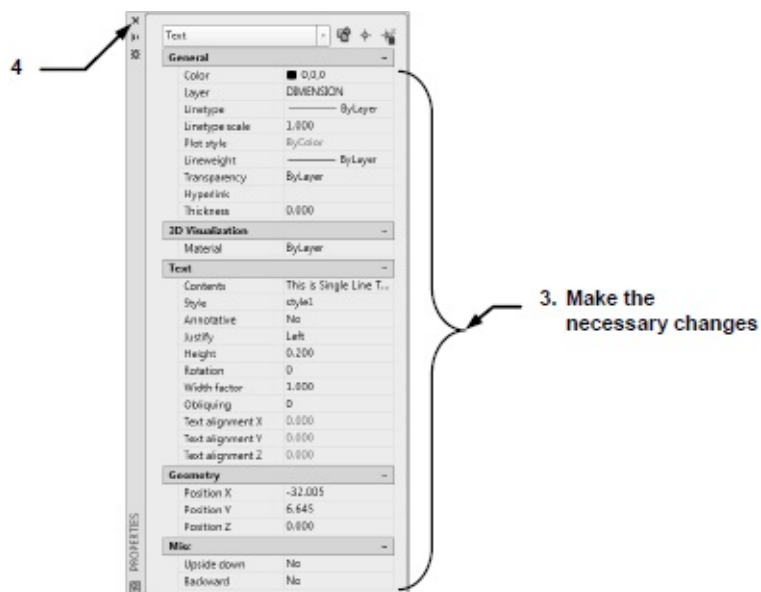

1. Double click on the **Single Line Text** you want to **edit**. The text will highlight.

This is Single Line Text.

2. Make the changes in place then press **<enter> <enter>**. (The second **<enter>** ends the command.)

## YOU CAN ALSO USE THE PROPERTIES PALETTE TO EDIT SINGLE LINE TEXT.

1. Single click on the **Single Line Text** you want to **edit**.
2. Right click and then select **Properties** from the menu.
3. Make any changes necessary then press the **Esc** key to deselect the text.
4. **Close** the Properties Palette.

## SPECIAL TEXT CHARACTERS

Characters such as the **Degree symbol ( ° )**, **Diameter symbol ( Ø )** and the **Plus / Minus symbols ( ± )** are created by typing %% and then the appropriate “code” letter.

<u>SYMBOL</u>	<u>CODE</u>
Ø Diameter	%%C
° Degree	%%D
± Plus / Minus	%%P

## SINGLE LINE TEXT

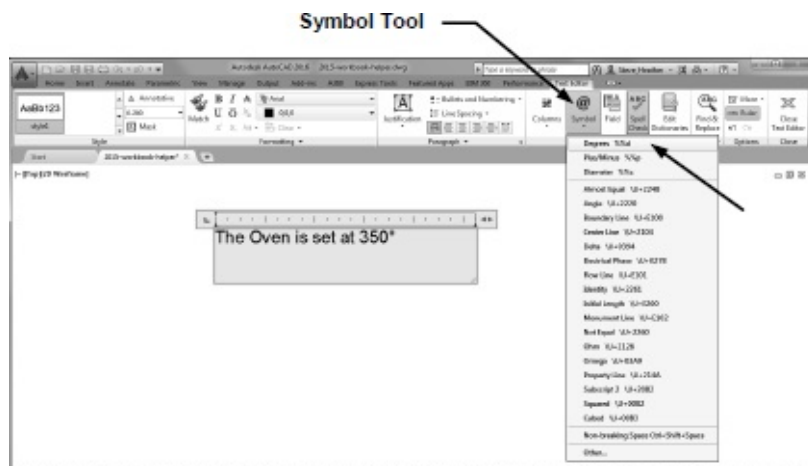

When using “Single Line Text”, type the code in the sentence. After you enter the code the symbol will appear.

### **Example:**

Entering **350%%D** will create: **350°**. The “D” is the “code” letter for degree.

## MULTILINE TEXT

When using Multiline Text you may enter the code in the sentence or you may select a symbol using the **Symbol Tool** located on the **Insert panel** of the **Text Editor** ribbon.

## Section 12

## UCS

## DISPLAYING THE UCS ICON

The **UCS icon** is merely a drawing aid that displays the location of the Origin. It can move with the Origin or stay in the default location. You can even change its appearance.

### SHOW UCS ICON AT ORIGIN

1. Right click on the **Origin icon**.
2. Select **UCS Icon Settings** from the shortcut menu.

3. **Show UCS Icon at Origin.**

- The UCS icon will follow the Origin as you move it. You will be able to see the Origin location at a glance.
- The UCS icon will not follow the Origin. It will stay in it's default location.

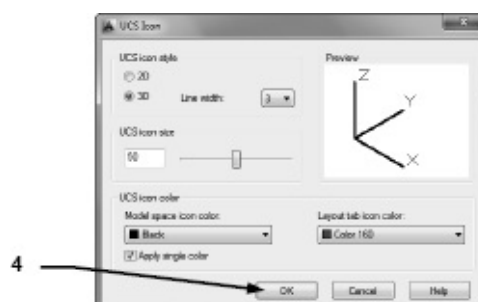

### HOW TO CHANGE THE UCS ICON APPEARANCE

1. Right click on the **Origin icon**.
2. Select **UCS Icon Settings** from the short cut menu.

3. Select **Properties.**

When you select this option the dialog box shown opposite will appear. You may change the Style, Size and Color of the icon at any time. Changing the appearance is personal preference and will not affect the drawing or commands.

4. When complete select the **OK** button.

## MOVING THE ORIGIN

The **ORIGIN** is where the **X**, **Y**, and **Z-axes** intersect. The Origin's **(0,0,0)** default location is in the lower left-hand corner of the drawing area. But you can move the Origin anywhere on the screen using the **UCS** command.

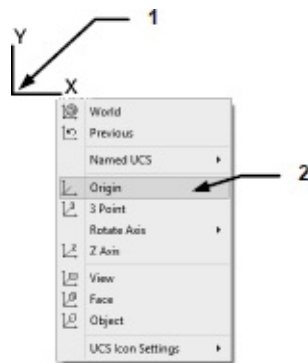

(The default location is designated as the “**World**” option or **WCS**. When it is moved it is **UCS**, User Coordinate System.)

You may move the Origin many times while creating a drawing. This is not difficult and will make it much easier to draw objects in specific locations.

Refer to the examples on the next page.

### TO MOVE THE ORIGIN:

1. Right click on the **Origin icon**.
2. Select **Origin** from the shortcut menu.
3. Place the new Origin location by entering coordinates or pressing the left mouse button.

### TO RETURN THE ORIGIN to the default “World” location (the lower left corner):

1. Right click on the **Origin icon**.
2. Select **World** from the shortcut menu.

**Why move the Origin? Examples on the next page.**

## EXAMPLES OF MOVING THE ORIGIN

### Why move the Origin?

If you move the **Origin** to the lower left corner of the rectangle it will make it very easy to accurately place the center of the circle.

### HOW TO PLACE THE CIRCLE ACCURATELY:

1. Select "**Origin**" from the shortcut menu as shown on the previous page.
2. Snap to the lower left corner of the rectangle using object snap **Endpoint**. (The UCS icon should now be displayed as shown above.)
3. Select the **Circle** command.
4. Enter the coordinates to the center of the circle: **2.554, 1.462 <enter>**
5. Enter the diameter: **1.384 <enter>**
6. Select "**World**" from the shortcut menu to return the UCS icon to its default location. (Refer to previous page.)

### More examples of why you would move the Origin:

There is also another method which you can use to move the **UCS**, it is also much quicker. You can select and drag the **UCS** to a new location, simply by clicking on the Icon until you see three blue grips, if you left click on the square grip you can then drag the Icon and snap it to a new location. Press **Esc** to clear the grips.

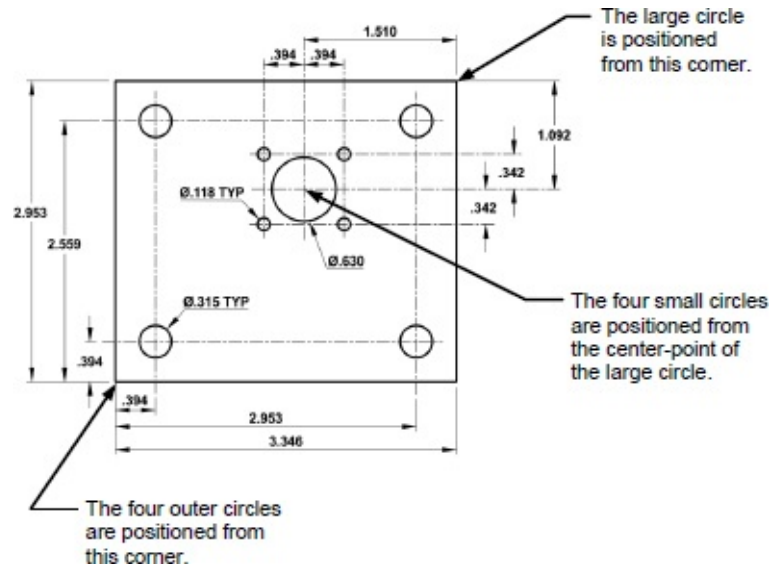

### Another example of why you would move the Origin:

Consider the example below; the four outer circles are positioned from the bottom left-hand corner of the rectangle. The large inner circle is positioned from the top

right-hand corner of the rectangle. And the four small circles are positioned from the large holes center-point.

To position all the circles accurately you could move the **UCS** to three different locations. The following page shows you how this is achieved.

1. Select the **UCS** icon then left click on the **square grip**.
2. Move the **UCS** icon to position **P1**.
3. Create and position the four outer circles.

4. Select the **UCS** icon then left click on the **square grip**.
5. Move the **UCS** icon to position **P2**.
6. Create and position the large inner circle.

7. Select the **UCS** icon then left click on the **square grip**.

8. Move the **UCS** icon to position **P3**.
9. Create and position the four inner small circles.

## **Section 13**

## **Constraints**

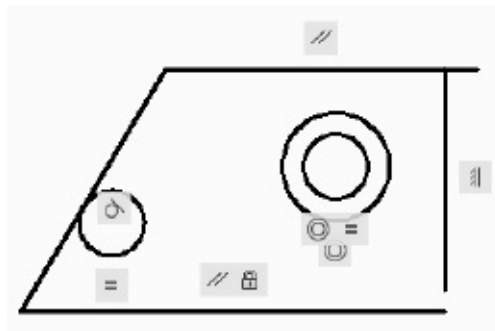

## PARAMETRIC DRAWING

**Parametric Drawing** is a method of assigning a constraint to an object that is controlled by another object. For example, you could put a constraint on line #1 to always be parallel to line #2. Or you could put a constraint on diameter #1 to always be the same size as diameter #2. If you make a change to #1 AutoCAD automatically makes the change to #2 depending on which constraint has been assigned.

**There are two general types of constraints:**

**GEOMETRIC:** Controls the relationship of objects with respect to each other. The Geometric constraints that will be discussed in this workbook are coincident, collinear, concentric, fix, parallel, perpendicular, horizontal, vertical, tangent, symmetrical and equal.

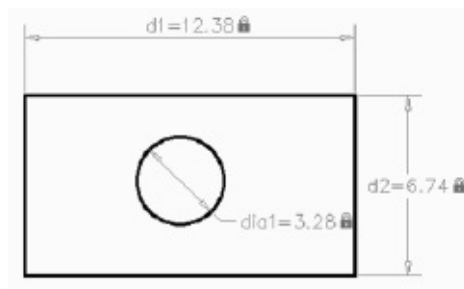

**Example:**

**DIMENSIONAL:** Dimensional constraints control the size and proportions of objects. They can constrain:

- Distances between objects or between points on objects.
- Angles between objects or between points on objects.
- Sizes of arcs and circles.

**Example:**

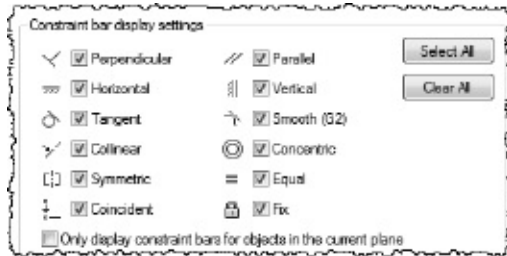

# GEOMETRIC CONSTRAINTS

## Overview of Geometric Constraints.

Geometric constraints control the relationship of objects with respect to each other. For example, you could assign the parallel constraint to 2 individual lines to assure that they would always remain parallel.

A list of Geometric Constraints available and their icons:

You can apply geometric constraints to 2D geometric objects only. Objects cannot be constrained between model space and paper space.

### When you apply a constraint, two things happen:

1. The object that you select adjusts automatically to conform to the specified constraint.
2. A gray constraint icon displays near the constrained object.

### Example:

If you apply the **Parallel** constraint to lines **A** and **B** you can insure that line **B** will always be parallel to line **A**.

## HOW TO APPLY GEOMETRIC CONSTRAINTS

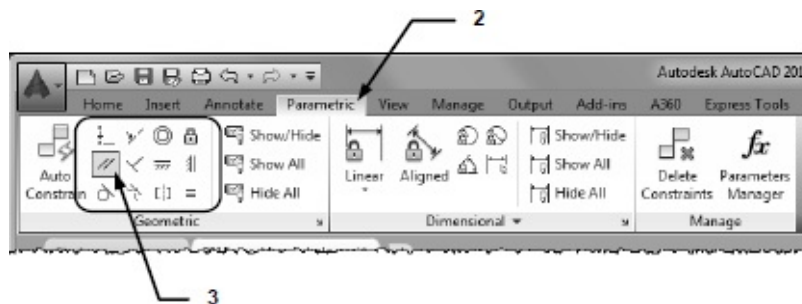

The following is an example of how to apply the Geometric Constraint **Parallel** to 2D objects.

*The remaining Geometric Constraints are described on the following pages.*

1. Draw the objects.  
Geometric constraints must be applied to **existing** geometric objects.

2. Select the **Parametric** tab.

3. Select a Geometric constraint tool from the Geometric panel.  
(In this example the **Parallel** constraint has been selected.)
4. Select the objects that you want to constrain.  
In most cases the order in which you select two objects is important. Normally the second object you select adjusts to the first object. In the example shown below **Line A** is selected first and **Line B** is selected second. As a result **Line B** adjusts to **Line A**.

## COINCIDENT CONSTRAINT

A coincident constraint forces two points to coincide.

1. Draw the objects.

2. Select the **Coincident** tool from the Geometric panel.

3. Select the first **Point**.  
(Remember it is important to select the points in the correct order. The first point will be the base location for the second point.)

4. Select the second Point.  
(Remember it is important to select the points in the correct order. The second point will move to the first point.)

The points are now locked together. If you move one object the other object will move also and the points will remain together.

## COLLINEAR CONSTRAINT

A collinear constraint forces two lines to follow the same infinite line.

1. Draw the objects.

2. Select the **Collinear** tool from the Geometric panel.

3. Select the first line.  
(The first line selected will be the base and the second line will move.)

4. Select the second line.  
(The second line will move in line with the first line selected.)

The two lines are now locked in line. If you move one line the other line will move also and they will remain **collinear**.

## CONCENTRIC CONSTRAINT

A concentric constraint forces selected circles, arcs, or ellipses to maintain the same center point.

1. Draw the objects.

2. Select the **Concentric** tool from the Geometric panel.

3. Select the first circle.  
(The first circle selected will be the base and the second circle will move.)

4. Select the second circle.

The second circle moves to have the same center point as the first object.

## FIXED CONSTRAINT

A Fixed constraint fixes a point or curve to a specified location and orientation relative to the Origin (World Coordinate System, WCS).

1. Draw the object.

2. Select the **Fixed** tool from the Geometric panel.

3. Select the Fixed location.

The bottom left corner is now fixed to the specified location but the other three corners can move. (**Note:** The “**Lock**” symbol may appear in a slightly different location)

Fixed corner but the other corners can move using grips

## PERPENDICULAR CONSTRAINT

A Perpendicular constraint forces two lines or polyline segments to maintain a 90 degree angle to each other.

1. Draw the objects.

2. Select the **Perpendicular** tool from the Geometric panel.

3. Select the First object.

(The first object will be the base angle and the second will rotate to become perpendicular to the first.)

4. Select the Second object.

The second object rotated to become perpendicular to the first object.

## HORIZONTAL CONSTRAINT

The Horizontal constraint forces a line to remain **parallel to the X-axis** of the **current UCS**.

1. Draw the objects.

2. Select the **Horizontal** tool from the Geometric panel.

3. Select the **Object**.

The object selected becomes **horizontal to the X-Axis of the current UCS**.

**Note:** If the object is a Polyline or Polygon use the “**2 point**” option. The **first** point will be the **pivot** point.

## VERTICAL CONSTRAINT

The Vertical constraint forces a line to remain **parallel to the Y-axis** of the **current UCS**.

1. Draw the objects.

2. Select the Vertical tool from the Geometric panel.

3. Select the **Object**.

The object selected becomes **vertical to the Y-Axis of the current UCS**.

**Note:** If the object is a Polyline or Polygon use the “**2 point**” option. The **first** point will define the **pivot** point.

## TANGENT CONSTRAINT

The Tangent constraint forces two objects to maintain a **point of tangency** to each other.

1. Draw the objects.

2. Select the **Tangent** tool from the Geometric panel.

3. Select the base object (Large Circle) and then the object (Line) to be tangent.

4. Select the base object (Large Circle) and then the object (Small Circle) to be tangent.

## SYMMETRIC CONSTRAINT

The Symmetric constraint forces two objects on a object to maintain **symmetry about a selected line**.

1. Draw the objects.

2. Select the **Symmetric** tool from the Geometric panel.

3. Select the base line (**1**) then the Line (**2**) to be symmetrical and then the line (**3**) to be symmetrical about.

4. Select the base line (1) then the Line (2) to be symmetrical and then the line (3) to be symmetrical about.

## EQUAL CONSTRAINT

The Equal constraint forces two objects to be **equal in size**. (Properties are not changed)

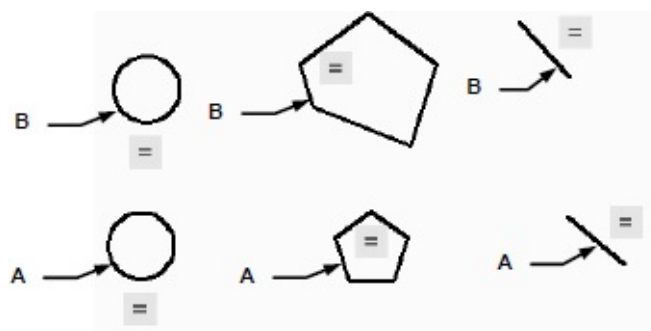

1. Draw the objects.

2. Select the **Equals** tool from the Geometric panel.

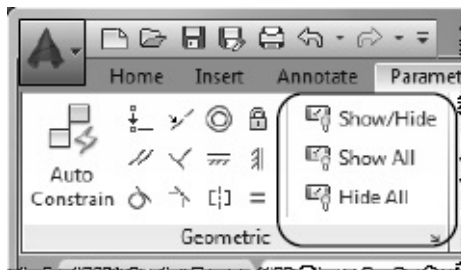

3. Select the base object (A) then select the object (B) to equal the selected base object.

## CONTROLLING THE DISPLAY OF GEOMETRIC CONSTRAINT ICONS

You may temporarily Hide the Geometric constraints or you may show individually selected constraints using the **Show** and **Hide** tools.

## Show All

This tool displays all geometric constraints.  
Click on the tool and the constraints appear.

## Hide All

This tool hides all geometric constraints.  
Click on the tool and the constraints disappear.

## Show / Hide

After you have selected the **Hide All** tool to make the constraints disappear, you may display individually selected geometric constraints.

1. Select the **Show/Hide** tool.
2. Select the object.
3. Press **<enter>**
4. Press **<enter>**

The geometric constraints for only the selected objects will appear.

# DIMENSIONAL CONSTRAINTS

## OVERVIEW OF DIMENSIONAL CONSTRAINTS

Dimensional constraints determine the distances or angles between objects, points on objects, or the size of objects.

Dimensional constraints include both a name and a value.

Dynamic constraints have the following characteristics:

- A. Remain the same size when zooming in or out.
- B. Can easily be turned on or off.
- C. Display using a fixed dimension style.
- D. Provide limited grip capabilities.
- E. Do not display on a plot.

There are 7 types of dimensional constraints. (They are similar to dimensions)

1. Linear
2. Aligned
3. Horizontal
4. Vertical
5. Angular
6. Radial
7. Diameter

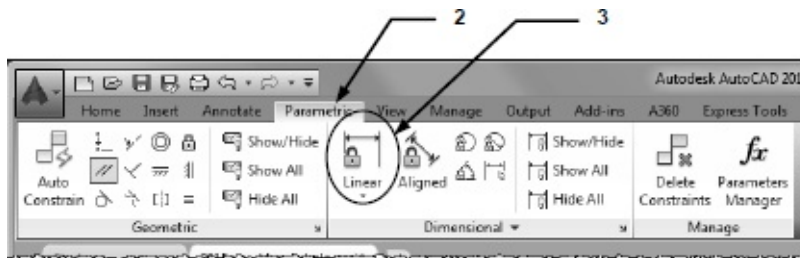

The following is an example of a drawing with dimensional constraints. The following pages will show you how to add dimensional constraints and how to edit them.

## HOW TO APPLY DIMENSIONAL CONSTRAINTS

The following is an example of how to apply the dimensional constraint **Linear** to a 2D object.

1. Draw the objects.
2. Select the **Parametric** tab.

3. Select a Dimensional Constraint tool from the Dimensional panel. (In this example the **Linear** tool has been selected)
4. Apply the “**Linear**” dimensional constraint as you would place a linear dimension.
  - A. Place the first point.
  - B. Place the second point.
  - C. Place the dimension line location.
5. Enter the desired value or **<enter>** to accept the displayed value. (Notice the constraint is highlighted until you entered the value)

6. The Dimensional constraint is then displayed with **Name (d1)** and **Value (12.38)**.

## HOW TO USE DIMENSIONAL CONSTRAINTS

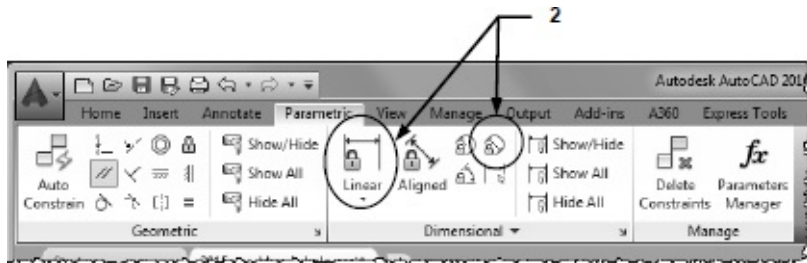

The following is an example of how to use dimensional constraint to change the dimensions of a 2D object.

1. Draw the objects.  
(Size is not important. The size will be changed using the dimensional constraints.)

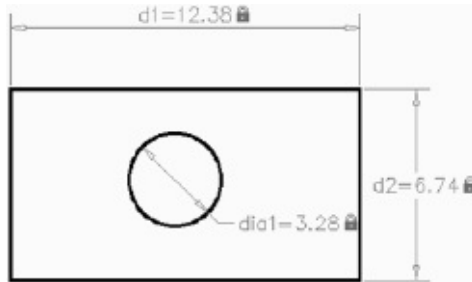

2. Apply Dimensional constraints.  
**Linear** and **Diameter**.

**Note:**

Dimensional constraints are very faint and will not print. If you want them to print refer to [page 13-24](#)

Now adjust the length and width using the dimensional constraints.

1. Double click on the **d1 dimensional constraint**.

2. Enter the new value for the length then press **<enter>**

**Note:** The length increased automatically in the direction of the “**2nd endpoint.**” If you want the length to change in the other direction you must apply the **geometric constraint “Fixed”** to the right hand corners. (See [page 13-8](#))

3. Double click on the **d2 dimensional constraint** and enter the new value for the width then press **<enter>**

## PARAMETER MANAGER

The Parameter Manager enables you to manage dimensional parameters. You can change the name, assign a numeric value or add a formula as its expression.

1. Select the **Parameter Manager** from the **Parametric tab / Manage Panel**.

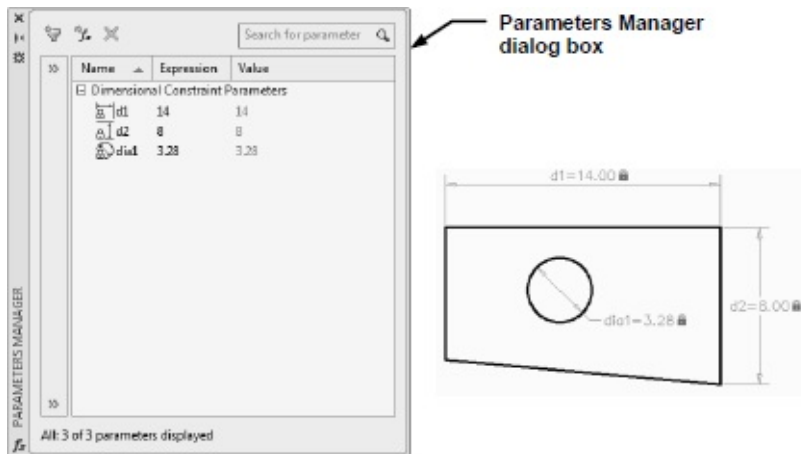

## COLUMN DESCRIPTIONS:

**Name:** Lists all of the dimensional constraints. The order can be changed to ascending or descending by clicking on the up or down arrow.

**Expression:** Displays the numeric value or formula for the dimension.

**Value:** Displays the current numeric value.

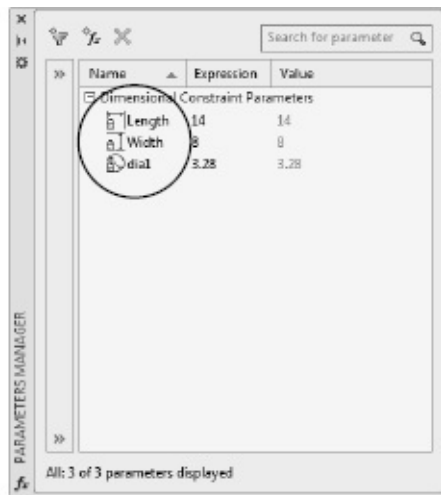

## PARAMETER MANAGER NAME CELL

You may change the name of the dimension to something more meaningful. For example you might change the name to **Length** and **Width** rather than **d1** and **d2**.

1. Double click in the **Name Cell** that you want to change.
2. Type the new name and press **<enter>**

### Example:

The names in the Parameter Manager shown below have been changed. Notice the dimensional constraints in the drawing changed also.

## PARAMETER MANAGER EXPRESSION CELL

You may change the value of a dimensional constraint by clicking on the Expression cell and entering a new value or formula.

1. Open the **Parameter Manager**.
2. Double click in the **Expression Cell** to change (**dia1** in this example)

3. Enter new value or formula.  
For this example: **width/2**  
This means the diameter will always be half the value of **d2** (width).

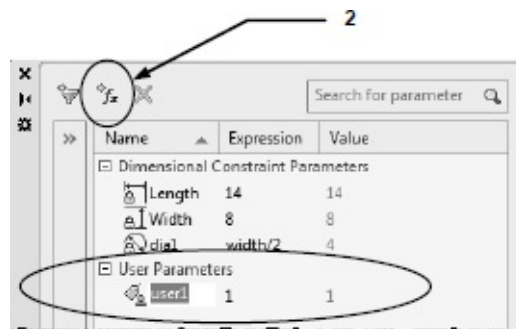

***Now whenever the width is changed the diameter will adjust also.***

## ADDING USER-DEFINED PARAMETERS

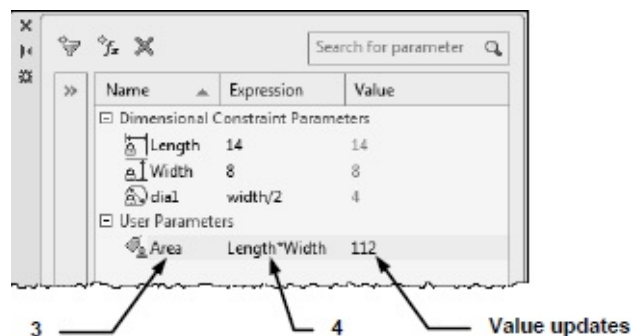

You may create and manage parameters that you define.

1. Open the **Parameter Manager**.
2. Select the “**New user parameter**” button.  
A “**User Parameters**” will appear.

3. Enter a desired **Name** for the expression.
4. Enter an **Expression**.

*The Value cell updates to display the current value.*

**Note:** With Imperial Units, the parameter manager interprets a minus or a dash (-) as a unit separator rather than a subtraction operation. To specify subtraction, include at least one space before or after the minus sign. For example, to subtract 9” from 5’, enter 5’ -9” rather than 5’-9”

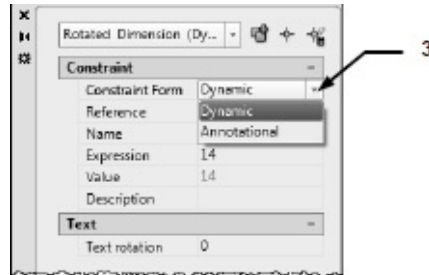

## CONVERT A DIMENSIONAL CONSTRAINT TO AN ANNOTATIONAL CONSTRAINT

Geometric and Dimensional constraints **do not plot**. If you would like to plot them you must convert them to an **Annotational Constraint**.

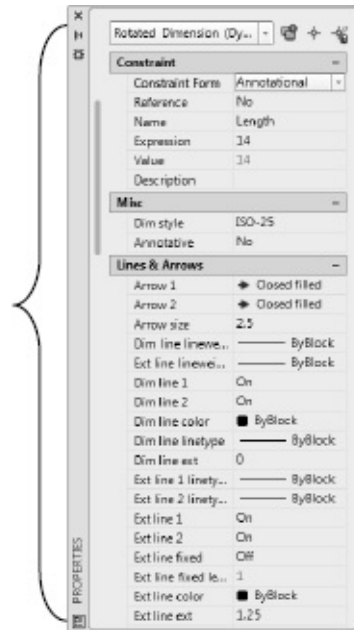

1. Select the **Constraint** to convert. (Click on it once)

2. Right click and select **Properties** from the list.
3. Select the **Constraint Form** down arrow and select **Annotational**.

4. The Properties palette is populated with additional properties as the constraint is now an Annotational Constraint.

5. The Annotational Constraint **will now plot**.

## CONTROL THE DISPLAY OF DIMENSIONAL CONSTRAINTS

You may turn off the display of Dimensional constraints using the **Show** and **Hide** tools. (Refer to [page 13-15.](#))

## DELETE A DIMENSIONAL CONSTRAINT

To permanently delete a dimensional constraint select the **Delete Constraints** button and then select the constraint to delete.

**Notes:**

# APPENDIX-A

# APPENDIX-B

## FREQUENTLY ASKED QUESTIONS

Q. **My Command Line has disappeared, how do I get it back?**

A. Press **Ctrl+9** on your keyboard. You can also use the same method to turn off the Command Line.

Q. **How do I change the Model Space background color?**

A. Right click with your mouse and select **Options / Display tab / Colors button**, in the **Context** window select **2D model space**, then select the **Color** drop-down list and change the color. Select **Apply & Close**. You can restore the original colors by selecting **Restore classic colors**.

Q. **How do I change the AutoCAD theme color?**

A. Right click with your mouse and select **Options / Display tab**, in the **Window Elements** window select the **Color scheme** drop-down list, then change the theme color to either **Dark** or **Light**. Select **Apply** then **OK**.

Q. **How do I reset AutoCAD to default factory settings?**

**WARNING:** Resetting AutoCAD to default factory settings will remove any custom templates, toolbars, ribbon tabs, and any modifications you have made. If you have any custom templates it is advisable to save them in a different location before resetting.

A. **Windows 7**

1. Select the Start menu.
2. Select the Autodesk folder.
3. Select the Autocad 2016 folder.
4. Select **“Reset Settings to Default.”**

A. **Windows 8**

1. Select the Windows button to access the interface.
2. Right-click near the bottom of the screen.
3. Select **All Apps**.
4. In the AutoCAD section select **“Reset Settings to Default.”**
