For each of the sequences in Exercises 23–52 determine whether the sequence is monotonic or eventually monotonic and whether the sequence is bounded above and/or below. If the sequence converges, give the limit.

23.  $\{11\}$
24.  $\left\{1 + \frac{1}{k}\right\}$
25.  $\left\{\sin\left(\frac{k\pi}{2}\right)\right\}$
26.  $\{\cos(k\pi)\}$
27.  $\left\{\frac{(-1)^k}{k+6}\right\}$
28.  $\{k^{1/10}\}$
29.  $\{(3^{-k} - 2)\}$
30.  $\left\{\left(\frac{1}{5}\right)^k\right\}$
31.  $\left\{\frac{k - 2^{-k}}{2^k}\right\}$
32.  $\left\{\frac{2^k - 2^{-k}}{2^k}\right\}$
33.  $\left\{\frac{k}{2+k}\right\}$
34.  $\left\{\frac{k^2 - 2}{k^2 + 2k + 2}\right\}$
35.  $\left\{\left(1 + \frac{1}{k}\right)^2\right\}$
36.  $\left\{\left(1 + \frac{1}{k}\right)^k\right\}$
37.  $\left\{\frac{2^k}{k!}\right\}$
38.  $\left\{\frac{k^2 - 2}{k^2 + 2k + 2}\right\}$
39.  $\{3^{1/k}\}$
40.  $\{k!\}$
41.  $\{(42 + (-1)^k)\}$
42.  $\left\{\frac{k}{k^2 + 2k + 2}\right\}$
43.  $\left\{\left(\frac{2k^2}{k^2 + 2k + 2}\right)^3\right\}$
44.  $\left\{\frac{k^2 - 1}{10000k + 2}\right\}$
45.  $\left\{\left(42 - \frac{k}{k^2 - 2k + 50}\right)\right\}$
46.  $\left\{\tan\left(\frac{k\pi}{2}\right)\right\}$
47.  $\left\{\frac{1 \cdot 3 \cdot 5 \cdots (2k-1)}{10^k}\right\}$
48.  $\left\{\frac{1 \cdot 3 \cdot 5 \cdots (2k-1)}{1 \cdot 4 \cdot 7 \cdots (3k-2)}\right\}$
49.  $\left\{\frac{\sin k}{k}\right\}$
50.  $\left\{\frac{k+1}{k+7}\right\}$
51.  $\left\{\frac{(k!)^2}{(2k)!}\right\}$
52.  $\left\{\frac{(k!)^3}{(3k)!}\right\}$

For the sequences in Exercises 53 and 54, determine whether the sequence converges or diverges. If the sequence converges, give the limit.

53.  $\{(k!)^{1/k}\}$
54.  $\{k^{1/k!}\}$

Evaluate the limits in Exercises 55–60. Use the theorems in this section to justify each step of your work.

55.  $\lim_{k \rightarrow \infty} \frac{\sin k}{2^k}$  (Hint: Use the Squeeze Theorem.)
56.  $\lim_{k \rightarrow \infty} \left(1 + \frac{1}{k}\right)\left(2 - \frac{1}{k}\right)$
57.  $\lim_{k \rightarrow \infty} \frac{k-7}{3k+5}$
58.  $\lim_{k \rightarrow \infty} \frac{k^3 + 1}{k^2}$
59.  $\lim_{k \rightarrow \infty} (\sqrt{k^2 + k} - k)$
60.  $\lim_{k \rightarrow \infty} (\sqrt{k^3 + k + 1} - \sqrt{k^3 - k - 1})$  (Hint: Write as a quotient and rationalize the numerator.)

## Applications

61. Suppose you invest \$100.00 in a bank that pays you a nominal annual interest rate of 6%. The bank offers you the option of compounding your money  $n$  times over the course of a year. Your balance in the account after one year is given by

$$a_k = 100.00 \left(1 + \frac{0.06}{k}\right)^k.$$

Find the balance in the account, rounded to the nearest cent, if you compound the interest  $k$  times during the year,

where  $k$  is 1, 2, 6, 12, 52, and 365. You should see that the balance at the end of the year is increasing. Do you believe the sequence is bounded? If so, by what value? Be as specific as possible.

62. We may use a recursively defined sequence to approximate the current amount of a radioactive element. For example, radioactive radium changes into lead over time. The rate of decay is proportional to the amount of radium present. Experimental data suggests that a gram of radium decays into lead at a rate

of  $\frac{1}{2337}$  gram per year. Let  $a_k$  be the amount of radium at the end of year  $k$ . Since the decay rate is constant, if we use a linear model to approximate the amount that remains after one year has passed, we have

$$a_1 = a_0 - \frac{1}{2337} a_0 = \frac{2336}{2337} a_0.$$

More generally, we obtain the recursion formula

$$a_{k+1} = \frac{2336}{2337} a_k.$$

Use this formula to estimate how much radium remains after 100 years if we start off with  $a_0 = 10$  grams of radium.

## Proofs

63. Prove that the geometric sequence  $\{r^k\}_{k=0}^{\infty}$  diverges when  $r < -1$ .
64. Prove that the sequence of factorials  $\{k!\}$  dominates every sequence of exponential functions  $\{b^k\}$ , where  $b > 0$ , by applying the ratio test from Theorem 7.6 to the sequence of quotients  $\left\{\frac{k!}{b^k}\right\}$ .

Complete the proof of Theorem 7.18 by evaluating the limits of the sequences in Exercises 65 and 66.

65. Explain why  $\lim_{k \rightarrow \infty} k^{1/k}$  is an indeterminate form. Use L'Hôpital's Rule or another valid method to prove that  $k^{1/k} \rightarrow 1$ .
66. Prove that  $\left(\frac{1}{k}\right)^p \rightarrow 0$ , when  $p > 0$ .

In Exercises 67–70, let  $\{a_k\}$  and  $\{b_k\}$  be convergent sequences with  $a_k \rightarrow L$  and  $b_k \rightarrow M$  as  $k \rightarrow \infty$  and let  $c$  be a constant. Prove the indicated basic limit rules from Theorem 7.11. You may wish to model your proofs on the proofs of the analogous statements from Section 1.5.

67. Prove that  $ca_k \rightarrow cL$ .
68. Prove that  $(a_k + b_k) \rightarrow L + M$ .
69. Prove that  $a_k b_k \rightarrow LM$ .
70. Prove that if  $M \neq 0$ , then  $\frac{a_k}{b_k} \rightarrow \frac{L}{M}$ .

In Exercises 71–74 let  $\{a_k\}$  be a sequence. Prove the indicated limit rules from Theorem 7.12. You may wish to model your proofs on the proofs of the analogous statements from Section 1.5.

71. Prove that if  $a_k \rightarrow L$  and  $a_k \rightarrow M$ , then  $L = M$ .
72. Prove that if  $\{a_k\} \rightarrow L$  and  $f$  is a function that is continuous at  $L$ , then  $f(a_k) \rightarrow f(L)$ .
73. Prove that if  $\{m_k\}$  and  $\{M_k\}$  are sequences that both converge to  $L$ , and if  $m_k \leq a_k \leq M_k$  for all  $k$ , then  $a_k \rightarrow L$ .
74. Prove that if  $|a_k| \rightarrow 0$ , then  $a_k \rightarrow 0$ .

75. Prove Theorem 7.9. That is, let  $a : [1, \infty) \rightarrow \mathbb{R}$  be a continuous function and let  $a_k = a(k)$  for every  $k \in \mathbb{Z}^+$ . Show that if  $\lim_{x \rightarrow \infty} a(x) = L$ , then  $\{a_k\} \rightarrow L$ .

76. Prove that the converse of Theorem 7.9 is not true by finding a continuous function  $a : [1, \infty) \rightarrow \mathbb{R}$  such that  $\lim_{x \rightarrow \infty} a(x)$  does not exist but  $\{a(k)\}$  converges.

77. Prove that if  $\{a_k\}$  is a sequence of nonzero terms with the property that  $\lim_{k \rightarrow \infty} a_k = \infty$ , then  $\frac{1}{a_k} \rightarrow 0$ .

Prove the statements about the convergence or divergence of sequences in Exercises 78–83, referring to theorems in the section as necessary. For each of these statements, assume that  $r$  is a real number and  $p$  is a positive real number.

78.  $k^p \rightarrow \infty$
79.  $\left(\frac{1}{k}\right)^p \rightarrow 0$
80. If  $r = 1$ , then  $r^k \rightarrow 1$ .
81. If  $|r| > 1$ , then the sequence  $\{r^k\}$  diverges and  $|r|^k \rightarrow \infty$ .
82. If  $|r| < 1$ , then the sequence  $r^k \rightarrow 0$ .
83.  $\frac{k^r}{(1+p)^k} \rightarrow 0$ .
84. Prove that if  $\lim_{k \rightarrow \infty} a_k = L$ , then  $\lim_{k \rightarrow \infty} a_{k+1} = L$ .

85. Prove that every convergent sequence is bounded.
86. Consider the sequence  $\{a_k\}$  defined recursively by  $a_1 = 1$  and for  $k > 1$ ,  $a_k = \sqrt{2a_{k-1}}$ . Prove that  $a_k \rightarrow 2$  by first proving that the limit must exist. (Hint: Use induction to show that the terms of the sequence may be expressed with the closed formula for  $a_k = 2^{1-(1/2)^{k-1}}$ .)
87. Let  $\{a_k\}$  be a sequence such that  $a_{2k} \rightarrow L$  and  $a_{2k+1} \rightarrow L$ . Prove that  $\{a_k\} \rightarrow L$ . (What you will have proven is that if the even terms and odd terms of a sequence both converge to  $L$ , then the sequence converges to  $L$ .)
88. Prove Theorem 7.14. That is, show that if  $\{a_k\}$  is a sequence that converges to  $L$ , then every subsequence of  $\{a_k\}$  also converges to  $L$ .

## Thinking Forward

- *A sequence of sums:* Consider the sequence  $\{a_k\}_{k=0}^{\infty}$  where  $a_k = 1 + \frac{1}{2} + \frac{1}{4} + \cdots + \frac{1}{2^k}$ . Note that after the zeroth term, every term is given by a sum. As  $k$  increases, the sum increases, so we see that this is an increasing sequence. Find a closed formula for  $a_k$  to show that the sequence is bounded and therefore converges.

- *Another sequence of sums:* Consider the sequence  $\{a_k\}_{k=1}^{\infty}$  where  $a_k = 1 + \frac{1}{2} + \frac{1}{3} + \cdots + \frac{1}{k}$ . Draw the graph of this sequence together with the graph of  $f(x) = \frac{1}{x}$ . Argue that  $a_k \geq \int_1^k \frac{1}{x} dx$ . What is  $\lim_{k \rightarrow \infty} \int_1^k \frac{1}{x} dx$ ? What does the value of this improper integral imply about the convergence of  $\{a_k\}$ ?

## 7.3 SERIES

- ▶ Series as limits of partial sums of sequences
- ▶ Convergence of series in terms of convergence of sequences of partial sums
- ▶ Geometric series and when they converge or diverge

### Adding Up Sequences to Get Series

If we take an infinite sequence and add up all of its terms, we get what is known as a **series**:

#### DEFINITION 7.21

##### Series of Real Numbers

A **series**  $\sum_{k=1}^{\infty} a_k$  is the sum of the terms of a sequence  $\{a_k\}$  of real numbers:

$$\sum_{k=1}^{\infty} a_k = a_1 + a_2 + a_3 + \cdots + a_k + \cdots$$

For each positive integer index  $k$ ,  $a_k$  is called the ***k*th term of the series**.

Of course if we wish to, we can also choose to start a series at an index other than  $k = 1$ . For example,  $\sum_{k=3}^{\infty} \frac{1}{k^2} = \frac{1}{9} + \frac{1}{16} + \frac{1}{25} + \cdots$  is a series.

Given a sequence, we can sum up the terms to get a series. We can also consider partial sums of a series to obtain another sequence:

#### DEFINITION 7.22

##### The Sequence of Partial Sums Associated with a Series

Given a series  $\sum_{k=1}^{\infty} a_k$ , for each positive integer  $n$  we can consider the **partial sum**,  $S_n$ , of the first through  $n$ th terms. That is,

$$S_n = a_1 + a_2 + a_3 + \cdots + a_n.$$

Considered together these form a **sequence of partial sums**:

$$\{S_n\} = \left\{ \sum_{k=1}^n a_k \right\} = \{a_1, (a_1 + a_2), (a_1 + a_2 + a_3), \dots, (a_1 + a_2 + a_3 + \cdots + a_n), \dots\}.$$

In other words, every series is a limit of partial sums:

$$\sum_{k=1}^{\infty} a_k = \lim_{n \rightarrow \infty} \sum_{k=1}^n a_k = \lim_{n \rightarrow \infty} S_n.$$

We can determine the long-term behavior of a series by examining the long-term behavior of its partial sums. For example, the series

$$\sum_{k=0}^{\infty} 2^k = 1 + 2 + 2^2 + 2^3 + \cdots + 2^k + \cdots$$

is the sum of a sequence of infinitely many numbers, each larger than the one before it. The partial sums for this series grow as we add up more and more terms, and the sum of

all the terms will be infinite. In other words, the sequence of partial sums clearly diverges to  $\infty$ :

$$\{S_n\} = \{1, 1 + 2, 1 + 2 + 2^2, 1 + 2 + 2^2 + 2^3, \dots\} = \{1, 3, 7, 15, 31, \dots\}.$$

In contrast, we will soon see that the series

$$\sum_{k=0}^{\infty} \left(\frac{1}{2}\right)^k = 1 + \frac{1}{2} + \left(\frac{1}{2}\right)^2 + \left(\frac{1}{2}\right)^3 + \dots + \left(\frac{1}{2}\right)^k + \dots$$

adds up to the real number 2. Just as with Riemann sums, in this example we are adding up infinitely many terms but the terms themselves are becoming infinitely small. Later in the section we will see that the sequence of partial sums for this sequence converges to 2; no matter how many terms in the series we add up, the sum never gets larger than 2:

$$\begin{aligned} \{S_n\} &= \left\{1, 1 + \frac{1}{2}, 1 + \frac{1}{2} + \left(\frac{1}{2}\right)^2, 1 + \frac{1}{2} + \left(\frac{1}{2}\right)^2 + \left(\frac{1}{2}\right)^3, \dots\right\} \\ &= \left\{1, \frac{3}{2}, \frac{7}{4}, \frac{15}{8}, \frac{31}{16}, \dots\right\}, \text{ which converges to } 2. \end{aligned}$$

## Convergence and Divergence of Series

In general, a series will converge to a real number, or not, depending on whether the limit of its partial sums converges to a real number:

### DEFINITION 7.23

#### Convergence or Divergence of a Series

Suppose  $\sum_{k=1}^{\infty} a_k$  is a series whose sequence of partial sums is  $S_n = \sum_{k=1}^n a_k$ . We say that the series **converges to a limit**  $L$  if  $\{S_n\}$  converges to  $L$ ; that is,

$$\sum_{k=1}^{\infty} a_k = L \quad \text{when} \quad \lim_{n \rightarrow \infty} \left( \sum_{k=1}^n a_k \right) = \lim_{n \rightarrow \infty} S_n = L.$$

In this case we say that the **sum** of the series is  $L$ . We say that a series **diverges** if its sequence of partial sums diverges.

Although sequences of partial sums may seem to be an additional complication, basing the convergence of a series on such sequences is the most natural thing we can do. The sequence of partial sums simply considers adding one additional term at a time. If the limit of the sequence of partial sums converges as we add more and more terms, then we say that the series converges, too.

Unfortunately, not every sequence whose terms become infinitely small will have a corresponding series that converges. For example, we will soon see that the series

$$\sum_{k=1}^{\infty} \frac{1}{k} = 1 + \frac{1}{2} + \frac{1}{3} + \dots + \frac{1}{k} + \dots$$

does not add up to a finite real number, even though the terms of the sequence  $\left\{\frac{1}{k}\right\}$  tend to zero. The fact that the series  $\sum_{k=1}^{\infty} \frac{1}{k}$  diverges is not immediately clear from examining the first few terms of its sequence of its partial sums:

$$\{S_n\} = \left\{1, 1 + \frac{1}{2}, 1 + \frac{1}{2} + \frac{1}{3}, 1 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4}, \dots\right\} = \left\{1, \frac{3}{2}, \frac{11}{6}, \frac{25}{12}, \frac{137}{60}, \dots\right\}.$$

Although it is difficult to tell from just the first few terms, we will see in Section 7.4 that this sequence of partial sums eventually grows without bound, even though with each term we are adding smaller and smaller numbers to the partial sums.

Determining whether a given series converges or diverges is not always an easy task. In fact, most of the rest of this chapter is devoted to developing techniques for determining whether series converge or diverge.

## The Algebra of Series

Convergent series obey most of the algebraic rules we might expect, although in Section 7.7 we will see that there are some surprises, too. The following theorem guarantees that series behave well with respect to sums and constant multiples:

### THEOREM 7.24

#### Sums and Constant Multiples of Convergent Series

If  $\sum_{k=1}^{\infty} a_k$  and  $\sum_{k=1}^{\infty} b_k$  are convergent series and  $c$  is any real number, then

$$(a) \quad \sum_{k=1}^{\infty} c a_k = c \sum_{k=1}^{\infty} a_k \qquad (b) \quad \sum_{k=1}^{\infty} (a_k + b_k) = \sum_{k=1}^{\infty} a_k + \sum_{k=1}^{\infty} b_k$$

This theorem is unsurprising, since we already know that both limits and sums commute with sums and constant multiples. We will prove part (b) and leave the proof of part (a) to Exercise 84.

#### **Proof.**

(b) The result follows from looking at limits of partial sums:

$$\begin{aligned} \sum_{k=1}^{\infty} (a_k + b_k) &= \lim_{n \rightarrow \infty} \sum_{k=1}^n (a_k + b_k) && \leftarrow \text{definition of series} \\ &= \lim_{n \rightarrow \infty} \left( \sum_{k=1}^n a_k + \sum_{k=1}^n b_k \right) && \leftarrow \text{sums commute with sums} \\ &= \lim_{n \rightarrow \infty} \sum_{k=1}^n a_k + \lim_{n \rightarrow \infty} \sum_{k=1}^n b_k && \leftarrow \text{sums commute with limits} \\ &= \sum_{k=1}^{\infty} a_k + \sum_{k=1}^{\infty} b_k. && \leftarrow \text{definition of series} \end{aligned}$$

Just as the tail of a sequence is what determines whether or not the sequence converges, the tail of a series is what determines the convergence or divergence of the series. This means that adding or removing any finite number of terms from the start of a series does not change its convergence properties. Of course if a series is convergent and we add or remove terms, then this does change the sum of the series. The proof involves splitting a sum from 1 to  $\infty$  into two sums, one from 1 to  $M - 1$  and one from  $M$  to  $\infty$ ; the details are left to Exercise 86.

### THEOREM 7.25

#### The Tail of a Series Determines the Convergence of the Series

For any integer  $M$ , the series  $\sum_{k=1}^{\infty} a_k$  and  $\sum_{k=M}^{\infty} a_k$  either both converge or both diverge. In addition, if  $\sum_{k=M}^{\infty} a_k$  converges to  $L$ , then  $\sum_{k=1}^{\infty} a_k$  converges to  $a_1 + a_2 + a_3 + \cdots + a_{M-1} + L$ .

## Geometric Series

In Section 7.1 we defined a **geometric sequence** as a sequence of the form  $\{cr^k\}_{k=0}^{\infty}$  for some constants  $c$  and  $r$ . If we add up the terms of a geometric sequence, we get a **geometric series**  $\sum_{k=0}^{\infty} cr^k$ . The next theorem completely characterizes the behavior of all geometric series. Not only can we determine exactly which geometric series converge or diverge just by looking at  $r$ , but we can also determine the exact sum of any convergent geometric series.

Since we can always factor a constant multiple out of a series, it suffices to characterize the behavior of geometric series of the form  $\sum_{k=0}^{\infty} r^k$ :

### THEOREM 7.26

#### Convergence and Divergence of Geometric Series

Suppose  $r$  is a nonzero real number. Then

- (a) For  $|r| < 1$ , the geometric series  $\sum_{k=0}^{\infty} r^k$  converges to the sum  $\frac{1}{1-r}$ .
- (b) For  $|r| \geq 1$ , the geometric series  $\sum_{k=0}^{\infty} r^k$  diverges.

For example, on the one hand, we can tell immediately from this theorem that the series  $\sum_{k=0}^{\infty} 5(1.1)^k$  must diverge, since  $|1.1| \geq 1$ . On the other hand, we can immediately deduce not only that the series  $\sum_{k=0}^{\infty} 5(0.9)^k$  converges (since  $|0.9| < 1$ ), but also what sum it converges to:

$$\sum_{k=0}^{\infty} 5(0.9)^k = 5 \sum_{k=0}^{\infty} (0.9)^k = 5 \left( \frac{1}{1-0.9} \right) = 50.$$

To prove this useful theorem, we will perform a clever algebraic manipulation to determine a formula for the partial sums of a geometric series and then examine the limit of these partial sums for various values of  $r$ .

**Proof.** We first note that if  $r = 1$ , then we have the series  $\sum_{k=0}^{\infty} 1 = 1 + 1 + 1 + \dots$ , which diverges to  $\infty$ . Thus for the rest of the proof we may assume that  $r \neq 1$ .

Let  $\sum_{k=0}^{\infty} r^k$  be a geometric series with  $r \neq 1$ . For any positive integer  $n$ , the  $n$ th partial sum of this series is

$$S_n = 1 + r + r^2 + r^3 + \dots + r^n.$$

If we multiply both sides of the preceding equation by  $r$ , we obtain

$$rS_n = r + r^2 + r^3 + r^4 + \dots + r^{n+1}.$$

Now an interesting thing happens. If we subtract the corresponding sides of the foregoing two equations, then all terms on the right-hand side cancel except for two terms, and we get

$$S_n - rS_n = 1 - r^{n+1}.$$

Factoring out  $S_n$  from the left side and then dividing both sides by  $r - 1$  (note that we specifically assumed that  $r \neq 1$  so that we could be sure that we were not dividing by zero in this step), we get a simple formula for the  $n$ th partial sum of the geometric series:

$$S_n = \frac{1 - r^{n+1}}{1 - r}.$$

To determine whether or not the series  $\sum_{k=0}^{\infty} r^k$  converges or diverges, we need to examine  $\lim_{n \rightarrow \infty} S_n$  in the cases  $|r| < 1$ ,  $|r| > 1$ , and  $r = -1$ . Note that the only part of  $S_n$  that depends upon  $n$  is the  $r^{n+1}$  term in the numerator.

If  $|r| < 1$ , then  $r^{n+1} \rightarrow 0$  as  $n \rightarrow \infty$  and therefore we have a convergent geometric series whose sum is

$$\sum_{k=1}^{\infty} r^k = \lim_{n \rightarrow \infty} \frac{1 - r^{n+1}}{1 - r} = \frac{1}{1 - r}.$$

If  $r > 1$ , then  $r^{n+1} \rightarrow \infty$  as  $n \rightarrow \infty$  and therefore the geometric series diverges:

$$\sum_{k=1}^{\infty} r^k = \lim_{n \rightarrow \infty} \frac{1 - r^{n+1}}{1 - r} \rightarrow \infty.$$

If  $r < -1$ , then the magnitude of  $r^{n+1}$  increases without bound as  $n \rightarrow \infty$  and the geometric series oscillates and diverges.

Finally, if  $r = -1$ , then the term  $r^{n+1} = (-1)^{n+1}$  alternates between 1 and  $-1$  for integer values of  $n$  as  $n \rightarrow \infty$  and again the limit of partial sums diverges. ■

We will spend much of the next three sections studying various methods that help us determine whether or not a series converges; but most of the time we will not be able to compute the actual sum of a convergent series. Geometric series are a rare example of series for which we can determine not only convergence, but also an exact sum. There is only one other type of series whose sums we can calculate exactly, and that is *telescoping series*; see Example 2.

## Examples and Explorations

### EXAMPLE 1

#### Analyzing series for convergence

Determine whether the following series converge or diverge:

$$(a) \sum_{k=5}^{\infty} (0.8)^k \qquad (b) \sum_{k=1}^{\infty} 1 \qquad (c) \sum_{k=0}^{\infty} (-1)^k$$

If a series converges, find its sum.

#### SOLUTION

- (a) Any series in which the quotient of every two consecutive terms is the same constant is a geometric series. That is the case here, since  $\frac{(0.8)^{k+1}}{(0.8)^k} = 0.8$ . When the absolute value of this quotient is less than 1, as we have here, the series will converge. The geometric series

$$\sum_{k=0}^{\infty} cr^k = c + cr + cr^2 + \cdots + cr^k + \cdots$$

converges to  $\frac{c}{1-r}$  if  $|r| < 1$ . In our series, since the first term is  $(0.8)^5$  and  $r = 0.8$ , the series converges to  $\frac{(0.8)^5}{1-0.8} = \frac{(0.8)^5}{0.2} = 1.6384$ .

- (b) We next consider the series in which every term is the constant 1. That is,

$$\sum_{k=1}^{\infty} 1 = 1 + 1 + 1 + \cdots + 1 + \cdots$$

Here the sequence of partial sums is

$$\begin{aligned} \{S_n\} &= 1, (1 + 1), (1 + 1 + 1), \dots \\ &= 1, 2, 3, \dots \end{aligned}$$

We see that the sequence of partial sums is  $\mathbb{Z}^+$ , which diverges. Thus, the series diverges as well.

(c) Not every divergent series diverges to infinity. For our third series, we have

$$\sum_{k=0}^{\infty} (-1)^k = 1 - 1 + 1 - 1 + \cdots + (-1)^k + \cdots$$

Here, the sequence of partial sums is

$$\begin{aligned} \{S_n\}_{n=0}^{\infty} &= 1, (1-1), (1-1+1), (1-1+1-1), \dots \\ &= 1, 0, 1, 0, \dots \end{aligned}$$

This sequence of partial sums diverges. Thus, the series diverges as well.  $\square$

### EXAMPLE 2 A telescoping series

Use a sequence of partial sums to determine whether the series  $\sum_{k=1}^{\infty} \frac{1}{k(k+1)}$  converges or diverges. If the series converges, find its value.

#### SOLUTION

You should verify that the  $k$ th term of this series has the partial-fraction decomposition

$$\frac{1}{k(k+1)} = \frac{1}{k} - \frac{1}{k+1}.$$

Therefore we may rewrite the series in the form

$$\sum_{k=1}^{\infty} \frac{1}{k(k+1)} = \sum_{k=1}^{\infty} \left( \frac{1}{k} - \frac{1}{k+1} \right).$$

Now using this decomposition, we construct the  $n$ th term in the sequence of partial sums:

$$S_n = \left( \frac{1}{1} - \frac{1}{2} \right) + \left( \frac{1}{2} - \frac{1}{3} \right) + \left( \frac{1}{3} - \frac{1}{4} \right) + \cdots + \left( \frac{1}{n} - \frac{1}{n+1} \right).$$

Note that between each two consecutive pairs, the second term of a pair cancels with the first term of the subsequent pair. The cancellation between these values gives rise to the term “telescoping” series in that each term in the sequence of partial sums collapses like a folding telescope. Because of the telescoping within the summation for  $S_n$ , we have

$$S_n = 1 - \frac{1}{n+1}.$$

We now take the limit of  $S_n$  as  $n \rightarrow \infty$  and see that  $\lim_{n \rightarrow \infty} \left( 1 - \frac{1}{n+1} \right) = 1$ . Therefore the series sums to 1.

Before we proceed to other examples, we note that telescoping series have the characteristic that each term of the series can be written as a sum of two or more summands and that once they are decomposed in this way, there will be cancellation between terms in the sequence of partial sums. That cancellation in a telescoping series is not always as simple as the cancellation in this example. You will see other telescoping series in the exercises.  $\square$

### EXAMPLE 3 Finding terms of a sequence of partial sums

Find the first five terms in the sequence of partial sums for the series  $\sum_{k=0}^{\infty} \frac{1}{k!}$ .

#### SOLUTION

The series is  $\sum_{k=0}^{\infty} \frac{1}{k!} = \frac{1}{0!} + \frac{1}{1!} + \frac{1}{2!} + \frac{1}{3!} + \frac{1}{4!} + \cdots$ .

The first five terms in the sequence of partial sums are

$$\begin{aligned} S_0 &= \frac{1}{0!} &&= 1 \\ S_1 &= \frac{1}{0!} + \frac{1}{1!} &&= 1 + 1 = 2 \\ S_2 &= \frac{1}{0!} + \frac{1}{1!} + \frac{1}{2!} &&= 1 + 1 + \frac{1}{2} = \frac{5}{2} \\ S_3 &= \frac{1}{0!} + \frac{1}{1!} + \frac{1}{2!} + \frac{1}{3!} &&= 1 + 1 + \frac{1}{2} + \frac{1}{6} = \frac{8}{3} \\ S_4 &= \frac{1}{0!} + \frac{1}{1!} + \frac{1}{2!} + \frac{1}{3!} + \frac{1}{4!} &&= 1 + 1 + \frac{1}{2} + \frac{1}{6} + \frac{1}{24} = \frac{65}{24}. \end{aligned}$$

In Chapter 8 we will see that this series converges to  $e$ . □

#### EXAMPLE 4

#### Working with geometric series

Show that each of the sums that follow defines a geometric series, and then determine which series converge and which diverge. Find the sum of each convergent series.

$$\text{(a)} \sum_{k=0}^{\infty} 7(0.9)^k \qquad \text{(b)} \sum_{k=5}^{\infty} \frac{1}{100} (-1.00001)^k \qquad \text{(c)} -\frac{43}{5} + \frac{43}{25} - \frac{43}{125} + \frac{43}{625} \dots$$

#### SOLUTION

- (a) The first of these series is in the standard form for a geometric series with  $c = 7$  and  $r = 0.9$ . Since  $|r| = |0.9| < 1$ , by Theorem 7.26 the series converges to  $\frac{c}{1-r} = \frac{7}{1-0.9} = 70$ .
- (b) The second series is almost in the standard form for a geometric series, but the index starts with 5, rather than 0. However, recall that the convergence of a series depends not upon the first few terms, but only upon the tail of the series. In this geometric series,  $r = -1.00001$ . Of course,  $|-1.00001| > 1$ , so by Theorem 7.26, this series diverges.
- (c) A geometric series may be defined recursively as a sum of terms in which every term after the first term,  $c$ , is the same constant multiple,  $r$ , of the previous term. In the third series in this example we see that the first term is  $c = -\frac{43}{5}$ . Every term after that is  $-\frac{1}{5}$  times the previous term. Since  $|r| = \left|-\frac{1}{5}\right| < 1$ , the given series is a convergent geometric series. Its sum is

$$\frac{-43/5}{1 - (-1/5)} = -\frac{43}{6}. \quad \square$$

#### EXAMPLE 5

#### Expressing repeating decimals as geometric series

Express the following repeating decimal expansions as geometric series and as the quotient of two integers:

$$\text{(a)} 0.123123123\dots \qquad \text{(b)} 6.2353535\dots$$

#### SOLUTION

- (a) Every decimal that is eventually repeating may be expressed as a geometric series and as the quotient of two integers, that is, as rational numbers. Note that

$$\begin{aligned} 0.123123123\dots &= 0.123(1 + 0.001 + (0.001)^2 + (0.001)^3 + \dots) \\ &= \sum_{k=0}^{\infty} 0.123(0.001)^k = \frac{0.123}{1 - 0.001} = \frac{0.123}{0.999} = \frac{123}{999} = \frac{41}{333}. \end{aligned}$$

- (b) The repetition in the expansion of our second decimal,  $6.2353535\dots$ , does not start until after the tenths place. To mimic the technique from (a), we need the repetition of the decimal to start at the decimal point. To accomplish this we may simultaneously multiply and divide by 10 to obtain  $\frac{1}{10}(62.353535\dots)$ . Now, working with the decimal  $0.353535\dots$ , we have

$$\begin{aligned} 0.353535\dots &= 0.35(1 + 0.01 + (0.01)^2 + (0.01)^3 + \dots) \\ &= \sum_{k=0}^{\infty} 0.35(0.01)^k = \frac{0.35}{1-0.01} = \frac{0.35}{0.99} = \frac{35}{99}. \end{aligned}$$

Thus,

$$6.2353535\dots = \frac{1}{10} \left( 62 + \frac{35}{99} \right) = \frac{6173}{990}. \quad \square$$

#### CHECKING THE ANSWER

These results may easily be checked with a calculator to see if our rational numbers have the correct decimal expansions. For example, when we divide 6173 by 990, we obtain  $6.2353535\dots$

#### EXAMPLE 6

#### Changing the index of a series

Rewrite the series  $\sum_{k=5}^{\infty} \frac{k}{k^2 + 3}$  with the index starting at zero.

#### SOLUTION

We introduce a different letter,  $j$ , as the new index. We want  $j = 0$  when  $k = 5$ , giving the relationship  $k = j + 5$ . If we replace each  $k$  with  $j + 5$  in the original expression for the series, we will have achieved our goal. We have

$$\sum_{j=0}^{\infty} \frac{j+5}{(j+5)^2 + 3} = \sum_{j=0}^{\infty} \frac{j+5}{j^2 + 10j + 28}. \quad \square$$

#### CHECKING THE ANSWER

We may check the answer by evaluating the original expression of the series for the first few values of  $k$  and doing the same for the first few values of  $j$  in our new expression. From the original expression, we have

$$\sum_{k=5}^{\infty} \frac{k}{k^2 + 3} = \frac{5}{28} + \frac{6}{39} + \frac{7}{52} + \dots$$

For the new expression, we have

$$\sum_{j=0}^{\infty} \frac{j+5}{j^2 + 10j + 28} = \frac{5}{28} + \frac{6}{39} + \frac{7}{52} + \dots$$

The first three terms of the two expressions agree.

#### ? TEST YOUR UNDERSTANDING

- ▶ What is a series? What is a sequence of partial sums?
- ▶ How do we define convergence for a series?
- ▶ What is meant by the “tail” of a series? Why does the tail of a series determine the convergence of the series?
- ▶ What is a geometric series? Which geometric series converge and which diverge?
- ▶ What is a telescoping series? Why are telescoping series given this name?

## EXERCISES 7.3

## Thinking Back

*Working with sequences:* Determine which of the sequences that follow converge and which diverge. Explain your reasoning for each sequence.

- ▶  $\{1 - r^{n+1}\}$  for  $0 < r < 1$
- ▶  $\{1 - r^{n+1}\}$  for  $r > 1$
- ▶  $\{1 - r^{n+1}\}$  for  $-1 < r < 0$
- ▶  $\{1 - r^{n+1}\}$  for  $r < -1$
- ▶  $\{n^r\}$  for  $r > 0$

- ▶  $\{n^r\}$  for  $r < 0$
- ▶ *Convergence of an Improper Integral:* If the function  $f : [1, \infty) \rightarrow \mathbb{R}$  is continuous on its domain, what does it mean for the improper integral  $\int_1^\infty f(x) dx$  to converge? What does it mean for the integral to diverge?
- ▶ *Convergence of a Sequence:* Let  $\{a_n\}$  be a sequence. What does it mean for the sequence to converge? What does it mean for the sequence to diverge?

## Concepts

0. *Problem Zero:* Read the section and make your own summary of the material.
1. *True/False:* Determine whether each of the statements that follow is true or false. If a statement is true, explain why. If a statement is false, provide a counterexample.
  - (a) *True or False:* If the sequence  $\{a_n\}$  converges, then the series  $\sum_{n=1}^\infty a_n$  converges.
  - (b) *True or False:* If a series  $\sum_{k=1}^\infty a_k$  diverges and  $\{S_n\}$  is its sequence of partial sums, then  $\lim_{n \rightarrow \infty} S_n = \infty$ .
  - (c) *True or False:* If two series  $\sum_{k=1}^\infty a_k$  and  $\sum_{k=1}^\infty b_k$  both diverge, then the series  $\sum_{k=1}^\infty (a_k + b_k)$  diverges.
  - (d) *True or False:* If  $\sum_{k=1}^\infty a_k$  and  $\sum_{k=1}^\infty b_k$  are two convergent series, then for any real numbers  $c$  and  $d$ ,  $\sum_{k=1}^\infty (ca_k + db_k) = c \sum_{k=1}^\infty a_k + d \sum_{k=1}^\infty b_k$ .
  - (e) *True or False:* If the series  $\sum_{k=0}^\infty a_{n+k}$  converges to 5, then the series  $\sum_{k=100}^\infty a_k$  converges to a value  $L < 5$ .
  - (f) *True or False:* If the series  $\sum_{k=N}^\infty a_k$  converges, then  $\sum_{k=N}^\infty a_k = \sum_{k=0}^\infty a_{n+k}$ .
  - (g) *True or False:* If a geometric series  $\sum_{k=0}^\infty cr^k$  converges, then  $\lim_{k \rightarrow \infty} cr^k = 0$ .
  - (h) *True or False:* The series  $\sum_{k=1}^\infty a_k$  where  $a_1 = 4$  and  $a_{k+1} = \frac{a_k}{2}$  for  $k > 1$ , converges to 7.
2. *Examples:* Construct examples of the thing(s) described in the following. Try to find examples that are different than any in the reading.
  - (a) A convergent geometric series  $\sum_{k=0}^\infty cr^k$  with  $r < 0$ .
  - (b) A divergent geometric series  $\sum_{k=0}^\infty cr^k$  with  $r < 0$ .
  - (c) A divergent series that is *not* a geometric series.
3. What is meant by the sequence of partial sums for a series  $\sum_{k=1}^\infty a_k$ ? Why does it make sense to define the convergence of a series in terms of the convergence of its sequence of partial sums?
4. What is meant by the tail of a series? Why does it make sense that the tail of a series determines the convergence of the series?
  5. What is the relationship between  $\sum_{k=1}^\infty a_k$  and  $\sum_{k=10}^\infty a_k$ ? If you knew that  $\sum_{k=10}^\infty a_k$  converged to 42, what other information would you need to know to find the sum of  $\sum_{k=1}^\infty a_k$ ?
  6. Explain why the sequence of partial sums of the series  $\sum_{k=1}^\infty a_k$  in which  $a_k > 0$  for every  $k \in \mathbb{Z}^+$  is strictly increasing.
  7. Explain how to change the index of the series  $\sum_{k=1}^\infty a_k$  to start with an initial value other than 1.
  8. What is a geometric progression? What determines the convergence of a geometric progression?
  9. What is a geometric series? What determines the convergence of a geometric series?
  10. Let  $\sum_{k=1}^\infty cr^k$  be a series with  $c$  and  $r \in \mathbb{R}$ . Explain why the convergence of this series depends only upon the magnitude of  $r$  and not on  $c$ .
  11. Explain why all the terms of a divergent geometric series are nonzero.
  12. What is a telescoping series? Give an example of a convergent telescoping series and an example of a divergent telescoping series.
  13. Find a series  $\sum_{k=1}^\infty a_k$  with all nonzero terms that converges to 1.
  14. Let  $\alpha \in \mathbb{R}$ . Explain why you can find a series  $\sum_{k=1}^\infty a_k$  with all nonzero terms that converges to  $\alpha$ . You may wish to use your answer to Exercise 13.
  15. Find two divergent series  $\sum_{k=1}^\infty a_k$  and  $\sum_{k=1}^\infty b_k$  such that the series  $\sum_{k=1}^\infty (a_k + b_k)$  converges. Carefully use the sequence of partial sums for this new series to show that your answer is correct.
  16. Find two divergent series  $\sum_{k=1}^\infty a_k$  and  $\sum_{k=1}^\infty b_k$  such that the series  $\sum_{k=1}^\infty (a_k - b_k)$  converges. Carefully use the sequence of partial sums for this new series to show that your answer is correct.
  17. Find two convergent geometric series  $\sum_{k=0}^\infty a_k = L$  and  $\sum_{k=0}^\infty b_k = M$  such that the series  $\sum_{k=0}^\infty (a_k \cdot b_k)$  converges. Does this series converge to  $LM$ ?

18. Find two convergent geometric series  $\sum_{k=0}^{\infty} a_k = L$  and  $\sum_{k=0}^{\infty} b_k = M$  with all positive terms such that  $\sum_{k=0}^{\infty} \frac{a_k}{b_k}$  converges but whose sum is not  $\frac{L}{M}$ .
19. Find two divergent geometric series  $\sum_{k=0}^{\infty} a_k$  and  $\sum_{k=0}^{\infty} b_k$  with all positive terms such that  $\sum_{k=0}^{\infty} \frac{a_k}{b_k}$  converges.
20. Find two convergent geometric series  $\sum_{k=0}^{\infty} a_k = L$  and  $\sum_{k=0}^{\infty} b_k = M$  with all positive terms such that  $\sum_{k=0}^{\infty} \frac{a_k}{b_k}$  diverges.

## Skills

In Exercises 21–28 provide the first five terms of the series.

21.  $\sum_{k=1}^{\infty} \frac{1}{k^2 + 2}$
22.  $\sum_{n=1}^{\infty} \frac{n+1}{n!}$
23.  $\sum_{j=0}^{\infty} (-1)^{j+1}$
24.  $\sum_{n=3}^{\infty} (2n+1)$
25.  $\sum_{i=0}^{\infty} \frac{i!}{(i+1)!}$
26.  $\sum_{k=0}^{\infty} \frac{k!}{(2k)!}$
27.  $\sum_{n=0}^{\infty} \frac{(-1)^n}{(2n)!}$
28.  $\sum_{n=1}^{\infty} (-1)^n \frac{n^2}{n!}$

In Exercises 29–36 provide the first five terms of the sequence of partial sums for the given series. You may find it useful to refer to your answers to Exercises 21–28.

29.  $\sum_{k=1}^{\infty} \frac{1}{k^2 + 2}$
30.  $\sum_{n=1}^{\infty} \frac{n+1}{n!}$
31.  $\sum_{j=0}^{\infty} (-1)^{j+1}$
32.  $\sum_{n=3}^{\infty} (2n+1)$
33.  $\sum_{i=0}^{\infty} \frac{i!}{(i+1)!}$
34.  $\sum_{k=0}^{\infty} \frac{k!}{(2k)!}$
35.  $\sum_{n=0}^{\infty} \frac{(-1)^n}{(2n)!}$
36.  $\sum_{n=1}^{\infty} (-1)^n \frac{n^2}{n!}$

Evaluate the finite sums in Exercises 37–42.

37.  $\sum_{k=0}^{100} \frac{1}{2^k}$
38.  $\sum_{k=1}^{50} \frac{1}{3^k}$
39.  $\sum_{k=0}^{1000} 2^k$
40.  $\sum_{j=1}^{60} 3^j$
41.  $\sum_{k=6}^{150} \left(\frac{2}{3}\right)^k$
42.  $\sum_{j=11}^{200} \left(\frac{3}{2}\right)^j$

Given that  $a_0 = -3$ ,  $a_1 = 5$ ,  $a_2 = -4$ ,  $a_3 = 2$ , and  $\sum_{k=2}^{\infty} a_k = 7$ , find the values of the specified quantities in Exercises 43–46.

43.  $\sum_{k=0}^{\infty} a_k$
44.  $\sum_{k=1}^{\infty} a_k$
45.  $\sum_{k=3}^{\infty} a_k$
46.  $\sum_{k=4}^{\infty} a_k$

For each of the geometric series in Exercises 47–60, determine whether the series converges or diverges. Give the sum of each convergent series.

47.  $\sum_{k=0}^{\infty} \frac{3}{2^k}$
48.  $\sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{3^n}$
49.  $\sum_{j=2}^{\infty} \frac{2^j}{3}$
50.  $\sum_{n=4}^{\infty} \frac{4}{11^n}$
51.  $\sum_{k=0}^{\infty} \pi \left(\frac{e}{3}\right)^k$
52.  $\sum_{k=0}^{\infty} e \left(\frac{\pi}{3}\right)^k$
53.  $\sum_{k=2}^{\infty} \left(-\frac{3}{5}\right)^k$
54.  $\sum_{k=0}^{\infty} \left(-\frac{9}{8}\right)^k$
55.  $\sum_{k=0}^{\infty} \frac{2^{k+2}}{5^{k-1}}$
56.  $\sum_{k=0}^{\infty} \frac{4^{k+1}}{3^{2k}}$
57.  $\sum_{k=0}^{\infty} \frac{(-3)^{k+1}}{4^{k-2}}$
58.  $\sum_{k=0}^{\infty} \frac{5^{k+1}}{(-6)^k}$
59.  $\frac{80}{3} - \frac{20}{3} + \frac{5}{3} - \frac{5}{12} + \dots$
60.  $\frac{99}{40} - \frac{99}{20} + \frac{99}{10} - \frac{99}{5} + \dots$

Show that each series in Exercises 61–66 is a telescoping series. For each series, provide the general term  $S_n$  in its sequence of partial sums and find the sum of the series if it converges.

61.  $\sum_{k=1}^{\infty} \left(\frac{1}{k} - \frac{1}{k+2}\right)$
62.  $\sum_{k=1}^{\infty} \frac{3}{k^2 + 3k + 2}$
63.  $\sum_{k=0}^{\infty} \left(\frac{1}{3^k} - \frac{1}{3^{k+1}}\right)$
64.  $\sum_{k=1}^{\infty} \frac{1}{k(k+1)(k+2)}$
65.  $\sum_{k=1}^{\infty} \ln \frac{k}{k+1}$
66.  $\sum_{k=2}^{\infty} \ln \frac{1}{k^2 - 1}$

For each series in Exercises 67–70, find all values of  $x$  for which the series converges.

67.  $\sum_{k=0}^{\infty} x^k$
68.  $\sum_{k=0}^{\infty} \left(\frac{3}{x}\right)^k$
69.  $\sum_{k=0}^{\infty} (\sin x)^k$
70.  $\sum_{k=0}^{\infty} \left(\frac{\cos x}{2}\right)^k$

Express each of the repeating decimals in Exercises 71–78 as a geometric series and as the quotient of two integers reduced to lowest terms.

71.  $0.237237237\dots$

72.  $3.454545\dots$

73.  $0.305130513051\dots$

74.  $2.2131313\dots$

75.  $1.272727\dots$

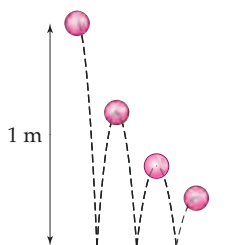

76.  $0.6345345\dots$

77.  $0.199999\dots$

78.  $0.999999\dots$

## Applications

79. Whenever a certain ball is dropped, it always rebounds to a height 60% of its original position. What is the total distance the ball travels before coming to rest when it is dropped from a height of 1 meter?

80. Whenever a certain ball is dropped, it always rebounds to a height  $p\%$  ( $0 < p < 100$ ) of its original position. What is the total distance the ball travels before coming to rest when it is dropped from a height of  $h$  meters?

In Exercises 81–83, find the areas of *fractals* by using properties of geometric series.

81. The figure shown is drawn recursively and then shaded. The largest square has side length 1 unit. A smaller square is inscribed in the square so that each vertex is at the midpoint of the larger square. This process is repeated recursively, resulting in shading as depicted in the figure. What is the area of the shaded portion of the picture?

82. The figure shown is drawn recursively and then shaded. The largest square has side length 1 unit. A square whose side length is  $r\%$  as long as the larger square is inscribed with one vertex on each edge of the larger square. This process is repeated recursively, resulting in shading as depicted in the figure. What is the area of the shaded portion of the picture?

83. The figure shown is called a Sierpinski triangle. It may be constructed recursively as follows: We start with a large black equilateral triangle. Every time we see a black equilateral triangle, we inscribe a white equilateral triangle with each vertex at the midpoint of a side of the black triangle. If the side of the largest triangle is 1 unit and this process is repeated recursively, what is the area of the white-shaded region?

## Proofs

84. Prove Theorem 7.24 (a). That is, show that if  $c$  is a real number and  $\sum_{k=1}^{\infty} a_k$  is a convergent series, then  $\sum_{k=1}^{\infty} ca_k = c \sum_{k=1}^{\infty} a_k$ .
85. Prove that if  $\sum_{k=1}^{\infty} a_k$  converges to  $L$  and  $\sum_{k=1}^{\infty} b_k$  converges to  $M$ , then the series  $\sum_{k=1}^{\infty} (a_k + b_k) = L + M$ .
86. Prove Theorem 7.25. That is, show that the series  $\sum_{k=1}^{\infty} a_k$  and  $\sum_{k=M}^{\infty} a_k$  either both converge or both diverge. In addition, show that if  $\sum_{k=M}^{\infty} a_k$  converges to  $L$ , then  $\sum_{k=1}^{\infty} a_k$  converges to  $a_1 + a_2 + a_3 + \dots + a_{M-1} + L$ .
87. Let  $\sum_{k=0}^{\infty} cr^k$  and  $\sum_{k=0}^{\infty} bv^k$  be two convergent geometric series. Prove that  $\sum_{k=0}^{\infty} (cr^k \cdot bv^k)$  converges. If

neither  $c$  nor  $b$  is 0, could the sum of this series be  $(\sum_{k=0}^{\infty} cr^k)(\sum_{k=0}^{\infty} bv^k)$ ?

88. Let  $\sum_{k=1}^{\infty} a_k$  be a convergent series and  $\sum_{k=1}^{\infty} b_k$  be a divergent series. Prove that the series  $\sum_{k=1}^{\infty} (a_k + b_k)$  diverges.
89. Let  $\sum_{k=0}^{\infty} cr^k$  and  $\sum_{k=0}^{\infty} bv^k$  be two convergent geometric series. If  $b$  and  $v$  are both nonzero, prove that

$$\sum_{k=0}^{\infty} \frac{cr^k}{bv^k}$$

is a geometric series. What condition(s) must be met for this series to converge?

## Thinking Forward

*Improper Integrals:* Determine whether the following improper integrals converge or diverge.

▶  $\int_1^{\infty} \frac{1}{x} dx$

▶  $\int_1^{\infty} \frac{1}{x^2} dx$

▶ *An Improper Integral and Infinite Series:* Sketch the function  $f(x) = \frac{1}{x}$  for  $x \geq 1$  together with the graph of the terms of the series  $\sum_{k=1}^{\infty} \frac{1}{k}$ . Argue that for every term  $S_n$  of the sequence of partial sums for this series,  $S_n > \int_1^{n+1} \frac{1}{x} dx$ . What does this result tell you about the convergence of the series?

## 7.4 INTRODUCTION TO CONVERGENCE TESTS

- ▶ Convergence tests for series
- ▶ The divergence test and the integral test
- ▶ Approximating series by using partial sums

### An Overview of Convergence Tests for Series

The rest of this chapter will be dedicated to determining which series converge and which diverge. In some sense the convergence of a sum of a sequence is a question of how fast the terms of that sequence converge to zero. If the terms of a sequence converge to zero, then the sum of that sequence might converge or it might not. For example we will soon see that the sum  $1 + \frac{1}{2^2} + \frac{1}{3^2} + \frac{1}{4^2} + \dots$  converges, but the sum  $1 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \dots$  is infinite, even though both of the sequences  $\left\{ \frac{1}{k^2} \right\}$  and  $\left\{ \frac{1}{k} \right\}$  converge to zero. The first sequence tends to zero fast enough that its sum is a real number, but the second sequence somehow does not tend to zero fast enough. Determining exactly what “fast enough” means is a nontrivial question.

At this point we can determine the convergence or divergence of certain series by looking at limits of partial sums or by recognizing a series as a geometric series. For most series, we will need a much bigger toolbox. For the rest of this chapter we will discuss various tests to help us decide which series converge and which diverge. These tests are as follows:

- ▶ The Divergence Test (Section 7.4)
- ▶ The Integral Test (Section 7.4)
- ▶ The Comparison Test (Section 7.5)
- ▶ The Limit Comparison Test (Section 7.5)
- ▶ The Ratio Test (Section 7.6)
- ▶ The Root Test (Section 7.6)
- ▶ The Alternating Series Test (Section 7.7)
- ▶ The Ratio Test for Absolute Convergence (Section 7.7)

At the end of Section 7.7 you will find a table that compares and contrasts the eight tests and comments on when they are most useful.

### The Divergence Test

If the terms of a sequence converge to zero, then the sum of those terms might be finite or might be infinite. But if the terms of a sequence do not converge to zero, then we can be

certain that the sum of those terms will be infinite. For example, the sequences  $\{2, 2^2, 2^3, \dots\}$  and  $\{1, 1, 1, \dots\}$  clearly have the infinite sums  $2 + 2^2 + 2^3 + \dots$  and  $1 + 1 + 1 + \dots$ , respectively.

### THEOREM 7.27

#### The Divergence Test

If the sequence  $\{a_k\}$  does not converge to zero, then the series  $\sum_{k=1}^{\infty} a_k$  diverges.

The divergence test gives us a quick way to determine that certain series diverge, but it can never tell us if a series converges. If we notice that the terms of a series do not converge to zero, then the divergence test immediately tells us that the series diverges. For example, the series  $\sum_{k=1}^{\infty} \frac{k}{k+1}$  must diverge because its sequence of terms  $\left\{\frac{k}{k+1}\right\}$  converges to 1, not 0. Note that if the terms of a series do converge to zero, then the divergence test tells us nothing at all.

**Proof.** It is easier to prove the contrapositive of the divergence test, so we will prove that if a series  $\sum_{k=1}^{\infty} a_k$  converges, then its sequence of terms  $\{a_k\}$  must converge to zero.

Suppose  $\sum_{k=1}^{\infty} a_k$  converges to a sum  $L$ . Then the sequence of partial sums

$$\{S_n\} = \{a_1 + a_2 + \dots + a_n\}$$

converges to  $L$ . Notice that the difference between the  $n$ th and  $(n-1)$ th partial sums is equal to the  $n$ th term of the series:

$$S_n - S_{n-1} = (a_1 + a_2 + a_3 + \dots + a_n) - (a_1 + a_2 + a_3 + \dots + a_{n-1}) = a_n.$$

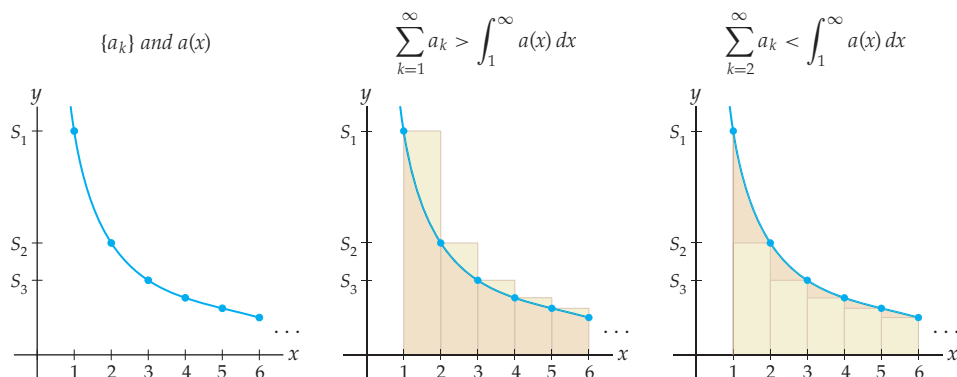

Note that  $\{S_{n-1}\}$  is just the sequence  $\{S_n\}$  with a different index. Therefore since  $\{S_n\}$  converges to  $L$ , we also have  $\{S_{n-1}\}$  converges to  $L$ . Now we can calculate the limit of the original terms  $a_n$  of our series:

$$\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} (S_n - S_{n-1}) = L - L = 0.$$

This means that the sequence of terms  $\{a_n\}$  converges to zero. ■

### The Integral Test

Suppose  $\{a_k\}$  is a sequence of positive numbers that converges to zero, and suppose that we are interested in its sum. Recall that we can often think of  $\{a_k\}$  as a sequence of heights on the graph of some continuous function  $a(x)$ , as shown in the leftmost figure that follows. We can also think of each term  $a_k$  as the area of a rectangle with height  $a_k$  and width  $\Delta x = 1$  in two different ways, as shown in the middle and rightmost figures. The sum of the areas of these rectangles is intimately related to the area under the graph of  $a(x)$  on  $[1, \infty)$ , an area that we can often calculate with an improper integral.

From the middle figure we see that if the integral of  $a(x)$  on  $[1, \infty)$  diverges, then so will the sum of  $\{a_k\}$  from  $k = 1$  to  $\infty$ , since the sum is larger than the area under the curve. From the rightmost figure we see that if the integral of  $a(x)$  on  $[1, \infty)$  converges, then so will the sum of  $\{a_k\}$  from  $k = 2$  to  $\infty$ , since that sum is smaller than the area under the curve. But then when  $k = 1$ , the term  $a_1$  must be finite, so the sum of  $\{a_k\}$  from  $k = 1$  to  $\infty$  will also converge.

In general, a series and its associated improper integral always converge or diverge together:

**THEOREM 7.28****The Integral Test**

If  $a(x)$  is a function that is continuous, positive, and decreasing on  $[1, \infty)$ , and if  $\{a_k\}$  is the sequence defined by  $a_k = a(k)$  for every  $k \in \mathbb{Z}^+$ , then

$$\sum_{k=1}^{\infty} a_k \quad \text{and} \quad \int_1^{\infty} a(x) dx$$

either both converge or both diverge.

The integral test provides a way to test the convergence or divergence of a series on the basis of the convergence or divergence of a related improper integral. This can be a useful test when we recognize the terms  $a_k$  as a function  $a(x)$  that we know how to integrate. It is important to note that a convergent series and its associated convergent improper integral do not in general converge to the same number  $L$ . The integral test tells us only whether or not a series converges; it does not tell us the actual sum of the series.

**Proof.** To prove this theorem it suffices to show that a series  $\sum_{k=1}^{\infty} a_k$  converges if and only if the improper integral  $\int_1^{\infty} a(x) dx$  converges, for some function  $a(x)$  that agrees with  $a_k$  on the positive integers. We will show that convergence of the series implies convergence of the integral, and leave the converse to Exercise 54.

Suppose the series  $\sum_{k=1}^{\infty} a_k$  converges to some value  $L$ . Since  $a_k > 0$  for every  $k$ , the sequence of partial sums  $S_n = a_1 + a_2 + \cdots + a_n$  is an increasing sequence that converges to  $L$ . Note that  $S_n$  is a left Riemann sum for  $\int_1^{n+1} a(x) dx$ . Since  $a(x)$  is assumed to be continuous, positive, and decreasing, this left Riemann sum is an upper sum; see the previous middle figure. Therefore, for every positive integer  $n$ ,

$$0 \leq \int_1^{n+1} a(x) dx \leq S_n \leq L.$$

Now, by Theorem 7.19,  $\{\int_1^n a(x) dx\}$  is an increasing sequence that is bounded above by  $L$  and therefore converges to some value less than or equal to  $L$ . Thus, the improper integral  $\int_1^{\infty} a(x) dx = \lim_{n \rightarrow \infty} \int_1^n a(x) dx$  converges, which is what we set out to show. ■

## Convergence and Divergence of $p$ -Series and the Harmonic Series

We have already seen that we can completely classify the convergence and divergence of geometric series of the form  $\sum_{k=1}^{\infty} r^k$ . These series have exponential terms, in the sense that the variable index  $k$  is in the exponent, and a constant  $r$  is in the base, of each term. We can also consider series with power function terms, in the sense that the variable index  $k$  is in the base, and a constant  $p$  is in the exponent, of each term. Such series are called  *$p$ -series* and are of the form

$$\sum_{k=1}^{\infty} k^{-p} = \sum_{k=1}^{\infty} \frac{1}{k^p}.$$

The case when  $p = 1$  is called the *harmonic series*:

$$\sum_{k=1}^{\infty} \frac{1}{k}.$$

The integral test allows us to completely classify the convergence and divergence of  $p$ -series:

### THEOREM 7.29

#### Convergence and Divergence of $p$ -series

Suppose  $p$  is any real number. Then

- (a) For  $p > 1$ , the  $p$ -series  $\sum_{k=1}^{\infty} \frac{1}{k^p}$  converges.
- (b) For  $p = 1$ , the harmonic series  $\sum_{k=1}^{\infty} \frac{1}{k}$  diverges.
- (c) For  $p < 1$ , the  $p$ -series  $\sum_{k=1}^{\infty} \frac{1}{k^p}$  diverges.

**Proof.** In Theorem 5.21 of Section 5.6, we showed that

$$\int_1^{\infty} \frac{1}{x^p} dx$$

converges when  $p > 1$  and diverges for  $p \leq 1$ . Therefore, by the integral test, a  $p$ -series also converges for  $p > 1$  and diverges for  $p \leq 1$ . ■

Again, we point out that a convergent series does not in general have the same value as its associated improper integral. For example, when  $p = 2$ ,

$$\int_1^{\infty} \frac{1}{x^2} dx = \lim_{b \rightarrow \infty} \left[ -\frac{1}{x} \right]_1^b = \lim_{b \rightarrow \infty} \left( -\frac{1}{b} + 1 \right) = 1.$$

The fact that this integral is finite means that the associated  $p$ -series  $\sum_{k=1}^{\infty} \frac{1}{k^2}$  must also converge. However, this  $p$ -series converges, not to 1, but rather to the much more surprising value

$$\sum_{k=1}^{\infty} \frac{1}{k^2} = \frac{\pi^2}{6}.$$

## Approximating a Convergent Series

Using the proof of the integral test, we may deduce that when the following series and related improper integrals both converge, their values are related by the inequalities

$$\int_2^{\infty} a(x) dx \leq \sum_{k=2}^{\infty} a(k) \leq \int_1^{\infty} a(x) dx \leq \sum_{k=1}^{\infty} a(k).$$

Thus, if we can evaluate these improper integrals, we can compute an upper and lower bound for the value of the series. (Similarly, but less likely, if we know the sum of the series in the preceding inequality, we may compute bounds for the value of the improper integral.)

This string of inequalities may be generalized to provide a method for bounding the error when we approximate the sum of a convergent series with one of its partial sums. We need a definition first, however:

## DEFINITION 7.30

## The Remainder of a Convergent Series

If  $\sum_{k=1}^{\infty} a_k$  is a convergent series with sum  $L$ , then we may approximate  $L$  with the  $n$ th partial sum  $S_n = \sum_{k=1}^n a_k$ . The  $n$ th **remainder** is defined by  $R_n = L - S_n = \sum_{k=n+1}^{\infty} a_k$ .

The remainder is the error that arises from using  $S_n$  to approximate the sum of the series. The next theorem gives us a tool for understanding the magnitude of this error when we have a series that, by the integral test, we know converges. If we choose a “large enough” value of  $n$  to force the remainder to be small, the  $n$ th partial sum will be a good approximation.

## THEOREM 7.31

## Approximating the Remainder for a Series That Converges by the Integral Test

If a function  $a$  is continuous, positive, and decreasing, and if the improper integral  $\int_1^{\infty} a(x) dx$  converges, then the  $n$ th remainder,  $R_n$ , for the series  $\sum_{k=1}^{\infty} a(k)$  is bounded by

$$0 \leq R_n \leq \int_n^{\infty} a(x) dx.$$

Furthermore, if we define  $B_n = \int_n^{\infty} a(x) dx$ , then

$$S_n \leq \sum_{k=1}^{\infty} a(k) \leq S_n + B_n.$$

As we mentioned before, the proof of the first string of inequalities in Theorem 7.31 is a generalization of the proof of the inequalities we proved in the integral test. The proof is left for Exercise 55. The second string of inequalities in Theorem 7.31 follows from the fact that the sequence of partial sums for a series satisfying the conditions of the integral test monotonically increases as it converges to the sum of the series. We use Theorem 7.31 in Example 2.

## Examples and Explorations

## EXAMPLE 1

## Choosing a convergence test

Determine whether the series  $\sum_{k=1}^{\infty} \frac{k}{e^{k^2}}$  converges or diverges. Prove that the answer is correct by applying an appropriate convergence test.

## SOLUTION

Frequently, more than one convergence test may be used to show that a given series converges or diverges. Right now, when you are presented with a new series,  $\sum_{k=1}^{\infty} a_k$ , you can quickly answer the following two questions:

- ▶ Does  $a_k \not\rightarrow 0$  as  $k \rightarrow \infty$ ? If so, then, by the divergence test, the series diverges.
- ▶ Does  $a_k = a(k)$ , where  $a$  is a continuous, positive, and decreasing function on  $[1, \infty)$ ? If so, is the improper integral  $\int_1^{\infty} a(x) dx$  “relatively easy” to evaluate? If it is, you may use the integral test.

After we introduce other convergence tests in the sections that follow, there will be new questions to add to this list. Every time you are presented with a new series, you can quickly

run through these questions to help you decide which test might be applicable. After you analyze the behavior of a variety of series, it should become more apparent which test(s) may be applied to a given series.

For the series given in this example, we see that  $\frac{k}{e^{k^2}} \rightarrow 0$  as  $k \rightarrow \infty$ . Therefore, the divergence test fails here.

Next, note that the function  $a(x) = xe^{-x^2}$  is continuous, positive, and decreasing on  $[1, \infty)$  and that  $a(k) = \frac{k}{e^{k^2}}$ . Thus, if we can evaluate the improper integral  $\int_1^\infty xe^{-x^2} dx$ , we will understand the behavior of the series. We now consider

$$\begin{aligned} \int_1^\infty xe^{-x^2} dx &= \lim_{b \rightarrow \infty} \int_1^b xe^{-x^2} dx && \leftarrow \text{the definition of the improper integral} \\ &= \lim_{b \rightarrow \infty} \left. -\frac{1}{2}e^{-x^2} \right|_1^b && \leftarrow \text{the Fundamental Theorem of Calculus} \\ &= \lim_{b \rightarrow \infty} \left( \frac{1}{2e} - \frac{1}{2e^{b^2}} \right) && \leftarrow \text{evaluation of the antiderivative at the endpoints} \\ &= \frac{1}{2e} && \leftarrow \text{evaluation of the limit} \end{aligned}$$

Since the improper integral converges, by the integral test the series converges as well.  $\square$

### EXAMPLE 2

#### Approximating a convergent series and finding a bound for the remainder

Use the third term,  $S_3$ , in the sequence of partial sums to approximate the sum of the series  $\sum_{k=1}^\infty \frac{k}{e^{k^2}}$ , and use Theorem 7.31 to find a bound on the remainder.

#### SOLUTION

To use Theorem 7.31 we must show that the series converges and that it satisfies the hypotheses of the integral test. We did this in Example 1. We now compute  $S_3$ :

$$S_3 = \frac{1}{e} + \frac{2}{e^4} + \frac{3}{e^9} \approx 0.404881.$$

Theorem 7.31 tells us that the third remainder  $R_3$  is bounded by

$$0 \leq R_3 \leq \int_3^\infty xe^{-x^2} dx = \frac{1}{2e^9} = B_3 \approx 0.000062.$$

Thus, if  $\sum_{k=1}^\infty \frac{k}{e^{k^2}} = L$ , then,

$$S_3 \leq L \leq S_3 + B_3.$$

That is,  $L \in (0.404881, 0.404943)$ . This approximation is quite good already.

We mentioned before that when we approximate a quantity, we usually begin with an understanding of how large an error we can tolerate. When we approximate a convergent series, this means that we should ensure that the remainder is smaller than the desired error. For the series in this example, if we wish the remainder to be less than, say,  $10^{-10}$ , we need to find the smallest value of  $n$  such that  $B_n \leq 10^{-10}$ . That is, we need to find  $n$  so that

$$\int_n^\infty xe^{-x^2} dx = \frac{1}{2e^{n^2}} \leq 10^{-10}.$$

We leave it to you to show that  $n = 5$  is the smallest positive integer satisfying the inequality. Thus,  $S_5 = \frac{1}{e} + \frac{2}{e^4} + \frac{3}{e^9} + \frac{4}{e^{16}} + \frac{5}{e^{25}} \approx 0.4048813986$  with the desired accuracy.  $\square$

**EXAMPLE 3** Using the divergence test

Determine whether the series  $\sum_{k=1}^{\infty} \left(\frac{k}{k+1}\right)^k$  converges or diverges.

**SOLUTION**

We hope that the limit:

$$\lim_{x \rightarrow \infty} \left(1 + \frac{1}{x}\right)^x$$

is familiar to you. Its value is  $e$ . If you do not recall this fact, review Chapter 1. Since we have  $1 + \frac{1}{x} = \frac{x+1}{x}$ , we also have

$$\lim_{k \rightarrow \infty} \left(\frac{k}{k+1}\right)^k = \frac{1}{e} \neq 0.$$

By the divergence test, the series diverges. □

**EXAMPLE 4** Analyzing a category of series for convergence

Find all values of  $p$  for which the series  $\sum_{k=1}^{\infty} \frac{k}{(1+k^2)^p}$  converge.

**SOLUTION**

When  $p < \frac{1}{2}$ ,  $\frac{k}{(1+k^2)^p} \rightarrow \infty$  as  $k \rightarrow \infty$ . Therefore, by the divergence test, the series diverge. When  $p = \frac{1}{2}$ ,  $\frac{k}{(1+k^2)^p} \rightarrow 1$  as  $k \rightarrow \infty$ . Again, by the divergence test, the series diverges. For  $p > \frac{1}{2}$ , the function  $\frac{x}{(1+x^2)^p}$  is continuous, positive, and decreasing for  $x \geq 1$  and, therefore, satisfies the hypotheses of the integral test. Thus, when we know the positive values of  $p$  for which the improper integrals

$$\int_1^{\infty} \frac{x}{(1+x^2)^p} dx$$

converge, we will know the values of  $p$  for which the series converge. Using the substitution  $u = 1 + x^2$ , we obtain the integral

$$\frac{1}{2} \int_2^{\infty} \frac{du}{u^p}.$$

We have previously seen that this improper integral converges when  $p > 1$  and diverges when  $0 < p \leq 1$ . Therefore, our series  $\sum_{k=1}^{\infty} \frac{k}{(1+k^2)^p}$  converge when  $p > 1$  and diverge otherwise. □

**? TEST YOUR UNDERSTANDING**

- ▶ What is the divergence test? What does the divergence test tell you about a series? What can the divergence test not tell you about a series?
- ▶ What is the integral test? How is the integral test used? What conditions must be met for the integral test to be effective?
- ▶ How do we show that a series converges or diverges?
- ▶ What is the remainder of a convergent series? How is the remainder related to the sequence of partial sums?
- ▶ How is the integral test extended to find a bound on the error for an approximation to a series?

## EXERCISES 7.4

## Thinking Back

*The contrapositive:* What is the contrapositive of the implication “If  $A$ , then  $B$ .”?

Find the contrapositives of the following implications:

- ▶ If a quadrilateral is a square, then it is a rectangle.

- ▶ If a positive integer is prime, then it has exactly two positive divisors.

- ▶ If  $r < 0$ , then  $|r| = -r$ .

- ▶ If  $a$  divides  $b$  and  $b$  divides  $c$ , then  $a$  divides  $c$ .

## Concepts

0. *Problem Zero:* Read the section and make your own summary of the material.

1. *True/False:* Determine whether each of the statements that follow is true or false. If a statement is true, explain why. If a statement is false, provide a counterexample.

- (a) *True or False:* If  $a_k \rightarrow 0$ , then  $\sum_{k=1}^{\infty} a_k$  converges.
- (b) *True or False:* If  $\sum_{k=1}^{\infty} a_k$  converges, then  $a_k \rightarrow 0$ .
- (c) *True or False:* The improper integral  $\int_1^{\infty} f(x) dx$  converges if and only if the series  $\sum_{k=1}^{\infty} f(k)$  converges.
- (d) *True or False:* The harmonic series converges.
- (e) *True or False:* If  $p > 1$ , the series  $\sum_{k=1}^{\infty} k^{-p}$  converges.
- (f) *True or False:* If  $f(x) \rightarrow 0$  as  $x \rightarrow \infty$ , then  $\sum_{k=1}^{\infty} f(k)$  converges.
- (g) *True or False:* If  $\sum_{k=1}^{\infty} f(k)$  converges, then  $f(x) \rightarrow 0$  as  $x \rightarrow \infty$ .
- (h) *True or False:* If  $\sum_{k=1}^{\infty} a_k = L$  and  $\{S_n\}$  is the sequence of partial sums for the series, then the sequence of remainders  $\{L - S_n\}$  converges to 0.

2. *Examples:* Construct examples of the thing(s) described in the following. Try to find examples that are different than any in the reading.

- (a) A divergent series  $\sum_{k=1}^{\infty} a_k$  in which  $a_k \rightarrow 0$ .
- (b) A divergent  $p$ -series.
- (c) A convergent  $p$ -series.

3. What is meant by a  $p$ -series?

4. Which  $p$ -series converge and which diverge?

5. Given a series  $\sum_{k=1}^{\infty} a_k$ , in general the divergence test is inconclusive when  $a_k \rightarrow 0$ . For a geometric series, however, if the limit of the terms of the series is zero, the series converges. Explain why.

6. Let  $f(x)$  be a function that is continuous, positive, and decreasing on the interval  $[1, \infty)$  such that  $\lim_{x \rightarrow \infty} f(x) =$

$\alpha > 0$ . What can the divergence test tell us about the series  $\sum_{k=1}^{\infty} f(k)$ ?

7. Let  $f(x)$  be a function that is continuous, positive, and decreasing on the interval  $[1, \infty)$  such that  $\lim_{x \rightarrow \infty} f(x) = \alpha > 0$ . What can the integral test tell us about the series  $\sum_{k=1}^{\infty} f(k)$ ?

8. Explain how you could adapt the integral test to analyze a series  $\sum_{k=1}^{\infty} f(k)$  in which the function  $f: [1, \infty) \rightarrow \mathbb{R}$  is continuous, negative, and increasing.

9. Provide a more general statement of the integral test in which the function  $f$  is continuous and *eventually* positive, and decreasing. Explain why your statement is valid.

10. What is meant by the remainder  $R_n$  of a series  $\sum_{k=1}^{\infty} a_k$ ?

11. For a convergent series satisfying the conditions of the integral test, why is every remainder  $R_n$  positive? How can  $R_n$  be used along with the term  $S_n$  from the sequence of partial sums to understand the quality of the approximation  $S_n$ ?

12. Explain why, if  $n$  is an integer greater than 1, the series  $\sum_{k=1}^{\infty} \frac{1}{\sqrt[k]{k}}$  diverges.

13. Explain why a function  $a(x)$  has to be continuous in order for us to use the integral test to analyze a series  $\sum_{k=1}^{\infty} a_k$  for convergence.

14. Sketch the graph of a function  $a(x)$  that is continuous, positive, and decreasing on the interval  $[1, \infty)$ . Use your graph to explain the geometrical relationships between the improper integral  $\int_1^{\infty} a(x) dx$  and the series  $\sum_{k=1}^{\infty} a(k)$  and  $\sum_{k=2}^{\infty} a(k)$ .

15. Find an example of a continuous function  $f: [1, \infty) \rightarrow \mathbb{R}$  such that  $\int_1^{\infty} f(x) dx$  diverges and  $\sum_{k=1}^{\infty} f(k)$  converges.

## Skills

In Exercises 16–23 use the divergence test to analyze the given series. Each answer should either be *the series diverges* or *the divergence test fails*, along with the reason for your answer.

16.  $\sum_{k=1}^{\infty} \frac{1}{k}$

17.  $\sum_{k=1}^{\infty} \frac{1}{k^2}$

18.  $\sum_{k=1}^{\infty} \frac{k}{3k^2 + 100}$

19.  $\sum_{k=1}^{\infty} \frac{k}{3k + 100}$

20.  $\sum_{k=1}^{\infty} \frac{1}{k^k}$

21.  $\sum_{k=1}^{\infty} \frac{k!}{k^k}$

22. 
$$\sum_{k=1}^{\infty} \left( \frac{k}{1+k} \right)^{k^2}$$

23. 
$$\sum_{k=1}^{\infty} \frac{k^2 + 1}{k!}$$

38. 
$$\sum_{k=1}^{\infty} \frac{1}{3k+5}$$

39. 
$$\sum_{k=1}^{\infty} k^3 e^{-k^4}$$

In Exercises 24–31, explain why the integral test may be used to analyze the given series and then use the test to determine whether the series converges or diverges.

24. 
$$\sum_{k=1}^{\infty} \frac{k}{e^k}$$

25. 
$$\sum_{k=0}^{\infty} e^{-k}$$

40. 
$$\sum_{k=1}^{\infty} \frac{\sin(1/k)}{k^2}$$

41. 
$$\sum_{k=2}^{\infty} \frac{1}{k(k-1)}$$

26. 
$$\sum_{k=2}^{\infty} \frac{1}{k(\ln k)^2}$$

27. 
$$\sum_{k=2}^{\infty} \frac{1}{k\sqrt{\ln k}}$$

42. 
$$\sum_{k=1}^{\infty} \frac{2^k}{k^5}$$

43. 
$$\sum_{k=1}^{\infty} \frac{k}{3^k}$$

28. 
$$\sum_{k=1}^{\infty} \frac{1+k}{k^2}$$

29. 
$$\sum_{k=4}^{\infty} \frac{2k-4}{k^2-4k+3}$$

30. 
$$\sum_{k=1}^{\infty} (3k-1)^{-2/3}$$

31. 
$$\sum_{k=3}^{\infty} \frac{1}{(k-2)^2}$$

Use either the divergence test or the integral test to determine whether the series in Exercises 32–43 converge or diverge. Explain why the series meets the hypotheses of the test you select.

32. 
$$\sum_{k=1}^{\infty} \frac{1}{2} k^{-3/4}$$

33. 
$$\sum_{k=1}^{\infty} k^{-3/2}$$

34. 
$$\sum_{k=1}^{\infty} \frac{\tan^{-1} k}{1+k^2}$$

35. 
$$\sum_{k=1}^{\infty} \frac{k}{2+k^2}$$

36. 
$$\sum_{k=1}^{\infty} \frac{k}{k^2+3}$$

37. 
$$\sum_{k=1}^{\infty} \frac{\ln k}{k}$$

For each series in Exercises 44–47, do each of the following:

- Use the integral test to show that the series converges.
- Use the 10th term in the sequence of partial sums to approximate the sum of the series.
- Use Theorem 7.31 to find a bound on the tenth remainder,  $R_{10}$ .
- Use your answers from parts (b) and (c) to find an interval containing the sum of the series.
- Find the smallest value of  $n$  so that  $R_n \leq 10^{-6}$ .

44. 
$$\sum_{k=1}^{\infty} \frac{k}{e^k}$$

45. 
$$\sum_{k=0}^{\infty} e^{-k}$$

46. 
$$\sum_{k=2}^{\infty} \frac{1}{k(\ln k)^2}$$

47. 
$$\sum_{k=1}^{\infty} \frac{1}{k^2}$$

In Exercises 48–51 find all values of  $p$  so that the series converges.

48. 
$$\sum_{k=1}^{\infty} \frac{\ln k}{k^p}$$

49. 
$$\sum_{k=2}^{\infty} \frac{1}{k(\ln k)^p}$$

50. 
$$\sum_{k=1}^{\infty} \frac{1}{(c+k)^p}, \text{ where } c > 0$$

51. 
$$\sum_{k=1}^{\infty} \frac{k}{(1+k^2)^p}$$

## Applications

52. Leila, in her capacity as a population biologist in Idaho, is trying to figure out how many salmon a local hatchery should release annually in order to revitalize the fishery. She knows that if  $p_k$  salmon spawn in Redfish Lake in a given year, then only  $0.2p_k$  fish will return to the lake from the offspring of that run, because of all the dams on the rivers between the sea and the lake. Thus, if she adds the spawn from  $h$  fish, from a hatchery, then the number of fish that return from that run  $k$  will be  $p_{k+1} = 0.2(p_k + h)$ .
- Show that the sustained number of fish returning approaches  $p_{\infty} = h \sum_{k=1}^{\infty} 0.2^k$  as  $k \rightarrow \infty$ .
  - Evaluate  $p_{\infty}$ .
  - How should Leila choose  $h$ , the number of hatchery fish to raise in order to hold the number of fish returning in each run at some constant  $P$ ?
53. Leila finds that there are more factors affecting the number of salmon that return to Redfish Lake than the dams: There are good years and bad years. These happen at random, but they are more or less cyclical, so she models

the number of fish  $q_k$  returning each year as  $q_{k+1} = (0.14(-1)^k + 0.36)(q_k + h)$ , where  $h$  is the number of fish whose spawn she releases from the hatchery annually.

- Show that the sustained number of fish returning in even-numbered years approaches approximately

$$q_e = 3h \sum_{k=1}^{\infty} 0.11^k.$$

(Hint: Make a new recurrence by using two steps of the one given.)

- Show that the sustained number of fish returning in odd-numbered years approaches approximately

$$q_o = \frac{61}{11} h \sum_{k=1}^{\infty} 0.11^k.$$

- How should Leila choose  $h$ , the number of hatchery fish to breed in order to hold the minimum number of fish returning in each run near some constant  $P$ ?

## Proofs

54. Let  $a : [1, \infty) \rightarrow \mathbb{R}$  be a continuous, positive, and decreasing function. Complete the proof of the integral test (Theorem 7.28) by showing that if the improper integral  $\int_1^\infty a(x) dx$  converges, then the series  $\sum_{k=1}^\infty a(k)$  does too.
55. Prove Theorem 7.31. That is, show that if a function  $a$  is continuous, positive, and decreasing, and if the improper integral  $\int_1^\infty a(x) dx$  converges, then the  $n$ th remainder,  $R_n$ , for the series  $\sum_{k=1}^\infty a(k)$  is bounded by

$$0 \leq R_n = \sum_{k=n+1}^\infty a(k) \leq \int_n^\infty a(x) dx.$$

56. Use the divergence test to prove that a  $p$ -series  $\sum_{k=1}^\infty \frac{1}{k^p}$  diverges when  $p < 0$ .
57. Use the divergence test to prove that a geometric series  $\sum_{k=1}^\infty cr^k$  diverges when  $|r| \geq 1$  and  $c \neq 0$ .

## Thinking Forward

- *A series of monomials:* Find all values of  $x$  for which the series  $\sum_{k=1}^\infty (4x)^k$  converges.
- *A series of monomials:* Find all values of  $x$  for which the series  $\sum_{k=1}^\infty \left(\frac{x}{3}\right)^k$  converges.

## 7.5 COMPARISON TESTS

- Analyzing series by comparing them with series whose behavior we understand
- Using inequalities to compare series
- Using limits to compare series

### The Comparison Test

Our first comparison is analogous to the comparison test for improper integrals we discussed in Section 5.6. In fact, if we combine the comparison test for improper integrals and the integral test, Theorem 7.28, we immediately obtain the next theorem.

#### THEOREM 7.32

#### The Comparison Test

Let  $\sum_{k=1}^\infty a_k$  and  $\sum_{k=1}^\infty b_k$  be two series with nonnegative terms such that  $0 \leq a_k \leq b_k$  for every positive integer  $k$ . If the series  $\sum_{k=1}^\infty b_k$  converges, then the series  $\sum_{k=1}^\infty a_k$  converges.

We should also mention the contrapositive of Theorem 7.32. That is, given the same hypotheses for the two series, if the series  $\sum_{k=1}^\infty a_k$  diverges, then the series  $\sum_{k=1}^\infty b_k$  diverges.

As you may recall from your work with the comparison test for improper integrals, using a comparison test requires finesse. When we are trying to discover whether a given series  $\sum_{k=1}^\infty c_k$  converges or diverges, we must think through a few questions:

- We fully understand the behavior of geometric series and  $p$ -series. Is the series a geometric series or a  $p$ -series? If it is, we are done.
- If the series is not a geometric series or a  $p$ -series, is it “similar enough” to one so that we can use the comparison test? If it is, we must ensure that the correct inequality holds. That is, if  $\sum_{k=1}^\infty d_k$  represents a geometric series or  $p$ -series with terms similar to the terms of  $\sum_{k=1}^\infty c_k$ , and if the series  $\sum_{k=1}^\infty d_k$  converges, we would need the inequality  $0 \leq c_k \leq d_k$  to hold for every  $k$ . If it does, then the

series  $\sum_{k=1}^{\infty} c_k$  converges as well. If, however,  $\sum_{k=1}^{\infty} d_k$  diverges, then we need the inequality  $0 \leq d_k \leq c_k$  to hold for every  $k$ . In this case we would deduce that the series  $\sum_{k=1}^{\infty} c_k$  diverges.

- ▶ If the series  $\sum_{k=1}^{\infty} c_k$  is not similar to a geometric series or a  $p$ -series, is it similar to another series whose behavior we can more easily analyze? If so, we may carry out the preceding comparison to analyze our series  $\sum_{k=1}^{\infty} c_k$ .

We use the comparison test in one example here and another later in our explorations.

Consider the series  $\sum_{k=1}^{\infty} \frac{k-1}{k^3+k+1}$ . This series is neither geometric nor a  $p$ -series. However, it is similar to the convergent  $p$ -series  $\sum_{k=1}^{\infty} \frac{1}{k^2}$ . We chose  $\sum_{k=1}^{\infty} \frac{1}{k^2}$  because the dominant term in the numerator of  $\frac{k-1}{k^3+k+1}$  is  $k$ , the dominant term in the denominator is  $k^3$ , and the quotient  $\frac{k}{k^3} = \frac{1}{k^2}$ . Now, since the  $p$ -series converges, we need the inequality

$$0 \leq \frac{k-1}{k^3+k+1} \leq \frac{1}{k^2}$$

to hold for every positive integer  $k$ . You should verify that this inequality is valid for every positive integer. Thus, the convergence of  $\sum_{k=1}^{\infty} \frac{1}{k^2}$  implies the convergence of  $\sum_{k=1}^{\infty} \frac{k-1}{k^3+k+1}$ .

If the inequality had not held for every  $k$ , using the comparison test would not have been quite as simple. For example, if we start with the similar-looking series  $\sum_{k=1}^{\infty} \frac{k+1}{k^3-k+1}$ , we would still want to compare that series with the  $p$ -series  $\sum_{k=1}^{\infty} \frac{1}{k^2}$ , so we would still suspect that the series  $\sum_{k=1}^{\infty} \frac{k+1}{k^3+k+1}$  converges. In this case, however, the required inequality

$$0 \leq \frac{k+1}{k^3-k+1} \leq \frac{1}{k^2}$$

does not hold for every positive integer. (For example,  $\frac{2+1}{2^3-2+1} \not\leq \frac{1}{2^2}$ .) We could try to find a different convergent series to compare successfully against  $\sum_{k=1}^{\infty} \frac{k+1}{k^3+k+1}$ , using the comparison test, but we may use the limit comparison test, presented next, more easily.

## The Limit Comparison Test

As we have just shown, although the comparison test can work effectively, we do not always have the required inequality between the terms of the given series and the most obvious comparison series. The limit comparison test provides another method of comparison, in which we do not have to consider inequalities. However, in exchange for avoiding inequalities, we must evaluate a limit.

### THEOREM 7.33

#### The Limit Comparison Test

Let  $\sum_{k=1}^{\infty} a_k$  and  $\sum_{k=1}^{\infty} b_k$  be two series with positive terms.

- (a) If  $\lim_{k \rightarrow \infty} \frac{a_k}{b_k} = L$ , where  $L$  is any positive real number, then either both series converge or both series diverge.
- (b) If  $\lim_{k \rightarrow \infty} \frac{a_k}{b_k} = 0$  and  $\sum_{k=1}^{\infty} b_k$  converges, then  $\sum_{k=1}^{\infty} a_k$  converges.
- (c) If  $\lim_{k \rightarrow \infty} \frac{a_k}{b_k} = \infty$  and  $\sum_{k=1}^{\infty} b_k$  diverges, then  $\sum_{k=1}^{\infty} a_k$  diverges.

The main result of Theorem 7.33 is found in part (a). Parts (b) and (c) are occasionally useful side results. Before we prove part (a) formally, consider the significance of  $\lim_{n \rightarrow \infty} \frac{a_k}{b_k} = L$ . This limit tells us that when  $k$  is “large,” the terms of series  $\sum_{k=1}^{\infty} a_k$  are roughly  $L$  times the size of the terms of the other series. But recall that multiplying the terms of a series by a nonzero constant does not change the convergence or divergence of the series. Thus, if one series converges, the other does also.

**Proof.** We will prove part (a) of Theorem 7.33 and leave parts (b) and (c) for Exercises 56 and 57.

Let  $\lim_{k \rightarrow \infty} \frac{a_k}{b_k} = L$ , where  $L$  is a positive real number. Thus, for any  $\epsilon > 0$ , there is an integer  $N$  such that  $\left| \frac{a_k}{b_k} - L \right| < \epsilon$  when  $k \geq N$ .

We now assume that the series  $\sum_{k=1}^{\infty} b_k$  converges and let  $\epsilon = L$ . We have  $\frac{a_k}{b_k} < 2L$ , or equivalently,  $a_k < 2Lb_k$  for  $k \geq N$ . Therefore,

$$\sum_{k=N}^{\infty} a_k < \sum_{k=N}^{\infty} 2Lb_k = 2L \sum_{k=N}^{\infty} b_k.$$

Recall that removing finitely many terms from a series does not change its convergence. Thus, from the preceding inequality above we see that the convergence of the series  $\sum_{k=1}^{\infty} b_k$  implies that the series  $\sum_{k=1}^{\infty} a_k$  converges as well.

Next we assume that the series  $\sum_{k=1}^{\infty} b_k$  diverges and let  $\epsilon = \frac{L}{2}$ . We now have  $\frac{a_k}{b_k} > \frac{L}{2}$ , or equivalently,  $a_k > \frac{L}{2}b_k$  for  $k \geq N$ . Here,

$$\sum_{k=N}^{\infty} a_k > \sum_{k=N}^{\infty} \frac{L}{2}b_k = \frac{L}{2} \sum_{k=N}^{\infty} b_k.$$

Removing finitely many terms from a series does not change its divergence. Thus, from this new inequality we see that the divergence of the series  $\sum_{k=1}^{\infty} b_k$  implies the divergence of  $\sum_{k=1}^{\infty} a_k$ . ■

As we mentioned earlier, to analyze the convergence of the series  $\sum_{k=1}^{\infty} \frac{k+1}{k^3+k+1}$  the most “obvious” series to use for a comparison is the convergent  $p$ -series  $\sum_{k=1}^{\infty} \frac{1}{k^2}$ . We do not have the necessary inequality between the terms of the two series to successfully use the comparison test, but the limit comparison test will succeed. Consider the limit

$$\lim_{k \rightarrow \infty} \frac{(k+1)/(k^3+k+1)}{1/k^2} = \lim_{k \rightarrow \infty} \frac{k^3+k^2}{k^3+k+1} = 1.$$

Since this limit is positive and finite, and because we already know the the  $p$ -series converges, we have proven that the series  $\sum_{k=1}^{\infty} \frac{k+1}{k^3+k+1}$  converges as well.

To use either of the comparison tests on a series  $\sum_{k=1}^{\infty} a_k$  successfully, follow these steps:

1. If the general term of your series is a quotient, consider the *dominant* term in the numerator  $n_k$  and the *dominant* term in the denominator  $d_k$ .
2. Consider the series  $\sum_{k=1}^{\infty} \frac{n_k}{d_k}$ . Simplify the quotient  $\frac{n_k}{d_k}$  as much as possible.
3. If the new series is a geometric series, a  $p$ -series, or another series whose behavior you can easily analyze, you now suspect that the original series  $\sum_{k=1}^{\infty} a_k$  has the same behavior as your new series  $\sum_{k=1}^{\infty} \frac{n_k}{d_k}$ .
4. Complete the details of your analysis, using either the comparison test or limit comparison test. Be sure to show that you have the correct inequality if you use the comparison test. That is,

- If the series  $\sum_{k=1}^{\infty} \frac{n_k}{d_k}$  converges, you must have

$$0 \leq a_k \leq \frac{n_k}{d_k} \text{ for every } k \in \mathbb{Z}^+.$$

- If the series  $\sum_{k=1}^{\infty} \frac{n_k}{d_k}$  diverges, you must have

$$0 \leq \frac{n_k}{d_k} \leq a_k \text{ for every } k \in \mathbb{Z}^+.$$

- If you use the limit comparison test, you must compute the limit

$$\lim_{k \rightarrow \infty} \frac{a_k}{n_k/d_k}.$$

If this limit is positive and finite, the series  $\sum_{k=1}^{\infty} a_k$  converges if and only if  $\sum_{k=1}^{\infty} \frac{n_k}{d_k}$  does.

## Examples and Explorations

### EXAMPLE 1

#### Using the comparison test

Determine whether the series  $\sum_{k=1}^{\infty} \frac{k^{3/2} - 1}{5k^3 + 3}$  converges or diverges.

#### SOLUTION

Recall the list of questions we started in Example 1 of Section 7.4:

- Does  $a_k \not\rightarrow 0$  as  $k \rightarrow \infty$ ? If so, then, by the divergence test, the series diverges.
- Does  $a_k = a(k)$ , where  $a$  is a continuous, positive, and decreasing function on  $[1, \infty)$ ? If so, is the improper integral  $\int_1^{\infty} a(x) dx$  “relatively easy” to evaluate? If it is, you may use the integral test.

We now add the following question:

- Is there another related series whose terms are similar to those of the given series and whose behavior you either know or can more easily determine? If so, you may use one of the comparison tests.

You may show that the divergence test would fail on the series given here and that the integral test would be impractical. We will use the comparison test, comparing the given series with  $\sum_{k=1}^{\infty} \frac{1}{5k^{3/2}}$ . The latter series converges, since it is a multiple of a convergent  $p$ -series. For every positive integer  $k$ , we have

$$0 \leq \frac{k^{3/2} - 1}{5k^3 + 3} \leq \frac{k^{3/2}}{5k^3} = \frac{1}{5} \frac{1}{k^{3/2}}.$$

Now, since the series  $\sum_{k=1}^{\infty} \frac{1}{5k^{3/2}}$  converges, by the comparison test we know that the series  $\sum_{k=1}^{\infty} \frac{k^{3/2} - 1}{5k^3 + 3}$  converges as well. The comparison test worked well here because the inequalities are exactly those required to show that the given series converges. We could also have used the limit comparison test. You will be asked to supply the details for this in Exercise 19.  $\square$

### EXAMPLE 2

#### Using the limit comparison test

Determine whether the series  $\sum_{k=1}^{\infty} (3k^2 + k + 1)^{-1/2}$  converges or diverges.

#### SOLUTION

The divergence test would fail on this series, and again, the integral test would be impractical. We note that each term of the series is positive and that

$$(3k^2 + k + 1)^{-1/2} = \frac{1}{\sqrt{3k^2 + k + 1}}.$$

If we consider the dominant term in the denominator, we are led to compare the series with the harmonic series  $\sum_{k=1}^{\infty} \frac{1}{k}$ . To use the limit comparison test we evaluate

$$\lim_{k \rightarrow \infty} \frac{1/\sqrt{3k^2 + k + 1}}{1/k} = \lim_{k \rightarrow \infty} \frac{k}{\sqrt{3k^2 + k + 1}} = \frac{1}{\sqrt{3}}.$$

Since the harmonic series diverges and this limit is positive and finite, the given series diverges as well. Note that the initial quotient in the preceding equation is the result of the division of  $\frac{1}{\sqrt{3k^2 + k + 1}}$  by  $\frac{1}{k}$ . We could also have used the reciprocal instead. If we had, the limit of that quotient would have been  $\sqrt{3}$ . Again, since the harmonic series diverges and this limit is positive and finite, the given series diverges.  $\square$

## ? TEST YOUR UNDERSTANDING

- ▶ What is the comparison test? How is the comparison test used?
- ▶ How is the comparison test for series related to the comparison test for improper integrals that we introduced in Section 5.6?
- ▶ What is the limit comparison test? How is the limit comparison test used?
- ▶ Which series are good to use in comparisons? How do you find a series to use for a comparison?
- ▶ What are the advantages and disadvantages of the comparison test versus the limit comparison test?

## EXERCISES 7.5

### Thinking Back

*The comparison test:* In Section 5.6 we discussed the comparison test for improper integrals.

- ▶ What is the comparison test for improper integrals?
- ▶ How is the comparison test for improper integrals used to analyze the convergence or divergence of an improper integral?
- ▶ Which improper integrals are used in the comparison test?

*The limit comparison test:* In Section 5.6 we discussed a limit comparison test for improper integrals.

- ▶ What is the limit comparison test for improper integrals?
- ▶ How is the limit comparison test for improper integrals used to analyze the convergence or divergence of an improper integral?
- ▶ Which improper integrals are used in the limit comparison test?

### Concepts

0. *Problem Zero:* Read the section and make your own summary of the material.

1. *True/False:* Determine whether each of the statements that follow is true or false. If a statement is true, explain why. If a statement is false, provide a counterexample.

- (a) *True or False:* If  $0 \leq f(x) \leq g(x)$  for every  $x \geq 0$  and the improper integral  $\int_0^{\infty} g(x) dx$  converges, then the improper integral  $\int_0^{\infty} f(x) dx$  converges.
- (b) *True or False:* If  $0 \leq f(x) \leq g(x)$  for every  $x > 0$  and  $\lim_{x \rightarrow \infty} \frac{f(x)}{g(x)} = 3$ , then the improper integrals  $\int_0^{\infty} g(x) dx$  and  $\int_0^{\infty} f(x) dx$  both converge.
- (c) *True or False:* If  $0 \leq a_k < \frac{1}{k}$  for every positive integer  $k$ , then the series  $\sum_{k=1}^{\infty} a_k$  converges.

- (d) *True or False:* If  $\frac{1}{k^2} < b_k$  for every positive integer  $k$ , then the series  $\sum_{k=1}^{\infty} b_k$  diverges.
- (e) *True or False:* If  $a_k \leq b_k$  for every positive integer  $k$  and the series  $\sum_{k=1}^{\infty} b_k$  converges, then the series  $\sum_{k=1}^{\infty} a_k$  converges.
- (f) *True or False:* If  $\sum_{k=1}^{\infty} a_k$  and  $\sum_{k=1}^{\infty} b_k$  both diverge, then  $\sum_{k=1}^{\infty} (a_k \cdot b_k)$  diverges.
- (g) *True or False:* If  $a_k$  and  $b_k$  are both positive for every positive integer  $k$  and  $\lim_{k \rightarrow \infty} \frac{a_k}{b_k} = \frac{1}{2}$ , then  $\sum_{k=1}^{\infty} a_k$  and  $\sum_{k=1}^{\infty} b_k$  both converge.
- (h) *True or False:* If  $\sum_{k=1}^{\infty} a_k$  and  $\sum_{k=1}^{\infty} b_k$  both converge, then  $\lim_{k \rightarrow \infty} \frac{a_k}{b_k}$  is finite.

2. *Examples:* Construct examples of the thing(s) described in the following. Try to find examples that are different than any in the reading.

- A  $p$ -series you could use as a comparison to show that the series  $\sum_{k=1}^{\infty} \frac{\sqrt{k+2}}{k^2+k+1}$  converges.
  - A  $p$ -series you could use as a comparison to show that the series  $\sum_{k=1}^{\infty} \sin\left(\frac{1}{k}\right)$  diverges.
  - A  $p$ -series other than  $\sum_{k=1}^{\infty} \frac{1}{k^2}$  you could use with the comparison test to show that the series  $\sum_{k=1}^{\infty} \frac{k-1}{k^3+k+1}$  converges.
- Explain how you could adapt the comparison test to analyze a series  $\sum_{k=1}^{\infty} a_k$  in which all of the terms are negative.
  - Use the comparison test to explain why the series  $\sum_{k=1}^{\infty} \frac{1}{\sqrt{k}}$  diverges when  $\alpha$  is an integer greater than 1.
  - Provide a more general statement of the comparison test in which the inequality  $0 \leq a_k \leq b_k$  holds only for integers  $k > K$ , where  $K$  is an arbitrary positive integer. Explain why your statement is valid.
  - Explain how you could adapt the limit comparison test to analyze a series  $\sum_{k=1}^{\infty} a_k$  in which all of the terms are negative.
  - Provide a more general statement of the limit comparison test in which  $\sum_{k=1}^{\infty} a_k$  and  $\sum_{k=1}^{\infty} b_k$  are two series whose terms are eventually positive. Explain why your statement is valid.
  - If you suspect that a series  $\sum_{k=1}^{\infty} a_k$  diverges, explain why you would need to compare the series with a divergent series, using either the comparison test or the limit comparison test.
  - If you suspect that a series  $\sum_{k=1}^{\infty} a_k$  converges, explain why you would want to compare the series with a convergent series, using either the comparison test or the limit comparison test.
  - Briefly outline the advantages and disadvantages of using the two comparison tests to analyze the behavior of a series  $\sum_{k=1}^{\infty} a_k$ .

Exercises 11–13 concern the series  $\sum_{k=2}^{\infty} \frac{1}{k \ln k}$ .

- Use the integral test to show that the series  $\sum_{k=2}^{\infty} \frac{1}{k \ln k}$  diverges.
- Let  $0 < p < 1$ . Show that  $0 \leq \frac{1}{k \ln k} \leq \frac{1}{k^p}$  for large values of  $k$ . Explain why we cannot use a  $p$ -series with  $0 < p < 1$  in a comparison test to verify the divergence of the series  $\sum_{k=2}^{\infty} \frac{1}{k \ln k}$ .
- Let  $0 < p < 1$ . Evaluate the limit  $\lim_{k \rightarrow \infty} \frac{1/(k \ln k)}{1/k^p}$ . Explain why we cannot use a  $p$ -series with  $0 < p < 1$  in a limit comparison test to verify the divergence of the series  $\sum_{k=2}^{\infty} \frac{1}{k \ln k}$ .

Let  $\sum_{k=1}^{\infty} a_k$  and  $\sum_{k=1}^{\infty} b_k$  be two series with positive terms. Answer the questions about the limit comparison test in Exercises 14–18.

- If  $\lim_{k \rightarrow \infty} \frac{a_k}{b_k} = L$ , where  $L$  is a positive finite number, what may we conclude about the two series?
- Fill in the blanks and select the correct word:  
If  $\lim_{k \rightarrow \infty} \frac{a_k}{b_k} = 0$  and  $\sum_{k=1}^{\infty} \underline{\hspace{1cm}}$  converges, then  $\sum_{k=1}^{\infty} \underline{\hspace{1cm}}$  (converges/diverges).
- If  $\lim_{k \rightarrow \infty} \frac{a_k}{b_k} = 0$  and  $\sum_{k=1}^{\infty} a_k$  converges, explain why we cannot draw any conclusions about the behavior of  $\sum_{k=1}^{\infty} b_k$ .
- Fill in the blanks and select the correct word:  
If  $\lim_{k \rightarrow \infty} \frac{a_k}{b_k} = \infty$  and  $\sum_{k=1}^{\infty} \underline{\hspace{1cm}}$  diverges, then  $\sum_{k=1}^{\infty} \underline{\hspace{1cm}}$  (converges/diverges).
- If  $\lim_{k \rightarrow \infty} \frac{a_k}{b_k} = \infty$  and  $\sum_{k=1}^{\infty} a_k$  diverges, explain why we cannot draw any conclusions about the behavior of  $\sum_{k=1}^{\infty} b_k$ .
- In Example 1 we used the comparison test to show that the series  $\sum_{k=1}^{\infty} \frac{k^{3/2} - k - 1}{5k^3 + 3}$  converges. Use the limit comparison test to prove the same result.
- In Example 1 of Section 7.4 we used the integral test to show that the series  $\sum_{k=1}^{\infty} \frac{k}{e^{k^2}}$  converges. Use the limit comparison test with the series  $\sum_{k=1}^{\infty} \frac{1}{e^k}$  to prove the same result.

## Skills

In Exercises 21–30 use one of the comparison tests to determine whether the series converges or diverges. Explain how the given series satisfies the hypotheses of the test you use.

$$21. \sum_{k=0}^{\infty} \frac{3k^2 + 1}{k^3 + k^2 + 5}$$

$$22. \sum_{k=1}^{\infty} \frac{3}{(1+2k)^2}$$

$$23. \sum_{k=2}^{\infty} \frac{3k-5}{k\sqrt{k^3-4}}$$

$$24. \sum_{k=1}^{\infty} \frac{\sqrt{k}}{1+k^2}$$

$$25. \sum_{k=1}^{\infty} \frac{1 + \ln k}{k}$$

$$26. \sum_{k=1}^{\infty} \frac{1}{k + 0.01}$$

$$27. \sum_{k=1}^{\infty} \frac{1 + \ln k}{k^2}$$

$$28. \sum_{k=1}^{\infty} \frac{1}{(k-\pi)^2}$$

$$29. \sum_{k=1}^{\infty} \frac{1 + \ln k}{k^3}$$

$$30. \sum_{k=1}^{\infty} \left(\frac{\sin k}{k}\right)^2$$

Use any convergence test from this section or the previous section to determine whether the series in Exercises 31–48 converge or diverge. Explain how the series meets the hypotheses of the test you select.

$$31. \sum_{k=1}^{\infty} k^{-1/2}$$

$$32. \sum_{k=1}^{\infty} k^{-4/3}$$

33. 
$$\sum_{k=1}^{\infty} \frac{k^{-3/4}}{k+2}$$

35. 
$$\sum_{k=1}^{\infty} \sin\left(\frac{1}{k}\right)$$

37. 
$$\sum_{k=1}^{\infty} \frac{\ln k}{k}$$

39. 
$$\sum_{k=1}^{\infty} \frac{\sqrt{k+1} - \sqrt{k}}{k}$$

41. 
$$\sum_{k=1}^{\infty} k^2 e^{-k^3}$$

34. 
$$\sum_{k=1}^{\infty} \cos\left(\frac{1}{k}\right)$$

36. 
$$\sum_{k=1}^{\infty} \frac{1}{1+k^2}$$

38. 
$$\sum_{k=1}^{\infty} \sin\left(\frac{1}{k^2}\right)$$

40. 
$$\sum_{k=1}^{\infty} \frac{1}{\sqrt{k+1} + \sqrt{k}}$$

42. 
$$\sum_{k=1}^{\infty} \frac{1}{\sqrt[3]{k+1} + \sqrt[3]{k}}$$

43. 
$$\sum_{k=1}^{\infty} \frac{k^2}{e^k}$$

47. 
$$\sum_{k=1}^{\infty} \frac{1}{2k+7}$$

In Exercises 49 and 50 find all values of  $p$  so that the series converges.

49. 
$$\sum_{k=1}^{\infty} \frac{k^p}{e^k}$$

44. 
$$\sum_{k=1}^{\infty} \frac{2^k}{k^2}$$

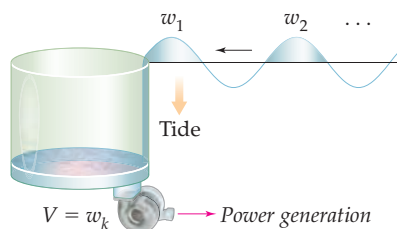

46. 
$$\sum_{k=3}^{\infty} \frac{k+1}{(k-2)^3}$$

48. 
$$\sum_{k=1}^{\infty} \frac{\sqrt{k}}{k^2+3}$$

50. 
$$\sum_{k=1}^{\infty} \frac{(\ln k)^p}{k^2}$$

## Applications

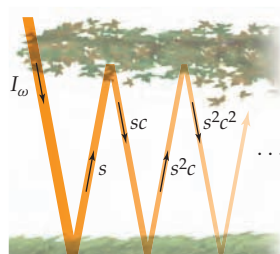

51. There are many ways to harness wave energy. One of them relies on a hollow platform that is anchored to the ocean floor. Waves wash over the top of the platform into the basin in its center, where the only way for water to get out is to pass through turbines, generating power.

When the tide is going out, the amount of water each wave leaves in the central basin is given by a random  $w_k$ , where  $0 \leq w_k \leq W r^{\alpha(k)}$ . Here,  $W$  is the amount of water deposited by the largest wave at high tide,  $r < 1$ , and  $\alpha(k)$  is a polynomial in  $k$  with positive coefficients and no constant term. Although the number of waves for a given tide is actually finite, it is easiest to use the infinite series  $V = \sum_{k=0}^{\infty} w_k$  to model the total water arriving in the basin. Does this series converge? Explain your answer.

52. Sandy is studying the relationship of light in a forest to the density of the canopy. She models this relationship

simply by supposing that a fixed amount of radiance  $I_\omega$  at a frequency  $\omega$  passes through the vegetation canopy. Once light is below the vegetation, a fraction  $s$  is reflected from the surface while a different fraction,  $c \geq s$ , is reflected from the vegetation canopy. The total ambient light inside the forest is the sum of all these direct and reflected lights: the direct light, plus that reflected from the surface, plus that reflected from the surface and then reflected from the vegetation, and so on.

Sandy writes the relationship she has found as

$$I_{\text{tot}} = I_\omega(1 + s + sc + s^2c + s^2c^2 + \dots).$$

Does this series converge? Why or why not?

## Proofs

53. Prove that if  $\sum_{k=1}^{\infty} a_k$  is a convergent series with  $a_k \geq 0$  for every positive integer  $k$ , then the series  $\sum_{k=1}^{\infty} a_k^2$  converges.
54. Prove that if  $\sum_{k=1}^{\infty} a_k$  is a convergent series with  $a_k \geq 0$  for every positive integer  $k$ , then the series  $\sum_{k=1}^{\infty} \frac{a_k}{k}$  converges.
55. Prove that if  $\sum_{k=1}^{\infty} a_k$  and  $\sum_{k=1}^{\infty} b_k$  are two convergent series with  $a_k \geq 0$  and  $b_k \geq 0$  for every positive integer  $k$ , then the series  $\sum_{k=1}^{\infty} (a_k \cdot b_k)$  converges.

In Exercises 56 and 57 we ask you to complete the proof of Theorem 7.33. For these exercises let  $\sum_{k=1}^{\infty} a_k$  and  $\sum_{k=1}^{\infty} b_k$  be two series with positive terms.

56. Show that if  $\lim_{k \rightarrow \infty} \frac{a_k}{b_k} = \infty$  and  $\sum_{k=1}^{\infty} b_k$  diverges, then  $\sum_{k=1}^{\infty} a_k$  diverges.
57. Show that if  $\lim_{k \rightarrow \infty} \frac{a_k}{b_k} = 0$  and  $\sum_{k=1}^{\infty} b_k$  converges, then  $\sum_{k=1}^{\infty} a_k$  converges.

## Thinking Forward

- ▶ *A series of monomials:* Find all values of  $x$  for which the series  $\sum_{k=1}^{\infty} \frac{x^{2k}}{k^2}$  converges.
- ▶ *A series of monomials:* Find all values of  $x$  for which the series  $\sum_{k=0}^{\infty} \frac{|x|}{4^k}$  converges.

## 7.6 THE RATIO AND ROOT TESTS

- ▶ Series containing powers, factorials, and/or factorial-like terms
- ▶ Using the ratio test to determine the convergence of a series
- ▶ Using the root test to determine the convergence of a series

### The Ratio Test

In this section we discuss two more convergence tests for series with positive terms: the ratio test and the root test. As we will see, the statements of these tests are quite similar. Both tests involve the evaluation of a limit. The magnitude of the appropriate limit can tell us whether the series converges or diverges. Unlike the limit we use in the limit comparison test, the limits we take for the tests in this section do not rely upon the terms of a secondary series. The ratio test, in particular, will be used extensively throughout the remainder of this chapter and in Chapter 8.

#### THEOREM 7.34

#### The Ratio Test

Let  $\sum_{k=1}^{\infty} a_k$  be a series with positive terms, and assume  $\rho = \lim_{k \rightarrow \infty} \frac{a_{k+1}}{a_k}$  exists.

- (a) If  $\rho < 1$ , the series converges.
- (b) If  $\rho > 1$ , the series diverges.
- (c) If  $\rho = 1$ , the test is inconclusive. (Use a different test!)

The main concept used in the proof of the ratio test is that a series in which  $\lim_{k \rightarrow \infty} \frac{a_{k+1}}{a_k} = \rho$  behaves like the geometric series  $\sum \rho^k$ .

**Proof.** Let  $\sum_{k=1}^{\infty} a_k$  be a series with positive terms, and let  $\rho = \lim_{k \rightarrow \infty} \frac{a_{k+1}}{a_k}$ .

We first assume that  $\rho < 1$ . In this case, there is a positive real number  $r$  such that  $\rho < r < 1$ . Since  $\rho = \lim_{k \rightarrow \infty} \frac{a_{k+1}}{a_k}$  and  $r > \rho$ , all values of the quotient  $\frac{a_{k+1}}{a_k}$  will be less than  $r$  for sufficiently large values of  $k$ . That is, there is a positive integer  $N$  such that, for  $k \geq N$ ,  $\frac{a_{k+1}}{a_k} < r$ . In particular,

$$a_{N+1} < a_N r.$$

The analogous inequalities hold for all subsequent successive pairs of terms of the series. For example,

$$a_{N+2} < a_{N+1} r$$

as well. Combining these two inequalities, we obtain  $a_{N+2} < a_N r^2$ . By induction, we may prove that

$$a_{N+n} < a_N r^n$$

for every positive integer  $n$ . (We leave this detail to Exercise 66.) We now consider the tail of the original series:

$$\begin{aligned} \sum_{k=N}^{\infty} a_k &= a_N + a_{N+1} + a_{N+2} + \cdots + a_{N+n} + \cdots \\ &< a_N + a_N r + a_N r^2 + \cdots + a_N r^n + \cdots \leftarrow \text{since } a_{N+n} < a_N r^n \text{ for every positive integer } n \\ &= a_N(1 + r + r^2 + \cdots + r^n + \cdots) \end{aligned}$$

Note that since  $a_N \in \mathbb{R}$  and  $r < 1$ , the preceding series is a convergent geometric series. Because this geometric series converges, by the comparison test and the fact that the tail of a series determines the convergence of the entire series, the series  $\sum_{k=1}^{\infty} a_k$  converges.

We now show that if  $\rho > 1$  the series diverges. Since  $\rho = \lim_{k \rightarrow \infty} \frac{a_{k+1}}{a_k}$  and  $\rho > 1$ , there is a positive integer  $N$  such that for every  $k \geq N$ ,  $a_{k+1} > a_k$ . Thus, after index  $N$ , the terms of the series form an increasing sequence. Furthermore, since  $a_N > 0$ , it follows that  $\lim_{k \rightarrow \infty} a_k \neq 0$ . The divergence test implies that when  $\rho > 1$  the series  $\sum_{k=1}^{\infty} a_k$  diverges.

Recall from Section 7.4 that a  $p$ -series  $\sum_{k=1}^{\infty} \frac{1}{k^p}$  converges when  $p > 1$  and diverges otherwise. In Example 1 we will show that for the (divergent) harmonic series  $\sum_{k=1}^{\infty} \frac{1}{k}$  and the (convergent)  $p$ -series  $\sum_{k=1}^{\infty} \frac{1}{k^2}$  the limit of the quotient of successive terms of the series is 1. This will complete the proof by showing that the ratio test is inconclusive when  $\rho = 1$ . ■

The ratio test works particularly well on series containing exponential factors, factorials, and/or factorial-like products. Since the terms of the series  $\sum_{k=0}^{\infty} \frac{2^k}{k!}$  contain both exponentials and factorials, the series is a perfect candidate for the ratio test. Here  $a_k = \frac{2^k}{k!}$  and  $a_{k+1} = \frac{2^{k+1}}{(k+1)!}$ , and we compute

$$\lim_{k \rightarrow \infty} \frac{a_{k+1}}{a_k} = \frac{2^{k+1}/(k+1)!}{2^k/k!} = \lim_{k \rightarrow \infty} \frac{2^{k+1}}{(k+1)!} \cdot \frac{k!}{2^k} = \lim_{k \rightarrow \infty} \frac{2}{k+1} = 0.$$

Since this limit is less than 1, the series converges.

## The Root Test

### THEOREM 7.35

#### The Root Test

Let  $\sum_{k=1}^{\infty} a_k$  be a series with positive terms, and assume  $\rho = \lim_{k \rightarrow \infty} \sqrt[k]{a_k} = \lim_{k \rightarrow \infty} (a_k)^{1/k}$  exists.

- (a) If  $\rho < 1$ , the series converges.
- (b) If  $\rho > 1$ , the series diverges.
- (c) If  $\rho = 1$ , the test is inconclusive. (Use a different test!)

The main idea in the proof of the root test is the same as it was in the proof of the ratio test: A series in which  $\lim_{k \rightarrow \infty} \sqrt[k]{a_k} = \rho$  behaves like the geometric series  $\sum \rho^k$ . Therefore, the proof of Theorem 7.35 may be modeled on our proof of the ratio test. This is left for Exercise 68. The root test works particularly well on series containing exponential factors or other factors with  $k$ th powers. The series  $\sum_{k=1}^{\infty} \left(\frac{2k}{3k-1}\right)^k$  is one such series. Here,

$$\lim_{k \rightarrow \infty} (a_k)^{1/k} = \lim_{k \rightarrow \infty} \left( \left( \frac{2k}{3k-1} \right)^k \right)^{1/k} = \lim_{k \rightarrow \infty} \frac{2k}{3k-1} = \frac{2}{3}.$$

Since this value is less than 1, the series converges.

## Examples and Explorations

## EXAMPLE 1

## Using the ratio test

Use the ratio test to determine the convergence or divergence of the following series:

$$(a) \sum_{k=0}^{\infty} \frac{10^k}{k!}$$

$$(b) \sum_{k=1}^{\infty} \frac{3^k}{k^5}$$

$$(c) \sum_{k=2}^{\infty} \frac{2^{3k-1}}{(2k-3)!}$$

## SOLUTION

- (a) We have already mentioned that the ratio test is particularly effective on series containing exponential factors, factorials, or factorial-like products. Each of the given series in this example contains at least one of these. Also, note that the terms of these series are positive for every value of  $k$ . In the first series we let  $a_k = \frac{10^k}{k!}$ . Thus,  $a_{k+1} = \frac{10^{k+1}}{(k+1)!}$  and

$$\rho = \lim_{k \rightarrow \infty} \frac{a_{k+1}}{a_k} = \lim_{k \rightarrow \infty} \frac{10^{k+1}/(k+1)!}{10^k/k!} = \lim_{k \rightarrow \infty} \frac{10^{k+1}}{(k+1)!} \frac{k!}{10^k} = \lim_{k \rightarrow \infty} \frac{10}{k+1} = 0.$$

Since  $\rho < 1$ , the series converges. Before we continue, be sure you understand the mechanics of the steps we just used. In particular, make sure you understand why  $\frac{(k+1)!}{k!} = k+1$ .

- (b) Here we let  $a_k = \frac{3^k}{k^5}$  and  $a_{k+1} = \frac{3^{k+1}}{(k+1)^5}$ . Then

$$\rho = \lim_{k \rightarrow \infty} \frac{a_{k+1}}{a_k} = \lim_{k \rightarrow \infty} \frac{3^{k+1}/(k+1)^5}{3^k/k^5} = \lim_{k \rightarrow \infty} \frac{3^{k+1}}{(k+1)^5} \frac{k^5}{3^k} = \lim_{k \rightarrow \infty} \frac{3k^5}{(k+1)^5} = 3.$$

Since  $\rho > 1$ , the series diverges. Before proceeding to the final series in this example we should note that we could also have used the divergence test to show that the given series diverges. Since exponential functions dominate polynomials, it follows that  $\frac{3^k}{k^5} \rightarrow \infty$  as  $k \rightarrow \infty$ .

- (c) For our final series we let  $a_k = \frac{2^{3k-1}}{(2k-3)!}$  and

$$a_{k+1} = \frac{2^{3(k+1)-1}}{(2(k+1)-3)!} = \frac{2^{3k+2}}{(2k-1)!}.$$

Note that to form  $a_{k+1}$  we replaced each occurrence of  $k$  by  $k+1$  in our formula for  $a_k$  and then simplified. Now,

$$\rho = \lim_{k \rightarrow \infty} \frac{a_{k+1}}{a_k} = \lim_{k \rightarrow \infty} \frac{2^{3k+2}/(2k-1)!}{2^{3k-1}/(2k-3)!} = \lim_{k \rightarrow \infty} \frac{2^{3k+2}}{(2k-1)!} \frac{(2k-3)!}{2^{3k-1}}.$$

We will need to simplify the rightmost quantity before we evaluate the limit. When we simplify the exponential factors in the numerator and denominator, we have

$$\frac{2^{3k+2}}{2^{3k-1}} = 2^{(3k+2)-(3k-1)} = 2^3 = 8.$$

From the definition of the factorial, we obtain

$$\frac{(2k-3)!}{(2k-1)!} = \frac{(2k-3)!}{(2k-1)(2k-2)(2k-3)!} = \frac{1}{(2k-1)(2k-2)}.$$

Therefore,

$$\rho = \lim_{k \rightarrow \infty} \frac{8}{(2k-1)(2k-2)} = 0.$$

By the ratio test, the series converges. □

**EXAMPLE 2****Showing that the ratio test is inconclusive when  $\rho = 1$** 

Show that the ratio test fails to determine the divergence of the harmonic series  $\sum_{k=1}^{\infty} \frac{1}{k}$  or the convergence of the  $p$ -series  $\sum_{k=1}^{\infty} \frac{1}{k^2}$ .

**SOLUTION**

We consider the harmonic series first. For the harmonic series,  $a_k = \frac{1}{k}$  and  $a_{k+1} = \frac{1}{k+1}$ . Thus,

$$\lim_{k \rightarrow \infty} \frac{a_{k+1}}{a_k} = \lim_{k \rightarrow \infty} \frac{1/(k+1)}{1/k} = \lim_{k \rightarrow \infty} \frac{k}{k+1} = 1.$$

We now consider  $\sum_{k=1}^{\infty} \frac{1}{k^2}$ . Here we have  $a_k = \frac{1}{k^2}$  and  $a_{k+1} = \frac{1}{(k+1)^2}$ . Hence,

$$\lim_{k \rightarrow \infty} \frac{a_{k+1}}{a_k} = \lim_{k \rightarrow \infty} \frac{1/(k+1)^2}{1/k^2} = \lim_{k \rightarrow \infty} \frac{k^2}{(k+1)^2} = 1.$$

We already know that the harmonic series diverges and the  $p$ -series with  $p = 2$  converges. This shows that the ratio test is inconclusive when  $\rho = \lim_{k \rightarrow \infty} \frac{a_{k+1}}{a_k} = 1$ .

Recall that we have already mentioned that the ratio test can be effective on series containing exponential factors, factorials, and/or factorial-like products. The two  $p$ -series in this example do not fall into this category. In particular, the ratio test will always be inconclusive for series whose terms are rational functions.  $\square$

**EXAMPLE 3****Analyzing a series containing products similar to factorials**

Determine the convergence or divergence of the following series:

- (a)  $\frac{2}{4} + \frac{2 \cdot 4}{4 \cdot 7} + \frac{2 \cdot 4 \cdot 6}{4 \cdot 7 \cdot 10} + \cdots + \frac{2 \cdot 4 \cdot 6 \cdots (2k)}{4 \cdot 7 \cdot 10 \cdots (3k+1)} + \cdots$
- (b)  $\frac{1}{2} + \frac{1 \cdot 3}{2 \cdot 4} + \frac{1 \cdot 3 \cdot 5}{2 \cdot 4 \cdot 6} + \cdots + \frac{1 \cdot 3 \cdot 5 \cdots (2k-1)}{2 \cdot 4 \cdot 6 \cdots (2k)} + \cdots$

**SOLUTION**

The terms of each of these series consist of quotients of factorial-like products. The ratio test will be the first convergence test we try on both series, but we will see that it succeeds only on the first.

- (a) For the first series, we let  $a_k = \frac{2 \cdot 4 \cdot 6 \cdots (2k)}{4 \cdot 7 \cdot 10 \cdots (3k+1)}$ . Then the numerator of  $a_{k+1}$  contains all of the same factors as the numerator of  $a_k$ , along with the factor  $2(k+1) = 2k+2$ . Similarly, the denominator contains all of the same factors, along with  $3(k+1) + 1 = 3k+4$ . Thus,  $a_{k+1} = \frac{2 \cdot 4 \cdot 6 \cdots (2k)(2k+2)}{4 \cdot 7 \cdot 10 \cdots (3k+1)(3k+4)}$  and

$$\begin{aligned} \rho &= \lim_{k \rightarrow \infty} \frac{a_{k+1}}{a_k} \\ &= \lim_{k \rightarrow \infty} \frac{2 \cdot 4 \cdot 6 \cdots (2k)(2k+2)/(4 \cdot 7 \cdot 10 \cdots (3k+1)(3k+4))}{2 \cdot 4 \cdot 6 \cdots (2k)/(4 \cdot 7 \cdot 10 \cdots (3k+1))} && \leftarrow \text{the definition of } \rho \\ &= \lim_{k \rightarrow \infty} \frac{2 \cdot 4 \cdot 6 \cdots (2k)(2k+2)}{4 \cdot 7 \cdot 10 \cdots (3k+1)(3k+4)} \cdot \frac{4 \cdot 7 \cdot 10 \cdots (3k+1)}{2 \cdot 4 \cdot 6 \cdots (2k)} && \leftarrow \text{invert and multiply} \\ &= \lim_{k \rightarrow \infty} \frac{2k+2}{3k+4} = \frac{2}{3}. && \leftarrow \text{simplify the expression} \\ & && \text{and evaluate the limit} \end{aligned}$$

Since  $\rho < 1$ , this series converges. Be sure that you understand the algebra in the preceding steps.

- (b) The algebra required to use the ratio test on our second series is quite similar, so we will evaluate  $\rho$  with less explanation. However, check that you understand the following work. We have

$$\rho = \lim_{k \rightarrow \infty} \frac{1 \cdot 3 \cdot 5 \cdots (2k-1)(2k+1)/(2 \cdot 4 \cdot 6 \cdots (2k) \cdot (2k+2))}{1 \cdot 3 \cdot 5 \cdots (2k-1)/(2 \cdot 4 \cdot 6 \cdots (2k))} = \lim_{k \rightarrow \infty} \frac{2k+1}{2k+2} = 1.$$

As we predicted, the ratio test is inconclusive.

We regroup the factors of the  $k$ th term of the series:

$$\frac{1 \cdot 3 \cdot 5 \cdots (2k-1)}{2 \cdot 4 \cdot 6 \cdots (2k)} = \frac{1}{2k} \cdot \frac{3}{2} \cdot \frac{5}{4} \cdots \frac{2k-1}{2k-2}.$$

Then we note that the quotients  $\frac{3}{2}, \frac{5}{4}, \dots, \frac{2k-1}{2k-2}$  are all greater than 1. We now have

$$\frac{1 \cdot 3 \cdot 5 \cdots (2k-1)}{2 \cdot 4 \cdot 6 \cdots (2k)} \geq \frac{1}{2k}.$$

Next we use the comparison test to show that our series diverges. Since each term of the series  $\sum_{k=1}^{\infty} \frac{1}{2k}$  is one-half of the corresponding term of the (divergent) harmonic series, this series diverges. Note also that, because  $\frac{1 \cdot 3 \cdot 5 \cdots (2k-1)}{2 \cdot 4 \cdot 6 \cdots (2k)} \geq \frac{1}{2k}$ , each term of our series is greater than the corresponding term of the divergent series, so by the comparison test our series diverges as well.  $\square$

#### EXAMPLE 4

#### Using the root test

Use the root test, if appropriate, to determine the convergence or divergence of the following series:

$$\sum_{k=0}^{\infty} \frac{10^k}{k!}$$

$$\sum_{k=1}^{\infty} \frac{3^k}{k^5}$$

$$\sum_{k=2}^{\infty} \frac{2^{3k-1}}{(2k-3)!}$$

#### SOLUTION

These are the same three series we analyzed in Example 1. We have mentioned that the root test is particularly effective on series containing exponential factors. In general, it should not be used on a series containing factorials or products like factorials. Therefore, of the three given series, only  $\sum_{k=1}^{\infty} \frac{3^k}{k^5}$  is a candidate for the root test. We have

$$\rho = \lim_{k \rightarrow \infty} (a_k)^{1/k} = \lim_{k \rightarrow \infty} \left( \frac{3^k}{k^5} \right)^{1/k} = \lim_{k \rightarrow \infty} \frac{(3^k)^{1/k}}{(k^5)^{1/k}}.$$

The numerator in the limit simplifies to 3, and the denominator is equal to  $(k^{1/k})^5$ . Recall that  $k^{1/k} \rightarrow 1$  as  $k \rightarrow \infty$ . (You will show this in the *Thinking Back* exercises at the end of this section.) Therefore, when we take the limit in the preceding equation, we obtain  $\rho = 3$ . Since  $\rho > 1$ , the series diverges.

Compare the analysis and algebra we did for this series in Example 1 with the work we did here. When the ratio and root tests may both be used successfully to analyze a series, sometimes the work required for one of these tests is significantly simpler than the work required for the other. For the series we just worked with, how do you think the tests compare?  $\square$

#### EXAMPLE 5

#### Showing that the root test is inconclusive when $\rho = 1$

Show that the root test fails to determine the divergence of the harmonic series  $\sum_{k=1}^{\infty} \frac{1}{k}$  or the convergence of the  $p$ -series  $\sum_{k=1}^{\infty} \frac{1}{k^2}$ .

**SOLUTION**

We consider the harmonic series first. For the harmonic series,  $a_k = \frac{1}{k}$ . We have

$$\lim_{k \rightarrow \infty} (a_k)^{1/k} = \lim_{k \rightarrow \infty} \frac{1}{k^{1/k}} = 1.$$

Therefore, the root test fails.

For the series  $\sum_{k=1}^{\infty} \frac{1}{k^2}$ ,

$$\lim_{k \rightarrow \infty} (a_k)^{1/k} = \lim_{k \rightarrow \infty} \frac{1}{(k^2)^{1/k}} = \lim_{k \rightarrow \infty} \frac{1}{k^{2/k}}.$$

Again, the limit of the denominator is indeterminate and of the type  $\infty^0$ . We leave it to you to show that  $\lim_{k \rightarrow \infty} \frac{1}{k^{2/k}} = 1$ .

As we mentioned in Example 1, we already know that the harmonic series diverges and the  $p$ -series with  $p = 2$  converges. These two series show that the root test cannot discern convergence from divergence when  $\rho = \lim_{k \rightarrow \infty} (a_k)^{1/k} = 1$ .

We point out again that the root test is most effective on series with exponential factors or series with other types of factors involving  $k$ th powers. Since  $p$ -series do not contain factors of these types, we should not expect the root test to work here. Again, as with the ratio test, the root test will always be inconclusive for series whose terms are rational functions.  $\square$

**? TEST YOUR UNDERSTANDING**

- ▶ What is the statement of the ratio test?
- ▶ Given a series  $\sum_{k=1}^{\infty} a_k$ , to use the ratio test we let  $\rho = \lim_{k \rightarrow \infty} \frac{a_{k+1}}{a_k}$ . If  $\rho < 1$ , the series converges and if  $\rho > 1$ , the series diverges. Why does the value 1 mark the boundary between convergence and divergence?
- ▶ What characteristics should you look for in a series before you try the ratio test?
- ▶ What is the statement of the root test?
- ▶ What characteristics should you look for in a series before you try the root test?

**EXERCISES 7.6****Thinking Back**

- ▶ *An indeterminate form of the type  $\infty^0$* : Explain why  $\lim_{k \rightarrow \infty} k^{1/k}$  has an indeterminate form of the type  $\infty^0$ . Then show that this limit equals 1.
- ▶ *Basic functions*: What is a monomial? What is a power function? What is a polynomial? What is a rational function?

**Concepts**

0. *Problem Zero*: Read the section and make your own summary of the material.
1. *True/False*: Determine whether each of the statements that follow is true or false. If a statement is true, explain why. If a statement is false, provide a counterexample.
  - (a) *True or False*: If  $a_k$  is a nonzero polynomial function, the series  $\sum_{k=1}^{\infty} a_k$  will diverge.
  - (b) *True or False*: The ratio test will be inconclusive for a series  $\sum_{k=1}^{\infty} a_k$  where  $a_k$  is a nonzero polynomial function of  $k$ .
  - (c) *True or False*: The ratio test will be inconclusive for a series  $\sum_{k=1}^{\infty} a_k$  where  $a_k$  is a rational function of  $k$ .
  - (d) *True or False*: If the function  $a_k$  contains factorials, the ratio test will be effective in determining the convergence or divergence of the series  $\sum_{k=1}^{\infty} a_k$ .
  - (e) *True or False*: The proof of the ratio test uses the fact that a geometric series  $\sum_{k=1}^{\infty} r^k$  converges when  $|r| < 1$ .

- (f) *True or False:* The root test can be used successfully to determine the convergence or divergence of every  $p$ -series.
- (g) *True or False:* The root test is only used to analyze the convergence of a series of the form  $\sum_{k=1}^{\infty} (a_k)^k$ .
- (h) *True or False:*  $\frac{(n+2)!}{n!} = 2$ .
2. *Examples:* Construct examples of the thing(s) described in the following. Try to find examples that are different than any in the reading.
- (a) A series containing factorials on which the ratio test will be effective in determining convergence or divergence.
- (b) A series containing factorials on which the ratio test will be ineffective in determining convergence or divergence.
- (c) A series on which the root test will be effective in determining convergence or divergence.
3. Let  $p(x)$  be a nonzero polynomial function. Evaluate  $\lim_{x \rightarrow \infty} \frac{p(x+1)}{p(x)}$ .
4. Use Exercise 3 to explain why the ratio test will be inconclusive for every series  $\sum_{k=1}^{\infty} a_k$  in which  $a_k$  is a polynomial.
5. Let  $r(x)$  be a nonzero rational function. Evaluate  $\lim_{x \rightarrow \infty} \frac{r(x+1)}{r(x)}$ .
6. Use Exercise 5 to explain why the ratio test will be inconclusive for every series  $\sum_{k=1}^{\infty} a_k$  in which  $a_k$  is a rational function of  $k$ .
7. Explain how you could adapt the ratio test to analyze a series  $\sum_{k=1}^{\infty} a_k$  in which the terms of the series are all negative.
8. Provide a more general statement of the ratio test in which the terms of the series are *eventually* all positive. Explain why your statement is valid.
9. Let  $\sum_{k=1}^{\infty} a_k$  be a series in which all the terms are positive. If  $\lim_{k \rightarrow \infty} \frac{a_{k+1}}{a_k} > 1$ , explain why both the ratio test and the divergence test could be used to show that the series diverges.
10. Explain why the ratio test does not work in determining the convergence or divergence of the series  $\sum_{k=1}^{\infty} \frac{k!}{(k+2)!}$ . What test would be more effective to analyze this series?
11. Let  $m(x) = Ax^r$  be a power function. Evaluate  $\lim_{x \rightarrow \infty} m(x)^{1/x}$ .
12. Use Exercise 11 to explain why the root test will be inconclusive for every series  $\sum_{k=1}^{\infty} a_k$  in which  $a_k$  is a power function.
13. Explain how you could adapt the root test to analyze a series  $\sum_{k=1}^{\infty} a_k$  in which the terms of the series are all negative.
14. Provide a more general statement of the root test in which the terms of the series are *eventually* all positive. Explain why your statement is valid.
15. Explain why it would be difficult to use the root test on the series  $\sum_{k=1}^{\infty} \frac{1}{k!}$ .
16. Explain why the series  $\sum_{k=1}^{\infty} \frac{1}{3^k}$  converges. Which convergence tests could be used to prove this?
17. Explain why the series  $\sum_{k=0}^{\infty} \frac{1}{3^k}$  converges. Which convergence tests could be used to prove this?
18. Explain why the series  $\sum_{k=0}^{\infty} \frac{1}{k!}$  converges. Which convergence tests could be used to prove this?
19. Explain why the ratio test cannot be used on the series  $1 + \frac{1}{5} + \frac{1}{10} + \frac{1}{50} + \frac{1}{100} + \frac{1}{500} + \dots$ . Then show that the series converges and find its sum.
20. Let  $\alpha$  and  $\beta$  be two distinct positive numbers less than 1. Explain why the ratio test cannot be used on the series  $\alpha + \beta + \alpha^2 + \beta^2 + \alpha^3 + \beta^3 + \dots$ . Then show that the series converges and find its sum.

## Skills

Simplify the quotients in Exercises 21–28 without using a calculator.

21.  $\frac{8!}{10!}$
22.  $\frac{700!}{699!}$
23.  $\frac{k!}{(k+2)!}$
24.  $\frac{(2n-2)!}{(2n)!}$
25.  $\frac{4!}{(2!)!}$
26.  $\frac{6!}{(3!)!}$
27.  $\frac{(n+1)!}{(n-2)!}$
28.  $\frac{1 \cdot 3 \cdot 5 \cdots (2k-1)}{1 \cdot 3 \cdot 5 \cdots (2k+1)}$

In Exercises 29–34 use the ratio test to analyze whether the given series converges or diverges. If the ratio test is inconclusive, use a different test to analyze the series.

29.  $\sum_{k=0}^{\infty} \frac{5^k}{k!}$
30.  $\sum_{k=1}^{\infty} \frac{5^k}{k^5}$
31.  $\sum_{k=0}^{\infty} \frac{1}{k^3 + 1}$
32.  $\sum_{k=1}^{\infty} \frac{k!}{(2k)!}$
33.  $\sum_{k=1}^{\infty} \frac{2 \cdot 4 \cdot 6 \cdots (2k)}{1 \cdot 3 \cdot 5 \cdots (2k-1)}$
34.  $\sum_{k=1}^{\infty} \frac{1 \cdot 4 \cdot 7 \cdots (3k-2)}{2 \cdot 4 \cdot 6 \cdots (2k)}$

In Exercises 35–40 use the root test to analyze whether the given series converges or diverges. If the root test is inconclusive, use a different test to analyze the series.

35. 
$$\sum_{k=1}^{\infty} \frac{5^k}{k^5}$$

36. 
$$\sum_{k=1}^{\infty} \frac{5^k}{k^2 4^{k+1}}$$

37. 
$$\sum_{k=0}^{\infty} \frac{1}{k^3 + 1}$$

38. 
$$\sum_{k=2}^{\infty} \left( \frac{1}{\ln k} \right)^k$$

39. 
$$\sum_{k=1}^{\infty} \left( \frac{1+4k}{5k-1} \right)^k$$

40. 
$$\sum_{k=1}^{\infty} \frac{k^k}{k!}$$

Use any convergence test from Sections 7.4–7.6 to determine whether the series in Exercises 41–59 converge or diverge. Explain why each series that meets the hypotheses of the test you select does so.

41. 
$$\sum_{k=1}^{\infty} \left( \frac{k+1}{3k+1} \right)^k$$

42. 
$$\sum_{k=1}^{\infty} \frac{3}{k(k+2)}$$

43. 
$$\sum_{k=1}^{\infty} \frac{4}{k+3}$$

44. 
$$\sum_{k=1}^{\infty} \frac{k^3}{k^2 + 7}$$

45. 
$$\sum_{k=0}^{\infty} \frac{k!}{(k+3)!}$$

46. 
$$\sum_{k=1}^{\infty} \frac{k^3}{2^k}$$

47. 
$$\sum_{k=1}^{\infty} \frac{\sqrt{k}}{k^2 + 3}$$

48. 
$$\sum_{k=1}^{\infty} \left( \frac{1}{k^2} \right)^{\sqrt{k}}$$

49. 
$$\sum_{k=1}^{\infty} \frac{3^k}{k^k}$$

50. 
$$\sum_{k=0}^{\infty} \frac{2^{k!}}{k!}$$

51. 
$$\sum_{k=1}^{\infty} \frac{(2k)!}{(k!)!}$$

52. 
$$\sum_{k=0}^{\infty} \frac{k!}{3^{k^2}}$$

53. 
$$\sum_{k=1}^{\infty} \frac{2 \cdot 5 \cdot 8 \cdots (3k-1)}{3 \cdot 5 \cdot 7 \cdots (2k+1)}$$

54. 
$$\sum_{k=0}^{\infty} \frac{2 \cdot 5 \cdot 8 \cdots (3k+2)}{1 \cdot 5 \cdot 9 \cdots (4k+1)}$$

55. 
$$\sum_{k=1}^{\infty} \left( \frac{k}{k+1} \right)^{k^2}$$

56. 
$$\sum_{k=1}^{\infty} \frac{e^{1/k}}{k^2}$$

57. 
$$\sum_{k=1}^{\infty} \frac{k!}{1 \cdot 3 \cdot 5 \cdot 7 \cdots (2k-1)}$$

58. 
$$\sum_{k=0}^{\infty} \frac{1 \cdot 4 \cdot 7 \cdots (3k+1)}{100^k}$$

59. 
$$\sum_{k=1}^{\infty} \frac{1 \cdot 4 \cdot 7 \cdots (3k-2)}{3 \cdot 6 \cdot 9 \cdots (3k)} \quad (\text{Hint: See Example 3.})$$

60. (a) Show that the series  $\sum_{k=1}^{\infty} \frac{\ln k}{k^2}$  converges.(b) Use the result from part (a) to show that  $\sum_{k=1}^{\infty} \frac{\ln k}{k^n}$  converges for every integer  $n > 2$ .61. Let  $n$  be a positive integer and let  $r > 1$ .(a) Show that the series  $\sum_{k=1}^{\infty} \frac{k^n}{r^k}$  converges.(b) Explain why part (a) proves that  $\lim_{k \rightarrow \infty} \frac{k^n}{r^k} = 0$ .

(c) Explain why part (b) proves that exponential growth dominates polynomial growth.

62. Let  $r > 1$ .(a) Show that the series  $\sum_{k=1}^{\infty} \frac{r^k}{k!}$  converges.(b) Explain why part (a) proves that  $\lim_{k \rightarrow \infty} \frac{r^k}{k!} = 0$ .

(c) Explain why part (b) proves that factorial growth dominates exponential growth.

63. (a) Show that the series  $\sum_{k=1}^{\infty} \frac{k!}{k^k}$  converges.(b) Explain why part (a) proves that  $\lim_{k \rightarrow \infty} \frac{k!}{k^k} = 0$ .(c) Explain why part (b) proves that the function  $k^k$  dominates factorial growth.

## Applications

In Exercises 64 and 65 we use the product notation  $\prod_{j=1}^n r_j$ . (The symbol  $\Pi$  is a capital  $\pi$ .) This notation is analogous to the summation notation  $\sum_{k=1}^n a_k$ , but means the product of the entries, rather than their sum. That is,

$$\prod_{j=1}^n r_j = r_1 \cdot r_2 \cdot r_3 \cdots r_n.$$

64. Leila needs to determine the number of trout to stock a lake with annually. She has evidence that between 65% and 95% of the trout persist in the lake from year to year. The actual percentage varies with the amount of fishing, as well as the weather, the number of insects available, and the fraction of the trout that are of a reproductive age. Denote the fraction of fish that persist from one year to the next by  $r_k \in [0.65, 0.95]$ . For simplicity, Leila assumes that  $\lim_{k \rightarrow \infty} r_k = 0.80$ . The number of fish she stocks annually is denoted  $s$ , with the steady number of fish in the

lake given by

$$f_{\infty} = s \left( 1 + \sum_{i=0}^{\infty} \left( \prod_{j=0}^i r_j \right) \right).$$

(a) Use the ratio test to show that this series converges.  
(b) Can Leila use the given assumptions to find  $f_{\infty}$ ? Explain.

65. In Exercise 64, Leila actually needs to estimate the steady number of fish  $f_{\infty}$  that will be in the lake for a given annual stocking rate  $s$ . She supposes that  $s = 420$  and that in the first 10 years of stocking the rates of persistence  $r_i$  are all equal to the mean:  $r_i = 0.80$  for  $i = 1, 2, \dots, 10$ . Note that she assumes that after the first 10 years the values of  $r_k$  can again vary between 0.65 and 0.95.

(a) Neglecting  $f_0$ , find  $f_{10} = s \sum_{i=0}^{10} \prod_{j=1}^i r_j$  for the given values of  $s$  and  $r_i$ .

(b) Use Theorem 7.31 to find an upper bound for the error in this estimate for  $f_{\infty}$ .

## Proofs

66. Use the principle of mathematical induction to prove that if  $a_{k+1} < a_k r$  for every  $k \geq N$ , then  $a_{N+n} < a_N r^n$ . Proving this implication completes our proof of the ratio test.

67. Prove that the ratio test will be inconclusive on every series of the form  $\sum_{k=1}^{\infty} a_k$  where  $a_k$  is a rational function of  $k$ .

68. Prove the root test. You may model your proof on the proof of the ratio test.

Exercises 69–72 build to a proof that the root test is inconclusive on every series  $\sum_{k=1}^{\infty} a_k$  where  $a_k$  is a rational function of  $k$ .

69. Let  $a_k = ck^m$ , where  $c > 0$  and  $m \in \mathbb{Z}$ . Prove that  $\lim_{k \rightarrow \infty} (ck^m)^{1/k} = 1$ . Explain why this shows that the root test is inconclusive for every series of the form  $\sum_{k=1}^{\infty} ck^m$ , including every  $p$ -series.

70. Let  $c_1$  be a real number,  $c_2$  be a positive real number, and  $m_1 \leq m_2$  be two nonnegative integers.

(a) Explain why, for large values of  $k$ , we have

$$0 < c_1 k^{m_1} + c_2 k^{m_2} \leq (c_1 + c_2) k^{m_2}.$$

(b) Use part (a), the result of Exercise 69, and the Squeeze Theorem to show that  $\lim_{k \rightarrow \infty} (c_1 k^{m_1} + c_2 k^{m_2})^{1/k} = 1$ .

Explain why this shows that the root test is inconclusive for every series of the form  $\sum_{k=1}^{\infty} (c_1 k^{m_1} + c_2 k^{m_2})$ .

71. (a) Use the result of Exercise 70 and mathematical induction to show that if  $c_m > 0$  and each  $m_j$  is a nonnegative integer with  $m_1 \leq m_2 \leq \dots \leq m_n$ , then  $\lim_{k \rightarrow \infty} (c_1 k^{m_1} + c_2 k^{m_2} + \dots + c_n k^{m_n})^{1/k} = 1$ .

(b) Explain why part (a) shows that the root test is inconclusive for every series of the form  $\sum_{k=1}^{\infty} (c_1 k^{m_1} + c_2 k^{m_2} + \dots + c_n k^{m_n})$ .

72. Use the result of Exercise 71 to show that the root test is inconclusive for every series of the form  $\sum_{k=1}^{\infty} a_k$  where  $a_k$  is a rational function of  $k$ .

## Thinking Forward

► *A series of monomials:* Find all values of  $x$  for which the series  $\sum_{k=1}^{\infty} \frac{x^{2k}}{k!}$  converges.

► *A series of monomials:* Find all values of  $x$  for which the series  $\sum_{k=1}^{\infty} \left(\frac{x}{k}\right)^k$  converges.

## 7.7 ALTERNATING SERIES

- The alternating series test and approximating convergent alternating series
- The difference between absolute and conditional convergence
- A summary of convergence tests for series

### Alternating Series

Unlike the divergence test, all of the convergence tests we discussed in Sections 7.4, 7.5 and 7.6 have required our series to have nonnegative terms. In this section we relax that requirement and discuss how to handle certain series in which the signs are arbitrary. We begin, however, with a discussion of series in which the signs alternate.

#### DEFINITION 7.36

#### Alternating Series

Let  $\{a_k\}$  be a sequence of positive numbers. A series of the form

$$\sum_{k=1}^{\infty} (-1)^{k+1} a_k \quad \text{or} \quad \sum_{k=1}^{\infty} (-1)^k a_k$$

is called an **alternating series**.

So, for an alternating series with each  $a_k > 0$ , we have one of two possible forms:

$$a_1 - a_2 + a_3 - a_4 + \dots + (-1)^{k+1} a_k + \dots$$

$$-a_1 + a_2 - a_3 + a_4 - \dots + (-1)^k a_k + \dots$$

We have already studied one type of alternating series. A geometric series  $\sum_{k=0}^{\infty} cr^k$  is an alternating series exactly when  $r < 0$ . For example, we have the alternating geometric series

$$\sum_{k=0}^{\infty} 3 \left(-\frac{1}{2}\right)^k = 3 - \frac{3}{2} + \frac{3}{4} - \frac{3}{8} + \cdots$$

An alternating series that we will see quite often is the **alternating harmonic series**

$$\sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{k} = 1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \cdots$$

### THEOREM 7.37

#### The Alternating Series Test

Let  $\{a_k\}$  be a sequence of positive numbers.

$$\text{If } a_{k+1} < a_k \text{ for every } k \geq 1 \quad \text{and} \quad \lim_{k \rightarrow \infty} a_k = 0,$$

then the alternating series

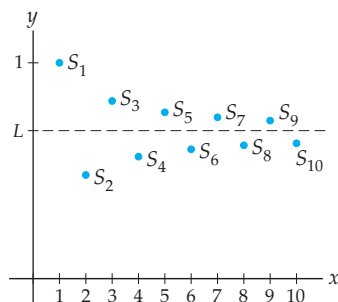

$$\sum_{k=1}^{\infty} (-1)^{k+1} a_k \quad \text{and} \quad \sum_{k=1}^{\infty} (-1)^k a_k$$

both converge.

Note that an arbitrary series that meets the two conditions (7.37) and (7.37) may or may not converge. For example, both the harmonic series and the  $p$ -series with  $p = 2$  satisfy those two conditions, but the former series diverges and the latter series converges. The two conditions ensure convergence only when the series is alternating. For example, the alternating harmonic series converges because it meets the two conditions of Theorem 7.37 and it is an alternating series.

The figure shown next illustrates the main ideas of the proof of the alternating series test with the graph of the first 10 terms of the sequence of partial sums  $\{S_n\}$  for the alternating harmonic series. In the graph we see that the subsequence  $\{S_{2n-1}\}$  is strictly decreasing and is bounded below. Similarly, the subsequence  $\{S_{2n}\}$  is strictly increasing and is bounded above. Since the terms of the series  $a_k \rightarrow 0$ , these two subsequences converge to the same value: the sum of the series,  $L$ . The graph of the sequence of partial sums for every alternating series of the form  $\sum_{k=1}^{\infty} (-1)^{k+1} a_k$  satisfying the conditions of the alternating series test will be similar.

The first 10 terms of the sequence of partial sums  $\{S_n\}$  for the alternating harmonic series

**Proof.** Let  $\{a_k\}$  be a strictly decreasing sequence of positive numbers such that  $a_k \rightarrow 0$  as  $k \rightarrow \infty$ . We will show that the alternating series  $\sum_{k=1}^{\infty} (-1)^{k+1} a_k$  converges and leave the convergence of the alternating series  $\sum_{k=1}^{\infty} (-1)^k a_k$  for Exercise 66. Consider the sequence of partial sums  $\{S_n\}$  given by

$$\begin{aligned} S_1 &= a_1 \\ S_2 &= a_1 - a_2 \\ S_3 &= a_1 - a_2 + a_3 \\ S_4 &= a_1 - a_2 + a_3 - a_4 \\ S_5 &= a_1 - a_2 + a_3 - a_4 + a_5 \\ &\vdots \qquad \qquad \qquad \vdots \end{aligned}$$

We consider the subsequence  $\{S_{2n-1}\}$  of  $\{S_n\}$ . That is,

$$\{S_{2n-1}\} = S_1, S_3, S_5, S_7, \dots$$

We will show that  $\{S_{2n-1}\}$  is bounded and strictly decreasing, and is, therefore, convergent. Consider the terms  $S_{2n-1}$  and  $S_{2n+1}$ . We have

$$\begin{aligned} S_{2n-1} &= a_1 - a_2 + a_3 - \dots - a_{2n-2} + a_{2n-1} \\ S_{2n+1} &= a_1 - a_2 + a_3 - \dots - a_{2n-2} + a_{2n-1} - a_{2n} + a_{2n+1} \end{aligned}$$

We will group the summands of these terms in two different ways to prove our assertions, but first we note that since the sequence  $\{a_k\}$  is strictly decreasing, each difference

$$a_k - a_{k+1} > 0.$$

Now,

$$\begin{aligned} S_{2n-1} &= a_1 - (a_2 - a_3) - \dots - (a_{2n-2} - a_{2n-1}) \\ S_{2n+1} &= a_1 - (a_2 - a_3) - \dots - (a_{2n-2} - a_{2n-1}) - (a_{2n} - a_{2n+1}). \end{aligned}$$

Each of the paired differences in these sums is positive, and since

$$S_{2n+1} = a_1 - (a_2 - a_3) - \dots - (a_{2n-2} - a_{2n-1}) - (a_{2n} - a_{2n+1}) = S_{2n-1} - (a_{2n} - a_{2n+1}),$$

we have  $S_{2n-1} > S_{2n+1}$ . Therefore, the sequence  $\{S_{2n-1}\}$  is strictly decreasing.

Every decreasing sequence is bounded above by its first term. We now show that the sequence  $\{S_{2n-1}\}$  is bounded below by zero. Consider the following grouping of the general term  $S_{2n-1}$ :

$$S_{2n-1} = (a_1 - a_2) + (a_3 - a_4) + \dots + (a_{2n-3} - a_{2n-2}) + a_{2n-1}.$$

Again, each of the paired differences in the formula is positive, as is  $a_{2n-1}$ . Thus  $S_{2n-1}$ , the sum of positive numbers, is positive. Therefore, the sequence is bounded below by zero. We now know that the sequence  $\{S_{2n-1}\}$  is bounded and strictly decreasing. Therefore, it converges to some value. Call this value  $L$ .

We will show that the subsequence  $\{S_{2n}\}$  also converges to  $L$ . Consider

$$S_{2n} = a_1 - a_2 + a_3 - \dots - a_{2n-2} + a_{2n-1} - a_{2n} = S_{2n-1} + a_{2n}.$$

The limit

$$\lim_{n \rightarrow \infty} S_{2n} = \lim_{n \rightarrow \infty} (S_{2n-1} + a_{2n}) = L + 0 = L,$$

since  $S_{2n-1} \rightarrow L$  and  $a_n \rightarrow 0$  as  $n \rightarrow \infty$ . Because the subsequences  $\{S_{2n-1}\}$  and  $\{S_{2n}\}$  both converge to  $L$ , the entire sequence of partial sums  $\{S_n\}$  converges to  $L$ . Therefore the series  $\sum_{k=1}^{\infty} (-1)^{k+1} a_k$  converges. ■

In our proof of the alternating series test, we could have shown that the subsequence  $\{S_{2n}\}$  is strictly increasing and bounded above. However, we did not need those two facts in the proof. You will prove these facts in Exercise 67.

Given any convergent series  $\sum_{k=1}^{\infty} b_k$ , the terms of the sequence of partial sums,  $\{S_n\}$ , may always be used to approximate the sum  $L$  of the series. Given an arbitrary convergent series, however, we cannot always be sure how good an approximation a term  $S_n$  in the sequence of partial sums is for  $L$ . The next theorem tells us that, in the sequence of partial sums for an alternating series satisfying the conditions of the alternating series test, the term  $S_n$  is within  $a_{n+1}$  of  $L$ .

**THEOREM 7.38****Approximating the Remainder for a Convergent Alternating Series**

Let  $L$  be the sum of an alternating series satisfying the hypotheses of the alternating series test. For any term  $S_n$  in the sequence of partial sums,

$$|L - S_n| < a_{n+1}.$$

Furthermore, the sign of the difference  $L - S_n$  is the sign of the coefficient of the term  $a_{n+1}$ .

**Proof.** We consider an alternating series of the form  $\sum_{k=1}^{\infty} (-1)^{k+1} a_k$  and leave the case of an alternating series of the form  $\sum_{k=1}^{\infty} (-1)^k a_k$  for Exercise 68.

In our proof of the alternating series test we showed that the subsequence  $\{S_{2n-1}\}$  of  $\{S_n\}$  was strictly decreasing and converged to a limit  $L$ . Similarly, one may show that the subsequence  $\{S_{2n}\}$  of  $\{S_n\}$  is strictly increasing. In the proof, we did show that the subsequence  $\{S_{2n}\}$  converges to  $L$ . Thus, for every  $n$ , either

$$S_n < L < S_{n+1} \quad \text{or} \quad S_{n+1} < L < S_n,$$

depending upon whether  $n$  is even or odd, respectively. In either case,

$$S_{n+1} - S_n = (-1)^{n+2} a_{n+1}.$$

If  $n$  is even, subtracting  $S_n$  throughout  $S_n < L < S_{n+1}$ , we obtain

$$0 < L - S_n < (-1)^{n+2} a_{n+1} = a_{n+1}.$$

If  $n$  is odd, when we subtract  $S_n$  throughout  $S_{n+1} < L < S_n$ , we obtain

$$(-1)^{n+2} a_{n+1} < L - S_n < 0.$$

Note that since  $n$  is odd, we have  $(-1)^{n+2} a_{n+1} = -a_{n+1}$ . If we multiply through by  $-1$  in  $(-1)^{n+2} a_{n+1} < L - S_n < 0$ , we obtain

$$0 < S_n - L < a_{n+1}.$$

Considering the two inequalities  $0 < L - S_n < a_{n+1}$  and  $0 < S_n - L < a_{n+1}$  together, whether  $n$  is even or odd, we have the desired inequality

$$|L - S_n| < a_{n+1}.$$

Moreover, we note that the sign of the difference  $L - S_n$  is the sign of the coefficient of the term  $a_{n+1}$ . ■

We have already mentioned that the alternating harmonic series  $\sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{k}$  satisfies the conditions of the alternating series test. If we add the first 10 terms of the series to obtain the 10th partial sum,  $S_{10}$ , we obtain

$$S_{10} = 1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \cdots - \frac{1}{10} \approx 0.646.$$

This is an approximation for the sum  $L$  of the series. By Theorem 7.38, the error in using  $S_{10}$  is at most  $\frac{1}{11} \approx 0.091$ . That is,  $|L - 0.646| < 0.091$ . Furthermore, the approximation  $S_{10} \approx 0.646$  is less than  $L$ , since the coefficient of  $a_{11}$  is positive. Therefore, we are ensured that the actual value of the sum  $L$  lies in the interval  $[S_{10}, S_{10} + a_{11}]$ , or, with decimal approximations,

$$0.646 < L < 0.737.$$

(In Chapter 8 we will prove that the sum of the alternating harmonic series is  $\ln 2 \approx 0.693$ . We see that  $\ln 2$  is indeed in the interval we computed.) We also note that although the alternating harmonic series converges, it converges quite slowly, in that it takes many terms of the series to obtain a good approximation for the sum.

## Absolute and Conditional Convergence

Consider the two alternating  $p$ -series

$$\sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{k} \quad \text{and} \quad \sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{k^2}.$$

We have already seen that the alternating series test may be used to prove that the alternating harmonic series converges. You should verify that the second alternating series shown also satisfies the conditions of the alternating series test and, therefore, converges. However, these two series are different in that, if you sum the absolute values of the terms, rather than the terms themselves, one of the resulting series diverges and one converges. That is,

$$\sum_{k=1}^{\infty} \left| \frac{(-1)^{k+1}}{k} \right| = \sum_{k=1}^{\infty} \frac{1}{k} \quad \text{and} \quad \sum_{k=1}^{\infty} \left| \frac{(-1)^{k+1}}{k^2} \right| = \sum_{k=1}^{\infty} \frac{1}{k^2},$$

and we have already determined that the harmonic series diverges and the  $p$ -series with  $p = 2$  converges. This distinction is the basis for our definitions of absolute convergence and conditional convergence.

### DEFINITION 7.39

#### Absolute Convergence

The series  $\sum_{k=1}^{\infty} b_k$  is said to **converge absolutely**, or be **absolutely convergent**, if the series  $\sum_{k=1}^{\infty} |b_k|$  converges.

We see that the series  $\sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{k^2}$  converges absolutely, since  $\sum_{k=1}^{\infty} \left| \frac{(-1)^{k+1}}{k^2} \right| = \sum_{k=1}^{\infty} \frac{1}{k^2}$  converges.

### DEFINITION 7.40

#### Conditional Convergence

A convergent series  $\sum_{k=1}^{\infty} b_k$  is said to **converge conditionally**, or be **conditionally convergent**, if the series  $\sum_{k=1}^{\infty} |b_k|$  diverges.

The alternating harmonic series is conditionally convergent because it converges, but the corresponding series of absolute values,  $\sum_{k=1}^{\infty} \left| \frac{(-1)^{k+1}}{k} \right| = \sum_{k=1}^{\infty} \frac{1}{k}$ , diverges.

The alternating series test was the first convergence test we studied that can directly handle series with some negative terms. However, as its name suggests, the alternating

series test may be applied only to alternating series. The next theorem allows us to examine series in which the signs of the terms are less rigidly specified.

### THEOREM 7.41 Absolute Convergence Implies Convergence

If the series  $\sum_{k=1}^{\infty} b_k$  converges absolutely, then it converges.

The content of Theorem 7.41 may seem slightly odd to you, but recall that the definitions of *convergence* and *absolute convergence* are distinct, so there is something to prove here.

**Proof.** Since the series  $\sum_{k=1}^{\infty} b_k$  converges absolutely, the series  $\sum_{k=1}^{\infty} |b_k|$  converges. Consider the sum  $|b_k| + b_k$ , and note that for every  $k \in \mathbb{Z}^+$ ,

$$0 \leq |b_k| + b_k \leq 2|b_k|.$$

Now, the series  $\sum_{k=1}^{\infty} 2|b_k|$  converges, since  $\sum_{k=1}^{\infty} 2|b_k| = 2\sum_{k=1}^{\infty} |b_k|$ . Thus, by the comparison test, the series

$$\sum_{k=1}^{\infty} (|b_k| + b_k)$$

converges. Finally, using both parts of Theorem 7.24, the difference of two convergent series is convergent, and it follows that

$$\sum_{k=1}^{\infty} (|b_k| + b_k) - \sum_{k=1}^{\infty} |b_k| = \sum_{k=1}^{\infty} ((|b_k| + b_k) - |b_k|) = \sum_{k=1}^{\infty} b_k.$$

We have thus shown that the series  $\sum_{k=1}^{\infty} b_k$  converges. ■

As we mentioned, Theorem 7.41 allows us to analyze the convergence of many (not necessarily alternating) series in which there are both positive and negative terms. For example, consider the series

$$1 - \frac{1}{4} + \frac{1}{9} - \frac{1}{16} + \frac{1}{25} - \frac{1}{36} + \frac{1}{49} - \frac{1}{64} + \frac{1}{81} - \dots$$

The series of absolute values is

$$1 + \frac{1}{4} + \frac{1}{9} + \frac{1}{16} + \frac{1}{25} + \frac{1}{36} + \frac{1}{49} + \frac{1}{64} + \frac{1}{81} + \dots = \sum_{k=1}^{\infty} \frac{1}{k^2}.$$

This is a convergent  $p$ -series. Therefore, the given series converges absolutely, and by Theorem 7.41 it also converges.

## The Curious Behavior of a Conditionally Convergent Series

By this point in your study of mathematics you should be very familiar with the commutative and associative laws of addition. That is, for real numbers  $a$ ,  $b$ , and  $c$ ,

$$a + b = b + a \quad \text{and} \quad (a + b) + c = a + (b + c).$$

We also know that these properties may be combined to show that a finite sum of real numbers may be computed in any order we wish, without affecting the result. However, as we will see in a moment, the same may not be true when we rearrange the terms of an infinite sum. In particular, we will see that if we rearrange the terms of the alternating harmonic series, we can make it converge to a different value. Admittedly, we do have to rearrange infinitely many of the terms for the sum to change, but the sum does change.

Earlier in the section we showed that the alternating harmonic series

$$\sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{k} = 1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \frac{1}{5} - \frac{1}{6} + \cdots$$

converges to a positive number  $L$  in the interval  $(0.646, 0.737)$  when the terms are in the order shown. For the argument we present next, we just need the fact that  $L > 0$ . Rearrange the terms of the alternating harmonic series as follows: Start with the first positive term, and then subtract the next two negative terms, add the next positive term and subtract the next two negative terms, etc. That is,

$$1 - \frac{1}{2} - \frac{1}{4} + \frac{1}{3} - \frac{1}{6} - \frac{1}{8} + \frac{1}{5} - \frac{1}{10} - \frac{1}{12} + \cdots$$

Take a moment to convince yourself that every term from the alternating harmonic series appears exactly once in our new sum, with the same sign it had in the original arrangement.

We now group the terms from the new arrangement as follows:

$$\begin{aligned} & \left(1 - \frac{1}{2}\right) - \frac{1}{4} + \left(\frac{1}{3} - \frac{1}{6}\right) - \frac{1}{8} + \left(\frac{1}{5} - \frac{1}{10}\right) - \frac{1}{12} + \cdots \\ &= \frac{1}{2} - \frac{1}{4} + \frac{1}{6} - \frac{1}{8} + \frac{1}{10} - \frac{1}{12} + \cdots \\ &= \frac{1}{2} \left(1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \frac{1}{5} - \frac{1}{6} + \cdots\right) \\ &= \frac{1}{2} \sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{k} = \frac{1}{2}L \end{aligned}$$

With this arrangement, the sum is  $\frac{1}{2}L$ , and since  $L > 0$ , the sum cannot equal  $L$ . This argument shows that the order of the summation is significant for the alternating harmonic series. Similarly, if we start with any conditionally convergent series, changing the order of (infinitely many) terms can result in a different sum. Perhaps more strangely, given a conditionally convergent series, we can find a rearrangement that will sum to any value we choose! For more on this, see Exercises 71–74.

## The Ratio Test for Absolute Convergence

Now that we have studied absolute and conditional convergence, we should think about convergence tests that will tell us when a series converges absolutely or converges conditionally. Each of the convergence tests we have studied may be adapted to analyze a series for absolute convergence. When presented with a series  $\sum_{k=1}^{\infty} b_k$  containing both positive and negative terms, we should always look at the series of absolute values,  $\sum_{k=1}^{\infty} |b_k|$ , first. If this series converges, then  $\sum_{k=1}^{\infty} b_k$  converges absolutely. By Theorem 7.41, the series  $\sum_{k=1}^{\infty} b_k$  also converges. Thus, we can often use a single convergence test to determine that a series converges and converges absolutely.

To determine that a series converges conditionally we *always* need to use two tests: one to show that the series  $\sum_{k=1}^{\infty} b_k$  converges and a second to show that the series of absolute values,  $\sum_{k=1}^{\infty} |b_k|$ , diverges. A single test can never suffice to determine conditional convergence.

Although the convergence tests we have studied may be adapted to analyze a series for absolute convergence, the variant of the ratio test we studied in Section 7.6 warrants special mention. Recall that, to use the ratio test, we must have a series of the form  $\sum_{k=1}^{\infty} a_k$  with each  $a_k > 0$ . To use the test, we examine  $\lim_{k \rightarrow \infty} \frac{a_{k+1}}{a_k}$ . In the ratio test for absolute convergence, we need a series with nonzero terms,  $\sum_{k=1}^{\infty} b_k$ , and instead examine  $\lim_{k \rightarrow \infty} \left| \frac{b_{k+1}}{b_k} \right|$ . We mention the ratio test for absolute convergence now because we will use

it frequently in Chapter 8. The proof of the ratio test for absolute convergence is almost identical to the proof we saw in Section 7.6 and is left for Exercise 70.

**THEOREM 7.42****The Ratio Test for Absolute Convergence**

Let  $\sum_{k=1}^{\infty} b_k$  be a series with nonzero terms, and assume  $\rho = \lim_{k \rightarrow \infty} \left| \frac{b_{k+1}}{b_k} \right|$  exists.

- (a) If  $\rho < 1$ , the series converges absolutely.
- (b) If  $\rho > 1$ , the series diverges.
- (c) If  $\rho = 1$ , the test is inconclusive. (Use a different test!)

The ratio test for absolute convergence works very well on many series containing exponential factors, factorials, and/or factorial-like products. The series  $\sum_{k=0}^{\infty} \frac{(-3)^k}{(2k)!}$  is a good candidate. Here,  $b_k = \frac{(-3)^k}{(2k)!}$  and  $b_{k+1} = \frac{(-3)^{k+1}}{(2(k+1))!}$ . Thus,

$$\begin{aligned} \lim_{k \rightarrow \infty} \left| \frac{b_{k+1}}{b_k} \right| &= \lim_{k \rightarrow \infty} \left| \frac{(-3)^{k+1}/(2k+2)!}{(-3)^k/(2k)!} \right| = \lim_{k \rightarrow \infty} \left| \frac{(-3)^{k+1}}{(2k+2)!} \cdot \frac{(2k)!}{(-3)^k} \right| \\ &= \lim_{k \rightarrow \infty} \frac{3}{(2k+2)(2k+1)} = 0. \end{aligned}$$

Therefore, this series converges absolutely.

## A Summary of Convergence Tests

The following table provides a compact summary of the statements of the convergence tests we've studied in Sections 7.4–7.7, along with a few notes about them:

Test	Theorem	Comments
Divergence Test Section 7.4	Given the series $\sum_{k=1}^{\infty} a_k$ , if $\lim_{n \rightarrow \infty} a_n \neq 0$ , the series diverges.	Can be used only to determine that a series diverges. Cannot be used to determine convergence.
Integral Test Section 7.4	If $f : [1, \infty) \rightarrow \mathbb{R}$ is a continuous, positive, and decreasing function, then the improper integral $\int_1^{\infty} f(x) dx$ and the series $\sum_{k=1}^{\infty} f(k)$ either both converge or both diverge.	The function $f$ must be relatively easy to integrate. This test is not appropriate for series containing factorials or factors like factorials.
Comparison Test Section 7.5	Let $\sum_{k=1}^{\infty} a_k$ and $\sum_{k=1}^{\infty} b_k$ be two series with nonnegative terms such that $0 \leq a_k \leq b_k$ for every positive integer $k$ . If the series $\sum_{k=1}^{\infty} b_k$ converges, then the series $\sum_{k=1}^{\infty} a_k$ converges.	Given a series to analyze, both comparison tests require you to find a related series different enough to be easy to analyze but similar enough to provide a meaningful comparison.
Limit Comparison Test Section 7.5	Let $\sum_{k=1}^{\infty} a_k$ and $\sum_{k=1}^{\infty} b_k$ be two series with positive terms. If $\lim_{k \rightarrow \infty} \frac{a_k}{b_k} = L$ , where $L$ is any positive real number, then either the series both converge or both diverge.	It is often easier to evaluate $\lim_{k \rightarrow \infty} \frac{a_k}{b_k}$ , rather than ensure the required inequalities of the comparison test. There is an extension of the limit comparison test. See Section 7.4 for details.

Test	Theorem	Comments
Ratio Test Section 7.6	Let $\sum_{k=1}^{\infty} a_k$ be a series with nonnegative terms, and let $\rho = \lim_{k \rightarrow \infty} \frac{a_{k+1}}{a_k}$ . If $\rho < 1$ , the series converges. If $\rho > 1$ , the series diverges. If $\rho = 1$ , the test is inconclusive.	Works well on series containing exponential factors, factorials, and/or factors like factorials.
Root Test Section 7.6	Let $\sum_{k=1}^{\infty} a_k$ be a series with positive terms, and let $\rho = \lim_{k \rightarrow \infty} \sqrt[k]{a_k} = (a_k)^{1/k}$ . If $\rho < 1$ , the series converges. If $\rho > 1$ , the series diverges. If $\rho = 1$ , the test is inconclusive.	Works well on series containing exponential factors, or other factors with $k$ th powers.
Alternating Series Test Section 7.7	Let $\{a_k\}$ be a strictly decreasing sequence of positive numbers such that $\lim_{k \rightarrow \infty} a_k = 0$ . Then the alternating series $\sum_{k=1}^{\infty} (-1)^{k+1} a_k$ and $\sum_{k=1}^{\infty} (-1)^k a_k$ both converge.	There is an extension of this test that guarantees that for a series satisfying the conditions of the test, if $S_n$ is any term in the sequence of partial sums, then $ L - S_n  < a_{n+1}$ , where $L$ is the sum of the series.
Absolute Convergence Implies Convergence Section 7.7	If the series $\sum_{k=1}^{\infty} b_k$ converges absolutely, then it converges.	Examine the series of absolute values, $\sum_{k=1}^{\infty}  b_k $ . If this series converges, the series $\sum_{k=1}^{\infty} b_k$ converges absolutely.
Ratio Test for Absolute Convergence Section 7.7	Let $\sum_{k=1}^{\infty} b_k$ be a series with nonzero terms, and let $\rho = \lim_{k \rightarrow \infty} \left  \frac{b_{k+1}}{b_k} \right $ . If $\rho < 1$ , the series converges absolutely. If $\rho > 1$ , the series diverges. If $\rho = 1$ , the test is inconclusive.	This test can <i>never</i> be used by itself to determine that a series converges conditionally.

## Examples and Explorations

### EXAMPLE 1

#### Using the alternating series test

Use the alternating series test to show that the series  $\sum_{k=0}^{\infty} \frac{(-1)^k}{k!}$  converges, and find an approximation to the sum within  $10^{-6}$  of its value.

#### SOLUTION

The given series is an alternating series. Although the absolute values of the first two terms are both 1, after that the absolute values of the terms monotonically decrease to zero, so the series satisfies the conditions of the alternating series test. Therefore, the series converges. To calculate an approximation within  $10^{-6}$  of the sum of the series, we find the first term whose absolute value is smaller than  $10^{-6}$ . That is, we find the smallest value of  $k$  such that  $\frac{1}{k!} \leq 10^{-6}$ . You may verify that  $\frac{1}{9!} > 10^{-6}$  and  $\frac{1}{10!} < 10^{-6}$ . Thus, if we compute the ninth partial sum,  $S_9$ , we have

$$S_9 = \frac{1}{0!} - \frac{1}{1!} + \frac{1}{2!} - \frac{1}{3!} + \frac{1}{4!} - \frac{1}{5!} + \frac{1}{6!} - \frac{1}{7!} + \frac{1}{8!} - \frac{1}{9!} \approx 0.36787919.$$

In addition, Theorem 7.38 tells us that  $S_9$  is less than the sum of the series,  $L$ , because  $L - S_9$  has the same sign as the term  $+\frac{1}{10!}$ . Furthermore, our approximation,  $S_9$ , is somewhat better than we specified, because  $L - S_9 < a_{10} \approx 2.8 \times 10^{-7}$ . We have  $L \in (S_9, S_9 + a_{10})$ . Therefore  $L \in (0.36787919, 0.36787947)$ .  $\square$

CHECKING  
THE ANSWER

In Chapter 8 we will see that the series  $\sum_{k=0}^{\infty} \frac{(-1)^k}{k!}$  converges to  $\frac{1}{e}$ . The value  $\frac{1}{e}$  is in the interval we obtained in Example 1.

### EXAMPLE 2

#### Analyzing series for absolute convergence, conditional convergence, and divergence

Determine whether the series

$$(a) \sum_{k=0}^{\infty} \frac{(-2)^k}{1+2^k} \qquad (b) \sum_{k=2}^{\infty} \frac{(-1)^k}{k \ln k} \qquad (c) \sum_{k=1}^{\infty} \frac{(-1)^k k^2}{k!}$$

converge absolutely, converge conditionally, or diverge.

#### SOLUTION

- (a) The divergence test often makes it (relatively) easy to see if a series diverges. The limit  $\lim_{k \rightarrow \infty} \frac{(-2)^k}{1+2^k}$  does not exist, because when  $k$  is even, the quotient approaches 1, and when  $k$  is odd, it approaches  $-1$ . Therefore, the series  $\sum_{k=0}^{\infty} \frac{(-2)^k}{1+2^k}$  diverges. Note that the limits of the terms of the other two series are both zero. Thus, the divergence test fails on those series and we must use other tests.
- (b) If we can show that the series of absolute values converges, we will have proved both absolute convergence and convergence, by Theorem 7.41. Consider the series of absolute values

$$\sum_{k=2}^{\infty} \left| \frac{(-1)^k}{k \ln k} \right| = \sum_{k=2}^{\infty} \frac{1}{k \ln k}.$$

We see that this series satisfies the conditions of the integral test. We compute the improper integral

$$\int_2^{\infty} \frac{1}{x \ln x} dx = \lim_{b \rightarrow \infty} \ln |\ln x|_2^b = \lim_{b \rightarrow \infty} (\ln |\ln b| - \ln |\ln 2|) = \infty.$$

Since this improper integral diverges, the series of absolute values diverges. This tells us that the original series does not converge absolutely. However, if we can show that the original series converges, we will know that it converges conditionally. We see that the original series is an alternating series. We have already mentioned that the limit of the terms of the series is zero. By the alternating series test, since  $\frac{1}{(k+1)\ln(k+1)} < \frac{1}{k \ln k}$  for every  $k \geq 2$ , the series  $\sum_{k=2}^{\infty} \frac{(-1)^k}{k \ln k}$  converges, and, therefore, converges conditionally. Before we analyze the remaining series, we repeat:

*Demonstrating conditional convergence for a series  $\sum_{k=1}^{\infty} a_k$  always requires the use of (at least) two convergence tests; you must show that the series  $\sum_{k=1}^{\infty} a_k$  converges and that the series  $\sum_{k=1}^{\infty} |a_k|$  diverges.*

- (c) When presented with a series containing factorials or factors similar to factorials, one of the two ratio tests is usually the best choice. (This does not mean that these tests have to succeed; recall Example 3 from Section 7.6!) Since the series  $\sum_{k=1}^{\infty} \frac{(-1)^k k^2}{k!}$  has both positive and negative terms, we use the ratio test for absolute convergence. We

have  $a_k = \frac{(-1)^k k^2}{k!}$ . Thus,  $a_{k+1} = \frac{(-1)^{k+1} (k+1)^2}{(k+1)!}$ . We now evaluate

$$\lim_{k \rightarrow \infty} \left| \frac{(-1)^{k+1} (k+1)^2 / (k+1)!}{(-1)^k k^2 / k!} \right| = \lim_{k \rightarrow \infty} \frac{(k+1)^2}{(k+1)!} \cdot \frac{k!}{k^2} = \lim_{k \rightarrow \infty} \frac{k+1}{k^2} = 0.$$

Therefore, by the ratio test for absolute convergence, the series  $\sum_{k=1}^{\infty} \frac{(-1)^k k^2}{k!}$  converges absolutely.  $\square$

**EXAMPLE 3****Modifying the root test to check for absolute convergence**

Modify and use the root test to analyze the series

$$\sum_{k=1}^{\infty} \left(-\frac{2}{k}\right)^k.$$

**SOLUTION**

Theorem 7.35, the root test, may be used on a series only if the terms are (eventually) all positive. However, just as we modified the ratio test, we may adapt the root test to check for absolute convergence. Given a series  $\sum_{k=1}^{\infty} a_k$ , instead of examining  $\lim_{k \rightarrow \infty} (a_k)^{1/k}$ , we let

$\rho = \lim_{k \rightarrow \infty} |a_k|^{1/k}$ . As with the ratio test for absolute convergence,

- ▶ if  $\rho < 1$ , the series converges absolutely;
- ▶ if  $\rho > 1$ , the series diverges;
- ▶ if  $\rho = 1$ , the test fails.

For our series we have

$$\rho = \lim_{k \rightarrow \infty} |a_k|^{1/k} = \lim_{k \rightarrow \infty} \left| \left(-\frac{2}{k}\right)^k \right|^{1/k} = \lim_{k \rightarrow \infty} \frac{2}{k} = 0.$$

So, the series converges absolutely.  $\square$

**? TEST YOUR UNDERSTANDING**

- ▶ What is an alternating series? What additional conditions must an alternating series meet in order to satisfy the conditions of the alternating series test?
- ▶ When a series meets the conditions of the alternating series test, how is the test extended to provide a bound on the remainder when a term from the sequence of partial sums is used to approximate the sum of the series?
- ▶ What is absolute convergence? What is the relationship between absolute convergence and convergence?
- ▶ What is conditional convergence? What is the relationship between conditional convergence and absolute convergence?
- ▶ How is it possible to use a single convergence test to show that a series converges absolutely? Why are two convergence tests required to show that a series converges conditionally?

**EXERCISES 7.7****Thinking Back**

- ▶ *A strictly increasing sequence of partial sums:* If  $a_k > 0$  for  $k \in \mathbb{Z}^+$ , explain why the sequence of partial sums for the series  $\sum_{k=1}^{\infty} a_k$  is strictly increasing.
- ▶ *A bounded sequence of partial sums:* If the series  $\sum_{k=1}^{\infty} a_k$  converges, explain why the sequence of partial sums is bounded.

## Concepts

0. *Problem Zero*: Read the section and make your own summary of the material.
1. *True/False*: Determine whether each of the statements that follow is true or false. If a statement is true, explain why. If a statement is false, provide a counterexample.
- True or False*:  $\sum_{k=1}^{\infty} (-1)^{k+1} a_k$  is an alternating series.
  - True or False*: If  $a_k > 0$  for  $k \in \mathbb{Z}^+$  and the alternating series  $\sum_{k=1}^{\infty} (-1)^k a_k$  converges, then the series  $\sum_{k=1}^{\infty} (-1)^{k+1} a_k$  converges.
  - True or False*: If  $a_k > 0$  for  $k \in \mathbb{Z}^+$  and the series  $\sum_{k=1}^{\infty} a_k$  converges, then the series also converges absolutely.
  - True or False*: If a function  $f$  satisfies the hypotheses of the integral test, then the series  $\sum_{k=1}^{\infty} (-1)^{k+1} f(k)$  converges.
  - True or False*: If a series  $\sum_{k=1}^{\infty} a_k$  converges conditionally, then the series  $\sum_{k=1}^{\infty} |a_k|$  diverges.
  - True or False*: If  $\sum_{k=1}^{\infty} a_k$  is a series such that  $\lim_{k \rightarrow \infty} \left| \frac{a_{k+1}}{a_k} \right| = 1$ , then the series converges conditionally.
  - True or False*: If  $\sum_{k=1}^{\infty} a_k$  is a series such that  $\lim_{k \rightarrow \infty} \sqrt[k]{|a_k|} < 1$ , then the series converges absolutely.
  - True or False*: If we rearrange infinitely many terms of the alternating harmonic series, we can change the value of its sum.
2. *Examples*: Construct examples of the thing(s) described in the following. Try to find examples that are different than any in the reading.
- A series that converges absolutely.
  - A series that converges conditionally.
  - A series  $\sum_{k=1}^{\infty} a_k$  such that  $\lim_{k \rightarrow \infty} \left| \frac{a_{k+1}}{a_k} \right| = 1$ , but the series is absolutely convergent.
3. What is an alternating series?

Exercises 4–8 concern the alternating series test. To use this test we need a series of the form

$$\sum_{k=1}^{\infty} (-1)^{k+1} a_k \quad \text{or} \quad \sum_{k=1}^{\infty} (-1)^k a_k,$$

where

- $\{a_k\}$  is a sequence of positive numbers;
  - the sequence  $\{a_k\}$  is strictly decreasing;
  - $\lim_{k \rightarrow \infty} a_k = 0$ .
4. Find an example of a divergent series of the form  $\sum_{k=1}^{\infty} (-1)^{k+1} a_k$

- that satisfies conditions (i) and (iii), but not condition (ii);
  - that satisfies conditions (i) and (ii), but not condition (iii).
5. A series can fail two of the three conditions, (i), (ii) and (iii), and still converge. Which of the three conditions must an alternating series pass in order to converge?
6. Explain why a series satisfying the hypotheses of the alternating series test has a sum with the same sign as the first term in the series.
7. Explain why the sum of a series satisfying the hypotheses of the alternating series test is between any two consecutive terms in its sequence of partial sums.
8. Outline the steps you would use to approximate the sum of a convergent series satisfying the hypotheses of the alternating series test to within  $\epsilon$  of its value.
9. What condition(s) must a series  $\sum_{k=1}^{\infty} a_k$  satisfy in order for the series to be absolutely convergent?
10. What condition(s) must a series  $\sum_{k=1}^{\infty} a_k$  satisfy in order for the series to be conditionally convergent?
11. Explain why one convergence test can suffice to show that a series converges absolutely, even though it always requires two to show that a series converges conditionally.
12. Explain why you must use two convergence tests to show that a series  $\sum_{k=1}^{\infty} a_k$  converges conditionally.
13. Explain why every convergent series consisting of positive terms is absolutely convergent.
14. Fill in each blank with an inequality involving  $p$ : The series  $\sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{k^p}$  converges absolutely if \_\_\_\_\_, converges conditionally if \_\_\_\_\_, and diverges if \_\_\_\_\_.
15. Fill in the blanks: Let  $f$  be a function with domain  $[1, \infty)$ . If the function  $|f|$  is \_\_\_\_\_ and \_\_\_\_\_, and if \_\_\_\_\_ converges, then the series \_\_\_\_\_ converges absolutely.
16. Fill in the blanks: Let  $\sum_{k=1}^{\infty} a_k$  and  $\sum_{k=1}^{\infty} b_k$  be two series such that  $0 \leq \text{_____} \leq \text{_____}$  for every \_\_\_\_\_. If the series \_\_\_\_\_ converges absolutely, then the series \_\_\_\_\_ converges absolutely.
17. Let  $\{a_k\}$  be a sequence of positive numbers. Explain why, if the series  $\sum_{k=1}^{\infty} a_{2k-1}$  and  $\sum_{k=1}^{\infty} a_{2k}$  both converge absolutely, the series  $\sum_{k=1}^{\infty} a_k$  converges absolutely.
18. Which convergence tests can be used only on series in which the terms eventually all have the same sign?
19. Give an example of divergent series  $\sum_{k=1}^{\infty} a_k$  and  $\sum_{k=1}^{\infty} b_k$  such that the series  $\sum_{k=1}^{\infty} a_k b_k$  converges.
20. Give an example of convergent series  $\sum_{k=1}^{\infty} a_k$  and  $\sum_{k=1}^{\infty} b_k$  such that the series  $\sum_{k=1}^{\infty} a_k b_k$  diverges.

## Skills

Determine whether the series in Exercises 21–23 converge or diverge. Note that these series do *not* satisfy the criteria of the alternating series test.

$$21. 1 - \frac{1}{2} - \frac{1}{2} + \frac{1}{3} + \frac{1}{3} + \frac{1}{3} - \frac{1}{4} - \frac{1}{4} - \frac{1}{4} - \frac{1}{4} + \dots$$

$$22. 1 - \frac{1}{2} - \frac{1}{3} + \frac{1}{4} + \frac{1}{5} - \frac{1}{6} - \frac{1}{7} + \frac{1}{8} + \frac{1}{9} - \frac{1}{10} + \dots$$

$$23. 1 - \frac{1}{2^3} + \frac{1}{3^2} - \frac{1}{4^3} + \frac{1}{5^2} - \frac{1}{6^3} + \frac{1}{7^2} - \frac{1}{8^3} + \frac{1}{9^2} - \dots$$

Use the alternating series test to determine whether the series in Exercises 24–29 converge or diverge. If a series converges, determine whether it converges absolutely or conditionally.

$$24. \sum_{k=1}^{\infty} \frac{(-k)^k}{k!}$$

$$25. \sum_{k=0}^{\infty} \frac{(-1)^{k+1}}{1+k^2}$$

$$26. \sum_{k=2}^{\infty} \frac{(-1)^{k+1}}{(\ln k)^2}$$

$$27. \sum_{k=0}^{\infty} \frac{(-2)^{k+1}}{1+3^k}$$

$$28. \sum_{k=0}^{\infty} \frac{(-1)^{k+1}k!}{(2k+1)!}$$

$$29. \sum_{k=0}^{\infty} \frac{(-1)^k k^2}{1+k^2}$$

Use the ratio test for absolute convergence to determine whether the series in Exercises 30–35 converge absolutely or diverge.

$$30. \sum_{k=1}^{\infty} \frac{(-k)^k}{k!}$$

$$31. \sum_{k=0}^{\infty} \frac{(-3)^{k+1}}{(2k)!}$$

$$32. \sum_{k=1}^{\infty} \frac{(-5)^k}{(k+1)! - k!}$$

$$33. \sum_{k=0}^{\infty} \frac{(-7)^k}{(2k+1)!}$$

$$34. \sum_{k=0}^{\infty} \frac{(-2)^k 1 \cdot 3 \cdot 5 \cdots (2k+1)}{1 \cdot 4 \cdot 7 \cdots (3k+1)}$$

$$35. \sum_{k=0}^{\infty} \frac{(-1)^k 1 \cdot 3 \cdot 5 \cdots (2k+1)}{1 \cdot 4 \cdot 7 \cdots (3k+1)}$$

Use any convergence tests from Sections 7.4–7.7 to determine whether the series in Exercises 36–51 converge absolutely, converge conditionally, or diverge. Explain why the series meets the hypotheses of the test you select.

$$36. \sum_{k=1}^{\infty} \frac{1}{(2k-1)(2k+1)}$$

$$37. \sum_{k=2}^{\infty} \frac{1}{k^2 - 1}$$

$$38. \sum_{k=2}^{\infty} \frac{(-1)^k}{k \ln k \ln(\ln k)}$$

$$40. \sum_{k=2}^{\infty} \frac{(-1)^k \ln k}{k^3 + 1}$$

$$42. \sum_{k=1}^{\infty} (-1)^k \frac{\sqrt{k^3 + 3k^2 - 5}}{k^2 + 3}$$

$$44. \sum_{k=1}^{\infty} (-1)^k e^{-k}$$

$$46. \sum_{k=1}^{\infty} (-1)^k k e^{-k^2}$$

$$48. \sum_{k=1}^{\infty} \frac{\sin \sqrt{k}}{k^{3/2}}$$

$$50. \sum_{k=1}^{\infty} \cos^3\left(\frac{1}{k}\right)$$

$$39. \sum_{k=1}^{\infty} \frac{(-1)^k k}{k+1}$$

$$41. \sum_{k=2}^{\infty} \frac{(-1)^k \ln k}{k+1}$$

$$43. \sum_{k=2}^{\infty} \frac{(-1)^k \ln k}{k^2 - 1}$$

$$45. \sum_{k=1}^{\infty} (-1)^k \frac{\sqrt[3]{k^2 + 3k + 1}}{k+1}$$

$$47. \sum_{k=1}^{\infty} (-1)^k e^{-k^2}$$

$$49. \sum_{k=1}^{\infty} \frac{\cos k}{k^2}$$

$$51. \sum_{k=1}^{\infty} \sin^3\left(\frac{1}{k}\right)$$

In Exercises 52–57 do each of the following:

- Show that the given alternating series converges.
- Compute  $S_{10}$  and use Theorem 7.38 to find an interval containing the sum  $L$  of the series.
- Find the smallest value of  $n$  such that Theorem 7.38 guarantees that  $S_n$  is within  $10^{-6}$  of  $L$ .

$$52. \sum_{k=1}^{\infty} \frac{(-1)^k}{k^3}$$

$$53. \sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{k^2}$$

$$54. \sum_{k=0}^{\infty} \frac{(-1)^k}{(2k+1)!}$$

$$55. \sum_{k=0}^{\infty} \frac{(-1)^k}{(2k)!}$$

$$56. \sum_{k=0}^{\infty} \frac{(-1)^{k+1}k!}{(2k+1)!}$$

$$57. \sum_{k=0}^{\infty} \frac{(-1)^k(k+1)}{k!}$$

In Exercises 58–61, find the values of  $p$  that make the series converge absolutely, the values that make the series converge conditionally, and the values that make the series diverge.

$$58. \sum_{k=2}^{\infty} \frac{(-1)^{k+1}}{k^p \ln k}$$

$$59. \sum_{k=1}^{\infty} \frac{(-1)^{k+1} \ln k}{k^p}$$

$$60. \sum_{k=0}^{\infty} (-1)^k k^p e^{-k^2}$$

$$61. \sum_{k=0}^{\infty} (-1)^k k^p e^{-k}$$

## Applications

62. On the coast of Oregon, near Newport, there is a sandbar in a tidal area that blocks water going out to sea. Some water can escape from the side of the pool that develops behind the bar. As the tide is going out, waves wash over the bar into the pool behind it. The depth of water left by the  $k$ th wave is  $w_k$ , where  $\lim_{k \rightarrow \infty} w_k = 0$ . Between waves, a little water flows out the side outlet. The deeper the water in the pool, the deeper is the channel at the

outlet, so that the amount of water flowing out of the pool between waves is  $0.03d_k$ , where  $d_k$  is the depth of the water in the pool after the  $k$ th wave. It follows that the depth of water in the pool is

$$d_0 - 0.03d_0 + w_1 - 0.03d_1 + w_2 - 0.03d_2 + \dots$$

Does this series converge? (Hint: Notice that we have  $d_k = (1 - 0.03)d_{k-1} + w_k$ .)

63. Alex is measuring nitrates from agricultural runoff from a new point source. The nitrates flow into a small pond, where Alex measures them. The contamination comes in pulses: The pond gains nitrates, then clean water flows for a while and the contaminated water flows away, and then another dump of nitrates occurs. Considering the flow of nitrates into the pond and the flow of the water and nitrate mixture out, Alex finds that the total amount of nitrate in the lake at his  $k$ th measurement satisfies  $A_k = 8069 - \frac{A_{k-1}}{7}$ . The water in the pond was initially

clean, so  $A_0 = 0$ .

- (a) Show that  $\frac{A_k - A_{k-1}}{A_{k-1} - A_{k-2}} = -\frac{1}{7}$ .  
 (b) Show that  $A_N = \sum_{k=1}^N (A_k - A_{k-1})$ .  
 (c) The lake started clean. Show that

$$\lim_{N \rightarrow \infty} A_N = \sum_{k=1}^{\infty} (A_k - A_{k-1})$$

converges.

## Proofs

64. Prove that every convergent geometric series converges absolutely.  
 65. Show that if a series  $\sum_{k=1}^{\infty} a_k$  converges absolutely, the series  $\sum_{k=1}^{\infty} a_k^2$  also converges.  
 66. Let  $\{a_k\}$  be a strictly decreasing sequence of positive numbers such that  $a_k \rightarrow 0$  as  $k \rightarrow \infty$ . Show that the alternating series  $\sum_{k=1}^{\infty} (-1)^k a_k$  converges. (Hint: We have already shown that the hypotheses imply that the series  $\sum_{k=1}^{\infty} (-1)^{k+1} a_k$  converges.)  
 67. Let  $\{a_k\}$  be a strictly decreasing sequence of positive numbers such that  $a_k \rightarrow 0$  as  $k \rightarrow \infty$ . Show that the subsequence  $\{S_{2n}\}$  of the sequence of partial sums  $\{S_n\}$  for the alternating series  $\sum_{k=1}^{\infty} (-1)^{k+1} a_k$  is strictly increasing and is bounded above by  $a_1$ .  
 68. Let  $\sum_{k=1}^{\infty} (-1)^k a_k$  be an alternating series that satisfies the hypotheses of the alternating series test. Prove that if  $S_n$  is a term in the sequence of partial sums, then

$$|L - S_n| < a_{n+1}$$

and, furthermore, the sign of the difference,  $L - S_n$ , is the sign of the coefficient of the term  $a_{n+1}$ .

69. Prove that if the series  $\sum_{k=1}^{\infty} a_k$  diverges, then the series  $\sum_{k=1}^{\infty} |a_k|$  also diverges.  
 70. Prove the ratio test for absolute convergence. That is, let  $\sum_{k=1}^{\infty} b_k$  be a series with nonzero terms, and let  $\rho = \lim_{k \rightarrow \infty} \left| \frac{b_{k+1}}{b_k} \right|$ .  
 (a) Show that if  $\rho < 1$ , the series converges absolutely.  
 (b) Show that if  $\rho > 1$ , the series diverges.  
 (c) Show that the test fails when  $\rho = 1$ , by finding a convergent series  $\sum_{k=1}^{\infty} c_k$  such that  $\left| \frac{c_{k+1}}{c_k} \right| \rightarrow 1$  as  $k \rightarrow \infty$  and a divergent series  $\sum_{k=1}^{\infty} d_k$  such that  $\left| \frac{d_{k+1}}{d_k} \right| \rightarrow 1$  as  $k \rightarrow \infty$ .

Changing the order of the summands in a conditionally convergent series can change the value of the sum. We showed this earlier in the section for the alternating harmonic series

$\sum_{k=1}^{\infty} (-1)^{k+1}/k$ . In Exercises 71–74 we will continue working with the alternating harmonic series to prove a few other, related properties.

71. Prove that the series consisting of just the positive terms of the alternating harmonic series diverges. That is, show that  $\sum_{k=1}^{\infty} \frac{1}{2k-1}$  diverges.  
 72. Prove that the series consisting of just the negative terms of the alternating harmonic series diverges. That is, show that  $\sum_{k=1}^{\infty} \left(-\frac{1}{2k}\right)$  diverges.  
 73. Let  $\alpha$  be any real number. Show that there is a rearrangement of the terms of the alternating harmonic series that converges to  $\alpha$ . (Hint: Argue that if you add up some finite number of the terms of  $\sum_{k=1}^{\infty} \frac{1}{2k-1}$ , the sum will be greater than  $\alpha$ . Then argue that, by adding in some other finite number of the terms of  $\sum_{k=1}^{\infty} \left(-\frac{1}{2k}\right)$ , you can get the sum to be less than  $\alpha$ . By alternately adding terms from these two divergent series as described in the preceding two steps, explain why the sequence of partial sums you are constructing will converge to  $\alpha$ .)  
 74. Show that there is a rearrangement of the terms of the alternating harmonic series that diverges to  $\infty$ . (Hint: Argue that if you add up some finite number of the terms of  $\sum_{k=1}^{\infty} \frac{1}{2k-1}$ , the sum will be greater than 1. Then argue that, by adding in some other finite number of the terms of  $\sum_{k=1}^{\infty} \left(-\frac{1}{2k}\right)$ , you can get the sum to be less than 1. Next, explain why you can get the sum to be greater than 2 if you add in more terms of  $\sum_{k=1}^{\infty} \frac{1}{2k-1}$ . Then argue again that you can get the sum to be less than 2 by adding in more terms of  $\sum_{k=1}^{\infty} \left(-\frac{1}{2k}\right)$ . By alternately adding terms from these two divergent series in a similar fashion as just described, explain why the sum can then go above 3, then below 3, above 4, then below 4, etc. Explain why such a process results in a sequence of partial sums that diverges to  $\infty$ .)

## Thinking Forward

- *A series of monomials:* Use the ratio test for absolute convergence to find all values of  $x$  for which the series  $\sum_{k=1}^{\infty} \frac{x^k}{k}$  converges.

- *A series of monomials:* Use the ratio test for absolute convergence to find all values of  $x$  for which the series  $\sum_{k=1}^{\infty} \frac{x^k}{k!}$  converges.

## CHAPTER REVIEW, SELF-TEST, AND CAPSTONES

Before you progress to the next chapter, be sure you are familiar with the definitions, concepts, and basic skills outlined here. The capstone exercises at the end bring together ideas from this chapter and look forward to future chapters.

### Definitions

Give precise mathematical definitions or descriptions of each of the concepts that follow. Then illustrate the definition or description with a graph or an algebraic example.

- ▶ A *sequence of real numbers*, including the meaning of a *term* of the sequence
- ▶ A *geometric sequence*
- ▶ An *arithmetic sequence*
- ▶ A *monotonic sequence*, including the definitions of *increasing* sequences, *decreasing* sequences, *strictly increasing* sequences, *strictly decreasing* sequences, *eventually increasing* sequences, and *eventually decreasing* sequences
- ▶ A *bounded sequence*
- ▶ The *limit* of a sequence
- ▶ A *series*, including the meaning of a *term* of the series
- ▶ The *sequence of partial sums* for a given series
- ▶ The *sum* of a convergent series
- ▶ The *remainder* of a convergent series
- ▶ An *alternating series*
- ▶ *Absolute convergence* for a series
- ▶ *Conditional convergence* for a series

### Theorems

Fill in the blanks to complete each of the following theorem statements:

*Tests for Monotonicity:* A sequence  $\{a_k\}$  is increasing if it passes any of the following tests:

- ▶ The *Difference Test*:  $\quad \geq 0$  for all  $k \geq 1$ .
- ▶ The *Ratio Test*: All terms are positive and  $\quad \geq 1$  for all  $k \geq 1$ .
- ▶ The *Derivative Test*:  $\quad \geq 0$  for all  $x \geq 1$ , given that  $a(x)$  is a function that is  $\quad$  on  $[1, \infty)$  and whose value at any positive integer  $k$  is  $a(k) = \quad$ .

*Basic Limit Rules for Convergent Sequences:* If  $\{a_k\}$  and  $\{b_k\}$  are convergent sequences with  $a_k \rightarrow L$  and  $b_k \rightarrow M$  as  $k \rightarrow \infty$ , and if  $c$  is any constant, then

- ▶  $ca_k \rightarrow \quad$ .
- ▶  $(a_k + b_k) \rightarrow \quad$ .
- ▶  $a_kb_k \rightarrow \quad$ .

- ▶ If  $M \neq 0$ , then  $\frac{a_k}{b_k} \rightarrow \quad$ .
- ▶ If  $f$  is a function that is  $\quad$  at  $L$ , then  $f(a_k) \rightarrow \quad$ .
- ▶ If  $a_k \rightarrow L$  and  $a_k \rightarrow M$ , then  $\quad$ .
- ▶ If  $\{m_k\}$  and  $\{M_k\}$  are convergent sequences that both converge to  $L$ , and if  $m_k \quad a_k \quad M_k$  for all  $k$ , then  $a_k \rightarrow \quad$ .
- ▶ If  $|a_k| \rightarrow \quad$ , then  $a_k \rightarrow \quad$ .
- ▶ Let  $\{a_k\}$  be a sequence that converges to  $L$ . Then every subsequence of  $\{a_k\}$   $\quad$ .
- ▶ If  $\{a_k\}$  is both bounded and (eventually) monotonic, then  $\{a_k\}$   $\quad$ .

*Sums and Constant Multiples of Convergent Series:* If  $\sum_{k=1}^{\infty} a_k$  and  $\sum_{k=1}^{\infty} b_k$  are convergent series and  $c$  is any real number, then

- ▶  $\sum_{k=1}^{\infty} c a_k = \quad$ .
- ▶  $\sum_{k=1}^{\infty} (a_k + b_k) = \quad + \quad$ .

### Sequences and Series

*Geometric Sequences:* Fill in the blanks.

- ▶ For  $r \quad$ , the sequence  $\{r^k\}$  diverges.
- ▶ For  $r \quad$ , the sequence  $\{r^k\}$  converges to  $\quad$ .

*Dominance Relationships for Sequences:* Order the following sequences by dominance when  $a > 0$  and  $b > 1$ :

- ▶  $\{k!\}$       ▶  $\{\ln k\}$       ▶  $\{b^k\}$       ▶  $\{k^a\}$

*Some Convergent Sequences Involving Exponents:* For any real number  $p > 0$ , the following sequences converge. Fill in each blank with the appropriate value.

- ▶  $p^{1/k} \rightarrow \quad$       ▶  $k^{1/k} \rightarrow \quad$       ▶  $\left(\frac{1}{k}\right)^p \rightarrow \quad$

*Geometric Series and  $p$ -series:* Suppose  $r$  is a nonzero real number and  $p > 0$ . Fill in the blanks.

- ▶ *Geometric Series:* For  $r \quad$ , the geometric series  $\sum_{k=0}^{\infty} r^k$  converges to the sum  $\quad$ .

- **Geometric Series:** For  $r$  \_\_\_\_\_ the geometric series  $\sum_{k=0}^{\infty} r^k$  diverges.
- **$p$ -series:** For  $p$  \_\_\_\_\_, the  $p$ -series  $\sum_{k=0}^{\infty} \frac{1}{k^p}$  converges and for  $p$  \_\_\_\_\_, the series diverges.

**Convergence Tests for Series:** Fill in the blanks.

- **The Divergence Test:** If the sequence  $\{a_k\}$  does not converge to \_\_\_\_\_, then the series  $\sum_{k=1}^{\infty} a_k$  \_\_\_\_\_.
- **The Integral Test:** If  $a(x)$  is a function that is \_\_\_\_\_, \_\_\_\_\_, and \_\_\_\_\_ on  $[1, \infty)$  and  $\{a_k\}$  is the sequence defined by  $a_k = \frac{1}{k}$  for every  $k \in \mathbb{Z}^+$ , then  $\sum_{k=1}^{\infty} a_k$  and  $\int_1^{\infty} a(x) dx$  either both \_\_\_\_\_ or both \_\_\_\_\_.
- **The Comparison Test:** Let  $\sum_{k=1}^{\infty} a_k$  and  $\sum_{k=1}^{\infty} b_k$  be two series with \_\_\_\_\_ terms such that  $0 < a_k < b_k$  for every positive integer  $k$ . If the series  $\sum_{k=1}^{\infty} b_k$  \_\_\_\_\_, then the series  $\sum_{k=1}^{\infty} a_k$  \_\_\_\_\_.
- **The Limit Comparison Test:** Let  $\sum_{k=1}^{\infty} a_k$  and  $\sum_{k=1}^{\infty} b_k$  be two series with positive terms.
- If  $\lim_{k \rightarrow \infty} \frac{a_k}{b_k} = L$ , where  $L$  is \_\_\_\_\_, then either the series both converge or both diverge.
- If  $\lim_{k \rightarrow \infty} \frac{a_k}{b_k} = 0$  and  $\sum_{k=1}^{\infty} b_k$  \_\_\_\_\_, then  $\sum_{k=1}^{\infty} a_k$  \_\_\_\_\_.

(There are two correct ways to fill in the last two blanks.)

- **The Ratio Test:** Let  $\sum_{k=1}^{\infty} a_k$  be a series with nonnegative terms, and let  $\rho = \lim_{k \rightarrow \infty} \frac{a_{k+1}}{a_k}$ .
- If  $\rho < 1$ , the series \_\_\_\_\_.
- If  $\rho > 1$ , the series \_\_\_\_\_.
- If  $\rho = 1$ , \_\_\_\_\_.
- **The Root Test:** Let  $\sum_{k=1}^{\infty} a_k$  be a series with nonnegative terms, and let  $\rho = \lim_{k \rightarrow \infty} \sqrt[k]{a_k}$ .
- If  $\rho < 1$ , the series \_\_\_\_\_.
- If  $\rho > 1$ , the series \_\_\_\_\_.
- If  $\rho = 1$ , \_\_\_\_\_.
- **The Alternating Series Test:** Let  $\{a_k\}$  be a sequence of positive numbers.
- If  $a_{k+1} < a_k$  for every  $k \geq 1$  and  $\lim_{k \rightarrow \infty} a_k = 0$ , then  $\sum_{k=1}^{\infty} (-1)^{k+1} a_k$  \_\_\_\_\_.
- **The Ratio Test for Absolute Convergence:** Let  $\sum_{k=1}^{\infty} a_k$  be a series with nonzero terms, and let  $\rho = \lim_{k \rightarrow \infty} \frac{|a_{k+1}|}{|a_k|}$ .
- If  $\rho < 1$ , the series \_\_\_\_\_.
- If  $\rho > 1$ , the series \_\_\_\_\_.
- If  $\rho = 1$ , \_\_\_\_\_.

## Skill Certification: Limits, Convergence, and Divergence

**Limits of sequences:** Determine whether the sequences that follow are bounded, monotonic and/or eventually monotonic. Determine whether each sequence converges or diverges. If the sequence converges, find its limit.

- |  |   |
|--|---|
| 1. $\left\{ \frac{e^k}{k} \right\}$                              | 2. $\left\{ e^{-k} \ln \frac{1}{k} \right\}$  |
| 3. $\left\{ \frac{2k^2 + 1}{3k^2 - 1} \right\}$                  | 4. $\left\{ \frac{(2k)!}{5^k} \right\}$   |
| 5. $\left\{ \frac{k^2}{k+3} - \frac{k^2}{k+4} \right\}$          | 6. $\left\{ \sin \left( \frac{\pi}{2k} \right) \right\}$                                    |
| 7. $\left\{ \frac{k!}{1 \cdot 3 \cdot 5 \cdots (2k-1)} \right\}$ | 8. $\left\{ \frac{1 \cdot 3 \cdot 5 \cdots (2k-1)}{3 \cdot 6 \cdot 9 \cdots (3k)} \right\}$ |

**Sequences of partial sums:** For each of the series that follow, (a) provide the first five terms in the sequence of partial sums  $\{S_k\}$ , (b) provide a closed formula for  $S_k$ , and (c) find the sum of the series by evaluating  $\lim_{k \rightarrow \infty} S_k$ .

9.  $\sum_{k=0}^{\infty} \left( \frac{1}{k+3} - \frac{1}{k+4} \right)$
10.  $\sum_{k=0}^{\infty} \left( \frac{2^k}{(k+3)!} - \frac{2^{k+1}}{(k+4)!} \right)$

11.  $\sum_{k=0}^{\infty} \left( \frac{(1/2)^k}{\ln(k+2)} - \frac{(1/2)^{k+1}}{\ln(k+3)} \right)$

12.  $\sum_{k=2}^{\infty} \ln \left( \frac{k}{k+1} \right)$

**Geometric series:** For each of the series that follow, find the sum or explain why the series diverges.

13.  $\sum_{k=4}^{\infty} \left( \frac{1}{3} \right)^{k+2}$

14.  $\sum_{k=0}^{\infty} 3 \left( \frac{-2}{5} \right)^k$

15.  $\sum_{k=0}^{\infty} (1)^k$

16.  $\sum_{k=0}^{\infty} \frac{5^{k+3}}{2^{3k+1}}$

**Convergence or divergence of a series:** For each of the series that follow, determine whether the series converges or diverges. Explain the criteria you are using and why your conclusion is valid.

17.  $\sum_{k=1}^{\infty} \ln k$

18.  $\sum_{k=1}^{\infty} \ln \left( \frac{1}{k^2} \right)$

19.  $\sum_{k=1}^{\infty} \frac{k}{\ln k}$

20.  $\sum_{k=1}^{\infty} \frac{\ln k}{k}$

$$21. \sum_{k=1}^{\infty} \frac{k}{3^k}$$

$$23. \sum_{k=1}^{\infty} \frac{k}{1+k^2}$$

$$25. \sum_{k=2}^{\infty} \frac{1}{\sqrt[k]{e}}$$

$$27. \sum_{k=1}^{\infty} \frac{1}{k + \sqrt{k}}$$

$$29. \sum_{k=0}^{\infty} \frac{1}{2^k + \sin k}$$

$$22. \sum_{k=1}^{\infty} \left(\frac{1}{k^2}\right)^{\sqrt{k}}$$

$$24. \sum_{k=0}^{\infty} \frac{5^k + k}{k! + 3}$$

$$26. \sum_{k=0}^{\infty} \frac{k!10^k}{3^k}$$

$$28. \sum_{k=0}^{\infty} \frac{5^k}{(k+1)!}$$

$$30. \sum_{k=0}^{\infty} \frac{5^{2k+1}}{(2k+1)!}$$

*Conditional and absolute convergence:* For each of the series that follow, determine whether the series converges absolutely, converges conditionally, or diverges. Explain the criteria you are using and why your conclusion is valid.

$$31. \sum_{k=1}^{\infty} (-1)^k \ln k$$

$$33. \sum_{k=1}^{\infty} (-1)^k e^{-k}$$

$$35. \sum_{k=0}^{\infty} \frac{(-2)^k}{1+2^k}$$

$$37. \sum_{k=0}^{\infty} \frac{(-1)^k}{3^k}$$

$$39. \sum_{k=1}^{\infty} (-1)^k \frac{\sqrt{k}}{3k-1}$$

$$32. \sum_{k=1}^{\infty} (-1)^k \frac{1}{\sqrt{k(1+k)}}$$

$$34. \sum_{k=1}^{\infty} (-1)^{k+1} \sin\left(\frac{\pi}{k}\right)$$

$$36. \sum_{k=1}^{\infty} (-1)^{k+1} \sin\left(\frac{\pi}{k}\right)$$

$$38. \sum_{k=1}^{\infty} (-1)^k \frac{k}{4^k}$$

$$40. \sum_{k=1}^{\infty} (-1)^{k+1} \frac{k^{100}}{2^k}$$

## Capstone Problems

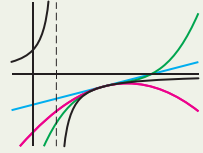

- A. Find the limits of the sequences  $\{(k!)^{1/k}\}$  and  $\{k^{1/k!}\}$  if they converge.
- B. Let  $0 < a < b$ . Does the sequence  $\{(a^k + b^k)^{1/k}\}$  converge or diverge? If it converges, find its limit. If it diverges, explain why.
- C. Determine whether the series  $\sum_{k=0}^{\infty} ke^{-k^2}$  converges or diverges. Explain the criteria you are using and why your conclusion is valid. Confirm your conclusion by using as many different convergence tests as you can.
- D. Consider the series  $\sum_{k=1}^{\infty} \frac{\sin k}{k^p}$ , where  $p \geq 1$ .
- Explain why the divergence test fails on this series and none of the other convergence tests discussed in Sections 7.4–7.6 apply to the series.
  - Show that the series converges when  $p > 1$ .
  - Show that the convergence tests from Section 7.7 fail to determine the convergence or divergence of this series when  $p = 1$ .
  - Do you think the series  $\sum_{k=1}^{\infty} \frac{\sin k}{k}$  converges or diverges?

## 8.1 POWER SERIES

- ▶ Infinite sums of polynomials
- ▶ The power series in  $x$  and the power series in  $x - x_0$
- ▶ The interval of convergence of a power series

### Power Series

In this chapter we will extend our study of series to include series of monomials of the form  $\sum_{k=0}^{\infty} a_k x^k$  and  $\sum_{k=0}^{\infty} a_k (x - x_0)^k$ . These are called power series. Before we start that discussion, we remind you that the tangent line to a differentiable function  $f(x)$  at a point  $x_0$  may be used to approximate  $f$  on an interval containing  $x_0$ . In this chapter we will discuss how higher degree polynomials can also be used to approximate functions. A *power series* is a generalization of these polynomials.

#### DEFINITION 8.1

##### Power Series in $x$

Let  $\{a_k\}_{k=0}^{\infty}$  be a sequence of real numbers and let  $x$  be a variable. A **power series in  $x$**  is a series of the form  $\sum_{k=0}^{\infty} a_k x^k$ . That is,

$$\sum_{k=0}^{\infty} a_k x^k = a_0 + a_1 x + a_2 x^2 + a_3 x^3 + \cdots + a_k x^k + \cdots$$

If  $c$  is a real number at which the series of constants  $\sum_{k=0}^{\infty} a_k c^k$  converges, the power series  $\sum_{k=0}^{\infty} a_k x^k$  is said to **converge** at  $c$ .

For example, if  $a_k = 1$  for every  $k \geq 0$ , we obtain the geometric series  $\sum_{k=0}^{\infty} x^k$ . We already know that this series converges to  $\frac{1}{1-x}$  when  $|x| < 1$  and diverges otherwise. That is,

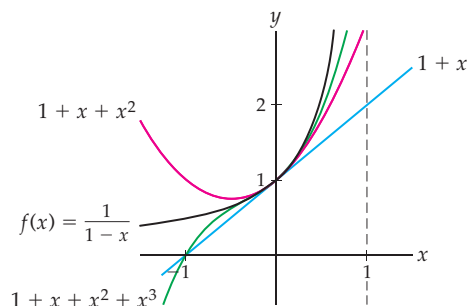

$$\sum_{k=0}^{\infty} x^k = \frac{1}{1-x} \quad \text{when } |x| < 1.$$

Now consider this formula from the following perspective: On the interval  $(-1, 1)$ , the function  $f(x) = \frac{1}{1-x}$  may be represented by the power series

$$\sum_{k=0}^{\infty} x^k = 1 + x + x^2 + x^3 + \cdots$$

This means that as we add more terms to the series, the sequence of partial sums, given by the polynomials  $1$ ,  $1 + x$ ,  $1 + x + x^2$ ,  $1 + x + x^2 + x^3$ ,  $\dots$  approximates the function  $f(x) = \frac{1}{1-x}$  more closely on the interval  $(-1, 1)$ . We see this behavior in the following figure:

The polynomials  $1 + x$ ,  $1 + x + x^2$ , and  $1 + x + x^2 + x^3$  approximate the function  $f(x) = \frac{1}{1-x}$

More generally:

- ▶ We say the power series in  $x$ ,  $\sum_{k=0}^{\infty} a_k x^k$ , converges to  $a_0$  when  $x = 0$ . Because of this behavior, every power series in  $x$  defines a function whose domain is a nonempty subset of the real numbers.
- ▶ A power series in  $x$  is a generalization of a polynomial, since if each  $a_k = 0$  when  $k > n$ , we obtain the  $n$ th-degree polynomial  $a_0 + a_1 x + a_2 x^2 + \cdots + a_n x^n$ .

We already know that polynomials, from a computational standpoint, form a relatively simple class of functions; they are easy to evaluate, differentiate, and integrate. We will see that our most familiar functions can be expressed in terms of a power series, at least on some finite interval. In addition, if a function can be expressed as a convergent power series in  $x$ , we may use polynomials to approximate the function on an interval centered at  $x = 0$ , as we illustrated with the function  $f(x) = \frac{1}{1-x}$ .

## The Interval of Convergence of a Power Series

We have already seen that every power series in  $x$  converges when  $x = 0$ . In a moment we will discuss a theorem that summarizes the possibilities for the types of intervals on which a power series in  $x$  can converge. Before we get to that theorem, however, we need the following one:

### THEOREM 8.2

#### The Convergence of a Power Series in $x$ at a Nonzero Point Implies Convergence on an Interval

Let  $\sum_{k=0}^{\infty} a_k x^k$  be a power series in  $x$ .

- (a) If the series converges at  $c \neq 0$ , then the series converges absolutely for all real numbers  $b$  such that  $|b| < |c|$ .
- (b) If the series diverges at  $c$ , then the series diverges for all real numbers  $d$  such that  $|c| < |d|$ .

**Proof.** For Theorem 8.2 (a) we are given that the power series  $\sum_{k=0}^{\infty} a_k x^k$  converges at  $c \neq 0$ . That is, the series of constants  $\sum_{k=0}^{\infty} a_k c^k$  converges. Since this series converges, the Divergence Test implies that  $\lim_{k \rightarrow \infty} a_k c^k = 0$ . Furthermore, since every convergent sequence is bounded, there is a real number  $M > 0$  such that  $|a_k c^k| \leq M$  for every  $k \geq 0$ . We will now show that the series  $\sum_{k=0}^{\infty} |a_k b^k|$  converges when  $|b| < |c|$ . This inequality implies that  $\left| \frac{b}{c} \right| < 1$ . For every  $k \geq 0$ , we have

$$0 \leq |a_k b^k| = \left| a_k c^k \left( \frac{b}{c} \right)^k \right| \leq M \left| \frac{b}{c} \right|^k.$$

Since  $\left| \frac{b}{c} \right| < 1$ , the geometric series  $\sum_{k=0}^{\infty} M \left| \frac{b}{c} \right|^k$  converges. Thus, by the preceding inequality and the comparison test, the series  $\sum_{k=0}^{\infty} |a_k b^k|$  converges. Hence, the series  $\sum_{k=0}^{\infty} a_k b^k$  converges absolutely and we have proven (a).

The proof of part (b) is left for Exercise 61. ■

As a consequence of Theorem 8.2 we have the following theorem:

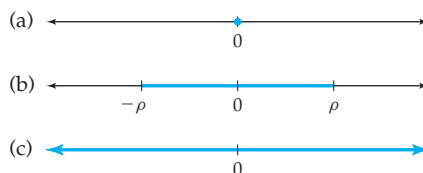

### THEOREM 8.3

#### The Convergence of a Power Series in $x$

Let  $\sum_{k=0}^{\infty} a_k x^k$  be a power series in  $x$ . Exactly one of the following occurs:

- The series converges only at  $x = 0$ .
- There exists a positive real number  $\rho$  such that the series converges absolutely for every  $x \in (-\rho, \rho)$  and diverges if  $x < -\rho$  or  $x > \rho$ .
- The series converges absolutely for every real number  $x$ .

Consider the following schematic illustrating the parts of Theorem 8.3:

Each of the conditions (a), (b), and (c) of Theorem 8.3 defines both an **interval of convergence** and a **radius of convergence** for the power series:

- ▶ When a power series in  $x$  satisfies part (a) of Theorem 8.3, we say that the interval of convergence for the series is trivial and the radius of convergence is 0.
- ▶ Next, note that part (b) of the theorem does *not* say whether the power series converges at either  $\rho$  or  $-\rho$ . In fact, a power series in  $x$  satisfying part (b) may converge at both  $\pm\rho$ , at neither of these points, or at just one of these points. Thus, here the interval of convergence will have one of the forms

$$[-\rho, \rho], (-\rho, \rho), [-\rho, \rho) \text{ and } (-\rho, \rho].$$

For any of these intervals, the radius of convergence is said to be  $\rho$ . When the series converges at  $\rho$  or  $-\rho$ , the convergence may be either conditional or absolute, depending upon the particular series. (See Exercise 62 for more on this.)

- ▶ Finally, in part (c) we say that the interval of convergence is  $\mathbb{R}$  and that the radius of convergence is infinite.

We will discuss several examples later in the section.

## Power Series in $x - x_0$

We wish to generalize the concept of a power series slightly. In the sections that follow we will be looking for power series representations for specified functions. At the beginning of the current section we saw that the function  $f(x) = \frac{1}{1-x}$  may be represented by the following power series in  $x$ :

$$\frac{1}{1-x} = \sum_{k=0}^{\infty} x^k.$$

We also saw that the graphs of the terms of the sequence of partial sums

$$1, 1+x, 1+x+x^2, 1+x+x^2+x^3, \dots$$

approximate the function with increasing accuracy on an interval centered at  $x = 0$  as we include more summands. We may form similar power series at points other than  $x = 0$ . When we do, we obtain a power series in  $x - x_0$ . Just as we hoped to find power series in  $x$  that converge on an interval centered at  $x = 0$ , we wish to find power series in  $x - x_0$  that converge on an interval centered at  $x = x_0$ .

#### DEFINITION 8.4 Power Series in $x - x_0$

Let  $\{a_k\}_{k=0}^{\infty}$  be a sequence of real numbers, let  $x$  be a variable, and let  $x_0$  be a real number. A **power series in  $x - x_0$**  is a series of the form  $\sum_{k=0}^{\infty} a_k (x - x_0)^k$ . That is,

$$\sum_{k=0}^{\infty} a_k (x - x_0)^k = a_0 + a_1(x - x_0) + a_2(x - x_0)^2 + a_3(x - x_0)^3 + \cdots + a_k (x - x_0)^k + \cdots$$

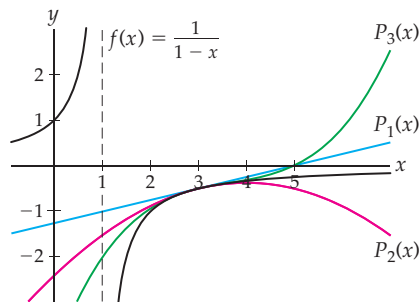

If  $c$  is a real number at which the series of constants  $\sum_{k=0}^{\infty} a_k (c - x_0)^k$  converges, the power series  $\sum_{k=0}^{\infty} a_k (x - x_0)^k$  is said to **converge** at  $c$ .

For example, if  $x_0 = 3$  and  $a_k = \left(-\frac{1}{2}\right)^{k+1}$ , we have the series

$$\sum_{k=0}^{\infty} \left(-\frac{1}{2}\right)^{k+1} (x - 3)^k = -\frac{1}{2} + \frac{1}{4}(x - 3) - \frac{1}{8}(x - 3)^2 + \frac{1}{16}(x - 3)^3 - \cdots$$

In Section 8.3 we will see that this power series in  $x - 3$  also converges to the function  $f(x) = \frac{1}{1-x}$ , but the series converges for every real number in the interval  $(1, 5)$ . In the following figure we graph the function  $f(x) = \frac{1}{1-x}$  along with linear, quadratic, and cubic polynomials from the sequence of partial sums:

Polynomial approximations to the function  $f(x) = \frac{1}{1-x}$  near  $x = 3$

Note that if we start with a power series in  $x - x_0$  and let  $x_0 = 0$ , we obtain a power series in  $x$ , so every power series in  $x$  is also a power series in  $x - x_0$  where  $x_0 = 0$ . Thus, a power series in  $x - x_0$  is a generalization of a power series in  $x$ . Theorem 8.3 outlined the possibilities for the radius of convergence and interval of convergence for a power series in  $x$ . The following theorem is the generalization of Theorem 8.3 for a power series in  $x - x_0$ :

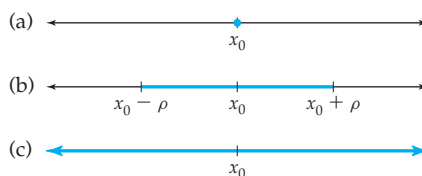

**THEOREM 8.5****The Convergence of a Power Series in  $x - x_0$** 

Let  $\sum_{k=0}^{\infty} a_k (x - x_0)^k$  be a power series in  $x - x_0$ . Exactly one of the following occurs:

- (a) The series converges only at  $x = x_0$ .
- (b) There exists a positive real number  $\rho$  such that the series converges absolutely for every  $x \in (x_0 - \rho, x_0 + \rho)$  and diverges if  $x < x_0 - \rho$  or  $x > x_0 + \rho$ .
- (c) The series converges absolutely for every real number  $x$ .

The following schematic illustrates the three parts of Theorem 8.5 for an interval of convergence for a power series in  $x - x_0$ :

Each of the conditions (a), (b), and (c) of Theorem 8.5 defines both an interval of convergence and a radius of convergence for the power series:

- ▶ If the power series converges only at  $x_0$ , we say that the interval of convergence for the series is trivial and the radius of convergence is 0.
- ▶ If the series converges on a finite but nontrivial interval, we say that the radius of convergence is  $\rho$ . Part (b) of Theorem 8.5 does not tell us whether the series converges or diverges at either of the two points  $x_0 + \rho$  and  $x_0 - \rho$ . Thus, in this case, the interval of convergence has one of the following forms:

$$[x_0 - \rho, x_0 + \rho], (x_0 - \rho, x_0 + \rho), [x_0 - \rho, x_0 + \rho) \text{ and } (x_0 - \rho, x_0 + \rho].$$

When the series converges at  $x_0 + \rho$  or  $x_0 - \rho$ , the convergence at either point may be either conditional or absolute, depending upon the particular series.

- ▶ If a power series in  $x - x_0$  converges everywhere, we say that the interval of convergence is  $\mathbb{R}$  and that the radius of convergence is infinite.

In the sections that follow, we will show how power series arise and how they may be used to help us understand the behavior of functions.

## Examples and Explorations

### EXAMPLE 1

#### Finding the interval of convergence and radius of convergence for a power series in $x$

Find the interval of convergence and radius of convergence for the following power series in  $x$ :

$$\sum_{k=0}^{\infty} \frac{1}{1 + 2^k} x^k = \frac{1}{2} + \frac{1}{3}x + \frac{1}{5}x^2 + \frac{1}{9}x^3 + \cdots$$

If the radius of convergence is finite, analyze the behavior of the series at the endpoints of the interval of convergence.

### SOLUTION

Although occasionally it will be more convenient to use the root test, throughout this chapter our primary tool for finding the interval of convergence for a power series will be the ratio test for absolute convergence.

For this series we let  $b_k = \frac{1}{1+2^k}x^k$ . Therefore,  $b_{k+1} = \frac{1}{1+2^{k+1}}x^{k+1}$ , and thus

$$\begin{aligned} \lim_{k \rightarrow \infty} \left| \frac{b_{k+1}}{b_k} \right| &= \lim_{k \rightarrow \infty} \left| \frac{x^{k+1}/(1+2^{k+1})}{x^k/(1+2^k)} \right| && \leftarrow \text{the ratio test for absolute convergence} \\ &= \lim_{k \rightarrow \infty} |x| \frac{1+2^k}{1+2^{k+1}} && \leftarrow \text{algebraic simplification of the quotient} \\ &= \lim_{k \rightarrow \infty} |x| \frac{(1/2^k)+1}{(1/2^k)+2} && \leftarrow \text{division by } 2^k \text{ in the numerator} \\ &&& \text{and denominator} \\ &= \frac{1}{2} |x|. && \leftarrow \text{evaluation of the limit} \end{aligned}$$

Before we proceed, notice that in the second line of the calculation we dropped the absolute value around the quotient  $\frac{1+2^k}{1+2^{k+1}}$  because it would be redundant, since each term in the quotient is positive. However, the absolute value is necessary around the variable  $x$ , since that variable may take on both positive and negative values.

Now, from the ratio test for absolute convergence we know that the series will converge absolutely if the limit is less than 1. Therefore we set up the inequality

$$\frac{1}{2} |x| < 1,$$

or equivalently,  $|x| < 2$ . This inequality tells us that the radius of convergence for our series is 2 and that the series converges absolutely when  $|x| < 2$  or equivalently when  $-2 < x < 2$ . Since the latter interval is finite, we will have to analyze the series at both endpoints of the interval, which we'll do in a moment. Before we do, we note that our results conform to part (b) of Theorem 8.3.

Now we consider the endpoints of the interval of convergence. We'll analyze the behavior of the power series when  $x = 2$  and leave the analysis for  $x = -2$  for Exercise 8. We evaluate our series when  $x = 2$  and obtain

$$\sum_{k=0}^{\infty} \frac{1}{1+2^k} 2^k = \sum_{k=0}^{\infty} \frac{2^k}{1+2^k}.$$

Consider the limit of the terms of this series as  $k \rightarrow \infty$ :  $\lim_{k \rightarrow \infty} \frac{2^k}{1+2^k} = 1$ . Thus, by the divergence test, the power series diverges when  $x = 2$ . In Exercise 8 you will show that the power series also diverges when  $x = -2$ . Therefore the interval of convergence for this power series is  $(-2, 2)$ .

Before we proceed to another example, we summarize a few of the main ideas we've used in this example. Our main tool for finding the radius of convergence and interval of convergence for any power series is the ratio test for absolute convergence. When you simplify  $\frac{b_{k+1}}{b_k}$ , remember to leave the variable  $x$  in an absolute value even if the other factors of the quotient are positive. When we are presented with a power series in  $x$ , if the radius of convergence  $\rho$  is positive and finite:

- ▶ The series converges absolutely for every value in the interval  $(-\rho, \rho)$ .
- ▶ You will need to analyze the behavior of the power series individually at both  $\rho$  and  $-\rho$ .

- The series may converge at one or both of the endpoints of the interval of convergence, but if it converges absolutely at either endpoint, then as you will see in Exercise 62, it will converge absolutely at the other endpoint.
- The ratio test for absolute convergence will *always fail* to uncover the convergence or divergence at the endpoints of a finite interval of convergence. We ask you to explain this phenomenon in Exercise 17. □

**EXAMPLE 2****More examples of finding the interval of convergence and radius of convergence for power series in  $x$** 

Find the interval of convergence and radius of convergence for the following power series in  $x$ :

$$(a) \sum_{k=0}^{\infty} k! x^k \qquad (b) \sum_{k=1}^{\infty} \left(\frac{2}{k}\right)^k x^{3k}.$$

If the radius of convergence is finite, analyze the behavior of the series at the endpoints of the interval of convergence.

**SOLUTION**

- (a) For the first series given, we again use the ratio test for absolute convergence. We let  $b_k = k! x^k$ . Thus,  $b_{k+1} = (k+1)! x^{k+1}$ , and we have

$$\lim_{k \rightarrow \infty} \left| \frac{b_{k+1}}{b_k} \right| = \lim_{k \rightarrow \infty} \left| \frac{(k+1)! x^{k+1}}{k! x^k} \right| = \lim_{k \rightarrow \infty} |x|(k+1).$$

Now, if  $x = 0$ , the preceding limit is zero, so the series converges absolutely at that point. However, if  $x \neq 0$ , the limit will be infinite. Therefore, by the ratio test for absolute convergence, we see that this series converges only when  $x = 0$ . The interval of convergence is trivial and the radius of convergence is 0.

- (b) For variety we use the modified root test on the second series given. This is a reasonable choice for that series because the factors of the terms of the series involve  $k$ th powers. We let  $b_k = \left(\frac{2}{k}\right)^k x^{3k}$  and evaluate

$$\lim_{k \rightarrow \infty} \sqrt[k]{|b_k|} = \lim_{k \rightarrow \infty} \sqrt[k]{|(2/k)^k x^{3k}|} = \lim_{k \rightarrow \infty} |x|^3 \frac{2}{k}.$$

Note that we evaluate the preceding limit as  $k \rightarrow \infty$ . No matter what value the variable  $x$  takes on, this limit is zero. That is,  $\lim_{k \rightarrow \infty} |x|^3 \frac{2}{k} = 0$ . Therefore, by the modified root test, the series converges absolutely for every value of  $x$ . Thus, the interval of convergence is  $\mathbb{R}$  and the radius of convergence is infinite. □

**EXAMPLE 3****Finding the interval of convergence and radius of convergence for power series in  $x - x_0$** 

Find the interval of convergence and radius of convergence for the following power series:

$$(a) \sum_{k=1}^{\infty} (-1)^{k+1} \frac{1}{k} (x+2)^k \qquad (b) \sum_{k=0}^{\infty} \frac{1}{(2k+1)!} (x-\pi)^k$$

If the radius of convergence is finite, analyze the behavior of the series at the endpoints of the interval of convergence.

## SOLUTION

- (a) For a power series in  $x - x_0$ , our primary tool for analyzing the interval of convergence is, again, the ratio test for absolute convergence. For the first series given, we let  $b_k = (-1)^{k+1} \frac{1}{k} (x+2)^k$ . Here,  $b_{k+1} = (-1)^{k+1} \frac{1}{k+2} (x+2)^{k+1}$  and we evaluate

$$\lim_{k \rightarrow \infty} \left| \frac{b_{k+1}}{b_k} \right| = \lim_{k \rightarrow \infty} \left| \frac{(-1)^{k+2} (x+2)^{k+1} / (k+1)}{(-1)^{k+1} (x+2)^k / k} \right| = \lim_{k \rightarrow \infty} |x+2| \frac{k}{k+1}.$$

Since we are evaluating this limit as  $k \rightarrow \infty$ , its value is  $|x+2|$ . By the ratio test for absolute convergence we know that the series will converge absolutely when  $|x+2| < 1$ . We now know that the radius of convergence is 1, and the interval of convergence contains  $(-3, -1)$ . Since this a finite interval, we also analyze the behavior of the series at the endpoints of the interval. When  $x = -1$ ,

$$\sum_{k=1}^{\infty} (-1)^{k+1} \frac{1}{k} (-1+2)^k = \sum_{k=1}^{\infty} (-1)^{k+1} \frac{1}{k}.$$

This is the alternating harmonic series that we already know converges conditionally. When  $x = -3$ ,

$$\sum_{k=1}^{\infty} (-1)^{k+1} \frac{1}{k} (-3+2)^k = \sum_{k=1}^{\infty} (-1)^{k+1} \frac{1}{k} (-1)^k = - \sum_{k=1}^{\infty} \frac{1}{k}.$$

This is just a constant multiple of the harmonic series, which diverges. Thus, our interval of convergence is  $(-3, -1]$ .

- (b) For our other given series, we let  $b_k = \frac{1}{(2k+1)!} (x-\pi)^k$ . Here,  $b_{k+1} = \frac{1}{(2(k+1)+1)!} (x-\pi)^{k+1}$  and we evaluate

$$\begin{aligned} \lim_{k \rightarrow \infty} \left| \frac{b_{k+1}}{b_k} \right| &= \lim_{k \rightarrow \infty} \left| \frac{(x-\pi)^{k+1} / (2(k+1)+1)!}{(x-\pi)^k / (2k+1)!} \right| = \lim_{k \rightarrow \infty} |x-\pi| \frac{(2k+1)!}{(2k+3)!} \\ &= \lim_{k \rightarrow \infty} |x-\pi| \frac{1}{(2k+2)(2k+3)}. \end{aligned}$$

Make sure you understand the simplification of the quotients in this equation. Since we are evaluating the limit as  $k \rightarrow \infty$ , the limit is zero for any value of  $x$ . Thus, this power series converges for every real number, and the radius of convergence is infinite.  $\square$

## EXAMPLE 4

## Analyzing a power series given in another form

Show that if  $m$  and  $b$  are real numbers and  $m \neq 0$ , then a series of the form

$$\sum_{k=0}^{\infty} a_k (mx+b)^k$$

is a power series in  $x + \frac{b}{m}$ . Then find the interval of convergence and radius of convergence for the series

$$\sum_{k=0}^{\infty} (-1)^k \frac{k}{3k+1} (2x-3)^k.$$

If the radius of convergence is finite, analyze the behavior of the series at the endpoints of the interval of convergence.

**SOLUTION**

The series  $\sum_{k=0}^{\infty} a_k(mx+b)^k$  is not in the form of a power series in  $x - x_0$ , but it can be put into that form. Since  $(mx+b)^k = m^k \left(x + \frac{b}{m}\right)^k$ , we have

$$\sum_{k=0}^{\infty} a_k(mx+b)^k = \sum_{k=0}^{\infty} a_k m^k \left(x + \frac{b}{m}\right)^k.$$

Thus, the series is a power series in  $x + \frac{b}{m}$ .

We do *not* need to put the series into this alternative form to find the radius of convergence or interval of convergence, however. We may use the ratio test for absolute convergence on the original form of the series. For the series  $\sum_{k=0}^{\infty} (-1)^k \frac{k}{3k+1} (2x-3)^k$ , we have  $b_k = (-1)^k \frac{k}{3k+1} (2x-3)^k$  and  $b_{k+1} = (-1)^{k+1} \frac{k+1}{3(k+1)+1} (2x-3)^{k+1}$ . We evaluate

$$\lim_{k \rightarrow \infty} \left| \frac{b_{k+1}}{b_k} \right| = \lim_{k \rightarrow \infty} \left| \frac{(-1)^{k+1} (k+1) (2x-3)^{k+1} / (3k+4)}{(-1)^k k (2x-3)^k / (3k+1)} \right| = \lim_{k \rightarrow \infty} |2x-3| \frac{(k+1)(3k+1)}{k(3k+4)}.$$

Here the limit is  $|2x-3|$ . By the ratio test for absolute convergence, we know that the series will converge absolutely when  $|2x-3| < 1$  or, equivalently, when  $\left|x - \frac{3}{2}\right| < \frac{1}{2}$ . Thus, the radius of convergence is  $\frac{1}{2}$ , and the interval of convergence contains  $(1, 2)$ . Since this is a finite interval, we also analyze the behavior of the series at the endpoints. When  $x = 1$ ,

$$\sum_{k=0}^{\infty} (-1)^k \frac{k}{3k+1} (2 \cdot 1 - 3)^k = \sum_{k=0}^{\infty} \frac{k}{3k+1}.$$

Since  $\lim_{k \rightarrow \infty} \frac{k}{3k+1} = \frac{1}{3}$ , the power series diverges at  $x = 1$ . In Exercise 9 we ask you to show that the power series also diverges when  $x = 2$ . Therefore, the interval of convergence for the series is  $(1, 2)$ .  $\square$

**? TEST YOUR UNDERSTANDING**

- ▶ What is a power series? What is the difference between a series of constants and a power series?
- ▶ What is the difference between a power series in  $x$  and a power series in  $x - x_0$ ?
- ▶ What is the difference between a polynomial and a power series?
- ▶ What is meant by the interval of convergence of a power series? What is meant by the radius of convergence of a power series?
- ▶ How are the interval of convergence and radius of convergence of a series determined?

## EXERCISES 8.1

## Thinking Back

- ▶ *Translating the graph of a function:* What is the relationship between the graph of a function  $f(x)$  and the graph of  $f(x - x_0)$  when  $x_0$  is a positive constant? When  $x_0$  is a negative constant?
- ▶ *Odd and Even Functions:* What is the definition of an odd function? An even function?
- ▶ Fill in the blanks: The graph of every odd function is symmetric about \_\_\_\_\_. The graph of every even function is symmetric about \_\_\_\_\_.

0. *Problem Zero:* Read the section and make your own summary of the material.
1. *True/False:* Determine whether each of the statements that follow is true or false. If a statement is true, explain why. If a statement is false, provide a counterexample.
  - (a) *True or False:*  $\sum_{k=1}^{\infty} \frac{1}{k} x^{-k}$  is a power series in  $x$ .
  - (b) *True or False:*  $\sum_{k=0}^{\infty} \frac{1}{k!} (x-2)^k$  is a power series in  $x-2$ .
  - (c) *True or False:*  $\sum_{k=0}^{\infty} \frac{(-1)^k}{(2k+1)!} x^{2k+1}$  is a power series in  $x$ .
  - (d) *True or False:* The series  $\sum_{k=0}^{\infty} k!(x+3)^k$  converges when  $x=3$ .
  - (e) *True or False:* If a power series in  $x$  converges conditionally when  $x=3$ , it converges absolutely at  $x=-2$ .
  - (f) *True or False:* If a power series in  $x$  diverges when  $x=3$ , it diverges at  $x=-4$ .
  - (g) *True or False:* If a power series in  $x-4$  converges absolutely when  $x=10$ , it converges absolutely at  $x=-1$ .
  - (h) *True or False:* If a power series in  $x+5$  converges conditionally when  $x=3$ , it converges conditionally at  $x=-13$ .
2. *Examples:* Construct examples of the thing(s) described in the following. Try to find examples that are different than any in the reading.
  - (a) A power series in  $x$  with a finite radius of convergence.
  - (b) A power series in  $x-4$  with an infinite radius of convergence.
  - (c) A power series in  $x+3$  that converges only at  $x=-3$ .
3. What is a power series in  $x$ ?
4. What is a power series in  $x-x_0$ ?
5. Explain why  $\sum_{k=0}^{\infty} (x-k)^k$  is *not* a power series.
6. What is meant by the interval of convergence for a power series in  $x$ ? How is the interval of convergence determined? If a power series in  $x$  has a nontrivial interval of convergence, what types of intervals are possible?
7. What is meant by the interval of convergence for a power series in  $x-x_0$ ? How is the interval of convergence determined? If a power series in  $x-x_0$  has a nontrivial interval of convergence, what types of intervals are possible?
8. Show that  $\sum_{k=0}^{\infty} \frac{1}{1+2^k} x^k$ , the power series in  $x$  from Example 1, diverges when  $x=-2$ .
9. Complete Example 4 by showing that the power series  $\sum_{k=0}^{\infty} (-1)^k \frac{k}{3k+1} (2x-3)^k$  diverges when  $x=2$ .
10. Show that the power series  $\sum_{k=0}^{\infty} \frac{(-1)^k}{2k+1} x^{2k+1}$  converges conditionally when  $x=1$  and when  $x=-1$ . What does this behavior tell you about the interval of convergence for the series?
11. Show that the power series  $\sum_{k=1}^{\infty} \frac{(-1)^k}{k} x^k$  converges conditionally when  $x=1$  and diverges when  $x=-1$ . What does this behavior tell you about the interval of convergence for the series?
12. Show that the power series  $\sum_{k=1}^{\infty} \frac{(-1)^k}{k^2} x^k$  converges absolutely when  $x=1$  and when  $x=-1$ . What does this behavior tell you about the interval of convergence for the series?
13. What is  $x_0$  if the interval of convergence for the power series  $\sum_{k=0}^{\infty} a_k (x-x_0)^k$  is  $(2, 10]$ ?
14. What is  $x_0$  if  $(p, q)$  is the interval of convergence for the power series  $\sum_{k=0}^{\infty} a_k (x-x_0)^k$ ?
15. What is  $x_0$  if the power series  $\sum_{k=0}^{\infty} a_k (x-x_0)^k$  converges conditionally at both  $x=-4$  and  $x=8$ .
16. Is it possible for a power series to have  $(0, \infty)$  as its interval of convergence? Explain your answer.
17. Let  $\sum_{k=0}^{\infty} a_k x^k$  be a power series in  $x$  with a positive and finite radius of convergence  $\rho$ . Explain why the ratio test for absolute convergence will fail to determine the convergence of this power series when  $x=\rho$  or when  $x=-\rho$ .
18. Let  $\sum_{k=0}^{\infty} a_k x^k$  be a power series in  $x$  with radius of convergence  $\rho$ . What is the radius of convergence of the power series  $\sum_{k=0}^{\infty} a_k (x-x_0)^k$ ? Make sure you justify your answer.
19. Let  $a_k \neq 0$  for each value of  $k$ , and let  $\sum_{k=0}^{\infty} a_k x^k$  be a power series in  $x$  with a positive and finite radius of convergence  $\rho$ . What is the radius of convergence of the power series  $\sum_{k=0}^{\infty} \frac{1}{a_k} x^k$ ?
20. Let  $\sum_{k=0}^{\infty} a_k x^k$  be a power series in  $x$  with interval of convergence  $[-2, 2)$ . What is the radius of convergence of the power series  $\sum_{k=0}^{\infty} a_k (x-3)^k$ ? Justify your answer.

## Skills

Find the interval of convergence for each power series in Exercises 21–48. If the interval of convergence is finite, be sure to analyze the convergence at the endpoints.

21. 
$$\sum_{k=0}^{\infty} \frac{1}{k!} x^k$$

23. 
$$\sum_{k=0}^{\infty} \frac{(-1)^k}{(2k)!} x^{2k}$$

25. 
$$\sum_{k=1}^{\infty} \frac{(-1)^k}{k+1} x^k$$

27. 
$$\sum_{k=1}^{\infty} \frac{1}{k} (x+2)^k$$

29. 
$$\sum_{k=1}^{\infty} \frac{2k+1}{k^3} (x-\pi)^k$$

31. 
$$\sum_{k=1}^{\infty} (-1)^k \frac{\sqrt{k}}{k^3} \left(x - \frac{3}{2}\right)^k$$

33. 
$$\sum_{k=0}^{\infty} (-1)^k \frac{k^2}{3^k} \left(x - \frac{1}{2}\right)^k$$

35. 
$$\sum_{k=0}^{\infty} \frac{(k!)^2}{(2k)!} (x+2)^k$$

37. 
$$\sum_{k=0}^{\infty} k! x^k$$

39. 
$$\sum_{k=1}^{\infty} \frac{\ln k}{k^2} \left(x + \frac{5}{3}\right)^k$$

41. 
$$\sum_{k=0}^{\infty} \frac{k+1}{3^k} (2x-5)^k$$

43. 
$$\sum_{k=0}^{\infty} \frac{\sqrt{k}}{k!} (4x+7)^k$$

22. 
$$\sum_{k=0}^{\infty} \frac{(-2)^k}{k!} x^k$$

24. 
$$\sum_{k=0}^{\infty} \frac{(-1)^k}{(2k+1)!} x^{2k+1}$$

26. 
$$\sum_{k=0}^{\infty} \frac{(-1)^k}{2k+1} x^{2k+1}$$

28. 
$$\sum_{k=1}^{\infty} \frac{1}{k^2} (x+3)^k$$

30. 
$$\sum_{k=1}^{\infty} (-1)^k \frac{1}{k^k} (x-1)^k$$

32. 
$$\sum_{k=1}^{\infty} \frac{2^k+1}{\sqrt{k}} x^k$$

34. 
$$\sum_{k=0}^{\infty} \frac{1}{3^k+5^k} x^k$$

36. 
$$\sum_{k=0}^{\infty} \frac{1}{3^k+5^k} (x+3)^k$$

38. 
$$\sum_{k=1}^{\infty} \frac{5}{k^2} x^k$$

40. 
$$\sum_{k=1}^{\infty} \frac{\sqrt{k+1}}{k^2} \left(x + \frac{1}{2}\right)^k$$

42. 
$$\sum_{k=0}^{\infty} \frac{k^2}{4^k+3} (3x+7)^k$$

44. 
$$\sum_{k=0}^{\infty} \frac{(-1)^k}{(2k+1)!} (3x+7)^{2k+1}$$

45. 
$$\sum_{k=1}^{\infty} \frac{1}{2 \cdot 4 \cdot 6 \cdots (2k)} x^k$$

46. 
$$\sum_{k=0}^{\infty} \frac{1}{1 \cdot 3 \cdot 5 \cdots (2k+1)} x^k$$

47. 
$$\sum_{k=1}^{\infty} \frac{1}{k^k} (x-3)^k$$

48. 
$$\sum_{k=0}^{\infty} \frac{k^3}{1 \cdot 3 \cdot 5 \cdots (2k+1)} (x+1)^k$$

In Exercises 49–52 find the radius of convergence for the given series.

49. 
$$\sum_{k=0}^{\infty} \frac{k!}{(k+m)!} x^k, \text{ where } m \in \mathbb{Z}^+$$

50. 
$$\sum_{k=0}^{\infty} \frac{k!}{((k+m)!)^2} x^k, \text{ where } m \in \mathbb{Z}^+$$

51. 
$$\sum_{k=0}^{\infty} \frac{k!}{(k+m)!(k+n)!} x^k, \text{ where } m \in \mathbb{Z}^+ \text{ and } n \in \mathbb{Z}^+$$

52. 
$$\sum_{k=0}^{\infty} \frac{(k!)^m}{(mk)!} x^k, \text{ where } m \in \mathbb{Z}^+$$

In Exercises 53–58 explain why the series is *not* a power series in  $x - x_0$ . Then use the ratio test for absolute convergence to find the values of  $x$  for which the given series converge.

53. 
$$\sum_{k=0}^{\infty} \left(\frac{1}{x+1}\right)^k$$

54. 
$$\sum_{k=0}^{\infty} (-1)^k \frac{1}{k!} x^{-k}$$

55. 
$$\sum_{k=0}^{\infty} \frac{(\sin x)^k}{k!}$$

56. 
$$\sum_{k=1}^{\infty} \frac{(-1)^k}{k} \left(\frac{x}{x-1}\right)^k$$

57. 
$$\sum_{k=1}^{\infty} \frac{1}{k^3} \left(\frac{x+2}{x-3}\right)^k$$

58. 
$$\sum_{k=1}^{\infty} \frac{(-1)^k k!}{k^2} \left(\frac{3x}{x-2}\right)^k$$

## Applications

59. Leila, in her capacity as a wildlife biologist, is faced with concerns over the viability of the beaver population in Idaho in the presence of the wolves that have moved to the area. She has read papers that show that if the beaver population in an area stays above a certain solution  $b(w)$  of a differential equation, where  $w$  represents the number of wolves in that area, then the population is viable. However, if the number of beavers falls below that function, then the population will collapse. Leila's solution of

the differential equation for the function is

$$b(w) = 39w^{2/3} \sum_{n=0}^{\infty} \frac{w^n}{19200^n n!}.$$

- Where does this series converge?
- Plot an approximation to  $b$  on the interval  $[0, 500]$ . How do you choose how many terms to use?

60. Leila is managing elk hunting for one herd in a region of Idaho. She is responsible for picking a hunting rate  $h$ , where  $h$  represents the fraction of the herd remaining after hunting season is over. Each year, the herd size changes by a number  $\Delta_k$  independently of the hunting rate. If  $P$  is the initial population of elk, then the number remaining after the first hunting season is  $Ph$ , the number remaining after the second is  $(Ph + \Delta_1)h$ , the number remaining after the third is  $((Ph + \Delta_1)h + \Delta_2)h$ , and so

on. The number after  $n$  seasons is

$$Ph^{n+1} + \sum_{k=1}^n \Delta_k h^{n-k}.$$

Leila needs to prevent the size of the herd from going to zero or to infinity as  $n \rightarrow \infty$ . Given that  $0 < h \leq 1$ , what conditions on  $\Delta_k$  are required?

## Proofs

61. Prove part (b) of Theorem 8.2. That is, let  $\sum_{k=0}^{\infty} a_k x^k$  be a power series in  $x$ , and show that if the series diverges at  $c$ , then the series diverges for all real numbers  $d$  such that  $|c| < |d|$ . (Hint: Use contradiction and part (a) of the theorem.)
62. Let  $\sum_{k=0}^{\infty} a_k x^k$  be a power series in  $x$  with a finite radius of convergence  $\rho$ . Prove that if the series converges absolutely at either  $\pm\rho$ , then the series converges absolutely at the other value as well.
63. Let  $\sum_{k=0}^{\infty} a_k (x - x_0)^k$  be a power series in  $x - x_0$  with a finite radius of convergence  $\rho$ . Prove that if the series converges absolutely at  $x_0 \pm \rho$ , then the series converges absolutely at the other value as well.
64. Prove that if  $(-\rho, \rho]$  is the interval of convergence for the series  $\sum_{k=0}^{\infty} a_k x^k$ , then the series converges conditionally at  $\rho$ . (Hint: Consider Exercise 62).
65. Prove that if  $(x_0 - \rho, x_0 + \rho]$  is the interval of convergence for the series  $\sum_{k=0}^{\infty} a_k (x - x_0)^k$ , then the series converges conditionally at  $x_0 + \rho$ .
66. Prove that if the power series  $\sum_{k=0}^{\infty} a_k x^k$  has a positive and finite radius of convergence  $\rho$ , then the series  $\sum_{k=0}^{\infty} a_k x^{2k}$  has radius of convergence  $\sqrt{\rho}$ .
67. Prove that if the power series  $\sum_{k=0}^{\infty} a_k x^k$  and  $\sum_{k=0}^{\infty} a_k x^{2k}$  have the same radius of convergence  $\rho$ , then  $\rho$  is 0, 1, or infinite. (Hint: Use Exercise 66).
68. Prove that if the power series  $\sum_{k=0}^{\infty} a_k x^k$  has a positive and finite radius of convergence  $\rho$ , and if  $m$  is a positive integer greater than 1, then the series  $\sum_{k=0}^{\infty} a_k x^{mk}$  has radius of convergence  $\sqrt[m]{\rho}$ .
69. Let  $b$  be a nonzero constant. Prove that the radius of convergence of the power series  $\sum_{k=0}^{\infty} b^k x^k$  is  $\frac{1}{|b|}$ .
70. Let  $\sum_{k=0}^{\infty} a_k x^k$  be a power series with a positive and finite radius of convergence  $\rho$ , and let  $c \neq 0$ . Prove that the series  $\sum_{k=0}^{\infty} a_k (cx)^k$  has radius of convergence  $\frac{\rho}{|c|}$ .
71. A certain power series  $\sum_{k=0}^{\infty} a_k x^k$  has the properties that  $a_0$  and  $a_1$  are nonzero and  $a_{k+2} = a_k$  for every  $k > 0$ .
- Prove that the radius of convergence  $\rho$  for the series is finite, and find the value of  $\rho$ .
  - Prove that the series diverges at the endpoints of the interval of convergence.
  - What is the sum of the series for  $x \in (-\rho, \rho)$ ? Give your answer in terms of  $x$ ,  $a_0$ , and  $a_1$ .
72. Recall that a rational function is the quotient of two polynomials. Prove that if  $a_k$  is a rational function of  $k$ , then the power series in  $x$   $\sum_{k=0}^{\infty} a_k x^k$  has radius of convergence  $\rho = 1$ .

## Thinking Forward

- *Constructing a power series of the form  $\sum_{k=0}^{\infty} \frac{f^{(k)}(0)}{k!} x^k$ .* Using  $f(x) = \sin x$ , construct the power series  $\sum_{k=0}^{\infty} \frac{f^{(k)}(0)}{k!} x^k$ .

- *Graphing  $\sin x$  and a polynomial approximation:* Graph the function  $\sin x$ , together with the polynomial formed from the first three nonzero terms you found in the previous problem, on the interval  $[-\pi, \pi]$ . What do you observe about the graphs of the two functions?

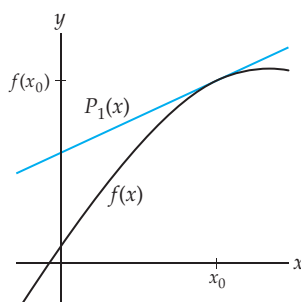

## 8.2 MACLAURIN SERIES AND TAYLOR SERIES

- ▶ Maclaurin polynomials and Taylor polynomials
- ▶ Taylor series
- ▶ Maclaurin series

### Maclaurin Polynomials and Taylor Polynomials

We know that when a function  $f$  is differentiable at a point  $x_0$ , the tangent line to the graph of  $f$  at the point  $(x_0, f(x_0))$  and with equation  $y = f(x_0) + f'(x_0)(x - x_0)$  is the best linear approximation to the graph “close” to the point of tangency, as depicted in the figure that follows. Since this equation is that of a first-degree polynomial, we use the notation  $P_1(x)$  to denote the tangent function. That is,  $P_1(x) = f(x_0) + f'(x_0)(x - x_0)$ .

The tangent line has two properties that make it a good approximation for the function close to the point of tangency: It has the same value as the function at  $x = x_0$ , and it has the same derivative as the function at  $x = x_0$ . That is,  $P_1(x_0) = f(x_0)$  and  $P'_1(x_0) = f'(x_0)$ .

For a function  $f$  with an  $n$ th-order derivative at the point  $x_0$ , we may similarly approximate the function with an  $n$ th-degree polynomial of the form

$$P_n(x) = a_0 + a_1(x - x_0) + a_2(x - x_0)^2 + \cdots + a_k(x - x_0)^k + \cdots + a_n(x - x_0)^n$$

if we insist that  $P_n(x)$  and  $f(x)$  share the following  $n + 1$  properties:  $P_n$  and  $f$  have the same value at  $x_0$ ,  $P'_n$  and  $f'$  have the same value at  $x_0$ ,  $P''_n$  and  $f''$  have the same value at  $x_0$ ,  $\dots$ , and finally  $P_n^{(n)}$  and  $f^{(n)}$  have the same value at  $x_0$ . To construct such a polynomial, we must determine the constants  $a_0, a_1, a_2, \dots, a_n$  so that the polynomial  $P_n(x)$  shares the necessary properties with the function  $f(x)$ .

Now consider the  $k$ th derivative of  $P_n(x)$ . Since the  $k$ th derivative of a polynomial of degree less than  $k$  is 0, the first nonzero term of  $P_n^{(k)}(x)$  is  $a_k k!$ , and we have

$$P_n^{(k)}(x) = a_k k! + a_{k+1}((k+1)k(k-1)\cdots 2)(x - x_0) + a_{k+2}((k+2)(k+1)k\cdots 3)(x - x_0)^2 + \cdots + a_n(n(n-1)(n-2)\cdots(n-k+1))(x - x_0)^{n-k}.$$

Now, if we evaluate this equation when  $x = x_0$ , we obtain  $P_n^{(k)}(x_0) = a_k k!$ . Since we wish to have  $P_n^{(k)}(x_0) = f^{(k)}(x_0)$ , we must have  $a_k = \frac{f^{(k)}(x_0)}{k!}$ . This holds for each integer  $0 \leq k \leq n$ , where we interpret  $f^{(0)}$  to be the function  $f$  itself. Therefore, the  $n$ th-degree polynomial we hope to use to approximate  $f$  at  $x_0$  is

$$\begin{aligned} P_n(x) &= f(x_0) + f'(x_0)(x - x_0) + \frac{f''(x_0)}{2!}(x - x_0)^2 + \cdots + \frac{f^{(n)}(x_0)}{n!}(x - x_0)^n \\ &= \sum_{k=0}^n \frac{f^{(k)}(x_0)}{k!}(x - x_0)^k. \end{aligned}$$

This important function is the basis for the following definition:

### DEFINITION 8.6 Taylor Polynomials and Maclaurin Polynomials

Let  $f$  be a function with an  $n$ th-order derivative at the point  $x_0$ . We define the  $n$ th **Taylor polynomial for  $f$  at  $x_0$**  to be the function

$$P_n(x) = \sum_{k=0}^n \frac{f^{(k)}(x_0)}{k!} (x - x_0)^k.$$

If  $x_0 = 0$ , we also call this the  $n$ th **Maclaurin polynomial for  $f$** , which is of the form,

$$P_n(x) = \sum_{k=0}^n \frac{f^{(k)}(0)}{k!} x^k.$$

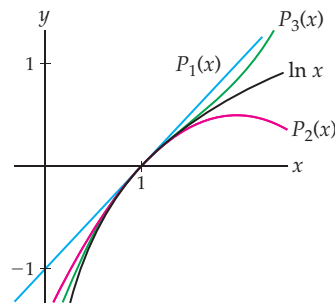

For example, the function  $f(x) = \ln x$  has derivatives of all orders at every point in its domain, so we may find the third Taylor polynomial for  $\ln x$  at  $x = 1$ . We have

$$f'(x) = \frac{1}{x}, \quad f''(x) = -\frac{1}{x^2} \quad \text{and} \quad f'''(x) = \frac{2}{x^3}.$$

To form the third Taylor polynomial  $P_3$  at  $x = 1$ , we evaluate the function and these three derivatives at  $x = 1$ :

$$f(1) = 0, \quad f'(1) = \frac{1}{1} = 1, \quad f''(1) = -\frac{1}{1^2} = -1 \quad \text{and} \quad f'''(1) = \frac{2}{1^3} = 2.$$

Therefore,  $P_3(x) = (x-1) - \frac{1}{2}(x-1)^2 + \frac{1}{3}(x-1)^3$ . Note that we have divided by the appropriate factorials to obtain the coefficients. We may also easily obtain the first and second Taylor polynomials for  $\ln x$  at  $x = 1$  by truncating  $P_3$  appropriately. That is,  $P_1(x) = x - 1$  is simply the tangent line to the function when  $x = 1$ , and  $P_2(x) = (x - 1) - \frac{1}{2}(x - 1)^2$  is the second-order Taylor polynomial at  $x = 1$ . Following are plots of  $P_1$ ,  $P_2$ , and  $P_3$ , along with a plot of the logarithm function:

Note that each of these three polynomials approximates the natural logarithm function close to  $x = 1$  and that the quality of the approximations improves as the degree of the Taylor polynomial increases.

## Taylor Series and Maclaurin Series

Mathematicians love to go to extremes. Notice that our definitions of the Taylor polynomial at  $x = x_0$  and the Maclaurin polynomial may be easily generalized to the following:

**DEFINITION 8.7** Taylor Series and Maclaurin Series

Let  $f$  be a function with derivatives of all orders at the point  $x_0$ . We define the **Taylor series for  $f$  at  $x_0$**  to be the following power series in  $x - x_0$ :

$$\sum_{k=0}^{\infty} \frac{f^{(k)}(x_0)}{k!} (x - x_0)^k.$$

If  $x_0 = 0$ , we also call this the **Maclaurin series for  $f$** , which is of the form,

$$\sum_{k=0}^{\infty} \frac{f^{(k)}(0)}{k!} x^k.$$

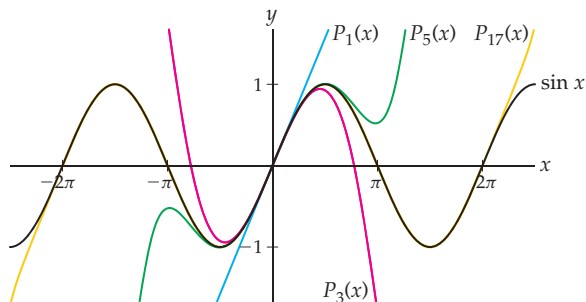

This is a wonderful definition, but what relationship does a Taylor series at  $x_0$  have to the original function  $f$  that is used to generate the series? Before answering that question, we will construct the Maclaurin series for the sine function:

$n$	$f^{(n)}(x)$	$f^{(n)}(0)$	$\frac{f^{(n)}(0)}{n!}$
0	$\sin x$	0	0
1	$\cos x$	1	1
2	$-\sin x$	0	0
3	$-\cos x$	-1	$-\frac{1}{3!}$
$\vdots$	$\vdots$	$\vdots$	$\vdots$
$2k$	$(-1)^k \sin x$	0	0
$2k + 1$	$(-1)^k \cos x$	$(-1)^k$	$(-1)^k \frac{1}{(2k + 1)!}$
$\vdots$	$\vdots$	$\vdots$	$\vdots$

The Maclaurin series for the sine function is

$$0 + x + 0x^2 - \frac{1}{3!}x^3 + 0x^4 + \frac{1}{5!}x^5 + 0x^6 - \dots,$$

or  $\sum_{k=0}^{\infty} \frac{(-1)^k}{(2k+1)!} x^{2k+1}$ . In the following figure, we plot the sine function and the Maclaurin series for the sine, along with the 1st, 3rd, 5th and 17th Maclaurin polynomials for the sine function:

Note that the sine function and the 17th Maclaurin polynomial overlap almost perfectly on the interval  $(-2\pi, 2\pi)$  and the sine function and its Maclaurin series *are identical* for every value of  $x$ , a fact that we will prove in Section 8.3.

We would like to repeat that a Maclaurin polynomial is just a Taylor polynomial when  $x_0 = 0$ . Taylor series and Maclaurin series bear the same relationship. Although the difference between the concepts is small, these are the traditional ways the names are used.

## Examples and Explorations

### EXAMPLE 1

#### Finding Maclaurin polynomials for $e^x$

Graph the exponential function  $e^x$  along with its first, second, and third Maclaurin polynomials.

#### SOLUTION

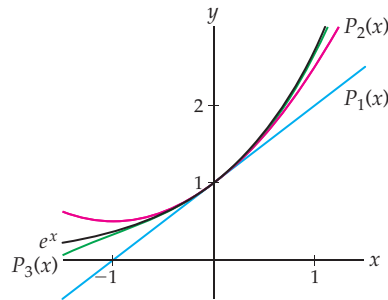

For any function  $f$  with a derivative of order 3 at  $x = 0$ , the first three Maclaurin polynomials are  $P_1(x) = f(0) + f'(0)x$ ,  $P_2(x) = f(0) + f'(0)x + \frac{f''(0)}{2!}x^2$ , and

$$P_3(x) = f(0) + f'(0)x + \frac{f''(0)}{2!}x^2 + \frac{f'''(0)}{3!}x^3.$$

Since every derivative of  $f(x) = e^x$  is  $e^x$ , we have  $f^{(k)}(0) = 1$  for every nonnegative integer  $k$ . Therefore the first, second, and third Maclaurin polynomials for  $e^x$  are

$$P_1(x) = 1 + x, \quad P_2(x) = 1 + x + \frac{1}{2}x^2 \quad \text{and} \quad P_3(x) = 1 + x + \frac{1}{2}x^2 + \frac{1}{6}x^3.$$

Following are the graphs:

□

### EXAMPLE 2

#### Finding the Maclaurin series for $e^x$

Find the Maclaurin series for the exponential function  $e^x$ , and find the interval of convergence for the series.

#### SOLUTION

In order to have a Maclaurin series, a function  $f$  must have a derivative of every order at  $x = 0$ . When this is the case, the Maclaurin series for  $f$  is given by  $\sum_{k=0}^{\infty} \frac{f^{(k)}(0)}{k!} x^k$ . We now

build upon the work we started in Example 1. As we mentioned, when  $f(x) = e^x$ ,  $f^{(k)}(0) = 1$  for every nonnegative integer  $k$ . Thus, the Maclaurin series for  $e^x$  is  $\sum_{k=0}^{\infty} \frac{1}{k!} x^k$ .

To find the interval of convergence of the series, we use the ratio test for absolute convergence, with  $b_k = \frac{1}{k!} x^k$  and  $b_{k+1} = \frac{1}{(k+1)!} x^{k+1}$ :

$$\begin{aligned} \lim_{k \rightarrow \infty} \left| \frac{b_{k+1}}{b_k} \right| &= \lim_{k \rightarrow \infty} \left| \frac{x^{k+1}/(k+1)!}{x^k/k!} \right| && \leftarrow \text{the ratio test for absolute convergence} \\ &= \lim_{k \rightarrow \infty} |x| \frac{k!}{(k+1)!} && \leftarrow \text{algebraic simplification of the quotient} \\ &= \lim_{k \rightarrow \infty} |x| \frac{1}{k+1} && \leftarrow \text{reduction of the factorials} \\ &= 0. && \leftarrow \text{evaluation of the limit} \end{aligned}$$

Since the limit is zero for every value of  $x$ , the series has an infinite radius of convergence and the interval of convergence is  $\mathbb{R}$ .  $\square$

### EXAMPLE 3 Finding Taylor series for $\ln x$ at $x = 2$

Find the Taylor series for  $\ln x$  at  $x = 2$  and the interval of convergence for the series. Also, graph the Taylor polynomials of degrees 1, 2, and 3 for  $\ln x$  at  $x = 2$ .

#### SOLUTION

Since  $f(x) = \ln x$  has derivatives of every order at every point in its domain, a Taylor series may be constructed for every  $x > 0$ . At  $x = 2$  the Taylor series is given by  $\sum_{k=0}^{\infty} \frac{f^{(k)}(2)}{k!} (x-2)^k$ .

To complete the series, we need to find the general form of the  $k$ th derivative of  $\ln x$  at  $x = 2$ . Toward that end, we construct the following table:

$k$	$f^{(k)}(x)$	$f^{(k)}(2)$	$\frac{f^{(k)}(2)}{k!}$
0	$\ln x$	$\ln 2$	$\ln 2$
1	$\frac{1}{x}$	$\frac{1}{2}$	$\frac{1}{2}$
2	$-\frac{1}{x^2}$	$-\frac{1}{2^2}$	$-\frac{1}{2 \cdot 2^2}$
3	$\frac{2}{x^3}$	$\frac{2}{2^3}$	$\frac{2}{3!2^3}$
4	$-\frac{3!}{x^4}$	$-\frac{3!}{2^4}$	$-\frac{3!}{4!2^4}$
$\vdots$	$\vdots$	$\vdots$	$\vdots$
$k$	$(-1)^{k-1} \frac{(k-1)!}{x^k}$	$(-1)^{k-1} \frac{(k-1)!}{2^k}$	$(-1)^{k-1} \frac{(k-1)!}{k!2^k} = (-1)^{k-1} \frac{1}{k2^k}$

(To be thorough, we should use the principle of mathematical induction to prove that

$$\frac{d^k}{dx^k} (\ln x) = (-1)^{k-1} \frac{(k-1)!}{x^k}.$$

We leave this step for Exercise 69.) Using the information in the table, we see that the Taylor series for  $\ln x$  at  $x = 2$  is

$$\sum_{k=0}^{\infty} \frac{f^{(k)}(2)}{k!} (x-2)^k = \ln 2 + \sum_{k=1}^{\infty} \frac{(-1)^{k-1}(k-1)!/2^k}{k!} (x-2)^k = \ln 2 + \sum_{k=1}^{\infty} \frac{(-1)^{k-1}}{k2^k} (x-2)^k.$$

Note that the “zeroth” derivative does not fall into the same pattern as every other derivative. Therefore, we split that term,  $\ln 2$ , off from the summation of the rest of the terms.

To find the interval of convergence for this series, we let

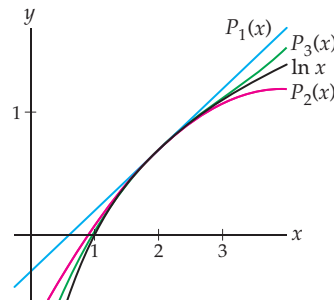

$$b_k = \frac{(-1)^{k-1}}{k2^k} (x-2)^k \quad \text{and} \quad b_{k+1} = \frac{(-1)^k}{(k+1)2^{k+1}} (x-2)^{k+1}$$

and evaluate

$$\begin{aligned} \lim_{k \rightarrow \infty} \left| \frac{b_{k+1}}{b_k} \right| &= \lim_{k \rightarrow \infty} \left| \frac{(-1)^k (x-2)^{k+1} / ((k+1)2^{k+1})}{(-1)^{k-1} (x-2)^k / (k2^k)} \right| && \leftarrow \text{ratio test for absolute convergence} \\ &= \lim_{k \rightarrow \infty} |x-2| \frac{k2^k}{(k+1)2^{k+1}} && \leftarrow \text{algebraic simplification of the quotient} \\ &= \lim_{k \rightarrow \infty} |x-2| \frac{k}{2(k+1)} && \leftarrow \text{reduction} \\ &= \frac{1}{2} |x-2|. && \leftarrow \text{evaluation of the limit} \end{aligned}$$

By the ratio test for absolute convergence, the series will converge absolutely when  $\frac{1}{2}|x-2| < 1$  or, equivalently, when  $|x-2| < 2$ . The radius of convergence is 2, and the series converges absolutely for  $0 < x < 4$ . In Exercise 3 you will show that the series diverges when  $x = 0$  and converges conditionally when  $x = 4$ . Thus, the interval of convergence for this series is  $(0, 4]$ .

Finally, in the following figure, we graph the natural logarithm function along with the Taylor polynomials  $P_1(x) = \ln 2 + \frac{1}{2}(x-2)$ ,  $P_2(x) = \ln 2 + \frac{1}{2}(x-2) - \frac{1}{8}(x-2)^2$ , and  $P_3(x) = \ln 2 + \frac{1}{2}(x-2) - \frac{1}{8}(x-2)^2 + \frac{1}{24}(x-2)^3$ :

□

#### EXAMPLE 4

#### Constructing binomial series

For a nonzero constant  $p$ , the Maclaurin series for  $(1+x)^p$  is called the **binomial series**. Show that the binomial series is given by  $\sum_{k=0}^{\infty} \binom{p}{k} x^k$ , where

$$\binom{p}{k} = \begin{cases} \frac{p(p-1)(p-2)\cdots(p-k+1)}{k!}, & \text{if } k > 0 \\ 1, & \text{if } k = 0. \end{cases}$$

**SOLUTION**

Let  $f(x) = (1+x)^p$ . We begin by constructing the following table:

$k$	$f^{(k)}(x)$	$f^{(k)}(0)$
0	$(1+x)^p$	1
1	$p(1+x)^{p-1}$	$p$
2	$p(p-1)(1+x)^{p-2}$	$p(p-1)$
3	$p(p-1)(p-2)(1+x)^{p-3}$	$p(p-1)(p-2)$
$\vdots$	$\vdots$	$\vdots$
$k$	$p(p-1)(p-2)\cdots(p-k+1)(1+x)^{p-k}$	$p(p-1)(p-2)\cdots(p-k+1)$

Using the information in this table, we see that the Maclaurin series for  $(1+x)^p$  is

$$1 + px + \frac{p(p-1)}{2!}x^2 + \frac{p(p-1)(p-2)}{3!}x^3 + \cdots + \frac{p(p-1)(p-2)\cdots(p-k+1)}{k!}x^k + \cdots$$

We define the **binomial coefficient**  $\binom{p}{k}$  by

$$\binom{p}{k} = \begin{cases} \frac{p(p-1)(p-2)\cdots(p-k+1)}{k!}, & \text{if } k > 0 \\ 1, & \text{if } k = 0. \end{cases}$$

The binomial coefficients  $\binom{p}{k}$  just defined are generalizations of the binomial coefficients you may have previously studied, for the case where  $p$  is a nonnegative integer and  $p \geq k$ . For example, if  $p = 3$ , then

$$\binom{3}{0} = 1, \quad \binom{3}{1} = \frac{3}{1} = 3, \quad \binom{3}{2} = \frac{3 \cdot 2}{2!} = 3, \quad \binom{3}{3} = \frac{3 \cdot 2 \cdot 1}{3!} = 1.$$

Note that  $\binom{3}{k} = 0$  for all integers  $k > 3$ , since the numerator of  $\binom{3}{k}$  would contain a factor of 0. Thus, here we would have the binomial series  $(1+x)^3 = 1 + 3x + 3x^2 + x^3$ , as expected.

In Exercise 58 we ask you to find the interval of convergence for binomial series. □

**EXAMPLE 5****Constructing the binomial series for  $\sqrt{1+x}$** 

Use the result from Example 4 to find the binomial series for  $f(x) = \sqrt{1+x}$ .

**SOLUTION**

We have  $f(x) = (1+x)^{1/2}$ . Thus,

$$\begin{aligned} \sqrt{1+x} &= \sum_{k=0}^{\infty} \binom{1/2}{k} x^k \\ &= 1 + \frac{1}{2}x + \frac{\frac{1}{2}\left(-\frac{1}{2}\right)}{2!}x^2 + \frac{\frac{1}{2}\left(-\frac{1}{2}\right)\left(-\frac{3}{2}\right)}{3!}x^3 + \frac{\frac{1}{2}\left(-\frac{1}{2}\right)\left(-\frac{3}{2}\right)\left(-\frac{5}{2}\right)}{4!}x^4 + \cdots \\ &= 1 + \frac{1}{2}x - \frac{1}{8}x^2 + \frac{1}{16}x^3 - \frac{5}{128}x^4 + \cdots \end{aligned}$$

□

## TEST YOUR UNDERSTANDING

- ▶ What is a Maclaurin polynomial and what is a Taylor polynomial? What is the difference between a Maclaurin polynomial and a Taylor polynomial?
- ▶ What is the relationship between the tangent line to a function  $f$  at  $x = x_0$  and a Taylor polynomial for  $f$  at  $x = x_0$ ?
- ▶ What is a Maclaurin series and what is a Taylor series? What is the difference between a Maclaurin series and a Taylor series?
- ▶ What is the relationship between a Maclaurin polynomial of degree  $n$  for a function  $f$  and the Maclaurin series for  $f$ ?
- ▶ What is the relationship between a Taylor polynomial of degree  $n$  for a function  $f$  at  $x = x_0$  and the Taylor series for  $f$  at  $x = x_0$ ?

## EXERCISES 8.2

### Thinking Back

- ▶ *Polynomials:* What is a polynomial? What is the domain of every polynomial function?
- ▶ *Derivatives and linear approximations:* If a function  $f$  is differentiable at the point  $x_0$ , what is the equation of the line tangent to the graph of  $f$  at  $x_0$ ? Why is this line a good approximation for  $f$  near  $x_0$ ?

### Concepts

0. *Problem Zero:* Read the section and make your own summary of the material.
1. *True/False:* Determine whether each of the statements that follow is true or false. If a statement is true, explain why. If a statement is false, provide a counterexample.
  - (a) *True or False:* If a function  $f$  is differentiable at 0, then  $f$  has a first-order Maclaurin polynomial.
  - (b) *True or False:* If a function  $f$  has derivatives of every order at  $x = 5$ , then  $f$  has a Taylor series at  $x = 5$ .
  - (c) *True or False:* The first-order Maclaurin polynomial for  $f(x) = |x|$  is  $P_1(x) = x$ .
  - (d) *True or False:* If a function  $f$  has a Taylor polynomial of order  $n$  at  $x = 3$ , then  $f$  has a Taylor polynomial of order  $k$  at  $x = 3$  for every  $k < n$ .
  - (e) *True or False:* If a function  $f$  has an  $n$ th-order Taylor polynomial  $P_n(x)$  at  $x = \pi$ , then  $f^{(n)}(\pi) = P_n(\pi)$ .
  - (f) *True or False:* If a function  $f$  has a Maclaurin series, then  $f$  has derivatives of every order at every point in its domain.
  - (g) *True or False:* If a function  $f$  has a Taylor series at a point  $x_0$ , then  $f$  has derivatives of every order at  $x_0$ .
  - (h) *True or False:* If a function  $f$  has a Taylor series at a every point in its domain, then  $f$  has a Maclaurin series.
2. *Examples:* Construct examples of the thing(s) described in the following. Try to find examples that are different than any in the reading.
  - (a) A function with a Maclaurin polynomial of order 3.
  - (b) A function with domain  $\mathbb{R}$  without a Maclaurin polynomial.
  - (c) A function with a Taylor series for every  $x_0 \in \mathbb{R}$ .
3. Show that the series
 
$$\ln 2 + \sum_{k=1}^{\infty} \frac{(-1)^{k-1}}{k2^k} (x-2)^k$$
 from Example 3 diverges when  $x = 0$  and converges conditionally when  $x = 4$ .
  4. What is a Taylor polynomial for a function  $f$  at a point  $x_0$ ?
  5. Let  $f$  be a twice-differentiable function at a point  $x_0$ . Using the words *value*, *slope*, and *concavity*, explain why the second Taylor polynomial  $P_2(x)$  might be a good approximation for  $f$  close to  $x_0$ .
  6. Let  $f$  be a twice-differentiable function at a point  $x_0$ . Explain why the sum
 
$$f(x) + f'(x)(x-x_0) + \frac{f''(x)}{2}(x-x_0)^2$$
 is *not* the second-order Taylor polynomial for  $f$  at  $x_0$ .
  7. What is a difference between the Maclaurin polynomial of order  $n$  and the Taylor polynomial of order  $n$  for a function  $f$ ?
  8. What is a difference between a Maclaurin polynomial and the Maclaurin series for a function  $f$ ?
  9. What is a difference between a Taylor polynomial and the Taylor series for a function  $f$  at a point  $x_0$ ?
  10. What is the relationship between a Maclaurin series and a power series in  $x$ ?
  11. If a function  $f$  has a Maclaurin series, what are the possibilities for the interval of convergence for that series?
  12. If a function  $f$  has a Taylor series at  $x_0$ , what are the possibilities for the interval of convergence for that series?

13. Let  $f(x) = 3x^2 - 2x + 5$ . Find the first-, second-, and third-order Maclaurin polynomials,  $P_1(x)$ ,  $P_2(x)$ , and  $P_3(x)$ , for  $f$ . Explain why  $f(x) = P_2(x) = P_3(x)$ . Graph  $f(x)$ ,  $P_1(x)$ , and  $P_2(x)$ .
14. Let  $f(x) = 4x^3 - 5x^2 - 6x + 7$ . Find the first- through fourth-order Maclaurin polynomials,  $P_1(x)$ ,  $P_2(x)$ ,  $P_3(x)$ , and  $P_4(x)$ , for  $f$ . Explain why  $f(x) = P_3(x) = P_4(x)$ . Graph  $f(x)$ ,  $P_1(x)$ ,  $P_2(x)$ , and  $P_3(x)$ .
15. Let  $f(x) = 3x^2 - 2x + 5$ . Find the first-, second-, and third-order Taylor polynomials,  $P_1(x)$ ,  $P_2(x)$ , and  $P_3(x)$ , for  $f$  at 1. Explain why  $f(x) = P_2(x) = P_3(x)$ .
16. Let  $f(x) = 4x^3 - 5x^2 - 6x + 7$ . Find the first- through fourth-order Taylor polynomials,  $P_1(x)$ ,  $P_2(x)$ ,  $P_3(x)$ , and  $P_4(x)$ , for  $f$  at 1. Explain why  $f(x) = P_3(x) = P_4(x)$ .
17. Let  $f(x) = ax^3 + bx^2 + cx + d$ , where  $a$ ,  $b$ ,  $c$ , and  $d$  are constants. Find the first- through fourth-order Taylor polynomials,  $P_1(x)$ ,  $P_2(x)$ ,  $P_3(x)$ , and  $P_4(x)$ , for  $f$  at  $x_0$ . Explain why  $f(x) = P_3(x) = P_4(x)$ .
18. Let  $f(x)$  be an  $n$ th-degree polynomial function.
- Explain why  $f$  has a Taylor series for every value of  $x_0$ .
  - Explain why  $P_m(x)$ , the  $m$ th-order Taylor polynomial for  $f$  at  $x_0$ , equals  $f(x)$  for every integer  $m \geq n$ .
19. Let  $f(x) = x^{7/3}$ .
- Find  $P_1(x)$  and  $P_2(x)$ , the Maclaurin polynomials of orders 1 and 2 for  $f$ . Graph  $f(x)$  together with  $P_1(x)$  and  $P_2(x)$ .
  - Explain why  $f$  does *not* have a Maclaurin polynomial of order 3.
20. Use the ideas in Exercise 19 to find a function that has a Maclaurin polynomial of order 3 but does not have a Maclaurin polynomial of order 4. Find a function  $f$  such that  $f$  has a Maclaurin polynomial of order  $n$  but does not have a Maclaurin polynomial of order  $n + 1$ .

## Skills

In Exercises 21–30 find the fourth Maclaurin polynomial  $P_4(x)$  for the specified function.

- |                    |                           |
|--------------------|---------------------------|
| 21. $\cos x$       | 22. $e^x$                 |
| 23. $\sin x$       | 24. $\ln(1 + x)$          |
| 25. $\cos 2x$      | 26. $\sin 3x$             |
| 27. $\sqrt{1 - x}$ | 28. $\frac{1 + x}{1 - x}$ |
| 29. $x \sin x$     | 30. $x^2 e^x$             |

In Exercises 31–40 find the Maclaurin series for the specified function. Note: These are the same functions as in Exercises 21–30.

- |                    |                           |
|--------------------|---------------------------|
| 31. $\cos x$       | 32. $e^x$                 |
| 33. $\sin x$       | 34. $\ln(1 + x)$          |
| 35. $\cos 2x$      | 36. $\sin 3x$             |
| 37. $\sqrt{1 - x}$ | 38. $\frac{1 + x}{1 - x}$ |
| 39. $x \sin x$     | 40. $x^2 e^x$             |

In Exercises 41–48 find the fourth Taylor polynomial  $P_4(x)$  for the specified function and the given value of  $x_0$ .

- |                              |                              |
|------------------------------|------------------------------|
| 41. $\cos x, \frac{\pi}{2}$  | 42. $e^x, 1$                 |
| 43. $\sin x, \pi$            | 44. $\sqrt{x}, 1$            |
| 45. $\ln x, 3$               | 46. $\sqrt[3]{x}, 1$         |
| 47. $\cos 2x, \frac{\pi}{4}$ | 48. $\sin 3x, \frac{\pi}{6}$ |

In Exercises 49–56 find the Taylor series for the specified function and the given value of  $x_0$ . Note: These are the same functions and values as in Exercises 41–48.

- |                              |                              |
|------------------------------|------------------------------|
| 49. $\cos x, \frac{\pi}{2}$  | 50. $e^x, 1$                 |
| 51. $\sin x, \pi$            | 52. $\sqrt{x}, 1$            |
| 53. $\ln x, 3$               | 54. $\sqrt[3]{x}, 1$         |
| 55. $\cos 2x, \frac{\pi}{4}$ | 56. $\sin 3x, \frac{\pi}{6}$ |

Exercises 57–62 concern the binomial series discussed in Example 4. In Exercises 59–62 use the binomial series to find the Maclaurin series for the given function.

57. Show that if  $p$  is a positive integer, then the binomial series for  $f(x) = (1 + x)^p$  is a polynomial.
58. Show that the radius of convergence for the binomial series is 1 when  $p$  is not a positive integer. What is the radius of convergence when  $p$  is a positive integer? (*Hint: Consider Exercise 57.*)
- |                              |                           |
|------------------------------|---------------------------|
| 59. $\sqrt[3]{1 + x}$        | 60. $\frac{1}{(1 + x)^2}$ |
| 61. $\frac{1}{\sqrt{1 + x}}$ | 62. $(1 + x)^{2/3}$       |
63. Let  $f(x) = \begin{cases} 0, & \text{if } x = 0 \\ e^{-1/x^2}, & \text{if } x \neq 0 \end{cases}$
- Use the definition of the derivative at a point to show that  $f$  has derivatives of all orders at  $x = 0$ .
  - Show that  $f^{(k)}(0) = 0$  for every nonnegative integer  $k$ .
  - What is the Maclaurin series for  $f$ ?
  - Explain why the Maclaurin series does not converge to  $f(x)$ .

## Applications

The second-order differential equation

$$x^2y'' + xy' + (x^2 - p^2)y = 0,$$

where  $p$  is a nonnegative integer, arises in many applications in physics and engineering, including one model for the vibration of a beaten drum. The solution of the differential equation is called the **Bessel function of order  $p$** , denoted by  $J_p(x)$ . It may be shown that  $J_p(x)$  is given by the following power series in  $x$ :

$$J_p(x) = \sum_{k=0}^{\infty} \frac{(-1)^k}{k!(k+p)!2^{2k+p}} x^{2k+p}.$$

Exercises 64–68 concern these Bessel functions.

64. What is the interval of convergence for  $J_0(x)$ ?
65. Find and graph the first four terms in the sequence of partial sums of  $J_0(x)$ .
66. What is the interval of convergence for  $J_1(x)$ ?
67. Graph the first four terms in the sequence of partial sums of  $J_1(x)$ .
68. What is the interval of convergence for  $J_p(x)$  where  $p$  is a nonnegative integer?

## Proofs

69. Use the principle of mathematical induction to prove that  $\frac{d^k}{dx^k}(\ln x) = (-1)^{k-1} \frac{(k-1)!}{x^k}$ , for  $k \geq 1$ .
70. Let  $f$  be a function with an  $n$ th-order derivative at a point  $x_0$ , and let  $P_n(x) = \sum_{k=0}^n \frac{f^{(k)}(x_0)}{k!} (x - x_0)^k$ . Prove that  $f^{(k)}(x_0) = P_n^{(k)}(x_0)$  for every nonnegative integer  $k \leq n$ .

## Thinking Forward

- ▶ *Graphing differences:* Let  $P_1(x)$ ,  $P_2(x)$ , and  $P_3(x)$  be the first three Maclaurin polynomials for the function  $e^x$ . Make separate graphs of the functions  $e^x - P_1(x)$ ,  $e^x - P_2(x)$ , and  $e^x - P_3(x)$  on the interval  $[-2, 2]$ . What do you observe? In particular, for each of these functions, for what values of  $x$  is the graph of the function within 0.1 of the  $x$ -axis?
- ▶ *Graphing more differences:* Let  $P_1(x)$ ,  $P_2(x)$ , and  $P_3(x)$  be the first three Maclaurin polynomials for the function  $\ln(1+x)$ . (*Hint: You may use your answer from Exercise 24 to construct these polynomials.*) Make separate graphs of the functions  $\ln(1+x) - P_1(x)$ ,  $\ln(1+x) - P_2(x)$ , and  $\ln(1+x) - P_3(x)$  on the interval  $(-1, 3)$ . What do you observe? In particular, for each of these functions, for what values of  $x$  is the graph of the function within 0.1 of the  $x$ -axis?

## 8.3 CONVERGENCE OF POWER SERIES

- ▶ The remainder of a power series
- ▶ Taylor's Theorem and Lagrange's form for the remainder
- ▶ Algebraic manipulations of power series

### The Remainder

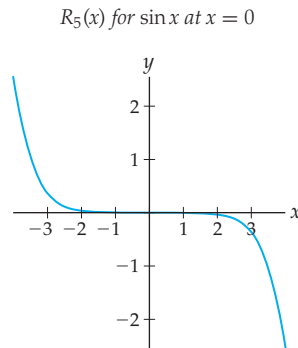

In Section 7.4 we defined the remainder of a convergent series of constants to be the difference of the sum  $L$  of the series and a term  $s_n$  from the sequence of partial sums. The remainder measures the error incurred in using  $s_n$  to approximate  $L$ . We now define the analogous concept for Taylor series and Maclaurin series.

#### DEFINITION 8.8 The Remainder of a Function

Let  $f$  be a function with an  $n$ th-order derivative at every point on an open interval containing the point  $x_0$ , and let  $P_n(x) = \sum_{k=0}^n \frac{f^{(k)}(x_0)}{k!} (x - x_0)^k$ , the  $n$ th Taylor polynomial for  $f$  at  $x_0$ . We define the  $n$ th **remainder** for  $f$ , denoted by  $R_n(x)$ , to be

$$R_n(x) = f(x) - P_n(x).$$

The remainder measures the error incurred in using the Taylor polynomial,  $P_n(x)$ , to approximate the function  $f(x)$ . As the notation implies, the remainder is a function of  $x$ . By the definition of the Taylor polynomial at  $x = x_0$ , the remainder will always be zero at  $x_0$  and generally is greater the farther  $x$  is from the point  $x_0$ . For example, we have seen that the fifth Maclaurin polynomial for the sine function is  $P_5(x) = x - \frac{x^3}{3!} + \frac{x^5}{5!}$ . Therefore, the fifth remainder for the sine function at  $x = 0$  is  $R_5(x) = \sin x - \left(x - \frac{x^3}{3!} + \frac{x^5}{5!}\right)$ , shown next:

Since the remainder is very close to zero on the interval  $(-1.5, 1.5)$ ,  $P_5(x)$  is an excellent approximation for the sine function on that interval.

We wish to understand the behavior of  $R_n(x)$  as  $n \rightarrow \infty$ . If  $\lim_{n \rightarrow \infty} R_n(x) = 0$  on some interval  $I$ , then the Taylor polynomials become better approximations for the function  $f$  as we include terms of higher degree, and, furthermore, the Taylor series is an alternative representation for  $f$  on the interval  $I$ . We will see that a Taylor series may converge to the function that generated it for every real number, converge to the function on a finite interval centered around the point  $x = x_0$ , or converge only at the point  $x_0$ . To see this, we need a tool to analyze the remainder.

## THEOREM 8.9

### Taylor's Theorem

Let  $f$  be a function that can be differentiated  $n + 1$  times in some open interval  $I$  containing the point  $x_0$ , and let  $R_n(x)$  be the  $n$ th remainder for  $f$  at  $x = x_0$ . The  $n$ th remainder for  $f$  is given by

$$R_n(x) = \int_{x_0}^x \frac{(x-t)^n}{n!} f^{(n+1)}(t) dt.$$

**Proof.** By the Fundamental Theorem of Calculus, we have

$$\int_{x_0}^x f'(t) dt = f(x) - f(x_0).$$

The bulk of our proof of Theorem 8.9 comes from repeatedly applying integration by parts to integrals derived from this equation. Using integration by parts on the integral, with  $u = f'(t)$  and  $dv = dt$ , we have  $du = f''(t) dt$  and may let  $v = t - x$ . (Our variable here is  $t$ . Think of  $x$  as a constant of integration.) We obtain

$$\begin{aligned} \int_{x_0}^x f'(t) dt &= f'(t)(t-x)|_{x_0}^x - \int_{x_0}^x (t-x)f''(t) dt \\ &= f'(x_0)(x-x_0) + \int_{x_0}^x (x-t)f''(t) dt. \end{aligned}$$

We apply integration by parts again, this time to the integral we just obtained with  $u = f''(t)$  and  $dv = (x - t) dt$ . Then  $du = f'''(t) dt$  and  $v = -\frac{(x-t)^2}{2}$ . (Remember that our variable is  $t$ .) Thus,

$$\begin{aligned}\int_{x_0}^x (x - x_0)f''(t) dt &= \left[ -f''(t) \frac{(x-t)^2}{2} \right]_{x_0}^x + \int_{x_0}^x \frac{(x-t)^2}{2} f'''(t) dt \\ &= \frac{f''(x_0)}{2}(x-x_0)^2 + \int_{x_0}^x \frac{(x-t)^2}{2} f'''(t) dt.\end{aligned}$$

We now combine the preceding equations to obtain

$$f(x) = f(x_0) + f'(x_0)(x - x_0) + \frac{f''(x_0)}{2}(x - x_0)^2 + \int_{x_0}^x \frac{(x-t)^2}{2} f'''(t) dt.$$

In Exercise 87 you will use the principle of mathematical induction to prove that

$$\begin{aligned}f(x) &= f(x_0) + f'(x_0)(x - x_0) + \frac{f''(x_0)}{2}(x - x_0)^2 + \dots \\ &\quad + \frac{f^{(n)}(x_0)}{n!}(x - x_0)^n + \int_{x_0}^x \frac{(x-t)^n}{n!} f^{(n+1)}(t) dt \\ &= P_n(x) + \int_{x_0}^x \frac{(x-t)^n}{n!} f^{(n+1)}(t) dt.\end{aligned}$$

If we now compare this with our definition of  $R_n(x)$ , we have our result. ■

Unfortunately, it is usually difficult to analyze the remainder by using the integral in Theorem 8.9. Instead, the next theorem gives us a more useful tool for understanding the remainder.

### THEOREM 8.10

#### Lagrange's Form for the Remainder

Let  $f$  be a function that can be differentiated  $n + 1$  times in some open interval  $I$  containing the point  $x_0$ , and let  $R_n(x)$  be the  $n$ th remainder for  $f$  at  $x = x_0$ . For each point  $x \in I$ , there is at least one  $c$  between  $x_0$  and  $x$  such that

$$R_n(x) = \frac{f^{(n+1)}(c)}{(n+1)!} (x - x_0)^{n+1}.$$

Theorem 8.10 follows from Theorem 8.9 and Theorem 4.31 of Section 4.6. We ask you to prove Theorem 8.10 in Exercise 88.

We now use Theorem 8.10 to prove that the sine function and its Maclaurin series are identical for every real number; that is,

$$\sin x = \sum_{k=0}^{\infty} \frac{(-1)^k}{(2k+1)!} x^{2k+1}.$$

We let  $f(x) = \sin x$ . We know that for every  $n \geq 0$ ,  $f^{(n+1)}(x)$  is one of the four functions  $\pm \sin x$  and  $\pm \cos x$ . For any of these functions,  $|f^{(n+1)}(c)| \leq 1$  for every value of  $x$ , so, using Lagrange's form for the remainder, we have

$$|R_n(x)| = \left| \frac{f^{(n+1)}(c)}{(n+1)!} x^{n+1} \right| \leq \frac{|x|^{n+1}}{(n+1)!}.$$

We now show that  $\lim_{n \rightarrow \infty} |R_n(x)| = 0$  for every value of  $x$ . Note that we are taking the limit as  $n \rightarrow \infty$ , so we may regard  $x$  as being fixed. Previously we proved that for every value of  $x$ ,  $\frac{|x|^n}{n!} \rightarrow 0$  as  $n \rightarrow \infty$ . Therefore by the Squeeze Theorem,  $\lim_{n \rightarrow \infty} |R_n(x)| = 0$ , which implies that  $\lim_{n \rightarrow \infty} R_n(x) = 0$ . Since  $\lim_{n \rightarrow \infty} R_n(x) = 0$  for every value of  $x$ , the sine function is equal to its Maclaurin series.

There are several important Maclaurin series that we will be using regularly. All of these series are summarized in the following table:

Function	Series	Interval of Convergence
$\sin x$	$\sum_{k=0}^{\infty} \frac{(-1)^k}{(2k+1)!} x^{2k+1}$	$\mathbb{R}$
$\cos x$	$\sum_{k=0}^{\infty} \frac{(-1)^k}{(2k)!} x^{2k}$	$\mathbb{R}$
$e^x$	$\sum_{k=0}^{\infty} \frac{1}{k!} x^k$	$\mathbb{R}$
$\frac{1}{1-x}$	$\sum_{k=0}^{\infty} x^k$	$(-1, 1)$
$\ln(1+x)$	$\sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{k} x^k$	$(-1, 1]$
$\tan^{-1} x$	$\sum_{k=0}^{\infty} \frac{(-1)^k}{2k+1} x^{2k+1}$	$[-1, 1]$
$\cosh x$	$\sum_{k=0}^{\infty} \frac{1}{(2k)!} x^{2k}$	$\mathbb{R}$
$\sinh x$	$\sum_{k=0}^{\infty} \frac{1}{(2k+1)!} x^{2k+1}$	$\mathbb{R}$

We have already proven that the sine function and its Maclaurin series are equal for every value of  $x$  and that the function  $\frac{1}{1-x}$  and its Maclaurin series are equal on the interval  $(-1, 1)$ . In Exercise 89 you will prove that cosine and its Maclaurin series are equal for every  $x$ . We will prove that  $e^x$  and its Maclaurin series are equal in Example 1. We derive the Maclaurin series for the hyperbolic cosine in Example 2 and leave the derivation of the hyperbolic sine function to Exercise 91. The convergence of the remaining two series in this table is proven in Section 8.4.

## Basic Manipulations of Maclaurin Series

In this subsection we will discuss three methods for obtaining a new Taylor series from known series relatively quickly: substitution, multiplication by a monomial, and the multiplication of two series. Given a function  $f$  that has derivatives of all orders at a point  $x_0$ , Definition 8.7 provides the pattern for constructing the Taylor series for the function. To form the series, we compute  $f^{(k)}(x)$  for every  $k$  and then evaluate  $f^{(k)}(x_0)$ . Unfortunately, finding higher order derivatives even for a relatively simple function can become quite complicated. For example, think about constructing the Maclaurin series for  $f(x) = \sin(x^2)$ . Since the sine function and  $x^2$  both have derivatives of all orders everywhere, the composition function has derivatives of all orders at  $x = 0$ . We need to find a pattern for the

derivatives of  $f$ . When we start taking the derivatives, we find that

$$f'(x) = 2x \cos(x^2), f''(x) = 2 \cos(x^2) - 4x^2 \sin(x^2), f'''(x) = -12x \sin(x^2) - 8x^3 \cos(x^2), \dots$$

Certainly, a pattern is developing, but the derivatives become increasingly unwieldy with increasing order. Fortunately, there is a simpler way to find the Maclaurin series for this function. We have already shown that  $\sin x = \sum_{k=0}^{\infty} \frac{(-1)^k}{(2k+1)!} x^{2k+1}$  and that this series converges for every real number. To construct the Maclaurin series for  $\sin(x^2)$ , all we have to do is substitute  $x^2$  for each occurrence of  $x$  in the Maclaurin series for the sine. That is, since

$$\sin x = \sum_{k=0}^{\infty} \frac{(-1)^k}{(2k+1)!} x^{2k+1}$$

the Maclaurin series for  $\sin(x^2)$  is

$$\sin(x^2) = \sum_{k=0}^{\infty} \frac{(-1)^k}{(2k+1)!} (x^2)^{2k+1} = \sum_{k=0}^{\infty} \frac{(-1)^k}{(2k+1)!} x^{4k+2}.$$

That was fast! Because the Maclaurin series for the sine converges for every real number, this new series will also converge for all real numbers.

More generally, given the Maclaurin series for a function  $f$ ,  $\sum_{k=0}^{\infty} \frac{f^{(k)}(0)}{k!} x^k$ , and a monomial  $cx^m$ , where  $c \in \mathbb{R}$  and  $m \in \mathbb{Z}^+$  we have the Maclaurin series for  $f(cx^m)$ ,

$$\sum_{k=0}^{\infty} \frac{f^{(k)}(0)}{k!} (cx^m)^k = \sum_{k=0}^{\infty} \frac{f^{(k)}(0)}{k!} c^k x^{mk}.$$

If the Maclaurin series  $\sum_{k=0}^{\infty} \frac{f^{(k)}(0)}{k!} x^k$  converges for every real number, so will the new series  $\sum_{k=0}^{\infty} \frac{f^{(k)}(0)}{k!} c^k x^{mk}$ . If the Maclaurin series  $\sum_{k=0}^{\infty} \frac{f^{(k)}(0)}{k!} x^k$  converges for every real number in the interval defined by  $|x| < \rho$ , the new series will converge on the interval defined by the inequality  $|cx^m| < \rho$ , that is  $|x| < \sqrt[m]{\rho/|c|}$ .

Next, when we have a Maclaurin series for  $f(x)$  that converges on an interval  $I$ , we may also quickly find the Maclaurin series for  $cx^m f(x)$ , where  $c \in \mathbb{R}$  and  $m$  is a nonnegative integer. We already know that for a convergent series of constants,

$$c \sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} ca_k.$$

We may similarly multiply a Maclaurin series by the monomial  $cx^m$ . That is, when  $f(x) = \sum_{k=0}^{\infty} \frac{f^{(k)}(0)}{k!} x^k$  converges on some interval  $I$ , the Maclaurin series for  $cx^m f(x)$  is

$$cx^m f(x) = cx^m \sum_{k=0}^{\infty} \frac{f^{(k)}(0)}{k!} x^k = \sum_{k=0}^{\infty} c \frac{f^{(k)}(0)}{k!} x^{k+m},$$

with interval of convergence  $I$ .

For example, we may immediately find the Maclaurin series for  $\frac{x^3}{1-x}$ , since this function is just  $x^3 \cdot \frac{1}{1-x}$ . So

$$\frac{x^3}{1-x} = x^3 \sum_{k=0}^{\infty} x^k = \sum_{k=0}^{\infty} x^{k+3} = \sum_{k=3}^{\infty} x^k.$$

Make sure you understand each of the preceding steps. Multiplication by a nonzero monomial does not change the interval of convergence, so this new Maclaurin series converges to  $\frac{x^3}{1-x}$  on the interval  $(-1, 1)$ .

Finally, given two functions  $f$  and  $g$  with convergent Taylor series at  $x_0$ ,  $f(x) = \sum_{k=0}^{\infty} a_k(x-x_0)^k$  and  $g(x) = \sum_{k=0}^{\infty} b_k(x-x_0)^k$ , and with intervals of convergence  $I_1$  and  $I_2$ , respectively, we may form the Taylor series at  $x_0$  for the product function  $f \cdot g$  by multiplying the two known series. That is,

$$f(x)g(x) = \sum_{k=0}^{\infty} c_k(x-x_0)^k,$$

where

$$c_k = \sum_{m=0}^k a_m b_{k-m} = a_0 b_k + a_1 b_{k-1} + \cdots + a_{k-1} b_1 + a_k b_0.$$

The interval of convergence for the new series is  $I_1 \cap I_2$ . See Example 7.

## Examples and Explorations

### EXAMPLE 1

**Showing that the exponential function and its Maclaurin series are identical for every  $x$**

Use Lagrange's form for the remainder to prove that

$$e^x = \sum_{k=0}^{\infty} \frac{1}{k!} x^k$$

for every real number.

### SOLUTION

Lagrange's form for the remainder is  $R_n(x) = \frac{f^{(n+1)}(c)}{(n+1)!} (x-x_0)^{n+1}$ , where  $c$  is between  $x_0$  and  $x$ . Here, since  $f(x) = e^x$ , we have  $f^{(n+1)}(c) = e^c$  for every  $n \geq 0$ . Furthermore, since  $x_0 = 0$ , we also have  $e^c < e^{|x|}$ , so

$$|R_n(x)| = \left| \frac{e^c}{(n+1)!} x^{n+1} \right| \leq e^{|x|} \frac{|x|^{n+1}}{(n+1)!}.$$

We now take the limit

$$\lim_{n \rightarrow \infty} |R_n(x)| \leq \lim_{n \rightarrow \infty} e^{|x|} \frac{|x|^{n+1}}{(n+1)!} = 0.$$

The limit is zero because the quotient  $\frac{|x|^{n+1}}{(n+1)!} \rightarrow 0$  as  $n \rightarrow \infty$  and we are taking the limit with respect to  $n$ , not  $x$ . This limit implies that  $\lim_{n \rightarrow \infty} R_n(x) = 0$  as well. Thus, the Maclaurin series for the exponential function converges to  $e^x$  for every value of  $x$ .  $\square$

### EXAMPLE 2

**Deriving the Maclaurin series for the hyperbolic cosine**

Show that  $\cosh x = \sum_{k=0}^{\infty} \frac{1}{(2k)!} x^{2k}$ .

**SOLUTION**

We saw in Section 2.6 that  $\cosh x = \frac{e^x + e^{-x}}{2}$ . Since  $e^x = \sum_{k=0}^{\infty} \frac{1}{k!} x^k = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \frac{x^4}{4!} + \cdots$ , by substitution we have

$$e^{-x} = \sum_{k=0}^{\infty} \frac{1}{k!} (-x)^k = 1 - x + \frac{x^2}{2!} - \frac{x^3}{3!} + \frac{x^4}{4!} - \cdots.$$

When we add the series for  $e^x$  and  $e^{-x}$ , all of the terms with odd exponents sum to zero. That is,

$$e^x + e^{-x} = 2 + \frac{2x^2}{2!} + \frac{2x^4}{4!} + \frac{2x^6}{6!} + \cdots.$$

Dividing the resulting series by 2, we obtain the series

$$\cosh x = \sum_{k=0}^{\infty} \frac{1}{(2k)!} x^{2k}. \quad \square$$

**EXAMPLE 3****Evaluating Maclaurin series at points in their intervals of convergence**

Find the sums of the following series:

(a)  $\sum_{k=0}^{\infty} \frac{(-5)^k}{k!}$

(b)  $\sum_{k=2}^{\infty} \frac{(-1)^k \pi^{2k+1}}{(2k+1)!}$

**SOLUTION**

In Chapter 7 we would only have asked whether these series converge or diverge. Since both series involve factorials, the most obvious convergence tests to try would be the ratio test or the ratio test for absolute convergence. However, we do not have to use any convergence test to show that the series converge.

- (a) Note that the first series is the Maclaurin series for  $e^x$  when  $x = -5$ . Since the Maclaurin series for  $e^x$  converges for every value of  $x$ , we have  $\sum_{k=0}^{\infty} \frac{(-5)^k}{k!} = e^{-5}$ .
- (b) Similarly, the Maclaurin series for  $\sin x$  also converges for every value of  $x$ . The second series is almost the Maclaurin series for  $\sin x$  when  $x = \pi$ . Since

$$0 = \sin \pi = \sum_{k=0}^{\infty} \frac{(-1)^k \pi^{2k+1}}{(2k+1)!} = \pi - \frac{\pi^3}{3!} + \sum_{k=2}^{\infty} \frac{(-1)^k \pi^{2k+1}}{(2k+1)!},$$

we have

$$\sum_{k=2}^{\infty} \frac{(-1)^k \pi^{2k+1}}{(2k+1)!} = \frac{\pi^3}{6} - \pi. \quad \square$$

**EXAMPLE 4****Using the Maclaurin series for  $f(x)$  to find a Maclaurin series for  $f(cx^m)$** 

Use the Maclaurin series for  $f(x) = \frac{1}{1-x} = \sum_{k=0}^{\infty} x^k$  to find the Maclaurin series for the function  $\frac{1}{4+x^2}$  and find the interval of convergence for the series.

**SOLUTION**

We begin with a small algebraic manipulation. To be able to use the Maclaurin series for  $\frac{1}{1-x}$  to find a Maclaurin series for  $\frac{1}{4+x^2}$  we first rewrite this function in the form

$$\begin{aligned} \frac{1}{4+x^2} &= \frac{1}{4} \cdot \left( \frac{1}{1+(x/2)^2} \right) = \frac{1}{4} \cdot \left( \frac{1}{1-(-(x/2)^2)} \right) && \leftarrow \text{algebra} \\ &= \frac{1}{4} f(-(x/2)^2) && \leftarrow \text{substitution} \end{aligned}$$

Thus, if we substitute  $-\left(\frac{x}{2}\right)^2$  for  $x$  in the series for  $f(x) = \frac{1}{1-x}$  and multiply by  $\frac{1}{4}$ , we get our series for  $\frac{1}{4+x^2}$ . That is,

$$\frac{1}{4+x^2} = \frac{1}{4} \sum_{k=0}^{\infty} \left(-\left(\frac{x}{2}\right)^2\right)^k = \frac{1}{4} \sum_{k=0}^{\infty} \left(-\frac{1}{4}\right)^k x^{2k}.$$

To find the interval of convergence for this new series, we make the same substitution in the inequality that defines the interval of convergence for our original series. That is, we replace  $x$  by  $-\left(\frac{x}{2}\right)^2$  in the inequality  $|x| < 1$ . We obtain

$$\left|-\left(\frac{x}{2}\right)^2\right| < 1 \text{ or, equivalently, } x^2 < 4.$$

The solution of this inequality is  $|x| < 2$ . Therefore, the series for  $\frac{1}{4+x^2}$  converges to the function on the interval  $(-2, 2)$ .  $\square$

**EXAMPLE 5****Manipulating a known Maclaurin series to find a new Maclaurin series**

Find the Maclaurin series and its interval of convergence for  $f(x) = \frac{x^2}{27-x^3}$ .

**SOLUTION**

We know that the function  $\frac{1}{1-x}$  has the Maclaurin series  $\sum_{k=0}^{\infty} x^k$  with interval of convergence  $(-1, 1)$ . We rewrite the given function  $f(x)$  as

$$f(x) = \frac{x^2}{27-x^3} = \frac{x^2}{27} \cdot \left(\frac{1}{1-(x/3)^3}\right).$$

You should check that the algebra is correct. We may find the Maclaurin series for  $\frac{1}{1-(x/3)^3}$  by substituting  $\left(\frac{x}{3}\right)^3$  into the series  $\sum_{k=0}^{\infty} x^k$ . We obtain

$$\frac{1}{1-(x/3)^3} = \sum_{k=0}^{\infty} \left(\left(\frac{x}{3}\right)^3\right)^k = \sum_{k=0}^{\infty} \left(\frac{x}{3}\right)^{3k}.$$

This series will converge when

$$\left|\left(\frac{x}{3}\right)^3\right| < 1 \text{ or, equivalently, } |x| < 3.$$

To find the Maclaurin series for  $f(x)$ , we multiply the series we just found by  $\frac{x^2}{27}$ . Thus,

$$\frac{x^2}{27-x^3} = \frac{x^2}{27} \sum_{k=0}^{\infty} \left(\frac{x}{3}\right)^{3k} = \sum_{k=0}^{\infty} \frac{x^{3k+2}}{3^{3k+3}}.$$

Since multiplication by a monomial does not affect the interval of convergence, this series converges on the interval  $(-3, 3)$ .  $\square$

**EXAMPLE 6****Deriving a Taylor series from a Maclaurin series**

Find the Taylor series for  $f(x) = \sin(x - \pi)$  at  $\pi$ .

**SOLUTION**

First note that we could use Definition 8.7 to find the desired Taylor series. However, since we already know that  $\sin t = \sum_{k=0}^{\infty} \frac{(-1)^k}{(2k+1)!} t^{2k+1}$ , we may obtain the Taylor series by substituting  $x - \pi$  for  $t$  in both versions of the function. We have

$$\sin(x - \pi) = \sum_{k=0}^{\infty} \frac{(-1)^k}{(2k+1)!} (x - \pi)^{2k+1}.$$

Furthermore, because the interval of convergence for the Maclaurin series is  $\mathbb{R}$ , the interval of convergence for this Taylor series is also  $\mathbb{R}$ .  $\square$

**EXAMPLE 7****Multiplying two Maclaurin series**

Find the fourth Maclaurin polynomial,  $P_4(x)$ , for  $e^x \ln(1+x)$ .

**SOLUTION**

We know the Maclaurin series for both  $e^x$  and  $\ln(1+x)$ ; namely, these are:

$$e^x = \sum_{k=0}^{\infty} \frac{x^k}{k!} = 1 + x + \frac{x^2}{2} + \frac{x^3}{6} + \frac{x^4}{24} + \cdots \quad \text{and}$$

$$\ln(1+x) = \sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{k} x^k = x - \frac{x^2}{2} + \frac{x^3}{3} - \frac{x^4}{4} + \cdots$$

We build the series for  $e^x \ln(1+x)$  term by term, by multiplying the preceding two series together. The constant term of the new series will be the product of the constant terms of the series for  $e^x$  and  $\ln(1+x)$ . These constants are 1 and 0, respectively, so the new series has 0 as its constant term. The coefficient of the  $x$  term is

$$1 \cdot 1 + 1 \cdot 0 = 1.$$

The coefficient of the  $x^2$  term is

$$1 \cdot \left(-\frac{1}{2}\right) + 1 \cdot 1 + \frac{1}{2} \cdot 0 = \frac{1}{2}.$$

Similarly, the coefficient of the  $x^3$  term is

$$1 \cdot \frac{1}{3} + 1 \cdot \left(-\frac{1}{2}\right) + \frac{1}{2} \cdot 1 + \frac{1}{6} \cdot 0 = \frac{1}{3}.$$

Finally, the coefficient of the  $x^4$  term is

$$1 \cdot \left(-\frac{1}{4}\right) + 1 \cdot \frac{1}{3} + \frac{1}{2} \cdot \left(-\frac{1}{2}\right) + \frac{1}{6} \cdot 1 + \frac{1}{24} \cdot 0 = 0.$$

Since the coefficient of the quartic term is 0, it follows that  $P_4(x) = P_3(x)$ , and we have

$$P_4(x) = x + \frac{1}{2}x^2 + \frac{1}{3}x^3.$$

We were not asked to find the entire Maclaurin series for  $e^x \ln(1+x)$ , nor were we asked for the interval of convergence for the series. Nonetheless, the interval of convergence for the product function is the intersection of the intervals of convergence of the two series. Since the Maclaurin series for  $e^x$  converges everywhere, the interval of convergence for the Maclaurin series for  $e^x \ln(1+x)$  would be the same as the interval of convergence for the Maclaurin series for  $\ln(1+x)$ , namely,  $(-1, 1]$ .  $\square$

### EXAMPLE 8

#### Using a Maclaurin polynomial to approximate the graph of a function

Find a Maclaurin polynomial for  $\sin x$  whose graph differs by less than 0.001 from the graph of  $\sin x$  on the interval  $[-\pi, \pi]$ .

#### SOLUTION

We wish to find a value of  $n$  to ensure that  $|R_n(x)| \leq 0.001$  on the interval  $[-\pi, \pi]$ . Using Theorem 8.10, we know that

$$R_n(x) = \frac{f^{(n+1)}(c)}{(n+1)!} (x - x_0)^{n+1} \text{ where } c \text{ is between } x_0 \text{ and } x.$$

When  $f(x) = \sin x$ , we know that  $f^{(n+1)}(x)$  is one of the functions  $\pm \sin x$  and  $\pm \cos x$ . For each of these functions,  $|f^{(n+1)}(x)| \leq 1$ . Letting  $x_0 = 0$ , we have

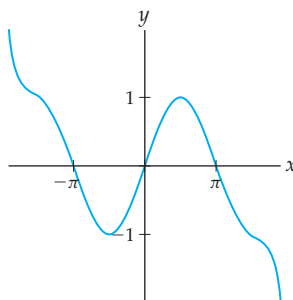

$$|R_n(x)| = \left| \frac{f^{(n+1)}(c)}{(n+1)!} x^{n+1} \right| \leq \frac{|x|^{n+1}}{(n+1)!}.$$

To ensure that  $|R_n(x)| \leq 0.001$  on  $[-\pi, \pi]$ , we find the smallest value of  $n$  such that

$$\frac{|\pi|^{n+1}}{(n+1)!} \leq 0.001.$$

We leave it to you to check that when  $n = 11$ , the quotient  $\frac{|\pi|^{11+1}}{(11+1)!} > 0.001$ , but  $\frac{|\pi|^{12+1}}{(12+1)!} \leq 0.001$ . Therefore,  $P_{12}(x) = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \frac{x^7}{7!} + \frac{x^9}{9!} - \frac{x^{11}}{11!}$  approximates  $\sin x$  to within 0.001 of its actual value on the interval  $[-\pi, \pi]$ . We graph this polynomial next and see that it does indeed look like an excellent approximation to the sine function on the interval  $[-\pi, \pi]$ :

$P_{12}(x)$  for  $\sin x$

When  $|x| > \pi$ ,  $P_{12}(x)$  ceases to be a good approximation for  $\sin x$ . If we want to approximate the sine function over a larger interval or find a closer approximation over the same interval, we would need to use a Maclaurin polynomial of a higher degree.  $\square$

### ? TEST YOUR UNDERSTANDING

- ▶ What is meant by the remainder of a function? What does the remainder measure?
- ▶ What does Taylor's Theorem tell us about the remainder? Why is Lagrange's form for the remainder more useful for analyzing the remainder?
- ▶ What are the Maclaurin series for  $\sin x$ ,  $\cos x$ ,  $e^x$ ,  $\frac{1}{1-x}$ ,  $\ln(1+x)$ , and  $\tan^{-1}x$ ?
- ▶ If you know the Maclaurin series for a function  $f(x)$ , how can you use that series to quickly find the Maclaurin series for  $f(cx^m)$ , where  $c \neq 0$  and  $m \in \mathbb{Z}^+$ ? How can the interval of convergence for the new series be found from the interval of convergence for the original series?
- ▶ If you know the Maclaurin series for a function  $f(x)$ , how can you use that series to quickly find the Maclaurin series for  $cx^mf(x)$ , where  $c \neq 0$  and  $m \in \mathbb{Z}^+$ ? What is the relationship between the interval of convergence for the new series and the interval of convergence for the original series?

## EXERCISES 8.3

### Thinking Back

- ▶ *Analyzing the quality of an approximation for a definite integral:* How is Theorem 5.27 used to analyze the quality of a midpoint approximation  $M_n$  for a definite integral  $\int_a^b f(x) dx$ ?
- ▶ *Analyzing the quality of an approximation for the sum of an alternating series:* If  $a_k > 0$  for every positive integer  $k$  and the series  $\sum_{k=1}^{\infty} (-1)^{k+1} a_k$  satisfies the conditions of the alternating series test, how can  $a_{n+1}$  be used to analyze the quality of the partial sum  $\sum_{k=1}^n (-1)^{k+1} a_k$  as an approximation for the sum of the series?

### Concepts

0. *Problem Zero:* Read the section and make your own summary of the material.
1. *True/False:* Determine whether each of the statements that follow is true or false. If a statement is true, explain why. If a statement is false, provide a counterexample.
  - (a) *True or False:* Every Maclaurin series converges to the function used to generate the series.
  - (b) *True or False:* Every Taylor series converges to the function used to generate the series at at least one point.
  - (c) *True or False:* If  $f$  is a function with derivatives of all orders at the point  $x_0$ , the  $n$ th remainder of  $f$  is given by  $R_n(x) = \sum_{k=n+1}^{\infty} \frac{f^{(k)}(x_0)}{k!} (x - x_0)^k$ .
  - (d) *True or False:* If  $f$  is a function with derivatives of all orders at the point  $x_0$ , the  $n$ th remainder of  $f$  is given by  $R_n(x) = \int_{x_0}^x \frac{(x-t)^n}{n!} f^{(n+1)}(t) dt$ .
  - (e) *True or False:* If  $f$  is a function with derivatives of all orders at the point  $x_0$ , the  $n$ th remainder of  $f$  is given by  $R_n(x) = \frac{f^{(n+1)}(c)}{(n+1)!} (x - x_0)^{n+1}$ , where  $c$  is between  $x_0$  and  $x$ .
  - (f) *True or False:* The  $n$ th remainder measures the error in using the Taylor polynomial  $P_n(x)$  to approximate the function that generated the polynomial.
  - (g) *True or False:* If the Maclaurin series for  $f(x)$  converges to  $f(x)$  on the interval  $(-\rho, \rho)$ , the Maclaurin series for  $f(x^3)$  converges to  $f(x^3)$  on the interval  $(-\rho^3, \rho^3)$ .
  - (h) *True or False:* If the Maclaurin series for  $f(x)$  converges to  $f(x)$  on the interval  $(-\rho, \rho)$ , the Maclaurin series for  $x^3f(x)$  converges to  $x^3f(x)$  on the interval  $(-\rho, \rho)$ .
2. *Examples:* Construct examples of the thing(s) described in the following. Try to find examples that are different than any in the reading.
  - (a) The third remainder  $R_3(x)$  for  $\sin x$  when  $P_3(x)$  is the third Taylor polynomial for  $\sin x$  at  $\frac{\pi}{4}$ .
  - (b) The integral given by Taylor's Theorem equal to the third remainder  $R_3(x)$  for  $\sin x$  when  $P_3(x)$  is the third Taylor polynomial for  $\sin x$  at  $\frac{\pi}{4}$ .
  - (c) Lagrange's form for the third remainder  $R_3(x)$  for  $\sin x$  when  $P_3(x)$  is the third Taylor polynomial for  $\sin x$  at  $\frac{\pi}{4}$ .

- If the series  $\sum_{k=0}^{\infty} a_k x^k$  converges to the function  $f(x)$  on the interval  $(-2, 2)$ , provide a formula for  $a_k$  in terms of the function  $f$ .
- If the series  $\sum_{k=0}^{\infty} b_k (x - 3)^k$  converges to the function  $g(x)$  on the interval  $(-2, 8)$ , provide a formula for  $b_k$  in terms of the function  $g$ .
- If the series  $\sum_{k=0}^{\infty} c_k (x - x_0)^k$  converges to the function  $h(x)$  for every real number, provide a formula for  $c_k$  in terms of the function  $h$ .
- Explain why  $\lim_{n \rightarrow \infty} \frac{|x|^n}{n!} = 0$  for every value of  $x$ .
- Let  $f(x) = \frac{1}{1-x}$  and  $g(x) = \frac{1}{ax+b}$ . Show that if  $b \neq 0$ , then  $g(x) = \frac{1}{b} f\left(-\frac{a}{b}x\right)$ .
- Given a function  $f$  and a Taylor polynomial for  $f$  at  $x_0$ , what is meant by the  $n$ th remainder  $R_n(x)$ ? What does  $R_n(x)$  measure?
- If  $f(x) = 4x^3 - 5x^2 + 6x + 1$  and  $P_3(x)$  is the third Taylor polynomial for  $f$  at  $-1$ , what is the third remainder  $R_3(x)$ ? What is  $R_4(x)$ ? (*Hint: You can answer this question without finding any derivatives.*)
- If  $f(x)$  is an  $n$ th-degree polynomial and  $P_n(x)$  is the  $n$ th Taylor polynomial for  $f$  at  $x_0$ , what is the  $n$ th remainder  $R_n(x)$ ? What is  $R_{n+1}(x)$ ?
- What is Taylor's Theorem?
- What is Lagrange's form for the remainder? Why is Lagrange's form usually more useful for analyzing the

remainder than the definition of the remainder or the integral provided by Taylor theorem?

- Why is it helpful to know the Maclaurin series for a few basic functions?
- If  $m$  is a positive integer, how can we find the Maclaurin series for the function  $f(cx^m)$  if we already know the Maclaurin series for the function  $f(x)$ ? How do you find the interval of convergence for the new series?
- If  $m$  is a positive integer, how can we find the Maclaurin series for the function  $cx^m f(x)$  if we already know the Maclaurin series for the function  $f(x)$ ? How do you find the interval of convergence for the new series?
- How may we find the Maclaurin series for  $f(x)g(x)$  if we already know the Maclaurin series for the functions  $f(x)$  and  $g(x)$ ? How do you find the interval of convergence for the new series?

Use an appropriate Maclaurin series to find the values of the series in Exercises 17–22.

- $\sum_{k=0}^{\infty} \frac{(-\pi)^k}{k!}$
- $\sum_{k=0}^{\infty} \frac{(-1)^k \pi^{2k}}{(2k)!}$
- $\sum_{k=0}^{\infty} \frac{(-1)^k}{2k+1} \left(\frac{1}{\sqrt{3}}\right)^{2k+1}$
- $\sum_{k=1}^{\infty} \frac{(-1)^k}{k} \left(\frac{1}{\pi}\right)^k$
- $\sum_{k=0}^{\infty} \frac{(-1)^k \pi^{2k+1}}{(2k+1)!}$
- $\sum_{k=1}^{\infty} \left(-\frac{1}{\pi}\right)^k$

## Skills

In Exercises 21–30 in Section 8.2 you were asked to find the fourth Maclaurin polynomial  $P_4(x)$  for the specified function. In Exercises 23–32 we ask you to give Lagrange's form for the corresponding remainder,  $R_4(x)$ .

- |                   |                       |
|-------------------|-----------------------|
| 23. $\cos x$      | 24. $e^x$             |
| 25. $\sin x$      | 26. $\ln(1+x)$        |
| 27. $\tan^{-1} x$ | 28. $\tan x$          |
| 29. $\sqrt{1-x}$  | 30. $\frac{1+x}{1-x}$ |
| 31. $x \sin x$    | 32. $x^2 e^x$         |

In Exercises 31–34 in Section 8.2 you were asked to find the Maclaurin series for the specified function. Now find the Lagrange's form for the remainder  $R_n(x)$ , and show that  $\lim_{n \rightarrow \infty} R_n(x) = 0$  on the specified interval.

- |                          |                             |
|--------------------------|-----------------------------|
| 33. $\cos x, \mathbb{R}$ | 34. $e^x, \mathbb{R}$       |
| 35. $\sin x, \mathbb{R}$ | 36. $\ln(1+x), (-1/2, 1/2)$ |

In Exercises 41–48 in Section 8.2, you were asked to find the fourth Taylor polynomial  $P_4(x)$  for the specified function and the given value of  $x_0$ . In Exercises 37–44 give Lagrange's form for the remainder  $R_4(x)$ .

- |                             |              |
|-----------------------------|--------------|
| 37. $\cos x, \frac{\pi}{2}$ | 38. $e^x, 1$ |
|-----------------------------|--------------|

- |                             |                      |
|-----------------------------|----------------------|
| 39. $\sin x, \pi$           | 40. $\sqrt{x}, 1$    |
| 41. $\ln x, 3$              | 42. $\sqrt[3]{x}, 1$ |
| 43. $\tan x, \frac{\pi}{4}$ | 44. $\tan^{-1} x, 1$ |

In Exercises 49–54 in Section 8.2 you were asked to find the Taylor series for the specified function at the given value of  $x_0$ . In Exercises 45–50 find the Lagrange's form for the remainder  $R_n(x)$ , and show that  $\lim_{n \rightarrow \infty} R_n(x) = 0$  on the specified interval.

- |   |                                  |
|---|----------------------------------|
| 45. $\cos x, \frac{\pi}{2}, \mathbb{R}$ | 46. $e^x, 1, \mathbb{R}$         |
| 47. $\sin x, \pi, \mathbb{R}$           | 48. $\sqrt{x}, 1, (1/2, 3/2)$    |
| 49. $\ln x, 3, (2, 4)$                  | 50. $\sqrt[3]{x}, 1, (1/2, 3/2)$ |

Find the Maclaurin series for the functions in Exercises 51–60 by substituting into a known Maclaurin series. Also, give the interval of convergence for the series.

- |                       |                       |
|-----------------------|-----------------------|
| 51. $e^{x^3}$         | 52. $e^{-3x^2}$       |
| 53. $\sin(-5x^2)$     | 54. $x \cos(x^2)$     |
| 55. $\frac{1}{8+x^3}$ | 56. $\frac{x}{9-x^2}$ |

57.  $\frac{e^x + e^{-x}}{2}$       58.  $\frac{e^x - e^{-x}}{2}$
59.  $\cos^2 x$  (Hint: Use the identity  $\cos^2 x = \frac{1}{2}(1 + \cos 2x)$ ).
60.  $\sin^2 x$  (Hint: Use the identity  $\cos^2 x = \frac{1}{2}(1 - \cos 2x)$ ).

Use appropriate Maclaurin series to find the first four nonzero terms in the Maclaurin series for the product functions in Exercises 61–66. Also, give the interval of convergence for the series.

61.  $e^x \sin x$       62.  $e^x \cos x$
63.  $e^x \ln(1 + x^3)$       64.  $(\sin 2x)(\tan^{-1} x^3)$
65.  $\frac{\sin x}{1 - x^2}$       66.  $\frac{\tan^{-1} x}{1 - x^3}$

Use appropriate Maclaurin series to express the quantities in Exercises 67–76 as alternating series. Then use Theorem 7.38 to approximate the value of the specified quantities to within 0.001 of their actual value. How many terms in each series would be needed to approximate the given quantity to within  $10^{-6}$  of its value? In Exercises 73–76 be sure to convert to radian measure first.

67.  $e^{-0.3}$       68.  $e^{-2}$
69.  $\ln 1.5$       70.  $\ln 1.3$
71.  $\tan^{-1} 0.4$       72.  $\tan^{-1}(-0.6)$
73.  $\sin 2^\circ$       74.  $\sin 1^\circ$
75.  $\cos 5^\circ$       76.  $\cos 10^\circ$

In Exercises 77–82,

- (a) Use appropriate Maclaurin series to express the quantities in series form.
- (b) Use Lagrange's form for the remainder to bound the error in using the 5th degree Maclaurin polynomial to approximate the given quantity.
- (c) Find the smallest value of  $n$  so that the  $n$ th degree Maclaurin polynomial approximation to the given quantity is guaranteed to be accurate to within  $10^{-6}$ .

77.  $e^{0.3}$       78.  $e^{0.9}$
79.  $\ln 0.5$       80.  $\ln 0.7$
81.  $\sin 1$       82.  $\cos 2$
83. Let

$$f(x) = \begin{cases} \frac{\sin x}{x}, & \text{if } x \neq 0 \\ 1, & \text{if } x = 0 \end{cases}$$

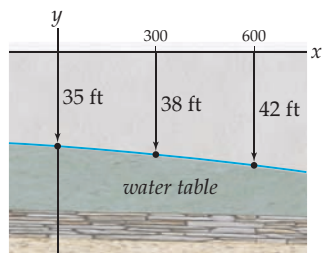

- (a) Use the definition of the derivative to prove that  $f$  is differentiable at 0.
- (b) Use the Maclaurin series for  $\sin x$  to find a Maclaurin series for  $f$ .
84. Let

$$f(x) = \begin{cases} \frac{1 - \cos x}{x}, & \text{if } x \neq 0 \\ 0, & \text{if } x = 0 \end{cases}$$

- (a) Use the definition of the derivative to prove that  $f$  is differentiable at 0.
- (b) Use the Maclaurin series for  $\cos x$  to find a Maclaurin series for  $f$ .

## Applications

85. Emmy is a civil engineer who has to approximate the slope of the water table along a certain line in the Hanford Nuclear Reservation. She can dig only three test holes to evaluate the depth of groundwater at certain points. She finds that the water table lies at  $(0, 35)$ ,  $(300, 38)$ , and  $(600, 42)$ , with all distances given in feet and positive vertical distances representing distances below the surface.

- (a) Using the data from the first two wells, estimate the slope of the water table. Use this slope to write an equation of a line that describes the water table.
- (b) Considering the equation of the line from part (a) as the first two terms of a Maclaurin series for the function  $w(x)$  describing the water table, write an expression for the error in this linear approximation.
- (c) Verify that the graph of the quadratic

$$w_2(x) = \frac{1}{180000}x^2 + \frac{1}{120}x + 35$$

passes through the three data points describing the water table.

- (d) Use the quadratic from part (c) to estimate the error in the linear approximation to the water table.

86. In 2009, Mirec was a civil engineer in Fargo, North Dakota. He was charged with monitoring the Red River as it flooded catastrophically in March of that year. By measuring the flow of the river very precisely, he was able to estimate the flow  $f(t)$  and many of its derivatives as of March 8, which he considered to be time  $t = 0$ . He found that  $f(0) = 988.9$ ,  $f'(0) = -853.8$ ,

$$f''(0) = 1026.9, \quad f'''(0) = -528.1, \quad f^{(4)}(0) = 141.3, \quad \text{and} \\ f^{(5)}(0) = -15.0.$$

- (a) Use these data to compute a Maclaurin polynomial of degree 5 for the flow.  
 (b) Mirec had to predict when the maximum flow would occur for  $t > 0$ . What day did he predict?

## Proofs

87. Use the principle of mathematical induction to complete the proof of Theorem 8.9. That is, show that

$$f(x) = \sum_{k=0}^n \frac{f^{(k)}(x_0)}{k!} (x - x_0)^k + \int_{x_0}^x \frac{(x - t)^n}{n!} f^{(n+1)}(t) dt.$$

88. Use Theorem 8.9 and Theorem 4.31 of Section 4.6 to prove Theorem 8.10. That is, show that if  $f$  is a function that can be differentiated  $n + 1$  times in some open interval  $I$  containing the point  $x_0$ , and if  $R_n(x)$  is the  $n$ th remainder for  $f$  at  $x = x_0$ , then for each point  $x \in I$  there is at least one  $c$  between  $x_0$  and  $x$  such that  $R_n(x) = \frac{f^{(n+1)}(c)}{(n+1)!} (x - x_0)^{n+1}$ .

89. Use Lagrange's form for the remainder to prove that the Maclaurin series for the cosine,

$$\cos x = \sum_{k=0}^{\infty} \frac{(-1)^k}{(2k)!} x^{2k},$$

converges for every real number.

90. Let  $f$  be a function with the property that  $|f^{(n)}(x)| < M$  for every nonnegative integer  $n$  and every real number  $x$ , where  $M$  is a positive number. Use Lagrange's form for the remainder to prove that the Taylor series for  $f$  at any point  $x_0$  converges to  $f$  for every real number.

91. Use the Maclaurin series for  $e^x$  and  $e^{-x}$  to prove that

$$\sinh x = \sum_{k=0}^{\infty} \frac{1}{(2k+1)!} x^{2k+1}.$$

## Thinking Forward

► *The derivative of a series:* Show that if you take the derivative of the Maclaurin series for  $e^x$  term by term, you get the same series back again. That is, show that

$$\frac{d}{dx}(e^x) = \sum_{k=0}^{\infty} \frac{x^k}{k!}.$$

► *The derivative of a series:* Show that if you take the derivative of the Maclaurin series for  $\sin x$  term by term, you get the series for  $\cos x$ . That is, show that

$$\frac{d}{dx}(\sin x) = \sum_{k=0}^{\infty} \frac{(-1)^k}{(2k)!} x^{2k} = \cos x.$$

## 8.4 DIFFERENTIATING AND INTEGRATING POWER SERIES

- Differentiating a power series term by term
- Integrating a power series term by term
- Using a Taylor polynomial to approximate a function

### Differentiating a Power Series

In Section 8.3 we discussed two methods for altering a Maclaurin series to obtain a new series: function composition and multiplication. We extend this idea by discussing the calculus of power series. The next two theorems tell us that we may differentiate and integrate power series term by term.

**THEOREM 8.11** Differentiating a Power Series

If  $\sum_{k=0}^{\infty} a_k(x-x_0)^k$  is a power series in  $x-x_0$  that converges to a function  $f(x)$  on an interval  $I$ , then the derivative of  $f$  is given by

$$f'(x) = \frac{d}{dx} \left( \sum_{k=0}^{\infty} a_k(x-x_0)^k \right) \stackrel{*}{=} \sum_{k=0}^{\infty} a_k \frac{d}{dx} ((x-x_0)^k) = \sum_{k=1}^{\infty} k a_k (x-x_0)^{k-1}.$$

The interval of convergence for this new series is  $I$ , with the possible exception that if  $I$  is a finite interval, the convergence at the endpoints of  $I$  may be different than it was for the initial series.

The starred equality in Theorem 8.11 is the most significant. The first equality just expresses the fact that the function  $f$  and its power series are equal. The third equality says that  $\frac{d}{dx}((x-x_0)^k) = k(x-x_0)^{k-1}$ . In Chapter 2 we proved that the derivative of a finite sum is the sum of the derivatives, but here we have an infinite sum. The second equality says that this summation property of the derivative in finite situations also holds for a convergent power series. The proof of Theorem 8.11 is beyond the scope of this course.

## Integrating a Power Series

---

**THEOREM 8.12** Integration of Power Series

Let  $\sum_{k=0}^{\infty} a_k(x-x_0)^k$  be a power series in  $x-x_0$  that converges to a function  $f(x)$  on an interval  $I$ .

(a) The indefinite integral of  $f$  is given by

$$\begin{aligned} \int f(x) dx &= \int \left( \sum_{k=0}^{\infty} a_k(x-x_0)^k \right) dx \\ &\stackrel{*}{=} \sum_{k=0}^{\infty} a_k \int (x-x_0)^k dx = \sum_{k=0}^{\infty} \frac{a_k}{k+1} (x-x_0)^{k+1} + C, \end{aligned}$$

where  $C$  is a constant. The interval of convergence for this new series is  $I$ , with the possible exception that if  $I$  is a finite interval, the convergence at the endpoints of  $I$  may be different than it was for the initial series.

(b) If  $c$  and  $d$  are two points in  $I$ , then the definite integral of  $f$  on the interval  $[c, d]$  is given by

$$\begin{aligned} \int_c^d f(x) dx &= \int_c^d \left( \sum_{k=0}^{\infty} a_k(x-x_0)^k \right) dx \stackrel{*}{=} \sum_{k=0}^{\infty} a_k \int_c^d (x-x_0)^k dx \\ &= \sum_{k=0}^{\infty} \frac{a_k}{k+1} [(x-x_0)^{k+1}]_c^d = \sum_{k=0}^{\infty} \frac{a_k}{k+1} ((d-x_0)^{k+1} - (c-x_0)^{k+1}). \end{aligned}$$

As in Theorem 8.11, the starred equalities in Theorem 8.12 are the most significant. The first equalities in parts (a) and (b) express the fact that the power series converges to the function  $f$ . All of the other equalities indicate basic facts about antiderivatives and definite integrals. In Chapter 4 we proved that the indefinite integral of a finite sum is the sum of the indefinite integrals, but in part (a) we have an infinite sum. Part (b) makes the analogous statement for definite integrals. The starred equalities say that these properties of antiderivatives and definite integrals are also valid for convergent power series. As with Theorem 8.11, the proof of Theorem 8.12 is beyond the scope of this course.

## Examples and Explorations

### EXAMPLE 1

Using the derivative to find the Maclaurin series for  $\frac{1}{(1-x)^2}$

Find the Maclaurin series for  $\frac{1}{(1-x)^2}$ .

### SOLUTION

We begin by noting that  $\frac{d}{dx}\left(\frac{1}{1-x}\right) = \frac{1}{(1-x)^2}$ . Since the Maclaurin series for  $\frac{1}{1-x}$  is  $\sum_{k=0}^{\infty} x^k$ , we may use Theorem 8.11 to find the Maclaurin series for  $\frac{1}{(1-x)^2}$ :

$$\frac{1}{(1-x)^2} = \frac{d}{dx}\left(\frac{1}{1-x}\right) = \frac{d}{dx}\left(\sum_{k=0}^{\infty} x^k\right) = \sum_{k=0}^{\infty} \frac{d}{dx}(x^k) = \sum_{k=1}^{\infty} kx^{k-1} = \sum_{k=0}^{\infty} (k+1)x^k.$$

Note that we changed the indexing of the series in the final step. This series has the same radius of convergence as the original series, namely 1, but the new series may converge at  $\pm 1$  even though the original series diverges at both endpoints.

When  $x = 1$ , we have the series  $\sum_{k=0}^{\infty} (k+1)$ , which diverges by the divergence test. Similarly, when  $x = -1$ , we obtain the series  $\sum_{k=0}^{\infty} (-1)^k (k+1)$ , which also diverges by the divergence test. Thus the interval of convergence for the series is  $(-1, 1)$ .  $\square$

### EXAMPLE 2

Using integration to find the Maclaurin series for  $\ln(1+x)$

Find the Maclaurin series for  $\ln(1+x)$ .

### SOLUTION

We could of course use Definition 8.7 to find the Maclaurin series for  $\ln(1+x)$ . However, we already know that

$$\frac{1}{1-x} = \sum_{k=0}^{\infty} x^k \quad \text{on the interval } (-1, 1).$$

If we replace each  $x$  in this equation with  $-x$ , we obtain the Maclaurin series for  $\frac{1}{1+x}$ :  
That is,

$$\frac{1}{1-(-x)} = \frac{1}{1+x} = \sum_{k=0}^{\infty} (-x)^k = \sum_{k=0}^{\infty} (-1)^k x^k.$$

This series has the same interval of convergence,  $(-1, 1)$ .

Now, since

$$\int_0^x \frac{1}{1+t} dt = \ln(1+t) \Big|_0^x = \frac{1}{1+x},$$

if we integrate our series for  $\frac{1}{1+t}$ , we will have our Maclaurin series for  $\ln(1+x)$ . That is,

$$\begin{aligned} \ln(1+x) &= \int_0^x \frac{1}{1+t} dt = \int_0^x \sum_{k=0}^{\infty} (-1)^k t^k dt = \sum_{k=0}^{\infty} (-1)^k \left( \int_0^x t^k dt \right) \\ &= \sum_{k=0}^{\infty} \left[ \frac{(-1)^k}{k+1} t^{k+1} \right]_0^x = \sum_{k=0}^{\infty} \frac{(-1)^k}{k+1} x^{k+1} = \frac{1}{2}x^2 + \frac{1}{3}x^3 - \dots \end{aligned}$$

The new series is guaranteed to have the same interval of convergence as the series for the function  $\frac{1}{1+x}$ , with the possible exception of the endpoints, which for this series are  $\pm 1$ . By changing the indexing of the series, we may also express this as

$$\ln(1+x) = \sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{k} x^k.$$

Finally, we need to see if the series converges at the endpoints of the interval. When  $x = 1$ , we have the alternating harmonic series  $\sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{k}$ . In Section 7.7 we showed that the alternating harmonic series converges conditionally. At that time we mentioned that the alternating harmonic series converges to  $\ln 2$ , and we now see why. When  $x = -1$ , we obtain the series  $\sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{k} (-1)^k = -\sum_{k=1}^{\infty} \frac{1}{k}$ . This is the (negative of the) harmonic series, which we know diverges. Thus the interval of convergence for the series is  $(-1, 1]$ .  $\square$

### EXAMPLE 3

#### Using integration to find the Maclaurin series for $\tan^{-1} x$

Outline the steps for finding the Maclaurin series for  $\tan^{-1} x$ .

#### SOLUTION

The procedure for finding the Maclaurin series for  $\tan^{-1} x$  is quite similar to the work we did in Example 2. Since  $\frac{d}{dx}(\tan^{-1} x) = \frac{1}{1+x^2}$ , we will perform the following steps:

- ▶ Substitute  $-x^2$  for  $x$  in the series for  $\frac{1}{1-x}$  to find the Maclaurin series for  $\frac{1}{1+x^2}$ .
- ▶ Use the same substitution in the inequality  $|x| < 1$  to find the interval of convergence for the new series.
- ▶ Integrate the latter series to find the series for  $\tan^{-1} x$ . Be sure to include a single constant of integration. The resulting new series will have the same interval of convergence as the series for  $\frac{1}{1+x^2}$ , with the possible change at the endpoints of the interval.
- ▶ Evaluate the function  $\tan^{-1} x$  and the series at  $x = 0$  to determine the value of the constant of integration.
- ▶ Determine whether the series converges absolutely, converges conditionally, or diverges at each endpoint of the interval of convergence.  $\square$

**EXAMPLE 4****Using a Maclaurin series to approximate a definite integral**

Approximate the definite integral  $\int_0^1 e^{-x^2} dx$  to within 0.001 of its value.

**SOLUTION**

The function  $e^{-x^2}$  does not have an elementary antiderivative. Therefore, we cannot use the Fundamental Theorem to evaluate the integral. We could use the techniques of Chapter 4 to approximate the integral, but Theorem 8.12 gives us another effective tool for approximating its value. Since

$$e^x = \sum_{k=0}^{\infty} \frac{x^k}{k!},$$

if we substitute  $-x^2$  for  $x$  in this series, we immediately obtain the Maclaurin series for  $e^{-x^2}$ :

$$e^{-x^2} = \sum_{k=0}^{\infty} \frac{(-x^2)^k}{k!} = \sum_{k=0}^{\infty} (-1)^k \frac{x^{2k}}{k!}.$$

Now, using Theorem 8.12, we have

$$\begin{aligned} \int_0^1 e^{-x^2} dx &= \int_0^1 \left( \sum_{k=0}^{\infty} (-1)^k \frac{x^{2k}}{k!} \right) dx = \sum_{k=0}^{\infty} \frac{(-1)^k}{k!} \left( \int_0^1 x^{2k} dx \right) \\ &= \sum_{k=0}^{\infty} \left[ \frac{(-1)^k x^{2k+1}}{k! (2k+1)} \right]_0^1 = \sum_{k=0}^{\infty} \frac{(-1)^k}{k!} \frac{1}{2k+1} \\ &= 1 - \frac{1}{3} + \frac{1}{10} - \frac{1}{42} + \frac{1}{216} - \frac{1}{1320} + \cdots \end{aligned}$$

This is a convergent alternating series that satisfies the conditions of the alternating series test. By Theorem 7.38 of Section 7.7, to approximate the value of the integral to within 0.001 of its value, we look for the first term of the series whose value is less than 0.001 and sum all the terms that precede it. Thus, the sum  $1 - \frac{1}{3} + \frac{1}{10} - \frac{1}{42} + \frac{1}{216} \approx 0.7475$  is within  $\frac{1}{1320} \approx 0.00076$  of the actual value of the integral. In fact, by Theorem 7.38,

$$0.7467 \approx \sum_{k=0}^5 \frac{(-1)^k}{k!} \frac{1}{2k+1} < \int_0^1 e^{-x^2} dx < \sum_{k=0}^4 \frac{(-1)^k}{k!} \frac{1}{2k+1} \approx 0.7475.$$

The terms of this series decrease in magnitude so quickly, that including a few extra terms would provide a much more accurate approximation for the integral.  $\square$

**? TEST YOUR UNDERSTANDING**

- ▶ If you know the Maclaurin series for a function  $f$ , how can you use that series to quickly find the Maclaurin series for  $f'$ ? What is the relationship between the interval of convergence for the Maclaurin series for  $f$  and the interval of convergence for the Maclaurin series for  $f'$ ?
- ▶ If you know the Taylor series for a function  $f$  at  $x = x_0$ , how can you use that series to quickly find the Taylor series for  $f'$  at  $x = x_0$ ? What is the relationship between the interval of convergence for the Taylor series for  $f$  at  $x = x_0$  and the interval of convergence for the Taylor series for  $f'$  at  $x = x_0$ ?

- ▶ If you know the Maclaurin series for a function  $f$ , how can you use that series to quickly find the Maclaurin series for  $\int f(x) dx$ ? What is the relationship between the interval of convergence for the Maclaurin series for  $f$  and the interval of convergence for the Maclaurin series for  $\int f(x) dx$ ?
- ▶ If you know the Taylor series for a function  $f$  at  $x = x_0$ , how can you use that series to quickly find the Taylor series for  $\int f(x) dx$  at  $x = x_0$ ? What is the relationship between the interval of convergence for the Taylor series for  $f$  at  $x = x_0$  and the interval of convergence for the Taylor series for  $\int f(x) dx$  at  $x = x_0$ ?
- ▶ If you know the Maclaurin series for the function  $f(x)$ , how can you combine techniques introduced in this section with the techniques from Section 8.3 to quickly find the Maclaurin series for the function  $\int c_1 x^{m_1} f(c_2 x^{m_2}) dx$ , where  $c_1$  and  $c_2$  are real numbers and  $m_1$  and  $m_2$  are positive integers? How would you determine the interval of convergence for the new series?

## EXERCISES 8.4

### Thinking Back

- ▶ *The derivative of a sum:* Prove that  $\frac{d}{dx}(f_1(x) + f_2(x)) = \frac{d}{dx}f_1(x) + \frac{d}{dx}f_2(x)$ . How would you prove that

$$\frac{d}{dx}\left(\sum_{k=1}^n f_k(x)\right) = \sum_{k=1}^n \frac{d}{dx}(f_k(x))?$$

- ▶ *The integral of a sum:* Prove that  $\int (f_1(x) + f_2(x)) dx = \int f_1(x) dx + \int f_2(x) dx$ . How would you prove that

$$\int \left(\sum_{k=1}^n f_k(x)\right) dx = \sum_{k=1}^n \left(\int f_k(x) dx\right)?$$

### Concepts

0. *Problem Zero:* Read the section and make your own summary of the material.
1. *True/False:* Determine whether each of the statements that follow is true or false. If a statement is true, explain why. If a statement is false, provide a counterexample.
  - (a) *True or False:* If a function  $f$  has a Taylor series at  $x = 5$  that converges to  $f$  for every value of  $x$ , then the function  $f'$  has a Taylor series at  $x = 5$  that converges to  $f'$  for every value of  $x$ .
  - (b) *True or False:* If the series  $\sum_{k=0}^{\infty} a_k (x - 5)^k$  converges to the function  $f(x)$  for every value of  $x$ , then the series  $\sum_{k=0}^{\infty} \frac{a_k}{k+1} (x - 5)^{k+1}$  converges to a function  $G(x)$  where  $G'(x) = f(x)$  for every value of  $x$ .
  - (c) *True or False:* If the series  $\sum_{k=0}^{\infty} a_k x^k$  converges absolutely on the interval  $(-\rho, \rho)$ , then for every  $x \in (-\rho, \rho)$ ,  $\frac{d}{dx}\left(\sum_{k=0}^{\infty} a_k x^k\right) = \sum_{k=0}^{\infty} (k+1)a_{k+1} x^k$ .
  - (d) *True or False:* If the interval of convergence for the series  $\sum_{k=0}^{\infty} a_k x^k$  contains the points  $c$  and  $d$ , then
    - (e) *True or False:* If the series  $\sum_{k=0}^{\infty} a_k x^k$  converges absolutely on the interval  $(-\rho, \rho)$ , then for every  $x \in (-\rho, \rho)$ ,  $\int \left(\sum_{k=0}^{\infty} a_k x^k\right) dx = \sum_{k=0}^{\infty} \frac{a_k}{k+1} x^{k+1}$ .
    - (f) *True or False:* If the interval of convergence of the power series  $\sum_{k=0}^{\infty} a_k x^k$  is  $(-3, 3)$ , then the interval of convergence of the power series  $\sum_{k=1}^{\infty} k a_k x^{k-1}$  is  $(-3, 3)$ .
    - (g) *True or False:* If the interval of convergence of the power series  $\sum_{k=0}^{\infty} a_k x^k$  is  $(-3, 3)$ , then the interval of convergence of the power series  $\sum_{k=0}^{\infty} \frac{a_k}{k+1} x^{k+1}$  is  $[-3, 3]$ .
    - (h) *True or False:* If the interval of convergence of the power series  $\sum_{k=0}^{\infty} a_k x^k$  is  $(-3, 3)$ , then the interval of convergence of the power series  $\sum_{k=0}^{\infty} \frac{a_k}{k+1} x^{k+1}$  contains  $(-3, 3)$ .
2. *Examples:* Construct examples of the thing(s) described in the following. Try to find examples that are different than any in the reading.
  - (a) A function  $f$  with a Maclaurin series that has  $[-2, 2]$  as its interval of convergence such that the Maclaurin series for  $f'$  converges only on the interval  $(-2, 2)$ .

$$\int_c^d \left(\sum_{k=0}^{\infty} a_k x^k\right) dx = \sum_{k=0}^{\infty} \frac{a_k}{k+1} (d^{k+1} - c^{k+1}).$$

- (b) A function  $f$  such that both  $f$  and  $f'$  have Taylor series with  $(0, 6]$  as their interval of convergence.
- (c) A function  $f$  such that both  $f$  and  $f'$  have Taylor series in  $(x - \pi)$  with  $\mathbb{R}$  as their interval of convergence.
3. If  $f(x) = \sum_{k=0}^{\infty} a_k (x - x_0)^k$ , what is  $f(x_0)$ ? What is  $f'(x_0)$ ? What is  $f''(x_0)$ ? What is  $f^{(k)}(x_0)$ ?
4. Let  $f(x) = \sum_{k=0}^{\infty} a_k (x - x_0)^k$  and let  $G$  be an antiderivative for  $f$ . Explain why we do not have enough information to determine  $G(x_0)$ . What is  $G'(x_0)$ ? What is  $G''(x_0)$ ? What is  $G^{(k)}(x_0)$ ?
5. Let  $f(x) = \sum_{k=0}^{\infty} a_k (x - x_0)^k$  and let  $G$  be the antiderivative for  $f$  with the property that  $G(x_0) = 7$ . Find the Taylor series in  $x_0$  for  $G$ .
6. Let  $f(x)$  be a function such that the power series in  $x - x_0$ ,  $\sum_{k=0}^{\infty} a_k (x - x_0)^k$  converges absolutely to  $f$  on the interval  $I$ . If  $G_1$  and  $G_2$  are two antiderivatives for  $f$ , explain why the power series in  $x - x_0$  for  $G_1$  and  $G_2$  have the same interval of convergence.
7. In Example 1 we used Theorem 8.11 to find the Maclaurin series for  $\frac{1}{(1-x)^2}$ . Explain how Theorem 8.11 could be used to find the Maclaurin series for  $\frac{1}{(1-x)^k}$ , where  $k$  is a positive integer greater than 2.
8. If  $f$  is a function such that  $f(0) = 1$  and  $f'(x) = f(x)$  for every value of  $x$ , find the Maclaurin series for  $f$ .
9. If  $f$  is a function such that  $f(0) = 2$  and  $f'(x) = -3f(x)$  for every value of  $x$ , find the Maclaurin series for  $f$ .
10. If  $f$  is a function such that  $f(0) = -3$  and  $f'(x) = 2f(x)$  for every value of  $x$ , find the Maclaurin series for  $f$ .

Perform the following steps for the power series in  $x - x_0$  in Exercises 11–16:

- (a) Find the interval of convergence,  $I$ , for the series.
- (b) Let  $f$  be the function to which the series converges on  $I$ . Find the power series in  $x - x_0$  for  $f'$ .
- (c) Find the power series in  $x - x_0$  for  $F(x) = \int_{x_0}^x f(t) dt$ .

$$11. \sum_{k=0}^{\infty} 2^k x^k \qquad 12. \sum_{k=0}^{\infty} \frac{5^k}{k!} (x - 3)^k$$

$$13. \sum_{k=0}^{\infty} \frac{(-1)^k}{(2k)!} x^k \qquad 14. \sum_{k=0}^{\infty} \frac{1}{k+2} x^{3k+1}$$

$$15. \sum_{k=1}^{\infty} \frac{(-1)^k}{k} (x+5)^k \qquad 16. \sum_{k=0}^{\infty} (-1)^k \frac{k!}{(2k)!} (x-7)^{2k}$$

17. (a) Explain why the definite integral  $I = \int_0^{0.5} \frac{dx}{1+x^3}$  exists.

- (b) Explain how to use Simpson's method to approximate  $I$  to within 0.001 of its actual value.
- (c) Use substitution in the Maclaurin series for  $\frac{1}{1-x}$  to find a Maclaurin series for  $\frac{1}{1+x^3}$ .
- (d) Explain how to use Theorems 7.38 and 8.12 to approximate  $I$  to within 0.001 of its actual value.
18. (a) Explain why the definite integral  $I = \int_0^2 \frac{dx}{1+x^3}$  exists.
- (b) Explain how to use Simpson's method to approximate the value of  $I$  to within 0.001 of its actual value.
- (c) Explain why you cannot use the method of Exercise 17 (b) and (c) to approximate  $I$ .
19. (a) Explain why the definite integral  $I = \int_0^{0.5} \sin(x^2) dx$  exists.
- (b) Explain how to use Simpson's method to approximate  $I$  to within 0.001 of its actual value.
- (c) Use substitution in the Maclaurin series for  $\sin x$  to find a Maclaurin series for  $\sin(x^2)$ .
- (d) Explain how to use Theorems 7.38 and 8.12 to approximate  $I$  to within 0.001 of its actual value.
20. (a) Explain why the definite integral  $I = \int_0^2 \sin(x^2) dx$  exists.
- (b) Explain how to use Simpson's method to approximate the value of  $I$  to within 0.001 of its actual value.
- (c) Use your answer from Exercise 19 (b) to explain how to use Theorems 7.38 and 8.12 to approximate  $I$  to within 0.001 of its actual value.
21. Show that when you take the derivative of the Maclaurin series for the sine function term by term you obtain the Maclaurin series for cosine.
22. Show that when you take the derivative of the Maclaurin series for the cosine function term by term you obtain the negative of the Maclaurin series for the sine.
23. Show that when you take the derivative of the Maclaurin series for the exponential function term by term you obtain the same series you started with. Why does that make sense?
24. (a) Verify that
- $$\frac{d}{dx} (x \sin(x^3)) = \sin(x^3) + 3x^3 \cos(x^3).$$
- (b) Use multiplication and/or substitution in the Maclaurin series for the sine and the cosine to find the Maclaurin series for  $x \sin(x^3)$ ,  $\sin(x^3)$ , and  $3x^3 \cos(x^3)$ .
- (c) Use Theorem 8.11 to find the Maclaurin series for  $\frac{d}{dx} (x \sin(x^3))$ , and show that this series is the sum of the Maclaurin series for  $\sin(x^3)$  and  $3x^3 \cos(x^3)$  you obtained in part (b).

## Skills

In Exercises 25–30, find Maclaurin series for the given pairs of functions, using these steps:

- (a) Use substitution and/or multiplication and the Maclaurin series for  $\frac{1}{1-x}$  to find the Maclaurin series for the given function. Also, provide the interval of convergence for the series you found.
- (b) Use Theorem 8.11 and your answer from part (a) to find the Maclaurin series for the given function. Also, provide the interval of convergence for the series you found.

25. (a)  $\frac{1}{1+x^2}$  (b)  $\frac{x}{(1+x^2)^2}$

26. (a)  $\frac{1}{1-x^3}$  (b)  $\frac{x^2}{(1-x^3)^2}$

27. (a)  $\frac{1}{1+8x^3}$  (b)  $\frac{x^2}{(1+8x^3)^2}$

28. (a)  $\frac{1}{3-x}$  (b)  $\frac{1}{(3-x)^2}$

29. (a)  $\frac{1}{4-x^2}$  (b)  $\frac{x}{(4-x^2)^2}$

30. (a)  $\frac{1}{(3-x)^2}$  (b)  $\frac{1}{(3-x)^3}$

(Hint: See Exercise 28).

In Exercises 31–34, find Maclaurin series for the given pairs of functions, using these steps:

- (a) Use substitution in the appropriate Maclaurin series to find the Maclaurin series for the given function.
- (b) Use Theorem 8.11 and your answer from part (a) to find the Maclaurin series for the given function.
- (c) Find the Maclaurin series for the function in (b), using multiplication and substitution with the appropriate Maclaurin series. Compare your answers from (b) and (c).

31. (a)  $\sin(x^2)$  (b)  $x \cos(x^2)$

32. (a)  $\cos(4x^3)$  (b)  $x^2 \sin(4x^3)$

33. (a)  $e^{-x^2}$  (b)  $xe^{-x^2}$

34. (a)  $\tan^{-1}\left(\frac{x^2}{3}\right)$  (b)  $\frac{x}{9+x^4}$

In Exercises 35–40, explore the Taylor series for the given pairs of functions, using these steps:

- (a) Find the Taylor series for the given function at the specified value of  $x_0$  and determine the interval of convergence for the series.
- (b) Use Theorem 8.11 and your answer from part (a) to find the Taylor series for the given function for the same value of  $x_0$ . Also, find the interval of convergence for your series.

35. (a)  $\frac{1}{1-x}$ ,  $x_0 = 3$  (b)  $\frac{1}{(1-x)^2}$

36. (a)  $\frac{1}{1-x}$ ,  $x_0 = -3$  (b)  $\frac{1}{(1-x)^2}$

37. (a)  $\frac{1}{2-x}$ ,  $x_0 = 3$  (b)  $\frac{1}{(2-x)^2}$

38. (a)  $\frac{1}{2-x}$ ,  $x_0 = -3$  (b)  $\frac{1}{(2-x)^2}$

39. (a)  $\frac{1}{1-3x}$ ,  $x_0 = 3$  (b)  $\frac{1}{(1-3x)^2}$

40. (a)  $\frac{1}{1-3x}$ ,  $x_0 = -3$  (b)  $\frac{1}{(1-3x)^2}$

In Exercises 41–50, find Maclaurin series for the given pairs of functions, using these steps:

- (a) Use substitution and/or multiplication and the appropriate Maclaurin series to find the Maclaurin series for the given function  $f$ .
- (b) Use Theorem 8.12 and your answer from part (a) to find the Maclaurin series for the antiderivative  $F = \int f$  that satisfies the specified initial condition.

41. (a)  $f(x) = \sin(x^3)$  (b)  $F(0) = 2$

42. (a)  $f(x) = x \cos(x^3)$  (b)  $F(0) = -1$

43. (a)  $f(x) = e^{-x^2/3}$  (b)  $F(0) = 0$

44. (a)  $f(x) = \tan^{-1}(x^2)$  (b)  $F(0) = \pi$

45. (a)  $f(x) = \frac{1}{1+x^3}$  (b)  $F(0) = -5$

46. (a)  $f(x) = \ln(4+x^2)$  (b)  $F(0) = -2$

47. (a)  $f(x) = x^2 \sin(5x^2)$  (b)  $F(0) = 1$

48. (a)  $f(x) = x^3 \cos\left(\frac{x}{2}\right)$  (b)  $F(0) = -4$

49. (a)  $f(x) = x^2 e^{-3x^2}$  (b)  $F(0) = 1$

50. (a)  $f(x) = x^4 \tan^{-1}(3x^3)$  (b)  $F(0) = 0$

Use Theorem 8.12 and the results from Exercises 41–50 to find series equal to the definite integrals in Exercises 51–60.

51.  $\int_0^2 \sin(x^3) dx$  52.  $\int_0^1 x \cos(x^3) dx$

53.  $\int_{-1}^1 e^{-x^2/3} dx$  54.  $\int_{0.1}^{0.2} \tan^{-1}(x^2) dx$

55.  $\int_0^{0.3} \frac{dx}{1+x^3}$  56.  $\int_{0.5}^1 \ln(4+x^2) dx$

57.  $\int_1^2 x^2 \sin(5x^2) dx$  58.  $\int_{0.5}^2 x^3 \cos\left(\frac{x}{2}\right) dx$

59.  $\int_{0.5}^1 x^2 e^{-3x^2} dx$

60.  $\int_0^{0.3} x^4 \tan^{-1}(3x^3) dx$

65.  $\int_0^{0.3} \frac{dx}{1+x^3}$

66.  $\int_{0.5}^1 \ln(4+x^2) dx$

Use the results from Exercises 51–60 and Theorem 7.38 to approximate the values of the definite integrals in Exercises 61–70 to within 0.001 of their values.

61.  $\int_0^2 \sin(x^3) dx$

62.  $\int_0^1 x \cos(x^3) dx$

67.  $\int_1^2 x^2 \sin(5x^2) dx$

68.  $\int_{0.5}^2 x^3 \cos\left(\frac{x}{2}\right) dx$

63.  $\int_{-1}^1 e^{-x^2/3} dx$

64.  $\int_{0.1}^{0.2} \tan^{-1}(x^2) dx$

69.  $\int_{0.5}^1 x^2 e^{-3x^2} dx$

70.  $\int_0^{0.3} x^4 \tan^{-1}(3x^3) dx$

## Applications

71. Airy's equation  $y'' = xy$  was developed to describe the patterns of light that pass through a circular aperture and that are caused by diffraction at the edges of the aperture. Show that the function

$$y_0(x) = 1 + \sum_{k=1}^{\infty} \frac{x^{3k}}{(2 \cdot 3)(5 \cdot 6) \cdots ((3k-1) \cdot 3k)}$$

is a solution of Airy's equation.

72. Annie throws a rock into the water near her camp on a very calm morning and watches the ripples spread from the point where the rock splashed. She knows that those ripples can be described radially by Bessel functions. The Bessel function of order  $p$  is given by

$$J_p(x) = \sum_{k=0}^{\infty} \frac{(-1)^k x^{2k+p}}{k!(k+p)!2^{2k+p}}$$

Show that

$$xJ_0(x) = \frac{d}{dx}(xJ_1(x)).$$

## Proofs

73. Prove that if the series  $\sum_{k=0}^{\infty} a_k x^k$  and  $\sum_{k=0}^{\infty} b_k x^k$  both converge to the same sum for every value of  $x$  in some nontrivial interval, then  $a_k = b_k$  for every nonnegative integer  $k$ .

74. Let  $f$  be an even function with Maclaurin series representation  $\sum_{k=0}^{\infty} a_k x^k$ . Prove that  $a_{2k+1} = 0$  for every nonnegative integer  $k$ .

75. Let  $f$  be an odd function with Maclaurin series representation  $\sum_{k=0}^{\infty} a_k x^k$ . Prove that  $a_{2k} = 0$  for every nonnegative integer  $k$ .

## Thinking Forward

► *The complex number  $i$ :* If we define  $i = \sqrt{-1}$ , show that  $i^2 = -1$ ,  $i^3 = -i$ , and  $i^4 = 1$ .

► *Euler's Formula:* Use the results of the previous exercise and the Maclaurin series for the sine, the cosine, and the exponential function to derive **Euler's formula**

$$e^{ix} = \cos x + i \sin x.$$

## CHAPTER REVIEW, SELF-TEST, AND CAPSTONES

Before you progress to the next chapter, be sure you are familiar with the definitions, concepts, and basic skills outlined here. The capstone exercises at the end bring together ideas from this chapter and look forward to future chapters.

### Definitions

Give precise mathematical definitions or descriptions of each of the concepts that follow. Then illustrate the definition or description with a graph or an algebraic example.

- ▶ *power series in  $x$*
- ▶ *power series in  $x - x_0$*
- ▶ *interval of convergence*
- ▶ *radius of convergence*
- ▶ *Maclaurin polynomial*
- ▶ *Taylor polynomial*
- ▶ *Maclaurin series*
- ▶ *Taylor series*
- ▶ *the remainder of a function*

### Theorems

Fill in the blanks to complete each of the following theorem statements:

- ▶ Let  $\sum_{k=0}^{\infty} a_k x^k$  be a power series in  $x$ . Exactly one of the following is true:  
The series converges only at \_\_\_\_\_.  
There exists a positive real number  $\rho$  such that the series converges absolutely for every  $x \in$  \_\_\_\_\_ and diverges if  $x$  \_\_\_\_\_ or  $x$  \_\_\_\_\_.  
The series converges absolutely for every \_\_\_\_\_.
- ▶ Let  $\sum_{k=0}^{\infty} a_k (x - x_0)^k$  be a power series in  $x - x_0$ . Exactly one of the following is true:  
The series converges only at \_\_\_\_\_.

There exists a positive real number  $\rho$  such that the series converges absolutely for every  $x \in$  \_\_\_\_\_ and diverges if  $x$  \_\_\_\_\_ or  $x$  \_\_\_\_\_.

The series converges absolutely for every \_\_\_\_\_.

- ▶ *Lagrange's Form for the Remainder*: Let  $f$  be a function that can be differentiated  $n + 1$  times in some open interval  $I$  containing the point  $x_0$ , and let  $R_n(x)$  be the  $n$ th remainder for  $f$  at  $x = x_0$ . For each point  $x \in I$ , there is at least one  $c$  between \_\_\_\_\_ and \_\_\_\_\_ such that  $R_n(x) =$  \_\_\_\_\_.

### Derivatives and Integrals of Power Series

*The Calculus of Power Series*: Let  $\sum_{k=0}^{\infty} a_k (x - x_0)^k$  be a power series in  $x - x_0$  that converges to a function  $f(x)$  on an interval  $I$ .

- ▶ The derivative of  $f$  is given by  $f'(x) =$  \_\_\_\_\_.  
The interval of convergence for this new series is \_\_\_\_\_, with the possible exception that \_\_\_\_\_.
- ▶ The indefinite integral of  $f$  is given by  $\int f(x) dx =$  \_\_\_\_\_.  
The interval of convergence for this new series is \_\_\_\_\_, with the possible exception that \_\_\_\_\_.
- ▶ If  $c$  and  $d$  are two points in  $I$ , then the definite integral of  $f$  on the interval  $[c, d]$  is given by  $\int_c^d f(x) dx =$  \_\_\_\_\_.

### Skill Certification: Working with Power Series

*Interval of convergence and radius of convergence*: Find the interval of convergence and radius of convergence for each of the given power series. If the interval of convergence is finite, test the series for convergence at each of the endpoints of the interval.

1.  $\sum_{k=2}^{\infty} \frac{1}{\ln k} x^k$
2.  $\sum_{k=2}^{\infty} (-1)^k \frac{1}{k (\ln k)^2} x^k$
3.  $\sum_{k=1}^{\infty} \ln k (x - 3)^k$
4.  $\sum_{k=1}^{\infty} k^k (x + 1)^k$

$$5. \sum_{k=0}^{\infty} \frac{5^k}{(2k)!} (x+2)^k$$

$$6. \sum_{k=1}^{\infty} \frac{k!}{k^k} (x-4)^k$$

$$7. \sum_{k=1}^{\infty} \frac{(-1)^k}{k2^k} (x-2)^k$$

$$8. \sum_{k=1}^{\infty} (x-3)^k$$

*Maclaurin and Taylor polynomials:* Find third-order Maclaurin or Taylor polynomial for the given function about the indicated point.

$$9. \tan^{-1} x, x_0 = 0$$

$$10. \tan x, x_0 = \frac{\pi}{3}$$

$$11. x \sin x, x_0 = 0$$

$$12. \sin x, x_0 = \frac{\pi}{2}$$

$$13. (x^2 + 1)^{3/2}, x_0 = 0$$

$$14. \sqrt{x}, x_0 = 1$$

*Maclaurin and Taylor series:* Find the indicated Maclaurin or Taylor series for the given function about the indicated point, and find the radius of convergence for the series.

$$15. \sin x, x_0 = 0$$

$$16. \sin x, x_0 = \frac{\pi}{2}$$

$$17. e^x, x_0 = 0$$

$$18. e^x, x_0 = 1$$

$$19. \frac{1}{1-x}, x_0 = 0$$

$$20. \frac{1}{1-x}, x_0 = 2$$

$$21. \frac{1}{x}, x_0 = 1$$

$$22. \frac{1}{x}, x_0 = -1$$

$$23. \sqrt{x}, x_0 = 1$$

$$24. \sqrt{x}, x_0 = 2$$

*Recognizing power series:* Use the Maclaurin series for  $\sin x$ ,  $\cos x$ , and  $e^x$  to find the values of the following series.

$$25. \pi - \frac{\pi^3}{3!} + \frac{\pi^5}{5!} - \frac{\pi^7}{7!} + \dots$$

$$26. \pi - \frac{\pi^2}{2!} + \frac{\pi^3}{3!} - \frac{\pi^4}{4!} + \frac{\pi^5}{5!} + \dots$$

$$27. 1 - \frac{\pi^2}{2^2 \cdot 2!} + \frac{\pi^4}{2^4 \cdot 4!} - \frac{\pi^6}{2^6 \cdot 6!} + \dots$$

$$28. e - \frac{e^3}{3!} + \frac{e^5}{5!} - \frac{e^7}{7!} + \dots$$

*Manipulating power series:* Find power series representations for the indicated functions.

29. Use the Maclaurin series for  $e^x$  to find power series representations for  $g(x) = x^2 e^x$ ,  $g'(x)$ , and  $\int g(x) dx$ .

30. Use the Maclaurin series for  $\frac{1}{1-x}$  to find a power series representation for  $\frac{x^2}{(1-x^3)^2}$ .

31. Use the Maclaurin series for  $\frac{1}{1-x}$  to find power series representations for  $\frac{1}{1+x}$ ,  $\ln(1+x)$ ,  $\int \ln(1+x) dx$ , and  $\int_0^2 \ln(1+x) dx$ .

32. Use the Maclaurin series for  $\cos x$  to find series representations for  $\cos(x^3)$ ,  $\int \cos(x^3) dx$ , and  $\int_0^1 \cos(x^3) dx$ .

*Approximations using power series:* Use the indicated power series to approximate each of the following quantities.

33. Find the Maclaurin series for  $e^{-x}$ , and use it to approximate  $\frac{1}{\sqrt{e}}$  to within 0.001 of its value. How many terms would you need to approximate  $\frac{1}{\sqrt{e}}$  to within  $10^{-6}$  of its value?

34. Find the Maclaurin series for  $e^{-x^2}$ , and use it to approximate  $\int_0^1 e^{-x^2} dx$  to within 0.001 of its value. How many terms would you need to approximate the integral to within  $10^{-6}$  of its value?

35. Find the Maclaurin series for  $\sin(x^2)$ , and use it to approximate  $\int_0^3 \sin(x^2) dx$  to within 0.001 of its value. How many terms would you need to approximate the integral to within  $10^{-6}$  of its value?

36. Find the Maclaurin series for  $\cos(x^4)$ , and use it to approximate  $\int_0^1 \cos(x^4) dx$  to within 0.001 of its value. How many terms would you need to approximate the integral to within  $10^{-6}$  of its value?

## Capstone Problems

A. Use the Maclaurin series for  $\sin x$ ,  $\cos x$ , and  $e^x$  to prove that

$$(a) \frac{d}{dx} (\sin x) = \cos x$$

$$(b) \frac{d}{dx} (\cos x) = -\sin x$$

$$(c) \frac{d}{dx} (e^x) = e^x$$

B. Consider the definite integral  $\int_0^1 \tan^{-1} x dx$ .

(a) Evaluate the integral using integration by parts.

(b) Recall that

$$\tan^{-1} x = \sum_{k=0}^{\infty} \frac{(-1)^k}{2k+1} x^{2k+1},$$

with interval of convergence  $[-1, 1]$ . Use Theorem 8.12 to evaluate the integral by integrating the Maclaurin series.

(c) Assuming that you can rearrange the terms of the series, show that your answers to (a) and (b) are equivalent.

C. Consider the first-order linear initial-value problem  $y' - y = 1$ ,  $y(0) = 2$ .

- (a) Use the techniques of Section 6.5 to show that  $y = 3e^x - 1$  is the solution to the initial-value problem.
- (b) Follow these steps to find a series solution to the problem:

- ▶ Assume that  $y$  may be represented by a power series in  $x$ . That is,  $y = \sum_{k=0}^{\infty} a_k x^k$ . Explain why  $a_0 = 2$ .
- ▶ Use Theorem 8.11 to explain why the power series for  $y'$  is  $y' = \sum_{k=1}^{\infty} k a_k x^{k-1}$ .
- ▶ Reindex the series for  $y'$  to show that  $y' = \sum_{k=0}^{\infty} (k+1) a_{k+1} x^k$ .
- ▶ Use the differential equation  $y' - y = 1$  to combine the series for  $y'$  and  $y$ , and thereby show that

$$\sum_{k=0}^{\infty} ((k+1)a_{k+1} - a_k) x^k = 1.$$

- ▶ Explain why the preceding series implies that  $a_1 - a_0 = 1$  and therefore  $a_1 = 3$ .
- ▶ Explain why we have the recursion formula  $a_{k+1} = \frac{a_k}{k+1}$  for every  $k \geq 1$ .
- ▶ Use the recursion formula to determine the values of  $a_k$  for  $k \geq 2$ .
- ▶ Use the values for  $a_0, a_1, a_2, \dots$  to find a series solution of the differential equation.
- ▶ Show that your series solution is equal to the function  $3e^x - 1$ .

D. Consider the initial-value problem  $y' - 2xy = x$ ,  $y(0) = 1$ .

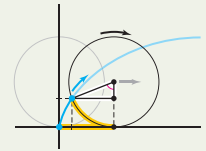

- (a) Use the techniques of Section 6.5 to solve the initial-value problem.
- (b) Use the series technique outlined in Problem D to solve the initial-value problem.
- (c) Show that your two solutions are equivalent.

## 9.1 PARAMETRIC EQUATIONS

- ▶ Defining and graphing parametric equations
- ▶ Finding slopes of tangent lines on parametric curves
- ▶ Finding the arc length of a parametric curve

### Parametric Equations

In most of this book up to now we have studied functions of the form  $y = f(x)$ , where  $y$  is explicitly expressed as a function of  $x$ . There are advantages to using equations of this form. In particular, they are often relatively easy to analyze and graph with the tools of calculus. However, there are disadvantages as well. One fundamental limitation is that not every curve of interest has a simple representation in this form. As we saw in Section 2.4, this limitation can be partially addressed by using implicitly defined functions of the form  $F(x, y) = c$ . In this section we discuss a different method for expressing relationships in the plane: parametric equations. When we use parametric equations, each variable is expressed independently as a function of a new variable, called a parameter. The knobs on an Etch A Sketch<sup>®</sup> toy show how each variable of a graph can be controlled individually. In a more complex setting, machine tools are also guided parametrically.

#### DEFINITION 9.1

#### Parametric Equations in Two Variables

**Parametric equations** in two variables are a pair of functions

$$x = f(t) \quad \text{and} \quad y = g(t),$$

where the **parameter**  $t$  is defined on some interval  $I$  of real numbers.

A **parametric curve** is the set of points in the coordinate plane:

$$\{(x(t), y(t)) \mid t \in I\}.$$

For example, we will soon show that the pair of equations

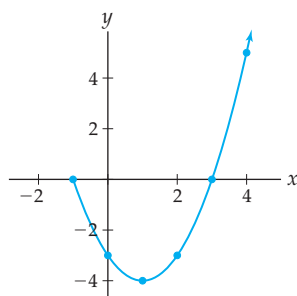

$$x = t + 1, \quad y = t^2 - 4 \quad \text{for } t \geq -2$$

has the graph shown next on the left, and that the pair of equations

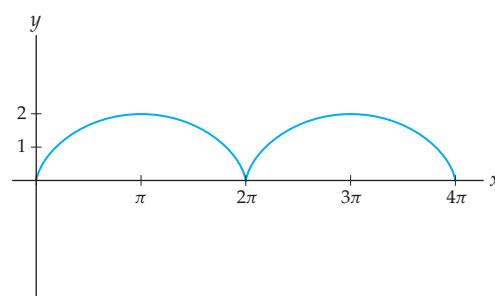

$$x = t - \sin t, \quad y = 1 - \cos t \quad \text{for } t \in [0, 4\pi]$$

has the graph shown on the right.

The graph of  $x = t + 1, y = t^2 - 4$

The graph of  $x = t - \sin t, y = 1 - \cos t$

In these equations we used the letter  $t$  as the parameter, so we say that the curves are **parametrized** by  $t$ . The particular letter that we use is not important. However, we will often think of  $t$  as representing time. When this is the case, we say that the curve is **parametrized by time**. On other occasions, the parameter may represent a rotation; in that case we might use the angles  $\theta$  or  $\phi$  as our parameter.

There are two important reasons for introducing parametric equations. First, some curves are most naturally expressed with parametric equations. Second, such equations can be generalized to express curves in three-dimensional space. (See Sections 10.5 and 11.1.) In many applications, we will have a curve or phenomenon we wish to understand and parametric equations will be the easiest way to describe the motion involved.

To gain a basic understanding of parametric equations, however, we continue by ignoring these important reasons, at least for now. Instead we will start with some parametric equations and look for the curves they describe.

## Graphing Parametric Equations

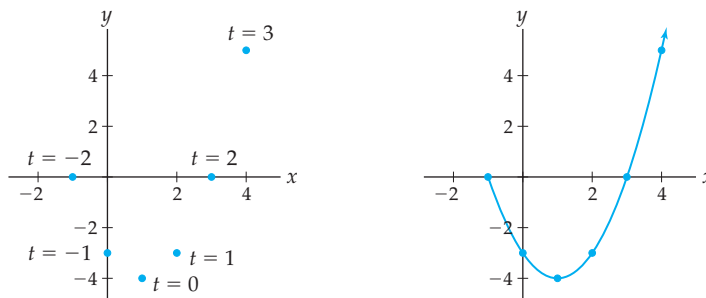

The most basic way to plot any curve is to plot points and then “connect the dots.” This is probably the first technique you learned when you started graphing functions. It is also the way your graphing calculator and most computer algebra systems plot curves. In fact, this is the very reason that graphs of curves with discontinuities often are not plotted well by a calculator. To start we will use the “connect the dots” approach to plot the parametric curve given by

$$x = t + 1 \quad \text{and} \quad y = t^2 - 4 \quad \text{for} \quad t \in [-2, \infty).$$

Using these equations, we may generate the following table that contains the coordinates of several points on the curve:

$t$	-2	-1	0	1	2	3
$x = t + 1$	-1	0	1	2	3	4
$y = t^2 - 4$	0	-3	-4	-3	0	5

We then plot the points  $(x, y)$  and connect the dots with a curve, as follows:

Observe that we have added an arrowhead to one end of the curve in the second figure. This is because, as the parameter  $t$  increases, it imposes a direction on the curve. For the values of  $t$  that we happened to consider, the curve begins at the smallest value,  $t = -2$ , and the arrow indicates the direction of motion as  $t$  increases. It is important to note that a given curve in the plane could be parametrized many different ways. Different parametric equations could traverse the same curve in the opposite direction. Other equations could traverse the same curve, but double back on portions of the curve over certain subintervals.

For example, in Exercises 14 and 15 we will ask you to show that the parametrization

$$x = 2t + 1 \quad \text{and} \quad y = 4t^2 - 4 \quad \text{for} \quad t \in [-1, \infty)$$

traces exactly the same curve as the one shown, and that the equations

$$x = \sin t + 1 \quad \text{and} \quad y = \sin^2 t - 4 \quad \text{for} \quad t \in (-\infty, \infty)$$

repeatedly trace a portion of the same parabola.

If the parametric equations are simple enough, we may also graph the curve by **eliminating the parameter**. The process of eliminating the parameter usually takes one of two forms. If the function  $x = f(t)$  is invertible and we can find a simple expression for the inverse,  $t = f^{-1}(x)$ , then we may obtain  $y = g(f^{-1}(x))$ . For example, this is possible with the preceding equations by solving  $x = t + 1$  for  $t$ , yielding  $t = x - 1$ . We then replace  $t$  with  $x - 1$  in the equation for  $y$ , giving the equation

$$y = (x - 1)^2 - 4.$$

This equation defines an upwards-opening parabola whose vertex is at the point  $(1, -4)$ , just as we saw earlier. However, note that when we eliminated the parameter we lost information: The equation  $y = (x - 1)^2 - 4$  neither contains information about the direction of motion imposed by the parameter nor tells us that the parametric equations specify only a portion of the parabola.

We may use a variation of this procedure when  $y = g(t)$  is invertible and we can find a simple expression for the inverse,  $t = g^{-1}(y)$ . In this case, we are expressing either  $x$  or  $y$  as a function of the other variable, and that allows us to use the techniques of earlier chapters to analyze the resulting function.

Another way to eliminate the parameter results in a relationship in which  $y$  is expressed implicitly as a function of  $x$ . For example, if  $x = 2 \sin t$  and  $y = 2 \cos t$ , then when we square both equations, add the two left-hand sides, and add the two right-hand sides, we obtain  $x^2 + y^2 = 4 \sin^2 t + 4 \cos^2 t$ . Using one of the Pythagorean identities, we have  $x^2 + y^2 = 4$ . Thus, the graph of these parametric equations lies on the circle with radius 2 and centered at the origin.

## Direction of Motion and Tangent Lines

In general, the parametric equations  $x = f(t)$  and  $y = g(t)$  do not have to be either continuous or differentiable. For the time being we will assume that the functions are differentiable, and, to allow us to use the chain rule, we will also assume that  $y$  is locally a differentiable function of  $x$  for a point at which  $x$  is a differentiable function of  $t$ .

We may use the derivatives of the parametric equations to obtain information about the direction of motion along the parametric curve with increasing values of  $t$ . When we compute  $\frac{dx}{dt}$  and  $\frac{dy}{dt}$  and examine the signs of these derivatives, we easily determine the direction in which the curve is being drawn. For example, for the parametric equation  $x = t + 1$  and  $y = t^2 - 4$  for  $t \geq -2$ , we have

$$\frac{dx}{dt} = 1 \quad \text{and} \quad \frac{dy}{dt} = 2t.$$

Thus, for all values of  $t$ , since  $\frac{dx}{dt} > 0$ , the curve is being traced from left to right. Since  $\frac{dy}{dt} < 0$  for  $-2 \leq t < 0$  and  $\frac{dy}{dt} > 0$  for  $t > 0$ , the curve is moving down at first, but then starts rising.

To understand the slope of a parametric curve we may use the chain rule,

$$\frac{dy}{dt} = \frac{dy}{dx} \frac{dx}{dt}.$$

Thus, if  $\frac{dx}{dt} \neq 0$ , then

$$\frac{dy}{dx} = \frac{dy/dt}{dx/dt} = \frac{y'(t)}{x'(t)}.$$

For example, the slope of the tangent line to the curve given by  $x = t + 1$  and  $y = t^2 - 4$  when  $t = 4$  is

$$\left. \frac{dy/dt}{dx/dt} \right|_{t=4} = \left. \frac{2t}{1} \right|_{t=4} = 8.$$

More generally, we use this idea to define the tangent line to a parametric curve.

### DEFINITION 9.2 The Slope of a Parametric Curve and the Tangent Line to a Parametric Curve

Let  $x = x(t)$ ,  $y = y(t)$  be parametric equations for  $t$  in some interval  $I$ , and let  $t_0$  be a point in  $I$  at which  $x'(t_0)$  and  $y'(t_0)$  both exist.

- (a) If  $x'(t_0) \neq 0$ , we define the **slope** of the parametric curve at the point  $(x(t_0), y(t_0))$  to be

$$m = \frac{y'(t_0)}{x'(t_0)}.$$

If  $x'(t_0) = 0$ , we define the slope to be

$$m = \lim_{t \rightarrow t_0} \frac{y'(t)}{x'(t)},$$

provided that the limit exists.

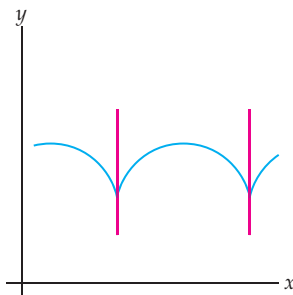

- (b) If the slope  $m$  is defined, the **tangent line** to the parametric curve at the point  $t_0$  is given by the equation

$$y - y(t_0) = m(x - x(t_0)).$$

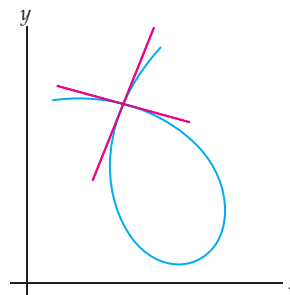

Note that certain tangents to parametric curves are vertical lines. As an extension to the preceding definition we may say that if  $\lim_{t \rightarrow t_0} \frac{y'(t)}{x'(t)} = \pm\infty$ , then the parametric curve has a **vertical tangent line** at  $(x(t_0), y(t_0))$  whose equation is  $x = x(t_0)$ .

Even when the functions  $f$  and  $g$  are differentiable, the curve defined by the parametric equations  $x = f(t)$ ,  $y = g(t)$  may have cusps or other anomalies. For example, the function in the figure that follows at the left is not differentiable at the cusps, although we will soon see that the parametric equations we use to define the curve are differentiable everywhere. In addition, a given parametric curve may have points with two or more tangent lines; see, for example, the following figure at the right:

Cusps are points of non-differentiability

A point on a parametric curve with two tangents

## Arc Length

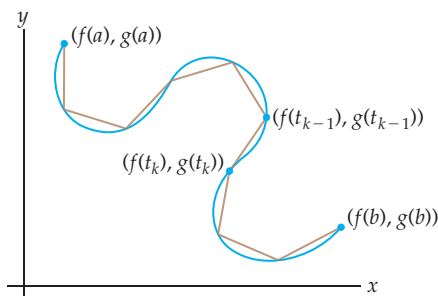

In Section 6.3 we saw that the arc length of a continuous function  $f(x)$  on an interval  $[x_1, x_2]$  is given by the formula

$$\int_{x_1}^{x_2} \sqrt{1 + (f'(x))^2} dx.$$

We will extend this definition to functions defined parametrically.

Suppose  $C$  is a parametric curve defined by  $x = f(t)$  and  $y = g(t)$  for  $t \in [a, b]$ . We can approximate the curve  $C$  with line segments:

Curve  $C$  can be approximated with line segments

We need to use general notation to compute the sum of the lengths of the approximating line segments. Toward that end we subdivide the interval  $[a, b]$  into  $n$  equal pieces and define  $\Delta t = \frac{b-a}{n}$ . Then, for  $k = 0, 1, 2, \dots, n$ , we define  $t_k = a + k\Delta t$ . The length of  $C$  can be approximated by the sum of the lengths of the segments extending from the points  $(f(t_{k-1}), g(t_{k-1}))$  to the points  $(f(t_k), g(t_k))$ . Notice that this is the same process we followed in Section 6.3, except that here we are subdividing the interval on which the parameter is defined. Using the distance formula and then adding up the lengths of each of the line segments, we arrive at the following approximation for the length of the curve  $C$  as the parameter  $t$  varies from  $a$  to  $b$ :

$$\sum_{k=1}^n \sqrt{(f(t_k) - f(t_{k-1}))^2 + (g(t_k) - g(t_{k-1}))^2}.$$

As in Section 6.3, the length of the curve  $C$  for  $t \in [a, b]$  is defined as the limit of the approximate quantity as the number of pieces in our subdivision increases without bound.

### DEFINITION 9.3 The Arc Length of a Parametric Curve

Let  $C$  be a curve in the plane with parametrization  $x = f(t)$ ,  $y = g(t)$  for  $t \in [a, b]$ , where  $f$  and  $g$  are differentiable functions of  $t$  such that the parametrization is a one-to-one function from the interval  $[a, b]$  to the curve  $C$ . Then the **length of the curve**  $C$  is

$$\lim_{n \rightarrow \infty} \sum_{k=1}^n \sqrt{(f(t_k) - f(t_{k-1}))^2 + (g(t_k) - g(t_{k-1}))^2},$$

where  $\Delta t = \frac{b-a}{n}$  and  $t_k = a + k\Delta t$ .

The requirement in Definition 9.3 that the parametrization be a one-to-one function from the interval  $[a, b]$  to the curve  $C$  ensures that  $C$  is traversed exactly once as  $t$  increases from  $a$  to  $b$ . This means that the parametrization does not trace any part of the curve more than

once. (Actually, this requirement can be relaxed somewhat; we can allow isolated points to be duplicated, and the definition will still hold.)

You may have noticed that the expression in Definition 9.3 looks almost like a limit of Riemann sums. The following theorem tells us how to interpret this quantity as a definite integral:

### THEOREM 9.4 The Arc Length of a Parametric Curve

Let  $C$  be a curve in the plane with parametrization  $x = f(t)$ ,  $y = g(t)$  for  $t \in [a, b]$  such that the parametrization is a one-to-one function from the interval  $[a, b]$  to the curve  $C$ . If  $x = f(t)$  and  $y = g(t)$  are differentiable functions of  $t$  such that  $f'(t)$  and  $g'(t)$  are continuous on  $[a, b]$ , then the length of the curve  $C$  is given by

$$\int_a^b \sqrt{(f'(t))^2 + (g'(t))^2} dt.$$

**Proof.** By Definition 9.3, the length of the curve  $C$  is

$$\lim_{n \rightarrow \infty} \sum_{k=1}^n \sqrt{(f(t_k) - f(t_{k-1}))^2 + (g(t_k) - g(t_{k-1}))^2}.$$

Some simple algebra then shows that this is equivalent to

$$\lim_{n \rightarrow \infty} \sum_{k=1}^n \sqrt{\left(\frac{f(t_k) - f(t_{k-1})}{\Delta t}\right)^2 + \left(\frac{g(t_k) - g(t_{k-1})}{\Delta t}\right)^2} \Delta t,$$

where  $\Delta t = \frac{b-a}{n}$  and  $t_k = a + k\Delta t$ . Applying the Mean Value Theorem to  $f$  and  $g$ , we find that for each  $k$  there are points  $t_k^*$  and  $t_k^{**}$  in  $[t_{k-1}, t_k]$  such that

$$f'(t_k^*) = \frac{f(t_k) - f(t_{k-1})}{\Delta t} \quad \text{and} \quad g'(t_k^{**}) = \frac{g(t_k) - g(t_{k-1})}{\Delta t}.$$

Thus the length of  $C$  is

$$\lim_{n \rightarrow \infty} \sum_{k=1}^n \sqrt{(f'(t_k^*))^2 + (g'(t_k^{**}))^2} \Delta t.$$

This last quantity is almost the limit of a Riemann sum. It is not the limit of a Riemann sum because  $t_k^*$  and  $t_k^{**}$  are, in general, different points. However, since  $f'$  and  $g'$  are both continuous, it can be shown that  $t_k^*$  and  $t_k^{**}$  get sufficiently close to each other as  $n \rightarrow \infty$  for this not to matter. (The proof of this fact is outside of the scope of the text.) Applying the preceding final result, we find that the limit of our sum is the desired integral

$$\int_a^b \sqrt{(f'(t))^2 + (g'(t))^2} dt. \quad \blacksquare$$

## Examples and Explorations

### EXAMPLE 1

#### Parametrizing the unit circle

Sketch the parametric curves determined by the following parametric equations:

(a)  $x = \cos t$ ,  $y = \sin t$ ,  $t \in [0, \pi]$

(b)  $x = \cos t$ ,  $y = \sin t$ ,  $t \in [\pi, 2\pi]$

(c)  $x = \sin(3t)$ ,  $y = \cos(3t)$ ,  $t \in [0, 2\pi]$

(d)  $x = \frac{1-t^2}{1+t^2}$ ,  $y = \frac{2t}{1+t^2}$ ,  $t \in [0, \infty)$

**SOLUTION**

- (a) We will start by eliminating the parameter, but also plot a few points along the way. If we square the equations for  $x$  and  $y$ , we obtain  $x^2 = \cos^2 t$  and  $y^2 = \sin^2 t$ . Now adding these two equations and applying the Pythagorean identity, we have

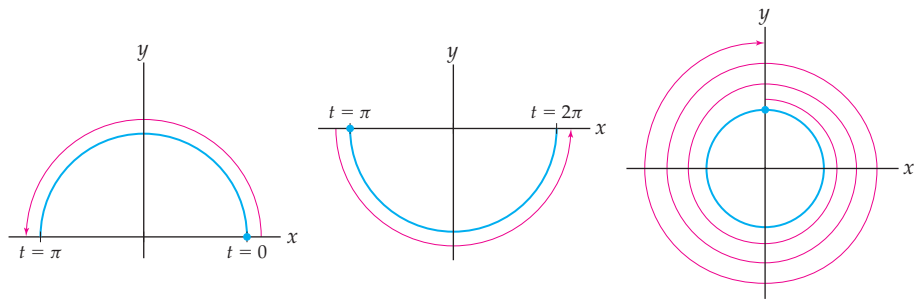

$$x^2 + y^2 = \cos^2 t + \sin^2 t = 1.$$

Therefore  $x^2 + y^2 = 1$ , which means that the parametric curve is (at least a portion of) a circle of radius 1 and centered at the origin. We want to know where on this circle the parametric curve lies, and we also want to know the direction of motion as  $t$  increases. Consider the following three values of  $t$ :  $t = 0$ ,  $t = \frac{\pi}{2}$ , and  $t = \pi$ . Corresponding to these values we have  $(x(0), y(0)) = (\cos 0, \sin 0) = (1, 0)$ ,

$$\left(x\left(\frac{\pi}{2}\right), y\left(\frac{\pi}{2}\right)\right) = \left(\cos \frac{\pi}{2}, \sin \frac{\pi}{2}\right) = (0, 1), \text{ and } (x(\pi), y(\pi)) = (\cos \pi, \sin \pi) = (-1, 0).$$

In addition, as  $t$  increases (slightly) from 0, both  $x$  and  $y$  will be positive. Thus, we see that the parametric curve is the top half of the unit circle and the direction of motion is counterclockwise; see the first figure that follows at the left.

- (b) We eliminated the parameter from these equations in part (a). A similar analysis of the behavior of the variables  $x$  and  $y$  as  $t$  increases from  $\pi$  to  $2\pi$  shows that this parametrization gives us the bottom half of the unit circle, with the direction of motion still being counterclockwise; see the middle figure. The details are left to Exercise 35.
- (c) We again eliminate the parameter by squaring each equation and adding. Once more, we obtain  $x^2 + y^2 = 1$ . As before, the curve is some portion of the unit circle centered at the origin. Now, however, when  $t = 0$ , we are at the point  $(x(0), y(0)) = (\sin 0, \cos 0) = (0, 1)$ . Furthermore, as  $t$  increases from 0,  $x$  increases and  $y$  decreases; therefore the direction of motion is clockwise. Finally, we note that for  $t \in [0, 2\pi]$  both  $x = \sin 3t$  and  $y = \cos 3t$  go through three periods. Therefore, the unit circle is traversed three times in the clockwise direction with these equations; see the following figure at the right:

- (d) We will see that this pair of equations is quite a different parametrization of the unit circle. Although it does not involve trigonometric functions, we may again eliminate the parameter by squaring each equation and adding the result:

$$\begin{aligned} x^2 + y^2 &= \left(\frac{1-t^2}{1+t^2}\right)^2 + \left(\frac{2t}{1+t^2}\right)^2 = \frac{1-2t^2+t^4+4t^2}{(1+t^2)^2} \\ &= \frac{1+2t^2+t^4}{(1+t^2)^2} = \frac{(1+t^2)^2}{(1+t^2)^2} = 1. \end{aligned}$$

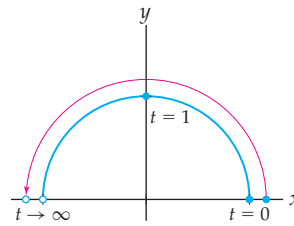

Thus, the parametric curve is again at least a portion of the unit circle. To determine which portion (and in what direction and with what speed), we begin by evaluating  $x$  and  $y$  for two values of  $t$ :

$t$	0	1
$x = \frac{1-t^2}{1+t^2}$	1	0
$y = \frac{2t}{1+t^2}$	0	1

Since the parameter  $t$  can vary from 0 to  $\infty$ , we also evaluate the following limits:

$$\lim_{t \rightarrow \infty} x(t) = \lim_{t \rightarrow \infty} \frac{1-t^2}{1+t^2} = -1, \quad \lim_{t \rightarrow \infty} y(t) = \lim_{t \rightarrow \infty} \frac{2t}{1+t^2} = 0.$$

Putting all this information together, we arrive at the following parametric curve:

Note that every point on the top half of the unit circle is traversed exactly once, except for  $(-1, 0)$ , which is not part of the parametrization. In addition, unlike the motion in parts (a), (b), and (c), the motion here does *not* take place at a uniform speed. For example, as  $t$  increases from 0 to 1, the particle moves all the way from  $(1, 0)$  to  $(0, 1)$ , but as  $t$  increases from 1, the particle moves from  $(0, 1)$  toward, but never reaches  $(-1, 0)$ .  $\square$

### EXAMPLE 2

#### Graphing an astroid

Sketch the graph of the curve described by the parametric equations

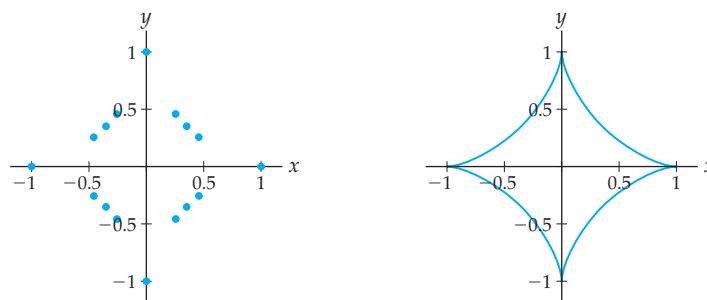

$$x = \cos^3 \theta \quad \text{and} \quad y = \sin^3 \theta.$$

#### SOLUTION

We begin by tabulating the coordinates of several points for some convenient values of  $\theta$ :

$\theta$	0	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$	$\frac{2\pi}{3}$	$\frac{3\pi}{4}$	$\frac{5\pi}{6}$
$x = \cos^3 \theta$	1	$\frac{3\sqrt{3}}{8}$	$\frac{\sqrt{2}}{4}$	$\frac{1}{8}$	0	$-\frac{1}{8}$	$-\frac{\sqrt{2}}{4}$	$-\frac{3\sqrt{3}}{8}$
$y = \sin^3 \theta$	0	$\frac{1}{8}$	$\frac{\sqrt{2}}{4}$	$\frac{3\sqrt{3}}{8}$	1	$\frac{3\sqrt{3}}{8}$	$\frac{\sqrt{2}}{4}$	$\frac{1}{8}$
$\theta$	$\pi$	$\frac{7\pi}{6}$	$\frac{5\pi}{4}$	$\frac{4\pi}{3}$	$\frac{3\pi}{2}$	$\frac{5\pi}{3}$	$\frac{7\pi}{4}$	$\frac{11\pi}{6}$
$x = \cos^3 \theta$	-1	$-\frac{3\sqrt{3}}{8}$	$-\frac{\sqrt{2}}{4}$	$-\frac{1}{8}$	0	$\frac{1}{8}$	$\frac{\sqrt{2}}{4}$	$\frac{3\sqrt{3}}{8}$
$y = \sin^3 \theta$	0	$-\frac{1}{8}$	$-\frac{\sqrt{2}}{4}$	$-\frac{3\sqrt{3}}{8}$	-1	$-\frac{3\sqrt{3}}{8}$	$-\frac{\sqrt{2}}{4}$	$-\frac{1}{8}$

We plot these points in the figure that follows on the left:

In addition, the slope of the curve at each point is a function of  $\theta$ :

$$\frac{dy}{dx} = \frac{dy/d\theta}{dx/d\theta} = \frac{\sin^2 \theta \cos \theta}{-\cos^2 \theta \sin \theta} = -\tan \theta.$$

Thus, the slope of the tangent line to the curve when  $\theta = 0$  is zero. We also see that the slope of the tangent line at every point in the first quadrant is negative, and since  $\lim_{\theta \rightarrow \pi/2^-} (-\tan \theta) = -\infty$ , the slopes are nearly vertical close to the point  $(0, 1)$ . When we analyze the tangents to the curve in the other three quadrants in a similar fashion, and connect the points appropriately, we obtain the graph on the right, known as an **astroid**.

Finally, we note that we can also eliminate the parameter. Here we have  $x^{2/3} = \cos^2 \theta$  and  $y^{2/3} = \sin^2 \theta$ . When we add these two equations together, we obtain  $x^{2/3} + y^{2/3} = 1$ , whose graph is the same astroid.  $\square$

### EXAMPLE 3

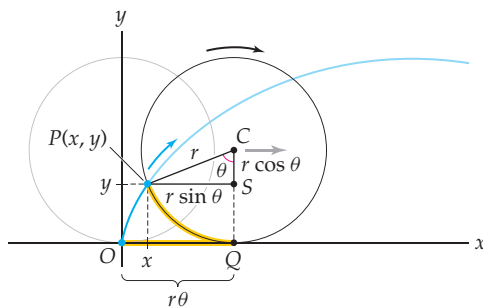

#### Finding parametric equations for the cycloid

Find the parametric equations that describe the curve traced by a point on the circumference of a wheel as it rolls along a straight path.

#### SOLUTION

We see that this is a more realistic application of parametric equations. We may visualize the given curve as the path traced by a point on a bicycle tire as it rolls along a road. In this situation we wish to understand a curve, and parametric equations provide an effective tool to describe it.

We let the radius of the wheel be  $r$  and, for convenience, we place our wheel on a track formed by the  $x$ -axis, with the point tracing the curve starting at the origin. The gray circle in the figure that follows shows the initial position of the wheel, and the black circle shows the wheel after it has rolled a short distance. The blue curve is what we wish to describe with the use of parametric equations.

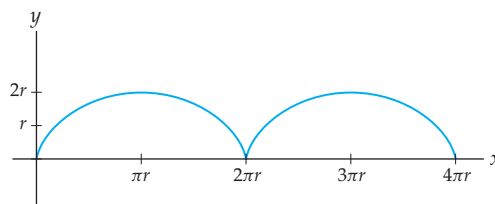

To parametrize the blue curve, we need to find a parameter that can be used to describe both the  $x$ - and  $y$ -coordinates of each point on the curve; one such parameter is the angle  $\theta$ , measured in radians, through which the wheel has rotated. We need to express the coordinates of each point  $P = P(x, y)$  on the curve in terms of the parameter  $\theta$ . On the one hand, first note that the arc  $\widehat{PQ}$  from  $P$  to  $Q$  subtended by  $\theta$  has length  $r\theta$  and that this length is precisely equal to the length of the horizontal segment  $\overline{OQ}$ . (To see this think of rolling the black circle back to its original position.) On the other hand, the length of  $\overline{OQ}$  is also equal to  $x$  plus the length of segment  $\overline{PS}$ . Since  $PS = r \sin \theta$  and  $OQ = r\theta$ , it follows that  $x = r\theta - r \sin \theta$ . Notice that we have now described the coordinate  $x$  in terms of the parameter  $\theta$  (and the constant  $r$ ).

Similarly,  $y$  plus the length of vertical segment  $\overline{SC}$  is equal to the radius  $r$ . Since the length of  $SC$  is  $r \cos \theta$ , we have  $y = r - r \cos \theta$ . Therefore, we can express the cycloid with the parametric equations

$$x = r\theta - r \sin \theta, \quad y = r - r \cos \theta, \quad \theta \in \mathbb{R}.$$

The following graph shows the cycloid after two revolutions of the circle:

□

#### EXAMPLE 4 Finding tangent lines on the cycloid

Find the equations of the tangent lines to the cycloid  $x = r\theta - r \sin \theta$ ,  $y = r - r \cos \theta$  at  $\theta = \frac{\pi}{2}$ .

#### SOLUTION

To find the equations of the tangent lines, we must first determine the derivative  $\frac{dy}{dx}$  in terms of the parameter  $\theta$ . The parametric equations for the cycloid are

$$x = r\theta - r \sin \theta, \quad y = r - r \cos \theta, \quad \theta \in \mathbb{R}.$$

It is easy to find the derivatives of the coordinates  $x$  and  $y$  with respect to the parameter  $\theta$ :

$$\frac{dx}{d\theta} = r - r \cos \theta, \quad \frac{dy}{d\theta} = r \sin \theta.$$

Now, using Definition 9.2, we have

$$\frac{dy}{dx} = \frac{dy/d\theta}{dx/d\theta} = \frac{r \sin \theta}{r - r \cos \theta} = \frac{\sin \theta}{1 - \cos \theta}.$$

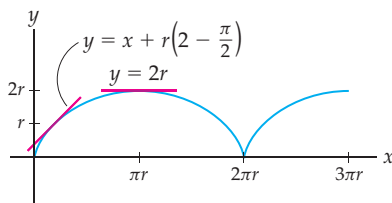

This means that at  $\theta = \frac{\pi}{2}$ , the slope of the tangent line will be  $\frac{\sin(\pi/2)}{1 - \cos(\pi/2)} = 1$ . The point on the cycloid corresponding to  $\theta = \frac{\pi}{2}$  is

$$(x, y) = \left( r \left( \frac{\pi}{2} - \sin \frac{\pi}{2} \right), r - r \cos \frac{\pi}{2} \right) = \left( r \left( \frac{\pi}{2} - 1 \right), r \right).$$

Therefore, the equation of the tangent line at  $\theta = \frac{\pi}{2}$  will be

$$y - r = 1 \left( x - r \left( \frac{\pi}{2} - 1 \right) \right), \quad \text{or equivalently,} \quad y = x + r \left( 2 - \frac{\pi}{2} \right).$$

The following figure shows the tangent line from this example as well as the horizontal tangent line from Example 5:

□

**EXAMPLE 5****Horizontal and vertical tangent lines on the cycloid**

Find all the points on the graph of the cycloid  $x = r\theta - r \sin \theta$ ,  $y = r - r \cos \theta$ ,  $\theta \in \mathbb{R}$  at which the tangent line is either horizontal or vertical, and find the equations of the horizontal tangent lines.

**SOLUTION**

The graph of the cycloid will have a horizontal tangent line wherever the numerator of  $\frac{dy}{dx} = \frac{\sin \theta}{1 - \cos \theta}$  is zero and the denominator is nonzero. This occurs when  $\theta$  is any odd multiple of  $\pi$ . Now we have to find the equations of these horizontal tangent lines. If  $\theta$  is an odd multiple of  $\pi$ , then  $\cos \theta = -1$  and therefore at such values of  $\theta$  we are at the  $y$ -coordinate  $y = r - r(-1) = 2r$ . Thus the equation of the horizontal tangent line at this point is  $y = 2r$ , which should be obvious from looking at the graph of the cycloid. In addition, this horizontal line is tangent to the cycloid at every point where the cycloid has a zero slope.

In the computations we just did, we found the locations and equations of the horizontal tangent lines on the graph of the cycloid. To find the vertical tangent lines, we must find the values of  $\theta$  for which the denominator of  $\frac{dy}{dx} = \frac{\sin \theta}{1 - \cos \theta}$  is zero but the numerator is nonzero, and the values of  $\alpha$  such that

$$\lim_{\theta \rightarrow \alpha} \frac{\sin \theta}{1 - \cos \theta}$$

is undefined. In Exercise 73 you will show that the latter occurs at each even multiple of  $\pi$ . □

**EXAMPLE 6****Analyzing the concavity of a parametric curve**

Let  $x = x(t)$  and  $y = y(t)$  be the parametric equations for a curve  $\mathcal{C}$ . Show that if  $x$  and  $y$  are both twice-differentiable functions of  $t$ , then the concavity at a point on  $\mathcal{C}$  is given by

$$\frac{d^2y}{dx^2} = \frac{\frac{dx}{dt} \frac{d^2y}{dt^2} - \frac{d^2x}{dt^2} \frac{dy}{dt}}{\left(\frac{dx}{dt}\right)^3}$$

when  $\frac{dx}{dt} \neq 0$ .

Use this result to confirm that the cycloid given by  $x = r\theta - r \sin \theta$ ,  $y = r - r \cos \theta$  is concave down everywhere except when  $\theta$  is an even multiple of  $\pi$ .

**SOLUTION**

We first note that by the chain rule we have

$$\frac{d^2x}{dt^2} = \frac{d}{dt} \left( \frac{dx}{dt} \right) = \frac{d}{dx} \left( \frac{dx}{dt} \right) \frac{dx}{dt}.$$

Therefore, when  $\frac{dx}{dt} \neq 0$ ,

$$\frac{d}{dx} \left( \frac{dx}{dt} \right) = \frac{d^2x/dt^2}{dx/dt}.$$

Similarly, we may show that

$$\frac{d}{dx} \left( \frac{dy}{dt} \right) = \frac{d^2y/dt^2}{dx/dt}.$$

Now, since  $\frac{dy}{dx} = \frac{dy/dt}{dx/dt}$ , it follows that

$$\begin{aligned} \frac{d^2y}{dx^2} &= \frac{d}{dx} \left( \frac{dy}{dx} \right) = \frac{d}{dx} \left( \frac{dy/dt}{dx/dt} \right) \\ &= \frac{\frac{dx}{dt} \frac{d}{dx} \left( \frac{dy}{dt} \right) - \frac{d}{dx} \left( \frac{dx}{dt} \right) \frac{dy}{dt}}{\left( \frac{dx}{dt} \right)^2} && \leftarrow \text{the quotient rule} \\ &= \frac{\frac{dx}{dt} \frac{d^2y/dt^2}{dx/dt} - \frac{d^2x/dt^2}{dx/dt} \frac{dy}{dt}}{\left( \frac{dx}{dt} \right)^2} && \leftarrow \text{the earlier equalities} \\ &= \frac{\frac{dx}{dt} \frac{d^2y}{dt^2} - \frac{d^2x}{dt^2} \frac{dy}{dt}}{\left( \frac{dx}{dt} \right)^3}. && \leftarrow \text{algebra} \end{aligned}$$

For the cycloid, since  $x = r\theta - r \sin \theta$  and  $y = r - r \cos \theta$ , we have

$$\frac{dx}{d\theta} = r - r \cos \theta, \quad \frac{d^2x}{d\theta^2} = r \sin \theta, \quad \frac{dy}{d\theta} = r \sin \theta, \quad \text{and} \quad \frac{d^2y}{d\theta^2} = r \cos \theta.$$

Combining these equations with the formula for  $\frac{d^2y}{dx^2}$ , we obtain

$$\begin{aligned} \frac{d^2y}{dx^2} &= \frac{(r - r \cos \theta)(r \cos \theta) - (r \sin \theta)(r \sin \theta)}{(r - r \cos \theta)^3} \\ &= \frac{r^2(\cos \theta - 1)}{r^3(1 - \cos \theta)^3} && \leftarrow \text{algebra and } \sin^2 \theta + \cos^2 \theta = 1 \\ &= -\frac{1}{r(1 - \cos \theta)^2}. && \leftarrow \text{algebra} \end{aligned}$$

Since  $r$  is a positive constant, the quotient  $-\frac{1}{r(1 - \cos \theta)^2} < 0$  when  $\theta$  is not a multiple of  $2\pi$ . Therefore, the cycloid is concave down when  $\theta$  is not an even multiple of  $\pi$ .  $\square$

### EXAMPLE 7

#### Finding the arc length of a parametric curve

Find the arc length of one arch of the cycloid traced by a point on the circumference of a wheel with radius  $r$  units (i.e., the portion of the graph of the cycloid that represents one full rotation of the wheel).

#### SOLUTION

One such arch is given by the portion of the cycloid corresponding to  $\theta \in [0, 2\pi]$ , since one full rotation of the wheel corresponds to  $2\pi$  radians. For  $\theta \in [0, 2\pi]$ , the desired arc length is given by

$$\int_0^{2\pi} \sqrt{(f'(\theta))^2 + (g'(\theta))^2} \, d\theta,$$

where  $f(\theta) = r\theta - r \sin \theta$  and  $g(\theta) = r - r \cos \theta$ . Thus, the arc length is

$$\int_0^{2\pi} \sqrt{(r - r \cos \theta)^2 + (r \sin \theta)^2} d\theta = r \int_0^{2\pi} \sqrt{2 - 2 \cos \theta} d\theta = 8r.$$

The details of the last step (in which the definite integral is calculated to be equal to  $8r$ ) are left for Exercise 40.  $\square$

### ? TEST YOUR UNDERSTANDING

- ▶ What is the definition of parametric equations?
- ▶ How do you graph parametric equations by plotting points? By eliminating the parameter?
- ▶ How do you find the derivative of a curve defined parametrically? How do you find the locations of any horizontal or vertical tangent lines on a parametric curve?
- ▶ The cycloid in Example 3 is the graph of some function of  $x$ —that is,  $y = h(x)$ —since the graph passes the vertical line test. Can you eliminate the parameter from the equations in Example 3 to find  $h(x)$ ?
- ▶ How can a definite integral be used to calculate the arc length of a parametric curve? How does this definite integral arise from a limit of approximations arrived at with the use of line segments?

## EXERCISES 9.1

### Thinking Back

*Eliminating a variable:* Find a relationship between variables  $x$  and  $y$  by eliminating the variable  $t$ .

- ▶  $x = t^2, y = t^6$
- ▶  $x = \sin t, y = \sin t$
- ▶  $x = \sin t, y = \cos t$
- ▶  $x = \sinh t, y = \cosh t$

*Arc length:* Find the arc length of the following curves on the given intervals.

- ▶  $y = 3x - 4, x \in [0, 5]$
- ▶  $y = \sqrt{4 - x^2}, x \in [0, 2]$
- ▶  $y = x^{3/2}, x \in [0, 4]$
- ▶  $y = x^2, x \in [0, 1]$

### Concepts

0. *Problem Zero:* Read the section and make your own summary of the material.
1. *True/False:* Determine whether each of the statements that follow is true or false. If a statement is true, explain why. If a statement is false, provide a counterexample.
  - (a) *True or False:* Every function  $y = f(x)$  can be written in terms of parametric equations.
  - (b) *True or False:* Given parametric equations  $x = x(t)$  and  $y = y(t)$ , the parameter can be eliminated to obtain the form  $y = f(x)$ .
  - (c) *True or False:* Every parametric curve passes the vertical line test.
  - (d) *True or False:* Every curve in the plane has a unique expression in terms of parametric equations.
  - (e) *True or False:* If the functions  $x = f(t)$  and  $y = g(t)$  are differentiable for every  $t \in \mathbb{R}$ , then the parametric curve defined by  $x$  and  $y$  is differentiable for every value of  $t$ .
  - (f) *True or False:* A curve parametrized by  $x = x(t), y = y(t)$  has a horizontal tangent line at  $(x(t_0), y(t_0))$  if  $y'(t) = 0$ .
  - (g) *True or False:* A curve parametrized by  $x = x(t), y = y(t)$  has a horizontal tangent line at  $(x(t_0), y(t_0))$  if  $x'(t) \neq 0$  and  $y'(t) = 0$ .
  - (h) *True or False:* The cycloid curve associated with a circle of radius  $r$  is made up of a series of semicircles of radius  $r$ .
2. *Examples:* Construct examples of the thing(s) described in the following. Try to find examples that are different than any in the reading.
  - (a) Parametric equations  $x = f(t), y = g(t)$  on the interval  $[0, 1]$  that trace the unit circle exactly once clockwise, starting at the point  $(1, 0)$ .
  - (b) Parametric equations  $x = f(t), y = g(t)$  on the interval  $[0, 2\pi)$  that trace the circle centered at  $(2, -3)$  with radius 5 exactly once counterclockwise, starting at the point  $(7, -3)$ .
  - (c) Parametric equations  $x = f(t), y = g(t)$  whose graph is not the graph of a function  $y = f(x)$ .
3. If  $x = x(t)$  and  $y = y(t)$  are differentiable functions of  $t$ , determine the direction of motion along the curve when

- (a)  $x'(t) > 0$  and  $y'(t) > 0$ .  
 (b)  $x'(t) > 0$  and  $y'(t) < 0$ .  
 (c)  $x'(t) < 0$  and  $y'(t) > 0$ .  
 (d)  $x'(t) < 0$  and  $y'(t) < 0$ .

4. Complete the following definition: *Parametric equations* are \_\_\_\_\_.

Use the results of Exercise 3 to analyze the direction of motion for the parametric curves given by the equations in Exercises 5–8.

5.  $x = t^2, y = t^3, t \in \mathbb{R}$   
 6.  $x = \sin t, y = \cos t, t \in \mathbb{R}$   
 7.  $x = e^t, y = \ln t, t > 0$   
 8.  $x = t^3 - t, y = t^3 + t, t \in \mathbb{R}$

In Exercises 9–11 parametrizations are provided for portions of the same function. For each problem do the following:

- (i) Eliminate the parameter to show that the curves are portions of the same function.  
 (ii) Describe the portion of the graph that each parametrization describes.  
 (iii) Discuss the direction of motion along the graph for each parametrization.

## Skills

In Exercises 16–23 sketch the parametric curve by plotting points.

16.  $x = t, y = t^2, t \in \mathbb{R}$   
 17.  $x = 3t + 1, y = t, t \in [-2, 5]$   
 18.  $x = 3t + 1, y = 2t, t \in [0, 8]$   
 19.  $x = 1 - 2t, y = 5 - 3t, t \in \mathbb{R}$   
 20.  $x = 2t - 1, y = 3t + 5, t \in \mathbb{R}$   
 21.  $x = t^3 - t, y = t^3 + t, t \in \mathbb{R}$   
 22.  $x = 2 \sin^3 t, y = 2 \cos^3 t, t \in [0, 2\pi]$   
 23.  $x = \cos^5 t, y = \sin^5 t, t \in [0, 2\pi]$

In Exercises 24–34 sketch the parametric curve by eliminating the parameter.

24.  $x = 2t - 1, y = 3t + 5, t \in \mathbb{R}$   
 25.  $x = 2t - 1, y = 3t^2 + 5, t \in \mathbb{R}$   
 26.  $x = t + 2, y = e^t, t \in \mathbb{R}$   
 27.  $x = \tan t, y = \tan t, t \in \left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$   
 28.  $x = \cos 2t, y = -\sin 2t, t \in [0, 2\pi]$   
 29.  $x = 3 \cos t, y = 4 \sin t, t \in [0, 2\pi]$   
 30.  $x = \sin t, y = \cos 2t, t \in [0, 2\pi]$   
 31.  $x = \cosh t, y = \sinh t, t \in \mathbb{R}$   
 32.  $x = \sec t, y = \tan t, t \in \left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$   
 33.  $x = \csc t, y = \cot t, t \in (0, \pi)$   
 34.  $x = \log_{10} t, y = \ln t, t \in (0, \infty)$   
 35. Finish Example 1 (b) by showing that the graph of the parametric equations  $x = \cos t, y = \sin t, t \in [\pi, 2\pi]$  is the bottom half of the unit circle centered at the origin with a counterclockwise direction of motion.

9. (a)  $x = t, y = t^2 - 1, t \geq 0$   
 (b)  $x = -t, y = t^2 - 1, t \geq 0$   
 10. (a)  $x = t^2, y = t^3, t \geq 0$   
 (b)  $x = t^2, y = t^3, t \leq 0$   
 11. (a)  $x = t, y = \sin t, t \geq 0$   
 (b)  $x = t - 1, y = \sin(t - 1), t \geq 1$

12. Suppose a parametric curve is given by parametric equations  $x = x(t), y = y(t)$  for  $t$  in some interval  $I$ . How can we find the slope of the parametric curve at some point  $(x(t_0), y(t_0))$ ? What is the equation of the tangent line to the parametric curve at the point  $t_0$ ?  
 13. Explain how we can find the locations at which a parametric curve determined by  $x = x(t)$  and  $y = y(t)$  has horizontal or vertical tangent lines.  
 14. Show that the parametrization  $x = 2t + 1, y = 4t^2 - 4$  for  $t \in [-1, \infty)$  has the same graph as the one we plotted point by point in the reading.  
 15. Explain why the parametrization  $x = \sin t + 1, y = \sin^2 t - 4$  for  $t \in (-\infty, \infty)$  repeatedly traces the same small portion of the graph of the function  $y = x^2 - 2x - 3$ .

In Exercises 36–39 provide a parametrization with the given properties

36. The curve is a circle centered at the origin. It is traced once, clockwise, starting at the point  $(0, 1)$  with  $t \in [0, 2\pi]$ .  
 37. The curve is a circle centered at the origin. It is traced once, counterclockwise, starting at the point  $(0, 3)$  with  $t \in [0, 1]$ .  
 38. The curve is a circle centered at the point  $(a, b)$ . It is traced once, counterclockwise, starting at the point  $(a+r, b)$  with  $t \in [0, 2\pi]$ .  
 39. The curve is a circle centered at the origin. It is traced once, counterclockwise, and contains all points of the unit circle except for  $(0, -1)$  with  $t \in \mathbb{R}$ .  
 40. Complete the calculation in Example 7 by using the trigonometric identity  $\sin^2\left(\frac{\theta}{2}\right) = \frac{1}{2}(1 - \cos \theta)$  to show that  $\int_0^{2\pi} \sqrt{1 - \cos \theta} \, d\theta = 4\sqrt{2}$ .

In Exercises 41–44 find an equation for the line tangent to the parametric curve at the given value of  $t$ .

41.  $x = 2t - 1, y = 3t + 5, t = -1$ .  
 42.  $x = t + 2, y = e^t, t = 0$ .  
 43.  $x = t^2, y = (2 - t)^2, t = \frac{1}{2}$ .  
 44.  $x = \cos^3 t, y = \sin^3 t, t = \frac{\pi}{4}$ .

In Exercises 45–48 use Example 6 to find  $\frac{d^2y}{dx^2}$  for the parametric curve at the given value of  $t$ . Note that these are the same parametric equations as in Exercises 41–44.

45.  $x = 2t - 1, y = 3t + 5, t = -1$ .  
 46.  $x = t + 2, y = e^t, t = 0$ .

47.  $x = t^2, y = (2 - t)^2, t = \frac{1}{2}$ .

48.  $x = \cos^3 t, y = \sin^3 t, t = \frac{\pi}{4}$ .

In Exercises 49–53 sketch the parametric curve and find its length.

49.  $x = 1 + t^2, y = 3 + 2t^3, t \in [0, 1]$

50.  $x = \cos \theta + \theta \sin \theta, y = \sin \theta - \theta \cos \theta, \theta \in [0, 2\pi]$

51.  $x = \sin^3 \theta, y = \cos^3 \theta, \theta \in [0, 2\pi]$

52.  $x = e^t \cos t, y = e^t \sin t, t \in [0, 1]$

53.  $x = 5 + 2t, y = e^t + e^{-t}, t \in [0, 1]$

54. Show that the graph of the parametric equations

$$x = a + (c - a)t, y = b + (d - b)t, t \in [0, 1]$$

is a line segment from  $(a, b)$  to  $(c, d)$ .

In Exercises 55–60 use the result of Exercise 54 to find parametric equations for the line segments connecting the given pairs of points in the direction indicated.

55. From  $(1, -3)$  to  $(6, 7)$

56. From  $(6, 7)$  to  $(1, -3)$

57. From  $(1, 4)$  to  $(-3, 5)$

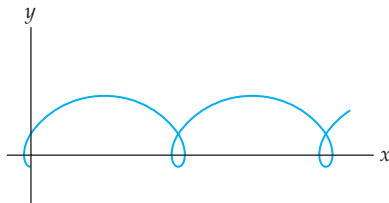

58. From  $(-3, 5)$  to  $(1, 4)$

59. From  $(\pi, 3)$  to  $(\pi, 8)$

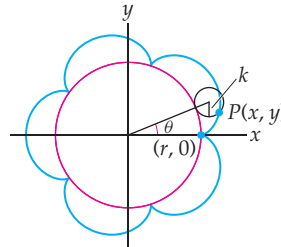

60. From  $(0, e)$  to  $(-6, e)$

61. Use the arc length formula for parametric equations and your answer to Exercise 55 to find the distance between the points  $(1, -3)$  and  $(6, 7)$ . Verify your answer by using the distance formula to compute the distance.

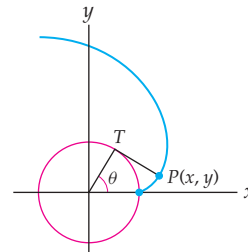

62. A **trochoid** is a generalization of a cycloid in which the point tracing the path is on a spoke of the wheel, instead of on the circumference. Thus, if the radius of the wheel is  $r$ , the point is  $k$  units from the center of the wheel, such that either  $k < r$  or  $k > r$ . (When  $k > r$ , you can think of the point being on a flange extending the radius of the wheel. This case occurs as train wheels roll, since there is an extension of each wheel beyond the portion of the wheel rolling on the track.) Find parametric equations for the trochoid.

63. An **epicycloid** is another variation of a cycloid in which the point tracing the path is on the circumference of a wheel, but the wheel is rolling without slipping on the outside of another wheel, instead of along a horizontal track. If the radius of the rolling wheel is  $k$  and the radius of the fixed wheel is  $r$ , find parametric equations for the epicycloid.

64. The **involute** of a circle is the curve described by the end-point  $P$  of a thread as it unwinds from a fixed circular spool. For simplicity suppose that the radius of the circular spool is  $r$  and that when the spool is placed with its center at the origin, the point  $P$  starts at  $(r, 0)$ . Assume that the thread is unwinding counterclockwise. Find parametric equations for the point  $P$ . (Hint: If the string is taut at all times as it unwinds, the length of segment  $PT$  is  $r\theta$ .)

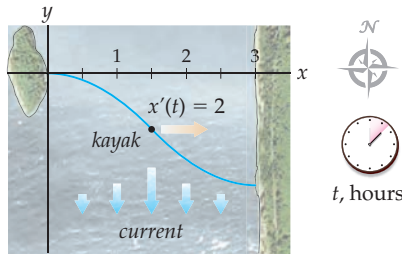

## Applications

65. (a) Find an integral that represents the length of an elliptical track whose equations are given by the parametric equations  $x = \sin \theta, y = 3 \cos \theta, \theta \in [0, 2\pi]$ , where  $x$  and  $y$  are in kilometers.  
 (b) Approximate the length of the track, using the midpoint method with 20 subintervals.
66. Annie needs to make a crossing in her kayak from an island to a north–south coastline 3 miles due east. It is foggy, so she cannot see any landmarks to steer by. Instead, she takes a compass heading due east and sticks to it all the way across. Tidal currents in the channel push

her boat southward at a speed proportional to the distance from either shoreline. She paddles at 2 miles per hour from west to east. That is, her east–west position changes with time as  $x'(t) = 2$ . Her north–south position changes as  $y'(t) = 1.778t^2 - 2.667t$ . Her starting position was  $(0, 0)$ , at time  $t = 0$ .

- (a) Solve the two given differential equations by integrating with respect to  $t$  to find a parametric description of Annie's path across the channel.  
 (b) How far south of her starting point does Annie make landfall?

- (c) Use a numerical integration technique to determine the distance she paddles.

67. Annie has to make the same crossing as in Exercise 66 two weeks later, again in a fog. Remembering how far off course she was pushed previously, she takes a compass heading 15 degrees north of east this time. Thus, her eastward speed is  $x'(t) = 2 \cos \frac{\pi}{12}$  and her north-south velocity is  $y'(t) = 0.444x(t)(x(t) - 3) + 2 \sin \frac{\pi}{12}$ .
- Solve the two given differential equations by integrating with respect to  $t$  to find a parametrization of Annie's path across the channel.
  - How far south of her starting point does Annie make landfall this time?
  - How far does she paddle? How long does she paddle?

## Proofs

68. Show that every function  $y = f(x)$  can be written as parametric equations.
69. Use your result from Exercise 68 to show that the arc length formula for a function  $y = f(x)$  is a special case of the arc length formula for a parametric curve.
70. Let  $c$  and  $d$  be constants, and for  $t \in [a, b]$  let  $f(t)$  and  $g(t)$  be differentiable functions with continuous first derivatives. Prove that the arc length of the parametric curve given by  $x = f(t)$ ,  $y(t) = g(t)$  for  $t \in [a, b]$  is equal to the arc length of the parametric curve defined by  $x = c + f(t)$ ,  $y(t) = d + g(t)$  for  $t \in [a, b]$  for every  $c$  and  $d$  in  $\mathbb{R}$ .
71. Let  $k > 0$  be a constant, and let  $f(t)$  and  $g(t)$  be differentiable functions of  $t$  with continuous first derivatives for every  $t \in [a, b]$ . Prove that the arc length of the curve defined by the parametric equations

$$x = kf(t), y = kg(t), t \in [a, b]$$

is  $k$  times as long as the arc length of the curve defined by the parametric equations

$$x = f(t), y = g(t), t \in [a, b].$$

What is the arc length of the curve defined by the equations

$$x = f(kt), y = g(kt), t \in [a/k, b/k]?$$

72. Show that the parametric curve associated with the linear parametric equations

$$x = m_1t + b_1, y = m_2t + b_2, t \in \mathbb{R}$$

is a line if  $m_1$  and  $m_2$  are not both zero. For what values of  $m_1$  and  $m_2$  will  $y$  be a function of  $x$ ? In this case, what is the slope of the line? What do the equations describe if  $m_1$  and  $m_2$  are both zero? Find parametric equations  $x = f(t)$ ,  $y = g(t)$  such that neither  $f$  nor  $g$  is a linear function, but the parametric curve associated with the equations is a line.

73. In Example 5 we saw that the cycloid

$$x = r\theta - r \sin \theta, y = r - r \cos \theta, \theta \in \mathbb{R}$$

has a horizontal tangent line at each odd multiple of  $\pi$ . Show that the cycloid has a vertical tangent at each even multiple of  $\pi$  by showing that  $\lim_{\theta \rightarrow 2k\pi} \frac{dy}{dx}$  does not exist wherever  $k$  is an integer.

## Thinking Forward

*Parametric equations in three dimensions:* Parametric equations can also be used to describe curves in three dimensions. Try to visualize the graphs described by the following parametric equations.

- A line through the origin:

$$x = t, y = -3t, z = 2t, t \in \mathbb{R}$$

- A helix centered on the  $z$ -axis:

$$x = \cos t, y = \sin t, z = t, t \in \mathbb{R}$$

- An expanding helix:

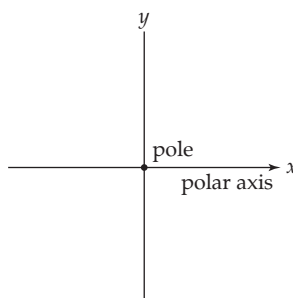

$$x = t \cos t, y = t \sin t, z = t, t \in [0, \infty)$$

## 9.2 POLAR COORDINATES

- ▶ Polar coordinates are defined
- ▶ Conversion formulas between rectangular and polar coordinates are derived
- ▶ Principles of graphing with polar coordinates are introduced

### Plotting Points in Polar Coordinates

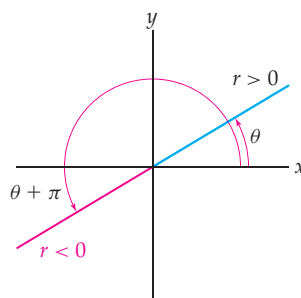

We begin by specifying a point called the **pole** and a ray emanating from the pole called the **polar axis**, as follows:

In the preceding figure you will notice that we've placed the pole at the origin of a rectangular coordinate system and the polar axis along the positive  $x$ -axis. This is the convention we always use with polar coordinates. As we will see later in the section, this convention will also allow us to derive formulas for converting between polar coordinates and rectangular coordinates.

In a polar system we use the coordinate pair  $(r, \theta)$  to represent a point in the plane. The first coordinate  $r$  is the signed distance from the pole, while  $\theta$  is an angular measure, in radians, from the polar axis. When  $\theta > 0$ , we rotate counterclockwise from the polar axis, and when  $\theta < 0$ , we rotate clockwise. When  $r > 0$ , we measure  $r$  units along the ray specified by the value of  $\theta$ . When  $r < 0$ , we measure  $|r|$  units in the opposite direction, which is equivalent to moving in the positive direction along the ray  $\theta + \pi$ , as shown here:

*For  $r > 0$  we move along the ray  $\theta$ ;  
for  $r < 0$  we move along  $\theta + \pi$*

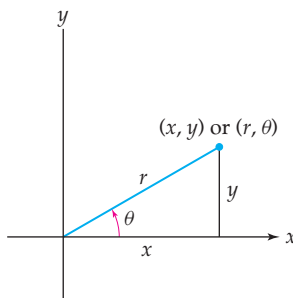

In the rectangular coordinate system, once scales on the axes are specified, there is a one-to-one correspondence between points in the plane and coordinates that name points. This relationship does not hold in the polar coordinate system. We have the following theorem:

**THEOREM 9.5** Equivalent Polar Coordinates

- (a) The polar coordinates  $(r, \theta + 2\pi k)$  represent the same point for every integer  $k$ .
- (b) The polar coordinates  $(-r, \theta + \pi)$  represent the same point as  $(r, \theta)$  for any value of  $\theta$ .
- (c) The polar coordinates  $(0, \theta)$  represent the pole for any value of  $\theta$ .

**Converting Between Polar and Rectangular Coordinates**

To convert from polar coordinates to rectangular coordinates, we will write the coordinates  $x$  and  $y$  as functions of the coordinates  $r$  and  $\theta$ . Then, given  $r$  and  $\theta$ , we will easily be able to find the corresponding  $x$  and  $y$ . The figure that follows shows a point in the first quadrant of the plane and its geometric representation in terms of both rectangular and polar coordinates. In the other three quadrants we can draw similar figures and reach the same conclusions as we do shortly; however, for simplicity we will use the first-quadrant picture as our general example.

Using the triangle shown, we see that  $\cos \theta = \frac{x}{r}$  and  $\sin \theta = \frac{y}{r}$ . This gives us the following theorem:

**THEOREM 9.6** Converting from Polar to Rectangular Coordinates

If a point in the plane is represented by  $(r, \theta)$  in polar coordinates, then the rectangular coordinates of the point are given by  $(x, y)$ , where

$$x = r \cos \theta \quad \text{and} \quad y = r \sin \theta.$$

Note that given the polar coordinates  $(r, \theta)$  of any point in the plane, there will be a unique pair of rectangular coordinates  $(x, y)$  representing the point.

To convert from rectangular coordinates to polar coordinates, we need to have a way of finding  $r$  and  $\theta$  given any coordinates  $x$  and  $y$ . Applying the Pythagorean theorem and the definition of the tangent function to the triangle in the figure shown, we have the following relationships:

**THEOREM 9.7** Converting from Rectangular to Polar Coordinates

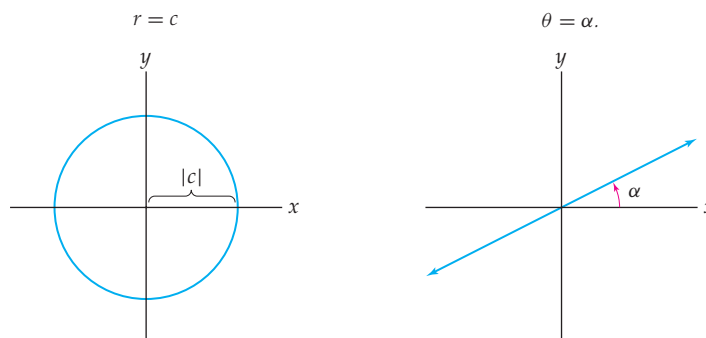

If a point in the plane is represented by  $(x, y)$  in rectangular coordinates, then the polar coordinates  $(r, \theta)$  of the point satisfy the following formulas:

$$r^2 = x^2 + y^2 \quad \text{and} \quad \tan \theta = \frac{y}{x}.$$

Notice that the formulas in Theorem 9.7 do not give unique values of  $r$  and  $\theta$  for given values of  $x$  and  $y$ . This is to be expected, since every point in the plane has multiple polar coordinate representations. For example, the rectangular coordinates  $(1, 1)$  may be expressed as  $(\sqrt{2}, \frac{\pi}{4} + 2k\pi)$  or  $(-\sqrt{2}, \frac{3\pi}{4} + 2k\pi)$ , for any positive integer  $k$ .

## The Graphs of Some Simple Polar Coordinate Equations

In rectangular coordinates, the simplest possible equations are those of the form  $x = a$  and  $y = b$ , where  $a$  and  $b$  are constants. Appropriately enough, the graphs of these equations are very simple as well: vertical and horizontal lines, respectively. In polar coordinates we first consider the equations  $r = c$  and  $\theta = \alpha$ , where  $c$  and  $\alpha$  are constants. For any real number  $c$ , the polar equation  $r = c$  describes the set of points  $|c|$  units from the pole. Therefore, the graph of  $r = c$  is a circle with radius  $|c|$  centered at the pole, as shown next at the left. For any real number  $\alpha$ , the polar equation  $\theta = \alpha$  describes the set of points with polar angle  $\alpha$ . At first you might think that this would give a graph of the ray with polar angle  $\theta$ . However, remember that when  $\theta = \alpha$ , the value of  $r$  can be either positive or negative. Therefore, the graph of  $\theta = \alpha$  is a line through the pole, as shown here at the right:

Two other simple categories of polar equations are those defined by

$$r = 2a \cos \theta \text{ and } r = 2a \sin \theta,$$

where  $a \neq 0$ . The following theorem tells us that these are the equations of circles passing through the pole and tangent to one of the coordinate axes.

### THEOREM 9.8

#### Circles Tangent to the Coordinate Axes at the Pole

For  $a \neq 0$ , the graphs of the equations

$$r = 2a \cos \theta \text{ and } r = 2a \sin \theta$$

are the circles whose equations in rectangular coordinates are

$$(x - a)^2 + y^2 = a^2 \text{ and } x^2 + (y - a)^2 = a^2,$$

respectively.

**Proof.** We prove that  $(x - a)^2 + y^2 = a^2$  is another equation for  $r = 2a \cos \theta$  and leave the other case for Exercise 68. We multiply both sides of  $r = 2a \cos \theta$  by  $r$  and use the facts that  $r^2 = x^2 + y^2$  and  $x = r \cos \theta$  to obtain

$$x^2 + y^2 = 2ax.$$

If we subtract  $2ax$  from each side of the equation and then complete the square, we get

$$(x - a)^2 + y^2 = a^2,$$

as required. The graph of this equation is the circle with radius  $a$  and centered at the point  $(a, 0)$ . The circle is tangent to the  $y$ -axis and passes through the pole. ■

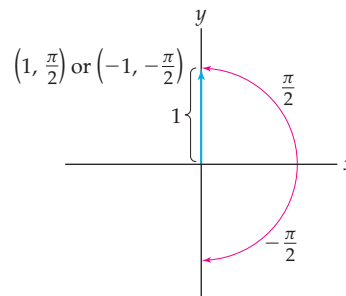

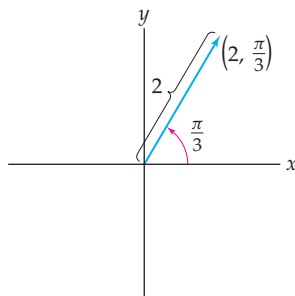

## Examples and Explorations

### EXAMPLE 1 Plotting points with polar coordinates

Plot the points that have polar coordinates  $(2, \frac{\pi}{3})$  and  $(-1, -\frac{\pi}{2})$ .

#### SOLUTION

To plot  $(2, \frac{\pi}{3})$ , we first locate the ray  $\theta = \frac{\pi}{3}$  and move 2 units (in the positive direction) along this ray, as shown next at the left. Similarly, to plot the point  $(-1, -\frac{\pi}{2})$ , we first find the ray  $\theta = -\frac{\pi}{2}$  and move 1 unit in the negative direction along that ray. Note that this operation is equivalent to moving one unit in the positive direction along the ray  $\theta = -\frac{\pi}{2} + \pi = \frac{\pi}{2}$ , as shown here at the right:

### EXAMPLE 2 Converting from polar to rectangular coordinates

Find the rectangular coordinates of the points that have polar coordinates  $(2, \frac{\pi}{3})$  and  $(-1, -\frac{\pi}{2})$ .

#### SOLUTION

We use the conversion formulas given in Theorem 9.6. For the first of the two pairs of coordinates we have

$$x = 2 \cos \frac{\pi}{3} \text{ and } y = 2 \sin \frac{\pi}{3}.$$

The rectangular coordinates are  $(1, \sqrt{3})$ .

The second coordinate pair converts to

$$x = -1 \cos \left(-\frac{\pi}{2}\right) = 0 \text{ and } y = -1 \sin \left(-\frac{\pi}{2}\right) = 1.$$

Compare these results with those you obtained in Example 1. □

**EXAMPLE 3** Finding all the polar coordinate representations for a point

Find all of the pairs of polar coordinates for the point with rectangular coordinates  $(1, \sqrt{3})$ .

**SOLUTION**

We use the conversion formulas given in Theorem 9.7 along with the fact that the point  $(1, \sqrt{3})$  lies in the first quadrant. We have  $r^2 = 1^2 + (\sqrt{3})^2 = 4$  and  $\tan \theta = \frac{\sqrt{3}}{1} = \sqrt{3}$ . Thus, either  $r = 2$  and  $\theta = \frac{\pi}{3} + 2\pi k$ , where  $k \in \mathbb{Z}$ , or  $r = -2$  and  $\theta = \frac{4\pi}{3} + 2\pi k$ , where  $k \in \mathbb{Z}$ . Note that although the angles  $\theta = \frac{4\pi}{3} + 2\pi k$  are in the third quadrant for each  $k$ , the fact that  $r < 0$  still gives us a point in the first quadrant.

This example builds on Example 2. When we converted the point  $(2, \frac{\pi}{3})$  to rectangular coordinates, we got the unique answer of that example. However, since every point in the polar plane has infinitely many names, when we convert back to polar coordinates we expect infinitely many answers.  $\square$

**EXAMPLE 4** Graphing polar equations by converting to rectangular coordinates

Graph the equations  $r = 4 \cos \theta$  and  $r = 5 \csc \theta$ .

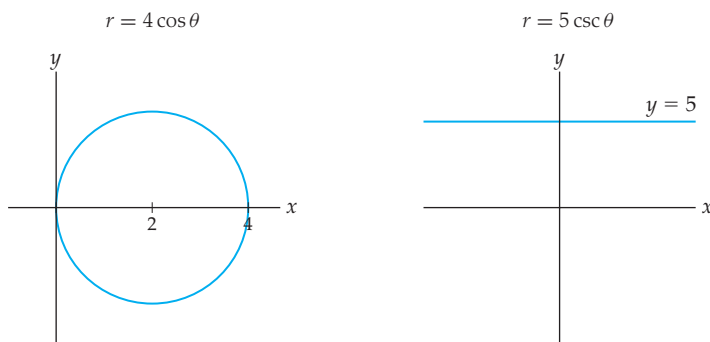

**SOLUTION**

We will begin with the polar equation  $r = 4 \cos \theta$ . From Theorem 9.8 we know that this is the equation for the circle whose equation in rectangular coordinates is  $(x - 2)^2 + y^2 = 4$ , as shown next at the left.

Now consider the polar equation  $r = 5 \csc \theta$ . We begin by multiplying both sides of the equation by  $\sin \theta$  to obtain

$$r \sin \theta = 5.$$

By Theorem 9.6 we have  $r \sin \theta = y$ ; combining this equation with the preceding one, we must have  $y = 5$ . Therefore, the graph of  $r = 5 \csc \theta$  is a horizontal line at height 5, as shown here at the right:

**CAUTION**

We graphed the polar equation  $r = 5 \csc \theta$  in Example 4 by transforming it to rectangular coordinates. Using Theorems 9.6 and 9.7, we can always transform an equation in polar coordinates to one in rectangular coordinates. However, as the next example demonstrates, we *cannot* expect that every polar equation will have a simple expression in rectangular coordinates. Therefore, we may not understand the polar equation any better by transforming it to rectangular coordinates.

**EXAMPLE 5** Converting a polar equation to an equation in rectangular coordinates

Convert the polar equation  $r = \cos 2\theta$  to rectangular coordinates.

**SOLUTION**

We begin by using the double-angle identity for cosine,  $\cos 2\theta = \cos^2 \theta - \sin^2 \theta$ . We now have  $r = \cos^2 \theta - \sin^2 \theta$ . Since  $\cos \theta = \frac{x}{r}$  and  $\sin \theta = \frac{y}{r}$ , we have

$$r = \frac{x^2}{r^2} - \frac{y^2}{r^2},$$

or equivalently,

$$r^3 = x^2 - y^2.$$

Finally, because  $r = \pm(x^2 + y^2)^{1/2}$ , we obtain the equation

$$\pm(x^2 + y^2)^{3/2} = x^2 - y^2.$$

We could now use the techniques of Section 2.4 to graph  $\pm(x^2 + y^2)^{3/2} = x^2 - y^2$ . However, that would be making the problem of graphing the relatively simple polar equation  $r = \cos 2\theta$  a complicated mess involving implicit functions. In the next section we will be discussing methods for graphing polar equations like  $r = \cos 2\theta$  directly.  $\square$

**? TEST YOUR UNDERSTANDING**

- ▶ What are the formulas for converting between rectangular coordinates and polar coordinates? How are these formulas derived?
- ▶ Why does every point in the plane have a unique pair of rectangular coordinates that represents the point, but have infinitely many pairs of polar coordinates that represent it?
- ▶ Why are the polar coordinates  $(8, -\frac{\pi}{6})$  not a representation of the point with rectangular coordinates  $(-4, 4\sqrt{3})$ , even though these values of  $r$ ,  $\theta$ ,  $x$ , and  $y$  satisfy the formulas  $r^2 = x^2 + y^2$  and  $\tan \theta = \frac{y}{x}$ ?
- ▶ Why is the graph of the equation  $r = 2a \cos \theta$  a circle in the polar plane?
- ▶ Why is the graph of the equation  $r = b \sec \theta$  a line in the polar plane?

**EXERCISES 9.2****Thinking Back**

*Plotting in a rectangular coordinate system:*

- ▶ Plot the points  $(1, 1)$ ,  $(1, 2)$ ,  $(1, 3)$ , and  $(1, 4)$  in a rectangular coordinate system. Fill in the blank: These points all lie on the same \_\_\_\_\_ line.
- ▶ Plot the points  $(-1, -2)$ ,  $(0, -2)$ ,  $(1, -2)$ , and  $(2, -2)$  in a rectangular coordinate system. Fill in the blank: These points all lie on the same \_\_\_\_\_ line.
- ▶ Plot the equations  $x = -3$  and  $y = 5$  in a rectangular coordinate system. Where do the graphs of these two equations intersect?

*Completing the square:*

- ▶ Consider the equation  $x^2 + y^2 = 4x$ . Use the method of completing the square to show that this equation is equivalent to  $(x - 2)^2 + y^2 = 4$ . (This calculation was used in Example 4.)
- ▶ Find the center and radius of the circle with equation

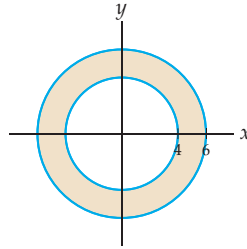

$$x^2 + y^2 + 6x - 8y - 44 = 0$$

by completing the square.

**Concepts**

0. *Problem Zero:* Read the section and make your own summary of the material.
1. *True/False:* Determine whether each of the statements that follow is true or false. If a statement is true, explain why. If a statement is false, provide a counterexample.
  - (a) *True or False:* Each point in the plane has a unique representation in rectangular coordinates.
  - (b) *True or False:* Each point in the plane has a unique representation in polar coordinates.
  - (c) *True or False:* If  $b \neq c$ , then the graphs of the polar equations  $r = b$  and  $r = c$  are different.
  - (d) *True or False:* If  $\alpha \neq \beta$ , then the graphs of the polar equations  $\theta = \alpha$  and  $\theta = \beta$  are different.

- (e) *True or False:* The graph of  $r = \csc \theta$  for  $-\frac{\pi}{2} < \theta < \frac{\pi}{2}$  is a horizontal line in a polar coordinate system.
- (f) *True or False:* In a polar coordinate system, the coordinates  $(r, \theta)$  and  $(r, \theta + \pi)$  represent the same point if and only if  $r = 0$ .
- (g) *True or False:* When  $A$  and  $B$  are nonzero constants, the graph of  $r = A \sin \theta + B \cos \theta$  is a circle in a polar coordinate system.
- (h) *True or False:* Every function  $r = f(\theta)$  in a polar coordinate system can be expressed in terms of rectangular coordinates  $x$  and  $y$ .
2. *Examples:* Construct examples of the thing(s) described in the following. Try to find examples that are different than any in the reading.
- Two pairs of polar coordinates for the point  $(0, 3)$  given in rectangular coordinates.
  - Two equations for the line  $y = x$  in polar coordinates.
  - The equations of two distinct circles with radius 2 tangent to the  $x$ -axis at the pole in polar coordinates.
3. Explain why every point in the polar coordinate plane has infinitely many different polar coordinate representations.
4. Consider the point in the plane given by polar coordinates  $(r, \theta) = \left(2, \frac{\pi}{3}\right)$ .
- Express this point in polar coordinates where  $r = 2$ , but  $\theta \neq \frac{\pi}{3}$ , if possible.
  - Express this point in polar coordinates where  $\theta = \frac{\pi}{3}$ , but  $r \neq 2$ , if possible.
  - Express this point in polar coordinates where  $r \neq 2$  and  $\theta \neq \frac{\pi}{3}$ , if possible.
5. Explain why the point  $(r, \theta) = \left(8, -\frac{\pi}{3}\right)$  is not a polar representation of the point with rectangular coordinates  $(x, y) = (-4, 4\sqrt{3})$ , even though these values of  $r$ ,  $\theta$ ,  $x$ , and  $y$  satisfy the formulas  $r^2 = x^2 + y^2$  and  $\tan \theta = \frac{y}{x}$ . Include a picture with your explanation.
6. Explain why the graphs of  $r = 3$  and  $r = -3$  are identical in a polar coordinate system.
7. Find all values of  $c$  such that the graphs of  $r = c$  and  $r = -c$  are the same in a polar coordinate system.
8. Explain why the graphs of  $\theta = \frac{\pi}{2}$  and  $\theta = -\frac{\pi}{2}$  are identical in a polar coordinate system.
9. Find all values of  $\alpha$  such that the graphs of  $\theta = \alpha$  and  $\theta = -\alpha$  are the same in a polar coordinate system.
10. In Example 5 we converted the simple polar equation  $r = \cos 2\theta$  into the messy rectangular equation  $\pm(x^2 + y^2)^{3/2} = x^2 - y^2$ . Does this rectangular equation have a simpler rectangular coordinate form? If so, what is it? If not, why not?
11. Explain why the inequalities  $r > 0$  and  $0 < \theta < \frac{\pi}{2}$  together describe the points in the first quadrant. Use similar inequalities to describe the points in the third quadrant.
12. Explain why the inequality  $0 \leq r \leq 2$  describes the points inside or on the circle with radius 2 and centered at the origin. Use a similar inequality to describe the points in the **annulus** shown here:

13. Find all polar coordinates that represent the point  $(1, 0)$  given in rectangular coordinates.
14. Find all polar coordinates that represent the point  $(0, 1)$  given in rectangular coordinates.
15. Find all polar coordinates that represent the point  $(-1, 0)$  that is also given in polar coordinates.
16. Find all values of  $a$  and  $b$  such that  $(a, b)$  represents the same point whether it is given in rectangular coordinates or polar coordinates.

## Skills

In Exercises 17–23 the polar coordinates for several sets of points are given. Find the rectangular coordinates for each of the points, and then plot and label the points in the same polar coordinate system.

- $\left(3, \frac{\pi}{6}\right)$ ,  $\left(-3, \frac{\pi}{6}\right)$ ,  $\left(3, -\frac{\pi}{6}\right)$  and  $\left(-3, -\frac{\pi}{6}\right)$
- $(1, 0)$ ,  $(2, 0)$ ,  $(3, 0)$ , and  $(4, 0)$
- $\left(5, \frac{\pi}{2}\right)$ ,  $\left(-5, -\frac{3\pi}{2}\right)$ ,  $\left(5, \frac{5\pi}{2}\right)$  and  $\left(-5, -\frac{\pi}{2}\right)$
- $\left(0, \frac{\pi}{6}\right)$ ,  $\left(0, \frac{\pi}{3}\right)$ ,  $(0, \pi)$  and  $(0, -\pi)$
- $\left(1, \frac{\pi}{4}\right)$ ,  $\left(2, \frac{\pi}{4}\right)$ ,  $\left(3, \frac{\pi}{4}\right)$  and  $\left(4, \frac{\pi}{4}\right)$

- $(2, 0)$ ,  $\left(2, \frac{\pi}{4}\right)$ ,  $\left(2, \frac{\pi}{2}\right)$ ,  $(2, \pi)$  and  $\left(2, \frac{3\pi}{2}\right)$
- $\left(1, -\frac{\pi}{2}\right)$ ,  $\left(2, -\frac{\pi}{2}\right)$ ,  $\left(3, -\frac{\pi}{2}\right)$  and  $\left(4, -\frac{\pi}{2}\right)$

In Exercises 24–31 find all polar coordinate representations for the point given in rectangular coordinates.

- $(0, 0)$
- $(0, -3)$
- $(3, 4)$
- $(-2, 0)$
- $(1, 0)$
- $(0, 2)$
- $(6, 2\sqrt{3})$
- $(3, -3)$

In Exercises 32–47 convert the equations given in polar coordinates to rectangular coordinates.

32.  $\theta = \pi$

33.  $\theta = \frac{\pi}{4}$

34.  $\theta = -\frac{\pi}{6}$

35.  $\theta = \frac{7\pi}{6}$

36.  $r = 2 \cos \theta$

37.  $r = 5 \sin \theta$

38.  $r = -3 \sec \theta$

39.  $r = 6 \csc \theta$

40.  $r = \tan \theta$

41.  $r = \sin 2\theta$

42.  $r^2 = \sin \theta$

43.  $r^2 = \cos \theta$

44.  $r = \sin 4\theta$

45.  $r = \theta$

46.  $r = \cos 4\theta$

47.  $r = \sin^3 \theta$

In Exercises 48–55 convert the equations given in rectangular coordinates to equations in polar coordinates.

48.  $x = 0$

49.  $y = 0$

50.  $x = 4$

51.  $y = x$

52.  $y = \sqrt{3}x$

53.  $y = -3$

54.  $y = x + 1$

55.  $y = mx$

In Exercises 56–59 convert the equations given in polar coordinates to equations in rectangular coordinates.

56.  $r = 1, r = -2, r = 3.$

57.  $r = k$ , for each positive integer  $k$  less than 10.

58.  $\theta = 0, \theta = \frac{\pi}{4}, \theta = -\frac{\pi}{2}.$

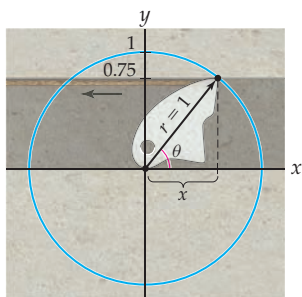

59.  $\theta = \frac{k\pi}{6}$ , for each positive integer  $k$  less than 12.

## Applications

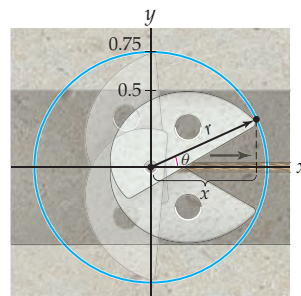

In Exercises 60 and 61 Ian is a rock climber. Rock protection these days relies on a process called camming. The idea for camming devices is that they push harder against the rock when they are loaded with the force of a fall.

60. Ian has one cam that is 1 inch wide, with a point where the rope attaches on its right corner, so that the device pivots on its left corner. In other words, the left corner of the cam becomes the center of a circle, and the point where the rope attaches follows the curve  $r = 1$ .

- (a) If a crack is 0.75 inch wide, at what angle must Ian turn the device in order to put it into the crack? (Hint: compute the  $x$ -coordinate of the right edge of the device.)
- (b) If Ian falls, the rope will pull on the right edge of the cam while the left edge remains wedged in a fixed position. What happens to the width of the cam in the crack?
61. Ian has another camming device, one that has two arms extending from a point where the rope attaches in the center.

The outside edge of each arm follows the curve  $r = 0.75$ . The ends of the arms make an angle  $\pm\theta$  with the rope, and the rope pulls along the ray  $\theta = 0$ . Ian can retract the arms so that  $\theta$  is small in order to put the device into a crack, and then a spring pulls them back so that each arm wedges against the walls of the crack.

- (a) Ian puts the device into a horizontal crack that is 1 inch tall. What angle do the arms make with the rope? (Hint: Compute the  $y$ -coordinates of the two arm ends.)
- (b) What happens if Ian falls, causing the rope to pull outwards (rightwards) in the crack?

## Proofs

62. Prove that the graph of the equation

$$r = k \sec \theta, \quad -\frac{\pi}{2} < \theta < \frac{\pi}{2},$$

is a vertical line for any value of  $k \neq 0$ .

63. Prove that the graph of the equation

$$r = k \csc \theta, \quad 0 < \theta < \pi,$$

is a horizontal line for any value of  $k \neq 0$ .

64. Let  $a \neq 0$ . Prove that the graph of the equation

$$r = \frac{a}{1 - \cos \theta}$$

is a parabola in a polar coordinate system. When  $a \neq 0$ , what is the graph of the equation  $r = \frac{a}{1 - \sin \theta}$ ?

65. Let  $a \neq 0$  and  $0 < b < 1$ . Prove that the graph of the equation

$$r = \frac{a}{1 - b \cos \theta}$$

is an ellipse in a polar coordinate system. When  $a \neq 0$  and  $b > 1$ , what is the graph of the equation  $r = \frac{a}{1 - b \cos \theta}$ ?

66. In this problem you will prove the three parts of Theorem 9.5:

- Prove that the polar coordinates  $(r, \theta + 2\pi k)$  represent the same point for every integer  $k$ .
- Prove that the point with polar coordinates  $(-r, \theta + \pi)$  represents the same point as  $(r, \theta)$  for any value of  $\theta$ .
- Prove that the polar coordinates  $(0, \theta)$  represent the pole for any value of  $\theta$ .

67. Show that the graph of the equation  $r = k \cos \theta$  is a circle tangent to the  $y$ -axis for any  $k \neq 0$ . What are the center and radius of the circle?

68. Finish the proof of Theorem 9.8 by showing that the graph of the equation  $r = 2k \sin \theta$  is a circle with center  $(0, k)$  and radius  $k$  tangent to the  $x$ -axis for any  $k \neq 0$ .

69. Modify the proof of Theorem 9.8 to show that the graph of the equation  $r = k \sin \theta + l \cos \theta$  is a circle. Find the center and radius in terms of  $k$  and  $l$ .

70. Find and prove a formula for the distance between the points  $(r_1, \theta_1)$  and  $(r_2, \theta_2)$  when they are plotted in a polar coordinate system.

## Thinking Forward

► *Understanding symmetry:*

When a function  $y = f(x)$  has the property that  $f(-x) = f(x)$  for every value of  $x$  in the domain of  $f$ , the function is said to be an *even* function and its graph in a rectangular coordinate system is symmetrical with respect to the  $y$ -axis. When a function  $r = f(\theta)$  has the property that  $f(-\theta) = f(\theta)$  for every value of  $\theta$  in the domain of  $f$ , what geometrical property would the graph of  $r = f(\theta)$  have when it is plotted in a polar coordinate system?

► *Understanding symmetry:*

When a function  $y = f(x)$  has the property that  $f(-x) = -f(x)$  for every value of  $x$  in the domain of  $f$ , the function is said to be an *odd* function and its graph in a rectangular coordinate system is symmetrical with respect to the origin. When a function  $r = f(\theta)$  has the property that  $f(-\theta) = -f(\theta)$  for every value of  $\theta$  in the domain of  $f$ , what geometrical property would the graph of  $r = f(\theta)$  have when it is plotted in a polar coordinate system?

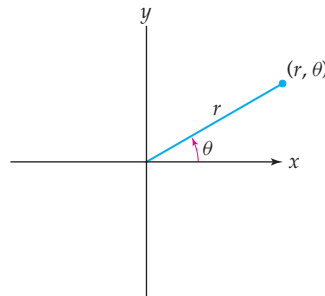

## 9.3 GRAPHING POLAR EQUATIONS

- ▶ A general method for graphing polar curves is provided
- ▶ Symmetry tests for polar curves are discussed
- ▶ Several categories of polar curves are introduced

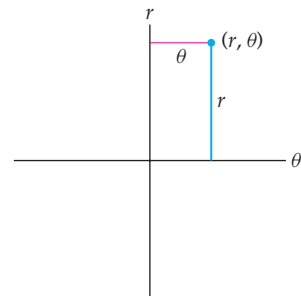

### Using the $\theta r$ -plane to Get Information About a Polar Graph

In Section 9.2 we introduced polar coordinates and studied how points and some simple equations are graphed. We can always transform an equation in polar coordinates to an equation in rectangular coordinates. Some polar equations have nice rectangular coordinate representations. Since we are now experts at graphing curves in a rectangular coordinate system, the transformed equation may be easier to graph. However, as we saw in Example 5 of Section 9.2, the transformation process to rectangular coordinates does not always result in a nice equation. To aid in our understanding of graphing polar equations in the **polar plane** (see the figure that follows at the left), we introduce the  $\theta r$ -plane (figure at right), which is simply a rectangular coordinate system with the variable  $\theta$  plotted on the horizontal axis and the variable  $r$  plotted on the vertical axis.

The polar plane

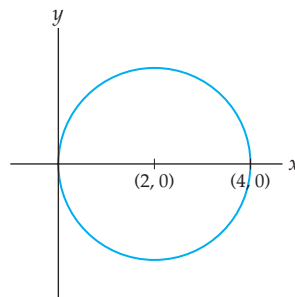

The  $\theta r$ -plane

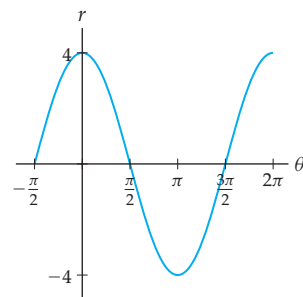

In Example 4 we graphed the equation  $r = 4 \cos \theta$  in the polar plane. We reproduce that graph next at the left. The figure at the right shows the graph of the same equation in the  $\theta r$ -plane.

$r = 4 \cos \theta$  in the polar plane

$r = 4 \cos \theta$  in the  $\theta r$ -plane

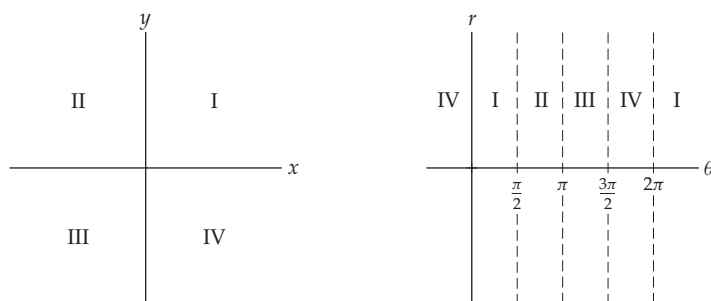

What is the connection between these two graphs? More generally, assuming that we are successful at graphing an equation  $r = f(\theta)$  in the  $\theta r$ -plane, how can we use the properties of that graph to draw the desired curve in the polar plane? Our reason for doing this should

be clear: We have a great deal of experience drawing curves in a rectangular coordinate system, and we wish to draw upon this experience to help us learn to understand curves in the polar plane.

First consider the inequalities that determine the four quadrants in the polar plane, as shown in the following table:

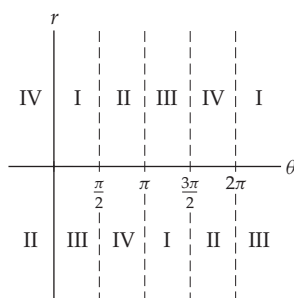

Quadrant	Inequality
I	$0 < \theta < \frac{\pi}{2}$
II	$\frac{\pi}{2} < \theta < \pi$
III	$\pi < \theta < \frac{3\pi}{2}$
IV	$\frac{3\pi}{2} < \theta < 2\pi$

The following diagrams show the same information in the polar plane (left) and in the  $\theta r$ -plane (right):

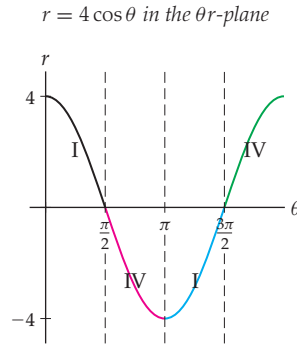

Notice that in the  $\theta r$ -plane the quadrant numbers start repeating; this is because, for example, quadrant I in the polar plane corresponds to angles  $0 < \theta < \frac{\pi}{2}$  as well as angles  $2\pi < \theta < \frac{5\pi}{2}$  and, in fact, to any angle in an interval of the form  $(0 + 2\pi k, \frac{\pi}{2} + 2\pi k)$ , where  $k$  is an integer.

The figure at the right illustrates the correspondence with the polar plane quadrants only when  $r$  is positive. Recall that when  $r$  is negative points are plotted in the diagonally opposite quadrant. The following figure shows this situation schematically:

Given the graph of a polar equation in the  $\theta r$ -plane, what does this information tell us about the graph of the curve in the polar plane? Consider again the graph of  $r = 4 \cos \theta$ . The following figure regrabs that equation with various pieces color-coded according to the sectors shown in the previous graph:

Notice that the black and blue portions of the graph will appear in the first quadrant when graphed in polar coordinates while the red and green portions will be in the fourth quadrant of the polar plane. This analysis tells us why the graph plotted appears only in the first and fourth quadrants; however, it does not tell us why the graph is a circle.

Certain points in the  $\theta r$ -plane can tell us a great deal about the corresponding graph in the polar plane. For example, consider those points in the  $\theta r$ -plane that lie *on* the  $\theta$ -axis. The  $r$ -coordinate of each of these points is zero. Since every point in the polar form  $(0, \theta)$  is drawn at the pole of the polar plane, each point on the  $\theta$ -axis corresponds to the pole in the polar plane. In terms of the previous color-coded graph, this means that the points at  $\theta = \frac{\pi}{2}$  and  $\theta = \frac{3\pi}{2}$  (and, in fact, for  $\theta$  any odd multiple of  $\frac{\pi}{2}$ ) correspond to the pole in the polar plane.

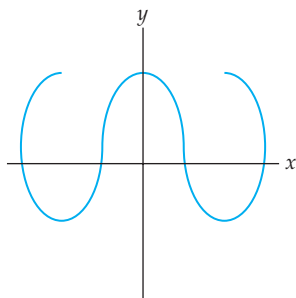

The points in the  $\theta r$ -plane with  $\theta$ -coordinate of the form  $\pi k$  and  $\frac{\pi}{2} + \pi k$  for some integer  $k$  are also good reference points. Points with  $\theta = \pi k$  will correspond to points in the polar plane that lie on the horizontal axis. Points with  $\theta = \frac{\pi}{2} + \pi k$  will correspond to points on the vertical axis in the polar plane. In terms of the color-coded graph, this means that the only vertical intercept of  $r = 4 \cos \theta$  in the polar plane will be at the pole (since the points where  $\theta = \frac{\pi}{2} + \pi k$  have  $r = 0$ ). Moreover, there are only two horizontal intercepts of  $r = 4 \cos \theta$  in the polar plane. We have already identified the horizontal intercept at the pole, and the only other horizontal intercept appears at the single point with polar coordinates  $(4, 0)$  or  $(-4, \pi)$  or  $(4, 2\pi)$ , etc. Notice that by examining certain points on the graph in the  $\theta r$ -plane, we have obtained all of the quadrant and intercept information for the corresponding graph in the polar plane.

## Symmetry in Polar Graphs

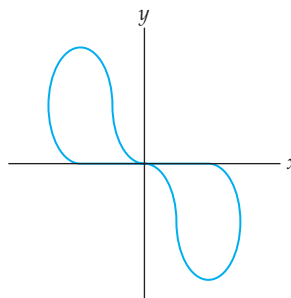

In Section 0.2 we discussed functions whose graphs are symmetrical with respect to the  $y$ -axis and functions whose graphs are symmetrical with respect to the origin. These functions are called *even* and *odd*, respectively. Graphs that do not represent functions can also show these symmetries. For example, the graph that follows at the left is symmetrical with respect to the vertical axis, but it is not the graph of a function in rectangular coordinates because it fails the vertical line test. Similarly, the graph at the right is symmetrical with respect to the origin, but it is not the graph of a function in rectangular coordinates.

Symmetry with respect to the vertical axis

Symmetry with respect to the origin

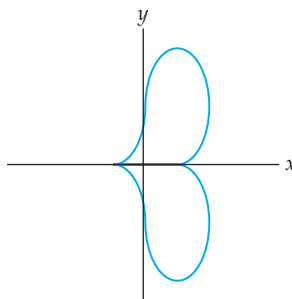

There is one more type of symmetry we'd like to consider: **symmetry with respect to the  $x$ -axis**. Using rectangular coordinates, we have the following definition (compare this with the definition of  $y$ -axis symmetry given in Definition 0.9 of Section 0.2):

### DEFINITION 9.9 Symmetry with Respect to the $x$ -axis

A graph in the  $xy$ -plane is said to be **symmetrical with respect to the  $x$ -axis** if, for every point  $(x, y)$  on the graph, the point  $(x, -y)$  is also a point on the graph.

Following is an example of a graph that is symmetrical with respect to the  $x$ -axis:

Symmetry with respect to the  $x$ -axis

We have now considered three types of symmetry. It is an interesting fact that if a graph has any two of those types of symmetry, it also has the third! The proof is straightforward and is left for Exercise 56.

### THEOREM 9.10 Relationships Among Symmetries in the Plane

Consider the following three types of symmetry:

- (a) symmetry with respect to the vertical axis;
- (b) symmetry with respect to the horizontal axis;
- (c) symmetry with respect to the origin.

If a graph in the plane has any two of these symmetries, then it has the third as well.

We are particularly concerned about symmetries in the polar plane because many of the equations we will be graphing have one or all of these symmetries. Such symmetries may

be recognized in the polar plane by understanding the relationships between  $r$  and  $\theta$ . By writing the definitions of these symmetries in terms of  $r$  and  $\theta$ , we arrive at the properties summarized in the following theorem:

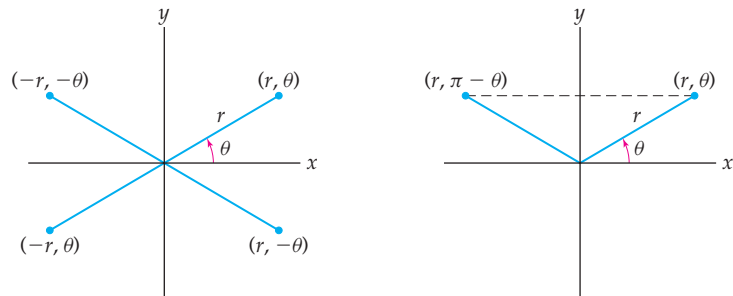

**THEOREM 9.11****Symmetries in the Polar Plane**

- (a) A graph is symmetrical with respect to the  $x$ -axis if, for every point  $(r, \theta)$  on the graph, the point  $(r, -\theta)$  is also on the graph.
- (b) A graph is symmetrical with respect to the  $y$ -axis if, for every point  $(r, \theta)$  on the graph, the point  $(-r, -\theta)$  is also on the graph.
- (c) A graph is symmetrical with respect to the origin if, for every point  $(r, \theta)$  on the graph, the point  $(-r, \theta)$  is also on the graph.

You can visualize these symmetry properties in the figure shown next at the left.

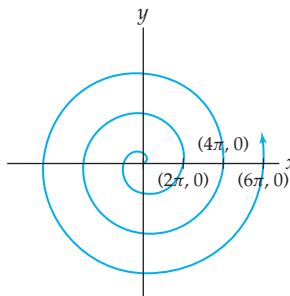

**CAUTION**

Note that because every point in the polar plane has multiple representations in terms of its polar coordinates, the symmetries in Theorem 9.11 may also be expressed in terms of other relationships between coordinates on the graph. For example, if  $(r, \theta)$  is on the graph whenever  $(r, \pi - \theta)$  is on the graph, then the graph will be symmetrical with respect to the  $y$ -axis; see the following figure at the right:

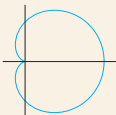

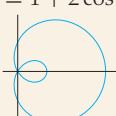

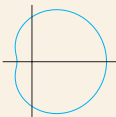

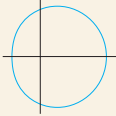

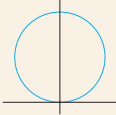

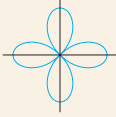

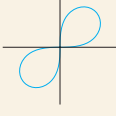

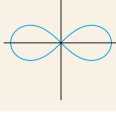

For example, we can see that the polar graph  $r = 4 \cos \theta$  is symmetrical with respect to the  $x$ -axis. Later we will examine a polar function that has all three types of symmetry mentioned in Theorem 9.11. Of course, polar graphs can lack all of these symmetries. For example, consider one of the simplest polar equations:  $r = \theta$ ,  $\theta \geq 0$ . This simple equation has a quite beautiful graph, known as the **spiral of Archimedes**.

The spiral of Archimedes

Before we proceed to our examples, we list several of the more common polar curves in the following compendium:

Equation	Name	Example
$r = a \pm b \cos \theta$ $r = a \pm b \sin \theta$ , where $a, b \in \mathbb{R}$ , $a \neq 0, b \neq 0$	Cardioid when $\left  \frac{a}{b} \right  = 1$	$r = 1 + \cos \theta$ 
	Limaçon when $\left  \frac{a}{b} \right  \neq 1$ ▶ with inner loop when $\left  \frac{a}{b} \right  < 1$	$r = 1 + 2 \cos \theta$ 
	▶ dimpled when $1 < \left  \frac{a}{b} \right  < 2$	$r = 3 + 2 \cos \theta$ 
	▶ convex when $\left  \frac{a}{b} \right  > 2$	$r = 5 + 2 \cos \theta$ 
$r = a \sin k\theta$ $r = a \cos k\theta$ , where $a \in \mathbb{R}$ and $k \in \mathbb{Z}$	Circle when $ k  = 1$	$r = \sin \theta$ 
	Rose curve with $2k$ petals when $k \neq 0$ is even	$r = \cos 2\theta$ 
	Rose curve with $k$ petals when $k \neq \pm 1$ is odd	$r = \cos 3\theta$ 
$r^2 = \pm a \sin 2\theta$ $r^2 = \pm a \cos 2\theta$ , where $a \in \mathbb{R}$ and $a \neq 0$	Lemniscate	$r^2 = \sin 2\theta$ 
		$r^2 = \cos 2\theta$ 

We will explore each of these curves shortly.

The names of several of the curves in the table are derived from the Greek and/or Latin. “Limaçon” comes from the Latin “limax,” or snail. “Cardioid” is derived from the Greek word “kardia,” or heart. “Lemniscate” has antecedents in both Greek and Latin; “lemniscos” and “lemniscus” both mean “ribbon.”

## Examples and Explorations

### EXAMPLE 1

#### Showing that the graphs of polar equations have symmetry

Show that  $r = 4 \cos \theta$  is symmetrical with respect to the  $x$ -axis and that  $r = \cos 2\theta$  is symmetrical with respect to the  $x$ -axis, the  $y$ -axis, and the origin.

#### SOLUTION

The cosine is an even function; therefore  $4 \cos(-\theta) = 4 \cos \theta$  for every value of  $\theta$ . Thus, if  $(r, \theta)$  is on the graph of  $r = 4 \cos \theta$ , then  $(r, -\theta)$  will also be on the graph. Therefore, the graph of  $r = 4 \cos \theta$  is symmetrical with respect to the  $x$ -axis.

We next turn to the equation  $r = \cos 2\theta$ . Showing that the graph of this equation is symmetrical with respect to the  $x$ -axis is similar to our analysis of  $r = 4 \cos \theta$  and is left for Exercise 15. To show that the graph is symmetrical with respect to the  $y$ -axis we will show that  $\cos(2(\pi - \theta)) = \cos 2\theta$  for every value of  $\theta$ . We have

$$\begin{aligned} \cos(2(\pi - \theta)) &= \cos(2\pi - 2\theta) && \leftarrow \text{distributive property} \\ &= \cos(-2\theta) && \leftarrow \text{periodicity of cosine} \\ &= \cos 2\theta. && \leftarrow \text{symmetry of cosine} \end{aligned}$$

Therefore,  $r = \cos 2\theta$  is symmetrical with respect to the  $y$ -axis. We are now done because, by Theorem 9.10,  $r = \cos 2\theta$  must also be symmetrical with respect to the origin.  $\square$

### EXAMPLE 2

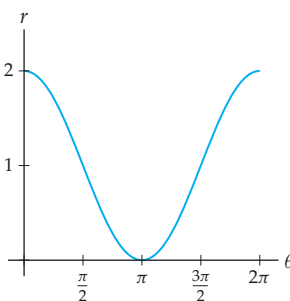

#### Graphing a cardioid

Graph the polar equation  $r = 1 + \cos \theta$ .

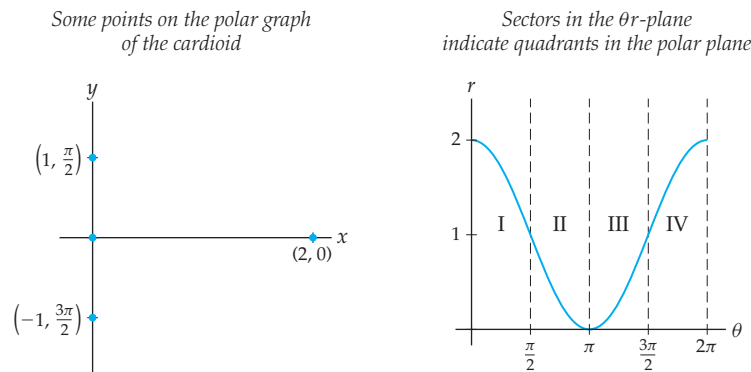

#### SOLUTION

We take this opportunity to show how some of the properties of the graphs of the polar functions in our earlier compendium may be constructed. First, notice that since  $1 + \cos \theta$  is periodic with period  $2\pi$ , we need only consider values of  $\theta$  in the interval  $[0, 2\pi)$ . Now consider the graph of  $r = 1 + \cos \theta$  in the  $\theta r$ -plane. This is the graph of  $\cos \theta$  shifted up one unit, as shown in the next figure. From certain points on this graph, we will be able to extract quadrant and intercept information about the polar graph.

$r = 1 + \cos \theta$  in the  $\theta r$ -plane

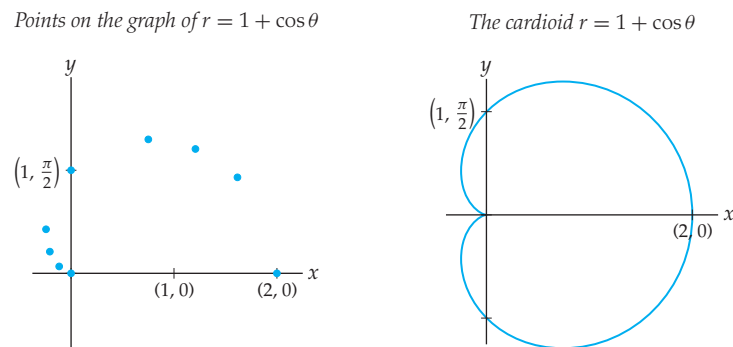

As we discussed earlier in this section, the points on the horizontal axis in the preceding graph correspond to the pole in the polar graph of the equation, so we know that the polar graph of  $r = 1 + \cos \theta$  passes through the pole. Moreover, the points on the graph where  $\theta$  is an integral multiple of  $\pi$  correspond to horizontal intercepts on the polar graph; in the given graph, the points at  $\theta = 0$  and  $\theta = 2\pi$  both correspond to the horizontal intercept  $(r, \theta) = (2, 0)$  on the polar graph and the point at  $\theta = \pi$  corresponds to the pole, as already mentioned. Finally, at odd multiples of  $\theta = \frac{\pi}{2}$ , the given graph indicates that the polar graph of  $r = 1 + \cos \theta$  will have vertical intercepts at the polar coordinates  $(1, \frac{\pi}{2})$  and  $(1, \frac{3\pi}{2})$ . This intercept information is recorded in the graph that follows at the left. We can also obtain quadrant information as shown in the following figure at the right:

When we test for symmetry, we see that  $1 + \cos(-\theta) = 1 + \cos \theta$ ; therefore the graph in the polar plane will be symmetrical with respect to the horizontal axis. This means that we need only consider values of  $\theta$  in the interval  $[0, \pi]$ . The following table shows values of  $r$  for several angles  $\theta \in [0, \pi]$ :

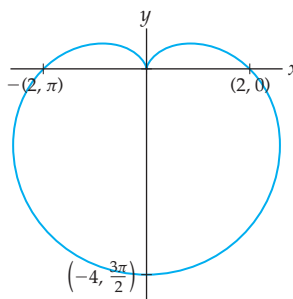

$\theta$	0	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$	$\frac{2\pi}{3}$	$\frac{3\pi}{4}$	$\frac{5\pi}{6}$	$\pi$
$r$	2	$1 + \frac{\sqrt{3}}{2}$	$1 + \frac{\sqrt{2}}{2}$	$\frac{3}{2}$	1	$\frac{1}{2}$	$1 - \frac{\sqrt{2}}{2}$	$1 - \frac{\sqrt{3}}{2}$	0

Plotting the intercepts and points from the table gives us the figure that follows at the left. Finally, we connect the plotted points with a smooth curve and use the symmetry of the graph to obtain the graph on the right, called a cardioid.

As mentioned in our chart before the examples, there are other equations whose graphs are cardioids in the polar plane. For example, the graph of the equation  $r = 2(1 - \sin \theta)$  is another cardioid:

The cardioid  $r = 2(1 - \sin \theta)$

In the Exercise 39 we ask you to graph this curve. □

### EXAMPLE 3

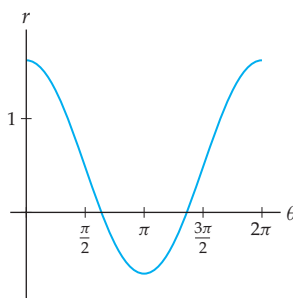

#### Graphing a limaçon

Graph the curve defined by the polar equation  $r = \frac{1}{2} + \cos \theta$ .

#### SOLUTION

The graph here is a member of the class of curves called the *limaçons*. We again start by graphing the equation  $r = \frac{1}{2} + \cos \theta$  in the  $\theta r$ -plane:

$$r = \frac{1}{2} + \cos \theta \text{ in the } \theta r\text{-plane}$$

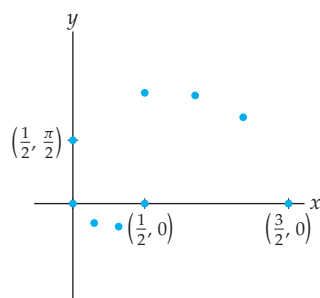

As in Example 2,  $r = \frac{1}{2} + \cos \theta$  is periodic with period  $2\pi$  and its graph in the polar plane will be symmetrical with respect to the  $x$ -axis. Therefore we need only consider values of  $\theta$  in the interval  $[0, \pi]$ . Horizontal intercepts occur at integral multiples of  $\pi$ , resulting in the polar points  $(\frac{3}{2}, 0)$  and  $(-\frac{1}{2}, \pi)$ . We will have a third horizontal intercept at the pole, corresponding to the value where  $r = 0$ . Here  $0 = \frac{1}{2} + \cos \theta$  has the unique solution  $\theta = \frac{2\pi}{3}$  on the interval  $[0, \pi]$ , and that solution corresponds to the polar point  $(0, \frac{2\pi}{3})$ . The only additional vertical intercept occurs when  $\theta = \frac{\pi}{2}$ ; here we have the polar point  $(\frac{1}{2}, \frac{\pi}{2})$ .

Unlike the situation in Example 2, the sign of  $r$  varies when  $\theta$  is in the interval  $[0, \pi]$ . We have  $r > 0$  when  $0 \leq \theta < \frac{2\pi}{3}$  and  $r < 0$  when  $\frac{2\pi}{3} < \theta \leq \pi$ . Here all values of  $\theta$  in the interval  $(0, \frac{\pi}{2})$  will be graphed in the first quadrant of the polar plane. Second-quadrant angles in the interval  $(\frac{\pi}{2}, \frac{2\pi}{3})$  will be graphed in the second quadrant of the polar plane, while second-quadrant angles in the interval  $(\frac{2\pi}{3}, \pi)$  will be graphed in the fourth quadrant of the polar plane! The following table lists the values of  $r$  for several angles  $\theta \in [0, \pi]$ :

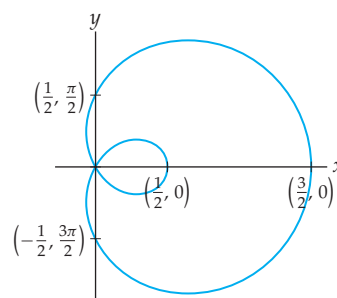

$\theta$	0	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$	$\frac{2\pi}{3}$	$\frac{3\pi}{4}$	$\frac{5\pi}{6}$	$\pi$
$r$	$\frac{3}{2}$	$\frac{1}{2} + \frac{\sqrt{3}}{2}$	$\frac{1}{2} + \frac{\sqrt{2}}{2}$	1	$\frac{1}{2}$	0	$\frac{1}{2} - \frac{\sqrt{2}}{2}$	$\frac{1}{2} - \frac{\sqrt{3}}{2}$	$-\frac{1}{2}$

The figure that follows at the left shows a plot of the intercepts and points given in the preceding table. By connecting these points with a smooth curve and using the symmetry of the graph, we obtain the limaçon shown at the right. As mentioned earlier, the term “limaçon” is derived from the Latin word for snail. The snail’s “shell” is more obvious in the plotted points than in the final graph.

Points on the graph of  $r = \frac{1}{2} + \cos \theta$

The limaçon  $r = \frac{1}{2} + \cos \theta$

□

#### EXAMPLE 4 A rose with four petals

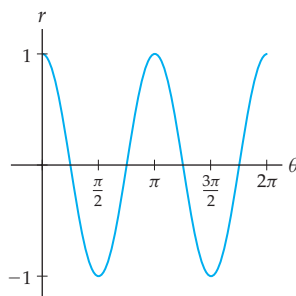

Graph the polar equation  $r = \cos 2\theta$ .

#### SOLUTION

In Example 1 we showed that the graph of  $r = \cos 2\theta$  is symmetrical with respect to the  $x$ -axis, with respect to the  $y$ -axis, and with respect to the origin. These symmetries will save us a considerable amount of work as we graph the given curve. In particular, we need only graph the curve on the interval  $[0, \frac{\pi}{2}]$  and then let the symmetry of the graph do the rest of the work.

We start our analysis by graphing the equation in the  $\theta r$ -plane:

$r = \cos 2\theta$  in the  $\theta r$ -plane

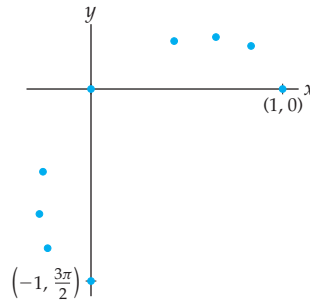

The only horizontal intercepts on the interval  $\theta \in [0, \frac{\pi}{2}]$  will occur at the polar point  $(1, 0)$  and when  $r$  is zero. We obtain the other horizontal intercept at the pole by finding the unique solution of the polar equation  $0 = \cos 2\theta$  for  $\theta \in [0, \frac{\pi}{2}]$ . This occurs when  $\theta = \frac{\pi}{4}$ . On our interval there will be one vertical intercept, at the polar point  $(-1, \frac{\pi}{2})$ .

From the graph, we can see that the sign of  $r$  varies when  $\theta$  is in the interval  $\left[0, \frac{\pi}{2}\right]$ . We have  $r > 0$  on the interval  $\left[0, \frac{\pi}{4}\right)$  and  $r < 0$  on  $\left(\frac{\pi}{4}, \frac{\pi}{2}\right]$ . Thus the values of  $\theta$  in the interval  $\left(0, \frac{\pi}{4}\right)$  will be graphed in the first quadrant while the values of  $\theta$  in the interval  $\left(\frac{\pi}{4}, \frac{\pi}{2}\right)$  will be graphed in the third quadrant. The following table lists values of  $r$  for several angles in the interval  $\left[0, \frac{\pi}{2}\right]$ :

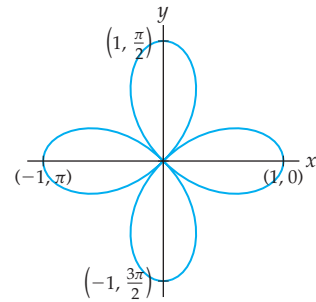

$\theta$	0	$\frac{\pi}{12}$	$\frac{\pi}{8}$	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{3\pi}{8}$	$\frac{5\pi}{12}$	$\frac{\pi}{2}$
$r$	1	$\frac{\sqrt{3}}{2}$	$\frac{\sqrt{2}}{2}$	$\frac{1}{2}$	0	$-\frac{1}{2}$	$-\frac{\sqrt{2}}{2}$	$-\frac{\sqrt{3}}{2}$	-1

Plotting the intercepts and points from the table gives us the picture shown next at the left. We connect these points with a smooth curve and use the symmetry of the graph to obtain the four-petaled rose graphed at the right.

Points on the graph of  $r = \cos 2\theta$

The rose  $r = \cos 2\theta$

In Exercise 55 you are asked to show that when  $n$  is a positive odd integer, the polar rose  $r = \cos n\theta$  or  $r = \sin n\theta$  is traced twice on the interval  $[0, 2\pi]$ . This implies that when  $n$  is odd, we need only graph  $r = \sin n\theta$  on the interval  $[0, \pi]$ . In addition, in Exercise 58 you are asked to show that for every integer  $n$ , the graph of  $r = \sin n\theta$  is symmetrical with respect to the  $y$ -axis. These facts will prove useful in the next example.

### EXAMPLE 5

#### A rose with three petals

Graph the polar equation  $r = \sin 3\theta$ .

#### SOLUTION

Because  $r = \sin 3\theta$  is a rose defined with the sine function and the odd integer  $n = 3$ , we need only consider the graph of  $r = \sin 3\theta$  for  $\theta \in \left[0, \frac{\pi}{2}\right]$ . The only horizontal intercepts of  $r = \sin 3\theta$  on the interval  $\left[0, \frac{\pi}{2}\right]$  will occur at the pole  $(0, 0)$ . However, the curve will pass through the pole twice, initially when  $\theta$  is zero and again when  $\theta$  is  $\frac{\pi}{3}$ . On our interval there will be one more vertical intercept at  $\left(-1, \frac{\pi}{2}\right)$ .

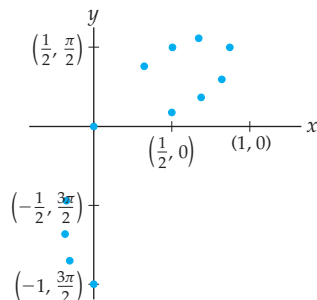

The sign of  $r$  varies when  $\theta$  is in the interval  $\left[0, \frac{\pi}{2}\right]$ :  $r > 0$  on  $\left[0, \frac{\pi}{3}\right)$  and  $r < 0$  on  $\left(\frac{\pi}{3}, \frac{\pi}{2}\right]$ . Thus the values of  $\theta$  in the interval  $\left(0, \frac{\pi}{3}\right)$  will be graphed in the first quadrant, while the values of  $\theta$  in the interval  $\left(\frac{\pi}{3}, \frac{\pi}{2}\right)$  will be graphed in the third quadrant. We again tabulate values of  $r$  for several angles in the interval  $\left[0, \frac{\pi}{2}\right]$ :

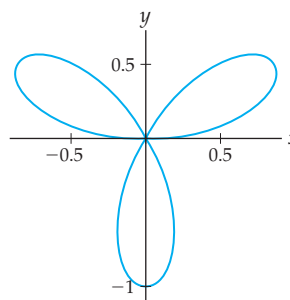

$\theta$	0	$\frac{\pi}{18}$	$\frac{\pi}{12}$	$\frac{\pi}{9}$	$\frac{\pi}{6}$	$\frac{2\pi}{9}$	$\frac{\pi}{4}$	$\frac{5\pi}{18}$	$\frac{\pi}{3}$	$\frac{7\pi}{18}$	$\frac{5\pi}{12}$	$\frac{4\pi}{9}$	$\frac{\pi}{2}$
$r$	0	$\frac{1}{2}$	$\frac{\sqrt{2}}{2}$	$\frac{\sqrt{3}}{2}$	1	$\frac{\sqrt{3}}{2}$	$\frac{\sqrt{2}}{2}$	$\frac{1}{2}$	0	$-\frac{1}{2}$	$-\frac{\sqrt{2}}{2}$	$-\frac{\sqrt{3}}{2}$	-1

Plotting the intercepts and these points gives us the graph shown next at the left. Connecting the points with a smooth curve and using the symmetry of the graph, we obtain the three-petaled rose graphed at the right.

Points on the graph of  $r = \sin 3\theta$

The rose  $r = \sin 3\theta$

□

### EXAMPLE 6

#### A lemniscate

Graph the polar equation  $r^2 = \sin 2\theta$ .

#### SOLUTION

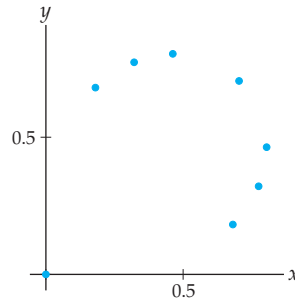

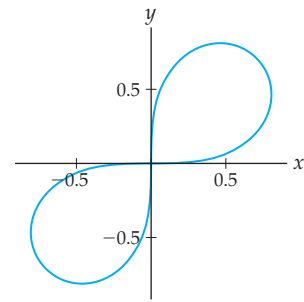

First we note that  $\theta$  cannot be a second- or fourth-quadrant angle, because if  $\theta$  were in one of those quadrants, then  $\sin 2\theta$  would be negative (since the sine is negative on the intervals  $(\pi, 2\pi)$  and  $(3\pi, 4\pi)$ ). In this case, because  $r^2 \geq 0$ , the equation  $r^2 = \sin 2\theta$  could not hold. Therefore the graph of our equation will appear only in the first and third quadrants of the polar plane.

We next show that the graph of  $r^2 = \sin 2\theta$  is symmetrical with respect to the origin. It suffices to show that for each point  $(r, \theta)$  on the graph of  $r^2 = \sin 2\theta$ , the point  $(r, \theta + \pi)$  is also on the graph. We have  $\sin(2(\theta + \pi)) = \sin(2\theta + 2\pi) = \sin 2\theta = r^2$ . Thus,  $(r, \theta + \pi)$  satisfies the equation  $r^2 = \sin 2(\theta + \pi)$ , so  $(r, \theta + \pi)$  is a point on the graph. Therefore the graph of  $r^2 = \sin 2\theta$  is symmetrical with respect to the origin.

We again tabulate values of  $r$  for several angles in the interval  $[0, \frac{\pi}{2}]$ :

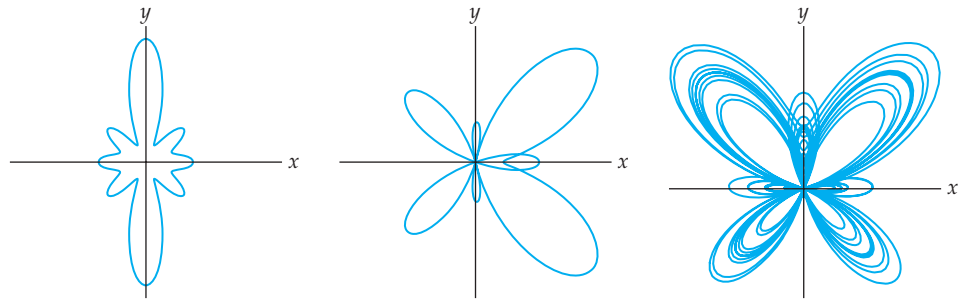

$\theta$	0	$\frac{\pi}{12}$	$\frac{\pi}{8}$	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{3\pi}{8}$	$\frac{5\pi}{12}$	$\frac{\pi}{2}$
$r$	0	$\frac{\sqrt{2}}{2}$	$\sqrt{\frac{\sqrt{2}}{2}}$	$\sqrt{\frac{\sqrt{3}}{2}}$	1	$\sqrt{\frac{\sqrt{3}}{2}}$	$\sqrt{\frac{\sqrt{2}}{2}}$	$\frac{\sqrt{2}}{2}$	0

Plotting the intercepts and points from the table gives us the graph shown next at the left. We connect these points with a smooth curve and use the symmetry of the graph to obtain the lemniscate graphed at the right.

Points on the graph of  $r^2 = \sin 2\theta$ The lemniscate  $r^2 = \sin 2\theta$ 

✓ CHECKING  
THE ANSWER

It is important to understand the basics of graphing polar curves by hand, but a graphing calculator or computer algebra system may be used to check your work. Calculators or software can also be used to graph many interesting examples that are too complicated to graph by hand. For example, the three figures that follow show some polar curves suggested by T. H. Fay (*American Mathematical Monthly*, 96 (1989), 442–443). The figures were graphed with the computer program *Mathematica*.

? TEST YOUR  
UNDERSTANDING

- ▶ Given a polar equation, why is it helpful to graph the equation in the  $\theta r$ -plane first?
- ▶ When  $\theta$  is a first-quadrant angle, in which quadrants might the polar point corresponding to  $\theta$  on the graph of an equation  $F(r, \theta) = 0$  appear? What about when  $\theta$  is a second-, third-, or fourth-quadrant angle? Why does this happen?
- ▶ How are the symmetries of a graph in polar coordinates recognized?
- ▶ When a polar function is symmetrical about both the  $x$ - and  $y$ -axes, why is it also symmetric about the origin?
- ▶ Which polar equations have polar graphs that are circles, cardioids, limaçons, roses, etc.?

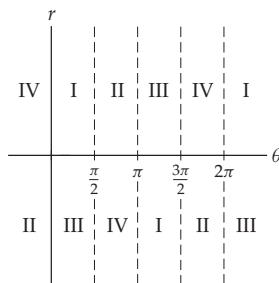

## EXERCISES 9.3

### Thinking Back

- ▶ *Finding points of intersection:* Graph the functions  $y = 1 + \sin x$  and  $y = \cos x$ , and find all points of intersection.
- ▶ *Finding points of intersection:* Graph the functions  $y = \frac{1}{2} + \cos x$  and  $y = \frac{1}{2} - \cos x$ , and find all points of intersection.
- ▶ *Translations of graphs:* What is the relationship between the graphs of the functions  $y = f(x)$  and  $y = f(x - k)$  when  $k > 0$ ?
- ▶ *Translations of graphs:* What is the relationship between the graphs of the functions  $y = f(x)$  and  $y = f(x) + k$  when  $k > 0$ ?

## Concepts

0. *Problem Zero*: Read the section and make your own summary of the material.
1. *True/False*: Determine whether each of the statements that follow is true or false. If a statement is true, explain why. If a statement is false, provide a counterexample.
- True or False*: If  $\frac{\pi}{2} < \theta < \pi$ , then the point  $(r, \theta)$  is located in the second quadrant when it is plotted in a polar coordinate system.
  - True or False*: The graph of  $r = \sin 5\theta$  is a five-petaled rose.
  - True or False*: The graph of  $r = \cos 6\theta$  is a six-petaled rose.
  - True or False*: If a graph in the polar plane is symmetrical with respect to the origin, then for every polar point  $(r, \theta)$  on the graph, the polar point  $(-r, \theta + 2\pi)$  is also on the graph.
  - True or False*: The graph of a polar function  $r = f(\theta)$  is symmetrical with respect to the  $y$ -axis if, for every point  $(r, \theta)$  on the graph, the point  $(r, -\theta)$  is also on the graph.
  - True or False*: When  $k$  is a positive integer, the polar roses  $r = \sin k\theta$  and  $r = \cos k\theta$  are symmetrical with respect to both the  $x$ -axis and  $y$ -axis if and only if  $k$  is even.
  - True or False*: In the rectangular coordinate system the graph of the equation  $(x^2 + y^2)^2 = k(x^2 - y^2)$  is a lemniscate for every  $k > 0$ .
  - True or False*: In the rectangular coordinate system the only function  $y = f(x)$  that is symmetrical with respect to both the  $y$ -axis and the origin is  $y = 0$ .
2. *Examples*: Construct examples of the thing(s) described in the following. Try to find examples that are different than any in the reading.
- An equation in polar coordinates whose graph is a cardioid.
  - An equation in polar coordinates whose graph is a limaçon.
  - An equation in polar coordinates whose graph is a lemniscate.
3. How can the graph of an equation  $r = f(\theta)$  in the  $\theta r$ -plane be used to provide information about the graph of the same equation in the polar plane?
4. Explain the significance of the following figure:

What is being shown in this figure?

5. This problem concerns the connections between the polar plane and the  $\theta r$ -plane.

- Which points in the  $\theta r$ -plane correspond to the pole in the polar plane, and why?
  - Which points in the  $\theta r$ -plane correspond to the horizontal axis in the polar plane, and why?
  - Which points in the  $\theta r$ -plane correspond to the vertical axis in the polar plane, and why?
6. What is the relationship between the graphs of  $r = f(\theta)$  and  $r = f(\theta - k)$  in the  $\theta r$ -plane for  $k > 0$ ? What is the relationship between the two graphs in polar coordinates?
7. Fill in the blanks:
- On a graph that is symmetrical with respect to the  $x$ -axis in the polar plane, if the polar point  $(2, \frac{\pi}{3})$  is on the graph, then the polar point \_\_\_\_\_ is also on the graph.
  - On a graph that is symmetrical with respect to the  $y$ -axis in the polar plane, if the polar point  $(2, \frac{\pi}{3})$  is on the graph, then the polar point \_\_\_\_\_ is also on the graph.
  - On a graph that is symmetrical with respect to the  $y$ -axis in the Cartesian coordinate system, if the point  $(3, 5)$  is on the graph, then the point \_\_\_\_\_ is also on the graph.
  - On a graph that is symmetrical with respect to the origin in the polar plane, if the polar point  $(2, \frac{\pi}{3})$  is on the graph, then the polar point \_\_\_\_\_ is also on the graph.
  - On a graph that is symmetrical with respect to the origin in the Cartesian coordinate system, if the point  $(3, 5)$  is on the graph, then the point \_\_\_\_\_ is also on the graph.
8. Fill in the blanks:
- If the point  $(r, \theta + \pi)$  is on the graph of a polar curve whenever the point  $(r, \theta)$  is on the graph, then the curve is symmetrical \_\_\_\_\_.
  - If the point \_\_\_\_\_ is on the graph of a polar curve whenever the point  $(r, \theta)$  is on the graph, then the curve is symmetrical with respect to the origin. (There is more than one way to answer this question correctly!)
  - If the point  $(-r, -\theta)$  is on the graph of a polar curve whenever the point  $(r, \theta)$  is on the graph, then the curve is symmetrical \_\_\_\_\_.
9. For each of the following, give an example of a polar equation whose graph has the type(s) of symmetry listed, if possible. If such an equation doesn't exist, explain why.
- symmetry about the  $x$ -axis
  - symmetry about the  $y$ -axis
  - symmetry about the origin
  - symmetry about the origin but not about the  $x$ -axis
  - symmetry about the  $x$ -axis,  $y$ -axis, and origin
  - symmetry about the  $x$ -axis and  $y$ -axis but not about the origin
10. For each type of polar curve, give a general form of the polar equation for that curve:
- a line passing through the pole
  - a circle centered at the pole

- (c) a cardioid  
 (d) a limaçon  
 (e) a rose with an odd number of petals  
 (f) a rose with an even number of petals  
 (g) a lemniscate  
 (h) the spiral of Archimedes
11. What type of polar curve is named for a heart? For a snail? For a ribbon?
12. What is the difference between a cardioid and a limaçon?
13. Which kind(s) of symmetry does the rose  $r = \cos 5\theta$  have? How many petals does this curve have? Which kind(s) of symmetry does the rose  $r = \sin 8\theta$  have? How many petals does this curve have?
14. Using polar coordinates, the graphs of the equations  $r = \cos k\theta$  and  $r = \sin k\theta$  are roses with  $k$  petals when  $k \geq 3$  is an odd integer. What are the polar graphs of these equations when  $k = 1$ ? What are the graphs of these equations when  $k$  is a negative odd integer?
15. Finish Example 1 by showing that  $r = \cos 2\theta$  is symmetrical with respect to the horizontal axis.
16. In this section we graphed many polar equations, and most of our examples followed similar procedures. Describe a general procedure for sketching the graph of a polar equation.

## Skills

Graph the equations in Exercises 17–24 in the  $\theta r$ -plane. Label each arc of your curve with the quadrant in which the corresponding polar graph will occur.

17.  $r = 1 - \cos \theta$   
 18.  $r = \frac{1}{2} - \sin \theta$   
 19.  $r = 2 + \sin \theta$   
 20.  $r = \sin 2\theta$   
 21.  $r = \cos^2 \theta$   
 22.  $r = \theta, r \leq 0$   
 23.  $r = \sec \theta$   
 24.  $r = 1 + \sin 3\theta$

Graph the equations in Exercises 25–32 in the polar plane. Compare your graphs with the corresponding graphs in Exercises 17–24.

25.  $r = 1 - \cos \theta$   
 26.  $r = \frac{1}{2} - \sin \theta$   
 27.  $r = 2 + \sin \theta$   
 28.  $r = \sin 2\theta$   
 29.  $r = \cos^2 \theta$   
 30.  $r = \theta, r \leq 0$   
 31.  $r = \sec \theta$   
 32.  $r = 1 + \sin 3\theta$

Find the smallest interval necessary to draw a complete graph of the functions in Exercises 33–38, and then graph each function using a graphing calculator or computer algebra system.

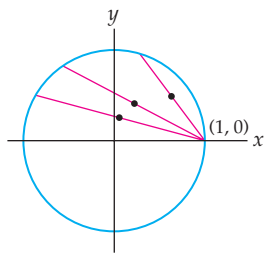

33.  $r = \cos(2\theta/5)$   
 34.  $r = \frac{4 \cos 3\theta + \cos 2\theta}{\cos \theta}$   
 35.  $r = \frac{4 \cos \theta + \cos 9\theta}{\cos \theta}$   
 36.  $r = e^{\sin \theta} - 2 \cos 4\theta$   
 37.  $r = e^{\sin \theta} - 2 \cos 4\theta + \sin^5(\theta/12)$

38.  $r = e^{\cos 2\theta} - 1.5 \cos 4\theta$   
 39. Graph the cardioid  $r = 2(1 - \sin \theta)$ .

For each pair of functions in Exercises 40–45,

- (a) Algebraically find all values of  $\theta$  where  $f_1(\theta) = f_2(\theta)$ .  
 (b) Sketch the two curves in the same polar coordinate system.  
 (c) Find all points of intersection between the two curves.
40.  $f_1(\theta) = \sin 2\theta$  and  $f_2(\theta) = -\sin 2\theta$   
 41.  $f_1(\theta) = \sin \theta$  and  $f_2(\theta) = \cos \theta$   
 42.  $f_1(\theta) = 1$  and  $f_2(\theta) = 2 \sin 2\theta$   
 43.  $f_1(\theta) = 1 + \sin \theta$  and  $f_2(\theta) = 1 - \cos \theta$   
 44.  $f_1(\theta) = \sin \theta$  and  $f_2(\theta) = \sin 2\theta$   
 45.  $f_1(\theta) = \sin^2 \theta$  and  $f_2(\theta) = \cos^2 \theta$
46. Graph the cardioids  $r = 1 + \cos \theta$ ,  $r = 2(1 + \cos \theta)$ , and  $r = 3(1 + \cos \theta)$  in the same polar coordinate system. What are the relationships among these three graphs? How does changing the constant  $k$  in the graph of the cardioid  $r = k(1 + \cos \theta)$  affect the graph? What happens when  $k < 0$ ?
47. Graph the cardioids  $r = 1 + \sin \theta$  and  $r = 1 - \sin \theta$ . What is the relationship between these two graphs?
48. Graph the limaçons  $r = \frac{1}{2} + \sin \theta$ ,  $r = 1 + \sin \theta$ ,  $r = 2 + \sin \theta$ , and  $r = 3 + \sin \theta$ . Make a conjecture about the behavior of graphs of limaçons of the form  $r = a + \sin \theta$  for various values of  $a$ . In particular, try to understand which values of  $a$  will give a limaçon with an inner loop. Which values of  $a$  will give a limaçon with a dimple? Which values of  $a$  will give a convex limaçon?
49. Graph the limaçons  $r = 3 + \cos \theta$ ,  $r = 3 + 3 \cos \theta$ ,  $r = 3 + 4 \cos \theta$ , and  $r = 3 + 6 \cos \theta$ . Make a conjecture about the behavior of graphs of limaçons of the form  $r = 3 + b \cos \theta$  for various values of  $b$ . In particular, try to understand which values of  $b$  will give a limaçon with an inner loop. Which values of  $b$  will give a limaçon with a dimple? Which values of  $b$  will give result in a convex limaçon?

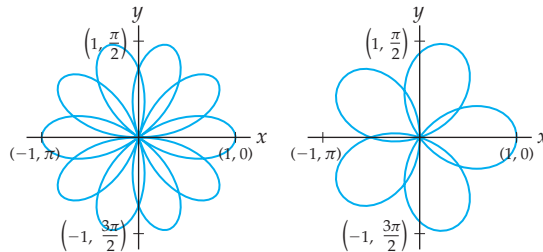

50. Consider the polar equation  $r^2 = \cos 2\theta$ .
- Show that the polar graph of this equation is symmetrical with respect to the  $x$ -axis.
  - Show that the polar graph of this equation is symmetrical with respect to the origin.
  - Explain why the polar graph of the equation is symmetrical with respect to the  $y$ -axis.
  - Use the techniques of this section to graph the equation.
  - How could you graph the equation with a calculator or computer algebra system?
51. Find an equation for the curve obtained as the set of midpoints of every chord with one endpoint at  $(1, 0)$  on the unit circle  $r = 1$ . Express your answer (a) with parametric equations, (b) in rectangular coordinates, and (c) in polar coordinates.

## Applications

53. Annie is using wood framing and a fabric shell to design a kayak. For simplicity, she considers making the cross section of the kayak follow the curve  $r = A(1 - 0.5 \sin \theta)$ , where  $A = 1$  at the middle of the kayak and becomes smaller as the cross section is taken farther from the middle of the boat. Sketch the cross section of the boat when  $A = 1$ .
54. Annie is concerned that her kayak will be too deep—it will draw too much water or else have too much freeboard to be easy to paddle. She decides to investigate a

52. The graph of  $r = \cos\left(\frac{5}{2}\theta\right)$  is the flower-like graph with 10 petals, shown next at the left:

The graph of  $r = \cos\left(\frac{5}{3}\theta\right)$  is also a flower-like graph, but with 5 petals, shown in the preceding figure at the right.

- Why does the graph of  $r = \cos\left(\frac{5}{2}\theta\right)$  have 10 petals while the graph of  $r = \cos\left(\frac{5}{3}\theta\right)$  has only 5?
- Let  $\frac{p}{q}$  be a positive rational number reduced to lowest terms with  $p > q$ . How many petals will the curve  $r = \cos\left(\frac{p}{q}\theta\right)$  have? What is the smallest interval of the form  $[0, b]$  required to obtain the graphs of these curves? Explain how to calculate  $b$  in terms of  $p$  and  $q$ .
- What is the graph of  $r = \cos k\theta$  when  $k$  is an irrational number?

cross-section function of the form

$$r = A(1 - 0.5 \sin \theta)(1 + 0.2 \cos^2 \theta).$$

- How does Annie need to alter the choice of  $A$  so that the width of this boat is the same as that without the term  $(1 + 0.2 \cos^2 \theta)$ ?
- Sketch this cross section with Annie's choice of  $A$  from part (a).
- Describe in words the effect that the multiplicative term  $(1 + 0.2 \cos^2 \theta)$  has on the cross section of the kayak. How is that effect achieved?

## Proofs

- Prove that when  $n$  is a positive odd integer, the polar rose  $r = \cos n\theta$  or  $r = \sin n\theta$  is traced twice on the interval  $[0, 2\pi]$  and thus has exactly  $n$  petals.
- Prove Theorem 9.10. That is, show that if a graph in the plane has any two of three types of symmetry, namely, symmetry about the  $x$ -axis, symmetry about the  $y$ -axis, and symmetry about the origin, then it has the third type of symmetry as well.
- Prove that, for every even integer  $n$ , the graph of  $r = \sin n\theta$  is symmetrical with respect to the  $x$ -axis.
- Prove that, for every integer  $n$ , the graph of  $r = \sin n\theta$  is symmetrical with respect to the  $y$ -axis.
- Prove that, for every even integer  $n$ , the graph of  $r = \cos n\theta$  is symmetrical with respect to the  $y$ -axis.
- Prove that, for every integer  $n$ , the graph of  $r = \cos n\theta$  is symmetrical with respect to the  $x$ -axis.

## Thinking Forward

- ▶ *Volume of a cylinder:* Find the volume of the right circular cylinder with height 2 units and cross-sectional circle given by the equation  $r = 4 \cos \theta$ .
- ▶ *Volume of a sphere:* Find the volume of the sphere whose equator is given by the equation  $r = 4 \cos \theta$ .

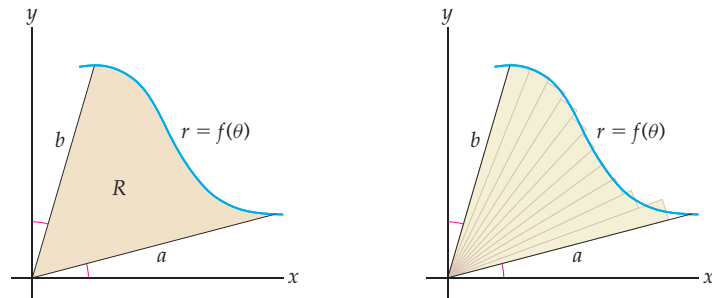

## 9.4 COMPUTING ARC LENGTH AND AREA WITH POLAR FUNCTIONS

- ▶ A formula for finding the area bounded by a polar curve is derived
- ▶ We explain how polar functions can be expressed with parametric equations
- ▶ A formula for finding the arc length of a polar curve is derived

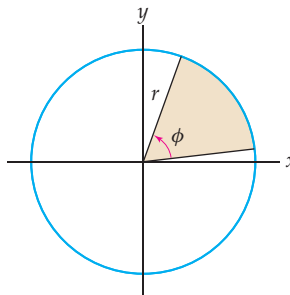

### Computing the Area Bounded by Polar Curves

We've seen that many interesting regions in the plane are bounded by polar functions of the form  $r = f(\theta)$ . We will start this section by discussing how to compute the area of such a region without transforming the equation into rectangular coordinates.

When working in rectangular coordinates, we used rectangles as our most “basic” shape—that is, as the building blocks for approximating areas of more complicated regions. When working in polar coordinates, it is more natural to approximate a region with sectors of circles. For example, consider a region  $R$  in the polar plane bounded by two rays  $\theta = \alpha$  and  $\theta = \beta$  and a polar function of the form  $r = f(\theta)$ , as shown next at the left. (Regions of this type will be the typical polar regions we wish to approximate; compare our work here with our work in rectangular coordinates when we considered the area under the graph of a function  $y = f(x)$  from  $x = a$  to  $x = b$ .) The following figure at the right shows the region  $R$  approximated with “wedges” (i.e., sectors of circles):

Of course, before we can use sectors of circles to approximate areas, we must determine how to find the area of a sector of a circle. Consider a sector of a circle with radius  $r$  and that has a central angle  $\phi$  (measured in radians):

The area of the sector is a fraction of the area of the circle. Specifically, it is  $\frac{\phi}{2\pi}$  times the area of the entire circle (i.e.,  $\frac{\phi}{2\pi}(\pi r^2) = \frac{1}{2}\phi r^2$ ), as stated in the following theorem:

**THEOREM 9.12**    **The Area of a Sector of a Circle**

In a circle of radius  $r$ , the area of a sector with central angle  $\phi$ , in radians, is given by

$$\text{Area} = \frac{1}{2}\phi r^2.$$

We will now return to the region  $R$  and its approximation with wedges. Although we could easily approximate the area of this region with a fixed number of wedges, we want to find the *exact* area; therefore we need to fix a general notation. The procedure is strikingly similar to our work with Riemann sums in Chapter 4, except that instead of dealing with approximating rectangles in rectangular coordinates, we will be dealing with approximating sectors in polar coordinates.

Let  $n$  be a positive integer, and define

$$\Delta\theta = \frac{\beta - \alpha}{n} \quad \text{and} \quad \theta_k = \alpha + k\Delta\theta.$$

We also choose some point  $\theta_k^*$  in each interval  $[\theta_{k-1}, \theta_k]$  and let  $S_k$  be the sector of the circle with radius  $f(\theta_k^*)$  centered at the origin and extending from the radius with polar angle  $\theta_{k-1}$  to the radius with polar angle  $\theta_k$ . These are the sectors shown earlier as wedges.

By Theorem 9.12, the area of the  $k$ th sector  $S_k$  is  $\frac{1}{2}(f(\theta_k^*))^2\Delta\theta$ . The approximate area of the region  $R$  is the sum of the areas of the sectors:

$$\text{Area of region } R \approx \sum_{k=1}^n \frac{1}{2}(f(\theta_k^*))^2\Delta\theta.$$

Notice that this is a Riemann sum for the function  $\frac{1}{2}(f(\theta))^2$  on the interval  $[\alpha, \beta]$ . Therefore, the area of  $R$  will be the limit of the Riemann sum as  $n \rightarrow \infty$ . That is,

$$\text{Area of region } R = \lim_{n \rightarrow \infty} \sum_{k=1}^n \frac{1}{2}(f(\theta_k^*))^2\Delta\theta.$$

We now have the following theorem:

**THEOREM 9.13**    **The Area of a Region in the Polar Plane Bounded by a Function  $r = f(\theta)$**

Let  $\alpha$  and  $\beta$  be real numbers such that  $0 \leq \beta - \alpha \leq 2\pi$ . Let  $R$  be the region in the polar plane bounded by the rays  $\theta = \alpha$  and  $\theta = \beta$  and a positive continuous function  $r = f(\theta)$ . Then the area of region  $R$  is

$$\frac{1}{2} \int_{\alpha}^{\beta} (f(\theta))^2 d\theta.$$

## Computing Arc Length in Polar Coordinates

Every polar function of the form  $r = f(\theta)$  can be easily rewritten in terms of parametric equations of the form  $x = x(\theta)$  and  $y = y(\theta)$ . Recall that to transform from polar coordinates

to rectangular coordinates we use

$$x = r \cos \theta, \quad y = r \sin \theta.$$

If  $r = f(\theta)$ , we immediately obtain

$$x = f(\theta) \cos \theta, \quad y = f(\theta) \sin \theta.$$

These are the parametric equations that we sought.

For example, to express the cardioid with equation  $r = 1 + \cos \theta$  in terms of parametric equations, we have

$$x = (1 + \cos \theta) \cos \theta, \quad y = (1 + \cos \theta) \sin \theta.$$

By thinking of polar functions as parametric equations, we can use the work we just did to find the arc length of a polar curve. If we combine the parametric equations  $x = f(\theta) \cos \theta$  and  $y = f(\theta) \sin \theta$  with Theorem 9.4 of Section 9.1, which tells us how to compute the arc length of a curve defined by parametric equations, we arrive at the following theorem:

### THEOREM 9.14

#### The Arc Length of a Polar Curve

Let  $r = f(\theta)$  be a differentiable function of  $\theta$  such that  $f'(\theta)$  is continuous for all  $\theta \in [\alpha, \beta]$ . Furthermore, assume that  $r = f(\theta)$  is a one-to-one function from  $[\alpha, \beta]$  to the graph of the function. Then the length of the polar graph of  $r = f(\theta)$  on the interval  $[\alpha, \beta]$  is

$$\int_{\alpha}^{\beta} \sqrt{(f'(\theta))^2 + (f(\theta))^2} d\theta.$$

**Proof.** Theorem 9.4 tells us that when  $x$  and  $y$  are functions of the parameter  $\theta$ , the arc length of the curve on the interval  $[\alpha, \beta]$  is

$$\int_{\alpha}^{\beta} \sqrt{\left(\frac{dx}{d\theta}\right)^2 + \left(\frac{dy}{d\theta}\right)^2} d\theta.$$

Combining this integral with the parametric equations for the curve,  $x = f(\theta) \cos \theta$  and  $y = f(\theta) \sin \theta$ , we have arc length

$$\int_{\alpha}^{\beta} \sqrt{\left(\frac{d}{d\theta}(f(\theta) \cos \theta)\right)^2 + \left(\frac{d}{d\theta}(f(\theta) \sin \theta)\right)^2} d\theta.$$

Taking the derivatives inside the radical gives

$$\int_{\alpha}^{\beta} \sqrt{(f'(\theta) \cos \theta - f(\theta) \sin \theta)^2 + (f'(\theta) \sin \theta + f(\theta) \cos \theta)^2} d\theta.$$

After expanding the terms under of the radical and simplifying (you will do this in Exercise 58), we obtain our result:

$$\int_{\alpha}^{\beta} \sqrt{(f'(\theta))^2 + (f(\theta))^2} d\theta. \quad \blacksquare$$

## Examples and Explorations

### EXAMPLE 1

#### Finding the area bounded by a polar rose

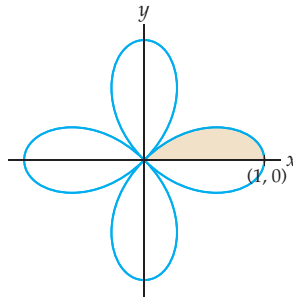

Calculate the area bounded by the curve  $r = \cos 2\theta$ .

**SOLUTION**

This is the first of three examples in which we use Theorem 9.13 to find areas of polar regions. As with all area computations, we must understand the area we are trying to compute. When we can, we will use the symmetry of the region to simplify our work.

Recall that we graphed this polar rose in Example 4 in Section 9.3. We reproduce that graph here, with one portion of the graph shaded:

To compute the area of the curve we will use the symmetry of the rose. We will calculate only the area of the shaded region of the figure—that is one-half of one of the petals (and one-eighth of the total area). The shaded region corresponds to the values of  $\theta$  in  $\left[0, \frac{\pi}{4}\right]$ . Therefore the area of the shaded region is

$$\frac{1}{2} \int_0^{\pi/4} \cos^2 2\theta \, d\theta.$$

The value of this integral is  $\frac{\pi}{16}$ . (You should be able to work out the details.) Since the area of the shaded region is one-eighth of the region bounded by the polar rose, the area bounded by the rose is  $\frac{\pi}{2}$  square units.  $\square$

**CAUTION**

In Example 1 we used the symmetry of the region to help us compute the area of a polar rose. Using such symmetries will often make area computations easier. We could also have computed the entire area from the integral

$$\frac{1}{2} \int_0^{2\pi} \cos^2 2\theta \, d\theta,$$

because the entire curve gets traced once on the interval  $[0, 2\pi]$ . However, it is not always correct to integrate over the interval  $[0, 2\pi]$  to find the area of a polar rose. When  $n \geq 3$  is odd, any polar rose of the form  $r = \cos n\theta$  or  $r = \sin n\theta$  is traced twice on the interval  $[0, 2\pi]$ . Therefore, to find the areas bounded by these roses, we could use integrals of the form

$$\frac{1}{2} \int_0^{\pi} \cos^2 n\theta \, d\theta \text{ or } \frac{1}{2} \int_0^{\pi} \sin^2 n\theta \, d\theta.$$

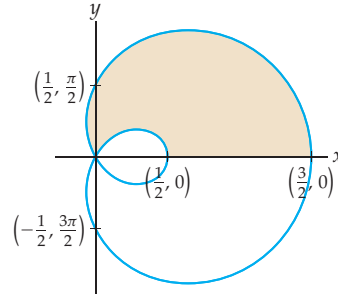

For these functions, integrating over the interval  $[0, 2\pi]$  would give an answer that is twice the correct value.

**EXAMPLE 2****Finding the area between the loops of a limaçon**

Calculate the area between the interior and exterior loops of the limaçon  $r = \frac{1}{2} + \cos \theta$ .

**SOLUTION**

This is the limaçon we graphed in Example 3 in Section 9.3. We reproduce that graph here, again with one portion shaded:

To compute the area between the loops of the limaçon, we will make use once more of the symmetry of the region. We will calculate the area of the shaded region of the figure. This area is one-half of our desired area. To do our calculation, we will first find the area between the  $x$ -axis and top half of the outer loop of the limaçon. Next, we will find the area between the  $x$ -axis and the top half of the inner loop. The difference of these areas will give us the area of the shaded region.

To compute the area between the  $x$ -axis and the top half of the outer loop of the limaçon, we use the integral

$$\frac{1}{2} \int_0^{2\pi/3} \left(\frac{1}{2} + \cos \theta\right)^2 d\theta.$$

The upper limit of this integral is  $\frac{2\pi}{3}$ , because that is the smallest positive value of  $\theta$  at which  $r = 0$  and the curve goes through the pole. The value of the integral is  $\frac{\pi}{4} + \frac{3\sqrt{3}}{16}$ . The area between the  $x$ -axis and the top half of the inner loop of the limaçon is given by the integral

$$\frac{1}{2} \int_{\pi}^{4\pi/3} \left(\frac{1}{2} + \cos \theta\right)^2 d\theta.$$

We integrate here over the interval  $\left[\pi, \frac{4\pi}{3}\right]$  because this is the interval that traces the desired portion of the curve. Note that we could also have integrated over the interval  $\left[\frac{2\pi}{3}, \pi\right]$ . This would have given us the area between the  $x$ -axis and the bottom half of the inner loop of the limaçon. Since the two halves of the inner loop have equal area, the values of the two integrals would be equal. The value of either of these integrals is  $\frac{\pi}{8} - \frac{3\sqrt{3}}{16}$ . Therefore, the shaded region has area

$$\frac{\pi}{4} + \frac{3\sqrt{3}}{16} - \left(\frac{\pi}{8} - \frac{3\sqrt{3}}{16}\right) = \frac{\pi + 3\sqrt{3}}{8}.$$

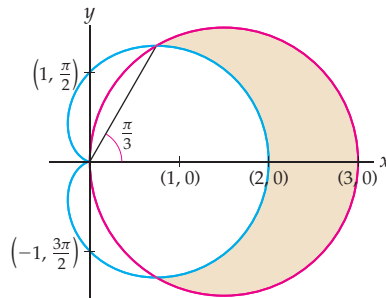

The area between the two loops is twice this value,  $\frac{\pi + 3\sqrt{3}}{4}$ . □

**EXAMPLE 3****Finding the area between two polar curves**

Calculate the area of the region in the polar plane that is inside the circle  $r = 3 \cos \theta$ , but outside the cardioid  $r = 1 + \cos \theta$ .

**SOLUTION**

The region in question is shown as the shaded part of the following graph:

Using the symmetry of the region, we know that it is enough to compute the area of the top half of the region and then multiply by 2. Solving  $3 \cos \theta = 1 + \cos \theta$  for  $\theta \in [0, \pi]$ , we see that the two curves intersect when  $\theta = \frac{\pi}{3}$ . Therefore the area of the top half of the region is given by the definite integral

$$\frac{1}{2} \int_0^{\pi/3} ((3 \cos \theta)^2 - (1 + \cos \theta)^2) d\theta.$$

The value of this integral is  $\frac{\pi}{2}$ . Since the area of the shaded region is one-half of the original region, the desired area is  $\pi$  square units.  $\square$

**EXAMPLE 4****Computing the arc length of a polar curve**

Compute the arc length of the cardioid defined by the polar equation  $r = 1 + \cos \theta$ .

**SOLUTION**

By Theorem 9.14, we need only evaluate the integral

$$\int_0^{2\pi} \sqrt{\left(\frac{d}{d\theta}(1 + \cos \theta)\right)^2 + (1 + \cos \theta)^2} d\theta.$$

After differentiating and simplifying, we find that the integral is equal to

$$\int_0^{2\pi} \sqrt{\sin^2 \theta + 1 + 2 \cos \theta + \cos^2 \theta} d\theta = \int_0^{2\pi} \sqrt{2 + 2 \cos \theta} d\theta.$$

The value of this definite integral is 8 (as you will show in Exercise 16). Therefore the arc length of the cardioid  $r = 1 + \cos \theta$  is 8 units.  $\square$

**TEST YOUR UNDERSTANDING**

- ▶ Why is the integral  $\int_{\alpha}^{\beta} \frac{1}{2} (f(\theta))^2 d\theta$  used to compute the area of a region in the polar plane bounded by the function  $r = f(\theta)$ ? Why not just use the integral  $\int_{\alpha}^{\beta} f(\theta) d\theta$ ?
- ▶ Given two polar equations  $r = f(\theta)$  and  $r = g(\theta)$ , why is it insufficient to solve the equation  $f(\theta) = g(\theta)$  for  $\theta$  in order to find the points of intersection of the two graphs? How do you find all points of intersection on the graphs of  $f$  and  $g$ ?
- ▶ How can the symmetries of the graphs of polar functions be used to simplify area calculations? Why is it important to know where curves intersect themselves or each other when you are calculating an area?
- ▶ How do you transform a polar function of the form  $r = f(\theta)$  into parametric equations  $x = x(\theta)$  and  $y = y(\theta)$ ?
- ▶ How do you compute the arc length of a polar function  $r = f(\theta)$ ?

## EXERCISES 9.4

## Thinking Back

Calculate each of the following definite integrals (these are precisely the definite integrals that were encountered in the reading for this section):

$$\blacktriangleright \frac{1}{2} \int_0^{\pi/4} \cos^2 2\theta \, d\theta$$

$$\blacktriangleright \frac{1}{2} \int_0^{\pi} \cos^2 3\theta \, d\theta$$

$$\blacktriangleright \frac{1}{2} \int_0^{2\pi/3} \left(\frac{1}{2} + \cos \theta\right)^2 \, d\theta$$

$$\blacktriangleright \frac{1}{2} \int_{\pi}^{4\pi/3} \left(\frac{1}{2} + \cos \theta\right)^2 \, d\theta$$

$$\blacktriangleright \frac{1}{2} \int_0^{\pi/3} ((3 \cos \theta)^2 - (1 + \cos \theta)^2) \, d\theta$$

## Concepts

- Problem Zero:** Read the section and make your own summary of the material.
- True/False:** Determine whether each of the statements that follow is true or false. If a statement is true, explain why. If a statement is false, provide a counterexample.
  - True or False:* To approximate the area of the region in the polar plane bounded by the function  $r = f(\theta)$  and the rays  $\theta = \alpha$  and  $\theta = \beta$ , we can use a sum of areas of sectors of circles.
  - True or False:* Suppose we subdivide the interval of angles  $\theta \in \left[\frac{\pi}{4}, \frac{\pi}{2}\right]$  into four equal subintervals. Then  $\Delta\theta = \frac{\pi}{16}$ .
  - True or False:* The area of the region in the polar plane bounded by the function  $r = f(\theta)$  and the rays  $\theta = \alpha$  and  $\theta = \beta$  is given by the definite integral  $\int_{\alpha}^{\beta} f(\theta) \, d\theta$ .
  - True or False:* The area between the continuous function  $r = f(\theta)$  and the  $\theta$ -axis on the interval  $[\alpha, \beta]$  in the  $\theta r$ -plane is given by the integral  $\int_{\alpha}^{\beta} |f(\theta)| \, d\theta$ .
  - True or False:* Since the graph of  $r = 2 \cos \theta$  is a circle with radius 1, the value of the integral  $\frac{1}{2} \int_0^{2\pi} (2 \cos \theta)^2 \, d\theta$  is  $\pi$ .
  - True or False:* The polar equation  $r = \cos 4\theta$  is traced twice as  $\theta$  varies from 0 to  $2\pi$ .
  - True or False:* Every polar function of the form  $r = f(\theta)$  can be written with parametric equations.
  - True or False:* If  $r = f(\theta)$  is a differentiable function for  $0 \leq \theta \leq 2\pi$ , then the integral  $\int_0^{2\pi} \sqrt{(f(\theta))^2 + (f'(\theta))^2} \, d\theta$  represents the length of the curve  $r = f(\theta)$  for  $0 \leq \theta \leq 2\pi$ .
- Examples:** Construct examples of the thing(s) described in the following. Try to find examples that are different than any in the reading.
  - An integral that represents the area of a circle with radius  $a$  in polar coordinates.
  - An integral that represents the circumference of a circle with radius  $a$  in polar coordinates.
  - An integral that represents the circumference of a circle with radius  $a$  in terms of parametric equations.
- When we use rectangular coordinates to approximate the area of a region, we subdivide the region into vertical strips and use a sum of areas of rectangles to approximate the area. Explain why we use a “wedge” (i.e., a sector of a circle) and not a rectangle when we use polar coordinates to compute an area.
  - When we investigated area in rectangular coordinates in Chapter 4, we often tried to find the areas of regions under curves  $y = f(x)$  from  $x = a$  to  $x = b$ . In the polar plane, the typical region whose area we wish to find is a region  $R$  bounded by two rays  $\theta = \alpha$  and  $\theta = \beta$  and a polar function of the form  $r = f(\theta)$ . Why is this our basic type of region in the polar plane?
  - In this section we described a method for approximating the area of a polar region bounded by two rays  $\theta = \alpha$  and  $\theta = \beta$  and a polar function  $r = f(\theta)$ . The method involved a “subdivide, approximate, and add” strategy in which we fixed some general notation. Draw a carefully labeled picture that illustrates the roles of  $\Delta\theta$ ,  $\theta_k^*$ , and  $f(\theta_k^*)$  for one approximating sector  $S_k$ .
  - Explain how we arrive at the definite integral formula  $\frac{1}{2} \int_{\alpha}^{\beta} (f(\theta))^2 \, d\theta$  in Theorem 9.13 for computing the area bounded by a polar function  $r = f(\theta)$  on an interval  $[\alpha, \beta]$ . (Your explanation should include a limit of Riemann sums.) What would the integral  $\int_{\alpha}^{\beta} f(\theta) \, d\theta$  represent?
  - Why do we require that  $0 \leq \beta - \alpha \leq 2\pi$  in the statement of Theorem 9.13?
  - Consider the three-petaled polar rose defined by  $r = \cos 3\theta$ . Explain why the definite integral  $\frac{1}{2} \int_0^{2\pi} \cos^2 3\theta \, d\theta$  calculates *twice* the area bounded by the petals of this rose.
  - Explain how the symmetries of the graphs of polar functions can be used to simplify area calculations.
  - Explain how to use parametric equations to transform a polar function  $r = f(\theta)$ .
  - Explain how to use parametric equations to transform the function  $y = f(x)$ .
  - What is the formula for computing the arc length of a polar curve  $r = f(\theta)$  where  $\theta \in [\alpha, \beta]$ ? What conditions on the polar function  $f(\theta)$  are necessary for this formula to hold?

13. Rick wants to show that the circumference of a unit circle is  $2\pi$ . He decides to use the arc length formula given in Theorem 9.14 with the function  $r = \sin \theta$  on the interval  $[0, 2\pi]$  and obtains  $2\pi$  as the length. Explain the two mistakes he made and how they cancelled to give the correct answer.

14. Give a geometric explanation of why

$$\frac{n}{2} \int_0^{2\pi/n} r^2 d\theta = \pi r^2$$

for any positive real number  $r$  and any positive integer  $n$ . Would the equation also hold for non-integer values of  $n$ ?

15. The following integral expression may be used to find the area of a region in the polar coordinate plane:

$$\frac{1}{2} \int_0^{\pi/4} \sin^2 \theta d\theta + \frac{1}{2} \int_{\pi/4}^{\pi/2} \cos^2 \theta d\theta.$$

Sketch the region and then compute its area. (If you prefer, you may use a simpler integral to compute the same area.)

16. Complete Example 4 by evaluating the integral  $\int_0^{2\pi} \sqrt{2 + 2 \cos \theta} d\theta$ .

## Skills

In Exercises 17–25 find a definite integral expression that represents the area of the given region in the polar plane, and then find the exact value of the expression.

17. The region enclosed by the spiral  $r = \theta$  and the  $x$ -axis on the interval  $0 \leq \theta \leq \pi$ .

18. The region inside one loop of the lemniscate  $r^2 = \sin 2\theta$ .

19. The region between the two loops of the limaçon  $r = 1 + \sqrt{2} \cos \theta$ .

20. The region between the two loops of the limaçon  $r = \sqrt{3} - 2 \sin \theta$ .

21. The region inside the cardioid  $r = 3 - 3 \sin \theta$  and outside the cardioid  $r = 1 + \sin \theta$ .

22. The region inside both of the cardioids  $r = 3 - 3 \sin \theta$  and  $r = 1 + \sin \theta$ .

23. The region inside the circle  $x^2 + y^2 = 1$  to the right of the vertical line  $x = \frac{1}{2}$ .

24. The region bounded by the limaçon  $r = 1 + k \sin \theta$ , where  $0 < k < 1$ . Bonus: Explain why the area approaches  $\pi$  as  $k \rightarrow 0$ .

25. The graph of the polar equation  $r = \sec \theta - 2 \cos \theta$  for  $\theta \in \left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$  is called a **strophoid**. Graph the strophoid and find the area bounded by the loop of the graph.

In Exercises 26–30 find a definite integral that represents the length of the specified polar curve, and then find the exact value of the integral.

26. The spiral  $r = \theta$  for  $0 \leq \theta \leq 2\pi$ .

27. The spiral  $r = e^\theta$  for  $0 \leq \theta \leq 2\pi$ .

28. The spiral  $r = e^\theta$  for  $2k\pi \leq \theta \leq 2(k+1)\pi$ .

29. The spiral  $r = e^{\alpha\theta}$  for  $0 \leq \theta \leq 2\pi$ , where  $\alpha$  is a nonzero constant.

30. The cardioid  $r = 2 - 2 \sin \theta$ , for  $0 \leq \theta \leq 2\pi$ .

In Exercises 31–36 find a definite integral that represents the length of the specified polar curve, and then use a graphing calculator or computer algebra system to approximate the value of the integral.

31. One petal of the polar rose  $r = \cos 2\theta$ .

32. One petal of the polar rose  $r = \cos 3\theta$ .

33. One petal of the polar rose  $r = \cos 4\theta$ .

34. The entire limaçon  $r = 1 + 2 \sin \theta$ .

35. The inner loop of the limaçon  $r = 1 + 2 \sin \theta$ .

36. The limaçon  $r = 2 + \cos \theta$ .

37. Complete Example 2 by evaluating the integral expression

$$\int_0^{2\pi/3} \left(\frac{1}{2} + \cos \theta\right)^2 d\theta - \int_{\pi}^{4\pi/3} \left(\frac{1}{2} + \cos \theta\right)^2 d\theta.$$

Each of the integrals or integral expressions in Exercises 38–44 represents the area of a region in the plane. Use polar coordinates to sketch the region and evaluate the expressions.

38.  $\frac{1}{2} \int_0^{2\pi} (1 + \sin \theta)^2 d\theta$

39.  $\int_0^{\pi} (1 + \cos \theta)^2 d\theta$

40.  $\int_{-\pi/2}^{\pi/2} (2 - \sin \theta)^2 d\theta$

41.  $\int_0^{\pi/2} \sin 2\theta d\theta$

42.  $3 \int_0^{\pi/2} \sin^2 3\theta d\theta$

43.  $\frac{1}{2} \int_0^{2\pi} (2 + \sin 4\theta)^2 d\theta$

44.  $\int_{-\pi/4}^{\pi/2} \left(\frac{\sqrt{2}}{2} + \sin \theta\right)^2 d\theta - \int_{-\pi/2}^{-\pi/4} \left(\frac{\sqrt{2}}{2} + \sin \theta\right)^2 d\theta$

45. Use Theorem 9.13 to show that the area of the circle defined by the polar equation  $r = a$  is  $\pi a^2$ .

46. Use Theorem 9.13 to show that the area of the circle defined by the polar equation  $r = 2a \cos \theta$  is  $\pi a^2$ .

47. Use Theorem 9.14 to show that the circumference of the circle defined by the polar equation  $r = a$  is  $2\pi a$ .

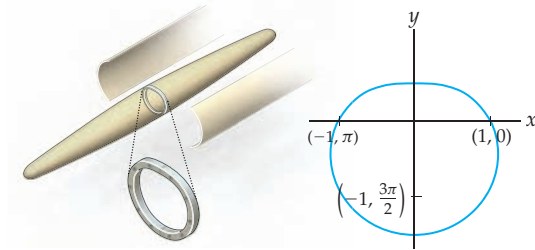

48. Use Theorem 9.14 to show that the area of the circle defined by the polar equation  $r = 2a \sin \theta$  is  $2\pi a$ .

49. Find the area interior to two circles with the same radius if each circle passes through the center of the other. (*Hint: Consider the circles  $r = a$  and  $r = 2a \cos \theta$ .)*

## Applications

50. Annie is designing a kayak with central cross section given by  $r = 1 - 0.5 \sin \theta$ , where  $r$  is measured in feet.

Kayak and central cross section

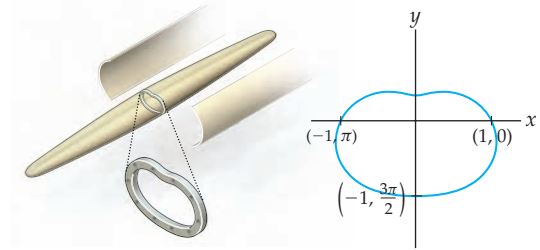

She will cover the kayak with an impermeable polyurethane fabric. The fabric comes in rolls 1 meter wide. Annie needs to use the length of the fabric to run the length of her boat, so she hopes to be able to use just two widths of the fabric to cover the boat. Will she be able to?

51. Annie's second potential design for the central cross section of her kayak is

$$r = 0.83(1 - 0.5 \sin \theta)(1 + 0.2 \cos^2 \theta).$$

New kayak and its central cross section

Will this design allow Annie to use just two widths of the fabric? (Hint: Use a numerical integration technique to approximate the length of the cross section.)

52. Ian sometimes sews his own outdoor gear. He wants to make a body-hugging climbing pack. The bottom of the pack is the area outside the circle  $r = 14$ , but inside  $r = 14\sqrt{2} \sin \theta$ , where  $r$  is measured in inches. Ian requires the pack to carry 2500 cubic inches of gear. If the pack has vertical sides, how tall does Ian need to make it?

## Proofs

53. Prove that the area of a sector with central angle  $\phi$  in a circle of radius  $r$  is given by  $A = \frac{1}{2} \phi r^2$ .
54. Prove that the area enclosed by one petal of the polar rose  $r = \cos 3\theta$  is the same as the area enclosed by one petal of the polar rose  $r = \sin 3\theta$ .
55. Prove that the area enclosed by all of the petals of the polar rose  $r = \cos 2n\theta$  is the same for every positive integer  $n$ .
56. Prove that the area enclosed by all of the petals of the polar rose  $r = \sin(2n + 1)\theta$  is the same for every positive integer  $n$ .
57. Prove that the part of the polar curve  $r = \frac{1}{\theta}$  that lies inside the circle defined by the polar equation  $r = 1$  has infinite length.
58. Complete the proof of Theorem 9.14 by verifying that
- $$(f'(\theta) \cos \theta - f(\theta) \sin \theta)^2 + (f'(\theta) \sin \theta + f(\theta) \cos \theta)^2$$
- is equal to
- $$(f'(\theta))^2 + (f(\theta))^2.$$

## Thinking Forward

The cardioid defined by  $r = 1 + \cos \theta$  and its interior is translated one unit perpendicular to the  $xy$ -plane to define a "cylinder."

- *Volume:* Find the volume of the cylinder.

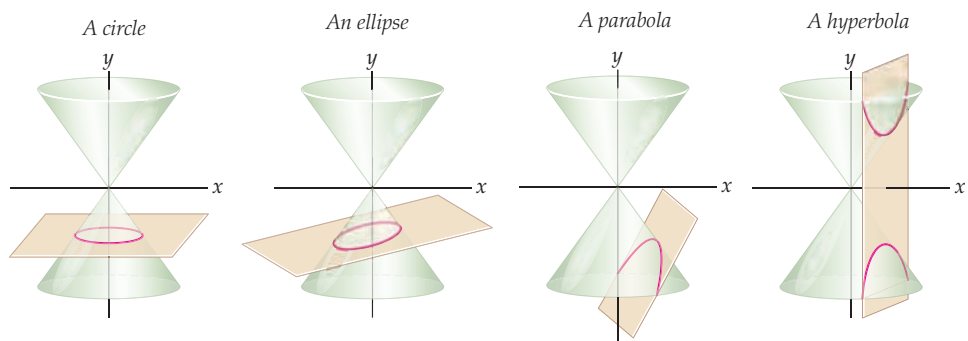

- *Surface area:* Find the surface area of the cylinder. Remember to include the top and bottom of the solid in your calculations.

## 9.5 CONIC SECTIONS\*

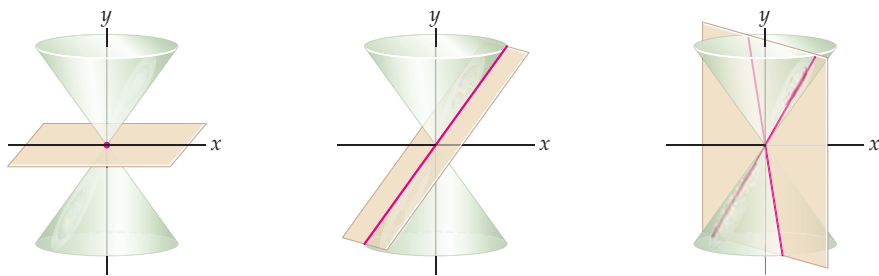

- ▶ Circles, ellipses, parabolas, and hyperbolas
- ▶ Using rectangular coordinates to express conics
- ▶ Using polar coordinates to express conics

### Circles and Ellipses

When the line  $y = x$  is revolved about the  $y$ -axis, we obtain a double cone. The point where the two cones meet is called the **vertex**. Any plane that does not pass through the vertex will intersect the cone in a curve called a **conic section**. There are four basic curves that may be formed when a plane intersects this cone:

A plane through the vertex will intersect the cone in either a single point, a line, or a pair of intersecting lines. These intersections are considered to be **degenerate** conic sections. For the remainder of this section we will assume that our conic sections are not degenerate.

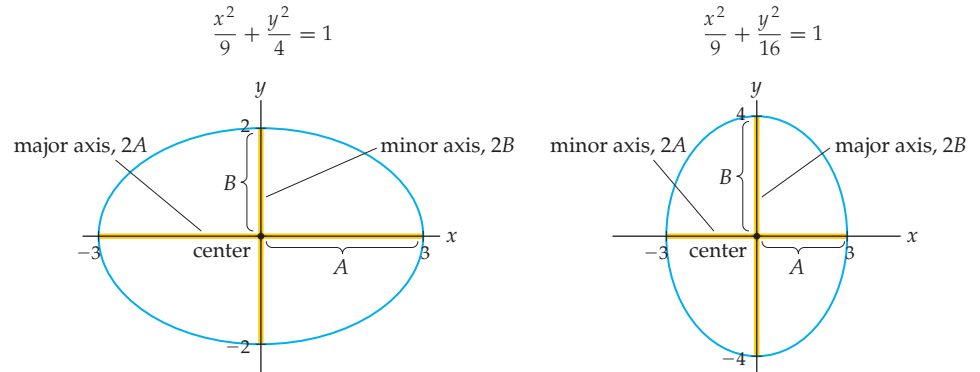

As shown, a plane perpendicular to the  $y$ -axis but that misses the vertex of the cone intersects the cone in a circle. If such a plane is tilted slightly, the curve of intersection will be an ellipse. As we know, the equation of the circle with center  $(x_0, y_0)$  and radius  $R$  can be written in the form  $(x - x_0)^2 + (y - y_0)^2 = R^2$ . When the circle is centered at the origin, its equation can be written in the form  $x^2 + y^2 = R^2$ . Such an equation can also be written in the form

$$\frac{x^2}{R^2} + \frac{y^2}{R^2} = 1.$$

If we allow the denominators of the two quotients in this equation to be different positive constants, we obtain the equation

$$\frac{x^2}{A^2} + \frac{y^2}{B^2} = 1.$$

You may know that the graph of such an equation is an ellipse.

When  $A > B$ , the graph of the ellipse  $\frac{x^2}{A^2} + \frac{y^2}{B^2} = 1$  is wider than it is tall. In this case, the segment of length  $2A$  is called the **major axis** of the ellipse and the segment of length  $2B$  is called the **minor axis**. When  $A < B$ , the ellipse is taller than it is wide. In this case,  $2B$  is the length of the major axis and  $2A$  is the length of the minor axis. We may consider a circle to be an ellipse in which the major and minor axes are equal.

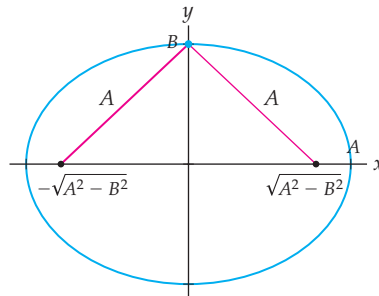

More classically, each conic section has a geometric definition. For example, the geometric definition for an ellipse is given in Definition 9.15:

#### DEFINITION 9.15

#### Ellipse

Given two points in a plane, called **foci**, an **ellipse** is the set of points in the plane such that the sum of the distances to the two foci is a constant.

We will show that the curve with equation  $\frac{x^2}{A^2} + \frac{y^2}{B^2} = 1$ , where  $A > B$ , satisfies Definition 9.15. The argument when  $A < B$  is similar.

Let  $\mathcal{V}$  represent the graph of the equation  $\frac{x^2}{A^2} + \frac{y^2}{B^2} = 1$ . From this equation, we may see that  $\mathcal{V}$  is symmetric with respect to both the  $x$ - and  $y$ -axes. Furthermore, the points  $(-A, 0)$ ,  $(A, 0)$ ,  $(0, -B)$ , and  $(0, B)$  are all on  $\mathcal{V}$ . We will show that the sum of the distances from every point on  $\mathcal{V}$  to the points  $(-\sqrt{A^2 - B^2}, 0)$  and  $(\sqrt{A^2 - B^2}, 0)$  is the constant  $2A$ . This will demonstrate that  $\mathcal{V}$  is an ellipse and that  $(-\sqrt{A^2 - B^2}, 0)$  and  $(\sqrt{A^2 - B^2}, 0)$  are the

coordinates of the foci. We begin by letting  $C = \sqrt{A^2 - B^2}$  and  $(x, y)$  be a point on  $\mathcal{V}$ . Also,

$$C^2 = A^2 - B^2 \quad \text{and} \quad y^2 = B^2 - \frac{B^2x^2}{A^2}.$$

Let  $D_1$  represent the distance from  $(x, y)$  to the point  $(C, 0)$ . Thus,

$$\begin{aligned} D_1^2 &= (x - C)^2 + y^2 \\ &= x^2 - 2Cx + C^2 + B^2 - \frac{B^2x^2}{A^2} && \leftarrow y^2 = B^2 - \frac{B^2x^2}{A^2} \\ &= A^2 - 2Cx + x^2 - \frac{B^2x^2}{A^2} && \leftarrow C^2 = A^2 - B^2 \\ &= \frac{A^4 - 2A^2Cx + (A^2 - B^2)x^2}{A^2} && \leftarrow \text{algebra} \\ &= \frac{A^4 - 2A^2Cx + C^2x^2}{A^2} && \leftarrow C^2 = A^2 - B^2 \end{aligned}$$

Since both the numerator and denominator of the last expression are perfect squares,  $D_1 = \frac{A^2 - Cx}{A}$ . In Exercise 55 you will be asked to perform a similar computation to show that the distance  $D_2$  from the point  $(x, y)$  to the point  $(-C, 0)$  is  $D_2 = \frac{A^2 + Cx}{A}$ . The sum of these distances is

$$D_1 + D_2 = \frac{A^2 - Cx}{A} + \frac{A^2 + Cx}{A} = 2A.$$

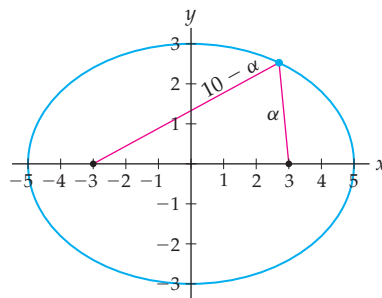

This gives us the following theorem (the proof of part (b) is similar to the preceding argument and is left for Exercise 56):

### THEOREM 9.16

#### The Equation and Foci of an Ellipse

- (a) If  $A > B > 0$ , the graph of the equation  $\frac{x^2}{A^2} + \frac{y^2}{B^2} = 1$  is an ellipse with foci  $(\pm\sqrt{A^2 - B^2}, 0)$ .
- (b) If  $0 < A < B$ , the graph of the equation  $\frac{x^2}{A^2} + \frac{y^2}{B^2} = 1$  is an ellipse with foci  $(0, \pm\sqrt{B^2 - A^2})$ .

For example, the foci of the ellipse  $\frac{x^2}{25} + \frac{y^2}{16} = 1$  are  $(\pm\sqrt{25 - 16}, 0) = (\pm 3, 0)$ . Furthermore, the sum of the distances from every point on this ellipse to the foci is 10 units, the length of the major axis.

## Parabolas

As a conic section, a parabola is obtained when the plane slicing a cone is parallel to a side of the cone. We studied parabolas extensively in Chapter 0. We know that the graph of the

equation  $y = x^2$  is an upwards-opening parabola with its vertex at the origin. We also saw that the graph of the equation  $y = a(x - x_0)^2 + y_0$  is a parabola, as long as  $a \neq 0$ . The vertex of the new parabola is  $(x_0, y_0)$ , while the constant  $a$  scales the graph of  $y = x^2$  vertically. In addition, if  $a < 0$ , the new parabola opens downwards.

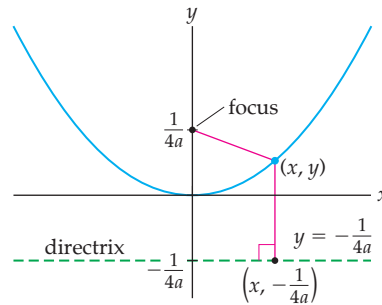

We may also define a parabola geometrically:

### DEFINITION 9.17

#### Parabola

A **parabola** is the set of all points in the plane equidistant from a given fixed line in the plane, called the **directrix** of the parabola, and a given fixed point called the **focus** of the parabola.

We show that the curve  $\mathcal{P}$  with equation  $y = ax^2$ , where  $a > 0$ , satisfies Definition 9.17. We will see that the focus is on the positive  $y$ -axis with coordinates  $(0, \frac{1}{4a})$  and the directrix is the horizontal line with equation  $y = -\frac{1}{4a}$ .

If we choose an arbitrary point  $(x, y)$  on the parabola, the distance from  $(x, y)$  to the line with equation  $y = -\frac{1}{4a}$  is  $y + \frac{1}{4a}$ , while its distance from the point  $(0, \frac{1}{4a})$  is

$$\begin{aligned}
 \sqrt{x^2 + \left(y - \frac{1}{4a}\right)^2} &= \sqrt{x^2 + y^2 - \frac{y}{2a} + \frac{1}{16a^2}} && \leftarrow \text{algebra} \\
 &= \sqrt{\frac{y}{a} + y^2 - \frac{y}{2a} + \frac{1}{16a^2}} && \leftarrow y = ax^2 \\
 &= \sqrt{y^2 + \frac{y}{2a} + \frac{1}{16a^2}} && \leftarrow \text{algebra} \\
 &= y + \frac{1}{4a}. && \leftarrow \text{the quantity is a perfect square}
 \end{aligned}$$

Since the distances from any point on  $\mathcal{P}$  to the directrix and the focus are equal,  $\mathcal{P}$  satisfies Definition 9.17. We generalize this result in the following theorem:

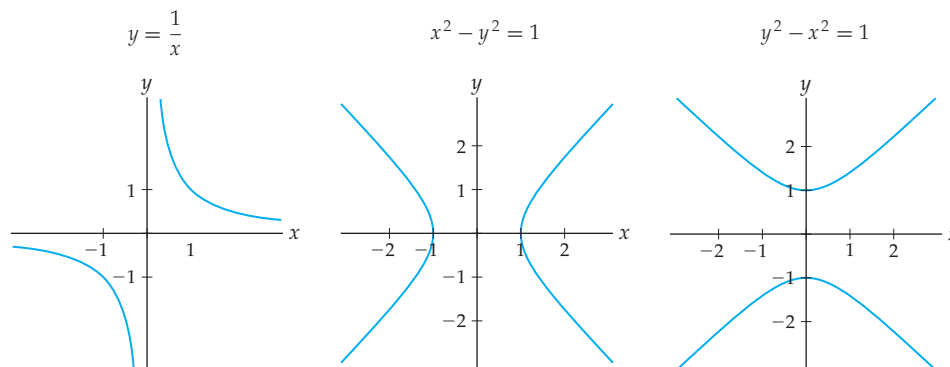

### THEOREM 9.18

#### The Focus and Directrix of a Parabola

Let  $y = a(x - x_0)^2 + y_0$  with  $a \neq 0$  be the equation of a parabola. The coordinates of the focus of the parabola are  $(x_0, y_0 + \frac{1}{4a})$ , and the equation of the directrix is  $y = y_0 - \frac{1}{4a}$ .

## Hyperbolas

The final conic section we will discuss is the hyperbola. A hyperbola is formed when a plane intersects both halves of the double cone (in a nondegenerate way). The most familiar hyperbola is the graph of the function  $y = \frac{1}{x}$ , although the graphs of the equations  $x^2 - y^2 = 1$  and  $y^2 - x^2 = 1$  are also hyperbolas.

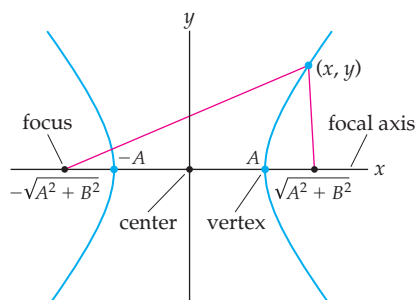

We will be discussing primarily hyperbolas with defining equations  $\frac{x^2}{A^2} - \frac{y^2}{B^2} = 1$  and  $\frac{y^2}{B^2} - \frac{x^2}{A^2} = 1$ , where  $A$  and  $B$  are positive constants.

Hyperbolas may also be defined geometrically:

### DEFINITION 9.19

#### Hyperbola

Given two points in a plane, called **foci**, a **hyperbola** is the set of points in the plane for which the difference of the distances to the two foci is constant. The line containing the foci is called the **focal axis**, the midpoint of the segment connecting the foci is called the **center** of the hyperbola, and the points where the focal axis intersects the hyperbola are called the **vertices** of the hyperbola.

The proof of the following theorem is quite similar to the proof of Theorem 9.16 and is left for Exercises 57 and 58:

### THEOREM 9.20

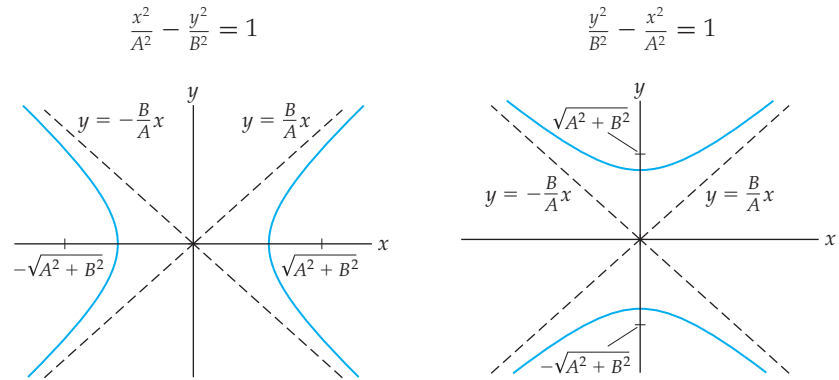

#### The Equation, Foci, and Asymptotes of a Hyperbola

Let  $A$  and  $B$  be positive.

(a) The graph of the equation  $\frac{x^2}{A^2} - \frac{y^2}{B^2} = 1$  is a hyperbola with foci  $(\pm\sqrt{A^2 + B^2}, 0)$ .

(b) The graph of the equation  $\frac{y^2}{B^2} - \frac{x^2}{A^2} = 1$  is a hyperbola with foci  $(0, \pm\sqrt{A^2 + B^2})$ .

The lines  $y = \frac{B}{A}x$  and  $y = -\frac{B}{A}x$  are asymptotes for these hyperbolas.

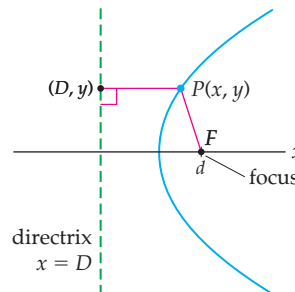

For example, since  $A = 3$  and  $B = 4$  in the equation  $\frac{x^2}{9} - \frac{y^2}{16} = 1$ , the foci of this hyperbola are  $(\pm 5, 0)$  and the graph has asymptotes  $y = \frac{4}{3}x$  and  $y = -\frac{4}{3}x$ .

## Conic Sections in Polar Coordinates

In Definition 9.17 we saw that a parabola is the set of all points in the plane equidistant from a given fixed line in the plane, where the line is called the directrix of the parabola and the fixed point is called the focus of the parabola. If we let  $F$  and  $l$  be the focus and directrix of the parabola, respectively, we may rephrase this definition by saying that a parabola is the set of all points  $P$  in the plane such that the ratio of the distance from  $F$  to  $P$  to the distance from  $l$  to  $P$  is 1. If we let  $FP$  represent the length of the segment from  $F$  to  $P$ , we have

$$\frac{FP}{\text{the distance from } l \text{ to } P} = 1.$$

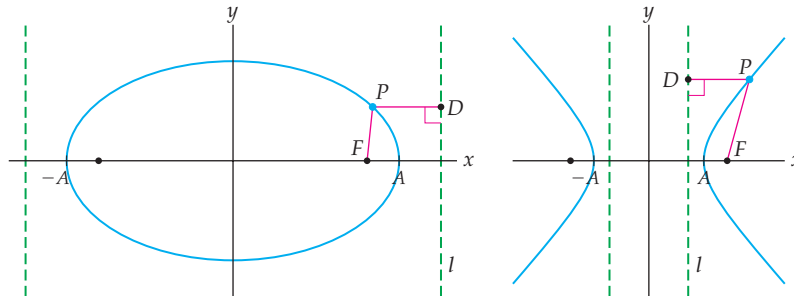

We may generalize this idea to provide alternative geometric definitions for ellipses and hyperbolas. We have already seen that circles have very simple representations in polar coordinates. The alternative definitions will allow us to find simple polar coordinate representations for parabolas, ellipses, and hyperbolas. For consistency, we may orient any of these three conics as shown here:

That is, we will use rightwards-opening parabolas with equations  $x = c(y - y_0)^2$  for  $c > 0$ . For the parabola there is a single vertical directrix,  $l$ , with equation  $x = D$ . If we let  $P = (x, y)$  be a point on the parabola, then the distance from  $P$  to  $l$  is  $DP$  and the distance from  $P$  to the focus,  $F$ , is  $FP$ . Here we have

$$\frac{FP}{DP} = 1.$$

The ellipses we consider will have equations  $\frac{x^2}{A^2} + \frac{y^2}{B^2} = 1$ , where  $A > B$  and, thus, where the major axis of the ellipse is on the  $x$ -axis. The hyperbolas we will consider are centered at the origin, open to the left and right and, therefore, have equations  $\frac{x^2}{A^2} - \frac{y^2}{B^2} = 1$ . Ellipses and hyperbolas also have directrices. In fact, every ellipse and every hyperbola has two directrices.

If  $F$  is the focus of an ellipse or a hyperbola  $\mathcal{V}$ , and  $D$  is a point on the directrix closest to that focus, then for every point  $P$  on  $\mathcal{V}$ , we have

$$\frac{FP}{DP} = e,$$

where  $e$  is a positive constant called the *eccentricity* of the curve. Recall that when  $A > B$ , the foci of the ellipse  $\frac{x^2}{A^2} + \frac{y^2}{B^2} = 1$  are  $(\pm\sqrt{A^2 - B^2}, 0)$  and the foci of the hyperbola  $\frac{x^2}{A^2} - \frac{y^2}{B^2} = 1$  are  $(\pm\sqrt{A^2 + B^2}, 0)$ .

### DEFINITION 9.21

#### The Eccentricity of Conic Sections

- (a) The *eccentricity*  $e$  of a parabola is 1.
- (b) When  $A > B > 0$ , the *eccentricity* of the ellipse  $\frac{x^2}{A^2} + \frac{y^2}{B^2} = 1$  is  $e = \frac{\sqrt{A^2 - B^2}}{A}$ , and when  $0 < A < B$ ,  $e = \frac{\sqrt{B^2 - A^2}}{B}$ .
- (c) The *eccentricity* of the hyperbola  $\frac{x^2}{A^2} - \frac{y^2}{B^2} = 1$  is  $e = \frac{\sqrt{A^2 + B^2}}{A}$ , and for  $\frac{y^2}{B^2} - \frac{x^2}{A^2} = 1$ ,  $e = \frac{\sqrt{A^2 + B^2}}{B}$ .

Note that from Definition 9.21 (b),  $0 < e < 1$  for an ellipse, and from Definition 9.21 (c),  $e > 1$  for a hyperbola. For example, the eccentricity of the ellipse  $\frac{x^2}{25} + \frac{y^2}{16} = 1$  is  $e = \frac{\sqrt{25 - 16}}{5} = \frac{3}{5}$ .

In Exercise 59 you will show that, for an ellipse or a hyperbola, the eccentricity is also

$$e = \frac{\text{the distance between the foci}}{\text{the distance between the vertices}}.$$

We use the eccentricity to define the directrices of ellipses and hyperbolas:

### DEFINITION 9.22

#### Directrices of Ellipses and Hyperbolas

- (a) When  $A > B$ , the **directrices** of the ellipse  $\frac{x^2}{A^2} + \frac{y^2}{B^2} = 1$  are the vertical lines  $x = \frac{A}{e}$  and  $x = -\frac{A}{e}$ , where  $e$  is the eccentricity of the ellipse. When  $B > A$ , the **directrices** of the ellipse are the horizontal lines  $y = \frac{B}{e}$  and  $y = -\frac{B}{e}$ , where  $e$  is the eccentricity of the ellipse.
- (b) The **directrices** of the hyperbola  $\frac{x^2}{A^2} - \frac{y^2}{B^2} = 1$  are the vertical lines  $x = \frac{A}{e}$  and  $x = -\frac{A}{e}$ , where  $e$  is the eccentricity of the hyperbola. The **directrices** of the hyperbola  $\frac{y^2}{B^2} - \frac{x^2}{A^2} = 1$  are the horizontal lines  $y = \frac{B}{e}$  and  $y = -\frac{B}{e}$ , where  $e$  is the eccentricity of the hyperbola.

Continuing with the brief example we started before, we see that the directrices of the ellipse  $\frac{x^2}{25} + \frac{y^2}{16} = 1$  are the lines  $x = \pm \frac{A}{e} = \pm \frac{5}{3/5} = \pm \frac{25}{3}$ .

With these definitions for eccentricity and directrices established, we have the following theorem:

### THEOREM 9.23

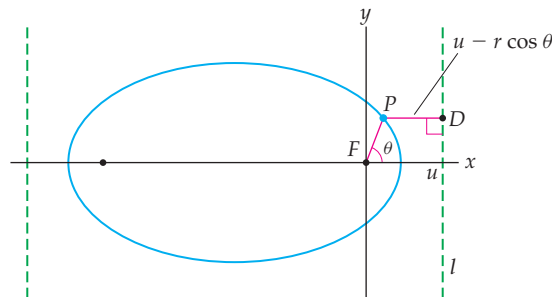

#### Eccentricity as the Ratio of Two Distances

Let  $F$  be the focus of a parabola, an ellipse, or a hyperbola, and let  $l$  be the directrix of the curve closest to  $F$ . If  $P$  is a point on the curve and  $D$  is the point on  $l$  closest to  $P$ , then

$$\frac{FP}{DP} = e.$$

The proof of Theorem 9.23 is mostly computational and is left for Exercises 60 and 61.

Note that the eccentricity of an ellipse is in the interval  $(0, 1)$ , the eccentricity of a parabola is 1 and the eccentricity of a hyperbola is greater than 1. We are now ready to express the equations for ellipses, parabolas, and hyperbolas in polar coordinates. We use a polar coordinate system in which the pole is at a focus,  $F$ , of the conic section. We position the parabola so that the directrix is perpendicular to the polar axis and the parabola opens to the right. For the ellipse and hyperbola, the focal axis should coincide with the polar axis. Let  $V$  represent any of these conics and  $P$  be a point on  $V$ . Let  $x = u$  be the equation of the directrix closest to the pole. The following figure illustrates the situation for an ellipse:

Now, the distance from the focus to the curve is  $FP = r$ . The distance from  $P$  to the directrix is  $DP = u - r \cos \theta$ . By Theorem 9.23 we have

$$\frac{FP}{DP} = \frac{r}{u - r \cos \theta} = e.$$

When we solve this equation for  $r$ , we get the following theorem:

### THEOREM 9.24 Conics in Polar Coordinates

The graph of the polar equation

$$r = \frac{eu}{1 + e \cos \theta}$$

is a conic with eccentricity  $e$  and directrix  $x = u$ .

## Examples and Explorations

### EXAMPLE 1

#### Finding the foci, eccentricity, and directrices for an ellipse

The graph of each of the equations that follow is an ellipse. Find the foci, eccentricity, and directrices for each.

(a)  $\frac{x^2}{16} + \frac{y^2}{4} = 1$

(b)  $9x^2 + 25y^2 = 900$

(c)  $\frac{x^2}{16} + \frac{y^2}{25} = 1$

(d)  $x^2 + 4x + 9y^2 - 18y - 23 = 0$

#### SOLUTION

- (a) Theorem 9.16 tells us that when  $A > B$ , the foci of the ellipse with equation  $\frac{x^2}{A^2} + \frac{y^2}{B^2} = 1$  are  $(\pm\sqrt{A^2 - B^2}, 0)$ . Therefore, the foci of the ellipse with equation  $\frac{x^2}{4^2} + \frac{y^2}{2^2} = 1$  have coordinates  $(\pm\sqrt{4^2 - 2^2}, 0) = (\pm 2\sqrt{3}, 0)$ .

From Definition 9.21, the eccentricity of the ellipse with equation  $\frac{x^2}{A^2} + \frac{y^2}{B^2} = 1$  is  $e = \frac{\sqrt{A^2 - B^2}}{A}$  when  $A > B$ . Here we have  $e = \frac{2\sqrt{3}}{4} = \frac{\sqrt{3}}{2}$ .

From Definition 9.22, the directrices of the ellipse with equation  $\frac{x^2}{A^2} + \frac{y^2}{B^2} = 1$  are the vertical lines  $x = \pm \frac{A}{e}$  when  $A > B$ . Here, the directrices have equations

$$x = \pm \frac{4}{\sqrt{3}/2} = \pm \frac{8\sqrt{3}}{3}.$$

- (b) Before we use the theorem and definitions we mentioned in part (a), we need to rewrite the equation in the correct form. Here,  $9x^2 + 25y^2 = 900$  is equivalent to

$$\frac{x^2}{10^2} + \frac{y^2}{6^2} = 1.$$

Therefore, the foci of this ellipse have coordinates  $(\pm\sqrt{10^2 - 6^2}, 0) = (\pm 8, 0)$ . The eccentricity of the ellipse is  $e = \frac{8}{10} = \frac{4}{5}$ , and the directrices have equations

$$x = \pm \frac{10}{4/5} = \pm \frac{25}{2}.$$

(c) Theorem 9.16 also tells us that when  $A < B$ , the foci of the ellipse with equation

$$\frac{x^2}{A^2} + \frac{y^2}{B^2} = 1$$

are  $(0, \pm\sqrt{B^2 - A^2})$ . Therefore, the foci of the ellipse with equation  $\frac{x^2}{16} + \frac{y^2}{25} = 1$  have coordinates  $(0, \pm\sqrt{5^2 - 4^2}) = (0, \pm 3)$ .

We use Definitions 9.21 and 9.22 to find the eccentricity and directrices of this ellipse. The eccentricity will be

$$e = \frac{\sqrt{B^2 - A^2}}{B},$$

and the directrices will be horizontal lines with equations

$$y = \frac{B}{e} \quad \text{and} \quad y = -\frac{B}{e}.$$

Here, we have  $e = \frac{\sqrt{5^2 - 4^2}}{5} = \frac{3}{5}$ . The directrices have equations  $y = \pm \frac{5}{3/5} = \pm \frac{25}{3}$ .

(d) For our final equation in this group, we complete the square for each variable in the equation  $x^2 + 4x + 9y^2 - 18y - 23 = 0$ . After completing the squares, we have the equation

$$(x + 2)^2 + 9(y - 1)^2 = 36.$$

Dividing both sides of the equation by 36, we obtain

$$\frac{(x + 2)^2}{6^2} + \frac{(y - 1)^2}{2^2} = 1.$$

The graph of this equation is the graph of the ellipse  $\frac{x^2}{6^2} + \frac{y^2}{2^2} = 1$  translated two units to the left and one unit up. The ellipse with equation  $\frac{x^2}{6^2} + \frac{y^2}{2^2} = 1$  has foci  $(\pm\sqrt{6^2 - 2^2}, 0) = (\pm 4\sqrt{2}, 0)$ . The eccentricity of this ellipse is  $e = \frac{4\sqrt{2}}{6} = \frac{2\sqrt{2}}{3}$ , and the directrices have equations  $x = \pm \frac{6}{2\sqrt{2}/3} = \pm \frac{9\sqrt{2}}{2}$ . Therefore, the foci of the ellipse with equation  $\frac{(x+2)^2}{6^2} + \frac{(y-1)^2}{2^2} = 1$  are  $(-2 \pm 4\sqrt{2}, 1)$ . Translating an ellipse does not change its eccentricity, but the directrices are  $x = -2 \pm \frac{9\sqrt{2}}{2}$ .  $\square$

## EXAMPLE 2

### Finding the focus and directrix for a parabola

Find the focus and directrix for the parabola with equation  $y = 4x^2 + 16x + 65$ .

### SOLUTION

We begin by completing the square. Here, we have  $y = 4(x + 4)^2 + 1$ . By Theorem 9.18, the focus of the parabola with equation  $y = a(x - x_0)^2 + y_0$  is  $(x_0, y_0 + \frac{1}{4a})$  and the equation of the directrix is  $y = y_0 - \frac{1}{4a}$ . Here  $a = 4$ ,  $x_0 = -4$ , and  $y_0 = 1$ . Therefore, the focus is the point  $(-4, 1 + \frac{1}{4 \cdot 4}) = (-4, \frac{17}{16})$  and the directrix has equation  $y = 1 - \frac{1}{4 \cdot 4} = \frac{15}{16}$ .  $\square$

**EXAMPLE 3****Finding the foci, asymptotes, eccentricity, and directrices for a hyperbola**

The graph of each of the equations that follow is a hyperbola. Find the foci, asymptotes, eccentricity, and directrices for each.

(a)  $\frac{x^2}{16} - \frac{y^2}{4} = 1$

(b)  $9x^2 - 25y^2 = 900$

(c)  $\frac{y^2}{25} - \frac{x^2}{16} = 1$

(d)  $x^2 + 4x - 9y^2 - 18y - 41 = 0$

**SOLUTION**

(a) Theorem 9.20 tells us that the foci of the hyperbola with equation  $\frac{x^2}{A^2} - \frac{y^2}{B^2} = 1$  are

$$(\sqrt{A^2 + B^2}, 0) \quad \text{and} \quad (-\sqrt{A^2 + B^2}, 0).$$

Therefore, the foci of the hyperbola with equation  $\frac{x^2}{4^2} - \frac{y^2}{2^2} = 1$  have coordinates

$$(\pm\sqrt{4^2 + 2^2}, 0) = (\pm 2\sqrt{5}, 0).$$

The same theorem also tells us that the hyperbola will have asymptotes  $y = \pm \frac{B}{A}x$ . The asymptotes for this hyperbola have equations  $y = \pm \frac{2}{4}x = \pm \frac{1}{2}x$ .

From Definition 9.21, the eccentricity of the hyperbola with equation  $\frac{x^2}{A^2} - \frac{y^2}{B^2} = 1$  is  $e = \frac{\sqrt{A^2 + B^2}}{A}$ . Here we have  $e = \frac{2\sqrt{5}}{4} = \frac{\sqrt{5}}{2}$ .

From Definition 9.22, the directrices of the hyperbola with equation  $\frac{x^2}{A^2} - \frac{y^2}{B^2} = 1$  are the vertical lines  $x = \pm \frac{A}{e}$ . Here, the directrices have equations  $x = \pm \frac{4}{\sqrt{5}/2} = \pm \frac{8\sqrt{5}}{5}$ .

(b) Before we use the theorem and definitions we mentioned in part (a), we need to rewrite the equation in the correct form. Here,  $9x^2 - 25y^2 = 900$  is equivalent to  $\frac{x^2}{10^2} - \frac{y^2}{6^2} = 1$ . Therefore, the foci of this hyperbola have coordinates  $(\pm\sqrt{10^2 + 6^2}, 0) = (\pm 2\sqrt{34}, 0)$ . The asymptotes have equations  $y = \pm \frac{6}{10}x = \pm \frac{3}{5}x$ . The eccentricity of the hyperbola is  $e = \frac{2\sqrt{34}}{10} = \frac{\sqrt{34}}{5}$ , and the directrices have equations  $x = \pm \frac{10}{\sqrt{34}/5} = \pm \frac{25\sqrt{34}}{17}$ .

(c) Theorem 9.20 also tells us that the foci of the hyperbola with equation  $\frac{y^2}{B^2} - \frac{x^2}{A^2} = 1$  are  $(0, \pm\sqrt{A^2 + B^2})$ . Therefore, the foci of the hyperbola with equation  $\frac{y^2}{25} - \frac{x^2}{16} = 1$  have coordinates  $(0, \pm\sqrt{4^2 + 5^2}) = (0, \pm\sqrt{41})$ . The asymptotes of a hyperbola with this type of equation are again  $y = \pm \frac{B}{A}x$ . Here, they have the equations  $y = \pm \frac{5}{4}x$ .

We use Definitions 9.21 and 9.22 to find the eccentricity and directrices of this hyperbola. The eccentricity will be

$$e = \frac{\sqrt{A^2 + B^2}}{B},$$

and the directrices will be horizontal lines with equations

$$y = \frac{B}{e} \quad \text{and} \quad y = -\frac{B}{e}.$$

Thus,  $e = \frac{\sqrt{4^2 + 5^2}}{5} = \frac{\sqrt{41}}{5}$  and the directrices have equations  $y = \pm \frac{5}{\sqrt{41}/5} = \pm \frac{25\sqrt{41}}{41}$ .

- (d) For our final equation in this group, begin by completing the square for each variable in the equation  $x^2 + 4x - 9y^2 - 18y - 41 = 0$ . You should confirm that this results in the equation

$$(x + 2)^2 - 9(y + 1)^2 = 36.$$

Dividing both sides of the equation by 36, we obtain

$$\frac{(x + 2)^2}{6^2} - \frac{(y + 1)^2}{2^2} = 1,$$

whose graph is the hyperbola with equation  $\frac{x^2}{6^2} - \frac{y^2}{2^2} = 1$ , translated two units to the left and one unit down. The hyperbola with equation  $\frac{x^2}{6^2} - \frac{y^2}{2^2} = 1$  has foci  $(\pm\sqrt{6^2 + 2^2}, 0) = (\pm 2\sqrt{10}, 0)$ . The asymptotes have equations  $y = \frac{2}{6}x = \frac{1}{3}x$  and  $y = -\frac{1}{3}x$ . The eccentricity of this hyperbola is  $e = \frac{2\sqrt{10}}{6} = \frac{\sqrt{10}}{3}$ , and the directrices have equations  $x = \pm \frac{6}{\sqrt{10}/3} = \pm \frac{9\sqrt{10}}{5}$ .

Therefore, the foci of our hyperbola are  $(-2 \pm 2\sqrt{10}, -1)$ . The asymptotes are the lines  $y + 1 = \frac{1}{3}(x + 2)$  and  $y + 1 = -\frac{1}{3}(x + 2)$ , or equivalently,  $y = \frac{1}{3}x - \frac{1}{3}$  and  $y = -\frac{1}{3}x - \frac{5}{3}$ . Translating the hyperbola did not change its eccentricity, but the directrices are  $x = -2 \pm \frac{9\sqrt{10}}{5}$ .  $\square$

#### EXAMPLE 4

#### Using polar coordinates to graph conics

Use polar coordinates to graph each of the following equations:

(a)  $r = \frac{1}{1 + \cos \theta}$

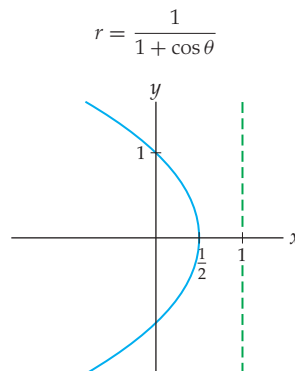

(b)  $r = \frac{2}{1 + 2 \cos \theta}$

(c)  $r = \frac{1}{2 + \cos \theta}$

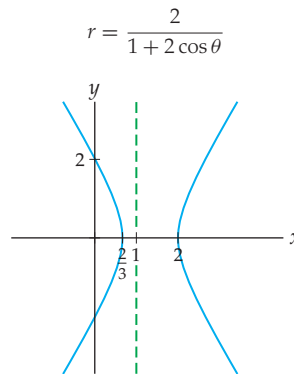

#### SOLUTION

By Theorem 9.24, the graph of the equation  $r = \frac{eu}{1 + e \cos \theta}$  is a conic with a focus at the pole and with eccentricity  $e$  and directrix  $x = u$ .

- (a) For  $r = \frac{1}{1 + \cos \theta}$  the eccentricity is  $e = 1$ , so the graph is a parabola. The directrix will be the vertical line  $x = 1$ .

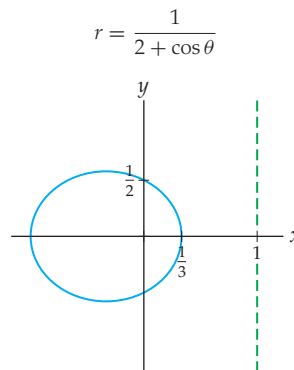

- (b) For  $r = \frac{2}{1+2\cos\theta}$  the eccentricity is  $e = 2$ , so the graph is a hyperbola. The directrix will be the vertical line  $x = 1$ .

- (c) Note that

$$r = \frac{1}{2 + \cos\theta} = \frac{1/2}{1 + 1/2\cos\theta}.$$

Here the eccentricity is  $e = \frac{1}{2}$ , so the graph is an ellipse. The directrix will be the vertical line  $x = 1$ .

□

### ? TEST YOUR UNDERSTANDING

- ▶ What is a conic section? How many different types of conic sections are there? What are the degenerate conic sections? What are the nondegenerate conic sections?
- ▶ What is the definition of a circle? What is the definition of an ellipse? What are the foci of an ellipse? What are the major and minor axes of an ellipse? What are the directrices of an ellipse? How do you recognize the equation for an ellipse in rectangular coordinates?
- ▶ What is the definition of a parabola? What is the focus of a parabola? What is the directrix of a parabola? How do you recognize the equation for a parabola in rectangular coordinates?
- ▶ What is the definition of a hyperbola? What are the foci of a hyperbola? What are the directrices of a hyperbola? How do you recognize the equation for a hyperbola in rectangular coordinates?
- ▶ What are the eccentricities of the conic sections? Specifically, what is the eccentricity of a parabola? In what intervals are the eccentricities for an ellipse and a hyperbola? How do you recognize the equation for a parabola, an ellipse, or a hyperbola in polar coordinates?

## EXERCISES 9.5

## Thinking Back

*Finding the center and radius for a circle by completing the square:* Each of the equations that follow is an equation for a circle. Find the center and radius for each.

- ▶  $x^2 + y^2 - y - \frac{3}{4} = 0$
- ▶  $x^2 + 4x + y^2 - 21 = 0$
- ▶  $x^2 + 3x + y^2 + y + \frac{3}{2} = 0$

*Completing the square:* Find the sets of points satisfying each of the following equations.

- ▶  $x^2 - 6x + y^2 + 2y + 10 = 0$
- ▶  $x^2 - 8x + y^2 - 10y + 40 = 0$
- ▶  $x^2 - 6x + y + 40 = 0$
- ▶  $x + y^2 - 4y - 5 = 0$

## Concepts

0. *Problem Zero:* Read the section and make your own summary of the material.
1. *True/False:* Determine whether each of the statements that follow is true or false. If a statement is true, explain why. If a statement is false, provide a counterexample.
  - (a) *True or False:* A conic section is the intersection of a double cone and a plane.
  - (b) *True or False:* A point is a conic section.
  - (c) *True or False:* An ellipse is the set of points in the plane equidistant from two distinct points.
  - (d) *True or False:* Given a line  $\mathcal{L}$  and a point  $P$  not on  $\mathcal{L}$ , a parabola is the set of points in the plane equidistant from  $\mathcal{L}$  and  $P$ .
  - (e) *True or False:* A parabola is also a hyperbola.
  - (f) *True or False:* If the focus of a parabola is on the directrix of the parabola, the parabola is degenerate.
  - (g) *True or False:* Given two distinct points in a plane, a hyperbola is the set of points in the plane for which the quotient of the distances to the two points is constant.
  - (h) *True or False:* The graph of the polar equation  $r = \frac{1}{1 + \sin\theta}$  is a parabola.
2. *Examples:* Construct examples of the thing(s) described in the following. Try to find examples that are different than any in the reading.
  - (a) A degenerate conic section.
  - (b) The equation for a hyperbola whose asymptotes are the coordinate axes.
  - (c) The equation for a parabola that opens to the left, in polar coordinates.

Complete the definitions in Exercises 3–5.
3. Given two points in a plane, called \_\_\_\_\_, an *ellipse* is the set of points in the plane for which \_\_\_\_\_.
4. Given a fixed line in the plane, called the \_\_\_\_\_, and a given fixed point called the \_\_\_\_\_, a *parabola* is the set of all points in the plane \_\_\_\_\_.
5. Given two points in a plane, called \_\_\_\_\_, a *hyperbola* is the set of points in the plane for which \_\_\_\_\_.
6. Explain why there are infinitely many different ellipses with the same foci.
7. Explain why there are infinitely many different hyperbolas with the same foci.
8. Three noncollinear points determine a unique circle. Do three noncollinear points determine a unique ellipse? If so, explain why. If not, provide three noncollinear points that are on two distinct ellipses.
9. The graph of the equation  $\frac{x^2}{A^2} + \frac{y^2}{B^2} = 1$  is an ellipse for any nonzero constants  $A$  and  $B$ .
  - (a) If  $A > B$ , what is the eccentricity of the ellipse?
  - (b) If  $A < B$ , what is the eccentricity of the ellipse?
  - (c) Explain why the eccentricity,  $e$ , of an ellipse is always between 0 and 1.
  - (d) If  $A > B$ , what is  $\lim_{A \rightarrow B} e$ ? What happens to the shape of the ellipse as  $A \rightarrow B$ ?
  - (e) If  $A > B$ , what is  $\lim_{A \rightarrow \infty} e$ ? What happens to the shape of the ellipse as  $A \rightarrow \infty$ ?
10. The graph of the equation  $\frac{x^2}{A^2} - \frac{y^2}{B^2} = 1$  is a hyperbola for any nonzero constants  $A$  and  $B$ .
  - (a) What is the eccentricity of the hyperbola?
  - (b) Explain why the eccentricity,  $e$ , of a hyperbola is always greater than 1.
  - (c) What is  $\lim_{A \rightarrow 0} e$ ? What happens to the shape of the hyperbola as  $A \rightarrow 0$ ?
  - (d) What is  $\lim_{A \rightarrow \infty} e$ ? What happens to the shape of the hyperbola as  $A \rightarrow \infty$ ?
11. When  $A > B$ , the directrices of the ellipse with equation  $\frac{x^2}{A^2} + \frac{y^2}{B^2} = 1$  are the lines with equations  $x = \pm \frac{A}{e}$ , where  $e$  is the eccentricity of the ellipse. What are the equations for the directrices when  $A < B$ ?
12. The directrices of the hyperbola with equation  $\frac{x^2}{A^2} - \frac{y^2}{B^2} = 1$  are the lines with equations  $x = \pm \frac{A}{e}$ , where  $e$  is the eccentricity of the hyperbola. What are the equations for the directrices of the hyperbola with equation  $\frac{y^2}{B^2} - \frac{x^2}{A^2} = 1$ ?

13. Sketch the graphs of the equations

$$r = \frac{1}{1 + \cos \theta} \quad \text{and} \quad r = \frac{1}{1 + \sin \theta}.$$

What is the relationship between these graphs? What is the eccentricity of each graph?

14. Sketch the graphs of the equations

$$r = \frac{2}{1 + 2 \cos \theta} \quad \text{and} \quad r = \frac{2}{1 + 2 \sin \theta}.$$

What is the relationship between these graphs? What is the eccentricity of each graph?

15. Sketch the graphs of the equations

$$r = \frac{2}{2 + \cos \theta} \quad \text{and} \quad r = \frac{2}{2 + \sin \theta}.$$

What is the relationship between these graphs? What is the eccentricity of each graph?

16. Let  $\alpha$ ,  $\beta$ , and  $\gamma$  be nonzero constants. Show that the graph of  $r = \frac{\alpha}{\beta + \gamma \cos \theta}$  is a conic section with eccentricity  $\left| \frac{\gamma}{\beta} \right|$  and directrix  $x = \frac{\alpha}{\gamma}$ .

17. Let  $\alpha$ ,  $\beta$ , and  $\gamma$  be nonzero constants. Show that the graph of  $r = \frac{\alpha}{\beta + \gamma \sin \theta}$  is a conic section with eccentricity  $\left| \frac{\gamma}{\beta} \right|$  and directrix  $y = \frac{\alpha}{\gamma}$ .

## Skills

Complete the square to describe the conics in Exercises 18–21.

18.  $2x^2 + 4x + y^2 - 6y - 3 = 0$

19.  $2x^2 + 4x - y^2 - 6y - 23 = 0$

20.  $4x + y^2 - 6y - 3 = 0$

21.  $y^2 - 8y - 4x^2 - 8x - 13 = 0$

Use Cartesian coordinates to express the equations for the parabolas determined by the conditions specified in Exercises 22–31.

22. directrix  $x = 3$ , focus  $(0, 1)$

23. directrix  $y = 0$ , focus  $(0, 1)$

24. directrix  $x = -1$ , focus  $(2, 5)$

25. directrix  $y = -6$ , focus  $(2, -8)$

26. directrix  $x = x_0$ , focus  $(x_1, y_1)$ , where  $x_0 \neq x_1$

27. directrix  $y = y_0$ , focus  $(x_1, y_1)$ , where  $y_0 \neq y_1$

28.  $r = \frac{3}{1 + \cos \theta}$

29.  $r = \frac{4}{1 + \sin \theta}$

30.  $r = \frac{\alpha}{1 + \cos \theta}$

31.  $r = \frac{\alpha}{1 + \sin \theta}$

Use Cartesian coordinates to express the equations for the ellipses determined by the conditions specified in Exercises 32–37.

32. foci  $(\pm 1, 0)$ , major axis 4

33. foci  $(\pm\sqrt{5}, 1)$ , major axis 6

34. foci  $(3, \pm 5)$ , major axis 12

35. foci  $\left(0, \pm \frac{3\sqrt{3}}{2}\right)$ , minor axis 3

36. foci  $(\pm\alpha, 0)$ , major axis  $4\alpha$

37. foci  $(0, \pm\alpha)$ , minor axis  $2\alpha$

Use Cartesian coordinates to express the equations for the hyperbolas determined by the conditions specified in Exercises 38–43.

38. foci  $(\pm 2, 0)$ , directrices  $x = \pm 1$

39. foci  $(\pm 6, 0)$ , directrices  $x = \pm 1$

40. foci  $(0, \pm 4)$ , directrices  $y = \pm 1$

41. foci  $(0, \pm 4)$ , directrices  $y = \pm 2$

42. foci  $(3, 1)$  and  $(7, 1)$ , directrix  $x = 4$

43. foci  $(3, 1)$  and  $(3, 9)$ , directrix  $y = 4$

Use polar coordinates to graph the conics in Exercises 44–51.

44.  $r = \frac{2}{1 + 3 \cos \theta}$

45.  $r = \frac{2}{1 - 3 \cos \theta}$

46.  $r = \frac{2}{1 + \cos \theta}$

47.  $r = \frac{5}{1 + \cos \theta}$

48.  $r = \frac{2}{4 + \cos \theta}$

49.  $r = \frac{2}{4 + \sin \theta}$

50.  $r = \frac{1}{1 - \cos \theta}$

51.  $r = \frac{2}{2 + \sin \theta}$

## Applications

In the late sixteenth century Johannes Kepler showed that the planets in our solar system revolve around the sun in elliptical orbits. Exercises 52–54 deal with the orbits of the Earth and Mars. These orbits are described by their eccentricities. If the coordinates for the orbit of a planet are oriented so that the major axis of the ellipse is aligned along the  $x$ -axis, then the Cartesian equation for the ellipse is  $\frac{x^2}{A^2} + \frac{y^2}{B^2} = 1$ , with  $A > B$ .

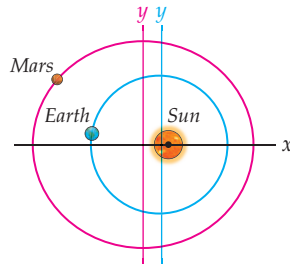

Recall that in this case  $2A$  is called the major axis of the ellipse. The *semimajor* axis has length  $A$ .

52. Show that the eccentricity satisfies the equation  $B^2 = A^2(1 - e^2)$ .

53. Measurements indicate that Earth's orbital eccentricity is 0.0167 and its semimajor axis is 1.00000011 astronomical units.

(a) Write a Cartesian equation for Earth's orbit.

(b) Give a polar coordinate equation for Earth's orbit, assuming that the sun is the focus of the elliptical orbit.

54. Measurements indicate that the orbital eccentricity of Mars is 0.0935 and its semimajor axis is 1.517323951 astronomical units.

- Write a Cartesian equation for the orbit of Mars.
- Do  $x$  and  $y$  have the same meaning as in Exercise 53?
- Give a polar coordinate equation for the orbit of Mars, assuming that the sun is the focus of the elliptical orbit.

## Proofs

- Let  $A > B > 0$ . Show that the distance from any point on the graph of the curve with equation  $\frac{x^2}{A^2} + \frac{y^2}{B^2} = 1$  to the point  $(-C, 0)$  is  $D_2 = \frac{A^2 + Cx}{A^2}$ , where  $C = \sqrt{A^2 - B^2}$ .
- Prove Theorem 9.16 (b). That is, show that if  $0 < A < B$ , the graph of the curve with equation  $\frac{x^2}{A^2} + \frac{y^2}{B^2} = 1$  is an ellipse with foci  $(0, \pm\sqrt{B^2 - A^2})$ .
- Prove Theorem 9.20 (a). That is, show that the graph of the equation  $\frac{x^2}{A^2} - \frac{y^2}{B^2} = 1$  satisfies Definition 9.19, where the points with coordinates  $(\pm\sqrt{A^2 + B^2}, 0)$  are the foci of the hyperbola.
- Prove Theorem 9.20 (b). That is, show that the graph of the equation  $\frac{y^2}{B^2} - \frac{x^2}{A^2} = 1$  satisfies Definition 9.19, where the points with coordinates  $(0, \pm\sqrt{A^2 + B^2})$  are the foci of the hyperbola.
- Prove that for an ellipse or a hyperbola the eccentricity is given by

$$e = \frac{\text{the distance between the foci}}{\text{the distance between the vertices}}.$$

In Exercises 60 and 61 we ask you to prove Theorem 9.23 for ellipses and hyperbolas.

- Consider the ellipse with equation  $\frac{x^2}{A^2} + \frac{y^2}{B^2} = 1$ , where  $A > B$ . Let  $F$  be the focus with coordinates  $(\sqrt{A^2 - B^2}, 0)$ . Let  $e = \frac{\sqrt{A^2 - B^2}}{A}$  and  $l$  be the vertical line with equation  $x = \frac{A}{e}$ . Show that for any point  $P$  on the ellipse,  $\frac{FP}{DP} = e$ , where  $D$  is the point on  $l$  closest to  $P$ .
- Consider the hyperbola with equation  $\frac{x^2}{A^2} - \frac{y^2}{B^2} = 1$ . Let  $F$  be the focus with coordinates  $(\sqrt{A^2 + B^2}, 0)$ . Let  $e = \frac{\sqrt{A^2 + B^2}}{A}$  and  $l$  be the vertical line with equation  $x = \frac{A}{e}$ . Show that for any point  $P$  on the hyperbola,  $\frac{FP}{DP} = e$ , where  $D$  is the point on  $l$  closest to  $P$ .

## Thinking Forward

*Analogs of conic sections in three dimensions:* Sketch each of the following.

- Given two points in three-dimensional space, a certain type of **ellipsoid** may be described as the set of points for which the sum of the distances to the two points is a constant.
- A certain type of **paraboloid** is the set of all points in three-dimensional space equidistant from a given plane and a given fixed point not on the plane.
- Given two points in three-dimensional space, a certain type of **hyperboloid** may be described as the set of points for which the difference of the distances to the two points is a constant.

## CHAPTER REVIEW, SELF-TEST, AND CAPSTONES

Before you progress to the next chapter, be sure you are familiar with the definitions, concepts, and basic skills outlined here. The capstone exercises at the end bring together ideas from this chapter and look forward to future chapters.

### Definitions

Give precise mathematical definitions or descriptions of each of the concepts that follow. Then illustrate the definition or description with a graph or an algebraic example.

- ▶ *Parametric equations* in two variables

- ▶ The *slope* of a parametric curve  $x = x(t)$ ,  $y = y(t)$  at the point  $(x(t_0), y(t_0))$
- ▶ *Symmetry with respect to the x-axis*

### Theorems

Fill in the blanks to complete each of the following theorem statements:

- ▶ Let  $C$  be a curve in the plane with parametrization  $x = f(t)$ ,  $y = g(t)$  for  $t \in [a, b]$  such that the parametrization is a \_\_\_\_\_ function from the interval  $[a, b]$  to the curve  $C$ . If  $x = f(t)$  and  $y = g(t)$  are differentiable functions of  $t$  such that  $f'(t)$  and  $g'(t)$  are \_\_\_\_\_ on  $[a, b]$ , then the length of the curve  $C$  is given by \_\_\_\_\_.
- ▶ For  $a \neq 0$ , the graph of the equation  $r = 2a \cos \theta$  is the \_\_\_\_\_ whose equation in rectangular coordinates is \_\_\_\_\_.
- ▶ For  $a \neq 0$ , the graph of the equation  $r = 2a \sin \theta$  is the \_\_\_\_\_ whose equation in rectangular coordinates is \_\_\_\_\_.
- ▶ A graph is symmetrical with respect to the  $x$ -axis if, for every point  $(r, \theta)$  on the graph, the point \_\_\_\_\_ is also on the graph.

- ▶ A graph is symmetrical with respect to the  $y$ -axis if, for every point  $(r, \theta)$  on the graph, the point \_\_\_\_\_ is also on the graph.
- ▶ A graph is symmetrical with respect to the origin if, for every point  $(r, \theta)$  on the graph, the point \_\_\_\_\_ is also on the graph.
- ▶ Let  $\alpha$  and  $\beta$  be real numbers such that  $0 \leq \beta - \alpha \leq 2\pi$ . Let  $R$  be the region in the polar plane bounded by the rays  $\theta = \alpha$  and  $\theta = \beta$  and a positive continuous function  $r = f(\theta)$ . Then the area of region  $R$  is \_\_\_\_\_.
- ▶ Let  $r = f(\theta)$  be a differentiable function of  $\theta$  such that  $f'(\theta)$  is continuous for all  $\theta \in [\alpha, \beta]$ . Furthermore, assume that  $r = f(\theta)$  is a one-to-one function from  $[\alpha, \beta]$  to the graph of the function. Then the length of the polar graph of  $r = f(\theta)$  on the interval  $[\alpha, \beta]$  is \_\_\_\_\_.

### Algebraic Rules

*The calculus of parametric equations:* Let  $x = f(t)$  and  $y = g(t)$ , where  $f$  and  $g$  are differentiable functions.

- ▶  $\frac{dy}{dx} = \frac{g'(t)}{f'(t)}$ .
- ▶ The arc length of the curve defined by the parametric equations on the interval  $[a, b]$  is \_\_\_\_\_.

*Conversion formulas:* Fill in the blanks to convert between rectangular coordinates and polar coordinates.

- ▶  $r = \sqrt{x^2 + y^2}$ .
- ▶  $\theta = \arctan\left(\frac{y}{x}\right)$ .

- ▶  $x = r \cos \theta$ .
- ▶  $y = r \sin \theta$ .

*The calculus of polar functions:* Let  $r = f(\theta)$ , where  $f$  is a positive differentiable function.

- ▶ The area enclosed by the function  $f$  and the rays  $\theta = \alpha$  and  $\theta = \beta$  is \_\_\_\_\_, provided that \_\_\_\_\_.
- ▶ The arc length of the curve defined by  $f$  on the interval  $[a, b]$  is \_\_\_\_\_.

### Skill Certification: Parametric Equations and Polar Coordinates

*Sketching parametric equations:* Sketch the curves defined by the given sets of parametric equations. Indicate the direction of motion on each curve.

- $x = t^2$ ,  $y = t^3$ ,  $t \in [-2, 2]$
- $x = 3t + 1$ ,  $y = -2t + 3$ ,  $t \in [0, 1]$
- $x = \sin t$ ,  $y = \cos t$ ,  $t \in [0, 4\pi]$
- $x = \sin t$ ,  $y = \cos^2 t$ ,  $t \in [0, 4\pi]$
- $x = \sec t$ ,  $y = \tan t$ ,  $t \in \left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$
- $x = \tan t$ ,  $y = 1 + \sec^2 t$ ,  $t \in \left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$

7.  $x = \sinh t, y = \cosh t, t \in \mathbb{R}$   
 8.  $x = \sinh t, y = \cosh^2 t, t \in \mathbb{R}$

*Lengths of parametric curves:* Find the arc lengths of the curves defined by the parametric equations on the specified intervals.

9.  $x = t^2, y = t^3, t \in [-2, 2]$   
 10.  $x = 3t + 1, y = -2t + 3, t \in [0, 1]$   
 11.  $x = \sin kt, y = \cos kt, t \in [0, 2\pi]$ , where  $k$  is a constant  
 12.  $x = \cosh t, y = t, t \in [0, 1]$

*Graphs of polar functions:* Use polar coordinates to graph each of the following functions.

13.  $r = \sin \theta$   
 14.  $r = 3 \cos \theta$   
 15.  $r = \sin 3\theta$   
 16.  $r = 3 \cos 4\theta$   
 17.  $r = 2 - 2 \sin \theta$   
 18.  $r = 4 - 2 \cos \theta$   
 19.  $r = 2 - \sqrt{8} \sin \theta$   
 20.  $r = 3 - 2 \cos \theta$   
 21.  $r^2 = -\sin 2\theta$   
 22.  $r^2 = 3 \cos 2\theta$

*The arc length of polar functions:* Find the arc lengths of the following polar functions.

23.  $r = a$ , where  $a$  is a positive constant, for  $\theta \in [0, 2\pi]$   
 24.  $r = a \cos \theta$ , where  $a$  is a positive constant, for  $\theta \in [0, \pi]$   
 25.  $r = a \sin \theta$  for  $\theta \in [0, \pi]$   
 26.  $r = \sin \theta + \cos \theta$  for  $\theta \in [0, \pi]$

27.  $r = 1 - \sin \theta$  for  $\theta \in [0, 2\pi]$

28.  $r = a \sin \theta + b \cos \theta$ , where  $a$  and  $b$  are positive constants for  $\theta \in [0, \pi]$

29.  $r = \sec \theta$  for  $\theta \in \left[-\frac{\pi}{6}, \frac{\pi}{6}\right]$

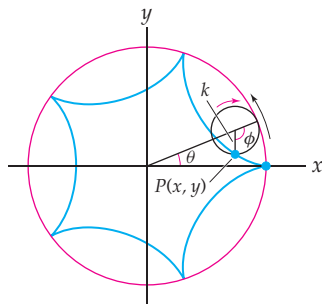

30.  $r = \csc \theta$  for  $\theta \in \left[\frac{\pi}{4}, \frac{3\pi}{4}\right]$

*Areas of regions bounded by polar functions:* Find the areas of the following regions.

31. The area bounded by the function  $r = a$ , where  $a$  is a positive constant.  
 32. The area bounded by the function  $r = a \cos \theta$ , where  $a$  is a positive constant.  
 33. The area bounded by one petal of  $r = \cos 2\theta$ .  
 34. The area bounded by one petal of  $r = \sin 3\theta$ .  
 35. The area bounded by  $r = 1 - \sin \theta$   
 36. The area between the inner and outer loops of  $r = 1 - \sqrt{2} \cos \theta$ .  
 37. The area bounded by one loop of  $r^2 = -\sin 2\theta$ .  
 38. The area bounded by one loop of  $r^2 = 4 \cos 2\theta$ .  
 39. The area that is inside both lemniscates  $r^2 = \cos 2\theta$  and  $r^2 = \sin 2\theta$ .  
 40. The area inside both polar roses  $r = \sin 3\theta$  and  $r = \cos 3\theta$ .

## Capstone Problems

- A. A **hypocycloid** is another generalization of a cycloid in which the point tracing the path is on the circumference of a wheel, but the wheel is rolling without slipping on the inside of another wheel. If the radius of the rolling wheel is  $k$  and the radius of the fixed wheel is  $r$ , find parametric equations for the hypocycloid.

What is the path if the radius of the smaller wheel is exactly one-half the radius of the larger wheel?

- B. A certain set of parametric equations has the properties that

$$x'(t) = x(t), \quad y'(t) = x(t)y(t), \quad x(0) = 1 \text{ and } y(0) = e.$$

- (a) Solve the system of differential equations. (*Hint: Start by solving the initial-value problem  $x'(t) = x(t)$  with  $x(0) = 1$ .*)  
 (b) Graph the parametric curve defined by  $x = x(t)$  and  $y = y(t)$  by eliminating the parameter.  
 C. When  $k \geq 2$  is an integer, the polar graph of  $r = \sin k\theta$  or  $r = \cos k\theta$  is a rose.  
 (a) How many petals does the rose have when  $k$  is an integer?  
 (b) What can you say about the symmetries of either  $r = \sin k\theta$  or  $r = \cos k\theta$  when  $k$  is rational? Use a graphing calculator or a computer algebra system to graph several cases before answering the question.  
 (c) What can you say about the polar graph of  $r = \sin k\theta$  or  $r = \cos k\theta$  when  $k$  is irrational?  
 D. Let  $r_1$  and  $r_2$  be positive real numbers and  $0 < \theta_2 - \theta_1 < \pi$ . Prove that the area of the triangle with vertices  $(0, 0)$ ,  $(r_1, \theta_1)$ , and  $(r_2, \theta_2)$  in the polar plane is  $\frac{r_1 r_2}{2} \sin(\theta_2 - \theta_1)$ .

### Three-Dimensional Space in Rectangular Coordinates

---

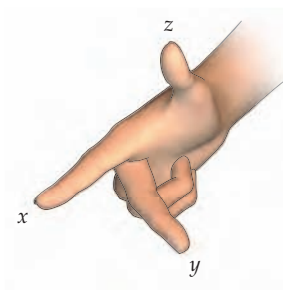

In this chapter we will study vectors and see how they are used in the descriptions of lines and planes in three dimensions. We will see that vectors have interrelated geometric and analytic properties. By studying the connections between the geometric and algebraic properties of vectors we will be able to gain a fuller understanding of vectors, lines, and planes.

In previous chapters we used a two-dimensional coordinate system almost exclusively. Until we reached Chapter 9, we focused on rectangular or Cartesian coordinates to name the points in the plane. Beginning with this section we expand this concept to describe a three-dimensional Cartesian system. In Chapter 13 we will discuss other useful coordinate systems for three-dimensional space. To construct a three-dimensional rectangular system we choose an origin  $O$  and three mutually perpendicular coordinate axes intersecting at  $O$ . The coordinate axes are ordered and usually labeled  $x$ ,  $y$ , and  $z$ . We will typically draw the system as shown here:

*A three-dimensional Cartesian coordinate system*

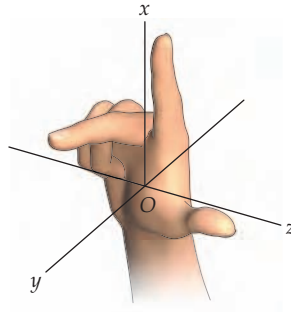

In this figure the  $z$ -axis is vertical, increasing as you go up, the  $y$ -axis increases from left to right, and the  $x$ -axis should be interpreted as pointing straight out from the page, increasing as it comes toward you. The figure shown is an example of a **right-handed system**, because it obeys the following “right-hand rule”: If the index finger of the right hand points in the positive  $x$  direction and the middle finger of the right hand points in the positive  $y$  direction, then the right thumb will naturally point in the positive  $z$  direction as the hand shown here illustrates:

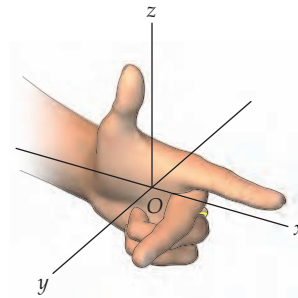

The coordinate system shown next at the left is also a right-handed system. However, there are labelings of the axes that give left-handed systems, as in the figure on the right.

Another right-handed  
Cartesian coordinate system

A left-handed system

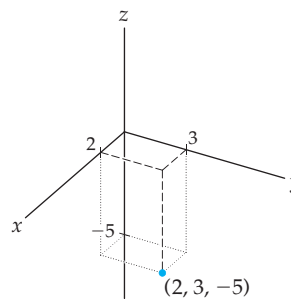

We used a different labeling of the axes when we discussed surfaces of revolution in Chapter 6. That labeling also gave us a right-handed system.

In Exercise 14 we will ask you about other possible labelings of the axes and about which labelings give right-handed systems. The notion of right-handedness will be crucial in Section 10.4, when we discuss the cross product. For now, it is just a convenient convention.

Once the axes are drawn, to complete the Cartesian system, a linear scale should be added to each axis, as is done with any two-dimensional rectangular system. Given the axes and their scales, there is a one-to-one correspondence between the points in the three-dimensional system and ordered triples of real numbers  $(a, b, c)$ .

We will often use the abbreviations **2-space** or  $\mathbb{R}^2$  (pronounced “R two”) to denote two-dimensional space. Similarly, we will use **3-space** or  $\mathbb{R}^3$  for three-dimensional space.

To locate a point  $(a, b, c)$  in a three-dimensional Cartesian coordinate system we move the appropriate number of units along each of the three coordinate axes. For example, the point  $(2, 3, -5)$  is the unique point 2 units in the positive  $x$  direction from the  **$yz$ -plane**, 3 units in the positive  $y$  direction from the  **$xz$ -plane**, and 5 units in the negative  $z$  direction from the  **$xy$ -plane**. The following figure below is illustrative:

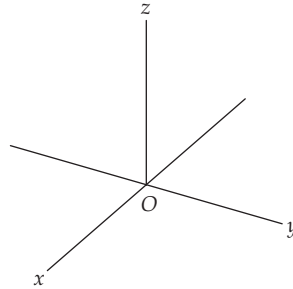

## An Introduction to Planes

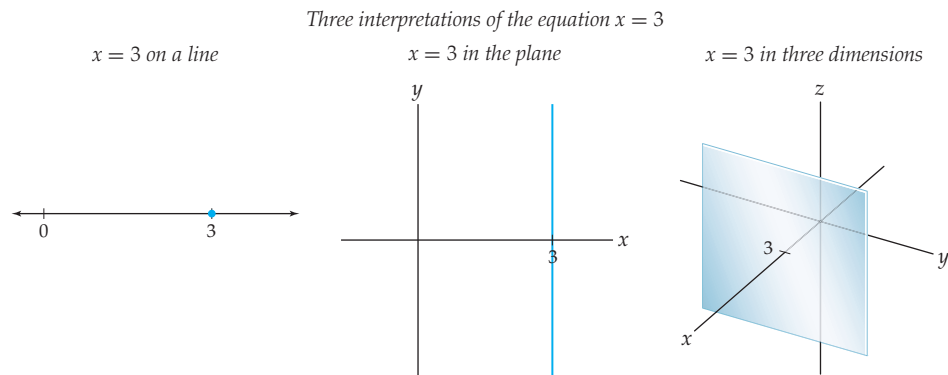

Two distinct intersecting lines in  $\mathbb{R}^3$  determine a unique plane. In particular, when taken in pairs, the coordinate axes determine **coordinate planes**. The  $x$ - and  $y$ -axes determine the  $xy$ -plane. Similarly, the  $x$ - and  $z$ -axes determine the  $xz$ -plane, and the  $y$ - and  $z$ -axes determine the  $yz$ -plane.

As you know, in a two-dimensional rectangular system the coordinate axes divide the plane into four parts known as quadrants. Similarly, in a three-dimensional system, the three coordinate planes divide the system into eight parts, known as *octants*. The octant in which  $x$ ,  $y$ , and  $z$  are all positive is called the *first octant*. The other seven octants are usually not numbered; however, they can be distinguished by the signs of the coordinates.

For example, the octant determined by the inequalities  $x < 0$ ,  $y < 0$ , and  $z > 0$  lies at the top (since  $z > 0$ ), left (since  $y < 0$ ) and back (since  $x < 0$ ) of the following system:

In mathematics, as in linguistics, it is important to realize that even simple statements are sensitive to the contexts in which they are made. For example, consider the mathematical sentence " $x = 3$ ." The three figures that follow illustrate different geometrical interpretations of this sentence. On a number line,  $x = 3$  is a point, as we see on the left. In a two-dimensional system,  $x = 3$  is the equation for a line parallel to the  $y$ -axis, as shown in the middle. In a three-dimensional system, the same equation  $x = 3$  represents a plane parallel to the  $yz$ -plane. Every point on this plane has the property that its  $x$ -coordinate is 3.

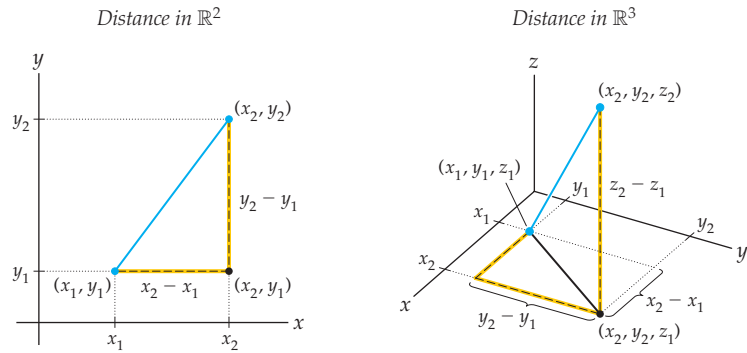

More generally, any equation of the form  $x = a$ ,  $y = b$ , or  $z = c$  represents a plane parallel to one of the coordinate planes. Of course there are planes in 3-space other than those parallel to the coordinate planes. We discuss planes fully in Section 10.6.

## Distances, Spheres, and Cylinders

We know that in 2-space the distance between the points  $(x_1, y_1)$  and  $(x_2, y_2)$  can be computed with the Pythagorean theorem;

$$\text{distance} = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}.$$

To find the distance between two points in  $\mathbb{R}^3$  we need to extend this formula appropriately.

### DEFINITION 10.1 The Distance Formula in $\mathbb{R}^3$

Let  $(x_1, y_1, z_1)$  and  $(x_2, y_2, z_2)$  be two points in  $\mathbb{R}^3$ . We define the **distance** between these points to be

$$\sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2 + (z_2 - z_1)^2}.$$

For example, to find the distance between the points  $(2, 1, -4)$  and  $(-3, 2, 1)$  we compute

$$\text{distance} = \sqrt{(2 - (-3))^2 + (1 - 2)^2 + (-4 - 1)^2} = \sqrt{25 + 1 + 25} = \sqrt{51}.$$

The distance between the points is  $\sqrt{51} \approx 7.14$  units.

To find the **midpoint** of a line segment connecting points  $P(x_1, y_1, z_1)$  and  $Q(x_2, y_2, z_2)$  we may just average the corresponding coordinates. That is, the midpoint of the segment  $PQ$  is the point  $\left(\frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2}, \frac{z_1 + z_2}{2}\right)$ . We ask you to prove this fact in Exercise 62. We may also use the idea of the midpoint of a segment to define what it means for two points to be symmetric about a third point. We say that  $P(x_1, y_1, z_1)$  and  $Q(x_2, y_2, z_2)$  are symmetric about a point  $R(x_3, y_3, z_3)$  if  $R$  is the midpoint of the segment  $PQ$ . For example, to find the point  $Q$  symmetric to  $P(-1, 2, 4)$  about the point  $R(2, 7, -1)$ , we see that  $Q$  must have coordinates  $(5, 12, -6)$  so that  $R$  is the midpoint of  $PQ$ .

A circle can be defined to be the set of points in a plane at a fixed distance from a given central point. Using the distance formula, we know that the equation of a circle in the  $xy$ -plane can be written as

$$(x - x_0)^2 + (y - y_0)^2 = r^2,$$

where the center of the circle is  $(x_0, y_0)$  and the radius (distance) is  $r$ . We may use a similar equation to describe the points on a sphere.

### DEFINITION 10.2 Spheres

A **sphere** is the set of points in three-dimensional space at a fixed distance from a given central point. The sphere with center  $(x_0, y_0, z_0)$  and radius  $r > 0$  is given by the formula

$$(x - x_0)^2 + (y - y_0)^2 + (z - z_0)^2 = r^2.$$

For example, the equation of the sphere centered at  $(-2, 3, 1)$  with radius 4 is

$$(x + 2)^2 + (y - 3)^2 + (z - 1)^2 = 16.$$

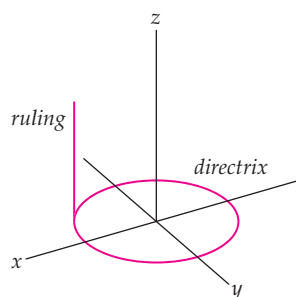

In common usage a cylinder is a circle translated a finite distance in a direction out of the plane of the circle. We now define a cylinder in a more general way. The curves we translate can be any curves in the plane.

### DEFINITION 10.3

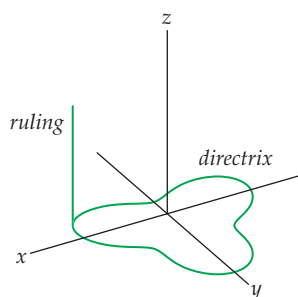

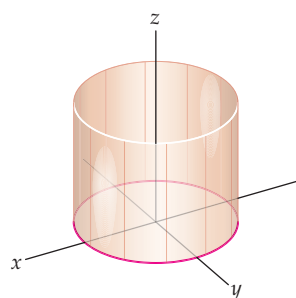

#### Cylinders

Let  $C$  be a curve in some plane  $\mathcal{P}$ , and let  $l$  be a line that intersects  $\mathcal{P}$ , but does not lie in  $\mathcal{P}$ . A **cylinder** is the set of all points in  $\mathbb{R}^3$  that are on lines parallel to  $l$  that intersect  $C$ . The curve  $C$  is called the **directrix** of the cylinder. The lines in the cylinder parallel to  $l$  are called **rulings** of the cylinder.

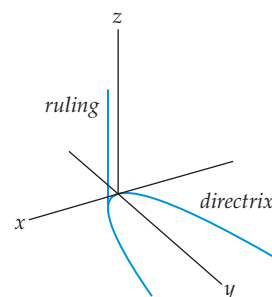

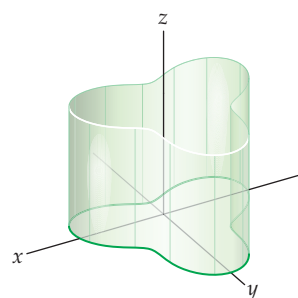

In the following examples each directrix is a curve in the  $xy$ -plane and the rulings are parallel to the  $z$ -axis:

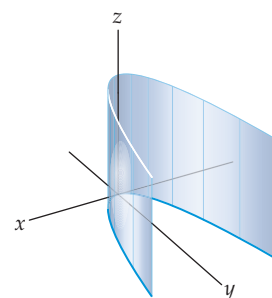

A circular cylinder

A noncircular cylinder

A parabolic cylinder

Most of the cylinders we will consider have rulings that are perpendicular to the plane containing the directrix. These cylinders are said to be **right** cylinders. The preceding examples are all right cylinders. As we mentioned earlier in this section, a given equation can have different graphs depending upon the context. When we consider the equation  $y = x^2$  in  $\mathbb{R}^2$ , we see that the graph is the familiar parabola. But when we consider the graph of this equation in  $\mathbb{R}^3$ , we observe that it is the right parabolic cylinder shown in the preceding, rightmost figure. In fact, the graph of any curve given by a function  $y = f(x)$  is a right cylinder when considered in  $\mathbb{R}^3$ . (Think of translating the graph in the direction of the  $z$ -axis.)

## Quadric Surfaces

A conic section can be thought of as the graph of a second-degree polynomial in two variables,

$$Ax^2 + By^2 + Cxy + Dx + Ey + F = 0,$$

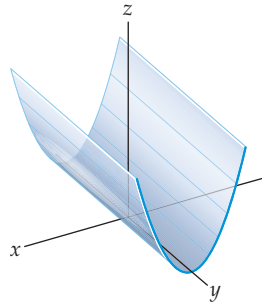

where  $A, B, C, \dots, F$  are constants. **Quadric surfaces** are the three-dimensional analogs of conic sections. A quadric surface is the graph of a second-degree polynomial in three variables; its equation is

$$Ax^2 + By^2 + Cz^2 + Dxy + Exz + Fyz + Gx + Hy + Iz + J = 0,$$

where  $A, B, C, \dots, J$  are constants. We will not need to consider this most general form for quadric surfaces because, under suitable translations and rotations, every quadric surface can be written in one of the following two forms:

$$Cz = Ax^2 + By^2 \quad \text{and} \quad Cz^2 = Ax^2 + By^2 + D.$$

If any of the constants in either of the preceding equations is zero, the corresponding quadric surface is said to be **degenerate**. The only type of degenerate quadric surface we will mention in detail is the one we get when the constant  $D = 0$  in the second equation. The graphs of these surfaces are the cones we discuss next. All other degenerate quadric surfaces are right cylinders of conic sections. For example, if we let  $A = C = 1$  and  $B = 0$  in the equation  $Cz = Ax^2 + By^2$ , we have  $z = x^2$ . The graph of this equation in  $\mathbb{R}^3$  is the right parabolic cylinder with directrix  $z = x^2$  shown here:

The cones and all nondegenerate quadric surfaces can be written in one of the following six forms for positive constants  $a, b$ , and  $c$ , possibly after another rotation:

1. Elliptic Cones:  $z^2 = \frac{x^2}{a^2} + \frac{y^2}{b^2}$
2. Ellipsoids:  $\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1$
3. Hyperboloids of One Sheet:  $\frac{x^2}{a^2} + \frac{y^2}{b^2} - \frac{z^2}{c^2} = 1$
4. Hyperboloids of Two Sheets:  $\frac{x^2}{a^2} + \frac{y^2}{b^2} - \frac{z^2}{c^2} = -1$
5. Elliptic Paraboloids:  $z = \frac{x^2}{a^2} + \frac{y^2}{b^2}$
6. Hyperbolic Paraboloids:  $z = \frac{x^2}{a^2} - \frac{y^2}{b^2}$

To help us understand these surfaces we will look at:

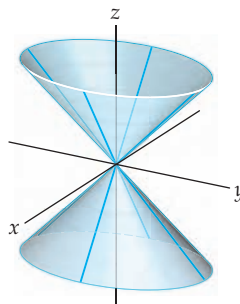

- ▶ the **intercepts**, the places where the graphs cross the coordinate axes,
- ▶ the **traces**, the intersections with the coordinate planes, and
- ▶ the **sections**, intersections with arbitrary planes parallel to the coordinate planes.

1. **Elliptic Cones:**  $z^2 = \frac{x^2}{a^2} + \frac{y^2}{b^2}$ .

The only place where the graph intersects one of the coordinate axes is the origin. The horizontal sections are ellipses with equations  $c^2 = \frac{x^2}{a^2} + \frac{y^2}{b^2}$ . The trace in the  $xz$ -plane is the pair of intersecting lines  $z = \pm \frac{x}{a}$ . Similarly, the trace in the  $yz$ -plane is the pair of intersecting lines  $z = \pm \frac{y}{b}$ . The following graph is one such elliptic cone:

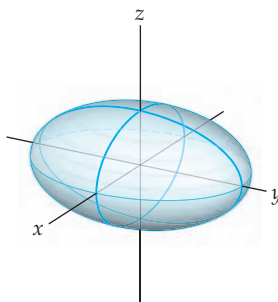

The elliptic cone  $z^2 = \frac{x^2}{4} + \frac{y^2}{9}$

2. **Ellipsoids:**  $\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1$ .

An ellipsoid is a three-dimensional analog of an ellipse. The  $x$ -intercepts are  $(\pm a, 0, 0)$ , the  $y$ -intercepts are  $(0, \pm b, 0)$ , and the  $z$ -intercepts are  $(0, 0, \pm c)$ . To find the trace in the  $xy$ -plane we set  $z = 0$  and see that we obtain the ellipse with equation  $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ . Similarly, the traces in the  $xz$ -plane and  $yz$ -plane are the ellipses  $\frac{x^2}{a^2} + \frac{z^2}{c^2} = 1$  and  $\frac{y^2}{b^2} + \frac{z^2}{c^2} = 1$ , respectively.

The ellipsoid  $\frac{x^2}{9} + \frac{y^2}{16} + \frac{z^2}{4} = 1$

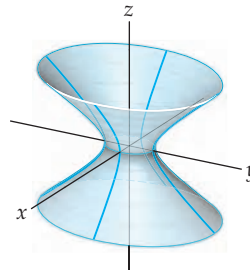

3. **Hyperboloids of One Sheet:**  $\frac{x^2}{a^2} + \frac{y^2}{b^2} - \frac{z^2}{c^2} = 1$ .

The  $x$ -intercepts are  $(\pm a, 0, 0)$  and the  $y$ -intercepts are  $(0, \pm b, 0)$ . There are no  $z$ -intercepts, since the equation  $-\frac{z^2}{c^2} = 1$  has no solutions. The trace in the  $xy$ -plane is the ellipse with equation  $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ . Similarly, every section parallel to the  $xy$ -plane is an ellipse, and the size of these ellipses increases with distance from the  $xy$ -plane.

When we set  $y = 0$  to find the trace in the  $xz$ -plane, we see that we obtain a hyperbola with equation  $\frac{x^2}{a^2} - \frac{z^2}{c^2} = 1$ . Similarly, the trace in the  $yz$ -plane is the hyperbola with equation  $\frac{y^2}{b^2} - \frac{z^2}{c^2} = 1$ .

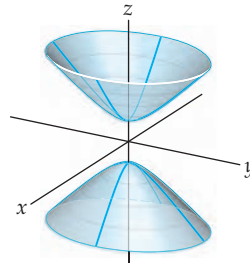

The hyperboloid  $\frac{x^2}{9} + \frac{y^2}{16} - \frac{z^2}{4} = 1$

4. **Hyperboloids of Two Sheets:**  $\frac{x^2}{a^2} + \frac{y^2}{b^2} - \frac{z^2}{c^2} = -1$ .

As the name implies, the graph of a hyperboloid of two sheets consists of two pieces. There are no  $x$ - or  $y$ -intercepts because, when  $z = 0$ , the equation  $\frac{x^2}{a^2} + \frac{y^2}{b^2} = -1$  has no real solutions. We can see that there are  $z$ -intercepts at  $(0, 0, \pm c)$  and that all points on the hyperboloid have the property that  $z \geq c$  or  $z \leq -c$ . For these values of  $z$ , the sections parallel to the  $xy$ -plane are all ellipses. The trace in the  $xz$ -plane is the hyperbola with equation  $\frac{x^2}{a^2} - \frac{z^2}{c^2} = -1$ . Similarly, the trace in the  $yz$ -plane is the hyperbola with equation  $\frac{y^2}{b^2} - \frac{z^2}{c^2} = -1$ .

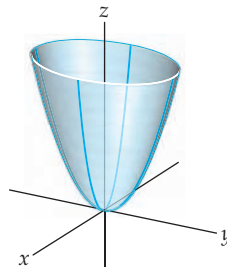

The hyperboloid  $\frac{x^2}{9} + \frac{y^2}{16} - \frac{z^2}{4} = -1$

5. **Elliptic Paraboloids:**  $z = \frac{x^2}{a^2} + \frac{y^2}{b^2}$ .

The only place where the graph of this elliptic paraboloid intersects any of the coordinate axes is the origin. The trace in the  $xz$ -plane is the parabola with equation  $z = \frac{x^2}{a^2}$ , and the trace in the  $yz$ -plane is the parabola with equation  $z = \frac{y^2}{b^2}$ . When  $a = b$ , the graph is the surface of revolution formed when the graph of  $z = \frac{x^2}{a^2}$  (in the  $xz$ -plane) is revolved around the  $z$ -axis.

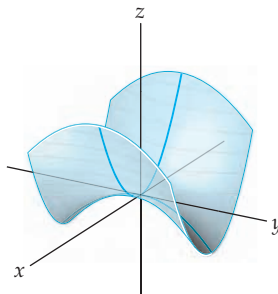

The elliptic paraboloid  $z = \frac{x^2}{4} + \frac{y^2}{9}$

6. **Hyperbolic Paraboloids:**  $z = \frac{x^2}{a^2} - \frac{y^2}{b^2}$ .

Again, the only place where this paraboloid intersects any of the coordinate axes is at the origin. The trace in the  $xy$ -plane is the pair of intersecting lines  $y = \pm \frac{b}{a}x$ . The trace in the  $xz$ -plane is the (upwards-opening) parabola with equation  $z = \frac{x^2}{a^2}$ , and the trace in the  $yz$ -plane is the (downwards-opening) parabola with equation  $z = -\frac{y^2}{b^2}$ .

The hyperbolic paraboloid  $z = \frac{x^2}{4} - \frac{y^2}{9}$

## Examples and Explorations

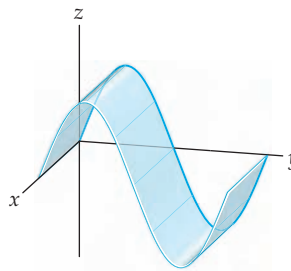

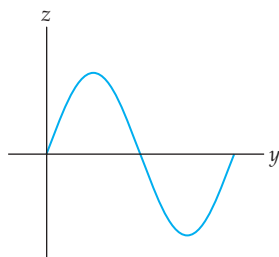

### EXAMPLE 1

#### Graphing a cylinder

Graph the cylinder in  $\mathbb{R}^3$  defined by  $z = \sin y$ ,  $0 \leq y \leq 2\pi$ .

#### SOLUTION

We begin by graphing the sine curve in the  $yz$ -plane, as shown next on the left, and then translate this graph, using the  $x$ -axis as a ruling, to obtain the graph on the right.

□

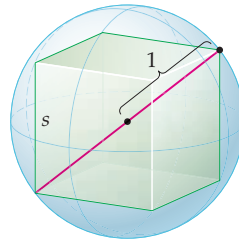

### EXAMPLE 2

#### Inscribing a cube in a sphere

Find the side length of the largest cube that can be inscribed in a sphere of radius 1.

#### SOLUTION

The largest cube that can be inscribed in the sphere has a main diagonal that is a diameter of the sphere.

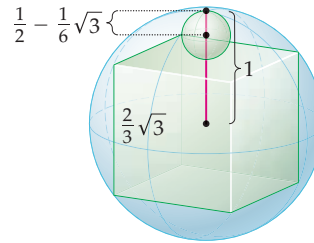

Therefore, the main diagonal of the cube will have length 2 units. If we let  $s$  be the length of each side of the cube, then, by the distance formula, we have  $s^2 + s^2 + s^2 = 2^2$ , or equivalently,  $3s^2 = 4$ . So, each side of the cube should measure  $\frac{2}{3}\sqrt{3}$  units.  $\square$

**EXAMPLE 3****Inscribing a sphere between a cube and a sphere**

Find the radius of the largest sphere that can be inscribed between the cube and sphere from Example 2.

**SOLUTION**

The following figure shows the sphere whose diameter we wish to find, along with the radius of the larger sphere:

The large sphere has radius 1 and each side of the cube measures  $\frac{2}{3}\sqrt{3}$  units. Therefore, the portion of this radius that extends above the cube has length  $1 - \frac{1}{2} \cdot \frac{2}{3}\sqrt{3} = 1 - \frac{1}{3}\sqrt{3}$  units. This is the diameter of the smaller sphere. Therefore the radius of the smaller sphere is  $\frac{1}{2} - \frac{1}{6}\sqrt{3}$  units.  $\square$

**? TEST YOUR UNDERSTANDING**

- ▶ What is the difference between a right-handed coordinate system and a left-handed coordinate system?
- ▶ What are the coordinate planes in three-dimensional space? How are they drawn?
- ▶ How are the distances between two points computed in two-dimensional space and three-dimensional space? How could the distance formula be generalized to find the distance between two points in  $n$ -dimensional space?
- ▶ What are the graphical representations of the equations  $x = a$  and  $y = b$  in  $\mathbb{R}^2$ ? What are the graphical representations of the equations  $x = a$ ,  $y = b$ , and  $z = c$  in 3-space?
- ▶ How do you write an equation of a sphere with a given center and radius?

## EXERCISES 10.1

## Thinking Back

*Lines parallel to the coordinate axes:* Provide equations for the specified lines.

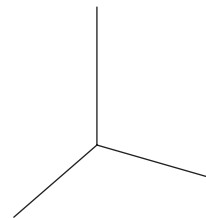

- ▶ The line parallel to the  $x$ -axis and containing the point  $(\pi, e)$ .
- ▶ The line parallel to the  $y$ -axis and containing the point  $(\pi, e)$ .
- ▶ The line parallel to the  $y$ -axis and containing the point  $(0, 5)$ .

*Circles in  $\mathbb{R}^2$ :* Provide equations for the specified circles.

- ▶ The circle in  $\mathbb{R}^2$  with center  $(3, 6)$  and tangent to the  $x$ -axis.
- ▶ The circle in  $\mathbb{R}^2$  with center  $(3, 6)$  and tangent to the  $y$ -axis.
- ▶ The circle in  $\mathbb{R}^2$  with center  $(-4, 3)$  and containing the point  $(5, -2)$ .

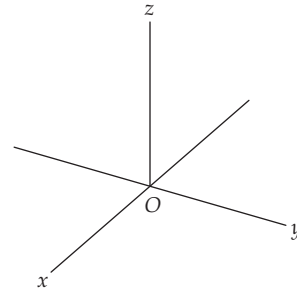

## Concepts

0. *Problem Zero:* Read the section and make your own summary of the material.
1. *True/False:* Determine whether each of the statements that follow is true or false. If a statement is true, explain why. If a statement is false, provide a counterexample.
  - (a) *True or False:* The distance between two distinct points can be zero.
  - (b) *True or False:* In the Cartesian plane the equation  $x = 5$  represents a line.
  - (c) *True or False:* In three-dimensional space the equation  $x = 5$  represents a line.
  - (d) *True or False:* In four-dimensional space the equation  $x = 5$  represents a plane.
  - (e) *True or False:* The equation
 
$$x^2 + y^2 + z^2 + 2x - 4y - 10z + 50 = 0$$
 represents a sphere with center  $(-1, 2, 5)$ .
  - (f) *True or False:* If a sphere in  $\mathbb{R}^3$  has its center in the first octant and is tangent to each of the coordinate planes, then its center is at the point  $(c, c, c)$  for some constant  $c$ .
  - (g) *True or False:* When two distinct spheres intersect, they intersect in either a point or a circle.
  - (h) *True or False:* Three noncollinear points in  $\mathbb{R}^3$  determine a unique plane.
2. *Examples:* Construct examples of the thing(s) described in the following. Try to find examples that are different than any in the reading.
  - (a) A plane parallel to the  $yz$ -plane.
  - (b) A sphere tangent to the  $xy$ -plane.
  - (c) A sphere tangent to all three coordinate planes.
3. Consider the equations  $y = 5$  and  $x = -3$ .
  - (a) What do these equations represent in a two-dimensional system?
  - (b) What do these equations represent in a three-dimensional system?
4. Consider the equation  $x + 2y = 4$ .
  - (a) What does this equation represent in a two-dimensional system?
  - (b) What does this equation represent in a three-dimensional system?
5. What are the coordinates of the vertices of a cube with side length 2, whose center is at the origin, and whose faces are parallel to the coordinate planes?
6. The sides of a  $2 \times 3 \times 4$  rectangular solid are parallel to the coordinate planes. The coordinates of four of its vertices are  $(1, -2, 3)$ ,  $(-1, -2, -1)$ ,  $(-1, 1, 3)$ , and  $(1, -2, 3)$ . What are the coordinates of the other four vertices?
7. What is the definition of a sphere?
8. What is the definition of a cylinder? What is the directrix? What is a ruling?
9. Consider the equation  $x^2 + y^2 = 4$ .
  - (a) What does this equation represent in a two-dimensional system?
  - (b) What does this equation represent in a three-dimensional system?
10. Consider the equation  $z = y^2$ .
  - (a) What does this equation represent in the  $yz$ -plane?
  - (b) What does this equation represent in a three-dimensional system?
11. What point is symmetric about the origin to the point  $(5, -6, 7)$ ?
12. What point is symmetric to the point  $(-1, 3, 6)$  with respect to the  $xy$ -plane?
13. What point is symmetric to the point  $(3, -7, -4)$  with respect to the plane  $z = 1$ ?
14. Find all of the  $x, y, z$  labelings of the axes in the diagram that follows. Determine which of your labelings are right-handed systems and which are left-handed systems.

15. Show that exchanging two of the axes labels on a right-handed system creates a left-handed system. What does exchanging two pairs of axes labels do (for example, exchanging  $x$  and  $y$  and then exchanging the “new”  $y$  and  $z$ )?
16. Sketch the point  $(2, 3, 4)$  in a three-dimensional Cartesian coordinate system, and then answer the following questions:
- Do the coordinates  $(2, 3, 4)$  represent a unique point in a three-dimensional Cartesian coordinate system?
  - Are there any other coordinates  $(a, b, c)$  that would have the same location as  $(2, 3, 4)$  in your graph?
  - How far from the  $xy$ -plane is the point  $(2, 3, 4)$ ?
  - How far from the  $xz$ -plane is the point  $(2, 3, 4)$ ?
  - How far from the  $yz$ -plane is the point  $(2, 3, 4)$ ?
  - How far from the  $x$ -axis is the point  $(2, 3, 4)$ ?
  - How far from the origin is the point  $(2, 3, 4)$ ?
  - How far from the point  $(1, -2, 3)$  is the point  $(2, 3, 4)$ ?
  - What is the equation of the sphere with center  $(2, 3, 4)$  and passing through the point  $(1, -2, 3)$ ?
  - What is the equation of the plane parallel to the  $xy$ -plane and that contains the point  $(2, 3, 4)$ ?
  - What is the equation of the plane parallel to the  $xz$ -plane and that contains the point  $(2, 3, 4)$ ?
  - What is the equation of the plane parallel to the  $yz$ -plane and that contains the point  $(2, 3, 4)$ ?
17. How does the Pythagorean theorem generalize to higher dimensions? In particular, how would you compute the distance between two points in four-dimensional space? Five-dimensional space?  $n$ -dimensional space?

18. The points in the first octant satisfy the inequalities  $x > 0$ ,  $y > 0$ ,  $z > 0$ . For each of the other seven octants, find a set of inequalities that describes the points in the octant. Use the inequalities to label the octants of the following right-handed coordinate system:

19. Use inequalities to describe each of the following sets, and sketch the regions:
- The region in the first octant above the plane  $z = 3$ .
  - The region inside the sphere with center  $(1, 2, 4)$  and radius 5.
  - The region inside the right circular cylinder with directrix  $x^2 + y^2 - 4x + 6y - 12 = 0$ .
20. Sketch the right circular cylinders:

$$x^2 + y^2 = 1, \quad x^2 + z^2 = 4, \quad \text{and} \quad y^2 + z^2 = 9.$$

## Skills

Find the distance between the given pair of points in Exercises 21–28.

- $(-2, 3)$  and  $(5, -6)$
- $(4, 0)$  and  $(-5, 12)$
- $(1, 4, 7)$  and  $(-2, 3, 5)$
- $(3, 0, -1)$  and  $(2, -8, 0)$
- $(-1, 4, -3)$  and  $(-4, 3, 1)$
- $(4, 5, 8, -2)$  and  $(-1, 3, -3, 6)$
- $(-1, 3, 5, 2, 0)$  and  $(0, 6, 1, -2, 3)$
- $(0, 0, \dots, 0)$  and  $(1, 1, \dots, 1)$  in  $n$ -space

In Exercises 29–35 find an equation of a sphere with the specified characteristics.

- center  $(3, -2, 5)$  and radius 5
- center  $(4, -2, -3)$  and radius 3
- center  $(2, 5, -7)$  and tangent to the  $xy$ -plane
- center  $(2, 5, -7)$  and tangent to the  $yz$ -plane
- center  $(2, 5, -7)$  and containing the origin

- containing the point  $(1, 4, 7)$  and whose center is  $(-2, 3, 5)$
- containing the point  $(3, 0, -1)$  and whose center is  $(2, -8, 0)$

Use the midpoint formula to find the equations of the spheres in Exercises 36 and 37.

- the sphere in which the segment with endpoints  $(3, -2, 6)$  and  $(5, 6, 4)$  is a diameter
- the sphere in which the segment with endpoints  $(6, -1, 4)$  and  $(-3, 3, 1)$  is a diameter

In Exercises 38 and 39 find the center and radius of the sphere with the given equation.

- $x^2 + y^2 + z^2 - 2x + 6y - 8z + 17 = 0$
- $x^2 + y^2 + z^2 + 3y - 5z + 3 = 0$
- Find the equations of the intersections of the sphere

$$x^2 + y^2 + z^2 - 2x + 6y - 8z + 17 = 0$$

with each of the coordinate planes.

Graph the quadric surfaces given by the equations in Exercises 41–48.

41.  $x^2 = \frac{y^2}{9} + \frac{z^2}{9}$

42.  $z^2 = \frac{x^2}{9} + \frac{y^2}{25}$

43.  $x^2 + y^2 + 1 = z^2$

44.  $x^2 + y^2 - z^2 = 1$

45.  $z = \frac{x^2}{9} + \frac{y^2}{25}$

46.  $9x^2 + 16y^2 + 16z^2 = 144$

47.  $z = x^2 - y^2$

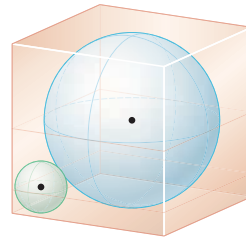

48.  $z = x^2 + y^2$

49. A circle is inscribed in a square so that each side of the square is tangent to the circle. A smaller circle is inscribed in the square so that this circle is tangent to two sides of the square and is tangent to the larger circle, as shown in the following figure:

What is the ratio of the radius of the smaller circle to the radius of the larger circle?

50. A sphere is inscribed in a cube so that each face of the cube is tangent to the sphere. A smaller sphere is inscribed in the cube so that this sphere is tangent to three sides of the cube and is tangent to the larger sphere, as shown in the following figure:

What is the ratio of the radius of the smaller sphere to the radius of the larger sphere? (*Hint: Try Exercise 49 first.*)

51. Show that the triangle with vertices  $(5, 4, -1)$ ,  $(3, 6, -1)$ , and  $(3, 4, 1)$  is equilateral.
52. Show that the triangle with vertices  $(1, 2, -2)$ ,  $(-3, 2, -6)$ , and  $(-3, 6, -2)$  is equilateral.
53. Show that the points  $(1, 5, 0)$ ,  $(3, 8, 6)$ , and  $(7, -7, 4)$  are the vertices of a right triangle and find its area.

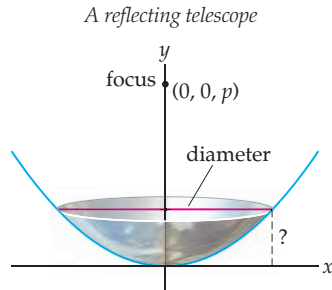

A **regular tetrahedron** is a solid with four faces in which each face is an equilateral triangle of the same size. In Exercises 54 and 55 you are asked some basic questions about regular tetrahedra.

54. (a) Show that the three points  $(1, 0, 0)$ ,  $(0, 1, 0)$ , and  $(0, 0, 1)$  are the vertices of an equilateral triangle.
- (b) Determine the two values of  $a$  so that the four points  $(1, 0, 0)$ ,  $(0, 1, 0)$ ,  $(0, 0, 1)$ , and  $(a, a, a)$  are the vertices of a regular tetrahedron.
55. Find the equations of the spheres that circumscribe the two tetrahedra you determined in Exercise 54 (b). (*Hint: The center of the sphere is the point  $(x_0, y_0, z_0)$ , where  $x_0$  is the mean of the  $x$ -coordinates of the four vertices of the tetrahedron, etc.*)
56. Show that the six points  $(1, 0, 0)$ ,  $(-1, 0, 0)$ ,  $(0, 1, 0)$ ,  $(0, -1, 0)$ ,  $(0, 0, 1)$ , and  $(0, 0, -1)$  form the vertices of a regular octahedron. (A **regular octahedron** is an eight-sided solid in which each face is an equilateral triangle of the same size, and in which four triangles come together at each vertex.)
57. Find the volume of the octahedron given in Exercise 56. (*Hint: Recall that the volume of a pyramid is  $\frac{1}{3} \cdot \text{height} \cdot \text{area of base}$ .*)

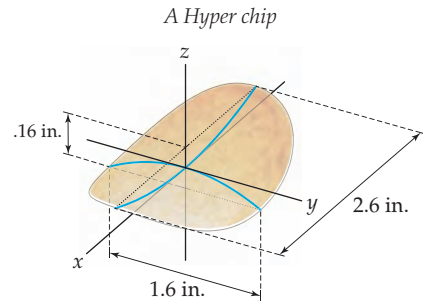

## Applications

58. Ian is doing a high traverse. One morning he looks at the map and notes that if he considers his camp to be at the origin, then his objective is at  $(5.9, 3.3, -0.37)$ . All distances are in miles.
- (a) How far away is his objective, as the crow flies?
- (b) In order to reach his objective, Ian has to go over a high pass that lies at  $(4.2, 4.4, 0.15)$  relative to his camp. Find a more realistic estimate of how far he has to go to his objective than that from part (a).
59. Annie is in a kayak in the middle of a channel between Orcas Island and Blakely Island, two of the San Juan Islands in Washington State. She knows from readings she has taken in the past that if she considers the town of Deer Harbor to be at the origin, then the summit of Constitution Peak is at  $(7.9, 4.0)$ , while the summit of Blakely Peak is at  $(9.3, -3.4)$ . All distances are given in miles. She pulls out her compass and finds that the summit of Constitution Peak is 15 degrees east of north from her, while the summit of Blakely Peak is at 100 degrees from north. How far is Annie from Deer Harbor?

60. The Subaru reflecting telescope on Mauna Kea, Hawaii, has a mirror in the shape of a circular paraboloid with a diameter of 8.3 meters and a focal length of 15 meters. While there are some tricks to how that focal length plays out in practice, if we put the center of the telescope at the origin, pointed straight up, then the effective focus would be at  $(0, 0, p)$ , where  $p$  satisfies  $4pz = x^2 + y^2$ , with all distances given in meters. How high above the  $xy$ -plane is the edge of the telescope?

61. The Hyper Potato Chip Company makes potato chips in the shape of hyperbolic paraboloids. Each chip satisfies the equation  $z = \frac{x^2}{a^2} - \frac{y^2}{a^2}$  when the center of the chip is placed at the origin. The height of each Hyper chip is 0.16 inch, the length is 2.6 inches, and the width is 1.6 inches. Find the parameter  $a$  and write the equation of a Hyper chip.

## Proofs

62. Prove that the midpoint of the line segment connecting the point  $(x_1, y_1, z_1)$  to the point  $(x_2, y_2, z_2)$  is  $\left(\frac{x_1+x_2}{2}, \frac{y_1+y_2}{2}, \frac{z_1+z_2}{2}\right)$ .
63. Given any edge  $\mathcal{E}$  of a tetrahedron, there is exactly one edge  $\mathcal{E}'$  that does not share a face with  $\mathcal{E}$ . We will call  $\mathcal{E}$  and  $\mathcal{E}'$  *opposite* edges of the tetrahedron. Prove that the

line segments connecting the midpoints of the opposite edges of a regular tetrahedron bisect each other.

64. Prove that the midpoint of the line segment connecting the points  $(x_1, x_2, \dots, x_n)$  and  $(y_1, y_2, \dots, y_n)$  in  $\mathbb{R}^n$  is  $\left(\frac{x_1+y_1}{2}, \frac{x_2+y_2}{2}, \dots, \frac{x_n+y_n}{2}\right)$ .

## Thinking Forward

*Hyperspheres:* A four-dimensional **hypersphere** is the set of all points in  $\mathbb{R}^4$  that are the same distance from a given central point.

- ▶ What is the equation of the hypersphere with center  $(1, 2, 3, 4)$  and passing through the point  $(2, 5, 3, -4)$ ?
- ▶ What is the equation of the hypersphere in which the segment with endpoints  $(1, 2, 3, 4)$  and  $(2, 5, 3, -4)$  is a diameter?
- ▶ Hyperspheres can be defined in  $\mathbb{R}^n$  for any integer  $n > 3$ . How would you define a hypersphere in  $\mathbb{R}^n$ ?

## 10.2 VECTORS

- ▶ Vectors in  $\mathbb{R}^2$  as ordered pairs and in  $\mathbb{R}^3$  as ordered triples
- ▶ The geometry of vectors
- ▶ Using vectors to analyze forces

### The Algebra and Geometry of Vectors

The mass and temperature of an object are examples of physical quantities that can be represented adequately with a single numeric value, a magnitude known as a **scalar**. Other quantities, such as displacements, velocities, and forces, need two measures—a magnitude *and* a direction—to represent them. Such quantities are represented by **vectors**.

#### DEFINITION 10.4

##### Vectors in $\mathbb{R}^2$ and $\mathbb{R}^3$

A **vector** in  $\mathbb{R}^2$  is an ordered pair  $\langle x, y \rangle$  subject to the following operations of addition and scalar multiplication:

- (a) The **sum** of vectors  $\langle x_1, y_1 \rangle$  and  $\langle x_2, y_2 \rangle$  is given by

$$\langle x_1, y_1 \rangle + \langle x_2, y_2 \rangle = \langle x_1 + x_2, y_1 + y_2 \rangle.$$

- (b) The **scalar multiple** of vector  $\langle x, y \rangle$  by a real number  $c$ , a **scalar**, is given by

$$c\langle x, y \rangle = \langle cx, cy \rangle.$$

Similarly, a **vector** in  $\mathbb{R}^3$  is an ordered triple  $\langle x, y, z \rangle$  subject to the following operations of addition and scalar multiplication:

- (c) The **sum** of vectors  $\langle x_1, y_1, z_1 \rangle$  and  $\langle x_2, y_2, z_2 \rangle$  is given by

$$\langle x_1, y_1, z_1 \rangle + \langle x_2, y_2, z_2 \rangle = \langle x_1 + x_2, y_1 + y_2, z_1 + z_2 \rangle.$$

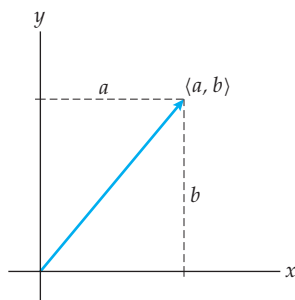

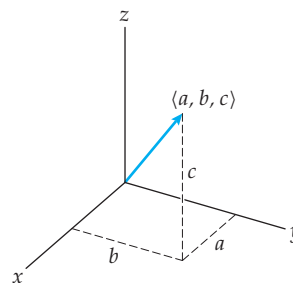

- (d) The **scalar multiple** of vector  $\langle x, y, z \rangle$  by scalar  $c$  is given by

$$c\langle x, y, z \rangle = \langle cx, cy, cz \rangle.$$

We will often use boldface type to denote vectors; for example  $\mathbf{u} = \langle 1, -5 \rangle$  is a vector in  $\mathbb{R}^2$  and  $\mathbf{v} = \langle \pi, e, -0.3 \rangle$  is a vector in  $\mathbb{R}^3$ . The entries of a vector are referred to as **components**. Thus, for the preceding vector  $\mathbf{v}$ , the  $x$ -component is  $\pi$ , the  $y$ -component is  $e$ , and the  $z$ -component is  $-0.3$ .

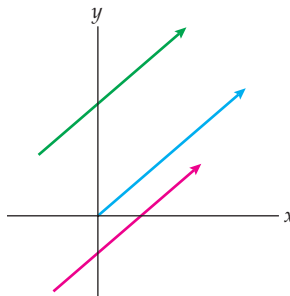

We will (almost) exclusively deal with vectors in  $\mathbb{R}^2$  and  $\mathbb{R}^3$ ; however, it should be clear that vectors with  $n$  components may be defined in an analogous fashion, as a set of ordered  $n$ -tuples with an addition and a scalar multiplication.

There are two geometric models that we may use for vectors in  $\mathbb{R}^2$  and  $\mathbb{R}^3$ . First, we may think of the vectors as **position vectors**. In this model we interpret the vector  $\langle a, b \rangle$  from  $\mathbb{R}^2$  as an arrow in the plane whose **initial point** is at the origin and whose **terminal point** is  $(a, b)$ . Similarly, we interpret the vector  $\langle a, b, c \rangle$  from  $\mathbb{R}^3$  as an arrow in 3-space whose initial point is at the origin and whose terminal point is  $(a, b, c)$ .

The position vector  $\langle a, b \rangle$  in  $\mathbb{R}^2$ The position vector  $\langle a, b, c \rangle$  in  $\mathbb{R}^3$ 

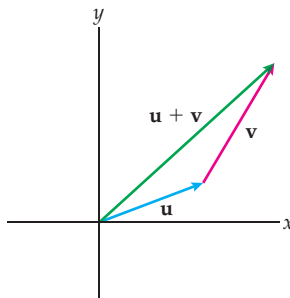

Our second geometric model is a variation of the preceding one. We may think of a vector  $\langle a, b \rangle$  as any translation of the the position vector from the previous model. Thus, any parallel arrow with the same length pointing in the same direction is another model for the vector  $\langle a, b \rangle$ .

Any parallel translation of a vector is the same vector

A similar model may be applied to vectors in  $\mathbb{R}^3$ .

Using the second model, we may geometrically add two vectors  $\mathbf{u}$  and  $\mathbf{v}$  as follows: As we show next, we place vector  $\mathbf{u}$  in the diagram and then place the initial point of  $\mathbf{v}$  at the terminal point of  $\mathbf{u}$ . The vector  $\mathbf{u} + \mathbf{v}$  is the vector that extends from the initial point of  $\mathbf{u}$  to the terminal point of  $\mathbf{v}$ .

Constructing  $\mathbf{u} + \mathbf{v}$  geometrically

Another important concept is the magnitude of a vector, along with its synonyms “norm” and “length.” We use the Pythagorean theorem in our definition.

### DEFINITION 10.5 The Magnitude, Norm, or Length of a Vector

The **magnitude**, **norm**, or **length** of a vector  $\mathbf{v}$  is denoted by  $\|\mathbf{v}\|$ .

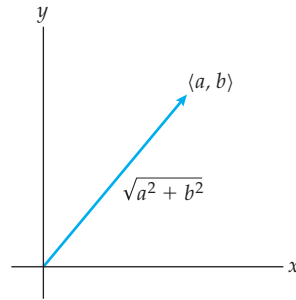

In  $\mathbb{R}^2$ , when  $\mathbf{v} = \langle a, b \rangle$ ,

$$\|\mathbf{v}\| = \sqrt{a^2 + b^2}.$$

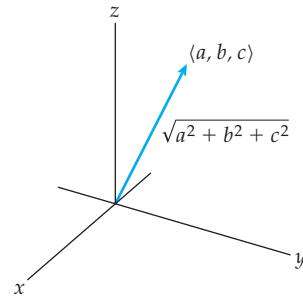

In  $\mathbb{R}^3$ , when  $\mathbf{v} = \langle a, b, c \rangle$ ,

$$\|\mathbf{v}\| = \sqrt{a^2 + b^2 + c^2}.$$

The magnitude of  $\langle a, b \rangle$  is  $\sqrt{a^2 + b^2}$

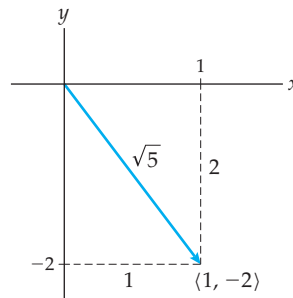

The magnitude of  $\langle a, b, c \rangle$  is  $\sqrt{a^2 + b^2 + c^2}$

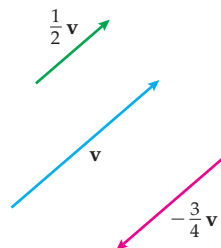

For example, the norm of the vector  $\mathbf{v} = \langle 1, -2 \rangle$  is  $\|\mathbf{v}\| = \sqrt{1^2 + (-2)^2} = \sqrt{5}$ .

$$\|\mathbf{v}\| = \sqrt{5}$$

When we multiply a vector by a scalar  $k > 0$ , we obtain the vector  $k\mathbf{v}$  that has the same direction as  $\mathbf{v}$  but whose magnitude is equal to the magnitude of  $\mathbf{v}$  multiplied by  $k$ . When  $k < 0$ ,  $k\mathbf{v}$  is the vector with direction opposite to the direction of the vector  $\mathbf{v}$  that has magnitude equal to the magnitude of  $\mathbf{v}$  multiplied by  $|k|$ . The following figure shows a vector  $\mathbf{v}$  along with two scalar multiples of  $\mathbf{v}$ :

A vector  $\mathbf{v}$  and two scalar multiples of  $\mathbf{v}$

**DEFINITION 10.6** Equal Vectors

Two vectors are said to be *equal* if and only if their corresponding components are equal.

In  $\mathbb{R}^2$ ,  $\langle x_1, y_1 \rangle = \langle x_2, y_2 \rangle$  if and only if  $x_1 = x_2$  and  $y_1 = y_2$ .

In  $\mathbb{R}^3$ ,  $\langle x_1, y_1, z_1 \rangle = \langle x_2, y_2, z_2 \rangle$  if and only if  $x_1 = x_2$ ,  $y_1 = y_2$ , and  $z_1 = z_2$ .

**DEFINITION 10.7** The Zero Vector in  $\mathbb{R}^2$  and  $\mathbb{R}^3$ 

The *zero vector* in  $\mathbb{R}^2$  is  $\mathbf{0} = \langle 0, 0 \rangle$  and the *zero vector* in  $\mathbb{R}^3$  is  $\mathbf{0} = \langle 0, 0, 0 \rangle$ .

Vectors in  $\mathbb{R}^2$  and  $\mathbb{R}^3$  obey many of the familiar algebraic properties that real numbers do.

**THEOREM 10.8** Algebraic Properties of Vectors

(a) *Vector addition is commutative:*

For any two vectors  $\mathbf{u}$  and  $\mathbf{v}$  with the same number of components,

$$\mathbf{u} + \mathbf{v} = \mathbf{v} + \mathbf{u}.$$

(b) *Vector addition is associative:*

For any three vectors  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$ , each with the same number of components,

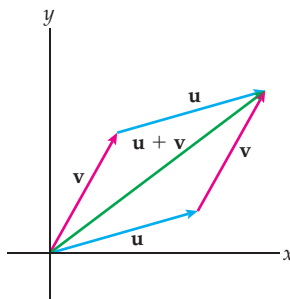

$$(\mathbf{u} + \mathbf{v}) + \mathbf{w} = \mathbf{u} + (\mathbf{v} + \mathbf{w}).$$

(c) *Scalar multiplication distributes over vector addition:*

For any scalar  $c$  and any two vectors  $\mathbf{u}$  and  $\mathbf{v}$  with the same number of components,

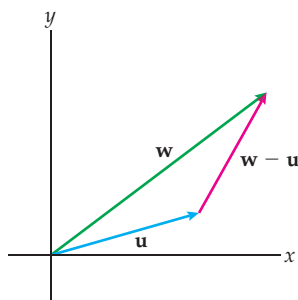

$$c(\mathbf{u} + \mathbf{v}) = c\mathbf{u} + c\mathbf{v}.$$

In Exercises 57, 58, and 59 we ask you to use Definition 10.4 to prove the three parts of Theorem 10.8. The following figure illustrates geometrically why vector addition is commutative. Since we may get from point  $A$  to point  $B$  via either of the paths  $\mathbf{u} + \mathbf{v}$  or  $\mathbf{v} + \mathbf{u}$ , and the figure formed is a parallelogram, addition is commutative.

By simply relabeling two of the vectors from the preceding illustration of addition, we see how we may subtract vectors geometrically. If we let  $\mathbf{w} = \mathbf{u} + \mathbf{v}$ , then  $\mathbf{v} = \mathbf{w} - \mathbf{u}$ , as the following figure illustrates:

Constructing  $\mathbf{w} - \mathbf{u}$  geometrically

We see that when  $\mathbf{u}$  and  $\mathbf{w}$  are placed at the same initial point,  $\mathbf{w} - \mathbf{u}$  is the vector that extends from the terminal point of  $\mathbf{u}$  to the terminal point of  $\mathbf{w}$ .

We may use scalar multiplication to define what it means for two vectors to be parallel.

### DEFINITION 10.9 Parallel Vectors

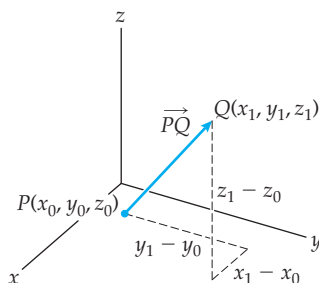

Two vectors are said to be *parallel* if and only if one of the vectors is a scalar multiple of the other.

As a consequence of this definition, the zero vector is parallel to every other vector, since, given any vector  $\mathbf{v}$ ,  $0\mathbf{v} = \mathbf{0}$ .

We also mention that there is a vector extending from a point  $P(x_0, y_0, z_0)$  to a point  $Q(x_1, y_1, z_1)$ . In this case we use the notation

$$\vec{PQ} = \langle x_1 - x_0, y_1 - y_0, z_1 - z_0 \rangle.$$

That is,  $\vec{PQ}$  is the vector whose initial point is  $P$  and whose terminal point is  $Q$ .

For example, if  $P(8, 5, -3)$  and  $Q(13, 5, -8)$ , then  $\vec{PQ} = \langle 13 - 8, 5 - 5, -8 - (-3) \rangle = \langle 5, 0, -5 \rangle$ .

## Unit Vectors

Often our primary interest is the direction of a nonzero vector  $\mathbf{v}$ . At such times we may use a vector with length 1 and that is parallel to  $\mathbf{v}$ . Vectors with length equal to 1 unit are called *unit* vectors.

**DEFINITION 10.10** Unit Vectors

A vector  $\mathbf{u}$  is said to be a *unit vector* if  $\|\mathbf{u}\| = 1$ .

To find a unit vector  $\mathbf{u}$  with the same direction as a given vector  $\mathbf{v} \neq \mathbf{0}$ , we may multiply  $\mathbf{v}$  by the reciprocal of its norm, as the following theorem states:

**THEOREM 10.11** Unit Vectors

Given any nonzero vector  $\mathbf{v}$ , the vector  $\frac{1}{\|\mathbf{v}\|}\mathbf{v}$  is a unit vector in the direction of  $\mathbf{v}$ .

We ask you to prove Theorem 10.11 in Exercise 60.

It is convenient to have a special notation for the unit vectors pointing in the positive direction of each of the coordinate axes. Hence, we make the following definition:

**DEFINITION 10.12** Standard Basis Vectors in  $\mathbb{R}^2$  and  $\mathbb{R}^3$ 

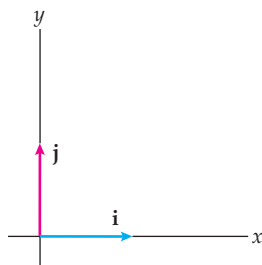

The *standard basis vectors* in  $\mathbb{R}^2$  are

$$\mathbf{i} = \langle 1, 0 \rangle \text{ and } \mathbf{j} = \langle 0, 1 \rangle.$$

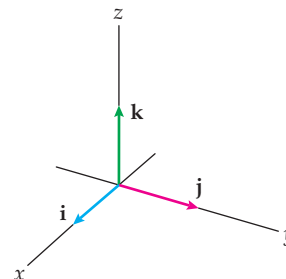

The *standard basis vectors* in  $\mathbb{R}^3$  are

$$\mathbf{i} = \langle 1, 0, 0 \rangle, \mathbf{j} = \langle 0, 1, 0 \rangle, \text{ and } \mathbf{k} = \langle 0, 0, 1 \rangle.$$

The standard basis vectors in  $\mathbb{R}^2$

The standard basis vectors in  $\mathbb{R}^3$

Any vector in  $\mathbb{R}^2$  or  $\mathbb{R}^3$  can be written in terms of the appropriate standard basis vectors. The vector  $\mathbf{v} = \langle a, b \rangle$  can be written as  $\mathbf{v} = a\mathbf{i} + b\mathbf{j}$ . Thus,  $\langle 8, -9 \rangle = 8\mathbf{i} - 9\mathbf{j}$ . Similarly, the vector  $\mathbf{v} = \langle a, b, c \rangle$  can be written as  $\mathbf{v} = a\mathbf{i} + b\mathbf{j} + c\mathbf{k}$ . Thus,  $\langle -7, 2, -3 \rangle = -7\mathbf{i} + 2\mathbf{j} - 3\mathbf{k}$ .

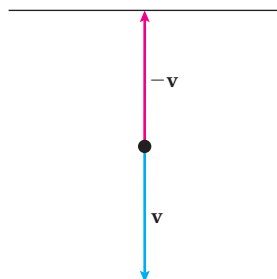

## Using Vectors to Analyze Forces

There are many applications involving vectors. Any quantity with both a magnitude and a direction may be analyzed with the use of vectors. Two common vector applications are *displacements* and *forces*. We discuss the analysis of forces here.

According to Newton's second law of motion, the vector sum of all of the forces acting on a body equals the mass  $m$  of the body times its acceleration:  $\mathbf{F} = m\mathbf{a}$ . Thus, if a body

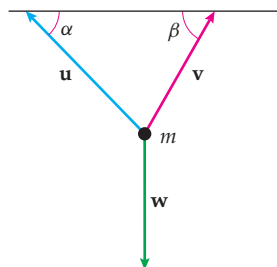

is not in motion, the sum of the forces acting upon it must be zero. As a simple example, the figure that follows shows a weight of 50 pounds suspended by a single rope. The rope exerts a force equal to 50 pounds, acting upwards, as the force of gravity acts downwards.

*The vector forces in each direction must have the same magnitude*

This same principle applies in more complicated contexts, as we will see shortly. A mass  $m$  is suspended from a ceiling by two chains that form angles  $\alpha$  and  $\beta$ . The sum of the three vectors  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  must be zero as long as the object is not in motion.

*The sum of the vectors  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  must be zero*

We explore a specific example of this type in Example 3.

## Examples and Explorations

### EXAMPLE 1

#### Adding and subtracting vectors

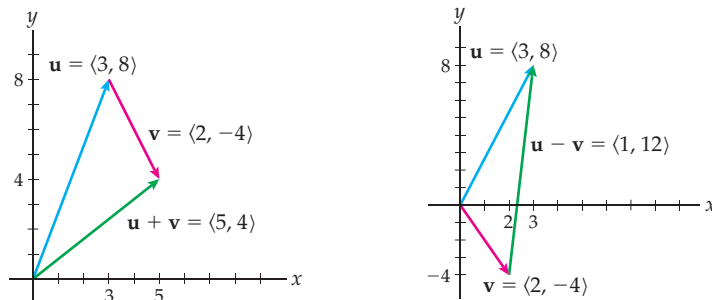

Let  $\mathbf{u} = \langle 3, 8 \rangle$  and  $\mathbf{v} = \langle 2, -4 \rangle$ . Compute  $\mathbf{u} + \mathbf{v}$  and  $\mathbf{u} - \mathbf{v}$ , and then sketch all four of these vectors.

#### SOLUTION

Using Definition 10.4, we have

$$\mathbf{u} + \mathbf{v} = \langle 3 + 2, 8 + (-4) \rangle = \langle 5, 4 \rangle \quad \text{and} \quad \mathbf{u} - \mathbf{v} = \langle 3 - 2, 8 - (-4) \rangle = \langle 1, 12 \rangle.$$

To add the two vectors geometrically we place the initial point of one of the vectors at the terminal point of the other. In the figure that follows at the left we have placed  $\mathbf{v}$  at the tip of  $\mathbf{u}$ . The sum is the vector extending from the initial point of  $\mathbf{u}$  to the terminal point of  $\mathbf{v}$ .

To subtract two vectors geometrically we position their initial points together, as we see in the right-hand figure. The vector  $\mathbf{u} - \mathbf{v}$  extends from the terminal point of  $\mathbf{v}$  to the terminal point of  $\mathbf{u}$ .  $\square$

**EXAMPLE 2****Finding a unit vector in the same direction as a given nonzero vector**

Find a unit vector with the same direction as the vector  $\mathbf{v} = \langle 4, -3, 5 \rangle$ .

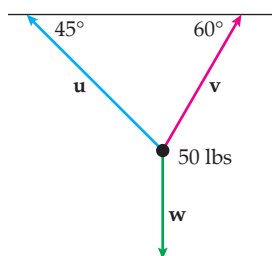

**SOLUTION**

The vector  $\mathbf{v}$  has norm  $\|\mathbf{v}\| = \sqrt{4^2 + (-3)^2 + 5^2} = \sqrt{50} = 5\sqrt{2}$ . The unit vector in the direction of  $\mathbf{v}$  is the vector  $\frac{1}{\|\mathbf{v}\|}\mathbf{v} = \frac{1}{5\sqrt{2}}\langle 4, -3, 5 \rangle$ . If we wish, we may distribute the scalar and rationalize the denominators to obtain  $\left\langle \frac{2}{5}\sqrt{2}, -\frac{3}{10}\sqrt{2}, \frac{1}{2}\sqrt{2} \right\rangle$ .  $\square$

**EXAMPLE 3****Finding the forces in cables suspending an object**

The figure that follows shows a 50-pound weight suspended by two cables. Find the force in each of the cables attached to the ceiling.

*The sum of the vector forces equals zero*

**SOLUTION**

Since the weight is stationary, the sum of the three vectors is  $\mathbf{u} + \mathbf{v} + \mathbf{w} = \mathbf{0}$ . We decompose each vector into its horizontal and vertical components, using the standard convention that motion to the right is positive on the  $x$ -axis and motion upward is positive on the  $y$ -axis. Therefore,

$$\mathbf{u} = -\cos 45^\circ \|\mathbf{u}\|\mathbf{i} + \sin 45^\circ \|\mathbf{u}\|\mathbf{j} = -\frac{\sqrt{2}}{2} \|\mathbf{u}\|\mathbf{i} + \frac{\sqrt{2}}{2} \|\mathbf{u}\|\mathbf{j},$$

$$\mathbf{v} = \cos 60^\circ \|\mathbf{v}\|\mathbf{i} + \sin 60^\circ \|\mathbf{v}\|\mathbf{j} = \frac{1}{2} \|\mathbf{v}\|\mathbf{i} + \frac{\sqrt{3}}{2} \|\mathbf{v}\|\mathbf{j}, \text{ and}$$

$$\mathbf{w} = -50\mathbf{j}.$$

In order to have  $\mathbf{u} + \mathbf{v} + \mathbf{w} = \mathbf{0}$ , the sum of the three  $x$ -components and the sum of the three  $y$ -components must both be zero. So,

$$\frac{\sqrt{2}}{2}\|\mathbf{u}\| = \frac{1}{2}\|\mathbf{v}\| \quad \text{and} \quad \frac{\sqrt{2}}{2}\|\mathbf{u}\| + \frac{\sqrt{3}}{2}\|\mathbf{v}\| = 50 \text{ pounds.}$$

From the first of these equations, we have  $\sqrt{2}\|\mathbf{u}\| = \|\mathbf{v}\|$ , which we can substitute into the second equation to obtain  $\|\mathbf{u}\| = \frac{100}{\sqrt{2} + \sqrt{6}} \approx 25.9$  pounds. Therefore  $\|\mathbf{v}\| \approx 36.6$  pounds.  $\square$

### ? TEST YOUR UNDERSTANDING

- ▶ What are the geometric and analytic interpretations of a vector in  $\mathbb{R}^2$ ? In  $\mathbb{R}^3$ ?
- ▶ How are vectors added and subtracted geometrically? Algebraically?
- ▶ What does it mean for one vector to be a scalar multiple of another vector? How can you tell whether two vectors are parallel?
- ▶ What is a unit vector? How do you find a unit vector with the same direction as a given vector?
- ▶ How can you use vectors to analyze the forces acting on an object?

## EXERCISES 10.2

### Thinking Back

*Properties of addition:* Provide definitions for the following properties.

- ▶ the commutative property of addition for real numbers
- ▶ the associative property of addition for real numbers
- ▶ the distributive property of multiplication over addition for real numbers

*Computing distances:* Find the distances between the specified pairs of points.

- ▶  $(-3, 4)$  and  $(6, -5)$
- ▶  $(11, 12, 13)$  and  $(11, 12, -2)$
- ▶  $(5, -2, -1)$  and  $(3, 0, -4)$

### Concepts

0. *Problem Zero:* Read the section and make your own summary of the material.
1. *True/False:* Determine whether each of the statements that follow is true or false. If a statement is true, explain why. If a statement is false, provide a counterexample.
  - (a) *True or False:* Every vector has a norm.
  - (b) *True or False:* Given any vector  $\mathbf{v}$ , there is a unit vector in the direction of  $\mathbf{v}$ .
  - (c) *True or False:* The unit vector in the direction of a given nonzero vector  $\mathbf{v}$  is always shorter than  $\mathbf{v}$ .
  - (d) *True or False:* Given two points  $A$  and  $B$  in 3-space, the vector from  $A$  to  $B$  is denoted by  $\overrightarrow{BA}$ .
  - (e) *True or False:* The vector  $\langle a, b \rangle$  in  $\mathbb{R}^2$  can be interpreted as the vector  $\langle a, b, 0 \rangle$  in  $\mathbb{R}^3$ .
  - (f) *True or False:* Standard basis vectors are unit vectors.
  - (g) *True or False:* For any nonzero vector  $\mathbf{v}$ , the vector  $-\mathbf{v}$  has the same length as  $\mathbf{v}$  but points in the opposite direction.
  - (h) *True or False:* If  $\mathbf{v} = \overrightarrow{AB}$ , then  $-\mathbf{v} = \overrightarrow{BA}$ .
2. *Examples:* Construct examples of the thing(s) described in the following. Try to find examples that are different than any in the reading.
  - (a) A unit vector in  $\mathbb{R}^2$  that is not parallel to either  $\mathbf{i}$  or  $\mathbf{j}$ .
  - (b) A vector in  $\mathbb{R}^3$  with magnitude 5.
  - (c) Two distinct vectors parallel to  $\langle 1, 2, -3 \rangle$ , each with norm 3.

In Exercises 3–8, let  $A, B, C, D, \dots, Z$  be points in  $\mathbb{R}^3$ . Simplify the given quantity.

- |  |  |
|--|--|
| 3. $\overrightarrow{AB} + \overrightarrow{BC}$                       | 4. $\overrightarrow{AB} + \overrightarrow{BC} + \overrightarrow{CD}$         |
| 5. $\overrightarrow{AB} + \overrightarrow{BA}$                       | 6. $\overrightarrow{BD} - \overrightarrow{CD}$                               |
| 7. $\overrightarrow{AB} + \overrightarrow{BC} + \overrightarrow{CA}$ | 8. $\overrightarrow{AB} + \overrightarrow{BC} + \dots + \overrightarrow{YZ}$ |

9. How do you add two vectors algebraically? Geometrically?
10. How do you subtract two vectors algebraically? Geometrically?

11. Find a vector parallel to  $\langle a, b, c \rangle$  but twice as long.
12. Find a vector parallel to  $\langle a, b, c \rangle$  but half as long and pointing in the opposite direction.
13. If the initial point of the vector  $\langle 2, 3, -5 \rangle$  is the point  $(-3, 2, 4)$ , what is the terminal point of the vector?
14. If the terminal point of the vector  $\langle 2, 3, -5 \rangle$  is the point  $(-3, 2, 4)$ , what is the initial point of the vector?
15. Find the terminal point of a vector of magnitude 5 that is parallel to the vector  $\langle 1, 2, 3 \rangle$  and whose initial point is  $(0, 3, -2)$ .
16. Let  $\mathbf{v}_0 = \langle a, b \rangle$  and let  $\mathbf{v} = \langle x, y \rangle$ . Describe the sets of points in  $\mathbb{R}^2$  satisfying the following properties:
  - (a)  $\|\mathbf{v}\| = 4$
  - (b)  $\|\mathbf{v}\| \leq 4$
  - (c)  $\|\mathbf{v} - \mathbf{v}_0\| = 4$
17. Let  $\mathbf{v}_0 = \langle a, b, c \rangle$  and let  $\mathbf{v} = \langle x, y, z \rangle$ . Describe the sets of points in  $\mathbb{R}^3$  satisfying the following properties:
  - (a)  $\|\mathbf{v}\| = 4$
  - (b)  $\|\mathbf{v}\| \leq 4$
  - (c)  $\|\mathbf{v} - \mathbf{v}_0\| = 4$
18. Let  $\mathbf{v} = \langle w, x, y, z \rangle$ . Describe the sets of points in  $\mathbb{R}^4$  satisfying  $\|\mathbf{v}\| = 4$ .
19. How do you generalize the ideas of this section to vectors with four components? To vectors with  $n$  components?
20. What is the set of all position vectors in  $\mathbb{R}^2$  of magnitude 5?
21. What is the set of all position vectors in  $\mathbb{R}^3$  of magnitude 5?
22. Consider the vector  $\mathbf{v} = \langle 2, 3, 7 \rangle$ .
  - (a) Graph  $\mathbf{v}$ .
  - (b) What vector is symmetric about the origin to  $\mathbf{v}$ ? Graph that vector.
  - (c) What vector is symmetric about the  $xy$ -plane to  $\mathbf{v}$ ? Graph that vector.
  - (d) What vector is symmetric about the point  $(0, 3, 0)$  to  $\mathbf{v}$ ? Graph that vector.
  - (e) What vector is symmetric about the plane  $z = 2$  to  $\mathbf{v}$ ? Graph that vector.

## Skills

In each of Exercises 23–28, find  $\mathbf{u} + \mathbf{v}$  and  $\mathbf{u} - \mathbf{v}$ . Also, sketch  $\mathbf{u}$ ,  $\mathbf{v}$ ,  $\mathbf{u} + \mathbf{v}$ , and  $\mathbf{u} - \mathbf{v}$ .

23.  $\mathbf{u} = \langle 2, -6 \rangle$ ,  $\mathbf{v} = \langle 6, 2 \rangle$
24.  $\mathbf{u} = \langle 3, -4 \rangle$ ,  $\mathbf{v} = \langle -1, 5 \rangle$
25.  $\mathbf{u} = \langle 1, -2 \rangle$ ,  $\mathbf{v} = \langle -3, 6 \rangle$
26.  $\mathbf{u} = \langle 4, 0 \rangle$ ,  $\mathbf{v} = \langle 0, 3 \rangle$
27.  $\mathbf{u} = \langle 1, -4, 6 \rangle$ ,  $\mathbf{v} = \langle 2, -4, 7 \rangle$
28.  $\mathbf{u} = \langle 3, 6, 11 \rangle$ ,  $\mathbf{v} = \langle 1, -2, 3 \rangle$

In Exercises 29–32 find  $\overrightarrow{PQ}$ .

29.  $P = (3, 6)$ ,  $Q = (-3, -2)$
30.  $P = (5, -3)$ ,  $Q = (3, -6)$
31.  $P = (1, -2, 5)$ ,  $Q = (1, -7, -2)$
32.  $P = (-1, 5, 4)$ ,  $Q = (-1, 6, 4)$

In Exercises 33–36 find the norm of the vector.

33.  $\mathbf{v} = \langle 3, -4 \rangle$
34.  $\mathbf{v} = \left\langle \frac{1}{2}, \frac{1}{3}, \frac{1}{4} \right\rangle$
35.  $\mathbf{v} = \left\langle \frac{1}{3}, \frac{1}{3}, -\frac{1}{3} \right\rangle$
36.  $\mathbf{v} = \langle 0, 0, 6 \rangle$

In Exercises 37–42, find  $\|\mathbf{v}\|$  and find the unit vector in the direction of  $\mathbf{v}$ .

37.  $\mathbf{v} = \langle 3, -4 \rangle$
38.  $\mathbf{v} = \left\langle \sqrt{\frac{1}{3}}, -\sqrt{\frac{2}{3}} \right\rangle$
39.  $\mathbf{v} = \left\langle \frac{1}{5}, \frac{1}{3} \right\rangle$
40.  $\mathbf{v} = \langle 2, 1, -5 \rangle$

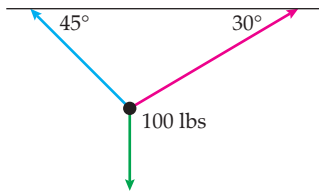

$$41. \mathbf{v} = \langle 1, 1, 1 \rangle \qquad 42. \mathbf{v} = \left\langle \frac{\sqrt{2}}{2}, \frac{1}{2}, \frac{1}{2} \right\rangle$$

In Exercises 43–51 find a vector with the given properties.

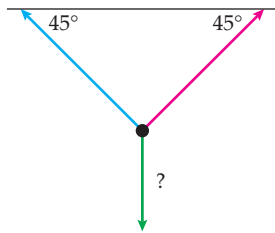

43. Find a vector in the direction of  $\langle 3, 1, 2 \rangle$  and with magnitude 5.
44. Find a vector in the direction of  $\langle -1, 2, 3 \rangle$  and with magnitude 3.
45. Find a vector in the direction of  $\langle 8, -7, 2 \rangle$  and with magnitude 2.
46. Find a vector in the direction of  $\langle 9, 0, -6 \rangle$  and with magnitude 7.
47. Find a vector in the direction opposite to  $\langle -1, -4, -6 \rangle$  and with magnitude 7.
48. Find a vector in the direction opposite to  $\langle -4, 5, -1 \rangle$  and with magnitude 3.
49. Find a vector in the direction opposite to  $\langle 0, -3, 4 \rangle$  and with magnitude 10.
50. Find a unit vector in the direction opposite to  $\langle 3, 4, 5 \rangle$ .
51. Find a vector of length 3 that points in the direction opposite to  $\langle 1, -2, 3 \rangle$ .
52. Let  $P = (2, 3, 0, -1)$  and  $Q = (3, -2, 1, 6)$  be points in four-dimensional space.
  - (a) Find  $\overrightarrow{PQ}$ .
  - (b) Find  $\|\overrightarrow{PQ}\|$ .
  - (c) Find the unit vector in the direction of  $\overrightarrow{PQ}$ .

## Applications

53. A weight of 100 pounds is suspended by two ropes as shown in the accompanying figure. What are the magnitudes of the forces in each of the ropes?

54. Each bolt attached in a certain ceiling is known to be able to withstand a force of 200 pounds before it pulls out. What is the maximum weight of an object that can be suspended in the following system?

55. Annie has to make a crossing by kayak from Stuart Island to Speiden Island, two islands in the San Juan archipelago that are part of Washington State.
- If she crosses due south during a slack tide at a leisurely 2 mph, what is a vector describing her velocity?
  - If she crosses in a perfectly southeastern direction at slack tide at 2 mph, what is a vector describing her velocity?
  - The tides can pump through the Stuart–Speiden channel at a good clip. The outgoing tide can move due west at 2 mph. When faced with this situation, Annie turns on the jets and paddles southeast at 3 mph. What is a vector describing her velocity?
56. Ian is descending Middle Cascade Glacier in North Cascades National Park in Washington State.
- Near the top of the glacier, he is descending a 30-degree slope due northwards at 3 mph. Give a vector describing his velocity.
  - Toward the middle of the glacier the slope steepens. Now Ian is descending directly northeast at a 45-degree angle. His speed is only 2 mph. What is a vector describing his velocity?
  - Now Ian needs to exit the glacier before he runs into the icefall. He contours due east, so that he is neither ascending nor descending. He is moving only at 1.5 mph now. What is a vector describing his velocity?

## Proofs

57. Prove part (a) of Theorem 10.8 for vectors in  $\mathbb{R}^3$ ; that is, show that for  $\mathbf{u} = \langle u_1, u_2, u_3 \rangle$  and  $\mathbf{v} = \langle v_1, v_2, v_3 \rangle$ ,

$$\mathbf{u} + \mathbf{v} = \mathbf{v} + \mathbf{u}.$$

58. Prove part (b) of Theorem 10.8 for vectors in  $\mathbb{R}^3$ ; that is, show that for  $\mathbf{u} = \langle u_1, u_2, u_3 \rangle$ ,  $\mathbf{v} = \langle v_1, v_2, v_3 \rangle$  and  $\mathbf{w} = \langle w_1, w_2, w_3 \rangle$ ,

$$(\mathbf{u} + \mathbf{v}) + \mathbf{w} = \mathbf{u} + (\mathbf{v} + \mathbf{w}).$$

59. Prove part (c) of Theorem 10.8 for vectors in  $\mathbb{R}^3$ ; that is, show that for  $\mathbf{u} = \langle u_1, u_2, u_3 \rangle$ ,  $\mathbf{v} = \langle v_1, v_2, v_3 \rangle$  and scalar  $c$ ,

$$c(\mathbf{u} + \mathbf{v}) = c\mathbf{u} + c\mathbf{v}.$$

60. Prove Theorem 10.11; that is, show that when  $\mathbf{v} \neq \mathbf{0}$ , the scaled vector  $\frac{1}{\|\mathbf{v}\|}\mathbf{v}$  is a unit vector with the same direction as  $\mathbf{v}$ .

61. Let  $c$  and  $d$  be scalars and let  $\mathbf{v}$  be a vector in  $\mathbb{R}^3$ . Show that the following distributive property holds:

$$(c + d)\mathbf{v} = c\mathbf{v} + d\mathbf{v}.$$

62. Use a vector argument to prove that the segment connecting the midpoints of two sides of a triangle is parallel to the third side of the triangle and half of its length.
63. Use vector methods to show that the diagonals of a parallelogram bisect each other.
64. Let  $\text{Quad}(PQRS)$  denote the quadrilateral in the  $xy$ -plane with vertices  $P$ ,  $Q$ ,  $R$ , and  $S$ . If  $P'$  is the midpoint of side  $PQ$ ,  $Q'$  is the midpoint of side  $QR$ ,  $R'$  is the midpoint of side  $RS$ , and  $S'$  is the midpoint of side  $SP$ , prove that  $\text{Quad}(P'Q'R'S')$  is a parallelogram.

## Thinking Forward

Perpendicular vectors in  $\mathbb{R}^2$ 

- ▶ How many vectors are there in  $\mathbb{R}^2$  that are perpendicular to a given nonzero vector  $\langle a, b \rangle$ ?
- ▶ How many unit vectors are there in  $\mathbb{R}^2$  that are perpendicular to a given nonzero vector  $\langle a, b \rangle$ ?
- ▶ Find a vector in  $\mathbb{R}^2$  that is perpendicular to the vector  $\langle 1, 3 \rangle$ .
- ▶ Find a unit vector in  $\mathbb{R}^2$  that is perpendicular to the vector  $\langle 1, 3 \rangle$ .

Perpendicular vectors in  $\mathbb{R}^3$ 

- ▶ How many vectors are there in  $\mathbb{R}^3$  that are perpendicular to a given nonzero vector  $\langle a, b, c \rangle$ ?
- ▶ How many unit vectors are there in  $\mathbb{R}^3$  that are perpendicular to a given nonzero vector  $\langle a, b, c \rangle$ ?
- ▶ Find a unit vector in  $\mathbb{R}^3$  that is perpendicular to both vectors  $\mathbf{i}$  and  $\mathbf{k}$ .

## 10.3 DOT PRODUCT

- ▶ The dot product
- ▶ The geometry of the dot product
- ▶ Projecting one vector onto another

### The Dot Product

In Section 10.2 we discussed how to multiply a vector  $\mathbf{v}$  by a scalar  $k$ . Recall that  $k\mathbf{v}$  is a vector parallel to  $\mathbf{v}$  with magnitude  $|k|$  times the magnitude of  $\mathbf{v}$  and with the same direction if  $k > 0$  and the opposite direction if  $k < 0$ . Here we will define the dot product, which allows us to multiply two vectors with the same number of components. In Section 10.4 we will discuss the cross product, a different method for multiplying two vectors in  $\mathbb{R}^3$ .

#### DEFINITION 10.13

##### Dot Product

Let  $\mathbf{u} = \langle u_1, u_2 \rangle$  and  $\mathbf{v} = \langle v_1, v_2 \rangle$  be vectors in  $\mathbb{R}^2$ . We define the *dot product*,  $\mathbf{u} \cdot \mathbf{v}$ , to be

$$\mathbf{u} \cdot \mathbf{v} = u_1v_1 + u_2v_2.$$

Let  $\mathbf{u} = \langle u_1, u_2, u_3 \rangle$  and  $\mathbf{v} = \langle v_1, v_2, v_3 \rangle$  be vectors in  $\mathbb{R}^3$ . We define the *dot product*,  $\mathbf{u} \cdot \mathbf{v}$ , to be

$$\mathbf{u} \cdot \mathbf{v} = u_1v_1 + u_2v_2 + u_3v_3.$$

For example, the dot product of the vectors  $\langle 1, 4 \rangle$  and  $\langle 7, -3 \rangle$  from  $\mathbb{R}^2$  is

$$\langle 1, 4 \rangle \cdot \langle 7, -3 \rangle = 1 \cdot 7 + 4 \cdot (-3) = 7 - 12 = -5,$$

and the dot product of the vectors  $\langle 2, 7, 6 \rangle$  and  $\langle -1, 2, -2 \rangle$  from  $\mathbb{R}^3$  is

$$\langle 2, 7, 6 \rangle \cdot \langle -1, 2, -2 \rangle = 2 \cdot (-1) + 7 \cdot 2 + 6 \cdot (-2) = -2 + 14 - 12 = 0.$$

Note that in both cases the dot product is a scalar, not a vector. For most of the rest of this section we will discuss the significance of the dot product and what this scalar tells us about the relationship between the two vectors. Note also that Definition 10.13 could easily be generalized to allow us to find the dot product of two vector in  $\mathbb{R}^n$ .

Theorem 10.14 collects several basic algebraic properties of the dot product. We prove part (b) for vectors in  $\mathbb{R}^3$  and leave the proofs of the other parts of the theorem for Exercise 62.

#### THEOREM 10.14

##### Algebraic Properties of the Dot Product

For any vectors  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$ , and any scalar  $k$ ,

- (a)  $\mathbf{u} \cdot \mathbf{v} = \mathbf{v} \cdot \mathbf{u}$
- (b)  $\mathbf{u} \cdot (\mathbf{v} + \mathbf{w}) = \mathbf{u} \cdot \mathbf{v} + \mathbf{u} \cdot \mathbf{w}$
- (c)  $k(\mathbf{u} \cdot \mathbf{v}) = (k\mathbf{u}) \cdot \mathbf{v} = \mathbf{u} \cdot (k\mathbf{v})$
- (d)  $\mathbf{v} \cdot \mathbf{v} = \|\mathbf{v}\|^2$

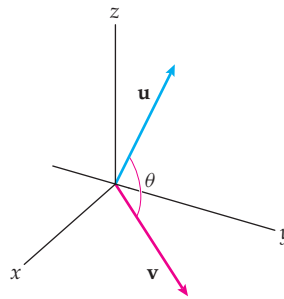

**Proof.** Let  $\mathbf{u} = \langle u_1, u_2, u_3 \rangle$ ,  $\mathbf{v} = \langle v_1, v_2, v_3 \rangle$ , and  $\mathbf{w} = \langle w_1, w_2, w_3 \rangle$ . Using the definitions of vector addition and the dot product, we have

$$\begin{aligned} \mathbf{u} \cdot (\mathbf{v} + \mathbf{w}) &= \langle u_1, u_2, u_3 \rangle \cdot (\langle v_1, v_2, v_3 \rangle + \langle w_1, w_2, w_3 \rangle) \\ &= \langle u_1, u_2, u_3 \rangle \cdot \langle v_1 + w_1, v_2 + w_2, v_3 + w_3 \rangle \\ &= u_1(v_1 + w_1) + u_2(v_2 + w_2) + u_3(v_3 + w_3) \\ &= u_1v_1 + u_1w_1 + u_2v_2 + u_2w_2 + u_3v_3 + u_3w_3 \\ &= (u_1v_1 + u_2v_2 + u_3v_3) + (u_1w_1 + u_2w_2 + u_3w_3) \\ &= \langle u_1, u_2, u_3 \rangle \cdot \langle v_1, v_2, v_3 \rangle + \langle u_1, u_2, u_3 \rangle \cdot \langle w_1, w_2, w_3 \rangle \\ &= \mathbf{u} \cdot \mathbf{v} + \mathbf{u} \cdot \mathbf{w}. \end{aligned}$$

Note that this proof may be generalized to vectors in  $\mathbb{R}^n$ . Similarly, the other parts of Theorem 10.14 may be generalized to vectors in  $\mathbb{R}^n$ .

We obtain a scalar as the dot product of the two vectors  $\mathbf{u}$  and  $\mathbf{v}$ . What does this number tell us about the geometric relationship between the two vectors? Before we answer that question, we need to mention that the angle between two nonzero vectors  $\mathbf{u}$  and  $\mathbf{v}$  is the angle  $0 \leq \theta \leq \pi$  created when  $\mathbf{u}$  and  $\mathbf{v}$  are considered as position vectors. (If either  $\mathbf{u} = \mathbf{0}$  or  $\mathbf{v} = \mathbf{0}$ , then the angle between  $\mathbf{u}$  and  $\mathbf{v}$  is undefined.)

The angle between two nonzero vectors is  $0 \leq \theta \leq \pi$

### THEOREM 10.15

#### The Geometry of the Dot Product

Let  $\mathbf{u}$  and  $\mathbf{v}$  be vectors. Then the dot product

$$\mathbf{u} \cdot \mathbf{v} = \begin{cases} 0, & \text{if either } \mathbf{u} = \mathbf{0} \text{ or } \mathbf{v} = \mathbf{0} \\ \|\mathbf{u}\| \|\mathbf{v}\| \cos \theta, & \text{if } \mathbf{u} \neq \mathbf{0} \text{ and } \mathbf{v} \neq \mathbf{0}, \text{ where } \theta \text{ is the angle between } \mathbf{u} \text{ and } \mathbf{v}. \end{cases}$$

This theorem provides a relationship between the dot product of two vectors, their lengths, and the angle between them.

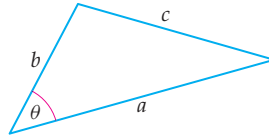

In Exercise 56 we ask you to prove Theorem 10.15 for vectors in  $\mathbb{R}^2$ . We will prove it for vectors in  $\mathbb{R}^3$  in a moment. Before we do, let us remind you of the **Law of Cosines**, which we will use in our proof.

### THEOREM 10.16

#### Law of Cosines

In a triangle with side lengths  $a$ ,  $b$ , and  $c$ , where  $\theta$  is the angle between the sides of length  $a$  and  $b$ ,

$$a^2 + b^2 - 2ab \cos \theta = c^2.$$

We are now ready to prove Theorem 10.15 for vectors in  $\mathbb{R}^3$ .

**Proof.** Let  $\mathbf{u} = \langle u_1, u_2, u_3 \rangle$  and  $\mathbf{v} = \langle v_1, v_2, v_3 \rangle$ . If either  $\mathbf{u}$  or  $\mathbf{v}$  is  $\mathbf{0}$ , then

$$u_1 v_1 + u_2 v_2 + u_3 v_3 = 0 + 0 + 0 = 0,$$

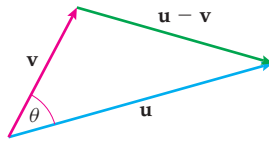

and we are done.

If neither  $\mathbf{u}$  nor  $\mathbf{v}$  is  $\mathbf{0}$  but they are parallel, then  $\mathbf{u} = k\mathbf{v}$  for some scalar  $k$ , and  $\theta$ , the angle between  $\mathbf{u}$  and  $\mathbf{v}$ , is either  $0$  or  $\pi$ . If  $\theta = 0$ , then  $\cos \theta = 1$  and  $\mathbf{u} = k\mathbf{v}$  for some positive scalar  $k$ . Using the appropriate algebraic properties of Theorem 10.14, we have

$$\mathbf{u} \cdot \mathbf{v} = k\mathbf{v} \cdot \mathbf{v} = k\|\mathbf{v}\|^2 = \|\mathbf{u}\|\|\mathbf{v}\|.$$

In Exercise 58 we ask you to analyze the case where  $\mathbf{u} = k\mathbf{v}$  and  $k < 0$ .

If neither  $\mathbf{u}$  nor  $\mathbf{v}$  is  $\mathbf{0}$ , and if  $0 < \theta < \pi$ , consider the following triangle formed from the vectors  $\mathbf{u}$  and  $\mathbf{v}$ :

From the Law of Cosines we know that

$$\|\mathbf{u}\|^2 + \|\mathbf{v}\|^2 - 2\|\mathbf{u}\|\|\mathbf{v}\|\cos \theta = \|\mathbf{u} - \mathbf{v}\|^2.$$

Rearranging, we get

$$\|\mathbf{u}\|\|\mathbf{v}\|\cos \theta = \frac{1}{2}(\|\mathbf{u}\|^2 + \|\mathbf{v}\|^2 - \|\mathbf{u} - \mathbf{v}\|^2).$$

To finish our proof we will show that the right-hand side of this last equality is the dot product  $\mathbf{u} \cdot \mathbf{v}$ .

Since  $\mathbf{u} = \langle u_1, u_2, u_3 \rangle$  and  $\mathbf{v} = \langle v_1, v_2, v_3 \rangle$ , we have  $\mathbf{u} - \mathbf{v} = \langle u_1 - v_1, u_2 - v_2, u_3 - v_3 \rangle$ . We also have the following norms:

$$\|\mathbf{u}\|^2 = u_1^2 + u_2^2 + u_3^2,$$

$$\|\mathbf{v}\|^2 = v_1^2 + v_2^2 + v_3^2, \quad \text{and}$$

$$\|\mathbf{u} - \mathbf{v}\|^2 = (u_1 - v_1)^2 + (u_2 - v_2)^2 + (u_3 - v_3)^2.$$

Therefore,  $\frac{1}{2}(\|\mathbf{u}\|^2 + \|\mathbf{v}\|^2 - \|\mathbf{u} - \mathbf{v}\|^2)$  equals

$$\begin{aligned} \frac{1}{2}((u_1^2 + u_2^2 + u_3^2) + (v_1^2 + v_2^2 + v_3^2) - (u_1^2 - 2u_1v_1 + v_1^2 + u_2^2 - 2u_2v_2 + v_2^2 + u_3^2 - 2u_3v_3 + v_3^2)) \\ = u_1 v_1 + u_2 v_2 + u_3 v_3 = \mathbf{u} \cdot \mathbf{v}. \end{aligned}$$

We now have our result. ■

As a corollary to Theorem 10.15 we may immediately determine when the angle between two vectors is acute, right, or obtuse:

**THEOREM 10.17** The Angle Between Two Vectors and the Dot Product

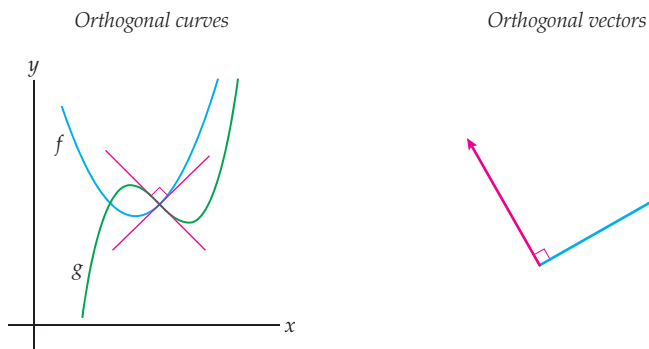

Let  $\theta$  be the angle between nonzero vectors  $\mathbf{u}$  and  $\mathbf{v}$ . Then

$$\theta \text{ is } \begin{cases} \text{acute, if and only if } \mathbf{u} \cdot \mathbf{v} > 0 \\ \text{right, if and only if } \mathbf{u} \cdot \mathbf{v} = 0 \\ \text{obtuse, if and only if } \mathbf{u} \cdot \mathbf{v} < 0. \end{cases}$$

The details of the proof are left for Exercise 60.

**DEFINITION 10.18** Orthogonal Curves and Vectors

- (a) Two curves are said to be **orthogonal** at a point of intersection if the tangent lines to the curves at the point of intersection are perpendicular.
- (b) Two nonzero vectors are **orthogonal** if the angle between them is a right angle.
- (c) The zero vector is **orthogonal** to every vector.

We have the following theorem, whose proof is left for Exercise 61:

**THEOREM 10.19** The Dot Product Test for Orthogonality

Vectors  $\mathbf{u}$  and  $\mathbf{v}$  are orthogonal if and only if  $\mathbf{u} \cdot \mathbf{v} = 0$ .

## Projections

---

Although our coordinate systems consist of mutually perpendicular axes, in certain applications one nonzero vector  $\mathbf{u}$  is of particular significance. When this is the case, we may wish to write another vector  $\mathbf{v}$  as a sum of two vectors, one of which is parallel to  $\mathbf{u}$ , the other orthogonal to  $\mathbf{u}$ .

**DEFINITION 10.20** Vector Projections and Vector Components

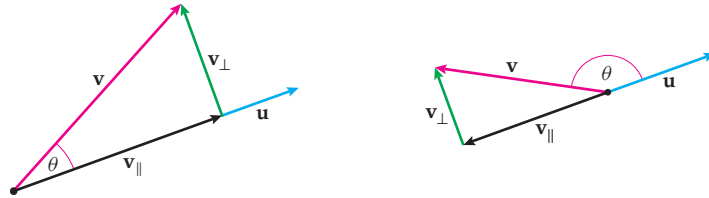

Let  $\mathbf{u}$  be a nonzero vector and let  $\mathbf{v}$  be any vector. We define the **vector projection of  $\mathbf{v}$  onto  $\mathbf{u}$** , denoted  $\mathbf{v}_{\parallel}$ , and the **vector component of  $\mathbf{v}$  orthogonal to  $\mathbf{u}$** , denoted  $\mathbf{v}_{\perp}$ , as the pair of vectors having the following three properties:

- (a)  $\mathbf{v}_{\parallel}$  is parallel to  $\mathbf{u}$ .
- (b)  $\mathbf{v}_{\perp}$  is orthogonal to  $\mathbf{u}$ .
- (c)  $\mathbf{v}_{\parallel} + \mathbf{v}_{\perp} = \mathbf{v}$ .

(Note that we will be using the notations  $\mathbf{v}_{\parallel}$  and  $\mathbf{v}_{\perp}$  only temporarily. The formal notations are given shortly.)

In Exercise 63 we ask you to prove that such a decomposition of  $\mathbf{v}$  is unique.

Geometrically we have one of the situations shown in the following two figures:

Since  $\mathbf{u} \cdot \mathbf{v} = \|\mathbf{u}\| \|\mathbf{v}\| \cos \theta$ , we have

$$\|\mathbf{v}\| \cos \theta = \frac{1}{\|\mathbf{u}\|} \mathbf{u} \cdot \mathbf{v} = \frac{\mathbf{u} \cdot \mathbf{v}}{\|\mathbf{u}\|}.$$

Observe that the signed quantity  $\|\mathbf{v}\| \cos \theta$  is positive when  $0 \leq \theta < 90^\circ$  and negative when  $90^\circ < \theta \leq 180^\circ$ . In either case,  $\|\mathbf{v}_{\parallel}\| = \|\mathbf{v}\| |\cos \theta|$ .

We use  $\|\mathbf{v}\| \cos \theta = \frac{\mathbf{u} \cdot \mathbf{v}}{\|\mathbf{u}\|}$  in the following definition:

#### DEFINITION 10.21

##### The Component of a Projection

Let  $\mathbf{u}$  be any nonzero vector. Then the *component of the projection of  $\mathbf{v}$  onto  $\mathbf{u}$*  is the scalar

$$\text{comp}_{\mathbf{u}} \mathbf{v} = \frac{\mathbf{u} \cdot \mathbf{v}}{\|\mathbf{u}\|}.$$

It bears repeating that  $\text{comp}_{\mathbf{u}} \mathbf{v}$  is a signed quantity and its sign depends upon the size of the angle between  $\mathbf{u}$  and  $\mathbf{v}$ .

From our earlier discussion,  $\mathbf{v}_{\parallel}$  equals  $\text{comp}_{\mathbf{u}} \mathbf{v}$  times the unit vector in the direction of  $\mathbf{u}$ , and we have

$$\mathbf{v}_{\parallel} = \frac{\mathbf{u} \cdot \mathbf{v}}{\|\mathbf{u}\|} \frac{\mathbf{u}}{\|\mathbf{u}\|} = \frac{\mathbf{u} \cdot \mathbf{v}}{\|\mathbf{u}\|^2} \mathbf{u}.$$

We now introduce the more formal notation for  $\mathbf{v}_{\parallel}$ .

#### DEFINITION 10.22

##### The Vector Projection

Let  $\mathbf{u}$  be any nonzero vector. Then the *vector projection of  $\mathbf{v}$  onto  $\mathbf{u}$*  is

$$\text{proj}_{\mathbf{u}} \mathbf{v} := \frac{\mathbf{u} \cdot \mathbf{v}}{\|\mathbf{u}\|^2} \mathbf{u}.$$

Finally, since  $\mathbf{v}_{\parallel} + \mathbf{v}_{\perp} = \mathbf{v}$ , the vector component of  $\mathbf{v}$  orthogonal to  $\mathbf{u}$  is

$$\mathbf{v}_{\perp} = \mathbf{v} - \text{proj}_{\mathbf{u}} \mathbf{v}.$$

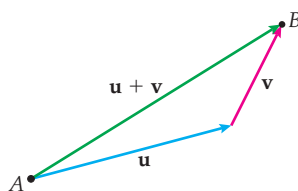

### The Triangle Inequality

You are probably familiar with the statement: “The shortest distance between two points is a straight line.” This is the famous *triangle inequality*. In the figure shown next, we have two paths from point  $A$  to point  $B$ . One is  $\mathbf{u} + \mathbf{v}$ , while the other is  $\mathbf{u}$  followed by  $\mathbf{v}$ . Since

$\mathbf{u} + \mathbf{v}$  is the straight path between the two points, its length must be shorter than the length of the path given by  $\mathbf{u}$  followed by  $\mathbf{v}$ . This inequality may be phrased in terms of vectors, as in the next theorem.

*The shortest distance between points A and B is the straight line*

This figure illustrates why the statement about the shortest distance is a statement about triangles!

### THEOREM 10.23

#### The Triangle Inequality

Given vectors  $\mathbf{u}$  and  $\mathbf{v}$ ,  $\|\mathbf{u} + \mathbf{v}\| \leq \|\mathbf{u}\| + \|\mathbf{v}\|$ , and  $\|\mathbf{u} + \mathbf{v}\| = \|\mathbf{u}\| + \|\mathbf{v}\|$  if and only if  $\mathbf{u} = \mathbf{0}$  or  $\mathbf{v} = \mathbf{0}$  or  $\mathbf{u} = k\mathbf{v}$  for some positive scalar  $k$ .

**Proof.** First note that if  $\mathbf{u} = \mathbf{0}$  or  $\mathbf{v} = \mathbf{0}$ , then  $\|\mathbf{u} + \mathbf{v}\| = \|\mathbf{u}\| + \|\mathbf{v}\|$ . If neither  $\mathbf{u}$  nor  $\mathbf{v}$  is  $\mathbf{0}$ , but  $\mathbf{u} = k\mathbf{v}$  for some positive scalar  $k$ , then

$$\|\mathbf{u} + \mathbf{v}\| = \|k\mathbf{v} + \mathbf{v}\| = (k + 1)\|\mathbf{v}\| = k\|\mathbf{v}\| + \|\mathbf{v}\| = \|\mathbf{u}\| + \|\mathbf{v}\|.$$

We now use the dot product to prove the inequality. We have

$$\begin{aligned} \|\mathbf{u} + \mathbf{v}\|^2 &= (\mathbf{u} + \mathbf{v}) \cdot (\mathbf{u} + \mathbf{v}) \\ &= \mathbf{u} \cdot \mathbf{u} + \mathbf{u} \cdot \mathbf{v} + \mathbf{v} \cdot \mathbf{u} + \mathbf{v} \cdot \mathbf{v} \\ &= \|\mathbf{u}\|^2 + 2\mathbf{u} \cdot \mathbf{v} + \|\mathbf{v}\|^2 \\ &= \|\mathbf{u}\|^2 + 2\|\mathbf{u}\|\|\mathbf{v}\|\cos\theta + \|\mathbf{v}\|^2 \\ &\leq \|\mathbf{u}\|^2 + 2\|\mathbf{u}\|\|\mathbf{v}\| + \|\mathbf{v}\|^2 \\ &= (\|\mathbf{u}\| + \|\mathbf{v}\|)^2. \end{aligned}$$

So,  $\|\mathbf{u} + \mathbf{v}\|^2 \leq (\|\mathbf{u}\| + \|\mathbf{v}\|)^2$ . Since magnitudes are nonnegative, we have our result,

$$\|\mathbf{u} + \mathbf{v}\| \leq \|\mathbf{u}\| + \|\mathbf{v}\|. \quad \blacksquare$$

## Examples and Explorations

### EXAMPLE 1

#### Finding the angle between two vectors

Find the angle between  $\mathbf{u} = \langle 1, 2, 3 \rangle$  and  $\mathbf{v} = \langle 2, 1, -4 \rangle$ .

#### SOLUTION

Here,

$$\begin{aligned} \mathbf{u} \cdot \mathbf{v} &= 2 + 2 - 12 = -8, \\ \|\mathbf{u}\| &= \sqrt{1^2 + 2^2 + 3^2} = \sqrt{14}, \quad \text{and} \\ \|\mathbf{v}\| &= \sqrt{2^2 + 1^2 + (-4)^2} = \sqrt{21}. \end{aligned}$$

Therefore, if  $\theta$  is the angle between  $\mathbf{u}$  and  $\mathbf{v}$ , then  $\cos\theta = \frac{\mathbf{u} \cdot \mathbf{v}}{\|\mathbf{u}\|\|\mathbf{v}\|} = \frac{-8}{\sqrt{14}\sqrt{21}} \approx -0.4666$ . Thus,  $\theta \approx 117.8^\circ$ . □

**EXAMPLE 2** Using the dot product to show orthogonality

Show that the triangle with vertices  $P = (6, 2, 2)$ ,  $Q = (2, 0, -1)$ , and  $R = (5, 1, -2)$  is a right triangle.

**SOLUTION**

We can form the vectors

$$\vec{PQ} = \langle -4, -2, -3 \rangle, \vec{PR} = \langle -1, -1, -4 \rangle, \text{ and } \vec{QR} = \langle 3, 1, -1 \rangle.$$

For  $\triangle PQR$  to be a right triangle, we need one right angle. Using the dot product, we see that although  $\vec{PQ}$  is orthogonal to neither  $\vec{PR}$  nor  $\vec{QR}$  (check this), we do have

$$\vec{PR} \cdot \vec{QR} = (-1)(3) + (-1)(1) + (-4)(-1) = 0.$$

Therefore the angle at vertex  $R$  is a right angle. Thus  $\triangle PQR$  is a right triangle.  $\square$

**EXAMPLE 3** Finding the projection of one vector onto another

Given vectors  $\mathbf{u} = \langle 8, 2 \rangle$  and  $\mathbf{v} = \langle -4, 5 \rangle$ , find  $\text{comp}_{\mathbf{u}} \mathbf{v}$ ,  $\text{proj}_{\mathbf{u}} \mathbf{v}$  the vector projection of  $\mathbf{v}$  onto  $\mathbf{u}$ , and the component of  $\mathbf{v}$  orthogonal to  $\mathbf{u}$ .

**SOLUTION**

The component of the projection of  $\mathbf{v}$  onto  $\mathbf{u}$  is

$$\text{comp}_{\mathbf{u}} \mathbf{v} = \frac{\langle 8, 2 \rangle \cdot \langle -4, 5 \rangle}{\|\langle 8, 2 \rangle\|} = \frac{-22}{\sqrt{68}}.$$

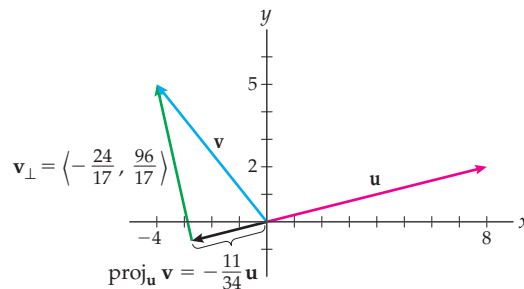

The vector projection of  $\mathbf{v}$  onto  $\mathbf{u}$  is  $\text{comp}_{\mathbf{u}} \mathbf{v}$  times the unit vector in the direction of  $\mathbf{u}$ . Thus,

$$\text{proj}_{\mathbf{u}} \mathbf{v} = \frac{\mathbf{u} \cdot \mathbf{v}}{\|\mathbf{u}\|^2} \mathbf{u} = \frac{\langle 8, 2 \rangle \cdot \langle -4, 5 \rangle}{\|\langle 8, 2 \rangle\|^2} \langle 8, 2 \rangle = -\frac{11}{34} \langle 8, 2 \rangle.$$

The vector component of  $\mathbf{v}$  orthogonal to  $\mathbf{u}$  is given by

$$\mathbf{v} - \text{proj}_{\mathbf{u}} \mathbf{v} = \langle -4, 5 \rangle - \left( -\frac{11}{34} \langle 8, 2 \rangle \right) = \left\langle -\frac{24}{17}, \frac{96}{17} \right\rangle.$$

The following figure shows these vectors:

 $\square$

**EXAMPLE 4****Finding the distance from a point to a line**

Find the distance from the point  $P = (1, 4, -2)$  to the line determined by the points  $Q = (3, -2, 5)$  and  $R = (0, 4, -3)$ .

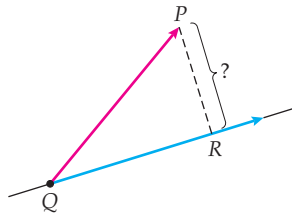

**SOLUTION**

The diagram that follows is a schematic illustrating the given situation. The distance we seek is merely the magnitude of the vector component of

$$\vec{QP} = \langle 1 - 3, 4 - (-2), -2 - 5 \rangle = \langle -2, 6, -7 \rangle$$

orthogonal to

$$\vec{QR} = \langle 0 - 3, 4 - (-2), -3 - 5 \rangle = \langle -3, 6, -8 \rangle.$$

We may first find

$$\text{proj}_{\vec{QR}} \vec{QP} = \frac{\vec{QR} \cdot \vec{QP}}{\|\vec{QR}\|^2} \vec{QR} = \frac{\langle -3, 6, -8 \rangle \cdot \langle -2, 6, -7 \rangle}{\|\langle -3, 6, -8 \rangle\|^2} \langle -3, 6, -8 \rangle = \frac{98}{109} \langle -3, 6, -8 \rangle.$$

Thus the vector component of  $\vec{QP}$  orthogonal to  $\vec{QR}$  is

$$\vec{QP} - \text{proj}_{\vec{QR}} \vec{QP} = \langle -2, 6, -7 \rangle - \frac{98}{109} \langle -3, 6, -8 \rangle = \left\langle \frac{76}{109}, \frac{66}{109}, \frac{21}{109} \right\rangle.$$

The distance from  $P$  to the line determined by the points  $Q$  and  $R$  is the magnitude of this vector, or

$$\left\| \left\langle \frac{76}{109}, \frac{66}{109}, \frac{21}{109} \right\rangle \right\| = \sqrt{\left(\frac{76}{109}\right)^2 + \left(\frac{66}{109}\right)^2 + \left(\frac{21}{109}\right)^2} = \frac{\sqrt{10573}}{109} \approx 0.94. \quad \square$$

**? TEST YOUR UNDERSTANDING**

- ▶ What is the definition of the dot product  $\mathbf{u} \cdot \mathbf{v}$ , and what is the geometric relationship among  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{u} \cdot \mathbf{v}$ ?
- ▶ How is the angle between two vectors defined and how is it computed?
- ▶ What does it mean to project one vector onto another? When would you want to compute such a projection? How is the projection computed?
- ▶ How do you find the vector component of one vector orthogonal to another vector?
- ▶ What is the triangle inequality? How is it proved? Why is the inequality  $|a+b| \leq |a|+|b|$ , where  $a$  and  $b$  are real numbers, also called the triangle inequality?

## EXERCISES 10.3

## Thinking Back

- ▶ *Law of Cosines:* Use the Law of Cosines to find the measures of the angles of a triangle with side lengths 2, 3, and 4.
- ▶ *The distance between a point and a sphere:* Find the shortest distance from the point  $(11, -3, 5)$  to the sphere  $(x + 2)^2 + (y - 3)^2 + z^2 = 16$ .
- ▶ *The Triangle Inequality:* Given  $a = 5$  and  $b = -3$ , verify that the triangle inequality  $|a + b| \leq |a| + |b|$  holds.

## Concepts

0. *Problem Zero:* Read the section and make your own summary of the material.
1. *True/False:* Determine whether each of the statements that follow is true or false. If a statement is true, explain why. If a statement is false, provide a counterexample.
  - (a) *True or False:* For all vectors  $\mathbf{u}$  and  $\mathbf{v}$  in  $\mathbb{R}^3$ ,  $\mathbf{u} \cdot \mathbf{v} = \mathbf{v} \cdot \mathbf{u}$ .
  - (b) *True or False:* The component of the projection of  $\mathbf{v}$  onto  $\mathbf{u}$ ,  $\text{comp}_{\mathbf{u}}\mathbf{v}$ , is a vector.
  - (c) *True or False:* The projection of  $\mathbf{v}$  onto  $\mathbf{u}$ ,  $\text{proj}_{\mathbf{u}}\mathbf{v}$ , is a vector in the direction of  $\mathbf{v}$ .
  - (d) *True or False:* Two curves are said to be *orthogonal* at a point if they intersect at the point.
  - (e) *True or False:* If  $\theta$  is the angle between two nonzero vectors  $\mathbf{u}$  and  $\mathbf{v}$ , then  $\cos \theta = \frac{\mathbf{u} \cdot \mathbf{v}}{\|\mathbf{u}\|\|\mathbf{v}\|}$ .
  - (f) *True or False:* If  $\mathbf{u}$  and  $\mathbf{v}$  are nonzero vectors such that  $\text{proj}_{\mathbf{u}}\mathbf{v} = \text{proj}_{\mathbf{v}}\mathbf{u}$ , then  $\mathbf{u}$  and  $\mathbf{v}$  are either equal or orthogonal.
  - (g) *True or False:* If  $\mathbf{u} \cdot \mathbf{v} = \|\mathbf{u}\|\|\mathbf{v}\|$ , where  $\mathbf{u}$  and  $\mathbf{v}$  are nonzero, then  $\mathbf{u} = k\mathbf{v}$ , where  $k > 0$ .
  - (h) *True or False:* The product  $(\mathbf{u} \cdot \mathbf{v}) \cdot \mathbf{w}$  is defined for vectors  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$ .
2. *Examples:* Construct examples of the thing(s) described in the following. Try to find examples that are different than any in the reading.
  - (a) Two nonzero vectors in  $\mathbb{R}^3$  whose dot product is zero.
  - (b) A function  $y = f(x)$  that is orthogonal to the function  $y = \sin x$  at  $x = 0$ .
  - (c) A vector  $\mathbf{v} \neq \mathbf{i}$  such that  $\text{proj}_{\mathbf{i}}\mathbf{v} = \mathbf{i}$ .
3. State the definition of the dot product.
4. What does it mean geometrically for two vectors to be orthogonal at a point? What does it mean algebraically? What do we mean when we say that two curves are orthogonal at a point of intersection?
5. Why is the Law of Cosines a generalization of the Pythagorean theorem?
6. Let  $\mathbf{v} = a\mathbf{i} + b\mathbf{j}$  and  $\mathbf{w} = c\mathbf{i} + d\mathbf{j}$ . Give conditions on the constants  $a, b, c$ , and  $d$  that guarantee that
  - (a)  $\mathbf{v}$  is parallel to  $\mathbf{w}$ .
  - (b)  $\mathbf{v}$  is perpendicular to  $\mathbf{w}$ .
7. Let  $\mathbf{v} = a\mathbf{i} + b\mathbf{j} + c\mathbf{k}$  and  $\mathbf{w} = \alpha\mathbf{i} + \beta\mathbf{j} + \gamma\mathbf{k}$ . Give conditions on the constants  $a, b, c, \alpha, \beta$ , and  $\gamma$  that guarantee that
  - (a)  $\mathbf{v}$  is parallel to  $\mathbf{w}$ .
  - (b)  $\mathbf{v}$  is perpendicular to  $\mathbf{w}$ .
8. What is the relationship between  $\|\mathbf{v}\|$  and  $\mathbf{v} \cdot \mathbf{v}$ ?
9. Let  $\mathbf{u}$  be a nonzero vector.
  - (a) Show that  $\mathbf{u} \cdot \mathbf{v} = \mathbf{u} \cdot \mathbf{w}$  does *not* necessarily imply that  $\mathbf{v} = \mathbf{w}$ .
  - (b) What geometric relationship must  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  satisfy if  $\mathbf{u} \cdot \mathbf{v} = \mathbf{u} \cdot \mathbf{w}$ ?
10. Let  $\mathbf{u}$  and  $\mathbf{v}$ , be nonzero vectors.
  - (a) When does  $\text{comp}_{\mathbf{u}}\mathbf{v} = \text{comp}_{\mathbf{v}}\mathbf{u}$ ?
  - (b) When does  $\text{proj}_{\mathbf{u}}\mathbf{v} = \text{proj}_{\mathbf{v}}\mathbf{u}$ ?
11. What geometric relationship must two vectors have in order for  $\|\mathbf{u} + \mathbf{v}\| = \|\mathbf{u}\| + \|\mathbf{v}\|$ ?
12. Consider the position vector  $\mathbf{i} = \langle 1, 0 \rangle$  in  $\mathbb{R}^2$ . Describe the set of position vectors  $\mathbf{v}$  in  $\mathbb{R}^2$  with the property that  $\mathbf{v} \cdot \mathbf{i} = 0$ .
13. Consider the position vector  $\mathbf{i} = \langle 1, 0, 0 \rangle$  in  $\mathbb{R}^3$ . Describe the set of position vectors  $\mathbf{v}$  in  $\mathbb{R}^3$  with the property that  $\mathbf{v} \cdot \mathbf{i} = 0$ .
14. Consider the position vector  $\mathbf{i} = \langle 1, 0 \rangle$  in  $\mathbb{R}^2$ . Describe the set of position vectors  $\mathbf{v}$  in  $\mathbb{R}^2$  with the property that  $\text{proj}_{\mathbf{i}}\mathbf{v} = \mathbf{i}$ .
15. Consider the position vector  $\mathbf{i} = \langle 1, 0, 0 \rangle$  in  $\mathbb{R}^3$ . Describe the set of position vectors  $\mathbf{v}$  in  $\mathbb{R}^3$  with the property that  $\text{proj}_{\mathbf{i}}\mathbf{v} = \mathbf{i}$ .
16. Let  $\mathbf{v}_0 = \langle a, b \rangle$ . Describe the set of points  $(x, y)$  such that, for  $\mathbf{v} = \langle x, y \rangle$ ,
  - (a)  $\mathbf{v} \cdot \mathbf{v}_0 = 0$ .
  - (b)  $(\mathbf{v} - \mathbf{v}_0) \cdot \mathbf{v}_0 = 0$ .
  - (c)  $(\mathbf{v} - \mathbf{v}_0) \cdot \mathbf{v} = 0$ .
17. Recall that when two lines are perpendicular, their slopes are negative reciprocals.
  - (a) Find a vector parallel to the line  $y = mx + b$ .
  - (b) If  $m \neq 0$ , find the slope of any line perpendicular to  $y = mx + b$  and find a vector parallel to that perpendicular line.
  - (c) Show that the dot product of the vectors in parts (a) and (b) is zero.

18. Let  $\mathbf{v}_1$  and  $\mathbf{v}_2$  be two nonzero position vectors in  $\mathbb{R}^2$  that are not scalar multiples of each other. Explain why, given any vector  $\mathbf{w}$  in  $\mathbb{R}^2$ , there are scalars  $c_1$  and  $c_2$  such that  $\mathbf{w} = c_1\mathbf{v}_1 + c_2\mathbf{v}_2$ .

19. To illustrate the concept in Exercise 18:  
 (a) Explain why the vectors  $\mathbf{v}_1 = \langle 1, -2 \rangle$  and  $\mathbf{v}_2 = \langle 3, 5 \rangle$  are not scalar multiples of each other.  
 (b) Find scalars  $c_1$  and  $c_2$  such that  $\langle 5, 1 \rangle = c_1\mathbf{v}_1 + c_2\mathbf{v}_2$ .

## Skills

In Exercises 20–23, find the dot product of the given pairs of vectors and the angle between the two vectors.

20.  $\mathbf{u} = \langle 1, 2 \rangle$ ,  $\mathbf{v} = \langle 3, 5 \rangle$

21.  $\mathbf{u} = \langle 2, 0, -5 \rangle$ ,  $\mathbf{v} = \langle -3, 7, -1 \rangle$

22.  $\mathbf{u} = \langle 3, -1, 2 \rangle$ ,  $\mathbf{v} = \langle -4, -6, 3 \rangle$

23.  $\mathbf{u} = \langle -5, 1, 3 \rangle$ ,  $\mathbf{v} = \langle -3, 2, 7 \rangle$

In Exercises 24–27, find  $\text{comp}_{\mathbf{u}}\mathbf{v}$ ,  $\text{proj}_{\mathbf{u}}\mathbf{v}$ , and the component of  $\mathbf{v}$  orthogonal to  $\mathbf{u}$ .

24.  $\mathbf{u} = \langle 1, 2 \rangle$ ,  $\mathbf{v} = \langle 3, 5 \rangle$

25.  $\mathbf{u} = \langle 3, -1, 2 \rangle$ ,  $\mathbf{v} = \langle -4, -6, 3 \rangle$

26.  $\mathbf{u} = \langle 2, 0, -5 \rangle$ ,  $\mathbf{v} = \langle -3, 7, -1 \rangle$

27.  $\mathbf{u} = \langle 3, 1, -2 \rangle$ ,  $\mathbf{v} = \langle -6, -2, 4 \rangle$

In Exercises 28–31, find  $\text{proj}_{\mathbf{u}}\mathbf{v}$  and  $\text{proj}_{\mathbf{v}}\mathbf{u}$ .

28.  $\mathbf{u} = \langle 1, 4 \rangle$ ,  $\mathbf{v} = \langle 2, -3 \rangle$

29.  $\mathbf{u} = \langle 3, -4 \rangle$ ,  $\mathbf{v} = \langle 16, 12 \rangle$

30.  $\mathbf{u} = \langle 3, 0, 1 \rangle$ ,  $\mathbf{v} = \langle 2, 2, -5 \rangle$

31.  $\mathbf{u} = \langle 1, -5, -1 \rangle$ ,  $\mathbf{v} = \langle 0, 1, 0 \rangle$

In Exercises 32–36, (a) compute  $\mathbf{u} \cdot \mathbf{v}$ , (b) find the angle between  $\mathbf{u}$  and  $\mathbf{v}$ , and (c) find  $\text{proj}_{\mathbf{u}}\mathbf{v}$ .

32. Let  $\mathbf{u} = \langle 1, 5 \rangle$  and  $\mathbf{v} = \langle 2, 7 \rangle$ .

33. Let  $\mathbf{u} = \langle -2, 3, 5 \rangle$  and  $\mathbf{v} = \langle 13, -5, 8 \rangle$ .

34. Let  $\mathbf{u} = \langle 0, 3, -4 \rangle$  and  $\mathbf{v} = \langle -5, 6, 0 \rangle$ .

35. Let  $\mathbf{u} = \langle 2, 4, -1, 2 \rangle$  and  $\mathbf{v} = \langle -1, 3, -2, 6 \rangle$ .

36. Let  $\mathbf{u} = \langle 5, -2, 3, 4 \rangle$  and  $\mathbf{v} = \langle 0, -1, 1, 7 \rangle$ .

For Exercises 37 and 38, let  $P = (2, 5, 7)$ ,  $Q = (-2, 1, -5)$ , and  $R = (-3, 0, 4)$ .

37. Find the distance between the point  $P$  and the line determined by the points  $Q$  and  $R$ .
38. Find the altitude of triangle  $\Delta PQR$  from vertex  $R$  to side  $\overline{PQ}$ .
39. Find the angle between the diagonal of a face of a cube and the adjoining edge of the cube that is *not* an edge of that face.
40. Find the angle between the diagonal of a cube and an adjoining edge of the cube.

41. Find the angle between the diagonal of a cube and an adjoining diagonal of one of the faces of the cube.

42. Find the angle between two distinct diagonals of a cube.

Exercises 43–53 deal with *direction angles* and *direction cosines*. Let  $\mathbf{v}$  be a nonzero vector in  $\mathbb{R}^3$ . The *direction angles*  $\alpha$ ,  $\beta$ , and  $\gamma$  of  $\mathbf{v}$  are the angles that  $\mathbf{v}$  makes with the positive  $x$ -,  $y$ - and  $z$ -axes, respectively. The *direction cosines* of  $\mathbf{v}$  are  $\cos \alpha$ ,  $\cos \beta$ , and  $\cos \gamma$ .

Find the direction angles and direction cosines for the vectors given in Exercises 43–46.

43.  $\langle 1, 2, 3 \rangle$

44.  $\langle -2, 0, 3 \rangle$

45.  $\langle -1, 1, -4 \rangle$

46.  $\langle -3, 4, 2 \rangle$

47. Show that for any vector  $\mathbf{v}$  in  $\mathbb{R}^3$ ,

$$\mathbf{v} = \|\mathbf{v}\| ((\cos \alpha)\mathbf{i} + (\cos \beta)\mathbf{j} + (\cos \gamma)\mathbf{k}),$$

where  $\alpha$ ,  $\beta$ , and  $\gamma$  are the direction angles of  $\mathbf{v}$ .

48. Use Exercise 47 to show that if  $\cos \alpha$ ,  $\cos \beta$ , and  $\cos \gamma$  are the direction cosines of a vector  $\mathbf{v}$ , then

$$\cos^2 \alpha + \cos^2 \beta + \cos^2 \gamma = 1.$$

In Exercises 49–51, two direction cosines are given. Use Exercise 48 to find the third direction cosine.

49.  $\cos \alpha = \frac{1}{2}$ ,  $\cos \beta = \frac{1}{2}$ .

50.  $\cos \beta = \frac{1}{4}$ ,  $\cos \gamma = \frac{1}{3}$ .

51.  $\cos \alpha = \frac{1}{2}$ ,  $\cos \gamma = \frac{\sqrt{3}}{4}$ .

52. Let  $\mathbf{v}$  be a vector in  $\mathbb{R}^n$ .

(a) How would you compute the direction angles and direction cosines for  $\mathbf{v}$ ?

(b) Show that if  $\alpha_1, \alpha_2, \dots, \alpha_n$  are the direction angles for  $\mathbf{v}$ , then  $\cos^2 \alpha_1 + \cos^2 \alpha_2 + \dots + \cos^2 \alpha_n = 1$ .

53. Let  $\mathbf{v} = \langle 1, 1, 1, \dots, 1 \rangle$  be a vector in  $\mathbb{R}^n$ .

(a) Use Exercise 52 to find the direction angles  $\alpha_1, \alpha_2, \dots, \alpha_n$ .

(b) Show that  $\alpha_i \rightarrow \frac{\pi}{2}$  as  $n \rightarrow \infty$ .

## Applications

54. Ian is climbing a glacier to a col, a gap in a ridge. The snow is steep, so he is zigzagging up, first northeast, then southeast, always 45 degrees away from due east, and always at 30 degrees from the horizontal. He travels at 0.5 mile per hour in whichever direction he heads.
- What is the component of his velocity horizontally, due east?
  - The map shows that the col is  $\frac{1}{4}$  mile east of him. How long will it take Ian to get there?
55. Annie is making a north-to-south crossing from one island to another, with a tidal current in the channel. The current in the channel is moving at 1 mph due west. Annie has pointed her kayak in the direction  $(1, -4)$  and is paddling at 2 mph.
- What angle does Annie's boat make with a direct southerly heading?
  - What is the component of Annie's velocity toward the south?
  - The crossing is 2 miles due south. How long will it take Annie?

## Proofs

56. Let  $\mathbf{u}$  and  $\mathbf{v}$  be two nonzero vectors in  $\mathbb{R}^2$ . Prove that  $\mathbf{u} \cdot \mathbf{v} = \|\mathbf{u}\|\|\mathbf{v}\|\cos\theta$ , where  $\theta$  is the angle between  $\mathbf{u}$  and  $\mathbf{v}$ .
57. Show that for any vector  $\mathbf{v}$  in  $\mathbb{R}^3$ ,
- $$\mathbf{v} = (\mathbf{v} \cdot \mathbf{i})\mathbf{i} + (\mathbf{v} \cdot \mathbf{j})\mathbf{j} + (\mathbf{v} \cdot \mathbf{k})\mathbf{k}.$$
58. Show that  $\mathbf{u} \cdot \mathbf{v} = \|\mathbf{u}\|\|\mathbf{v}\|\cos\theta$  when  $\mathbf{u}$  and  $\mathbf{v}$  are nonzero vectors such that  $\mathbf{u} = k\mathbf{v}$  with  $k < 0$ .
59. Use the fact that  $\mathbf{u} \cdot \mathbf{v} = \|\mathbf{u}\|\|\mathbf{v}\|\cos\theta$  to prove the Cauchy–Schwarz inequality  $|\mathbf{u} \cdot \mathbf{v}| \leq \|\mathbf{u}\|\|\mathbf{v}\|$ . What relationship must  $\mathbf{u}$  and  $\mathbf{v}$  have in order for  $|\mathbf{u} \cdot \mathbf{v}| = \|\mathbf{u}\|\|\mathbf{v}\|$ ?
60. Let  $\theta$  be the angle between nonzero vectors  $\mathbf{u}$  and  $\mathbf{v}$ . Prove each of the following:
- $\theta$  is acute if and only if  $\mathbf{u} \cdot \mathbf{v} > 0$
  - $\theta$  is right if and only if  $\mathbf{u} \cdot \mathbf{v} = 0$
  - $\theta$  is obtuse if and only if  $\mathbf{u} \cdot \mathbf{v} < 0$
61. Prove that vectors  $\mathbf{u}$  and  $\mathbf{v}$  are orthogonal if and only if  $\mathbf{u} \cdot \mathbf{v} = 0$ . (This is Theorem 10.19.)
62. Prove the following statements from Theorem 10.14 for vectors in  $\mathbb{R}^3$ :
- $\mathbf{u} \cdot \mathbf{v} = \mathbf{v} \cdot \mathbf{u}$
  - $k(\mathbf{u} \cdot \mathbf{v}) = (k\mathbf{u}) \cdot \mathbf{v} = \mathbf{u} \cdot (k\mathbf{v})$
  - $\mathbf{v} \cdot \mathbf{v} = \|\mathbf{v}\|^2$
63. Let  $\mathbf{u}$  be a nonzero vector and let  $\mathbf{v}$  be any vector. Show that the decomposition  $\mathbf{v} = \mathbf{v}_{\parallel} + \mathbf{v}_{\perp}$ , where  $\mathbf{v}_{\parallel}$  is parallel to  $\mathbf{u}$  and  $\mathbf{v}_{\perp}$  is orthogonal to  $\mathbf{u}$ , is unique. (*Hint: Assume that there is another decomposition with these properties, and show that the two decompositions must be identical.*)
64. Use a vector argument to prove that a parallelogram is a rectangle if and only if the diagonals have the same length.
65. Use a vector argument to prove that a parallelogram is a rhombus if and only if the diagonals are perpendicular.

## Thinking Forward

*Lines and vectors:* Find the specified unit vectors.

- ▶ Two unit vectors parallel to the line  $y = \frac{3}{5}x - 7$ .
- ▶ Two unit vectors perpendicular to the line  $y = \frac{3}{5}x - 7$ .
- ▶ Two unit vectors parallel to the line  $y = mx + b$ .
- ▶ Two unit vectors perpendicular to the line  $y = mx + b$ .

## 10.4 CROSS PRODUCT

- ▶ Multiplying two vectors in  $\mathbb{R}^3$  using the cross product
- ▶ The geometry of the cross product
- ▶ The relationship between the algebra and the geometry of the cross product

### Determinants of $3 \times 3$ Matrices

Before we get to the definition of the cross product, it will be convenient to discuss how to compute the determinant of a 3-by-3 matrix, or, more briefly, a  $3 \times 3$  matrix. First, a **matrix** is a rectangular array of entries. Here we are interested primarily in  $3 \times 3$  matrices (i.e., arrays with 3 rows and 3 columns):

$$\begin{bmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{bmatrix}.$$

The **determinant** of a square matrix is a value derived from the entries of the matrix. In particular, for a  $3 \times 3$  matrix we may use the following definition:

#### DEFINITION 10.24

##### The Determinant of a $3 \times 3$ Matrix

The **determinant** of the  $3 \times 3$  matrix  $A = \begin{bmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{bmatrix}$ , denoted by  $\det A$ , is the sum

$$\det \begin{bmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{bmatrix} = a_1 b_2 c_3 - a_1 b_3 c_2 + a_2 b_3 c_1 - a_2 b_1 c_3 + a_3 b_1 c_2 - a_3 b_2 c_1.$$

At first it might seem difficult to remember how to compute this sum. Fortunately, there is a nice visual trick that can be used to help. Compare the products along the six colored “diagonals” shown in the following matrix with the final sum in Definition 10.24. Note that four of the six diagonals wrap around the matrix as they descend.

Every  $3 \times 3$  matrix has six “diagonals”

$$\begin{bmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{bmatrix}$$

If the diagonal goes down from left to right, add the product. If the diagonal goes down from right to left, subtract the product. The resulting sum is the determinant of the  $3 \times 3$  matrix.

For example, to compute the determinant of the matrix

$$M = \begin{bmatrix} 1 & -2 & 5 \\ 0 & 3 & -1 \\ -3 & 2 & 4 \end{bmatrix},$$

we add the products along the six diagonals, making sure to use the appropriate signs:

$$\begin{aligned}\det M &= (1)(3)(4) + (-2)(-1)(-3) + (5)(0)(2) - (1)(-1)(2) - (-2)(0)(4) - (5)(3)(-3) \\ &= 12 - 6 + 0 + 2 + 0 + 45 = 53.\end{aligned}$$

The determinant is defined for all square matrices, but for larger square matrices a recursive definition is used. For example, the determinant of a  $4 \times 4$  matrix is a modified sum of the determinants of four  $3 \times 3$  matrices, the determinant of a  $5 \times 5$  matrix is a modified sum of the determinants of five  $4 \times 4$  matrices, etc. As a result, these determinants have more summands than those that lie along diagonals. In general, the determinant of an  $n \times n$  matrix involves the sum of  $n!$  products, with each product containing  $n$  factors. For example, computing the determinant of a  $5 \times 5$  matrix involves the sum of  $5! = 120$  products, each with 5 factors. In this text we will be using only the determinants of  $3 \times 3$  matrices to compute cross products. The study of matrices and determinants belongs to a branch of mathematics called *linear algebra*. Here we are introducing the minimum necessary to help us define the cross product.

## The Cross Product

Our final vector product, the cross product, will be defined in terms of the determinant of a matrix containing the components of two vectors. Later in this section we will examine geometric properties of this product. We will also see that the cross product can be used to determine areas of parallelograms and, along with the dot product, to compute the volumes of solids known as parallelepipeds. In Section 10.6 we will see how the cross product is used to find equations of planes in  $\mathbb{R}^3$ .

The cross product differs from our two previous vector products in that it is defined only for vectors in  $\mathbb{R}^3$ . (Recall that when we multiply a vector by a scalar, the vector can have any number of components and that we may take the dot product on any two vectors with the same number of components.)

### DEFINITION 10.25

#### The Cross Product

Let  $\mathbf{u} = \langle u_1, u_2, u_3 \rangle = u_1\mathbf{i} + u_2\mathbf{j} + u_3\mathbf{k}$  and  $\mathbf{v} = \langle v_1, v_2, v_3 \rangle = v_1\mathbf{i} + v_2\mathbf{j} + v_3\mathbf{k}$ . Then the **cross product** of  $\mathbf{u}$  and  $\mathbf{v}$ , denoted by  $\mathbf{u} \times \mathbf{v}$ , is

$$\mathbf{u} \times \mathbf{v} = \det \begin{bmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ u_1 & u_2 & u_3 \\ v_1 & v_2 & v_3 \end{bmatrix} = (u_2v_3 - u_3v_2)\mathbf{i} + (u_3v_1 - u_1v_3)\mathbf{j} + (u_1v_2 - u_2v_1)\mathbf{k}.$$

For example, we'll compute the cross product of the vectors  $\mathbf{u} = \langle -1, 3, 4 \rangle$  and  $\mathbf{v} = \langle 2, 0, -5 \rangle$ :

$$\begin{aligned}\mathbf{u} \times \mathbf{v} &= \det \begin{bmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -1 & 3 & 4 \\ 2 & 0 & -5 \end{bmatrix} \\ &= (3 \cdot (-5) - 4 \cdot 0)\mathbf{i} + (4 \cdot 2 - (-1) \cdot (-5))\mathbf{j} + (-1 \cdot 0 - 3 \cdot 2)\mathbf{k} \\ &= -15\mathbf{i} + 3\mathbf{j} - 6\mathbf{k} = \langle -15, 3, -6 \rangle.\end{aligned}$$

Shortly we will discuss the geometric relationship between  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{u} \times \mathbf{v}$ , but right now at least we know how to compute a cross product.

One simple geometric consequence of the definition is that the cross product of two parallel vectors is  $\mathbf{0}$ .

**THEOREM 10.26**    **The Cross Product of Parallel Vectors**

The cross product of two parallel vectors  $\mathbf{u}$  and  $\mathbf{v}$  in  $\mathbb{R}^3$  is  $\mathbf{u} \times \mathbf{v} = \mathbf{0}$ .

The proof of Theorem 10.26 follows from the definition of the cross product and is left for Exercise 65.

## Algebraic Properties of the Cross Product

---

The cross product may be the first product you've encountered that is *not* commutative. However, it is *anticommutative*. That is, for every two vectors  $\mathbf{u}$  and  $\mathbf{v}$  in  $\mathbb{R}^3$ , we have the following:

**THEOREM 10.27**    **The Cross Product Is Anticommutative**

For any vectors  $\mathbf{u}$  and  $\mathbf{v}$  in  $\mathbb{R}^3$ ,

$$\mathbf{v} \times \mathbf{u} = -(\mathbf{u} \times \mathbf{v}).$$

The proof of Theorem 10.27 follows from the definition of the cross product and is left for Exercise 66.

**THEOREM 10.28**    **Multiplication by a Scalar and the Cross Product**

For any vectors  $\mathbf{u}$  and  $\mathbf{v}$  in  $\mathbb{R}^3$  and any scalar  $c$ ,

$$c(\mathbf{u} \times \mathbf{v}) = (c\mathbf{u}) \times \mathbf{v} = \mathbf{u} \times (c\mathbf{v}).$$

Again the proof follows from the definition of the cross product. This proof is left for Exercise 67.

As with multiplication and addition of scalars, the cross product is distributive over addition. Because the cross product is not commutative, we need to state *two* distributive properties. Again, their proofs follow from the definition of the cross product; they are left for Exercise 68.

**THEOREM 10.29**    **Distributive Properties of the Cross Product**

Let  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  be vectors in  $\mathbb{R}^3$ . Then

$$\text{(a) } \mathbf{u} \times (\mathbf{v} + \mathbf{w}) = \mathbf{u} \times \mathbf{v} + \mathbf{u} \times \mathbf{w}.$$

$$\text{(b) } (\mathbf{u} + \mathbf{v}) \times \mathbf{w} = \mathbf{u} \times \mathbf{w} + \mathbf{v} \times \mathbf{w}.$$

The final algebraic property we discuss here provides a relationship between the dot product and cross product and will be used shortly to help us understand the geometry of the cross product. It is known as Lagrange's identity.

**THEOREM 10.30**    **Lagrange's Identity**

Let  $\mathbf{u}$  and  $\mathbf{v}$  be vectors in  $\mathbb{R}^3$ . Then

$$\|\mathbf{u} \times \mathbf{v}\|^2 = \|\mathbf{u}\|^2\|\mathbf{v}\|^2 - (\mathbf{u} \cdot \mathbf{v})^2.$$

The proof of Theorem 10.30 entails expanding the quantities on both sides of Lagrange's identity. This task is left for Exercise 70.

## The Geometry of the Cross Product

We begin by showing that the cross product  $\mathbf{u} \times \mathbf{v}$  is orthogonal to both  $\mathbf{u}$  and  $\mathbf{v}$ . As an immediate consequence the cross product is orthogonal to any plane containing both  $\mathbf{u}$  and  $\mathbf{v}$ .

### THEOREM 10.31 The Cross Product $\mathbf{u} \times \mathbf{v}$ is Orthogonal to Both $\mathbf{u}$ and $\mathbf{v}$

Let  $\mathbf{u}$  and  $\mathbf{v}$  be vectors in  $\mathbb{R}^3$ . Then

$$(a) \quad \mathbf{u} \cdot (\mathbf{u} \times \mathbf{v}) = 0.$$

$$(b) \quad \mathbf{v} \cdot (\mathbf{u} \times \mathbf{v}) = 0.$$

**Proof.** We prove part (a) and leave part (b) for Exercise 69. Let  $\mathbf{u} = \langle u_1, u_2, u_3 \rangle$  and  $\mathbf{v} = \langle v_1, v_2, v_3 \rangle$ . Then, by the definition of the cross product,

$$\mathbf{u} \times \mathbf{v} = \langle u_2v_3 - u_3v_2, u_3v_1 - u_1v_3, u_1v_2 - u_2v_1 \rangle$$

and

$$\begin{aligned} \mathbf{u} \cdot (\mathbf{u} \times \mathbf{v}) &= \langle u_1, u_2, u_3 \rangle \cdot \langle u_2v_3 - u_3v_2, u_3v_1 - u_1v_3, u_1v_2 - u_2v_1 \rangle \\ &= u_1(u_2v_3 - u_3v_2) + u_2(u_3v_1 - u_1v_3) + u_3(u_1v_2 - u_2v_1) \\ &= 0. \end{aligned}$$

Recall that for vectors  $\mathbf{u}$  and  $\mathbf{v}$ , we have  $\mathbf{u} \cdot \mathbf{v} = \|\mathbf{u}\| \|\mathbf{v}\| \cos \theta$ , where  $\theta$  is the angle between the vectors. The magnitude of the cross product is related to the magnitudes of the vectors and the angle between them.

### THEOREM 10.32 The Cross Product $\mathbf{u} \times \mathbf{v}$ and the Angle Between $\mathbf{u}$ and $\mathbf{v}$

Let  $\mathbf{u}$  and  $\mathbf{v}$  be nonzero vectors in  $\mathbb{R}^3$  with the same initial point. Then

$$\|\mathbf{u} \times \mathbf{v}\| = \|\mathbf{u}\| \|\mathbf{v}\| \sin \theta,$$

where  $\theta$  is the angle between  $\mathbf{u}$  and  $\mathbf{v}$ .

**Proof.** By Lagrange's identity

$$\|\mathbf{u} \times \mathbf{v}\|^2 = \|\mathbf{u}\|^2 \|\mathbf{v}\|^2 - (\mathbf{u} \cdot \mathbf{v})^2.$$

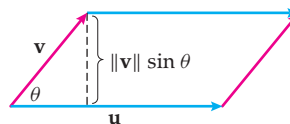

But since  $\mathbf{u} \cdot \mathbf{v} = \|\mathbf{u}\| \|\mathbf{v}\| \cos \theta$ , we have

$$\|\mathbf{u} \times \mathbf{v}\|^2 = \|\mathbf{u}\|^2 \|\mathbf{v}\|^2 - (\|\mathbf{u}\| \|\mathbf{v}\| \cos \theta)^2 = \|\mathbf{u}\|^2 \|\mathbf{v}\|^2 (1 - \cos^2 \theta) = \|\mathbf{u}\|^2 \|\mathbf{v}\|^2 \sin^2 \theta.$$

Taking the square root of the leftmost and rightmost quantities produces our desired result. ■

Two nonparallel vectors determine a parallelogram. The cross product can help us find the area of that parallelogram.

The area of the parallelogram is  $\|\mathbf{u}\| \|\mathbf{v}\| \sin \theta$

**THEOREM 10.33** The Area of a Parallelogram

Let  $\mathbf{u}$  and  $\mathbf{v}$  be vectors in  $\mathbb{R}^3$ . Then the area of the parallelogram determined by  $\mathbf{u}$  and  $\mathbf{v}$  is given by  $\|\mathbf{u} \times \mathbf{v}\|$ .

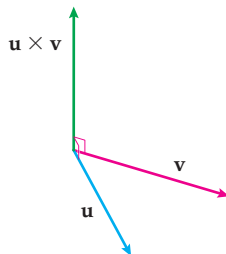

**Proof.** We first consider the case where  $\mathbf{u}$  and  $\mathbf{v}$  are parallel vectors. Here the parallelogram determined by  $\mathbf{u}$  and  $\mathbf{v}$  is degenerate; that is, it is collapsed into a line segment and has zero area. By Theorem 10.26  $\mathbf{u} \times \mathbf{v} = \mathbf{0}$ , so  $\|\mathbf{u} \times \mathbf{v}\| = \|\mathbf{0}\| = 0$ .

If  $\mathbf{u}$  and  $\mathbf{v}$  are not parallel, then the area of the parallelogram determined by  $\mathbf{u}$  and  $\mathbf{v}$  is the product of the length of one of the sides and the distance between that side and the opposite side.

In our parallelogram,  $\|\mathbf{u}\|$  is the length of one side. In the parallelogram shown in the previous figure, we see that the distance from that side to the opposite side is  $\|\mathbf{v}\| \sin \theta$ . Therefore the area of the parallelogram is  $\|\mathbf{u}\| \|\mathbf{v}\| \sin \theta = \|\mathbf{u} \times \mathbf{v}\|$ . ■

We have already discussed what it means for a three-dimensional coordinate system to be left- or right-handed. Similarly, three vectors  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  that cannot be translated into the same plane are said to form a **right-handed triple** if, when the index finger of the right hand points in the direction of  $\mathbf{u}$  and the middle finger of the right hand points in the direction of  $\mathbf{v}$ , then the right thumb will naturally point in the direction of  $\mathbf{w}$ . In particular, for any two nonparallel vectors  $\mathbf{u}$  and  $\mathbf{v}$  in  $\mathbb{R}^3$ , the vectors  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{u} \times \mathbf{v}$  always form a right-handed triple.

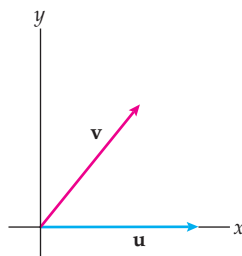

The vectors  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{u} \times \mathbf{v}$  form a right-handed triple

**THEOREM 10.34** Two Nonparallel Vectors and Their Cross Product Form a Right-Handed Triple

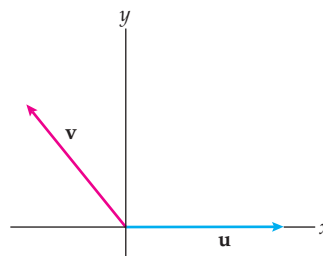

Let  $\mathbf{u}$  and  $\mathbf{v}$  be nonparallel vectors in  $\mathbb{R}^3$ . Then the vectors  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{u} \times \mathbf{v}$  form a right-handed triple.

**Proof.** Let  $\mathbf{u}$  and  $\mathbf{v}$  be nonparallel position vectors in  $\mathbb{R}^3$ . We may position our coordinate axes so that  $\mathbf{u}$  lies along the positive  $x$ -axis and  $\mathbf{v}$  lies in the  $xy$ -plane and has a positive  $y$ -coordinate. That is,  $\mathbf{u} = \langle u_1, 0, 0 \rangle$  and  $\mathbf{v} = \langle v_1, v_2, 0 \rangle$  with  $u_1 > 0$  and  $v_2 > 0$ . The sign of  $v_1$  may be positive, zero, or negative. Two of these possibilities are illustrated here:

Vectors  $\mathbf{u}$  and  $\mathbf{v}$  with  $v_1 > 0$

Vectors  $\mathbf{u}$  and  $\mathbf{v}$  with  $v_1 < 0$

In any of the three cases, when we take the cross product we obtain

$$\mathbf{u} \times \mathbf{v} = \det \begin{bmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ u_1 & 0 & 0 \\ v_1 & v_2 & 0 \end{bmatrix} = \langle 0, 0, u_1 v_2 \rangle.$$

Since  $\mathbf{u} \times \mathbf{v}$  has a positive  $z$ -coordinate, we have our desired result. ■

The next theorem reiterates several of the basic geometric properties of the cross product that we have already proved. We summarize these properties in Theorem 10.35 because they may be used as an alternative (geometric) definition of the cross product. When they are used as such, the algebraic properties follow as a consequence.

### THEOREM 10.35 The Geometry of the Cross Product

Let  $\mathbf{u}$  and  $\mathbf{v}$  be vectors in  $\mathbb{R}^3$ .

If  $\mathbf{u}$  and  $\mathbf{v}$  are parallel then  $\mathbf{u} \times \mathbf{v} = \mathbf{0}$ .

If  $\mathbf{u}$  and  $\mathbf{v}$  are not parallel, then  $\mathbf{u} \times \mathbf{v}$  has the following properties:

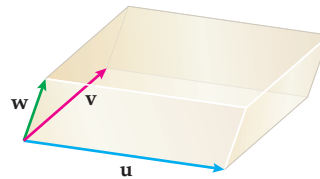

- (a)  $\|\mathbf{u} \times \mathbf{v}\| = \|\mathbf{u}\|\|\mathbf{v}\|\sin \theta$ .
- (b)  $\mathbf{u} \times \mathbf{v}$  is perpendicular to any plane containing both  $\mathbf{u}$  and  $\mathbf{v}$ .
- (c)  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{u} \times \mathbf{v}$  form a right-handed triple.

## Triple Scalar Product

We cannot randomly combine three vectors  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  from  $\mathbb{R}^3$  with dot and cross products. For example, the combination  $(\mathbf{u} \cdot \mathbf{v}) \cdot \mathbf{w}$  is *not* defined, since  $\mathbf{u} \cdot \mathbf{v}$  is a scalar and we need two vectors to form a dot product. Similarly,  $(\mathbf{u} \cdot \mathbf{v}) \times \mathbf{w}$  is not defined. (Why?) However, the product  $\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w})$  is defined and has an important geometrical interpretation. In addition, we will see that  $\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w}) = (\mathbf{u} \times \mathbf{v}) \cdot \mathbf{w}$ . Both of these are examples of **triple scalar products**. In Exercise 80 we discuss the **vector triple product**  $\mathbf{u} \times (\mathbf{v} \times \mathbf{w})$ .

A **parallelepiped** is a three-dimensional analog of a parallelogram, in much the same way that a cube is a three-dimensional analog of a square. Specifically, a parallelepiped is a six-sided solid whose surface consists of three pairs of parallel faces, each of which is a parallelogram. Any three vectors  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  in  $\mathbb{R}^3$  that do not lie in the same plane will determine a parallelepiped.

The parallelepiped determined by  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$

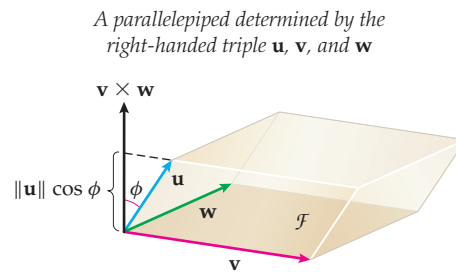

In Theorem 10.33 we saw that the area of a parallelogram involves a cross product. Similarly, the volume of the parallelepiped involves a triple scalar product.

### THEOREM 10.36 The Triple Scalar Product and the Volume of Parallelepipeds

Let  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  be vectors in  $\mathbb{R}^3$ . Then  $|\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w})|$  is the volume of the parallelepiped determined by  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$ . Furthermore, the volume of the parallelepiped is  $\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w})$  if and only if  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  form a right-handed triple.

**Proof.** Let  $\mathcal{F}$  denote one of the sides of the parallelepiped determined by vectors  $\mathbf{v}$  and  $\mathbf{w}$ . From Theorem 10.33 we know that the area of  $\mathcal{F}$  is  $\|\mathbf{v} \times \mathbf{w}\|$ . The distance between  $\mathcal{F}$  and the opposite face is the distance from the terminal end of  $\mathbf{u}$  to  $\mathcal{F}$ . There are two cases to consider:  $\mathbf{u}$  and  $\mathbf{v} \times \mathbf{w}$  are either on the same side of  $\mathcal{F}$  or on opposite sides of  $\mathcal{F}$ .

Suppose  $\mathbf{u}$  and  $\mathbf{v} \times \mathbf{w}$  are on the same side of  $\mathcal{F}$ . Then  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  must form a right-handed triple. Since  $\mathbf{v} \times \mathbf{w}$  is perpendicular to  $\mathcal{F}$ , the distance from the terminal end of  $\mathbf{u}$  to  $\mathcal{F}$  is the component,  $\text{comp}_{\mathbf{v} \times \mathbf{w}} \mathbf{u} = \|\mathbf{u}\| \cos \phi$ , of the projection of  $\mathbf{u}$  onto  $\mathbf{v} \times \mathbf{w}$ , where  $\phi$  is the angle between  $\mathbf{u}$  and  $\mathbf{v} \times \mathbf{w}$ . The following figure shows an example of this case:

Here, since  $\mathbf{u}$  and  $\mathbf{v} \times \mathbf{w}$  are on the same side of  $\mathcal{F}$ ,  $\phi < 90^\circ$  and  $\cos \phi > 0$ . Thus the volume of the parallelepiped is  $\|\mathbf{u}\| \|\mathbf{v} \times \mathbf{w}\| \cos \phi = \mathbf{u} \cdot (\mathbf{v} \times \mathbf{w})$ .

In the case where  $\mathbf{u}$  and  $\mathbf{v} \times \mathbf{w}$  are on opposite sides of  $\mathcal{F}$ ,  $\phi > 90^\circ$  and  $\cos \phi < 0$ . Thus the volume of the parallelepiped is  $-\|\mathbf{u}\| \|\mathbf{v} \times \mathbf{w}\| \cos \phi = -\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w})$ .

We now have our desired result: The volume of the parallelepiped is  $\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w})$  if and only if  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  form a right-handed triple, and in any case the volume is  $|\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w})|$ . ■

Theorem 10.36 also gives us a simple computational criterion for determining when three vectors lie in the same plane: The triple scalar product  $\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w})$  is equal to zero if and only if  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  are coplanar.

The following theorem describes relationships between dot and cross products:

### THEOREM 10.37 Properties of the Triple Scalar Product

Let  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  be vectors in  $\mathbb{R}^3$ . Then

$$(a) \quad \mathbf{u} \cdot (\mathbf{v} \times \mathbf{w}) = \mathbf{v} \cdot (\mathbf{w} \times \mathbf{u}) = \mathbf{w} \cdot (\mathbf{u} \times \mathbf{v})$$

$$(b) \quad \mathbf{u} \cdot (\mathbf{v} \times \mathbf{w}) = (\mathbf{u} \times \mathbf{v}) \cdot \mathbf{w}$$

Part (b) of Theorem 10.37 says, roughly, that in a triple scalar product the dot and cross products can be “exchanged.” We prove part (a) next and leave part (b) for Exercise 76.

**Proof.** First suppose that  $\mathbf{u}$ ,  $\mathbf{v}$ ,  $\mathbf{w}$  form a right-handed triple. Then  $\mathbf{v}$ ,  $\mathbf{w}$ ,  $\mathbf{u}$  and  $\mathbf{w}$ ,  $\mathbf{u}$ ,  $\mathbf{v}$  do also. (Why?) Thus, from Theorem 10.36, the three triple scalar products  $\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w})$ ,  $\mathbf{v} \cdot (\mathbf{w} \times \mathbf{u})$ , and  $\mathbf{w} \cdot (\mathbf{u} \times \mathbf{v})$  all give the volume of the parallelepiped determined by  $\mathbf{u}$ ,  $\mathbf{v}$  and  $\mathbf{w}$ . Therefore they are all equal.

For the converse, if  $\mathbf{u}$ ,  $\mathbf{v}$ ,  $\mathbf{w}$  do not form a right-handed triple, then neither  $\mathbf{v}$ ,  $\mathbf{w}$ ,  $\mathbf{u}$  nor  $\mathbf{w}$ ,  $\mathbf{u}$ ,  $\mathbf{v}$  do. Here the volume of the parallelepiped determined by  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  is

$$-\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w}) = -\mathbf{v} \cdot (\mathbf{w} \times \mathbf{u}) = -\mathbf{w} \cdot (\mathbf{u} \times \mathbf{v}).$$

Therefore in this case we also have  $\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w}) = \mathbf{v} \cdot (\mathbf{w} \times \mathbf{u}) = \mathbf{w} \cdot (\mathbf{u} \times \mathbf{v})$ . ■

## Examples and Explorations

### EXAMPLE 1

#### Using a cross product to find the area of a parallelogram

- (a) Use Definition 10.25 to compute  $\mathbf{u} \times \mathbf{v}$  for vectors  $\mathbf{u} = \langle 2, 0, -3 \rangle$  and  $\mathbf{v} = \langle -1, 4, 2 \rangle$ .  
 (b) Find the area of the parallelogram determined by  $\mathbf{u}$  and  $\mathbf{v}$ .

#### SOLUTION

- (a) We use Definition 10.25 to compute the cross product:

$$\begin{aligned} \mathbf{u} \times \mathbf{v} &= \det \begin{bmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 2 & 0 & -3 \\ -1 & 4 & 2 \end{bmatrix} \\ &= ((0)(2) - (-3)(4))\mathbf{i} + ((-3)(-1) - (2)(2))\mathbf{j} + ((2)(4) - (0)(-1))\mathbf{k} \\ &= 12\mathbf{i} - \mathbf{j} + 8\mathbf{k}. \end{aligned}$$

- (b) The area of the parallelogram determined by  $\mathbf{u}$  and  $\mathbf{v}$  is

$$\|\mathbf{u} \times \mathbf{v}\| = \|12\mathbf{i} - \mathbf{j} + 8\mathbf{k}\| = \sqrt{12^2 + (-1)^2 + 8^2} = \sqrt{209} \approx 14.5 \text{ square units.} \quad \square$$

#### CHECKING THE ANSWER

We may check the plausibility of our cross product  $\mathbf{u} \times \mathbf{v}$  with the dot products:

$$\mathbf{u} \cdot (\mathbf{u} \times \mathbf{v}) = \langle 2, 0, -3 \rangle \cdot \langle 12, -1, 8 \rangle = 2 \cdot 12 + 0(-1) - 3 \cdot 8 = 0 \quad \text{and}$$

$$\mathbf{v} \cdot (\mathbf{u} \times \mathbf{v}) = \langle -1, 4, 2 \rangle \cdot \langle 12, -1, 8 \rangle = -1 \cdot 12 + 4(-1) + 2 \cdot 8 = 0.$$

These calculations show that the cross product we obtained is orthogonal to both of the vectors  $\mathbf{u}$  and  $\mathbf{v}$ .

### EXAMPLE 2

#### Cross products involving the standard basis vectors

Find the cross products of the standard basis vectors:

$$\begin{array}{lll} \mathbf{i} \times \mathbf{i} & \mathbf{i} \times \mathbf{j} & \mathbf{i} \times \mathbf{k} \\ \mathbf{j} \times \mathbf{i} & \mathbf{j} \times \mathbf{j} & \mathbf{j} \times \mathbf{k} \\ \mathbf{k} \times \mathbf{i} & \mathbf{k} \times \mathbf{j} & \mathbf{k} \times \mathbf{k} \end{array}$$

#### SOLUTION

The cross product of two parallel vectors is  $\mathbf{0}$ . Since every vector is parallel to itself, we immediately have

$$\mathbf{i} \times \mathbf{i} = \mathbf{j} \times \mathbf{j} = \mathbf{k} \times \mathbf{k} = \mathbf{0}.$$

Each of the basis vectors is a unit vector, and the angle between two *distinct* basis vectors is  $90^\circ$ . Therefore the norm of the cross product of two distinct basis vectors is 1 by property (a) of Theorem 10.35.

By property (b) of the same theorem, we know that the cross product of any two distinct basis vectors must be (plus or minus) the remaining basis vector. For example,  $\mathbf{i} \times \mathbf{j} = \pm\mathbf{k}$ . We need only determine which of  $\mathbf{i}$ ,  $\mathbf{j}$ , and  $\pm\mathbf{k}$  forms a right-handed triple. Here,  $\mathbf{i}$ ,  $\mathbf{j}$ , and  $\mathbf{k}$  form such a triple (check this), so  $\mathbf{i} \times \mathbf{j} = \mathbf{k}$ . Also, because the cross product is anticommutative, if we reverse the order within  $\mathbf{i} \times \mathbf{j} = \mathbf{k}$ , we will have  $\mathbf{j} \times \mathbf{i} = -\mathbf{k}$ .

The complete list of the cross products using the basis vectors is

$$\begin{array}{lll} \mathbf{i} \times \mathbf{i} = \mathbf{0} & \mathbf{i} \times \mathbf{j} = \mathbf{k} & \mathbf{i} \times \mathbf{k} = -\mathbf{j} \\ \mathbf{j} \times \mathbf{i} = -\mathbf{k} & \mathbf{j} \times \mathbf{j} = \mathbf{0} & \mathbf{j} \times \mathbf{k} = \mathbf{i} \\ \mathbf{k} \times \mathbf{i} = \mathbf{j} & \mathbf{k} \times \mathbf{j} = -\mathbf{i} & \mathbf{k} \times \mathbf{k} = \mathbf{0}. \end{array}$$

□

### EXAMPLE 3 Finding the area of a triangle determined by three points

Find the area of the triangle with vertices  $A = (4, -2)$ ,  $B = (7, 3)$ , and  $C = (-1, 3)$ .

#### SOLUTION

We first find the vectors

$$\begin{aligned} \vec{AB} &= \langle 7 - 4, 3 - (-2) \rangle = \langle 3, 5 \rangle \text{ and} \\ \vec{AC} &= \langle -1 - 4, 3 - (-2) \rangle = \langle -5, 5 \rangle. \end{aligned}$$

The area of the triangle with vertices at  $A$ ,  $B$ , and  $C$  is one-half of the area of the parallelogram determined by  $\vec{AB}$  and  $\vec{AC}$ . We would like to use the technique of Example 1 to find the area of the parallelogram, but in order to take the cross product of two vectors, they must have three components. Here we can treat the  $xy$ -plane as part of 3-space by thinking of the  $xy$ -plane as the plane in  $\mathbb{R}^3$  with  $z = 0$ . That is, we let  $\vec{AB} = \langle 3, 5, 0 \rangle$  and  $\vec{AC} = \langle -5, 5, 0 \rangle$ .

Now,

$$\begin{aligned} \text{Area } \triangle ABC &= \frac{1}{2} \|\vec{AB} \times \vec{AC}\| = \frac{1}{2} \left\| \det \begin{bmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 3 & 5 & 0 \\ -5 & 5 & 0 \end{bmatrix} \right\| \\ &= \frac{1}{2} \|(0 - 0)\mathbf{i} + (0 - 0)\mathbf{j} + (15 - (-25))\mathbf{k}\| = \frac{1}{2} \|40\mathbf{k}\| \\ &= 20 \text{ square units.} \end{aligned}$$

□

### EXAMPLE 4 Finding the volume of a parallelepiped

- (a) Find the volume of the parallelepiped determined by  $\mathbf{u} = \langle 0, 3, -2 \rangle$ ,  $\mathbf{v} = \langle 5, 3, -1 \rangle$ , and  $\mathbf{w} = \langle -3, 2, 7 \rangle$ .
- (b) Do the vectors  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  form a right-handed triple or a left-handed triple?

#### SOLUTION

- (a) The volume of the parallelepiped determined by  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  is the absolute value of the triple scalar product  $\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w})$ . Although we could first evaluate the cross product  $\mathbf{v} \times \mathbf{w}$  and then take the dot product of the resulting vector with  $\mathbf{u}$ , it is slightly more efficient to just take the absolute value of the determinant of the  $3 \times 3$  matrix formed from the components of  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  as the rows. (In Exercise 78, we ask you to explain why this always works.)

Thus, the required volume is

$$|\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w})| = \left| \det \begin{bmatrix} 0 & 3 & -2 \\ 5 & 3 & -1 \\ -3 & 2 & 7 \end{bmatrix} \right| = |0 + 9 - 20 + 0 - 105 - 18| = |-134| \\ = 134 \text{ cubic units.}$$

- (b) By Theorem 10.36, the vectors  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  form a left-handed triple, since the triple scalar product  $\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w}) = -134 < 0$ .  $\square$

### TEST YOUR UNDERSTANDING

- ▶ How do you find the determinant of a  $3 \times 3$  matrix?
- ▶ What is the definition of the cross product?
- ▶ What are the geometric properties of the cross product?
- ▶ How do you find the area of a parallelogram determined by two vectors? How do you find the volume of a parallelepiped determined by three vectors?
- ▶ How do you find the area of a triangle determined by three points?

## EXERCISES 10.4

### Thinking Back

- ▶ *Coordinate system:* Explain what it means for a coordinate system to be right-handed and what it means for a coordinate system to be left-handed.
- ▶ *Orthogonal vectors:* Let  $\mathbf{u}$  and  $\mathbf{v}$  be two nonparallel position vectors in  $\mathbb{R}^3$  lying in the  $xy$ -plane. Find two unit vectors orthogonal to both  $\mathbf{u}$  and  $\mathbf{v}$  without using the cross product.

### Concepts

0. *Problem Zero:* Read the section and make your own summary of the material.
1. *True/False:* Determine whether each of the statements that follow is true or false. If a statement is true, explain why. If a statement is false, provide a counterexample.
  - (a) *True or False:* For any two vectors  $\mathbf{u}$  and  $\mathbf{v}$  in  $\mathbb{R}^3$ ,  $\mathbf{u} \times \mathbf{v} = \mathbf{v} \times \mathbf{u}$ .
  - (b) *True or False:* If  $\mathbf{u}$  and  $\mathbf{v}$  are two vectors in  $\mathbb{R}^3$ , then  $\mathbf{u} \times \mathbf{v} = \mathbf{u} \cdot \mathbf{v}$ .
  - (c) *True or False:* If  $\mathbf{u} \times \mathbf{v} = \mathbf{v} \times \mathbf{u}$ , then  $\mathbf{u}$  and  $\mathbf{v}$  are parallel.
  - (d) *True or False:* If  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  are vectors in  $\mathbb{R}^3$ , then  $(\mathbf{u} \times \mathbf{v}) \times \mathbf{w} = \mathbf{u} \times (\mathbf{v} \times \mathbf{w})$ .
  - (e) *True or False:* The triple scalar product can be used to find the volume of a parallelepiped.
  - (f) *True or False:* If  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  are vectors in  $\mathbb{R}^3$ , then  $\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w}) = -\mathbf{v} \cdot (\mathbf{u} \times \mathbf{w})$ .
  - (g) *True or False:* If  $\mathbf{u}$  and  $\mathbf{v}$  are nonparallel vectors in  $\mathbb{R}^3$ , then  $\frac{\mathbf{u} \cdot \mathbf{v}}{\|\mathbf{u} \times \mathbf{v}\|} = \cot \theta$ , where  $\theta$  is the angle between  $\mathbf{u}$  and  $\mathbf{v}$ .
  - (h) *True or False:* If  $\mathbf{u}$  and  $\mathbf{v}$  are unit vectors in  $\mathbb{R}^3$ , then  $\mathbf{u} \times \mathbf{v}$  is also a unit vector.
2. *Examples:* Construct examples of the thing(s) described in the following. Try to find examples that are different than any in the reading.
  - (a) Two nonzero vectors  $\mathbf{u}$  and  $\mathbf{v}$  in  $\mathbb{R}^3$  such that  $\mathbf{u} \times \mathbf{v} = \mathbf{v} \times \mathbf{u}$ .
  - (b) Three vectors  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  in  $\mathbb{R}^3$  such that  $(\mathbf{u} \times \mathbf{v}) \times \mathbf{w} \neq \mathbf{u} \times (\mathbf{v} \times \mathbf{w})$ .
  - (c) Three vectors  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  in  $\mathbb{R}^3$  such that  $(\mathbf{u} \times \mathbf{v}) \times \mathbf{w} = \mathbf{u} \times (\mathbf{v} \times \mathbf{w})$ .
3. What is the definition of the cross product?
4. How is the determinant of a  $3 \times 3$  matrix used in the computation of the determinant of two vectors  $\mathbf{u} = \langle u_1, u_2, u_3 \rangle$  and  $\mathbf{v} = \langle v_1, v_2, v_3 \rangle$ ?
5. If  $\mathbf{u}$  and  $\mathbf{v}$  are nonzero vectors in  $\mathbb{R}^3$ , what is the geometric relationship between  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{u} \times \mathbf{v}$ ?
6. What is Lagrange's identity? How is it used to understand the geometry of the cross product?
7. If  $\mathbf{u}$  and  $\mathbf{v}$  are nonzero vectors in  $\mathbb{R}^3$ , why do the equations  $\mathbf{u} \cdot (\mathbf{u} \times \mathbf{v}) = 0$  and  $\mathbf{v} \cdot (\mathbf{u} \times \mathbf{v}) = 0$  tell us that the cross product is orthogonal to both  $\mathbf{u}$  and  $\mathbf{v}$ ?
8. What is meant by the parallelogram determined by vectors  $\mathbf{u}$  and  $\mathbf{v}$  in  $\mathbb{R}^3$ ? How do you find the area of this parallelogram?
9. Sketch the parallelogram determined by the two vectors  $\langle 1, 2 \rangle$  and  $\langle 3, -1 \rangle$ . How can you use the cross product to find the area of this parallelogram?
10. What is meant by the triangle determined by vectors  $\mathbf{u}$  and  $\mathbf{v}$  in  $\mathbb{R}^3$ ? How do you find the area of this triangle?
11. If  $\|\mathbf{u} \times \mathbf{v}\| = \|\mathbf{u}\|\|\mathbf{v}\|$ , what is the geometric relationship between  $\mathbf{u}$  and  $\mathbf{v}$ ?

12. Give an example of three vectors in  $\mathbb{R}^3$  that form a right-handed triple. Explain how you can use the same three vectors to form a left-handed triple.
13. Give an example of three nonzero vectors  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  in  $\mathbb{R}^3$  such that  $\mathbf{u} \times \mathbf{v} = \mathbf{u} \times \mathbf{w}$  but  $\mathbf{v} \neq \mathbf{w}$ . What geometric relationship must the three vectors have for this to happen?
14. What is the definition of the triple scalar product for vectors  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  in  $\mathbb{R}^3$ ?
15. If the triple scalar product  $\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w})$  is equal to zero, what geometric relationship do the vectors  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  have?
16. What is a parallelepiped? What is meant by the parallelepiped determined by the vectors  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$ ? How do you find the volume of the parallelepiped determined by  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$ ?
17. If  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  are three vectors in  $\mathbb{R}^3$ , what is wrong with the expression  $\mathbf{u} \times \mathbf{v} \times \mathbf{w}$ ?
18. If  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  are three vectors in  $\mathbb{R}^3$ , which of the following products make sense and which do not?
  - (a)  $\mathbf{u} \cdot (\mathbf{v} \cdot \mathbf{w})$
  - (b)  $\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w})$
  - (c)  $\mathbf{u} \times (\mathbf{v} \cdot \mathbf{w})$
  - (d)  $\mathbf{u} \times (\mathbf{v} \times \mathbf{w})$
19. If  $\mathbf{u}$  and  $\mathbf{v}$  are vectors in  $\mathbb{R}^3$  such that  $\mathbf{u} \cdot \mathbf{v} = 0$  and  $\mathbf{u} \times \mathbf{v} = \mathbf{0}$ , what can we conclude about  $\mathbf{u}$  and  $\mathbf{v}$ ?
20. If  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  are three mutually orthogonal vectors in  $\mathbb{R}^3$ , explain why  $\mathbf{u} \times (\mathbf{v} \times \mathbf{w}) = \mathbf{0}$ .
21. If  $\mathbf{u}$  and  $\mathbf{v}$  are vectors in  $\mathbb{R}^3$  such that  $\mathbf{u} \times \mathbf{v} = \mathbf{v} \times \mathbf{u}$ , what can we conclude about  $\mathbf{u}$  and  $\mathbf{v}$ ?

## Skills

In Exercises 22–29 compute the indicated quantities when  $\mathbf{u} = \langle 2, 1, -3 \rangle$ ,  $\mathbf{v} = \langle 4, 0, 1 \rangle$ , and  $\mathbf{w} = \langle -2, 6, 5 \rangle$ .

22.  $\mathbf{u} \times \mathbf{v}$  and  $\mathbf{v} \times \mathbf{u}$
23.  $\mathbf{u} \times \mathbf{w}$  and  $\mathbf{w} \times \mathbf{u}$
24.  $\mathbf{v} \times \mathbf{w}$  and  $\mathbf{w} \times \mathbf{v}$
25.  $(\mathbf{u} \times \mathbf{v}) \times \mathbf{w}$  and  $\mathbf{u} \times (\mathbf{v} \times \mathbf{w})$
26.  $(\mathbf{u} \times \mathbf{v}) \cdot \mathbf{w}$  and  $\mathbf{w} \cdot (\mathbf{v} \times \mathbf{u})$
27. Find the area of the parallelogram determined by the vectors  $\mathbf{u}$  and  $\mathbf{v}$ .
28. Find the area of the parallelogram determined by the vectors  $\mathbf{v}$  and  $\mathbf{w}$ .
29. Find the volume of the parallelepiped determined by vectors  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$ . Do  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  form a right-handed triple?

In Exercises 30–35 compute the indicated quantities when  $\mathbf{u} = \langle -3, 1, -4 \rangle$ ,  $\mathbf{v} = \langle 2, 0, 5 \rangle$ , and  $\mathbf{w} = \langle 1, 3, 13 \rangle$ .

30.  $\mathbf{u} \times \mathbf{v}$  and  $\mathbf{v} \times \mathbf{u}$
31.  $\mathbf{u} \times \mathbf{w}$  and  $\mathbf{w} \times \mathbf{u}$
32.  $\mathbf{v} \times \mathbf{w}$  and  $\mathbf{w} \times \mathbf{v}$
33.  $(\mathbf{u} \times \mathbf{v}) \cdot \mathbf{w}$  and  $\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w})$
34. Find the area of the parallelogram determined by the vectors  $\mathbf{u}$  and  $\mathbf{v}$ .
35. Find the volume of the parallelepiped determined by the vectors  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$ .

In Exercises 36–41 use the given sets of points to find:

- (a) A nonzero vector  $\mathbf{N}$  perpendicular to the plane determined by the points.
- (b) Two unit vectors perpendicular to the plane determined by the points.
- (c) The area of the triangle determined by the points.
36.  $P(1, 4, 6)$ ,  $Q(-3, 5, 0)$ ,  $R(3, 2, -1)$

41.  $P(1, 6)$ ,  $Q(0, -3)$ ,  $R(-5, 4)$   
(Hint: Think of the  $xy$ -plane as part of  $\mathbb{R}^3$ .)

Suppose a triangle has side lengths  $a$ ,  $b$ , and  $c$ . The *semiperimeter* of the triangle is defined to be  $s = \frac{1}{2}(a + b + c)$ .

We can use the side lengths of the triangle to calculate its area by applying **Heron's formula**:

$$\text{Area} = \sqrt{s(s-a)(s-b)(s-c)}.$$

Use Heron's formula to compute the areas of the triangles determined by the points  $P$ ,  $Q$ , and  $R$  in Exercises 42–44:

42.  $P$ ,  $Q$ , and  $R$  from Exercise 36
43.  $P$ ,  $Q$ , and  $R$  from Exercise 37
44.  $P$ ,  $Q$ , and  $R$  from Exercise 41
45. Heron's formula allows us to compute the area of a triangle from its side lengths.
  - (a) Explain why knowing the side lengths of a quadrilateral is *not* sufficient to compute the area of the quadrilateral.
  - (b) Explain why knowing the side lengths of a quadrilateral and the length of one diagonal is sufficient to compute the area of the quadrilateral.
  - (c) Explain why knowing the side lengths of a quadrilateral and the measure of the angle at one vertex is also sufficient to compute the area of the quadrilateral.

Use the results of Exercise 45 to find the areas of the quadrilaterals  $PQRS$  specified in Exercises 46–49.

46.  $PQ = 6$ ,  $QR = 7$ ,  $RS = 8$ ,  $SP = 9$ ,  $PR = 10$
47.  $PQ = 6$ ,  $QR = 7$ ,  $RS = 8$ ,  $SP = 9$ ,  $QS = 10$
48.  $PQ = 6$ ,  $QR = 7$ ,  $RS = 8$ ,  $SP = 6$ ,  $\angle P = 60^\circ$
49.  $PQ = 7$ ,  $QR = 8$ ,  $RS = 8$ ,  $SP = 9$ ,  $\angle R = 60^\circ$

In Exercises 50–53 the coordinates of points  $P$ ,  $Q$ ,  $R$ , and  $S$  are given. (a) Determine whether quadrilateral  $PQRS$  is a parallelogram. (b) Find the area of quadrilateral  $PQRS$ .

50.  $P(0, 0)$ ,  $Q(-1, 3)$ ,  $R(-4, -1)$ ,  $S(-3, -2)$   
 51.  $P(-1, 3)$ ,  $Q(2, 5)$ ,  $R(4, 1)$ ,  $S(1, -1)$   
 52.  $P(2, 7)$ ,  $Q(3, -1)$ ,  $R(1, -10)$ ,  $S(-1, -2)$   
 53.  $P(-1, 3)$ ,  $Q(2, 5)$ ,  $R(6, 3)$ ,  $S(4, -2)$

In Exercises 54–57 the coordinates of points  $P$ ,  $Q$ ,  $R$ , and  $S$  are given. (a) Show that the four points are coplanar. (b) Determine whether quadrilateral  $PQRS$  is a parallelogram. (c) Find the area of quadrilateral  $PQRS$ .

54.  $P(0, 0, 0)$ ,  $Q(1, -2, 5)$ ,  $R(-1, 2, 11)$ ,  $S(-2, 4, 6)$   
 55.  $P(2, -3, 8)$ ,  $Q(-2, 4, 6)$ ,  $R(7, 18, -7)$ ,  $S(15, 4, -3)$   
 56.  $P(1, 2, 6)$ ,  $Q(4, 1, -5)$ ,  $R(3, 6, 8)$ ,  $S(0, 4, 13)$   
 57.  $P(3, 4, -2)$ ,  $Q(7, 0, 6)$ ,  $R(2, 1, 7)$ ,  $S(5, -2, 13)$

## Applications

Some crystals have rhombohedral structures. A rhombohedron is a parallelepiped in which all of the edge lengths are equal and each of the six faces is a congruent rhombus. Find the volumes of the rhombohedral crystals described in Exercises 58 and 59.

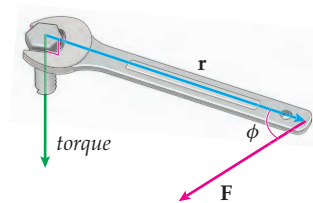

A rhombohedral crystal

58. Each side length is 1 cm, and the acute angles in each face measure  $60^\circ$ . (Hint: Let vector  $\mathbf{i}$  form one of the edges of the rhombohedron, and let a second nonparallel edge be in the  $xy$ -plane.)  
 59. Each side length is 2 cm, and the acute angles in each face measure  $45^\circ$ . (See the hint in the previous exercise.)

Turning a bolt with a wrench produces a **torque** vector that drives the bolt forward. The magnitude of the torque vector is  $\|\mathbf{r}\|\|\mathbf{F}\|\sin\theta$ , where  $\mathbf{r}$  is the vector along the handle of the wrench,  $\mathbf{F}$  is the force vector applied to the handle of the wrench, and  $\theta$  is the angle between these two vectors. Therefore, the magnitude of the torque is  $\|\mathbf{r} \times \mathbf{F}\|$ . In Exercises 60 and 61, find the magnitude of the torque. Express each answer in foot-pounds.

The torque vector

60. A force of 20 lb is applied to a wrench with a 6-inch handle at an angle of  $60^\circ$ .  
 61. A force of 40 lb is applied to a wrench with a 9-inch handle at an angle of  $90^\circ$ .

## Proofs

62. Prove that the determinant of a  $3 \times 3$  matrix with integer entries is an integer.  
 63. Let  $A$  be a  $3 \times 3$  matrix with determinant  $D$ , and let  $A'$  be a  $3 \times 3$  matrix obtained from  $A$  by exchanging two rows. Prove that  $\det A' = -D$ .  
 64. Let  $B$  be a  $3 \times 3$  matrix with determinant  $d$ , and let  $B'$  be a  $3 \times 3$  matrix obtained from  $B$  by exchanging two columns. Prove that  $\det B' = -d$ .  
 65. Use the definition of the cross product to prove that the cross product of two parallel vectors is  $\mathbf{0}$ . (This is Theorem 10.26.)  
 66. Use the definition of the cross product to prove that the cross product of two vectors  $\mathbf{u}$  and  $\mathbf{v}$  is anticommutative; that is, prove that  $\mathbf{u} \times \mathbf{v} = -\mathbf{v} \times \mathbf{u}$ . (This is Theorem 10.27.)  
 67. Let  $\mathbf{u}$  and  $\mathbf{v}$  be vectors in  $\mathbb{R}^3$  and let  $c$  be a scalar. Prove that  $c(\mathbf{u} \times \mathbf{v}) = (c\mathbf{u}) \times \mathbf{v} = \mathbf{u} \times (c\mathbf{v})$ . (This is Theorem 10.28).  
 68. Let  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  be vectors in  $\mathbb{R}^3$ . Prove:  

$$\mathbf{u} \times (\mathbf{v} + \mathbf{w}) = \mathbf{u} \times \mathbf{v} + \mathbf{u} \times \mathbf{w} \quad \text{and}$$

$$(\mathbf{u} + \mathbf{v}) \times \mathbf{w} = \mathbf{u} \times \mathbf{w} + \mathbf{v} \times \mathbf{w}.$$
 (This is Theorem 10.29.)  
 69. Let  $\mathbf{u}$  and  $\mathbf{v}$  be vectors in  $\mathbb{R}^3$ . Prove that  $\mathbf{v} \cdot (\mathbf{u} \times \mathbf{v}) = 0$ . (This is Theorem 10.31(b).)  
 70. Let  $\mathbf{u}$  and  $\mathbf{v}$  be vectors in  $\mathbb{R}^3$ . Prove Lagrange's identity, Theorem 10.30:  

$$\|\mathbf{u} \times \mathbf{v}\|^2 = \|\mathbf{u}\|^2\|\mathbf{v}\|^2 - (\mathbf{u} \cdot \mathbf{v})^2.$$

71. Let  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  be three vectors in  $\mathbb{R}^3$  in which the components of each vector are integers.

- Prove that the volume of the parallelepiped determined by  $\mathbf{u}$ ,  $\mathbf{v}$  and  $\mathbf{w}$  is an integer.
- Find examples of vectors  $\mathbf{u}$  and  $\mathbf{v}$  with integer components that show that the area of the parallelogram determined by  $\mathbf{u}$  and  $\mathbf{v}$  can be either an integer or an irrational number.

72. Let  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  be three mutually perpendicular vectors in  $\mathbb{R}^3$ .

- Prove that  $\mathbf{u} \times (\mathbf{v} \times \mathbf{w}) = \mathbf{0}$ .
- Show that  $|\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w})| = \|\mathbf{u}\| \|\mathbf{v}\| \|\mathbf{w}\|$ .

73. Let  $\mathbf{u}$  and  $\mathbf{v}$  be vectors in  $\mathbb{R}^3$  such that  $\mathbf{u} \cdot \mathbf{v} \neq 0$ . Prove that if  $\theta$  is the angle between  $\mathbf{u}$  and  $\mathbf{v}$ , then  $\tan \theta = \frac{\|\mathbf{u} \times \mathbf{v}\|}{\mathbf{u} \cdot \mathbf{v}}$ .

74. Let  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  be vectors in  $\mathbb{R}^3$ . Prove that  $\mathbf{u} \times \mathbf{v} = \mathbf{u} \times \mathbf{w}$  if and only if  $\mathbf{u}$  is parallel to  $\mathbf{v} - \mathbf{w}$ .

75. Let  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  be vectors in  $\mathbb{R}^3$  with  $\mathbf{u} \neq \mathbf{0}$ . Show that if  $\mathbf{u} \times \mathbf{v} = \mathbf{u} \times \mathbf{w}$  and  $\mathbf{u} \cdot \mathbf{v} = \mathbf{u} \cdot \mathbf{w}$ , then  $\mathbf{v} = \mathbf{w}$ .

76. Let  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  be vectors in  $\mathbb{R}^3$ . Prove that

$$\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w}) = (\mathbf{u} \times \mathbf{v}) \cdot \mathbf{w}.$$

(This is part (b) of Theorem 10.37.)

77. Prove that, for vectors  $\mathbf{r}$ ,  $\mathbf{s}$ ,  $\mathbf{u}$ , and  $\mathbf{v}$  in  $\mathbb{R}^3$ ,

$$(\mathbf{r} \times \mathbf{s}) \cdot (\mathbf{u} \times \mathbf{v}) = (\mathbf{r} \cdot \mathbf{u})(\mathbf{s} \cdot \mathbf{v}) - (\mathbf{r} \cdot \mathbf{v})(\mathbf{s} \cdot \mathbf{u}).$$

78. Let  $\mathbf{u} = \langle u_1, u_2, u_3 \rangle$ ,  $\mathbf{v} = \langle v_1, v_2, v_3 \rangle$ , and  $\mathbf{w} = \langle w_1, w_2, w_3 \rangle$ . Show that

$$\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w}) = \det \begin{bmatrix} u_1 & u_2 & u_3 \\ v_1 & v_2 & v_3 \\ w_1 & w_2 & w_3 \end{bmatrix}.$$

79. Prove that if vectors  $\mathbf{r}$ ,  $\mathbf{s}$ ,  $\mathbf{u}$ , and  $\mathbf{v}$  in  $\mathbb{R}^3$  can all be translated to the same plane, then

$$(\mathbf{r} \times \mathbf{s}) \times (\mathbf{u} \times \mathbf{v}) = \mathbf{0}.$$

80. The product  $\mathbf{u} \times (\mathbf{v} \times \mathbf{w})$  is an example of a vector called a *vector triple product*.

- Show that if  $\mathbf{v} = \langle v_1, v_2, v_3 \rangle$  and  $\mathbf{w} = \langle w_1, w_2, w_3 \rangle$ , then  $\mathbf{i} \times (\mathbf{v} \times \mathbf{w}) = w_1 \mathbf{v} - v_1 \mathbf{w}$ .
- Derive similar expressions from  $\mathbf{j} \times (\mathbf{v} \times \mathbf{w})$  and  $\mathbf{k} \times (\mathbf{v} \times \mathbf{w})$ .
- Use your results from parts (a) and (b) to show that  $\mathbf{u} \times (\mathbf{v} \times \mathbf{w}) = (\mathbf{u} \cdot \mathbf{w})\mathbf{v} - (\mathbf{u} \cdot \mathbf{v})\mathbf{w}$ .
- Use your results from part (c) and the anticommutativity of the cross product to derive a similar expression for the vector triple product  $(\mathbf{u} \times \mathbf{v}) \times \mathbf{w}$ .
- Use your results from parts (c) and (d) to show that the cross product is *not* associative.
- Under what conditions is

$$\mathbf{u} \times (\mathbf{v} \times \mathbf{w}) = (\mathbf{u} \times \mathbf{v}) \times \mathbf{w}?$$

## Thinking Forward

*Planes in  $\mathbb{R}^3$* : Different geometric conditions can be used to specify a plane. The following questions ask you to explain why the specified conditions uniquely determine a plane.

- ▶ Explain why two nonparallel vectors and a point uniquely determine a plane containing both vectors and the point.

- ▶ Explain why a single nonzero vector and a point uniquely determine a plane containing the point. (*Hint: Think of the collection of vectors orthogonal to the given vector with the given point as the initial point of all of the vectors.*)
- ▶ Give two other sets of geometric conditions that would uniquely determine a plane in  $\mathbb{R}^3$ .

## 10.5 LINES IN THREE-DIMENSIONAL SPACE

- ▶ Using vectors to construct equations for lines in  $\mathbb{R}^3$
- ▶ Parallel, intersecting, and skew lines
- ▶ Computing the distance from a point to a line

### Equations for Lines

Recall that the general form for the equation of a line in the  $xy$ -plane is  $ax + by = d$ , where  $a$ ,  $b$ , and  $d$  are scalars. An equation of this form is called a **linear equation in two variables**. In this section we will discuss how to write equations of lines in three-dimensional space.

It seems natural to think that the graph of a **linear equation in three variables**,

$$ax + by + cz = d, \text{ where } a, b, c, \text{ and } d \text{ are scalars,}$$

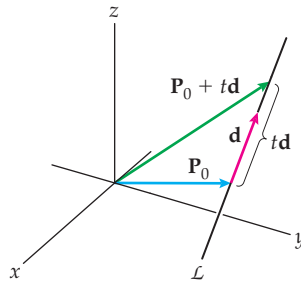

would be a line in 3-space. However, as we will see in Section 10.6, the graphs of such equations are planes, not lines! (Recall our discussion of these equations in Section 10.2. There we examined the linear equation  $x = 3$  and saw that in 3-space the graph of the equation was a plane parallel to the  $yz$ -plane. The equation  $x = 3$  is a simple example of an equation of the form  $ax + by + cz = d$ , with  $a = 1$ ,  $b = c = 0$ , and  $d = 3$ .) So, if the graph of a linear equation in three variables is not a line, what types of equations *do* give lines?

As you know, a line in the plane can be determined by two distinct points or by a point and a direction, specified by a slope. In 3-space the situation is analogous: A line can be determined by two distinct points or by a single point and a direction, specified by a vector. To determine an equation for a line,  $\mathcal{L}$ , in 3-space we will use a point,  $P_0$ , on  $\mathcal{L}$  and a **direction vector**,  $\mathbf{d}$ , parallel to  $\mathcal{L}$ . If we are given two points, we can immediately compute a direction vector and start by finding a parametrization for  $\mathcal{L}$ . If  $P_0 = (x_0, y_0, z_0)$  and  $P_1 = (x_1, y_1, z_1)$  are two distinct points on  $\mathcal{L}$ , then a direction vector for  $\mathcal{L}$  is

$$\mathbf{d} = \overrightarrow{P_0P_1} = \langle x_1 - x_0, y_1 - y_0, z_1 - z_0 \rangle.$$

We now let  $P_0$  be the point  $(x_0, y_0, z_0)$  and  $\mathbf{d}$  be the vector  $\langle a, b, c \rangle$ . Point  $P_0$  corresponds to the position vector  $\mathbf{P}_0 = \langle x_0, y_0, z_0 \rangle$ . Every point on  $\mathcal{L}$  can be obtained by adding a suitable multiple of  $\mathbf{d}$  to the position vector  $\mathbf{P}_0$ , as in the following figure:

A line in a three-dimensional Cartesian coordinate system

That is, every point on  $\mathcal{L}$  is of the form  $\mathbf{P}_0 + t\mathbf{d}$ , for some value of our parameter  $t$ . This result immediately gives us a **vector function**,  $\mathbf{r}(t)$ , for the line  $\mathcal{L}$ . That is,

$$\begin{aligned} \mathbf{r}(t) &= \mathbf{P}_0 + t\mathbf{d}, \quad \text{or} \\ \mathbf{r}(t) &= \langle x_0, y_0, z_0 \rangle + t \langle a, b, c \rangle, \quad \text{or} \\ \mathbf{r}(t) &= \langle x_0 + at, y_0 + bt, z_0 + ct \rangle, \end{aligned}$$

where  $-\infty < t < \infty$ . Any of these three equations is a parametrization for  $\mathcal{L}$ . From the last of the equations, we may immediately find parametric equations for the line  $\mathcal{L}$ :

$$x(t) = x_0 + at, \quad y(t) = y_0 + bt, \quad z(t) = z_0 + ct, \quad \text{where } -\infty < t < \infty.$$

Assuming that none of the components of the vector  $\mathbf{d}$  is zero, we can solve each of the preceding equations for the parameter  $t$  to obtain

$$t = \frac{x - x_0}{a}, \quad t = \frac{y - y_0}{b}, \quad t = \frac{z - z_0}{c}.$$

We may use these equations to eliminate the parameter  $t$  to find a **symmetric form** for the line  $\mathcal{L}$ :

$$\frac{x - x_0}{a} = \frac{y - y_0}{b} = \frac{z - z_0}{c}.$$

Thus, we may use a vector equation, parametric equations, or the symmetric form to specify a line, and given any one of these, we may quickly obtain the others.

For example, to find an equation of the line  $\mathcal{L}$  containing the points  $P = (3, 2, -3)$  and  $Q = (-1, 4, 2)$ , we immediately have a direction vector

$$\mathbf{d} = \overrightarrow{PQ} = \langle -1 - 3, 4 - 2, 2 - (-3) \rangle = \langle -4, 2, 5 \rangle.$$

Using  $P$  for our point on  $\mathcal{L}$ , we obtain

$$\begin{aligned} \mathbf{r}(t) &= \langle 3, 2, -3 \rangle + t \langle -4, 2, 5 \rangle, \quad -\infty < t < \infty, \quad \text{and} \\ \mathbf{r}(t) &= \langle 3 - 4t, 2 + 2t, -3 + 5t \rangle, \quad -\infty < t < \infty. \end{aligned}$$

Either of these two equations is a vector function whose graph is  $\mathcal{L}$ . If we prefer to express  $\mathcal{L}$  by means of parametric equations, we have

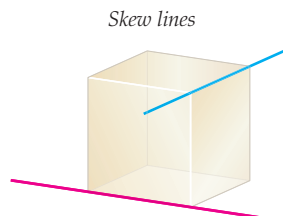

$$x(t) = 3 - 4t, \quad y(t) = 2 + 2t, \quad z(t) = -3 + 5t, \quad -\infty < t < \infty.$$

Finally, if we want to use the symmetric form, we have

$$\frac{x - 3}{-4} = \frac{y - 2}{2} = \frac{z + 3}{5}.$$

## Two Lines in $\mathbb{R}^3$

Given two lines in the plane, the lines either intersect, are parallel, or are identical. In three-dimensional space there is a fourth possibility: The lines may be **skew**; that is, they neither are parallel nor intersect. For example, on a cube, some edges intersect and some are parallel, but the lines containing the highlighted edges in the following cube are skew:

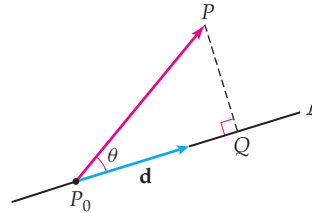

Given the equations of two lines, we can use the direction vectors of the lines to start our analysis of the relationship between the lines. If the direction vectors of the two lines are scalar multiples of each other, then the lines are either parallel or identical. If the direction vectors of the two lines are not multiples of each other, the lines either intersect or are skew. To complete the analysis, we determine whether or not the lines share a point. Parallel lines that share a point are identical. Nonparallel lines that share a point (obviously) intersect.

## The Distance from a Point to a Line (Revisited)

The distance from a point,  $P$ , to a line,  $\mathcal{L}$ , is the distance from  $P$  to the closest point on  $\mathcal{L}$ . This is the distance along a line through  $P$  and perpendicular to  $\mathcal{L}$ . That distance can be computed with the technique of Example 4 from Section 10.3. Here, we provide an alternative method.

Let  $\mathbf{r}(t) = \mathbf{P}_0 + t\mathbf{d}$ ,  $-\infty < t < \infty$ , be a parametrization for  $\mathcal{L}$ . Thus,  $P_0$  is on  $\mathcal{L}$  and  $\mathbf{d}$  is parallel to  $\mathcal{L}$ , as in the following figure:

Now, suppose  $Q$  is the point on the line  $\mathcal{L}$  that is closest to the point  $P$ , as in the figure shown. If we knew the location of the point  $Q$ , then we could immediately use the distance formula to calculate the length of  $\overrightarrow{PQ}$ . Typically, though, we do not know the location of  $Q$ . However, we do see that  $\|\overrightarrow{PQ}\| = \|\overrightarrow{P_0P}\| \sin \theta$ , where  $\theta$  is the angle between  $\overrightarrow{P_0P}$  and  $\mathbf{d}$ . Now, by Theorem 10.32,

$$\|\mathbf{d} \times \overrightarrow{P_0P}\| = \|\mathbf{d}\| \|\overrightarrow{P_0P}\| \sin \theta.$$

Thus, we have

$$\|\overrightarrow{PQ}\| = \|\overrightarrow{P_0P}\| \sin \theta = \frac{\|\mathbf{d} \times \overrightarrow{P_0P}\|}{\|\mathbf{d}\|}.$$

To summarize, we have the following theorem:

### THEOREM 10.38 The Distance from a Point to a Line

Given a point  $P$  and a line  $\mathcal{L}$  parameterized by  $\mathbf{r}(t) = \mathbf{P}_0 + t\mathbf{d}$ , the distance from  $P$  to  $\mathcal{L}$  is

$$\frac{\|\mathbf{d} \times \overrightarrow{P_0P}\|}{\|\mathbf{d}\|}.$$

## Examples and Explorations

### EXAMPLE 1

**Expressing the equation of a line in symmetric form when one component of the direction vector is zero**

Find an equation of the line  $\mathcal{L}$  containing the points  $P = (-5, 6, -1)$  and  $Q = (4, 6, -7)$ . Write the answer as a parametrization, in terms of parametric equations, and in symmetric form.

### SOLUTION

A direction vector for the line is

$$\overrightarrow{PQ} = \langle 4 - (-5), 6 - 6, -7 - (-1) \rangle = \langle 9, 0, -6 \rangle.$$

However, any nonzero multiple of  $\overrightarrow{PQ}$  may be used instead. Here we will take  $\mathbf{d} = \frac{1}{3}\overrightarrow{PQ} = \langle 3, 0, -2 \rangle$  as our direction vector. Now, using  $P$  for our point on  $\mathcal{L}$ , we have

$$\mathbf{r}(t) = \langle -5, 6, -1 \rangle + t \langle 3, 0, -2 \rangle, \quad -\infty < t < \infty,$$

$$\mathbf{r}(t) = \langle -5 + 3t, 6, -1 - 2t \rangle, \quad -\infty < t < \infty.$$

Either of these two equations is a parametrization.

Using the second of the two forms, we have the parametric equations

$$x(t) = -5 + 3t, \quad y(t) = 6, \quad z(t) = -1 - 2t, \quad -\infty < t < \infty.$$

There is also a symmetric form for a line  $\mathcal{L}$  if one of the three components of the direction vector  $\mathbf{d}$  is zero. When  $\mathbf{P}_0 = \langle x_0, y_0, z_0 \rangle$  and  $\mathbf{d} = \langle a, 0, c \rangle$ , then, as before, we have the parametrization

$$\begin{aligned} \mathbf{r}(t) &= \mathbf{P}_0 + t\mathbf{d}, \quad -\infty < t < \infty \\ &= \langle x_0 + at, y_0, z_0 + ct \rangle, \quad -\infty < t < \infty. \end{aligned}$$

We have the following parametric equations for  $\mathcal{L}$ :

$$x(t) = x_0 + at, \quad y(t) = y_0, \quad z(t) = z_0 + ct, \quad -\infty < t < \infty.$$

The symmetric form for  $\mathcal{L}$  is

$$\frac{x - x_0}{a} = \frac{z - z_0}{c}, \quad y = y_0.$$

Thus, for our line  $\mathcal{L}$ , we have

$$\frac{x + 5}{3} = \frac{z + 1}{-2}, \quad y = 6.$$

There are analogous expressions when one of the other components of the direction vector is zero. □

## EXAMPLE 2

### Converting from symmetric form to parametric equations

Given the symmetric equations

$$\frac{x - 4}{5} = \frac{y + 2}{-3} = \frac{z - 1}{7}$$

for a line  $\mathcal{L}$ , find parametric equations for  $\mathcal{L}$ .

### SOLUTION

We introduce the parameter,  $t$ , as follows:

$$t = \frac{x - 4}{5} = \frac{y + 2}{-3} = \frac{z - 1}{7}.$$

So,

$$x - 4 = 5t$$

$$y + 2 = -3t$$

$$z - 1 = 7t,$$

where  $-\infty < t < \infty$ . These equations are parametric equations for  $\mathcal{L}$ . We may also write the system in the form

$$x(t) = 4 + 5t, \quad y(t) = -2 - 3t, \quad z(t) = 1 + 7t, \quad -\infty < t < \infty. \quad \square$$

## EXAMPLE 3

## Determining when two lines are parallel

Consider the lines  $\mathcal{L}_1$  and  $\mathcal{L}_2$  respectively given by the parametrizations

$$\mathbf{r}_1(t) = \langle 3 + 5t, -1 - 6t, 4t \rangle, -\infty < t < \infty, \text{ and}$$

$$\mathbf{r}_2(t) = \langle 4 - 10t, 7 + 12t, -1 - 8t \rangle, -\infty < t < \infty.$$

Are lines  $\mathcal{L}_1$  and  $\mathcal{L}_2$  parallel? If they are, find the distance between them.

## SOLUTION

Two distinct lines  $\mathcal{L}_1$  and  $\mathcal{L}_2$  are parallel if they have (nonzero) parallel direction vectors,  $\mathbf{d}_1$  and  $\mathbf{d}_2$ , respectively. That is, the lines are parallel if there is a scalar,  $k$ , such that  $\mathbf{d}_2$  is equal to  $k\mathbf{d}_1$ .

Lines  $\mathcal{L}_1$  and  $\mathcal{L}_2$  have direction vectors  $\mathbf{d}_1 = \langle 5, -6, 4 \rangle$  and  $\mathbf{d}_2 = \langle -10, 12, -8 \rangle$ , respectively. Since  $\mathbf{d}_2 = -2\mathbf{d}_1$ , the lines are either parallel or identical. Two parallel lines are identical if they share a point. We may use any point on either of the lines and check whether that point is on the other line. One convenient point on  $\mathcal{L}_1$  is  $\mathbf{r}_1(0) = \langle 3, -1, 0 \rangle$ . Is  $\langle 3, -1, 0 \rangle$  also on  $\mathcal{L}_2$ ? It is if there is a solution of the system of equations

$$4 - 10t = 3$$

$$7 + 12t = -1$$

$$-1 - 8t = 0.$$

Note that the unique solution of the last of these equations is  $t = -\frac{1}{8}$ , but this value does not satisfy either of the other equations. Therefore, there is no value of  $t$  that simultaneously satisfies all three of the preceding equations. This fact tells us that the lines  $\mathcal{L}_1$  and  $\mathcal{L}_2$  are parallel, but not identical.

To find the distance between the two lines, we choose any point on one of the lines and find the distance from that point to the other line. We already know that  $\langle 3, -1, 0 \rangle$  is on  $\mathcal{L}_1$ . We will therefore use this point as  $P$ . We need a point on  $\mathcal{L}_2$ , so we will use  $\mathbf{r}_2(0) = \langle 4, 7, -1 \rangle$ . That is, we will let  $P_0 = \langle 4, 7, -1 \rangle$ . Thus  $\overrightarrow{P_0P} = \langle -1, -8, 1 \rangle$ . Finally, the direction vector  $\mathbf{d}_2 = \langle -10, 12, -8 \rangle$ . We are now ready to use the distance formula given in Theorem 10.38. The distance from the point  $P$  to the line  $\mathcal{L}_2$ , and therefore the distance between  $\mathcal{L}_1$  and  $\mathcal{L}_2$ , is

$$\frac{\| \langle -10, 12, -8 \rangle \times \langle -1, -8, 1 \rangle \|}{\| \langle -10, 12, -8 \rangle \|} = \frac{\| \langle -52, 18, 92 \rangle \|}{\sqrt{308}} = \sqrt{\frac{2873}{77}} \approx 6.1 \text{ units.}$$

As an extension of this example, consider the parametrization

$$\mathbf{r}_3(t) = \langle -12 + 15t, 17 - 18t, -12 + 12t \rangle, -\infty < t < \infty.$$

A direction vector for this parametrization is  $\mathbf{d}_3 = \langle 15, -18, 12 \rangle$ , which is a scalar multiple of  $\mathbf{d}_1$ . Furthermore, the point  $\langle 3, -1, 0 \rangle$  is on the line determined by  $\mathbf{r}_3(t)$ , since the system of equations

$$-12 + 15t = 3$$

$$17 - 18t = -1$$

$$-12 + 12t = 0$$

has the solution  $t = 1$ . Thus,  $\mathbf{r}_3$  is a different parametrization for  $\mathcal{L}_1$ .

Note that the two parameters are *not* equal at the point  $\langle 3, -1, 0 \rangle$ ; that is,

$$\mathbf{r}_1(0) = \langle 3, -1, 0 \rangle = \mathbf{r}_3(1).$$

This is irrelevant! The significant concepts here are that the lines are parallel and they share a point; therefore they must represent the same line.  $\square$

## EXAMPLE 4

## Determining when two lines intersect

Do the lines  $\mathcal{L}_1$  and  $\mathcal{L}_2$ , respectively given by

$\mathbf{r}_1(t) = \langle -8 - 5t, 3 - t, 4 \rangle$ ,  $-\infty < t < \infty$ , and  $\mathbf{r}_2(t) = \langle 6 + t, 4 + 2t, 1 + 3t \rangle$ ,  $-\infty < t < \infty$ , intersect?

## SOLUTION

We see immediately that the direction vectors for these lines are  $\mathbf{d}_1 = \langle -5, -1, 0 \rangle$  and  $\mathbf{d}_2 = \langle 1, 2, 3 \rangle$ , which are *not* parallel. (Why?) Do the lines share a point? If so, the lines intersect. If not, they are skew.

Finding a candidate for a point of intersection here is more delicate than in Example 3, where we could have used *any* point on either of the lines. We *cannot* just equate the corresponding components, as written, and try to solve for  $t$ . If you try this, you will see that the system

$$-8 - 5t = 6 + t, \quad 3 - t = 4 + 2t, \quad 4 = 1 + 3t$$

has no solution. However, as we will see in a moment, the lines *do* intersect! The difficulty here is with the parameters. Although we've used the letter  $t$  as the parameter for each line, there are *two* distinct parameters, one for  $\mathcal{L}_1$  and a second for  $\mathcal{L}_2$ . To proceed, we change the name of the variable for one of the parameters. Let

$$\mathbf{r}_2(u) = \langle 6 + u, 4 + 2u, 1 + 3u \rangle, \quad -\infty < u < \infty.$$

Now we equate the corresponding components of  $\mathbf{r}_1$  and  $\mathbf{r}_2$  to obtain the system

$$-8 - 5t = 6 + u, \quad 3 - t = 4 + 2u, \quad 4 = 1 + 3u.$$

This system has the unique solution  $t = -3$ ,  $u = 1$ . Thus, the lines do intersect at

$$\mathbf{r}_1(-3) = \mathbf{r}_2(1). \quad \square$$

## CHECKING THE ANSWER

To verify our conclusion, we evaluate

$$\mathbf{r}_1(-3) = \langle -8 - 5(-3), 3 - (-3), 4 \rangle = \langle 7, 6, 4 \rangle$$

and

$$\mathbf{r}_2(1) = \langle 6 + 1, 4 + 2 \cdot 1, 1 + 3 \cdot 1 \rangle = \langle 7, 6, 4 \rangle.$$

These calculations confirm that the point  $(7, 6, 4)$  is on both lines.

## EXAMPLE 5

## Finding the distance from a point to a line

Find the distance from the point  $P = (2, 0, 1)$  to the line given by

$$\mathbf{r}(t) = \langle 3 - t, -5 + 4t, 6 \rangle, \quad -\infty < t < \infty.$$

## SOLUTION

Here,  $P_0 = (3, -5, 6)$  corresponds to  $\mathbf{r}(0)$  and  $\mathbf{d} = \langle -1, 4, 0 \rangle$  is the direction vector for the line. Thus,  $\|\mathbf{d}\| = \sqrt{17}$  and  $\vec{P_0P} = \langle -1, 5, -5 \rangle$ . The norm of  $\mathbf{d} \times \vec{P_0P}$  is computed as follows:

$$\|\mathbf{d} \times \vec{P_0P}\| = \left\| \det \begin{bmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -1 & 4 & 0 \\ -1 & 5 & -5 \end{bmatrix} \right\| = \|-20\mathbf{i} - 5\mathbf{j} - \mathbf{k}\| = \sqrt{426}.$$

By Theorem 10.38, the distance from  $P$  to the line is  $\frac{\|\mathbf{d} \times \vec{P_0P}\|}{\|\mathbf{d}\|} = \frac{\sqrt{426}}{\sqrt{17}} \approx 5.0$  units.  $\square$

## TEST YOUR UNDERSTANDING

- ▶ How do you find an equation of a line determined by two points?
- ▶ How do you find an equation of a line parallel to a given vector and passing through a given point?
- ▶ Given a parametrization of a line, parametric equations of a line, or the equation of the line in symmetric form, how do you find the other forms?
- ▶ What are parallel lines, intersecting lines, and skew lines in 3-space?
- ▶ How do you find the distance from a point to a line?

## EXERCISES 10.5

### Thinking Back

*Lines in the plane:* Write the equation of the specified lines in  $\mathbb{R}^2$  as vector parametrizations and in symmetric form.

- ▶  $y = 2x + 5$
- ▶ The line perpendicular to the line  $y = 2x + 5$  and containing the point  $(2, -1)$ .
- ▶  $y = mx + b$

- ▶ The line perpendicular to the line  $y = mx + b$  and containing the point  $(0, b)$ .
- ▶ *The distance between two points in the plane:* What is the formula for computing the distance between points  $(x_1, y_1)$  and  $(x_2, y_2)$ ?
- ▶ *The distance between a point and a line in the plane:* Describe a method for computing the distance between the point  $(x_0, y_0)$  and the line  $y = mx + b$ .

### Concepts

0. *Problem Zero:* Read the section and make your own summary of the material.
1. *True/False:* Determine whether each of the statements that follow is true or false. If a statement is true, explain why. If a statement is false, provide a counterexample.
  - (a) *True or False:* Two parallel lines that share a point are identical.
  - (b) *True or False:* If the direction vector for a line is not a multiple of one of the standard basis vectors, then the line will intersect all three coordinate planes.
  - (c) *True or False:* If a line  $\mathbf{r}(t) = \mathbf{P}_1 + t\mathbf{d}$ ,  $-\infty < t < \infty$ , is parallel to the  $xz$ -plane then  $\mathbf{d}$  must have the form  $(a, 0, c)$  for some real numbers  $a$  and  $c$ .
  - (d) *True or False:* If  $\mathbf{r}_1(t) = \mathbf{P}_1 + t\mathbf{d}_1$ ,  $-\infty < t < \infty$ , and  $\mathbf{r}_2(t) = \mathbf{P}_2 + t\mathbf{d}_2$ ,  $-\infty < t < \infty$ , are vector parametrizations for lines in 3-space with  $\mathbf{d}_1 \neq \mathbf{d}_2$ , then the lines do not intersect.
  - (e) *True or False:* If  $\mathbf{r}_1(t) = \mathbf{P}_1 + t\mathbf{d}_1$ ,  $-\infty < t < \infty$ , and  $\mathbf{r}_2(t) = \mathbf{P}_2 + t\mathbf{d}_2$ ,  $-\infty < t < \infty$ , are vector parametrizations for lines in 3-space with  $\mathbf{P}_1 = \mathbf{P}_2$ , then the lines intersect.
  - (f) *True or False:* Let  $\mathbf{r}_1(t) = \mathbf{P}_1 + t\mathbf{d}_1$ ,  $-\infty < t < \infty$ , and  $\mathbf{r}_2(t) = \mathbf{P}_2 + t\mathbf{d}_2$ ,  $-\infty < t < \infty$ , be vector parametrizations for lines in 3-space. If  $\mathbf{P}_1 \neq \mathbf{P}_2$  and  $\mathbf{d}_1 \neq \mathbf{d}_2$ , then the lines cannot be identical.
  - (g) *True or False:* Let  $\mathbf{r}_1(t) = \mathbf{P}_1 + t\mathbf{d}_1$ ,  $-\infty < t < \infty$ , and  $\mathbf{r}_2(t) = \mathbf{P}_2 + t\mathbf{d}_2$ ,  $-\infty < t < \infty$ , be vector parametrizations for lines in 3-space. If  $\mathbf{P}_1 \neq \mathbf{P}_2$  and  $\mathbf{d}_1 \neq \mathbf{d}_2$ , then the lines cannot be parallel.
  - (h) *True or False:* If  $\mathbf{r}_1(t) = \mathbf{P}_1 + t\mathbf{d}_1$ ,  $-\infty < t < \infty$ , and  $\mathbf{r}_2(t) = \mathbf{P}_2 + t\mathbf{d}_2$ ,  $-\infty < t < \infty$ , are vector parametrizations for lines in 3-space with  $\mathbf{d}_1 \neq \mathbf{d}_2$ , then the lines are skew.
2. *Examples:* Construct examples of the thing(s) described in the following. Try to find examples that are different than any in the reading.
  - (a) A line in  $\mathbb{R}^3$  that is parallel to the  $xz$ -plane.
  - (b) A line in  $\mathbb{R}^3$  through the origin.
  - (c) A line parallel to the  $z$ -axis.
3. What is a linear equation in three variables? Give an example. What is the graph of a linear equation in three variables?
4. Provide two sets of geometric conditions that can be used to determine a line.
5. Let  $P$  and  $Q$  be distinct points in  $\mathbb{R}^3$ . Provide a step-by-step procedure for finding the equation of the line containing  $P$  and  $Q$ .
6. Let  $P = (a, b, c)$  and  $Q = (\alpha, \beta, \gamma)$  be distinct points in  $\mathbb{R}^3$ . Explain why the parametrization
 
$$x = a + (\alpha - a)t, \quad y = b + (\beta - b)t, \quad z = c + (\gamma - c)t,$$
 for  $0 \leq t \leq 1$ , describes the line segment connecting  $P$  and  $Q$ . What parametrization would describe the segment from  $Q$  to  $P$ ?
7. Explain how the slopes of two lines in  $\mathbb{R}^2$  can be used to determine whether the lines are parallel or identical. If the two lines are not parallel or identical, what must be true about the lines?
8. Explain how the direction vectors of two lines in  $\mathbb{R}^3$  can be used to determine whether the two lines are parallel or identical. If the two lines are not parallel or identical, what are the possibilities for them?

9. Find an equation of the line containing the point  $(-1, 3, 7)$  with direction vector  $\langle 2, -4, 9 \rangle$ .
- (a) Use a different direction vector to find another equation for the same line.
- (b) Find an equation for the same line with the form
- $$x = at + 5, y = bt + y_0, z = ct + z_0.$$

10. Find an equation of the line containing the point  $(x_0, y_0, z_0)$  with direction vector  $\langle a, b, c \rangle$ .
- (a) Use a different direction vector to find another equation for the same line.
- (b) Assuming that  $a \neq 0$ , find an equation for the same line with the form

$$x = at + 5, y = bt + y_0, z = ct + z_0.$$

11. Find the points where the line

$$\mathbf{r}(t) = \langle 4 - 3t, 8 + 7t, 5 + t \rangle, -\infty < t < \infty,$$

intersects each of the coordinate planes.

12. If  $a, b$ , and  $c$  are nonzero, find the points where the line

$$\mathbf{r}(t) = \langle x_0 + at, y_0 + bt, z_0 + ct \rangle$$

intersects each of the coordinate planes. If  $a = 0$ , explain why the line is parallel to the  $yz$ -plane.

13. Find the points where the line

$$x = t + 2, y = 2t - 5, z = -4t - 7$$

intersects each of the coordinate planes.

14. Find the points where the line

$$x = -3t + 5, y = 4, z = 2t + 11$$

intersects the  $xy$ -plane and  $yz$ -plane. Explain why the line does *not* intersect the  $xz$ -plane.

15. Find the point where the line

$$x = -7, y = t, z = 5$$

intersects the  $xz$ -plane. Explain why the line does *not* intersect the other two coordinate planes.

16. Let

$$x = at + x_0, y = bt + y_0, z = ct + z_0$$

be parametric equations for a line  $\mathcal{L}$  in  $\mathbb{R}^3$ . If  $x_0, y_0$ , and  $z_0$  are all nonzero, give conditions on  $a, b$ , and  $c$  so that

- (a)  $\mathcal{L}$  intersects all three coordinate planes.
- (b)  $\mathcal{L}$  intersects the  $xy$ - and  $yz$ -planes, but not the  $xz$ -plane.
- (c)  $\mathcal{L}$  intersects exactly one of three coordinate planes.
17. Let  $\mathcal{L}$  be the line determined by the equation

$$\mathbf{r}(t) = \langle 2 + 7t, 3 - 5t, 2t \rangle, -\infty < t < \infty.$$

- (a) Give parametric equations for  $\mathcal{L}$ .
- (b) Write an equation for  $\mathcal{L}$  in symmetric form.

18. Let  $\mathcal{L}$  be the line determined by the equation

$$\frac{x}{4} = \frac{y+2}{5} = -\frac{z-8}{3}.$$

- (a) Provide a vector parametrization for  $\mathcal{L}$ .
- (b) Give parametric equations for  $\mathcal{L}$ .

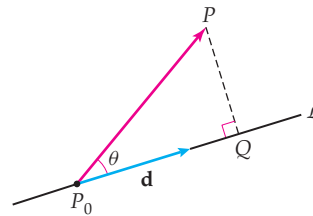

19. Let  $\mathcal{L}$  be the line determined by the system of equations

$$x(t) = 4, y(t) = 3 - 5t, z(t) = t, -\infty < t < \infty.$$

- (a) Provide a vector parametrization for  $\mathcal{L}$ .
- (b) Write an equation for  $\mathcal{L}$  in symmetric form.

20. We wish to find the distance from the point  $P$  to the line  $\mathcal{L}$  as shown in the figure that follows. We know the coordinates of points  $P$  and  $P_0$ , but we do not know the coordinates of point  $Q$ .

- (a) If you knew the measure of angle  $\theta$ , explain how you would find the distance from point  $P$  to line  $\mathcal{L}$ .

- (b) Using a cross product, explain how you can find the distance from point  $P$  to line  $\mathcal{L}$  even if you do not know the measure of angle  $\theta$ .

## Skills

In Exercises 21 and 22, find the equation of the line containing the given points in slope–intercept form. Then, use the technique of this section to find a vector parametrization for the same line. Finally, show that your equations are equivalent.

21.  $P(0, 5), Q(2, -1)$   
 22.  $P(3, -2), Q(6, 4)$

In Exercises 23–28, find an equation of the line containing the given point and parallel to the given vector. Express your answer (a) as a vector parametrization, (b) in terms of parametric equations, and (c) in symmetric form.

23.  $P(0, 0, 0), \mathbf{d} = \langle 1, 2, -4 \rangle$

24.  $P(2, 3, 5), \mathbf{d} = \langle 2, 3, 5 \rangle$   
 25.  $P(-1, 3, 7), \mathbf{d} = \langle 2, 0, 4 \rangle$   
 26.  $P(x_0, y_0, z_0), \mathbf{d} = \langle a, b, c \rangle$   
 27.  $P(3, 1), \mathbf{d} = \langle 2, 5 \rangle$   
 28.  $P(1, 3, -2, 4), \mathbf{d} = \langle 4, -1, 5, 8 \rangle$

In Exercises 29–34, find an equation of the line containing the given pair of points. Express your answer (a) as a vector parametrization, (b) in terms of parametric equations, and (c) in symmetric form.

29.  $P(0, 0, 0), Q(4, -1, 6)$   
 30.  $P(3, -1, 7), Q(5, 8, -2)$

31.  $P(-4, 11, 0)$ ,  $Q(4, 11, 2)$   
 32.  $P(x_0, y_0, z_0)$ ,  $Q(x_1, y_1, z_1)$   
 33.  $P(1, 6)$ ,  $Q(4, 5)$   
 34.  $P(3, -1, 2, 6)$ ,  $Q(1, 4, 5, -2)$   
 35. (a) Find a vector parametrization for the line containing the points  $P(x_0, y_0, z_0)$  and  $Q(x_1, y_1, z_1)$ .  
 (b) Apply a restriction to your parameter from part (a) so that the result parametrizes the *segment* from  $P$  to  $Q$ .

In Exercises 36–39, use the result of Exercise 35 to find parametric equations for the line segment connecting point  $P$  to point  $Q$ .

36.  $P(0, 2, 3)$ ,  $Q(4, 5, -1)$   
 37.  $P(1, 7, 3)$ ,  $Q(-1, -2, 5)$   
 38.  $P(0, 0, 0)$ ,  $Q(1, 2, 3)$   
 39.  $P(3, -1, 4)$ ,  $Q(-1, 5, 9)$

In Exercises 40–45, determine whether the given pairs of lines are parallel, identical, intersecting, or skew. If the lines are parallel, compute the distance between them. If the lines intersect, find the point of intersection and the angle at which the lines intersect.

40.  $\mathbf{r}_1(t) = \langle 2 + t, 5 - 3t, 6 + 7t \rangle$ ,  
 $\mathbf{r}_2(u) = \langle 3 - u, 4 + 3u, 5 - 2u \rangle$   
 41.  $\mathbf{r}_1(t) = \langle 2t + 6, -t + 1, 3t \rangle$ ,  
 $\mathbf{r}_2(t) = \langle -4t + 3, 2t - 1, -6t + 2 \rangle$   
 42.  $\mathbf{r}_1(t) = \langle 3 - t, 7 + t, 4 + 5t \rangle$ ,  
 $\mathbf{r}_2(t) = \langle 3 - t, 4 + 3t, 5 - 2t \rangle$

43.  $\mathbf{r}_1(t) = \langle 5t + 2, -4t, t - 7 \rangle$ ,  
 $\mathbf{r}_2(t) = \langle -3t + 4, -t + 12, -2t - 1 \rangle$   
 44.  $\mathbf{r}_1(t) = \langle 4 + 5t, 6, 7 - 2t \rangle$ ,  
 $\mathbf{r}_2(t) = \langle 6 - 4t, -3 + 3t, -1 + 4t \rangle$   
 45.  $\mathbf{r}_1(t) = \langle 2 + 5t, 6 - 4t, 8 + t \rangle$ ,  
 $\mathbf{r}_2(u) = \langle 2 - 10u, 3 + 8u, -2u \rangle$

In Exercises 46–49, calculate the distance from the given point to the given line in the following two ways: (a) using the method of Example 4 from Section 10.3 and (b) using Theorem 10.38 from this section.

46. Point  $P(-6, 3, 0)$  to the line determined by the points  $Q(3, -1, 5)$  and  $R(4, 5, -2)$ .  
 47. Point  $P(0, 1, -2)$  to the line given by

$$\mathbf{r}(t) = \langle 1 + 5t, -6 + t, -4t \rangle.$$

48. Point  $P(-6, 3, 0)$  to the line given by

$$\frac{x-3}{4} = \frac{y+2}{6} = z.$$

49. Point  $P(2, 5)$  to the line  $y = 2x - 3$ .  
 50. Find the distance from the point  $P(2, 3, -1, 4)$  to the line determined by the points  $Q(1, 0, 4, 8)$  and  $R(3, 4, -1, 6)$ .  
 51. Find values for  $\alpha$  such that the lines determined by

$$\mathbf{r}_1(t) = \langle 4 - t, -6 + 2t, 6 + 5t \rangle \quad \text{and}$$

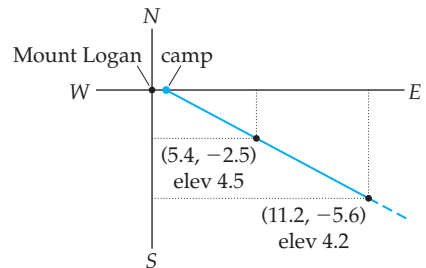

$$\mathbf{r}_2(t) = \langle \alpha t, 2 - 2\alpha t, 3 + 15t \rangle$$

are (a) parallel and (b) orthogonal.

## Applications

52. Emmy is a civil engineer at the Hanford Nuclear Reservation in Washington State. She has discovered a leak of toxic wastes in one of the tank farms of the facility. The tank farm is huge, and she does not know which tank is leaking. Worse yet, the tanks are all underground. Inspecting the tanks would require digging up the entire tank farm, an operation that is considered too expensive. Instead, Emmy has wells dug in several locations around the tank farm, to try to trace the leak back to its source. If the earth's surface is considered to be the  $xy$ -plane, then the bottom of the tank farm is the plane  $z = -40$ , where the distance is given in feet. Emmy's wells find contaminated groundwater at the points  $(758, 60, -49)$  and  $(1033, 247, -55)$ . If the waste is leaking from the bottom of one of the tanks and is moving along a straight path, what is the location of the tank she should check first for the leak?
53. Ian is climbing Mount Logan in Canada's Icefield Range. He has made a second camp high on a ridge of the mountain. He does not know how high his camp is,

but he notices that a summit far away lines up perfectly with a nearer minor point whose height he can read on his map. When Ian considers the summit of Mount Logan to be  $(0, 0, 5.96)$ , he finds that the far summit is at  $(11.2, -5.6, 4.2)$  and the nearer point is at  $(5.4, -2.5, 4.5)$ . All the coordinates are given in kilometers. Ian's camp is due east of the summit of Mount Logan. How high is Ian on the mountain? How far is he from the summit?

## Proofs

54. Let  $\mathcal{L}_1$  and  $\mathcal{L}_2$  be lines in  $\mathbb{R}^3$ , with  $P_1$  and  $Q_1$  points on  $\mathcal{L}_1$  and  $P_2$  and  $Q_2$  points on  $\mathcal{L}_2$ . Show that  $\mathcal{L}_1$  is parallel to  $\mathcal{L}_2$  if and only if  $\vec{P_1Q_1}$  is parallel to  $\vec{P_2Q_2}$ .
55. Prove that the distance from the point  $P$  to the line given by the equation  $\mathbf{r}(t) = \mathbf{P}_0 + t\mathbf{d}$  is given by  $\frac{\|\mathbf{d} \times \vec{P_0P}\|}{\|\mathbf{d}\|}$ .

## Thinking Forward

- ▶ *Lines tangent to spheres:* Let  $\mathcal{S}$  denote the unit sphere centered at the origin. How many lines are there that are tangent to  $\mathcal{S}$ ? How many lines are there that are tangent to  $\mathcal{S}$  at each point on the sphere? How many lines are there that are tangent to  $\mathcal{S}$  and parallel to one of the coordinate planes? How many lines are there that are tangent to  $\mathcal{S}$  and parallel to one of the coordinate axes?
- ▶ *Planes tangent to spheres:* Let  $\mathcal{S}$  denote the unit sphere centered at the origin. How many planes are there that are tangent to  $\mathcal{S}$ ? How many planes are there that are tangent to  $\mathcal{S}$  at each point on the sphere? How many planes are there that are tangent to  $\mathcal{S}$  and parallel to one of the coordinate planes? How many planes are there that are tangent to  $\mathcal{S}$  and parallel to one of the coordinate axes?

## 10.6 PLANES

- ▶ Using a normal vector and a point to construct the equation for a plane
- ▶ Computing the distance from a point to a plane
- ▶ Determining whether two planes are parallel or intersect

### The Equation of a Plane

In our final section of the chapter we discuss planes in three-dimensional space. Just as curves in two dimensions have tangent lines, surfaces have tangent planes, and those planes can be used as approximations for the surface. We will visit these topics in Chapter 12.

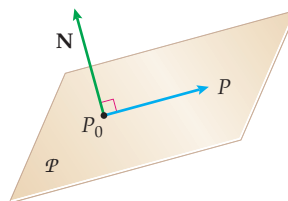

There are several geometric conditions that determine a unique plane. For example, each of the following sets of information uniquely determines one plane in  $\mathbb{R}^3$ :

- ▶ three noncollinear points;
- ▶ a line and a point not on the line;
- ▶ two distinct intersecting lines;
- ▶ two (distinct) parallel lines.

Our path to the equation of a plane, however, involves a point on the plane and a single vector,  $\mathbf{N}$ , called a **normal vector**, orthogonal to the plane. We will also see, in examples and exercises, how we can find an equation for the plane given any of the conditions just listed.

Let  $P_0 = (x_0, y_0, z_0)$  be a given point on a plane  $\mathcal{P}$  and let  $\mathbf{N} = \langle a, b, c \rangle$  be a vector orthogonal to  $\mathcal{P}$ . Place  $\mathbf{N}$  so that its initial point is at  $P_0$ , and consider the vector  $\overrightarrow{P_0P}$ , where  $P$  is an arbitrary point on  $\mathcal{P}$ .

*A plane is determined by a point on the plane and a vector orthogonal to the plane*

Note that since  $\mathbf{N}$  is orthogonal to  $\mathcal{P}$ , it is orthogonal to every vector lying in  $\mathcal{P}$ . In particular,  $\mathbf{N}$  is orthogonal to the vector  $\overrightarrow{P_0P}$ , and thus  $\mathbf{N} \cdot \overrightarrow{P_0P} = 0$ . If  $P = (x, y, z)$ , then

$$\mathbf{N} \cdot \overrightarrow{P_0P} = \langle a, b, c \rangle \cdot \langle x - x_0, y - y_0, z - z_0 \rangle = 0.$$

Carrying out the dot product, we obtain the following equation for a plane:

$$a(x - x_0) + b(y - y_0) + c(z - z_0) = 0.$$

This equation is analogous to the point-slope form for the equation of a line that we studied in Chapter 0.

We may rearrange the last equation to obtain

$$ax + by + cz = ax_0 + by_0 + cz_0.$$

Since  $a$ ,  $b$ ,  $c$ ,  $x_0$ ,  $y_0$ , and  $z_0$  are all constants, if we let  $d = ax_0 + by_0 + cz_0$ , then

$$ax + by + cz = d,$$

the **general form for the equation of a plane**. Recall from the last section that equations of this form are called linear equations and the graph of a linear equation in three variables is a plane.

For example, to find the equation of the plane that has the normal vector  $\mathbf{N} = \langle 5, -3, 8 \rangle$  and contains the point  $(2, -7, 1)$ , we set up the equation

$$\langle 5, -3, 8 \rangle \cdot \langle x - 2, y - (-7), z - 1 \rangle = 0.$$

We can then write the equation in either of the forms

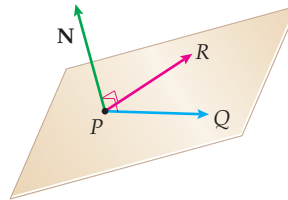

$$5(x - 2) - 3(y + 7) + 8(z - 1) = 0 \quad \text{and} \quad 5x - 3y + 8z = 39.$$

## Geometric Conditions That Determine Planes

We now know how to find the equation of a plane given a normal vector to the plane and a point on the plane. When we are given different geometric conditions that determine a plane, we will follow this same procedure to find the equation of the plane.

Suppose we know three noncollinear points on a plane and we wish to find the equation for the plane. We can use the three points to find a normal vector for the plane and then use this normal vector and any one of the three points to find the equation of the plane, as we did at the beginning of this section. One normal vector to the plane containing  $P$ ,  $Q$ , and  $R$  is the cross product  $\mathbf{N} = \overrightarrow{PQ} \times \overrightarrow{PR}$ , as shown in the following figure:

*A plane is determined by three noncollinear points*

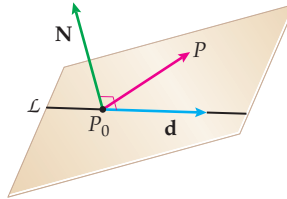

We will discuss how to find the equation of a plane by using one more of the sets of geometric conditions that determine the plane. You should then consider how to find equations for planes by using the other sets of geometric conditions.

A given line and a point not on the line define a plane uniquely. When you have the equation for a line,  $\mathbf{r}(t) = \mathbf{P}_0 + t\mathbf{d}$ , together with a point,  $P$ , not on the line, you immediately

know that  $P$  and  $P_0$  are two distinct points on some plane  $\mathcal{P}$ . In addition, the direction vector  $\mathbf{d}$  for the line gives you one vector parallel to the plane. We already know that we can find a vector normal to  $\mathcal{P}$  if we have two nonparallel vectors that are parallel to the plane (since we can then use their cross product). Vectors  $\mathbf{d}$  and  $\vec{P_0P}$  meet our requirements. Thus, we will use  $\mathbf{N} = \mathbf{d} \times \vec{P_0P}$  and point  $P_0$  to find the equation of the plane.

*A plane is determined by a line and a point not on the line*

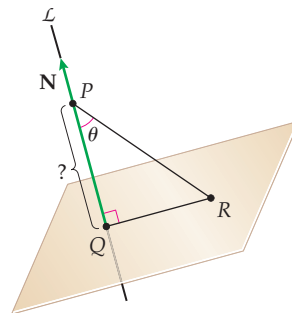

## Distances

The distance from a point  $P$ , to a plane,  $\mathcal{P}$ , is the distance from  $P$  to the closest point on  $\mathcal{P}$ . This is the distance along a line through  $P$  and orthogonal to  $\mathcal{P}$ .

When we have the equation of a plane, we can immediately find a vector,  $\mathbf{N}$ , normal to the plane. One way to find the distance from point  $P$  to plane  $\mathcal{P}$  would be to find the equation of the line  $\mathcal{L}$  containing  $P$  with direction vector  $\mathbf{N}$ . We could then locate the point  $Q$  of intersection of  $\mathcal{L}$  and  $\mathcal{P}$ . Finally we could use the distance formula to calculate the distance from  $P$  to  $Q$ .

*Finding the distance from a point to a plane*

The method just outlined would work, but is more than we need to just find the distance from  $P$  to the plane. The extra work comes when we perform several steps to find the point of intersection,  $Q$ . It turns out that we do not need to find  $Q$ . We do need to find  $\|\vec{QP}\|$ , and this magnitude is  $|\text{comp}_{\mathbf{N}} \vec{RP}|$ , where  $R$  can be any point on the plane  $\mathcal{P}$ .

To summarize, we have the following theorem:

### THEOREM 10.39

#### The Distance from a Point to a Plane

Given a point  $P$  and a plane  $\mathcal{P}$  containing a point  $R$  with normal vector  $\mathbf{N}$ , the distance from  $P$  to  $\mathcal{P}$  is

$$|\text{comp}_{\mathbf{N}} \vec{RP}| = \frac{|\mathbf{N} \cdot \vec{RP}|}{\|\mathbf{N}\|}.$$

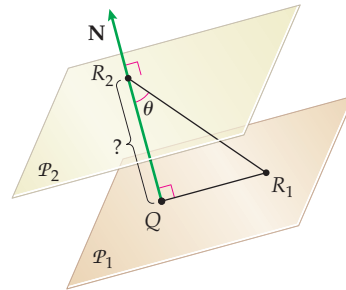

The following theorem is a direct consequence of Theorem 10.39:

**THEOREM 10.40**    **The Distance Between a Plane and the Origin**

Let  $P = (x_0, y_0, z_0)$  be any point on the plane  $\mathcal{P}$ . The distance between the origin and  $\mathcal{P}$  is given by  $|(x_0, y_0, z_0) \cdot \mathbf{n}|$  where  $\mathbf{n}$  is a unit normal vector for  $\mathcal{P}$ .

The proof of Theorem 10.40 is left for Exercise 62. We may also adapt Theorem 10.39 to find the distance between parallel planes  $\mathcal{P}_1$  and  $\mathcal{P}_2$ .

*Finding the distance between two parallel planes*

Since  $\mathcal{P}_1$  and  $\mathcal{P}_2$  are parallel, they have a common normal vector  $\mathbf{N}$ . We need a single point on each of the planes. Suppose that  $R_1 = (x_1, y_1, z_1)$  is on  $\mathcal{P}_1$  and  $R_2 = (x_2, y_2, z_2)$  is on  $\mathcal{P}_2$ . We may now apply Theorem 10.39 to compute the distance to obtain the following:

**THEOREM 10.41**    **The Distance Between Parallel Planes**

Given a point  $R_1$  on a plane  $\mathcal{P}_1$  and a point  $R_2$  on a parallel plane  $\mathcal{P}_2$  with common normal vector  $\mathbf{N}$ , the distance from  $\mathcal{P}_1$  to  $\mathcal{P}_2$  is

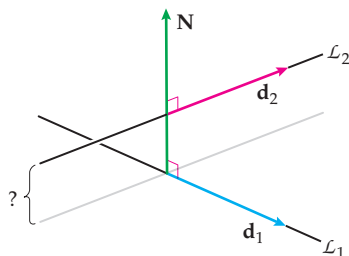

$$\frac{|\mathbf{N} \cdot \overrightarrow{R_1 R_2}|}{\|\mathbf{N}\|}.$$

For our final distance computation we compute the distance between two skew lines. When two lines  $\mathcal{L}_1$  and  $\mathcal{L}_2$  are skew, we can find a unique pair of parallel planes such that each of the parallel planes contains one of the skew lines. To visualize this situation, think of a translation that takes one of the lines onto the  $x$ -axis. The same translation moves the other line to another line somewhere in the coordinate system that is skew in relation to the  $x$ -axis. Now, rotate this new system around the  $x$ -axis until the skew line lies in a plane parallel to the  $xy$ -plane, say,  $z = c$ . This rotation leaves the  $x$ -axis fixed. The planes  $z = 0$  and  $z = c$  are the unique parallel planes that contain these transformed lines. Since our translation and rotation did not change the relative orientations of the lines, if you rotate the lines back and then translate the lines back to their original positions, these two operations together will take the planes  $z = 0$  and  $z = c$  to the unique pair of parallel planes containing the original skew lines. Furthermore, since the distance between the planes  $z = 0$  and  $z = c$  is  $|c|$ , that is also the distance between the original skew lines. This *will not* be our method for computing the distance between skew lines, but we hope that it makes the geometry easier to understand.

Our method computes the distance between the unique parallel planes that contain the skew lines. If we had the normal vector to these parallel planes, we could use Theorem 10.41

to compute the distance. The normal vector  $\mathbf{N}$  may be computed from the direction vectors  $\mathbf{d}_1$  and  $\mathbf{d}_2$  for  $\mathcal{L}_1$  and  $\mathcal{L}_2$ . As the following figure shows, the normal vector  $\mathbf{N} = \mathbf{d}_1 \times \mathbf{d}_2$ :

Combining this reasoning with Theorem 10.41, we have

### THEOREM 10.42

#### The Distance Between Skew Lines

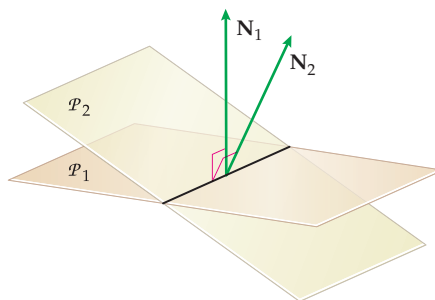

Let  $\mathcal{L}_1$  and  $\mathcal{L}_2$  be nonparallel lines with equations  $\mathbf{r}_1(t) = P_1 + t\mathbf{d}_1$  and  $\mathbf{r}_2(t) = P_2 + t\mathbf{d}_2$ , respectively. Then the distance between  $\mathcal{L}_1$  and  $\mathcal{L}_2$  is given by

$$\frac{|(\mathbf{d}_1 \times \mathbf{d}_2) \cdot \overrightarrow{P_1P_2}|}{\|\mathbf{d}_1 \times \mathbf{d}_2\|}.$$

## Intersecting Planes

We now turn our attention to intersections; two planes may intersect, and a line may intersect a plane. Two distinct planes in 3-space either intersect or are parallel. Given the equations of two planes, we can immediately tell whether or not they intersect by examining the normal vectors of the planes. If the normal vectors are parallel, then the planes are parallel and possibly even identical. The planes are identical if and only if the original equations are equivalent. As the following figure illustrates, when the normal vectors are not parallel, the planes will intersect in a line. To find the equation of the line of intersection, we will need a direction vector for the line and a point on the line. The direction vector can be found with the use of the cross product.

*The line of intersection of two planes is orthogonal to each of the normal vectors*

Thus, to find the equation of the line of intersection of two intersecting planes  $\mathcal{P}_1$  and  $\mathcal{P}_2$ , we find their respective normal vectors  $\mathbf{N}_1$  and  $\mathbf{N}_2$ . We also determine a single point on the line of intersection. We use the cross product  $\mathbf{N}_1 \times \mathbf{N}_2$  as the direction vector for the line of intersection in order to determine the equation of the line.

Given a line and a plane in 3-space, one of three things must occur: The line and plane can intersect in a unique point, the line and plane can be parallel, or the line may lie *in* the plane. We can determine which of these situations occurs by looking at the dot product of the direction vector for the line and the normal vector for the plane. If  $\mathbf{d}$  is the direction vector for the line and  $\mathbf{N}$  is the normal vector for the plane, we consider  $\mathbf{d} \cdot \mathbf{N}$ . If  $\mathbf{d} \cdot \mathbf{N} = 0$ , the two vectors are orthogonal, so either the line and plane are parallel or the line is in the plane. If  $\mathbf{d} \cdot \mathbf{N} \neq 0$ , the line and plane intersect in a unique point.

## Examples and Explorations

### EXAMPLE 1

#### Finding the equation of a plane determined by three points

Show that the three points  $P = (2, -1, 5)$ ,  $Q = (9, 3, 7)$ , and  $R = (4, 7, -5)$  are noncollinear, and find the equation of the plane they determine.

#### SOLUTION

We form the vectors

$$\vec{PQ} = \langle 9 - 2, 3 - (-1), 7 - 5 \rangle = \langle 7, 4, 2 \rangle \text{ and } \vec{PR} = \langle 4 - 2, 7 - (-1), -5 - 5 \rangle = \langle 2, 8, -10 \rangle$$

and note that they are not parallel, since neither of them is a scalar multiple of the other. This implies that the three points are noncollinear. Next, we compute our normal vector. To find a normal vector we may take the cross product of the two vectors we just found. We let  $\mathbf{N} = \vec{PQ} \times \vec{PR} = \langle 7, 4, 2 \rangle \times \langle 2, 8, -10 \rangle = \langle -56, 74, 48 \rangle$ . Finally, since  $P$ ,  $Q$ , and  $R$  are all in the plane, we are free to choose any of them as our designated point. We will use  $P$ . We now have an equation for the plane:

$$-56(x - 2) + 74(y + 1) + 48(z - 5) = 0.$$

Note that the components of  $\mathbf{N}$  are all multiples of 2. This is because the components of both vectors are integers and all components of  $\vec{PR}$  are multiples of 2. To make our calculation (slightly) simpler, we could have scaled  $\vec{PR}$  by  $\frac{1}{2}$  before we took the cross product. Scaling either  $\vec{PQ}$  or  $\vec{PR}$  by a nonzero constant leaves the relative geometry of the vectors unchanged. Certainly, if  $\vec{PQ}$  and  $\vec{PR}$  are not parallel, then  $\vec{PQ}$  and  $k(\vec{PR})$  are not parallel for any nonzero scalar  $k$ . Had we scaled  $\vec{PR}$  by  $\frac{1}{2}$ , we would have obtained the normal vector

$$\tilde{\mathbf{N}} = \vec{PQ} \times \left( \frac{1}{2} \vec{PR} \right) = \langle -28, 37, 24 \rangle.$$

Using this as our normal vector, we would have gotten

$$-28(x - 2) + 37(y + 1) + 24(z - 5) = 0$$

as the equation for our plane. This equation is equivalent to the one we found before.  $\square$

### EXAMPLE 2

#### Finding the equation of a plane determined by a line and a point not on the line

Show that the point  $Q(3, -4, -1)$  is not on the line,  $\mathcal{L}$ , determined by

$$\mathbf{r}(t) = \langle 8 - 3t, -2 + 5t, 6 + 2t \rangle.$$

Give a general form for the equation of the plane  $\mathcal{P}$  determined by  $Q$  and  $\mathcal{L}$ .

**SOLUTION**

If  $P$  were on  $\mathcal{L}$ , there would be a value of  $t$  that simultaneously satisfied the system of equations

$$8 - 3t = 3, \quad -2 + 5t = -4, \quad 6 + 2t = -1.$$

Since the solutions of each of the three equations are different,  $Q$  is not on  $\mathcal{L}$ .

We quickly note that the vector  $\mathbf{d} = \langle -3, 5, 2 \rangle$  is a direction vector for  $\mathcal{L}$  and point  $Q_0(8, -2, 6)$  is on  $\mathcal{L}$ . Another vector parallel to the plane of interest is  $\overrightarrow{Q_0Q}$ . Here,

$$\overrightarrow{Q_0Q} = \langle 3 - 8, -4 - (-2), -1 - 6 \rangle = \langle -5, -2, -7 \rangle.$$

To find a normal vector to the plane, we use the cross product of  $\mathbf{d}$  and  $\overrightarrow{Q_0Q}$ :

$$\mathbf{d} \times \overrightarrow{Q_0Q} = \langle -3, 5, 2 \rangle \times \langle -5, -2, -7 \rangle = \langle -31, -31, 31 \rangle.$$

Since we are interested primarily in the direction of this vector, we may scale it by any nonzero value to obtain simpler coefficients. We will scale the cross product by  $-\frac{1}{31}$  and let  $\mathbf{N} = \langle 1, 1, -1 \rangle$ .

We can use either  $Q$  or  $Q_0$  as our point on the plane. If we use  $Q$  to obtain the equation for the plane, we arrive at the equation

$$1(x - 3) + 1(y + 4) - 1(z + 1) = 0.$$

A general form for the equation of the plane is  $x + y - z = 0$ . □

**EXAMPLE 3****Finding the distance from a point to a plane**

Find the distance from the point  $P = (6, 3, -2)$  to the plane given by  $3x - y + 2z = 4$ .

**SOLUTION**

We need a point on the plane. Verify that  $R = (0, 0, 2)$  is on the plane. We can immediately find the vector  $\overrightarrow{RP}$  and a normal vector  $\mathbf{N}$  to the plane. In this example we have  $\overrightarrow{RP} = \langle 6, 3, -4 \rangle$  and  $\mathbf{N} = \langle 3, -1, 2 \rangle$ . Thus, the distance from  $P$  to the plane can be computed as follows:

$$|\text{comp}_{\mathbf{N}} \overrightarrow{RP}| = \frac{|\mathbf{N} \cdot \overrightarrow{RP}|}{\|\mathbf{N}\|} = \frac{|\langle 3, -1, 2 \rangle \cdot \langle 6, 3, -4 \rangle|}{\|\langle 3, -1, 2 \rangle\|} = \frac{|18 - 3 - 8|}{\sqrt{3^2 + 1^2 + 2^2}} = \frac{7}{\sqrt{14}} = \frac{\sqrt{14}}{2}. \quad \square$$

**EXAMPLE 4****Finding the distance between two parallel planes**

Show that the plane  $\mathcal{P}_1$  with equation  $-4x + 6y + 2z = 1$  and the plane  $\mathcal{P}_2$  given by  $2x - 3y - z = 5$  are parallel. Then compute the distance between  $\mathcal{P}_1$  and  $\mathcal{P}_2$ .

**SOLUTION**

The plane  $\mathcal{P}_1$  has the normal vector  $\mathbf{N}_1 = \langle -4, 6, 2 \rangle$  and the plane  $\mathcal{P}_2$  has the normal vector  $\mathbf{N}_2 = \langle 2, -3, -1 \rangle$ . Notice that the vectors  $\mathbf{N}_1$  and  $\mathbf{N}_2$  are scalar multiples of each other. This means that the planes  $\mathcal{P}_1$  and  $\mathcal{P}_2$  are parallel.

Now, the point  $R_1 = (0, 0, 1/2)$  is on plane  $\mathcal{P}_1$  and the point  $R_2 = (0, 0, -5)$  is on plane  $\mathcal{P}_2$ . (Check these.) We use Theorem 10.41 to compute the distance between the planes:

$$\frac{|\langle 2, -3, -1 \rangle \cdot \overrightarrow{R_1R_2}|}{\|\langle 2, -3, -1 \rangle\|} = \frac{|\langle 2, -3, -1 \rangle \cdot \langle 0, 0, -11/2 \rangle|}{\|\langle 2, -3, -1 \rangle\|} = \frac{11\sqrt{14}}{28}. \quad \square$$

## EXAMPLE 5

## Finding the distance between two skew lines

Find the distance between the skew lines  $\mathcal{L}_1$  and  $\mathcal{L}_2$ , respectively given by the vector functions

$$\mathbf{r}_1(t) = \langle 5 + 3t, -7 + t, 2 - 5t \rangle \text{ and } \mathbf{r}_2(t) = \langle -2t, 7, 1 - 3t \rangle.$$

## SOLUTION

Before we begin to compute the distance, we should really think about the relationship of the lines  $\mathcal{L}_1$  and  $\mathcal{L}_2$ . Are they really skew? Might they intersect, be parallel, or even be identical?

Direction vectors for  $\mathcal{L}_1$  and  $\mathcal{L}_2$  are  $\mathbf{d}_1 = \langle 3, 1, -5 \rangle$  and  $\mathbf{d}_2 = \langle -2, 0, -3 \rangle$ , respectively. Since these direction vectors are not scalar multiples of each other, the lines either intersect or are skew. Now, at this point we could look for a point of intersection. However, let us think about the process we are about to start. We are about to compute the distance between  $\mathcal{L}_1$  and  $\mathcal{L}_2$ . If this distance is zero, the lines intersect. If the distance is positive, the lines are skew.

We first find the normal vector  $\mathbf{N}$ :

$$\mathbf{N} = \mathbf{d}_1 \times \mathbf{d}_2 = \langle 3, 1, -5 \rangle \times \langle -2, 0, -3 \rangle = \langle -3, 19, 2 \rangle.$$

(Check this.) We will use  $P_1 = \mathbf{r}_1(0) = \langle 5, -7, 2 \rangle$  and  $P_2 = \mathbf{r}_2(0) = \langle 0, 7, 1 \rangle$  as our points on  $\mathcal{L}_1$  and  $\mathcal{L}_2$ , respectively. Thus,  $\overrightarrow{P_1P_2} = \langle -5, 14, -1 \rangle$ . Finally, we use Theorem 10.42 to find the distance between  $\mathcal{L}_1$  and  $\mathcal{L}_2$ . This distance is

$$\frac{|\mathbf{N} \cdot \overrightarrow{P_1P_2}|}{\|\mathbf{N}\|} = \frac{|(-3, 19, 2) \cdot (-5, 14, -1)|}{\|(-3, 19, 2)\|} = \frac{279}{374} \sqrt{374}.$$

Since the distance is nonzero, the lines are skew. □

## EXAMPLE 6

## Finding the line of intersection of two planes

Show that the planes whose equations are  $-x + 2y - 4z = 6$  and  $3x + 5y - z = 4$  intersect, and find parametric equations for the line of intersection.

## SOLUTION

The normal vector to  $-x + 2y - 4z = 6$  is  $\mathbf{N}_1 = \langle -1, 2, -4 \rangle$ , while the normal vector to  $3x + 5y - z = 4$  is  $\mathbf{N}_2 = \langle 3, 5, -1 \rangle$ . These normal vectors are not parallel; therefore the planes must intersect. The line of intersection must be orthogonal to each of the normal vectors. To find the direction vector,  $\mathbf{d}$ , for the line of intersection, we use the cross product. Here,

$$\mathbf{d} = \mathbf{N}_1 \times \mathbf{N}_2 = \langle -1, 2, -4 \rangle \times \langle 3, 5, -1 \rangle = \langle 18, -13, -11 \rangle.$$

To find the equation for the line of intersection, we now need only a point on the line, which will, of course, lie on each of the planes. Unless the line is parallel to one of the coordinate planes, it will intersect all three coordinate planes. In this example, our line will intersect all three coordinate planes, because all three components of  $\mathbf{d}$  are nonzero. To simplify our search for a point of intersection, we can decide to find such a point in one of the coordinate planes. Here, we will look for the point of intersection in the  $xy$ -plane. Thus, we will set  $z = 0$  in each of the equations  $-x + 2y - 4z = 6$  and  $3x + 5y - z = 4$ , to obtain the system

$$-x + 2y = 6 \text{ and } 3x + 5y = 4,$$

which has the solution  $x = -2$  and  $y = 2$ . Thus, the point  $(-2, 2, 0)$  is in each of the planes and therefore on our line of intersection. Parametric equations for the line of intersection are

$$x(t) = -2 + 18t, \quad y(t) = 2 - 13t, \quad z(t) = -11t, \quad -\infty < t < \infty. \quad \square$$

**EXAMPLE 7****Understanding the geometry of a line and a plane**

Let  $\mathcal{L}$  be the line given by  $\mathbf{r}(t) = \langle 4 + t, -3 + 5t, 2 - 3t \rangle$  and  $\mathcal{P}$  be the plane with equation  $-x + 5y + 6z = 5$ . Show that  $\mathcal{L}$  and  $\mathcal{P}$  intersect and find the point of intersection.

**SOLUTION**

The vector  $\mathbf{d} = \langle 1, 5, -3 \rangle$  is a direction vector for  $\mathcal{L}$ , while the vector  $\mathbf{N} = \langle -1, 5, 6 \rangle$  is normal to  $\mathcal{P}$ . We compute the dot product:

$$\mathbf{d} \cdot \mathbf{N} = \langle 1, 5, -3 \rangle \cdot \langle -1, 5, 6 \rangle = -1 + 25 - 18 = 6 \neq 0.$$

Since the dot product is *not* zero, the line and plane intersect. Because  $\mathcal{L}$  and  $\mathcal{P}$  intersect, there will be a value of the parameter  $t = t_0$  such that  $\mathbf{r}(t_0)$  is on the plane. That is, the coordinates  $(x(t_0), y(t_0), z(t_0))$  given by

$$x(t_0) = 4 + t_0, \quad y(t_0) = -3 + 5t_0, \quad z(t_0) = 2 - 3t_0$$

satisfy the equation of the plane. Since  $-x + 5y + 6z = 5$ , we have

$$-x(t_0) + 5y(t_0) + 6z(t_0) = 5.$$

Equivalently,

$$-(4 + t_0) + 5(-3 + 5t_0) + 6(2 - 3t_0) = 5.$$

Solving this equation for  $t_0$ , we obtain  $t_0 = 2$ . We now have the point of intersection,

$$(x(2), y(2), z(2)) = (6, 7, -4). \quad \square$$

**? TEST YOUR UNDERSTANDING**

- ▶ How do you use a point on a plane and a vector normal to the plane to find the equation of the plane?
- ▶ How do you use other geometric conditions to find the equation of a plane? For example, how do you find the equation of a plane containing three noncollinear points or a plane containing two intersecting lines?
- ▶ How do you find the distance from a point to a plane? How do you find the distance between two parallel planes? How do you find the distance between two skew lines?
- ▶ How do you determine when two planes intersect? How do you find the line of intersection when they do?
- ▶ How do you determine when a line intersects a plane? How do you find the point of intersection when it does?

**EXERCISES 10.6****Thinking Back**

- ▶ *Linear equations:* Explain why the equation
 
$$2x - 3y = 5$$
 represents a line in the  $xy$ -plane, but represents a plane in a three-dimensional coordinate system.
- ▶ *Orthogonal vectors:* Show that  $\mathbf{u} = \langle 1, 2, -3 \rangle$  is orthogonal to  $a\mathbf{v} + b\mathbf{w}$ , where  $\mathbf{v} = \langle 1, 1, 1 \rangle$ ,  $\mathbf{w} = \langle -1, 2, 1 \rangle$ , and  $a$  and  $b$  are any real numbers. Interpret this statement geometrically.

## Concepts

- Problem Zero:** Read the section and make your own summary of the material.
- True/False:** Determine whether each of the statements that follow is true or false. If a statement is true, explain why. If a statement is false, provide a counterexample.
  - True or False:** The graph of every linear equation in  $\mathbb{R}^3$  is a line.
  - True or False:** Three distinct points determine a plane.
  - True or False:** Two distinct lines in  $\mathbb{R}^3$  always determine a plane.
  - True or False:** Three concurrent lines determine a plane. (**Concurrent** means that the three lines intersect in a common point.)
  - True or False:** If two distinct lines in  $\mathbb{R}^3$  are not skew, they determine a unique plane.
  - True or False:** If two distinct planes in  $\mathbb{R}^3$  intersect, they intersect in a unique line.
  - True or False:** If the direction vector of a line is parallel to the normal vector to a plane, the line and plane are parallel.
  - True or False:** Let  $\mathcal{P}_1$  and  $\mathcal{P}_2$  be distinct planes with normal vectors  $\mathbf{N}_1$  and  $\mathbf{N}_2$ , respectively. If  $\mathbf{N}_1 \times \mathbf{N}_2 = \mathbf{0}$ , the planes are parallel.
- Examples:** Construct examples of the thing(s) described in the following. Try to find examples that are different than any in the reading.
  - A plane parallel to  $x + 3y - 4z = 7$ .
  - A line orthogonal to the plane  $x + 3y - 4z = 7$ .
  - A plane orthogonal to the line

$$x = 3t - 5, y = -2t + 7, z = -4.$$

- Let  $ax + by + cz = d$  be the equation of a plane with  $a$ ,  $b$ ,  $c$ , and  $d$  all nonzero. What are the coordinates of the intersection of the plane and the  $x$ -,  $y$ -, and  $z$ -axes? Explain how to use these points to sketch the plane.
- Explain why two planes orthogonal to the same vector are either parallel or identical.
- Let  $\mathbf{v} = \langle a, b, c \rangle$  and  $\mathbf{w} = \langle \alpha, \beta, \gamma \rangle$ , where  $\mathbf{v}$  and  $\mathbf{w}$  are *not* parallel vectors. Explain why the planes  $ax + by + cz = d$  and  $\alpha x + \beta y + \gamma z = \delta$  intersect.
- Explain why there are infinitely many different planes containing any given line in  $\mathbb{R}^3$ . What form does the equation of a plane containing the  $x$ -axis have?
- What does it mean for three points to be collinear? How do you determine that three given points are collinear? What does it mean for three points to be noncollinear?
- Explain why three noncollinear points determine a unique plane. Explain how you would use the coordinates of the

points to find the equation of the plane. Explain why three collinear points do not determine a unique plane.

- Explain why a line  $\mathcal{L}$  and a point  $P$  not on  $\mathcal{L}$  determine a unique plane. Explain how you would use the equation of  $\mathcal{L}$  and the coordinates  $P$  to find the equation of the plane. Explain why  $P$  and  $\mathcal{L}$  do *not* determine a unique plane if  $P$  is on  $\mathcal{L}$ .
- Explain why two intersecting lines determine a unique plane. Explain how you would use the equations of the lines to find the equation of the plane.
- Explain why two distinct parallel lines determine a unique plane. Explain how you would use the equations of the lines to find the equation of the plane.
- Explain why two skew lines do *not* determine a plane.
- Explain why any two skew lines lie on a unique pair of parallel planes.
- The angle  $\theta$  between two intersecting planes, called the **dihedral angle**, is defined to be the angle between the two normal vectors to the planes, where

$$\theta = \cos^{-1} \frac{\mathbf{N}_1 \cdot \mathbf{N}_2}{\|\mathbf{N}_1\| \|\mathbf{N}_2\|}.$$

Draw a figure that illustrates the dihedral angle and explain why the definition given is a reasonable definition.

- Given the equations

$$x = at + x_0, y = bt + y_0, z = ct + z_0$$

for a line  $\mathcal{L}$  and

$$\alpha x + \beta y + \gamma z = \delta$$

for a plane  $\mathcal{P}$ , explain how to determine whether  $\mathcal{L}$  is orthogonal to  $\mathcal{P}$ .

- Explain how to tell when two planes are perpendicular.
- When a line  $\mathcal{L}$  intersects a plane  $\mathcal{P}$  the angle between them is defined to be the complement of the acute angle between the direction vector for the line and the normal vector to the plane. Draw a figure that illustrates this angle, and explain why the definition given is a reasonable definition.
- Explain the similarities in the derivations of the formulas for the distances from a point to a plane and from a point to a line.
- Explain the derivation of the formula for finding the distance between two skew lines  $\mathcal{L}_1$  and  $\mathcal{L}_2$ . Why does this formula work?
- Two distinct nonparallel planes intersect in a line. Outline a procedure for finding the equation of the line of intersection.

## Skills

In Exercises 21–30, find the equations of the planes determined by the given conditions.

- The plane contains the origin and is normal to the vector  $\langle 4, -1, 5 \rangle$ .
- The plane contains the point  $(-2, 3, -1)$  and is normal to the vector  $3\mathbf{i} - 2\mathbf{j}$ .
- The plane contains the point  $(2, -1, 6)$  and is normal to the vector  $\langle 2, -1, 6 \rangle$ .

24. The plane contains the points  $(1, 0, 0)$ ,  $(0, 1, 0)$ , and  $(0, 0, 1)$ .
25. The plane contains the points  $(2, 4, 3)$ ,  $(3, -5, 0)$ , and  $(-4, 1, 6)$ .
26. The plane contains the points  $(-4, 0, 0)$ ,  $(0, 3, 0)$ , and  $(0, 0, 5)$ .
27. The plane contains the points  $(x_0, 0, 0)$ ,  $(0, y_0, 0)$ , and  $(0, 0, z_0)$ .
28. The plane contains the point  $(1, 2, -5)$  and the line determined by  $\mathbf{r}(t) = \langle -4 + t, 3 + 5t, 2 - 3t \rangle$ .
29. The plane contains the point  $(-4, 1, 3)$  and the line determined by  $\mathbf{r}(t) = \langle 3 + 7t, -2 + t, 3 + 4t \rangle$ .
30. The plane contains the point  $(-4, 1, 3)$  and is normal to the line determined by  $\mathbf{r}(t) = \langle -4 + t, 3 + 5t, 2 - 3t \rangle$ .

31. Show that the lines determined by

$$\mathbf{r}_1(t) = \langle -2 - 5t, 3 + 2t, 4t \rangle \text{ and}$$

$$\mathbf{r}_2(t) = \langle 8 + 15t, 1 - 6t, 3 - 12t \rangle$$

are parallel, and then find an equation of the plane containing both lines.

32. Show that the lines determined by

$$\mathbf{r}_1(t) = \langle 3 - 5t, -2 + t, 6 \rangle \text{ and}$$

$$\mathbf{r}_2(t) = \langle 4 + 15t, 5 - 3t, 4 \rangle$$

are parallel, and then find an equation of the plane containing both lines.

33. Show that the lines determined by

$$\mathbf{r}_1(t) = \langle 7, 3 - 4t, 2 + 6t \rangle \text{ and}$$

$$\mathbf{r}_2(t) = \langle 6 - t, 3 + 8t, 9 - 5t \rangle$$

intersect, and then find an equation of the plane containing the two lines.

34. Show that the lines determined by

$$\mathbf{r}_1(t) = \langle 3 - t, 4 - 4t, -3 + 4t \rangle \text{ and}$$

$$\mathbf{r}_2(t) = \langle 5 - t, -6 + 2t, -2 + t \rangle$$

intersect, and then find an equation of the plane containing both lines.

In Exercises 35–38, find an equation of the line of intersection of the two given planes.

35.  $x + 2y + 3z = 4$  and  $-2x + y - 4z = 6$
36.  $y - 5z = 3$  and  $6x - 7y = 5$
37.  $x = 4$  and  $3x - 5y + 2z = -3$
38.  $x - 2z = 7$  and  $x - 3y - 4z = 0$

## Applications

54. Emmy is trying to get information about the water table below the Hanford reservation. She has drilled wells that show that the water table can be found at  $(0, 0, -35)$  and  $(300, 0, -38)$ . She drills one more well and finds the water table at  $(0, 300, -37)$ .
- (a) Find a plane that approximates the water table.
- (b) If she drills another hole at  $x = 300$ ,  $y = 300$ , how deep does she expect to find the water table?

39. Find the distance from the point  $(2, 0, -3)$  to the plane  $3x - 4y + 5z = 1$ .

40. Show that the planes given by  $2x - 4y - 3z = 5$  and  $-4x + 8y + 6z = 1$  are parallel, and find the distance between the planes.

41. Show that the planes given by  $2x - 3y + 5z = 7$  and  $-6x + 9y - 15z = 8$  are parallel, and find the distance between the planes.

42. Show that the planes given by  $y - 7z = 16$  and  $2y - 14z = 5$  are parallel, and find the distance between the planes.

43. Show that the lines with the equations

$$\frac{x+1}{2} = \frac{y-3}{-4} = \frac{z-2}{5} \text{ and } \frac{x-4}{3} = \frac{y+1}{2} = \frac{z}{3}$$

are skew, find the equations of the parallel planes containing the lines, and find the distance between the lines.

Use your answers from Exercise 14 to find the angle between the indicated planes in Exercises 44 and 45.

44.  $7x - 3y + 5z = 6$  and  $2x + 3y - z = 1$

45.  $-x + 7y - 2z = 5$  and  $3x + 5y - 4z = 2$

Use Exercise 17 to find the angle between the indicated lines and planes in Exercises 46 and 47.

46.  $\mathbf{r}(t) = \langle 5 + 2t, 6 - t, 4 + 5t \rangle$  and  $3y + 5z = -4$

47.  $\mathbf{r}(t) = \langle 3 + 5t, 2 - t, 4 - 3t \rangle$  and  $-10x + 2y + 6z = 7$

In Exercises 48–51, determine whether the given line is parallel to, intersects, or lies in the given plane. If the line is parallel to the plane, calculate its distance from the plane. If the line intersects the plane, find the point and angle at which they intersect.

48.  $\mathbf{r}(t) = \langle t, -5 - 2t, -1 + 3t \rangle$  and  $4x - 5y + 2z = 5$

49.  $\mathbf{r}(t) = \langle 3 - 2t, -4, 5 - 4t \rangle$  and  $2x + 5y - z = 7$

50.  $\mathbf{r}(t) = \langle 4 + t, 6 - 5t, -3t \rangle$  and  $3x + 3y - 4z = 30$

51.  $\mathbf{r}(t) = \langle 5 + 6t, 3 - t, 0 \rangle$  and  $7y - 5z = 3$

52. At every point on a sphere  $(x-a)^2 + (y-b)^2 + (z-c)^2 = r^2$ , there is some plane tangent to the sphere. Explain how to find the equation of the tangent plane at any given point.

53. Use your answer in Exercise 52 to find the equations of the planes tangent to the given spheres at the specified points.

(a)  $x^2 + y^2 + z^2 = 1$  at  $\left(\frac{1}{2}, \frac{1}{4}, \frac{\sqrt{11}}{4}\right)$ .

(b)  $(x-1)^2 + (y+2)^2 + z^2 = 9$  at  $(3, 0, 1)$ .

55. Annie is sitting on a beach in the evening, looking out at a mooring buoy. She wonders how deep the water is at the buoy. She assumes that the beach slopes out as a plane. She is sitting at a point  $(150, 30, 5)$  relative to the buoy, where a  $z$ -coordinate of zero represents sea level and the coordinates are given in feet. The point on the shore that is closest to the buoy looks as if it is around  $(120, 40, 0)$  relative to the buoy. There is a piece of driftwood down the beach that seems to be at about  $(140, 60, 5)$ . How deep is the water at the buoy?

## Proofs

56. Let  $\mathcal{L}_1$  and  $\mathcal{L}_2$  be two skew lines. Prove that no plane contains both  $\mathcal{L}_1$  and  $\mathcal{L}_2$ .
57. Prove that the planes determined by the equations  $ax + by + cz = d$  and  $\alpha x + \beta y + \gamma z = \delta$  are perpendicular if and only if  $a\alpha + b\beta + c\gamma = 0$ .
58. Let  $\mathbf{a}$ ,  $\mathbf{b}$ , and  $\mathbf{c}$  be position vectors terminating in some plane  $\mathcal{P}$ . Show that  $(\mathbf{a} \times \mathbf{b}) + (\mathbf{b} \times \mathbf{c}) + (\mathbf{c} \times \mathbf{a})$  is normal to  $\mathcal{P}$ .
59. (a) Show that the distance from the point  $P(x_0, y_0, z_0)$  to the plane with equation  $ax + by + cz + d = 0$  is
- $$\frac{|ax_0 + by_0 + cz_0 + d|}{\sqrt{a^2 + b^2 + c^2}}.$$
- (b) Use the result of part (a) to recalculate the distance in Exercise 39.
60. Let  $\mathbf{r}_1(t) = \mathbf{P}_1 + t\mathbf{d}_1$  and  $\mathbf{r}_2(t) = \mathbf{P}_2 + t\mathbf{d}_2$  be parametrizations for two nonparallel lines. Prove that the lines intersect if and only if the three vectors  $\mathbf{P}_1 - \mathbf{P}_2$ ,  $\mathbf{d}_1$ , and  $\mathbf{d}_2$  are coplanar.
61. Let  $\mathbf{r}_1(t) = \mathbf{P}_0 + t\mathbf{d}_1$  and  $\mathbf{r}_2(u) = \mathbf{Q}_0 + u\mathbf{d}_2$  respectively be the equations of lines  $\mathcal{L}_1$  and  $\mathcal{L}_2$ . Show that  $(\mathbf{P}_0 - \mathbf{Q}_0) \cdot (\mathbf{d}_1 \times \mathbf{d}_2) = 0$  if and only if  $\mathcal{L}_1$  and  $\mathcal{L}_2$  lie in the same plane.
62. Prove Theorem 10.40. That is, show that if  $P = (x_0, y_0, z_0)$  is a point on plane  $\mathcal{P}$ , then the distance between the origin and  $\mathcal{P}$  is given by  $|\langle x_0, y_0, z_0 \rangle \cdot \mathbf{n}|$ , where  $\mathbf{n}$  is a unit normal vector to  $\mathcal{P}$ .

## Thinking Forward

- ▶ *A plane tangent to a surface:* A particular smooth surface has tangent vectors  $\mathbf{v}_x = \mathbf{i} - 3\mathbf{j}$  and  $\mathbf{v}_y = \mathbf{i} + 4\mathbf{k}$  at the point  $P(2, -3, 4)$ . Find the equation of the tangent plane to the surface by finding the normal vector to the plane  $\mathbf{N} = \mathbf{v}_x \times \mathbf{v}_y$  containing the point  $P$ .
- ▶ *A plane tangent to a surface:* A particular smooth surface has tangent vectors  $\mathbf{v}_x = \mathbf{i} + \alpha\mathbf{j}$  and  $\mathbf{v}_y = \mathbf{i} + \beta\mathbf{k}$  at the point  $P(x_0, y_0, z_0)$ . Find the equation of the tangent plane to the surface by finding the normal vector to the plane  $\mathbf{N} = \mathbf{v}_x \times \mathbf{v}_y$  containing the point  $P$ .

## CHAPTER REVIEW, SELF-TEST, AND CAPSTONES

Before you progress to the next chapter, be sure you are familiar with the definitions, concepts, and basic skills outlined here. The capstone exercises at the end bring together ideas from this chapter and look forward to future chapters.

### Definitions

Give precise mathematical definitions or descriptions of each of the concepts that follow. Then illustrate the definition with a sketch or an algebraic example.

- ▶ a *sphere* in  $\mathbb{R}^3$
- ▶ a *cylinder* in  $\mathbb{R}^3$ , along with the *directrix* and the *rulings* of the cylinder
- ▶ *vectors* in  $\mathbb{R}^2$  and  $\mathbb{R}^3$
- ▶ the *scalar* multiple of a vector
- ▶ the *magnitude*, *norm*, or *length* of a vector
- ▶ the *dot product* of two vectors
- ▶ the *standard basis vectors* in  $\mathbb{R}^2$  and  $\mathbb{R}^3$
- ▶ *orthogonal* curves and vectors
- ▶ the *projection* of one vector onto another
- ▶ the *determinant* of a  $3 \times 3$  matrix
- ▶ the *cross product* of two vectors from  $\mathbb{R}^3$

### Theorems

Fill in the blanks to complete each of the following theorem statements:

- ▶ Given any nonzero vector  $\mathbf{v}$ , the vector \_\_\_\_\_ is a unit vector in the direction of  $\mathbf{v}$ .
- ▶ For any vectors  $\mathbf{u} = \langle u_1, u_2, u_3 \rangle$  and  $\mathbf{v} = \langle v_1, v_2, v_3 \rangle$ ,  $\mathbf{u} \cdot \mathbf{v} = \underline{\hspace{2cm}}$ .
- ▶ If  $\mathbf{u}$  and  $\mathbf{v}$  are two nonzero vectors, then  $\mathbf{u} \cdot \mathbf{v} = \underline{\hspace{2cm}} \cos \theta$ , where  $\theta$  is \_\_\_\_\_.
- ▶ *Law of Cosines:* In a triangle with side lengths  $a$ ,  $b$ , and  $c$ , where  $\theta$  is the angle between the sides of length  $a$  and  $b$ ,  $a^2 + b^2 - \underline{\hspace{2cm}} = c^2$ .
- ▶ Let  $\theta$  be the angle between nonzero vectors  $\mathbf{u}$  and  $\mathbf{v}$ . Then
 
$$\theta \text{ is } \begin{cases} \underline{\hspace{2cm}} & \text{if and only if } \mathbf{u} \cdot \mathbf{v} > 0 \\ \underline{\hspace{2cm}} & \text{if and only if } \mathbf{u} \cdot \mathbf{v} = 0 \\ \underline{\hspace{2cm}} & \text{if and only if } \mathbf{u} \cdot \mathbf{v} < 0. \end{cases}$$

- ▶ *The Triangle Inequality:* Given any vectors  $\mathbf{u}$  and  $\mathbf{v}$ ,  $\|\mathbf{u} + \mathbf{v}\|$  \_\_\_\_\_  $\|\mathbf{u}\| + \|\mathbf{v}\|$ .
- ▶ The cross product of two parallel vectors  $\mathbf{u}$  and  $\mathbf{v}$  in  $\mathbb{R}^3$  is \_\_\_\_\_.
- ▶ For any vectors  $\mathbf{u}$  and  $\mathbf{v}$  in  $\mathbb{R}^3$ ,  $\mathbf{v} \times \mathbf{u} =$  \_\_\_\_\_  $(\mathbf{u} \times \mathbf{v})$ .
- ▶ For any vectors  $\mathbf{u}$  and  $\mathbf{v}$  in  $\mathbb{R}^3$  and any scalar  $c$ ,  $c(\mathbf{u} \times \mathbf{v}) =$  \_\_\_\_\_  $=$  \_\_\_\_\_.
- ▶ For vectors  $\mathbf{u}$  and  $\mathbf{v}$  in  $\mathbb{R}^3$ ,  $\mathbf{u} \cdot (\mathbf{u} \times \mathbf{v}) =$  \_\_\_\_\_ and  $\mathbf{v} \cdot (\mathbf{u} \times \mathbf{v}) =$  \_\_\_\_\_.
- ▶ Let  $\mathbf{u}$  and  $\mathbf{v}$  be nonzero vectors in  $\mathbb{R}^3$  with the same initial point. Then  $\|\mathbf{u} \times \mathbf{v}\| =$  \_\_\_\_\_  $\sin \theta$ , where  $\theta$  is \_\_\_\_\_.
- ▶ If  $\mathbf{u}$  and  $\mathbf{v}$  are nonparallel vectors in  $\mathbb{R}^3$ , then  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{u} \times \mathbf{v}$  form a \_\_\_\_\_ triple.
- ▶ If  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  are vectors in  $\mathbb{R}^3$ , then \_\_\_\_\_ is the volume of the parallelepiped determined by  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$ .
- ▶ The distance from a point  $P$  to a line  $\mathcal{L}$  parametrized by  $\mathbf{r}(t) = \mathbf{P}_0 + t\mathbf{d}$  is \_\_\_\_\_.
- ▶ The distance from a point  $P$  to a plane  $\mathcal{P}$  containing a point  $R$  with normal vector  $\mathbf{N}$  is \_\_\_\_\_.

## Notation and Algebraic Rules for Vectors

*Notation:* Describe the meanings of each of the following mathematical expressions:

- ▶  $\mathbb{R}^2$
- ▶  $\mathbb{R}^3$
- ▶  $\langle a, b \rangle$
- ▶  $\langle a, b, c \rangle$
- ▶  $\vec{PQ}$
- ▶  $\|\mathbf{v}\|$
- ▶  $\mathbf{i}$
- ▶  $\mathbf{j}$
- ▶  $\mathbf{k}$
- ▶  $\mathbf{u} \cdot \mathbf{v}$
- ▶  $\mathbf{u} \times \mathbf{v}$
- ▶  $\text{comp}_{\mathbf{u}}\mathbf{v}$
- ▶  $\text{proj}_{\mathbf{u}}\mathbf{v}$

*Algebraic Properties of Vector Arithmetic:* Each of the statements that follow demonstrates a commutative rule, an associative rule, or a distributive rule of vector arithmetic. Fill in the blanks and give the name of the relevant property.

- ▶ For any two vectors  $\mathbf{u}$  and  $\mathbf{v}$  with the same number of components,  $\mathbf{u} + \mathbf{v} =$  \_\_\_\_\_.
- ▶ For any three vectors  $\mathbf{u}$ ,  $\mathbf{v}$  and  $\mathbf{w}$ , each with the same number of components,  $(\mathbf{u} + \mathbf{v}) + \mathbf{w} =$  \_\_\_\_\_.
- ▶ For any scalar  $c$  and any two vectors  $\mathbf{u}$  and  $\mathbf{v}$  with the same number of components,  $c(\mathbf{u} + \mathbf{v}) =$  \_\_\_\_\_.
- ▶ For any vectors  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$ ,  $\mathbf{u} \cdot (\mathbf{v} + \mathbf{w}) =$  \_\_\_\_\_.
- ▶ For any vectors  $\mathbf{u}$  and  $\mathbf{v}$ , and any scalar  $k$ ,  $k(\mathbf{u} \cdot \mathbf{v}) =$  \_\_\_\_\_  $=$  \_\_\_\_\_.
- ▶ Let  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  be vectors in  $\mathbb{R}^3$ . Then  $\mathbf{u} \times (\mathbf{v} + \mathbf{w}) =$  \_\_\_\_\_.
- ▶  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  be vectors in  $\mathbb{R}^3$ . Then  $(\mathbf{u} + \mathbf{v}) \times \mathbf{w} =$  \_\_\_\_\_.

## Skill Certification: Working in $\mathbb{R}^3$

*Distances between points:* Find the distance between each pair of points.

1.  $(1, 2, -3)$  and  $(4, 7, -3)$
2.  $(-5, 7, 0)$  and  $(0, 6, -3)$
3.  $(1, 5, -2)$  and  $(3, 9, -1)$
4.  $(4, 6, 2)$  and  $(1, 3, -5)$

*Equations of Spheres:* Find the equation of the specified sphere.

5. center  $(2, -3, 4)$ , radius 6
6. center  $(2, -3, 4)$ , tangent to the  $xz$ -plane
7. the segment with endpoints  $(1, 5, -2)$  and  $(3, 9, -1)$  is a diameter
8. center  $(4, 6, 2)$ ,  $(1, 3, -5)$  is a point on the sphere

*Products and Norms:* In Exercises 9–24 let  $\mathbf{u} = \mathbf{i}$ ,  $\mathbf{v} = 2\mathbf{j}$ , and  $\mathbf{w} = \mathbf{i} + 2\mathbf{j} + \frac{1}{2}\mathbf{k}$ .

9. Sketch the position vectors  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$ .
10. Sketch the parallelogram determined by  $\mathbf{u}$  and  $\mathbf{v}$ .
11. Sketch the parallelepiped determined by  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$ .
12. Compute  $\|\mathbf{u}\|$ , and use the result to label your sketches in Exercises 9–11.
13. Compute  $\|\mathbf{v}\|$ , and use the result to label your sketches in Exercises 9–11.
14. Compute  $\|\mathbf{w}\|$ , and use the result to label your sketches in Exercises 9–11.
15. Compute  $\mathbf{u} \cdot \mathbf{v}$ .
16. Compute  $\mathbf{u} \times \mathbf{v}$ .
17. Compute the angle between  $\mathbf{u}$  and  $\mathbf{v}$ .
18. Compute the area of the parallelogram determined by  $\mathbf{u}$  and  $\mathbf{v}$ .
19. Compute the lengths of the diagonals of the parallelogram determined by  $\mathbf{u}$  and  $\mathbf{v}$ .
20. Find a vector orthogonal to both  $\mathbf{u}$  and  $\mathbf{v}$ .
21. Find a unit vector orthogonal to both  $\mathbf{u}$  and  $\mathbf{v}$ .
22. Compute the volume of the parallelepiped determined by  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$ .
23. Compute the areas of the six faces of the parallelepiped determined by  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$ .
24. Compute the lengths of the four diagonals of the parallelepiped determined by  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$ . (*Hint:  $\mathbf{u} + \mathbf{v} + \mathbf{w}$  is one of the diagonals.*)

*Products and Norms:* Let  $\mathbf{u} = \langle 2, 4, -1 \rangle$ ,  $\mathbf{v} = \langle 0, -3, 2 \rangle$ , and  $\mathbf{w} = \langle -1, 1, 5 \rangle$ . Use these vectors to find the specified quantities in Exercises 25–36.

25.  $\|\mathbf{u}\|$
26.  $\|\mathbf{v}\|$
27.  $\mathbf{u} \cdot \mathbf{v}$
28.  $\mathbf{u} \times \mathbf{v}$
29. the angle between  $\mathbf{u}$  and  $\mathbf{v}$
30. the area of the parallelogram determined by  $\mathbf{u}$  and  $\mathbf{v}$
31. the lengths of the diagonals of the parallelogram determined by  $\mathbf{u}$  and  $\mathbf{v}$
32. a vector orthogonal to both  $\mathbf{u}$  and  $\mathbf{v}$
33. a unit vector orthogonal to both  $\mathbf{u}$  and  $\mathbf{v}$
34. the volume of the parallelepiped determined by  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$
35. the areas of the six faces of the parallelepiped determined by  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$
36. the lengths of the four diagonals of the parallelepiped determined by  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$

*Lines and Planes Determined by Points:* Consider the three points  $P(2, -3, 5)$ ,  $Q(3, 1, 0)$ , and  $R(-1, 0, 7)$ . Find the following.

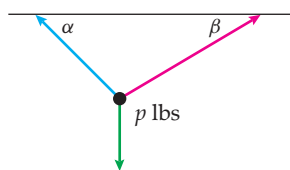

37. an equation for the line containing  $P$  and  $Q$
38. an equation for the line containing  $P$  and  $R$
39. an equation for the plane containing  $P$ ,  $Q$ , and  $R$
40. the area of the triangle determined by  $P$ ,  $Q$ , and  $R$

*Intersections and Distances:* Let  $P$  be the point with coordinates  $(1, 2, -3)$ ,  $\mathcal{L}$  be the line with equation  $\mathbf{r}(t) = \langle 2 + 5t, -3 + t, -4t \rangle$ , and  $\mathcal{P}$  be the plane with equation  $x - 3y + 4z = 5$ . Find the following.

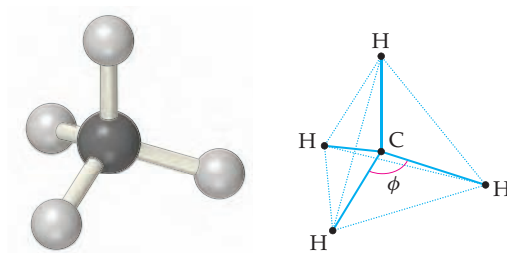

41. the distance from  $P$  to  $\mathcal{L}$
42. the distance from  $P$  to  $\mathcal{P}$
43. the point at which  $\mathcal{L}$  intersects  $\mathcal{P}$
44. the angle at which  $\mathcal{L}$  intersects  $\mathcal{P}$

## Capstone Problems

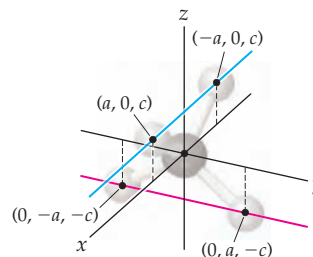

- A. A weight of  $p$  pounds is suspended by two ropes as shown in the figure that follows. What are the magnitudes of the forces in each of the ropes?

- B. Explain why the solid with vertices  $(1, 0, 0)$ ,  $(-1, 0, 0)$ ,  $(0, 1, 0)$ ,  $(0, -1, 0)$ ,  $(0, 0, 1)$ , and  $(0, 0, -1)$  is a regular octahedron.
- (a) Find the area of each face.
  - (b) Find the equations of the three lines that form the edges of the face of the octahedron with vertices  $(1, 0, 0)$ ,  $(0, 1, 0)$ , and  $(0, 0, 1)$ .
  - (c) Find the equation of each face of the octahedron.
  - (d) Find the volume of the octahedron.
- C. Find the equation of the sphere with center  $(1, -3, 5)$  and tangent to the plane with equation  $3x - 5y - 2z = 6$ . Find the equation of the sphere with center  $(\alpha, \beta, \gamma)$  and tangent to the plane with equation  $ax + by + cz = d$ .
- D. One molecule of methane is composed of one carbon atom (chemical symbol C) and four hydrogen atoms (chemical symbol H). Therefore the chemical formula for methane is  $\text{CH}_4$ . Geometrically, if we picture the carbon atom at the center of the molecule, the four hydrogen atoms would lie at the four vertices of a regular tetrahedron. (Recall that a regular tetrahedron is a solid with four congruent faces, each of which is an equilateral triangle.) Each of the hydrogen atoms is bonded to the carbon atom, but the hydrogens are not bonded to each other. Following is a schematic of methane inside a regular tetrahedron:

To aid you in visualizing the molecule, it might help to place the carbon atom at the origin of a three-dimensional coordinate system with two of the hydrogen atoms in the  $xz$ -plane at  $(a, 0, c)$  and  $(-a, 0, c)$ . Then the other two hydrogen atoms must lie in the  $yz$ -plane at  $(0, a, -c)$  and  $(0, -a, -c)$ , as shown here:

Since the carbon is at the origin, the coordinates of these four points also give the components of the vectors from the carbon atom to the hydrogen atoms.

- (a) In methane the H–C–H bond angles are all equal. Explain why this means that

$$\langle a, 0, c \rangle \cdot \langle -a, 0, c \rangle = \langle a, 0, c \rangle \cdot \langle 0, a, -c \rangle.$$

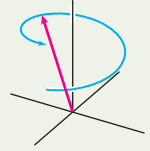

- (b) What are the H–C–H bond angles in methane?

## 11.1 VECTOR-VALUED FUNCTIONS

- ▶ Defining curves in  $\mathbb{R}^3$  with parametric equations in three variables
- ▶ Vector functions in  $\mathbb{R}^2$  and  $\mathbb{R}^3$
- ▶ Curves defined with parametric equations in  $\mathbb{R}^2$  and  $\mathbb{R}^3$

### Parametric Equations in $\mathbb{R}^3$

---

For most of this book we have studied functions  $f : X \rightarrow Y$  whose domains and codomains are subsets of the real numbers. In this chapter we broaden our study to include functions whose codomains are subsets of  $\mathbb{R}^2$  or  $\mathbb{R}^3$ . Such functions are called vector-valued functions or vector functions. The graph of such a function is a curve in the plane, with codomain  $\mathbb{R}^2$ , or a curve in 3-space, with codomain  $\mathbb{R}^3$ . We will still use the basic concepts of calculus to analyze these functions, their graphs, and their applications.

Recall that in Chapter 9 we defined parametric equations in  $\mathbb{R}^2$  to be a pair of functions

$$x = x(t) \quad \text{and} \quad y = y(t),$$

where  $t$  is a *parameter* defined on some interval  $I$  of real numbers. At the time we also remarked that the definition could be extended to three-dimensional space, which we do here:

#### DEFINITION 11.1

#### Parametric Equations in $\mathbb{R}^3$

*Parametric equations* in  $\mathbb{R}^3$  are triples of functions

$$x = x(t), y = y(t), \text{ and } z = z(t),$$

where the *parameter*  $t$  is defined on some interval  $I$  of real numbers.

The *parametric curve*, or *space curve*, associated with the equations is the set of points

$$\{(x(t), y(t), z(t)) \in \mathbb{R}^3 \mid t \in I\}.$$

For example, the equations

$$x = \cos t, \quad y = \sin t, \quad z = t, \quad t \in [0, 4\pi]$$

are parametric equations in three variables. (See Example 1.)

### Vector-Valued Functions

---

Another way to express a curve defined by parametric equations, using slightly different notation, is with a vector-valued function. Our definition follows:

### DEFINITION 11.2 Vector Functions with Three Components

Let

$$x = x(t), y = y(t), \text{ and } z = z(t)$$

be three real-valued functions, each of which is defined on some interval  $I \subseteq \mathbb{R}$ . A **vector function**, or **vector-valued function**,  $\mathbf{r}(t)$ , with three components is a function of the form

$$\mathbf{r}(t) = \langle x(t), y(t), z(t) \rangle = x(t)\mathbf{i} + y(t)\mathbf{j} + z(t)\mathbf{k}.$$

The variable  $t$  in the vector function is called the **parameter**. The functions  $x = x(t)$ ,  $y = y(t)$ , and  $z = z(t)$  are called the **components** of  $\mathbf{r}(t)$ . The **vector curve**, or **space curve**, associated with the vector function is the set of points

$$\{(x(t), y(t), z(t)) \mid t \in I\}$$

in  $\mathbb{R}^3$ .

Note that for every value of  $t \in I$ , the value of the function is a vector. When we consider a vector-valued function that represents the position of a particle, we always interpret the vector as a position vector and the vector curve as the set of terminal points of all the position vectors of the particle. That is, the collection of points

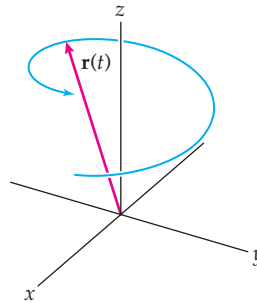

$$(x(t), y(t), z(t)) \text{ for } t \in I,$$

is the vector curve for  $\mathbf{r}(t) = \langle x(t), y(t), z(t) \rangle$  since these are the terminal points of the vectors

$$\langle x(t), y(t), z(t) \rangle \text{ for } t \in I.$$

A vector curve is illustrated in the following figure:

*The collection of terminal points of the position vectors forms the graph of a vector function*

We could similarly define a vector function with two components to be a function of the form  $\mathbf{r}(t) = \langle x(t), y(t) \rangle = x(t)\mathbf{i} + y(t)\mathbf{j}$ , where  $x(t)$  and  $y(t)$  are functions of  $t$  on some interval  $I \subseteq \mathbb{R}$ . This is an alternative way of expressing a function defined by two parametric equations.

Note that we will sometimes consider a vector function and a real-valued function of a single variable,  $f(t)$ , simultaneously. When we do, we will refer to  $f(t)$  as a **scalar function**.

## Parametrized Curves

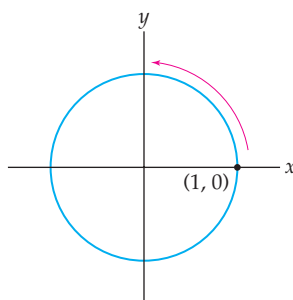

The space curve associated with the vector function  $\mathbf{r}(t) = \langle x(t), y(t), z(t) \rangle$  is the set of points  $\{(x(t), y(t), z(t)) \mid t \in I \subseteq \mathbb{R}\}$ . Along with the curve itself, the parameter,  $t$ , imposes

directionality on the curve, pointing in the direction in which  $t$  is increasing. This directionality is indicated with an arrow.

To understand a space curve, it can be helpful to analyze its projection onto one of the coordinate planes. For example, rather than immediately drawing  $\mathbf{r}(t) = \langle x(t), y(t), z(t) \rangle$  in 3-space, we may consider the image of the parametric curve defined by  $x = x(t)$  and  $y = y(t)$  in the  $xy$ -plane. We could similarly consider the projections onto the  $yz$ - and  $xz$ -planes. If we judiciously select which two components to consider, we will obtain the best information.

For example, consider the function  $\mathbf{r}(t) = \langle \cos t, \sin t, t \rangle$  for  $t \in [0, 4\pi]$ . Temporarily ignoring the  $z$ -component of this function, we have the parametric equations  $x = \cos t$  and  $y = \sin t$ . From our work in Chapter 9, we recognize that these equations describe the unit circle centered at the origin. In addition, the curve is traced twice, counterclockwise, starting at the point  $(1, 0)$  as  $t$  increases on the interval  $[0, 4\pi]$ , as in the following figure:

The projection of the vector function onto the  $xy$ -plane

To incorporate the  $z$ -coordinate, we note that  $z$  increases as  $t$  increases. The complete vector curve will spiral around the  $z$ -axis as  $t$  increases, and we obtain the following circular helix:

To visualize a vector curve, it may help to tabulate the points in 3-space that correspond to a few values of the parameter  $t$ . We do this in the examples that follow.

Scalars, scalar functions, and vector-valued functions may be combined algebraically in various ways. For example, the product of the scalar  $k$  and the vector function  $\mathbf{r}(t) = \langle x(t), y(t), z(t) \rangle$  is

$$k \mathbf{r}(t) = k \langle x(t), y(t), z(t) \rangle = \langle kx(t), ky(t), kz(t) \rangle.$$

The product of a scalar function  $f(t)$  and the vector function  $\mathbf{r}(t) = \langle x(t), y(t), z(t) \rangle$  is

$$f(t) \mathbf{r}(t) = f(t) \langle x(t), y(t), z(t) \rangle = \langle f(t)x(t), f(t)y(t), f(t)z(t) \rangle.$$

The dot product and cross product of the vector functions  $\mathbf{r}_1(t) = \langle x_1(t), y_1(t), z_1(t) \rangle$  and  $\mathbf{r}_2(t) = \langle x_2(t), y_2(t), z_2(t) \rangle$  are, respectively,

$$\begin{aligned}\mathbf{r}_1(t) \cdot \mathbf{r}_2(t) &= \langle x_1(t), y_1(t), z_1(t) \rangle \cdot \langle x_2(t), y_2(t), z_2(t) \rangle \\ &= x_1(t)x_2(t) + y_1(t)y_2(t) + z_1(t)z_2(t) \quad \text{and}\end{aligned}$$

$$\begin{aligned}\mathbf{r}_1(t) \times \mathbf{r}_2(t) &= \langle x_1(t), y_1(t), z_1(t) \rangle \times \langle x_2(t), y_2(t), z_2(t) \rangle \\ &= \langle y_1(t)z_2(t) - y_2(t)z_1(t), x_2(t)z_1(t) - x_1(t)z_2(t), x_1(t)y_2(t) - x_2(t)y_1(t) \rangle.\end{aligned}$$

Note that the dot product is a scalar function and the cross product is a vector function. The structures of the various products formed with two component vector functions are similar.

## Limits and Continuity of Vector Functions

The limit of a vector-valued function may be defined in terms of the limits of the components.

### DEFINITION 11.3 The Limit of a Vector Function

Let  $\mathbf{r}(t) = \langle x(t), y(t), z(t) \rangle$  be a vector-valued function defined on a punctured interval around  $t_0$ . The **limit** of  $\mathbf{r}(t)$  as  $t$  approaches  $t_0$ , denoted by  $\lim_{t \rightarrow t_0} \mathbf{r}(t)$ , is defined by

$$\lim_{t \rightarrow t_0} \mathbf{r}(t) = \lim_{t \rightarrow t_0} \langle x(t), y(t), z(t) \rangle = \lim_{t \rightarrow t_0} x(t) \mathbf{i} + \lim_{t \rightarrow t_0} y(t) \mathbf{j} + \lim_{t \rightarrow t_0} z(t) \mathbf{k},$$

provided that each of the limits,  $\lim_{t \rightarrow t_0} x(t)$ ,  $\lim_{t \rightarrow t_0} y(t)$ , and  $\lim_{t \rightarrow t_0} z(t)$ , exists.

Similarly, the **limit** of the vector function  $\mathbf{r}(t) = \langle x(t), y(t) \rangle$  is

$$\lim_{t \rightarrow t_0} \mathbf{r}(t) = \lim_{t \rightarrow t_0} \langle x(t), y(t) \rangle = \lim_{t \rightarrow t_0} x(t) \mathbf{i} + \lim_{t \rightarrow t_0} y(t) \mathbf{j},$$

provided that each of the limits,  $\lim_{t \rightarrow t_0} x(t)$  and  $\lim_{t \rightarrow t_0} y(t)$ , exists.

As in Definition 11.3, our definition of the continuity of a vector-valued function relies on the continuity of the component functions.

### DEFINITION 11.4 The Continuity of a Vector Function

Let  $\mathbf{r}(t)$  be a vector-valued function defined on an open interval  $I \subseteq \mathbb{R}$ , and let  $t_0 \in I$ . The function  $\mathbf{r}(t)$  is said to be **continuous** at  $t_0$  if

$$\lim_{t \rightarrow t_0} \mathbf{r}(t) = \mathbf{r}(t_0).$$

For a vector function  $\mathbf{r}(t) = \langle x(t), y(t), z(t) \rangle$  this definition means that  $\mathbf{r}$  is continuous at  $t_0$  if and only if  $\lim_{t \rightarrow t_0} \mathbf{r}(t) = \langle x(t_0), y(t_0), z(t_0) \rangle$ . The analogous statement holds for a vector function with two components. We also define continuity on an interval, using the ideas of Chapter 1.

**DEFINITION 11.5** The Continuity of a Vector Function on an Interval

A vector function  $\mathbf{r}(t)$  is *continuous on an interval*  $I$  if it is continuous at every interior point of  $I$ , right continuous at any closed left endpoint, and left continuous at any closed right endpoint.

## Examples and Explorations

**EXAMPLE 1**

## Graphing a circular helix by plotting points

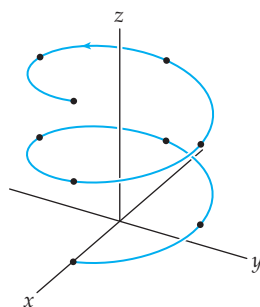

Graph the circular helix defined by  $\mathbf{r}(t) = \langle \cos t, \sin t, t \rangle$  for  $t \in [0, 4\pi]$  by plotting points on the curve.

**SOLUTION**

We've tabulated the coordinates of several points on the curve for values of  $t$  in the interval  $[0, 4\pi]$ :

$t$	0	$\pi/2$	$\pi$	$3\pi/2$	$2\pi$
$(x, y, z)$	(1, 0, 0)	(0, 1, $\pi/2$ )	(-1, 0, $\pi$ )	(0, -1, $3\pi/2$ )	(1, 0, $2\pi$ )
$t$		$5\pi/2$	$3\pi$	$7\pi/2$	$4\pi$
$(x, y, z)$		(0, 1, $5\pi/2$ )	(-1, 0, $3\pi$ )	(0, -1, $7\pi/2$ )	(1, 0, $4\pi$ )

These points and the helix are shown in the following figure:

□

**EXAMPLE 2**

## Graphing a spiral

Graph the vector curve defined by  $\mathbf{r}(t) = \langle t \sin t, t \cos t \rangle$  for  $t \in [0, 4\pi]$ .

**SOLUTION**

We have already seen that the graph of the parametric equations  $x = \sin t$ ,  $y = \cos t$  for  $t \in [0, 4\pi]$  is a circle with radius 1 and centered at the origin. The graph of this parametrization starts at (0, 1) when  $t = 0$ , and the circle is traced twice, in a clockwise direction for

$t \in [0, 4\pi]$ . The graph of  $\mathbf{r}(t)$  is related. If we square  $x = t \sin t$  and  $y = t \cos t$  and add, we obtain

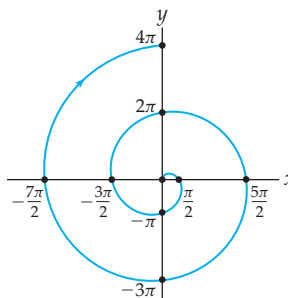

$$x^2 + y^2 = t^2 \sin^2 t + t^2 \cos^2 t = t^2.$$

This is not the equation of a circle, but we know that  $\sqrt{x^2 + y^2} = t$  is the distance from the origin. That is, the distance from the origin increases with  $t$  as the particle revolves around the origin. When  $t = 0$ , we have  $(x, y) = (0, 0)$ , and the graph will spiral out clockwise as  $t$  increases. To obtain a more precise graph, we will plot a few values of  $(x, y)$  corresponding to values of the parameter in the table.

We also evaluate a few reference points for the space curve in the following table:

$t$	0	$\pi/2$	$\pi$	$3\pi/2$	$2\pi$
$(x, y)$	(0, 0)	$(\pi/2, 0)$	$(0, -\pi)$	$(-3\pi/2, 0)$	$(0, 2\pi)$
$t$		$5\pi/2$	$3\pi$	$7\pi/2$	$4\pi$
$(x, y)$		$(5\pi/2, 0)$	$(0, -3\pi)$	$(-7\pi/2, 0)$	$(0, 4\pi)$

We plot these points along with the spiral in the following figure:

□

### EXAMPLE 3

#### Graphing a conical helix

Graph the vector curve defined by  $\mathbf{r}(t) = \langle t \sin t, t, t \cos t \rangle$  for  $t \in [0, 4\pi]$ .

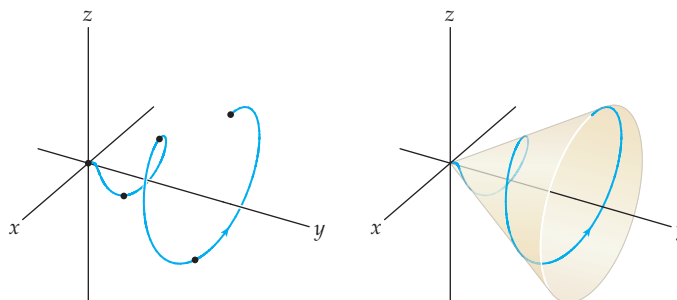

#### SOLUTION

We begin by considering a projection of this curve onto the  $xz$ -plane. The graph in the  $xz$ -plane will be defined by the parametric equations  $x = t \sin t$ ,  $z = t \cos t$ . The graph of these equations is the spiral we graphed in Example 2, except in the  $xz$ -plane rather than in the  $xy$ -plane.

Note that when we include the  $y$ -coordinate, we obtain a helix that winds around the  $y$ -axis. We evaluate a few reference points for the space curve in the following table:

$t$	0	$\pi$	$2\pi$	$3\pi$	$4\pi$
$(x, y, z)$	(0, 0, 0)	$(0, \pi, -\pi)$	$(0, 2\pi, 2\pi)$	$(0, 3\pi, -3\pi)$	$(0, 4\pi, 4\pi)$

These points and the curve are shown next. This curve is an example of a *conical helix* because the graph can be drawn on the surface of a cone.

□

**CHECKING  
THE ANSWER**

Elegant graphs such as the ones we have shown may be produced with a computer algebra system like Maple, Mathematica, or Matlab. However, many simple curves may be drawn by hand using the techniques introduced in this section.

**EXAMPLE 4**

**Evaluating the limit of a vector function**

Evaluate the limits of the following vector functions if they exist:

$$\lim_{t \rightarrow 0} \left\langle t \sin \frac{1}{t}, \frac{t}{e^t - 1} \right\rangle \quad \text{and} \quad \lim_{t \rightarrow 2} \left\langle \frac{t-2}{t^2-4}, \frac{2^t-4}{t-2}, \frac{t}{t-2} \right\rangle$$

**SOLUTION**

The limit of the first vector function exists if and only if the two limits

$$\lim_{t \rightarrow 0} t \sin \frac{1}{t} \quad \text{and} \quad \lim_{t \rightarrow 0} \frac{t}{e^t - 1}$$

exist. We may use the Squeeze Theorem to show that  $\lim_{t \rightarrow 0} t \sin \frac{1}{t} = 0$  and L'Hôpital's Rule to show that  $\lim_{t \rightarrow 0} \frac{t}{e^t - 1} = 1$ . Therefore,  $\lim_{t \rightarrow 0} \left\langle t \sin \frac{1}{t}, \frac{t}{e^t - 1} \right\rangle = \langle 0, 1 \rangle$ .

For the other vector function, the limits of the first two components exist, since

$$\lim_{t \rightarrow 2} \frac{t-2}{t^2-4} = \lim_{t \rightarrow 2} \frac{1}{t+2} = \frac{1}{4} \quad \text{and} \quad \lim_{t \rightarrow 2} \frac{2^t-4}{t-2} = \lim_{t \rightarrow 2} (\ln 2)2^t = 4 \ln 2.$$

However, the limit of the third component,  $\lim_{t \rightarrow 2} \frac{t}{t-2}$ , does not exist. Therefore,

$$\lim_{t \rightarrow 2} \left\langle \frac{t-2}{t^2-4}, \frac{2^t-4}{t-2}, \frac{t}{t-2} \right\rangle$$

does not exist.

□

**? TEST YOUR  
UNDERSTANDING**

- ▶ What are parametric equations in two variables? How does the definition generalize to parametric equations in three variables?
- ▶ What techniques can you use to graph parametric equations in three variables?
- ▶ What is a vector-valued function? How is the definition related to the definition of parametric equations?
- ▶ What techniques can you use to graph a vector function in three variables?
- ▶ If one or more of the components of a vector function is discontinuous, how does that affect the graph of the function?

## EXERCISES 11.1

## Thinking Back

*Parametric equations for the unit circle:* Find parametric equations for the unit circle centered at the origin of the  $xy$ -plane that satisfy the given conditions.

- ▶ The graph is traced counterclockwise once on the interval  $[0, 2\pi]$  starting at the point  $(1, 0)$ .
- ▶ The graph is traced clockwise once on the interval  $[0, 2\pi]$  starting at the point  $(1, 0)$ .

- ▶ The graph is traced counterclockwise twice on the interval  $[0, 2\pi]$  starting at the point  $(1, 0)$ .
- ▶ *Parametric equations for a circle:* Find parametric equations whose graph is the circle with radius  $\rho$  centered at the point  $(a, b)$  in the  $xy$ -plane such that the graph is traced counterclockwise  $k > 0$  times on the interval  $[0, 2\pi]$  starting at the point  $(a + \rho, b)$ .

## Concepts

0. *Problem Zero:* Read the section and make your own summary of the material.
1. *True/False:* Determine whether each of the statements that follow is true or false. If a statement is true, explain why. If a statement is false, provide a counterexample.
  - (a) *True or False:* Every curve in the plane has a unique expression in terms of a vector-valued function with two components.
  - (b) *True or False:* Every space curve has a unique expression in terms of a vector-valued function with three components.
  - (c) *True or False:* The graph of two parametric equations in two variables is also the graph of a vector-valued function with two components.
  - (d) *True or False:* Every vector-valued function in three variables can be expressed in terms of three parametric equations.
  - (e) *True or False:* The graph of three parametric equations is also the graph of a vector-valued function with three components.
  - (f) *True or False:* If  $\mathbf{r}(t)$  is a vector-valued function with domain  $\mathbb{R}$ ,  $\lim_{t \rightarrow c} \mathbf{r}(t)$  exists for every  $c \in \mathbb{R}$ .
  - (g) *True or False:* If a point  $t_0$  is in the domain of a vector function  $\mathbf{r}(t)$ , then  $\lim_{t \rightarrow t_0} \mathbf{r}(t) = \mathbf{r}(t_0)$ .
  - (h) *True or False:* Every vector function is continuous at every point in its domain.
2. *Examples:* Construct examples of the thing(s) described in the following. Try to find examples that are different than any in the reading.
  - (a) Parametric equations with three components for a circular helix winding around the  $x$ -axis
  - (b) A vector-valued function with two components whose graph is a spiral starting at the origin
  - (c) A vector-valued function with three components whose graph is a circle contained in the plane 5 units from the  $yz$ -plane.
3. Let  $y = f(x)$ . What is the definition of  $\lim_{x \rightarrow c} f(x) = L$ ?
4. Let  $\mathbf{r}(t) = \langle x(t), y(t), z(t) \rangle$ . What is the definition of  $\lim_{t \rightarrow c} \mathbf{r}(t)$ ?
5. Explain why we do *not* need an “epsilon–delta” definition for the limit of a vector-valued function.
6. Let  $y = f(x)$ . State the definition for the continuity of the function  $f$  at a point  $c$  in the domain of  $f$ .
7. Let  $\mathbf{r}(t) = \langle x(t), y(t), z(t) \rangle$ . Provide a definition for the continuity of the vector function  $\mathbf{r}$  at a point  $c$  in the domain of  $\mathbf{r}$ .
8. Most of the parametric equations and vector-valued functions we have studied have component functions that are continuous. What happens when one of the component functions is discontinuous at a point? For example, the “floor” function  $z(t) = [t]$  has a jump discontinuity for every integer  $t$ . What is the graph of the equations
 
$$x = \cos 2\pi t, y = \sin 2\pi t, z = [t], t \in \mathbb{R}?$$
9. Let  $\mathbf{r}(t) = \langle x(t), y(t) \rangle$ ,  $t \in [a, b]$ , be a vector-valued function, where  $a < b$  are real numbers and the functions  $x(t)$  and  $y(t)$  are continuous. Explain why the graph of  $\mathbf{r}$  is contained in some circle centered at the origin. (*Hint: Think about the Extreme Value Theorem.*)
10. Let  $\mathbf{r}(t) = \langle x(t), y(t) \rangle$ ,  $t \in [a, \infty)$ , be a vector-valued function, where  $a$  is a real number. Explain why the graph of  $\mathbf{r}$  may or may not be contained in a circle centered at the origin. (*Hint: Graph the functions  $\mathbf{r}_1(t) = \langle \frac{1}{t}, \frac{1}{t} \rangle$  and  $\mathbf{r}_2(t) = \langle t, t \rangle$ , both with domain  $[1, \infty)$ .*)
11. Let  $\mathbf{r}(t) = \langle x(t), y(t), z(t) \rangle$ ,  $t \in [a, b]$ , be a vector-valued function, where  $a < b$  are real numbers and the functions  $x(t)$ ,  $y(t)$ , and  $z(t)$  are continuous. Explain why the graph of  $\mathbf{r}$  is contained in some sphere centered at the origin.
12. Let  $\mathbf{r}(t) = \langle x(t), y(t), z(t) \rangle$ ,  $t \in [a, \infty)$ , be a vector-valued function, where  $a$  is a real number. Explain why the graph of  $\mathbf{r}$  may or may not be contained in some sphere centered at the origin. (*Hint: Consider the functions  $\mathbf{r}_1(t) = \langle \cos t, \sin t, 1/t \rangle$  and  $\mathbf{r}_2(t) = \langle \cos t, \sin t, t \rangle$ , both with domain  $[1, \infty)$ .*)
13. As we saw in Example 1, the graph of the vector-valued function  $\mathbf{r}(t) = \langle \cos t, \sin t, t \rangle$ , for  $t \in [0, 2\pi]$  is a circular helix that spirals counterclockwise around the  $z$ -axis and climbs as  $t$  increases. Find another parametrization for this helix so that the motion along the helix is faster for a given change in the parameter.
14. As we saw in Example 1, the graph of the vector-valued function  $\mathbf{r}(t) = \langle \cos t, \sin t, t \rangle$ , for  $t \in [0, 2\pi]$  is a circular helix that spirals counterclockwise around the  $z$ -axis and climbs as  $t$  increases. Find another parametrization for this helix so that the motion is downwards.

15. Let  $\mathbf{r}(t) = \langle x(t), y(t) \rangle$ ,  $t \in [a, \infty)$ , be a vector-valued function, where  $a$  is a real number. Under what conditions would the graph of  $\mathbf{r}$  have a horizontal asymptote as  $t \rightarrow \infty$ ? Provide an example illustrating your answer.
16. Let  $\mathbf{r}(t) = \langle x(t), y(t) \rangle$ ,  $t \in [a, \infty)$ , be a vector-valued function, where  $a$  is a real number. Under what conditions would the graph of  $\mathbf{r}$  have a vertical asymptote as  $t \rightarrow \infty$ ? Provide an example illustrating your answer.
17. What is the dot product of the vector functions  $\mathbf{r}_1(t) = \langle x_1(t), y_1(t) \rangle$  and  $\mathbf{r}_2(t) = \langle x_2(t), y_2(t) \rangle$ ?
18. Compute the cross product of the vector functions  $\mathbf{r}_1(t) = \langle x_1(t), y_1(t) \rangle$  and  $\mathbf{r}_2(t) = \langle x_2(t), y_2(t) \rangle$  by thinking of  $\mathbb{R}^2$  as the  $xy$ -plane in  $\mathbb{R}^3$ . That is, let  $\mathbf{r}_1(t) = \langle x_1(t), y_1(t), 0 \rangle$  and  $\mathbf{r}_2(t) = \langle x_2(t), y_2(t), 0 \rangle$ , and take the cross product of these vector functions.

In Exercises 19–21 sketch the graph of a vector-valued function  $\mathbf{r}(t) = \langle x(t), y(t) \rangle$  with the specified properties. Be sure to indicate the direction of increasing values of  $t$ .

19. Domain  $t \geq 0$ ,  $\mathbf{r}(0) = \langle 0, 3 \rangle$ ,  $\mathbf{r}(1) = \langle -2, 1 \rangle$ ,  $\lim_{t \rightarrow \infty} x(t) = -5$ , and  $\lim_{t \rightarrow \infty} y(t) = -\infty$ .

20. Domain  $t \geq 0$ ,  $\mathbf{r}(0) = \langle 1, 0 \rangle$ ,  $\mathbf{r}(2) = \langle 0, -1 \rangle$ ,  $\lim_{t \rightarrow \infty} x(t) = -2$ , and  $\lim_{t \rightarrow \infty} y(t) = -3$ .
21. Domain  $t \in \mathbb{R}$ ,  $\mathbf{r}(2) = \langle 1, 1 \rangle$ ,  $\mathbf{r}(0) = \langle -3, 3 \rangle$ ,  $\mathbf{r}(-2) = \langle -5, -5 \rangle$ ,  $\lim_{t \rightarrow -\infty} x(t) = \infty$ ,  $\lim_{t \rightarrow -\infty} y(t) = -\infty$ , and  $\lim_{t \rightarrow \infty} \mathbf{r}(t) = \langle 0, 0 \rangle$ .
22. Given a vector-valued function  $\mathbf{r}(t)$  with domain  $\mathbb{R}$ , what is the relationship between the graph of  $\mathbf{r}(t)$  and the graph of  $k\mathbf{r}(t)$ , where  $k > 1$  is a scalar?
23. Given a vector-valued function  $\mathbf{r}(t)$  with domain  $\mathbb{R}$ , what is the relationship between the graph of  $\mathbf{r}(t)$  and the graph of  $\mathbf{r}(kt)$ , where  $k > 1$  is a scalar?
24. Explain why the graph of every vector-valued function  $\mathbf{r}(t) = \langle \cos t, \sin t, f(t) \rangle$  lies on the surface of the cylinder  $x^2 + y^2 = 1$  for every continuous function  $f$ .
25. Explain why the graph of every vector-valued function  $\mathbf{r}(t) = \langle \cos t, \sin t, \cos t \rangle$  lies on the intersection of the two cylinders  $x^2 + y^2 = 1$  and  $y^2 + z^2 = 1$ .

## Skills

Find parametric equations for each of the vector-valued functions in Exercises 26–34, and sketch the graphs of the functions, indicating the direction for increasing values of  $t$ .

26.  $\mathbf{r}(t) = \langle \sin 3t, \cos 3t \rangle$  for  $t \in [0, 2\pi]$
27.  $\mathbf{r}(t) = \langle 2 - \sin t, 4 + \cos t \rangle$  for  $t \in [0, 2\pi]$
28.  $\mathbf{r}(t) = \langle \sin t, \cos 2t \rangle$  for  $t \in [0, 2\pi]$
29.  $\mathbf{r}(t) = \langle 1 + \sin t, 3 - \cos 2t \rangle$  for  $t \in [0, 2\pi]$
30.  $\mathbf{r}(t) = (3 + t)\mathbf{i} + \left(3 - \frac{1}{t}\right)\mathbf{j}$  for  $t > 0$
31.  $\mathbf{r}(t) = \langle t, t^2, t^3 \rangle$  for  $t \in [0, 2]$
32.  $\mathbf{r}(t) = \langle \cos^2 t, 4 \sin t, t \rangle$  for  $t \in [0, 2\pi]$
33.  $\mathbf{r}(t) = \langle \cos^2 t, \sin 2t \rangle$  for  $t \in [0, 2\pi]$
34.  $\mathbf{r}(t) = \langle t \sin t, t \cos t, t \rangle$  for  $t \in [0, 4\pi]$

Evaluate and simplify the indicated quantities in Exercises 35–41.

35.  $\langle 1, 3t, t^3 \rangle + \langle t, t^2, t^3 \rangle$
36.  $\langle 1, t, t^2 \rangle - \langle t, t^2, t^3 \rangle$
37.  $5 \langle \cos t, \sin t \rangle$
38.  $t \langle \sin t, \cos t \rangle$
39.  $\langle \sin t, \cos t \rangle \cdot \langle \cos t, -\sin t \rangle$
40.  $((\sin t)\mathbf{i} + (\cos t)\mathbf{j} + t\mathbf{k}) \times ((\cos t)\mathbf{i} + (\sin t)\mathbf{j})$

41.  $\langle 1, t, t^2 \rangle \times \langle t, t^2, t^3 \rangle$

Evaluate the limits in Exercises 42–45.

42.  $\lim_{t \rightarrow 0} \langle \sin 3t, \cos 3t \rangle$
43.  $\lim_{t \rightarrow \pi} \langle \sin t, \cos t, \sec t \rangle$
44.  $\lim_{t \rightarrow 1^-} \left\langle \ln t, \frac{e^t - 1}{t - 1}, e^t \right\rangle$
45.  $\lim_{t \rightarrow 0^+} \left\langle \frac{\sin t}{t}, \frac{1 - \cos t}{t}, \left(1 + \frac{1}{t}\right)^t \right\rangle$

Find and graph the vector function  $\mathbf{r}(t) = \langle x(t), y(t) \rangle$  determined by the differential equations in Exercises 46–48.

46.  $x'(t) = x$ ,  $y'(t) = x^2$ ,  $x(0) = 1$ ,  $y(0) = 2$ . (Hint: Start by solving the initial-value problem  $x'(t) = x$ ,  $x(0) = 1$ .)
47.  $x'(t) = 1 + x^2$ ,  $y'(t) = x^2$ ,  $x(0) = 0$ ,  $y(0) = 1$  (Hint: Start by solving the initial-value problem  $x'(t) = 1 + x^2$ ,  $x(0) = 0$ .)
48.  $x'(t) = -y$ ,  $y'(t) = x$ ,  $x(0) = 1$ ,  $y(0) = 0$  (Hint: What familiar pair of functions have the given properties?)
49. Show that the graph of the vector function  $\mathbf{r}(t) = \langle 3 \sin t, 5 \cos t, 4 \sin t \rangle$  is a circle. (Hint: Show that the graph lies on a sphere and in a plane.)

## Applications

50. Annie is conscious of tidal currents when she is sea kayaking. This activity can be tricky in an area south-southwest of Cattle Point on San Juan Island in Washington State. Annie is planning a trip through that area and finds that the velocity of the current changes with time and can be

expressed by the vector function

$$\left\langle 0.4 \cos\left(\frac{\pi(t-8)}{6}\right), -1.1 \cos\left(\frac{\pi(t-11)}{6}\right) \right\rangle,$$

where  $t$  is measured in hours after midnight, speeds are given in knots, and  $(0, 1)$  points due north.

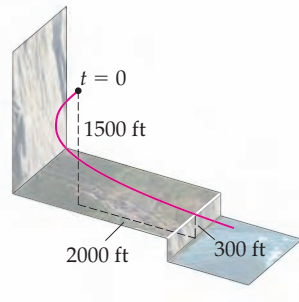

- What is the velocity of the current at 8:00 A.M.?
- What is the velocity of the current at 11:00 A.M.?
- Annie needs to paddle through here heading south-east,  $135$  degrees from north. She wants the current to push her. What is the best time for her to pass this point? (Hint: Find the dot product of the given vector function with a vector in the direction of Annie's travel, and determine when the result is maximized.)

51. Arne is a wingsuit base jumper in Norway. He is working out a jump from a cliff high above a fjord. After a couple of seconds, he will be  $1500$  meters above the bottom of the fjord, will reach his terminal velocity of  $14$  meters per second towards the ground, and will travel  $30$  meters per second horizontally. He calls the time when this happens  $t = 0$ . Below the cliff from which he jumped, the ground slopes to a second cliff,  $300$  meters above the water of the fjord. Arne must clear that second cliff,  $2000$  meters due south from his point at  $t = 0$ . For  $t \geq 0$ , his position function is given by

$$\left\langle A \sin\left(\frac{\pi t}{21}\right), \frac{A}{2}t, 1200 - 14t \right\rangle.$$

Approximately how large can  $A$  be while still allowing Arne to clear the second cliff?

The cliffs above the fjord

52. The DNA molecule takes the shape of a double helix—two helices that stay a roughly uniform distance apart.

- Neglecting actual dimensions, we can model one strand of DNA using the vector function

$$h_1(t) = \langle \cos(t), \sin(t), \alpha t \rangle.$$

Sketch the graph of  $h_1$ . What is the effect of the parameter  $\alpha$ ?

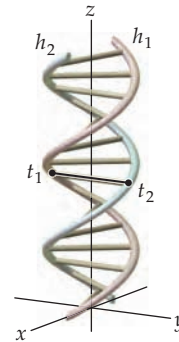

- A second strand of DNA can be constructed by shifting the first. Does the graph of

$$h_2(t) = \langle \cos(t), \sin(t), \alpha t + \beta \rangle$$

ever intersect that of  $h_1$ ?

- The distance between two curves is the minimum distance between any two points on the curves. What is the distance between  $h_1$  and  $h_2$  if  $\alpha = 1$  and  $\beta = \pi$ ? (Hint: Write two points on the curves using parameters  $t_1$  and  $t_2$ , expand the formula for the distance between them, and then use a trigonometric identity for addition. Then let  $s = t_1 - t_2$  and minimize.)

A DNA molecule

53. Every description of the DNA molecule says that the strands of the helices run in opposite directions. This is meant as a statement about chemistry, not about the geometric shape of the double helix. Consider two helices

$$h_1(t) = \langle \cos t, \sin t, \alpha t \rangle, \text{ and}$$

$$h_2(t) = \langle \sin t, \cos t, \alpha t \rangle.$$

- Sketch these two helices in the same coordinate system, and show that they run geometrically in different directions.
- Explain why it is impossible for these two helices to fail to intersect, and hence why they could not form a configuration for DNA.

## Proofs

54. Let  $\mathbf{r}(t) = \langle x(t), y(t) \rangle$  be a vector-valued function defined on an open interval containing the point  $t_0$ . Prove that  $\mathbf{r}(t)$  is continuous at  $t_0$  if and only if  $x(t)$  and  $y(t)$  are both continuous at  $t_0$ .
55. Prove that the graph of the vector function  $\mathbf{r}(t) = \langle t \sin t, t \cos t, t \rangle$ , where  $t \geq 0$ , is a conical helix by showing that it lies on the graph of the cone described by  $z = \sqrt{x^2 + y^2}$ .
56. Let  $c_1$  and  $c_2$  be scalars,  $\mathbf{r}_1(t)$  and  $\mathbf{r}_2(t)$  be continuous vector functions with two components, and  $t_0$  be a point in the domains of both  $\mathbf{r}_1$  and  $\mathbf{r}_2$ . Prove that

$$\lim_{t \rightarrow t_0} (c_1 \mathbf{r}_1(t) + c_2 \mathbf{r}_2(t)) = c_1 \mathbf{r}_1(t_0) + c_2 \mathbf{r}_2(t_0).$$

57. Let  $\mathbf{r}_1(t)$  and  $\mathbf{r}_2(t)$  be continuous vector functions with two components, and let  $t_0$  be a point in the domains of both  $\mathbf{r}_1$  and  $\mathbf{r}_2$ . Prove that

$$\lim_{t \rightarrow t_0} (\mathbf{r}_1(t) \cdot \mathbf{r}_2(t)) = \mathbf{r}_1(t_0) \cdot \mathbf{r}_2(t_0).$$

58. Let  $\mathbf{r}_1(t)$  and  $\mathbf{r}_2(t)$  be continuous vector functions with three components, and let  $t_0$  be a point in the domains of both  $\mathbf{r}_1$  and  $\mathbf{r}_2$ . Prove that

$$\lim_{t \rightarrow t_0} (\mathbf{r}_1(t) \times \mathbf{r}_2(t)) = \mathbf{r}_1(t_0) \times \mathbf{r}_2(t_0).$$

59. Prove that the dot product of the continuous vector-valued functions  $\mathbf{r}_1(t) = \langle x_1(t), y_1(t) \rangle$  and  $\mathbf{r}_2(t) = \langle x_2(t), y_2(t) \rangle$  is a continuous scalar function.
60. If  $\alpha$ ,  $\beta$ , and  $\gamma$  are nonzero constants, the graph of a vector function of the form  $\mathbf{r}(t) = \langle \alpha t, \beta t^2, \gamma t^3 \rangle$  is called a *twisted cubic*. Prove that a twisted cubic intersects any plane in at most three points.
61. Let  $x_1(t)$ ,  $x_2(t)$ ,  $y_1(t)$ , and  $y_2(t)$  be differentiable scalar functions. Prove that the dot product of the vector-valued functions  $\mathbf{r}_1(t) = \langle x_1(t), y_1(t) \rangle$  and  $\mathbf{r}_2(t) = \langle x_2(t), y_2(t) \rangle$  is a differentiable scalar function.

## Thinking Forward

- ▶ *The derivative of a vector function:* Give a definition for the differentiability of a vector-valued function.
- ▶ *The integral of a vector function:* Give a definition for the definite integral of a vector-valued function.

## 11.2 THE CALCULUS OF VECTOR FUNCTIONS

- ▶ Differentiation and integration of vector functions
- ▶ Velocity and acceleration for vector-valued functions
- ▶ The geometry of the derivative of a vector-valued function

### The Derivative of a Vector Function

In order for the vector function  $\mathbf{r}(t) = \langle x(t), y(t), z(t) \rangle$  to be differentiable, we need each of the component functions  $x$ ,  $y$ , and  $z$  to be differentiable.

#### DEFINITION 11.6 The Derivative of a Vector Function

Let

$$x = x(t), y = y(t), \text{ and } z = z(t)$$

be three real-valued functions, each of which is differentiable at every point in some interval  $I \subseteq \mathbb{R}$ . The *derivative* of the vector function  $\mathbf{r}(t) = \langle x(t), y(t), z(t) \rangle$  is

$$\mathbf{r}'(t) = \langle x'(t), y'(t), z'(t) \rangle = x'(t)\mathbf{i} + y'(t)\mathbf{j} + z'(t)\mathbf{k}.$$

Similarly, the *derivative* of the vector function  $\mathbf{r}(t) = \langle x(t), y(t) \rangle$  is

$$\mathbf{r}'(t) = \langle x'(t), y'(t) \rangle = x'(t)\mathbf{i} + y'(t)\mathbf{j}.$$

In these cases we say that the function  $\mathbf{r}$  is *differentiable*.

For example, if  $\mathbf{r}(t) = \langle \sin t, \cos t, t^2 \rangle$  for  $t \in \mathbb{R}$ , then  $\mathbf{r}'(t) = \langle \cos t, -\sin t, 2t \rangle$ .

Recall that in Chapter 2 the derivative of a (scalar) function was defined in terms of a limit. Thus, the derivatives of the component functions,  $x'(t)$ ,  $y'(t)$ , and  $z'(t)$ , are defined in terms of a limit, and we have the following theorem, the proof of which is left for Exercise 62:

### THEOREM 11.7 The Derivative of a Vector-Valued Function

Let  $\mathbf{r}(t)$  be a differentiable vector function with either two or three components. The derivative of  $\mathbf{r}(t)$  is given by

$$\mathbf{r}'(t) = \lim_{h \rightarrow 0} \frac{\mathbf{r}(t+h) - \mathbf{r}(t)}{h}.$$

When you prove Theorem 11.7, be sure to interpret  $\mathbf{r}(t+h)$  correctly. For a vector function in  $\mathbb{R}^3$ ,

$$\mathbf{r}(t+h) = \langle x(t+h), y(t+h), z(t+h) \rangle.$$

In  $\mathbb{R}^2$ ,  $\mathbf{r}(t+h)$  has the analogous meaning.

### THEOREM 11.8 The Chain Rule for Vector-Valued Functions

Let  $t = f(\tau)$  be a differentiable real-valued function of  $\tau$ , and let  $\mathbf{r}(t)$  be a differentiable vector function with either two or three components such that  $f(\tau)$  is in the domain of  $\mathbf{r}$  for every value of  $\tau$  on some interval  $I$ . Then

$$\frac{d\mathbf{r}}{d\tau} = \frac{d\mathbf{r}}{dt} \frac{dt}{d\tau}.$$

**Proof.** We will prove the Chain Rule for the case where  $\mathbf{r}(t) = \langle x(t), y(t) \rangle$  and leave the case where  $\mathbf{r}(t)$  has three components to Exercise 67. In either case, the hard work was actually done in Chapter 2 when we proved the Chain Rule for the composition of two scalar functions. By the definition of the derivative of a vector-valued function,

$$\begin{aligned} \frac{d}{d\tau}(\mathbf{r}(t)) &= \frac{d}{d\tau}(\langle x(t), y(t) \rangle) && \leftarrow \text{the definition of } \mathbf{r} \\ &= \left\langle \frac{d}{d\tau}(x(t)), \frac{d}{d\tau}(y(t)) \right\rangle && \leftarrow \text{the definition of the derivative of a vector function} \\ &= \left\langle \frac{dx}{dt} \frac{dt}{d\tau}, \frac{dy}{dt} \frac{dt}{d\tau} \right\rangle && \leftarrow \text{the Chain Rule for scalar functions} \\ &= \left\langle \frac{dx}{dt}, \frac{dy}{dt} \right\rangle \frac{dt}{d\tau} && \leftarrow \text{multiplication of a vector function by a scalar function} \\ &= \frac{d\mathbf{r}}{dt} \frac{dt}{d\tau} && \leftarrow \text{the definition of the derivative of a vector function} \quad \blacksquare \end{aligned}$$

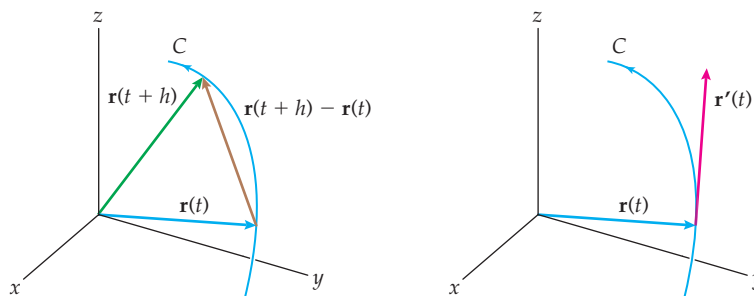

Returning to the example we used earlier, let  $\mathbf{r}(t) = \langle \sin t, \cos t, t^2 \rangle$  for  $t \in \mathbb{R}$ , and let  $t = e^{3\tau}$ . Then

$$\begin{aligned} \frac{d\mathbf{r}}{d\tau} &= \langle \cos t, -\sin t, 2t \rangle (3e^{3\tau}) = \langle \cos e^{3\tau}, -\sin e^{3\tau}, 2e^{3\tau} \rangle (3e^{3\tau}) \\ &= \langle 3e^{3\tau} \cos e^{3\tau}, -3e^{3\tau} \sin e^{3\tau}, 6e^{6\tau} \rangle. \end{aligned}$$

## The Geometry of the Derivative

We use Theorem 11.7 to interpret the geometry of the derivative. Recall from Section 10.2 that the difference  $\mathbf{v} - \mathbf{w}$  of two vectors with the same initial point may be interpreted as the vector that extends from the terminal point of  $\mathbf{w}$  to the terminal point of  $\mathbf{v}$ . Thus, for position vectors  $\mathbf{r}(t+h)$  and  $\mathbf{r}(t)$ , the numerator of the quotient  $\frac{\mathbf{r}(t+h) - \mathbf{r}(t)}{h}$  is the vector that points from the terminal point of  $\mathbf{r}(t)$  to the terminal point of  $\mathbf{r}(t+h)$ , as shown here at the left:

If the scalar,  $h$ , in the denominator of the quotient is positive, the direction of  $\frac{\mathbf{r}(t+h) - \mathbf{r}(t)}{h}$  is the same as the direction of  $\mathbf{r}(t+h) - \mathbf{r}(t)$ , although their magnitudes may differ. (A similar argument may be made when  $h < 0$ .) As with the derivative of a function of a single variable, the derivative is tangent to the curve at  $\mathbf{r}(t)$ . As shown in the graph on the right, we will always assume that the initial point of the derivative  $\mathbf{r}'(t)$  is positioned at the terminal point of the vector  $\mathbf{r}(t)$ . This ensures that the derivative is tangent to the curve  $C$  at  $\mathbf{r}(t)$ .

We may also use the derivative of the vector function to construct a tangent line to the vector curve.

### DEFINITION 11.9 The Tangent Line to a Vector Curve

Let  $\mathbf{r}(t) = \langle x(t), y(t), z(t) \rangle$  be a differentiable vector function on some interval  $I \subseteq \mathbb{R}$ , and let  $t_0$  be a point in  $I$  such that  $\mathbf{r}'(t_0) \neq \mathbf{0}$ . The **tangent line** to the vector curve defined by  $\mathbf{r}(t)$  at  $\mathbf{r}(t_0)$  is given by

$$\mathcal{L}(t) = \mathbf{r}(t_0) + t \mathbf{r}'(t_0).$$

From Definition 11.9 we see that the tangent line is the line containing the point  $\mathbf{r}(t_0)$  whose direction vector is  $\mathbf{r}'(t_0)$ .

## Velocity and Acceleration

Recall that when  $t$  represents time and  $y = s(t)$  represents the position function of a particle moving along a straight path,  $s'(t)$  and  $s''(t)$  represent the velocity and acceleration of the particle, respectively. We define the velocity and acceleration of a particle moving along a space curve determined by a vector function in an analogous fashion.

**DEFINITION 11.10****Velocity, Speed, and Acceleration along a Space Curve**

Let  $\mathbf{r}(t) = \langle x(t), y(t), z(t) \rangle$  be a differentiable vector-valued function defined at every point in some time interval  $I \subseteq \mathbb{R}$ , and let  $C$  be the space curve defined by  $\mathbf{r}(t)$ .

(a) The **velocity**,  $\mathbf{v}$ , of the particle as it moves along  $C$  is given by

$$\mathbf{v}(t) = \mathbf{r}'(t) = \langle x'(t), y'(t), z'(t) \rangle.$$

(b) The **speed** of the particle as it moves along  $C$  is given by

$$\|\mathbf{v}(t)\| = \|\langle x'(t), y'(t), z'(t) \rangle\|.$$

(c) In addition, if  $\mathbf{r}(t)$  is twice differentiable, the **acceleration**,  $\mathbf{a}$ , of the particle as it moves along  $C$  is given by

$$\mathbf{a}(t) = \mathbf{v}'(t) = \mathbf{r}''(t) = \langle x''(t), y''(t), z''(t) \rangle.$$

Note that velocity and acceleration are vectors, but speed is a scalar, since it is the norm of the velocity.

**Derivatives of Vector Products**

Recall that there are three products that apply to vectors: Vectors may be multiplied by scalars, two vectors with the same number of components may be multiplied by means of the dot product, and two three-component vectors may be multiplied via the cross product. The same products apply to vector functions. Fortunately, the derivatives of these product functions follow the rules we would predict.

**THEOREM 11.11****Derivatives of Products of Vector Functions**

Let  $k$  be a scalar,  $f(t)$  be a differentiable scalar function, and  $\mathbf{r}(t)$  be a differentiable vector function. Then

$$(a) \quad \frac{d}{dt}(k\mathbf{r}(t)) = k\mathbf{r}'(t).$$

$$(b) \quad \frac{d}{dt}(f(t)\mathbf{r}(t)) = f'(t)\mathbf{r}(t) + f(t)\mathbf{r}'(t).$$

Furthermore, if  $\mathbf{r}_1(t)$  and  $\mathbf{r}_2(t)$  are differentiable vector functions with both having either two or three components, then

$$(c) \quad \frac{d}{dt}(\mathbf{r}_1(t) \cdot \mathbf{r}_2(t)) = \mathbf{r}'_1(t) \cdot \mathbf{r}_2(t) + \mathbf{r}_1(t) \cdot \mathbf{r}'_2(t).$$

Finally, if  $\mathbf{r}_1(t)$  and  $\mathbf{r}_2(t)$  are both differentiable three-component vector functions, then

$$(d) \quad \frac{d}{dt}(\mathbf{r}_1(t) \times \mathbf{r}_2(t)) = \mathbf{r}'_1(t) \times \mathbf{r}_2(t) + \mathbf{r}_1(t) \times \mathbf{r}'_2(t).$$

Recall that the dot product is commutative, so the order of the products in Theorem 11.11 (c) is not significant, but since the cross product is not commutative, the order of the products in Theorem 11.11 (d) is significant.

The proof of each part of Theorem 11.11 follows directly from the definitions of the derivative and the relevant product. We will prove Theorem 11.11(c) when  $\mathbf{r}_1(t)$  and  $\mathbf{r}_2(t)$

are differentiable vector functions with two components. The proofs of all other parts of Theorem 11.11 are left for Exercises 63–66.

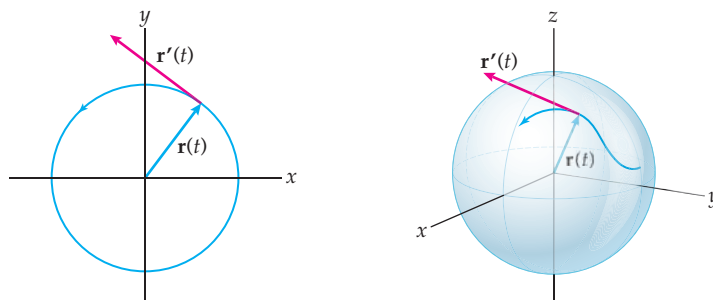

**Proof.** Let  $\mathbf{r}_1(t) = \langle x_1(t), y_1(t) \rangle$  and  $\mathbf{r}_2(t) = \langle x_2(t), y_2(t) \rangle$ . Then

$$\mathbf{r}_1(t) \cdot \mathbf{r}_2(t) = \langle x_1(t), y_1(t) \rangle \cdot \langle x_2(t), y_2(t) \rangle = x_1(t)x_2(t) + y_1(t)y_2(t).$$

Thus, when we take the derivative, we have

$$\begin{aligned} \frac{d}{dt}(\mathbf{r}_1(t) \cdot \mathbf{r}_2(t)) &= \frac{d}{dt}(x_1(t)x_2(t) + y_1(t)y_2(t)) \\ &= x_1'(t)x_2(t) + x_1(t)x_2'(t) + y_1'(t)y_2(t) + y_1(t)y_2'(t) \\ &= (x_1'(t)x_2(t) + y_1'(t)y_2(t)) + (x_1(t)x_2'(t) + y_1(t)y_2'(t)) \\ &= \langle x_1'(t), y_1'(t) \rangle \cdot \langle x_2(t), y_2(t) \rangle + \langle x_1(t), y_1(t) \rangle \cdot \langle x_2'(t), y_2'(t) \rangle \\ &= \mathbf{r}_1'(t) \cdot \mathbf{r}_2(t) + \mathbf{r}_1(t) \cdot \mathbf{r}_2'(t). \end{aligned}$$

When the magnitude of a vector function is constant, the function and its derivative are orthogonal, as stated in the next theorem. This result is not terribly surprising: In  $\mathbb{R}^2$ , any vector function with constant magnitude  $k$  has a graph that is at least a portion of a circle with radius  $k$  centered at the origin, and every tangent to a circle is orthogonal to the radius at the point of tangency. The three-dimensional case is similar: Every vector function with constant magnitude  $k$  has a graph that lies on the boundary of a sphere of radius  $k$  and that is centered at the origin. The following figures illustrate the two- and three-dimensional cases (left and right, respectively).

### THEOREM 11.12

#### A Vector Function with a Constant Magnitude Is Orthogonal to Its Derivative

Let  $\mathbf{r}(t)$  be a differentiable vector function such that  $\|\mathbf{r}(t)\| = k$  for some constant  $k$ . Then

$$\mathbf{r}(t) \cdot \mathbf{r}'(t) = 0.$$

**Proof.** Since the magnitude of  $\mathbf{r}(t)$  is constant, so is its square. That is,

$$\|\mathbf{r}(t)\|^2 = k^2,$$

where  $k^2$  is a constant. However, recall that

$$\|\mathbf{r}(t)\|^2 = \mathbf{r}(t) \cdot \mathbf{r}(t).$$

So we have

$$\mathbf{r}(t) \cdot \mathbf{r}(t) = k^2.$$

We now take the derivative of each side of the latter equation, using Theorem 11.11 (c) to take the derivative of the left side, and obtain

$$\mathbf{r}(t) \cdot \mathbf{r}'(t) + \mathbf{r}'(t) \cdot \mathbf{r}(t) = 2\mathbf{r}(t) \cdot \mathbf{r}'(t) = 0.$$

Since their dot product is zero, the vectors  $\mathbf{r}(t)$  and  $\mathbf{r}'(t)$  are orthogonal. ■

## Integration of a Vector Function

Recall from Chapter 4 that every function that is continuous on an interval  $[a, b]$  is integrable on  $[a, b]$ . We use this property in the following definition:

### DEFINITION 11.13 The Integral of a Vector Function

Let  $x = x(t)$ ,  $y = y(t)$ , and  $z = z(t)$  be three real-valued functions with antiderivatives

$$\int x(t) dt, \quad \int y(t) dt, \quad \text{and} \quad \int z(t) dt,$$

respectively, on some interval  $I \subseteq \mathbb{R}$ . Then the vector function

$$\int \mathbf{r}(t) dt = \int (x(t)\mathbf{i} + y(t)\mathbf{j} + z(t)\mathbf{k}) dt = \mathbf{i} \int x(t) dt + \mathbf{j} \int y(t) dt + \mathbf{k} \int z(t) dt$$

is an **antiderivative** of the vector function  $\mathbf{r}(t) = \langle x(t), y(t), z(t) \rangle$ .

Similarly, if  $x(t)$ ,  $y(t)$ , and  $z(t)$  are all integrable on the interval  $[a, b]$ , then the **definite integral** of the vector function  $\mathbf{r}(t)$  from  $a$  to  $b$  is the vector

$$\int_a^b \mathbf{r}(t) dt = \int_a^b (x(t)\mathbf{i} + y(t)\mathbf{j} + z(t)\mathbf{k}) dt = \mathbf{i} \int_a^b x(t) dt + \mathbf{j} \int_a^b y(t) dt + \mathbf{k} \int_a^b z(t) dt.$$

Note that every antiderivative of a vector function is another vector function and any two antiderivatives of the same function differ by a constant (vector). However, the definite integral of a vector function is unique and is a constant (vector). In order for a vector function  $\mathbf{r}(t) = \langle x(t), y(t), z(t) \rangle$  to be integrable, each of its component functions must be integrable. This condition tells us that we could also find  $\int_a^b \mathbf{r}(t) dt$  as the limit of a Riemann sum if necessary. We explore antiderivatives and definite integrals in the examples and exercises.

## Examples and Explorations

### EXAMPLE 1

#### The derivative of a vector function

Find the derivative of the vector function  $\mathbf{r}(t) = \langle \cos t, \sin t, t \rangle$ , and find the tangent lines to the curve defined by  $\mathbf{r}$  at  $t = \frac{\pi}{4}$  and  $t = \pi$ .

#### SOLUTION

To find the derivative of  $\mathbf{r}(t)$ , we take the derivative of each component function to obtain  $\mathbf{r}'(t) = \langle -\sin t, \cos t, 1 \rangle$ .

We now find the tangent line when  $t = \frac{\pi}{4}$ . Since

$$\mathbf{r}\left(\frac{\pi}{4}\right) = \left\langle \frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2}, \frac{\pi}{4} \right\rangle \quad \text{and} \quad \mathbf{r}'\left(\frac{\pi}{4}\right) = \left\langle -\frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2}, 1 \right\rangle,$$

the equation of the tangent line at  $t = \frac{\pi}{4}$  is

$$\mathcal{L}_1(\tau) = \left\langle \frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2}, \frac{\pi}{4} \right\rangle + \tau \left\langle -\frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2}, 1 \right\rangle.$$

Because we may use any nonzero multiple of the direction vector as the direction vector for our line, we may also express the line as

$$\mathcal{L}_1(\tau) = \left\langle \frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2}, \frac{\pi}{4} \right\rangle + \tau \langle -1, 1, \sqrt{2} \rangle.$$

Similarly, when  $t = \pi$ , the tangent line will pass through the terminal point of the position vector  $\mathbf{r}(\pi) = \langle -1, 0, \pi \rangle$  and will have the direction vector  $\mathbf{r}'(\pi) = \langle 0, -1, 1 \rangle$ . The equation of this line is

$$\mathcal{L}_2(\tau) = \langle -1, 0, \pi \rangle + \tau \langle 0, -1, 1 \rangle. \quad \square$$

### EXAMPLE 2

#### Using derivatives to understand the graph of a vector function

Graph the vector function  $\mathbf{r}(t) = t^2\mathbf{i} + (3t - 2t^3)\mathbf{j}$ .

#### SOLUTION

Let  $\mathcal{C}$  represent the graph of the function. We begin by noting that  $\mathcal{C}$  will lie entirely in the first and fourth quadrants, since  $x = t^2$ . We also note that because  $x = t^2$  is an even function and  $y = 3t - 2t^3$  is an odd function,  $\mathcal{C}$  will be symmetric with respect to the  $x$ -axis. To understand the complete graph we need only analyze the vector function for positive values of  $t$ . We first note that the only time  $\mathcal{C}$  will intersect the  $y$ -axis is when  $x = 0$ , but  $\mathcal{C}$  will intersect the  $x$ -axis for the three values of  $t$  when  $3t - 2t^3 = 0$ , namely,  $t = 0$  and  $t = \pm\sqrt{\frac{3}{2}}$ .

We take the derivative and obtain

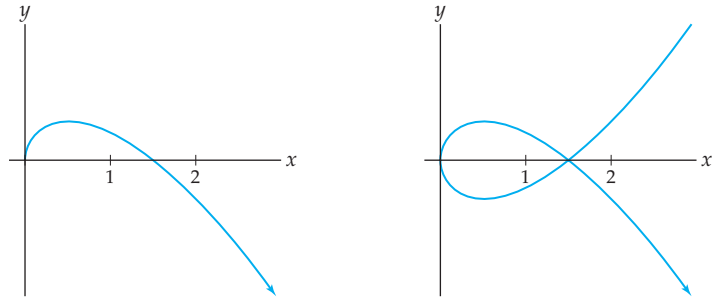

$$\mathbf{r}'(t) = 2t\mathbf{i} + (3 - 6t^2)\mathbf{j}.$$

We can find where the curve  $\mathcal{C}$  has horizontal tangents by finding the values where  $\frac{dy}{dx} = 0$ .

By the chain rule we know that  $\frac{dy}{dx} = \frac{dy/dt}{dx/dt}$ . Here we have

$$\frac{dy}{dx} = \frac{dy/dt}{dx/dt} = \frac{3 - 6t^2}{2t}.$$

We see that the slope of the tangent lines to  $\mathcal{C}$  will be zero when  $t = \pm\frac{1}{\sqrt{2}}$  and will be undefined when  $t = 0$ . For  $t > 0$ , we note that  $\frac{dx}{dt}$  is positive,  $\frac{dy}{dt} > 0$  when  $t \in (0, 1/\sqrt{2})$ , and  $\frac{dy}{dt} < 0$  when  $t > \frac{1}{\sqrt{2}}$ . Therefore, the graph will have a relative maximum when  $t = \frac{1}{\sqrt{2}}$ . We also note that  $y > 0$  for  $t \in (0, \sqrt{3/2})$  and  $y < 0$  for  $t > \sqrt{3/2}$ . Incorporating this information into a graph, we obtain the figure that follows on the left. We then use symmetry to obtain the complete graph on the right.

### EXAMPLE 3 The integral of a vector function

Find the antiderivative of the vector function  $\mathbf{r}(t) = \langle \cos t, \sin t, t \rangle$ , and compute the definite integral of  $\mathbf{r}$  from 0 to  $\pi$ .

#### SOLUTION

We integrate

$$\int \mathbf{r}(t) dt = \int \langle \cos t, \sin t, t \rangle dt = \mathbf{i} \int \cos t dt + \mathbf{j} \int \sin t dt + \mathbf{k} \int t dt = \left\langle \sin t, -\cos t, \frac{t^2}{2} \right\rangle + \mathbf{C},$$

where  $\mathbf{C}$  is a vector constant and has the form  $\mathbf{C} = \langle c_1, c_2, c_3 \rangle$  for scalar constants  $c_1$ ,  $c_2$ , and  $c_3$ .

We use the Fundamental Theorem of Calculus to evaluate the definite integral

$$\int_0^\pi \mathbf{r}(t) dt.$$

We already have an antiderivative  $\left\langle \sin t, -\cos t, \frac{t^2}{2} \right\rangle$  for  $\mathbf{r}(t)$ . Thus, to compute the definite integral, we evaluate this antiderivative at 0 and  $\pi$  and take the difference. That is,

$$\int_0^\pi \mathbf{r}(t) dt = \left\langle \sin t, -\cos t, \frac{t^2}{2} \right\rangle \Big|_0^\pi = \left\langle 0, 1, \frac{\pi^2}{2} \right\rangle - \left\langle 0, -1, 0 \right\rangle = \left\langle 0, 2, \frac{\pi^2}{2} \right\rangle. \quad \square$$

Example 3 was a rather mechanical and artificial use of the integral. In a slightly more satisfying example, we are given a formula for a tangent vector and are asked to find a vector function that contains a particular point.

### EXAMPLE 4 Finding a position vector given its velocity vector

A particle is moving along a space curve. The velocity vector for the curve is given by  $\mathbf{v}(t) = \langle \sin t, t^2, t^3 \rangle$ . When  $t = 0$ , the position of the particle is  $(3, -2, 5)$ . Find the position function for the curve.

#### SOLUTION

We begin by integrating  $\mathbf{v}(t) = \mathbf{r}'(t) = \langle \sin t, t^2, t^3 \rangle$ :

$$\mathbf{r}(t) = \int \mathbf{v}(t) dt = \int \langle \sin t, t^2, t^3 \rangle dt = (-\cos t + c_1) \mathbf{i} + \left( \frac{t^3}{3} + c_2 \right) \mathbf{j} + \left( \frac{t^4}{4} + c_3 \right) \mathbf{k}.$$

We now use the initial position  $\mathbf{r}(0) = 3\mathbf{i} - 2\mathbf{j} + 5\mathbf{k} = (-\cos 0 + c_1) \mathbf{i} + \left( \frac{0^3}{3} + c_2 \right) \mathbf{j} + \left( \frac{0^4}{4} + c_3 \right) \mathbf{k}$ . Solving the system

$$3 = -1 + c_1, \quad -2 = 0 + c_2, \quad 5 = 0 + c_3,$$

we obtain  $c_1 = 4$ ,  $c_2 = -2$ , and  $c_3 = 5$ . Thus,

$$\mathbf{r}(t) = (-\cos t + 4)\mathbf{i} + \left(\frac{t^3}{3} - 2\right)\mathbf{j} + \left(\frac{t^4}{4} + 5\right)\mathbf{k}. \quad \square$$

### CHECKING THE ANSWER

We may check our answer to Exercise 4 in two steps. First we take the derivative of  $\mathbf{r}(t) = (-\cos t + 4)\mathbf{i} + \left(\frac{t^3}{3} - 2\right)\mathbf{j} + \left(\frac{t^4}{4} + 5\right)\mathbf{k}$  and obtain

$$\mathbf{r}'(t) = (\sin t)\mathbf{i} + t^2\mathbf{j} + t^3\mathbf{k},$$

giving us the correct tangent vector function.

Next, we evaluate

$$\mathbf{r}(0) = (-\cos 0 + 4)\mathbf{i} + \left(\frac{0^3}{3} - 2\right)\mathbf{j} + \left(\frac{0^4}{4} + 5\right)\mathbf{k} = \langle 3, -2, 5 \rangle.$$

Thus, we have the correct solution.

### EXAMPLE 5

#### Finding the angle between two intersecting vector functions

Show that the conical helices defined by the vector functions  $\mathbf{r}_1(t) = \langle t \cos t, t \sin t, t \rangle$  and  $\mathbf{r}_2(t) = \langle t \sin t, t, t \cos t \rangle$  intersect at the origin, and then find the angle of intersection between the curves.

#### SOLUTION

Since both  $\mathbf{r}_1(0) = (0, 0, 0)$  and  $\mathbf{r}_2(0) = (0, 0, 0)$ , the two helices intersect at the origin. We now find the tangent vectors to both graphs. The derivatives are

$$\mathbf{r}'_1(t) = \langle \cos t - t \sin t, \sin t + t \cos t, 1 \rangle \quad \text{and} \quad \mathbf{r}'_2(t) = \langle \sin t + t \cos t, 1, \cos t - t \sin t \rangle.$$

The tangent vectors when  $t = 0$  are  $\mathbf{r}'_1(0) = \langle 1, 0, 1 \rangle$  and  $\mathbf{r}'_2(0) = \langle 0, 1, 1 \rangle$ . Recall that the cosine of the angle  $\theta$  between two vectors  $\mathbf{u}$  and  $\mathbf{v}$  is given by  $\cos \theta = \frac{\mathbf{u} \cdot \mathbf{v}}{\|\mathbf{u}\|\|\mathbf{v}\|}$ . Thus, the cosine of the angle between the helices at the origin is

$$\cos \theta = \frac{\langle 1, 0, 1 \rangle \cdot \langle 0, 1, 1 \rangle}{\|\langle 1, 0, 1 \rangle\| \|\langle 0, 1, 1 \rangle\|} = \frac{1}{\sqrt{2}\sqrt{2}} = \frac{1}{2}.$$

Therefore, the (acute) angle of intersection between the two curves is  $60^\circ$ . □

### ? TEST YOUR UNDERSTANDING

- ▶ We defined the derivative of a vector-valued function in terms of the derivatives of its component functions. Why do we bother stating and proving Theorem 11.7, which says that we can find a derivative by using the limit of a difference quotient?
- ▶ Given a vector-valued function  $\mathbf{r}$  and its graph  $C$ , what geometric relationship does the derivative function have to  $C$ ?
- ▶ Under what conditions are a vector-valued function and its derivative orthogonal?
- ▶ For a vector-valued function  $\mathbf{r}(t)$ , when would the velocity vector  $\mathbf{v}(t)$  and acceleration vector  $\mathbf{a}(t)$  be orthogonal?
- ▶ Given an acceleration vector  $\mathbf{a}(t)$ , how would you find the position vector  $\mathbf{r}(t)$ ?

## EXERCISES 11.2

## Thinking Back

*Differentiability:* Use the definition of the derivative to find the derivatives of the following functions.

- ▶  $f(x) = x^2$
- ▶  $f(x) = x^3 - 1$
- ▶  $f(x) = \sqrt{x+1}$

*Integrability:* Use the definition of the definite integral to evaluate the following integral.

- ▶  $\int_1^4 (x+3) dx$
- ▶  $\int_0^2 x^2 dx$
- ▶  $\int_1^3 (x^2 - 3) dx$

## Concepts

0. *Problem Zero:* Read the section and make your own summary of the material.
1. *True/False:* Determine whether each of the statements that follow is true or false. If a statement is true, explain why. If a statement is false, provide a counterexample.
  - (a) *True or False:* If  $\mathbf{r}(t)$  is a vector-valued function with domain  $\mathbb{R}$ , then  $\lim_{h \rightarrow 0} \mathbf{r}(t+h)$  exists.
  - (b) *True or False:* If  $\mathbf{r}(t)$  is a vector-valued function with domain  $\mathbb{R}$ , then  $\lim_{h \rightarrow 0} \frac{\mathbf{r}(t+h) - \mathbf{r}(t)}{h}$  exists.
  - (c) *True or False:* Given a differentiable vector-valued function  $\mathbf{r}(t)$ , if  $\|\mathbf{r}(t)\|$  is constant, then  $\mathbf{r}(t) \cdot \mathbf{r}'(t) = 0$ .
  - (d) *True or False:* Given a differentiable vector-valued function  $\mathbf{r}(t)$ , if  $\mathbf{r}(t) \cdot \mathbf{r}'(t) = 0$ , then  $\|\mathbf{r}(t)\|$  is constant.
  - (e) *True or False:* Given a twice-differentiable vector-valued function  $\mathbf{r}(t)$ , if  $\|\mathbf{r}(t)\|$  is constant, then  $\mathbf{r}'(t) \cdot \mathbf{r}''(t) = 0$ .
  - (f) *True or False:* Given a differentiable vector-valued function  $\mathbf{r}(t)$ , if  $\|\mathbf{r}(t)\|$  is constant, then  $\mathbf{r}(t) \times \mathbf{r}'(t) \neq 0$ .
  - (g) *True or False:* Given a twice-differentiable vector-valued function, the velocity and acceleration vectors are never equal.
  - (h) *True or False:* If  $\mathbf{r}(t)$  is a vector-valued function defined on the interval  $[a, b]$ , then  $\int_a^b \mathbf{r}(t) dt$  exists.
2. *Examples:* Construct examples of the thing(s) described in the following. Try to find examples that are different than any in the reading.
  - (a) A differentiable vector function.
  - (b) A differentiable vector function  $\mathbf{r}(t) = \langle x(t), y(t), z(t) \rangle$  in which none of the component functions is a constant but  $\|\mathbf{r}(t)\|$  is constant.
  - (c) A twice-differentiable vector function  $\mathbf{r}(t) = \langle x(t), y(t), z(t) \rangle$  in which none of the component functions is a constant but  $\mathbf{r}(t) = \mathbf{r}'(t)$  for every  $t$ .
3. State what it means for a scalar function  $y = f(x)$  to be differentiable at a point  $c$ .
4. State what it means for a vector function  $\mathbf{r}(t) = \langle x(t), y(t), z(t) \rangle$  to be differentiable.
5. Explain why we do not need to explicitly use a limit in the definition for the derivative of a vector function  $\mathbf{r}(t) = \langle x(t), y(t), z(t) \rangle$ .
6. Given a differentiable vector-valued function  $\mathbf{r}(t)$ , explain why  $\mathbf{r}'(t_0)$  is tangent to the curve defined by  $\mathbf{r}(t)$  when the initial point of  $\mathbf{r}'(t_0)$  is placed at the terminal point of  $\mathbf{r}(t_0)$ .
7. Give an example of a vector-valued function  $\mathbf{r}(t)$  that is *not* differentiable at at least one point in its domain. Explain why your example is not differentiable at that point. Graph the function, and discuss the problem there is with constructing a tangent vector at the point of nondifferentiability.
8. In our discussion of the geometry of the derivative we graphed a differentiable vector function  $\mathbf{r}(t)$  and the difference quotient  $\frac{\mathbf{r}(t+h) - \mathbf{r}(t)}{h}$  for positive values of  $h$ . Draw the corresponding picture for negative values of  $h$ , and explain why  $\lim_{h \rightarrow 0^-} \frac{\mathbf{r}(t+h) - \mathbf{r}(t)}{h}$  will result in the same tangent vector.
9. State what it means for a scalar function  $y = f(x)$  to be integrable on an interval  $[a, b]$ .
10. State what it means for a vector function  $\mathbf{r}(t) = \langle x(t), y(t), z(t) \rangle$  to be integrable.
11. Explain why we do not need to explicitly use a limit in the definition for the definite integral of a vector function  $\mathbf{r}(t) = \langle x(t), y(t), z(t) \rangle$ .
12. This exercise has to do with the integrability of vector functions.
  - (a) Explain why every vector function  $\mathbf{r}(t) = \langle x(t)y(t), z(t) \rangle$  defined on  $[a, b]$  is integrable if each of the component functions  $x(t)$ ,  $y(t)$ , and  $z(t)$  is continuous.
  - (b) When a vector function  $\mathbf{r}(t)$  defined on  $[a, b]$  is integrable,  $\mathbf{r}(t) = \int_a^b \mathbf{r}(t) dt$  may be difficult to evaluate. Explain why.
13. Complete the following definition: If  $\mathbf{r}(t) = \langle x(t), y(t), z(t) \rangle$  is a differentiable position function, then the **velocity** vector  $\mathbf{v}(t)$  is . . .
14. Complete the following definition: If  $\mathbf{r}(t) = \langle x(t), y(t), z(t) \rangle$  is a twice-differentiable position function, then the **acceleration** vector  $\mathbf{a}(t)$  is . . .
15. Let  $t = f(\tau)$  be a differentiable real-valued function of  $\tau$ , and let  $\mathbf{r}(t)$  be a differentiable vector function with

either two or three components such that  $f(\tau)$  is in the domain of  $\mathbf{r}$  for every value of  $\tau$  on some interval  $I$ . Find

$$\frac{d}{d\tau}(\mathbf{r}(f(\tau))).$$

16. Find the derivative of the vector-valued function  $\mathbf{r}(t) = t^2\mathbf{i} - 6t^2\mathbf{j}$ ,  $t > 0$ , and show that the derivative at any point  $t_0$  is a scalar multiple of the derivative at any other point. What does this property say about the graph of  $\mathbf{r}$ ? Use that information to sketch the graph of  $\mathbf{r}$ .
17. Find the derivative of the vector-valued function  $\mathbf{r}(t) = \langle t^3, 5t^3, -2t^3 \rangle$ ,  $t > 0$ , and show that the derivative at any point  $t_0$  is a scalar multiple of the derivative at any other

point. What does this property say about the graph of  $\mathbf{r}$ ? Sketch the graph of  $\mathbf{r}$ .

18. The graph of every vector-valued function  $\mathbf{r}(t)$  is a curve in the  $xy$ -plane. If  $\mathbf{r}$  is twice differentiable, explain how information about  $\mathbf{r}'(t)$  and  $\mathbf{r}''(t)$  can be used to graph  $\mathbf{r}$ .
19. What is the relationship between the graph of a differentiable vector function  $\mathbf{r}(t)$  and the graph of  $\int \mathbf{r}'(t) dt$ , one of the antiderivatives of  $\mathbf{r}'(t)$ ?
20. Given a differentiable vector function  $\mathbf{r}(t)$  defined on  $[a, b]$ , explain why the integral  $\int_a^b \|\mathbf{r}'(t)\| dt$  would be a scalar, not a vector.

## Skills

In Exercises 21–23 you are given a vector function  $\mathbf{r}$  and a scalar function  $t = f(\tau)$ . Compute  $\frac{d\mathbf{r}}{d\tau}$  in the following two ways:

- (a) By using the chain rule  $\frac{d\mathbf{r}}{d\tau} = \frac{d\mathbf{r}}{dt} \frac{dt}{d\tau}$ .
- (b) By substituting  $t = f(\tau)$  into the formula for  $\mathbf{r}$ .

Ensure that your two answers are consistent.

21.  $\mathbf{r}(t) = \langle t, t^2, t^3 \rangle$ ,  $t = \sin \tau$
22.  $\mathbf{r}(t) = \langle \cos t, \sin t, t \rangle$ ,  $t = \tau^3$
23.  $\mathbf{r}(t) = \langle t^2 \sin t^2, t, t^2 \cos t^2 \rangle$ ,  $t = \sqrt{\tau}$

In Exercises 24–29 a vector function and a point on the graph of the function are given. Find an equation for the line tangent to the curve at the specified point, and then find an equation for the plane orthogonal to the tangent line containing the given point.

24.  $\mathbf{r}(t) = \langle t, t^2, t^3 \rangle$ ,  $(2, 4, 8)$
25.  $\mathbf{r}(t) = te^t\mathbf{i} + t \ln t\mathbf{j}$ ,  $(e, 0, 0)$
26.  $\mathbf{r}(t) = \left\langle \sec t, \frac{1}{t+1}, e^t \ln(t+1) \right\rangle$ ,  $(1, 1, 0)$
27.  $\mathbf{r}(t) = \langle \sin t, \cos t, 2 \sin 2t \rangle$ ,  $(1, 0, 0)$
28.  $\mathbf{r}(t) = \langle t, t, t^{3/2} \rangle$ ,  $(4, 4, 8)$
29.  $\mathbf{r}(t) = \cos 3t\mathbf{i} + \sin 4t\mathbf{j} + t\mathbf{k}$ ,  $\left(0, 0, \frac{\pi}{2}\right)$

Find the velocity and acceleration vectors for the position vectors given in Exercises 30–34.

30.  $\mathbf{r}(t) = \langle t, t^2, t^3 \rangle$
31.  $\mathbf{r}(t) = te^t\mathbf{i} + t \ln t\mathbf{j}$
32.  $\mathbf{r}(t) = \left\langle \sec t, \frac{1}{t}, e^t \ln t \right\rangle$
33.  $\mathbf{r}(t) = \langle \sin t, \cos t, 2 \sin 2t \rangle$
34.  $\mathbf{r}(t) = \cos 3t\mathbf{i} + \sin 4t\mathbf{j} + t\mathbf{k}$

In Exercises 35–39 a vector function  $\mathbf{r}(t)$  and scalar function  $t = f(\tau)$  are given. Find  $\frac{d\mathbf{r}}{d\tau}$ .

35.  $\mathbf{r}(t) = \langle t, t^2, t^3 \rangle$ ,  $t = \tau^3 + 1$

36.  $\mathbf{r}(t) = te^t\mathbf{i} + t \ln t\mathbf{j}$ ,  $t = e^\tau$
37.  $\mathbf{r}(t) = \langle \sec t, 1/t, e^t \ln t \rangle$ ,  $t = \tau^{-1}$
38.  $\mathbf{r}(t) = \langle \sin t, \cos t, 2 \sin 2t \rangle$ ,  $t = \sqrt{\tau^2 + 1}$
39.  $\mathbf{r}(t) = \cos 3t\mathbf{i} + \sin 4t\mathbf{j} + t\mathbf{k}$ ,  $t = 5\tau - 2$

Evaluate the integrals in Exercises 40–44.

40.  $\int \langle t, t^2, t^3 \rangle dt$
41.  $\int \langle \sin t, \cos t, \tan t \rangle dt$
42.  $\int_1^2 \langle te^t, \ln t, \tan^{-1} t \rangle dt$
43.  $\int_0^{2\pi} \langle \sin t, \cos t, t \rangle dt$
44.  $\int_0^{2\pi} \|\langle \sin t, \cos t, t \rangle\| dt$

Use the given velocity vectors  $\mathbf{v}(t) = \mathbf{r}'(t)$  and initial positions in Exercises 45–48 to find the position function  $\mathbf{r}(t)$ .

45.  $\mathbf{v}(t) = \langle t, t^2 \rangle$ ,  $\mathbf{r}(0) = \langle 3, -4 \rangle$
46.  $\mathbf{v}(t) = \langle 0, \sec t \tan t, \sec^2 t \rangle$ ,  $\mathbf{r}(\pi) = \langle -2, 4, 3 \rangle$
47.  $\mathbf{v}(t) = e^t\mathbf{i} + \ln t\mathbf{j}$ ,  $\mathbf{r}(1) = \mathbf{i} - 6\mathbf{j}$
48.  $\mathbf{v}(t) = \cos t\mathbf{i} + \sin t\mathbf{j} + t\mathbf{k}$ ,  $\mathbf{r}(0) = -\mathbf{i} + 5\mathbf{j}$

Use the given acceleration vectors  $\mathbf{a}(t) = \mathbf{v}'(t) = \mathbf{r}''(t)$  and initial conditions in Exercises 49–52 to find the position function  $\mathbf{r}(t)$ .

49.  $\mathbf{a}(t) = \langle 2t, 3t^2 \rangle$ ,  $\mathbf{v}(0) = \langle 1, -2 \rangle$ ,  $\mathbf{r}(0) = \langle 2, -3 \rangle$
50.  $\mathbf{a}(t) = \langle 1, \sec t \tan t, \sec^2 t \rangle$ ,  
 $\mathbf{v}(\pi) = \langle 0, 3, -1 \rangle$ ,  $\mathbf{r}(\pi) = \langle 4, 5, -2 \rangle$
51.  $\mathbf{a}(t) = -32\mathbf{j}$ ,  $\mathbf{v}(0) = 5\mathbf{i} + 5\mathbf{j}$ ,  $\mathbf{r}(0) = 26\mathbf{j}$
52.  $\mathbf{a}(t) = \langle \sin 3t, t^2, \cos 3t \rangle$ ,  $\mathbf{v}(0) = \langle 0, 0, 0 \rangle$ ,  $\mathbf{r}(0) = \langle 2, -5, 3 \rangle$
53. Find all points of intersection between the vector function  $\mathbf{r}(t) = \langle t, t^2, t^3 \rangle$  and the plane defined by  $3x - 3y + z = 1$ .

Find all points of intersection between the graphs of the vector functions in Exercises 54–56, and find the acute angle of intersection of the curves at those points.

54.  $\mathbf{r}_1(t) = \langle t, t^2 \rangle$  and  $\mathbf{r}_2(t) = \langle t^2, t \rangle$

55.  $\mathbf{r}_1(t) = \langle 3 \cos t, 3 \sin t \rangle$  and  $\mathbf{r}_2(t) = \langle 2 + 2 \sin t, 2 \cos t \rangle$

56.  $\mathbf{r}_1(t) = \langle \cos t, \sin t, t \rangle$  and  $\mathbf{r}_2(t) = \langle \sin t, \cos t, t \rangle$

## Applications

58. Annie is making a crossing from south to north between two islands. The distance between the islands is 2 miles. A current in the channel pushes her off her line and slows her progress towards the opposite island. Her position  $t$  hours after leaving the southern island is

$$(0.255t^3 - 0.479t^2, 2t - 0.958t^2 + 0.511t^3).$$

Space coordinates are measured in miles from her starting position; time is measured in hours.

- (a) What is Annie's actual velocity vector at any time  $t$ ?  
 (b) Where is Annie's speed a minimum? What is her speed at that point?

59. Arne is a wingsuit base jumper in Norway. He wants to jump off a cliff above a fjord, 900 meters atop the valley floor. He knows that when he jumps, his downward acceleration due to gravity will be constant while there will be an upward acceleration depending on the air catching his wingsuit. He will convert about half of that upward acceleration into forward motion, which will cause drag. We ignore that, since he is still basically falling. Thus, his acceleration will be approximately

$$\langle -0.5dy'(t), -9.8 - dy'(t) \rangle,$$

57. A certain vector function has the properties that its graph is a space curve passing through the point  $(0, 1, 2)$  and that its tangent vector at every point on the curve is equal to the position vector. Find the position function and sketch its graph.

where  $y(t)$  denotes his vertical distance (in meters) from the jump point. The constant  $d \approx 0.36$  is a parameter describing air resistance. Note that after he jumps,  $y$  will always be negative.

- (a) What is Arne's velocity at time  $t$  in terms of his position relative to the start?  
 (b) Observe that the second coordinate of his velocity is his vertical speed, which is actually  $y'(t)$ . Use this fact to write an expression for  $y(t)$  in terms of  $y'(t)$ .  
 (c) Arne's horizontal speed away from his jump point is the first coordinate of his velocity; call it  $x'(t)$ . Write an expression for  $x'(t)$  in terms of  $y'(t)$ .  
 (d) Use parts (b) and (c) and integrate one more time to find a vector in terms of  $y(t)$  describing Arne's position at any time  $t$ .  
 (e) The cliff Arne jumps from is vertical for the first 100 meters down, but it quickly slopes out below that. To survive the jump, Arne must clear a point 200 meters below him and 80 meters horizontally away. He quickly makes a calculation showing that it will take him more than 7.4 seconds to fall 200 meters. Can he make it?

## Proofs

60. Prove that the tangent vector is always orthogonal to the position vector for the vector-valued function  $\mathbf{r}(t) = \langle \sin t, \sin t \cos t, \cos^2 t \rangle$ .

61. Let  $\mathbf{r}(t)$  be a vector-valued function whose graph is a curve  $C$ , and let  $\mathbf{a}(t)$  be the acceleration vector. Prove that if  $\mathbf{a}(t)$  is always zero, then  $C$  is a straight line.

62. Prove Theorem 11.7 for vectors in  $\mathbb{R}^2$ . That is, let  $x(t)$  and  $y(t)$  be two scalar functions, each of which is differentiable on an interval  $I \subseteq \mathbb{R}$ , and let  $\mathbf{r}(t) = \langle x(t), y(t) \rangle$  be a vector function. Prove that

$$\mathbf{r}'(t) = \lim_{h \rightarrow 0} \frac{\mathbf{r}(t+h) - \mathbf{r}(t)}{h}.$$

63. Let  $k$  be a scalar and  $\mathbf{r}(t)$  be a differentiable vector function. Prove that  $\frac{d}{dt}(k\mathbf{r}(t)) = k\mathbf{r}'(t)$ . (This is Theorem 11.11 (a).)

64. Let  $f(t)$  be a differentiable scalar function and  $\mathbf{r}(t)$  be a differentiable vector function. Prove that

$$\frac{d}{dt}(f(t)\mathbf{r}(t)) = f'(t)\mathbf{r}(t) + f(t)\mathbf{r}'(t).$$

(This is Theorem 11.11 (b).)

65. Let  $\mathbf{r}_1(t)$  and  $\mathbf{r}_2(t)$  be differentiable vector functions with three components each. Prove that

$$\frac{d}{dt}(\mathbf{r}_1(t) \cdot \mathbf{r}_2(t)) = \mathbf{r}'_1(t) \cdot \mathbf{r}_2(t) + \mathbf{r}_1(t) \cdot \mathbf{r}'_2(t).$$

(This is Theorem 11.11 (c).)

66. Let  $\mathbf{r}_1(t)$  and  $\mathbf{r}_2(t)$  both be differentiable three-component vector functions. Prove that

$$\frac{d}{dt}(\mathbf{r}_1(t) \times \mathbf{r}_2(t)) = \mathbf{r}'_1(t) \times \mathbf{r}_2(t) + \mathbf{r}_1(t) \times \mathbf{r}'_2(t).$$

(This is Theorem 11.11 (d).)

67. Let  $t = f(\tau)$  be a differentiable real-valued function of  $\tau$ , and let  $\mathbf{r}(t)$  be a differentiable vector function with three components such that  $f(\tau)$  is in the domain of  $\mathbf{r}$  for every value of  $\tau$  on some interval  $I$ . Prove that  $\frac{d\mathbf{r}}{d\tau} = \frac{d\mathbf{r}}{dt} \frac{dt}{d\tau}$ . (This is Theorem 11.8.)

68. Let  $\mathbf{r}(t)$  be a differentiable vector function. Prove that  $\frac{d}{dt}(\|\mathbf{r}\|) = \frac{1}{\|\mathbf{r}\|} \mathbf{r} \cdot \mathbf{r}'$ . (Hint:  $\|\mathbf{r}\|^2 = \mathbf{r} \cdot \mathbf{r}$ .)

69. Let  $\mathbf{r}(t)$  be a differentiable vector function such that  $\mathbf{r}(t) \cdot \mathbf{r}'(t) = 0$  for every value of  $t$ . Prove that  $\|\mathbf{r}(t)\|$  is a constant.
70. For constants  $\alpha$ ,  $\beta$ , and  $\gamma$ , the graph of a vector-valued function of the form

$$\mathbf{r}(t) = \alpha e^{\gamma t}(\cos t)\mathbf{i} + \alpha e^{\gamma t}(\sin t)\mathbf{j} + \beta e^{\gamma t}\mathbf{k}, \quad t \geq 0$$

is called a *concho-spiral*. Prove that the angle between the tangent vector to a concho-spiral and the vector  $\mathbf{k}$  is constant.

71. Prove that if a particle moves along a curve at a constant speed, then the velocity and acceleration vectors are orthogonal.

## Thinking Forward

- ▶ *Unit Tangent Vectors in  $\mathbb{R}^2$* : Given the vector function  $\mathbf{r}(t) = \langle t^2, t^3 \rangle$ , find a vector of length 1 tangent to the curve at the point  $\mathbf{r}(1)$ . How many vectors in  $\mathbb{R}^2$  are there of length 1 that are orthogonal to this tangent vector?
- ▶ *Unit Tangent Vectors in  $\mathbb{R}^3$* : Given the vector function  $\mathbf{r}(t) = \langle t, t^2, t^3 \rangle$ , find a vector of length 1 tangent to the curve at the point  $\mathbf{r}(1)$ . How many vectors in  $\mathbb{R}^3$  are there of length 1 that are orthogonal to this tangent vector?
- ▶ *Orthogonal Vectors*: For any constants  $a$ ,  $b$ , and  $c$ , show that the velocity and acceleration vectors for
 
$$\mathbf{r}(t) = \langle a \sin bt, a \cos bt, ct \rangle$$
 are orthogonal.
- ▶ *Horizontal Vectors*: For any constants  $a$ ,  $b$ , and  $c$ , show that the acceleration vector for
 
$$\mathbf{r}(t) = \langle a \sin bt, a \cos bt, ct \rangle$$
 is parallel to the  $xy$ -plane.

## 11.3 UNIT TANGENT AND UNIT NORMAL VECTORS

- ▶ The unit tangent and principal unit normal vectors to a space curve
- ▶ The osculating plane, the plane of “best fit” to a space curve
- ▶ The binormal vector to a space curve

### Unit Tangent and Unit Normal Vectors

Our goal for the remainder of this chapter is to understand the graphs of vector functions and the motion of particles whose trajectories can be specified by a vector function. No matter what parametrization,  $\mathbf{r}(t)$ , we use for a curve  $C$ , the derivative vector  $\mathbf{r}'(t)$  will be tangent to  $C$  at the terminal point of  $\mathbf{r}(t)$ , assuming that  $\mathbf{r}(t)$  is differentiable and  $\mathbf{r}'(t) \neq \mathbf{0}$ . We will be interested primarily in the direction of the tangent vector, not its magnitude, so we make the following definition:

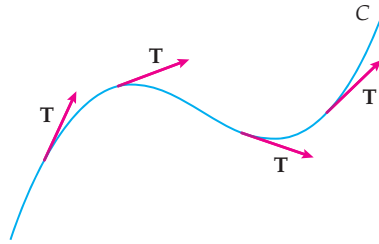

#### DEFINITION 11.14

#### The Unit Tangent Vector

Let  $\mathbf{r}(t)$  be a differentiable vector function on some interval  $I \subseteq \mathbb{R}$  such that  $\mathbf{r}'(t) \neq \mathbf{0}$  on  $I$ . The *unit tangent function* is defined to be

$$\mathbf{T}(t) = \frac{\mathbf{r}'(t)}{\|\mathbf{r}'(t)\|}.$$

As we do with the tangent vector  $\mathbf{r}'(t)$ , we will always position the initial point of the unit tangent vector  $\mathbf{T}(t)$  at the terminal point of  $\mathbf{r}(t)$  to ensure that  $\mathbf{T}(t)$  is tangent to the curve  $C$ , as shown in the following figure:

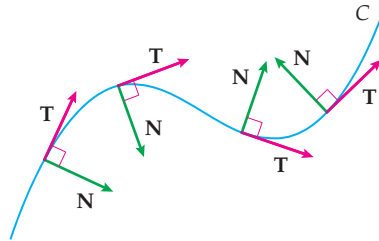

Since the magnitude of the unit tangent vector is constant, Theorem 11.12 tells us that  $\mathbf{T}(t)$  and its derivative are always orthogonal. We use this property in the following definition:

**DEFINITION 11.15**    **The Principal Unit Normal Vector**

Let  $\mathbf{r}(t)$  be a differentiable vector function on some interval  $I \subseteq \mathbb{R}$  such that the derivative of the unit tangent vector  $\mathbf{T}'(t) \neq \mathbf{0}$  on  $I$ . The **principal unit normal vector** at  $\mathbf{r}(t)$  is defined to be

$$\mathbf{N}(t) = \frac{\mathbf{T}'(t)}{\|\mathbf{T}'(t)\|}.$$

Definition 11.15 ensures that the principal unit normal vector is a unit vector, that it is orthogonal to the tangent vectors, and that it points in the direction in which  $C$  is bending. The following figure illustrates these properties:

## The Osculating Plane and the Binormal Vector

We do not expect curves, even curves in the plane, to contain straight segments. For example, the parabola defined by the equation  $y = x^2$  does not contain any linear pieces. However, we have mentioned that the tangent line is the best linear approximation to a differentiable function at the point of tangency. Analogously, we do not expect portions of space curves to be planar. That is, there may not be a plane that contains even a small segment of a space curve, but we may use the unit tangent and principal unit normal vectors to define a plane, the **osculating plane**, in which the curve fits “best.”

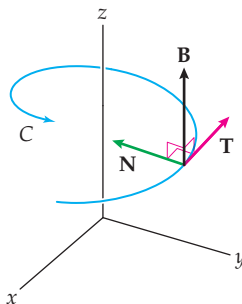

**DEFINITION 11.16**    **The Osculating Plane and the Binormal Vector**

Let  $\mathbf{r}(t) = \langle x(t), y(t), z(t) \rangle$  be a differentiable vector function on some interval  $I \subseteq \mathbb{R}$  such that the derivative of the unit tangent vector  $\mathbf{T}'(t_0) \neq \mathbf{0}$  where  $t_0 \in I$ . The **binormal vector**  $\mathbf{B}$  at  $\mathbf{r}(t_0)$  is defined to be

$$\mathbf{B}(t_0) = \mathbf{T}(t_0) \times \mathbf{N}(t_0),$$

and the **osculating plane** at  $\mathbf{r}(t_0)$  is defined by

$$\mathbf{B}(t_0) \cdot \langle x - x(t_0), y - y(t_0), z - z(t_0) \rangle = 0.$$

The preceding figure illustrates Definition 11.16. At a point on the curve  $C$  the vectors  $\mathbf{T}$  and  $\mathbf{N}$  determine a unique plane, the osculating plane. (*Osculating* comes from the Latin “osculum” meaning “kiss.”) From its definition, the binormal vector  $\mathbf{B}$  is orthogonal to both  $\mathbf{T}$  and  $\mathbf{N}$ , and therefore to the osculating plane. Vectors  $\mathbf{T}$ ,  $\mathbf{N}$ , and  $\mathbf{B}$  are three mutually perpendicular unit vectors. (We ask you to prove this in Exercise 47.) In the order  $\mathbf{T}$ ,  $\mathbf{N}$ ,  $\mathbf{B}$  they also form a right-hand coordinate system, called the **TNB-frame**, *moving frame*, or **Frenet frame**. This frame allows for a more in-depth understanding of the motion of a particle moving along a space curve.

When we are working with a curve in the  $xy$ -plane, since both  $\mathbf{T}$  and  $\mathbf{N}$  lie in the plane, the  $xy$ -plane is the osculating plane. In this case, we may think of the  $xy$ -plane as part of a three-dimensional coordinate system, with every binormal vector parallel to the  $z$ -axis. Thus, for a planar curve, at every point where the binormal vector exists,  $\mathbf{B}(t_0) = \pm \mathbf{k}$ .

## Examples and Explorations

### EXAMPLE 1

#### Finding a unit tangent vector and a unit normal vector in the plane

Find the unit tangent and principal unit normal vectors to the graph of the sine function  $y = \sin x$  at  $x = \frac{\pi}{2}$  and at  $x = \frac{5\pi}{4}$ .

#### SOLUTION

Any function of the form  $y = f(x)$  has the parametrization  $x = t$ ,  $y = f(t)$ . Thus, we may use the vector function  $\mathbf{r}(t) = \langle t, \sin t \rangle$  to compute the desired vectors. The unit tangent vector

$$\mathbf{T}(t) = \frac{\mathbf{r}'(t)}{\|\mathbf{r}'(t)\|} = \frac{\langle 1, \cos t \rangle}{\|\langle 1, \cos t \rangle\|} = \frac{\langle 1, \cos t \rangle}{\sqrt{1 + \cos^2 t}}.$$

To compute the principal unit normal vector  $\mathbf{N}(t) = \frac{\mathbf{T}'(t)}{\|\mathbf{T}'(t)\|}$ , we first use the quotient rule to find  $\mathbf{T}'(t)$ . You may check that:

$$\mathbf{T}'(t) = \frac{\sin t \langle \cos t, -1 \rangle}{(1 + \cos^2 t)^{3/2}}.$$

Dividing  $\mathbf{T}'(t)$  by its magnitude and simplifying, we obtain

$$\mathbf{N}(t) = \frac{\sin t \langle \cos t, -1 \rangle}{|\sin t| \sqrt{1 + \cos^2 t}}.$$

Evaluating the unit tangent vector and principal unit normal vector at  $t = \frac{\pi}{2}$ , we get

$$\mathbf{T}\left(\frac{\pi}{2}\right) = \langle 1, 0 \rangle \text{ and } \mathbf{N}\left(\frac{\pi}{2}\right) = \langle 0, -1 \rangle.$$

This result should not be a surprise. At  $\frac{\pi}{2}$  we expect there to be a horizontal tangent and a vertical normal vector pointing into the curve. In addition, since we chose a parametrization

that traced the curve from left to right, the tangent vector should (and does) point to the right.

At  $t = \frac{5\pi}{4}$  we obtain

$$\mathbf{T}\left(\frac{5\pi}{4}\right) = \frac{\langle 1, \cos(5\pi/4) \rangle}{\sqrt{1 + \cos^2(5\pi/4)}} = \frac{\langle 1, -\sqrt{2}/2 \rangle}{\sqrt{1 + 1/2}} = \frac{1}{\sqrt{3}}\langle \sqrt{2}, -1 \rangle \text{ and } \mathbf{N}\left(\frac{5\pi}{4}\right) = \frac{1}{\sqrt{3}}\langle 1, \sqrt{2} \rangle. \quad \square$$

 **CHECKING THE ANSWER**

Now, given that we are dealing with the function  $y = \sin x$ , perhaps it seemed that the preceding computations were (unnecessarily) complicated. If they did, you were right! For a differentiable function of the form  $y = f(x)$ , we have other techniques for finding the desired unit vectors. Since  $f'(x_0)$  is the slope of  $f$  at  $x_0$ , we can immediately obtain the tangent vector,  $\langle f'(x), 1 \rangle$ . If we divide this vector by its magnitude, we will obtain the equation of the unit tangent vector at  $x_0$ . Recall that two nonvertical lines in the plane are perpendicular if and only if their slopes are negative reciprocals. Therefore, a normal vector at  $x_0$  will be a multiple of  $\pm \langle 1, -f'(x_0) \rangle$ . To obtain the principal unit normal vector at  $x_0$ , we again divide by the magnitude and choose the correct sign, the one that points *into* the curve. Example 2 repeats these computations with a space curve, for which the additional complexity is necessary. Before continuing to that example, repeat the calculations in Example 1, using the analysis just outlined to find the unit tangent and principal unit normal vectors to  $y = \sin x$  at  $x = \frac{\pi}{2}$  and at  $x = \frac{5\pi}{4}$ . Make sure your results agree with the answers we found in Example 1.

**EXAMPLE 2**

**Finding the equation of an osculating plane**

Find the unit tangent and principal unit normal vectors to the graph of the helix defined by the vector function  $\mathbf{r}(t) = \langle \cos t, \sin t, t \rangle$  at  $t = \frac{\pi}{2}$  and at  $t = \frac{5\pi}{4}$ . Then, use these vectors to construct the equations of the osculating planes at those points on the curve.

**SOLUTION**

We start by computing

$$\mathbf{r}'(t) = \langle -\sin t, \cos t, 1 \rangle.$$

Thus,

$$\mathbf{T}(t) = \frac{\mathbf{r}'(t)}{\|\mathbf{r}'(t)\|} = \frac{\langle -\sin t, \cos t, 1 \rangle}{\|\langle -\sin t, \cos t, 1 \rangle\|} = \frac{\langle -\sin t, \cos t, 1 \rangle}{\sqrt{2}}.$$

To compute  $\mathbf{N}(t)$  we will divide  $\mathbf{T}'(t)$  by its magnitude. In this example, since the radical in the denominator of the final quotient in the preceding equation is a constant, it will cancel when we divide. Thus, to make our computation slightly simpler, we will divide the derivative of  $\langle -\sin t, \cos t, 1 \rangle$  by its magnitude. We obtain

$$\mathbf{N}(t) = \frac{\langle -\cos t, -\sin t, 0 \rangle}{\|\langle -\cos t, -\sin t, 0 \rangle\|} = \frac{\langle -\cos t, -\sin t, 0 \rangle}{\sqrt{1}} = \langle -\cos t, -\sin t, 0 \rangle.$$

We now evaluate these functions to obtain the required vectors at  $t = \frac{\pi}{2}$  and at  $t = \frac{5\pi}{4}$ . At  $t = \frac{\pi}{2}$  we have

$$\begin{aligned} \mathbf{T}\left(\frac{\pi}{2}\right) &= \frac{\langle -\sin(\pi/2), \cos(\pi/2), 1 \rangle}{\sqrt{2}} = \frac{\langle -1, 0, 1 \rangle}{\sqrt{2}} \text{ and} \\ \mathbf{N}\left(\frac{\pi}{2}\right) &= \langle -\cos(\pi/2), -\sin(\pi/2), 0 \rangle = \langle 0, -1, 0 \rangle. \end{aligned}$$

At  $t = \frac{5\pi}{4}$  we have

$$\mathbf{T}\left(\frac{5\pi}{4}\right) = \frac{\langle -\sin(5\pi/4), \cos(5\pi/4), 1 \rangle}{\sqrt{2}} = \frac{\langle \sqrt{2}/2, -\sqrt{2}/2, 1 \rangle}{\sqrt{2}} = \left\langle \frac{1}{2}, -\frac{1}{2}, \frac{\sqrt{2}}{2} \right\rangle \quad \text{and}$$

$$\mathbf{N}\left(\frac{5\pi}{4}\right) = \left\langle -\cos\left(\frac{5\pi}{4}\right), -\sin\left(\frac{5\pi}{4}\right), 0 \right\rangle = \left\langle \frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2}, 0 \right\rangle.$$

Finally, we construct the equations of the osculating planes. For the equation of a plane, we need a point on the plane and a vector orthogonal to the plane. For an osculating plane at a point  $t_0$ , we will use the terminal point of the vector  $\mathbf{r}(t_0)$  and the binormal vector  $\mathbf{B}(t_0) = \mathbf{T}(t_0) \times \mathbf{N}(t_0)$ , respectively.

At  $t = \frac{\pi}{2}$  we have  $\mathbf{r}\left(\frac{\pi}{2}\right) = \left\langle 0, 1, \frac{\pi}{2} \right\rangle$  and

$$\mathbf{B}\left(\frac{\pi}{2}\right) = \mathbf{T}\left(\frac{\pi}{2}\right) \times \mathbf{N}\left(\frac{\pi}{2}\right) = \frac{\langle -1, 0, 1 \rangle}{\sqrt{2}} \times \langle 0, -1, 0 \rangle = \frac{\langle 1, 0, 1 \rangle}{\sqrt{2}}.$$

For simplicity we may use  $\langle 1, 0, 1 \rangle$  as the vector orthogonal to the osculating plane and obtain the equation  $x + z = \frac{\pi}{2}$  for the osculating plane.

Similarly, at  $t = \frac{5\pi}{4}$  we have  $\mathbf{r}\left(\frac{5\pi}{4}\right) = \left\langle -\frac{\sqrt{2}}{2}, -\frac{\sqrt{2}}{2}, \frac{5\pi}{4} \right\rangle$  and

$$\mathbf{B}\left(\frac{5\pi}{4}\right) = \left\langle \frac{1}{2}, -\frac{1}{2}, \frac{\sqrt{2}}{2} \right\rangle \times \left\langle \frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2}, 0 \right\rangle = \left\langle -\frac{1}{2}, \frac{1}{2}, \frac{\sqrt{2}}{2} \right\rangle.$$

Again, for simplicity we may use  $\langle -1, 1, \sqrt{2} \rangle$  as the vector orthogonal to the osculating plane. Therefore, when  $t = \frac{5\pi}{4}$ , we obtain the equation  $-x + y + \sqrt{2}z = \frac{5\pi\sqrt{2}}{4}$  for the osculating plane.  $\square$

### CHECKING THE ANSWER

There are several things we can check in our answers to Example 2.

- ▶ As the parameter  $t$  increases, the helix is spiraling upwards. Therefore, each tangent vector should have a positive  $z$ -component. Note that  $\mathbf{T}(t) = \frac{\langle -\sin t, \cos t, 1 \rangle}{\sqrt{2}}$ . The  $z$ -component is always  $\frac{1}{\sqrt{2}}$ .
- ▶ Each of the answers should be a unit vector. (They are, as you can check.)
- ▶ At each of the points, the tangent and normal vectors should be orthogonal. Here we can use the dot product. For example, at  $t = \frac{5\pi}{4}$ ,

$$\mathbf{T}\left(\frac{5\pi}{4}\right) \cdot \mathbf{N}\left(\frac{5\pi}{4}\right) = \left\langle \frac{1}{2}, -\frac{1}{2}, \frac{\sqrt{2}}{2} \right\rangle \cdot \left\langle \frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2}, 0 \right\rangle = 0.$$

### TEST YOUR UNDERSTANDING

- ▶ How is the unit tangent vector defined? Why is the unit tangent vector useful?
- ▶ How is the principal unit normal vector defined? Why are the unit tangent vector at a point  $P$  and the principal unit normal vector at  $P$  always orthogonal?
- ▶ Why does the principal unit normal vector always point “into” the curve?
- ▶ How is the osculating plane defined? What is its geometric relationship to a space curve at a point?
- ▶ What is the binormal vector?

## EXERCISES 11.3

## Thinking Back

► *Unit vectors:* If  $\mathbf{v}$  is a nonzero vector, explain why  $\frac{\mathbf{v}}{\|\mathbf{v}\|}$  is a unit vector.

► *Equation of a plane:* Find the equation of the plane determined by the vectors  $\langle 1, -3, 5 \rangle$  and  $\langle 2, 4, -1 \rangle$  and containing the point  $(0, 3, -2)$ .

## Concepts

- Problem Zero:** Read the section and make your own summary of the material.
- True/False:** Determine whether each of the statements that follow is true or false. If a statement is true, explain why. If a statement is false, provide a counterexample.
  - True or False:* For every position vector,  $\mathbf{r}(t)$ ,  $\mathbf{r}'(t) \cdot \mathbf{r}''(t) = 0$ .
  - True or False:* If  $\|\mathbf{T}'(t)\| = 0$ , then  $\mathbf{N}(t)$  is not defined.
  - True or False:* The cross product of two unit vectors is another unit vector.
  - True or False:* If  $C$  is a curve in the  $xy$ -plane and the principal unit normal vector,  $\mathbf{N}$ , is defined at the point  $P_0$  on  $C$ , then the  $xy$ -plane is the osculating plane for  $C$  at  $P_0$ .
  - True or False:* If a vector function has a unit tangent vector and a principal unit normal vector at a point, then it has a binormal vector at that point also.
  - True or False:* If the unit tangent vector,  $\mathbf{T}(t)$ , the principal unit normal vector,  $\mathbf{N}(t)$ , and the binormal vector  $\mathbf{B}(t)$ , are all defined for some value of  $t$ , then  $\mathbf{B}(t) \times \mathbf{N}(t) = -\mathbf{T}(t)$ .
  - True or False:* If the unit tangent vector,  $\mathbf{T}(t)$ , the principal unit normal vector,  $\mathbf{N}(t)$ , and the binormal vector  $\mathbf{B}(t)$ , are all defined at some point  $t$ , then  $\mathbf{T}(t) \cdot (\mathbf{N}(t) \times \mathbf{B}(t)) = 1$ .
  - True or False:* A space curve can have infinitely many different osculating planes.
- Examples:** Construct examples of the thing(s) described in the following. Try to find examples that are different than any in the reading.
  - A differentiable vector-valued function  $\mathbf{r}(t)$  that does not have a unit tangent vector at any point.
  - A twice-differentiable vector-valued function with a unit tangent vector at every point but that does not have a unit normal vector at any point.
  - A nonconstant differentiable vector function  $\mathbf{r}(t) = \langle x(t), y(t) \rangle$  for which the  $xy$ -plane is *not* the osculating plane.
- Imagine that you are driving on a twisting mountain road. Describe the unit tangent vector, principal unit normal vector, and binormal vector as you ascend, descend, twist right, and twist left.
- Given a differentiable vector-valued function  $\mathbf{r}(t)$ , what is the definition of the unit tangent vector  $\mathbf{T}(t)$ ?
- Under what conditions does a differentiable vector-valued function  $\mathbf{r}(t)$  *not* have a unit tangent vector at a point in the domain of  $\mathbf{r}(t)$ ?
- Let  $\mathcal{L}$  be a straight line in  $\mathbb{R}^3$ . Find vector functions with the following properties:
  - The graph of  $\mathbf{r}_1(t)$  is  $\mathcal{L}$ , and  $\mathbf{r}_1(t)$  has a unit tangent vector for every value of  $t$ .
  - The graph of  $\mathbf{r}_2(t)$  is  $\mathcal{L}$ , and there is a least one value of  $t$  at which  $\mathbf{r}_2(t)$  does not have a unit tangent vector.
- Given a differentiable vector-valued function  $\mathbf{r}(t)$ , what is the relationship between  $\mathbf{r}'(t_0)$  and  $\mathbf{T}(t_0)$  at a point  $t_0$  in the domain of  $\mathbf{r}(t)$ ?
- Given a differentiable vector-valued function  $\mathbf{r}(t)$ , what are the advantages and disadvantages in using  $\mathbf{r}'$  or  $\mathbf{T}$  to analyze the behavior of  $\mathbf{r}(t)$ ?
- Given a twice-differentiable vector-valued function  $\mathbf{r}(t)$ , what is the definition of the principal unit normal vector  $\mathbf{N}(t)$ ?
- Given a twice-differentiable vector-valued function  $\mathbf{r}(t)$ , why does the principal unit normal vector  $\mathbf{N}(t)$  point into the curve? (*Hint: Use the definition!*)
- Given a twice-differentiable vector-valued function  $\mathbf{r}(t)$  and a point  $t_0$  in its domain, what are the geometric relationships between the unit tangent vector  $\mathbf{T}(t_0)$ , the principal unit normal vector  $\mathbf{N}(t_0)$ , and  $\left. \frac{d\mathbf{N}}{dt} \right|_{t_0}$ ?
- Under what conditions does a twice-differentiable vector-valued function  $\mathbf{r}(t)$  *not* have a principal unit normal vector at a point in the domain of  $\mathbf{r}(t)$ ?
- Given a twice-differentiable vector-valued function  $\mathbf{r}(t)$ , what is the definition of the binormal vector  $\mathbf{B}(t)$ ?
- We've seen that the graph of a continuous function  $y = f(x)$  is the same as the graph of the vector-valued function  $\mathbf{r}(t) = \langle t, f(t) \rangle$ . What is the direction of the binormal vector  $\mathbf{B}(t)$  when the graph of  $f$  is concave up? When the graph is concave down? What happens to  $\mathbf{B}(t)$  at a point of inflection?
- Under what conditions does a twice-differentiable vector-valued function  $\mathbf{r}(t)$  *not* have a binormal vector at a point in the domain of  $\mathbf{r}(t)$ ?
- Given a twice-differentiable vector-valued function  $\mathbf{r}(t)$  and a point  $t_0$  in its domain, what is the osculating plane at  $\mathbf{r}(t_0)$ ?
- Carefully outline the steps you would use to find the equation of the osculating plane at a point  $\mathbf{r}(t_0)$  on the graph of a vector function.
- If the osculating plane is the same at every point on a space curve, what must be true about the curve?
- Given the three mutually perpendicular vectors  $\mathbf{T}(t_0)$ ,  $\mathbf{N}(t_0)$ , and  $\mathbf{B}(t_0)$  at a point  $\mathbf{r}(t_0)$ , how many distinct planes contain the point and two of the vectors?

20. Let  $C$  be the graph of a vector-valued function  $\mathbf{r}$ . The plane determined by the vectors  $\mathbf{N}(t_0)$  and  $\mathbf{B}(t_0)$  and containing the point  $\mathbf{r}(t_0)$  is called the **normal** plane for  $C$  at  $\mathbf{r}(t_0)$ . Find the equation of the normal plane to the helix determined by  $\mathbf{r}(t) = \langle \cos t, \sin t, t \rangle$  for  $t = \pi$ .

21. Let  $C$  be the graph of a vector-valued function  $\mathbf{r}$ . The plane determined by the vectors  $\mathbf{T}(t_0)$  and  $\mathbf{B}(t_0)$  and containing the point  $\mathbf{r}(t_0)$  is called the **rectifying** plane for  $C$  at  $\mathbf{r}(t_0)$ . Find the equation of the rectifying plane to the helix determined by  $\mathbf{r}(t) = \langle \cos t, \sin t, t \rangle$  when  $t = \pi$ .

## Skills

For each of the vector-valued functions in Exercises 22–28, find the unit tangent vector.

22.  $\mathbf{r}(t) = \langle t, t^2 \rangle$   
 23.  $\mathbf{r}(t) = \langle t^2 + 5, 5t, 4t^3 \rangle$   
 24.  $\mathbf{r}(t) = \langle \cos \alpha t, \sin \alpha t \rangle$   
 25.  $\mathbf{r}(t) = \langle \cos^3 t, \sin^3 t \rangle$   
 26.  $\mathbf{r}(t) = \langle t, t^2, t^3 \rangle$   
 27.  $\mathbf{r}(t) = \langle 3 \sin t, 5 \cos t, 4 \sin t \rangle$   
 28.  $\mathbf{r}(t) = \langle \sin 2t, \cos 2t, t \rangle$

For each of the vector-valued functions in Exercises 29–34, find the unit tangent vector and the principal unit normal vector at the specified value of  $t$ .

29.  $\mathbf{r}(t) = \langle t, t^2 \rangle$ ,  $t = 1$   
 30.  $\mathbf{r}(t) = \langle a \sinh t, b \cosh t \rangle$ , where  $a$  and  $b$  are positive,  $t = 0$   
 31.  $\mathbf{r}(t) = \langle \cos \alpha t, \sin \alpha t \rangle$ , where  $\alpha > 0$ ,  $t = \pi$   
 32.  $\mathbf{r}(t) = \langle \cos^3 t, \sin^3 t \rangle$ ,  $t = \frac{\pi}{4}$   
 33.  $\mathbf{r}(t) = \langle 3 \sin t, 5 \cos t, 4 \sin t \rangle$ ,  $t = \pi$   
 34.  $\mathbf{r}(t) = \langle \sin 2t, \cos 2t, t \rangle$ ,  $t = \frac{\pi}{4}$

For each of the vector-valued functions in Exercises 35–39, find the unit tangent vector, the principal unit normal vector, the binormal vector, and the equation of the osculating plane at the specified value of  $t$ .

35.  $\mathbf{r}(t) = \langle t, t^2, \frac{2}{3}t^3 \rangle$  at  $t = 1$   
 36.  $\mathbf{r}(t) = \langle \frac{t}{\sqrt{2}}, \sqrt{t}, \frac{1}{3}t^{3/2} \rangle$  at  $t = 1$   
 37.  $\mathbf{r}(t) = \langle e^t, e^{-t}, \sqrt{2}t \rangle$  at  $t = 0$   
 38.  $\mathbf{r}(t) = \langle 3 \sin t, 5 \cos t, 4 \sin t \rangle$  at  $t = \frac{\pi}{4}$   
 39.  $\mathbf{r}(t) = \langle \sin 2t, \cos 2t, t \rangle$  at  $t = \frac{\pi}{2}$

Using the definitions of the normal plane and rectifying plane in Exercises 20 and 21, respectively, find the equations of these planes at the specified points for the vector functions in Exercises 40–42. Note: These are the same functions as in Exercises 35, 37, and 39.

40.  $\mathbf{r}(t) = \langle t, t^2, \frac{2}{3}t^3 \rangle$  at  $t = 1$   
 41.  $\mathbf{r}(t) = \langle e^t, e^{-t}, \sqrt{2}t \rangle$  at  $t = 0$   
 42.  $\mathbf{r}(t) = \langle \sin 2t, \cos 2t, t \rangle$  at  $t = \frac{\pi}{2}$

## Applications

43. Annie is kayaking with her friend Jim. Jim is inexperienced, and soon his boat is upside down. Being inexperienced, he also fails to execute a roll, so he has to swim. Since they are both in single kayaks, they cannot get him back in the boat, so Jim grabs his kayak and Annie's kayak, and Annie tows the whole lot towards shore. There is a current, so if they did not paddle, they would follow a path defined by the vector function  $\mathbf{r}(t) = \langle t^{1.5}, t(1.7 - t) \rangle$ , where  $t$  represents time in hours.

- (a) For  $0 \leq t \leq 1.7$ , where would they move fastest if they did not paddle at all?  
 (b) Their best strategy to get to shore is to paddle exactly orthogonally to the current, towards the land that is on the inside of the path of the current. If they get things in order and start paddling at  $t = 0.1$ , in what direction are they paddling?

44. Ian is planning a return from a mountain in the Cascades. He will descend to around 6000 feet and then follow a contour, staying high and out of the trees to make travel easy, until he is at a point directly above a trail. He will then descend directly to the trail. The contour at 6000 feet follows the curve  $\mathbf{r}(x) = \langle x, 0.45x^2 + x \rangle$ . Ian uses his map to determine that he will be at the point where he needs to descend to the trail when he can first see a mountain peak that is on a compass heading of 30 degrees; that is, when the tangent to the level curve is 30 degrees east of north.

- (a) Where does that happen? What is the unit tangent vector at that point?  
 (b) When he reaches that point, he will descend directly down the slope, orthogonally to the contour. Downhill is generally north. What compass heading will that be? What is the unit normal vector there?

## Proofs

45. Prove that the cross product of two orthogonal unit vectors is a unit vector.
46. Let  $y = f(x)$  be a function with domain  $\mathbb{R}$  and that is differentiable at every point in its domain, and let  $\mathbf{r}(t) = \langle t, f(t) \rangle$ .
- Explain why the graph of  $\mathbf{r}$  is the same as the graph of  $y = f(x)$ .
  - Prove that the unit tangent vector at  $\mathbf{r}(\alpha)$  is parallel to the tangent line to  $f$  at  $\alpha$ .
  - Prove that the principal unit normal vector for  $\mathbf{r}$  is undefined at every inflection point of  $f$ .
47. Let  $\mathbf{r}(t) = \langle x(t), y(t), z(t) \rangle$  be a differentiable vector function on some interval  $I \subseteq \mathbb{R}$  such that the derivative of the unit tangent vector  $\mathbf{T}'(t_0) \neq \mathbf{0}$ , where  $t_0 \in I$ . Prove that the binormal vector

$$\mathbf{B}(t_0) = \mathbf{T}(t_0) \times \mathbf{N}(t_0)$$

- is a unit vector;
- is orthogonal to both  $\mathbf{T}(t_0)$  and  $\mathbf{N}(t_0)$ .

Also, prove that  $\mathbf{T}(t_0)$ ,  $\mathbf{N}(t_0)$ , and  $\mathbf{B}(t_0)$  form a right-handed coordinate system.

## Thinking Forward

- ▶ *Equation of a circle:* Find an equation for the circle of radius  $\rho$  whose center is  $\rho$  units from the point  $(a, b)$  in the direction of the vector  $\langle \alpha, \beta \rangle$ .
- ▶ *Equation of a sphere:* Find an equation for the sphere of radius  $\rho$  whose center is  $\rho$  units from the point  $(a, b, c)$  in the direction of the vector  $\langle \alpha, \beta, \gamma \rangle$ .

## 11.4 ARC LENGTH PARAMETRIZATIONS AND CURVATURE

- ▶ The arc length of a curve in  $\mathbb{R}^3$
- ▶ Arc length parametrizations
- ▶ The curvature of planar curves and space curves

### The Arc Length of Space Curves

We begin this section with a reminder of some of the work we did in Section 9.1. Let  $x = x(t)$  and  $y = y(t)$  be differentiable functions of  $t$ . In Definition 9.3 we said that the arc length of the parametric curve determined by  $x$  and  $y$  on an interval  $[a, b]$  was

$$\lim_{n \rightarrow \infty} \sum_{k=1}^n \sqrt{(x(t_k) - x(t_{k-1}))^2 + (y(t_k) - y(t_{k-1}))^2},$$

where  $\Delta t = \frac{b-a}{n}$  and  $t_k = a + k\Delta t$ . Then, in Theorem 9.4 we argued that the arc length could be evaluated with the use of  $\int_a^b \sqrt{(x'(t))^2 + (y'(t))^2} dt$ .

We now express Definition 9.3 and Theorem 9.4 in the language of vector functions. The vector function  $\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j}$  has the same graph as the parametric equations. Definition 9.3 would say that the arc length of the vector curve on the interval  $[a, b]$  would be  $\lim_{n \rightarrow \infty} \sum_{k=1}^n \|\mathbf{r}(t_k) - \mathbf{r}(t_{k-1})\|$ , where  $\Delta t = \frac{b-a}{n}$  and  $t_k = a + k\Delta t$ . Similarly,  $\int_a^b \|\mathbf{r}'(t)\| dt$  represents the length of the vector curve for  $t \in [a, b]$ . These formulas are valid, since

$$\begin{aligned} \|\mathbf{r}(t_k) - \mathbf{r}(t_{k-1})\| &= \sqrt{(x(t_k) - x(t_{k-1}))^2 + (y(t_k) - y(t_{k-1}))^2} \text{ and} \\ \|\mathbf{r}'(t)\| &= \sqrt{(x'(t))^2 + (y'(t))^2}, \end{aligned}$$

by the Pythagorean theorem and the definition of the norm of a vector, respectively.

The great thing about these forms is that they carry over to space curves (or even to curves in higher dimensions)! Thus, we have the following definition:

**DEFINITION 11.17** The Arc Length of a Vector Curve

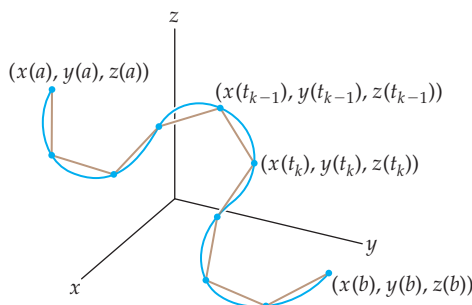

Let  $C$  be a curve in  $\mathbb{R}^3$  given by the vector function  $\mathbf{r}(t) = \langle x(t), y(t), z(t) \rangle$  for  $t \in [a, b]$ , where  $x$ ,  $y$ , and  $z$  are differentiable functions of  $t$  and such that the function is one-to-one from the interval  $[a, b]$  to the curve  $C$ . The **length of the curve**  $C$  from  $a$  to  $b$ , denoted by  $l(a, b)$ , is

$$l(a, b) = \lim_{n \rightarrow \infty} \sum_{k=1}^n \|\mathbf{r}(t_k) - \mathbf{r}(t_{k-1})\|,$$

where  $\Delta t = \frac{b-a}{n}$  and  $t_k = a + k\Delta t$ .

The following figure illustrates the idea behind the definition of arc length:

*The arc length of a vector curve may be approximated by using segments*

We also have the following theorem:

**THEOREM 11.18** The Arc Length of a Vector Curve

Let  $C$  be a curve in  $\mathbb{R}^3$  given by the vector function  $\mathbf{r}(t) = \langle x(t), y(t), z(t) \rangle$  such that the function is one-to-one from the interval  $[a, b]$  to the curve  $C$ . If  $x$ ,  $y$ , and  $z$  are differentiable functions of  $t$  such that  $x'$ ,  $y'$ , and  $z'$  are continuous on  $[a, b]$ , then the length of the curve  $C$  from  $\mathbf{r}(a)$  to  $\mathbf{r}(b)$  is given by

$$l(a, b) = \int_a^b \|\mathbf{r}'(t)\| dt.$$

A proof of Theorem 11.18 may be adapted from the proof of Theorem 9.4 in Section 9.1 and is left to you.

## Arc Length Parametrizations

We have already discussed the geometry of the relationship between a differentiable vector function and its derivative. The derivative gives us information about the rate and direction of motion of a particle moving along a vector curve. Recall that for a real-valued function of the form  $y = f(x)$ , the second derivative gives us more subtle information about the shape of the curve and the sign of  $f''$  tells us whether a curve is concave up or concave down. Space curves are even more complicated than planar curves. A single number cannot tell us everything about how a space curve is bending. However, we do want to know about the “curvature” of a space curve. We will get to that definition later in this section.

To help us define curvature in a relatively easy way, we need to settle on a particular type of parametrization for a given vector curve. You should have already realized that a given vector curve has many different parametrizations. For example, in Chapter 9 we examined several parametrizations for the unit circle. In fact, every vector curve has infinitely many different parametrizations. For example, for every nonzero value of  $k$ , the vector function  $\mathbf{r}(t) = \langle \cos kt, \sin kt \rangle$  for  $t \geq 0$  provides a different parametrization of the unit circle. The differences between two of these parametrizations are the rate at which the particle traces the circle and the direction of motion. For every value of  $k$ , the particle starts at the point  $(1, 0)$  when  $t = 0$ . The motion is clockwise when  $k < 0$  and counterclockwise when  $k > 0$ . The rate at which the particle moves increases linearly with  $k$ . For example, when  $k = 1$ , the particle traces the unit circle once on the interval  $[0, 2\pi)$ , but if  $k = 5$ , the particles traces the circle 5 times on the same interval.

Similarly, every vector curve in  $\mathbb{R}^3$  has infinitely many parametrizations. The particular type of parametrization that we need for our upcoming definition of curvature is called an “arc length parametrization.”

**DEFINITION 11.19****Arc Length Parametrization**

Let  $C$  be the graph of a differentiable vector function  $\mathbf{r}(t)$  defined on an interval  $I$ . The function  $\mathbf{r}(t)$  is said to be an **arc length parametrization** for  $C$  if

$$\int_c^d \|\mathbf{r}'(t)\| dt = d - c$$

for every  $c$  and  $d \in I$ . Also,  $C$  is said to be **parametrized by arc length**.

When a curve is parametrized by arc length, the length of every segment of the curve is equal to the change in the value of the parameter. For example,  $\mathbf{r}_1(t) = \langle \cos t, \sin t \rangle$  and  $\mathbf{r}_2(t) = \langle \cos 2t, \sin 2t \rangle$  are both parametrizations of the unit circle. The function  $\mathbf{r}_1(t)$  is an arc length parametrization of the unit circle, since

$$\int_c^d \|\mathbf{r}'_1(t)\| dt = \int_c^d \|\langle -\sin t, \cos t \rangle\| dt = \int_c^d \sqrt{\sin^2 t + \cos^2 t} dt = \int_c^d dt = d - c.$$

However, the function  $\mathbf{r}_2(t)$  is not an arc length parametrization of the unit circle, since

$$\begin{aligned} \int_c^d \|\mathbf{r}'_2(t)\| dt &= \int_c^d \|\langle -2 \sin 2t, 2 \cos 2t \rangle\| dt \\ &= \int_c^d \sqrt{4 \sin^2 2t + 4 \cos^2 2t} dt = \int_c^d 2 dt = 2(d - c). \end{aligned}$$

In the next theorem we will see that when we use an arc length parametrization, the derivative of  $\mathbf{r}$  with respect to arc length is particularly simple.

**THEOREM 11.20****The Derivative of a Vector Function with Respect to Arc Length**

Let  $C$  be a curve in  $\mathbb{R}^3$  given by the differentiable vector function  $\mathbf{r}(t) = \langle x(t), y(t), z(t) \rangle$  such that  $\mathbf{r}(t)$  is one-to-one from the interval  $[a, b]$  to the curve  $C$  and has a nonzero derivative. If we define the real-valued function  $s(t)$  by

$$s(t) = \int_a^t \|\mathbf{r}'(\tau)\| d\tau,$$

then

$$\frac{d\mathbf{r}}{ds} = \mathbf{T}(t)$$

is the unit tangent vector function for  $C$ .

**Proof.** We first note that

$$\int_a^t \|\mathbf{r}'(\tau)\| d\tau = l(a, t) = s(t).$$

That is,  $s(t)$  represents the arc length of  $C$  between the terminal points of  $\mathbf{r}(a)$  and  $\mathbf{r}(t)$ .

Now, by the Fundamental Theorem of Calculus

$$s'(t) = \frac{ds}{dt} = \|\mathbf{r}'(t)\|,$$

and by the chain rule,

$$\frac{d\mathbf{r}}{dt} = \frac{d\mathbf{r}}{ds} \frac{ds}{dt}.$$

Solving for  $\frac{d\mathbf{r}}{ds}$  and using the fact that  $\frac{ds}{dt} = \|\mathbf{r}'(t)\|$ , we have

$$\frac{d\mathbf{r}}{ds} = \frac{\mathbf{r}'(t)}{\|\mathbf{r}'(t)\|}.$$

We see that  $\frac{d\mathbf{r}}{ds}$  has the same direction as  $\mathbf{r}'(t)$  and remind you that any nonzero vector divided by its magnitude is a unit vector. Thus,  $\frac{d\mathbf{r}}{ds} = \mathbf{T}(t)$ , the unit tangent vector to  $C$ . ■

With most parametrizations of a curve, both the direction *and* magnitude of the tangent vectors change as a particle traverses the curve. However, Theorem 11.20 tells us that when a curve is parametrized by arc length, since the derivative is a unit vector, only the directions of the tangent vectors are changing. This change in the unit tangent vectors is the basis for the following definition:

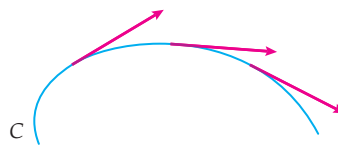

### DEFINITION 11.21

#### Curvature

Let  $C$  be the graph of a vector function  $\mathbf{r}(s)$  defined on an interval  $I$ , parametrized by arc length  $s$ , and with unit tangent vector  $\mathbf{T}$ . The **curvature**  $\kappa$  of  $C$  at a point on the curve is the scalar given by

$$\kappa = \left\| \frac{d\mathbf{T}}{ds} \right\|.$$

*The magnitude of the rate of change of the unit tangent vector defines curvature*

The following theorem tells us the relationship between the derivative of the unit tangent vector, curvature, and the principal unit normal vector:

### THEOREM 11.22

#### The Relationship Between $\frac{d\mathbf{T}}{ds}$ , $\kappa$ , and $\mathbf{N}$

Let  $C$  be the graph of a vector function  $\mathbf{r}(s)$  defined on an interval  $I$  and parametrized by arc length  $s$ . If the unit tangent vector  $\mathbf{T}$  has a nonzero derivative, then

$$\frac{d\mathbf{T}}{ds} = \kappa\mathbf{N}.$$

The proof of Theorem 11.22 follows from the facts that the vector functions  $\frac{d\mathbf{T}}{ds}$ ,  $\frac{d\mathbf{T}}{dt}$ , and  $\mathbf{N}$  are scalar multiples of each other and that  $\|\mathbf{N}\| = 1$ . The details are left for Exercise 64.

Although Definition 11.21 provides an elegant way to express and understand curvature, it is usually impractical in computations, because, unfortunately, arc length parametrizations are frequently difficult to construct.

The next two theorems provide more computationally efficient alternatives for computing the curvature.

**THEOREM 11.23****Formulas for the Curvature of a Space Curve**

Let  $C$  be the graph of a twice-differentiable vector function  $\mathbf{r}(t)$  defined on an interval  $I$  with unit tangent vector  $\mathbf{T}(t)$ . Then the curvature  $\kappa$  of  $C$  at a point on the curve is given by

$$\begin{aligned} \text{(a)} \quad \kappa &= \frac{\|\mathbf{T}'(t)\|}{\|\mathbf{r}'(t)\|} \\ \text{(b)} \quad \kappa &= \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3} \end{aligned}$$

**Proof.** Let  $s$  be an arc length parameter for  $C$ .

(a) By the chain rule,

$$\kappa = \left\| \frac{d\mathbf{T}}{ds} \right\| = \left\| \frac{d\mathbf{T}/dt}{ds/dt} \right\| = \frac{\|\mathbf{T}'(t)\|}{\|\mathbf{r}'(t)\|}.$$

(b) By the chain rule and Theorem 11.20,

$$\mathbf{r}'(t) = \frac{d\mathbf{r}}{dt} = \frac{d\mathbf{r}}{ds} \frac{ds}{dt} = \mathbf{T} \frac{ds}{dt}.$$

Differentiating with respect to  $t$  by the product rule, we obtain

$$\mathbf{r}''(t) = \frac{d\mathbf{T}}{dt} \frac{ds}{dt} + \mathbf{T} \frac{d^2s}{dt^2}.$$

Now, first by the chain rule and then by Theorem 11.22, we have

$$\mathbf{r}''(t) = \frac{d\mathbf{T}}{ds} \frac{ds}{dt} \frac{ds}{dt} + \mathbf{T} \frac{d^2s}{dt^2} = \kappa \mathbf{N} \left( \frac{ds}{dt} \right)^2 + \mathbf{T} \frac{d^2s}{dt^2}.$$

Using the preceding equations to form the cross product  $\mathbf{r}'(t) \times \mathbf{r}''(t)$ , we obtain

$$\begin{aligned} \mathbf{r}'(t) \times \mathbf{r}''(t) &= \mathbf{T} \frac{ds}{dt} \times \left( \kappa \mathbf{N} \left( \frac{ds}{dt} \right)^2 + \mathbf{T} \frac{d^2s}{dt^2} \right) \\ &= \kappa (\mathbf{T} \times \mathbf{N}) \left( \frac{ds}{dt} \right)^3 + (\mathbf{T} \times \mathbf{T}) \frac{ds}{dt} \frac{d^2s}{dt^2} \\ &= \kappa \mathbf{B} \left( \frac{ds}{dt} \right)^3 = \kappa \mathbf{B} \|\mathbf{r}'(t)\|^3, \end{aligned}$$

since  $\mathbf{T} \times \mathbf{N} = \mathbf{B}$  and the cross product of any three-component vector with itself is  $\mathbf{0}$ . Finally, if we take the norms of the first and last parts in the preceding chain of equalities and divide by  $\|\mathbf{r}'(t)\|^3$ , we have our result. ■

Even with Theorem 11.23, the computation of the curvature can be quite laborious. We provide a complete calculation in Example 3.

It is also convenient to have formulas for the curvature of planar curves. The following theorem gives us a simpler method for computing the curvature of a function of the form  $y = f(x)$  and for finding the curvature of a curve defined by a vector function with two components:

**THEOREM 11.24** Formulas for Curvature in the Plane

- (a) Let  $y = f(x)$  be a twice-differentiable function. Then the curvature of the graph of  $f$  is given by

$$\kappa = \frac{|f''(x)|}{(1 + (f'(x))^2)^{3/2}}.$$

- (b) Let  $C$  be the graph of a vector function  $\mathbf{r}(t) = \langle x(t), y(t) \rangle$  in the  $xy$ -plane, where  $x$  and  $y$  are twice-differentiable functions of  $t$  such that  $x'(t)$  and  $y'(t)$  are not simultaneously zero. Then the curvature  $\kappa$  of  $C$  at a point on the curve is given by

$$\kappa = \frac{|x'(t)y''(t) - x''(t)y'(t)|}{((x'(t))^2 + (y'(t))^2)^{3/2}}.$$

We ask you to prove Theorem 11.24 in Exercises 65 and 66.

We make two final definitions to aid our understanding of curves. For a vector curve  $C$  with a positive curvature at a point, we define the radius of curvature and osculating circle.

**DEFINITION 11.25** Radius of Curvature and Osculating Circle

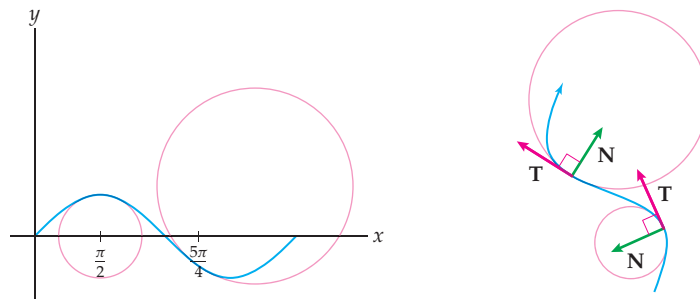

Let  $C$  be the graph of a vector function  $\mathbf{r}$ , and let  $\mathbf{r}(t_0)$  be the position vector for a point on  $C$  at which the curvature  $\kappa > 0$ .

- (a) The **radius of curvature**  $\rho$  of  $C$  at  $\mathbf{r}(t_0)$  is given by

$$\rho = \frac{1}{\kappa}.$$

- (b) The **osculating circle** to the curve  $C$  at  $\mathbf{r}(t_0)$  is the circle in the osculating plane, with radius  $\rho$ , and whose center is the terminal point of the position vector  $\mathbf{r}(t_0) + \rho\mathbf{N}(t_0)$ .

As we mentioned in Section 11.3, when a curve  $C$  is planar, the osculating plane is the plane. In this case, the osculating circle also lies in the plane. The figure appearing next at the left shows a portion of the sine curve and the osculating circles when  $x = \frac{\pi}{2}$  and when  $x = \frac{5\pi}{4}$ . In Example 2 we discuss how to find the equations of these circles. The figure at the right is a space curve, also with two osculating circles.

In two or three dimensions, an osculating circle is the circle that fits the shape of the curve “the best,” in that the curvatures of the curve and the osculating circle are the same at the point of tangency.

## Examples and Explorations

**EXAMPLE 1** Finding the arc length of a space curve

Find the arc length of the helix defined by  $\mathbf{r}(t) = \langle \cos \alpha t, \sin \alpha t, \beta t \rangle$  on the interval  $[a, b]$ , where  $a$ ,  $b$ ,  $\alpha$ , and  $\beta$  are constants.

**SOLUTION**

The integral

$$\int_a^b \|\mathbf{r}'(t)\| dt = \int_a^b \|\langle -\alpha \sin \alpha t, \alpha \cos \alpha t, \beta \rangle\| dt$$

represents the specified arc length and equals

$$\int_a^b \sqrt{\alpha^2 \sin^2 \alpha t + \alpha^2 \cos^2 \alpha t + \beta^2} dt = \int_a^b \sqrt{\alpha^2 + \beta^2} dt = (b - a)\sqrt{\alpha^2 + \beta^2}. \quad \square$$

**EXAMPLE 2** Finding osculating circles in the plane

Find the equations of the osculating circles to the graph of the sine function  $y = \sin x$  at  $x = \frac{\pi}{2}$  and at  $x = \frac{5\pi}{4}$ .

**SOLUTION**

This is a continuation of Example 1 in Section 11.3. In that example, we found the unit tangent and principal unit normal vectors to the curve at  $x = \frac{\pi}{2}$  and at  $x = \frac{5\pi}{4}$ . Next, we need the curvature. Using Theorem 11.24(a), we have

$$\kappa = \frac{|f''(x)|}{(1 + (f'(x))^2)^{3/2}} = \frac{|-\sin x|}{(1 + \cos^2 x)^{3/2}}.$$

At  $x = \frac{\pi}{2}$ , we have  $\kappa = 1$ . The radius of curvature  $\rho = \frac{1}{\kappa} = 1$ . Therefore, the center of the osculating circle will be one unit from the point  $\left(\frac{\pi}{2}, \sin\left(\frac{\pi}{2}\right)\right) = \left(\frac{\pi}{2}, 1\right)$  in the direction of the principal unit normal vector  $\mathbf{N}\left(\frac{\pi}{2}\right) = \langle 0, -1 \rangle$ . Thus, the osculating circle will have its center at  $\left(\frac{\pi}{2}, 0\right)$  and have radius 1. The equation of this circle is  $\left(x - \frac{\pi}{2}\right)^2 + y^2 = 1$ .

$$\text{At } x = \frac{5\pi}{4},$$

$$\kappa = \frac{|-\sin(5\pi/4)|}{(1 + \cos^2(5\pi/4))^{3/2}} = \frac{\sqrt{2}/2}{(3/2)^{3/2}} = \frac{2}{3\sqrt{3}}.$$

The radius of curvature is the reciprocal of  $\kappa$ , so  $\rho = \frac{3\sqrt{3}}{2}$ . The principal unit normal vector  $\mathbf{N}\left(\frac{5\pi}{4}\right) = \frac{1}{\sqrt{3}}\langle 1, \sqrt{2} \rangle$ . The osculating circle will have its center at the terminal point of the position vector  $\left\langle \frac{5\pi}{4}, \sin\left(\frac{5\pi}{4}\right) \right\rangle + \rho \mathbf{N}\left(\frac{5\pi}{4}\right) = \left\langle \frac{5\pi}{4} + \frac{3}{2}, \sqrt{2} \right\rangle$  and have radius  $\frac{3\sqrt{3}}{2}$ . The equation of the circle is  $\left(x - \frac{5\pi}{4} - \frac{3}{2}\right)^2 + (y - \sqrt{2})^2 = \frac{27}{4}$ . The graph of the function, along with these two osculating circles, appears on the left preceding Example 1.  $\square$

**EXAMPLE 3** Finding the center and radius of an osculating circle to a space curve

Find the center and radius of the osculating circle to the graph of the helix defined by the vector function  $\mathbf{r}(t) = \langle \cos t, \sin t, t \rangle$  at  $t = \frac{\pi}{2}$  and at  $t = \frac{5\pi}{4}$ .

**SOLUTION**

This is also a continuation of an example from Section 11.3. In Example 2 of that section, we found the unit tangent and principal unit normal vectors to the helix at  $t = \frac{\pi}{2}$  and at  $t = \frac{5\pi}{4}$ . Now we need the curvature. Using Theorem 11.23(b), we have

$$\kappa = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3} = \frac{\|(-\sin t, \cos t, 1) \times (-\cos t, -\sin t, 0)\|}{\|(-\sin t, \cos t, 1)\|^3} = \frac{\|(\sin t, -\cos t, 1)\|}{\sqrt{2}^3} = \frac{1}{2}.$$

The curvature at every point on the helix is  $\frac{1}{2}$ . (Why does it make sense that the curvature on this helix is constant?) The radius of curvature is constantly 2. Finally, we only need the center points for the two circles. At  $t = \frac{\pi}{2}$ , the center of the osculating circle will be

$$\mathbf{r}\left(\frac{\pi}{2}\right) + 2\mathbf{N}\left(\frac{\pi}{2}\right) = \left\langle 0, 1, \frac{\pi}{2} \right\rangle + 2\langle 0, -1, 0 \rangle = \left\langle 0, -1, \frac{\pi}{2} \right\rangle.$$

The osculating circle will therefore have its center at  $\left(0, -1, \frac{\pi}{2}\right)$  and have radius 2.

At  $t = \frac{5\pi}{4}$ , the center of the osculating circle will be

$$\mathbf{r}\left(\frac{5\pi}{4}\right) + 2\mathbf{N}\left(\frac{5\pi}{4}\right) = \left\langle -\frac{\sqrt{2}}{2}, -\frac{\sqrt{2}}{2}, \frac{5\pi}{4} \right\rangle + 2\left\langle \frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2}, 0 \right\rangle = \left\langle \frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2}, \frac{5\pi}{4} \right\rangle.$$

The osculating circle will therefore have its center at  $\left(\frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2}, \frac{5\pi}{4}\right)$  and have radius 2.  $\square$

**? TEST YOUR UNDERSTANDING**

- ▶ How is the arc length of a vector-valued function defined? Why is this definition consistent with the definitions of arc length you learned for differentiable functions of the form  $y = f(x)$  and for parametric equations  $x = x(t)$  and  $y = y(t)$ ?
- ▶ What does it mean for a vector function to be parametrized by arc length?
- ▶ How is curvature defined? Why is the definition of curvature difficult to use?
- ▶ For a twice-differentiable function  $y = f(x)$ , how is the curvature at a point  $x_0$  related to the concavity of the graph at  $x_0$ ?
- ▶ What is the radius of curvature at a point  $P$  on a curve? How is the osculating circle at  $P$  defined?

**EXERCISES 11.4****Thinking Back**

- ▶ *The arc length of the sine function:* Find the arc length of the sine function  $y = e^{x/2} + e^{-x/2}$  for  $0 \leq x \leq 1$ .
- ▶ *The arc length of the cycloid:* Find the arc length of the cycloid  $x = \theta - \sin \theta$ ,  $y = 1 - \cos \theta$ , for  $0 \leq \theta \leq 2\pi$ .

**Concepts**

0. *Problem Zero:* Read the section and make your own summary of the material.
1. *True/False:* Determine whether each of the statements that follow is true or false. If a statement is true, explain why. If a statement is false, provide a counterexample.
  - (a) *True or False:* For every differentiable vector-valued function  $\mathbf{r}$ ,  $\int_a^b \|\mathbf{r}'(t)\| dt \geq (b - a)$ .
  - (b) *True or False:* Every vector-valued function has an arc length parametrization.
  - (c) *True or False:* Every straight line has constant curvature.
  - (d) *True or False:* The radius of curvature is the reciprocal of the curvature.
  - (e) *True or False:* The radius of curvature is zero at every point on a straight line.
  - (f) *True or False:* If a vector-valued function  $\mathbf{r}$  is differentiable for some value of  $t$ , its curvature at that point is positive.
  - (g) *True or False:* If a vector-valued function  $\mathbf{r}$  is twice differentiable at some value  $t_0$ , then the osculating circle is defined at  $\mathbf{r}(t_0)$ .

- (h) *True or False:* If a vector-valued function  $\mathbf{r}$  has a principal unit normal vector for some value  $t_0$ , then the osculating circle at  $\mathbf{r}(t_0)$  is defined.
- Examples: Construct examples of the thing(s) described in the following. Try to find examples that are different than any in the reading.
    - An arc length parametrization for a straight line in the plane.
    - A space curve with constant curvature.
    - A space curve with varying curvature.
  - Define what it means for a curve to be parametrized by arc length.
  - Explain how a ruler made of string could be used to understand an arc length parametrization.
  - Why are the concepts of “concave up” and “concave down” insufficient for quantifying how a space curve bends?
  - Let  $C$  be the graph of the vector-valued function  $\mathbf{r}(t)$ . Define the curvature at a point on  $C$ .
  - What makes Definition 11.21 for curvature easy to understand? What makes it difficult to use?
  - Let  $P_0$  be a point on a curve  $C$  with positive curvature  $\kappa$ . Define the radius of curvature at  $P_0$ .
  - Compare the definition of curvature with the four formulas given in Theorems 11.23 and 11.24. Discuss when each formula would be the easiest to use.
  - Sam and Ben are arguing about the curvature of a function  $y = f(x)$ . Sam claims that the maximum curvature of every such function occurs at a relative extremum. Ben disagrees. Who is right? If Sam is right, prove the result. If Ben is right, provide a counterexample that disproves Sam’s claim.
  - Recall that the graph of the vector function  $\mathbf{r}(t) = \langle a + \alpha t, b + \beta t, c + \gamma t \rangle$  is a straight line in  $\mathbb{R}^3$  if constants  $\alpha$ ,  $\beta$ , and  $\gamma$  are not all zero.
    - Show that the curvature at every point on this line is zero and the radius of curvature at every point is undefined.
    - Explain why what you showed in part (a) makes sense.
  - Let  $\alpha > 0$ .
    - Explain why the graph of the vector function  $\mathbf{r}(t) = \langle a + \alpha \cos t, b + \alpha \sin t \rangle$  is a circle  $C$  with center  $(a, b)$  and radius  $\alpha$ .
    - Show that the curvature at every point on  $C$  is  $\frac{1}{\alpha}$  and the radius of curvature at every point is  $\alpha$ .
    - Explain why the osculating circle at every point on  $C$  is the circle  $C$ .
    - Explain why the answers to parts (a), (b), and (c) make sense.
  - Give a step-by-step procedure for finding the equation of the osculating circle at a point on a planar curve where the curvature is nonzero.
  - Give a step-by-step procedure for finding the center and radius of the osculating circle at a point on a space curve where the curvature is nonzero.
  - Show that the second derivative of the function of  $y = x^2$  is constant, but its curvature varies with  $x$ .
  - Show that the curvature of the function of  $y = \sqrt{1 - x^2}$ ,  $x \in (-1, 1)$ , is constant, but its second derivative varies with  $x$ .
- In Exercises 17–21 sketch the graph of a vector-valued function  $\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j}$  with the specified properties.
- $\mathbf{r}(1) = \langle 1, 2 \rangle$ ,  $\kappa(1) = 3$ ,  $\mathbf{N}(1) = \left\langle \frac{3}{5}, \frac{4}{5} \right\rangle$   
 $\mathbf{r}(3) = \langle -3, 5 \rangle$ ,  $\kappa(3) = 3$ ,  $\mathbf{N}(3) = \left\langle \frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}} \right\rangle$
  - $\mathbf{r}(0) = \langle 0, 0 \rangle$ ,  $\kappa(0) = 0$ ,  $\mathbf{N}(0)$  is undefined  
 $\mathbf{r}(2) = \langle 3, 7 \rangle$ ,  $\kappa(2) = 1$ ,  $\mathbf{N}(2) = \langle 1, 0 \rangle$
  - $\mathbf{r}(1) = \langle 3, 5 \rangle$ ,  $\rho(1) = 3$ ,  $\mathbf{N}(1) = \langle 1, 0 \rangle$   
 $\mathbf{r}(4) = \langle -2, 4 \rangle$ ,  $\rho(4) = 2$ ,  $\mathbf{N}(4) = \left\langle \frac{\sqrt{3}}{3}, \frac{\sqrt{6}}{3} \right\rangle$
  - $\kappa$  is always 0,  $\mathbf{r}(0) = \langle 2, 0 \rangle$ ,  $\mathbf{r}(1) = \langle 0, 2 \rangle$
  - $\kappa$  is always  $\frac{1}{2}$ ,  $\mathbf{r}(0) = \langle 2, 0 \rangle$ ,  $\mathbf{r}(1) = \langle 0, 2 \rangle$

## Skills

Find the arc length of the curves defined by the vector-valued functions on the specified intervals in Exercises 22–27.

22.  $\mathbf{r}(t) = \langle 3t - 4, -2t + 5, t + 3 \rangle$ ,  $[1, 5]$

23.  $\mathbf{r}(t) = \langle 3 \cos 4t, 3 \sin 4t \rangle$ ,  $\left[0, \frac{\pi}{2}\right]$

24.  $\mathbf{r}(t) = \langle t - \sin t, 1 - \cos t \rangle$ ,  $[0, 2\pi]$

25.  $\mathbf{r}(t) = \langle 4 \sin t, t^{3/2}, -4 \cos t \rangle$ ,  $[0, 4]$

26.  $\mathbf{r}(t) = \langle e^t, \sqrt{2}t, e^{-t} \rangle$ ,  $[0, 1]$

27.  $\mathbf{r}(t) = \langle e^t \sin t, e^t \cos t, e^t \rangle$ ,  $[0, \pi]$

In Exercises 28–30 show that the given vector-valued functions are not arc length parametrizations. Then find an

arc length parametrization for the curves defined by those functions.

28.  $\mathbf{r}(t) = \langle 3 \cos t, 3 \sin t \rangle$

29.  $\mathbf{r}(t) = \langle 3 + 2t, 4 - t, -1 + 5t \rangle$

30.  $\mathbf{r}(t) = \langle \cos t, \sin t, t \rangle$

In Exercises 31–35 find the curvature of the given function at the indicated value of  $x$ . Then sketch the curve and the osculating circle at the indicated point.

31.  $y = e^x$ ,  $x = 0$

32.  $y = \sin x$ ,  $x = \frac{\pi}{2}$

33.  $y = \csc x$ ,  $x = \frac{\pi}{2}$

34.  $y = \sqrt{x}$ ,  $x = 2$

35.  $y = \frac{1}{3}(x^2 + 2)^{3/2}$ ,  $x = 1$

Find the curvature of each of the functions defined by the parametric equations in Exercises 36–38.

36.  $x = k \cos t$ ,  $y = k \sin t$

37.  $x = a \cos t$ ,  $y = b \sin t$

38.  $x = \cos t + t \sin t$ ,  $y = \sin t - t \cos t$

Find the curvature of each of the vector-valued functions defined in Exercises 39–44.

39.  $\mathbf{r}(t) = \langle t - \sin t, 1 - \cos t \rangle$

40.  $\mathbf{r}(t) = \langle t, t^2, t^3 \rangle$

41.  $\mathbf{r}(t) = \langle t \sin t, t \cos t, t \rangle$

42.  $\mathbf{r}(t) = \langle t \sin t, t \cos t, 2t \rangle$

43.  $\mathbf{r}(t) = \langle t \sin t, t \cos t, \alpha t \rangle$ , where  $\alpha$  is a constant

44.  $\mathbf{r}(t) = \langle \sin t, \cos t, \cosh t \rangle$

45. Find the value(s) of  $x$  where the curvature is greatest on the graph of  $y = x^3$ .

46. Show that the curvature on the parabola defined by  $y = x^2$  is greatest at the origin.

47. Show that the curvature is constant at every point on the circular helix defined by  $\mathbf{r}(t) = \langle a \cos t, a \sin t, bt \rangle$ , where  $a$  and  $b$  are positive constants.

48. Find the points on the graphs of  $y = e^x$  and  $y = \ln x$  where the curvature is maximal. Explain how the two answers are related.

49. Let  $\mathbf{r}(t) = \left\langle \cos t, \sin t, \frac{1}{t} \right\rangle$ ,  $t > 0$ . Show that  $\lim_{t \rightarrow \infty} \kappa = 1$  and  $\lim_{t \rightarrow 0^+} \kappa = 0$ .

## Applications

58. Ian will walk along a contour on the side of a mountain to get from a point he calls the origin to the point  $(2, 0)$ , with distances measured in miles. Unfortunately, the mountainside is riven by gullies and ridges. Thus, his route will follow the curve

$$\mathbf{r}(t) = \langle 1.2t - 0.5t^2 + 0.1t^4, 0.15 \sin(6\pi t) \rangle.$$

How far does Ian actually have to walk?

59. Travelling along a contour on a mountainside is usually most difficult at the points of greatest curvature of the

50. Find the curvature on the graph of the elliptical helix defined by  $\mathbf{r}(t) = \langle a \cos t, b \sin t, ct \rangle$ , where  $a$ ,  $b$ , and  $c$  are positive constants.

Exercises 51 and 52 derive the equations necessary to define the **torsion**  $\tau$  of a space curve. (Torsion measures the rate at which a space curve twists away from the osculating plane.) In each of these exercises, let  $C$  be a space curve and let  $\mathbf{r}(s)$  be an arc length parametrization for  $C$  such that  $\frac{d\mathbf{T}}{ds}$  and  $\frac{d\mathbf{N}}{ds}$  exist at every point on  $C$ .

51. Explain why  $\frac{d\mathbf{B}}{ds}$  exists at every point on  $C$ . (Hint: Differentiate  $\mathbf{B} = \mathbf{T} \times \mathbf{N}$  with respect to arc length.)

52. Use Exercise 51 and Theorem 11.12 to show that  $\frac{d\mathbf{B}}{ds}$  is parallel to  $\mathbf{N}$ . (Hint: Recall that  $\frac{d\mathbf{T}}{ds} = \kappa\mathbf{N}$ .) Since  $\frac{d\mathbf{B}}{ds}$  and  $\mathbf{N}$  are parallel, we define the torsion  $\tau$  to be the scalar such that  $\frac{d\mathbf{B}}{ds} = -\tau\mathbf{N}$ .

53. Use Exercise 52 to show that  $\frac{d\mathbf{N}}{ds} = -\kappa\mathbf{T} + \tau\mathbf{B}$ , where  $\kappa$  is the curvature. (Hint: Differentiate  $\mathbf{N} = \mathbf{B} \times \mathbf{T}$  with respect to arc length.)

Use the definition of torsion in Exercise 52 to compute the torsion of the vector functions in Exercises 54–56.

54.  $\mathbf{r}(t) = \langle \cos t, \sin t, t \rangle$

55.  $\mathbf{r}(t) = \langle \cosh t, \sinh t, t \rangle$

56.  $\mathbf{r}(t) = \langle 3 \sin t, 5 \cos t, 4 \sin t \rangle$

57. Use the results of Exercise 52 to show that the torsion of a planar curve  $C$  is zero at every point on  $C$ .

route, since these indicate deep gullies or sharp, rocky promontories that must be passed.

(a) Sketch the graph of Ian's route from the previous problem.

(b) Sketch each component of the curve describing his route. What information does that give you about the curvature?

(c) Roughly where does Ian expect the greatest difficulties?

## Proofs

60. Use Theorem 11.24 to prove that the curvature of a linear function  $y = mx + b$  is zero for every value of  $x$ .

61. Use Theorem 11.24 to prove that the curvature is zero at a point of inflection of a twice-differentiable function  $y = f(x)$ .

62. Prove that a planar curve with constant curvature is either a line or a circle. Give an example of a space curve with constant curvature that is neither a line nor a circle.

63. Prove that the magnitude of the acceleration of a particle moving along a curve,  $C$ , with a constant speed is proportional to the curvature of  $C$ .

64. Let  $C$  be the graph of a vector function  $\mathbf{r}(s)$  defined on an interval  $I$  and parametrized by arc length  $s$ .

(a) If the unit tangent vector  $\mathbf{T}$  has a nonzero derivative, use the chain rule and the definitions of the unit tangent vector  $\mathbf{T}$  and principal unit normal vector  $\mathbf{N}$  to show that  $\frac{d\mathbf{T}}{ds}$ ,  $\frac{d\mathbf{T}}{dt}$ , and  $\mathbf{N}$  are scalar multiples of each

other. In particular, argue that  $\frac{d\mathbf{T}}{ds} = \alpha\mathbf{N}$  for some scalar  $\alpha$ .

- (b) Use the fact that  $\mathbf{N}$  is a unit vector to show that the constant  $\alpha$  in part (a) must equal  $\kappa$ .

65. Let  $y = f(x)$  be a twice-differentiable function. Show that the curvature of the graph of  $f$  is given by

$$\kappa = \frac{|f''(x)|}{(1 + (f'(x))^2)^{3/2}}.$$

This is part (a) of Theorem 11.24. (Hint: Use the parametrization  $x = t$ ,  $y = f(t)$ .)

66. Let  $C$  be the graph of a vector function  $\mathbf{r}(t) = \langle x(t), y(t) \rangle$  in the  $xy$ -plane, where  $x(t)$  and  $y(t)$  are twice-differentiable functions of  $t$ . Show that the curvature  $\kappa$  of  $C$  at a point on the curve is given by

$$\kappa = \frac{|x'(t)y''(t) - x''(t)y'(t)|}{((x'(t))^2 + (y'(t))^2)^{3/2}}.$$

This is part (b) of Theorem 11.24.

## Thinking Forward

A decomposition of the acceleration vector: Find  $\text{comp}_{\mathbf{v}(t)}\mathbf{a}(t)$ , where  $\mathbf{v}$  and  $\mathbf{a}$  are the velocity and acceleration vectors, respectively, of the following functions.

- ▶  $\mathbf{r}(t) = \langle t, t^2, t^3 \rangle$
- ▶  $\mathbf{r}(t) = \langle \cos t, \sin t, t \rangle$
- ▶  $\mathbf{r}(t) = \langle e^t \sin t, e^t \cos t, e^t \rangle$

## 11.5 MOTION

- ▶ The behavior of objects subject to the force of gravity
- ▶ The displacement and distance of projectiles
- ▶ The tangential and normal components of the acceleration vector

### Motion Under the Force of Gravity

In Chapter 2 we discussed motion along a straight path. The motions we examined were of two types: straight up and down, and straight back and forth. Now that we have studied vector functions, we are ready to widen the discussion to motion along curves in a plane and motion along a space curve. We begin by discussing motion under the force of gravity.

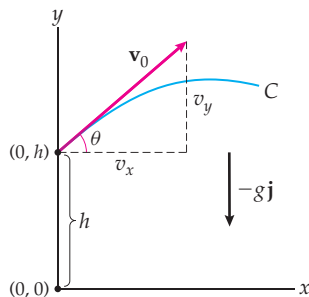

Imagine a catapult that can propel a rock with an initial velocity of 30 miles per hour. A number of questions arise:

- ▶ If the catapult always releases the rock at the same angle to the horizontal, how far will the rock travel?
- ▶ Along what path would the rock travel?
- ▶ What is the maximum height reached by the rock?
- ▶ How long will it take until the rock hits the ground?
- ▶ How fast will the rock be travelling upon impact?
- ▶ If the catapult can be moved to the top of a hill, would the rock travel farther?
- ▶ If the angle at which the catapult releases the rock can be adjusted, what angle would maximize the distance the rock travels?
- ▶ Will the motion be planar?

We will answer some of these questions in this section and leave others to the exercises.

To begin our analysis we will assume that wind resistance and friction are negligible and that our object is a point mass. Recall that (on Earth) the gravitational constant  $g$  is 32 feet per second per second in the English system, and 9.8 meters per second per second

in the metric system. We know from experience that a thrown object travels in a curved path. When we ignore wind resistance, we may assume that the motion is planar and use a two-dimensional coordinate system that places the initial position of the object at  $(0, h)$ , where  $h$  is the starting height of the projectile (as it is released). The following diagram illustrates the starting point of our analysis:

We assume that the projectile moves along a planar curve  $C$  given by the vector function  $\mathbf{r}(t) = \langle x(t), y(t) \rangle$ . The initial velocity of the vector function is

$$\mathbf{v}_0 = \mathbf{v}(0) = \mathbf{r}'(0) = v_x \mathbf{i} + v_y \mathbf{j} = \|\mathbf{v}_0\| \cos \theta \mathbf{i} + \|\mathbf{v}_0\| \sin \theta \mathbf{j}.$$

We also assume that the acceleration of the projectile after it is released is due solely to gravity, which is constant and acts downwards. Therefore,  $\mathbf{r}''(t) = \mathbf{a}(t) = -g\mathbf{j}$ . We will now be able to find the vector function  $\mathbf{v}$  by integrating  $\mathbf{a}$ . That is,

$$\mathbf{v}(t) = \int \mathbf{a}(t) dt = \int \langle 0, -g \rangle dt = \langle c_1, -gt + c_2 \rangle,$$

where  $c_1$  and  $c_2$  are constants of integration. We may evaluate these constants because we know the initial velocity  $\mathbf{v}(0) = \langle \|\mathbf{v}_0\| \cos \theta, \|\mathbf{v}_0\| \sin \theta \rangle = \langle c_1, c_2 \rangle$ . Consequently,

$$c_1 = \|\mathbf{v}_0\| \cos \theta \quad \text{and} \quad c_2 = \|\mathbf{v}_0\| \sin \theta.$$

We have the velocity function

$$\mathbf{v}(t) = \langle \|\mathbf{v}_0\| \cos \theta, -gt + \|\mathbf{v}_0\| \sin \theta \rangle.$$

Now, we integrate  $\mathbf{v}$  to find  $\mathbf{r}$ :

$$\begin{aligned} \mathbf{r}(t) &= \int \mathbf{v}(t) dt = \int \langle \|\mathbf{v}_0\| \cos \theta, -gt + \|\mathbf{v}_0\| \sin \theta \rangle dt \\ &= \langle (\|\mathbf{v}_0\| \cos \theta) t + C_1, -\frac{1}{2}gt^2 + (\|\mathbf{v}_0\| \sin \theta) t + C_2 \rangle. \end{aligned}$$

Here  $C_1$  and  $C_2$  are new constants of integration that may be evaluated by using the initial position of the projectile. We positioned our coordinate system so that  $\mathbf{r}(0) = \langle 0, h \rangle$ . So, we obtain  $C_1 = 0$  and  $C_2 = h$ ; thus, the parametrization for  $C$  is

$$\mathbf{r}(t) = \left\langle (\|\mathbf{v}_0\| \cos \theta) t, -\frac{1}{2}gt^2 + (\|\mathbf{v}_0\| \sin \theta) t + h \right\rangle.$$

It follows that the path of the projectile is a parabola, because when we eliminate the parameter  $t$  from the equations

$$x = (\|\mathbf{v}_0\| \cos \theta) t, \quad y = -\frac{1}{2}gt^2 + (\|\mathbf{v}_0\| \sin \theta) t + h,$$

we obtain the quadratic function

$$y = -\frac{g}{2\|\mathbf{v}_0\|^2 \cos^2 \theta} x^2 + (\tan \theta)x + h.$$

(Recall that  $\mathbf{v}_0$ ,  $\theta$  and  $h$  are all constants.)

We will consider extended examples next.

## Displacement and Distance Travelled

We are all familiar with the sentence:

*The shortest distance between two points is a straight line.*

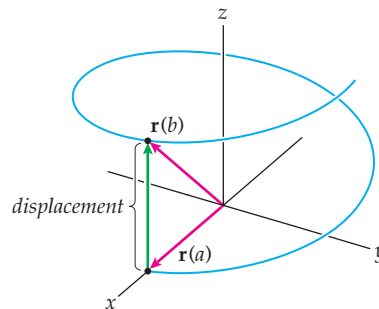

This shortest distance is the displacement, while the length of the curve traversed by an object is the distance travelled. In terms of vector functions we have the following definition:

### DEFINITION 11.26 Displacement Versus Distance Travelled

Let the vector-valued function  $\mathbf{r}(t)$  represent the position function for a particle travelling on a curve  $C$ . If the domain of  $\mathbf{r}$  is an interval  $I$  containing points  $a$  and  $b$ :

- (a) The **displacement** of the the particle from  $a$  to  $b$  is given by the vector  $\mathbf{r}(b) - \mathbf{r}(a)$ .
- (b) The **distance travelled** by the particle from  $a$  to  $b$  is given by the scalar  $\int_a^b \|\mathbf{r}'(t)\| dt$ .

The following figure illustrates these definitions:

The displacement vector is the vector with initial point  $\mathbf{r}(a)$  and terminal point  $\mathbf{r}(b)$ . The distance travelled is this length of the curve connecting  $\mathbf{r}(a)$  and  $\mathbf{r}(b)$ . As a quick example, for the helix defined by the vector function  $\mathbf{r}(t) = \langle \cos t, \sin t, t \rangle$ , the displacement vector from 0 to  $2\pi$  is

$$\mathbf{r}(2\pi) - \mathbf{r}(0) = \langle \cos 2\pi, \sin 2\pi, 2\pi \rangle - \langle \cos 0, \sin 0, 0 \rangle = \langle 1, 0, 2\pi \rangle - \langle 1, 0, 0 \rangle = \langle 0, 0, 2\pi \rangle,$$

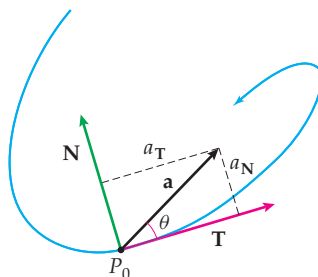

while the distance travelled by a particle on the helix from 0 to  $2\pi$  is

$$\begin{aligned} \int_0^{2\pi} \|\mathbf{r}'(t)\| dt &= \int_0^{2\pi} \| \langle -\sin t, \cos t, 1 \rangle \| dt = \int_0^{2\pi} \sqrt{\sin^2 t + \cos^2 t + 1} dt \\ &= \int_0^{2\pi} \sqrt{2} dt = 2\sqrt{2}\pi. \end{aligned}$$

## Tangential and Normal Components of Acceleration

We have already seen that every vector in  $\mathbb{R}^3$  can be decomposed into a sum of three vectors that are directed along the  $x$ -,  $y$ -, and  $z$ -axes. Doing this requires nothing more than writing a vector  $\mathbf{v}$  in the form  $\mathbf{v} = a\mathbf{i} + b\mathbf{j} + c\mathbf{k}$ . Rather than using this type of decomposition, however, when we are working with curves resulting from the motion of objects in  $\mathbb{R}^3$ , it is often convenient to decompose the acceleration vector into a sum of two vectors, one of which is in the direction of the unit tangent vector  $\mathbf{T}$  and the other is in the direction of

the principal unit normal vector  $\mathbf{N}$ . These two components are known as the **tangential component of acceleration** and the **normal component of acceleration**, respectively, and are illustrated as follows:

Even the graph of a very complicated vector function in  $\mathbb{R}^3$  is locally planar, as long as the function is twice differentiable. As we mentioned in Section 11.3, the osculating plane fits a space curve “best” at a point  $P_0$  on the curve, and the osculating plane is determined by the point  $P_0$  and the unit tangent and principal unit normal vectors at  $P_0$ .

### THEOREM 11.27

#### The Tangential and Normal Components of Acceleration

Let  $\mathbf{r}(t)$  be a twice-differentiable vector function with either two or three components and with derivatives  $\mathbf{r}'(t) = \mathbf{v}(t)$  and  $\mathbf{r}''(t) = \mathbf{a}(t)$ . Then the tangential component of acceleration  $a_T$  is given by

$$a_T = \frac{\mathbf{v} \cdot \mathbf{a}}{\|\mathbf{v}\|}$$

and the normal component of acceleration  $a_N$  is given by

$$a_N = \frac{\|\mathbf{v} \times \mathbf{a}\|}{\|\mathbf{v}\|}.$$

**Proof.** Since vectors  $\mathbf{v}$  and  $\mathbf{T}$  are scalar multiples,  $\text{comp}_{\mathbf{T}}\mathbf{a} = \text{comp}_{\mathbf{v}}\mathbf{a}$ . From the figure shown, if  $\theta$  is the angle between vectors  $\mathbf{a}$  and  $\mathbf{v}$ , then

$$a_T = \|\mathbf{a}\| \cos \theta = \frac{\|\mathbf{v}\| \|\mathbf{a}\| \cos \theta}{\|\mathbf{v}\|} = \frac{\mathbf{v} \cdot \mathbf{a}}{\|\mathbf{v}\|}.$$

Similarly,

$$a_N = \|\mathbf{a}\| \sin \theta = \frac{\|\mathbf{v}\| \|\mathbf{a}\| \sin \theta}{\|\mathbf{v}\|} = \frac{\|\mathbf{v} \times \mathbf{a}\|}{\|\mathbf{v}\|}. \quad \blacksquare$$

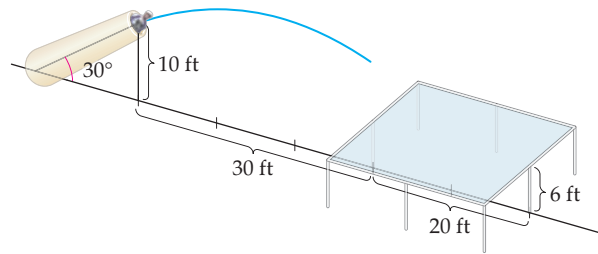

Note that if  $\mathbf{r}(t) = \langle x(t), y(t) \rangle$ , then to take the cross product in Theorem 11.27, we would let  $\mathbf{v}(t) = \langle x'(t), y'(t), 0 \rangle$ , and let  $\mathbf{a}(t) = \langle x''(t), y''(t), 0 \rangle$ . The normal component of acceleration is also called **centripetal acceleration**.

## Examples and Explorations

### EXAMPLE 1

#### The Human Cannonball

Chuckles the Human Cannonball is to be shot from the circus cannon. The muzzle of the cannon is 10 feet above ground level and is initially at an angle of  $30^\circ$  with the horizontal. The muzzle velocity of the cannon is 30 mph. The square net to catch Chuckles measures 20 feet on each side and is placed at a height of 6 feet, 30 feet directly in front of the muzzle of the cannon. Should Chuckles call an ambulance?

### SOLUTION

We place our coordinate system so that the muzzle of the cannon is at  $(0, 10)$ . The leading edge of the net will then be at  $(30, 6)$ . The muzzle speed of 30 mph is equivalent to 44 feet/sec. At the angle of  $30^\circ$ , Chuckles' initial velocity function will be

$$\mathbf{v}_0 = 44 \cos 30^\circ \mathbf{i} + 44 \sin 30^\circ \mathbf{j} = 22\sqrt{3}\mathbf{i} + 22\mathbf{j}.$$

Since, in general,  $\mathbf{r}(t) = \langle (\|\mathbf{v}_0\| \cos \theta) t, -\frac{1}{2}gt^2 + (\|\mathbf{v}_0\| \sin \theta) t + h \rangle$ , here we have

$$\mathbf{r}(t) = \left\langle (\|\mathbf{v}_0\| \cos \theta) t, -\frac{1}{2}gt^2 + (\|\mathbf{v}_0\| \sin \theta) t + h \right\rangle = \left\langle 22\sqrt{3}t, -16t^2 + 22t + 10 \right\rangle,$$

where we have used the gravitational constant  $g = 32$  feet/sec<sup>2</sup>. We next find the time it takes until Chuckles would reach the net's height of 6 feet. To do this we set the  $y$ -component of  $\mathbf{r}(t)$  equal to 6 and solve for  $t$ .

That is, we solve  $-16t^2 + 22t + 10 = 6$  and obtain the roots  $t = \frac{11 \pm \sqrt{185}}{16}$ . In this context, only the positive root  $t = \frac{11 + \sqrt{185}}{16}$  is relevant. It would take Chuckles approximately 1.53 seconds before he reached a height of 6 feet. We now use the  $x$ -component of  $\mathbf{r}(t)$  to find the horizontal distance that Chuckles would travel in 1.53 seconds and obtain the distance  $22\sqrt{3}(1.53) \approx 58.3$  feet. Since the net extends only from 30 feet to 50 feet from the cannon muzzle, Chuckles should prepare for a bad landing.  $\square$

### EXAMPLE 2

#### The Human Cannonball, part 2

Chuckles the Human Cannonball is unhappy with the planned scenario of Example 1. If the angle of the cannon can be adjusted, at what angle should Chuckles ask to be shot so that he hits the middle of the net? You may assume that all other constants given in Example 1 remain the same.

### SOLUTION

We now have the vector function

$$\mathbf{r}(t) = \langle (44 \cos \theta) t, -16t^2 + (44 \sin \theta) t + 10 \rangle.$$

We need to find the values of  $t$  and  $\theta$  such that the  $x$ -component is 40 and the  $y$ -component is 6. That is, we need to solve the system of equations

$$(44 \cos \theta) t = 40 \text{ and } -16t^2 + (44 \sin \theta) t + 10 = 6$$

simultaneously for  $t$  and  $\theta$ . There are four pairs of values for  $t$  and  $\theta$  that satisfy this system of equations, but only the two pairs in which  $t$  is positive make sense contextually. One pair is  $t \approx 0.94$  second and  $\theta \approx 14^\circ$ . The other pair is  $t \approx 2.68$  seconds and  $\theta \approx 70^\circ$ . (We ask you to solve the same system of equations in Exercise 25.)  $\square$

CHECKING  
THE ANSWER

In Example 1 Chuckles would have gone over 55 feet if he had been shot at an angle of  $30^\circ$ . It makes sense that if he is shot at a smaller angle of elevation, he wouldn't travel as far. In Exercise 33 we will ask you to prove that in a ground-to-ground trajectory, a projectile always travels the greatest horizontal distance when it is shot at an angle of  $45^\circ$  with the horizontal. Therefore, it also makes sense that there would be a second solution in Example 2 in which the angle of elevation would be greater than  $45^\circ$ . This doesn't, of course, tell us that the numbers we found are correct, only that they are reasonable.

### EXAMPLE 3 The Human Cannonball, part 3

Chuckles the Human Cannonball is happier with the scenario of Example 2, but he needs to decide which of the two angles would be preferable. The big top tent he is under is 50 feet tall.

#### SOLUTION

If Chuckles is shot at the smaller angle, he would hit the net at a more shallow angle, which might lead to his skidding off the net. For this reason the steeper angle might be preferable. However, we should also consider his speed upon impact and the maximum height he would reach if he were shot at the two angles. We consider his speed upon impact and the maximum height he would reach if he were shot at an angle of  $70^\circ$ . We leave the analysis at the initial angle of  $14^\circ$  for Exercise 26.

Since the velocity function under the force of gravity is

$$\mathbf{v}(t) = \langle \|\mathbf{v}_0\| \cos \theta, -gt + \|\mathbf{v}_0\| \sin \theta \rangle,$$

we have

$$\begin{aligned} \mathbf{v}(t) &= \langle \|\mathbf{v}_0\| \cos \theta, -gt + \|\mathbf{v}_0\| \sin \theta \rangle = \langle 44 \cos 70^\circ, -32t + 44 \sin 70^\circ \rangle \\ &= \langle 15.0, -32t + 41.3 \rangle. \end{aligned}$$

To find Chuckles' speed upon impact, recall that speed is the magnitude of velocity and that, at an angle of  $70^\circ$ , he will hit the net after about 2.7 seconds. Therefore, his speed upon impact will be

$$\|\mathbf{v}(2.7)\| = \|\langle 15.0, -32(2.7) + 41.3 \rangle\| = \|\langle 15.0, -45 \rangle\| \approx 47 \text{ feet per second.}$$

To find the maximum height we consider the  $y$ -component of the position function  $\mathbf{r}(t)$ . This is

$$y(t) = -16t^2 + (44 \sin 70^\circ)t + 10 = -16t^2 + 41.3t + 10.$$

The maximum height will be attained when  $y'(t) = -32t + 41.3 = 0$ . (Why?) Thus, the maximum height occurs at about 1.3 seconds. The corresponding height is

$$y(1.3) = -16(1.3)^2 + 41.3(1.3) + 10 \approx 37 \text{ feet.}$$

He has plenty of room to spare! □

### EXAMPLE 4 Finding centripetal acceleration

A girl is swinging a small plane attached to a string 2 feet long in a circle over her head at a rate of 20 revolutions per minute. If the circle is horizontal at a height of 6 feet above the ground, find a vector function that models the path of the plane and find the centripetal acceleration of the plane.

## SOLUTION

The vector function

$$\mathbf{r}(t) = \left\langle 2 \cos\left(\frac{2\pi}{3}t\right), 2 \sin\left(\frac{2\pi}{3}t\right), 6 \right\rangle$$

has the motion described, where  $t$  is measured in seconds. Note that every 3 seconds the plane would complete exactly one revolution, as specified. The velocity and acceleration vectors are, respectively,

$$\mathbf{v}(t) = \left\langle -\frac{4\pi}{3} \sin\left(\frac{2\pi}{3}t\right), \frac{4\pi}{3} \cos\left(\frac{2\pi}{3}t\right), 0 \right\rangle \text{ and}$$

$$\mathbf{a}(t) = \left\langle -\frac{8\pi^2}{9} \cos\left(\frac{2\pi}{3}t\right), -\frac{8\pi^2}{9} \sin\left(\frac{2\pi}{3}t\right), 0 \right\rangle.$$

The centripetal acceleration, or equivalently, the normal component of acceleration,  $a_N$ , is given by

$$\begin{aligned} a_N &= \frac{\|\mathbf{v} \times \mathbf{a}\|}{\|\mathbf{v}\|} = \frac{\left\| \left\langle -\frac{4\pi}{3} \sin\left(\frac{2\pi}{3}t\right), \frac{4\pi}{3} \cos\left(\frac{2\pi}{3}t\right), 0 \right\rangle \times \left\langle -\frac{8\pi^2}{9} \cos\left(\frac{2\pi}{3}t\right), -\frac{8\pi^2}{9} \sin\left(\frac{2\pi}{3}t\right), 0 \right\rangle \right\|}{\left\| \left\langle -\frac{4\pi}{3} \sin\left(\frac{2\pi}{3}t\right), \frac{4\pi}{3} \cos\left(\frac{2\pi}{3}t\right), 0 \right\rangle \right\|}} \\ &= \frac{\|(0, 0, 32\pi^3/27)\|}{4\pi/3} = \frac{32\pi^3/27}{4\pi/3} = \frac{8\pi^2}{9}. \end{aligned}$$

Note that in this example the velocity and acceleration vectors are orthogonal. When this occurs, the normal component of acceleration will be the magnitude of the acceleration vector, as we find here.  $\square$

### ? TEST YOUR UNDERSTANDING

- ▶ How are the vector functions giving the velocity and position of an object moving under the acceleration due to gravity derived from the gravitational constant?
- ▶ Why does a projectile subject to gravity move in a parabolic arch?
- ▶ How are the component functions for the position and velocity of a projectile used to determine the height reached by the object, the distance travelled by the object, and the travel time of the projectile?
- ▶ What are the normal and tangential components of acceleration? How is the osculating plane related to the components of acceleration?
- ▶ What is centripetal acceleration?

## EXERCISES 11.5

### Thinking Back

- ▶ *Projecting one vector onto another:* Show that the formula for the projection of a vector  $\mathbf{v}$  onto a nonzero vector  $\mathbf{u}$  is given by  $\text{proj}_{\mathbf{u}}\mathbf{v} = \frac{\mathbf{u} \cdot \mathbf{v}}{\|\mathbf{u}\|^2} \mathbf{u}$ , where  $\mathbf{u} \neq \mathbf{0}$ .
- ▶ *The difference between a vector and its projection onto another vector:* If  $\mathbf{u} \neq \mathbf{0}$  and  $\mathbf{v}$  is an arbitrary vector, what is the geometric relationship between  $\mathbf{v}$ ,  $\text{proj}_{\mathbf{u}}\mathbf{v}$ , and  $\mathbf{v} - \text{proj}_{\mathbf{u}}\mathbf{v}$ ?

### Concepts

0. *Problem Zero:* Read the section and make your own summary of the material.
1. *True/False:* Determine whether each of the statements that follow is true or false. If a statement is true, explain why. If a statement is false, provide a counterexample.
  - (a) *True or False:* When the wind resistance is negligible, a projectile travels on a parabolic path if its initial velocity has a nonzero horizontal component.
  - (b) *True or False:* The velocity of a projectile is zero when it has reached its maximum height.
  - (c) *True or False:* If the wind resistance is negligible, the horizontal component of velocity is constant.
  - (d) *True or False:* The acceleration of a projectile is  $-\mathbf{g}\mathbf{k}$ , where  $g$  is the gravitational constant.
  - (e) *True or False:* The velocity of a moving particle is defined to be the absolute value of its speed.

- (f) *True or False:* Centripetal acceleration and the normal component of acceleration are identical.
- (g) *True or False:* The sum of the tangential component of acceleration and the normal component of acceleration is the acceleration.
- (h) *True or False:* If  $\|\mathbf{r}(b) - \mathbf{r}(a)\| = \int_a^b \|\mathbf{r}'(t)\| dt$  for every  $a$  and  $b$  in the domain of  $\mathbf{r}$ , then the curve defined by  $\mathbf{r}$  is parametrized by arc length.
2. *Examples:* Construct examples of the thing(s) described in the following. Try to find examples that are different than any in the reading.
- (a) A nonconstant vector function  $\mathbf{r}(t)$  defined on an interval  $[a, b]$  for which

$$\|\mathbf{r}(b) - \mathbf{r}(a)\| = \int_a^b \|\mathbf{r}'(t)\| dt.$$

- (b) A vector function with a nonzero acceleration vector such that the normal component of acceleration is always zero.
- (c) A vector function with a nonzero acceleration vector such that the tangential component of acceleration is always zero.
3. Explain why an object thrown horizontally on a planet with a smaller gravitational force than Earth's would travel farther.

In our derivation of the position function  $\mathbf{r}(t) = \left\langle (\|\mathbf{v}_0\| \cos \theta) t, -\frac{1}{2} g t^2 + (\|\mathbf{v}_0\| \sin \theta) t + h \right\rangle$  for the motion of a projectile, we ignored air resistance and wind effects. In Exercises 4 and 5 we ask you to think about how these effects would change the model.

4. Air resistance is a type of friction. It is a vector that is proportional to, and acting in the opposite direction from, the velocity. How would incorporating air resistance change the development of our model of the motion of a projectile?
5. We may model the wind as a vector with a direction. How would including the wind change the development of our model of the motion of a projectile?
6. A projectile reaches its maximum height  $H$  at time  $t_0 > 0$ . What fraction of  $H$  does it reach at time  $\frac{1}{2} t_0$ ?

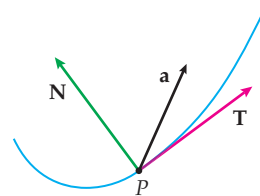

## Skills

In Exercises 14–17, find (a) the displacement vectors from  $\mathbf{r}(a)$  to  $\mathbf{r}(b)$ , (b) the magnitude of the displacement vector, and (c) the distance travelled by a particle on the curve from  $a$  to  $b$ .

14.  $\mathbf{r}(t) = \langle t, t^2 \rangle$ ,  $a = 2$ ,  $b = 3$
15.  $\mathbf{r}(t) = \langle t \sin t, t \cos t \rangle$ ,  $a = 0$ ,  $b = \pi$
16.  $\mathbf{r}(t) = \langle e^t \sin t, e^t \cos t, e^t \rangle$ ,  $a = 0$ ,  $b = 1$
17.  $\mathbf{r}(t) = \langle \alpha \sin \beta t, \alpha \cos \beta t, \gamma t \rangle$ ,  $a = 0$ ,  $b = 1$

Find the tangential and normal components of acceleration for the position functions in Exercises 18–22

7. Given that an object is moving along the graph of a vector function  $\mathbf{r}(t)$  defined on an interval  $[a, b]$ , what is meant by the displacement of the object from  $t = a$  to  $t = b$ ?
8. If an object is moving along the graph of a vector function  $\mathbf{r}(t)$  defined on an interval  $[a, b]$ , how can the distance the object travels from  $t = a$  to  $t = b$  be calculated?
9. Define each of the following: the tangential component of acceleration, the normal component of acceleration, and centripetal acceleration. How are each of these quantities computed?
10. In the graph that follows, a portion of a curve is drawn, along with the unit tangent vector,  $\mathbf{T}$ , principal unit normal vector,  $\mathbf{N}$ , and acceleration vector,  $\mathbf{a}$ , at point  $P$ . Add the vectors  $\text{proj}_{\mathbf{T}} \mathbf{a}$  and  $\text{proj}_{\mathbf{N}} \mathbf{a}$  to the graph, and label the magnitudes of these vectors appropriately.

11. Imagine that you are driving on a twisting mountain road. Describe the tangential and normal components of acceleration as you ascend, descend, twist right, and twist left.
12. Two marbles roll off a table at the same moment. One of the marbles has a horizontal speed of 1 inch per second, and the other has a horizontal speed of 4 inches per second.
- (a) Which marble hits the ground first?
- (b) If the surface of the table is 3 feet from the ground, what are the speeds of the marbles as they hit?
13. Let  $f(t)$  be a nonconstant continuous function.
- (a) Explain why a particle moving along the vector function  $\mathbf{r}(t) = \langle f(t), (f(t))^2 \rangle$  is on a parabolic path.
- (b) What condition must  $f(t)$  satisfy so that  $\mathbf{r}(t) \cdot \mathbf{a}(t) = 0$ ?

18.  $\mathbf{r}(t) = \langle t, t^2 \rangle$
19.  $\mathbf{r}(t) = \langle \sin 3t, \cos 4t \rangle$
20.  $\mathbf{r}(t) = \langle t \sin t, t \cos t \rangle$
21.  $\mathbf{r}(t) = \langle e^t \sin t, e^t \cos t, e^t \rangle$
22.  $\mathbf{r}(t) = \langle 2 \sin t, 3 \cos t, \cos 2t \rangle$
23. Find the tangential and normal components of acceleration for a particle moving along the circular helix defined by  $\mathbf{r}(t) = \langle \cos t, \sin t, t \rangle$ .
24. Find the tangential and normal components of acceleration for a particle moving along the conical helix defined by  $\mathbf{r}(t) = \langle t \cos t, t \sin t, t \rangle$ .

## Applications

25. Finish Example 2 by solving the system of equations

$$(44 \cos \theta) t = 40 \text{ and } -16t^2 + (44 \sin \theta) t + 10 = 6$$

for  $\theta$  and  $t$ . (Hint: Solve the first equation for  $\cos \theta$  and the second equation for  $\sin \theta$ , and use a Pythagorean identity.)

26. Finish Example 3 by calculating the maximum height Chuckles the Human Cannonball will reach and the speed at which he will hit the net if he is shot from the cannon at an elevation of  $14^\circ$ .

Complete Exercises 27–31 using the appropriate gravitational constants from the table that follows. In each exercise you may ignore wind resistance.

	$g$ in $\text{m}/\text{sec}^2$	$g$ in $\text{ft}/\text{sec}^2$
Earth	9.8	32
Moon	1.6	5.2
Mars	3.7	12.1
Jupiter	24.8	81

27. In 1968 Bob Beamon set an Olympic record in the long jump in the Mexico City Olympic Games with a jump of 8.90 meters.

- Assuming that his angle of elevation was  $30^\circ$ , how fast was he running as he jumped?
- Assuming that he could have performed the long jump on the moon with the same initial velocity and same angle of elevation, how far would Beamon have gone?

28. There is considerable controversy surrounding who hit the longest home run in professional baseball. However, any ball that travels 500 feet in the air is considered “monumental.” Assuming that a hitter contacts a ball 4 feet from the ground and that the ball leaves the bat with a  $45^\circ$  angle of elevation and subsequently travels a horizontal distance of 500 feet, answer the following questions:

- How fast is the speed of the ball right after contact?
- What is the maximum height reached by the ball?
- How long does the ball spend in the air after being hit?
- On May 22, 1963, Mickey Mantle, playing for the New York Yankees, hit a home run that struck a point

on the façade of the right-field roof of the old Yankee Stadium approximately 115 feet high and 370 feet from home plate. Explain why this is not enough information to determine how far the ball would have travelled if it had not hit the façade.

29. In 1974 Nolan Ryan, then playing for the California Angels, was credited with throwing one of the fastest pitches in professional baseball history. The pitch reached a speed of 100.9 mph.

- Assume that the horizontal distance from the pitcher’s mound to the catcher’s glove was 60 feet, that the ball left Ryan’s hand at a height of 6 feet, and that it was caught by the catcher with his hand at a height of 3 feet. What was the angle of elevation of the pitch as it left Ryan’s hand?
- If Ryan had thrown the ball at the same speed and from the same height at an angle of elevation of  $45^\circ$ , what horizontal distance would the ball have travelled before it hit the ground?

30. A certain type of tank gun can be shot with a muzzle velocity of 1500 meters per second.

- At what angle should the cannon be shot to hit a target 1 kilometer away? You may assume that the target and the muzzle of the cannon are at the same height.
- What is the range of the cannon? Assume that the muzzle of the cannon is 5 meters high.
- If the tank is repositioned atop a small hill so that the muzzle of the cannon is now 20 meters above the surrounding area, what is the new range of the cannon?
- If the cannon were on Jupiter with its muzzle 5 meters high, what would its range be?

31. An aircraft is flying toward the tank gun discussed in Exercise 30. Assume that the muzzle of the gun is 5 meters high and the gun can fire with a maximum angle of elevation of  $60^\circ$ . At what altitude should the pilot of the plane fly to keep out of the gun’s range?

32. In 1971, during NASA’s Apollo 14 mission to the moon, astronaut Alan Shepard hit a golf ball that is estimated to have travelled 2400 feet on the lunar surface, almost a half mile. Assuming a similar terrain, and ignoring wind resistance, how far would his shot have travelled on Earth?

## Proofs

33. Show that a ball thrown with an angle of elevation of  $45^\circ$  will travel farther than if it is thrown at any other angle. (Hint: Assume that the initial and final heights of the ball are equal, that the initial velocity is fixed, and that friction and wind resistance are negligible.)

34. Prove that an object thrown at an acute angle of elevation travels along a parabolic path, if wind resistance is ignored.

35. Let  $\mathbf{r}(t)$  be a vector function whose graph is a space curve containing distinct points  $P$  and  $Q$ . Prove that if the acceleration is always  $\mathbf{0}$ , then the graph of  $\mathbf{r}$  is a straight line.

36. Assuming that the initial height of a projectile is zero, prove that doubling the initial velocity of the projectile has the effect of multiplying the maximum height of the projectile and the horizontal distance travelled by the projectile by a factor of 4.

37. Prove that the normal component of acceleration is 0 at a point of inflection on the graph of a twice-differentiable function  $y = f(x)$ . (Hint: The graph of  $y = f(x)$  is also the graph of the vector function  $\mathbf{r}(t) = \langle t, f(t) \rangle$ .)

38. Prove that if a particle moves along a curve at a constant speed, then  $a_N = \|\mathbf{a}\|$  and  $a_T = 0$ . Is the converse true? That is, if  $a_N = \|\mathbf{a}\|$  and  $a_T = 0$ , must the particle be moving at a constant speed?

## Thinking Forward

► *The graph of a function  $f : \mathbb{R}^2 \rightarrow \mathbb{R}$*

A vector-valued function with two components can be thought of as a function with a domain that is a subset of  $\mathbb{R}$  and a codomain  $\mathbb{R}^2$ . We've seen that the graph of such a function is a curve in the plane. We may also define functions that have a subset of  $\mathbb{R}^2$  as the domain and the codomain  $\mathbb{R}$ . In general terms, what is the graph of such a function? (One such function is  $f(x, y) = x^2 - 3x \sin y^2$ .)

► *The graph of a function  $f : \mathbb{R}^3 \rightarrow \mathbb{R}$*

A vector-valued function with three components can be thought of as a function with a domain that is a subset of  $\mathbb{R}$  and a codomain  $\mathbb{R}^3$ . The graph of such a function is a space curve. We may also define functions that have a subset of  $\mathbb{R}^3$  as the domain and the codomain  $\mathbb{R}$ . In general terms, what is the graph of such a function? (One such function is  $f(x, y, z) = x + 2y - 5xyz$ .)

## CHAPTER REVIEW, SELF-TEST, AND CAPSTONES

Before you progress to the next chapter, be sure you are familiar with the definitions, concepts, and basic skills outlined here. The capstone exercises at the end bring together ideas from this chapter and look forward to future chapters.

### Definitions

Give precise mathematical definitions or descriptions of each of the concepts that follow. Then illustrate the definition with a graph or an algebraic example.

- *parametric equations* in  $\mathbb{R}^2$  and  $\mathbb{R}^3$
- *a vector function* or *vector-valued function* in  $\mathbb{R}^2$  and  $\mathbb{R}^3$
- *a space curve*
- the *limit* of a vector function  $\mathbf{r}(t)$  as  $t$  approaches  $t_0$
- the *derivative* of a vector function  $\mathbf{r}(t)$
- an *antiderivative* of a vector function  $\mathbf{r}(t)$
- the *definite integral* of a vector function  $\mathbf{r}(t)$  on an interval  $[a, b]$
- the *unit tangent function* for a differentiable vector function  $\mathbf{r}(t)$

- the *principal unit normal vector* at  $\mathbf{r}(t)$
- the *binormal vector* at  $\mathbf{r}(t_0)$
- the *osculating plane* at  $\mathbf{r}(t_0)$
- an *arc length parametrization* for the graph of a differentiable function  $\mathbf{r}(t)$
- the *curvature* at a point on the graph of a vector function  $\mathbf{r}(s)$
- the *radius of curvature* at a point on the graph of a vector function  $\mathbf{r}(t)$
- the *osculating circle* at a point on the graph of a vector function  $\mathbf{r}(t)$

### Theorems

Fill in the blanks to complete each of the following theorem statements:

- The derivative of a vector function  $\mathbf{r}(t)$  is given by  $\mathbf{r}'(t) = \lim_{h \rightarrow 0} \frac{\mathbf{r}(t+h) - \mathbf{r}(t)}{h}$ .
- *The Chain Rule for Vector-Valued Functions:* Let  $t = f(\tau)$  be a differentiable real-valued function of  $\tau$ , and let  $\mathbf{r}(t)$  be a differentiable vector function with either two or three components such that  $f(\tau)$  is in the domain of  $\mathbf{r}$  for every value of  $\tau$  on some interval  $I$ . Then  $\frac{d\mathbf{r}}{d\tau} = \mathbf{r}'(f(\tau)) f'(\tau)$ .
- Let  $C$  be the graph of a twice-differentiable vector function  $\mathbf{r}(t)$  defined on an interval  $I$  and with unit tangent

vector  $\mathbf{T}(t)$ . Then the curvature  $\kappa$  of  $C$  at a point on the curve is given by  $\kappa = \frac{\|\mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3}$  and  $\kappa = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3}$ .

- Let  $y = f(x)$  be a twice-differentiable function. Then the curvature of the graph of  $f$  is given by  $\kappa = \frac{|f''(x)|}{(1 + f'(x)^2)^{3/2}}$ .
- Let  $C$  be the graph of a vector function  $\mathbf{r}(t) = \langle x(t), y(t) \rangle$  in the  $xy$ -plane, where  $x(t)$  and  $y(t)$  are twice-differentiable functions of  $t$  such that  $x'(t)$  and  $y'(t)$  are not simultaneously zero. Then the curvature  $\kappa$  of  $C$  at a point on the curve is given by  $\kappa = \frac{|x''(t)y'(t) - x'(t)y''(t)|}{(x'(t)^2 + y'(t)^2)^{3/2}}$ .

## Notation and Rules

*Notation:* Describe the meanings of each of the following mathematical expressions.

- ▶  $\mathbf{r}(t)$                       ▶  $\mathbf{v}(t)$                       ▶  $\mathbf{a}(t)$
- ▶  $\mathbf{T}(t)$                       ▶  $\mathbf{N}(t)$                       ▶  $\mathbf{B}(t)$
- ▶  $\kappa$                             ▶  $\rho$                             ▶  $a_T$
- ▶  $a_N$

*Derivatives of Products:* Fill in the following blanks to complete a differentiation rule for vectors.

- ▶ Let  $k$  be a scalar and  $\mathbf{r}(t)$  be a differentiable vector function. Then  $\frac{d}{dt}(k\mathbf{r}(t)) = \underline{\hspace{2cm}}$ .
- ▶ Let  $f(t)$  be a differentiable scalar function and  $\mathbf{r}(t)$  be a differentiable vector function. Then  $\frac{d}{dt}(f(t)\mathbf{r}(t)) = \underline{\hspace{2cm}}$ .
- ▶ If  $\mathbf{r}_1(t)$ ,  $\mathbf{r}_2(t)$  are differentiable vector functions, both having either two or three components, then  $\frac{d}{dt}(\mathbf{r}_1(t) \cdot \mathbf{r}_2(t)) = \underline{\hspace{2cm}}$ .
- ▶ If  $\mathbf{r}_1(t)$  and  $\mathbf{r}_2(t)$  are both differentiable three-component vector functions, then  $\frac{d}{dt}(\mathbf{r}_1(t) \times \mathbf{r}_2(t)) = \underline{\hspace{2cm}}$ .
- ▶ Let  $\mathbf{r}(t)$  be a differentiable vector function such that  $\|\mathbf{r}(t)\| = k$  for some constant  $k$ . Then  $\mathbf{r}(t) \cdot \mathbf{r}'(t) = \underline{\hspace{2cm}}$ .

## Skill Certification: The Calculus of Vector Functions

*Sketching vector functions:* Sketch the following vector functions.

1.  $\mathbf{r}(t) = \langle t, t^3 \rangle, t \in \mathbb{R}$
2.  $\mathbf{r}(t) = \langle \cos t, t \rangle, t \in \mathbb{R}$
3.  $\mathbf{r}(t) = \langle t, \sin 2t, \cos 2t \rangle, t \in [0, 4\pi]$
4.  $\mathbf{r}(t) = \langle t, t \cos t, t \sin t \rangle, t \in [0, 4\pi]$

*Finding limits:* Find the given limits if they exist. If a limit does not exist, explain why.

5.  $\lim_{t \rightarrow 0} \left\langle \frac{1/(3+t) - 1/3}{t}, \frac{(3+t)^2 - 9}{t} \right\rangle$
6.  $\lim_{t \rightarrow -3} \left\langle \frac{|t+3|}{t+3}, \frac{|t+3|}{t-3} \right\rangle$
7.  $\lim_{t \rightarrow 0} \left\langle \frac{\sin t}{t}, \frac{1 - \cos t}{t}, (1+t)^{1/t} \right\rangle$
8.  $\lim_{t \rightarrow 1} \left\langle (\ln t)^{t-1}, t^{(1/t)-1}, \frac{\sin(\ln t)}{t-1} \right\rangle$

*Velocity and acceleration vectors:* Find the velocity and acceleration vectors for the given vector functions.

9.  $\mathbf{r}(t) = \langle t, 2t - 3, 3t + 5 \rangle$
10.  $\mathbf{r}(t) = \langle t, 2t^2, 3t^3 \rangle$
11.  $\mathbf{r}(t) = \langle \cos 2t, \sin 3t \rangle$
12.  $\mathbf{r}(t) = \langle e^t, t, e^{-t} \rangle$

*Unit tangent vectors:* Find the unit tangent vector for the given function at the specified value of  $t$ .

13.  $\mathbf{r}(t) = \langle t, t^3 \rangle, t = 2$
14.  $\mathbf{r}(t) = \langle 3 \sin 2t, 3 \cos 2t \rangle, t = \frac{\pi}{3}$
15.  $\mathbf{r}(t) = \langle \alpha \sin \beta t, \alpha \cos \beta t \rangle, t = 0$
16.  $\mathbf{r}(t) = \langle t, 5 \sin 3t, 5 \cos 3t \rangle, t = \frac{\pi}{6}$
17.  $\mathbf{r}(t) = \langle t, 2t \sin t, 2t \cos t \rangle, t = \pi$
18.  $\mathbf{r}(t) = \langle t, \alpha \sin \beta t, \alpha \cos \beta t \rangle, t = 0$

*Principal unit normal vectors:* Find the principal unit normal vector for the given function at the specified value of  $t$ .

19.  $\mathbf{r}(t) = \langle t, t^3 \rangle, t = 2$
20.  $\mathbf{r}(t) = \langle 3 \sin 2t, 3 \cos 2t \rangle, t = \frac{\pi}{3}$
21.  $\mathbf{r}(t) = \langle \alpha \sin \beta t, \alpha \cos \beta t \rangle$ , where  $\alpha$  and  $\beta$  are positive,  $t = 0$
22.  $\mathbf{r}(t) = \langle t, 5 \sin 3t, 5 \cos 3t \rangle, t = \frac{\pi}{6}$
23.  $\mathbf{r}(t) = \langle t, 2t \sin t, 2t \cos t \rangle, t = \pi$
24.  $\mathbf{r}(t) = \langle t, \alpha \sin \beta t, \alpha \cos \beta t \rangle, t = 0$

*Binormal vectors and osculating planes:* Find the binormal vector and equation of the osculating plane for the given function at the specified value of  $t$ .

25.  $\mathbf{r}(t) = \langle t, t^3 \rangle, t = 2$
26.  $\mathbf{r}(t) = \langle 3 \sin 2t, 3 \cos 2t \rangle, t = \frac{\pi}{3}$
27.  $\mathbf{r}(t) = \langle \alpha \sin \beta t, \alpha \cos \beta t \rangle, t = 0$
28.  $\mathbf{r}(t) = \langle t, 5 \sin 3t, 5 \cos 3t \rangle, t = \frac{\pi}{6}$
29.  $\mathbf{r}(t) = \langle t, 2t \sin t, 2t \cos t \rangle, t = \pi$
30.  $\mathbf{r}(t) = \langle t, \alpha \sin \beta t, \alpha \cos \beta t \rangle, t = 0$

*Osculating circles:* Find the equation of the osculating circle to the given function at the specified value of  $t$ .

31.  $\mathbf{r}(t) = \langle t, t^3 \rangle, t = 2$
32.  $\mathbf{r}(t) = \langle 3 \sin 2t, 3 \cos 2t \rangle, t = \frac{\pi}{3}$
33.  $\mathbf{r}(t) = \langle \alpha \sin \beta t, \alpha \cos \beta t \rangle, t = 0$

*Osculating circles:* Find the center and radius of the osculating circle to the given vector function at the specified value of  $t$ .

34.  $\mathbf{r}(t) = \langle t, 5 \sin 3t, 5 \cos 3t \rangle, t = \frac{\pi}{6}$
35.  $\mathbf{r}(t) = \langle t, 2t \sin t, 2t \cos t \rangle, t = \pi$
36.  $\mathbf{r}(t) = \langle t, \alpha \sin \beta t, \alpha \cos \beta t \rangle, t = 0$

*Osculating circles:* Find the equation of the osculating circle to the given scalar function at the specified point.

37.  $f(x) = x^2, (0, 0)$

38.  $f(x) = \cos x, (0, 1)$

39.  $f(x) = e^x, (0, 1)$

40.  $f(x) = \ln x, (1, 0)$

## Capstone Problems

- A. A certain vector function  $\mathbf{r}(t)$  has the properties that its graph is a space curve passing through the point  $(4, -3, 6)$  and that its derivative is  $\mathbf{r}'(t) = -2\mathbf{r}(t)$ . Find  $\mathbf{r}(t)$ .
- B. Let  $y = f(x)$  be a twice-differentiable function.
- Carefully outline the steps required to find the equation of the osculating circle at an arbitrary point  $x_0$  in the domain of  $f$ .
  - Write a program, using a computer algebra system such as Maple, Mathematica, or Matlab, to animate the osculating circle moving along the graph of the function  $y = \sin x$ .
- C. Let  $\mathbf{r}(t) = \langle x(t), y(t), z(t) \rangle$  be a twice-differentiable function.
- Carefully outline the steps required to find the unit tangent vector, principal unit normal vector, and binormal vector at an arbitrary point  $t_0$  in the domain of  $\mathbf{r}$ .
  - Write a program, using a computer algebra system such as Maple, Mathematica, or Matlab, to animate the Frenet frame moving along the graph of the function  $\mathbf{r}(t) = \langle \cos t, \sin t, t \rangle$ .
- D. Suppose a small planet is orbiting the sun. Its position relative to the center of the sun is given by some vector function  $\mathbf{r} = \mathbf{r}(t)$ . When we put Newton's second law of motion together with his law of gravitation, with the sun at the origin, we find that the position of the planet at time  $t$  satisfies  $\frac{d^2\mathbf{r}}{dt^2} = -\frac{GM\mathbf{r}}{r^3}$ , where  $G$  is the gravitational constant,  $M$  is the mass of the sun, and  $r = \|\mathbf{r}\|$ . Define  $\mathbf{u} = \mathbf{r} \times \frac{d\mathbf{r}}{dt}$ . It turns out that  $\mathbf{u}$  is a constant vector.

- (a) Use the relation  $\mathbf{v}_1 \times (\mathbf{v}_1 \times \mathbf{v}_2) = -\|\mathbf{v}_1\|^2\mathbf{v}_2$  for orthogonal vectors  $\mathbf{v}_1$  and  $\mathbf{v}_2$  to show that

$$\frac{d^2\mathbf{r}}{dt^2} \times \mathbf{u} = \frac{GM}{r} \frac{d\mathbf{r}}{dt}.$$

- (b) Antidifferentiate the result of part (a), using the fact that  $\mathbf{u}$  is constant to show that

$$\frac{d\mathbf{r}}{dt} \times \mathbf{u} = GM \frac{\mathbf{r}}{r} + \mathbf{w}$$

for some constant vector  $\mathbf{w}$ .

- (c) Since  $\frac{d\mathbf{r}}{dt} \times \mathbf{u}$  is orthogonal to  $\mathbf{u}$  and  $\mathbf{r}$  is orthogonal to  $\mathbf{u}$ , it follows that  $\mathbf{w}$  is orthogonal to  $\mathbf{u}$ . If we let  $\theta$  denote the angle from  $\mathbf{w}$  to  $\mathbf{r}$ , then  $(r, \theta)$  represents polar coordinates for the position of the planet in the  $\mathbf{r}\mathbf{w}$ -plane. Use this fact and the relation

$$(\mathbf{v}_1 \times \mathbf{v}_2) \cdot \mathbf{v}_3 = \mathbf{v}_1 \cdot (\mathbf{v}_2 \times \mathbf{v}_3)$$

to show that

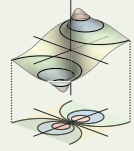

$$\|\mathbf{u}\|^2 = GMr + \|\mathbf{w}\|r \cos \theta.$$

- (d) Convert the last expression in part (c) to Cartesian coordinates to conclude that the satellite's orbit around the planet is an ellipse (or circle) whenever  $\|\mathbf{w}\| < GM$ . This is Kepler's first law of planetary motion: Planets follow an elliptical path around the sun. The law can be generalized to describe the orbit of any relatively small body around a much larger body.

## 12.1 FUNCTIONS OF TWO AND THREE VARIABLES

- ▶ Functions of two and three variables
- ▶ The graphs of linear functions of two variables and surfaces of revolution
- ▶ Level curves and level surfaces

### Functions of Two Variables

Recall that a function  $f : A \rightarrow B$  is an assignment that associates to each element  $x$  of the domain set  $A$  exactly one element  $f(x)$  of the codomain set  $B$ . Calculus is a tool that allows us to analyze and understand functions. Thus far we have focused primarily on the following types of functions:

- ▶ For the first third of this text, we studied primarily the calculus of functions for which the sets  $A$  and  $B$  are subsets of the real numbers.
- ▶ When we studied sequences in Chapter 7, we insisted that the domain be the set of natural numbers while the target set was usually a subset of the real numbers.
- ▶ The vector-valued functions we studied in Chapter 11 had domains that were subsets of the real numbers and target sets that were subsets of  $\mathbb{R}^n$  for a fixed value of  $n \geq 2$ .

We now turn our attention to functions whose domains are subsets of either  $\mathbb{R}^2$  or  $\mathbb{R}^3$  but that have a target set that is a subset of the real numbers. We will first consider functions whose domains are subsets of  $\mathbb{R}^2$  and soon discuss functions whose domains are subsets of  $\mathbb{R}^3$ . We refer to these as functions of two variables and functions of three variables, respectively.

For example, consider the addition of two real numbers  $x$  and  $y$ . We may take addition to be a function  $f : \mathbb{R}^2 \rightarrow \mathbb{R}$  that uses the rule

$$f(x, y) = x + y.$$

Note that we already have a slight, but common, abuse of notation. Since we denote elements of  $\mathbb{R}^2$  in one of the notations  $\langle x, y \rangle$  or  $(x, y)$ , perhaps we should write  $f(\langle x, y \rangle)$  or  $f((x, y))$ ; however, we use the simpler and more common notation  $f(x, y)$ .

The order of the input variables  $x$  and  $y$  is significant in a function of two variables. Consider the function  $g : \mathbb{R}^2 \rightarrow \mathbb{R}$  defined by the rule  $g(x, y) = 5x - y$ . For this function we do not generally have  $g(a, b) = g(b, a)$ . For example,  $g(1, 0) = 5 \cdot 1 - 0 = 5$  and  $g(0, 1) = 5 \cdot 0 - 1 = -1$ . (When would we have  $g(a, b) = g(b, a)$ ?)

As with functions whose domains are subsets of  $\mathbb{R}$ , we often do not specify the domain of a function when it is a subset of  $\mathbb{R}^2$ . If the function is defined by an equation, we assume that the domain is the largest subset of  $\mathbb{R}^2$  for which the equation is defined. The range of a function of two variables is the set of possible outputs.

#### DEFINITION 12.1

#### The Domain and Range of a Function of Two Variables

If  $f$  is a function that takes an element from an unspecified subset of  $\mathbb{R}^2$  into  $\mathbb{R}$ , then we will take the **domain** of  $f$  to be the largest subset of  $\mathbb{R}^2$  for which  $f$  is defined:

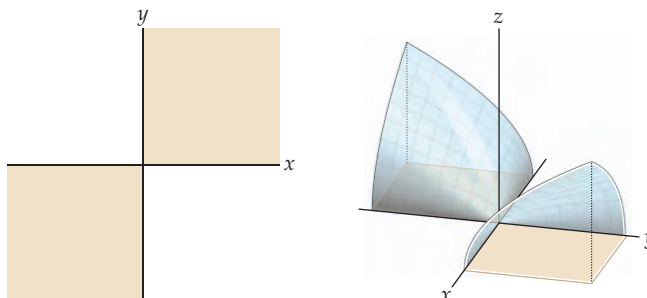

$$\text{Domain}(f) = \{(x, y) \in \mathbb{R}^2 \mid f(x, y) \text{ is defined}\}.$$

The **range** of  $f$  is the set of all possible outputs of  $f$ . That is,

$$\text{Range}(f) = \{z \in \mathbb{R} \mid \text{there exists } (x, y) \in \text{Domain}(f) \text{ with } f(x, y) = z\}.$$

For example, the domain of the function  $h(x, y) = \sqrt{xy}$  consists of all points  $(x, y) \in \mathbb{R}^2$  such that the product  $xy \geq 0$ . The latter is the case on the coordinate axes and when the signs of  $x$  and  $y$  are the same (i.e., in the first and third quadrants). The range of  $h$  consists of all nonnegative real numbers.

The domain of  $h(x, y) = \sqrt{xy}$

## Graphing a Function of Two Variables

When we wish to analyze the behavior of a function, it is often helpful to understand the graph of the function.

### DEFINITION 12.2

#### The Graph of a Function of Two Variables

The **graph** of a function of two variables,  $f$ , is the collection of ordered triples whose first two coordinates are in the domain of  $f$ . That is,

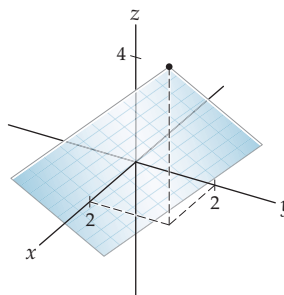

$$\text{Graph}(f) = \{(x, y, f(x, y)) \in \mathbb{R}^3 \mid (x, y) \in \text{Domain}(f)\}.$$

In other words the graph of a function of two variables is a particular subset of a three-dimensional Cartesian coordinate system. Consider the first function we mentioned in this chapter:  $f(x, y) = x + y$ . The graph of  $f$  is the subset of  $\mathbb{R}^3$  given by

$$\text{Graph}(f) = \{(x, y, x + y) \mid (x, y) \in \mathbb{R}^2\}.$$

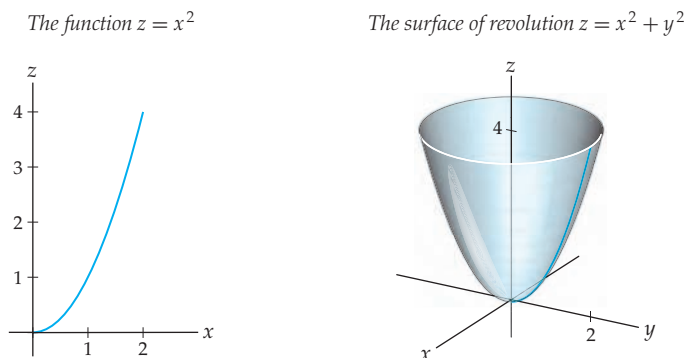

If we let  $z = f(x, y) = x + y$ , we see that the graph of  $f$  consists of exactly those points in the plane  $z = x + y$ .

The graph of  $f(x, y) = x + y$

In Exercise 69 we ask you to prove that when  $a$ ,  $b$ , and  $c$  are constants, the graph of the function  $f(x, y) = ax + by + c$  is a plane.

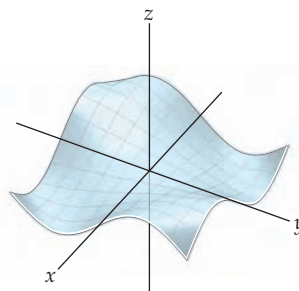

In Chapter 6 we discussed another type of surface that may be readily expressed by a function of two variables. Recall that when we revolve the graph of a continuous function  $f$  that exists on an interval  $[a, b]$ , where  $0 \leq a < b$ , around the  $y$ -axis, we obtain a surface of revolution. As a reminder, consider the surface we obtain when we revolve the graph of the function  $f(x) = x^2$ , on the interval  $[0, 2]$ , around the  $z$ -axis. Following are the graphs of the function and the surface:

It is quite easy to express this surface as a function of two variables. When the interval we are using is  $[a, b]$  with  $0 \leq a < b$ , we replace every occurrence of the variable  $x$  by the quantity  $\sqrt{x^2 + y^2}$  in the formula for the function and evaluate  $z = f(\sqrt{x^2 + y^2})$ . In our simple example here we have  $z = (\sqrt{x^2 + y^2})^2 = x^2 + y^2$ . We provide other examples in the subsections that follow.

We will see that graphs of functions of two variables can be considerably more complicated than graphs of functions of a single variable. As we progress through this chapter, we will discuss limits, continuity, and differentiability for functions of two and three variables. Understanding these concepts will enable us to analyze the functions more thoroughly. In general, if a function of two variables is sufficiently well behaved, its graph will be a surface in three-dimensional space  $\mathbb{R}^3$ . The graph of the plane  $z = x + y$  is one such example. But graphs of functions of two variables can be much more complicated. Here we see a graph of a portion of the surface defined by the function  $f(x, y) = \sin(xy)$ :

The graph of  $f(x, y) = \sin(xy)$

## Functions of Three Variables

We now turn our attention to functions of three variables (i.e., those functions whose domains are subsets of  $\mathbb{R}^3$  and whose codomains are subsets of  $\mathbb{R}$ ). An example of a function of three variables is given by the formula  $f(x, y, z) = xy + z - 7$ . As before, we usually do

not specify the domain of a function when it is a subset of  $\mathbb{R}^3$ . Rather, we assume that the domain is the largest subset of  $\mathbb{R}^3$  for which the rule is defined. The range of a function of three variables is the set of possible outputs of the function.

### DEFINITION 12.3

#### The Domain and Range of a Function of Three Variables

If  $f$  is a function that takes an element from an unspecified subset of  $\mathbb{R}^3$  into  $\mathbb{R}$ , then we will take the **domain** of  $f$  to be the largest subset of  $\mathbb{R}^3$  for which  $f$  is defined:

$$\text{Domain}(f) = \{(x, y, z) \in \mathbb{R}^3 \mid f(x, y, z) \text{ is defined}\}.$$

The **range** of  $f$  is the set of all possible outputs of  $f$ . That is,

$$\text{Range}(f) = \{w \in \mathbb{R} \mid \text{there exists } (x, y, z) \in \text{Domain}(f) \text{ with } f(x, y, z) = w\}.$$

For example, the domain of the function  $f(x, y, z) = \sqrt{xyz}$  consists of all points  $(x, y, z) \in \mathbb{R}^3$  such that the product  $xyz \geq 0$ . The latter is the case on the coordinate planes, in the first octant (when  $x$ ,  $y$ , and  $z$  are all positive), and in those octants where exactly one of the signs of  $x$ ,  $y$ , and  $z$  is the positive. The range of this function consists of all nonnegative real numbers.

### DEFINITION 12.4

#### The Graph of a Function of Three Variables

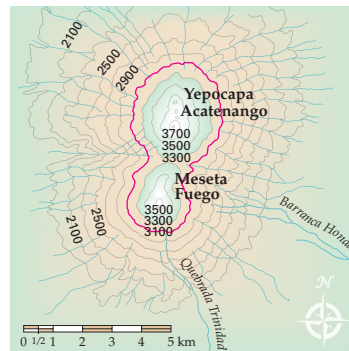

The **graph** of a function of three variables,  $f$ , is the collection of ordered quadruples whose first three coordinates are in the domain of  $f$ . That is,

$$\text{Graph}(f) = \{(x, y, z, f(x, y, z)) \in \mathbb{R}^4 \mid (x, y, z) \in \text{Domain}(f)\}.$$

In other words the graph of a function of three variables is a particular subset of a four-dimensional Cartesian coordinate system! Note that we are not providing even a single example of the graph of a function of three variables here. We have mentioned that the graph of a sufficiently well-defined function of two variables is a surface (basically a two-dimensional object) in three-dimensional space  $\mathbb{R}^3$ . The graph of even the simplest function of three variables is a so-called hypersurface (three-dimensional object) existing in four-dimensional space,  $\mathbb{R}^4$ . Later in this section we will discuss how to use level surfaces to help visualize such objects, but it is often more efficient to try to understand them by using the techniques of calculus and *not* try to sketch them.

## Level Curves and Level Surfaces

A topographic map renders a portion of the surface of the Earth in a two-dimensional form:

The map shows the Fuego and Acatenango volcanic complexes in Guatemala. Each curve on the map displays those points on the surface of these complexes that are at the same elevation. For example, the curve marked 3100 displays the points on the surface at 3100 meters. Thus, if you walked along that curve, you would neither ascend nor descend as you circumnavigated the volcanos. This topographic map gives us a way to understand the surface of the indicated region in Guatemala, although the map itself is flat. We will use this idea to help us understand functions of two variables. We make the following definition:

**DEFINITION 12.5****Level Curves**

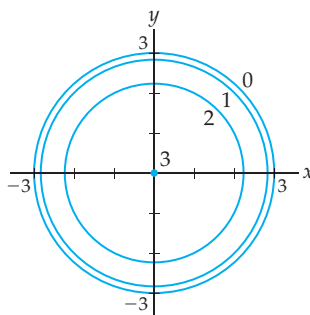

Let  $f$  be a function of two variables and let  $c$  be a point in the range of  $f$ . The **level curve** for  $f$  at height  $c$  is the curve in the plane with equation  $f(x, y) = c$ .

Thus, each point on the level curve is at the same height on the surface determined by the function. The collection of level curves for a function of two variables,  $f$ , in effect, gives us a topographic map for the surface of the graph of  $f$ . For example, consider  $f(x, y) = \sqrt{9 - (x^2 + y^2)}$ , a function of two variables. The range of  $f$  is the interval  $[0, 3]$ . If we choose the values 0, 1, 2, and 3 for  $c$ , we have the equations

$$\sqrt{9 - (x^2 + y^2)} = 0, \quad \sqrt{9 - (x^2 + y^2)} = 1, \quad \sqrt{9 - (x^2 + y^2)} = 2 \quad \text{and} \quad \sqrt{9 - (x^2 + y^2)} = 3.$$

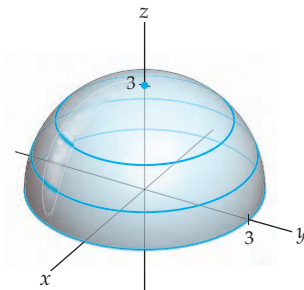

The graphs of these four equations are the following level curves, although note that the only point that satisfies the equation  $\sqrt{9 - (x^2 + y^2)} = 3$  is the origin  $(0, 0)$ :

Level curves for  $f(x, y) = \sqrt{9 - (x^2 + y^2)}$

Now, if we stack these circles at the appropriate heights and interpolate similar circles between them, we can envision the hemisphere that is the graph of  $f$ :

The graph of  $f(x, y) = \sqrt{9 - (x^2 + y^2)}$

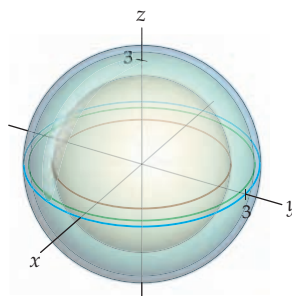

As we mentioned earlier, the graph of a function of three variables is a four-dimensional object. To aid our understanding of these functions, we can sometimes use level surfaces analogous to the level curves we have defined.

**DEFINITION 12.6****Level Surfaces**

Let  $f$  be a function of three variables and let  $c$  be a point in the range of  $f$ . The **level surface** for  $f$  at height  $c$  is the surface in three-dimensional space with equation  $f(x, y, z) = c$ .

We now consider an example quite similar to the one we just discussed. Let the function  $g(x, y, z) = \sqrt{9 - (x^2 + y^2 + z^2)}$ . The range of  $g$  is the interval  $[0, 3]$ . We will find the level surfaces for  $c = 0, 1, 2,$  and  $3$ . When  $c = 0$ , we have  $0 = \sqrt{9 - (x^2 + y^2 + z^2)}$ , or equivalently,  $x^2 + y^2 + z^2 = 9$ . Thus, the level surface for  $c = 0$  is a sphere of radius 3 and centered at the origin. You may check that the level surface for  $c = 1$  is the sphere of radius  $\sqrt{8}$  and centered at the origin; the level surface for  $c = 2$  is the sphere of radius  $\sqrt{5}$ , also centered at the origin; and the level "surface" for  $c = 3$  is the single point  $(0, 0, 0)$ . We see that each level surface of the graph of  $g$  is a sphere and that the radii of the level spheres get smaller as  $c$  increases from 0 to 3. The level surfaces are concentric spheres centered at the origin.

Three level surfaces for  $g(x, y, z) = \sqrt{9 - (x^2 + y^2 + z^2)}$

In fact, the graph of  $g$  is the "top" half of the hypersphere defined by the equation  $w^2 + x^2 + y^2 + z^2 = 9$ . The spheres that are the level surfaces for  $g$  are analogous to the circles that are the level curves for the function  $f$  we discussed before. Understanding the geometry of a function with one fewer variable can help us understand the graph of a figure that exists in a higher dimension.

**Examples and Explorations****EXAMPLE 1****Understanding the basic properties of functions of two variables**

For each of the following functions of two variables, evaluate the function at the given values and find the domain and range of the function:

- (a)  $f(x, y) = 3x - 4y + 5$ ;  $(3, 4)$ ,  $(4, 3)$       (b)  $g(x, y) = \frac{x^2 - y^2}{x}$ ;  $(2, 5)$ ,  $(3, 0)$   
 (c)  $h(r, s) = \frac{\ln(2r + s)}{2r + s}$ ;  $(1, 0)$ ,  $(0, e)$

**SOLUTION**

(a) We first evaluate the function for the specified pairs of coordinates:

$$f(3, 4) = 3 \cdot 3 - 4 \cdot 4 + 5 = 9 - 16 + 5 = -2 \quad \text{and} \\ f(4, 3) = 3 \cdot 4 - 4 \cdot 3 + 5 = 12 - 12 + 5 = 5.$$

In particular, we note that the order of the coordinates is significant when we evaluate this function. The domain of the function  $f(x, y) = 3x - 4y + 5$  is  $\mathbb{R}^2$ , since the function is defined for every ordered pair in  $\mathbb{R}^2$ . Finally, the range of  $f$  is  $\mathbb{R}$ , because every real number can be obtained (in infinitely many different ways). For example, if we let  $r$  be an arbitrary nonzero real number, the ordered pair  $\left(\frac{r-5}{3}, 0\right)$  has the property that  $f\left(\frac{r-5}{3}, 0\right) = r$ . Thus, the function  $f$  maps  $\mathbb{R}^2$  onto  $\mathbb{R}$ .

- (b) We evaluate the function  $g$  for the specified pairs of coordinates:

$$g(2, 5) = \frac{2^2 - 5^2}{2} = \frac{4 - 25}{2} = -\frac{21}{2} \quad \text{and} \quad g(3, 0) = \frac{3^2 - 0^2}{3} = 3.$$

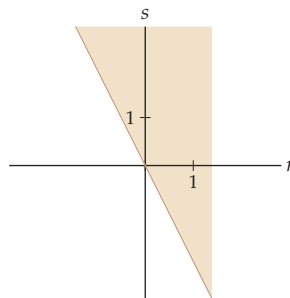

The domain of the function  $g$  is the set of all ordered pairs  $\{(x, y) \in \mathbb{R}^2 \mid x \neq 0\}$ , since  $g$  is defined for all ordered pairs except when  $x = 0$ . As with  $f$ , the range of  $g$  is  $\mathbb{R}$ , because every real number can be obtained as an output from  $g$ . For example,  $g(r, 0) = r$  and  $g(r, r) = 0$  for every nonzero real number  $r$ .

- (c) Before we evaluate the function  $h$  for the specified pairs of coordinates, note that we are using different letters to represent our variables, but  $h$  is just another function of two variables. When we evaluate  $h$  for a particular coordinate pair, we assume that the first value in the pair is the  $r$ -value and the second is the  $s$ -value, since we wrote the function as  $h(r, s)$ . Thus,

$$h(1, 0) = \frac{\ln(2 \cdot 1 + 0)}{2 \cdot 1 + 0} = \frac{\ln 2}{2} \quad \text{and} \quad h(0, e) = \frac{\ln(2 \cdot 0 + e)}{2 \cdot 0 + e} = \frac{1}{e}.$$

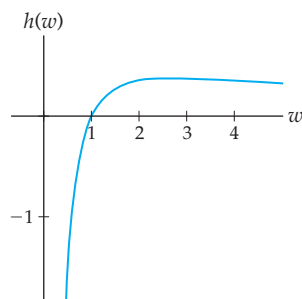

Because the domain of the natural logarithm is all positive real numbers, the domain of the function  $h$  is the set of all ordered pairs  $\{(r, s) \in \mathbb{R}^2 \mid 2r + s > 0\}$ , shown here:

$$\text{The domain of } h(r, s) = \frac{\ln(2r + s)}{2r + s}$$

Finding the range of  $h$  is slightly more difficult. As an aid, we note that if we let  $w = 2r + s$ , we may represent the function in the form  $h(w) = \frac{\ln w}{w}$ . Using the techniques of single-variable calculus, you may show that this function has the following graph:

$$\text{The graph of } h(w) = \frac{\ln w}{w}$$

It can be shown that the maximum of this function,  $1/e$ , occurs when  $w=e$  and that  $\lim_{w \rightarrow 0^+} \frac{\ln w}{w} = -\infty$ . Therefore the range of the function  $\frac{\ln w}{w}$  is  $(-\infty, 1/e]$ . Since the quantity  $2r + s$  can take on any real value, this interval will also be the range of  $h(r, s) = \frac{\ln(2r+s)}{2r+s}$ .  $\square$

### EXAMPLE 2 Composing functions of two variables

Consider the functions

$$g(t) = t^3, \quad h(t) = t^2 - 7, \quad f(x, y) = x^2 - y, \quad w(x, y) = \frac{x}{y}, \quad \text{and} \quad \mathbf{r}(t) = \langle \sin t, \cos t \rangle$$

For each of the following, simplify the expression or explain why it is not possible to evaluate that particular expression:

- (a)  $f(g(t))$       (b)  $g(f(x, y))$       (c)  $w(g(t), h(t))$       (d)  $w(\mathbf{r}(t))$       (e)  $f(w(x, y))$

#### SOLUTION

(a) This composition is not defined. The range of the function  $g$  is  $\mathbb{R}$ , but the domain of  $f$  is  $\mathbb{R}^2$ .

(b) This composition is defined, and

$$g(f(x, y)) = g(x^2 - y) = (x^2 - y)^3.$$

(c) This composition is also defined, and

$$w(g(t), h(t)) = \frac{g(t)}{h(t)} = \frac{t^3}{t^2 - 7}.$$

(d) The output of the vector function  $\mathbf{r}$  is the ordered pair  $\langle \sin t, \cos t \rangle$ , so this composition is defined and

$$w(\mathbf{r}(t)) = \frac{\sin t}{\cos t} = \tan t.$$

(e) This composition is not defined. The range of the function  $w$  is a subset of  $\mathbb{R}$ , but the domain of  $f$  is  $\mathbb{R}^2$ .  $\square$

### EXAMPLE 3 Graphing surfaces of revolution

Sketch the surfaces formed when the graphs of the following functions on the specified intervals are revolved around the  $z$ -axis:

- (a)  $f(x) = x - 1$  on the interval  $[0, 2]$       (b)  $g(x) = x^3 - x$  on the interval  $[-1, 0]$

Also, find the equation for each surface as a function of two variables.

#### SOLUTION

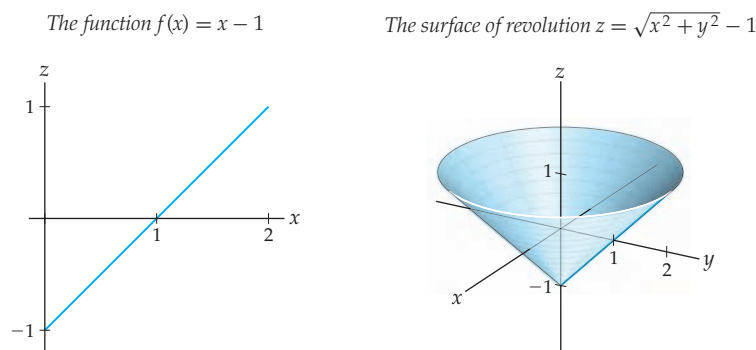

We begin by noting that, for each function, we are considering the dependent variable to be  $z$ . Thus the graph of the function  $f$  on the interval  $[0, 2]$  is a line segment, and the graph of  $g$  on the interval  $[-1, 0]$  is a portion of the cubic function, both in the  $xz$ -plane.

(a) For our first function, since our interval is  $[0, 2]$ , all we need to do to obtain the equation of the first surface of revolution as a function of two variables is to replace  $x$  with  $\sqrt{x^2 + y^2}$  in the formula for the function  $f$  and obtain

$$z = f\left(\sqrt{x^2 + y^2}\right) = \sqrt{x^2 + y^2} - 1.$$

The graphs of the function and the surface are as follows:

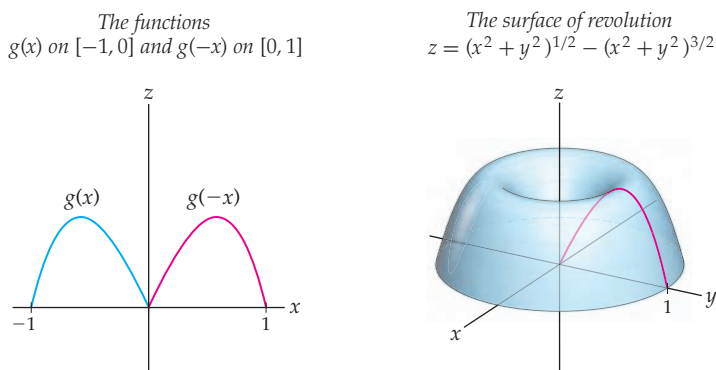

- (b) For our second function, our interval is  $[-1, 0]$ . When we have an interval  $[a, b]$  with  $a < b \leq 0$ , we consider the function  $g(-x)$  on the interval  $[-b, -a]$  instead. Here we have

$$g(-x) = ((-x)^3 - (-x)) = x - x^3 \text{ on } [0, 1],$$

and we proceed as we did in part (a). To obtain the equation of the second surface of revolution as a function of two variables, we replace the occurrences of  $x$  with  $\sqrt{x^2 + y^2}$  in the formula for  $g(-x)$  and obtain

$$z = g\left(-\sqrt{x^2 + y^2}\right) = (x^2 + y^2)^{1/2} - (x^2 + y^2)^{3/2}.$$

Here are the graphs of the functions and the surface:

□

#### EXAMPLE 4 Drawing level curves

Let  $f(x, y) = -\frac{8x}{x^2 + y^2 + 1}$ . Sketch level curves  $f(x, y) = c$  for  $c = -3, -2, -1, 0, 1, 2$ , and  $3$ .

#### SOLUTION

For each value of  $c$ , we will graph the set of points that are solutions of the equation  $-\frac{8x}{x^2 + y^2 + 1} = c$ . We begin with  $c = 0$ . The equation  $-\frac{8x}{x^2 + y^2 + 1} = 0$  holds exactly when  $x = 0$ . Thus, the level curve here is the  $y$ -axis.

Next, when  $c = 1$ , we have the equation

$$-\frac{8x}{x^2 + y^2 + 1} = 1.$$

The denominator of the function is never zero. Therefore, we obtain the equivalent equation  $-8x = x^2 + y^2 + 1$  when we multiply both sides of the given equation by  $x^2 + y^2 + 1$ . Then,

$$-8x = x^2 + y^2 + 1$$

$$x^2 + 8x + y^2 = -1 \quad \leftarrow \text{arithmetic}$$

$$(x + 4)^2 + y^2 = 15 \quad \leftarrow \text{completing the square}$$

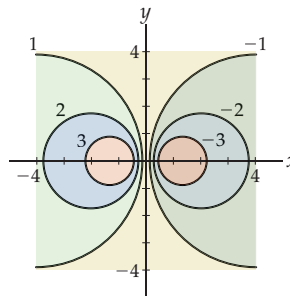

At this point we recognize that the level curve when  $c = 1$  is the circle with radius  $\sqrt{15}$  and centered at  $(-4, 0)$ . Nearly identical calculations reveal that the level curve when  $c = -1$  is given by the equation  $(x - 4)^2 + y^2 = 15$ , whose graph is the circle with radius  $\sqrt{15}$  and centered at  $(4, 0)$ .

The other level curves we wish to find are also circles. Similar calculations provide the information in the following table:

$c$	equation	radius	center
2	$(x + 2)^2 + y^2 = 3$	$\sqrt{3}$	$(-2, 0)$
-2	$(x - 2)^2 + y^2 = 3$	$\sqrt{3}$	$(2, 0)$
3	$(x + \frac{4}{3})^2 + y^2 = \frac{7}{9}$	$\frac{\sqrt{7}}{3}$	$(-\frac{4}{3}, 0)$
-3	$(x - \frac{4}{3})^2 + y^2 = \frac{7}{9}$	$\frac{\sqrt{7}}{3}$	$(\frac{4}{3}, 0)$

Therefore, we have the following graph of the level curves:

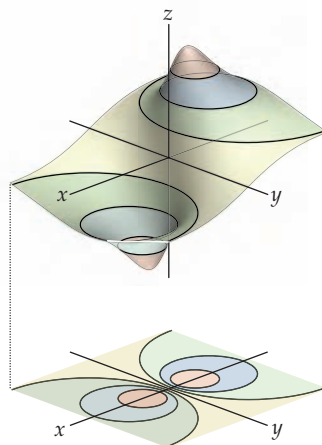

Level curves for  $f(x, y) = -\frac{8x}{x^2 + y^2 + 1}$

We may extend the analysis we used to obtain these level curves to find the range of the function  $f$ . (See Exercise 8.)

Finally, the graph of  $f$  shown next was generated by a computer algebra system. The breaks between the colors correspond to the level curves we just found. If you have access to such a program, it can greatly aid your understanding of the graphs of functions of two variables.

$$f(x, y) = -\frac{8x}{x^2 + y^2 + 1}$$

□

**EXAMPLE 5****Understanding the basic properties of functions of three variables**

For each of the following functions of three variables, evaluate the function at the given values and find the domain and range of the function:

- (a)  $f(x, y, z) = xyz + xy + z$ ;  $(1, 2, 3)$       (b)  $g(x, y, z) = \frac{x^2 - y^2}{x + z}$ ;  $(-3, 2, 4)$   
 (c)  $h(r, s, t) = \frac{\ln(r + s + t)}{r + s + t}$ ;  $(e, e^2, -e)$

**SOLUTION**

- (a) We first evaluate the function for the specified triple of coordinates:

$$f(1, 2, 3) = 1 \cdot 2 \cdot 3 + 1 \cdot 2 + 3 = 6 + 2 + 3 = 11.$$

The domain of the function  $f(x, y, z) = xyz + xy + z$  is  $\mathbb{R}^3$ , since the function is defined for every ordered triple in  $\mathbb{R}^3$ . Finally, the range of  $f$  is  $\mathbb{R}$ , because every real number can be obtained (in infinitely many different ways). For example, let  $r$  be an arbitrary real number, then the ordered triple  $(0, 0, r)$  has the property that  $f(0, 0, r) = r$ . Thus, the function  $f$  maps  $\mathbb{R}^3$  onto  $\mathbb{R}$ .

- (b) We first evaluate the function  $g$  for the specified triple of coordinates:

$$g(-3, 2, 4) = \frac{(-3)^2 - 2^2}{-3 + 4} = \frac{9 - 4}{1} = 5.$$

The domain of the function  $g$  is the set of all ordered triples  $\{(x, y, z) \in \mathbb{R}^3 \mid x + z \neq 0\}$ , since  $g$  is defined for all triples except when  $x + z = 0$ . That is, the domain of  $g$  consists of all points in  $\mathbb{R}^3$  except those points on the plane defined by the equation  $x + z = 0$ . The range of  $g$  is  $\mathbb{R}$ , because every real number can be obtained as an output from  $g$ . For example, if we let  $r$  be an arbitrary nonzero real number, the ordered pair  $(r, 0, 0)$  has the property that  $g(r, 0, 0) = r$ .

- (c) This function is quite similar to the function found in part (c) of Example 1. Thus, our analysis will be quite similar. We have

$$h(e, e^2, -e) = \frac{\ln(e + e^2 - e)}{e + e^2 - e} = \frac{2}{e^2}.$$

Since the domain of the natural logarithm is all positive real numbers, the domain of the function  $h$  is the set of all ordered triples  $\{(r, s, t) \in \mathbb{R}^3 \mid r + s + t > 0\}$ . That is, the domain consists of all points in  $\mathbb{R}^3$  above the plane defined by the equation  $r + s + t = 0$ .

As in part (c) of Example 1, the range of  $h(r, s, t) = \frac{\ln(r+s+t)}{r+s+t}$  is the interval  $(-\infty, 1/e]$ . □

### TEST YOUR UNDERSTANDING

- ▶ What is a function of two variables? What is a function of three variables? What is a function of  $n$  variables?
- ▶ How do you determine the domain of a function of two or three variables? What is the range of a function?
- ▶ Why is the graph of a linear function of two variables a plane?
- ▶ How many dimensions are required to sketch the graph of a function of two variables? How many dimensions are required to sketch the graph of a function of three variables?
- ▶ What is a level curve? What is a level surface? How can level curves be used to understand a function of two variables? How can level surfaces be used to understand a function of three variables?

## EXERCISES 12.1

### Thinking Back

- ▶ *The definition of a function:* Explain why Definition 0.1 is general enough to include functions of two and three variables.
- ▶ *The domain and range of a function of two variables:* Explain why Definition 0.2 is not general enough to define the domain or range of a function of two or three variables.

### Concepts

0. *Problem Zero:* Read the section and make your own summary of the material.
1. *True/False:* Determine whether each of the statements that follow is true or false. If a statement is true, explain why. If a statement is false, provide a counterexample.
  - (a) *True or False:* The domain of a function of two variables is a subset of  $\mathbb{R}^2$ .
  - (b) *True or False:* The range of a function of two variables is a subset of  $\mathbb{R}^2$ .
  - (c) *True or False:* The graph of a function of two variables is a subset of  $\mathbb{R}^3$ .
  - (d) *True or False:* The domain of a function of three variables is a subset of  $\mathbb{R}$ .
  - (e) *True or False:* The range of a function of three variables is a subset of  $\mathbb{R}$ .
  - (f) *True or False:* The graph of a function of three variables is a subset of  $\mathbb{R}^4$ .
  - (g) *True or False:* The graph of a linear function of two variables is a plane.
  - (h) *True or False:* If a function  $f : \mathbb{R} \rightarrow \mathbb{R}$  is continuous on an interval  $[0, p]$  then the surface formed when the graph of  $f$  is rotated about the  $y$ -axis may be expressed as a function of two variables.
2. *Examples:* Construct examples of the thing(s) described in the following. Try to find examples that are different than any in the reading.
  - (a) A function of two variables whose graph is a plane.
  - (b) A function of two variables whose graph is the surface of revolution formed when the graph of a function of a single variable is revolved around the  $y$ -axis.
  - (c) A function of two variables for which each level curve is a parabola.
3. Let  $f : \mathbb{R} \rightarrow \mathbb{R}$  be a function of a single variable. Explain why the graph of  $f$  is a subset of  $\mathbb{R}^2$ .
4. Let  $f : \mathbb{R}^2 \rightarrow \mathbb{R}$  be a function of two variables. Explain why the graph of  $f$  is a subset of  $\mathbb{R}^3$ .
5. Let  $f : \mathbb{R}^3 \rightarrow \mathbb{R}$  be a function of three variables. Explain why the graph of  $f$  is a subset of  $\mathbb{R}^4$ .

6. (a) Graph  $f(x) = x$ .  
 (b) Graph the function  $f(x, y) = x + y$ . Explain why the graph of  $f(x, y) = x + y$  contains the origin,  $(0, 0, 0)$ .  
 (c) The graph of the function

$$f(x, y, z) = x + y + z$$

is a **hyperplane** of dimension 3 in  $\mathbb{R}^4$ . Explain why “hyperplane” is a good name for the graph. (“Hyper” is from a Greek word meaning *over* or *beyond*. The Latin equivalent is *super*, meaning essentially the same thing.) Explain why the graph of  $f$  contains the origin,  $(0, 0, 0, 0)$ .

- (d) Fill in the blanks: The graph of the function  $f(x_1, x_2, \dots, x_n) = x_1 + x_2 + \dots + x_n$  is a hyperplane of dimension \_\_\_\_\_ in \_\_\_\_\_.  
 7. (a) Graph the function  $f(x) = \sqrt{1 - x^2}$ .

- (b) Graph the function  $f(x, y) = \sqrt{1 - x^2 - y^2}$ . (Hint: Let  $z = \sqrt{1 - x^2 - y^2}$ , and then square both sides of the equation.)

- (c) The graph of the function

$$f(x, y, z) = \sqrt{1 - x^2 - y^2 - z^2}$$

is half of a **hypersphere** of dimension 3. Explain why “hypersphere” is a good name for the graph and why the graph is only half of the hypersphere. What equation defines the entire hypersphere?

- (d) Fill in the blanks: The graph of the function  $f(x_1, x_2, \dots, x_n) = \sqrt{1 - x_1^2 - x_2^2 - \dots - x_n^2}$  is half of a \_\_\_\_\_ of dimension \_\_\_\_\_ in \_\_\_\_\_.

8. Find the range of the function  $f(x, y) = -\frac{8x}{x^2 + y^2 + 1}$  from Example 4 by finding the largest value,  $M$ , and smallest value,  $m$ , of  $c$  for which the equation

$$-\frac{8x}{x^2 + y^2 + 1} = c$$

has a solution. (Hint: Find the two values for  $c$  such that the level “curves” are a single point. Then show that the given equation has a solution for every value of  $c$  between those two values.)

9. Let  $z = f(x, y)$  be a function of two variables. Explain why the two sets  $\{(x, y) \mid (x, y, z) \in \text{Graph}(f)\}$  and  $\text{Domain}(f)$  are identical.  
 10. Let  $z = f(x, y)$  be a function of two variables. Explain why the two sets  $\{z \mid (x, y, z) \in \text{Graph}(f)\}$  and  $\text{Range}(f)$  are identical.  
 11. Let  $w = f(x, y, z)$  be a function of three variables. Explain why the two sets  $\{(x, y, z) \mid (x, y, z, w) \in \text{Graph}(f)\}$  and  $\text{Domain}(f)$  are identical.  
 12. Let  $w = f(x, y, z)$  be a function of three variables. Explain why the two sets  $\{w \mid (x, y, z, w) \in \text{Graph}(f)\}$  and  $\text{Range}(f)$  are identical.

In Exercises 13–21, provide a rough sketch of the graph of a function of two variables with the specified level “curve(s).” (There are many possible correct answers to each question.)

13. One level curve consists of a single point.  
 14. One level curve consists of exactly two points.  
 15. One level curve is a circle together with the point that is the center of the circle.  
 16. One level curve consists of all the points  $(m, n)$  where  $m$  and  $n$  are both integers.  
 17. All of the level curves are circles except one, which is a point.  
 18. All of the level curves are circles.  
 19. Some level curves consist of two concentric circles.  
 20. Some level curves consist of infinitely many concentric circles.  
 21. All of the level curves are squares.

## Skills

In Exercises 22–28, evaluate the given function at the specified points in the domain, and then find the domain and range of the function.

22.  $f(x, y) = x^2y^3, \left(\frac{1}{2}, \frac{4}{3}\right), (0, \pi)$

23.  $f(x, y) = x^2 - y^2, (1, 5), (-3, -2)$

24.  $g(x, y) = \frac{x^2 + y^2}{x + y}, (\pi, 1), (4, 5)$

25.  $g(x, y) = \frac{\ln(xy)}{\sqrt{1-x}}, (-e, -1), \left(\frac{1}{2}, 2\right)$

26.  $f(x, y) = \frac{\sin(x-y)}{x-y}, (0, \pi), \left(\frac{\pi}{2}, \frac{\pi}{3}\right)$

27.  $f(x, y, z) = x^2 + y^2 + z^2, (1, 0, -5), \left(\frac{1}{2}, -1, \frac{1}{3}\right)$

28.  $f(x, y, z) = \frac{x+y+z}{xyz}, (1, -2, 6), (-3, -2, 4)$

In Exercises 29–36, let

$$g_1(t) = \sin t, g_2(t) = \cos t, g_3(t) = 1 - t,$$

$$f_1(x, y) = x^2 + y^2, f_2(x, y) = \frac{x^2}{y^2}, f_3(x, y, z) = \frac{x+y}{y+z},$$

$$\mathbf{r}_1(t) = (1 + t, t - 1), \mathbf{r}_2(t) = (t, t^2, t^3).$$

Either simplify the specified composition or explain why the composition cannot be formed.

29.  $f_1(g_1(t), g_2(t))$

30.  $g_1(f_1(x, y), f_2(x, y))$

31.  $g_1(g_2(t))$

32.  $f_1(\mathbf{r}_1(t))$

33.  $f_3(g_2(t), g_1(t), g_3(t))$

34.  $f_1(f_2(x, y), f_3(x, y, z))$

35.  $r_2(g_3(t))$

36.  $r_2(f_3(x, y, z))$

In Exercises 37–42, sketch the surface of revolution formed when the given function on the specified interval is revolved around the  $z$ -axis and find a function of two variables with the surface as its graph.

37.  $f(x) = x, [0, 3]$

38.  $f(x) = \sqrt{x}, [0, 4]$

39.  $f(x) = x^2, [0, 2]$

40.  $f(x) = x^{3/2}, [0, 1]$

41.  $f(x) = \sin x, \left[0, \frac{\pi}{2}\right]$

42.  $f(x) = \cos x, \left[0, \frac{\pi}{2}\right]$

In Exercises 43–52, sketch the level curves  $c = -3, -2, -1, 0, 1, 2, 3$  if they exist for the specified function.

43.  $f(x, y) = x + y$

44.  $f(x, y) = \frac{3x}{y}$

45.  $f(x, y) = \frac{3x}{y^2}$

46.  $f(x, y) = \sqrt{xy}$

47.  $f(x, y) = 4 - (x^2 + y^2)$

48.  $f(x, y) = x^2 - y^2$

49.  $f(x, y) = \sin(x + y)$

50.  $f(x, y) = \cos(xy)$

51.  $f(x, y) = y \csc x$

52.  $f(x, y) = y \sec x$

In Exercises 53–58, determine the level surfaces  $c = -3, -2, -1, 0, 1, 2, 3$  if they exist for the specified function.

53.  $f(x, y, z) = x + 2y + 3z$

54.  $f(x, y, z) = -2x - y + 4z$

55.  $f(x, y, z) = \frac{x}{y - z}$

56.  $f(x, y, z) = \frac{x^2 + y^2}{z}$

57.  $f(x, y, z) = x^2 + y^2 + z^2$

58.  $f(x, y, z) = \sqrt{1 - (x^2 + y^2 + z^2)}$

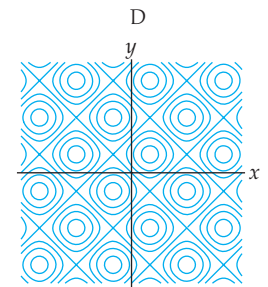

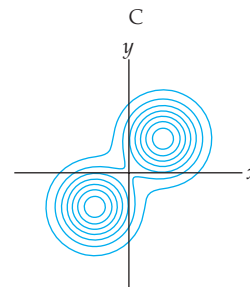

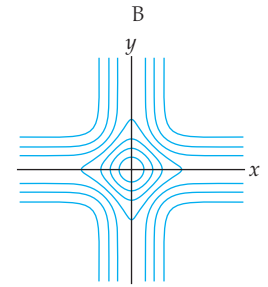

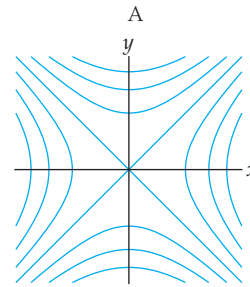

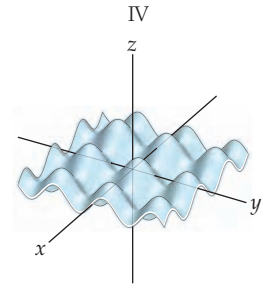

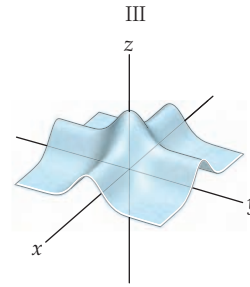

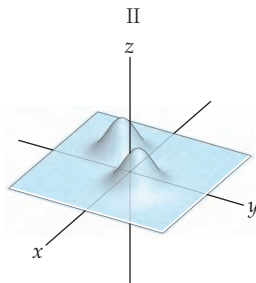

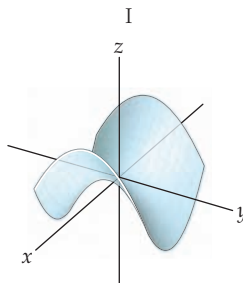

In Exercises 59–62, match the given function of two variables with the surfaces in Figures I–IV and with the level curves in Figures A–D. Make sure you explain your reasoning.

59.  $f(x, y) = x^2 - y^2$

60.  $f(x, y) = e^{-(x+1)^2 - (y+1)^2} + e^{-(x-1)^2 - (y-1)^2}$

61.  $f(x, y) = e^{-x^2} + e^{-y^2}$

62.  $f(x, y) = \sin x + \sin y$

63. We may express the volume of a right circular cylinder by using the function of two variables,  $V(r, h) = \pi r^2 h$ , where  $r$  is the radius of either end of the cylinder and  $h$  is the height of the cylinder. What is the domain of the function  $V(r, h)$ ? Express the surface area,  $S$ , of a cylinder as a function of variables  $r$  and  $h$ .
64. Express the volume,  $V$ , and surface area,  $S$ , of a right circular cone with radius  $r$  and height  $h$  as functions of two variables. What is the domain of each function?
65. Express the volume,  $V$ , and surface area,  $S$ , of a rectangular parallelepiped (i.e., a box) with side lengths  $x$ ,  $y$ , and  $z$  as functions of three variables. What is the domain of each function?
66. Express the formulas for converting from polar coordinates to rectangular coordinates found in Section 9.2 as functions of two variables. What is the domain of each function?

## Applications

67. Leila has been gathering data on the population density of caribou in a valley of the Selkirk Range in British Columbia, Canada. In winter, the caribou stay close to the bottom of the valley. Leila models the population for February with the function

$$p_F(x, y) = 13e^{-(y+0.5x-2)^2} e^{-0.2(x-1)^2},$$

where  $x$  and  $y$  are measured in miles from the center of the valley.

- Where are the caribou most likely to be found?
- During the summer, there is a stream in the valley. What is a vector in the direction of the stream?

68. Emmy is still trying to track down a leak in her Hanford tank farm. She has modeled the depth of a layer of basalt under the farm as a plane, but she has come to realize that there is a joint in the basalt that drops the level by a foot north of the curve with equation  $x = 50 + 0.3y^{1.25}$ . Thus, her model for the basalt layer is now

$$b(x, y) = -40 - \frac{1}{350}x + \frac{1}{725}y - u(x - 50 + 0.3y^{1.25}),$$

where  $u$  is the unit step function. The toxic solution must flow along the impenetrable layer of basalt. What is the route of its flow, and what is a vector giving the direction of its flow at any point?

## Proofs

69. For constants  $a$ ,  $b$ , and  $c$ , a function of two variables of the form  $f(x, y) = ax + by + c$  is called a **linear function of two variables**. Show that the graph of the linear function  $f(x, y) = ax + by + c$  is a plane with normal vector  $\langle a, b, -1 \rangle$  containing the point  $(0, 0, c)$ .
70. Let  $z = f(x, y)$  be a function of two variables. Prove that when  $c_1 \neq c_2$ , the level curves defined by the equations  $f(x, y) = c_1$  and  $f(x, y) = c_2$  do not intersect.
71. Let  $z = f(x, y)$  be a function of two variables. Prove that if the level curves defined by the equations  $f(x, y) = c_1$  and  $f(x, y) = c_2$  intersect, then the curves are identical. (*Hint: See Exercise 70.*)
72. Let  $w = f(x, y, z)$  be a function of three variables. Prove that when  $c_1 \neq c_2$ , the level surfaces defined by the equations  $f(x, y, z) = c_1$  and  $f(x, y, z) = c_2$  do not intersect.
73. Let  $w = f(x, y, z)$  be a function of three variables. Prove that if the level surfaces defined by the equations  $f(x, y, z) = c_1$  and  $f(x, y, z) = c_2$  intersect, then the surfaces are identical. (*Hint: See Exercise 72.*)

## Thinking Forward

- ▶ *A kind of derivative for a function of two variables:* Explain why the derivative of the function  $\frac{3x}{y^4}$  is  $\frac{3}{y^4}$  if  $x$  is the variable and  $y$  is a constant and is  $-\frac{12x}{y^5}$  if  $y$  is the variable and  $x$  is a constant. What is the derivative if both  $x$  and  $y$  are constants?
- ▶ *A kind of derivative for a function of three variables:* Explain why the derivative of the function  $xe^{-4z} \sin y$  is  $e^{-4z} \sin y$  if  $x$  is the variable and  $y$  and  $z$  are constants, and the derivative is  $xe^{-4z} \cos y$  if  $y$  is the variable and  $x$  and  $z$  are constants, and the derivative is  $-4xe^{-4z} \sin y$  if  $z$  is the variable and  $x$  and  $y$  are constants. What is the derivative if  $x$ ,  $y$ , and  $z$  are all constants?

## 12.2 OPEN SETS, CLOSED SETS, LIMITS, AND CONTINUITY

- ▶ Open sets and closed sets
- ▶ The limit for a function of two or more variables
- ▶ The continuity of functions of two or more variables

### Open Sets and Closed Sets

The tools of calculus introduced in Chapters 1 and 2 allow us to analyze functions of a single variable. The definitions of the limit, continuity, and differentiability require that our functions be defined on an open interval. Some theorems, such as the Extreme Value Theorem, require that our functions be defined on a closed interval. To understand these concepts for functions of two and three variables, we will spend the next few pages defining terms like *open sets*, *closed sets*, and *bounded sets*. It may be helpful to review the basic calculus concepts and theorems you studied in those earlier chapters before proceeding through this section.

We first define the following:

#### DEFINITION 12.7 Open Disks and Open Balls

Let  $\epsilon > 0$ .

- (a) Let  $(x_0, y_0) \in \mathbb{R}^2$ . A subset of  $\mathbb{R}^2$  of the form

$$\{(x, y) \mid (x - x_0)^2 + (y - y_0)^2 < \epsilon\}$$

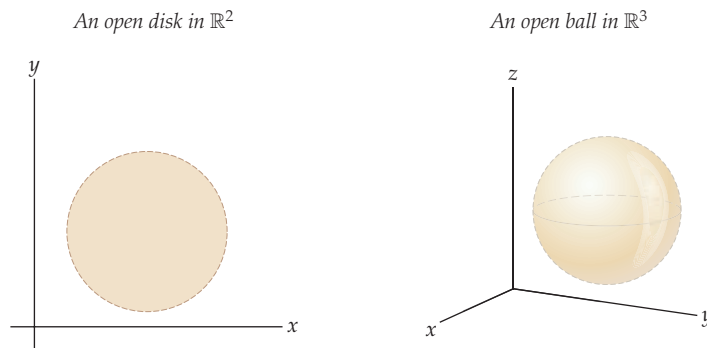

is said to be an **open disk** in  $\mathbb{R}^2$ .

- (b) Let  $(x_0, y_0, z_0) \in \mathbb{R}^3$ . A subset of  $\mathbb{R}^3$  of the form

$$\{(x, y, z) \mid (x - x_0)^2 + (y - y_0)^2 + (z - z_0)^2 < \epsilon\}$$

is said to be an **open ball** in  $\mathbb{R}^3$ .

Thus, an open disk is a subset of  $\mathbb{R}^2$  contained within a circle, not including the points on the circumference of the circle. Similarly, an open ball is a subset of  $\mathbb{R}^3$  contained within a sphere, not including the points on the surface of the sphere.

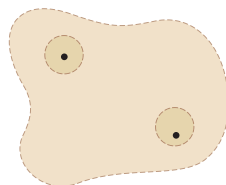

These basic objects allow us to define open sets in  $\mathbb{R}^2$  and  $\mathbb{R}^3$ .

**DEFINITION 12.8** Open Sets in  $\mathbb{R}^2$  and  $\mathbb{R}^3$ 

- (a) A subset  $S$  of  $\mathbb{R}^2$  is said to be **open** if, for every point  $(x, y) \in S$ , there is an open disk  $D$  such that  $(x, y) \in D \subseteq S$ .
- (b) A subset  $S$  of  $\mathbb{R}^3$  is said to be **open** if, for every point  $(x, y, z) \in S$ , there is an open ball  $B$  such that  $(x, y, z) \in B \subseteq S$ .

*A set  $S$  in the plane is open if, for every point in  $S$ , there is an open disk that both contains the point and is a subset of the set  $S$*

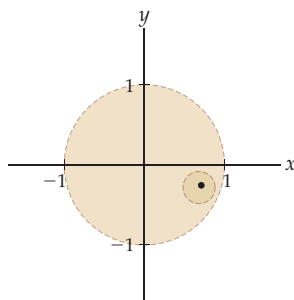

The following four examples illustrate the definition of an open set in  $\mathbb{R}^2$  (consider the analogous examples in  $\mathbb{R}^3$ ):

1. Every open disk is itself an open set. For example, the unit open disk

$$U = \{(x, y) \mid x^2 + y^2 < 1\}$$

is an open set because, for every point  $(x, y)$  in  $U$ , there is another smaller, open disk  $D$  such that  $(x, y) \in D \subseteq U$ .

*The unit disk  $U = \{(x, y) \mid x^2 + y^2 < 1\}$  is an open set*

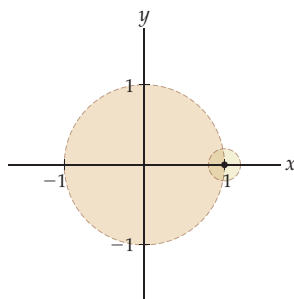

2. If we let  $W$  be the unit disk together with any point on the circumference of the circle, say,  $(1, 0)$ , then the set  $W$  will not be an open set. That is,

$$W = \{(x, y) \mid x^2 + y^2 < 1\} \cup \{(1, 0)\}.$$

The point  $(1, 0)$  is in  $W$ , so this set is not open, because there is no open disk containing  $(1, 0)$  that is a subset of  $W$ .

*The set  $W = \{(x, y) \mid x^2 + y^2 < 1\} \cup \{(1, 0)\}$  is not an open set*

3. Similarly, if we let  $\bar{U} = \{(x, y) \mid x^2 + y^2 \leq 1\}$ , our set includes all points inside and on the circumference of the unit circle. Like the set  $W$ , this set is also not open.
4. The **empty set**, denoted by  $\emptyset$ , contains no elements and is a subset of every set. As a subset of  $\mathbb{R}^2$ , the empty set is open, since it vacuously satisfies Definition 12.8 (a).

**DEFINITION 12.9****The Complement of a Set in  $\mathbb{R}^2$  and  $\mathbb{R}^3$** 

(a) Let  $A$  be a subset of  $\mathbb{R}^2$ . The **complement** of  $A$ , denoted  $A^c$ , is the set

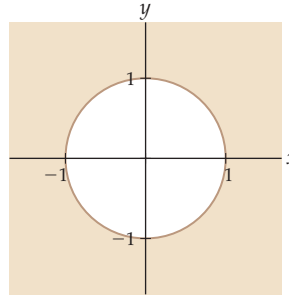

$$A^c = \{(x, y) \in \mathbb{R}^2 \mid (x, y) \notin A\}.$$

(b) Let  $A$  be a subset of  $\mathbb{R}^3$ . The **complement** of  $A$ , denoted  $A^c$ , is the set

$$A^c = \{(x, y, z) \in \mathbb{R}^3 \mid (x, y, z) \notin A\}.$$

That is, the complement of a set  $A$  is the set of all points *not* in  $A$ . For example, the complement of the unit disk  $U = \{(x, y) \mid x^2 + y^2 < 1\}$  is the set  $U^c = \{(x, y) \mid x^2 + y^2 \geq 1\}$ .

The complement of the unit disk in  $\mathbb{R}^2$

We ask you to prove the following theorem in Exercise 63:

**THEOREM 12.10****The Complement of the Complement of a Set Is the Original Set**

If  $S$  is a subset of  $\mathbb{R}^2$  or  $\mathbb{R}^3$ , then  $(S^c)^c = S$ .

We use the idea of the complement of a set to define a closed set.

**DEFINITION 12.11****Closed Sets in  $\mathbb{R}^2$  and  $\mathbb{R}^3$** 

A subset  $S$  of  $\mathbb{R}^2$  or  $\mathbb{R}^3$  is said to be **closed** if its complement,  $S^c$ , is open.

For example, the set  $U^c = \{(x, y) \mid x^2 + y^2 \geq 1\}$  is a closed set because it is the complement of the open set  $U = \{(x, y) \mid x^2 + y^2 < 1\}$ . Note that a set is not closed just because it is not open. Later, in Example 1, we will show that the set  $\{(x, y) \mid x \geq 0 \text{ and } y > 0\}$  is neither open nor closed. In that respect, this set is similar to a half-open, half-closed interval like  $[0, 1)$ .

We ask you to prove the following theorem in Exercise 64:

**THEOREM 12.12****The Complement of a Closed Set Is an Open Set**

If  $S$  is a closed subset of  $\mathbb{R}^2$  or  $\mathbb{R}^3$ , then  $S^c$  is an open set.

We now define the boundary of a set.

## DEFINITION 12.13

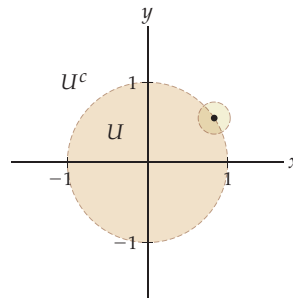

**The Boundary of a Subset of  $\mathbb{R}^2$  or  $\mathbb{R}^3$** 

- (a) Let  $A$  be a subset of  $\mathbb{R}^2$ . A point  $(x, y)$  is said to be a **boundary point** of  $A$  if every open disk containing  $(x, y)$  in  $\mathbb{R}^2$  intersects both  $A$  and  $A^c$ .
- (b) Let  $A$  be a subset of  $\mathbb{R}^3$ . A point  $(x, y, z)$  is said to be a **boundary point** of  $A$  if every open ball containing  $(x, y, z)$  in  $\mathbb{R}^3$  intersects both  $A$  and  $A^c$ .

The set of all boundary points of a set  $A$  is called the **boundary** of  $A$  and is denoted by  $\partial A$ .

The boundary of the unit disk  $U = \{(x, y) \mid x^2 + y^2 < 1\}$  consists exactly of the points on the unit circle. That is,  $\partial U = \{(x, y) \mid x^2 + y^2 = 1\}$ .

*Every open disk containing a point on the unit circle intersects both  $U$  and  $U^c$*

There are many interesting theorems about open and closed sets in  $\mathbb{R}^2$  and  $\mathbb{R}^3$ . We ask you to prove several of these in the exercises.

Recall that we have already defined what it means for a function to be bounded. We now define what it means for a set to be bounded.

## DEFINITION 12.14

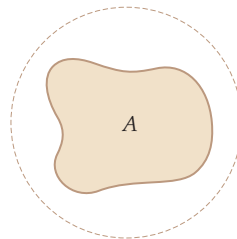

**Bounded Subsets of  $\mathbb{R}^2$  and  $\mathbb{R}^3$** 

- (a) A subset  $A$  of  $\mathbb{R}^2$  is said to be **bounded** if  $A$  is a subset of some open disk  $D$  in  $\mathbb{R}^2$ .
- (b) A subset  $A$  of  $\mathbb{R}^3$  is said to be **bounded** if  $A$  is a subset of some open ball  $B$  in  $\mathbb{R}^3$ .

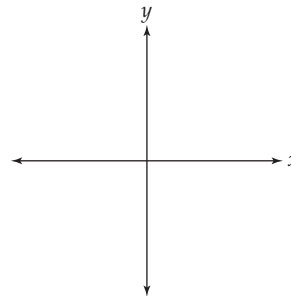

A subset of  $\mathbb{R}^2$  or  $\mathbb{R}^3$  that is not bounded is said to be **unbounded**.

For example, the set  $A$  in the following figure is bounded, while the set consisting of the coordinate axes in  $\mathbb{R}^2$  or  $\mathbb{R}^3$  is unbounded.

*A is a bounded set*

*The points on the coordinate axes form an unbounded set*

Now that we have set forth these preliminary definitions, after a brief review of the definition of the limit of a function of a single variable, we will be ready to define the limit of a function of two or three variables.

## The Limit of a Function of Two or More Variables

Recall that for a function,  $f$ , of a single variable, we defined  $\lim_{x \rightarrow a} f(x) = L$  if, for every  $\epsilon > 0$ , there is a  $\delta > 0$  such that  $|f(x) - L| < \epsilon$  whenever  $0 < |x - a| < \delta$ . The definition makes precise the informal idea that a function  $f$  has a limit  $L$  at a point  $a$  if the output values of  $f$  are “close to”  $L$  for values of the input variable  $x$  that are “close to”  $a$ . We will use this definition as a model to define the limit for functions of two and three variables. Before we get to the new definition, however, note that the definition of the limit implies that the function  $f$  be defined on a punctured open interval. In Exercise 7 we ask how this is accomplished.

There is very little that needs to be changed in the definition of a limit for a function of a single variable to form a definition for the limit of a function of two or three variables. Certainly the types of domains are different: The domain of a function of two variables consists of a set of ordered pairs, and the domain of a function of three variables consists of a set of ordered triples.

### DEFINITION 12.15

#### The Limit of a Function of Two or More Variables

Let  $f$  be a function of two or more variables. The limit of  $f$  at  $\mathbf{a}$  is  $L$  if, for every  $\epsilon > 0$ , there is a  $\delta > 0$  such that  $|f(\mathbf{x}) - L| < \epsilon$  whenever  $0 < \|\mathbf{x} - \mathbf{a}\| < \delta$ . In this case we write  $\lim_{\mathbf{x} \rightarrow \mathbf{a}} f(\mathbf{x}) = L$ .

In the case where  $f$  is a function of two variables, we may let  $\mathbf{x} = \langle x, y \rangle$  and  $\mathbf{a} = \langle a, b \rangle$ , therefore  $\lim_{\mathbf{x} \rightarrow \mathbf{a}} f(\mathbf{x}) = L$  means that for every  $\epsilon > 0$ , there is a  $\delta > 0$  such that

$$|f(x, y) - L| < \epsilon \text{ whenever } 0 < \sqrt{(x - a)^2 + (y - b)^2} < \delta.$$

Similarly, if  $f$  is a function of three variables, we may let  $\mathbf{x} = \langle x, y, z \rangle$  and  $\mathbf{a} = \langle a, b, c \rangle$ . Here,  $\lim_{\mathbf{x} \rightarrow \mathbf{a}} f(\mathbf{x}) = L$  means that for every  $\epsilon > 0$ , there is a  $\delta > 0$  such that

$$|f(x, y, z) - L| < \epsilon \text{ whenever } 0 < \sqrt{(x - a)^2 + (y - b)^2 + (z - c)^2} < \delta.$$

The vector notation of Definition 12.15 can be used in place of the preceding two expanded statements. We will use the more succinct notation when appropriate.

Limits of combinations of functions of two or three variables obey the same types of algebraic properties we saw for limits of functions of a single variable in Chapter 1.

### THEOREM 12.16

#### Rules for Calculating Limits of Combinations

If  $\lim_{\mathbf{x} \rightarrow \mathbf{a}} f(\mathbf{x})$  and  $\lim_{\mathbf{x} \rightarrow \mathbf{a}} g(\mathbf{x})$  exist, then the following rules hold for their combinations:

**Constant Multiple Rule:**  $\lim_{\mathbf{x} \rightarrow \mathbf{a}} kf(\mathbf{x}) = k \lim_{\mathbf{x} \rightarrow \mathbf{a}} f(\mathbf{x})$  for any real number  $k$ .

**Sum Rule:**  $\lim_{\mathbf{x} \rightarrow \mathbf{a}} (f(\mathbf{x}) + g(\mathbf{x})) = \lim_{\mathbf{x} \rightarrow \mathbf{a}} f(\mathbf{x}) + \lim_{\mathbf{x} \rightarrow \mathbf{a}} g(\mathbf{x})$ .

**Difference Rule:**  $\lim_{\mathbf{x} \rightarrow \mathbf{a}} (f(\mathbf{x}) - g(\mathbf{x})) = \lim_{\mathbf{x} \rightarrow \mathbf{a}} f(\mathbf{x}) - \lim_{\mathbf{x} \rightarrow \mathbf{a}} g(\mathbf{x})$ .

**Product Rule:**  $\lim_{\mathbf{x} \rightarrow \mathbf{a}} (f(\mathbf{x})g(\mathbf{x})) = \left( \lim_{\mathbf{x} \rightarrow \mathbf{a}} f(\mathbf{x}) \right) \left( \lim_{\mathbf{x} \rightarrow \mathbf{a}} g(\mathbf{x}) \right)$ .

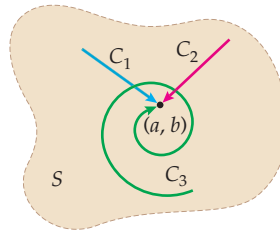

**Quotient Rule:**  $\lim_{\mathbf{x} \rightarrow \mathbf{a}} \frac{f(\mathbf{x})}{g(\mathbf{x})} = \frac{\lim_{\mathbf{x} \rightarrow \mathbf{a}} f(\mathbf{x})}{\lim_{\mathbf{x} \rightarrow \mathbf{a}} g(\mathbf{x})}$ , if  $\lim_{\mathbf{x} \rightarrow \mathbf{a}} g(\mathbf{x}) \neq 0$ .

Another important theorem concerning limits of functions of a single variable has an analog for functions of two or more variables. Theorem 1.8 tells us that the function  $f : \mathbb{R} \rightarrow \mathbb{R}$  has the two-sided limit  $\lim_{x \rightarrow a} f(x) = L$  if and only if the two one-sided limits  $\lim_{x \rightarrow a^+} f(x)$  and  $\lim_{x \rightarrow a^-} f(x)$  are both equal to  $L$ . Before we state the analogous theorem for functions of two or more variables, we define what we mean by the limit of a function of two or more variables *along a path*.

**DEFINITION 12.17****The Limit of a Function of Two or Three Variables Along a Path**

- (a) Let  $f$  be a function of two variables defined on an open set  $S \subseteq \mathbb{R}^2$ . If the graph of the continuous vector function  $\langle x(t), y(t) \rangle$  is a curve  $C \subset S$  such that  $\lim_{t \rightarrow t_0} \langle x(t), y(t) \rangle = \langle a, b \rangle$ , then we define the **limit of  $f$  as  $(x, y)$  approaches  $(a, b)$  along  $C$** , denoted by  $\lim_{\substack{(x,y) \rightarrow (a,b) \\ C}} f(x, y)$ , to be  $\lim_{t \rightarrow t_0} f(x(t), y(t))$ .
- (b) Let  $f$  be a function of three variables defined on an open set  $S \subseteq \mathbb{R}^3$ . If the graph of the continuous vector function  $\langle x(t), y(t), z(t) \rangle$  is a curve  $C \subset S$  such that  $\lim_{t \rightarrow t_0} \langle x(t), y(t), z(t) \rangle = \langle a, b, c \rangle$ , then we define the **limit of  $f$  as  $(x, y, z)$  approaches  $(a, b, c)$  along  $C$** , denoted by  $\lim_{\substack{(x,y,z) \rightarrow (a,b,c) \\ C}} f(x, y, z)$ , to be  $\lim_{t \rightarrow t_0} f(x(t), y(t), z(t))$ .

The following schematic illustrates three such curves containing a point  $(a, b)$  in an open subset of  $\mathbb{R}^2$ .

**THEOREM 12.18****The Limit of a Function of Two or More Variables Along Distinct Paths**

Let  $f$  be a function of two or more variables defined on an open set  $S$ . Then the limit  $\lim_{\mathbf{x} \rightarrow \mathbf{a}} f(\mathbf{x}) = L$  exists if and only if  $\lim_{\substack{\mathbf{x} \rightarrow \mathbf{a} \\ C}} f(\mathbf{x}) = L$  for every path  $C$  containing the point  $(a, b)$ .

Given an open set  $S$  containing a point  $\mathbf{a}$ , there are infinitely many paths containing  $\mathbf{a}$  that are also contained in  $S$ . Thus, it is impractical to prove that a limit of two or more variables exists by showing that the limit of the function along each path is the same. Theorem 12.18 is usually applied when the limit does not exist and we can find two distinct paths  $C_1$  and  $C_2$  such that

$$\lim_{\substack{\mathbf{x} \rightarrow \mathbf{a} \\ C_1}} f(\mathbf{x}) \neq \lim_{\substack{\mathbf{x} \rightarrow \mathbf{a} \\ C_2}} f(\mathbf{x}).$$

For example, consider the function  $f(x, y) = \frac{xy}{x^2 + y^2}$ . We will show that  $\lim_{(x,y) \rightarrow (0,0)} f(x, y)$  does not exist by evaluating the limit along two paths containing the origin and getting different values. First consider the limit along the  $x$ -axis (i.e., when  $y = 0$ ):

$$\lim_{\substack{(x,y) \rightarrow (0,0) \\ x\text{-axis}}} f(x, y) = \lim_{\substack{(x,y) \rightarrow (0,0) \\ x\text{-axis}}} \frac{xy}{x^2 + y^2} = \lim_{x \rightarrow 0} \frac{x \cdot 0}{x^2 + 0} = \lim_{x \rightarrow 0} 0 = 0.$$

However, along the line  $y = x$ ,

$$\lim_{\substack{(x,y) \rightarrow (0,0) \\ y=x}} f(x,y) = \lim_{\substack{(x,y) \rightarrow (0,0) \\ y=x}} \frac{xy}{x^2 + y^2} = \lim_{x \rightarrow 0} \frac{x \cdot x}{x^2 + x^2} = \lim_{x \rightarrow 0} \frac{x^2}{2x^2} = \lim_{x \rightarrow 0} \frac{1}{2} = \frac{1}{2}.$$

Since the two limits do not agree, it follows from Theorem 12.18 that  $\lim_{(x,y) \rightarrow (0,0)} f(x,y)$  does not exist.

## The Continuity of a Function of Two or More Variables

Recall that if  $f$  is a function of a single variable,  $f$  is said to be continuous at a point  $a$  in the domain of  $f$  if  $\lim_{x \rightarrow a} f(x) = f(a)$ . We will define what it means for a function of two or more variables to be continuous at a point in its domain with an analogous definition.

### DEFINITION 12.19

#### The Continuity of Functions of Two or Three Variables

Let  $f$  be a function of two or three variables defined on an open set  $S$ , and let  $\mathbf{a}$  be a point in  $S$ . Then  $f$  is **continuous** at  $\mathbf{a}$  if  $\lim_{\mathbf{x} \rightarrow \mathbf{a}} f(\mathbf{x}) = f(\mathbf{a})$ .

Also,  $f$  is **continuous on  $S$**  if  $f$  is continuous at every point  $\mathbf{a} \in S$ .

If the domain of  $f$  is  $\mathbb{R}^2$  or  $\mathbb{R}^3$  and  $f$  is continuous at every point in its domain, then  $f$  is **continuous everywhere**.

Since continuity is defined in terms of a limit, it follows that sums, differences, and products of continuous functions will also be continuous. In addition, quotients will be continuous as long as we do not divide by zero. Most of the functions we work with on a regular basis are continuous at every point in their domains. For example, the function  $f(x,y) = \frac{xy}{x^2 + y^2}$  we discussed just after Theorem 12.18 is continuous at every point in its domain. This domain is the set of all points in  $\mathbb{R}^2$  except the origin, so if  $a$  and  $b$  are not both zero, we will have

$$\lim_{(x,y) \rightarrow (a,b)} \frac{xy}{x^2 + y^2} = \frac{ab}{a^2 + b^2}.$$

This function is discontinuous at the origin for two reasons: The function is not defined at the origin, and  $\lim_{(x,y) \rightarrow (0,0)} \frac{xy}{x^2 + y^2}$  does not exist.

## Examples and Explorations

### EXAMPLE 1

#### Understanding open sets, closed sets, and boundaries

For each of the following subsets of  $\mathbb{R}^2$ , determine whether the set is open, closed, or neither open nor closed. Find the boundary of each set as well.

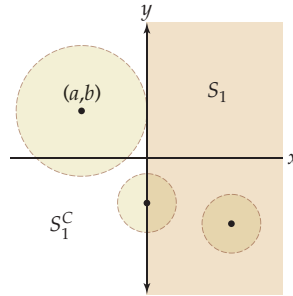

- (a)  $S_1 = \{(x,y) \in \mathbb{R}^2 \mid x \geq 0\}$       (b)  $S_2 = \{(x,y) \in \mathbb{R}^2 \mid y \neq 0\}$   
 (c)  $S_3 = \{(x,y) \in \mathbb{R}^2 \mid x \geq 0 \text{ and } y > 0\}$

#### SOLUTION

- (a) The set  $S_1$  is the right half-plane. The complement of  $S_1$  is  $S_1^c = \{(x,y) \in \mathbb{R}^2 \mid x < 0\}$ . Any point  $(a,b)$  with  $a < 0$  is in  $S_1^c$ . The open ball  $B_1 = \{(x,y) \mid (x-a)^2 + (y-b)^2 < a^2\}$  contains  $(a,b)$  and is a subset of  $S_1^c$ . Therefore,  $S_1^c$  is an open set. Its complement  $(S_1^c)^c = S_1$  is a closed set. The boundary of  $S_1$  is the  $y$ -axis, since every open ball

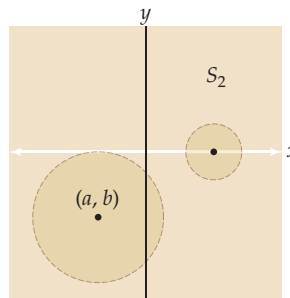

containing a point on the  $y$ -axis contains points of both  $S_1$  and  $S_1^c$  but points off the  $y$ -axis do not share this property. The following figure is illustrative:

*The set  $S_1$  is closed because  $S_1^c$  is open*

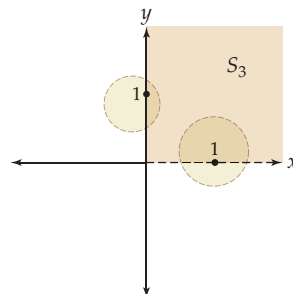

- (b) The set  $S_2$  consists of all points in the plane, except for those on the  $x$ -axis. We will show that this set is open. If we choose the point  $(a, b) \in S_2$ , then  $b \neq 0$ . The open ball  $B_2 = \{(x, y) \mid (x - a)^2 + (y - b)^2 < b^2\}$  contains  $(a, b)$  and is a subset of  $S_2$  whether  $b > 0$  or  $b < 0$ . (In the illustration that follows,  $b < 0$ .) Therefore,  $S_2$  is an open set. The boundary of  $S_2$  is the  $x$ -axis, since every open ball containing a point on the  $x$ -axis contains points of both  $S_2$  and  $S_2^c$  but points not on the  $x$ -axis do not share this property.

*The set  $S_2$  is open*

- (c) The set  $S_3$  consists of all points in the first quadrant, along with those points on the positive  $y$ -axis. We will show that  $S_3$  is neither open nor closed.  $S_3$  is not open because, although  $(0, 1) \in S_3$ , we cannot find an open ball containing  $(0, 1)$  that is also a subset of  $S_3$ , since every open ball containing  $(0, 1)$  contains points of both  $S_3$  and  $S_3^c$ . To show that  $S_3$  is not closed, we will show that  $S_3^c$  is not open. Although  $(1, 0) \in S_3^c$ , every open ball that contains  $(1, 0)$  intersects both  $S_3$  and  $S_3^c$ . Therefore,  $S_3$  is neither open nor closed. The boundary of  $S_3$  is  $\partial S_3 = \{(x, 0) \mid x \geq 0\} \cup \{(0, y) \mid y \geq 0\}$ .

*The set  $S_3$  is neither open nor closed*

## EXAMPLE 2

## Evaluating limits of functions of two and three variables

Evaluate the limits:

$$(a) \lim_{(x,y,z) \rightarrow (2,-2,3)} (xy^2 + 4xyz) \quad (b) \lim_{(x,y) \rightarrow (0,0)} \frac{x^2y^3 + 5xy - 3}{x + y - 1} \quad (c) \lim_{(x,y) \rightarrow (0,3)} \frac{(\sin x)(\cos y)}{e^{xy} - 2}$$

## SOLUTION

(a) The function in the first limit is a polynomial function of three variables. Just as polynomials of a single variable are continuous for every real number, polynomials of two variables are continuous for every point in  $\mathbb{R}^2$  and polynomials of three variables are continuous for every point in  $\mathbb{R}^3$ . Therefore, to determine the limit, we may evaluate the function  $f(x, y, z) = xy^2 + 4xyz$  at  $(2, -2, 3)$ . We obtain

$$\lim_{(x,y,z) \rightarrow (2,-2,3)} (xy^2 + 4xyz) = 2(-2)^2 + 4 \cdot 2(-2)3 = -40.$$

(b) Similarly, rational functions of two or three variables are also continuous where they are defined. The values where the second function  $g(x, y) = \frac{x^2y^3 + 5xy - 3}{x + y - 1}$  is discontinuous are those points where the denominator is zero, namely, all points along the line defined by the equation  $x + y = 1$ . Since the origin does not satisfy this equation, the function  $g$  is continuous at  $(0, 0)$ . Therefore,

$$\lim_{(x,y) \rightarrow (0,0)} \frac{x^2y^3 + 5xy - 3}{x + y - 1} = \frac{0^2 \cdot 0^3 + 5 \cdot 0 \cdot 0 - 3}{0 + 0 - 1} = 3.$$

(c) Since the function in our final limit is an algebraic combination of the sine, cosine, and exponential functions, all of which are transcendental functions, it will also be continuous where it is defined. The points where the function  $h(x, y) = \frac{(\sin x)(\cos y)}{e^{xy} - 2}$  will be discontinuous will be the solutions of the equation  $e^{xy} = 2$ , or equivalently, points on the hyperbola defined by the equation  $y = \frac{\ln 2}{x}$ . The point  $(0, 3)$  does not satisfy this equation, so the function  $h$  is continuous at  $(0, 3)$ . Therefore,

$$\lim_{(x,y) \rightarrow (0,3)} \frac{(\sin x)(\cos y)}{e^{xy} - 2} = \frac{(\sin 0)(\cos 3)}{e^{0 \cdot 3} - 2} = 0. \quad \square$$

## EXAMPLE 3

## Showing that a limit does not exist

Explain why  $\lim_{(x,y) \rightarrow (6,3)} \frac{x^2 + xy - 6y^2}{x^2 - 4y^2}$  does not exist.

## SOLUTION

The function  $f(x, y) = \frac{x^2 + xy - 6y^2}{x^2 - 4y^2}$  is a rational function of two variables, but the point  $(6, 3)$  is not in the domain of  $f$  because the polynomial that forms the denominator of  $f$  evaluates to 0 at  $(6, 3)$ . However, the numerator also evaluates to 0 at that point. Thus, this limit is an indeterminate form of the type  $\frac{0}{0}$ . As we did with rational functions of a single variable, we may try to simplify the quotient, so that we may use a multivariable version of the Cancellation Theorem to evaluate the limit. Since  $\frac{x^2 + xy - 6y^2}{x^2 - 4y^2} = \frac{(x-2y)(x+3y)}{(x-2y)(x+2y)}$ , we have

$$\lim_{(x,y) \rightarrow (6,3)} \frac{x^2 + xy - 6y^2}{x^2 - 4y^2} = \lim_{(x,y) \rightarrow (6,3)} \frac{(x-2y)(x+3y)}{(x-2y)(x+2y)}$$

Now, we are tempted to cancel the common factor that occurs in the numerator and denominator and say that

$$\lim_{(x,y) \rightarrow (6,3)} \frac{(x-2y)(x+3y)}{(x-2y)(x+2y)} = \lim_{(x,y) \rightarrow (6,3)} \frac{x+3y}{x+2y}$$

However, the equality between the two limits is not valid. There is an analog to the Cancellation Theorem for limits of functions of more than one variable, but the analog would apply only when the cancellation of factors introduces a single point into the domain of the reduced function. In our example, although the functions  $f(x, y) = \frac{x^2 + xy - 6y^2}{x^2 - 4y^2}$  and  $g(x, y) = \frac{x + 3y}{x + 2y}$  are equivalent when  $x \neq 2y$ , they are not equivalent for points on the line  $x = 2y$ . However, Definition 12.15 requires that, for  $\lim_{(x,y) \rightarrow (a,b)} f(x, y)$  to exist, the function  $f$  must be defined on an open set containing the point  $(a, b)$ , with the possible exception that  $f$  does not have to be defined at the point  $(a, b)$  itself. Thus, although  $\lim_{(x,y) \rightarrow (6,3)} \frac{x + 3y}{x + 2y} = \frac{5}{4}$ , we cannot conclude that our original limit has the same value. The function  $f(x, y) = \frac{x^2 + xy - 6y^2}{x^2 - 4y^2}$  is undefined along the line defined by  $x = 2y$ , and thus  $f$  is undefined for infinitely many points in every open set containing the point  $(6, 3)$ . Therefore  $\lim_{(x,y) \rightarrow (6,3)} \frac{x^2 + xy - 6y^2}{x^2 - 4y^2}$  does not exist.

However, if  $C$  is any curve in the plane that intersects the line  $x = 2y$  only at the point  $(6, 3)$ , then

$$\lim_{(x,y) \rightarrow (6,3)} \frac{x^2 + xy - 6y^2}{x^2 - 4y^2} = \lim_{(x,y) \rightarrow (6,3)} \frac{x + 3y}{x + 2y} = \frac{5}{4}. \quad \square$$

**EXAMPLE 4****Evaluating limits along paths**

Show that  $\lim_{(x,y) \rightarrow (0,0)} \frac{x^2 y}{x^4 + y^2}$  does not exist by evaluating the limit along the curves defined by the parabolas  $y = mx^2$ .

**SOLUTION**

In Exercise 13 you will show that

$$\lim_{(x,y) \rightarrow (0,0)} \frac{x^2 y}{x^4 + y^2} = 0$$

when  $C$  is either the  $x$ - or  $y$ -axis. However, the fact that these limits exist and agree is not enough to conclude that the limit is zero. When we evaluate the limit of the function along a parabola of the form  $y = mx^2$ , we will see that the result depends upon the value of  $m$ . From this observation, we conclude that the limit does not exist. We have

$$\lim_{\substack{(x,y) \rightarrow (0,0) \\ y=mx^2}} \frac{x^2 y}{x^4 + y^2} = \lim_{x \rightarrow 0} \frac{x^2 \cdot mx^2}{x^4 + (mx^2)^2} = \lim_{x \rightarrow 0} \frac{mx^4}{x^4(1 + m^2)} = \lim_{x \rightarrow 0} \frac{m}{1 + m^2} = \frac{m}{1 + m^2}.$$

Since this limit is a nonconstant function of  $m$ ,  $\lim_{(x,y) \rightarrow (0,0)} \frac{x^2 y}{x^4 + y^2}$  does not exist. □

**EXAMPLE 5****Using polar coordinates to evaluate limits**

Evaluate the limits

$$(a) \lim_{(x,y) \rightarrow (0,0)} \frac{x^2 y}{x^2 + y^2} \qquad (b) \lim_{(x,y) \rightarrow (0,0)} \frac{xy}{x^2 + y^2}$$

if they exist.

**SOLUTION**

In Chapter 9 we saw that we could translate between rectangular coordinates and polar coordinates by using the equations  $r^2 = x^2 + y^2$ ,  $\tan \theta = \frac{y}{x}$ ,  $x = r \cos \theta$ , and  $y = r \sin \theta$ .

Changing to polar coordinates can be useful when a function contains the factor  $x^2 + y^2$ , which we find in both of the given limits.

(a) First,

$$\lim_{(x,y) \rightarrow (0,0)} \frac{x^2 y}{x^2 + y^2} = \lim_{r \rightarrow 0} \frac{(r \cos \theta)^2 (r \sin \theta)}{r^2} = \lim_{r \rightarrow 0} \frac{r^3 \sin \theta \cos^2 \theta}{r^2} = \lim_{r \rightarrow 0} r \sin \theta \cos^2 \theta.$$

Since we are taking the limit as  $r \rightarrow 0$ , and the limit contains a factor of  $r$ , its value is zero for every value of  $\theta$ .

(b) We also convert the second limit to polar coordinates and obtain

$$\lim_{(x,y) \rightarrow (0,0)} \frac{xy}{x^2 + y^2} = \lim_{r \rightarrow 0} \frac{(r \cos \theta)(r \sin \theta)}{r^2} = \lim_{r \rightarrow 0} \frac{r^2 \sin \theta \cos \theta}{r^2} = \lim_{r \rightarrow 0} \sin \theta \cos \theta.$$

Here, the value of the limit depends upon the angle  $\theta$ . Therefore, the limit can be different along different paths approaching the origin. For example,

$$\lim_{\substack{(x,y) \rightarrow (0,0) \\ \theta=0}} \frac{xy}{x^2 + y^2} = \lim_{r \rightarrow 0} 0 = 0 \quad \text{and} \quad \lim_{\substack{(x,y) \rightarrow (0,0) \\ \theta=\pi/4}} \frac{xy}{x^2 + y^2} = \lim_{r \rightarrow 0} \frac{1}{2} = \frac{1}{2}.$$

Thus  $\lim_{(x,y) \rightarrow (0,0)} \frac{xy}{x^2 + y^2}$  does not exist.  $\square$

### EXAMPLE 6

### Examining the continuity of a piecewise-defined function

Determine where the functions

$$(a) f(x, y) = \begin{cases} \frac{x^2 y}{x^2 + y^2}, & \text{if } (x, y) \neq (0, 0) \\ 0, & \text{if } (x, y) = (0, 0) \end{cases} \quad (b) g(x, y) = \begin{cases} \frac{xy}{x^2 + y^2}, & \text{if } (x, y) \neq (0, 0) \\ 0, & \text{if } (x, y) = (0, 0) \end{cases}$$

are continuous.

### SOLUTION

These are the same functions we discussed in Example 5, except that their values have been defined at the origin. Since rational functions are continuous everywhere in their domains, both of the given functions are continuous everywhere, with the possible exception of the origin.

(a) Because we already showed that

$$\lim_{(x,y) \rightarrow (0,0)} \frac{x^2 y}{x^2 + y^2} = \lim_{(x,y) \rightarrow (0,0)} f(x, y) = 0 = f(0, 0),$$

the function  $f$  is also continuous at the origin. Therefore,  $f$  is continuous everywhere.

(b) Although  $g$  is continuous everywhere except the origin, there is no way to define the function at  $(0, 0)$  to make  $g$  continuous, since we have already seen that  $\lim_{(x,y) \rightarrow (0,0)} g(x, y)$  does not exist.  $\square$

### TEST YOUR UNDERSTANDING

- ▶ What are open and closed sets in  $\mathbb{R}$ ? In  $\mathbb{R}^2$ ? In  $\mathbb{R}^3$ ?
- ▶ What is a bounded set in  $\mathbb{R}$ ? In  $\mathbb{R}^2$ ? In  $\mathbb{R}^3$ ?
- ▶ What is the definition of the limit of a function of one variable? Of two variables? Of three variables? What does it mean intuitively for these limits to exist?
- ▶ What do we mean by the limit of a function of two or three variables along a path? What is the analogous concept for a function of a single variable?
- ▶ What is the definition of the continuity of a function of one variable at a point? Of two variables? Of three variables?

## EXERCISES 12.2

## Thinking Back

- *Intervals*: What is meant by an open interval in  $\mathbb{R}$ ? What is meant by a closed interval in  $\mathbb{R}$ ? Is every interval either open or closed?
- *Limits*: If  $f$  is a function of a single variable, what is the intuitive interpretation of  $\lim_{x \rightarrow a} f(x)$ ? What is the formal definition?

## Concepts

0. *Problem Zero*: Read the section and make your own summary of the material.

1. *True/False*: Determine whether each of the statements that follow is true or false. If a statement is true, explain why. If a statement is false, provide a counterexample.

- (a) *True or False*: The complement of a closed subset of  $\mathbb{R}^2$  is an open subset of  $\mathbb{R}^2$ .
- (b) *True or False*: Every subset of  $\mathbb{R}^2$  is either open or closed.
- (c) *True or False*: There are subsets of  $\mathbb{R}^2$  that are both open and closed.
- (d) *True or False*: If a subset  $S$  of  $\mathbb{R}^3$  is neither open nor closed, then  $S^c$  is neither open nor closed.
- (e) *True or False*: If  $\lim_{(x,y) \rightarrow (0,0)} f(x,y) = L$ , then  $f(0,0) = L$ .
- (f) *True or False*: If

$$\lim_{(x,y) \rightarrow (a,b)} f(x,y) = L, \quad \text{then} \quad \lim_{(x,y) \rightarrow (a,b)} f(x,y) = L$$

for every path  $C$  containing  $(a,b)$ .

(g) *True or False*: If

$$\lim_{(x,y) \rightarrow (a,b)} f(x,y) = L$$

for every path  $C$  containing  $(a,b)$ , then  $f(x,y)$  is continuous at  $(a,b)$ .

(h) *True or False*: If  $f(x,y)$  is continuous everywhere and  $\lim_{(x,y) \rightarrow (0,0)} f(x,y) = L$ , then  $f(0,0) = L$ .

2. *Examples*: Construct examples of the thing(s) described in the following. Try to find examples that are different than any in the reading.

- (a) An open subset of  $\mathbb{R}^3$ .
- (b) A closed subset of  $\mathbb{R}^3$ .
- (c) A subset of  $\mathbb{R}^3$  that is both open and closed.

3. If

$$\lim_{(x,y) \rightarrow (1,-3)} f(x,y) = 5 \quad \text{and} \quad \lim_{(x,y) \rightarrow (1,-3)} f(x,y) = 5,$$

where  $C_1$  and  $C_2$  are two distinct curves in  $\mathbb{R}^2$  containing the point  $(1,-3)$ , what can you say about

$$\lim_{(x,y) \rightarrow (1,-3)} f(x,y)?$$

4. If

$$\lim_{(x,y) \rightarrow (-2,0)} g(x,y) = 5 \quad \text{and} \quad \lim_{(x,y) \rightarrow (-2,0)} g(x,y) = 8,$$

where  $C_1$  and  $C_2$  are two distinct curves in  $\mathbb{R}^2$  containing the point  $(-2,0)$ , what can you say about  $\lim_{(x,y) \rightarrow (-2,0)} g(x,y)$ ?

5. If

$$\lim_{(x,y) \rightarrow (3,-7)} f(x,y) = 5$$

for every curve  $C$  in  $\mathbb{R}^2$  containing the point  $(3,-7)$ , what can you say about  $\lim_{(x,y) \rightarrow (3,-7)} f(x,y)$ ? What can you say about  $f(3,-7)$ ?

6. If  $g: \mathbb{R}^3 \rightarrow \mathbb{R}$  is continuous at the point  $(a,b,c)$  and  $C$  is a curve in  $\mathbb{R}^3$  containing the point  $(a,b,c)$ , what can we say about

$$\lim_{(x,y,z) \rightarrow (a,b,c)} g(x,y,z)?$$

7. How does the definition of the limit of a function of a single variable,  $f$ , imply that  $f$  is defined on the union of two open intervals?

8. How does the definition of the limit of a function of two variables,  $f$ , imply that  $f$  is defined on an open subset of  $\mathbb{R}^2$ ?

9. How does the definition of the limit of a function of three variables,  $f$ , imply that  $f$  is defined on an open subset of  $\mathbb{R}^3$ ?

10. Explain how the definition of the limit of a function of two or three variables along a path simplifies to the limit of a function of a single variable.

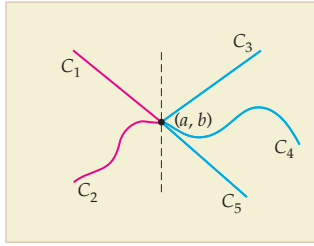

11. Review the definition of continuity of a function of a single variable,  $f$ , at a point. Why is it necessary for  $f$  to be defined on the union of two open intervals?

12. Review the definition of continuity of a function of two or three variables,  $f$ , at a point. Why is it necessary for  $f$  to be defined on an open subset of  $\mathbb{R}^2$  or  $\mathbb{R}^3$ ?

13. Show that when  $C$  is either the  $x$ - or  $y$ -axis, we have

$$\lim_{(x,y) \rightarrow (0,0)} \frac{x^2 y}{x^4 + y^2} = 0.$$

14. Copy the figure that follows onto a sheet of paper. Now cut a slit along the dashed line, leave the left side of the paper on the table, and gently raise the right side of the paper along the slit.

- (a) Explain how the paper may be interpreted as the graph of a function of two variables,  $f(x, y)$ .  
 (b) If the tabletop is the  $xy$ -plane, explain why

$$\lim_{(x,y) \rightarrow (a,b)} f(x, y) = \lim_{(x,y) \rightarrow (a,b)} f(x, y) = 0.$$

- (c) Explain why

$$\lim_{(x,y) \rightarrow (a,b)} f(x, y) = \lim_{(x,y) \rightarrow (a,b)} f(x, y) = \lim_{(x,y) \rightarrow (a,b)} f(x, y) > 0.$$

- (d) Explain why  $\lim_{(x,y) \rightarrow (a,b)} f(x, y)$  does not exist.

15. Provide a definition for  $\lim_{(x,y) \rightarrow (a,b)} f(x, y) = \infty$ . Model your definition on Definitions 1.9 and 12.15.  
 16. Provide a definition for  $\lim_{(x,y,z) \rightarrow (a,b,c)} f(x, y, z) = \infty$ . Model your definition on Definitions 1.9 and 12.15.

17. Find functions  $f(x, y)$  and  $g(x, y)$  and a point  $(a, b) \in \mathbb{R}^2$  such that

$$\lim_{(x,y) \rightarrow (a,b)} f(x, y) + \lim_{(x,y) \rightarrow (a,b)} g(x, y) \neq \lim_{(x,y) \rightarrow (a,b)} (f(x, y) + g(x, y)).$$

Does this example contradict the sum rule for limits of a function of two variables?

18. Find functions  $f(x, y)$  and  $g(x, y)$  and a point  $(a, b) \in \mathbb{R}^2$  such that

$$\left( \lim_{(x,y) \rightarrow (a,b)} f(x, y) \right) \left( \lim_{(x,y) \rightarrow (a,b)} g(x, y) \right) \neq \lim_{(x,y) \rightarrow (a,b)} (f(x, y)g(x, y)).$$

Does this example contradict the product rule for limits of a function of two variables?

19. Let  $f$  be a function of two variables that is continuous everywhere.

- (a) Explain why the function  $\frac{f(x, y)}{x - y}$  is continuous if and only if  $x \neq y$ .

- (b) Use Definition 12.15 to explain why  $\lim_{(x,y) \rightarrow (a,a)} \frac{f(x, y)}{x - y}$  does not exist for any real number  $a$ .

20. Let  $f$  be a function of three variables that is continuous everywhere.

- (a) Explain why the function  $\frac{f(x, y, z)}{x + y + z}$  is continuous if and only if  $x + y + z \neq 0$ .

- (b) Use Definition 12.15 to explain why

$$\lim_{(x,y,z) \rightarrow (a,b,-(a+b))} \frac{f(x, y, z)}{x + y + z}$$

does not exist for any pair  $(a, b)$  of real numbers.

## Skills

In Exercises 21–26, (a) determine whether the given subset of  $\mathbb{R}^2$  is open, closed, both open and closed, or neither open nor closed, (b) find the complement of the set, and (c) find the boundary of the given set.

21. all points  $(x, y)$  such that  $x > 0$  and  $y > 0$   
 22. all points on the coordinate axes  
 23. all points satisfying the inequality  $|x| + |y| \leq 1$   
 24. all points  $(x, y)$  such that  $|x| < 1$  and  $|y| \leq 2$   
 25. the empty set  
 26.  $\mathbb{R}^2$

In Exercises 27–32, (a) determine whether the given subset of  $\mathbb{R}^3$  is open, closed, both open and closed, or neither open nor closed, (b) find the complement of the set, and (c) find the boundary of the given set.

27. all points  $(x, y, z)$  such that  $x > 0$ ,  $y < 0$  and  $z < 0$   
 28. all points on the coordinate axes  
 29. all points on the  $xy$ -plane  
 30. all points  $(x, y, z)$  such that  $|x| < 1$ ,  $|y| < 2$ , and  $|z| > 3$   
 31. the empty set  
 32.  $\mathbb{R}^3$

Evaluate the limits in Exercises 33–40 if they exist.

33.  $\lim_{(x,y) \rightarrow (-2,\pi)} x^2 y^3 \sin y$       34.  $\lim_{(x,y,z) \rightarrow (3,-4,\pi/4)} \frac{x^2 y}{\tan z}$   
 35.  $\lim_{(x,y) \rightarrow (1,2)} \frac{x^2 + y^2}{x^2 - y^2}$       36.  $\lim_{(x,y) \rightarrow (-2,1)} \frac{x^3 - y^3}{x^2 - y^2}$   
 37.  $\lim_{\substack{(x,y) \rightarrow (3,3) \\ x=3}} \frac{x^3 - y^3}{x^2 - y^2}$       38.  $\lim_{\substack{(x,y) \rightarrow (3,3) \\ y=3}} \frac{x^3 - y^3}{x^2 - y^2}$   
 39.  $\lim_{\substack{(x,y) \rightarrow (3,3) \\ y=x}} \frac{x^3 - y^3}{x^2 - y^2}$       40.  $\lim_{(x,y) \rightarrow (3,3)} \frac{x^3 - y^3}{x^2 - y^2}$

In Exercises 41–46, use polar coordinates to analyze the given limits.

41.  $\lim_{(x,y) \rightarrow (0,0)} \frac{x^2}{x^2 + y^2}$       42.  $\lim_{(x,y) \rightarrow (0,0)} \frac{y^2}{x^2 + y^2}$   
 43.  $\lim_{(x,y) \rightarrow (0,0)} \frac{x^2 y^2}{x^2 + y^2}$       44.  $\lim_{(x,y) \rightarrow (0,0)} \frac{x^2 y^3}{x^4 + 2x^2 y^2 + y^4}$   
 45.  $\lim_{(x,y) \rightarrow (0,0)} \frac{xy}{\sqrt{x^2 + y^2}}$       46.  $\lim_{(x,y) \rightarrow (0,0)} \frac{\sin(x^2 + y^2)}{x^2 + y^2}$

Determine the domains of the functions in Exercises 47–56, and find where the functions are continuous.

47.  $f(x, y) = \frac{x^2}{x^2 - y^2}$

48.  $f(x, y, z) = \frac{xy^2}{x + y - z}$

49.  $f(x, y) = \sqrt{x^2 + y}$

50.  $f(x, y, z) = \ln(x^2 + y^2 + z^2)$

51.  $f(x, y, z) = \frac{\sin(x + y + z)}{\sqrt{x + y + z}}$

52.  $f(x, y, z) = e^{-xyz}$

53.  $f(x, y) = \begin{cases} \frac{xy}{\sqrt{x^2 + y^2}}, & \text{if } (x, y) \neq (0, 0) \\ 0, & \text{if } (x, y) = (0, 0) \end{cases}$

54.  $f(x, y) = \begin{cases} \frac{xy}{x^2 + y^2}, & \text{if } (x, y) \neq (0, 0) \\ 0, & \text{if } (x, y) = (0, 0) \end{cases}$

55.  $f(x, y) = \begin{cases} \frac{\sin(x^2 + y^2)}{x^2 + y^2}, & \text{if } (x, y) \neq (0, 0) \\ 1, & \text{if } (x, y) = (0, 0) \end{cases}$

56.  $f(x, y) = \begin{cases} e^{-1/(x^2 + y^2)}, & \text{if } (x, y) \neq (0, 0) \\ 0, & \text{if } (x, y) = (0, 0) \end{cases}$

## Applications

The *ideal gas law* states that the pressure,  $P$ , volume,  $V$ , temperature in degrees Kelvin,  $T$ , and amount,  $n$ , of a gas are related by the equation  $P = \frac{nRT}{V}$ , where  $R$  is the *universal gas constant*. In Exercises 57–60, assume that the amount of the gas is constant and evaluate the specified limits.

57. If the volume is held fixed, what is  $\lim_{T \rightarrow 0} P$ ? Explain why this makes sense.

58. If the volume is held fixed, what is  $\lim_{T \rightarrow \infty} P$ ? Explain why this makes sense.

59. If the temperature is held fixed, what is  $\lim_{V \rightarrow 0^+} P$ ? Explain why this makes sense.

60. If the temperature is held fixed, what is  $\lim_{V \rightarrow \infty} P$ ? Explain why this makes sense.

61. Emmy is charting a layer of basalt beneath a Hanford tank farm. She has determined that on the south end of the tank farm the basalt lies at

$$b_1(x, y) = -40 - \frac{1}{350}x + \frac{1}{725}y,$$

while on the north the plane of the top of the basalt seems to be at

$$b_2(x, y) = -39.5 - \frac{1}{150}x + \frac{1}{300}y.$$

(a) If the surface of the basalt layer is continuous, what is the line of intersection of these planes on the Earth's surface?

(b) If the surface of the basalt layer is continuous, where should it be when  $x = 150$  at the intersection of the planes?

(c) Emmy drills a test hole at that point and finds that the basalt lies at  $-41.2$  feet. What conclusions might she draw from this result?

62. Annie is intrigued by the currents off the western point of Patos Island, one of the San Juan Islands that are part of Washington State. The currents coming off the north side of the island can be faster than those coming off the south side. She models the speed of the current as a function of  $x$  and  $y$ , using  $s(x, y) = 1 + \frac{0.25y}{\sqrt{x^2 + y^2}}$ , where distances

are given in miles, the origin is a point in the water just west of the point of the island, and Patos Island can be considered to lie to the right of the origin. For simplicity Annie just lets the current speed function go right over the island, although obviously there is no water there.

(a) Show that the speed of the current far north of the island is approximately 1.25 mph.

(b) Show that the speed of the current far south of the island is approximately 0.75 mph.

(c) Show that if Annie paddles through the origin along a line  $x = my$  with  $m$  constant, then her speed is constant.

(d) The speed of the current is evidently not defined at the origin, but does  $\lim_{(x, y) \rightarrow (0, 0)} s(x, y)$  exist? Explain. Can you imagine what the water looks like at the origin?

## Proofs

63. Prove Theorem 12.10. That is, show that  $(S^c)^c = S$  when  $S$  is a subset of  $\mathbb{R}^2$  or  $\mathbb{R}^3$ .

64. Prove that if  $S$  is a closed subset of  $\mathbb{R}^2$  or  $\mathbb{R}^3$ , then  $S^c$  is an open set. This is Theorem 12.12.

65. Let  $S$  be a subset of  $\mathbb{R}^2$  or  $\mathbb{R}^3$ . Prove that a set  $S$  is open if and only if  $\partial S \cap S = \emptyset$ .

66. Let  $S$  be a subset of  $\mathbb{R}^2$  or  $\mathbb{R}^3$ . Prove that a set  $S$  is closed if and only if  $\partial S \subseteq S$ .

67. Let  $S$  be a subset of  $\mathbb{R}^2$  or  $\mathbb{R}^3$ . Prove that  $\partial S = \partial(S^c)$ .

68. Let  $S$  be a subset of  $\mathbb{R}^2$  or  $\mathbb{R}^3$ . Prove that  $\partial S$  is a closed set.

69. Let  $S$  be a subset of  $\mathbb{R}^2$  or  $\mathbb{R}^3$ . Prove that  $\partial(\partial S) \subseteq \partial S$ .

70. Prove that the empty set is both an open subset and a closed subset of  $\mathbb{R}^2$ .

71. Prove that  $\mathbb{R}^2$  is both an open subset and a closed subset of  $\mathbb{R}^2$ .

## Thinking Forward

- ▶ *The derivative along a cut edge:* Let  $f(x, y) = x^2y^3$ . Find the rate of change of  $f$  in the (positive)  $y$  direction when the surface is cut by the plane with equation  $x = 2$ . Find the rate of change of  $f$  in the (positive)  $x$  direction when the surface is cut by the plane with equation  $y = 1$ .
- ▶ *The derivative when two variables are held fixed:* Let  $f(x, y, z) = x^2y^3\sqrt{z}$ . Find the rate of change of  $f$  in the (positive)  $z$ -direction when the values of  $x$  and  $y$  are constant. Find the rate of change of  $f$  in the (positive)  $y$  direction when the values of  $x$  and  $z$  are constant. Find the rate of change of  $f$  in the (positive)  $x$  direction when the values of  $y$  and  $z$  are constant.

## 12.3 PARTIAL DERIVATIVES

- ▶ Partial derivatives of functions of two and three variables
- ▶ The geometry of partial derivatives
- ▶ Higher order partial derivatives

### Partial Derivatives of Functions of Two and Three Variables

Recall that a function  $f$  of a single variable is differentiable at a point  $c$  in its domain if  $\lim_{h \rightarrow 0} \frac{f(c+h) - f(c)}{h}$  exists. When this limit exists, the derivative  $f'(c)$  gives us the slope of the tangent line to the graph of the function at the point  $(c, f(c))$ . In the next section we will discuss what it means for a function of two variables,  $f(x, y)$ , to be differentiable at a point in its domain. However, right now we remark that the graph of a function of two variables is a surface and the analogous tangent “object” to a function of two variables is a plane, not a line. In fact, a function of two variables whose graph is sufficiently smooth at a point  $(x_0, y_0)$  in the domain of  $f$  has infinitely many tangent lines at the point  $(x_0, y_0, f(x_0, y_0))$ . Each of these tangent lines lies in the plane tangent to the surface at  $(x_0, y_0, f(x_0, y_0))$ . In order to understand the plane tangent to a surface, we begin by defining the partial derivatives of a function of two variables.

#### DEFINITION 12.20

#### Partial Derivatives for a Function of Two Variables

Let  $f$  be a function of two variables defined on an open set  $S$  containing the point  $(x_0, y_0)$ .

- (a) The **partial derivative with respect to  $x$  at  $(x_0, y_0)$** , denoted by  $f_x(x_0, y_0)$ , is the limit

$$\lim_{h \rightarrow 0} \frac{f(x_0 + h, y_0) - f(x_0, y_0)}{h},$$

provided that this limit exists.

- (b) Similarly, the **partial derivative with respect to  $y$  at  $(x_0, y_0)$** , denoted by  $f_y(x_0, y_0)$ , is the limit

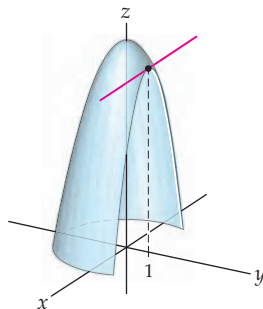

$$\lim_{h \rightarrow 0} \frac{f(x_0, y_0 + h) - f(x_0, y_0)}{h},$$

provided that this limit exists.

We may also define the partial-derivative functions  $f_x(x, y)$  and  $f_y(x, y)$ . The domains of these functions are the sets of all points where the respective limits mentioned in Definition 12.22 exist. The partial derivatives measure the rates of change of the function  $f$  in the  $x$  and  $y$  directions. For example, when  $f(x, y) = 9 - x^2 - y^2$ ,

$$\begin{aligned} f_x(2, 1) &= \lim_{h \rightarrow 0} \frac{f(2+h, 1) - f(2, 1)}{h} = \lim_{h \rightarrow 0} \frac{(9 - (2+h)^2 - 1^2) - 4}{h} \\ &= \lim_{h \rightarrow 0} \frac{-4h - h^2}{h} = \lim_{h \rightarrow 0} (-4 - h) = -4. \end{aligned}$$

The following figure shows the graph of  $f$ :

The cut edge toward the right is the intersection of the surface with the plane  $y = 1$ . When we compute  $f_x(2, 1)$ , we are finding the rate of change of this curve in the (positive)  $x$  direction.

In Exercise 23 we ask you to use the definition to show that  $f_y(2, 1) = -2$ . This partial derivative represents the rate of change of the surface in the positive  $y$  direction at the point  $(2, 1)$ . We may visualize this partial derivative as the rate of change of the curve created when the surface is cut by the plane  $x = 2$ .

More generally, a partial derivative with respect to  $x$  provides the rate of change of the function in the  $x$  direction. That is, if we fix the  $y$ -variable at  $y_0$ , we may think of the function  $f(x, y_0)$  as a function of a single variable  $x$ , and the partial derivative tells us the rate of change of that function. To visualize this, we may think of the curve created when the surface  $f(x, y)$  is cut by the vertical plane  $y = y_0$ . The partial derivative  $f_x(x_0, y_0)$  is the slope of the tangent line of this function at  $(x_0, y_0)$ . Similarly, when we take the partial derivative of the function with respect to  $y$ , we fix  $x_0$  and the result is a function of the single variable  $y$ .

We may also define partial derivatives for functions of three variables.

### DEFINITION 12.21

#### Partial Derivatives for a Function of Three Variables

Let  $f$  be a function of three variables defined on an open set  $S$  containing the point  $(x_0, y_0, z_0)$ .

- (a) The **partial derivative with respect to  $x$  at  $(x_0, y_0, z_0)$** , denoted by  $f_x(x_0, y_0, z_0)$ , is the limit

$$\lim_{h \rightarrow 0} \frac{f(x_0 + h, y_0, z_0) - f(x_0, y_0, z_0)}{h},$$

provided that this limit exists.

- (b) The **partial derivative with respect to  $y$  at  $(x_0, y_0, z_0)$** , denoted by  $f_y(x_0, y_0, z_0)$ , is the limit

$$\lim_{h \rightarrow 0} \frac{f(x_0, y_0 + h, z_0) - f(x_0, y_0, z_0)}{h},$$

provided that this limit exists.

- (c) The **partial derivative with respect to  $z$  at  $(x_0, y_0, z_0)$** , denoted by  $f_z(x_0, y_0, z_0)$ , is the limit

$$\lim_{h \rightarrow 0} \frac{f(x_0, y_0, z_0 + h) - f(x_0, y_0, z_0)}{h},$$

provided that this limit exists.

From the preceding definitions, we see that to compute the partial derivative  $f_x$  for a function of two variables, we treat the variable  $y$  like a constant and take the derivative of the function as if it were a function of the single variable  $x$ . Similarly, to compute  $f_y$ , we treat the variable  $x$  like a constant and take the derivative of the function as if it were a function of the single variable  $y$ . When  $f$  is a function of three variables, to find  $f_x$ , we treat *both*  $y$  and  $z$  like constants and take the derivative of the function as though it were a function of the single variable  $x$ . Analogous statements hold for finding partial derivatives with respect to  $y$  and  $z$ . This discussion leads to the following shortcuts:

- ▶ Let  $f(x, y)$  be a function of two variables. The partial derivative  $f_x(x, y)$  may be computed by treating  $y$  like a constant and taking the derivative of the resulting function of the single variable  $x$ , using any appropriate rules for finding derivatives. Similarly, the partial derivative  $f_y(x, y)$  may be computed by treating  $x$  like a constant and taking the derivative of the resulting function of the single variable  $y$ , using any appropriate rules for finding derivatives.
- ▶ Let  $f(x, y, z)$  be a function of three variables. The partial derivative  $f_x(x, y, z)$  may be computed by treating  $y$  and  $z$  like constants and taking the derivative of the resulting function of the single variable  $x$ , using any appropriate rules for finding derivatives. The partial derivative  $f_y(x, y, z)$  may be computed by treating  $x$  and  $z$  like constants and taking the derivative of the resulting function of the single variable  $y$ , using any appropriate rules for finding derivatives. Finally, the partial derivative  $f_z(x, y, z)$  may be computed by treating  $x$  and  $y$  like constants and taking the derivative of the resulting function of the single variable  $z$ , using any appropriate rules for finding derivatives.

For example, if  $f(x, y, z) = x \sin(yz) + y^2$ , we have the following partial derivatives:

$$f_x(x, y, z) = \sin(yz), \quad f_y(x, y, z) = xz \cos(yz) + 2y, \quad \text{and} \quad f_z(x, y, z) = xy \cos(yz).$$

There are alternative notations for partial derivatives. For example, when  $w = f(x, y, z)$ , we may use the following notation:

$$\begin{aligned} \frac{\partial w}{\partial x} &= \frac{\partial}{\partial x}(f) = \frac{\partial f}{\partial x} = f_x(x, y, z), \\ \frac{\partial w}{\partial y} &= \frac{\partial}{\partial y}(f) = \frac{\partial f}{\partial y} = f_y(x, y, z), \\ \frac{\partial w}{\partial z} &= \frac{\partial}{\partial z}(f) = \frac{\partial f}{\partial z} = f_z(x, y, z). \end{aligned}$$

Note that we are using the notation  $\frac{\partial}{\partial x}$  as an operator meaning “take the partial derivative with respect to  $x$ ” of the function, and  $\frac{\partial w}{\partial x}$  is the partial derivative.

## Higher Order Partial Derivatives

In Section 12.6 we will see how partial derivatives are used to locate points in the domain where the relative extremes of a function of two variables occur. We will also see how higher order partial derivatives may be used to classify those points as maxima, minima, or neither maxima nor minima.

**DEFINITION 12.22** Second-Order Partial Derivatives

Let  $f(x, y)$  be a function of two variables. We define the following four second-order partial derivatives for  $f$ :

$$\begin{array}{ll} \text{(a)} \quad \frac{\partial^2 f}{\partial x^2} = \frac{\partial}{\partial x} \left( \frac{\partial f}{\partial x} \right) = f_{xx}(x, y). & \text{(b)} \quad \frac{\partial^2 f}{\partial x \partial y} = \frac{\partial}{\partial x} \left( \frac{\partial f}{\partial y} \right) = f_{yx}(x, y). \\ \text{(c)} \quad \frac{\partial^2 f}{\partial y \partial x} = \frac{\partial}{\partial y} \left( \frac{\partial f}{\partial x} \right) = f_{xy}(x, y). & \text{(d)} \quad \frac{\partial^2 f}{\partial y^2} = \frac{\partial}{\partial y} \left( \frac{\partial f}{\partial y} \right) = f_{yy}(x, y). \end{array}$$

Similarly, there are nine different second-order partial derivatives for a function of three variables. Note that in parts (b) and (c) of the definition above we have  $\frac{\partial^2 f}{\partial x \partial y} = f_{yx}(x, y)$  and  $\frac{\partial^2 f}{\partial y \partial x} = f_{xy}(x, y)$ , respectively. These are *not* typographical errors. When we write  $\frac{\partial^2 f}{\partial x \partial y}$ , we mean take the partial derivative of the function  $f$  first with respect to variable  $y$  and then take the partial derivative of the result with respect to  $x$ . The notation  $f_{yx}$  has an analogous meaning. The order in which the partial derivatives is taken in part (c) is reversed. The partial derivatives in parts (b) and (c) are referred to as ***mixed partial derivatives***.

When  $f(x, y) = x \cos y + x^2$ , we have the following partial derivatives:

$$f_x(x, y) = \cos y + 2x \text{ and } f_y(x, y) = -x \sin y.$$

The second-order partial derivatives are:

$$f_{xx}(x, y) = 2, \quad f_{xy}(x, y) = -\sin y = f_{yx}(x, y), \quad \text{and } f_{yy}(x, y) = -x \cos y.$$

Note that the mixed partial derivatives  $f_{xy}(x, y)$  and  $f_{yx}(x, y)$  are equal. This does not always happen, but the mixed partial derivatives will be equal everywhere in an open set  $S$  if the mixed second-order partial derivatives are continuous on  $S$ .

**THEOREM 12.23** Clairaut's Theorem: The Equality of the Mixed Second-Order Partial Derivatives

Let  $f(x, y)$  be a function defined on an open subset  $S$  of  $\mathbb{R}^2$ . If the second-order partial derivatives of  $f$  are continuous everywhere in  $S$ , then  $f_{xy}(x, y) = f_{yx}(x, y)$  at every point in  $S$ .

We will omit the proof of Clairaut's theorem.

In our earlier example, the function and all of its partial derivatives were continuous everywhere in  $\mathbb{R}^2$ . Therefore, by Clairaut's theorem the mixed partial derivatives  $f_{xy}$  and  $f_{yx}$  are guaranteed to be equal, as we computed.

Although we will rarely have the need, we may similarly find third- or even higher-order partial derivatives for functions of two or more variables. We explore a few examples shortly.

**Finding a Function When the Partial Derivatives Are Given**

Earlier in this section we saw that the function  $f(x, y) = x \cos y + x^2$  has the partial derivatives

$$f_x(x, y) = \cos y + 2x \quad \text{and} \quad f_y(x, y) = -x \sin y.$$

Is there a way to reverse this process? That is, given two functions  $g(x, y)$  and  $h(x, y)$ , is it possible to find a function  $F(x, y)$  such that  $g(x, y) = F_x(x, y)$  and  $h(x, y) = F_y(x, y)$ ? Although we cannot do this for every pair of functions  $g$  and  $h$ , we can do it when the functions satisfy the following theorem:

**THEOREM 12.24****The Existence of a Function with Specified Partial Derivatives**

Let  $g(x, y)$  and  $h(x, y)$  be functions with continuous partial derivatives  $g_y(x, y)$  and  $h_x(x, y)$ , respectively. Then there exists a function  $F(x, y)$  such that  $F_x(x, y) = g(x, y)$  and  $F_y(x, y) = h(x, y)$  if and only if  $g_y(x, y) = h_x(x, y)$ .

For example, consider the pair of functions  $g(x, y) = y^2e^{xy^2}$  and  $h(x, y) = 2xye^{xy^2} - \sin y$ . There is a function  $F(x, y)$  such that

$$F_x(x, y) = g(x, y) = y^2e^{xy^2} \text{ and } F_y(x, y) = h(x, y) = 2xye^{xy^2} - \sin y$$

since  $g_y(x, y) = (2y + 2xy^3)e^{xy^2} = h_x(x, y)$ . In a moment we will outline a procedure for finding  $F$ . We first note, however, that for the pair  $\hat{g}(x, y) = e^{xy}$  and  $\hat{h}(x, y) = e^{xy}$ , such a function does *not* exist, since  $\hat{g}_y(x, y) = xe^{xy} \neq ye^{xy} = \hat{h}_x(x, y)$ . Theorem 12.24 tells us that a function  $F$  exists only when functions  $g$  and  $h$  have the specified relationship.

Given that the functions  $g$  and  $h$  satisfy the condition in Theorem 12.24, we now outline the steps required to find a function  $F(x, y)$ . We will use the given pair of functions  $g(x, y) = y^2e^{xy^2}$  and  $h(x, y) = 2xye^{xy^2} - \sin y$ . To find  $F$ , we start by considering the form of a function  $F$  whose partial derivative with respect to  $x$  is  $g(x, y) = F_x(x, y) = y^2e^{xy^2}$ . We integrate  $g(x, y)$  with respect to  $x$ , treating  $y$  like a constant:

$$\int y^2e^{xy^2} dx = e^{xy^2} + q(y) = F(x, y).$$

Note:

- ▶ Instead of having a simple “constant of integration,” we have an unknown function  $q(y)$ , because when we take the partial derivative of any function of  $y$  with respect to  $x$ , the derivative is zero.
- ▶ We can check our work in two ways. First, we may compute  $\frac{\partial}{\partial x}(F(x, y))$  to ensure that it would result in the function  $g$  that we were given. Second, we will take  $\frac{\partial}{\partial y}(F(x, y))$  to ensure that this partial derivative is consistent with the function  $h(x, y)$  that we were given. We carry out this step next.

We compute

$$\frac{\partial}{\partial y}(F(x, y)) = \frac{\partial}{\partial y}(e^{xy^2} + q(y)) = 2xye^{xy^2} + q'(y).$$

In order for this partial derivative,  $2xye^{xy^2} + q'(y)$ , to equal  $h(x, y) = 2xye^{xy^2} - \sin y$ , we must have  $q'(y) = -\sin y$ . This happens when  $q(y) = \cos y + C$ , where  $C$  is any constant. Therefore,  $F(x, y) = e^{xy^2} + \cos y + C$  is the function we sought. We may check this result by showing that  $F_x(x, y) = g(x, y) = y^2e^{xy^2}$ .

To summarize, given functions  $g(x, y)$  and  $h(x, y)$ , there is a function  $F(x, y)$  such that  $g(x, y) = F_x(x, y)$  and  $h(x, y) = F_y(x, y)$  if and only if  $g_y(x, y) = h_x(x, y)$ . When this is the case, you may find  $F$  as follows:

- ▶ Evaluate  $\int g(x, y) dx = F(x, y)$ . Be sure to include a “function of integration,”  $q(y)$ , as part of the antiderivative.
- ▶ Compute  $\frac{\partial}{\partial y}(F(x, y))$ .

- ▶ Set  $\frac{\partial}{\partial y}(F(x, y)) = h(x, y)$ , and solve the resulting equation for  $q'(y)$ .
- ▶ Finish constructing  $F(x, y)$  by finding an antiderivative for  $q'(y)$ .
- ▶ Check your work by showing that  $F_x(x, y) = g(x, y)$ .

Theorem 12.24 may be rephrased in terms of a first-order differential equation. A differential equation of the form

$$g(x, y) + h(x, y) \frac{dy}{dx} = 0$$

is said to be **exact** if  $g_y(x, y) = h_x(x, y)$ . In this case, the implicitly defined function  $F(x, y) + C = 0$ , where  $C$  is a constant, is the solution of the differential equation. Using the same functions as before, we see that the differential equation

$$y^2 e^{xy^2} + (2xy e^{xy^2} - \sin y) \frac{dy}{dx} = 0$$

is exact, since if  $g(x, y) = y^2 e^{xy^2}$  and  $h(x, y) = 2xy e^{xy^2} - \sin y$ , then

$$g_y(x, y) = (2y + 2xy^3) e^{xy^2} = h_x(x, y).$$

The solution of this differential equation is the function  $F(x, y) = e^{xy^2} + \cos y + C = 0$ .

## Examples and Explorations

### EXAMPLE 1

#### Using the definition to compute partial derivatives

Use the definition to find the indicated partial derivatives for the following functions:

- (a)  $f_y$  when  $f(x, y) = \frac{x}{y}$                       (b)  $\frac{\partial g}{\partial z}$  when  $g(x, y, z) = \frac{z^2}{xy^3}$

#### SOLUTION

$$\begin{aligned} \text{(a)} \quad f_y(x, y) &= \lim_{h \rightarrow 0} \frac{f(x, y+h) - f(x, y)}{h} && \leftarrow \text{the definition of } f_y \\ &= \lim_{h \rightarrow 0} \frac{\frac{x}{y+h} - \frac{x}{y}}{h} && \leftarrow \text{the function is } \frac{x}{y} \\ &= \lim_{h \rightarrow 0} -\frac{hx}{hy(y+h)} && \leftarrow \text{algebra} \\ &= \lim_{h \rightarrow 0} -\frac{x}{y(y+h)} && \leftarrow \text{Cancellation Theorem} \\ &= -\frac{x}{y^2} && \leftarrow \text{evaluation of the limit} \end{aligned}$$

$$\begin{aligned} \text{(b)} \quad \frac{\partial g}{\partial z} &= \lim_{h \rightarrow 0} \frac{g(x, y, z+h) - g(x, y, z)}{h} && \leftarrow \text{the definition of } \frac{\partial g}{\partial z} \\ &= \lim_{h \rightarrow 0} \frac{\frac{(z+h)^2}{xy^3} - \frac{z^2}{xy^3}}{h} && \leftarrow \text{the function is } \frac{z^2}{xy^3} \\ &= \lim_{h \rightarrow 0} \frac{2zh + h^2}{hxy^3} && \leftarrow \text{algebra} \\ &= \lim_{h \rightarrow 0} \frac{2z + h}{xy^3} && \leftarrow \text{Cancellation Theorem} \\ &= \frac{2z}{xy^3} && \leftarrow \text{evaluation of the limit} \end{aligned}$$

□

We can check our answers by using “shortcuts” for finding derivatives. Since  $f(x, y) = xy^{-1}$ , to find  $f_y$  we treat  $x$  as though it were a constant and take the derivative of the resulting function of  $y$ . We obtain  $f_y(x, y) = -xy^{-2}$ , which is equivalent to the derivative we found in part (a). Similarly, if we treat both  $x$  and  $y$  as constants in the function  $g$  and take the derivative of the resulting function of  $z$ , we obtain the result we found in part (b).

### EXAMPLE 2

#### Finding the partial derivatives of a function of two variables at a point and interpreting them graphically

$$\text{Let } f(x, y) = \frac{x}{y^2} - \frac{y}{x}.$$

- Find the first-order partial derivatives  $f_x$  and  $f_y$ .
- Evaluate  $f_x(-1, 2)$  and  $f_y(-1, 2)$ , and find equations for the lines tangent to the surface in the  $x$  and  $y$  directions at the point  $(-1, 2, f(-1, 2))$ .
- Find an equation for the plane containing the point  $(-1, 2, f(-1, 2))$  and the lines from part (b).

#### SOLUTION

- The first-order partial derivatives are

$$f_x(x, y) = \frac{1}{y^2} + \frac{y}{x^2} \text{ and } f_y(x, y) = -\frac{2x}{y^3} - \frac{1}{x}.$$

- At  $(-1, 2)$ , we have  $f(-1, 2) = \frac{7}{4}$ ,  $f_x(-1, 2) = \frac{9}{4}$ , and  $f_y(-1, 2) = \frac{5}{4}$ . These partial derivatives represent the rates of change of the function  $f$  in the  $x$  direction and  $y$  direction, respectively, at the point  $(-1, 2)$ . Therefore, direction vectors of the lines tangent to the surface at  $(-1, 2)$  are  $\mathbf{i} + \frac{9}{4}\mathbf{k}$  and  $\mathbf{j} + \frac{5}{4}\mathbf{k}$ . Thus, the line tangent to the surface at  $(-1, 2, \frac{7}{4})$  in the  $x$  direction is given by the parametric equations

$$x = -1 + t, \quad y = 2, \quad z = \frac{7}{4} + \frac{9}{4}t.$$

Similarly, the line tangent to the surface at  $(-1, 2, \frac{7}{4})$  in the  $y$  direction is given by the parametric equations

$$x = -1, \quad y = 2 + t, \quad z = \frac{7}{4} + \frac{5}{4}t.$$

- To obtain the normal vector for the plane containing the two intersecting lines we found in part (b), we take the cross product of the direction vectors for the lines. That is,

$$\mathbf{N} = \left\langle 0, 1, \frac{5}{4} \right\rangle \times \left\langle 1, 0, \frac{9}{4} \right\rangle = \left\langle \frac{9}{4}, \frac{5}{4}, -1 \right\rangle.$$

The equation for the plane orthogonal to this vector and containing the point  $(-1, 2, \frac{7}{4})$  is

$$\left\langle \frac{9}{4}, \frac{5}{4}, -1 \right\rangle \cdot \left\langle x + 1, y - 2, z - \frac{7}{4} \right\rangle = 0,$$

or equivalently,  $\frac{9}{4}x + \frac{5}{4}y - z = -\frac{3}{2}$ . □

### EXAMPLE 3

#### Finding the equation of a plane containing the tangent lines in the $x$ and $y$ directions

Let  $f(x, y)$  be a function with first-order partial derivatives  $f_x(a, b)$  and  $f_y(a, b)$  at a point  $(a, b)$  in the domain of  $f$ .

- Find equations for the lines tangent to the surface in the  $x$  and  $y$  directions at the point  $(a, b, f(a, b))$ .
- Find an equation for the plane containing the point  $(a, b, f(a, b))$  and the lines from part (a).

**SOLUTION**

- (a) Our analysis follows the work we did in Example 2. The partial derivatives represent the rates of change of the function  $f$  in the  $x$  and  $y$  directions, respectively, at the point  $(a, b)$ . Therefore, direction vectors of the lines tangent to the surface at  $(a, b)$  are  $\mathbf{i} + f_x(a, b)\mathbf{k}$  and  $\mathbf{j} + f_y(a, b)\mathbf{k}$ . Thus, the line tangent to the surface at  $(a, b, f(a, b))$  in the  $x$  direction is given by the parametric equations

$$x = a + t, \quad y = b, \quad z = f(a, b) + f_x(a, b)t.$$

Similarly, the line tangent to the surface at  $(a, b, f(a, b))$  in the  $y$  direction is given by the parametric equations

$$x = a, \quad y = b + t, \quad z = f(a, b) + f_y(a, b)t.$$

- (b) To obtain the normal vector for the plane containing the two intersecting lines we found in part (b), we take the cross product of the direction vectors for the lines. That is,

$$\mathbf{N} = \langle 0, 1, f_y(a, b) \rangle \times \langle 1, 0, f_x(a, b) \rangle = \langle f_x(a, b), f_y(a, b), -1 \rangle.$$

The equation for the plane orthogonal to this vector and containing the point  $(a, b, f(a, b))$  is

$$\langle f_x(a, b), f_y(a, b), -1 \rangle \cdot \langle x - a, y - b, z - f(a, b) \rangle = 0,$$

or equivalently,  $f_x(a, b)(x - a) + f_y(a, b)(y - b) = z - f(a, b)$ .  $\square$

**CHECKING THE ANSWER**

We may use the general form for the equation of the plane to check our result from Example 2. We had the point  $(-1, 2, f(-1, 2)) = (-1, 2, \frac{7}{4})$  and partial derivatives  $f_x(-1, 2) = \frac{9}{4}$  and  $f_y(-1, 2) = \frac{5}{4}$ . Therefore, the equation of the plane is

$$\frac{9}{4}(x + 1) + \frac{5}{4}(y - 2) = z - \frac{7}{4},$$

which we see is equivalent to our final answer in Example 2.

**EXAMPLE 4****Computing higher order partial derivatives**

Let  $f(x, y) = \frac{x}{y^2} - \frac{y}{x}$ .

- (a) Find all second-order partial derivatives for  $f$ , and show that the mixed second-order partial derivatives are equal.  
 (b) Show that the mixed third-order partial derivatives  $f_{xxy}$ ,  $f_{xyx}$ , and  $f_{yxx}$  are all equal.

**SOLUTION**

- (a) We found the first-order partial derivatives  $\frac{\partial f}{\partial x} = \frac{1}{y^2} + \frac{y}{x^2}$  and  $\frac{\partial f}{\partial y} = -\frac{2x}{y^3} - \frac{1}{x}$  in Example 2. We have

$$\begin{aligned} \frac{\partial^2 f}{\partial x^2} &= \frac{\partial}{\partial x} \left( \frac{1}{y^2} + \frac{y}{x^2} \right) = -\frac{2y}{x^3}, \\ \frac{\partial^2 f}{\partial y \partial x} &= \frac{\partial}{\partial y} \left( \frac{1}{y^2} + \frac{y}{x^2} \right) = -\frac{2}{y^3} + \frac{1}{x^2}, \\ \frac{\partial^2 f}{\partial x \partial y} &= \frac{\partial}{\partial x} \left( -\frac{2x}{y^3} - \frac{1}{x} \right) = -\frac{2}{y^3} + \frac{1}{x^2}, \\ \frac{\partial^2 f}{\partial y^2} &= \frac{\partial}{\partial y} \left( -\frac{2x}{y^3} - \frac{1}{x} \right) = \frac{6x}{y^4}. \end{aligned}$$

Note that the partial derivatives  $\frac{\partial^2 f}{\partial y \partial x}$  and  $\frac{\partial^2 f}{\partial x \partial y}$  are equal.

- (b) We may compute the required third-order partial derivatives by taking the appropriate partial derivatives of the results from part (a).

$$f_{xxy} = \frac{\partial}{\partial y} \left( \frac{\partial^2 f}{\partial x^2} \right) = \frac{\partial}{\partial y} \left( -\frac{2y}{x^3} \right) = -\frac{2}{x^3},$$

$$f_{xyx} = \frac{\partial}{\partial x} \left( \frac{\partial^2 f}{\partial y \partial x} \right) = \frac{\partial}{\partial x} \left( -\frac{2}{y^3} + \frac{1}{x^2} \right) = -\frac{2}{x^3}.$$

Since  $f_{yxx} = \frac{\partial}{\partial x} \left( \frac{\partial^2 f}{\partial x \partial y} \right)$  and we already know that  $\frac{\partial^2 f}{\partial x \partial y} = \frac{\partial^2 f}{\partial y \partial x}$ , we may conclude that  $f_{yxx} = -\frac{2}{x^3}$  as well.  $\square$

**EXAMPLE 5****Finding a function when the partial derivatives are given**

Show that there is a function  $F(x, y)$  such that  $F_x(x, y) = g(x, y)$  and  $F_y(x, y) = h(x, y)$  when

$$g(x, y) = y \cos(xy) \text{ and } h(x, y) = x \cos(xy) + 3y^2.$$

Then find  $F$ .

**SOLUTION**

We use Theorem 12.24 to show that there is such a function. Since the partial derivatives

$$g_y(x, y) = \cos(xy) - xy \sin(xy) = h_x(x, y),$$

Theorem 12.24 guarantees that a function  $F(x, y)$  exists.

Now, to find  $F$ , we integrate  $g(x, y)$  with respect to  $x$ :

$$\int y \cos(xy) \, dx = \sin(xy) + q(y) = F(x, y).$$

As we remarked in our discussion earlier in this section, we may check our work by finding both first-order partial derivatives of this function to be sure that  $\frac{\partial}{\partial x}(F(x, y)) = g(x, y)$  and  $\frac{\partial}{\partial y}(F(x, y))$  is consistent with  $h(x, y)$ . You should check that  $\frac{\partial}{\partial x}(F(x, y)) = g(x, y)$ . Checking the consistency of the other partial derivative is part of our procedure. Here,

$$\frac{\partial}{\partial y}(F(x, y)) = \frac{\partial}{\partial y}(\sin(xy) + q(y)) = x \cos(xy) + q'(y).$$

In order for this partial derivative,  $x \cos(xy) + q'(y)$ , to equal  $h(x, y) = x \cos(xy) + 3y^2$ , we must have  $q'(y) = 3y^2$ . This happens when  $q(y) = y^3 + C$ , where  $C$  is any constant. Therefore,  $F(x, y) = \sin(xy) + y^3 + C$  is the function we sought.

If we are given a point on the graph of  $F$ , we may use that information to evaluate the constant  $C$ . For example, here, if we want the graph of  $F$  to contain the point  $(0, 2, 5)$ , then we must have

$$F(0, 2) = \sin(0 \cdot 2) + 2^3 + C = 8 + C = 5.$$

Therefore,  $C = -3$ , and our function is  $F(x, y) = \sin(xy) + y^3 - 3$ .  $\square$

**CHECKING THE ANSWER**

We may check our answer by finding the partial derivatives of our function

$$F(x, y) = \sin(xy) + y^3 + C$$

Since  $F_x(x, y) = y \cos(xy) = g(x, y)$  and  $F_y(x, y) = x \cos(xy) + 3y^2 = h(x, y)$ , our work was correct.

**EXAMPLE 6****Solving an exact differential equation**

Show that the differential equation

$$y \cos(xy) + (x \cos(xy) + 3y^2) \frac{dy}{dx} = 0$$

is exact. Solve the initial-value problem  $F\left(\frac{\pi}{3}, 6\right) = 200$ .

**SOLUTION**

Showing that the differential equation is exact requires the same steps that we performed in Example 5. If we let  $g(x, y) = y \cos(xy)$  and  $h(x, y) = x \cos(xy) + 3y^2$ , then  $g_y(x, y) = \cos(xy) - xy \sin(xy) = h_x(x, y)$ , so the differential equation is exact. Furthermore, the general solution of the differential equation is  $F(x, y) + C = 0$ , where  $F(x, y)$  is the same function we found in Example 5. That is,

$$F(x, y) = \sin(xy) + y^3 + C = 0.$$

To solve the initial-value problem, we determine the value of  $C$  that satisfies  $F\left(\frac{\pi}{3}, 6\right) = 200$ . When  $x = \frac{\pi}{3}$  and  $y = 6$ , we have  $\sin(2\pi) + 6^3 + C = 200$ . The unique solution of this equation is  $C = -16$ . Therefore, the solution to the initial-value problem is

$$\sin(xy) + y^3 - 16 = 0 \quad \square$$

**? TEST YOUR UNDERSTANDING**

- ▶ What are the definitions of the partial derivatives with respect to  $x$  and  $y$  for a function  $f(x, y)$ ? How are these definitions similar to the definition for the derivative of a function of a single variable? How are they different?
- ▶ What are the geometrical interpretations for  $f_x(a, b)$  and  $f_y(a, b)$  at a point  $(a, b)$  in the domain of a function  $f$ ? When these partial derivatives exist, how can we find the equations of lines tangent to the surface defined by  $f$  in the  $x$  and  $y$  directions? How can we find the equation of the plane containing these lines?
- ▶ How may the shortcuts for derivatives of a function of a single variable be applied to find partial derivatives of functions of two or three variables?
- ▶ How are higher order partial derivatives computed? What is meant by mixed second-order partial derivatives? What conditions are sufficient to guarantee that the mixed second-order partial derivatives are equal?
- ▶ What condition(s) must  $g(x, y)$  and  $h(x, y)$  satisfy for these functions to equal the first-order partial derivatives of a function  $F(x, y)$ ? That is, when will  $g(x, y) = F_x(x, y)$  and  $h(x, y) = F_y(x, y)$ ? What is the procedure for finding  $F$ ?

**EXERCISES 12.3****Thinking Back**

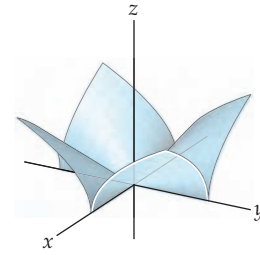

- ▶ *Finding a direction vector for a tangent line:* Find a direction vector for the line tangent to the curve  $y = x^3$  when  $x = 2$ .
- ▶ *Finding the equation of the plane containing two intersecting lines:* Show that the lines given by  $\mathbf{r}_1(t) = \langle 3t - 4, -4t + 1, t \rangle$  and  $\mathbf{r}_2(t) = \langle -t + 2, 2t - 9, -2t + 7 \rangle$  intersect, and find the equation of the plane containing the lines.

**Concepts**

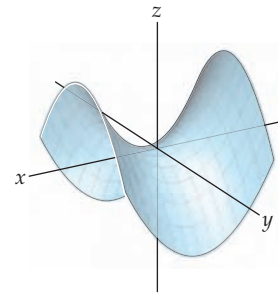

0. *Problem Zero:* Read the section and make your own summary of the material.
1. *True/False:* Determine whether each of the statements that follow is true or false. If a statement is true, explain why. If a statement is false, provide a counterexample.
  - (a) *True or False:* The partial derivative of a function  $f(x, y)$  with respect to  $x$  is defined by  $\lim_{h \rightarrow 0} \frac{f(x+h, y) - f(x, y)}{h}$  if the limit exists.
  - (b) *True or False:* The partial derivative of a function  $g(r, s)$  with respect to  $s$  is defined by  $\lim_{h \rightarrow 0} \frac{g(r, s+h) - g(r, s)}{h}$  if the limit exists.
  - (c) *True or False:* The second-order partial derivative of a function  $f(x, y)$  with respect to  $x$  and  $y$  is defined by  $\lim_{h \rightarrow 0} \frac{f(x+h, y+h) - f(x, y)}{h}$  if the limit exists.

- (d) *True or False:* If  $(a, b)$  is a point in the domain of a function  $f(x, y)$  with continuous partial derivatives, then  $f_x(a, b) = f_y(a, b)$ .
- (e) *True or False:* If  $(a, b)$  is a point in the domain of a function  $f(x, y)$  with continuous second-order partial derivatives, then  $f_{xy}(a, b) = f_{yx}(a, b)$ .
- (f) *True or False:* If  $(a, b)$  is a point in the domain of a function  $f(x, y)$  at which the second-order partial derivatives exist but are not continuous, then  $f_{xy}(a, b) \neq \frac{\partial^2 f}{\partial y \partial x}(a, b)$ .
- (g) *True or False:* If  $f(x, y) = |x|y$ , then  $f_x(x, y)$  at  $(0, 0)$  does not exist.
- (h) *True or False:* If  $f(x, y) = |x|y$ , then  $f_y(x, y)$  at  $(0, 0)$  does not exist.
2. *Examples:* Construct examples of the thing(s) described in the following. Try to find examples that are different than any in the reading.
- (a) A function  $f(x, y)$  such that  $f_x(x, y) = y^2 e^{xy^2}$ .
- (b) A function  $g(x, y)$  such that  $\frac{\partial g}{\partial y} = xy + e^{4x} \sin 3y$ .
- (c) A function  $F(x, y)$  such that  $F_x(x, y) = \sec^2 x + \frac{1}{2}y^2 + \frac{4}{3}e^{4x} \cos 3y$  and  $F_y(x, y) = xy - e^{4x} \sin 3y$ .
3. Draw a line on a piece of paper. If the paper is on a horizontal surface, how does the pitch or slope of the line change as you rotate the paper on the tabletop?
4. Draw a line on a piece of paper. If the paper is on an angled surface, how does the pitch or slope of the line change as you rotate the paper on the surface? Why would it *not* make sense to talk about the slope of a plane?
5. Let  $(x_0, y_0)$  be a point in the domain of the function  $f(x, y)$  at which  $f_x(x_0, y_0)$  and  $f_y(x_0, y_0)$  both exist. Explain how these partial derivatives may be interpreted as the slopes of lines tangent to the surface defined by  $f(x, y)$  at the point  $(x_0, y_0)$ .
6. Let  $f(x)$  be a differentiable function of a single variable  $x$ .
- (a) What is the relationship between the graph of  $f(x)$  and the graph of the function of two variables,  $g(x, y) = f(x)$ ?
- (b) For what values of  $x$  and  $y$  do the first-order partial derivatives of  $g$  exist?
- (c) What are  $\frac{\partial g}{\partial x}$  and  $\frac{\partial g}{\partial y}$ ? Why do these partial derivatives make sense?
7. Let  $f(y)$  be a differentiable function of a single variable  $y$ .
- (a) What is the relationship between the graph of  $f(y)$  and the graph of the function of two variables,  $g(x, y) = f(y)$ ?
- (b) For what values of  $x$  and  $y$  do the first-order partial derivatives of  $g$  exist?
- (c) What are  $\frac{\partial g}{\partial x}$  and  $\frac{\partial g}{\partial y}$ ? Why do these partial derivatives make sense?
8. The function  $f(x, y) = |x|y$  is graphed in the figure that follows. Use the definition of the partial derivatives to show that  $f_x(0, 0) = f_y(0, 0) = 0$ . What are the equations

of the lines tangent to the surface in the  $x$  and  $y$  directions at  $(0, 0, 0)$ ? What is the equation of the plane containing these two lines?

9. The function  $g(x, y) = x^2 - y^2$  is graphed in the figure that follows. Use the definition of the partial derivatives to show that  $g_x(0, 0) = g_y(0, 0) = 0$ . What are the equations of the lines tangent to the surface in the  $x$  and  $y$  directions at  $(0, 0, 0)$ ? What is the equation of the plane containing these two lines?

10. Compare the graphs in Exercises 8 and 9. Which of these surfaces do you think has a well-defined tangent plane at  $(0, 0, 0)$ ?
11. Let  $f(x, y) = \begin{cases} 0, & \text{if } xy = 0 \\ 1, & \text{if } xy \neq 0. \end{cases}$  Use the definition of the partial derivatives to show that  $f_x(0, 0) = f_y(0, 0) = 0$ . Explain why this example shows that the existence of the partial derivatives at a point  $(x_0, y_0)$  for a function  $f(x, y)$  does *not* guarantee that  $f$  is continuous at  $(x_0, y_0)$ .
12. Consider the function  $f$  defined in Exercise 11.
- (a) Use the definition of the partial derivatives to show that  $f_x(x_0, 0)$  exists for every value of  $x_0$  but  $f_y(x_0, 0)$  exists only when  $x_0 = 0$ .
- (b) Use the definition of the partial derivatives to show that  $f_y(0, y_0)$  exists for every value of  $y_0$  but  $f_x(0, y_0)$  exists only when  $y_0 = 0$ .
13. Let  $f(x, y, z) = \begin{cases} 0, & \text{if } xyz = 0 \\ 1, & \text{if } xyz \neq 0. \end{cases}$  Use the definition of the partial derivatives to show that  $f_x(0, 0, 0) = f_y(0, 0, 0) = f_z(0, 0, 0) = 0$ . Explain why this example shows that the existence of the partial derivatives at a point  $(x_0, y_0, z_0)$  for a function  $f(x, y, z)$  does *not* guarantee that  $f$  is continuous at  $(x_0, y_0, z_0)$ .

14. Consider the function  $f$  defined in Exercise 13. Use the definition of the partial derivatives to show that  $f_x(x_0, y_0, 0)$  and  $f_y(x_0, y_0, 0)$  exist for every value of  $x_0$  and  $y_0$  but  $f_z(x_0, y_0, 0)$  exists only when at least one of  $x_0$  and  $y_0$  is zero.
15. Assume that  $f(x, y)$  is a function of two variables with partial derivatives of every order. Assume also that the order in which the partial derivatives are taken is significant.
- How many different second-order partial derivatives does  $f$  have?
  - How many different third-order partial derivatives does  $f$  have?
  - How many different  $n$ th-order partial derivatives does  $f$  have?
16. Assume that  $g(x, y, z)$  is a function of three variables with partial derivatives of every order. Assume also the order in which the partial derivatives are taken is significant.
- How many different second-order partial derivatives does  $g$  have?
  - How many different third-order partial derivatives does  $g$  have?
  - How many different  $n$ th-order partial derivatives does  $g$  have?
17. Assume that  $f(x, y)$  is a function of two variables with partial derivatives of every order. Assume also that the order in which the partial derivatives are taken is *not* significant.
- How many different second-order partial derivatives does  $f$  have?
  - How many different third-order partial derivatives does  $f$  have?
  - How many different  $n$ th-order partial derivatives does  $f$  have?
18. Assume that  $g(x, y, z)$  is a function of three variables with partial derivatives of every order. Assume also that the order in which the partial derivatives are taken is *not* significant.
- How many different second-order partial derivatives does  $g$  have?
  - How many different third-order partial derivatives does  $g$  have?
  - How many different  $n$ th-order partial derivatives does  $g$  have?
19. Let  $f(x, y)$  and  $g(x, y)$  be functions of two variables with the property that  $\frac{\partial f}{\partial x} = \frac{\partial g}{\partial x}$  for every point  $(x, y) \in \mathbb{R}^2$ . What is the relationship between  $f$  and  $g$ ?
20. Let  $f(x, y)$  and  $g(x, y)$  be functions of two variables with the property that  $\frac{\partial f}{\partial y} = \frac{\partial g}{\partial y}$  for every point  $(x, y) \in \mathbb{R}^2$ . What is the relationship between  $f$  and  $g$ ?
21. Let  $f(x, y)$  and  $g(x, y)$  be functions of two variables with the property that  $\frac{\partial f}{\partial x} = \frac{\partial g}{\partial x}$  and  $\frac{\partial f}{\partial y} = \frac{\partial g}{\partial y}$  for every point  $(x, y) \in \mathbb{R}^2$ . What is the relationship between  $f$  and  $g$ ?
22. Let  $f(x, y, z)$  and  $g(x, y, z)$  be functions of three variables with the property that  $\frac{\partial f}{\partial y} = \frac{\partial g}{\partial y}$  for every point  $(x, y, z) \in \mathbb{R}^3$ . What is the relationship between  $f$  and  $g$ ?

## Skills

Use the definition of the partial derivative to find the partial derivatives specified in Exercises 23–26.

23.  $f_y(2, 1)$  when  $f(x, y) = 9 - x^2 - y^2$
24.  $f_x(0, -3)$  and  $f_y(0, -3)$  when  $f(x, y) = \frac{3x}{y^2}$
25.  $\frac{\partial f}{\partial x}$ ,  $\frac{\partial f}{\partial y}$  and  $\frac{\partial f}{\partial z}$  when  $f(x, y, z) = \frac{xy^2}{z}$
26.  $\frac{\partial g}{\partial x}$  and  $\frac{\partial g}{\partial y}$  when  $g(x, y) = \frac{\sqrt{y}}{x+1}$

Find the first-order partial derivatives for the functions in Exercises 27–36.

27.  $f(x, y) = e^x \sin(xy)$       28.  $g(x, y) = \tan^{-1}(xy^2)$
29.  $f(x, y) = x^y$       30.  $g(x, y) = \frac{\ln(y^2+1)}{x}$
31.  $f(x, y) = x \sin y$       32.  $g(x, y) = x \cos y$
33.  $f(r, \theta) = r \sin \theta$       34.  $g(r, \theta) = r \cos \theta$
35.  $f(x, y, z) = \frac{xy^2}{x+z}$
36.  $g(x, y, z) = 2xy + 2xz + 2yz$

In Exercises 37–42, use the partial derivatives you found in Exercises 27–32 and the point  $(x_0, y_0)$  specified to (a) find the equation of the line tangent to the surface defined

by the function in the  $x$  direction, (b) find the equation of the line tangent to the surface defined by the function in the  $y$  direction, and (c) find the equation of the plane containing the lines you found in parts (a) and (b).

37. Exercise 27,  $(0, \frac{\pi}{2})$       38. Exercise 28,  $(1, 0)$
39. Exercise 29,  $(e, 3)$       40. Exercise 30,  $(3, 0)$
41. Exercise 31,  $(2, \frac{\pi}{3})$       42. Exercise 32,  $(1, \pi)$

In Exercises 43–50, compute all of the second-order partial derivatives for the functions in Exercises 27–34 and show that the mixed partial derivatives are equal.

43. Exercise 27      44. Exercise 28
45. Exercise 29      46. Exercise 30
47. Exercise 31      48. Exercise 32
49. Exercise 33      50. Exercise 34

For the partial derivatives given in Exercises 51–54, find the most general form for a function of two variables,  $f(x, y)$ , with the given partial derivative.

51.  $\frac{\partial f}{\partial x} = 0$       52.  $\frac{\partial f}{\partial y} = 0$
53.  $\frac{\partial f}{\partial x^2} = 0$       54.  $\frac{\partial^2 f}{\partial y \partial x} = 0$

For the partial derivatives given in Exercises 55–58, find the most general form for a function of three variables,  $f(x, y, z)$ , with the given partial derivative.

55.  $\frac{\partial f}{\partial x} = 0$

56.  $\frac{\partial f}{\partial y} = 0$

57.  $\frac{\partial f}{\partial x^2} = 0$

58.  $\frac{\partial^2 f}{\partial y \partial x} = 0$

For each pair of functions in Exercises 59–62, use Theorem 12.24 to show that there is a function of two variables,  $F(x, y)$ , such that  $\frac{\partial F}{\partial x} = g(x, y)$  and  $\frac{\partial F}{\partial y} = h(x, y)$ . Then find  $F$ .

59.  $g(x, y) = e^x \cos y$ ,  $h(x, y) = -e^x \sin y + 2y$

60.  $g(x, y) = \frac{1}{xy} - \sin x$ ,  $h(x, y) = -\frac{\ln x}{y^2}$

61.  $g(x, y) = \frac{y}{1+x^2y^2}$ ,  $h(x, y) = \frac{x}{1+x^2y^2}$

62.  $g(x, y) = \frac{2x}{y}$ ,  $h(x, y) = -\frac{x^2}{y^2}$

Solve the exact differential equations in Exercises 63–66.

63.  $e^y + (xe^y - 7)\frac{dy}{dx} = 0$

64.  $y \cos(xy) - 3 + (x \cos(xy) + 2)\frac{dy}{dx} = 0$

65.  $e^x \ln y + x^3 + \frac{e^x}{y} \frac{dy}{dx} = 0$

66.  $\frac{12x^3}{y^5} - \frac{15x^4}{y^6} \frac{dy}{dx} = 0$

## Applications

67. Recall that the volume,  $V$ , of a cylinder is given by  $V(r, h) = \pi r^2 h$ . Find  $\frac{\partial V}{\partial r}$  and  $\frac{\partial V}{\partial h}$ . What are the physical interpretations of these partial derivatives?

68. The pressure  $P$  of an ideal gas is given by  $P(n, T, V) = \frac{nRT}{V}$ , where  $n$  is the amount of the gas,  $R$  is a constant,  $T$  is the temperature of the gas in degrees Kelvin, and  $V$  is the volume of the gas. Find  $\frac{\partial P}{\partial n}$ ,  $\frac{\partial P}{\partial V}$ , and  $\frac{\partial P}{\partial T}$ . What are the physical interpretations of these partial derivatives?

69. Annie is covering the kayak she is building with fabric. She knows that the shape of the fabric, when stretched across the ribs of her kayak, satisfies the differential equation  $f_{xx} + f_{yy} = 0$ .

(a) Annie has no interest in solving that equation; she is just building a kayak. You, however, should show that  $\alpha e^{nx} \sin ny$  and  $\beta e^{ny} \sin nx$  are solutions for any real numbers  $n$ ,  $\alpha$ , and  $\beta$ .

(b) Assuming that she needed something to do besides apply the fabric to her kayak, Annie measured and normalized the function describing the ribs near the bow to find that they have the shape given by

$$f(x, 0) = 0.04 \sin\left(\frac{\pi x}{2}\right),$$

$$f(x, 1) = 0.04 e^{\pi/2} \sin\left(\frac{\pi x}{2}\right),$$

$$f(0, y) = 0,$$

$$f(1, y) = 0.04 e^{\pi y/2}.$$

What solution  $f(x, y)$  from part (a) satisfies these conditions? Sketch the solution.

70. Alex is modeling traffic patterns at a bottleneck on a freeway as it leaves Denver. He uses a well-known equation  $u_x + u_t = 0$ , where  $u = u(x, t)$  is a scaled traffic density at a point  $x$  on the highway at time  $t$ .

(a) Show that  $u_n(x, t) = \sin(n(x-t))$  is a solution of the equation for any integer  $n$ .

(b) Alex finds that in heavy traffic at the bottleneck the solution of his equation can look like

$$24 + \sum_{n=1}^N \frac{\sin(n(x-t))}{n} \text{ for some integer } N.$$

Show that this is a solution, and plot it for  $N = 8$ . Can you tell what happens as  $N$  gets large?

## Proofs

71. Let  $z = (f(x, y))^n$ . Show that

$$\frac{\partial z}{\partial x} = n(f(x, y))^{n-1} \frac{\partial f}{\partial x} \text{ and } \frac{\partial z}{\partial y} = n(f(x, y))^{n-1} \frac{\partial f}{\partial y}.$$

72. Let  $z = f(x, y)g(x, y)$ . Show that

$$\frac{\partial z}{\partial x} = \frac{\partial f}{\partial x} g(x, y) + f(x, y) \frac{\partial g}{\partial x} \text{ and}$$

$$\frac{\partial z}{\partial y} = \frac{\partial f}{\partial y} g(x, y) + f(x, y) \frac{\partial g}{\partial y}.$$

73. Let  $z = \frac{f(x, y)}{g(x, y)}$ . Show that

$$\frac{\partial z}{\partial x} = \frac{f_x(x, y)g(x, y) - f(x, y)g_x(x, y)}{(g(x, y))^2} \text{ and}$$

$$\frac{\partial z}{\partial y} = \frac{f_y(x, y)g(x, y) - f(x, y)g_y(x, y)}{(g(x, y))^2}.$$

74. Let  $p(x)$  be a polynomial of degree  $n$ ,  $q(y)$  be any function of  $y$ , and  $f(x, y) = p(x)q(y)$ . Prove that

$$\frac{\partial^{n+1}f}{\partial x^{n+1}} = 0.$$

75. Let  $f(x)$  be a differentiable function of  $x$ ,  $g(y)$  be a differentiable function of  $y$ , and  $h(x, y) = f(x) + g(y)$ . Prove

that

$$\frac{\partial^2 h}{\partial x \partial y} = \frac{\partial^2 h}{\partial y \partial x}.$$

76. Let  $f(x)$  be a differentiable function of  $x$ ,  $g(y)$  be a differentiable function of  $y$ , and  $h(x, y) = f(x)g(y)$ . Prove that

$$\frac{\partial^2 h}{\partial x \partial y} = \frac{\partial^2 h}{\partial y \partial x}.$$

## Thinking Forward

A chain rule for functions of two variables: Let  $f(x, y) = x^2y^3$ ,  $x = s \cos t$ , and  $y = s \sin t$ .

- ▶ Find  $\frac{\partial f}{\partial x}$  and  $\frac{\partial f}{\partial y}$ .
- ▶ Find  $\frac{\partial x}{\partial s}$  and  $\frac{\partial x}{\partial t}$ .
- ▶ Find  $\frac{\partial y}{\partial s}$  and  $\frac{\partial y}{\partial t}$ .

- ▶ Substitute the expressions for  $x$  and  $y$  into  $f(x, y)$ .
- ▶ Find  $\frac{\partial f}{\partial s}$  and  $\frac{\partial f}{\partial t}$  using the preceding results.
- ▶ Make a conjecture about the relationship between  $\frac{\partial f}{\partial s}$ ,  $\frac{\partial f}{\partial x}$ ,  $\frac{\partial f}{\partial y}$ ,  $\frac{\partial x}{\partial s}$ , and  $\frac{\partial y}{\partial s}$ .

## 12.4 DIRECTIONAL DERIVATIVES AND DIFFERENTIABILITY

- ▶ Directional derivatives
- ▶ Differentiability of functions of two and three variables
- ▶ The tangent plane to a function of two variables

### The Directional Derivative

In Section 12.3 we defined the partial derivatives for a function of two or three variables. Recall that when  $f(x, y)$  is a function of two variables, the partial derivatives  $\frac{\partial f}{\partial x}$  and  $\frac{\partial f}{\partial y}$  tell us the rate of change of the function  $f$  in the (positive)  $x$  and  $y$  directions, respectively, when these derivatives exist. How can we compute the rate of change of  $f$  in a different direction? To do this we define the **directional derivative** of  $f$  in the direction of a specified unit vector  $\mathbf{u}$ .

#### DEFINITION 12.25

#### The Directional Derivative of a Function of Two Variables

Let  $f(x, y)$  be a function of two variables defined on an open set containing the point  $(x_0, y_0)$ , and let  $\mathbf{u} = \langle \alpha, \beta \rangle$  be a unit vector. The **directional derivative** of  $f$  at  $(x_0, y_0)$  in the direction of  $\mathbf{u}$ , denoted by  $D_{\mathbf{u}}f(x_0, y_0)$ , is given by

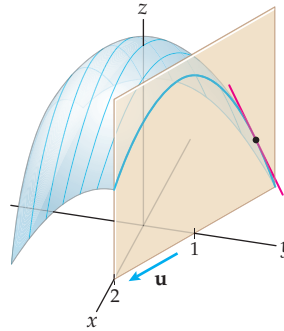

$$\lim_{h \rightarrow 0} \frac{f(x_0 + \alpha h, y_0 + \beta h) - f(x_0, y_0)}{h},$$

provided that this limit exists.

Note that when  $\mathbf{u} = \mathbf{i}$  or  $\mathbf{u} = \mathbf{j}$ , the directional derivative is  $\frac{\partial f}{\partial x}$  or  $\frac{\partial f}{\partial y}$ , respectively. That is, for a point  $(x_0, y_0)$  in the domain of  $f$  at which the partial derivatives exist,

$$D_{\mathbf{i}}f(x_0, y_0) = f_x(x_0, y_0) \text{ and } D_{\mathbf{j}}f(x_0, y_0) = f_y(x_0, y_0).$$

Thus, the directional derivative generalizes the partial derivatives. The figure shown next indicates the geometry of the directional derivative. We may visualize  $D_{\mathbf{u}}f(x_0, y_0)$  as the slope of the cut edge at the point  $(x_0, y_0, f(x_0, y_0))$  when we slice the surface  $z = f(x, y)$  with a vertical plane parallel to the vector  $\mathbf{u}$  containing the point.

To compute the directional derivative of the function  $f(x, y) = \frac{x^2}{y}$  at the point  $(-1, 2)$  in the direction of the vector  $\mathbf{v} = \langle 3, -4 \rangle$ , we first need to find a unit vector  $\mathbf{u}$  with the same direction as  $\mathbf{v}$ . We have

$$\mathbf{u} = \frac{1}{\|\mathbf{v}\|} \mathbf{v} = \frac{1}{\sqrt{3^2 + (-4)^2}} \langle 3, -4 \rangle = \left\langle \frac{3}{5}, -\frac{4}{5} \right\rangle.$$

Thus, the directional derivative

$$D_{\mathbf{u}}f(-1, 2) = \lim_{h \rightarrow 0} \frac{\frac{(-1 + 3h/5)^2}{2 - 4h/5} - \frac{(-1)^2}{2}}{h} = \lim_{h \rightarrow 0} \frac{-20h + 9h^2}{h(50 - 20h)} = \lim_{h \rightarrow 0} \frac{-20 + 9h}{50 - 20h} = -\frac{2}{5}.$$

Geometrically, the number  $-\frac{2}{5}$  describes the slope of the line tangent to the cut edge of the graph when the surface defined by  $f(x, y) = \frac{x^2}{y}$  is sliced by the vertical plane parallel to the vector  $\mathbf{u} = \left\langle \frac{3}{5}, -\frac{4}{5} \right\rangle$  and containing the point  $(-1, 2)$ . We may use all of this information to find the equation of the line tangent to the surface at the point  $(-1, 2, f(-1, 2)) = \left(-1, 2, \frac{1}{2}\right)$ . Here, that equation is

$$x = -1 + \frac{3}{5}t, \quad y = 2 - \frac{4}{5}t, \quad z = \frac{1}{2} - \frac{2}{5}t.$$

More generally, for a point  $(x_0, y_0)$  in the domain of a function  $f(x, y)$  and a unit vector  $\mathbf{u} = \langle \alpha, \beta \rangle$  for which the directional derivative  $D_{\mathbf{u}}f(x_0, y_0)$  exists, the equation of the line tangent to the surface defined by  $f$  at the point  $(x_0, y_0, f(x_0, y_0))$  will be

$$x = x_0 + \alpha t, \quad y = y_0 + \beta t, \quad z = f(x_0, y_0) + D_{\mathbf{u}}f(x_0, y_0)t.$$

We may also define the directional derivative for a function of three variables.

### DEFINITION 12.26

#### The Directional Derivative of a Function of Three Variables

Let  $f(x, y, z)$  be a function of three variables defined on an open set containing the point  $(x_0, y_0, z_0)$ , and let  $\mathbf{u} = \langle \alpha, \beta, \gamma \rangle$  be a unit vector. The **directional derivative** of  $f$  at  $(x_0, y_0, z_0)$  in the direction of  $\mathbf{u}$ , denoted by  $D_{\mathbf{u}}f(x_0, y_0, z_0)$ , is given by

$$\lim_{h \rightarrow 0} \frac{f(x_0 + \alpha h, y_0 + \beta h, z_0 + \gamma h) - f(x_0, y_0, z_0)}{h},$$

provided that this limit exists.

As with a directional derivative for a function of two variables, when  $\mathbf{u}$  is one of the standard basis vectors,

$$\begin{aligned} D_{\mathbf{i}}f(x_0, y_0, z_0) &= f_x(x_0, y_0, z_0), \\ D_{\mathbf{j}}f(x_0, y_0, z_0) &= f_y(x_0, y_0, z_0), \\ D_{\mathbf{k}}f(x_0, y_0, z_0) &= f_z(x_0, y_0, z_0). \end{aligned}$$

## Differentiability

Recall that for a function  $y = f(x)$  defined on an open interval containing the point  $x_0$ , we defined the derivative of  $f$  in terms of the limit of the difference quotient; that is,

$$f'(x_0) = \lim_{h \rightarrow 0} \frac{f(x_0 + h) - f(x_0)}{h},$$

provided that the limit exists. Unfortunately, we cannot use a definition analogous to this to define the differentiability of a function of two or more variables. In Exercise 98 of Section 2.2 we asked you to show that if a function  $y = f(x)$  is differentiable at  $x_0$  and  $\Delta y = f(x_0 + \Delta x) - f(x_0)$ , then

$$\Delta y = f'(x_0)\Delta x + \epsilon \Delta x,$$

where  $\epsilon$  is a function satisfying  $\lim_{\Delta x \rightarrow 0} \epsilon = 0$ . This property tells us that the function  $f$  is “locally linear” near  $x_0$  and, furthermore, that we may use the tangent line at  $(x_0, f(x_0))$  to approximate the function  $f$  on some interval containing  $x_0$ . We will use an analogous property to define differentiability for a function of two or three variables.

### DEFINITION 12.27

#### Differentiability for Functions of Two Variables

Let  $z = f(x, y)$  be a function of two variables defined on an open set containing the point  $(x_0, y_0)$ , and let  $\Delta z = f(x_0 + \Delta x, y_0 + \Delta y) - f(x_0, y_0)$ . The function  $f$  is said to be **differentiable** at  $(x_0, y_0)$  if the partial derivatives  $f_x(x_0, y_0)$  and  $f_y(x_0, y_0)$  both exist and

$$\Delta z = f_x(x_0, y_0)\Delta x + f_y(x_0, y_0)\Delta y + \epsilon_1 \Delta x + \epsilon_2 \Delta y,$$

where  $\epsilon_1$  and  $\epsilon_2$  are functions of  $\Delta x$  and  $\Delta y$ , and both go to zero as  $(\Delta x, \Delta y) \rightarrow (0, 0)$ .

In general, it is cumbersome to use Definition 12.27 to show that a function of two variables is differentiable. Fortunately, when the partial derivatives are continuous at  $(x_0, y_0)$ , we may use the following theorem:

### THEOREM 12.28

#### The Continuity of the Partial Derivatives Guarantees Differentiability

If  $f(x, y)$  is a function of two variables with partial derivatives  $\frac{\partial f}{\partial x}$  and  $\frac{\partial f}{\partial y}$  that are continuous on some open set containing the point  $(x_0, y_0)$ , then  $f$  is differentiable at  $(x_0, y_0)$ .

Theorem 12.28 allows us to verify much more readily where a function is differentiable, for most of the common functions we study. For example, consider the function  $f(x, y) = \frac{x^2}{y}$

that we discussed earlier in the section. The partial derivatives  $f_x(x, y) = \frac{2x}{y}$  and  $f_y(x, y) = -\frac{x^2}{y^2}$  of this function are continuous at every point in the domain of  $f$ . That is, they are continuous on the set  $S = \{(x, y) \mid y \neq 0\}$ . Therefore,  $f$  is differentiable on  $S$ . As this example illustrates, every rational function of two variables will be differentiable everywhere the function is defined, because the only places where the partial derivatives will be discontinuous are the points where the function itself is discontinuous.

It bears repeating that a function with partial derivatives at a point  $(x_0, y_0)$  may or may not be differentiable at  $(x_0, y_0)$ . For example, the function

$$f(x, y) = \begin{cases} 0, & \text{if } x = 0 \text{ or } y = 0 \\ 1, & \text{otherwise} \end{cases}$$

has the property that  $f_x(0, 0) = 0 = f_y(0, 0)$ . Although these partial derivatives exist,  $f$  is not differentiable at the origin, because  $f$  does not satisfy Definition 12.27. In fact, the function is not even continuous at the origin.

When a function of two variables,  $f(x, y)$ , is differentiable at a point  $(x_0, y_0)$ , we may modify the equality  $\Delta z = f_x(x_0, y_0)\Delta x + f_y(x_0, y_0)\Delta y + \epsilon_1\Delta x + \epsilon_2\Delta y$  from Definition 12.27 to find the equation of the plane tangent to the surface defined by  $f$  at  $(x_0, y_0)$ . If we let  $\Delta x = x - x_0$ ,  $\Delta y = y - y_0$ , and  $\Delta z = z - f(x_0, y_0)$ , we immediately have the equation of the tangent plane when we drop the terms  $\epsilon_1\Delta x$  and  $\epsilon_2\Delta y$ .

### THEOREM 12.29

#### Using the Partial Derivatives to Find the Equation of the Tangent Plane

Let  $f(x, y)$  be a function of two variables that is differentiable at the point  $(x_0, y_0)$ . Then the equation of the plane tangent to the surface defined by  $f(x, y)$  at  $(x_0, y_0)$  is

$$f_x(x_0, y_0)(x - x_0) + f_y(x_0, y_0)(y - y_0) = z - f(x_0, y_0).$$

Before we give the definition of what it means for a function of three variables to be differentiable, recall that the graph of a function of three variables is a three-dimensional object existing in four-dimensional space,  $\mathbb{R}^4$ . If this graph is sufficiently well behaved, the natural tangent object to the surface is a **hyperplane** in  $\mathbb{R}^4$ . Perhaps the easiest way to think about a hyperplane is by considering the general equation that defines one. Just as the equation  $a_1x_1 + a_2x_2 = b$  defines a line in  $\mathbb{R}^2$  and the equation  $a_1x_1 + a_2x_2 + a_3x_3 = b$  defines a plane in  $\mathbb{R}^3$ , the equation  $a_1x_1 + a_2x_2 + a_3x_3 + a_4x_4 = b$  defines a hyperplane in  $\mathbb{R}^4$ .

### DEFINITION 12.30

#### Differentiability for Functions of Three Variables

Let  $w = f(x, y, z)$  be a function of three variables defined on an open set containing the point  $(x_0, y_0, z_0)$ , and let  $\Delta w = f(x_0 + \Delta x, y_0 + \Delta y, z_0 + \Delta z) - f(x_0, y_0, z_0)$ . The function  $f$  is said to be **differentiable** at  $(x_0, y_0, z_0)$  if the partial derivatives  $f_x(x_0, y_0, z_0)$ ,  $f_y(x_0, y_0, z_0)$ , and  $f_z(x_0, y_0, z_0)$  all exist and

$$\Delta w = f_x(x_0, y_0, z_0)\Delta x + f_y(x_0, y_0, z_0)\Delta y + f_z(x_0, y_0, z_0)\Delta z + \epsilon_1\Delta x + \epsilon_2\Delta y + \epsilon_3\Delta z,$$

where  $\epsilon_1$ ,  $\epsilon_2$ , and  $\epsilon_3$  all go to zero as  $(\Delta x, \Delta y, \Delta z) \rightarrow (0, 0, 0)$ .

The following theorem for functions of three variables is an analog of Theorem 12.28 for functions of two variables:

**THEOREM 12.31****The Continuity of the Partial Derivatives Guarantees Differentiability**

If  $f(x, y, z)$  is a function of three variables with partial derivatives  $\frac{\partial f}{\partial x}$ ,  $\frac{\partial f}{\partial y}$ , and  $\frac{\partial f}{\partial z}$  that are continuous on some open set containing the point  $(x_0, y_0, z_0)$ , then  $f$  is differentiable at  $(x_0, y_0, z_0)$ .

The hyperplane that may be used to approximate a differentiable function of three variables,  $w = f(x, y, z)$ , “close to” a point of differentiability  $(x_0, y_0, z_0)$  is given by the equation

$$f_x(x_0, y_0, z_0)(x - x_0) + f_y(x_0, y_0, z_0)(y - y_0) + f_z(x_0, y_0, z_0)(z - z_0) = w - f(x_0, y_0, z_0).$$

This equation may be generalized to even higher dimensions.

**Examples and Explorations****EXAMPLE 1****Computing directional derivatives**

Find the directional derivative of  $f(x, y) = \frac{x}{y^2}$  in the direction of the vector  $3\mathbf{i} - 2\mathbf{j}$  at the point  $(5, -3)$ .

**SOLUTION**

Before we compute any directional derivative, we need to have a unit vector in the correct direction. We divide the vector  $3\mathbf{i} - 2\mathbf{j}$  by its magnitude  $\sqrt{3^2 + (-2)^2} = \sqrt{13}$  and obtain the unit vector  $\mathbf{u} = \frac{3}{\sqrt{13}}\mathbf{i} - \frac{2}{\sqrt{13}}\mathbf{j}$ . Now,

$$\begin{aligned} D_{\mathbf{u}}f(5, -3) &= \lim_{h \rightarrow 0} \frac{\frac{5 + (3/\sqrt{13})h}{(-3 - (2/\sqrt{13})h)^2} - \frac{5}{(-3)^2}}{h} \\ &= \lim_{h \rightarrow 0} \frac{1}{h} \cdot \frac{9(5 + (3/\sqrt{13})h) - 5(-3 - (2/\sqrt{13})h)^2}{9(-3 - (2/\sqrt{13})h)^2} \\ &= \lim_{h \rightarrow 0} \frac{1}{h} \cdot \frac{45 + \frac{27}{\sqrt{13}}h - 45 - \frac{60}{\sqrt{13}}h - \frac{20}{13}h^2}{9\left(-3 - \frac{2}{\sqrt{13}}h\right)^2} = \lim_{h \rightarrow 0} \frac{-\frac{33}{\sqrt{13}} - \frac{20}{13}h}{9\left(-3 - \frac{2}{\sqrt{13}}h\right)^2} \\ &= -\frac{11}{27\sqrt{13}}. \end{aligned}$$

□

**EXAMPLE 2****Using partial derivatives to determine where a function is differentiable**

Find the first-order partial derivatives for the functions

$$\text{(a) } f(x, y) = \frac{x^2\sqrt{y}}{x-1} \qquad \text{(b) } g(x, y) = \frac{\ln x}{\tan^{-1}y} \qquad \text{(c) } P(r, \theta, \phi) = \frac{r\theta}{\phi}$$

Use the partial derivatives to determine the sets on which the functions are differentiable.

**SOLUTION**

(a) The partial derivatives of  $f$  are

$$\frac{\partial f}{\partial x} = \frac{x(x-2)\sqrt{y}}{(x-1)^2} \quad \text{and} \quad \frac{\partial f}{\partial y} = \frac{x^2}{2(x-1)\sqrt{y}}.$$

These partial derivatives are continuous wherever the denominators are nonzero and  $y > 0$ . They are continuous on the set  $S_1 = \{(x, y) \mid x \neq 1 \text{ and } y > 0\}$ , and  $f$  is differentiable at every point in  $S_1$ .

- (b) The partial derivatives of  $g$  are

$$\frac{\partial g}{\partial x} = \frac{1}{x \tan^{-1} y} \quad \text{and} \quad \frac{\partial g}{\partial y} = -\frac{\ln x}{(1 + y^2)(\tan^{-1} y)^2}.$$

Since the domain of  $g$  consists of just the points in  $\mathbb{R}^2$  for which  $x > 0$  and  $y \neq 0$ , both of these partial derivatives are continuous only on the set  $S_2 = \{(x, y) \mid x > 0 \text{ and } y \neq 0\}$ . Our function  $g$  is differentiable at every point in  $S_2$ .

- (c) Finally, for  $P$  we have

$$\frac{\partial P}{\partial r} = \frac{\theta}{\phi}, \quad \frac{\partial P}{\partial \theta} = \frac{r}{\phi}, \quad \text{and} \quad \frac{\partial P}{\partial \phi} = -\frac{r\theta}{\phi^2}.$$

These partial derivatives are continuous everywhere in the domain of  $P$ . That is, they are continuous on the set  $S_3 = \{(r, \theta, \phi) \mid \phi \neq 0\}$ . The function  $P$  is differentiable at every point in its domain.  $\square$

### EXAMPLE 3

#### Finding the equation of the tangent plane

Find the equation of the tangent plane to the function

(a)  $f(x, y) = \frac{x^2\sqrt{y}}{x-1}$  at  $(3, 4)$ . (b)  $g(x, y) = \frac{\ln x}{\tan^{-1} y}$  at  $(e, 1)$ .

#### SOLUTION

These are the two functions we discussed in Example 2.

- (a) From the work we have already done, we know that the partial derivatives of  $f$  are continuous on an open set containing the point  $(3, 4)$ . At  $(3, 4)$ , we have  $f(3, 4) = 9$ ,  $f_x(3, 4) = \frac{3(3-2)\sqrt{4}}{(3-1)^2} = \frac{3}{2}$ , and  $f_y(3, 4) = \frac{3^2}{2(3-1)\sqrt{4}} = \frac{9}{8}$ . Thus, the equation of the tangent plane is

$$\frac{3}{2}(x-3) + \frac{9}{8}(y-4) = z-9, \quad \text{or equivalently,} \quad 12x + 9y - 8z = 0.$$

- (b) At  $(e, 1)$ , we have  $g(e, 1) = \frac{4}{\pi}$ ,  $g_x(e, 1) = \frac{4}{\pi e}$ , and  $g_y(e, 1) = -\frac{8}{\pi^2}$ . Thus, the equation of the tangent plane is

$$\frac{4}{\pi e}(x-e) - \frac{8}{\pi^2}(y-1) = z - \frac{4}{\pi}. \quad \square$$

### TEST YOUR UNDERSTANDING

- ▶ What is a directional derivative? What is the geometric significance of a directional derivative for a function of two variables? What is the relationship between a directional derivative and a partial derivative?
- ▶ Why do we need to use a unit vector when we are computing a directional derivative? What happens if you do not use a unit vector when you compute a directional derivative? How do you compute a directional derivative for a function of two variables? For a function of three variables?
- ▶ What is the definition of differentiability for a function of two variables? How is the definition of differentiability for a function of two variables related to the definition of differentiability for a function of a single variable?

- ▶ What is the definition of differentiability for a function of three variables? How could you generalize this definition to a function of four (or more) variables?
- ▶ When  $f(x, y)$  is a differentiable function of two variables at  $(x_0, y_0)$ , why is

$$f_x(x_0, y_0)(x - x_0) + f_y(x_0, y_0)(y - y_0) = z - f(x_0, y_0)$$

the equation of the tangent plane at  $(x_0, y_0)$ ?

## EXERCISES 12.4

### Thinking Back

- ▶ *Collinear tangent lines:* Show that the left- and right-hand derivatives exist for the function  $f(x) = x^3$  at  $x = 2$ . Show also that the lines with slopes  $f'_-(2)$  and  $f'_+(2)$  at the point  $(2, 8)$  are collinear.
- ▶ *Noncollinear tangent lines:* Show that the left- and right-hand derivatives exist for the function  $f(x) = |x| + 3$  at  $x = 0$ . Show also that the lines with slopes  $f'_-(0)$  and  $f'_+(0)$  at the point  $(0, 3)$  are not collinear.

### Concepts

0. *Problem Zero:* Read the section and make your own summary of the material.
1. *True/False:* Determine whether each of the statements that follow is true or false. If a statement is true, explain why. If a statement is false, provide a counterexample.
  - (a) *True or False:* If  $f(x, y)$  is a function of two variables, then  $D_{\mathbf{j}}f(a, b) = f_y(a, b)$ , provided that these derivatives exist at  $(a, b)$ .
  - (b) *True or False:* If  $\mathbf{u}$  is a unit vector and the directional derivative  $D_{\mathbf{u}}f(a, b)$  exists for a function of two variables,  $f$ , then  $D_{\mathbf{u}}f(a, b) = -D_{-\mathbf{u}}f(a, b)$ .
  - (c) *True or False:* If  $f(x, y)$  is a function of two variables and  $D_{\mathbf{u}}f(a, b)$  exists for some unit vector  $\mathbf{u}$ , then  $D_{\mathbf{v}}f(a, b)$  exists for every unit vector  $\mathbf{v}$ .
  - (d) *True or False:* If  $f(x, y, z)$  is a function of three variables and  $\mathbf{v} \in \mathbb{R}^3$  is a nonzero vector, then  $D_{\mathbf{v}/\|\mathbf{v}\|}f(a, b, c) = \frac{1}{\|\mathbf{v}\|}D_{\mathbf{v}}f(a, b, c)$ .
  - (e) *True or False:* If the partial derivatives  $f_x(a, b)$  and  $f_y(a, b)$  both exist for a function of two variables,  $f(x, y)$ , then  $f$  is differentiable at the point  $(a, b)$ .
  - (f) *True or False:* A function of two variables,  $f(s, t)$ , is differentiable at the point  $(a, b)$  if the partial derivatives  $f_s$  and  $f_t$  are continuous on an open set containing the point  $(a, b)$ .
  - (g) *True or False:* If a function of two variables,  $f(x, y)$ , is differentiable at the point  $(a, b)$ , then  $D_{\mathbf{u}}f(a, b) = D_{\mathbf{v}}f(a, b)$  for all unit vectors  $\mathbf{u}$  and  $\mathbf{v}$ .
  - (h) *True or False:* If  $f(x, y)$  is differentiable at the point  $(a, b)$ , then there is a unit vector  $\mathbf{u}$  such that  $D_{\mathbf{u}}f(a, b) \neq 1$ .
2. *Examples:* Construct examples of the thing(s) described in the following. Try to find examples that are different than any in the reading.
  - (a) A function of two variables,  $f(x, y)$ , such that  $D_{\mathbf{u}}f(0, 0) = 0$  for every unit vector  $\mathbf{u} \in \mathbb{R}^2$ .
  - (b) A function of three variables,  $f(x, y, z)$ , such that  $f_x(0, 0, 0) = f_y(0, 0, 0) = f_z(0, 0, 0) = 0$  but  $f$  is not differentiable at  $(0, 0, 0)$ .
  - (c) A function of three variables,  $f(x, y, z)$ , such that  $D_{\mathbf{u}}f(0, 0, 0) = 0$  for every unit vector  $\mathbf{u} \in \mathbb{R}^3$ .
3. How many unit vectors are there in  $\mathbb{R}^1$ ? How many unit vectors are there in  $\mathbb{R}^n$  for  $n > 1$ ?
4. Let  $\mathbf{u}$  be a unit vector in  $\mathbb{R}^2$ .
  - (a) Explain why  $-\mathbf{u}$  is a unit vector.
  - (b) If  $(a, b)$  is a point in the domain of the function of two variables,  $f(x, y)$ , at which  $D_{\mathbf{u}}f(a, b)$  exists, what is the relationship between  $D_{\mathbf{u}}f(a, b)$  and  $D_{-\mathbf{u}}f(a, b)$ ?
5. What is the definition of the directional derivative for a function of two variables,  $f(x, y)$ ? Be sure to include the words "unit vector" in your definition.
6. What is the definition of the directional derivative for a function of three variables,  $f(x, y, z)$ ? Be sure to include the words "unit vector" in your definition.
7. Let  $\mathbf{v}$  be a vector in  $\mathbb{R}^n$  and let  $f$  be a function of  $n$  variables. How would we define the directional derivative of  $f$  in the direction of a unit vector  $\mathbf{u} \in \mathbb{R}^n$  at  $\mathbf{v}$ ?
8. Let  $f(x, y) = x + y$  and  $\mathbf{u} = \langle \alpha, \beta \rangle$  be a unit vector.
  - (a) Use the definition of the directional derivative to find  $D_{\mathbf{u}}f(1, 2)$ .
  - (b) Explain why  $\langle k\alpha, k\beta \rangle$  is a unit vector only when  $|k| = 1$ .
  - (c) Assume that  $|k| \neq 1$  and evaluate the limit
 
$$\lim_{h \rightarrow 0} \frac{(1 + (k\alpha)h) + (2 + (k\beta)h) - (1 + 2)}{h}.$$
  - (d) Use your results from parts (a) and (c) to explain why it is necessary to use a unit vector in the definition of the directional derivative.
9. Let  $f(x, y) = xy$  and  $\mathbf{u} = \langle \alpha, \beta \rangle$  be a unit vector.
  - (a) Use the definition of the directional derivative to find  $D_{\mathbf{u}}f(-1, 3)$ .
  - (b) Assume that  $|k| \neq 1$  and evaluate
 
$$\lim_{h \rightarrow 0} \frac{(-1 + (k\alpha)h)(3 + (k\beta)h) - (-1 \cdot 3)}{h}.$$

- (c) Use your results from parts (a) and (b) to explain why it is necessary to use a unit vector in the definition of the directional derivative.
10. Let  $f(x, y) = e^x \sin y$  and  $\mathbf{u} = \langle \alpha, \beta \rangle$  be a unit vector.
- (a) Use the definition of the directional derivative to find  $D_{\mathbf{u}}f(0, \pi)$ .
- (b) Assume that  $|k| \neq 1$  and evaluate
- $$\lim_{h \rightarrow 0} \frac{e^{k\alpha h} \sin(\pi + k\beta h)}{h}.$$
- (Hint:  $\sin(A + B) = \sin A \cos B + \sin B \cos A$ .)
- (c) Use your results from parts (a) and (b) to explain why it is necessary to use a unit vector in the definition of the directional derivative.
11. Let  $f(x)$  be a function of a single variable. Define the directional derivative of  $f$  in the direction of the unit vector  $\mathbf{u} = \langle \alpha \rangle$  at a point  $c$ . What are the only possible values for  $\alpha$ ?
12. Use your definition from Exercise 11 to show that the directional derivative of a function of a single variable  $f(x)$  at a point  $c$  in the direction of  $\mathbf{i}$  is  $f'(c)$  and that the directional derivative of  $f$  at  $c$  in the direction of  $-\mathbf{i}$  is  $-f'(c)$ .
13. What does it mean for a function of two variables,  $f(x, y)$ , to be differentiable at a point  $(a, b)$ ?
14. If the function  $f(x, y)$  is differentiable at a point  $(a, b)$ , explain why the tangent lines to the graph of  $f$  at  $(a, b)$  in the  $x$  and  $y$  directions are sufficient to determine the tangent plane to the surface.
15. Let  $\mathbf{u}_1$  and  $\mathbf{u}_2$  be two nonparallel unit vectors in  $\mathbb{R}^2$ . If the function  $f(x, y)$  is differentiable at a point  $(a, b)$ , explain why the tangent lines to the graph of  $f$  at  $(a, b)$  in the  $\mathbf{u}_1$  and  $\mathbf{u}_2$  directions are sufficient to determine the tangent plane to the surface.
16. What does it mean for a function of three variables,  $f(x, y, z)$ , to be differentiable at a point  $(a, b, c)$ ?
17. If the function  $f(x, y, z)$  is differentiable at a point  $(a, b, c)$ , explain why the tangent lines to the graph of  $f$  at  $(a, b, c)$  in the  $x$ ,  $y$ , and  $z$  directions are sufficient to determine the tangent hyperplane to the surface.
18. Let  $\mathbf{u}_1, \mathbf{u}_2$ , and  $\mathbf{u}_3$  be three unit vectors in  $\mathbb{R}^3$  that cannot be put into the same plane. If the function  $f(x, y, z)$  is differentiable at a point  $(a, b, c)$ , explain why the tangent lines to the graph of  $f$  at  $(a, b, c)$  in the  $\mathbf{u}_1, \mathbf{u}_2$ , and  $\mathbf{u}_3$  directions are sufficient to determine the tangent hyperplane to the surface.
19. Using Definition 12.30 as a model, provide a definition of differentiability for a function of  $n$  variables.
20. Using Theorem 12.31 as a model, provide a conjecture you think would be sufficient to guarantee that a function of  $n$  variables is differentiable at a point in its domain.

## Skills

In Exercises 21–28, find the directional derivative of the given function at the specified point  $P$  and in the direction of the given unit vector  $\mathbf{u}$ .

21.  $f(x, y) = x^2 - y^2$  at  $P = (2, 3)$ ,  $\mathbf{u} = \left\langle \frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2} \right\rangle$

22.  $f(x, y) = x^2 - y^2$  at  $P = (2, 3)$ ,  $\mathbf{u} = \frac{3}{5}\mathbf{i} - \frac{4}{5}\mathbf{j}$

23.  $f(x, y) = \frac{x}{y^2}$  at  $P = (-2, 1)$ ,  $\mathbf{u} = \left\langle \frac{\sqrt{10}}{10}, -\frac{3\sqrt{10}}{10} \right\rangle$

24.  $f(x, y) = \frac{x}{y^2}$  at  $P = (-2, 1)$ ,  $\mathbf{u} = -\frac{5}{13}\mathbf{i} + \frac{12}{13}\mathbf{j}$

25.  $f(x, y) = \sqrt{\frac{y}{x}}$  at  $P = (4, 9)$ ,  $\mathbf{u} = \left\langle -\frac{\sqrt{17}}{17}, -\frac{4\sqrt{17}}{17} \right\rangle$

26.  $f(x, y) = \sqrt{\frac{y}{x}}$  at  $P = (4, 9)$ ,  $\mathbf{u} = \frac{15}{17}\mathbf{i} + \frac{8}{17}\mathbf{j}$

27.  $f(x, y, z) = x^2 + y^2 - z^3$  at  $P = (2, -2, 2)$ ,  $\mathbf{u} = \left\langle \frac{3}{5}, 0, \frac{4}{5} \right\rangle$

28.  $f(x, y, z) = x^2 + y^2 - z^3$  at  $P = (2, -2, 2)$ ,

$$\mathbf{u} = \frac{2}{3}\mathbf{i} - \frac{2}{3}\mathbf{j} + \frac{1}{3}\mathbf{k}$$

In Exercises 29–34, find the equation of the line tangent to the surface at the given point  $P$  and in the direction of the given unit vector  $\mathbf{u}$ . Note that these are the same functions, points, and vectors as in Exercises 21–26.

29.  $f(x, y) = x^2 - y^2$  at  $P = (2, 3)$ ,  $\mathbf{u} = \left\langle \frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2} \right\rangle$

30.  $f(x, y) = x^2 - y^2$  at  $P = (2, 3)$ ,  $\mathbf{u} = \frac{3}{5}\mathbf{i} - \frac{4}{5}\mathbf{j}$

31.  $f(x, y) = \frac{x}{y^2}$  at  $P = (-2, 1)$ ,  $\mathbf{u} = \left\langle \frac{\sqrt{10}}{10}, -\frac{3\sqrt{10}}{10} \right\rangle$

32.  $f(x, y) = \frac{x}{y^2}$  at  $P = (-2, 1)$ ,  $\mathbf{u} = -\frac{5}{13}\mathbf{i} + \frac{12}{13}\mathbf{j}$

33.  $f(x, y) = \sqrt{\frac{y}{x}}$  at  $P = (4, 9)$ ,  $\mathbf{u} = \left\langle -\frac{\sqrt{17}}{17}, -\frac{4\sqrt{17}}{17} \right\rangle$

34.  $f(x, y) = \sqrt{\frac{y}{x}}$  at  $P = (4, 9)$ ,  $\mathbf{u} = \frac{15}{17}\mathbf{i} + \frac{8}{17}\mathbf{j}$

In Exercises 35–38, find the directional derivative of the given function at the specified point  $P$  and in the direction of the given vector  $\mathbf{v}$ .

35.  $f(x, y) = x^2 - y^2$  at  $P = (3, 3)$ ,  $\mathbf{v} = \langle -1, 5 \rangle$

36.  $f(x, y) = \frac{x}{y^2}$  at  $P = (9, -3)$ ,  $\mathbf{v} = 2\mathbf{i} + 7\mathbf{j}$

37.  $f(x, y) = \sqrt{\frac{y}{x}}$  at  $P = (1, 16)$ ,  $\mathbf{v} = \langle 2, -1 \rangle$

38.  $f(x, y, z) = x^2 + y^2 - z^3$  at  $P = (0, -2, 5)$ ,  $\mathbf{v} = -\mathbf{i} + 3\mathbf{j} + 5\mathbf{k}$

In Exercises 39–42, show that the directional derivative of the given function at the specified point  $P$  is zero for every unit vector  $\mathbf{u}$ .

39.  $f(x, y) = xy + 2x - y$  at  $P = (1, -2)$

40.  $f(x, y) = 3x^2 - 4xy + 2y^2$  at  $P = (0, 0)$

41.  $f(x, y) = (x + 1)y^2$  at  $P = (-1, 0)$

42.  $f(x, y, z) = x^2 + y^2 - z^3$  at  $P = (0, 0, 0)$

Find all points where the first-order partial derivatives of the functions in Exercises 43–54 are continuous. Then use Theorems 12.28 and 12.31 to determine the sets in which the functions are differentiable.

43.  $f(x, y) = x^2 - y^2$

44.  $f(x, y) = \frac{x}{y^2}$

45.  $f(x, y) = \frac{x}{x^2 + y^2 - 1}$

46.  $f(x, y) = \frac{x}{x^2 + y^2}$

47.  $f(x, y) = \sin(xy)$

48.  $f(x, y) = \cos(xy)$

49.  $f(x, y) = \tan(xy)$

50.  $f(x, y) = \tan(x + y)$

51.  $f(x, y) = \sqrt{\frac{y}{x}}$ ,  $x > 0$ ,  $y \geq 0$

52.  $f(x, y) = \ln(xy^2)$

53.  $f(x, y, z) = x^2 + y^2 - z^3$

54.  $f(x, y, z) = \frac{x}{y^2 + z^2}$

Use the first-order partial derivatives of the functions in Exercises 55–64 to find the equation of the plane tangent to

the graph of the function at the indicated point  $P$ . Note that these are the same functions as in Exercises 43–52.

55.  $f(x, y) = x^2 - y^2$ ,  $P = (1, -3)$

56.  $f(x, y) = \frac{x}{y^2}$ ,  $P = (-4, 7)$

57.  $f(x, y) = \frac{x}{x^2 + y^2}$ ,  $P = (-3, 0)$

58.  $f(x, y) = \frac{x}{x^2 + y^2 - 1}$ ,  $P = (1, -3)$

59.  $f(x, y) = \sin(xy)$ ,  $P = \left(2, \frac{\pi}{2}\right)$

60.  $f(x, y) = \cos(xy)$ ,  $P = (\pi, -3)$

61.  $f(x, y) = \tan(xy)$ ,  $P = \left(1, -\frac{\pi}{4}\right)$

62.  $f(x, y) = \tan(x + y)$ ,  $P = (0, \pi)$

63.  $f(x, y) = \sqrt{\frac{y}{x}}$ ,  $P = (1, 9)$

64.  $f(x, y) = \ln(xy^2)$ ,  $P = (1, -3)$

Use the first-order partial derivatives of the functions in Exercises 65 and 66 to find the equation of the hyperplane tangent to the graph of the function at the indicated point  $P$ . Note that these are the same functions as in Exercises 53 and 54.

65.  $f(x, y, z) = x^2 + y^2 - z^3$ ,  $P = (1, -5, 3)$

66.  $f(x, y, z) = \frac{x}{y^2 + z^2}$ ,  $P = (4, 0, 2)$

## Applications

67. Ian is travelling along a glacier on a line directly north-east. The elevation of the glacier in that area is described by the function

$$f(x, y) = 1.2 - 0.2x^2 - 0.3y^2 + 0.1xy - 0.25x,$$

where  $x$ ,  $y$ , and  $f$  are given in miles.

- If Ian is at the point  $(0, 0)$ , how steeply is he descending?
- In what direction would Ian have to turn in order to contour across (i.e., neither ascend nor descend) the glacier?

68. Alex is laying out a new road that will descend from the mountains near Boulder, Colorado. The local topography is described by the function

$$f(x, y) = 1.1 - 0.2x + 0.05y^2 + 0.1xy.$$

All distances are given in miles. The technical requirements for the road stipulate that the road must be built at a 6% grade. That is, the road will descend 6 feet for every 100 feet it travels horizontally. If Alex's current position is  $(-0.5, 0)$  and the road is going generally southeast, in which direction does he need to look to survey the next section of road?

## Proofs

- Let  $(a, b)$  be a point in the domain of the function of two variables,  $f(x, y)$ , and  $\mathbf{u}$  be a unit vector for which  $D_{\mathbf{u}}f(a, b)$  exists. Prove that  $D_{-\mathbf{u}}f(a, b) = -D_{\mathbf{u}}f(a, b)$ .
- Let  $f(x, y)$  be a function of two variables and  $k$  be a constant. Prove that if  $f$  is differentiable at the point  $(a, b)$  and  $D_{\mathbf{u}}f(a, b) = k$  for every unit vector  $\mathbf{u} \in \mathbb{R}^2$ , then  $k = 0$ .
- Let  $f(x, y)$  be a function of two variables. Prove that if  $f$  is differentiable at the point  $(a, b)$ , then there is a unit vector,  $\mathbf{u}$ , such that  $D_{\mathbf{u}}f(a, b) \neq 1$ . (Hint: See Exercise 70.)

## Thinking Forward

- ▶ *Paraboloid:* Sketch the paraboloid that is the graph of the function  $f(x, y) = 4 - x^2 - y^2$ . What is the point  $(a, b)$  at which the function attains its maximum value? What is the directional derivative  $D_{\mathbf{u}}f(a, b)$  for any unit vector  $\mathbf{u}$ ?
- ▶ *Hyperboloid:* Sketch the hyperboloid that is the graph of the function  $g(x, y) = x^2 - y^2$ . Does the function  $g$  have any extreme values? What is the directional derivative  $D_{\mathbf{u}}g(0, 0)$  for any unit vector  $\mathbf{u}$ ?

## 12.5 THE CHAIN RULE AND THE GRADIENT

- ▶ The chain rule for functions of two or more variables
- ▶ The gradient
- ▶ The gradient and directional derivatives

### The Chain Rule

In Theorem 12.29 we saw that if a function of two variables,  $f(x, y)$ , is differentiable at a point  $(x_0, y_0)$  in its domain, then the equation of the plane tangent to the surface is given by

$$f_x(x_0, y_0)(x - x_0) + f_y(x_0, y_0)(y - y_0) = z - f(x_0, y_0).$$

Just as a line tangent to the graph of a function of a single variable may be used to approximate the function close to the point of tangency, we may use the tangent plane to approximate a differentiable function of two variables. If we let  $\Delta x = x - x_0$ ,  $\Delta y = y - y_0$ , and  $\Delta z = z - f(x_0, y_0)$ , the previous equation becomes

$$\Delta z = f_x(x_0, y_0)\Delta x + f_y(x_0, y_0)\Delta y.$$

This equation may be interpreted to say that, close to the point of tangency, the difference between the value of the function  $f$  and the corresponding value on the tangent plane is approximately  $f_x(x_0, y_0)\Delta x + f_y(x_0, y_0)\Delta y$ . We will use this property to prove the chain rule for functions of two or more variables.

Recall that when  $y = f(x)$  is a function of the single variable  $x$ , and  $x$  is a function of another variable  $t$ , we may find the rate of change of  $f$  with respect to  $t$  with the chain rule,  $\frac{dy}{dt} = \frac{dy}{dx} \frac{dx}{dt}$ . If any of our functions is a function of two or more variables, we need to adapt the chain rule to fit the particular functions we have.

### THEOREM 12.32

#### Chain Rule (Version I)

Given functions  $z = f(x, y)$ ,  $x = u(t)$ , and  $y = v(t)$ , for all values of  $t$  at which  $u$  and  $v$  are differentiable, and if  $f$  is differentiable at  $(u(t), v(t))$ , then

$$\frac{dz}{dt} = \frac{\partial z}{\partial x} \frac{dx}{dt} + \frac{\partial z}{\partial y} \frac{dy}{dt}.$$

For example, if  $z = x^2 \sin y$ ,  $x = t^3$ , and  $y = e^{5t}$ , then

$$\frac{dz}{dt} = \frac{\partial z}{\partial x} \frac{dx}{dt} + \frac{\partial z}{\partial y} \frac{dy}{dt} = (2x \sin y)(3t^2) + (x^2 \cos y)(5e^{5t}).$$

Although this equation is correct, it is better to replace  $x$  and  $y$  with their respective functions of  $t$  and simplify the result:

$$\frac{dz}{dt} = (2(t^3) \sin(e^{5t}))(3t^2) + ((t^3)^2 \cos(e^{5t}))(5e^{5t}) = 6t^5 \sin(e^{5t}) + 5t^6 e^{5t} \cos(e^{5t}).$$

In Example 1 we verify this derivative by first replacing  $x$  and  $y$  with their respective functions of  $t$  and then taking the derivative of the resulting function.

**THEOREM 12.33****Chain Rule (Version II)**

Given functions  $z = f(x, y)$ ,  $x = u(s, t)$ , and  $y = v(s, t)$ , for all values of  $s$  and  $t$  at which  $u$  and  $v$  are differentiable, and if  $f$  is differentiable at  $(u(s, t), v(s, t))$ , then

$$\frac{\partial z}{\partial s} = \frac{\partial z}{\partial x} \frac{\partial x}{\partial s} + \frac{\partial z}{\partial y} \frac{\partial y}{\partial s} \quad \text{and} \quad \frac{\partial z}{\partial t} = \frac{\partial z}{\partial x} \frac{\partial x}{\partial t} + \frac{\partial z}{\partial y} \frac{\partial y}{\partial t}.$$

For example, if  $z = e^x \cos y$ ,  $x = s^2 t^3$ , and  $y = \frac{s}{t}$ , then

$$\frac{\partial z}{\partial s} = \frac{\partial z}{\partial x} \frac{\partial x}{\partial s} + \frac{\partial z}{\partial y} \frac{\partial y}{\partial s} = (e^x \cos y)(2st^3) + (-e^x \sin y) \left(\frac{1}{t}\right).$$

Again, although this equation is correct, it is better to replace  $x$  and  $y$  with their respective functions of  $s$  and  $t$  and simplify the result:

$$\frac{\partial z}{\partial s} = \left(e^{s^2 t^3} \cos\left(\frac{s}{t}\right)\right)(2st^3) + \left(-e^{s^2 t^3} \sin\left(\frac{s}{t}\right)\right)\left(\frac{1}{t}\right) = e^{s^2 t^3} \left(2st^3 \cos\left(\frac{s}{t}\right) - \frac{1}{t} \sin\left(\frac{s}{t}\right)\right).$$

In Example 2 we continue this example by finding  $\frac{\partial z}{\partial t}$  and verifying that both of these partial derivatives are correct by replacing  $x$  and  $y$  with their respective functions of  $s$  and  $t$  and then taking the partial derivatives of the resulting function.

We now prove Theorem 12.32. The proof of Theorem 12.33 is similar and is left for Exercise 65.

**Proof.** Let  $x = u(t)$ ,  $y = v(t)$ , and  $t_0$  be a point in the domains of both  $u$  and  $v$ , where the functions are differentiable and where  $f$  is differentiable at  $(x_0, y_0) = (u(t_0), v(t_0))$ . By Definition 12.27, at  $(x_0, y_0)$  we have

$$\Delta z = \frac{\partial f}{\partial x} \Delta x + \frac{\partial f}{\partial y} \Delta y + \epsilon_1 \Delta x + \epsilon_2 \Delta y,$$

where  $\epsilon_1 \rightarrow 0$  and  $\epsilon_2 \rightarrow 0$  as  $(\Delta x, \Delta y) \rightarrow (0, 0)$ . If we divide both sides of this equation by  $\Delta t$ , we obtain

$$\frac{\Delta z}{\Delta t} = \frac{\partial f}{\partial x} \frac{\Delta x}{\Delta t} + \frac{\partial f}{\partial y} \frac{\Delta y}{\Delta t} + \epsilon_1 \frac{\Delta x}{\Delta t} + \epsilon_2 \frac{\Delta y}{\Delta t}.$$

If we let  $\Delta x = u(t_0 + \Delta t) - u(t_0)$  and  $\Delta y = v(t_0 + \Delta t) - v(t_0)$ , then  $\Delta x \rightarrow 0$  and  $\Delta y \rightarrow 0$  as  $\Delta t \rightarrow 0$ . Consequently,  $\epsilon_1 \rightarrow 0$  and  $\epsilon_2 \rightarrow 0$  as  $\Delta t \rightarrow 0$ . Taking the limit of the quotients, we get:

$$\begin{aligned} \frac{dz}{dt} &= \lim_{\Delta t \rightarrow 0} \frac{\Delta z}{\Delta t} = \lim_{\Delta t \rightarrow 0} \left( \frac{\partial f}{\partial x} \frac{\Delta x}{\Delta t} + \frac{\partial f}{\partial y} \frac{\Delta y}{\Delta t} + \epsilon_1 \frac{\Delta x}{\Delta t} + \epsilon_2 \frac{\Delta y}{\Delta t} \right) \\ &= \frac{\partial f}{\partial x} \frac{dx}{dt} + \frac{\partial f}{\partial y} \frac{dy}{dt}. \end{aligned}$$

After examining Theorems 12.32 and 12.33, you may be able to guess that there is a more comprehensive version of the chain rule, which we state in the following theorem:

**THEOREM 12.34****Chain Rule (Complete Version)**

Given functions  $z = f(x_1, x_2, \dots, x_n)$  and  $x_i = u_i(t_1, t_2, \dots, t_m)$  for  $1 \leq i \leq n$ , for all values of  $t_1, t_2, \dots, t_m$  at which each  $u_i$  is differentiable, and if  $f$  is differentiable at  $(u_1(t_1, t_2, \dots, t_m), u_2(t_1, t_2, \dots, t_m), \dots, u_n(t_1, t_2, \dots, t_m))$ , then

$$\frac{\partial z}{\partial t_j} = \frac{\partial z}{\partial x_1} \frac{\partial x_1}{\partial t_j} + \frac{\partial z}{\partial x_2} \frac{\partial x_2}{\partial t_j} + \cdots + \frac{\partial z}{\partial x_n} \frac{\partial x_n}{\partial t_j}, \quad \text{for } 1 \leq j \leq m.$$

## The Gradient

In Section 12.6 we will be finding extrema for functions of two variables. Recall that the extreme values of a function of a single variable occur at the function's critical points (i.e., those points at which the derivative either is zero or does not exist). For functions of two variables, we will use the *gradient* of the function to find extrema.

### DEFINITION 12.35 The Gradient

Let  $z = f(x, y)$  be a function of two variables. The **gradient** of  $f$  is the vector function defined by

$$\nabla f(x, y) = \frac{\partial f}{\partial x} \mathbf{i} + \frac{\partial f}{\partial y} \mathbf{j} = \langle f_x(x, y), f_y(x, y) \rangle.$$

Similarly, if  $w = f(x, y, z)$  is a function of three variables, then the **gradient** of  $f$  is the vector function defined by

$$\nabla f(x, y, z) = \frac{\partial f}{\partial x} \mathbf{i} + \frac{\partial f}{\partial y} \mathbf{j} + \frac{\partial f}{\partial z} \mathbf{k} = \langle f_x(x, y, z), f_y(x, y, z), f_z(x, y, z) \rangle.$$

The domain of the gradient is the set of all points in the domain of  $f$  at which the partial derivatives exist.

The symbol  $\nabla f$  is read “the gradient of  $f$ ,” “grad  $f$ ,” or “del  $f$ .”

Recall that when the first-order partial derivatives of  $f$  are continuous in a neighborhood of a point  $P$ , the function is differentiable at  $P$ . Therefore, if the gradient of  $f$  is continuous in a neighborhood of a point  $P$ , the function is differentiable at  $P$ . In particular, a differentiable function of two variables,  $f(x, y)$ , can have an extreme value only at a point at which the gradient is the zero vector, since such points are the only places where the tangent plane might be horizontal (a necessary, but insufficient, condition for having an extreme). Therefore, our first step for locating extreme values will be to find those places where the gradient is zero. We see that for a function of two or three variables, the gradient plays the role that the derivative plays for functions of a single variable.

## Using the Gradient to Compute the Directional Derivative

In Section 12.4 we introduced the directional derivative and defined it in terms of a limit. As we will see in the following theorem, the gradient provides a shortcut for finding the directional derivative when the first-order partial derivatives of the function exist:

### THEOREM 12.36 The Gradient and the Directional Derivative

Let  $f(x, y)$  be a function of two variables and  $(x_0, y_0)$  be a point in the domain of  $f$  at which  $f$  is differentiable. Then, for every unit vector  $\mathbf{u} \in \mathbb{R}^2$ ,

$$D_{\mathbf{u}} f(x_0, y_0) = \nabla f(x_0, y_0) \cdot \mathbf{u}.$$

Similarly, if  $\mathbf{u} \in \mathbb{R}^3$  is a unit vector,  $f(x, y, z)$  is a function of three variables, and  $(x_0, y_0, z_0)$  is a point in the domain of  $f$  at which  $f$  is differentiable, then

$$D_{\mathbf{u}} f(x_0, y_0, z_0) = \nabla f(x_0, y_0, z_0) \cdot \mathbf{u}.$$

Recall that in Section 12.4 we used Definition 12.26 to find the directional derivative of the function  $f(x, y) = \frac{x^2}{y}$  at the point  $(-1, 2)$  in the direction of the unit vector  $\mathbf{u} = \left\langle \frac{3}{5}, -\frac{4}{5} \right\rangle$

and saw that  $D_{\mathbf{u}}f(-1, 2) = -\frac{2}{5}$ . We now compute the same derivative, but using Theorem 12.36. First we need the gradient of  $f$ :

$$\nabla f(x, y) = \frac{\partial f}{\partial x} \mathbf{i} + \frac{\partial f}{\partial y} \mathbf{j} = \frac{2x}{y} \mathbf{i} - \frac{x^2}{y^2} \mathbf{j}.$$

At  $(-1, 2)$ ,  $\nabla f(-1, 2) = -\mathbf{i} - \frac{1}{4}\mathbf{j}$ . Now, using the theorem, we have

$$D_{\mathbf{u}}f(-1, 2) = \nabla f(-1, 2) \cdot \mathbf{u} = \left(-\mathbf{i} - \frac{1}{4}\mathbf{j}\right) \cdot \left(\frac{3}{5}\mathbf{i} - \frac{4}{5}\mathbf{j}\right) = -\frac{2}{5}.$$

Although the computation using the definition was not terrible, Theorem 12.36 certainly saves time, particularly when the limit in the definition is difficult to work with.

We now prove Theorem 12.36.

**Proof.** We prove the theorem when  $f$  is a function of two variables and leave the case when  $f$  is a function of three variables for Exercise 66. By Definition 12.26 we have

$$D_{\mathbf{u}}f(x_0, y_0) = \lim_{h \rightarrow 0} \frac{f(x_0 + \alpha h, y_0 + \beta h) - f(x_0, y_0)}{h},$$

where  $\mathbf{u} = \langle \alpha, \beta \rangle$ . We now define the function  $F(h) = f(x_0 + \alpha h, y_0 + \beta h)$  and note that  $F$  is a function of the single variable  $h$ , because  $\alpha$ ,  $\beta$ ,  $x_0$ , and  $y_0$  are all constants. Thus,

$$D_{\mathbf{u}}f(x_0, y_0) = \lim_{h \rightarrow 0} \frac{F(h) - F(0)}{h} = F'(0),$$

by the definition of the derivative. If we let  $x = x_0 + \alpha \cdot h$  and  $y = y_0 + \beta \cdot h$ , then, by the chain rule, Theorem 12.32, it follows that

$$F'(h) = \frac{\partial f}{\partial x} \frac{\partial x}{\partial h} + \frac{\partial f}{\partial y} \frac{\partial y}{\partial h} = f_x(x, y)\alpha + f_y(x, y)\beta.$$

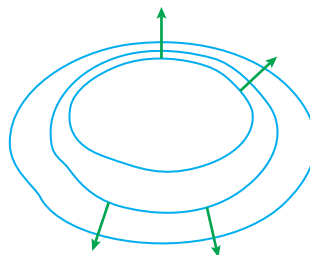

Now, when  $h = 0$ ,  $x = x_0$  and  $y = y_0$ . Thus, if we evaluate the equation for  $F'(h)$  at  $h = 0$ , we have

$$F'(0) = D_{\mathbf{u}}f(x_0, y_0) = f_x(x_0, y_0)\alpha + f_y(x_0, y_0)\beta = \nabla f(x_0, y_0) \cdot \mathbf{u},$$

the result we seek. ■

The gradient of a function  $f(x, y)$  gives us information about two important geometric properties of the function. Theorem 12.37 tells us that the gradient  $\nabla f$  points in the direction in which  $f$  increases most rapidly, and Theorem 12.38 says that the gradient at  $(x_0, y_0)$  is orthogonal to the level curve  $f(x, y) = c_0$ , where  $c_0 = f(x_0, y_0)$ . In the figure that follows, the green gradient vectors are orthogonal to the level curves and point in the direction in which the function increases most rapidly. Generally, that means that they point in the direction in which the level curves are most tightly spaced. If you are a hiker familiar with topographic maps, this is saying that the shortest path to the peak crosses the level curves quickly. It may be a difficult trek, but it does minimize the distance you have to travel.

*The gradient vectors are orthogonal to the level curves*

## THEOREM 12.37

**The Gradient Points in the Direction of Greatest Increase**

Let  $f$  be a function of two or three variables, and let  $P$  be a point in the domain of  $f$  at which  $f$  is differentiable. Then the gradient of  $f$  at  $P$  points in the direction in which  $f$  increases most rapidly.

**Proof.** We prove the theorem when  $f$  is a function of two variables and leave the case when  $f$  is a function of three variables for Exercise 74. By Theorem 12.36,

$$D_{\mathbf{u}}f(x_0, y_0) = \nabla f(x_0, y_0) \cdot \mathbf{u} = \|\nabla f(x_0, y_0)\| \|\mathbf{u}\| \cos \theta,$$

where  $\theta$  is the angle between the vectors  $\nabla f(x_0, y_0)$  and  $\mathbf{u}$ . Now, since  $\mathbf{u}$  is a unit vector,  $\|\mathbf{u}\| = 1$ . Thus,

$$D_{\mathbf{u}}f(x_0, y_0) = \|\nabla f(x_0, y_0)\| \cos \theta.$$

The quantity on the right is greatest when  $\theta = 0$ . Therefore, the directional derivative is greatest when  $\mathbf{u}$  is parallel to the gradient. ■

Going back to the function  $f(x, y) = \frac{x^2}{y}$ , we have  $\nabla f(-1, 2) = -\mathbf{i} - \frac{1}{4}\mathbf{j}$ . This vector points in the direction in which  $f$  increases most quickly at the point  $(-1, 2)$ , and the rate of change of  $f$  in that direction is the magnitude

$$\|\nabla f(-1, 2)\| = \left\| -\mathbf{i} - \frac{1}{4}\mathbf{j} \right\| = \sqrt{(-1)^2 + \left(-\frac{1}{4}\right)^2} = \frac{\sqrt{17}}{4}.$$

The function decreases most rapidly in the opposite direction,  $-\nabla f(-1, 2) = \mathbf{i} + \frac{1}{4}\mathbf{j}$ , and the rate of change of  $f$  in this direction is  $-\frac{\sqrt{17}}{4}$ .

## THEOREM 12.38

**Gradient Vectors are Orthogonal to Level Curves**

Let  $f$  be a function of two variables, and let  $(x_0, y_0)$  be a point in the domain of  $f$  at which  $f$  is differentiable. If  $\mathcal{C}$  is the level curve containing the point  $c_0 = f(x_0, y_0)$ , then  $\nabla f(x_0, y_0)$  and  $\mathcal{C}$  are orthogonal at  $f(x_0, y_0)$ .

**Proof.** Let  $x = g(t)$ ,  $y = h(t)$  be a parametrization for the level curve  $\mathcal{C}$  at height  $f(x_0, y_0) = c_0$  such that  $g(t_0) = x_0$  and  $h(t_0) = y_0$ . The curve  $\mathcal{C}$  has equation  $f(x, y) = c_0$ , or in terms of the parametrization,  $F(t) = f(g(t), h(t)) = c_0$ . Now, by Theorem 12.32 and the fact that  $F(t)$  is a constant function, we have

$$F'(t) = \frac{\partial f}{\partial x} \frac{\partial x}{\partial t} + \frac{\partial f}{\partial y} \frac{\partial y}{\partial t} = 0.$$

In particular, at  $t = t_0$

$$F'(t_0) = \nabla f(x_0, y_0) \cdot \langle g'(t_0), h'(t_0) \rangle = 0.$$

But  $\langle g'(t_0), h'(t_0) \rangle$  is the tangent vector to the level curve  $\mathcal{C}$  at  $t = t_0$ . Therefore, the equation tells us that the gradient at  $(x_0, y_0)$  and the level curve are orthogonal at  $f(x_0, y_0)$ . ■

## Examples and Explorations

## EXAMPLE 1

**Verifying a derivative (chain rule, version I)**

Let  $z = x^2 \sin y$ ,  $x = t^3$ , and  $y = e^{5t}$ . Verify that

$$\frac{dz}{dt} = 6t^5 \sin(e^{5t}) + 5t^6 e^{5t} \cos(e^{5t})$$

by replacing  $x$  and  $y$  with their respective functions of  $t$  and then taking the derivative of the resulting function.

**SOLUTION**

Earlier in the section we used Theorem 12.32 to obtain the derivative shown. Now we express  $z$  as a function of  $t$ :

$$z = (t^3)^2 \sin(e^{5t}) = t^6 \sin(e^{5t}).$$

Taking the derivative with respect to  $t$ , we have

$$\frac{dz}{dt} = 6t^5 \sin(e^{5t}) + 5t^6 e^{5t} \cos(e^{5t}). \quad \square$$

**EXAMPLE 2****Using the chain rule (version II) to find a partial derivative**

Let  $z = e^x \cos y$ ,  $x = s^2 t^3$ , and  $y = \frac{s}{t}$ . Earlier in the section we found  $\frac{\partial z}{\partial s}$ . Now we use Theorem 12.33 to find  $\frac{\partial z}{\partial t}$ , and then we verify that both of these partial derivatives are correct by replacing  $x$  and  $y$  with their respective functions of  $s$  and  $t$  and taking the appropriate partial derivatives of the resulting function.

**SOLUTION**

By Theorem 12.33,

$$\frac{\partial z}{\partial t} = \frac{\partial z}{\partial x} \frac{\partial x}{\partial t} + \frac{\partial z}{\partial y} \frac{\partial y}{\partial t} = (e^x \cos y)(3s^2 t^2) + (-e^x \sin y) \left(-\frac{s}{t^2}\right).$$

This result is correct, but it is preferable to write the function as a function of just  $s$  and  $t$ . We use  $x = s^2 t^3$  and  $y = \frac{s}{t}$  to do so:

$$\frac{\partial z}{\partial t} = \left(e^{s^2 t^3} \cos\left(\frac{s}{t}\right)\right)(3s^2 t^2) + \left(-e^{s^2 t^3} \sin\left(\frac{s}{t}\right)\right)\left(-\frac{s}{t^2}\right) = e^{s^2 t^3} \left(3s^2 t^2 \cos\left(\frac{s}{t}\right) + \frac{s}{t^2} \sin\left(\frac{s}{t}\right)\right).$$

To verify these partial derivatives, we first write  $z$  as a function of  $s$  and  $t$ ; that is,

$$z = e^{s^2 t^3} \cos\left(\frac{s}{t}\right).$$

We now find  $\frac{\partial z}{\partial s}$  and  $\frac{\partial z}{\partial t}$ , using the appropriate derivative rules:

$$\frac{\partial z}{\partial s} = 2st^3 e^{s^2 t^3} \cos\left(\frac{s}{t}\right) - \frac{1}{t} e^{s^2 t^3} \sin\left(\frac{s}{t}\right).$$

If we factor this equation, we obtain what we had earlier in the section, namely,

$$\frac{\partial z}{\partial s} = e^{s^2 t^3} \left(2st^3 \cos\left(\frac{s}{t}\right) - \frac{1}{t} \sin\left(\frac{s}{t}\right)\right).$$

Finally,

$$\frac{\partial z}{\partial t} = 3s^2 t^2 e^{s^2 t^3} \cos\left(\frac{s}{t}\right) + \frac{s}{t^2} e^{s^2 t^3} \sin\left(\frac{s}{t}\right).$$

This is equivalent to the result we obtained before. □

**EXAMPLE 3****Using the chain rule**

If  $w = f(x, y, z)$ ,  $x = u(s, t)$ ,  $y = v(s, t)$ , and  $z = w(s, t)$  are differentiable functions at every point in their domains, what are  $\frac{\partial w}{\partial s}$  and  $\frac{\partial w}{\partial t}$ ?

**SOLUTION**

We have

$$\frac{\partial w}{\partial s} = \frac{\partial w}{\partial x} \frac{\partial x}{\partial s} + \frac{\partial w}{\partial y} \frac{\partial y}{\partial s} + \frac{\partial w}{\partial z} \frac{\partial z}{\partial s} \quad \text{and} \quad \frac{\partial w}{\partial t} = \frac{\partial w}{\partial x} \frac{\partial x}{\partial t} + \frac{\partial w}{\partial y} \frac{\partial y}{\partial t} + \frac{\partial w}{\partial z} \frac{\partial z}{\partial t}. \quad \square$$

**EXAMPLE 4** Finding and interpreting the gradient

Find the gradient of each of the following functions:

$$(a) f(x, y) = e^y \sin\left(\frac{x}{y}\right) \qquad (b) g(x, y, z) = xy^2 - \frac{z}{xy^3}$$

Then find the direction in which the function  $f$  increases most rapidly at the point  $(\pi, 1)$  and the rate of change of  $f$  in that direction. Finally, find the direction in which  $g$  decreases most rapidly at the point  $(2, -1, 4)$  and the rate of change of  $g$  in that direction.

**SOLUTION**

(a) The gradient of  $f$  is

$$\nabla f(x, y) = \frac{e^y}{y} \cos\left(\frac{x}{y}\right) \mathbf{i} + e^y \left( \sin\left(\frac{x}{y}\right) - \frac{x}{y^2} \cos\left(\frac{x}{y}\right) \right) \mathbf{j}.$$

At  $(\pi, 1)$ ,  $\nabla f(\pi, 1) = e \cos(\pi) \mathbf{i} + e(\sin(\pi) - \pi \cos(\pi)) \mathbf{j} = -e\mathbf{i} + \pi e\mathbf{j}$ . This is the direction in which  $f$  increases most rapidly at  $(\pi, 1)$ , and the magnitude

$$\|\nabla f(\pi, 1)\| = \|-e\mathbf{i} + \pi e\mathbf{j}\| = \sqrt{e^2 + \pi^2 e^2} = e\sqrt{1 + \pi^2}$$

is the rate of change of  $f$  in that direction.

(b) The gradient of  $g$  is

$$\nabla g(x, y, z) = \left( y^2 + \frac{z}{x^2 y^3} \right) \mathbf{i} + \left( 2xy + \frac{3z}{xy^4} \right) \mathbf{j} - \frac{1}{xy^3} \mathbf{k}.$$

At  $(2, -1, 4)$ ,

$$\begin{aligned} \nabla g(2, -1, 4) &= \left( (-1)^2 + \frac{4}{2^2(-1)^3} \right) \mathbf{i} + \left( 2 \cdot 2 \cdot (-1) + \frac{3 \cdot 4}{2 \cdot (-1)^4} \right) \mathbf{j} - \frac{1}{2 \cdot (-1)^3} \mathbf{k} \\ &= 2\mathbf{j} + \frac{1}{2}\mathbf{k}. \end{aligned}$$

This is the direction in which  $g$  increases most rapidly at  $(2, -1, 4)$ , so  $g$  decreases most rapidly in the opposite direction,  $-2\mathbf{j} - \frac{1}{2}\mathbf{k}$ . The rate of decrease in this direction is the negative of the magnitude

$$\|\nabla g(2, -1, 4)\| = \sqrt{2^2 + (1/2)^2} = \frac{1}{2}\sqrt{17}. \quad \square$$

**EXAMPLE 5** Finding a function given its gradient

Find the function  $f(x, y)$  whose gradient is  $\nabla f(x, y) = (2x + x^2 y^2)e^{xy^2} \mathbf{i} + 2x^3 y e^{xy^2} \mathbf{j}$ .

**SOLUTION**

This is really the same type of problem we saw in Example 5 in Section 12.3. In that example we were given functions  $g(x, y)$  and  $h(x, y)$  and we used them to find a function  $f$  such that  $f_x(x, y) = g(x, y)$  and  $f_y(x, y) = h(x, y)$ . Now we have  $g(x, y) = f_x(x, y) = (2x + x^2 y^2)e^{xy^2}$  and  $h(x, y) = f_y(x, y) = 2x^3 y e^{xy^2}$ . Recall that, to ensure that such a function  $f$  existed, we showed that  $\frac{\partial g}{\partial y} = \frac{\partial h}{\partial x}$ . Here,

$$\frac{\partial}{\partial y} ((2x + x^2 y^2)e^{xy^2}) = (6x^2 y + 2x^3 y^3)e^{xy^2} = \frac{\partial}{\partial x} (2x^3 y e^{xy^2}),$$

so we should be able to find a function  $f$  with the given gradient.

Since the function  $2x^3ye^{xy^2}$  is slightly simpler than the other function, we choose to integrate this function with respect to  $y$  as the first step in finding  $f$ :

$$f(x, y) = \int 2x^3ye^{xy^2} dy = x^2e^{xy^2} + q(x).$$

(If you are wondering how we integrated this function, try a  $u$ -substitution with  $u = xy^2$ .) Next, to find  $q(x)$ , we differentiate  $f(x, y)$  with respect to  $x$  and ensure that the resulting derivative equals  $(2x + x^2y^2)e^{xy^2}$ . That is,

$$\frac{\partial}{\partial x}(x^2e^{xy^2} + q(x)) = (2x + x^2y^2)e^{xy^2} + q'(x).$$

Thus, we must have  $q'(x) = 0$  and  $q(x) = C$ , where  $C$  is a constant. We now have  $f(x, y) = x^2e^{xy^2} + C$ .  $\square$

### CHECKING THE ANSWER

We may check our answer by showing that for

$$f(x, y) = x^2e^{xy^2} + C, \quad \text{we have} \quad \nabla f(x, y) = (2x + x^2y^2)e^{xy^2}\mathbf{i} + 2x^3ye^{xy^2}\mathbf{j}.$$

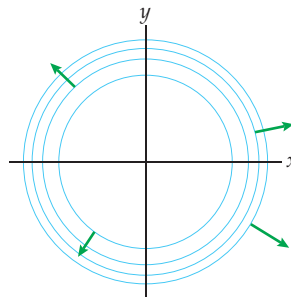

### EXAMPLE 6

#### Showing that gradient vectors are orthogonal to level curves

Show that the gradient vectors are orthogonal to the level curves for the function  $f(x, y) = x^2 + y^2$ .

#### SOLUTION

The graph of  $f(x, y) = x^2 + y^2$  is a paraboloid, each of whose level curves is a circle centered at the origin. The gradient is  $\nabla f(x, y) = 2x\mathbf{i} + 2y\mathbf{j}$ ; thus, every gradient vector points directly outward from the origin. For the point  $(x_0, y_0)$  the gradient is  $\nabla f(x_0, y_0) = 2x_0\mathbf{i} + 2y_0\mathbf{j}$ , and a tangent vector to the level curve containing the point  $(x_0, y_0)$  is  $y_0\mathbf{i} - x_0\mathbf{j}$ . The following figure shows the level curves  $x^2 + y^2 = c$  for  $c = 1, 2, 3$ , and 4.

The gradient vector and tangent vector are orthogonal.  $\square$

### ? TEST YOUR UNDERSTANDING

- ▶ If  $f$  is a function of variables  $x_1, x_2, \dots, x_n$ , and each of these variables is a function of  $t_1, t_2, \dots, t_m$ , how would we find  $\frac{\partial f}{\partial t_1}$ ? How many summands would there be in this partial derivative?
- ▶ What is the gradient? What does the gradient tell us about a function?
- ▶ If  $f$  is a function of two variables, what is the relationship between the gradient of  $f$  and the level curves of  $f$ ?
- ▶ How can the gradient be used to compute the directional derivative of a function?
- ▶ Given the gradient of a function of two variables, how would we find the function?

## EXERCISES 12.5

## Thinking Back

- *Chain rule:* If  $f$  is a function of  $x$  and  $x$  is a function of  $t$ , how is the chain rule used to find the rate of change of  $f$  with respect to  $t$ ?
- *Critical points:* What is the definition of a critical point for a function of a single variable? How do we use critical points to locate the extrema of the function?

## Concepts

0. *Problem Zero:* Read the section and make your own summary of the material.
1. *True/False:* Determine whether each of the statements that follow is true or false. If a statement is true, explain why. If a statement is false, provide a counterexample.
- (a) *True or False:* If  $z = f(x, y)$  and  $x = u(s, t)$ , then  $\frac{\partial z}{\partial s} = \frac{\partial z}{\partial x} \frac{\partial x}{\partial s}$ .
- (b) *True or False:* If  $z = f(x, y)$  and  $x = u(t)$ , then  $\frac{dz}{dt} = \frac{\partial z}{\partial x} \frac{dx}{dt}$ .
- (c) *True or False:* If  $z = f(x, y)$ , then  $\nabla f(x, y) = \frac{\partial z}{\partial x} + \frac{\partial z}{\partial y}$ .
- (d) *True or False:* If  $z = f(x, y)$  and  $\nabla f(1, 3) = \mathbf{0}$ , then the graph of  $f$  is differentiable at  $(1, 3)$ .
- (e) *True or False:* If  $z = f(x, y)$  and  $\mathbf{u}$  is a unit vector, then  $D_{\mathbf{u}}f(a, b) = \nabla f(a, b) \cdot \mathbf{u}$ .
- (f) *True or False:* If  $f(x, y, z)$  is differentiable at  $(a, b, c)$  and  $\mathbf{u} \in \mathbb{R}^3$  is a unit vector, then  $D_{\mathbf{u}}f(a, b, c) = \nabla f(a, b, c) \cdot \mathbf{u}$ .
- (g) *True or False:* If  $w = f(x, y, z)$  is differentiable at  $(a, b, c)$ , then  $-\nabla f(a, b, c)$  points in the direction in which  $f$  is decreasing most rapidly at  $(a, b, c)$ .
- (h) *True or False:* If  $z = f(x, y)$  is differentiable at  $(-1, 0)$ , and if  $f(-1, 0) = 4$ , then  $\nabla f(-1, 0)$  is orthogonal to the level curve  $f(x, y) = 4$  at  $(-1, 0)$ .
2. *Examples:* Construct examples of the thing(s) described in the following. Try to find examples that are different than any in the reading.
- (a) A function  $z = f(x, y)$  for which  $\nabla f(0, 0) = \mathbf{0}$  but  $f$  is not differentiable at  $(0, 0)$ .
- (b) A function  $z = f(x, y)$  for which  $\nabla f(0, 0) = \mathbf{0}$  for every point in  $\mathbb{R}^2$ .
- (c) A function  $z = f(x, y)$  and a unit vector  $\mathbf{u}$  such that  $D_{\mathbf{u}}f(0, 0) \neq \nabla f(0, 0) \cdot \mathbf{u}$ .
3. Let  $z = e^{-x}(3xy - 4x + y^2)$ ,  $x = \sin t$ , and  $y = \cos t$ .
- (a) Find  $\frac{dz}{dt}$  by using the Chain Rule, Theorem 12.32.
- (b) Find  $\frac{dz}{dt}$  by evaluating  $f(x(t), y(t)) = f(\sin t, \cos t)$  and taking the derivative of the resulting function.
- (c) Show that your answers from parts (a) and (b) are the same. Which method was easier?
4. Let  $z = e^{-xy^2}$ ,  $x = s \sin t$ , and  $y = s^2 \cos t$ .
- (a) Find  $\frac{\partial z}{\partial s}$  by using the Chain Rule, Theorem 12.33.
- (b) Find  $\frac{\partial z}{\partial s}$  by evaluating  $f(x(s, t), y(s, t)) = f(s \sin t, s^2 \cos t)$  and taking the partial derivative with respect to  $s$  of the resulting function.
- (c) Show that your answers from parts (a) and (b) are the same. Which method was easier?
5. Explain why the chain rule from Chapter 2 is a special case of Theorem 12.34 with  $n = 1$  and  $m = 1$ .
6. Explain why Theorem 12.32 is a special case of Theorem 12.34 with  $n = 2$  and  $m = 1$ .
7. Explain why Theorem 12.33 is a special case of Theorem 12.34 with  $n = 2$  and  $m = 2$ .
8. Consider the function  $f(x, y) = 2x + 3y$ .
- (a) Why is the graph of  $f$  a plane?
- (b) In what direction is  $f$  increasing most rapidly at the point  $(-1, 4)$ ?
- (c) In what direction is  $f$  increasing most rapidly at the point  $(x_0, y_0)$ ?
- (d) Why are your answers to parts (b) and (c) the same?
9. Continue with the function  $f(x, y) = 2x + 3y$  from Exercise 8.
- (a) What are the level curves of  $f$ ?
- (b) Show that every gradient vector,  $\nabla f(x, y)$ , is orthogonal to every level curve of  $f$ .
10. Consider the function  $f(x, y) = ax + by$ , where neither  $a$  nor  $b$  is zero.
- (a) Why is the graph of  $f$  a plane?
- (b) In what direction is  $f$  increasing most rapidly at the point  $(2, -3)$ ?
- (c) In what direction is  $f$  increasing most rapidly at the point  $(x_0, y_0)$ ?
- (d) Why are your answers to parts (b) and (c) the same?
11. Continue with the function  $f(x, y) = ax + by$  from Exercise 10.
- (a) What are the level curves of  $f$ ?
- (b) Show that every gradient vector,  $\nabla f(x, y)$ , is orthogonal to every level curve of  $f$ .
12. If a function  $f(x, y)$  is differentiable at  $(a, b)$ , explain how to use the gradient  $\nabla f(a, b)$  to find the equation of the plane tangent to the graph of  $f$  at  $(a, b)$ .
13. If a function  $f(x, y, z)$  is differentiable at  $(a, b, c)$ , explain how to use the gradient  $\nabla f(a, b, c)$  to find the equation of the hyperplane tangent to the graph of  $f$  at  $(a, b, c)$ .

14. Sketch level curves  $z = 1, 4, 9,$  and  $16$  for the function  $z = x^2 + y^2$ . Include the graphs of three gradient vectors on each level curve. What do you observe?
15. Sketch level curves  $z = 9, 16, 21,$  and  $24$  for the function  $z = 25 - x^2 - y^2$ . Include the graphs of three gradient vectors on each level curve. What do you observe?
16. Sketch level curves  $z = 1, 4, 9,$  and  $16$  for the function  $z = \frac{x^2}{4} + \frac{y^2}{9}$ . Include the graphs of three gradient vectors on each level curve. What do you observe?
17. Sketch level curves  $z = -1, 0,$  and  $1$  for the function  $z = x^2 - y^2$ . Include the graphs of three gradient vectors on each level curve. What do you observe?
18. When would you have to use the definition of the directional derivative rather than the shortcut  $D_{\mathbf{u}}f(x_0, y_0) = \nabla f(x_0, y_0) \cdot \mathbf{u}$ ?
19. Imagine using a topographic map to plan a hike on a mountain. If your hike stays on a single contour line, what does that mean about the difficulty of the hike? If you intentionally hike perpendicularly to the contour lines, what does *that* mean about the difficulty of the hike?
20. An isotherm is a curve on a weather map connecting points on the map that have the same temperature. From a point on an isotherm, which direction would result in the greatest temperature change?

## Skills

Use Theorem 12.32 to find the indicated derivatives in Exercises 21–26. Express your answers as functions of a single variable.

21.  $\frac{dz}{dt}$  when  $z = \sin x \cos y$ ,  $x = e^t$ , and  $y = t^3$ .
22.  $\frac{dz}{dt}$  when  $z = x^3 e^y$ ,  $x = \sin t$ , and  $y = \cos t$ .
23.  $\frac{dx}{dt}$  when  $x = r \cos \theta$ ,  $r = t^2 - 5$ , and  $\theta = t^3 + 1$ .
24.  $\frac{dy}{dt}$  when  $y = r \sin \theta$ ,  $r = t^3$ , and  $\theta = \sqrt{t}$ .
25.  $\frac{dr}{dt}$  when  $r = \sqrt{x^2 + y^2}$ ,  $x = \sqrt{t}$ , and  $y = t^2$ .
26.  $\frac{d\theta}{dt}$  when  $\theta = \tan^{-1}\left(\frac{y}{x}\right)$ ,  $x = e^t$ , and  $y = e^{2t}$ .

Use Theorem 12.33 to find the indicated derivatives in Exercises 27–30. Express your answers as functions of two variables.

27.  $\frac{\partial z}{\partial s}$  when  $z = x^2 y^3$ ,  $x = t \sin s$ , and  $y = s \cos t$ .
28.  $\frac{\partial z}{\partial t}$  when  $z = x^2 y^3$ ,  $x = t \sin s$ , and  $y = s \cos t$ .
29.  $\frac{\partial z}{\partial r}$  when  $z = (x^2 + xy)e^y$ ,  $x = r \cos \theta$ , and  $y = r \sin \theta$ .
30.  $\frac{\partial z}{\partial \theta}$  when  $z = (x^2 + xy)e^y$ ,  $x = r \cos \theta$ , and  $y = r \sin \theta$ .

Use Theorem 12.34 to find the indicated derivatives in Exercises 31–36. Be sure to simplify your answers.

31.  $\frac{dx}{dt}$  when  $x = \rho \sin \phi \cos \theta$ ,  $\rho = t^2$ ,  $\phi = t^3$ , and  $\theta = t^4$ .
32.  $\frac{dx}{dt}$  when  $x = \rho \sin \phi \sin \theta$ ,  $\rho = \sqrt{t}$ ,  $\phi = \sqrt[3]{t}$ , and  $\theta = \sqrt[4]{t}$ .
33.  $\frac{\partial w}{\partial \rho}$  when  $w = (x^2 + z)e^y$ ,  $x = \rho \sin \phi \cos \theta$ ,  $y = \rho \sin \phi \sin \theta$ ,  $z = \rho \cos \phi$ .
34.  $\frac{\partial w}{\partial \theta}$  when  $w = (x^2 + z)e^y$ ,  $x = \rho \sin \phi \cos \theta$ ,  $y = \rho \sin \phi \sin \theta$ ,  $z = \rho \cos \phi$ .
35.  $\frac{d\rho}{dt}$  when  $\rho = \sqrt{x^2 + y^2 + z^2}$ ,  $x = \sqrt{t}$ ,  $y = t^2$ ,  $z = t^3$ .
36.  $\frac{d\theta}{dt}$  when  $\theta = \tan^{-1}\left(\frac{yz}{x}\right)$ ,  $x = e^t$ ,  $y = e^{2t}$ ,  $z = e^{3t}$ .

Find the gradient of the given functions in Exercises 37–42.

37.  $z = x^2 \sin y + y \sin x$
38.  $z = \tan^{-1}\left(\frac{y}{x}\right)$
39.  $f(x, y) = \sqrt{x^2 + y^2}$
40.  $f(x, y) = y \sec^{-1}\left(\frac{1}{x}\right)$
41.  $f(x, y, z) = \sqrt{x^2 + y^2 + z^2}$
42.  $f(x, y, z) = \cos^{-1}\left(\frac{z}{\sqrt{x^2 + y^2 + z^2}}\right)$

In Exercises 43–48:

- (a) Find the direction in which the given function increases most rapidly at the specified point.
- (b) Find the rate of change of the function in the direction you found in part (a).
- (c) Find the direction in which the given function decreases most rapidly at the specified point.

Note: These are the same functions as in Exercises 37–42.

43.  $z = x^2 \sin y + y \sin x$  at  $(\pi, \frac{\pi}{2})$
44.  $z = \tan^{-1}\left(\frac{y}{x}\right)$  at  $(1, \sqrt{3})$
45.  $f(x, y) = \sqrt{x^2 + y^2}$  at  $(2, -3)$
46.  $f(x, y) = y \sec^{-1} x$  at  $(2, 5)$
47.  $f(x, y, z) = \sqrt{x^2 + y^2 + z^2}$  at  $(2, -1, -2)$
48.  $f(x, y, z) = \cos^{-1}\left(\frac{z}{\sqrt{x^2 + y^2 + z^2}}\right)$  at  $(\sqrt{10}, -1, 5)$

In Exercises 49–54, find the directional derivative of the given function at the specified point  $P$  and in the specified direction  $\mathbf{v}$ . Note that some of the direction vectors are *not* unit vectors.

49.  $z = e^x \tan y$ ,  $P = \left(0, \frac{\pi}{4}\right)$ ,  $\mathbf{v} = 3\mathbf{i} - \mathbf{j}$
50.  $z = 3x^4 - 5y^2$ ,  $P = (1, -2)$ ,  $\mathbf{v} = \left\langle \frac{5}{13}, -\frac{12}{13} \right\rangle$
51.  $z = \ln\left(\frac{x}{y^2}\right)$ ,  $P = (7, 1)$ ,  $\mathbf{v} = -\mathbf{i} - 4\mathbf{j}$
52.  $z = \sqrt{x^2 + y^2}$ ,  $P = (-3, 4)$ ,  $\mathbf{v} = \langle 4, -3 \rangle$

53.  $w = x \sin y \cos z$ ,  $P = \left(3, \frac{\pi}{4}, -\frac{\pi}{2}\right)$ ,  $\mathbf{v} = \mathbf{i} - 2\mathbf{j} + 3\mathbf{k}$
54.  $w = \ln\left(\frac{x^2}{yz}\right) + \ln\left(\frac{z}{xy}\right) - \ln\left(\frac{x}{y^2}\right)$ ,  $P = (3, 5, 8)$ ,  
 $\mathbf{v} = 13\mathbf{i} + 21\mathbf{j} + 34\mathbf{k}$

In Exercises 55–60, find a function of two variables with the given gradient.

55.  $\nabla f(x, y) = \left\langle -\frac{3}{x}, \frac{1}{y} \right\rangle$

56.  $\nabla f(x, y) = (2x + \cos x \cos y)\mathbf{i} - \sin x \sin y\mathbf{j}$
57.  $\nabla f(x, y) = -\frac{y}{x^2 + y^2}\mathbf{i} + \frac{x}{x^2 + y^2}\mathbf{j}$
58.  $\nabla f(x, y) = (y^2 e^{xy^2}, 2xy e^{xy^2})$
59.  $\nabla f(x, y) = \left\langle \frac{y}{(x+y)^2}, -\frac{x}{(x+y)^2} \right\rangle$
60.  $\nabla f(x, y) = \left(\frac{1}{y} - \frac{y}{x^2}\right)\mathbf{i} + \left(\frac{1}{x} - \frac{x}{y^2}\right)\mathbf{j}$

## Applications

61. Ian is travelling along a glacier. The elevation of the glacier in his area is described by the function

$$f(x, y) = 1.2 - 0.2x^2 - 0.3y^2 + 0.1xy - 0.25x,$$

where  $x$ ,  $y$ , and  $f$  are given in miles.

- (a) What is the direction that Ian would need to go to descend most steeply if he is at the point  $(0.5, -0.5)$ ?
- (b) In what direction would Ian have to turn in order to contour (i.e., neither ascend nor descend) across the glacier?

62. Emmy is tracking down another source of contamination at Hanford, this time in a warehouse containing numerous 55-gallon drums of waste. Detectors placed throughout the facility have measured a certain amount of radiation at different points. From these measurements, Emmy has constructed a polynomial approximation to the radiation given by

$$f(x, y) = -0.0156x^2 - 0.0392y^2 + 0.0268xy + 1.7x + 20,$$

where the radiation is measured in microrems per hour and the distances  $x$  and  $y$  are measured in feet from a corner of the warehouse. At what location in the warehouse should Emmy start her search for the contaminated drum?

## Proofs

63. Prove that  $\|\nabla f(x, y, z)\| = 1$  for every point in the domain of the function  $f(x, y, z) = \sqrt{x^2 + y^2 + z^2}$  except the origin.
64. Use at least two methods to prove that  $\frac{dr}{dt} = 0$  when  $r = \sqrt{x^2 + y^2}$ ,  $x = \alpha \cos t$ , and  $y = \alpha \sin t$  if  $\alpha$  is a constant.
65. Prove Theorem 12.33. That is, show that if  $z = f(x, y)$ ,  $x = u(s, t)$ , and  $y = v(s, t)$ , then, for all values of  $s$  and  $t$  at which  $u$  and  $v$  are differentiable, and if  $f$  is differentiable at  $(u(s, t), v(s, t))$ , it follows that

$$\frac{\partial z}{\partial s} = \frac{\partial z}{\partial x} \frac{\partial x}{\partial s} + \frac{\partial z}{\partial y} \frac{\partial y}{\partial s} \quad \text{and} \quad \frac{\partial z}{\partial t} = \frac{\partial z}{\partial x} \frac{\partial x}{\partial t} + \frac{\partial z}{\partial y} \frac{\partial y}{\partial t}.$$

66. Prove Theorem 12.36 when  $f$  is a function of three variables. That is, show that if  $(x_0, y_0, z_0)$  is a point in the domain of  $f(x, y, z)$  at which the first-order partial derivatives of  $f$  exist, and if  $\mathbf{u} \in \mathbb{R}^3$  is a unit vector for which the directional derivative  $D_{\mathbf{u}}f(x_0, y_0, z_0)$  also exists, then  $D_{\mathbf{u}}f(x_0, y_0, z_0) = \nabla f(x_0, y_0, z_0) \cdot \mathbf{u}$ .

In Exercises 67–72 you will prove several basic properties of the gradient for functions of two variables. In each exercise, assume that  $f$  and/or  $g$  is differentiable.

67. Prove that  $\nabla f = 0$  if  $f$  is the constant function  $f(x, y) = c$ .
68. Prove that  $\nabla(\alpha f)(x, y) = \alpha \nabla f(x, y)$ , where  $\alpha$  is a constant.

69. Prove that

$$\nabla(f(x, y) + g(x, y)) = \nabla f(x, y) + \nabla g(x, y).$$

70. Prove that

$$\nabla(\alpha f(x, y) + \beta g(x, y)) = \alpha \nabla f(x, y) + \beta \nabla g(x, y),$$

where  $\alpha$  and  $\beta$  are constants.

71. Prove that

$$\nabla(f(x, y)g(x, y)) = f(x, y)\nabla g(x, y) + g(x, y)\nabla f(x, y).$$

72. Prove that

$$\nabla\left(\frac{f(x, y)}{g(x, y)}\right) = \frac{g(x, y)\nabla f(x, y) - f(x, y)\nabla g(x, y)}{(g(x, y))^2},$$

where  $g(x, y) \neq 0$ .

73. Analogous properties hold for functions of three variables. What would you have to change in the proofs in Exercises 67–72 to make them work for functions of three variables?
74. Let  $f(x, y, z)$  be a function of three variables, and let  $P$  be a point in the domain of  $f$  at which  $f$  is differentiable. Prove that the gradient of  $f$  at  $P$  points in the direction in which  $f$  increases most rapidly. (This is Theorem 12.37.)

## Thinking Forward

- ▶ *The gradient at a maximum:* If a function of two variables,  $f(x, y)$ , is differentiable at a point  $(x_0, y_0)$  where the function has a maximum, what is  $\nabla f(x_0, y_0)$ ?
- ▶ *The gradient at a minimum:* If a function of three variables,  $f(x, y, z)$ , is differentiable at a point  $(x_0, y_0, z_0)$  where the function has a minimum, what is  $\nabla f(x_0, y_0, z_0)$ ?

## 12.6 EXTREME VALUES

- ▶ Local and global extrema of functions of two variables
- ▶ Critical points of functions of two variables
- ▶ Using critical points to find the local extrema of functions of two variables

### The Gradient at a Local Extremum

Many of the ideas in this section parallel the analogous concepts for functions of a single variable. It would be worthwhile to review the definitions of local extrema and critical points for functions of a single variable. Before proceeding in this section, we also suggest that you think about how the first- and second-derivative tests can be adapted for functions of two variables, if at all. Further, we suggest that when you are done with this section, think about how the concepts presented here might be adapted to analyze functions of three or more variables.

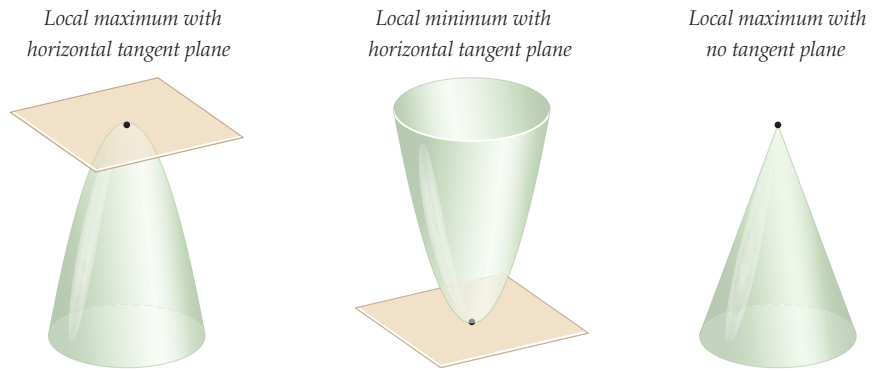

Suppose a function  $f(x, y)$  has a local maximum at some point  $(x_0, y_0)$ . This means that the value of  $f(x_0, y_0)$  is greater than or equal to all other “nearby” values of the function. More precisely, we have the following definition:

#### DEFINITION 12.39

#### Local and Global Extrema of a Function of Two Variables

- (a) A function  $f(x, y)$  has a **local** or **relative maximum** at  $(x_0, y_0)$  if  $f(x_0, y_0) \geq f(x, y)$  for every point  $(x, y)$  in some open disk containing  $(x_0, y_0)$ .
- (b) A function  $f(x, y)$  has a **local** or **relative minimum** at  $(x_0, y_0)$  if  $f(x_0, y_0) \leq f(x, y)$  for every point  $(x, y)$  in some open disk containing  $(x_0, y_0)$ .
- (c) A function  $f(x, y)$  has a **local** or **relative extremum** at  $(x_0, y_0)$  if  $f$  has either a local maximum or a local minimum at  $(x_0, y_0)$ .
- (d) A function  $f(x, y)$  has a **global** or **absolute maximum** at  $(x_0, y_0)$  if  $f(x_0, y_0) \geq f(x, y)$  for every point  $(x, y)$  in the domain of  $f$ .
- (e) A function  $f(x, y)$  has a **global** or **absolute minimum** at  $(x_0, y_0)$  if  $f(x_0, y_0) \leq f(x, y)$  for every point  $(x, y)$  in the domain of  $f$ .
- (f) A function  $f(x, y)$  has a **global** or **absolute extremum** at  $(x_0, y_0)$  if  $f$  has either a global maximum or a global minimum at  $(x_0, y_0)$ .

Clearly, every global extremum is also a local extremum. At a local extremum, the plane tangent to the function must be either horizontal or undefined. Consider the following three graphs:

When a function has a horizontal tangent plane at a point  $P$ , its gradient at  $P$  is zero. Such a point is called a **stationary point**. When a function is not differentiable at a point, its gradient there is either zero or undefined. Points at which either of these things occur are called **critical points**.

**DEFINITION 12.40****Stationary Points of a Function of Two Variables**

A point  $(x_0, y_0)$  in the domain of a function  $f(x, y)$  is called a **stationary point** of  $f$  if  $f$  is differentiable at  $(x_0, y_0)$  and  $\nabla f(x_0, y_0) = \mathbf{0}$ .

In the first two of the preceding three graphs, the functions have stationary points where the graphs have the horizontal tangent planes. The condition that  $f(x, y)$  needs to be differentiable at  $(x_0, y_0)$  is necessary, since  $\nabla f(x_0, y_0) = \mathbf{0}$  does not ensure that  $f$  is differentiable at  $(x_0, y_0)$ . Consider, for example, the function

$$f(x, y) = \begin{cases} 0, & \text{if } x = 0 \text{ or } y = 0 \\ 1, & \text{otherwise.} \end{cases}$$

In Section 12.4, we saw that  $\nabla f(0, 0) = \mathbf{0}$  but that  $f$  is *not* differentiable at the origin. Therefore,  $(0, 0)$  is not a stationary point for  $f$ .

**DEFINITION 12.41****Critical Points of a Function of Two Variables**

A point  $(x_0, y_0)$  in the domain of a function  $f(x, y)$  is called a **critical point** of  $f$  if  $(x_0, y_0)$  is a stationary point of  $f$  or if  $f$  is not differentiable at  $(x_0, y_0)$ .

Therefore, each of the three graphs shown before has a critical point at its local extremum. In fact, a local extremum can occur only at a critical point.

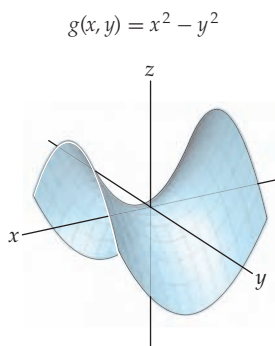

**THEOREM 12.42****Local Extrema Occur at Critical Points**

If  $f(x, y)$  has a local extremum at  $(x_0, y_0)$ , then  $(x_0, y_0)$  is a critical point of  $f$ .

The proof of Theorem 12.42 is similar to the proof of Theorem 3.3 in Section 3.1 and is left for Exercise 56.

The converse of Theorem 12.42 is not true. For example, consider the function  $g(x, y) = x^2 - y^2$ :

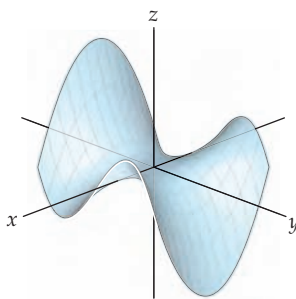

Here we have  $\nabla g(0, 0) = \mathbf{0}$ , but the function has neither a maximum nor a minimum at  $(0, 0)$ . This example leads us to the definition of a **saddle point**.

#### DEFINITION 12.43

##### Saddle Points of a Function of Two Variables

A point  $(x_0, y_0)$  in the domain of a function  $f(x, y)$  is called a **saddle point** of  $f$  if  $(x_0, y_0)$  is a stationary point of  $f$  at which there is neither a maximum nor a minimum.

The term “saddle point” comes from the fact that the graphs of the surfaces near the simplest saddle points look like saddles, as we see in the graph of  $g(x, y) = x^2 - y^2$ . However, the graphs near other saddle points can look far more complicated. For example, the graph of  $f(x, y) = x^2y - y^3$ , which also has a saddle point at the origin, is as follows:

## The Second-Derivative Test for Classifying Local Extrema

We will now discuss a method for determining whether a function has a local maximum, local minimum, or saddle point at each stationary point. This test uses the second-order partial derivatives of the function. You may be wondering why we are not starting by discussing a test that uses the first-order partial derivatives. The short answer is that such a test is somewhat impractical. You will explore the reason for that in Exercise 7.

Before we discuss the second-order partial derivative test, we define the *discriminant* of a function of two variables.

**DEFINITION 12.44****The Hessian and the Discriminant of a Function of Two Variables**

Let  $f(x, y)$  be a function with continuous second-order partial derivatives on some open set  $S$ .

(a) The *Hessian* of  $f$  is the  $2 \times 2$  matrix of second-order partial derivatives:

$$H_f = \begin{bmatrix} \frac{\partial^2 f}{\partial x^2} & \frac{\partial^2 f}{\partial y \partial x} \\ \frac{\partial^2 f}{\partial x \partial y} & \frac{\partial^2 f}{\partial y^2} \end{bmatrix}.$$

(b) The *discriminant* of  $f$  is the determinant of the Hessian. That is,

$$\det(H_f) = \frac{\partial^2 f}{\partial x^2} \frac{\partial^2 f}{\partial y^2} - \left( \frac{\partial^2 f}{\partial x \partial y} \right)^2.$$

Note that since we require that the second-order partial derivatives be continuous to form either the Hessian or the discriminant, the determinant of the Hessian matrix is equivalent to the discriminant because Theorem 12.23 guarantees the equality of the mixed second-order partial derivatives.

The discriminant of a function of two variables is a related function of two variables. For example, when  $f(x, y) = x^3 e^{2y}$ , we have the first-order partial derivatives

$$\frac{\partial f}{\partial x} = 3x^2 e^{2y} \quad \text{and} \quad \frac{\partial f}{\partial y} = 2x^3 e^{2y}$$

and the second-order partial derivatives

$$\frac{\partial^2 f}{\partial x^2} = 6x e^{2y}, \quad \frac{\partial^2 f}{\partial y^2} = 4x^3 e^{2y}, \quad \text{and} \quad \frac{\partial^2 f}{\partial x \partial y} = 6x^2 e^{2y}.$$

Therefore, the discriminant is

$$\det(H_f(x, y)) = (6x e^{2y})(4x^3 e^{2y}) - (6x^2 e^{2y})^2 = -12x^4 e^{4y}.$$

We finally note that the Hessian may be generalized to functions of three or more variables, although we will not be using the Hessian in these contexts. We will be using the Hessian and the discriminant to analyze the stationary points of a function of two variables. The Hessian of a function of three variables may be used in a similar manner.

**THEOREM 12.45****The Second-Order Partial-Derivative Test for Classifying Stationary Points**

Let  $f(x, y)$  be a function with continuous second-order partial derivatives on some open disk containing the point at  $(x_0, y_0)$ . If  $f$  has a stationary point at  $(x_0, y_0)$ , then

- (a)  $f$  has a relative maximum at  $(x_0, y_0)$  if  $\det(H_f(x_0, y_0)) > 0$  with  $f_{xx}(x_0, y_0) < 0$  or  $f_{yy}(x_0, y_0) < 0$ .
- (b)  $f$  has a relative minimum at  $(x_0, y_0)$  if  $\det(H_f(x_0, y_0)) > 0$  with  $f_{xx}(x_0, y_0) > 0$  or  $f_{yy}(x_0, y_0) > 0$ .
- (c)  $f$  has a saddle point at  $(x_0, y_0)$  if  $\det(H_f(x_0, y_0)) < 0$ .
- (d) If  $\det(H_f(x_0, y_0)) = 0$ , no conclusion may be drawn about the behavior of  $f$  at  $(x_0, y_0)$ .

Before we prove Theorem 12.45, we consider two examples. First, for the function

$$f(x, y) = x^2 + xy + y^2 + 3x - 6y,$$

we have  $f_x(x, y) = 2x + y + 3$  and  $f_y(x, y) = x + 2y - 6$ . When we solve the system of equations

$$2x + y + 3 = 0 \quad \text{and} \quad x + 2y - 6 = 0,$$

we find the only stationary point of  $f$ , namely,  $(-4, 5)$ . The second-order partial derivatives are  $f_{xx}(x, y) = 2$ ,  $f_{yy}(x, y) = 2$ , and  $f_{xy}(x, y) = 1$ . Therefore,  $\det(H_f(-4, 5)) = 2 \cdot 2 - 1^2 = 3$ . Since  $\det(H_f(-4, 5)) > 0$ ,  $f_{xx}(-4, 5) > 0$ , and  $f_{yy}(-4, 5) > 0$ , it follows by Theorem 12.45 that  $f$  has a local minimum at  $(-4, 5)$ .

Next, if we let  $g(x, y) = x^6 + y^6$ , then  $\nabla g(x, y) = 6x^5\mathbf{i} + 6y^5\mathbf{j}$ . The point  $(0, 0)$  is the only stationary point for  $g$ . The second-order partial derivatives are  $g_{xx}(x, y) = 30x^4$ ,  $f_{yy}(x, y) = 30y^4$ , and  $f_{xy}(x, y) = 0$ . Therefore,  $\det(H_g(0, 0)) = 0$ . Thus, no conclusion can be drawn from Theorem 12.45 about the behavior of  $g$  at the origin. However, since  $g(0, 0) = 0$  and  $g(x, y) > 0$  for every point in  $\mathbb{R}^2$  except the origin, we may deduce that  $g$  has an absolute minimum of 0 at the origin, without using the theorem.

We will prove Theorem 12.45 in a moment, but perhaps the following remarks will help explain the reasoning in the proof: Recall that the sign of the second derivative of a function of a single variable determines whether a function is concave up or concave down. Similarly, the sign of the second-order directional derivative  $D_{\mathbf{u}}(D_{\mathbf{u}}f(x, y)) = D_{\mathbf{u}}^2f(x, y)$  may be used to determine whether the function is concave up or concave down in the direction of the unit vector  $\mathbf{u}$ . If  $D_{\mathbf{u}}^2f(x_0, y_0) > 0$  for every unit vector at a stationary point  $(x_0, y_0)$ , then the function has a local minimum at the stationary point. Similarly, if  $D_{\mathbf{u}}^2f(x_0, y_0) < 0$  for every unit vector at the stationary point, then the function has a local maximum there.

One final note before we turn to the proof: Recall that the discriminant of a quadratic polynomial  $y = ax^2 + bx + c$  is the quantity  $b^2 - 4ac$  and the discriminant of a function of two variables is given in Definition 12.44. In the proof of Theorem 12.45, we use this term in both contexts.

**Proof.** In Exercise 55 you will prove that for a function  $f(x, y)$  with continuous second-order partial derivatives, the second directional derivative in the direction of the unit vector  $\mathbf{u} = (\alpha, \beta)$  is given by

$$D_{\mathbf{u}}^2f(x, y) = \alpha^2f_{xx}(x, y) + 2\alpha\beta f_{xy}(x, y) + \beta^2f_{yy}(x, y).$$

Now let  $(x_0, y_0)$  be a stationary point of  $f$ , and let

$$A = f_{xx}(x_0, y_0), \quad B = f_{xy}(x_0, y_0), \quad \text{and} \quad C = f_{yy}(x_0, y_0).$$

Before proceeding further, note that  $AC - B^2$  is the discriminant,  $\det(H_f(x_0, y_0))$ . We have

$$D_{\mathbf{u}}^2f(x_0, y_0) = \alpha^2A + 2\alpha\beta B + \beta^2C.$$

Now, if  $\alpha \neq 0$  and we let  $m = \frac{\beta}{\alpha}$ , then

$$D_{\mathbf{u}}^2f(x_0, y_0) = \alpha^2 \left( A + 2\frac{\beta}{\alpha}B + \left(\frac{\beta}{\alpha}\right)^2 C \right) = \alpha^2 (A + 2mB + m^2C).$$

The polynomial  $q(m) = A + 2Bm + Cm^2$  is a quadratic in  $m$  and has the same roots as  $D_{\mathbf{u}}^2f(x_0, y_0)$ . Now, if the discriminant,  $4B^2 - 4AC$ , of this polynomial is negative, then  $q(m)$  has no real roots. Thus, if  $AC - B^2 > 0$ , then  $q(m)$  has no real roots, and the sign of  $q(m)$  never changes. In order for  $AC - B^2$  to be positive, the signs of  $A$  and  $C$  must be the same. So, if  $A = f_{xx}(x_0, y_0)$ ,  $C = f_{yy}(x_0, y_0)$ , and  $AC - B^2 = \det(H_f(x_0, y_0))$  are all positive, the function is concave up in every direction at the stationary point  $(x_0, y_0)$ , and it follows that  $f$  has a local minimum at  $(x_0, y_0)$ . If  $A$  and  $C$  are both negative with  $AC - B^2 > 0$ , the function is concave down in every direction at  $(x_0, y_0)$ , and it follows that  $f$  has a local maximum at  $(x_0, y_0)$ . If  $AC - B^2 < 0$ , the polynomial  $q(m)$

has two real roots, and then the function  $f$  is concave up in some directions and concave down in other directions. Therefore,  $f$  has a saddle at the stationary point. If  $AC - B^2 = 0$ , we cannot draw any conclusions about the function. In Exercises 10-12 we ask you to show that a function can have a local maximum, local minimum, or saddle point when  $AC - B^2 = 0$ . Finally, if  $\alpha = 0$ , then  $\beta \neq 0$ , and we may modify the argument by factoring  $\beta^2$  instead of  $\alpha^2$  out of the equation for  $D_{\mathbf{u}}^2 f(x, y)$ . ■

## Examples and Explorations

### EXAMPLE 1

#### Finding and analyzing stationary points

Find the local extrema of the function  $f(x, y) = x^3 - 3xy - y^3$ . Classify each extreme point as a local or global minimum or maximum.

#### SOLUTION

Our function is a polynomial. Every polynomial in two variables is differentiable at every point in  $\mathbb{R}^2$ , so the only critical points of  $f$  will be stationary points. The gradient of  $f$  is

$$\nabla f(x, y) = (3x^2 - 3y)\mathbf{i} + (-3x - 3y^2)\mathbf{j}.$$

To find the stationary points, we look for the points that make the gradient  $\mathbf{0}$ . We look for solutions of the system of equations

$$3x^2 - 3y = 0 \quad \text{and} \quad -3x - 3y^2 = 0.$$

Using the first equation, we see that  $y = x^2$ . Substituting  $x^2$  for  $y$  in the second equation and simplifying, we obtain  $x(x^3 + 1) = 0$ . This equation has solutions  $x = 0$  and  $x = -1$ . Since  $x^2 = y$ , we have the two stationary points  $(0, 0)$  and  $(-1, 1)$ .

Now, the second-order partial derivatives of  $f$  are

$$f_{xx}(x, y) = 6x, \quad f_{yy}(x, y) = -6y, \quad \text{and} \quad f_{xy}(x, y) = -3.$$

The discriminant is  $\det(H_f(x, y)) = (6x)(-6y) - (-3)^2 = -36xy - 9$ . At the stationary points, we have  $\det(H_f(0, 0)) = -9$  and  $\det(H_f(-1, 1)) = 27$ . By Theorem 12.45, since  $\det(H_f(0, 0)) < 0$ , there is a saddle point at  $(0, 0)$ , and since  $\det(H_f(-1, 1)) > 0$  and  $f_{xx}(-1, 1) = -6 < 0$ ,  $f$  has a local maximum at  $(-1, 1)$ .

Finally, it is good to know if there is an absolute maximum at  $(-1, 1)$  or just a relative maximum. We have  $f(-1, 1) = 1$ , but when  $x = 0$ ,  $\lim_{y \rightarrow -\infty} f(0, y) = \lim_{y \rightarrow -\infty} (-y^3) = \infty$ .

Therefore,  $f$  has just a relative maximum at  $(-1, 1)$ . □

### EXAMPLE 2

#### Tabulating information about stationary points

Find the local extrema of the function  $g(x, y) = 3x^2y - 3y + y^3$ . Classify each extreme point as a local or global minimum or maximum.

#### SOLUTION

Again, the function is a polynomial, so the only critical points of  $g$  will be stationary points. The gradient of  $g$  is

$$\nabla g(x, y) = g_x(x, y)\mathbf{i} + g_y(x, y)\mathbf{j} = 6xy\mathbf{i} + (3x^2 - 3 + 3y^2)\mathbf{j}.$$

To find the stationary points, we look for solutions of the system of equations

$$6xy = 0 \quad \text{and} \quad 3x^2 - 3 + 3y^2 = 0.$$

From the first equation, we see that one of  $x$  and  $y$  must be zero. Substituting  $x = 0$  into the second equation and solving for  $y$ , we have  $y = \pm 1$ . Similarly, if  $y = 0$ , solving for  $x$  yields  $x = \pm 1$ . Thus, we have exactly four stationary points:  $(0, 1)$ ,  $(0, -1)$ ,  $(1, 0)$ , and  $(-1, 0)$ .

The second-order partial derivatives of  $g$  are

$$g_{xx}(x, y) = 6y, \quad g_{yy}(x, y) = 6y, \quad \text{and} \quad g_{xy}(x, y) = 6x.$$

The discriminant is  $\det(H_g(x, y)) = (6y)(6y) - (6x)^2 = 36(y^2 - x^2)$ . When there are several stationary points, it is convenient to tabulate the relevant information about the discriminant and second-order partial derivatives in order to classify the stationary points. Accordingly, we construct the following table:

$(x_0, y_0)$	$\det(H_g(x_0, y_0)) = 36(y_0^2 - x_0^2)$	$g_{xx}(x_0, y_0) = 6y_0$	$g(x_0, y_0)$	conclusion
$(0, 1)$	36	6	-2	minimum
$(0, -1)$	36	-6	2	maximum
$(1, 0)$	-36		0	saddle point
$(-1, 0)$	-36		0	saddle point

It remains to determine whether the function has an absolute minimum at  $(0, 1)$  or just a relative minimum, and an absolute maximum at  $(0, -1)$  or just a relative maximum. Note that when  $x = 0$ , we have the limits

$$\lim_{y \rightarrow \infty} g(0, y) = \lim_{y \rightarrow \infty} (-3y + y^3) = \infty \quad \text{and} \quad \lim_{y \rightarrow -\infty} g(0, y) = \lim_{y \rightarrow -\infty} (-3y + y^3) = -\infty.$$

Therefore,  $g$  has a relative minimum at  $(0, 1)$  and a relative maximum at  $(0, -1)$ .  $\square$

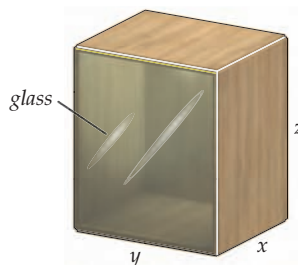

### EXAMPLE 3

#### Optimizing a function of two variables

Max is planning to construct a box with five wooden sides and a glass front. If the wood costs \$5 per square foot and the glass costs \$10 per square foot, what dimensions should Max use for the box to minimize the cost of the materials if the box needs to have a volume of 12 cubic feet?

#### SOLUTION

Following is a schematic of the box:

Using the dimensions in the figure and the fact that the volume of the box is to be 12 cubic feet, we have the constraint  $V = xyz = 12$  between the variables. The glass front has area  $yz$ . Therefore, the cost of the glass will be  $\$10yz$ . The back wooden face will cost  $\$5yz$ , the left and right sides will each cost  $\$5xz$ , and the top and bottom will each cost  $\$5xy$ . Thus,

in dollars, the cost of the box will be  $10xy + 10xz + 15yz$ . Now, from our constraint on the volume, we have  $z = \frac{12}{xy}$ , which we may use in our equation for the cost to rewrite our function with just two variables:

$$C(x, y) = 10xy + \frac{120}{y} + \frac{180}{x}, \quad \text{where } x > 0 \quad \text{and} \quad y > 0.$$

To find the stationary points, we find the first-order partial derivatives

$$C_x = 10y - \frac{180}{x^2} \quad \text{and} \quad C_y = 10x - \frac{120}{y^2}.$$

Setting these partial derivatives equal to zero and solving simultaneously, we obtain  $x = 3$  and  $y = 2$ . We also have the second-order partial derivatives

$$C_{xx} = \frac{360}{x^3}, \quad C_{yy} = \frac{240}{y^3}, \quad \text{and} \quad C_{xy} = 10.$$

Thus, the discriminant at  $(3, 2)$  is  $\det(H_C(3, 2)) = \left(\frac{360}{27}\right)\left(\frac{240}{8}\right) - 10^2 = 300 > 0$ , and since  $C_{xx}(3, 2) > 0$  as well, this stationary point gives us a minimum cost for the box. These values tell us that the glass should be a square 2 feet on each side and the other dimension of the box should be 3 feet.  $\square$

#### EXAMPLE 4

#### Using the derivative to find the distance from a point to a plane

In Theorem 10.39 in Chapter 10 we showed that the distance between a point  $P$  and a plane  $\mathcal{P}$  is given by  $\frac{|\mathbf{N} \cdot \overrightarrow{RP}|}{\|\mathbf{N}\|}$ , where  $R$  is any point in the plane and  $\mathbf{N}$  is a normal vector for  $\mathcal{P}$ . Use the minimization techniques discussed in this section to show that the distance from the point  $P(x_0, y_0, z_0)$  to the plane  $\mathcal{P}$  with equation  $ax + by + cz = d$  is also given by

$$\frac{|ax_0 + by_0 + cz_0 - d|}{\sqrt{a^2 + b^2 + c^2}}.$$

#### SOLUTION

Let  $(x, y, z)$  be an arbitrary point in the plane  $\mathcal{P}$ . We wish to minimize the distance from  $P$  to  $(x, y, z)$  given by

$$\text{distance} = \sqrt{(x - x_0)^2 + (y - y_0)^2 + (z - z_0)^2}.$$

However, as we have previously mentioned, if we minimize the square of the distance, we accomplish the same goal. We will minimize

$$\text{distance}^2 = (x - x_0)^2 + (y - y_0)^2 + (z - z_0)^2$$

subject to the constraint that  $ax + by + cz = d$ . Now, at least one of the coefficients  $a$ ,  $b$ , and  $c$  is nonzero. Without loss of generality, we assume that  $c \neq 0$ , so we have  $z = \frac{d - ax - by}{c}$ . Thus, we will minimize the function

$$D(x, y) = (x - x_0)^2 + (y - y_0)^2 + \left(\frac{d - ax - by}{c} - z_0\right)^2.$$

Here,

$$\nabla D = \left(2(x - x_0) - \frac{2a}{c} \left(\frac{d - ax - by}{c} - z_0\right)\right) \mathbf{i} + \left(2(y - y_0) - \frac{2b}{c} \left(\frac{d - ax - by}{c} - z_0\right)\right) \mathbf{j}.$$

Setting  $\nabla D = \mathbf{0}$  and solving for  $x$  and  $y$  is cumbersome, but the unique stationary point for  $D$  is

$$\left( \frac{ad - aby_0 - acz_0 + b^2x_0 + c^2x_0}{a^2 + b^2 + c^2}, \frac{bd - abx_0 - bcz_0 + a^2y_0 + c^2y_0}{a^2 + b^2 + c^2} \right).$$

In Exercise 13, you are asked to provide the details of this result. In Exercise 14, you are also asked to show that this point provides an absolute minimum for the function  $D$ . In Exercise 15, you are asked to show that this minimal value is  $\frac{(ax_0 + by_0 + cz_0 - d)^2}{a^2 + b^2 + c^2}$ , and we have the desired result.  $\square$

## ? TEST YOUR UNDERSTANDING

- ▶ What are stationary points? What are critical points? What are saddle points?
- ▶ Where do the local extrema of a function of two variables occur? How do we use the first-order partial derivatives to find local extrema?
- ▶ How do we use the second-order partial derivatives to classify the stationary points of a function of two variables?
- ▶ What is the main idea in the proof of Theorem 12.45 that is used to classify the stationary points of a function of two variables?
- ▶ How could the ideas from this section be adapted to find the extrema of functions of three variables? How would the definitions have to be modified? Could Theorem 12.45 be generalized to handle three variables?

## EXERCISES 12.6

### Thinking Back

- ▶ *First-Derivative Test:* Review the first-derivative test for functions of a single variable. Explain how the test works, what conditions a function must satisfy to make the test useful, and when, if ever, the test might fail.
- ▶ *Second-Derivative Test:* Review the second-derivative test for functions of a single variable. Explain how the test works, what conditions a function must satisfy to make the test useful, and when, if ever, the test might fail.

### Concepts

0. *Problem Zero:* Read the section and make your own summary of the material.
1. *True/False:* Determine whether each of the statements that follow is true or false. If a statement is true, explain why. If a statement is false, provide a counterexample.
  - (a) *True or False:* If  $\nabla f(a, b) = \mathbf{0}$ , then  $f$  has a stationary point at  $(a, b)$ .
  - (b) *True or False:* If  $(a, b)$  is a stationary point of a function  $f(x, y)$ , then  $(a, b)$  is a critical point of  $f$ .
  - (c) *True or False:* If  $(a, b)$  is a critical point of a function  $f(x, y)$ , then  $(a, b)$  is a stationary point of  $f$ .
  - (d) *True or False:* If  $(a, b)$  is a saddle point of a function  $f(x, y)$ , then  $(a, b)$  is a critical point of  $f$ .
  - (e) *True or False:* If  $f(x, y)$  has a local maximum at  $(a, b)$ , then  $f(a, b) > f(x, y)$  for every point in some open disk containing  $(a, b)$ .
  - (f) *True or False:* The function  $f(x, y) = \pi$  has an absolute minimum at every point in  $\mathbb{R}^2$ .
  - (g) *True or False:* A function  $f(x, y)$  can have an absolute maximum and an absolute minimum at every point in  $\mathbb{R}^2$ .
  - (h) *True or False:* If the graph of  $f(x, y)$  is a plane and  $D_{\mathbf{u}}f(a, b) \neq 0$  for some point  $(a, b)$ , then  $f$  has no extrema.
2. *Examples:* Construct examples of the thing(s) described in the following. Try to find examples that are different than any in the reading.
  - (a) A function of two variables with a local minimum at  $(1, -3)$ .
  - (b) A function of two variables with a point of nondifferentiability at  $(4, -5)$ .
  - (c) A function of two variables with a saddle point at  $(0, 0)$ .
3. How do you find the critical points of a function of two variables,  $f(x, y)$ ? What is the significance of the critical points?
4. What is a stationary point of a function of two variables,  $f(x, y)$ ? What, if anything, is the difference between a critical point and a stationary point of  $f$ ?
5. What is a saddle point of a function of two variables,  $f(x, y)$ ?

- Explain why every saddle point is both a stationary point and a critical point.
- Review the first-derivative test for a function of a single variable, set forth in Theorem 3.8 from Section 3.2. Explain why it might be difficult to design or implement an analogous test for a function of two or more variables.
- In the proof of Theorem 12.45 we argued that, for a unit vector  $\langle \alpha, \beta \rangle$ , if  $\alpha = 0$ , then  $\beta \neq 0$ . Explain why by finding the only possible values of  $\beta$ .
- In the proof of Theorem 12.45 we mentioned that if the quantity  $AC - B^2 > 0$ , then the signs of  $A$  and  $C$  are the same. Explain why.

Theorem 12.45 is inconclusive when the discriminant,  $\det(H_f)$ , is zero at a stationary point. In Exercises 10–12 we ask you to illustrate this fact by analyzing three functions of two variables with stationary points at the origin.

- Show that the function  $f(x, y) = x^4 + y^4$  has a stationary point at the origin. Show that the discriminant  $\det(H_f(0, 0)) = 0$ . Explain why  $f$  has an absolute minimum at the origin.
- Show that the function  $g(x, y) = -(x^4 + y^4)$  has a stationary point at the origin. Show that the discriminant  $\det(H_g(0, 0)) = 0$ . Explain why  $g$  has an absolute maximum at the origin.
- Show that the function  $h(x, y) = x^3 + y^3$  has a stationary point at the origin. Show that the discriminant  $\det(H_h(0, 0)) = 0$ . Show that there are points arbitrarily close to the origin such that  $h(x, y) > 0$ . Show that there are points arbitrarily close to the origin such that  $h(x, y) < 0$ . Explain why all this shows that  $h$  has a saddle at the origin.

In Exercises 13–16 we ask you to complete some of the details we omitted in Example 4.

- Show that the unique solution of the system of equations

$$2(x - x_0) - \frac{2a}{c} \left( \frac{d - ax - by}{c} - z_0 \right) = 0 \quad \text{and}$$

$$2(y - y_0) - \frac{2b}{c} \left( \frac{d - ax - by}{c} - z_0 \right) = 0$$

is

$$\left( \frac{ad - aby_0 - acz_0 + b^2x_0 + c^2x_0}{a^2 + b^2 + c^2}, \frac{bd - abx_0 - bcz_0 + a^2y_0 + c^2y_0}{a^2 + b^2 + c^2} \right).$$

- Use Theorem 12.45 to show that the point

$$\left( \frac{ad - aby_0 - acz_0 + b^2x_0 + c^2x_0}{a^2 + b^2 + c^2}, \frac{bd - abx_0 - bcz_0 + a^2y_0 + c^2y_0}{a^2 + b^2 + c^2} \right)$$

provides an absolute minimum for the function

$$D(x, y) = (x - x_0)^2 + (y - y_0)^2 + \left( \frac{d - ax - by}{c} - z_0 \right)^2.$$

- Show that the minimal value of

$$D(x, y) = (x - x_0)^2 + (y - y_0)^2 + \left( \frac{d - ax - by}{c} - z_0 \right)^2,$$

is  $\frac{(ax_0 + by_0 + cz_0 - d)^2}{a^2 + b^2 + c^2}$  by evaluating

$$D \left( \frac{ad - aby_0 - acz_0 + b^2x_0 + c^2x_0}{a^2 + b^2 + c^2}, \frac{bd - abx_0 - bcz_0 + a^2y_0 + c^2y_0}{a^2 + b^2 + c^2} \right).$$

- Let  $\mathcal{P}$  be the plane  $ax + by + cz = d$ ,  $\mathbf{N} = \langle a, b, c \rangle$  be the normal vector to  $\mathcal{P}$ ,  $R$  be a point on  $\mathcal{P}$ , and  $P$  be the point  $(x_0, y_0, z_0)$ . Show that the distance formula we derived for computing the distance from point  $P$  to plane  $\mathcal{P}$  in Chapter 10,  $\frac{|\mathbf{N} \cdot \overrightarrow{RP}|}{\|\mathbf{N}\|}$ , is equivalent to the distance formula we derived in Example 4. That is, show that

$$\frac{|\mathbf{N} \cdot \overrightarrow{RP}|}{\|\mathbf{N}\|} = \frac{|ax_0 + by_0 + cz_0 - d|}{\sqrt{a^2 + b^2 + c^2}}.$$

- Let  $P$  be the point  $(x_1, y_1, z_1)$ ,  $P_0$  be the point  $(x_0, y_0, z_0)$ ,  $\mathbf{d}$  be the vector  $\langle a, b, c \rangle$ , and  $\mathcal{L}$  be the line parametrized by  $\mathbf{r}(t) = \mathbf{P}_0 + t\mathbf{d}$ . In Chapter 10 we showed that the distance from  $P$  to  $\mathcal{L}$  is  $\frac{\|\mathbf{d} \times \overrightarrow{P_0P}\|}{\|\mathbf{d}\|}$ . Explain how to derive this distance formula by minimizing a function of a single variable.
- Show that  $f(x, y) = \sqrt{x^2 + y^2}$  has a critical point at  $(0, 0)$ . Explain why  $f$  has an absolute minimum at  $(0, 0)$  and why you cannot use Theorem 12.45 to show this.
- Every function of a single variable,  $f(x) = x^n$ , where  $n$  is a positive integer greater than 1 will have a critical point at  $x = 0$ . For which values of  $n$  will there be a relative minimum at  $x = 0$ ? For which values of  $n$  will there be an inflection point at  $x = 0$ ? Are there any other possibilities for the behavior of the function at  $x = 0$ ?
- Consider a function of two variables,  $f(x, y) = x^m y^n$ , where  $m$  and  $n$  are positive integers. What conditions do  $m$  and  $n$  have to satisfy in order for  $f$  to have a relative minimum at the origin? What conditions do  $m$  and  $n$  have to satisfy in order for  $f$  to have a saddle point at the origin? Are there any other possibilities for the behavior of the function at the origin? It may be helpful to refer to your answers to Exercise 19 before you answer this question.

## Skills

In Exercises 21–26, find the discriminant of the given function.

21.  $f(x, y) = e^{2x} \cos y$

22.  $g(x, y) = e^{-3x} \sin(2y)$

23.  $f(s, t) = s^3 e^{t/2}$

24.  $g(s, t) = s^2 t e^{-st^2}$

25.  $f(\theta, \phi) = \cos \theta \sin \phi$

26.  $g(\theta, \phi) = \cos \theta \cos \phi$

In Exercises 27–30, use the result from Example 4 to find the distance from the point  $P$  to the given plane.

27.  $P = (3, 5, -2)$ ,  $x - 3y + 4z = 8$

28.  $P = (-1, 3, 5)$ ,  $5x - 2y - 7z + 2 = 0$

29.  $P = (4, 0, -3)$ ,  $12y - 5z = 7$

30.  $P = (-3, 2, 6)$ ,  $x = 3y + 5z$

In Exercises 31–52, find the relative maxima, relative minima, and saddle points for the given functions. Determine whether the function has an absolute maximum or absolute minimum as well.

31.  $f(x, y) = 3x^2 + 3x + 6y^2 - 7$

32.  $g(x, y) = 4x^2 - 8xy + y^2 + 3y + 5$

33.  $f(x, y) = x^3 + y^3 - 12x - 3y + 15$

34.  $g(x, y) = x^3 + 6x^2 + 6y^2 - 4$

35.  $f(x, y) = x^3 - 12xy + y^3$

36.  $g(x, y) = x^4 - 8x^2y + y^4$

37.  $f(x, y) = 2x^2 - 2xy + 4y^2 + 3x + 9y - 5$

38.  $g(x, y) = 8x^3 - 3xy^2 + 2y^3 - 4x - 2$

39.  $f(x, y) = 8xy + \frac{1}{x} + \frac{1}{y}$

40.  $g(x, y) = e^x \cos y$

41.  $f(x, y) = x \sin y$

42.  $g(x, y) = x^2 + \sin y - 3$

43.  $f(x, y) = e^{x^2} \cos y$

44.  $g(x, y) = 5x - 4y^2 + x \ln y$ ,  $y > 0$

45.  $f(x, y) = e^{xy}$

46.  $g(x, y) = \frac{1}{x^2 + y^2}$

47.  $f(x, y) = \frac{1}{x^2 + y^2 - 1}$

48.  $g(x, y) = \frac{1}{x^2 + y^2 + 1}$

49.  $f(x, y) = x^2y^2$

50.  $g(x, y) = xy^2$

51.  $f(x, y) = x^3y^2$

52.  $g(x, y) = x^3y$

## Applications

53. Bob plans to build a rectangular wooden box. The plywood he will use for the bottom costs \$2 per square foot. The pine for the sides costs \$5 per square foot, and the oak for the top costs \$7 per square foot. What should the dimensions of the box be to minimize the cost of a box with a volume of 20 cubic feet?

54. Bob plans to build a rectangular wooden box. The wood he will use for the bottom costs \$A per square foot. The wood for the sides costs \$B per square foot, and the wood for the top costs \$C per square foot. What should the dimensions of the box be to minimize the cost of a box with a volume of  $V$  cubic feet?

## Proofs

55. Prove that for a function  $f(x, y)$  with continuous second-order partial derivatives, the second directional derivative in the direction of the unit vector  $\mathbf{u} = \langle a, b \rangle$  is given by

$$D_{\mathbf{u}}^2 f(x, y) = a^2 f_{xx}(x, y) + 2ab f_{xy}(x, y) + b^2 f_{yy}(x, y).$$

56. Prove Theorem 12.42. That is, show that if  $f(x, y)$  has a local extremum at  $(x_0, y_0)$ , then  $(x_0, y_0)$  is a critical point of  $f$ . (Hint: Consider the functions of a single variable,  $g(x) = f(x, y_0)$  and  $h(y) = f(x_0, y)$ .)

57. Prove that if the square of the distance from the point  $(x_0, y_0)$  to the line with equation  $ax + by = \gamma$  is minimized, then the distance from  $(x_0, y_0)$  to the line is also minimized.

58. Prove that if the square of the distance from the point  $(x_0, y_0)$  to the curve with equation  $g(x, y) = 0$  is minimized, then the distance from  $(x_0, y_0)$  to the curve is also minimized.

## Thinking Forward

► *A function without extrema:* What is the domain of the function  $f(x, y) = 3x - 4y$ ? Explain why  $f(x, y)$  has no local extrema on its domain.

► *Extrema on a closed and bounded set:* How could we find the maximum and minimum values of the function  $f(x, y) = 3x - 4y$  if we restrict the domain to the disk  $x^2 + y^2 \leq 1$ ?

## 12.7 LAGRANGE MULTIPLIERS

- ▶ Constrained extrema
- ▶ The method of Lagrange multipliers
- ▶ The Extreme Value Theorem for functions of two or more variables

### Constrained Extrema

In Example 3 of the previous section, we discussed how to construct a box with five sides made of wood and one side made of glass. We saw that if the wood costs \$5 per square foot and the glass costs \$10 per square foot, the cost of constructing the box is  $C(x, y) = 10xy + 10xz + 15yz$ . In Section 12.6, we discussed how to optimize functions of two independent variables. Fortunately, we were also told that the volume of the box was to be 12 cubic feet, giving the **constraint** equation  $12 = xyz$ . This constraint equation allowed us to eliminate one of the variables. In the example, we showed that the values  $x = 3$  and  $y = z = 2$  together minimize the function subject to the constraint. Now, consider the gradient of the function  $C(x, y, z) = 10xy + 10xz + 15yz$  at the point  $(3, 2, 2)$ . Since

$$\nabla C(x, y, z) = (10y + 10z)\mathbf{i} + (10x + 15z)\mathbf{j} + (10x + 15y)\mathbf{k},$$

we have  $\nabla C(3, 2, 2) = 40\mathbf{i} + 60\mathbf{j} + 60\mathbf{k}$ . In addition, if we write the constraint equation in the form  $g(x, y, z) = xyz - 12 = 0$ , we may also compute the gradient of this function at the point  $(3, 2, 2)$ . When we do, we obtain

$$\nabla g(x, y, z) = yz\mathbf{i} + xz\mathbf{j} + xy\mathbf{k} \quad \text{and} \quad \nabla g(3, 2, 2) = 4\mathbf{i} + 6\mathbf{j} + 6\mathbf{k}.$$

Note that  $\nabla C(3, 2, 2)$  is a multiple of  $\nabla g(3, 2, 2)$ . This is not a coincidence; it is a consequence of the main theorem of this section, presented next. The technique we discuss here is called the **method of Lagrange multipliers**, or, more simply, **Lagrange's method**. This technique tells us that the gradient of a function of several variables is always a scalar multiple of the gradient of the constraint equation at a point that optimizes the function.

#### THEOREM 12.46 The Method of Lagrange Multipliers

Let  $f$  and  $g$  be functions with continuous first-order partial derivatives. If  $f(x, y)$  has a relative extremum at a point  $(x_0, y_0)$  subject to the constraint  $g(x, y) = 0$ , then  $\nabla f(x_0, y_0)$  and  $\nabla g(x_0, y_0)$  are parallel. Thus, if  $\nabla g(x_0, y_0) \neq \mathbf{0}$ ,

$$\nabla f(x_0, y_0) = \lambda \nabla g(x_0, y_0)$$

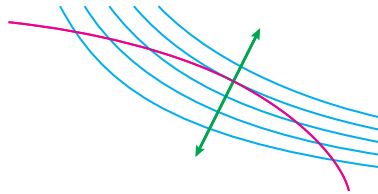

for some scalar  $\lambda$ .

Although we have stated Theorem 12.46 in terms of functions of two variables, it is also true if  $f$  and  $g$  are both functions of three or more variables.

#### DEFINITION 12.47 Lagrange Multiplier

The scalar  $\lambda$  mentioned in Theorem 12.46 is called a **Lagrange multiplier**.

The following figure shows a schematic illustrating Theorem 12.46.

The blue curves are level curves for a function  $f(x, y)$ . The red curve is the graph of a constraint equation  $g(x, y) = 0$ . At an extreme of  $f$  subject to the constraint, the gradients of both  $f$  and  $g$  are parallel. These are the green vectors shown in the figure.

Before we prove Theorem 12.46, we again consider our earlier example, to see how Lagrange's method works. We optimize the function  $C(x, y, z) = 10xy + 10xz + 15yz$  subject to the constraint  $g(x, y, z) = xyz - 12 = 0$ . We've seen that

$$\nabla C(x, y, z) = (10y + 10z)\mathbf{i} + (10x + 15z)\mathbf{j} + (10x + 15y)\mathbf{k} \quad \text{and} \quad \nabla g(x, y, z) = yz\mathbf{i} + xz\mathbf{j} + xy\mathbf{k}.$$

By Theorem 12.46, we must then have

$$\nabla C(x, y, z) = \lambda \nabla g(x, y, z)$$

for some constant  $\lambda$ . This equation gives rise to the following system of three equations with four unknowns:

$$\begin{aligned} 10y + 10z &= \lambda yz, \\ 10x + 15z &= \lambda xz, \quad \text{and} \\ 10x + 15y &= \lambda xy. \end{aligned}$$

We are unable to find a unique solution for such a system. We need a fourth equation relating the variables. Fortunately we have the constraint equation  $xyz = 12$ . The resulting system of four equations in four unknowns is nonlinear, since each of the original three equations has a term that is the product of three variables. Solving a nonlinear system can require numerical tricks. Indeed, many nonlinear systems of equations are impossible to solve exactly. Here, a little perseverance does pay off. It is often helpful to solve each of the equations involving  $\lambda$  for  $\lambda$  and equate the results. When we do this for the preceding system, we obtain

$$\lambda = \frac{10y + 10z}{yz} = \frac{10x + 15z}{xz} = \frac{10x + 15y}{xy},$$

or equivalently,

$$\frac{10}{z} + \frac{10}{y} = \frac{10}{z} + \frac{15}{x} = \frac{10}{y} + \frac{15}{x}.$$

Since  $\frac{10}{z} + \frac{15}{x} = \frac{10}{y} + \frac{15}{x}$ , we must have  $y = z$ , and since  $\frac{10}{z} + \frac{10}{y} = \frac{10}{z} + \frac{15}{x}$ , we must also have  $y = z = \frac{2}{3}x$ . Now, because  $xyz = 12$ , it follows that  $x = 3$  and  $y = z = 2$ , the same result we obtained in Section 12.6. Note that we did not solve the system for  $\lambda$ : The actual value of  $\lambda$  is not significant.

We are now ready to prove Theorem 12.46.

**Proof.** Let  $z = f(x, y)$  be the function of two variables that we wish to optimize subject to the constraint  $g(x, y) = 0$ . Assume that  $\nabla g(x, y) \neq \mathbf{0}$  for any point in the domain of  $g$ , let  $C$  be the curve determined by  $g(x, y) = 0$ , and let  $\mathbf{r}(t) = (x(t), y(t))$  be a parametrization for  $C$ . Along the curve  $C$ ,  $z$  may be expressed as a function of the single variable  $t$ :  $z = f(x(t), y(t))$ . By the chain rule, the derivative  $\frac{dz}{dt}$  is given by

$$\frac{dz}{dt} = \frac{\partial f}{\partial x} \frac{dx}{dt} + \frac{\partial f}{\partial y} \frac{dy}{dt},$$

or equivalently,

$$\frac{dz}{dt} = f_x(x, y)x'(t) + f_y(x, y)y'(t).$$

But note that  $\nabla f(x, y) = f_x(x, y)\mathbf{i} + f_y(x, y)\mathbf{j}$  and  $\mathbf{r}'(t) = x'(t)\mathbf{i} + y'(t)\mathbf{j}$  is the tangent function to the curve  $C$ . Now, if  $t_0$  is a point that optimizes  $f$  subject to the constraint  $g(x, y) = 0$ , then the derivative  $\left. \frac{dz}{dt} \right|_{t=t_0} = 0$ . So, at  $t_0$ , the dot product  $\nabla f(x(t_0), y(t_0)) \cdot \mathbf{r}'(t_0) = 0$ . Thus, the vectors  $\nabla f(x(t_0), y(t_0))$  and  $\mathbf{r}'(t_0)$  are orthogonal. But by Theorem 12.38,  $\nabla g(x(t_0), y(t_0))$  is also orthogonal to  $C$  at  $(x(t_0), y(t_0))$ . Therefore,  $\nabla f(x(t_0), y(t_0))$  and  $\nabla g(x(t_0), y(t_0))$  are parallel, since they are orthogonal to the same vector. ■

## Optimizing a Function on a Closed and Bounded Set

Recall that the Extreme Value Theorem tells us that every continuous function on a closed interval will have both a maximum value and a minimum value on the interval. We have the following analogous theorem for functions of two variables:

### THEOREM 12.48

#### The Extreme Value Theorem for a Function of Two Variables

Let  $f$  be a continuous function of two variables defined on the closed and bounded set  $S$ . Then there exist points  $(x_M, y_M)$  and  $(x_m, y_m)$  in  $S$  such that  $f(x_M, y_M)$  is the maximum value of  $f$  on  $S$  and  $f(x_m, y_m)$  is the minimum value of  $f$  on  $S$ .

The proof of Theorem 12.48 lies outside the scope of this text. An analogous theorem also holds when  $f$  is a function of more than two variables, and we will use that theorem when appropriate.

Given a continuous function  $f$  defined on a closed and bounded set  $S$ , we may use the following outline to find those points  $(x_M, y_M)$  and  $(x_m, y_m)$  which maximize and minimize  $f$  on  $S$ :

1. Find the stationary points and other critical points of  $f$ .
2. Select only those critical points that lie in  $S$ .
3. Evaluate the function at each of the critical points found in step 2.
4. Use the method of Lagrange multipliers to locate the points on the boundary of  $S$  that maximize and minimize  $f$ .
5. Evaluate the function at each of the critical points on the boundary of  $S$ .
6. Use the extrema from steps 3 and 5 to find the maximum and minimum values of the function  $f$  on  $S$ .

## Optimizing a Function with Two Constraints

We may extend the ideas of this section to optimize a function of three variables,  $w = f(x, y, z)$ , subject to two constraints. In this context, the constraints,  $g(x, y, z) = 0$  and  $h(x, y, z) = 0$ , define surfaces in  $\mathbb{R}^3$ . Assuming that these surfaces intersect in a curve, we would be attempting to find the maximum and minimum values of  $f$  on this curve of intersection. To do this, we attempt to solve the system given by

$$\nabla f(x_0, y_0, z_0) = \lambda \nabla h(x_0, y_0, z_0) + \mu \nabla g(x_0, y_0, z_0),$$

where  $\lambda$  and  $\mu$  are both Lagrange multipliers. (See Example 5.)

## Examples and Explorations

## EXAMPLE 1

## Optimizing a function subject to a constraint

Find the maximum and minimum of the function  $f(x, y) = xy$  subject to the constraint  $x^2 + 4y^2 = 16$ .

## SOLUTION

We could solve the equation  $x^2 + 4y^2 = 16$  for either  $x$  or  $y$  and use the resulting equation to rewrite the function  $f$  in terms of a single variable. However, we will use Lagrange's method to optimize the function. We start by writing the constraint in the form  $g(x, y) = x^2 + 4y^2 - 16 = 0$  and find

$$\nabla f(x, y) = y\mathbf{i} + x\mathbf{j} \quad \text{and} \quad \nabla g(x, y) = 2x\mathbf{i} + 8y\mathbf{j}.$$

We now set up the system of equations determined by  $\nabla f(x, y) = \lambda \nabla g(x, y)$ , where  $\lambda$  is a constant. Here we have

$$y = 2\lambda x \quad \text{and} \quad x = 8\lambda y.$$

Our third equation relating the variables is the constraint equation  $x^2 + 4y^2 = 16$ . We solve each of the two equations for  $\lambda$  and equate the results:

$$\frac{y}{2x} = \lambda = \frac{x}{8y}.$$

We may now deduce that  $x^2 = 4y^2$ . Using this relationship in the constraint equation, we find that  $2x^2 = 16$ . Therefore,  $x = \pm 2\sqrt{2}$ , and from this we have  $y = \pm\sqrt{2}$ . Thus, we have the four pairs of coordinates

$$(2\sqrt{2}, \sqrt{2}), (2\sqrt{2}, -\sqrt{2}), (-2\sqrt{2}, \sqrt{2}), \quad \text{and} \quad (-2\sqrt{2}, -\sqrt{2}).$$

Finally, we evaluate the function  $f(x, y)$  at each of these points and obtain

$$f(2\sqrt{2}, \sqrt{2}) = 4, \quad f(2\sqrt{2}, -\sqrt{2}) = -4, \quad f(-2\sqrt{2}, \sqrt{2}) = -4, \quad \text{and} \quad f(-2\sqrt{2}, -\sqrt{2}) = 4.$$

The maximum value of  $f$  subject to the constraint is 4. This maximum occurs at both  $(2\sqrt{2}, \sqrt{2})$  and  $(-2\sqrt{2}, -\sqrt{2})$ . The minimum value of the function is  $-4$ . The minimum occurs at both  $(-2\sqrt{2}, \sqrt{2})$  and  $(2\sqrt{2}, -\sqrt{2})$ .  $\square$

 CHECKING THE ANSWER

We may check our answers by evaluating the gradients of  $f$  and  $g$  at the points we just found and showing that they are indeed parallel. For example, since

$$\nabla f(x, y) = y\mathbf{i} + x\mathbf{j} \quad \text{and} \quad \nabla g(x, y) = 2x\mathbf{i} + 8y\mathbf{j},$$

we have

$$\nabla f(2\sqrt{2}, \sqrt{2}) = \sqrt{2}\mathbf{i} + 2\sqrt{2}\mathbf{j} \quad \text{and} \quad \nabla g(2\sqrt{2}, \sqrt{2}) = 4\sqrt{2}\mathbf{i} + 8\sqrt{2}\mathbf{j}.$$

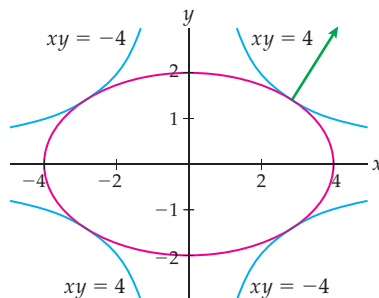

Note that  $\nabla f(2\sqrt{2}, \sqrt{2}) = \frac{1}{4}\nabla g(2\sqrt{2}, \sqrt{2})$ . The gradients are indeed parallel when  $(x, y) = (2\sqrt{2}, \sqrt{2})$ . Similarly, at each of the other three points we found in Example 1, we have  $\nabla f(x_0, y_0) = \frac{1}{4}\nabla g(x_0, y_0)$ .

**EXAMPLE 2****Analyzing the result of an optimization problem**

Analyze the result of Example 1 by graphing the level curves of the function  $f(x, y) = xy$  corresponding to the constrained extrema, along with the constraint equation  $x^2 + 4y^2 = 16$ .

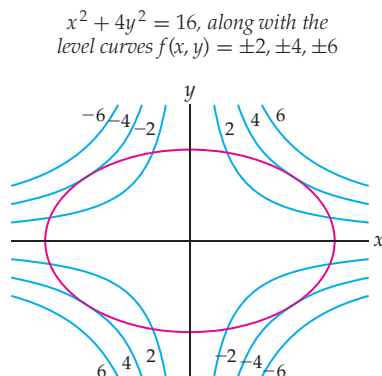

**SOLUTION**

In Example 1 we found that the maximum and minimum of  $f(x, y) = xy$  subject to the constraint  $x^2 + 4y^2 = 16$  were 4 and  $-4$ , respectively. We graph the level curves  $xy = 4$  and  $xy = -4$  along with the following ellipse, which is the graph of the equation  $x^2 + 4y^2 = 16$ :

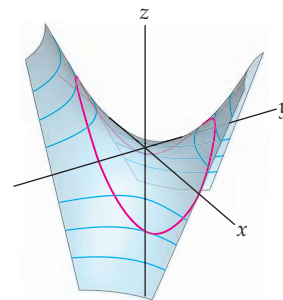

Note that the level curves and the ellipse are tangent at the maxima and minima. In the first and third quadrants, the level curve is the graph of  $xy = 4$ . This graph intersects the ellipse at  $(2\sqrt{2}, \sqrt{2})$  and  $(-2\sqrt{2}, -\sqrt{2})$ . Since the curves are tangent at these two points, the gradients of the two curves would be orthogonal to the curves at those points. Therefore, the gradients would be parallel at those points. We show only one of these gradients in the preceding figure, because they overlap.

The figure that follows at the left shows the ellipse, together with four additional level curves of the function  $f$ . Note that the ellipse is tangent only to the level curves  $f(x, y) = 4$  and  $f(x, y) = -4$ .

The graph of  $f(x, y) = xy$  restricted to  $x^2 + 4y^2 = 16$

The figure at the right shows the graph of the surface defined by  $f(x, y) = xy$ , together with the curve on that surface resulting from the constraint  $x^2 + 4y^2 = 16$ . On this graph, you see the two maxima and two minima that we found.  $\square$

**EXAMPLE 3****Understanding the difference between a function and a constraint**

Find the maximum and minimum of the function  $f(x, y) = x^2 + 4y^2 - 16$  subject to the constraint  $xy = 0$ .

**SOLUTION**

Here we have reversed the roles of the function and the constraint given in Example 1. We could proceed as outlined before, but note that since we now have the constraint  $xy = 0$ , either  $x$  or  $y$  must be zero. If  $x = 0$ , then  $f(0, y) = 4y^2 - 16$ , which has minimum value  $-16$  when  $y = 0$ , but no maximum value, since the function increases without bound as  $y \rightarrow \pm\infty$ . Similarly, if  $y = 0$ , then  $f(x, 0) = x^2 - 16$ . Again, there is a minimum of  $-16$  when  $x = 0$  and no maximum value. Therefore, subject to the constraint, the function  $f(x, y) = x^2 + 4y^2 - 16$  has a minimum of  $-16 = f(0, 0)$  and no maximum value.

Our point here is that if you confuse the function and the constraint, you may obtain vastly different results. Make sure that you understand which function you are trying to optimize and which function is your constraint.  $\square$

**EXAMPLE 4****Optimizing a function on a closed and bounded domain**

Find the maximum and minimum of the function  $f(x, y) = x^3 + 9x^2 + 6y^2$  on the region  $x^2 + y^2 \leq 9$ .

**SOLUTION**

Since  $f$  is a polynomial, the only critical points of  $f$  are stationary points. We have  $\nabla f(x, y) = (3x^2 + 18x)\mathbf{i} + 12y\mathbf{j}$ . The stationary points of  $f$  will satisfy the equations

$$3x(x + 6) = 0 \quad \text{and} \quad 12y = 0.$$

The only points satisfying these two equations are  $(0, 0)$  and  $(-6, 0)$ . Of these points, only  $(0, 0)$  satisfies the inequality  $x^2 + y^2 \leq 9$ , so it is a point where the maximum or minimum may occur. We ignore the other point, since it is outside the domain.

We now consider points on the boundary of the region. These points are given by the constraint  $x^2 + y^2 = 9$ . We let  $g(x, y) = x^2 + y^2 - 9 = 0$ . Now,  $\nabla g(x, y) = 2x\mathbf{i} + 2y\mathbf{j}$ . By Lagrange's method, we have the system of equations  $3x^2 + 18x = 2\lambda x$  and  $12y = 2\lambda y$ . From the second of these equations, we see that either  $y = 0$  or  $\lambda = 6$ . If  $y = 0$ , then by the constraint equation,  $x = \pm 3$ . Using  $\lambda = 6$  in the first of the equations, we have  $3x^2 + 6x = 0$ , so either  $x = -2$  or  $x = 0$ . Again using the constraint when  $x = -2$ , we obtain  $y = \pm\sqrt{5}$ , and when  $x = 0$ , we have  $y = \pm 3$ .

We now have a list of seven points where the maximum and minimum of the function on the given domain may occur:

$$(0, 0), (3, 0), (-3, 0), (-2, \sqrt{5}), (-2, -\sqrt{5}), (0, 3), \quad \text{and} \quad (0, -3).$$

When we evaluate the function at these seven points, we see that

$$f(0, 0) = 0, \quad f(3, 0) = 108, \quad f(-3, 0) = 54, \quad f(-2, \pm\sqrt{5}) = 58, \quad \text{and} \quad f(0, \pm 3) = 54.$$

We see that the maximum of  $f$  on the region is 108 and the minimum of the function on the region is 0. Note that it was *not* necessary to use the second-derivative test to analyze  $f$  at  $(0, 0)$ , since we were looking for the maximum and minimum of the function on the given region and we had to analyze the behavior of  $f$  only at the finite number of points we obtained in the previous steps. When we evaluated the function at the seven points we found, the minimum value of the function and the maximum value of the function at those points had to give the two values we wanted.

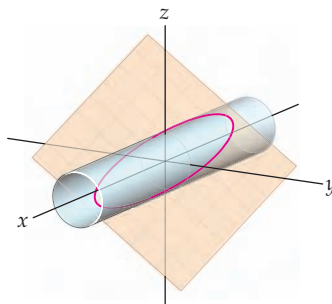

Although we successfully answered the question posed in this example, in Exercise 13 you will show that the function  $f(x, y) = x^3 + 9x^2 + 6y^2$  with domain  $\mathbb{R}^2$  has only a relative minimum at  $(0, 0)$ , not an absolute minimum, and that  $f$  has a saddle point at the other stationary point,  $(-6, 0)$ .  $\square$

**EXAMPLE 5****Optimizing a function of three variables with two constraints**

Find the points in  $\mathbb{R}^3$  that are farthest from the origin and that lie on both the cylinder  $y^2 + z^2 = 1$  and the plane  $x + 2y + 3z = 0$ .

**SOLUTION**

As usual, it is sufficient (and easier) to maximize the square of the distance from the origin,  $D(x, y, z) = x^2 + y^2 + z^2$ , subject to the constraints  $g(x, y, z) = y^2 + z^2 - 1 = 0$  and  $h(x, y, z) = x + 2y + 3z = 0$ . As the following figure illustrates, geometrically we are looking for the point(s) on the ellipse formed by the intersection of the cylinder and plane farthest from the origin.

The gradients of the three functions we are interested in are

$$\begin{aligned}\nabla D(x, y, z) &= 2x\mathbf{i} + 2y\mathbf{j} + 2z\mathbf{k}, \\ \nabla g(x, y, z) &= 2y\mathbf{j} + 2z\mathbf{k}, \quad \text{and} \\ \nabla h(x, y, z) &= \mathbf{i} + 2\mathbf{j} + 3\mathbf{k}.\end{aligned}$$

We wish to solve the system  $\nabla D(x, y, z) = \lambda \nabla g(x, y, z) + \mu \nabla h(x, y, z)$  subject to  $g(x, y, z) = 0$  and  $h(x, y, z) = 0$ . This leads to the following system of five equations:

$$\begin{aligned}2x &= 0 + \mu, \\ 2y &= \lambda \cdot 2y + \mu \cdot 2, \\ 2z &= \lambda \cdot 2z + \mu \cdot 3, \\ y^2 + z^2 &= 1, \quad \text{and} \\ x + 2y + 3z &= 0.\end{aligned}$$

Since  $\mu = 2x$ , we may eliminate  $\mu$  to obtain a system with only four equations in four variables:

$$y = \lambda y + 2x, \quad z = \lambda z + 3x, \quad y^2 + z^2 = 1, \quad x + 2y + 3z = 0.$$

A little thought tells us that if either  $y = 0$  or  $z = 0$ , the system does not have a solution. So we may solve the first two of these equations for  $\lambda$  and equate the results. We obtain

$$\frac{y - 2x}{y} = \frac{z - 3x}{z},$$

or equivalently,  $x(2z - 3y) = 0$ . So, either  $x = 0$  or  $z = \frac{3}{2}y$ .

If  $x = 0$ , then when we solve the equations  $y^2 + z^2 = 1$  and  $2y + 3z = 0$  for  $y$  and  $z$ , we have  $(x, y, z) = \left(0, \frac{3}{\sqrt{13}}, -\frac{2}{\sqrt{13}}\right)$  or  $(x, y, z) = \left(0, -\frac{3}{\sqrt{13}}, \frac{2}{\sqrt{13}}\right)$ . These two points are both 1 unit from the origin.

Now, using  $z = \frac{3}{2}y$  we solve the system  $y^2 + \left(\frac{3}{2}y\right)^2 = 1$  and  $x + 2y + 3 \cdot \frac{3}{2}y = 0$  and obtain the points  $\left(-\sqrt{13}, \frac{2}{\sqrt{13}}, \frac{3}{\sqrt{13}}\right)$  and  $\left(\sqrt{13}, -\frac{2}{\sqrt{13}}, -\frac{3}{\sqrt{13}}\right)$ . These two points are each  $\sqrt{14}$  units from the origin. They are the two points on the cylinder and plane that are farthest from the origin. The other two points are the points on the cylinder and plane that are closest to the origin.  $\square$

## ? TEST YOUR UNDERSTANDING

- ▶ What is a constraint equation? Does every continuous function have a maximum value and minimum value subject to a constraint?
- ▶ What is a Lagrange multiplier? What is the method of Lagrange multipliers? If we try to optimize the function of three variables,  $w = f(x, y, z)$ , subject to the constraint  $g(x, y, z) = 0$ , how many equations do we obtain when we use the method of Lagrange multipliers? How many variables are in the system?
- ▶ What methods do you know to find the maxima and minima of a function of two or more variables subject to a constraint?
- ▶ What is the Extreme Value Theorem for a function of two variables? Three variables? What is the relationship between the Extreme Value Theorem for a function of a single variable to the Extreme Value Theorem for a function of two or more variables?
- ▶ Outline the steps you should take to find the maximum value and minimum value of a function of two variables on a closed and bounded set. Would the steps change if you had a function of three variables on a closed and bounded set?

## EXERCISES 12.7

### Thinking Back

- ▶ *Optimizing a function of two variables subject to a constraint:* If you wish to find the maximum and minimum of the function  $f(x, y) = xy$  subject to the constraint  $x^2 + 4y^2 = 16$ , you may eliminate one variable of  $f$  by solving the constraint equation for either  $x$  or  $y$  and rewriting  $f$  in terms of a single variable. Do this and then use the techniques of Chapter 3 to find the maximum and minimum of the resulting function.
- ▶ *Optimizing a function of three variables subject to a constraint:* If you wish to find the maximum and minimum of the function  $f(x, y, z) = xyz$  subject to the constraint  $x^2 + 4y^2 + 9z^2 = 16$ , you may eliminate one variable of  $f$  by solving the constraint equation for  $x$ ,  $y$ , or  $z$  and rewriting  $f$  in terms of two variables. Do this and then use the techniques of Section 12.6 to find the maximum and minimum of the resulting function.

### Concepts

0. *Problem Zero:* Read the section and make your own summary of the material.
1. *True/False:* Determine whether each of the statements that follow is true or false. If a statement is true, explain why. If a statement is false, provide a counterexample.
  - (a) *True or False:* Every function of two variables  $f(x, y)$  subject to a constraint  $g(x, y) = 0$  has both a maximum and a minimum value.
  - (b) *True or False:* The function  $f(x, y, z) = \frac{xy}{y+z}$  has both a minimum and a maximum on the region defined by  $x^2 + y^2 + z^2 \leq 1$ .
  - (c) *True or False:* The function  $f(x, y, z) = e^{\sin xy} \cos(xy+z)$  has both a minimum and a maximum on the region defined by  $x^2 + y^2 + z^2 \leq 1$ .
  - (d) *True or False:* The function  $f(x, y) = xy + 2y - 5xy^2$  has both a minimum and a maximum on the region defined by  $x^2 + y^2 \geq 1$ .
  - (e) *True or False:* The function  $y = x^2$  has both a maximum and a minimum for  $x \in (-2, 2)$ .
  - (f) *True or False:* If  $f(x_0, y_0)$  is the maximum value of  $f$  on a region  $\mathcal{R}$ , then  $f(x_0, y_0)$  is the maximum value of  $f$ .
  - (g) *True or False:* If  $f(x_0, y_0)$  is the maximum value of  $f$  on its domain, then  $f(x_0, y_0)$  is the maximum value of  $f$  on every closed and bounded region  $\mathcal{R}$ .
  - (h) *True or False:* If  $f(x, y)$  is a continuous function and if  $m$  and  $M$  are the minimum and maximum values of  $f$  on its domain, then  $m \leq f(x, y) \leq M$  on every closed and bounded region  $\mathcal{R}$ .

2. *Examples:* Construct examples of the thing(s) described in the following. Try to find examples that are different than any in the reading.
- A function of two variables  $f(x, y)$ , along with a constraint  $g(x, y) = 0$ , that could be optimized with the method of Lagrange multipliers.
  - A function of two variables  $f(x, y)$ , along with a constraint  $g(x, y) = 0$ , that could be optimized by eliminating one of the variables.
  - A function of two variables  $f(x, y)$  that has neither a maximum nor a minimum value on the set  $x^2 + y^2 \leq 4$ .
- What is the distinction between the function  $z = f(x, y)$  and the constraint equation  $g(x, y) = 0$  when we use the method of Lagrange multipliers?
  - Outline a method for optimizing a function of two variables,  $z = f(x, y)$ .
  - Describe two methods for optimizing a function  $z = f(x, y)$  subject to a constraint.
  - What is meant by a “closed” subset of  $\mathbb{R}^2$ ? What is meant by a “bounded” subset of  $\mathbb{R}^2$ ?
  - Give an example of each of the following:
    - A subset of  $\mathbb{R}^2$  that is neither closed nor bounded.
    - A subset of  $\mathbb{R}^2$  that is closed but not bounded.
    - A subset of  $\mathbb{R}^2$  that is not closed but is bounded.
    - A subset of  $\mathbb{R}^2$  that is closed and bounded.
  - What is meant by a “closed” subset of  $\mathbb{R}^3$ ? What is meant by a “bounded” subset of  $\mathbb{R}^3$ ?
  - Give an example of each of the following:
    - A subset of  $\mathbb{R}^3$  that is neither closed nor bounded.
    - A subset of  $\mathbb{R}^3$  that is closed but not bounded.
    - A subset of  $\mathbb{R}^3$  that is not closed but is bounded.
    - A subset of  $\mathbb{R}^3$  that is closed and bounded.
  - Outline the steps required to find the minimum and maximum of a function of two variables on a closed and bounded set  $\mathcal{R}$ .
  - Given a function of three variables,  $w = f(x, y, z)$ , and a constraint equation  $g(x, y, z) = 0$ , how many equations would we obtain if we tried to optimize  $f$  by the method of Lagrange multipliers?
  - Given a function of  $n$  variables,  $z = f(x_1, x_2, \dots, x_n)$ , and a constraint equation,  $g(x_1, x_2, \dots, x_n) = 0$ , how many equations would we obtain if we tried to optimize  $f$  by the method of Lagrange multipliers?
  - In Example 4 we found that the function  $f(x, y) = x^3 + 9x^2 + 6y^2$  has stationary points at  $(0, 0)$  and  $(-6, 0)$ .
    - Use the second-derivative test to show that  $f$  has a saddle point at  $(-6, 0)$ .
    - Use the second-derivative test to show that  $f$  has a relative minimum at  $(0, 0)$ .
    - Use the value of  $f(-10, 0)$  to argue that  $f$  has a relative minimum at  $(0, 0)$ , and not an absolute minimum, without using the second-derivative test.
- In Exercises 14–17, by considering the function  $f(x, y) = x^2y$  subject to the constraint  $x + y = 0$ , you will explore a situation in which the method of Lagrange multipliers does not provide an extremum of a function.
- Show that the only point given by the method of Lagrange multipliers for the function  $f(x, y) = x^2y$  subject to the constraint  $x + y = 0$  is  $(0, 0)$ .
  - Explain why  $(0, 0)$  is *not* an extremum of  $f(x, y) = x^2y$  subject to the constraint  $x + y = 0$ .
  - Why does the method of Lagrange multipliers fail with this function?
  - Optimize  $f(x, y) = x^2y$  subject to the constraint  $ax + by = 0$  for nonzero constants  $a$  and  $b$ . Are there any nonzero values of  $a$  and  $b$  for which the method of Lagrange multipliers succeeds?
  - Explain how you could use the method of Lagrange multipliers to find the extrema of a function of two variables,  $f(x, y)$ , subject to the constraint that  $(x, y)$  is on the boundary of the rectangle  $\mathcal{R}$  defined by  $a \leq x \leq b$  and  $c \leq y \leq d$ .
  - Explain the steps you would take to find the extrema of a function of two variables,  $f(x, y)$ , if  $(x, y)$  is a point in the rectangle  $\mathcal{R}$  defined by  $a \leq x \leq b$  and  $c \leq y \leq d$ .
  - Explain how you could use the method of Lagrange multipliers to find the extrema of a function of two variables,  $f(x, y)$ , subject to the constraint that  $(x, y)$  is a point on the boundary of a triangle  $\mathcal{T}$  in the  $xy$ -plane.
  - Explain the steps you would take to find the extrema of a function of two variables,  $f(x, y)$ , if  $(x, y)$  is a point in a triangle  $\mathcal{T}$  in the  $xy$ -plane.
  - When you use the method of Lagrange multipliers to find the maximum and minimum of  $f(x, y) = x + y$  subject to the constraint  $xy = 1$ , you obtain two points. Is there a relative maximum at one of the points and a relative minimum at the other? Which is which?
  - Let  $f(x, y)$  be a differentiable function such that  $\nabla f(x, y) \neq \mathbf{0}$  for every point in the domain of  $f$ , and let  $\mathcal{R}$  be a closed, bounded subset of  $\mathbb{R}^2$ . Explain why the maximum and minimum of  $f$  restricted to  $\mathcal{R}$  occur on the boundary of  $\mathcal{R}$ .

## Skills

In Exercises 24–32, find the maximum and minimum of the function  $f$  subject to the given constraint. In each case explain why the maximum and minimum must both exist.

- $f(x, y) = x + y$  when  $x^2 + y^2 = 16$
- $f(x, y) = x + y$  when  $x^2 + 4y^2 = 16$

- $f(x, y) = xy$  when  $x^2 + y^2 = 16$
- $f(x, y) = xy$  when  $x^2 + 4y^2 = 16$
- $f(x, y, z) = x + y + z$  when  $x^2 + y^2 + z^2 = 9$
- $f(x, y, z) = x + y + z$  when  $x^2 + 4y^2 + 16z^2 = 64$
- $f(x, y, z) = xyz$  when  $x^2 + y^2 + z^2 = 9$

31.  $f(x, y, z) = xyz$  when  $x^2 + 4y^2 + 16z^2 = 64$

32.  $f(x, y, z) = xy$  when  $x^2 + y^2 + z^2 = 9$

In Exercises 33–38, find the point on the given curve closest to the specified point. Recall that if you minimize the square of the distance, you have minimized the distance as well.

33.  $(0, 0)$  and  $x^3 + y^3 = 1$

34.  $(0, 0)$  and  $x^2 + y^3 = 1$

35.  $(0, 0)$  and  $\sqrt{x} + \sqrt{y} = 1$

36.  $(1, 1)$  and  $\sqrt{x} + \sqrt{y} = 2$

37.  $(0, 0)$  and  $x^n + y^n = 1$  for  $n$  a positive, odd integer

38.  $(0, 0)$  and  $x^n + y^n = 1$  where  $n > 2$  is a positive, even integer

In Exercises 39–43, find the point on the given surface closest to the specified point.

39.  $xyz = 1$  and  $(0, 0, 0)$

40.  $x + 2y - 3z = 7$  and  $(0, 0, 0)$

41.  $ax + by + cz = d$  and  $(0, 0, 0)$

42.  $ax + by + cz = d$  and  $(\alpha, \beta, \gamma)$

43.  $x + 2y - 3z = 4$  and  $(-1, 5, 3)$

In Exercises 44–49, find the maximum and minimum of the given function on the specified region. Also, give the points where the maximum and minimum occur.

44.  $f(x, y) = 3x^2 - 5y^2$  on the circular region  $x^2 + y^2 \leq 1$

45.  $f(x, y) = 3x^2 + 5y^2$  on the square with vertices  $(1, 1)$ ,  $(-1, 1)$ ,  $(-1, -1)$ , and  $(1, -1)$

46.  $f(x, y) = x^2 + y$  on the circular region  $x^2 + y^2 \leq 4$

47.  $f(x, y) = x^2 + y$  on the square with vertices  $(1, 0)$ ,  $(0, 1)$ ,  $(-1, 0)$ , and  $(0, -1)$

48.  $f(x, y) = \frac{x}{y}$  on the circular region  $x^2 + (y - 2)^2 \leq 1$

49.  $f(x, y) = \frac{x}{y}$  on the rectangle given by  $-1 \leq x \leq 1$ ,  $1 \leq y \leq 4$

50. Find the dimensions of the rectangular solid with maximum volume such that all sides are parallel to the coordinate planes; one vertex is at the origin; and the vertex diagonally opposite is in the first octant and on the plane with equation  $2x + 5y + 6z = 30$ .

51. Find the dimensions of the rectangular solid with maximum volume such that all sides are parallel to the coordinate planes; one vertex is at the origin; and the vertex diagonally opposite is in the first octant and on the plane with equation  $ax + by + cz = d$ , where  $a$ ,  $b$ ,  $c$ , and  $d$  are positive real numbers.

52. Find the points in  $\mathbb{R}^3$  closest to the origin and that lie on the cylinder  $x^2 + y^2 = 4$  and the plane  $x - 3y + 2z = 6$ .

53. Find the points in  $\mathbb{R}^3$  closest to the origin and that lie on the cone  $z^2 = x^2 + y^2$  and the plane  $x + 2y = 6$ .

## Applications

54. Julia plans to make a cylindrical vase in which the bottom of the vase is to be 0.3 cm thick and the curved, lateral part of the vase is to be 0.2 cm thick. If the vase needs to have a volume of 1 liter, what should its dimensions be to minimize its weight?

55. Bob is building a toy chest for his son that will be a rectangular box with an open top. The base will be made from plywood that costs \$2 per square foot, and the sides will be made from oak that costs \$5 per square foot. What dimensions should Bob make the toy chest if he wants it to have a capacity of 10 cubic feet but wishes to minimize the cost of the wood?

## Proofs

56. Let  $T$  be a triangle with side lengths  $a$ ,  $b$ , and  $c$ . The *semiperimeter* of  $T$  is defined to be  $s = \frac{1}{2}(a + b + c)$ . Heron's formula for the area  $A$  of a triangle is

$$A = \sqrt{s(s-a)(s-b)(s-c)}.$$

Use Heron's formula and the method of Lagrange multipliers to prove that, for a triangle with perimeter  $P$ , the equilateral triangle maximizes the area.

57. Prove that a square maximizes the area of all rectangles with perimeter  $P$ .

58. Prove that if you minimize the square of the distance from the origin to a point  $(x, y)$  subject to the constraint  $g(x, y) = 0$ , you have minimized the distance from the origin to  $(x, y)$  subject to the same constraint.

59. Prove that if you minimize the square of the distance from the origin to a point  $(x, y, z)$  subject to the constraint

$g(x, y, z) = 0$ , then you have minimized the distance from the origin to  $(x, y, z)$  subject to the same constraint.

60. Let  $a$  and  $b$  be nonzero real numbers and let  $r > 0$ . Prove that the point closest to the origin on the circle  $(x - a)^2 + (y - b)^2 = r^2$  is on the line that contains the points  $(0, 0)$  and  $(a, b)$ .
61. Let  $(\alpha, \beta)$  and  $(a, b)$  be distinct points in  $\mathbb{R}^2$ , and let  $r$  be a positive real number. Use the result of Exercise 60 to prove that the point closest to  $(\alpha, \beta)$  on the circle  $(x - a)^2 + (y - b)^2 = r^2$  is on the line that contains the points  $(\alpha, \beta)$  and  $(a, b)$ .
62. Let  $a, b$ , and  $c$  be nonzero real numbers and let  $r > 0$ . Prove that the point closest to the origin on the sphere  $(x - a)^2 + (y - b)^2 + (z - c)^2 = r^2$  is on the line that contains the points  $(0, 0, 0)$  and  $(a, b, c)$ .
63. Let  $(\alpha, \beta, \gamma)$  and  $(a, b, c)$  be distinct points in  $\mathbb{R}^3$ , and let  $r$  be a positive real number. Use the result of Exercise 62 to prove that the point closest to  $(\alpha, \beta, \gamma)$  on the sphere

$(x - a)^2 + (y - b)^2 + (z - c)^2 = r^2$  is on the line that contains the points  $(\alpha, \beta, \gamma)$  and  $(a, b, c)$ .

The **arithmetic mean** of the real numbers  $a_1, a_2, \dots, a_n$  is  $\frac{1}{n}(a_1 + a_2 + \dots + a_n)$ . If  $a_i > 0$  for  $1 \leq i \leq n$ , then the **geometric mean** of  $a_1, a_2, \dots, a_n$  is  $(a_1 a_2 \cdots a_n)^{1/n}$ . In Exercises 64–66 we ask you to prove that the geometric mean is always less than the arithmetic mean for a set of positive numbers.

64. Use the method of Lagrange multipliers to show that  $\sqrt{xy} \leq \frac{1}{2}(x + y)$  when  $x$  and  $y$  are both positive.
65. Use the method of Lagrange multipliers to show that  $\sqrt[3]{xyz} \leq \frac{1}{3}(x + y + z)$  when  $x, y$ , and  $z$  are all positive.
66. Use the method of Lagrange multipliers to show that  $(a_1 a_2 \cdots a_n)^{1/n} \leq \frac{1}{n}(a_1 + a_2 + \dots + a_n)$  when  $a_1, a_2, \dots, a_n$  are all positive.

## Thinking Forward

► *A Double Summation:* Let

$$\sum_{i=1}^m \sum_{j=1}^n f(i, j) = \sum_{i=1}^m \left( \sum_{j=1}^n f(i, j) \right).$$

Evaluate  $\sum_{i=1}^{15} \sum_{j=1}^{10} ij^2$ .

► *Reordering a Double Summation:* Explain why

$$\sum_{i=1}^m \sum_{j=1}^n f(i, j) = \sum_{j=1}^n \sum_{i=1}^m f(i, j).$$

## CHAPTER REVIEW, SELF-TEST, AND CAPSTONES

Before you progress to the next chapter, be sure you are familiar with the definitions, concepts, and basic skills outlined here. The capstone exercises at the end bring together ideas from this chapter and look forward to future chapters.

### Definitions

Give precise mathematical definitions or descriptions of each of the following concepts that follow. Then illustrate the definition with a graph or an algebraic example.

- a *level curve* for  $f(x, y)$
- a *level surface* for  $f(x, y, z)$
- an *open disk* in  $\mathbb{R}^2$
- an *open ball* in  $\mathbb{R}^3$
- an *open subset* of  $\mathbb{R}^2$  or  $\mathbb{R}^3$
- the *complement* of a subset  $\mathbb{R}^2$  or  $\mathbb{R}^3$
- a *closed subset* of  $\mathbb{R}^2$  or  $\mathbb{R}^3$
- the *boundary* of a subset of  $\mathbb{R}^2$  or  $\mathbb{R}^3$
- a *bounded subset* of  $\mathbb{R}^2$  or  $\mathbb{R}^3$
- the  $\epsilon$ - $\delta$  definition of the statement  $\lim_{\mathbf{x} \rightarrow \mathbf{a}} f(\mathbf{x}) = L$ , where  $f$  is a function of two or more variables
- the limit of a function of two or three variables *along a path*
- what it means in terms of a limit for a function  $f$  of two or three variables to be *continuous* at a point in the domain of  $f$
- the limit definition of the *partial derivatives*  $f_x(x_0, y_0)$  and  $f_y(x_0, y_0)$
- the limit definition of the *partial derivatives*  $f_x(x_0, y_0, z_0)$ ,  $f_y(x_0, y_0, z_0)$ , and  $f_z(x_0, y_0, z_0)$
- the limit definition of the *directional derivative* of a function of two or three variables,  $f$ , at a point  $P$  in the direction of a unit vector  $\mathbf{u}$
- the *gradient* of a function  $f$  of two or three variables
- a function  $f$  of two or three variables has a *local minimum* or a *local maximum* at a point  $P$
- a function  $f$  of two or three variables has a *global minimum* or a *global maximum* at a point  $P$

- ▶ a function  $f$  of two or three variables has a *stationary point* at a point  $P$
- ▶ a function  $f$  of two or three variables has a *critical point* at a point  $P$

- ▶ a function  $f(x, y)$  has a *saddle point* at a point  $(x_0, y_0)$
- ▶ the *Hessian* and *discriminant* of a function  $f(x, y)$

## Theorems

Fill in the blanks to complete each of the following theorem statements:

- ▶ If  $S$  is a closed subset of  $\mathbb{R}^3$ , then  $S^c$  is \_\_\_\_\_ subset of  $\mathbb{R}^3$ .
- ▶ Let  $f(x, y)$  be a function defined on an open subset  $S$  of  $\mathbb{R}^2$ . If the second-order partial derivatives of a function  $f(x, y)$  are \_\_\_\_\_ in a (an) \_\_\_\_\_ subset  $S$  of  $\mathbb{R}^2$ , then  $f_{xy}(x, y) = f_{yx}(x, y)$  at every point in  $S$ .
- ▶ If  $f(x, y)$  is a function of two variables with the partial derivatives  $\frac{\partial f}{\partial x}$  and  $\frac{\partial f}{\partial y}$  that are \_\_\_\_\_ on \_\_\_\_\_ containing the point  $(x_0, y_0)$ , then  $f$  is differentiable at  $(x_0, y_0)$ .
- ▶ Let  $f(x, y)$  be a function of two variables that is differentiable at the point  $(x_0, y_0)$ . The equation of the plane tangent to the surface defined by  $f(x, y)$  at  $(x_0, y_0)$  is \_\_\_\_\_.

- ▶ *The chain rule*: Given functions  $z = f(x, y)$ ,  $x = u(s, t)$ , and  $y = v(s, t)$ , for all values of  $s$  and  $t$  at which  $u$  and  $v$  are differentiable, and if  $f$  is differentiable at  $(u(s, t), v(s, t))$ ,  $\frac{\partial z}{\partial s} = \underline{\hspace{2cm}}$  and  $\frac{\partial z}{\partial t} = \underline{\hspace{2cm}}$ .
- ▶ Let  $f(x, y)$  be a function of two variables and  $(x_0, y_0)$  be a point in the domain of  $f$  at which the first-order partial derivatives of  $f$  exist. If  $\mathbf{u} \in \mathbb{R}^2$  is a \_\_\_\_\_ for which the directional derivative  $D_{\mathbf{u}}f(x_0, y_0)$  also exists, then  $D_{\mathbf{u}}f(x_0, y_0) = \underline{\hspace{2cm}}$ .
- ▶ If  $f(x, y)$  is a function of two or three variables and  $P$  is a point in the domain of  $f$  at which  $f$  is differentiable, then the \_\_\_\_\_ of  $f$  at  $P$  points in the direction in which  $f$  \_\_\_\_\_.
- ▶ If  $f(x, y)$  has a local extremum at  $(x_0, y_0)$ , then  $(x_0, y_0)$  is a \_\_\_\_\_ of  $f$ .

## Notation, Algebraic Rules, and Optimization

*Notation*: Describe the meanings of each of the following mathematical expressions:

- For  $A \subset \mathbb{R}^2$ ,
- ▶  $A^c$  ▶  $\partial A$
- ▶  $f_x(x_0, y_0)$  ▶  $f_y(x_0, y_0)$  ▶  $f_z(x_0, y_0, z_0)$
- ▶  $\frac{\partial w}{\partial x}$  ▶  $\frac{\partial w}{\partial y}$  ▶  $\frac{\partial w}{\partial z}$
- ▶  $D_{\mathbf{u}}f(x_0, y_0)$  ▶  $\nabla f(x, y)$  ▶  $\nabla f(x, y, z)$

*Limits of combinations*: Fill in the blanks to complete the limit rules. You may assume that  $\lim_{\mathbf{x} \rightarrow \mathbf{a}} f(\mathbf{x})$  and  $\lim_{\mathbf{x} \rightarrow \mathbf{a}} g(\mathbf{x})$  exist and that  $k$  is a scalar.

- ▶  $\lim_{\mathbf{x} \rightarrow \mathbf{a}} kf(\mathbf{x}) = \underline{\hspace{2cm}}$ .
- ▶  $\lim_{\mathbf{x} \rightarrow \mathbf{a}} (f(\mathbf{x}) + g(\mathbf{x})) = \underline{\hspace{2cm}}$ .
- ▶  $\lim_{\mathbf{x} \rightarrow \mathbf{a}} (f(\mathbf{x}) - g(\mathbf{x})) = \underline{\hspace{2cm}}$ .
- ▶  $\lim_{\mathbf{x} \rightarrow \mathbf{a}} f(\mathbf{x})g(\mathbf{x}) = \underline{\hspace{2cm}}$ .
- ▶  $\lim_{\mathbf{x} \rightarrow \mathbf{a}} f(\mathbf{x})g(\mathbf{x}) = \underline{\hspace{2cm}}$ , provided that \_\_\_\_\_.

*Function optimization*: Fill in the blanks to complete optimization facts.

- ▶ Let  $f(x, y)$  be a function with continuous second-order partial derivatives on some open disk containing the point  $(x_0, y_0)$ . If  $(x_0, y_0)$  is a stationary point in the domain of  $f$ , then
  - (a)  $f$  has a relative maximum at  $(x_0, y_0)$  if  $\det(H_f(x_0, y_0)) \underline{\hspace{2cm}}$  with  $f_{xx}(x_0, y_0) \underline{\hspace{2cm}}$  or  $f_{yy}(x_0, y_0) \underline{\hspace{2cm}}$ .
  - (b)  $f$  has a relative minimum at  $(x_0, y_0)$  if  $\det(H_f(x_0, y_0)) \underline{\hspace{2cm}}$  with  $f_{xx}(x_0, y_0) \underline{\hspace{2cm}}$  or  $f_{yy}(x_0, y_0) \underline{\hspace{2cm}}$ .
  - (c)  $f$  has a saddle point at  $(x_0, y_0)$  if  $\det(H_f(x_0, y_0)) \underline{\hspace{2cm}}$ .
  - (d) No conclusion may be drawn about the behavior of  $f$  at  $(x_0, y_0)$  if  $\det(H_f(x_0, y_0)) \underline{\hspace{2cm}}$ .
- ▶ Let  $f$  and  $g$  be functions with continuous first-order partial derivatives. If  $f(x, y)$  has a relative extremum at a point  $(x_0, y_0)$  subject to the constraint  $g(x, y) = 0$ , then \_\_\_\_\_ and \_\_\_\_\_ are parallel.

## Skill Certification: The Calculus of Multivariable Functions

**Level curves:** Sketch the level curves  $f(x, y) = c$  of the following functions for  $c = -3, -2, -1, 0, 1, 2$ , and  $3$ :

- $f(x, y) = -\frac{2y}{x}$
- $f(x, y) = y^2 - x^2$
- $f(x, y) = x - \sin^{-1} y$
- $f(x, y) = x \sec y$

**Evaluating limits:** Evaluate the following limits, or explain why the limit does not exist.

- $\lim_{(x,y) \rightarrow (1,2)} \frac{x^2 + y^2}{x^2 - y^2}$
- $\lim_{(x,y) \rightarrow (4,\pi)} \tan^{-1} \left( \frac{y}{x} \right)$
- $\lim_{(x,y) \rightarrow (0,0)} \frac{x^3 + y^3}{x^2 + y^2}$
- $\lim_{(x,y) \rightarrow (0,0)} \frac{x + y}{x^2 + y^2}$
- $\lim_{(x,y,z) \rightarrow (1,0,-1)} \frac{\sin(xy)}{x^2 - y^2 + z^2}$
- $\lim_{(x,y,z) \rightarrow (0,0,0)} \frac{x^2 + y^2}{x^2 + y^2 + z^2}$
- $\lim_{\substack{(x,y) \rightarrow (0,0) \\ x=0}} \frac{x^2 + y^2}{x^2 - y^2}$
- $\lim_{\substack{(x,y) \rightarrow (0,0) \\ y=0}} \frac{x^2 + y^2}{x^2 - y^2}$

**Continuity:** Find the set of points where the function is continuous.

- $f(x, y) = \frac{x + y}{x - y}$
- $f(x, y) = \cos \left( \frac{1}{x - y} \right)$
- $f(x, y) = \ln xy$
- $f(x, y, z) = \frac{x + y + z}{x - 2y + 3z}$
- $f(x, y, z) = \frac{x + y + z}{x^2 + y^2 + z^2}$

**Partial derivatives:** Find all first- and second-order partial derivatives for the following functions:

- $f(x, y) = \frac{x + y}{x^2 + y^2}$
- $f(x, y) = \tan^{-1} \left( \frac{y}{x} \right)$
- $f(x, y) = xye^{x^2}$
- $f(x, y, z) = \ln(x + y + z)$
- $f(x, y, z) = xz^2e^y$

**Directional derivatives:** Find the directional derivative of the given function at the specified point  $P$  in the direction of

the given vector. Note: The given vectors may not be unit vectors.

- $f(x, y) = \frac{y}{x}$ ,  $P = (4, 3)$ ,  $\mathbf{v} = \langle 2, -3 \rangle$
- $f(x, y) = \frac{y}{x}$ ,  $P = (4, 3)$ ,  $\mathbf{v} = \langle 3, -2 \rangle$
- $f(x, y) = \frac{x + y}{x^2 + y^2}$ ,  $P = (1, 2)$ ,  $\mathbf{v} = \langle 3, -2 \rangle$
- $f(x, y) = \frac{xy}{x^2 + y^2}$ ,  $P = (-2, 1)$ ,  $\mathbf{v} = \left\langle \frac{3}{5}, -\frac{4}{5} \right\rangle$
- $f(x, y, z) = xy^2z^3$ ,  $P = (0, 0, 0)$ ,  $\mathbf{v} = \langle 1, -2, -1 \rangle$
- $f(x, y, z) = \sqrt{\frac{xy}{z}}$ ,  $P = (2, 3, 1)$ ,  $\mathbf{v} = \langle 2, 1, -2 \rangle$

**Gradients:** Find the gradient of the given function, and find the direction in which the function increases most rapidly at the specified point  $P$ .

- $f(x, y) = \frac{y}{x}$ ,  $P = (4, 3)$
- $f(x, y) = \frac{x}{y}$ ,  $P = (4, 3)$
- $f(x, y) = x \sin y$ ,  $P = \left( 3, \frac{\pi}{2} \right)$
- $f(x, y) = \tan^{-1} \left( \frac{y}{x} \right)$ ,  $P = (-2, 2)$
- $f(x, y, z) = \frac{x^2y}{z}$ ,  $P = (0, 3, -1)$
- $f(x, y, z) = \ln(x + y + z)$ ,  $P = (e, 0, -1)$

**Extrema:** Find the local maxima, local minima, and saddle points of the given functions.

- $f(x, y) = 2x^2 + y^2 + y + 5$
- $f(x, y) = x^3 - 12xy - y^3$
- $f(x, y) = x^3 + y^3 - 6x^2 + 3y^2 - 4$
- $f(x, y) = x^4 + y^4 + 4xy$

## Capstone Problems

A. **Chain Rule:** Let  $z = f(x, y)$ ,  $x = x(s, t)$ , and  $y = y(t)$ .

- Find  $\frac{\partial z}{\partial s}$  and  $\frac{\partial z}{\partial t}$ .
- Use the results of part (a) to find  $\frac{\partial z}{\partial s}$  and  $\frac{\partial z}{\partial t}$  when  $z = x^2 \sin y$ ,  $x = e^{s/t}$ , and  $y = t^3$ . Express your answer in terms of  $s$  and  $t$ .

B. **Laplace's equation:** A function  $f(x, y)$  is said to satisfy **Laplace's equation** if  $\frac{\partial^2 f}{\partial x^2} + \frac{\partial^2 f}{\partial y^2} = 0$ .

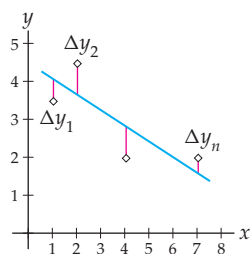

- Show that the function  $f(x, y) = \tan^{-1} \left( \frac{y}{x} \right)$  satisfies Laplace's equation.

- Show that the function  $f(x, y) = \ln \left( \frac{y}{x} \right)$  does not satisfy Laplace's equation.

C. **Extrema on a closed and bounded set:** Find and classify the maxima, minima, and saddle points of the function  $f(x, y) = y^3 - 3x^2y$  on the square region with vertices  $(\pm 3, \pm 3)$ .

D. **The Method of Least Squares:** The **method of least squares** is one way to fit a line to a collection of data points. The object of this method is to find the slope  $m$  and  $y$ -intercept  $b$  for a **regression line**  $y = mx + b$  that provides the minimal sum for the squares of the vertical distances

from the data points to the line, as indicated in the following figure:

Most scientific calculators have built-in programs to find the equation of the regression line for a collection of data

points  $(x_1, y_1), (x_2, y_2), \dots, (x_n, y_n)$ , but here we ask you to first prove that:

$$(a) \quad m = \frac{(\sum x_k)(\sum y_k) - n(\sum x_k y_k)}{(\sum x_k)^2 - n(\sum x_k^2)} \quad \text{and}$$

$$b = \frac{1}{n} \left( \sum y_k - m \sum x_k \right),$$

where each of the summations is evaluated from  $k = 1$  to  $k = n$ .

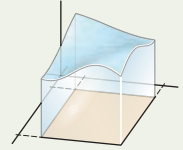

Use the results of part (a) to find the equations of the regression lines for the following collections of data:

- (b)  $(1, 2), (3, 4), (5, 5), (6, 8)$
- (c)  $(1, 2), (1, 4), (5, 2), (5, 4)$

## 13.1 DOUBLE INTEGRALS OVER RECTANGULAR REGIONS

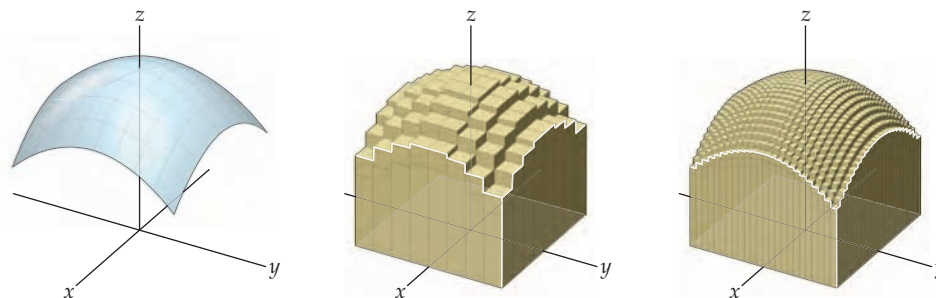

- ▶ Computing volumes bounded by functions of two variables
- ▶ Defining double integrals as the limit of a Riemann sum
- ▶ Using Fubini's theorem to evaluate double integrals as iterated integrals

### Volumes

Consider the following two questions:

- ▶ How can we compute the volume of a solid?
- ▶ How can we compute the mass of a solid whose density varies from point to point?

The way in which we will answer these two questions is quite similar to the methods we used in single-variable calculus. For example, to find the volume of the solid bounded above by the surface and below by the  $xy$ -plane, in the left-hand figure that follows, we subdivide the volume into vertical slices whose volumes we can reasonably approximate, as we see in the middle figure, and then, take a limit as the size of the pieces goes to zero and, simultaneously, the number of pieces goes to infinity. This brief outline summarizes much of what we will do in this chapter.

We will begin by reviewing and extending the summation notation we introduced in Chapter 4.

### Double and Triple Summations

Recall that

$$\sum_{k=1}^n a_k = a_1 + a_2 + a_3 + \cdots + a_{n-1} + a_n.$$

We take this idea a step or two further by introducing double and triple sums.

## DEFINITION 13.1

## Double Sums and Triple Sums

(a) The *double summation*  $\sum_{j=1}^m \sum_{k=1}^n a_{jk}$  is given by

$$\begin{aligned} \sum_{j=1}^m \sum_{k=1}^n a_{jk} &= \sum_{j=1}^m \left( \sum_{k=1}^n a_{jk} \right) \\ &= \sum_{j=1}^m (a_{j1} + a_{j2} + a_{j3} + \cdots + a_{jn}) \\ &= a_{11} + a_{12} + a_{13} + \cdots + a_{1n} \\ &\quad + a_{21} + a_{22} + a_{23} + \cdots + a_{2n} \\ &\quad + \vdots \quad \vdots \quad \vdots \quad \cdots \quad \vdots \\ &\quad + a_{m1} + a_{m2} + a_{m3} + \cdots + a_{mn}. \end{aligned}$$

(b) Similarly, the *triple summation*  $\sum_{i=1}^l \sum_{j=1}^m \sum_{k=1}^n a_{ijk}$  is given by

$$\sum_{i=1}^l \sum_{j=1}^m \sum_{k=1}^n a_{ijk} = \sum_{i=1}^l \left( \sum_{j=1}^m \left( \sum_{k=1}^n a_{ijk} \right) \right).$$

For example, consider the following double sum:

$$\sum_{j=1}^2 \sum_{k=1}^3 j^2 k = (1^2 \cdot 1 + 1^2 \cdot 2 + 1^2 \cdot 3) + (2^2 \cdot 1 + 2^2 \cdot 2 + 2^2 \cdot 3) = 1 + 2 + 3 + 4 + 8 + 12 = 30.$$

We know that, for finite sums, addition obeys both the commutative and associative rules. In Exercises 71 and 72 you will use these properties to prove the following theorem:

## THEOREM 13.2

## Changing the Order of a Finite Double or Triple Sum

For positive integers  $l$ ,  $m$ , and  $n$ ,

$$(a) \sum_{j=1}^m \sum_{k=1}^n a_{jk} = \sum_{k=1}^n \sum_{j=1}^m a_{jk}$$

$$(b) \sum_{i=1}^l \sum_{j=1}^m \sum_{k=1}^n a_{ijk} = \sum_{j=1}^m \sum_{k=1}^n \sum_{i=1}^l a_{ijk} = \sum_{k=1}^n \sum_{i=1}^l \sum_{j=1}^m a_{ijk}$$

Note that there are three additional permutations of the summations in Theorem 13.2(b) equal to those listed.

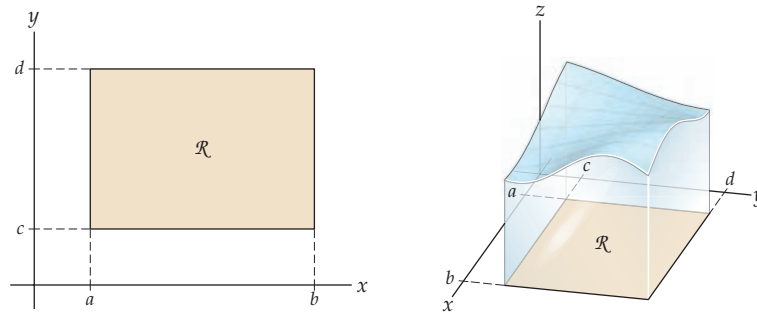

## Double Integrals over Rectangular Regions

Starting with Section 13.2, we will allow more complicated domains, but we begin by considering functions defined on rectangular regions. Let  $a < b$  and  $c < d$  be real numbers and

$\mathcal{R}$  be the rectangle in the  $xy$ -plane defined by

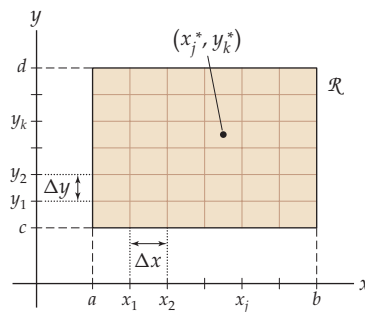

$$\mathcal{R} = \{(x, y) \mid a \leq x \leq b \text{ and } c \leq y \leq d\},$$

as shown in the following figure at the left:

We also assume that  $f(x, y) > 0$  is a function defined at every point of  $\mathcal{R}$ , as we see in the figure on the right. Here is our procedure for finding the volume  $V$  of the solid bounded below by  $\mathcal{R}$  and bounded above by the graph of  $f$ :

- ▶ We subdivide the interval  $[a, b]$  into  $m$  equal subintervals, each of width  $\Delta x = \frac{b-a}{m}$ , and also let  $x_j = a + j\Delta x$  for  $0 \leq j \leq m$ .
- ▶ Similarly, we subdivide the interval  $[c, d]$  into  $n$  equal subintervals, each of width  $\Delta y = \frac{d-c}{n}$ , and let  $y_k = c + k\Delta y$  for  $0 \leq k \leq n$ .
- ▶ The preceding subdivisions partition the rectangle into  $m \times n$  congruent rectangles as follows:

- ▶ For each  $j = 1, 2, \dots, m$  and  $k = 1, 2, \dots, n$ , we select a point  $(x_j^*, y_k^*)$  in the subrectangle  $\mathcal{R}_{jk} = \{(x, y) \mid x_{j-1} \leq x \leq x_j \text{ and } y_{k-1} \leq y \leq y_k\}$ . One such point is shown in the previous figure.
- ▶ We let  $\Delta A$  be the common area of each subrectangle. That is,  $\Delta A = \Delta x \Delta y$ .
- ▶ The product  $f(x_j^*, y_k^*) \Delta A$  approximates the volume of the solid bounded below by the rectangle  $\mathcal{R}_{jk}$  and above by the graph of  $f$ .
- ▶ When we sum these approximate volumes over all of the subrectangles, we obtain an approximation for the volume of  $V$ .

The summations

$$\sum_{j=1}^m \sum_{k=1}^n f(x_j^*, y_k^*) \Delta A = \sum_{k=1}^n \sum_{j=1}^m f(x_j^*, y_k^*) \Delta A$$

are both **Riemann sums** for  $f$  on  $\mathcal{R}$ .

We now define  $\Delta$  to be the length of the diagonal of each subrectangle. That is,

$$\Delta = \sqrt{(\Delta x)^2 + (\Delta y)^2}.$$

Taking the limit as  $\Delta \rightarrow 0$  ensures that  $m \rightarrow \infty$  and  $n \rightarrow \infty$ . We use the limit of the Riemann sum as  $\Delta \rightarrow 0$  to define the volume of the solid  $V$ , provided that the limit exists. The following definitions formalize these ideas:

### DEFINITION 13.3 Riemann Sums for Functions of Two Variables

Let  $a < b$  and  $c < d$  be real numbers, let  $\mathcal{R}$  be the rectangle defined by

$$\mathcal{R} = \{(x, y) \mid a \leq x \leq b \text{ and } c \leq y \leq d\},$$

and let  $f(x, y)$  be a function defined on  $\mathcal{R}$ . The sums

$$\sum_{j=1}^m \sum_{k=1}^n f(x_j^*, y_k^*) \Delta A = \sum_{k=1}^n \sum_{j=1}^m f(x_j^*, y_k^*) \Delta A$$

are **Riemann sums** for  $f$  on  $\mathcal{R}$ , where  $x_j$ ,  $x_j^*$ ,  $y_k$ ,  $y_k^*$ ,  $\Delta x$ ,  $\Delta y$ , and  $\Delta A$  are defined as outlined before.

### DEFINITION 13.4 Double Integrals

Let  $a < b$  and  $c < d$  be real numbers, let  $\mathcal{R}$  be the rectangle defined by

$$\mathcal{R} = \{(x, y) \mid a \leq x \leq b \text{ and } c \leq y \leq d\},$$

and let  $f(x, y)$  be a function defined on  $\mathcal{R}$ . Provided that the limits exist, the **double integral** of  $f$  over  $\mathcal{R}$  is

$$\iint_{\mathcal{R}} f(x, y) \, dA = \lim_{\Delta \rightarrow 0} \sum_{j=1}^m \sum_{k=1}^n f(x_j^*, y_k^*) \Delta A = \lim_{\Delta \rightarrow 0} \sum_{k=1}^n \sum_{j=1}^m f(x_j^*, y_k^*) \Delta A,$$

where the double sums are Riemann sums, as outlined in Definition 13.3, and where  $\Delta = \sqrt{(\Delta x)^2 + (\Delta y)^2}$ . When the limits exist, the function  $f$  is said to be **integrable** on  $\mathcal{R}$ .

Note that as  $\Delta \rightarrow 0$ , the increment of area  $\Delta A \rightarrow 0$ . For every function that is continuous on a rectangular region, the limit will exist and the function will be integrable.

### DEFINITION 13.5 The Volume of a Solid and the Signed Volume

Let  $a < b$  and  $c < d$  be real numbers, let  $\mathcal{R}$  be the rectangle defined by

$$\mathcal{R} = \{(x, y) \mid a \leq x \leq b \text{ and } c \leq y \leq d\},$$

and let  $f(x, y)$  be an integrable function defined on  $\mathcal{R}$ .

- (a) The **signed volume** between the graph of  $f$  and the rectangle  $\mathcal{R}$  is defined to be the double integral  $\iint_{\mathcal{R}} f(x, y) \, dA$ .
- (b) The **(absolute) volume** between the graph of  $f$  and the rectangle  $\mathcal{R}$  is defined to be the double integral  $\iint_{\mathcal{R}} |f(x, y)| \, dA$ .

As a consequence of Definition 13.5, if  $f(x, y) \geq 0$  on  $\mathcal{R}$ , then the double integral  $\iint_{\mathcal{R}} f(x, y) dA$  represents the volume of the solid bounded above by the graph of  $f$  and below by the rectangle  $\mathcal{R}$ .

In Example 1, we compute the volume of the solid bounded above by the graph of the function  $f(x, y) = x^2y$  on the rectangle

$$\mathcal{R} = \{(x, y) \mid 1 \leq x \leq 3 \text{ and } 2 \leq y \leq 5\}$$

by using Definition 13.4 to evaluate the double integral  $\iint_{\mathcal{R}} x^2y dA$ . We will see that such computations are rather lengthy and time consuming. Fortunately, we have an alternative.

## Iterated Integrals and Fubini's Theorem

As we mentioned, using the definition to evaluate a double integral is a lengthy process. When we can, we will use iterated integrals to evaluate double integrals.

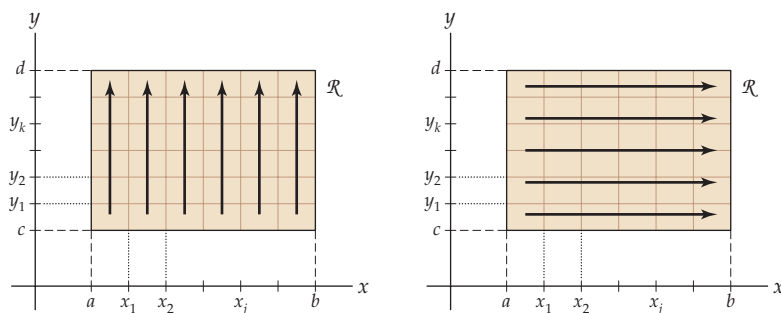

### DEFINITION 13.6

#### Iterated Integrals

Let  $a$ ,  $b$ ,  $c$ , and  $d$  be real numbers. We define the following *iterated integrals*:

$$\begin{aligned} \text{(a)} \quad & \int_a^b \int_c^d f(x, y) dy dx = \int_a^b \left( \int_c^d f(x, y) dy \right) dx \\ \text{(b)} \quad & \int_c^d \int_a^b f(x, y) dx dy = \int_c^d \left( \int_a^b f(x, y) dx \right) dy. \end{aligned}$$

The general idea here is that the subdivisions that are used to construct a Riemann sum for a double integral over a rectangle  $\mathcal{R}$  may be added most easily in one of two orders:

As the figures show, either we sum over the subrectangles, first moving up each column and then moving to the right, or we sum along the rows from left to right and then move up. The first order of summation gives us part (a) of Definition 13.6. The other order gives us the iterated integral in part (b).

We will evaluate an iterated integral after we introduce Fubini's theorem, which tells us that we may use an iterated integral, rather than the definition of the double integral, to evaluate a double integral.

### THEOREM 13.7 Fubini's Theorem

Let  $a < b$  and  $c < d$  be real numbers, let  $\mathcal{R}$  be the rectangle defined by

$$\mathcal{R} = \{(x, y) \mid a \leq x \leq b \text{ and } c \leq y \leq d\},$$

and let  $f(x, y)$  be continuous on  $\mathcal{R}$ . Then

$$\iint_{\mathcal{R}} f(x, y) \, dA = \int_c^d \int_a^b f(x, y) \, dx \, dy = \int_a^b \int_c^d f(x, y) \, dy \, dx.$$

**Proof.** A rigorous proof of Fubini's theorem is beyond the scope of this text, but we provide a less formal argument. From the definition of the integral as a limit of a Riemann sum, we have

$$\int_c^d \int_a^b f(x, y) \, dx \, dy = \int_c^d \left( \int_a^b f(x, y) \, dx \right) dy = \lim_{n \rightarrow \infty} \sum_{k=1}^n \left( \lim_{m \rightarrow \infty} \sum_{j=1}^m f(x_j^*, y_k^*) \Delta x \right) \Delta y,$$

where  $\Delta x = \frac{b-a}{m}$ ,  $\Delta y = \frac{d-c}{n}$ , and  $(x_j^*, y_k^*)$  is a sample point in the  $jk$ th subrectangle. We know that for the finite summations

$$\sum_{k=1}^n \sum_{j=1}^m f(x_j^*, y_k^*) \Delta x \Delta y = \sum_{j=1}^m \sum_{k=1}^n f(x_j^*, y_k^*) \Delta y \Delta x.$$

Fubini's theorem follows from the fact that when  $f$  is continuous, the orders of both the limits and the sums may be interchanged:

$$\begin{aligned} \int_c^d \int_a^b f(x, y) \, dx \, dy &= \lim_{n \rightarrow \infty} \sum_{k=1}^n \left( \lim_{m \rightarrow \infty} \sum_{j=1}^m f(x_j^*, y_k^*) \Delta x \right) \Delta y \\ &= \lim_{m \rightarrow \infty} \sum_{j=1}^m \left( \lim_{n \rightarrow \infty} \sum_{k=1}^n f(x_j^*, y_k^*) \Delta y \right) \Delta x \\ &= \int_a^b \int_c^d f(x, y) \, dy \, dx. \end{aligned}$$

To illustrate Fubini's theorem, let

$$\mathcal{R} = \{(x, y) \mid 1 \leq x \leq 3 \text{ and } 2 \leq y \leq 5\}.$$

Then

$$\iint_{\mathcal{R}} x^2 y \, dA = \int_2^5 \int_1^3 x^2 y \, dx \, dy = \int_1^3 \int_2^5 x^2 y \, dy \, dx.$$

For rectangular regions, the level of difficulty of the two iterated integrals we may use to evaluate the double integral is the same. In Section 13.2 we will discuss how to evaluate double integrals over more complicated regions. At that time we will see that, for a more

complicated region, one of the two orderings of the iterated integrals can make the evaluation process much simpler. Here we evaluate

$$\begin{aligned}
 \iint_{\mathcal{R}} x^2 y \, dA &= \int_2^5 \int_1^3 x^2 y \, dx \, dy && \leftarrow \text{Fubini's theorem} \\
 &= \int_2^5 \left( \int_1^3 x^2 y \, dx \right) dy && \leftarrow \text{evaluation procedure for the iterated integral} \\
 &= \int_2^5 \left[ \frac{1}{3} x^3 y \right]_{x=1}^{x=3} dy && \leftarrow \text{the Fundamental Theorem of Calculus} \\
 &= \int_2^5 \left( \frac{27}{3} y - \frac{1}{3} y \right) dy = \int_2^5 \frac{26}{3} y \, dy && \leftarrow \text{evaluation of the inner antiderivative} \\
 &= \left[ \frac{13}{3} y^2 \right]_{y=2}^{y=5} && \leftarrow \text{the Fundamental Theorem of Calculus} \\
 &= \frac{13}{3} (25 - 4) = 91. && \leftarrow \text{evaluation of the outer antiderivative}
 \end{aligned}$$

Note that when we evaluate the inner integral with respect to  $x$ , we treat the other variable,  $y$ , as a constant. Not until we evaluate the outer integral with respect to  $y$  do we consider  $y$  as a variable. In Exercise 17 you will use the other order of integration to evaluate this double integral.

## Examples and Explorations

### EXAMPLE 1

#### Using the definition to evaluate a double integral

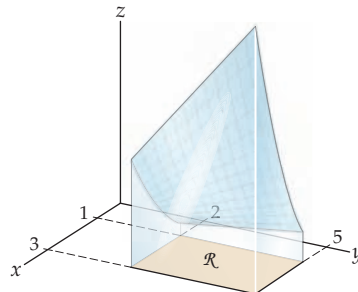

Let

$$\mathcal{R} = \{(x, y) \mid 1 \leq x \leq 3 \text{ and } 2 \leq y \leq 5\}.$$

Use the definition of the double integral to evaluate  $\iint_{\mathcal{R}} x^2 y \, dA$ .

#### SOLUTION

Before we evaluate the integral, we note that it represents the volume of the solid bounded above by the graph of  $f(x, y) = x^2 y$  and below by the  $xy$ -plane on the rectangular region  $\mathcal{R}$ , since  $x^2 y \geq 0$  on  $\mathcal{R}$ . This solid is shown here:

To use Definition 13.5 to evaluate the integral, for our starred points  $(x_j^*, y_k^*)$  we will choose  $(x_j, y_k) = (1 + j\Delta x, 2 + k\Delta y)$  for each  $j$  and  $k$ . Thus, the double integral of  $x^2 y$  on  $\mathcal{R}$  is given by

$$\iint_{\mathcal{R}} x^2 y \, dA = \lim_{\Delta \rightarrow 0} \sum_{j=1}^m \sum_{k=1}^n (1 + j\Delta x)^2 (2 + k\Delta y) \Delta A.$$

Recall that using the definition to compute a definite integral of a function of a single variable can be quite time consuming. Still, we will use the definition to evaluate this double integral, but will use Fubini's theorem to evaluate other double integrals.

We start working on the Riemann sum. Since the index of the "interior" summation is  $k$ ,

$$\sum_{j=1}^m \sum_{k=1}^n (1 + j\Delta x)^2 (2 + k\Delta y) \Delta A = \sum_{j=1}^m (1 + j\Delta x)^2 \Delta A \left( \sum_{k=1}^n (2 + k\Delta y) \right).$$

Now, using properties of summations from Chapter 4, we have

$$\sum_{k=1}^n (2 + k\Delta y) = 2n + \frac{1}{2}n(n+1)\Delta y.$$

Combining the preceding two equations gives

$$\sum_{j=1}^m (1 + j\Delta x)^2 \Delta A \left( \sum_{k=1}^n (2 + k\Delta y) \right) = \sum_{j=1}^m (1 + j\Delta x)^2 \Delta A \left( 2n + \frac{1}{2}n(n+1)\Delta y \right).$$

Again using properties of summations from Chapter 4, we obtain

$$\sum_{j=1}^m (1 + j\Delta x)^2 = \sum_{j=1}^m (1 + 2j\Delta x + j^2(\Delta x)^2) = m + m(m+1)\Delta x + \frac{1}{6}m(m+1)(2m+1)(\Delta x)^2.$$

Incorporating this result into the original Riemann sum, we have

$$\begin{aligned} \sum_{j=1}^m \sum_{k=1}^n (1 + j\Delta x)^2 (2 + k\Delta y) \Delta A &= \\ & \left( m + m(m+1)\Delta x + \frac{1}{6}m(m+1)(2m+1)(\Delta x)^2 \right) \left( 2n + \frac{1}{2}n(n+1)\Delta y \right) \Delta A. \end{aligned}$$

But recall that  $\Delta x = \frac{b-a}{m} = \frac{2}{m}$ ,  $\Delta y = \frac{d-c}{n} = \frac{3}{n}$  and  $\Delta A = \Delta x \Delta y = \frac{6}{mn}$ , so the Riemann sum equals

$$\begin{aligned} & \left( m + m(m+1)\frac{2}{m} + \frac{1}{6}m(m+1)(2m+1)\left(\frac{2}{m}\right)^2 \right) \left( 2n + \frac{1}{2}n(n+1)\frac{3}{n} \right) \frac{6}{mn} \\ &= 6 \left( 1 + \frac{2(m+1)}{m} + \frac{2(m+1)(2m+1)}{3m^2} \right) \left( 2 + \frac{3(n+1)}{2n} \right). \end{aligned}$$

We are finally ready to evaluate the limit of the Riemann sum! We get

$$\begin{aligned} \iint_{\mathcal{R}} x^2 y \, dA &= \lim_{\Delta \rightarrow 0} 6 \left( 1 + \frac{2(m+1)}{m} + \frac{2(m+1)(2m+1)}{3m^2} \right) \left( 2 + \frac{3(n+1)}{2n} \right) \\ &= \lim_{m \rightarrow \infty} \left( \lim_{n \rightarrow \infty} 6 \left( 1 + \frac{2(m+1)}{m} + \frac{2(m+1)(2m+1)}{3m^2} \right) \left( 2 + \frac{3(n+1)}{2n} \right) \right) \\ &= 6 \left( 1 + 2 + \frac{4}{3} \right) \left( 2 + \frac{3}{2} \right) = 91. \end{aligned}$$

□

### CHECKING THE ANSWER

Note that we evaluated this double integral earlier in the section by using Fubini's theorem. Of course, we obtained the same result.

### EXAMPLE 2

#### Using Fubini's theorem

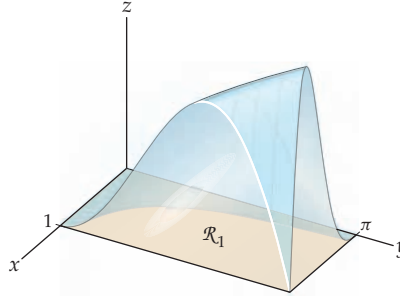

Use Fubini's theorem to evaluate the following double integrals:

- $\iint_{\mathcal{R}_1} xy \sin(x^2 y) \, dA$ , where  $\mathcal{R}_1 = \{(x, y) \mid 0 \leq x \leq 1 \text{ and } 0 \leq y \leq \pi\}$ .
- $\iint_{\mathcal{R}_2} (\sin x + e^{-2y}) \, dA$ , where  $\mathcal{R}_2 = \{(x, y) \mid 0 \leq x \leq \pi \text{ and } 0 \leq y \leq 1\}$ .
- $\iint_{\mathcal{R}_3} \ln y \, dA$ , where  $\mathcal{R}_3 = \{(x, y) \mid 0 \leq x \leq 5 \text{ and } \frac{1}{e} \leq y \leq e\}$ .

## SOLUTION

- (a) Our first integral represents the volume of the solid bounded above by the graph of  $xy \sin(x^2y)$  and below by the  $xy$ -plane on the rectangular region  $\mathcal{R}_1$ , since  $xy \sin(x^2y) \geq 0$  on  $\mathcal{R}_1$ . Following is a graph of this solid:

By Fubini's theorem,

$$\iint_{\mathcal{R}_1} xy \sin(x^2y) \, dA = \int_0^1 \int_0^\pi xy \sin(x^2y) \, dy \, dx = \int_0^\pi \int_0^1 xy \sin(x^2y) \, dx \, dy.$$

As we mentioned earlier, for rectangular regions the levels of difficulty of the two iterated integrals given by Fubini's theorem should be quite similar. We choose the second integral here. We begin by evaluating  $\int_0^1 xy \sin(x^2y) \, dx$ . Note that when we integrate the "interior" integral with respect to  $x$ , we treat  $y$  as a constant. Therefore, we may use substitution to find an antiderivative for the function  $xy \sin(x^2y)$  with respect to  $x$ . The function  $-\frac{1}{2} \cos(x^2y)$  is such an antiderivative. We may check this by taking the partial derivative  $\frac{\partial}{\partial x} \left( -\frac{1}{2} \cos(x^2y) \right)$  and observing that it is, indeed,  $xy \sin(x^2y)$ . Therefore,

$$\int_0^1 xy \sin(x^2y) \, dx = \left[ -\frac{1}{2} \cos(x^2y) \right]_{x=0}^{x=1} = -\frac{1}{2} (\cos(1^2y) - \cos(0^2y)) = \frac{1}{2} (1 - \cos y).$$

We now have

$$\iint_{\mathcal{R}_1} xy \sin(x^2y) \, dA = \int_0^\pi \int_0^1 xy \sin(x^2y) \, dx \, dy = \int_0^\pi \frac{1}{2} (1 - \cos y) \, dy.$$

The integral on the right is a definite integral like those we saw in Chapter 4. We have

$$\int_0^\pi \frac{1}{2} (1 - \cos y) \, dy = \left[ \frac{1}{2} (y - \sin y) \right]_{y=0}^{y=\pi} = \frac{\pi}{2}.$$

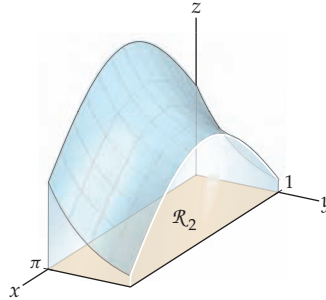

Note that the answer here is a constant. Recall that when  $f(x)$  is an integrable function on an interval  $[a, b]$ , the value of the definite integral  $\int_a^b f(x) \, dx$  is a constant. Similarly, when  $f(x, y)$  is an integrable function on a rectangle  $\mathcal{R}$ , the value of the double integral  $\iint_{\mathcal{R}} f(x, y) \, dA$  is a constant.

Before we proceed to the other double integrals, we summarize the steps we just used:

- ▶ Use Fubini's theorem to express the double integral as an iterated integral.
- ▶ Choose an order of integration. The levels of difficulty of the two iterated integrals given by Fubini's theorem may differ. Choose the order that is easier to evaluate.
- ▶ Whichever of the two iterated integrals you choose, work on the "interior" integral first, treating the other variable as a constant. (In the example we just

completed, the interior variable was  $x$  and the exterior variable was  $y$ . You may use any of the integration techniques from Chapter 5 in the process.)

- ▶ When you are done with this interior integration, you should have a new definite integral that involves just the exterior variable. (In the preceding example, the last step involved evaluating a definite integral with respect to  $y$ .)
  - ▶ Evaluate the exterior integral.
  - ▶ The result should be a constant.
- (b) Our second integral represents the volume of the solid bounded above by the graph of  $\sin x + e^{-2y}$  and below by the  $xy$ -plane on the rectangular region  $\mathcal{R}_2$ , since  $\sin x + e^{-2y} \geq 0$  on  $\mathcal{R}_2$ . Following is a graph of this solid:

Again by Fubini's theorem,

$$\iint_{\mathcal{R}_2} (\sin x + e^{-2y}) dA = \int_0^\pi \int_0^1 (\sin x + e^{-2y}) dy dx = \int_0^\pi \int_0^1 (\sin x + e^{-2y}) dx dy.$$

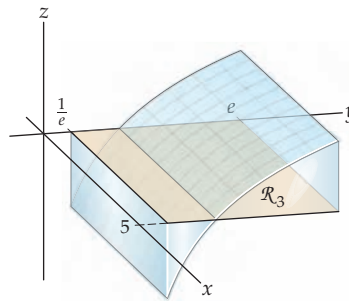

We evaluate the first iterated integral here. We begin by evaluating  $\int_0^1 (\sin x + e^{-2y}) dy$ . We integrate with respect to  $y$ , treating  $x$  as a constant. Therefore,

$$\int_0^1 (\sin x + e^{-2y}) dy = \left[ (\sin x)y - \frac{1}{2}e^{-2y} \right]_{y=0}^{y=1} = \sin x + \frac{1 - e^{-2}}{2}.$$

We now integrate this function with respect to  $x$  on the interval  $[0, \pi]$ :

$$\int_0^\pi \left( \sin x + \frac{1 - e^{-2}}{2} \right) dx = \left[ -\cos x + \frac{1 - e^{-2}}{2}x \right]_{x=0}^{x=\pi} = 2 + \frac{\pi(1 - e^{-2})}{2}.$$

- (c) Our third integral represents a signed volume, since the graph of  $\ln y$  takes on both positive and negative values on the rectangular region  $\mathcal{R}_3$ , as shown in the following figure:

Here we have

$$\iint_{\mathcal{R}_3} \ln y dA = \int_0^5 \int_{1/e}^e \ln y dy dx = \int_{1/e}^e \int_0^5 \ln y dx dy.$$

We now evaluate the second iterated integral. Note that the function  $\ln y$  is constant with respect to  $x$ ; therefore,

$$\int_0^5 \ln y \, dx = [(\ln y)x]_{x=0}^{x=5} = 5 \ln y.$$

We integrate this function with respect to  $y$  on the interval  $[\frac{1}{e}, e]$ :

$$\int_{1/e}^e 5 \ln y \, dy = 5 [y \ln y - y]_{y=1/e}^{y=e} = 5 \left( (e \ln e - e) - \left( \frac{1}{e} \ln \frac{1}{e} - \frac{1}{e} \right) \right) = 10e^{-1}. \quad \square$$

**EXAMPLE 3****Computing volume**

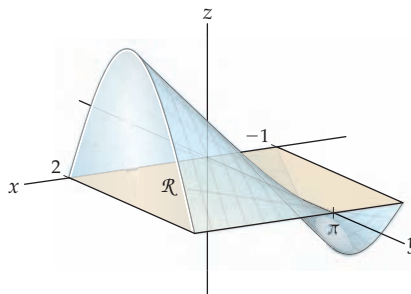

Find the volume of the solid between the graph of the function  $f(x, y) = x \sin y$  and the rectangle  $\mathcal{R}$ ,

$$\mathcal{R} = \{(x, y, 0) \mid -1 \leq x \leq 2 \text{ and } 0 \leq y \leq \pi\}$$

in the  $xy$ -plane.

**SOLUTION**

Following is a graph of the function  $f$  on the rectangular region  $\mathcal{R}$ :

Note that  $f(x, y) \geq 0$  on the rectangle  $\mathcal{R}_1 = \{(x, y) \mid 0 \leq x \leq 2 \text{ and } 0 \leq y \leq \pi\}$  and  $f(x, y) \leq 0$  on the rectangle  $\mathcal{R}_2 = \{(x, y) \mid -1 \leq x \leq 0 \text{ and } 0 \leq y \leq \pi\}$ . Therefore the volume we want is given by the difference

$$\iint_{\mathcal{R}} |x \sin y| \, dA = \iint_{\mathcal{R}_1} x \sin y \, dA - \iint_{\mathcal{R}_2} x \sin y \, dA.$$

We will use Fubini's theorem to compute both of these double integrals:

$$\iint_{\mathcal{R}_1} x \sin y \, dA = \int_0^2 \int_0^\pi x \sin y \, dy \, dx \quad \text{and} \quad \iint_{\mathcal{R}_2} x \sin y \, dA = \int_{-1}^0 \int_0^\pi x \sin y \, dy \, dx.$$

Both iterated integrals require us to compute the integral

$$\int_0^\pi x \sin y \, dy = [-x \cos y]_{y=0}^{y=\pi} = 2x.$$

We now finish the evaluation of the two iterated integrals:

$$\iint_{\mathcal{R}_1} x \sin y \, dA = \int_0^2 2x \, dx = [x^2]_{x=0}^{x=2} = 4 \quad \text{and} \quad \iint_{\mathcal{R}_2} x \sin y \, dA = \int_{-1}^0 2x \, dx = [x^2]_{x=-1}^{x=0} = -1.$$

Therefore, the volume  $\iint_{\mathcal{R}} |x \sin y| \, dA = 4 - (-1) = 5$ . □

## TEST YOUR UNDERSTANDING

- ▶ What are double sums and triple sums?
- ▶ What is a Riemann sum for a function of two variables over a rectangular region?
- ▶ What is the definition of a double integral?
- ▶ What is an iterated integral? How are iterated integrals defined? What is the difference between a double integral and an iterated integral?
- ▶ How is the volume between the graph of a function of two variables  $f(x, y)$  and the  $xy$ -plane defined? Not every double integral gives a volume. Why? Which double integrals represent volumes? Which do not?

## EXERCISES 13.1

### Thinking Back

- ▶ *Using summation formulas:* Verify that the formulas  $\sum_{k=1}^n k = \frac{n(n+1)}{2}$  and  $\sum_{k=1}^n k^2 = \frac{n(n+1)(2n+1)}{6}$  hold when  $n = 4$  and  $n = 7$ .
- ▶ *Using the definition to compute a definite integral:* Evaluate the definite integral  $\int_1^4 x^2 dx$  as the limit of a right Riemann sum.

### Concepts

0. *Problem Zero:* Read the section and make your own summary of the material.
1. *True/False:* Determine whether each of the statements that follow is true or false. If a statement is true, explain why. If a statement is false, provide a counterexample.
  - (a) *True or False:*

$$\sum_{j=1}^{10} \sum_{k=1}^{15} j k^2 = \sum_{k=1}^{10} \sum_{j=1}^{15} j^2 k$$
  - (b) *True or False:*

$$\sum_{j=1}^m \sum_{k=1}^n j^2 k^3 = \left( \sum_{j=1}^m j^2 \right) \left( \sum_{k=1}^n k^3 \right)$$
  - (c) *True or False:*

$$\sum_{j=1}^m \sum_{k=1}^n e^{jk^2} = \left( \sum_{j=1}^m e^j \right) \left( \sum_{k=1}^n e^{k^2} \right)$$
  - (d) *True or False:* If  $f(x, y)$  is continuous on the rectangle  $\mathcal{R} = \{(x, y) \mid a \leq x \leq b \text{ and } c \leq y \leq d\}$ , then  $\iint_{\mathcal{R}} f(x, y) dA$  exists.
  - (e) *True or False:* If  $f(x, y)$  is continuous on the rectangle  $\mathcal{R} = \{(x, y) \mid a \leq x \leq b \text{ and } c \leq y \leq d\}$ , then  $\iint_{\mathcal{R}} f(x, y) dA = \int_a^b \int_c^d f(x, y) dx dy$ .
  - (f) *True or False:* If  $f(x, y)$  is continuous on the rectangle  $\mathcal{R} = \{(x, y) \mid a \leq x \leq b \text{ and } c \leq y \leq d\}$ , then  $\iint_{\mathcal{R}} f(x, y) dA = \int_a^b \int_c^d f(x, y) dy dx$ .
  - (g) *True or False:* If  $f(x, y)$  is continuous on the rectangle  $\mathcal{R} = \{(x, y) \mid a \leq x \leq b \text{ and } c \leq y \leq d\}$ , then  $\int_b^a \int_a^c f(x, y) dy dx = \int_a^b \int_c^d f(x, y) dy dx$ .
  - (h) *True or False:* If  $f(x, y)$  is continuous on the rectangle  $\mathcal{R} = \{(x, y) \mid a \leq x \leq b \text{ and } c \leq y \leq d\}$ , then  $\int_c^d \int_a^b f(x, y) dx dy = \int_a^b \int_c^d f(x, y) dy dx$ .
2. *Examples:* Construct examples of the thing(s) described in the following. Try to find examples that are different than any in the reading.
  - (a) Two different sigma notation expressions of the same double sum.
  - (b) A double summation whose value is zero although none of the summands is zero.
  - (c) A nonzero function  $f(x, y)$  defined on the rectangle  $\mathcal{R} = \{(x, y) \mid -2 \leq x \leq 2 \text{ and } -3 \leq y \leq 3\}$  such that  $\iint_{\mathcal{R}} f(x, y) dA = 0$ .
3. Express the sum  $3e^4 + 3e^9 + 3e^{16} + 4e^4 + 4e^9 + 4e^{16}$  using double-summation notation.
4. Express the sum  $\frac{2}{5} + \frac{2}{6} + \frac{2}{7} + \frac{2}{8} + \frac{4}{5} + \frac{4}{6} + \frac{4}{7} + \frac{4}{8}$  using double-summation notation.
5. How many summands are in  $\sum_{j=3}^{13} \sum_{k=5}^{20} \frac{j^2}{e^{jk}}$ ?
6. How many summands are in  $\sum_{j=0}^m \sum_{k=k_0}^n j^k$ ?
7. How many summands are in  $\sum_{i=2}^{15} \sum_{j=3}^{17} \sum_{k=4}^{19} \frac{i}{j+k}$ ?
8. How many summands are in  $\sum_{i=i_0}^l \sum_{j=j_0}^m \sum_{k=k_0}^n k^i j^k$ ?
9. Discuss the similarities and differences between the definition of the definite integral found in Chapter 4 and the definition of the double integral found in this section.
10. Explain how to construct a Riemann sum for a function of two variables over a rectangular region.
11. Explain how to construct a *midpoint* Riemann sum for a function of two variables over a rectangular region for which each  $(x_j^*, y_k^*)$  is the midpoint of the subrectangle
 
$$\mathcal{R}_{jk} = \{(x, y) \mid x_{j-1} \leq x_j^* \leq x_j \text{ and } y_{k-1} \leq y_k^* \leq y_k\}.$$
 Refer to your answer to Exercise 10 or to Definition 13.3.
12. What is the difference between a double integral and an iterated integral?

13. State Fubini's theorem.
14. Explain why using an iterated integral to evaluate a double integral is often easier than using the definition of the double integral to evaluate the integral.
15. Explain how the Fundamental Theorem of Calculus is used in evaluating the iterated integral  $\int_a^b \int_c^d f(x, y) dy dx$ .
16. Explain how the Fundamental Theorem of Calculus is used in evaluating the iterated integral  $\int_c^d \int_a^b f(x, y) dx dy$ .
17. Earlier in this section, we showed that we could use Fubini's theorem to evaluate the integral  $\iint_{\mathcal{R}} x^2 y dA$  and we showed that  $\int_2^5 \int_1^3 x^2 y dx dy = 91$ . Now evaluate the double integral by evaluating the iterated integral  $\int_1^3 \int_2^5 x^2 y dy dx$ .

Explain why it would be difficult to evaluate the double integrals in Exercises 18 and 19 as iterated integrals.

18.  $\iint_{\mathcal{R}} e^{xy} dA$ ,  
where  $\mathcal{R} = \{(x, y) \mid 1 \leq x \leq 2 \text{ and } 1 \leq y \leq 3\}$
19.  $\iint_{\mathcal{R}} \cos(xy) dA$ ,  
where  $\mathcal{R} = \{(x, y) \mid \frac{\pi}{4} \leq x \leq \frac{\pi}{2} \text{ and } \frac{\pi}{2} \leq y \leq \pi\}$
20. Use the results of Exercises 18 and 19 to explain why it may not be possible to evaluate a double integral by using an iterated integral.
21. Show that  $\int_a^b \int_c^d f(x, y) dy dx$  does not always equal  $\int_c^d \int_a^b f(x, y) dx dy$  by evaluating these two iterated integrals for  $f(x, y) = \frac{x-y}{(x+y)^3}$  when  $a = c = 0$  and  $b = d = 1$ . Why does this result not violate Fubini's theorem?
22. Outline the steps required to find the volume of the solid bounded by the graph of a function  $f(x, y)$  and the  $xy$ -plane for  $a \leq x \leq b$  and  $c \leq y \leq d$ .

## Skills

Evaluate the sums in Exercises 23–28.

23.  $\sum_{j=1}^3 \sum_{k=1}^2 j^k$
24.  $\sum_{j=1}^3 \sum_{k=1}^2 k^j$
25.  $\sum_{j=1}^3 \sum_{k=1}^4 (3j - 4k)$
26.  $\sum_{j=1}^m \sum_{k=1}^n (j - k)$
27.  $\sum_{i=1}^4 \sum_{j=1}^3 \sum_{k=1}^2 ij^2k^3$
28.  $\sum_{i=1}^l \sum_{j=1}^m \sum_{k=1}^n ij^2k^3$

Use Definition 13.4 to evaluate the double integrals in Exercises 29–32.

29.  $\iint_{\mathcal{R}} xy dA$   
where  $\mathcal{R} = \{(x, y) \mid 0 \leq x \leq 2 \text{ and } 1 \leq y \leq 4\}$
30.  $\iint_{\mathcal{R}} x^2 y dA$   
where  $\mathcal{R} = \{(x, y) \mid -1 \leq x \leq 0 \text{ and } 0 \leq y \leq 2\}$
31.  $\iint_{\mathcal{R}} xy^3 dA$   
where  $\mathcal{R} = \{(x, y) \mid -2 \leq x \leq 2 \text{ and } -1 \leq y \leq 1\}$
32.  $\iint_{\mathcal{R}} x^2 y^3 dA$   
where  $\mathcal{R} = \{(x, y) \mid 1 \leq x \leq 3 \text{ and } 0 \leq y \leq 2\}$

Evaluate each of the integrals in Exercises 33–36 as an iterated integral, and then compare your answers with those you found in Exercises 29–32.

33. The integral in Exercise 29.
34. The integral in Exercise 30.
35. The integral in Exercise 31.
36. The integral in Exercise 32.

Evaluate each of the double integrals in Exercises 37–54 as iterated integrals.

37.  $\iint_{\mathcal{R}} (3 - x + 4y) dA$ ,  
where  $\mathcal{R} = \{(x, y) \mid 0 \leq x \leq 1 \text{ and } -1 \leq y \leq 3\}$
38.  $\iint_{\mathcal{R}} y^2 dA$ ,  
where  $\mathcal{R} = \{(x, y) \mid -3 \leq x \leq 2 \text{ and } -2 \leq y \leq 2\}$
39.  $\iint_{\mathcal{R}} (2 - 3x^2 + y^2) dA$ ,  
where  $\mathcal{R} = \{(x, y) \mid -3 \leq x \leq 2 \text{ and } 3 \leq y \leq 5\}$
40.  $\iint_{\mathcal{R}} (x - e^y) dA$ ,  
where  $\mathcal{R} = \{(x, y) \mid -3 \leq x \leq 2 \text{ and } -2 \leq y \leq 2\}$
41.  $\iint_{\mathcal{R}} \sin(x + 2y) dA$ ,  
where  $\mathcal{R} = \{(x, y) \mid 0 \leq x \leq \pi \text{ and } 0 \leq y \leq \frac{\pi}{2}\}$
42.  $\iint_{\mathcal{R}} x \sin x \cos y dA$ ,  
where  $\mathcal{R} = \{(x, y) \mid -3 \leq x \leq 2 \text{ and } -2 \leq y \leq 2\}$
43.  $\iint_{\mathcal{R}} xe^{xy} dA$ ,  
where  $\mathcal{R} = \{(x, y) \mid 0 \leq x \leq 1 \text{ and } 0 \leq y \leq \ln 5\}$
44.  $\iint_{\mathcal{R}} x^2 \cos(xy) dA$ ,  
where  $\mathcal{R} = \{(x, y) \mid 0 \leq x \leq \pi \text{ and } 0 \leq y \leq 1\}$
45.  $\iint_{\mathcal{R}} \frac{x}{x+y} dA$ ,  
where  $\mathcal{R} = \{(x, y) \mid 1 \leq x \leq 4 \text{ and } 0 \leq y \leq 3\}$
46.  $\iint_{\mathcal{R}} x^3 e^{x^2 y} dA$ ,  
where  $\mathcal{R} = \{(x, y) \mid 0 \leq x \leq 4 \text{ and } -1 \leq y \leq 1\}$
47.  $\iint_{\mathcal{R}} y \sin x dA$ ,  
where  $\mathcal{R} = \{(x, y) \mid 0 \leq x \leq \frac{\pi}{2} \text{ and } 0 \leq y \leq 1\}$
48.  $\iint_{\mathcal{R}} \sin(2x + y) dA$ ,  
where  $\mathcal{R} = \{(x, y) \mid 0 \leq x \leq \frac{\pi}{2} \text{ and } 0 \leq y \leq \frac{\pi}{2}\}$
49.  $\iint_{\mathcal{R}} y^2 \sin x dA$ ,  
where  $\mathcal{R} = \{(x, y) \mid 0 \leq x \leq \pi \text{ and } 0 \leq y \leq 3\}$

$$50. \iint_{\mathcal{R}} xy \sin(x^2) dA,$$

where  $\mathcal{R} = \{(x, y) \mid 0 \leq x \leq \sqrt{\pi} \text{ and } 0 \leq y \leq 1\}$

$$51. \iint_{\mathcal{R}} y \cos(xy) dA,$$

where  $\mathcal{R} = \{(x, y) \mid 0 \leq x \leq \frac{\pi}{2} \text{ and } 0 \leq y \leq 1\}$

$$52. \iint_{\mathcal{R}} e^{x+y} dA,$$

where  $\mathcal{R} = \{(x, y) \mid 0 \leq x \leq 1 \text{ and } 0 \leq y \leq 1\}$

$$53. \iint_{\mathcal{R}} x^2 e^{xy} dA,$$

where  $\mathcal{R} = \{(x, y) \mid 0 \leq x \leq 1 \text{ and } 0 \leq y \leq 1\}$

$$54. \iint_{\mathcal{R}} \frac{dA}{x^2 + 2xy + y^2},$$

where  $\mathcal{R} = \{(x, y) \mid 1 \leq x \leq 2 \text{ and } 0 \leq y \leq 1\}$

In Exercises 55–58, find the signed volume between the graph of the given function and the  $xy$ -plane over the specified rectangle in the  $xy$ -plane.

$$55. f(x, y) = 3x - 2y^5 + 1,$$

where  $\mathcal{R} = \{(x, y) \mid -4 \leq x \leq 6 \text{ and } 0 \leq y \leq 7\}$

$$56. f(x, y) = x^2 - y^3 + 4,$$

where  $\mathcal{R} = \{(x, y) \mid 0 \leq x \leq 3 \text{ and } -2 \leq y \leq 3\}$

$$57. f(x, y) = y^3 e^{xy^2},$$

where  $\mathcal{R} = \{(x, y) \mid 0 \leq x \leq 2 \text{ and } -2 \leq y \leq 3\}$

$$58. f(x, y) = xy^3 e^{x^2 y^2},$$

where  $\mathcal{R} = \{(x, y) \mid -2 \leq x \leq -1 \text{ and } -2 \leq y \leq 0\}$

In Exercises 59–64, find the volume between the graph of the given function and the  $xy$ -plane over the specified rectangle.

$$59. f(x, y) = xy,$$

where  $\mathcal{R} = \{(x, y) \mid -2 \leq x \leq 3 \text{ and } -1 \leq y \leq 5\}$

$$60. f(x, y) = -2x^2 y^3,$$

where  $\mathcal{R} = \{(x, y) \mid -2 \leq x \leq 3 \text{ and } -1 \leq y \leq 5\}$

$$61. f(x, y) = \sin x \cos y,$$

where  $\mathcal{R} = \{(x, y) \mid 0 \leq x \leq \pi \text{ and } 0 \leq y \leq \pi\}$

$$62. f(x, y) = \frac{y}{x} e^y,$$

where  $\mathcal{R} = \{(x, y) \mid 1 \leq x \leq e \text{ and } 0 \leq y \leq 2\}$

$$63. f(x, y) = \frac{x}{y} + \frac{y}{x},$$

where  $\mathcal{R} = \{(x, y) \mid 1 \leq x \leq 3 \text{ and } 1 \leq y \leq 5\}$

$$64. f(x, y) = x^2 y e^{xy},$$

where  $\mathcal{R} = \{(x, y) \mid 0 \leq x \leq 1 \text{ and } 0 \leq y \leq 2\}$

Use midpoint Riemann sums with the specified numbers of subintervals to approximate the iterated integrals in Exercises 65–68. (See Exercise 11 for the definition of a midpoint Riemann sum for a double integral.)

$$65. \int_0^1 \int_0^{3/2} e^{xy} dx dy.$$
 Let each subrectangle be a square with side length  $\frac{1}{2}$  unit.

$$66. \int_0^\pi \int_0^1 \sin(xy) dy dx.$$
 Use four subrectangles by dividing each of the intervals  $[0, \pi]$  and  $[0, 1]$  into two equal pieces.

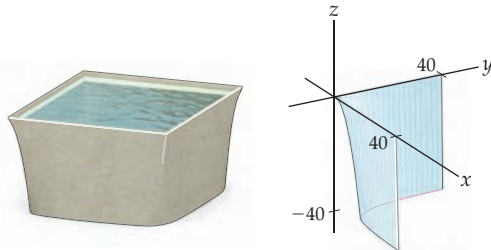

$$67. \int_0^1 \int_0^{\pi/2} \cos(xy) dx dy.$$
 Use six subrectangles by dividing the interval  $[0, \frac{\pi}{2}]$  into three equal pieces and the interval  $[0, 1]$  into two equal pieces.

$$68. \int_0^1 \int_0^1 y \sin(x^2) dx dy.$$
 Let each subrectangle be a square with side length  $\frac{1}{3}$  unit.

## Applications

69. Emmy oversees the operations of a number of sedimentation tanks, into which a toxic solution is dumped so that the toxic materials will settle out. The base of each tank is a square with side lengths of 80 feet, but she does not know the volume of any of the tanks. She defines a function

$$r(t) = \begin{cases} \frac{-(t-10)^2}{100} + 1, & \text{if } t < 10 \\ 1, & \text{if } t \geq 10. \end{cases}$$

With this function, one-fourth of a tank is described by the surface  $-12r(x)r(y)$  for  $x \in [0, 40]$ ,  $y \in [0, 40]$ . The rest of the tank is the same function reflected about the lines  $x = 40$  and  $y = 40$  and the point  $(40, 40)$ . What is the volume of each tank?

70. Leila has been assigned the task of estimating the number of caribou in a rectangular management unit (an area of land) during the summer. She imposes coordinates on the unit, which is 4 miles wide by 5 miles long (i.e.,  $[0, 4] \times [0, 5]$ ). She does not have time to commission a count of population, but she knows from a past study that the density of caribou in this region in July is approximated by  $d(x, y) = 0.08x^2 y^2 - 0.456x^2 y - 0.08x^2 - 0.328xy^2 + 1.87xy + 0.328x - 0.061y^2 + 0.347y + 0.061$ . Roughly how many caribou can be found in the management unit?

## Proofs

71. Prove Theorem 13.2(a). That is, prove that  $\sum_{j=1}^m \sum_{k=1}^n a_{jk} = \sum_{k=1}^n \sum_{j=1}^m a_{jk}$ .

72. List the other five orders for the summations in  $\sum_{i=1}^l \sum_{j=1}^m \sum_{k=1}^n a_{ijk}$ , and prove that all six orders for the summations are equal.

73. Let  $a < b$  and  $c < d$  be real numbers, and let  $\mathcal{R}$  be the rectangle defined by

$$\mathcal{R} = \{(x, y) \mid a \leq x \leq b \text{ and } c \leq y \leq d\}$$

in the  $xy$ -plane. If  $g(x)$  is continuous on the interval  $[a, b]$  and  $h(y)$  is continuous on  $[c, d]$ , use Fubini's theorem to prove that

$$\iint_{\mathcal{R}} g(x)h(y) \, dA = \left( \int_a^b g(x) \, dx \right) \left( \int_c^d h(y) \, dy \right).$$

74. Let  $a$  and  $b$  be positive real numbers, and let

$$\mathcal{R} = \{(x, y) \mid -a \leq x \leq a \text{ and } -b \leq y \leq b\}.$$

Assuming that  $g$  and  $h$  are continuous on their domains, prove that  $\iint_{\mathcal{R}} g(x)h(y) \, dA = 0$  if either  $g$  or  $h$  is an odd function.

75. Let  $a < b$  and  $c < d$  be real numbers, and let  $\mathcal{R}$  be the rectangle in the  $xy$ -plane defined by

$$\mathcal{R} = \{(x, y) \mid a \leq x \leq b \text{ and } c \leq y \leq d\}.$$

Prove that  $\iint_{\mathcal{R}} dA = (b-a)(d-c)$ . What is the relationship between  $\mathcal{R}$  and the product  $(b-a)(d-c)$ ?

## Thinking Forward

► *Riemann sums for functions of three variables:* Provide a definition of a Riemann sum for a function of three variables. Model your definition on Definition 13.3.

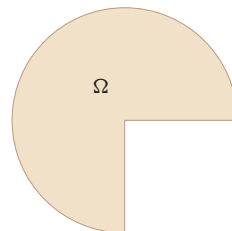

► *Triple integrals:* Provide a definition for a triple integral  $\iiint_S f(x, y, z) \, dV$ , where  $S$  is a rectangular box in  $\mathbb{R}^3$  given by  $S = \{(x, y, z) \mid a_1 \leq x \leq a_2, b_1 \leq y \leq b_2 \text{ and } c_1 \leq z \leq c_2\}$ . Model your definition on Definition 13.4.

## 13.2 DOUBLE INTEGRALS OVER GENERAL REGIONS

- Analyzing bounded regions in the plane
- Defining and computing double integrals on general regions
- The algebraic properties of double integrals

### General Regions in the Plane

In Section 13.1 we defined the double integral of a function of two variables over a rectangular region. We now wish to generalize this concept to define a double integral over a general region  $\Omega$  (omega) bounded by a simple closed curve—that is, a two-dimensional region in which the boundary may be represented by a finite collection of curves with differentiable parametrizations. Following is an example of such a region:

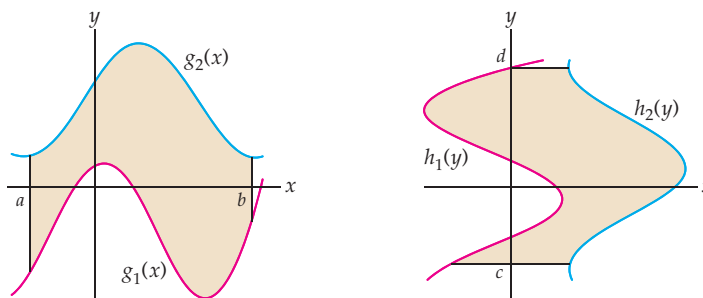

Unlike definite integrals, which are defined on finite intervals, for double integrals over regions more complicated than a rectangle we have to make an effort to understand the region  $\Omega$  over which the double integral is defined.

In particular, the regions we use must be subdivided into subregions that fall into one of the following two types:

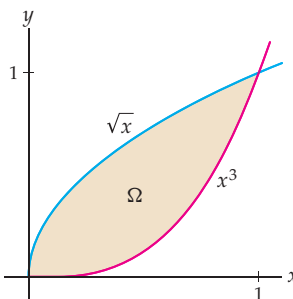

### DEFINITION 13.8 Type I and Type II Regions

- (a) Let  $y = g_1(x)$  and  $y = g_2(x)$  be two functions defined on the interval  $[a, b]$  such that  $g_1(x) \leq g_2(x)$  for every  $x \in [a, b]$ . The region  $\Omega$  bounded above by  $g_2(x)$ , below by  $g_1(x)$ , on the left by the line  $x = a$ , and on the right by the line  $x = b$  is said to be a **type I region**.
- (b) Let  $x = h_1(y)$  and  $x = h_2(y)$  be two functions defined on the interval  $[c, d]$  such that  $h_1(y) \leq h_2(y)$  for every  $y \in [c, d]$ . The region  $\Omega$  bounded on the left by  $h_1(y)$ , on the right by  $h_2(y)$ , below by the line  $y = c$ , and above by the line  $y = d$  is said to be a **type II region**.

A type I region is shown next at the left, and a type II region next on the right.

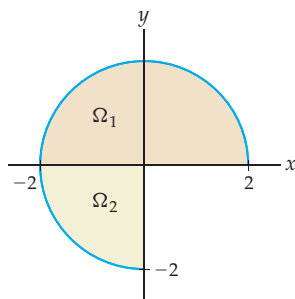

Many regions naturally fall into one or the other of these two categories. Some regions, however, may be considered to be either a type I or a type II region. For example, consider the area in the first quadrant between the functions  $y = \sqrt{x}$  and  $y = x^3$ :

As a type I region,  $\Omega$  is bounded above by  $y = \sqrt{x}$  and below by  $y = x^3$  for  $x \in [0, 1]$ . As a type II region,  $\Omega$  is bounded on the left by  $x = y^2$  and on the right by  $x = \sqrt[3]{y}$  for  $y \in [0, 1]$ .

Many regions need to be subdivided so that their subregions fall more simply into one of the two categories. For example, the region  $\Omega$  bounded above by the semicircle with equation  $y = \sqrt{4 - x^2}$  and below by the quarter circle  $y = -\sqrt{4 - x^2}$  on the interval  $[-2, 0]$  and by the  $x$ -axis on the interval  $[0, 2]$  may be subdivided into the two subregions  $\Omega_1$  and  $\Omega_2$ , as pictured next. We see that  $\Omega_1$  and  $\Omega_2$  are type I regions.

Note, however, that there are always many ways to subdivide such a region. If we wish, we may divide this region into three quarter circles, each of which may be considered to be a type I or a type II region. For example,  $\Omega_2$ , shown in the preceding figure, is also a type II region, bounded on the left by  $x = -\sqrt{4 - y^2}$  and on the right by the  $y$ -axis on the interval  $-2 \leq y \leq 0$ .

## Double Integrals over General Regions

We now expand our definition of the double integral to allow us to compute a double integral over a general region  $\Omega$  whose boundary is a simple closed curve. Let  $f(x, y)$  be defined on  $\Omega$ . Note that since  $\Omega$  is bounded, there exists a rectangle  $\mathcal{R} = \{(x, y) \mid a \leq x \leq b \text{ and } c \leq y \leq d\}$  such that  $\Omega$  is a subset of  $\mathcal{R}$  (i.e.,  $\Omega \subseteq \mathcal{R}$ ).

### DEFINITION 13.9 Double Integrals over General Regions

Let  $\Omega$  be a region in the  $xy$ -plane bounded by a simple closed curve, let  $f(x, y)$  be a function defined on  $\Omega$ , and let  $\mathcal{R} = \{(x, y) \mid a \leq x \leq b \text{ and } c \leq y \leq d\}$  be a rectangle containing  $\Omega$ . We define the **double integral** of  $f$  over  $\Omega$  to be

$$\iint_{\Omega} f(x, y) \, dA = \iint_{\mathcal{R}} F(x, y) \, dA,$$

where

$$F(x, y) = \begin{cases} f(x, y), & \text{if } (x, y) \in \Omega \\ 0, & \text{if } (x, y) \notin \Omega, \end{cases}$$

provided that the double integral  $\iint_{\mathcal{R}} F(x, y) \, dA$  exists.

As with double integrals defined on rectangular regions, we will try to evaluate double integrals on general regions with Fubini's theorem. To use Fubini's theorem in this context, when we wish to integrate the function  $f(x, y)$  over the type I region  $\Omega$  bounded above by  $g_2(x)$ , below by  $g_1(x)$ , on the left by the line  $x = a$ , and on the right by the line  $x = b$ , we set up the iterated integral

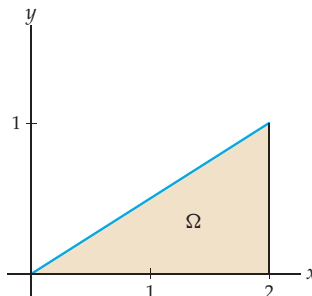

$$\iint_{\Omega} f(x, y) \, dA = \int_a^b \int_{g_1(x)}^{g_2(x)} f(x, y) \, dy \, dx.$$

Similarly, to integrate  $f(x, y)$  over the type II region bounded on the left by  $h_1(y)$ , on the right by  $h_2(y)$ , below by the line  $y = c$ , and above by the line  $y = d$ , we set up the iterated integral

$$\iint_{\Omega} f(x, y) \, dA = \int_c^d \int_{h_1(y)}^{h_2(y)} f(x, y) \, dx \, dy.$$

Note that in each case the limits of the outer integration are constants, and the limits of the inner integration are functions of the outer variable of integration.

For example, let  $\Omega$  be the following triangular region in the first quadrant:

To evaluate the double integral of a function  $f(x, y)$  on this region, we may treat  $\Omega$  either as the type I region bounded below by  $y = 0$  and above by  $y = \frac{1}{2}x$  for  $x \in [0, 2]$  or as the type II region bounded on the left by the function  $x = 2y$  and on the right by the function  $x = 2$  for  $y \in [0, 1]$ . Therefore,

$$\iint_{\Omega} f(x, y) \, dA = \int_0^2 \int_0^{x/2} f(x, y) \, dy \, dx = \int_0^1 \int_{2y}^2 f(x, y) \, dx \, dy.$$

Depending upon the function  $f(x, y)$ , one of these two iterated integrals may be significantly easier to evaluate. When  $f(x, y) = \cos(x^2)$ , treating  $\Omega$  as a type I region results in a significantly simpler integral, since the inner integral may be easily evaluated with the Fundamental Theorem of Calculus:

$$\int_0^{x/2} \cos(x^2) \, dy = [y \cos(x^2)]_{y=0}^{y=x/2} = \frac{1}{2}x \cos(x^2).$$

To finish evaluating the iterated integral, we now use substitution to find an antiderivative for the resulting function. We have

$$\int_0^2 \frac{1}{2}x \cos(x^2) \, dx = \left[ \frac{1}{4} \sin(x^2) \right]_{x=0}^{x=2} = \frac{1}{4} \sin 4.$$

By contrast, if we try to evaluate the double integral by using the iterated integral

$$\int_0^1 \int_{2y}^2 \cos(x^2) \, dx \, dy,$$

we are immediately stymied by the fact that the function  $\cos(x^2)$  does *not* have a simple antiderivative when we are integrating first with respect to the variable  $x$ .

This example illustrates how crucial it is to be able to analyze a given planar region as both a type I region and a type II region. When we write a double integral as an iterated integral, one of the two possible orders of integration can result in a computation that is significantly easier than the other. In such a case, the relatively simple chore of selecting the appropriate order of integration saves a great deal of work integrating.

## Algebraic Properties of Double Integrals

The algebraic properties set forth in the next theorem are similar to the algebraic properties of definite integrals we studied in Chapter 4. The proofs of these properties follow from the definition of the double integral and are left for Exercises 67 and 68.

**THEOREM 13.10 Algebraic Properties of the Double Integral**

Let  $f(x, y)$  and  $g(x, y)$  be integrable functions on the general region  $\Omega$ , and let  $c \in \mathbb{R}$ . Then

$$(a) \quad \iint_{\Omega} cf(x, y) \, dA = c \iint_{\Omega} f(x, y) \, dA.$$

$$(b) \quad \iint_{\Omega} (f(x, y) + g(x, y)) \, dA = \iint_{\Omega} f(x, y) \, dA + \iint_{\Omega} g(x, y) \, dA.$$

As we mentioned earlier in the section, we may also need to decompose a region into subregions. The following theorem tells us that the double integral is well behaved with respect to reasonable subdivisions:

**THEOREM 13.11 Subdividing the Region on Which a Double Integral Is Defined**

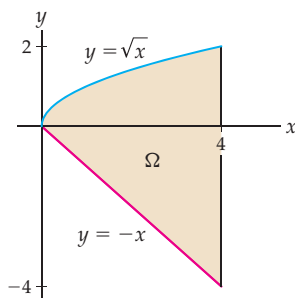

Let  $f(x, y)$  be an integrable function on the general region  $\Omega$ . If  $\Omega_1$  and  $\Omega_2$  are general regions that are subsets of  $\Omega$  that do not overlap, except possibly on their boundaries, and if  $\Omega = \Omega_1 \cup \Omega_2$ , then

$$\iint_{\Omega} f(x, y) \, dA = \iint_{\Omega_1} f(x, y) \, dA + \iint_{\Omega_2} f(x, y) \, dA.$$

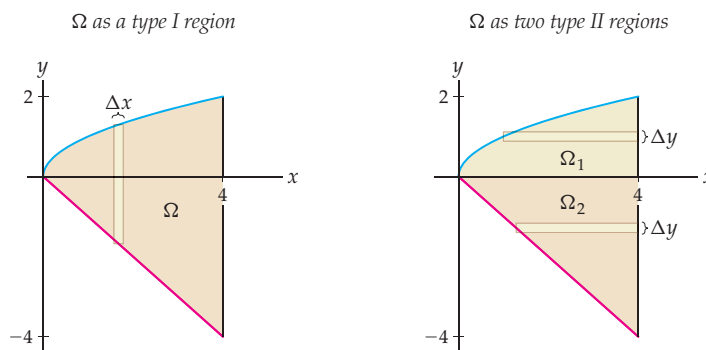

Example 1 provides an application of Theorem 13.11 that illustrates how to split a region into subregions for integration.

**Examples and Explorations****EXAMPLE 1****Expressing a planar region as a type I region and a type II region**

Express the double integral  $\iint_{\Omega} f(x, y) \, dA$  as an iterated integral over the following region  $\Omega$ , itself expressed as both a type I region and a type II region:

**SOLUTION**

It is slightly easier to express  $\Omega$  as type I region. To envision the boundary components of a type I region, it often helps to draw a “typical” vertical strip, as shown in the figure at the left.

Each vertical strip that crosses the region is bounded below by the function  $y = -x$  and above by the function  $y = \sqrt{x}$ . Such vertical strips would cover  $\Omega$  as  $x$  varies over the interval  $[0, 4]$ . Thus, to integrate  $f(x, y)$  over  $\Omega$  as a type I region, we have

$$\iint_{\Omega} f(x, y) dA = \int_0^4 \int_{-x}^{\sqrt{x}} f(x, y) dy dx.$$

To understand the region as a type II region, we draw two horizontal strips. Above the  $x$ -axis, these strips are bounded on the left by the function  $x = y^2$  and on the right by the line  $x = 4$ . Such strips would cover  $\Omega_1$  as  $y$  varies over the interval  $[0, 2]$ , as pictured at the right. Similarly, below the  $x$ -axis such strips are bounded on the left by the function  $x = -y$  and on the right by the line  $x = 4$ . They would cover  $\Omega_2$  as  $y$  varies over the interval  $[-4, 0]$ . Thus, to integrate a function  $f(x, y)$  over  $\Omega$  as a type II region, we would have

$$\iint_{\Omega} f(x, y) dA = \int_{-4}^0 \int_{-y}^4 f(x, y) dx dy + \int_0^2 \int_{y^2}^4 f(x, y) dx dy.$$

Note that we have used Theorem 13.11 to break the integral over  $\Omega$  into the integrals over  $\Omega_1$  and  $\Omega_2$ . Also, observe that for all three iterated integrals shown, the limits of the outer integrals are constants. The limits of the inner integrals are functions of the outer variable, although they may be constant functions.  $\square$

### EXAMPLE 2

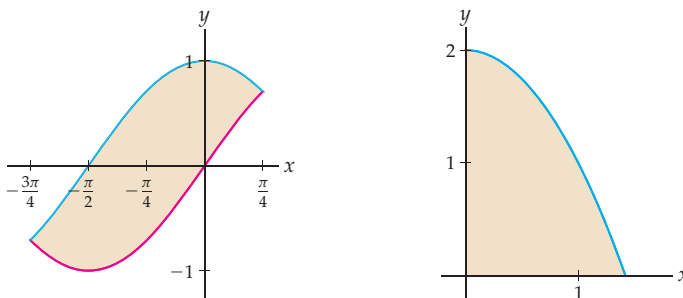

#### Drawing a region determined by an iterated integral

Sketch the regions determined by the iterated integrals:

(a)  $\int_{-3\pi/4}^{\pi/4} \int_{\cos x}^{\sin x} xy \, dy \, dx$       (b)  $\int_0^2 \int_0^{\sqrt{2-y}} xe^{x^2} \, dx \, dy$

#### SOLUTION

- (a) The region described by the first integral is bounded below by the function  $y = \cos x$  and above by  $y = \sin x$  for values of  $x$  in the interval  $[-3\pi/4, \pi/4]$ . This region is shown here at the left:

- (b) The region described by the second integral is bounded on the left by the line  $x = 0$  and on the right by the function  $x = \sqrt{2 - y}$  for values of  $y$  in the interval  $[0, 2]$ . For convenience, to sketch the function  $x = \sqrt{2 - y}$ , we may rewrite it as  $y = 2 - x^2$ , where  $x \geq 0$ . This region is shown at the right.  $\square$

**EXAMPLE 3****Evaluating an iterated integral**

Evaluate the iterated integrals from Example 2.

**SOLUTION**

To evaluate an iterated integral, we begin by evaluating the inner integral.

- (a) Thus, when we evaluate  $\int_{-3\pi/4}^{\pi/4} \int_{\cos x}^{\sin x} xy \, dy \, dx$ , we start with

$$\int_{\cos x}^{\sin x} xy \, dy = \left[ \frac{1}{2}xy^2 \right]_{y=\cos x}^{y=\sin x} = \frac{1}{2}x(\sin^2 x - \cos^2 x) = -\frac{1}{2}x \cos(2x).$$

For the rightmost equality, we used the double-angle identity for the cosine. We now integrate this function on the interval  $\left[-\frac{3\pi}{4}, \frac{\pi}{4}\right]$  to complete the evaluation of the iterated integral:

$$\int_{-3\pi/4}^{\pi/4} \left(-\frac{1}{2}x \cos(2x)\right) dx = \left[-\left(\frac{1}{4}x \sin(2x) + \frac{1}{8} \cos(2x)\right)\right]_{-3\pi/4}^{\pi/4} = -\frac{\pi}{4}.$$

Note that we used integration by parts to find the antiderivative of the function.

- (b) For the second iterated integral,  $\int_0^2 \int_0^{\sqrt{2-y}} xe^{x^2} \, dx \, dy$ , we again work first on the inner integral. Here we use substitution to find the antiderivative:

$$\int_0^{\sqrt{2-y}} xe^{x^2} \, dx = \left[ \frac{1}{2}e^{x^2} \right]_0^{\sqrt{2-y}} = \frac{1}{2}(e^{2-y} - 1).$$

We now evaluate the outer integral:

$$\int_0^2 \frac{1}{2}(e^{2-y} - 1) \, dy = \left[-\frac{1}{2}(e^{2-y} + y)\right]_0^2 = \frac{1}{2}(e^2 - 3). \quad \square$$

**EXAMPLE 4****Reversing the order of integration in an iterated integral**

Reverse the order of integration in the iterated integral  $\int_0^2 \int_0^{\sqrt{2-y}} xe^{x^2} \, dx \, dy$ . Then evaluate the new iterated integral and show that the result is the same as the value obtained in Example 3.

**SOLUTION**

This is one of the integrals we have been discussing since Example 2. In that example, we drew the region  $\Omega$ , expressed as a type II region. To reverse the order of integration we must first express  $\Omega$  as a type I region. Using the work we did in Example 2, we see that the region is bounded above by  $y = 2 - x^2$  and below by  $y = 0$ , where  $x$  is in the interval  $[0, \sqrt{2}]$ . Thus,

$$\int_0^2 \int_0^{\sqrt{2-y}} xe^{x^2} \, dx \, dy = \int_0^{\sqrt{2}} \int_0^{2-x^2} xe^{x^2} \, dy \, dx.$$

Again, working on the inner integral, we have

$$\int_0^{2-x^2} xe^{x^2} dy = [xe^{x^2}y]_0^{2-x^2} = (2x - x^3)e^{x^2}.$$

To finish this example we evaluate the outer integral. Using the techniques of integration by substitution and integration by parts, we obtain

$$\int_0^{\sqrt{2}} (2x - x^3)e^{x^2} dx = \left[ \frac{1}{2}(3 - x^2)e^{x^2} \right]_0^{\sqrt{2}} = \frac{1}{2}(e^2 - 3).$$

As we have previously mentioned, when we evaluate an iterated integral, sometimes one order of integration leads to a computation that is significantly simpler than the other order of integration. Which order of integration did you find easier for this integral, the one we did in Example 3, or the one we just completed?  $\square$

### ? TEST YOUR UNDERSTANDING

- ▶ What is a general region in the  $xy$ -plane? What is a type I region? What is a type II region? Is every general region either a type I region or a type II region?
- ▶ How is the definition of the double integral over a rectangular region used to define the double integral of a function over a general region? Why does this definition make sense?
- ▶ How is a region that is neither a type I region nor a type II region decomposed into subregions that are type I or type II?
- ▶ Which order of integration in an iterated integral is associated with a type I region, and which order of integration in an iterated integral is associated with a type II region? Why?
- ▶ How can the shape of a region  $\Omega$  help or hinder in the evaluation of the double integral  $\iint_{\Omega} f(x, y) dA$ ? Does the interval  $[a, b]$  ever make a definite integral  $\int_a^b g(x) dx$  easier or harder to evaluate?

## EXERCISES 13.2

### Thinking Back

- ▶ *Finding the area between two curves:* If  $g_1(x)$  and  $g_2(x)$  are two continuous functions such that  $g_1(x) \leq g_2(x)$  on the interval  $[a, b]$ , find a definite integral representing the area between the graphs of the two functions on  $[a, b]$ .
- ▶ *Finding the area between two curves:* If  $h_1(y)$  and  $h_2(y)$  are two continuous functions such that  $h_1(y) \leq h_2(y)$  on the interval  $[c, d]$ , find a definite integral representing the area between the graphs of the two functions on  $[c, d]$ .

### Concepts

0. *Problem Zero:* Read the section and make your own summary of the material.
1. *True/False:* Determine whether each of the statements that follow is true or false. If a statement is true, explain why. If a statement is false, provide a counterexample.
  - (a) *True or False:* Every rectangular region in the plane, with its sides parallel to the coordinate axes, may be considered to be either a type I region or a type II region.
  - (b) *True or False:* Every rectangular region in the plane may be considered to be a type I region or a type II region.
  - (c) *True or False:* Every region in the plane can be expressed as either a single type I region or a single type II region.
  - (d) *True or False:* A general region in the plane with a polygonal boundary can be decomposed into finitely many type I and type II regions.

- (e) *True or False:* To evaluate the double integral  $\iint_{\Omega} f(x, y) dA$  where  $\Omega$  is a type I region, you integrate first with respect to  $y$ .
- (f) *True or False:* If  $\Omega$  is the set of all points satisfying the inequality  $x^2 + y^2 \leq 4$ , then  $\iint_{\Omega} f(x, y) dA = \int_{-2}^2 \int_{-\sqrt{4-y^2}}^{\sqrt{4-y^2}} f(x, y) dx dy$ .
- (g) *True or False:* If  $f$  is a continuous function and  $\Omega = \Omega_1 \cup \Omega_2$ , then  $\iint_{\Omega} f(x, y) dA = \iint_{\Omega_1} f(x, y) dA + \iint_{\Omega_2} f(x, y) dA$ .
- (h) *True or False:* If  $f$  is a positive continuous function defined on a region  $\Omega$ , and if  $\Gamma \subset \Omega$ , then  $\iint_{\Gamma} f(x, y) dA \leq \iint_{\Omega} f(x, y) dA$ .
2. *Examples:* Construct examples of the thing(s) described in the following. Try to find examples that are different than any in the reading.
- A non-rectangular region that can be expressed as a single type I region or as a single type II region.
  - A rectangular region  $\Omega$  that can be expressed neither as a single type I region nor as a single type II region.
  - A region  $\Omega$  that can be expressed as a single type II region, but that requires two type I regions intersecting only on their boundaries, in order to express  $\Omega$  simply.
3. Explain the difference between a type I region and a type II region.
4. Let  $\mathcal{R} = \{(x, y) \mid a \leq x \leq b \text{ and } c \leq y \leq d\}$  be a rectangular region. Explain why  $\mathcal{R}$  is both a type I region and a type II region.

Which of the iterated integrals in Exercises 5–8 could correctly be used to evaluate the double integral  $\iint_{\mathcal{R}} f(x, y) dA$ , where  $f(x, y)$  is a continuous function and  $\mathcal{R}$  is the rectangular region bounded by the lines  $x = 1$ ,  $x = 4$ ,  $y = 2$ , and  $y = 6$ ? For each incorrect integral, how could it be changed to give the correct value?

$$5. \int_1^4 \int_2^6 f(x, y) dy dx \qquad 6. \int_4^1 \int_6^2 f(x, y) dy dx$$

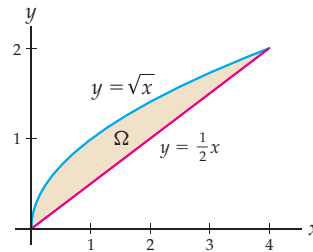

$$7. \int_1^4 \int_2^6 f(x, y) dx dy \qquad 8. \int_2^6 \int_1^4 f(x, y) dx dy$$

Which of the iterated integrals in Exercises 9–12 could correctly be used to evaluate the double integral  $\iint_{\Omega} f(x, y) dA$ , where  $f(x, y)$  is a continuous function and  $\Omega$  is the right triangular region bounded below by the  $x$ -axis, on the left by the  $y$ -axis, and along the hypotenuse by the line  $y = -x + 2$ ? For each incorrect integral, how could it be changed to give the correct value?

$$9. \int_0^2 \int_0^{-x+2} f(x, y) dy dx \qquad 10. \int_0^{-x+2} \int_0^2 f(x, y) dx dy$$

$$11. \int_0^2 \int_0^{-y+2} f(x, y) dx dy \qquad 12. \int_2^0 \int_{-y+2}^0 f(x, y) dx dy$$

13. The following region  $\Omega$  is bounded by the functions  $y = \frac{1}{2}x$  and  $y = \sqrt{x}$ :

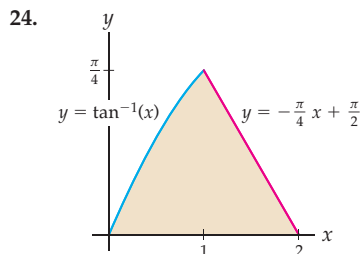

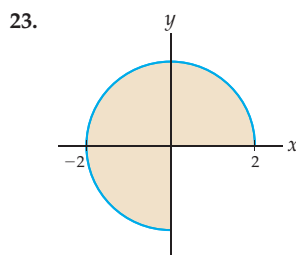

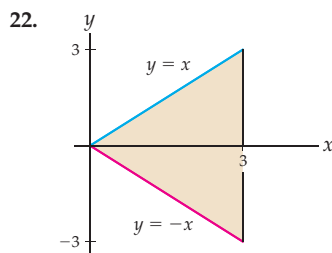

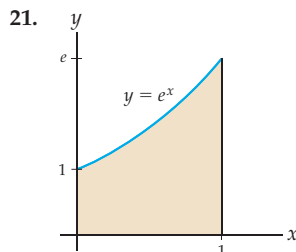

Express  $\Omega$  as a type I region and as a type II region. Referring to Definition 13.8, if  $\Omega$  is a type I region, what are  $a$  and  $b$ ? If  $\Omega$  is a type II region, what are  $c$  and  $d$ ?

14. Explain why the double integral  $\iint_{\Omega} dA$  gives the area of the region  $\Omega$ . Illustrate your explanation with an example.
15. Let  $g_1(x)$  and  $g_2(x)$  be two continuous functions such that  $g_1(x) \leq g_2(x)$  on the interval  $[a, b]$ , and let  $\Omega$  be the region in the  $xy$ -plane bounded by  $g_1$  and  $g_2$  on  $[a, b]$ . Use your answer to Exercise 14 to set up an iterated integral whose value is the area of  $\Omega$ . How is this iterated integral related to the definite integral you would have used to compute the area of  $\Omega$  in Chapter 4?
16. Let  $h_1(y)$  and  $h_2(y)$  be two continuous functions such that  $h_1(x) \leq h_2(x)$  on the interval  $[c, d]$ , and let  $\Omega$  be the region in the  $xy$ -plane bounded by  $h_1$  and  $h_2$  on  $[c, d]$ . Use your answer to Exercise 14 to set up an iterated integral whose value is the area of  $\Omega$ . How is this iterated integral related to the definite integral you would have used to compute the area of  $\Omega$  in Chapter 4?
17. Use the results of Exercises 15 and 16 to find the area of the region  $\Omega$  shown in Exercise 13.
18. Express the area of the region  $\Omega$  between the function  $f(x) = x^2$  and the  $x$ -axis on the interval  $[-3, 3]$  as an iterated integral, integrating first with respect to  $x$ . Express the area of  $\Omega$  as a sum of two iterated integrals, integrating first with respect to  $y$  in each. Now evaluate your integrals.
19. Express the area of the region  $\Omega$  between the function  $f(x) = x^3$  and the  $x$ -axis on the interval  $[-3, 3]$  as a sum of two iterated integrals, integrating first with respect to  $x$  in each. Express the area of  $\Omega$  as a sum of two different iterated integrals, integrating first with respect to  $y$ . Now evaluate your integrals.
20. When you wish to evaluate the definite integral  $\int_a^b f(x) dx$  of a continuous function  $f$ , the interval  $[a, b]$  is never an impediment to using the Fundamental Theorem of Calculus. However, when you wish to evaluate the double integral  $\iint_{\Omega} g(x, y) dA$  of a continuous function  $g$  over a region  $\Omega$ , the region can make the evaluation process easier or harder. Why?

## Skills

Let  $f(x, y)$  be a continuous function. For each region  $\Omega$  shown in Exercises 21–24, set up one or more (if necessary) iterated integrals to compute  $\iint_{\Omega} f(x, y) dA$ , (a) where you integrate first with respect to  $y$  and (b) where you integrate first with respect to  $x$ .

Let  $f(x, y)$  be a continuous function. Sketch each region  $\Omega$  described in Exercises 25–28. Then set up one or more (if necessary) iterated integrals to compute  $\iint_{\Omega} f(x, y) dA$ , (a) where you integrate first with respect to  $y$  and (b) where you integrate first with respect to  $x$ .

25.  $\Omega = \{(x, y) \mid 0 \leq x \leq \frac{\pi}{4} \text{ and } \sin x \leq y \leq \cos x\}$

26.  $\Omega = \{(x, y) \mid -2 \leq x \leq 2 \text{ and } |x| \leq y \leq 2\}$

27.  $\Omega = \{(x, y) \mid |x| + |y| \leq 1\}$

28.  $\Omega = \{(x, y) \mid x^2 + y^2 \leq 9\}$

In Exercises 29–34, sketch the region determined by the limits of the iterated integrals and then give another iterated integral (or a sum of iterated integrals if necessary) using the opposite order of integration.

29.  $\int_1^2 \int_{\ln x}^{e^x} f(x, y) dy dx$

30.  $\int_0^2 \int_x^{-x+4} f(x, y) dy dx$

31.  $\int_0^{\pi/2} \int_0^{\sin y} f(x, y) dx dy$

32.  $\int_0^8 \int_0^{\sqrt[3]{y}} f(x, y) dx dy$

33.  $\int_0^{\pi/2} \int_{\sin y}^1 f(x, y) dx dy$

34.  $\int_0^8 \int_{\sqrt[3]{y}}^2 f(x, y) dx dy$

In Exercises 35–40, find the volume of the solid bounded above by the given function over the specified region  $\Omega$ .

35.  $f(x, y) = 10 - 2x + y$ , with  $\Omega$  the region from Exercise 21.

36.  $f(x, y) = 10 - 2x + y$ , with  $\Omega$  the region from Exercise 22.

37.  $f(x, y) = \sqrt{4 - x^2 - y^2}$ , with  $\Omega$  the region from Exercise 23.

38.  $f(x, y) = x^2 y$ , with  $\Omega$  the region from Exercise 25.

39.  $f(x, y) = \sin x \cos y$ , with  $\Omega$  the region from Exercise 26.

40.  $f(x, y) = 1 - |x| - |y|$ , with  $\Omega$  the region from Exercise 27.

Find the volumes of the solids described in Exercises 41–44.

41. The portion of the first octant bounded by the coordinate planes and the plane  $3x + 4y + 6z = 12$ .

42. The solid bounded above by the plane with equation  $2x + 3y - z = 2$  and bounded below by the triangle with vertices  $(1, 0, 0)$ ,  $(4, 0, 0)$ , and  $(0, 2, 0)$ .

43. The solid bounded above by the paraboloid with equation  $z = 8 - x^2 - y^2$  and bounded below by the rectangle  $\mathcal{R} = \{(x, y) \mid 1 \leq x \leq 2 \text{ and } 0 \leq y \leq 2\}$  in the  $xy$ -plane.

44. The solid bounded above by the hyperboloid with equation  $z = x^2 - y^2$  and bounded below by the square with vertices  $(2, 2, -4)$ ,  $(2, -2, -4)$ ,  $(-2, -2, -4)$ , and  $(-2, 2, -4)$ .

Evaluate the iterated integrals in Exercises 45–48 by reversing the order of integration. Explain why it is easier to reverse the order of integration than evaluate the given iterated integral.

45.  $\int_0^9 \int_{\sqrt{y}}^3 \sqrt{1 + x^3} dx dy$

46.  $\int_0^{\sqrt{\pi}} \int_x^{\sqrt{\pi}} \cos(y^2) dy dx$

47.  $\int_0^{\sqrt{3}} \int_{\tan^{-1} x}^{\pi/3} \sec y dy dx$

48.  $\int_0^1 \int_{\pi/4}^{\cot^{-1} y} \csc x dx dy$

In Exercises 49–58, sketch the region determined by the iterated integral and then evaluate the integral. For some of these integrals, it may be helpful to reverse the order of integration.

$$49. \int_0^3 \int_{x+2}^{2x-3} (x^2 + 3xy) \, dy \, dx$$

$$50. \int_0^3 \int_{y+2}^{2y-3} (x^2 + 3xy) \, dx \, dy$$

$$51. \int_4^9 \int_2^{\sqrt{x}} (x^3 + y^2) \, dy \, dx \quad 52. \int_4^9 \int_2^{\sqrt{y}} (x^2 + 3xy) \, dx \, dy$$

$$53. \int_0^{\pi/4} \int_{\tan x}^{\sec x} y \, dy \, dx \quad 54. \int_0^1 \int_{-e^x}^{e^x} \sin(e^x) \, dy \, dx$$

$$55. \int_0^1 \int_y^1 e^{x^2} \, dx \, dy \quad 56. \int_0^{\pi/4} \int_0^{\sec x} \sec x \, dy \, dx$$

$$57. \int_{\pi/4}^{3\pi/4} \int_0^{\csc y} \csc y \, dx \, dy$$

$$58. \int_0^3 \int_0^{\sqrt{9-y^2}} \sqrt{9-x^2} \, dx \, dy$$

In Exercises 59–62, evaluate the double integral over the specified region.

$$59. \iint_{\Omega} x e^{x^3} \, dA, \text{ where } \Omega \text{ is the triangular region with vertices } (0, 0), (2, 0), \text{ and } (2, 2).$$

$$60. \iint_{\Omega} x e^{x^3} \, dA, \text{ where } \Omega \text{ is the triangular region in the first quadrant bounded below by the } x\text{-axis, bounded above by the line } y = mx, \text{ where } m > 0, \text{ and bounded on the right by the line with equation } x = 1.$$

$$61. \iint_{\Omega} x^2 y^3 \, dA, \text{ where } \Omega \text{ is the region in the first quadrant bounded by the graphs of the curves } y = x^2 \text{ and } x = y^2.$$

$$62. \iint_{\Omega} dA, \text{ where } \Omega \text{ is the region in the first quadrant bounded by the graphs of the curves } y = x^m \text{ and } y = x^n, \text{ where } m \text{ and } n \text{ are distinct positive integers.}$$

## Applications

63. Emmy oversees the operation of a sedimentation lagoon that was built and lined using the natural contours of the terrain. The bottom of the lagoon is the part of the surface

$$z = \frac{1}{10}|x| + \frac{1}{10}|y| - 3$$

that lies below the  $z = 0$  plane, where all units are in meters and  $z = 0$  represents the water level. What is the volume of the lagoon?

64. Leila is designing a new summer range management unit for caribou in the Selkirk Mountains in the Idaho panhandle. The old unit was laid out as a rectangle, which had nothing to do with the behavior of the caribou. The

new one is supposed to resemble the actual area in which the caribou live. Leila has used a study which indicates that the density of caribou in this region in July is approximated by  $d(x, y) = 0.08x^2y^2 - 0.456x^2y - 0.08x^2 - 0.328xy^2 + 1.87xy + 0.328x - 0.061y^2 + 0.347y + 0.061$ . Her proposed southern boundary for the management unit is a mountain ridge that roughly follows the curve  $0.0195x^4$ , while the northern border is a political boundary at  $\frac{x}{4} + 4$ .

The western boundary is a state line on which she places the  $y$ -axis. Roughly how many caribou can be found in the management unit?

## Proofs

65. Let  $f(x, y)$  be an integrable function on the rectangle  $\mathcal{R} = \{(x, y) \mid a \leq x \leq b \text{ and } c \leq y \leq d\}$ , and let  $\alpha \in \mathbb{R}$ . Use the definition of the double integral to prove that

$$\iint_{\mathcal{R}} \alpha f(x, y) \, dA = \alpha \iint_{\mathcal{R}} f(x, y) \, dA.$$

66. Let  $f(x, y)$  and  $g(x, y)$  be integrable functions on the rectangle  $\mathcal{R} = \{(x, y) \mid a \leq x \leq b \text{ and } c \leq y \leq d\}$ . Use the definition of the double integral to prove that

$$\begin{aligned} \iint_{\mathcal{R}} (f(x, y) + g(x, y)) \, dA \\ = \iint_{\mathcal{R}} f(x, y) \, dA + \iint_{\mathcal{R}} g(x, y) \, dA. \end{aligned}$$

67. Prove Theorem 13.10 (a). That is, show that if  $f(x, y)$  is an integrable function on the general region  $\Omega$  and  $c \in \mathbb{R}$ , then

$$\iint_{\Omega} \alpha f(x, y) \, dA = \alpha \iint_{\Omega} f(x, y) \, dA.$$

68. Prove Theorem 13.10 (b). That is, show that if  $f(x, y)$  and  $g(x, y)$  are integrable functions on the general region  $\Omega$ , then

$$\begin{aligned} \iint_{\Omega} (f(x, y) + g(x, y)) \, dA \\ = \iint_{\Omega} f(x, y) \, dA + \iint_{\Omega} g(x, y) \, dA. \end{aligned}$$

69. Let  $a$ ,  $b$ , and  $c$  be positive real numbers. Prove that the volume of the pyramid with vertices  $(0, 0, 0)$ ,  $(a, 0, 0)$ ,  $(0, b, 0)$ , and  $(0, 0, c)$  is  $\frac{1}{6}abc$ .
70. Let  $a$  and  $c$  be positive real numbers. Prove that the volume of the right-square pyramid with vertices  $(a, a, 0)$ ,  $(-a, a, 0)$ ,  $(a, -a, 0)$ ,  $(-a, -a, 0)$ , and  $(0, 0, c)$  is  $\frac{4}{3}a^2c$ . (Hint: Use the result of Exercise 69.)

## Thinking Forward

- *Three iterated integrals:* Let  $[a_1, a_2]$ ,  $[b_1, b_2]$ , and  $[c_1, c_2]$  be three closed intervals. Explain why the triple integral

$$\int_{a_1}^{a_2} \int_{b_1}^{b_2} \int_{c_1}^{c_2} dz \, dy \, dx$$

computes the volume of the rectangular solid with length  $a_2 - a_1$ , width  $b_2 - b_1$ , and height  $c_2 - c_1$ .

- *Three more iterated integrals:* Evaluate the triple integral

$$\int_0^2 \int_0^{-(3/2)x+3} \int_0^{4-2x-(4/3)y} dz \, dy \, dx,$$

and give a physical interpretation to the integral.

## 13.3 DOUBLE INTEGRALS IN POLAR COORDINATES

- Expressing a double integral with polar coordinates
- Finding areas of regions bounded by functions expressed with polar coordinates
- Finding volumes of solids bounded by functions expressed with polar coordinates

### Polar Coordinates and Double Integrals

In Chapter 9 we saw that every point in the coordinate plane can be expressed with polar coordinates  $(r, \theta)$ , where  $\theta$ , in radians, measures the counterclockwise rotation from the positive  $x$ -axis and  $r$  measures the signed distance that the point is from the origin on the line determined by  $\theta$ . In Chapter 9 we allowed  $r$  and  $\theta$  to be any real numbers. In this section, where we discuss how to use polar coordinates to evaluate double integrals, we will insist that  $r \geq 0$  and that  $\theta$  be a real number in an interval of width  $2\pi$ , typically  $\theta \in [0, 2\pi]$  or  $\theta \in [-\pi, \pi]$ .

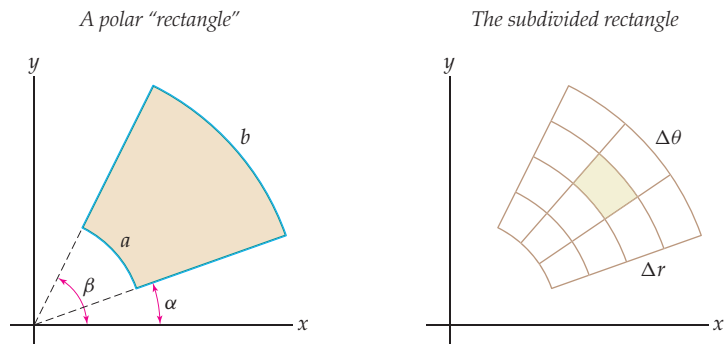

In the first two sections of this chapter we discussed how to use rectangular coordinates to integrate functions of two variables. Here, we extend this idea to functions and regions that are more naturally expressed with polar coordinates. That is, we wish to find

$$\int_{\mathcal{R}} f(r, \theta) \, dA,$$

where  $f$  is a function of  $r$  and  $\theta$  and the region  $\mathcal{R}$  is also expressed in terms of  $r$  and  $\theta$ . In Section 13.1 we began with a basic rectangular region, which we then partitioned into subrectangles. Here we start with a polar “rectangle” defined by the inequalities

$$0 \leq a \leq r \leq b \quad \text{and} \quad \alpha \leq \theta \leq \beta,$$

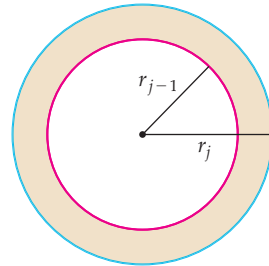

as shown in the following figure at the left:

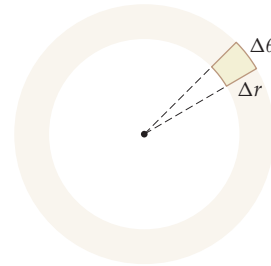

In the right-hand figure, we see the same region divided into “subrectangles.” We follow a procedure analogous to that we used in Section 13.1. We assume that  $f(r, \theta)$  is a function defined at every point of  $\mathcal{R}$ . We will outline the steps required to find the volume  $V$  of the solid bounded below by  $\mathcal{R}$  and bounded above by the graph of  $f$  in a moment, but first we need to understand how to compute the area of one of the subregions, shown in the right-hand figure.

The areas of the “subrectangles” depend upon the values of  $\Delta r$  and  $\Delta\theta$ . Consider the **annulus** with inner radius  $r_{j-1}$  and outer radius of  $r_j$ , as shown in the following figure at the left:

The annulus with inner and outer radii  $r_{j-1}$  and  $r_j$

A slice of the annulus

The area of the annulus is given by

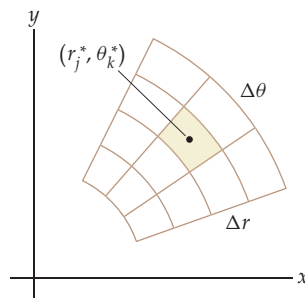

$$\pi(r_j^2 - r_{j-1}^2) = \pi(r_j + r_{j-1})(r_j - r_{j-1}) = 2\pi \frac{r_j + r_{j-1}}{2} \Delta r.$$

Note that if we let  $\hat{r}_j = \frac{r_j + r_{j-1}}{2}$ , then  $\hat{r}_j \in [r_{j-1}, r_j]$ . Thus, the area of the annulus is  $2\pi \hat{r}_j \Delta r$ . The area of a “slice” of the annulus corresponding to an angular rotation of  $\Delta\theta$  will be

$$(2\pi \hat{r}_j \Delta r) \frac{\Delta\theta}{2\pi} = \hat{r}_j \Delta r \Delta\theta.$$

We are now ready to approximate the volume  $V$  of the solid bounded below by  $\mathcal{R}$  and above by the graph of  $f$ :

- ▶ We subdivide the interval  $[a, b]$  into  $m$  equal subintervals, each of width  $\Delta r = \frac{b-a}{m}$ , and we also let  $r_j = a + j\Delta r$  for  $0 \leq j \leq m$ .
- ▶ Similarly, we subdivide the interval  $[\alpha, \beta]$  into  $n$  equal subintervals, each of width  $\Delta\theta = \frac{\beta-\alpha}{n}$ , and we let  $\theta_k = \alpha + k\Delta\theta$  for  $0 \leq k \leq n$ .
- ▶ The subdivisions we just created partition the polar rectangle into  $m \times n$  polar rectangles, like the one shown earlier at the right.
- ▶ For each  $j = 1, 2, \dots, m$  and  $k = 1, 2, \dots, n$ , we select a point  $(r_j^*, \theta_k^*)$  in the sub-rectangle  $\mathcal{R}_{jk} = \{(r, \theta) \mid r_{j-1} \leq r_j^* \leq r_j \text{ and } \theta_{k-1} \leq \theta_k^* \leq \theta_k\}$ .

One such point is shown in the preceding figure.

- ▶ The area of a subregion is given by  $\hat{r}_j \Delta r \Delta \theta$ , where  $\hat{r}_j \in [r_{j-1}, r_j]$ .
- ▶ The product  $f(r_j^*, \theta_k^*) \hat{r}_j \Delta r \Delta \theta$  approximates the volume of the solid bounded below by the rectangle  $\mathcal{R}_{jk}$  and above by the graph of  $f$ .
- ▶ When we sum these approximate volumes over all of the subregions, we obtain an approximation for the volume of  $V$ :

$$\sum_{j=1}^m \sum_{k=1}^n f(r_j^*, \theta_k^*) \hat{r}_j \Delta r \Delta \theta.$$

The limit of this summation provides the iterated integral of the function on the polar region  $\mathcal{R}$ , namely,

$$\int_{\alpha}^{\beta} \int_a^b f(r, \theta) r \, dr \, d\theta = \lim_{\Delta \rightarrow 0} \sum_{j=1}^m \sum_{k=1}^n f(r_j^*, \theta_k^*) \hat{r}_j \Delta r \Delta \theta,$$

where  $\Delta = \sqrt{(\Delta r)^2 + (\Delta \theta)^2}$ .

We evaluate this type of iterated integral just as we evaluated iterated integrals expressed with rectangular coordinates. For example, we may prove that the volume of a sphere with radius  $R$  is  $\frac{4}{3}\pi R^3$  by integrating the function  $f(x, y) = \sqrt{R^2 - (x^2 + y^2)}$  over the polar rectangle  $\mathcal{R} = \{(r, \theta) \mid 0 \leq r \leq R \text{ and } 0 \leq \theta \leq 2\pi\}$ . Before we integrate, however, we must express  $f$  in polar coordinates. Recall that  $r^2 = x^2 + y^2$ . Therefore  $z = \sqrt{R^2 - r^2}$ . The volume of the top hemisphere is given by the integral

$$\int_0^{2\pi} \int_0^R \sqrt{R^2 - r^2} \, r \, dr \, d\theta.$$

The inner integral is evaluated as

$$\int_0^R \sqrt{R^2 - r^2} \, r \, dr = \left[ -\frac{1}{3}(R^2 - r^2)^{3/2} \right]_0^R = \frac{1}{3}R^3.$$

We now evaluate the outer integral:

$$\int_0^{2\pi} \frac{1}{3}R^3 \, d\theta = \left[ \frac{1}{3}R^3\theta \right]_0^{2\pi} = \frac{2}{3}\pi R^3.$$

Therefore the volume of the entire sphere is  $\frac{4}{3}\pi R^3$ .

## Double Integrals in Polar Coordinates over General Regions

We may also use polar coordinates to evaluate an iterated integral over a more general region

$$\Omega = \{(r, \theta) \mid f_1(\theta) \leq r \leq f_2(\theta) \text{ and } \alpha \leq \theta \leq \beta\}.$$

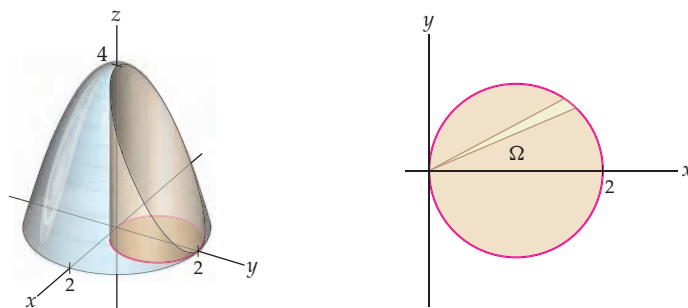

For a polar function  $g(r, \theta)$  defined on the region  $\Omega$ , we have

$$\int_{\alpha}^{\beta} \int_{f_1(\theta)}^{f_2(\theta)} g(r, \theta) \, r \, dr \, d\theta.$$

If  $g(r, \theta) \geq 0$  on  $\Omega$ , then the iterated integral represents the volume of the solid bounded above by the function  $g(r, \theta)$  over the region  $\Omega$ . If  $g(r, \theta)$  takes on both positive and negative

values on  $\Omega$ , then the double integral represents the signed volume of the solid between the graph of the function  $g(r, \theta)$  and the coordinate plane over the region  $\Omega$ .

For example, consider the following figures:

To find the volume of the solid bounded below by the disk whose boundary is the circle with equation  $r = 2 \cos \theta$  in the coordinate plane and bounded above by the paraboloid  $z = 4 - x^2 - y^2$ , we evaluate the integral

$$\int_0^\pi \int_0^{2 \cos \theta} (4 - r^2) r \, dr \, d\theta.$$

Note that:

- ▶ Our limits of integration for  $\theta$  are 0 and  $\pi$ , because the entire circle is traced once over this interval.
- ▶ Our limits of integration for  $r$  are 0 and  $2 \cos \theta$ , since every "slice" emanating from the origin has those boundaries, as we see in the right-hand figure.
- ▶ We have replaced  $x^2 + y^2$  with  $r^2$  to express the function with polar coordinates.
- ▶ If we had preferred, we could have used the expression

$$2 \int_0^{\pi/2} \int_0^{2 \cos \theta} (4 - r^2) r \, dr \, d\theta$$

to evaluate the volume, since both the circular region and the surface are symmetric with respect to the  $xz$ -plane.

To evaluate either of the preceding integrals, we begin with the inner integration:

$$\int_0^{2 \cos \theta} (4 - r^2) r \, dr = \left[ 2r^2 - \frac{1}{4}r^4 \right]_0^{2 \cos \theta} = 8 \cos^2 \theta - 4 \cos^4 \theta.$$

To finish the computation of the volume, we have

$$\int_0^\pi (8 \cos^2 \theta - 4 \cos^4 \theta) \, d\theta = \left[ \frac{5}{2}\theta + \frac{5}{2} \sin \theta \cos \theta - \sin \theta \cos^3 \theta \right]_0^\pi = \frac{5}{2}\pi.$$

Every double integral expressed with rectangular coordinates may also be expressed with polar coordinates. Recall that we may use the equations

$$x = r \cos \theta \quad \text{and} \quad y = r \sin \theta$$

to change from rectangular coordinates to polar coordinates. Therefore, the double integral

$$\iint_{\Omega} f(x, y) \, dA$$

may also be expressed as

$$\iint_{\Omega} f(r \cos \theta, r \sin \theta) r \, dr \, d\theta.$$

The value of making this transformation depends upon the region  $\Omega$  and the particular function  $f$  we are trying to integrate. If  $\Omega$  has a more “natural” expression in polar coordinates, or if  $f$  has a simpler antiderivative in polar coordinates, the change to polar coordinates may make the evaluation of the integral considerably easier. We look at such an integral in Example 4.

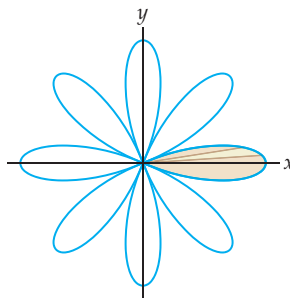

## Examples and Explorations

### EXAMPLE 1 Finding the area bounded by a polar rose

Use a double integral to calculate the area bounded by the curve  $r = \cos 4\theta$ .

#### SOLUTION

As with all area computations, we must understand the region whose area we are trying to compute. When we can, we will use the symmetry of the region to simplify our work. In Chapter 9 we saw that the graph of an equation of the form  $r = \cos n\theta$  or  $r = \sin n\theta$  is a polar rose when  $n > 1$  is an integer. In addition, if  $n$  is even, the figure has  $2n$  petals; if  $n$  is odd, the figure has  $n$  petals. The graph of this curve is as follows:

To compute the area bounded by the curve, we will use the symmetry of the rose. Note that we have shaded one of the eight petals of the rose. The values of  $\theta$  for which the graph passes through the origin correspond to the roots of  $\cos 4\theta$  (i.e., odd multiples of  $\pi/8$ ). A sample radial slice of each petal starts at the origin and ends on the curve. The shaded region corresponds to the values of  $\theta$  in the interval  $[-\pi/8, \pi/8]$ . The double integral whose value is the area of the shaded region is

$$\int_{-\pi/8}^{\pi/8} \int_0^{\cos 4\theta} r \, dr \, d\theta.$$

Evaluating the inner integral first, we obtain

$$\int_0^{\cos 4\theta} r \, dr = \left[ \frac{1}{2} r^2 \right]_0^{\cos 4\theta} = \frac{1}{2} \cos^2 4\theta.$$

Now, evaluating the outer integral, we have

$$\int_{-\pi/8}^{\pi/8} \frac{1}{2} \cos^2 4\theta \, d\theta = \left[ \frac{1}{4} \theta + \frac{1}{16} \sin 4\theta \cos 4\theta \right]_{-\pi/8}^{\pi/8} = \frac{\pi}{16}.$$

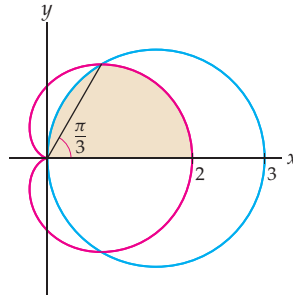

Since the area of the shaded region is one-eighth of the region bounded by the polar rose, the area bounded by the rose is  $\frac{\pi}{2}$  square units.  $\square$

**EXAMPLE 2****Finding the area between two polar curves**

Use a double integral to calculate the area of the region in the polar plane that is inside both the circle  $r = 3 \cos \theta$  and the cardioid  $r = 1 + \cos \theta$ .

**SOLUTION**

By the symmetry of the graphs, half of the region whose area we wish to calculate is the shaded portion of the following figure:

We will compute the area of the top half of the region and then multiply by 2. Solving the equation  $3 \cos \theta = 1 + \cos \theta$ , we see that the two curves intersect when  $\theta = \frac{\pi}{3}$ . In the figure, we have drawn the ray  $\theta = \frac{\pi}{3}$ . The iterated integral that represents the area of the portion of the shaded region for values of  $\theta \leq \frac{\pi}{3}$  is

$$\int_0^{\pi/3} \int_0^{1+\cos\theta} r \, dr \, d\theta,$$

and the iterated integral that represents the area of the portion of the shaded region for  $\frac{\pi}{3} \leq \theta \leq \frac{\pi}{2}$  is

$$\int_{\pi/3}^{\pi/2} \int_0^{3\cos\theta} r \, dr \, d\theta.$$

In Exercise 12 you will show that the values of these two integrals are  $\frac{1}{4}\pi + \frac{9}{16}\sqrt{3}$  and  $\frac{3}{8}\pi - \frac{9}{16}\sqrt{3}$ , respectively. Therefore, the area of the shaded region is  $\frac{5}{8}\pi$  and the value of the area we wish to compute is  $\frac{5}{4}\pi$  square units.  $\square$

**EXAMPLE 3****Using a double integral to prove the area formula for the circle**

Use a double integral to prove that the area of a circle with radius  $R$  is  $\pi R^2$ .

**SOLUTION**

We will compute the area of the circle whose equation is  $r = R$ . The area is given by the iterated integral

$$\int_0^{2\pi} \int_0^R r \, dr \, d\theta.$$

The inner integral is

$$\int_0^R r \, dr = \left[ \frac{1}{2}r^2 \right]_0^R = \frac{1}{2}R^2.$$

We now evaluate the outer integral:

$$\int_0^{2\pi} \frac{1}{2}R^2 d\theta = \left[ \frac{1}{2}R^2\theta \right]_0^{2\pi} = \pi R^2.$$

In Exercises 63 and 64 you will prove this result twice more by finding the area of the circles with equations  $r = 2R \cos \theta$  and  $r = 2R \sin \theta$ .  $\square$

#### EXAMPLE 4

#### Changing an integral from rectangular to polar coordinates

Evaluate the integral  $\int_0^2 \int_{\sqrt{3}x}^{\sqrt{16-x^2}} (x^2 + y^2) dy dx$ .

#### SOLUTION

We may try to evaluate the integral as it is written. To do this, we evaluate the inner integral first:

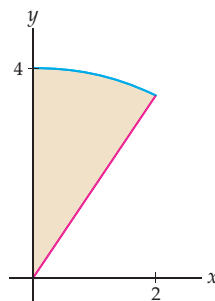

$$\begin{aligned} \int_{\sqrt{3}x}^{\sqrt{16-x^2}} (x^2 + y^2) dy &= \left[ x^2y + \frac{1}{3}y^3 \right]_{\sqrt{3}x}^{\sqrt{16-x^2}} \\ &= \left( x^2\sqrt{16-x^2} + \frac{1}{3}(16-x^2)^{3/2} \right) - \left( \sqrt{3}x^3 + \frac{1}{3}3\sqrt{3}x^3 \right) \\ &= x^2\sqrt{16-x^2} + \frac{1}{3}(16-x^2)^{3/2} - 2\sqrt{3}x^3. \end{aligned}$$

Now, to finish the problem, we would need to evaluate the integral

$$\int_0^2 \left( x^2\sqrt{16-x^2} + \frac{1}{3}(16-x^2)^{3/2} - 2\sqrt{3}x^3 \right) dx.$$

With diligence, we would use trigonometric substitution to find an antiderivative for the integrand, but we present an alternative.

We may replace the original integrand  $x^2 + y^2$  with its polar coordinate equivalent  $r^2$ . We shall similarly see that the region described by the limits of the integral may be expressed with polar coordinates. These are two essential things to consider when you are deciding between using rectangular and polar coordinates. The region in question is bounded above by the graph of the function  $y = \sqrt{16-x^2}$  and bounded below by the line whose equation is  $y = \sqrt{3}x$ , where  $x \in [0, 2]$ . Here is the region:

This region is a sector of the circle  $r = 4$ , where  $\frac{\pi}{3} \leq \theta \leq \frac{\pi}{2}$ . We may now rewrite the integral in terms of polar coordinates. Whenever we convert from rectangular to polar coordinates, we must replace either  $dy dx$  or  $dx dy$  by  $r dr d\theta$ . As we already mentioned, in this example we replace  $x^2 + y^2$  with  $r^2$ . The limits for the integration with respect to  $r$  extend from 0 to 4, and the limits for  $\theta$  extend from  $\frac{\pi}{3}$  to  $\frac{\pi}{2}$ . Therefore we have

$$\int_0^2 \int_{\sqrt{3}x}^{\sqrt{16-x^2}} (x^2 + y^2) dy dx = \int_{\pi/3}^{\pi/2} \int_0^4 r^3 dr d\theta.$$

We first evaluate the inner integral:

$$\int_0^4 r^3 dr = \left[ \frac{1}{4} r^4 \right]_0^4 = 64.$$

We now finish by evaluating the outer integral:

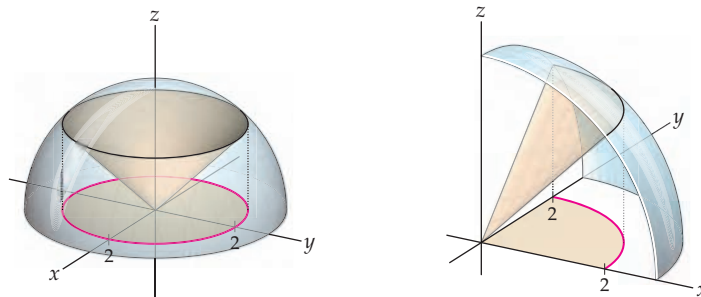

$$\int_{\pi/3}^{\pi/2} 64 d\theta = [64\theta]_{\pi/3}^{\pi/2} = 64 \left( \frac{\pi}{2} - \frac{\pi}{3} \right) = \frac{32}{3} \pi. \quad \square$$

### EXAMPLE 5 Using polar coordinates to compute a volume

Find the volume of the solid bounded above by the sphere  $x^2 + y^2 + z^2 = 8$  and bounded below by the cone with equation  $z = \sqrt{x^2 + y^2}$ .

#### SOLUTION

The sphere and cone intersect along a circle. If we rewrite the equations in the forms  $z^2 = 8 - x^2 - y^2$  and  $z^2 = x^2 + y^2$  and equate the results, we see that  $x^2 + y^2 = 4$ . The disk bounded by the circle defined by this equation is the region over which we need to integrate the difference of the two functions. The graph that follows at the left shows the entire hemisphere and cone, along with the disk in the  $xy$ -plane, over which we will integrate. The open figure depicted at the right shows a quarter of the left-hand figure.

To find the volume of the solid, we will integrate the difference of the two functions over the indicated circle in the  $xy$ -plane. In polar coordinates, the equations of the top hemisphere and the cone are  $z = \sqrt{8 - r^2}$  and  $z = r$ , respectively. The equation of the circle of intersection of the sphere and cone projected onto the  $xy$ -plane is  $r = 2$ . Therefore, the iterated integral representing the volume is

$$\int_0^{2\pi} \int_0^2 (\sqrt{8 - r^2} - r) r dr d\theta.$$

We now evaluate the iterated integral by first working on the inner integral:

$$\int_0^2 (r\sqrt{8 - r^2} - r^2) dr = \left[ -\frac{1}{3}(8 - r^2)^{3/2} - \frac{1}{3}r^3 \right]_0^2 = \frac{16}{3}(\sqrt{2} - 1).$$

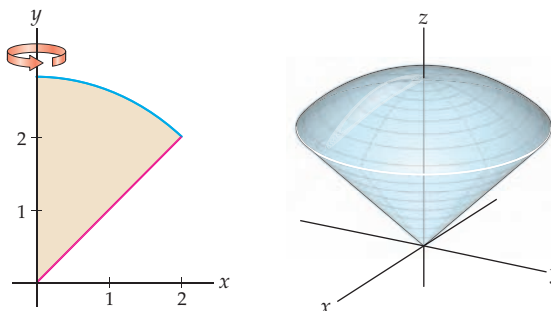

We next integrate the rightmost quantity with respect to  $\theta$  over the interval  $[0, 2\pi]$ :

$$\int_0^{2\pi} \frac{16}{3}(\sqrt{2} - 1) d\theta = \frac{32}{3}\pi(\sqrt{2} - 1).$$

This is the volume of the region we wished to find. □

**CHECKING  
THE ANSWER**

The volume we were asked to find is the volume of the solid of revolution created when the region in the first quadrant bounded above by the graph of  $y = \sqrt{8 - x^2}$  and below by the line  $y = x$  is rotated about the  $y$ -axis, as we illustrate in the following figures:

We may evaluate the volume of this region using either the washer method or the shell method, both of which we discussed in Chapter 6. Using the shell method, we have

$$2\pi \int_0^2 x(\sqrt{8 - x^2} - x) dx.$$

You should check that the value of this integral is also  $\frac{32}{3}\pi(\sqrt{2} - 1)$ .

**TEST YOUR  
UNDERSTANDING**

- ▶ How are polar coordinates used to express double integrals?
- ▶ What are the formulas needed to convert from rectangular to polar coordinates? What are the formulas needed to convert from polar to rectangular coordinates?
- ▶ How are iterated integrals used to calculate areas between functions that are expressed in polar coordinates? How can a single integral be used to express such areas?
- ▶ How are iterated integrals used to calculate the volumes bounded by functions that are expressed in polar coordinates?
- ▶ How is an integral that is expressed in rectangular coordinates rewritten in terms of polar coordinates? When would such rewriting be advantageous? When would it be disadvantageous? How would an integral that is expressed in polar coordinates be expressed in terms of rectangular coordinates?

## EXERCISES 13.3

### Thinking Back

Each of the integral expressions that follow represents the area of a region in the plane bounded by a function expressed in polar coordinates. Use the ideas from this section and from Chapter 9 to sketch the regions, and then evaluate each integral.

▶  $\frac{1}{2} \int_0^\pi \cos^2 3\theta d\theta$

▶  $4 \int_0^{\pi/4} \cos^2 2\theta d\theta$

▶  $\int_0^{2\pi/3} \left(\frac{1}{2} + \cos \theta\right)^2 d\theta - \int_\pi^{4\pi/3} \left(\frac{1}{2} + \cos \theta\right)^2 d\theta$

▶  $\frac{1}{2} \int_{\pi/6}^{5\pi/6} ((3 \sin \theta)^2 - (1 + \sin \theta)^2) d\theta$

## Concepts

0. *Problem Zero*: Read the section and make your own summary of the material.

1. *True/False*: Determine whether each of the statements that follow is true or false. If a statement is true, explain why. If a statement is false, provide a counterexample.

(a) *True or False*: To approximate the area of the region in the polar plane bounded by the function  $r = f(\theta)$  and the rays  $\theta = \alpha$  and  $\theta = \beta$ , we can use a sum of areas of sectors of circles.

(b) *True or False*: Suppose we subdivide the interval of angles  $\theta \in \left[\frac{\pi}{4}, \frac{\pi}{2}\right]$  into four equal subintervals. Then  $\Delta\theta = \frac{\pi}{16}$ .

(c) *True or False*: If  $f(\theta) \geq 0$  on the interval  $[\alpha, \beta]$ , then the area of the region in the polar plane bounded by the function  $r = f(\theta)$  and the rays  $\theta = \alpha$  and  $\theta = \beta$  is given by the iterated integral  $\int_{\alpha}^{\beta} \int_0^{f(\theta)} r \, dr \, d\theta$ .

(d) *True or False*: If  $f(\theta) \geq 0$  on the interval  $[\alpha, \beta]$ , then the volume of the solid bounded above by the function  $g(r, \theta) = r^2$ , over the region in the polar plane bounded by the function  $r = f(\theta)$  and the rays  $\theta = \alpha$  and  $\theta = \beta$ , is given by the iterated integral  $\int_{\alpha}^{\beta} \int_0^{f(\theta)} r^2 \, dr \, d\theta$ .

(e) *True or False*: Since the graph of  $r = 2 \cos 2\theta$  is a circle with radius 1, the value of the integral  $\int_0^{2\pi} \int_0^{2 \cos \theta} r \, dr \, d\theta$  is  $\pi$ .

(f) *True or False*: The polar equation  $r = \sin 4\theta$  is traced twice as  $\theta$  varies from 0 to  $2\pi$ .

(g) *True or False*:

$$\int_0^{\pi} \int_1^5 (x^3 + y^3)^2 \, dy \, dx = \int_0^{\pi} \int_1^5 (\theta^3 + r^3)^2 \, dr \, d\theta.$$

(h) *True or False*:

$$\int_0^2 \int_0^{\sqrt{4-x^2}} (x^2 + y^2)^3 \, dy \, dx = \int_0^{\pi/2} \int_0^2 r^7 \, dr \, d\theta.$$

2. *Examples*: Construct examples of the thing(s) described in the following. Try to find examples that are different than any in the reading.

(a) An iterated integral that represents the area of a circle with radius  $R$  express with polar coordinates.

(b) An iterated integral using polar coordinates that represents the volume of a sphere with radius  $R$ .

(c) An iterated integral in rectangular coordinates that would be easier to evaluate by using polar coordinates.

3. Let  $\alpha < \beta$  and  $a < b$ . In polar coordinates, a polar rectangle is bounded by the two rays  $\theta = \alpha$  and  $\theta = \beta$  and the two circles  $r = a$  and  $r = b$ . Sketch a polar rectangle and explain why this is the basic region for integration in the polar coordinate plane.

4. When we use rectangular coordinates to approximate the area of a region, we subdivide the region into vertical strips and approximate the area by using a sum of areas of rectangles. Explain why we use a wedge (i.e., a sector of a circle), and not a rectangle, when we employ polar coordinates to compute an area.

5. In this section we described a method for approximating the volume bounded by a function  $f$  above a polar region bounded by two rays  $\theta = \alpha$  and  $\theta = \beta$  and between two circles  $r = a$  and  $r = b$ . The method employed a “subdivide, approximate, and add” strategy that involved using some general notation. Draw a carefully labeled picture that illustrates the roles of  $\Delta\theta$ ,  $\theta_k^*$ ,  $\Delta r$ , and  $r_j^*$  for one approximating region.

6. In Section 9.4 we showed that the area in the polar coordinate plane bounded by the function  $r = f(\theta)$  on the interval  $[\alpha, \beta]$  is given by the integral  $\frac{1}{2} \int_{\alpha}^{\beta} (f(\theta))^2 \, d\theta$ . In this section we discussed how to use the iterated integral  $\int_{\alpha}^{\beta} \int_0^{f(\theta)} r \, dr \, d\theta$  to compute the same area. Explain why the value of these two integrals is the same.

7. Let  $0 < f_1(\theta) < f_2(\theta)$  on the interval  $[\alpha, \beta]$ . What does the integral  $\int_{\alpha}^{\beta} \int_{f_1(\theta)}^{f_2(\theta)} r \, dr \, d\theta$  represent in a rectangular  $\theta r$ -coordinate system? What does the integral represent in a polar coordinate system?

8. Why do we require that  $0 \leq \beta - \alpha \leq 2\pi$  when we are trying to find the volume of a solid bounded above by the graph of a function  $z = g(r, \theta)$ , over a region bounded by the polar functions  $r = f_1(\theta)$  and  $r = f_2(\theta)$ , where  $f_1(\theta) \leq f_2(\theta)$  on the interval  $[\alpha, \beta]$ ? If  $0 \leq \beta - \alpha \leq 2\pi$ , does that condition ensure that the integral

$$\int_{\alpha}^{\beta} \int_{f_1(\theta)}^{f_2(\theta)} g(r, \theta) \, r \, dr \, d\theta$$

will represent the volume we want?

9. Consider the three-petaled polar rose defined by  $r = \cos 3\theta$ . Explain why the iterated integral  $\int_0^{2\pi} \int_0^{\cos 3\theta} r \, dr \, d\theta$  calculates *twice* the area bounded by the petals of this rose.

10. Explain how the symmetries of the graphs of polar functions can be used to simplify area calculations.

11. Give a geometric explanation why

$$n \int_0^{2\pi/n} \int_0^R r \, dr \, d\theta = \pi R^2$$

for any positive real number  $R$  and any positive integer  $n$ . Would the equation also hold for nonintegral values of  $n$ ?

12. Complete Example 2 by showing that

$$\int_0^{\pi/3} \int_0^{1+\cos\theta} r \, dr \, d\theta = \frac{1}{4}\pi + \frac{9}{16}\sqrt{3}$$

and

$$\int_{\pi/3}^{\pi/2} \int_0^{3\cos\theta} r \, dr \, d\theta = \frac{3}{8}\pi - \frac{9}{16}\sqrt{3}.$$

In Exercises 13–20, we explore the relationship between the shell method for finding volumes of solids of revolution discussed in Chapter 6 and the method of double integrals using polar coordinates.

13. Sketch a function  $z = f(x)$  in the  $xz$ -plane such that  $f(x) \geq 0$  on the interval  $[0, b]$ . Use the shell method to find an integral that represents the volume of the solid of revolution obtained when the region bounded above by the graph

of  $f$  and bounded below by the  $x$ -axis on the interval  $[0, b]$  is rotated about the  $z$ -axis.

14. Explain why the function  $z = g(x, y) = f(\sqrt{x^2 + y^2})$  is the equation of the surface obtained when the graph of  $f$  is rotated about the  $z$ -axis. Sketch the surface obtained when your function from Exercise 13 is rotated about the  $z$ -axis.
15. Use the techniques of Section 13.2 to obtain an iterated integral that employs rectangular coordinates to represent the volume of the solid that is bounded above by the graph of the function  $g$  from Exercise 14 and below by the  $xy$ -plane over the circular disk  $x^2 + y^2 \leq b^2$ .
16. Use the techniques of this section to obtain an iterated integral that employs polar coordinates to represent the volume of the solid discussed in Exercise 15.
17. Show that the integrals from Exercises 13 and 16 evaluate to the same quantity.
18. Let  $0 < a < b$ . Use the shell method to find an integral that represents the volume of the solid of revolution obtained when the region bounded above by the graph of  $f$  and bounded below by the  $x$ -axis on the interval  $[a, b]$  is rotated about the  $z$ -axis.
19. Use the techniques of this section to obtain an iterated integral that employs polar coordinates to represent the volume of the solid bounded above by the graph of the function  $g$  from Exercise 14 and below by the  $xy$ -plane over the annulus  $a^2 \leq x^2 + y^2 \leq b^2$ .
20. Show that the integrals from Exercises 18 and 19 evaluate to the same quantity.

## Skills

Each of the integrals or integral expressions in Exercises 21–28 represents the area of a region in the plane. Use polar coordinates to sketch the region and evaluate the expressions.

$$21. \int_0^{2\pi} \int_0^{1+\sin\theta} r \, dr \, d\theta \qquad 22. \int_0^\pi \int_0^{1+\cos\theta} r \, dr \, d\theta$$

$$23. 2 \int_{-\pi/2}^{\pi/2} \int_0^{2-\sin\theta} r \, dr \, d\theta \qquad 24. 2 \int_0^{\pi/2} \int_0^{\sin\theta} r \, dr \, d\theta$$

$$25. 2 \int_0^{\pi/2} \int_0^{\sin 3\theta} r \, dr \, d\theta \qquad 26. \int_0^{2\pi} \int_0^{2+\sin 4\theta} r \, dr \, d\theta$$

$$27. 2 \int_{-\pi/4}^{\pi/2} \int_0^{(\sqrt{2}/2)+\sin\theta} r \, dr \, d\theta - 2 \int_{-\pi/2}^{-\pi/4} \int_0^{(\sqrt{2}/2)+\sin\theta} r \, dr \, d\theta$$

$$28. 2 \int_0^{2\pi/3} \int_0^{(1/2)+\cos\theta} r \, dr \, d\theta - 2 \int_\pi^{4\pi/3} \int_0^{(1/2)+\cos\theta} r \, dr \, d\theta$$

In Exercises 29–38, find an iterated integral in polar coordinates that represents the area of the given region in the polar plane and then evaluate the integral.

29. The region enclosed by the spiral  $r = \theta$  and the  $x$ -axis on the interval  $0 \leq \theta \leq \pi$ .
30. The region inside one loop of the lemniscate  $r^2 = \sin 2\theta$ .
31. The region between the two loops of the limaçon  $r = 1 + \sqrt{2} \cos \theta$ .
32. The region between the two loops of the limaçon  $r = \sqrt{3} - 2 \sin \theta$ .
33. The region inside the cardioid  $r = 3 - 3 \sin \theta$  and outside the cardioid  $r = 1 + \sin \theta$ .
34. The region where the two cardioids  $r = 3 - 3 \sin \theta$  and  $r = 1 + \sin \theta$  overlap.
35. The region inside the circle  $x^2 + y^2 = 1$  and to the right of the vertical line  $x = \frac{1}{2}$ .
36. One loop of the curve  $r = 4 \sin 3\theta$ .
37. The region bounded by the limaçon  $r = 1 + k \sin \theta$ , where  $0 < k < 1$ . Explain why it makes sense for the area to approach  $\pi$  as  $k \rightarrow 0$ .

38. The graph of the polar equation  $r = \sec \theta - 2 \cos \theta$  is called a **strophoid**. Graph the strophoid and find the area bounded by the loop of the graph.

Each of the integrals or integral expressions in Exercises 39–46 represents the volume of a solid in  $\mathbb{R}^3$ . Use polar coordinates to describe the solid, and evaluate the expressions.

$$39. 2 \int_0^{2\pi} \int_0^4 r \sqrt{16 - r^2} \, dr \, d\theta$$

$$40. 2 \int_0^{2\pi} \int_0^R r \sqrt{R^2 - r^2} \, dr \, d\theta$$

$$41. \int_0^{2\pi} \int_0^2 (4r - r^3) \, dr \, d\theta$$

$$42. \int_0^\pi \int_0^R (R^2 r - r^3) \, dr \, d\theta$$

$$43. \int_0^{2\pi} \int_0^3 (6r - 2r^2) \, dr \, d\theta$$

$$44. h \int_0^{2\pi} \int_0^R \left( r - \frac{r^2}{R} \right) \, dr \, d\theta$$

$$45. \int_{-\pi/4}^{5\pi/4} \int_0^{(\sqrt{2}/2)+\sin\theta} r \, dr \, d\theta$$

$$46. 2 \int_{-\pi/4}^{\pi/2} \int_0^{(\sqrt{2}/2)+\sin\theta} r \, dr \, d\theta - 2 \int_{-\pi/2}^{-\pi/4} \int_0^{(\sqrt{2}/2)+\sin\theta} r \, dr \, d\theta$$

In Exercises 47–56, use polar coordinates to find an iterated integral that represents the volume of the solid described and then find the volume of the solid.

47. The region enclosed by the paraboloids  $z = x^2 + y^2$  and  $z = 16 - x^2 - y^2$ .
48. The region enclosed by the paraboloids  $z = x^2 + y^2$  and  $z = R^2 - x^2 - y^2$ .
49. The region between the cone with equation  $z = \sqrt{x^2 + y^2}$  and the unit sphere centered at the origin.
50. The region between the cone with equation  $z = \sqrt{x^2 + y^2}$  and the sphere centered at the origin and with radius  $R$ .

51. The region bounded above by the unit sphere centered at the origin and bounded below by the plane  $z = \frac{3}{5}$ .
52. The region bounded above by the unit sphere centered at the origin and bounded below by the plane  $z = h$  where  $0 \leq h \leq 1$ .
53. The region between two spheres with radius 1 if each passes through the center of the other.
54. The region between two spheres with radius  $R$  if each passes through the center of the other.
55. The region bounded below by the graph of the cone with equation  $z = \sqrt{x^2 + y^2}$  and bounded above by the plane  $z = h$ , where  $h > 0$ .
56. The region bounded below by the graph of the cone with equation  $z = \sqrt{x^2 + y^2}$  and bounded above by the plane  $z = 8 - \frac{x}{2}$ .

Sketch the region of integration for each of integrals in Exercises 57–60, and then evaluate the integral by converting to polar coordinates.

$$57. \int_0^{3\sqrt{2}/2} \int_x^{\sqrt{9-x^2}} dy dx$$

$$58. \int_0^1 \int_{(\sqrt{3}/3)y}^{\sqrt{4-y^2}} \sqrt{x^2 + y^2} dx dy$$

$$59. \int_0^4 \int_0^{\sqrt{16-x^2}} e^{x^2} e^{y^2} dy dx$$

$$60. \int_{1/2}^1 \int_{-\sqrt{1-x^2}}^{\sqrt{1-x^2}} \left( 2 \ln x + \ln \left( 1 + \left( \frac{y}{x} \right)^2 \right) \right) dy dx$$

## Applications

61. Leila has been assigned the task of determining the risk to elk herds from the wolf population in a certain region of Idaho. She needs to find out the number of wolves near two distinct elk herds, one centered at the origin and the other 12 miles due north. She estimates the density of wolves in the region as 0.08 wolf per square mile. How many wolves would she expect to find within 12 miles of both herds?
62. Emmy needs to determine the volume of a sedimentation tank. The tank is circular with a radius of 75 feet as viewed from above, with a small concrete island that contains circulation and monitoring equipment in the center. The island has a radius of 7 feet. The depth of the tank at any distance  $r$  from the center is  $d(r) = 0.15 \times 10^{-13} r^8 - 15$ , where the surface of the solution in the tank is at depth zero. What is the volume of the tank?

## Proofs

63. Use a double integral to prove that the area of the circle with radius  $R$  and equation  $r = 2R \cos \theta$  is  $\pi R^2$ .
64. Use a double integral to prove that the area of the circle with radius  $R$  and equation  $r = 2R \sin \theta$  is  $\pi R^2$ .
65. Use a double integral in polar coordinates to prove that the volume of a sphere with radius  $R$  is  $\frac{4}{3} \pi R^3$ .
66. Let  $h$  and  $R$  be positive real numbers. Explain why the region bounded above by the graph of the function  $f(x, y) = h - \frac{h}{R} \sqrt{x^2 + y^2}$  and below by the  $xy$ -plane is a cone with height  $h$  and radius  $R$ . Use a double integral with polar coordinates to prove that the volume of this cone is  $\frac{1}{3} \pi R^2 h$ .
67. Use a double integral with polar coordinates to prove that the area of a sector with central angle  $\phi$  in a circle of radius  $R$  is given by  $A = \frac{1}{2} \phi R^2$ .
68. Use a double integral with polar coordinates to prove that the area enclosed by one petal of the polar rose  $r = \cos 3\theta$  is the same as the area enclosed by one petal of the polar rose  $r = \sin 3\theta$ .
69. Use a double integral with polar coordinates to prove that the combined area enclosed by all of the petals of the polar rose  $r = \cos 2n\theta$  is the same for every positive integer  $n$ .
70. Use a double integral with polar coordinates to prove that the combined area enclosed by all of the petals of the polar rose  $r = \sin(2n + 1)\theta$  is the same for every positive integer  $n$ .

## Thinking Forward

- *A triple integral using cylindrical coordinates:* Show that the triple integral

$$\int_0^{2\pi} \int_0^R \int_0^h r dz dr d\theta = \pi R^2 h.$$

Explain why this integral gives the volume of a right circular cylinder with radius  $R$  and height  $h$ .

- *A triple integral using spherical coordinates:* Evaluate the triple integral

$$\int_0^\pi \int_0^{2\pi} \int_0^R \rho^2 \sin \phi d\rho d\theta d\phi.$$

Note that this integral gives the volume of a sphere with radius  $R$ .

## 13.4 APPLICATIONS OF DOUBLE INTEGRALS

- ▶ Using an iterated integral to find the mass of an object in the plane
- ▶ Finding the center of mass and centroid of a planar region
- ▶ Using double integrals to define the moment of inertia and the radius of gyration

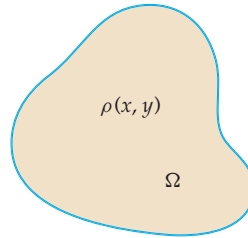

### The Mass of a Planar Region

In Section 6.4 we saw that the mass of a linear rod parallel to the  $x$ -axis with varying density  $\rho(x) > 0$  is given by the integral

$$\int_a^b \rho(x) dx.$$

In the current section we first discuss how to find the mass of a region lying in the  $xy$ -plane when the density is a function of both variables  $x$  and  $y$ . Recall that in Sections 13.1 and 13.2 we discussed a strategy for computing the volume of a solid bounded above by a positive function  $f(x, y)$  over a rectangular region in the plane and over a more general region in  $\mathbb{R}^2$ , respectively. We employ the same strategy here to find the mass of an object in the plane when the density of the object is given by the function  $\rho(x, y)$ , where  $\rho(x, y) > 0$  for every point in the domain, as indicated in the following figure.

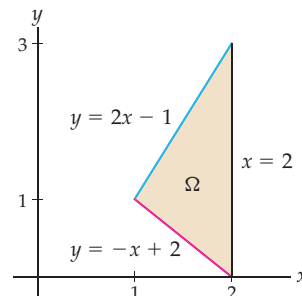

*Region in the plane with variable density  $\rho(x, y)$*

The technique of subdividing, approximating, and adding is precisely what is required here to approximate the mass of a planar region whose density is given by  $\rho(x, y)$ . Therefore, in the limit, to find the exact value of the mass of such a region in the plane, we may use the double integral

$$\text{Mass} = \iint_{\Omega} \rho(x, y) dA.$$

Depending upon the density function  $\rho$  and the region  $\Omega$ , we may choose to evaluate the double integral as either a type I or type II region, using rectangular coordinates, or we may choose to use polar coordinates. For example, consider the triangular region  $\Omega$  with vertices  $(1, 1)$ ,  $(2, 0)$ , and  $(2, 3)$ . If the density at every point in  $\Omega$  is proportional to the distance the point is from the  $y$ -axis, then  $\rho(x, y) = kx$ , where  $k > 0$  is a constant of proportionality. It is somewhat easier to treat  $\Omega$  as a type I region. The equations of the boundary segments are shown in the following figure:

Therefore, the integral

$$\int_1^2 \int_{-x+2}^{2x-1} kx \, dy \, dx$$

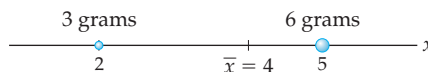

represents the mass of the region. In Exercise 15 you will show that the value of this integral is  $\frac{5}{2}k$ . In Example 2, we discuss finding the mass of a region when the use of polar coordinates provides a simpler computation.

## The Center of Mass and First Moments

Consider a system of two point masses on the  $x$ -axis: mass  $m_1$  at point  $x_1$  and mass  $m_2$  at point  $x_2$ . The **center of mass**,  $\bar{x}$ , of this simple system may be found with the formula:

$$\bar{x} = \frac{m_1 x_1 + m_2 x_2}{m_1 + m_2}.$$

For example, if a mass of 3 grams is located at  $x = 2$  and a mass of 6 grams is located at  $x = 5$ , the center of mass of this system is found at  $\bar{x} = \frac{3 \cdot 2 + 6 \cdot 5}{3 + 6} = 4$ , as shown in the following figure:

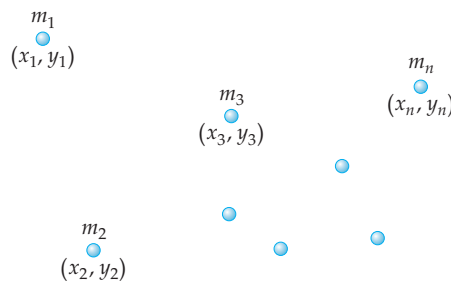

This value conforms to our experience that the center of mass of the system should be closer to the larger mass.

Similarly, for  $n$  point masses  $m_1, m_2, m_3, \dots, m_n$ , at the  $x$ -coordinates  $x_1, x_2, x_3, \dots, x_n$ , respectively, the center of mass of this system is given by

$$\bar{x} = \frac{m_1 x_1 + m_2 x_2 + \dots + m_n x_n}{m_1 + m_2 + \dots + m_n} = \frac{\sum_{k=1}^n m_k x_k}{\sum_{k=1}^n m_k}.$$

We may generalize this idea to point masses in two (or three) dimensions:

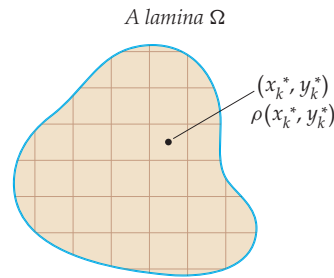

Thus, for point masses,  $m_1, m_2, m_3, \dots, m_n$ , at the coordinate pairs  $(x_1, y_1), (x_2, y_2), (x_3, y_3), \dots, (x_n, y_n)$ , the center of mass of this system is given by the point  $(\bar{x}, \bar{y})$ , where

$$\bar{x} = \frac{\sum_{k=1}^n m_k x_k}{\sum_{k=1}^n m_k} \quad \text{and} \quad \bar{y} = \frac{\sum_{k=1}^n m_k y_k}{\sum_{k=1}^n m_k}.$$

Note that the computations for  $\bar{x}$  and  $\bar{y}$  are independent of each other;  $\bar{x}$  depends only on the masses and their  $x$ -coordinates and  $\bar{y}$  depends only on the masses and their  $y$ -coordinates.

We now turn our attention to finding the center of mass of a planar region with a density function  $\rho(x, y)$ . Such a region is called a **lamina** (*plural laminæ*). We employ our usual strategy of subdividing the region into small pieces, approximating the mass of each small subregion by a single value of the density function over the subregion and then adding all

those values. In this context, we may approximate the  $x$ - and  $y$ -coordinates of the center of mass independently. The following figure provides a schematic:

The approximate mass of each subregion is given by its (approximate) density  $\rho(x_k^*, y_k^*)$  times its area  $\Delta A$ . In the denominators that follow, we sum over all of the subregions. In the numerators, we need the extra factors  $x_k^*$  and  $y_k^*$ , as we are trying to approximate  $\bar{x}$  and  $\bar{y}$ , respectively. Thus,  $\bar{x}$  and  $\bar{y}$  may be approximated by

$$\bar{x} \approx \frac{\sum_{k=1}^n x_k^* \rho(x_k^*, y_k^*) \Delta A}{\sum_{k=1}^n \rho(x_k^*, y_k^*) \Delta A} \quad \text{and} \quad \bar{y} \approx \frac{\sum_{k=1}^n y_k^* \rho(x_k^*, y_k^*) \Delta A}{\sum_{k=1}^n \rho(x_k^*, y_k^*) \Delta A}.$$

In the limit, as the mesh of our grid goes to zero, we obtain the exact coordinates of  $\bar{x}$  and  $\bar{y}$ :

$$\bar{x} = \frac{\iint_{\Omega} x \rho(x, y) \, dA}{\iint_{\Omega} \rho(x, y) \, dA} \quad \text{and} \quad \bar{y} = \frac{\iint_{\Omega} y \rho(x, y) \, dA}{\iint_{\Omega} \rho(x, y) \, dA}.$$

We use the integrals in the numerators in the following definition:

### DEFINITION 13.12

#### First Moments About the $x$ - and $y$ -axes

Let  $\Omega$  be a lamina in the  $xy$ -plane in which the density at each point is given by the continuous function  $\rho(x, y)$ .

(a) The **first moment** of the mass in  $\Omega$  about the  $y$ -axis is

$$M_y = \iint_{\Omega} x \rho(x, y) \, dA.$$

(b) The **first moment** of the mass in  $\Omega$  about the  $x$ -axis is

$$M_x = \iint_{\Omega} y \rho(x, y) \, dA.$$

Thus, if we let  $m = \iint_{\Omega} \rho(x, y) \, dA$ , then  $m$  is the mass of the lamina  $\Omega$  and the coordinates of the center of mass are

$$\bar{x} = \frac{M_y}{m} \quad \text{and} \quad \bar{y} = \frac{M_x}{m}.$$

The first moments are also known as the **linear moments**. Upon first glance, you might think that there are errors in the definitions of the first moment. We see, for example, that  $M_y = \iint_{\Omega} x \rho(x, y) \, dA$ . To help remember this notation, recall that the factor  $x$  in the integrand measures the distance from the  $y$ -axis—hence the designation  $M_y$ . The first moments  $M_y$  and  $M_x$  provide measures of the distribution of the mass with respect to the  $y$ - and  $x$ -axes, respectively. It is possible to generalize these concepts to measure the distributions about other vertical and horizontal lines. For example, to measure the distribution of the mass about the vertical line  $x = x_0$ , we would evaluate the integral  $\iint_{\Omega} (x - x_0) \rho(x, y) \, dA$ . We will not be using these more general moments in this text.

Returning to our earlier example, we again consider the triangular region  $\Omega$  with vertices  $(1, 1)$ ,  $(2, 0)$ , and  $(2, 3)$ . Recall that the density at every point in  $\Omega$  was proportional to the point's distance from the  $y$ -axis. At that time, we computed the mass of the lamina as

$$m = \int_1^2 \int_{-x+2}^{2x-1} kx \, dy \, dx = \frac{5}{2}k,$$

where  $k$  is a constant of proportionality. The integrals we need for the first moments require only minor adjustments:

$$M_y = \int_1^2 \int_{-x+2}^{2x-1} kx^2 \, dy \, dx = \frac{17}{4}k,$$

and

$$M_x = \int_1^2 \int_{-x+2}^{2x-1} kxy \, dy \, dx = \frac{27}{8}k.$$

Therefore,

$$\bar{x} = \frac{M_y}{m} = \frac{(17/4)k}{(5/2)k} = \frac{17}{10} \quad \text{and} \quad \bar{y} = \frac{M_x}{m} = \frac{(27/8)k}{(5/2)k} = \frac{27}{20}.$$

Note that the center of mass,  $(17/20, 27/20)$ , is located within the region  $\Omega$ . When a region is convex, the center of mass lies within the region. Physically, when the center of mass lies within the region, the lamina may be balanced at that point.

When the density of a two-dimensional region  $\Omega$  is constant, the center of mass is also called the **centroid** of  $\Omega$ . In Exercise 20, you will explain why the centroid relates only to the geometry of the region and not to its mass.

## Moments of Inertia

The moment of inertia of an object measures how difficult it is to change the angular momentum of the object. The moment of inertia of a spinning wheel is what makes it difficult for the wheel to stop when it is rotating. The integrals required to calculate the moments of inertia about the  $x$ - and  $y$ -axes are quite similar to those needed for the first moments.

### DEFINITION 13.13

#### Moments of Inertia

Let  $\Omega$  be a lamina in the  $xy$ -plane for which the density at each point is given by the continuous function  $\rho(x, y)$ .

- (a) The **moment of inertia about the  $y$ -axis** of the lamina is

$$I_y = \iint_{\Omega} x^2 \rho(x, y) \, dA.$$

- (b) The **moment of inertia about the  $x$ -axis** of the lamina is

$$I_x = \iint_{\Omega} y^2 \rho(x, y) \, dA.$$

- (c) The **moment of inertia about the origin** of the lamina, also known as the **polar moment**, is

$$I_o = \iint_{\Omega} (x^2 + y^2) \rho(x, y) \, dA.$$

The moments of inertia are also known as the **second moments**. We may use these moments of inertia to compute the **radius of gyration** about the  $y$ -axis, the  $x$ -axis, and the origin. If the lamina has mass  $m$ , these are

$$R_y = \sqrt{\frac{I_y}{m}}, \quad R_x = \sqrt{\frac{I_x}{m}}, \quad \text{and} \quad R_o = \sqrt{\frac{I_o}{m}},$$

respectively. The radii of gyration are the radial distances at which the mass of the lamina could be concentrated without changing its rotational inertia. We compute the moments of inertia and radii of gyration for a region in Examples 4 and 5.

## Probability Distributions

We've seen that when we integrate a density function  $\rho$  over a lamina region  $\Omega$ , we obtain the mass of the lamina. Similarly, if we know a population density over a planar region, we may compute the population. We provide such a computation in Example 6. We may also use an iterated integral to find the probability of an event when we know a **joint probability distribution function**. Recall that a continuous probability distribution function on an interval  $[a, b]$  is a positive-valued function  $f$  defined on  $[a, b]$  such that  $\int_a^b f(x) dx = 1$ . A joint probability distribution function of two variables on a subset  $X \subset \mathbb{R}^2$  is a positive-valued function  $f : X \rightarrow [0, \infty)$  such that  $\iint_X f(x, y) dA = 1$ . To compute the probability of an event  $Z \subset X$ , we evaluate the integral  $\iint_Z f(x, y) dA$ . Joint probability distribution functions of more than two variables are defined in an analogous manner, but we shall not be using them in this text.

## Examples and Explorations

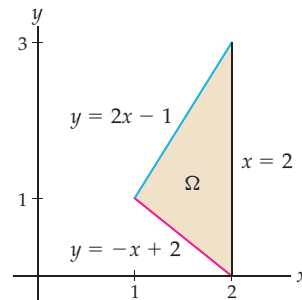

### EXAMPLE 1

#### Finding the centroid of a triangular region

Find the centroid of the triangular region with vertices  $(1, 1)$ ,  $(2, 0)$ , and  $(2, 3)$ .

#### SOLUTION

This is the same triangular region we used earlier in the section, but here we assume that the density  $\rho$  is constant:

Since  $\rho$  is constant, we may factor it out of the integral. In our computation for  $\bar{x}$  we have

$$\bar{x} = \frac{\iint_{\Omega} x \rho dA}{\iint_{\Omega} \rho dA} = \frac{\rho \iint_{\Omega} x dA}{\rho \iint_{\Omega} dA} = \frac{\iint_{\Omega} x dA}{\iint_{\Omega} dA}.$$

Similarly, we would have

$$\bar{y} = \frac{\iint_{\Omega} y \, dA}{\iint_{\Omega} dA}.$$

The integrals in the rightmost denominators each evaluate to the area of  $\Omega$ . For this example, we may use either the indicated double integral or, since  $\Omega$  is a triangle, the area formula for triangles to compute the area of  $\Omega$ . We cannot avoid setting up an iterated integral, however, because we need to evaluate the integrals in the numerators. Here we need to evaluate the following three related integrals:

$$\text{Area} = \int_1^2 \int_{-x+2}^{2x-1} dy \, dx, \quad M_y = \int_1^2 \int_{-x+2}^{2x-1} x \, dy \, dx, \quad \text{and} \quad M_x = \int_1^2 \int_{-x+2}^{2x-1} y \, dy \, dx.$$

These integrals evaluate to

$$\text{Area} = \frac{3}{2}, \quad M_y = \frac{5}{2}, \quad \text{and} \quad M_x = 2.$$

Therefore, we have

$$\bar{x} = \frac{M_y}{\text{Area of } \Omega} = \frac{5/2}{3/2} = \frac{5}{3} \quad \text{and} \quad \bar{y} = \frac{M_x}{\text{Area of } \Omega} = \frac{2}{3/2} = \frac{4}{3}.$$

Thus, the centroid of the triangle is  $(5/3, 4/3)$ . Note that this point is inside the triangle. As we mentioned when we computed the center of mass in our earlier example, if a region  $\Omega$  is convex, the centroid must be located within  $\Omega$ .  $\square$

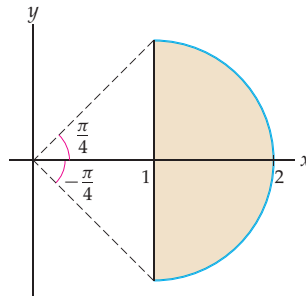

### EXAMPLE 2

#### Using polar coordinates to find a mass

Find the mass of the semicircular lamina whose boundary on the left is given by the line  $x = 1$  and on the right is given by  $(x - 1)^2 + y^2 = 1$  if the density at every point is proportional to its distance from the origin.

#### SOLUTION

The lamina we have described is shown here:

Since the density is proportional to the distance from the origin, it may be expressed easily in polar coordinates as a function of the radial distance  $r$ . That is,  $\rho(r) = kr$ , where  $k > 0$  is a constant of proportionality. The equation of the circle in polar coordinates is  $r = 2 \cos \theta$ , and the vertical line  $x = 1$  in polar coordinates is given by  $r = \sec \theta$ . Finally, we use  $r \, dr \, d\theta$  for our increment of area,  $dA$ . Therefore, the mass of the plate is given by

$$\int_{-\pi/4}^{\pi/4} \int_{\sec \theta}^{2 \cos \theta} kr^2 \, dr \, d\theta.$$

To evaluate this iterated integral, we first evaluate the inner integral:

$$\int_{\sec \theta}^{2 \cos \theta} kr^2 dr = \left[ \frac{1}{3}kr^3 \right]_{\sec \theta}^{2 \cos \theta} = \frac{1}{3}k(8 \cos^3 \theta - \sec^3 \theta).$$

We may now use the techniques of Chapter 5 to evaluate the outer integral:

$$\int_{-\pi/4}^{\pi/4} \frac{1}{3}k(8 \cos^3 \theta - \sec^3 \theta) d\theta = \frac{1}{9}k(17\sqrt{2} + 3 \ln(\sqrt{2} - 1)).$$

You will show the details of this integration in Exercise 22. □

### EXAMPLE 3

#### Using polar coordinates to find a center of mass

Find the center of mass of the semicircular lamina from Example 2.

#### SOLUTION

To start, we note that the  $y$ -coordinate of the center of mass is  $\bar{y} = 0$ , since the region  $\Omega$  and the density function are symmetric with respect to the  $x$ -axis. Now, we have already computed the mass of the plate, using the integral

$$\int_{-\pi/4}^{\pi/4} \int_{\sec \theta}^{2 \cos \theta} kr^2 dr d\theta.$$

We still need to calculate  $M_y$ , the first moment of the mass about the  $y$ -axis. For  $M_y$ , all we have to do is introduce  $x$  into the preceding integrand. Since we are using polar coordinates, we will use the fact that  $x = r \cos \theta$  instead. Therefore,

$$M_y = \int_{-\pi/4}^{\pi/4} \int_{\sec \theta}^{2 \cos \theta} kr^3 \cos \theta dr d\theta = \frac{1}{60}k(157\sqrt{2} + 15 \ln(\sqrt{2} - 1)).$$

You will show the details of this integration in Exercise 23. Thus, the  $x$ -coordinate of the center of mass is given by

$$\frac{M_y}{\text{mass}} = \bar{x} = \frac{\frac{k}{60}(157\sqrt{2} + 15 \ln(\sqrt{2} - 1))}{\frac{k}{9}(17\sqrt{2} + 3 \ln(\sqrt{2} - 1))} = \frac{471\sqrt{2} + 45 \ln(\sqrt{2} - 1)}{340\sqrt{2} + 60 \ln(\sqrt{2} - 1)} \approx 1.4638.$$

Again, as a quick check on the reasonableness of the answer, the point  $(\bar{x}, \bar{y}) \approx (1.4638, 0)$  is within the region  $\Omega$ . □

#### CHECKING THE ANSWER

In Example 3, we used the symmetry of the region  $\Omega$  and the density function to claim that  $\bar{y} = 0$ . If we wish, we may evaluate an iterated integral to compute  $M_x$ . Here, since the variable of integration on the inner integral is  $r$ , we may factor the integral as follows:

$$M_x = \int_{-\pi/4}^{\pi/4} \int_{\sec \theta}^{2 \cos \theta} kr^3 \sin \theta dr d\theta = \left( \int_{-\pi/4}^{\pi/4} \sin \theta d\theta \right) \left( \int_{\sec \theta}^{2 \cos \theta} kr^3 dr \right).$$

Now, since sine is an odd function and the interval  $[-\pi/4, \pi/4]$  is symmetric with respect to the origin, it follows that  $\int_{-\pi/4}^{\pi/4} \sin \theta d\theta = 0$ , and therefore  $M_x$  and  $\bar{y}$  are both zero, as we reasoned before.

### EXAMPLE 4

#### Finding the moments of inertia for a triangular region

Find the moments of inertia for the triangular lamina  $\Omega$  in the  $xy$ -plane and with vertices  $(1, 1)$ ,  $(2, 0)$ , and  $(2, 3)$  if the density at every point in  $\Omega$  is proportional to the distance the point is from the  $y$ -axis.

**SOLUTION**

This is the same region we used in previous examples. We have  $\rho(x, y) = kx$ , where  $k > 0$  is a constant of proportionality. Earlier in the section we saw that

$$M_y = \int_1^2 \int_{-x+2}^{2x-1} kx^2 \, dy \, dx \quad \text{and} \quad M_x = \int_1^2 \int_{-x+2}^{2x-1} kxy \, dy \, dx.$$

The integrals we need for  $I_y$  and  $I_x$  require the extra factors  $x$  and  $y$ , respectively. In Exercises 18 and 19 you will show that the values of these integrals are

$$I_y = \int_1^2 \int_{-x+2}^{2x-1} kx^3 \, dy \, dx = \frac{147}{20}k \quad \text{and} \quad I_x = \int_1^2 \int_{-x+2}^{2x-1} kxy^2 \, dy \, dx = \frac{28}{5}k.$$

From Definition 13.13, we see that  $I_o = I_y + I_x$ . Here we have  $I_o = \frac{147}{20}k + \frac{28}{5}k = \frac{259}{20}k$ .  $\square$

**EXAMPLE 5****Finding the radii of gyration for a triangular region**

Find the radii of gyration about the  $x$ -axis,  $y$ -axis, and origin for the triangular lamina  $\Omega$  with vertices  $(1, 1)$ ,  $(2, 0)$ , and  $(2, 3)$  if the density at every point in  $\Omega$  is proportional to the distance the point is from the  $y$ -axis.

**SOLUTION**

In Example 4 we computed the moments of inertia for this region, and earlier in this section we saw that the mass of  $\Omega$  is  $m = \frac{5}{2}k$ . The radii of gyration with respect to the  $y$ -axis,  $x$ -axis, and origin are, respectively,

$$R_y = \sqrt{\frac{I_y}{m}} = \sqrt{\frac{(147/20)k}{(5/2)k}} = \sqrt{\frac{147}{50}}, \quad R_x = \sqrt{\frac{I_x}{m}} = \sqrt{\frac{(28/5)k}{(5/2)k}} = \frac{\sqrt{56}}{5}, \quad \text{and}$$

$$R_o = \sqrt{\frac{I_o}{m}} = \sqrt{\frac{(259/20)k}{(5/2)k}} = \sqrt{\frac{259}{50}}. \quad \square$$

**EXAMPLE 6****Determining a population from a population density**

A biologist is culturing a population of bacteria in a circular petri dish with a radius of 5 centimeters. She introduces bacteria into the dish and incubates the dish for 24 hours. At the end of that time she estimates that the colony of bacteria in the dish contains 100 bacteria per square centimeter at the center of the dish, with the population decreasing linearly to the edge of the dish. She estimates the population density to be 10 bacteria per square centimeter at the edge. Approximately how many bacteria are in the dish?

**SOLUTION**

This problem is nearly identical to those in which we were given a (mass) density function  $\rho$  for a lamina region  $\Omega$ . To find the total mass, we used an iterated integral to integrate the density function  $\rho$  over the region  $\Omega$ . We will do the same here to find the population of bacteria. We start by imposing a polar coordinate system on the circular petri dish, with the center of the dish at the origin. Since there are 100 bacteria per square centimeter at the origin and the density decreases linearly to 10 bacteria per square centimeter at the edge of the dish, the function  $\rho(r, \theta) = 100 - 18r$  gives us the population density at every point

in the petri dish for  $r \in [0, 5]$ . Therefore, the population of bacteria in the dish is given by the iterated integral

$$\int_0^{2\pi} \int_0^5 (100 - 18r) r \, dr \, d\theta.$$

The value of this integral is  $1000\pi \approx 3100$  bacteria. Note that we have rounded our answer, since the biologist clearly approximated her values for the two population densities.  $\square$

### ? TEST YOUR UNDERSTANDING

- ▶ Given a system of point masses in the plane, how is the center of mass of the system computed? How is this idea used to find the center of mass of a lamina  $\Omega$  whose density function is  $\rho(x, y)$ ?
- ▶ What is the centroid of a region  $\Omega$ ? What is the relationship between the centroid of a region and its center of mass? Why is the centroid of  $\Omega$  independent of the mass of  $\Omega$ ?
- ▶ How is the moment of inertia of a region  $\Omega$  with respect to the  $x$ - and  $y$ -axes defined? How are these definitions related to the definitions of the first moments of  $\Omega$  with respect to the  $x$ - and  $y$ -axes? What is meant by the polar moment?
- ▶ How are the radii of gyration with respect to the  $x$ - and  $y$ -axes,  $R_x$ , and  $R_y$  defined for a region  $\Omega$ ? What integrals need to be computed to find  $R_x$  and  $R_y$ ?
- ▶ How are the integrals for masses, first moments, and moments of inertia related? Which of the three integrals is easiest to step up? Given one of these integrals, how would you modify it to set up the other integrals? When would rectangular coordinates be easier to use for these integrals? When would polar coordinates be easier to use?

## EXERCISES 13.4

### Thinking Back

- ▶ *Mass of a rod:* Suppose a thin rod with a radius of 1 centimeter and a length of 20 centimeters has a varying density such that the density of the rod  $x$  centimeters from the left end is given by the function  $\rho(x) = 10 + 0.01x^2$  grams per cubic centimeter. Find the mass of the rod.
- ▶ *More questions about the rod:* How far from the left end of the rod is the center of mass in the previous problem? How far from the left end of the rod is the moment of inertia? How far from the left end of the rod is the radius of gyration?

### Concepts

0. *Problem Zero:* Read the section and make your own summary of the material.
1. *True/False:* Determine whether each of the statements that follow is true or false. If a statement is true, explain why. If a statement is false, provide a counterexample.
  - (a) *True or False:* The center of mass of a lamina,  $\Omega$ , in the  $xy$ -plane is a point in  $\Omega$ .
  - (b) *True or False:* The centroid of a region,  $\Omega$ , in the  $xy$ -plane is a point in  $\Omega$ .
  - (c) *True or False:* The center of mass of a circular region is the center of the circle for every density function  $\rho(x, y)$ .
  - (d) *True or False:* The centroid of a circular region is the center of the circle.
  - (e) *True or False:* The first moment of the mass in a lamina  $\Omega$  about the  $x$ -axis is given by  $M_x = \iint_{\Omega} x \rho(x, y) \, dA$ , where  $\rho(x, y)$  is the lamina's density function.
  - (f) *True or False:* If  $M_x$  and  $I_x$  are the first and second moments, respectively, for a lamina in the  $xy$ -plane, then  $xM_x = I_x$ .
  - (g) *True or False:* If  $I_x$ ,  $I_y$ , and  $I_o$  are the moments of inertia of a lamina about the  $x$ -axis,  $y$ -axis, and origin, respectively, then  $I_o = I_x + I_y$ .
  - (h) *True or False:* If  $m$  is the mass of a lamina,  $I_y$  is the moment of inertia of the lamina about the  $y$ -axis, and  $R_y$  is the radius of gyration about the  $y$ -axis, then  $R_y^2 = I_y/m$ .

2. *Examples:* Construct examples of the thing(s) described in the following. Try to find examples that are different than any in the reading.
- A lamina  $\Omega$  in the  $xy$ -plane and a density function  $\rho(x, y)$  such that the center of mass of  $\Omega$  and the centroid of  $\Omega$  are the same.
  - A lamina  $\Omega$  in the  $xy$ -plane and a non-constant density function  $\rho(x, y)$  such that the center of mass of  $\Omega$  and the centroid of  $\Omega$  are the same.
  - A lamina  $\Omega$  in the  $xy$ -plane such that the center of mass is *not* in  $\Omega$ .

Identify the quantities determined by the integral expressions in Exercises 3–11. If  $x$  and  $y$  are both measured in centimeters and  $\rho(x, y)$  is a density function in grams per square centimeter, give the units of the expression.

- $\iint_{\Omega} dA$
- $\iint_{\Omega} x dA$  and  $\iint_{\Omega} y dA$
- $\frac{\iint_{\Omega} x dA}{\iint_{\Omega} dA}$  and  $\frac{\iint_{\Omega} y dA}{\iint_{\Omega} dA}$
- $\iint_{\Omega} \rho(x, y) dA$
- $\iint_{\Omega} x \rho(x, y) dA$  and  $\iint_{\Omega} y \rho(x, y) dA$
- $\frac{\iint_{\Omega} x \rho(x, y) dA}{\iint_{\Omega} \rho(x, y) dA}$  and  $\frac{\iint_{\Omega} y \rho(x, y) dA}{\iint_{\Omega} \rho(x, y) dA}$
- $\iint_{\Omega} x^2 \rho(x, y) dA$  and  $\iint_{\Omega} y^2 \rho(x, y) dA$
- $\iint_{\Omega} (x^2 + y^2) \rho(x, y) dA$
- $\sqrt{\frac{\iint_{\Omega} x^2 \rho(x, y) dA}{\iint_{\Omega} \rho(x, y) dA}}$  and  $\sqrt{\frac{\iint_{\Omega} y^2 \rho(x, y) dA}{\iint_{\Omega} \rho(x, y) dA}}$

Throughout this section we computed several integrals relating to the triangular region  $\Omega$  with vertices  $(1, 1)$ ,  $(2, 0)$ , and  $(2, 3)$ . In Exercises 12–19 you are asked to provide the details of those computations.

12. Show that the area of  $\Omega$  is  $\frac{3}{2}$  by using the area formula for triangles and by evaluating the integral
- $$\int_1^2 \int_{-x+2}^{2x-1} dy dx.$$
13. Show that when the density of the region is constant, the first moment about the  $y$ -axis is

$$M_y = \int_1^2 \int_{-x+2}^{2x-1} x dy dx = \frac{5}{2}.$$

14. Show that when the density of the region is constant, the first moment about the  $x$ -axis is

$$M_x = \int_1^2 \int_{-x+2}^{2x-1} y dy dx = 2.$$

15. Show that when the density of the region is proportional to the distance from the  $y$ -axis, the mass of  $\Omega$  is given by

$$\int_1^2 \int_{-x+2}^{2x-1} kx dy dx = \frac{5}{2}k.$$

16. Show that when the density of the region is proportional to the distance from the  $y$ -axis, the first moment about the  $y$ -axis is

$$M_y = \int_1^2 \int_{-x+2}^{2x-1} kx^2 dy dx = \frac{17}{4}k.$$

17. Show that when the density of the region is proportional to the distance from the  $y$ -axis, the first moment about the  $x$ -axis is

$$M_x = \int_1^2 \int_{-x+2}^{2x-1} kxy dy dx = \frac{27}{8}k.$$

18. Show that when the density of the region is proportional to the distance from the  $y$ -axis, the moment of inertia about the  $y$ -axis is

$$I_y = \int_1^2 \int_{-x+2}^{2x-1} kx^3 dy dx = \frac{147}{20}k.$$

19. Show that when the density of the region is proportional to the distance from the  $y$ -axis, the first moment about the  $x$ -axis is

$$I_x = \int_1^2 \int_{-x+2}^{2x-1} kxy^2 dy dx = \frac{28}{5}k.$$

20. Explain why the location of the centroid relates only to the geometry of the region and not its mass.
21. Find the moments of inertia about the  $x$ - and  $y$ -axes for the semicircular lamina described in Example 2. Assume that the density at every point is proportional to the distance of the point from the origin.
22. Complete Example 2 by showing that

$$\begin{aligned} \int_{-\pi/4}^{\pi/4} \frac{k}{3} (8 \cos^3 \theta - \sec^3 \theta) d\theta \\ = \frac{k}{9} (17\sqrt{2} + 3 \ln(\sqrt{2} - 1)). \end{aligned}$$

23. Complete Example 3 by showing that

$$\begin{aligned} \int_{-\pi/4}^{\pi/4} \int_{\sec \theta}^{2 \cos \theta} kr^3 \cos \theta dr d\theta \\ = \frac{k}{60} (157\sqrt{2} + 15 \ln(\sqrt{2} - 1)). \end{aligned}$$

## Skills

In Exercises 24–30, let  $\mathcal{T}$  be the triangular region with vertices  $(0, 0)$ ,  $(1, 1)$ , and  $(1, -1)$ .

24. Find the centroid of  $\mathcal{T}$ .
25. If the density at each point in  $\mathcal{T}$  is proportional to the point's distance from the  $y$ -axis, find the mass of  $\mathcal{T}$ .
26. If the density at each point in  $\mathcal{T}$  is proportional to the point's distance from the  $y$ -axis, find the center of mass of  $\mathcal{T}$ .
27. If the density at each point in  $\mathcal{T}$  is proportional to the point's distance from the  $y$ -axis, find the moments of inertia about the  $x$ - and  $y$ -axes. Use these answers to find the radii of gyration of  $\mathcal{T}$  about the  $x$ - and  $y$ -axes.
28. If the density at each point in  $\mathcal{T}$  is proportional to the point's distance from the  $x$ -axis, find the mass of  $\mathcal{T}$ .
29. If the density at each point in  $\mathcal{T}$  is proportional to the point's distance from the  $x$ -axis, find the center of mass of  $\mathcal{T}$ .
30. If the density at each point in  $\mathcal{T}$  is proportional to the point's distance from the  $x$ -axis, find the moments of inertia about the  $x$ - and  $y$ -axes. Use these answers to find the radii of gyration of  $\mathcal{T}$  about the  $x$ - and  $y$ -axes.

In Exercises 31–37, let  $\mathcal{T}_2$  be the triangular region with vertices  $(1, 0)$ ,  $(2, 1)$ , and  $(2, -1)$ . Note that  $\mathcal{T}_2$  is a translation of the triangle we used in Exercises 24–30.

31. Find the centroid of  $\mathcal{T}_2$ .
32. If the density at each point in  $\mathcal{T}_2$  is proportional to the point's distance from the  $y$ -axis, find the mass of  $\mathcal{T}_2$ .
33. If the density at each point in  $\mathcal{T}_2$  is proportional to the point's distance from the  $y$ -axis, find the center of mass of  $\mathcal{T}_2$ .
34. If the density at each point in  $\mathcal{T}_2$  is proportional to the point's distance from the  $y$ -axis, find the moments of inertia about the  $x$ - and  $y$ -axes. Use these answers to find the radii of gyration of  $\mathcal{T}_2$  about the  $x$ - and  $y$ -axes.
35. If the density at each point in  $\mathcal{T}_2$  is proportional to the square of the point's distance from the  $y$ -axis, find the mass of  $\mathcal{T}_2$ .
36. If the density at each point in  $\mathcal{T}_2$  is proportional to the square of the point's distance from the  $y$ -axis, find the center of mass of  $\mathcal{T}_2$ .
37. If the density at each point in  $\mathcal{T}_2$  is proportional to the square of the point's distance from the  $y$ -axis, find the moments of inertia about the  $x$ - and  $y$ -axes. Use these answers to find the radii of gyration of  $\mathcal{T}_2$  about the  $x$ - and  $y$ -axes.

In Exercises 38–44, let  $\mathcal{R}$  be the rectangular region with vertices  $(0, 0)$ ,  $(b, 0)$ ,  $(0, h)$ , and  $(b, h)$ .

38. Find the centroid of  $\mathcal{R}$ .
39. If the density at each point in  $\mathcal{R}$  is proportional to the point's distance from the  $y$ -axis, find the mass of  $\mathcal{R}$ .
40. If the density at each point in  $\mathcal{R}$  is proportional to the point's distance from the  $y$ -axis, find the center of mass of  $\mathcal{R}$ .

41. If the density at each point in  $\mathcal{R}$  is proportional to the point's distance from the  $y$ -axis, find the moments of inertia about the  $x$ - and  $y$ -axes. Use these answers to find the radii of gyration of  $\mathcal{R}$  about the  $x$ - and  $y$ -axes.
42. If the density at each point in  $\mathcal{R}$  is proportional to the square of the point's distance from the  $y$ -axis, find the mass of  $\mathcal{R}$ .
43. If the density at each point in  $\mathcal{R}$  is proportional to the square of the point's distance from the  $y$ -axis, find the center of mass of  $\mathcal{R}$ .
44. If the density at each point in  $\mathcal{R}$  is proportional to the square of the point's distance from the  $y$ -axis, find the moments of inertia about the  $x$ - and  $y$ -axes. Use these answers to find the radii of gyration of  $\mathcal{R}$  about the  $x$ - and  $y$ -axes.

In Exercises 45–51, let  $\mathcal{C} = \{(x, y) \mid x^2 + y^2 \leq 1\}$ .

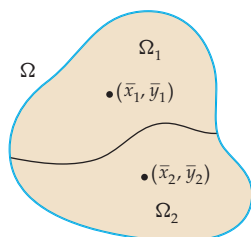

45. Find the centroid of  $\mathcal{C}$ .
46. If the density at each point in  $\mathcal{C}$  is proportional to the point's distance from the  $y$ -axis, find the mass of  $\mathcal{C}$ .
47. If the density at each point in  $\mathcal{C}$  is proportional to the point's distance from the  $y$ -axis, find the center of mass of  $\mathcal{C}$ .
48. If the density at each point in  $\mathcal{C}$  is proportional to the point's distance from the  $y$ -axis, find the moments of inertia about the  $x$ - and  $y$ -axes. Use these answers to find the radii of gyration of  $\mathcal{C}$  about the  $x$ - and  $y$ -axes.
49. If the density at each point in  $\mathcal{C}$  is proportional to the point's distance from the origin, find the mass of  $\mathcal{C}$ .
50. If the density at each point in  $\mathcal{C}$  is proportional to the point's distance from the origin, find the center of mass of  $\mathcal{C}$ .
51. If the density at each point in  $\mathcal{C}$  is proportional to the point's distance from the origin, find the moments of inertia about the  $x$ -axis, the  $y$ -axis, and the origin. Use these answers to find the radii of gyration of  $\mathcal{C}$  about the  $x$ -axis, the  $y$ -axis, and the origin.

In Exercises 52–58, let  $\mathcal{S} = \{(x, y) \mid x^2 + y^2 \leq 1 \text{ and } x \geq 0\}$ .

52. Find the centroid of  $\mathcal{S}$ .
53. If the density at each point in  $\mathcal{S}$  is proportional to the point's distance from the  $y$ -axis, find the mass of  $\mathcal{S}$ .
54. If the density at each point in  $\mathcal{S}$  is proportional to the point's distance from the  $y$ -axis, find the center of mass of  $\mathcal{S}$ .
55. If the density at each point in  $\mathcal{S}$  is proportional to the point's distance from the  $y$ -axis, find the moments of inertia about the  $x$ - and  $y$ -axes. Use these answers to find the radii of gyration of  $\mathcal{S}$  about the  $x$ - and  $y$ -axes.
56. If the density at each point in  $\mathcal{S}$  is proportional to the point's distance from the origin, find the mass of  $\mathcal{S}$ .
57. If the density at each point in  $\mathcal{S}$  is proportional to the point's distance from the origin, find the center of mass of  $\mathcal{S}$ .

58. If the density at each point in  $\mathcal{S}$  is proportional to the point's distance from the origin, find the moments of inertia about the  $x$ -axis, the  $y$ -axis, and the origin. Use these answers to find the radii of gyration of  $\mathcal{S}$  about the  $x$ -axis, the  $y$ -axis, and the origin.
59. Let  $\Omega$  be a lamina in the  $xy$ -plane. Suppose  $\Omega$  is composed of two non-overlapping laminae  $\Omega_1$  and  $\Omega_2$ , as follows:

Show that if the masses and centers of masses of  $\Omega_1$  and  $\Omega_2$  are  $m_1$  and  $m_2$ , and  $(\bar{x}_1, \bar{y}_1)$  and  $(\bar{x}_2, \bar{y}_2)$ , respectively, then the center of mass of  $\Omega$  is  $(\bar{x}, \bar{y})$ , where

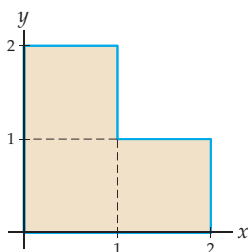

$$\bar{x} = \frac{m_1 \bar{x}_1 + m_2 \bar{x}_2}{m_1 + m_2} \quad \text{and} \quad \bar{y} = \frac{m_1 \bar{y}_1 + m_2 \bar{y}_2}{m_1 + m_2}.$$

60. Let  $\Omega$  be a lamina in the  $xy$ -plane. Suppose  $\Omega$  is composed of  $n$  non-overlapping laminae  $\Omega_1, \Omega_2, \dots, \Omega_n$ . Show that if the masses of these laminae are  $m_1, m_2, \dots, m_n$  and the centers of masses are  $(\bar{x}_1, \bar{y}_1), (\bar{x}_2, \bar{y}_2), \dots, (\bar{x}_n, \bar{y}_n)$ , then the center of mass of  $\Omega$  is  $(\bar{x}, \bar{y})$ , where

$$\bar{x} = \frac{\sum_{k=1}^n m_k \bar{x}_k}{\sum_{k=1}^n m_k} \quad \text{and} \quad \bar{y} = \frac{\sum_{k=1}^n m_k \bar{y}_k}{\sum_{k=1}^n m_k}.$$

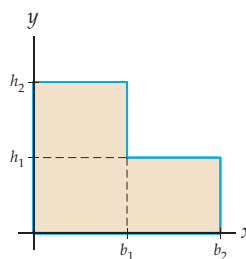

Use the results of Exercises 59 and 60 to find the centers of masses of the laminae in Exercises 61–67.

61. In the following lamina, all angles are right angles and the density is constant:

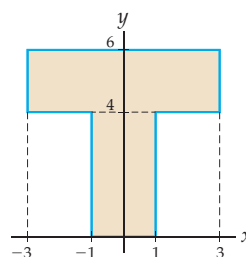

62. Use the lamina from Exercise 61, but assume that the density is proportional to the distance from the  $x$ -axis.

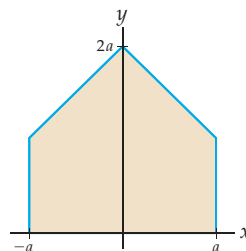

63. In the following lamina, all angles are right angles and the density is constant:

64. In the following lamina, all angles are right angles and the density is constant:

65. Use the lamina from Exercise 64, but assume that the density is proportional to the distance from the  $x$ -axis.
66. The lamina in the figure that follows is bounded above by the lines with equations  $y = x + 2a$  and  $y = -x + 2a$  and below by the  $x$ -axis on the interval  $-a \leq x \leq a$ . The density of the lamina is constant.

67. Use the lamina from Exercise 66, but assume that the density is proportional to the distance from the  $x$ -axis.

## Applications

68. Leila has been required to track down a grizzly that attacked a person. The bear once had a radio collar, but has lost it. From the old data, Leila knows that the bear's range is roughly a region bounded by the  $x$ -axis, the  $y$ -axis, and the line  $y = 4.3 - 0.8x$ . The bear is equally likely to be found in any part of that region. The probability density function for the bear's location is  $f(x, y) = 0.0873$ . There is a trail that lies roughly along the  $y$ -axis. How far must Leila's team bushwhack from the trail in order for her team to have a 50% chance of finding the bear on the first day of the search?
69. In Exercise 68, what is the expected distance from the road at which the bear is likely to be found? (*Hint: Compute the first moment in the  $x$ -direction for the distribution.*)

## Proofs

Recall that a **median** of a triangle is a segment connecting a vertex of a triangle to the midpoint of the opposite side. Let  $\mathcal{T}$  be the triangle with vertices  $(0, 0)$ ,  $(a, 0)$ , and  $(c, d)$ . In Exercises 70–72, prove the given statements.

70. The medians of triangle  $\mathcal{T}$  are **concurrent**; that is, all three medians intersect at the same point,  $P$ .
71. Use the integral definition for the centroid to show that the centroid of  $\mathcal{T}$  is point  $P$  from Exercise 70.
72. Prove that the centroid of triangle  $\mathcal{T}$  is two-thirds of the way from each vertex to the opposite side.
73. Prove that the centroid of a circle is the center of the circle.
74. Recall that an annulus is the region between two concentric circles. Prove that the centroid of an annulus is the common center of the two circles.

## Thinking Forward

- *A triple iterated integral:* Let  $\alpha$ ,  $\beta$ ,  $\gamma$ ,  $\delta$ ,  $\epsilon$ , and  $\zeta$  be real numbers. Evaluate the triple iterated integral

$$\int_{\alpha}^{\beta} \int_{\gamma}^{\delta} \int_{\epsilon}^{\zeta} dz \, dy \, dx.$$

What does this integral represent?

- *A triple iterated integral of a density function:* Let  $\alpha$ ,  $\beta$ ,  $\gamma$ ,  $\delta$ ,  $\epsilon$ , and  $\zeta$  be real numbers, and let  $\rho(x, y, z)$  be a function giving the density at each point of a three-dimensional rectangular solid. What does the triple integral

$$\int_{\alpha}^{\beta} \int_{\gamma}^{\delta} \int_{\epsilon}^{\zeta} \rho(x, y, z) \, dz \, dy \, dx.$$

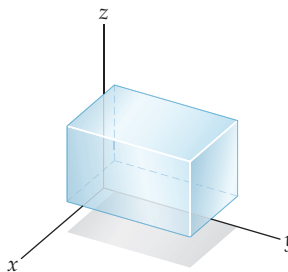

represent?

## 13.5 TRIPLE INTEGRALS

- Generalizing integration to functions of three variables
- Computing triple integrals defined on rectangular solids and on more general regions
- Computing mass, center of mass, and moments of inertia of three-dimensional solids

### Triple Integrals over Rectangular Solids

In Section 13.1 we defined the double integral of a function of two variables over a rectangular region in the plane. We will be building upon Definition 13.4 to define the triple integral of a function of three variables over a region in  $\mathbb{R}^3$  that is a rectangular solid, such as the following one:

Later in this section we will extend our definition to more general regions in  $\mathbb{R}^3$ . We will define the triple integral in terms of the limit of a Riemann sum, just as we did for the double integral. Rather than belabor the details, we quickly outline the steps needed to

define a triple integral. If you have questions, then you should reread Section 13.1, which discusses the steps more completely for double integrals. We start with Riemann sums for a function of three variables.

**DEFINITION 13.14****Riemann Sums for a Function of Three Variables**

Let  $a_1 < a_2$ ,  $b_1 < b_2$ , and  $c_1 < c_2$  be real numbers, let  $\mathcal{R}$  be the rectangular solid defined by

$$\mathcal{R} = \{(x, y, z) \mid a_1 \leq x \leq a_2, b_1 \leq y \leq b_2, \text{ and } c_1 \leq z \leq c_2\},$$

and let  $f(x, y, z)$  be a function defined on  $\mathcal{R}$ . The sum

$$\sum_{i=1}^l \sum_{j=1}^m \sum_{k=1}^n f(x_i^*, y_j^*, z_k^*) \Delta V$$

is a **Riemann Sum** for  $f$  on  $\mathcal{R}$ , where

$$\Delta x = \frac{a_2 - a_1}{l}, \quad \Delta y = \frac{b_2 - b_1}{m}, \quad \Delta z = \frac{c_2 - c_1}{n}, \quad \Delta V = \Delta x \Delta y \Delta z,$$

$x_i = a_1 + i\Delta x$  for  $0 \leq i \leq l$ ,  $y_j = b_1 + j\Delta y$  for  $0 \leq j \leq m$ ,  $z_k = c_1 + k\Delta z$  for  $0 \leq k \leq n$ ,

and  $x_i^* \in [x_{i-1}, x_i]$ ,  $y_j^* \in [y_{j-1}, y_j]$ ,  $z_k^* \in [z_{k-1}, z_k]$ .

Note that the nested summations in Definition 13.14 may be done in any of  $3! = 6$  orders. The order we give in the definition is just one of those six, and we could have used any of the other five instead.

We now define  $\Delta$  to be the length of the space diagonal of each rectangular solid. That is,

$$\Delta = \sqrt{(\Delta x)^2 + (\Delta y)^2 + (\Delta z)^2}.$$

When we take the limit  $\Delta \rightarrow 0$ , this ensures that  $l \rightarrow \infty$ ,  $m \rightarrow \infty$ , and  $n \rightarrow \infty$  simultaneously. We use the limit of the Riemann sum as  $\Delta \rightarrow 0$  to define the triple integral, provided that the limit exists.

**DEFINITION 13.15****Triple Integrals**

Let  $a_1 < a_2$ ,  $b_1 < b_2$ , and  $c_1 < c_2$  be real numbers, let  $\mathcal{R}$  be the rectangular solid defined by

$$\mathcal{R} = \{(x, y, z) \mid a_1 \leq x \leq a_2, b_1 \leq y \leq b_2, \text{ and } c_1 \leq z \leq c_2\},$$

and let  $f(x, y, z)$  be a function defined on  $\mathcal{R}$ . Provided that the limit exists, the **triple integral** of  $f$  over  $\mathcal{R}$  is

$$\iiint_{\mathcal{R}} f(x, y, z) dV = \lim_{\Delta \rightarrow 0} \sum_{i=1}^l \sum_{j=1}^m \sum_{k=1}^n f(x_i^*, y_j^*, z_k^*) \Delta V,$$

where the triple sum in the equation is a Riemann sum as outlined in Definition 13.14, and where  $\Delta = \sqrt{(\Delta x)^2 + (\Delta y)^2 + (\Delta z)^2}$ . When the triple integral exists on  $\mathcal{R}$ , the function  $f$  is said to be **integrable** on  $\mathcal{R}$ .

Note that as  $\Delta \rightarrow 0$ , the increment of volume  $\Delta V \rightarrow 0$  as well. The summations in Definition 13.15 can be ordered in five other ways to obtain the same value for the triple integral.

At this point you may be wondering what the value of a particular triple integral represents about the function  $f(x, y, z)$ . As we have seen before, the answer depends upon the context. For example, if  $f$  is the constant function  $f(x, y, z) = 1$ , the triple integral  $\iiint_{\mathcal{R}} dV$  would be a complicated way to compute the volume of the rectangular solid  $\mathcal{R}$ . If this were the only application of triple integration, we would not be bothering with the concept. However, recall that in Section 13.4 we showed that the double integral  $\int_a^b \int_c^d \rho(x, y) dy dx$  gives the mass of the lamina rectangle  $\mathcal{R} = \{(x, y) \mid a \leq x \leq b \text{ and } c \leq y \leq d\}$  if  $\rho(x, y)$  is the density function for the lamina. Similarly, if  $\rho(x, y, z) \geq 0$  is a density function of a rectangular solid  $\mathcal{R}$ , the triple integral  $\iiint_{\mathcal{R}} \rho(x, y, z) dV$  gives the mass of the solid. Later in this section we will see how to use triple integrals to find the center of mass and moments of inertia for three-dimensional regions also. These will be our primary applications of triple integration.

## Iterated Integrals and Fubini's Theorem

As we saw in Section 13.1, it is usually simpler to evaluate a double integral by using an iterated integral rather than the definition. The situation here is similar.

### DEFINITION 13.16

#### Iterated Triple Integrals

Let  $a_1, a_2, b_1, b_2, c_1,$  and  $c_2$  be real numbers. The *iterated triple integral* is

$$\int_{a_1}^{a_2} \int_{b_1}^{b_2} \int_{c_1}^{c_2} f(x, y, z) dz dy dx = \int_{a_1}^{a_2} \left( \int_{b_1}^{b_2} \left( \int_{c_1}^{c_2} f(x, y, z) dz \right) dy \right) dx.$$

Again, there are five other orderings we could use to construct an iterated triple integral. For example,

$$\int_{b_1}^{b_2} \int_{c_1}^{c_2} \int_{a_1}^{a_2} f(x, y, z) dx dz dy = \int_{b_1}^{b_2} \left( \int_{c_1}^{c_2} \left( \int_{a_1}^{a_2} f(x, y, z) dx \right) dz \right) dy.$$

For a region that is a rectangular solid, the different orderings for the integrals usually do not significantly change the level of difficulty in a problem. The ordering shown in Definition 13.16 is the one we will try first in most problems.

We have a version of Fubini's theorem that tells us that we may use an iterated triple integral, rather than the definition of the triple integral, to evaluate a triple integral.

### THEOREM 13.17

#### Fubini's Theorem for Triple Integrals

Let  $a_1, a_2, b_1, b_2, c_1,$  and  $c_2$  be real numbers, and let  $\mathcal{R}$  be the rectangular solid defined by

$$\mathcal{R} = \{(x, y, z) \mid a_1 \leq x \leq a_2, b_1 \leq y \leq b_2, \text{ and } c_1 \leq z \leq c_2\}.$$

If  $f(x, y, z)$  is continuous on  $\mathcal{R}$ , then

$$\iiint_{\mathcal{R}} f(x, y, z) dV = \int_{a_1}^{a_2} \int_{b_1}^{b_2} \int_{c_1}^{c_2} f(x, y, z) dz dy dx$$

and is also equal to any of the other five possible orderings for the iterated triple integral.

The proof of this version of Fubini's theorem is again beyond the scope of the text, but here is an example illustrating how it is used: Let

$$\mathcal{R} = \{(x, y, z) \mid 1 \leq x \leq 3, 2 \leq y \leq 6, \text{ and } 4 \leq z \leq 7\}.$$

Assume that the density at each point of  $\mathcal{R}$  is proportional to the distance of the point from the  $xy$ -plane. That is,  $\rho(x, y, z) = kz$ , where  $k$  is a constant of proportionality. We may use Theorem 13.17 to find the mass of  $\mathcal{R}$ . The mass of the solid is given by

$$\iiint_{\mathcal{R}} kz \, dV = \int_1^3 \int_2^6 \int_4^7 kz \, dz \, dy \, dx.$$

Here we have

$$\begin{aligned} \iiint_{\mathcal{R}} kz \, dV &= \int_1^3 \int_2^6 \int_4^7 kz \, dz \, dy \, dx && \leftarrow \text{Fubini's theorem} \\ &= \int_1^3 \left( \int_2^6 \left( \int_4^7 kz \, dz \right) dy \right) dx && \leftarrow \text{evaluation procedure for the iterated} \\ & && \text{integral} \\ &= \int_1^3 \left( \int_2^6 \left[ \frac{1}{2}kz^2 \right]_{z=4}^{z=7} dy \right) dx && \leftarrow \text{the Fundamental Theorem of} \\ & && \text{Calculus} \\ &= \int_1^3 \left( \int_2^6 \left( \frac{1}{2}k(49 - 16) \right) dy \right) dx && \leftarrow \text{evaluation of the innermost} \\ & && \text{antiderivative} \\ &= \int_1^3 \left[ \frac{33}{2}ky \right]_{y=2}^{y=6} dx = \int_1^3 66k \, dx && \leftarrow \text{evaluation of the next integral} \\ &= [66kx]_{x=1}^{x=3} = 132k. && \leftarrow \text{evaluation of the outer integral} \end{aligned}$$

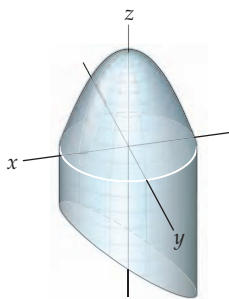

If we had used any of the five other orders of integration to evaluate the triple integral, we would have obtained the same result.

## Triple Integrals over General Regions

We now expand our definition of the triple integral to allow us to compute a triple integral over more general regions. The general regions we will use are of three types. First, consider a region  $\Omega_{xy}$  in the  $xy$ -plane and two functions  $z = g_1(x, y)$  and  $z = g_2(x, y)$  defined on  $\Omega_{xy}$  such that  $g_1(x, y) \leq g_2(x, y)$  for every point in  $\Omega_{xy}$ . We define the three-dimensional region  $\Omega$  to be the set

$$\Omega = \{(x, y, z) \mid g_1(x, y) \leq z \leq g_2(x, y) \text{ for } (x, y) \in \Omega_{xy}\}.$$

For example, in the following figure,  $\Omega_{xy}$  is the circle in the  $xy$ -plane, with radius 2, and centered at the origin, and the solid shown is bounded below by the plane with equation  $g_1(x, y) = \frac{1}{2}x - \frac{1}{2}y - 2$  and is bounded above by the paraboloid with equation  $g_2(x, y) = 4 - x^2 - y^2$ :

The other two types of regions we will be using are defined in a similar manner. In one, we start with a region  $\Omega_{xz}$  in the  $xz$ -plane and consider two functions  $y = h_1(x, z)$  and  $y = h_2(x, z)$  such that  $h_1(x, z) \leq h_2(x, z)$  for every  $(x, z) \in \Omega_{xz}$ . In the other, we start with a region  $\Omega_{yz}$  in the  $yz$ -plane and consider two functions  $x = k_1(y, z)$  and  $x = k_2(y, z)$  such that  $k_1(y, z) \leq k_2(y, z)$  for every  $(y, z) \in \Omega_{yz}$ .

**DEFINITION 13.18****Triple Integrals over General Regions**

Let  $\Omega$  be a general region in  $\mathbb{R}^3$  of one of the three types just described, and let

$$\mathcal{R} = \{(x, y, z) \mid a_1 \leq x \leq a_2, b_1 \leq y \leq b_2, \text{ and } c_1 \leq z \leq c_2\}$$

be a rectangular solid containing  $\Omega$ . We define the **triple integral** of  $f$  over  $\Omega$  to be

$$\iiint_{\Omega} f(x, y, z) \, dV = \iiint_{\mathcal{R}} F(x, y, z) \, dV,$$

where

$$F(x, y, z) = \begin{cases} f(x, y, z), & \text{if } (x, y, z) \in \Omega \\ 0, & \text{if } (x, y, z) \notin \Omega \end{cases}$$

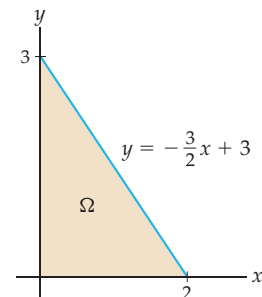

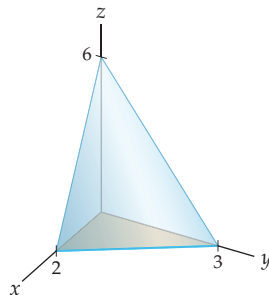

provided that the triple integral  $\iiint_{\mathcal{R}} F(x, y, z) \, dV$  exists.

We will use Fubini's theorem to evaluate triple integrals on such general regions. To use Fubini's theorem in this context, when we wish to integrate the function  $f(x, y, z)$  over a region  $\Omega$  bounded below by  $g_1(x, y)$  and above by  $g_2(x, y)$  over a region  $\Omega_{xy}$  in the  $xy$ -plane, we evaluate

$$\iiint_{\Omega} f(x, y, z) \, dV = \iint_{\Omega_{xy}} \int_{g_1(x, y)}^{g_2(x, y)} f(x, y, z) \, dz \, dA.$$

Once we have evaluated the inner integral  $\int_{g_1(x, y)}^{g_2(x, y)} f(x, y, z) \, dz$ , we evaluate the remaining double integral, using the techniques we discussed in Sections 13.2 and 13.3, depending upon the particular integral we are facing. We evaluate integrals over the other general regions in an analogous manner.

For example, to evaluate the triple integral of the function  $f(x, y, z) = 5x - 3y$  over the tetrahedral region  $\Omega$  bounded by the coordinate planes and the plane containing the points  $(2, 0, 0)$ ,  $(0, 3, 0)$ , and  $(0, 0, 6)$ , we first try to visualize  $\Omega$ . The region, which lies in the first octant, is shown here at the left:

Because this region is relatively simple, we may consider it as belonging to *any* of the three general types we outlined earlier. We will consider it to be of the first type. The equation of the plane containing the three specified points as a function of  $x$  and  $y$  is

$g_2(x, y) = -3x - 2y + 6$ . Since  $\Omega$  is bounded below by the  $xy$ -plane, we use  $g_1(x, y) = 0$ . Therefore,

$$\iiint_{\Omega} (5x - 3y) dV = \iint_{\Omega_{xy}} \int_0^{-3x-2y+6} (5x - 3y) dz dA,$$

where  $\Omega_{xy}$  is the triangular region shown at the right. Here it is particularly easy to find  $\Omega_{xy}$ , since it is the bottom face of the tetrahedron. More generally, however,  $\Omega_{xy}$  is the projection of  $\Omega$  onto the  $xy$ -plane. To evaluate the double integral over  $\Omega_{xy}$  we may treat this region as either a type I region or a type II region, as described in Section 13.2. For this example, we will treat  $\Omega_{xy}$  as a type I region. Thus we have

$$\iint_{\Omega_{xy}} \int_0^{-3x-2y+6} (5x - 3y) dz dA = \int_0^2 \int_0^{-(3/2)x+3} \int_0^{-3x-2y+6} (5x - 3y) dz dy dx.$$

Before we evaluate this triple integral, notice that the limits of the innermost integral are functions of the variables of the outer two integrals (although one of them is a constant function), the limits of the middle integral are functions of the variable of the outermost integral (although, again, one of them is a constant function), and the limits of the outermost integral are constants. When we complete the evaluation of the iterated integral, we will see that our answer is also a constant. These are properties you should *always* have when you set up and evaluate an iterated triple integral. Now,

$$\begin{aligned} & \int_0^2 \int_0^{-(3/2)x+3} \int_0^{-3x-2y+6} (5x - 3y) dz dy dx \\ &= \int_0^2 \int_0^{-(3/2)x+3} [(5x - 3y)z]_{z=0}^{z=-3x-2y+6} dy dx && \leftarrow \text{the Fundamental} \\ & && \text{Theorem of Calculus} \\ &= \int_0^2 \int_0^{-(3/2)x+3} (-15x^2 - xy + 6y^2 + 30x - 18y) dy dx && \leftarrow \text{evaluation and} \\ & && \text{multiplication} \\ &= \int_0^2 \left[ -15x^2y - \frac{1}{2}xy^2 + 2y^3 + 30xy - 9y^2 \right]_{y=0}^{y=-(3/2)x+3} dx && \leftarrow \text{the Fundamental} \\ & && \text{Theorem of Calculus} \\ &= \int_0^2 \left( \frac{117}{8}x^3 - \frac{261}{4}x^2 + \frac{171}{2}x - 27 \right) dx && \leftarrow \text{evaluation and} \\ & && \text{simplification} \\ &= \left[ \frac{117}{32}x^4 - \frac{87}{4}x^3 + \frac{171}{4}x^2 - 27x \right]_{x=0}^{x=2} = \frac{3}{2}. && \leftarrow \text{the Fundamental} \\ & && \text{Theorem of Calculus} \end{aligned}$$

In this example, we see that the evaluation of even a relatively simple triple integral over a simple region can necessitate a lengthy computation. None of the steps in this computation are terribly difficult, but there are certainly many points at which small mistakes can lead to an incorrect result. Care must be taken in setting up and evaluating triple integrals, as we will see in the examples that follow.

## Applications of Triple Integration

The applications we discussed in Section 13.4 generalize to three-dimensional space in a natural way. We have already mentioned that if we know the density function  $\rho(x, y, z)$  for a region  $\Omega \subset \mathbb{R}^3$ , then  $\iiint_{\Omega} \rho(x, y, z) dV$  represents the mass of  $\Omega$ . The definitions for the first and second moments and for the center of mass of a three-dimensional region are closely related to the definitions we made for laminae in  $\mathbb{R}^2$ .

## DEFINITION 13.19

## First Moments About the Coordinate Planes

Let  $\Omega$  be a region in  $\mathbb{R}^3$  in which the density at each point is given by the continuous function  $\rho(x, y, z)$ .

(a) The **first moment** of the mass in  $\Omega$  with respect to the  $yz$ -plane is

$$M_{yz} = \iiint_{\Omega} x \rho(x, y, z) dV.$$

(b) The **first moment** of the mass in  $\Omega$  with respect to the  $xz$ -plane is

$$M_{xz} = \iiint_{\Omega} y \rho(x, y, z) dV.$$

(c) The **first moment** of the mass in  $\Omega$  with respect to the  $xy$ -plane is

$$M_{xy} = \iiint_{\Omega} z \rho(x, y, z) dV.$$

Just as we did with laminæ, the center of mass of a region  $\Omega \subset \mathbb{R}^3$  is computed from the first moments and the mass of  $\Omega$ . If the mass of  $\Omega$  is  $m = \iiint_{\Omega} \rho(x, y, z) dV$ , then the center of mass of  $\Omega$  is  $(\bar{x}, \bar{y}, \bar{z})$ , where

$$\bar{x} = \frac{M_{yz}}{m}, \quad \bar{y} = \frac{M_{xz}}{m}, \quad \text{and} \quad \bar{z} = \frac{M_{xy}}{m}.$$

We may also define moments of inertia about the three coordinate axes and use them to compute the radius of gyration about each axis.

## DEFINITION 13.20

## Moments of Inertia About the Coordinate Axes

Let  $\Omega$  be a region in  $\mathbb{R}^3$  in which the density at each point is given by the continuous function  $\rho(x, y, z)$ .

(a) The **moment of inertia of  $\Omega$  about the  $x$ -axis** is

$$I_x = \iiint_{\Omega} (y^2 + z^2) \rho(x, y, z) dV.$$

(b) The **moment of inertia of  $\Omega$  about the  $y$ -axis** is

$$I_y = \iiint_{\Omega} (x^2 + z^2) \rho(x, y, z) dV.$$

(c) The **moment of inertia of  $\Omega$  about the  $z$ -axis** is

$$I_z = \iiint_{\Omega} (x^2 + y^2) \rho(x, y, z) dV.$$

To compute the **radii of gyration** about the  $x$ -,  $y$ -, and  $z$ -axes, we use

$$R_x = \sqrt{I_x/m}, \quad R_y = \sqrt{I_y/m}, \quad \text{and} \quad R_z = \sqrt{I_z/m},$$

respectively. These are the radial distances at which the mass of the solid could be concentrated without changing its rotational inertia about the specified axis. We will provide examples of all of these computations in the examples that follow.

## Examples and Explorations

**EXAMPLE 1****Finding the volume of a rectangular parallelepiped**

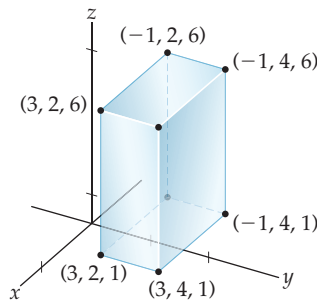

Set up the six iterated triple integrals that could be used to find the volume of the rectangular parallelepiped defined by

$$\mathcal{R} = \{(x, y, z) \mid -1 \leq x \leq 3, 2 \leq y \leq 4, \text{ and } 1 \leq z \leq 6\}.$$

Evaluate one of the triple integrals to show that the volume of the parallelepiped is the product of its length, width, and height.

**SOLUTION**

The following rectangular solid measures 4 units in the  $x$  direction, 2 units in the  $y$  direction, and 5 units in the  $z$  direction:

The volume of this solid is  $4 \times 2 \times 5 = 40$  cubic units.

The first iterated integral we could use to compute the volume is

$$\text{Volume} = \iiint_{\mathcal{R}} dV = \int_{-1}^3 \int_2^4 \int_1^6 dz dy dx.$$

This order of integration is typically the first one we try. We will discuss the reasons for this in Example 3. Here we note that the innermost integration is with respect to  $z$ , the middle integration is with respect to  $y$ , and the outer integration is with respect to  $x$ . Therefore, the limits on the inner, middle, and outer integrals are the values that correspond to those variables from the definition of the parallelepiped. To obtain the other five possible iterated integrals, we permute the differentials  $dx$ ,  $dy$ , and  $dz$ , moving the limits of integration in the corresponding way. Thus, we also have

$$\begin{aligned} \text{Volume} &= \int_2^4 \int_{-1}^3 \int_1^6 dz dx dy = \int_{-1}^3 \int_1^6 \int_2^4 dy dz dx \\ &= \int_1^6 \int_{-1}^3 \int_2^4 dy dx dz = \int_2^4 \int_1^6 \int_{-1}^3 dx dz dy = \int_1^6 \int_2^4 \int_{-1}^3 dx dy dz. \end{aligned}$$

We now evaluate the triple integral, using the first ordering we provided. Note that we work from the innermost integral to the outermost integral:

$$\begin{aligned} \int_{-1}^3 \int_2^4 \int_1^6 dz dy dx &= \int_{-1}^3 \int_2^4 [z]_1^6 dy dx = \int_{-1}^3 \int_2^4 5 dy dx \\ &= \int_{-1}^3 [5y]_2^4 dx = \int_{-1}^3 10 dx \\ &= [10x]_{-1}^3 = 40. \end{aligned}$$

Our answers agree: The volume of  $\mathcal{R}$  is 40 cubic units. As we mentioned earlier in the section, we would not have bothered to define triple integration if this were the only application. For example, in Example 2 we find the mass of the solid  $\mathcal{R}$ , assuming that the density is a nonconstant function.  $\square$

**EXAMPLE 2****Finding the mass of a rectangular parallelepiped**

Find the mass of the solid  $\mathcal{R}$  from Example 1, assuming that the density at every point of  $\mathcal{R}$  is proportional to the distance of the point from the  $xz$ -plane.

**SOLUTION**

Instead of integrating the constant function  $f(x, y, z) = 1$  to find the volume of  $\mathcal{R}$ , here we integrate the density function  $\rho(x, y, z) = ky$ , where  $k$  is a constant of proportionality, to find the mass of the solid. Almost all of the work involved in setting up the iterated triple integral was done in Example 1; the only change is the integrand. We choose the same order of variables that we used before:

$$\begin{aligned} \text{Mass} &= \iiint_{\mathcal{R}} ky \, dV = \int_{-1}^3 \int_2^4 \int_1^6 ky \, dz \, dy \, dx \\ &= \int_{-1}^3 \int_2^4 [kyz]_1^6 \, dy \, dx = \int_{-1}^3 \int_2^4 5ky \, dy \, dx \\ &= \int_{-1}^3 \left[ \frac{5}{2}ky^2 \right]_2^4 \, dx = \int_{-1}^3 30k \, dx \\ &= [30kx]_{-1}^3 = 120k. \end{aligned}$$

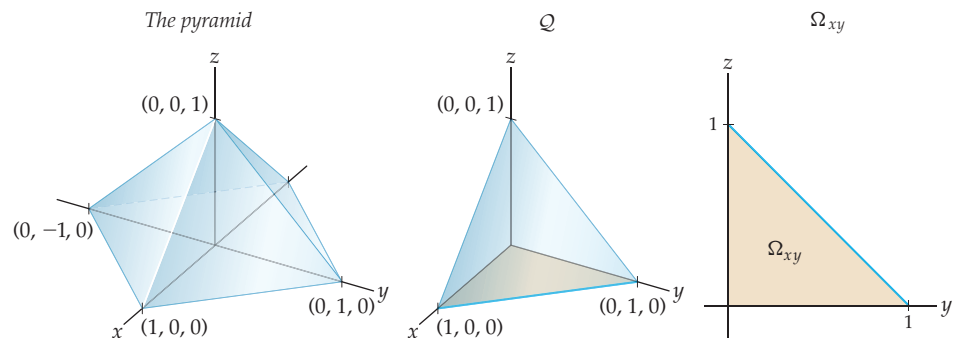

Note again that there are five other orders we could have used for the iterated integral. For this particular problem, the levels of difficulty for the integrations would be similar.  $\square$

**EXAMPLE 3****Finding the volume of a pyramid**

Use a triple integral to find the volume of the pyramid  $\mathcal{P}$  whose base is the square with vertices  $(1, 0, 0)$ ,  $(0, 1, 0)$ ,  $(-1, 0, 0)$ , and  $(0, -1, 0)$  and whose top vertex is  $(0, 0, 1)$ .

**SOLUTION**

The pyramid  $\mathcal{P}$  is shown in the following figure at the left:

By the symmetry of  $\mathcal{P}$ , the pyramid  $\mathcal{Q}$  in the middle figure has a volume that is one-quarter of the volume of  $\mathcal{P}$ . We will find the volume of  $\mathcal{Q}$  and then multiply by 4 to obtain the volume of  $\mathcal{P}$ . The oblique planar face of  $\mathcal{Q}$  has equation  $x + y + z = 1$ . We mentioned in Example 1 that we would explain the reason for typically choosing the order of integration specified by  $dz \, dy \, dx$ . When we have a function of two variables, we tend to think of  $z$  as

a function of  $x$  and  $y$ . Similarly, when we have a function of a single variable, we tend to think of  $y$  as a function  $x$ . This is the convention we have grown accustomed to and that may cause us to prefer it. Notice that in the iterated integral we evaluated in Example 2, the upper limit on the innermost integral is a function of two variables. We preferred to express the equation of the oblique planar face as a function of  $x$  and  $y$ . Similarly, when we provide the limits on the middle integral, we need to express one or both boundaries as functions of a single variable. When we do so, we prefer to express the limits on this integral as functions of  $x$ . The projection of  $\mathcal{Q}$  onto the  $xy$ -plane gives the region  $\Omega_{xy}$  shown at the right. The right-hand boundary of  $\Omega_{xy}$  may be expressed either as  $y = -x + 1$  or as  $x = -y + 1$ . We prefer the former, which is the upper limit that we use on the middle integral. In Example 6 we will use one of the other orders of integration to construct an iterated triple integral, but for now the volume of  $\mathcal{Q}$  is given by the following iterated triple integral:

$$\begin{aligned} \text{Volume of } \mathcal{Q} &= \int_0^1 \int_0^{-x+1} \int_0^{-x-y+1} dz \, dy \, dx = \int_0^1 \int_0^{-x+1} [z]_0^{-x-y+1} dy \, dx \\ &= \int_0^1 \int_0^{-x+1} (-x - y + 1) dy \, dx = \int_0^1 \left[ -xy - \frac{1}{2}y^2 + y \right]_0^{-x+1} dx \\ &= \int_0^1 \left( \frac{1}{2}x^2 - x + \frac{1}{2} \right) dx = \left[ \frac{1}{6}x^3 - \frac{1}{2}x^2 + \frac{1}{2}x \right]_0^1 = \frac{1}{6} \text{ cubic units.} \end{aligned}$$

Multiplying this answer by 4, we find that the volume of  $\mathcal{P}$  is  $\frac{2}{3}$  cubic unit.  $\square$

### CHECKING THE ANSWER

Recall that the volume of a pyramid is  $\frac{1}{3}$ (area of the base)(height). Each side of the square base of pyramid  $\mathcal{P}$  has length  $\sqrt{2}$ . The height of  $\mathcal{P}$  is 1. Therefore, the volume of  $\mathcal{P}$  is  $\frac{1}{3}\sqrt{2} \cdot \sqrt{2} \cdot 1 = \frac{2}{3}$  cubic unit, as we just found.

### EXAMPLE 4 Finding the center of mass of a pyramid

Find the center of mass of the pyramid  $\mathcal{P}$  from Example 3, assuming that the density of the pyramid is uniform.

#### SOLUTION

By the symmetries of  $\mathcal{P}$  and its density function, the first moments of the mass with respect to the  $yz$ - and  $xz$ -planes are both zero. Therefore, if we let  $(\bar{x}, \bar{y}, \bar{z})$  be the center of mass of  $\mathcal{P}$ , then both  $\bar{x}$  and  $\bar{y}$  are zero. To find  $\bar{z}$ , we could compute both the mass of  $\mathcal{P}$  and the first moment  $M_{xy}$  of  $\mathcal{P}$  when the density function  $\rho(x, y, z) = k$ , where  $k$  is a constant. However, note that the  $z$ -coordinates for the centers of mass of the pyramids  $\mathcal{P}$  and  $\mathcal{Q}$  are equal. Although the  $x$ - and  $y$ -coordinates of the centers of mass of  $\mathcal{P}$  and  $\mathcal{Q}$  would be different, we already know that  $\bar{x} = \bar{y} = 0$  for  $\mathcal{P}$ . Therefore, using our work from Example 3, we find that the mass of  $\mathcal{Q}$  is given by

$$m = \int_0^1 \int_0^{-x+1} \int_0^{-x-y+1} k \, dz \, dy \, dx = \frac{1}{6}k.$$

The moment of inertia of  $\mathcal{Q}$  with respect to the  $xy$ -plane is

$$\begin{aligned} M_{xy} &= \int_0^1 \int_0^{-x+1} \int_0^{-x-y+1} kz \, dz \, dy \, dx = \int_0^1 \int_0^{-x+1} \left[ \frac{1}{2}kz^2 \right]_0^{-x-y+1} dy \, dx \\ &= \int_0^1 \int_0^{-x+1} \frac{1}{2}k(-x - y + 1)^2 dy \, dx = \int_0^1 \left[ -\frac{1}{6}k(-x - y + 1)^3 \right]_0^{-x+1} dx \\ &= \int_0^1 \frac{1}{6}k(-x + 1)^3 dx = \left[ -\frac{1}{24}k(-x + 1)^4 \right]_0^1 = \frac{1}{24}k. \end{aligned}$$

Therefore, the  $z$ -coordinate of the center of mass of both  $\mathcal{P}$  and  $\mathcal{Q}$  is

$$\bar{z} = \frac{M_{xy}}{m} = \frac{k/24}{k/6} = \frac{1}{4},$$

and the center of mass of  $\mathcal{P}$  is  $(0, 0, 1/4)$ . Note that the point  $(0, 0, 1/4)$  lies inside the pyramid. This shows that our result is plausible.  $\square$

### EXAMPLE 5

#### Finding the moments of inertia and radii of gyration for a pyramid

Find the moments of inertia about the coordinate axes for the pyramid  $\mathcal{Q}$  from Example 3, assuming that its density is uniform. Use those moments to find the radius of gyration about each coordinate axis.

#### SOLUTION

In Example 4 we saw that the mass of  $\mathcal{Q}$  is

$$m = \int_0^1 \int_0^{-x+1} \int_0^{-x-y+1} k \, dz \, dy \, dx = \frac{1}{6}k.$$

To find the moment of inertia about the  $x$ -axis, we modify this integral by including the factor  $(y^2 + z^2)$  in the integrand. Thus, we have

$$I_x = \int_0^1 \int_0^{-x+1} \int_0^{-x-y+1} k(y^2 + z^2) \, dz \, dy \, dx.$$

The evaluation procedure for this integral is quite similar to those in Examples 3 and 4. In Exercise 15 you will show that  $I_x = \frac{1}{30}k$ .

To find the radius of gyration about the  $x$ -axis, we compute  $R_x = \sqrt{\frac{I_x}{m}}$ , where  $m$  is the mass of  $\mathcal{Q}$ . We get

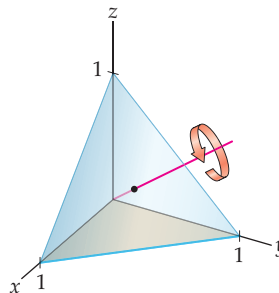

$$R_x = \sqrt{\frac{I_x}{m}} = \sqrt{\frac{(1/30)k}{(1/6)k}} = \frac{\sqrt{5}}{5}.$$

Now, to find the moments of inertia about the  $y$ - and  $z$ -axes, and the corresponding radii of gyration, we could evaluate the integrals

$$I_y = \int_0^1 \int_0^{-x+1} \int_0^{-x-y+1} k(x^2 + z^2) \, dz \, dy \, dx, \quad I_z = \int_0^1 \int_0^{-x+1} \int_0^{-x-y+1} k(x^2 + y^2) \, dz \, dy \, dx,$$

and follow that by calculating  $R_y = \sqrt{I_y/m}$  and  $R_z = \sqrt{I_z/m}$ . You will do exactly that in Exercises 16 and 17. Here we ask you to convince yourself that pyramid  $\mathcal{Q}$  has rotational symmetry about the line given by the parametric equations

$$x = t, \quad y = t, \quad z = t$$

A rotation of  $\frac{\pi}{3}$  about this line takes each coordinate axis to one of the others, depending upon the direction of the rotation. In the rotation shown in the preceding figure, the  $x$ -axis would rotate onto the  $y$ -axis, etc. This means that the moments of inertia and the radii of gyration for all three coordinate axes must be equal. That is,

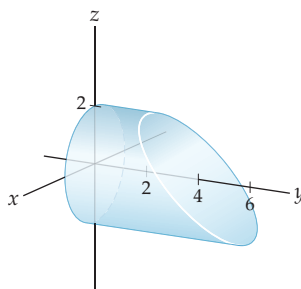

$$I_x = I_y = I_z = \frac{1}{30}k \quad \text{and} \quad R_x = R_y = R_z = \frac{\sqrt{5}}{5}. \quad \square$$

### EXAMPLE 6 Finding the mass of a slice of a cylinder

Find the mass of the slice of the right circular cylinder  $x^2 + z^2 = 4$  bounded on the left by the  $xz$ -plane and on the right by the plane with equation  $x - y + z = -4$  if the density at each point in the cylinder is proportional to the distance of the point from the  $xz$ -plane.

#### SOLUTION

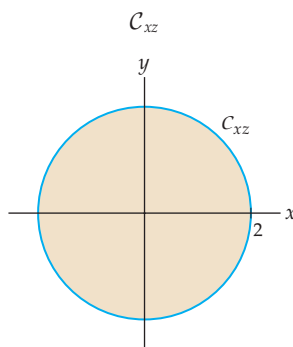

The region we have described is shown here:

The density function we need to integrate is  $\rho(x, y, z) = ky$ , where  $k$  is a positive constant of proportionality. Let  $\mathcal{C}$  represent the slice of the cylinder under consideration. We need to evaluate the triple integral

$$\iiint_{\mathcal{C}} ky \, dV.$$

No matter which order of integration we settle upon, the function  $\rho$  will be relatively simple to integrate. The order we will use depends upon the characteristics of the region. In particular, we will consider the projection of  $\mathcal{C}$  onto the coordinate planes and decide which is simplest. Since the cylinder is symmetric with respect to the  $y$ -axis, the projection of  $\mathcal{C}$  onto the  $xz$ -plane will be the circle with radius 2, centered at the origin of that plane. Let  $\mathcal{C}_{xz}$  be this projection.

The projections of  $\mathcal{C}$  onto the other coordinate planes would be more difficult to analyze; thus we will integrate *first* with respect to  $y$ . The limits on this integral are  $y = 0$  and

$y = x + z + 4$ , the equations of the planes that form the boundaries of  $\mathcal{C}$ . We now have

$$\iiint_{\mathcal{C}} ky \, dV = \iint_{\mathcal{C}_{xz}} \int_0^{x+z+4} ky \, dy \, dA.$$

We next turn our attention to setting up iterated integrals to evaluate the double integral over  $\mathcal{C}_{xz}$ . The region  $\mathcal{C}_{xz}$  is bounded above by the semicircle with equation  $z = \sqrt{4 - x^2}$  and below by the semicircle with equation  $z = -\sqrt{4 - x^2}$ . Thus, we have

$$\iiint_{\mathcal{C}} ky \, dV = \int_{-2}^2 \int_{-\sqrt{4-x^2}}^{\sqrt{4-x^2}} \int_0^{x+z+4} ky \, dz \, dx.$$

The evaluation of this integral is left for you in Exercise 18. As we see in this example, the main difficulty in evaluating a triple integral often lies in analyzing the region of integration. When you evaluate the preceding integral, you will see that it is a chore, but you will still be using only basic integration techniques that were first introduced in Chapter 5.  $\square$

### ? TEST YOUR UNDERSTANDING

- ▶ What is a Riemann sum for a function of three variables? How many different orderings are possible for the nested summations? Does the order of the summations matter?
- ▶ How is the triple integral for a function  $f$  over a rectangular solid defined? How is this definition similar to the definition of the double integral of a function over a rectangular region? How is it different?
- ▶ What is an iterated triple integral? What is Fubini's theorem? How are iterated integrals used to compute triple integrals? How many choices are possible when you order the variables of integration in an iterated triple integral?
- ▶ What are the three types of three-dimensional regions we discussed in this section? What are the orders of integration associated with each of these different regions?
- ▶ What applications of triple integration did we discuss in this section? How are integrals for masses, first moments of mass, and moments of inertia related to each other?

## EXERCISES 13.5

### Thinking Back

- ▶ *Using iterated double integrals to compute area:* Let  $\Omega$  be the region in the first quadrant bounded by the  $x$ -axis and the lines with equations  $x = 1$  and  $y = x$ . Set up iterated double integrals that represent the area of  $\Omega$  in which  $\Omega$  is treated first as a type I region and then as a type II region.
- ▶ *Using iterated double integrals to compute mass:* Let  $\Omega$  be the first-quadrant region bounded by the  $y$ -axis and the lines with equations  $y = x$  and  $y = 2 - x$ . If the density at each point of  $\Omega$  is given by the function  $\rho(x, y)$ , set up iterated double-integral expressions that represent the mass of  $\Omega$  in which  $\Omega$  is treated first as a type I region and then as a type II region.

### Concepts

0. *Problem Zero:* Read the section and make your own summary of the material.
1. *True/False:* Determine whether each of the statements that follow is true or false. If a statement is true, explain why. If a statement is false, provide a counterexample.
  - (a) *True or False:* If  $f(x, y, z)$  is a continuous function on the rectangular solid defined by  $\mathcal{R} = \{(x, y, z) \mid a_1 \leq x \leq a_2, b_1 \leq y \leq b_2, \text{ and } c_1 \leq z \leq c_2\}$ , then  $\iiint_{\mathcal{R}} f(x, y, z) \, dV = \int_{a_1}^{a_2} \int_{b_1}^{b_2} \int_{c_1}^{c_2} f(x, y, z) \, dx \, dy \, dz$ .
  - (b) *True or False:* If  $f(x, y, z)$  is a continuous function on the rectangular solid defined by  $\mathcal{R} = \{(x, y, z) \mid a_1 \leq x \leq a_2, b_1 \leq y \leq b_2, \text{ and } c_1 \leq z \leq c_2\}$ , then  $\iiint_{\mathcal{R}} f(x, y, z) \, dV = \int_{a_1}^{a_2} \int_{c_1}^{c_2} \int_{b_1}^{b_2} f(x, y, z) \, dy \, dz \, dx$ .
  - (c) *True or False:* If  $f(x, y, z)$  is a continuous function of three variables and  $\Omega = \Omega_1 \cup \Omega_2$  is a subset of  $\mathbb{R}^3$ , then  $\iiint_{\Omega} f(x, y, z) \, dV = \iiint_{\Omega_1} f(x, y, z) \, dV + \iiint_{\Omega_2} f(x, y, z) \, dV$ .

- (d) *True or False:* If  $\Omega$  is a bounded subset of  $\mathbb{R}^3$ , then there is a rectangular solid  $\mathcal{R}$  with its sides parallel to the coordinate planes such that  $\Omega \subseteq \mathcal{R}$ .
- (e) *True or False:* If  $f$  is a positive continuous function defined on a region  $\Omega$  and  $\Gamma \subseteq \Omega$ , then  $\iiint_{\Gamma} f(x, y, z) dV \leq \iiint_{\Omega} f(x, y, z) dV$ .
- (f) *True or False:* If  $\rho(x, y, z)$  gives the density at every point of a region  $\Omega$ , then the first moment of the mass in  $\Omega$  with respect to the  $xy$ -plane is  $M_{xy} = \iiint_{\Omega} xy \rho(x, y, z) dV$ .
- (g) *True or False:* If  $\rho(x, y, z)$  gives the density at every point of a region  $\Omega$ , then the moment of inertia of  $\Omega$  about the  $x$ -axis is  $I_x = \iiint_{\Omega} (y^2 + z^2) \rho(x, y, z) dV$ .
- (h) *True or False:* If  $g_1(x, y) \leq g_2(x, y)$  on the square region  $\mathcal{R} = \{(x, y) \mid 0 \leq x \leq 2 \text{ and } 0 \leq y \leq 2\}$ , then the iterated integral  $\int_0^2 \int_0^2 \int_{g_1(x, y)}^{g_2(x, y)} dV$  represents the volume of the solid bounded below by  $g_1(x, y)$  and above by  $g_2(x, y)$  on  $\mathcal{R}$ .
2. *Examples:* Construct examples of the thing(s) described in the following. Try to find examples that are different than any in the reading.
- (a) An iterated triple integral over a rectangular solid such that the integral gives the mass of the solid.
- (b) An iterated triple integral over a non-rectangular solid such that the integral gives the volume of the solid.
- (c) An iterated triple integral over a solid such that the integral gives the moment of inertia of the solid about the  $y$ -axis.
3. Explain why

$$\sum_{i=1}^l \sum_{j=1}^m \sum_{k=1}^n ij^2k^3 = \sum_{j=1}^m \sum_{k=1}^n \sum_{i=1}^l ij^2k^3.$$

4. Explain how to construct a Riemann sum for a function of three variables over a rectangular solid.
5. Explain how to construct a *midpoint* Riemann sum for a function of three variables over a rectangular solid for which each  $(x_i^*, y_j^*, z_k^*)$  is the midpoint of the subsolid  $\mathcal{R}_{ijk} = \{(x, y, z) \mid x_{i-1} \leq x_i^* \leq x_i, y_{j-1} \leq y_j^* \leq y_j, \text{ and } z_{k-1} \leq z_k^* \leq z_k\}$ . Refer either to your answer to Exercise 4 or to Definition 13.14.
6. Discuss the similarities and differences between the definition of the double integral found in Section 13.1 and the definition of the triple integral found in this section.
7. What is the difference between a triple integral and an *iterated* triple integral?
8. Let  $f(x, y, z)$  be a continuous function of three variables, let

$$\Omega_{xy} = \{(x, y) \mid a \leq x \leq b \text{ and } h_1(x) \leq y \leq h_2(x)\}$$

be a set of points in the  $xy$ -plane, and let

$$\Omega = \{(x, y, z) \mid (x, y) \in \Omega_{xy} \text{ and } g_1(x, y) \leq z \leq g_2(x, y)\}$$

be a set of points in 3-space. Find an iterated triple integral equal to the triple integral  $\iiint_{\Omega} f(x, y, z) dV$ . How

would your answer change if

$$\Omega_{xy} = \{(x, y) \mid a \leq y \leq b \text{ and } h_1(y) \leq x \leq h_2(y)\}?$$

9. Let  $f(x, y, z)$  be a continuous function of three variables, let

$$\Omega_{yz} = \{(y, z) \mid a \leq y \leq b \text{ and } h_1(y) \leq z \leq h_2(y)\}$$

be a set of points in the  $yz$ -plane, and let

$$\Omega = \{(x, y, z) \mid (y, z) \in \Omega_{yz} \text{ and } g_1(y, z) \leq x \leq g_2(y, z)\}$$

be a set of points in 3-space. Find an iterated triple integral equal to the triple integral  $\iiint_{\Omega} f(x, y, z) dV$ . How would your answer change if

$$\Omega_{yz} = \{(y, z) \mid a \leq z \leq b \text{ and } h_1(z) \leq y \leq h_2(z)\}?$$

10. Let  $f(x, y, z)$  be a continuous function of three variables, let

$$\Omega_{xz} = \{(x, z) \mid a \leq x \leq b \text{ and } h_1(x) \leq z \leq h_2(x)\}$$

be a set of points in the  $xz$ -plane, and let

$$\Omega = \{(x, y, z) \mid (x, z) \in \Omega_{xz} \text{ and } g_1(x, z) \leq y \leq g_2(x, z)\}$$

be a set of points in 3-space. Find an iterated triple integral equal to the triple integral  $\iiint_{\Omega} f(x, y, z) dV$ . How would your answer change if

$$\Omega_{xz} = \{(x, z) \mid a \leq z \leq b \text{ and } h_1(z) \leq x \leq h_2(z)\}?$$

11. Let  $\rho(x, y, z)$  be a density function defined on the rectangular solid  $\mathcal{R}$  where

$$\mathcal{R} = \{(x, y, z) \mid -1 \leq x \leq 3, 0 \leq y \leq 2, \text{ and } 2 \leq z \leq 7\}.$$

Set up iterated integrals representing the mass of  $\mathcal{R}$ , using all six distinct orders of integration.

12. Let  $\rho(x, y, z)$  be a density function defined on the rectangular solid  $\mathcal{R}$  where

$$\mathcal{R} = \{(x, y, z) \mid a_1 \leq x \leq a_2, b_1 \leq y \leq b_2, \text{ and } c_1 \leq z \leq c_2\}.$$

Set up iterated integrals representing the mass of  $\mathcal{R}$ , using all six distinct orders of integration.

13. Let  $\rho(x, y, z)$  be a density function defined on the tetrahedron  $\Omega$  with vertices  $(0, 0, 0)$ ,  $(2, 0, 0)$ ,  $(0, 4, 0)$ , and  $(0, 0, 3)$ . Set up iterated integrals representing the mass of  $\Omega$ , using all six distinct orders of integration.

14. Let  $\rho(x, y, z)$  be a density function defined on the tetrahedron  $\Omega$  with vertices  $(0, 0, 0)$ ,  $(a, 0, 0)$ ,  $(0, b, 0)$ , and  $(0, 0, c)$ , where  $a$ ,  $b$ , and  $c$  are positive real numbers. Set up iterated integrals representing the mass of  $\Omega$ , using all six distinct orders of integration.

In Exercises 15–17, evaluate the three integrals that can be used to find the moments of inertia for the pyramid  $\mathcal{Q}$  described in Example 5 and then use those values to find the radii of gyration about the coordinate axes. Recall that the mass of  $\mathcal{Q}$  is  $\frac{1}{6}k$ .

15. Show that

$$I_x = \int_0^1 \int_0^{-x+1} \int_0^{-x-y+1} k(y^2 + z^2) dz dy dx = \frac{1}{30}k.$$

16. Show that

$$I_y = \int_0^1 \int_0^{-x+1} \int_0^{-x-y+1} k(x^2 + z^2) dz dy dx = \frac{1}{30}k.$$

Use your answer to show that  $R_y = \frac{\sqrt{5}}{5}$ .

17. Show that

$$I_z = \int_0^1 \int_0^{-x+1} \int_0^{-x-y+1} k(x^2 + y^2) dz dy dx = \frac{1}{30}k.$$

Use your answer to show that  $R_z = \frac{\sqrt{5}}{5}$ .

18. Complete Example 6 by evaluating the iterated integral

$$\int_{-2}^2 \int_{-\sqrt{4-x^2}}^{\sqrt{4-x^2}} \int_0^{x+z+4} ky dz dy dx.$$

Identify the quantities determined by the integral expressions in Exercises 19–24. If  $x$ ,  $y$ , and  $z$  are all measured in centimeters and  $\rho(x, y, z)$  is a density function in grams per cubic centimeter on the three-dimensional region  $\Omega$ , give the units of the expression.

19.  $\iiint_{\Omega} dV$                       20.  $\iiint_{\Omega} \rho(x, y, z) dV$

21.  $\iiint_{\Omega} x \rho(x, y, z) dV$                       22.  $\frac{\iiint_{\Omega} z \rho(x, y, z) dV}{\iiint_{\Omega} \rho(x, y, z) dV}$

23.  $\iiint_{\Omega} (x^2 + z^2) \rho(x, y, z) dV$

24.  $\sqrt{\frac{\iiint_{\Omega} (x^2 + z^2) \rho(x, y, z) dV}{\iiint_{\Omega} \rho(x, y, z) dV}}$

## Skills

Evaluate the iterated integrals in Exercises 25–30.

25.  $\int_0^1 \int_2^4 \int_{-1}^5 (x + yz^2) dx dy dz$

26.  $\int_1^3 \int_{-1}^5 \int_0^3 xy^2z dz dy dx$

27.  $\int_0^1 \int_0^{6-y} \int_0^{3-3y-(1/2)z} (y-z) dx dz dy$

28.  $\int_0^1 \int_0^{3-3y} \int_0^{6y} \frac{x}{y} dz dx dy$

29.  $\int_0^{\pi/2} \int_0^{\cos y} \int_0^{\sin y} (2x + y) dz dx dy$

30.  $\int_0^1 \int_0^3 \int_0^{\sin^{-1}x} (x + y) dz dy dx$

Evaluate the triple integrals in Exercises 31–34 over the specified rectangular solid regions.

31.  $\iiint_{\mathcal{R}} x^2yz dV$ , where  
 $\mathcal{R} = \{(x, y, z) \mid -2 \leq x \leq 1, 0 \leq y \leq 3, \text{ and } 1 \leq z \leq 5\}$

32.  $\iiint_{\mathcal{R}} (x + 2y + 3z) dV$ , where  
 $\mathcal{R} = \{(x, y, z) \mid 0 \leq x \leq 4, 1 \leq y \leq 5, \text{ and } 2 \leq z \leq 7\}$

33.  $\iiint_{\mathcal{R}} z \sin x \cos y dV$ , where  
 $\mathcal{R} = \{(x, y, z) \mid 0 \leq x \leq \pi, \frac{3\pi}{2} \leq y \leq 2\pi, \text{ and } 1 \leq z \leq 3\}$

34.  $\iiint_{\mathcal{R}} \ln(xy z^2) dV$ , where  
 $\mathcal{R} = \{(x, y, z) \mid 1 \leq x \leq 3, 1 \leq y \leq e, \text{ and } 1 \leq z \leq 2\}$

Describe the three-dimensional region expressed in each iterated integral in Exercises 35–44.

35.  $\int_{-2}^4 \int_2^6 \int_0^5 f(x, y, z) dy dx dz$

36.  $\int_{-1}^5 \int_{-3}^2 \int_4^8 f(x, y, z) dz dx dy$

37.  $\int_0^3 \int_0^3 \int_0^{3-y} f(x, y, z) dz dy dx$

38.  $\int_0^2 \int_0^3 \int_{4x/3}^4 f(x, y, z) dz dx dy$

39.  $\int_0^3 \int_0^{1-y/3} \int_0^{2-(2/3)y-2z} f(x, y, z) dx dz dy$

40.  $\int_0^2 \int_0^{1-3x/2} \int_{2x+(4/3)y-4}^0 f(x, y, z) dz dy dx$

41.  $\int_{-3}^3 \int_{-\sqrt{9-x^2}}^{\sqrt{9-x^2}} \int_{-\sqrt{9-x^2-y^2}}^{\sqrt{9-x^2-y^2}} f(x, y, z) dz dy dx$

42.  $\int_{-3}^3 \int_{-\sqrt{9-x^2}}^{\sqrt{9-x^2}} \int_{-3}^3 f(x, y, z) dz dy dx$

43.  $\int_{-3}^3 \int_{-\sqrt{9-y^2}}^{\sqrt{9-y^2}} \int_0^{9-y^2-z^2} f(x, y, z) dx dz dy$

44.  $\int_{-3}^3 \int_{-\sqrt{9-z^2}}^{\sqrt{9-z^2}} \int_0^{3-\sqrt{x^2+z^2}} f(x, y, z) dy dx dz$

In Exercises 45–52, rewrite the indicated integral with the specified order of integration.

45. Exercise 35 with the order  $dx dy dz$ .
46. Exercise 36 with the order  $dy dz dx$ .
47. Exercise 37 with the order  $dx dy dz$ .
48. Exercise 38 with the order  $dx dy dz$ .
49. Exercise 39 with the order  $dz dy dx$ .
50. Exercise 40 with the order  $dx dy dz$ .
51. Exercise 41 with the order  $dy dx dz$ .
52. Exercise 42 with the order  $dy dx dz$ .

Find the masses of the solids described in Exercises 53–56.

53. The first-octant solid bounded by the coordinate planes and the plane  $3x + 4y + 6z = 12$  if the density at each point is proportional to the distance of the point from the  $xz$ -plane.

54. The solid bounded above by the plane with equation  $2x + 3y - z = 2$  and bounded below by the triangle with vertices  $(1, 0, 0)$ ,  $(4, 0, 0)$ , and  $(0, 2, 0)$  if the density at each point is proportional to the distance of the point from the  $xy$ -plane.
55. The solid bounded above by the paraboloid with equation  $z = 8 - x^2 - y^2$  and bounded below by the rectangle  $\mathcal{R} = \{(x, y, 0) \mid 1 \leq x \leq 2 \text{ and } 0 \leq y \leq 2\}$  in the  $xy$ -plane if the density at each point is proportional to the square of the distance of the point from the origin.
56. The solid bounded above by the hyperboloid with equation  $z = x^2 - y^2$  and bounded below by the square with vertices  $(2, 2, -4)$ ,  $(2, -2, -4)$ ,  $(-2, -2, -4)$ , and  $(-2, 2, -4)$  if the density at each point is proportional to the distance of the point from the plane with equation  $z = -4$ .

## Applications

In Exercises 57–60, let  $\mathcal{R}$  be the rectangular solid defined by  $\mathcal{R} = \{(x, y, z) \mid 0 \leq x \leq 4, 0 \leq y \leq 3, 0 \leq z \leq 2\}$ .

57. Assume that the density of  $\mathcal{R}$  is uniform throughout.
  - (a) Without using calculus, explain why the center of mass is  $(2, 3/2, 1)$ .
  - (b) Verify that the center of mass is  $(2, 3/2, 1)$ , using the appropriate integral expressions.
58. Assume that the density of  $\mathcal{R}$  is uniform throughout, and find the moment of inertia about the  $x$ -axis and the radius of gyration about the  $x$ -axis.
59. Assume that the density at each point in  $\mathcal{R}$  is proportional to the distance of the point from the  $xy$ -plane.
  - (a) Without using calculus, explain why the  $x$ - and  $y$ -coordinates of the center of mass are  $\bar{x} = 2$  and  $\bar{y} = \frac{3}{2}$ , respectively.
  - (b) Use an appropriate integral expression to find the  $z$ -coordinate of the center of mass.
60. Assuming that the density at each point in  $\mathcal{R}$  is proportional to the distance of the point from the  $xy$ -plane, find the moment of inertia about the  $x$ -axis and the radius of gyration about the  $x$ -axis.

In Exercises 61–64, let  $\mathcal{R}$  be the rectangular solid defined by  $\mathcal{R} = \{(x, y, z) \mid 0 \leq a_1 \leq x \leq a_2, 0 \leq b_1 \leq y \leq b_2, 0 \leq c_1 \leq z \leq c_2\}$ .

61. Assume that the density of  $\mathcal{R}$  is uniform throughout.
  - (a) Without using calculus, explain why the center of mass is  $\left(\frac{a_1+a_2}{2}, \frac{b_1+b_2}{2}, \frac{c_1+c_2}{2}\right)$ .
  - (b) Verify that  $\left(\frac{a_1+a_2}{2}, \frac{b_1+b_2}{2}, \frac{c_1+c_2}{2}\right)$  is the center of mass by using the appropriate integral expressions.
62. Assume that the density of  $\mathcal{R}$  is uniform throughout, and find the moment of inertia about the  $x$ -axis and the radius of gyration about the  $x$ -axis.

63. Assume that the density at each point in  $\mathcal{R}$  is proportional to the distance of the point from the  $yz$ -plane.
  - (a) Without using calculus, explain why the  $y$ - and  $z$ -coordinates of the center of mass are  $\bar{y} = \frac{b_1+b_2}{2}$  and  $\bar{z} = \frac{c_1+c_2}{2}$ , respectively.
  - (b) Use an appropriate integral expression to find the  $x$ -coordinate of the center of mass.
64. Assuming that the density at each point in  $\mathcal{R}$  is proportional to the distance of the point from the  $yz$ -plane, find the first moment of inertia about the  $x$ -axis and the radius of gyration about the  $x$ -axis.

Let  $a$ ,  $b$ , and  $c$  be positive real numbers. In Exercises 65–68, let  $\mathcal{T}$  be the tetrahedron with vertices  $(0, 0, 0)$ ,  $(a, 0, 0)$ ,  $(0, b, 0)$ , and  $(0, 0, c)$ .

65. Assume that the density at each point in  $\mathcal{T}$  is uniform throughout.
  - (a) Find the  $x$ -coordinate of the center of mass of  $\mathcal{T}$ .
  - (b) Explain how to use your answer from part (a) to find the  $y$ - and  $z$ -coordinates of the center of mass without doing any other computations.
66. Assume that the density of  $\mathcal{T}$  is uniform throughout. Set up the integrals required to find the moment of inertia about the  $x$ -axis and the radius of gyration about the  $x$ -axis.
67. Assume that the density at each point in  $\mathcal{T}$  is proportional to the distance of the point from the  $xz$ -plane. Set up the integral expressions required to find the center of mass of  $\mathcal{T}$ .
68. Assuming that the density at each point in  $\mathcal{T}$  is proportional to the distance of the point from the  $yz$ -plane, set up the integrals required to find the first moment of inertia about the  $x$ -axis and the radius of gyration about the  $x$ -axis.

## Proofs

69. Let  $\mathcal{R} = \{(x, y, z) \mid a_1 \leq x \leq a_2, b_1 \leq y \leq b_2, \text{ and } c_1 \leq z \leq c_2\}$ . If  $\alpha(x)$ ,  $\beta(y)$ , and  $\gamma(z)$  are integrable on the intervals  $[a_1, a_2]$ ,  $[b_1, b_2]$ , and  $[c_1, c_2]$ , respectively, use Fubini's theorem to prove that

$$\begin{aligned} \iiint_{\mathcal{R}} \alpha(x)\beta(y)\gamma(z) \, dV \\ = \left( \int_{a_1}^{a_2} \alpha(x) \, dx \right) \left( \int_{b_1}^{b_2} \beta(y) \, dy \right) \left( \int_{c_1}^{c_2} \gamma(z) \, dz \right). \end{aligned}$$

70. Let  $a$ ,  $b$ , and  $c$  be positive real numbers, and let  $\mathcal{R} = \{(x, y, z) \mid -a \leq x \leq a, -b \leq y \leq b, \text{ and } -c \leq z \leq c\}$ . Prove that  $\iiint_{\mathcal{R}} \alpha(x)\beta(y)\gamma(z) \, dV = 0$  if any of  $\alpha$ ,  $\beta$ , and  $\gamma$  is an odd function.
71. Let  $\mathcal{R} = \{(x, y, z) \mid a_1 \leq x \leq a_2, b_1 \leq y \leq b_2, \text{ and } c_1 \leq z \leq c_2\}$ . Prove that

$$\iiint_{\mathcal{R}} dV = (a_2 - a_1)(b_2 - b_1)(c_2 - c_1).$$

What is the relationship between  $\mathcal{R}$  and the product  $(a_2 - a_1)(b_2 - b_1)(c_2 - c_1)$ ?

72. Let  $f(x, y, z)$  be an integrable function on the rectangular solid  $\mathcal{R} = \{(x, y, z) \mid a_1 \leq x \leq a_2, b_1 \leq y \leq b_2, \text{ and } c_1 \leq z \leq c_2\}$ , and let  $\kappa \in \mathbb{R}$ . Use the definition of the triple integral to prove that

$$\iiint_{\mathcal{R}} \kappa f(x, y, z) \, dV = \kappa \iiint_{\mathcal{R}} f(x, y, z) \, dV.$$

73. Let  $f(x, y, z)$  and  $g(x, y, z)$  be integrable functions on the rectangular solid  $\mathcal{R} = \{(x, y, z) \mid a_1 \leq x \leq a_2, b_1 \leq y \leq b_2, \text{ and } c_1 \leq z \leq c_2\}$ . Use the definition of the triple integral to prove that

$$\begin{aligned} \iiint_{\mathcal{R}} (f(x, y, z) + g(x, y, z)) \, dV \\ = \iiint_{\mathcal{R}} f(x, y, z) \, dV + \iiint_{\mathcal{R}} g(x, y, z) \, dV. \end{aligned}$$

## Thinking Forward

- *Cylindrical coordinates:* When we use polar coordinates in the  $xy$ -plane and the usual  $z$ -coordinate, we are using *cylindrical coordinates*. Let  $\Omega_{xy}$  be a region in the  $xy$ -plane such that for each point  $(r, \theta)$  in  $\Omega_{xy}$ ,  $h_1(\theta) \leq r \leq h_2(\theta)$  and  $\alpha \leq \theta \leq \beta$ . Then, if  $g_1(x, y) \leq z \leq g_2(x, y)$  for each  $(x, y)$  in  $\Omega_{xy}$ , explain why

$$\begin{aligned} \iiint_{\Omega} f(x, y, z) \, dV &= \iint_{\Omega_{xy}} \int_{g_1(x, y)}^{g_2(x, y)} f(x, y, z) \, dz \, dA \\ &= \int_{\alpha}^{\beta} \int_{h_1(\theta)}^{h_2(\theta)} \int_{g_1(r \cos \theta, r \sin \theta)}^{g_2(r \cos \theta, r \sin \theta)} f(r \cos \theta, r \sin \theta, z) \, r \, dz \, dr \, d\theta. \end{aligned}$$

- *Cylindrical coordinates:* Use the results of the previous exercise to explain why the triple integral

$$\int_0^{2\pi} \int_0^3 \int_0^{9-r^2} kr^2 \, dz \, dr \, d\theta$$

represents the mass of a solid bounded below by the  $xy$ -plane and bounded above by the paraboloid with equation  $z = 9 - x^2 - y^2$  if the density at every point in the solid is proportional to the distance of the point from the origin. Then determine the mass of the solid.

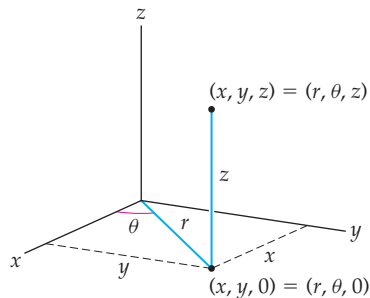

## 13.6 INTEGRATION WITH CYLINDRICAL AND SPHERICAL COORDINATES

- ▶ Generalizing polar coordinates to three dimensions
- ▶ Converting between rectangular coordinates, cylindrical coordinates, and spherical coordinates
- ▶ Constructing triple integrals with cylindrical and spherical coordinates

### Cylindrical Coordinates

In this section we will discuss two generalizations of polar coordinates to three-dimensional space: *cylindrical coordinates* and *spherical coordinates*. We will also discuss how these coordinate systems may be used in triple integrals. We will see that the cylindrical coordinate system uses two linear measures and one angular measure to locate each point in  $\mathbb{R}^3$  and the spherical coordinate system uses one linear measure and two angular measures to locate points.

In the cylindrical coordinate system, we use polar coordinates in the  $xy$ -plane and the usual  $z$ -coordinate to locate positions off of the  $xy$ -plane. As we see in the following figure, given a point  $P$  with rectangular coordinates  $(x, y, z)$ ,  $r$  measures the distance from the projection of  $P$  in the  $xy$ -plane to the origin and  $\theta$  measures the angular rotation from the  $x$ -axis to the ray containing the origin and the point  $(x, y, 0)$ :

That is, if  $(x, y, z)$  is a point in  $\mathbb{R}^3$  given in rectangular coordinates, then, in cylindrical coordinates we have  $(r, \theta, z)$ , where

$$r^2 = x^2 + y^2, \quad \tan \theta = \frac{y}{x}, \quad \text{and} \quad z = z.$$

Note that the values for  $r$  and  $\theta$  are computed just as they were when we were discussing polar coordinates in the plane. Since our primary motivation in this chapter is integration, we will typically choose  $r \geq 0$  and restrict values of  $\theta$  to an interval of length  $2\pi$ , usually either  $[0, 2\pi]$  or  $[-\pi, \pi]$ .

When we have the coordinates of a point  $(r, \theta, z)$  in cylindrical coordinates, the rectangular coordinates are  $(x, y, z)$ , where

$$x = r \cos \theta, \quad y = r \sin \theta, \quad \text{and} \quad z = z.$$

From Section 13.5, we know that, for a three-dimensional region,  $\Omega$ , that is bounded below by the function  $g_1(x, y)$  and above by  $g_2(x, y)$  on the domain  $\Omega_{xy}$ , the triple integral of the function  $f(x, y, z)$  is

$$\iiint_{\Omega} f(x, y, z) dV = \iint_{\Omega_{xy}} \int_{g_1(x, y)}^{g_2(x, y)} f(x, y, z) dz dA.$$

In Section 13.5 we discussed how to use rectangular coordinates to evaluate the exterior double integral over the region  $\Omega_{xy}$ . However, in Section 13.3 we saw that the increment of area  $dA$  is given by  $r dr d\theta$  in polar coordinates. Therefore, to use cylindrical coordinates to evaluate the triple integral of  $f$ , we replace each occurrence of  $x$  in  $f$ ,  $g_1$ , and  $g_2$  with  $r \cos \theta$  and each occurrence of  $y$  with  $r \sin \theta$  and we use  $r dz dr d\theta$  in place of the increment of volume  $dV$ . We also need to express the region  $\Omega_{xy}$  in terms of *polar* coordinates, as we did in Section 13.3.

For example, we will compute the mass of the region  $\Omega$  bounded above by the paraboloid with equation  $g(x, y) = 4 - x^2 - y^2$  and bounded below by the  $xy$ -plane, assuming that the density at each point is proportional to the distance of the point from the  $xy$ -plane. The triple integral we wish to evaluate is  $\iiint_{\Omega} kz dV$ . Using rectangular coordinates, we could evaluate

$$\int_{-2}^2 \int_{-\sqrt{4-x^2}}^{\sqrt{4-x^2}} \int_0^{4-x^2-y^2} kz dz dy dx.$$

However, using cylindrical coordinates, we will have a simpler iterated integral. With cylindrical coordinates, the equation of the paraboloid is  $z = 4 - r^2$ . The projection of the solid onto the  $xy$ -plane is a circle with radius 2 and centered at the origin. The equation of this circle is  $r = 2$  for  $\theta \in [0, 2\pi]$ . Finally, our increment of volume is  $dV = r dz dr d\theta$ . Therefore, the mass may be computed by

$$\begin{aligned} \int_0^{2\pi} \int_0^2 \int_0^{4-r^2} k z r dz dr d\theta &= \int_0^{2\pi} \int_0^2 \left[ \frac{1}{2} k r z^2 \right]_0^{4-r^2} dr d\theta \\ &= \int_0^{2\pi} \int_0^2 \frac{1}{2} k r (4 - r^2)^2 dr d\theta \\ &= - \int_0^{2\pi} \left[ \frac{1}{12} k (4 - r^2)^3 \right]_0^2 d\theta \\ &= \int_0^{2\pi} \frac{16}{3} k d\theta = \left[ \frac{16}{3} k \theta \right]_0^{2\pi} = \frac{32\pi}{3} k. \end{aligned}$$

Every iterated triple integral requires three integrations, so we expect the computation to require at least that much work, but as we see in this example, using the cylindrical coordinate system here provides a much simpler path toward the solution. Evaluating the equivalent iterated triple integral in rectangular coordinates would be even more laborious.

Consider using cylindrical coordinates to evaluate triple integrals when the projection of the region of integration  $\Omega$  onto the  $xy$ -plane,  $\Omega_{xy}$ , has a “natural” expression in polar coordinates. This will always occur when  $\Omega$  displays rotational symmetry about the  $z$ -axis.

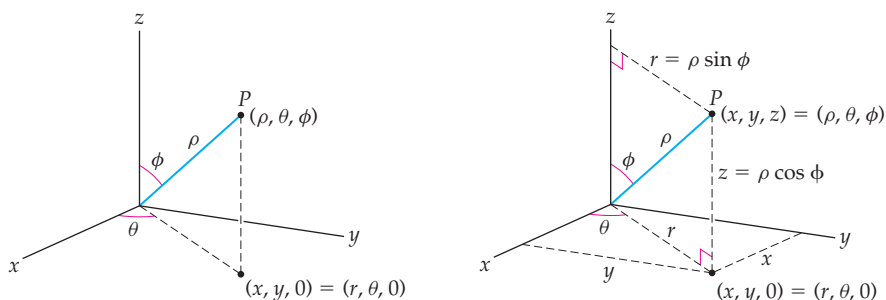

## Spherical Coordinates

Let  $(x, y, z)$  be the rectangular coordinates of a point  $P$  in  $\mathbb{R}^3$ . As we just discussed, we may also express the coordinates of  $P$  as cylindrical coordinates  $(r, \theta, z)$ , where

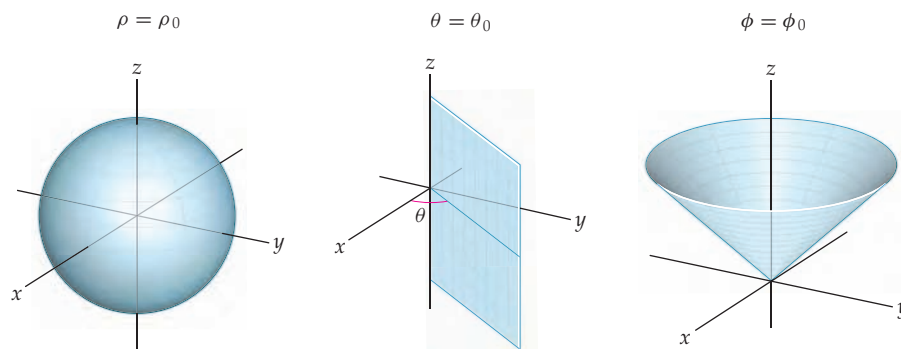

$$r^2 = x^2 + y^2, \quad \tan \theta = \frac{y}{x}, \quad \text{and} \quad z = z.$$

In the spherical system, the coordinates of a point  $P$  in  $\mathbb{R}^3$  are given by  $(\rho, \theta, \phi)$ , where  $\rho$  is the distance that  $P$  is from the origin,  $\theta$  is the same angle we used in the cylindrical system, and  $\phi \in [0, \pi]$  is the angle that the ray from the origin through  $P$  makes with the

positive  $z$ -axis, as we see in the figure that follows at the left. The figure at the right shows the relationships between the spherical, cylindrical, and rectangular coordinates.

The angles  $\theta$  and  $\phi$  will be measured in radians. We will always assume that  $0 \leq \phi \leq \pi$  and that  $\theta$  lies in some interval of length  $2\pi$ , typically  $\theta \in [0, 2\pi]$  or  $\theta \in [-\pi, \pi]$ . In the figures that follow, we show a sphere, a plane, and a cone. These are the graphs obtained when  $\rho$ ,  $\theta$ , and  $\phi$ , respectively, are constant.

We summarize the relationships between the variables of our three-dimensional coordinate systems in the following theorem:

### THEOREM 13.21

#### Converting Between the Three-Dimensional Coordinate Systems

Let  $P$  be a point in  $\mathbb{R}^3$  with coordinates  $(x, y, z)$  in the rectangular coordinate system,  $(r, \theta, z)$  in the cylindrical coordinate system, and  $(\rho, \theta, \phi)$  in the spherical coordinate system.

- (a) The cylindrical coordinates and rectangular coordinates for  $P$  are related by the following equations:

$$r = \sqrt{x^2 + y^2}, \quad \tan \theta = \frac{y}{x}, \quad \text{and} \quad z = z$$

$$x = r \cos \theta, \quad y = r \sin \theta, \quad \text{and} \quad z = z.$$

- (b) The cylindrical coordinates and spherical coordinates for  $P$  are related by the following equations:

$$\rho = \sqrt{r^2 + z^2}, \quad \theta = \theta, \quad \text{and} \quad \tan \phi = \frac{r}{z}$$

$$r = \rho \sin \phi, \quad \theta = \theta, \quad \text{and} \quad z = \rho \cos \phi.$$

- (c) The rectangular coordinates and spherical coordinates for  $P$  are related by the following equations:

$$\rho = \sqrt{x^2 + y^2 + z^2}, \quad \tan \theta = \frac{y}{x}, \quad \text{and} \quad \cos \phi = \frac{z}{\sqrt{x^2 + y^2 + z^2}}$$

$$x = \rho \sin \phi \cos \theta, \quad y = \rho \sin \phi \sin \theta, \quad \text{and} \quad z = \rho \cos \phi.$$

For example, if the rectangular coordinates of a point  $P$  are  $(1, \sqrt{3}, 2\sqrt{3})$ , then

$$r = \sqrt{x^2 + y^2} = \sqrt{1^2 + (\sqrt{3})^2} = 2, \quad z = 2\sqrt{3}, \quad \text{and} \quad \tan \theta = \frac{y}{x} = \frac{\sqrt{3}}{1} = \sqrt{3}.$$

Therefore,  $\theta = \frac{\pi}{3}$  and the cylindrical coordinates for  $P$  are  $(2, \frac{\pi}{3}, 2\sqrt{3})$ . Now that we have the cylindrical coordinates for  $P$ , we may use either those or the rectangular coordinates for  $P$  to find the spherical coordinates for  $P$ . We'll use the cylindrical coordinates. We have

$$\rho = \sqrt{r^2 + z^2} = \sqrt{2^2 + (2\sqrt{3})^2} = 4, \quad \theta = \frac{\pi}{3}, \quad \text{and} \quad \tan \phi = \frac{r}{z} = \frac{2}{2\sqrt{3}} = \frac{1}{\sqrt{3}}.$$

Therefore, since  $\phi \in [0, \pi]$ , we have  $\phi = \frac{\pi}{6}$ . So the spherical coordinates for  $P$  are  $(4, \frac{\pi}{3}, \frac{\pi}{6})$ .

## Integration with Spherical Coordinates

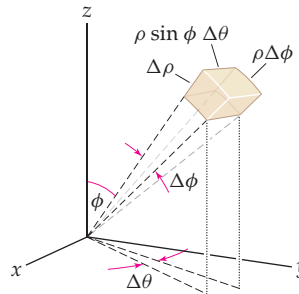

Recall that to integrate a function  $f(r, \theta)$  over a region  $\Omega \subset \mathbb{R}^2$ , we use  $dA = r \, dr \, d\theta$  for our increment of area. That is,

$$\iint_{\Omega} f(r, \theta) \, dA = \iint_{\Omega} f(r, \theta) \, r \, dr \, d\theta.$$

Similarly, as we saw earlier in this section, when we integrate a function  $f(r, \theta, z)$  over a region  $\Omega \subset \mathbb{R}^3$ , we use  $dV = r \, dz \, dr \, d\theta$  for our increment of volume and obtain

$$\iiint_{\Omega} f(r, \theta, z) \, dV = \iiint_{\Omega} f(r, \theta, z) \, r \, dz \, dr \, d\theta.$$

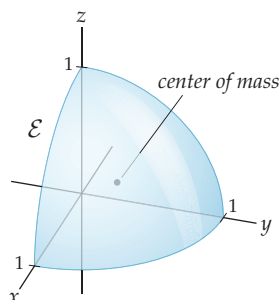

When we use spherical coordinates, we must also adapt our increment of volume. Here, we will have  $dV = \rho^2 \sin \phi \, d\rho \, d\theta \, d\phi$ . To see this, start by considering an increment of volume in spherical coordinates determined by  $\Delta\rho = \rho_i - \rho_{i-1}$ ,  $\Delta\theta = \theta_j - \theta_{j-1}$ , and  $\Delta\phi = \phi_k - \phi_{k-1}$ . When  $\Delta\rho$ ,  $\Delta\theta$ , and  $\Delta\phi$  are small, this region is nearly a rectangular solid, as shown next. Thus, its volume may be approximated by the product of its three dimensions.

The measure of the side of this solid determined by  $\Delta\rho$  is just that linear measure. The approximate measure of the side determined by  $\Delta\phi$  is  $\rho\Delta\phi$ , since it is the arc of the circle of radius  $\rho$  subtended by the angle  $\Delta\phi$ . The projection of the third side into the  $xy$ -plane is shown in the figure. This projection is an arc of a circle with radius  $r$  (in cylindrical coordinates) subtended by the angle  $\Delta\theta$ . Therefore, the measure of the projection is  $r\Delta\theta$ . However, since  $r = \rho \sin \phi$ , the approximate measure of the third side is  $r\Delta\theta = \rho \sin \phi \Delta\theta$ . Multiplying these three factors together, we have  $\Delta V = \rho^2 \sin \phi \, \Delta\rho \, \Delta\theta \, \Delta\phi$ . When we take the limit as  $\Delta\rho$ ,  $\Delta\theta$ , and  $\Delta\phi$  all tend to zero, we have the volume differential  $dV = \rho^2 \sin \phi \, d\rho \, d\theta \, d\phi$ . Therefore, when we have a function  $f(\rho, \theta, \phi)$  given in spherical coordinates and defined on a three-dimensional region  $\Omega$ , the integral of  $f$  on  $\Omega$  is

$$\iiint_{\Omega} f(\rho, \theta, \phi) \, \rho^2 \sin \phi \, d\rho \, d\theta \, d\phi.$$

Typically, the spherical coordinate system is used when the boundaries of a solid are spheres or parts of spheres. For example, let  $\mathcal{E}$  be the portion of the unit sphere centered at the origin in the first octant, as shown in the following figure:

We will find the center of mass of  $\mathcal{E}$ , assuming that it has uniform density  $k$ . To find the  $x$ -coordinate of the center of mass,  $\bar{x}$ , we start by computing the first moment with respect to the  $yz$ -plane. We have

$$M_{yz} = \iiint_{\mathcal{E}} kx \, dV = \int_0^{\pi/2} \int_0^{\pi/2} \int_0^1 k\rho^3 \sin^2 \phi \cos \theta \, d\rho \, d\theta \, d\phi,$$

since  $x = \rho \sin \phi \cos \theta$  and  $dV = \rho^2 \sin \phi \, d\rho \, d\theta \, d\phi$ . In Exercise 18 you will show that  $M_{yz} = \frac{1}{16}\pi k$ . Similarly, the mass,  $m$ , of  $\mathcal{E}$  is given by the integral

$$m = \iiint_{\mathcal{E}} k \, dV = \int_0^{\pi/2} \int_0^{\pi/2} \int_0^1 k\rho^2 \sin \phi \, d\rho \, d\theta \, d\phi.$$

However, we may circumvent this computation because the value of that integral has to be one-eighth of the volume of a sphere times the (uniform) density  $k$ . That is,  $m = \frac{1}{8} \left( \frac{4}{3}\pi \right) k = \frac{1}{6}\pi k$ . In Exercise 19 we ask that you evaluate the integral to obtain this result. Therefore,  $\bar{x} = \frac{M_{yz}}{m} = \frac{3}{8}$ . Because of the symmetry of  $\mathcal{E}$ , the  $y$ - and  $z$ -coordinates of the center of mass must also be  $\frac{3}{8}$ . So the center of mass of  $\mathcal{E}$  is  $\left( \frac{3}{8}, \frac{3}{8}, \frac{3}{8} \right)$ . (In Exercises 20 and 21, you are asked to show that  $M_{xy}$  and  $M_{xz}$  both equal  $\frac{1}{16}\pi k$  to confirm this result.)

## Examples and Explorations

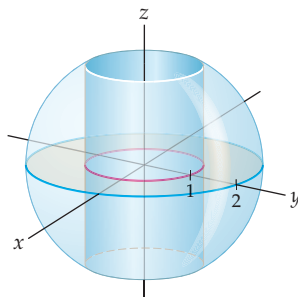

### EXAMPLE 1

#### Finding the volume of a region between a cylinder and a sphere

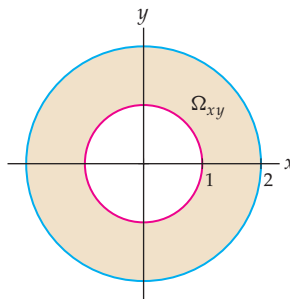

Use rectangular, cylindrical, and spherical coordinates to set up triple integrals representing the volume inside the sphere with equation  $x^2 + y^2 + z^2 = 4$  but outside the cylinder with equation  $x^2 + y^2 = 1$ .

#### SOLUTION

The sphere is centered at the origin and has radius 2. The  $z$ -axis is the axis of symmetry for the cylinder with radius 1. The graph is as follows:

Let  $\Omega$  represent the region. Since  $\Omega$  is symmetric with respect to the  $z$ -axis, when we use rectangular coordinates we will integrate first with respect to  $z$ . The projection of  $\Omega$  onto the  $xy$ -plane is the annulus  $\Omega_{xy}$ , shown here:

It would require several subdivisions to represent  $\Omega_{xy}$  as a sum of type I and type II regions. However, we can use rectangular coordinates to represent the volume of  $\Omega$  by setting up a triple integral giving the volume of the entire sphere and then subtracting a triple integral that represents the portion of the volume of the sphere inside the cylinder. That is, the volume of  $\Omega$  is

$$\int_{-2}^2 \int_{-\sqrt{4-x^2}}^{\sqrt{4-x^2}} \int_{-\sqrt{4-x^2-y^2}}^{\sqrt{4-x^2-y^2}} dz dy dx - \int_{-1}^1 \int_{-\sqrt{1-x^2}}^{\sqrt{1-x^2}} \int_{-\sqrt{4-x^2-y^2}}^{\sqrt{4-x^2-y^2}} dz dy dx.$$

Note that it is more natural to represent  $\Omega_{xy}$  with polar coordinates than with rectangular coordinates. This is why it will be easier to represent the volume of  $\Omega$  with cylindrical coordinates than it was with rectangular coordinates. In cylindrical coordinates, the equations of the upper and lower hemispheres are  $z = \sqrt{4-r^2}$  and  $z = -\sqrt{4-r^2}$ , respectively. We must also remember to include the factor  $r$  in the integrand when we use cylindrical coordinates. Therefore, the triple integral representing the volume of  $\Omega$  is

$$\int_0^{2\pi} \int_1^2 \int_{-\sqrt{4-r^2}}^{\sqrt{4-r^2}} r dz dr d\theta.$$

Lastly, we will use spherical coordinates to set up a triple integral for the volume. In spherical coordinates, the equation of the sphere is  $\rho = 2$ . Since  $x = \rho \sin \phi \cos \theta$  and  $y = \rho \sin \phi \sin \theta$ , the equation of the cylinder  $x^2 + y^2 = 1$  in spherical coordinates is

$$(\rho \sin \phi \cos \theta)^2 + (\rho \sin \phi \sin \theta)^2 = 1.$$

We ask you to show in Exercise 22 that this equation simplifies to  $\rho = \csc \phi$ . To set up the iterated integral, we also need the correct interval of values for  $\phi$ . The sphere and cylinder intersect when  $\csc \phi = 2$ . The values of  $\phi$  satisfying this relationship within the interval  $[0, \pi]$  are  $\phi = \frac{\pi}{6}$  and  $\phi = \frac{5\pi}{6}$ . Recall that when we integrate with spherical coordinates, we must include the factor  $\rho^2 \sin \phi$  in the integrand. Therefore, the volume of  $\Omega$  is given by

$$\int_{\pi/6}^{5\pi/6} \int_0^{2\pi} \int_{\csc \phi}^2 \rho^2 \sin \phi d\rho d\theta d\phi. \quad \square$$

### EXAMPLE 2

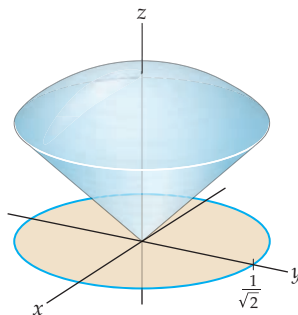

#### Finding the volume of a region between a cone and a sphere

Use rectangular, cylindrical, and spherical coordinates to set up triple integrals representing the volume bounded below by the cone with equation  $z = \sqrt{x^2 + y^2}$  and bounded above by the unit sphere centered at the origin.

**SOLUTION**

The  $z$ -axis is the axis of symmetry for the cone. Its vertex is at the origin and it opens upward. Here is the graph:

Let  $\Omega$  represent the region. Since  $\Omega$  is symmetric with respect to the  $z$ -axis, when we use rectangular coordinates we will integrate first with respect to  $z$ . The cone and sphere intersect at height  $z = \frac{1}{\sqrt{2}}$  in a circle with radius  $\frac{1}{\sqrt{2}}$ . Therefore, the projection of  $\Omega$  onto the  $xy$ -plane is a circle  $\Omega_{xy}$  with radius  $\frac{1}{\sqrt{2}}$  and centered at the origin. The equation for this circle is  $x^2 + y^2 = \frac{1}{2}$ .

The region  $\Omega_{xy}$  may be treated as either a type I or type II region. We will treat it as a type I region. Using rectangular coordinates, we find that the volume of  $\Omega$  is

$$\int_{-1/\sqrt{2}}^{1/\sqrt{2}} \int_{-\sqrt{(1/2)-x^2}}^{\sqrt{(1/2)-x^2}} \int_{\sqrt{x^2-y^2}}^{\sqrt{1-x^2-y^2}} dz dy dx.$$

We will now use an iterated integral with cylindrical coordinates to represent the volume of  $\Omega$ . In cylindrical coordinates, the equation of the upper hemisphere of the unit sphere is  $z = \sqrt{1-r^2}$  and the equation of the cone is  $z = r$ . We include the factor  $r$  in the integrand when we use cylindrical coordinates, and we obtain the integral

$$\int_0^{2\pi} \int_0^{1/\sqrt{2}} \int_r^{\sqrt{1-r^2}} r dz dr d\theta$$

for the volume of  $\Omega$ .

Finally, we will use spherical coordinates to set up a triple integral for the volume. In spherical coordinates, the equation of the sphere is  $\rho = 1$  and the equation of the cone is  $\phi = \frac{\pi}{4}$ . Recall that when we integrate with spherical coordinates, we must include the factor  $\rho^2 \sin \phi$  in the integrand. Therefore, the volume of  $\Omega$  is given by

$$\int_0^{\pi/4} \int_0^{2\pi} \int_0^1 \rho^2 \sin \phi d\rho d\theta d\phi.$$

- ▶ Under what conditions should you use rectangular, cylindrical, or spherical coordinates in evaluating triple integrals?

## EXERCISES 13.6

### Thinking Back

- ▶ *Graphing with polar coordinates:* Use polar coordinates in  $\mathbb{R}^2$  to graph each of the following equations:
  - ▶  $r = 3$
  - ▶  $r = 2 \cos \theta$
  - ▶  $\theta = \frac{\pi}{3}$
  - ▶  $r = 1 + 2 \sin \theta$
- ▶ *Rectangular versus polar coordinates:* When is it easier to use the rectangular coordinate system in  $\mathbb{R}^2$ ? When is it easier to use the polar coordinate system?
- ▶ *Integrating with polar coordinates:* Let  $\Omega$  be a region in  $\mathbb{R}^2$ . Provide a double integral that represents the area of  $\Omega$  when you integrate with polar coordinates.

### Concepts

0. *Problem Zero:* Read the section and make your own summary of the material.
1. *True/False:* Determine whether each of the statements that follow is true or false. If a statement is true, explain why. If a statement is false, provide a counterexample.
  - (a) *True or False:* With cylindrical coordinates, the graph of the function  $z = \sqrt{2r \cos \theta - r^2}$  is a hemisphere.
  - (b) *True or False:* With spherical coordinates, the graph of  $\phi = \frac{\pi}{2}$  is the  $xy$ -plane.
  - (c) *True or False:* With spherical coordinates, for every value of  $a \in (0, \pi)$  the intersection of the graphs of  $\phi = a$  and  $\rho = 1$  is a circle with radius 1.
  - (d) *True or False:* The graph of  $z = r$  in cylindrical coordinates is the same as the graph of  $\phi = \frac{\pi}{4}$  in spherical coordinates.
  - (e) *True or False:* If  $f$  is an integrable function of three variables on a region  $\Omega$ , then
 
$$\iiint_{\Omega} f(x, y, z) \, dz \, dy \, dx = \iiint_{\Omega} f(r, \theta, z) \, dz \, dr \, d\theta.$$
  - (f) *True or False:* If  $f$  is an integrable function of three variables on a region  $\Omega$ , then
 
$$\iiint_{\Omega} f(x, y, z) \, dz \, dy \, dx = \iiint_{\Omega} f(x(r, \theta), y(r, \theta), z) \, r \, dz \, dr \, d\theta.$$
  - (g) *True or False:* The integral
 
$$\int_0^{2\pi} \int_0^{2\pi} \int_0^R \rho^2 \sin \phi \, d\rho \, d\theta \, d\phi = \frac{4}{3} \pi R^3.$$
  - (h) *True or False:* The rectangular, cylindrical, and spherical coordinate systems are the only coordinate systems in  $\mathbb{R}^3$ .
2. *Examples:* Construct examples of the thing(s) described in the following. Try to find examples that are different than any in the reading.
  - (a) A region in  $\mathbb{R}^3$  that is most easily expressed with rectangular coordinates.
  - (b) A region in  $\mathbb{R}^3$  that is most easily expressed with cylindrical coordinates.
  - (c) A region in  $\mathbb{R}^3$  that is most easily expressed with spherical coordinates.
3. What are the graphs of the constant functions  $x = x_0$ ,  $y = y_0$ , and  $z = z_0$  in the rectangular coordinate system?
4. What are the graphs of the constant functions  $r = r_0$ ,  $\theta = \theta_0$ , and  $z = z_0$  in the cylindrical coordinate system?
5. What are the graphs of the constant functions  $\rho = \rho_0$ ,  $\theta = \theta_0$ , and  $\phi = \phi_0$  in the spherical coordinate system?
6. For what values of  $\alpha \in [0, \pi]$  in the spherical coordinate system is the graph  $\phi = \alpha$  not a cone?

Fill in the blanks for the conversion formulas in Exercises 7–12.

7. To convert from rectangular to cylindrical coordinates:  $r = \underline{\hspace{2cm}}$ ,  $\theta = \underline{\hspace{2cm}}$ ,  $z = \underline{\hspace{2cm}}$ .

8. To convert from cylindrical to rectangular coordinates:  
 $x = \underline{\hspace{2cm}}$ ,  $y = \underline{\hspace{2cm}}$ ,  $z = \underline{\hspace{2cm}}$ .
9. To convert from rectangular to spherical coordinates:  
 $\rho = \underline{\hspace{2cm}}$ ,  $\theta = \underline{\hspace{2cm}}$ ,  $\phi = \underline{\hspace{2cm}}$ .
10. To convert from spherical to rectangular coordinates:  
 $x = \underline{\hspace{2cm}}$ ,  $y = \underline{\hspace{2cm}}$ ,  $z = \underline{\hspace{2cm}}$ .
11. To convert from cylindrical to spherical coordinates:  
 $\rho = \underline{\hspace{2cm}}$ ,  $\theta = \underline{\hspace{2cm}}$ ,  $\phi = \underline{\hspace{2cm}}$ .
12. To convert from spherical to cylindrical coordinates:  
 $r = \underline{\hspace{2cm}}$ ,  $\theta = \underline{\hspace{2cm}}$ ,  $z = \underline{\hspace{2cm}}$ .
13. What are the six forms used to express the volume increment  $dV$  when you use rectangular coordinates to evaluate a triple integral? How do you decide which order to use?
14. The volume increment  $dV = \underline{\hspace{2cm}}$  when you use cylindrical coordinates to evaluate a triple integral. Why is this the standard order of integration for cylindrical coordinates?
15. The volume increment  $dV = \underline{\hspace{2cm}}$  when you use spherical coordinates to evaluate a triple integral. Why is this the standard order of integration for spherical coordinates?
16. What geometric conditions do you look for when you are deciding which coordinate system to use in  $\mathbb{R}^3$ ?
17. What geometric conditions do you look for when you are deciding which coordinate system to use when you are evaluating a triple integral?

In Exercises 18–21, we ask you to confirm a result from earlier in the section. Let  $\mathcal{E}$  be the portion of the unit sphere centered at the origin in the first octant. Assume that  $\mathcal{E}$  has uniform density  $k$ .

18. Show that the first moment of  $\mathcal{E}$  is  $M_{yz} = \frac{1}{16}\pi k$ .
19. Show that the mass of  $\mathcal{E}$  is  $\frac{1}{6}\pi k$  by evaluating the integral

$$\iiint_{\mathcal{E}} k dV = \int_0^{\pi/2} \int_0^{\pi/2} \int_0^1 k \rho^2 \sin \phi d\rho d\theta d\phi.$$

20. Set up the appropriate triple integral with spherical coordinates to show that  $M_{xy} = \frac{1}{16}\pi k$ .
21. Set up the appropriate triple integral with spherical coordinates to show that  $M_{xz} = \frac{1}{16}\pi k$ .
22. From Example 1, recall that  $x^2 + y^2 = 1$  is the equation of the cylinder with radius 1, whose axis of symmetry is the  $z$ -axis. Show that the equation of this cylinder in spherical coordinates is  $\rho = \csc \phi$ .

## Skills

Find the coordinates specified in Exercises 23–28.

23. Give the cylindrical and spherical coordinates for the point with rectangular coordinates  $(1, 0, 0)$ .
24. Give the cylindrical and spherical coordinates for the point with rectangular coordinates  $(-6, 6, 6)$ .
25. Give the rectangular and spherical coordinates for the point with cylindrical coordinates  $(\sqrt{48}, \pi/3, 4)$ .
26. Give the rectangular and spherical coordinates for the point with cylindrical coordinates  $(4, \pi/3, 6)$ .
27. Give the rectangular and cylindrical coordinates for the point with spherical coordinates  $(8, \pi/2, \pi)$ .
28. Give the rectangular and cylindrical coordinates for the point with spherical coordinates  $(6, \pi/4, \pi/4)$ .

Describe the graphs of the equations in Exercises 29–38 in  $\mathbb{R}^3$ , and provide alternative equations in the specified coordinate systems.

29. Change  $x = 4$  to the cylindrical and spherical systems.
30. Change  $z = x + y$  to the cylindrical and spherical systems.
31. Change  $r = 2$  to the rectangular and spherical systems.
32. Change  $r = 4 \sin \theta$  to the rectangular and spherical systems.
33. Change  $\theta = \frac{\pi}{2}$  to the rectangular system.

34. Change  $\theta = \alpha$ , where  $\alpha$  is a constant, to the rectangular system.
35. Change  $\rho = 2$  to the rectangular and cylindrical systems.
36. Change  $\phi = \frac{\pi}{4}$  to the rectangular and spherical systems.
37. Change  $\phi = \frac{\pi}{2}$  to the rectangular and cylindrical systems.
38. Change  $\phi = \frac{3\pi}{4}$  to the rectangular and cylindrical systems.

The iterated integrals in Exercises 39–42 use cylindrical coordinates. Describe the solids determined by the limits of integration.

39.  $\int_0^{2\pi} \int_0^3 \int_0^r f(r, \theta, z) r dz dr d\theta$
40.  $\int_0^{\pi} \int_1^2 \int_0^{r^2} f(r, \theta, z) r dz dr d\theta$
41.  $\int_0^{\pi} \int_0^{2 \sin \theta} \int_0^{\sqrt{16-r^2}} f(r, \theta, z) r dz dr d\theta$
42.  $\int_0^{\pi/2} \int_0^1 \int_0^{\sqrt{1-r^2}} f(r, \theta, z) r dz dr d\theta$

The iterated integrals in Exercises 43–46 use spherical coordinates. Describe the solids determined by the limits of integration.

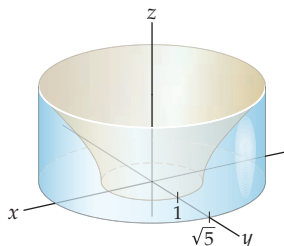

43.  $\int_{\pi/2}^{\pi} \int_0^{2\pi} \int_0^2 f(\rho, \theta, \phi) \rho^2 \sin \phi \, d\rho \, d\theta \, d\phi$
44.  $\int_0^{\pi/2} \int_0^{\pi/2} \int_0^1 f(\rho, \theta, \phi) \rho^2 \sin \phi \, d\rho \, d\theta \, d\phi$
45.  $\int_0^{\pi/4} \int_0^{2\pi} \int_0^{3 \sec \theta} f(\rho, \theta, \phi) \rho^2 \sin \phi \, d\rho \, d\theta \, d\phi$
46.  $\int_{\pi/4}^{\pi/2} \int_0^{2\pi} \int_0^{3 \csc \theta} f(\rho, \theta, \phi) \rho^2 \sin \phi \, d\rho \, d\theta \, d\phi$

Use a triple integral with either cylindrical or spherical coordinates to find the volumes of the solids described in Exercises 47–56.

47. The region inside both the sphere with equation  $x^2 + y^2 + z^2 = 4$  and the cylinder with equation  $x^2 + (y - 1)^2 = 1$ .
48. The region inside the cylinder with equation  $x^2 + (y - 1)^2 = 1$ , bounded below by the  $xy$ -plane and bounded above by the cone with equation  $z = \sqrt{x^2 + y^2}$ .
49. The region bounded below by the  $xy$ -plane, bounded above by the sphere with radius 2 and centered at the origin, and outside the cylinder with equation  $x^2 + y^2 = 1$ .
50. The region bounded below by the plane with equation  $z = c$  and bounded above by the sphere with equation  $x^2 + y^2 + z^2 = R^2$ , where  $c$  and  $R$  are constants such that  $0 < c < R$ .
51. The region bounded above by the plane with equation  $z = x$  and bounded below by the paraboloid with equation  $z = x^2 + y^2$ .
52. The region bounded above by the sphere with equation  $\rho = 2$  and bounded below by the cone with equation  $\phi = \frac{\pi}{3}$ .
53. The region in the next figure which is bounded below by the  $xy$ -plane, bounded above by the hyperboloid with equation  $x^2 + y^2 - z^2 = 1$ , and inside the cylinder with equation  $x^2 + y^2 = 5$ .
54. The first-octant region bounded above by the sphere with equation  $\rho = R$  and bounded below by the plane with equation  $z = x + y$ .
55. The region bounded above by the sphere with equation  $\rho = R$  and bounded below by the cone with equation  $\phi = \alpha$ . Explain why the volume should be zero if  $\alpha = 0$  and  $\frac{4}{3}\pi R^3$  if  $\alpha = \pi$ .
56. The region bounded above by the sphere with equation  $\rho = R$  and bounded below by the plane with equation  $z = b$ , where  $0 \leq b \leq R$ . Explain why the volume should be  $\frac{2}{3}\pi R^3$  if  $b = 0$  and zero if  $b = R$ . Use that result to find the volume of the region when  $-R \leq b < 0$ .

Find the specified quantities for the solids described in Exercises 57–66.

57. The mass of the region from Exercise 47, assuming that the density at every point is proportional to the square of the point's distance from the  $z$ -axis.
58. The mass of the region from Exercise 48, assuming that the density at every point is proportional to the square of the point's distance from the  $xy$ -plane.
59. The center of mass of the region from Exercise 49, assuming that the density at every point is proportional to the point's distance from the  $z$ -axis.
60. The center of mass of the region from Exercise 50, assuming that the density at every point is proportional to the point's distance from the  $xy$ -plane.
61. The mass of the region from Exercise 51, assuming that the density at every point is proportional to the square of the point's distance from the  $xy$ -plane.
62. The moment of inertia about the  $z$ -axis of the region from Exercise 52, assuming that the density at every point is inversely proportional to the point's distance from the  $z$ -axis.
63. The moment of inertia about the  $z$ -axis of the region from Exercise 53, assuming that the density at every point is inversely proportional to the point's distance from the  $z$ -axis.
64. The mass of the region from Exercise 54, assuming that the density at every point is proportional to the point's distance from the  $xy$ -plane.
65. The center of mass of the region from Exercise 55, assuming that the density of the region is constant.
66. The moment of inertia about the  $xy$ -plane of the region from Exercise 56, assuming that the density of the region is constant.

## Applications

67. Emmy is responsible for a tank that is circular when viewed from above. The tank has a radius of 75 feet. An island with a radius of 8 feet lies at the center of the tank and contains monitoring equipment. Emmy knows that the sides of the tank are vertical but the bottom of the tank is the surface of a sphere of radius 150 feet, forming a bowl at the bottom. At the edge of the tank, the depth is 8 feet. What is the volume of the tank?
68. Annie is a sea-kayaking guide who finds herself with time on her hands in the winter. She is building a wood-and-fabric kayak for herself, but is concerned about its capacity for cargo. The outside surface of the kayak satisfies the equation

$$r = \frac{(49 - l^2)(2 - \sin \theta)}{147},$$

where the coordinates are cylindrical,  $r$  is the distance from a line joining the tips of the boat, and  $l$  is the horizontal distance from the center.

- (a) What is the volume of the kayak?
- (b) When Annie sits in a kayak, the seat and her body fill about 5 cubic feet of the boat. The stringers, which are supports inside that run the length of the kayak, take up space, so the interior has a radius that is 1.5 inches smaller than what you calculated in part (a). Approximately how much cargo space will she actually have in the kayak?

## Proofs

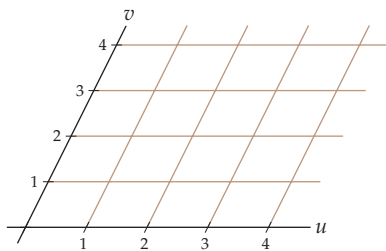

69. Let  $a$  be a constant. Prove that the equation of the plane  $x = a$  is  $r = a \sec \theta$  in cylindrical coordinates.
70. Let  $b$  be a constant. Prove that the equation of the plane  $y = b$  is  $r = b \csc \theta$  in cylindrical coordinates.
71. Let  $a$  be a constant. Prove that the equation of the plane  $x = a$  is  $\rho = a \csc \phi \sec \theta$  in spherical coordinates.
72. Let  $b$  be a constant. Prove that the equation of the plane  $y = b$  is  $r = b \csc \phi \csc \theta$  in spherical coordinates.
73. Let  $R$  be the radius of the base of a cone and  $h$  be the height of the cone. Use cylindrical coordinates to set up

and evaluate a triple integral proving that the volume of the cone is  $\frac{1}{3}\pi R^2 h$ .

74. Let  $R$  be the radius of a sphere. Use cylindrical coordinates to set up and evaluate a triple integral proving that the volume of the sphere is  $\frac{4}{3}\pi R^3$ .
75. Repeat Exercise 73, but using spherical coordinates.
76. Repeat Exercise 74, but using spherical coordinates.

## Thinking Forward

A *non-standard coordinate system in  $\mathbb{R}^2$* : Imagine a coordinate system in  $\mathbb{R}^2$  in which the coordinate axes  $u$  and  $v$  are *not* perpendicular, as shown in the figure.

- Explain why every point in  $\mathbb{R}^2$  has unique coordinates in this coordinate system.

- What is the area of each of the small parallelograms in the figure?
- If  $\mathbf{a}$  is a vector parallel to the  $u$ -axis and  $\mathbf{b}$  is a vector parallel to the  $v$ -axis, what is the area of the parallelogram determined by  $\mathbf{a}$  and  $\mathbf{b}$ ?

A *non-standard coordinate system in  $\mathbb{R}^3$* : Imagine a three-dimensional analog to the coordinate system described in the previous problem, except that now there are three coordinate axes meeting at an origin but the three axes are not mutually perpendicular.

- What is the volume of each parallelepiped determined by a unit change in the  $u$ ,  $v$ , and  $w$  directions?
- If  $\mathbf{a}$ ,  $\mathbf{b}$ , and  $\mathbf{c}$  are vectors parallel to the  $u$ -,  $v$ -, and  $w$ -axes, respectively, what is the volume of the parallelepiped determined by  $\mathbf{a}$ ,  $\mathbf{b}$ , and  $\mathbf{c}$ ?

## 13.7 JACOBIANS AND CHANGE OF VARIABLES

- ▶ Using nonstandard coordinate systems in  $\mathbb{R}^2$
- ▶ Using nonstandard coordinate systems in  $\mathbb{R}^3$
- ▶ Using Jacobians to construct double and triple integrals

### Change of Variables in $\mathbb{R}^2$

The first integration technique that we discussed in Chapter 5 was integration by substitution. At that time we saw that

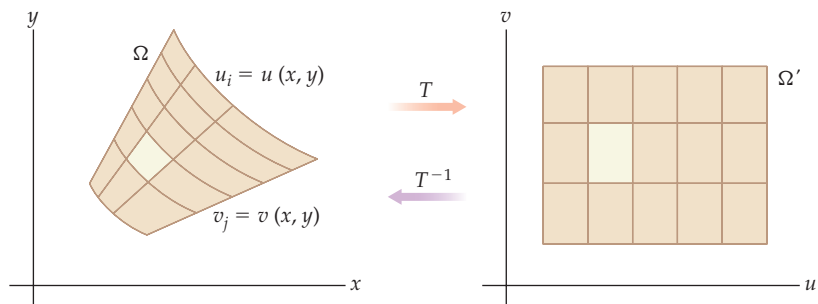

$$\int_a^b f(g(x))g'(x) dx = \int_c^d f(u) du,$$

where  $u = g(x)$ ,  $c = g(a)$ , and  $d = g(b)$ . The point of changing the variable in that context was to obtain an integral  $\int_c^d f(u) du$  that was simpler to evaluate than the original integral. We studied related phenomena when we introduced polar coordinates, cylindrical coordinates, and spherical coordinates. Some integrals are easier to evaluate when we represent them in those coordinate systems. No matter how comfortable we may feel with the rectangular coordinate system, analyzing an integral with an alternative coordinate system often makes the evaluation of a double or triple integral simpler. For example, we discussed how to evaluate a double integral  $\iint_{\Omega} g(x, y) dA$  when we analyzed  $\Omega$  as a type I region or a type II region in Section 13.2, but then, in Section 13.3, we extended our discussion by analyzing  $\Omega$  in terms of polar coordinates. In Section 13.3 we saw that

$$\iint_{\Omega} g(x, y) dA = \int_{\alpha}^{\beta} \int_{f_1(\theta)}^{f_2(\theta)} g(r \cos \theta, r \sin \theta) r dr d\theta$$

when the boundary components of  $\Omega$  are determined by the polar functions  $r = f_1(\theta)$  and  $r = f_2(\theta)$  for  $\theta \in [\alpha, \beta]$ . In the current section we will learn how to generalize this idea so that we can use other coordinate systems to analyze double and triple integrals.

Typically we start with some region  $\Omega$  in  $\mathbb{R}^2$ . We wish to find a function  $T : \Omega \rightarrow \Omega'$  such that  $\Omega'$  is a simpler subset of  $\mathbb{R}^2$ . Such functions are called **transformations**. In particular, we will require the transformations that we use in this section to be both one-to-one and differentiable at every point in the interior of  $\Omega$ . As the following schematic illustrates, we consider the points in  $\Omega$  to be given by the rectangular coordinates  $(x, y)$  and the points in our target to be given by coordinates  $(u, v)$ :

The goal is to determine a transformation  $T$  such that  $T(\Omega) = \Omega'$  may be more simply analyzed in the new coordinate system. In our schematic, the image set  $\Omega'$  is a rectangle, but the image set does not need to be that simple.

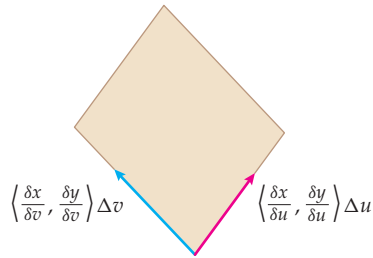

The coordinates  $u$  and  $v$  are both functions of  $x$  and  $y$ . That is,

$$u = u(x, y) \quad \text{and} \quad v = v(x, y).$$

Since we require  $T$  to be one-to-one on the interior of  $\Omega$ , it is also invertible. Therefore, the  $x$ - and  $y$ -coordinates in the interior of  $\Omega$  are functions of  $u$  and  $v$ ; that is,

$$x = x(u, v) \quad \text{and} \quad y = y(u, v).$$

The grid lines in  $\Omega$  in the previous figure at the left are level curves of the form  $u_i = u(x, y)$  for  $1 \leq i \leq m$  and  $v_j = v(x, y)$  for  $1 \leq j \leq n$ . Optimally, the boundaries of  $\Omega$  are also level curves. If we let  $\Delta u = u_{i+1} - u_i$  and  $\Delta v = v_{j+1} - v_j$ , then when the mesh of the grid is relatively small, each subregion, such as the highlighted region in the left-hand figure, may be approximated by a parallelogram. We expand this subregion in the following figure:

We may normalize the vectors  $\langle \frac{\partial x}{\partial u}, \frac{\partial y}{\partial u} \rangle$  and  $\langle \frac{\partial x}{\partial v}, \frac{\partial y}{\partial v} \rangle$  at a typical point  $(x, y)$  so that they both have unit length. In this case, the sides of the parallelogram have length  $\langle \frac{\partial x}{\partial u}, \frac{\partial y}{\partial u} \rangle \Delta u$  and  $\langle \frac{\partial x}{\partial v}, \frac{\partial y}{\partial v} \rangle \Delta v$ . As we know from Chapter 10, the area of this parallelogram is given by the magnitude of the cross product

$$\left( \left\langle \frac{\partial x}{\partial u}, \frac{\partial y}{\partial u}, 0 \right\rangle \Delta u \right) \times \left( \left\langle \frac{\partial x}{\partial v}, \frac{\partial y}{\partial v}, 0 \right\rangle \Delta v \right) = \left( \left\langle \frac{\partial x}{\partial u}, \frac{\partial y}{\partial u}, 0 \right\rangle \times \left\langle \frac{\partial x}{\partial v}, \frac{\partial y}{\partial v}, 0 \right\rangle \right) \Delta u \Delta v.$$

Recall that the cross product

$$\left\langle \frac{\partial x}{\partial u}, \frac{\partial y}{\partial u}, 0 \right\rangle \times \left\langle \frac{\partial x}{\partial v}, \frac{\partial y}{\partial v}, 0 \right\rangle = \det \begin{bmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \frac{\partial x}{\partial u} & \frac{\partial y}{\partial u} & 0 \\ \frac{\partial x}{\partial v} & \frac{\partial y}{\partial v} & 0 \end{bmatrix} = \left( \frac{\partial x}{\partial u} \frac{\partial y}{\partial v} - \frac{\partial x}{\partial v} \frac{\partial y}{\partial u} \right) \mathbf{k}.$$

Furthermore, the quantity  $\frac{\partial x}{\partial u} \frac{\partial y}{\partial v} - \frac{\partial x}{\partial v} \frac{\partial y}{\partial u}$  is the determinant of the  $2 \times 2$  matrix:

$$\det \begin{bmatrix} \frac{\partial x}{\partial u} & \frac{\partial y}{\partial u} \\ \frac{\partial x}{\partial v} & \frac{\partial y}{\partial v} \end{bmatrix} = \frac{\partial x}{\partial u} \frac{\partial y}{\partial v} - \frac{\partial x}{\partial v} \frac{\partial y}{\partial u}.$$

We use this determinant in the next definition.

## DEFINITION 13.22

The Jacobian for a Transformation in  $\mathbb{R}^2$ 

Let  $\Omega$  and  $\Omega'$  be subsets of  $\mathbb{R}^2$ . If the transformation  $T : \Omega \rightarrow \Omega'$  has a differentiable inverse with  $x = x(u, v)$  and  $y = y(u, v)$ , then we define the **Jacobian** of the transformation  $T$ , denoted by  $\frac{\partial(x, y)}{\partial(u, v)}$ , to be the determinant of the matrix of partial derivatives; that is

$$\frac{\partial(x, y)}{\partial(u, v)} = \det \begin{bmatrix} \frac{\partial x}{\partial u} & \frac{\partial y}{\partial u} \\ \frac{\partial x}{\partial v} & \frac{\partial y}{\partial v} \end{bmatrix} = \frac{\partial x}{\partial u} \frac{\partial y}{\partial v} - \frac{\partial x}{\partial v} \frac{\partial y}{\partial u}.$$

Using Definition 13.22, we see that the area of the parallelogram we were discussing is

$$\left| \frac{\partial(x, y)}{\partial(u, v)} \right| \Delta u \Delta v.$$

Now, to approximate the integral of a function  $g(x, y)$  over a region  $\Omega$ , we may use the Riemann sum

$$\sum_{i=1}^m \sum_{j=1}^n g(x_i, y_j) \Delta A = \sum_{i=1}^m \sum_{j=1}^n g(x(u_i, v_j), y(u_i, v_j)) \left| \frac{\partial(x, y)}{\partial(u, v)} \right| \Delta u \Delta v.$$

When we take the limit of this Riemann sum as  $m \rightarrow \infty$  and  $n \rightarrow \infty$ , we have

$$\iint_{\Omega} g(x, y) dA = \iint_{\Omega'} g(x(u, v), y(u, v)) \left| \frac{\partial(x, y)}{\partial(u, v)} \right| du dv.$$

If the preceding iterated integral is simple enough, we may use it to evaluate the double integral.

Our formulas for converting between rectangular and polar coordinates define a transformation if we omit the origin and insist that  $\Omega \in [0, 2\pi)$ . Recall that to convert from rectangular to polar coordinates, we use

$$r = \sqrt{x^2 + y^2} \quad \text{and} \quad \tan \theta = \frac{y}{x}.$$

To convert from polar coordinates to rectangular coordinates, we use

$$x = r \cos \theta \quad \text{and} \quad y = r \sin \theta.$$

Thus, subject to the restrictions we mentioned, the Jacobian of the transformation is

$$\frac{\partial(x, y)}{\partial(r, \theta)} = \det \begin{bmatrix} \frac{\partial x}{\partial r} & \frac{\partial y}{\partial r} \\ \frac{\partial x}{\partial \theta} & \frac{\partial y}{\partial \theta} \end{bmatrix} = \det \begin{bmatrix} \cos \theta & \sin \theta \\ -r \sin \theta & r \cos \theta \end{bmatrix} = r(\cos^2 \theta + \sin^2 \theta) = r.$$

This is the result we expect, since we know that

$$\iint_{\Omega} g(x, y) dA = \iint_{\Omega'} g(r \cos \theta, r \sin \theta) \left| \frac{\partial(x, y)}{\partial(r, \theta)} \right| dr d\theta = \iint_{\Omega'} g(r \cos \theta, r \sin \theta) r dr d\theta.$$

That is, the factor  $r$  we introduced in order to use polar coordinates to evaluate a double integral is just the Jacobian of the transformation.

To find a change of variable in order to simplify an integral  $\iint_{\Omega} f(x, y) dA$ , we determine invertible and differentiable functions  $u = u(x, y)$  and  $v = v(x, y)$  that allow us to analyze  $\Omega$  more easily. To use Definition 13.22 to find the Jacobian we must also find the inverse of the transformation, which requires us to determine the functions  $x = x(u, v)$  and  $y = y(u, v)$ .

Rather than go through this step, we may use the fact that  $\frac{\partial(x,y)}{\partial(u,v)} \frac{\partial(u,v)}{\partial(x,y)} = 1$ . The proof of this equation is left for Exercise 60.

## Change of Variables in $\mathbb{R}^3$

The situation is quite similar in three dimensions. As we have already seen, a three-dimensional region may be easier to analyze with a coordinate system other than the rectangular system in  $\mathbb{R}^3$ . Rather than derive the analogous iterated triple integral in as great a detail as we did for the two-dimensional case, we will summarize the changes. We start with some region  $\Omega$  initially expressed with rectangular coordinates in  $\mathbb{R}^3$ . A function  $T : \Omega \rightarrow \Omega'$  is a transformation in  $\mathbb{R}^3$ . We require our transformations in  $\mathbb{R}^3$  to be both invertible and differentiable in the interior of  $\Omega$ . We consider the points in  $\Omega$  to be given by the rectangular coordinates  $(x, y, z)$  and the points in our target to be given by coordinates  $(u, v, w)$ .

The coordinates  $u, v$ , and  $w$  are all functions of  $x, y$ , and  $z$ . That is,

$$u = u(x, y, z), \quad v = v(x, y, z), \quad \text{and} \quad w = w(x, y, z).$$

Since  $T$  is invertible, it follows that  $x, y$ , and  $z$  are each functions of  $u, v$ , and  $w$ :

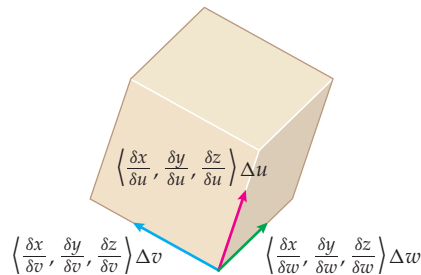

$$x = x(u, v, w), \quad y = y(u, v, w), \quad \text{and} \quad z = z(u, v, w).$$

We use level surfaces to subdivide  $\Omega$ :

$$u_i = u(x, y, z) \text{ for } 1 \leq i \leq l, v_j = v(x, y, z) \text{ for } 1 \leq j \leq m, \text{ and } w_k = w(x, y, z) \text{ for } 1 \leq k \leq n.$$

Optimally, the boundaries of  $\Omega$  are level surfaces.

We subdivide  $\Omega$  into small pieces, each of which may be approximated with a small parallelepiped, as follows:

The volume of the parallelepiped is given by the triple scalar product

$$\begin{aligned} & \left( \left\langle \frac{\partial x}{\partial u}, \frac{\partial y}{\partial u}, \frac{\partial z}{\partial u} \right\rangle \Delta u \right) \times \left( \left\langle \frac{\partial x}{\partial v}, \frac{\partial y}{\partial v}, \frac{\partial z}{\partial v} \right\rangle \Delta v \right) \cdot \left( \left\langle \frac{\partial x}{\partial w}, \frac{\partial y}{\partial w}, \frac{\partial z}{\partial w} \right\rangle \Delta w \right) = \\ & \left( \left\langle \frac{\partial x}{\partial u}, \frac{\partial y}{\partial u}, \frac{\partial z}{\partial u} \right\rangle \times \left\langle \frac{\partial x}{\partial v}, \frac{\partial y}{\partial v}, \frac{\partial z}{\partial v} \right\rangle \right) \cdot \left\langle \frac{\partial x}{\partial w}, \frac{\partial y}{\partial w}, \frac{\partial z}{\partial w} \right\rangle \Delta u \Delta v \Delta w. \end{aligned}$$

Recall that the triple scalar product is equal to the determinant of an appropriate  $3 \times 3$  matrix. We use this matrix to define the Jacobian of a transformation in  $\mathbb{R}^3$ .

## DEFINITION 13.23

The Jacobian for a Transformation in  $\mathbb{R}^3$ 

Let  $\Omega$  and  $\Omega'$  be subsets of  $\mathbb{R}^3$ . If the transformation  $T : \Omega \rightarrow \Omega'$  has a differentiable inverse with  $x = x(u, v, w)$ ,  $y = y(u, v, w)$ , and  $z = z(u, v, w)$ , then we define the **Jacobian** of the transformation  $T$ , denoted by  $\frac{\partial(x, y, z)}{\partial(u, v, w)}$ , to be the determinant of the matrix of partial derivatives; that is,

$$\frac{\partial(x, y, z)}{\partial(u, v, w)} = \det \begin{bmatrix} \frac{\partial x}{\partial u} & \frac{\partial y}{\partial u} & \frac{\partial z}{\partial u} \\ \frac{\partial x}{\partial v} & \frac{\partial y}{\partial v} & \frac{\partial z}{\partial v} \\ \frac{\partial x}{\partial w} & \frac{\partial y}{\partial w} & \frac{\partial z}{\partial w} \end{bmatrix}.$$

Thus, we may express the volume of the parallelepiped as  $\left| \frac{\partial(x, y, z)}{\partial(u, v, w)} \right| \Delta u \Delta v \Delta w$ . Using this expression in a Riemann sum and taking the appropriate limit, we see that

$$\iiint_{\Omega} g(x, y, z) dV = \iiint_{\Omega'} g(x(u, v, w), y(u, v, w), z(u, v, w)) \left| \frac{\partial(x, y, z)}{\partial(u, v, w)} \right| du dv dw.$$

If the preceding iterated integral is simple enough, we may use it to evaluate the triple integral.

The procedure just given is consistent with the evaluation procedure we established when we introduced spherical coordinates in Section 13.6. From Theorem 13.21, we know that, given the spherical coordinates  $(\rho, \theta, \phi)$  of a point, we may obtain the rectangular coordinates of the point with

$$x = \rho \sin \phi \cos \theta, \quad y = \rho \sin \phi \sin \theta, \quad \text{and} \quad z = \rho \cos \phi.$$

In Exercise 52 you are asked to compute the Jacobian of this transformation and show that

$$\frac{\partial(x, y, z)}{\partial(\rho, \theta, \phi)} = \det \begin{bmatrix} \frac{\partial x}{\partial \rho} & \frac{\partial y}{\partial \rho} & \frac{\partial z}{\partial \rho} \\ \frac{\partial x}{\partial \theta} & \frac{\partial y}{\partial \theta} & \frac{\partial z}{\partial \theta} \\ \frac{\partial x}{\partial \phi} & \frac{\partial y}{\partial \phi} & \frac{\partial z}{\partial \phi} \end{bmatrix} = -\rho^2 \sin \phi.$$

Therefore, we again find that

$$\begin{aligned} \iiint_{\Omega} g(x, y, z) dV &= \iiint_{\Omega'} g(x(\rho, \theta, \phi), y(\rho, \theta, \phi), z(\rho, \theta, \phi)) \left| \frac{\partial(x, y, z)}{\partial(\rho, \theta, \phi)} \right| d\rho d\theta d\phi \\ &= \iiint_{\Omega'} g(x(\rho, \theta, \phi), y(\rho, \theta, \phi), z(\rho, \theta, \phi)) \rho^2 \sin \phi d\rho d\theta d\phi. \end{aligned}$$

## Examples and Explorations

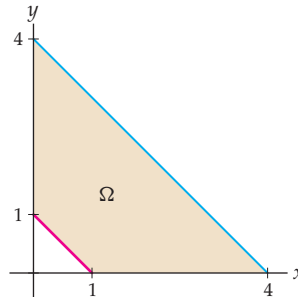

## EXAMPLE 1

## Evaluating a double integral by changing the variable

Evaluate the double integral  $\iint_{\Omega} \frac{1}{(x+y)^2} dA$ , where  $\Omega$  is the trapezoidal region in the first quadrant bounded by the lines  $x + y = 1$  and  $x + y = 4$  and the  $x$ - and  $y$ -axes.

**SOLUTION**

Following is the region  $\Omega$ :

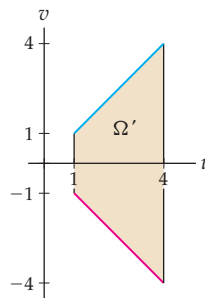

It would be possible to decompose  $\Omega$  into two type I regions or two type II regions, but we will use a change of variable that allows us to evaluate the integral with a single iterated integral. The difficulty here is that, relative to the  $x$ - and  $y$ -axes, the region is mildly complicated. If one of our coordinate axes were parallel to the parallel sides of the trapezoid and the other were perpendicular to those sides, we would be able to treat  $\Omega$  more simply. Fortunately, we may accomplish this aim with the change of variable

$$u = x + y \quad \text{and} \quad v = y - x.$$

Note that the level curves for  $u = x + y$  are lines with slope  $-1$  and the level curves for  $v$  are lines with slope  $1$ , as we suggested. With this transformation, the equation of the lines  $x + y = 1$  and  $x + y = 4$  are expressed more simply as  $u = 1$  and  $u = 4$ , respectively. Solving the system  $u = x + y$  and  $v = y - x$  simultaneously, we may express  $x$  and  $y$  as the following functions of  $u$  and  $v$ :

$$x = \frac{1}{2}(u - v) \quad \text{and} \quad y = \frac{1}{2}(u + v).$$

Using these functions, we see that the  $x$ -axis ( $y = 0$ ) has equation  $v = -u$  and the  $y$ -axis ( $x = 0$ ) has equation  $v = u$ . Therefore, under the transformation, the graph of  $\Omega'$  in the  $uv$ -plane is as follows:

Our new variables make it easier to treat  $\Omega'$  as a type I region. Before we set up the appropriate double integral, we need the Jacobian of the transformation. It is

$$\frac{\partial(x, y)}{\partial(u, v)} = \det \begin{bmatrix} \frac{\partial x}{\partial u} & \frac{\partial y}{\partial u} \\ \frac{\partial x}{\partial v} & \frac{\partial y}{\partial v} \end{bmatrix} = \det \begin{bmatrix} \frac{1}{2} & \frac{1}{2} \\ -\frac{1}{2} & \frac{1}{2} \end{bmatrix} = \frac{1}{2}.$$

Now, the double integral will be

$$\iint_{\Omega} \frac{1}{(x+y)^2} dA = \frac{1}{2} \int_1^4 \int_{-u}^u \frac{1}{u^2} dv du.$$

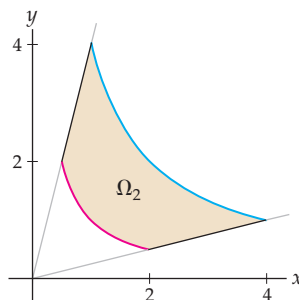

Note that because the Jacobian is a constant for this transformation, we were able to factor it out of the iterated integral. The most difficult part of the process is finding the appropriate change of variable to simplify  $\Omega$  and, therefore, the double integral. The transformation we used was *not* the only one we could have used, but it sufficed to simplify the integral. We leave the evaluation of the iterated integral to Exercise 22.  $\square$

**EXAMPLE 2****Evaluating another double integral by changing the variable**

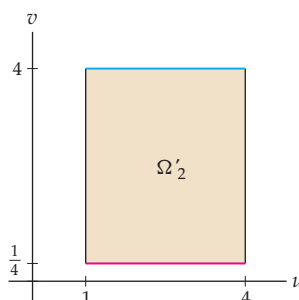

Evaluate the double integral  $\iint_{\Omega_2} \frac{x}{y} dA$ , where  $\Omega_2$  is the first-quadrant region bounded by the lines  $y = \frac{1}{4}x$  and  $y = 4x$  and the curves  $y = \frac{1}{x}$  and  $y = \frac{4}{x}$ .

**SOLUTION**

Following is the region:

It would be possible to decompose  $\Omega_2$  into three type I regions or three type II regions, but we will use a change of variable that allows us to evaluate the integral with a single iterated integral. Note that the curves  $y = \frac{1}{x}$  and  $y = \frac{4}{x}$  may also be expressed as  $xy = 1$  and  $xy = 4$ , respectively. If we let  $u = xy$ , then we may express these two curves as  $u = 1$  and  $u = 4$ . The lines  $y = \frac{1}{4}x$  and  $y = 4x$  may be expressed as  $\frac{y}{x} = \frac{1}{4}$  and  $\frac{y}{x} = 4$ , respectively. If we let  $v = \frac{y}{x}$ , we may express these lines as  $v = \frac{1}{4}$  and  $v = 4$ . Thus, in the  $uv$ -plane, the graph of  $\Omega_2$  is transformed to the rectangle  $\Omega'_2$ , as shown in the following figure:

We will treat  $\Omega'_2$  as a type I region, although we could just as easily treat it as a type II region.

Before we set up the appropriate double integral, we need the Jacobian of the transformation. Here we will use the fact that  $\frac{\partial(x,y)}{\partial(u,v)} \frac{\partial(u,v)}{\partial(x,y)} = 1$ . We have

$$\frac{\partial(u,v)}{\partial(x,y)} = \det \begin{bmatrix} \frac{\partial u}{\partial x} & \frac{\partial v}{\partial x} \\ \frac{\partial u}{\partial y} & \frac{\partial v}{\partial y} \end{bmatrix} = \det \begin{bmatrix} y & -\frac{y}{x^2} \\ x & \frac{1}{x} \end{bmatrix} = \frac{2y}{x}.$$

Now, since  $\frac{y}{x} = v$ , it follows that  $\frac{\partial(u,v)}{\partial(x,y)} = 2v$ . Thus,  $\frac{\partial(x,y)}{\partial(u,v)} = \frac{1}{2v}$ .

Alternatively, we could solve the system

$$u = xy \quad \text{and} \quad v = \frac{y}{x}$$

for  $x$  and  $y$ . In Exercise 25, you will show that

$$x = \sqrt{\frac{u}{v}} = u^{1/2} v^{-1/2} \quad \text{and} \quad y = \sqrt{uv} = u^{1/2} v^{1/2}$$

and to use these equations to show that  $\frac{\partial(x,y)}{\partial(u,v)} = \frac{1}{2v}$ . Either way, we need to express the Jacobian in terms of the new variables, here  $u$  and  $v$ .

We are now ready to rewrite the double integral in terms of the new variables. Since  $v = \frac{y}{x}$ , we have  $\frac{x}{y} = \frac{1}{v}$ ; thus, the double integral will be

$$\iint_{\Omega_2} \frac{x}{y} dA = \frac{1}{2} \int_1^4 \int_{1/4}^4 \frac{1}{v^2} dv du.$$

The factor  $\frac{1}{2}$  in front of the integral was originally a factor of the Jacobian. Again, the most difficult part of this process is finding the appropriate change of variable to simplify  $\Omega_2$  and, therefore, the double integral. We leave the evaluation of the iterated integral to Exercise 26.  $\square$

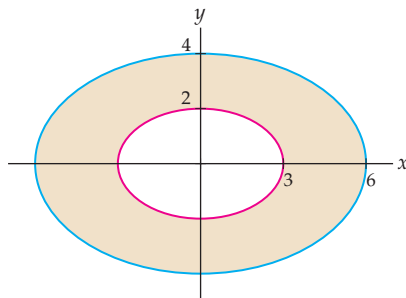

### EXAMPLE 3

#### Finding the area of an elliptical annulus

Find the area between the ellipses with equations  $4x^2 + 9y^2 = 36$  and  $4x^2 + 9y^2 = 144$ .

#### SOLUTION

Let  $\mathcal{S}$  represent this annulus, shown in the following figure:

If this were a circular annulus, it would be quite easy to find its area. Fortunately, using a suitably chosen transformation we can obtain a circular annulus. Let  $u = 2x$  and  $v = 3y$ . The equations of the ellipses are  $4x^2 + 9y^2 = 36$  and  $4x^2 + 9y^2 = 144$ , or equivalently,  $(2x)^2 + (3y)^2 = 36$  and  $(2x)^2 + (3y)^2 = 144$ . Now, using the transformation, we have

$$u^2 + v^2 = 36 \quad \text{and} \quad u^2 + v^2 = 144.$$

That is,  $\mathcal{S}'$  is a circular annulus with inner radius 6 and outer radius 12. In order to find the Jacobian of the transformation, we solve for  $x$  and  $y$  in terms of  $u$  and  $v$ . Here we have  $x = \frac{1}{2}u$  and  $y = \frac{1}{3}v$ . Thus, the Jacobian of the transformation is

$$\frac{\partial(x,y)}{\partial(u,v)} = \det \begin{bmatrix} \frac{\partial x}{\partial u} & \frac{\partial y}{\partial u} \\ \frac{\partial x}{\partial v} & \frac{\partial y}{\partial v} \end{bmatrix} = \det \begin{bmatrix} \frac{1}{2} & 0 \\ 0 & \frac{1}{3} \end{bmatrix} = \frac{1}{6}.$$

The area of the ellipse is given by the double integral

$$\iint_S dA = \iint_{S'} \left| \frac{\partial(x, y)}{\partial(u, v)} \right| dA = \iint_{S'} \frac{1}{6} dA.$$

In our previous examples, we used rectangular coordinates to evaluate the transformed integrals, but here it is simpler to use polar coordinates. We obtain

$$\iint_S dA = \frac{1}{6} \int_0^{2\pi} \int_6^{12} r \, dr \, d\theta = 18\pi. \quad \square$$

### ✓ CHECKING THE ANSWER

We could also have computed the area of this annulus by means of the area formula for an ellipse, or

$$\text{Area} = \pi ab,$$

where  $a$  and  $b$  are the lengths of the semimajor and semiminor axes of the ellipse. In this example, the area of the larger ellipse is  $4 \cdot 6\pi = 24\pi$  and the area of the smaller ellipse is  $2 \cdot 3\pi = 6\pi$ . Therefore, the area of the annulus is  $18\pi$ , as we saw before.

### ? TEST YOUR UNDERSTANDING

- ▶ What is the integration-by-substitution formula for evaluating a definite integral? Why is this formula consistent with the change-of-variable formula that uses Jacobians for evaluating a double integral? What is the “Jacobian” in the integration-by-substitution formula?
- ▶ How is a Jacobian related to an area in  $\mathbb{R}^2$ ? How is it related to a volume in  $\mathbb{R}^3$ ?
- ▶ What is the Jacobian when you convert from rectangular coordinates to polar coordinates in  $\mathbb{R}^2$ ? The Jacobians for the transformations from rectangular coordinates to polar coordinates in  $\mathbb{R}^2$  and from rectangular coordinates to cylindrical coordinates in  $\mathbb{R}^3$  are equal. Why does this make sense?
- ▶ What is the Jacobian for the transformation from rectangular coordinates to spherical coordinates in  $\mathbb{R}^3$ ?
- ▶ What do we look for when we are considering a coordinate system to help us evaluate a double or triple integral?

## EXERCISES 13.7

### Thinking Back

- ▶ *Integration by substitution:* What is the integration-by-substitution formula for definite integrals? How is it derived?
- ▶ *Integrating with polar coordinates:* Let  $\Omega$  be a region in  $\mathbb{R}^2$ . Give a double integral that represents the area of  $\Omega$  when you integrate with polar coordinates.
- ▶ *Integrating with cylindrical coordinates:* Let  $\Omega$  be a region in  $\mathbb{R}^3$ . Give a triple integral that represents the volume of  $\Omega$  when you integrate with cylindrical coordinates.
- ▶ *Integrating with spherical coordinates:* Let  $\Omega$  be a region in  $\mathbb{R}^3$ . Give a triple integral that represents the volume of  $\Omega$  when you integrate with spherical coordinates.

### Concepts

0. *Problem Zero:* Read the section and make your own summary of the material.
1. *True/False:* Determine whether each of the statements that follow is true or false. If a statement is true, explain why. If a statement is false, provide a counterexample.
  - (a) *True or False:* There is a transformation in  $\mathbb{R}^2$  that takes a circle to a rectangle.
  - (b) *True or False:* There is a transformation in  $\mathbb{R}^2$  that takes a parallelogram to a square.
  - (c) *True or False:* There is a transformation in  $\mathbb{R}^3$  that takes a cylinder to a rectangular solid.
  - (d) *True or False:* There is a transformation in  $\mathbb{R}^3$  that takes a sphere to a rectangular solid.

- (e) *True or False:* If  $u = 2x + y$  and  $v = x - 2y$ , then  $x = \frac{2}{5}u + \frac{1}{5}v$  and  $y = \frac{1}{5}u - \frac{2}{5}v$ .
- (f) *True or False:* If  $u = 2x + y$  and  $v = x - 2y$ , then  $\frac{\partial(x,y)}{\partial(u,v)} = \frac{1}{5}$ .
- (g) *True or False:* Given a rectangular region  $\mathcal{R}$  in the  $xy$ -plane and a square region  $\mathcal{R}'$  in the  $uv$ -plane, there is a transformation taking  $\mathcal{R}$  to  $\mathcal{R}'$ .
- (h) *True or False:* Given a rectangular region  $\mathcal{R}$  in the  $xy$ -plane and a square region  $\mathcal{R}'$  in the  $uv$ -plane, there is a unique transformation taking  $\mathcal{R}$  to  $\mathcal{R}'$ .
2. *Examples:* Construct examples of the thing(s) described in the following. Try to find examples that are different than any in the reading.
- (a) A transformation  $T : \mathbb{R}^2 \rightarrow \mathbb{R}^2$  whose Jacobian is a positive constant.
- (b) A transformation  $T : \mathbb{R}^2 \rightarrow \mathbb{R}^2$  whose Jacobian varies.
- (c) A transformation  $T : \mathbb{R}^3 \rightarrow \mathbb{R}^3$  whose Jacobian is a negative constant.
3. Let  $T$  be a transformation in  $\mathbb{R}^2$ . How is the Jacobian of the transformation related to the change in the increment of area,  $\Delta A$ ?

Let  $\mathcal{R}$  be the rectangle in the Cartesian coordinate system with vertices  $(1, 0)$ ,  $(3, 2)$ ,  $(2, 3)$ , and  $(0, 1)$ . Use  $\mathcal{R}$  to answer Exercises 4–9.

4. Set up and evaluate iterated double integrals equal to  $\iint_{\mathcal{R}} x^2 y \, dA$ , treating  $\mathcal{R}$  as a union of type I regions.
5. Set up and evaluate iterated double integrals equal to  $\iint_{\mathcal{R}} x^2 y \, dA$ , treating  $\mathcal{R}$  as a union of type II regions.
6. Show that the boundaries of  $\mathcal{R}$  are the lines with equations  $x + y = 1$ ,  $x + y = 5$ ,  $x - y = 1$ , and  $x - y = -1$ .
- (a) Use these equations to explain why the change of variables  $u = x + y$  and  $v = x - y$  results in the simpler system of equations in the  $uv$ -coordinate system.
- (b) Sketch the graph of the transformed rectangle  $\mathcal{R}'$  in the  $uv$ -coordinate system.
7. Use your transformation from Exercise 6 to express  $x$  and  $y$  as functions of  $u$  and  $v$ , and find the Jacobian of the transformation.
8. Find the Jacobian of the transformation from Exercise 6, using the fact that  $\frac{\partial(x,y)}{\partial(u,v)} \frac{\partial(u,v)}{\partial(x,y)} = 1$ .
9. Set up and evaluate a single iterated double integral equal to  $\iint_{\mathcal{R}} x^2 y \, dA$  in which you integrate with respect to  $u$  and  $v$  rather than with respect to  $x$  and  $y$ .

Let  $a$  and  $b$  be constants. Use the transformation  $T : \mathbb{R}^2 \rightarrow \mathbb{R}^2$  defined by  $u = x + a$  and  $v = y + b$  to answer Exercises 10–13.

10. What does this transformation do to the point with coordinates  $(x_0, y_0)$ ? What does the transformation do to a vertical line  $x = x_0$ ? What does the transformation do to a horizontal line  $y = y_0$ ?
11. What does this transformation do to a region  $\Omega$ ? In particular, if  $a = 3$ ,  $b = 4$ , and  $\Omega$  is the rectangle defined by

the inequalities  $0 \leq x \leq 1$  and  $0 \leq y \leq 2$ , what is the image of  $\Omega$  under the given transformation?

12. What are  $x$  and  $y$  as functions of  $u$  and  $v$ ? What is the Jacobian of this transformation? How does your answer conform to the answer to Exercise 3?
13. Explain why this transformation would or would not be useful for evaluating a double integral.
- Let  $a$  and  $b$  be positive constants. Use the transformation  $T : \mathbb{R}^2 \rightarrow \mathbb{R}^2$  defined by  $u = ax$  and  $v = by$  to answer Exercises 14–17.
14. What does this transformation do to the point with coordinates  $(x_0, y_0)$ ? What does the transformation do to a vertical line  $x = x_0$ ? What does the transformation do to a horizontal line  $y = y_0$ ?
15. What does this transformation do to a region  $\Omega$ ? In particular, if  $a = 3$ ,  $b = \frac{1}{2}$ , and  $\Omega$  is the square defined by the inequalities  $0 \leq x \leq 1$  and  $0 \leq y \leq 1$ , what is the image of  $\Omega$  under the given transformation?
16. What are  $x$  and  $y$  as functions of  $u$  and  $v$ ? What is the Jacobian of this transformation? How does your answer conform to the answer to Exercise 3?
17. If we allow either  $a$  or  $b$  to be negative, how would that change your answers to Exercises 14 and 16?

Let  $\theta \in [0, 2\pi)$ . Use the transformation  $T : \mathbb{R}^2 \rightarrow \mathbb{R}^2$  defined by  $u = (\sin \theta)x - (\cos \theta)y$  and  $v = (\cos \theta)x + (\sin \theta)y$  to answer Exercises 18 and 19.

18. What does this transformation do to a region  $\Omega$ ? In particular, if  $\theta = \frac{\pi}{6}$  and  $\Omega$  is the rectangle defined by the inequalities  $0 \leq x \leq 1$  and  $0 \leq y \leq 2$ , what is the image of  $\Omega$  under the given transformation?
19. What are  $x$  and  $y$  as functions of  $u$  and  $v$ ? What is the Jacobian of this transformation? How does your answer conform to the answer to Exercise 3?
20. Let  $T : \mathbb{R}^3 \rightarrow \mathbb{R}^3$  be a transformation. How is the Jacobian of the transformation related to the change of the increment of volume,  $\Delta V$ ?

Exercises 21–23 continue the work started in Example 1.

21. Evaluate the double integral  $\iint_{\Omega} \frac{1}{(x+y)^2} \, dA$  without using a change of variables. Note that you will need to treat  $\Omega$  as the union of two type I regions or two type II regions.
22. Complete Example 1 by evaluating the iterated integral  $\frac{1}{2} \int_1^4 \int_{-u}^u \frac{1}{u^2} \, dv \, du$ .
23. Find the areas of the trapezoid  $\Omega$  and the transformed trapezoid  $\Omega'$  in Example 1. What is the relationship between these two areas and the Jacobian of the transformation?

Exercises 24–26 continue the work started in Example 2.

24. We mentioned that to evaluate the double integral  $\iint_{\Omega_2} \frac{x}{y} \, dA$  without using a change of variables, you would need to decompose  $\Omega_2$  into a union of three type I regions or three type II regions. What are those decompositions?

25. Show that if  $u = xy$  and  $v = \frac{y}{x}$ , then

$$x = \sqrt{\frac{u}{v}} = u^{1/2} v^{-1/2} \quad \text{and} \quad y = \sqrt{uv} = u^{1/2} v^{1/2}.$$

Use these formulas to show that  $\frac{\partial(x,y)}{\partial(u,v)} = \frac{1}{2v}$ .

## Skills

In Exercises 27–32, functions  $x = x(u, v)$  and  $y = y(u, v)$  are given that determine transformations from an  $xy$ -coordinate system to a  $uv$ -coordinate system in  $\mathbb{R}^2$ . Use these functions to determine a region in the  $xy$ -plane that has the image specified for the given values of  $u$  and  $v$ , and find the Jacobian of the transformation.

27.  $x = u - v$  and  $y = u + v$  for  $0 \leq u \leq 2$  and  $0 \leq v \leq 1$   
 28.  $x = 3u + 4v$  and  $y = 4u - 3v$  for  $1 \leq u \leq 3$  and  $1 \leq v \leq 5$   
 29.  $x = \frac{u}{v}$  and  $y = uv$  for  $1 \leq u \leq 2$  and  $1 \leq v \leq 3$   
 30.  $x = u^2 + v^2$  and  $y = u^2 - v^2$  for  $0 \leq u \leq 4$  and  $0 \leq v \leq 4$   
 31.  $x = u \sin v$  and  $y = u \cos v$  for  $0 \leq u \leq 2$  and  $0 \leq v \leq \pi$   
 32.  $x = u \sec v$  and  $y = u \tan v$  for  $0 \leq u \leq 2$  and  $0 \leq v \leq \frac{\pi}{4}$

For each double integral in Exercises 33–38, (a) sketch the region  $\Omega$ , (b) use the specified transformation to sketch the transformed region, and (c) use the transformation to evaluate the integral.

33.  $\iint_{\Omega} (x + y)^2 dA$ , where  $\Omega$  is the trapezoid with vertices  $(1, 3)$ ,  $(3, 1)$ ,  $(9, 3)$ , and  $(3, 9)$ . Use the transformation given by  $u = x + y$  and  $v = x - y$ .  
 34. Evaluate the integral from Exercise 33, but use the transformation given by  $u = x + y$  and  $v = 3x - y$ .  
 35. Evaluate the integral from Exercise 33, but use the transformation given by  $u = x + y$  and  $v = \frac{x}{y}$ .  
 36.  $\iint_{\Omega} xy dA$ , where  $\Omega$  is the trapezoid with vertices  $(2, 3)$ ,  $(3, 2)$ ,  $(5, 3)$ , and  $(3, 5)$ . Use the transformation from Exercise 33.  
 37. Evaluate the double integral from Exercise 36, using the transformation given by  $u = x + y$  and  $v = 2y - x$ .  
 38.  $\iint_{\Omega} \left( \frac{y^3}{x} - xy \right) dA$ , where  $\Omega$  is the region in the first and second quadrants that is bounded above by the hyperbola  $y^2 - x^2 = 12$ , bounded below by the hyperbola  $y^2 - x^2 = 3$ , and bounded on the left and right by the lines  $y = -2x$  and  $y = 2x$ , respectively. Use the transformation given by  $u = \frac{y}{x}$  and  $v = y^2 - x^2$ .

Evaluate the double integrals in Exercises 39–48. Use suitable transformations as necessary.

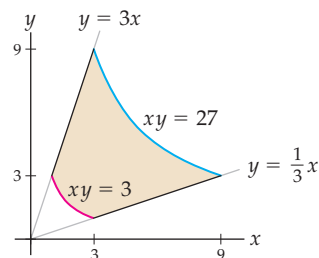

39.  $\iint_{\Omega} (x - y)^3 dA$ , where  $\Omega$  is the parallelogram with vertices  $(0, 0)$ ,  $(3, 0)$ ,  $(5, 2)$ , and  $(2, 2)$ .  
 40.  $\iint_{\Omega} xy dA$ , where  $\Omega$  is the parallelogram from Exercise 39.  
 41.  $\iint_{\Omega} \frac{2y - x}{3x + y + 1} dA$ , where  $\Omega$  is the parallelogram with vertices  $(0, 0)$ ,  $(2, 1)$ ,  $(1, 4)$ , and  $(-1, 3)$ .

26. Complete Example 2 by evaluating the iterated integral

$$\iint_{\Omega_2} \frac{x}{y} dA = \frac{1}{2} \int_1^4 \int_{1/4}^4 \frac{1}{v^2} dv du.$$

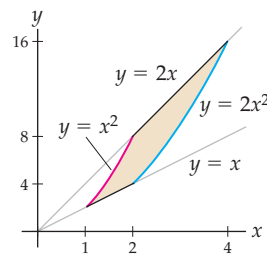

42.  $\iint_{\Omega} (3x^2 - 5xy - 2y^2) dA$ , where  $\Omega$  is the parallelogram from Exercise 41.

43.  $\iint_{\Omega} \left( \frac{x^2}{y^2} + x^2 y^2 \right) dA$ , where  $\Omega$  is the following region:

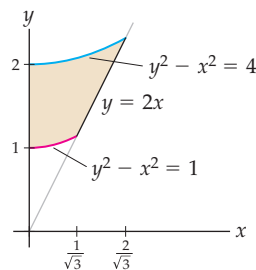

44.  $\iint_{\Omega} xy^3 dA$ , where  $\Omega$  is the region from Exercise 43.

45.  $\iint_{\Omega} \frac{y^2}{x^3} dA$ , where  $\Omega$  is the following region:

46.  $\iint_{\Omega} \frac{y + xy}{x^2} dA$ , where  $\Omega$  is the region from Exercise 45.

47.  $\iint_{\Omega} \frac{x^3}{y^3} dA$ , where  $\Omega$  is the following region:

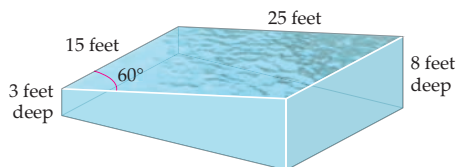

48.  $\iint_{\Omega} x^2 \left( 1 - \frac{1}{y^2} \right) dA$ , where  $\Omega$  is the region from Exercise 47.

## Applications

49. Joe plans to build a swimming pool in his backyard in the shape of parallelogram to fit the contours of his property in the dimensions shown in the following figure:

The shallow end of the pool will start at a depth of 3 feet and will increase linearly to a depth of 8 feet on the opposite side of the pool. How much water will the pool hold?

50. Joe also plans to build a goldfish pond in the front of his house in the shape of an ellipse with a 5-foot major axis and a 3-foot minor axis. The water in the pond will be deepest at the center of the pond. The depth of the water, in feet, at any point in the pond will be given by the function  $d(x, y) = 2\sqrt{\frac{x^2}{25} + \frac{y^2}{9}} - 2$ , where  $(x, y) = (0, 0)$  represents the center of the surface of the pond. How much water will the pond hold?

## Proofs

51. The formulas for converting from cylindrical coordinates to rectangular coordinates are

$$x = r \cos \theta, \quad y = r \sin \theta, \quad \text{and} \quad z = z.$$

Prove that the Jacobian  $\frac{\partial(x, y, z)}{\partial(r, \theta, z)} = r$ .

52. The formulas for converting from spherical coordinates to rectangular coordinates are

$$x = \rho \sin \phi \cos \theta, \quad y = \rho \sin \phi \sin \theta, \quad \text{and} \quad z = \rho \cos \phi.$$

Prove that the Jacobian  $\frac{\partial(x, y, z)}{\partial(\rho, \theta, \phi)} = -\rho^2 \sin \phi$ .

Let  $\alpha, \beta, \gamma$ , and  $\delta$  be constants. A transformation  $T: \mathbb{R}^2 \rightarrow \mathbb{R}^2$ , where

$$x = \alpha u + \beta v \quad \text{and} \quad y = \gamma u + \delta v,$$

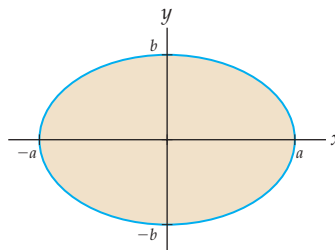

is called a **linear transformation** of  $\mathbb{R}^2$ . Use this transformation to answer Exercises 53–55.

53. Prove that a linear transformation takes a line  $ax + by = c$  in the  $xy$ -plane to a line in the  $uv$ -plane if the Jacobian of the transformation is nonzero.
54. Prove that there is a linear transformation that takes a line in the  $xy$ -plane to a point in the  $uv$ -plane if the Jacobian of the transformation is zero.
55. Assuming that the Jacobian is nonzero, find expressions for  $u$  and  $v$  as functions of  $x$  and  $y$ .
56. Let  $\alpha_i, \beta_i$ , and  $\gamma_i$  be constants for  $i = 1, 2$ , and  $3$ . A transformation  $T: \mathbb{R}^3 \rightarrow \mathbb{R}^3$  defined by

$$\begin{aligned} x &= \alpha_1 u + \beta_1 v + \gamma_1 w, \\ y &= \alpha_2 u + \beta_2 v + \gamma_2 w, \quad \text{and} \\ z &= \alpha_3 u + \beta_3 v + \gamma_3 w. \end{aligned}$$

is called a **linear transformation** of  $\mathbb{R}^3$ . Prove that this transformation takes a plane  $ax + by + cz = d$  in the  $xyz$ -coordinate system to a plane in the  $uvw$ -coordinate system if the Jacobian of the transformation is nonzero.

57. Use a change of variables to prove that the area of the ellipse with equation  $\left(\frac{x}{a}\right)^2 + \left(\frac{y}{b}\right)^2 = 1$  is  $\pi ab$ .

58. Use a change of variables to prove that the volume of the ellipsoid with equation  $\left(\frac{x}{a}\right)^2 + \left(\frac{y}{b}\right)^2 + \left(\frac{z}{c}\right)^2 = 1$  is  $\frac{4}{3}\pi abc$ .
59. Prove the following chain rule for Jacobians: If  $x$  and  $y$  are differentiable functions of  $u$  and  $v$ , and if  $u$  and  $v$  are differentiable functions of  $s$  and  $t$ , then

$$\frac{\partial(x, y)}{\partial(s, t)} = \frac{\partial(x, y)}{\partial(u, v)} \frac{\partial(u, v)}{\partial(s, t)}.$$

60. Let  $\Omega$  and  $\Omega'$  be subsets of  $\mathbb{R}^2$ . Use the results of Exercise 59 to prove that if a transformation  $T: \Omega \rightarrow \Omega'$  is invertible, and if both  $T$  and  $T^{-1}$  are differentiable, then

$$\frac{\partial(x, y)}{\partial(u, v)} \frac{\partial(u, v)}{\partial(x, y)} = 1.$$

## Thinking Forward

Determinants of  $3 \times 3$  matrices: Let

$$A = \begin{bmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{bmatrix}.$$

The determinant of  $A$ ,  $\det(A)$ , may be defined in terms of determinants of  $2 \times 2$  matrices as follows:

$$\det(A) = a_{11} \det \begin{bmatrix} a_{22} & a_{23} \\ a_{32} & a_{33} \end{bmatrix} - a_{12} \det \begin{bmatrix} a_{21} & a_{23} \\ a_{31} & a_{33} \end{bmatrix} + a_{13} \det \begin{bmatrix} a_{21} & a_{22} \\ a_{31} & a_{32} \end{bmatrix}.$$

- ▶ Show that the previous definition of  $\det(A)$  provides the same result as the procedure we used to find the determinant of a  $3 \times 3$  matrix earlier in this section.
- ▶ Use the preceding definition to find

$$\det \begin{bmatrix} 1 & 3 & 4 \\ -2 & 5 & -1 \\ -4 & 2 & -3 \end{bmatrix}.$$

- ▶ In an analogous fashion, find a recursion formula for computing the determinant of a  $4 \times 4$  matrix in terms of determinants of  $3 \times 3$  matrices.

## CHAPTER REVIEW, SELF-TEST, AND CAPSTONES

Before you progress to the next chapter, be sure you are familiar with the definitions, concepts, and basic skills outlined here. The capstone exercises at the end bring together ideas from this chapter and look forward to the next chapter.

### Definitions

Give precise mathematical definitions or descriptions of each of the concepts that follow. Then illustrate the definition with a graph or an algebraic example.

- ▶ a *Riemann sum* for a function  $z = f(x, y)$  defined on a rectangle  $\mathcal{R} = \{(x, y) \mid a \leq x \leq b \text{ and } c \leq y \leq d\}$

- ▶ the *double integral* of  $f$  over

$$\mathcal{R} = \{(x, y) \mid a \leq x \leq b \text{ and } c \leq y \leq d\}$$

- ▶ the *double integral* of  $f$  over a general region

$$\Omega \subseteq \{(x, y) \mid a \leq x \leq b \text{ and } c \leq y \leq d\}$$

- ▶ the *Jacobian* of a transformation  $T: \Omega \rightarrow \Omega'$

### Theorems

Fill in the blanks to complete each of the following theorem statements:

- ▶ *Fubini's theorem*: Let  $a < b$  and  $c < d$  be real numbers, and let  $\mathcal{R}$  be the rectangle defined by

$$\mathcal{R} = \{(x, y) \mid a \leq x \leq b \text{ and } c \leq y \leq d\}.$$

If  $f(x, y)$  is continuous on  $\mathcal{R}$ , then  $\iint_{\mathcal{R}} f(x, y) dA =$  \_\_\_\_\_.

- ▶ If  $f(x, y)$  is an integrable function and  $c \in \mathbb{R}$ , then  $\iint_{\Omega} cf(x, y) dA =$  \_\_\_\_\_.
- ▶ If  $f(x, y)$  and  $g(x, y)$  are integrable functions, then  $\iint_{\Omega} (f(x, y) + g(x, y)) dA =$  \_\_\_\_\_.
- ▶ Let  $f(x, y)$  be an integrable function on the general region  $\Omega$ . If  $\Omega_1$  and  $\Omega_2$  are general regions that are subsets of \_\_\_\_\_, and if  $\Omega = \Omega_1 \cup \Omega_2$ , then  $\iint_{\Omega} f(x, y) dA =$  \_\_\_\_\_.

### Notation and Algebraic Rules

*Notation*: Give the meanings of each of the following mathematical expressions:

$$\sum_{j=1}^m \sum_{k=1}^n a_{jk}$$

$$\sum_{i=1}^l \sum_{j=1}^m \sum_{k=1}^n a_{ijk}$$

$$\iint_{\mathcal{R}} f(x, y) dA$$

$$\int_a^b \int_{g_1(x)}^{g_2(x)} f(x, y) dy dx$$

$$\int_c^d \int_{h_1(y)}^{h_2(y)} f(x, y) dx dy$$

$$\iiint_{\mathcal{R}} f(x, y, z) dV$$

$$\int_a^b \int_{h_1(x)}^{h_2(x)} \int_{g_1(x, y)}^{g_2(x, y)} f(x, y, z) dz dy dx.$$

$$\frac{\partial(x, y)}{\partial(u, v)}$$

$$\frac{\partial(x, y, z)}{\partial(u, v, w)}$$

*Converting between coordinate systems*: Provide the conversion formulas between each of the coordinate systems that follow. Include a sketch indicating the reason for each formula.

- ▶ Given rectangular coordinates  $x$  and  $y$ , the polar coordinates are  $r =$  \_\_\_\_\_ and  $\tan \theta =$  \_\_\_\_\_.

- ▶ Given polar coordinates  $r$  and  $\theta$ , the rectangular coordinates are  $x = \underline{\hspace{2cm}}$  and  $y = \underline{\hspace{2cm}}$ .
- ▶ Given rectangular coordinates  $x$ ,  $y$ , and  $z$ , the cylindrical coordinates are  $r = \underline{\hspace{2cm}}$ ,  $\tan \theta = \underline{\hspace{2cm}}$ , and  $z = \underline{\hspace{2cm}}$ .
- ▶ Given cylindrical coordinates  $r$ ,  $\theta$ , and  $z$ , the rectangular coordinates are  $x = \underline{\hspace{2cm}}$ ,  $y = \underline{\hspace{2cm}}$ , and  $z = \underline{\hspace{2cm}}$ .
- ▶ Given rectangular coordinates  $x$ ,  $y$ , and  $z$ , the spherical coordinates are  $\rho = \underline{\hspace{2cm}}$ ,  $\theta = \underline{\hspace{2cm}}$ , and  $\phi = \underline{\hspace{2cm}}$ .
- ▶ Given spherical coordinates  $\rho$ ,  $\tan \theta$ , and  $\cos \phi$ , the spherical coordinates are  $x = \underline{\hspace{2cm}}$ ,  $y = \underline{\hspace{2cm}}$ , and  $z = \underline{\hspace{2cm}}$ .
- ▶ Given cylindrical coordinates  $r$ ,  $\theta$ , and  $z$ , the spherical coordinates are  $\rho = \underline{\hspace{2cm}}$ ,  $\theta = \underline{\hspace{2cm}}$ , and  $\tan \phi = \underline{\hspace{2cm}}$ .
- ▶ Given spherical coordinates  $\rho$ ,  $\theta$ , and  $\phi$ , the cylindrical coordinates are  $r = \underline{\hspace{2cm}}$ ,  $\theta = \underline{\hspace{2cm}}$ , and  $z = \underline{\hspace{2cm}}$ .

*First and Second Moments:* Let  $\rho(x, y)$  be a continuous density function for a lamina  $\Omega$  in the  $xy$ -plane. Provide iterated integrals or iterated integral expressions that could be used to compute each of the following quantities:

- ▶ the mass of  $\Omega$
- ▶ the first moment of the mass in  $\Omega$  about the  $y$ -axis
- ▶ the first moment of the mass in  $\Omega$  about the  $x$ -axis
- ▶ the center of mass of  $\Omega$
- ▶ the moment of inertia of the mass in  $\Omega$  about the  $y$ -axis
- ▶ the moment of inertia of the mass in  $\Omega$  about the  $x$ -axis
- ▶ the moment of inertia of the mass in  $\Omega$  about the origin
- ▶ the radius of gyration of the mass in  $\Omega$  about the  $y$ -axis
- ▶ the radius of gyration of the mass in  $\Omega$  about the  $x$ -axis
- ▶ the radius of gyration of the mass in  $\Omega$  about the origin

## Skill Certification: Integrating Functions of Two and Three Variables

*Using the definition to evaluate a double integral:* Evaluate the given double integrals as a limit of a Riemann sum. For each integral, let  $\mathcal{R} = \{(x, y) \mid 0 \leq x \leq 2 \text{ and } 1 \leq y \leq 4\}$ .

$$1. \iint_{\mathcal{R}} (x + 2y) \, dA \qquad 2. \iint_{\mathcal{R}} (xy^2) \, dA$$

*Evaluating a double integral as an iterated integral:* Use Fubini's theorem to evaluate the given double integrals. For each integral, show that you obtain the same result when you integrate using both possible orders of integration when  $\mathcal{R} = \{(x, y) \mid 0 \leq x \leq 2 \text{ and } 1 \leq y \leq 4\}$ .

$$3. \iint_{\mathcal{R}} (x + 2y) \, dA \qquad 4. \iint_{\mathcal{R}} (xy^2) \, dA$$

*Evaluating iterated integrals:* Sketch the region determined by the limits of the given iterated integrals, and then evaluate the integrals.

$$5. \int_0^1 \int_{x^2}^{\sqrt{x}} x^2 y^3 \, dy \, dx \qquad 6. \int_0^2 \int_0^{\sqrt{4-x^2}} y^3 \, dy \, dx$$

$$7. \int_0^1 \int_{-\sqrt{1-y^2}}^{\sqrt{1-y^2}} \frac{x}{y+1} \, dx \, dy \qquad 8. \int_1^2 \int_0^{1/x} \sqrt{xy} \, dy \, dx$$

$$9. \int_1^4 \int_0^{1/y} \frac{x}{y} \, dx \, dy \qquad 10. \int_0^2 \int_0^y x \sqrt{y^2 - x^2} \, dx \, dy$$

*Reversing the order of integration:* Sketch the region determined by the limits of the given iterated integrals, and then evaluate the integrals by reversing the order of integration.

$$11. \int_0^4 \int_{\sqrt{x}}^2 y \cos x \, dy \, dx \qquad 12. \int_0^{\sqrt{\pi}} \int_x^{\sqrt{\pi}} \sin y^2 \, dy \, dx$$

$$13. \int_0^9 \int_{\sqrt{y}}^3 \frac{1}{1+x^3} \, dx \, dy \qquad 14. \int_0^{16} \int_{\sqrt[3]{x}}^2 \frac{1}{1+y^5} \, dy \, dx$$

$$15. \int_0^4 \int_y^4 e^{y/x} \, dx \, dy \qquad 16. \int_0^1 \int_{\sqrt{x}}^1 e^{x/y^2} \, dy \, dx$$

*Using polar coordinates to evaluate iterated integrals:* Sketch the region determined by the limits of the given iterated integrals, and then evaluate the integrals.

$$17. \int_0^{\pi/2} \int_0^3 r^2 \, dr \, d\theta \qquad 18. \int_{\pi/2}^{3\pi/2} \int_1^4 r^{3/2} \, dr \, d\theta$$

$$19. \int_0^{\pi/2} \int_0^{2\sin\theta} r^3 \, dr \, d\theta \qquad 20. \int_0^{2\pi} \int_0^{1+\sin\theta} r \, dr \, d\theta$$

*Using polar coordinates to evaluate iterated integrals:* Evaluate the given iterated integrals by converting them to polar coordinates. Include a sketch of the region.

$$21. \int_0^2 \int_0^{\sqrt{4-y^2}} e^{x^2+y^2} \, dx \, dy$$

$$22. \int_0^4 \int_0^{\sqrt{4y-y^2}} \frac{1}{\sqrt{x^2+y^2}} \, dx \, dy$$

$$23. \int_{-3}^3 \int_{-\sqrt{9-x^2}}^{\sqrt{9-x^2}} \frac{x+2y}{x^2+y^2} \, dy \, dx$$

$$24. \int_{-5}^0 \int_{-\sqrt{25-x^2}}^0 \frac{3}{(4+x^2+y^2)^3} \, dy \, dx$$

*Evaluating triple integrals:* Each of the triple integrals that follows represents the volume of a solid. Sketch the solid and evaluate the integral.

$$25. \int_0^2 \int_1^4 \int_{-2}^3 dx \, dy \, dz \qquad 26. \int_1^5 \int_{-2}^0 \int_{-1}^3 dz \, dy \, dx$$

$$27. \int_0^4 \int_0^{3-(3/4)x} \int_0^{2-(1/2)x-(2/3)y} dz \, dy \, dx$$

$$28. \int_0^3 \int_0^{2-2y/3} \int_0^{4-(4/3)y-2z} dx \, dz \, dy$$

$$29. \int_{-2}^2 \int_0^{\sqrt{4-x^2}} \int_0^y dz dy dx$$

$$30. \int_0^{2\pi} \int_0^2 \int_0^5 r dz dr d\theta$$

$$31. \int_0^{2\pi} \int_0^3 \int_0^{\sqrt{9-r^2}} r dz dr d\theta$$

$$32. \int_0^{2\pi} \int_0^4 \int_r^4 r dz dr d\theta$$

$$33. \int_0^{2\pi} \int_0^4 \int_0^{4-r} r dz dr d\theta$$

$$34. \int_0^{\pi} \int_0^2 \int_0^{r \sin \theta} r dz dr d\theta$$

$$35. \int_0^{\pi} \int_0^{2\pi} \int_0^5 \rho^2 \sin \phi d\rho d\theta d\phi$$

$$36. \int_0^{\pi/4} \int_0^{2\pi} \int_0^{4 \sec \theta} \rho^2 \sin \phi d\rho d\theta d\phi$$

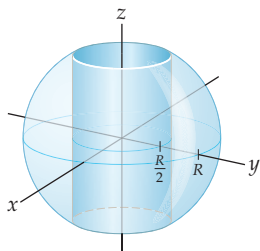

## Capstone Problems

A. Show that

$$\int_0^1 \int_0^1 \frac{x-y}{(x+y)^3} dy dx \neq \int_0^1 \int_0^1 \frac{x-y}{(x+y)^3} dx dy.$$

Explain why this does not contradict Fubini's theorem.

B. A hole with radius  $\frac{R}{2}$  is drilled through the center of a sphere with radius  $R$ , as shown in the following figure. Find the volume of the resulting solid. (Hint: You may assume that the equation of the sphere is  $x^2 + y^2 + z^2 = R^2$  and the equation of the cylinder through the sphere is  $x^2 + y^2 = (R/2)^2$ .)

C. Find the center of mass and moment of inertia about the  $z$ -axis for the solid from Problem B, assuming that it has a uniform density.

D. Evaluate the integral

$$\iint_{\mathcal{T}} \ln \left( \frac{y-x}{x+y} \right) dA,$$

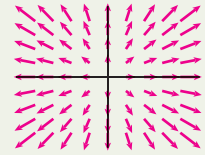

where  $\mathcal{T}$  is the first-quadrant triangular region with vertices  $(2, 3)$ ,  $(2, 4)$ , and  $(3, 4)$ .

## 14.1 VECTOR FIELDS

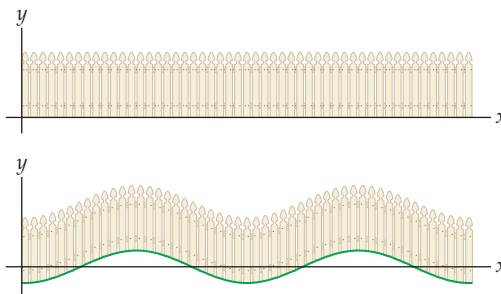

- ▶ An overview of vector analysis
- ▶ Assigning a vector to each point in Euclidean space
- ▶ Conservative vector fields and their potential functions

### Calculus and Vector Analysis

---

In this final chapter, we unify and generalize our understanding of integration and the Fundamental Theorem of Calculus. We will generalize the original notion of integration that was introduced in Chapter 4 to enable us to integrate over curves other than the  $x$ -axis, extend the integration results of Chapter 13 to allow us to perform double integration over regions other than regions in the  $xy$ -plane, and see new multivariate extensions of the Fundamental Theorem of Calculus. The basic ideas will be the same, but the context in which we implement them will be more subtle and more varied. Now would be an excellent time to review what you have studied about the integration of functions of one variable, vector-valued functions, and multivariate functions.

Here are two examples of the types of questions we will address in this chapter. First, consider a fence whose base is a straight line, like the  $x$ -axis, and another fence whose base is along an undulating hill:

Both fences clearly have well-defined areas. To find the area of the first, we integrate

$$A = \int h(x) dx,$$

where  $h(x)$  is a function that tells us the height of the fence above the  $x$ -axis. The area of the second fence is not quite this integral, since the curve of its base will distort the fence. Still, the fence height and its base appear smooth, so its area ought to be expressible as a one-variable integration of something, where we integrate along the green curve in the figure. The resulting integral will combine ideas we used for computing arc lengths and areas in previous chapters. The resulting integral will have the form

$$A = \int h(t)\varphi(t) dt,$$

where  $\varphi(t)$  is a factor that accounts for the bending of the base.

Similarly, in Section 6.4 we discussed work  $W$  as the product of force  $F$  and distance  $d$ , or  $W = Fd$ . From this equation, we saw how to choose an appropriate integral to calculate the work done in pumping water out the top of a tank, opposite the downward force of gravity. If we wanted to know the work required to move an object along a more

complicated path, and opposed to a variable force, we would expect that this, too, could be expressed as an integral, perhaps now with multiple inputs.

In Section 14.2 we will see how to solve both of these problems. For now, we introduce a new mathematical object that is necessary for the solution.

## Vector Fields

One immediate question that confronts us when considering how to generalize the Fundamental Theorem of Calculus to several dimensions is the issue of what, exactly, we are trying to integrate. As we saw in the preceding example we might be interested in finding the area of a fence whose base is curved; we might also be interested in the work done by that fence as it stays upright in a windstorm, when whirling wind exerts forces of different strengths and in different directions on the fence at different points. This idea of varying forces associated with points in space or points in the plane motivates the notion of a *vector field*.

A vector field is a function that assigns a vector to each point in its domain. Thus, a vector field in the plane has inputs that are points in the  $xy$ -plane and outputs that are vectors in the  $xy$ -plane; a vector field in  $\mathbb{R}^3$  has inputs that are points in  $\mathbb{R}^3$  and outputs that are vectors in  $\mathbb{R}^3$ .

### DEFINITION 14.1

#### Vector Field

A **vector field in  $\mathbb{R}^2$**  is a function  $\mathbf{F}(x, y)$  with domain  $D \subseteq \mathbb{R}^2$  and whose outputs are vectors in  $\mathbb{R}^2$  of the form

$$\mathbf{F}(x, y) = \langle F_1(x, y), F_2(x, y) \rangle$$

for each point  $(x, y)$  in  $D$ .

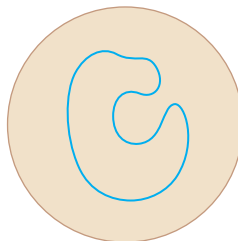

Similarly, a **vector field in  $\mathbb{R}^3$**  is a function  $\mathbf{G}(x, y, z)$  with domain  $D \subseteq \mathbb{R}^3$  and whose outputs are vectors in  $\mathbb{R}^3$  of the form

$$\mathbf{G}(x, y, z) = \langle G_1(x, y, z), G_2(x, y, z), G_3(x, y, z) \rangle$$

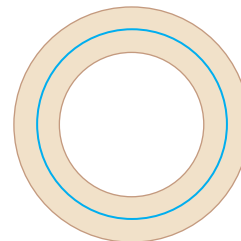

for each point  $(x, y, z)$  in  $D$ .

In this chapter, the only vector fields we are interested in are those whose domains are well-behaved enough to support vector analysis. Thus, for the remainder of our discussion of vector fields, we will always suppose that every vector field has a domain  $D$  that is open, connected, and simply connected. This means that  $D$  is open in the sense of Chapter 12; that, for any two points  $P$  and  $Q$  in  $D$ , there is a path from  $P$  to  $Q$  that lies in  $D$ ; and that any loop in  $D$  can be smoothly contracted to a point in  $D$ . In general, a two-dimensional region is simply connected if it does not contain any holes.

*A region in  $\mathbb{R}^2$  that is simply connected*

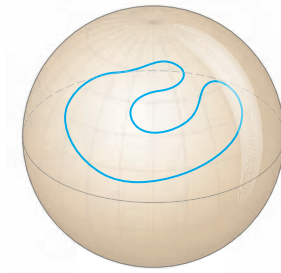

*A region in  $\mathbb{R}^2$  that is not simply connected*

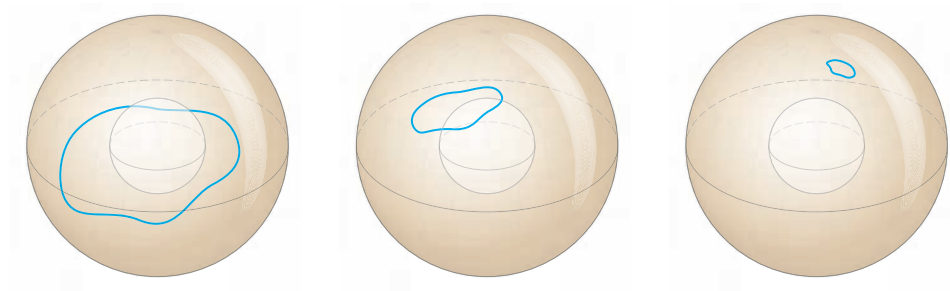

A region in  $\mathbb{R}^3$  that is simply connected

A region in  $\mathbb{R}^3$  that is not simply connected

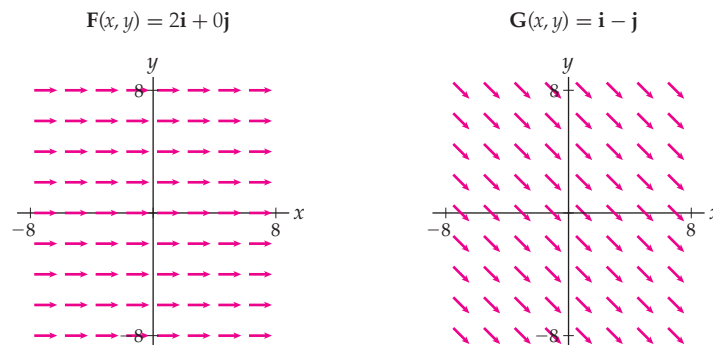

A three-dimensional region may have holes and yet still be simply connected, as shown in the following sequence of figures:

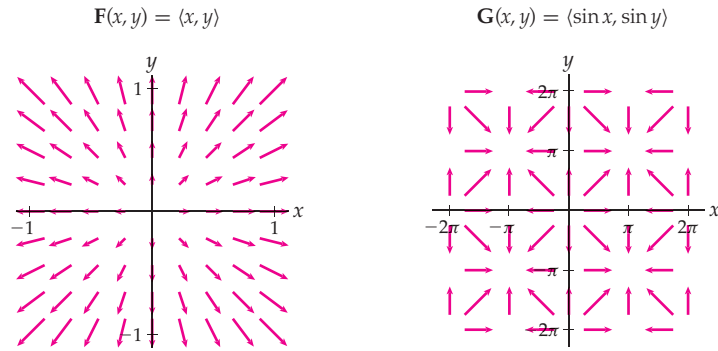

We will also usually assume that the vector field in question is sufficiently smooth so that the component functions are continuous and have continuous first partial derivatives.

The notion of a vector field in  $\mathbb{R}^n$  may of course be defined analogously for any natural number  $n$ , but we will not need such vector fields in this text.

Following are pictures of the vector fields  $\mathbf{F}(x, y) = 2\mathbf{i} + 0\mathbf{j}$  and  $\mathbf{G}(x, y) = \mathbf{i} - \mathbf{j}$ , where at each point  $(x, y)$  we draw the vector  $\langle F_1(x, y), F_2(x, y) \rangle$ :

Note that these diagrams show only some of the vectors. A true representation would look like a solid block of color, because every point in the plane would have a vector associated with it. The following vector fields  $\mathbf{F}(x, y) = \langle x, y \rangle$  and  $\mathbf{G}(x, y) = \langle \sin x, \sin y \rangle$  are slightly more interesting:

Note that in the vector field  $\mathbf{F}$  the magnitudes of the vectors in the codomain increase as we move away from the origin and have constant magnitude on concentric circles about the origin. For example,  $\|\mathbf{F}(x, y)\| = 1$  if and only if  $(x, y)$  lies on the unit circle. In addition, all vectors emanating from points near the origin point away from the origin. In such a situation the origin is called a **source**. In all of our vector fields, the vectors are drawn so that their lengths are representative of their magnitudes.

In the vector field  $\mathbf{G}$ , all vectors emanating from points near the origin again point away from the origin, so the origin is a source. In addition because of the periodicity of the sine function, all coordinate pairs of the form  $(2k\pi, 2n\pi)$ , where  $k$  and  $n$  are both integers, are also sources. Note, however, that all of the vectors that emanate from points surrounding  $(\pi, \pi)$  point towards  $(\pi, \pi)$ . Such a point is called a **sink**. Again by the periodicity of the sine, all points of the form  $((2k+1)\pi, (2n+1)\pi)$ , where  $k$  and  $n$  are both integers, are also sinks.

## Conservative Vector Fields

Some vector fields, such as  $\mathbf{F}(x, y) = \langle x, y \rangle$ , can be written as the gradient of a function. For example, we might have

$$\mathbf{F}(x, y) = \nabla f(x, y), \quad \text{where} \quad f(x, y) = \frac{x^2}{2} + \frac{y^2}{2} \quad \text{and} \quad \nabla f = \frac{\partial f}{\partial x} \mathbf{i} + \frac{\partial f}{\partial y} \mathbf{j}$$

This is one of the infinitely many possible choices for the function  $f(x, y)$ . It is also true that

$$\mathbf{F}(x, y) = \nabla g(x, y), \quad \text{where} \quad g(x, y) = \frac{x^2}{2} + \frac{y^2}{2} + \alpha,$$

for any choice of the constant  $\alpha$ .

If a vector field can be expressed as a gradient, then it has many mathematically desirable attributes, including being easy to integrate along curves, a property we will see in the next section. Such fields are known as *conservative vector fields*.

### DEFINITION 14.2

#### Conservative Vector Field

A **conservative vector field**  $\mathbf{F}$  is a vector field that can be written as the gradient of some function  $f$ . That is,

$$\mathbf{F}(x, y) = \nabla f(x, y) = \frac{\partial f}{\partial x} \mathbf{i} + \frac{\partial f}{\partial y} \mathbf{j}$$

if  $f(x, y)$  is a function of two variables, or

$$\mathbf{F}(x, y, z) = \nabla f(x, y, z) = \frac{\partial f}{\partial x} \mathbf{i} + \frac{\partial f}{\partial y} \mathbf{j} + \frac{\partial f}{\partial z} \mathbf{k}$$

if  $f(x, y, z)$  is a function of three variables.

In either case, any function  $f$  whose gradient is equal to  $\mathbf{F}$  is called a **potential function** for  $\mathbf{F}$ .

Recall that if a function  $g(x, y)$  has continuous first and second partial derivatives, then

$$\frac{\partial^2 g}{\partial y \partial x} = \frac{\partial^2 g}{\partial x \partial y}.$$

So, to verify that  $\mathbf{F}(x, y) = \langle F_1(x, y), F_2(x, y) \rangle$  is a conservative vector field with a potential function  $f(x, y)$  (with continuous second partial derivatives), it is sufficient to check that

$$\frac{\partial F_1}{\partial y} = \frac{\partial F_2}{\partial x},$$

since equality of these first partial derivatives of the components of  $\mathbf{F}$  means that the mixed second-order partial derivatives of  $f$  are equal. In fact, a vector field

$$\mathbf{F}(x, y) = \langle F_1(x, y), F_2(x, y) \rangle,$$

whose first partial derivatives  $\frac{\partial F_1}{\partial y}$  and  $\frac{\partial F_2}{\partial x}$  are both continuous on an open subset of  $\mathbb{R}^2$ , is conservative if and only if  $\frac{\partial F_1}{\partial y} = \frac{\partial F_2}{\partial x}$ .

The situation is similar for vector fields in  $\mathbb{R}^3$ , except there are more mixed partial derivatives to check. Note that potential functions are not unique. As we saw earlier, if  $f(x, y)$  is a potential function for a conservative vector field  $\mathbf{F}(x, y)$ , then so is  $f(x, y) + \alpha$  for any constant  $\alpha$ .

In some cases it will be enough to know that a vector field is conservative; in others, it will be important to find a potential function for the field. By thinking through the definitions of conservative vector fields and potential functions, we can see that the question is one of recovering a function from its partial derivatives. That is easy to do by integrating, but there is a subtle point to consider.

For example, let

$$\mathbf{G}(x, y, z) = 6xz\mathbf{i} + \cos y\mathbf{j} + 3x^2\mathbf{k}.$$

By checking all six mixed second partial derivatives, we find that  $\mathbf{G}$  is indeed conservative. Now, we want a potential function  $g(x, y, z)$  whose gradient is  $\mathbf{G}$ . Any  $g$  that satisfies

$$\frac{\partial g}{\partial x} = 6xz, \quad \frac{\partial g}{\partial y} = \cos y, \quad \frac{\partial g}{\partial z} = 3x^2$$

will work. We let  $G_1(x, y, z) = 6xz$ ,  $G_2(x, y, z) = \cos y$ , and  $G_3(x, y, z) = 3x^2$  and begin by integrating  $G_1$  with respect to  $x$ :

$$\int G_1(x, y, z) dx = \int 6xz dx = 3x^2z + \alpha = g(x, y, z).$$

But the gradient of this function is not  $\mathbf{G}(x, y, z)$ . Here we have

$$\nabla g(x, y, z) = 6xz\mathbf{i} + 0\mathbf{j} + 3x^2\mathbf{k}.$$

We are missing a term that will give the correct partial derivative for  $y$ . Since the terms of  $g$  that do not involve  $x$  are constants with respect to differentiation by  $x$ , we can fix the problem by integrating all the terms of  $G_2$  that do not involve  $x$ , integrating the terms of  $G_3$  that involve neither  $x$  nor  $y$ , and adding the results to the function  $g$  that we have already found. This gives

$$\int G_2(x, y, z) dy = \int \cos y dy = \sin y + \alpha.$$

Since none of the terms of  $G_3$  involve only  $z$ , when we add  $\sin y + \alpha$  to our previous function and set the constant term to zero, we obtain

$$g(x, y, z) = 3x^2z + \sin y.$$

You may check that

$$\nabla g(x, y, z) = \langle 6xz, \cos y, 3x^2 \rangle = \mathbf{G}(x, y, z).$$

More generally, to find the potential functions  $f(x, y)$  and  $g(x, y, z)$  for the respective conservative vector fields

$$\mathbf{F}(x, y) = \langle F_1(x, y), F_2(x, y) \rangle \quad \text{and} \quad \mathbf{G}(x, y, z) = \langle G_1(x, y, z), G_2(x, y, z), G_3(x, y, z) \rangle,$$

we construct

$$f(x, y) = \int F_1(x, y) \, dx + B \quad \text{and} \quad g(x, y, z) = \int G_1(x, y, z) \, dx + B + C,$$

where  $B$  is the integral with respect to  $y$  of the terms in  $F_2(x, y)$  or  $G_2(x, y, z)$  that have no  $x$  factor and  $C$  is the integral with respect to  $z$  of the terms in  $G_3(x, y, z)$  that have no  $x$  or  $y$  factor.

It is also possible, and sometimes more convenient, to perform these integrations in other orders. Consider the complexities of the component functions when you are deciding.

## Examples and Explorations

### EXAMPLE 1 Drawing vector fields in the plane

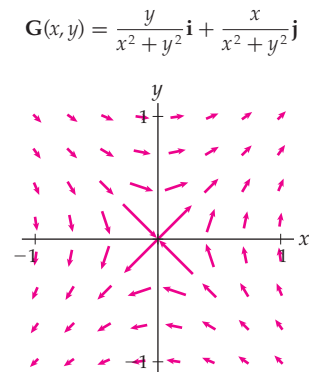

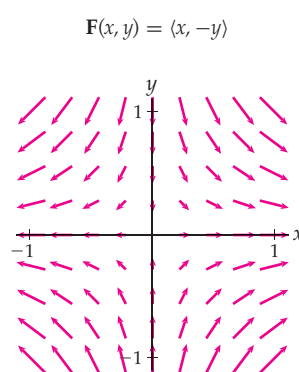

Sketch or use graphing software to create plots of the following vector fields in  $\mathbb{R}^2$ :

(a)  $\mathbf{F}(x, y) = \langle x, -y \rangle$

(b)  $\mathbf{G}(x, y) = \frac{y}{x^2 + y^2} \mathbf{i} + \frac{x}{x^2 + y^2} \mathbf{j}$

#### SOLUTION

Following are the two vector fields:

Each vector in the field is computed using the component functions. For example,  $\mathbf{F}(1, 1/2) = \langle 1, -1/2 \rangle$ . Our graphs are drawn with software, but they may be drawn by hand. □

## EXAMPLE 2

Drawing vector fields in  $\mathbb{R}^3$ 

Sketch or use graphing software to create plots of the given vector fields in  $\mathbb{R}^3$ . Identify any sources or sinks in each vector field.

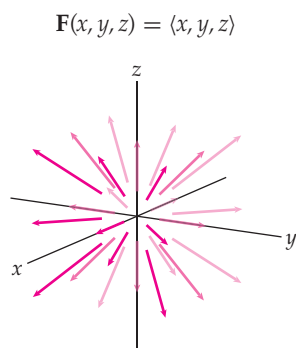

(a)  $\mathbf{F}(x, y, z) = \langle x, y, z \rangle$

(b)  $\mathbf{G}(x, y, z) = y\mathbf{i} - x\mathbf{j} + z\mathbf{k}$

## SOLUTION

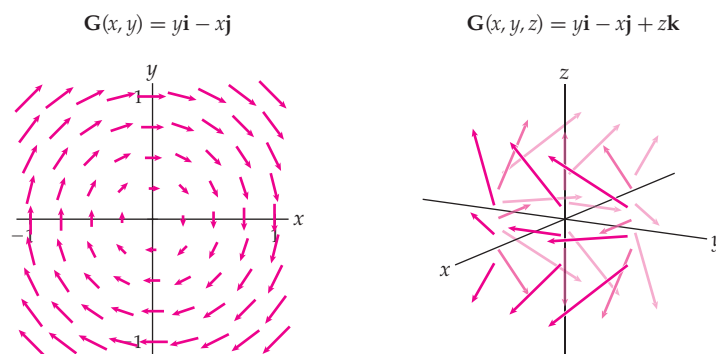

Three-dimensional vector fields can be a little difficult to understand, even when we use graphing software. As an aid, it may be useful to visualize the analogous vector field one dimension lower.

- (a) The vector field  $\mathbf{F}(x, y) = \langle x, y \rangle$  that we drew earlier in the section is a two-dimensional analog for the field shown next. Each vector points away from the origin, their magnitudes increase as you move away from the origin, and the magnitudes are constant on spheres centered at the origin. Note that to determine any particular vector in the field, we evaluate the function at a point. For example,  $\mathbf{F}(1, 2, 3) = \langle 1, 2, 3 \rangle$ .

Note that the origin is a source in this vector field, since all vectors emanating from points near the origin point away from it.

- (b) We first sketch the two-dimensional vector field  $\mathbf{G}(x, y) = y\mathbf{i} - x\mathbf{j}$  shown next at the left. We see that the vectors are tangent to concentric circles centered at the origin and that their magnitudes increase as you move away from the origin. In the three-dimensional vector field  $\mathbf{G}(x, y, z) = y\mathbf{i} - x\mathbf{j} + z\mathbf{k}$  shown at the right, the  $\mathbf{k}$ -components of the vectors increase as you move away from the  $xy$ -plane as well.

This vector field has no sources or sinks.

□

**EXAMPLE 3****Determining whether a vector field is conservative**

Determine whether the vector fields from Example 1 are conservative.

(a)  $\mathbf{F}(x, y) = \langle x, -y \rangle$

(b)  $\mathbf{G}(x, y) = \frac{y}{x^2 + y^2} \mathbf{i} + \frac{x}{x^2 + y^2} \mathbf{j}$

**SOLUTION**

A vector field  $\mathbf{F}(x, y) = \langle F_1(x, y), F_2(x, y) \rangle$  is conservative if and only if

$$\frac{\partial F_1}{\partial y} = \frac{\partial F_2}{\partial x}$$

when  $\frac{\partial F_1}{\partial y}$  and  $\frac{\partial F_2}{\partial x}$  are both continuous on some open subset of  $\mathbb{R}^2$ .

(a) For the vector field  $\mathbf{F}(x, y) = \langle x, -y \rangle$ ,

$$\frac{\partial F_1}{\partial y} = \frac{\partial}{\partial y}(x) = 0 \quad \text{and} \quad \frac{\partial F_2}{\partial x} = \frac{\partial}{\partial x}(-y) = 0.$$

Since these partial derivatives are the same,  $\mathbf{F}(x, y)$  is indeed conservative.

(b) For the vector field  $\mathbf{G}(x, y) = \frac{y}{x^2 + y^2} \mathbf{i} + \frac{x}{x^2 + y^2} \mathbf{j}$ ,

$$\frac{\partial G_1}{\partial y} = \frac{\partial}{\partial y} \left( \frac{y}{x^2 + y^2} \right) = \frac{x^2 - y^2}{(x^2 + y^2)^2} \quad \text{and} \quad \frac{\partial G_2}{\partial x} = \frac{\partial}{\partial x} \left( \frac{x}{x^2 + y^2} \right) = \frac{y^2 - x^2}{(x^2 + y^2)^2}.$$

Since  $\frac{\partial G_1}{\partial y} \neq \frac{\partial G_2}{\partial x}$  and these partial derivatives are continuous on every open subset of  $\mathbb{R}^2$  not containing the origin,  $\mathbf{G}(x, y)$  is not conservative.  $\square$

**EXAMPLE 4****Finding a potential function for a vector field in  $\mathbb{R}^2$** 

Find a potential function for the vector field  $\mathbf{F}(x, y) = \langle x, -y \rangle$  from Example 1.

**SOLUTION**

Since

$$\mathbf{F}(x, y) = \langle x, -y \rangle,$$

$$f(x, y) = \int x \, dx + B = \frac{x^2}{2} + \alpha + B,$$

where  $\alpha$  is an arbitrary constant and  $B$  is the integral with respect to  $y$  of the terms in  $F_2(x, y)$  in which the factor  $x$  does not appear. In this case, that is all of  $F_2(x, y)$ , so

$$B = \int (-y) \, dy = \frac{-y^2}{2} + \beta,$$

where  $\beta$  is an arbitrary constant. Setting the constants equal to zero since they do not affect the gradient of  $f(x, y)$ , we have

$$f(x, y) = \frac{x^2}{2} - \frac{y^2}{2}. \quad \square$$

**CHECKING  
THE ANSWER**

We can verify this solution by computing  $\nabla f$  directly:

$$\nabla f(x, y) = f_x(x, y) \mathbf{i} + f_y(x, y) \mathbf{j} = x \mathbf{i} - y \mathbf{j} = \mathbf{F}(x, y).$$

**EXAMPLE 5****Finding a potential function for a vector field in  $\mathbb{R}^3$** 

Find a potential function for

$$\mathbf{G}(x, y, z) = \left(\frac{y}{x^2+1} + z\right)\mathbf{i} + \tan^{-1}x\mathbf{j} + (x + \cos z)\mathbf{k}.$$

**SOLUTION**

We start by integrating  $G_1(x, y, z)$ . We have

$$g(x, y, z) = \int \left(\frac{y}{x^2+1} + z\right) dx + B + C = y \tan^{-1}x + xz + \alpha + B + C,$$

where  $\alpha$  is an arbitrary constant,  $B$  is the integral with respect to  $y$  of the terms in  $G_2(x, y, z)$  in which the factor  $x$  does not appear, and  $C$  is the integral with respect to  $z$  of the terms in  $G_3(x, y, z)$  in which neither the factor  $x$  nor the factor  $y$  appears. In this case  $B = 0$ , because the only term in  $G_2(x, y, z)$  is  $\tan^{-1}x$  and this part of the function  $g(x, y, z)$  is already recovered by the integral of  $G_1(x, y, z)$ . For  $C$ , however, there is a term with no  $x$ - or  $y$ -component, so

$$C = \int \cos z \, dz = \sin z + \beta,$$

where  $\beta$  is an arbitrary constant. Combining these results and setting the arbitrary constants to zero, we see that

$$g(x, y, z) = y \tan^{-1}x + xz + \sin z$$

is a potential function for  $\mathbf{G}(x, y, z)$ . □

**CHECKING THE ANSWER**

We can verify this solution by computing  $\nabla g(x, y, z)$  directly:

$$\nabla g(x, y, z) = \langle g_x, g_y, g_z \rangle = \left(\frac{y}{x^2+1} + z\right)\mathbf{i} + \tan^{-1}x\mathbf{j} + (x + \cos z)\mathbf{k} = \mathbf{G}(x, y, z).$$

**? TEST YOUR UNDERSTANDING**

- ▶ Which curve is longer, the curve  $y = 0$  for  $0 \leq x \leq \pi$  or the curve  $y = \sin x$  for  $0 \leq x \leq \pi$ ? Why? With the answer to this question in mind, which of the fences pictured in the illustration on page 1086 has a greater area? Why?
- ▶ Which of the vector fields pictured in this section would carry an object caught within towards the origin? Why?
- ▶ If  $f(x, y, z)$  is a potential function for  $\mathbf{F}(x, y, z)$ , then what is  $\nabla f(x, y, z)$ ?
- ▶ What does it mean to say that a vector field  $\mathbf{F}(x, y)$  is conservative? How would you show that a vector field failed to be conservative?
- ▶ Given a conservative vector field, how do we find its potential function? How does the procedure for finding a potential function for a conservative vector field in the plane differ from the procedure for finding a potential function for a conservative vector field in  $\mathbb{R}^3$ ?

## EXERCISES 14.1

## Thinking Back

- *Work as an integral of force and distance:* Find the work done in moving an object along the  $x$ -axis from the origin to  $x = \frac{\pi}{2}$  if the force acting on the object at a given value of  $x$  is  $F(x) = x \sin x$ .

*Vector geometry:* Use properties of vectors to obtain each of the specified quantities.

- Find a unit vector that points in the direction of  $\mathbf{F}(3, 3, \sqrt{13})$  for the vector field

$$\mathbf{F} = z(x - y)^2 \mathbf{i} + \sqrt{y} \mathbf{j} + \mathbf{k}.$$

- Find the equation of a line through the origin and parallel to  $\mathbf{F}(3, 3, \sqrt{13})$ .

*Calculus of vector-valued functions:* Calculate each of the following.

- $\frac{d}{dt}(\mathbf{r}(t))$ , where  $\mathbf{r}(t) = 3 \cos^2 t \mathbf{i} + 5t \mathbf{j} + \frac{t}{t^2+1} \mathbf{k}$ .  
 ►  $\int \mathbf{r}(t) dt$ , where  $\mathbf{r}(t) = e^t \mathbf{i} + t^3 \mathbf{j} - 4 \mathbf{k}$ .

## Concepts

- Problem Zero:* Read the section and make your own summary of the material.
- True/False:* Determine whether each of the statements that follow is true or false. If a statement is true, explain why. If a statement is false, provide a counterexample.
  - True or False:* A vector field is a function whose outputs are scalars.
  - True or False:* A vector field is a function whose outputs are vectors.
  - True or False:* A vector field is a function whose inputs are scalars.
  - True or False:* A vector field in  $\mathbb{R}^3$  is a function whose inputs are points in  $\mathbb{R}^3$ .
  - True or False:* A conservative vector field has infinitely many potential functions.
  - True or False:* Every vector field  $\mathbf{F}(x, y)$  is the gradient of some function  $f(x, y)$ .
  - True or False:* If two functions have the same gradient, they are the same function.
  - True or False:* Work is the integral of force times distance.
- Examples:* Construct examples of the thing(s) described in the following. Try to find examples that are different than any in the reading.
  - A vector field in  $\mathbb{R}^2$  and another in  $\mathbb{R}^3$ .
  - A conservative vector field.
  - A vector field that is not conservative.
- What are the inputs of a vector field in the Cartesian plane?
- What are the inputs of a vector field in  $\mathbb{R}^3$ ?
- What are the outputs of a vector field in the Cartesian plane?
- What are the outputs of a vector field in  $\mathbb{R}^3$ ?
- What does it mean to say that a vector field is conservative?
- Do the vectors in the range of  $\mathbf{F}(x, y) = x\mathbf{i} + y\mathbf{j}$  point towards or away from the origin?
- What is the difference between the graphs of  $\mathbf{G}(x, y) = \mathbf{i} + \mathbf{j}$  and  $\mathbf{F}(x, y) = 2\mathbf{i} + 2\mathbf{j}$ ?
- What is the difference between the graphs of  $\mathbf{G}(x, y, z) = -\mathbf{i} - \mathbf{j} - \mathbf{k}$  and  $\mathbf{F}(x, y, z) = \mathbf{i} + \mathbf{j} + \mathbf{k}$ ?
- What is the difference between the graphs of  $\mathbf{G}(x, y) = x\mathbf{i} + y\mathbf{j}$  and  $\mathbf{F}(x, y) = -x\mathbf{i} - y\mathbf{j}$ ?
- What is the difference between the graphs of  $\mathbf{G}(x, y, z) = 2\mathbf{i} - 3\mathbf{j} + z\mathbf{k}$  and  $\mathbf{F}(x, y, z) = -2\mathbf{i} + 3\mathbf{j} - z\mathbf{k}$ ?
- Consider the vector field  $\mathbf{F}(x, y, z) = \langle yz, xz, xy \rangle$ . Find a vector field  $\mathbf{G}(x, y, z)$  with the property that, for all points in  $\mathbb{R}^3$ ,  $\mathbf{G}(x, y, z) = 2\mathbf{F}(x, y, z)$ .
- What is the difference between vector fields  $\mathbf{F}(x, y) = \langle x^2, y^2 \rangle$  and  $\mathbf{G}(x, y) = \langle x^2, y^2, 0 \rangle$ ?
- How would you show that a given vector field in  $\mathbf{R}^2$  is not conservative?
- How would you show that a given vector field in  $\mathbf{R}^3$  is not conservative?

## Skills

In Exercises 17–24, find a potential function for the given vector field.

- $\mathbf{F}(x, y) = \langle 3x^2 \cos y, -x^3 \sin y \rangle$
- $\mathbf{F}(x, y) = \langle e^y \sec^2 x, e^y \tan x \rangle$

- $\mathbf{G}(x, y) = \langle 5x^4 + y, x - 12y^3 \rangle$
- $\mathbf{G}(x, y) = \mathbf{i} - \mathbf{j}$
- $\mathbf{F}(x, y, z) = yz\mathbf{i} + xz\mathbf{j} + xy\mathbf{k}$
- $\mathbf{F}(x, y, z) = e^{y^2} \mathbf{i} + (2xye^{y^2} + \sin z)\mathbf{j} + y \cos z \mathbf{k}$

23.  $\mathbf{G}(x, y, z) = \cos y \mathbf{i} + (\sin z - x \sin y) \mathbf{j} + y \cos z \mathbf{k}$

24.  $\mathbf{G}(x, y, z) = \langle ye^{xy+z}, xe^{xy+z}, e^{xy+z} \rangle$

Sketch the vector fields in Exercises 25–32.

25.  $\mathbf{F}(x, y) = 2\mathbf{i} + 0\mathbf{j}$

26.  $\mathbf{F}(x, y) = 0\mathbf{i} + 2\mathbf{j}$

27.  $\mathbf{F}(x, y) = \mathbf{i} + \mathbf{j}$

28.  $\mathbf{F}(x, y) = 2\mathbf{i} + 2\mathbf{j}$

29.  $\mathbf{F}(x, y) = \mathbf{i} - \mathbf{j}$

30.  $\mathbf{F}(x, y) = -\mathbf{i} + \mathbf{j}$

31.  $\mathbf{F}(x, y) = x\mathbf{i} + 2y\mathbf{j}$

32.  $\mathbf{F}(x, y) = -2x\mathbf{i} - 3y\mathbf{j}$

Show that the vector fields in Exercises 33–40 are not conservative.

33.  $\mathbf{F}(x, y) = \langle xy, -y \rangle$

34.  $\mathbf{F}(x, y) = \langle x^2 + y^2, \cos y \rangle$

35.  $\mathbf{G}(x, y) = \frac{1}{x^2 + y} \mathbf{i} + \frac{y}{x} \mathbf{j}$

36.  $\mathbf{G}(x, y) = y\mathbf{i} - x\mathbf{j}$

37.  $\mathbf{F}(x, y, z) = 2\mathbf{i} - z\mathbf{j} + e^{yz}\mathbf{k}$

38.  $\mathbf{F}(x, y, z) = \tan(yz)\mathbf{i} + (xz \sec^2(yz) - 2)\mathbf{j} + 4z^3\mathbf{k}$

39.  $\mathbf{G}(x, y, z) = \langle 3, yz, z + 12 \rangle$

40.  $\mathbf{G}(x, y, z) = \langle e^y + z, xe^y + z, x + y \rangle$

Determine whether or not each of the vector fields in Exercises 41–48 is conservative. If the vector field is conservative, find a potential function for the field.

41.  $\mathbf{F}(x, y) = e^y \mathbf{i} + \sin y \mathbf{j}$

42.  $\mathbf{F}(x, y) = \left\langle \tan^{-1} y, \frac{x}{1+y^2} \right\rangle$

43.  $\mathbf{G}(x, y) = \langle 2x + y \cos(xy), x \cos(xy) - 1 \rangle$

44.  $\mathbf{G}(x, y) = yx^2 \mathbf{i} + e^y \mathbf{j}$

45.  $\mathbf{F}(x, y, z) = \langle ye^{2z} + 1, xe^{2z}, 2xye^{2z} \rangle$

46.  $\mathbf{F}(x, y, z) = \mathbf{i} + 2\mathbf{j} - 3\mathbf{k}$

47.  $\mathbf{G}(x, y, z) = (z - y)\mathbf{i} - xy\mathbf{j} + (xz + y)\mathbf{k}$

48.  $\mathbf{G}(x, y, z) = \langle \sin(yz), \cos(yz), x^2 \rangle$

## Applications

49. Construct a vector field to describe each of the situations that follow. There may be more than one choice of constant that gives an accurate answer. (*Hint: Examples from the section and earlier exercises may be useful, as well as plotting a few vectors from a given field.*)

- A thin film of water flowing across a flat plate from right to left at a constant rate.
- A thin film of liquid flowing across a flat plate diagonally from top left to bottom right at a constant rate.
- A thin film of liquid flowing on a flat plate rotating counterclockwise about the origin.

50. Write a vector field to describe each of the flows that follow. As in Exercise 49, there may be more than one choice of constant that gives an accurate answer.

- A thin film of liquid flowing across a flat plate from top to bottom at a constant rate.

- A thin film of liquid flowing across a flat plate in the direction of  $3\mathbf{i} + 2\mathbf{j}$  at a constant rate.

- Fluid rotating clockwise around the origin.

51. Annie uses a vector field to model the current in a channel in the San Juan Islands in Washington State. She has imposed a coordinate system centered at the origin of the area she is interested in, and she is looking at the region  $[-1, 1] \times [-1, 1]$ . The velocity of the current is given by  $\langle 0.9 - x^2 + 0.5y^2, xy \rangle$ .

- Sketch the vector field.
- Is the vector field conservative? If so, what is an equation of a potential function? Explain the relationship between the potential function and the current.
- Can you tell where the land that influences the current lies?

## Proofs

52. Prove that a conservative vector field has infinitely many potential functions.

53. Prove that if two functions  $f(x, y)$  and  $g(x, y)$  have the same gradient, then they differ by at most a constant.

## Thinking Forward

*Integration of vector fields:* In order to answer the questions posed at the beginning of this section, we ought to be able to use the “subdivide, approximate, and add” strategy from Chapter 6. The results—area and work—should be scalars.

- ▶ How might the integral to find the arc length of  $\mathbf{r}(t)$  from  $t = a$  to  $t = b$  in Section 11.4 be modified to produce the area of a fence whose base is  $\mathbf{r}(t)$  and whose height is given by  $h(t) = h(x(t), y(t))$ ?

- ▶ Write down some possible interpretations of what integrating a vector field along a curve to find work could mean, bearing in mind that the result should be a scalar.

## 14.2 LINE INTEGRALS

- ▶ Defining the integral of a multivariate function along a curve
- ▶ Defining the integral of a vector field along a curve
- ▶ Using the Fundamental Theorem of Line Integrals

### Integrals Along Curves in Space

In this section, we address both of the problems posed at the beginning of the chapter: how to find the area of a fence whose base is not the  $x$ -axis and how to compute work along a curve in space. We will also see an extension of the Fundamental Theorem of Calculus.

Since both of our motivating questions have to do with curves in space, we recall the discussion in Section 11.4 of parametrized curves in  $\mathbb{R}^2$  and  $\mathbb{R}^3$ . In general, in order for us to be able to compute the arc length of a curve  $C$ , we need the curve to be described by a vector function  $\mathbf{r}(t) = \langle x(t), y(t), z(t) \rangle$  such that  $\mathbf{r} : [a, b] \rightarrow C$  is one-to-one,  $\|\mathbf{r}'(t)\| \neq 0$  for all  $t \in [a, b]$ , and each of the component functions  $x(t)$ ,  $y(t)$ , and  $z(t)$  is differentiable and has a continuous first derivative. Throughout the rest of the chapter, we will call such curves and parametrizations *smooth*. For a smooth curve  $C$  with smooth parametrization  $\mathbf{r}(t)$  and endpoints  $\mathbf{r}(a)$ ,  $\mathbf{r}(b)$ , Theorem 11.18 gives the arc length  $\mathcal{L}$  of  $C$  as

$$\mathcal{L}(a, b) = \int_a^b \|\mathbf{r}'(t)\| dt.$$

### Line Integrals of Multivariate Functions

Our process for computing the area of a fence whose base is a smooth curve  $C$  uses the same ideas we found in Definition 4.9, when we defined the definite integral. When we computed the area under a curve on an interval, we used the “subdivide, approximate, and add” strategy. We saw that the area is the limit of the sum of areas of approximating subrectangles. More formally,

$$A = \lim_{n \rightarrow \infty} \sum_{k=1}^n (\text{height of } k\text{th rectangle} \times \text{width of } k\text{th rectangle}).$$

In Chapter 4 this equation became

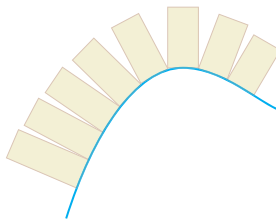

$$A = \lim_{n \rightarrow \infty} \sum_{k=1}^n f(x_k^*) \Delta x = \int_a^b f(x) dx.$$

Here we want to say the same thing, adjusting for the fact that our curve  $C$  is smoothly parametrized by  $\mathbf{r}(t)$  for  $a \leq t \leq b$ . So now the width of an approximating subrectangle is given by

$$\|\mathbf{r}'(t)\| = \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2 + \left(\frac{dz}{dt}\right)^2},$$

and the height is given by  $f(t_k^*)$ , where, as before,  $t_k^*$  is an arbitrary value of  $t$  in the  $k$ th subdivision of  $[a, b]$ , as seen in the following figure:

Approximating the area of a function defined on a curve

Combining these insights, we define the integral of a multivariate function along a curve in space.

### DEFINITION 14.3 Line Integral of a Multivariate Function

Let  $C$  be a curve in  $\mathbb{R}^3$  with a smooth parametrization  $\mathbf{r}(t) = \langle x(t), y(t), z(t) \rangle$  for  $t \in [a, b]$ . Then the **integral of  $f(x, y, z)$  along  $C$**  is

$$\int_C f(x, y, z) ds = \int_a^b f(x(t), y(t), z(t)) \|\mathbf{r}'(t)\| dt.$$

The definition for curves in  $\mathbb{R}^2$  is analogous. They are the same as curves in  $\mathbb{R}^3$ , except that all  $z$ -components are zero. Also, note the new notation:

$$ds = \|\mathbf{r}'(t)\| dt.$$

The integral along  $C$  is sometimes referred to as the **integral with respect to arc length**.

Line integrals of multivariate functions act like the single-variable integrals of Chapter 4 because, after the substitutions for  $f(x, y, z)$  and  $\|\mathbf{r}'(t)\|$  in terms of  $t$ , they are single-variable integrals. Note that if  $f(x, y, z)$  is constantly equal to 1, the line integral returns just the arc length of  $C$ . This situation is parallel to that for single-variable integrals: The interval  $[a, b]$  has length  $b - a$ , and

$$\int_a^b 1 dx = b - a.$$

Line integrals are additive, like single-variable integrals. That is, if  $C = C_1 \cup C_2$ , where  $C_1$  and  $C_2$  overlap in a single point, then

$$\int_C f(x, y, z) ds = \int_{C_1} f(x, y, z) ds + \int_{C_2} f(x, y, z) ds.$$

This property is particularly useful when a natural parametrization of  $C$  by  $\mathbf{r}(t)$  has  $\mathbf{r}'(t) = \mathbf{0}$  at a point. We can then rewrite the integral along  $C$  as a sum of two integrals that do not have this problem. If a curve  $C$  is not itself smooth, but can be written as a finite sum of smooth curves, we say that  $C$  is **piecewise smooth**.

Another point of similarity between line integrals and single-variable integrals is that the direction of integration matters. Recall from Chapter 4 that

$$\int_a^b f(x) dx = - \int_b^a f(x) dx.$$

The same is true for the integral along a curve  $C$  with endpoints  $P$  and  $Q$ . If  $\mathbf{r}_1(t)$  is a smooth parametrization of  $C$  that starts at  $P$  and ends at  $Q$ , and if  $\mathbf{r}_2(t)$  is a smooth parametrization of  $C$  that starts at  $Q$  and ends at  $P$ , then the integral along  $C$  using  $\mathbf{r}_1(t)$  will be the negative of the integral along  $C$  using  $\mathbf{r}_2(t)$ .

## Line Integrals of Vector Fields

In Chapter 6 we discussed the concept of *work*. We now generalize this concept to include work done by a variable force acting along a curve in space. We represent the force acting in each of the  $\mathbf{i}$ ,  $\mathbf{j}$ , and  $\mathbf{k}$  directions as a vector field whose component functions vary with location in space:

$$\mathbf{F}(x, y, z) = F_1(x, y, z)\mathbf{i} + F_2(x, y, z)\mathbf{j} + F_3(x, y, z)\mathbf{k}.$$

Here  $F_1(x, y, z)$  measures the action of  $\mathbf{F}(x, y, z)$  in the  $\mathbf{i}$  direction,  $F_2(x, y, z)$  measures the action of  $\mathbf{F}(x, y, z)$  in the  $\mathbf{j}$  direction, and  $F_3(x, y, z)$  measures the action of  $\mathbf{F}(x, y, z)$  in the  $\mathbf{k}$  direction.

To compute work done by a vector field along a curve, we follow our usual strategy of subdividing, approximating, and adding, followed by taking a limit as the size of the subdivisions approaches zero. In this case, the limit will be the integral of the vector field along the curve. Subdividing the curve uses the position vector  $\langle x_n - x_{n-1}, y_n - y_{n-1}, z_n - z_{n-1} \rangle$  to approximate the curve between points  $(x_n, y_n, z_n)$  and  $(x_{n-1}, y_{n-1}, z_{n-1})$ . To compute the action of the vector field  $\mathbf{F}(x, y, z)$  on this small piece of the curve,  $F_1(x_n, y_n, z_n)$  is used to approximate  $F_1$ , the action of  $\mathbf{F}(x, y, z)$  in the  $\mathbf{i}$  direction for that subdivision. The components  $F_2(x_n, y_n, z_n)$  and  $F_3(x_n, y_n, z_n)$  are similarly used in the  $\mathbf{j}$  and  $\mathbf{k}$  directions. This approximation is a constant force in a fixed direction, so we multiply  $F_1(x_n, y_n, z_n) \cdot (x_n - x_{n-1})$  to get the action of  $\mathbf{F}(x, y, z)$  in the  $\mathbf{i}$  direction. Also, summing in the  $\mathbf{j}$  and  $\mathbf{k}$  directions, we have

$W \approx F_1(x_n, y_n, z_n) \cdot (x_n - x_{n-1}) + F_2(x_n, y_n, z_n) \cdot (y_n - y_{n-1}) + F_3(x_n, y_n, z_n) \cdot (z_n - z_{n-1})$  as the approximate work done by  $\mathbf{F}(x, y, z)$  on the  $n$ th subdivided piece of the curve. Adding the action along the  $n$  pieces of the subdivided curve, we obtain

$$\sum_{n=1}^M (F_1(x_n, y_n, z_n) \cdot (x_n - x_{n-1}) + F_2(x_n, y_n, z_n) \cdot (y_n - y_{n-1}) + F_3(x_n, y_n, z_n) \cdot (z_n - z_{n-1})).$$

As  $M$  approaches infinity, the change in  $x$ ,  $y$ , and  $z$  becomes  $\mathbf{r}'(t)$  and  $\mathbf{F}(x_n, y_n, z_n)$  becomes the value of the field at a point; thus, the limit of the summation becomes

$$\begin{aligned} \int_a^b \left( F_1(x, y, z) \cdot \frac{\partial}{\partial x} \mathbf{r}(t) + F_2(x, y, z) \cdot \frac{\partial}{\partial y} \mathbf{r}(t) + F_3(x, y, z) \cdot \frac{\partial}{\partial z} \mathbf{r}(t) \right) dt \\ = \int_a^b \mathbf{F}(x, y, z) \cdot \mathbf{r}'(t) dt = \int_C \mathbf{F}(x, y, z) \cdot d\mathbf{r}. \end{aligned}$$

This result motivates our definition of the line integral of a vector field.

### DEFINITION 14.4

#### Line Integral of a Vector Field

Suppose that  $C$  is a smooth curve in  $\mathbb{R}^3$  with a smooth parametrization  $\mathbf{r}(t)$  for  $t \in [a, b]$  and with a vector field  $\mathbf{F}(x, y, z) = F_1\mathbf{i} + F_2\mathbf{j} + F_3\mathbf{k}$  whose component functions are each continuous on  $C$  and whose domain is open, connected, and simply connected. Then the **line integral of  $\mathbf{F}(x, y, z)$  along  $C$**  is

$$\int_C \mathbf{F}(x, y, z) \cdot d\mathbf{r} = \int_a^b (F_1(x, y, z)x'(t) + F_2(x, y, z)y'(t) + F_3(x, y, z)z'(t)) dt.$$

Two alternative ways of writing this integral are

$$\int_C \mathbf{F}(x, y, z) \cdot d\mathbf{r} = \int_C (F_1 dx + F_2 dy + F_3 dz) = \int_C \mathbf{F} \cdot \mathbf{T} ds,$$

where  $\mathbf{T}$  is the unit tangent vector. You are encouraged to check that all of the representations really are equivalent by carrying out the relevant substitutions and simplifications. For example, since the unit tangent vector is  $\mathbf{T} = \frac{\mathbf{r}'(t)}{\|\mathbf{r}'(t)\|}$  and the differential is  $ds = \|\mathbf{r}'(t)\| dt$ , upon cancellation we see that  $\int_C \mathbf{F} \cdot \mathbf{T} ds$  is equivalent to the line integral given in Definition 14.4.

As with the line integrals of multivariate functions discussed earlier in the section, changing the direction of travel along  $C$  changes the sign. If  $\mathbf{r}(t)$  and  $\mathbf{q}(t)$  are smooth parametrizations that traverse the curve  $C$  in opposite directions, then

$$\int_C \mathbf{F}(x, y, z) \cdot d\mathbf{r} = - \int_C \mathbf{F}(x, y, z) \cdot d\mathbf{q}.$$

## The Fundamental Theorem of Line Integrals

Line integrals of vector fields can be complicated to compute in practice, depending on the curve  $C$  and the choice of  $\mathbf{r}(t)$  to describe it. In the case of conservative vector fields, however, the fact that  $\mathbf{F}(x, y, z)$  is a gradient allows us to reduce the line integral of the vector field to subtraction.

### THEOREM 14.5

#### The Fundamental Theorem of Line Integrals

Let  $C$  be a smooth curve that is the graph of the vector function  $\mathbf{r}(t)$  defined on the interval  $[a, b]$  with  $P = \mathbf{r}(a)$  and  $Q = \mathbf{r}(b)$ . If  $\mathbf{F}(x, y, z)$  is a conservative vector field with  $\mathbf{F}(x, y, z) = \nabla f(x, y, z)$  on an open, connected, and simply connected domain containing the curve  $C$ , then

$$\int_C \mathbf{F}(x, y, z) \cdot d\mathbf{r} = f(Q) - f(P).$$

Before we prove Theorem 14.5, note that  $P = \mathbf{r}(a)$  and  $Q = \mathbf{r}(b)$ . These equations represent a common abuse of notation, because  $P$  and  $Q$  are points, but  $\mathbf{r}(a)$  and  $\mathbf{r}(b)$  are vectors. By this we mean that if  $P$  is the point  $(x_0, y_0, z_0)$ , then  $\mathbf{r}(a) = \langle x_0, y_0, z_0 \rangle$  and  $f(P) = f(x_0, y_0, z_0)$ .

**Proof.** If  $\mathbf{F}(x, y, z) = \nabla f(x, y, z)$  and  $\mathbf{r}(t)$  is a smooth parametrization of  $C$  with  $\mathbf{r}(a) = P$  and  $\mathbf{r}(b) = Q$ , and if  $\|\mathbf{r}'(t)\| \neq 0$  for all  $t \in [a, b]$ , then

$$\mathbf{F}(x, y, z) = \frac{\partial f}{\partial x} \mathbf{i} + \frac{\partial f}{\partial y} \mathbf{j} + \frac{\partial f}{\partial z} \mathbf{k} \quad \text{and} \quad \mathbf{r}'(t) = \frac{dx}{dt} \mathbf{i} + \frac{dy}{dt} \mathbf{j} + \frac{dz}{dt} \mathbf{k}.$$

Therefore,

$$\mathbf{F} \cdot d\mathbf{r} = \left( \frac{\partial f}{\partial x} \frac{dx}{dt} + \frac{\partial f}{\partial y} \frac{dy}{dt} + \frac{\partial f}{\partial z} \frac{dz}{dt} \right) dt.$$

By the chain rule, we have

$$\mathbf{F} \cdot d\mathbf{r} = \frac{d}{dt} (f(x(t), y(t), z(t))) dt = \frac{d}{dt} (f(t)) dt.$$

Therefore,

$$\begin{aligned} \int_C \mathbf{F} \cdot d\mathbf{r} &= \int_a^b \frac{d}{dt} (f(t)) dt \\ &= f(x(b), y(b), z(b)) - f(x(a), y(a), z(a)) \\ &= f(Q) - f(P). \end{aligned}$$

Theorem 14.5 is very useful, since it allows us to avoid finding an explicit parametrization of  $C$  and many important vector fields in the sciences are conservative. In Exercise 65, you will show that a consequence of this theorem is that line integrals of conservative vector

fields depend only on the endpoints of curves, not on the curves themselves. Such integrals are therefore said to be *independent of path*.

## Examples and Explorations

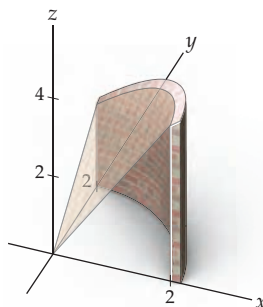

### EXAMPLE 1

#### Area of a fence whose base is a curve in the plane

Find the area of a wall whose base is the part of the circle of radius 2 centered at the origin, lying in the first quadrant, and whose height at point  $(x, y)$  is given by  $f(x, y) = 2x + y$ .

#### SOLUTION

Following is an illustration of the wall, along with the plane defined by  $z = 2x + y$ :

The quarter-circle base of the wall may be parametrized by  $\mathbf{r}(t) = \langle 2 \cos t, 2 \sin t \rangle$ , where  $0 \leq t \leq \frac{\pi}{2}$ , so

$$\|\mathbf{r}'(t)\| = \sqrt{4 \sin^2 t + 4 \cos^2 t} = 2.$$

We then substitute into the two-variable version of Definition 14.3:

$$\begin{aligned} \int_C f(x, y) \, ds &= \int_a^b f(x(t), y(t)) \|\mathbf{r}'(t)\| \, dt \\ &= \int_0^{\pi/2} (2(2 \cos t) + 2 \sin t) \cdot 2 \, dt \\ &= [8 \sin t - 4 \cos t]_0^{\pi/2} = 12. \end{aligned}$$

As usual, when we are computing an area, it is important to remember that integration gives the *signed* area; thus, if  $f(x, y)$  were negative at any point on  $C$ , we would need to compensate by integrating  $|f(x, y)|$ .  $\square$

### EXAMPLE 2

#### Integrating a multivariate function along a curve in $\mathbb{R}^3$

Find

$$\int_C f(x, y, z) \, ds,$$

where  $C$  is the line segment from  $(1, 4, 2\sqrt{3})$  to  $(3, 7, 4\sqrt{3})$  and

$$f(x, y, z) = x + y + z.$$

#### SOLUTION

Recall that the line segment from the point  $(a, b, c)$  to the point  $(d, e, f)$  may be parametrized by

$$\mathbf{r}(t) = \langle a + t(d - a), b + t(e - b), c + t(f - c) \rangle, \quad \text{for } 0 \leq t \leq 1.$$

In this case we have

$$\mathbf{r}(t) = \langle 1 + 2t, 4 + 3t, 2\sqrt{3} + 2\sqrt{3}t \rangle \text{ for } t \in [0, 1].$$

So,

$$\mathbf{r}'(t) = \langle 2, 3, 2\sqrt{3} \rangle, \quad \|\mathbf{r}'(t)\| = 5,$$

and on the curve,

$$f(x(t), y(t), z(t)) = 5 + 2\sqrt{3} + (5 + 2\sqrt{3})t.$$

Substituting gives

$$\begin{aligned} \int_C f(x, y, z) \, ds &= \int_0^1 (5 + 2\sqrt{3} + (5 + 2\sqrt{3})t)5 \, dt \\ &= 5 \left[ (5 + 2\sqrt{3})t + \frac{1}{2}(5 + 2\sqrt{3})t^2 \right]_0^1 \\ &= \frac{75}{2} + 15\sqrt{3}. \end{aligned}$$

□

### EXAMPLE 3

#### Computing line integrals of vector fields

Find the line integral  $\int_C \mathbf{F} \cdot d\mathbf{r}$  for each of the following vector fields along the given curve:

- (a)  $\mathbf{F}(x, y) = \langle -y, x \rangle$ , where  $C_1$  is the straight segment from  $(3, 0)$  to  $(8, \pi)$ .  
 (b)  $\mathbf{F}(x, y, z) = \langle e^y, xe^z, y^2 \rangle$ , where  $C_2$  is the curve given by  $\mathbf{r}(t) = \langle t, 2, t^2 \rangle$ , for  $-2 \leq t \leq 2$ .

#### SOLUTION

- (a) The curve  $C_1$  is smoothly parametrized by

$$\mathbf{r}(t) = \langle 3 + 5t, \pi t \rangle, \quad 0 \leq t \leq 1.$$

Thus,  $\mathbf{r}'(t) = \langle 5, \pi \rangle$ . So,

$$\begin{aligned} \int_{C_1} \mathbf{F}(x, y) \cdot d\mathbf{r} &= \int_0^1 \langle -\pi t, 3 + 5t \rangle \cdot \langle 5, \pi \rangle dt \\ &= \int_0^1 3\pi \, dt = 3\pi. \end{aligned}$$

- (b) For  $C_2$  and  $\mathbf{F}(x, y, z)$ ,

$$\mathbf{r}(t) = \langle t, 2, t^2 \rangle, \quad \text{for } -2 \leq t \leq 2.$$

Therefore,  $\mathbf{r}'(t) = \langle 1, 0, 2t \rangle$ . So,

$$\begin{aligned} \int_{C_2} \mathbf{F}(x, y, z) \cdot d\mathbf{r} &= \int_{-2}^2 \langle e^2, te^2, 4 \rangle \cdot \langle 1, 0, 2t \rangle dt \\ &= \int_{-2}^2 (e^2 + 8t) dt \\ &= [e^2 t + 4t^2]_{-2}^2 \\ &= (2e^2 + 16) - (-2e^2 + 16) = 4e^2. \end{aligned}$$

□

## EXAMPLE 4

## Applying the Fundamental Theorem of Line Integrals

Use the Fundamental Theorem of Line Integrals to evaluate the following:

- (a) The line integral

$$\int_{C_1} \mathbf{F}(x, y) \cdot d\mathbf{r},$$

where  $\mathbf{F}(x, y) = \left\langle 6x^2 \ln(y+1), \frac{2x^3}{y+1} \right\rangle$  and  $C_1$  is the straight segment from  $(1, 1)$  to  $(3, 7)$ .

- (b) The line integral

$$\int_{C_2} \mathbf{G}(x, y, z) \cdot d\mathbf{r},$$

where  $\mathbf{G}(x, y, z) = \langle yze^{xyz}, xze^{xyz}, xye^{xyz} \rangle$  and  $C_2$  is the circular helix about the  $z$ -axis given by

$$\mathbf{r}(t) = \langle \cos t, \sin t, t \rangle, \text{ for } t \in \left[ \frac{\pi}{4}, \frac{3\pi}{4} \right].$$

## SOLUTION

- (a) The Fundamental Theorem of Line Integrals makes it quite easy to carry out these integrations; it is enough to verify that the vector field in question is conservative, compute the potential function, substitute according to the theorem, and subtract. In the case of the first field,

$$\frac{\partial}{\partial y}(6x^2 \ln(y+1)) = \frac{6x^2}{y+1} = \frac{\partial}{\partial x} \left( \frac{2x^3}{y+1} \right),$$

so  $\mathbf{F}$  is conservative. Integrating, we find a potential function for  $\mathbf{F}$ :

$$f(x, y) = 2x^3 \ln(y+1).$$

By the Fundamental Theorem,

$$\int_{C_1} \mathbf{F}(x, y) \cdot d\mathbf{r} = f(3, 7) - f(1, 1) = 54 \ln 8 - 2 \ln 2 = 162 \ln 2 - 2 \ln 2 = 160 \ln 2.$$

- (b) In the case of the second field, it is easier to integrate  $g_1(x, y, z) = yze^{xyz}$  with respect to  $x$  and check that the resulting function can be adjusted as necessary to produce a potential function for  $\mathbf{G}$ . Integration yields

$$g(x, y, z) = e^{xyz}; \quad \mathbf{G}(x, y, z) = \nabla g(x, y, z).$$

Therefore,  $g(x(t), y(t), z(t)) = e^{t \cos t \sin t}$ . Evaluating  $\mathbf{r}(\pi/4)$  and  $\mathbf{r}(3\pi/4)$  gives us  $(\sqrt{2}/2, \sqrt{2}/2, \pi/4)$  as the starting point of  $C_2$  and  $(-\sqrt{2}/2, \sqrt{2}/2, 3\pi/4)$  as the end-point of  $C_2$ . Then

$$\int_{C_2} \mathbf{G}(x, y, z) \cdot d\mathbf{r} = g \left( -\frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2}, \frac{3\pi}{4} \right) - g \left( \frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2}, \frac{\pi}{4} \right) = e^{-3\pi/8} - e^{\pi/8}. \quad \square$$

## EXAMPLE 5

## Evaluating line integrals of vector functions along closed curves

Integrate each of the following vector fields along the specified closed curve  $C$ :

- (a)  $\mathbf{F}(x, y) = (y+2)\mathbf{i} + (x+3)\mathbf{j}$ , where  $C$  is the unit circle in the plane, traversed counterclockwise starting and ending at  $(1, 0)$ .
- (b)  $\mathbf{G}(x, y) = y\mathbf{i} - y^2\mathbf{j}$ , where  $C$  is the square with vertices  $(1, 0)$ ,  $(0, 1)$ ,  $(-1, 0)$ , and  $(0, -1)$ , traversed counterclockwise starting and ending at  $(1, 0)$ .

## SOLUTION

- (a) The vector field  $\mathbf{F}(x, y)$  is conservative, since  $\frac{\partial}{\partial y}(y+2) = 1 = \frac{\partial}{\partial x}(x+3)$ , so we can use the Fundamental Theorem of Line Integrals. A potential function for  $\mathbf{F}(x, y)$  is

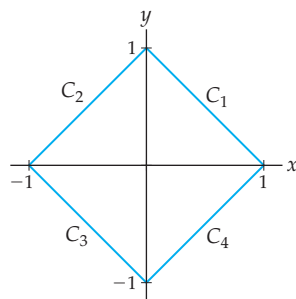

$$f(x, y) = 2x + xy + 3y.$$

The unit circle is smoothly parametrized by  $\mathbf{r}(t) = (\cos t)\mathbf{i} + (\sin t)\mathbf{j}$  for  $t \in [0, 2\pi]$ . So,  $\mathbf{r}'(t) = \langle -\sin t, \cos t \rangle$ . Since we are integrating over a closed curve, we expect to end where we started. As we know, when we evaluate  $\mathbf{r}(t)$  at  $t = 0$  and  $t = 2\pi$ , we start and stop at  $(1, 0)$ . Applying the Fundamental Theorem gives

$$\int_C \mathbf{F}(x, y) \cdot d\mathbf{r} = f(1, 0) - f(1, 0) = 0.$$

The zero value we obtain here is not a coincidence: In Exercise 64 you will prove that the integral of *any* conservative vector field along any closed curve is equal to zero.

- (b) The vector field  $\mathbf{G}(x, y)$  is not conservative, since  $\frac{\partial}{\partial y}(y) = 1$  but  $\frac{\partial}{\partial x}(y^2) = 0$ . Because the vector field is not conservative, we may not use the Fundamental Theorem of Line Integrals. For this, piecewise-smooth, simple closed curve, we will perform a separate integration for each of the sides of the square, as indicated in the following figure:

We parametrize each side of the square as follows:

- ▶ For side  $C_1$  we use  $x = 1 - t$  and  $y = t$ , where  $0 \leq t \leq 1$ .
- ▶ For  $C_2$  we use  $x = 1 - t$  and  $y = 2 - t$ , where  $1 \leq t \leq 2$ .
- ▶ For  $C_3$  we use  $x = -3 + t$  and  $y = 2 - t$ , where  $2 \leq t \leq 3$ .
- ▶ Finally, for  $C_4$  we use  $x = -3 + t$  and  $y = -4 + t$ , where  $3 \leq t \leq 4$ .

To evaluate the line integral, we have

$$\int_C \mathbf{G}(x, y) \cdot d\mathbf{r} = \int_{C_1} \mathbf{G}(x, y) \cdot d\mathbf{r} + \int_{C_2} \mathbf{G}(x, y) \cdot d\mathbf{r} + \int_{C_3} \mathbf{G}(x, y) \cdot d\mathbf{r} + \int_{C_4} \mathbf{G}(x, y) \cdot d\mathbf{r}.$$

On  $C_1$  we have  $\mathbf{G}(x(t), y(t)) = \langle t, -t^2 \rangle$  and  $d\mathbf{r} = \langle -1, 1 \rangle dt$ . Therefore,

$$\begin{aligned} \int_{C_1} \mathbf{G}(x, y) \cdot d\mathbf{r} &= \int_0^1 \langle t, -t^2 \rangle \cdot \langle -1, 1 \rangle dt \\ &= \int_0^1 (-t - t^2) dt \\ &= \left[ -\frac{1}{2}t^2 - \frac{1}{3}t^3 \right]_0^1 = -\frac{5}{6}. \end{aligned}$$

On  $C_2$  we have  $\mathbf{G}(x(t), y(t)) = \langle 2 - t, -(2 - t)^2 \rangle$  and  $d\mathbf{r} = \langle -1, -1 \rangle dt$ . Hence,

$$\begin{aligned} \int_{C_2} \mathbf{G}(x, y) \cdot d\mathbf{r} &= \int_1^2 \langle 2 - t, -(2 - t)^2 \rangle \cdot \langle -1, -1 \rangle dt \\ &= \int_1^2 (t - 2 + (2 - t)^2) dt \\ &= \left[ \frac{1}{2}t^2 - 2t - \frac{1}{3}(2 - t)^3 \right]_1^2 = -\frac{1}{6}. \end{aligned}$$

The integrals for sides  $C_3$  and  $C_4$  are similar. You should check that the values of these integrals are  $-\frac{1}{6}$  and  $-\frac{5}{6}$ , respectively. Therefore,

$$\int_C \mathbf{G}(x, y) \cdot d\mathbf{r} = -\frac{5}{6} - \frac{1}{6} - \frac{1}{6} - \frac{5}{6} = -2 \quad \square$$

### EXAMPLE 6 Computing the work done along a curve

Find the work done by the vector field  $\mathbf{F}(x, y) = y^2\mathbf{i} - x^2\mathbf{j}$  along the curve parametrized by  $x = t^2$ ,  $y = t^3$ , for  $0 \leq t \leq 2$ .

#### SOLUTION

To find the work, we compute the line integral  $\int_C \mathbf{F}(x, y) \cdot d\mathbf{r}$ , where  $\mathbf{r}(t) = \langle t^2, t^3 \rangle$ . Here we have  $\mathbf{F}(x(t), y(t)) = \langle t^6, -t^4 \rangle$  and  $d\mathbf{r} = \langle 2t, 3t^2 \rangle dt$ . Thus,

$$\begin{aligned} \int_C \mathbf{F}(x, y) \cdot d\mathbf{r} &= \int_0^2 \langle t^6, -t^4 \rangle \cdot \langle 2t, 3t^2 \rangle dt \\ &= \int_0^2 (2t^7 - 3t^6) dt = \left[ \frac{1}{4}t^8 - \frac{3}{7}t^7 \right]_0^2 = \frac{64}{7}. \end{aligned} \quad \square$$

#### ? TEST YOUR UNDERSTANDING

- ▶ How does the integral of a multivariate function along a smooth curve resemble a single-variable integral from Chapter 4? Why does it do so?
- ▶ What does  $ds$  stand for in terms of  $\mathbf{r}(t)$ ?
- ▶ What does  $d\mathbf{r}$  stand for in terms of  $\mathbf{r}(t)$ ?
- ▶ Why does the integral of any conservative vector field along any smooth or piecewise-smooth curve depend only on the endpoints and not on the curve?
- ▶ Why does the integral of any conservative vector field along any smooth or piecewise-smooth closed curve always equal zero?

## EXERCISES 14.2

### Thinking Back

*Average value:* Review the average value formula from Section 4.6. Use the formula to compute the average value of the following functions.

- ▶  $g(x) = x^2 + x + 2$  on  $[1, 5]$
- ▶  $f(x) = \cos x$  on  $[\pi, 2\pi]$

*Arc length:* Review the discussion of arc length in Sections 6.3 and 11.4. Compute the length of the following curves.

- ▶ The plane curve  $\langle t, t^2 \rangle$  from  $t = 4$  to  $t = 6$
- ▶ The circular helix given by  $\mathbf{r}(t) = \cos z\mathbf{i} + \sin z\mathbf{j} + z\mathbf{k}$  from  $z = 0$  to  $z = 2\pi$

## Concepts

0. *Problem Zero*: Read the section and make your own summary of the material.
1. *True/False*: Determine whether each of the statements that follow is true or false. If a statement is true, explain why. If a statement is false, provide a counterexample.
- True or False*: The integral of a multivariate function along a smooth curve  $C$  produces a scalar.
  - True or False*: The integral of a vector field  $\mathbf{F}(x, y)$  along a smooth curve  $C$  produces a vector.
  - True or False*: A smooth parametrization  $\mathbf{r}(t)$  must have  $\mathbf{r}'(t) \neq 0$  for all points on the curve.
  - True or False*: If a curve is not itself smooth, but can be written as a finite sum of smooth curves, it is possible to integrate either a multivariate function or a vector field along the curve by integrating over each smooth piece separately.
  - True or False*: If a vector field is conservative, it cannot be integrated along any curve.
  - True or False*: The Fundamental Theorem of Line Integrals applies to the integral of a conservative vector field along a smooth curve.
  - True or False*: Every integral of a vector field along a smooth curve can be evaluated with the Fundamental Theorem of Line Integrals.
  - True or False*: The integral of a vector field along a smooth closed curve is always zero.
2. *Examples*: Construct examples of the thing(s) described in the following. Try to find examples that are different than any in the reading.
- A smooth parametrization of the straight line between two points in  $\mathbb{R}^3$ .
  - A smooth curve  $C$  that is not a straight line, and a smooth parametrization of  $C$ .
  - A vector field  $\mathbf{F}(x, y)$  such that the integral of  $\mathbf{F}(x, y)$  around the unit circle is zero.
3. Write, but do not evaluate, the line integral  $\int_C f(x, y, z) \, ds$  as an integral explicitly in terms of  $t$  if  $f(x, y, z) = e^{xyz}$  and  $\mathbf{r}(t) = t\mathbf{i} + t^2\mathbf{j} + t^4\mathbf{k}$  for  $a \leq t \leq b$ .
4. Make a chart of all the new notation in this section, including what each item means in terms you already understand.
- For each integral in Exercises 5–8, give the vector field that is being integrated.
- $\int_C (x + y) \, dx + xy \, dy$
  - $\int_C \cos(x^2y) \, dx - 3e^y \, dy$
  - $\int_C xy^2 \, dx + (xy - z) \, dy + \cos y \, dz$
  - $\int_C xyz \, dx + \sin(zy) \, dy + (z - x) \, dz$
9. Write the first alternative form of  $\int_C \mathbf{F}(x, y) \cdot d\mathbf{r}$  for  $\mathbf{F}(x, y)$  and  $C_1$  from Example 3. (This alternative form is described immediately after Definition 14.4 and is used in Exercises 5–8.)
10. Write the first alternative form of  $\int_C \mathbf{G}(x, y, z) \cdot d\mathbf{r}$  for  $\mathbf{G}(x, y, z)$  and  $C_2$  from Example 3. (This alternative form is described immediately after Definition 14.4 and is used in Exercises 5–8.)
- Translate  $ds$  into terms of  $\mathbf{r}(t)$ .
  - Translate  $d\mathbf{r}$  into terms of  $\mathbf{r}(t)$ .
  - Write  $\int_C \mathbf{F}(x, y) \cdot d\mathbf{r}$  explicitly as an integral of  $t$ , where  $\mathbf{F}(x, y) = \langle x^2y, x - y \rangle$  and  $\mathbf{r}(t) = \langle 2t, e^t \rangle$  for  $a \leq t \leq b$ .
  - Write  $\int_C \mathbf{F}(x, y, z) \cdot d\mathbf{r}$  explicitly as an integral of  $t$ , where  $\mathbf{F}(x, y, z) = \langle zy - x, xz - y, xy - z \rangle$  and  $\mathbf{r}(t) = \langle t, \cos t, \sin t \rangle$  for  $a \leq t \leq b$ .
  - Give a smooth parametrization  $\mathbf{r}(t)$  for the unit circle, starting and ending at  $(1, 0)$  and travelling in the counterclockwise direction.
  - Give a smooth parametrization  $\mathbf{r}(t)$  for the unit circle, starting and ending at  $(1, 0)$  and travelling in the clockwise direction.
  - Give a smooth parametrization  $\mathbf{r}(t)$  for the circular helix with radius 2 and centered about the  $y$ -axis, starting at  $(2, 0, 0)$  and completing two full revolutions.
  - Give a smooth parametrization  $\mathbf{r}(t)$  for the straight line between the points  $(\pi, e, 1)$  and  $(3, 7, 13)$ .
  - In Chapter 4 we defined the **average value** of an integrable function  $f$  on the interval  $[a, b]$  to be  $\frac{1}{b-a} \int_a^b f(x) \, dx$ . Generalize this expression to a formula that will give the average value of  $f(x, y, z)$  along a smooth curve  $C$  parametrized by  $\mathbf{r}(t)$  for  $a \leq t \leq b$ .
  - Use your intuition from Exercise 19 to propose a formula for the average value of  $\mathbf{F}(x, y, z)$  along a smooth curve  $C$  parametrized by  $\mathbf{r}(t)$  for  $a \leq t \leq b$ .

## Skills

In Exercises 21–28, evaluate the multivariate line integral of the given function over the specified curve.

- $g(x, y) = x$ , with  $C$  the graph of  $y = x^2$  in the  $xy$ -plane from the origin to  $(2, 4)$ .
- $f(x, y) = e^{xy}$ , with  $C$  the line with equation  $x = 3y$  for  $-1 \leq y \leq 1$ .
- $f(x, y) = x^2 + y^2$ , with  $C$  the unit circle traversed counterclockwise.

24.  $f(x, y) = x^2 + y^2$ , with  $C$  the unit circle traversed *clockwise*.
25.  $f(x, y, z) = e^{x+y+z}$ , with  $C$  the straight line segment from the origin to  $(1, 2, 3)$ .
26.  $g(x, y, z) = xyz$ , with  $C$  the curve parametrized by  $\mathbf{r}(t) = \left\langle \frac{\sqrt{2}}{3}t^3, t^2, t \right\rangle$  for  $1 \leq t \leq 4$ .
27.  $f(x, y, z) = e^{x^2+y+z^2}$ , with  $C$  the circular helix of radius 1, centered about the  $z$ -axis, and parametrized by  $\mathbf{r}(t) = \langle \cos t, \sin t, t \rangle$  from height 0 to  $\pi$ .
28.  $f(x, y, z) = e^{x^2+y^2+z^2}$ , with  $C$  the circular helix of radius 1, centered about the  $y$ -axis, and parametrized by  $\mathbf{r}(t) = \langle \cos t, t, \sin t \rangle$  for  $\pi \leq y \leq 3\pi$ .

Evaluate each of the vector field line integrals in Exercises 29–36 over the indicated curves.

29.  $\mathbf{F}(x, y) = \mathbf{i} - \mathbf{j}$ , with  $C$  the curve with equation  $y - x^2 = 1$  for  $5 \leq x \leq 10$ .
30.  $\mathbf{F}(x, y) = y\mathbf{i} - x\mathbf{j}$ , with  $C$  the circle of radius 2, centered at the origin, and traversed counterclockwise starting at  $(2, 0)$ .
31.  $\mathbf{F}(x, y)$  and  $C$  are as in Exercise 29, but  $C$  is traversed in the reverse direction, from  $x = 10$  to  $x = 5$ .
32.  $\mathbf{F}(x, y, z) = 2^z\mathbf{i} + \ln x\mathbf{j} + xz\mathbf{k}$ , with  $C$  the curve parametrized by  $(t, \ln t, t)$  for  $1 \leq t \leq e^2$ .
33.  $\mathbf{F}(x, y) = y \sin xy\mathbf{i} + x \cos xy\mathbf{j}$ , with  $C$  the cardioid given by  $r = 1 + 2 \cos \theta$  from  $\theta = 0$  to  $\theta = 2\pi$ .
34.  $\mathbf{F}(x, y, z) = yz\mathbf{i} + x\mathbf{j} + z^2\mathbf{k}$ , with  $C$  the straight line segment from the origin to  $(1, 0, 4)$ .
35.  $\mathbf{F}(x, y, z) = -x^2y\mathbf{i} + x^3\mathbf{j} + y^2\mathbf{k}$ , with  $C$  the circular helix parametrized by  $x = \cos t$ ,  $y = \sin t$ ,  $z = t$ , for  $2\pi \leq t \leq 3\pi$ .
36.  $\mathbf{F}(x, y, z) = \frac{2}{1-z}\mathbf{i} + \mathbf{j} - \frac{1}{z^2+1}\mathbf{k}$ , with  $C$  the curve parametrized by  $x = \ln(1+t)$ ,  $y = \ln(1-t^2)$ ,  $z = t$ , for  $3 \leq t \leq 7$ .

Use the Fundamental Theorem of Line Integrals, if applicable, to evaluate the integrals in Exercises 37–44. Otherwise, show that the vector field is not conservative.

37.  $\mathbf{F}(x, y) = \left\langle \frac{1}{x} + \ln y, \frac{1}{y} + \frac{x}{y} \right\rangle$ , with  $C$  the straight line segment from  $(\pi, e)$  to  $(1, \pi)$ .
38.  $\mathbf{F}(x, y) = \langle 2^x \ln 2, 2y \rangle$ , with  $C$  the straight line segment from  $(3, 7)$  to  $(0, 1)$ .

39.  $\mathbf{F}(x, y, z) = \langle -z, 1, x \rangle$ , with  $C$  the circular helix given by  $x = \cos t$ ,  $y = t$ ,  $z = \sin t$ , for  $0 \leq t \leq 2\pi$ .
40.  $\mathbf{F}(x, y) = \left\langle \frac{xe^x}{(x+y+4)^2}, \frac{-e^x}{(x+y+4)^2} \right\rangle$ , with  $C$  the cardioid given by  $r = (1 + 2 \sin \theta)$  from  $\theta = 0$  to  $\theta = \pi$ .
41.  $\mathbf{F}(x, y, z) = yz^{xy} \ln z\mathbf{i} + xz^{xy} \ln z\mathbf{j} + \frac{z^{xy}}{z}\mathbf{k}$ , with  $C$  any curve from  $(0, 0, 1)$  to  $(2, 16, 3)$ .
42.  $\mathbf{F}(x, y, z) = (\cos(zy) - \sin(zy))\mathbf{i} - (xz \sin(zy) + xz \cos(zy))\mathbf{j} - (xy \sin(zy) + xy \cos(zy))\mathbf{k}$ , with  $C$  any curve from  $(5, \frac{\pi}{2}, \frac{\pi}{3})$  to  $(2, 0, 2\pi)$ .
43.  $\mathbf{F}(x, y, z) = z \sin x\mathbf{i} + x \ln(y+4)\mathbf{j} + y\mathbf{k}$ , with  $C$  the unit circle traversed counterclockwise starting at the point  $(1, 0)$ .
44.  $\mathbf{F}(x, y, z) = (z^3 + 1)\mathbf{i} + x \cos z\mathbf{j} + xye^{xyz}\mathbf{k}$ , with  $C$  the curve parametrized by  $\mathbf{r}(t) = t^2\mathbf{i} + t^3\mathbf{j} - t\mathbf{k}$  for  $0 \leq t \leq 4$ .

Evaluate the line integrals in Exercises 45–50.

45.  $\int_C \mathbf{F}(x, y) \cdot d\mathbf{r}$ , where  $\mathbf{F}(x, y) = -y\mathbf{i} + x\mathbf{j}$  and  $C$  is the spiral  $x = t \cos t$ ,  $y = t \sin t$ , for  $\pi \leq t \leq 2\pi$ .
46.  $\int_C \mathbf{F}(x, y, z) \cdot d\mathbf{r}$ , where
- $$\mathbf{F}(x, y, z) = \frac{y^2}{z}\mathbf{i} + \frac{2xy}{z}\mathbf{j} - \frac{xy^2}{z^2}\mathbf{k}$$
- and  $C$  is the portion of the conical helix  $x = t \cos t$ ,  $y = t \sin t$ ,  $z = t$ , for  $t = \pi$  to  $t = \frac{3\pi}{2}$ .
47.  $\int_C f(x, y) ds$ , where  $f(x, y) = (x^2 + y^2)^{1/2}$  and  $C$  is the curve parametrized by  $x = t \sin t$ ,  $y = t \cos t$ , for  $0 \leq t \leq 4\pi$ .
48.  $\int_C \mathbf{F}(x, y, z) \cdot d\mathbf{r}$ , where

$$\mathbf{F}(x, y, z) = \frac{\ln(z+4)}{x}\mathbf{i} + xyz\mathbf{j} + y\mathbf{k}$$

and  $C$  is the curve parametrized by  $x = 4t$ ,  $y = t^2$ ,  $z = 1 - t$ , for  $0 \leq t \leq 1$ .

49.  $\int_C \mathbf{F}(x, y, z) \cdot d\mathbf{r}$ , where

$$\mathbf{F}(x, y, z) = (yze^{xyz} + 2)\mathbf{i} + (xze^{xyz} - 1)\mathbf{j} + xye^{xyz}\mathbf{k}$$

and  $C$  is the curve of intersection of the surface  $z = \sqrt{x^2 + y^2}$  and the plane  $z - x + y = 10$ .

50.  $\int_C f(x, y, z) ds$ , where  $f(x, y, z) = (x+z)3^y$  and  $C$  is the curve parametrized by  $x = 2 - t$ ,  $y = 4t$ ,  $z = t + 5$ , for  $t = 1$  to  $t = 4$ .

## Applications

In Exercises 51–54, assume that a thin wire in space follows the given curve  $C$  and that the density of the wire at any point on  $C$  is given by  $\rho(x, y, z)$ . Find the mass of the wire by computing the line integral of the density function along the specified curve.

51.  $C$  is the portion of the unit circle that lies in the first quadrant, and  $\rho(x, y) = \ln(e^2 \sqrt{x^2 + y^2})$ .
52.  $C$  is the straight line through  $(5, -10)$  and  $(0, 2)$ , and  $\rho(x, y) = e^{x+y}$ .

53.  $C$  is parametrized by  $\mathbf{r}(t) = \left\langle 2t + 1, 10 - t, \frac{t^2}{2} \right\rangle$  from  $t = 0$  to  $t = 1$ , and  $\rho(x, y, z) = (x + 2y)\sqrt{2z + 5}$ .
54.  $C$  is the conical helix parametrized by  $\mathbf{r}(t) = \langle t \cos t, t \sin t, t \rangle$  from  $t = 0$  to  $t = 3\pi$ , and  $\rho(x, y, z) = \sqrt{x^2 + y^2 + z^2}$ .

In Exercises 55–58, find the work done by the given vector field  $\mathbf{F}$  along the specified curve  $C$ .

55.  $\mathbf{F}(x, y) = y\mathbf{i} - x\mathbf{j}$ , where  $C$  is the portion of the circle of radius 2, centered at the origin, and in the first quadrant, traversed counterclockwise from  $(2, 0)$  to  $(0, 2)$ .
56.  $\mathbf{F}(x, y) = xe^y\mathbf{i} + 2y\mathbf{j}$ , where  $C$  is the curve  $y = \ln x$  from  $(e, 1)$  to  $(e^2, 2)$ .
57.  $\mathbf{F}(x, y, z) = x \ln y\mathbf{i} + z\mathbf{j} + z^2\mathbf{k}$ , where  $C$  is the curve parametrized by  $(t, e^t, e^{-t})$  from  $(1, e, 1/e)$  to  $(\ln 2, 2, 1/2)$ .
58.  $\mathbf{F}(x, y, z) = yz\mathbf{i} + xz\mathbf{j} + xy\mathbf{k}$ , where  $C$  is the curve that is on the hyperbolic saddle and is parametrized by  $(\cos t, \sin t, \cos^2 t - \sin^2 t)$  for  $0 \leq t \leq \frac{\pi}{4}$ .

For a function  $f(x, y)$  defined along a curve  $C$  in the plane, we may define the **average value** of  $f$  on  $C$  to be the integral of  $f$  along  $C$ , divided by the length of  $C$ :

$$f_{\text{avg}}(C) = \frac{\int_C f(x, y) ds}{\int_C ds}.$$

A similar definition applies to functions of three variables. (See also Exercise 19.) In Exercises 59 and 60, use these definitions to find the average value of the specified function along the given curve.

59.  $f(x, y) = \sin^{-1} y \cos^{-1} x$ , with  $C$  the portion of the unit circle that lies in the first quadrant.
60.  $g(x, y, z) = xze^{xyz}$ , with  $C$  the straight line segment from the origin to the point  $(1, 1, 1)$ .

61. If  $C$  is a smooth closed curve in the plane, the **flux** of a vector field  $\mathbf{F}(x, y)$  across  $C$  measures the net flow out of the region enclosed by  $C$  and is defined to be

$$\int_C \mathbf{F}(x, y) \cdot \mathbf{n} ds,$$

where  $\mathbf{n}$  is a unit vector that is perpendicular to  $C$  and points in the “outward” direction. Find the flux of  $\mathbf{F}(x, y) = xe^{x^2+y^2}\mathbf{i} + ye^{x^2+y^2}\mathbf{j}$  across the boundary of the unit circle. (On the unit circle,  $\mathbf{n} = \langle x, y \rangle$ .)

62. Ian is planning a trip into the Wind River Range of mountains in Wyoming. He will carry ice gear, rock gear, and backpacking gear to a total of 80 pounds. He will follow a trail so that his position is given by

$$\langle 0.7t^2 + 1, 1.5t(2 - t), 0.1t^3 \rangle \text{ for } t \in [0, 1].$$

Distances are given in miles. How much work does Ian have to do to carry his pack on this trail?

63. Annie is making a crossing from one island to another, with a strong current in the channel. Her path is given by  $\mathbf{r}(t) = \langle t, 0.2t(1.2 - t) \rangle$  for  $t \in [0, 1.2]$ , while the velocity of the current is  $V = \langle 0, 0.9x(1.2 - x) \rangle$ , with the times in hours and the speeds in miles per hour.
- (a) Is the velocity of the current a conservative vector field?
- (b) Evaluate the line integral of the velocity of the current along the curve of Annie’s paddling path.
- (c) What is the physical significance of the line integral?

## Proofs

64. Prove that if  $\mathbf{F}$  is a conservative vector field, then the line integral of  $\mathbf{F}$  along any smooth closed curve  $C$  is zero.
65. Prove that if  $\mathbf{F}(x, y, z)$  is a conservative vector field, then line integrals of  $\mathbf{F}(x, y, z)$  are independent of path.

## Thinking Forward

*Integration across a surface:* In the next section, we will use the results of this section to enable us to deal with integrals on surfaces. We already know some of the basics, developed in Chapter 11.

- ▶ Our original computation of the arc length of a space curve in Chapter 11 used the “subdivide, approximate, and add” strategy and then took a limit, to end up with  $\int \|\mathbf{r}'(t)\| dt = \int ds$  as the integral used to compute arc length. How could this construction be modified to compute the area of a surface  $\mathcal{S}$  that is not part of the  $xy$ -plane?
- ▶ What should be added to the answer to the previous problem to compute the average value of a function  $f(x(t), y(t), z(t))$  across a smooth surface  $\mathcal{S}$ ?
- ▶ How could the integral of a vector field along a curve that we developed in this section be generalized to integrate a vector field across a surface?

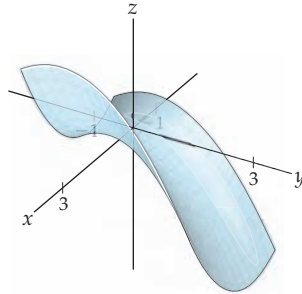

## 14.3 SURFACES AND SURFACE INTEGRALS

- ▶ Using parametric equations to define surfaces
- ▶ Computing the integral of a multivariate function on a surface
- ▶ Using an integral to compute the flow through a surface

### Parametrized Surfaces

In this section we will address the question of how to compute double integrals over surfaces that do not lie in a coordinate plane, and we will see how to integrate a vector field across a surface. In essence, this section generalizes double integrals in the same way that the previous section generalized integrals of functions of one variable. Surface area in the context of integrating over surfaces plays a role analogous to that of arc length in the context of line integrals: In both cases, the basic size of the object is calculated.

The surfaces we are most familiar with are those that are the graphs of functions of two variables,  $z = f(x, y)$ . One such surface, given by  $z = x^2 - y^2$  for  $x \in [-1, 3]$  and  $y \in [-1, 3]$ , is the following:

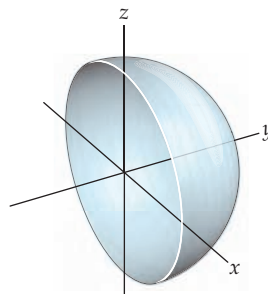

As we have done in other contexts, we will move back and forth between expressing a surface  $S$  in terms of points and in terms of position vectors.

Some surfaces cannot be expressed in the form  $z = f(x, y)$  but may still be obtained by distorting a portion of a plane while preserving its two-dimensionality. In general, a surface is the image of a region of the  $uv$ -plane under a change of variables like those we studied in Section 13.7. Just as a curve  $C$  is called a parametrized curve when described by  $\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j} + z(t)\mathbf{k}$ , a surface  $S$  given by

$$\mathbf{r}(u, v) = x(u, v)\mathbf{i} + y(u, v)\mathbf{j} + z(u, v)\mathbf{k},$$

for points  $(u, v) \in D$ , where  $D$  is a region in the  $uv$ -plane, is known as a **parametrized surface**. Typically  $D$  is a relatively simple subset of the  $uv$ -plane, such as a rectangle or a circle. For instance, consider the half of the unit sphere in  $\mathbb{R}^3$  that lies on the nonnegative side of the  $xz$ -plane:

This surface can be parametrized by

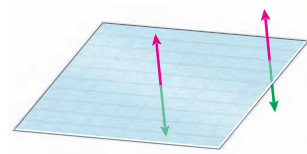

$$\mathbf{r}(u, v) = \langle \sin u \sin v, \cos u, \sin u \cos v \rangle, \text{ where } u \in \left[0, \frac{\pi}{2}\right] \text{ and } v \in [0, 2\pi].$$

Since we are interested in doing calculus, we want to deal only with smooth surfaces and parametrizations. A parametrization

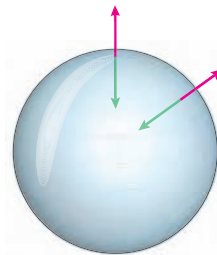

$$\mathbf{r}(u, v) = x(u, v)\mathbf{i} + y(u, v)\mathbf{j} + z(u, v)\mathbf{k} \text{ for } (u, v) \in D$$

is **smooth** if it is differentiable, if it has a continuous first derivative, and if  $\nabla \mathbf{r}(u, v) \neq \mathbf{0}$  for all  $(u, v) \in D$ . A surface  $S$  is smooth if it has a smooth parametrization. We will also work only with surfaces that are **orientable**; that is, surfaces for which there is a consistent choice of normal vector  $\mathbf{n}$ . Planes and spheres have this property. The Möbius band is an example of a **nonorientable** surface, since there is no consistent choice of normal vector.

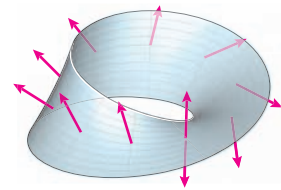

Planes are orientable

Spheres are orientable

A Möbius band is nonorientable

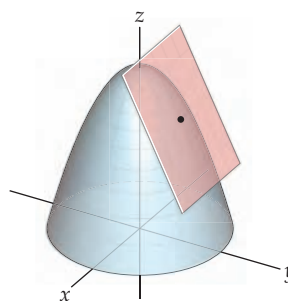

Nonorientable surfaces will not be discussed in this book, although they are interesting in their own right.

## Surface Area and Surface Integrals of Multivariate Functions

If we restrict our attention to smooth surfaces, we can use the “subdivide, approximate, and add” strategy first to approximate surface area and then to take the limit of increasingly fine approximations. This limit will result in an integration that yields the exact surface area.

Just as we approximated curves by their tangent vectors, we approximate surfaces by their tangent planes. Recall from Section 12.3 that the vectors  $\langle 1, 0, f_x(x_0, y_0) \rangle$  and  $\langle 0, 1, f_y(x_0, y_0) \rangle$  both lie in the plane tangent to the graph of  $z = f(x, y)$  at the point  $(x_0, y_0, f(x_0, y_0))$ .

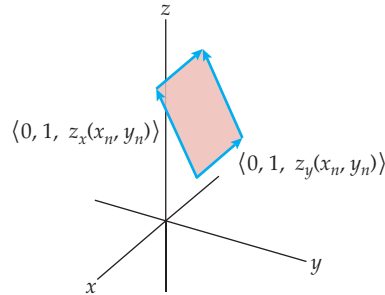

Since these vectors lie in the tangent plane, the parallelogram they determine is a piece of the tangent plane. We will use such parallelograms to approximate the area of the surface.

Starting with the familiar case, suppose we are interested in the area of the surface  $\mathcal{S}$  described by

$$x\mathbf{i} + y\mathbf{j} + z(x, y)\mathbf{k}$$

for  $(x, y) \in D \subseteq \mathbb{R}^2$ , with  $z(x, y)$  smooth on  $D$ . By partitioning  $D$  into  $n$  subregions and choosing  $(x_n, y_n)$  in each region, we can use the area of the parallelogram with sides  $\langle 1, 0, z_x(x_n, y_n) \rangle \Delta x$  and  $\langle 0, 1, z_y(x_n, y_n) \rangle \Delta y$ ,

as shown in the preceding figure, to approximate the area of the part of the surface that lies over the  $n$ th subregion:

$$\begin{aligned} A_n &\approx \|\langle 1, 0, z_x(x_n, y_n) \rangle \Delta x \times \langle 0, 1, z_y(x_n, y_n) \rangle \Delta y\| \\ &\approx \sqrt{(z_x(x_n, y_n))^2 + (z_y(x_n, y_n))^2 + 1} \Delta x \Delta y. \end{aligned}$$

Adding approximations over the subregions, we have

$$\text{Surface area} \approx \sum_{n=1}^M \sqrt{(z_x(x_n, y_n))^2 + (z_y(x_n, y_n))^2 + 1} \Delta x \Delta y.$$

The limit as the sizes of the subregions approach zero gives the exact surface area:

$$\begin{aligned} \text{Surface area} &= \int_D \sqrt{(z_x)^2 + (z_y)^2 + 1} \, dA \\ &= \iint_{\mathcal{S}} \sqrt{(z_x)^2 + (z_y)^2 + 1} \, dy \, dx. \end{aligned}$$

If instead  $\mathcal{S}$  is a general surface parametrized by  $\mathbf{r}(u, v) = \langle x(u, v), y(u, v), z(u, v) \rangle$ , then the approximation is done with the formulas

$$\mathbf{r}_u(u, v) = x_u \mathbf{i} + y_u \mathbf{j} + z_u \mathbf{k} \quad \text{and} \quad \mathbf{r}_v(u, v) = x_v \mathbf{i} + y_v \mathbf{j} + z_v \mathbf{k},$$

both of which lie in the plane tangent to  $\mathcal{S}$  at the point  $(x(u, v), y(u, v), z(u, v))$ . Substituting  $\|\mathbf{r}_u \times \mathbf{r}_v\|$  for  $\|\langle 1, 0, z_x(x_n, y_n) \rangle \times \langle 0, 1, z_y(x_n, y_n) \rangle\|$  in the approximation for  $A_n$ , and  $dA$  for  $\Delta x \Delta y$  yields

$$\text{Surface area} = \int_D \|\mathbf{r}_u(x, y, z) \times \mathbf{r}_v(x, y, z)\| \, dA.$$

This equation motivates our definition of the area of a surface and simplifies some notation as well.

## DEFINITION 14.6

## Surface Area

The **surface area** of a smooth surface  $S$  is

$$\int_S 1 \, dS.$$

(a) If  $S$  is given by  $z = f(x, y)$  for  $(x, y) \in D \subseteq \mathbb{R}^2$ , then

$$dS = \sqrt{\left(\frac{\partial z}{\partial x}\right)^2 + \left(\frac{\partial z}{\partial y}\right)^2 + 1} \, dA.$$

(b) If  $S$  is parametrized by  $\mathbf{r}(u, v)$  for  $(u, v) \in D$ , then

$$\begin{aligned} dS &= \|\mathbf{r}_u \times \mathbf{r}_v\| \, dA \\ &= \|\mathbf{r}_u \times \mathbf{r}_v\| \, du \, dv. \end{aligned}$$

Once we know how to find the area of a surface, it is easy to see what we ought to do to integrate a function  $f(x, y, z)$  on that surface: multiply the area integrand  $dS$  by  $f(x, y, z)$ , and integrate. Then the integral of a function  $f(x, y, z)$  over a surface  $S$  is

$$\int_S f(x, y, z) \, dS$$

The motivation for this definition of the integral of a function over a surface is the same as our motivation for the integral of a function along a curve. In each case, the integrand becomes

$$(\text{value of function}) \times (\text{size of region}),$$

where the size of the region is a length or an area, depending on the dimension. Thus, our definition of the integral of a multivariate function over a surface is as follows:

## DEFINITION 14.7

## Surface Integral of a Multivariate Function

The **integral of  $f(x, y, z)$  over a smooth surface  $S$**  is

$$\begin{aligned} \int_S f(x, y, z) \, dS &= \iint_D f(x(u, v), y(u, v), z(u, v)) \|\mathbf{r}_u \times \mathbf{r}_v\| \, dA \\ &= \iint_D f(x(u, v), y(u, v), z(u, v)) \|\mathbf{r}_u \times \mathbf{r}_v\| \, du \, dv, \end{aligned}$$

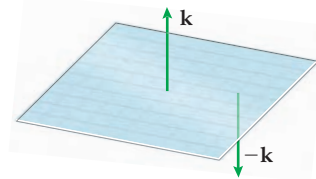

where  $D$  is the domain of the smooth parametrization of  $S$  by  $\mathbf{r}(u, v)$ .

This definition is more tricky in practice than it appears, since  $S$  may be quite complex. One of the attractive features of the Divergence Theorem, which appears later in this chapter, is that it provides an alternative way of evaluating some surface integrals.

## The Flux of a Vector Field Across a Surface

Integrating a vector field over a surface is similar to integrating a vector field along a curve, although in the case of a surface there is a conceptual change beyond the increase in dimension. The interaction of vector field and surface of most general interest is the *flux*

through the surface; that is, the measurement of what is transferred through the surface by the action of the vector field. As an example, consider the passage of fluid through a membrane. If we know the rates and directions of flow at every point on the surface, we should be able to find the total flow through the surface by integrating the rates of flow at every point on the surface. We are thus summing the action of vector field  $\mathbf{F}(x, y, z)$  through the surface, in the direction normal to the surface at that point. Because we are interested only in the direction that is perpendicular, and not a magnitude, we will represent the normal direction by a unit normal vector  $\mathbf{n}$ . Because we have restricted our attention to surfaces that are orientable, any surface we consider has a continuous and well-defined unit normal vector. We need only to decide in which direction we want to travel across the surface. For instance, the vectors  $\mathbf{k}$  and  $-\mathbf{k}$  are both unit vectors perpendicular to the  $xy$ -plane; to evaluate the flux of a vector field through the  $xy$ -plane, as shown in the figure that follows, we would need to know which direction we were interested in,  $\mathbf{k}$  or  $-\mathbf{k}$ .

Now that we have resolved to count the activity of  $\mathbf{F}(x, y, z)$  in the direction normal to  $S$ , our usual strategy of “subdivide, approximate, and add” will involve subdividing the surface into small subregions, then choosing an arbitrary point  $(x_n, y_n, z_n)$  in each subregion, and approximating the total flow through that region by computing  $\mathbf{F}(x_n, y_n, z_n) \cdot \mathbf{n}$ , where  $\mathbf{n}$  is the unit normal vector at  $(x_n, y_n, z_n)$ .

### DEFINITION 14.8

#### Flux of a Vector Field Across a Surface

If  $\mathbf{F}(x, y, z)$  is a continuous vector field defined on an oriented surface  $S$  given by  $\mathbf{r}(u, v)$  for  $(u, v) \in D$  with unit normal vector  $\mathbf{n}$ , then the **flux** of  $\mathbf{F}(x, y, z)$  through  $S$  is

$$\int_S \mathbf{F}(x, y, z) \cdot \mathbf{n} \, dS.$$

(a) If  $S$  is the graph of  $z = z(x, y)$ , then

$$\int_S \mathbf{F}(x, y, z) \cdot \mathbf{n} \, dS = \iint_D (\mathbf{F}(x, y, z) \cdot \mathbf{n}) \|z_x \times z_y\| \, dy \, dx.$$

(b) If  $S$  is parametrized by  $u$  and  $v$ , then

$$\int_S \mathbf{F}(x, y, z) \cdot \mathbf{n} \, dS = \iint_D (\mathbf{F}(x, y, z) \cdot \mathbf{n}) \|\mathbf{r}_u \times \mathbf{r}_v\| \, du \, dv.$$

Note that  $\mathbf{n}$ , being a unit normal vector to  $S$ , satisfies

$$\mathbf{n} = \pm \frac{\mathbf{r}_u \times \mathbf{r}_v}{\|\mathbf{r}_u \times \mathbf{r}_v\|}.$$

We might be tempted to cancel the magnitudes and simply integrate  $\mathbf{F} \cdot (\mathbf{r}_u \times \mathbf{r}_v)$ , but this is correct only if  $\mathbf{r}_u \times \mathbf{r}_v$  happens to point in the desired direction.

## Examples and Explorations

## EXAMPLE 1

## Computing surface areas

Find the areas of the following surfaces:

- (a) The portion of the plane  $z = 3x + 5y$  that lies above the rectangle  $[0, 1] \times [1, 5]$  in the  $xy$ -plane.  
 (b) The unit sphere.

## SOLUTION

- (a) The portion of the plane we seek is the graph of the function  $f(x, y) = 3x + 5y$  with  $f_x = 3$  and  $f_y = 5$ . Then

$$dS = \sqrt{9 + 25 + 1} dA = \sqrt{35} dA.$$

So,

$$\int_S dS = \int_1^5 \int_0^1 \sqrt{35} dx dy = 4\sqrt{35}.$$

- (b) The unit sphere is parametrized by

$$\mathbf{r}(u, v) = \langle \cos u \sin v, \sin u \sin v, \cos v \rangle \text{ for } u \in [0, 2\pi] \text{ and } v \in [0, \pi].$$

Thus,

$$\mathbf{r}_u = \langle -\sin u \sin v, \cos u \sin v, 0 \rangle \quad \text{and} \quad \mathbf{r}_v = \langle \cos u \cos v, \sin u \cos v, -\sin v \rangle.$$

You should verify that

$$\|\mathbf{r}_u \times \mathbf{r}_v\| = \sin v.$$

So,

$$\int_S dS = \int_0^{2\pi} \int_0^\pi \sin v dv du = 4\pi. \quad \square$$

 CHECKING THE ANSWER

- (a) The surface here is a parallelogram whose four vertices are  $(0, 1, f(0, 1)) = (0, 1, 5)$ ,  $(1, 1, f(1, 1)) = (1, 1, 8)$ ,  $(1, 5, f(1, 5)) = (1, 5, 28)$ , and  $(0, 5, f(0, 5)) = (0, 5, 25)$ . This parallelogram is congruent to the parallelogram determined by the vectors  $\langle 1, 0, 3 \rangle$  and  $\langle 0, 4, 20 \rangle$ . As we saw in Section 10.4, the area of the latter parallelogram is  $\|\langle 1, 0, 3 \rangle \times \langle 0, 4, 20 \rangle\|$ . You may check that the value of this norm is also  $4\sqrt{35}$ .  
 (b) The surface area of a sphere with radius  $R$  is given by  $4\pi R^2$ . Since the radius was 1 in our example, we obtained the correct result.

## EXAMPLE 2

## Integrating a multivariate function on a surface

Integrate the indicated functions over the accompanying surfaces:

- (a) The function  $g(x, y, z) = 4x^2 + 4y^2 + 1$  over the portion of the surface  $\mathcal{S}$  defined by  $z = 1 - x^2 - y^2$  and that lies above the unit disk in the  $xy$ -plane.  
 (b) The function  $h(x, y, z) = e^{x-2z}$ , where  $\mathcal{S}$  is the surface parametrized by

$$\mathbf{r}(u, v) = \langle 2u + 3v, 7v, u + 5v \rangle \text{ for } 0 \leq u \leq \pi \text{ and } 2 \leq v \leq 4.$$

## SOLUTION

- (a) This surface is the graph of  $z$  as a function of  $x$  and  $y$ , where  $\frac{\partial z}{\partial x} = -2x$  and  $\frac{\partial z}{\partial y} = -2y$ , so we have

$$dS = \sqrt{4x^2 + 4y^2 + 1} \, dA$$

and

$$\int_S g(x, y, z) \, dS = \iint_{\text{unit disk}} (4x^2 + 4y^2 + 1) \sqrt{4x^2 + 4y^2 + 1} \, dA.$$

It is easier to evaluate this integral with polar coordinates. Recall that  $x^2 + y^2 = r^2$  and  $dA = r \, dr \, d\theta$ . Since we are integrating above the unit disk, we have

$$\begin{aligned} \int_0^{2\pi} \int_0^1 (4r^2 + 1) \sqrt{4r^2 + 1} \, r \, dr \, d\theta &= \int_0^{2\pi} \int_0^1 r(4r^2 + 1)^{3/2} \, dr \, d\theta \\ &= \int_0^{2\pi} \frac{1}{20} [(4r^2 + 1)^{5/2}]_{r=0}^{r=1} \, d\theta \\ &= \int_0^{2\pi} \frac{5^{5/2} - 1}{20} \, d\theta = \frac{\pi(25\sqrt{5} - 1)}{10}. \end{aligned}$$

- (b) This surface is parametrized by  $\mathbf{r}(u, v) = \langle 2u + 3v, 7v, u + 5v \rangle$ . We have

$$\mathbf{r}_u = \langle 2, 0, 1 \rangle \quad \text{and} \quad \mathbf{r}_v = \langle 3, 7, 5 \rangle.$$

Then

$$dS = \|\mathbf{r}_u \times \mathbf{r}_v\| \, dA = \|\langle -7, -7, 14 \rangle\| \, dA = 7\sqrt{6} \, dA.$$

We rewrite  $h$  in terms of the parameters  $u$  and  $v$ , giving

$$h(x(u, v), y(u, v), z(u, v)) = e^{(2u+3v)-2(u+5v)} = e^{-7v}.$$

So,

$$\begin{aligned} \int_S h(x, y, z) \, dS &= 7\sqrt{6} \int_D e^{-7v} \, dA \\ &= 7\sqrt{6} \int_0^\pi \int_2^4 e^{-7v} \, dv \, du \\ &= 7\sqrt{6} \int_0^\pi \left[ -\frac{1}{7} e^{-7v} \right]_2^4 \, du \\ &= \sqrt{6} \int_0^\pi (e^{-14} - e^{-28}) \, du = \frac{\sqrt{6}\pi(e^{14} - 1)}{e^{28}}. \end{aligned}$$

□

## EXAMPLE 3

## The mass of a lamina

Recall that a lamina is a two-dimensional object with a density function  $\rho$  and that the mass is the integral of the density function over the region occupied by the lamina.

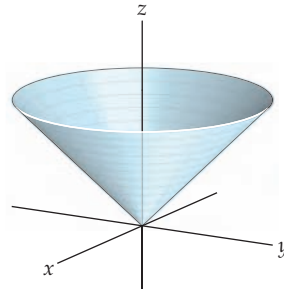

Find the mass of each lamina:

- (a)  $S$  is the portion of the cone  $z = \sqrt{x^2 + y^2}$  that lies above the disk of radius 3 in the  $xy$ -plane and centered at the origin.  $S$  has the constant density function  $\rho(x, y, z) = k$ .
- (b)  $S$  is the same surface, but with density function  $\rho(x, y, z) = x^2 + y^2 + z^2$ .

**SOLUTION**

(a) This surface, shown next, is a graph of  $z$  in terms of  $x$  and  $y$ , with

$$\frac{\partial z}{\partial x} = \frac{x}{\sqrt{x^2 + y^2}} \quad \text{and} \quad \frac{\partial z}{\partial y} = \frac{y}{\sqrt{x^2 + y^2}}.$$

So,

$$dS = \sqrt{\frac{x^2}{x^2 + y^2} + \frac{y^2}{x^2 + y^2} + 1} dA = \sqrt{2} dA.$$

The mass of this lamina is given by

$$\int_S k dS = \int_D k\sqrt{2} dA,$$

where  $D$  is the circle with radius 3 and centered at the origin. Because of the symmetry of the lamina, it is convenient to integrate with polar coordinates. We have

$$\begin{aligned} \int_0^{2\pi} \int_0^3 k\sqrt{2} r dr d\theta &= \int_0^{2\pi} \left[ \frac{k\sqrt{2}r^2}{2} \right]_0^3 d\theta \\ &= \int_0^{2\pi} \frac{9k\sqrt{2}}{2} d\theta = 9k\sqrt{2}\pi. \end{aligned}$$

(b) In this case the differential,  $dS$ , is the same as before, but

$$\rho(x, y, z) = x^2 + y^2 + z^2 = x^2 + y^2 + (\sqrt{x^2 + y^2})^2 = 2x^2 + 2y^2,$$

since  $z = \sqrt{x^2 + y^2}$ . So,

$$\begin{aligned} \int_S \rho(x, y, z) dS &= \int_D (2x^2 + 2y^2)\sqrt{2} dA \\ &= \int_0^{2\pi} \int_0^3 2r^2\sqrt{2} r dr d\theta \\ &= \int_0^{2\pi} \int_0^3 2\sqrt{2}r^3 dr d\theta \\ &= \int_0^{2\pi} \left[ \frac{\sqrt{2}}{2}r^4 \right]_0^3 d\theta \\ &= \int_0^{2\pi} \frac{81\sqrt{2}}{2} d\theta = 81\sqrt{2}\pi. \end{aligned}$$

□

## EXAMPLE 4

## Finding the flux through a surface

Find the fluxes of

- (a)  $\mathbf{F}(x, y, z) = yz\mathbf{i} + 3x \cos z\mathbf{j} - 4y^2x\mathbf{k}$  through the rectangle  $1 \leq y \leq 10$  and  $2 \leq z \leq 4$  in the  $yz$ -plane in the positive  $x$  direction.
- (b)  $\mathbf{F}(x, y, z) = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$  through the upper half of the unit sphere in the direction of the unit normal vector with positive  $z$ -component.

## SOLUTION

- (a) This surface is just a piece of the  $yz$ -plane. It is parametrized by

$$y\mathbf{j} + z\mathbf{k} \quad 1 \leq y \leq 10, \quad 2 \leq z \leq 4.$$

Because of the orientation,  $\mathbf{n} = \mathbf{i}$ , so

$$\mathbf{F}(x, y, z) \cdot \mathbf{n} = (yz\mathbf{i} + 3x \cos z\mathbf{j} - 4y^2x\mathbf{k}) \cdot \mathbf{i} = yz.$$

The flux of  $\mathbf{F}(x, y, z)$  through  $S$  is

$$\int_S \mathbf{F} \cdot \mathbf{n} \, dS = \int_1^{10} \int_2^4 yz \, dz \, dy = 297.$$

- (b) Here the surface is given by

$$z = \sqrt{1 - x^2 - y^2}.$$

The choice of  $\mathbf{n}$  should have a positive  $z$ -component. We recall from Chapter 12 that if  $z = f(x, y)$ , then the vector

$$\left\langle 1, 0, \frac{\partial z}{\partial x} \right\rangle \times \left\langle 0, 1, \frac{\partial z}{\partial y} \right\rangle = \left\langle -\frac{\partial z}{\partial x}, -\frac{\partial z}{\partial y}, 1 \right\rangle$$

is normal to the surface. This vector already has a positive  $z$ -component, so all we have to do is scale it to form a unit vector. We have

$$\mathbf{v} = \left\langle -\frac{\partial z}{\partial x}, -\frac{\partial z}{\partial y}, 1 \right\rangle = \left\langle \frac{x}{\sqrt{1 - x^2 - y^2}}, \frac{y}{\sqrt{1 - x^2 - y^2}}, 1 \right\rangle$$

perpendicular to the surface. This equation yields

$$\frac{\mathbf{v}}{\|\mathbf{v}\|} = \mathbf{n} = \left\langle x, y, \sqrt{1 - x^2 - y^2} \right\rangle$$

as the desired unit normal. We can also use that information to compute

$$dS = \sqrt{\frac{x^2}{1 - x^2 - y^2} + \frac{y^2}{1 - x^2 - y^2} + 1} \, dA = \frac{1}{\sqrt{1 - x^2 - y^2}} \, dA.$$

If we let  $D$  be the unit disk in the  $xy$ -plane and centered at the origin, then the flux through  $S$  in the positive  $z$  direction is

$$\begin{aligned} \int_S \mathbf{F}(x, y, z) \cdot \mathbf{n} \, dS &= \int_D \left( \langle x, y, z \rangle \cdot \left\langle x, y, \sqrt{1 - x^2 - y^2} \right\rangle \right) \frac{1}{\sqrt{1 - x^2 - y^2}} \, dA \\ &= \int_D \left( \langle x, y, \sqrt{1 - x^2 - y^2} \rangle \cdot \left\langle x, y, \sqrt{1 - x^2 - y^2} \right\rangle \right) \frac{1}{\sqrt{1 - x^2 - y^2}} \, dA \\ &= \int_D \frac{1}{\sqrt{1 - x^2 - y^2}} \, dA \\ &= \int_0^{2\pi} \int_0^1 \frac{r}{\sqrt{1 - r^2}} \, dr \, d\theta \\ &= \int_0^{2\pi} \left[ -(1 - r^2)^{1/2} \right]_0^1 \, d\theta \\ &= \int_0^{2\pi} 1 \, d\theta = 2\pi. \end{aligned}$$

□

## TEST YOUR UNDERSTANDING

- ▶ How was the “subdivide, approximate, and add” approach used in motivating the definition of surface area?
- ▶ What is measured by  $\int_S dS$ ?
- ▶ What is measured by  $\int_S f(x, y, z) dS$ ?
- ▶ Why does this section refer only to vector fields in  $\mathbb{R}^3$ ?
- ▶ What is measured by  $\int_S \mathbf{F} \cdot \mathbf{n} dS$ ?

## EXERCISES 14.3

### Thinking Back

- ▶ *Area:* Finding the area of a region in the  $xy$ -plane is one of the motivating applications of integration. It is also a special case of the surface area calculation developed in this section. Find the area of the region in the  $xy$ -plane bounded by the curves  $y = x^2$  and  $x = \sqrt{y}$ .
- ▶ *Double integrals:* The double integrals of Chapter 13 were our first exposure to surface integrals, on the very well-behaved surface of the  $xy$ -plane. Evaluate  $f(x, y) = x^2 - y^2$  on the region bounded by the  $x$ -axis and the curve defined by  $y = 4 - x^2$ .
- ▶ *Average value:* Recall that the average value of a function of two variables  $f(x, y)$  on a region  $\Omega$  is given by the quotient
 
$$\frac{\iint_{\Omega} f(x, y) dA}{\iint_{\Omega} dA}.$$
 Compute the average value of  $g(x, y) = xy$  on the first-quadrant region bounded by  $y = x$  and  $y = x^2$ .

### Concepts

0. *Problem Zero:* Read the section and make your own summary of the material.
1. *True/False:* Determine whether each of the statements that follow is true or false. If a statement is true, explain why. If a statement is false, provide a counterexample.
  - (a) *True or False:* The result of integrating a vector field over a surface is a vector.
  - (b) *True or False:* The result of integrating a function over a surface is a scalar.
  - (c) *True or False:* For a region  $R$  in the  $xy$ -plane,  $dS = dA$ .
  - (d) *True or False:* In computing  $\int_S f(x, y, z) dS$ , the direction of the normal vector is irrelevant.
  - (e) *True or False:* If  $f(x, y, z)$  is defined on an open region containing a smooth surface  $S$ , then  $\int_S f(x, y, z) dS$  measures the flow through  $S$  in the positive  $z$  direction determined by  $f(x, y, z)$ .
  - (f) *True or False:* If  $\mathbf{F}(x, y, z)$  is defined on an open region containing a smooth surface  $S$ , then  $\int_S \mathbf{F}(x, y, z) \cdot \mathbf{n} dS$  measures the flow through  $S$  in the direction of  $\mathbf{n}$  determined by the field  $\mathbf{F}(x, y, z)$ .
  - (g) *True or False:* In computing

$$\int_S \mathbf{F}(x, y, z) \cdot \mathbf{n} dS,$$

the direction of the normal vector is irrelevant.

- (h) *True or False:* In computing

$$\int_S \mathbf{F}(x, y, z) \cdot \mathbf{n} dS$$

with  $\mathbf{n}$  pointing in the correct direction, we could use a scalar multiple of  $\mathbf{n}$ , since the length will cancel in the  $dS$  term.

2. *Examples:* Construct examples of the thing(s) described in the following. Try to find examples that are different than any in the reading.
  - (a) Two different surfaces with the same area. (Try to make these very different, not just shifted copies of each other.)
  - (b) Let  $S$  be the surface parametrized by
 
$$\mathbf{r}(u, v) = x(u, v)\mathbf{i} + y(u, v)\mathbf{j} + z(u, v)\mathbf{k}.$$
 Give two different unit normal vectors to  $S$  at the point  $r(u_0, v_0)$ .
  - (c) A smooth surface that can be smoothly parametrized as  $\mathbf{r}(x, z) = \langle x, f(x), z \rangle$ .
3. Why do surface integrals of multivariate functions *not* include an  $\mathbf{n}$  term, whereas surface integrals of vector fields *do* include this term?

- Make a chart of all the new notation, definitions, and theorems in this section, including what each new item means in terms you already understand.
- Compute a general formula for  $dS$  for any plane  $ax + by + cz = k$  if  $c \neq 0$ .
- Relate the integrand  $\mathbf{F} \cdot \mathbf{n} dS$  to the discussions of work in Sections 6.4 and 14.2.
- Give a smooth parametrization of the upper half of the unit sphere in terms of  $x$  and  $y$ .
- Compute  $dS$  for your parametrization in Exercise 7.
- Give a smooth parametrization, in terms of  $u$  and  $v$ , of the sphere of radius  $k$  and centered at the origin.
- Compute  $dS$  for your parametrization in Exercise 9.
- Given a smooth surface  $S$  described as a function  $z = f(x, y)$ , calculate the upwards-pointing normal vector for  $S$ .
- Give a smooth parametrization for a “generalized cylinder”  $S$ , given by extending the curve  $y = x^2$  upwards and downwards from  $z = -2$  to  $z = 3$ .
- Compute  $\mathbf{n}$  for the surface  $S$  in Exercise 12.
- Generalize your answer to Exercise 12 to give a parametrization and a normal vector for the extension of any differentiable plane curve  $y = f(x)$  through  $a \leq z \leq b$ .
- Use what you know about average value from previous sections to propose a formula for the average value of a multivariate function  $f(x, y, z)$  on a smooth surface  $S$ .
- Use what you know about averages to propose a formula for the average rate of flux of a vector field  $\mathbf{F}(x, y, z)$  through a smooth surface  $S$  in the direction of  $\mathbf{n}$ .
- If  $S$  is parametrized by  $\mathbf{r}(u, v)$ , why is  $dS = \|\mathbf{r}_u \times \mathbf{r}_v\| du dv$  the correct factor to use to account for distortion of area?
- Examine the parametrization of surfaces and the computation of  $dS$  in light of the discussion of change of variables and the Jacobian in Section 13.7. How are these ideas related?
- Give a formula for a normal vector to the surface  $S$  determined by  $x = f(y, z)$ , where  $f(y, z)$  is a function with continuous partial derivatives.
- Give a formula for a normal vector to the surface  $S$  determined by  $y = g(x, z)$ , where  $g(x, z)$  is a function with continuous partial derivatives.

## Skills

Find the areas of the given surfaces in Exercises 21–26.

- $S$  is the portion of the plane with equation  $y - z = \frac{\pi}{2}$  that lies above the rectangle determined by  $0 \leq x \leq 4$  and  $3 \leq y \leq 6$ .
- $S$  is the portion of the plane with equation  $x = y + z$  that lies above the region in the  $xy$ -plane that is bounded by  $y = x$ ,  $y = 5$ ,  $y = 10$ , and the  $y$ -axis.
- $S$  is the portion of the saddle surface determined by  $z = x^2 - y^2$  that lies above and/or below the annulus in the  $xy$ -plane determined by the circles with radii  $\frac{\sqrt{3}}{2}$  and  $\sqrt{2}$  and centered at the origin.
- $S$  is the portion of the surface determined by  $x = 9 - y^2 - z^2$  that lies on the positive side of the  $yz$ -plane (i.e., where  $x \geq 0$ ).
- $S$  is the portion of the surface parametrized by  $\mathbf{r}(u, v) = (3u - v, v + u, v - u)$  whose preimage (the domain in the  $uv$ -plane) is the unit square  $[0, 1] \times [0, 1]$ .
- $S$  is the lower branch of the hyperboloid of two sheets  $z^2 = x^2 + y^2 + 1$  that lies below the annulus determined by  $1 \leq r \leq 2$  in the  $xy$ -plane.

Integrate the given function over the accompanying surface in Exercises 27–34.

- $f(x, z) = e^{-(x^2+z^2)}$ , where  $S$  is the unit disk centered at the point  $(0, 2, 0)$  and in the plane  $y = 2$ .
- $f(x, y, z) = x^2 - y + 3z$ , where  $S$  is the portion of the plane with equation  $2x - 6y + 3z = 1$  whose preimage in the  $xz$ -plane is the region bounded by the coordinate axes and the lines with equations  $z = 4$  and  $x = z$ .
- $f(x, y, z) = xyz^2$ , where  $S$  is the portion of the cone  $\sqrt{3}z = \sqrt{x^2 + y^2}$  that lies within the sphere of radius 4 and centered at the origin.

- $f(x, y, z) = e^z$ , where  $S$  is the portion of the unit sphere in the first octant.
- $f(x, y, z) = \frac{y}{x} \sqrt{4z^2 + 1}$ , where  $S$  is the portion of the paraboloid  $z = x^2 + y^2$  that lies above the rectangle determined by  $1 \leq x \leq e$  and  $0 \leq y \leq 2$  in the  $xy$ -plane.
- $f(x, y, z) = e^{\sqrt{8y^2 - 4z + 1}} (4z + 8x^2 + 1)^{-1/2}$ , where  $S$  is the portion of the saddle surface with equation  $z = y^2 - x^2$  that lies above the region in the  $xy$ -plane bounded by the line with equation  $y = x$  in the first quadrant, the line with equation  $y = -x$  in the second quadrant, and the unit circle.
- $f(x, y, z) = x - z + y^2$ , where  $S$  is given by

$$\mathbf{r}(u, v) = (u + v) \mathbf{i} + 2\sqrt{u^2 + v^2} \mathbf{j} + (u - v) \mathbf{k}$$

on the region in the  $uv$ -plane bounded by the graphs of  $v = u$  and  $v = u^2$ .

- $f(x, y, z) = \frac{1}{x \ln(z + 2y)}$ , where  $S$  is the surface given by  $\mathbf{r}(u, v) = 2u \mathbf{i} + (u + v) \mathbf{j} + (2u - 2v) \mathbf{k}$  for  $3 \leq u \leq 7$  and  $2 \leq v \leq 10$ .

Find the flux of the given vector field through the given surface in Exercises 35–42.

- $\mathbf{F}(x, y, z) = \cos(xyz) \mathbf{i} + \mathbf{j} - yz \mathbf{k}$ , where  $S$  is the portion of the surface with equation  $z = y^3 - y^2$  that lies above and/or below the rectangle determined by  $-3 \leq x \leq 2$  and  $-1 \leq y \leq 1$  in the  $xy$ -plane, with  $\mathbf{n}$  pointing in the positive  $z$  direction.
- $\mathbf{F} = \left\langle x \ln(xz), 5z, \frac{1}{y^2 + 1} \right\rangle$ , where  $S$  is the region of the plane with equation  $12x - 9y + 3z = 10$ , where  $2 \leq x \leq 3$  and  $5 \leq y \leq 10$ , with  $\mathbf{n}$  pointing upwards.

37.  $\mathbf{F}(x, y, z) = -xz\mathbf{i} - yz\mathbf{j} + z^2\mathbf{k}$ , where  $S$  is the cone with equation  $z = \sqrt{x^2 + y^2}$  between  $z = 2$  and  $z = 4$ , with  $\mathbf{n}$  pointing outwards.
38.  $\mathbf{F}(x, y, z) = \langle yz, xz, xy \rangle$ , where  $S$  is the portion of the saddle determined by  $z = x^2 - y^2$  that lies above the region in the  $xy$ -plane bounded by the  $x$ -axis and the parabola with equation  $y = 1 - x^2$ .
39.  $\mathbf{F}(x, y, z) = z \cos yz\mathbf{j} + z \sin yz\mathbf{k}$ , where  $S$  is the portion of the plane with equation  $2x - 8y - 10z = 42$  that lies on the positive side of the rectangle with corners  $(0, -\pi, 0)$ ,  $(0, \pi, 0)$ ,  $(0, \pi, \pi)$ , and  $(0, -\pi, \pi)$  in the  $yz$ -plane.
40.  $\mathbf{F}(x, y, z) = \mathbf{i} + \mathbf{j} + \mathbf{k}$ , where  $S$  is the lower half of the unit sphere, with  $\mathbf{n}$  pointing outwards.
41.  $\mathbf{F}(x, y, z) = 5\mathbf{i} + 13\mathbf{j} + 2\mathbf{k}$ , where  $S$  is the unit sphere, with  $\mathbf{n}$  pointing outwards.
42.  $\mathbf{F}(x, y, z) = -y\mathbf{i} + x\mathbf{j} - e^{yz}\mathbf{k}$ , where  $S$  is the cylinder with equation  $x^2 + y^2 = 9$  from  $z = 2$  to  $z = 4$ , with  $\mathbf{n}$  pointing outwards.

Evaluate the integrals in Exercises 43–48.

43. Find  $\int_S 1 \, dS$ , where  $S$  is the portion of the surface determined by  $z = x^2 - \sqrt{3}y$  that lies above the region in the  $xy$ -plane bounded by the  $x$ -axis and the lines with equations  $y = 2x$  and  $x = 3$ .

44. Find  $\int_S \mathbf{F}(x, y, z) \cdot \mathbf{n} \, dS$  if

$$\mathbf{F}(x, y, z) = \frac{\ln(x^2 + y^2 + 1)}{z + 3}\mathbf{i} + \frac{y}{y + 1}\mathbf{j} + e^{z^2}\mathbf{k},$$

where  $S$  is the portion of the sphere with radius 2, centered at the origin, and that lies below the plane with equation  $z = -\sqrt{2}$ , with  $\mathbf{n}$  pointing outwards.

45. Find the integral of  $f(x, y, z) = z^3 + z(x^2 + 2y)$  on the portion of the unit sphere that lies in the first octant, above the rectangle  $\left[0, \frac{1}{2}\right] \times \left[0, \frac{1}{3}\right]$  in the  $xy$ -plane.
46. Find  $\int_S 1 \, dS$ , where  $S$  is the portion of the surface with equation  $x = e^{yz} - e^{-yz}$  that lies on the positive side of the circle of radius 3 and centered at the origin in the  $yz$ -plane.
47. Find  $\int_S \mathbf{F}(x, y, z) \cdot \mathbf{n} \, dS$  if

$$\mathbf{F}(x, y, z) = 2xz\mathbf{i} + 2yz\mathbf{j} - 18\mathbf{k}$$

and  $S$  is the portion of the hyperboloid  $x^2 + y^2 - 9 = z^2$  that lies between the planes  $z = -4$  and  $z = 0$ , with  $\mathbf{n}$  pointing outwards.

48. Find the integral of  $f(x, y, z) = x - y - z$  on the portion of the plane with equation  $10x - \sqrt{33}y + 36z = 30$  with  $2 \leq x \leq 7$  and  $1 \leq z \leq 2$ .

## Applications

Find the masses of the laminae in Exercises 49 and 50.

49. The lamina occupies the region of the hyperbolic saddle with equation  $z = x^2 - y^2$  that lies above and/or below the disk of radius 2 about the origin in the  $xy$ -plane where the density is uniform.
50. The lamina occupies the region of the hyperboloid with equation  $z^2 + 4 = x^2 + y^2$  that lies above and/or below the disk of radius 5 about the origin in the  $xy$ -plane, and the density function,  $\rho(x, y, z)$ , is proportional to distance from the origin.

Find the flux of the given vector field through a permeable membrane described by surface  $S$  in Exercises 51 and 52.

51.  $\mathbf{F}(x, y, z) = y\mathbf{i} + x\mathbf{j} + \mathbf{k}$ , where  $S$  is the paraboloid with equation  $z = 4x^2 + y^2 + 1$  that lies above the annulus determined by  $1 \leq x^2 + y^2 \leq 4$  in the  $xy$ -plane.
52.  $\mathbf{F}(x, y, z) = -z\mathbf{i} + y\mathbf{j} + x\mathbf{k}$ , where  $S$  is the surface with equation  $y = \cos z$  for  $1 \leq x \leq 5$  and  $0 \leq z \leq \frac{\pi}{2}$ .
53. Suppose that an electric field is given by

$$\mathbf{E} = 2y\mathbf{i} + 2xy\mathbf{j} + yz\mathbf{k}.$$

Compute the flux  $\int_S \mathbf{E} \cdot \mathbf{n} \, dA$  of the field through the unit cube  $[0, 1] \times [0, 1] \times [0, 1]$ .

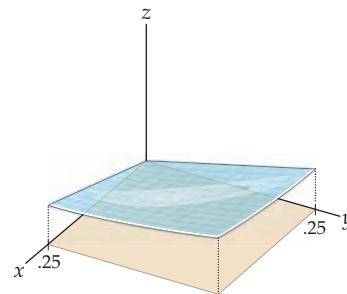

54. Suppose that an electric field is given by

$$\mathbf{E} = \frac{K}{(x^2 + y^2 + z^2)^{3/2}}(x\mathbf{i} + y\mathbf{j} + z\mathbf{k}),$$

where  $K$  is a constant. Show that the flux of the field through any sphere centered at the origin is constant.

Mac owns a farm in the Palouse, a large agricultural region in the northwestern United States. One field on his farm can be modeled as the surface  $s(x, y) = 0.24\sqrt{x^2 + y^2}$  on the square  $[0, 0.25] \times [0, 0.25]$ , where all distances are given in miles. Use this information to answer Exercises 55 and 56.

55. What is the actual area of Mac's field?

56. Mac is concerned with evapotranspiration from his land: the process wherein moisture from the soil evaporates, or is taken up by plants and then transpired into the air. The problem is that certain parts of his field tend to be drier than others, and since the whole field is tilted so as to face south, the entire field dries out more quickly than if it were flat. The rate at which the field dries out depends

on how much solar radiation hits Mac's land (i.e., a flux of radiation into the field). On a hot day in July at noon, the rays of the sun hit the earth parallel to the line  $\langle 0, t, -3t \rangle$  for  $t \in \mathbb{R}$ . Compare the solar flux through this field with that through the horizontal rectangle  $[0, 0.25] \times [0, 0.25]$  in the  $xy$ -plane that underlies it.

## Proofs

57. Show that reversing the orientation of a surface  $S$  reverses the sign of  $\int_S \mathbf{F}(x, y, z) \cdot \mathbf{n} \, dS$ .
58. Show that the two definitions of  $dS$  in Definition 14.6 are equivalent, by showing that if  $S$  is a surface described by  $\mathbf{r}(x, y) = (x, y, z(x, y))$  for  $(x, y) \in D$ , then

$$\|\mathbf{r}_x(x, y) \times \mathbf{r}_y(x, y)\| = \sqrt{\left(\frac{\partial z}{\partial x}\right)^2 + \left(\frac{\partial z}{\partial y}\right)^2 + 1}.$$

59. Let  $R$  be a simply connected region in the  $xy$ -plane. Show that the portion of the paraboloid with equation  $z = x^2 + y^2$  determined by  $R$  has the same area as the portion of the saddle with equation  $z = x^2 - y^2$  determined by  $R$ .
60. Let  $a$ ,  $b$ , and  $c$  be nonzero constants. Find a general formula for the area of the portion of the plane with equation  $ax + by + cz = k$  that lies above a rectangle  $[\alpha, \beta] \times [\gamma, \delta]$  in the  $xy$ -plane.

## Thinking Forward

- ▶ *Integrating vector fields over three-dimensional regions:* Let  $W$  be a three-dimensional region in  $\mathbb{R}^3$ . If a vector field measures the movement of a gas or a fluid in space, what should the integral of a field over  $W$  measure?
- ▶ *Comparing double integrals and surface integrals:* Think about how surface integrals compared and contrasted with double integrals in the plane. What changes and what is the same in these two cases?
- ▶ *Computations in  $\mathbb{R}^4$ :* In  $\mathbb{R}^3$ , a surface is determined by (1) its normal vector at every point and (2) one point on the surface. An intuitive way to think of this is that, in  $\mathbb{R}^3$ ,  $\mathbf{n}$  tells us which direction is not occupied by the surface because it is perpendicular to the surface. It can be difficult to visualize, but the same procedure can be lifted to solids in  $\mathbb{R}^4$ . How might we write an integral to determine the volume of a three-dimensional region  $W$  in  $\mathbb{R}^4$ ? How might we integrate over surfaces in  $\mathbb{R}^4$ ?

## 14.4 GREEN'S THEOREM

- ▶ Defining the del operator,  $\nabla$
- ▶ Understanding the relationships between the divergence and the curl
- ▶ Extending the Fundamental Theorem of Calculus into the plane

### The Fundamental Theorem of Calculus and Green's Theorem

In this section, and in the two that follow, we generalize the spirit of the Fundamental Theorem of Calculus in a new way. Recall that the Fundamental Theorem says that, under appropriate conditions,

$$\int_a^b f(x) dx = F(b) - F(a),$$

where  $F(x)$  is an antiderivative of  $f(x)$ . One way of interpreting this theorem is that it relates the behavior of the function  $F(x)$  on the boundary of a set in  $\mathbb{R}$  to the behavior of the derivative of  $F(x)$  in the interior of the region. The region in question is the interval  $[a, b]$ ; its boundary is the set containing points  $a$  and  $b$ , and its interior is the open interval  $(a, b)$ .

Given a function  $g(x, y)$  defined on a bounded region  $\mathcal{R}$  of the plane, it is reasonable, therefore, to ask if there is some relationship between  $\int_{\mathcal{R}} g(x, y) dA$  and an operation on the curve  $C$  that is the boundary of  $\mathcal{R}$ . Since the boundary curve is more complicated than the two endpoints of an interval in  $\mathbb{R}$ , we expect that this operation will be more complicated; we shall see that it is an integration. Similarly, we can hope that there is a relationship between  $f(x, y, z)$  defined on a bounded region  $\mathcal{R}$  in  $\mathbb{R}^3$  and an operation on the surface  $S$  that forms the boundary of  $\mathcal{R}$ . As in the case of line and surface integrals, we will sometimes find that vector fields are relevant to the discussion.

### The Del Operator, the Divergence, and the Curl

The theorems of the next three subsections are improved by compact notation involving two quantities associated with vector fields: the *divergence* and the *curl*. To state these quantities, it is convenient and traditional to define a vector operator: the *del operator*,  $\nabla$ .

#### DEFINITION 14.9

#### The Del Operator, $\nabla$

The *del operator*,  $\nabla$ , is the vector of operations

$$\nabla = \frac{\partial}{\partial x} \mathbf{i} + \frac{\partial}{\partial y} \mathbf{j} + \frac{\partial}{\partial z} \mathbf{k}$$

or, in  $\mathbb{R}^2$ ,

$$\nabla = \frac{\partial}{\partial x} \mathbf{i} + \frac{\partial}{\partial y} \mathbf{j}.$$

This operator is used in dot or cross products with vector fields. For example, if

$$\mathbf{F}(x, y, z) = (x + y)\mathbf{i} + e^{xyz}\mathbf{j} + (x - y + z^2)\mathbf{k},$$

then

$$\begin{aligned} \nabla \cdot \mathbf{F}(x, y, z) &= \frac{\partial}{\partial x}(x + y) + \frac{\partial}{\partial y}e^{xyz} + \frac{\partial}{\partial z}(x - y + z^2) \\ &= 1 + xze^{xyz} + 2z \end{aligned}$$

and

$$\begin{aligned}\nabla \times \mathbf{F}(x, y, z) &= \left( \frac{\partial}{\partial x} \mathbf{i} + \frac{\partial}{\partial y} \mathbf{j} + \frac{\partial}{\partial z} \mathbf{k} \right) \times ((x+y)\mathbf{i} + e^{xyz}\mathbf{j} + (x-y+z^2)\mathbf{k}) \\ &= \left( \frac{\partial}{\partial y}(x-y+z^2) - \frac{\partial}{\partial z}(e^{xyz}) \right) \mathbf{i} + \left( \frac{\partial}{\partial z}(x+y) - \frac{\partial}{\partial x}(x-y+z^2) \right) \mathbf{j} \\ &\quad + \left( \frac{\partial}{\partial x}(e^{xyz}) - \frac{\partial}{\partial y}(x+y) \right) \mathbf{k} \\ &= (-1 - xyz e^{xyz})\mathbf{i} - \mathbf{j} + (yze^{xyz} - 1)\mathbf{k}.\end{aligned}$$

For a vector field in  $\mathbb{R}^3$ , the operation  $\nabla \cdot \mathbf{F}(x, y, z)$  produces a scalar that is the sum of  $\mathbf{F}$ 's directional derivatives in each of the  $\mathbf{i}$ ,  $\mathbf{j}$ , and  $\mathbf{k}$  directions. If  $\mathbf{F}(x, y, z)$  represents the flow of a gas or fluid, then the sign of this scalar corresponds to whether the gas or fluid is compressing ( $\nabla \cdot \mathbf{F}(x, y, z)$  is negative) or expanding ( $\nabla \cdot \mathbf{F}(x, y, z)$  is positive). The scalar is known as the *divergence* of the vector field  $\mathbf{F}(x, y, z)$ .

#### DEFINITION 14.10

##### Divergence of a Vector Field

The *divergence* of vector field  $\mathbf{F}$  is the dot product of  $\nabla$  and  $\mathbf{F}$ .

(a) In  $\mathbb{R}^2$ , if  $\mathbf{F}(x, y) = F_1(x, y)\mathbf{i} + F_2(x, y)\mathbf{j}$ , then

$$\operatorname{div} \mathbf{F}(x, y) = \nabla \cdot \mathbf{F}(x, y) = \frac{\partial F_1}{\partial x} + \frac{\partial F_2}{\partial y}.$$

(b) In  $\mathbb{R}^3$ , if  $\mathbf{F}(x, y, z) = F_1(x, y, z)\mathbf{i} + F_2(x, y, z)\mathbf{j} + F_3(x, y, z)\mathbf{k}$ , then

$$\operatorname{div} \mathbf{F}(x, y, z) = \nabla \cdot \mathbf{F}(x, y, z) = \frac{\partial F_1}{\partial x} + \frac{\partial F_2}{\partial y} + \frac{\partial F_3}{\partial z}.$$

The divergence at a point of a vector field measures the magnitude of the rate of change of the vector field away from a source or towards a sink.

In a similar vein, the cross product  $\nabla \times \mathbf{F}$  is called the *curl* of the field. At a point in the vector field, the curl corresponds physically to the circulation or rotation of the field at that point. This interpretation of the curl is motivated by applications in engineering and physics.

#### DEFINITION 14.11

##### Curl of a Vector Field

The *curl* of a vector field  $\mathbf{F}(x, y, z) = F_1(x, y, z)\mathbf{i} + F_2(x, y, z)\mathbf{j} + F_3(x, y, z)\mathbf{k}$  is the cross product of  $\nabla$  with  $\mathbf{F}(x, y, z)$ :

$$\operatorname{curl} \mathbf{F} = \nabla \times \mathbf{F}(x, y, z) = \left( \frac{\partial F_3}{\partial y} - \frac{\partial F_2}{\partial z} \right) \mathbf{i} + \left( \frac{\partial F_1}{\partial z} - \frac{\partial F_3}{\partial x} \right) \mathbf{j} + \left( \frac{\partial F_2}{\partial x} - \frac{\partial F_1}{\partial y} \right) \mathbf{k}.$$

If  $\mathbf{F}(x, y) = (F_1(x, y), F_2(x, y))$  is a vector field in  $\mathbb{R}^2$ , we define the curl of  $\mathbf{F}$  to be  $\operatorname{curl} (F_1(x, y), F_2(x, y), 0)$ . So,

$$\begin{aligned}\operatorname{curl} \mathbf{F} &= \operatorname{curl} (F_1(x, y), F_2(x, y), 0) = \nabla \times (F_1(x, y), F_2(x, y), 0) \\ &= \left( \frac{\partial F_2}{\partial x} - \frac{\partial F_1}{\partial y} \right) \mathbf{k}.\end{aligned}$$

Using the same field as before, namely,  $\mathbf{F}(x, y, z) = (x+y)\mathbf{i} + e^{xyz}\mathbf{j} + (x-y+z^2)\mathbf{k}$ , we have

$$\operatorname{div} \mathbf{F} = 1 + xze^{xyz} + 2z,$$

which is a scalar because it is the result of a dot product, and

$$\operatorname{curl} \mathbf{F} = (-1 - xye^{xyz})\mathbf{i} - \mathbf{j} + (yze^{xyz} - 1)\mathbf{k},$$

which is a vector because it is the result of a cross product.

Recall that the cross product is not commutative:  $\nabla \times \mathbf{F} \neq \mathbf{F} \times \nabla$ . In Chapter 10, we saw that the cross product may be computed as the determinant of a  $3 \times 3$  matrix. We may use that approach to find the curl as well:

$$\begin{aligned} \nabla \times \mathbf{F}(x, y, z) &= \nabla \times \langle F_1(x, y, z), F_2(x, y, z), F_3(x, y, z) \rangle \\ &= \det \begin{bmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ F_1(x, y, z) & F_2(x, y, z) & F_3(x, y, z) \end{bmatrix}. \end{aligned}$$

There is a special relationship between the divergence and curl of a field, on the one hand, and the curl of a conservative vector field, on the other:

### THEOREM 14.12

#### Divergence of Curl and Curl of a Gradient

- (a) If  $\mathbf{F} = \langle F_1(x, y, z), F_2(x, y, z) \rangle$  is a vector field in  $\mathbb{R}^2$  or  $\mathbf{F} = \langle F_1(x, y, z), F_2(x, y, z), F_3(x, y, z) \rangle$  is a vector field in  $\mathbb{R}^3$ , for which  $F_1$ ,  $F_2$ , and  $F_3$  have continuous second-order partial derivatives, then

$$\operatorname{div}(\operatorname{curl} \mathbf{F}) = \nabla \cdot (\nabla \times \mathbf{F}) = 0.$$

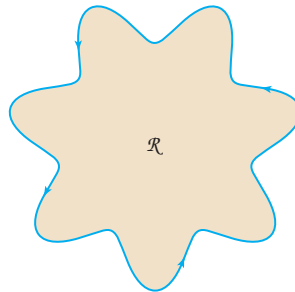

- (b) For a multivariate function  $f$  in  $\mathbb{R}^2$  or  $\mathbb{R}^3$  with continuous second partial derivatives,

$$\operatorname{curl} \nabla f = \nabla \times (\nabla f) = \mathbf{0}.$$

In each case proofs may be obtained by using the equality of mixed partial derivatives. We ask you to prove these identities in Exercises 55 and 56.

## Green's Theorem

Our next extension of the Fundamental Theorem of Calculus is in the plane. Consider a region  $\mathcal{R}$  of the plane whose boundary is a smooth, simple closed curve  $C$ , oriented counterclockwise.

Green's Theorem asserts that integrating along the boundary curve  $C$  is equal to integrating a double integral over the interior of  $\mathcal{R}$ . Recall the notation from Section 14.2: For a vector field  $\mathbf{F}(x, y) = \langle F_1(x, y), F_2(x, y) \rangle$  and a curve  $\mathbf{r}(t) = \langle x(t), y(t) \rangle$ , for  $a \leq t \leq b$ ,

$$\int_C \mathbf{F}(x, y) \cdot d\mathbf{r} = \int_C F_1(x, y) dx + F_2(x, y) dy = \int_a^b \left( F_1(x, y) \frac{dx}{dt} + F_2(x, y) \frac{dy}{dt} \right) dt.$$

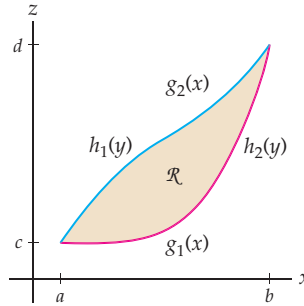

## THEOREM 14.13

## Green's Theorem

Let  $\mathbf{F}(x, y) = (F_1(x, y), F_2(x, y))$  be a vector field defined on a region  $\mathcal{R}$  in the plane whose boundary is a smooth or piecewise-smooth, simple closed curve  $C$ . If  $\mathbf{r}(t)$  is a parametrization of  $C$  in the counterclockwise direction (as viewed from the positive  $z$ -axis), then

$$\int_C \mathbf{F}(x, y) \cdot d\mathbf{r} = \int_C F_1(x, y) dx + F_2(x, y) dy = \iint_{\mathcal{R}} \left( \frac{\partial F_2}{\partial x} - \frac{\partial F_1}{\partial y} \right) dA.$$

**Proof.** A thorough proof of Green's Theorem is beyond the scope of this text. However, we will sketch the proof for a region that can be described both as the set of points lying between smooth functions  $g_1(x)$  and  $g_2(x)$ , for  $a \leq x \leq b$ , with  $g_1(a) = g_2(a)$  and  $g_1(b) = g_2(b)$ , and also as the set of points lying between smooth functions  $h_1(y)$  and  $h_2(y)$ , for  $c \leq y \leq d$ , with  $h_1(c) = h_2(c)$  and  $h_1(d) = h_2(d)$ .

To prove Green's Theorem for this region, let  $C$  be the boundary curve traversed in the counterclockwise direction. Then  $C = C_1 \cup C_2$ , where  $C_1 = \mathbf{r}_1(t) = (t, g_1(t))$  for  $a \leq t \leq b$  and  $C_2 = \mathbf{r}_2(t) = (t, g_2(t))$  for  $a \leq t \leq b$ . (Since we are going around the boundary of  $R$  counterclockwise, our path along  $C_2$  will be in the negative direction.)

Fix a vector field  $\mathbf{F}(x, y) = F_1(x, y)\mathbf{i} + F_2(x, y)\mathbf{j}$ . Then, for a given  $x \in [a, b]$ ,

$$\int_{g_1(x)}^{g_2(x)} \frac{\partial F_1}{\partial y} dy = [F_1(x, y)]_{g_1(x)}^{g_2(x)} = F_1(x, g_2(x)) - F_1(x, g_1(x)).$$

So,

$$\begin{aligned} \int_a^b \int_{g_1(x)}^{g_2(x)} \frac{\partial F_1}{\partial y} dy dx &= \int_a^b F_1(x, g_2(x)) - F_1(x, g_1(x)) dx \\ &= - \int_b^a F_1(x, g_2(x)) dx - \int_a^b F_1(x, g_1(x)) dx = - \int_C F_1(x, y) dx. \end{aligned}$$

A parallel argument shows that

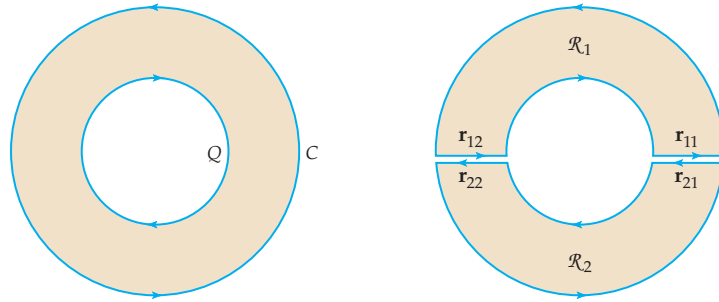

$$\begin{aligned} \int_c^d \int_{h_1(y)}^{h_2(y)} \frac{\partial F_2}{\partial x} dx dy &= \int_c^d F_2(h_2(y), y) - F_2(h_1(y), y) dy \\ &= \int_c^d F_2(h_2(y), y) dy + \int_d^c F_2(h_1(y), y) dy = \int_C F_2(x, y) dy. \end{aligned}$$

Combining the two results gives the desired equality:

$$\int_C \mathbf{F}(x, y) \cdot d\mathbf{r} = \iint_{\mathcal{R}} \left( \frac{\partial F_2}{\partial x} - \frac{\partial F_1}{\partial y} \right) dA. \quad \blacksquare$$

Green's Theorem can be used to evaluate line integrals over simple closed curves with reverse (clockwise) parametrizations. Since reversing the direction of travel in a parametrization of a curve changes the sign of the resulting line integral, we can multiply both sides of the preceding equation by  $-1$  to obtain a formula for clockwise-traversed curves. (See Example 5.)

The relationship between interior double integrals and boundary line integrals given by Green's Theorem also applies to regions  $S$  that are not themselves bounded by smooth or piecewise-smooth simple closed curves, provided that  $S$  can be written as a sum of such regions. For instance, if  $Q$  is the annular region  $Q = \{(x, y) \mid 4 \leq x^2 + y^2 \leq 16\}$  shown next at the left, we may represent this region as the union of  $\mathcal{R}_1$  and  $\mathcal{R}_2$ , where each of the subregions has a piecewise-smooth simple closed boundary, as in the figure at the right:

Moreover, if both  $\mathcal{R}_1$  and  $\mathcal{R}_2$  have parametrizations with counterclockwise orientations, as indicated in the two figures, then the line integrals along the pairs  $\mathbf{r}_{11}$ ,  $\mathbf{r}_{21}$  and  $\mathbf{r}_{12}$ ,  $\mathbf{r}_{22}$  will cancel in the total summation, since we are integrating the same vector field  $\mathbf{F}(x, y)$  along the same curve in opposite directions. So these curves can be disregarded in our treatment of  $Q$ . Looking at the curves that form the boundary of  $Q$ , we see that it is important that the inner curve  $D$  be parametrized in the *clockwise* direction, because of how its components must be parametrized as boundaries of  $\mathcal{R}_1$  and  $\mathcal{R}_2$ . Taking all this into account, we may conclude that

$$\int_C \mathbf{F}(x, y) \cdot d\mathbf{r} + \int_D \mathbf{F}(x, y) \cdot d\mathbf{r} = \iint_Q \left( \frac{\partial F_2}{\partial y} - \frac{\partial F_1}{\partial x} \right) dA,$$

where  $C$  is the outer edge traversed counterclockwise and  $D$  is the inner edge traversed clockwise.

Green's Theorem can be restated in terms of both the divergence and the curl.

### THEOREM 14.14

#### Green's Theorem: Curl and Divergence Expressions

Let  $\mathcal{R}$  be a region in the plane to which Green's Theorem applies, with smooth boundary curve  $C$  oriented in the counterclockwise direction by  $\mathbf{r}(t) = \langle x(t), y(t) \rangle$  for  $a \leq t \leq b$ , with vector field  $\mathbf{F}(x, y) = \langle F_1(x, y), F_2(x, y) \rangle$  defined on  $\mathcal{R}$ .

**(a)** Green's Theorem, curl form:

A unit vector perpendicular to the  $xy$ -plane and thus to the region  $R$  in the positive direction is just  $\mathbf{n} = \mathbf{k}$ . So we can rewrite Green's Theorem as

$$\int_C \mathbf{F}(x, y) \cdot d\mathbf{r} = \iint_{\mathcal{R}} \left( \frac{\partial F_2}{\partial x} - \frac{\partial F_1}{\partial y} \right) dA = \iint_{\mathcal{R}} \text{curl } \mathbf{F} \cdot \mathbf{k} \, dA.$$

**(b)** Green's Theorem, divergence form:

If we restrict our attention to the plane, we see that a unit vector that lies in the  $xy$ -plane and is perpendicular to the curve  $C$  is given by

$$\mathbf{n} = \frac{y'(t)}{\sqrt{(x'(t))^2 + (y'(t))^2}} \mathbf{i} + \frac{-x'(t)}{\sqrt{(x'(t))^2 + (y'(t))^2}} \mathbf{j}.$$

Then Green's Theorem is equivalent to the statement

$$\int_C \mathbf{F}(x, y) \cdot \mathbf{n} \, ds = \iint_{\mathcal{R}} \text{div } \mathbf{F} \, dA.$$

Note that in Theorem 14.14 (a) we treat  $\mathbf{F}$  as a vector field in  $\mathbb{R}^3$  whose  $\mathbf{k}$ -component is zero, since the integrand on the right-hand side of the equation is the  $\mathbf{k}$ -component of the curl of a vector field in  $\mathbb{R}^3$ .

**Proof.**

- (a) The curl form of Green's Theorem is the direct result of labeling the terms in the original statement of the theorem.
- (b) The divergence form requires a little manipulation:

$$\begin{aligned} & \int_C \mathbf{F}(x, y) \cdot \mathbf{n} \, ds \\ &= \int_a^b \left( F_1(x, y) \frac{y'(t)}{\sqrt{(x'(t))^2 + (y'(t))^2}} + F_2(x, y) \frac{-x'(t)}{\sqrt{(x'(t))^2 + (y'(t))^2}} \right) \sqrt{(x'(t))^2 + (y'(t))^2} \, dt \\ &= \int_C F_1(x, y) \, dy - F_2(x, y) \, dx = \int_C -F_2(x, y) \, dx + F_1(x, y) \, dy. \end{aligned}$$

Applying Green's Theorem to this last line integral gives

$$\begin{aligned} \int_C -F_2(x, y) \, dx + F_1(x, y) \, dy &= \iint_{\mathcal{R}} \left( \frac{\partial F_1}{\partial x} + \frac{\partial F_2}{\partial y} \right) dA \\ &= \iint_{\mathcal{R}} \operatorname{div} \mathbf{F} \, dA. \end{aligned}$$

These equivalent formulations do not affect our application of Green's Theorem; rather, they foreshadow the generalization of the theorem to regions that are surfaces other than the  $xy$ -plane, to Stokes' Theorem, and to a higher dimensional analog called the Divergence Theorem. There are various statements of Green's Theorem, including the divergence and curl forms, throughout mathematical literature. ■

## Examples and Explorations

### EXAMPLE 1

#### Computing the divergence and the curl

- (a) Compute the divergence of  $\mathbf{F}(x, y) = x^2\mathbf{i} + xy\mathbf{j}$ .
- (b) Compute the divergence and curl of  $\mathbf{G}(x, y, z) = \frac{1}{xyz}\mathbf{i} + e^{xyz}\mathbf{j} + \frac{1}{z^2+1}\mathbf{k}$ .

#### SOLUTION

- (a) We use Definition 14.10 to find the divergence of  $\mathbf{F}$ :

$$\begin{aligned} \operatorname{div} \mathbf{F}(x, y) &= \nabla \cdot \mathbf{F}(x, y) \\ &= \frac{\partial F_1}{\partial x} + \frac{\partial F_2}{\partial y} \\ &= 2x + x = 3x. \end{aligned}$$

- (b) We again use Definition 14.10 to find the divergence of  $\mathbf{G}$ , or

$$\mathbf{G}(x, y, z) = G_1(x, y, z)\mathbf{i} + G_2(x, y, z)\mathbf{j} + G_3(x, y, z)\mathbf{k} = \frac{1}{xyz}\mathbf{i} + e^{xyz}\mathbf{j} + \frac{1}{z^2+1}\mathbf{k}.$$

We have

$$\begin{aligned} \operatorname{div} \mathbf{G}(x, y, z) &= \nabla \cdot \mathbf{G}(x, y, z) \\ &= \frac{\partial G_1}{\partial x} + \frac{\partial G_2}{\partial y} + \frac{\partial G_3}{\partial z} \\ &= -\frac{yz}{(xyz)^2} + xze^{xyz} - \frac{2z}{(z^2+1)^2}. \end{aligned}$$

We now use Definition 14.11 to compute the curl:

$$\begin{aligned}\operatorname{curl} \mathbf{G}(x, y, z) &= \nabla \times \mathbf{G}(x, y, z) \\ &= \left( \frac{\partial G_3}{\partial y} - \frac{\partial G_2}{\partial z} \right) \mathbf{i} + \left( \frac{\partial G_1}{\partial z} - \frac{\partial G_3}{\partial x} \right) \mathbf{j} + \left( \frac{\partial G_2}{\partial x} - \frac{\partial G_1}{\partial y} \right) \mathbf{k} \\ &= (0 - xye^{xyz})\mathbf{i} + \left( -\frac{xy}{(xyz)^2} - 0 \right) \mathbf{j} + \left( yze^{xyz} + \frac{xz}{(xyz)^2} \right) \mathbf{k} \\ &= -xye^{xyz}\mathbf{i} - \frac{xy}{(xyz)^2}\mathbf{j} + \left( yze^{xyz} + \frac{xz}{(xyz)^2} \right) \mathbf{k}.\end{aligned}$$

□

**EXAMPLE 2****Verifying Green's Theorem**

Verify Green's Theorem for the unit disk in the  $xy$ -plane with boundary curve  $C$ , traversed counterclockwise, where  $\mathbf{F}(x, y) = x\mathbf{i} + 2x\mathbf{j}$ .

**SOLUTION**

Let  $R$  be the unit disk and  $C$  be the boundary curve parametrized by

$$\mathbf{r}(t) = \langle \cos t, \sin t \rangle, \text{ for } 0 \leq t \leq 2\pi.$$

So,  $\frac{d\mathbf{r}}{dt} = \langle -\sin t, \cos t \rangle$ , for  $0 \leq t \leq 2\pi$ . We also express the vector field  $\mathbf{F}$  in terms of the parameter  $t$ :

$$\mathbf{F}(x(t), y(t)) = \langle x(t), 2x(t) \rangle = \langle \cos t, 2 \cos t \rangle.$$

Then

$$\int_C \mathbf{F}(x, y) \cdot d\mathbf{r} = \int_0^{2\pi} (-\cos t \sin t + 2 \cos^2 t) dt.$$

You should verify that  $\frac{1}{2} \cos^2 t + \sin t \cos t + t$  is an antiderivative of  $-\cos t \sin t + 2 \cos^2 t$ . Therefore,

$$\int_0^{2\pi} (-\cos t \sin t + 2 \cos^2 t) dt = \left[ \frac{1}{2} \cos^2 t + \sin t \cos t + t \right]_0^{2\pi} = 2\pi.$$

We will now perform the double integration given by Green's Theorem. Since  $\mathbf{F}(x, y) = x\mathbf{i} + 2x\mathbf{j}$ , we have  $\frac{\partial F_2}{\partial x} = 2$  and  $\frac{\partial F_1}{\partial y} = 0$ . Therefore,

$$\begin{aligned}\iint_R \left( \frac{\partial F_2}{\partial x} - \frac{\partial F_1}{\partial y} \right) dA &= \iint_{\mathcal{R}} 2 dA \\ &= \int_0^{2\pi} \int_0^1 2r dr d\theta \\ &= \int_0^{2\pi} [r^2]_0^1 d\theta = 2\pi.\end{aligned}$$

As expected, our results agree. □

**EXAMPLE 3****Computing with Green's Theorem**

Evaluate  $\int_C \mathbf{F}(x, y) \cdot d\mathbf{r}$ , where  $\mathbf{F}(x, y) = xy\mathbf{i} + xy^3\mathbf{j}$  and  $C$  is the boundary of the rectangle in the  $xy$ -plane and whose sides are the coordinate axes and the lines  $y = 2$  and  $x = 3$ .

**SOLUTION**

This problem shows some of the strength of Green's Theorem. Parametrizing the four distinct pieces of  $C$  would not be difficult in this case, but it would be tedious. Meanwhile, the region  $\mathcal{R}$  that  $C$  encloses is very easy to describe. Applying Green's Theorem, we have

$$\begin{aligned}\int_C \mathbf{F}(x, y) \cdot d\mathbf{r} &= \iint_{\mathcal{R}} \left( \frac{\partial F_2}{\partial x} - \frac{\partial F_1}{\partial y} \right) dA \\ &= \int_0^3 \int_0^2 (y^3 - x) dy dx \\ &= \int_0^3 \left[ \frac{1}{4}y^4 - xy \right]_0^2 dx \\ &= \int_0^3 (4 - 2x) dx \\ &= [4x - x^2]_0^3 = 3.\end{aligned}$$

□

**EXAMPLE 4****Using Green's Theorem with a conservative vector field**

Use Green's Theorem to evaluate

$$\int_C \mathbf{F}(x, y) \cdot d\mathbf{r},$$

where  $C$  is the boundary of the first-quadrant region  $\mathcal{R}$  that lies between the curves  $y = x^2$  and  $y = x$  and where the conservative vector field  $\mathbf{F}(x, y) = \nabla f(x, y)$ , in which  $f(x, y) = e^{xy}$ .

**SOLUTION**

Computing the partial derivatives of  $f(x, y)$ , we have

$$\mathbf{F}(x, y) = ye^{xy}\mathbf{i} + xe^{xy}\mathbf{j}.$$

Then,

$$\begin{aligned}\int_C \mathbf{F}(x, y) \cdot d\mathbf{r} &= \int_{\mathcal{R}} \left( \frac{\partial F_2}{\partial x} - \frac{\partial F_1}{\partial y} \right) dA \\ &= \int_{\mathcal{R}} ((e^{xy} + xye^{xy}) - (e^{xy} + xye^{xy})) dA = 0.\end{aligned}$$

Green's Theorem, together with the equality of the second-order mixed partial derivatives, gives us another proof of the Fundamental Theorem of Line Integrals for smooth or piecewise-smooth simple closed curves. If  $\mathbf{F}(x, y) = F_1(x, y)\mathbf{i} + F_2(x, y)\mathbf{j}$  is conservative, then, by the equality of the mixed partial derivatives,

$$\frac{\partial F_2}{\partial x} = \frac{\partial F_1}{\partial y}.$$

So, for a conservative vector field and a smooth or piecewise-smooth simple closed curve  $C$  that is the boundary of a region  $\mathcal{R}$

$$\int_C \mathbf{F}(x, y) \cdot d\mathbf{r} = \int_{\mathcal{R}} \left( \frac{\partial F_2}{\partial x} - \frac{\partial F_1}{\partial y} \right) dA = \int_{\mathcal{R}} 0 dA = 0.$$

□

**CHECKING  
THE ANSWER**

Applying the Fundamental Theorem of Line Integrals to

$$\int_C \mathbf{F}(x, y) \cdot d\mathbf{r}$$

directly, where  $C$  is parametrized by  $\mathbf{r}(t)$  for  $a \leq t \leq b$ , gives

$$\int_C \mathbf{F}(x, y) \cdot d\mathbf{r} = f(x(b), y(b)) - f(x(a), y(a)) = 0,$$

since the curve's being closed entails that  $(x(b), y(b)) = (x(a), y(a))$ .

**EXAMPLE 5****Using Green's Theorem for curves with reverse orientation**

Use Green's Theorem to evaluate  $\int_C \mathbf{F}(x, y) \cdot d\mathbf{r}$ , where  $\mathbf{F}(x, y) = y\mathbf{i} + 2x\mathbf{j}$  and  $C$  is the boundary of the region bounded by the  $x$ -axis and the curve  $y = 1 - x^2$ , traversed in the clockwise direction.

**SOLUTION**

From Section 14.2, we know that reversing the direction of travel along a curve changes the sign of the line integrals along that curve. Here, since  $\mathbf{F}(x, y) = y\mathbf{i} + 2x\mathbf{j}$ , we have

$$\frac{\partial}{\partial x}(2x) - \frac{\partial}{\partial y}(y) = 2 - 1 = 1.$$

So, in this case, Green's Theorem implies that

$$\begin{aligned} \int_C \mathbf{F}(x, y) \cdot d\mathbf{r} &= - \iint_R 1 \, dA \\ &= - \int_{-1}^1 \int_0^{1-x^2} 1 \, dy \, dx \\ &= \int_{-1}^1 x^2 - 1 \, dx \\ &= \left[ \frac{1}{3}x^3 - x \right]_{-1}^1 = -\frac{4}{3}. \end{aligned}$$

□

**EXAMPLE 6****Analyzing water flow in a river channel**

The Los Angeles River is channelized for much of its length. The channelized portion of the river flows in concrete banks with uniform width and slope and runs straight from north to south. Therefore, the velocity vector of the flow is  $\mathbf{F} = 0\mathbf{i} + f(y)\mathbf{j}$ . Suppose we measure the rate of flow at two points that are close to one another.

- One day the flow is found to have speed 0.4 feet per second at the top and bottom edges of a rectangle  $\mathcal{R}$  with boundary  $C$  enclosing the river. Find  $\int_C \mathbf{F} \cdot d\mathbf{r}$ .
- Suppose that another day we find that the rate of flow at the lower edge of the rectangle is slightly higher than the flow at the top. Use the divergence form of Green's Theorem to explain what unusual phenomenon is occurring in Los Angeles that day.

**SOLUTION**

- Since the flow at the top and bottom is the same, the edge vectors have opposite signs, and the  $x$ -component of the velocity field is zero, it follows that the integral is zero.
- We have

$$0 < \int_C \mathbf{F} \cdot \mathbf{n} \, ds = \iint_{\mathcal{R}} \frac{\partial f}{\partial y} \, dA.$$

But since the river is channelized,  $\frac{\partial f}{\partial y} > 0$  at some points in  $\mathcal{R}$ . This means that the flow is increasing, so it must be raining. □

**? TEST YOUR UNDERSTANDING**

- ▶ What is the definition of the divergence of a vector field? What does the divergence measure?
- ▶ What is the definition of the curl of a vector field? What does the curl measure?
- ▶ How is Green's Theorem similar to the Fundamental Theorem of Calculus from Chapter 4?

- ▶ How can Green's Theorem be used to compute line integrals around smooth or piecewise-smooth simple closed curves that are parametrized in the *clockwise* direction?
- ▶ In our examples, we used Green's Theorem to reduce line integrals to double integrals (though the reverse direction is also sometimes useful, as we will see in the exercises). In what way is this use different from our use of the Fundamental Theorem of Calculus from Chapter 4?

## EXERCISES 14.4

### Thinking Back

*Remembering the Fundamental Theorem of Calculus:* Answer the following questions about the Fundamental Theorem of Calculus.

- ▶ Consider the "region" in  $\mathbb{R}^1$  given by the interval  $[a, b]$ . What is the boundary of this region? What is its interior?
- ▶ Suppose that  $g(x)$  is a differentiable function on  $[a, b]$ . Express  $g(b) - g(a)$  in terms of a function on the interior of  $[a, b]$ .

- ▶ Express  $\int_a^b f(x) dx$  in terms of something on the boundary of  $[a, b]$ .

*Intractable Integrals:* One of the virtues of Green's Theorem—in both directions—is that it gives us a way to rewrite difficult integrals in a form we hope will be easier to manipulate.

- ▶ Give an example of a differentiable function  $f(x, y)$  that is not obviously integrable.

### Concepts

0. *Problem Zero:* Read the section and make your own summary of the material.
1. *True/False:* Determine whether each of the statements that follow is true or false. If a statement is true, explain why. If a statement is false, provide a counterexample.
  - (a) *True or False:* The del operator,  $\nabla$ , converts vectors into scalars.
  - (b) *True or False:* The del operator,  $\nabla$ , measures the rotation of a vector field.
  - (c) *True or False:* The divergence of a vector field is a scalar.
  - (d) *True or False:* The curl of a vector field is a vector.
  - (e) *True or False:* The curl of a gradient vector field is  $\mathbf{0}$ .
  - (f) *True or False:* Both the Fundamental Theorem of Calculus (Theorem 4.24) and Green's Theorem relate the integral of a function on a (mathematically well-behaved) region to a quantity measured on the boundary of that region.
  - (g) *True or False:* The curl of a vector field measures how much the field is compressing or expanding.
  - (h) *True or False:* The conclusion of Green's Theorem does not depend on the direction of parametrization of the boundary curve in question.
2. *Examples:* Construct examples of the thing(s) described in the following. Try to find examples that are different than any in the reading.
  - (a) A smooth simple closed curve parametrized in the counterclockwise direction.
  - (b) A smooth simple closed curve parametrized in the clockwise direction.
  - (c) A simple closed curve that is not smooth, but is piecewise smooth, parametrized in the counterclockwise direction.
3. In what sense is the integrand of the double integral in Green's Theorem the antiderivative of the vector field?
4. Make a chart of all the new notation, definitions, and theorems in this section, including what each new item means in terms of you already understand.
5. Give two examples of quantities that may be computed by  $\int_C \mathbf{F} \cdot d\mathbf{r}$ .
6. Give three examples of quantities that may be computed by  $\iint_{\mathcal{R}} G(x, y) dA$ .
7. Explain how your answer to Exercise 6 is relevant to the discussion of Green's Theorem.
8. Draw the annular region bounded by  $r = 1$  and  $r = 2$ . Divide it into two regions, each of which is suitable for the application of Green's Theorem.
9. If the velocity of a flow of a gas at a point  $(x, y, z)$  is represented by  $\mathbf{F}$  and the gas is compressing at that point, what does this imply about the divergence of  $\mathbf{F}$  at the point?
10. Give an example of a field with negative divergence at the origin.
11. If the velocity of a flow of a gas at a point  $(x, y, z)$  is represented by  $\mathbf{F}$  and the gas is expanding at that point, what does this imply about the divergence of  $\mathbf{F}$  at the point?
12. Give an example of a field with positive divergence at  $(1, 0, \pi)$ .
13. Use the vector field  $\mathbf{F}(x, y) = x^2 e^y \mathbf{i} + \cos x \sin y \mathbf{j}$  and Green's Theorem to write the line integral of  $\mathbf{F}(x, y)$  about the unit circle, traversed counterclockwise, as a double integral. Do not evaluate the integral.

14. Use the same vector field as in Exercise 13 together with the divergence form of Green's Theorem to write the line integral of  $\mathbf{F}(x, y)$  about the unit circle as a double integral. Do not evaluate the integral.

15. Use the same vector field as in Exercise 13, and compute the  $\mathbf{k}$ -component of the curl of  $\mathbf{F}(x, y)$ .

16. Use the curl form of Green's Theorem to write the line integral of  $\mathbf{F}(x, y)$  about the unit circle as a double integral. Do not evaluate the integral.

## Skills

Compute the divergence of the vector fields in Exercises 17–22.

17.  $\mathbf{F}(x, y) = yx^2\mathbf{i} - x\cos y\mathbf{j}$

18.  $\mathbf{G}(x, y) = \langle x\cos(xy), y\cos(xy) \rangle$

19.  $\mathbf{G}(x, y, z) = yz^2\mathbf{i} - x\sin z\mathbf{j} + x^2e^{xy}\mathbf{k}$

20.  $\mathbf{G}(x, y, z) = (x^2 + y - z)\mathbf{i} - 2y\cos z\mathbf{j} + e^{x^2+y^2+z^2}\mathbf{k}$

21.  $\mathbf{F}(x, y, z) = \sin^{-1}(xy)\mathbf{i} + \ln(y+z)\mathbf{j} + \frac{1}{(2x+3y+5z+1)}\mathbf{k}$

22.  $\mathbf{F}(x, y, z) = xe^{yz}\mathbf{i} + ye^{xz}\mathbf{j} + ze^{xy}\mathbf{k}$

Compute the curl of the vector fields in Exercises 23–28.

23.  $\mathbf{F}(x, y, z) = \sin^{-1}(xy)\mathbf{i} + \ln(y+z)\mathbf{j} + \frac{1}{(2x+3y+5z+1)}\mathbf{k}$

24.  $\mathbf{G}(x, y, z) = (x^2 + y - z)\mathbf{i} - 2y\cos z\mathbf{j} + e^{x^2+y^2+z^2}\mathbf{k}$

25.  $\mathbf{F}(x, y, z) = xe^{yz}\mathbf{i} + ye^{xz}\mathbf{j} + ze^{xy}\mathbf{k}$

26.  $\mathbf{F}(x, y) = -4x^2y\mathbf{i} + 4xy^2\mathbf{j}$

27.  $\mathbf{F}(x, y) = \cos(x+y)\mathbf{i} + \sin(x-y)\mathbf{j}$

28.  $\mathbf{G}(x, y, z) = (2y+3z)\mathbf{i} + 2xy^2\mathbf{j} + (zx-y)\mathbf{k}$

Use Green's Theorem to evaluate the integrals in Exercises 29–34.

29. Find  $\int_C \mathbf{F} \cdot d\mathbf{r}$ , where  $\mathbf{F}(x, y) = -4x^2y\mathbf{i} + 4xy^2\mathbf{j}$  and  $C$  is the unit circle traversed counterclockwise.

30. Find  $\int_C \mathbf{F} \cdot d\mathbf{r}$ , where  $\mathbf{F}(x, y) = (y^3 + 3x^2y)\mathbf{i} + 2x\mathbf{j}$  and  $C$  is the boundary of the half of the unit circle that lies above the  $x$ -axis, traversed counterclockwise.

31. Find  $\int_C \mathbf{F} \cdot d\mathbf{r}$ , where  $\mathbf{F}(x, y) = (x+2y)\mathbf{i} + (x-2y)\mathbf{j}$  and  $C$  is the boundary of the region bounded by the curves  $x = y^2, x = 4$ , traversed counterclockwise.

32. Find  $\int_C \mathbf{F} \cdot d\mathbf{r}$ , where  $\mathbf{F}(x, y) = y\ln(x+1)^2\mathbf{i} + \mathbf{j}$  and  $C$  is the boundary of the square with vertices at  $(0, 0), (0, 2), (2, 0)$ , and  $(2, 2)$ , traversed counterclockwise.

33. Find  $\int_C \mathbf{F} \cdot d\mathbf{r}$ , where

$$\mathbf{F}(x, y) = xe^{x^2+y^2}\mathbf{i} + (10\sin y + x)\mathbf{j}$$

and  $C$  is the boundary of the region in the third quadrant bounded by  $y = x$  and the  $x$ -axis, for  $x \in [-1, 0]$ , traversed counterclockwise.

34. Find  $\int_C \mathbf{F} \cdot d\mathbf{r}$ , where  $\mathbf{F}(x, y) = xy\mathbf{i} + 4(x-y)\mathbf{j}$  and  $C$  is the boundary of the region bounded by the curves  $x = 1, x = e, y = e^x$ , and  $y = \ln x$ , traversed counterclockwise.

Verify Green's Theorem by working Exercises 35–42 in pairs. In each pair, evaluate the desired integrals first directly and then using the theorem.

35. Directly compute (i.e., without using Green's Theorem)  $\int_C \mathbf{F}(x, y) \cdot d\mathbf{r}$ , where  $\mathbf{F}(x, y) = y^2\mathbf{i} - xy\mathbf{j}$  and  $C$  is the unit circle traversed counterclockwise.

36. Use Green's Theorem to evaluate the line integral in Exercise 35.

37. Directly compute (i.e., without using Green's Theorem)  $\int_C \mathbf{F}(x, y) \cdot d\mathbf{r}$ , where

$$\mathbf{F}(x, y) = (2^x + y)\mathbf{i} + (2x - y)\mathbf{j}$$

and  $C$  is the triangle described by  $x = 0, y = 0$ , and  $y = 1 - x$ , traversed counterclockwise.

38. Use Green's Theorem to evaluate the line integral in Exercise 37.

39. Directly compute (i.e., without using Green's Theorem)  $\iint_{\mathcal{R}} (3y - 3x) dA$ , where  $\mathcal{R}$  is the portion of the disk of radius 2, centered at the origin, and lying above the  $x$ -axis.

40. Use Green's Theorem to evaluate the double integral in Exercise 39.

41. Directly compute (i.e., without using Green's Theorem)  $\iint_{\mathcal{R}} (e^x + e^y) dA$ , where  $\mathcal{R}$  is the region bounded by the lines  $x = 1, x = \ln 2, y = 0$ , and  $y = 2$ .

42. Use Green's Theorem to evaluate the double integral in Exercise 41.

Evaluate the integrals in Exercises 43–46 directly or using Green's Theorem.

43.  $\int_C \mathbf{F} \cdot d\mathbf{r}$ , where  $\mathbf{F}(x, y) = y2^x\mathbf{i} + xy^e\mathbf{j}$  and  $C$  is the boundary of the square with vertices at  $(0, 0), (0, 1), (1, 0)$ , and  $(1, 1)$ , traversed clockwise.

44.  $\int_C \mathbf{F}(x, y) \cdot d\mathbf{r}$ , where  $\mathbf{F}(x, y) = \frac{1}{2}x^2y^3\mathbf{i} + xy\mathbf{j}$  and  $C$  is the circle of radius 3, centered at the origin, traversed clockwise.

45.  $\iint_{\mathcal{R}} (2xe^{x^2+y^2} + 2ye^{-(x^2+y^2)}) dA$ , where  $\mathcal{R}$  is the annulus bounded by  $r = 1$  and  $r = 2$ .

46.  $\iint_{\mathcal{R}} (3xy - 4x^2y) dA$ , where  $\mathcal{R}$  is the unit disk.

## Applications

47. Find the work done by the vector field

$$\mathbf{F}(x, y) = (\cos(x^2) + 4xy^2)\mathbf{i} + (2y - 4x^2y)\mathbf{j}$$

in moving an object around the unit circle, starting and ending at  $(1, 0)$ .

48. Find the work done by the vector field

$$\mathbf{F}(x, y) = x^3y^2\mathbf{i} + (y - x)\mathbf{j}$$

in moving an object around the triangle with vertices  $(1, 1)$ ,  $(2, 2)$ , and  $(3, 1)$ , starting and ending at  $(2, 2)$ .

49. Find the work done by the vector field

$$\mathbf{F}(x, y) = \frac{xe^{\sqrt{x^2+y^2}}}{\sqrt{x^2+y^2}}\mathbf{i} + \frac{ye^{\sqrt{x^2+y^2}}}{\sqrt{x^2+y^2}}\mathbf{j}$$

in moving an object around the unit circle, starting and ending at  $(1, 0)$ .

50. Find the work done by the vector field

$$\mathbf{F}(x, y) = (\cos x - 3ye^x)\mathbf{i} + \sin x \sin y\mathbf{j}$$

in moving an object around the periphery of the rectangle with vertices  $(0, 0)$ ,  $(2, 0)$ ,  $(2, \pi)$ , and  $(0, \pi)$ , starting and ending at  $(2, \pi)$ .

51. The current through a certain passage of the San Juan Islands in Washington State is given by

$$\mathbf{F} = \langle F_1(x, y), F_2(x, y) \rangle = \langle 0, 1.152 - 0.8x^2 \rangle.$$

Consider a disk  $\mathcal{R}$  of radius 1 mile and centered on this region. Denote the boundary of the disk by  $\partial\mathcal{R}$ .

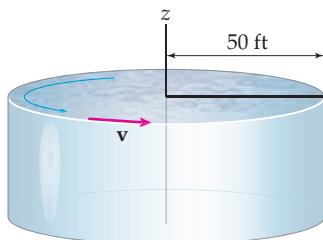

- (a) Compute
- $\iint_{\mathcal{R}} \left( \frac{\partial F_2}{\partial x} - \frac{\partial F_1}{\partial y} \right) dA$
- .

- (b) Show that

$$\int_{\partial\mathcal{R}} \mathbf{F} \cdot \mathbf{n} \, ds = \int_0^{2\pi} (1.152 - 0.8 \cos^2 \theta) \sin \theta \, d\theta.$$

Conclude that Green's Theorem is valid for the current in this area of the San Juan Islands.

- (c) What do the integrals from Green's Theorem tell us about this region of the San Juan Islands?
52. Emmy has to examine how well a waste tank with radius 50 feet is stirred. The current at the edge of the tank moves at  $\frac{\pi}{4}$  radians per minute in a counterclockwise direction. Emmy knows that if the vector field of the current velocity is  $\mathbf{v} = \langle v_1(x, y), v_2(x, y) \rangle$ , then the average value of  $\frac{\partial v_2}{\partial x} - \frac{\partial v_1}{\partial y}$  in the tank must be at least 1.5 in order to get adequate mixing in the tank. Does she need to speed up stirring for this tank?

53. Traffic can be described by fluid properties such as density and momentum; hence it is usually modeled as a continuum. Consider a straight road with multiple lanes going due north. Fast traffic uses the lanes farther left, and slower traffic uses the ones to the right. Denote the velocity of traffic at any point of the road by  $\mathbf{v}(x, y) = \langle 0, v_2(x, y) \rangle$ . Also; that is, assume that the speed in any particular lane is constant; that is,  $\frac{\partial v_2}{\partial y} = 0$ .

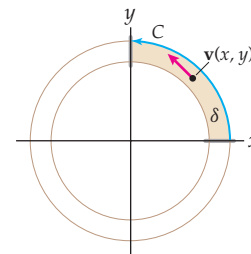

- (a) What can we say about the curl
- $\frac{\partial v_2}{\partial x} - \frac{\partial v_1}{\partial y}$
- at any point on the road? What does it mean for that quantity to be small? What if it is large? Does this quantity have anything to do with traffic safety?

- (b) Suppose that
- $v_2(x, y) = 75 - ax$
- in miles per hour, where
- $x$
- is measured in miles. Compute both sides of Green's Theorem for the traffic flow over a segment of highway described by
- $S = [0, 0.0113] \times [0, 0.5]$
- with boundary
- $C$
- . In other words, verify that

$$\int_C \mathbf{v}(x, y) \cdot d\mathbf{x} = \iint_S \left( \frac{\partial v_2}{\partial x} - \frac{\partial v_1}{\partial y} \right) dx \, dy.$$

- (c) What is the significance of either of the integrals from part (b) for the traffic? Comment on whether the integral on the left or the integral on the right would be easier for traffic engineers to calculate from measurements.

54. Traffic engineers use road tubes to measure the number and speed of cars passing a line in the road. Suppose traffic engineers set road tubes on a freeway whose inner edge lies along the circle  $x^2 + y^2 = 0.2$  and whose outer edge is  $x^2 + y^2 = 0.2113$ . The traffic is flowing counterclockwise in the first quadrant of the circles. The road tubes lie along the lines  $y = 0$  and  $x = 0$ , and the measurements show that the speed of cars along the inner circle is 69 mph while along the outside circle it is 61 mph. Denote the stretch of road in the first quadrant by  $S$  with oriented boundary  $C$ , and denote the velocity of the cars at any point by  $\mathbf{v}(x, y)$ .

- (a) Compute
- $\int_C \mathbf{v}(x, y) \cdot d\mathbf{x}$
- . What is the significance of the sign of this quantity?

- (b) Use Green's Theorem to compute the average curl of the traffic on this stretch of road:

$$\frac{1}{A} \iint_S \left( \frac{\partial v_2}{\partial x} - \frac{\partial v_1}{\partial y} \right) dx \, dy.$$

Here,  $A$  is the area of the roadway.

## Proofs

55. Let  $\mathbf{F}$  be a vector field in  $\mathbb{R}^2$  or  $\mathbb{R}^3$ . Prove that  $\operatorname{div} \operatorname{curl} \mathbf{F} = 0$ . (This is Theorem 14.12, part (a).)
56. Let  $f$  be a function of two or three variables. Prove that  $\operatorname{curl} \nabla f = \mathbf{0}$ . (This is Theorem 14.12, part (b).)
57. Prove that, for any conservative vector field  $\mathbf{F}(x, y)$ ,

$$\iint_R \left( \frac{\partial F_2}{\partial x} - \frac{\partial F_1}{\partial y} \right) dA = 0$$

for any simply connected region  $R \subset \mathbb{R}^2$  whose boundary is smooth or piecewise smooth.

58. Give an example of a vector field defined on a simply connected region  $\mathcal{R} \subset \mathbb{R}^2$  whose boundary is smooth or piecewise smooth, that is not a conservative field, but whose integral over the unit disk does have the property that

$$\iint_{\mathcal{R}} \left( \frac{\partial F_2}{\partial x} - \frac{\partial F_1}{\partial y} \right) dA = 0.$$

Your example shows that the converse of Exercise 57 fails.

## Thinking Forward

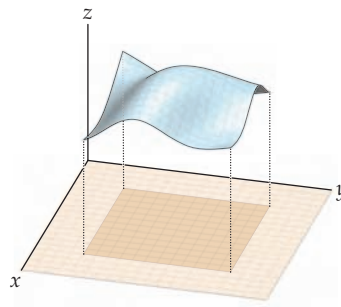

- ▶ *Generalizing Green's Theorem:* How might we generalize Green's Theorem to two-dimensional regions that are surfaces in  $\mathbb{R}^3$ , rather than patches in the  $xy$ -plane? What sort of statement do you expect?
- ▶ *Another generalization of Green's Theorem:* How might we generalize Green's Theorem to higher dimensions? What sort of relationship might we hope to find between a triple integral over a (reasonably well-behaved) three-dimensional region of space and a double integral over the surface that is the boundary of this region?

## 14.5 STOKES' THEOREM

- ▶ Generalizing Green's Theorem to smooth surfaces other than the plane
- ▶ Expressing Stokes' Theorem in terms of the curl
- ▶ Computations using Stokes' Theorem

### A Generalization of Green's Theorem

The goal of this section is to generalize Green's Theorem to regions that are two dimensional but that do not lie in the  $xy$ -plane. For this to work, we will need our surfaces to be well behaved enough that they act like a small portion of the  $xy$ -plane that floated off into space and were deformed only in a smooth (or piecewise-smooth) way, as shown in the following figure:

Recall from Section 14.3 that we restrict our attention to surfaces that are smooth or piecewise smooth. In these circumstances, Green's Theorem still holds, provided that we take account of the distortion of the surface.

## Stokes' Theorem

The generalized form of Green's Theorem known as *Stokes' Theorem* is traditionally written in terms of the curl of a vector field. Recall that the curl form of Green's Theorem states that, under appropriate restrictions on  $C$  and  $\mathcal{R}$ ,

$$\int_C \mathbf{F}(x, y) \cdot d\mathbf{r} = \iint_{\mathcal{R}} \text{curl } \mathbf{F}(x, y) \cdot \mathbf{k} \, dA.$$

In the context of a general surface, what matters is that  $\mathbf{k}$  is a unit vector normal to  $\mathcal{R}$  and pointing in the direction from which  $C$  was parametrized counterclockwise. Generalizing gives Stokes' Theorem:

### THEOREM 14.15

#### Stokes' Theorem

Let  $S$  be a smooth or piecewise-smooth oriented surface with a smooth or piecewise-smooth boundary curve  $C$ . Suppose that  $S$  has an (oriented) unit normal vector  $\mathbf{n}$  and that  $C$  has a parametrization that traverses  $C$  in the counterclockwise direction with respect to  $\mathbf{n}$ . If  $\mathbf{F}(x, y, z) = F_1(x, y, z)\mathbf{i} + F_2(x, y, z)\mathbf{j} + F_3(x, y, z)\mathbf{k}$  is a vector field on an open region containing  $S$ , then

$$\int_C \mathbf{F}(x, y, z) \cdot d\mathbf{r} = \iint_S \text{curl } \mathbf{F}(x, y, z) \cdot \mathbf{n} \, dS.$$

If  $S$  is a region of the  $xy$ -plane, then the unit normal is  $\mathbf{k}$  and the right-hand side of the preceding equation is

$$\iint_S \left( \frac{\partial F_2}{\partial x} - \frac{\partial F_1}{\partial y} \right) dA,$$

which is Green's Theorem. Another way to think of this is that Green's Theorem is a special case of Stokes' Theorem for regions in the  $xy$ -plane.

**Proof.** A thorough proof of Stokes' Theorem is beyond the scope of this course; however, we do provide a sketch.

To sketch the proof, first consider a plane  $P$  in space, other than the  $xy$ -plane. Since  $P$  is a plane, we could relabel points and treat the new plane as the  $xy$ -plane. This would involve a change of variables using the techniques of Chapter 13. Green's Theorem will hold here, since the relabeled plane behaves exactly like the old  $xy$ -plane in every respect. (For an example, consider substituting the  $xz$ -plane for the  $xy$ -plane. It is not too difficult to figure out what Green's Theorem should be in the  $xz$ -plane.)

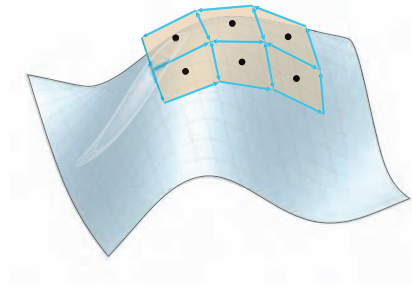

Now consider an oriented smooth surface  $S$  in space. Since  $S$  is smooth, we can seek to understand it by subdividing it into many small subregions, each of which is closely approximated by the tangent plane at a point in the subregion. On this tiny piece of tangent plane, Green's Theorem applies. With a careful trace through definitions and notation, we can show that when we modify Green's Theorem to account for the plane no longer being the  $xy$ -plane, the new integrand will be  $\text{curl } \mathbf{F}(x, y, z) \cdot \mathbf{n} \, dS$ , as is required by Stokes' Theorem.

Next we recall the discussion of Green's Theorem for regions that are sums of regions bounded by simple closed curves, like the annular region discussed in the previous section. As the following figure indicates, we approximate the surface with small portions of approximating tangent planes. It

takes a bit more work to show that the line integrals around adjoining pieces of these approximating tangent planes cancel as they do for the annular region. (The subtlety in this case is that the *planes* are different.)

*A smooth surface approximated with portions of tangent planes*

Once this is done, we resort to our usual plan of taking a limit of approximations to find the exact value. The outline of the proof of Stokes' Theorem follows the same "subdivide, approximate, and add" strategy that we have used in previous integration results. The major steps are as follows:

- ▶ Show that Green's Theorem can be applied in any plane and that when it is, the integrand is as desired.
- ▶ Subdivide  $S$  into subregions, and argue that  $S$  is well approximated by gluing lots of subdivision tangent planes together.
- ▶ Argue that applying Green's Theorem to all these tiny tangent planes cancels all shared borders, leaving only the perimeter.
- ▶ Approximate the true integral by calculating the sum of Green's Theorem on tangent planes.
- ▶ Add up the subregion approximations, and take a limit as the subregions become arbitrarily small. Addition becomes integration in the limit. ■

## Examples and Explorations

### EXAMPLE 1

#### Verifying Stokes' Theorem

Verify Stokes' Theorem for the vector fields

(a)  $\mathbf{F}(x, y, z) = yz\mathbf{i} + xz\mathbf{j} + xy\mathbf{k}$  and (b)  $\mathbf{G}(x, y, z) = -y\mathbf{i} + x\mathbf{j} + e^z\mathbf{k}$

on the surface defined by  $S = \{(x, y, z) \mid z = 1 - x^2 - y^2, x^2 + y^2 \leq 1\}$ , with outward unit normal vector.

#### SOLUTION

The graph of  $S$  is the part of the downwards-opening paraboloid  $z = 1 - x^2 - y^2$  that lies above the  $xy$ -plane, with boundary curve,  $C$ , equal to the unit circle in the  $xy$ -plane.

To verify Stokes' Theorem, we separately compute

$$\iint_S \operatorname{curl} \mathbf{F}(x, y, z) \cdot \mathbf{n} \, dS \quad \text{and} \quad \int_C \mathbf{F}(x, y, z) \cdot d\mathbf{r}$$

and compare the results.

(a) For  $\mathbf{F}(x, y, z) = yz\mathbf{i} + xz\mathbf{j} + xy\mathbf{k}$ ,

$$\operatorname{curl} \mathbf{F}(x, y, z) = \nabla \times \mathbf{F}(x, y, z) = \mathbf{0}.$$

This equation implies that

$$\iint_S \operatorname{curl} \mathbf{F}(x, y, z) \cdot \mathbf{n} \, dS = 0.$$

Turning to the line integral of  $\mathbf{F}(x, y, z)$  about the boundary of  $S$ , we observe that  $\mathbf{F}(x, y, z)$  is conservative:

$$\mathbf{F}(x, y, z) = \nabla f, \quad \text{where } f(x, y, z) = xyz.$$

By the Fundamental Theorem of Line Integrals,

$$\int_C \mathbf{F}(x, y, z) \cdot d\mathbf{r} = 0,$$

because  $C$  is closed. (Note that Theorem 14.12 also explains why  $\operatorname{curl} \mathbf{F}(x, y, z) = \mathbf{0}$ , since  $\mathbf{F}(x, y, z)$  is conservative.)

- (b) Recall that, for a surface  $S$  given by  $z = f(x, y)$ , a normal vector is  $\mathbf{N} = \left\langle -\frac{\partial z}{\partial x}, -\frac{\partial z}{\partial y}, 1 \right\rangle$ . This vector in general needs to be scaled before it becomes a unit normal vector, and it may point in the opposite of the desired direction, depending on orientation of  $S$ . In this case,

$$\mathbf{N} = \langle 2x, 2y, 1 \rangle,$$

which does point in the desired direction, away from the  $z$ -axis. The scaling will cancel in the integration.

Combining the above with the fact that  $\operatorname{curl} \mathbf{G}(x, y, z) = \operatorname{curl} (-y\mathbf{i} + x\mathbf{j} + e^z\mathbf{k}) = 2\mathbf{k}$ , we have

$$\begin{aligned} \iint_S \operatorname{curl} \mathbf{G}(x, y, z) \cdot \mathbf{N} \, dS &= \iint_S 2 \, dA \\ &= \int_0^{2\pi} \int_0^1 2r \, dr \, d\theta \\ &= \int_0^{2\pi} [r^2]_0^1 \, d\theta \\ &= \int_0^{2\pi} 1 \, d\theta = 2\pi. \end{aligned}$$

To compute the line integral  $\int_C \mathbf{G}(x, y, z) \cdot d\mathbf{r}$  directly, we first note that  $C$  is parametrized by

$$\mathbf{r}(t) = \cos t \mathbf{i} + \sin t \mathbf{j} + 0\mathbf{k} \quad \text{for } 0 \leq t \leq 2\pi$$

with

$$d\mathbf{r} = \langle -\sin t, \cos t, 0 \rangle dt \quad \text{for } 0 \leq t \leq 2\pi.$$

On the curve  $C$ ,

$$\mathbf{G}(x, y, z) = -y\mathbf{i} + x\mathbf{j} + e^z\mathbf{k} = -\sin t \mathbf{i} + \cos t \mathbf{j} + 1\mathbf{k}.$$

Substituting gives

$$\int_C \mathbf{G}(x, y, z) \cdot d\mathbf{r} = \int_0^{2\pi} (\sin^2 t + \cos^2 t) dt = \int_0^{2\pi} 1 \, dt = 2\pi.$$

Again, we have verified Stokes' Theorem. □

**EXAMPLE 2****Using Stokes' Theorem for a graph  $y = f(x, z)$** 

Use Stokes' Theorem to compute  $\int_C \mathbf{F}(x, y, z) \cdot d\mathbf{r}$ , where

$$\mathbf{F}(x, y, z) = xyz\mathbf{i} + (y - 2)\mathbf{j} + yz\mathbf{k}$$

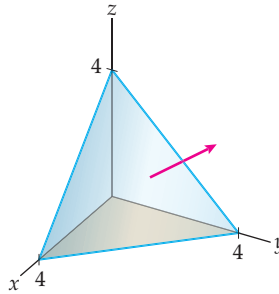

and  $C$  is the boundary of the region of the plane

$$x + y + z = 4$$

that lies to the right of the triangular region  $0 \leq z \leq 4$ ,  $0 \leq x \leq z$  in the  $xz$ -plane, oriented in the positive  $y$  direction.

**SOLUTION**

The surface shown next is the graph of  $y = 4 - x - z$ .

Modifying our previous calculation of  $\mathbf{N}$  for surfaces  $z = f(x, y)$ , we have the normal vector

$$\mathbf{N} = \left\langle -\frac{\partial y}{\partial x}, 1, -\frac{\partial y}{\partial z} \right\rangle = \langle 1, 1, 1 \rangle.$$

Computing  $\text{curl } \mathbf{F}(x, y, z)$  yields:

$$\text{curl } \mathbf{F}(x, y, z) = z\mathbf{i} + xy\mathbf{j} - xz\mathbf{k}.$$

Then,

$$\begin{aligned} \iint_S \text{curl } \mathbf{F}(x, y, z) \cdot \mathbf{N} \, dS &= \int_0^2 \int_0^z (z + xy - xz) \, dx \, dz \\ &= \int_0^2 \int_0^z (z + x(4 - x - z) - xz) \, dx \, dz \\ &= \int_0^2 \left[ xz + \frac{1}{2}(4 - 2z)x^2 - \frac{1}{3}x^3 \right]_0^z \, dz \\ &= \int_0^2 \left( 3z^2 - \frac{4}{3}z^3 \right) \, dz \\ &= \left[ z^3 - \frac{1}{3}z^4 \right]_0^2 = \frac{8}{3}. \end{aligned}$$

□

**EXAMPLE 3****Using Stokes' Theorem for an arbitrary surface**

Use Stokes' Theorem to evaluate the integral of the vector field

$$\mathbf{F}(x, y, z) = \langle e^{xyz}, -xy^2z, xyz^2 \rangle$$

around the curve  $C$  given by  $y^2 + z^2 = 9$  in the plane  $x = 5$  and traversed in the counter-clockwise direction when viewed from the right (i.e., where  $x > 5$ ).

## SOLUTION

Here any smooth orientable surface whose boundary is  $C$  will do. We make the simple choice of a disk of radius 3 in the plane  $x = 5$  and with center  $(5, 0, 0)$ . This plane is parallel to the  $yz$ -plane. Hence, a unit normal vector is  $\mathbf{i}$ .

Evaluating  $\mathbf{F}(x, y, z)$ , we have

$$\begin{aligned}\operatorname{curl} \mathbf{F} &= \nabla \times \langle e^{xyz}, -xy^2z, xyz^2 \rangle \\ &= \langle xz^2 + xy^2, xye^{xyz} - yz^2, -y^2z - xze^{xyz} \rangle.\end{aligned}$$

If we let  $D$  be the disk with radius 3, centered on the  $x$ -axis, and in the plane  $x = 5$ , substituting according to Stokes' Theorem gives

$$\begin{aligned}\int_C \mathbf{F}(x, y, z) \cdot d\mathbf{r} &= \iint_S \operatorname{curl} \mathbf{F}(x, y, z) \cdot \mathbf{n} \, dS = \iint_D (xz^2 + xy^2) \, dA \\ &= \iint_D x(z^2 + y^2) \, dA.\end{aligned}$$

To finish the integration, we will use polar coordinates. Here,  $r^2 = z^2 + y^2$  and  $dA = r \, dr \, d\theta$ . Furthermore, since  $x = 5$ , we have

$$\begin{aligned}\iint_D x(z^2 + y^2) \, dA &= \int_0^{2\pi} \int_0^3 5r^2 \, r \, dr \, d\theta = \int_0^{2\pi} \left[ \frac{5}{4}r^4 \right]_0^3 \, d\theta \\ &= \int_0^{2\pi} \frac{405}{4} \, d\theta = \frac{405\pi}{2}.\end{aligned}$$

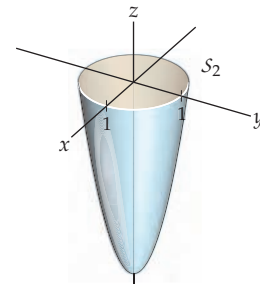

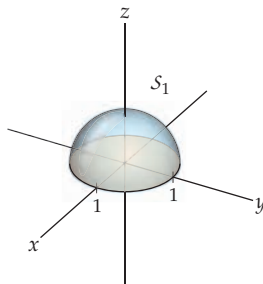

□

### TEST YOUR UNDERSTANDING

- ▶ What is the relationship between Green's Theorem and Stokes' Theorem?
- ▶ What is the relationship between Stokes' Theorem and the Fundamental Theorem of Calculus?
- ▶ Why are both sides of the equation in Stokes' Theorem potentially more complicated than they are in either the Fundamental Theorem of Calculus or Green's Theorem?
- ▶ Suppose that  $S_1$  and  $S_2$  are two different smooth oriented surfaces with a common boundary curve  $C$  and a common orientation relative to  $C$ . (That is, travelling counterclockwise along  $C$  with respect to  $S_1$  is the same direction as travelling counterclockwise with respect to  $S_2$ .) Let  $\mathbf{F}(x, y, z)$  be a vector field that is defined on an open set containing both surfaces. What does Stokes' Theorem imply about

$$\iint_{S_1} \mathbf{F}(x, y, z) \cdot \mathbf{n}_1 \, dS \quad \text{and} \quad \iint_{S_2} \mathbf{F}(x, y, z) \cdot \mathbf{n}_2 \, dS$$

if, for example,  $S_1$  is the hemisphere that is the graph of  $z = \sqrt{1 - x^2 - y^2}$  and  $S_2$  is the paraboloid that is the graph of  $z = 4(x^2 + y^2 - 1)$ , as shown in the figures that follow? Both of these graphs are bounded by the unit circle in the  $xy$ -plane.

- ▶ In the examples, why are  $\mathbf{n}$  and  $dS$  never explicitly separated? (It may be useful to look at Section 14.3.)

## EXERCISES 14.5

## Thinking Back

*Antecedents:* Stokes' Theorem is an immediate generalization of Green's Theorem, but it is related to other theorems as well. For instance, it can also be viewed as a two-dimensional version of the Fundamental Theorem of Line Integrals.

- ▶ Review the Fundamental Theorem of Line Integrals in Section 14.2. For conservative vector fields, what does the theorem imply about  $\int_{C_1} \mathbf{F} \cdot d\mathbf{r}$  and  $\int_{C_2} \mathbf{F} \cdot d\mathbf{r}$  if  $C_1$

and  $C_2$  are two smooth curves with common initial and terminal points and  $\mathbf{F}$  is smooth?

- ▶ Review the Fundamental Theorem of Calculus in Chapter 4. What parts of the Stokes' Theorem equation correspond to the interval of integration, the integrand, and the antiderivative?

## Concepts

0. *Problem Zero:* Read the section and make your own summary of the material.
1. *True/False:* Determine whether each of the statements that follow is true or false. If a statement is true, explain why. If a statement is false, provide a counterexample.
  - (a) *True or False:* Stokes' Theorem asserts that the flux of a vector field through a smooth surface with a smooth boundary is equal to the line integral of this field about the boundary of the surface.
  - (b) *True or False:* Stokes' Theorem can be interpreted as a generalization of Green's Theorem.
  - (c) *True or False:* Stokes' Theorem applies only to conservative vector fields.
  - (d) *True or False:* Stokes' Theorem is always used as a way to evaluate difficult surface integrals.
  - (e) *True or False:* Stokes' Theorem can be interpreted as a generalization of the Fundamental Theorem of Line Integrals.
  - (f) *True or False:* If  $\mathbf{F}(x, y, z)$  is a conservative vector field, then Stokes' Theorem and Theorem 14.12 together give an alternative proof of the Fundamental Theorem of Line Integrals for simple closed curves.
  - (g) *True or False:* Stokes' Theorem can be interpreted as a generalization of the Fundamental Theorem of Calculus.
  - (h) *True or False:* Stokes' Theorem can be used to evaluate surface area.
2. *Examples:* Construct examples of the thing(s) described in the following. Try to find examples that are different than any in the reading.
  - (a) A smooth surface with a smooth boundary.
  - (b) A surface that is not smooth, but that has a smooth boundary.
  - (c) A surface that is smooth, but does not have a smooth boundary.
3. Write two different normal vectors for a smooth surface  $S$  given by  $(x, y, g(x, y))$  at the point  $(x_0, y_0, g(x_0, y_0))$ .
4. Make a chart of all the new notation, definitions, and theorems in this section, including what each new thing means in terms you already understand.
5. Suppose that  $S_1$  is the upper half of the unit sphere, with outwards-pointing normal  $\mathbf{n}_1$ , and  $S_2$  is a balloon-shaped surface whose boundary is the unit circle and whose orientation leads to counterclockwise parametrization of the unit circle. If  $\mathbf{F}(x, y, z)$  is a smooth vector field defined on a region large enough to include both surfaces, what is the relationship between  $\iint_{S_1} \text{curl } \mathbf{F} \cdot \mathbf{n}_1 dS$  and  $\iint_{S_2} \text{curl } \mathbf{F} \cdot \mathbf{n}_2 dS$ ?
6. In what way is Green's Theorem a special case of Stokes' Theorem?
7. If  $\text{curl } \mathbf{F}(x, y, z) \cdot \mathbf{n}$  is constantly equal to 1 on a smooth surface  $S$  with a smooth boundary curve  $C$ , then Stokes' Theorem can reduce the integral for the surface area to a line integral. State this integral.
8. In what way is Stokes' Theorem a generalization of the Fundamental Theorem of Line Integrals?
9. Why is the orientation of  $S$  important to the statement of Stokes' Theorem? What will change if the orientation is reversed?
10. Draw a picture of a smooth surface with subdivisions and locally approximating tangent planes.
11. Give an example of a vector field whose orientation does not affect the outcome of Stokes' Theorem.
12. In your own words, explain how the "subdivide, approximate, and add" strategy from Chapter 4 is applied in the sketch of the proof of Stokes' Theorem.
13. Why is  $dA$  in Green's Theorem replaced by  $dS$  in Stokes' Theorem?
14. Given a smooth surface  $S$  with boundary curve the unit circle traversed counterclockwise, rewrite
 
$$\iint_S \text{curl } \mathbf{F}(x, y, z) \cdot \mathbf{n} dS$$
 as a double integral in the plane.
15. Given an integral of the form  $\int_C \mathbf{F} \cdot d\mathbf{r}$ , what considerations would lead you to evaluate the integral with Stokes' Theorem?
16. Given an integral of the form  $\iint_S \text{curl } \mathbf{F}(x, y, z) \cdot \mathbf{n} dS$ , what considerations would lead you to evaluate the integral with Stokes' Theorem?
17. Why does the statement of Stokes' Theorem require that the surface  $S$  be smooth or piecewise smooth? What, if anything, goes wrong if this condition is not met?
18. Why does the statement of Stokes' Theorem require that the boundary curve  $C$  be smooth or piecewise smooth? What, if anything, goes wrong if this condition is not met?

## Skills

Evaluate the integrals in Exercises 19–32. In some cases, Stokes' Theorem will help; in other cases, it may be preferable to evaluate the integrals directly.

19.  $\int_C \mathbf{F}(x, y, z) \cdot d\mathbf{r}$ , where  $C$  is the boundary of the triangle in the plane  $y = 2$  and with vertices  $(1, 2, 0)$ ,  $(0, 2, 0)$ , and  $(0, 2, 1)$ , with the normal vector pointing in the positive  $y$  direction and

$$\mathbf{F}(x, y, z) = 3yz\mathbf{i} + e^x\mathbf{j} + x^2z\mathbf{k}.$$

20.  $\int_C \mathbf{F}(x, y, z) \cdot d\mathbf{r}$ , where  $C$  is in the plane  $z = 12 - x - y$ , with upwards-pointing normal vector, and is the boundary of the region that lies above the square in the  $xy$ -plane and with vertices  $(3, 5, 0)$ ,  $(3, 7, 0)$ ,  $(4, 5, 0)$ , and  $(4, 7, 0)$ , and where

$$\mathbf{F}(x, y, z) = (y - z)\mathbf{i} + 2x\mathbf{j} + 5xz\mathbf{k}.$$

21.  $\iint_S \text{curl } \mathbf{F}(x, y, z) \cdot \mathbf{n} dS$ , where  $S$  is the portion of the plane  $x + y - z = 0$  with upwards-pointing normal vector and

$$\mathbf{F}(x, y, z) = yze^{xyz}\mathbf{i} + xze^{xyz}\mathbf{j} + xye^{xyz}\mathbf{k}.$$

22.  $\iint_S \text{curl } \mathbf{F}(x, y, z) \cdot \mathbf{n} dS$ , where  $S$  is the portion of the paraboloid  $z = x^2 + y^2$  that lies above the square  $-1 \leq x \leq 1$ ,  $0 \leq y \leq 2$  in the  $xy$ -plane with upwards-pointing normal vector and

$$\mathbf{F}(x, y, z) = x^3yz\mathbf{i} + xy^2z\mathbf{j} + yz\mathbf{k}.$$

23.  $\int_C \mathbf{F}(x, y, z) \cdot d\mathbf{r}$ , where  $C$  is the closed curve in the plane  $y = x$  and formed by the curves  $x = z$  and  $x^2 = z$ , traversed counterclockwise with respect to normal vector  $\mathbf{n} = (1, -1, 0)$ , and where

$$\mathbf{F}(x, y, z) = 7xy\mathbf{i} - z\mathbf{j} + 3xyz\mathbf{k}.$$

24.  $\int_C \mathbf{F}(x, y, z) \cdot d\mathbf{r}$ , where  $C$  is the boundary of the region in the plane  $z = 2x - y + 10$  and that lies above the curves  $x = 1$ ,  $x = 2$ , and  $y = e^x$ , and where

$$\mathbf{F}(x, y, z) = (3x + y)\mathbf{i} + (y - 2z)\mathbf{j} + (2 + 3z)\mathbf{k}.$$

25.  $\iint_S \text{curl } \mathbf{F}(x, y, z) \cdot \mathbf{n} dS$ , where  $S$  is the cap of the unit sphere that lies below the  $xy$ -plane and inside the cylinder  $x^2 + y^2 = \frac{1}{9}$  with outwards-pointing normal vector and where

$$\mathbf{F}(x, y, z) = -yz^2\mathbf{i} + xz^2\mathbf{j} + 3^{-xyz}\mathbf{k}.$$

26.  $\iint_S \text{curl } \mathbf{F}(x, y, z) \cdot \mathbf{n} dS$ , where  $S$  is the portion of the hyperbolic paraboloid  $z = x^2 - y^2$  that lies inside the elliptical cylinder  $4x^2 + 9y^2 = 36$  with upwards-pointing normal vector and  $\mathbf{F}(x, y, z) = (1 - yz \sin(xyz))\mathbf{i} - (1 + xz \sin(xyz))\mathbf{j} + (1 - xy \sin(xyz))\mathbf{k}$ .

27.  $\int_C \mathbf{F}(x, y, z) \cdot d\mathbf{r}$ , where  $C$  is the curve in the plane  $x - y + z = 20$  and that lies above the curves  $y = 4$  and  $y = x^2$  in the  $xy$ -plane, traversed counterclockwise with respect to  $\mathbf{n} = (1, -1, 1)$ , and where  $\mathbf{F}(x, y, z) = (2x - 3y + 4z)\mathbf{i} + (5x + y - z)\mathbf{j} + (x + 4y + 2z)\mathbf{k}$ .

28.  $\int_C \mathbf{F}(x, y, z) \cdot d\mathbf{r}$ , where  $C$  is the curve on the paraboloid  $z = x^2 + y^2$  that lies above the unit circle, traversed counterclockwise with respect to the outwards-pointing normal vector, and where

$$\mathbf{F}(x, y, z) = (3x + y - z)\mathbf{i} + (4y - 2z)\mathbf{j} + (x - 3z)\mathbf{k}.$$

29.  $\iint_S \text{curl } \mathbf{F}(x, y, z) \cdot \mathbf{n} dS$ , where  $S$  is the portion of the surface  $y = \sqrt{4 - x^2 - z^2}$  that lies between  $y = 4$  and  $y = \sqrt{3}$  with normal vector pointing in the positive  $y$  direction and where

$$\mathbf{F}(x, y, z) = (-4z - xz^2)\mathbf{i} + \sin(xyz)\mathbf{j} + (4x + x^2z)\mathbf{k}.$$

30.  $\iint_S \text{curl } \mathbf{F}(x, y, z) \cdot \mathbf{n} dS$ , where  $S$  is the portion of the surface  $z = e^{x^2+y^2}$  that lies above the plane  $z = \frac{1}{4}$  with upwards-pointing normal vector and where

$$\mathbf{F}(x, y, z) = \ln(2x + 1)\mathbf{i} + 2y^{x+1}\mathbf{j} + xe^y\mathbf{k}.$$

31.  $\int_C \mathbf{F} \cdot d\mathbf{r}$ , where  $C$  is the intersection of the surface  $z = e^{-(x^2+y^2)}$  and the cylinder  $x^2 + y^2 = 9$  and where

$$\mathbf{F}(x, y, z) = (3x + 3, 4x + \ln(y^2 + 1) - z, 2x + y).$$

32.  $\iint_S \text{curl } \mathbf{F}(x, y, z) \cdot \mathbf{n} dS$ , where  $S$  is the bottom sheet of the hyperboloid  $z^2 = x^2 + y^2 + 1$  that lies above the plane  $z = 2\sqrt{2}$  with outwards-pointing normal vector.

The hypothesis of Stokes' Theorem requires that the vector field  $\mathbf{F}$  be defined and continuously differentiable on an open set containing the surface  $S$  bounded by  $C$ , that  $C$  be simple, smooth, and closed, and that  $S$  be oriented and smooth. For each of the situations in Exercises 33–36, show that Stokes' Theorem does not apply.

33.  $\mathbf{F}(x, y, z) = \left\langle \frac{x}{x^2+y^2}, -\frac{y}{x^2+y^2}, z^2 \right\rangle$ , and  $C$  is the unit circle.

34.  $\mathbf{F}(x, y, z) = \langle \ln(xy + 1) + 5^x 3^y 2^z, 4xz^2 \rangle$ , and  $C$  is the boundary of the square in the plane  $z = 6$  and with vertices at  $(2, 0, 6)$ ,  $(-2, 0, 6)$ ,  $(2, 4, 6)$ , and  $(-2, 4, 6)$ .

35.  $S$  is the portion of the cone  $z = \sqrt{x^2 + y^2}$  inside the cylinder  $x^2 + y^2 = k^2$  for some  $k \geq 0$ .

36.  $S$  is the pyramid with vertices at  $(0, 0, 6)$ ,  $(2, 0, 0)$ ,  $(-2, 0, 0)$ ,  $(0, 3, 0)$ , and  $(0, -3, 0)$ .

## Applications

For a given vector field  $\mathbf{F}(x, y, z)$  and simple closed curve  $C$ , traversed counterclockwise to a chosen normal vector  $\mathbf{n}$ , the **circulation** of  $\mathbf{F}(x, y, z)$  around  $C$  measures the rotation of the fluid about  $C$  in the direction counterclockwise to the aforementioned chosen normal vector and is defined to be  $\int_C \mathbf{F}(x, y, z) \cdot d\mathbf{r}$ . Find the circulation of the given vector field around  $C$  in Exercises 37 and 38.

37.  $\mathbf{F}(x, y, z) = \mathbf{i} + \mathbf{j} + \mathbf{k}$ , and  $C$  is the curve of intersection of the plane  $\theta = \frac{\pi}{4}$  or  $\theta = \frac{5\pi}{4}$  and the unit sphere.

38.  $\mathbf{F}(x, y, z) = \langle 3y, -x, e^{x+y} \rangle$ , and  $C$  is the intersection of the cone  $z = \sqrt{x^2 + y^2}$  and the unit sphere.

Consider once again the notion of the rotation of a vector field. If a vector field  $\mathbf{F}(x, y, z)$  has  $\text{curl } \mathbf{F} = \mathbf{0}$  at a point  $P$ , then the field is said to be **irrotational** at that point. Show that the fields in Exercises 39–42 are irrotational at the given points.

39.  $\mathbf{F}(x, y, z) = \langle -\sin x, 3y^3, 4z + 12 \rangle$ ,  $P = (2, 3, 4)$ .  
 40.  $\mathbf{F}(x, y, z) = \langle y + z, x + z, x + y \rangle$ ,  $P = (1, -1, 1)$ .  
 41.  $\mathbf{F}(x, y, z) = \langle 2xyz, x^2z, x^2y \rangle$ ,  $P = (1, 1, 1)$ .  
 42.  $\mathbf{F}(x, y, z) = \nabla f(x, y, z)$ , where  $f(x, y, z)$  is a function defined on  $\mathbb{R}^3$  and has continuous first and second partial derivatives, and where  $P = (x_0, y_0, z_0)$ .

Find the work done by the given vector field moving around the curve in the indicated direction in Exercises 43 and 44.

43.  $\mathbf{F}(x, y, z) = yz\mathbf{i} + 2xz\mathbf{j} + xy\mathbf{k}$ , and  $C$  is the curve formed by the intersection of the plane  $12x + 2y - z = 15$  and the cylinder  $y^2 + z^2 = 4$ , traversed counterclockwise with respect to the normal vector  $\mathbf{n} = \langle 12, 2, -1 \rangle$ .

44.  $\mathbf{F}(x, y, z) = \left\langle \frac{2x}{x^2 + y^2 + z^2 + 1}, \frac{2y}{x^2 + y^2 + z^2 + 1}, \frac{2z}{x^2 + y^2 + z^2 + 1} \right\rangle$ , and  $C$  is the curve created by the intersection of the plane  $z = 4$  with the surface  $x^2 + 2y - z = 0$ , when  $y \geq 0$ , together with the line segment connecting the points  $(2, 0, 4)$  and  $(-2, 0, 4)$ , traversed counterclockwise with respect to the normal vector  $\mathbf{k}$ .

45. The current through a certain region of the San Juan Islands in Washington State is given by  $\mathbf{F} = \langle 0, 1.152 - 0.8x^2 \rangle$ . Consider a disk  $R$  of radius 1 mile centered on this region. Denote the boundary of the disk by  $\partial R$ .  
 (a) Compute  $\iint_R \nabla \times \mathbf{F} \cdot \mathbf{n} \, dA$ .  
 (b) Show that

$$\iint_{\partial R} \mathbf{F} \cdot d\mathbf{r} = \int_0^{2\pi} (1.152 - 0.8 \cos^2 \theta) \sin \theta \, d\theta = 0.$$

Conclude that Stokes' Theorem is valid for the current in this region of the San Juan Islands.

- (c) What do the integrals from Stokes' Theorem tell us about this region of the San Juan Islands?

## Proofs

46. (a) Use Stokes' Theorem and the Fundamental Theorem of Line Integrals to show that

$$\iint_S \text{curl } \mathbf{F}(x, y, z) \cdot \mathbf{n} \, dS = 0$$

for any conservative vector field  $\mathbf{F}$ .

- (b) Without using Stokes' Theorem, show that

$$\iint_S \text{curl } \mathbf{F}(x, y, z) \cdot \mathbf{n} \, dS = 0$$

for any conservative vector field  $\mathbf{F}$ .

47. Show that if  $C$  is a smooth curve in a plane  $z = r$ , where  $r$  is an arbitrary constant, that is parallel to the  $xy$ -plane, and if  $\mathbf{F}(x, y, z) = \langle F_1(x, y, z), F_2(x, y, z), F_3(x, y, z) \rangle$ , then  $\int_C \mathbf{F} \cdot d\mathbf{r}$  does not depend on  $F_3$ .  
 48. State and prove a version of Exercise 47 for smooth curves in planes of the form  $x = r$  and of the form  $y = r$ .  
 49. Let  $C$  be a smooth simple closed curve in the plane  $ax + by + cz = k$  with nonzero constants  $a, b, c$ , and  $k$ , and

let  $\mathbf{F}(x, y, z) = \langle F_1(x, y, z), F_2(x, y, z), F_3(x, y, z) \rangle$  be a vector field whose component functions are linear. Show that  $\int_C \mathbf{F} \cdot d\mathbf{r}$  depends only on the area enclosed by  $C$ .

50. Show that  $\int_C \mathbf{F} \cdot d\mathbf{r} = 0$  does not imply that  $\mathbf{F}$  is conservative, by (1) computing  $\int_C \mathbf{F} \cdot d\mathbf{r}$  for  $C$  the unit circle and  $\mathbf{F}(x, y, z) = x\mathbf{i} - y\mathbf{j} + 2^z \ln(z + 1)\mathbf{k}$  and (2) showing that  $\mathbf{F}$  is not conservative but has zero curl.  
 51. Suppose  $S_1$  and  $S_2$  are two smooth surfaces with the same smooth boundary curve  $C$  and that traversing the boundary in the counterclockwise direction determined by the orientation of the surfaces describes the same direction of travel along  $C$ . Moreover, let  $\mathbf{F}(x, y, z)$  be a smooth vector field defined on a region containing both surfaces. Show that

$$\iint_{S_1} \text{curl } \mathbf{F}(x, y, z) \cdot \mathbf{n} \, dS = \iint_{S_2} \text{curl } \mathbf{F}(x, y, z) \cdot \mathbf{n} \, dS$$

In this case, the integral is **surface independent**, a property analogous to the path independence of line integrals for conservative vector fields.

## Thinking Forward

*Generalizing to Higher Dimensions:* Stokes' Theorem is about a surface inside of  $\mathbb{R}^3$ . But the essence of the theorem has to do with integrating over a surface, and does not use any properties that  $\mathbb{R}^3$  has which  $\mathbb{R}^4$  does not.

- How would a version of Stokes' Theorem for  $\mathbb{R}^4$  need to change to accommodate the extra dimension?

- If we take the perspective that Stokes' Theorem is a two-dimensional version of the Fundamental Theorem of Line Integrals, it is natural to ask what a three-dimensional version of Stokes' Theorem would look like. Make a conjecture about a three-dimensional version of Stokes' Theorem. (Note that the previous question asks about a surface in  $\mathbb{R}^4$ , while this question is about a three-dimensional region in  $\mathbb{R}^4$ .)

## 14.6 THE DIVERGENCE THEOREM

- ▶ Extending the Fundamental Theorem of Calculus to three-dimensional regions
- ▶ The Divergence Theorem
- ▶ Justifying the Divergence Theorem

### The Divergence Theorem

Our final theorem of vector analysis presents the Divergence Theorem, another generalization of Green's Theorem and, in turn, of the Fundamental Theorem of Calculus. Here the essential boundary-to-interior relationship is extended to three-dimensional solids, whose boundaries are surfaces.

To set up the Divergence Theorem, we will need to discuss bounded three-dimensional regions in space. The sort of solids we are interested in are regions  $W \subseteq \mathbb{R}^3$  whose boundaries are smooth (or piecewise-smooth), simple closed oriented surfaces. Intuitively, we want the boundary of  $W$  to be a reasonably well-behaved surface with a choice of inward and outward normal vector. Recall our requirement that all vector fields we use in this chapter be smooth; that is, that their component functions be continuous and have continuous first derivatives.

To see how Green's Theorem can be scaled up in dimension, let  $W$  be a reasonably well-behaved region in  $\mathbb{R}^3$ . For example,  $W$  might be described as

$$\{(x, y, z) \mid a \leq x \leq b, \quad g_1(x) \leq y \leq g_2(x), \quad f_1(x, y) \leq z \leq f_2(x, y)\}$$

or analogous solids for each of the other five permutations of  $x$ ,  $y$ , and  $z$ .

Recall the divergence form of Green's Theorem, which reads, under the usual assumptions about  $\mathbf{F}(x, y, z)$ ,  $C$ , and  $R$ ,

$$\int_C \mathbf{F}(x, y) \cdot \mathbf{n} \, ds = \iint_R \operatorname{div} \mathbf{F} \, dA.$$

If  $W$  is as described, then Green's Theorem applies to every slice of  $W$  that is parallel to the  $xy$ -plane. On the basis of past experience, it is reasonable to suppose that subdividing the height range into small subintervals, using a choice from within each subinterval to approximate, and adding the approximations will, in the limit, yield the correct value.

On the left-hand side of the preceding equation, we have an integral of line integrals, which should result in a two-dimensional, or surface, integral. On the right-hand side of the equation, we have a double integral, which should result in a volume.

The Divergence Theorem says that this is in essence what happens:

#### THEOREM 14.16

#### Divergence Theorem

Suppose  $W$  is a region in  $\mathbb{R}^3$  bounded by a smooth or piecewise-smooth closed oriented surface  $S$ . If  $\mathbf{F}(x, y, z)$  is defined on an open region containing  $W$ , then

$$\iiint_W \operatorname{div} \mathbf{F}(x, y, z) \, dV = \iint_S \mathbf{F}(x, y, z) \cdot \mathbf{n} \, dS$$

where  $\mathbf{n}$  is the outwards unit normal vector.

**Proof.** Again, a thorough proof of this theorem is beyond the scope of this book. We sketch a direct proof of the Divergence Theorem for very well-behaved regions in  $\mathbb{R}^3$ .

To prove the Divergence Theorem for the type of region  $W$  that we have described, it suffices to prove that

$$\begin{aligned}\iiint_W \frac{\partial F_1}{\partial x} dV &= \iint_S F_1(x, y, z) \mathbf{i} \cdot \mathbf{n} dS, \\ \iiint_W \frac{\partial F_2}{\partial y} dV &= \iint_S F_2(x, y, z) \mathbf{j} \cdot \mathbf{n} dS, \text{ and} \\ \iiint_W \frac{\partial F_3}{\partial z} dV &= \iint_S F_3(x, y, z) \mathbf{k} \cdot \mathbf{n} dS\end{aligned}$$

where  $\mathbf{n} = \langle n_1, n_2, n_3 \rangle$  and  $\mathbf{F} = \langle F_1, F_2, F_3 \rangle$ . We prove the last equation for regions  $W$  as we have described them. Such regions can be understood as the regions between  $S_1 = \{(x, y, z) \mid z = f_1(x, y)\}$  and  $S_2 = \{(x, y, z) \mid z = f_2(x, y)\}$  for points  $(x, y)$  in the region  $D$  of the  $xy$ -plane described by  $a \leq x \leq b$ ,  $g_1(x) \leq y \leq g_2(x)$ . Then

$$\iint_S F_3(x, y, z) \mathbf{k} \cdot \mathbf{n} dS = \iint_{S_2} F_3(x, y, z) \mathbf{k} \cdot \mathbf{n} dS + \iint_{S_1} F_3(x, y, z) \mathbf{k} \cdot \mathbf{n} dS.$$

We let  $M = \left\| \left\langle \frac{\partial F_2}{\partial x}, \frac{\partial F_2}{\partial y}, -1 \right\rangle \right\|$ . On  $S_2$ ,  $\mathbf{n}$  has a positive  $\mathbf{k}$ -component, so  $\mathbf{n} = \frac{1}{M} \left\langle -\frac{\partial F_2}{\partial x}, -\frac{\partial F_2}{\partial y}, 1 \right\rangle$ , and on  $S_1$ ,  $\mathbf{n}_1$  has a negative  $\mathbf{k}$ -component, so  $\mathbf{n}_1 = \frac{1}{M} \left\langle \frac{\partial F_2}{\partial x}, \frac{\partial F_2}{\partial y}, -1 \right\rangle$ , and  $\mathbf{n}_1 = -\mathbf{n}$ . Substituting, we have

$$\begin{aligned}\iint_S F_3(x, y, z) \mathbf{k} \cdot \mathbf{n} dS &= \iint_{S_2} F_3(x, y, z) \mathbf{k} \cdot \mathbf{n} dS - \iint_{S_1} F_3(x, y, z) \mathbf{k} \cdot \mathbf{n} dS \\ &= \iint_S \left( \int_{f_1(x, y)}^{f_2(x, y)} \frac{\partial F_3}{\partial z} dz \right) dS = \iiint_W \frac{\partial F_3}{\partial z} dV. \quad \blacksquare\end{aligned}$$

One way to give a physical intuition for the Divergence Theorem is to recall that the divergence of a vector field in  $\mathbb{R}^3$  measures whether or not a gas represented by the field is expanding or compressing. If a gas occupies a region of space, and it is expanding, then the left-hand side of the Divergence Theorem—the integral of  $\operatorname{div} \mathbf{F}$ —will be positive. At the same time, if a gas in a region is expanding, we would expect that it will have a positive flux flowing out through its boundary. This is part of what the Divergence Theorem asserts: Since both sides of the equation give the same value, in particular they have the same sign. The finer detail in the theorem keeps track of the exact relationship.

The Divergence Theorem can be extended to relate surface and volume integrals for solids bounded by more than one closed surface. This procedure is similar to that for Green's Theorem and, as in that case, requires some bookkeeping to make sure that the theorem is being applied correctly. An example is given in Example 3.

## A Summary of Theorems About Vector Analysis

Having arrived at the end of a chapter on vector analysis, which is in turn at the end of a three-semester calculus sequence, it is appropriate to examine some of the most salient results side by side, to appreciate their similarities as well as their differences arising from context. A summary of the chief results of this chapter and their precursors follows. You may find it a useful exercise to reconsider the notation, background assumptions, and context pertaining to each theorem.

Theorem Name	Integral Statement	Reference
Fundamental Theorem of Calculus	$\int_a^b f(x) dx = F(b) - F(a)$	Theorem 4.24
Fundamental Theorem of Line Integrals	$\int_C \nabla f(x, y, z) \cdot d\mathbf{r} = f(Q) - f(P)$	Theorem 14.5
Green's Theorem	$\iint_R \left( \frac{\partial F_2}{\partial x} - \frac{\partial F_1}{\partial y} \right) dA = \int_C \mathbf{F}(x, y) \cdot d\mathbf{r}$	Theorem 14.13
Stokes' Theorem	$\iint_S \text{curl } \mathbf{F}(x, y, z) \cdot \mathbf{n} dS = \int_C \mathbf{F}(x, y, z) \cdot d\mathbf{r}$	Theorem 14.15
Divergence Theorem	$\iiint_W \text{div } \mathbf{F}(x, y, z) dV = \iint_S \mathbf{F}(x, y, z) \cdot \mathbf{n} dS$	Theorem 14.16

## Examples and Explorations

### EXAMPLE 1

#### Verifying the Divergence Theorem

Verify the conclusion of the Divergence Theorem for the vector field

$$\mathbf{F}(x, y, z) = x^2\mathbf{i} + y^2\mathbf{j} + z^2\mathbf{k}$$

with region  $\mathcal{R}$ , the unit ball centered at the origin.

#### SOLUTION

To compute

$$\iint_S \mathbf{F}(x, y, z) \cdot \mathbf{n} dS,$$

recall that  $S$ , the unit sphere that is the boundary of  $\mathcal{R}$ , is parametrized by

$$\mathbf{r}(\phi, \theta) = (\cos \theta \sin \phi, \sin \theta \sin \phi, \cos \phi), \text{ for } 0 \leq \phi \leq \pi \text{ and } 0 \leq \theta \leq 2\pi.$$

Then

$$\mathbf{r}_\phi(\phi, \theta) = \langle \cos \theta \cos \phi, \sin \theta \cos \phi, -\sin \phi \rangle \text{ and } \mathbf{r}_\theta(\phi, \theta) = \langle -\sin \theta \sin \phi, \cos \theta \sin \phi, 0 \rangle.$$

The cross product,

$$\mathbf{r}_\phi \times \mathbf{r}_\theta = \langle \cos \theta \sin^2 \phi, \sin \theta \sin^2 \phi, \cos \phi \sin \phi \rangle,$$

and  $\|\mathbf{r}_\phi \times \mathbf{r}_\theta\| = \sin \phi$ . For all values of  $\phi$  and  $\theta$ , the vector  $\mathbf{r}_\phi \times \mathbf{r}_\theta$  points away from the origin and thus in the direction of the outwards unit normal. Therefore, we let

$$\mathbf{n} = \frac{\mathbf{r}_\phi \times \mathbf{r}_\theta}{\sin \phi} = \langle \cos \theta \sin \phi, \sin \theta \sin \phi, \cos \phi \rangle.$$

On  $S$ ,

$$\mathbf{F}(x, y, z) = \langle \cos^2 \theta \sin^2 \phi, \sin^2 \theta \sin^2 \phi, \cos^2 \phi \rangle.$$

So,

$$\begin{aligned} \mathbf{F}(x, y, z) \cdot \mathbf{n} &= \langle \cos^2 \theta \sin^2 \phi, \sin^2 \theta \sin^2 \phi, \cos^2 \phi \rangle \cdot \langle \cos \theta \sin \phi, \sin \theta \sin \phi, \cos \phi \rangle \\ &= \cos^3 \theta \sin^3 \phi + \sin^3 \theta \sin^3 \phi + \cos^3 \phi. \end{aligned}$$

Substituting, we have

$$\begin{aligned}
 \iint_S \mathbf{F}(x, y, z) \cdot \mathbf{n} \, dS &= \int_0^{2\pi} \int_0^\pi (\cos^3 \theta \sin^3 \phi + \sin^3 \theta \sin^3 \phi + \cos^3 \phi) \, d\phi \, d\theta \\
 &= \int_0^{2\pi} \left[ (\cos^3 \theta + \sin^3 \theta) \left( -\frac{1}{3} \sin^2 \phi \cos \phi - \frac{2}{3} \cos \phi \right) - \frac{1}{3} \cos^2 \phi \sin \phi - \frac{2}{3} \phi \right]_0^\pi \, d\theta \\
 &= \int_0^{2\pi} \frac{4}{3} (\cos^3 \theta + \sin^3 \theta) \, d\theta \\
 &= \frac{4}{3} \left[ \sin \theta - \frac{1}{3} \sin^3 \theta - \cos \theta + \frac{1}{3} \cos^3 \theta \right]_0^{2\pi} = 0.
 \end{aligned}$$

To compute the triple integral given by the Divergence Theorem, we find

$$\operatorname{div} \mathbf{F}(x, y, z) = 2x + 2y + 2z.$$

Since  $\mathcal{R}$  is the unit sphere, this integral is most convenient to evaluate in spherical coordinates. Converting  $\operatorname{div} \mathbf{F}(x, y, z)$  into spherical coordinates gives

$$\begin{aligned}
 \iiint_R \operatorname{div} \mathbf{F}(x, y, z) \, dV &= 2 \int_0^{2\pi} \int_0^\pi \int_0^1 (\rho \cos \theta \sin \phi + \rho \sin \theta \sin \phi + \rho \cos \phi) \rho^2 \sin \phi \, d\rho \, d\phi \, d\theta \\
 &= 2 \int_0^{2\pi} \int_0^\pi \int_0^1 \rho^3 (\cos \theta \sin^2 \phi + \sin \theta \sin^2 \phi + \cos \phi \sin \phi) \, d\rho \, d\phi \, d\theta \\
 &= 2 \int_0^{2\pi} \int_0^\pi \left[ \frac{1}{4} \rho^4 (\cos \theta \sin^2 \phi + \sin \theta \sin^2 \phi + \cos \phi \sin \phi) \right]_0^1 \, d\phi \, d\theta \\
 &= \frac{1}{2} \int_0^{2\pi} \int_0^\pi (\cos \theta \sin^2 \phi + \sin \theta \sin^2 \phi + \cos \phi \sin \phi) \, d\phi \, d\theta \\
 &= \frac{1}{2} \int_0^{2\pi} \left[ (\cos \theta + \sin \theta) \left( \frac{1}{2} \phi - \frac{1}{4} \sin 2\phi \right) + \frac{1}{2} \sin^2 \phi \right]_0^\pi \, d\theta \\
 &= \frac{\pi}{4} \int_0^{2\pi} (\cos \theta + \sin \theta) \, d\theta \\
 &= \frac{\pi}{4} [\sin \theta - \cos \theta]_0^{2\pi} = 0.
 \end{aligned}$$

□

### EXAMPLE 2

#### Using the Divergence Theorem

Use the Divergence Theorem to evaluate the following flux integrals:

(a) 
$$\iint_S \mathbf{F}(x, y, z) \cdot \mathbf{n} \, dS,$$

where

$$\mathbf{F}(x, y, z) = x\mathbf{i} + ze^{xz}\mathbf{j} + xyz\mathbf{k}$$

and  $S$  is the surface of the rectangular solid bounded by the planes  $x = 0$ ,  $x = 5$ ,  $y = 0$ ,  $y = 3$ ,  $z = 0$ , and  $z = 7$ .

(b) 
$$\iint_S \mathbf{G}(x, y, z) \cdot \mathbf{n} \, dS$$

where

$$\mathbf{G}(x, y, z) = (e^{yz} - x^2yz)\mathbf{i} + xy^2z\mathbf{j} + 2z\mathbf{k}$$

and  $S$  is the surface of the ellipsoid  $x^2 + y^2 + 4z^2 = 16$ .

**SOLUTION**

(a) Computing the divergence of  $\mathbf{F}(x, y, z)$ , we find that

$$\operatorname{div} \mathbf{F} = 1 + xy.$$

Applying the Divergence Theorem allows us to rewrite the integral:

$$\begin{aligned} \iint_S \mathbf{F}(x, y, z) \cdot \mathbf{n} \, dS &= \iiint_R (1 + xy) \, dz \, dy \, dx \\ &= \int_0^5 \int_0^3 \int_0^7 (1 + xy) \, dz \, dy \, dx \\ &= \int_0^5 \int_0^3 (7 + 7xy) \, dy \, dx \\ &= \int_0^5 \left[ 7y + \frac{7}{2}xy^2 \right]_0^3 \, dx \\ &= \int_0^5 \left( 21 + \frac{63}{2}x \right) \, dx \\ &= \left[ 21x + \frac{63}{4}x^2 \right]_0^5 = \frac{1995}{4}. \end{aligned}$$

(b) Computing the divergence of  $\mathbf{G}(x, y, z)$ , we find that

$$\operatorname{div} \mathbf{G} = -2xyz + 2xyz + 2 = 2.$$

Applying the Divergence Theorem allows us to rewrite the surface integral as a volume integral, which we evaluate by means of cylindrical coordinates.

$$\begin{aligned} \iint_S \mathbf{G} \cdot \mathbf{n} \, dS &= \iiint_R \operatorname{div} \mathbf{G} \, dV \\ &= \int_0^{2\pi} \int_0^4 \int_{-\sqrt{4-(r^2/4)}}^{\sqrt{4-(r^2/4)}} 2r \, dz \, dr \, d\theta \\ &= \int_0^{2\pi} \int_0^4 [2rz]_{-\sqrt{4-(r^2/4)}}^{\sqrt{4-(r^2/4)}} \, dr \, d\theta \\ &= \int_0^{2\pi} \int_0^4 4r \sqrt{4 - \frac{1}{4}r^2} \, dr \, d\theta \\ &= \int_0^{2\pi} \left[ -\frac{16}{3} \left( 4 - \frac{1}{4}r^2 \right)^{3/2} \right]_0^4 \, d\theta \\ &= \int_0^{2\pi} \frac{128}{3} \, d\theta \\ &= \frac{256\pi}{3}. \end{aligned}$$

□

**EXAMPLE 3****Using the Divergence Theorem for a region bounded by two surfaces**

Use the Divergence Theorem to evaluate

$$\iint_{S_1} \mathbf{F}(x, y, z) \cdot \mathbf{n} \, dS - \iint_{S_2} \mathbf{F}(x, y, z) \cdot \mathbf{n} \, dS,$$

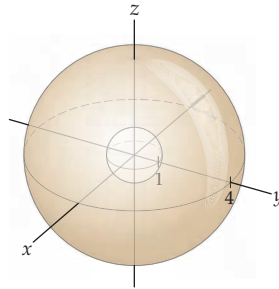

where

$$\mathbf{F}(x, y, z) = x\mathbf{i} + y\mathbf{j} + z\mathbf{k},$$

$S_1$  is the surface of the sphere of radius 4 centered at the origin, and  $S_2$  is the unit sphere.

**SOLUTION**

The region is bounded by two concentric spheres:

Computing  $\operatorname{div} \mathbf{F}$ , we find that  $\operatorname{div} \mathbf{F} = 1 + 1 + 1 = 3$ . Now, applying the Divergence Theorem gives

$$\begin{aligned} \iint_{S_1} \mathbf{F}(x, y, z) \cdot \mathbf{n} \, dS - \iint_{S_2} \mathbf{F}(x, y, z) \cdot \mathbf{n} \, dS &= \int_0^{2\pi} \int_0^\pi \int_1^4 3\rho^2 \sin \phi \, d\rho \, d\phi \, d\theta \\ &= \int_0^{2\pi} \int_0^\pi [\rho^3 \sin \phi]_1^4 \, d\phi \, d\theta \\ &= \int_0^{2\pi} \int_0^\pi 63 \sin \phi \, d\phi \, d\theta \\ &= \int_0^{2\pi} [-63 \cos \phi]_0^\pi \, d\theta \\ &= \int_0^{2\pi} 126 \, d\theta = 252\pi. \end{aligned}$$

□

**EXAMPLE 4****Calculating an electric field intensity by using Gauss' Law**

Gauss' Law is a method for calculating an electric field intensity  $\mathbf{E}$  generated by simple charge distributions. Given some charge density  $\rho(\mathbf{x})$  in a region  $\Omega$  enclosed by a surface  $S$ , Gauss' Law states that the electric field at any point  $\mathbf{x} \in \Omega$  satisfies

$$\nabla \cdot \mathbf{E}(\mathbf{x}) = \frac{\rho(\mathbf{x})}{\epsilon_0},$$

where  $\epsilon_0$  is a constant called the *permittivity of free space*. Integrate both sides of this equation and apply the Divergence Theorem to establish the following integral form of Gauss' Law:

$$\iint_S \operatorname{div} \mathbf{E} \, dA = \frac{1}{\epsilon_0} \iiint_\Omega \rho \, dV.$$

**SOLUTION**

Integrating both sides of the the equation, we see that

$$\iiint_\Omega \nabla \cdot \mathbf{E} \, dV = \frac{1}{\epsilon_0} \iiint_\Omega \rho \, dV.$$

Applying the Divergence Theorem to the left side and noting that the boundary of the region  $\Omega$  is  $S$  gives

$$\iint_S \operatorname{div} \mathbf{E} \, dA = \frac{1}{\epsilon_0} \iiint_\Omega \rho \, dV.$$

□

## ? TEST YOUR UNDERSTANDING

- ▶ What is the relationship between the Divergence Theorem and the Fundamental Theorem of Calculus?
- ▶ What relationship exists among the Divergence Theorem, Green's Theorem, and Stokes' Theorem?
- ▶ If we wish to use the Divergence Theorem to compute the flux of a vector field flowing into a closed bounded region  $W \subseteq \mathbb{R}^3$ , how does the theorem need to be adapted?
- ▶ In Example 1, what properties of the vector field caused the outcome to be zero?
- ▶ How do the change-of-variables factors arise in each of the integrals in Example 1?

## EXERCISES 14.6

### Thinking Back

*A Long Look Back:* Here at end of the chapter, which is in turn the end of the course, and moreover the end of a multise­mester calculus odyssey, it is appropriate to reflect on the unifying questions, insights, and results that characterize the subject.

- ▶ How do the definitions of differentiation and integration that we have made throughout this text rely on the earlier idea of a limit that we defined in Chapter 1?
- ▶ How does the strategy of subdivision, approximation, and addition interact with limits in the justifications of the theorems given in Chapter 14?

- ▶ Are there any questions about integration that you had before reading this chapter that are now resolved? What are they?
- ▶ Are there any questions about integration that you had before reading this chapter that you still have? What are they?
- ▶ Do you have any new questions about integration now that had not occurred to you before reading this chapter? What are they?

### Concepts

0. *Problem Zero:* Read the section and make your own summary of the material.
1. *True/False:* Determine whether each of the statements that follow is true or false. If a statement is true, explain why. If a statement is false, provide a counterexample.
  - (a) *True or False:* The Fundamental Theorem of Line Integrals, Green's Theorem, Stokes' Theorem, and the Divergence Theorem bear a family resemblance to the Fundamental Theorem of Calculus and can in some way be interpreted as generalizations of that theorem.
  - (b) *True or False:* The vector field  $\mathbf{F}$  in the statement of the Divergence Theorem must satisfy the condition we have required throughout this chapter that the component functions of  $\mathbf{F}$  be continuous with continuous derivatives on an open region that contains the region in which we wish to apply the theorem.
  - (c) *True or False:* The Divergence Theorem is interesting only as a tool for evaluating difficult flux integrals.
  - (d) *True or False:* It is often, though not always, easier to integrate over a region in  $\mathbb{R}^3$  than to evaluate a surface integral.
  - (e) *True or False:* The Divergence Theorem is a generalization of the technique of integration by parts.
- (f) *True or False:* The Divergence Theorem is a consequence of Stokes' Theorem.
- (g) *True or False:* The Divergence Theorem can be used to calculate the flux through a region that is bounded by two distinct smooth simple closed surfaces.
- (h) *True or False:* The Divergence Theorem is a generalization of Green's Theorem.
2. *Examples:* Construct examples of the thing(s) described in the following. Try to find examples that are different than any in the reading.
  - (a) A simple closed surface that is smooth.
  - (b) A simple closed surface that is not smooth, but is piecewise smooth.
  - (c) A simple closed surface that is neither smooth nor piecewise smooth.
3. Does the Divergence Theorem apply to surfaces that are not closed?
4. Make a chart of all the new notation, definitions, and theorems in this section, including what each new item means in terms of what you already understand.
5. Give an intuitive explanation of why the paraboloid  $z = x^2 + y^2$  is smooth but the surface of the rectangular solid bounded by the coordinate planes and the planes  $x = 14$ ,  $y = 5$ , and  $z = 32$  is only piecewise smooth.

6. Give an intuitive explanation of why the surface of a tetrahedron is piecewise smooth but the surface of the cone  $z = \sqrt{x^2 + y^2}$  is not.
7. (a) Let  $\mathbf{F}(x, y, z) = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$ , and let  $S$  be the unit sphere. Make a sketch of the field. Without evaluating the integral, do you expect that  $\iint_S \mathbf{F} \cdot \mathbf{n} \, dS$  will be positive, negative, or zero? Why?
- (b) Let  $\mathbf{F}(x, y, z) = 3\mathbf{i} + 7\mathbf{j} + 9\mathbf{k}$ , and let  $S$  be the unit sphere. Make a sketch of the field. Without evaluating the integral, do you expect that  $\iint_S \mathbf{F} \cdot \mathbf{n} \, dS$  will be positive, negative, or zero? Why?
- (c) Use the Divergence Theorem to check your guesses in parts (a) and (b).
8. Recall from Section 14.4 that the divergence of a vector field is related to the expansion or compression of a gas whose motion is represented by that field. If a gas whose motion is represented by a vector field is expanding (or compressing) in a region of space, what effect should that have on the flux of the vector field out of (or into) a closed region  $W$ ? Making some additional assumptions about the direction of the vectors in  $\mathbf{F}$  may help you to think about this situation.
9. If  $\mathbf{F}(x, y, z) = \nabla f(x, y, z)$  is a conservative vector field, what will  $\text{div } \mathbf{F}$  be?
10. Give an example of a conservative vector field whose divergence is not uniformly equal to zero in  $\mathbb{R}^3$ .
11. Give an example of a conservative vector field whose divergence is uniformly equal to zero in  $\mathbb{R}^3$ .
12. Give an example of a non-conservative vector field whose divergence is uniformly equal to zero in  $\mathbb{R}^3$ .
13. Give an example of a non-conservative vector field whose divergence is never equal to zero in  $\mathbb{R}^3$ .
14. Considering your answers to Exercises 10–13, what do you conjecture is true or not true about conservative vector fields in the context of the Divergence Theorem?

## Skills

In Exercises 21–24, compute the divergence of the given vector field.

21.  $\mathbf{F}(x, y, z) = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$
22.  $\mathbf{F}(x, y, z) = yz \cos z \mathbf{i} + (z - x)\mathbf{j} + e^x y \mathbf{k}$
23.  $\mathbf{F}(x, y, z) = xe^{xy} \mathbf{i} + ye^{xy} \mathbf{j} + ze^{xy} \mathbf{k}$
24.  $\mathbf{F}(x, y, z) = \cos x \mathbf{i} - y \sin zy \mathbf{j} + \cos z \mathbf{k}$

In Exercises 25–40, evaluate the integral

$$\iint_S \mathbf{F}(x, y, z) \cdot \mathbf{n} \, dS$$

for the specified function  $\mathbf{F}(x, y, z)$  and the given surface  $S$ . In each integral,  $\mathbf{n}$  is the outwards-pointing normal vector.

25.  $\mathbf{F}(x, y, z) = 4x^3 y z \mathbf{i} + 6x^2 y^2 z \mathbf{j} + 6x^2 y z^2 \mathbf{k}$ , and  $S$  is the surface of the first-octant cube with side length  $\pi$  and with one vertex at the origin.

Decide whether or not each of the integrals in Exercises 15–20 can be evaluated by means of the Divergence Theorem. (You do not need to evaluate the integrals.)

15.  $\iint_S \mathbf{F}(x, y, z) \cdot \mathbf{n} \, dS$  where  $S$  is the cone  $y = \sqrt{x^2 + z^2}$  between  $y = 0$  and  $y = 4$  and where

$$\mathbf{F}(x, y, z) = x y z \mathbf{i} + 2^{xyz} \mathbf{j} + \frac{x}{y^2 + 1} \mathbf{k}.$$

16.  $\iint_S \mathbf{F}(x, y, z) \cdot \mathbf{n} \, dS$  where  $S$  is the surface of the tetrahedron bounded by the three coordinate planes and the plane  $3x + 2y + 6z = 12$  and where

$$\mathbf{F}(x, y, z) = z \sin y \mathbf{i} - x \cos z \mathbf{j} + z \cos y \mathbf{k}.$$

17.  $\iint_S \mathbf{F}(x, y, z) \cdot \mathbf{n} \, dS$  where  $S$  is the unit sphere and  $\mathbf{F}(x, y, z) = \langle e^{\sqrt{x^2 + y^2 + z^2}}, \ln(x^2 y^2 z^2), 5x^3 z \rangle$ .

18.  $\iint_S \mathbf{F}(x, y, z) \cdot \mathbf{n} \, dS$  where  $S$  is the portion of the surface  $x = z^3$  that lies between the planes  $y = 13$  and  $y = 42$  and where

$$\mathbf{F}(x, y, z) = \left\langle \cos(xy), \frac{1}{y^2 z^2 + 1}, x + y \right\rangle.$$

19.  $\iint_S \mathbf{F}(x, y, z) \cdot \mathbf{n} \, dS$  where  $S$  is the portion of the hyperboloid of two sheets  $x^2 + y^2 + 1 = z^2$  that lies between the planes  $z = 5$  and  $z = 10$  and where

$$\mathbf{F}(x, y, z) = \langle x^2 - 2y + z^2, 4x + z - 2, 2^{xyz} \rangle.$$

20.  $\iint_S \mathbf{F}(x, y, z) \cdot \mathbf{n} \, dS$  where  $S$  is the surface of the torus parametrized by

$$x = (3 + \cos v) \cos u, \quad y = (3 + \cos v) \sin u, \quad z = \sin v$$

and where  $\mathbf{F}(x, y, z) = (3x - z)\mathbf{i} - x^2 z \mathbf{j} + xy^7 \mathbf{k}$ .

26.  $\mathbf{F}(x, y, z) = xy^2 \mathbf{i} + y(z - 3x)\mathbf{j} + 4xyz \mathbf{k}$ , and  $S$  is the surface of the region  $W$  bounded by the planes  $y = 0$ ,  $y = z$ ,  $z = 3$ ,  $x = 0$ , and  $x = 4$ .

27.  $\mathbf{F}(x, y, z) = e^z x \sin y \mathbf{i} + e^z \cos y \mathbf{j} + e^x \tan^{-1} y \mathbf{k}$ , and  $S$  is the surface of the region  $W$  that lies within the unit sphere and above the plane  $z = \frac{\sqrt{2}}{2}$ .

28.  $\mathbf{F}(x, y, z) = x^3 \mathbf{i} + y^3 \mathbf{j} + z^3 \mathbf{k}$ , and  $S$  is the sphere of radius 3 and centered at the origin.

29.  $\mathbf{F}(x, y, z) = 15xz^2 \mathbf{i} + 15yx^2 \mathbf{j} + 15yz \mathbf{k}$ , and  $S$  is the surface of the lower half of the unit sphere, along with the unit circle in the plane.

30.  $\mathbf{F}(x, y, z) = 4xy \mathbf{i} - yz \mathbf{j} + z^3 x \mathbf{k}$ , and  $S$  is the surface of the region  $W$  that lies within the cone  $z = \sqrt{x^2 + y^2}$  and between the planes  $z = 1$  and  $z = 4$ .

31.  $\mathbf{F}(x, y, z) = \langle xz, yz, xyz \rangle$ , and  $S$  is the surface of the cylinder with equation  $x^2 + y^2 = 9$  for  $-2 \leq z \leq 2$ .

32.  $\mathbf{F}(x, y, z) = \langle e^{x^2+y^2+z^2}, 3y-z, ye^x \rangle$ , and  $S$  is the unit sphere.
33.  $\mathbf{F}(x, y, z) = \sin y \cos z \mathbf{i} + yz^2 \mathbf{j} + xz^2 \mathbf{k}$ , and  $S$  is the surface of the region  $W$  bounded by the paraboloid  $y = x^2 + z^2$  and the planes  $y = 1$  and  $y = 4$ .
34.  $\mathbf{F}(x, y, z) = \langle 2x - y, yz - ye^{2x}, x^2 + yz \rangle$ , and  $S$  is the surface of the region that lies within  $x = y^2 + z^2$  and  $x = 2z + 1$ .
35.  $\mathbf{F}(x, y, z) = \left\langle x^2y^2, 2xy, \frac{2xz^3}{3} \right\rangle$ , and  $S$  is the surface of the region that lies within the hyperboloid with equation  $x^2 = z^2 + y^2 + 1$  and between the planes  $x = 1$  and  $x = 4$ .
36.  $\mathbf{F}(x, y, z) = x2^z \ln 2 \mathbf{i} + (x - y + z) \mathbf{j} + (2y + 4z) \mathbf{k}$ , and  $S$  is the surface of the first-octant region  $W$  bounded by the coordinate planes and the plane  $x + y + 2z = 2$ .
37.  $\mathbf{F}(x, y, z) = \left\langle \frac{xe}{2}, zx - ye, \frac{3ez}{2} + \ln(x^2y^2z^2 + 1) \right\rangle$ , and  $S$  is the surface of the sphere of radius 3 and centered at  $(2, 1, 3)$ .
38.  $\mathbf{F}(x, y, z) = \langle e^{x^2+z^2}, 4y, e^{x^2+z^2} \rangle$ , and  $S$  is the surface of the right circular cylinder of radius 1 whose axis is the line  $(2, t, 2)$  that runs parallel to the  $y$ -axis. The left and right sides of the cylinder lie in the planes  $y = 3$  and  $y = 0$ , respectively.
39.  $\mathbf{F}(x, y, z) = 8x\mathbf{i} - 13y\mathbf{j} + (13z - 12e^y)\mathbf{k}$ , and  $S$  is the surface of the region  $W$  that lies above the region  $|y| \leq |x|$ ,  $y \geq 0$  in the  $xy$ -plane, within the unit circle, and below the saddle  $z = x^2 - y^2$ .
40.  $\mathbf{F}(x, y, z) = 4 \cos z + 2x\mathbf{i} + (3y - z)\mathbf{j} + 12z\mathbf{k}$ , and  $S$  is the surface of the region  $W$  bounded below by  $z = x^2 + y^2$  and above by the sphere  $x^2 + y^2 + z^2 = 2$  centered at the origin.

In Exercises 41–44, find the fluxes of the vector fields through the given surfaces in the direction of the outwards-pointing normal vector.

41.  $\mathbf{F}(x, y, z) = \langle xe^y, \ln(xyz), xyz^2 \rangle$ , and  $S$  is the surface of the rectangular solid with vertices  $(1, 1, 1)$ ,  $(1, 5, 1)$ ,  $(1, 1, 4)$ ,  $(1, 5, 4)$ ,  $(7, 1, 1)$ ,  $(7, 5, 1)$ ,  $(7, 1, 4)$ , and  $(7, 5, 4)$ .
42.  $\mathbf{F}(x, y, z) = 2xz\mathbf{i} + 4xy\mathbf{j} - 8zy\mathbf{k}$ , and  $S$  is the surface determined by  $y = 4 - x^2$ ,  $y \geq 0$ ,  $0 \leq z \leq 5$ .
43.  $\mathbf{F}(x, y, z) = \langle y \cos z, 3y, \sin(xy) \rangle$ , and  $S$  is the surface of the pyramid with the square base in the  $xy$ -plane and with vertices  $(1, 1, 0)$ ,  $(-1, 1, 0)$ ,  $(1, -1, 0)$ ,  $(-1, -1, 0)$  and apex  $(0, 0, 4)$ .
44.  $\mathbf{F}(x, y, z) = \left\langle x^2y^2z^2, z - x - y, \frac{y}{z+1} \right\rangle$ , and  $S$  is the surface of the region bounded by  $z = x^2$ ,  $x = 0$ , and  $4x + 2z = 4$ .

## Applications

45. The current through a certain region of the San Juan Islands in Washington State is given by  $\mathbf{F} = \langle 0, 1.152 - 0.8x^2 \rangle$ . Consider a disk  $R$  of radius 1 centered on this region. Denote the circle that comprises the boundary of the disk by  $\partial R$ .
- Compute  $\iint_R \nabla \cdot \mathbf{F} dA$ .
  - Show that  $\int_{\partial R} \mathbf{F} \cdot \mathbf{n} ds = 0$ . Conclude that the Divergence Theorem is valid for the current in this region of the San Juan Islands.
  - What do the values of the integrals from the Divergence Theorem tell us about this region of the San Juan Islands?
46. Suppose that an electric field is given by  $\mathbf{E} = \langle 2y, 2xy, yz \rangle$ . Use the Divergence Theorem to compute the flux  $\iint_S \mathbf{E} \cdot d\mathbf{A}$  of the field through the surface of the unit cube  $[0, 1] \times [0, 1] \times [0, 1]$ .
47. Consider a straight road with multiple lanes going due north. The road is 0.0113 mile wide. Denote the velocity

of traffic at any point of the road by  $\mathbf{v}(x, y) = \langle 0, v_2(x, y) \rangle$ . Traffic engineers are using road tubes along the lines  $y = 0$  and  $y = 1$  to monitor the speed of traffic.

- (a) Suppose that the road tubes indicate that  $v_2(x, 1) = v_2(x, 0) - 5$ . Compute

$$\int_C \mathbf{v} \cdot \mathbf{n} ds < 0,$$

and discuss what this inequality means for traffic in this stretch of road.

- (b) Compute the average divergence

$$\frac{1}{A} \iint_S \nabla \cdot \mathbf{v} dx dy$$

of  $\mathbf{v}$  on this stretch, where  $A$  is the area of the roadway. What is the significance of the average divergence as regards the traffic?

## Proofs

48. Show that if  $\mathbf{F}(x, y, z) = \text{curl } \mathbf{G}(x, y, z)$  for some smooth vector field  $\mathbf{G}$ , and if  $S$  is a smooth or piecewise-smooth simple closed surface, then

$$\iint_S \mathbf{F} \cdot \mathbf{n} dS = 0.$$

49. Show that if  $\mathbf{F}$  is conservative, it does not follow that  $\iint_S \mathbf{F}(x, y, z) \cdot \mathbf{n} dS = 0$ , by using the Divergence Theorem

to evaluate  $\iint_S \mathbf{F}(x, y, z) \cdot \mathbf{n} dS$ , where  $\mathbf{F}(x, y, z) = \nabla f(x, y, z)$ ,  $f(x, y, z) = x^2 + y^2 + z^2$ , and  $S$  is the unit sphere with outwards-pointing normal vector.

50. Suppose that  $\mathbf{F}(x, y, z) = \text{curl } \mathbf{G}(x, y, z)$  for some smooth vector field  $\mathbf{G}$  and  $W$  is a region in  $\mathbb{R}^3$  that is bounded by a smooth simple closed surface. Use the table of integral theorems on page 1145 to equate  $\iiint_W \text{div } \mathbf{F}(x, y, z) dV$  with a line integral.

51. Suppose  $\mathcal{S}$  is any smooth or piecewise-smooth simple closed surface enclosing a region  $W$  in  $\mathbb{R}^3$ , and let

$$\mathbf{F}(x, y, z) = \langle ax + b, cy + d, ez + f \rangle,$$

where  $a, b, c, d, e$ , and  $f$  are scalars and  $a, b$ , and  $c$  are not all zero. Find a condition for the relationship of  $a, b$ , and  $c$  that will guarantee that  $\iint_{\mathcal{S}} \mathbf{F} \cdot \mathbf{n} \, dS$  is positive for any choice of smooth or piecewise-smooth simple closed surface  $\mathcal{S}$  in  $\mathbb{R}^3$ .

52. Let  $\mathbf{F}(x, y, z)$  and  $\mathcal{S}$  be as in Exercise 51. Find a condition for the relationship of  $a, b$ , and  $c$  which will guarantee that  $\iint_{\mathcal{S}} \mathbf{F} \cdot \mathbf{n} \, dS = 0$  for any choice of smooth or piecewise-smooth simple closed surface  $\mathcal{S}$  in  $\mathbb{R}^3$ .
53. Show that if  $\iint_{\mathcal{S}} \mathbf{F}(x, y, z) \cdot \mathbf{n} \, dS = 0$ , it does not follow that  $\mathbf{F}$  is conservative.

## Thinking Forward

*Calculus in  $\mathbb{R}^4$  and beyond:* The results of this chapter have illustrated several ways that the Fundamental Theorem of Calculus generalizes to two and three dimensions. Earlier chapters have shown us how to integrate and find partial derivatives of functions taking any finite number of inputs. It is reasonable to ask, then, if the Fundamental Theorem has analogs in  $\mathbb{R}^n$ ,  $n \geq 4$ .

- ▶ What do you think the Divergence Theorem for  $\mathbb{R}^4$  might say? What is the guiding intuition for a Divergence Theorem in  $\mathbb{R}^n$ ?
- ▶ As in the case of generalizing Green's Theorem to  $\mathbb{R}^3$ , there is more than one way to try to generalize the Divergence Theorem to  $\mathbb{R}^4$  and beyond. What is a way to generalize the Divergence Theorem that is different from the preceding answer you gave.

*Calculus for functions from  $\mathbb{R}^n$  to  $\mathbb{R}^m$ :* Vector fields can be construed as functions from, say,  $\mathbb{R}^3$  to  $\mathbb{R}^3$ , both multivariate and vector-valued. There are many applications for functions of the general form

$$\mathbf{f}(x_1, \dots, x_n) = \langle f_1(x_1, \dots, x_n), \dots, f_m(x_1, \dots, x_n) \rangle,$$

where  $n$  and  $m$  are natural numbers. Consider  $f : \mathbb{R}^4 \rightarrow \mathbb{R}^5$ . There are  $4 \times 5 = 20$  partial derivatives of  $f$ , but if  $f$  has smooth component functions, we can still expect to do calculus.

- ▶ What might an integral of  $f$  represent? How might we handle the partial derivatives of  $f$  in a matrix?

*Analysis:* This book is an introduction to, among other things, the theory of integration. But there are more questions to ask.

- ▶ Is there a way to integrate a function with dense discontinuities—for example, the function whose output is 1 if the input is irrational and zero otherwise? This function cannot be integrated by the methods of Chapter 4, but there is a way to expand the notion of integration that will allow us to integrate the function on finite intervals. This and other questions are addressed in analysis courses.

## CHAPTER REVIEW, SELF-TEST, AND CAPSTONES

Be sure you are familiar with the definitions, concepts, and basic skills outlined here. The capstone exercises at the end bring together ideas from this chapter.

### Definitions

Give precise mathematical definitions or descriptions of each of the concepts that follow. Then illustrate the definition with a graph or an algebraic example.

- ▶ a *vector field*
- ▶ a *conservative vector field*
- ▶ a *potential function*
- ▶ a *smooth parametrization*
- ▶ the *integral* of a function of two or three variables along a curve  $C$
- ▶ the *line integral* of a vector field  $\mathbf{F}(x, y, z)$  along a curve  $C$
- ▶ the *surface area* of a smooth surface  $\mathcal{S}$
- ▶ The *integral* of  $f(x, y, z)$  over a smooth surface  $\mathcal{S}$
- ▶ the *flux* of a vector field across a surface
- ▶ the *divergence* of a vector field
- ▶ the *curl* of a vector field

## Theorems

Fill in the blanks to complete each of the following theorem statements:

- *The Fundamental Theorem of Line Integrals:* If  $\mathbf{F}(x, y, z)$  is a \_\_\_\_\_ vector field with  $\mathbf{F}(x, y, z) = \nabla f(x, y, z)$  on an \_\_\_\_\_, \_\_\_\_\_, and \_\_\_\_\_ domain containing the curve  $C$  with endpoints  $P$  and  $Q$ , then

$$\int_C \mathbf{F}(x, y, z) \cdot d\mathbf{r} = \underline{\hspace{2cm}}.$$

- For any vector field  $\mathbf{F}$  in  $\mathbb{R}^2$  or  $\mathbb{R}^3$ ,
- $$\operatorname{div}(\operatorname{curl} \mathbf{F}) = \underline{\hspace{2cm}} = \underline{\hspace{2cm}}.$$
- For multivariate functions  $f$  in  $\mathbb{R}^2$  or  $\mathbb{R}^3$  with continuous second partial derivatives,
- $$\operatorname{curl} \nabla f = \underline{\hspace{2cm}} = \underline{\hspace{2cm}}.$$
- *Green's Theorem:* Let  $\mathbf{F}(x, y) = \langle F_1(x, y), F_2(x, y) \rangle$  be a vector field defined on a region  $R$  in the  $xy$ -plane whose boundary is a \_\_\_\_\_ curve  $C$ . If  $\mathbf{r}(t)$  is a parametrization of  $C$  in the counterclockwise direction (as viewed from the positive  $z$ -axis), then

$$\begin{aligned} \int_C \mathbf{F}(x, y) \cdot d\mathbf{r} &= \int_C \underline{\hspace{1cm}} dx + \underline{\hspace{1cm}} dy \\ &= \iint_R (\underline{\hspace{1cm}} - \underline{\hspace{1cm}}) dA. \end{aligned}$$

- *Stokes' Theorem:* Let  $S$  be a \_\_\_\_\_ or \_\_\_\_\_ surface with a \_\_\_\_\_ or \_\_\_\_\_ boundary curve  $C$ . Suppose that  $S$  has an (oriented) unit normal vector  $\mathbf{n}$  and that  $C$  has a parametrization which traverses  $C$  in the \_\_\_\_\_ direction with respect to  $\mathbf{n}$ . If  $\mathbf{F}(x, y, z) = F_1(x, y, z)\mathbf{i} + F_2(x, y, z)\mathbf{j} + F_3(x, y, z)\mathbf{k}$  is a vector field on an open region containing  $S$ , then

$$\int_C \mathbf{F}(x, y, z) \cdot d\mathbf{r} = \iint_S \underline{\hspace{2cm}} dS.$$

- *Divergence Theorem:* Suppose  $W$  is a region in  $\mathbb{R}^3$  bounded by a \_\_\_\_\_ or \_\_\_\_\_ surface  $S$ . If  $\mathbf{F}(x, y, z)$  is defined on an open region containing  $W$ , then

$$\iiint_W \operatorname{div} \mathbf{F}(x, y, z) dV = \iint_S \underline{\hspace{2cm}} dS$$

where  $\mathbf{n}$  is the outwards \_\_\_\_\_.

## Notation and Integration Rules

*Notation:* Describe the meanings of each of the following mathematical expressions.

- $\nabla$       ►  $\operatorname{div} \mathbf{F}(x, y, z)$       ►  $\operatorname{curl} \mathbf{F}(x, y, z)$

*Integration Theorems:* Assuming that the necessary hypotheses are present for each of the following integration theorems, provide an alternative method for evaluating the given integral.

- *The Fundamental Theorem of Calculus:*

$$\int_a^b f(x) dx = \underline{\hspace{2cm}}$$

- *The Fundamental Theorem of of Line Integrals:*

$$\int_C \nabla f(x, y, z) \cdot d\mathbf{r} = \underline{\hspace{2cm}}$$

- *Green's Theorem:*

$$\iint_R \left( \frac{\partial f_2}{\partial x} - \frac{\partial f_1}{\partial y} \right) dA = \underline{\hspace{2cm}}$$

- *Stokes' Theorem:*

$$\iint_S \operatorname{curl} \mathbf{F}(x, y, z) \cdot \mathbf{n} dS = \underline{\hspace{2cm}}$$

- *Divergence Theorem:*

$$\iiint_W \operatorname{div} \mathbf{F}(x, y, z) dV = \underline{\hspace{2cm}}$$

## Skill Certification: Vector Calculus

*Potential Functions:* Find a potential function for each vector field.

- $\mathbf{F}(x, y) = \langle 3x^2y^2, 2x^3y \rangle$
- $\mathbf{F}(x, y) = \frac{y^2}{x}\mathbf{i} + 2y \ln x \mathbf{j}$
- $\mathbf{G}(x, y, z) = xze^{y^2}\mathbf{i} + 2xyze^{y^2}\mathbf{j} + xe^{y^2}\mathbf{k}$
- $\mathbf{G}(x, y, z) = \langle 2xy^2ze^{x^2yz}, (1+x^2yz)e^{x^2yz}, x^2y^2e^{x^2yz} \rangle$

*Conservative Vector Fields:* Determine whether the vector fields that follow are conservative. If the field is conservative, find a potential function for it.

- $\mathbf{F}(x, y) = \frac{2x}{y}\mathbf{i} + \frac{x^2}{y^2}\mathbf{j}$
- $\mathbf{F}(x, y) = \langle (1+xy)e^{xy}, e^{xy} \rangle$
- $\mathbf{F}(x, y) = \langle y^3e^{xy^2}, (1+2xy^2)e^{xy^2} \rangle$

8.  $\mathbf{F}(x, y, z) = \left\langle \frac{y}{z}, \frac{x}{z}, -\frac{xy}{z^2} \right\rangle$   
 9.  $\mathbf{G}(x, y, z) = \cos y \sin z \mathbf{i} - x \sin y \sin z \mathbf{j} - x \cos y \cos z \mathbf{k}$   
 10.  $\mathbf{G}(x, y, z) = y^2 z \mathbf{i} + 2xy z \mathbf{j} + xy^2 \mathbf{k}$

*Line Integrals:* Evaluate the line integral of the given function over the specified curve.

11.  $\int_C \mathbf{F}(x, y) \cdot d\mathbf{r}$ , where  $\mathbf{F}(x, y) = 7y^2 \mathbf{i} - 3xy \mathbf{j}$  and  $C$  is the line segment  $x = t, y = 3t$  for  $0 \leq t \leq 1$ .  
 12.  $\int_C \mathbf{F}(x, y) \cdot d\mathbf{r}$ , where  $\mathbf{F}(x, y) = \langle 8x^2 y, -9xy^2 \rangle$  and  $C$  is the curve parametrized by  $x = t^2, y = t^3$  for  $0 \leq t \leq 1$ .  
 13.  $\int_C \mathbf{F}(x, y) \cdot d\mathbf{r}$ , where  $\mathbf{F}(x, y) = \frac{x}{x^2+y^2} \mathbf{i} - \frac{y}{x^2+y^2} \mathbf{j}$  and  $C$  is the unit circle centered at the origin.  
 14.  $\int_C \mathbf{F}(x, y, z) \cdot d\mathbf{r}$ , where  $\mathbf{F}(x, y, z) = yz \mathbf{i} + xz \mathbf{j} + xy \mathbf{k}$  and  $C$  is the curve parametrized by  $x = t^2, y = t^{-2}, z = t$  for  $1 \leq t \leq 3$ .  
 15.  $\int_C \mathbf{F}(x, y, z) \cdot d\mathbf{r}$ , where  $\mathbf{F}(x, y, z) = \langle e^x, e^y, e^z \rangle$  and  $C$  is the line segment from  $(0, 0, 0)$  to  $(1, 1, 1)$ .  
 16.  $\int_C \mathbf{F}(x, y, z) \cdot d\mathbf{r}$ , where  $\mathbf{F}(x, y, z) = \langle e^x, e^y, e^z \rangle$  and  $C$  is the curve parametrized by  $x = t, y = t^2, z = t^3$  for  $0 \leq t \leq 1$ . Compare your answer with that of Exercise 15.

*Surface Area:* Find the area of each of the following surfaces.

17. The portion of the plane  $2x + 3y + 4z = 12$  that lies in the first octant.  
 18. The portion of the plane  $2x + 3y + 4z = 12$  that lies inside the cylinder with equation  $x^2 + y^2 = 9$ .  
 19. The portion of the sphere with equation  $x^2 + y^2 + z^2 = 16$  that lies inside the cylinder with equation  $x^2 + y^2 = 9$ .  
 20. The portion of the paraboloid with equation  $z = 9 - x^2 - y^2$  that lies above the  $xy$ -plane.

*Flux:* Find the outward flux of the given vector field through the specified surface.

21.  $\mathbf{F}(x, y, z) = \langle x, y, z \rangle$  and  $S$  is the portion of the cone with equation  $z = \sqrt{x^2 + y^2}$  for  $z \leq 3$ .  
 22.  $\mathbf{F}(x, y, z) = \langle x, y, z \rangle$  and  $S$  is the sphere with equation  $x^2 + y^2 + z^2 = 9$ .  
 23.  $\mathbf{F}(x, y, z) = xyz \mathbf{i}$  and  $S$  is the portion of the plane with equation  $x + y + z = 4$  in the first octant.  
 24.  $\mathbf{F}(x, y, z) = x^2 \mathbf{i} + y^2 \mathbf{j} + z^2 \mathbf{k}$  and  $S$  is the top half of the unit sphere centered at the origin.

*Divergence and Curl:* Find the divergence and curl of the following vector fields.

25.  $\mathbf{F}(x, y) = (3x + 4y) \mathbf{i} + (x - 5y) \mathbf{j}$   
 26.  $\mathbf{F}(x, y) = x^2 y \mathbf{i} + xy^3 \mathbf{j}$   
 27.  $\mathbf{F}(x, y, z) = (x - y) \mathbf{i} + (y - z) \mathbf{j} + (z - x) \mathbf{k}$   
 28.  $\mathbf{F}(x, y, z) = (y^2 - z^2) \mathbf{i} + (z^2 - x^2) \mathbf{j} + (x^2 - y^2) \mathbf{k}$

*Green's Theorem:* Use Green's Theorem to evaluate the integral  $\int_C \mathbf{F} \cdot d\mathbf{r}$  for the given vector field and curve.

29.  $\mathbf{F}(x, y) = (y^2 + 1) \mathbf{i} + 2xy \mathbf{j}$  and  $C$  is the circle with equation  $x^2 + y^2 = 9$ , traversed counterclockwise.

30.  $\mathbf{F}(x, y) = \langle e^x \cos y, e^x \sin y \rangle$  and  $C$  is the ellipse with equation  $3x^2 + 4y^2 = 25$ , traversed counterclockwise.  
 31.  $\mathbf{F}(x, y) = xy \mathbf{j}$  and  $C$  is the square with vertices  $(\pm 3, \pm 3)$ , traversed counterclockwise.  
 32.  $\mathbf{F}(x, y) = y \mathbf{i} - x \mathbf{j}$  and  $C$  is the square with vertices  $(\pm 3, \pm 3)$ , traversed counterclockwise.

*Stokes' Theorem:* Evaluate the integrals that follow. In some cases Stokes' Theorem will help; in other cases it may be preferable to evaluate the integrals directly.

33.  $\int_C \mathbf{F}(x, y, z) \cdot d\mathbf{r}$ , where

$$\mathbf{F}(x, y, z) = (y^2 - x^2) \mathbf{i} + (z^2 - y^2) \mathbf{j} + (x^2 - y^2) \mathbf{k}$$

$C$  is the triangle with vertices  $(2, 0, 0)$ ,  $(0, 6, 0)$ , and  $(0, 0, 3)$ , and  $\mathbf{n}$  points upwards.

34.  $\int_C \mathbf{F}(x, y, z) \cdot d\mathbf{r}$ , where  $\mathbf{F}(x, y, z) = \langle y^3, -4z, 4x^2 \rangle$ ,  $C$  is the circle in the  $xy$ -plane parametrized by  $x = 2 \cos t, y = 2 \sin t$ , and  $\mathbf{n}$  points upwards.  
 35.  $\iint_S \text{curl } \mathbf{F}(x, y, z) \cdot \mathbf{n} \, dS$ , where

$$\mathbf{F}(x, y, z) = \langle 5y, 5x, z^2 \rangle,$$

$S$  is the portion of the unit sphere  $x^2 + y^2 + z^2 = 1$  above the plane  $z = \frac{1}{2}$ , and  $\mathbf{n}$  is the upwards-pointing normal vector.

36.  $\iint_S \text{curl } \mathbf{F}(x, y, z) \cdot \mathbf{n} \, dS$ , where

$$\mathbf{F}(x, y, z) = \langle x^3 y z, xy^2 z, yz \rangle,$$

$S$  is the portion of the hyperboloid  $z = x^2 - y^2 + 1$  that lies above the square with vertices  $(\pm 1, \pm 1)$ , and  $\mathbf{n}$  is the upwards-pointing normal vector.

*Divergence Theorem:* Evaluate the integral

$$\iint_S \mathbf{F}(x, y, z) \cdot \mathbf{n} \, dS$$

for the specified vector field  $\mathbf{F}$  and surface  $S$ . In each case,  $\mathbf{n}$  is the outwards-pointing normal vector.

37.  $\mathbf{F}(x, y, z) = x^2 y \mathbf{i} + y^2 z \mathbf{j} + xz^2 \mathbf{k}$  and  $S$  is the hemisphere bounded above by  $x^2 + y^2 + z^2 = 1$  and bounded below by the  $xy$ -plane.  
 38.  $\mathbf{F}(x, y, z) = x^2 \mathbf{i} + y^2 \mathbf{j} + z^2 \mathbf{k}$  and  $S$  is the surface of the rectangular solid described by the inequalities  $0 \leq x \leq 3, 0 \leq y \leq 2$ , and  $0 \leq z \leq 1$ .  
 39.  $\mathbf{F}(x, y, z) = x^3 z \mathbf{i} + xy \mathbf{j} + 4yz \mathbf{k}$  and  $S$  is the boundary of the frustum of the cone with equation  $x = \sqrt{y^2 + z^2}$  between the planes  $x = 2$  and  $x = 5$ .  
 40.  $\mathbf{F}(x, y, z) = xy \mathbf{i} + xyz \mathbf{j} + yz \mathbf{k}$  and  $S$  is the boundary of the cylinder with equation  $x^2 + z^2 = 4$  for  $0 \leq y \leq 5$ .

## Capstone Problems

A. Let  $\mathbf{F} = \mathbf{F}(x, y, z)$  and  $\mathbf{G} = \mathbf{G}(x, y, z)$ . Prove that

$$\begin{aligned}\nabla(\mathbf{F} \cdot \mathbf{G}) &= (\mathbf{F} \cdot \nabla)\mathbf{G} + (\mathbf{G} \cdot \nabla)\mathbf{F} \\ &\quad + \mathbf{F} \times (\nabla \times \mathbf{G}) + \mathbf{G} \times (\nabla \times \mathbf{F}).\end{aligned}$$

B. The **Laplacian** of a function  $f$  of two or three variables is the divergence of the gradient. That is,

$$\nabla^2 f = \nabla \cdot (\nabla f).$$

The **vector Laplacian** of a vector field

$$\mathbf{F}(x, y, z) = \langle F_1(x, y, z), F_2(x, y, z), F_3(x, y, z) \rangle$$

is

$$\nabla^2 \mathbf{F} = \langle \nabla^2 F_1, \nabla^2 F_2, \nabla^2 F_3 \rangle.$$

Prove that, for a vector field  $\mathbf{F} = \mathbf{F}(x, y, z)$ ,

$$\nabla \times (\nabla \times \mathbf{F}) = \nabla(\nabla \cdot \mathbf{F}) - \nabla^2 \mathbf{F}.$$

C. Show that  $\int_C \mathbf{F} \cdot d\mathbf{r} = \pi\rho^2$  when  $\mathbf{F}(x, y) = -y\mathbf{i} + x\mathbf{j}$  and  $C$  is the circle with radius  $\rho$  centered at the origin and traversed counterclockwise.

(a) Formulate a conjecture for the value of the integral  $\int_C \mathbf{F} \cdot d\mathbf{r}$ , where  $\mathbf{F}(x, y) = -y\mathbf{i} + x\mathbf{j}$  and  $C$  is any simple closed curve.

(b) Prove your conjecture.

(c) Use your conjecture to find the area of the ellipse with parametrization

$$x = a \cos t \quad \text{and} \quad y = b \sin t.$$

D. Let  $\mathbf{F} = \mathbf{F}(x, y, z)$  and  $\mathbf{G} = \mathbf{G}(x, y, z)$  be vector fields defined on a region  $R$  enclosed by an orientable surface  $\mathcal{S}$  with outwards unit normal vector  $\mathbf{n}$ . Prove that if

$$\nabla \cdot \mathbf{F} = \nabla \cdot \mathbf{G} \quad \text{and} \quad \nabla \times \mathbf{F} = \nabla \times \mathbf{G}$$

on  $R$  and  $\mathbf{F} \cdot \mathbf{n} = \mathbf{G} \cdot \mathbf{n}$  on  $\mathcal{S}$ , then  $\mathbf{F} = \mathbf{G}$  on  $\mathcal{S}$ .

this page left intentionally blank

Chapter 0

Section 0.1

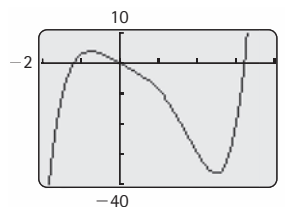

1. F, F, F, T, F, F, T, T.
3. See the reading at the beginning of this section.
5.  $\text{Domain}(f) = \{x \in \mathbb{R} \mid f(x) \text{ is defined}\}$ ; for  $f(x) = \sqrt{x}$  the domain is  $\text{Domain}(f) = \{x \in \mathbb{R} \mid x \geq 0\}$ .
7. (a) Yes:  $\sqrt{3+1} = 2$ ; (b) No:  $\sqrt{1+1} \neq 1$ ; (c) No:  $\sqrt{-5+1}$  is undefined.
9. (a)  $f(2) = 5$ ; (b) There is no  $x$  with  $f(x) = 0$ ; (c) You can solve  $y = x^2 + 1$  for  $x$  if and only if  $y \in [1, \infty)$ .
11. One example is  $f(2) = 3, f(4) = 1, f(6) = 3, f(8) = 2, f(10) = 1$ .
13. Yes, it could be a function; however, it would not be one-to-one.
15. (a) This is well-defined as the function  $f(x) = x$ , for  $x \in \mathbb{R}$ . (b) Not well-defined, since we would need  $f(0) = 0$ , and  $f(3) = 3$ , but 0 and 3 are not in the target set  $(0, 3)$ . (c) This is well-defined as the multivariable function  $f(x, y, z) = (x, y, z)$ , for  $(x, y, z) \in \mathbb{R}^3$ .
17. See the reading near Theorem 0.27.
19.  $f(2) = f(-2)$
21. (a)  $f(x) < 0$  for all  $x \in I$ ; (b)  $f(b) < f(a)$  for all  $b > a$  in  $I$
23. Average rate of change of  $f$  on  $[a, b]$  is given by  $\frac{f(b)-f(a)}{b-a}$ . Here  $f(b) - f(a)$  is the difference  $\Delta y$  of  $y$ -values, or the "rise." Similarly,  $b - a$  is the difference  $\Delta x$  of  $x$ -values, or the "run."
25. The largest possible  $\delta$  for the local maximum at  $x = 2$  is approximately  $\delta = 1.5$ .
27. Domain  $[1, \infty)$ , range  $[0, \infty)$
29. Domain  $x \neq -2$ , range  $y \neq 0$
31. Domain  $\mathbb{R}$ , range  $(0, 1]$
33.  $(-\infty, 0] \cup [2, \infty)$
35.  $(-\infty, -3] \cup [1, \infty)$
37.  $(-\infty, -3) \cup (1, \infty)$
39.  $(-\infty, -3) \cup (-3, -1] \cup [1, 3) \cup (3, \infty)$
41.  $(1, 2) \cup (2, \infty)$
43. (a) 17; (b)  $a^6 + 1$ ; (c)  $(x^2 + 1)^2 + 1 = x^4 + 2x^2 + 2$ .
45. (a)  $\sqrt{25+9+4} = \sqrt{38}$ ; (b)  $\sqrt{9+0+16} = 5$ ;  
(c)  $\sqrt{x^2 + y^2 + z^2}$

47. (a)  $(9, -3, 13)$ ; (b)  $(17, 2, 8)$ ; (c)  $(3a + b, a, b)$ .

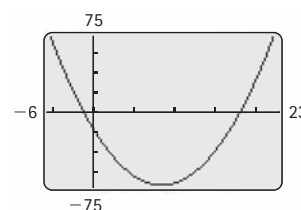

49.  $f(-1) = -2, f(0) = 1, f(1) = 4, f(2) = 8$

51. One good window for this graph is  $x \in [-1, 1], y \in [-0.3, 1]$ .

53.

55.

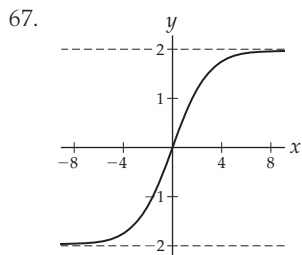

57. (a) Domain  $\mathbb{R}$ , range  $[-1, \infty)$ ; (b) roots at  $x = 0$  and  $x = 2$ ,  $y$ -intercept at  $y = 0$ , local and global minimum at  $x = 1$  (with a value of  $f(1) = -1$ ), no local or global maxima, no inflection points; (c) positive on  $(-\infty, 0) \cup (2, \infty)$ , negative on  $(0, 2)$ , decreasing on  $(-\infty, 1)$ , increasing on  $(1, \infty)$ , concave up on  $\mathbb{R}$ , concave down nowhere; (d) no asymptotes.

59. (a) Domain  $\mathbb{R}$ , range  $[-4.75, \infty)$ ; (b) roots at  $x \approx -1.6$  and  $x = 0$ ,  $y$ -intercept at  $y = 0$ , local and global minimum at  $x = -1$  (with a value of  $f(-1) = -4.75$ ), local minimum at  $x = 2$  (with value  $f(2) = 2$ ), local maximum at  $x = 1$  (with value  $f(1) = 3.25$ ), inflection points at  $x \approx 0$  and  $x \approx 1.5$ ; (c) positive on  $(-\infty, 1.6) \cup (0, \infty)$ , negative on  $(-1.6, 0)$ , decreasing on  $(-\infty, -1) \cup (1, 2)$ , increasing on  $(-1, 1) \cup (2, \infty)$ , concave up on  $(-\infty, 0) \cup (1.5, \infty)$ , concave down on  $(0, 1.5)$ ; (d) no asymptotes.

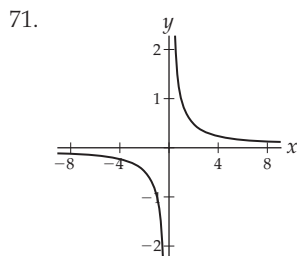

61. (a) Domain  $\mathbb{R}$ , range  $(1, 2]$ ; (b) no roots,  $y$ -intercept at  $y = 2$ , local and global maximum at  $x = 0$  (with a value of  $f(0) = 2$ ), no local or global minima, inflection points at  $x = -1$  and  $x = 1$ ; (c) positive on  $(-\infty, \infty)$ , negative nowhere, increasing on  $(-\infty, 0)$ , decreasing on  $(0, \infty)$ , concave up on  $(-\infty, -1) \cup (1, \infty)$ , concave down on  $(-1, 1)$ ; (d) horizontal asymptote at  $y = 1$ .

63. One example is the graph of  $f(x) = 2^{-x}$ .

65. Not possible.

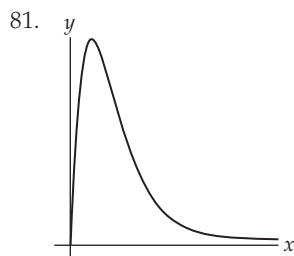

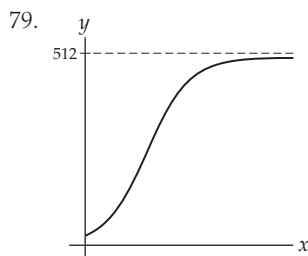

69. One example is the graph of  $f(x) = \frac{(x^2-1)(x^2-4)}{x}$ .

73. 4.2

75.  $\frac{\sqrt{10}-\sqrt{2}}{8}$

77.  $-\frac{100}{99}$

83. (a) Independent variables  $a$  and  $b$ , dependent variable  $H$ , function equation  $H(a, b) = \sqrt{a^2 + b^2}$ ;  
 (b) independent variables  $x$ ,  $y$ , and  $z$ , dependent variable  $V$ , function equation  $V(x, y, z) = xyz$ .

85. 356 groundhogs

87. (a)  $I(t) = \begin{cases} 36,000, & \text{if } 0 \leq t < 4 \\ 38,500, & \text{if } 4 \leq t < 6 \\ 49,000, & \text{if } t \geq 6. \end{cases}$

(b)  $M(t) = \begin{cases} 36,000t, & \text{if } 0 \leq t < 4 \\ 144,000 + 38,500(t-4), & \text{if } 4 < t \leq 6 \\ 221,000 + 49,000(t-6), & \text{if } t \geq 6. \end{cases}$

(c) You will have earned a total of one million dollars after approximately 21.9 years.

89. The range of  $f$  is the set of real numbers  $y$  such that there is some  $x$  with  $3x - 1 = y$ . This range is  $\mathbb{R}$ , since for any real number  $y$ , the number  $x = \frac{y+1}{3}$  has the property that  $f(x) = 3\left(\frac{y+1}{3}\right) - 1 = y$ .

91. It suffices to show that  $f$  is not one-to-one if and only if it fails the Horizontal Line Test. Not one-to-one means there exists some  $a \neq b$  in the domain of  $f$  such that  $f(a) = f(b)$ . This is precisely what it means for  $f$  to intersect the horizontal line  $y = f(a)$  in two places, namely,  $(a, f(a))$  and  $(b, f(b)) = (b, f(a))$ .

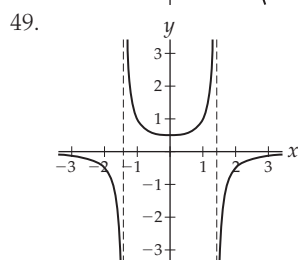

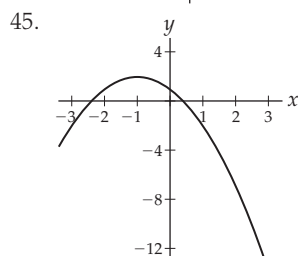

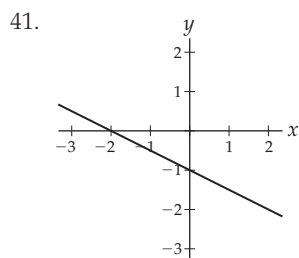

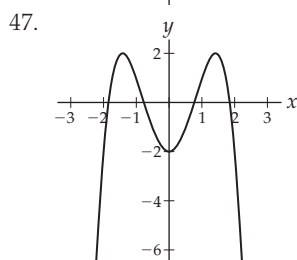

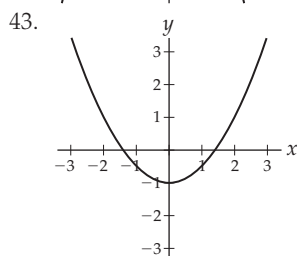

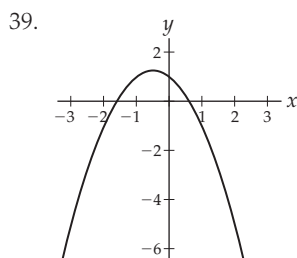

93. For all  $a$  and  $b$  in  $(-\infty, \infty)$ , we have  $a < b \Rightarrow -3a > -3b \Rightarrow 1 - 3a > 1 - 3b \Rightarrow f(a) > f(b)$ .

95. For all real numbers  $a$  and  $b$ ,  

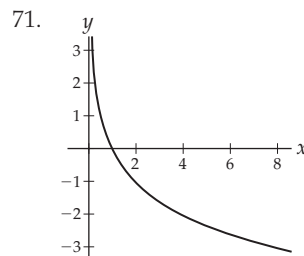

$$\frac{f(b)-f(a)}{b-a} = \frac{(-2b+4)-(-2a+4)}{b-a} = \frac{-2(b-a)}{b-a} = -2.$$

## Section 0.2

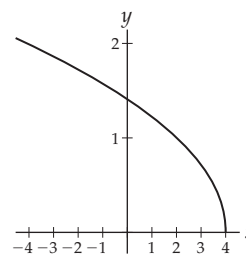

- F, T, T, F, F, F, F, F.
- $(f-g)(x) = (f+(-g))(x) = f(x)+(-g)(x) = f(x)-g(x)$ .
- (a) One answer is  $(1, 2)$ ; (b) one answer is  $f\left(\frac{1}{2}x\right)$ ;  
 (c)  $(-1, 4)$ ; (d)  $(2, -5)$ .
- (a) The domain is the set of  $x$  such that  $x \in [2, \infty)$  and  $f(x) \in [-10, \infty)$ . Since the range of  $f$ ,  $[-3, 3]$ , always satisfies the second condition, the domain of  $g \circ f$  is  $[2, \infty)$ . (b) We would need to know which  $x$ -values guarantee that  $g(x) \in [2, \infty)$ . (c) Not enough information for  $f \circ f$ ; the domain of  $g \circ g$  is  $[-10, \infty)$ .
- $f(2x)$
- If  $f$  is odd then  $f(0)$  is either 0 or undefined.
- (a)  $f(-2) = 1, f(-1) = -2, f(3) = 4$  ( $f(0)$  could be anything); (b)  $f(-2) = -1, f(-1) = 2, f(0) = 0$ , and  $f(3) = -4$ .
- $(f^{-1})^{-1} = f$ .
- $f^{-1}$  has domain  $(-\infty, 3]$  and range  $[-1, 1)$ .
- The missing entries in the first column are  $-3, -2, 0, 0$ . The missing entries in the second column are  $-2, 3, 3, -6$ . The missing entries in the third column are  $-1, 2, 2, -7$ .
- Domain  $x \neq 2$ ;  $(f+g)(x) = x^2 + 1 + \frac{1}{x-2}$ ;  
 $(f+g)(1) = 1$ .
- Domain  $(0, 2) \cup (2, \infty)$ ;  $\left(\frac{g}{h}\right)(x) = \left(\frac{1}{x-2}\right) / \sqrt{x}$ ;  
 $\left(\frac{g}{h}\right)(1) = -1$ .
- Domain  $x \neq 2, x \neq \frac{5}{2}$ ;  $(g \circ g)(x) = \frac{1}{\frac{1}{x-2}-2}$ ;  
 $(g \circ g)(1) = -\frac{1}{3}$ .
- Domain  $x \neq 7$ ;  $g(x-5) = \frac{1}{(x-5)-2}$ ;  $g(1-5) = -\frac{1}{6}$ .
- Domain  $x \geq -\frac{1}{3}$ ;  $h(3x+1) = \sqrt{3x+1}$ ;  $h(3(1)+1) = 2$
- The new row is 3, 5, 9, 7, 9, 3, 7.
- The new row is 2, 3, 2, 2, 3, 2, 3.
- The new row is 0, 1, 3, 2, 3, 0, 2.
- For  $x = 1, 2, 3, 4, 5, 6, 7$  we have  $g(x-1) = 1, 0, 1, 1, 0, 1, 0$ , respectively.

69.  $f(g(x)) = f\left(\frac{x}{1+x}\right) = \frac{x/(1+x)}{1 - (x/(1+x))} = x$  (for  $x \neq -1$ );  
similarly,  $g(f(x)) = x$  for  $x \neq 1$ .

73.  $f$  is invertible on the restricted domain  $[0, 2]$ , and its inverse has the following graph:

51.  $(f+g)(-1) = 0$ ,  $(f+g)(0) = 1$ ,  $(f+g)(1) = 0$ ,  
 $(f+g)(2) = 9$ ,  $(f+g)(3) = 14$ ;

$$(f+g)(x) = \begin{cases} x+1, & \text{if } x \leq 0 \\ x^2 - x, & \text{if } 0 < x < 2 \\ x^2 + 5, & \text{if } x \geq 2. \end{cases}$$

53.  $(g \circ f)(-1) = 1$ ,  $(g \circ f)(0) = -1$ ,  $(g \circ f)(1) = -1$ ,  
 $(g \circ f)(2) = 5$ ,  $(g \circ f)(3) = 5$ ;

$$(g \circ f)(x) = \begin{cases} -2x+1, & \text{if } x \leq 0 \\ -x^2, & \text{if } 0 < x < \sqrt{2} \\ 5, & \text{if } x \geq \sqrt{2}. \end{cases}$$

55.  $f(-1-1) = -3$ ,  $f(0-1) = -1$ ,  $f(1-1) = 1$ ,  
 $f(2-1) = 1$ ,  $f(3-1) = 4$ ;

$$f(x-1) = \begin{cases} 2x-1, & \text{if } x \leq 1 \\ (x-1)^2, & \text{if } x > 1. \end{cases}$$

57. One way:  $g(x) = 3x+5$ ,  $h(x) = x^2$ ; another way:  
 $g(x) = x+5$ ,  $h(x) = 3x^2$ .

59. One way:  $g(x) = \frac{6}{x}$ ,  $h(x) = x+1$ ; another way:  
 $g(x) = 6x$ ,  $h(x) = \frac{1}{x+1}$ .

61. Even, since  $f(-x) = (-x)^4 + 1 = f(x)$ .

63. Neither, since  $f(-x) \neq f(x)$  and  $f(-x) \neq -f(x)$ .

65. Odd, since  $f(-x) = -f(x)$ .

67.  $f(g(x)) = 2 - 3\left(-\frac{1}{3}x + \frac{2}{3}\right) = x$  and  
 $g(f(x)) = -\frac{1}{3}(2 - 3x) + \frac{2}{3} = x$ .

75.  $f^{-1}(x) = \frac{1-2x}{5}$

77.  $f^{-1}(x) = \frac{1}{x-1}$

79.  $f^{-1}(x) = \frac{-x-1}{x-1}$

81. (a)  $S(x) = x^2$ ; (b)  $C(S) = 4.25S + 200$ ;  
(c)  $C(x) = 4.25x^2 + 200$ ;  $C(x)$  is the composition  
 $C(S(x))$ .

83. (a)  $C(n) = 20 + 12n$ . (b) Suppose there were  $a$  and  $b$  in the domain  $(-\infty, \infty)$  of  $C(n)$  with  $C(a) = C(b)$ . In this case  $20 + 12a = 20 + 12b$ , so  $12a = 12b$ , and therefore we must have  $a = b$ . (c)  $n(C) = \frac{C-20}{12}$ . This function describes the number  $n$  of shirts that you can have made for  $C$  dollars. (d)  $n(150) \approx 10.83$ , so you can make 10 full shirts.

85.  $f(2x) = (2x)^k = 2^k x^k = 2^k f(x)$ .

87. (a) If  $(x, y)$  is on the graph of  $f$ , then  $y = f(x)$ , so  $kf(x) = ky$ ; thus  $(x, ky)$  is a point on the graph of  $kf(x)$ .  
(b) If  $(x, y)$  is on the graph of  $f$ , then  $y = f(x)$ , so  $f\left(k\left(\frac{1}{k}x\right)\right) = f(x) = y$ , so  $\left(\frac{1}{k}x, y\right)$  is on the graph of  $f(kx)$ .

89. If  $f$  is odd then for all  $x$  in the domain of  $f$  we have  $f(-x) = -f(x)$ . In particular,  $f(-0) = -f(0)$ , so  $f(0) = -f(0)$ . This means we must have  $f(0) = 0$ .

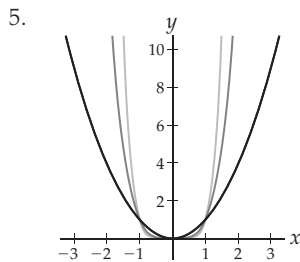

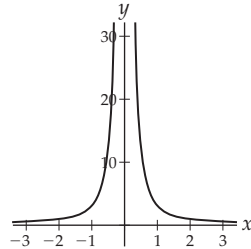

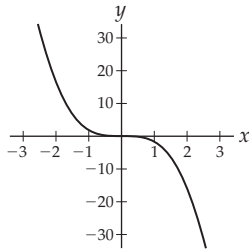

91. Since  $f^{-1}(f(x)) = x$  for all  $x$  in the domain of  $f$ , we know that  $f^{-1}$  is defined for all values  $f(x)$  in the range of  $f$ . Therefore the domain of  $f^{-1}$  is the range of  $f$ . Similarly, since  $f(f^{-1}(x)) = x$ , the range of  $f^{-1}$  is in the domain of  $f$ .

93. If  $f(a) = b$  then  $f^{-1}(f(a)) = f^{-1}(b)$  and therefore  $a = f^{-1}(b)$ .

Section 0.3

1. T, F, T, F, F, T, T, F.
3. The graphs look like:

7. Yes;  $\frac{1}{f(x)} = \frac{1}{Ax^k} = \frac{1}{A}x^{-k}$ , so  $C = \frac{1}{A}$  and  $r = -k$ .

9. Leading coefficient 3, leading term  $3x^4$ , degree 4, constant term 0, coefficients  $a_1 = 4$ ,  $a_3 = -11$ .

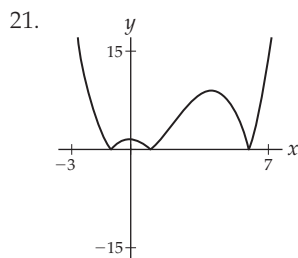

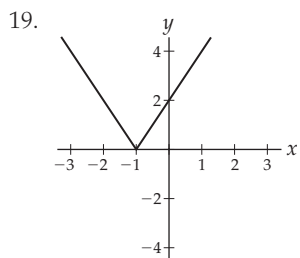

11. If  $b^2 - 4ac < 0$ , then  $\sqrt{b^2 - 4ac}$  is not a real number, so by the quadratic formula the quadratic has no real roots. If  $f(x) = 3x^2 + 2x + 6$ , then  $b^2 - 4ac = 2^2 - 4(3)(6) = -68$  is negative.

13. After reducing,  $f(x)$  becomes  $\frac{x-1}{x+2}$ , which has a vertical asymptote at  $x = -2$ .

15. One answer is  $f(x) = \frac{3x^2+1}{(x+2)(x-2)}$ .

17. (a) Graph the functions given in part (b) to see three possible answers; (b)  $f(x) = \frac{-(x-1)(x-3)(x+1)}{(x-2)^2(x+1)}$ ;

$$f(x) = \frac{-(x-1)(x-3)(x+1)^2}{(x-2)^2(x+1)^2}; f(x) = \frac{-(x-1)^2(x-3)(x+1)}{(x-2)(x+1)(x^2+1)}$$

23. If  $x \geq 0$  then  $\sqrt{x^2} = x$ , and if  $x < 0$  then  $\sqrt{x^2} = -x$ .

25. Domain  $\mathbb{R}$ , zero at  $x = 0$

27. Domain  $(0, \infty)$ , never zero

29. Domain  $(-\infty, -1) \cup (1, \infty)$ , never zero

31. Domain  $(-\infty, -1) \cup (-1, 3]$ , zero at  $x = 3$

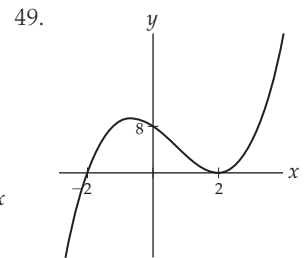

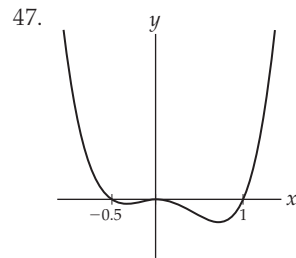

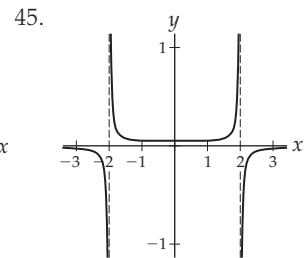

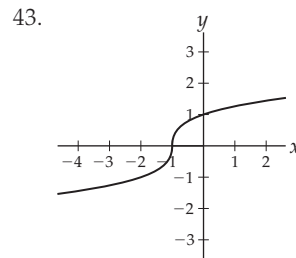

33. Domain  $(-\infty, -1] \cup [6, \infty)$ , zero at  $x = -1$

35.  $y + 2 = -(x - 3)$

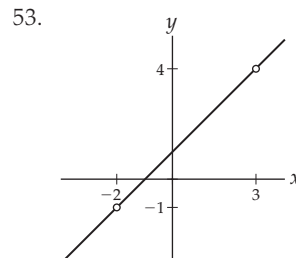

37.  $y - 4 = 2(x + 1)$

39. One possible answer is  $f(x) = 2x^2$ .

41. One possible answer is  $f(x) = x(x - 2)(x - 4)$ .

51. The graph of  $f$  has roots at  $x = 0$ ,  $x = -3$ , and  $x = 1$ , vertical asymptotes at  $x = \pm 2$ , and no horizontal asymptotes.

55. The graph of  $f$  has a hole at  $x = -1$ , roots at  $x = -\frac{3}{2}$  and  $x = 1$ , a vertical asymptote at  $x = 3$ , and no horizontal asymptotes.

57. The parts of the graph of  $y = \sin x$  that are below the  $x$ -axis should be reflected across the  $x$ -axis to obtain the graph of  $g(x)$ .

59. The graph should look like the one you found in Exercise 57, but shifted down two units.

61.  $f(x) = \frac{2}{x}$

63.  $f(x) = -(x + 2)(x - 1)^3$

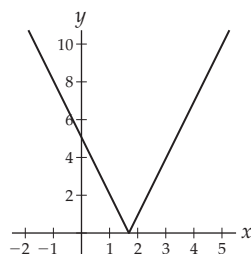

65.  $f(x) = (x - 2)^2 + 2$

67.  $f(x) = \frac{-4(x^2+1)(x-4)}{(x+2)(x-2)(x-4)}$

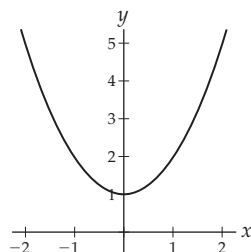

69.  $f(x) = \frac{-4(x-1)(x+1)}{(x^2+1)^2}$

71.  $f(x) = |2(x + 1)(x - 3)|$

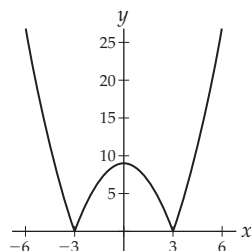

$$73. |5 - 3x| = \begin{cases} 5 - 3x, & \text{if } x \leq \frac{5}{3} \\ 3x - 5, & \text{if } x > \frac{5}{3} \end{cases}$$

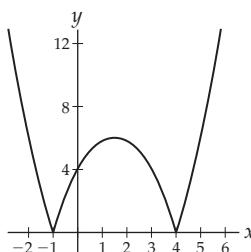

$$75. |x^2 + 1| = x^2 + 1 \text{ for all real numbers } x$$

$$77. |9 - x^2| = \begin{cases} 9 - x^2, & \text{if } -3 \leq x \leq 3 \\ -(9 - x^2), & \text{if } x < -3 \text{ or } x > 3. \end{cases}$$

$$79. |x^2 - 3x - 4| = \begin{cases} x^2 - 3x - 4, & \text{if } x \leq -1 \\ -(x^2 - 3x - 4), & \text{if } -1 < x < 4 \\ x^2 - 3x - 4, & \text{if } x \geq 4. \end{cases}$$

81. The minimum possible degree is 3.

83. No, since polynomials increase or decrease without bound and do not have asymptotes. A rational function might be a better choice.

85. If  $f(x) = Ax^k$  and  $g(x) = Bx^l$  are power functions, then  $(f \circ g)(x) = f(Bx^l) = A(Bx^l)^k = (AB^k)x^{lk}$  is also a power function.

87. If  $f(x) = mx + b$  and  $g(x) = nx + c$  then  $f(g(x)) = f(nx + c) = m(nx + c) + b = (mn)x + (mc + b)$ .

89. If  $f(x) = Ax^3 + \text{lower-degree terms}$  and  $g(x) = Bx^3 + \text{lower-degree terms}$ , then  $f(x)g(x) = ABx^6 + \text{lower-degree terms}$ . Since  $f$  and  $g$  are cubic we know that  $A$  and  $B$  are nonzero. Thus  $AB$  must also be nonzero, and therefore  $fg$  is of degree 6.

91. (a) If  $f(x) = k$  for all  $k$ , then  $f(x) = k = 0x + k$  is also a linear function. (b) If  $f(x) = mx + b$  is a linear function with  $m \neq 0$ , then  $f$  is a polynomial of degree 1 with coefficients  $a_1 = m$  and  $a_0 = b$ . If  $f(x) = mx + b$  with  $m = 0$  then  $f$  is a polynomial of degree zero with sole coefficient  $a_0 = b$ .

93. A number of the form  $f(c) = \frac{p(c)}{q(c)}$  is equal to zero when its numerator  $p(c)$  is zero but its denominator  $q(c)$  is not.

### Section 0.4

1. F, T, T, T, T, F, T, F.

3. A function is exponential if it can be written in the form  $f(x) = Ab^x$ ; the variable is in the exponent and a constant is in the base. For a power function, the situation is reversed.  $x^x$  is neither a power nor an exponential function because a variable appears in both the base and the exponent.

5.  $\sqrt{3} \approx 1.73205$ . We have  $2^{1.7} \approx 3.2490$ ,  $2^{1.73} \approx 3.3173$ ,  $2^{1.732} \approx 3.3219$ ,  $2^{1.7320} \approx 3.3219$ ,  $2^{1.73205} \approx 3.3220$ , and so on. Each of these approximations gets closer to the value of  $2^{\sqrt{3}}$ .

7.  $f(x) = 3(e^{-2})^x \approx 3(0.135)^x$ ,  $g(x) = -2e^{(\ln 3)x} \approx -2e^{1.0986x}$ .

9. We must have  $b > 0$  and  $b \neq 1$ , since those conditions are necessary for  $b^x$  to be an exponential function.

11. The graph that passes through  $(2, 1)$  is  $\log_2 x$ ; the graph that passes through  $(2, \frac{1}{2})$  is  $\log_4 x$ .

13.  $f(x) = 2 \ln x$  is the graph of  $\ln x$  stretched vertically by a factor of 2;  $g(x) = -\ln x$  is the graph of  $\ln x$  reflected over the  $x$ -axis.

15. If  $\theta$  is an angle in standard position, then  $\sin \theta$  is the vertical coordinate  $y$  of the point  $(x, y)$  where the terminal edge of  $\theta$  intersects the unit circle.

17. The terminal edges of the angles  $\frac{\pi}{4}$ ,  $\frac{9\pi}{4}$ , and  $-\frac{7\pi}{4}$  all meet the unit circle at the same point (and in particular, at the same  $y$ -coordinate).

19.  $\cos \theta = x$  is  $-\frac{\sqrt{8}}{3}$  if  $\theta$  is in the third quadrant;

$\cos \theta = \frac{\sqrt{8}}{3}$  if  $\theta$  is in the fourth quadrant;  $\theta$  cannot be in the first or second quadrant.

21. See Definition 0.27 for the restricted domains of the trigonometric functions, and thus the ranges of the inverse trigonometric functions. The domain of  $\arcsin x$  is  $[-1, 1]$ , the domain of  $\arctan x$  is all of  $\mathbb{R}$ , and the domain of  $\operatorname{arcsec} x$  is  $(-\infty, -1] \cup [1, \infty)$ . Their ranges are the restricted domains of  $\sin x$ ,  $\tan x$ , and  $\sec x$ , respectively.

23. Only (a) and (c) are defined.

25. (a) Negative; (b) Negative; (c) Positive; (d) Positive

27.  $(2, 3) \cup (3, \infty)$                       29.  $(2, \infty)$

31.  $\dots \cup \left(-\frac{5\pi}{2}, -\frac{3\pi}{2}\right) \cup \left(-\frac{\pi}{2}, \frac{\pi}{2}\right) \cup \left(\frac{5\pi}{2}, \frac{7\pi}{2}\right) \cup \dots$

33.  $-2$

35.  $4$

37.  $-1$

39.  $\sqrt{2}$

41.  $\pi$

43.  $\frac{3\pi}{4}$

45.  $x = \frac{\ln 3}{\ln(3/2)} \approx 2.70951$

47.  $x = -\frac{17}{15}$

49.  $x = \pi k$ , where  $k$  is any integer

51.  $\frac{\sqrt{35}}{6}$

53.  $-\frac{17}{18}$

55. Negative

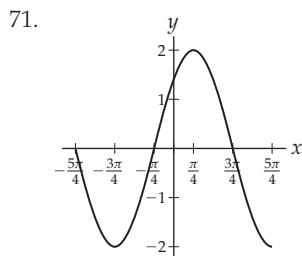

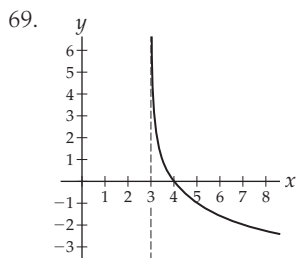

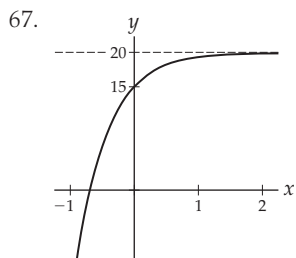

57.  $\sqrt{1-x^2}$

59.  $x^2 + 1$

61.  $\sqrt{1 - \left(\frac{3}{x}\right)^2}$

63.  $1 - 2(5x)^2$

65. Start with the graph of  $y = \left(\frac{1}{2}\right)^x$ , then reflect over the  $x$ -axis and shift up by 10 units.

73.  $f(x) = 2e^{-x} - 3$

75.  $f(x) = -5e^{-x} + 10$

77.  $f(x) = -\cos 2x$

79. (a)  $I(t) \approx 10,000e^{0.08t}$ ; (b)  $I(t) = 10,000(1.085)^t$ .

81. (a)  $S(t) = 250e^{-\ln 2/29t} \approx 250e^{-0.0239t}$ , or equivalently,  $S(t) = 250(0.97638)^t$ ; (b) 2.39%; (c) 156 years

83. 211.97 feet

85. Seeking a contradiction, suppose that  $A$  and  $b$  are nonzero real numbers with  $Ab^x = 0$  for some real number  $x$ . Since  $A \neq 0$  we know  $b^x = 0$ , and therefore that  $x(\ln b) = \ln(b^x) = \ln 0$ . But this is a contradiction because  $\ln 0$  is undefined, so the product  $x(\ln b)$  of real numbers cannot equal  $\ln 0$ .

87.  $\log_2 x = \log_3 x \Leftrightarrow \frac{\ln x}{\ln 2} = \frac{\ln x}{\ln 3} \Leftrightarrow (\ln 3)(\ln x) = (\ln 2)(\ln x) \Leftrightarrow (\ln x)(\ln 3 - \ln 2) = 0 \Leftrightarrow \ln x = 0 \Leftrightarrow x = 1$ .

89.  $y = \log_b x$  if and only if  $b^y = x$ . Since the only solution of  $b^y = 1$  is  $y = 0$  (if  $b \neq 0$ ), we know that  $\log_b 1 = 0$ .

91. Since  $x = b^{\log_b x}$ , we have  $\log_b(x^a) = \log_b((b^{\log_b x})^a) = \log_b(b^{(a \log_b x)}) = (a \log_b x) = a \log_b x$ .

93. (a)  $\log_b\left(\frac{1}{x}\right) = \log_b(x^{-1}) = -\log_b x$ ;

(b)  $\log_b\left(\frac{x}{y}\right) = \log_b(xy^{-1}) = \log_b x - \log_b y$ .

95. (a) For any angle  $\theta$ ,  $(\cos \theta, \sin \theta)$  are the coordinates of the point where the terminal edge of  $\theta$  meets the unit circle. Since the equation of the unit circle is  $x^2 + y^2 = 1$  and we have  $x = \cos \theta$  and  $y = \sin \theta$ , we must have  $\sin^2 \theta + \cos^2 \theta = 1$ .

97. For any angle  $\theta$ ,  $\sin \theta$  is the  $y$ -coordinate where the terminal edge of  $\theta$  meets the unit circle. The angle  $-\theta$  is the angle of the same magnitude as  $\theta$  but opening in the clockwise direction from the  $x$ -axis, and therefore its terminal edge will be the same as the terminal edge of  $\theta$  except reflected across the  $x$ -axis. Therefore the  $y$ -coordinates of these two terminal edges have the same magnitude but opposite signs; in other words,  $\sin(-\theta) = -\sin \theta$ . The remaining even/odd identities can be proved in a similar fashion.

99.  $\sin 2\theta = \sin(\theta + \theta) = \sin \theta \cos \theta + \sin \theta \cos \theta = 2 \sin \theta \cos \theta$ . The identity for  $\cos 2\theta$  is proved similarly, and the alternative forms follow from the first two forms and the Pythagorean identity.

### Section 0.5

1. F, T, T, F, T, T, F, F.

3. If  $C$  is true, then  $D$  must be true. If  $C$  is false, then  $D$  may or may not be true.

5. "For all  $x > 0$ , we have  $x > -2$ ." and "If  $x > 0$ , then  $x > -2$ ."

7. The original statement is true. The converse is "Every rectangle is a square," which is false. The contrapositive is "Everything that is not a rectangle is not a square," which is true.

9. The contrapositive is "Not( $Q$ )  $\Rightarrow$  Not( $P$ )," which is logically equivalent to  $P \Rightarrow Q$ .

11. False.

13. True.

15. True.

17. True. The negation is "For all real numbers  $x$ ,  $x \leq 2$  and  $x \geq 3$ ."

19. True. The negation is "There exists a real number that is both rational and irrational."

21. True. The negation is "There exists  $x$  such that, for all  $y$ ,  $y \neq x^2$ ." (In other words, "There exists  $x$  for which there is no  $y$  with  $y = x^2$ .")
23. True. The negation is "There is some integer  $x$  greater than 1 for which  $x < 2$ ."
25. False. One counterexample is  $x = 1.35$ .
27. False.
29. False. One counterexample is  $x = -1$ .
31. True. One example is  $x = 3$ .
33. True. The negation is "There exist real numbers  $a$  and  $b$  such that  $a < b$  but  $3a + 1 \geq 3b + 1$ ."
35. True.    37. False.
39. True.
41. True. One example is  $x = -1$ , since for all  $y$  we have  $|y| > -1$ .
43. True.
45. False. The only counterexample where the two sides of the double implication are not equivalent is  $x = 0$ ,  $y = 0$ .
47. (a)  $B \Rightarrow (\text{Not } A)$ ; (b)  $(\text{Not } B) \Rightarrow A$
49. (a)  $(\text{Not } A) \Rightarrow (\text{Not } B)$ ; (b)  $A \Rightarrow B$
51. (a)  $C \Rightarrow (A \text{ and } B)$ ; (b)  $\text{Not}(C) \Rightarrow (\text{Not } A) \text{ or } (\text{Not } B)$
53. (a)  $(B \text{ and } C) \Rightarrow A$ ; (b)  $((\text{Not } B) \text{ or } (\text{Not } C)) \Rightarrow (\text{Not } A)$
55. (a) The converse is "If  $x$  is rational, then  $x$  is a real number." (b) The contrapositive is "If  $x$  is irrational, then  $x$  is not a real number." (c)  $x = \pi$  is a counterexample to the original and the contrapositive.
57. (a) The converse is "If  $x \geq 3$ , then  $x > 2$ ." (b) The contrapositive is "If  $x < 3$ , then  $x \leq 2$ ." which is false. (c)  $x = 2.5$  is a counterexample to both the original and the contrapositive.
59. (a) The converse is "If  $\sqrt{x}$  is not a real number, then  $x$  is negative." (b) The contrapositive is "If  $\sqrt{x}$  is a real number, then  $x$  is nonnegative." (c) No possible counterexamples for any of the statements.
61. (a) The converse is "If  $|x| = -x$ , then  $x \leq 0$ ." (b) The contrapositive is "If  $|x| \neq -x$ , then  $x > 0$ ." (c) No possible counterexamples for any of the statements.
63. (a) The converse is "If  $x^2 > x$ , then  $x$  is not zero." (b) The contrapositive is "If  $x^2 \leq x$ , then  $x = 0$ ." (c)  $x = 0.5$  is a counterexample to the original statement and its contrapositive; the converse happens to be true.
65. (a) The converse is "If there is some integer  $n$  such that  $x = 2n + 1$ , then  $x$  is odd." (b) The contrapositive is "If there is no integer  $n$  such that  $x = 2n + 1$ , then  $x$  is not odd." (c) No possible counterexamples for any of the statements.
67. Linda wears a red hat, Alina wears a blue hat, Phil wears a green hat, Stuart wears a yellow hat.
69. Liz and Rein are liars, and Zubin tells the truth. Here is an argument that proves this solution is correct: If Liz told the truth then everyone would, which would contradict Rein's and Zubin's statements. Therefore Liz must be a liar. Now if Rein is telling the truth, then by Rein's statement, Zubin must tell the truth also, but Zubin's statement would be false; another contradiction. Therefore Rein must be lying. This makes Zubin's statement true, so Zubin is telling the truth.
71. Kate and Hyun are liars and Jaan tells the truth. Here's why: Seeking a contradiction, suppose Kate tells the truth. Then by her statement both Hyun and Jaan lie. If Hyun lies then her statement means that Kate also lies, which is a contradiction. Therefore we can assume that Kate lies. Thus Hyun's statement is false, so Hyun is a liar. But by Kate's false statement, at least one of Hyun or Jaan tells the truth. Therefore Jaan tells the truth.
73. Suppose  $x$  is irrational and  $r$  is rational. Seeking a contradiction, suppose  $x - r$  is rational. Since the sum of two rational numbers is rational, we know that  $(x - r) + r = x$  must be rational. But this contradicts the hypothesis that  $x$  is irrational; therefore  $x - r$  must be an irrational number.
75. If  $n$  is even and  $m$  is odd then there are integers  $k$  and  $l$  such that  $n = 2k$  and  $m = 2l + 1$ . Then  $n + m = (2k) + (2l + 1) = 2(k + l) + 1$ . Since  $k + l$  is an integer, this means that  $n + m$  is odd.
77. Let  $n = 2k$  and  $m = 2l + 1$  and compute  $n$  times  $m$ .
79. If  $M = \left(\frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2}\right)$ , the distance formula easily shows that  $\text{dist}(M, P) = \text{dist}(M, Q)$ .
81. If  $a$ ,  $b$ , and  $c$  are any real numbers with  $b \neq 0$  and  $c \neq 0$ , then  $\frac{a/b}{c} = \frac{a/b}{c/1} = \frac{a(1)}{bc} = \frac{a}{bc}$ .
83. Follow the outline given in the problem.
85.  $|a - b| + |b| \geq |(a - b) + b| = |a|$  so  $|a - b| \geq |a| - |b|$ .
87.  $|x - c| > \delta$  if and only if  $x - c > \delta$  or  $x - c < -\delta$ , which is equivalent to having  $x > c + \delta$  or  $x < c - \delta$ , meaning that  $x \in (c + \delta, \infty) \cup x \in (-\infty, c - \delta)$ .

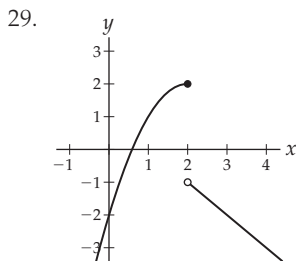

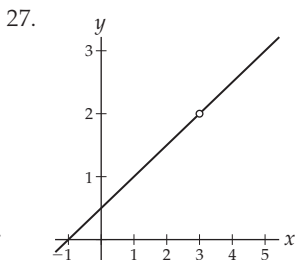

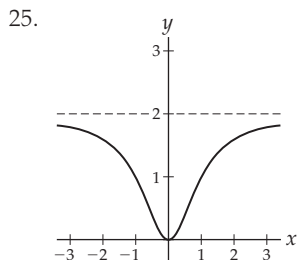

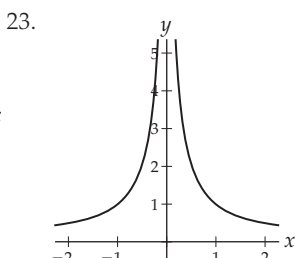

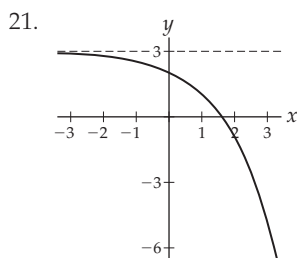

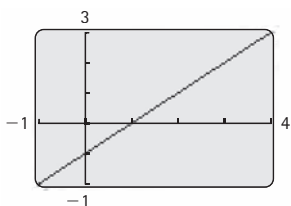

For answers to odd-numbered Skill Certification exercises in the Chapter Review, please visit the Book Companion Web Site at [www.whfreeman.com/tkcalculus](http://www.whfreeman.com/tkcalculus).

## Chapter 1

### Section 1.1

1. T, F, T, F, F, T, F, T.
3.  $\lim_{x \rightarrow 1} f(x) = 5$ ; cannot say anything about  $f(1)$
5.  $\lim_{x \rightarrow 2^-} f(x)$  is not equal to 8.
7.  $f$  has a horizontal asymptote at  $y = 3$  and a vertical asymptote at  $x = 1$ .
9. (a) The terms get smaller;  $\lim_{k \rightarrow \infty} \frac{1}{3^k} = 0$ . (b) For every  $k > 8$  the terms will be less than 0.0001.

11. (a) The terms get larger and larger as more numbers are added. (b) For every  $k > 44$  the terms will be greater than 1000.
13. (a) By solving  $s(t) = 0$  we see that the orange hits the surface of the moon at about  $t = 2.75$  seconds. The average rate of change on  $[1.75, 2.75]$  is  $-11.925$  feet per second; on  $[2.25, 2.75]$  it is  $-13.25$ , on  $[2.5, 2.75]$  it is  $-13.9125$ , and on  $[2.625, 2.75]$  it is  $-14.2438$ . (b) We might estimate  $-14.5$  feet per second on impact.
15. (a) 6.25 for four rectangles, and 5.8125 for eight. (b) If we did this for more and more rectangles, the area approximation would decrease to become closer and closer to the actual area under the curve. We might estimate 5.5 square units from our earlier work. (The actual answer turns out to be about 5.33.)
17. Let the graph of the function escape out to  $\pm\infty$  at  $x = 2$  with a vertical asymptote at the last minute.
19. (a)  $g(1)$  is of the form  $\frac{0}{0}$  and therefore is not defined. A calculator graph is shown here. It is not immediately clear that  $g(x)$  is not defined at  $x = 1$ . Tracing along the graph near  $x = 1$  might reveal a hole in the graph, depending on your calculator. (b) Even though  $g(1)$  is undefined, the function values do approach 0 as  $x \rightarrow 1$ , so the limit exists and is equal to 0.

31.  $-2, -2, -2, -2$
33.  $-2, 2, \text{DNE}, 2$
35.  $\infty, -\infty, \text{DNE}, \text{undefined}$     37.  $-1, -1, -1, -2$
39. 7
41. DNE:  $-\infty$  from the left and  $\infty$  from the right.
43.  $\frac{1}{7}$
45. DNE:  $\infty$  from the left and  $-\infty$  from the right.
47.  $-3$     49. 0
51. DNE:  $\sin x$  oscillates between  $-1$  and  $1$  as  $x \rightarrow \infty$ .
53. DNE:  $-\infty$  from the left and  $\infty$  from the right.
55. 2    57.  $\frac{1}{2}$
59. 1
61. DNE:  $\infty$  from the left and  $-\infty$  from the right.
63. DNE: 4 from the left and  $-5$  from the right.
65. 2    67.  $-93$
69. DNE:  $-\infty$  from the left and  $\infty$  from the right.
71. 0    73. 1
75. (a)  $S(0) = \frac{12}{3} = 4$ ; (b) 17, 19, 21; (c) 22; (d) 22.
77. (a) Your  $y$ -range will have to be quite large; (b)  $\infty$ ; (c) population explosion past what any finite-sized planet can handle; (d) in this model no world would be left after 2027.
79. For  $k = 101$  we have  $\frac{101(101+1)}{2} = 5151$ , and for larger  $k$  the quantity  $\frac{k(k+1)}{2}$  will be still larger.
81. By the previous problem, if  $x$  is within 0.01 of  $x = 1$  then  $(x - 1)^2$  is in the interval  $(0, 0.0001)$ , and thus  $0 < (x - 1)^2 < 0.0001$ . Therefore  $\frac{1}{(x-1)^2} > \frac{1}{0.0001} = 10,000$ .

Section 1.2

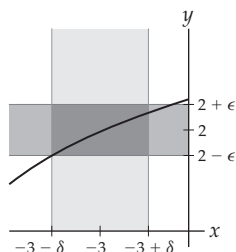

1. F, F, F, F, F, T, T.
3. See the reading at the beginning of the section.
5. (a)  $(1, 1.5) \cup (1.5, 2)$ ; (b)  $(0, 0.25) \cup (0.25, 0.5)$ ; (c)  $(0, 1) \cup (1, 2)$
7. If  $x \in (2 - \delta, 2) \cup (2, 2 + \delta)$ , then  $f(x) \in (5 - \epsilon, 5 + \epsilon)$ .
9. If  $x \in (N, \infty)$ , then  $f(x) \in (2 - \epsilon, 2 + \epsilon)$ .
11. If  $x \in (1, 1 + \delta)$ , then  $f(x) \in (M, \infty)$ .

13. Combine the two figures above Theorem 1.8. The two blue one-sided  $\delta$ -bars combine to make a punctured  $\delta$ -interval around  $x = c$ .

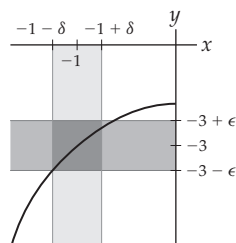

15. (1.75, 6.25)

17. There is some  $M > 0$  for which there is no  $N > 0$  that would guarantee that if  $x > N$ , then  $\frac{1000}{x} > M$ .

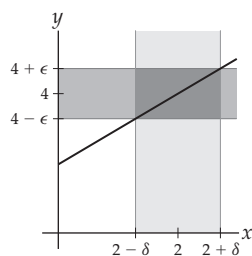

19. For all  $\epsilon > 0$ , there exists a  $\delta > 0$  such that if  $x \in (-3 - \delta, -3) \cup (-3, -3 + \delta)$ , then  $\sqrt{x+7} \in (2 - \epsilon, 2 + \epsilon)$ .

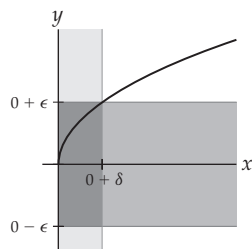

21. For all  $\epsilon > 0$ , there exists a  $\delta > 0$  such that if  $x \in (-1 - \delta, -1) \cup (-1, -1 + \delta)$ , then  $x^3 - 2 \in (-3 - \epsilon, -3 + \epsilon)$ .

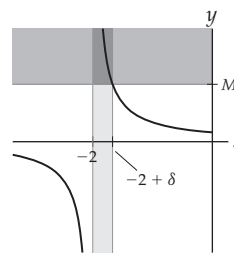

23. For all  $\epsilon > 0$ , there exists a  $\delta > 0$  such that if  $x \in (2 - \delta, 2) \cup (2, 2 + \delta)$ , then  $\frac{x^2 - 4}{x - 2} \in (4 - \epsilon, 4 + \epsilon)$ .

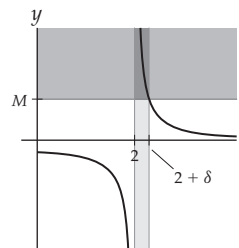

25. For all  $\epsilon > 0$ , there exists a  $\delta > 0$  such that if  $x \in (0, \delta)$ , then  $\sqrt{x} \in (-\epsilon, \epsilon)$ .

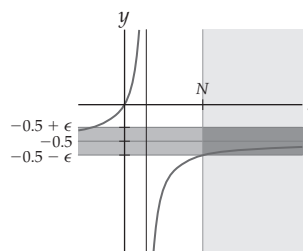

27. For all  $M > 0$ , there exists a  $\delta > 0$  such that if  $x \in (-2, -2 + \delta)$ , then  $\frac{1}{x+2} \in (M, \infty)$ .

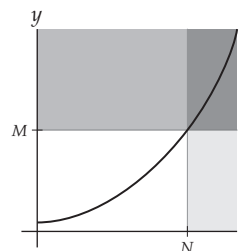

29. For all  $M > 0$ , there exists a  $\delta > 0$  such that if  $x \in (2, 2 + \delta)$ , then  $\frac{1}{2^x - 4} \in (M, \infty)$ .

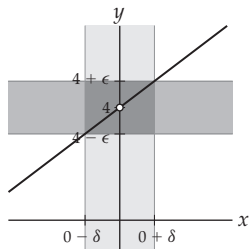

31. For all  $\epsilon > 0$ , there is some  $N > 0$  such that if  $x \in (N, \infty)$ , then  $\frac{x}{1-2x} \in (-0.5 - \epsilon, -0.5 + \epsilon)$ .

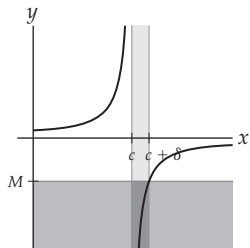

33. For all  $M > 0$ , there is some  $N > 0$  such that if  $x \in (N, \infty)$ , then  $x^3 + x + 1 \in (M, \infty)$ .

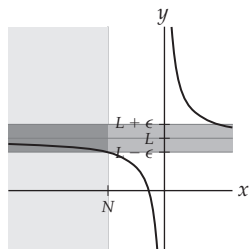

35. For all  $\epsilon > 0$ , there exists a  $\delta > 0$  such that if  $h \in (-\delta, 0) \cup (0, \delta)$ , then  $\frac{(2+h)^2 - 4}{h} \in (4 - \epsilon, 4 + \epsilon)$ .

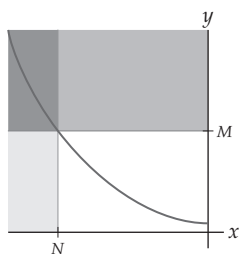

37. For all  $M < 0$ , there exists some  $\delta > 0$  such that if  $x \in (c, c + \delta)$ , then  $f(x) \in (-\infty, M)$ .

39. For all  $\epsilon > 0$  there is some  $N < 0$  such that if  $x \in (-\infty, N)$ , then  $f(x) \in (L - \epsilon, L + \epsilon)$ .

41. For all  $M > 0$ , there is some  $N < 0$  such that if  $x \in (-\infty, N)$ , then  $f(x) \in (M, \infty)$ .

43.  $\delta = (8.5)^{1/3} - 2 \approx 0.0408$     45.  $\delta = 3$   
 47.  $\delta = \frac{\pi}{4}$   
 49.  $\delta \approx 1.11$ , using a calculator approximation to solve  $\frac{1 - \cos x}{x} = \frac{1}{2}$ .  
 51.  $\delta \approx 0.016662$     53.  $\delta = 1$   
 55.  $\delta \approx 0.0005$     57.  $N = 5$

59.  $N = e^{100}$     61.  $N = \frac{\ln(\frac{1}{2})}{\ln 3} \approx -0.63093$   
 63.  $N = \sqrt{104} \approx 10.198$   
 65. (a) 149.3 months; (b) yes, since  $\lim_{t \rightarrow \infty} 50t = \infty$ .  
 67. (a) \$18.68; (b) between \$16.20 and \$21.50; (c)  $L = 6000, c = 18.68, \epsilon = 1000, \delta = 2.48$ .  
 69. (a) For all  $\epsilon > 0$ , there exists  $\delta > 0$  such that if  $x \in (2 - \delta, 2) \cup (2, 2 + \delta)$ , then  $7 - x \in (5 - \epsilon, 5 + \epsilon)$ . (b)  $2 - \delta < x < 2 + \delta$  and  $x \neq 2$  means that  $-\delta < x - 2 < \delta$  and  $x \neq 2$ . This means that  $|x - 2| < \delta$  and  $x - 2 \neq 0$ , and thus  $0 < |x - 2| < \delta$ . (c)  $5 - \epsilon < 7 - x < 5 + \epsilon$  means that  $-\epsilon < 2 - x < \epsilon$ , and thus that  $|2 - x| < \epsilon$ , which is equivalent to  $|x - 2| < \epsilon$ . (d) For a given  $\epsilon > 0$ , choose  $\delta = \epsilon$ . (e) Given any  $\epsilon > 0$ , let  $\delta = \epsilon$ . If  $x \in (2 - \delta, 2) \cup (2, 2 + \delta)$ , then  $0 < |x - 2| < \delta$  by part (b). Thus by part (d),  $|x - 2| < \epsilon$ , and therefore  $7 - x \in (5 - \epsilon, 5 + \epsilon)$  by part (c).  
 71. (a) For all  $\epsilon > 0$ , there exists  $N > 0$  such that if  $x \in (N, \infty)$ , then  $\frac{1}{x} \in (0 - \epsilon, 0 + \epsilon)$ . (b)  $x \in (N, \infty)$  is equivalent to  $x > N$ . (c)  $\frac{1}{x} \in (-\epsilon, \epsilon)$  means that  $-\epsilon < \frac{1}{x} < \epsilon$ . For the limit we are considering,  $\frac{1}{x}$  approaches  $y = 0$  from above, so we actually wish to show that we can guarantee  $0 < \frac{1}{x} < \epsilon$ . (d) For a given  $\epsilon > 0$ , choose  $N = \frac{1}{\epsilon}$ . (e) Given any  $\epsilon > 0$ , let  $N = \frac{1}{\epsilon}$ . If  $x \in (N, \infty)$  then  $x > N > 0$  by part (b). Thus by our choice from part (d),  $0 < \frac{1}{x} < \epsilon$ , and thus  $0 < \frac{1}{x} < \epsilon$ . By part (c) this means  $-\epsilon < \frac{1}{x} < \epsilon$  and thus  $\frac{1}{x} \in (0 - \epsilon, 0 + \epsilon)$ .

Section 1.3

1. T, T, F, T, T, F, F, F.  
 3. For all  $\epsilon > 0$ , there exists a  $\delta > 0$  such that if  $0 < |x + 2| < \delta$ , then  $|\frac{3}{x+1} + 3| < \epsilon$ .  
 5.  $0 < |x - 5| < 0.01; |f(x) + 2| < 0.5$   
 7.  $x \in (1.9, 2) \cup (2, 2.1)$   
 9.  $x^2 - 1 \in (-3.5, -2.5)$  (note that there are in fact no  $x$ -values with this property)  
 11.  $f(x) \in (L - \epsilon, L + \epsilon)$   
 13. The statement is false. One counterexample is  $x = 1.5$ , since  $x = 1.5$  satisfies  $0 < |x - 2| < 1$ , but not  $|x^2 - 4| < 0.5$ , since  $(1.5)^2 = 2.25$ .  
 15. The statement is false. One counterexample is  $x = 0.74$ ; this value satisfies  $0 < |x - 0| < 0.75$  but not  $|x^2 - 0| < 0.5$ , since  $(0.74)^2 = 0.5476$ .

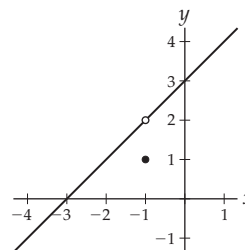

17. The statement is true. Sketch the graph of  $y = x^2$  and show an  $\epsilon$  interval around  $y = 4$  with  $\epsilon = 0.4$  (i.e., show the horizontal "bar" between  $y = 3.6$  and  $y = 4.4$ ). Then draw the  $\delta$  interval around  $x = -2$  with  $\delta = 0.075$ , excluding  $x = -2$  (i.e., show the vertical "bar" between  $x = -2.075$  and  $x = -1.925$ , excluding  $x = -2$ ). Indicate on your graph that every  $x$ -value in  $(-2.075, -2) \cup (-2, -1.925)$  has an  $f(x)$ -value in  $(3.6, 4.4)$ .
19. (a)  $\delta = \frac{5}{325}$ ; (b)  $\delta = \frac{.01}{325}$ ; (c)  $\delta = 1$
21. See the proof of Theorem 1.11.
23.  $\delta = \frac{0.25}{3}$                                     25.  $\delta = 0.25$
27.  $N = \sqrt{1000} \approx 31.62$               29.  $\delta = \epsilon$
31.  $\delta = \frac{\epsilon}{4}$                                     33.  $\delta = \sqrt{\frac{\epsilon}{5}}$
35.  $\delta = \sqrt{\epsilon}$                               37.  $\delta = \min(1, 2\epsilon)$
39.  $\delta = \min(1, \epsilon/5)$                 41.  $\delta = \epsilon^2$
43.  $\delta = \frac{1}{M}$
45. With  $C(r) = 0.25(2\pi r(5)) + 0.5(2\pi r^2) + 0.1(2(2\pi r) + 5)$ , we have (a)  $r \approx 1.94$  inches; (b)  $|C(r) - 30| < 10$ ; (c)  $r \in (1.43, 2.38)$ , so  $|r - 1.94| < 0.44$ .
47. Given  $\epsilon > 0$ , choose  $\delta = \epsilon/2$ . Then if  $0 < |x - 1| < \delta$ , we have  $|(2x + 4) - 6| = 2|x - 1| < 2\delta = \epsilon$ .
49. Given  $\epsilon > 0$ , choose  $\delta = \epsilon$ . Then if  $0 < |x + 6| < \delta$ , we have  $|(x + 2) - (-4)| = |x + 6| < \delta = \epsilon$ .
51. Given  $\epsilon > 0$ , choose  $\delta = \frac{\epsilon}{6}$ . Then if  $0 < |x - 4| < \delta$ , we have  $|(6x - 1) - (23)| = |6x - 24| = 6|x - 4| < 6\delta = \epsilon$ .
53. Given  $\epsilon > 0$ , choose  $\delta = \sqrt{\epsilon/3}$ . Then if  $0 < |x| < \delta$ , we have  $|(3x^2 + 1) - 1| = |3x^2| = 3|x|^2 < 3\delta^2 = 3(\sqrt{\epsilon/3})^2 = \epsilon$ .
55. Given  $\epsilon > 0$ , choose  $\delta = \sqrt{\frac{\epsilon}{2}}$ . Then if  $0 < |x - 1| < \delta$ , we have  $|(2x^2 - 4x + 3) - 1| = |2x^2 - 4x + 2| = 2|x^2 - 2x + 1| = 2|x - 1|^2 < 2\delta^2 = \epsilon$ .
57. Given  $\epsilon > 0$ , choose  $\delta = \epsilon$ . Then if  $0 < |x - 1| < \delta$ , we have  $\left| \frac{x^2 - 1}{x - 1} - 2 \right| = \left| \frac{x^2 - 2x + 1}{x - 1} \right| = |x - 1| < \delta = \epsilon$ .
59. Given  $\epsilon > 0$ , choose  $\delta = \epsilon^2$ . Then if  $5 < x < 5 + \delta$ , we have  $0 < x - 5 < \delta$  and thus  $|\sqrt{x - 5} - 0| = \sqrt{x - 5} < \sqrt{\delta} = \epsilon$ .
61. Given  $M > 0$ , choose  $\delta = 1/M$ . Then if  $x \in (-2, -2 + \delta)$ , we have  $0 < x + 2 < \delta$ , and thus  $\frac{1}{x+2} > \frac{1}{\delta} = \frac{1}{1/M} = M$ .
63. Given  $\epsilon > 0$ , choose  $N = \frac{1}{\epsilon}$ . Then if  $x > N$ , we have  $\left| \frac{2x-1}{x} - 2 \right| = \left| \frac{2x-1-2x}{x} \right| = \frac{1}{|x|} < \frac{1}{N} = \epsilon$ .
65. Given  $M > 0$ , choose  $N = \frac{M+5}{3}$ . Then if  $x > N$ , we have  $3x - 5 > 3N - 5 = M$ .
67. Given  $\epsilon > 0$ , choose  $\delta = \min(1, \epsilon/5)$ . Then if  $0 < |x - 3| < \delta$ , we have  $|(x^2 - 2x - 3) - 0| = |x^2 - 2x - 3| = |x - 3||x + 1| < \delta|x + 1| \leq \delta(5) \leq \epsilon$ .

69. Given  $\epsilon > 0$ , choose  $\delta = \min(1, \epsilon/5)$ . Then if  $0 < |x - 5| < \delta$ , we have  $|(x^2 - 6x + 7) - 2| = |x^2 - 6x + 5| = |x - 5||x - 1| < \delta|x - 1| \leq \delta(5) = \epsilon$ .

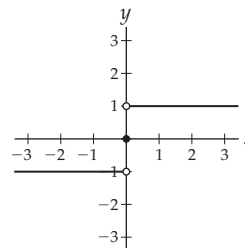

71. Given  $\epsilon > 0$ , choose  $\delta = \min(1, \epsilon/3)$ . Then if  $0 < |x - 2| < \delta$ , we have  $\left| \frac{4}{x^2} - 1 \right| = \frac{|2-x||2+x|}{x^2} < \delta \frac{|2+x|}{x^2} \leq \delta(3) = \epsilon$ .

**Section 1.4**

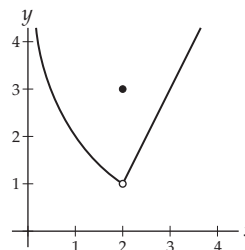

- T, T, F, F, F, F, T, F.
- $\lim_{x \rightarrow 1} f(x) = f(1)$
- See the reading.
- Define  $f(1)$  to be 0.
- Removable discontinuity, neither left nor right continuous. One possible graph is:

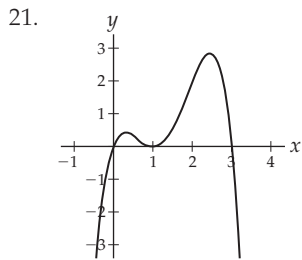

11. Jump discontinuity, neither left nor right continuous. One possible graph is:

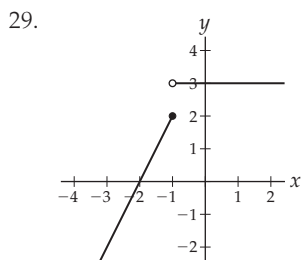

- For all  $\epsilon > 0$ , there exists  $\delta > 0$  such that whenever  $x \in (c - \delta, c + \delta)$ , we also have  $f(x) \in (f(c) - \epsilon, f(c) + \epsilon)$ .
- For all  $\epsilon > 0$ , there exists  $\delta > 0$  such that whenever  $x \in (c, c + \delta)$ , we also have  $f(x) \in (f(c) - \epsilon, f(c) + \epsilon)$ .
- See the reading.
- The graph below is not continuous on  $[1, 3]$ , and there is no minimum value on that interval.

23. Continuous on  $(-\infty, 2) \cup (2, \infty)$ , removable discontinuity at  $x = 2$ , neither left- nor right continuous at  $x = 2$ .
25. Continuous on  $(-\infty, -1) \cup (-1, 1] \cup (1, \infty)$ , removable discontinuity at  $x = -1$ , infinite discontinuity at  $x = 1$ , left continuous at  $x = 1$ .
27. Not possible.

31. Not possible.                      33. 6
35.  $-17$
37. Can't do this yet, since 0 is not in the domain of  $x^{-3}$ .
39. Continuous at  $x = 3$ .
41. Jump discontinuity and left continuous at  $x = 2$ .
43. Continuous at  $x = 1$ , jump discontinuity and right continuous at  $x = 2$ .
45. Not continuous at  $x = 2$ .
47. Continuous at  $x = 1$ .
49. (a) Since  $f$  is continuous on  $[-2, 2]$ , the Extreme Value Theorem guarantees that  $f$  will attain global maximum and minimum values on  $[-2, 2]$ . (b) The maximum value on that interval occurs twice, at  $x = -2$  and at  $x = 2$ , and the minimum value occurs both at  $x \approx -1.22$  and at  $x \approx 1.22$ .
51. (a) Since  $f$  is continuous on  $[-1, 1]$ , the Extreme Value Theorem guarantees that  $f$  will attain global maximum and minimum values on  $[-1, 1]$ . (b) The maximum value on that interval occurs at  $x = 0$ , and the minimum value occurs twice, at  $x = -1$  and  $x = 1$ .
53. (a) Since  $f$  is continuous on  $[0, 2]$ , the Extreme Value Theorem guarantees that  $f$  will attain global maximum and minimum values on  $[0, 2]$ . (b) The minimum value on that interval occurs at  $x = \frac{4}{3}$ , and the maximum value occurs twice, at  $x = 0$  and  $x = 2$ .

55. (a) Since  $f$  is continuous on  $[0, 2]$  and  $K = 0$  is between  $f(0) = 5$  and  $f(2) = -11$ , the Intermediate Value Theorem guarantees that there is some  $c \in (0, 2)$  such that  $f(c) = 0$ . (b) Using a graph we can approximate that in  $(0, 2)$  there is one such value of  $c$ , namely,  $c \approx 1.5$ .
57. (a) Since  $f$  is continuous on  $[-2, 4]$  and  $K = -4$  is between  $f(-2) = -22$  and  $f(4) = 14$ , the Intermediate Value Theorem guarantees that there is some  $c \in (-2, 4)$  such that  $f(c) = -4$ . (b) Using a graph we can approximate that in  $(-2, 4)$  there are three such values of  $c$ , namely,  $c = 1$ ,  $c \approx -0.73$ , and  $c \approx 2.73$ .
59. (a) Since  $f$  is continuous on  $[2, 4]$  and  $K = -4$  is between  $f(2) = -6$  and  $f(4) = 14$ , the Intermediate Value Theorem guarantees that there is some  $c \in (2, 4)$  such that  $f(c) = -4$ . (b) Using a graph we can approximate that in  $(2, 4)$  there is one such value of  $c$ , namely,  $c \approx 2.73$ .
61. (a) Since  $f$  is continuous everywhere, the Intermediate Value Theorem applies on any interval  $[a, b]$ . For example, since  $f(-3) = -25 < -15$  and  $f(0) = 2 > -15$ , the Intermediate Value Theorem guarantees that there is some  $c \in (-3, 0)$  for which  $f(c) = -15$ . (b) Using a graph we can approximate that  $c \approx -2.57$  is such a value.
63. (a) Since  $f$  is continuous everywhere, the Intermediate Value Theorem applies on any interval  $[a, b]$ . For example, since  $f(0) = 0 < \frac{1}{2}$  and  $f(\frac{\pi}{2}) = 1 > \frac{1}{2}$ , the Intermediate Value Theorem guarantees that there is some  $c \in (0, \frac{\pi}{2})$  for which  $f(c) = \frac{1}{2}$ . (b)  $c = \frac{\pi}{6}$  is such a value.
65. (a) Since  $f$  is continuous everywhere, the Intermediate Value Theorem applies on any interval  $[a, b]$ . For example, since  $f(-\frac{1}{3}) = 0 < 1$  and  $f(2) = 7 > 1$ , the Intermediate Value Theorem guarantees that there is some  $c \in (0, 7)$  for which  $f(c) = 1$ . (b)  $c = 0$  is such a value.
67. Positive on  $(-\infty, -2) \cup (-\frac{1}{2}, \infty)$ , negative on  $(-2, -\frac{1}{2})$
69. Positive on  $(-\infty, -2) \cup (-1, 1) \cup (2, \infty)$ , negative on  $(-2, -1) \cup (1, 2)$
71. Positive on  $(2, \infty)$ , negative on  $(-\infty, 2)$
73. Positive on  $(0, 2]$ , negative on  $(-\infty, 0) \cup (2, \infty)$
75. The length  $H(t)$  of Alina's hair is a continuous function because her hair can't suddenly get longer or shorter without going through a continuous change, so the theorems apply. We are given that  $H(0) = 2$  and  $H(6) = 42$ . The Extreme Value Theorem says that Alina's hair had a maximum and a minimum length sometime in the last 6 years. The Intermediate Value Theorem says that Alina's hair has been every length between 2 and 42 inches at some point during the last 6 years.

77. The Extreme Value Theorem says that at some point in the past year, there was a time when Phil's wagon contained the most gas and a time when it contained the least. The Intermediate Value Theorem says that for every amount between 0 and 19 gallons of gas, there was at least one time in the past year that Phil's wagon contained that amount of gas.
79. (a)  $M(v) = \begin{cases} 8,500, & \text{if } 0 \leq v < 30 \\ 10,000, & \text{if } 30 \leq v < 60 \\ 11,500, & \text{if } 60 \leq v < 90 \\ 13,000, & \text{if } v = 90. \end{cases}$   
 (b)  $M(0) = 8,500$ ,  $M(30) = 10,000$ ,  $M(59) = 10,000$ ,  $M(61) = 11,500$ , and  $M(90) = 13,000$ ; (c)  $M(v)$  fails to be continuous at  $v = 30$ ,  $v = 60$ , and  $v = 90$ .
81. Given  $\epsilon > 0$ , let  $\delta = \epsilon/3$ . If  $0 < |x - 2| < \delta$ , then  $|(3x - 5) - (3(2) - 5)| = |3x - 6| = 3|x - 2| < 3\delta = \epsilon$ .
83. Given  $\epsilon > 0$ , choose  $\delta = \epsilon$ . If  $0 < |x - c| < \delta$ , then  $||x| - |c|| < |x - c| < \delta = \epsilon$ .
85.  $f$  is not continuous at  $c = 2$ . For example, consider  $\epsilon = 1$ . No matter how small we take  $\delta > 0$ , there are irrational values of  $x$  with  $0 < |x - 2| < \delta$  for which  $|f(x) - f(c)| = |x^2 - 0| = x^2$  is outside of the interval  $(0 - \epsilon, 0 + \epsilon) = (-1, 1)$ .
87. If  $A > 0$  then for large magnitude  $N$  we will have  $f(-N) < 0 < f(N)$ , and if  $A < 0$  then for large magnitude  $N$  we will have  $f(-N) > 0 > f(N)$ . In either case the Intermediate Value Theorem applies to the continuous cubic function  $f(x)$  on  $[-N, N]$  and therefore  $f(x)$  has at least one real root on  $[-N, N]$ .
89. Suppose  $c \geq 0$ ; the proof for  $c \leq 0$  is similar. Given  $\epsilon > 0$ , let  $\delta = \min\left(1, \frac{\epsilon}{2c+1}\right)$ . If  $0 < |x - c| < \delta$ , then since  $\delta \leq 1$  we have  $c - 1 < x < c + 1$ . Then  $|x^2 - c^2| = |x - c| \cdot |x + c| < \delta \cdot |x + c| \leq \delta|(c + 1) + c| = \delta(2c + 1) = \frac{\epsilon}{2c+1}(2c + 1) = \epsilon$ .
91. Suppose  $c > 0$ ; the proof for  $c < 0$  is similar. Given  $\epsilon > 0$ , let  $\delta = \min\left(1, \epsilon \cdot \frac{(c-1)^2 c^2}{2c+1}\right)$ . If  $0 < |x - c| < \delta$ , then since  $\delta \leq 1$  we have  $c - 1 < x < c + 1$ . Then  $\left|\frac{1}{x^2} - \frac{1}{c^2}\right| = \frac{|c^2 - x^2|}{|x^2 c^2|} = \frac{|c-x| \cdot |c+x|}{x^2 c^2} < \frac{\delta|c+x|}{x^2 c^2} \leq \frac{\delta|c+(c+1)|}{(c-1)^2 c^2} = \epsilon$ .
93. Suppose  $c > 0$ . Given  $\epsilon > 0$ , let  $\delta = \min\left(1, \epsilon \cdot \frac{\sqrt{c-1} + \sqrt{c}}{2c+1}\right)$ . If  $0 < |x - c| < \delta$ , then since  $\delta \leq 1$  we have  $c - 1 < x < c + 1$ . Then  $|\sqrt{x} - \sqrt{c}| = \frac{|x^2 - c^2|}{\sqrt{x} + \sqrt{c}} = \frac{|x-c| \cdot |x+c|}{\sqrt{x} + \sqrt{c}} < \frac{\delta|x+c|}{\sqrt{x} + \sqrt{c}} \leq \frac{\delta|(c+1)+c|}{\sqrt{c-1} + \sqrt{c}} = \epsilon$ .
- Section 1.5**
1. T, T, F, F, T, F, F, T.
3. See Theorem 1.20.
5. Consider the limit  $\lim_{x \rightarrow 1} \frac{x-1}{x^2-1}$ .
7.  $f(x) = x$ ,  $g(x) = \frac{1}{x}$ ,  $c = 0$  is one example. This does not contradict the product rule for limits because one of the limits does not exist as  $x \rightarrow 0$ .
9. For all  $\epsilon > 0$ , there exists  $\delta > 0$  such that if  $0 < |x - c| < \delta$ , then  $|(f(x) - g(x)) - (L - M)| < \epsilon$ , where  $L = \lim_{x \rightarrow c} f(x)$  and  $M = \lim_{x \rightarrow c} g(x)$ .
11. To get this function we add the power function  $\sqrt{x}$  and the constant function 1, and then compose the result with the power function  $x^3$ . Thus by the sum and composition rules for limits, and the fact that power and constant functions are continuous, we know that this function  $f$  is continuous and thus we can calculate its limits at domain points by evaluation.
13. -2
15. Not enough information.
17.  $\frac{1}{2}$
19. The graph of  $g$  looks just like the graph of  $f$  but with a hole at  $x = 1$ .  $f(1) = 2$  but  $g(1)$  is undefined, while both functions approach 2 as  $x$  approaches 1.
21. Limits as  $x \rightarrow c$  are not determined by function values at the point  $x = c$ ; they are determined by the behavior of the function in question as  $x$  approaches  $c$ .
23. Consider a picture like the ones that follow the Squeeze Theorem for limits in the reading, but think of them upside-down.
25. Using the constant multiple rule followed by the continuity of linear functions, we have  $\lim_{x \rightarrow 1} 15(3 - 2x) = 15 \lim_{x \rightarrow 1} (3 - 2x) = 15(3 - 2(1)) = 15$ .
27. Applying the sum rule, the product rule, the constant multiple rule, and then the continuity of power and linear functions, in that order, we have  $\lim_{x \rightarrow 3} (3x + x^2(2x + 1)) = \lim_{x \rightarrow 3} (3x) + \lim_{x \rightarrow 3} (x^2(2x + 1)) = \lim_{x \rightarrow 3} (3x) + \lim_{x \rightarrow 3} x^2 \cdot \lim_{x \rightarrow 3} (2x + 1) = 3(3) + (3^2)(2(3) + 1) = 72$ .

57. 1
59.  $\frac{\pi}{6}$
61.  $\frac{2}{\pi}$
63. 6
65. 3
67. -1
69. -1
71. Continuous on  $\mathbb{R}$ .
73. Continuous on  $(-\infty, -2)$  and on  $(-2, \infty)$ ; neither left nor right continuous at  $x = -2$ .
75. Continuous on  $(-\infty, 1)$  and on  $(1, \infty)$ ; neither left nor right continuous at  $x = 1$ .
77. Continuous on  $(-\infty, \pi)$  and  $(\pi, \infty)$ ; right but not left continuous at  $x = \pi$ .
79. 0
81. 0
83. 0
85. 0
87. (a)  $T(63,550) = \$14381.50$ ; (b) this value for  $T(63,550)$  matches up with the value of the next piece  $14,381.5 + 0.31(m - 63,550)$  when  $m = 63,550$ . This means that when you change tax brackets, the higher tax rate only applies to the amount over 63,550.

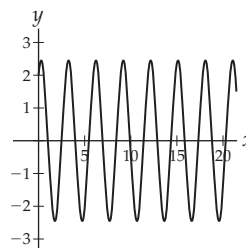

89. If  $f(x) = a_n x^n + a_{n-1} x^{n-1} + \dots + a_1 x + a_0$  is a polynomial function and  $c$  is a real number, then by the sum rule, constant multiple rule, and limit of a constant, we have  $\lim_{x \rightarrow c} f(x) = a_n \lim_{x \rightarrow c} x^n + a_{n-1} \lim_{x \rightarrow c} x^{n-1} + \dots + a_1 \lim_{x \rightarrow c} x + a_0$ . Since power functions with positive integer powers are continuous everywhere, we can solve each of the component limits by evaluation, which gives us  $\lim_{x \rightarrow c} f(x) = a_n c^n + a_{n-1} c^{n-1} + \dots + a_1 c + a_0 = f(c)$ . Therefore the polynomial function  $f$  is continuous at  $x = c$ .
91. Given  $\epsilon > 0$ , we can choose  $\delta > 0$  so that if  $x \in (c - \delta, c) \cup (c, c + \delta)$ , then  $f(x)$  is within  $\frac{\epsilon}{|k|}$  of  $L$ . Then  $|kf(x) - kL| = |k||f(x) - L| < |k|(\epsilon/|k|) = \epsilon$ .
93. If  $\lim_{x \rightarrow c} f(x)$  exists and  $\lim_{x \rightarrow c} g(x)$  exists and is nonzero, then by the product and reciprocal rules for limits we have  $\lim_{x \rightarrow c} \frac{f(x)}{g(x)} = \lim_{x \rightarrow c} f(x) \frac{1}{g(x)} = \lim_{x \rightarrow c} f(x) \lim_{x \rightarrow c} \frac{1}{g(x)} = \lim_{x \rightarrow c} f(x) \frac{1}{\lim_{x \rightarrow c} g(x)} = \frac{\lim_{x \rightarrow c} f(x)}{\lim_{x \rightarrow c} g(x)}$ .
95. Given  $c \in \mathbb{R}$ ,  $\lim_{x \rightarrow c} f(x) = \lim_{x \rightarrow c} A b^x = A \lim_{x \rightarrow c} (e^{\ln b})^x = A(\lim_{x \rightarrow c} e^x)^{\ln b} = A(e^c)^{\ln b} = A(e^{\ln b})^c = A b^c = f(c)$ .
97. Mimic the proof in the reading that  $\sin x$  is continuous everywhere.
99. If  $x = c$  is in the domain of  $\sec x$ , then  $c$  is not a multiple of  $\frac{\pi}{2}$ , and  $\cos c \neq 0$ . Therefore  $\lim_{x \rightarrow c} \sec x = \lim_{x \rightarrow c} \frac{1}{\cos x}$  is the quotient of  $\lim_{x \rightarrow c} 1$  by  $\lim_{x \rightarrow c} \cos x = \cos c$ , or  $\frac{1}{\cos c} = \sec c$ .

## Section 1.6

1. T, T, F, T, T, T, F, F.
3.  $\lim_{x \rightarrow c} \frac{f(x)}{g(x)} = \frac{L}{M}$       5.  $\lim_{x \rightarrow c} \frac{f(x)}{g(x)}$  is infinite
7.  $\infty + \infty \rightarrow \infty$ ,  $\infty - \infty$  is indeterminate,  $\infty + 1 \rightarrow \infty$ , and  $0 + \infty \rightarrow \infty$ .
9. See Theorems 1.27 and 1.28.
11. (a) The numerator approaches 1 while the denominator gets larger and larger, which makes the quotient get smaller and smaller; (b) see the reading; (c) the denominator approaches 1 while the numerator gets smaller and smaller, which makes the quotient get smaller and smaller.
13. (a) The numerator approaches 1 while the denominator gets smaller and smaller, which makes the quotient get larger and larger; (b) the numerator gets larger and larger, making the quotient get larger and larger, while at the same time the denominator gets smaller and smaller, making the quotient get larger and larger still; (c) the denominator approaches 1 while the numerator gets larger and larger, which makes the quotient get larger and larger.

41.  $-\infty$       43.  $-\frac{1}{3}$
45. DNE;  $\lim_{x \rightarrow 0^-} \frac{x^2+1}{x(x-1)} = \infty$ ,  $\lim_{x \rightarrow 0^+} \frac{x^2+1}{x(x-1)} = -\infty$
47.  $-1$       49.  $-9$
51.  $-\infty$       53. 0
55. 0      57. 0
59.  $\infty$       61. 0
63.  $-\infty$       65.  $\infty$
67. 0
69.  $-\infty$  from the left,  $\infty$  from the right
71. 0      73.  $\infty$
75. 1      77.  $e^2$
79.  $e^3$
81.  $\infty$ ; population explosion impossible for any finite-sized planet to contain.
83. (a)  $\lim_{t \rightarrow \infty} s(t)$  does not exist, since both sine and cosine oscillate between  $-1$  and  $1$  as  $x \rightarrow \infty$ . (b) There is no friction to damp the oscillations of the spring. (c)

$$s(t) = \sqrt{2} \sin\left(\sqrt{\frac{9}{2}} t\right) + 2 \cos\left(\sqrt{\frac{9}{2}} t\right)$$

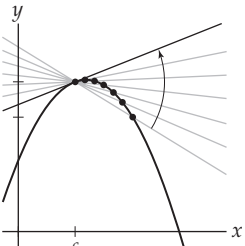

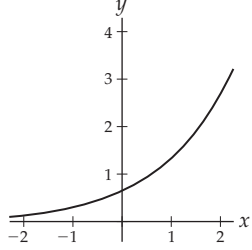

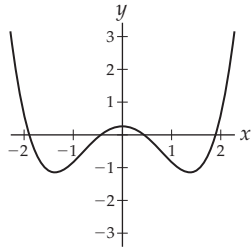

85.  $\lim_{x \rightarrow \infty} (a_n x^n + a_{n-1} x^{n-1} + \cdots + a_1 x + a_0) =$   
 $\lim_{x \rightarrow \infty} \left( a_n x^n \left( 1 + \frac{a_{n-1}}{a_n x} + \cdots + \frac{a_1}{a_n x^{n-1}} + \frac{a_0}{a_n x^n} \right) \right) =$   
 $\left( \lim_{x \rightarrow \infty} a_n x^n \right) (1 + 0 + \cdots + 0 + 0) = \lim_{x \rightarrow \infty} a_n x^n.$
87. Mimic the proof of the first part of Theorem 1.24, but using  $-M < 0$ .
89. Given  $\epsilon > 0$ , choose  $N_1 > 0$  to get  $f(x)$  within  $\frac{\epsilon}{2}$  of  $L$  and choose  $N_2 > 0$  to get  $g(x)$  within  $\frac{\epsilon}{2}$  of  $M$ . Then for  $N = \max(N_1, N_2)$  and  $x > N$  we have  $(L + M) - \epsilon < f(x) + g(x) < (L + M) + \epsilon$ .
91. By Theorem 1.25 and the previous exercise,  
 $\lim_{x \rightarrow \infty} x^{-k} = \lim_{x \rightarrow \infty} \frac{1}{x^k} \rightarrow \frac{1}{\infty} \rightarrow 0.$
93. By Theorem 1.25 and the previous exercise,  
 $\lim_{x \rightarrow \infty} e^{-x} = \lim_{x \rightarrow \infty} \frac{1}{e^x} \rightarrow \frac{1}{\infty} \rightarrow 0.$

For answers to odd-numbered Skill Certification exercises in the Chapter Review, please visit the Book Companion Web Site at [www.whfreeman.com/tkcalculus](http://www.whfreeman.com/tkcalculus).

## Chapter 2

### Section 2.1

- T, T, F, F, T, T, T, T.
- We only know one point on the line.
- $d$  is the difference  $s(b) - s(a)$  in position,  $t$  is the difference  $b - a$  in time, and  $r = \frac{d}{t}$ .
- They are all the same.
- The secant lines have slopes 0.995, 0.9995, and 0.99995, so again 1 is a good estimate for the slope of the tangent line.
- (a) In order, the  $x$ -coordinate of the first dot, the  $x$ -coordinate of the second dot, the  $y$ -coordinate of the first dot, and the  $y$ -coordinate of the second dot. (b) The horizontal and vertical distances, respectively, between the first and second dot. (c) The slope of the line connecting the two dots, and the slope of the line tangent to the graph at the first dot.
- The answers are the same as those in Exercise 11.
- (c)  $<$  (d)  $<$  (a)  $<$  (b)
- $x = 0.5$ ;  $x = -1$  (or  $x = 2$ );  $x = -0.4$  and  $x = 1.3$
- 
- At  $x = 1$  your graph should have a height of 2 and a horizontal tangent line. At  $x = 3$  your graph should be drawn so that its tangent line has a slope of 2.
- Your graph should go through the points  $(-1, 2)$  and  $(1, -2)$ , and the tangent line at each of those points should have slope 3.
- 
- Your graph of  $y = f'(x)$  should have zeroes at  $x = -1.5$ ,  $x = 0$ , and  $x = 1.5$ , should be positive on  $(-\infty, -1.5)$  and  $(0, 1.5)$ , and should be negative on  $(-1.5, 0)$  and  $(1.5, \infty)$ .
- Clearly the graph of  $f'$  should have a root at  $x = 0$  and should be positive on  $(-\infty, 0)$  and negative on  $(0, \infty)$ . There is one more thing to notice here, however; the graph of  $f$  gets very "flat" at its ends, so its tangent lines have very shallow slopes as  $x \rightarrow \infty$  and as  $x \rightarrow -\infty$ . Therefore, the graph of the derivative should be approaching zero as  $x \rightarrow \infty$  and as  $x \rightarrow -\infty$ . Thus your graph of  $f'$  should also have a two-sided horizontal asymptote at  $y = 0$ .
- Your graph should have horizontal tangent lines at  $x = -2$  and at  $x = 0$ . Moreover, the tangent lines to the graph of your function should have a negative slope everywhere on  $(-\infty, -2)$ , a positive slope everywhere on  $(-2, 0)$ , and a negative slope everywhere on  $(0, \infty)$ .
- 
- For  $h = 1, h = 0.5, h = 0.25$ , and  $h = 0.1$ , respectively, we have secant lines with slopes  $-3, -2.5, -2.25$ , and  $-2.1$ . One estimate of  $f'(1)$  is  $-2$ .
- For  $h = 1, h = 0.5, h = 0.25$ , and  $h = 0.1$ , respectively, we have secant lines with slopes  $2, 1.25, 1.0625$ , and  $1.01$ . One estimate of  $f'(0)$  is  $1$ .
- For  $h = 1, h = 0.5, h = 0.25$ , and  $h = 0.1$ , respectively, we have secant lines with slopes  $0.6931, 0.4463, 0.2425$ , and  $0.0995$ . One estimate of  $f'(0)$  is  $0$ .
- For  $h = 1, h = 0.5, h = 0.25$ , and  $h = 0.1$ , respectively, we have secant lines with slopes  $-0.4597, -0.2448, -0.1244$ , and  $-0.04996$ . One estimate of  $f'\left(\frac{\pi}{2}\right)$  is  $0$ .

43. For  $h = 1$ ,  $h = 0.5$ ,  $h = 0.25$ , and  $h = 0.1$ , respectively, we have secant lines with slopes 1, 1, 1, and 1. One estimate of  $f'(3)$  is 1.
45. Average velocities on  $[0, 0.5]$ ,  $[0, 0.25]$ ,  $[0, 0.1]$  are  $-8$ ,  $-4$ , and  $-1.6$  feet per second, respectively. We would expect the initial velocity to be 0.
47. Average velocities on  $[2, 2.1]$  and  $[2, 2.01]$  are  $-65.6$  and  $-64.16$  feet per second. Average velocities on  $[1.9, 2]$  and  $[1.99, 2]$  are  $-62.4$  and  $-63.84$  feet per second, respectively. We might expect the velocity at time  $t = 2$  to be about 64 feet per second.
49. Although this book does not know what you did today, we will not repeat it here.
51. (a) Her average rate of change is zero on  $[0, 30]$ ; this means that after 30 minutes she is exactly as far away from the oak tree as she was at time  $t = 0$ . (b) The second 10 minutes. (c) One approximation might be  $\frac{140-280}{10-5} = -28$  feet per minute. The fact that the sign is negative indicates that she is moving *toward* the oak tree. (d)  $t \approx 4$  minutes,  $t \approx 12$  minutes,  $t \approx 25$  minutes. These are the times she changes direction. (e)  $(4, 12)$  and  $(25, 30)$ . These are the times she is moving toward the oak tree.
53. (a)  $h(12)$  is the average height of a 12-year-old, in feet.  $h'(12)$  is measured in feet per year and represents the instantaneous rate of change of the height of a 12-year-old person; that is,  $h'(12)$  is the rate at which an average 12-year-old is growing (in feet per year). (b)  $h(12)$  is positive;  $h'(12)$  is positive. (c)  $h(t)$  might have a maximum at  $t \approx 60$  years (people may tend to slouch or get shorter as they get older);  $h'(t)$  might have a maximum at  $t \approx 14$  years (growth spurt).
55. 5 miles per hour
57. (a) About 139.163 billion dollars; (b) about 3.445 billion dollars per year; (c) about 3.479 billion dollars per year; (d) something a little bit less than the previous answer (the actual answer turns out to be about 3.436 billion dollars a year).
59. If  $f(x) = mx + c$  with  $m > 0$ , then on any interval  $[a, b]$  the average rate of change of  $f$  is  $\frac{f(b)-f(a)}{b-a} = \frac{(mb+c)-(ma+c)}{b-a} = m$ , which is positive by assumption. This means that for all  $b > a$  we have  $f(b) = f(a) + m(b-a)$ , and thus  $f(b) > f(a)$ ; this is the definition of what it means for  $f$  to be increasing.

### Section 2.2

1. F, F, F, F, F, F, T.
3. (a)  $f'(5) = \lim_{h \rightarrow 0} \frac{f(5+h)-f(5)}{h} = \lim_{z \rightarrow 5} \frac{f(z)-f(5)}{z-5}$ ;  
 (b)  $f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h)-f(x)}{h} = \lim_{z \rightarrow x} \frac{f(z)-f(x)}{z-x}$ ;  
 (c)  $f'_+(-2) = \lim_{h \rightarrow 0^+} \frac{f(-2+h)-f(-2)}{h} = \lim_{z \rightarrow -2^+} \frac{f(z)-f(-2)}{z+2}$ .
5. Let  $z = x + h$ . Then  $h \rightarrow 0$  is equivalent to  $z \rightarrow x$ , and  $z - x = h$ .
7.  $\lim_{x \rightarrow 2} (4x^3 - 5x + 1) = 23$  and  $\lim_{h \rightarrow 0} \frac{(4(2+h)^3 - 5(2+h) + 1) - 23}{h}$  exists.
9.  $f$  is differentiable, and thus continuous, at  $x = c$ .
11. Continuous yes, differentiable no, left and right differentiable yes.
13. See the graphs in the reading in the discussion about differentiability.
15. (a) If  $f(x) = 3x^2 - 1$  then  $f'(-4) = -24$ . (b) If  $f(x) = 3x^2 - 1$  then  $\left. \frac{df}{dx} \right|_{-4} = -24$ . (c)  $\left. \frac{d}{dx} \right|_{-4} (3x^2 - 1) = -24$ .
17.  $3x^2 - 2$ ,  $3x^2 - 2$ ,  $3x^2 - 2$ , and  $(3x^2 - 2)(x^3 - 2x + 1)$ ; the last notation represents a product of the derivative and the function.
19. For all  $\epsilon > 0$ , there exists  $\delta > 0$  such that if  $h \in (-\delta, 0) \cup (0, \delta)$ , then  $\frac{(3+h)^2 - 9}{h} \in (f'(3) - \epsilon, f'(3) + \epsilon)$ .
21. Since  $f'(4) = \frac{1}{2\sqrt{4}} = \frac{1}{4}$ , the tangent line to  $f$  at  $x = 4$  has equation  $y = f(4) + f'(4)(x - 4) = 2 + \frac{1}{4}(x - 4)$ . The value of  $f(x)$  at  $x = 4.1$  should be close to the value of this linear function at  $x = 4.1$ , which is  $2 + \frac{1}{4}(4.1 - 4) = 2.025$ . This is rather close to the calculator approximation of  $\sqrt{4.1} = 2.02485$ .
23.  $\lim_{h \rightarrow 0} \frac{(-3+h)^2 - (-3)^2}{h} = -6$ ;  $\lim_{z \rightarrow -3} \frac{z^2 - 9}{z - 3} = -6$
25.  $\lim_{h \rightarrow 0} \frac{\frac{1}{-1+h} + 1}{h} = -1$ ;  $\lim_{z \rightarrow -1} \frac{\frac{1}{z} + 1}{z + 1} = -1$
27.  $\lim_{h \rightarrow 0} \frac{(1 - (-1+h)^3) - (1 - (-1)^3)}{h} = -3$ ;  $\lim_{z \rightarrow -1} \frac{(1 - z^3) - 2}{z + 1} = -3$
29.  $\lim_{h \rightarrow 0} \frac{\sqrt{9+h} - 3}{h} = \frac{1}{6}$ ;  $\lim_{z \rightarrow 9} \frac{\sqrt{z} - 3}{z - 9} = \frac{1}{6}$
31.  $\lim_{h \rightarrow 0} \frac{\frac{(2+h)-1}{(2+h)+3} - \frac{2-1}{2+3}}{h} = \frac{4}{25}$ ;  $\lim_{z \rightarrow 2} \frac{\frac{z-1}{z+3} - \frac{1}{5}}{z-2} = \frac{4}{25}$
33.  $\lim_{h \rightarrow 0} \frac{e^h - 1}{h} = 1$ ;  $\lim_{z \rightarrow 0} \frac{e^z - 1}{z} = 1$
35.  $\lim_{h \rightarrow 0} \frac{\sinh h - 0}{h} = 1$ ;  $\lim_{z \rightarrow 0} \frac{\sin z - 0}{z - 0} = 1$
37.  $\lim_{h \rightarrow 0} \frac{\tanh h - 0}{h} = 1$ ;  $\lim_{z \rightarrow 0} \frac{\tanz - 0}{z - 0} = 1$
39.  $\lim_{h \rightarrow 0} \frac{(-2(x+h)^2) - (-2x^2)}{h} = -4x$
41.  $\lim_{h \rightarrow 0} \frac{((x+h)^3 + 2) - (x^3 + 2)}{h} = 3x^2$
43.  $\lim_{z \rightarrow x} \frac{\frac{2}{z+1} - \frac{2}{x+1}}{z-x} = -2 \frac{1}{(x+1)^2}$
45.  $\lim_{z \rightarrow x} \frac{\frac{1}{z^2} - \frac{1}{x^2}}{z-x} = \frac{-2}{x^3}$

47.  $\lim_{h \rightarrow 0} \frac{3\sqrt{x+h} - 3\sqrt{x}}{h} = \frac{3}{2\sqrt{x}}$
49.  $\lim_{z \rightarrow x} \frac{\sqrt{2z+1} - \sqrt{2x+1}}{z-x} = \frac{1}{\sqrt{1+2x}}$
51.  $\lim_{h \rightarrow 0} \frac{\frac{(x+h)-1}{(x+h)+3} - \frac{x-1}{x+3}}{h} = \frac{4}{(x+3)^2}$
53.  $\lim_{h \rightarrow 0} \frac{\frac{(x+h)^3}{x+h+1} - \frac{x^3}{x+1}}{h} = \frac{2x^3+3x^2}{(x+1)^2}$
55.  $6x^2$ ,  $12x$ , and  $12$ .      57.  $6x$  and  $12$
59.  $y = -6x - 9$       61.  $y + 1 = -3(x - 1)$
63.  $y - 2 = -(x - 3)$
65. Continuous everywhere except at  $x = 2$ , and neither left nor right continuous at that point. Not differentiable, but left and right differentiable, at  $x = -1$ . Not differentiable, and not left or right differentiable, at  $x = 2$ .
67. Continuous everywhere except at  $x = -1$ , where it is only left continuous. Not differentiable at  $x = -1$ . Left but not right differentiable at  $x = -1$ .
69.  $\lim_{x \rightarrow 0} \frac{1}{x}$  does not exist, and neither does  $\lim_{h \rightarrow 0} \frac{1}{0+h} - \frac{1}{0}$  since  $\frac{1}{0}$  is undefined. Therefore  $f$  is neither continuous nor differentiable at  $x = 0$ , from either side.
71.  $\lim_{h \rightarrow 0^-} \frac{|(2+h)^2 - 4| - 0}{h} = -4$ ,  $\lim_{h \rightarrow 0^+} \frac{|(2+h)^2 - 4| - 0}{h} = 4$ , so  $f$  is both left and right differentiable at  $x = 2$ , but not differentiable at  $x = 2$ .
73.  $f'_-(2) = \lim_{h \rightarrow 0^-} \frac{((2+h)+4) - 3(2)}{h} = 1$ ;  
 $f'_+(2) = \lim_{h \rightarrow 0^+} \frac{3(2+h) - 3(2)}{h} = 3$ ;  $f'(2)$  does not exist.
75.  $f'_-(1) = \lim_{h \rightarrow 0^-} \frac{(1+h)^2 - (1)^2}{h} = 2$ ;  
 $f'_+(1) = \lim_{h \rightarrow 0^+} \frac{(2(1+h)-1) - (1)^2}{h} = 2$ ;  $f'(1) = 2$ .
77. Continuous but not differentiable at  $x = 0$ .
79. Not continuous and not differentiable at  $x = 1$ .
81.  $f(1) = -4$  is less than zero and  $f(3) = 4$  is greater than zero. Since  $f$  is continuous on  $[1, 3]$ , the Intermediate Value Theorem tells us that  $f$  must have a root between  $x = 1$  and  $x = 3$ .
83.  $f(0) = 1$  is greater than zero and  $f(1) = -1$  is less than zero. Since  $f$  is continuous on  $[0, 1]$ , the Intermediate Value Theorem tells us that  $f$  must have a root between  $x = 0$  and  $x = 1$ .
85.  $f(-2) = -7$  is less than zero and  $f(1) = 2$  is greater than zero. Since  $f$  is continuous on  $[-2, 1]$ , the Intermediate Value Theorem tells us that  $f$  must have a root between  $x = -2$  and  $x = 1$ .
87.  $\lim_{h \rightarrow 0} \frac{s(1+h) - s(1)}{h} = -32$ .
89. (a) The graph has a bump/hill shape with roots at  $x = 0$  and at  $x = 2$ . The physical interpretation is that your velocity is always positive and that you start out with a zero velocity, speed up, and then eventually slow back down to a zero velocity. (b) The graph has a root at about  $x = 1$  and is positive on  $[0, 1)$  and negative on  $(1, 2]$  (for example, a line with negative slope passing through  $(1, 0)$ ). This represents the fact that you were speeding up, and then slowing down, during your trip.
91. (a)  $S(3) = 200 + 8(10)(3) = \$440$ ,  
 $S(6) = 200 + 8(10)(6) = \$680$ , and  
 $S(8) = 200 + 8(10)(6) + 11.5(10)(2) = \$910$ .  $S'(3) = 80$  dollars per week,  $S'(8) = 11.5(10) = \$115$  dollars per week. Cannot compute  $S'(6)$  because the rate at which you are paid changes at that point.  
 (b)  $S(t) = 200 + 8(10)t$ , if  $t \leq 6$  and  
 $S(t) = 680 + 11.5(10)(t - 6)$ , if  $t > 6$ . (c) Continuous but not differentiable. (d)  $\lim_{t \rightarrow 6} s(t) = s(6) = 680$ , but  
 $\lim_{h \rightarrow 0^+} \frac{s(6+h) - s(6)}{h} = 115$  while  $\lim_{h \rightarrow 0^-} \frac{s(6+h) - s(6)}{h} = 80$ .
93.  $\lim_{h \rightarrow 0} \frac{(m(x+h)+b) - (mx+b)}{h} = \lim_{h \rightarrow 0} \frac{mh}{h} = \lim_{h \rightarrow 0} m = m$ .
95. The tangent line to  $f$  at  $x = c$  has slope  $f'(c)$  and passes through the point  $(c, f(c))$ . Putting this slope and point into the point-slope form of a line gives the desired answer.
97.  $f'(c)$  exists when  $\lim_{h \rightarrow 0} \frac{f(c+h) - f(c)}{h}$  exists, which is true precisely when  $f'_+(c) = \lim_{h \rightarrow 0^+} \frac{f(c+h) - f(c)}{h}$  and  $f'_-(c) = \lim_{h \rightarrow 0^-} \frac{f(c+h) - f(c)}{h}$  exist and are equal.

## Section 2.3

1. T, F, T, F, F, T, T, T.
3.  $\frac{d}{dx}(kf(x)) = k \frac{df}{dx}$ ;  $\frac{d}{dx}(f(x) + g(x)) = \frac{df}{dx} + \frac{dg}{dx}$ ;  
 $\frac{d}{dx}(f(x) - g(x)) = \frac{df}{dx} - \frac{dg}{dx}$
5. See the first paragraph in the reading.
7. The power rule only applies to functions of the form  $x^k$ , and  $3^x$  cannot be written in this form because there is a variable in the exponent.
9. The rule is  $f'(x)g(x)h(x) + f(x)g'(x)h(x) + f(x)g(x)h'(x)$ . Then  $y' = (2)(x^2 + x + 1)(1 - 3x^4) + (2x - 1)(2x + 1)(1 - 3x^4) + (2x - 1)(x^2 + x + 1)(-12x^3)$ .
11. 5      13. 8
15.  $f$  has negative slope for  $x < 0$  and positive slope for  $x > 0$ , so  $f'(x)$  is negative on  $x < 0$  and positive on  $x > 0$ . Then  $f'$  has positive slope everywhere, so  $f''(x)$  is positive everywhere. Continue this type of argument for the remaining graphs.
17. As you can see, this algebra is no fun. If you remember to simplify functions before differentiating then you will not have this problem.

19. No; we can say  $f$  is continuous at  $x = 2$ , but it might approach that breakpoint  $x = 2$  with different slopes from the left and the right.

21.  $a = -2, b = 6$

23. 4

25. 1

27.  $\frac{27}{2}$

29. (a)  $f'(x) = (2x)(x+1) + (x^2)(1)$ . (b) Multiply out first to get  $f(x) = x^3 + x^2$ ; then  $f'(x) = 3x^2 + 2x$ . (c) Multiply out the answer in part (a) to get the answer in part (b).

31. (a)  $f'(x) = \frac{7}{2}x^{5/2}(2 - 5x^3) + x^{7/2}(-15x^2)$ . (b) Multiply out first to get  $f(x) = 2x^{7/2} - 5x^{13/2}$ ; then  $f'(x) = 7x^{5/2} - \frac{65}{2}x^{11/2}$ . (c) Multiply out the answer in part (a) to get the answer in part (b).

33. (a)  $f'(x) = \frac{(2x-3x^2)\sqrt{x} - (x^2-x^3)(1/2)x^{-1/2}}{(1-3x^4)^2}$ . (b) Expand first to get  $f(x) = x^{1.5} - x^{2.5}$ ; then  $f'(x) = 1.5x^{0.5} - 2.5x^{1.5}$ . (c) Multiply out the answer in part (a) to get the answer in part (b).

35.  $f'(x) = -3(7x^6)$

37.  $f'(x) = 12x$

39.  $f'(x) = 2(3) - 4(5x^4)$

41.  $f'(x) = 2x + 1$

43.  $f'(x) = 81x^2 + 108x + 36$

45.  $f'(x) = -6x^2$

47.  $f'(x) = \frac{d}{dx}(x-1) = 1$ , for  $x \neq -1$

49.  $f'(x) = 0$

51.  $f'(x) = \frac{8}{5}x^{3/5}$

53.  $f'(x) = -\frac{8}{5}x^{-13/5} - 2$

55.  $f'(x) = \frac{(7x^6 - 15x^4)(1 - 3x^4) - (x^7 - 3x^5 + 4)(-12x^3)}{(1 - 3x^4)^2}$

57.  $f'(x) = -3x^{-5/2}$

59.  $f'(x) = \frac{23}{(4+5x)^2}$

61. It is easier to differentiate after simplifying to

$$f(x) = \frac{1}{x^2 - 5x + 6}. \text{ We have}$$

$$f'(x) = \frac{0(x^2 - 5x + 6) - (1)(2x - 5)}{(x^2 - 5x + 6)^2} = \frac{-2x + 5}{(x^2 - 5x + 6)^2}.$$

63.  $f'(x) = \frac{2x(x^3 + 5x^2 - 3x) - x^2(3x^2 + 10x - 3)}{(x^3 + 5x^2 - 3x)^2}$

$$65. f'(x) = \begin{cases} -1, & \text{if } x < 0 \\ \text{DNE}, & \text{if } x = 0 \\ 1, & \text{if } x > 0. \end{cases} \quad 67. f'(x) = \begin{cases} -2, & \text{if } x < \frac{1}{2} \\ \text{DNE}, & \text{if } x = \frac{1}{2} \\ 2, & \text{if } x > \frac{1}{2}. \end{cases}$$

$$69. f'(x) = \begin{cases} 3x^2, & \text{if } x < 1 \\ \text{DNE}, & \text{if } x = 1 \\ 1, & \text{if } x > 1. \end{cases} \quad 71. f'(x) = \begin{cases} -2x, & \text{if } x \leq 0 \\ 2x, & \text{if } x > 0. \end{cases}$$

73.  $f(x) = \frac{1}{2}x^6 - \frac{2}{3}x^3 + 4x + 1$

75.  $f(x) = -\frac{4}{7}x^7 + x + \frac{18}{7}$

77.  $f(x) = -\frac{3}{10}x^{10} + 4x^6 + \frac{1}{5}x^5 - 8x + 2$

79. (a)  $a(t) = 0.024t, s(t) = 0.004t^3 + 400t$  (assuming initial position is  $s_0 = 0$  at Venus).  $a_0 = 0$  thousands of miles per hour per hour,  $v_0 = 400$  miles per hour,  $s_0 = 0$  miles. (b) Yes, since the velocity is always positive. (c) No, the acceleration is increasing (since  $a(t) = 0.024t$  grows larger as  $t$  increases). (d) Approximately 140 hours, at which time it will be going about 635.2 thousand miles per hour.

81. If  $a(t) = -32$  then (by antidifferentiating)  $v(t) = -32t + C$ , and  $v(0) = v_0$  implies that  $C = v_0$ . Now (by antidifferentiating)  $s(t) = -16t^2 + v_0t + K$ , and  $s(0) = s_0$  implies that  $K = s_0$ .

83. (a)  $s(t) = -\frac{2}{5}t^3 - 17t^2 + 575$ ; (b)  $s(5) = 100, s'(5) = -200, s''(5) = -46, s'(0) = 0$ ; (c) 575 feet; (d)  $a(t) = -\frac{12}{5}t - 34$  is *not* constant.

85. Suppose  $k$  is a positive integer.  $\frac{d}{dx}(x^k) = \lim_{h \rightarrow 0} \frac{(x+h)^k - x^k}{h}$   
 $= \lim_{h \rightarrow 0} \frac{(x^k + khx^{k-1} + h^2 \cdot (\text{lower-order terms})) - x^k}{h}$   
 $= \lim_{h \rightarrow 0} \frac{khx^{k-1} + h^2 \cdot (\text{lower-order terms})}{h}$   
 $= \lim_{h \rightarrow 0} (kx^{k-1} + h \cdot (\text{lower-order terms})) = kx^{k-1}.$

87.  $(f - g)'(x) = \frac{d}{dx}(f + (-g))$   
 $= \frac{d}{dx}(f) + \frac{d}{dx}(-g) = \frac{d}{dx}(f) + (-1)\frac{d}{dx}(g) = f'(x) - g'(x).$

89.  $\left(\frac{f}{g}\right)'(x) = \lim_{h \rightarrow 0} \frac{\frac{f(x+h)}{g(x+h)} - \frac{f(x)}{g(x)}}{h}$   
 $= \lim_{h \rightarrow 0} \frac{\frac{f(x+h)g(x) - f(x)g(x+h)}{g(x+h)g(x)}}{h}$   
 $= \lim_{h \rightarrow 0} \frac{f(x+h)g(x) - f(x)g(x+h)}{hg(x+h)g(x)}$   
 $= \lim_{h \rightarrow 0} \frac{f(x+h)g(x) - f(x)g(x) + f(x)g(x) - f(x)g(x+h)}{hg(x+h)g(x)}$   
 $= \lim_{h \rightarrow 0} \frac{g(x)(f(x+h) - f(x)) - f(x)(g(x+h) - g(x))}{hg(x+h)g(x)}$   
 $= \lim_{h \rightarrow 0} \frac{\left(g(x)\frac{f(x+h) - f(x)}{h} - f(x)\frac{g(x+h) - g(x)}{h}\right)}{g(x+h)g(x)}$   
 $= \frac{g(x)\left(\lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}\right) - f(x)\left(\lim_{h \rightarrow 0} \frac{g(x+h) - g(x)}{h}\right)}{\lim_{h \rightarrow 0} (g(x+h)g(x))}$   
 $= \frac{g(x)f'(x) - f(x)g'(x)}{\lim_{h \rightarrow 0} (g(x+h)g(x))} = \frac{f'(x)g(x) - f(x)g'(x)}{(g(x))^2}.$

91. (a) Since any two functions with the same derivative differ by a constant, it suffices to prove that the derivative of  $\frac{1}{k+1}x^{k+1}$  is  $x^k$ . By the power rule and the constant multiple rule we have  $\frac{d}{dx}\left(\frac{1}{k+1}x^{k+1}\right) = \frac{1}{k+1} \frac{d}{dx}(x^{k+1}) = \frac{1}{k+1}(k+1)x^{(k+1)-1} = x^k$ . (b) If  $k = -1$  then there will be division by zero in the calculation from part (a). Therefore, this proof does not work in the case where  $f(x) = x^{-1}$ .

69.  $\frac{dy}{dx} = \frac{4x}{y}$

71.  $\frac{dy}{dx} = \frac{-6x - y^2}{2xy}$

73.  $\frac{dy}{dx} = \frac{-3(y^2 - y + 6)}{(3x + 1)(2y - 1)}$

75.  $\frac{dy}{dx} = \frac{5y}{\frac{3}{2}(3y - 1)^{-1/2} - 5x}$

77.  $\frac{dy}{dx} = \frac{(3y - 1)^2}{2y(3y - 1) - 3(y^2 + 1)}$

79.  $\frac{dy}{dx} = \frac{2x^3y^2(y + 1) - y^2(y + 1)^2}{x^4y^2 - x^2(y + 1)^2}$

81. (a) Slope is  $-\frac{1}{\sqrt{3}}$  at the point  $\left(\frac{1}{2}, \frac{\sqrt{3}}{2}\right)$  and  $\frac{1}{\sqrt{3}}$  at the point  $\left(\frac{1}{2}, -\frac{\sqrt{3}}{2}\right)$ . (b) Slope is -1 at the point  $\left(\frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2}\right)$ , and 1 at the point  $\left(-\frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2}\right)$ . (c)  $(1, 0)$  and  $(-1, 0)$ . (d)  $\left(\frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2}\right)$  and  $\left(-\frac{\sqrt{2}}{2}, -\frac{\sqrt{2}}{2}\right)$

83. (a)  $(1, -1)$ ; (b)  $(-3, 1)$ ; (c) none; (d)  $(-3, 1)$

85. If Linda sells magazines at a rate of  $\frac{dm}{dt} = 12$  magazine subscriptions per week, and she makes  $\frac{dD}{dm} = 4$  dollars per magazine, then by the chain rule, the amount of money she makes each week is  $\frac{dD}{dt} = \frac{dD}{dm} \frac{dm}{dt} = 4(12) = 48$  dollars per week.

87. (a)  $\frac{dA}{dr} = 2\pi r$ . (b) No; Yes.

(c)  $\frac{dA}{dt} = \frac{d}{dt}(\pi(r(t))^2) = 2\pi r(t)r'(t) = 2\pi r \frac{dr}{dt}$ . (d) Yes; Yes. (e)  $\left.\frac{dA}{dt}\right|_{r=24} = 2\pi(24)(2) = 96\pi$ .

89.  $\frac{d}{dx}\left(\frac{f(x)}{g(x)}\right) = \frac{d}{dx}(f(x)(g(x))^{-1}) = \frac{d}{dx}(f(x)) \cdot (g(x))^{-1} + f(x) \cdot \frac{d}{dx}((g(x))^{-1}) = f'(x) \cdot (g(x))^{-1} + f(x) \cdot (-g(x))^{-2}g'(x) = \frac{f'(x)}{g(x)} - \frac{f(x)g'(x)}{(g(x))^2} = \frac{f'(x)g(x) - f(x)g'(x)}{(g(x))^2}$ .

91. Mimic the proof in Example 5(a).

93. Let  $y = x^{-k}$ , where  $-k$  is a negative integer. Then  $x^k y = 1$ , so by implicit differentiation and the product rule, we have  $kx^{k-1}y + x^k y' = 0$ , and therefore  $y' = \frac{-kx^{k-1}x^{-k}}{x^k} = -kx^{-k-1}$ .

## Section 2.5

- T, T, F, F, T, T, F, T.
- No, since the base is a variable. No, since the exponent is a variable.
- When  $k = 1$  we have  $\frac{d}{dx}(e^x) = \frac{d}{dx}(e^{1x}) = 1e^{1x} = e^x$ .  
When  $b = e$  we have  $\frac{d}{dx}(b^x) = \frac{d}{dx}(e^x) = (\ln e)e^x = (1)e^x = e^x$ .
- $\ln x$  is of the form  $\log_b x$  with  $b = e$ .
- The graph passing through  $(0, 2)$  is  $2(2^x)$ ; the graph passing through  $(0, 1)$  and  $(1, 4)$  is  $4^x$ ; the graph passing through  $(2, 4)$  is  $2^x$ .
- $f(3) = 2^9 = 512$  and  $g(3) = 8^2 = 64$ . The solutions of  $2^{(x^2)} = (2^x)^2$  are  $x = 0$  and  $x = 2$ .
- Consider that logarithmic functions are the inverses of exponential functions, and use the definition of one-to-one.
- Logarithmic differentiation is the process of applying  $\ln|x|$  to both sides of an equation  $y = f(x)$  and then differentiating both sides in order to solve for  $f'(x)$ . It is useful for finding derivatives of functions that involve multiple products or quotients, and functions that have variables in both a base and an exponent.
- $f'(x) = -(2 - e^{5x})^{-2}(-5e^{5x})$
- $f'(x) = 6xe^{-4x} - 12x^2e^{-4x}$
- $f'(x) = \frac{(-1)e^x - (1-x)e^x}{e^{2x}}$
- $e^x(x^2 + 3x - 1) + e^x(2x + 3)$
- $f'(x) = 3x^2$ , with  $x > 0$
- $f'(x) = e^{(e^x)}e^x$
- $f'(x) = e^{e^x+1}$
- $f'(x) = 0$
- $f'(x) = -3x^{-4}e^{2x} + x^{-3}(2e^{2x})$
- $f'(x) = 2x \log_2 x + \frac{x}{\ln 2} + 3x^2$
- $f'(x) = \frac{1}{x^2 + e^{\sqrt{x}}} \left( 2x + e^{\sqrt{x}} \left( \frac{1}{2}x^{-1/2} \right) \right)$
- $f'(x) = \frac{1}{2}(\log_2(3x - 5))^{-1/2} \left( \frac{1}{\ln 2} \frac{1}{3x - 5} (\ln 3)3^x \right)$
- $f'(x) = 2x \ln(\ln x) + x^2 \frac{1}{\ln x} \cdot \frac{1}{x}$
- $f'(x) = (\ln 2)2^{x^2}(2x)$
- $f'(x) = \begin{cases} (\ln 2)2^x, & \text{if } x < -2 \\ \text{DNE}, & \text{if } x = -2 \\ -\frac{2}{x^3}, & \text{if } x > -2. \end{cases}$

$$47. f'(x) = \begin{cases} 2x, & \text{if } x < 1 \\ \text{DNE}, & \text{if } x = 1 \\ \frac{1}{x'}, & \text{if } x \geq 1. \end{cases}$$

$$49. f'(x) = \frac{1}{2}(x \ln|2^x + 1|)^{-1/2} \left( \ln|2^x + 1| + \frac{(\ln 2)x2^x}{2^x + 1} \right)$$

$$51. f'(x) = \frac{2^x \sqrt{x^3 - 1}}{\sqrt{x}(2x - 1)} \left( \ln 2 + \frac{3x^2}{2(x^3 - 1)} - \frac{1}{2x} - \frac{2}{2x - 1} \right)$$

$$53. f'(x) = x^{\ln x}(2)(\ln x) \left( \frac{1}{x} \right)$$

$$55. f'(x) = \left( \frac{x}{x-1} \right)^x \left( \ln x - \ln(x-1) + 1 - \frac{x}{x-1} \right)$$

$$57. f'(x) = (\ln x)^{\ln x} \left( \frac{\ln(\ln x)}{x} + \frac{1}{x} \right)$$

$$59. f(x) = \frac{e^{4x}}{3x^5 - 1} \quad 61. f(x) = \frac{1}{2} \ln|x^2 + 3| + C$$

$$63. f(x) = \ln(1 + e^x) + C$$

$$65. (a) A(t) = 1000e^{0.077t}; (b) A(30) \approx \$10,074.42; (c) t \approx 18 \text{ years.}$$

$$67. (a) 1250 \text{ people; (b) 45,000 people; (c) about 119 days;}$$

$$(d) P'(t) = \frac{45,000(0.12)(35)e^{-0.12t}}{(1 + 35e^{-0.12t})^2}, \text{ which is always positive; this means that the graph of } P(t) \text{ is always moving up as we move from left to right.}$$

$$69. \frac{d}{dx}(e^{kx}) = e^{kx} \cdot \frac{d}{dx}(kx) = e^{kx} \cdot k = ke^{kx}$$

$$71. \text{ If } f(x) = Ae^{kx} \text{ is exponential, then } f'(x) = Ake^{kx} = k(Ae^{kx}) = kf(x), \text{ so } f'(x) \text{ is proportional to } f(x).$$

$$73. \text{ For } x > 0 \text{ we have } |x| = x \text{ and therefore } \frac{d}{dx}(\ln|x|) = \frac{d}{dx}(\ln x) = \frac{1}{x}. \text{ For } x < 0 \text{ we have } |x| = -x \text{ and therefore by the chain rule we have } \frac{d}{dx}(\ln|x|) = \frac{d}{dx}(\ln(-x)) = \frac{1}{-x}(-1) = \frac{1}{x}.$$

## Section 2.6

- T, F, F, T, F, T, F, T.
- See the proof in the reading.
- (a) If  $x$  is in degrees, then the slope of the graph of  $\sin x$  at  $x = 0$  is very small, and in particular not equal to  $\cos 0 = 1$ . To convince yourself of this, graph  $\sin x$  (in degrees) together with the line  $y = x$  (which has slope 1 at  $x = 0$ ).
- (a)  $\cos(3x^2)$  is a composition, not a product, but the product rule was applied; (b) the chain rule was applied incorrectly, with the derivative of  $3x^2$  written on the inside instead of the outside.
- No, because to differentiate  $\sin^{-1}(\sin x) = x$  we would first need to know how to differentiate  $\sin^{-1} x$ , which is exactly what we would be trying to prove.
- The expressions are equal; the algebraic expression is clearly easier to evaluate at a given number.

13. (a) Use the fact that  $\frac{1}{2}e^{-x} \geq 0$  for all  $x$ , and split the expressions in the definitions of  $\cosh x$  and  $\sinh x$  into sums. (b) Calculate the two limits by dividing top and bottom by  $e^x$  and show they are both equal to 1.
15. (a) Think about the graph of the sum of  $\frac{1}{2}e^x$  and  $-\frac{1}{2}e^{-x}$ .  
 (b) Calculate  $\lim_{x \rightarrow -\infty} \frac{\frac{1}{2}(e^x - e^{-x})}{\frac{1}{2}e^{-x}}$  by dividing top and bottom by  $e^{-x}$ , and show that this limit is equal to 1.
17.  $f'(x) = \frac{2x \cos x + (x^2 + 1) \sin x}{\cos^2 x}$
19.  $f'(x) = -\csc^2 x + \csc x \cot x$
21.  $f'(x) = 0$
23.  $f'(x) = 3 \sec x \sec^2 x + 3 \sec x \tan^2 x$
25.  $f'(x) = \cos(\cos(\sec x))(-\sin(\sec x))(\sec x \tan x)$
27.  $f'(x) = e^{\csc^2 x} (2 \csc x)(-\csc x \cot x)$
29.  $f'(x) = \frac{-(\ln 2)2^x(5x \sin x) + 2^x(5 \sin x + 5x \cos x)}{25x^2 \sin^2 x}$
31.  $f'(x) = \sqrt{\sin x \cos x} + \frac{1}{2}x(\sin x \cos x)^{-1/2}(\cos^2 x - \sin^2 x)$
33.  $f'(x) = \frac{(6x \ln x + 3x) \tan x - 3x^2 \ln x \sec^2 x}{\tan^2 x}$
35.  $f'(x) = \cos(\ln x) \left(\frac{1}{x}\right)$
37.  $f'(x) = \frac{6x}{\sqrt{1-9x^4}}$
39.  $f'(x) = 2x \arctan x^2 + x^2 \left(\frac{2x}{1+x^4}\right)$
41.  $f'(x) = \frac{2x}{|x^2| \sqrt{x^4 - 1}}$
43.  $f'(x) = \frac{1}{\sqrt{1 - \sec^4 x}} (2 \sec x)(\sec x \tan x)$
45.  $\frac{\tan^{-1} x}{\sqrt{1-x^2}} - \frac{\sin^{-1} x}{1+x^2}$   
 $(\tan^{-1} x)^2$
47.  $f'(x) = \frac{1}{\operatorname{arcsec}(\sin^2 x)} \frac{1}{\sin^2 x \sqrt{\sin^4 x - 1}} (2 \sin x \cos x)$
49.  $f'(x) = \sec(1 + \tan^{-1} x) \tan(1 + \tan^{-1} x) \times \left(\frac{1}{1+x^2}\right)$
51.  $f'(x) = \sinh x^3 + 3x^3 \cosh x^3$
53.  $f'(x) = \sinh(\ln(x^2 + 1)) \left(\frac{1}{x^2 + 1}\right) (2x)$
55.  $f'(x) = \frac{1}{2}(\cosh^2 x + 1)^{-1/2} (2 \cosh x \sinh x)$
57.  $f'(x) = \frac{3x^2}{\sqrt{x^6 + 1}}$
59.  $f'(x) = \frac{1}{\sqrt{x^2 + 1}} (\cosh^{-1} x) - \sinh^{-1} x \left(\frac{1}{\sqrt{x^2 - 1}}\right)$   
 $(\cosh^{-1} x)^2$
61.  $f'(x) = \cos(e^{\sinh^{-1} x}) e^{\sinh^{-1} x} \frac{1}{x^2 + 1}$
63.  $f'(x) = (\sin x)^x \left(\ln(\sin x) + \frac{x \cos x}{\sin x}\right)$
65.  $f'(x) = (\sin x)^{\cos x} \left(-\sin x \ln(\sin x) + \frac{\cos^2 x}{\sin x}\right)$
67.  $f(x) = \sin^{-1} 2x$
69.  $f(x) = \frac{1}{6} \ln(1 + 9x^2)$
71.  $f(x) = \sin^{-1} \left(\frac{3x}{2}\right)$
73.  $f(x) = \sinh^{-1} 2x$
75.  $f(x) = -\frac{1}{6} \ln(1 - 9x^2)$
77.  $f(x) = \sinh^{-1} \left(\frac{3x}{2}\right)$
79. (a) To simplify things, let  $C = \frac{\sqrt{4km - f^2}}{2m}$ ; since  $k$ ,  $m$ , and  $f$  are all constants, so is  $C$ . Then follow the given hint.  
 (b) Set  $s(0) = s_0$  and  $s'(0) = v_0$  and solve for  $A$  and  $B$ .
81. (a) 625 feet, according to the model (the official number is 630). (b) About 82 degrees from horizontal. (c) About 13 degrees from horizontal.
83. Mimic the proof in the reading for  $\frac{d}{dx}(\sin x)$ , except using a sum identity for cosine in the second step.
85.  $\frac{d}{dx}(\csc x) = \frac{d}{dx} \left(\frac{1}{\sin x}\right) = \frac{(0)(\sin x) - (1)(\cos x)}{(\sin x)^2} = \frac{-\cos x}{\sin^2 x} = -\left(\frac{1}{\sin x}\right) \left(\frac{\cos x}{\sin x}\right) = -\csc x \cot x$ .
87. Differentiating both sides of  $\tan(\tan^{-1} x) = x$  gives us  $\sec^2(\tan^{-1} x) \frac{d}{dx}(\tan^{-1} x) = 1$ , and therefore  $\frac{d}{dx}(\tan^{-1} x) = \frac{1}{\sec^2(\tan^{-1} x)}$ . By one of the Thinking Back problems in this section, we have  $\sec^2(\tan^{-1} x) = 1 + x^2$ , and therefore  $\frac{d}{dx}(\tan^{-1} x) = \frac{1}{1+x^2}$ .
89.  $x^2 - y^2 = \cosh^2 t - \sinh^2 t = \left(\frac{e^t - e^{-t}}{2}\right)^2 - \left(\frac{e^t + e^{-t}}{2}\right)^2 = \frac{e^{2t} - 2e^t e^{-t} + e^{-2t} - e^{2t} - 2e^t e^{-t} + e^{-2t}}{2} = 1$ . For the bonus question, consider whether  $\cosh t$  can ever be negative.
91. Expand the right-hand side using the definitions and simplify to get the left-hand side.
93. Mimic the proof in the reading that was given for the derivative of  $\sinh x$ .
95. Mimic the proof in the reading that was given for the derivative of  $\sinh^{-1} x$ .
97.  $\frac{e^y - e^{-y}}{2} = x \implies e^y - \frac{1}{e^y} = 2x \implies \frac{e^{2y} - 1}{e^y} = 2x \implies e^{2y} - 2xe^y - 1 = 0$ . This is quadratic in  $e^y$ , and the quadratic formula gives  $e^y = \frac{2x \pm \sqrt{4x^2 + 4}}{2}$ , and thus  $y = \ln(x \pm \sqrt{x^2 + 1})$ . Since logarithms are only defined for positive numbers we have  $y = \ln(x + \sqrt{x^2 + 1})$ .
99. Start with  $y = \tanh x = \frac{\sinh x}{\cosh x}$  and use the exercises above.

For answers to odd-numbered Skill Certification exercises in the Chapter Review, please visit the Book Companion Web Site at [www.whfreeman.com/tkcalculus](http://www.whfreeman.com/tkcalculus).

## Chapter 3

## Section 3.1

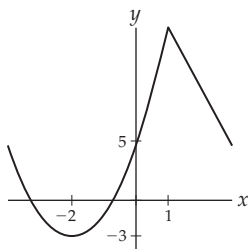

1. T, T, T, F, F, T, F, F.
3.  $f'(1)$  is either 0 or does not exist. If  $f$  is differentiable at  $x = 1$  then  $f'(1)$  must equal 0.
5.  $x = -2, x = 0, x = 4, x = 5$ .
7.  $f'$  has at least two zeroes in the interval  $[-4, 2]$ .
9. There is some  $c \in (-2, 4)$  with  $f'(c) = -\frac{1}{3}$ .
11. If  $f$  is continuous on  $[a, b]$ , differentiable on  $(a, b)$ , and if  $f(a) = f(b) = 0$ , then there exists at least one value  $c \in (a, b)$  for which the tangent line to  $f$  at  $x = c$  is horizontal.
13. The graph of  $f(x) = (x - 2)(x - 6)$  is one example.
15. Your graph should have roots at  $x = -2$  and  $x = 2$  and horizontal tangent lines at three places between these roots.
17. One example is an "upside-down V" with roots at  $x = -2$  and  $x = 2$  where the top point of the V occurs at  $x = -1$ .
19. One example is the function  $f$  that is equal to  $x + 3$  for  $-3 \leq x < -1$  and equal to 0 for  $x = -1$ .
21. Draw a graph that happens to have a slight "cusp" just at the place where its tangent line would have been equal to the average rate of change.
23.  $f'(x) = 0$  at  $x = \frac{3}{2}$  and  $f'(x)$  does not exist at  $x = 3$ .  $f$  has a local maximum at  $x = \frac{3}{2}$  and a local minimum at  $x = 3$ .
25.  $f'(x) = 0$  at  $x \approx 0.5, x \approx 2$ , and  $x \approx 3.5$ .  $f$  has a local minimum at  $x \approx 0.5$  and a local maximum at  $x \approx 3.5$ . There is neither a maximum nor a minimum at  $x \approx 2$ .
27. One critical point at  $x = -0.65$ , a local minimum.
29. Critical points  $x = -3, x = 0, x = 1$ , a local minimum, maximum, and minimum, respectively.
31. One critical point at  $x = \ln\left(\frac{3}{2}\right)$ , a local maximum.
33. Undefined at  $x = 0$ . One critical point at  $x = \frac{e}{2}$ , a local maximum.
35. Critical points at points of the form  $x = \pi k$  where  $k$  is an integer; local minima at the odd multiples  $x = \pi(2k + 1)$ , local maxima at the even multiples  $x = \pi(2k)$ .
37. From the graph,  $f$  appears to be continuous on  $[-3, 1]$  and differentiable on  $(-3, 1)$ , and moreover  $f(-3) = f(1) = 0$ , so Rolle's Theorem applies. Therefore there is some  $c \in (-3, 1)$  such that  $f'(c) = 0$ . In this example there are three such values of  $c$ , namely  $c \approx -2.3, c = -1$ , and  $c = 0.3$ .
39. From the graph,  $f$  appears to be continuous on  $[0, 4]$  and differentiable on  $(0, 4)$ , and moreover  $f(0) = f(4) = 0$ , so Rolle's Theorem applies. Therefore there is some  $c \in (0, 4)$  such that  $f'(c) = 0$ . In this example there are three such values of  $c$ , namely  $c \approx 0.5, c \approx 2$ , and  $c \approx 3.5$ .
41.  $f$  is continuous and differentiable everywhere, and  $f(0) = f(3) = 0$ , so Rolle's Theorem applies;  $c = \frac{1}{3}(4 - \sqrt{7})$  and  $c = \frac{1}{3}(4 + \sqrt{7})$ .
43.  $f$  is continuous and differentiable everywhere, and  $f(-2) = f(2) = 0$ , so Rolle's Theorem applies;  $c \approx -1.27279, c \approx 0$ , and  $c \approx 1.27279$ .
45.  $f$  is continuous and differentiable everywhere, and  $\cos\left(-\frac{\pi}{2}\right) = \cos\left(\frac{3\pi}{2}\right) = 0$ , so Rolle's Theorem applies;  $c = 0, c = \pi$ .
47.  $f$  is continuous and differentiable everywhere, and  $f(0) = f(2) = 0$ , so Rolle's Theorem applies;  $c = \sqrt{2}$ .
49.  $f$  appears continuous on  $[0, 2]$  and differentiable on  $(0, 2)$ ; there is one value  $x = c$  that satisfies the conclusion of the Mean Value Theorem, roughly at  $x \approx 1.2$ .
51.  $f$  appears continuous on  $[-3, 0]$  and differentiable on  $(-3, 0)$ ; there are two values  $x = c$  that satisfy the conclusion of the Mean Value Theorem, at  $c \approx -2.8$  and  $c \approx -0.9$ .
53.  $f$  is not continuous or differentiable on  $[-3, 2]$ , so the Mean Value Theorem does not apply.
55.  $f$  is continuous and differentiable on  $[-2, 3]$ ;  $c \approx -0.5275$  and  $c \approx 2.5275$ .
57.  $f$  is continuous on  $[0, 1]$  and differentiable on  $(0, 1)$ , so the Mean Value Theorem applies;  $c \approx 0.4028$ .
59.  $f$  is continuous and differentiable everywhere, so the Mean Value Theorem applies;  $c = \cos^{-1}\left(\frac{2}{\pi}\right) \approx 0.88$ .
61.  $C(h)$  is a differentiable function, and  $C'(4) = 0.6 \neq 0$ , so  $C(h)$  cannot have a local minimum at  $h = 4$ .
63. (a) Let  $s(t)$  be Alina's distance from the grocery store (in miles) at time  $t$ . Then  $s(0) = 20$  and  $s(0.5) = 0$ ; since  $s(t)$  is continuous and differentiable, the MVT applies, and tells you that there is some time  $c \in (0, 0.5)$  where  $s'(c) = \frac{0-20}{0.5-0} = -40$  miles per hour (the negative sign means she is travelling towards the store).  
(b) Questions to think about: Could Alina possibly have been travelling under 40 miles per hour for her whole trip? Or over 40 miles an hour for her whole trip? If her velocity was less than 40 miles per hour at some point, and more than 40 miles per hour at some other point, can she have avoided going *exactly* 40 miles per hour at some time during her trip? Why or why not?
65. See the proof in the reading.
67. Suppose  $r_1, r_2$ , and  $r_3$  are the roots of  $f$ . Since  $f$  is continuous and differentiable everywhere, Rolle's Theorem guarantees that  $f'$  will have at least one root on  $[r_1, r_2]$ , and at least one root on  $[r_2, r_3]$ ; therefore  $f'$  has at least two roots.

69.  $g(x)$  is continuous on  $[a, b]$  and differentiable on  $(a, b)$  because  $f$  is. Moreover,  $g(a) = f(a) - f(a) = 0$  and  $g(b) = f(b) - f(a) = f(a) - f(a) = 0$ , so Rolle's Theorem applies to  $g(x)$ . Therefore we can conclude that there is some  $c \in (a, b)$  such that  $g'(c) = 0$ . Since  $g'(x) = f'(x) - 0 = f'(x)$ , this also means that  $f'(c) = 0$ , as desired.

### Section 3.2

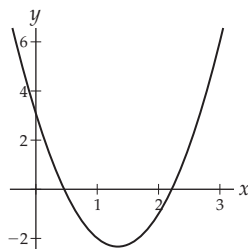

1. T, T, T, F, F, F, F, F.
3. See the first paragraph in the reading.
5. Yes; yes; no.
7. A function can only change sign at roots and discontinuities or non-domain points, and the critical points of  $f$  are exactly these types of points for  $f'$ .

9.

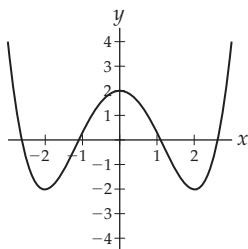

11. If  $a < b \leq 0$  then  $a^4 > b^4$ , and if  $0 < a < b$  then  $a^4 < b^4$ . With derivatives, we have  $f'(x) = 4x^3$ , which is negative for  $x < 0$  and positive for  $x > 0$ .
13.  $x = \pm\sqrt{15}$ ;
15. There is some constant  $C$  such that  $g(x) - h(x) = C$  for all  $x$  in their domains.
17.  $f$  is shown in Graph II and  $f'$  is shown in Graph I.

19.

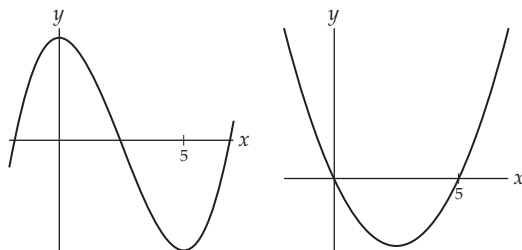

21. Your graph of  $f'$  should have roots at  $x = 0$  and  $x = 2$ , and should be positive on  $(0, \infty)$  and negative on  $(-\infty, 0)$ . In particular this means that your graph of  $f'$  should "bounce" off the  $x$ -axis at  $x = 2$ .

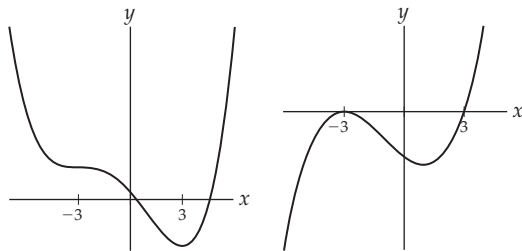

23.

25. Your graph of  $f$  should have horizontal tangent lines at  $x = 1$  at  $x = 3$ , and should be decreasing on  $(-\infty, 1)$  and  $(1, 3)$  and increasing on  $(3, \infty)$ . The graph of  $f$  has an inflection point, but not a local extremum, at  $x = 1$ , and a local minimum at  $x = 3$ .
27. Increasing on  $(-\infty, 0)$  and  $(3, \infty)$ ; decreasing on  $(0, 3)$ .
29. Decreasing on  $(-\infty, -2)$  and  $(2, \infty)$ ; increasing on  $(-2, 2)$ .
31. Decreasing on  $(-\infty, 1)$  and increasing on  $(1, \infty)$ .
33. Decreasing on  $(-\infty, 0)$  and increasing on  $(0, \infty)$ .
35. Increasing on intervals of the form  $[2k + 1, 2k + 3]$  where  $k$  is an integer, and decreasing elsewhere.
37. Increasing on intervals of the form  $[-\frac{\pi}{4} + \pi k, \frac{\pi}{4} + \pi k]$ , decreasing elsewhere.
39. Local maximum at  $x = 0$ , local minimum at  $x = 2$
41. Local maximum at  $x = -\frac{1}{2}$
43. No local extrema
45. Local maxima at all odd integers, local minima at all even integers
47. No local extrema
49. Local maximum at  $x = 0$
51. Possible pictures of  $f$  and  $f'$ , respectively:

53. Possible pictures of  $f$  and  $f'$ , respectively:

55. Your graph of  $f$  should be increasing on  $(-\infty, 1)$ ,  $(3, 8)$ , and  $(8, \infty)$  and decreasing on  $(1, 3)$ . It should also have horizontal tangent lines at  $x = 1$  (a local maximum) and  $x = 8$  (not an extremum), and be nondifferentiable at  $x = 3$  (a local minimum). Your graph of  $f'$  should be positive on  $(-\infty, 1)$ ,  $(3, 8)$ , and  $(8, \infty)$  and negative on  $(1, 3)$ . It should also have roots at  $x = 1$  and  $x = 8$  and be undefined at  $x = 3$ .

57. Defined everywhere, roots at  $x = -\frac{1}{3}$  and  $x = 2$ . Positive on  $(-\infty, -\frac{1}{3}) \cup (2, \infty)$  and negative elsewhere. Local minimum at  $x = \frac{5}{6}$ . Increasing on  $(\frac{5}{6}, \infty)$  and decreasing elsewhere.  $\lim_{x \rightarrow -\infty} f(x) = \infty$  and  $\lim_{x \rightarrow \infty} f(x) = \infty$ .
59. Defined everywhere, roots at  $x = -1$  and  $x = 1$ . Positive on  $(-1, 1)$  and negative elsewhere. Local minimum at  $x = 1$ . Increasing on  $(-\infty, -\frac{1}{3})$  and  $(1, \infty)$  and decreasing elsewhere.  $\lim_{x \rightarrow \infty} f(x) = \infty$  and  $\lim_{x \rightarrow -\infty} f(x) = -\infty$ .
61. Defined everywhere, root at  $x = 0$ . Positive on  $(0, \infty)$  and negative elsewhere. Critical point at  $x = 2$  that is *not* a local extremum. Increasing everywhere (yes, even including  $x = 2$  – although answering  $(-\infty, 2) \cup (2, \infty)$  is sufficient for our purposes here).  $\lim_{x \rightarrow -\infty} f(x) = -\infty$  and  $\lim_{x \rightarrow \infty} f(x) = \infty$ .
63. Defined everywhere, root at  $x = -\frac{11}{2}$ . Positive on  $(-\frac{11}{2}, \infty)$  and negative elsewhere. Local maximum at  $x = -2$ , local minimum at  $x = -\frac{5}{3}$ . Increasing on  $(-\infty, -2) \cup (-2, -\frac{5}{3})$  and decreasing elsewhere.  $\lim_{x \rightarrow -\infty} f(x) = -\infty$  and  $\lim_{x \rightarrow \infty} f(x) = \infty$ .
65. Defined everywhere, roots at  $x = \pm 1$ . Positive on  $(-1, 1)$  and negative elsewhere. Local maximum at  $x = 0$ . Increasing on  $(-\infty, 0)$  and decreasing elsewhere.  $\lim_{x \rightarrow -\infty} f(x) = -\infty$  and  $\lim_{x \rightarrow \infty} f(x) = -\infty$ .
67. Defined everywhere except at  $x = 1$ , where there is a vertical asymptote; root at  $x = -1$ . Positive on  $(-\infty, -1) \cup (1, \infty)$  and negative elsewhere it is defined. No local extrema. Always decreasing.  $\lim_{x \rightarrow -\infty} f(x) = 0$  and  $\lim_{x \rightarrow \infty} f(x) = 0$ , so there is a horizontal asymptote at  $y = 0$ .
69. Defined everywhere; no roots. Positive everywhere. Local minimum at  $x = 0$ . Increasing on  $(0, \infty)$  and decreasing elsewhere.  $\lim_{x \rightarrow \infty} f(x) = \infty$  and  $\lim_{x \rightarrow -\infty} f(x) = \infty$ .
71. Defined except at  $x = -3$  and  $x = 2$  where there are vertical asymptotes; root at  $x = 1$ . Positive on  $(-\infty, -3) \cup (2, \infty)$  and negative elsewhere. Local maximum at  $x = 1$ , local minimum at  $x = \frac{11}{3}$ . Horizontal asymptote at  $y = 1$ .
73. Defined except at  $x = 2$  where there is a vertical asymptote; roots at  $x = 0$  and  $x = 1$ . Positive on  $(1, 2) \cup (2, \infty)$  and negative elsewhere. Local maximum at  $x = 0$ , local minima at  $x = 3 - \sqrt{5}$  and  $x = 3 + \sqrt{5}$ . Increasing on  $(-\infty, 0) \cup (3 - \sqrt{5}, 2) \cup (3 + \sqrt{5}, \infty)$  and decreasing elsewhere. No horizontal asymptote.
75. Defined on  $(0, \infty)$ ; root at  $x = 1$ . Positive on  $(1, \infty)$  and negative elsewhere it is defined. Local minimum at  $x = \frac{1}{e}$ . Increasing on  $(\frac{1}{e}, \infty)$  and decreasing elsewhere

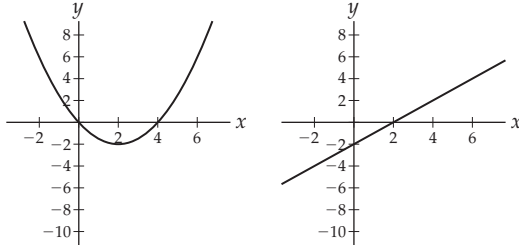

it is defined.  $\lim_{x \rightarrow 0^+} f(x) = \infty$ , so there is a vertical asymptote at  $x = 0$ .  $\lim_{x \rightarrow \infty} f(x) = \infty$ .

77. Defined everywhere, root at  $x = 0$ . Positive everywhere except  $x = 0$ . Local minimum at  $x = 0$ , local maximum at  $x = \frac{-2}{\ln 3}$ . Increasing on  $(-\infty, \frac{-2}{\ln 3}) \cup (0, \infty)$  and negative elsewhere.  $\lim_{x \rightarrow -\infty} f(x) = 0$ , so there is a horizontal asymptote on the left at  $y = 0$ .  $\lim_{x \rightarrow \infty} f(x) = \infty$ , so there is no horizontal asymptote on the right.
79. Defined on  $(0, \infty)$ , root at  $x = 1$ . Positive on  $(1, \infty)$  and negative elsewhere it is defined. Local maximum at  $x = e$ . Increasing on  $(0, e)$  and decreasing elsewhere it is defined.  $\lim_{x \rightarrow 0^+} f(x) = -\infty$ , so there is a vertical asymptote at  $x = 0$ .  $\lim_{x \rightarrow \infty} f(x) = 0$ , so there is a horizontal asymptote at  $y = 0$ .
81. Defined everywhere, no roots. Positive everywhere. Local maximum at  $x = 1 - \frac{1}{\sqrt{3}}$ , local minimum at  $x = 1 + \frac{1}{\sqrt{3}}$ . Increasing on  $(-\infty, 1 - \frac{1}{\sqrt{3}}) \cup (1 + \frac{1}{\sqrt{3}}, \infty)$  and decreasing elsewhere.  $\lim_{x \rightarrow -\infty} f(x) = 0$ , so there is a horizontal asymptote on the left at  $y = 0$ .  $\lim_{x \rightarrow \infty} f(x) = \infty$ , so there is no horizontal asymptote on the right.
83. (a)  $(0, 2.5)$ ; (b)  $t = 2.5$ ; (c)  $(0, 1)$  and  $(3.3, 4)$ ; (d)  $(3.5, 3.8)$  is such an interval; Bubbles is moving towards the left side of the tunnel and is slowing down while doing so.
85. (a) When  $t = (1/0.51)((2n + 1)(\pi/2) - 2.04)$ ; at these times the tide is going neither in nor out, and thus these are times of low and high tides. (b) The high tides occur when  $n = 1, 5, 9, \dots$  in the expression from part (a); the low tides occur when  $n = 3, 7, 11, \dots$  (c) Just before low tide, as the current is moving south.
87. Given that  $f(x) = mx + b$  where  $m \neq 0$  (so  $f$  is nonconstant), show that  $f'$  is either always positive or always negative. Since  $f'(x) = m$  is a (nonzero) constant, this is clearly the case.
89. Mimic the proof from the reading of part (a) of the theorem.
91. Mimic the proof from the reading of part (a) of the theorem.

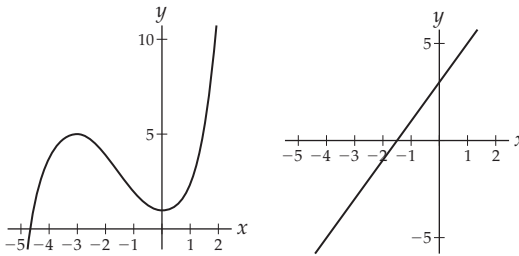

### Section 3.3

1. F, F, F, T, T, F, F, F.
3. See the discussion following Definition 3.9.
5. The converse is "If  $f$  is concave up on  $I$ , then  $f''$  is positive on  $I$ ," which is *false* ( $f''(x)$  might be zero at some point).
7. The graph of  $f(x) = -x^3$  has this property at  $x = 0$ .
9.  $f''(x) = 30x^4$ , so  $f''(0) = 0$ . However,  $f''(-1) > 0$  and  $f''(1) > 0$ , so  $f''$  does not change sign at  $x = 0$ ; therefore  $x = 0$  is not an inflection point of  $f$ .
11. Linear

13. 5, 4.
15. Draw an arc connecting (0, 5) and (3, 1) that is concave up.
17. Draw an arc connecting (0, -5) and (3, -1) that is concave up.
19. The function  $f(x) = -e^x$  has these properties on all of  $\mathbb{R}$ .
21. Possible graph of  $f'$  followed by possible graph of  $f''$ :

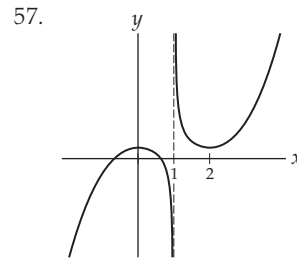

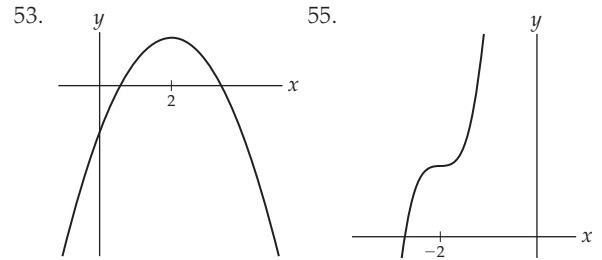

23. Your graph of  $f'$  should have roots at  $x = -3$  and at  $x = 0$  and should be positive on  $(-\infty, -3)$  and negative on  $(-3, 0)$  and  $(0, \infty)$ . Your graph of  $f''$  should have roots at  $x \approx -2$  and  $x = 0$  and should be negative on  $(-\infty, -2) \cup (0, \infty)$  and positive on  $(-2, 0)$ .
25. Possible graph of  $f$  followed by possible graph of  $f''$

27. Your graph of  $f'$  should be decreasing on  $(-\infty, 2)$  and increasing on  $(2, \infty)$ , with a local minimum at  $x = 2$ . Your graph of  $f$  should be concave down on  $(-\infty, 2)$  and concave up on  $(2, \infty)$ , with an inflection point at  $x = 2$ .
29. Local maximum at  $x = 0$ , local minimum at  $x = 2$
31. Local maximum at  $x = -\frac{1}{2}$
33. No local extrema
35. Local maxima at all odd integers, local minima at all even integers
37. No local extrema
39. Local maximum at  $x = 0$
41. Always concave up; no inflection points.
43. Concave up on  $(-\infty, 0) \cup (1, \infty)$ , concave down on  $(0, 1)$ ; inflection points at  $x = 0$  and  $x = 1$ .
45. Concave up on  $(-\infty, -1) \cup (0, \infty)$ , concave down on  $(-1, 0)$ ; inflection points at  $x = -1$  and  $x = 0$ .
47. Concave up on  $(-\infty, \ln(\frac{9}{16}))$ , concave down on  $(\ln(\frac{9}{16}), \infty)$ ; inflection point at  $\ln(\frac{9}{16})$ .

49. Concave up on  $(-\infty, 1 - \frac{\sqrt{2}}{2}) \cup (1 + \frac{\sqrt{2}}{2}, \infty)$ , concave down on  $(1 - \frac{\sqrt{2}}{2}, 1 + \frac{\sqrt{2}}{2})$ ; inflection points at  $x = 1 \pm \frac{\sqrt{2}}{2}$ .
51. Concave down on intervals of the form  $(\frac{\pi}{4} + 2\pi k, \frac{5\pi}{4} + 2\pi k)$  for integers  $k$ , concave up elsewhere; inflection points at points of the form  $\frac{\pi}{4} + \pi k$  for integers  $k$ .

53. 55.
- 57.
59. Among other things, your graph should have roots at  $x = -3$  and  $x = -1$ , a local minimum at  $x = -2$ , and inflection points at  $x = -1$  and  $x = 0$ .
61. Among other things, your graph should have roots at  $x = -3$ ,  $x = 1$ , and  $x = 4$ , a local maximum at  $x = -2$ , a local minimum at  $x = 3$ , and inflection points at  $x = -1$ ,  $x = 1$ , and  $x = 2$ .
63. Defined everywhere, roots at  $x = -3$  and  $x = 0$ . Positive on  $(-\infty, -3) \cup (0, \infty)$  and negative elsewhere. Local minimum at  $x = -\frac{3}{2}$ . Increasing on  $(-\frac{3}{2}, \infty)$  and decreasing elsewhere. No inflection points. Concave up everywhere.  $\lim_{x \rightarrow \infty} f(x) = \infty$  and  $\lim_{x \rightarrow -\infty} f(x) = \infty$ .
65. Defined everywhere, roots at  $x = -3$  and  $x = 0$ . Positive on  $(-3, 0) \cup (0, \infty)$  and negative elsewhere. Local maximum at  $x = -2$ , local minimum at  $x = 0$ . Increasing on  $(-\infty, -3) \cup (0, \infty)$  and decreasing elsewhere. Inflection point at  $x = -1$ . Concave up on  $(-1, \infty)$  and concave down elsewhere.  $\lim_{x \rightarrow \infty} f(x) = \infty$  and  $\lim_{x \rightarrow -\infty} f(x) = -\infty$ .
67. Defined everywhere, roots at  $x = -1$  and  $x = 0$ . Positive on  $(0, \infty)$  and negative elsewhere. Local maximum at  $x = \frac{1}{3}$ , local minimum at  $x = 1$ . Increasing on  $(-\infty, -1) \cup (-\frac{1}{3}, \infty)$  and decreasing elsewhere. Inflection point at  $x = -\frac{2}{3}$ . Concave up on  $(-\frac{2}{3}, \infty)$  and concave down elsewhere.  $\lim_{x \rightarrow \infty} f(x) = \infty$  and  $\lim_{x \rightarrow -\infty} f(x) = -\infty$ .

69. Defined everywhere, roots at  $x = -2$  and  $x = 0$ . Positive on  $(-\infty, -2) \cup (0, \infty)$  and negative elsewhere. Local minimum at  $x = -\frac{3}{2}$ . Increasing on  $(-\frac{3}{2}, \infty)$  and decreasing elsewhere. Inflection points at  $x = -1$  and  $x = 0$ . Concave up on  $(-\infty, -1) \cup (0, \infty)$  and concave down elsewhere.
71. Defined for  $x \geq 0$ , roots at  $x = 0$  and  $x = 4$ . Positive on  $(0, 4)$  and negative elsewhere it is defined. Local maximum at  $x = \frac{4}{3}$ . Increasing on  $(0, \frac{4}{3})$  and decreasing elsewhere it is defined. No inflection points. Always concave down.  $\lim_{x \rightarrow \infty} f(x) = -\infty$ .
73. Defined everywhere except at  $x = 1$  and  $x = 4$ ; root at  $x = -1$ . Positive on  $(4, \infty)$  and negative elsewhere it is defined. No local extrema. Decreasing everywhere. No inflection points. Concave up on  $(4, \infty)$  and concave down elsewhere it is defined.  $\lim_{x \rightarrow 1} f(x) = -\frac{2}{3}$  but  $f(1)$  is not defined, so  $f$  has a hole at  $x = 1$ .  $\lim_{x \rightarrow 4} f(x)$  is infinite ( $\infty$  from the right and  $-\infty$  from the left), so  $f$  has a vertical asymptote at  $x = 4$ .  $\lim_{x \rightarrow \pm\infty} f(x) = 1$ , so  $f$  has a horizontal asymptote at  $x = 1$ .
75. Defined everywhere, root at  $x = 1$ . Positive on  $(-\infty, 1)$  and negative elsewhere. Local minimum at  $x = 2$ . Increasing on  $(2, \infty)$  and decreasing elsewhere. Inflection point at  $x = 3$ . Concave up on  $(-\infty, 3)$  and concave down elsewhere.  $\lim_{x \rightarrow \infty} f(x) = \infty$  and  $\lim_{x \rightarrow \infty} f(x) = 0$ , so there is a horizontal asymptote on the right – but not the left – at  $y = 0$ .
77. Local minimum at  $x = 1$ .
79. Defined everywhere, roots at  $x = 0$  and  $x = 1$ . Never positive, and negative everywhere except at the roots. Local minimum at  $x = \frac{1}{8}$ , local maximum at  $x = 0$ . Increasing on  $(-\infty, 0) \cup (1, \infty)$  and decreasing elsewhere. Inflection point at  $x = 1$ . Concave up on  $(-\infty, 0) \cup (0, 1)$  and concave down elsewhere.  $\lim_{x \rightarrow \infty} f(x) = \infty$  and  $\lim_{x \rightarrow -\infty} f(x) = -\infty$ .
81. Defined for  $x > 0$ , no roots. Always positive. Local minimum at  $x = 1$ . Increasing on  $(1, \infty)$  and decreasing elsewhere it is defined. Inflection point at  $x = e$ . Concave up on  $(0, e)$  and concave down elsewhere it is defined.  $\lim_{x \rightarrow 0^+} f(x) = \infty$  so there is a vertical asymptote at  $x = 0$ .  $\lim_{x \rightarrow \infty} f(x) = \infty$  so there is no horizontal asymptote.
83.  $f$  has a local minimum at  $x = 0$ , no local maxima, and no inflection points.
85.  $f$  has no local extrema and no inflection points.
87. (a)  $[0, 15]$ ; he is north of the corner, walking north and slowing down. (b)  $[60, 80]$ ; he is south of the corner, walking south and speeding up. (c)  $[15, 40]$ ; he is walking south and speeding up (first north and then south of the corner). (d) At  $t = 40$ ; he is south of the corner, walking south; he just finished speeding up (in

the southward direction) and is now just starting to slow down (but still walking in the southward direction).

89. The glacier is concave down for  $x \in (2.532, 5.294)$ .
91. Mimic the proof of part (a) of the same theorem.
93. If  $f(x) = ax^2 + bx + c$ , then  $f''(x) = 2a$ . If  $a > 0$  then  $f''(x) > 0$  for all  $x$ , so  $f$  is always concave up. If  $a < 0$  then  $f''(x) < 0$  for all  $x$ , so  $f$  is always concave down.
95. If  $f''(x) = 0$  on an interval  $I$ , then  $f'(x) = k$  must be constant, and therefore  $f(x) = kx + c$  must be linear.

### Section 3.4

- F, T, T, F, F, F, F, F.
- The derivative may or may not be zero (or fail to exist) at the endpoints of the interval.
- There will not be any endpoint extrema; there may or may not be a global maximum (or minimum) on the interval.
- For example,  $f$  might have a vertical asymptote on  $I$ .
- (a) Global minimum at  $x = 0$ , no global maximum. (b) Global minimum at  $x = 5$ , global maximum at  $x = 2$ . (c) Global minimum at  $x = 0$ , no global maximum. (d) Global minimum at  $x = 0$ , no global maximum. (e) Global minimum at  $x = 0$ , no global maximum. (f) Global minimum at  $x = 0$ , no global maximum.
- (a) Global maximum at  $x = -1$  with value  $f(-1) = 7$ , global minimum at  $x = -3$  with value  $f(-3) = -45$ . (b) Global maximum at  $x = 0$  with value  $f(0) = 0$ , global minimum at  $x = 2$  with value  $f(2) = -20$ . (c) No global maximum, global minimum at  $x = 2$  with value  $f(2) = -20$ . (d) Global maximum at  $x = -1$  with value  $f(-1) = 7$ , no global minimum.
- (a) Global maximum at  $x = -1$  with value  $f(-1) = 11$ , global minimum at  $x = 1$  with value  $f(1) = -5$ . (b) No global maximum or global minimum. (c) Global maximum at  $x = -1$  with value  $f(-1) = 11$ , no global minimum. (d) Global maximum at  $x = 0$  with value  $f(0) = 0$ , global minimum at  $x = 3$  with value  $f(3) = -117$ .
- (a) Global maximum at  $x = 0$  with value  $f(0) = 1$ , global minimum at  $x = 3$  with value  $f(3) = \frac{1}{1+\sqrt{3}}$ . (b) No global maximum or global minimum. (c) Global maximum at  $x = 1$  with value  $f(1) = \frac{1}{2}$ , global minimum at  $x = 2$  with value  $f(2) = \frac{1}{1+\sqrt{2}}$ . (d) Global maximum at  $x = 0$  with value  $f(0) = 1$ , no global minimum.
- (a) Global maximum at  $x = 4$  with value  $f[4] = 56$ , global minimum at  $x = 1$  with value  $f(1) = -2$ . (b) No global maximum, global minimum at  $x = 1$  with value  $f(1) = -2$ . (c) Global maximum at  $x = 0$  with value  $f(0) = 0$ , no global minimum. (d) No global maximum, no global minimum.

19. (a) Global minimum at  $x = 0$  and  $x = 4$  with value  $f(0) = f(4) = \frac{1}{\sqrt{3}}$ ; no global maximum. (b) Global minimum at  $x = 10$  with value  $f(10) = \frac{1}{3\sqrt{7}}$ , no global maximum. (c) Global minimum at  $x = 0$  with value  $f(0) = \frac{1}{\sqrt{3}}$ , no global maximum. (d) No global minimum, no global maximum.
21. The most optimal solution is to let the horizontal straight edges have length zero, resulting in a circle of radius  $\frac{60}{\pi}$ .
23. The horizontal top and bottom edges should have length  $\approx 19.6903$  units, and the vertical edges should have length 13.1268 units.
25.  $x = 18$  and  $y = 18$                       27.  $a = 50, b = 50$
29. 200    31.  $\left(-\frac{1}{5}, \frac{2}{5}\right)$
33.  $\left(\frac{2-\sqrt{6}}{2}, 1.75\right)$  or  $\left(\frac{2+\sqrt{6}}{2}, 1.75\right)$
35. A square pen with sides of length  $\frac{175}{2}$  feet will produce the maximum area of 7656.25 square feet.
37. Four parallel north-south fences of length 125 feet, and two east-west fences of length 250 feet. The resulting pen will have an area of 31,250 square feet.
39. 180 feet of border fencing
41. About 143 feet of border fencing
43. The base of the box should have sides of length 6.26 inches, and the height of the box should be approximately 10.65 inches. The resulting largest possible volume is approximately 417.48 cubic inches.
45. The largest possible volume is 11,664 cubic inches; the largest possible surface area is 3,332.6 square inches.
47. The largest possible volume is 14,851 cubic inches; the largest possible surface area is 462.6 square inches.
49. At  $t = 0$  minutes; at the right endpoint of the model (one such endpoint could be  $t = 5$ ).
51. The minimum area occurs when you cut the wire so that 4.399 inches of wire are used to make the circle. The maximum area occurs when you don't cut the wire at all, and use all 10 inches to make the circle.
53. The minimum area occurs when you cut the wire so that 0.577 inches of wire are used to make the circle. The maximum area occurs when you don't cut the wire at all, and use all 10 inches to make the circle.
55. To get the minimum surface area, the oil drums should be constructed so they are  $\frac{40}{\pi 20^{2/3}} \approx 3.0767$  feet high with a radius of  $\frac{20^{1/3}}{\pi} \approx 1.8533$  feet. There is no global maximum.
57. To minimize the cost, the cans should be made with a radius of  $2\left(\frac{5}{\pi}\right)^{1/3} \approx 2.335$  inches, and a height of  $\approx 11.6754$  inches. It is not possible to maximize the cost.
59. The steam pipe should be buried along the 800-foot side of the parking lot for 425 feet, and then diagonally under the parking lot to the opposite corner.
61. (a) You would sell the most (975 paintings) at \$5.00 apiece. You would sell the least (15 paintings) at \$45.00 apiece. (b)  $R(c) = c(0.6c^2 - 54c + 1230)$ . (c) You would earn the most money (\$8327.10) by selling the paintings for \$15.28 apiece. You would earn the least money (\$672.90) by selling the paintings for \$44.72 apiece. (d) Although you sell the most paintings when charging \$5.00 apiece, you only earn \$5.00 for each of those paintings.
63. If the sides of the rectangle have length  $x$  and  $y$ , then  $P = 2x + 2y$ , so  $y = \frac{1}{2}(P - 2x)$ . Therefore the area is  $A = xy = x\left(\frac{1}{2}(P - 2x)\right)$ , which has derivative  $A'(x) = \frac{1}{2}P - 2x$ . Thus the only critical point of  $A(x)$  is  $x = \frac{P}{4}$ . Since  $A'\left(\frac{P}{4} - 1\right) > 0$  and  $A'\left(\frac{P}{4} + 1\right) < 0$ , the first-derivative test tells us that  $A(x)$  has a local maximum at  $x = \frac{P}{4}$ ; in fact it is the global maximum of  $A(x)$  on  $\left[0, \frac{P}{2}\right]$ . Therefore  $A$  is maximized when  $x = \frac{P}{4}$  (and thus  $y = \frac{P}{4}$ ), i.e., when the rectangle is a square.

### Section 3.5

- F, T, T, F, T, T, F, F.
- $V = \pi y^2 s, SA = 2\pi y s + 2\pi y^2$
- $V = \frac{\pi}{4} h^3, SA = \frac{3}{2}\pi h^2$
- See Theorem 3.13(a) for the statement of the theorem. A triangle with legs of lengths 3 and 4 will have a hypotenuse of length  $\sqrt{3^2 + 4^2} = \sqrt{25} = 5$ .
- $\frac{dV}{dt} = 4\pi r^2 \frac{dr}{dt}$
- $\frac{dV}{dt} = \frac{E^2}{2\pi^2} \frac{dE}{dt}$ , or equivalently,  $\frac{dV}{dt} = 2r^2 \frac{dE}{dt}$ .
- (a)  $\frac{dV}{dt} = 4\pi r^2 \frac{dr}{dt}$ ; (b)  $\frac{dS}{dt} = 8\pi r \frac{dr}{dt}$ .
- $\frac{dV}{dt} = 2\pi r h \frac{dr}{dt}$                                       17.  $\frac{dV}{dt} = \frac{3\pi}{4} h^2 \frac{dh}{dt}$
- $A = \frac{P^2}{16}$     21.  $SA = 4\pi h + 8\pi$
- $SA = \pi r \sqrt{r^2 + 25} + \pi r^2$                       25.  $A = \frac{c^2}{4}$
- $f' = 2uu' + kv'$                                       29.  $f' = v + tv' + kv'$
- $f' = 2v'\sqrt{u+w} + \frac{v(u+w)'}{\sqrt{u+w}}$
- $f' = w'(u+t)^2 + 2w(u+t)(u'+1)$
- $f' = \frac{1}{k}(u't + u + w')$
- $\frac{dA}{dt} \Big|_{r=12} = 96\pi \frac{\text{in}^2}{\text{sec}}; \frac{dA}{dt} \Big|_{r=24} = 192\pi \frac{\text{in}^2}{\text{sec}};$   
 $\frac{dA}{dt} \Big|_{r=100} = 800\pi \frac{\text{in}^2}{\text{sec}}.$

39.  $\frac{dV}{dt} \Big|_{s=8} = 6(8)^2 = 384$  cubic inches per minute.

41.  $\frac{dV}{dt} \Big|_{x=\sqrt[3]{55}} = 6(\sqrt[3]{55})^2 \approx 86.77$  cubic inches per minute.

43.  $\frac{dr}{dt} \Big|_{r=12} = \frac{5}{24\pi}$  in/sec      45.  $16 \frac{\text{in}^2}{\text{sec}}$

47. Suppose  $x$  is Stuart's distance from the streetlight,  $l$  is the length of his shadow, and  $y = x + l$  is the distance from the tip of his shadow to the streetlight. Then  $\frac{dy}{dt} \Big|_{x=10} = -\frac{40}{7}$  ft/sec; this does not depend on  $x$ .

49.  $\frac{2}{\sqrt{128}} \approx 0.177$  feet per second downwards.

51. The area is growing by 6 square feet per second at that particular moment.

53.  $\frac{dr}{dt} \Big|_{h=4} = \frac{1}{8\pi}$  in/sec      55.  $\frac{dh}{dt} \Big|_{h=4} = \frac{1}{12\pi}$  in/sec

57.  $\frac{dh}{dt} \Big|_{h=3} = -\frac{25}{72\pi}$  in/min

59. (a)  $\frac{dA}{dt} = 2b - a$  for all times  $t$ . (b)  $1 \leq a < 21$  and  $0 < b \leq 10$ , with  $0 \leq t < 5$ . (c) The area is increasing when  $2b > a$  and decreasing when  $2b < a$ . In terms of time, the area is increasing from time  $t = 0$  to time  $t = 2.375$  and then decreasing from time  $t = 2.375$  to time  $t = 5$ .

61. (a) We see that  $x(t)/(13200 - 11710) = \tan(\pi/2 - \theta(t))$ . It follows that  $x' = -1490 \sec^2(\pi/2 - \theta)\theta'$ . (b) Now  $\theta' = -(11\pi/180)/60$  radians per minute (negative because the sun is going down), and when it hits Ian the shadow makes  $\tan \theta = 1490/3100$ . It follows that  $x' = 25.4$  feet per minute.

63.  $\frac{d}{dr} \left( \frac{4}{3} \pi r^3 \right) = 4\pi r^2$

65. Mimic the work in Example (c).

### Section 3.6

1. F, F, F, F, T, F, T, F.

3. See the discussion at the beginning of the section.

5.  $y = 2(x - 1)$  is the line tangent to  $f$  at  $x = 1$ , and  $y = x - 1$  is the line tangent to  $g(x)$  at  $x = 1$ . Very close to  $x = 1$  the graphs of  $f$  and  $g$  are very close to the graphs of these tangent lines.

7.  $\lim_{x \rightarrow \infty} \frac{x}{2^x} \rightarrow \frac{\infty}{\infty}$  and  $\lim_{x \rightarrow \infty} \frac{1/2^x}{1/x} \rightarrow \frac{0}{0}$ ; the first form works better.

9.  $\lim_{x \rightarrow \infty} \frac{\ln x}{x^2} \rightarrow \frac{\infty}{\infty}$  and  $\lim_{x \rightarrow \infty} \frac{x^{-2}}{\frac{1}{\ln x}} \rightarrow \frac{0}{0}$ ; the first form works better.

11.  $\lim_{x \rightarrow 0} \frac{x}{\sin x} \rightarrow \frac{0}{0}$  and  $\lim_{x \rightarrow 0} \frac{\csc x}{\frac{1}{x^{-1}}} \rightarrow \frac{\infty}{\infty}$ ; the first form works better.

13. The only error is in the second application of L'Hôpital's Rule (it does not apply).

15. (a)  $\lim_{x \rightarrow 1} \frac{2x+1}{1} = 3$ ; (b)  $\lim_{x \rightarrow 1} (x+2) = 3$

17. (a)  $\lim_{x \rightarrow \infty} \frac{1}{-6x} = 0$ ; (b)  $\lim_{x \rightarrow \infty} \frac{\frac{1}{2} - \frac{1}{x^2}}{\frac{x}{2} - 3} = \frac{0-0}{0-3} = 0$

19. (a)  $\lim_{x \rightarrow \infty} \frac{3e^{3x}}{-2e^{2x}} = \lim_{x \rightarrow \infty} \frac{3e^x}{-2} = -\infty$ ; (b)  $\lim_{x \rightarrow \infty} \frac{1}{\frac{1}{e^{3x}} - \frac{1}{e^x}} = -\infty$

21.  $-8 \ln 2$

23.  $\frac{1}{2}$

25. 0

27. 0

29.  $\infty$

31. 0

33. 0

35. 0

37. 1

39. 1

41. 0

43. 0

45.  $-1$

47. 1

49.  $\infty$

51. 1

53.  $e$

55. 1

57. 0

59. 1

61. 1

63. 1

65.  $\lim_{x \rightarrow \infty} \frac{x+100}{x} = 1$ , so neither dominates.

67.  $\lim_{x \rightarrow \infty} \frac{2x^{100}}{100x^2} = \infty$ , so  $v(x)$  dominates  $u(x)$ .

69.  $\lim_{x \rightarrow \infty} \frac{e^x}{2^x} = \infty$ , so  $v(x)$  dominates  $u(x)$ .

71. Neither function dominates.

73.  $\lim_{x \rightarrow \infty} \frac{0.001e^{0.001x}}{100x^{100}} = \infty$ , so  $u(x)$  dominates  $v(x)$ .

75. 0

77.  $\infty$

79.  $\infty$

81. On  $I$ ,  $f$  has a global maximum at  $x = 1$  and a global minimum at  $x = \frac{1}{e}$ , since  $\lim_{x \rightarrow 0^+} f(x) = 0$ . On  $J$ ,  $f$  has no global maximum and a global minimum at  $x = \frac{1}{3}$ , since  $\lim_{x \rightarrow \infty} f(x) = \infty$ .

83. On  $I$ ,  $f$  has a global maximum at  $x = 3$  and a global minimum at  $x = 0$ . On  $J$ ,  $f$  has a global maximum at  $x = 3$  but no global minimum.

85. On  $I$ ,  $f$  has no global maximum and a global minimum at  $x = \pi$ , since  $\lim_{x \rightarrow 0^+} f(x) = \infty$ . On  $J$ ,  $f$  has no global minimum and no global maximum, since  $\lim_{x \rightarrow 0^+} f(x) = \infty$  and  $\lim_{x \rightarrow 2\pi^-} f(x) = -\infty$ .

87.  $\frac{\Delta w}{\Delta t} = \frac{w(t) - w(0)}{t - 0} = \frac{w(t)}{t}$ .

89. Split into a sum of two limits, the first of which is  $\lim_{t \rightarrow \infty} E(t) = \frac{E_0}{1 + 0.2W_0}$  and the second of which is of the form  $\frac{\infty}{\infty}$  and which by L'Hôpital's Rule is equal to 0.

91. If  $f(x) = Ae^{kx}$  is exponential and  $g(x) = x^2$ , then by applying L'Hôpital's rule twice, we have  $\lim_{x \rightarrow \infty} \frac{Ae^{kx}}{x^2} = \lim_{x \rightarrow \infty} \frac{Ake^{kx}}{2x} = \lim_{x \rightarrow \infty} \frac{Ak^2e^{kx}}{2}$ , which in the limit is equal to  $\infty$ .

93. If  $f(x) = Ae^{kx}$  is exponential and  $g(x) = Bx^r$  is a power function, then by applying L'Hôpital's rule  $r$  times, we have

$$\lim_{x \rightarrow \infty} \frac{Ae^{kx}}{Bx^r} = \lim_{x \rightarrow \infty} \frac{Ake^{kx}}{Brx^{r-1}} = \cdots = \lim_{x \rightarrow \infty} \frac{Akr^r e^{kx}}{Br(r-1)(r-2) \cdots (1)},$$

which is of the form  $\frac{\infty}{\text{constant}} \rightarrow \infty$ .

95.  $\lim_{x \rightarrow \infty} \ln \left( \left( 1 + \frac{r}{x} \right)^x \right) = \lim_{x \rightarrow \infty} x \ln \left( 1 + \frac{r}{x} \right) =$

$$\lim_{x \rightarrow \infty} \frac{\ln \left( 1 + \frac{r}{x} \right)}{\frac{1}{x}} = \lim_{x \rightarrow \infty} \frac{\frac{1}{1 + \frac{r}{x}} \left( -\frac{r}{x^2} \right)}{-\frac{1}{x^2}} = \lim_{x \rightarrow \infty} \frac{r}{1 + \frac{r}{x}} = r, \text{ and}$$

thus  $\lim_{x \rightarrow \infty} \left( 1 + \frac{r}{x} \right)^x = e^r$ .

For answers to odd-numbered Skill Certification exercises in the Chapter Review, please visit the Book Companion Web Site at [www.whfreeman.com/tkcalculus](http://www.whfreeman.com/tkcalculus).

## Chapter 4

### Section 4.1

1. T, T, T, F, F, F, F, F.
3. The terms in the sum do not appear to have a consistent pattern.
5. The sum of the squares of the integers greater than or equal to 3 and less than or equal to 87.
7. (a)  $b_p + b_{p+1} + \cdots + b_{q-1} + b_q$ . (b) Index is  $i$ , starting value is  $p$ , ending value is  $q$ ,  $b_i$  describes each term in the sum. (c)  $p$  and  $q$  must be nonnegative integers;  $b_i$  can be any real number; also, we must have  $p \leq q$ .
9. One possible answer is  $a_k = k^2$ ,  $m = 3$ ,  $n = 7$ .
11. The first sum is  $1 + \frac{1}{2} + \frac{1}{5} + \frac{1}{10} + \cdots + \frac{1}{65}$ ; the second sum is  $2 \left( \frac{1}{2} + \frac{1}{4} + \frac{1}{10} + \frac{1}{20} + \cdots + \frac{1}{130} \right)$ .
13. (a)  $\sum_{k=1}^5 \frac{2}{k^2}$ ; (b)  $\sum_{k=2}^6 \frac{2}{(k-1)^2}$ ; (c)  $\sum_{k=0}^4 \frac{2}{(k+1)^2}$ .
15. (a)  $\sum_{k=1}^2 k = 1 + 2 = 3$ , and  $\frac{2(2+1)}{2} = \frac{6}{2} = 3$ ;  
(b)  $\sum_{k=1}^8 k = 1 + 2 + 3 + 4 + 5 + 6 + 7 + 8 = 36$ , and  $\frac{8(8+1)}{2} = \frac{72}{2} = 36$ ;  
(c)  $\sum_{k=1}^9 k = 1 + 2 + 3 + 4 + 5 + 6 + 7 + 8 + 9 = 45$ , and  $\frac{9(9+1)}{2} = \frac{90}{2} = 45$ .
17. See Theorem 4.4.
19. The area under  $f'$  should be related to the function  $f$ , since in the example the area under  $v(t) = s'(t)$  is related to the distance travelled  $s(t)$ .
21.  $\sum_{k=1}^8 3$ ;  $m = 1$ ,  $n = 8$ ,  $a_k = 3$
23.  $\sum_{k=1}^5 \frac{k+2}{k^3}$  and  $\sum_{k=3}^7 \frac{k}{(k-2)^3}$  are the most obvious ways.
25.  $\sum_{k=2}^{10} (k^2 + 1)$
27.  $\sum_{k=1}^n \frac{k}{n}$
29.  $16 + 25 + 36 + 49 + 64 + 81 = 271$

31.  $0 + \frac{1}{8} + \frac{1}{2} + \frac{9}{8} + 2 + \frac{25}{8} = \frac{55}{8}$

33. Approximately  
 $0.17321 + 0.17607 + 0.17889 + 0.18166 + 0.18439 +$   
 $0.18708 + 0.18973 + 0.19235 + 0.19494 + 0.19748 \approx 1.8558$

35.  $3n - \frac{n(n+1)}{2}$ ;  $-4750$ ;  $-123,750$ ;  $-497,500$ .

37.  $\frac{n(n+1)(2n+1)}{6} + 2\frac{n(n+1)}{2} + n - 13$ ;  $348, 537$ ;  $42, 042, 737$ ;  
 $334, 835, 487$ .

39.  $\frac{1}{n^4} \left( \frac{n^2(n+1)^2}{4} - n \right)$ ;  $0.255024$ ;  $0.251001$ ;  $0.2505$

41.  $2a_0 + 2a_1 + 2a_2 - a_{101} + \sum_{k=3}^{100} a_k$

43.  $\sum_{k=2}^{25} (3k^2 + 2k - 1) - 52$  45. 48

47.  $\lim_{n \rightarrow \infty} \frac{2n^3 + 6n^2 + 10n}{6n^3} = \frac{1}{3}$

49.  $\lim_{n \rightarrow \infty} \frac{n + n(n+1) + \frac{1}{6}n(n+1)(2n+1)}{n^3 - 1} = \frac{1}{3}$

51.  $\lim_{n \rightarrow \infty} \left( 1 + \frac{n^2 + n}{n^2} + \frac{2n^3 + 3n^2 + n}{6n^3} \right) = 1 + 1 + \frac{2}{6} = \frac{7}{3}$

53. Answers can vary depending on what you choose to use as your velocity in each subinterval. Using the initial velocity of each 5-second chunk we approximate that the distance travelled is  $d \approx 5v(0) + 5v(5) + 5v(10) + 5v(15) + 5v(20) + 5v(25) + 5v(30) + 5v(35) = 2310$  feet.

55. (a) In any year  $t$ ,  $B(t)$  is the sum of the increases  $I(1), I(2), \dots, I(t)$ . (b) The graph of  $I(t)$  is a series of rectangles with heights  $I(1), I(2)$ , and so on. For any year  $t$ ,  $B(t)$  is the sum of the areas of the first through  $t$ th rectangles. (c) In any given year, if  $I$  is positive then  $B$  will increase that year; if  $I$  is negative then  $B$  will decrease that year. It seems like  $I$  could be related to the derivative of  $B$ .

57. (a)  $A(n) = \sum_{k=1}^n 10(0.7)^k$ ; (b)  $A(3) = 15.33$  billion,  $A(4) = 17.73$  billion, and  $A(5) = 19.41$  billion; (c)  $A(10) = 22.67$  billion, so the total might be about 23 billion dollars.

59.  $\sum_{k=0}^n 3a_k = 3a_0 + 3a_1 + 3a_2 + \cdots + 3a_n =$   
 $3(a_0 + a_1 + a_2 + \cdots + a_n) = 3 \sum_{k=0}^n a_k$ .

61. Pairing the first and last terms in the sum  $1 + 2 + 3 + \cdots + n$  gives a sum of  $n + 1$ . Pairing the second and second-to-last terms also gives a sum of  $n + 1$ . Continuing in this fashion we obtain  $\frac{n}{2}$  pairs whose sum is  $n + 1$ .

### Section 4.2

1. F, T, F, F, F, T, T, F.
3. (a) Counting partial squares as half-squares, the blob has an approximate area of  $46 \left( \frac{1}{4} \right) + 36 \left( \frac{1}{8} \right) = 16$  square units. (b) Two possible ways to improve the approximation are to count partial squares more accurately depending on their sizes, or to use a finer grid.

5. (a) The right sum is an over-approximation, and the left sum an under-approximation, in this example. Both the midpoint sum and the trapezoid sum look like very close approximations. (b) The midpoint sum was off by the smallest amount, with an error of only about 0.0417.
7. (a) 7.85; (b) No; (c) upper sum is  $\geq 8.2$ , lower sum is  $\leq 7.5$ ; (d) No; (e) No.
9. The heights of the rectangles used with the upper sum are by definition always greater than or equal to the heights of the rectangles used for any other Riemann sum.
11. (a)  $M_1 = 0$ ,  $M_2 = 2$ ; (b)  $M_1 = 0$ ,  $M_2 = \frac{2}{3}$  (or  $\frac{4}{3}$ ),  $M_3 = 2$ ; (c)  $M_1 = 0$ ,  $M_2 = \frac{1}{2}$ ,  $M_3 = \frac{3}{2}$ ,  $M_4 = 2$ .
13. (a) Meters; (b) the area of a rectangle; (c) looks like distance should be related to the area under the velocity curve.
15. Part of the sum indicates that we have  $\Delta x = \frac{1}{2}$ , whereas another part tells us that  $\Delta x = 0.25$ .
17. Right sum with  $f(x) = x^2$ ,  $N = 4$ ,  $\Delta x = \frac{1}{2}$ , and  $x_k = 1 + \frac{k}{2}$ ; thus  $a = 1$  and  $b = 3$ .
19. Trapezoid sum with  $f(x) = \sin x$ ,  $N = 100$ ,  $\Delta x = 0.05$ , and  $x_k = 0 + 0.05k$  (so  $x_{k-1} = 0 + 0.05(k-1)$ ); thus  $a = 0$  and  $b = 0 + 0.05(100) = 5$ .
21. 1.219                                      23. 51.88
25.  $\frac{8}{3}$     27. (a) 5; (b) 6.875
29. (a) 1.16641; (b) 1.26997            31. (a) 51.3434; (b) 52.9562
33. (a) 2; (b) 2.148; (c) 2.25
35. Exact = 26; LS = 24.5; RS = 27.5; midpoint = 26; upper = 27.5; lower = 24.5; trapezoid = 26
37. Exact =  $\frac{\pi}{2}$ ; LHS  $\approx 1.366$ ; RHS  $\approx 1.366$ ; midpoint  $\approx 1.630$ ; upper  $\approx 1.866$ ; lower  $\approx 0.866$ ; trapezoid  $\approx 1.366$ .
39.  $\sum_{k=1}^4 \frac{1}{4} \sqrt{\frac{k}{4}} + 1$
41.  $\sum_{k=1}^6 e^{(2k+3)/4} \left(\frac{1}{2}\right)$
43.  $\sum_{k=1}^4 \frac{\sin(\frac{\pi}{4}(k-1)) + \sin(\frac{\pi}{4}k)}{2} \left(\frac{\pi}{4}\right)$
45. (a) 1320 feet; (b) 3080 feet
47. With a right sum we approximate that the change in temperature is  $-24.2385$  degrees.
49. (a)  $c_1 \approx 6114.15$ ,  $c_2 \approx 8722.35$ ; (b) plotting  $g(t) = 6114.15 + 8722.35(\sin((t-90)\pi/105) - 2/\pi)$  with the four data points between 90 and 195 days gives a relatively good fit.
51. Since  $f$  is increasing, we have  $x_{k-1} \leq x_k$ ; now apply Definition 4.6.

53. Draw a picture of a concave up function with a trapezoid sum approximation. Compare the trapezoid to the area under the curve. What do you notice?

### Section 4.3

1. F, T, F, F, F, F, T, F.
3.  $\int_a^b f(x)dx$ ; the definite integral of  $f$  on  $[a, b]$
5.  $\int_a^b f(x)dx = \lim_{n \rightarrow \infty} \sum_{k=1}^n f(x_k^*)\Delta x$ , where  $\Delta x = \frac{b-a}{n}$ ,  $x_k = a + k\Delta x$ , and  $x_k^*$  is a point in the  $k$ th subinterval  $[x_{k-1}, x_k]$ .
7. The region between the graph of  $f$  and the  $x$ -axis from  $x = a$  to  $x = a$  has a width of zero.
9. A larger portion of the region between the graph of  $f(x) = x^2 - 4$  and the  $x$ -axis on  $[-3, 3]$  is negative, so the definite integral is negative.
11. 0
13. (a) Negative; (b) negative
15. (a)  $\int_a^b (f(x) + g(x))dx = \int_a^b f(x)dx + \int_a^b g(x)dx$ , but  $\int_a^b f(x) \cdot g(x)dx \neq \int_a^b f(x)dx \cdot \int_a^b g(x)dx$ . (b) With  $f(x) = x$  and  $g(x) = 1$ ,  $\int_0^1 f(x)dx = \frac{1}{2}$ ,  $\int_0^1 g(x)dx = 1$ , and  $\int_0^1 (f(x) + g(x))dx = \frac{3}{2}$ . (c) With  $f(x) = x$  and  $g(x) = x$ ,  $\int_0^1 f(x)dx = \frac{1}{2}$  and  $\int_0^1 g(x)dx = \frac{1}{2}$ , but  $\int_0^1 f(x)g(x)dx = \frac{1}{3}$ .
17. (a)  $\sum_{k=1}^n \left(\frac{3k}{n}\right)^2 \left(\frac{3}{n}\right) = \frac{27}{n^3} \left(\frac{n(n+1)(2n+1)}{6}\right)$   
 (b)  $\sum_{k=1}^n \left(\frac{3}{n}(k-1)\right)^2 \left(\frac{3}{n}\right) = \frac{27}{n^3} \left(\frac{n(n+1)(2n+1)}{6} - 2\frac{n(n+1)}{2} + n\right)$  (c) For  $n = 100$ , RHS  $\approx 9.13545$  and LHS  $\approx 8.86545$ ; for  $n = 1000$ , RHS  $\approx 9.0135$  and LHS  $\approx 8.9865$ . (d) Both expressions approach 9 as  $n \rightarrow \infty$ .
19. (a) Infinite discontinuity (vertical asymptote) at  $x = 0$ ; (b) the area accumulated would be infinite; (c) a sequence of Riemann sum approximations would not converge to a real number as  $n \rightarrow \infty$ ; (d) compare the two graphs and speculate.
21. 2    23. 264
25.  $\frac{\pi}{2}$     27.  $\frac{1}{2}$
29. 5    31. 14
33. Not enough information.            35. Not enough information.
37.  $-8$     39.  $-\frac{52}{3}$
41. (a)  $\sum_{k=1}^n \left(5 - \left(2 + \frac{3k}{n}\right)\right) \left(\frac{3}{n}\right) = \frac{3}{n}(3n) - \frac{9}{n^2} \left(\frac{n(n+1)}{2}\right)$ .  
 (b) 4.455, 4.4955; (c)  $\frac{9}{2}$ .
43. (a)  $\sum_{k=1}^n 2 \left(\frac{k}{n}\right)^2 \left(\frac{1}{n}\right) = \frac{2}{n^3} \left(\frac{n(n+1)(2n+1)}{6}\right)$ . (b) 0.6767, 0.667667; (d)  $\frac{2}{3}$ .

45. (a)  $\sum_{k=1}^n \left( \left( 2 + \frac{k}{n} \right) + 1 \right)^2 \left( \frac{1}{n} \right) = \frac{1}{n}(9n) + \frac{6}{n^2} \left( \frac{n(n+1)}{2} \right) + \frac{1}{n^3} \left( \frac{n(n+1)(2n+1)}{6} \right)$ . (b) 12.3684, 12.3368; (c)  $\frac{37}{3}$ .
47.  $\frac{62}{3}$                               49. -93
51.  $\frac{136}{3}$
53. (a)  $\int_0^{40} (-0.22t^2 + 8.8t) dt$ ; (b) 2346.67 feet.
55.  $\int_a^b cf(x) dx = \lim_{n \rightarrow \infty} \sum_{k=1}^n cf(x_k^*) \Delta x = c \lim_{n \rightarrow \infty} \sum_{k=1}^n f(x_k^*) \Delta x = c \int_a^b f(x) dx$ .
57. If  $\int_a^b f(x) dx = \lim_{n \rightarrow \infty} \sum_{k=1}^n f(x_k) \Delta x$ , then  $\int_b^a f(x) dx = \lim_{n \rightarrow \infty} \sum_{k=1}^n f(x_{n-k}) (-\Delta x) = - \lim_{n \rightarrow \infty} \sum_{k=1}^n f(x_k) \Delta x = - \int_a^b f(x) dx$ .
59. The area in question is a trapezoid with heights  $a$  and  $b$  and width  $b - a$ , therefore area  $\frac{a+b}{2}(b-a) = \frac{1}{2}(b^2 - a^2)$ .
61. Simplify  $\sum_{k=1}^n \left( a + \frac{k(b-a)}{n} \right)^2 \left( \frac{b-a}{n} \right)$ , apply sum formulas, and then take the limit as  $n \rightarrow \infty$ . Remember that  $a$  and  $b$  are constants.
25.  $\frac{1}{3}x^3 + \frac{1}{\ln 2}(2^x) + 4x + C$
29.  $\frac{3.2}{\ln(1.43)}(1.43)^x - 50x + C$
33.  $\frac{1}{3} \sec(3x) + C$
37.  $\pi x + C$
41.  $\frac{1}{3} \sec^{-1}(3x) + C$
45.  $x^2 e^x + C$
49.  $e^x - e^{2x} + C$
53.  $\frac{x^2}{\ln x} + C$
57.  $\ln x \cos x + C$
61.  $x \tanh x + C$
65.  $\frac{1}{ab} \sec(ax) + C$
69. (a)  $v(t) = -32t + 42$  feet per second;  
(b)  $s(t) = -16t^2 + 42t + 4$  feet.
71. See the proof in the reading.
73.  $\frac{d}{dx} \left( \frac{1}{k} e^{kx} \right) = \left( \frac{1}{k} \right) (k) e^{kx} = e^{kx}$ , and  $\frac{d}{dx} \left( \frac{1}{\ln b} b^x \right) = \left( \frac{1}{\ln b} \right) (\ln b) b^x = b^x$ .
75. Each of the integrands is the derivative of the corresponding inverse trigonometric function in its solution.
77. See the proof in the reading.
79. By the sum rule for differentiation, and the fact that the derivative of a constant is zero,  $\frac{d}{dx}(G(x)) = \frac{d}{dx}(F(x) + C)$  implies that  $G'(x) = F'(x) + 0$ .

#### Section 4.4

- T, F, F, T, F, F, F, F, F.
  - An antiderivative of  $f$  is just one function whose derivative is  $f$ , while the indefinite integral  $\int f(x) dx$  is the family of all antiderivatives of  $f$ .
  - See Definitions 4.9 and 4.15. The definite integral is a number while the indefinite integral is a family of functions; the definite integral concerns area while the indefinite integral concerns antiderivatives; we calculate definite integrals using Riemann sums, but we calculate indefinite integrals by antidifferentiating.
  - All blanks should contain  $\frac{1}{7}x^7$ .
  - At this point we don't know of a function whose derivative is  $\sec x$ , but we do know of a function whose derivative is  $\sin x$  (it is  $-\cos x$ ).
  - See the theorems in this section.
  - $\frac{d}{dx} \left( \frac{1}{2} e^{(x^2)} (x^2 - 1) \right) = x^3 e^{(x^2)}$
  - $\frac{d}{dx} (x(\ln x - 1)) = 1(\ln x - 1) + x \left( \frac{1}{x} - 0 \right) = \ln x$
  - One easy example is  $f(x) = x, g(x) = x^2$ .
  - $F'(x) = \csc^2 x$  for both  $x < 0$  and  $x > 0$ . The piecewise antiderivative  $F(x)$  here differs from the one in Theorem 4.18 by being shifted up 100 units on the right of the  $y$ -axis. Notice from the graphs that this does transformation does not affect the slope of the graph of  $F(x)$ .
  - $\frac{1}{3}x^3 - \frac{1}{2}x^6 - 7x + C$       23.  $\frac{3}{4}x^4 + \frac{5}{3}x^3 - \frac{3}{2}x^2 - 5x + C$
- F, F, T, F, F, T, T, F.
  - The Fundamental Theorem of Calculus relates the concept of signed area under a curve to antiderivatives, which enables us to quickly find the exact areas under curves, and connects the important concepts of definite integrals and indefinite integrals.
  - The Mean Value Theorem
  - $\frac{1}{b-a} \int_a^b v(t) dt$  is equal to  $\frac{s(b)-s(a)}{b-a}$ , so  $\int_a^b v(t) dx = s(b) - s(a)$ . Since  $s(t)$  is an antiderivative of  $v(t)$ , this is an example of the equation in the Fundamental Theorem.
  - $f(4) \approx 4.125$
  - $f(-2) \approx 2.5$
  - (a)  $\lim_{n \rightarrow \infty} \left( \frac{3}{n} \left( n \right) + \frac{6}{n^2} \frac{n(n+1)}{2} + \frac{3}{n^3} \frac{n(n+1)(2n+1)}{6} \right) = 7$ ;  
(b)  $3 \left( \frac{1}{3} \right) (2^3 - 1^3) = 7$ ; (c)  $\left[ 3 \left( \frac{1}{3} \right) x^3 \right]_1^2 = 7$
  - (a)  $\frac{100}{101}$ ; (b) 5000
  - Equivalent to FTC: (a), (d), and (e).

19.  $\frac{12}{5}$   
23.  $-\frac{2}{3}(5)^{-3/2} + \frac{2}{3}(2)^{-3/2}$

27.  $\sqrt{2} - 1$

31.  $2\pi$

35.  $\frac{\pi}{4}$

39.  $\ln 7 - \ln 2$

43.  $\ln(32) - \ln(8)$

47.  $\frac{3\pi}{2} - \pi \ln 8$

51.  $\frac{3}{2}$

55.  $\frac{1}{2} \cot\left(\frac{\pi^2}{16}\right) - \frac{1}{2} \cot\left(\frac{\pi^2}{4}\right)$

57.  $-\frac{3}{2} \ln 5$

61.  $\frac{343}{12}$

65.  $\int_0^{24} 0.05tdt = \left[\frac{0.05}{2}t^2\right]_0^{24} = 14.4$  gallons.

67. (a) Supposing that the "positive" direction is to the right, the figurine moves right along the track for the first five seconds, then left for the next five seconds, then right again, then left again. (b) approximately 5.27 inches, 3.125 inches, and 0 inches. (c) approximately 14.84 inches.

69.  $\frac{9}{14}$

71. (a) 80, and there is a line of about 5 people at noon; (b) 50 customers per hour; (c) at 3:00 P.M. there are about 40 people in the line; (d) every customer has been served.

73.  $\int_a^b x dx = \left[\frac{1}{2}x^2\right]_a^b = \frac{1}{2}b^2 - \frac{1}{2}a^2 = \frac{1}{2}(b^2 - a^2)$ .

75. If  $F$  is an antiderivative of  $f$ , then  $kF$  is an antiderivative of  $kf$ . Therefore  $\int_a^b kf(x)dx = kF(b) - kF(a) = k(F(b) - F(a)) = k[F(x)]_a^b = k \int_a^b f(x)dx$ .

77. See the proof in the reading.

79. If  $G(x) = F(x) + C$  then  $[G(x)]_a^b = [F(x) + C]_a^b = (F(b) + C) - (F(a) + C) = F(b) - F(a) = [F(x)]_a^b$ .

### Section 4.6

1. F, F, T, F, F, F, T.

3. Three (although two of them will be equal); positive; negative

5. (a)  $\int_{-3}^4 f(x)dx$ ; (b)  $\int_{-3}^{-1} f(x)dx - \int_{-1}^2 f(x)dx + \int_2^4 f(x)dx$

7. negative; positive

9. One possible example is  $f(x) = x$  on  $[-2, 2]$ .

21.  $\frac{42}{\ln 2}$

25.  $4 - 2\sqrt{3}$

29.  $\frac{\pi}{8}$

33.  $-\frac{1}{2e} + \frac{1}{2}$

37.  $\frac{3}{\ln 4}$

41.  $\ln 9 - \ln 14$

45.  $\frac{\pi}{6}$

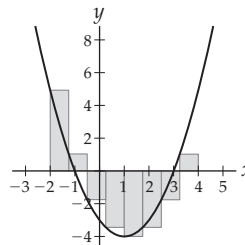

49.  $-\frac{3}{20}$

53.  $\frac{1}{e} + e$

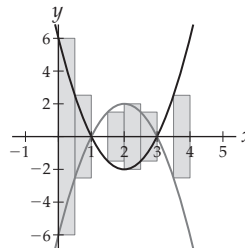

59.  $\frac{25}{2}$

63.  $3 - \frac{1}{\sqrt{2}}$

11. (a) See graph that follows; (b)  $\int_{-2}^4 f(x)dx$ ;  
(c)  $\int_{-2}^{-1} f(x)dx - \int_{-1}^3 f(x)dx + \int_3^4 f(x)dx$ .

13. (a) See graph that follows; (b)  $\int_0^1 (g(x) - f(x))dx$   
 $+ \int_1^3 (f(x) - g(x))dx + \int_3^4 (g(x) - f(x))dx$ .

15. Approximately  $-\frac{10}{3}$

17. Draw any graph where the average height of the graph on  $[-2, 5]$  is 10, and the slope from  $(-2, f(-2))$  to  $(5, f(5))$  on your graph is  $-3$ .

19. See the reading.

21.  $f$  is continuous on  $[1, 5]$ , so the Mean Value Theorem for Integrals applies and says that there is some  $c \in (1, 5)$  for which  $f(c) = c(c - 6)$  is equal to the average value  $\frac{1}{5-1} \int_1^5 x(x - 6)dx$  of the function  $f$ . You can compute this average value; it is equal to  $-\frac{23}{3}$ . Therefore, there is some  $c \in (1, 5)$  such that  $f(c) = -\frac{23}{3}$ . We can solve the equation  $f(c) = -\frac{23}{3}$  to find such a value of  $c$ . Actually there are two such values:  $c \approx 1.8453$  and  $c \approx 4.1547$ .

23. Using a left sum with  $n = 10$ , we have (a) 43.333; (b) 80.

25. Using a left sum with  $n = 8$ , we have (a)  $-11.1973$ ;  
(b) 12.2229.

27. (a)  $\frac{5}{2}$ ; (b)  $\frac{13}{2}$

29. (a)  $-\frac{4}{3}$ ; (b)  $\frac{109}{12}$

31. (a)  $\frac{25}{2}$ ; (b) 25.2

33. (a) 54, (b)  $\frac{194}{3}$

35. (a)  $\frac{2}{9}$ , (b)  $\frac{2}{9}$

37. (a)  $\frac{\pi}{2}$ , (b)  $\frac{\pi}{2}$

39. Using a left sum with  $n = 8$ , we have 22.

41.  $\frac{13}{2}$

43.  $\frac{38}{6}$

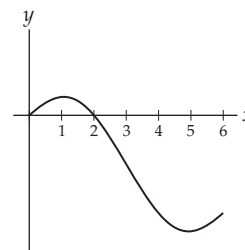

45. 15
47.  $\frac{19}{3}$
49.  $\frac{145}{12}$
51.  $-2 + \sqrt{3} + \frac{\pi}{3}$
53.  $(f(-1) + f(-0.75) + f(-0.5) + f(-0.25) + f(0) + f(0.25) + f(0.5) + f(0.75)) \left(\frac{1}{4}\right) \approx 1.981$
55. One possible approximation is  $\left(f\left(\frac{\pi}{4}\right) + f\left(\frac{\pi}{2}\right) + \cdots + f(2\pi)\right) \left(\frac{\pi}{4}\right) = 0$
57. 7
59. 4
61. -1
63.  $\frac{1}{2}(e^2 - e^{-2})$
65.  $\frac{11}{28}$
67. 0
69.  $c = 1$
71.  $c = \frac{-3 + \sqrt{201}}{12}$

73.  $-1 + \sqrt{3}$
75. (a) There is some time  $c \in (0, 4)$  when  $f'(c) = \frac{f(4) - f(0)}{4 - 0} = 1.44$ ; therefore there is some time  $c$  in the first four days when the rate of growth of the plant is 1.44 centimeters per day. (b) There is some time  $c$  during the first four days when the height of the plant is equal to the average height of the plant over those four days. Since this average height is 1.92 feet, we know that there is some  $c \in (0, 4)$  such that  $f(c) = 1.92$ . We can solve for  $c = 2.3094$ .
77. (a)  $\int_{1.51}^{5.29} (55 - f(x)) dx + \int_{5.29}^{18} (r(x) - f(x)) dx + \int_{18}^{30.71} (s(x) - g(x)) dx + \int_{30.71}^{34.49} (55 - g(x)) dx$ ;  
(b) 561.9 square feet (too big!)
79. Write out the Riemann sum for each side; the absolute values on the right-hand side factor out of both the sum and the limit.
81. See the reading concerning the development of average value in the plant height example.

### Section 4.7

1. F, F, F, T, F, T, T, F.
3.  $\int_2^x t^2 dt$
5.  $x$  is the independent variable;  $A(x)$  is the dependent variable, which represents the signed area under the graph of  $f(t)$  from  $t = 0$  to  $t = x$ ;  $t$  does not affect the dependent or independent variable.
7. (a) As  $x$  increases, the signed area  $A(x)$  accumulated also increases, but at a rate that decreases. Thus the rate of change of the rate of change of  $A(x)$  is negative, so  $A(x)$  is concave down). (b)  $A''(x) = \frac{d}{dx} \left( \frac{d}{dx} \int_0^x f(t) dt \right) = \frac{d}{dx} (f(x)) = f'(x)$ ; therefore,  $f$  decreasing  $\Rightarrow f'$  negative  $\Rightarrow A''$  negative  $\Rightarrow A$  concave down.
9. (a)  $A'(x)$  and  $B'(x)$  are both equal to  $x^2$ , so  $A(x)$  and  $B(x)$  differ by a constant. (b)  $A(x) - B(x) = \int_0^x t^2 dt - \int_3^x t^2 dt = \int_0^3 t^2 dt$ , which is a constant. (c)  $\int_0^3 t^2 dt$  is the signed area under the graph of  $y = x^2$  from  $x = 0$  to  $x = 3$ .

11.  $F(x) = A(g(x))$ , where  $A(x) = \int_3^x \sin t dt$  is outside and  $g(x) = x^2$  is inside.
13.  $A(5) < A(0) < A(-1) < A(-2)$
15.  $A(x)$  is positive on approximately  $[0, 2]$  and negative on  $[2, 6]$ .  $A(x)$  increases on  $[0, 1]$ , then decreases on  $[1, 5]$ , then increases again on  $[5, 6]$ . The graph of  $A$  has the following shape:

17. See the proof of Theorem 4.35.
19. (a)  $f(b) - f(a)$ ; (b) 0.
21. (a)  $\ln x = \int_1^x \frac{1}{t} dt$  is defined on  $(0, \infty)$  because  $\frac{1}{x}$  is continuous on  $(0, \infty)$ . Moreover,  $\ln x = \int_1^x \frac{1}{t} dt$  is zero for  $x = 1$ , increases without bound as  $x \rightarrow \infty$ , and decreases without bound as  $x \rightarrow 0^+$ ; therefore  $\ln x$  has range  $(-\infty, \infty)$ . (b) Follows from the fact that we define  $e^x$  to be the inverse of  $\ln x$ .
23.  $\ln 10 - 1$
25.  $\log_b x = \frac{1}{\ln b} \int_1^x \frac{1}{t} dt$ , or  $\log_b x = \int_1^x \frac{1}{(\ln b)t} dt$
27. (a)  $A(2)$  is the signed area under the graph of  $t^2 + 1$  from  $t = 1$  to  $t = 2$ ; (b)  $A(2) = \frac{10}{3}$ ,  $A(5) = \frac{136}{3}$ ;  
(c)  $A(x) = \frac{1}{3}x^3 + x - \frac{4}{3}$
29. (a)  $A(x)$  is the signed area under the graph of  $\frac{1}{t}$  from  $t = 3$  to  $t = x$ ; (b)  $A(2) = \ln 2 - \ln 3$ ,  $A(5) = \ln 5 - \ln 3$ ;  
(c)  $A(x) = \ln x - \ln 3$
31.  $\int_0^x \sin^2(3^t) dt$ ,  $\int_2^x \sin^2(3^t) dt$ ,  $\int_{-1}^x \sin^2(3^t) dt$
33.  $\int_0^x e^{(t^2)} dt$ ,  $\int_{-2}^x e^{(t^2)} dt$ ,  $\int_{10}^x e^{(t^2)} dt$
35.  $-e^{x^2+1}$
37.  $\cos(x^2)(2x)$
39.  $\int_1^{\sqrt{x}} \ln t dt + \frac{1}{2}\sqrt{x} \ln \sqrt{x}$
41. 0
43.  $-2 \ln |x^2| - 4$
45.  $54x$
47.  $\sin((x+2)^2) - \sin(x^2)$
49.  $f(x) = \frac{1}{2} \ln |2x - 1| + 3$
51.  $f(x) = \int_2^x \frac{1}{t^3+1} dt$
53.  $f(x) = \int_1^x e^{-t^2} dt$
55. Using left and right sums with 9 rectangles,  $1.92897 < \ln 10 < 2.82897$ .
57. Using left and right sums with four rectangles,  $0.877269 < \ln e < 1.14881$ .

59. (a)  $s(t) = \int_0^t \sin(0.1w^2)dw$ ; (b) about 2.41143 feet to the right of the starting position; (c) each rectangle has a height measured in feet per second and a width measured in seconds, thus an area that is measured in feet; (d) by looking at the graph of  $v(t) = \sin(0.1t^2)$ , the velocity oscillates faster and faster between 1 and  $-1$  feet per second.
61. (a)  $F_{i_0}(t) = \int_{i_0}^t 86400f(x)dx = 86400[-1.033x^3 + 441.75x^2 - 53605x]_{i_0}^t$ ; (b)  $F_{90}(195) \approx 58.9$  billion cubic feet; (c) about 17.971 billion cubic feet, about 76% of which flows through between days 90 and 195.
63. If  $G$  is an antiderivative of  $f$ , then by the Fundamental Theorem of Calculus we have  $\int_a^b f(x)dx = G(b) - G(a)$ . Therefore,  $A(x) = \int_0^x f(t)dt = G(x) - G(0)$ . Since  $A$  and  $G$  differ by a constant, they have the same derivative, namely,  $f$ ; thus  $A$  is an antiderivative of  $f$ .
65. See the proof given in the reading.
67. This is a just a rewording of the Second Fundamental Theorem, since  $F(x) = \int_a^x f(t)dt$  and the Second Fundamental Theorem tells us that the derivative of  $F$  is  $f$ .
69. (a)  $F' = f$ ,  $F$  is continuous on  $[a, b]$ , and  $F$  is differentiable on  $(a, b)$ . (b) There exists a number  $c \in (a, b)$  such that  $F'(c) = \frac{F(b) - F(a)}{b - a}$ . (c)  $f(c) = F'(c) = \frac{F(b) - F(a)}{b - a} = \frac{\int_a^b f(t)dt - \int_a^a f(t)dt}{b - a} = \frac{\int_a^b f(t)dt}{b - a}$ .
71. Since  $\frac{1}{t}$  is continuous for  $t > 0$ , the first part of the Second Fundamental Theorem guarantees that if  $\ln x = \int_1^x \frac{1}{t}dt$ , then  $\ln x$  is continuous and differentiable on  $(0, \infty)$ .
73.  $\ln 1 = \int_1^1 \frac{1}{t}dt = 0$ . Since the signed area under  $\frac{1}{t}$  is positive over any interval in  $(0, \infty)$ , if  $0 < x < 1$ , then  $\ln x = \int_1^x \frac{1}{t}dt = -\int_x^1 \frac{1}{t}dt$  is negative. Similarly, if  $x > 1$ , then  $\ln x = \int_1^x \frac{1}{t}dt$  is positive.
75. (a)  $\frac{d}{dx}(\ln ax) = \frac{d}{dx} \int_1^{ax} \frac{1}{t}dt = \frac{1}{ax}(a) = \frac{1}{x}$ . (b)  $\ln ax$  and  $\ln x$  have the same derivative, so they must differ by a constant, that is,  $\ln ax = \ln x + C$ . (c)  $\ln a = \ln 1 + C$ , so  $\ln a = 0 + C$ , so  $C = \ln a$ . Then just rename  $x$  to be  $b$  to complete the proof.
77.  $\ln \frac{a}{b} = \ln(ab^{-1}) = \ln a + \ln(b^{-1}) = \ln a - \ln b$

For answers to odd-numbered Skill Certification exercises in the Chapter Review, please visit the Book Companion Web Site at [www.whfreeman.com/tkcalculus](http://www.whfreeman.com/tkcalculus).

## Chapter 5

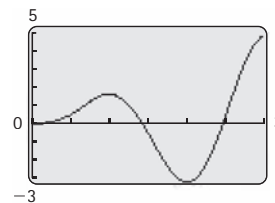

### Section 5.1

- T, F, F, F, T, F, T, F.
- Both integrals turn into  $\int \frac{1}{u} du$  after a change of variables;  $u = x^2 + 1$  in the first case,  $u = \ln x$  in the second.
- Three possible answers are  $\int 3x^2 \sin(x^3) dx$ ,  $\int \frac{\sin(\ln x)}{x} dx$ , and  $\int \frac{\sin(\sqrt{x}+2)}{2\sqrt{x}} dx$ .
- Three possible answers are  $\int \frac{3}{\sqrt{3x+1}} dx$ ,  $\int \frac{\cos x}{\sqrt{\sin x}} dx$ , and  $\int \frac{1}{x\sqrt{\ln x}} dx$ .
- $du = (2x + 1) dx$
- $du = \cos x dx$
- $\int_{-1}^5 u^2 du = \frac{126}{3} = 42$ ;  
 $\int_{x=-1}^{x=5} u^2 du = \frac{1}{3}(5)^6 - \frac{1}{3}(-1)^6 = 5208$ ;  
 $\int_{u(-1)}^{u(5)} u^2 du = \int_1^{25} u^2 du = \frac{1}{3}(25)^3 - \frac{1}{3}(1)^3 = 5208$
- Three of the many such integrals are in Exercises 34, 37, and 51.
- (a)  $\frac{1}{2} \int u^2 du = \frac{1}{6}(x^2 - 1)^3 + C$ ;  
(b)  $\int (x^5 - 2x^3 + x) dx = \frac{1}{6}x^6 - \frac{1}{2}x^4 + \frac{1}{2}x^2 + C$ ;  
(c) the answers differ by a constant:  
 $\frac{1}{6}(x^2 - 1)^3 = \frac{1}{6}x^6 - \frac{1}{2}x^4 + \frac{1}{2}x^2 - \frac{1}{6}$ .
- (a)  $-\frac{1}{3} \int_{x=-2}^{x=2} e^u du = -\frac{1}{3}[e^{5-3x}]_{-2}^2 = -\frac{1}{3}(e^{-1} - e^{11})$ ;  
(b)  $-\frac{1}{3} \int_{11}^{-1} e^u du = -\frac{1}{3}[e^u]_{11}^{-1} = -\frac{1}{3}(e^{-1} - e^{11})$
- $\frac{1}{9}(3x + 1)^3 + C$
- $4 \ln(x^2 + 1) + C$
- $\frac{1}{2}(\sqrt{x} + 3)^2 + C$
- $-\frac{1}{2} \cot x^2 + C$
- $\frac{1}{3} \ln |3x + 1| + C$
- $\frac{1}{2\pi} \sin^2 \pi x + C$
- $\frac{1}{2} \sec 2x + C$
- $-\frac{1}{6} \cot^6 x + C$
- $\frac{1}{11}x^{11} + \frac{1}{4}x^8 + \frac{1}{5}x^5 + C$
- $-\frac{4}{5} \cos(x^{5/4}) + C$
- $\frac{1}{2 \ln 2} 2^{2x+1} + C$
- $\frac{2}{3}(\ln x)^{3/2} + C$
- $\frac{1}{4}(\ln x)^2 + C$
- $\frac{3}{2} \ln(x^2 + 1) + \tan^{-1} x + C$
- $-\ln |2 - e^x| + C$
- $-2e^{-x} - x + C$
- $-\frac{1}{8} \cos^8 x + C$
- $(\sin x^2)^{1/2} + C$
- $\cos\left(\frac{1}{x}\right) + C$
- $\frac{1}{3}(x^2 + 1)^{3/2} + C$
- $\frac{2}{5}(x + 1)^{5/2} - \frac{2}{3}(x + 1)^{3/2} + C$

63.  $\frac{2}{27}(3x+1)^{3/2} - \frac{2}{9}(3x+1)^{1/2} + C$   
 65.  $-\cos(e^x) + C$   
 67.  $\frac{1}{103}(x-1)^{103} + \frac{2}{102}(x-1)^{102} + \frac{1}{101}(x-1)^{101} + C$   
 69.  $\frac{1}{2} \cosh x^2 + C$   
 73. 0  
 77.  $\frac{\pi}{8}$   
 79.  $1/4 + (5/2) \ln 2 - (1/2) \ln 10$   
 81. (a) 0; (b)  $c = 1$ .  
 85. 33.2128 cubic inches  
 87. (a)  $\int_0^{k\pi} \sin\left(2\left(x - \frac{\pi}{4}\right)\right) dx = -\frac{1}{2} \sin(2k\pi) = 0$  for any integer  $k$ ; (b)  $f$  is a general sine function with period  $\pi$  whose graph is half above and half below the  $x$ -axis.  
 89. Since  $\frac{d}{dx}(f(u(x))) = f'(u(x))u'(x)$ , we have  $\int f'(u(x))u'(x) dx = f(u(x)) + C$ .  
 91. See the proof of Theorem 5.3.

### Section 5.2

1. F, T, F, F, T, F, T, F.  
 3.  $\int u dv = uv - \int v du$ ;  
 (b)  $\int u(x)v'(x) dx = u(x)v(x) - \int v(x)u'(x) dx$   
 5.  $\int x \sin x dx$ ;  $\int x \ln x dx$       7.  $\int \ln x dx$   
 9. If  $u = 1$ , then integrating  $dv$  is equivalent to solving the original integral.  
 11. Exercises 28, 27, and 30 are three such examples.  
 13.  $du = 3 \cos 3x dx$  and  $dv = dx$ ;  $\int u dv = \int \sin 3x dx$ , and  $\int v du = \int 3x \cos 3x dx$ . The first integral is clearly easier, and the second integral can be rewritten in terms of the first using integration by parts.  
 15.  $[g(x)]_a^b - [h(x)]_a^b = (g(b) - g(a)) - (h(b) - h(a)) = (g(b) - h(b)) - (g(a) - h(a)) = [g(x) - h(x)]_a^b$ .  
 17. (a)  $\frac{d}{dx}(x \ln x) = \ln x + 1$ ; (b)  $\int (\ln x + 1) dx = x \ln x + C$ ;  
 (c)  $\int \ln x dx = x \ln x - \int 1 dx$   
 19.  $u = x, v = \frac{1}{\ln 2} 2^x$       21.  $u = \ln x, v = -x^{-2}$   
 23.  $u = \tan^{-1} x, dv = dx$   
 25. (a)  $x^3 \ln x - \frac{1}{3}x^3 + C$ ; (b)  $\frac{1}{3}(x^3 \ln x^3 - x^3) + C$ ; (c) Your answers should differ by a constant, which in this case is  $C = 0$ .  
 27.  $xe^x - e^x + C$       29.  $\frac{1}{2}x^2 \ln x - \frac{1}{4}x^2 + C$   
 31.  $-\frac{1}{2} \cos x^2 + C$       33.  $\frac{1}{3}x^2 e^{3x} - \frac{2}{9}xe^{3x} + \frac{2}{27}e^{3x} + C$   
 35.  $-xe^x - e^x + C$       37.  $\frac{3}{2}e^{x^2} + C$   
 39.  $3(x \ln x - x)$   
 41.  $-e^{-x}(x^2 + 1) - 2xe^{-x} - 2e^{-x} + C$   
 43.  $3x + \ln x + C$   
 45.  $\frac{1}{3}x^3 - 2(xe^x - e^x) + \frac{1}{2}e^{2x} + C$   
 47.  $\frac{2}{3}x^{3/2} \ln x - \frac{4}{9}x^{3/2} + C$       49.  $\frac{1}{2}x^2 e^{x^2} - \frac{1}{2}e^{x^2} + C$   
 51.  $-x \cot x + \ln |\sin x| + C$   
 53.  $x^3 \sin x + 3x^2 \cos x - 6x \sin x - 6 \cos x + C$   
 55.  $-\frac{1}{2}x^2 \cos x^2 + \frac{1}{2} \sin x^2 + C$   
 57.  $x \tan^{-1} 3x - \frac{1}{6} \ln |1 + 9x^2| + C$   
 59.  $-\frac{1}{5}e^{2x} \cos x + \frac{2}{5}e^{2x} \sin x + C$   
 61.  $\frac{1}{\ln(2/3)}(2/3)^x + C$   
 63.  $\frac{1}{2}e^{-x} \sin x - \frac{1}{2}e^{-x} \cos x + C$   
 65.  $x \tan x - \ln |\sec x| + C$   
 67.  $\frac{1}{2}x^2 \tan^{-1} x + \frac{1}{2} \tan^{-1} x - \frac{1}{2}x + C$   
 69.  $\frac{1}{2}x\sqrt{x^2 + 1} - \frac{1}{2} \sin h^{-1} x + C$   
 71.  $2 \ln 2 - 1$       73.  $-\frac{2}{e}$   
 75.  $\frac{1}{2}e^\pi + \frac{1}{2}$       77.  $\frac{1}{4}(\pi + 2 \ln 2)$   
 79. (a)  $-\frac{2}{e}$ ; (b)  $1 + \frac{-2+e}{e}$   
 81. (a)  $-\frac{1}{4} - \frac{3\pi}{8}$ ; (b)  $\frac{5\pi}{8}(2 + \pi)$   
 83. 4.27569 inches  
 85. About 15.47 cubic inches  
 87. (a)  $-\frac{5}{\pi} \cos(\pi t) + \frac{5}{\pi^2} \sin(\pi t)$ ; (b) the particle moves right, then left, then right again, a greater distance each time – see the picture of  $s(t)$  that follows; (c) at  $t = 3$  seconds it is more than 4 feet to the right, and it is just turning around to come back to the starting position; (d) after a long time the particle oscillates back and forth by greater and greater distances, moving faster and faster to cover more distance in the same time period.

89. (a) See the proof of Theorem 5.8;  
 (b)  $\frac{d}{dx}(x \ln x - x) = \ln x + x \left(\frac{1}{x}\right) - 1 = \ln x$ .
91. (a) Let  $u = \tan^{-1} x$  and  $dv = dx$  to get  
 $x \tan^{-1} x - \int \frac{x}{x^2+1} dx$ , and then use substitution with  
 $w = x^2 + 1$  to turn this into  $x \tan^{-1} x - \frac{1}{2} \int \frac{1}{w} dw =$   
 $x \tan^{-1} x - \frac{1}{2} \ln |w| + C = x \tan^{-1} x - \frac{1}{2} \ln(x^2 + 1) + C$ .  
 (b)  $\frac{d}{dx}(x \tan^{-1} x - \frac{1}{2} \ln(x^2 + 1)) =$   
 $\tan^{-1} x + x \left(\frac{1}{x^2+1}\right) - \frac{1}{2} \left(\frac{1}{x^2+1}\right) (2x) = \tan^{-1} x$ .

### Section 5.3

- F, T, T, T, T, F, F, T.
- A rational function is a function that can be expressed as a quotient of polynomials. A rational function is proper if the degree of its numerator is strictly less than the degree of its denominator, and improper otherwise.
- $p(x) = q(x)(x^2 - x + 3) + (3x + 1);$   
 $\frac{p(x)}{q(x)} = (x^2 - x + 3) + \frac{3x+1}{q(x)}$
- Divide both sides by  $q(x)$  and simplify.
- $m(x)$  will have degree 2 and the degree of  $R(x)$  will be strictly less than the degree of  $q(x)$ .
- Hint: Try an example, and then think about it in general.
- If  $q(x)$  is an irreducible quadratic then  $\frac{p(x)}{q(x)}$  is its own partial fractions decomposition; there is nothing further we can decompose. If  $q(x)$  is a reducible quadratic then  $q(x)$  is a product  $l_1(x)l_2(x)$  of two linear functions, and we can obtain a partial fractions decomposition of the form  $\frac{A_1}{l_1(x)} + \frac{A_2}{l_2(x)}$ ; in the example given, we have  $l_1(x) = x - 1$  and  $l_2(x) = x - 2$ .
- $y = x^2 - 3x + 5 = \left(x - \frac{3}{2}\right)^2 + \frac{11}{4}$  can be obtained from the graph of  $y = x^2$  by translating  $\frac{3}{2}$  units to the right and  $\frac{11}{4}$  units up.
- $\ln|x - 2| - \ln|x + 1| + C$
- $\ln|x - 1| - 2(x - 1)^{-1} + C$
- $x + \ln|x| + \frac{6}{x} + C$
- $\frac{5}{2}x^2 - 5x + 8 \ln|x - 2| + 27 \ln|x + 3| + C$
- $\frac{1}{7} \left( 2 \ln|x - 2| - \ln|x^2 + 3| + \sqrt{3} \tan^{-1} \left( \frac{1}{\sqrt{3}} x \right) \right) + C$
- $2 \ln|x - 1| - \ln|x^2 + x + 1| + C$
- $\ln|x^2 - 4x + 5| + 2 \tan^{-1}(x - 2) + C$
- $3 \ln|x - 2| + (x - 2)^{-1} + \frac{1}{2}(x - 2)^{-2} + C$ .
- $\frac{1}{3} \ln|3x + 1| - 2 \ln|x - 3| + C$

- $\frac{1}{2} \ln|x^2 + 1| + \tan^{-1} x - \frac{1}{2} \ln|x^2 + 3| + C$
- $-x^{-1} - 2 \ln|x| + \ln|x^2 + 1| - \tan^{-1} x + C$
- $-\ln|x + 1| + \frac{3}{2} \ln(x^2 + 1) + \tan^{-1} x + C$
- $x^2 + 3 \ln|x^2 - 4| + C$
- $\frac{1}{3}x^3 - \frac{5}{2}x^2 + 6x + C$
- $\frac{2}{3}x^3 - 2x + \frac{1}{2} \ln|x^2 - 4x + 1| + C$
- $\ln 2 - \ln 6 + \ln 5$
- $\ln 3 - \ln 4 + \ln 2$
- $2 + \ln 4 - \ln 2$
- $-\ln|\cos x| + \frac{1}{1+\ln x} + C$
- $\ln|1 + \ln x| + \frac{1}{1+\ln x} + C$
- (a)  $-\frac{\ln 3}{2}$ ; (b)  $\frac{1}{4}$
- (a)  $\frac{1}{2} \left( \ln 5 - \frac{2}{5} \right) \approx 0.605$ ; (b)  $x \approx 0.669$ ; note that  $f(0.668) \approx 0.605$ .
- $r(t) = \ln \left( \frac{p(t)(K-p_0)}{p_0(K-p(t))} \right)$ , and thus  $p(t) = \frac{p_0 K e^{r(t)}}{K - p_0 + p_0 e^{r(t)}}$ .
- Either mimic the example after Theorem 5.14 by adding and subtracting  $\left(\frac{b}{2}\right)^2$ , or else just simply multiply out  $f(x) = \left(x + \frac{b}{2}\right)^2 + \left(c - \frac{b^2}{4}\right)$  and show that it is equal to  $x^2 + bx + c$ .

### Section 5.4

- F, F, F, F, F, T, T.
- $\frac{d}{dx} \left( -\frac{1}{5} \cos^5 x + \frac{1}{7} \cos^7 x \right) =$   
 $\cos^4 x \sin x - \cos^6 x \sin x = \cos^4 x \sin x (1 - \cos^2 x) =$   
 $\cos^4 x \sin x \sin^2 x = \sin^3 x \cos^4 x$ .
- Multiply the integrand by  $\frac{\csc x + \cot x}{\csc x + \cot x}$ .
- Three possible examples are the integrals in Exercises 21, 22, and 41.
- Reduce powers with double-angle identities
- Apply the identity  $\cot^2 x = \csc^2 x - 1$  repeatedly until the integrand is converted into a sum of expressions that we can integrate. The power of cotangent will eventually decrease to zero.
- Use parts with  $u = \csc^{k-2} x$  and  $dv = \csc^2 x$ .
- Reduce powers with double-angle identities.
- Use  $\tan^2 x = \sec^2 x - 1$  to rewrite the integrand entirely in terms of secant, saving one copy of  $\sec x \tan x$  for the differential of the substitution  $u = \sec x$ .
- (a) Rewrite as  $\int (1 - \cos^2 x) \cos^2 x dx = \int \cos^2 x dx - \int \cos^4 x dx$  and then apply double-angle identities to reduce powers;  
 (b)  $\int \left( \frac{1}{2} \sin 2x \right)^2 dx = \frac{1}{8} \left( x - \frac{1}{4} \sin 4x \right) + C$ .
- $\frac{1}{2}x - \frac{1}{12} \sin(6x) + C$
- $\sin x - \frac{2}{3} \sin^3 x + \frac{1}{5} \sin^5 x + C$

25.  $-\frac{1}{2} \ln |\cos 2x| + C$
27.  $\frac{1}{4} \ln |\sec 4x + \tan 4x| + C$
29.  $-\frac{1}{4} \cot^4 x + \frac{1}{2} \cot^2 x + \ln |\sin x| + C$
31.  $\frac{1}{4} \sec 2x \tan 2x + \frac{1}{4} \ln |\sec 2x + \tan 2x| + C$
33.  $\frac{3}{8}x + \frac{1}{4} \sin 2x + \frac{1}{32} \sin 4x + C$
35. One way is to use parts with  $u = \csc^2 x$  and  $dv = \csc^2 x dx$  to get  $-\csc^2 x \cot x - 2 \int \csc^2 x \cot^2 x dx$ . Then use substitution with  $u = \cot x$  to get  $-\csc^2 x \cot x + \frac{2}{3} \cot^3 x + C$ .
37.  $\frac{1}{5} \sin^5 x - \frac{1}{7} \sin^7 x + C$       39.  $\frac{1}{3} \sec^3 x - \sec x + C$
41.  $-\frac{1}{8}x - \frac{1}{96} \sin(12x) + C$       43.  $\frac{1}{8} \sec^8 x + C$
45.  $\frac{1}{7} \sec^7 x - \frac{2}{5} \sec^5 x + \frac{1}{3} \sec^3 x + C$
47.  $\frac{1}{14} \sin^{14} x - \frac{1}{8} \sin^{16} x + \frac{1}{18} \sin^{18} x + C$
49.  $-\frac{1}{2} \csc x \cot x + \frac{1}{2} \ln |\csc x + \cot x| + C$
51.  $\frac{1}{3} \sec^3 x + C$       53.  $-\ln |\cos x| + C$
55.  $\sin x + C$       57.  $\frac{1}{\cos x} + C$
59.  $-\frac{1}{2} \cos^2 x \ln(\cos x) + \frac{1}{4} \cos^2 x + C$
61.  $\frac{2}{9} \cos^{9/2} x - \frac{2}{5} \cos^{5/2} x + C$
63.  $\frac{1}{3} \cosh^3 x + C$       65.  $\frac{1}{7} \cosh^7 x + C$
67.  $\frac{16}{15}$       69.  $\frac{4}{3}$
71.  $\frac{4}{15}$       73.  $\frac{8}{15}$
75.  $\frac{1}{3}$       77. (a) 0; (b)  $\frac{32}{15}$ ; (c)  $\frac{16}{15\pi}$
79. (a) 1.5; (b)  $\frac{1}{2} + \frac{3\sqrt{3}}{\pi}$       81.  $\ln(7 + 4\sqrt{3})$  inches
83. See the proof of Theorem 5.17 in the reading.
85. (a)  $\int \sin^4 x dx = -\frac{1}{4} \sin^3 x \cos x + \frac{3}{8}x - \frac{3}{16} \sin 2x + C$ , and  $\int \sin^8 x dx = -\frac{1}{8} \sin^7 x \cos x - \frac{7}{48} \sin^5 x \cos x - \frac{35}{192} \sin^3 x \cos x + \frac{35}{128}x - \frac{35}{256} \sin 2x$ . (b) The formula reduces the power of  $\sin x$  in the integrand by two every time we apply it. (c) Apply integration by parts with  $u = \sin^{k-1} x$  and  $dv = \sin x dx$ , so that  $v = -\cos x$  and  $du = (k-1) \sin^{k-2} x \cos x dx$ . After applying the integration by parts formula, multiply out the integrand to obtain a term of the form  $(k-1) \int \sin^k x dx$ . Then solve for  $\int \sin^k x dx$ .

## Section 5.5

1. T, T, T, F, F, T, F, T.
3. (a)  $1 = \sec^2 u \frac{du}{dx}$ , so  $dx = \sec^2 u du$ ; (b)  $\frac{dx}{du} = \sec^2 u$ , so  $dx = \sec^2 u du$
5. See the reading.
7. In terms of the Pythagorean identity, sine and cosine behave the same way; we can always use  $x = \sin u$  instead of  $x = \cos u$ .
9.  $x = a \sin u$  makes sense only for  $x \in [-1, 1]$ , but the domain of  $a^2 - x^2$  is  $(-\infty, \infty)$ . On the other hand,  $x = a \tan u$  makes sense for  $x \in (-\infty, \infty)$ , i.e., everywhere that  $x^2 + a^2$  is defined.
11. (a) Use algebra; (b) use conventional substitution with  $u = 4 + x^2$ ; (c) use trigonometric substitution with  $x = 2 \tan u$ ; (d) use algebra after writing  $16 - x^4 = (4 - x^2)(4 + x^2)$ .
13. See the proof of Theorem 5.18.
15. See the proof of Theorem 5.18.
17.  $\sqrt{1 - x^2}$  is not defined on  $[2, 3]$ ; its domain is  $[-1, 1]$ .
19. Three of the many such integrals are in Exercises 41, 42, and 46.
21.  $\sqrt{1 - x^2}$       23.  $\frac{x}{\sqrt{x^2 + 4}}$
25.  $\tan^2 u = \frac{(x-5)^2}{9 - (x-5)^2}$
27.  $\sin(2 \cos^{-1} x) = 2x\sqrt{1 - x^2}$
29.  $(x + 3)^2 - 11; x + 3 = \sqrt{11} \sec u$
31.  $(x - \frac{5}{2})^2 - \frac{21}{4}; x - \frac{5}{2} = \frac{\sqrt{21}}{2} \sec u$
33.  $12 - 2(x + 2)^2; x + 2 = \sqrt{6} \sin u$
35. (a)  $\int \frac{1}{9 \tan^2 u + 9} (3 \sec^2 u) du = \frac{1}{3} \tan^{-1} \frac{x}{3} + C$ ;  
(b)  $\frac{1}{9} \int \frac{1}{(\frac{x}{3})^2 + 1} dx = \frac{1}{3} \tan^{-1} \frac{x}{3} + C$ .
37. (a)  $\frac{1}{2} \int \frac{1}{u} du = \frac{1}{2} \ln |4 + x^2| + C$   
(b)  $\int \frac{2 \tan u}{4 + 4 \tan^2 u} (2 \sec^2 u) du = -\ln \left| \frac{2}{\sqrt{x^2 + 4}} \right| + C$
39.  $-\frac{\sqrt{4 - x^2}}{x} - \sin^{-1} \frac{x}{2} + C$
41.  $(x^2 - 1)^{1/2} + C$       43.  $\sin^{-1} \frac{x}{\sqrt{3}} + C$
45.  $\sqrt{9 - x^2} - 3 \ln \left( \frac{\sqrt{9 - x^2} + 3}{x} \right) + C$
47.  $\frac{1}{2}(x - 2)\sqrt{1 - (x - 2)^2} + \frac{1}{2} \sin^{-1}(x - 2) + C$
49.  $\frac{\sqrt{x^2 - 9}}{9x} + C$       51.  $\frac{x}{\sqrt{1 - x^2}} + C$
53.  $\frac{1}{3} \tan^{-1} \left( \frac{x - 2}{3} \right) + C$

55.  $-\frac{1}{4}\sqrt{9-4x^2} + \frac{3}{2}\sin^{-1}\frac{2x}{3} + C$
57.  $\frac{1}{2}(x-4)\sqrt{(x-4)^2+9} + \frac{9}{2}\ln\left|\frac{1}{3}\sqrt{(x-4)^2+9} + \frac{1}{3}(x-4)\right| + C$
59.  $\sqrt{3-x^2}\left(\frac{15}{8}x - \frac{1}{4}x^3\right) + \frac{27}{8}\sin^{-1}\left(\frac{x}{\sqrt{3}}\right) + C$
61.  $\frac{1}{2}x\sqrt{2-x^2} + \sin^{-1}\left(\frac{x}{\sqrt{2}}\right) + C$
63. If  $x > 1$ , we have  $\sqrt{x^2-1} - \sec^{-1}x + C$ ; if  $x < -1$ , we have  $\sqrt{x^2-1} + \sec^{-1}x + C$ .
65.  $\ln(2(\sqrt{x^2-2}+x)) + C$
67.  $\frac{1}{5}(x^2+1)^{5/2} - \frac{1}{3}(x^2+1)^{3/2}$
69.  $x\ln(1+x^2) - 2x + 2\tan^{-1}x + C$
71.  $\frac{1}{3}(e^{2x}+1)^{3/2} + C$
73.  $-\frac{1}{3}\frac{\sqrt{e^{2x}+3}}{e^x} + C$
75.  $\frac{1}{2}x^2 - 2\ln(x^2+4) + C$
77.  $-\frac{2}{9}x + \frac{1}{9}x^3 - \frac{23}{9\sqrt{6}}\tan^{-1}\left(\sqrt{\frac{3}{2}}x\right) + C$
79.  $\frac{1}{3}(20)^{3/2} - \frac{1}{3}(4)^{3/2}$
81.  $\frac{1}{3}\ln 10 - \frac{1}{3}\ln(3+\sqrt{34})$
83.  $-\sqrt{3} + \sqrt{15}$
85.  $\frac{2}{3} - \frac{1}{3\sqrt{7}}$
87.  $\sinh^{-1}\frac{x}{2} + C$
89.  $\sinh^{-1}x - \tanh(\sinh^{-1}x) + C$
91. (a)  $4\pi\int_{-\sqrt{42}}^{\sqrt{42}}\sqrt{42-x^2}dx$ ; (b) using trigonometric substitution with  $x = \sqrt{42}\sin u$ , we obtain a volume of approximately 829 cubic millimeters.
93. (a)  $2\int_{-r}^r\sqrt{r^2-x^2}dx$   
 (b)  $2\int_{-\pi/2}^{\pi/2}\sqrt{r^2-r^2\sin^2u}(r\cos u)du =$   
 $2r^2\int_{-\pi/2}^{\pi/2}\cos^2u du = 2r^2\left(\frac{1}{2}\right)\int_{-\pi/2}^{\pi/2}(1+\cos 2u)du =$   
 $r^2\left[u + \frac{1}{2}\sin 2u\right]_{-\pi/2}^{\pi/2} = \pi r^2$

### Section 5.6

1. F, F, F, F, T, T, F, T.
3. The interval over which we are integrating could be infinite, or the function to be integrated could have a discontinuity or a vertical asymptote on the interval.
5. The integrand  $\frac{1}{e^x}$  is continuous on  $[0, 1]$ , in particular with no vertical asymptotes; this integral is not improper.

7. The Fundamental Theorem of Calculus does not apply here because  $(x-3)^{-4/3}$  is not continuous at  $x=3$ , inside the interval  $[0, 5]$ . Applying it anyway would give the incorrect answer  $\frac{-3}{2^{1/3}} + \frac{3}{(-3)^{1/3}}$ , when the correct answer is that the improper integral diverges.
9. If  $p \geq 1$  and  $x \in [0, 1]$  then  $\frac{1}{x^p}$  is greater than  $\frac{1}{x}$ , whose improper integral on  $[0, 1]$  is known to diverge.
11. Since  $\frac{1}{x+1} < \frac{1}{x}$  for  $x \geq 1$  and  $\int_1^\infty \frac{1}{x} dx$  diverges, this comparison does not tell us anything.
13.  $\frac{1}{x+1} \leq \frac{1}{x}$ , but knowing that an improper integral is less than a divergent one does not give us any information. Instead, note that the graph of  $y = \frac{1}{x+1}$  is just a horizontal translation of the graph of  $y = \frac{1}{x}$ . This means their improper integrals are related; how?
15. We can split at any point in  $[1, \infty)$ , for example at  $x=2$  to get:  $\int_1^2 \frac{1}{x-1} dx + \int_2^\infty \frac{1}{x-1} dx$ .
17.  $\int_0^2 \frac{1}{2x^2-10x+12} dx + \int_2^{2.5} \frac{1}{2x^2-10x+12} dx$   
 $+ \int_{2.5}^3 \frac{1}{2x^2-10x+12} dx + \int_3^5 \frac{1}{2x^2-10x+12} dx$
19. Choosing  $x = \pm 1$  for the splits, we have  
 $\int_{-\infty}^{-1} \frac{e^{-x^2}}{x^2} dx + \int_{-1}^0 \frac{e^{-x^2}}{x^2} dx + \int_0^1 \frac{e^{-x^2}}{x^2} dx + \int_1^\infty \frac{e^{-x^2}}{x^2} dx$ .

67. Converges by limit comparison with  $\frac{1}{x^2}$
69. Diverges by comparison with  $\frac{1}{x^{1/3}}$
71. About 1.25 pounds.
73. About 3.23 years.
75. If  $p > 1$ , then
- $$\int_1^\infty \frac{1}{x^p} dx = \lim_{B \rightarrow \infty} \int_1^B x^{-p} dx = \lim_{B \rightarrow \infty} \left[ \frac{1}{-p+1} x^{-p+1} \right]_1^B =$$
- $$\lim_{B \rightarrow \infty} \left( \frac{1}{1-p} B^{1-p} - \frac{1}{1-p} \right) = \frac{1}{p-1}. \text{ Note that we used the}$$
- fact that  $p > 1$  to take the limit, since in that case we have  $1 - p < 0$  and  $B^{1-p} \rightarrow 0$  as  $B \rightarrow \infty$ .
77. If  $p \geq 1$ , then  $\int_0^1 \frac{1}{x^p} dx = \lim_{A \rightarrow 0^+} \int_A^1 x^{-p} dx =$
- $$\lim_{A \rightarrow 0^+} \left[ \frac{1}{-p+1} x^{-p+1} \right]_A^1 = \lim_{A \rightarrow 0^+} \left( \frac{1}{1-p} - \frac{1}{1-p} A^{1-p} \right)$$
- diverges.
79. Mimic the proof of the case of Theorem 5.23 in the reading.
81. We will suppose that  $d > c$ ; the case where  $d < c$  is similar. We have  $\int_{-\infty}^d f(x) dx + \int_d^{\infty} f(x) dx =$
- $$\left( \int_{-\infty}^c f(x) dx + \int_c^d f(x) dx \right) + \int_d^{\infty} f(x) dx = \int_{-\infty}^c f(x) dx +$$
- $$\left( \int_c^d f(x) dx + \int_d^{\infty} f(x) dx \right) = \int_{-\infty}^c f(x) dx + \int_c^{\infty} f(x) dx.$$

## Section 5.7

- T, T, F, T, T, T, F.
  - Use pictures similar to the three immediately before Theorem 5.24, but with an increasing function.
  - One example is  $f(x) = -x^2 + 2x + 3$  on  $[0, 3]$ , with  $n = 3$  left and right sums.
  - The same example from Problem 5 works here as well.
  - Midpoint sum
  - Do the approximation separately on  $[a, c]$  and on  $[c, b]$  and calculate bounds for the error on each piece using Theorem 5.27. The total error will be less than or equal to the sum of the absolute values of the two errors you calculated.
  - See the discussion in the reading prior to Theorem 5.27.
  - (a)  $\text{LEFT}(n) < \text{MID}(n) < \text{TRAP}(n) < \text{RIGHT}(n)$ ;  
(b) between  $\text{TRAP}(n)$  and  $\text{MID}(n)$ .
  - Using the weighted average from Exercise 61, the  $n = 1000$  Simpson's Rule approximation is 1.09861229, which we would expect to be an even better approximation.
  - By the old formula we have
- $$\int_1^5 (3x^2 - x + 4) dx = 3 \int_1^5 x^2 dx - \int_1^5 x dx + \int_1^5 4 dx =$$
- $$3 \left( \frac{1}{3} \right) (5^3 - 1^3) - \left( \frac{1}{2} \right) (5^2 - 1^2) + 4(5 - 1) = 128 \text{ and}$$
- by the new formula we also have
- $$\int_1^5 (3x^2 - x + 4) dx = \frac{5-1}{6} ((3(1)^2 - 1 + 4) + 4(3(3)^2 -$$
- $$3 + 4) + (3(5)^2 - 5 + 4)) = 128.$$
- Mimic Example 3 but with  $n = 4$  instead of  $n = 6$ .
  - $\text{RIGHT}(4) = 40$ . Since  $f'(x) = 2x + 1$  is positive on  $[0, 4]$  we know that  $f(x) = x^2 + x$  is monotonically increasing on  $[0, 4]$ . Therefore we can guarantee that  $|\text{E}_{\text{RIGHT}(4)}| \leq |f(4) - f(0)| \left( \frac{4-0}{4} \right) = 20$ . The actual area is about 29.33, which is within the error bounds of our approximation.
  - $\text{LEFT}(6) = 0.37404$ . Since  $f'(x) = -e^{-x}$  is negative on  $[1, 3]$  we know that  $f(x) = e^{-x}$  is monotonically decreasing on  $[1, 3]$ . Therefore we can guarantee that  $|\text{E}_{\text{LEFT}(6)}| \leq |f(3) - f(1)| \left( \frac{3-1}{6} \right) = |e^{-3} - e^{-1}| \left( \frac{1}{3} \right) = 0.106031$ . The actual area is approximately 0.318092, which is within the error bounds for our approximation.
  - $\text{TRAP}(6) = 0.321033$ . Since  $f''(x) = e^{-x}$  is positive on  $[1, 3]$  we know that  $f(x) = e^{-x}$  is concave up on  $[1, 3]$ . Moreover,  $|f''(x)| = |e^{-x}| \leq e^{-1}$  for all  $x \in [1, 3]$ . Therefore we can guarantee that  $|\text{E}_{\text{TRAP}(6)}| \leq \frac{e^{-1}(3-1)^3}{12(6)^2} = 0.00681258$ .
  - $\text{MID}(12) = 7.63016$ . Since  $f''(x) = -\frac{1}{x^2}$  is negative on  $[1, 7]$  we know that  $f(x) = \ln x$  is concave down on  $[1, 7]$ . Moreover  $|f''(x)| = |-\frac{1}{x^2}| \leq \frac{1}{1^2} = 1$  for all  $x \in [1, 7]$ . Therefore  $|\text{E}_{\text{MID}(12)}| \leq \frac{1(7-1)^3}{24(12)^2} = 0.0625$ .
  - $\text{TRAP}(8) = 3.25174$ ; using the fact that  $|f''(x)| \leq 2$  for all  $x \in [0, 2]$  (this is not the best possible bound), we can guarantee that  $|\text{E}_{\text{TRAP}(8)}| \leq 0.0208333$ .
  - $\text{LEFT}(9) \approx 0.996$ ;  $|\text{E}_{\text{LEFT}(9)}| \leq 0.484$ .
  - $\text{SIMP}(12) = 24$ . Since  $f^{(4)} = 0$  for all  $x \in [-2, 4]$  we can guarantee that  $\text{E}_{\text{SIMP}(12)} \leq 0$ , i.e., that the estimate is in fact exact.
  - $\text{SIMP}(4) = 3.7266$ . Since  $f'[4] = 24$  for all  $x \in [-1, 2]$  we can guarantee that  $\text{E}_{\text{SIMP}(4)} \leq 0.1266$ .
  - $\text{SIMP}(8) = 0$ . Since  $f'[4] \leq 1$  for all  $x \in [-\pi, \pi]$  we can guarantee that  $\text{E}_{\text{SIMP}(8)} \leq 0.013$ .
  - Since  $f(x) = xe^x$  is monotonically increasing on  $[-1, 1]$ , Theorem 5.25 guarantees we can have  $|\text{E}_{\text{LEFT}(n)}| \leq 0.5$  if we choose  $n = 13$  or higher. We have  $\text{LEFT}(13) = 0.509077$ .
  - Since  $f(x) = \frac{1}{x}$  is monotonically decreasing on  $[2, 4]$ , Theorem 5.25 guarantees we can have  $|\text{E}_{\text{LEFT}(n)}| \leq 0.05$  if we choose  $n = 10$  or higher. We have  $\text{RIGHT}(10) = 0.668771$ .
  - Since  $f(x) = x^2$  is concave up on  $[0, 3]$  with  $f''(x) = 2$  for all  $x$ , Theorem 5.27 guarantees we can have  $|\text{E}_{\text{MID}(n)}| \leq 0.1$  if we choose  $n = 5$  or higher. We have  $\text{MID}(5) = 8.91$ .
  - Since  $f(x) = x^{2/3}$  is concave down on  $[1, 4]$  with  $|f''(x)| \leq \frac{2}{9}$  for all  $x \in [1, 4]$ , Theorem 5.27 guarantees we can have  $|\text{E}_{\text{MID}(n)}| \leq 0.005$  if we choose  $n = 10$  or higher. We have  $\text{TRAP}(10) = 5.44578$ .

49. Since  $f(x) = 10e^{-x}$  has  $|f^{[4]}(x)| \leq 10$  for all  $x \in [0, 2]$ , Theorem 5.30 guarantees we can have  $|E_{\text{SIMP}(n)}| \leq 0.01$  if we choose  $n = 4$  or higher, meaning that we should use 2 or more parabola-topped rectangles. We have  $\text{SIMP}(4) = 8.64956$ .
51. Since  $f(x) = \sin x$  has  $|f^{[4]}(x)| \leq 1$  for all  $x$ , Theorem 5.30 guarantees we can have  $|E_{\text{SIMP}(n)}| \leq 0.0005$  if we choose  $n = 8$  or higher, meaning that we should use 4 or more parabola-topped rectangles. We have  $\text{SIMP}(8) = 2.00027$ .
53. (a)  $\text{LEFT}(4) = 32.96$  degrees,  $\text{RIGHT}(4) = 19.99$  degrees,  $\text{MID}(4) = 25.6717$  degrees,  $\text{TRAP}(4) = 26.48$  degrees, and  $\text{SIMP}(4) = 25.94$  degrees. (b)  $|E_{\text{LEFT}(4)}| < 12.97$ ,  $|E_{\text{RIGHT}(4)}| < 12.97$ ,  $|E_{\text{MID}(4)}| < 0.625$ ,  $|E_{\text{TRAP}(4)}| < 1.25$ , and  $|E_{\text{SIMP}(4)}| < 0.208$ .
55. Hints: For (a) you need to use four parabolas, over the intervals  $[1993, 1995]$ ,  $[1995, 1997]$ ,  $[1997, 1999]$ , and  $[1999, 2001]$ . In part (b) note that the area under the graph of  $r$  on an interval is the change in the GDP over that interval. For part (c) you can make a table of difference quotients to estimate  $r'$ , and then repeat that process to estimate higher derivatives.
57. Remember that the period of time must be in seconds. A discrete integral for the total flow is  $\phi \approx (1/3)(60 \times 60 \times 60 \times 24(700 + 4 \times 1000 + 2 \times 6300 + 4 \times 4000 + 2 \times 500 + 4 \times 650 + 700)) + 60(24(700 \times 5) \times 60) = 65,275,200,000$ . The answer is in cubic feet of water. Inasmuch as the last flow is 700 cfs, as is the first, and the flow is periodic, it seems obvious that we should take the flow to be a constant 700 cfs for the last five days of the year, which is where that last term comes from.
59. Mimic the proof of part (a) of the theorem given in the reading.
61. Use the expanded sum expressions for the trapezoid sum with  $n$  subdivision points called  $x_0, x_2, x_4, \dots, x_{2n}$ , the midpoint sum with the same  $n$  subdivision points and thus midpoints  $x_1, x_3, x_5, \dots, x_{2n-1}$ , and compare to Simpson's Rule with all  $2n$  subdivision points  $x_0, x_1, x_2, \dots, x_{2n}$ .
63. Generalize the method shown for  $n = 6$  in Example 3 to arbitrary  $n$ .
7. (a)  $\Delta x = \frac{1}{2}$ , subdivision points  $x_0 = 0, x_1 = 0.5, x_2 = 1, x_3 = 1.5$ , and  $x_4 = 2$ ; (b) using midpoints,  $x_1^* = 0.25, x_2^* = 0.75, x_3^* = 1.25$ , and  $x_4^* = 1.75$ ; (c) corresponding values  $f(x_1^*) = 0.0625, f(x_2^*) = 0.5625, f(x_3^*) = 1.5625$ , and  $f(x_4^*) = 3.0625$ ; (d)  $(16\pi - \pi((0.75)^2)^2) \left(\frac{1}{2}\right) \approx 24.6357$ .
9.  $\pi \int_2^3 (1+x)^2 dx$ ; the solid obtained by rotating the region between the graph of  $f(x) = 1+x$  and the  $x$ -axis on  $[2, 3]$  around the  $x$ -axis.
11.  $\pi \int_0^2 (4-x^2) dx$ ; the solid obtained by rotating the region between the graph of  $f(x) = \sqrt{4-x^2}$  and the  $x$ -axis on  $[0, 2]$  around the  $x$ -axis.
13. They are equal.
15. The second one is larger.
17. The second one is larger.
19. The region between  $f(x) = x+1$  and the line  $y = 4$  from  $x = 1$  to  $x = 3$ , rotated around the  $x$ -axis.
21. The region between  $f(x) = x-1$  and the  $x$ -axis on  $[1, 3]$ , rotated around the  $x$ -axis.
23. The region between the graph of  $f(x) = 2x+1$  and the line  $y = 5$  on the  $x$ -interval  $[0, 2]$ , rotated about the  $y$ -axis.
25.  $\pi \int_{-3}^0 2^2 dy + \pi \int_0^3 (2^2 - (f^{-1}(y))^2) dy$
27.  $\pi + 2\pi + 3\pi + 4\pi = 10\pi$
29.  $3\pi + (2 + 2\sqrt{2})\pi + (3 + 2\sqrt{3})\pi + 8\pi \approx 70.03$
31.  $\pi \int_1^3 \left(\frac{3}{x}\right)^2 dx = 6\pi$
33.  $\pi \int_0^1 (3^2 - 1^2) dy + \pi \int_1^3 \left(\left(\frac{3}{y}\right)^2 - 1^2\right) dy = 8\pi + 4\pi = 12\pi$
35.  $\pi \int_0^3 (5^2 - (y+2)^2) dy = 36\pi$
37.  $\pi \int_2^5 (3^2 - (3 - (x-2))^2) dx = 18\pi$
39.  $\pi \int_0^3 (3^2 - ((y+2) - 2)^2) dy = 18\pi$
41.  $\pi \int_0^4 (2^2 - (\sqrt{4-y})^2) dy + \pi \int_4^5 (2^2) dy = 8\pi + 4\pi = 12\pi$
43.  $\pi \int_0^4 ((3 - (\sqrt{4-y}))^2 - 1^2) dy + \pi \int_4^5 (3^2 - 1^2) dy = 8\pi + 8\pi = 16\pi$
45.  $\pi \int_1^{5/3} ((5-x)^2 - (2x)^2) dx + \pi \int_{5/3}^4 ((2x)^2 - (5-x)^2) dx = \frac{112\pi}{27} = \frac{1813\pi}{27} = \frac{1925\pi}{27}$
47.  $\pi \int_0^4 \left((\sqrt{y})^2 - \left(\frac{y}{2}\right)^2\right) dy = \frac{8\pi}{3}$
49.  $\pi \int_0^2 ((2x+1)^2 - (x^2+1)^2) dx = \frac{104\pi}{15}$
51.  $\pi \int_1^4 (x^2 - ((x-2)^2)^2) dx = \frac{72\pi}{5}$
53.  $\pi \int_1^4 ((x+1)^2 - ((x-2)^2 + 1)^2) dx = \frac{117\pi}{5}$
55.  $\pi \int_0^\pi (1 - \cos x)^2 dx \approx 14.80$
57.  $\pi \int_0^2 (\pi - \cos^{-1}(1-y))^2 dy \approx 18.4399$

For answers to odd-numbered Skill Certification exercises in the Chapter Review, please visit the Book Companion Web Site at [www.whfreeman.com/tkcalculus](http://www.whfreeman.com/tkcalculus).

## Chapter 6

### Section 6.1

1. F, F, F, T, T, T, T, T.
3. (a)  $2.25\pi$ ; (b)  $5.25\pi$
5. Mimic the example and illustrations in the reading at the beginning of the section.

59. (a) 481 feet; (b) 91,636,272 cubic feet;  
 (c)  $\int_0^{481} \left(756 - \frac{756}{481}x\right)^2 dx = 91,636,272$ .
61. The cone can be obtained by rotating the region under  $y = \frac{3}{5}x$  around the  $x$ -axis; this solid has volume  

$$\pi \int_0^5 \left(\frac{3}{5}x\right)^2 dx = 15\pi.$$
63. A cone of radius  $r$  can be obtained by rotating the region under the graph of  $y = \frac{r}{h}x$  around the  $x$ -axis; this solid has volume  $\pi \int_0^h \left(\frac{r}{h}x\right)^2 dx = \frac{1}{3}\pi r^2 h$ .

### Section 6.2

1. T, T, F, F, F, T, F, T.
3. (a) Washer of volume  $\frac{15\pi}{2}$ ; (b) shell of volume  $\frac{15\pi}{4}$ ;  
 (c) cylinder of volume  $\frac{3\pi}{4}$ ; (d) disk of volume  $\frac{9\pi}{2}$ ;  
 (e) shell of volume  $\frac{9\pi}{4}$ ; (f) washer of volume  $\frac{21\pi}{2}$ .
5. Shells have the same types of dimensions as washers, but what we think of as a height on a shell is considered a thickness on a washer, and vice-versa.
7. (a)  $\Delta x = 0.5$ , subdivision points  $x_0 = 0$ ,  $x_1 = 0.5$ ,  $x_2 = 1$ ,  $x_3 = 1.5$ , and  $x_4 = 2$ ; (b) midpoints  $x_1^* = 0.25$ ,  $x_2^* = 0.75$ ,  $x_3^* = 1.25$ , and  $x_4^* = 1.75$ ; (c) corresponding values  $f(x_1^*) = 0.0625$ ,  $f(x_2^*) = 0.5625$ ,  $f(x_3^*) = 1.5625$ , and  $f(x_4^*) = 3.0625$ ; (d)  $2\pi rh\Delta x = 2\pi \cdot \frac{3}{4} \cdot \frac{9}{16} \cdot \frac{1}{2} = \frac{27}{64}\pi$
9.  $\int_0^2 2\pi y^3 dy = 2\pi \int_0^2 y(y^2) dy$ ; the solid obtained by rotating the region between the graph of  $f(x) = \sqrt{x}$ , the  $y$ -axis, and the line  $y = 2$  around the  $x$ -axis
11. The region between the graph of  $f(x) = \cos x$  and the  $x$ -axis on the interval  $\left[0, \frac{\pi}{4}\right]$ , rotated around the  $y$ -axis
13. The region between  $y = x^2 + 4$  and  $y = 5$  from  $x = 0$  to  $x = 1$ , rotated around the  $x$ -axis
15. The region between  $y = e^x$  and  $y = e$  from  $x = 0$  to  $x = 1$ , rotated around the  $x$ -axis
17.  $2\pi \int_0^2 y(3 - f^{-1}(y)) dy$       19.  $2\pi \int_0^2 x(f(x) + 3) dx$
21. With shells:  $2(2\pi \int_0^2 y(2 - y) dy)$ ; with disks:  $2(\pi \int_0^2 x^2 dx)$ ; disks are easier in this case.
23. With shells:  $2\pi \int_0^1 (3 - x)(x^2 + 1) dx$ ; with washers:  $\pi \int_0^1 (3^2 - 2^2) dy + \pi \int_1^2 ((3 - \sqrt{y-1})^2 - 2^2) dy$ ; shells are easier.
25.  $3.093 + 8.099 + 9.572 + 5.154 = 25.92$
27.  $10.953 + 14.082 + 16.671 + 18.426 = 60.132$
29.  $2\pi \int_0^2 x(4 - x^2) dx = 8\pi$
31.  $2\pi \int_0^2 (2 - x)(4 - x^2) dx = \frac{40\pi}{3}$
33.  $2\pi \int_2^5 x(x - 2) dx = 36\pi$
35.  $2\pi \int_0^3 (3 - y)(5 - (y + 2)) dy = 18\pi$
37.  $2\pi \int_2^5 (x - 2)(x - 2) dx = 18\pi$
39.  $2\pi \int_0^2 x(5 - (4 - x^2)) dx = 12\pi$
41.  $2\pi \int_0^2 (3 - x)(5 - (4 - x^2)) dx = 16\pi$
43.  $2\pi \int_1^5 (5 - x)((x + 1) + 2) dx = \frac{256\pi}{3}$
45.  $2\pi \int_0^1 y((2 + \sqrt{y}) - (2 - \sqrt{y})) dy + 2\pi \int_1^4 y((2 + \sqrt{y}) - y) dy = \frac{8\pi}{5} + \frac{64\pi}{5} = \frac{72\pi}{5}$
47.  $2\pi \int_0^1 (y + 1)((2 + \sqrt{y}) - (2 - \sqrt{y})) dy + 2\pi \int_1^4 (y + 1)((2 + \sqrt{y}) - y) dy = \frac{64\pi}{15} + \frac{287\pi}{15} = \frac{117\pi}{5}$
49.  $2\pi \int_0^2 x(4 - (4 - x^2)) dx = 2\pi \int_0^2 x^3 dx = 8\pi$
51.  $2\pi \int_0^6 x((x - 3)^2 + 2) dx = 180\pi$
53.  $2\pi \int_0^1 y(\sqrt{y} - y^2) dy = \frac{3\pi}{10}$
55. With disks:  $\pi \int_0^3 (9 - x^2)^2 dx = \frac{648\pi}{5}$
57. With shells:  $2\pi \int_0^2 x(x^2 - 4x + 4) dx = \frac{8\pi}{3}$
59. With disks:  $\pi \int_0^{2/3} 9 dx + \pi \int_{2/3}^2 \left(\frac{2}{x}\right)^2 dx = 10\pi$ ; with shells:  $2\pi \int_0^1 2y dy + 2\pi \int_1^3 \left(\frac{2}{y}\right) y dy = 10\pi$
61. With shells:  $2\pi \int_{-2}^0 (3 - x)(2 + x) dx + 2\pi \int_0^2 (3 - x)(2 - x) dx = \frac{44\pi}{3} + \frac{28\pi}{3}$
63.  $2\pi \int_{0.6}^3 y \left(2\sqrt{\frac{1}{0.15}(3 - y)}\right) dy \approx 125.463$  cubic centimeters.
65. See the proof of Theorem 9.4.
67. The sphere can be obtained by rotating the region under  $y = \sqrt{9 - x^2}$  around the  $x$ -axis; with the shell method, this solid has volume  $2\pi \int_0^3 x(2\sqrt{9 - x^2}) dx$ . We can solve this integral with the substitution  $u = 9 - x^2$ ,  $du = -2x dx$  to obtain a volume of  $36\pi$ , just as predicted by the volume formula.
69. A sphere of radius  $r$  can be obtained by rotating the region between the graph of  $y = \sqrt{r^2 - x^2}$  and the  $x$ -axis on  $[-r, r]$  around the  $x$ -axis. Using integration by substitution with  $u = r^2 - x^2$ ,  $du = -2x dx$ , the volume of this solid is  $2\pi \int_0^r x(\sqrt{r^2 - x^2} - (-\sqrt{r^2 - x^2})) dx = 2\pi \int_0^r x(2\sqrt{r^2 - x^2}) dx = \frac{4}{3}\pi r^3$ . Technical note: Usually we can't do the shell method along the  $x$ -axis when we've rotated a region around the  $x$ -axis; it works here only because the solid is a perfect sphere, so it is equivalent to rotating the region between the graph of  $x = \sqrt{r^2 - y^2}$  and the  $y$ -axis from  $y = -r$  to  $y = r$  around the  $y$ -axis.

## Section 6.3

1. T, F, T, F, T, F, T, F, T.
3. See Definition 9.6.
5. See the proof of Theorem 9.7.
7.  $y = e^x$
9. No;  $f(x)$  has a vertical asymptote at  $x = \frac{\pi}{2}$ .
11. Both arc lengths are given by the definite integral  $\int_0^2 \sqrt{1+4x^2} dx$ , so they are equal. This makes sense because  $f(x) = x^2 - 3$  and  $g(x) = 5 - x^2$  differ by a vertical flip and shift only; these transformations should not affect the arc length.
13.  $2 \int_{-5}^5 \sqrt{1 + \left(\frac{-x}{\sqrt{25-x^2}}\right)^2} dx$
15. (a) 3.79009; (b) 3.81994; (c) it is unclear which approximation might be the best.
17. See the reading before Definition 9.9.
19. 16.97
21. 2.3
23.  $2 + 4\sqrt{3} \approx 8.9282$
25.  $\Delta y_1 = 7, \Delta y_2 = 1, \Delta y_3 = 1, \Delta y_4 = 7; 16.97$
27.  $\Delta y_1 \approx 0.405, \Delta y_2 \approx 0.288, \Delta y_3 \approx 0.223, \Delta y_4 \approx 0.182$ ; approximately 2.3
29.  $\Delta y_1 = 2\sqrt{2}, \Delta y_2 = 0, \Delta y_3 = -2\sqrt{2}; 2 + 4\sqrt{3} \approx 8.9282$
31.  $\int_{-1}^4 \sqrt{10} dx = 5\sqrt{10}$
33.  $\int_1^3 \sqrt{1+9x} dx = \frac{2}{27}(28)^{3/2} - \frac{2}{27}(10)^{3/2}$
35.  $\int_{-1}^1 \sqrt{28+18x} dx = \frac{1}{27}(46)^{3/2} - \frac{1}{27}(10)^{3/2}$
37.  $\int_{-3}^3 \frac{3}{\sqrt{9-x^2}} dx = 3\pi$
39.  $\frac{1}{2} \int_0^1 \frac{1+x}{\sqrt{x}} dx = \frac{4}{3}$
41.  $2 \int_0^2 x^{-1/3} dx = 3(2^{2/3})$
43.  $\int_1^2 \frac{1+16x^2}{8x} dx = 3 + \frac{\ln 2}{8} \approx 3.087$
45.  $\int_{\pi/4}^{3\pi/4} \csc x dx = \ln(2\sqrt{2} + 3)$
47.  $f(x) = e^{3x}, [a, b] = [-2, 5]$
49.  $f(x) = \frac{1}{x}, [a, b] = [2, 3]$
51.  $f(x) = \ln |\cos x|, [a, b] = [0, \frac{\pi}{4}]$
53. One approximation is 3.09573
55. One approximation is 9.05755
57.  $8\pi\sqrt{5} + 40\pi\sqrt{37}$
59.  $\frac{\pi}{64}(35\sqrt{377} + 91\sqrt{1385} + 189\sqrt{3737} + 341\sqrt{8297})$

61.  $\pi\sqrt{\pi^2 + 4}$
63.  $4\sqrt{2}\pi$
65.  $\frac{\pi}{6}(17\sqrt{17} - 1)$
67.  $\frac{\pi}{18}(343 - 13^{3/2})$
69.  $\frac{\pi}{16}(4e^4\sqrt{16e^8+1} + \ln(4e^4 + \sqrt{16e^8+1}) - 4e^{-4}\sqrt{16e^{-8}+1} - \ln(4e^{-4} + \sqrt{16e^{-8}+1}))$
71.  $2\pi\sqrt{2} + \pi \ln(\sqrt{2} + 1) - \pi \ln(\sqrt{2} - 1)$
73.  $\int_0^{\sqrt{6}} \sqrt{1+x^2} dx = \sqrt{\frac{21}{2}} + \frac{1}{2} \ln(\sqrt{6} + \sqrt{7}) \approx 4.0545$  inches
75. See the discussion in the reading preceding Definition 9.6.
77. (a) The distance from  $(a, f(a)) = (a, ma + c)$  to  $(b, f(b)) = (b, mb + c)$  is given by  $\sqrt{(b-a)^2 + ((mb+c) - (ma+c))^2} = \sqrt{(b-a)^2 + m^2(b-a)^2} = (b-a)\sqrt{1+m^2}$ . Since the graph of  $f(x) = mx + c$  is a line, this is the exact arc length. (b) If  $f(x) = mx + c$ , then  $f'(x) = m$ , which is constant, so the arc length is given by  $\int_a^b \sqrt{1+m^2} dx = [\sqrt{1+m^2}]_a^b = \sqrt{1+m^2}(b-a)$ .
79. If  $f(x) = \sqrt{r^2 - x^2}$  (the top half of the circle), then  $f'(x) = -\frac{x}{\sqrt{r^2 - x^2}}$ . Thus the circumference of the circle is twice the arc length of the top half:  $2 \int_{-r}^r \sqrt{1 + \left(-\frac{x}{\sqrt{r^2 - x^2}}\right)^2} dx = 2 \int_{-r}^r \frac{r}{\sqrt{r^2 - x^2}} dx$ . Using trigonometric substitution with  $x = r \sin u$  (and changing the limits of integration accordingly), this is equal to  $2r \int_{-\pi/2}^{\pi/2} 1 du = 2r[u]_{-\pi/2}^{\pi/2} = 2r\left(\frac{\pi}{2} - \left(-\frac{\pi}{2}\right)\right) = 2\pi r$ .
81. (a) Use the fact that  $\frac{s+t}{q} = \frac{t}{p}$ . (b) Use the fact that  $C = \sqrt{A^2 + B^2}$ . (c) Start with the fact that the surface area of the frustum is  $S = \pi q(s+t) - \pi pt$ . (d) Combine the given relationship with the equation  $S = \pi(p+q)s$ .
83. Apply the definite integral formula in Theorem 9.10 to the function  $f(x) = \sqrt{r^2 - x^2}$  on the interval  $[-r, r]$ , and then solve the integral. Simplify the integrand as much as possible before attempting to integrate!

## Section 6.4

1. F, T, F, T, F, T, F, T.
3. See the reading at the beginning of the section.
5. The depth at the bottom of the pool is constant, but the depth along the side walls varies at different parts of the wall.
7. If you know  $x_k, \Delta x$ , and  $N$ , then you can solve for  $a$  and  $b$ , since  $x_k = a + k\Delta x$  and  $\Delta x = \frac{b-a}{N}$ .

9. It would require 38,422.9 foot-pounds of work to lift the entire full hot tub; it would take significantly less work to pump the water out of the tub, since only the water at the bottom of the tub has to move 4 feet (the rest of the water has a shorter distance to travel).
11. Hint: Think about the definitions of  $\Delta y$  and  $y_k$ .
13. Hydrostatic force is calculated using the *area* of a slice of the pool wall, not the volume of a slice of the entire pool.
15. See the paragraphs in the reading just before the Examples and Explorations subsection. The extra dimension  $\Delta x$  becomes the differential  $dx$  when we pass from a Riemann sum to a definite integral.
17. In the numerators each individual centroid coordinate is multiplied by the area of the corresponding rectangle, which makes centroid coordinates from larger rectangles count more than those from smaller rectangles.
19.  $1920\pi$  grams                      21. 2000 foot-pounds
23. 1497.6 pounds
25.  $\Delta x = 6$ ,  $x_0 = 0$ ,  $x_1 = 6$ ,  $x_2 = 12$ ,  $x_3 = 18$ ,  $x_4 = 24$ . If we choose  $x_1^* = 0$ ,  $x_2^* = 6$ ,  $x_3^* = 12$ , and  $x_4^* = 18$ , then the mass is approximately 3746.95 grams.
27.  $\Delta y = 1$ ,  $y_0 = 0$ ,  $y_1 = 1$ ,  $y_2 = 2$ ,  $y_3 = 3$ ,  $y_4 = 4$ . If we choose  $y_1^* = 0.5$ ,  $y_2^* = 1.5$ ,  $y_3^* = 2.5$ , and  $y_4^* = 3.5$ , then the work is approximately 3301.97 foot-pounds.
29.  $\Delta y = 1$ ,  $y_0 = 0$ ,  $y_1 = 1$ ,  $y_2 = 2$ ,  $y_3 = 3$ ,  $y_4 = 4$ . If we choose  $y_1^* = 0.5$ ,  $y_2^* = 1.5$ ,  $y_3^* = 2.5$ , and  $y_4^* = 3.5$ , then the force is 7987.2 pounds.
31.  $(\bar{x}, \bar{y}) \approx (5.417, 1.142)$               33.  $(\bar{x}, \bar{y}) \approx (0.819, 4.604)$
35.  $(\bar{x}, \bar{y}) = \left(\frac{363}{65}, \frac{15}{13}\right)$                       37.  $(\bar{x}, \bar{y}) = \left(\frac{4}{5}, \frac{32}{7}\right)$
39.  $(\bar{x}, \bar{y}) \approx \left(\frac{\pi}{2}, 0.6\right)$                       41. 46,436 grams
43.  $m = (1.5)^2 \int_0^{12} (4.2 + 0.4x - 0.03x^2) dx = 139.32$  grams
45. 125 grams
47. (a) The solid of revolution obtained by revolving the region between the graph of  $y = 8 - \frac{2}{25}x^2$  and the  $x$ -axis on  $[0, 10]$  around the  $y$ -axis;  
 (b)  $\rho(y) = -\frac{0.97}{8}y + 1.12$ ;  
 (c)  $m = \pi \int_0^8 \left(-\frac{0.97}{8}y + 1.12\right) \left(100 - \frac{25}{2}y\right) dy = 1001.12$  ounces
49. 6.126 foot-pounds
51.  $W = (62.4)(40) \int_0^3 (3 - y) dy = 11,232$  foot-pounds
53.  $W = (62.4) \left(\frac{4\pi}{25}\right) \int_0^{10} y^2(10 - y) dy = 26,138.1$  foot-pounds
55.  $W = (62.4)(16\pi) \int_0^{13} (16 - y) dy = 387,366$  foot-pounds
57.  $W = (42.3)(100)(2) \int_0^8 \sqrt{64 - (8 - y)^2} (16 - y) dy + (42.3)(100)(2) \int_0^{16} \sqrt{64 - (16 - y)^2} (16 - y) dy \approx 6,289,650$  foot-pounds.
59.  $W = (20)(18) + (0.25) \int_0^{18} (18 - y) dy = 400.5$  foot-pounds.
61. 3.1765 pounds
63.  $F = (62.4)(8) \int_0^3 (3 - y) dy = 2246.4$  pounds
65.  $F = (62.4)(0.8\pi) \int_0^1 (1 - y) dy = 78,4142$  pounds
67.  $F = 62.4 \int_0^{200} \left(\frac{150}{200}y + 250\right) (200 - y) dy = 3.744 \times 10^8$  pounds
69.  $F = 62.4 \int_0^8 (6 + y)(12 - y) dy + 62.4 \int_8^{12} (20)(12 - y) dy \approx 47,257$  pounds.
71. Leila should put the repeater approximately at coordinates (4.85, 4.26).
73.  $m = \rho V = \rho A \Delta x$ . Adding up the mass on each cross section gives a Riemann sum of the form  $\sum_{k=1}^n \rho(x_k^*) A(x_k^*) \Delta x$ . Since  $\rho$  and  $A$  are continuous functions, this Riemann sum converges to a definite integral.
75.  $F = \omega Ad = \omega ld \Delta y$ . Adding up the hydrostatic force on each cross section gives a Riemann sum of the form  $\sum_{k=1}^n \omega(x_k^*) l(x_k^*) d(x_k^*) \Delta y$ . Since  $\omega$ ,  $l$ , and  $A$  are continuous functions, this Riemann sum converges to a definite integral.

### Section 6.5

1. T, F, T, F, T, T, T, T.
3. A solution of a differential equation is one of possibly many functions that makes the differential equation true, while a solution of an initial-value problem is the unique function that makes both the differential equation and the initial value true.
5. If  $y(x) = \sqrt{x + C}$  then  $\frac{dy}{dx} = \frac{1}{2}(x + C)^{-1/2} = \frac{1}{2\sqrt{x + C}} = \frac{1}{2y}$ .
7. (a) The initial-value problem is  $\frac{dv}{dt} = -9.8$  with  $v(0) = 0$ . The solution is  $v(t) = -9.8t$ . (b) The initial-value problem is  $\frac{ds}{dt} = -9.8t$  with  $s(0) = 100$ . The solution is  $s(t) = 100 - 4.9t^2$ .
9. The  $x$  and  $y$  parts of the differential equation have been "separated" into factors. A differential equation in separable form can be solved by dividing both sides by  $q(y)$ , integrating both sides, and then solving for  $y$ , if each of these steps are possible.
11.  $A = e^{-C}$
13. The solutions of the differential equation flow through the slope field; this means that we can trace out approximate solution curves in the slope field. For an initial-value problem we can begin at the initial value and then trace out a curve by flowing along with the slope field to obtain a sketch of the unique solution.

15. When using Euler's method to approximate a solution of  $\frac{dy}{dx} = g(x, y)$  we have at each step a vertical change of  $\Delta y_k = g(x_k, y_k) \Delta x$ . The value  $g(x_k, y_k)$  is the same as  $\left. \frac{dy}{dx} \right|_{(x_k, y_k)}$ .

17. (a) 500. (b) Since  $0 < P < 500$  we have  $0 < 1 - \frac{P}{500} < 1$ ; since  $P$  is growing we have  $\frac{dP}{dt} > 0$ . Therefore  $k$  must be positive. (c) When  $P$  is small, the quantity  $\frac{P}{500}$  is also small, so  $\frac{dP}{dt} \approx kP(1 - 0) = kP$ . (d) When  $P \approx 500$  we have  $\frac{P}{500} \approx 1$ , and therefore  $\frac{dP}{dt} \approx kP(1 - 1) = 0$ .

19.  $y(x) = \frac{1}{7}x^7 + 2x^4 + 16x + C$

21.  $y(x) = Ae^{x^2}$

23.  $y(x) = Ae^{1/3x^3}$

25.  $y = \pm \sqrt{6x + 2 \ln|x| + C}$

27.  $y(x) = \ln\left(\frac{1}{2}x^2 + C\right)$

29.  $y(x) = 4e^{3x}$

31.  $y(x) = -2x^3 + 5$

33.  $y(x) = 3e^{-x} + 1$

35.  $y(x) = \sqrt{6x + 4}$

37.  $y(x) = -e^{1/2x^2}$

39.  $y(x) = -\ln(-e^x + 1 + e^{-2})$

41.  $y(x) = \frac{1}{2} \ln|1 + x^2| + 4$

43.  $y = 4900 - 3900e^{-x/500}$

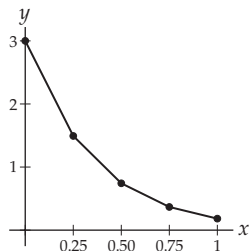

45.  $y = \frac{1}{3}(1 + 5e^{6x})$

47.  $y = \frac{2e^{3x}}{1 + 2e^{3x}}$

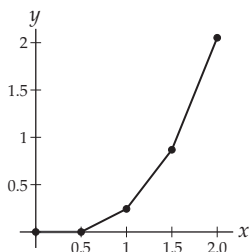

49.  $y(x) = \frac{1}{1 - \sin x}$

51.  $y(x) = \sqrt[3]{x^3 - 6x + 512}$

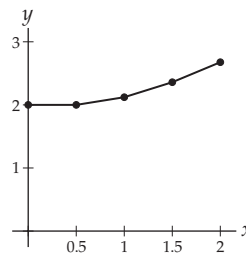

53.  $(x_1, y_1) = (0.25, 1.5)$ ,  $(x_2, y_2) = (0.5, 0.75)$ ,  $(x_3, y_3) = (0.75, 0.375)$ ,  $(x_4, y_4) = (1, 0.1875)$ . A plot of these points gives:

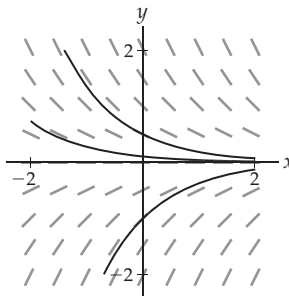

55.  $(x_1, y_1) = (0.5, 0)$ ,  $(x_2, y_2) = (1, 0.25)$ ,  $(x_3, y_3) = (1.5, 0.875)$ ,  $(x_4, y_4) = (2, 2.0625)$ . A plot of these points gives:

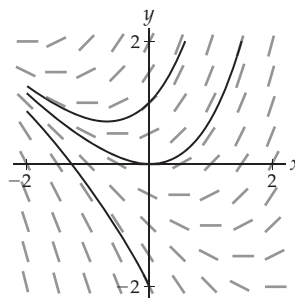

57.  $(x_1, y_1) = (0.5, 2)$ ,  $(x_2, y_2) = (1, 2.125)$ ,  $(x_3, y_3) = (1.5, 2.36)$ ,  $(x_4, y_4) = (2, 2.68)$ . A plot of these points gives:

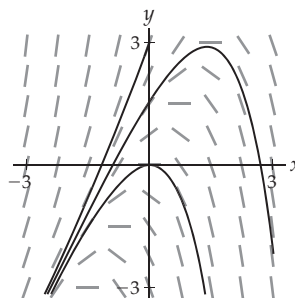

59.

61.

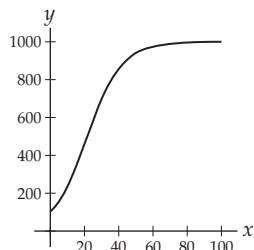

63.

65. (a)  $\frac{dP}{dt} = 0.0139P$ ; with initial value  $P(0) = 1.08$  million the solution is  $P(t) = 1.08e^{0.0139t}$ . (b) Between 55 and 56 years ago. (c) Just under 50 years.

67. (a)  $\frac{dC}{dt} = -kC$  for some proportionality constant  $k$ . The solution is  $C(t) = Ae^{-kt}$  for some constant  $A$  that represents the initial amount  $C(0)$  of carbon when the organism died. (b)  $k = \frac{\ln 2}{5730} \approx 0.00012$ . (c) About 19,188 years old.

69. (a)  $\frac{dP}{dt} = 0.1P \left(1 - \frac{P}{1000}\right)$ , and by separation of variables followed by partial fractions (or the formula in Theorem 9.21) we obtain  $P(t) = \frac{1000(100)e^{0.1t}}{1000 + 100(e^{0.1t} - 1)}$ .  
 (b) The graph is shown next. (c) According to the logistic model, the population will be growing the fastest in about 21.97 years.

71. (a) We'll set  $t = 0$  at 8 pm and measure time in hours. The differential equation is  $\frac{dT}{dt} = k(70 - T)$ , and its solution is  $T(t) = 70 + 18.8e^{kt}$ . (b)  $k \approx 0.1433$ . (c) Just after 5 pm.
73. (a) The differential equation is  $\frac{dP}{dt} = kP^{1.1}$ , and its solutions are of the form  $P(t) = (-0.1kt + C)^{-10}$ .  
 (b) With  $t = 0$  set at 2005 we have  $P(t) = (-0.1(0.008)t + 0.83)^{-10}$ . (c) In mid-2013.
75. By separation of variables we have  $\int \frac{1}{Q} dQ = \int k dt$ , which gives  $\ln|Q| = kt + C$ . Thus  $|Q| = e^{kt+C}$  so  $Q = Ae^{kt}$ . Since  $Q(0) = Q_0$  we have  $Q_0 = Ae^{k(0)}$  and thus  $A = Q_0$ .
77.  $\lim_{t \rightarrow \infty} P(t) = \lim_{t \rightarrow \infty} \frac{LP_0 e^{kt}}{L + P_0(e^{kt} - 1)} = \lim_{t \rightarrow \infty} \frac{LP_0}{Le^{-kt} + P_0 - P_0 e^{-kt}} = \frac{LP_0}{P_0} = L$ .
79.  $\lim_{t \rightarrow \infty} (A - (A - T_0)e^{-kt}) = A - 0 = A$ . If the model represents cooling, then  $T > A$  and thus  $A - T < 0$ ; in this case we wish the rate of change  $\frac{dT}{dt} = k(A - T)$  to be negative, which it will be if  $k > 0$ . For a model of heating we have  $T < A$  and thus  $A - T > 0$  and we want a positive rate of change, which again requires  $k > 0$ .
9.  $a_k = a_{k-1} + 1$ , for  $k \geq 2$ .
11. There exists an  $N > 0$  such that for all  $k > N$ ,  $a_{k+1} > a_k$ .
13. There exists an  $N > 0$  such that for all  $k > N$ ,  $a_{k+1} < a_k$ .
15. Bounded above: there exists a real number  $M$  such that  $M > a_k$  for every  $k$ . Bounded below: there exists a real number  $m$  such that  $m < a_k$  for every  $k$ . Bounded: both bounded above and bounded below.
17.  $\{(-1)^k k\}$
19. The necessary inequalities will not hold if some or all of the terms are negative.
21.  $f_1 = f_2 = 1, f_3 = 2, f_4 = 3$  and  $f_5 = 5$
23. Every nonempty subset  $S$  of the real numbers that is bounded below has a greatest lower bound.
25.  $a_k = (1/2)(1 + (-1)^k)$       27.  $a_k = k \left(\frac{1}{3}\right)^k$
29.  $a_k = \frac{k+1}{2k+1}$       31.  $2, 0, \frac{2}{3}, 0, \frac{2}{5}$
33.  $\frac{\cos(x)}{x+1}, \frac{\cos(2x)}{x^2+4}, \frac{\cos(3x)}{x^3+9}, \frac{\cos(4x)}{x^4+16}, \frac{\cos(5x)}{x^5+25}$
35.  $1, \frac{\sqrt{2}}{2}, \frac{\sqrt{3}}{3}, \frac{1}{2}, \frac{\sqrt{5}}{5}$       37. 2
39. -1      41. 1
43.  $3, 3\left(\frac{1}{2}\right), 3\left(\frac{1}{2}\right)^2, 3\left(\frac{1}{2}\right)^3, 3\left(\frac{1}{2}\right)^4$
45.  $-2, -2(-3), -2(-3)^2, -2(-3)^3, -2(-3)^4$
47.  $\{-3 + 10k\}_{k=0}^{\infty}$       49.  $\{1 - 2k\}_{k=0}^{\infty}$
51.  $((k+1)^2 - 5(k+1)) - (k^2 - 5k) = 2k - 4 > 0$  for  $k \geq 3$ , so the sequence is eventually strictly increasing.
53.  $\frac{k+1}{k+3} - \frac{k}{k+2} = \frac{2}{(k+2)(k+3)} > 0$  for  $k \geq 0$ , so the sequence is strictly increasing.
55.  $\frac{(k+1)^2/(k+1)!}{k^2/k!} = \frac{k+1}{k^2} < 1$  for  $k \geq 2$ , so the sequence is eventually strictly decreasing.
57.  $\frac{3^{k+1}/(2 \cdot 4 \cdot 6 \cdots (2k)(2k+2))}{3^k/(2 \cdot 4 \cdot 6 \cdots (2k))} = \frac{3}{2k+2} < 1$  for  $k \geq 1$ , so the sequence is strictly decreasing.
59. When  $f(x) = \frac{\sqrt{x+1}}{x}, f'(x) = -\frac{x+2}{2x^2\sqrt{x+1}}$ , which is negative for  $x > 0$ , so the sequence is strictly decreasing.
61. When  $f(x) = \frac{\sin x}{x}, f'(x) = \frac{x \cos x - \sin x}{x^2}$ , which changes sign infinitely often for  $x > 0$ . The test fails, but the sequence is neither increasing nor decreasing.

For answers to odd-numbered Skill Certification exercises in the Chapter Review, please visit the Book Companion Web Site at [www.whfreeman.com/tkcalculus](http://www.whfreeman.com/tkcalculus).

## Chapter 7

### Section 7.1

- T, T, F, F, F, F, F, T.
- A function whose domain is  $\mathbb{Z}^+$
- The subscript  $k$  for the term  $a_k$
- 1, 3, 5, 7, 9,  $a_k = 2k - 1$
- Decreasing and unbounded
- Not monotonic, bounded
- Not monotonic, bounded
- Not monotonic, bounded
- Eventually decreasing, bounded
- Not monotonic, unbounded

75.  $x_5 \approx 1.26097$                       77.  $x_7 \approx -25.1327$
79.  $x_{k+1} = x_k - \frac{x_k^2 - a}{2x_k} = \frac{1}{2} \left( x_k + \frac{a}{x_k} \right)$
81.  $x_3 \approx 1.7321$                       83.  $x_6 \approx 10.0499$
85. (a) The signs of  $x_k$  alternate, and starting with  $x_2$  the magnitudes of the terms increase. Therefore, two successive terms will never be very close. (b)  $f(2) = 0$ .
87. To the nearest milligram the levels are:  
100; 175; 231; 273; 305; 329; 347.
89. 100; 105; 110.25; 115.76; 121.55.  $n = 0$  represents the initial investment. The sequence is increasing without bound.
91. Since  $\{a_k\}$  is increasing  $a_{k+1} \geq a_k$  for every  $k$ . Since  $\{a_k\}$  is decreasing  $a_{k+1} \leq a_k$  for every  $k$ . Therefore  $a_{k+1} = a_k$  for every  $k$ .
93. Use the difference test  $S_{n+1} - S_n = a_{n+1} > 0$ , therefore  $\{S_n\}$  is an increasing sequence.
95. If each case, we may multiply both sides of the given inequality by  $a_k$ , maintaining the direction of the inequality since each term is positive.

### Section 7.2

1. T, F, F, T, F, T, T, F.
3. By the definition of convergence, only the terms after  $N$  that depend on the given  $\epsilon$  determine convergence. These are precisely the terms that define the tail of the sequence.
5. If the sequences  $\{a_k\}$  and  $\{b_k\}$  both converge, the sequence  $\{a_k - b_k\}$  converges by Theorem 7.11.
7. Let  $a_k = b_k = k$                       9. Let  $a_k = k^2$  and  $b_k = k$
11. Let  $a_k = \frac{1}{k}$  and  $b_k = \frac{1}{k^2}$                       13.  $\left\{ \frac{(-1)^k}{k} \right\}$
15. Such a sequence is not possible. The first term of the sequence is an upper bound for the sequence.
17.  $a_k = (k!)^2$
19. The limit  $\lim_{x \rightarrow \infty} \frac{x^3}{e^x}$  is an indeterminate form of the type  $\frac{\infty}{\infty}$ . We may use L'Hôpital's Rule to show that  $\lim_{x \rightarrow \infty} \frac{x^3}{e^x} = 0$ .
21. For  $0 < r < 1$  the sequence is bounded, monotonically decreasing and converges to zero. For  $r = 1$  the sequence is constant, and converges to  $c$ . For  $r > 1$  the sequence is unbounded, monotonically increasing and diverges.
23. Constant, therefore monotonic and bounded, converges to 11
25. Not eventually monotonic, bounded, no limit
27. Not eventually monotonic, bounded, converges to zero
29. Strictly decreasing, bounded, converges to  $-2$
31. Eventually strictly decreasing, bounded, converges to zero
33. Strictly increasing, bounded, converges to 1
35. Strictly decreasing, bounded, converges to 1
37. Eventually strictly decreasing, bounded, converges to zero
39. Strictly decreasing, bounded, converges to 1
41. Not monotonic, bounded, does not converge
43. Strictly increasing, bounded, converges to 8
45. Eventually strictly increasing, bounded, converges to 42
47. Eventually strictly increasing, bounded below, but not bounded above, diverges to  $\infty$
49. Not monotonic, bounded, converges to zero
51. Monotonically decreasing, bounded, converges to zero
53. Monotonically increasing, unbounded, diverges
55. The sine function is bounded between  $-1$  and  $1$ . So  $-1 \leq \sin(2^k) \leq 1$ , and thus  $-\frac{1}{2^k} \leq \frac{\sin(2^k)}{2^k} \leq \frac{1}{2^k}$ . Both  $\left\{ -\frac{1}{2^k} \right\}$  and  $\left\{ \frac{1}{2^k} \right\}$  converge to zero by Theorem 7.15. By Theorem 7.19 the limit is therefore zero.
57.  $\lim_{k \rightarrow \infty} \frac{k-7}{3k+5} = \lim_{k \rightarrow \infty} \frac{1-(7/k)}{3+(5/k)} = \frac{1}{3}$
59. Multiply the numerator and denominator by  $\sqrt{k^2 + k} + k$ , then divide the numerator and denominator of the new expression by  $k$ . The limit is  $\frac{1}{2}$ .
61. To the nearest cent the answers are 106.00, 106.09, 106.15, 106.17, 106.18, and 106.18. The sequence is bounded by  $100e^{0.06}$
63. Assume that the sequence converges to  $L$  for  $r < -1$ , then by Theorem 7.12 the sequence  $\{|r^k|\}_{k=0}^{\infty}$  converges to  $|L|$ . However, this sequence is also geometric and its convergence contradicts the fact that geometric sequences diverge when the base is greater than 1.
65. The limit is indeterminate of the type  $\infty^0$ . By L'Hôpital's Rule  $\lim_{x \rightarrow \infty} \frac{\ln x}{x} = 0$ . Exponentiating we have  $\lim_{x \rightarrow \infty} x^{1/x} = e^0 = 1$ .
67. If  $c = 0$ , the sequence is constant and converges to zero. So assume  $c \neq 0$ . Let  $\epsilon > 0$  be given. Since the sequence  $\{a_k\} \rightarrow L$ , there is an  $N > 0$  such that for every  $k > N$ ,  $|a_k - L| < \frac{\epsilon}{|c|}$ . Thus, for  $k > N$ ,  $|ca_k - cL| < \epsilon$ . Therefore,  $\{ca_k\} \rightarrow cL$ .
69. Let  $\epsilon > 0$  be given. Since  $\{b_k\} \rightarrow M$ , there is an  $N_1 > 0$  such that  $b_k - M < \frac{\epsilon}{2(1+|L|)}$  and an  $N_2 > 0$  such that  $b_k - M < 1$  for  $k > N_1$  and  $k > N_2$ , respectively. For  $k > N_2$  we also have  $|b_k| < 1 + |M|$ . Similarly, since  $\{a_k\} \rightarrow L$ , there is an  $N_3 > 0$  such that for every  $k > N_3$ ,  $|a_k - L| < \frac{\epsilon}{2(1+|M|)}$ . Let  $N = \max(N_1, N_2, N_3)$ . Now,  $|a_k b_k - LM| = |a_k b_k - Lb_k + Lb_k - LM| \leq |a_k - L||b_k| + |b_k - M||L|$ . From our analysis above, for  $k > N$  this last quantity is less than or equal to  $\frac{\epsilon}{2(1+|M|)}(1 + |M|) + \frac{\epsilon}{2(1+|L|)}|L| < \frac{\epsilon}{2} + \frac{\epsilon}{2} = \epsilon$ . Therefore,  $a_k b_k \rightarrow LM$ .

71. See the proof of Theorem 1.6.
73. See the proof of Theorem 1.29.
75. If  $\lim_{x \rightarrow \infty} a(x) = L$ , then there is an  $N > 0$  such that for every  $x > N$ ,  $|a(x) - L| < \epsilon$ . Since  $a_k = a(k)$ , for every  $k > N$  we have  $|a_k - L| < \epsilon$ . Therefore,  $a_k \rightarrow L$ .
77. Let  $\epsilon > 0$  be given. Since  $a_k \rightarrow \infty$ , there is an  $N > 0$  such that for every  $k > N$  we have  $a_k > \frac{1}{\epsilon}$ . For  $k > N$ , we therefore have  $\frac{1}{a_k} < \epsilon$ . So,  $\frac{1}{a_k} \rightarrow 0$ .
79. The terms of the sequence  $\left\{ \left( \frac{1}{k} \right)^p \right\}$  are the reciprocals of the terms of the sequence  $\{k^p\}$ , so you may use your answer from Exercise 78.
81. If  $|r| > 1$ , then the subsequence  $\{r^{2k}\}$  is monotonically increasing and unbounded, therefore the sequence  $r^n$  diverges.
83. Use L'Hôpital's Rule to show that  $\lim_{x \rightarrow \infty} \frac{x^r}{(1+p)^x} = 0$ .
85. If the sequence  $\{a_k\}$  converges to  $L$ , then for  $\epsilon = 1$  there is an  $N > 0$  such that  $|a_k - L| < 1$  for  $k > N$ . Thus, for  $n > N$  we have  $|a_k| < \max(|L - 1|, |L + 1|)$ . Let  $M = \max(|a_1|, |a_2|, \dots, |a_N|, |L - 1|, |L + 1|)$ . For every  $k$ ,  $|a_k| < M$ .
87. Let  $\epsilon > 0$ . There is an  $N_1 > 0$  such that for  $k > N_1$ ,  $|a_{2k} - L| < \epsilon$ . Similarly, there is an  $N_2 > 0$  such that for  $k > N_2$ ,  $|a_{2k+1} - L| < \epsilon$ . Let  $N = \max(N_1, N_2)$ . For every  $k > N$  we have  $|a_k - L| < \epsilon$ . Thus,  $a_k \rightarrow L$ .

### Section 7.3

1. F, F, F, T, F, T, T, F.
3. The sequence of partial sums is the sequence  $a_n$  where  $S_n = \sum_{k=1}^n a_k$ . When we add any list of numbers, we always add one new summand at a time. This is precisely what we do when we form the sequence of partial sums.
5.  $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^9 a_k + \sum_{k=10}^{\infty} a_k$ . To find the sum of  $\sum_{k=10}^{\infty} a_k$ , you would need to know  $\sum_{k=1}^9 a_k$ .
7.  $\sum_{k=1}^{\infty} a_k = \sum_{j=s}^{\infty} a_{j-s+1}$
9. A series that can be written in the form  $\sum_{k=0}^{\infty} cr^k$ . A geometric series will converge if  $|r| < 1$ .
11. Since a geometric series has the form  $\sum_{k=0}^{\infty} cr^k$ , the only way for a geometric series to contain a zero term is if one or both of  $c$  or  $r$  is zero. When this occurs the series converges to  $c$ .
13.  $\sum_{k=1}^{\infty} \frac{1}{2^k}$
15. Use  $\sum_{k=1}^{\infty} 1$  and  $\sum_{k=1}^{\infty} (-1)$ . Then each term of the series  $\sum_{k=1}^{\infty} (1 - 1)$  is zero.
17. Use  $\sum_{k=0}^{\infty} \left(\frac{1}{2}\right)^k$  for both series. This series converges to 2, but the product series  $\sum_{k=0}^{\infty} \left(\frac{1}{4}\right)^k$  converges to  $\frac{4}{3}$ .
19. The series  $\sum_{k=0}^{\infty} 2^k$  and  $\sum_{k=0}^{\infty} 4^k$  both diverge, but the series  $\sum_{k=0}^{\infty} \frac{2^k}{4^k}$  converges to 2.
21.  $\frac{1}{3}, \frac{1}{6}, \frac{1}{11}, \frac{1}{18}, \frac{1}{27}$

55. The series converges to  $\frac{100}{3}$ .
57. The series converges to  $-\frac{192}{7}$ .
59. The series converges to  $\frac{64}{3}$ .
61.  $S_n = \left(1 - \frac{1}{3}\right) + \left(\frac{1}{2} - \frac{1}{4}\right) + \left(\frac{1}{3} - \frac{1}{5}\right) + \dots + \left(\frac{1}{n-1} - \frac{1}{n+1}\right) + \left(\frac{1}{n} - \frac{1}{n+2}\right) = 1 + \frac{1}{2} - \frac{1}{n+1} - \frac{1}{n+2}$ .  
The series converges to  $\frac{3}{2}$ .
63.  $S_n = \left(1 - \frac{1}{3}\right) + \left(\frac{1}{3} - \frac{1}{3^2}\right) + \left(\frac{1}{3^2} - \frac{1}{3^3}\right) + \dots + \left(\frac{1}{3^n} - \frac{1}{3^{n+1}}\right) = 1 - \frac{1}{3^{n+1}}$ . The series converges to 1.
65. The series diverges.
67.  $x \in (-1, 1)$
69. The series converges for every value of  $x$  except odd multiples of  $\frac{\pi}{2}$ .
71.  $237 \sum_{k=1}^{\infty} (0.001)^k = \frac{79}{333}$
73.  $3051 \sum_{k=1}^{\infty} (0.0001)^k = \frac{339}{1111}$
75.  $1 + 27 \sum_{k=1}^{\infty} (0.01)^k = \frac{14}{11}$
77.  $\frac{1}{10} (1 + 9 \sum_{k=1}^{\infty} (0.1)^k) = \frac{1}{5}$
79. 4 meters
81.  $\frac{2}{3}$
83.  $\frac{\sqrt{3}}{4}$
85. Let  $\{S_n\}$  be the sequence of partial sums for the first series and  $\{T_n\}$  be the sequence of partial sums for the second series. We know that these sequences converge to  $L$  and  $M$ , respectively. By Theorem 7.11 this sequence,  $\{a_n + b_n\}$ , that is the sequence of partial sums for the series  $\sum_{k=1}^{\infty} (a_k + b_k)$ , converges to  $L + M$ .

87. The series  $\sum_{k=0}^{\infty} (cr^k \cdot bv^k)$  is a convergent geometric series since  $|rv| < 1$ . The series of the products *cannot* converge to the product of the sums of the two series.
89. The series  $\sum_{k=0}^{\infty} \frac{cr^k}{bv^k} = \left(\frac{c}{b}\right) \sum_{k=0}^{\infty} \left(\frac{r}{v}\right)^k$ , which is a geometric series. The series will converge if  $\left|\frac{r}{v}\right| < 1$ .

### Section 7.4

1. F, T, F, F, T, F, F, T.
3.  $\sum_{k=1}^{\infty} \frac{1}{k^p}$
5. For a geometric series  $\sum_{k=1}^{\infty} cr^k$ , the limit  $\lim_{k \rightarrow \infty} cr^k = 0$  if and only if  $|r| < 1$ . The geometric series converges if and only if  $|r| < 1$ .
7. The series diverges.
9. If  $f: [1, \infty) \rightarrow \mathbb{R}$  is a continuous function that is eventually positive and decreasing, then the improper integral  $\int_1^{\infty} f(x) dx$  and the series  $\sum_{k=1}^{\infty} f(k)$  either both converge or both diverge. The statement is valid because the “tail” of a series determines its convergence or divergence.
11.  $R_n$  is an upper bound on the error in using  $S_n$  to approximate the sum of the series. If we can ensure that  $R_n$  is small, we can ensure the quality of the approximation is good.
13. If  $f(x)$  is not continuous, then the improper integral  $\int_1^{\infty} a(x) dx$  may not be defined.
15.  $\sin(\pi x)$
17. The divergence test fails since  $\lim_{k \rightarrow \infty} \frac{1}{k^2} = 0$ .
19. The series diverges since  $\lim_{k \rightarrow \infty} \frac{k}{3k+100} = \frac{1}{3}$ .
21. The divergence test fails since  $\lim_{k \rightarrow \infty} \frac{k!}{k^k} = 0$ .
23. The divergence test fails since  $\lim_{k \rightarrow \infty} \frac{k^2+1}{k!} = 0$ .
25. The function  $f(x) = e^{-x}$  is continuous, positive, and decreasing on the interval  $[0, \infty)$ . The series converges because the improper integral  $\int_0^{\infty} e^{-x} dx = 1$ .
27. The function  $f(x) = \frac{1}{x\sqrt{\ln x}}$  is continuous, positive, and decreasing on the interval  $[2, \infty)$ . The series diverges because the improper integral  $\int_2^{\infty} \frac{dx}{x\sqrt{\ln x}}$  diverges.
29. The function  $f(x) = \frac{2x-4}{x^2-4x+3}$  is continuous, positive, and decreasing on the interval  $[4, \infty)$ . The series diverges because the improper integral  $\int_4^{\infty} \frac{2x-4}{x^2-4x+3} dx$  diverges.
31. The function  $f(x) = \frac{1}{(x-2)^2}$  is continuous, positive, and decreasing on the interval  $[3, \infty)$ . The series converges because the improper integral  $\int_3^{\infty} \frac{dx}{(x-2)^2}$  converges.
33. A convergent  $p$ -series,  $p = 3/2$
35. The function  $f(x) = \frac{k}{2+k^2}$  satisfies the conditions of the integral test and the integral  $\int_1^{\infty} \frac{x}{2+x^2} dx$  diverges.
37. The function  $f(x) = \frac{\ln x}{x}$  is continuous, positive and eventually decreasing. Since the integral  $\int_1^{\infty} \frac{\ln x}{x} dx$  diverges, the series diverges.
39. The series converges. Use the integral test.
41. This telescoping series converges to 1. You can also use the integral test to show that the series converges.
43. The series converges. Use the integral test.
45. (b)  $S_{10} \approx 1.581950$ , (c)  $R_{10} = e^{-10} \approx 0.000045$ , (d)  $(1.581950, 1.581995)$ , (e) 14
47. (b)  $S_{10} \approx 1.5$ , (c)  $R_{10} = 0.1$ , (d)  $(1.5, 1.6)$ , (e) 1000000
49.  $p > 1$  51.  $p > 1$
53. (a) We have  $q_2 = (0.22)(q_1 + h)$ ,  $q_4 = (0.11)^2 q_0 + 0.33h(0.11)$ , and more generally  $q_{2N} = (0.11)^N q_0 + 0.33h \sum_{k=0}^{N-1} (0.11)^k$ . (b)  $q_3 = 0.11q_1 + 0.61h$ ,  $q_5 = (0.11)^2 q_1 + 0.61h(0.11)$ , and more generally  $q_{2N+1} = (0.11)^N q_1 + 0.61h \sum_{k=0}^{N-1} (0.11)^k$ . (c) The sum during the even-numbered years is  $0.33h \frac{1}{1-0.11} \approx 0.371h$ . So Leila needs  $0.371h = P$ . That is,  $h \approx 2.697P$ .
55. Since  $f$  is continuous, positive, and decreasing, each summand  $f(k) \leq \int_{k-1}^k f(x) dx$ . Therefore,  $\sum_{k=n+1}^{\infty} f(k) \leq \int_n^{\infty} f(x) dx$ .
57. Let  $c > 0$ . There are several cases to consider. When  $r \leq -1$ ,  $\lim_{k \rightarrow \infty} cr^k$  does not exist. When  $r = 1$ ,  $\lim_{k \rightarrow \infty} cr^k = c$ . When  $r > 1$ ,  $\lim_{k \rightarrow \infty} cr^k = \infty$ . The situations when  $c < 0$  are similar.

### Section 7.5

1. T, F, F, F, F, F, F, F.
3. Use the comparison test to analyze the series  $\sum_{k=1}^{\infty} (-a_k)$ .
5. Let  $\sum_{k=1}^{\infty} a_k$  and  $\sum_{k=1}^{\infty} b_k$  be two series with nonnegative terms such that  $0 \leq a_k \leq b_k$  for every positive integer  $k$  larger than some positive integer  $K$ . If the series  $\sum_{k=1}^{\infty} b_k$  converges, then the series  $\sum_{k=1}^{\infty} a_k$  converges. This is valid because the convergence or divergence of a series only depends upon the “tail” of the series.
7. Let  $\sum_{k=1}^{\infty} a_k$  and  $\sum_{k=1}^{\infty} b_k$  be two series whose terms are eventually positive. The three parts of the theorem remain unchanged. This is valid because the convergence or divergence of a series only depends upon the “tail” of the series.
9. If the series converges and you compare it to a divergent series you will not gain any useful information.

11. The improper integral  $\int_2^{\infty} \frac{dx}{x \ln x}$  diverges.
13. The value of the limit is zero. Since  $p$ -series diverge for  $0 < p < 1$ , we don't get any useful information from the limit comparison test.
15.  $b_k, a_k$ , converges                      17.  $b_k, a_k$ , diverges
19. The  $p$ -series  $\sum_{k=1}^{\infty} \frac{1}{k^{3/2}}$  converges and  
 $\lim_{k \rightarrow \infty} \frac{(k^{3/2} - k - 1)/(5k^3 + 3)}{1/k^{3/2}} = \frac{1}{5}$ . Therefore the given series converges.
21. Compare the series to the harmonic series using the limit comparison test to show that the series diverges.
23. The terms of this series are positive starting with  $k = 2$ . Compare the series to the convergent  $p$ -series  $\sum_{k=1}^{\infty} \frac{1}{k^{3/2}}$  using the limit comparison test to show that the given series converges.
25. The terms of this series are positive. Compare the series to the harmonic series using either comparison test to show that the given series diverges.
27. The terms of this series are positive. Compare the series to the convergent  $p$ -series with  $p = 3/2$ . Since  
 $\lim_{k \rightarrow \infty} \frac{(1 + \ln k)/k^2}{1/k^{3/2}} = 0$ , by the limit comparison test the given series converges.
29. The terms of this series are positive. Compare the series to the convergent  $p$ -series with  $p = 2$ . Since  
 $\lim_{k \rightarrow \infty} \frac{(1 + \ln k)/k^2}{1/k^2} = 0$ , by the limit comparison test the given series converges.
31. A divergent  $p$ -series,  $p = \frac{1}{2}$
33. Use either comparison test with the  $p$ -series  $\sum_{k=1}^{\infty} \frac{1}{k^{7/4}}$  to show that the series converges.
35. Use the limit comparison test with the harmonic series to show that the series diverges.
37. Use the comparison test with the harmonic series to show that the series diverges.
39. Use the limit comparison test with the  $p$ -series  $\sum_{k=1}^{\infty} \frac{1}{k^{3/2}}$  to show that the series converges.
41. The series converges. Use the integral test.
43. The series converges. Use the integral test.
45. The series converges. Use the integral test.
47. Use the limit comparison test with the harmonic series to show that the series diverges.
49.  $p \in \mathbb{R}$
51. It converges. Write  $\alpha(n) = a_1 n + a_2 n^2 + \cdots + a_N n^N$ . Since all the coefficients are positive, then  $\alpha(n) > a_1 n$ . It follows that  $V = \sum_{n=0}^{\infty} w_n < W \sum_{n=0}^{\infty} (r^{a_1})^n = \frac{W}{1 - r^{a_1}}$ .
53. Since  $\sum_{k=1}^{\infty} a_k$  converges and all terms are nonnegative, there is an  $N > 0$  such that for all  $n > N$  we have  $a_k < 1$ . Therefore, when  $n > N$  we also have  $a_k^2 < a_k$ . Therefore, by the comparison test the series  $\sum_{k=1}^{\infty} a_k^2$  converges.
55. We compare the series  $\sum_{k=1}^{\infty} (a_k \cdot b_k)$  to the series using the limit comparison test. We have  $\lim_{k \rightarrow \infty} \frac{a_k \cdot b_k}{a_k} = \lim_{k \rightarrow \infty} b_k$ . By the divergence test, the value of this limit is zero. Therefore, since the series  $\sum_{k=1}^{\infty} a_k$  converges, by the limit comparison test the series  $\sum_{k=1}^{\infty} (a_k \cdot b_k)$  converges.
57. Since  $\lim_{k \rightarrow \infty} \frac{a_k}{b_k} = 0$ , there is an  $N > 0$  such that for every  $k > N$   $0 < a_k < b_k$ . Therefore, by the comparison test the series  $\sum_{k=1}^{\infty} a_k$  converges.

3. 1
5. 1
7. The ratio test could be used on the series  $\sum_{k=1}^{\infty} (-a_k)$ .
9. The series satisfies the hypotheses of the ratio test. Since the terms are positive and  $\lim_{k \rightarrow \infty} \frac{a_{k+1}}{a_k} > 1$ ,  $\lim_{k \rightarrow \infty} a_k \neq 0$ , therefore the series diverges by the divergence test.
11. 1
13. The root test could be used on the series  $\sum_{k=1}^{\infty} (-a_k)$ .
15. It is not immediately apparent how to evaluate  $\lim_{k \rightarrow \infty} \left(\frac{1}{k!}\right)^{1/k}$ . It is more practical to use the ratio test.
17. It is a convergent geometric series. You could also show this using the integral, comparison, limit comparison, ratio, or root tests.
19.  $\lim_{k \rightarrow \infty} \frac{a_{k+1}}{a_k}$  does not exist, but the series is the sum of two convergent geometric series;  $\sum_{k=0}^{\infty} \frac{1}{10^k} = \frac{10}{9}$  and  $\frac{1}{5} \sum_{k=0}^{\infty} \frac{1}{10^k} = \frac{2}{9}$ . So the sum is  $\frac{4}{3}$ .
21.  $\frac{1}{90}$     23.  $\frac{1}{(k+2)(k+1)}$
25. 12    27.  $n^3 - n$
29. The series converges by the ratio test.
31. The ratio test is inconclusive, but the series converges.
33. The ratio test is inconclusive, but the series diverges by the divergence test.
35. The series diverges.
37. The root test is inconclusive, but the series converges.
39. The series converges.
41. Each term of the series is positive, and it converges by the ratio test.

43. Compare the series to  $\sum_{k=1}^{\infty} \frac{1}{k}$  using the limit comparison test to show that the series diverges.
45. The series converges. You may show this by comparing it to the convergent  $p$ -series,  $\sum_{k=1}^{\infty} \frac{1}{k^3}$  using the limit comparison test.
47. Each term of the series is positive, and it converges by the limit comparison test.
49. Each term of the series is positive, and it converges by the root test.
51. Each term of the series is positive, and it converges by the ratio test.
53. Each term of the series is positive, and it diverges by the ratio test.
55. Each term of the series is positive, and it converges by the root test.
57. Each term of the series is positive, and it converges by the ratio test.
59. Each term of the series is greater than the corresponding term of the divergent series  $\sum_{k=1}^{\infty} \frac{1}{3k'}$ , thus the series diverges by the comparison test.
61. (a) Use the ratio test. (b) Use the divergence test. (c) By the definition of dominance.
63. (a) Use the ratio test. (b) Use the divergence test. (c) By the definition of dominance.
65. (a)  $420 \frac{1-r_{11}}{1-r} \approx 1920$ . (b)  $f_{10} + \int_{10}^{\infty} 0.95^x dx \approx 1931$ .
67. See Exercise 5.
69. Use L'Hôpital's Rule to show that  $\lim_{x \rightarrow \infty} x^{1/x} = 1$ . From this we may show that  $\lim_{k \rightarrow \infty} (ck^m)^{1/k} = 1$ . Every  $p$ -series has this form.
71. (a) For large values of  $k$ , each term of the series is less than  $(c_1 + c_2 + \dots + c_n)k^{m_n}$ . (b) Part (a) shows that the root test is inconclusive for the series.

### Section 7.7

1. F, T, T, F, T, F, T, T.
3. A series of the form  $\sum_{k=1}^{\infty} (-1)^{k+1} a_k$  or  $\sum_{k=1}^{\infty} (-1)^k a_k$  where  $\{a_k\}$  is a sequence of positive numbers.
5. If  $\lim_{k \rightarrow \infty} a_k \neq 0$  the series will diverge by the divergence test.
7. Since the signs of the terms of the series are alternating and their magnitudes are monotonically decreasing, the terms of the sequence of partial sums have the stated property.
9. The series  $\sum_{k=1}^{\infty} |a_k|$  must converge.
11. Look at the definitions. For absolute convergence you must only show that the series  $\sum_{k=1}^{\infty} |a_k|$  converges; to show conditional convergence, you must show that the series  $\sum_{k=1}^{\infty} |a_k|$  diverges and the series  $\sum_{k=1}^{\infty} a_k$  converges.
13. If all of the terms of the series  $\sum_{k=1}^{\infty} a_k$  are positive, then  $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} |a_k|$ , so if the series converges it is absolutely convergent.
15. Monotonically decreasing,  $\lim_{x \rightarrow \infty} f(x) = 0$ ,  $\int_1^{\infty} f(x) dx$ ,  $\sum_{k=1}^{\infty} f(k)$
17. By Theorem 7.24

37. The series is a convergent telescoping series. It converges absolutely.
39. The series diverges.
41. The series converges conditionally.
43. The series converges absolutely.
45. The series converges conditionally.
47. The series converges absolutely.
49. The series converges absolutely.
51. The series converges absolutely.
53. (b)  $S_{10} = 0.817$ ,  $L \in (0.817, 0.827)$ , (c)  $n = 999$
55. (b)  $S_{10} = 0.5403023058681397174018$ ,  $L \in (0.5403023058681397174009, 0.5403023058681397174018)$ , (c)  $n = 5$
57. (b)  $S_{10} = 0.36787946$ ,  $L \in (0.36787943, 0.36787946)$ , (c)  $n = 11$
59. When  $p > 1$  the series converges absolutely, when  $0 < p \leq 1$  the series converges conditionally and when  $p \leq 0$  the series diverges.
61. The series converges absolutely for every value of  $p$ .
63. (a) As long as the denominator isn't zero we have
$$\frac{A_n - A_{n-1}}{A_{n-1} - A_{n-2}} = \frac{8069 - A_{n-1}(1+1/7)}{8069 - A_{n-2}(1+1/7)}$$

$$= \frac{8069 - (8069 - A_{n-2}(1/7))(1+1/7)}{8069 - A_{n-2}(1+1/7)}$$

$$= \frac{8069 - 8069}{8069 - A_{n-2}(1+1/7)} - \frac{(8069 - A_{n-2}(1+1/7))(1/7)}{8069 - A_{n-2}(1+1/7)} = -\frac{1}{7}.$$
 (b) It is a telescoping sum. (c) Since it is an alternating series and the  $n$ th term goes to zero as  $n \rightarrow \infty$ . The alternating series test applies and shows that it converges. It is also a geometric series, whose sum is 7060.375.

65. If  $\sum_{k=1}^{\infty} a_k$  converges, then for some  $N > 0$  every  $a_k < 1$  when  $k > N$ . Thus, for  $k > N$ ,  $a_k^2 < a_k$ . By the comparison test, the series  $\sum_{k=N+1}^{\infty} a_k^2$  converges and thus the series  $\sum_{k=1}^{\infty} a_k^2$  converges.
67. Model your proof on the argument found in the proof of the alternating series test.
69. This is the contrapositive of Theorem 7.41.
71. Compare the series to the harmonic series using the limit comparison test.
73. Use the hint!
43.  $\mathbb{R}$
45.  $\mathbb{R}$
47.  $\mathbb{R}$
49. 1
51.  $\mathbb{R}$
53. The powers of  $x + 1$  are negative;  $x < -2$  and  $x > 0$
55. Powers of  $\sin x$ ;  $\mathbb{R}$
57. Powers of  $\frac{x+2}{x-3}$ ;  $x \leq \frac{1}{2}$
59. (a) On  $[0, \infty)$ . (b) There are many ways to answer this question. Use enough terms that the error is not visible on the graph. Since the range of the function is approximately  $[0, 2500]$  on the interval, to ensure that the error is smaller than, e.g. 2%, we should require  $39500^{2/3}(500/19200)^n/n! < 50$ , which occurs for  $n = 2$ . It follows that one or two terms suffice to get a good picture.

For answers to odd-numbered Skill Certification exercises in the Chapter Review, please visit the Book Companion Web Site at [www.whfreeman.com/tkcalculus](http://www.whfreeman.com/tkcalculus).

## Chapter 8

### Section 8.1

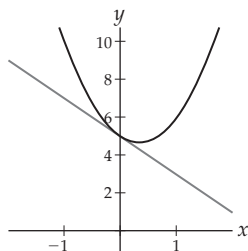

1. F, T, T, F, T, T, T, F.
3. A series of the form  $\sum_{k=0}^{\infty} a_k x^k$ .
5. The bases of the factors  $(x - k)^k$  vary with the index.
7. The interval of values of  $x$  for which the series converges. It is often best to use the ratio test for absolute convergence to find those values for which  $\lim_{k \rightarrow \infty} \left| \frac{a_{k+1}}{a_k} \right| |x - x_0| < 1$ . The interval of convergence can be an open interval centered at  $x_0$ , a half-open interval centered at  $x_0$ , a closed interval centered at  $x_0$ , or  $\mathbb{R}$ .
9. When  $x = 2$  we have the series  $\sum_{k=0}^{\infty} (-1)^k \frac{k}{3k+1}$ . Since  $\lim_{k \rightarrow \infty} (-1)^k \frac{k}{3k+1} \neq 0$ , the power series diverges when  $x = 2$ .
11. When  $x = 1$  we have the alternating harmonic series, which converges conditionally. When  $x = -1$  we have the harmonic series, which diverges. These two pieces of information, together with Theorem 8.3, tell us the series has the interval of convergence  $(-1, 1]$ .
13. 6
15. 2
17. If the radius of convergence is  $\rho$  the limit  $\lim_{k \rightarrow \infty} \left| \frac{a_{k+1}}{a_k} \right| \rho = 1$ , which means that the ratio test for absolute convergence fails at the endpoints of the interval of convergence.
19.  $\frac{1}{\rho}$
21.  $\mathbb{R}$
23.  $\mathbb{R}$
25.  $(-1, 1]$
27.  $[-3, -1)$
29.  $[\pi - 1, \pi + 1]$
31.  $\left[\frac{1}{2}, \frac{5}{2}\right]$
33.  $\left(-\frac{5}{2}, \frac{7}{2}\right)$
35.  $(-6, 2)$
37. 0
39.  $\left[-\frac{8}{3}, -\frac{2}{3}\right]$
41.  $(1, 4)$
61. The statement follows from the contrapositive of part (a) of Theorem 8.2.
63. At  $x_0 + \rho$  consider the series  $\sum_{k=0}^{\infty} |a_k((x + \rho) - x_0)^k| = \sum_{k=0}^{\infty} |a_k \rho^k|$ . This is precisely the series of absolute values when the original series is evaluated at  $x_0 - \rho$ . Therefore, if the original series converges absolutely at one endpoint of the interval of convergence, it converges absolutely at the other endpoint as well.
65. If the series converges absolutely at  $x_0 + \rho$ , then by Exercise 63 it converges absolutely at  $x_0 - \rho$  as well.
67. By Exercise 66, if the radius of convergence,  $\rho$ , of both series is finite, then  $\rho = \sqrt{\rho}$ . The only solutions to this equation are 0 and 1.
69. Use the ratio test for absolute convergence.
71. (a) Since  $a_{k+2} = a_k$  for every  $k > 0$ , the series  $\sum_{k=0}^{\infty} a_k x^k$  may be rewritten as  $a_0 \sum_{k=0}^{\infty} x^{2k} + a_1 \sum_{k=0}^{\infty} x^{2k+1}$ . These two series both have radius of convergence 1, so the series has radius of convergence 1. (b) The two series mentioned above diverge at  $\pm 1$ . (c)  $\frac{a_0 + a_1 x}{1 - x^2}$

### Section 8.2

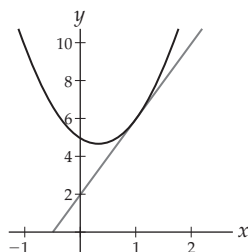

1. T, T, F, T, F, F, T, F.
3. At  $x = 0$ , we have  $\ln 2 - \sum_{k=1}^{\infty} \frac{1}{k}$  which diverges, since the harmonic series diverges. At  $x = 4$ , we have  $\ln 2 + \sum_{k=1}^{\infty} \frac{(-1)^{k-1}}{k}$  that converges conditionally.
5. The second Taylor polynomial has the same value, the same slope for its tangent line, and the same concavity as the function  $f$  at the point  $x_0$ .
7. A Maclaurin polynomial is an approximation to the function  $f$  at zero. A Taylor polynomial at  $x_0$  is an approximation to  $f$  at  $x_0$ .
9. A Taylor polynomial of degree  $n$  is an approximation to the function  $f$  at  $x_0$ . It is possible for a Taylor series for a function  $f$  to converge to  $f$  on the interval of convergence for the series. In this case the series is an alternate way to represent the function on the interval of convergence.

11. The single point 0; an interval with one of the forms  $(-\rho, \rho)$ ,  $(-\rho, \rho]$ ,  $[-\rho, \rho)$ ,  $[-\rho, \rho]$  where  $\rho > 0$ , or  $\mathbb{R}$ .
13.  $P_1(x) = 5 - 2x, P_2(x) = P_3(x) = 5 - 2x + 3x^2$ . For any polynomial function  $f$  of degree  $n$ , the  $m$ th Maclaurin polynomial for  $f$ ,  $P_m(x) = f(x)$  when  $m \geq n$ .

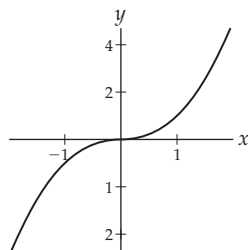

15.  $P_1(x) = 6 + 4(x - 1)$ ,  $P_2(x) = P_3(x) = 6 + 4(x - 1) + 3(x - 1)^2$ . For any polynomial function  $f$  of degree  $n$ , the  $m$ th Taylor polynomial for  $f$ ,  $P_m(x) = f(x)$  when  $m \geq n$ .

17.  $P_1(x) = (ax_0^3 + bx_0^2 + cx_0 + d) + (3ax_0^2 + 2bx_0 + c)(x - x_0)$ ,  $P_2(x) = (ax_0^3 + bx_0^2 + cx_0 + d) + (3ax_0^2 + 2bx_0 + c)(x - x_0) + (3ax_0 + b)(x - x_0)^2$ ,  $P_3(x) = P_4(x) = (ax_0^3 + bx_0^2 + cx_0 + d) + (3ax_0^2 + 2bx_0 + c)(x - x_0) + (3ax_0 + b)(x - x_0)^2 + a(x - x_0)^3$ .

For any polynomial function  $f$  of degree  $n$ , the  $m$ th Taylor polynomial for  $f$ ,  $P_m(x) = f(x)$  when  $m \geq n$ .

19. (a)  $P_1(x) = P_2(x) = 0$ . (b) The third derivative of  $f$  is undefined at 0.

21.  $1 - \frac{1}{2}x^2 + \frac{1}{24}x^4$       23.  $x - \frac{1}{6}x^3$
25.  $1 - 2x^2 + \frac{2}{3}x^4$
27.  $1 - \frac{1}{2}x - \frac{1}{8}x^2 - \frac{1}{16}x^3 - \frac{5}{128}x^4$
29.  $x^2 - \frac{1}{6}x^4$       31.  $\sum_{k=0}^{\infty} \frac{(-1)^k}{(2k)!} x^{2k}$

33.  $\sum_{k=0}^{\infty} \frac{(-1)^k}{(2k+1)!} x^{2k+1}$       35.  $\sum_{k=0}^{\infty} \frac{(-4)^k x^{2k}}{(2k)!}$

37.  $1 - \frac{1}{2}x - \sum_{k=2}^{\infty} \frac{1 \cdot 3 \cdot 5 \cdots (2k-3)}{2^k k!} x^k$

39.  $\sum_{k=0}^{\infty} \frac{(-1)^k}{(2k+1)!} x^{2k+2}$

41.  $-\left(x - \frac{\pi}{2}\right) + \frac{1}{6}\left(x - \frac{\pi}{2}\right)^3$

43.  $-(x - \pi) + \frac{1}{6}(x - \pi)^3$

45.  $\ln 3 + \frac{1}{3}(x - 3) - \frac{1}{18}(x - 3)^2 + \frac{1}{81}(x - 3)^3 - \frac{1}{324}(x - 3)^4$

47.  $-2\left(x - \frac{\pi}{4}\right) + \frac{4}{3}\left(x - \frac{\pi}{4}\right)^3$

49.  $\sum_{k=0}^{\infty} \frac{(-1)^{k+1}}{2k+1} \left(x - \frac{\pi}{2}\right)^{2k+1}$

51.  $\sum_{k=0}^{\infty} \frac{(-1)^{k+1}}{2k+1} (x - \pi)^{2k+1}$

53.  $\ln 3 + \sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{k3^k} (x - 3)^k$

55.  $\sum_{k=0}^{\infty} \frac{(-1)^{k+1} 2^{2k+1}}{k!} \left(x - \frac{\pi}{4}\right)^{2k+1}$

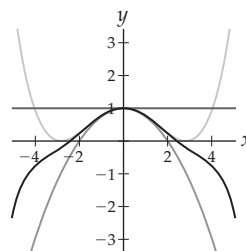

57. When  $p$  is a positive integer, the coefficients defined by  $\binom{p}{k} = \frac{p(p-1)(p-2)\cdots(p-k+1)}{k!}$  are all 0 for integers  $k > p$ .

59.  $\sum_{k=0}^{\infty} \binom{1/3}{k} x^k$

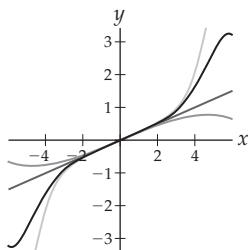

61.  $\sum_{k=0}^{\infty} \binom{-1/2}{k} x^k$

63. (a) and (b)  $f'(0) = \lim_{h \rightarrow 0} \frac{e^{-1/h^2}}{h} = 0$ . Using induction, show that  $f^{(k)}(0) = 0$  for every  $k \in \mathbb{Z}^+$ . (c) The Maclaurin series is the constant function 0. (d) The series made of (infinitely many) zeroes converges to zero for every value of  $x$ , but the function  $f(x) = 0$  if and only if  $x = 0$ .

65.  $1, 1 - \frac{1}{4}x^2, 1 - \frac{1}{4}x^2 + \frac{1}{64}x^4, 1 - \frac{1}{4}x^2 + \frac{1}{64}x^4 - \frac{1}{2304}x^6$

67.  $\frac{1}{2}x, \frac{1}{2}x - \frac{1}{16}x^3, \frac{1}{2}x - \frac{1}{16}x^3 + \frac{1}{384}x^5, \frac{1}{2}x - \frac{1}{16}x^3 + \frac{1}{384}x^5 - \frac{1}{18,432}x^7$

69. When  $k = 1$   $\frac{d}{dx}(\ln x) = \frac{1}{x} = (-1)^{1-1} \frac{(1-1)!}{x^1}$ . Next assume the statement holds for  $k$ ,  
 $\frac{d^{k+1}}{dx^{k+1}}(\ln x) = -(k+1)(-1)^{k-1} \frac{(k-1)!}{x^{k+1}} = (-1)^k \frac{k!}{x^{k+1}}$ .  
 Therefore, the statement holds for  $k \geq 1$ .

### Section 8.3

1. F, T, F, T, T, F, T.

3.  $a_k = \frac{f^{(k)}(0)}{k!}$

5.  $c_k = \frac{h^{(k)}(x_0)}{k!}$

7.  $\frac{1}{b} f\left(-\frac{a}{b}x\right) = \frac{1}{b} \frac{1}{1+(a/b)x} = \frac{1}{ax+b}$

9.  $R_3(x) = R_4(x) = 0$ .

11. Taylor's Theorem gives us the formula

$$R_n(x) = \int_{x_0}^x \frac{(x-t)^n}{n!} f^{(n+1)}(t) dt \text{ for computing the } n^{\text{th}} \text{ remainder in terms of an integral.}$$

13. When you know a few such series you can use them to quickly find the Maclaurin series for many related functions.  
 15. If the Maclaurin series for  $f(x)$  is  $\sum_{k=0}^{\infty} a_k x^k$ , the Maclaurin series for  $cx^m f(x)$  is  $\sum_{k=0}^{\infty} ca_k x^{k+m}$ . The intervals of convergence for the two series are the same.

17.  $e^{-\pi}$

21. 0

25.  $\frac{\cos c}{120} x^5$

29.  $-\frac{7}{256(1-c)^{9/2}} x^5$

33.  $R_n(x) = \frac{f^{(n+1)}(c)x^{n+1}}{(n+1)!}$ . Since  $f(x) = \cos x$ , the derivatives cycle through  $-\sin x$ ,  $-\cos x$ ,  $\sin x$  and  $\cos x$ .

$$\lim_{n \rightarrow \infty} |R_n(x)| \leq \frac{|x|^{n+1}}{(n+1)!} = 0$$

35.  $R_n(x) = \frac{f^{(n+1)}(c)x^{n+1}}{(n+1)!}$ . Since  $f(x) = \sin x$ , the derivatives cycle through  $\cos x$ ,  $-\sin x$ ,  $-\cos x$  and  $\sin x$ .

$$\lim_{n \rightarrow \infty} |R_n(x)| \leq \frac{|x|^{n+1}}{(n+1)!} = 0$$

37.  $-\frac{\sin c}{120} \left(x - \frac{\pi}{2}\right)^5$

41.  $\frac{1}{5c^5} (x-3)^5$

39.  $\frac{\cos c}{120} (x-\pi)^5$

43.  $\left( \frac{88(1+\tan^2 c)^2 \tan^2 c + 16(1+\tan^2 c)^3}{120} + \frac{16 \tan^4 c (1+\tan^2 c)}{120} \right) \left(x - \frac{\pi}{4}\right)^5$

45.  $|R_n x| \leq \frac{|x - \frac{\pi}{2}|^{n+1}}{(n+1)!}$

49.  $\frac{1}{(n+1)c^{n+1}} (x-3)^{n+1}$

53.  $\sum_{k=0}^{\infty} (-1)^{k+1} \frac{5^{2k+1} x^{4k+2}}{(2k+1)!}, \mathbb{R}$

57.  $\sum_{k=0}^{\infty} \frac{x^{2k}}{(2k)!}, \mathbb{R}$

61.  $x + x^2 + \frac{1}{3}x^3 - \frac{1}{30}x^5, \mathbb{R}$

65.  $x + \frac{5}{6}x^3 + \frac{101}{120}x^5 + \frac{4241}{5040}x^7(-1, 1)$

67.  $e^{-0.3} = \sum_{k=0}^{\infty} \frac{(-0.3)^k}{k!} \approx \sum_{k=0}^3 \frac{(-0.3)^k}{k!} = 0.7405$ . Use  $\sum_{k=0}^6 \frac{(-0.3)^k}{k!}$ .

69.  $\ln 1.5 = \sum_{k=1}^{\infty} \frac{(-1)^{k+1} 0.5^k}{k} \approx \sum_{k=1}^7 \frac{(-1)^{k+1} 0.5^k}{k} \approx 0.4058$ . Use  $\sum_{k=1}^{15} \frac{(-1)^{k+1} 0.5^k}{k}$ .

71.  $\tan^{-1} 0.4 = \sum_{k=0}^{\infty} \frac{(-1)^k 0.4^{2k+1}}{2k+1} \approx \sum_{k=0}^2 \frac{(-1)^k 0.4^{2k+1}}{2k+1} \approx 0.3807$ . Use  $\sum_{k=0}^5 \frac{(-1)^k 0.4^{2k+1}}{2k+1}$ .

73.  $\sin \frac{\pi}{90} = \sum_{k=0}^{\infty} \frac{(-1)^k (\pi/90)^{2k+1}}{(2k+1)!} \approx \frac{\pi}{90} \approx 0.0349$ . Use  $\sum_{k=0}^1 \frac{(-1)^k (\pi/90)^{2k+1}}{(2k+1)!}$ .

75.  $\cos \frac{\pi}{36} = \sum_{k=0}^{\infty} \frac{(-1)^k (\pi/36)^{2k}}{(2k)!} \approx \sum_{k=0}^1 \frac{(-1)^k (\pi/36)^{2k}}{(2k)!} \approx 0.9962$ . Use  $\sum_{k=0}^2 \frac{(-1)^k (\pi/36)^{2k}}{(2k)!}$ .

77. (a)  $e^{0.3} = \sum_{k=0}^{\infty} \frac{(0.3)^k}{k!}$ , (b)  $|R_5(x)| \leq \frac{e^{0.3}(0.3)^6}{720}$ , (c) 7

79. (a)  $\ln 0.5 = -\sum_{k=1}^{\infty} \frac{(0.5)^k}{k}$ , (b)  $\frac{1}{6}$ , (c) 999, 999

81. (a)  $\sin 1 = \sum_{k=0}^9 \frac{(-1)^k}{(2k+1)!}$ , (b)  $\frac{1}{720}$ , (c) 11

83. (a)  $\lim_{h \rightarrow 0} \frac{(\sin h)/h - 1}{h} = 0$ . (b)  $\sum_{k=0}^{\infty} \frac{(-1)^k}{(2k+1)!} x^{2k}$

85. (a)  $y = \frac{1}{100}x + 35$ . (b) From Theorem 8.10, the error term is of form  $\frac{w''(c)x^2}{2}$  for some  $c \in [0, 300]$ .

(d) Assuming that the quadratic is somewhat close to  $w(t)$ , the error term is approximated by  $w_2''(x)x^2/2$ . This is bounded above by

$$\max_{0 \leq x \leq 300} w_2''(x)300^2/2 = \frac{1}{90000} 90000/2 = 1/2. \text{ We estimate that the line is at most half a foot off of the water table over the entire 300 foot interval.}$$

87. The partial proof of Theorem 8.9 in the text shows that the theorem holds for  $k = 1$  and  $k = 2$ . Assume the theorem is valid for an arbitrary value of  $k$ . Applying integration by parts to the integral with  $u = f^{(n+1)}(t)$  and  $dv = \frac{(x-t)^n}{n!} dt$ , we see that the integral in the statement equals  $\frac{f^{(n+1)}(x_0)}{(n+1)!} (x-x_0)^{n+1} + \int_{x_0}^x \frac{(x-t)^{n+1}}{n!} f^{(n+2)}(t) dt$ . When we combine this with the summation  $\sum_{k=0}^n \frac{f^{(k)}(x_0)}{k!} (x-x_0)^k$  we have the result.
89. Model your proof on the argument found after Theorem 8.10, showing that the remainder for  $\sin x$  goes to 0 as  $n \rightarrow \infty$ .
91. Model your proof on the argument found Example 2.

### Section 8.4

- T, T, T, T, F, F, F, T.
- $f(x_0) = a_0, f'(x_0) = a_1, f''(x_0) = 2a_2, f^{(k)}(x_0) = k!a_k$
- $G(x) = 7 + \sum_{k=0}^{\infty} \frac{a_k}{k} (x-x_0)^k$
- Since  $\frac{d^{k-1}}{dx^{k-1}} \left( \frac{1}{1-x} \right) = \frac{(k-1)!}{(1-x)^k}$  to find the Maclaurin series for  $\frac{1}{(1-x)^k}$  we could take the  $(k-1)^{\text{st}}$  derivative of the series for  $\frac{1}{1-x}$ , term by term, and divide each term by  $k!$ .
- $2 \sum_{k=0}^{\infty} \frac{(-1)^k 3^k}{k!} x^k$
- (a)  $\left(-\frac{1}{2}, \frac{1}{2}\right)$ , (b)  $\sum_{k=0}^{\infty} (k+1)2^{k+1}x^k$ , (c)  $\sum_{k=1}^{\infty} \frac{2^{k-1}}{k} x^k$
- (a)  $(-\infty, \infty)$ , (b)  $\sum_{k=0}^{\infty} \frac{(-1)^{k+1}(k+1)}{(2k+2)!} x^k$ , (c)  $\sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{k(2k-2)!} x^k$
- (a)  $(-6, -4]$ , (b)  $\sum_{k=0}^{\infty} (-1)^{k+1}(x+5)^k$ , (c)  $\sum_{k=2}^{\infty} \frac{(-1)^{k+1}}{(k-1)k} (x+5)^k$
- The function  $\frac{1}{1+x^3}$  is continuous on the interval  $[0, 0.5]$ .  
(a) Use Theorem 5.30 to find the number of terms required to give an approximation accurate to within 0.001 of its actual value. Then form the Simpson's approximation with the appropriate number of terms.  
(b)  $\sum_{k=0}^{\infty} (-1)^k x^{3k}$  (c) Evaluate the definite integral of the series from part (b) term by term from 0 to 0.5. Sum all of the terms that are greater than 0.001. This is the approximation.
- The function  $\sin(x^2)$  is continuous on the interval  $[0, 0.5]$ . (a) Use Theorem 5.30 to find the number of terms required to give an approximation accurate to within 0.001 of its actual value. Then form the Simpson's approximation with the appropriate number of terms. (b)  $\sum_{k=0}^{\infty} \frac{(-1)^k}{(2k+1)!} x^{4k+2}$  (c) Evaluate the definite integral of the series from part (b) term by term from 0 to 0.5. Sum all of the terms that are greater than 0.001. This is the approximation.
- $\frac{d}{dx} \left( \sum_{k=0}^{\infty} \frac{(-1)^k}{(2k+1)!} x^{2k+1} \right) = \sum_{k=0}^{\infty} \frac{(-1)^k}{(2k+1)!} \frac{d}{dx} (x^{2k+1}) = \sum_{k=0}^{\infty} \frac{(-1)^k}{(2k)!} x^{2k}$
- $\frac{d}{dx} \left( \sum_{k=0}^{\infty} \frac{(-1)^k}{k!} x^k \right) = \sum_{k=0}^{\infty} \frac{(-1)^k}{k!} \frac{d}{dx} (x^k) = \sum_{k=0}^{\infty} \frac{(-1)^k}{k!} x^k$
- (a)  $\sum_{k=0}^{\infty} (-1)^k x^{2k}, (-1, 1)$ , (b)  $\sum_{k=1}^{\infty} (-1)^{k+1} k x^{2k-1}, (-1, 1)$
- (a)  $\sum_{k=0}^{\infty} (-2)^k x^{3k}, \left(-\frac{1}{2}, \frac{1}{2}\right)$ , (b)  $\sum_{k=1}^{\infty} (-2)^{k-3} k x^{3k-1}, \left(-\frac{1}{2}, \frac{1}{2}\right)$
- (a)  $\sum_{k=0}^{\infty} \frac{1}{2^{2k+2}} x^{2k}, (-2, 2)$ , (b)  $\sum_{k=1}^{\infty} \frac{k}{2^{2k+2}} x^{2k-1}, (-2, 2)$
- (a)  $\sum_{k=0}^{\infty} \frac{(-1)^k}{(2k+1)!} x^{4k+2}$ , (b)  $\sum_{k=0}^{\infty} \frac{(-1)^k}{(2k)!} x^{4k+1}$
- (a)  $\sum_{k=0}^{\infty} \frac{(-1)^k}{k!} x^{2k}$ , (b)  $\sum_{k=0}^{\infty} \frac{(-1)^k}{k!} x^{2k+1}$
- (a)  $\sum_{k=0}^{\infty} \frac{1}{(-2)^{k+1}} (x-3)^k, (1, 5)$ , (b)  $\sum_{k=0}^{\infty} \frac{k+1}{(-2)^{k+2}} (x-3)^k, (1, 5)$
- (a)  $\sum_{k=0}^{\infty} (-1)^{k+1} (x-3)^k, (2, 4)$ , (b)  $\sum_{k=0}^{\infty} (-1)^k (k+1) (x-3)^k, (2, 4)$
- (a)  $-\frac{1}{8} \sum_{k=0}^{\infty} \left(-\frac{3}{8}\right)^k (x-3)^k, \left(\frac{1}{3}, \frac{17}{3}\right)$ , (b)  $-\frac{1}{24} \sum_{k=0}^{\infty} \left(-\frac{3}{8}\right)^{k+1} (k+1) (x-3)^k, \left(\frac{1}{3}, \frac{17}{3}\right)$
- (a)  $\sum_{k=0}^{\infty} \frac{(-1)^k}{(2k+1)!} x^{6k+3}$ , (b)  $2 + \sum_{k=0}^{\infty} \frac{(-1)^k}{(6k+4)(2k+1)!} x^{6k+4}$
- (a)  $\sum_{k=0}^{\infty} \left(\frac{-1}{3}\right)^k \frac{x^{2k}}{k!}$ , (b)  $\sum_{k=0}^{\infty} \left(\frac{-1}{3}\right)^k \frac{x^{2k+1}}{(2k+1)k!}$
- (a)  $\sum_{k=0}^{\infty} (-1)^k x^{3k}$ , (b)  $-5 + \sum_{k=0}^{\infty} \frac{(-1)^k}{3k+1} x^{3k+1}$
- (a)  $\sum_{k=0}^{\infty} (-1)^k \frac{5^{2k+1}}{(2k+1)!} x^{4k+4}$ , (b)  $1 + \sum_{k=0}^{\infty} (-1)^k \frac{5^{2k+1}}{(4(k+1)(2k+1)!} x^{4k+5}$
- (a)  $\sum_{k=0}^{\infty} \frac{(-3)^k x^{2k+2}}{k!}$ , (b)  $1 + \sum_{k=0}^{\infty} \frac{(-3)^k x^{2k+3}}{(2k+3)k!}$
- $\sum_{k=0}^{\infty} \frac{(-1)^k}{(3k+2)(2k+1)!} 2^{6k+3}$       53.  $2 \sum_{k=0}^{\infty} \frac{(-1)^k}{(2k+1)3^k k!}$
- $\sum_{k=0}^{\infty} \frac{(-1)^k}{3k+1} (0.3)^{3k+1}$
- $\sum_{k=0}^{\infty} \frac{(-1)^k 5^{2k+1}}{(4k+5)(2k+1)!} (2^{4k+5} - 1)$
- $\sum_{k=0}^{\infty} \frac{(-3)^k}{(2k+3)k!} - \sum_{k=0}^{\infty} \frac{(-3)^k}{2^{2k+3}(2k+3)k!}$
- $\sum_{k=0}^{10} \frac{(-1)^k 2^{6k+3}}{(3k+2)(2k+1)!} \approx 0.45254$
- $\sum_{k=0}^3 \frac{2(-1)^k}{(2k+1)3^k k!} \approx 1.79824$

65.  $\sum_{k=0}^1 \frac{(-1)^k}{(3k+1)} 0.3^{3k+1} \approx 0.29798$
67.  $\sum_{k=0}^{27} \frac{(-1)^k 5^{2k+1}}{(4k+5)(2k+1)!} (2^{4k+5} - 1) \approx -0.039348$
69.  $\sum_{k=0}^9 \frac{(-1)^k 3^k}{(2k+3)k!} (1 - 0.5^{2k+3}) \approx 0.48101$
71.  $y_0''(x) = \sum_{k=1}^{\infty} \frac{(3k)(3k-1)x^{3k-2}}{(2 \cdot 3)(5 \cdot 6) \cdots ((3k-1) \cdot 3k)} =$   
 $x + \sum_{k=2}^{\infty} \frac{x^{3k-2}}{(2 \cdot 3)(5 \cdot 6) \cdots ((3k-4) \cdot (3k-3))}$ . On the other side of the equation we see that  
 $xy_0(x) = x + x \sum_{k=1}^{\infty} \frac{x^{3k}}{(2 \cdot 3)(5 \cdot 6) \cdots ((3k-1) \cdot 3k)} =$   
 $x + \sum_{k=1}^{\infty} \frac{x^{3k+1}}{(2 \cdot 3)(5 \cdot 6) \cdots ((3k-1) \cdot 3k)} =$   
 $x + \sum_{k=2}^{\infty} \frac{x^{3k-2}}{(2 \cdot 3)(5 \cdot 6) \cdots ((3k-1) \cdot 3k)}$ . These are the same, so  $y_0$  is a solution to Airy's equation.
73. The two series are the Maclaurin series for some function  $f(x)$ . Thus, the series  $\sum_{k=0}^{\infty} (a_k - b_k)x^k$  is a Maclaurin series for the zero function. Thus, each coefficient  $a_k - b_k = 0$ .
75. Let  $f$  be an odd function with  $f(x) = \sum_{k=0}^{\infty} a_k x^k$ . Since  $f$  is odd, we have  $f(x) = -f(-x)$  for every  $x$  in the domain. This means that  $f(x) = \sum_{k=0}^{\infty} (-1)^{k+1} a_k x^k$ . From Exercise 73 we have that  $a_k = (-1)^{k+1} a_k$  for every  $k$ . This is only possible if  $a_{2k} = 0$  for every  $k$ .

## Chapter 9

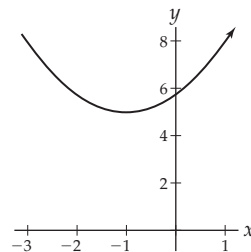

### Section 9.1

- T, F, F, F, F, T, F.
- (a) To the right and up. (b) To the right and down. (c) To the left and up. (d) To the left and down.
- Up and to the left when  $t < 0$ , up and to the right when  $t > 0$ .
- Up and to the right
- (i)  $y = x^2 - 1$ , (ii) (a) the right half of the parabola, (b) the left half of the parabola; (iii) motion to the right as  $t$  increases for (a), and motion to the left as  $t$  increases for (b).
- The graphs are the portions of  $y = \sin x$  to the right of the  $y$ -axis. The direction of motion for both is to the right.
- There is a horizontal tangent line at a value,  $t_0$ , where  $\frac{dy}{dt} = 0$  and  $\frac{dx}{dt} \neq 0$  or when  $\lim_{t \rightarrow t_0} \frac{dy/dt}{dx/dt} = 0$ . There is a vertical tangent line at value  $t_0$  where  $\frac{dy}{dt} \neq 0$  and  $\frac{dx}{dt} = 0$  or when  $\lim_{t \rightarrow t_0} \frac{dy/dt}{dx/dt} = \pm\infty$ .

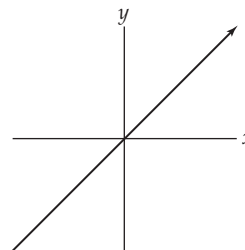

15. Since the sine function is periodic and  $-1 \leq \sin t \leq 1$  for all values of  $t$ , the values of  $x$  and  $y$  will also be bounded;  $0 \leq x \leq 2$  and  $-4 \leq y \leq -3$ .

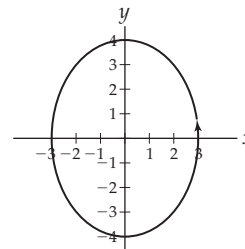

25.  $y = 3 \left( \frac{x+1}{2} \right)^2 + 5$

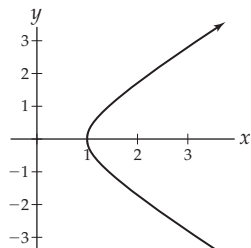

27.  $y = x$

29.  $\left( \frac{x}{3} \right)^2 + \left( \frac{y}{4} \right)^2 = 1$

31.  $x^2 - y^2 = 1$

33.  $x^2 - y^2 = 1$ , same graph as in Exercise 31

35.  $x^2 + y^2 = 1$ , when  $t = \pi$ ,  $(x, y) = (-1, 0)$ ,  $t = \frac{3\pi}{2}$ ,  $(x, y) = (0, -1)$  and  $t = 2\pi$ ,  $(x, y) = (1, 0)$

37.  $x = -3 \sin(2\pi t)$ ,  $y = 3 \cos(2\pi t)$

39.  $x = \frac{2t}{1+t^2}$ ,  $x = \frac{1-t^2}{1+t^2}$

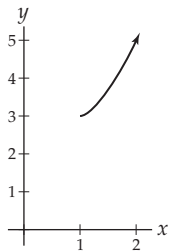

41.  $y - 2 = \frac{3}{2}(x + 3)$

43.  $y - \frac{9}{4} = -3\left(x - \frac{1}{4}\right)$

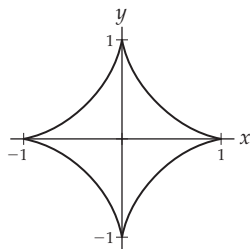

45. 0

47. 8

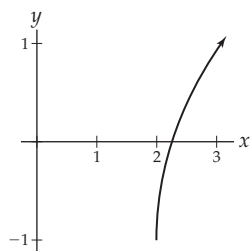

49.  $\frac{2}{27}(10\sqrt{10} - 1)$

51. 6

53.  $e - \frac{1}{e}$

55.  $x = 1 + 5t$ ,  $y = -3 + 10t$ ,  $t \in [0, 1]$

57.  $x = 1 - 4t$ ,  $y = 4 + t$ ,  $t \in [0, 1]$

59.  $x = \pi$ ,  $y = 3 + 5t$ ,  $t \in [0, 1]$

61.  $5\sqrt{5}$

63.  $x = (k+r) \cos \theta - k \cos\left(\frac{(k+r)\theta}{k}\right)$ ,  
 $y = (k+r) \sin \theta - r \sin\left(\frac{(k+r)\theta}{k}\right)$

65.  $\int_0^{2\pi} \sqrt{\cos^2 t + 9 \sin^2 t} dt \approx 13.4$

67. (a)  $x(t) = 1.932t$ ,  $y(t) = 0.552t^3 - 1.287t^2 + 0.518t$ ,  
(b) 0.232 miles, (c) 3.044 miles

69. When  $x = t$  and  $y = f(t)$ , we have  
 $\int_a^b \sqrt{(x'(t))^2 + (y'(t))^2} dt = \int_a^b \sqrt{1 + (f'(t))^2} dt$ .

71.  $\int_a^b \sqrt{((kf)'(t))^2 + ((kg)'(t))^2} dt =$   
 $k \int_a^b \sqrt{(f'(t))^2 + (g'(t))^2} dt = k$  times the arc length of the second set of parametric equations. The arc length of the final set of parametric equations is the same as the length of the second set of parametric equations.

73.  $\frac{dy}{dx} = \frac{\sin \theta}{1 - \cos \theta}$ . By L'Hôpital's rule  
 $\lim_{\theta \rightarrow 2k\pi^+} \frac{\sin \theta}{1 - \cos \theta} = \lim_{\theta \rightarrow 2k\pi^+} \frac{\cos \theta}{\sin \theta} = \infty$  and  
 $\lim_{\theta \rightarrow 2k\pi^-} \frac{\sin \theta}{1 - \cos \theta} = \lim_{\theta \rightarrow 2k\pi^-} \frac{\cos \theta}{\sin \theta} = -\infty$ . Thus, there is a vertical tangent line at each even multiple of  $\pi$ .

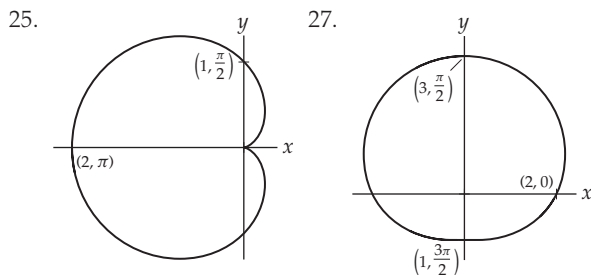

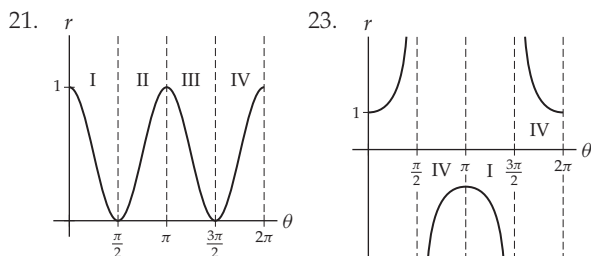

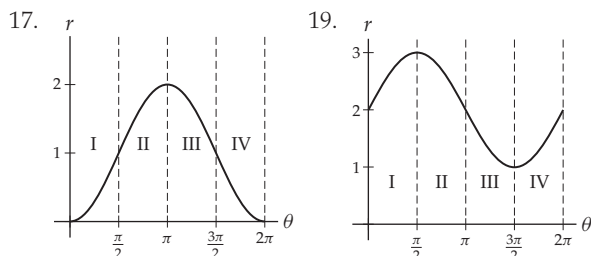

## Section 9.2

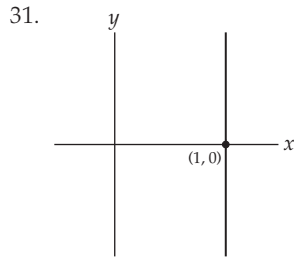

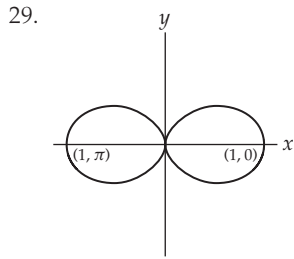

- T, F, F, F, T, T, T, T.
- The value of  $\theta$  in the polar coordinates for a point  $P$  measures the angular rotation of  $P$  from the  $x$ -axis. Adding an integer rotation of  $2\pi$  doesn't change the location of the point.
- The point  $(8, -\frac{\pi}{3})$  is in the fourth quadrant. The point  $(-4, 4\sqrt{3})$  is in the second quadrant.
- The graphs of  $r = c$  and  $r = -c$  are the same for every real number  $c$ .
- $\alpha = k\frac{\pi}{2}$  for any integer  $k$ .
- Every point  $(r, \theta)$  is on a ray in the first quadrant when  $r > 0$  and  $0 < \theta < \frac{\pi}{2}$ . The points in the third quadrant are given by the inequalities  $r > 0$  and  $\pi < \theta < \frac{3\pi}{2}$ .
- $(1, 2k\pi)$  and  $(-1, (2k+1)\pi)$  for every integer  $k$ .
- $(1, (2k+1)\pi)$  and  $(-1, 2k\pi)$  for every integer  $k$ .
- $(\frac{3\sqrt{3}}{2}, \frac{3}{2})$ ,  $(-\frac{3\sqrt{3}}{2}, -\frac{3}{2})$ ,  $(\frac{3\sqrt{3}}{2}, -\frac{3}{2})$ ,  $(-\frac{3\sqrt{3}}{2}, \frac{3}{2})$
- $(0, 5)$ ,  $(0, -5)$ ,  $(0, 5)$ ,  $(0, 5)$
- $(\frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2})$ ,  $(\sqrt{2}, \sqrt{2})$ ,  $(\frac{3\sqrt{2}}{2}, \frac{3\sqrt{2}}{2})$ ,  $(2\sqrt{2}, 2\sqrt{2})$
- $(0, -1)$ ,  $(0, -2)$ ,  $(0, -3)$ ,  $(0, -4)$
- $(1, 2k\pi)$  and  $(-1, (2k+1)\pi)$  for any integer  $k$ .

27.  $\left(2, \frac{\pi}{2} + 2\pi k\right)$  and  $\left(-2, -\frac{\pi}{2} + 2\pi k\right)$  for any integer  $k$
29.  $\left(4\sqrt{3}, \frac{\pi}{6} + 2\pi k\right)$  and  $\left(-4\sqrt{3}, \frac{7\pi}{6} + 2\pi k\right)$  for any integer  $k$ .
31.  $\left(3\sqrt{2}, -\frac{\pi}{4} + 2\pi k\right)$  and  $\left(-3\sqrt{2}, \frac{3\pi}{4} + 2\pi k\right)$  for any integer  $k$ .
33.  $y = x$
35.  $y = \frac{\sqrt{3}}{3}x$
37.  $x^2 + \left(y - \frac{5}{2}\right)^2 = \left(\frac{5}{2}\right)^2$
39.  $y = 6$
41.  $(x^2 + y^2)^{3/2} = 2xy$
43.  $\pm(x^2 + y^2)^{3/2} = x$
45.  $x \tan \sqrt{x^2 + y^2} = y$
47.  $(x^2 + y^2)^2 = y^3$
49.  $\theta = 0$ .
51.  $\theta = \frac{\pi}{4}$ .
53.  $r = -3 \csc \theta$ .
55.  $\tan \theta = m$
57.  $x^2 + y^2 = k^2$
59. For  $k = 1$  and  $k = 7$ ,  $y = \frac{\sqrt{3}}{3}x$ . For  $k = 2$  and  $k = 8$ ,  $y = \sqrt{3}x$ . For  $k = 3$  and  $k = 9$ ,  $x = 0$ . For  $k = 4$  and  $k = 10$ ,  $y = -\sqrt{3}x$ . For  $k = 5$  and  $k = 11$ ,  $y = -\frac{\sqrt{3}}{3}x$ . For  $k = 6$  and  $k = 12$ ,  $y = 0$ .
61. (a) Assuming the arms of the cam remain symmetrically placed, each  $\frac{3}{4}$  inch arm must fit in a half inch of the crack. Thus, we require  $0.75 \sin \theta = \frac{1}{2}$ , so  $\theta = \sin^{-1} \frac{2}{3}$ .  
(b) This causes the cam to push even harder against the walls of the crack.
63. Since  $\csc \theta = \frac{r}{y}$ , we have,  $r = k \frac{r}{y}$ , or equivalently  $y = k$ .
65. We have  $a = r - br \cos \theta$ . In rectangular coordinates this can be written  $\sqrt{x^2 + y^2} = a + bx$ . Squaring both sides, completing the square, and simplifying, we may obtain  $\left(x - \frac{ab}{1-b^2}\right)^2 + \frac{y^2}{1-b^2} = \left(\frac{a}{1-b^2}\right)^2$  which is the equation of an ellipse if  $0 < b < 1$ . If  $b > 1$  the equation gives a hyperbola.
67. Since  $\cos \theta = \frac{x}{r}$ , we have  $r = \frac{x}{\cos \theta}$ , or equivalently  $r^2 = x^2 + y^2 = ax$ . When you complete the square for this equation you obtain  $\left(x - \frac{a}{2}\right)^2 + y^2 = \left(\frac{a}{2}\right)^2$ . So the graph of the equation is a circle with center  $\left(\frac{a}{2}, 0\right)$  and radius  $\frac{a}{2}$ .
69. Since  $\cos \theta = \frac{x}{r}$  and  $\sin \theta = \frac{y}{r}$ , we have  $r = k \frac{y}{r} + l \frac{x}{r}$ , or equivalently  $r^2 = x^2 + y^2 = lx + ky$ . When you complete the square for this equation you obtain  $\left(x - \frac{l}{2}\right)^2 + \left(y - \frac{k}{2}\right)^2 = \frac{k^2 + l^2}{4}$ . So the graph of the equation is a circle with center  $\left(\frac{l}{2}, \frac{k}{2}\right)$  and radius  $\frac{\sqrt{k^2 + l^2}}{2}$ .

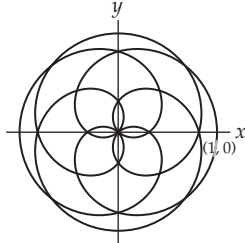

## Section 9.3

1. F, T, F, T, F, T, T, T.
3. The  $\theta$ -intercepts of the graph in the  $\theta r$ -plane correspond to the places where the polar graph passes through the pole. The location of the graph in the  $\theta r$ -plane corresponds to the quadrant in which the polar graph is drawn.
5. (a) All  $\theta$ -intercepts of the graph in the  $\theta r$ -plane correspond to the places where the polar graph passes through the pole. (b) The points on the  $\theta$ -axis correspond to the points on the horizontal axis in the polar plane. (c) All points on the vertical lines  $\theta = (2k + 1)\frac{\pi}{2}$  correspond to the points on the vertical axis in the polar plane.
7. (a)  $\left(2, -\frac{\pi}{3}\right)$  (b)  $\left(2, \frac{2\pi}{3}\right)$  (c)  $(-3, 5)$  (d)  $\left(2, \frac{4\pi}{3}\right)$  (e)  $(-3, -5)$
9. (a)  $r = 2 \cos \theta$  (b)  $r = 2 \sin \theta$  (c)  $r = \sin 2\theta$  (d)  $r^2 = \sin 2\theta$  (e)  $r = \sin 2\theta$  (f) not possible
11. A cardioid, a limaçon, and a lemniscate.
13.  $r = \cos 5\theta$ : symmetry about the horizontal axis and rotational symmetry, five petals.  $r = \sin 8\theta$ : symmetry about the  $x$ - and  $y$ -axes, symmetry about the origin, rotational symmetry, sixteen petals.
15. Since  $\cos(-2\theta) = \cos 2\theta$  the graph will be symmetrical with respect to the horizontal axis.

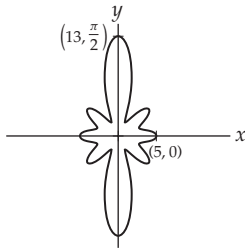

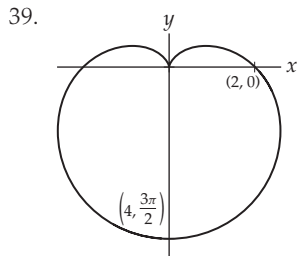

33. Use the interval  $[0, 10\pi]$ .

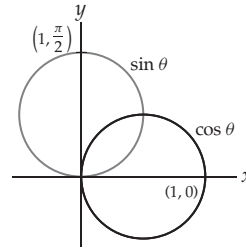

35. Use the intervals  $[0, \frac{\pi}{2}] \cup (\frac{\pi}{2}, \frac{3\pi}{2}] \cup (\frac{3\pi}{2}, 2\pi]$ .

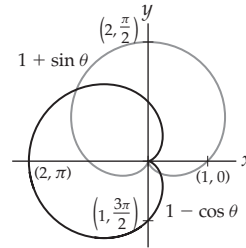

37. Use the interval  $[0, 24\pi]$ .

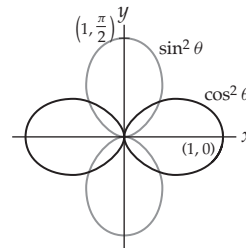

41. (a)  $\frac{\pi}{4} + k\pi$  for every integer  $k$ . (c) The curves intersect at  $(0, 0)$  and  $(\frac{\sqrt{2}}{2}, \frac{\pi}{4})$ .

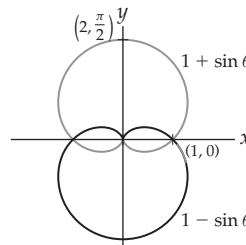

43. (a)  $\frac{3\pi}{4} + k\pi$  for every integer  $k$ . (b) Graph is shown below. (c) The curves intersect at  $(0, 0)$ ,  $(1 + \frac{\sqrt{2}}{2}, \frac{3\pi}{4})$  and  $(1 - \frac{\sqrt{2}}{2}, \frac{7\pi}{4})$ .

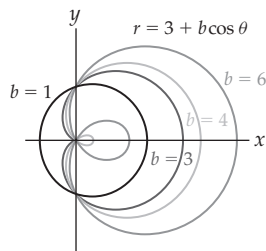

45. (a)  $\frac{\pi}{4} + \frac{k\pi}{2}$  for  $k = 0, 1, 2$  and  $3$ . (b) Graph is shown below. (c) The curves intersect at  $(0, 0)$ ,  $(\frac{1}{2}, \frac{\pi}{4} + \frac{k\pi}{2})$  for every integer  $k$ .

47. They are the mirror images of each other.

49. When  $0 \leq b \leq \frac{3}{2}$  the limaçon will be convex. When  $\frac{3}{2} < b \leq 3$  there will be a dimple. When  $b = 3$  the curve is a cardioid.

51. (a)  $x = \frac{1}{2} + \frac{1}{2} \cos t, y = \frac{1}{2} \sin t, t \in \mathbb{R}$ ,  
 (b)  $(x - \frac{1}{2})^2 + y^2 = \frac{1}{4}$ , (c)  $r = \cos \theta$

53.

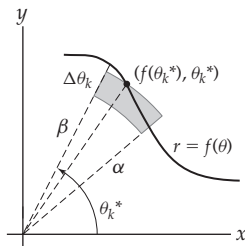

55. We will prove the statement for  $f(\theta) = \sin n\theta$ . The argument for  $f(\theta) = \cos n\theta$  is similar. Let  $(r, \theta)$  be a point on the graph of  $f(\theta) = \sin n\theta$ . That is,  $r = \sin n\theta$ . If  $n$  is a positive odd integer, then by the angle sum identity for sine we have  $\sin(n(\theta + \pi)) = -\sin(n\theta)$ . Therefore the point  $(-r, \sin(n(\theta + \pi))) = (-r, -\sin(n\theta))$  has the same location as  $(r, \theta)$ . Thus, the graph traced on the interval  $[\pi, 2\pi]$  is the same as the graph traced on the interval  $[0, \pi]$ .
57. Let  $(r, \theta)$  be a point on the graph of  $f(\theta) = \sin n\theta$  where  $n$  is even. We have  $f(-\theta) = \sin(-n\theta) = \sin(2\pi - n\theta) = \sin(n\theta)$ . Therefore, the point  $(r, -\theta)$  is also on the graph. Thus, the graph is symmetrical with respect to the  $x$ -axis.
59. Let  $(r, \theta)$  be a point on the graph of  $f(\theta) = \cos n\theta$ , where  $n$  is even. It suffices to show that  $(r, \pi - \theta)$  is also on the graph. We have  $f(\pi - \theta) = \cos(n(\pi - \theta)) = \cos(n\theta)$ . Therefore, the point  $(r, \pi - \theta)$  is also on the graph.

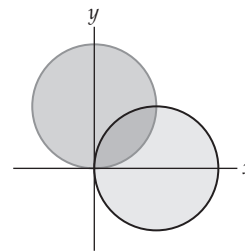

Section 9.4

1. T, T, F, T, F, F, T, F.  
 3. For a function  $r = f(\theta)$  in polar coordinates,  $\theta$  is an angular rotation. A small change  $\Delta\theta$  determines a wedge-shaped slice of the region.

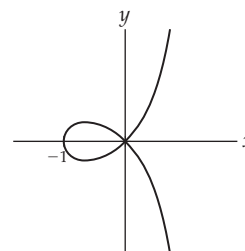

5.

7. To compute an area we need  $\beta > \alpha$  for the limits of integration in the integral. So that we don't compute a portion of the area twice, we need  $\beta - \alpha < 2\pi$ .
9. It is often simpler to compute a known fraction of the total area and then finish by multiplying by the appropriate factor. Review Example 2 to see how this may be done.
11.  $x = t, y = f(t)$
13. The graph of the equation  $r = \sin \theta$  is a circle with radius  $\frac{1}{2}$ . Since he integrated on the interval  $[0, 2\pi]$  the circle is traced twice, so he got the correct answer.
15. The expression computes the area inside the two circles below. The area is  $\frac{\pi - 2}{8}$ .

17.  $\frac{1}{2} \int_0^\pi \theta^2 d\theta = \frac{\pi^3}{6}$
19.  $\int_0^{3\pi/4} (1 + \sqrt{2} \cos \theta)^2 d\theta - \int_{3\pi/4}^\pi (1 + \sqrt{2} \cos \theta)^2 d\theta = 3 + \pi$
21.  $\int_{-\pi/2}^{\pi/6} ((3 - 3 \sin \theta)^2 - (1 + \sin \theta)^2) d\theta = 8\pi + 9\sqrt{3}$
23.  $\int_0^{\pi/3} (1 - \sec^2 \theta) d\theta = \frac{\pi}{3} - \frac{\sqrt{3}}{4}$
25.  $\int_0^{\pi/4} (\sec \theta - 2 \cos \theta)^2 d\theta = 2 - \frac{\pi}{2}$

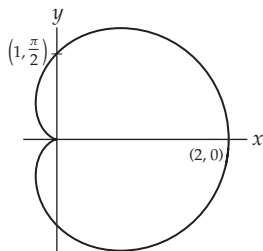

27.  $\int_0^{2\pi} \sqrt{2} e^\theta d\theta = \sqrt{2}(e^{2\pi} - 1)$
29.  $\int_0^{2\pi} \sqrt{1 + \alpha^2} e^{\alpha\theta} d\theta = \frac{\sqrt{1 + \alpha^2}}{\alpha} (e^{2\pi\alpha} - 1)$
31.  $2 \int_0^{\pi/4} \sqrt{4 \sin^2 2\theta + \cos^2 2\theta} d\theta \approx 2.422$
33.  $2 \int_0^{\pi/8} \sqrt{16 \sin^2 4\theta + \cos^2 4\theta} d\theta \approx 2.145$

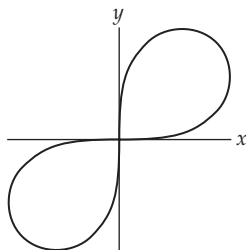

35.  $\int_{7\pi/6}^{11\pi/6} \sqrt{(1 + 2 \sin \theta)^2 + 4 \cos^2 \theta} d\theta \approx 2.682$

37.  $\frac{3\sqrt{3} + \pi}{4}$

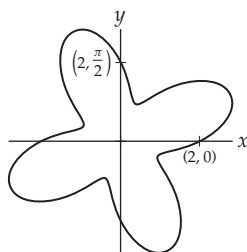

39.  $\frac{3\pi}{2}$

41. 1

43.  $\frac{9\pi}{2}$

45. The area is  $\frac{1}{2} \int_0^{2\pi} a^2 d\theta = \pi a^2$ .

47. The circumference is  $\int_0^{2\pi} a d\theta = 2\pi a$ .

49.  $a^2 \left( \frac{2\pi}{3} - \frac{\sqrt{3}}{2} \right)$

51. The length of the central cross section of the kayak is about 6.15 feet or about 1.87 meters. Annie should be able to use just two widths of the fabric.

53.  $A = \frac{1}{2} \int_{\theta_0}^{\theta_0 + \phi} r^2 d\theta = \frac{1}{2} \phi r^2$ .

55. For any positive integer  $n$ , the area is given by  $n \int_0^{2\pi/n} \cos^2(2n\theta) d\theta = \frac{\pi}{2}$ .

57. The length of the curve is given by the improper integral  $\int_1^\infty \sqrt{\frac{1}{\theta^2} + \frac{1}{\theta^4}} d\theta$  which diverges to  $\infty$ .

Section 9.5

1. T, T, F, T, F, T, F, T.

3. See Definition 9.15

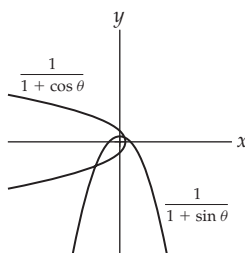

5. See Definition 9.19

7. Since a hyperbola is the set of points in the plane for which the difference between the distances of the foci is a constant, and there are infinitely many differences which can be obtained in this way, there are infinitely many different hyperbolas with the same foci.

9. (a)  $\frac{\sqrt{A^2 - B^2}}{A}$ , (b)  $\frac{\sqrt{B^2 - A^2}}{B}$ , (c) Since  $\sqrt{A^2 - B^2} < A$  and  $\sqrt{B^2 - A^2} < B$ , (d) It becomes more circular. (e) It elongates and flattens.

11.  $y = \pm \frac{B}{e}$

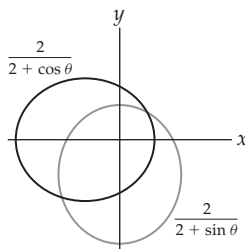

13.

Both are parabolas with a focus at the origin;

$r = \frac{1}{1 + \cos \theta}$  opens to the left, the other opens down. All parabolas have eccentricity one.

15.

Both are ellipses with a focus at the origin;  $r = \frac{2}{2 + \cos \theta}$  has its major axis on the  $x$ -axis, the other has its major axis on the  $y$ -axis. Each has eccentricity  $\frac{1}{2}$ .

17.  $\frac{\alpha}{\beta + \gamma \sin \theta} = \frac{\frac{\gamma}{\beta} \frac{\alpha}{\gamma}}{1 + \frac{\gamma}{\beta} \sin \theta}$

19. The equation is equivalent to  $\frac{(x+1)^2}{8} - \frac{(y+3)^2}{16} = 1$ . Its graph is a hyperbola with center  $(-1, -3)$  opening to the left and right.

21. The equation is equivalent to  $\frac{(y-4)^2}{25} - \frac{4(x+1)^2}{25} = 1$ . Its graph is a hyperbola with center  $(-1, 4)$  opening up and down.

23.  $y = \frac{1}{2}x^2 + \frac{1}{2}$

25.  $y = -\frac{1}{4}x^2 - 7$

27.  $y = \frac{1}{2(y_1 - y_0)}(x - x_1)^2 + \frac{y_0 + y_1}{2}$

29.  $y = -\frac{1}{8}x^2 + 2$

31.  $y = -\frac{1}{2\alpha}x^2 + \frac{\alpha}{2}$

33.  $\frac{x^2}{9} + \frac{(y-1)^2}{4} = 1$

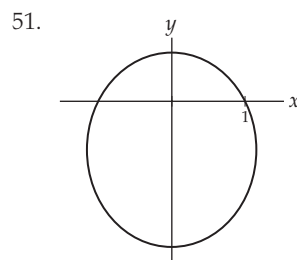

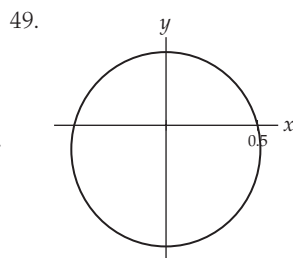

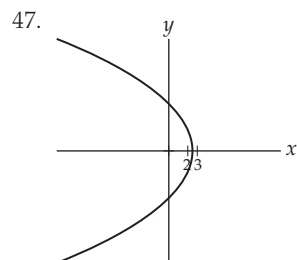

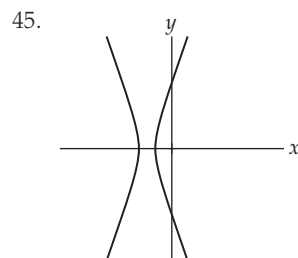

35.  $\frac{4x^2}{9} + \frac{y^2}{9} = 1$

37.  $\frac{x^2}{a^2} + \frac{y^2}{2a^2} = 1$

39.  $\frac{x^2}{6} - \frac{y^2}{30} = 1$

41.  $\frac{y^2}{8} - \frac{x^2}{8} = 1$

43.  $\frac{(y-5)^2}{4} - \frac{(x-3)^2}{12} = 1$

53. (a)  $\frac{x^2}{1.00000011^2} + \frac{y^2}{0.9998606552^2} = 1$ ,

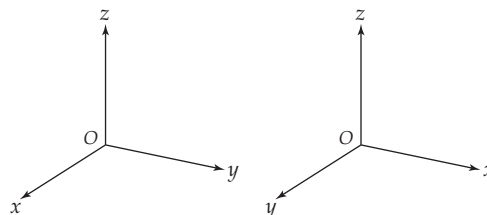

(b)  $r = \frac{1.00000011}{1 + 0.0167 \cos \theta}$

55. Model your argument on the proof that the distance from any point on the graph of the curve to the point  $(0, \sqrt{A^2 - B^2})$  is  $D_1 = \frac{A^2 - Cx}{A^2}$ .57. Model your proof on the analogous argument for an ellipse by showing that the distance from any point  $(x, y)$  on the curve in the first quadrant to the focus  $(\sqrt{A^2 + B^2}, 0)$  is  $D_1 = \frac{Cx - A^2}{A}$  and the distance from  $(x, y)$  to the focus  $(-\sqrt{A^2 + B^2}, 0)$  is  $D_2 = \frac{Cx + A^2}{A}$ , where  $C = \sqrt{A^2 + B^2}$ . Thus, the difference of the distances is  $2A$  for every point on the curve.59. For an ellipse with equation  $\frac{x^2}{A^2} + \frac{y^2}{B^2} = 1$  where  $A > B > 0$ , the distance between the foci is  $2\sqrt{A^2 - B^2}$  and the distance between the vertices is  $2A$ . We have  $\frac{2\sqrt{A^2 - B^2}}{2A} = e$ . The situation when  $0 < A < B$  is similar, as is the computation for a hyperbola.61. Let  $P = (x, y)$  be a point in the first quadrant on the hyperbola defined by  $\frac{x^2}{A^2} - \frac{y^2}{B^2} = 1$ . The coordinates of the focus on the positive  $x$ -axis is  $F = (\sqrt{A^2 + B^2}, 0)$  and the equation of the directrix which intersects the positive  $x$ -axis is  $x = \frac{A}{e}$ . Let  $D$  be the point on the directrix closest to  $P$ . Then  $DP = x - \frac{A}{e}$  and  $FP = \sqrt{(x - \sqrt{A^2 + B^2})^2 + y^2}$ . Use the fact that  $y^2 = \frac{B^2}{A^2}x^2 - B^2$  to show that  $\frac{FP}{DP} = e$ .For answers to odd-numbered Skill Certification exercises in the Chapter Review, please visit the Book Companion Web Site at [www.whfreeman.com/tkcalculus](http://www.whfreeman.com/tkcalculus).

## Chapter 10

### Section 10.1

- F, T, F, F, F, T, T, T.
- (a)  $y = 5$  is a line parallel to the  $x$ -axis;  $x = -3$  is a line parallel to the  $y$ -axis (b)  $y = 5$  is a plane parallel to the  $xz$ -plane;  $x = -3$  is a plane parallel to the  $yz$ -plane
- $(1, 1, 1)$ ,  $(1, 1, -1)$ ,  $(1, -1, 1)$ ,  $(1, -1, -1)$ ,  $(-1, 1, 1)$ ,  $(-1, 1, -1)$ ,  $(-1, -1, 1)$ , and  $(-1, -1, -1)$
- The set of all points in  $\mathbb{R}^3$  equidistant from a given point  $(x_0, y_0, z_0)$ .
- (a) A circle with radius 2 centered at the origin, (b) a right circular cylinder with radius 2 centered on the  $z$ -axis.
- $(-5, 6, -7)$
- $(3, -7, 6)$
- There are three possible exchanges:  $x$  with  $y$ ,  $x$  with  $z$  and  $y$  with  $z$ . We will discuss the first of these. The others are similar. If the placement of  $x$ ,  $y$ , and  $z$  form a right-hand coordinate system, then the axes can be oriented to be superimposed on the graph below left. Switching the labels on the  $x$  and  $y$  axes we obtain the left-hand system below right. Exchanging two pairs of the labels will give another right-handed system.

17. The distance between the points  $(a_1, a_2, \dots, a_n)$  and  $(b_1, b_2, \dots, b_n)$  is

$$\sqrt{(a_1 - b_1)^2 + (a_2 - b_2)^2 + \dots + (a_n - b_n)^2}.$$

19. (a)  $x > 0, y > 0, z > 3,$   
 (b)  $(x-1)^2 + (y-2)^2 + (z-4)^2 < 25,$   
 (c)  $(x-2)^2 + (y+3)^2 < 25$

21.  $\sqrt{130}$                               23.  $\sqrt{14}$

25.  $\sqrt{26}$                                 27.  $\sqrt{51}$

29.  $(x-3)^2 + (y+2)^2 + (z-5)^2 = 25$

31.  $(x-2)^2 + (y-5)^2 + (z+7)^2 = 49$

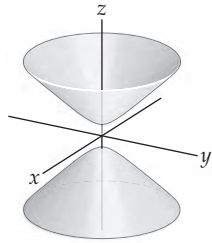

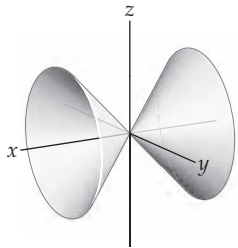

33.  $(x-2)^2 + (y-5)^2 + (z+7)^2 = 78$

35.  $(x-2)^2 + (y+8)^2 + z^2 = 66$

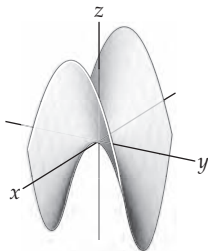

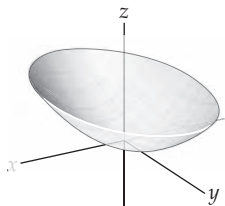

37.  $(x - \frac{3}{2})^2 + (y - 1)^2 + (z - \frac{5}{2})^2 = \frac{53}{2}$

39. Center  $(0, -\frac{3}{2}, \frac{5}{2}),$  radius  $\frac{\sqrt{22}}{2}$

41.                                        43.

45.                                        47.

49.  $3 - 2\sqrt{2}$

51. Use the distance formula to show that the length of each side of the triangle is  $\sqrt{8}$ .

53. Use the distance formula to show that the lengths of the sides of the triangle are 7, 14 and  $\sqrt{245}$ . Since  $7^2 + 14^2 = (\sqrt{245})^2$ , the triangle is right. The area is 49 square units.

55.  $(x - \frac{1}{2})^2 + (y - \frac{1}{2})^2 + (z - \frac{1}{2})^2 = \frac{3}{4}$  and  
 $(x - \frac{1}{6})^2 + (y - \frac{1}{6})^2 + (z - \frac{1}{6})^2 = \frac{3}{4}$

57.  $\frac{4}{3}$

59. The compass readings give the slopes of lines from her boat to the respective peaks. Thus her boat is on the line  $(y - 4.0) = \tan(75\pi/180)(x - 7.9)$  from Constitution Peak, and it is on the line  $(y + 3.4) = \tan(\frac{-10\pi}{180})(x - 9.3)$ . Those lines intersect at  $(6.07, -2.83)$ . Thus, she is 6.7 miles from Deer Harbor.

61.  $a = \pm 3.81$

63. Consider the regular tetrahedron with vertices  $(1, 0, 0), (0, 1, 0), (0, 0, 1)$  and  $(1, 1, 1)$  from Exercise 54. The midpoint of the segment connecting the midpoints of the opposite edges is the point  $(\frac{1}{2}, \frac{1}{2}, \frac{1}{2})$ .

## Section 10.2

1. T, F, F, F, T, T, T, T.

3.  $\vec{AC}$

5.  $\mathbf{0}$

7.  $\mathbf{0}$

9. Algebraically, you add them "componentwise."

Geometrically, you place the initial point of a vector  $\mathbf{w}$  at the terminal point of a vector  $\mathbf{v}$ . The vector  $\mathbf{v} + \mathbf{w}$  is the vector that has the same initial point as  $\mathbf{v}$  and the same terminal point as  $\mathbf{w}$ .

11.  $(2a, 2b, 2c)$

13.  $(-1, 5, -1)$

15.  $(\frac{5\sqrt{14}}{14}, 3 + \frac{10\sqrt{14}}{14}, -2 + \frac{15\sqrt{14}}{14})$

17. (a) The set of all position vectors whose terminal points are on the sphere of radius 4 centered at the origin.  
 (b) The set of all position vectors whose terminal points are in or on the sphere of radius 4 centered at the origin.  
 (c) The set of all vectors whose initial point is  $(a, b, c)$  and whose terminal point is on the sphere of radius 4 centered at  $(a, b, c)$ .

19. Use vectors with 4 (or  $n$ ) components. Algebraically, you still add vectors component by component and when you multiply a vector by a scalar you multiply each component by that scalar.

21. The set of all position vectors whose terminal points are on the sphere of radius 5 centered at the origin.

23.  $\mathbf{u} + \mathbf{v} = \langle 8, -4 \rangle; \mathbf{u} - \mathbf{v} = \langle -4, -8 \rangle$

25.  $\mathbf{u} + \mathbf{v} = \langle -2, 4 \rangle; \mathbf{u} - \mathbf{v} = \langle 4, -8 \rangle$

27.  $\mathbf{u} + \mathbf{v} = \langle 3, -8, 13 \rangle; \mathbf{u} - \mathbf{v} = \langle -1, 0, -1 \rangle$

29.  $\langle -6, -8 \rangle$

31.  $\langle 0, -5, -7 \rangle$

33. 5

35.  $\frac{\sqrt{3}}{3}$

37.  $\|\mathbf{v}\| = 5, \langle \frac{3}{5}, -\frac{4}{5} \rangle$

39.  $\|\mathbf{v}\| = \frac{\sqrt{34}}{15}, \frac{15}{\sqrt{34}} \langle \frac{1}{5}, \frac{1}{3} \rangle$

41.  $\|\mathbf{v}\| = \sqrt{3}, \frac{1}{\sqrt{3}} \langle 1, 1, 1 \rangle$

43.  $\frac{5}{\sqrt{14}} \langle 3, 1, 2 \rangle$

45.  $\frac{2}{\sqrt{117}} \langle 8, -7, 2 \rangle$       47.  $\frac{7}{\sqrt{53}} \langle 1, 4, 6 \rangle$
49.  $\frac{7}{\sqrt{53}} \langle 1, 4, 6 \rangle$       51.  $-\frac{3}{\sqrt{14}} \langle 1, -2, 3 \rangle$
53. The magnitude of the force in the rope on the left is  $50(3\sqrt{2} - \sqrt{6})$  pounds and the magnitude of the force in the rope on the right is  $100(\sqrt{3} - 1)$  pounds.
55. (a)  $\langle 0, -2 \rangle$ , (b)  $\langle \sqrt{2}, -\sqrt{2} \rangle$ , (c)  $\langle \sqrt{3} - 2, -\sqrt{3} \rangle$
57.  $\mathbf{u} + \mathbf{v} = \langle u_1, u_2, u_3 \rangle + \langle v_1, v_2, v_3 \rangle = \langle u_1 + v_1, u_2 + v_2, u_3 + v_3 \rangle = \langle v_1 + u_1, v_2 + u_2, v_3 + u_3 \rangle = \langle v_1, v_2, v_3 \rangle + \langle u_1, u_2, u_3 \rangle = \mathbf{v} + \mathbf{u}$ .
59.  $c(\mathbf{u} + \mathbf{v}) = c(\langle u_1, u_2, u_3 \rangle + \langle v_1, v_2, v_3 \rangle) = c(\langle u_1 + v_1, u_2 + v_2, u_3 + v_3 \rangle) = \langle c(u_1 + v_1), c(u_2 + v_2), c(u_3 + v_3) \rangle = \langle cu_1 + cv_1, cu_2 + cv_2, cu_3 + cv_3 \rangle = \langle cu_1, cu_2, cu_3 \rangle + \langle cv_1, cv_2, cv_3 \rangle = c \langle u_1, u_2, u_3 \rangle + c \langle v_1, v_2, v_3 \rangle = c\mathbf{u} + c\mathbf{v}$ .
61.  $(c + d)\mathbf{v} = (c + d)\langle v_1, v_2, v_3 \rangle = \langle (c + d)v_1, (c + d)v_2, (c + d)v_3 \rangle = \langle cv_1 + dv_1, cv_2 + dv_2, cv_3 + dv_3 \rangle = \langle cv_1, cv_2, cv_3 \rangle + \langle dv_1, dv_2, dv_3 \rangle = c\langle v_1, v_2, v_3 \rangle + d\langle v_1, v_2, v_3 \rangle = c\mathbf{v} + d\mathbf{v}$ .
63. Let  $\mathbf{u} = \langle u_1, u_2 \rangle$  and  $\mathbf{v} = \langle v_1, v_2 \rangle$  be two position vectors. The vertices of the parallelogram determined by  $\mathbf{u}$  and  $\mathbf{v}$  are  $(0, 0)$ ,  $(u_1, u_2)$ ,  $(v_1, v_2)$  and  $(u_1 + v_1, u_2 + v_2)$ . The midpoint of both opposite pairs of vertices is  $\left(\frac{u_1 + v_1}{2}, \frac{u_2 + v_2}{2}\right)$ .

### Section 10.3

1. T, F, F, F, T, T, T, F.
3. See Definition 10.13.
5. When the angle between the sides with lengths  $a$  and  $b$  is right, the Law of Cosines reduces to the Pythagorean theorem since  $\cos 90^\circ = 0$ .
7. (a) Assuming none of the constants are zero, we need  $\frac{\alpha}{a} = \frac{\beta}{b} = \frac{\gamma}{c}$ ; (b)  $a\alpha + b\beta + c\gamma = 0$ .
9. (a) Let  $\mathbf{u} = \mathbf{v} = \mathbf{i}$  and  $\mathbf{w} = \mathbf{i} + \mathbf{j}$ ; (b)  $\mathbf{u}$  must be orthogonal to  $\mathbf{v} - \mathbf{w}$
11. The two vectors must be parallel and point in the same direction.
13. Any position vector that lies in the  $yz$ -plane.
15. Any vector of the form  $\langle 1, v_2, v_3 \rangle$ .
17. (a)  $\langle 1, m \rangle$ , (b) slope  $-\frac{1}{m}$ ,  $\langle -m, 1 \rangle$ , (c)  $\langle 1, m \rangle \cdot \langle -m, 1 \rangle = -m + m = 0$ .
19. (a) If there were a scalar  $c$  such that  $c\mathbf{v}_1 = \mathbf{v}_2$ , in order for the first components to be equal we would need  $c = 3$ , but  $3\mathbf{v}_1 = \langle 3, -6 \rangle \neq \mathbf{v}_2$ . (b)  $2\mathbf{v}_1 + 1\mathbf{v}_2 = \langle 5, 1 \rangle$ .
21.  $-1, \cos^{-1}\left(-\frac{1}{\sqrt{1711}}\right)$
23.  $38, \cos^{-1}\left(\frac{38}{\sqrt{2170}}\right)$
25.  $\text{proj}_{\mathbf{u}}\mathbf{v} = \mathbf{0}$ ,  $\text{comp}_{\mathbf{u}}\mathbf{v} = 0$ , and the component of  $\mathbf{v}$  orthogonal to  $\mathbf{u}$  is  $\mathbf{v}$
27.  $\text{comp}_{\mathbf{u}}\mathbf{v} = -2\sqrt{14}$ ;  $\text{proj}_{\mathbf{u}}\mathbf{v} = \mathbf{v}$ ; and the component of  $\mathbf{v}$  orthogonal to  $\mathbf{u}$  is  $\mathbf{0}$
29.  $\text{proj}_{\mathbf{u}}\mathbf{v} = \mathbf{0}$ ,  $\text{proj}_{\mathbf{v}}\mathbf{u} = \mathbf{0}$
31.  $\text{proj}_{\mathbf{u}}\mathbf{v} = -\frac{5}{27} \langle 1, -5, -1 \rangle$ ,  $\text{proj}_{\mathbf{v}}\mathbf{u} = \langle 0, -5, 0 \rangle$
33. (a)  $-1$ ; (b)  $\cos^{-1}\left(-\frac{1}{2\sqrt{2451}}\right)$ ; (c)  $-\frac{1}{38}\mathbf{u}$
35. (a)  $24$ ; (b)  $\cos^{-1}\left(\frac{24\sqrt{2}}{50}\right)$ ; (c)  $\frac{24}{25}\mathbf{u}$
37.  $\frac{48}{83}\sqrt{166}$
39.  $\frac{\pi}{2}$
41.  $\cos^{-1}\left(\frac{\sqrt{6}}{3}\right)$
43.  $\cos \alpha = \frac{1}{\sqrt{14}}$ ,  $\alpha = \cos^{-1}\left(\frac{1}{\sqrt{14}}\right)$ ,  $\cos \beta = \frac{2}{\sqrt{14}}$ ,  $\beta = \cos^{-1}\left(\frac{2}{\sqrt{14}}\right)$ ,  $\cos \gamma = \frac{3}{\sqrt{14}}$ ,  $\gamma = \cos^{-1}\left(\frac{3}{\sqrt{14}}\right)$
45.  $\cos \alpha = -\frac{1}{\sqrt{18}}$ ,  $\alpha = \cos^{-1}\left(-\frac{1}{\sqrt{18}}\right)$ ,  $\cos \beta = \frac{1}{\sqrt{18}}$ ,  $\beta = \cos^{-1}\left(\frac{1}{\sqrt{18}}\right)$ ,  $\cos \gamma = -\frac{4}{\sqrt{18}}$ ,  $\gamma = \arccos\left(-\frac{4}{\sqrt{18}}\right)$
47. Let  $\mathbf{v} = \langle a, b, c \rangle$ . From their definitions,  $\cos \alpha = \frac{a}{\|\mathbf{v}\|}$ ,  $\cos \beta = \frac{b}{\|\mathbf{v}\|}$  and  $\cos \gamma = \frac{c}{\|\mathbf{v}\|}$ . Thus,  $\|\mathbf{v}\|((\cos \alpha)\mathbf{i} + (\cos \beta)\mathbf{j} + (\cos \gamma)\mathbf{k}) = a\mathbf{i} + b\mathbf{j} + c\mathbf{k} = \mathbf{v}$ .
49.  $\cos \gamma = \pm \frac{\sqrt{2}}{2}$       51.  $\cos \beta = \pm \frac{3}{4}$
53. (a)  $\alpha_i = \cos^{-1}\left(\frac{1}{\sqrt{n}}\right)$ ; (b)  $\lim_{n \rightarrow \infty} \cos^{-1}\left(\frac{1}{\sqrt{n}}\right) = \frac{\pi}{2}$
55. (a)  $\tan^{-1}\left(\frac{1}{4}\right)$ , (b)  $4\sqrt{4/17} \approx 1.9$ , (c) slightly more than 1 hour.
57. If  $\mathbf{v} = \langle a, b, c \rangle$ , then  $\mathbf{v} \cdot \mathbf{i} = a$ ,  $\mathbf{v} \cdot \mathbf{j} = b$  and  $\mathbf{v} \cdot \mathbf{k} = c$ . Thus,  $(\mathbf{v} \cdot \mathbf{i})\mathbf{i} + (\mathbf{v} \cdot \mathbf{j})\mathbf{j} + (\mathbf{v} \cdot \mathbf{k})\mathbf{k} = a\mathbf{i} + b\mathbf{j} + c\mathbf{k} = \mathbf{v}$ .
59. Taking the absolute value of each side of  $\mathbf{u} \cdot \mathbf{v} = \|\mathbf{u}\|\|\mathbf{v}\|\cos \theta$ , we see that  $|\mathbf{u} \cdot \mathbf{v}| = \|\mathbf{u}\|\|\mathbf{v}\||\cos \theta|$ . Since  $|\cos \theta| \leq 1$  we have our result. In order to have the equality, the two vectors must be parallel.
61. If either  $\mathbf{u}$  or  $\mathbf{v}$  is  $\mathbf{0}$ , then  $\mathbf{u} \cdot \mathbf{v} = 0$  and  $\mathbf{u}$  and  $\mathbf{v}$  are orthogonal, since  $\mathbf{0}$  is orthogonal to every vector. If neither  $\mathbf{u}$  nor  $\mathbf{v}$  is  $\mathbf{0}$ , then  $\mathbf{u} \cdot \mathbf{v} = \|\mathbf{u}\|\|\mathbf{v}\|\cos \theta$  by Theorem 10.15, where  $\theta$  is the angle between the position vectors  $\mathbf{u}$  and  $\mathbf{v}$ . Since neither  $\mathbf{u}$  nor  $\mathbf{v}$  is  $\mathbf{0}$ , the dot product is only zero if  $\cos \theta = 0$ , that is, if  $\mathbf{u}$  and  $\mathbf{v}$  are orthogonal.
63. Assume that  $\mathbf{v} = \mathbf{v}_{\parallel} + \mathbf{v}_{\perp}$  and  $\mathbf{w} = \mathbf{w}'_{\parallel} + \mathbf{w}'_{\perp}$  are two sums such that  $\mathbf{v}_{\parallel}$  and  $\mathbf{w}'_{\parallel}$  are both parallel to  $\mathbf{u}$  and  $\mathbf{v}_{\perp}$  and  $\mathbf{w}'_{\perp}$  are both orthogonal to  $\mathbf{u}$ . Then  $\mathbf{v}_{\parallel} + \mathbf{v}_{\perp} = \mathbf{v}'_{\parallel} + \mathbf{v}'_{\perp}$ , so  $\mathbf{v}_{\parallel} - \mathbf{v}'_{\parallel} = \mathbf{v}'_{\perp} - \mathbf{v}_{\perp}$ . The difference on the left will also be parallel to  $\mathbf{u}$  and the difference on the right will also be orthogonal to  $\mathbf{u}$ . Thus, they are orthogonal to each other. The only way for this to happen is if they are both  $\mathbf{0}$ . Therefore, the two decompositions are the same.

65. Let  $\mathbf{u}$  and  $\mathbf{v}$  be two nonparallel position vectors. The diagonals of the parallelogram determined by  $\mathbf{u}$  and  $\mathbf{v}$  are the vectors  $\mathbf{u} + \mathbf{v}$  and  $\mathbf{u} - \mathbf{v}$ . The dot product  $(\mathbf{u} + \mathbf{v}) \cdot (\mathbf{u} - \mathbf{v}) = \mathbf{u} \cdot \mathbf{u} - \mathbf{u} \cdot \mathbf{v} + \mathbf{v} \cdot \mathbf{u} + \mathbf{v} \cdot \mathbf{v} = \|\mathbf{u}\|^2 - \|\mathbf{v}\|^2$ , since the dot product is commutative. If the parallelogram is a rhombus, then  $\|\mathbf{u}\| = \|\mathbf{v}\|$ . Thus, the dot product of the vectors forming the diagonals is zero, so they are perpendicular. Conversely, if the diagonals of the parallelogram are perpendicular, we must have  $\|\mathbf{u}\|^2 - \|\mathbf{v}\|^2 = 0$  and  $\|\mathbf{u}\| = \|\mathbf{v}\|$ , so the parallelogram is a rhombus.

### Section 10.4

- F, F, T, F, T, T, F.
- See Definition 10.25.
- The cross product,  $\mathbf{u} \times \mathbf{v}$ , is orthogonal to both  $\mathbf{u}$  and  $\mathbf{v}$ . The magnitude of  $\mathbf{u} \times \mathbf{v}$  is  $\|\mathbf{u}\|\|\mathbf{v}\|\sin\theta$  where  $\theta$  is the angle between  $\mathbf{u}$  and  $\mathbf{v}$ . The vectors  $\mathbf{u}$ ,  $\mathbf{v}$  and  $\mathbf{u} \times \mathbf{v}$  form a right-hand triple.
- The dot product is zero if and only if the vectors are orthogonal.
- Embed the vectors in  $\mathbb{R}^3$  as  $\langle 1, 2, 0 \rangle$  and  $\langle 3, -1, 0 \rangle$ . The cross product  $\langle 1, 2, 0 \rangle \times \langle 3, -1, 0 \rangle = \langle 0, 0, -7 \rangle$ . The norm of this vector is 7, which is the area of the parallelogram in square units.
- They are orthogonal.
- Let  $\mathbf{u} = \langle 1, 0, 0 \rangle$ ,  $\mathbf{v} = \langle 2, 1, 1 \rangle$  and  $\mathbf{w} = \langle 4, 1, 1 \rangle$ . If  $\mathbf{u} \times \mathbf{v} = \mathbf{u} \times \mathbf{w}$ , then  $\mathbf{u}$  is parallel to  $\mathbf{v} - \mathbf{w}$ .
- As position vectors, the three vectors lie in the same plane.
- The cross product is not associative, so we must specify whether we mean  $(\mathbf{u} \times \mathbf{v}) \times \mathbf{w}$  or  $\mathbf{u} \times (\mathbf{v} \times \mathbf{w})$ .
- At least one of them is  $\mathbf{0}$ .
- They are parallel.
- $\langle 23, -4, 14 \rangle$ ,  $\langle -23, 4, -14 \rangle$
- $\langle -46, 3, -22 \rangle$ ,  $\langle -42, -30, -38 \rangle$
- $\sqrt{213}$
- 106 cubic units. No, they form a left-handed triple.
- $\langle 25, 35, -10 \rangle$ ,  $\langle -25, -35, 10 \rangle$
- 0, 0
- 0
- (a)  $\langle -24, 7, 15 \rangle$  (b)  $\pm \frac{1}{5\sqrt{34}} \langle -24, 7, 15 \rangle$ , (c)  $\frac{5}{2}\sqrt{34}$ .
- (a)  $\langle 20, -9, 30 \rangle$ ; (b)  $\pm \frac{1}{\sqrt{1381}} \langle 20, -9, 30 \rangle$ ; (c)  $\frac{\sqrt{1381}}{2}$
- (a)  $\mathbf{k}$ ; (b)  $\pm \mathbf{k}$ ; (c) 26
- $\frac{\sqrt{850}}{2}$
- (a) The lengths of the sides of a quadrilateral do not determine the quadrilateral's area. For example, a square with side lengths 1 unit has an area of 1 square unit, but a rhombus with side lengths 1 and opposite interior angles of  $30^\circ$  has area  $\frac{\sqrt{3}}{2}$ . (b) If you know the side lengths and the length of one diagonal you can decompose the quadrilateral into two triangles. (c) The side lengths adjacent to the angle whose measure is known determine a unique triangle. You may find the length of the third side of the triangle, which is a diagonal of the quadrilateral and use the reasoning from (b).
- $\frac{3}{4}(\sqrt{759} + \sqrt{2079})$
- $16\sqrt{759} + 6\sqrt{70}$
- (a) Parallelogram, (b) 16 square units
- (a) Not a parallelogram, (b)  $\frac{49}{2}$  square units
- (a)  $\overrightarrow{PQ} = \overrightarrow{SR}$  but  $P, Q, R$  and  $S$  are not collinear, (b) parallelogram, (b)  $7\sqrt{254}$  square units
- (a)  $\overrightarrow{PQ}$  and  $\overrightarrow{SR}$  are parallel, (b) not a parallelogram, (b)  $\frac{7}{2}\sqrt{146}$  square units
- $4\sqrt{2\sqrt{2}-2} \approx 3.64$  cubic centimeters
- 30 foot-pounds
- If  $A = \begin{bmatrix} a & b & c \\ d & e & f \\ g & h & i \end{bmatrix}$ , then  $\det A = aei + bfg + cdh - afh - bdi - ceg$ . Show that when you exchange any two rows of  $A$ , you obtain the negative of this sum.
- If  $\mathbf{v} = \langle a, b, c \rangle$  and  $\alpha$  is a scalar, then  $\mathbf{v} \times (\alpha \mathbf{v}) = (\alpha bc - \alpha bc)\mathbf{i} + (\alpha ac - \alpha ac)\mathbf{j} + (\alpha ab - \alpha ab)\mathbf{k} = \mathbf{0}$ .
- Let  $\mathbf{u} = \langle u_1, u_2, u_3 \rangle$  and  $\mathbf{v} = \langle v_1, v_2, v_3 \rangle$ . Show that  $c(\mathbf{u} \times \mathbf{v})$ ,  $(c\mathbf{u}) \times \mathbf{v}$ , and  $\mathbf{u} \times (c\mathbf{v})$  are all equal  $(c(u_2v_3 - u_3v_2), c(u_3v_1 - u_1v_3), c(u_1v_2 - u_2v_1))$ .
- Let  $\mathbf{u} = \langle u_1, u_2, u_3 \rangle$  and  $\mathbf{v} = \langle v_1, v_2, v_3 \rangle$ , the triple scalar product  $\mathbf{v} \cdot (\mathbf{u} \times \mathbf{v}) = \det \begin{bmatrix} v_1 & v_2 & v_3 \\ u_1 & u_2 & u_3 \\ v_1 & v_2 & v_3 \end{bmatrix}$ . Show that this determinant is zero.
- (a) The volume of the parallelepiped determined by  $\mathbf{u}$ ,  $\mathbf{v}$  and  $\mathbf{w}$  is the absolute value of the determinant of the matrix in which the rows are the components of  $\mathbf{u}$ ,  $\mathbf{v}$  and  $\mathbf{w}$ . Since each component is an integer, the determinant and its absolute value are integers. (b) The area of the parallelogram determined by  $\mathbf{i}$  and  $\mathbf{j}$  is 1. The area of the parallelogram determined by  $\mathbf{i}$  and  $\mathbf{j} + \mathbf{k}$  is  $\sqrt{2}$ .
- Divide the left and right sides of the equations  $\|\mathbf{u} \times \mathbf{v}\| = \|\mathbf{u}\|\|\mathbf{v}\|\sin\theta$  and  $\mathbf{u} \cdot \mathbf{v} = \|\mathbf{u}\|\|\mathbf{v}\|\cos\theta$  to obtain the result.

75. If  $\mathbf{u} \times \mathbf{v} = \mathbf{u} \times \mathbf{w}$ , then  $\mathbf{u}$  is parallel to  $\mathbf{v} - \mathbf{w}$  and if  $\mathbf{u} \cdot \mathbf{v} = \mathbf{u} \cdot \mathbf{w}$ , then  $\mathbf{u}$  is orthogonal to  $\mathbf{v} - \mathbf{w}$ . Thus,  $\mathbf{v} - \mathbf{w}$  is orthogonal to itself. This can only happen if  $\mathbf{v} - \mathbf{w} = \mathbf{0}$ .
77. Let  $\mathbf{r} = \langle r_1, r_2, r_3 \rangle$ ,  $\mathbf{s} = \langle s_1, s_2, s_3 \rangle$ ,  $\mathbf{u} = \langle u_1, u_2, u_3 \rangle$  and  $\mathbf{v} = \langle v_1, v_2, v_3 \rangle$ . Show that both sides of the equality are equal to  $r_1s_2u_1v_2 + r_1s_3u_1v_3 + r_2s_1u_2v_1 + r_2s_3u_2v_3 + r_3s_2u_3v_2 + r_3s_3u_3v_2 - (r_1s_2u_2v_1 + r_1s_3u_3v_1 + r_2s_1u_1v_2 + r_2s_3u_3v_2 + r_3s_1u_1v_3 + r_3s_2u_2v_3)$ .
79. If  $\mathbf{r}$ ,  $\mathbf{s}$ ,  $\mathbf{u}$ , and  $\mathbf{v}$  all lie in some plane  $\mathcal{P}$ , then the cross products  $\mathbf{r} \times \mathbf{s}$  and  $\mathbf{u} \times \mathbf{v}$  are both orthogonal to  $\mathcal{P}$ . Therefore, these two vectors are parallel and the cross product of two parallel vectors is  $\mathbf{0}$ .

### Section 10.5

- T, F, T, F, T, F, F, F, F.
- A linear equation in three variables is an equation that can be written in the form  $Ax + By + Cz = D$ , where  $A$ ,  $B$ ,  $C$ , and  $D$  are real numbers. An example is  $2x - 3y + \pi z = 12$ . The graph of every linear equation in three variables is a plane.
- Let  $P = (a, b, c)$  and  $Q = (\alpha, \beta, \gamma)$ . The direction vector for the line is  $\pm \langle a - \alpha, b - \beta, c - \gamma \rangle$ . We will choose the positive sign for this vector, and we may choose either point  $P$  or point  $Q$ ; we will choose  $Q$ . The equation of the line as a vector function is  $\mathbf{r}(t) = \langle \alpha + (a - \alpha)t, \beta + (b - \beta)t, \gamma + (c - \gamma)t \rangle$ .
- If the slopes of the two lines are equal, the lines are either parallel or identical. Two lines in  $\mathbb{R}^2$  that aren't parallel or identical intersect in a unique point.
- (a)  $\mathbf{r}_1(t) = \langle -1 + 2t, 3 - 4t, 7 + 9t \rangle$   
(b)  $\mathbf{r}_2(t) = \langle -1 + 4t, 3 - 8t, 7 + 18t \rangle$   
(c)  $x = 2t + 5, y = -4t - 9, z = 9t + 34$
- $(0, \frac{52}{3}, \frac{19}{3})$ ;  $(\frac{52}{7}, 0, \frac{27}{7})$ ;  $(19, -27, 0)$
- $(0, -9, 1)$ ;  $(\frac{9}{2}, 0, -17)$ ;  $(\frac{1}{4}, -\frac{17}{2}, 0)$
- $(-7, 0, 5)$ . The line is parallel to the  $y$ -axis.
- (a)  $x = 2 + 7t, y = 3 - 5t, z = 2t$ . (b)  $\frac{x-2}{7} = \frac{y-3}{-5} = \frac{z}{2}$ .
- (a)  $\mathbf{r}(t) = \langle 4, 3 - 5t, t \rangle$ ; (b)  $x = 4, \frac{y-3}{-5} = z$
- In slope-intercept form,  $y = -3x + 5$ . Next,  $x = 2t$  and  $y = 5 - 6t$ . Eliminate the parameter  $t$  to obtain the previous equation.
- (a)  $\mathbf{r}(t) = \langle t, 2t, -4t \rangle$ ; (b)  $x = t, y = 2t, z = -4t$ ;  
(c)  $x = \frac{y}{2} = -\frac{z}{4}$
- (a)  $\mathbf{r}(t) = \langle 2t - 1, 3, 4t + 7 \rangle$ ;  
(b)  $x = 2t - 1, y = 3, z = 4t + 7$ ; (c)  $y = 3, \frac{x+1}{2} = \frac{z-7}{4}$
- (a)  $\mathbf{r}(t) = \langle 2t + 3, 5t + 1 \rangle$ ; (b)  $x = 2t + 3, y = 5t + 1$ ;  
(c)  $\frac{x-3}{2} = \frac{y-1}{5}$
- (a)  $\mathbf{r}(t) = \langle 4t, -t, 6t \rangle$ ; (b)  $x = 4t, y = -t, z = -6t$ ;  
(c)  $\frac{x}{4} = -y = \frac{z}{6}$
- (a)  $\mathbf{r}(t) = \langle 8t - 4, 11, 2t \rangle$ ; (b)  $x = 8t - 4, y = 11, z = 2t$ ;  
(c)  $y = 11, \frac{x+4}{8} = \frac{z}{2}$
- (a)  $\mathbf{r}(t) = \langle 3t + 1, -t + 6 \rangle$ ; (b)  $x = 3t + 1, y = -t + 6$ ;  
(c)  $\frac{x-1}{3} = -y + 6$
- (a)  $\mathbf{r}(t) = \langle (x_1 - x_0)t + x_0, (y_1 - y_0)t + y_0, (z_1 - z_0)t + z_0 \rangle$ ;  
(b)  $\mathbf{r}(t) = \langle (x_1 - x_0)t + x_0, (y_1 - y_0)t + y_0, (z_1 - z_0)t + z_0 \rangle$ ,  $0 \leq t \leq 1$
- $\mathbf{r}(t) = \langle -2t + 1, -9t + 7, 2t + 3 \rangle, 0 \leq t \leq 1$
- $\mathbf{r}(t) = \langle -4t + 3, 6t - 1, 5t + 4 \rangle, 0 \leq t \leq 1$
- The lines are parallel. They are  $\sqrt{\frac{117}{7}}$  units apart.
- The lines intersect at  $(-8, 8, -9)$ .
- The lines are parallel. They are  $5\sqrt{\frac{61}{21}}$  units apart.
- $\sqrt{\frac{1084}{21}}$
- $\frac{4\sqrt{5}}{5}$
- (a)  $\alpha = -3$ , (b)  $\alpha = 15$
- To the nearest tenth of a kilometer, he is at an elevation of 4.7 km and is 0.7 km east of the summit.
- See the proof preceding Theorem 10.38.

### Section 10.6

- F, F, F, F, T, T, F, T.
- $(\frac{d}{a}, 0, 0)$ ,  $(0, \frac{d}{b}, 0)$ ,  $(0, 0, \frac{d}{c})$ . You can plot these three points and construct the triangle with these points as vertices to understand the plane that contains them.
- If the vectors normal to the two planes are not parallel, the two planes intersect in a line.
- It means that the three points lie on a single line. Let  $P$ ,  $Q$ , and  $R$  be the points. If the two vectors  $\overrightarrow{PQ}$  and  $\overrightarrow{PR}$  are parallel, the points are collinear. If the three points don't lie on the same line, by definition they are noncollinear.
- Three noncollinear points determine a unique plane. Any two distinct points on  $\mathcal{L}$  along with  $P$  determine the plane. Choose any point  $Q$  on  $\mathcal{L}$ . Construct the vector  $\overrightarrow{PQ}$ . A normal vector to the plane is given by  $\mathbf{N} = \overrightarrow{PQ} \times \mathbf{d}$ , where  $\mathbf{d}$  is the direction vector for  $\mathcal{L}$ . Use  $P$  and  $\mathbf{N}$  to find the equation of the plane. In  $\mathbb{R}^3$  there are infinitely many different planes containing every line.
- Choose two distinct points on one of the lines and one point on the other. These three points determine a unique plane. (See the answer to Exercise 9.) Every point on both lines lies in the plane determined by the three chosen points.

13. Let  $\mathbf{d}$  and  $\mathbf{d}'$  be the direction vectors for the lines  $\mathcal{L}$  and  $\mathcal{L}'$ , respectively. Since the lines are skew,  $\mathbf{N} = \mathbf{d} \times \mathbf{d}' \neq \mathbf{0}$ . Any point from  $\mathcal{L}$  along with  $\mathbf{N}$  and any point from  $\mathcal{L}'$  along with  $\mathbf{N}$  determine the unique pair of parallel planes.
15. The direction vector for  $\mathcal{L}$  is  $\mathbf{d} = \langle a, b, c \rangle$  and the normal vector for  $\mathcal{P}$  is  $\mathbf{N} = \langle \alpha, \beta, \gamma \rangle$ . The line and plane are orthogonal if and only if  $\mathbf{d}$  and  $\mathbf{N}$  are scalar multiples.
17. Let  $Q$  be the point of intersection between  $\mathcal{L}$  and  $\mathcal{P}$ . If  $\mathcal{L}$  is orthogonal to  $\mathcal{P}$ , then every line in  $\mathcal{P}$  passing through  $Q$  is orthogonal to  $\mathcal{L}$ , and the angle between  $\mathcal{L}$  and  $\mathcal{P}$  is  $\frac{\pi}{2}$ . Otherwise, the angle described is the minimum angle that  $\mathcal{L}$  can form with any line in  $\mathcal{P}$  through  $Q$ .
19. The formula builds upon the computation of the component of a vector in the direction of a given vector. We choose arbitrary points  $P_1$  and  $P_2$  on lines  $\mathcal{L}_1$  and  $\mathcal{L}_2$ , respectively, and  $|\text{comp}_{\mathbf{N}} \overrightarrow{P_1 P_2}|$ , where  $\mathbf{N}$  is the cross product of the direction vectors of  $\mathcal{L}_1$  and  $\mathcal{L}_2$ . The formula works because the skew lines lie on a unique pair of parallel planes.
21.  $4x - y + 5z = 0$                       23.  $2x - y + 6z = 41$
25.  $12x - 5y + 19z = 61$
27.  $y_0 z_0 x + x_0 z_0 y + x_0 y_0 z = x_0 y_0 z_0$
29.  $3x + 7y - 7z = -26$
31. The direction vectors for the lines  $\langle -5, 2, 4 \rangle$  and  $\langle 15, -6, -12 \rangle$  are scalar multiples of each other, so the lines are parallel;  $14x + 55y - 10z = 137$ .
33. The point  $(7, -5, 14)$  is on both lines;  
 $14x + 3y + 2z = 111$ .
35.  $\mathbf{r}(t) = \left\langle -\frac{8}{5} - 11t, \frac{14}{5} - 2t, 5t \right\rangle$
37.  $\mathbf{r}(t) = \langle 4, 3 + 2t, 5t \rangle$
39.  $\sqrt{2}$
41. The normal vectors are parallel, so the planes are parallel. They are  $\frac{29}{3\sqrt{38}}$  units apart.
43. The direction vectors of the lines are  $\langle 2, -4, 5 \rangle$  and  $\langle 3, 2, 3 \rangle$ . Since these vectors aren't scalar multiples of each other, the lines either intersect, or are skew. The planes containing the lines are  $-22x + 9y + 16z = 81$  and  $-22x + 9y + 16z = -97$ , respectively, so the lines must be skew. The distance between the lines is  $\frac{178}{\sqrt{821}}$ .
45.  $\cos^{-1} \left( \frac{4\sqrt{3}}{9} \right)$
47.  $\frac{\pi}{2}$
49. The line and plane are parallel. They are  $\frac{13}{15}\sqrt{30}$  units apart.
51. They intersect at  $\left( \frac{143}{7}, \frac{3}{7}, 0 \right)$  at an angle of  $\frac{\pi}{2} - \cos^{-1} \left( \frac{7}{\sqrt{2738}} \right)$ .
53. (a)  $\frac{1}{2}x + \frac{1}{4}y + \frac{\sqrt{11}}{4}z = 1$ , (b)  $2x + 2y + z = 7$
55. The plane of the beach is  $3x + y - 16z = 400$ . The water is about 25 feet deep at the buoy.
57. The planes are perpendicular if and only if their normal vectors are orthogonal, that is if and only if  $\langle a, b, c \rangle \cdot \langle \alpha, \beta, \gamma \rangle = a\alpha + b\beta + c\gamma = 0$ .
59. (a) Let  $\mathcal{P}$  be the plane. By Theorem 10.39 the distance from  $P$  to  $\mathcal{P}$  is  $\frac{|\mathbf{N} \cdot \overrightarrow{RP}|}{\|\mathbf{N}\|}$ , where  $\mathbf{N} = \langle a, b, c \rangle$  is the normal vector to  $\mathcal{P}$  and  $R$  is a point on  $\mathcal{P}$ . At least one of the constants,  $a$ ,  $b$ , and  $c$  is nonzero. Assume  $c \neq 0$ , the other cases are similar. Since  $R$  is on  $\mathcal{P}$ , it has coordinates  $\left( x_1, y_1, -\frac{d+ax_1+by_1}{c} \right)$ . Thus,  

$$\overrightarrow{RP} = \left\langle x_0 - x_1, y_0 - y_1, z_0 + \frac{d+ax_1+by_1}{c} \right\rangle$$
. So,  $\frac{|\mathbf{N} \cdot \overrightarrow{RP}|}{\|\mathbf{N}\|} = \frac{|ax_0 - ax_1 + by_0 - by_1 + cz_0 + d + ax_1 + by_1|}{\sqrt{a^2 + b^2 + c^2}} = \frac{|ax_0 + by_0 + cz_0 + d|}{\sqrt{a^2 + b^2 + c^2}}$ .
- (b)  $\sqrt{2}$
61. If  $\mathcal{L}_1$  and  $\mathcal{L}_2$  lie in the same plane, then they intersect, are parallel, or are identical. If they are parallel or identical then  $\mathbf{d}_1 \times \mathbf{d}_2 = \mathbf{0}$ , so the result holds. If  $\mathcal{L}_1$  and  $\mathcal{L}_2$  intersect, then  $\mathbf{d}_1 \times \mathbf{d}_2$  is orthogonal to every vector in their plane, so again the result holds. Conversely, if  $(\mathbf{P}_0 - \mathbf{Q}_0) \cdot (\mathbf{d}_1 \times \mathbf{d}_2) = 0$ , the vector  $\mathbf{d}_1 \times \mathbf{d}_2$  is orthogonal to every vector connecting a point on line  $\mathcal{L}_1$  and a point on  $\mathcal{L}_2$ , so  $\mathbf{d}_1 \times \mathbf{d}_2$  is the normal vector to the plane containing the two lines.

For answers to odd-numbered Skill Certification exercises in the Chapter Review, please visit the Book Companion Web Site at [www.whfreeman.com/tkcalculus](http://www.whfreeman.com/tkcalculus).

## Chapter 11

### Section 11.1

- F, F, T, T, F, F, F.
- The limit  $\lim_{x \rightarrow c} f(x) = L$  means that for all  $\epsilon > 0$ , there exists  $\delta > 0$  such that if  $x \in (c - \delta, c) \cup (c, c + \delta)$ , then  $f(x) \in (L - \epsilon, L + \epsilon)$ .
- The limit of vector-valued function is defined in terms of the limits of the components of the functions. Each component is a function of a single variable. These limits are defined using an "epsilon-delta" definition.
- The function  $\mathbf{r}$  is said to be **continuous** at a point  $c$  in the domain of  $\mathbf{r}$  if  $\lim_{t \rightarrow c} \mathbf{r}(t) = \mathbf{r}(c)$ .
- Since the functions  $x(t)$  and  $y(t)$  are both continuous functions, by the Extreme Value Theorem each of these functions has a minimum value and a maximum value on the interval  $[a, b]$ . Let  $M$  be the largest of the absolute values of these four numbers. The graph of  $\mathbf{r}(t)$  on  $[a, b]$  is contained within the circle  $x^2 + y^2 = 2M^2$ .

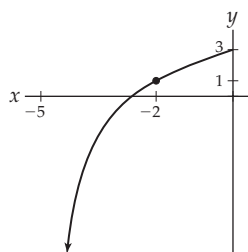

11. Since the functions  $x(t)$ ,  $y(t)$  and  $z(t)$  are all continuous functions, by the Extreme Value Theorem each of these functions has a maximum value on the interval  $[a, b]$ . Let  $M$  be the maximum of these three maxima. The graph of  $\mathbf{r}(t)$  on  $[a, b]$  is contained within the sphere  $x^2 + y^2 + z^2 = 3M^2$ .

13.  $\mathbf{r}(t) = \langle \cos 2t, \sin 2t, 2t \rangle, [0, \pi]$

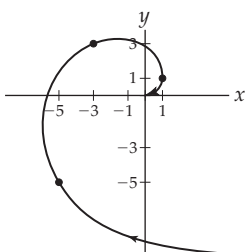

15. We need  $\lim_{t \rightarrow \infty} y(t) = L$ , where  $L$  is the value of the horizontal asymptote and one of the limits;  $\lim_{t \rightarrow \infty} x(t) = \infty$  or  $\lim_{t \rightarrow \infty} x(t) = -\infty$ . For example, the function  $\mathbf{r}(t) = \left\langle t, 5 - \frac{1}{t} \right\rangle$ .

17.  $x_1(t)x_2(t) + y_1(t)y_2(t)$

19.

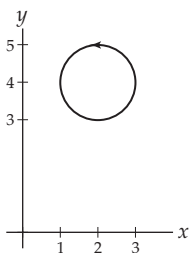

21.

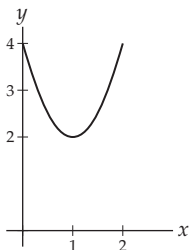

23. The graphs are the same. The rate at which the curve is drawn is faster when  $k$  is large.

25. Every point on the graph of  $\mathbf{r}(t)$  satisfies the equations of both cylinders.

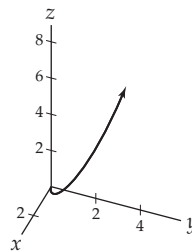

27.  $x(t) = 2 - \sin t, y(t) = 4 + \cos t$ .

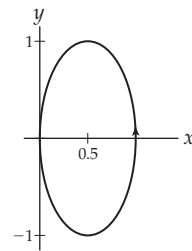

29.  $x(t) = 1 + \sin t, y(t) = 3 - \cos 2t$ . The graph is the portion of the parabola shown below. The motion starts at  $(1, 2)$  and the particle moves to the right for  $t \in \left[0, \frac{\pi}{2}\right]$  and  $t \in \left[\frac{3\pi}{2}, 2\pi\right]$  and to the left for  $t \in \left[\frac{\pi}{2}, \frac{3\pi}{2}\right]$

31.  $x(t) = t, y(t) = t^2, z(t) = t^3$

33.  $x(t) = \cos^2 t, y(t) = \sin 2t$

35.  $\langle 1 + t, 3t + t^2, 2t^3 \rangle$

37.  $\langle 5 \cos t, 5 \sin t \rangle$

39. 0

41. 0

43.  $\langle 0, -1, -1 \rangle$

45.  $\langle 1, 0, 1e \rangle$

47.  $x(t) = \tan t, y(t) = \tan t - t + 1$

49. Every point on the graph of  $\mathbf{r}(t)$  satisfies both the equation of the sphere with equation  $x^2 + y^2 + z^2 = 25$  and the plane with equation  $4x - 3z = 0$ .

51.  $A \approx 24.7$

53. These curves both lie on the cylinder with equation  $x^2 + y^2 = 1$ . One progresses clockwise around it, the other counterclockwise. Therefore, they must meet.

55. The parametric equations  $x(t) = t \sin t, y(t) = t \cos t$  and  $z(t) = t$  satisfy the equation  $z = \sqrt{x^2 + y^2}$ . Therefore, the graph of  $\mathbf{r}(t)$  lies on the graph of the cone.

57. Let  $\mathbf{r}_1(t) = \langle x_1(t), y_1(t) \rangle$  and  $\mathbf{r}_2(t) = \langle x_2(t), y_2(t) \rangle$ . The components  $\mathbf{r}_1(t)$  and  $\mathbf{r}_2(t)$  are continuous. We know that products and sums of continuous functions are continuous. Therefore, the function  $\mathbf{r}_1(t) \cdot \mathbf{r}_2(t) = x_1(t)x_2(t) + y_1(t)y_2(t)$  is continuous. The result follows from this.

59. See the proof in Exercise 57.

61. We know that products and sums of differentiable functions are differentiable. Therefore, the function  $\mathbf{r}_1(t) \cdot \mathbf{r}_2(t) = x_1(t)x_2(t) + y_1(t)y_2(t)$  is differentiable.

## Section 11.2

- F, F, T, T, F, F, F, F.
- The function is differentiable at  $c$  if  $\lim_{h \rightarrow 0} \frac{f(c+h) - f(c)}{h}$  exists.
- A vector function is differentiable at a point  $c$  if each of its component functions is differentiable at  $c$ . The differentiability of these scalar functions at a point has already been defined.
- Let  $\mathbf{r}(t) = \langle t, |t| \rangle$ . The graph of this function is the same as the graph of  $y = |x|$ . The corner at the origin means that the function doesn't have a well-defined tangent vector at the origin.
- Let  $f(x)$  be a function defined on the interval  $[a, b]$ . The function is integrable if  $\lim_{n \rightarrow \infty} \sum_{k=1}^n f(x_k^*) \Delta x$  exists, where  $\Delta x = \frac{b-a}{n}$ ,  $x_k = a + k\Delta x$ , and  $x_k^* \in [x_{k-1}, x_k]$ .
- A vector function is integrable on an interval  $[a, b]$  if each of its component functions is integrable on  $[a, b]$ . The integrability of these scalar functions on  $[a, b]$  has already been defined.
- $\langle x'(t), y'(t), z'(t) \rangle$
- $\frac{d}{d\tau}(\mathbf{r}(f(\tau))) = \mathbf{r}'(f(\tau))f'(\tau)$ .
- $\mathbf{r}'(t) = \langle 3t^2, 15t^2, -6t^2 \rangle$ . If  $t_0$  and  $t_1$  are positive real numbers, then  $\mathbf{r}'(t_0) = \langle 3t_0^2, 15t_0^2, -6t_0^2 \rangle = 3t_0^2 \langle 1, 5, -2 \rangle$  and  $\mathbf{r}'(t_1) = \langle 3t_1^2, 15t_1^2, -6t_1^2 \rangle = 3t_1^2 \langle 1, 5, -2 \rangle$ . Since  $\mathbf{r}'(t_0)$  and  $\mathbf{r}'(t_1)$  are both multiples of the same vector, they are scalar multiples of each other. The graph of  $\mathbf{r}(t)$  is a portion of a straight line.
- They differ by a constant vector.
- $\langle \cos \tau, 2 \sin \tau \cos \tau, 3 \sin^2 \tau \cos \tau \rangle$
- $\left\langle \sin \tau + \tau \cos \tau, \frac{1}{2\sqrt{\tau}}, \cos \tau - \tau \sin \tau \right\rangle$
- $x = e + 2et, y = t, z = 0; 2ex + y = 1 + 2e^2$
- $x = 1 + t, y = 0, z = -4t; x - 4z = 1$
- $x = 3t, y = 4t, z = t + \pi/2; 3x + 4y + z = \pi/2$
- $\mathbf{v}(t) = \langle (t+1)e^t, 1 + \ln t \rangle, \mathbf{a}(t) = \langle (t+2)e^t, \frac{1}{t} \rangle$
- $\mathbf{v}(t) = \langle \cos t, -\sin t, 4 \cos 2t \rangle$ ,  
 $\mathbf{a}(t) = \langle -\sin t, -\cos t, -8 \sin 2t \rangle$
- $\langle 3\tau^2, 6\tau^2(\tau^3 + 1), 9\tau^2(\tau^3 + 1)^2 \rangle$
- $\left\langle -\frac{1}{\tau^2} \sec \frac{1}{\tau} \tan \frac{1}{\tau}, 1, \frac{1}{\tau^2} e^{1/\tau} (\ln \tau - \tau) \right\rangle$
- $\langle -15 \sin(15\tau - 6), 20 \cos(20\tau - 8), 5 \rangle$
- $\langle -\cos t + c_1, \sin t + c_2, -\ln |\cos t| + c_3 \rangle$
- $\langle 0, 0, 2\pi^2 \rangle$
- $\langle \frac{1}{2}t^2 + 3, \frac{1}{3}t^3 - 4 \rangle$
- $\langle e^t + 1 - e, t \ln t - t - 5 \rangle$
- $\left\langle \frac{1}{3}t^3 + t + 2, \frac{1}{4}t^4 - 2t - 3 \right\rangle$
- $\langle 5t, -16t^2 + 5t + 26 \rangle$

- $(1, 1, 1)$
- The circles intersect at  $\left(\frac{9}{4}, \pm \frac{\sqrt{63}}{4}\right)$ . The angle of intersection at both points is  $\cos^{-1} \frac{3}{4}$  radians.
- The function is  $\mathbf{r}(t) = \langle 0, e^t, 2e^t \rangle$ . The graph is the ray with parametric equations  $x = 0, y = s, z = 2s$  for  $s > 0$ .
- (a)  $\langle -0.5dy(t), -9.8t - dy(t) \rangle$ , (b)  $-\frac{9.8t+y(t)}{d}$ , (c)  $x'(t) = 4.9t + 0.5y'(t)$ , (d)  $\langle 2.45t^2 + 0.5y(t), y(t) \rangle$ , (e) No, he should not jump.
- If  $\mathbf{a}(t) = \langle 0, 0, 0 \rangle$ , then  $\mathbf{v}(t) = \langle \alpha, \beta, \gamma \rangle$ , where  $\alpha, \beta$ , and  $\gamma$  are constants. We also have  $\mathbf{r}(t) = \langle \alpha t + \delta, \beta t + \epsilon, \gamma t + \lambda \rangle$ , where  $\delta, \epsilon$ , and  $\lambda$  are also constants. The graph of  $\mathbf{r}(t)$  is a straight line.
- We will prove the case where  $\mathbf{r}(t) = \langle x(t), y(t) \rangle$ . The case where  $\mathbf{r}(t)$  has three components is similar. We have  $k\mathbf{r}(t) = \langle kx(t), ky(t) \rangle$  and  $\frac{d}{dt}(k\mathbf{r}(t)) = \left\langle \frac{d}{dt}(kx(t)), \frac{d}{dt}(ky(t)) \right\rangle = \langle kx'(t), ky'(t) \rangle = k\langle x'(t), y'(t) \rangle = k\mathbf{r}'(t)$ .
- Let  $\mathbf{r}_1(t) = \langle x_1(t), y_1(t), z_1(t) \rangle$  and  $\mathbf{r}_2(t) = \langle x_2(t), y_2(t), z_2(t) \rangle$ . Then  $\frac{d}{dt}(\mathbf{r}_1(t) \cdot \mathbf{r}_2(t)) = \frac{d}{dt}(x_1x_2 + y_1y_2 + z_1z_2) = x_1'x_2 + x_1x_2' + y_1'y_2 + y_1y_2' + z_1'z_2 + z_1z_2' = \frac{d}{dt}(\langle x_1, y_1, z_1 \rangle \cdot \langle x_2, y_2, z_2 \rangle) + \langle x_1, y_1, z_1 \rangle \cdot \frac{d}{dt}(\langle x_2, y_2, z_2 \rangle) = \mathbf{r}_1'(t) \cdot \mathbf{r}_2(t) + \mathbf{r}_1(t) \cdot \mathbf{r}_2'(t)$ .
- Let  $\mathbf{r}(t) = \langle x(t), y(t), z(t) \rangle$ . Then  $\frac{d}{d\tau}(\mathbf{r}(t)) = \frac{d}{d\tau}(\langle x, y, z \rangle) = \left\langle \frac{dx}{d\tau} \frac{dt}{d\tau}, \frac{dy}{d\tau} \frac{dt}{d\tau}, \frac{dz}{d\tau} \frac{dt}{d\tau} \right\rangle = \left\langle \frac{dx}{dt}, \frac{dy}{dt}, \frac{dz}{dt} \right\rangle \frac{dt}{d\tau} = \frac{d\mathbf{r}}{dt} \frac{dt}{d\tau}$ .
- We will show that  $\|\mathbf{r}(t)\|^2$  is a constant. Since  $\mathbf{r}$  is continuous, this is equivalent. Taking the derivative we have  $\frac{d}{dt}(\|\mathbf{r}(t)\|^2) = \frac{d}{dt}(\mathbf{r}(t) \cdot \mathbf{r}(t)) = 2\mathbf{r}(t) \cdot \mathbf{r}'(t) = 0$ . Since the derivative of  $\|\mathbf{r}(t)\|^2$  is a zero, we must have  $\|\mathbf{r}(t)\|$  is a constant.
- Apply the result of Exercise 69.

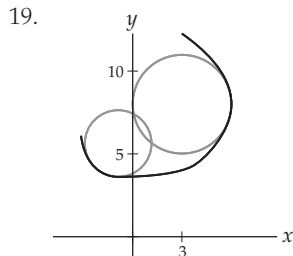

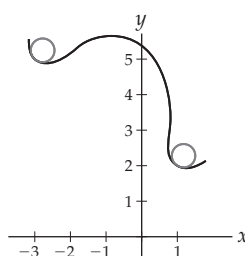

## Section 11.3

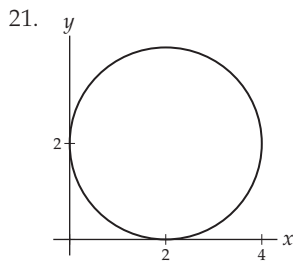

- F, T, F, T, T, T, T, T.
- All of these vectors have magnitude one. The unit tangent vector points straight ahead. The principal unit normal vector is orthogonal to the unit tangent vector and points "into" the curve. Together these two vectors determine the osculating plane that is the plane in which the curve fits "best" at the point of tangency. The binormal vector is normal to the osculating plane. The tangent vector, normal vector and binormal vector form a right-hand triple, so when the curve is bending to the left, it points up, and when the road bends to the right, it points down.
- The unit tangent vector won't exist at any point  $t_0$  at which  $\mathbf{r}'(t_0) = \mathbf{0}$ .

7. If  $\mathbf{r}'(t_0) \neq \mathbf{0}$ , then they point in the same direction, but  $\mathbf{T}(t_0)$  is a unit vector, and  $\mathbf{r}'(t_0)$  can have a different length.
9.  $\mathbf{N}(t) = \frac{\mathbf{T}'(t)}{\|\mathbf{T}'(t)\|}$
11. All of these vectors have magnitude one. The unit tangent vector points straight in the direction of motion of the curve. The principal unit normal vector is orthogonal to the unit tangent vector and points “into” the curve. Together these two vectors determine the osculating plane that is the plane in which the curve fits “best” at the point of tangency. The derivative  $\frac{d\mathbf{N}}{dt}\Big|_{t_0}$  is orthogonal to both the tangent vector and normal vector.
13. At each point  $t_0$  at which  $\mathbf{r}(t_0) \neq \mathbf{0}$ ,  $\mathbf{B}(t_0) = \mathbf{T}(t_0) \times \mathbf{N}(t_0)$ , where  $\mathbf{T}$  and  $\mathbf{N}$  are the unit tangent vector and principal unit normal vector, respectively.
15. It isn't defined when  $\mathbf{r}'(t) = \mathbf{0}$ .
17. Find  $\mathbf{r}'(t_0)$ . If  $\mathbf{r}'(t_0) \neq \mathbf{0}$  continue. Find the unit tangent vector at  $t_0$ ,  $\mathbf{T}(t_0)$ . If  $\mathbf{T}(t_0) \neq \mathbf{0}$ , continue. Find the principal unit normal vector at  $t_0$ ,  $\mathbf{N}(t_0)$ . Find the binormal vector at  $t_0$ ,  $\mathbf{B}(t_0) = \mathbf{T}(t_0) \times \mathbf{N}(t_0)$ . The osculating plane contains the point  $\mathbf{r}(t_0)$  and has  $\mathbf{B}(t_0)$  as its normal vector.
19. 3                                  21.  $x = 1$
23.  $\frac{1}{\sqrt{144t^4 + 4t^2 + 25}}(2t, 5, 12t^2)$
25.  $\frac{1}{|\sin(t)\cos(t)}(-\cos^2 t \sin t, \sin^2 t \cos t)$
27.  $\frac{1}{5}(3\cos t, -5\sin t, 4\cos t)$
29.  $\mathbf{T}(1) = \left\langle \frac{\sqrt{5}}{5}, \frac{2\sqrt{5}}{5} \right\rangle$ ,  $\mathbf{N}(1) = \left\langle -\frac{2\sqrt{5}}{5}, -\frac{\sqrt{5}}{5} \right\rangle$
31.  $\mathbf{T}(\pi) = \langle -\sin \alpha\pi, \cos \alpha\pi \rangle$ ,  
 $\mathbf{N}(\pi) = \langle -\cos \alpha\pi, -\sin \alpha\pi \rangle$
33.  $\mathbf{T}(\pi) = \left\langle -\frac{3}{5}, 0, -\frac{4}{5} \right\rangle$ ,  $\mathbf{N}(\pi) = \langle 0, 1, 0 \rangle$
35.  $\mathbf{T}(1) = \left\langle \frac{\sqrt{14}}{14}, \frac{\sqrt{14}}{7}, \frac{3\sqrt{14}}{14} \right\rangle$ ,  $\mathbf{N}(1) = \frac{1}{\sqrt{266}} \langle -11, -8, 9 \rangle$ ,  
 $\mathbf{B}(1) = \frac{1}{\sqrt{123}} \langle 7, -7, 5 \rangle$ ,  $7x - 7y + 5z = 5$
37.  $\mathbf{T}(0) = \left\langle \frac{1}{2}, -\frac{1}{2}, \frac{\sqrt{2}}{2} \right\rangle$ ,  $\mathbf{N}(0) = \left\langle \frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2}, 0 \right\rangle$ ,  
 $\mathbf{B}(0) = \left\langle -\frac{1}{2}, \frac{1}{2}, \frac{\sqrt{2}}{2} \right\rangle$ ,  $-x + y + \sqrt{2}z = 0$
39.  $\mathbf{T}\left(\frac{\pi}{2}\right) = \left\langle -\frac{2\sqrt{5}}{5}, 0, \frac{\sqrt{5}}{5} \right\rangle$ ,  $\mathbf{N}\left(\frac{\pi}{2}\right) = \left\langle \frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2}, 0 \right\rangle$ ,  
 $\mathbf{B}\left(\frac{\pi}{2}\right) = \left\langle -\frac{\sqrt{5}}{5}, 0, -\frac{2\sqrt{5}}{5} \right\rangle$ ,  $x + 2z = \pi$
41. Normal plane:  $x - y + \sqrt{2}z = 0$ . Rectifying plane:  
 $x + y = 2$ .
43. (a) Their tangent vector is  $\langle 1.5t^{0.5}, 1.7 - 2t \rangle$ , so that their speed is  $4t^2 - 4.45t + 2.89$ . This is concave up, so their maximum speed will occur when  $t$  is a maximum on the interval at  $t = 1.7$ . (b) Approximately  $\langle 0.95, -0.30 \rangle$ .
45. For any two vectors  $\mathbf{a}$  and  $\mathbf{b}$  in  $\mathbb{R}^3$   
 $\|\mathbf{a} \times \mathbf{b}\| = \|\mathbf{a}\|\|\mathbf{b}\|\sin \theta$ . If  $\mathbf{a}$  and  $\mathbf{b}$  are orthogonal unit vectors, then  $\|\mathbf{a}\|$ ,  $\|\mathbf{b}\|$  and  $\sin \theta$  are all one. Thus,  $\mathbf{a} \times \mathbf{b}$  is a unit vector.
47. The three properties follow from the definition of the three vectors and the geometric properties of the cross product. Since  $\mathbf{T}(t_0)$  and  $\mathbf{N}(t_0)$  are orthogonal unit vectors, their cross product  $\mathbf{B}(t_0)$  is another unit vector and is orthogonal to them both. Furthermore, we know that for any two nonparallel vectors  $\mathbf{a}$  and  $\mathbf{b}$ ,  $\mathbf{a}$ ,  $\mathbf{b}$ , and  $\mathbf{a} \times \mathbf{b}$  form a right-hand triple.

## Section 11.4

1. F, F, T, T, F, F, T.
3. Informally, it means that for every unit change in the parameter, a unit change occurs along the curve. For the formal definition see Definition 11.19.
5. There are more ways for a curve to bend. Think of a spring. The concepts of “concave up” and “concave down” are insufficient to describe how it is bending.
7. So that curvature has a consistent definition, the rate of change of the tangent vector with respect to arc length provides a relatively simple definition. Unfortunately, it is often difficult to find an arc length parametrization for a curve.
9. When you have an arc length parametrization for the curve, use the definition. Use Theorem 11.23(a) when you have a space curve and  $\mathbf{T}'(t)$  is easy to compute. Use Theorem 11.23(b) when you have a twice-differentiable parametrization for the space curve. Use Theorem 11.24(a) for a planar curve defined by a twice-differentiable function  $y = f(x)$ . Use Theorem 11.24(b) for a planar curve defined by a vector function.
11. (a) By Theorem 11.23,  $\kappa = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3}$ . So, if  $\mathbf{r}(t) = \langle a + \alpha t, b + \beta t, c + \gamma t \rangle$ , then  $\mathbf{r}'(t) = \langle \alpha, \beta, \gamma \rangle$  and  $\mathbf{r}''(t) = \langle 0, 0, 0 \rangle$ , so  $\kappa = 0$ . Since  $\kappa = 0$ , the radius of curvature is undefined. (b) A straight line doesn't curve, so this is consistent with our concept of curvature.
13. Let  $(x_0, y_0)$  be a point on the curve. Find the curvature,  $\kappa$ , at  $(x_0, y_0)$  using the appropriate part of Theorem 11.24. If  $\kappa \neq 0$ , the radius of curvature  $\rho = \frac{1}{\kappa}$ . Find the normal vector,  $\mathbf{N}$  at  $(x_0, y_0)$ . The radius of the osculating circle is  $\rho$ . The center of the osculating circle is the terminal point of the position vector  $\langle x_0, y_0 \rangle + \rho\mathbf{N}$ .
15.  $y'' = 2$  and by Theorem 11.24,  $\kappa = \frac{2}{(1+4x^2)^{3/2}}$ .

23.  $6\pi$

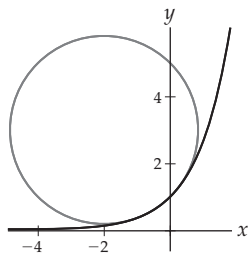

25.  $\frac{488}{27}$

27.  $\sqrt{3}(e^\pi - 1)$

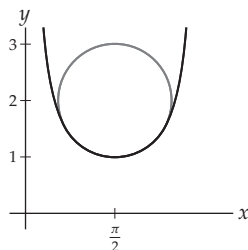

29. The arc length of the curve on the interval  $[0, 1]$  is  $\sqrt{30}$ ;

$$\mathbf{r}(s) = \left\langle 3 + \frac{\sqrt{30}}{15}s, 4 - \frac{\sqrt{30}}{30}s, -1 + \frac{\sqrt{30}}{6}s \right\rangle$$

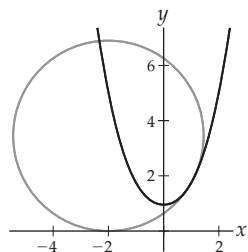

31.  $\kappa = \frac{\sqrt{2}}{4}$

33.  $\kappa = 1$

35.  $\frac{\sqrt{3}}{6}$

37.  $\frac{ab}{(a^2 \sin^2 t + b^2 \cos^2 t)^{3/2}}$

39.  $\frac{1}{2\sqrt{2(1-\cos t)}}$

41.  $\sqrt{\frac{t^4 + 5t^2 + 8}{(t^2 + 2)^3}}$

43.  $\sqrt{\frac{t^4 + (4 + \alpha^2)t^2 + 4 + 4\alpha^2}{(t^2 + 1 + \alpha^2)^3}}$

45.  $\pm \frac{1}{45^{1/4}}$       47.  $\kappa = \frac{a}{a^2 + b^2}$

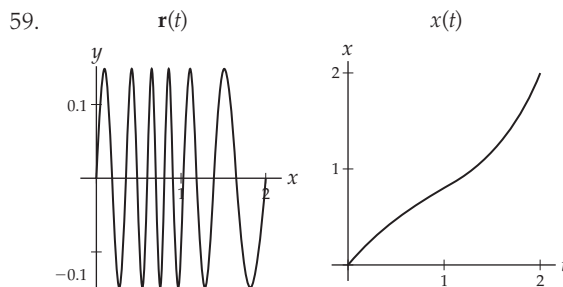

49.  $\kappa = t^3 \sqrt{\frac{t^6 + t^2 + 4}{(t^4 + 1)^3}}$  has the stated limits.

51. We differentiate:  $\frac{d}{ds}(\mathbf{B}) = \frac{d}{ds}(\mathbf{T} \times \mathbf{N}) = \frac{d\mathbf{T}}{ds} \times \mathbf{N} + \mathbf{T} \times \frac{d\mathbf{N}}{ds}$ . Since the quantities on the right exist at every point on  $C$ , the derivative exists.

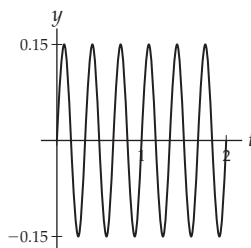

53. We differentiate:  $\frac{d}{ds}(\mathbf{N}) = \frac{d}{ds}(\mathbf{B} \times \mathbf{T}) = \frac{d\mathbf{B}}{ds} \times \mathbf{T} + \mathbf{B} \times \frac{d\mathbf{T}}{ds} = -\tau \mathbf{N} \times \mathbf{T} + \mathbf{B} \times (\kappa \mathbf{N}) = \tau \mathbf{B} - \kappa \mathbf{T}$

55.  $\frac{6+t^2}{4+t^2+t^4}$

57. By choosing the coordinate axes appropriately we may assume that the curve  $C$  lies in the  $xy$ -plane. Thus, the binormal vector  $\mathbf{B}(t) = \pm \mathbf{k}$ , and in either case is a constant. Therefore,  $\frac{d\mathbf{B}}{ds} = 0$ . Thus, the torsion is zero.

$y(t)$

(b) When the  $x$ -coordinate changes slowly, that means that the  $y$ -coordinate is changing quickly relative to it. The greatest curvature should occur near the point where the slope of the  $x$ -coordinate is smallest, while the  $y$ -coordinate changes quickly. (c) The slope of the first component of the curve is a minimum at about  $t = 0.91$ , and the second component turns quickly at about  $t = 0.92$ . We expect the curvature to be greatest at about that point.

61. By Theorem 11.24  $\kappa = \frac{|f''(x)|}{(1 + (f'(x))^2)^{3/2}}$ . Let  $x$  be a point of inflection of a twice-differentiable function,  $f$ . Since  $f''(x) = 0$  at each inflection point, we have  $\kappa = 0$ .

63. Let  $\mathbf{r}(t)$  be a twice differentiable vector-valued function with graph  $\mathcal{C}$ . By Theorem 11.23 the curvature at each point on  $\mathcal{C}$  is  $\kappa = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3}$ . But recall that  $\|\mathbf{r}'(t) \times \mathbf{r}''(t)\| = \|\mathbf{r}'(t)\| \|\mathbf{r}''(t)\| \sin \theta$  where  $\theta$  is the angle between  $\mathbf{r}'(t)$  and  $\mathbf{r}''(t)$ . Since the speed of the particle is constant, by Theorem 11.12  $\mathbf{r}'(t)$  and  $\mathbf{r}''(t)$  are orthogonal. Therefore,  $\kappa = \frac{\|\mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^2}$ . But the denominator of this expression is the square of the speed, which we are assuming is constant. Therefore, the curvature is proportional to the magnitude of the acceleration.
65. Let  $\mathbf{r}(t) = \langle t, f(t), 0 \rangle$ . So,  $\mathbf{r}'(t) = \langle 1, f'(t), 0 \rangle$  and  $\mathbf{r}''(t) = \langle 0, f''(t), 0 \rangle$ . By Theorem 11.23
- $$\kappa = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3} = \frac{\|(0, 0, f''(t))\|}{\|(1, f'(t), 0)\|} = \frac{|f''(t)|}{(1 + (f'(t))^2)^{3/2}}.$$

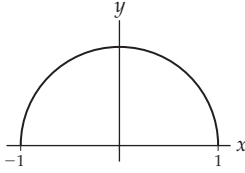

### Section 11.5

- T, F, T, T, F, T, F, F.
- When the downward acceleration due to the force of gravity is smaller, an object takes longer to fall to the ground. When the object is thrown horizontally, it still takes longer to hit the ground. Therefore, it travels farther.
- You can include the wind velocity as a vector added to the velocity vector of the projectile.
- $\mathbf{r}(b) - \mathbf{r}(a)$
- These are the magnitudes of the acceleration vector, parallel to the tangent vector and parallel to the principal normal unit vector, respectively. Their values are given by  $a_T = \frac{\mathbf{v} \cdot \mathbf{a}}{\|\mathbf{v}\|}$  and  $a_N = \frac{\|\mathbf{v} \times \mathbf{a}\|}{\|\mathbf{v}\|^2}$ .
- The tangential component of acceleration always points in the instantaneous direction of your motion, tangent to the curve defined by your path. The normal component of acceleration is orthogonal to your direction of motion and points "into" the curve, so if you are curving to the left, it points to your left; if you are ascending, it points upward, etc.
- (a) If you eliminate the parameter, the function may be expressed in the form  $y = x^2$ . (b) This will occur when  $\|\mathbf{r}(t)\|$  is a constant and more generally when  $f'(t)f''(t) + 4f(t)(f'(t))^3 + 4(f(t))^2 f'(t)f''(t) = 0$ .
- (a)  $\langle 0, -\pi \rangle$ , (b)  $\pi$ , (c)  $\frac{1}{2}(\pi \sqrt{\pi^2 + 1} + \ln(\pi + \sqrt{\pi^2 + 1}))$
- (a)  $\langle \alpha \sin \beta, \alpha(\cos \beta - 1), \gamma \rangle$ ,  
(b)  $\sqrt{\alpha^2 - 2\alpha \cos \beta + 1 + \gamma^2}$ , (c)  $\sqrt{\alpha^2 \beta^2 + \gamma^2}$
- $a_T = \frac{-27 \sin 3t \cos 3t + 64 \sin 4t \cos 4t}{\sqrt{9 \cos^2 3t + 16 \sin^2 4t}}$ ,  
 $a_N = \frac{|48 \cos 3t \cos 4t + 36 \sin 3t \sin 4t|}{\sqrt{9 \cos^2 3t + 16 \sin^2 4t}}$
- $a_T = \sqrt{3}e^t$ ,  $a_N = \sqrt{2}e^t$
- $a_T = 0$ ,  $a_N = 1$
- The values of  $t$  are the roots of  $16t^4 - 129t^2 + 101 = 0$ . These are approximately  $\pm 0.94$  seconds and  $\pm 2.68$  seconds. Only the positive values make sense in the context of the problem. When  $t = 0.94$ ,  $\theta \approx 14^\circ$  and when  $t = 2.68$ ,  $\theta \approx 70^\circ$ .
- (a) 10 meters per second, (b) 54 meters
- (a)  $0^\circ$ , (b) 292 feet
- 86,000 meters
- The function  $\mathbf{r}(t) = \langle x(t), y(t) \rangle = \left\langle (\|\mathbf{v}_0\| \cos \theta) t, -\frac{1}{2}gt^2 + (\|\mathbf{v}_0\| \sin \theta) t \right\rangle$  models the motion of the ball. The ball will hit the ground when the  $y$ -component is zero. This will occur when  $t = \frac{\|\mathbf{v}_0\| \sin \theta}{g}$ . At this time it will have travelled  $\frac{\|\mathbf{v}_0\| \sin \theta \cos \theta}{g}$  units horizontally. Thus, the  $x$ -component will be maximized when  $\theta = 45^\circ$ .
- If  $\mathbf{a}(t) = \langle 0, 0, 0 \rangle$ , then the velocity vector is  $\mathbf{v}(t) = \langle \alpha, \beta, \gamma \rangle$  for constants  $\alpha$ ,  $\beta$  and  $\gamma$ . The position function will be  $\mathbf{r}(t) = \langle a + \alpha t, b + \beta t, c + \gamma t \rangle$ , where  $a$ ,  $b$ , and  $c$  are three more constants. The graph of  $\mathbf{r}(t)$  is a straight line.
- Let  $\mathbf{r}(t) = \langle t, f(t), 0 \rangle$ . Then  $\mathbf{v}(t) = \langle 1, f'(t), 0 \rangle$  and  $\mathbf{a}(t) = \langle 0, f''(t), 0 \rangle$ . We have  $\mathbf{v}(t) \times \mathbf{a}(t) = \langle 0, 0, f''(t) \rangle$ . At a point of inflection we have  $a_T = \frac{\|\mathbf{v}(t) \times \mathbf{a}(t)\|}{\|\mathbf{v}(t)\|^2} = 0$ .

## Chapter 12

### Section 12.1

- T, F, T, F, T, T, T, T.
  - The graph of  $f$  is the set  $\{(x, f(x)) | x \in \mathbb{R}\}$ .
  - The graph of  $f$  is the set  $\{(x, y, z, f(x, y, z)) | (x, y, z) \in \mathbb{R}^3\}$ .
  - 7.
- 

(a)

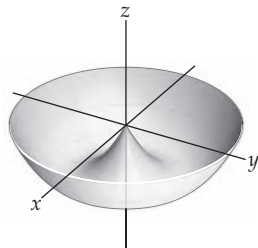

(b)
- (c) The prefix *hyper* means *above*. The range of the square root function is nonnegative real numbers.  $x^2 + y^2 + z^2 + w^2 = 1$ . (d) Hypersphere,  $n, \mathbb{R}^{n+1}$ .
- A point  $(x, y, z)$  is on the graph of  $f$  if and only if  $(x, y)$  is in the domain of the function  $f$ .
  - A point  $(x, y, z, w)$  is on the graph of  $f$  if and only if  $(x, y, z)$  is in the domain of the function  $f$ .

13.

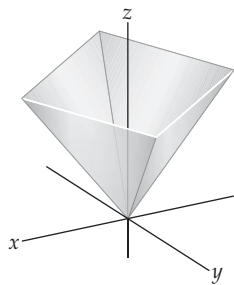

15.

17. See the answer to Exercise 13

19. See the answer to Exercise 15

21.

23.  $-24, 5$ ,  $\text{Domain}(f) = \mathbb{R}^2$ ,  $\text{Range}(f) = \mathbb{R}$

25.  $(1 + e)^{-1/2}, 0$ ,  $\text{Domain}(f) = \{(x, y) | 0 < x < 1 \text{ and } y > 0\} \cup \{(x, y) | x < 0 \text{ and } y < 0\}$ ,  $\text{Range}(f) = \mathbb{R}$

27.  $26, \frac{49}{36}$ ,  $\text{Domain}(f) = \mathbb{R}^3$ ,  $\text{Range}(f) = \{w \in \mathbb{R} | w \geq 0\}$

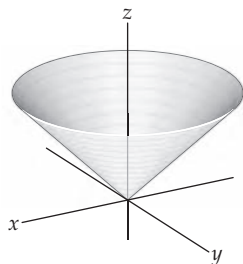

29. 1

31.  $\sin(\cos t)$

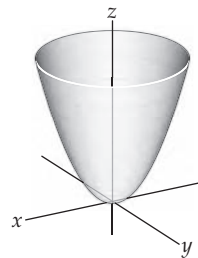

33.  $\frac{\cos t + \sin t}{\sin t + 1 - t}$

35.  $(1 - t, (1 - t)^2, (1 - t)^3)$

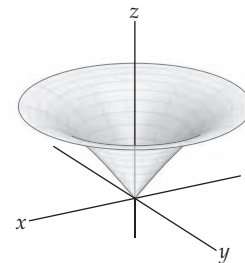

37.  $F(x, y) = \sqrt{x^2 + y^2}$

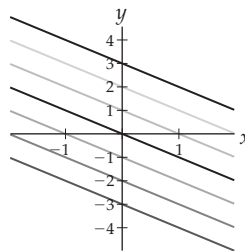

39.  $F(x, y) = x^2 + y^2$

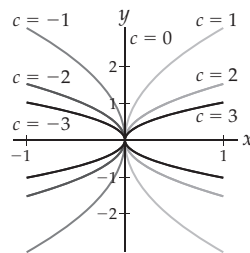

41.  $F(x, y) = \sin \sqrt{x^2 + y^2}$

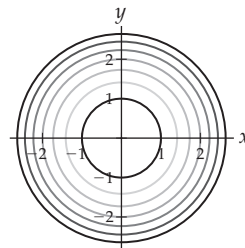

43.

45.

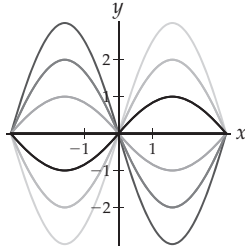

47.

49. Only the level curves for  $c = -1, 0$  and  $1$  are defined. The level curves for  $c = -1$  are the parallel lines defined by  $x + y = -\frac{\pi}{2} + 2k\pi$  where  $k \in \mathbb{Z}$ . The level curves for  $c = 0$  are the parallel lines defined by  $x + y = k\pi$  where  $k \in \mathbb{Z}$ . The level curves for  $c = 1$  are the parallel lines defined by  $x + y = \frac{\pi}{2} + 2k\pi$  where  $k \in \mathbb{Z}$ .

51.

53. The level surfaces are the planes with equations  $x + 2y + 3z = c$  for  $c = -3, -2, -1, 0, 1, 2, 3$ .
55. The level surface  $\frac{x}{y-z} = c$  consists of every point on the plane  $x - cy + cz = 0$  except those points where  $y = z$ .
57. The level surfaces for  $c = -3, -2$  and  $-1$  are undefined. The level surface  $x^2 + y^2 + z^2 = 0$  is the origin. The level surfaces  $x^2 + y^2 + z^2 = c$  for  $c = 1, 2,$  and  $3$  are the spheres centered at the origin with radii  $1, \sqrt{2},$  and  $\sqrt{3}$ , respectively.
59. I A 61. III B
63. Domain( $V$ ) =  $\{(r, h) | r > 0 \text{ and } h > 0\}$ ,  
 $S(r, h) = 2\pi r^2 + 2\pi rh$ .
65.  $V(x, y, z) = xyz$ ,  $S(x, y, z) = 2xy + 2xz + 2yz$ ,  
 Domain( $V$ ) = Domain( $S$ ) =  $\{(x, y, z) | x > 0, y > 0 \text{ and } z > 0\}$ .
67. (a) From examining a plot, we can see that the caribou are distributed up and down the valley along the line  $y = -0.5x + 2$ . (b) From examining a plot, we can see that the caribou are distributed up and down the valley along the line  $y = -0.5x + 2$ . Thus the stream roughly follows the bottom of the valley,  $(4, -2)$ .
69. The graph of the equation  $z = ax + by + c$  is a plane. The normal vector to the plane  $ax + by - z + c = 0$  is  $(a, b, -1)$ . When  $x = 0$  and  $y = 0$  we have  $z = c$ .
71. If  $c_1$  is not equal to  $c_2$ , then since  $f$  is a function,  $f(x, y)$  cannot equal both  $c_1$  and  $c_2$  for the same input  $(x, y)$ . Thus,  $c_1$  must equal  $c_2$  in order for the level curves to intersect. But this implies that the level curves are identical.
73. You may model your proof on the solution of Exercise 71.

**Section 12.2**

1. T, F, T, T, F, T, F, T.
3. Nothing, the limit may or may not exist.
5.  $\lim_{(x,y) \rightarrow (3,-7)} f(x, y) = 5$ ,  $f(3, -7)$  could be any real number, or could even be undefined.
7. When  $\lim_{x \rightarrow c} f(x) = L$ , the function  $f$  must be defined on  $(c - \delta, c) \cup (c, c + \delta)$  for some  $\delta > 0$ .

9. When  $\lim_{(x,y,z) \rightarrow (a,b,c)} f(x, y, z) = L$ , the function  $f$  must be defined on a punctured ball defined by the inequality  $0 < \sqrt{(x-a)^2 + (y-b)^2 + (z-c)^2} < \delta$  for some  $\delta > 0$ .
11. For  $f$  to be continuous at  $c$ , we must have  $\lim_{x \rightarrow c} f(x) = f(c)$ . For the limit to exist,  $f$  must be defined on  $(c - \delta, c) \cup (c, c + \delta)$  for some  $\delta > 0$ .
13. Along the  $x$ -axis  $\lim_{(x,y) \rightarrow (0,0)} \frac{x^2 y}{x^4 + y^2} = \lim_{x \rightarrow 0} \frac{x^2 \cdot 0}{x^4 + 0} = 0$ . Along the  $y$ -axis  $\lim_{(x,y) \rightarrow (0,0)} \frac{x^2 y}{x^4 + y^2} = \lim_{y \rightarrow 0} \frac{0 \cdot y}{0 + y^2} = 0$ .
15. We say that  $\lim_{(x,y) \rightarrow (a,b)} f(x, y) = \infty$  if for every  $M > 0$  there is a  $\delta > 0$  such that  $f(x, y) > M$  whenever  $\sqrt{(x-a)^2 + (y-b)^2} < \delta$ .
17. Let  $f(x, y) = \frac{x^2}{x^2 + y^2}$  and  $g(x, y) = \frac{y^2}{x^2 + y^2}$  then  $\lim_{(x,y) \rightarrow (0,0)} (f(x, y) + g(x, y)) = 1$ ; but neither of the individual limits exists as  $(x, y) \rightarrow (0, 0)$ . This does not contradict the sum rule for limits of a function of two variables since neither of the individual limits exists.
19. (a) The quotient of two continuous functions is continuous, as long as the denominator is not zero. (b) For every real number  $a$ , every open disk containing the point  $(a, a)$  contains infinitely many points of the line  $y = x$ . Therefore, the quotient is not even defined for infinitely many points in any open ball containing  $(a, a)$ .
21. (a) Open, (b)  $\{(x, y) | x \leq 0 \text{ or } y \leq 0\}$ ,  
 (c)  $\{(x, 0) | x \geq 0\} \cup \{(0, y) | y \geq 0\}$
23. (a) Closed, (b)  $\{(x, y) | |x| + |y| > 1\}$ ,  
 (c)  $\{(x, y) | |x| + |y| = 1\}$
25. (a) Both open and closed, (b)  $\mathbb{R}^2$ , (c) the empty set
27. (a) Open, (b)  $\{(x, y, z) | x \leq 0, y \geq 0 \text{ or } z \geq 0\}$ ,  
 (c)  $\{(x, y, 0) | x \geq 0, y \leq 0\} \cup \{(x, 0, z) | x \geq 0, z \leq 0\} \cup \{(0, y, z) | y \leq 0, z \leq 0\}$
29. (a) Closed, (b)  $\{(x, y, z) | z \neq 0\}$  (c) the  $xy$ -plane
31. (a) Both open and closed, (b)  $\mathbb{R}^3$ , (c) the empty set
33. 0 35.  $-\frac{5}{3}$
37.  $\frac{9}{2}$  39. does not exist
41.  $\lim_{r \rightarrow 0} \frac{r^2 \cos^2 \theta}{r^2} = \lim_{r \rightarrow 0} \cos^2 \theta$ . Since the limit is a nonconstant function of  $\theta$ , the limit does not exist.
43.  $\lim_{r \rightarrow 0} \frac{(r^2 \cos^2 \theta)(r^2 \sin^2 \theta)}{r^2} = \lim_{r \rightarrow 0} r^2 \cos^2 \theta \sin^2 \theta = 0$ .
45.  $\lim_{r \rightarrow 0} \frac{(r \cos \theta)(r \sin \theta)}{r} = \lim_{r \rightarrow 0} r \cos \theta \sin \theta = 0$ .
47. Domain( $f$ ) =  $\{(x, y) | x^2 \neq y^2\}$ .  $f$  is continuous on its domain.
49. Domain( $f$ ) =  $\{(x, y) | y \geq -x^2\}$ .  $f$  is continuous on the set  $\{(x, y) | y > -x^2\}$ .

51. Domain( $f$ ) =  $\{(x, y, z) | x + y + z > 0\}$ .  $f$  is continuous on its domain.
53. Domain( $f$ ) =  $\mathbb{R}^2$ .  $f$  is continuous everywhere.
55. Domain( $f$ ) =  $\mathbb{R}^2$ .  $f$  is continuous everywhere.
57. The limit is zero. The pressure would decrease as the gas cools off.
59. The limit is infinite. The pressure increases without bound as the gas is compressed.
61. (a)  $y = \frac{232}{119}x - \frac{4350}{17}$ , (b)  $-40.38$  feet, (c) There are many possibilities. The surface might not be as planar as her previous results led her to believe. She might have been unlucky and hit a pocket or hole in the basalt. Or again, there might be a joint in the basalt layer that would cause a discontinuity in its depth.
63.  $x \in S$  if and only if  $x \notin S^c$ .  $x \notin S^c$  if and only if  $x \in (S^c)^c$ . Therefore,  $S = (S^c)^c$ .
65. We prove the statement when  $S \subseteq \mathbb{R}^2$ . The proof for  $\mathbb{R}^3$  is similar. First, assume  $S$  is open. Thus, for every  $x \in S$  there is an open disk  $D$  such that  $x \in D \subseteq S$ . This implies that  $x \notin \partial S$ . Therefore,  $\partial S \cap S = \emptyset$ . Now, assume  $S$  is not open. There exists an  $x \in S$  such that for every open disk  $D$  containing  $x$ ,  $D \cap S^c$  is nonempty. Therefore,  $x \in \partial S \cap S$ .
67. We prove the statement when  $S \subseteq \mathbb{R}^2$ . The proof for  $\mathbb{R}^3$  is similar.  $x \in \partial S$  if and only if for every open disk  $D$  containing  $x$ ,  $D$  intersects both  $S$  and  $S^c$ . Since  $S = (S^c)^c$ , this occurs if and only if  $x \in \partial(S^c)$ .
69. By Exercise 68,  $\partial S$  is a closed set, and by Exercise 66 the boundary of a closed set is a subset of the set. Therefore,  $\partial(\partial S) \subseteq \partial S$ .
71. The complement of  $\emptyset$  in  $\mathbb{R}^2$  is  $\mathbb{R}^2$ . By Exercise 70,  $\emptyset$  is both open and closed. Since the complement of an open set is closed and the complement of a closed set is open,  $\mathbb{R}^2$  is both open and closed.

### Section 12.3

1. T, T, F, F, T, F, F, F.
3. The slope remains zero.
5.  $f_x(x_0, y_0)$  and  $f_y(x_0, y_0)$  represent the slopes of the curves formed by the intersection of the surface and the planes  $y = y_0$  and  $x = x_0$ , respectively. The lines tangent to these curves are also tangent to the surface.
7. (a) The graph of  $g$  is the "cylinder" created when the graph of  $f$  is translated in the  $x$  direction. (b)  $\frac{\partial g}{\partial x}$  exists for every value of  $x$  and  $y$  if  $y$  is in the domain of  $f$ .  $\frac{\partial g}{\partial y}$  exists for all values of  $x$  and  $y$  where  $f'(y)$  exists. (c)  $\frac{\partial g}{\partial x} = 0$  and  $\frac{\partial g}{\partial y} = f'(y)$
9.  $g_x(0, 0) = \lim_{h \rightarrow 0} \frac{h^2 - 0}{h} = 0 = \lim_{h \rightarrow 0} \frac{-h^2 - 0}{h} = g_y(0, 0)$ . The tangent line in the  $x$  direction is the  $x$ -axis and the tangent line in the  $y$  direction is the  $y$ -axis. The plane containing these two lines is  $z = 0$ .
11.  $f_x(0, 0) = \lim_{h \rightarrow 0} \frac{f(h, 0) - f(0, 0)}{h} = \lim_{h \rightarrow 0} \frac{0 - 0}{h} = 0$ . The computation for  $f_y(0, 0)$  is similar. The function is discontinuous at  $(0, 0)$ .
13.  $f_x(0, 0, 0) = \lim_{h \rightarrow 0} \frac{f(h, 0, 0) - f(0, 0, 0)}{h} = \lim_{h \rightarrow 0} \frac{0 - 0}{h} = 0$ . The computations for  $f_y(0, 0, 0)$  and  $f_z(0, 0, 0)$  are similar. The function is discontinuous at  $(0, 0, 0)$ .
15. (a)  $2^2$ , (b)  $2^3$ , (c)  $2^n$
17. (a) 3, (b) 4, (c)  $n + 1$
19.  $f(x, y) - g(x, y) = h(y)$ , where  $h(y)$  is a function of  $y$
21.  $f(x, y) - g(x, y) = C$ , where  $C$  is a constant
23.  $-2$
25.  $\frac{\partial f}{\partial x} = \frac{y^2}{z}$ ,  $\frac{\partial f}{\partial y} = \frac{2xy}{z}$ ,  $\frac{\partial f}{\partial z} = -\frac{xy^2}{z^2}$
27.  $\frac{\partial f}{\partial x} = e^x(\sin(xy) + y \cos(xy))$ ,  $\frac{\partial f}{\partial y} = xe^x \cos(xy)$
29.  $\frac{\partial f}{\partial x} = yx^{y-1}$ ,  $\frac{\partial f}{\partial y} = (\ln x)x^y$
31.  $\frac{\partial f}{\partial x} = \sin y$ ,  $\frac{\partial f}{\partial y} = x \cos y$
33.  $\frac{\partial f}{\partial r} = \sin \theta$ ,  $\frac{\partial f}{\partial \theta} = r \cos \theta$
35.  $\frac{\partial f}{\partial x} = \frac{y^2 z}{(x+z)^2}$ ,  $\frac{\partial f}{\partial y} = \frac{2xy}{x+z}$ ,  $\frac{\partial f}{\partial z} = -\frac{xy^2}{(x+z)^2}$
37. (a)  $x = t, y = \frac{\pi}{2}, z = \frac{\pi}{2}t$ , (b)  $x = 0, y = \frac{\pi}{2} + t, z = 0$ , (c)  $\frac{\pi}{2}x = z$
39. (a)  $x = e + t, y = 3, z = e^3 + 3e^2t$ , (b)  $x = e, y = 3 + t, z = e^3 + e^3t$ , (c)  $3e^2x + e^3y - z = 5e^3$
41. (a)  $x = 2 + t, y = \frac{\pi}{3}, z = \sqrt{3} + \frac{\sqrt{3}}{2}t$ , (b)  $x = 2, y = \frac{\pi}{3} + t, z = \sqrt{3} + t$ , (c)  $\sqrt{3}x + 2y - 2z = \frac{2\pi}{3}$
43.  $\frac{\partial^2 f}{\partial x^2} = e^x(\sin(xy) + 2y \cos(xy) - y^2 \sin(xy))$ ,  
 $\frac{\partial^2 f}{\partial x \partial y} = \frac{\partial^2 f}{\partial y \partial x} = e^x(\cos(xy) + x \cos(xy) - xy \sin(xy))$ ,  
 $\frac{\partial^2 f}{\partial y^2} = -x^2 e^x \sin(xy)$
45.  $\frac{\partial^2 f}{\partial x^2} = y(y-1)x^{y-2}$ ,  $\frac{\partial^2 f}{\partial x \partial y} = \frac{\partial^2 f}{\partial y \partial x} = x^{y-1}(1 + y \ln x)$ ,  
 $\frac{\partial^2 f}{\partial y^2} = (\ln x)^2 x^y$
47.  $\frac{\partial^2 f}{\partial x^2} = 0$ ,  $\frac{\partial^2 f}{\partial x \partial y} = \frac{\partial^2 f}{\partial y \partial x} = \cos y$ ,  $\frac{\partial^2 f}{\partial y^2} = -x \sin y$
49.  $\frac{\partial^2 f}{\partial r^2} = 0$ ,  $\frac{\partial^2 f}{\partial r \partial \theta} = \frac{\partial^2 f}{\partial \theta \partial r} = \cos \theta$ ,  $\frac{\partial^2 f}{\partial \theta^2} = -r \sin \theta$
51.  $f(x, y) = h(y)$
53.  $f(x, y) = xh_1(y) + h_2(y)$
55.  $f(x, y, z) = h(y, z)$
57.  $f(x, y, z) = xh_1(y, z) + h_2(y, z)$
59.  $\frac{\partial g}{\partial y} = \frac{\partial h}{\partial x}$ ,  $F(x, y) = e^x \cos y + y^2 + C$

61.  $\frac{\partial g}{\partial y} = \frac{\partial h}{\partial x}$ ,  $F(x, y) = \tan^{-1}(xy) + C$
63.  $xe^y - 7y + C = 0$
65.  $e^x \ln y + \frac{1}{4}x^4 + C = 0$
67.  $\frac{\partial V}{\partial r} = 2\pi rh$ . This tells us how fast the volume changes with a unit change in the radius.  $\frac{\partial V}{\partial h} = \pi r^2$ . This tells us how fast the volume changes with a unit change in the height.
69. (b)  $0.04e^{\pi y/2} \sin \frac{\pi x}{2}$
71. Both results follow from the Chain Rule (Theorem 2.12), the power rule, and the definition of the partial derivative.
73. Both results follow from the Quotient Rule (Theorem 2.11) and the definition of the partial derivative.
75.  $\frac{\partial h}{\partial y} = g'(y)$ , so  $\frac{\partial^2 h}{\partial x \partial y} = 0$ . Similarly,  $\frac{\partial h}{\partial x} = f'(x)$ , so  $\frac{\partial^2 h}{\partial y \partial x} = 0$ .

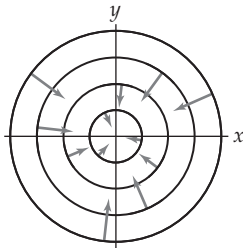

### Section 12.4

- T, T, F, F, F, T, F, T.
- There are two unit vectors in  $\mathbb{R}^1$ ,  $\mathbf{i}$  and  $-\mathbf{i}$ . There are infinitely many unit vectors in  $\mathbb{R}^n$  when  $n > 1$ .
- The directional derivative of  $f(x, y)$  at  $(x_0, y_0)$  in the direction of the unit vector  $\mathbf{u} = \langle a, b \rangle$  is the limit  $\lim_{h \rightarrow 0} \frac{f(x_0 + a \cdot h, y_0 + b \cdot h) - f(x_0, y_0)}{h}$ , provided that this limit exists.
- $D_{\mathbf{u}}f(\mathbf{v}) = \lim_{h \rightarrow 0} \frac{f(\mathbf{v} + h\mathbf{u}) - f(\mathbf{v})}{h}$ , provided that this limit exists.
- (a)  $D_{\mathbf{u}} = 3\alpha - \beta$ , (b)  $3k\alpha - k\beta$ , (c) The limit from part (b) is different for each value of  $k$ . We want the value of the directional derivative to depend upon the direction of  $\mathbf{u}$ , not its magnitude.
- $\lim_{h \rightarrow 0} \frac{f(c + \alpha h) - f(c)}{h}$ ,  $\alpha = \pm 1$
- See Definition 12.27.
- If  $f(x, y)$  is differentiable at the point  $(a, b)$ , all of the lines tangent to the surface defined by  $f$  at  $(a, b)$  lie in the same plane, so any two distinct lines in that plane may be used to determine the equation of the plane.
- If  $f(x, y, z)$  is differentiable at the point  $(a, b, c)$ , all of the lines tangent to the graph of  $f$  at  $(a, b, c)$  lie in the same hyperplane, so any three non-coplanar lines in that hyperplane may be used to determine the equation of the hyperplane.
- Let  $y = f(\mathbf{x})$  be a function of  $n$  variables defined on an open set containing the point  $\mathbf{x}_0$  and let  $\Delta y = f(\mathbf{x}_0 + \Delta \mathbf{x}) - f(\mathbf{x}_0)$ . The function  $f$  is said to be **differentiable** at  $\mathbf{x}_0$  if the partial derivatives  $f_{x_i}(\mathbf{x}_0)$  exist for each  $1 \leq i \leq n$  and  $\Delta y = \langle f_{x_1}(\mathbf{x}_0), f_{x_2}(\mathbf{x}_0), \dots, f_{x_n}(\mathbf{x}_0) \rangle \cdot \Delta \mathbf{x} + \epsilon \cdot \Delta \mathbf{x}$ , where  $\epsilon \rightarrow \mathbf{0}$  as  $\Delta \mathbf{x} \rightarrow \mathbf{0}$ .
- $-\sqrt{2}$
- $-11 \frac{\sqrt{10}}{10}$
- $-7 \frac{\sqrt{17}}{816}$
- $-\frac{36}{5}$
- $x = 2 + \frac{\sqrt{2}}{2}t, y = 3 + \frac{\sqrt{2}}{2}t, z = -5 - \sqrt{2}t$
- $x = -2 + \frac{\sqrt{10}}{10}t, y = 1 - \frac{3\sqrt{10}}{10}t, z = -2 - 11 \frac{\sqrt{10}}{10}t$
- $x = 4 - \frac{\sqrt{17}}{17}t, y = 9 - \frac{4\sqrt{17}}{17}t, z = \frac{3}{2} - 7 \frac{\sqrt{17}}{816}$
- $-\frac{18}{13}\sqrt{26}$
- $-\frac{33}{40}\sqrt{5}$
- For every unit vector  $\mathbf{u} = \langle \alpha, \beta \rangle$ ,  $\lim_{h \rightarrow 0} \frac{(1 + \alpha h)(-2 + \beta h) + 2(1 + \alpha h) - (-2 + \beta h) - 2}{h} = 0$ .
- For every unit vector  $\mathbf{u} = \langle \alpha, \beta \rangle$ ,  $\lim_{h \rightarrow 0} \frac{\alpha h(\beta h)^2}{h} = 0$ .
- $f$  has continuous first-order partial derivatives and is differentiable at every point in  $\mathbb{R}^2$ .
- The function has continuous first-order partial derivatives and is differentiable at every point in  $\mathbb{R}^2$  except when  $x^2 + y^2 = 1$ .
- The function has continuous first-order partial derivatives and is differentiable at every point in  $\mathbb{R}^2$ .
- The function has continuous first-order partial derivatives and is differentiable at every point in  $\mathbb{R}^2$  at which the product  $xy$  is not an odd multiple of  $\frac{\pi}{2}$ .
- The function has continuous first-order partial derivatives and is differentiable at every point such that  $x > 0$  and  $y > 0$ .
- The function has continuous first-order partial derivatives and is differentiable at every point in  $\mathbb{R}^3$ .
- $2(x - 1) + 6(y + 3) = z + 8$
- $x + 9z = -6$
- $\pi x + 4y + 2z = 4\pi$
- $\pi x - 4y + 2z = 2\pi - 2$
- $9x - y + 6z = 18$
- $2(x - 1) - 10(y + 5) - 27(z - 3) = w + 1$
- (a) At about a 10 degree slope. (b) He must move in the direction  $(0, 1)$  or  $(0, -1)$ , due south or due north.
- Let  $\mathbf{u} = \langle \alpha, \beta \rangle$ . By Definition 12.26,  $D_{-\mathbf{u}}f(a, b) = \lim_{\eta \rightarrow 0} \frac{f(a - \alpha\eta, b - \beta\eta) - f(a, b)}{\eta}$ . If we let  $h = -\eta$ , we have  $D_{-\mathbf{u}}f(a, b) = \lim_{h \rightarrow 0} \frac{f(a + \alpha h, b + \beta h) - f(a, b)}{-h} = -D_{\mathbf{u}}f(a, b)$ .
- By Exercise 70,  $f$  cannot be differentiable at  $(a, b)$  if  $D_{\mathbf{u}}f(a, b) = 1$  for every unit vector  $\mathbf{u}$ .

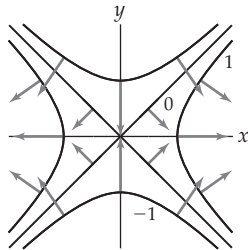

## Section 12.5

- F, F, F, F, F, T, T, T.
- $e^{-\sin t}(2 \sin t \cos t - 3 \sin t \cos^2 t - \cos^3 t + 3 \cos^2 t - 3 \sin^2 t - 4 \cos t)$ .
- When  $n = m = 1$ ,  $\frac{\partial z}{\partial t_j} = \frac{\partial z}{\partial x_1} \frac{\partial x_1}{\partial t_j} + \frac{\partial z}{\partial x_2} \frac{\partial x_2}{\partial t_j} + \dots + \frac{\partial z}{\partial x_n} \frac{\partial x_n}{\partial t_j}$  simplifies to  $\frac{dz}{dt_1} = \frac{dz}{dx_1} \frac{dx_1}{dt_1}$ .
- When  $n = m = 2$ ,  $\frac{\partial z}{\partial t_j} = \frac{\partial z}{\partial x_1} \frac{\partial x_1}{\partial t_j} + \frac{\partial z}{\partial x_2} \frac{\partial x_2}{\partial t_j} + \dots + \frac{\partial z}{\partial x_n} \frac{\partial x_n}{\partial t_j}$  simplifies to  $\frac{\partial z}{\partial t_1} = \frac{\partial z}{\partial x_1} \frac{\partial x_1}{\partial t_1} + \frac{\partial z}{\partial x_2} \frac{\partial x_2}{\partial t_1}$  and  $\frac{\partial z}{\partial t_2} = \frac{\partial z}{\partial x_1} \frac{\partial x_1}{\partial t_2} + \frac{\partial z}{\partial x_2} \frac{\partial x_2}{\partial t_2}$ .
- (a) The level curves of  $f$  are the lines with equations  $y = -\frac{2}{3}x + C$  where  $C \in \mathbb{R}$ . (b) The vector  $\langle 3, -2 \rangle$  may be used as a direction vector for every level curve,  $\nabla f(x, y) = \langle 2, 3 \rangle$ , and  $\langle 3, -2 \rangle \cdot \langle 2, 3 \rangle = 0$ .
- (a) The level curves of  $f$  are the lines with equations  $y = -\frac{a}{b}x + C$  where  $C \in \mathbb{R}$ . (b) The vector  $\langle b, -a \rangle$  may be used as a direction vector for every level curve,  $\nabla f(x, y) = \langle a, b \rangle$ , and  $\langle b, -a \rangle \cdot \langle a, b \rangle = 0$ .
- $\nabla f(a, b, c) \cdot \langle (x, y, z) - (a, b, c) \rangle = w - f(a, b, c)$ .
- The level curves are concentric circles centered at the origin. The gradient vectors are orthogonal to the level curves and point toward the origin. The gradient vectors increase in magnitude as you get further from the origin.

- The level curves are hyperbolas. The gradient vectors are orthogonal to the level curves and point toward the  $x$ -axis and away from the  $y$ -axis. The gradient vectors increase in magnitude as you get further from the origin.

- Staying on a contour line means that you are always staying at the same elevation, so the hike is relatively easy. Walking perpendicularly to the contour lines means you are always either ascending or descending, making the hike more rigorous.
- $e^t \cos(e^t) \cos(t^3) - 3t^2 \sin(e^t) \sin(t^3)$
- $2t \cos(t^3 + 1) + (15t^2 - 3t^4) \sin(t^3 + 1)$
- $\frac{1+4t^3}{2\sqrt{t+t^4}}$
- $2s^3 t^2 \cos s \cos^3 t \sin s + 3s^2 t^2 \cos^3 t \sin^2 s$
- $e^{r \sin \theta} (2r \cos^2 \theta + 2r \sin \theta \cos \theta + r^2 \sin \theta \cos^2 \theta + r^2 \sin^2 \theta \cos \theta)$
- $2t \sin(t^3) \cos(t^4) + 3t^4 \cos(t^3) \cos(t^4) - 4t^5 \sin(t^3) \sin(t^4)$
- $e^{\rho \sin \phi \sin \theta} (2\rho \sin^2 \phi \cos^2 \theta + \rho^2 \sin^3 \phi \sin \theta \cos^2 \theta + \rho \sin \phi \cos \phi \sin \theta + \cos \phi)$
- $\frac{1}{2}(1 + 4t^3 + 6t^5)(t + t^4 + t^6)^{-1/2}$
- $\langle 2x \sin y + y \cos x, x^2 \cos y + \sin x \rangle$
- $\frac{1}{\sqrt{x^2 + y^2}} \langle x, y \rangle$
- $\frac{1}{\sqrt{x^2 + y^2 + z^2}} \langle x, y, z \rangle$
- (a)  $\langle \frac{3\pi}{2}, 0 \rangle$ , (b)  $\frac{3\pi}{2}$ , (c)  $-\langle \frac{3\pi}{2}, 0 \rangle$
- (a)  $\langle \frac{2}{\sqrt{13}}, -\frac{3}{\sqrt{13}} \rangle$ , (b) 1, (c)  $-\langle \frac{2}{\sqrt{13}}, -\frac{3}{\sqrt{13}} \rangle$
- (a)  $\langle \frac{2}{3}, -\frac{1}{3}, -\frac{2}{3} \rangle$ , (b) 1, (c)  $-\langle \frac{2}{3}, -\frac{1}{3}, -\frac{2}{3} \rangle$
- $\frac{\sqrt{10}}{10}$
- $\frac{55\sqrt{17}}{119}$
- $\frac{9\sqrt{7}}{14}$
- $f(x, y) = \ln \left| \frac{y}{x^3} \right| + C$
- $f(x, y) = \tan^{-1} \left( \frac{y}{x} \right) + C$
- $f(x, y) = \frac{x}{x+y} + C$
- (a)  $(0.5, -0.35)$ , (b)  $\pm (0.35, 0.5)$ .
- $\nabla f(x, y, z) = \left\langle \frac{x}{\sqrt{x^2 + y^2 + z^2}}, \frac{y}{\sqrt{x^2 + y^2 + z^2}}, \frac{z}{\sqrt{x^2 + y^2 + z^2}} \right\rangle$ , so  $\|\nabla f(x, y, z)\| = \left( \frac{x}{\sqrt{x^2 + y^2 + z^2}} \right)^2 + \left( \frac{y}{\sqrt{x^2 + y^2 + z^2}} \right)^2 + \left( \frac{z}{\sqrt{x^2 + y^2 + z^2}} \right)^2 = 1$

65. We have  $z = f(x, y)$ ,  $x = u(s, t)$  and  $y = v(s, t)$ . Assume that  $u, v$  and  $z = f(u(s, t), v(s, t))$  are differentiable at a point  $(s_0, t_0)$  and that  $x_0 = u(s_0, t_0)$  and  $y_0 = v(s_0, t_0)$ . We will show that  $\frac{\partial z}{\partial s} = \frac{\partial z}{\partial x} \frac{\partial x}{\partial s} + \frac{\partial z}{\partial y} \frac{\partial y}{\partial s}$ . The remaining equality is quite similar. By the definition of the partial derivative at  $s_0$ :
- $$\frac{\partial z}{\partial s} = \lim_{\Delta s \rightarrow 0} \frac{f(u(s_0 + \Delta s, t_0), v(s_0 + \Delta s, t_0)) - f(u(s_0, t_0), v(s_0, t_0))}{\Delta s} = \lim_{\Delta s \rightarrow 0} \frac{f(u(s_0 + \Delta s, t_0), v(s_0 + \Delta s, t_0)) - f(x_0, y_0)}{\Delta s} = \lim_{\Delta s \rightarrow 0} \frac{\Delta z}{\Delta s}$$
- Now, when  $\Delta s$  is sufficiently small, we may replace the numerator in the equation above by  $f_x(x_0, y_0)\Delta x + f_y(x_0, y_0)\Delta y$ . We now have
- $$\frac{\partial z}{\partial s} = \lim_{\Delta s \rightarrow 0} \frac{f_x(x_0, y_0)\Delta x + f_y(x_0, y_0)\Delta y}{\Delta s} = \lim_{\Delta s \rightarrow 0} \left( f_x(x_0, y_0) \frac{\Delta x}{\Delta s} + f_y(x_0, y_0) \frac{\Delta y}{\Delta s} \right) = \frac{\partial z}{\partial x} \frac{\partial x}{\partial s} + \frac{\partial z}{\partial y} \frac{\partial y}{\partial s}$$

67.  $\frac{\partial f}{\partial x} = 0 = \frac{\partial f}{\partial y}$ , so  $\nabla f = \mathbf{0}$ .
69.  $\nabla(f(x, y) + g(x, y))$   
 $= \langle f_x(x, y) + g_x(x, y), f_y(x, y) + g_y(x, y) \rangle$   
 $= \langle f_x(x, y), f_y(x, y) \rangle + \langle g_x(x, y), g_y(x, y) \rangle$   
 $= \nabla f(x, y) + \nabla g(x, y)$ .
71.  $\nabla(f(x, y)g(x, y)) = \langle f_x(x, y)g(x, y) + f(x, y)g_x(x, y), f_y(x, y)g(x, y) + f(x, y)g_y(x, y) \rangle$   
 $= g(x, y)\langle f_x(x, y), f_y(x, y) \rangle + f(x, y)\langle g_x(x, y), g_y(x, y) \rangle$   
 $= f(x, y)\nabla g(x, y) + g(x, y)\nabla f(x, y)$ .
73. Use three component vectors rather than two component vectors.

**Section 12.6**

- F, T, F, T, F, T, T, T.
- A critical point of  $f$  is a point at which either  $\nabla f = \mathbf{0}$  or  $\nabla f$  does not exist. The only place a function can have an extreme value at an interior point of its domain is at a critical point.
- A saddle point is a stationary point at which there is neither a maximum nor a minimum.
- The first derivative test for a function of a single variable requires that you check the sign of the first derivative to the left and right of a critical point. To use an analogous test for a function of two variables, we would have to check the sign of the directional derivative at infinitely many points encircling each critical point.
- If  $A$  and  $C$  have opposite signs then both terms  $AC$  and  $-B^2$  are negative, so their sum is negative.
- $g(x, y) = -f(x, y)$  from Exercise 10, so since  $f(x, y)$  has a minimum at the origin,  $g$  has a maximum at the origin.
- Plow through the algebra!
- Plow through the algebra!
- The distance from  $P$  to an arbitrary point on  $\mathcal{L}$  is given by

$$d(t) = \sqrt{(x_0 - x_1 + at)^2 + (y_0 - y_1 + bt)^2 + (z_0 - z_1 + ct)^2}$$

To find the distance from  $P$  to  $\mathcal{L}$  we may minimize the function  $d(t)$ .

- $f$  will have an absolute minimum at  $x = 0$  if  $n$  is even and an inflection point if  $n$  is odd. There are no other possibilities.
- $-4e^{4x}$
- $-\frac{3}{4}s^4e^t$
- $\cos^2 \theta \sin^2 \phi - \sin^2 \theta \cos^2 \phi$
- $\frac{14}{13}\sqrt{26}$
- $\frac{8}{13}$
- $f\left(-\frac{1}{2}, 0\right) = -\frac{31}{4}$  is the absolute minimum
- $f(-2, -1) = 33$ , local maximum;  $f(-2, 1) = 29$ , saddle;  $f(2, -1) = 1$ , saddle;  $f(2, 1) = -3$ , local minimum
- $f(0, 0) = 0$ , saddle;  $f(4, 4) = -64$ , local minimum
- $f\left(-\frac{3}{2}, -\frac{3}{2}\right) = -14$ , absolute minimum
- $f\left(\frac{1}{2}, \frac{1}{2}\right) = 6$ , local minimum
- Every point of the form  $(0, k\pi)$  where  $k \in \mathbb{Z}$  is a stationary point. They are all saddle points.
- There is a saddle point at every point of the form  $(0, k\pi)$  where  $k \in \mathbb{Z}$ .
- $f(0, 0) = 1$ , saddle
- $f(0, 0) = -1$ , local maximum
- $f$  has an absolute minimum at every point of the form  $(0, y)$  or  $(x, 0)$ .
- $f$  has saddle point at every point of the form  $(0, y)$ , a local minimum at every point of the form  $(x, 0)$  for  $x > 0$ , and a local maximum at every point of the form  $(x, 0)$  for  $x < 0$ .

- The box should have a square base measuring  $\frac{10}{9}\sqrt[3]{\frac{81}{5}}$  feet on each side and a height of  $\sqrt[3]{\frac{81}{5}}$  feet.

- By Theorem 12.36,  $D_{\mathbf{u}}f(x, y) = af_x(x, y) + bf_y(x, y)$ . Taking the directional derivative, again, we obtain  $D_{\mathbf{u}}(D_{\mathbf{u}}f(x, y)) = D_{\mathbf{u}}^2f(x, y) = D_{\mathbf{u}}(af_x(x, y) + bf_y(x, y)) = a^2f_{xx}(x, y) + abf_{yx}(x, y) + baf_{xy}(x, y) + b^2f_{yy}(x, y)$ . Since the function has continuous second-order partial derivatives, the mixed second-order partial derivatives are equal and we have the result.
- Let  $(x, y)$  be a point on the line. The distance from  $(x_0, y_0)$  to  $(x, y)$  is given by  $d = \sqrt{(x - x_0)^2 + (y - y_0)^2}$  and the square of the distance from  $(x_0, y_0)$  to  $(x, y)$  is given by  $D = (x - x_0)^2 + (y - y_0)^2$ . The gradients of these two functions are  $\nabla d = \frac{1}{2\sqrt{(x-x_0)^2 + (y-y_0)^2}}(2(x-x_0)\mathbf{i} + 2(y-y_0)\mathbf{j})$  and  $\nabla D = 2(x-x_0)\mathbf{i} + 2(y-y_0)\mathbf{j}$ . The critical points of these two functions are the same and would have the same minima.

## Section 12.7

1. F, F, T, F, F, F, F, T.
3. The function  $f$  represents the quantity we wish to maximize or minimize. The constraint equation provides an interrelationship between the variables of  $f$ .
5. We can either eliminate one of the variables by solving the constraint equation for one of the variables, or use the method of Lagrange multipliers.
7. (a)  $\{(x, y) | x > 0\}$ , (b)  $\{(x, y) | x \geq 0\}$ ,  
(c)  $\{(x, y) | x^2 + y^2 < 1\}$ ,  
(d)  $\{(x, y) | x^2 + y^2 \leq 1\}$
9. (a)  $\{(x, y, z) | x > 0\}$ , (b)  $\{(x, y, z) | x \geq 0\}$ ,  
(c)  $\{(x, y, z) | x^2 + y^2 + z^2 < 1\}$ , (d)  
 $\{(x, y, z) | x^2 + y^2 + z^2 \leq 1\}$
11. 4
13.  $f_{yy}(x, y) = 12$  and the discriminant of  $f$  is  $\det(H_f(x, y)) = 72(x + 3)$ . (a)  $\det(H_f(-6, 0)) < 0$  so there is a saddle point at  $(-6, 0)$ . (b)  $\det(H_f(0, 0)) > 0$  and  $f_{yy}(0, 0) > 0$  so there is a relative minimum at  $(0, 0)$ . (c) From Example 4 we already know (i) that  $f(0, 0) = 0$  is the absolute minimum of  $f$  on the region defined by  $x^2 + y^2 \leq 9$  and (ii) the point  $(0, 0)$  is an interior point to that region, so there is, at least, a relative minimum of  $f$  at the origin. Since  $f(-10, 0) = -100 < 0 = f(0, 0)$ , the minimum is only relative, not absolute.
15. When  $y = -x$  we are looking for the critical points of the function  $g(x) = -x^3$ . The only critical point of  $g$  is its inflection point at  $x = 0$ .
17. When  $y = -\frac{a}{b}x$  we are looking for the critical points of the function  $h(x) = -\frac{a}{b}x^3$ . The only critical point of  $h$  is its inflection point at  $x = 0$ .
19. Find the extrema of the function  $f$  using the techniques of Section 12.6. Choose only the critical points in  $\mathcal{R}$ . Evaluate  $f$  at the critical points. Use the results of Exercise 18 to find the extrema on the boundary of  $\mathcal{R}$ . Choose the largest and smallest values of the function in the interior of  $\mathcal{R}$  and on the boundary of  $\mathcal{R}$ .
21. Find the extrema of the function  $f$  using the techniques of Section 12.6. Choose only the critical points in  $\mathcal{T}$ . Evaluate  $f$  at the critical points. Use the results of Exercise 20 to find the extrema on the boundary of  $\mathcal{T}$ . Choose the largest and smallest values of the function in the interior of  $\mathcal{T}$  and on the boundary of  $\mathcal{T}$ .
23. The Extreme Value Theorem guarantees that a maximum and minimum of  $f$  occurs on  $\mathcal{R}$ . If the gradient exists everywhere and is never zero,  $f$  does not have any critical points, so the maximum and minimum must occur on the boundary of  $\mathcal{R}$ .
25.  $f\left(\frac{8\sqrt{5}}{5}, \frac{2\sqrt{5}}{5}\right) = 2\sqrt{5}$  is the maximum and  $f\left(-\frac{8\sqrt{5}}{5}, -\frac{2\sqrt{5}}{5}\right) = -2\sqrt{5}$  is the minimum. Both exist because the ellipse is a closed and bounded set.
27.  $f(2\sqrt{2}, \sqrt{2}) = f(-2\sqrt{2}, -\sqrt{2}) = 4$  is the maximum and  $f(2\sqrt{2}, -\sqrt{2}) = f(-2\sqrt{2}, \sqrt{2}) = -4$  is the minimum. Both exist because the ellipse is a closed and bounded set.
29.  $f\left(\frac{32}{\sqrt{21}}, \frac{8}{\sqrt{21}}, \frac{2}{\sqrt{21}}\right) = 2\sqrt{21}$  is the maximum and  $f\left(-\frac{32}{\sqrt{21}}, -\frac{8}{\sqrt{21}}, -\frac{2}{\sqrt{21}}\right) = -2\sqrt{21}$  is the minimum. Both exist because the ellipsoid is a closed and bounded set.
31. The maxima and minima occur at the eight points  $\left(\pm \frac{8}{\sqrt{3}}, \pm \frac{4}{\sqrt{3}}, \pm \frac{2}{\sqrt{3}}\right)$ . When an even number of the signs are negative the function has a maximum of  $\frac{64}{3\sqrt{3}}$ . When an odd number of the signs are negative the function has a minimum of  $-\frac{64}{3\sqrt{3}}$ . Both exist because the ellipsoid is a closed and bounded set.
33.  $(1, 0)$  and  $(0, 1)$
35.  $\left(\frac{1}{4}, \frac{1}{4}\right)$
37.  $(1, 0)$  and  $(0, 1)$
39.  $(1, 1, 1), (-1, -1, 1), (-1, 1, -1), (1, -1, -1)$
41.  $\left(\frac{ad}{a^2+b^2+c^2}, \frac{bd}{a^2+b^2+c^2}, \frac{cd}{a^2+b^2+c^2}\right)$
43.  $\left(-\frac{5}{7}, \frac{39}{7}, \frac{15}{7}\right)$
45. The maximum of 8 occurs at each corner of the square and the minimum is  $0 = f(0, 0)$ .
47. The maximum is  $1 = f(1, 0) = f(0, 1) = f(-1, 0)$ . The minimum is  $-1 = f(0, -1)$ .
49. The maximum is  $1 = f(1, 1)$ . The minimum is  $-1 = f(-1, 1)$ .
51.  $x = \frac{d}{3a}, y = \frac{d}{3b}, z = \frac{d}{3c}$
53.  $\left(\frac{6}{5}, \frac{12}{5}, \frac{6\sqrt{5}}{5}\right)$
55. The base should be a square  $5\sqrt[3]{2/5}$  feet on each side. The height should be  $\sqrt[3]{2/5}$  feet.
57. Maximize  $f(x, y) = xy$  subject to the constraint that  $g(x, y) = 2x + 2y - P = 0$ .
59. The distance is  $d = \sqrt{x^2 + y^2 + z^2}$  and the square of the distance is  $D = x^2 + y^2 + z^2$ ,  
 $\nabla D = \frac{x}{\sqrt{x^2 + y^2 + z^2}}\mathbf{i} + \frac{y}{\sqrt{x^2 + y^2 + z^2}}\mathbf{j} + \frac{z}{\sqrt{x^2 + y^2 + z^2}}\mathbf{k}$  and  $\nabla D = 2x\mathbf{i} + 2y\mathbf{j} + 2z\mathbf{k}$ . The system of equations  $\nabla D = \lambda \nabla g$  and  $\nabla D = \lambda \nabla g$  have the same solutions.
61. Rotating, scaling or translating the point and the circle does not change the essential geometry of the system, if  $P = (\alpha, \beta)$  is not the center of the circle  $(a, b)$ , the point closest to  $P$  on the circle will be on the line containing both  $P$  and  $(a, b)$ .
63. Rotating, scaling or translating the point and the sphere does not change the essential geometry of the system, if  $P = (\alpha, \beta, \gamma)$  is not the center of the sphere  $(a, b, c)$ , the point closest to  $P$  on the sphere will be on the line containing both  $P$  and  $(a, b, c)$ .

65. Let  $A > 0$ , use the method of Lagrange multipliers to show that the function  $f(x, y, z) = \sqrt[3]{xyz}$  has its maximum value when  $x = y = z = A$ , subject to the constraint equation  $g(x, y, z) = \frac{1}{3}(x + y + z) - A = 0$ .

Thus,  $\sqrt[3]{xyz} \leq \frac{1}{3}(x + y + z)$  when  $x, y$  and  $z$  are all positive.

For answers to odd-numbered Skill Certification exercises in the Chapter Review, please visit the Book Companion Web Site at [www.whfreeman.com/tkcalculus](http://www.whfreeman.com/tkcalculus).

## Chapter 13

### Section 13.1

- T, T, F, T, F, T, T, T.
- $\sum_{j=3}^4 \sum_{k=2}^4 j e^{k^2}$ .
- 176
- 3360
- A definite integral is the limit of a Riemann sum of function of a single variable  $f(x)$  over a closed interval  $[a, b]$  as the number of subintervals goes to  $\infty$ . A double integral is the limit of a double Riemann sum of function of a two variables  $f(x, y)$  over a rectangular region that has been subdivided into smaller subrectangles in both the  $x$  and  $y$  directions as the numbers of pieces in those two directions goes to  $\infty$ .
- For each subrectangle  $\mathcal{R}_{jk}$  choose  $(x_j^*, y_k^*) = \left( \frac{x_{j-1} + x_j}{2}, \frac{y_{k-1} + y_k}{2} \right)$ .
- See Theorem 13.7.
- To evaluate the integral first find an antiderivative for  $f$  with respect to  $y$ . You use the FTC to evaluate the inner integral by evaluating this function at  $d$  and  $c$  and evaluating the difference. The result will be the definite integral of a function of the single variable  $x$ . Use the FTC to evaluate this integral, if possible.
- 91
- The first step in the integration will be fine, but the resulting integral will be one without a simple antiderivative. Say you integrate first with respect to  $y$ . You will obtain  $\int_{\pi/4}^{\pi/2} \frac{1}{x} \left( \sin(\pi x) - \sin\left(\frac{\pi}{2}x\right) \right) dx$ . The function  $\frac{1}{x} \left( \sin(\pi x) - \sin\left(\frac{\pi}{2}x\right) \right)$  does *not* have a simple antiderivative.
- $\int_0^1 \int_0^1 \frac{x-y}{(x+y)^3} dy dx = \frac{\pi}{2}$  and  $\int_0^1 \int_0^1 \frac{x-y}{(x+y)^3} dx dy = -\frac{\pi}{2}$ . This does not violate Fubini's Theorem because the function is not continuous everywhere on the rectangle  $\mathcal{R} = \{(x, y) | 0 \leq x \leq 1 \text{ and } 0 \leq y \leq 1\}$ .
- 20
- 48

69. Approximately 64533.3 cubic feet

- The result follows from the commutative property of addition.
- By Fubini's Theorem
 
$$\iint_{\mathcal{R}} g(x)h(y) dA = \int_a^b \int_c^d g(x)h(y) dy dx = \int_a^b g(x) dx \int_c^d h(y) dy = \left( \int_a^b g(x) dx \right) \left( \int_c^d h(y) dy \right).$$
- Use the result of Exercise 73. The product  $(b-a)(d-c)$  is the area of rectangle  $\mathcal{R}$ .

### Section 13.2

- T, F, F, T, T, T, F, T.
- A type I region is bounded below by a function  $g_1(x)$ , above by a function  $g_2(x)$ , on the left by  $x = a$  and on the right by  $x = b$ , for constants  $a < b$ . A type II region is bounded on the left by a function  $h_1(y)$ , on the right by a function  $h_2(y)$ , above by  $y = d$  and below by  $y = c$ , for constants  $c < d$ .
- Correct
- Reverse  $dx$  and  $dy$ .
- Correct
- Correct
- As a type I region,  $\Omega$  is bounded below by the function  $y = \frac{1}{2}x$  and above by the function  $y = \sqrt{x}$  on the interval  $[a, b] = [0, 4]$ . As a type II region,  $\Omega$  is bounded below on the left by the function  $x = y^2$  and on the right by the function  $x = 2y$  on the interval  $[c, d] = [0, 2]$ .
- The area of  $\Omega = \int_a^b \int_{g_1(x)}^{g_2(x)} dy dx = \int_a^b [y]_{g_1(x)}^{g_2(x)} dx = \int_a^b (g_2(x) - g_1(x)) dx$ .
- $\frac{4}{3}$
- $\int_{-3}^0 \int_{-x^3}^0 dy dx + \int_0^3 \int_0^{x^3} dy dx = \int_{-27}^0 \int_{-3}^{\sqrt[3]{y}} dx dy + \int_0^3 \int_{\sqrt[3]{y}}^3 dx dy = 0$

21. (a)  $\int_0^1 \int_0^{e^x} f(x, y) dy dx,$

(b)  $\int_0^1 \int_0^1 f(x, y) dx dy + \int_1^e \int_{\ln y}^1 f(x, y) dx dy$

23. (a)  $\int_{-2}^2 \int_0^{\sqrt{4-x^2}} f(x, y) dy dx + \int_{-2}^0 \int_{-\sqrt{4-x^2}}^0 f(x, y) dy dx,$

(b)  $\int_{-2}^2 \int_{-\sqrt{4-y^2}}^0 f(x, y) dx dy + \int_0^2 \int_0^{\sqrt{4-y^2}} f(x, y) dx dy$

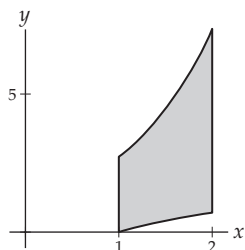

25. (a)  $\int_0^{\pi/4} \int_{\sin x}^{\cos x} f(x, y) dy dx,$

(b)  $\int_0^{\sqrt{2}/2} \int_0^{\sin^{-1} y} f(x, y) dx dy + \int_{\sqrt{2}/2}^1 \int_0^{\cos^{-1} y} f(x, y) dx dy$

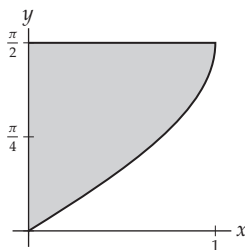

27. (a)  $\int_{-1}^0 \int_{-x-1}^{x+1} f(x, y) dy dx + \int_0^1 \int_{x-1}^{-x+1} f(x, y) dy dx,$

(b)  $\int_{-1}^0 \int_{-y-1}^{y+1} f(x, y) dx dy + \int_0^1 \int_{y-1}^{-y+1} f(x, y) dx dy$

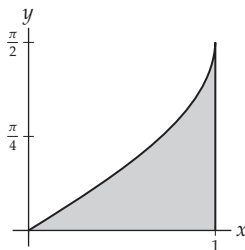

29.  $\int_0^1 \int_1^{e^y} f(x, y) dx dy + \int_1^e \int_1^2 f(x, y) dx dy + \int_e^{e^2} \int_{\ln y}^2 f(x, y) dx dy$

31.  $\int_0^1 \int_{\sin^{-1} x}^{\pi/2} f(x, y) dy dx$

33.  $\int_0^1 \int_0^{\sin^{-1} x} f(x, y) dy dx$

39. 0

41. 4

43.  $\frac{26}{3}$

45.  $\frac{2}{9}(56\sqrt{7} - 1)$ . The function  $\sqrt{1+x^3}$  does not have a simple antiderivative.

47. 1. The function  $\sec y$  has a simpler antiderivative when integrated with respect to  $x$  than it does when integrated with respect to  $y$ .

49.  $-\frac{927}{8}$

51.  $\frac{101027}{90}$

53.  $\frac{\pi}{8}$

55.  $\frac{1}{2}(e - 1)$

57. 2

59.  $\frac{1}{3}(e^8 - 1)$

61.  $\frac{3}{110}$

63. 200 cubic meters

65. Using the notation of Definition 13.4, the equality holds since  $\iint_{\mathcal{R}} \alpha f(x, y) dA = \lim_{\Delta \rightarrow 0} \sum_{j=1}^m \sum_{k=1}^n \alpha f(x_j^*, y_k^*) \Delta A =$

$$\alpha \lim_{\Delta \rightarrow 0} \sum_{k=1}^m \sum_{j=1}^n f(x_j^*, y_k^*) \Delta A = \alpha \iint_{\mathcal{R}} f(x, y) dA.$$

67. Let  $\mathcal{R} = \{(x, y) | a \leq x \leq b \text{ and } c \leq y \leq d\}$  be a rectangle containing  $\Omega$ . From Exercise 65,

$$\iint_{\mathcal{R}} \alpha F(x, y) dA = \alpha \iint_{\mathcal{R}} F(x, y) dA, \text{ where}$$

$F(x, y) = f(x, y)$  on  $\Omega$  and is zero everywhere else in  $\mathcal{R}$ .

Thus,  $\alpha F(x, y) = \alpha f(x, y)$  for every point in  $\Omega$  and is zero everywhere else in  $\mathcal{R}$ , also, so the statement holds.

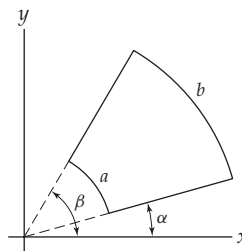

69. The volume is given by the integral

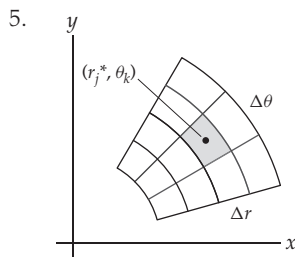

$$\int_0^a \int_0^{-b/ay+b} \left( c - \frac{c}{a}x - \frac{c}{b}y \right) dy dx = \frac{1}{6}abc.$$

### Section 13.3

1. T, T, F, F, F, F, T, T.

3. The values  $\theta = \alpha$ ,  $\theta = \beta$ ,  $r = a$  and  $r = b$  provide constant boundaries for the region.

7. In the rectangular coordinate system the integral represents the area between the graphs of  $f_1(\theta)$  and  $f_2(\theta)$  on the interval  $[\alpha, \beta]$ . In a polar system, the integral represents the volume of the solid bounded above by the function  $f(r, \theta) = \frac{1}{r}$  on the polar region bounded by the two functions between the rays  $\theta = \alpha$  and  $\theta = \beta$ .

9. Because the curve is traced twice on the interval  $[0, 2\pi]$ .

11. For any positive integer  $n$ , the integral represents the area of a sector of a circle whose central angle is  $\frac{2\pi}{n}$ . This area would be  $\frac{\pi R^2}{n}$ . The equation holds for every nonzero value of  $n$ .

13.  $2\pi \int_0^b xf(x) dx$

15.  $\int_{-b}^b \int_{-\sqrt{b^2-x^2}}^{\sqrt{b^2-x^2}} f(\sqrt{x^2+y^2}) dy dx$

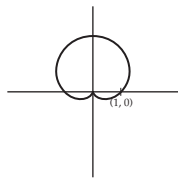

17. From Exercise 16 we have the integral

$$\int_0^{2\pi} \int_0^b rf(r) dr d\theta = \left( \int_0^{2\pi} d\theta \right) \left( \int_0^b rf(r) dr \right) =$$

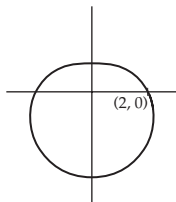

$$2\pi \int_0^b rf(r) dr, \text{ which equals the answer to Exercise 14.}$$

19.  $\int_0^{2\pi} \int_a^b rf(r) dr d\theta$

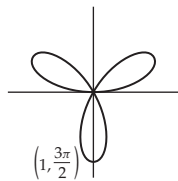

21.  $\frac{3\pi}{2}$

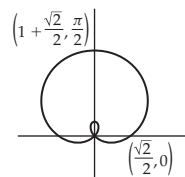

23.  $\frac{9\pi}{2}$

25.  $\frac{\pi}{4}$

27. The area between the inner and outer loops of the limaçon is  $\frac{3+\pi}{2}$

29.  $\int_0^\pi \int_0^\theta r dr d\theta = \frac{\pi^3}{6}$

31.  $2 \int_0^{3\pi/4} \int_0^{1+\sqrt{2}\cos\theta} r dr d\theta - 2 \int_\pi^{5\pi/4} \int_0^{1+\sqrt{2}\cos\theta} r dr d\theta =$

33.  $2 \int_{-\pi/2}^{\pi/6} \int_{1+\sin\theta}^{3-3\sin\theta} r dr d\theta = 8\pi + 9\sqrt{3}$

35.  $2 \int_0^{\pi/3} \int_{\sec\theta/2}^1 r dr d\theta = \frac{\pi}{3} - \frac{\sqrt{3}}{4}$

37.  $\int_0^{2\pi} \int_0^{1+k\sin\theta} r dr d\theta = \pi \left( 1 + \frac{k^2}{2} \right)$ . When  $k = 0$ , "the limaçon" is a circle with radius one.

39. A sphere of radius 4 centered at the origin,  $\frac{256}{3}\pi$ .

41. The portion of the hyperboloid  $z = 4 - r^2$  above the  $xy$ -plane,  $8\pi$ .

43. The portion of the cone  $z = 6 - 2r$  above the  $xy$ -plane,  $18\pi$ .

45. The cylinder formed by the outer loop of the limaçon  $r = \frac{\sqrt{2}}{2} + \sin\theta$  with height 1,  $\frac{3}{4}(1 + \pi)$ .

47.  $\int_0^{2\pi} \int_0^{2\sqrt{2}} (16 - 2r^2)r dr d\theta = 64\pi$

49.  $\int_0^{2\pi} \int_0^{\sqrt{2}/2R} (\sqrt{R^2 - r^2} - r)r dr d\theta = \frac{\pi R^3}{3}(2 - \sqrt{2})$

51.  $\int_0^{2\pi} \int_0^{4/5} \left( \sqrt{1 - r^2} - \frac{3}{5} \right) r dr d\theta = \frac{52}{375}\pi$

53.  $\int_0^{2\pi} \int_0^{\sqrt{3}/2} (2\sqrt{1 - r^2} - 1)r dr d\theta = \frac{5}{12}\pi$

55.  $\int_0^{2\pi} \int_0^h (h - r)r dr d\theta = \frac{1}{3}\pi h^3$

57.  $\frac{9\pi}{8}$

59.  $\frac{\pi}{4}e^{16}$

61. Approximately 14 wolves.

63.  $\int_0^\pi \int_0^{2R\cos\theta} r dr d\theta = \pi R^2$

65.  $2 \int_0^{2\pi} \int_0^R \sqrt{R^2 - r^2} r dr d\theta = \frac{4}{3}\pi R^3$

67.  $\int_0^\phi \int_0^R r dr d\theta = \frac{1}{2}\phi R^2$

69.  $\int_0^{2\pi} \int_0^{\cos 2n\theta} r dr d\theta = \frac{\pi}{2}$  for every positive integer  $n$

## Section 13.4

1. F, F, F, T, F, F, T, T.

3. The area of  $\Omega$ . The units are square centimeters.5. The coordinates of the centroid of  $\Omega$ . The units are centimeters.7. The first moments  $M_y$  and  $M_x$ . The units are grams-centimeters.9. The second moments  $I_y$  and  $I_x$ . The units are grams-square centimeters.11. The radii of gyration  $R_y$  and  $R_x$ . The units are centimeters.

$$13. \int_1^2 \int_{-x+2}^{2x-1} x \, dy \, dx = \int_1^2 [xy]_{-x+2}^{2x-1} dx = \int_1^2 (3x^2 - 3x) dx = \left[ x^3 - \frac{3}{2}x^2 \right]_1^2 = (8-6) - \left(1 - \frac{3}{2}\right) = \frac{5}{2}.$$

15. This is the same integral as in Exercise 13, with an extra factor of  $k$ .

$$17. \int_1^2 \int_{-x+2}^{2x-1} kxy \, dy \, dx = \frac{k}{2} \int_1^2 x [y^2]_{-x+2}^{2x-1} dx = \frac{k}{2} \int_1^2 (3x^3 - 3x) dx = \frac{k}{2} \left[ \frac{3}{4}x^4 - \frac{3}{2}x^2 \right]_1^2 = \frac{k}{2} \left( (12-6) - \left( \frac{3}{4} - \frac{3}{2} \right) \right) = \frac{27}{8}k.$$

$$19. \int_1^2 \int_{-x+2}^{2x-1} kxy^2 \, dy \, dx = \frac{k}{3} \int_1^2 x [y^3]_{-x+2}^{2x-1} dx = 3k \int_1^2 (x^4 - 2x^3 + 2x^2 - x) dx = 3k \left[ \frac{1}{5}x^5 - \frac{1}{2}x^4 + \frac{2}{3}x^3 - \frac{1}{2}x^2 \right]_1^2 = 3k \left( \left( \frac{32}{5} - 8 + \frac{16}{3} - 2 \right) - \left( \frac{1}{5} - \frac{1}{2} + \frac{2}{3} - \frac{1}{2} \right) \right) = \frac{28}{5}k.$$

$$21. I_y = \left( \frac{673}{175} \sqrt{2} - \frac{1}{5} \ln(\sqrt{2} + 1) \right) k,$$

$$I_x = \left( \frac{821}{2100} \sqrt{2} + \frac{1}{20} \ln(\sqrt{2} + 1) \right) k$$

$$23. \int_{\sec \theta}^{2 \cos \theta} kr^3 \cos \theta \, dr = \frac{k}{4} (16 \cos^5 \theta - \sec^3 \theta),$$

$$\int_{-\pi/4}^{\pi/4} \frac{k}{4} (16 \cos^5 \theta - \sec^3 \theta) \, d\theta = \frac{k}{60} (157\sqrt{2} + 15 \ln(\sqrt{2} - 1))$$

25.  $\frac{2}{3}k$ , where  $k$  is the constant of proportionality27.  $I_x = \frac{2}{15}k$ ,  $I_y = \frac{2}{5}k$ ,  $R_x = \frac{\sqrt{5}}{5}$ ,  $R_y = \frac{\sqrt{15}}{5}$ , where  $k$  is the constant of proportionality

29.  $\left(\frac{3}{4}, 0\right)$       31.  $\left(\frac{5}{3}, 0\right)$

33.  $\left(\frac{17}{10}, 0\right)$

35.  $\frac{17}{6}k$ , where  $k$  is the constant of proportionality37.  $I_x = \frac{49}{90}k$ ,  $I_y = \frac{43}{5}k$ ,  $R_x = 7\frac{\sqrt{255}}{255}$ ,  $R_y = \frac{\sqrt{21930}}{85}$ , where  $k$  is the constant of proportionality39.  $\frac{1}{2}kb^2h$ , where  $k$  is the constant of proportionality41.  $I_y = \frac{1}{4}kb^4h$ ,  $I_x = \frac{1}{6}kb^2h^3$ ,  $R_y = \frac{\sqrt{2}}{2}b$ ,  $R_x = \frac{\sqrt{3}}{3}h$ , where  $k$  is the constant of proportionality

43.  $\left(\frac{3}{4}b, \frac{1}{2}h\right)$

45.  $(0, 0)$

47.  $(0, 0)$

49.  $\frac{2}{3}\pi k$ , where  $k$  is the constant of proportionality

51.  $I_x = I_y = \frac{1}{5}k\pi$ ,  $I_o = \frac{2}{5}k\pi$ ;  $R_x = R_y = \frac{\sqrt{30}}{10}$ ;  $R_o = \frac{\sqrt{15}}{5}$ .

53.  $\frac{2}{3}k$ , where  $k$  is the constant of proportionality55.  $I_y = \frac{4}{15}k$ ,  $I_x = \frac{2}{15}k$ ,  $R_y = \frac{\sqrt{10}}{5}$ ,  $R_x = \frac{\sqrt{5}}{5}$ , where  $k$  is the constant of proportionality

57.  $\left(\frac{3}{2\pi}, 0\right)$

59. The masses of  $\Omega_1$  and  $\Omega_2$  may be treated as point masses located at  $(\bar{x}_1, \bar{y}_1)$  and  $(\bar{x}_2, \bar{y}_2)$ , respectively. The center of mass of this two-point system is given by  $\bar{x} = \frac{m_1\bar{x}_1 + m_2\bar{x}_2}{m_1 + m_2}$  and  $\bar{y} = \frac{m_1\bar{y}_1 + m_2\bar{y}_2}{m_1 + m_2}$ .

61.  $\left(\frac{5}{6}, \frac{5}{6}\right)$

63.  $\left( \frac{b_1^2h_2 + b_2^2h_1 - b_1b_2h_1}{2(b_1h_2 + b_2h_1 - b_1h_1)}, \frac{b_1h_2^2 + b_2h_1^2 - b_1h_1^2}{2(b_1h_2 + b_2h_1 - b_1h_1)} \right)$

65.  $\left(0, \frac{260}{57}\right)$

67.  $\left(0, \frac{15}{14}a\right)$

69. Approximately 1.79

71. We assume that  $0 < c < a$  and leave the case where  $0 < a \leq c$  to you. Using the result of Exercise 70 we have

$$\bar{x} = \frac{\int_0^c \int_0^{d/cx} x \, dy \, dx + \int_0^c \int_0^{d/c-a(x-a)} x \, dy \, dx}{ad/2} = \frac{a+c}{3}$$

and

$$\bar{y} = \frac{\int_0^c \int_0^{d/cx} y \, dy \, dx + \int_0^c \int_0^{d/c-a(x-a)} y \, dy \, dx}{ad/2} = \frac{d}{3}.$$

73. Use polar coordinates and the circle  $r = a$ , where  $a$  is a positive constant. The first moments are

$$M_x = \int_0^{2\pi} \int_0^a r^2 \cos \theta \, dr \, d\theta = 0 \text{ and}$$

$$M_y = \int_0^{2\pi} \int_0^a r^2 \sin \theta \, dr \, d\theta = 0. \text{ Therefore, the origin is the centroid of the circle.}$$

## Section 13.5

1. F, T, F, T, T, F, T, F.
3. The two summations contain the same summands, although the summands are rearranged. By the commutative and associative properties of addition, they are equal.
5. For each subsolid  $\mathcal{R}_{i,j,k}$  choose  $(x_i^*, y_j^*, z_k^*) = \left( \frac{x_{i-1} + x_i}{2}, \frac{y_{j-1} + y_j}{2}, \frac{z_{k-1} + z_k}{2} \right)$ .
7. A triple integral is the limit of a Riemann sum over a rectangular solid  $\mathcal{R}$  as the limit of the mesh of subdivisions of  $\mathcal{R}$  goes to zero. An iterated triple integral is the result of three consecutive integrations in the order specified by the placement of the variables of integration.

$$9. \int_a^b \int_{h_1(y)}^{h_2(y)} \int_{g_1(y,z)}^{g_2(y,z)} f(x, y, z) \, dx \, dz \, dy,$$

$$\int_a^b \int_{h_1(z)}^{h_2(z)} \int_{g_1(y,z)}^{g_2(y,z)} f(x, y, z) \, dx \, dy \, dz$$

$$11. \int_{-1}^3 \int_0^2 \int_2^7 \rho(x, y, z) \, dz \, dy \, dx,$$

$$\int_0^2 \int_{-1}^3 \int_2^7 \rho(x, y, z) \, dz \, dx \, dy,$$

$$\int_{-1}^3 \int_2^7 \int_0^2 \rho(x, y, z) \, dy \, dz \, dx,$$

$$\int_2^7 \int_{-1}^3 \int_0^2 \rho(x, y, z) \, dy \, dx \, dz,$$

$$\int_0^2 \int_2^7 \int_{-1}^3 \rho(x, y, z) \, dx \, dz \, dy,$$

$$\int_2^7 \int_0^2 \int_{-1}^3 \rho(x, y, z) \, dx \, dy \, dz$$

$$13. \int_0^2 \int_0^{4-2x} \int_0^{3-(3/2)x-(3/4)y} \rho(x, y, z) \, dz \, dy \, dx,$$

$$\int_0^4 \int_0^{2-(1/2)y} \int_0^{3-(3/2)x-(3/4)y} \rho(x, y, z) \, dz \, dx \, dy,$$

$$\int_0^2 \int_0^{3-(3/2)x} \int_0^{4-2x-(4/3)z} \rho(x, y, z) \, dy \, dz \, dx,$$

$$\int_0^3 \int_0^{2-(2/3)z} \int_0^{4-2x-(4/3)z} \rho(x, y, z) \, dy \, dx \, dz,$$

$$\int_0^4 \int_0^{4-(4/3)z} \int_0^{2-(1/2)y-(2/3)z} \rho(x, y, z) \, dx \, dz \, dy,$$

$$\int_0^3 \int_0^{3-(3/4)y} \int_0^{2-(1/2)y-(2/3)z} \rho(x, y, z) \, dx \, dy \, dz$$

$$15. \int_0^{-x-y+1} k(y^2 + z^2) \, dz$$

$$= k \left( y^2(-x-y+1) + \frac{1}{3}(-x-y+1)^3 \right),$$

$$\int_0^{-x+1} k \left( y^2(-x-y+1) + \frac{1}{3}(-x-y+1)^3 \right) \, dy$$

$$= \frac{k}{6}(x-1)^4, \int_0^1 \frac{k}{6}(x-1)^4 \, dx = \frac{k}{30}$$

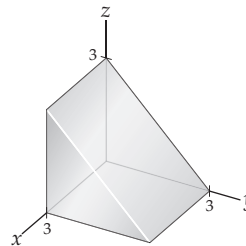

$$17. \int_0^{-x-y+1} k(x^2 + y^2) \, dz = k(-x+1)(x^2 + y^2),$$

$$\int_0^{-x+1} k(-x+1)(x^2 + y^2) \, dy =$$

$$\frac{k}{12}(7x^4 - 12x^3 + 12x^2 - 4x + 1),$$

$$\int_0^1 \frac{k}{12}(7x^4 - 12x^3 + 12x^2 - 4x + 1) \, dx = \frac{k}{30}$$

19. The volume of  $\Omega$ . The units are cubic centimeters.
21. The first moment  $M_{yz}$ . The units are grams-centimeters.
23. The moment of inertia about the  $y$ -axis,  $I_y$ . The units are grams-square centimeters.
25. 36
27.  $\frac{145}{48}$
29.  $\frac{1}{3} + \frac{\pi}{8}$
31. 162
33. 8
35. The rectangular solid given by  $\mathcal{R} = \{(x, y, z) \mid 2 \leq x \leq 6, 0 \leq y \leq 5 \text{ and } -2 \leq z \leq 4\}$ .
37. The "half-cube":

39. The tetrahedron with vertices  $(0, 0, 0)$ ,  $(2, 0, 0)$ ,  $(0, 3, 0)$  and  $(0, 0, 1)$ .
41. A sphere with radius 3 centered at the origin.
43. The region bounded on the right by the paraboloid  $x = 9 - y^2 - z^2$  and bounded on the left by the  $yz$ -plane.
45.  $\int_{-2}^4 \int_0^5 \int_2^6 f(x, y, z) \, dy \, dx \, dz$
47.  $\int_0^3 \int_0^{3-z} \int_0^3 f(x, y, z) \, dx \, dy \, dz$
49.  $\int_0^2 \int_0^{3-(3/2)x} \int_0^{1-(1/2)x-(1/3)y} f(x, y, z) \, dz \, dy \, dx$

51.  $\int_{-3}^3 \int_{-\sqrt{9-z^2}}^{\sqrt{9-z^2}} \int_{-\sqrt{9-x^2-z^2}}^{\sqrt{9-x^2-z^2}} f(x, y, z) \, dy \, dx \, dz$
53.  $3k$ , where  $k$  is the constant of proportionality
55.  $\frac{31412}{315}k$ , where  $k$  is the constant of proportionality
57. (a) The centroid of a rectangular box is its midpoint.  
 (b) For example,  $\bar{x} = \frac{\int_0^4 \int_0^3 \int_0^2 x \, dz \, dy \, dx}{\int_0^4 \int_0^3 \int_0^2 dz \, dy \, dx} = 2$ .
59. (a) Since the density is proportional to the distance from the  $xy$ -plane, the location of the  $x$ - and  $y$ -coordinates will be the same as in Exercise 57. (b)  $\bar{z} = \frac{4}{3}$
61. (a) The centroid of a rectangular box is its midpoint.  
 (b) For example,  $\bar{x} = \frac{\int_{a_1}^{a_2} \int_{b_1}^{b_2} \int_{c_1}^{c_2} x \, dz \, dy \, dx}{\int_{a_1}^{a_2} \int_{b_1}^{b_2} \int_{c_1}^{c_2} dz \, dy \, dx} = \frac{a_1 + a_2}{2}$ .
63. (a) Since the density is proportional to the distance from the  $yz$ -plane, the location of the  $y$ - and  $z$ -coordinates will be the same as in Exercise 61. (b)  $\bar{x} = \frac{2(a_2^3 - a_1^3)}{3(a_2^2 - a_1^2)}$
65. (a)  $\bar{x} = \frac{a}{4}$ . (b) The  $y$ -coordinate of the center of mass will also be one-fourth of the distance from the  $xz$ -plane to the point  $(0, b, 0)$ , i.e.,  $\bar{y} = \frac{b}{4}$ . Similarly,  $\bar{z} = \frac{c}{4}$ .
67. The mass of the tetrahedron is  $m = \int_0^a \int_0^{b-(b/a)x} \int_0^{c(1-(x/a)-(y/b))} ky \, dz \, dy \, dx$ , where  $k$  is a constant of proportionality. The center of mass is given by  $(\bar{x}, \bar{y}, \bar{z})$ , where
- $$\bar{x} = \frac{1}{m} \int_0^a \int_0^{b-(b/a)x} \int_0^{c(1-(x/a)-(y/b))} kxy \, dz \, dy \, dx,$$
- $$\bar{y} = \frac{1}{m} \int_0^a \int_0^{b-(b/a)x} \int_0^{c(1-(x/a)-(y/b))} ky^2 \, dz \, dy \, dx, \text{ and}$$
- $$\bar{z} = \frac{1}{m} \int_0^a \int_0^{b-(b/a)x} \int_0^{c(1-(x/a)-(y/b))} kyz \, dz \, dy \, dx.$$
69. By Fubini's Theorem  $\iiint_{\mathcal{R}} \alpha(x)\beta(y)\gamma(z) \, dV$
- $$= \int_{a_1}^{a_2} \int_{b_1}^{b_2} \int_{c_1}^{c_2} \alpha(x)\beta(y)\gamma(z) \, dz \, dy \, dx$$
- $$= \int_{a_1}^{a_2} \alpha(x) \int_{b_1}^{b_2} \beta(y) \int_{c_1}^{c_2} \gamma(z) \, dz \, dy \, dx$$
- $$= \left( \int_{a_1}^{a_2} \alpha(x) \, dx \right) \left( \int_{b_1}^{b_2} \beta(y) \, dy \right) \left( \int_{c_1}^{c_2} \gamma(z) \, dz \right).$$
71. Use the result of Exercise 69. The product  $(a_2 - a_1)(b_2 - b_1)(c_2 - c_1)$  is the volume of rectangular solid  $\mathcal{R}$ .
73. Using the notation of Definition 13.15, the equality holds since  $\iiint_{\mathcal{R}} (f(x, y, z) + g(x, y, z)) \, dV$
- $$= \lim_{\Delta \rightarrow 0} \sum_{i=1}^l \sum_{j=1}^m \sum_{k=1}^n \left( f(x_i^*, y_j^*, z_k^*) + g(x_i^*, y_j^*, z_k^*) \right) \Delta V$$
- $$= \lim_{\Delta \rightarrow 0} \sum_{i=1}^l \sum_{j=1}^m \sum_{k=1}^n f(x_i^*, y_j^*, z_k^*) \Delta V +$$
- $$\lim_{\Delta \rightarrow 0} \sum_{i=1}^l \sum_{j=1}^m \sum_{k=1}^n g(x_i^*, y_j^*, z_k^*) \Delta V$$
- $$= \iiint_{\mathcal{R}} f(x, y, z) \, dV + \iiint_{\mathcal{R}} g(x, y, z) \, dV.$$

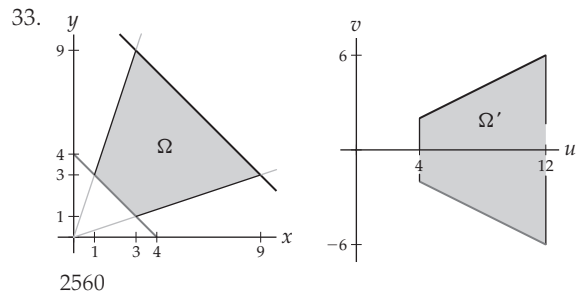

## Section 13.6

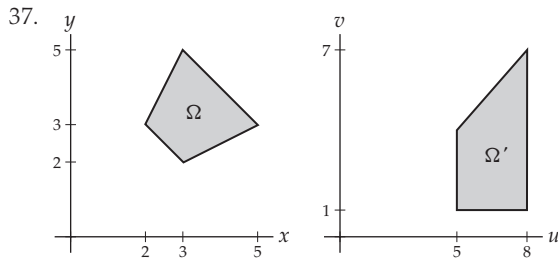

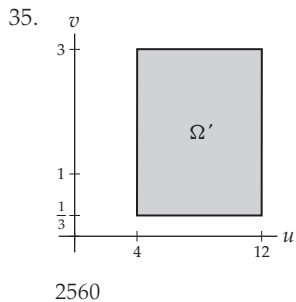

1. T, T, F, T, T, T, F, F.
3.  $x = x_0$  is a plane parallel to the  $yz$ -plane,  $y = y_0$  is a plane parallel to the  $xz$ -plane and  $z = z_0$  is a plane parallel to the  $xy$ -plane.
5.  $\rho = \rho_0$  is a sphere centered at the origin,  $\theta = \theta_0$  is a vertical half-plane starting at the  $z$ -axis, and  $\phi = \phi_0$  is a cone whose axis of symmetry is the  $z$ -axis.
7.  $r = \sqrt{x^2 + y^2}$ ,  $\theta = \tan^{-1}\left(\frac{y}{x}\right)$ ,  $z = z$ .
9.  $\rho = \sqrt{x^2 + y^2 + z^2}$ ,  $\theta = \tan^{-1}\left(\frac{y}{x}\right)$ ,  
 $\phi = \cos^{-1}\left(\frac{z}{\sqrt{x^2 + y^2 + z^2}}\right)$ .
11.  $\rho = \sqrt{r^2 + z^2}$ ,  $\theta = \theta$ ,  $\phi = \tan^{-1}\left(\frac{r}{z}\right)$ .
13.  $dx \, dy \, dz$ ,  $dx \, dz \, dy$ ,  $dy \, dx \, dz$ ,  $dy \, dz \, dx$ ,  $dz \, dx \, dy$ ,  $dz \, dy \, dx$ . You make your choice based on the shape of the region of integration.
15.  $\rho^2 \sin \phi \, d\rho \, d\theta \, d\phi$ . Since  $\rho$  is usually expressed as a function of  $\theta$  and  $\phi$ , this usually provides the simplest order of integration.
17. The region of integration  $\Omega$  usually determines the coordinate system you choose. You usually start with the coordinate system that provides the simplest expression for  $\Omega$ .
19.  $\int_0^{\pi/2} \int_0^{\pi/2} \int_0^1 k\rho^2 \sin \phi \, d\rho \, d\theta \, d\phi$   
 $= \frac{k}{3} \int_0^{\pi/2} \int_0^{\pi/2} \sin \phi \, d\theta \, d\phi = \frac{\pi k}{6} \int_0^{\pi/2} \sin \phi \, d\phi = \frac{\pi k}{6}$ .
21.  $M_{xz} = \int_0^{\pi/2} \int_0^{\pi/2} \int_0^1 k\rho^3 \sin^2 \phi \sin \theta \, d\rho \, d\theta \, d\phi$
23. Cylindrical  $(1, 0, 0)$ , spherical  $\left(1, 0, \frac{\pi}{2}\right)$
25. Rectangular  $(2\sqrt{3}, 6, 4)$ , spherical  $\left(8, \frac{\pi}{3}, \frac{\pi}{3}\right)$
27. Rectangular  $(0, 0, -8)$ , cylindrical  $(0, 0, -8)$
29. A plane parallel to the  $yz$ -plane, cylindrical  $r = 4 \sec \theta$ , spherical  $\rho = 4 \csc \phi \sec \theta$ .
31. A right circular cylinder centered on the  $z$ -axis, rectangular  $x^2 + y^2 = 4$ , spherical  $\rho = 2 \csc \phi$ .
33. The half of the  $yz$ -plane in which  $y \geq 0$ .
35. A sphere centered at the origin with radius 2, rectangular  $x^2 + y^2 + z^2 = 4$ , cylindrical  $r^2 + z^2 = 4$ .
37. The  $xy$ -plane, rectangular  $z = 0$ , cylindrical  $z = 0$ .
39. The region bounded below by the  $r\theta$ -plane and bounded above by the cone  $z = r$  on the circle with radius 3 centered at the origin.
41. The region inside the right circular cylinder with equation  $r = 2 \sin \theta$ , bounded below by the  $r\theta$ -plane and bounded above by the sphere with radius 4 centered at the origin.
43. The hemisphere below the  $xy$ -plane of the sphere with radius 2 centered at the origin.

45. The region inside the upward opening right circular cone that has the  $z$ -axis as its axis of symmetry, height 3, and base with radius 3.
47.  $\frac{48\pi - 64}{9}$                                       49.  $2\sqrt{3}\pi$
51.  $\frac{\pi}{32}$     53.  $\frac{16}{3}\pi$
55.  $\frac{2}{3}\pi R^3(1 - \cos \alpha)$ . If  $\alpha = 0$  the solid is "empty," so the volume should be zero. If  $\alpha = \pi$ , the solid is a sphere, so the volume should be  $\frac{4}{3}\pi R^3$ .
57.  $\frac{1920\pi - 3328}{225}k$ , where  $k$  is the constant of proportionality.
59.  $(x, y, z) = \left(0, 0, \frac{94}{15\sqrt{3} + 40\pi}\right)$ .
61.  $\frac{7\pi}{1024}k$ , where  $k$  is the constant of proportionality.
63.  $\frac{16\pi}{3}k$ , where  $k$  is the constant of proportionality.
65.  $x = y = 0, z = \frac{3}{8}R(\cos \alpha + 1)$ .
67. Approximately 31800 cubic feet
69. Since  $x = r \cos \theta = a$ , when we solve for  $r$  we have  $r = a \sec \theta$ .
71. Since  $x = \rho \sin \phi \cos \theta = a$ , when we solve for  $\rho$  we have  $\rho = a \csc \phi \sec \theta$ .
73.  $\int_0^{2\pi} \int_0^R \int_{hr/R}^h r \, dz \, dr \, d\theta = \int_0^{2\pi} \int_0^R \left(hr - \frac{h}{R}r^2\right) dr \, d\theta$   
 $= \int_0^{2\pi} \frac{1}{6}R^2h \, d\theta = \frac{1}{3}\pi R^2h$ .
75.  $\int_0^{\tan^{-1}(R/h)} \int_0^{2\pi} \int_0^{h \sec \phi} \rho^2 \sin \phi \, d\rho \, d\theta \, d\phi$   
 $= \int_0^{\tan^{-1}(R/h)} \int_0^{2\pi} \frac{1}{3}h^3 \frac{\sin \phi}{\cos^3 \phi} \, d\theta \, d\phi$   
 $= \int_0^{\tan^{-1}(R/h)} \frac{2}{3}\pi h^3 \frac{\sin \phi}{\cos^3 \phi} \, d\phi = \frac{1}{3}\pi R^2h$ .
13. It would not be particularly useful because it only translates the region and would not provide a simpler expression for the limits of integration.
15. It scales the region by a factor of  $a$  units horizontally and  $b$  units vertically. The rectangle is scaled to the rectangle in the  $uv$ -plane where  $0 \leq u \leq 3$  and  $0 \leq v \leq \frac{1}{2}$ .
17. If  $a < 0$ , in addition to a scaling factor, there is a reflection about the vertical axis, and if  $b < 0$  there is a reflection about the horizontal axis. The sign of the Jacobian changes if either  $a$  or  $b$  is negative, but it does not change if both are negative.
19.  $x = (\sin \theta)u + (\cos \theta)v$  and  $y = -(\cos \theta)u + (\sin \theta)v$ ,  $\frac{\partial(x,y)}{\partial(u,v)} = 1$ . The transformation rotates points about the origin. It does not change the area of the region, therefore the Jacobian should be, and is, 1.
21.  $\iint_{\Omega} \frac{1}{(x+y)^2} \, dA = \int_0^1 \int_{1-x}^{4-x} \frac{1}{(x+y)^2} \, dy \, dx + \int_1^4 \int_0^{4-x} \frac{1}{(x+y)^2} \, dy \, dx = \ln 4$
23.  $\text{Area}(\Omega) = \frac{15}{2}$  square units and  $\text{Area}(\Omega') = 15$  square units,  $\text{Area}(\Omega) = \frac{\partial(x,y)}{\partial(u,v)} \cdot \text{Area}(\Omega')$
25. The quotient  $\frac{u}{v} = xy \cdot \frac{x}{y} = x^2$ . Therefore,  $x = \sqrt{\frac{u}{v}}$ . Similarly the product  $uv = xy \cdot \frac{y}{x} = y^2$ . Therefore,  $y = \sqrt{uv}$ . So,  $\frac{\partial(x,y)}{\partial(u,v)} = \begin{bmatrix} \frac{1}{x} & \frac{1}{2}\sqrt{\frac{v}{u}} \\ -\frac{1}{2}\sqrt{\frac{u}{v^3}} & \frac{1}{2}\sqrt{\frac{u}{v}} \end{bmatrix} = \frac{1}{2v}$ .
27. The rectangle with vertices  $(0, 0)$ ,  $(2, 2)$ ,  $(1, 3)$  and  $(-1, 1)$ ;  $\frac{\partial(x,y)}{\partial(u,v)} = 2$ .
29. The region in the first quadrant bounded by the hyperbolas with equations  $y = \frac{1}{x}$  and  $y = \frac{4}{x}$  and lines  $y = x$  and  $y = 9x$ ,  $\frac{\partial(x,y)}{\partial(u,v)} = \frac{2u}{v}$ .
31. The right half of the circle with radius two centered at the origin,  $\frac{\partial(x,y)}{\partial(u,v)} = -u$ .

### Section 13.7

1. T, T, T, T, T, F, T, F.
3. It is a scaling factor. For example, in the simplest case when the Jacobian is a constant,  $k$ , the area of the domain set  $\Omega$  is  $k$  times the area of the target set  $\Omega'$ .
5.  $\int_0^1 \int_{-y+1}^{y+1} x^2 y \, dx \, dy + \int_1^2 \int_{y-1}^{y+1} x^2 y \, dx \, dy + \int_2^3 \int_{y-1}^{5-y} x^2 y \, dx \, dy = \frac{4}{5} + \frac{17}{2} + \frac{97}{10} = 19$ .
7.  $x = \frac{u+v}{2}, y = \frac{u-v}{2}, \frac{\partial(x,y)}{\partial(u,v)} = -\frac{1}{2}$
9.  $\frac{1}{16} \int_1^5 \int_{-1}^1 (u+v)^2 (u-v) \, dv \, du = 19$
11. It translates the region  $a$  units horizontally and  $b$  units vertically. The rectangle is translated to the rectangle in the  $uv$ -plane where  $3 \leq u \leq 4$  and  $4 \leq v \leq 6$ .

$\frac{399}{8}$

39.  $\frac{81}{2}$

41.  $\frac{21}{2} \ln 2$

43.  $\frac{160}{3} + 6552 \ln 3$

45.  $\frac{15}{8}$

47.  $\frac{5}{64}$

49. 1100 cubic feet.

51.  $\frac{\partial(x,y,z)}{\partial(r,\theta,z)} = \det \begin{bmatrix} \cos \theta & \sin \theta & 0 \\ -r \sin \theta & r \cos \theta & 0 \\ 0 & 0 & 1 \end{bmatrix} = r.$

53. Using the transformation in the equation  $ax + by = c$  we obtain  $(a\alpha + b\gamma)u + (a\beta + b\delta)v = c$ , which is a linear equation, if the coefficients of  $u$  and  $v$  are not both zero. This is the case when the Jacobian is nonzero.

55.  $u = \frac{1}{\alpha\delta - \beta\gamma}(\delta x - \beta y)$  and  $v = \frac{1}{\alpha\delta - \beta\gamma}(-\gamma x + \alpha y)$

57. Use the transformation given by  $x = au$  and  $y = bv$ . You will transform the equation to the equation of the unit circle centered at the origin.

59. Show that  $\det \begin{bmatrix} \frac{\partial x}{\partial u} & \frac{\partial y}{\partial u} \\ \frac{\partial x}{\partial v} & \frac{\partial y}{\partial v} \end{bmatrix} \det \begin{bmatrix} \frac{\partial u}{\partial s} & \frac{\partial v}{\partial s} \\ \frac{\partial u}{\partial t} & \frac{\partial v}{\partial t} \end{bmatrix} =$

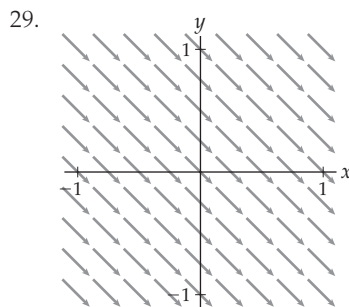

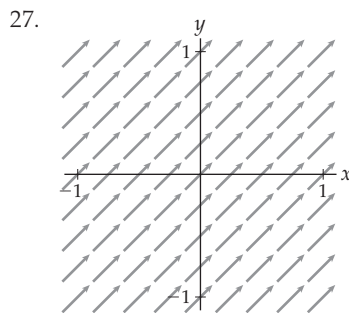

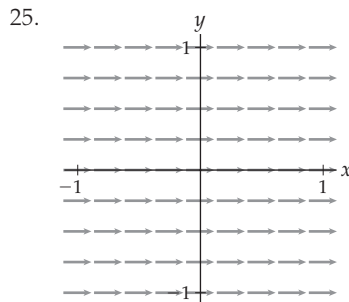

$\det \begin{bmatrix} \frac{\partial x}{\partial u} \frac{\partial u}{\partial s} + \frac{\partial x}{\partial v} \frac{\partial v}{\partial s} & \frac{\partial y}{\partial u} \frac{\partial u}{\partial s} + \frac{\partial y}{\partial v} \frac{\partial v}{\partial s} \\ \frac{\partial x}{\partial u} \frac{\partial u}{\partial t} + \frac{\partial x}{\partial v} \frac{\partial v}{\partial t} & \frac{\partial y}{\partial u} \frac{\partial u}{\partial t} + \frac{\partial y}{\partial v} \frac{\partial v}{\partial t} \end{bmatrix}.$

## Chapter 14

### Section 14.1

1. F, T, F, T, T, F, F, T
3. A vector field in the Cartesian plane, or  $\mathbb{R}^2$ , has domain  $D \subseteq \mathbb{R}^2$ .
5. Vectors in the Cartesian plane.
7. A vector field  $\mathbf{F}$  is conservative if it is the gradient of some function  $f$ .
9. For every point  $(x, y) \in \mathbb{R}^2$ ,  $\mathbf{F}(x, y)$  and  $\mathbf{G}(x, y)$  are parallel; only for  $(0, 0)$  are they the same vector.
11. For every point  $(x, y) \in \mathbb{R}^2$ ,  $\mathbf{F}(x, y) = -\mathbf{G}(x, y)$ ; at  $(0, 0)$  they the same vector.
13.  $\mathbf{G}(x, y, z) = (2yz, 2xz, 2xy)$
15. Let  $\mathbf{F}(x, y) = (f_1(x, y), f_2(x, y))$ . If  $f_{1,y} \neq f_{2,x}$ , then  $\mathbf{F}$  is not conservative.
17.  $f(x, y) = x^3 \cos y$
19.  $g(x, y) = x^5 + xy - 3y^4$
21.  $f(x, y, z) = xyz$
23.  $g(x, y, z) = x \cos y + y \sin z$

31.

33.  $\frac{\partial}{\partial y}(xy) = y \neq \frac{\partial}{\partial x}(-y) = 0$

35.  $\frac{\partial}{\partial y}\left(\frac{1}{x^2+y}\right) = -(x^2+y)^{-2} \neq \frac{\partial}{\partial x}\left(\frac{y}{x}\right) = \frac{-y}{x^2}$

37.  $\frac{\partial}{\partial z}(-z) = -1 \neq \frac{\partial}{\partial y}(e^{yz}) = ze^{yz}$

39.  $\frac{\partial}{\partial z}(yz) = y \neq \frac{\partial}{\partial y}(z+12)$

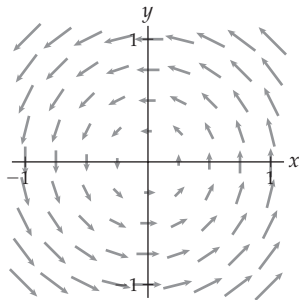

41. Not conservative

43.  $g(x, y) = x^2 + \sin(xy) - y$

45.  $f(x, y, z) = xy e^{2z} + x$

47. Not conservative

49. (a) Since the fluid is moving at a constant rate,  $\mathbf{F}(x, y)$  should have a constant magnitude. Since the motion is horizontal only, there is no  $\mathbf{j}$  component to the field. Since the motion is in the negative  $\mathbf{i}$  direction, a reasonable field is  $\mathbf{F}(x, y) = -\alpha\mathbf{i}$ , for any positive constant  $\alpha$ . (b)  $\mathbf{F}(x, y) = \langle -\alpha, -\alpha \rangle$ , for any real number  $\alpha > 0$ . (c)  $\mathbf{G}(x, y) = -y\mathbf{i} + x\mathbf{j}$

(c)

51. (b) It is conservative. Potential functions have the form  $Q(x, y) = 0.9x - \frac{x^3}{3} + \frac{1}{2}xy^2 + k$ . This function represents, in some sense, the amount of water that needs to get through a passage, or if you prefer, the pressure of the water that must pass through. (c) There are points of land due north and due south of this channel, forcing the water through a relatively narrower passage.
53. Suppose that  $f(x, y)$  and  $g(x, y)$  satisfy  $\nabla f(x, y) = \nabla g(x, y)$ . Then

$$f(x, y) = \int f_x(x, y) dx + B_f + \alpha_f$$

and  $g(x, y) = \int g_x(x, y) dx + B_g + \alpha_g$ , where  $B_f$  is the integral with respect to  $y$  of all the terms in  $f_y(x, y)$  that do not involve an  $x$  term,  $B_g$  is the integral with respect to  $y$  of all the terms in  $g_y(x, y)$  that do not involve an  $x$  term, and  $\alpha_f, \alpha_g$  are arbitrary constants. Since  $g_y(x, y) = f_y(x, y)$ ,  $B_f = B_g$ , and  $f(x, y) = g(x, y) + \alpha$ .

## Section 14.2

1. T, F, T, T, F, T, F, F

3.  $\int_a^b e^{t^2} \sqrt{1+4t^2+16t^6} dt$

5.  $\mathbf{F}(x, y) = (x+y)\mathbf{i} + xy\mathbf{j}$

7.  $\mathbf{F}(x, y, z) = \langle xy^2, xy-z, \cos y \rangle$

9.  $\int_C \mathbf{F}(x, y) \cdot d\mathbf{r} = \int_C (-y) dx + x dy$

11.  $ds = \|\mathbf{r}'(t)\| dt$

13.  $\int_a^b (4t^2 e^t + 2te^t - e^{2t}) dt$

15.  $\mathbf{r}(t) = \cos t \mathbf{i} + \sin t \mathbf{j}, 0 \leq t \leq 2\pi$

17.  $\mathbf{r}(t) = \langle 2 \cos t, t, 2 \sin t \rangle, 0 \leq t \leq 4\pi$

19.  $f_{\text{avg}}(C) = \frac{\int_C f(x, y, z) ds}{\int_C ds}$

21.  $\frac{1}{12}(17^{3/2} - 1)$

23.  $\mathbf{r}(t) = \langle \cos t, \sin t \rangle, 0 \leq t \leq 2\pi; \|\mathbf{r}(t)\| = 1,$   
 $\int_C f(x, y) ds = 2\pi.$

25.  $\mathbf{r}(t) = \langle t, 2t, 3t \rangle, 0 \leq t \leq 1$ . Then

$$\int_C f ds = \sqrt{14} \int_0^1 e^{6t} dt = \frac{\sqrt{14}(e^6 - 1)}{6}.$$

27.  $\sqrt{2}e(e^\pi - 1)$

29.  $\mathbf{r}(t) = \langle t, t^2 + 1 \rangle, \mathbf{r}'(t) = \langle 1, 2t \rangle,$

$$\int_C \mathbf{F}(x, y) \cdot d\mathbf{r} = \int_5^{10} (1 - 2t) dt = -70$$

31. 70

33. 0 since  $\mathbf{F}(x, y)$  is conservative and  $C$  is closed.35.  $\pi$ 

37.  $\ln \pi - \pi - 1$

39.  $\mathbf{F}$  is not conservative:  $\frac{\partial f_1}{\partial z} = -1 \neq 1 = \frac{\partial f_3}{\partial x}$

41.  $3^{32} - 1, \mathbf{F}(x, y, z) = \nabla(z^{xy})$ ; the integral is path independent.

43.  $\mathbf{F}$  is not conservative:  $\frac{\partial f_2}{\partial z} = 0 \neq 1 = \frac{\partial f_3}{\partial y}$

45.  $\frac{7}{3}\pi^3$

47.  $\|\mathbf{r}'(t)\| = \|\langle \sin t + t \cos t, \cos t - t \sin t \rangle\| = \sqrt{1+t^2},$   
 $\int_C f(x, y) ds = \frac{1}{3}((16\pi)^{3/2} - 1)$

49.  $\mathbf{F}(x, y, z) = \nabla f(x, y, z)$ , where  $f(x, y, z) = e^{xyz} + 2x - y$ . The intersection of the surfaces is an ellipse, in particular a closed curve. So the integral is zero.

51.  $4\pi$

53. 112

55.  $-2\pi$

57.  $\frac{1}{3}(\ln 2)^3 + \ln 2 - \frac{31}{24}e^{-3}$

59.  $\frac{\pi^2}{12}$

61.  $2\pi e$

63. (a) No; (b) 0; (c) It is a measure of how much the current helps or hurts Annie's progress.

65. Suppose that  $\mathbf{F}(x, y, z)$  is a conservative vector field. Then  $\mathbf{F}(x, y, z) = \nabla f(x, y, z)$  for some  $f(x, y, z)$ . Let  $\mathbf{r}(t)$ ,  $a \leq t \leq b$  be a smooth parametrization of  $C$ . By the Fundamental Theorem of Line Integrals,

$$\int_C \mathbf{F}(x, y, z) \cdot d\mathbf{r}$$

$= f(x(b), y(b), z(b)) - f(x(a), y(a), z(a))$ , which depends only on the endpoints of  $C$  and not on  $C$  itself.

### Section 14.3

- F, T, T, T, F, T, F, T.
- Surface integrals of multivariate functions only need to account for the distortion of the surface's area compared to a comparable region in the parameter plane ( $xy$  or  $uv$ ); surface integrals of vector fields need to account for the action of  $\mathbf{F}(x, y, z)$  through the surface, that is, in the normal direction.
- $dS = \sqrt{\frac{a^2 + b^2 + c^2}{c^2}}$
- $\mathbf{r}(x, y) = \langle x, y, \sqrt{1 - x^2 - y^2} \rangle$ .
- $\mathbf{r}(u, v) = \langle k \cos u \cos v, k \sin u \cos v, k \sin v \rangle$ ,  $0 \leq u \leq 2\pi$ ,  $0 \leq v \leq \pi$ .
- $\mathbf{n} = -f_x \mathbf{i} - f_y \mathbf{j} + \mathbf{k}$       13.  $\mathbf{n} = 2t\mathbf{i} - \mathbf{j}$
- $f_{\text{avg}}(S) = \frac{\int_S f(x, y, z) dS}{\int_S 1 dS}$
- $\|\mathbf{r}_u \times \mathbf{r}_v\|$  is the area of the parallelogram with sides  $\mathbf{r}_u$  and  $\mathbf{r}_v$ ; the area of this parallelogram approximates the area of the portion of the tangent plane used to approximate the area of  $S$ ; in the limit, the analogy is exact.
- $\mathbf{n} = \mathbf{i} - f_y \mathbf{j} - f_z \mathbf{k}$       21.  $12\sqrt{2}$
- $\frac{19\pi}{6}$       25.  $2\sqrt{6}$
- $\pi - \frac{\pi}{e}$       29. 0
- $4e^2 + 14$       33.  $\frac{20}{21}\sqrt{3}$
- $-\frac{12}{5}$       37.  $240\pi$
- $\mathbf{n} = \langle 2, -8, -10 \rangle$ ;  $\int_S \mathbf{F} \cdot \mathbf{n} dS = -2 \int_{\pi}^0 \int_0^1 4z \cos yz + 5z \sin yz dA = -20\pi$ .
- 0
- $\int_S 1 dS = \int_0^3 \int_0^{2x} 2\sqrt{x^2 + 1} dy dx = \frac{4}{3}(10^{3/2} - 1)$ .
- $\frac{61}{324} + \frac{2^{-2/3}}{\ln 2} - \frac{1}{2\ln 2}$       47.  $-832\pi$
- $\frac{k\pi}{6}(17^{3/2} - 1)$       51.  $3\pi$
- $\frac{596(37^{3/2} + 48)}{5(37^{3/2} - 5)}$       55. 0.0643 square miles
- Reversing the orientation of  $S$  means substituting  $-\mathbf{n}$  for  $\mathbf{n}$ . Factoring  $-1$  out of the integral gives the desired result.

59. In both cases, the surface area is  $\int 1 dS$  with limits determined by  $R$ . Computing  $dS$  for each surface, we see that they are equal. ( $dS = \sqrt{4x^2 + 4y^2 + 1}$ )

### Section 14.4

- F, F, T, T, T, T, F, F.
- The terms in the integrand are the mixed partial derivatives of the component functions of the vector field.
- Work done by  $\mathbf{F}$  moving a particle along  $C$ , flux perpendicular to  $C$ .
- Setting  $G(x, y) = \frac{\partial f_2}{\partial x} - \frac{\partial f_1}{\partial y}$ , allows the use of Green's Theorem to evaluate the integral.
- At the point  $(x, y, z)$ ,  $\text{div } \mathbf{F}$  will be negative.
- At the point  $(x, y, z)$ ,  $\text{div } \mathbf{F}$  will be positive.
- $-\iint_R (\sin x \sin y + x^2 e^y) dA$ , where  $R$  is the unit circle
- $-\sin x \sin y - x^2 e^y$       17.  $2xy + x \sin y$
- 0
- $\frac{y}{\sqrt{1-(xy)^2}} + \frac{1}{y+z} - \frac{5}{(2x+3y+5z+1)^2}$
- $-\left(\frac{3}{(2x+3y+5z+1)^2} + \frac{1}{y+z}\right)\mathbf{i} + \left(\frac{2}{(2x+3y+5z+1)^2}\right)\mathbf{j} - \frac{x}{\sqrt{1-x^2y^2}}\mathbf{k}$
- $(xz e^{xy} - xy e^{xz}, xy e^{yz} - yz e^{xy}, yz e^{xz} - xz e^{yz})$
- $(\cos(x-y) + \sin(x+y))\mathbf{k}$
- Using Green's Theorem we have  $\int_0^{2\pi} \int_0^1 4r^3 dr d\theta = 2\pi$ .
- $-\frac{32}{3}$       33.  $\frac{1}{4}(e^2 - 2e + 3)$
0. Note that  $\mathbf{F}$  is not conservative, so this is not the result of applying the Fundamental Theorem of Line Integrals.
- $\frac{1}{2}$       39. 16
- $4 - 2e + (e^2 - 1)(\ln 2 - 1)$       43.  $\frac{1}{\ln 2} - \frac{1}{e+1}$
- 0
- Work is given by  $\int_C \mathbf{F} \cdot d\mathbf{r}$ . Using Green's Theorem to evaluate the integral, we have  $W = -2\pi$ .
- $\mathbf{F}$  is conservative, so  $W = 0$ .
- (a) 0; (c) They tell us that there is no creation of water inside the passage. The water flowing in and out is balanced.

53. (a) Since speed increases as we move left among the lanes, we can say that  $\frac{\partial v_2}{\partial x} < 0$ , while the fact that  $v_1 \equiv 0$  means that  $\frac{\partial v_1}{\partial y} = 0$ . This means that the curl is always negative – the traffic tends to have a rotation to it. If the curl is low, it means all lanes are running nearly the same speed, but if it is high, then the variation in speeds among the lanes is high. Generally, low curl is safer. (b) The curl in this case is  $-\alpha$ , so the area integral on the right is approximately  $-0.00568\alpha$ . The curve integral on the left divides into four segments. Since  $d\mathbf{r}$  goes in opposite directions on the top and bottom and the speeds are the same there, those segments cancel. The integral on the left segment is  $\int_{0.5}^0 75 \, dy$ , while that on the right is  $\int_0^{0.5} (75 - 0.0113\alpha) \, dy$ . Thus the integral on the left is  $\int_0^{0.5} -0.0113\alpha$ , which ends up the same as the other side. (c) These describe the average curl for the traffic flow on this stretch of road, i.e., the circulation of traffic on this stretch. The higher the number, the less safe the road. The curve integral is what engineers would be able to compute using road tubes they put down to measure the number and speed of passing cars. In other words, they could put road tubes along  $y = 0$  and  $y = 0.5$  to compute the curve integral.
55. Directly computing  $\operatorname{div} \operatorname{curl} \mathbf{F}$ , we find that  $\operatorname{div} \operatorname{curl} \mathbf{F}$  is

$$\frac{\partial^2 F_3}{\partial x \partial y} - \frac{\partial^2 F_2}{\partial x \partial z} + \frac{\partial^2 F_1}{\partial y \partial z} - \frac{\partial^2 F_3}{\partial y \partial x} + \frac{\partial^2 F_2}{\partial z \partial x} - \frac{\partial^2 F_1}{\partial z \partial y} = 0.$$

57. If  $\mathbf{F}$  is a conservative vector field, then by the Fundamental Theorem of Line Integrals,  $\int_C \mathbf{F} \cdot d\mathbf{r} = 0$  for any closed simple smooth or piecewise-smooth curve. By Green's Theorem, we have

$$\iint_R \left( \frac{\partial F_2}{\partial x} - \frac{\partial F_1}{\partial y} \right) dA = \int_C \mathbf{F} \cdot d\mathbf{r} = 0$$

### Section 14.5

1.  $F, T, F, F, T, T, T, T$ .
3.  $\left\langle -\frac{\partial g}{\partial x}, -\frac{\partial g}{\partial y}, 1 \right\rangle$  and  $\left\langle \frac{\partial g}{\partial x}, \frac{\partial g}{\partial y}, -1 \right\rangle$
5. By Stokes' Theorem, both integrals are equivalent to  $\int_C \mathbf{F}(x, y, z) \cdot d\mathbf{r}$ . So they are equal to each other.
7.  $SA = \int_C \mathbf{F}(x, y, z) \cdot d\mathbf{r}$
9. The orientation of  $\mathcal{S}$  determines the direction of travel along  $C$ ; in Stokes' Theorem,  $C$  is traversed counterclockwise with respect to  $n$ . If the orientation is reversed, the integrals will change sign.
11. Any conservative vector field will have  $\int_C \mathbf{F} \cdot d\mathbf{r} = 0$ , so any conservative vector field is an example of this.
13. Both notations refer to area. In the case of Green's Theorem,  $dA$  refers to ordinary area. In the case of Stokes' Theorem,  $dS$  keeps track of any distortion to the area of the surface  $\mathcal{S}$  caused by transforming a patch of the  $uv$ -plane to parametrize  $\mathcal{S}$ .

15. Answers will vary. When the line integral has a piecewise-continuous boundary that requires the evaluation of several smooth pieces, but by using the right-hand side of Stokes' Theorem, we can obtain the same result with a single area integral.
17. Answers will vary. If a surface for an intended application of Stokes' Theorem is not smooth or piecewise smooth, there is no guarantee that the incremental application of Green's Theorem in the tangent planes is accurate, or even well defined.
19.  $\frac{35}{12}$
21. 0
23.  $\frac{1}{12}$
25.  $\frac{16\pi}{81}$
27.  $\frac{320}{3}$
29.  $8\pi$
31.  $36\pi$
33.  $\mathbf{F}$  is not defined on the  $z$ -axis.
35.  $\mathcal{S}$  is not smooth; in particular,  $\mathbf{n}$  is not well-defined at the cone point,  $(0, 0, 0)$ .
37. This vector field is conservative, so  $\int_C \mathbf{F} \cdot d\mathbf{r} = 0$ .
39.  $\operatorname{curl} \mathbf{F} = \mathbf{0}$
41.  $\operatorname{curl} \mathbf{F} = \mathbf{0}$
43.  $-60\pi$

45. (a) 0; (b)  $r = r(\theta) = \langle x(\theta), y(\theta) \rangle = \langle \cos \theta, \sin \theta \rangle$ . Thus on  $\partial R$  we have  $\mathbf{F} = \langle 0, 1.152 - 0.8 \cos^2 \theta \rangle$  and  $d\mathbf{r} = \frac{d}{d\theta} \langle \cos \theta, \sin \theta \rangle d\theta = \langle -\sin \theta, \cos \theta \rangle d\theta$ , hence  $\int_{\partial R} \mathbf{F} \cdot d\mathbf{r} = \int_0^{2\pi} (1.152 - 0.9 \cos^2 \theta) \cos \theta \, d\theta = 0$ ; (c) They tell us that there is no net circulation of water in this zone.
47. Using Stokes' Theorem to compute the integral gives  $\mathbf{n} = \pm \mathbf{k}$ , depending on the direction in which  $C$  is traversed. The  $\mathbf{k}$  component of  $\operatorname{curl} \mathbf{F}$  does not depend on  $F_3$ , so  $\int_C \mathbf{F} \cdot d\mathbf{r}$  does not depend on  $F_3$ .
49. Since  $\mathbf{n} = \pm \langle a, b, c \rangle$  on all of the surface, and the partial derivatives of  $F_1, F_2, F_3$  are all constants,  $\operatorname{curl} \mathbf{F} \cdot \mathbf{n} \, dS$  will be some constant  $r$ . Then  $\int_C \mathbf{F} \cdot d\mathbf{r} = r \iint_S dA$ , which depends only on area.
51. This is a direct consequence of Stokes' Theorem. By the theorem, both sides of the equation are equal to  $\int_C \mathbf{F}(x, y, z) \cdot d\mathbf{r}$ .

### Section 14.6

1.  $T, T, F, T, F, F, T, T$ .
3. No. Such surfaces have no interior (or infinite interior).
5. On the surface of the paraboloid, there is always a well-defined choice of normal vector; intuitively speaking, the graph has no sharp corners. The rectangular solid, however, is (piecewise) comprised of smooth planes, but the intersections of these planes form sharp corners on the surface, which do not have well-defined normal vectors.
7. (a) positive (b) zero
9.  $f_{xx} + f_{yy} + f_{zz}$
11.  $G(x, y, z) = 3i - 4j + 57k$
13.  $\langle x + yz, y + 2xz, z + xy \rangle$

15. Not possible:  $S$  is neither smooth nor piecewise-smooth.
17. Not possible:  $\mathbf{F}(x, y, z)$  is not defined throughout the region enclosed by  $\mathcal{S}$ .
19. Possible: this integral satisfies the conditions of the Divergence Theorem.
21.  $\operatorname{div} \mathbf{F} = 3$                       23.  $\operatorname{div} \mathbf{F} = 3e^{xyz} + 3xyz e^{xyz}$
25.  $3\pi^7$                                 27. 0
29.  $12\pi$                                 31. 0
33.  $\frac{21\pi}{2}$                                 35.  $675\pi$
37.  $36\pi e$                             39.  $\frac{8}{3}$
41.  $18(e^5 + \ln 5 - e) + 4320$     43. 16
45. (a) 0; (b)  $\int_{\partial R} \mathbf{F} \cdot \mathbf{n} \, dS = \int_0^{2\pi} (1.152 - 0.9 \cos^2 \theta) \sin \theta \, d\theta = 0$ ; (c) They tell us that the same amount of water flows into the region as flows out. The fact that the divergence vanishes everywhere in the region shows that there are no sources or sinks of water in the region.
47. (a) No traffic can leave the roadway to either side, so this means that there is a net flux of cars into this stretch of road: traffic is slowing down. This condition could not persist indefinitely, since the road will fill up. (b) By the Divergence Theorem, it is the  $-0.0565$  computed in part (a) divided by the area  $0.0113$  of the road; i.e.,  $-5$ . The divergence here is  $\frac{\partial v_2}{\partial y}$ , which is the acceleration along the road. Since this is negative, it confirms that traffic is slowing down.
49.  $12\pi$                                 51.  $a + b + c > 0$
53. Let  $\mathcal{S}$  be the unit sphere and let  $\mathbf{F}(x, y, z) = \langle -2xz, 2yz, xy \rangle$ . Then  $\mathbf{F}$  is not conservative, since  $\frac{\partial f_1}{\partial z} = -2x \neq y = \frac{\partial f_3}{\partial x}$ . However,  $\operatorname{div} \mathbf{F} = 0$ , so by the Divergence Theorem,  $\iint_{\mathcal{S}} \mathbf{F}(x, y, z) \cdot \mathbf{n} \, dS = 0$ .

## ALGEBRA REVIEW

### The Quadratic Formula

The solutions of  $ax^2 + bx + c = 0$  are of the form

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

### Factoring Formulas

$$a^2 - b^2 = (a - b)(a + b)$$

$$a^3 + b^3 = (a + b)(a^2 - ab + b^2)$$

$$a^3 - b^3 = (a - b)(a^2 + ab + b^2)$$

$$a^n - b^n = (a - b)(a^{n-1} + a^{n-2}b + a^{n-3}b^2 + \dots + ab^{n-2} + b^{n-1})$$

### The Binomial Theorem

$$(a + b)^n = a^n + \binom{n}{1}a^{n-1}b + \binom{n}{2}a^{n-2}b^2 + \dots + \binom{n}{k}a^{n-k}b^k + \dots + \binom{n}{n-1}ab^{n-1} + b^n,$$

where  $\binom{n}{k} = \frac{n!}{k!(n-k)!}$  and  $k! = 1 \cdot 2 \cdot 3 \cdot \dots \cdot k$

### Definition of Absolute Value

$$|a| = \begin{cases} a, & \text{if } a \geq 0 \\ -a, & \text{if } a < 0 \end{cases}$$

### Inequalities and Distance

The following are equivalent:

- ▶  $|x - c| < \delta$
- ▶ the distance between  $x$  and  $c$  is less than  $\delta$
- ▶  $x \in (c - \delta, c + \delta)$

The following are equivalent:

- ▶  $|x - c| > \delta$
- ▶ the distance between  $x$  and  $c$  is greater than  $\delta$
- ▶  $x \in (-\infty, c - \delta) \cup (c + \delta, \infty)$

## BASIC FUNCTION TYPES

### Linear Functions

$$f(x) = mx + b$$

### Power Functions

$$f(x) = Ax^k, \text{ where } k \text{ is rational}$$

### Polynomial Functions

$$f(x) = a_n x^n + a_{n-1} x^{n-1} + a_{n-2} x^{n-2} + \dots + a_2 x^2 + a_1 x + a_0,$$

where  $n$  is a positive integer

### Rational Functions

$$f(x) = \frac{p(x)}{q(x)}, \text{ where } p(x) \text{ and } q(x) \text{ are polynomials}$$

### Exponential Functions

$f(x) = Ab^x$  or  $f(x) = Ae^{kx}$ , with  $A \neq 0$ ,  $b > 0$ , and  $b \neq 1$ , where

$$e = \lim_{h \rightarrow 0} (1 + h)^{1/h}$$

### Logarithmic Functions

$f(x) = A \ln x$  or  $f(x) = A \log_b x$ , with  $A \neq 0$ ,  $b > 0$ , and  $b \neq 1$ , where  $\ln x = \log_e x$  and

$$\log_b(b^x) = x \text{ for all } x \text{ and } b^{\log_b x} = x \text{ for all } x > 0.$$

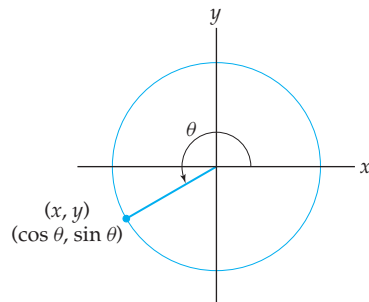

### Hyperbolic Functions

$$\sinh x = \frac{e^x - e^{-x}}{2}, \cosh x = \frac{e^x + e^{-x}}{2}, \tanh x = \frac{e^x - e^{-x}}{e^x + e^{-x}}$$

### Trigonometric Functions

for an angle  $\theta$  in standard position,

$$\begin{aligned} \sin \theta &= \frac{y}{r} & \cos \theta &= \frac{x}{r} & \tan \theta &= \frac{y}{x} \\ \csc \theta &= \frac{r}{y} & \sec \theta &= \frac{r}{x} & \cot \theta &= \frac{x}{y} \end{aligned}$$

### Inverse Trigonometric Functions

$f(x) = \sin^{-1} x$ ,  $f(x) = \tan^{-1} x$ , and  $f(x) = \sec^{-1} x$  are the inverses of  $\sin x$ ,  $\tan x$ , and  $\sec x$ , and thus

$$\sin^{-1}(\sin x) = x \text{ for } x \in \left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$$

$$\sin(\sin^{-1} x) = x \text{ for } x \in [-1, 1]$$

$$\tan^{-1}(\tan x) = x \text{ for } x \in \left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$$

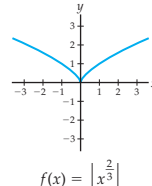

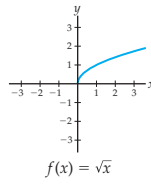

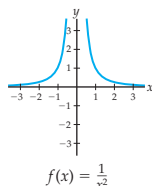

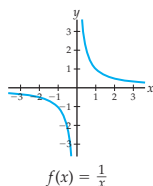

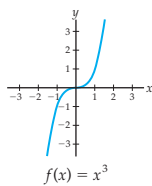

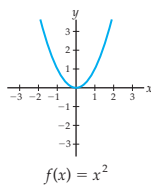

$$\tan(\tan^{-1} x) = x \text{ for } x \in (-\infty, \infty)$$

$$\sec^{-1}(\sec x) = x \text{ for } x \in \left[0, \frac{\pi}{2}\right) \cup \left(\frac{\pi}{2}, \pi\right]$$

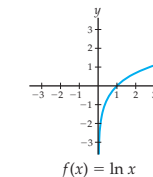

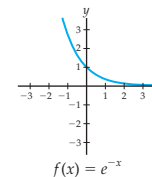

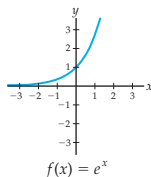

$$\sec(\sec^{-1} x) = x \text{ for } x \in (-\infty, -1] \cup [1, \infty)$$

## BASIC GRAPHS

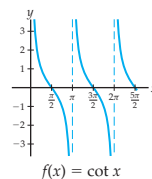

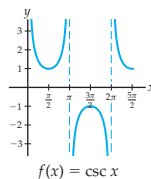

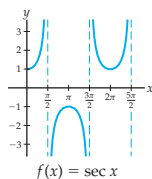

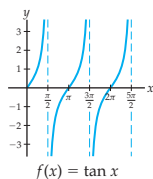

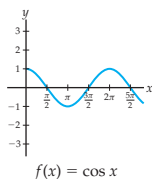

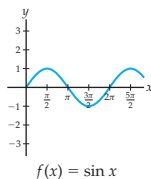

### Power Functions

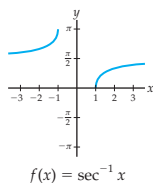

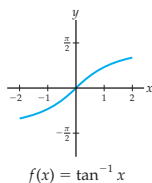

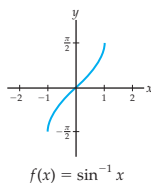

### Exponential and Logarithmic Functions

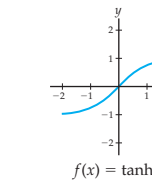

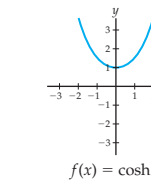

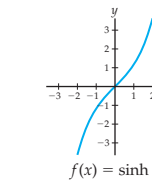

### Trigonometric Functions

### Inverse Trigonometric Functions

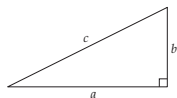

### Hyperbolic Functions

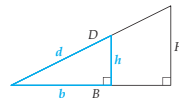

## GEOMETRY

### Pythagorean Theorem

$$a^2 + b^2 = c^2$$

### Law of Similar Triangles

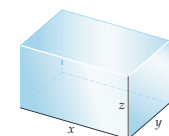

$$\frac{h}{b} = \frac{H}{B}$$

$$\frac{d}{b} = \frac{D}{B}$$

$$\frac{d}{h} = \frac{D}{H}$$

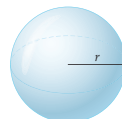

### Rectangular Solid

$$V = xyz$$

$$S = 2xy + 2yz + 2xz$$

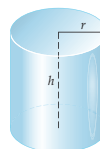

### Sphere

$$V = \frac{4}{3}\pi r^3$$

$$S = 4\pi r^2$$

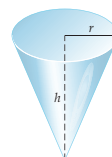

### Cylinder

$$V = \pi r^2 h$$

$$S = 2\pi r h + 2\pi r^2$$

### Cone

$$V = \frac{1}{3}\pi r^2 h$$

$$S = \pi r \sqrt{r^2 + h^2} + \pi r^2$$

To test your understanding of these and other prerequisites to calculus, work through the Chapter 0 Review Exercises, in particular the Notation and Skill Certification sections. Those review exercises can serve as a Diagnostic Test for precalculus and algebra comprehension.

## DIFFERENTIAL CALCULUS

### Definition of the Limit

$\lim_{x \rightarrow c} f(x) = L$  means that:

For all  $\epsilon > 0$ , there exists a  $\delta > 0$  such that if  $x \in (c - \delta, c) \cup (c, c + \delta)$ , then  $f(x) \in (L - \epsilon, L + \epsilon)$ .

Equivalently, in terms of absolute value inequalities,  $\lim_{x \rightarrow c} f(x) = L$  means that:

For all  $\epsilon > 0$ , there exists a  $\delta > 0$  such that if  $0 < |x - c| < \delta$ , then  $|f(x) - L| < \epsilon$ .

### The Extreme Value Theorem

If  $f$  is continuous on a closed interval  $[a, b]$ , then there exist values  $M$  and  $m$  in the interval  $[a, b]$  such that  $f(M)$  is the maximum value of  $f(x)$  on  $[a, b]$  and  $f(m)$  is the minimum value of  $f(x)$  on  $[a, b]$ .

### The Intermediate Value Theorem

If  $f$  is continuous on a closed interval  $[a, b]$ , then for any  $K$  strictly between  $f(a)$  and  $f(b)$ , there exists at least one  $c \in (a, b)$  such that  $f(c) = K$ .

### Definition of the Derivative

The derivative of a function  $f(x)$  is defined to be the function:

$$f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$$

or, equivalently:

$$f'(x) = \lim_{z \rightarrow x} \frac{f(z) - f(x)}{z - x}.$$

### Derivative Rules

$$\frac{d}{dx}(kf(x)) = kf'(x)$$

$$\frac{d}{dx}(f(x) + g(x)) = f'(x) + g'(x)$$

$$\frac{d}{dx}(f(x)g(x)) = f'(x)g(x) + f(x)g'(x)$$

$$\frac{d}{dx} \left( \frac{f(x)}{g(x)} \right) = \frac{f'(x)g(x) - f(x)g'(x)}{(g(x))^2}$$

$$\frac{d}{dx}(f(g(x))) = f'(g(x))g'(x)$$

### Rolle's Theorem

If  $f$  is continuous on  $[a, b]$  and differentiable on  $(a, b)$ , and if  $f(a) = f(b) = 0$ , then there exists at least one value  $c \in (a, b)$  for which  $f'(c) = 0$ .

### The Mean Value Theorem

If  $f$  is continuous on  $[a, b]$  and differentiable on  $(a, b)$ , then there exists at least one value  $c \in (a, b)$  such that

$$f'(c) = \frac{f(b) - f(a)}{b - a}.$$

### Derivatives of Basic Functions

$$\frac{d}{dx}(x^k) = kx^{k-1}$$

$$\frac{d}{dx}(e^{kx}) = ke^{kx}$$

$$\text{If } b > 0 \text{ and } b \neq 1, \text{ then } \frac{d}{dx}(b^x) = (\ln b)b^x$$

$$\frac{d}{dx}(\ln|x|) = \frac{1}{x}$$

$$\text{If } b > 0 \text{ and } b \neq 1, \text{ then } \frac{d}{dx}(\log_b|x|) = \frac{1}{(\ln b)x}$$

$$\frac{d}{dx}(\sin x) = \cos x$$

$$\frac{d}{dx}(\cos x) = -\sin x$$

$$\frac{d}{dx}(\tan x) = \sec^2 x$$

$$\frac{d}{dx}(\cot x) = -\csc^2 x$$

$$\frac{d}{dx}(\sec x) = \sec x \tan x$$

$$\frac{d}{dx}(\csc x) = -\csc x \cot x$$

$$\frac{d}{dx}(\sin^{-1} x) = \frac{1}{\sqrt{1-x^2}}$$

$$\frac{d}{dx}(\tan^{-1} x) = \frac{1}{1+x^2}$$

$$\frac{d}{dx}(\sec^{-1} x) = \frac{1}{|x|\sqrt{x^2-1}}$$

$$\frac{d}{dx}(\sinh x) = \cosh x$$

$$\frac{d}{dx} \cosh x = \sinh x$$

$$\frac{d}{dx} \tanh x = \text{sech}^2 x$$

## INTEGRAL CALCULUS

### Definition of the Definite Integral

If  $f$  is defined on  $[a, b]$  then the definite integral of  $f$  on  $[a, b]$  is

$$\int_a^b f(x) dx = \lim_{n \rightarrow \infty} \sum_{k=1}^n f(x_k^*) \Delta x,$$

if this limit exists, where  $\Delta x = \frac{b-a}{n}$ ,  $x_k = a + k \Delta x$ , and  $x_k^*$  is any choice of point in  $[x_{k-1}, x_k]$ .

### Definition of the Indefinite Integral

The indefinite integral of a continuous function  $f$  is the family of antiderivatives

$$\int f(x) dx = F(x) + C,$$

where  $F$  is any antiderivative of  $f$ .

### Fundamental Theorem of Calculus

If  $f$  is continuous on  $[a, b]$  and  $F$  is any antiderivative of  $F$ , then

$$\int_a^b f(x) dx = F(b) - F(a).$$

### Integrals of Basic Functions

$$\int x^k dx = \frac{1}{k+1} x^{k+1} + C \quad (\text{for } k \neq -1)$$

$$\int \frac{1}{x} dx = \ln |x| + C$$

$$\int e^{kx} dx = \frac{1}{k} e^{kx} + C \quad (\text{for } k \neq 0)$$

$$\int b^x dx = \frac{1}{\ln b} b^x + C \quad (\text{for } b > 0 \text{ and } b \neq 1)$$

$$\int \ln x dx = x \ln x - x + C$$

$$\int \sin x dx = -\cos x + C$$

$$\int \cos x dx = \sin x + C$$

$$\int \sec^2 x dx = \tan x + C$$

$$\int \csc^2 x dx = -\cot x + C$$

$$\int \sec x \tan x dx = \sec x + C$$

$$\int \csc x \cot x dx = -\csc x + C$$

$$\int \tan x dx = -\ln |\cos x| + C$$

$$\int \cot x dx = \ln |\sin x| + C$$

$$\int \sec x dx = \ln |\sec x + \tan x| + C$$

$$\int \csc x dx = -\ln |\csc x + \cot x| + C$$

$$\int \frac{1}{\sqrt{1-x^2}} dx = \sin^{-1} x + C$$

$$\int \frac{1}{1+x^2} dx = \tan^{-1} x + C$$

$$\int \frac{1}{|x|\sqrt{x^2-1}} dx = \sec^{-1} x + C$$

$$\int \sin^{-1} x dx = x \sin^{-1} x + \sqrt{1-x^2} + C$$

$$\int \tan^{-1} x dx = x \tan^{-1} x - \frac{1}{2} \ln(x^2 + 1) + C$$

$$\int \sinh x dx = \cosh x + C$$

$$\int \cosh x dx = \sinh x + C$$

$$\int \operatorname{sech}^2 x dx = \tanh x + C$$

$$\int \frac{1}{\sqrt{x^2+1}} dx = \sinh^{-1} x + C$$

$$\int \frac{1}{\sqrt{x^2-1}} dx = \cosh^{-1} x + C$$

$$\int \frac{1}{1-x^2} dx = \tanh^{-1} x + C$$
