Foreword

The title of this volume – *Globalization and Environmental Challenges: Reconceptualizing Security in the 21st Century* – sums up many of the dilemmas and challenges facing policy-makers today. First, environmental change is global; no part of the world is spared. Second, we have to face change now; ignoring the challenge is not an option if our children are to thrive. Third, in an increasingly connected world, security is more than just the absence of war; it depends on diverse, but linked – indeed, often competing – factors such as political, social, economic, and environmental interests. Central to these, as the title of this book suggests, is the environment.

As a large and economically powerful union, the EU enjoys economies of scale. These can be exploited to address environmental threats – at local, national, and Union levels. It is sobering to recall, however, that even the enlarged EU is not autonomous and that the health of the European environment also depends on policies and practices in other parts of the world. Nowhere is this more evident than with climate change. Changes and challenges are now global, and thus our policy responses must be global too. Our security is indivisible, but our responses remain all too clearly fractured and divided.

Second, the concept of ‘sustainable development’ shows that time is a crucial factor in environmental security. The future can only be secured insofar as we act responsibly now; prevarication will have costs which future generations will pay. This implies urgent choices now. Fortunately, the developing science of costing environmental goods and services suggests that taking action on the environment not only has costs, but also has significant short- to medium-term financial and other benefits. Nonetheless, questions remain as to when best to take action and how such action can accommodate political and economic timetables.

Third, the environment is indeed a key component of modern security. Environmental degradation may destabilize societies by reducing economic opportunity. Degraded environments can be breeding grounds for other social ills, such as impaired human health or declining social cohesion. Developing countries with populations directly dependent on environmental resources are also particularly vulnerable to conflict over access to limited or declining resources. Environment is thus central to modern security, but also needs to be integrated with other factors such as energy, mobility, and food requirements. The question for policy-makers is how, in practical terms, to align these diverse interests.

Since the end of the Cold War, the security debate has changed fundamentally. A study which addresses the new challenges and suggests responses will therefore be a welcome addition to the policy-maker’s toolkit. For this reason, I warmly welcome this volume.

Brussels, in June 2007

Stavros Dimas
Commissioner for the
Environment, European Union

Foreword

This volume on *Globalization and Environmental Challenges: Reconceptualizing Security in the 21st Century* implements the mission of the United Nations University of advancing knowledge for human security, peace, and development. This volume, written by over 100 experts from all continents, combines the two research programmes of UNU on ‘environment and sustainable development’ as well as on ‘peace and governance’.

It addresses the question whether the fundamental change of the international order since the end of the Cold War has triggered a reconceptualization of security not only in the OECD world but also in Africa, Asia and Latin America as it has been perceived by scholars from many disciplines as well as by government and international organization officials.

This book addresses the conceptual linkages between the four key goals of the United Nations system of security, peace, development and the environment, the conceptualization of security in Confucianism, Buddhism, Hinduism as well as in Jewish, Christian and Muslim thinking, in the philosophical and ethical traditions in the Orient and Occident as well as in the pre- and post-Columbian philosophy in Latin America. The book discusses also the spatial context and dimensions of security concepts, their reconceptualization in different disciplines and in international organizations within the UN system, OSCE, the European Union, OECD and NATO, and the conclusions that have been drawn in different regions and by regional organizations since 1990 and how this is reflected in alternative perspectives on future security.

The nine editors of this major scientific reference book – three women from India, Mexico and Kenya as well as six men from Europe, North America and the Arab world – offer multidisciplinary and multicultural analyses to key concepts of the UN Charter: ‘international peace and security’ and how these concepts have changed since 1990.

This reconceptualization debate on security was partly triggered by several reports of two Secretaries-Generals of the United Nations: *The Agenda for Peace* by Boutros Boutros-Ghali in 1992 and by the report *In Larger Freedom* by Kofi Annan in 2005 as well as by initiatives by UNDP, UNESCO and also by research conducted by the United Nations University.

This volume is the third in the *Hexagon Series on Human and Environmental Security and Peace*. The ‘hexagon’ is also the logo of the UNU system that combines under the goal of human security five research areas on peace, governance, development, science, technology and society as well as the environment.

This unique compilation of global scholarship deserves many readers and should be available in all major university and research libraries in all parts of the world and for all scholars also on the Internet.

Tokyo, June 2007

Hans van Ginkel
Rector, United Nations University and
United Nations Under-Secretary-General

Foreword

This volume on *Globalization and Environmental Challenges: Reconceptualizing Security in the 21st Century* in the *Hexagon Series on Human and Environmental Security and Peace* argues that the most immediate concerns for most human beings are soft threats to our common security, including those posed by environmental problems. Poverty, environmental degradation, and despair have killed people, and affected societies and nations in the global South.

As security policies insufficiently address environmental concerns a complementary approach based on North-South cooperation through sustainable development is needed. Sustainable development has become the precautionary aspect of peace policy.

UNEP's work on environment and conflict was based on three pillars: a) its *Post-Conflict Assessment Unit*, which assesses environmental conditions in post-conflict zones; b) the *Environment and Security Initiative* (ENVSEC) by UNEP, UNDP and OSCE in Southeast Europe, the Caucasus and Central Asia; and c) UNEP's *Division on Early Warning and Assessment* (DEWA) that launched an 'Environment and Conflict Prevention Initiative'.

Environmental conflict and cooperation are still under-theorized, and many case studies on the sub-national level are needed. The research community should identify risk factors of environmental conflict and best practices for environmental cooperation that can support the efforts of international organizations. For Kofi Annan 'soft' threats can be more pressing concerns than traditional dangers for national security.

In this volume 92 scholars and officials from all continents are assembled by an able team of nine co-editors from nine countries, among them three women from New Delhi, Nairobi and Cuernavaca and six men from Germany, Hungary, the Netherlands, Poland, Tunisia and the United States. They analyze the new conceptual and policy linkages that have been added to the initial task of the UN system to maintain 'international peace and security', i.e. development and the environment. Environmental challenges due to climate change, desertification, water scarcity and degradation have increasingly posed new security threats, vulnerabilities and risks that ignore national borders. They can only be mitigated by effective global and regional multilateral cooperation. Avoiding these new types of conflicts triggered by these new security dangers and concerns by environmental cooperation and peacemaking must become a political priority of utmost urgency for the 21st century.

This book deserves many readers in all parts of the world, especially in those countries where university and research libraries may not be able to afford such reference books. It is hoped that these scientific and policy-relevant messages can again be made available with the support of private foundations and donors to the young generation in the global South that will experience many of these challenges to their security and survival during this century.

Höxter, June 2007

Klaus Töpfer
Former Under-Secretary General of the United Nations and Executive-Director, United Nations Environment Programme (1997-2006)

The Graveyard of Fallen Monuments

P. H. Liotta

*"By understanding many things,
I have accomplished nothing."
– the final words of Hugo Grotius, 1645¹*

Here, in the graveyard of fallen monuments, we always talk of war and peace. This is where empires – and the forgotten, too – come to when they have to die. Alexander said that place was Afghanistan, but he was wrong. (Well, at least he wasn't fully right.) The Miracle of Holland knew it best, it seems: That rule of law, and the order of things, best distinguish man from beast. The monuments represent the failures of our lives, collective grief.

Here, in the first circle of the fallen, denial constitutes a simple grief. The burning Bush, two million skulls in Pol Pot's image, the crestfallen Lenin bust. Peace, here, never passes understanding. Shantih, shantih ... the beast within proclaims – but doesn't practice. From El Alamein to Abu Ghraib, we'd rather die than accept an error. Blindly, we stand ready to carry out all that seems simple to abide by: What matters most now matters least.

And so, in the second stage, anger starts to bubble up and reason seems to matter least. We take "it" out on anyone, or anything, to satisfy our starving grief. The structure of a culture, land, belief, and God . . . all ripping at the seams. O heartless world that has such creatures in it, where perpetual war and permanent peace are batted about in broken minds and still-born souls. Feast on this. We die together or alone. The choice is yours, and ours, and any beast's.

In the third descending spiral, things get tough. We begin to bargain with the beast that is ourselves. We believe everything we knew was wrong, but now belief least becomes the path to get things done. Mission accomplished, and we follow on to grief. World order is so easy: just push off into heartbreak and go on believing till you die. To prepare for war, don't always talk of peace. Abide by what others might proclaim is wrong. What seems

most unseemly, when you pass through the Scylla and Charybdis of depression, the seams of space and time and truth clawing you inside, is this: Recognize the beast we were, the human we might wish to be. Is there something wrong with peace? The triumph of the spirit comes when each proclaims victory for the least, the powerless hung, each, on the tree of a soul. Something good can come from grief. If not a rule of law, this is something we could learn before we die.

Perhaps there are some truths that never truly die.
Perhaps there are some practices that stitch together all the seams of differences, and distance, the burden of accepting grief.
Perhaps tonight, the *Geist* of all the errors of our past will rise like some great beast to bear our grievance toward those who matter most, and listen least.
Perhaps tomorrow, in the story's told, the war within was waged for peace.

In the graveyard of fallen monuments, we learned least to live before we died. We talked of peace but always practiced war. Pity the beast; embrace the grief: skilled at everything, to seem to have done nothing. The world was our beginning. The world must be our end.

for Ambassador Jonathan Dean

1 Grotius, theorist and founder of what is today called international law, was committed in his lifetime to conflict resolution, compromise, negotiation. He is often called "The Miracle of Holland."

For Prof. Dr. Georg Zundel (1931-2007)

17 May 1931 in Tübingen (Germany)
† 11. March 2007 in Salzburg (Austria)

His work as a natural scientist and philanthropist
for disarmament and international cooperation,
for peace and reconciliation among peoples and
his support for peace and conflict research
will be remembered.

We the nine editors from nine countries

coming from four continents:

Hans Günter Brauch (Germany),
Navnita Chadha Behera (India),
Béchir Chourou (Tunisia),
Pál Dunay (Hungary),
John Grin (The Netherlands),
Patricia Kameri-Mbote (Kenya),
P. H. Liotta (USA),
Czesław Mesjasz (Poland),
Úrsula Oswald Spring (Mexico),

dedicate this volume to

our children or godchildren

- representing all children of the globe -

who will experience

during the 21st century

whether

the messages of these

joint scientific efforts will become reality.

Acknowledgements

This volume has emerged from a series of ten panels on “Reconceptualizing Security in an Era of Globalization” at the 5th Pan-European Conference on International Relations in The Hague, The Netherlands, 9–11 September 2004, and from two previous workshops at the 45th annual ISA Convention in Montreal, Canada, 17–20 March 2004 and two panels at the 20th IPRA conference in Sopron, Hungary, 5–9 July 2004 were early versions of selected chapters were presented.¹ But most chapters were subsequently commissioned from invited experts from different disciplines and all parts of the world and all submissions were anonymously peer reviewed and subsequently revised by the authors.

Financial contributions for these workshops and for the preparation and production of this book were made by the following donors: the Berghof Foundation for Conflict Research in Berlin, the European Commission and NATO in Brussels, the Netherlands Organisation for Scientific Research (NOW) in The Hague and Springer-Verlag in Heidelberg.

Hans Günter Brauch is grateful to the Berghof Foundation for Conflict Research in Germany, a private scientific foundation, and to the chairman of its Funding Committee, Prof. Dr. Horst Fischer (University Bochum). A foundation grant covered a part of the editorial and production costs of this book. He is especially grateful to the founder of the Berghof Foundation, Prof. Dr. rer. nat. Georg Zundel, a former Professor at the Technical University of Munich. For more than three decades, the Berghof Foundation has funded often unconventional, trans- and multidisciplinary and goal-oriented international research and scientific cooperation.

In his speech, at a meeting of this foundation to honour its sponsor at his 75th birthday on 30 September 2006, Hans Günter Brauch announced this book as a belated intellectual birthday present.² However, Prof. Zundel died on 11 March 2007 and thus could not receive this gift anymore. In an obituary the AFES-PRESS board³ wrote about Prof. Dr. Georg Zundel:

His impressive personality; his work as a distinguished and concerned natural scientist and as a socially responsible entrepreneur; as a policy-oriented philanthropist interested in peace issues and as a sponsor of independent, innovative and policy-relevant peace research in Germany will be remembered by his admirers, friends and grant recipients.

The work of AFES-PRESS and the publication of the *Hexagon Series on Human and Environmental Security and Peace* was made possible by several grants funded by the Berghof Foundation he established in 1971.

We mourn for a generous human being with extraordinary charisma and are grateful for his persistent support for peace oriented initiatives for international rapprochement and reconciliation, for interdisciplinary cooperation as well as his openness for new and courageous initiatives in applied peace research. We will continue to adhere to his mission and contribute as scientists and concerned citizens to a realization of his scientific and policy goals for a better world adhering to his motto in his memoirs “Much has to be done.”

This book is dedicated to the memory of this distinguished natural scientist for his philanthropic work for independent peace research in Germany and Austria.

1 The contributions have been documented for the workshop in Montreal at: <http://www.afespress.de/html/download_isa.html>; for the workshop in Sopron at: <http://www.afespress.de/html/download_sopron.html> and for the workshop in The Hague at: <http://www.afespress.de/html/the_hague_programme.html>.

2 See the text of this speech at: <http://afespress.de/pdf/Brauch_Zundel_Rede.pdf>.

3 See the text at: <http://afespress.de/pdf/Zundel_web_dedication.pdf>.

- AFES-PRESS received a financial support under grant SNE-3-CT-1003-503699 from the DG Aerospace and Industry, European Commission to cover the costs of an AFES-PRESS research team consisting of three AFES-PRESS board members from Germany, The Netherlands and Poland, two colleagues from Tunisia and Egypt and four Ph.D. candidates from Germany, France and Italy to participate at three workshops during 2004:
 - at the 45th ISA Convention in Montreal Canada, 17-20 March 2004;
 - at the 20th IPRA Conference in Sopron, Hungary, 5-9 July 2004;
 - at the 5th Pan-European Conference on International Relations, 8-11 September 2004.
 and to start with the review, editorial and production process of the two volumes emerging from these workshops as well as to prepare two workshops in 2005 in Istanbul and Bonn.
- AFES-PRESS appreciates a subsidy from NATO contributing to a realization of the workshop in The Hague enabling the participation of seven colleagues from NATO Mediterranean dialogue countries (Algeria, Egypt, Israel, Jordan, Tunisia, Turkey) and also from Palestine. Hans Günter Brauch would like to thank Dr. Nicola de Santis from the Public Diplomacy Division at the NATO Secretariat for his assistance and support. The NATO grant also contributed to the production costs of this book and of its index.
- Prof. Dr. John Grin would like to thank the Netherlands Organization for Scientific Research (NOW) in The Hague that covered the travel costs of two participants and co-editors from Mexico and India for the third workshop in The Hague.
- The editors of this book would like to thank their institutions for permitting to use a part of their time and their infrastructure for the realization of this project:
- *PD Dr. Hans Günter Brauch* would like to thank AFES-PRESS and Úrsula Oswald Spring for her good cooperation, scientific advice, friendship, encouragement and support, Czeslaw Mesjasz and John Grin for their good advice, friendship and full support during several difficult decisions and all co-editors for their devotion and hard work as reviewers and contributors. Without such a fine global multidisciplinary team this volume would not have been possible.
- *Prof. Dr. Úrsula Oswald Spring* is grateful to the Centre for Regional Multidisciplinary Studies (CRIM) and the National University of Mexico (UNAM), for permitting her to allocate a part of her research time to this project and to allow her three extensive stays in Germany to collaborate with the lead editor. As the first MunichRE chair on Social Vulnerability at UNU-EHS she appreciates the support of UNU-EHS in Bonn and of the MunichRe Foundation. Finally, she wants to thank AFES-PRESS for permitting her to use its research library and office facilities during her stay in Europe in the summers of 2005, 2006 and 2007 and for the intellectually stimulating professional discussions with Hans Günter Brauch.
- *Prof. Dr. Czeslaw Mesjasz* would like to thank Lidia for her patience and support and Hans Guenter Brauch for his compassion, hard work, inspiration and friendship.
- *Prof. Dr. John Grin* wishes to thank his fellow editors, especially Hans Günter Brauch, who pairs incredible energy to patience and understanding. He owes his assistant Amy-Jane Gielen for relieving him of many other duties, thus being able to spend time on this volume, and his family for adding the sort of duties which keep one in healthy balance.
- *Dr. Pál Dunay* would like to thank his spouse Andrea for her unceasing patience and also his colleagues at the Hungarian Institute of International Affairs.
- *Prof. Navnita Chadha Behera* would like to thank Hans Guenter for his encouragement and hard work, to all co-editors for good cooperation and to Ajay and her daughter Ananya for their unfailing support and patience.

- *Prof. Dr. Patricia Kameri-Mbote* would like to thank her husband John Mbote for his unwavering support, patience and friendship. Hans Guenter for spurring team spirit and getting work done.

Springer-Verlag contributed to the costs of the layout and to the production of the index. Hans Günter Brauch would like to thank Dr. Christian Witschel, the chief editor of Geosciences with Springer-Verlag, for his support of this project and for his patience with an international team and Ms. Christine Adolph, the producer of this book within Springer-Verlag, for her efficient coordination and implementation of this project, as well as the many other unnamed persons with Springer-Verlag for their devotion to this publication.

All editorial decisions were made by the editors in their personal capacity only. The funders had no influence on the themes of this book and on the views expressed by its authors. None of the authors and editors has and will receive any personal remuneration from this collaborative research project. Any income will be used by AFES-PRESS, a non-profit scientific society under German law, in consultation with the co-editors, solely for future projects to further global scientific cooperation including a planned new bookaid project for Third World Libraries.⁴

All editors are grateful to Thomas Bast, who in his quiet and efficient way, acted as the webmaster for the workshops in Montreal, Sopron and The Hague, and produced several versions of the proofs, the whole layout as well as the index.

The editors and the producer would like to thank Ms. Patrizia Kummer, director of D.T.u.L. GmbH in Fellbach near Stuttgart, for permitting the producer to use the infrastructure of her company for this book selflessly. This support has greatly facilitated the work of the producer.

The editors are grateful to Ronald Lappin, the International Programme Director of *Gute Buecher fuer Alle* e.V., in Mosbach (Germany), for his extremely careful language editing. He speaks many languages and thus he could often anticipate what the non-native speakers intended to express, and adapt the language of most non-native speakers to proper British English.

Last but not least, the editors are grateful to the 92 authors, coming from 36 countries and 17 scientific disciplines: from political science (54), philosophy (5), economics (5), military service and studies (5), geography (4), history (3), law (3), physics (2), theology (2), environmental science (2), Chinese, Korean and Japanese studies (2), sociology (1), Latin and Greek (1), engineering (1), electronics (1), bioethics (1) and anthropology (1) for their contributions to this book and for their readiness to reflect the critiques and suggestions of the anonymous reviewers trying to look beyond the boundaries of their respective discipline and expertise.

The editors are grateful to Stavros Dimas (Greece), Commissioner for the Environment in the European Commission, to the former Rector of the University of the United Nations, Prof. Dr. Hans van Ginkel (The Netherlands), and Prof. Dr. Klaus Töpfer (Germany), the former Secretary General of UNEP, for their forewords, and to Ambassador Jonathan Dean (USA), the Hon. Dr. Narcis Serra, the former Vice-president of the Government and

Permissions and Credits

The editors and authors are grateful to the following publishers and authors who granted permission to use partly copy-righted materials:

- The copyright for the aerial photo of Mumbai for the book cover was granted by Mr. Thomas Loster, director of the MunichRe Foundation in Munich.
- The copyright to use the photo of Prof. Dr. Georg Zundel in the dedications was granted by his widow, Ms. Renate Zundel.

In chapter 1, Hans Günter Brauch would like to thank:

- Bjørn Møller (2003) and Úrsula Oswald Spring (2007) for their previous publications that inspired and are reflected in table 1.2.

In chapter 4, Ole Wæver appreciates the permission of the co-editors and the publisher to use parts of a text he wrote for the *Festschrift* for Hakan Wiberg and to develop it further in this chapter:

- Wæver, Ole, 2004: “Peace and Security: two concepts and their relationship”, in: Guzzini, Stefano; Jung, Dietrich (Eds.): *Contemporary Security Analysis and Copenhagen Peace Research* (London: Routledge): 53–65.

The new enlarged version is greatly influenced by the unusually penetrating, knowledgeable and inspiring comments from three anonymous reviewers and the series’ main editor.

In chapter 6, Indra de Soysa would like to thank the Uppsala University’s Department of Peace and Conflict Research and PRIO for permission to use data from the Uppsala-PRIO dataset in figures 6.1, 6.2 and 6.3 as published in:

- Gleditsch, Nils Petter; Wallensteen, Peter; Eriksson, Mikael; Sollenberg, Margareta; Strand, Havard, 2002: “Armed Conflict 1946–2001: A New Dataset”, in: *Journal of Peace Research*, 39,5: 615–637.

The map in figure 6.4 is based on:

- ViewConflicts 2.2 developed jointly by the Norwegian University of Science and Technology’s Department of Geography and the ‘Armed Conflicts’ Data Project, a result of cooperation between the Peace Research Institute Oslo (PRIO) and Uppsala University’s Department of Peace and Conflict Research

The figures 6.5, 6.6 and 6.7 are based on the WDI CD-Rom of the World Bank that is available as:

- World Bank, 2002: *World Development Indicators*, CD Rom (Washington, DC: World Bank).

All permissions have been granted by the holders of the copyright or are in the public domain.

In chapter 10, Úrsula Oswald Spring acknowledges the permission of EOLSS to develop her own conceptual ideas published in a previous publication further:

- Oswald Spring, Úrsula, 2006a, 2007: “International Security, Peace, Development, and Environment”, in: Oswald Spring, Úrsula (Ed.): *Encyclopedia of Life Support System*, vol. 39 (Oxford: Oxford-EOLSS Publisher): available online at: <<http://www.eolss.net>>.

In chapter 13, Eun-Jeung Lee, is grateful for the permission to reproduce three maps in

- Figure 13.1: Map of the Chou Dynasty. Source: Printed with permission of The Minneapolis Institute of Arts; at: <<http://www.artsmia.org/art-of-asia/history/dynastychou.cfm>>.
- Figure 13.2: Map of the Sung Empire. Source: Printed with permission of The Minneapolis Institute of Arts; at: <<http://www.artsmia.org/art-of-asia/history/north-sung-dynasty-map.cfm>>.
- Figure 13.3: Historic map of Korea (Koryô). Source: Printed with permission of Henny Savenije; at: <<http://www.hendrick-hamel.henny-savenije.pe.kr/oldtonew.htm>>.

In chapter 14, Mituso and Tamayo Okamoto are grateful to the Ittetsu Morishita Art Studio for permission to use in figure 14.1 a photo by Yoshito Matsushige.

In chapter 15, Naresh Dadhich would like to thank for permission to reproduce figure 15.1:

- Figure 15.1: Chanakya: Also known as Kautilya, the Writer of Artha-Shastra, the first known treatise on the government and economy in the 3rd Century B.C. Source: <<http://www.kamat.com/kalranga/ancient/3335.htm>>. Permission to reprint this image has been granted by Vikas Kamat on 15 September 2007; see at: <www.kamat.com>.

The two photos of Gandhi are in the public domain according to South African and Indian copyright law:

- Figure 15.2: Gandhi dressed as a satyagrahi (non-violent activist) in 1913. Source: at: <http://commons.wikimedia.org/wiki/Image:Gandhi_satyagrahi.jpg>. A South African work that is in the public domain in South Africa according to this rule is in the public domain in the U.S. only if it was in the public domain in South Africa in 1996.
- Figure 15.3: A photo of Gandhi taken in London at the request of Lord Irwin in 1931. Source: at: <http://commons.wikimedia.org/wiki/Image:Gandhi_studio_1931.jpg>. The photographer is unknown and the photo is more than 70 years old. According to the Bern Convention and the law of most countries, this photo is in the public domain.

In chapter 22, Hans Günter Brauch acknowledges that the figures 22.1-22.3 were developed further based on previous figures by Zürn, by Leibfried/Zürn and by Oswald. He is grateful to these three authors for their inspiration and draft figures in German and English.

- Figure 22.1: Security tasks and threats for the state and society. Source: Developed further based on Zürn (1998: 99).
- Figure 22.2: Changes of the democratic, judicial, and intervention state during the transformation from a national to a post-national constellation, and its relevance for security. Source: Adapted and modified based on Leibfried/Zürn 2005: 39.
- Figure 22.3: Expanded concepts of Security. Sources: Møller (2003); Oswald (2001, 2007).

In chapter 26, Úrsula Oswald Spring, acknowledges the permission of the copyright holders to reproduce the following tables and figures:

- Table 26.1: Oil reserves, production and consumption in the world (data for 2004). Source: Z Magazine; at: <<http://www.scaruffi.com/politics/oil.html>>. The permission has been granted by Michael Albert of Z Magazine.
- Table 26.2: Social Gap in Mexico. Source: INEGI (2004) and Bank of Mexico (2004). This is in the public domain in Mexico.

- Table 26.3: Bank Savings in Mexico. Source: Bank of Mexico (2004). This is in the public domain in Mexico.
- Figure 26.1: Well-being by Regions (Growth of regional GDP from 1820 to 1998). Source: OECD 2005; at: <www.oecd.org/dataoecd/34/6/34711139.pdf>. Reproduction of OECD materials is granted free of charge for a maximum of 2 tables or graphs.
- Figure 26.2: Most important problems in LA. What do you consider to be the country's most important problem? Percentage of respondents in 2004. Source: Latinobarómetro (2004). This is globally in the public domain.
- Figure 26.3: Evolution of Poverty in Latin America (million of persons). Source: CEPAL (2004). This is globally in the public domain.
- Figure 26.4: Undernourished Population in LA and the Caribbean: 1998–2000. Source: CEPAL (2004), estimation by CEPAL based on FAO data. This is globally in the public domain.
- Figure 26.5: Poverty and support of women. Poverty at the household level with men and women working (in per cent). Source: CEPAL (2004), Unity or Women and Development. This is globally in the public domain.
- Figure 26.6: Total work, paid and unpaid labour by gender and urban-rural differences. Source: CEPAL (2004), Unity or Women and Development. This is globally in the public domain.
- Figure 26.7: Leading global risk factors and contributions to the burden of disease (per cent of disability-adjusted life years lost). Source: United System Standing Committee on Nutrition/ The Lancet (2006). The permission has been granted.
- Figure 26.8: Confidence in Institutions in Latin America (in per cent). Source: Latinobarómetro (2005). This is globally in the public domain.
- Figure 26.9: Satisfaction with the government and democracy. Question: How satisfied are you with the way democracy works in your country? (per cent responding 'not very satisfied' and 'not at all satisfied'). Source: Latinobarómetro (2005). This is globally in the public domain.
- Figure 26.10: Mexican Migrants to the U.S. from 1990 to 2003 (in 1000 persons). Source: U.S. Census Bureau (2005) drafted by Fernando Lozano at CRIM/UNAM. The permission has been granted by the colleague at CRIM/UNAM.

In Chapter 32, Arlene B. Tickner and Ann C. Mason acknowledge the permission of the copyright holder to reproduce:

- Figure 32.1: Transparency International Corruption Perceptions Index 2005. May 2005. Source: <http://www.transparency.org/cpi/2005/cpi2005_infocus.html#worldmap>. Prof. Dr J. Graf Lambsdorff of the University of Passau produced the CPI table. See: <www.transparency.org/surveys/#cpi> or: <www.icgg.org>. The permission was granted by Email on 30 May 2006 by Marie Wolkers, Senior Research Coordinator, Transparency International - International Secretariat, Berlin.

In chapter 33, Jacek Kugler is grateful to the Strategic Decisions Group (2002) that inspired:

- Figure 33.1: Prediction Politics. Source: Adapted from Strategic Decisions Group (2002).

In chapter 38, Ulrich Albrecht and Hans Günter Brauch are grateful to Ole Wæver for permission to reproduce the following two tables:

- Table 38.2: Elements of the Three European Schools in Security Theory. Source: Wæver 2004: 13.
- Table 38.3: Reconceptualizing of Security in the US, Europe, and the Rest of the World. Source: Adapted from and inspired by Wæver 2004: 16,

In chapter 40, Hans Günter Brauch appreciates the permission of Ben Wisner and the co-authors of the “Policy Memorandum on Climate Change and Human Security” of 15 April 2007 for permission to use material from this collaborative study to which he contributed:

- Table 40.1: “Matrix of Possible Climate Change and Security Interactions over Time”, in: Wisner, Ben; Fordham, Maureen; Kelman, Ilan; Johnston, Barbara Rose; Simon, David; Lavell, Allan; Brauch, Hans Günter; Oswald Spring, Ursula; Wilches-Chaux, Gustavo; Moench, Marcus; Weiner, Daniel, 2007: *Policy Memorandum by Scientists regarding the UN Security Council’s first discussion on Climate Change: Climate Change and Human Security*, 15 April 2007; at: <http://www.afes-press.de/pdf/ClimateChange_and_HumanSecurity.pdf>.
- For the full text and the affiliations of all eleven co-authors, see at: <http://www.afes-press.de/pdf/ClimateChange_and_HumanSecurity.pdf>.

In chapter 44, Ole Wæver appreciates the permission of Lynne Rienner Publishers to base this chapter on a much abbreviated version of a chapter in: Wæver/Buzan/de Wilde 2008. For meticulous work on the references the author is grateful to Simon Sylvest Wæver. The novel parts of the present chapter compared to the one in Wæver/Buzan/de Wilde 2008 are mostly due to the proficient prodding by the lead editor and an anonymous referee.

In chapter 45, Jaap de Wilde is grateful to Lynne Rienner Publishers for permission to use figure 45.1 that is based on Buzan/Wæver/de Wilde (1998) and on Wæver/Buzan/de Wilde (2008).

In chapter 60, Mustafa Aydin – Neslihan Kaptanoglu acknowledge the permission of the copyright holders to use the following three maps:

- Figure 60.1: Borders of the former Soviet Union of 1989 and of the Russian Federation and its Near Abroad. Source: University of Texas, Perry-Castañeda Library Map Collection; at: <http://www.lib.utexas.edu/maps/commonwealth/soviet_union_admin_1989.jpg>. This map is in the public domain.
- Figure 60.2: Geography of the Broader Middle East and North Africa (BMENA) Region. Source: Wikipedia: “Middle East”; at: <http://en.wikipedia.org/wiki/Middle_East>. This map is in the public domain.
- Figure 60.3: European Neighbourhood Policy. Source: Marchetti (2006: 21). Permission was granted on 17 September 2007 by Andreas Marchetti, Center for European Integration Studies (ZEI), Bonn.

In chapter 61, Bechir Chourou would like to thank the following copyright holders for their permission to use the following tables and maps:

- Table 61.1: Direct and indirect threats to human security. Source: Bajpai (2000: 40).
- Table 61.2: Selected social and economic indicators for the Arab world. Source: UNDP (2005) is in the public domain.
- Table 61.3: Comparative Human Development Indicators. Source: UNDP (2005) is in the public domain.
- Table 61.4: Top World Oil Net Exporters, 2005* (*OPEC members in italics*). Source: U.S. Energy Information Administration: in: *Annual Energy Review 2006* is in the public domain; at: <http://www.eia.doe.gov/emeu/aer/pdf/pages/sec11_20.pdf>.

- Table 61.5: Top World Oil Producers, 2005 (*OPEC members in italics*). Source: U.S. Energy Information Administration: in: *Annual Energy Review 2006* is in the public domain; at: <http://www.eia.doe.gov/emeu/aer/pdf/pages/sec11_20.pdf>.
- Figure 61.1: Crude Oil Reserves (1 January 2005). Source: U.S. Energy Information Administration: in: *Annual Energy Review 2006* is in the public domain; based on *Oil and Gas Journal*, p. 324; at: <http://www.eia.doe.gov/emeu/aer/pdf/pages/sec11_8.pdf>.
- Figure 61.2: Natural Gas Reserves (1 January 2005). Source: U.S. Energy Information Administration: in: *Annual Energy Review 2006* is in the public domain; based on *Oil and Gas Journal*, at: <http://www.eia.doe.gov/emeu/aer/pdf/pages/sec11_8.pdf>.
- Figure 61.3: Oil Production and Consumption. National and regional figures refer to consumption. Source: *BP Statistical Review of World Energy June 2006*; at: <<http://www.bp.com/statisticalreview>>. Permission to use the material was granted by BP.
- Figure 61.4: Major oil consumers. Source: *BP Statistical Review of World Energy June 2006*; at: <<http://www.bp.com/statisticalreview>>. Permission to use the material was granted by BP.
- Figure 61.5: U.S. Oil Imports by Source. Source: *BP Statistical Review of World Energy June 2006*; at: <<http://www.bp.com/statisticalreview>>. Permission to use the material was granted by BP.
- Figure 61.6: The Middle East 1914. Source: © Philippe Rekacewicz, *Le Monde Diplomatique*, August 1992; at: <<http://mondediplo.com/maps/IMG/arton2057.jpg>>. Permission has been obtained from the copyright holder.
- Figure 61.7: Sykes-Picot Agreement of 1916. Source: Passia, Palestinian Maps; at: <http://www.passia.org/palestine_facts/MAPS/1916-sykes-picot-agreement.html>. Permission has been obtained.
- Figure 61.8: Middle East in 1939. Source: © Philippe Rekacewicz, *Le Monde Diplomatique*, August 1992; at: <<http://mondediplo.com/maps/IMG/arton2058.jpg>>. Permission has been obtained from copyright holder.
- Figure 61.9: Middle East and North Africa in 1995. Source: University of Texas at Austin, Perry-Castañeda Library Map Collection. This map is in the public domain; at: <http://www.lib.utexas.edu/maps/middle_east_and_asia/n_africa_mid_east_pol_95.jpg>.

In chapter 62, U. Joy Ogwu is grateful for the permission by the Sahel and West Africa Club of OECD to reproduce the following two maps of ECOWAS countries:

- Figure 62.1: Map on the regional institutions in West Africa, produced by the Sahel and West Africa Club (2006). Source: Sahel and West Africa Club (2006); at: <<http://www.oecd.org/dataoecd/6/55/38506469.pdf>>. Reproduction of OECD materials is granted free of charge for a maximum of 2 tables or graphs.
- Figure 62.2: Population density in West Africa in 2005. Source: Sahel and West Africa Club (2006); at: <<http://www.oecd.org/dataoecd/7/32/38506458.pdf>>. Reproduction of OECD materials is granted free of charge for a maximum of 2 tables or graphs.

In chapter 63, Martin R. Rupiya and Alfred G. Nhema are grateful to the copyright holders for their permission to include the following maps:

- Figure 63.1: A working definition of the Horn of Africa for this chapter. Source: <<http://www.igad.org/>>. Responsible is: IGAD Secretariat, Avenue Georges Clemenceau P.O. Box 2653 Djibouti, Republic of Djibouti. The map is not copyright protected.

- Figure 63.2: Eritrea and Ethiopia. Source: International Boundaries Research Unit, Durham University <www.dur.ac.uk/ibru>. Permission was granted on 22 March 2007 by Martin Pratt, Director of Research, International Boundaries Research Unit, Department of Geography, Durham University, Durham DH1 3LE, United Kingdom.

In chapter 65, Navnita Chadha Behera appreciates the permission of the United Nations Cartographic Section to reproduce as

- Figure 65.1: Map of South Asia. Source: The United Nations Cartographic Section, South Asia. 2007: <www.un.org/Depts/Cartographic/map/profile/seasia.pdf>. The permission has been granted by the UN Cartographic Service by Email on 17 September by Mr. Vladimir Bessarabov.

In chapter 66, Eun-Jeung Lee is grateful to The University of Texas at Austin and to SIPRI in Stockholm for using the following material in:

- Figure 66.1: Map of East Asia. Source: Perry-Castañeda LibraryMap Collection, The University of Texas at Austin, at: <<http://www.lib.utexas.edu/maps/asia.html>>. The map is in the public domain and does not require a copyright permission.
- Table 66.2: Military Expenditure of East Asian Countries (1989–2004) in constant US\$ equivalents for 2004. Source: SIPRI 1990–2005; at: <http://first.sipri.org/non_first/result_milex.php?send>. The data are published with permission of © SIPRI.
- Table 66.3: Military Expenditure of East Asian Countries (1989–2004) as percentage of GDP. Source: SIPRI 1990–2005; at: <http://first.sipri.org/non_first/result_milex.php?send>. The data are published with permission of © SIPRI.

In chapter 67, Alan Hunter and Liu Cheng are grateful for the permission to use copyrighted material:

- Figure 67.1: Map of China. Source: <http://www.lib.utexas.edu/maps/middle_east_and_asia/china_polor.jpg>; © University of Texas, Library; this map is in the public domain; for copyright details see at: <<http://www.lib.utexas.edu/maps>>.
- Figure 67.2: China's oil use growth since 1980 and projection until 2020. Source: Sinton/Stern/Aden/Levin 2005: 5. Reprinted with permission by the copyright holder. Additional sources are listed in the original.
- Table 67.6: Summarized Table of Natural Disasters in the People's Republic of China from 1906 to 2006. Source: EM-DAT: The OFDA/CRED International Disaster Database, <www.em-dat.net> - Université Catholique de Louvain - Brussels - Belgium; created on 9 May 2006. Permission was granted on 11 May 2007 by Prof. Guha-Sapir, director of CRED. Permission was granted by Nathaniel Aden on 14 August 2006.

In chapter 68, Kevin P. Clements and Wendy L. Foley are grateful for permission for:

- Figure 68.1: Map of the Pacific Region. Source: © Marney Brosnan, University of Canterbury, Department of Geography, reproduced with the permission of the copyright holder.

In chapter 69, Francisco Rojas Aravena, has used two maps that are in the public domain:

- Figure 69.1: Map of Central America and the Caribbean. Source: Permission granted by University of Texas Library, Austin; this map is in public domain and not copyrighted; <http://www.lib.utexas.edu/maps/americas/central_america_refo2.jpg>.
- Figure 69.2: Map of South America. Source: Permission granted by University of Texas Library, Austin; this map is in public domain and not copyrighted; download at: <http://www.lib.utexas.edu/maps/americas/south_america_refo4.jpg>.

Chapter 70 by P.H. Liotta and James F. Miskel relies on earlier discussions by Liotta (2002, 2005) in different contributions to Security Dialogue. The permission to use this material has been granted by SAGE and by the editor of this Journal.

In chapter 72, Heinz-Dieter Jopp and Roland Kaestner acknowledge the permission of the copyright holders to use the following maps:

- Figure 72.2: Current Population Density. Source: CIESIN, Columbia University Permission was obtained by the copyright holder who recommended the following for citing the GPWv3 and GRUMP data products:
 - *Gridded Population of the World*, version 3 (GPWv3): Center for International Earth Science Information Network (CIESIN), Columbia University; and Centro Internacional de Agricultura Tropical (CIAT). 2005. Gridded Population of the World Version 3 (GPWv3). Palisades, NY: Socioeconomic Data and Applications Center (SEDAC), Columbia University. Available at <<http://sedac.ciesin.columbia.edu/gpw>>. (date of download).
 - *Population Grids*: Center for International Earth Science Information Network (CIESIN), Columbia University; and Centro Internacional de Agricultura Tropical (CIAT). 2005. Gridded Population of the World Version 3 (GPWv3): Population Grids. Palisades, NY: Socioeconomic Data and Applications Center (SEDAC), Columbia University. Available at <<http://sedac.ciesin.columbia.edu/gpw>> (date of download).
 - *Population Density Grids*: Center for International Earth Science Information Network (CIESIN), Columbia University; and Centro Internacional de Agricultura Tropical (CIAT). 2005. Gridded Population of the World Version 3 (GPWv3): Population Density Grids. Palisades, NY: Socioeconomic Data and Applications Center (SEDAC), Columbia University. Available at: <<http://sedac.ciesin.columbia.edu/gpw>>. (date of download).
- Figure 72.4: Geographic Distribution of the Warming Process. Source: IPCC 2007: 253, IPCC Synthesis Report, Habiba Gitay, Slide 4. Written permission of the copyright holder to reprint this map has been received.
- Figure 72.5: Potential Drought Zones 2040-2070. Source: Hadley Centre. Written permission from the copyright holder was obtained.
- Figure 72.6: Major Agriculturally Utilized Areas. Source: Millennium Ecosystem Assessment. Written permission of the copyright holder was obtained.
- Figure 72.7: Population Density 2004, Urban Centres, Tropical Cyclones, and Regions with First-time Occurrence of Tropical Cyclones. Source: WBGU - German Advisory Council on Global Change (2008), *World in Transition - Climate Change as a Security Risk*, Earthscan, London (forthcoming). Written permission of the copyright holder to publish this figure was obtained.
- Figure 72.8: Natural Disasters since 1900. Source: EM-DAT: The OFDA/CRED International Disaster Database - <www.em-dat.net> - Université Catholique de Louvain - Brussels - Belgium, 2007; WBGU - German Advisory Council on Global Change (2008), *World in Transition - Climate Change as a Security Risk*, Earthscan, London (forthcoming). Written permission of copyright holder was obtained from Mr. Benno Pilar-deaux.
- Figure 72.9: Geographic Distribution of Drought, Water Shortages, and Tropical Cyclones. Source: Millennium Ecosystem Assessment. Written permission of copyright holder was obtained.

In chapter 74, G.A. Mc Bean is grateful for permission to use statistical material in

- Table 74.1: Trigger events of natural disasters based on EM-Dat and MunichRe analyses. Sources: EM-DAT: *The OFDA/CRED International Disaster Database* (Louvain: Université Catholique de Louvain); MunichRe 2006: 2; at: <www.munichre.com>. These data are in the public domain and all sources have been provided.

Rethinking Security in the New Century – Return to the Grotean Pattern

Jonathan Dean

Responding to 1989: Towards Cooperative Security

The main business of human society is to safeguard the life of its members. This rich and fascinating volume surveys the many ways of protecting humankind against the threats to human life in today's world – armed conflict in all its forms, inhumane treatment, disease, natural catastrophe, the consequences of man-made environmental degradation, and scarcity of food, water and health care. The emphasis of the book is on the years since the end of the Cold War in 1989-90, and on the challenges to security, old and new, with a special focus on environmental and human security, which have arisen in that period.

As we will describe further, a pattern of transatlantic cooperation among governments and civil society groups to cope with security challenges began to emerge in Europe after the Napoleonic Wars. With important exceptions, this pattern continued in the nineteenth and twentieth centuries and into the post-cold war period. This trend confirmed Grotius' analysis of the human condition – the global nature of human society, its solidarity in agreeing on rules and new forms of cooperation to meet challenges to human life, and its emphasis on the importance of individuals and groups as well as of states, which – despite devolution of their powers to supra- and sub-national entities – remain the main units of the international system.

The events of the years since 1989-90 have in general shown a worldwide trend of cooperation in dealing with man- and nature-made crises. They have largely repudiated the Hobbesian use-of-force approach. At the same time, they have provided renewed evidence that the world is not ready for a cen-

tral governmental authority. Although efforts to control war showed some improvement in this period, attempts to deal with human-caused environmental degradation made little progress in blocking a process which in time may make this planet uninhabitable for human population. Rapid increase of that population is one cause of the problem.

New Security Challenges: Unilateral American Responses

The major events of the years since 1989-90 included a worldwide cooperative effort in the 1991 Gulf War to repulse the Iraqi invasion of Kuwait. The widespread terrorist attacks on Western and other targets from the early 1990's to the present have failed to bring the popular uprisings in the Muslim states in support of the fundamentalist cause hoped for by terrorist leaders. However, they did elicit worldwide anti-terrorist cooperation of police, intelligence, and finance control, and the beginnings of cooperative efforts to deal with some of the underlying causes of terrorism. Fears of terrorist use of WMD remain widespread, although in fact the main terrorist weapon has remained conventional high explosives.

The U.S. military action in Afghanistan following the 9/11 attacks on New York and Washington, although deliberately unilateral and refusing many offers of help, was quite widely supported in world opinion. However, the U.S.-UK military action against Iraq in March 2003 broke radically with the pattern of cooperative engagement of previous U.S. administrations. It showed the costly effects of a go-it-alone policy, including inability to use the international institutions – UN weapons inspection and the Security Council – which might have neutralized the

Iraqi regime. The consequence was U.S. inability to elicit more than token military, political, and economic cooperation in dealing with Iraq, capped by unwillingness of the Bush administration to devote the military and economic resources needed to cope with the task in Iraq. This outcome clearly showed the limits of U.S. 'super-power' and the unambiguous need for a cooperative approach.

Grotius on Preventive Attack

It is interesting to recall that wide international disapproval of the Bush administration's doctrine of preventive attack had been foreshadowed by Hugo Grotius (1625), when he said "to maintain that the bare probability of some remote or future annoyance from a neighbouring state affords a just grounds of hostile aggression, is a doctrine repugnant to every principle of equity." (*On the Law of War and Peace*, Book II, Chapter I, para. XVII).¹ Pointing to the crucial difficulty of obtaining accurate intelligence about an adversary's intentions, Grotius points out that action in self-defence is not justified "unless we are certain, not only regarding the power of our neighbour, but also regarding his intention." (Book II, Chapter 22, para. IV).

Natural Disasters of 2004/2005 and Cooperative Security Responses

Natural catastrophes in the form of the December 2004 Tsunami in the Indian Ocean, equally devastating hurricanes in the Gulf of Mexico in late summer 2005, and a huge earthquake in Kashmir and Northern Pakistan in October of 2005 brought cooperative efforts to temper the disasters. There was during 2005 worthwhile cooperation between the U.S. government, WHO, the EU, and Asian governments in preparing defences against the avian flu. After long delays in each case, the United States joined Japan, South Korea, Russia and China in negotiating to curb the nuclear capabilities of North Korea, and with the UK, France and Germany in seeking to prevent development of nuclear weapons by Iran.

1 See: Grotius (1625, 1975, 1990) for free download at: <http://www.geocities.com/Athens/Thebes/8098/>; on Grotius: Bull/ Kingsbury/Roberts (1992); Edwards (1981), Onuma (2001), Tuck (2001, 2005).

But the devastation of New Orleans and the Gulf Coast revealed the existence of an underprivileged underclass, while in November 2005, youth riots in Muslim suburbs of French cities suddenly exploded out of years of low social regard and extremely limited job and career opportunities and could portend serious confrontations ahead.

Two Hundred Years of Cooperative Security

I have mentioned the emergence of cooperative efforts to control war in the Napoleonic period. Two hundred years ago, as the Napoleonic wars were bringing casualties of millions and huge political disruption, a new phenomenon emerged in the history of war. It consisted of two components. The first was establishment of multinational public peace societies proposing a wide range of institutions for avoiding or controlling war, like compulsory arbitration by a neutral international umpire and agreed limitation of arms.

Often in history there has been intense public opposition to specific wars, for example, the opposition in Russia to continuing World War I which led to the Bolshevik Revolution, and the opposition to the Vietnam War in the United States and elsewhere. But what happened in the early nineteenth century after acceptance of war over millennia as desirable or at least as a given component of human history, was the emergence of organizations which categorically opposed war as such. The names and dates of the new organizations in the U.S. and UK were significant: *The Massachusetts Peace Society* (1814), the *New York Peace Society* (1815), the *London Peace Society* (1816), and the *American Peace Society* (1828). These associations agitated for peace and against war through public meetings, pamphlets and tracts, and by lobbying with governments. From the outset, and throughout the nineteenth century, these associations collaborated with organizations in the United States on the one hand and organizations in Great Britain, France, Belgium and Germany on the other, forming a transatlantic community of peace interests. The Western European peace associations were from the outset sceptical of the efforts to achieve categorical rejection of war energetically pursued by the Americans, preferring to promote specific measures to avoid or limit war.

Cooperative Security since the Vienna Final Act of 1815

The second component was the radical innovations of ongoing cooperation among the victors in war, in this case the victors over Napoleon, to maintain the peace. A large part of the credit for this change was due to far-sighted British policy. Prime Minister William Pitt the Younger began to plan the post-war peacekeeping structure in the 1790's. British cash was used to pay off the other main victors over Napoleon – the governments of Austria, Prussia, and Russia – to keep them engaged in the peace process. The four governments formed the Quadripartite Alliance and negotiated the 1815 Vienna Final Act setting forth the terms of the European peace settlement. The British urged that representatives of the four victorious powers meet periodically to discuss and decide on issues arising from the implementation of the Vienna Final Act and to ensure the peace of Europe. To keep a friendly eye on France and to engage French resources in the post-war settlement, France was later admitted to the Quadripartite Alliance, much as defeated Federal Germany was admitted to the NATO alliance over a century later. Continuing Pitt's far-sighted cooperative approach to security, British Foreign Secretary Canning extended to the Western hemisphere a prohibition against territorial acquisition by European states. Cooperation between the British Navy and a much weaker U.S. Navy created a transatlantic zone of peace.²

Over the years, European and American peace associations and governments collaborated in a series of agreements limiting war, like the 1856 Paris Declaration Respecting Maritime Law, the first Geneva Convention (1864) and the agreements at the first and second Hague Peace Conferences. The Concert of Europe lasted only until 1822 in its full form, but for many years peacetime coordination by ambassadors and senior officials continued and reached many agreements. The important innovation of ongoing peacetime coordination of international security by the victors in war was replicated and expanded by the victors in World War I and World War II in the form of the League of Nations and of the United Nations.

As we have seen, by the middle of the nineteenth century, Western – i.e. American, British and Western European – governments and public associations were nagged in close dialogue, exchange of ideas, and in intermittent collaboration on preventing and

controlling war and were establishing institutions and treaties to this end. In fact, a rudimentary global security system was emerging through this transatlantic collaboration.

This collaboration continued throughout the nineteenth century. And, in fact, despite, or because of, the failure of World War I and of World War II, it continued through the twentieth century.

This is not the place to attempt to describe the reasons why, after thousands of years of warfare throughout human history, a revolutionary change in public and also governmental attitudes toward war began to emerge in the early nineteenth century, but at least some of the underlying causes for this radical change seem evident. They include: (1) technological weapon innovation and the mounting carnage, destruction, and cost of war; (2) modern communications and media, which rapidly brought news of military events to publics as well as government officials; (3) social factors, including rising levels of income and education after the Industrial Revolution – this broadened the intellectual horizons of governmental officials and encouraged participation of publics in issues of war and peace; (4) changing, shared values of government officials and publics. These included the emergence of the Grotean idea of a known planet occupied by members of a single species. Finally, (5) the growth of democratic governments and institutions enhanced the influence of the electorate on security and other issues, and the openness of governments to public opinion. Growing understanding and cooperation in the especially difficult area of controlling war and armed conflict was accompanied by the growth of a habit of international cooperation in coping with natural disasters.

Shift from Cooperative to Unilateral Security Policy?

The trend toward global cooperation in a wide variety of areas was continued after the end of the Cold War by skilful diplomacy in the administration of George H.W. Bush, with the unification of Germany and the dissolution of the Soviet Union and the first Gulf War. But the trend toward increasing international cooperation was then sharply broken by the second Bush administration, intoxicated by its situation as the sole superpower, and determined to wield its power without the limitations imposed by allies.

To find the reasons for this sharp break in U.S. policy, we have to go back to the foundation of the

2 See e.g.: Holsti 1991; Kissinger 1994; Osiander 1994.

United States in revolution against established power, its population by political refugees of all kinds, and to the growth of the concept that the United States were especially favoured by divine providence in its institutions and values. At the outset of the twentieth century, a large (25 per cent) component of the American electorate was characterized by attitudes of suspicion and superiority to the outside world and a desire to be isolated from it. But for over 75 years, from World War I to the end of the Cold War, public manifestation of the isolationist position in the U.S. was considered unpatriotic and suppressed through public disapproval. During this period, the reality of the outside world and of American military power became evident to all, including the isolationists. The end of the Cold War removed the pressure of public disapproval and abruptly released the pent-up forces of American isolationism in the transmuted form of heavily armed, highly nationalistic unilateralism,

which captured control of the Congress in 1994 and of the presidency in 2000.

Returning to the Cooperative Tradition of Security Policy

Policy errors, military reverses, denial of cooperation by foreign governments, and the growing disaffection of the American electorate have tempered some of the hubristic excesses of the administration of George W. Bush. The chances are good that after one or two congressional election cycles and a presidential election, the United States will rejoin its own cooperative tradition of the past century and that the trend toward a cooperative world security system will be resumed, with greater U.S.-European collaboration at the UN, in controlling armed violence, and in coping with the environment.

Peace, Development, Ecology and Security IPRA 40 Years after Groningen

Úrsula Oswald Spring

Four Objectives: Peace, Development, Ecology and Security

We the peoples of the United Nations determined to save succeeding generations from the scourge of war, ... and to reaffirm faith in fundamental human rights, in the dignity and worth of the human person, in the equal rights of men and women and of nations large and small, and to establish conditions under which justice and respect for the obligations arising from treaties and other sources of international law can be obtained, and to promote social progress and better standards of life in larger freedom.

The preamble of the Charter of the United Nations, signed on 26 June 1945 in San Francisco, foresaw the conceptual tension between “*we the peoples*” as the reference object of the political debate and scientific discourse on ‘human security’ and the ‘states’ or ‘nations’ as the key actors and objects of activities related to ‘national’ and ‘international security’. ‘National’ vs. ‘human security’ has been in the centre of the political debate and scientific discourse on ‘reconceptualization of security’ that has emerged since the various turns in world history in the late 20th century: the end of the Cold War (1989), the implosion of the Soviet Union (1991) that ended the prevailing bipolar structure of global politics where nuclear deterrence, doctrines of mutual assured destruction (MAD) and an intensive arms race determined by fear, uncertainty as well as technological imperatives, and driven by a security dilemma absorbed more than 1,000 billion US dollars annually for a huge militarized global economy with ‘baroque’ (Kaldor 1982) features.

In Latin America the major turning points have been the end of the military dictatorships, the third

wave of democratization in the 1980’s, and the ‘lost decade’ due to the long-lasting economic crises; in East Asia the end of the Maoist period in China and the financial crisis of the 1990’s, and in Africa the peaceful transformation of South Africa as well as the progressing failure of the state, and the increase of internal violence dominated by warlords and their criminal allies.

This duality is also reflected in the purposes and principles of the United Nations Charter where Art. 1 stated: “to maintain international peace and security”, “to develop friendly relations among nations”, “to achieve international cooperation in solving international problems of an economic, social, cultural, or humanitarian character, and in promoting and encouraging respect for human rights and fundamental freedoms for all without distinction as to race, sex, language, or religion”. To achieve “international peace and security” have been the guiding principles of the United Nations since 1945, while the “international problems” of development and environment have been added later into the UN agenda with the process of decolonization and national independence, and the concern for environmental challenges since the Stockholm Conference on the Environment in 1972.

This preface essay briefly sketches the contextual changes and the lost utopias of the 20th century, the increasing global development gap leading to new development and security linkages before turning to the fragile democracies in Latin America, with poverty and intensifying social cleavages. The preface then turns to peace research, to the first forty years of the International Peace Research Association (IPRA) and the impact of peace researchers on the peace process in Latin America.

Contextual Changes and Lost Utopias in the 20th Century

During the 20th century, the Mexican Revolution (1910), followed by the October Revolution in Russia (1917), created a socialist utopia with the goal to redistribute political and economic power to peasants and workers. The *Russian Revolution* led by Lenin and later Stalin, divided the world into capitalism and communism. During the Stalinist regime in the Soviet Union, internal repression and purges crushed any criticism. In Europe, the competition for imperial dominance between the German and the Austro-Hungarian Empire, the United Kingdom and France led to the First World War (1914–1918), which changed the global geopolitical order, the political context in Europe and in the colonies. The gradual emergence of two new world powers: the United States and the Soviet Union with competing political, economic and social systems, could not avoid World War II. The alliance between Britain, France and United States on one side, and the Soviet Union on the other, defeated Nazi Germany in 1945. However, the trauma of two devastating wars with 20 million deaths after the First and 50 million deaths after the Second World War left deep wounds.

In order to consolidate world peace, 51 nations founded the United Nations Organization (UNO) with a Security Council which is tasked to respond to threats of peace and to foster peaceful cooperation among and to prevent the emergence of conflicts. But at the summit of Yalta in February 1945, a new division of Europe in two spheres of influence was created that evolved into a bipolar global order with an intensive arms race. The competition between both ideological blocks stimulated the growth of science and technology, especially in the military and aerospace sector. In 1957, the Soviet Union launched ‘Sputnik’ as an initial step for the conquest of outer space. During the war and post-war period the knowledge in medicine, pharmacy, vaccines against polio, smallpox and measles, and antibiotics grew rapidly.

In 1989, the euphoria after the fall of the Berlin wall and the hope for a less conflictive world was quickly drowned in old and new-armed confrontations. Instead of using the financial resources as a peace dividend for resolving poverty and its consequences, new conflicts and international terrorism gave birth to a new arms build-up primarily by the sole remaining superpower, comprising weapons of mass destruction (WMD).

Today seven countries are recognized nuclear weapons states (US, Russia, UK, France, China, India, Pakistan), one country is assumed to have nuclear weapons (Israel) and a few other countries have been claimed by the US as ‘rogue states’ trying to acquire such weapons (Iran, North Korea) while no weapons of mass destruction were found in Iraq in 2003, and Libya has given up its ambitions to acquire such weapons.

The conflictive situations in South East and East Asia with the Korean (1950–1953) and the Vietnam War (1963–1975), in the Middle East between Israel and its Arab neighbours as well as between Iraq, Iran and Kuwait (1980–1988, 1990–1991), in Africa and in many countries of Asia (Riegel 2001) have led to a systematic reflection on peace, conflict resolution and non-violence that has led during the Cold War to the emergence of a value-oriented and critical scientific research programme focusing on peace and conflict research with the goal to overcome this global conflict structure with peaceful change.

Development and Security: The Development Gap

After five decades of development strategies and multiple programmes the North-South gap in terms of GDP has grown, as has the income gap between rich and poor within countries (CEPAL 2004). This gap is especially critical for those countries with high levels of poverty, malnourishment, subsistence crops, raw material exports, and insufficient educational facilities and infrastructure, leading often to failing state institutions in the so-called ‘Fourth World’ (Nuscheler 1995; Arnsprenger 1999). Old colonial structures have undermined independence through inherited borders dividing people, neo-colonialism and warlords, linked to the personal interest of elites and “belly politics” (Bayart 1993), thus transforming parts of Sub-Sahara Africa into ‘failed states’ (Tetzlaff 2003). Most industrialized countries have remained indifferent to this human drama that has become even more urgent due to the HIV/AIDS pandemic that has killed millions of people and worsened social and political conditions in many countries (Ngoma/Le Roux in this volume; Poku 2008), thus mortgaging the future socio-economic development of these countries (Horkheimer/Adorno 1947).

In this complex socio-economic and environmental context, new threats for collective and personal security have emerged. They have been further aggra-

vated by global climate change, increase of disasters, chaotic urbanization, unemployment, terrorist acts, organized crime, illegal migration, structural discrimination of women, and violence in families that often led to survival strategies of young people. The coexistence of these phenomena offers scientists and peace researchers a renewed opportunity to rethink the importance of development processes with the goal to improve environmental and human security.

Undoubtedly the development paradigm has become more complex (Küng/Senghaas 2004), but also more similar between developing countries and the poor. It has been homogenized by the process of globalization and characterized by instant world communications (Castells 2002; Habermas 2001a), financial flows (Mesjasz 2003), and increasing trade interdependence (Solis/Diaz/Ángeles 2002), controlled by multinational enterprises (Kaplan 2003; Saxe-Fernandez 2004). Free market ideology, private competition, deregulation and increasing privatization processes and mergers of enterprise (WB, IMF, G-7), linked to a shrinking state intervention, are the new 'growth motors' championed by multinational enterprises and the multilateral organizations of Bretton Woods (World Bank, International Monetary Fund), as well as the World Trade Organization.

This economic model of late capitalism (Habermas 1995; Saxe Fernández 2003; Oswald Spring 2004) has concentrated income and wealth but also augmented unemployment, increasingly excluding young and old people from the labour market, and relying on temporary female workers with lower standards. This model has been politically and military supported by a superpower and its allies and the economic elites in developing countries. Military superiority and an increasing homogenized culture based on consumerism and mass media manipulation (Castells 2002) have created four main conflict foci: a) poverty, marginalization and exclusion; b) militarism and physical violence; c) gender, indigenous and minority discrimination; and d) environmental destruction with natural resource depletion.

Fragile Democracies, Poverty, and Income Gap in Latin America

In the 1960's and 1970's, dependency theories emerged from Latin America that have been developed further into a centre-periphery approach by Senghaas (1972) and to a 'structural imperialism' by Galtung (1975). Asia contributed its experiences with non-

violence and 'ahimsa' that led first to independence of India and later to peace education. The non-violent movement for racial liberation in the US, inspired by Martin Luther King, provided another input. In the rainbow nation of South Africa, the peaceful transition from Apartheid and repression to democracy was crucial for future peace efforts in Latin America (e.g. in El Salvador, Nicaragua and Guatemala) and in Asia (India, Pakistan and other internal conflicts) during the 1990's. The reconciliation processes between victimizers and victims created models of multidimensional integration and 'Truth Commissions' promoting democratization processes.

Nevertheless, the results of five decades of development are disappointing, with at least two lost decades in Latin America. The increasing concern with poverty, urbanization, and climate change has led the *United Nations Development Programme* (UNDP 1994) to shift the traditional narrow security focus linked to nation states to a new concept, directly related to people, it termed as 'human security' to complement its goal of 'human development'. For UNDP human security focuses on life and dignity instead of military threats, and includes "protection from the threat of disease, hunger, unemployment, crime, social conflict, political repression and environmental hazards" (UNDP 1994: 23).

The Canadian and Norwegian governments have promoted 'human security' as part of a new foreign policy and *Weltanschauung* with a focus on 'freedom from fear' in order "to provide security so individuals can pursue their lives in peace" (Krause 2004). According to the Canadian Foreign Ministry "Lasting security cannot be achieved until people are protected from violent threats to their rights, safety or lives". The threats are posed by interstate and intrastate conflicts, crimes, domestic violence, terrorism, small arms, inhumane weapons and antipersonnel landmines, which requires a strict application of the rule of law with transparent national, regional and local judicial courts and mechanisms, the fulfilment of human rights law and education, including good governance, democracy, respecting minorities and conflict prevention (Dedring in this volume).

The Japanese approach has focused on 'freedom from want' and it "comprehensively covers all menaces that threaten human survival, daily life, and dignity ... and strengthens efforts to confront these threats", such as diseases, poverty, financial crises, hunger, unemployment, crime, social conflict, political repression, land degradation, deforestation, environmental hazards, population growth, migration, ter-

rorism, drug production and trafficking. At the initiative of Japan a *Commission on Human Security* (CHS) was established in 2001 promoting public understanding, engagement, and support for human security; developing the concept as an operational tool for policy formulation and implementation, and proposing concrete programmes to address critical threats. *Human Security Now* (CHS 2003) supports the Millennium Development Goals within a people-centred security framework, by offering 2.8 billion persons a prospect for a life with dignity that suffer from poverty, bad health, illiteracy, and violence (Shinoda 2008).

With regard to Latin America the economic crises and the persistence of poverty – closely related to the neoliberal model adopted by most governments and their elites – has widened the internal income gap, destroyed the middle class, and reduced the job prospects for most young people. The euphoria with overcoming the military regimes and electing democratic governments collapsed with the increasing crises. In the early 21st century most people seem to prefer an authoritarian government and economic stability over a democratic system of rule (see chapter 26 by Oswald in this volume).

Latin America has the most unequal income distribution in the world, with a concentration of wealth in small elites. Between 1990 and 2002, only five countries improved their economic situation; seven lost and six maintained it (CEPAL 2004). A tendency prevails to concentrate wealth in the upper class, making the middle class and the poor highly vulnerable. Urban and rural women have coped with these crises with their own survival strategies (Oswald 1991). Furthermore, a large number of peasants abandoned their rural livelihood, migrated to urban slums or left illegally for the US.

IPRA 40 Years After Groningen and the Peace Process in Latin America

In 1959, the *Peace Research Institute* in Oslo (PRIO) was founded, and different peace initiatives from the Scandinavian countries have emerged. Their link to women's emancipation movements and the declaration of human rights prepared the soil for a more systematic and international reflection on peace.

In 1962, the *Women's International League for Peace and Freedom* (WILPF) established a Consultative Commission on peace research. The International Peace Research Newsletter (IPR-N) appeared the fol-

lowing year, and a preliminary meeting was held in Switzerland. In 1964 the *International Peace Research Association* (IPRA) was founded in London and in 1964, Bert Røling (1970) organized its first international meeting in Groningen (The Netherlands).¹ Elise Boulding (1992, 2000) and Kenneth Boulding (USA) were among the intellectual pioneers of peace research and of IPRA in the US.

In the 1960's, new peace research institutes were founded in Northern Europe and in the early 1970's in Central Europe. In Sweden in 1966, the Stockholm International Peace Research Institute (SIPRI) was launched by Gunnar and Alva Myrdal. In 1967 in Copenhagen (Denmark) a small private peace research institute emerged that was later replaced by the Copenhagen Peace Research Institute (COPRI) that became in 2003 part of the Danish Institute of International Studies (DIIS), and in 1970 in Finland the Tampere Peace Research Institute (TAPRI) was set up with the support of the Finnish Parliament. Peace and conflict research institutes and programmes were later set up at several other Scandinavian universities, e.g. in Uppsala, Göteborg, Tromsø. Somewhat later, in Germany several peace research institutions were founded.²

Since the 1970's, peace research institutes, programmes, units and societies were established in many universities in Europe (e.g. the Swiss Peace Foundation), in North America (), in Mesoamerica (),

1 See: IPRA's history at: <http://soc.kuleuven.be/pol/ipra/about/history.html>: Founded in 1964, IPRA developed from a conference organized by the 'Quaker International Conferences and Seminars' in Clarens, Switzerland, 16–20 August 1963. The participants decided to hold international Conferences on Research on International Peace and Security (COROIPAS). Under the leadership of John Burton, the Continuing Committee met in London, 1–3 December 1964. At that time, they took steps to broaden the original concept of holding research conferences. The decision was made to form a professional association with the principal aim of increasing the quantity of research focused on world peace and ensuring its scientific quality. An Executive Committee including Bert V. A. Røling, Secretary General (The Netherlands), John Burton (United Kingdom), Ljubivoje Acimovic (Yugoslavia), Jerzy Sawicki (Poland), and Johan Galtung (Norway) was appointed (Galtung 1998). This group was also designated as Nominating Committee for a 15-person Advisory Council to be elected at the first general conference of IPRA, to represent various regions, disciplines, and research interests in developing the work of the Association. See also Kodama (2004) at: http://soc.kuleuven.be/pol/ipra/downloads/notebook_attachments/IPRApath.pdf.

in Africa (), and in Asia (Kodama 2004). Later the *International Peace Research Association* (IPRA) was assisted by regional peace research societies, such as the *European Peace Research Association* (EUPRA) and the *North American Consortium on Peace Research, Education and Development* (COPRED) that in 2001 merged with the *Peace Studies Association* (PSA) to become *The Peace and Justice Studies Association* (PJSJA), the *Latin American Council on Peace Research* (CLAIP), the *Asia-Pacific Peace Research Association* (APPRA) as well as the *African Peace Research Association* (AFPRA). In 1974, IPRA organized its first International Peace Research Association (IPRA): congress in Varanasi (India), in 1977 in Oaxtepec (Mexico), in 1988 in Rio de Janeiro (Brazil), and in 1998 in Durban (South Africa), thus gradually overcoming its original basis in OECD and in Socialist countries, learning from the South on issues like non-violence, conflict resolution, and conciliation processes with Truth Commissions. During the 1970's, peace educators joined peace researchers in IPRA and in the 1980's, peace movements generated a third pillar of the organization.

After 42 years, the balance of IPRA has been positive. Several study groups have changed their initial research subject adapting to the different threats to peace, and other groups have started studying new themes. As an example, the *Food Study Group* changed after 10 years to the *Human Right to Food Group* and finally, split into two commissions: one studying international human rights, especially collaborating with the rights of children and women; and the other group started including environmental rights and the new threats of global warming, water scarcity, and environmental pollution in war and after war regions. This last commission changed four years ago and is presently known as the *Ecology and Peace Commission*.

In 2006 at its 21st conference in Calgary, IPRA's work was taking place in 19 standing Commissions: Art and Peace ; Conflict Resolution and Peace-Building; Eastern Europe ; Ecology and Peace; Forced Migration; Gender and Peace; Global Political Economy; Indigenous Peoples' Rights; Internal Conflicts; International Human Rights; Nonviolence (Kelly/Paige/Gilliart 1992; Glenn 2002); Peace Culture and Communications; Peace Education; Peace History; Peace Movements; Peace Theories; Reconciliation; Religion and Peace; and the Security and Disarmament Commission.

The interrelation of peace education with practical peace learning courses brought peace researchers together with peace movements and gave new dynamism into the organization. Changes in the General Secretariat and Presidency of IPRA from Europe (1964-1979, 1995-2000, 2005-) to Japan (1979-1983, 2000-2005), the US (1983-1987, 1989-1994), to Latin America (1987-1989, 1998-2000) and the Pacific (1994-1998) is a sign that international networks exists and are active in the field of conciliation and theory development. If sometimes tense relations have existed between members, study commissions exist; this itself is a dynamic expression of the complexity of peace research and a challenge for applying theoretical knowledge into practice. However, the critical financial situation of IPRA has made it difficult to designate a Secretary-General from a Southern country, since host universities have to cooperate with the running administrative costs and offer some staff to organize and promote international conferences. This fact is especially important in order to maintain the equilibrium between regions as well as gender balance. During its 42-year history only one Secretary-General and one President of IPRA were women (table 1); however, five of six vice-presidents (1994-2000) were women from Hungary, Germany, Lebanon, Chile and Togo.

In 1977, IPRA held its first international conference in Oaxtepec (Mexico) at a time when this country had accepted refugees from almost all Latin American countries that were expelled by repressive military dictatorships. In 1977, with more than 120 Latin American scholars present, the *Latin American Council of Peace Research* (CLAIP) was created. Its activities were linked to the democratization processes occurring in Latin American nations, and international denunciations of torture, human right infractions, massacres and disappearances of social and political leaders were made internationally (CLAIP, 1979; Mols 2004). Gradually, during the 1980's and

2 In Germany, at the initiative of Federal President Gustav Heinemann a German Society for Peace and Conflict Research (DGFK) was set up in 1970, in 1971 the Peace Research Institute in Frankfurt (HSFK or PRIF), and the Institute for Peace Research and Security Policy at the University of Hamburg (ISFH) were founded. Later peace research units and programmes were developed at several German universities, e.g. in Tübingen (1970), Münster, Marburg, and Duisburg and as independent non-profit scientific institutions, e.g. AFES-PRESS in 1987; Brauch/Bräunling/Hermle/Mallmann 1969; Brauch 1979; Rittberger/Zürn 1990; Wasmuht 1999. In 2001 an independent German Society for Peace Research (DGFF) was set up in Osnabrück.

20.	Sopron, Hungary (2004)		
21.	Calgary, Canada (2006)		
		Presidents	
		The first IPRA President was Kevin Clements (New Zealand, 1994 – 1998).	
		His successor was Úrsula Oswald Spring (Mexico, 1998 – 2000).	

1990's, many researchers returned to their countries with democratically elected governments, bringing peace messages with them.

But structural, physical and cultural violence still remained, linked now with organized crime, drug trafficking, gangs, post-war traumas, extreme poverty, chaotic urbanization, and often-illegal international migration. CLAIP members and Latin American (LA) universities are studying these processes of violence, and become directly involved in peace-building processes in South and Central America. The complex situation brought up national and sub-regional peace associations at *FLACSO* (Secretary-General Francisco Rojas) with affiliates in Chile, Argentina, Brazil, Costa Rica, Cuba, El Salvador, Guatemala, Mexico and the Dominican Republic; the *Pontífica Universidad Católica* of Peru (Felipe Mac Gregor); the *University of Brasilia* (Nielsen Paolo de Pires) and the *Holistic University in Brazil* (Peter Weil); the *University of Peace in Costa Rica*; *Respuesta para la Paz* in Argentina (Sara Horowitz and Diana de la Rúa); and the *Institute of International Relations and Peace Research* (IRIPAZ, Luis Alberto Padilla) in Guatemala. They are researching peace, conflicts and conflict resolution; regional conflict resolution (Haiti, Peru-Ecuador, Bolivia); public policy of conflict prevention and peace; education and peace formation; mediation and nego-

tiation; international relations, development and horizontal cooperation in LA; ongoing changes and threats in Latin America; sustainable development, ecology and disasters; technology of information; globalization, transnationalization and corruption; social exclusion; integration of LA and LA Parliament; defence, small and light armaments and humanitarian aid. Peace efforts in LA were systematized (CLAIP 1979); globalization and peace research reviewed (Oswald 2000); peace was linked to security and democratization processes in LA (Oswald 2002) and non-violent conflict resolution between indigenous and minorities explored (Oswald 2004 and 2004a).

The positive experience of CLAIP, given its links with universities and social movements in the subcontinent, induced the establishment of the *Asian Pacific Peace Research Association*, and the highly conflictive situation in Africa stimulated also the creation of an *African Peace Research Association*. In 1998, the international congress was held in Durban, South Africa, in order to learn from the peaceful transition processes, led by Nelson Mandela. His leadership in Africa involved multiple peace efforts and reconciliation processes between historically divided ethnic groups and struggling clans.

The complexity of socio-economic, environmental, and political conflicts brought IPRA through its

regional associations a larger field of research. New challenges to peace education (Reardon 1996; Reardon/Norland 1994), a growing field to analyze and participate in worldwide peace activism; alternative bottom-up models of governance and women struggling for dignified life conditions obliged IPRA to widen its research perspectives. IPRA showed governments and international organizations that human beings want to live in peace and use processes of non-violent conflict resolution. Conflicts are motors of change and development, but when reoriented to personal ambitions and geopolitical interests mismanaged conflict and change dynamics (Gluckman 1965) can destroy the entire world. Physical and structural violence is inherent in the highly competitive free-market system and its present laws of globalization, where specifically women were affected by the loss of human security.

In summary, the socialist utopia was destroyed by a repressive and bureaucratic communist regime. Which utopia is left to develop ethic principles, communitarian responsibility and environmentally sustainable development processes, in order to induce 'post-modern democracy of consensus', with equity, cultural diversity, real citizen representation, life quality and human, gender and environmental security (HUGE; Oswald 2001)?

The history of wars, domination, and destruction brought poverty and death. Will the emerging civilization guarantee diverse, just, equitable, and sustainable coexistence caring for the vulnerable? This is the challenge for peace researchers, educators and actors, and IPRA together with CLAIP has to reinvigorate its effort to find concrete answers to these new challenges.

Globalization from Below: Ecofeminist Alternatives to Corporate Globalization

Vandana Shiva

Introduction

Corporate globalization is a transfer of knowledge and natural resources, like seeds and water held, conserved, and used collectively by women for their communities, to global corporations. This transfer of wealth goes hand in hand with the transformation of nature, society, and women's status. Biodiversity and water are transformed from commons to commodities. Women, the creators of value, the providers of basic needs are turned into a dispensable sex. As women's rights to seed and water, their rights arising from providing food and water are eroded, women are devalued in society. When the sacred Ganga becomes a commodity, women, the water providers become dispensable. When agriculture is chemicalized and corporatized, women's work in agriculture is destroyed. As women are displaced from work, they not only lose their right to work, they also lose their right to live.

The practice of female feticide started in Punjab in the late 1970's as a consequence of the convergence of the commodification of agriculture, and with it the commodification of culture, women's displacement from productive roles in agriculture, and the rise of new technologies. In the last two decades female feticide has denied more than 10 million women their right to be born. Every year about 500,000 unborn girls are aborted.¹ India's population grew 21 per cent between 1991 and 2001 to 1.03 billion people. While the population grew, girls were disappearing. The change in sex ratio combined with population growth reveals there are 36 million fewer females in the pop-

ulation than would be expected. This is half the world's 60 million 'missing' women - those women who were not allowed to be born because of sex-selective abortion. And female feticide is most prevalent in rich, high growth areas like Punjab, Haryana, Delhi, and Gujarat. These are the areas where the culture of the market is the defining source of value. And in this marketplace women have no value but just a market price. In a market calculus it is cheaper to abort a female fetus than pay a dowry for a daughter.

The spread of dowry - used largely for purchasing consumer goods such as cars, televisions, and refrigerators - is contemporaneous and contiguous with the spread of the culture of consumerism. But women are not just victims of corporate globalization. They are also its strongest resisters and creators of alternatives.

Women's Rights to Knowledge and Biodiversity

Globalization and technological change is changing women's rights at two levels. Firstly, it is eroding women's rights to knowledge and creativity, to natural wealth like biodiversity and water. Women in India are the seed keepers and water keepers. They are also the keepers of traditional knowledge. The emergence of new forms of property as 'intellectual property' is allowing the piracy of centuries of traditional knowledge by global corporations. This in effect is a transfer of knowledge from women to corporations, and is an undermining of women's knowledge and creative rights. That is why I have spent the last decade fighting illegitimate forms of 'intellectual property' based on biopiracy as illustrated below in the three cases of *neem*, *basmati*, and wheat.

1 See: "10 million girls missing in India", in: *Asian Age*, 9 January 2006; "Female Feticide in India crossed 1 crore in 20 years", in: *Indian Express*, 9 January 2006.

On 8 March 2005, International Women's Day, we won a major victory in a biopiracy case after a 10-year legal battle in the European Patent Office. The United States Department of Agriculture and W.R. Grace jointly claimed to have 'invented' the use of the *neem tree* (*Azadirachta indica*) for controlling pests and diseases in agriculture. On the basis of this claim they were granted patent number 436257 by the European Patent Office.

Neem, or *azad darakht* to use its Persian name, which translates as free tree, has been used as a natural pesticide and medicine in India for over 2,000 years. As a response to the 1984 disaster at the Union Carbide's pesticide plant in Bhopal, I started a campaign with the slogan: "no more Bhopals, plant a *neem*." A decade later we found that because W.R. Grace was claiming to have invented the use of *neem*, the free tree was no longer going to be freely accessible to us. We launched a challenge to the *neem* biopiracy and more than 100,000 people joined the campaign. Another decade later, the European Patent Office revoked the patent.

Our success in defeating the claims of the US government and US corporations to traditional knowledge and biodiversity came because we combined research with action, and we mobilized and built movements at the local level. Three women working in global solidarity - Magda Aelvoet, former president of the Greens in the European Parliament; Linda Bullard, the president of the International Federation of Organic Agriculture Movements (IFOAM); and myself - saw the case through for over a decade without losing hope. Our lawyer, Dr. Dolder, a professor of intellectual property at Basel University, gave his best without expecting typical patent lawyer fees.

The *neem* victory throws light on one of the most pernicious aspects of the current rules of globalization - the WTO's *Trade Related Aspects of Intellectual Property Rights* (TRIPS) agreement. TRIPS allows global corporations to patent anything and everything - life forms, seeds, plants, medicines, and traditional knowledge. Patents are supposed to satisfy three criteria: novelty, non-obviousness, and utility. 'Novelty' requires that the invention not be part of 'prior art' or existing knowledge; 'non-obviousness' requires that someone familiar in the art would not take the same step. Most patents based on the appropriation of indigenous knowledge violate these criteria, because they range from direct piracy to minor tinkering involving steps obvious to anyone trained in the techniques and disciplines involved. Since a patent is an exclusive right granted for an invention, patents

on life and traditional knowledge are twice as harmful and add insult to injury. Such patents are not based on inventions; they serve as instruments for preventing the poor from satisfying their own needs and using their own biodiversity and their own knowledge.

Patents on seeds not only allow monopolies on genetically engineered seed, they allow patenting of traditional varieties and properties used by farmers over millennia. This biopiracy is illustrated in the cases of rice and wheat.

Basmati Biopiracy

The Indian subcontinent is the biggest producer and exporter of superfine aromatic rice: *basmati*. India grows 650,000 tons of basmati annually. Basmati covers 10 to 15 per cent of the land area under rice cultivation in India. Basmati and non-basmati rice are exported to more than 80 countries across the world. Basmati exports were 488,700 tons and amounted to US \$ 280 million. Non-basmati rice exports in 1996-1997 were 1.9 million tons and amounted to US \$ 450 million. The main importers of Indian basmati are the Middle East (65 per cent), Europe (20 per cent) and the US (10 to 15 per cent). Fetching US \$ 850 a ton in the European Union (EU) compared with US \$ 700 a ton for Pakistani basmati and US \$ 500 a ton for Thai fragrant rice. Indian basmati is the most expensive rice being imported by the EU. Basmati has been grown for centuries on the subcontinent, as is evident from ancient texts, folklore, and poetry. One of the earliest references to basmati is made in the famous epic of *Heer Ranjha*, written by the poet Varis Shah in 1766. This naturally perfumed variety of rice has been treasured and possessively guarded by nobles, and eagerly coveted by foreigners. It has evolved over centuries of observation, experimentation, and selection by farmers who have developed numerous varieties of the rice to meet various ecological conditions, cooking needs, and tastes. There are 27 documented varieties of basmati grown in India. The superior qualities of basmati must predominantly be attributed to the contributions of the subcontinent's farmers.

On 2 September 1997, Texas-based RiceTec was granted patent number 5663484 on basmati rice lines and grains. The patent of this 'invention' is exceptionally broad and includes 20 claims within it. The patent covered the genetic lines of basmati and includes genes from the varieties developed by farmers. It thus automatically covered farmers' varieties and allowed

RiceTec to collect royalties from farmers growing varieties developed by them and their forefathers.

RiceTec's strain, trading under brand names such as Kasmati, Texmati, and Jasmati, possess the same qualities – long grain, distinct aroma, high-yield, and semi-dwarf – as our traditional Indian varieties. RiceTec is essentially derived from basmati; it cannot be claimed as 'novel' and therefore should not be patentable. Through a four-year-long campaign, we overturned most of RiceTec's patent claims to basmati.

Wheat Biopiracy

Monsanto's biopiracy of Indian wheat forms an integral part of the life of most Indians. It has been the principal crop in several regions of India for thousands of years. India is the second-largest producer of wheat (73.5 million tons) after China. Twenty-five million hectares of wheat are cultivated in India. In addition to being the staple food of most Indians, wheat is closely associated with religious ceremonies and festivals. Each traditional variety has its own religious or cultural significance. The different varieties of wheat, the use of different wheat preparations in rituals, and the medicinal and therapeutic properties of wheat have all been documented in ancient Indian texts and scriptures.

Monsanto's patent registered with the European Patent Office claims to have 'invented' wheat plants derived from a traditional Indian variety and products made from the soft milling traits that the traditional Indian wheat provides. Monsanto's patent claims its plants were derived from varieties of traditional Indian wheat called Nap Hal. There is no traditional Indian wheat called Nap Hal. In Hindi the word would mean 'that which gives no fruit' and could be a name for Monsanto's terminator seeds. 'Nap Hal' is evidently a distortion of 'Nepal', since the wheat varieties were collected from near the Nepal border.

In February 2004, the Research Foundation and Greenpeace filed a legal challenge against Monsanto's biopiracy. By September 2004, Monsanto's patent had been revoked. These victories do not mean our work is over. Corporations continue to patent life forms and pirate traditional knowledge. They also continue to impose unjust and immoral seed and patent laws on countries. Parallel to the struggle to defend women's rights to biodiversity and knowledge is the struggle to defend the women's right to water.

Women's Right to Water

Women in a small hamlet in Kerala succeeded in shutting down a *Coca-Cola* plant. "When you drink Coke, you drink the blood of people," said Mylamma, the woman who started the movement against Coca-Cola in Plachimada. The Coca-Cola plant in Plachimada was commissioned in March 2000 to produce 1,224,000 bottles of Coca-Cola products a day and issued a conditional license to install a motor-driven water pump by the *panchayat*. However, the company started to illegally extract millions of litres of clean water. According to the local people, Coca-Cola was extracting 1.5 million litres per day. The water level started to fall, dropping from 150 to 500 feet below the earth's surface. Tribals and farmers complained that water storage and supply were being adversely affected by indiscriminate installation of bore wells for tapping groundwater, resulting in serious consequences for crop cultivation. The wells were also threatening traditional drinking-water sources, ponds and water tanks, waterways and canals. When the company failed to comply with the panchayat request for details, a show cause notice was served and the license was cancelled. Coca-Cola unsuccessfully tried to bribe the panchayat president A. Krishnan, with 300 million rupees.

Not only did Coca-Cola steal the water of the local community, it also polluted what it didn't take. The company deposited waste material outside the plant which, during the rainy season, spread into paddy fields, canals, and wells, causing serious health hazards. As a result of this dumping, 260 bore wells provided by public authorities for drinking water and agriculture facilities have become dry. Coca-Cola was also pumping wastewater into dry bore wells within the company premises. In 2003, the district medical officer informed the people of Plachimada that their water was unfit for drinking. The women, who already knew their water was toxic, had to walk miles to get water. Coca-Cola had created water scarcity in a water-abundant region.

The women of Plachimada were not going to allow this hydro piracy. In 2002 they started a *dharna* (sit-in) at the gates of Coca-Cola. To celebrate one year of their agitation, I joined them on Earth Day 2003. On 21 September 2003, a huge rally delivered an ultimatum to Coca-Cola. And in January 2004, a World Water Conference brought global activists like Jose Bové and Maude Barlow to Plachimada to support the local activists. A movement started by local

adivasi women had unleashed a national and global wave of people's energy in their support.

The local panchayat used its constitutional rights to serve notice to Coca-Cola. The Perumatty panchayat also filed public interest litigation in the Kerala High Court against Coca-Cola. The court supported the women's demands and, in an order given on 16 December 2003, Justice Balakrishnana Nair ordered Coca-Cola to stop pirating Plachimada's water. Justice Nair's decision stated:

The public trust doctrine primarily rests on the principle that certain resources like air, sea, waters, and the forests have such a great importance to the people as a whole that it would be wholly unjustified to make them a subject of private ownership. The said resources being a gift of nature, they should be made freely available to everyone irrespective of their status in life. The doctrine enjoins upon the government to protect the resources for the enjoyment of the general public rather than to permit their use for private ownership or commercial purpose. Our legal system – based on English common law – includes the public trust doctrine as part of its jurisprudence. The State is the trustee of all natural resources, which are by nature meant for public use and enjoyment. Public at large is the beneficiary of the sea-shore, running waters, airs, forests, and ecologically fragile lands. The State as a trustee is under a legal duty to protect the natural resources. These resources meant for public use cannot be converted into private ownership.

On 17 February 2004, the Kerala chief minister, under pressure from the growing movement and a drought-aggravated water crisis, ordered the closure of the Coca-Cola plant. The victory of the movement in Plachimada was the result of creating broad alliances and using multiple strategies. The local movement of women in Plachimada triggered recognition of people's community rights to water in law, while also triggering movements against the 87 other Coca-Cola and Pepsi plants where water is being depleted and polluted.

Plachimada Declaration

Water is the basis of life; it is the gift of nature; it belongs to all living beings on earth.

Water is not private property. It is a common resource for the sustenance of all.

Water is the fundamental human right. It has to be conserved, protected, and managed. It is our fundamental obligation to prevent water scarcity and pollution and to preserve it for generations.

Water is not a commodity. We should resist all criminal attempts to marketize, privatize, and corporatize water. Only through these means can we ensure the fundamental and inalienable right to water for people all over the world.

The water policy should be formulated on the basis of this outlook.

The right to conserve, use, and manage water is fully vested with the local community. This is the very basis of water democracy. Any attempt to reduce or deny this right is a crime.

The production and marketing of the poisonous products of the Coca-Cola and Pepsi-Cola corporations lead to total destruction and pollution and also endangers the very existence of local communities.

The resistance that has come up in Plachimada, Puduchery, and in various parts of the world is the symbol of our valiant struggle against the devilish corporate gangs who pirate our water.

We, who are in the battlefield in full solidarity with the adivasis who have put up resistance against the tortures of the horrid commercial forces in Plachimada, exhort the people all over the world to boycott the products of Coca-Cola and Pepsi-Cola.

Plachimada created new energy for local resistance everywhere. In May 2004, groups from across India fighting against water mining met in Delhi to coordinate their actions as the *Coca Cola Pepsi Quit India Campaign*.

Commodification of Our Rivers

Delhi, India's capital has been sustained for centuries by the river Yamuna. The 16th century poet Sant Vallabhacharya wrote the *Yamunastakam* in praise of the Yamuna.

I bow joyfully to Yamuna, the source of all spiritual abilities.

You are richly endowed with innumerable sands glistening from contact with lotus-feet of Krishna.

Your water is delightfully scented with fragrant flowers from the fresh flowers from the fresh forests that flourish on your banks.

You bear the beauty of Krishna, Cupid's father, who is worshipped by both the gods and demons.

You rush down from Kalinda Mountain, your waters bright with white foam.

Anxious for love you gush onward, rising and falling through the boulders.

Your excited, undulating motions create melodious songs, and it appears that you are mounted on a swaying palanquin of love.

Glory be to Yamuna, daughter of the sun, who increases love for Krishna.

You have descended to purify the earth.

Parrots, peacocks, swans, and other birds serve you with their various sons, as if they were your dear friends.

Your waves appear as braceleted arms, and your banks as beautiful hips decorated with sands that look like pearl-studded ornaments.

I bow to you, fourth beloved of Krishna.

You are adorned with countless qualities, and are praised by Siva, Brahma, and other gods.

Two decades of industrialization have turned the Yamuna into a toxic sewer. Instead of stopping the pollution, the World Bank, using the scarcity created by the pollution, pushed the Delhi government to privatize Delhi's water supply and get water from the Tehri Dam on the Ganges, hundreds of miles away. A privatized plant that could have been built for 1 billion rupees has cost the public 7 billion rupees.

The privatization of Delhi's water supply is centered around the Sonia Vihar water treatment plant. The plant, which was inaugurated on 21 June 2002, is designed at a cost of 1.8 billion rupees for a capacity of 635 million litres a day on a 10-year build-operate-transfer (BOT) basis. The contract between Delhi Jal Board and the French company *Ondeo Degremont* (a subsidiary of the *Suez Lyonnaise des Eaux* Water Division – the water giant of the world), is supposed to provide safe drinking water for the city.

The water for the Suez-Degremont plant in Delhi will come from the Tehri Dam through the Upper Ganga Canal to Muradnagar in Western Uttar Pradesh and then through a giant pipeline to Delhi. The Upper Ganga Canal, which starts at Haridwar and carries the holy water of the Ganga to Kanpur via Muradnagar, is the main source of irrigation for this region.

Suez is not bringing in private foreign investment. It is appropriating public investment. Public-private partnerships are, in effect, private appropriation of public investment. But the financial costs are not the highest costs. The real costs are social and ecological. The Ganga is also being transformed from a river of life to a river of death by the ecological consequences of damming and diversion. The Tehri Dam, located in the outer Himalaya, in the Tehri-Garhwal district of Uttaranchal, is planned to be the fifth highest dam in

the world. If completed, it will be 260.5 metres high and create a lake spread over an area of 45 square kilometres of land in the Bhagirathi and Bhilangana valleys. The dam will submerge 4,200 hectares of the most fertile flat land in those valleys without benefiting the region in any way.

Additionally, the area is earthquake prone and the huge Tehri Dam is located in a seismic fault zone. Between 1816 and 1991, there have been 17 earthquakes in the Garhwal region, with recent ones occurring in Uttarkashi in 1991 and Chamoli in 1998. The International Commission on Large Dams has declared the dam site "extremely hazardous."

If the dam collapses from an earthquake – or from any other fault, such as a landslide – the devastation will be unimaginable. The huge reservoir will be emptied in 22 minutes. Within an hour Rishikesh will be under 260 metres of water. Within the next 23 minutes Haridwar will be submerged under 232 metres of water. Bijnor, Meerut, Hapur, and Bulandshahar will be under water within 12 hours. The dam is potentially dangerous for large parts of North-western India, and large areas in the Gangetic Plain could be devastated.

Delhi's ever growing water demands have already led to major diversions of water from other regions. Delhi already gets 455 million litres from the Ganga. With the Sonia Vihar plant's demand for 635 million litres, 1,090 million litres per day are diverted from the Ganga. Further diversions of three billion cubic metres per second from the Ganga are built into the Sharda and Yamuna river link. Delhi is also demanding 180 million litres per day to be diverted from Punjab's Dhakra Dam. Water will also be diverted to Delhi from the Renuka Dam on the Giri River (1,250 million cubic litres per day) and Keshau Dam on the Tons River (610 million cubic litres per day). These diversions will have huge ecological and social costs. On 13 June 2005, five farmers were shot while protesting the diversion of water from Bisalpur dam for Jaipur city through an Asian Development Bank project. The mega diversion for water waste by the rich in Delhi could trigger major 'water conflicts'.

Building water democracy means building alliances. When advertisement for the inauguration of Suez's Sonia Vihar plant appeared on 2 June 2002, I started to contact citizens groups in Delhi and people's movements along the Ganges. Each group helped frame the struggle against privatization and everyone's issue became a key to resistance. The 100,000 people displaced by Tehri Dam were linked to the millions of Indians who hold the Ganges as a

cred, who, in turn, were connected to farmers whose land and water would be appropriated. Millions signed petitions saying, "Our Mother Ganga is not for sale." We organized a Jal Swaraj Yatra (a water democracy journey) from 15 to 22 March, World Water Day. We did Ganga Yatras to rejuvenate the living culture of the sacred Ganges. A million people were reached; 150,000 signed a hundred-metre 'river' of cloth to protest privatization.

The government of Uttaranchal (where the Tehri Dam is located) and the government of Uttar Pradesh (from where the water was to be diverted) refused to supply water to the Suez plant in Delhi. We do not need privatization or river diversions to address Delhi's water problems. We have shown how with eq-

uitable distribution and a combination of conservation, recycling, and reduction in use, Delhi's water needs can be met locally. We need democracy and conservation. The seeds for the water democracy movement in Delhi have been sown. We now have to nurture them to reclaim water as a commons and a public good. When Paul Wolfowitz visited India as the President of World Bank, women were there to tell him and the World Bank to keep their hands off our water.

As we defend our seed and knowledge, our food and water, we are shaping another world - a world centred on women and nature, a world sustaining the life of all beings.

Towards a Human Security Perspective for the Mediterranean

Narcís Serra

The Mediterranean presents many challenges in terms of security, as it is a focus for many of the political, economic, and social tensions that can also be found on a global scale. Thus in 1995, the leaders of European and Mediterranean countries decided to launch the Barcelona Process with the aim of working together to build an area of peace, shared prosperity, and human exchange. Today, these objectives are still unresolved issues. European and Mediterranean actors will have to continue in their efforts to reach this goal, at the same time as updating these objectives and making use of any new instruments that become available. In terms of security, for example, the Mediterranean cannot be excluded from the growing interest in the concept of human security.

The 'human security' concept was first used in the 1994 UNDP report on human development. Since then there has been a growing consensus that in a world in which both the concept of threat and the nature of armed conflict have undergone significant transformation, it is the individual citizen who should be made the main object of protection. Particularly since the end of the Cold War, challenges in the area of international security have gone from focusing on purely military-based protection of the interests of the state and its territory to a concept based on the need to guarantee people's security through what is commonly expressed as 'freedom from fear' and 'freedom from want'. The doctrine of human security, therefore, has widened the traditional debate in this field, a debate that has been dominated since the Second World War (and particularly during the Cold War) by the doctrine of national security. It was in the mid-20th century that international security assumed a distinctly political and military nature, since attacks from other countries had become the main threat to state sovereignty and the international order. Now, in con-

trast, the greatest threats come from failed states that have become mired in 'new wars' in which the civilian population ends up as the main victim of any armed conflict. It is these threats, together with those of international terrorism, human rights abuses, extreme poverty, and infectious diseases that now represent the main challenges to the well-being of individual citizens.

The *European Security Strategy* (ESS), adopted by the European Council in December 2003, is one of the best examples of the transformation of security challenges that the European Union has had to face at the dawn of the 21st century. In the words of the Council document, "Europe faces new threats which are more diverse, less visible and less predictable." These threats include terrorism, the proliferation of weapons of mass destruction, regional conflicts, the breakdown of the state, and organized crime. At the same time, none of these threats is of a solely military nature, nor can they be countered by using only military instruments. In this respect, the Strategy entitled *A Secure Europe in a Better World* advises facing up to these threats in the knowledge that "the first line of defence will often be abroad", at the same time as calling for the creation of security in neighbouring countries and for the reinforcement of effective multilateralism as the framework of the international order.

In September 2004, a group of academics, diplomats, and experts headed by Mary Kaldor, a professor from the London School of Economics, presented a report to Javier Solana, the EU High Representative for the Common Foreign and Security Policy, which was entitled *A Human Security Doctrine for Europe*. In this report, the *Study Group on Europe's Security Capabilities* proposes that human security should be consolidated as the narrative strategy of the Union's foreign policy, thus granting it with the necessary ca-

pabilities. In this way, emphasis is placed upon the void that exists between the real needs in the area of security and the capabilities currently available (which basically consist of armed forces designed to fight against foreign armies and to safeguard state borders). By adopting a human security doctrine, the European Union will be contributing to the creation of a more secure global order, in the full knowledge that “Europeans cannot be secure while others in the world live in severe insecurity,” as the report states.

In order to implement the *European Security Strategy* in the direction proposed, the document “A Human Security Doctrine for Europe” establishes five key principles with which all human security operations should comply. The first of these states the primacy of human rights, thus echoing the proposals of the International Commission on Intervention and State Sovereignty report *The Responsibility to Protect*, published in December 2001. The second principle is the establishment of a clear political authority. The third espouses multilateralism, or giving priority to the international legal order. The bottom-up approach that is to say, taking action while bearing in mind the needs of the local population, is the fourth principle for human security operations. Finally, the last principle refers to the need to adopt a regional focus when dealing with crisis.

The report also proposes the creation of a “Human Security Response Force” made up of 15,000 men and women, of whom one third would be civilians, in addition to establishing a new legal framework which would decide when intervention should take place, as well as coordinating operations on the ground.

Shortly after the publication of this document, the European Parliament’s Committee on Foreign Affairs published a report on the European Security Strategy, presented by the MEP Helmut Kuhne. The report acknowledges the importance of the civil-military missions proposed by the *Study Group on Europe’s Security Capabilities* within the framework of the ESDP, as well as the introduction of a civilian component into the Human Security Response Force, called the “Human Security Volunteer Service”. In the light of the content of the Kuhne report, many points of contact exist between the *European Security Strategy* and the document *A Human Security Doctrine for Europe*, especially in terms of the ability of the human security doctrine to implement the European Security Strategy.

At this point, it remains to be seen whether, in the Mediterranean region, the 2003 Strategy succeeds in

incorporating an approach that complies with the principles of human security. As this document acknowledges, the Mediterranean is a key region in terms of the Union’s external relations. Europe’s commitment to its neighbouring regions (Eastern Europe and the Mediterranean countries) is one of the Union’s strategic components in its attempts to guarantee its security and that of its neighbouring countries. In the words of the Strategy, “the European Union’s interests require a continued engagement with Mediterranean partners, through more effective economic, security and cultural cooperation in the framework of the Barcelona Process.”

Nevertheless, in spite of the Mediterranean’s importance for European security, and also despite the existence of a political and security dimension in the framework of the Barcelona Process, advances made in recent years have been few. By way of illustration, conflicts such as the Arab-Israeli, the situation in the Western Sahara, and the division of Cyprus are all still unresolved. Unfortunately, it cannot be claimed that the Mediterranean is a more secure place for its states and citizens in 2007 than it was in 1995.

In fact, in recent years, even greater emphasis has been placed on the need to advance through cooperation with respect to security in the Mediterranean, and by incorporating the approach of human security. In the Near East, in spite of the positive signals produced following Israel’s unilateral withdrawal from Gaza, the Israeli position hardened in 2006, culminating in the war with Lebanon that summer. Three members of the Barcelona Process (Israel, the Palestinian Authority and Lebanon) were plunged into a military escalation which clearly showed that the possibility of achieving one of the objectives laid down in the Barcelona Declaration, to create an area of peace in the Mediterranean, was long way off. The situation also highlighted the fact that in the event of a military escalation as the one in the Near East, it was not only the security of the state that was endangered, but also and particularly that of its citizens. The conflict in Lebanon, by which we refer both to the Israeli attack in July 2006 and the later struggle between the Lebanese army and the terrorist networks in the Naher el Bared Palestinian refugee camp, demonstrates that it is always the civilian population that suffers most from such a climate of insecurity. At the same time, the situation of insecurity in the region has meant that progress with discussions promoted by the Barcelona Process on the subject of security has been hampered. This is why it has become vitally important to break this vicious circle. But that can only be achieved

through large doses of political determination and leadership and, within this context, discussions on points directly linked to human security (such as the protection of civilians and mine clearance) might represent a good opportunity to recommence the dialogue on security.

In the Maghreb region, threats to the security of citizens and states are increasingly related to the proliferation of terrorist networks. The 2007 attacks in Morocco and Algeria raised fears of a fresh outbreak of violence in the western Mediterranean basin, and recalled the nightmare situation experienced by Algeria in the first half of the 1990's; but what is even worse, they showed how the terrorist methods used in Iraq and Afghanistan were being increasingly imported into the region. These events highlighted the need to increase cooperation in the area of security between the north and south of the Mediterranean, as well as between the southern countries themselves. Having said that, it should be borne in mind that the objective of such cooperation is not only to maintain the stability of the state, but also to safeguard the lives of citizens. As a consequence (and in accordance with agreements made at the 2005 Euro-Mediterranean Summit in Barcelona), such cooperation should never be carried out at the expense of respect for human rights or the fundamental freedoms of European and Mediterranean citizens.

In view of this context, the EU and its Mediterranean partners will have to redouble their efforts in order to move forward towards a shared security agenda that incorporates the protection of citizens as one of its main priorities. This should be undertaken in a transversal manner, within the framework of the Barcelona Process, the European Neighbourhood Policy, and the bilateral relations that exist between EU member states and their Mediterranean partners.

To this end, there are three points that should be given particular consideration, both at a political and an academic level. The first is the problem of coherence and consistency. For a number of years the Barcelona Process has coexisted alongside the European Neighbourhood Policy, and yet neither the European nor the Mediterranean partners have managed to arrive at a clear conclusion on the subject of 'who does what' or, more to the point, 'who is better prepared to do what'. Thus some serious thought should be given as to which of these frameworks (not to mention the criteria used to decide on the division of labour) will produce the best results in terms of promoting a human security agenda in the Mediterranean. Furthermore, care should be taken to avoid a

situation in which contradictions exist between the two agendas in the area of security, or any unnecessary overlap of responsibilities. Finally, it should be stressed that the main challenge in terms of coordinating the agendas of the Barcelona Process and the European Neighbourhood Policy is for the EU to adopt a common foreign policy. At this point in time, close attention should be paid to developments in the current constitutional crisis, to see whether the solution of the simplified Treaty (which is expected to be debated by the European Council in June 2007) will lead to the creation of the post of Foreign Affairs Minister, thereby providing Europe with a necessary (albeit still insufficient) instrument for establishing a true common foreign and security policy.

The second idea derives from observing one of the aforementioned conflicts: Lebanon. The Lebanese crisis in the summer of 2006 highlighted, once again, Europe's shortcomings in terms of coordination and shared vision. The EU has begun to compensate for this deficiency with its determined involvement in the pacification and progress in the region through the deployment of troops by countries such as France, Italy, and Spain, as part of the new UN mission. Nevertheless, time will demonstrate (and in fact, it is already doing so) that an exclusively military approach has little chance of achieving the desired results. Missions of a civilian nature and those military missions in which civilians play a greater role might help to guarantee not only state security in Lebanon, but also more effective protection of its citizens' rights.

The third point for consideration is linked to a subject that is awakening increasing interest in works on European integration: strengthened cooperation. Following the successive enlargements of the EU, and the growing plurality of the states of which it is comprised, it has become clear that the only way to move forward is through strengthened cooperation initiatives. This means that a group of states could opt to embark on such a cooperation project without all the states having to join them, though they would leave the door open for any other country to sign up to the initiative. This may prove to be the most effective strategy for moving ahead towards a Mediterranean human security agenda, given that neither all the EU states nor all their Euro-Mediterranean partners will be as keen (or as reluctant) to agree on policies in this field. Strengthened cooperation can bring about gradual but constant advances in aspects that have been neglected until now (such as the security sector reform), or in issues that have not been sufficiently ex-

plored (such as protection of civilians and mine clearance). The establishment of pilot schemes that would enable us to go into the dialogue on security in greater depth could represent a decisive show of determination to create a human security doctrine for the Mediterranean.

Finally, and by way of conclusion, it must be stressed that the *European Security Strategy* adopted in December 2003 does not impose human security, but rather it accepts or enables it. The doctrine of human security facilitates an implementation that is best

suited to the Strategy's principles and, in this sense, the Mediterranean represents the greatest challenge for the ESDP. This is the main region that demands action from the EU, action that could facilitate the definition and application of Europe's role in foreign policy. Furthermore, the Mediterranean is the field in which the principles of human security promise to be most effective, especially given the fact that a large proportion of the security challenges in this region involve the protection of the human rights of its population.

1 Introduction: Globalization and Environmental Challenges: Reconceptualizing Security in the 21st Century

Hans Günter Brauch

1.1 Introductory Remark

This book focuses on the *reconceptualization of security in the 21st century* that has gradually evolved since the end of the East-West conflict (1989–1991) and that has been significantly influenced by processes of globalization and global environmental change.

This global turn has resulted in the end of the Cold War (1946–1989), which some historians have interpreted as a ‘long peace’ (Gaddis 1987, 1997) with a highly armed bipolar international order, the collapse of the Soviet Union (1991) and of a competitive global ideology, system of rule and military superpower. These events brought about a fundamental and peaceful change in international order that made the reunification of Germany (1990) and of Europe with the Eastern enlargement of the EU (2004, 2007) possible.

This turn has been portrayed either as a ‘victory’ of US superiority (Schweitzer 1994) or as an outcome of a ‘political learning’ (Grunberg/Risse-Kappen 1992) based on a new thinking (*‘Perestroika’*) of Gorbachev that contributed to the first major peaceful global change in modern history. This ‘global turn’ (1989–1991) has been the fourth major change since the French Revolution that was instrumental for the emergence of a new international order. Three previous turning points in modern history were the result of revolutions (1789, 1911–1918) and of wars (1796–1815, 1914–1918, 1931–1949) resulting in a systemic transformation.

This fourth peaceful turn triggered a peaceful (Czechoslovakia) and violent disintegration of multi-ethnic states (USSR, Yugoslavia); it contributed to the emergence of ‘failing’ states (e.g. Somalia, Afghanistan) and to ‘new wars’ (Kaldor/Vashee 1997; Kaldor 1999; Münkler 2002, 2005). Besides the events in Europe during 1989, events in other parts of the world had no similar impact on the new global (dis)order during the 1990’s, e.g. the death of Mao Zedong (1976) and the economic reforms of Deng Xiaoping

in China (1978–1990); the end of the dictatorships and the third wave of democratization in Latin America; and the many new wars in Africa due to weak, failing or failed states where warlords took over control in parts of West (Liberia) and Eastern Africa (Somalia), as well as in Asia (Afghanistan).

This chapter aims at a mental mapping of the complex interaction between this most recent global structural change and conceptual innovation that have occurred in academia, in international organizations as well as in the declarations and statements of governments since 1990 up to spring 2007. It refers only briefly to the term and concept of security (1.2, see for details chapters 3–9 in this volume), to the contextual context: events, structures, concepts and action (1.3), to the theme of contextual change, conceptual innovation as tools for knowledge creation and action (1.4), to the drivers and centres of conceptual innovation (1.5), to four scientific disciplines: history, philosophy, social sciences, and international law (1.6), to the *Hexagon Series on Human and Environmental Security and Peace* and to the goal of the three related volumes (1.7), to the goals, structure, authors, and audience of this book (1.8) as well as to the expected audience of this book (1.9).

1.2 Object: Term and Concept of Security.

Security is a basic *term* and a key *concept* in the social sciences that is used in intellectual traditions and schools, conceptual frameworks, and approaches. The term ‘security’ is associated with many different meanings that refer to frameworks and dimensions, apply to individuals, issue areas, societal conventions, and changing historical conditions and circumstances. Thus, security as an individual or societal political value has no independent meaning and is always related

Table 1.1: Vertical Levels and Horizontal Dimensions of Security in North and South

Security dimension \Rightarrow Level of interaction \Downarrow (referent objects)	Military	Political	Economic	Environmental \Downarrow	Social
Human \Rightarrow			Social, energy, food, health, livelihood threats, challenges and risks may pose a <i>survival dilemma</i> in areas with high vulnerability		
Village/Community/Society				$\Downarrow \Uparrow$	
National	"Security dilemma of competing states" (National Security Concept)		"Securing energy, food, health, livelihood etc." (Human Security Concept) combining all levels of analysis & interaction		
International/Regional				$\Downarrow \Uparrow$	
Global/Planetary \Rightarrow					

to a context and a specific individual or societal value system and its realization (see chap. 4 by Brauch).

Security is a societal value or symbol (Kaufmann 1970, 1973) that is used in relation to protection, lack of risks, certainty, reliability, trust and confidence, predictability in contrast with danger, risk, disorder and fear. As a social science concept, "security is ambiguous and elastic in its meaning" (Art 1993: 821). Arnold Wolfers (1962: 150) pointed to two sides of the security concept: "Security, in an *objective* sense, measures the absence of threats to acquired values, in a *subjective* sense, the absence of fear that such values will be attacked."

For the constructivists, security is *intersubjective* referring to "what actors make of it" (Wendt 1992, 1999). Thus, security depends on a normative core that can not simply be taken for granted. Political constructions of security have real world effects, because they guide action of policymakers, thereby exerting constitutive effects on political order (see chap. 4 by Wæver, 37 by Baylis, 51 by Hintermeier in this vol.). The 'security concept' has gradually widened since the 1980's (Krell 1981; Jahn/Lemaitre/Wæver 1987; Wæver/Lemaitre/Tromer 1989; Buzan/Wæver/de Wilde 1995, 1998; Wæver/Buzan/de Wilde 2008; chap. 38 by Albrecht/Brauch). For Wæver (1997, chap. 4 and 44) security is the result of a speech act ('securitization'), according to which an issue is treated as: "an existential threat to a valued referent object" to allow "urgent and exceptional measures to deal with the threat". Thus, the "securitizing actor" points "to an existential threat" and thereby legitimizes "extraordinary measures".

'Security in an objective sense' refers to specific *security dangers*, i.e. to 'threats, challenges, vulnerabilities and risks' (Brauch 2003, 2005, 2005a) to specific *security dimensions* (political, military, economic, so-

cial, environmental) and *referent objectives* (international, national, human) as well as *sectors* (social, energy, food, water), while 'security in a subjective sense' refers to *security concerns* that are expressed by government officials, media representatives, scientists or 'the people' in a speech act or in written statements (historical sources) by those who securitize 'dangers' as security 'concerns' being existential for the survival of the referent object and that require and legitimize extraordinary measures and means to face and cope with these concerns. Thus, *security concepts* have always been the product of orally articulated or written statements by those who use them as tools to analyse, interpret, and assess past actions or to request or legitimize present or future activities in meeting the specified security threats, challenges, vulnerabilities, and risks.

The Copenhagen School (Buzan/Wæver 1997; Wæver 1997; Buzan/Wæver/de Wilde 1998; Wæver/Buzan/de Wilde 2008), distinguished among five dimensions (*widening*: military, political, economic, societal and environmental), and five referent objects ('whose security') or levels of interaction or analysis (*deepening*: international, regional, national, domestic groups, individual). They did not review the *sectorialization* of security from the perspective of *national* (international, regional) and *human security* (Brauch 2003, 2005, 2005a; table I.I).

Influenced by different worldviews, rival theories and mindsets, security is a key concept of competing schools of a) *war, strategic or security studies* from a realist perspective, and b) *peace and conflict research* from an idealist or pragmatic view (chap. 40 by Albrecht/Brauch). Since 1990, interparadigm debates emerged between traditional, critical, and constructivist approaches. Within the UN and NATO, different concepts coexist, a state-centred political and

Table 1.2: Expanded Concepts of Security (Møller 2001, 2003; Oswald 2001, 2007)

Concepts of security	Reference object (security of whom?)	Value at risk (security of what?)	Source(s) of threat (security from whom/ what?)
National Security [political, military dimension]	The state	Sovereignty, territorial integrity	Other states, guerilla, terrorism (substate actors)
Societal security [dimension]	Nations, societal groups	National unity, identity	(States) Nations, migrants, alien cultures
Human security	Individuals, humankind	Survival, quality of life	State, globalization, GEC, nature, terrorism
Environmental security [dimension]	Ecosystem	Sustainability	Humankind
Gender security	Gender relations, indigenous people, minorities, children, elders	Equality, equity, identity, solidarity, social representations	Patriarchy, totalitarian institutions (governments, religions, elites, culture), intolerance, violence

military concept, and an extended security concept with economic, societal, and environmental dimensions. A widening and deepening of the security concept prevailed in OECD countries, while other countries adhered to a narrow military concept

Not only the scope of ‘*securitization*’ (Wæver 1997, 1997a) has changed, but also the referent object from a ‘national’ to a ‘human-centred’ security concept, both within the UN system (UNDP 1994; UNESCO 1997, 1998, 1999, 2001, 2003; UNU 2002; UNU-EHS 2004), and in the academic security community.

In European security discourses, an ‘extended’ security concept is used by governments and in scientific debates (Buzan/Wæver/de Wilde 1998). Møller (2001, 2003) distinguished a ‘national’ and three expanded security concepts of ‘societal, human, and environmental security’. Oswald (2001, 2007, 2008) introduced a combined ‘human, gender and environmental’ (HUGE) security concept (table 1.2).

While since the 19th century the key ‘actor’ has been the state, it has not necessarily been a major ‘referent object’ of security which is often referred to as ‘the people’ or ‘our people’ whose survival is at stake (Brauch chap. 3; Albrecht/Brauch chap. 38). From 1947 to 1989 national and military security issues became a matter of means (armaments), instruments (intelligence) and strategies (deterrence). Wæver (1995: 45) argued that environmental issues may pose threats of violent conflicts and that they may also put the survival of the people at stake (e.g. by forced migration) without a threat of war.

Whether a threat, challenge, vulnerability, and risk (Brauch 2005a, 2006) becomes an ‘objective security danger’ or a ‘subjective security concern’ also depends

on the political context. While in Europe climate change has become a major security issue, in the US, during the administration of George W. Bush this problem was downgraded. Labelling climate change a security issue implies different degrees of urgency and means for coping with it.

The traditional understanding of security “as the absence of existential threats to the state emerging from another state” (Müller 2002: 369) has been challenged both with regard to the key subject (the state) and carrier of security needs, and its exclusive focus on the “physical - or political - dimension of security of territorial entities” that are behind the suggestions for a horizontal and vertical widening of the security concept.

The meaning of security was also interpreted as a reaction to globalization and to global environmental change. In Europe, several critical approaches to security gradually evolved as the *Aberystwyth* (Booth, Wyn Jones, William), *Paris* (Bigo, Badie) and *Copenhagen* (Wiberg, Wæver, Møller) schools that led to the development of a *New European Security Theory* (NEST, e.g. Bürger/Stritzel 2005) and a ‘networked manifesto’ (CASE 2006; chap. 38 by Albrecht/Brauch).

1.3 Events – Structures – Concepts – Action

Political and scientific concepts, like security, are used within a complex context (Koselleck 2006). These concepts have a temporal and systematic structure, they embody and reflect the time when they were used and they are thus historical documents in the

persistent change in the history of short events (*histoire des événements*) and long structures (Braudel's (1949, 1969, 1972) *histoire de la longue durée*). Concepts are influenced by manifold perceptions and interpretations of events that only rarely change the basic structures of international politics and of international relations (IR).

The political events of 1989, the rare coincidence of a reform effort from the top and a yearning for freedom and democracy from the bottom, as part of a peaceful upheaval in East Central Europe toppled the Communist governments in all East Central European countries within three months, and thus were instrumental for the collapse of the Soviet Union and the dissolution of the Warsaw Treaty Organization and the Comecon (1991).

The Cold War bipolar order of two rival highly armed political systems with the capability to destroy the globe with its weapons of mass destruction based on nuclear deterrence doctrines became obsolete as well as the traditional security legitimizations with the arms of the other side. This structural change of the international order influenced the security policy agendas and provoked a global political and scientific debate on the reconceptualization of security. This debate has been global, stimulated by many policy actors, scientists and intellectuals. The results of this process are documented in the national security doctrines and strategies (e.g. in the US) and in defence white papers of many countries (e.g. in Germany 1994, 2006). They have also been an object of analysis of the scientific community that gradually emancipated itself from the US conceptual dominance (Wæver 2004; Wæver/Buzan 2006). But these Northern discourses on security have been unaware and ignored the thinking of the philosophical traditions in Asia, Africa, Latin America, and in the Arab world.

While Huntington in his 'clash of civilization' (1993, 1996) succeeded to 'securitize culture' from the vantage point of US national security interests and strategies, the critical responses (Said; Chomsky; Ajami) reflected the cultural and religious diversity of the other five billion people that have been primarily an object of security thinking and policy during and after the Cold War.

This reconceptualization of security has impacts on international agendas and thus on political action on many different levels. UNDP (1994) introduced a 'people-centred' human security concept that was subsequently promoted by the *Human Security Network* (as 'freedom from fear'), and by the *Human Security Commission* (as 'freedom from want'), to which Kofi

Annan added as a third pillar: 'freedom to live in dignity' and the *United Nations University* (UNU) as the fourth pillar: 'freedom from hazard impact' (Bogardi/Brauch 2005; Brauch 2005, 2005a).

An effort of the only remaining superpower to regain control over the security discourse in its 'war on terror' by trying to politically adapt scientific evidence on climate change and to constrain scientific freedom has failed. Other efforts by a leading neo-conservative think tank to pay scientists a fee for challenging the fourth IPCC Report (2007) to downgrade and thus to de-securitize these new dangers posed by anthropogenic climate change may also fail.¹

The increasing perception of global environmental change (GEC) as a 'threat' to the survival of humankind and the domestic backlash in the US against the narrow security concepts and policies of the Neocons has widely established a widened, deepened, and sectorialized security concept that increasingly reflects the existing cultural and religious diversity also in the political debate on security as well as in scientific discourses. In this context, this volume has a dual function: a) to map this global conceptual change; and b) to create a wide scientific and political awareness of the new threats, challenges, vulnerabilities and risks that often differ from the perception of the present political elite in the only remaining superpower.

Thus, conceptualizing security concepts and defining the manifold security interests and preferences, structures the public policy discourse and legitimates the allocation of scarce financial resources to 'face' and 'cope' with major security dangers and concerns that threaten the survival of states, human beings or humankind and thus require 'extraordinary' political action.

1.4 Contextual Change, Conceptual Innovation as Tools for Knowledge Creation and Action

A key analytical question to which all authors were invited to reflect is to which extent the structural change in the global and regional international order

1 See: Ian Sample: "Scientists offered cash to dispute climate study", in: *The Guardian*, 2 February 2007; Elisabeth Rosenthal; Andrew C. Revkin: "Science Panel Calls Global Warming 'Unequivocal'", in: *The New York Times*, 3 February 2007; Juliet Eilperin: "Humans Faulted For Global Warming International Panel Of Scientists Sounds Dire Alarm", in: *Washington Post*, 3 February 2007.

was instrumental, triggered or contributed to this conceptual innovation and diversity in the global security discourse since 1990 or to which extent other events or regional or national structural changes have initiated a conceptual rethinking.

From the perspective of this author, major changes in the international order for the past 500 years have been:

- The *Hispanic World Order*: Expulsion of the Arabs and conquest of the Americas (1492–1618) by Spain and Portugal that resulted in a global order dominated by the Christian ‘civilized world’ that perceived the South as ‘primitive barbarians’;
- The *peace of Münster and Osnabrück* (1648) after the religious Thirty Years War (1618–1648), and the emergence of the Westphalian European order based on territorial states and an emerging international law;
- The *Utrecht Settlement* and the century of war and peace in the order of Christian princes (1715–1814).

After the independence of the United States (1776), the French Revolution (1789), and the wars of liberation in Latin America (1809–1824) and the emergence of many new independent states (1817–1839) in Europe four major international orders and major global structural and contextual changes can be distinguished:

- The *Peace Settlement of Vienna* (1815) and the European order of a balance of power based on a Concert of Europe (1815–1914) in an era of imperialism (Africa, Asia) and the post-colonial liberation in Latin America.
- The *Peace of Versailles* (1919) with a collapse of the European world order, a declining imperialism and the emergence of two new power centres in the US and in the USSR with competing political, social, economic, and cultural designs and a new global world order based on the security system of the *League of Nations* (1919–1939).
- The *Political Settlement of Yalta* (February 1945) and the system of the United Nations discussed at the Conferences in Dumbarton Oaks (1944), *Chapultepec* (January/ February 1945), and adopted at *San Francisco* (April/June 1945).

With these turning points during the European dominance of world history, the thinking on security changed. External and internal security became major tasks of the modern dynastic state. With the French Revolution and its intellectual and political conse-

quences the thinking on ‘*Rechtssicherheit*’ (legal predictability guaranteed by a state based on laws) gradually evolved. With the Covenant of the League of Nation ‘*collective security*’ became a key concept in international law and in international relations (IR).

Since 1945, this ‘national security’ concept has become a major focus of the IR discipline that gradually spread from iAberystwyth (1919) via the US after 1945 to the rest of the world. The Cold War (1946–1989) was both a political, military, and economic struggle and an ideological, social, and cultural competition when the modern ‘security concept’ emerged as a political and a scientific concept in the social sciences that was intellectually dominated by the American (Katzenstein 1996) and Soviet (Adomeit 1998) strategic culture. With the end of the Cold War, the systemic conflict between both superpowers and nuclear deterrence became obsolete and its prevailing security concepts had to be reconsidered and adjusted to the new political conditions, security dangers, and concerns.

This process of rethinking or ‘reconceptualization of security concepts’ and ‘redefinition of security interests’ that was triggered by the global turn of 1989–1991 and slightly modified by the events of 11 September 2001 (Der Derian 2004; Kupchan 2005; Risse 2005; Müller 2005; Guzzini 2005) and the subsequent US-led ‘war on terror’ has become a truly global process.

The intellectual dominance of the two Cold War superpowers has been replaced by an intellectual pluralism representing the manifold intellectual traditions but also the cultural and religious diversity. In this and the two subsequent volumes authors representing the five billion people outside the North Atlantic are given a scientific ‘voice’ that is often ignored in the inward oriented national security discourses that may contribute little to an understanding of these newly emerging intellectual debates after the end of the Cold War.

According to Tierney and Maliniak (2005: 58–64): “American scholars are a relatively insular group who primarily assign American authors to their students.”² In an overview of three rival theories of realism, liberalism and idealism (constructivism), Snyder (2004: 53–62) listed among the founders of realism (Morgenthau, Waltz) and idealism (Wendt, Ruggie) only Americans but of liberalism two Europeans (Smith, Kant). Among the thinkers in all three schools of realism (Mearsheimer, Walt), liberalism (Doyle, Keohane, Ikenberry) and idealism (Barnett and the only two women: Sikkink, Finnemore) again only Americans

qualified. This may reflect the prevailing image of the 'us' and 'they'. But in a second survey Malinak, Oakes, Peterson and Tierney (2007: 62–68) concluded that:

89 per cent of scholars believe that the war [in Iraq] will ultimately decrease US security. 87 per cent consider the conflict unjust, and 85 per cent are pessimistic about the chances of achieving a stable democracy in Iraq in the next 10–15 years. ... 96 per cent view the United States as less respected today than in the past (Malinak/Oakes/Peterson/Tierney 2007: 63).

A large majority of US IR scholars opposed unilateral US military intervention and called for a UN endorsement. Seventy per cent describe themselves as liberals and only 13 per cent as conservative. Their three most pressing foreign-policy issues during the next 10 years reflect the official policy agenda: international terrorism (50 per cent), proliferation of weapons of mass destruction (45 per cent), the rise of China (40 per cent). Only a minority consider global warming (29 per cent), global poverty (19 per cent) and resource scarcity (14 per cent) as the most pressing issues.²

These snapshots refer to a certain parochialism within the IR discipline which made the perception of the global process of reconceptualization of security, and of new centres of conceptual innovation on security more difficult. But the thinking of the writers outside the North Atlantic and their different concerns matter in the 21st century when the centres of economic, political, and military power may shift to other parts of the world (see part IX in this book).

1.5 Drivers and Centres of Conceptual Innovation

The drivers of the theoretical discourse on security and the intellectual centres of conceptual innovation have moved away from both Russia (after 1989) but gradually also from the United States. During the 1980's, the conceptual thinking on 'alternative se-

curity' or 'defensive defence' in Europe was looking for political and military alternatives to the mainstream deterrence doctrines and nuclear policies (Weizsäcker 1972; Afheldt 1976; SAS 1984, 1989; Brauch/Kennedy 1990, 1992, 1993; Møller 1991, 1992, 1995). It was a major intellectual force behind the independent 'peace movement' that called for both disarmament and human rights in both camps (e.g. END, 1980–1989).

In 2007, the discourses on security are no longer a primarily American social science (Crawford/Jarvis 2001; Hoffmann 2001; Nossal 2001; Zürn 2003). The critiques of peace researchers and alternative security experts in Europe during the 1970's and 1980's, but also new national perspectives during the 1990's, e.g. in France (Lacoste, Bigo, Badie), in the UK (Buzan, Booth, Smith, Rogers), Canada (Porter 2001), Germany (Albrecht, Czempiel, Senghaas, Rittberger) challenged American conceptualizations of national security. Since the 1990's in Southern Europe a re-emergence of geopolitics (France, Italy, Spain) could be observed (Brauch, chap. 22). In other parts of the world a critical or new geopolitics school emerged (O'Tuathail, Dalby) but also a spatialization of global challenges (ecological geopolitics or political geo-ecology). In Germany there has been a focus on progressing debordering, or deterritorialization of political processes (Wolf, Zürn) primarily in the EU while new barriers were directed against immigration from the South in both the US (toward Mexico) and in Europe (in the Mediterranean).

Groom and Mandaville (2001: 151) noted an "increasingly influential European set of influences that have historically, and more recently, informed the disciplinary concerns and character of IR" that have been stimulated by the writings of Foucault, Bourdieu, Luhmann, Habermas, Beck and from peace research by Galtung, Burton, Bouthoul, Albrecht, Czempiel, Rittberger, Senghaas, Väyrynen. Since the 1980's, the conceptual visions of African (Nkruma, Nyerere and Kaunda) and Arab leaders (Nasser), as well as the Southern concepts of self-reliance and Latin American theories of 'dependencia' of the 1960's and 1970's (Furtado 1965; Marini 1973; Dos Santos 1978) had only a minor impact on Western thinking in international relations and on security.

Since 1990 the new centres of conceptual innovation are no longer the US Department of Defense or the US academic centres in security studies in the Ivy League programmes. The effort by US neo-conservatives to reduce the global security agenda to weapons

2 They claimed: "The subject may be international relations, but the readings are overwhelmingly American. Almost half of the scholars surveyed report that 10 per cent or less of the material in their introductory courses is written by non-Americans, with a full 10 per cent of professors responding that they do not assign any authors from outside the United States. Only 5 per cent of instructors give non-Americans equal billing on their syllabuses" (Tierney/Malinak 2005: 63). While one third in the US IR field are women, among the 25 most influential scholars are only men, among them many are considered leading security experts.

of mass destruction and to the 'war on terror' has also failed, and many scholars share the scepticism.

However, most journals on security studies (e.g. *International Security*) are produced in the US and the North American market has remained the biggest book market for the security related literature. Since 1990 new journals on IR and security problems have evolved elsewhere, and since 1992 the triennial pan-European Conferences on International Relations (ECPR) in Heidelberg (1992), Paris (1995), Vienna (1998), Canterbury (2001), The Hague (2004) and Torino (2007) have supplemented the Annual International Studies Association conferences in North America where the intellectual debates on both security, peace, environment, and development are taking place. In August 2005 ECPR and ISA with partners in other parts of the world organized the first world conference on international relations in Istanbul.

In the political realm, the US as the only remaining superpower – irrespective of its 48 per cent contribution to global arms expenditures (SIPRI 2006) – has lost its predominance to set and control the international security agenda and US scholars no longer set the theoretical, conceptual, and empirical agenda of the scientific security discourse. In Europe and elsewhere new centres of intellectual and conceptual innovation have emerged in the security realm:

- In Europe, *Aberystwyth*, *Paris*, and *Copenhagen* have been associated with three new critical 'schools' on security theory (Wæver 2004).
- The *Copenhagen School* combined peace research with the Grotian tradition of the English School, integrating inputs from Scandinavian, British, German, and French discourses (Buzan/Wæver/de Wilde 1997; Wæver/Buzan/de Wilde 2008).
- The *human security concept* was promoted by Mahub ul Haq (Pakistan) with the UNDP report of 1994 and then developed further with Japanese support by the *Human Security Commission* (2003) and promoted both by UNESCO and UNU globally.
- Civil society organizations in South Asia developed the concept of *livelihood security*.
- International organizations introduced the sectoral concepts of *energy* (IEA, OECD), *food* (FAO, WFP), *water* (UNEP) and *health* (WHO) security (see Hexagon vol. IV).
- In the US and Canada, and in Switzerland and Norway the concept of *environmental security* as

security concerns emerged during the 1980's and 1990's.

- Since 1990 the epistemic community of the *Intergovernmental Panel on Climate Change* (IPCC) provoked a global scientific and policy debate on climate change.
- The *Earth System Science Partnership* (ESSP) and its four programmes: IHDP (*International Human Dimensions Programme*), IGBP (*International Geosphere-Biosphere Programme*), WCRP (*World Climate Research Programme*) and *Diversitas* and its project GECHS (*Global Environmental Change and Human Security*) resulted in global scientific networks that address new security dangers and concerns.

Trends in the *reconceptualization of security* that will be mapped in the Hexagon Series are:

- *widening, deepening, and sectorialization* of security concepts;
- shift of referent object from the state to human beings or humankind (*human security*);
- perception of *new security dangers* (threats, challenges, vulnerabilities, and risks) and *securitization* of new security concerns due to an articulation by national and international organizations, scientific epistemic communities, and an attentive public with a progressing decentralization and diversity of information control through the internet;
- search for new non-military strategies to face and cope with these newly perceived security dangers and concerns and new environmental dangers, hazards, and disasters that pose no classical security dilemma (Herz 1950, 1959, 1962) for states but a 'survival dilemma' (Brauch 2004, chap. 40) for people.

These new drivers and centres of conceptual innovation have fundamentally challenged the narrow state-focused security concept of the traditionalists and realists in the Cold War.

1.6 History, Social Sciences, Philosophy, International Law

Events, structures, and concepts stand for three different historical approaches of:

- a *history of events* (of states and government elites) in diplomacy, conflicts, and wars focusing on the activities of states during wars;

- a *history of structures* (history of ‘longue durée’ and of conjunctural cycles) in the accounts on social, societal, and economic history;
- a history of ideas (*Ideengeschichte*) and concepts (*Begriffsgeschichte*).

1.6.1 Contextual Change and Conceptual History

The history of concepts was instrumental for a major German editorial project on key historical concepts (Brunner/Conze/Koselleck 1972–1997). Koselleck (1979, 1989, 1994, 1996, 2000, 2002, 2006) addressed the complex interlinkages between the temporal features of events, structures, and concepts in human (societal) history but also the dualism between experience and concepts (chap. 3 by Brauch). ‘

Conze (1984: 831–862) reviewed the evolution of the meaning of the German concepts security (*‘Sicherheit’*) and protection (*‘Schutz’*) that evolved – based on Roman and Medieval sources – since the 17th century with the dynastic state and was closely linked to the modern state. Since 1648 internal security was distinguished from external security which became a key concept of foreign and military policy and of international law. During the 17th and 18th centuries internal security was stressed by Hobbes and Pufendorf as the main task of the sovereign for the people.

In the American constitution, safety is linked to liberty. During the French Revolution the declaration of citizens’ rights declared security as one of its four basic human rights. For Wilhelm von Humboldt the state became a major actor to guarantee internal and external security while Fichte stressed the concept of mutuality where the state as the granter of security and the citizen interact. Influenced by Kant, Humboldt, and Fichte the concept of the *‘Rechtsstaat’* (legally constituted state) and *‘Rechtssicherheit’* (legal predictability of the state) became key features of the thinking on security in the early 19th century (Conze 1984).

The concept of ‘social security’ gradually evolved in the 19th and 20th centuries, especially during F.D. Roosevelt’s New Deal as a key goal to advance the security of the citizens: “the security of the home, the security of the livelihood, and the security of the social insurance.” This was addressed in the *Atlantic Charter* of 1941 as “securing, for all, improved labour standards, economic advancement and social security.” In 1948 social security became a key human right in Art. 22 of the General Declaration of Human Rights.

The ‘national’ security concept in the US resulted in the emergence of the American security system (Czempiel 1966), or of a national security state (Yergin 1977). It was used to legitimate a major shift in the mindset from the isolationism of the 1930’s to the internationalism in the post-war years, i.e. from a fundamental criticism of military armaments to a legitimization of an unprecedented military and arms build-up and militarization of the mindset of post-war foreign policy elites.

The changes in the thinking on security and their embodiment in security concepts are also a semantic reflection of the fundamental changes as they have been perceived in different parts of the world and conceptually articulated in alternative or new and totally different security concepts. Competing securitization efforts of terrorism or climate change are behind the transatlantic and global security policy debate and the global scientific conceptual discourse.

1.6.2 Conceptual Mapping in the Social Sciences

In the social sciences, the security concept has been widely used in *political science* (chap. 37 by Baylis in this vol.), and *economics* (chap. 36 by Mursheed and 43 Mesjasz) that focus on different actors: on the political realm (governments, parliaments, public, media, citizens); on society (societal groups) and on the business community (firms, customers, economic and fiscal policies). In political science, the security concept has been used in its threefold context: *policy* (field of security policy), *politics* (process on security, military, and arms issues), and *polity* (legal norms, laws, and institutions on the national and international level). The US National Security Act of 1947 (Czempiel 1966, Brauch 1977) and its adjustments has created the legal and institutional framework for the evolution of the ‘national security state’, sometimes also referred to as a military-industrial complex (Eisenhower 1972). This evolution has been encapsulated in the US debate on the concepts of ‘national’ and since 2001 also ‘homeland’ security.

1.6.3 Analysis of Concepts and their Linkages in Philosophy

The evolution and systematic analysis of concepts has been a major task of political philosophy and of the history of ideas. In German several philosophical publications documented the contemporary philosophy and its concepts in its interrelationship to their hi-

historical structure and the sciences.³ From a philosophical perspective after the end of the Cold War, Makropoulos (1995: 745–750) analysed the evolution of the German concept ‘Sicherheit’ from its Latin and Greek origins and its evolution and transformation during the medieval period, after the reformation as a concept in theology, philosophy, politics and law, with a special focus on Hobbes, Locke, Wolff, Rousseau, and Kant. In the 20th century he reviewed the prevention and compensation of genuinely social and technical insecurity as well as new social risks. While this article briefly noted the concept of ‘social security’ the key concept of ‘national security’ or the more recent concepts of ‘human security’ were not mentioned.

1.6.4 Security Concepts in National Public and International Law

Since the 18th century the security concept was widely used in the context of constitutional or public law for the legal system providing ‘*Rechtssicherheit*’ for the citizens in their engagement with the state. The concepts of ‘international peace and security’ have been repeatedly used in the Covenant and in the UN Charter where Art. I,1 outlines its key purpose:

to maintain international peace and *security*, and to that end: to take effective collective measures for the prevention and removal of threats to the peace ... 2. to develop friendly relations among nations ... 3. to achieve international cooperation ... [and] 4. to be a centre for harmonizing the actions of nations in the attainment of these common ends.

Wolfrum (1994: 51) points to the subjective and objective elements of ‘international security’, the pursuit of which “implies a transformation of international relations so that every state is assured that peace will not be broken, or at least that any breach of the peace will

be limited in its impact.” In addition he referred to the “defining characteristic of the concept of collective security [as] the protection of the members of the system against a possible attack on the part of any other member of the same system,” and he noted that “the distinction drawn between the concepts of collective security and collective self-defence has been blurred to some extent in practice, and it also has lost relevance with respect to the United Nations” because due to the universal nature of the UN system “any distinction based upon external or internal acts of aggression [have been rendered] meaningless.”

1.6.5 Debate on Security Concepts within the United Nations

In a report of the Secretary-General on *Concepts of Security* (UN 1986)⁴ that was prepared by government experts from Algeria, Venezuela, Sweden (chair), China, GDR, Romania, Uganda, USSR, Argentina, Yugoslavia, Malaysia, India and Australia security was defined as:

a condition in which States consider that there is no danger of military attack, political pressure or economic coercion, so that they are able to pursue freely their own development and progress. International security is thus the result and the sum of the security of each and every State member of the international community; accordingly, international security cannot be reached without full international cooperation. However, security is a relative rather than an absolute term. National and international security need to be viewed as matters of degree (UN 1986: 2).

Secretary-General Pérez de Cuéllar noted that “concepts of security are the different bases on which States and the international community as a whole rely for their security” and he observed that “the

3 See e.g. the historical dictionary of philosophy (*Historisches Wörterbuch der Philosophie*) published first in 1899 by Rudolf Eisler, and its fourth edition (1927–1930). A different approach was pursued in the new *Historisches Wörterbuch der Philosophie*, launched and edited by Joachim Ritter and written by a team of more than 1,500 scholars that has been published in twelve volumes between 1971 and 2004. It includes four types of contributions: a) terminological articles, b) key concepts with minor changes in history, c) combined concepts in their systematic context (e.g. in logic), and d) historical method for more detailed articles that track the continuity and change of concepts from Classical Greek to contemporary philosophical treatments.

4 The GA in Res. 37/99 of 13 December 1983 called for “a comprehensive study of concepts of security, in particular security policies which emphasize cooperative efforts and mutual understanding between states, with a view of developing proposals for policies aimed at preventing the arms race, building confidence in relations between states, enhancing the possibility of reaching agreements on arms limitation and disarmament and promoting political and economic security (UN DOC A/40/533).” This resulted in several reports published by the Secretary-General on the “Relationship between Disarmament and International Security” (Disarmament Study Series No. 8, 1982); on “Concepts of Security” (Disarmament Study Series No. 14, 1986) and on “Study on Defensive Security Concepts and Policies” (Disarmament Study Series No. 26, 1993).

group recognized the different security concepts [that] have evolved in response to the need for national security and as a result of changing political, military, economic and other circumstances.” He summarized the group’s common understanding on six elements of a security concept:

- a) All nations have the right to security.
- b) The use of military force for purposes other than self-defence is no legitimate instrument of national policy.
- c) Security should be understood in comprehensive terms, recognizing the growing interdependence of political, military, economic, social, geographical and technological factors.
- d) Security is the concern of all nations and in the light of the threat of proliferating challenges to global security all nations have the right and duty to participate in the search for constructive solutions.
- e) The world’s diversities with respect to ethnic origins, language, culture, history, customs, ideologies, political institutions, socio-economic systems and levels of development should not be allowed to constitute obstacles to international cooperation for peace and security.
- f) Disarmament and arms limitation...is an important approach to international peace and security and it has thus become the most urgent task facing the entire international community (UN 1986: v-vi).

Since 1990, Secretaries-General Boutros Ghali (1992, 1995) and Annan (2005) have conceptualized ‘security’ and ‘human security’ that according to Annan’s report *In Longer Freedom* is based on ‘freedom from want’, ‘freedom from fear’ and ‘freedom to live in dignity’.

For the post Cold War (1990–2006) years, Michael Bothe (chap. 35) reviewed the changes in the use of the concept of security in UNSC decisions on activities that have been considered as threats to ‘international peace and security’ or as ‘breaches of peace’. Jürgen Dedring (chap. 46) reviewed the introduction of the ‘human security’ concept in the deliberations of the Security Council as a result of the activities of Canada on the protection of civilians in armed conflicts while Fuentes (2002; 2008) analysed the activities of the Human Security Network in the promotion of a common human security agenda within and outside of the UN system.

In the scientific disciplines reviewed in this volume, key changes could be noticed in the meaning of the concept of security as well as in the five dimen-

sions of a wider security concept. This process of reconceptualizing security since 1990 could also be observed in statements of international organizations (UN, OSCE, EU, OECD, NATO) and in the interfaces between security and development. Much evidence could be found for the working hypothesis that the global turn has resulted in a reconceptualization of security.

1.6.6 Reconceptualization of Regional Security

New security concepts have been adopted with the *Declaration of the Organization of American States* in October 2003 in Mexico (chap. 69 by Rojas), with the *European Security Strategy* of 2003 (chap. 51 by Hintermeier) by the European Union, by the United Nations in 2005 (chap. 47 by Einsiedel/Nitschke), as well as by NATO (chap. 55 by Dunay; chap. 56 by Bin) but also new collective security tasks have been taken up by the UN Security Council.

However, this retrospective analysis is not sufficient. With the ongoing globalization process, new transnational non-state actors (from transnational corporations, to terrorist and crime networks) have directly affected objective security dangers and subjective concerns. It is not only ‘international terrorism’ that has become a major new security danger and thus the major object of securitization in many US national security policy statements and in numerous UN and other resolutions by IGOs, threats to ‘human security’ in other parts of the world are also posed by the impact of global climate change via an increase in the number and intensity of natural hazards and disasters (storms, cyclones, hurricanes but also drought) that are caused by anthropogenic activities that are partly responsible for the misery of those affected most by extreme weather events (e.g. by cyclones in Bangladesh or by drought in the Sahel zone). These events have contributed to internal displacement and migration and have thus reached the North as new ‘soft’ security problems (Brauch 2002; Oswald 2007).

All these developments caused by global environmental change have contributed to the emergence of a new phase in earth history, the “anthropocene” (Crutzen 2002; Crutzen/Stoermer 2000; Clark/Crutzen/Schellnhuber; Oswald/Brauch/Dalby 2008) that poses new security dangers and concerns, and for many people in the South and for some of the most vulnerable and affected also a ‘survival dilemma’ (Brauch 2004, and chap. 42).

Thus, besides the global turn of 1990, several regional and national structural changes, the impacts of globalization, and with global environmental change a new set of dangers and concerns for the security and survival of humankind are evolving. The perception of or the securitization of these new security dangers as threats for international, regional, national, and human security have all contributed to a reconceptualization of security.

1.7 Three Volumes on Reconceptualizing Security

This book is the first of three volumes that address different aspects of an ‘intellectual mapping’ of the ongoing process of reconceptualizing security. The two related volumes address:

- *Facing Global Environmental Change: Environmental, Human, Energy, Food, Health and Water Security Concepts*;
- *Coping with Global Environmental Change, Disasters and Security – Threats, Challenges, Vulnerabilities and Risks*.

These three books in the *Hexagon Series on Human and Environmental Security and Peace* (HESP) aim to achieve these scientific goals: a) a global *North-South scientific debate on reconceptualizing security*; b) a *multidisciplinary debate and learning*; and c) a *dialogue between academia and policymakers* in international organizations, national governments and *between academia and nongovernmental actors* in civil society and in social movements on security concepts. These three volumes focus on the conceptual thinking on a wide notion of security in all parts of the world that is used to legitimate the allocation of public and private resources and to justify the use of force both to ‘protect’ and to ‘kill’ people in the realization of major values.

The ‘hexagon’ represents six key factors contributing to global environmental change – three nature-induced or supply factors: soil, water and air (atmosphere and climate), and three human-induced or demand factors: population change (growth and decline), urban systems (industry, habitat, pollution) and rural systems (agriculture, food, nature protection). Throughout the history of the earth and of the homo sapiens these six factors have interacted. The supply factors have created the preconditions for life while human behaviour and economic consumption patterns have contributed to its challenges (increase in

extreme weather events) and fatal outcomes for human beings and society. The Hexagon series will cover the complex interactions among these six factors and their extreme and in some cases even fatal outcomes (hazards/disasters, internal displacements and forced migration, crises, and conflicts), as well as crucial social science concepts relevant for their analysis.

Issues in three research fields on environment, security, and peace, especially in the environmental security realm and from a human security perspective, will be addressed with the goal to contribute to a fourth phase of research on environmental security from a normative peace research and/or human security perspective (Brauch 2003; Dalby/Brauch/Oswald 2008). This book series offers a platform for scientific communities dealing with global environmental and climate change, disaster reduction, environmental security, peace and conflict research, as well as for the humanitarian aid and the policy community in governments and international organizations.

1.8 Goals, Structure, Authors and Audience of this Book

The basic research questions this global reference book addresses are threefold:

- Did these manifold structural changes in the political order trigger a rethinking or *reconceptualization* of the key ‘security concept’ globally, nationally, and locally?
- To which extent were two other global processes instrumental for this new thinking on security: a) the process of economic, political, and cultural *globalization* and b) the evolving perception of the impact of *global environmental change* (GEC) due to climate change, soil erosion, and desertification as well as water scarcity and deterioration?
- Or were the changes in the thinking on security the result of a scientific revolution (Kuhn 1962) resulting in a major paradigm shift?

1.8.1 Theoretical Contexts for Security Reconceptualizations

The first two chapters introduce into the international debate on reconceptualizing security since 1989. *Czeslaw Mesjasz* approaches the reconceptualizing of security from the vantage point of systems theory as attributes of social systems.

1.8.2 Security, Peace, Development and Environment

Hans Günter Brauch (chap. 3) introduces a conceptual quartet consisting of *Security, Peace, Environment and Development* that are addressed by four specialized research programmes of peace research, security, development, and environmental studies. After an analysis of six linkages between these key concepts, four linkage concepts will be discussed: a) the *security dilemma* (for the peace-security linkage); b) the concept of *sustainable development* (for the development-environment linkage); c) *sustainable peace* (peace-development-environment linkage) and the new concept of a d) *survival dilemma* (security-environment-development linkage). Six experts review the debates on efforts to reconceptualize these six dyadic linkages: 1: peace and security (chap. 4 by *Ole Wæver*); 2: peace and development (chap. 5 by *Indra de Soysa*.); 3: peace and environment (chap. 6 by *Úrsula Oswald Spring*); 4: development and security (chap. 7 by *Peter Uvin*); 5: development and environment (chap. 8 by *Casey Brown*); and 6: security and environment (chap. 9 by *Simon Dalby*).

While since the French Revolution (1789) many political concepts (including *peace* and *security*) were reconceptualized, the political concepts of *development* and *environment* have gradually evolved since the 1950's and 1970's on national and international political agendas. The authors of chapters 4 to 9 were invited to consider these questions:

- a) Has the peace and security agenda in the UN Charter been adapted to a global contextual change with the disappearance of bipolarity and the emergence of a single superpower? Has the understanding of the classic concepts affecting peace and security: sovereignty, non-use of force (Art. 2,4) and non-intervention (Art. II,7 of UN Charter) changed with the increase of humanitarian interventions and peacekeeping operations?
- b) Which impact did the increase in violence in Europe since 1991, the emergence of new asymmetric, ethno-religious, internal conflicts, and the challenge by non-state actors in a rapidly globalizing world have on the theoretical debates on the six dyadic linkages?
- c) Which impact did the change in the peace-security dyad have on environment and development concepts? Did environment and development policies benefit from the global turn? Was it instrumental for the increase in 'failing states' (Somalia, Afghanistan)?

- d) Have the summits in Rio de Janeiro (UNCED, 1992) and in Johannesburg (UNSSD, 2002), and the formulation of the *Millennium Development Goals* benefited from the turn?
- e) Has the attack of 11 September 2001 on the US changed the priorities of security and development policies, nationally, regionally and globally?

Not all authors have responded to these questions, rather they discussed questions they considered the most relevant from their respective scientific and research perspective. They have widened and deepened the concepts from disciplines and have introduced southern perspectives to the security discourse.

1.8.3 Philosophical, Ethical, and Religious Contexts for Reconceptualizing Security

During the Cold War national and international security was a key policy concept for allocating financial resources and legitimating policies on the use of force. During this period the thinking on security of American and Soviet scholars dominated the paradigms and conceptual debates in the West and East, but also in the divided South. With the end of the Cold War this conceptual dichotomy was overcome. In the post Cold War era, prior to and after 11 September 2001, theoreticians have reconceptualized security in different directions.

Samuel P. Huntington's (1996) simplification of a new 'Islamic-Confucian threat' used cultural notions to legitimate military postures to stabilize the Western dominance and US leadership. Huntington provoked many critical replies by scholars from different regions, cultures and religions. Instead of reducing 'culture' to an object for the legitimization of the military power of one country, the authors in part III have been asked to review the thinking on security in their own culture or religion as it has evolved over centuries and has and may still influence implicitly the thinking and action of policymakers in their region.

Introducing part III, *Úrsula Oswald Spring* (Mexico, chap. 10) compares the thinking on peace in the East, West, and South. Eight chapters were written by authors representing different cultures and religions: *Eun-Jeung Lee* (Korea, chap. 13 on: Security in Confucianism and in Korean philosophy and ethics); *Mitsuo* and *Tamayo Okamoto* (Japan, chap. 14 on: Security in Japanese philosophy and ethics); *Naresh Dadhich* (India, chap. 15 on: Thinking on security in Hinduism and in contemporary political philosophy and ethics in India); *Robert Eisen* (USA, chap. 16 on security in

Jewish philosophy and ethics); *Frederik Arends* (Netherlands, chap. 17: security in Western philosophy and ethics); *Hassan Hanafi* (Egypt, chap. 18: security in Arab and Muslim philosophy and ethics); *Jacob Emmanuel Mabe* (Cameroon/Germany, chap. 19: Security in African philosophy, ethics and history of ideas); *Georgina Sánchez* (Mexico, chap. 20: Security in Mes- oamerican philosophy, ethics and history of ideas); *Domício Proença Júnior* and *Eugenio Diniz* (Brazil, chap. 21: The Brazilian view on the conceptualization of security: philosophical, ethical and cultural contexts and issues); while *Michael von Brück* (Germany, chap. 11: security in Buddhism and Hinduism), and *Kurt W. Radtke* (Germany/Netherlands, chap. 12: Security in Chinese, Korean and Japanese philosophy and ethics) compare the thinking on security in two eastern religions and the thinking in Chinese, Korean, and Japanese philosophy and ethics. The authors were invited to discuss these questions:

- a) Which security concepts have been used in the respective philosophy, ethics, and religion?
- b) How have these concepts evolved in different philosophical, ethical, and religious debates?
- c) What are the referents of the thinking on security: a) humankind, b) the nation state, c) society, or d) the individual human being?
- d) How are these concepts being used today and do these religious and philosophical traditions still influence the thinking of decision-makers on security in the early 21st century?
- e) Did the global contextual change of 1990 as well as the events of 11 September 2001 have an impact on the religious, philosophical, and ethical debates related to security?

The goal of this part is to sensitize the readers not to perceive the world only through the narrow conceptual lenses prevailing primarily in the Western or North Atlantic debates on security concepts and policies. Rather, the cultural, philosophical and religious diversity that influence the thinking on and related policies may sensitize policymakers.

1.8.4 Spatial Context and Referents of Security Concepts

During the Cold War the narrow ‘national security’ concept has prevailed (table 1.2). Since 1990 two parallel debates have taken place among analysts of *globalization* (in OECD countries) focusing on processes of de-territorialization and de-borderization as well as proponents of new ‘spatial’ approaches to internatio-

nal relations (*geo-strategy*, *geopolitics*, *geo-economics*). There was no significant controversy between both schools. Both approaches may contribute to an understanding of the co-existence of pre-modern, modern and post-modern thinking on sovereignty and its relationship to security. The major dividing line between both perspectives, often pursued in the tradition of realism or pragmatism, is the role of ‘space’ in international affairs (see chap. 22 by Brauch).

In the Westphalian system sovereign states may be defined in terms of a) territory, b) people, and c) government (system of rule). Thus, the territorial category of ‘space’ has been a constituent of modern international politics. No state exists without a clearly defined territory. ‘Spatiality’ is the term used to describe the dynamic and interdependent relationship between a society’s construction of space on society (Soja 1985). This concept applies not only to the social level, but also to the individual, for it draws attention to the fact that this relationship takes place through individual human actions, and also constrains and enables these actions (Giddens 1984). During the 1960’s and 1970’s, spatial science was widely used in geography and it attracted practitioners interested in ‘spatial order’ and in related policies (Schmidt 1995: 798–799). However, the micro level analyses in human geography are of no relevance for international relations where the concept of ‘territoriality’ is often used as:

a strategy which uses bounded spaces in the exercise of power and influence. ... Most social scientists ... focus on the efficiency of territoriality as a strategy, in a large variety of circumstances, involving the exercise of power, influence and domination. ... The efficiency of territoriality is exemplified by the large number of ‘containers’ into which the earth’s surface is divided. By far the best example of its benefits to those wishing to exercise power is the state, which is necessarily a territorial body. Within its territory, the state apparatus assumes sovereign power: all residents are required to ‘obey the laws of the land’ in order for the state to undertake its central roles within society; boundaries are policed to control people and things entering and leaving. Some argue that territoriality is a necessary strategy for the modern state, which could not operate successfully without it (Johnston 1996: 871; Mann 1984).

This very notion of the ‘territoriality’ of the state has been challenged by international relations specialists. Herz (1959) argued that the territorial state could easily be penetrated by intercontinental missiles armed with nuclear weapons. In the 1970’s, some globalists announced the death of the state as the key actor of international politics, and during the recent debate some analysts of *globalization* proclaimed the end of

the nation state and a progressing deborderization and deterritorialization have become key issues of analysis from the two opposite and competing perspectives of globalization and *geopolitique* but also from critical geopolitics. For the deborderized territories a new form of *raison d'état* may be needed.

The authors of part IV have been invited to address the following questions:

- a) Has the debate on security been influenced by the two schools focusing on globalization and geopolitics as well as by pre-modern, modern, and post-modern thinking on space?
- b) To which extent have there been changes in the spatial referents of security, with regard to global environmental change, globalization, regionalization, the nation state, as well as sub-national actors, such as societal, ethnic and religious groups, terrorist networks, or transnational criminal groups active in narco-trafficking?

The authors of the twelve chapters address two competing approaches of globalization vs. critical geopolitics or ecological geopolitics vs. political geo-ecology (chap. 22 by *Hans Günter Brauch*); on a structural setting for global environmental politics in a hierarchical international system from a geopolitical view (chap. 23 by *Vilho Harle* and *Sami Moiso*); the role and contributions of the Global Environmental Change and Human Security (GECHS) project within IHDP (Chap. 24 by *Jon Barnett*, *Karen O'Brien* and *Richard Matthew*); globalization and security: the US 'Imperial Presidency': global impacts in Iraq and Mexico (chap. 25 by *John Saxe-Fernández*); and on: Globalization from below: The World Social Forum: A platform for reconceptualizing security? (chap. 26: by *Úrsula Oswald Spring*).

Mustafa Aydın and *Sinem Acikmese* (chap. 27) discuss identity-based security threats in a globalized world with a focus on Islam, while *Björn Hettne* (chap. 28): in world regions as referents reviews concepts of regionalism and regionalization of security. *Bharat Karnad* (chap. 29) addresses the nation state as the key referent with a focus on concepts of national security, while *Varun Sahni* (chap. 30) provides a critical analysis of the role of sub-national actors (society, ethnic, religious groups) as referents. *Gunhild Hoogensen* (chap. 31) focuses on terrorist networks and *Arlene B. Tickner* and *Ann C. Mason* (chap. 32) on criminal narco-traffic groups as non-state actors as referents and finally *Jacek Kugler* (chap. 33) offers his ideas on reconceptualizing of security research by integrating individual level data.

1.8.5 Reconceptualization of Security in Scientific Disciplines

The security concept is used in many scientific disciplines and programmes. In this part *Jean Marc Coicaud* (chap. 34) contemplates on security as a philosophical construct, *Michael Bothe* (chap. 35) offers an empirical review of the changing security concept as reflected in resolutions of the UN Security Council, while *S. Mansoob Murshed* (chap. 36) discusses the changing use of security in economics, *John Baylis* (chap. 37) reviews the changing use of the security concept in international relations, and *Ulrich Albrecht* and *Hans Günter Brauch* (chap. 38) reconstruct the changes in the security concept in security studies and peace research. The authors were invited to discuss these questions:

- a) Did a reconceptualization of security occur in these scientific disciplines and programmes?
- b) Did the global turn of 1990 and the events of 11 September 2001 have an influence or major impact on a reconceptualization of security or have other developments (e.g. globalization or demography) or events been more instrumental?
- c) Which other factors were instrumental for a reconceptualization, e.g. of risk, risk society and modernity, that directly influence the scientific debate on security?

1.8.6 Reconceptualizing Dimensions of Security since 1990

Laura Shepherd and *Jutta Weldes* (chap. 39) introduce into the sixth part by discussing security as the state (of) being free from danger, and *Hans Günter Brauch* (chap. 40) contrasts the state-centred 'security dilemma' (Herz 1959) with a people-centred 'survival dilemma'. Barry Buzan, Ole Wæver and Jaap de Wilde (1998) distinguished among five sectors or dimensions of security of which they analyse in this book the military (*Buzan*, chap. 41), societal (*Wæver*, chap. 44), and environmental (*de Wilde*, chap. 45) security dimensions while the political one is discussed by *Thomaz Guedes da Costa* (chap. 42) and economic one by *Czesaw Mesjasz* (chap. 43). They were invited to reflect on these questions:

- a) To which extent have new theoretical paradigms, approaches, and concepts in different parts of the world influenced the reconceptualization of security dimensions?

- b) To which extent have different worldviews, cognitive lenses, and mindsets framed the securitization of the five key sectors or dimensions of security?
- c) To which extent has the conceptualization of the five sectors or dimensions of security been influenced by the global turn of 1989 and by the events of 11 September 2001?
- d) Has there been a fundamental difference in the perception of the impact of both events in Europe, in the USA, and in other parts of the world for the five security dimensions?
- e) Has the policy relevance of different security dimensions contributed to competing security agendas, and were they instrumental for the clash among conflicting views of security in the UN Security Council since 2002, prior to and after the war in Iraq?

1.8.7 Institutional Security Concepts Revisited for the 21st Century

With the end of the Cold War, the bipolar system that relied primarily on systems of collective self-defence (Art. 51 of UN Charter) has been overcome with the dissolution of the Warsaw Treaty Organization in 1991. In a brief interlude from 1991–1994, the systems of global and regional collective security were on the rise, and even NATO, the only remaining system of collective self-defence, was ready to act under a mandate of the CSCE, or since 1994 of the OSCE. However, with the failure of the UN and OSCE to cope with the conflicts in the post Yugoslav space, since 1994 NATO's relevance grew again, and with its gradual enlargement from 16 to 27 countries, NATO has again become the major security institution for hard security issues while the role of the UN system and of its regional collective security organizations expanded also into the soft 'human' security areas.

Since 1994, when UNDP first introduced the human security concept, this concept has been debated by the UN Security Council (see chap. 46 by *Jürgen Dedring*), in reports by the UN Secretary-General (chap. 47 by *Sebastian Einsiedel*, *Heiko Nitzschke* and *Tarun Chhabra*) and has been used by UNDP as well as by UNESCO and other UN organizations such as UNU (Bogardi/Brauch 2005, 2005a). The reconceptualization of security in the CSCE and OSCE since 1990 is documented by *Monika Wohlfeld* (chap. 49).

Four chapters review the complex reconceptualization of security by and within the European Union, from the perspective of the chair of the EU's Military Committee (Chap. 50 by General *Rolando Mosca*

Moschini) who presents its comprehensive security concept, while *Stefan Hintermeier* (chap. 51) focuses on the reconceptualization of the EU's foreign and security policy since 1990 and *Andreas Maurer* and *Roderick Parkes* (chap. 52) deal with the EU's justice and home affairs policy and democracy from the Amsterdam to The Hague Programme and finally *Magnus Ekengren* (chap. 53) focuses on the EU's functional security by moving from intergovernmental to community-based security concepts and policies.

Two chapters focus on the reconceptualization of security in NATO since 1990 (*Pál Dunay*, chap. 55) and on NATO's role in the Mediterranean and the Middle East after the Istanbul Summit (*Alberto Bin*, chap. 56). The security and development nexus is introduced by *Peter Uvin* (chap. 8), the coordination issues within the UN system is addressed by *Ole Jacob Sending* (chap. 48) and the harmonization of the three goals of peace, security, and development for the EU by *Louka T. Katseli* (chap. 54). From the perspective of Germany *Stephan Klingebiel* and *Katja Roehder* (chap. 58) carry the considerations further by discussing the manifold new interfaces between development and security, while *Ortwin Hennig* and *Reinhold Elges* (chap. 57) review the German Action Plan for civilian crisis prevention, conflict resolution, and peace consolidation as a practical experience with the reconceptualization of security and its implementation in a new diplomatic instrument. The authors of part VII were asked to consider these questions:

- a) Which concepts of security have been used by the respective international organizations in their charter and basic policy documents? To which extent has the understanding of security changed in the declaratory as well as in the operational policy of this security institution? To which extent was the global turn of 1989 instrumental for a reconceptualization of security by the UN, its independent global and regional organizations and programmes?
- b) Has there been a shrinking of the prevailing post Cold War security concept since 11 September 2001, both in declaratory and operational terms? To which extent has there been a widening, a deepening or a sectorialization of security since 1990 in OSCE, EU and NATO, and to which extent has this been reflected in NATO's role in the Mediterranean and in the Middle East? And to which extent did the security institutions adopt the concepts of environmental and human security in their policy declarations and in their operative policy activities?

1.8.8 Reconceptualizing Regional Security for the 21st Century

A major reconceptualization of security has been triggered by the fundamental global contextual change that occurred with the end of the Cold War. The narrow Hobbesian view of security threats posed by the military capabilities and intentions of the other military alliance has been overcome and replaced by a widening, deepening and sectorialization of the regional thinking on security. The security concepts offer a framework for the analysis of hard security threats and manifold political, economic, environmental security challenges, vulnerabilities and risks. The redefinition of security interests by security institutions as influenced by the conceptual lenses that influence the subjective security perception.

Among the authors of part VIII are the foreign minister of Nigeria *Joy Ogwu* who offers a regional political security perspective from and for Western Africa (chap. 62) while *Alfred Nhema* and *Martin Rupiya* (Zimbabwe, chap. 63) provide a grim regional security perspective from and for the Horn, Eastern and Southern Africa, and *Naison Ngoma* and *Len le Roux* (Zambia, South Africa, chap. 64) offer a regional security perspective from and for Southern Africa.

The regional security in Europe in the 21st century is analyzed by *Sven Biscop* (Belgium, chap. 59), while *Mustafa Aydin* and *Neslihan Kaptanolu* (Turkey, chap. 60) discuss three concepts of regionalization of great power security concerns for the intertwining between the new neighborhood, the near abroad, and the greater and wider Middle East while *Bechir Chourou* (Tunisia, chap. 61) contributes a regional security perspective from and for the Arab world. Three regional security perspectives for three sub-regions in Asia are offered by *Navnita Chadha Behera* (India, chap. 65) for South Asia, by *Eu-Jeung Lee* (chap. 66) for China, South and North Korea and Japan and by *Liu Cheng* and *Alan Hunter* (China/UK, chap. 67) for China for the early 21st century. *Kevin P. Clements* and *Wendy L. Foley* (Australia, New Zealand, chap. 68) review the regional security debate in the South Pacific on peace and security with alternative formulations in the post-Cold War era and *Francisco Rojas Aravena* (Chile, chap. 69) assesses the key regional security issues on the American continent, its challenges, perceptions, and concepts and *P.H. Liotta* (USA) and *James F. Miskel* (USA) offer thoughts for an ethical framework for security. The authors of part VIII were invited to consider these questions:

- a) Which impact did scientific and political security discourses and communication processes have on the reconceptualization of regional security?
- b) How relevant have security concepts been for the formulation of security interests in international politics and international relations? Which role has the rethinking of security in the new millennium played in regional debates on peace and security in Europe, in the Neighbourhood, Near Abroad, and Greater or Wider Middle East?

1.8.9 Reconceptualizing Security and Alternative Futures

This part will carry the discussion on security concepts into the future from a theoretical perspective on prediction in security theory and policy by *Czesaw Mesjasz* (chap. 71), from the vantage point of two military officers, *Heinz Dieter Jopp* and *Roland Kaestner* (chap. 72), and of an environmental and hazard specialist *Gordon A. McBean* (chap. 74) who discusses the role of prediction with regards to natural hazards and sustainable development. *Heikki Patomäki* (chap. 73) debates from a hypothetical scenario on learning from possible futures for global security.

1.8.10 Summary Conclusions

In this final part *Úrsula Oswald Spring* and *Hans Günter Brauch* (chap. 75) summarize the results of this global mapping of the rethinking on security. Based on the analysis of the trends in global thinking the authors discuss the policy relevance of security concepts for the structuring of the security debate and for policy-making both in national governments and in international organizations.

1.9 Editorial Process

As indicated above (1.7) this book differs from available publications on security by aiming at a fourfold dialogue. Such an ambitious effort may transcend the narrow professional or institutional horizon of some reviewers who often expect that such a project should be developed within the mainstream methodological approaches of international relations.

The editors pursue three goals: a) to contribute to *problem awareness* for the different security concepts in North and South, on hard and soft security issues, on non-military, primarily environmental challenges and environmental security problems; b) to stimulate

and encourage interdisciplinary scientific research and political efforts to resolve, prevent, and avoid that environmental factors may contribute to violent conflicts (both scientific and political *agenda-setting*); and c) to contribute to a better understanding of the complex interactions between natural processes, nature and human-induced regional environmental changes (*learning*).

While power has once been defined by Karl Deutsch (1963, 1966) as not having to learn, during the 20th century the resistance to any *anticipatory* learning by those who control the resources over outcomes has been significant. In history, it often required severe foreign policy and domestic crises (e.g. in the US in the 1970's during the Vietnam War and in the former Soviet Union in the 1980's during the Afghanistan War) to stimulate major re-assessments of existing foreign and security policies and to launch fundamental revisions.

Several scientists (E.U. von Weizsäcker 1989; E.O. Wilson 1998) have described the 21st century as the century of the environment. For the new century, Edward O. Wilson (1998a) has referred to a growing *consilience*, i.e. the interlocking of causal explanations across disciplines, what implies that the interfaces of disciplines become as important as the disciplines. Ted Munn (2002), in his preface to the *Encyclopedia of Global Environmental Change*, argued based on Wilson:

that this interlocking amongst the natural sciences will in the 21st century also touch 'the borders of the social sciences and humanities'. In the environmental context, environmental scientists in diverse specialties, including human ecology, are more precisely defining the area in which that species arose, and those parts that must be sustained for human survival (Wilson 1998).

Anticipatory learning must acknowledge this need for a growing *consilience* that causal explanations across disciplines may contribute to new understanding and knowledge that will be needed to cope with the challenges of the 'international risk society' (Beck 1992, 1999, 2007).

All authors of this and subsequent volume were specifically invited by the lead editor in consultation with John Grin and Czesaw Mesjasz to contribute to three workshops on reconceptualizing security at the:

- 45th Annual ISA Convention in Montreal, Quebec, Canada, 17-20 March 2004⁵;
- 20th IPRA Conference in Sopron, Hungary, 5-9 July 2004⁶;

- 5th Pan-European Conference on International Relations (ECPR) in The Hague, the Netherlands, 8-11 September 2004.⁷

At these workshops all papers were critiqued by discussants and by the audience. All chapters in this volume have been peer reviewed by at least two anonymous reviewers, and subsequently all chapters in this volume have been revised by the authors.

This book is not addressed *only* to the political science, international relations, strategic studies, peace research, development, and environmental studies community in the OECD world. Its scope is broader and more ambitious. It intends to broaden the scope and to sensitize the reader to the thinking in different disciplines, cultures, and global regions, especially on nature and humankind. The editors have worked hard that these three related books on 'reconceptualizing security' will be of relevance for scholars, educators and students and the more generally academically trained audience in many scientific disciplines, such as: *political science* (international relations, security studies, environmental studies, peace research, conflict and war studies); *sociology* (security conceptualization and risk society); *economics* (globalization and security); *philosophy, theology, comparative religion and culture* (security conceptualization); *international law* (security conceptualization), *geosciences* (global environmental change, climate change, desertification, water), *geography* (global environmental change, population, urbanization, food); *military science* (military academies).

The global thinking on security is also of importance for policymakers and their advisers on the national and international level in: a) foreign, defence, development, and environment ministries and their policy-oriented think tanks; b) international organizations: NATO, European institutions, UN, UNESCO, FAO, WHO, UNDP, UNEP, IEA, UNU, et al.; c) for the *Human Security Network*; d) for the environment and security network of the representatives of 27 EU foreign ministries; and in e) nongovernmental organizations in the areas of foreign and defence, development and environment policies; as well as for f) diverse social and indigenous movements. The thinking on security and on the specific security policies of countries, alliances, and international organizations are also a special focus for educators (at all levels) and media specialists.

2 Security as Attributes of Social Systems

Czeslaw Mesjasz

2.1 Introduction

As in other areas of social sciences, in security studies theory follows the unfolding processes and provides descriptions and interpretations. Causal explanations are rare or superficial. Predictions or normative approaches are even more difficult to find. It may be claimed that in the contemporary discussion on security, analytical properties of that concept too often are either concealed in a broad ideological discourse, or are deriving from common sense reasoning. Attention is paid to the universalization of security, political, doctrinal, and even ideological issues and to critical approaches, with a lack of care for definitions. Too frequently the questions are asked what we think about this or that definition of security. What political doctrine and/or scientific paradigm does it conform to? Less attention is being paid to the most fundamental question: What security is about?

Bearing in mind broader reflections on security, it is necessary to reflect upon more specific facets of security – the identification of threats and risks, the limits of prediction, actions taken to maintain or to restore security, consequences of securitization or desecuritization, validity of policy recommendations.

It is impossible to answer whether the broad idea of security can be refined to fulfil the needs of more rigorous theorizing. But it is possible to study the analytical properties of the broadened definitions of security, i.e. to which extent they can be used for description, explanation of causal relationships, and prediction of phenomena in various social collectivities, not solely in international relations. Since security theory by definition has a normative character, thus expectations are going even further and analytical properties of the concept of security should facilitate normative applications.

Usually security is treated as an attribute of different social entities (collectivities) – states, groups of states, society (defined in different ways), or as in the case of human security, as a property of living condi-

tions of individuals. It is then necessary to discuss security not as a broad and fuzzy normative idea, but as a property of the status of social entities and of their elements (individuals). Security treated as a feature of social systems can be viewed both in terms of ‘objective’ properties, as well as a construct emerging in the discourse of the external observers and/or participants.

This chapter addresses the following questions: How security treated as a property of social systems and of their elements (individuals) can be described and studied. Whether there exists any set of universal properties, a kind of ‘core concept’, which can be identified in all circumstances when the term ‘security’ is applied.

In a kind of mirror approach, in identifying links between security-related issues and complex systems studies, Murray Gell-Mann (2002), a Nobel Prize winner and specialist in complexity studies, saw an obstacle in a too broad definition of security (Alberts/Czerwinski 2002). Systems thinking, systems approach, and complex systems studies can be used in security theory and policy as sources of analogies, metaphors, and mathematical models. Using another approach, four of Wittgenstein’s (2002) ‘language games’ emerge including: (1) the meaning of security, (2) the meaning of system, (3) the meaning of ideas where the concepts of system and security are jointly applied, and (4) the meaning of complexity.¹

In the first part of the chapter interpretations of the notion security are briefly presented (2.2). In the second part, the core concept of security is developed into a collection of attributes of social systems, of their elements and of their environment (2.3). Security-related attributes of social systems are treated as an introduction to the assessment of possible analytical properties of various kinds of security, from human to military security. Complex systems studies are

1 Applications of the concept of language game in IR theory have been recently analysed by Fierke (2002).

proposed as a foundation for description, explanation of causal relations, prediction, anticipation, normative approach, prescription, retrospection, retrodiction, control and regulation in security-oriented discourse (2.4).

2.2 Interpretations of Security

Security and politics have been important areas of applications of various ideas drawn from systems thinking.² The newly emerging military and non-military threats such as low-intensity conflicts, regional conflicts, terrorism, environmental disturbances, etc. cannot be embraced without ideas taken from modern complex systems studies.

2.2.1 Evolution of the Concept of Security

It is impossible to elaborate a comprehensive and unequivocal definition of the security concept. The approaches presented below reflect a twofold evolution of the applications of the term 'security'. In the first group security is associated with international relations and either treated as an 'objective' attribute of a situation of the state or as an outcome of social discourse, as an 'act of speech' – performative utterance, a result of 'securitization' (see chapters by Buzan, Wæver and de Wilde in this volume).

The second group includes a rank of ideas either deriving from the international security discourse, or developed independently: 'internal security' within a country, security in military considerations, security as a public good, and security in an universal sense (of any individual and of any social entity) – societal security, and first and foremost, human security.

Etymological discussions on the origins of the English notion 'security' are twofold and reflect a discrepancy already existing in Latin interpretations of the term *securus* (Brauch 2003, 2005, 2005a) (Liotta

2002). In the first interpretation, the term security derives from Latin *securus* safe, secure, from *se* without + *cura* care - the quality or state of being secure or as a freedom from danger (freedom from fear or anxiety). In the second interpretation, the English word 'security' originates from the Latin word '*securus*' but a different interpretation. '*Se*' means 'without' and '*curus*' meaning 'uneasiness' or 'full of cares or worries'.

The difference of interpretations stems from the absence of an unequivocal interpretation of the term *cura* (*curas*) – cares and/or worries. The Latin term *cura* can be also interpreted in French as 'soin' or 'souci' (Touchefeu 2005). According to Maldonado (2000): "The prefix *se-* occurs in the word *securus* 'safe, free from worry', and appears to be formed from the word *curas*, 'cares or worries'. I say 'appears' since the inflectional suffixes (*-as* and *-us*, here) are also changed; whether *se-* attaches to the noun *cura* or whether there was once an adjective *curus* meaning something like "full of cares or worries" and *securus* is the only adjective remaining."³ 'Security' originally meant liberation from uneasiness, or a peaceful situation without any risks or threats. The term 'security' has many meanings, including 'to feel safe' and 'to be protected', and is used to describe a situation without risks or worries.

The traditional interpretation of security is deriving from foreign policy and international relations – 'objective' or 'military security'. This sense of security can be extended by the concept of internal security, i.e. absence of threats to the state system and to the everyday life of its citizens caused by political and or military disturbances within the borders of a country. After 11 September 2001 a broadened concept of 'homeland security' embodying both external and internal threats was institutionalized in the US on 25 November 2002, when President George W. Bush signed the Homeland Security Act. The second term 'military security' can to a large extent be associated with both traditional meanings of security – external and internal. In numerous cases all combat-related military activities are given a security context in its traditional sense as national (state) security.

2 The impact of systems concepts can be found in peace and security-related research summarized in Mesjasz (1988): the first models of military conflicts and wars by Frederick Lanchester (1916) and Lewis F. Richardson (1960), universal models of Pitirim Sorokin (1970) and Quincy Wright (1965), national and military security (origins of RAND Corporation), development of game theory-based conflict studies (Rapoport 1960), classical security studies by Morton A. Kaplan (1957) and Karl W. Deutsch (1966), and in contemporary studies on widened security concepts proposed by the 'Copenhagen School' (Buzan/Wæver/de Wilde 1998).

3 This discrepancy is also reflected in some other languages, e.g. in Polish *bezpieczeństwo* (without care (in Polish, *bez* – without, *piecza* – care) and in Russian *безопасность* (without threat) (in Russian *bez* – without, *опасность* (o) – threat). Further studies on etymology of security in other languages could also provide more insights in the studies of deepened and broadened interpretations of security.

In the 1990's, after the collapse of the Soviet empire, a new security approach or paradigm emerged. Widening of the security concept was proposed from a constructivist point of view by the Copenhagen School (Buzan/Wæver/de Wilde 1998; see also chapters in this volume). Security lost its traditional 'objective' character and is perceived as an 'act of speech' or a result of 'securitization'. Security is thus a self-referential practice, because an issue becomes a security issue – not necessarily because a real existential threat exists, but the issue is depicted as a threat.

A discourse that presents something as an existential threat to a referent object does not by itself create securitization. It is solely a securitizing move and the issue is securitized only if and when the audience accepts it as such. Securitization studies aims to gain understanding of who securitizes, on what issues (threats), for whom (referent objects), why, with what results and under what conditions (Buzan/Wæver/de Wilde 1998). 'Desecuritization' can be defined as a process where a 'threat' which under one 'speech act' compels extraordinary measures in another 'speech act' is presented as not requiring such measures (Wæver 1995)⁴.

Deepening the agenda of security studies means moving either down to the level of individual or human security or up to the level of international or global security, with regional and societal security as possible intermediate points. Paradoxically, deepening of security was proposed by a realist scholar, Ken Booth (1991), who was even later called a 'fallen realist'.

The widest and deepest security concept is 'human security' (UNDP 1994: 23), which has two basic aspects: safety from chronic threats as hunger, disease, and repression ('freedom from want') and protection from sudden and harmful disruptions in the patterns of daily life ('freedom from fear'). According to Sen (2000: 1), human security focuses on "...survival, daily life and dignity of human beings." Its strong universal normative interpretation has an ethical and political impact, and its universal character makes it disputable in more rigorous applications (Burgess/Owen 2004).

Such universal applications have often led to a misuse or abuse of the security concept in the scientific and political discourse. To preserve and enhance the usefulness of that concept in theory and in practice, an eclectic or 'common-sense' approach is proposed to combine the declared objective value of the neo-re-

alist security concept with the constructivist approach, and its 'widened' and 'deepened' features viewed as an 'act of speech'. Such an approach is needed to refer to security not only as a political and ideological category, but in operational terms, relevant for research and policy-making. Security can be also viewed as a socio-economic category of a public good (Kaul/Conceição/Le Goulven/Mendoza 2003), and a new emerging challenge of security of information society, including security of information systems ('informational security') is also addressed.

2.2.2 The Core Security Concept

Adding to the survey of reconceptualizations of security (see Brauch 2003, 2005 and chapters 1 and 4 in this volume) it is worthwhile to rethink what security is about. The following questions can be a point of departure for further considerations:

1. What are the characteristics of a social collectivity (or system) which can be depicted as secure?
2. How can those characteristics be specified in a more detailed form, not only with a broad but superficial and sometimes contradictory meaning?

If the term 'security' is assigned to a wide variety of social categories, then the question is whether there is a common denominator, a core concept, in all applications of that term. If this is true, what are the causes that the same term is assigned to different states of social systems and their elements? What interpretations can be assigned to the metaphor of security? Even an introductory linguistic inquiry allows concluding that security is not a dead metaphor, but a dormant and perhaps even an extended metaphor.⁵

If security is not a dead metaphor, then three transformations of its metaphorical sense can be presented. *First*, new characteristics were added to the initial meaning of security in international relations ('state' and 'internal' security), and they are selected in various processes of securitization as a kind of

4 These concepts are supplemented with complacency or 'non-securitization' of apparent threats (Buzan/Wæver/de Wilde 1998: 57).

5 In a 'dead metaphor' a transferred image is not present, e.g. money, because it was first minted at the temple of Juno Moneta. In a 'dormant metaphor' the initial idea has been lost, e.g. the strategy originally derived from Greek 'strategos', general or leader. An 'extended metaphor' sets up a principal subject with several subsidiary subjects or comparisons, e.g. our house is a castle, a fortress and a nest. For discussions on metaphors in social sciences see: Ortony (1979); Lakoff/Johnson (1980); Mirowski (1989, 1994); Morgan (1996).

'menu for choice' with some constraints, such as threats as disturbances requiring unusual activities.

The *second* rationale for its widespread applications is that the collection of characteristics to describe a positive perception of a state of any social entity and/or individual as security embodies so many characteristics that it is becoming too universal, if not trivial, pointing to security as all the good in the world. It may be even stated that such a definition of security and of human security in particular, is becoming a substitute for other ethical and religious norms referring to the quality of life.

The *third* assertion is used here as a point of departure. Despite extended and deepened contemporary interpretations of security, a limited collection of common attributes of that notion related to social systems and their elements can be defined in systemic terms. Those systemic attributes of security are associated with existence of social systems and their elements, e.g. individuals. Accordingly, the core concept of security is a kind of an invariant element of all situations when the term security is spelled out. In terms of a semantic analysis this invariant is the link between all meanings of security treated as dormant and extended metaphors. Thus the core element of security can be treated as a foundation of securitization treated as an 'act of speech' or a performative utterance.

Presence or absence of security of any social system or an individual, i.e. of circumstances threatening their existence and compelling to undertake extraordinary activities, can be translated into a collection of simple systemic characteristics. This collection can be called the 'core concept' of security since all its elements can be identified in any attempt to define security both objectively and stemming from various securitization discourses.

The expectation for the continued existence of any social system is the key element of the assessment of its security. Of course, for living systems and some social systems, the predicted termination of its existence is also a part of its set of norms. If survival or the predicted decay is the aims of existence, a kind of desired state, then any disturbance negatively affecting that process requires countermeasures. Thus a normative notion disturbance (disruption) – actual or potential, could be associated with such terms as danger, threat, challenge, vulnerability, and risk (Brauch 2005a), whose meaning also requires further elucidation. To guarantee clarity of considerations several ideas from systems thinking such as stability, instability, discontinuity, complexity, and several others are

not applicable at this level of general considerations. But a closer look at their meaning may identify numerous simplifications and contradictions (Mesjasz 1999).

'Disturbance' refers to any object and can be caused by internal and external factors, or by a mixture of both. The disturbance should be identified by any observer-participant (internal, external), and if securitized – regarded as threatening an actual status (existence?) of the system (individual), should lead to appropriate actions.

The control theory is used irrespective of its deficiencies due to constructivist limitations. Social systems are treated as constructs made by observers or participants initially in their cognitive processes and later in the social discourse. The term social systems is used interchangeably with collectivities since in a constructivist approach the systems are created by observers or participants from any social collectivities, e.g. a system constructed solely for the purpose of the study. This approach does not allow responding unequivocally what social systems are but permits to circumvent the search for a universal definition of those systems.⁶

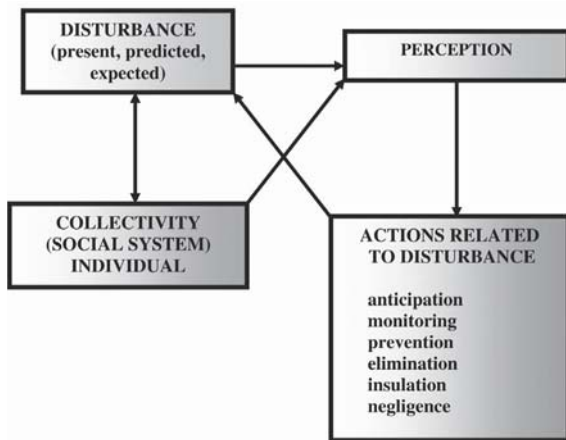

Similarly, in order to limit the too general character of the core concept of security, a neutral concept of an impulse influencing a system is replaced with a negatively valued notion of disturbance. Thus, the core concept of security is a kind of framework for all normative discussions on existence and survival of any social collectivities and individuals. Although it is designed for ordering the discourse on relatively well-defined, 'technical' aspects of security, it can also be helpful to introduce an additional rigour in the discussions on security based on broadly defined terms, like identity, or 'freedom from fear'. To discuss such ideas it is necessary to understand the sense of the word 'game'. The 'core scheme' of security can be extended in various directions by a combination of these attributes

1. *Reference object*: state, region, alliance, society, various social groups, nations, minorities, ethnic groups, individuals, global system;
2. *Areas where existential disturbances (threats) are emerging (sectors)*: political, military, economic, ecological, societal, informational.

⁶ An epistemological and ontological background for this application of the systems approach can be found in Midgley (2003).

3. *Methods of prediction (identification) of disruptions*: from search for 'objective' threats to subjectively perceived threats, also resulting from social discourse ('securitization').
4. *Methods of planning and performing extraordinary actions (anticipation)* aimed at monitoring, preventing or eliminating existential threats (figure 2.1):.

Figure 2.1: The Core Concept of Security

Additional attention must be paid to changing interpretations of the scheme in 'widening' and 'deepening' the meaning of security. In classical, state-oriented interpretations of security, the disturbance (threat) could be resulting from purposive actions by a clearly defined 'threatener' undermining actual or potential existence of a threatened object (system). In the widened and deepened interpretations of security, the disturbances are not so easily identified. If security is understood as the absence of unusual disturbances requiring extraordinary measures, then the questions are arising what is unusual (threatening) disturbance, how it can be identified (predicted), and what does extraordinary mean?

In systemic terms an idea of securitization is equivalent to the identification of external and internal changes perceived as actually or potentially disturbing a given state (equilibrium?), and in an ultimate resort terminating the existence of a social system and of its elements (individuals). Here it can only cursorily be mentioned that prediction of disturbances in the process of securitization also requires more precise considerations. Securitization allows defining the extraordinary character of actions which are to be undertaken in response to the disturbances.

In the process of universalization of the sense of security two doubts are arising. If too broadly defined

categories are applied to depict some processes (events) as disturbing for social systems, e.g. threats to identity, or 'freedom from want, freedom from fear', then their sense of exceptionality is lost. By the same token, the actions undertaken in consequence of such broadly defined disturbances can lose their extraordinary character, or on the contrary, actions taken as normal can gain an exceptional sense.

This phenomenon is reflected in the discourse on societal, economic and human security. The categories used for defining security constitute a certain continuum - from more or less specifically defined categories in the classical security discourse, through less precise terms used in political, economic, societal to vaguely depicted characteristics of human security.

The core security concept remains relevant for the continuum of interpretations of security. In the process of securitization it is always the difference between a desired state and the actual state which is securitized in the discourse. The less precisely the desired state is described, the more the disturbances concern not the actual state but predictions and/or norms and even basic values of securitizing actors. One of the arguments used against securitization of environmental threats is that they are linked to long-term predictions for which no valuable proofs can be given at present. Similarly, the disturbances equivalent to differences between desired and actual states are gaining a more abstract character, e.g. 'freedom from fear', preservation of identity, etc. As a result, securitization is becoming even more dependent on the social discourse, or in other words, more 'constructivist' and exposed to distortions.

Consequences of universalization on human security require further studies.⁷ Nevertheless, it can be concluded that the core concept of security can be treated as a relevant foundation for any kind of security, from state-oriented ones to the most universal human security.

2.2.3 Systemic Interpretation of Security

The core concept of security (figure 2.1) is a point of departure for developing a broader framework idea of security which can be used for studying the links between security treated as attributes of social systems and various concepts defined as systems thinking, systems approach or complex systems studies (figure 2.2). This scheme cannot capture all aspects of secu-

⁷ Insights of the meaning of human security were presented in: *Security Dialogue*, 35, 3 (September 2004).

ity but offers a foundation for more rigorous considerations on security and its attributes, and for the discourse on all concepts associated with security. A collection of these concepts is given below.

1. *Reference object*:

- social entity (subsystem) and individual as an element of a system;
- dimensions of security (survival, identity, coherence, or perhaps a broadly defined identity).

2. *Disturbance* (threat, risk, danger):

- semantic distinctions between threat, danger and risk;
- relations between meaning of those terms;
- securitization of social phenomena: threats, dangers and risks.

3. *Vulnerabilities*:

- vulnerability as a systemic property;
- relations between vulnerabilities and threats, risks and dangers.

4. *Prediction (identification) of threat (risk, danger)*:

- classical approach: risk and uncertainty;
- threat, risk and uncertainty, and methods and limits of their prediction;
- known threat (risk, danger): known consequences and unknown consequences;
- unknown (hidden) threat, unknown features and consequences.

5. *Actions*:

- prevention, pre-emption, securitization, desecuritization;
- negligence;
- elimination.

6. *Structural aspects of security of social systems*:

- links between military, political, economic, environmental, and societal domains of security (relations between domains);
- links between security of elements and security of collectivities (security of individuals and of collectivities).

7. *Attributes of a 'secure' reference object (system of reference objects)*:

- minimization of uncertainty, continuity, survival, increased capabilities of prediction;
- stability as synonymous to desired status with predictable future states.

8. *Inter-system relational aspects of security*:

- typology of systems - units (states, other social entities - ethnic groups, etc.);
- security dilemma, relations with other social systems, relations with natural environment.

The attributes of security as a property of social systems will be developed in further research.⁸ It will provide a 'framework' for a discussion of applications of various ideas of systems thinking in security theory and policy research:

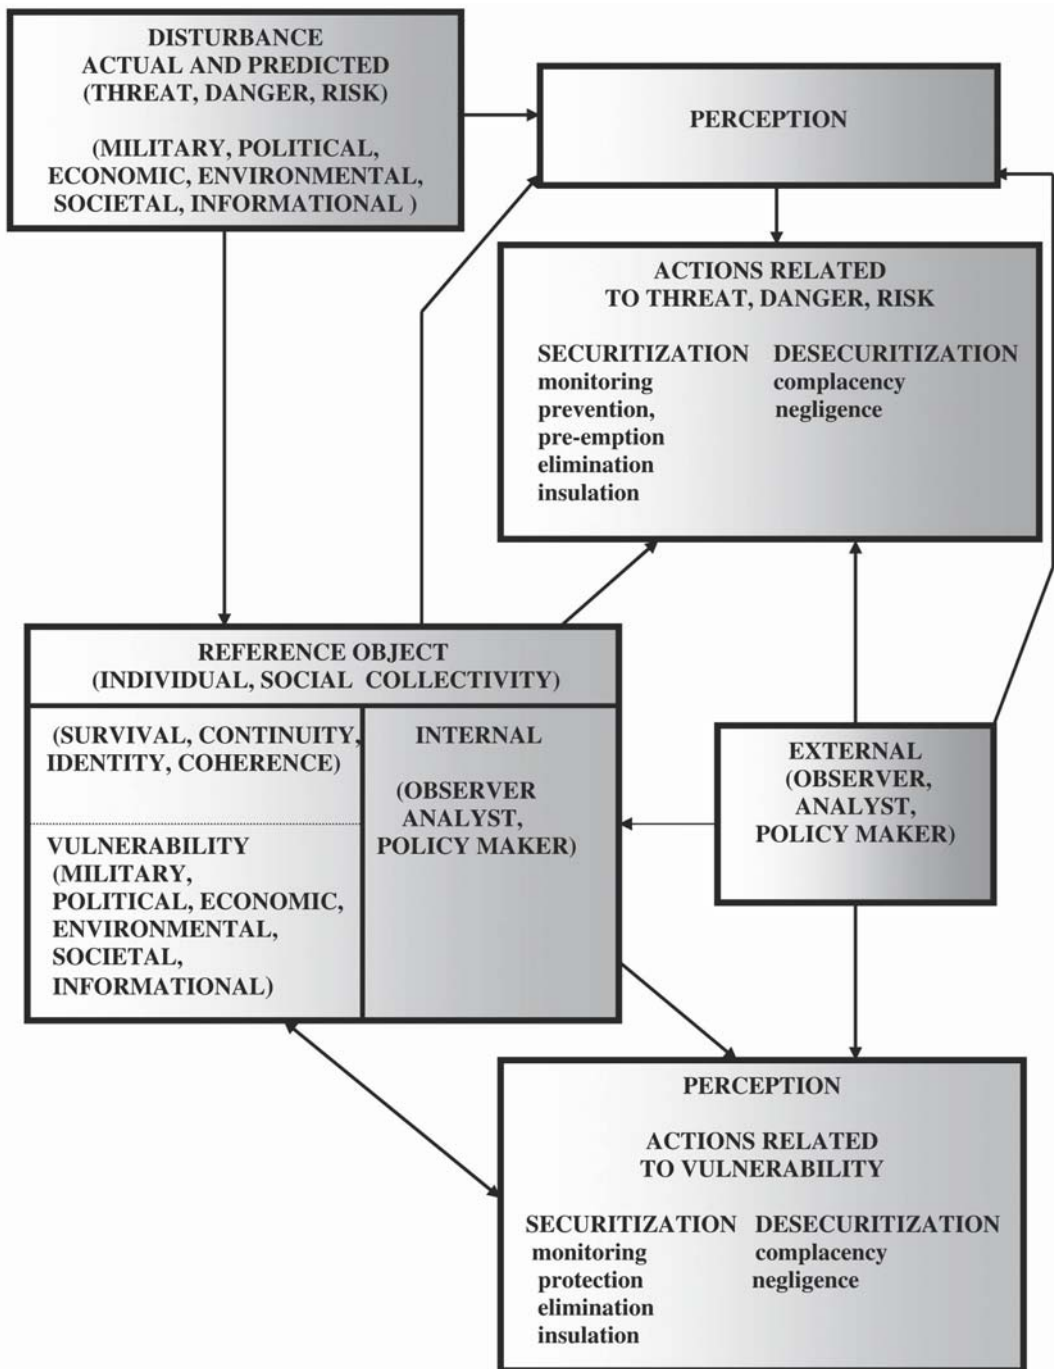

- the concept of stability in IR and links with various ideas of security (peace);
- bipolarity vs. multipolarity;
- power cycle theory;
- systems thinking and hegemonic stability;
- turbulence and chaos in globalizing world politics;
- evolutionary systems, world politics and security;
- systems thinking, governance (global governance) and security;
- democratic peace and systems thinking;
- thermodynamics, peace and war;
- new mathematical ideas and security: catastrophe theory and fuzzy systems;
- applications of computer simulation models in security-oriented research;
- complexity theories and concepts of security;
- social learning, complex systems and security;
- systems thinking and military security (theory, combat and non-war military operations);
- vulnerability of social systems;
- systems approach and identification of threats of terrorism;
- applications of systems approach in preventing terrorism.

2.3 Complex Systems and Security

Systems thinking exerted a strong impact upon security theory and policy in a direct and in an indirect way. Due to misinterpretations and abuses, it seems necessary to present a brief overview of basic ideas of systems thinking which can be found in security-related discourse in theory and policy making. Sys-

8 The attributes of the systemic idea of security will be developed in several texts published in a forthcoming volume of the Hexagon series, including the author's monograph with working title: *Stability, Turbulence or Chaos? Systems Thinking, and Theory and Policy of Security*, forthcoming.

Figure 2.2: Systemic Framework of Security.

tems thinking and complexity studies literature can be divided into several streams, beginning from the advanced writings for specialists, usually loaded with mathematical reasoning and ending with simplified, popular works.

2.3.1 Defining Systems and Complexity

There are various interpretations of cybernetics and systems thinking, but according to Ludwig von Bertalanffy (1968) the former can be regarded as part of the latter. To avoid unnecessary typological considerations, it is also assumed that complex systems studies are regarded

as a part of systems thinking (Mesjasz 1988; Midgley 2003). Even more difficult are definitions of 'studies of complexity' and 'complex systems studies'. The author does not use the terms 'complexity theory', or 'complexity science' although an idea of the "emerging sciences of complexity" was proposed (Waldrop 1992). These challenges were referred to by Horgan (1995) in: "From Complexity to Perplexity". There is no commonly accepted definition of complexity that seems neither needed nor achievable.⁹

Complex systems exhibit non-linear behaviour that is frequently referred to as positive feedback where internal or external changes to a system produce amplifying effects. Non-linear systems can generate a specific temporal behaviour which is called chaos. Chaotic behaviour can be observed in time series as data points that appear random, and devoid of any pattern but show a deeper, underlying effect. During unstable periods, such as chaos, non-linear systems are susceptible to shocks (sometimes very small). This phenomenon, called 'sensitivity to initial conditions' and popularized as the Edward Lorenz's 'butterfly effect', exemplifies the cases, where a small change may generate a disproportionate change (Gleick 1997).

Among the most recent ideas of complex research are scale-free networks discovered by Albert-László Barabási (2003). After finding that various networks, including social and biological ones, had heavy-tailed degree distributions, Barabási and collaborators coined the term 'scale-free network' to describe the class of networks that exhibit a power-law degree distribution, which they presumed to describe all real world networks of interest.

Complexity can be also characterized by a multitude of other ideas such as artificial life, fractals, bifur-

cations, co-evolution, spontaneous self-organization, self-organized criticality, chaos, edge of chaos, instability, irreducibility, adaptability, and far-from-equilibrium-states. These concepts are associated predominantly with the research by scholars at the Santa Fe Institute, and with the works of Ilya Prigogine on thermodynamics (dissipative structures, far-from-equilibrium systems), and of Herman Haken (2004) on synergetics.

These ideas can be called 'hard' complexity research in analogy to 'hard' systems thinking.¹⁰ The 'soft' complexity research, or 'soft' systems thinking, includes ideas of complexity elaborated in other areas of cybernetics and systems thinking, social sciences, and in psychology. Initially, they were developed independently but after the growing impact of CAS and chaos, their authors began to treat the 'hard' complexity concepts as a source of new ideas.

Subjectivity is the first aspect of complexity in the 'soft' approach. Following this reasoning, from the perspective of the second-order cybernetics, or in a broader approach, constructivism (Glazersfeld 1995; Biggiero 2001), complexity is not an intrinsic property of an object but rather depends on the observer.

To identify a meaning of complexity based on some properties of the relationships between observers (human or cognitive systems) and observed systems (all systems) Biggiero (2001: 3) treats predictability of behaviour of an entity as the fundamental criterion for distinguishing various kinds of complexity. He proposes three classes of complexity: (a) deterministically or stochastically unpredictable objects; (b) predictable objects with infinite computational capacity; and (c) predictable objects with a transcomputational capacity. From this typology, he defined 'observed irreducible complexity' (OIC) as those states of unpredictability, which allow to classify an object in one of these three classes. This definition distinguishes complexity semantically in the new sense.

Biggiero's typologies lead to two conclusions for studying social systems. *First*, self-reference characterizes the first class, which relates to many forms of undecidability and interactions among observing systems (Foerster 1982). This property favours the subjective interpretations of complexity. *Second*, human systems are characterized by the presence of all sources and types of complexity. Thus, human systems are the "complexities of complexities" (Biggiero 2001: 4-6).

9 First attempts to study complex entities go back to Weaver (1948: disorganized and organized complexity), Simon (1962: Architecture of Complexity) and Ashby (1963: Law of Requisite Variety). In explaining complexity Seth Lloyd (1989) identified 31 definitions. Later, according to Horgan (1997: 303) this number increased to 45. Numerous definitions of complexity have been offered (Waldrop 1992; Gell-Mann 1995; Kauffman 1993, 1995; Holland 1995; Bak 1996; Bar-Yam 1997; Rosser 1999; Biggiero 2001). The impossibility to decomposit this entity and its incomprehensibility are facets of complexity. According to Gell-Mann (1995) complexity is a function of the interactions between elements in a system. Nicolis and Prigogine (1989) prefer measures of complexity based on system 'behaviour' rather than system interactions. Behaviour is also a basis of analysis and description of Complex Adaptive Systems (CAS; Holland 1995).

10 The term soft complexity science is used, among others, by Richardson and Cilliers (2001).

In the social sciences, and particularly in sociology, special attention is given to the concepts of complexity of social systems proposed by Niklas Luhmann. As one of a few authors, he attempted to provide a comprehensive definition of a social system based solely on communication and on the concept of *autopoiesis* (self-creation) of biological systems. According to Luhmann, a complex system is one where there are more possibilities than can be actualized. *Complexity of operations* means that the number of possible relations becomes too large with respect to the capacity of elements to establish relations. It means that complexity enforces selection. The other concept of complexity is defined as a problem of *observation*. If a system has to select its relations itself, it is difficult to foresee what relations it will select, for even if a particular selection is known, it is not possible to deduce which selections would be made (Luhmann 1990: 81). The idea of complexity of Luhmann is also used in defining risk in social systems. The large number of elements in a given system means that not all elements can relate to all other elements. Complexity means the need for selectivity, and the need for selectivity means contingency, and contingency means risk (Luhmann 1993).

Complexity of social system developed by Luhmann is strongly linked to self-reference since reduction of complexity is also a property of the system's own self-observation, because no system can possess total self-insight. This phenomenon is representative for epistemology of modern social sciences, where observation and self-observation, reflexivity and self-reflexivity, and subsequently, self-reference are playing a growing role. According to this interpretation, social systems are becoming self-observing, self-reflexive entities trying to solve arising problems through the processes of adaptation (learning).

An interesting definition of complexity was proposed by biologist Robert Rosen, who also elaborated the concept of anticipatory system, i.e. a system containing a predictive model of itself and/or its environment, which allows it to change the state at an instant in accord with the model's predictions pertaining to a latter instant (Rosen 1985: 341). According to Rosen (1998: 392) a system is simple if all its models are simulable. A system that is not simple, and that accordingly must have a non-simulable model, is complex. Rosen's anticipatory systems have been supplemented by the ideas of incursion (inclusive or implicit recursion) and hyperincursion (incursion with multiple solutions) developed by Daniel Dubois (1998).¹¹

2.3.2 Complex Systems and Security: Mathematical Models, Analogies and Metaphors

There is a specific factor allowing the distinguishing of traditionally defined systems thinking from complexity research, at least until the mid-1980s. While systems thinking sought for holistic ideas and universal patterns in all kinds of systems, complexity research defined its goals in a more specific manner. A common theoretical framework, the vision of underlying unity illuminating nature and humankind is viewed as an epistemological foundation of complexity studies (Waldrop 1992: 12-13).

This claim for unity results from an assumption, that there are simple sets of mathematical rules that when followed by a computer give rise to extremely complicated, or rather complex, patterns. Thus it can be concluded that simple rules underlie many extremely complicated phenomena in the world. With the help of powerful computers, scientists can root those rules out. Subsequently, at least some rules of complex systems could be unveiled. Although such an approach was criticized, as based on a seductive syllogism (Horgan 1995; Richardson/Cilliers 2001), it appears that it still exists explicitly or implicitly in numerous works in the hard complexity research. Another important epistemological contribution of complexity, and of nonlinearity in particular, is if not impossibility, then at least very limited capability of prediction and control which are viewed as the most important characteristic of complex systems.

Ideas originated in systems thinking and complexity studies are used in security-oriented research as models, analogies, and metaphors. According to this distinction, the term *model* is used only for mathematical structures. Mathematical models in complexity studies can be applied in three areas: computing-based experimental mathematics, high precision measurement made across various disciplines and confirming *universality* of complexity properties and

11 Using Luhmann's concept of complexity, Qvortrup has introduced the concept of hypercomplexity. He linked Simon's 'bounded rationality' as a limitation to choice (selection) with the complexity resulting from impossibility to make that selection. Hypercomplexity is complexity inscribed in complexity, e.g. second-order complexity. It is the result of one observer's description of another observer's descriptions of complexity, or it is the result of a complex observer's description of its own complexity (Qvortrup 2003: 7).

rigorous mathematical studies embodying new analytical models, theorems and results.

Models, analogies and metaphors deriving from systems thinking and complexity studies are gaining a special significance in the social sciences. They are treated as 'scientific' and obtain supplementary political influence resulting from 'sound' normative (precisely prescriptive), legitimacy in any debate on security theory and policy.

Models, analogies, and metaphors are instruments of theories in social sciences and are applied for description, explanatory of causal relations, prediction, anticipation, normative approach, prescription, retrospection, retrodiction, control and regulation.

Bell, Raiffa, and Tversky (1988) have proposed to discern between the normative approach resulting from mathematical models, predominantly game models, and the prescriptive approach reflecting recommendations resulting from decision analysis, including also qualitative aspects. Following the distinction from traditional cybernetics, control and regulation approach can also be proposed. In management this approach is expressed in a way that the dominant analogy or metaphor influences control of a system, i.e. they differ for mechanistic, evolutionary or learning system (Senge 1990; Palmer/Dunford 1996).¹²

Complexity associated with non-linear dynamics adds some new elements to our knowledge of social dynamics. We not only become aware that social systems are uncontrollable, but even desirability of such control is already doubted. Self-organization is regarded as the desired pattern of dynamics in economics and politics. This was already reflected in Hayek's (1967) interest in complexity of social systems as an argument against a centrally planned economy. Another lesson of non-linear dynamics and complex systems is that social changes are produced by both deterministic historical factors and chance events that may push social phenomena to new patterns of behaviour. Thanks to a better understanding of the confluence of chance and determinism in social systems we may better learn what kind of actions we have to undertake, or even perhaps, what kind of norms we have to apply.

Analogies and metaphors of rather loosely interpreted nonlinearity, chaos, complexity, self-organization, etc. in many instances have become the backbone of the post-modernist (post-structuralist) science. Reaffirmation of limited predictability has become an epistemological foundation of the discourse-based science. Numerous examples can be quoted but as an illustration it is worthwhile to recall the work by Dobuzinskis (1992) or synthesis of Braudel and Priogogine made by Wallerstein (2000: 160-169).

These epistemological links between complexity research and social sciences are predominantly associated with 'hard' complexity. The input to this area exerted by the 'soft' complexity research is equally significant. Reflexive complexity of society has become one of the foundations of post-modern social theory.

Unfortunately, various abuses and misuses may occur, when analogies and metaphors drawn from 'hard' complexity research, and to a lesser extent from 'soft' complexity research, are treated too carelessly even by eminent social theoreticians of post-modernism/post-structuralism. Several examples of such abuses are mirrored in the so-called 'Sokal Hoax' and other examples widely described by the originator of that hoax (Sokal/Bricmont 1998). Its warning message conveyed is of a special importance since broadening and deepening the concept of security contributed to the development of critical security research frequently referring to as post-modernism, and sometimes to complex systems research (Albert/Hilkermeier 2003).

Summarizing the discussion on the links between complexity research and security theory and policy, the following premises must be taken into account in further considerations. *First*, 'grand theories' of security and of the complexity of social systems are lacking. *Second*, social systems are mental constructs of the observers (participants) as interpretations of behaviour of their components and entities. If studies concentrate on 'tangible', observable attributes of social systems, then 'hard' complexity methods, mainly mathematical models, including simulations, can be applied. Otherwise, the discussion must include self-reflexive ideas taken from 'soft' complexity studies.

2.3.3 Complex Systems in Security Theory and Policy: Can Expectations be fulfilled?

An overview of security-related expectations to complex systems studies should open with a sociological survey where this question will be answered: Who and

12 Limitations of the prediction of behaviour, design and control of complex systems impose also other approaches to complex systems. Axelrod and Cohen (1999: xvi) proposed to "harness" complexity of social systems: "to convey a perspective that is not explanatory but active - seeking to improve but without being able fully to control."

what is expecting from whom? What can be delivered by those to whom the expectations are addressed?

Expectations towards complex systems research are often articulated by specialists in International Relations, in security studies, and peace and conflict research. All those disciplines are eclectic, thus complexity studies naturally enrich the epistemology of those sciences. Complex systems are applied by representatives of mainstream security studies, who treat it as a kind of extension of rational choice-based considerations (Axelrod/Cohen 1999), and by critical approaches in security research, and in International Relations (Albert/Hilkermeier 2003).

Policy makers are the second group who, rather indirectly, through academic research and/or advisors express hopes to ameliorate their understanding of the world with the use of complex systems ideas. Some expectations of the military community resemble those of policy makers, especially at the strategic level. Numerous expectations of the military are derived from their will to adapt complexity methods at all levels to situations where military units can be used, not only in military conflicts but also in post-conflict situations and in various emergency situations. It is also necessary to mention the media and the societies, or the general public, who are also awaiting new insights from complexity research.

Who is the addressee of those expectations and questions? First and foremost, it is a very incoherent community of academics, advisors, and other professionals. The second group are professional military analysts who are involved in developing new methods of accomplishing functions of military systems at all levels of their hierarchy.

In the relations between complexity research, and security theory and policy, three phenomena can be observed. *First*, applications of ‘fancy’ analogies and metaphors in the jargon of security writers, frequently without deeper understanding of the terms. *Second*, simplifying uses of complex systems by specialists familiar with the complex systems methods but not too familiar with the existing body of knowledge in the social sciences. *Third*, a majority of policy makers using such terms as stability, turbulence, chaos, etc. are not aware that the origins of their ideas are rooted in mathematical theory of automatic control, which, in turn, can be viewed as a part of cybernetics and/or systems theory (Bellman 1953; Ashby 1963).

Due to a very wide scope of meaning of security, and to a multitude of complexities, it is obviously impossible to enumerate all expectations towards the complex systems research. The fundamental expecta-

tion is simple. Although increasing complexity is viewed as a law of nature and society, after the end of the Cold War the process of ‘complexification’ of the world system has accelerated substantially. Social systems of the turn of the centuries are more complex and are labelled as chaotic society, or “risk society” (Beck 1992, 1999). Reflected in all prognoses, uncertainty, speed of change and complexity of political and economic affairs, as well as environmental challenges contribute to the incomprehensibility of the world at all levels of its internal hierarchy (Glenn/Gordon 2006).

Since its very beginning, the complexity research was perceived as a source of a certain promise, a source of a new language and at the same time contributed to such perception, that there were some patterns in complexity, which could be disclosed by the mathematical models taken from a new field of science. This intellectual and emotional incomprehensibility and an appeal for new approaches are well-reflected by the metaphor of *The Ingenuity Gap* proposed by Homer-Dixon (2002).

Assuming that security is always associated with an unusual disturbance undermining the existence (functioning) of an individual or system it may be assumed that in all security-oriented theories and policies, three basic human desires are expressed:

1. Reduction of uncertainty by enhancing predictive capabilities and strengthening the potential of anticipatory activities.
2. Identification of patterns of functioning of the social systems and their components, allowing the enhancement of protection against the disturbances, ex ante and ex post.
3. Elaboration of norms and methods allowing an improved functioning of social systems and of their components.

This triad reflects the essence of any normative social discipline, yet for studies of security it has a special meaning due to the fundamental sense of security. Complex systems ideas can be applied in all areas of security theory and policy in descriptive, explanatory, predictive, normative, prescriptive, retrodictive, retrospective, control and regulatory approaches.

In traditional state-centred security studies based upon ‘simplicity’, expectations if not hopes for enhanced capabilities of prediction were the main goal of applications of ‘scientific’ methods, including the ideas borrowed from early systems thinking: stability, polarity and hegemonic stability. More sophisticated descriptions and analyses based on systems thinking,

e.g. the bipolarity vs. multipolarity dispute of the 1960's and 1970's, were to a large extent refined by applications of traditional systems thinking. Concepts drawn from the 'older' systems thinking had and still have multiple applications in security-related considerations, e.g. the discourse on international stability (Mesjasz 1988).

The basic ideas of complex systems research applicable in security studies in all areas and at all levels of social hierarchy are represented by the following characteristics: self-organization and emerging properties, adaptation and co-evolution, the power of small events, sensitivity to initial conditions, nonlinearity, reflexivity and self-reflexivity, edge of chaos, What are the peculiar advantages and disadvantages of applications of complex systems research in contemporary security-oriented discourse, and in policy making?

2.3.3.1 Description and Explanation

Due to the fact that description and explanation of causal relationships are difficult to separate, both approaches are discussed together. Analogies and metaphors that are drawn from complex systems research have significantly enriched the security discourse. It is now commonly accepted that only in few cases mechanistic explanations of functioning of social systems can be applied. Terms as complexity, self-organization, the edge of chaos and the like have influenced the security discourse. In most of these considerations it is not clearly stated what is truly chaotic (what attributes of social systems?) but undoubtedly such metaphors are a heuristically valuable instrument. As stated above, the notions taken from complex systems studies have substantially enriched the hermeneutics of the security discourse based on non-mechanistic interpretations of social systems.

In this point it is almost impossible to distinguish between the impact of 'hard' and 'soft' complexity. The latter referring to reflexivity opens up the possibility to study cognitive aspects of social systems and the processes of communication as the basic instrument of applications of learning systems in security studies.

Communication offers an interesting link between complex systems research and contemporary security policy. Politicians, scholars, the general public and journalists seek for utterances reflecting their perceptions of uncertainty and incomprehensibility. The term 'chaos' is a good example as a well-known metaphor reflecting some properties of nonlinearity. The scholarly community has offered works with titles responding to that demand: "Hidden Order" (Holland

1995), "The Origins of Order" (Kauffman 1993), "End of Certainty" (Prigogine 1997), "Is Future Given?" (Prigogine 2003), and many similar ones. The need for understanding by lay readers and the demand for marketable titles are obvious, but recognized scholars presenting such concepts have participated in this specific social discourse. It remains an open question to which extent such new terms allow for the naming of new social phenomena.

As an example the metaphor 'order out of chaos' can be cited. The meaning of chaos, the Greek term, is associated with disorder, as well as chasm and void. This word has a strong emotional appeal and almost immediately was applied in security discourse. 'Order out of chaos' may have two meanings; the first refers to the emergence of order while the second can be interpreted as disclosure of a hidden order concealed by irregular behaviour.

Complex systems research has provided a new understanding of explanation. It especially concerns the possibility of explanation/prediction of the phenomena at the macro-level from the behaviour of the elements at the micro-level. A good example of this strategy is the Sugarscape project where the question "can you explain it?" is asked along with the question as "can you grow it?" (Epstein/Axtell 1996: 177).

It is also worthwhile to pay attention to the relation between the notion 'complexity' and the notion of 'the order parameter' introduced by Landau and the 'slaving principle' formulated by Haken (2004) in his 'synergetics'. When a complex system is close to an unstable point, the behaviour of this system can be described and understood in terms of order parameters (the most unstable variables of the system). Since the number of order parameters is much smaller than the number components of the system, an enormous compression of information takes place. Therefore we can describe the behaviour of a self-organizing complex system only with a few equations. This may support some expectations for security studies that perhaps some of those parameters can be identified in social systems in studies of risks, threats, and vulnerabilities.

2.3.3.2 Prediction

Enhanced capabilities of prediction, or even early warning, are undoubtedly the most important desire of security policy, and subsequently of the majority of strands of security-related studies. Therefore the term stability borrowed from control theory has become a buzzword of security theory and policy. Stability in its original sense can be treated as equivalent to increa-

sed predictability. First of all it is necessary to recall that predictability is dependent on an observer while determinism is not. In its most radical form prediction implies connections of necessity, not of probability, between non-perfectly well-defined states, of the system separated by finite time intervals. It means that in order to predict the future of the system we must know its present state. But present knowledge is never perfect and there are always the measurement errors in any determination of the present state (Saperstein 2002: 38).

It should also be mentioned that the divide linear is predictable and non-linear is not predictable, is a simplification. For instance, Newton's equations for the two-body Kepler problem (the Sun and one planet) are non-linear and yet explicitly solvable. It means that nonlinearity does not always lead to chaos. At the same time the fundamental equation of quantum mechanics, the Schrödinger's equation, is absolutely linear (Sokal/Bricmont 1998: 144-145). Saperstein (2002) using a relatively simple model of a bipolar arms race shows how including disturbance in such a model may help in predicting occurrence of unpredictability in a (model) situation which was to some extent predictable beforehand. It means that in such a situation non linear models provide a specific additional knowledge about the limits of predictability.

The complex adaptive systems (CAS), the basic idea of complexity theory have numerous applications in modelling the behaviour of social systems. Since the results of CAS simulations are to a large extent not replicable then more advanced methods can be used to improve their usefulness in prediction. It can be achieved directly by improving data gathering, relevance of parameters, better understanding of the links between micro- and macro-levels, although it is always of limited validity. The CAS models are also helpful as an instrument supporting heuristic processes. Not all paths of developments can be predicted by qualitative human reasoning. Therefore new patterns of phenomena achieved thanks to complex systems can add new solutions difficult to develop, or unachievable otherwise. CAS has another advantage in prediction. They can simulate learning processes both at the level of elements as well as at the level of entire systems.

The discourse on the predictive capability of complexity ideas and their limitations is predominantly built upon mathematical models. However, it is not the only advantage of complex systems research. The language of analogies and metaphors used for explaining the mathematical models and deriving from those

models can also be seen as a significant tool allowing for the enhancement of cognitive and heuristic capabilities of academics and political actors. The complexity thinking with more attention paid not to general solutions but for local equilibria undoubtedly strengthens the predictive capabilities of policy makers by enriching their mental models with new, less plausible counterintuitive options, which could have been otherwise omitted in the decision-making process. This phenomenon has been very popular in management, where training management in (complex) systems thinking is an important instrument of increasing efficiency (Senge 1990).

2.3.3.3 Normative and Prescriptive Approach

Security studies and associated domains have a strong normative bias. Norms in security can be analysed at several levels. They may result from ideology, interests, epistemological determinants, and purely individual motivations and rules. Norms in security studies concern: (1) prediction of threats (what is the threat, risk, danger?); (2) prevention and pre-emption of emergence of threats; (3) rules of behaviour when threats are affecting the system (individual); and finally (4), what to do to minimize the consequences of the materialized threats.

Similarly, as for all approaches, normative consequences of applications of complexity models in security-related theory can be found in two areas: a) in general security considerations and b) in military aspects of security.

In general security theory and policy complexity studies were the final impulse for abandoning the search for universal and stable patterns. It was a natural consequence of the limited predictability resulting from nonlinearity. The central norm is at present not how to protect against the impact of a broadly defined environment but how to adapt to it dynamically in a most efficient way. The norms of behaviour are identified with the rules of social learning.

In military applications complex models contributed to the changing approach to combat which is perceived in non-linear terms, not as a clash of hard balls, but rather as an interaction of swarms. In consequence the centralized visions of command are replaced with decentralization and command is viewed as one of the stimulants of self-organization (Moffat 2003).

2.3.3.4 Retrospection and Retrodiction

Retrospection or *post hoc* explanation as the basic instrument of methodology of historical studies is not a frequent approach in security discourse. Only when the need for better understanding of the current status is needed explanations of examples from the past are used in helping to understand better the present phenomena. Although from the epistemological point of view retrospection and retrodiction are different, in preliminary methodological considerations the differences are not so important. Similarly to retrospection, retrodiction, or the 'what if' approach, is not too widely approved in security theory. It is always treated as too speculative for scientific considerations.

An opposite tendency can be observed in military thought. Retrospection and retrodiction are indispensable in case studies and/or war gaming, and complexity-based models have become one of the most efficient instruments of studying achievements and errors of command in historical battles (Ilachinski 1996a; Czerwinski 2003), or within the framework of the Project Albert run by the Marine Corps Warfighting Laboratory (see at: <www.projectalbert.org>).

2.3.3.5 Control and Regulation

Although in classical cybernetics control and regulation are separated, in this survey they are discussed together. Similarly to prediction, any expectations that results of complexity research might help in significant improving control of social systems proved unjustifiable. The strive for rigid, centralized control has been replaced by approaches aiming at improvements of learning processes. Hierarchies are replaced by networks and this is common both in non-military security considerations as well as in military theory and practice. A shift from hierarchical to distributed command and control. In general security theory, it is mirrored both in more sceptical views of traditional security – awareness of limits of capabilities, even of the superpowers. Widening and deepening of security, and especially the impact of post-modernism on security theory (security resulting of 'securitization'), can also be viewed as a sign of resignation from expectations for far-reaching control at all levels of societal hierarchy.

2.4 Complex Systems and Security Theory and Practice

2.4.1 General Concepts

Variety and scope of the meaning of security along with the multitude of complexity-related models and methods help elaborate a preliminary survey of the links between both areas. The links are illustrated with works, which are to some extent representative for the given class. This survey should be seen as a foundation of a more comprehensive and detailed typology.

Applications of complex systems in security are found both in non-military security theory and policy, and in military thought on security. In a very extensive approach, all military theory could be viewed as security-oriented. By the same token, it is sometimes difficult to discern between military and non-military applications of systems models. However, in the proposed surveys, this traditional divide has been maintained. Since the applications of systems thinking predates the origins of developed complex systems studies, only the works where complexity is explicitly referred to are quoted.

2.4.2 Direct Links between International Security and Complex Systems

Most representative for this area are the following works, where complexity-based metaphors are applied for a thorough description and analysis of processes in international relations with a strong emphasis put on security at various levels (Rosenau 1990, 1997; Snyder/Jervis 1993; Jervis 1997; Wilson 1999). Similar efforts to apply complex systems ideas in security theory and policy were also made by the US military research community. A rank of works in which both civilian security issues as well as military applications of security are described began to appear in the 1990's and are published continuously (Alberts/Czerwinski 2002).

2.4.2.1 Indirect Links between International Security and Complex Systems

Several examples exist of indirect links between security and complex systems. Due to size and scope of the chapter only one case is referred to. Although systems thinking was always an indispensable element of Wallerstein's work, in his recent studies an interesting example can be found when he discusses the specific

features of the forthcoming phase of the Kondratieff cycle and the prospect of the world with the concepts of chaos, bifurcation, and emerging ideologies (Wallerstein 2000: 435-471).

2.4.2.2 Complex Systems Modelling and Widened Idea of Security

This part of the survey requires further specification. In this area, the applications of Complex Adaptive Systems are frequently drawing upon the pioneering work by Epstein and Axtell (1996) and concentrate upon a large variety of issues associated with internal security (homeland security), with stress put on terrorism and civil violence.

Another area of the use of complexity models is the study of the threats emerging in an 'information society'. Two fields of applications of complexity models can be quoted. The first, including the security of information processing, storing and gathering, and the second, including the applications of advanced information technology concepts and systems in security-related theory and practice. In the second area, in addition to specific models, broader conceptual approaches should be specified. New threats and the vulnerability of the information society are associated with various forms of asymmetric warfare. One of its facets depicted in the second part of this chapter is the use of the internet-based networks, an idea that has been drawn from complexity theory and IT theory on terrorism and organized crime.

One of the widest reaching proposals for using complex systems was proposed for the intelligence services by Andrus (2005). He suggests that due to the development of new information, distributing internet-based tools which are functionally similar to CAS such like the Wiki and the Blog can be an inspiration for similar self-organized, complex tools for the intelligence community. It is worthwhile to mention that perhaps due to the difficulties with defining human security the applications of complex models in the studies of that specific kind of security seem to be difficult to identify.

2.4.3 Complex Systems in Military Applications

2.4.3.1 Military Security: Theories of Warfare, Conflict, Combat, Command, and Control

Systems thinking in various forms, beginning from systems analysis and ending with complex systems re-

search, had numerous military applications in the period after World War II. First and foremost it is necessary to recall the RAND Corporation which already in the 1940's and 1950's was the pioneer centre of systems analysis. Applications of complex systems research in various areas still remain an important area of interest for the RAND Corporation (RAND Workshop 2000).

Several widely popularized examples showing the consequences of nonlinearity in various mathematical models of conflicts and arms races models were presented by Saperstein (1984, 1991, 2002). Another example of applications of non-linear systems was presented by Beyerchen (1992) who identified nonlinearity in the theories of war developed by Clausewitz. In this work and in similar ones, a simple, coordinated classical war is viewed as a counterpart of a war treated as a non-linear phenomenon.

Several surveys of possible applications of complexity in warfare theory were prepared by military specialists, such as Ilachinski (1996, 1996a), Czerwinski (2003), and Moffat (2003). Two organizations are of special importance for research on complexity and the military. The first is the US Department of Defense Control and Command Research Program publishing the *Information Age Transformation Series*. The second is the Center for Naval Analyses Corporation (CNA) (see at: <www.cna.org>), whose research is represented by two projects: ISAAC (Irreducible Semi-Autonomous Adaptive Combat) and EINSTEIN. ISAAC is a simple multi-agent-based 'toy model' of land combat that was developed to illustrate how certain aspects of land combat can be viewed as emergent phenomena resulting from the collective, nonlinear, decentralized interactions among notional combatants. EINSTEIN (Enhanced ISAAC Neural Simulation Tool) has been designed as an advanced continuation and extension of ISAAC.

From many ideas described in the writings on complexity and military security the most representative seems to be the comparison of 'traditional' land warfare with the modern, 'non-linear' land warfare. The essential difference between the two can be expressed with the metaphor: "combat collision of Newtonian billiard balls vs. combat as self-organized ecology of living fluids" (Czerwinski 2003: 68).

A comprehensive approach to the combat theory was presented by Moffat (2003) that provided a comprehensive overview of actual and potential uses of Complex Adaptive Systems in combat command planning and control. Some of the models presented in

this book, e.g. knowledge flow and knowledge representation, are directly linked with the more or less precisely defined 'Information Age'. The essence of that approach, representative for all uses of complexity in military applications, is depicted in table 2.1.

Table 2.1: Relation between Complexity and Information Age Warfare. **Source:** Moffat (2003: 49).

Complexity Concept	Information Age Force
Nonlinear interaction	Combat forces composed of a large number of nonlinearly interacting parts.
Decentralized control	There is no master 'oracle' dictating the actions of each and every combatant.
Self-organization	Local action which often appears 'chaotic' induces long-range order.
Non-equilibrium order	Military conflicts, by their nature, proceed far from equilibrium. Correlation of local effects is key.
Adaptation	Combat forces must continuously adapt and co-evolve in a changing environment.
Collectivist dynamics	There is a continual feedback between the behaviour of combatants and the command structure.

All military applications of complex systems have been summarized by Ilachinski (1996a) in a concept of eight tiers of applicability of complex systems theory to warfare:

1. General metaphors for complexity in warfare;
2. Policy and general guidelines for strategy;
3. 'Conventional' warfare models and approaches;
4. Description of the Complexity of Combat;
5. Combat technology enhancement;
6. Combat AIDS;
7. Synthetic combat environment;
8. Original conceptualizations of combat.

2.4.3.2 Asymmetric Warfare

In the modern world new kinds of conflicts are becoming more frequent. One part is dominating but due to different reasons, the weaker part can potentially inflict heavy harm on its stronger counterpart. This new category of threats is called asymmetric warfare (Kaldor 1999). It is predominantly used in the United States as an unmatched superpower of the

present but can be also extended to other circumstances.

One of the concepts of asymmetric warfare directly associated with complexity models is netwar that refers to an emerging model of conflicts and crime at the societal level, involving measures short of traditional war, where the protagonists use network forms of organization and related doctrines, strategies, and technologies attuned to the information age. They are composed of dispersed groups communicating via the internet and other advanced means of communications. They differ from traditional guerilla organizations which although dispersed, had centralized hierarchical organizations, doctrines, and strategies (Lesser/Hoffman/Arquilla/Ronfeldt/Zanini/Jenkins 1999).

Terrorism can be studied from five conceptual perspectives: (1) terrorism as/and crime; (2) terrorism as/and politics; (3) terrorism as/and warfare; (4) terrorism as/and communication; and (5) terrorism as/and religious fundamentalism. In addition, the sources of terrorism constitute a hierarchy - from global issues to religious fanaticism. Terrorism treated as a method of warfare is an exemplary example of asymmetric warfare, or of the netwars. Although each perspective has its specificity, in this survey of applications of complexity methods they are not separated.

Paradoxically contemporary terrorism is to some extent possible thanks to the technological development - exploiting vulnerabilities of the 'complex information society', and using modern techniques of communication. So just naturally various networks models have become the fundamental instrument of anti-terrorism activities. Prediction, the basic challenge of security theory and policy, in anti-terrorist activities must be supported by identification of hiding people, concealed organizations (networks), and strategies.

For Russell Ackoff the systems approach is vital for combating terrorism at all levels of societal hierarchy (Knowledge Wharton 2002; Mesjasz 2002). Coming out from such a general assumption many specific applications of complex systems in prediction, anticipation, prevention, elimination and damage minimizing of terrorism have been proposed. The importance of complexity studies in anti-terrorism campaign is reflected in the fact that the *Terreo*, a digital art commentary on the Homeland Security Advisory System based upon principal ideas of complexity and, e.g. strange loops, directly links complex systems and terrorism (see at: <<http://www.terreo.com/about/default.shtml>>).

Terrorism is based upon networks and that is why the networks models have become a fundamental instrument of anti-terrorist research. The simplest model is built upon Social Network Analysis (SNA) - a mathematical method for 'connecting the dots'. SNA allows us to map and measure complex, and sometimes covert, human groups and organizations. Since terrorist networks are more complex, therefore the scale-free networks seem to be a relevant instrument for analysis of terrorism and for developing counter-terrorism measures (Barabási 2003; Fellman/Wright 2004). They are particularly useful in helping to understand the logic of operations of terrorist networks. Similarly, in more general terms, complex adaptive systems also can be applied for anti-terrorist activities. Many ideas on the topic have been already presented both by civilian authors (Ahmed/Elgazzar/Hegazi 2006) and, what is obvious, by the US military research institutions (Horne/Johnson 2003) or the Project Albert of the US Marine Corps. Attempts were made to include modelling of cognitive mechanisms in the models. An example of the sophistication of complexity-related models that were applied in studies of terrorism is the adaptation of the percolation models to study clandestine social phenomena including terrorism (Galam 2003).

2.4.3.3 Non-war Military Operations

Due to the changing role of the armed forces, e.g. asymmetric warfare, peacekeeping, peace enforcing, policy duties and humanitarian assistance, applications of complex systems in military thought have also been expanded to all activities called *Military Operations Other Than War* (MOOTW). Decision-making processes are becoming decentralized and more is left for the initiative of the individuals. This phenomenon is leading to increased complexity. Therefore it is natural that all these activities have become a subject of modelling with the use of complexity models, and especially with Complex Adaptive Systems (Goodman 2000).

2.4.4 Complex Systems in Other Non-Military Applications

As mentioned in the earlier part of this chapter, applications of ideas from complex systems research can be extended to all areas of security discourse - economic, societal, environmental, and human security. It must be underlined that in all of them the core concept of security maintains its validity.

Two areas of security require special attention. The first one is environmental security. Relations between systems and its environment and/or holistic views of nature and society as well as the challenges of sustainability of social and natural systems have naturally made complex systems ideas a part of discourse on environmental security (see for example the chapter by Casey Brown in this volume) or the strong impact of systems rethinking upon the approach developed by Homer-Dixon, as to quote from a few of many writings. Due to a large number of issues and vast literature this area of research has to be left for separate considerations.

Another new domain of applications of complex systems concepts is related to human security. Although analytical aspects of the concept of human security are still being discussed, due to the universal properties it can be expected that in more rigorous approaches complex systems ideas will find their relevant role. This chapter can be thus treated as an encouragement and introduction to further studies of human security based upon complex systems epistemology.

2.5 Conclusions

Considerations presented in the chapter allow us to formulate two fundamental conclusions. Firstly, complex systems studies have become an indispensable part of the epistemology of security theory, and eventually, a useful instrument of security policy at the cognitive (language) level. It concerns both the impact on action and the impact on the processes of social communication, although it would be rather difficult to measure that impact. The uses of complexity-related mathematical models and analogies and metaphors have broadened the epistemological foundations of security research.

Secondly, systems thinking can help in better understanding security discourse by concentrating upon the universal characteristics of security reflected in the core concept of security.

Obviously it does not mean that the systems approach directly responded to the expectations of security studies in prediction, explanation of causal effects, prediction, prescription, normative approach, retrospection, retrodiction and in enhancing (always limited), capabilities to influence the social phenomena. It only means that in all of the approaches it may be used in a manner more relevant to social reality.

The applications of the systems ideas in the security discourse have several weaknesses of which two are most important. *First*, too high expectations from security theory and policy, and *second*, mutual misuses and abuses. Security specialists, journalists and politicians too frequently treat the systems and/or complexity-related utterances as an element of the new, modern and to some extent 'magic' language. By the same token, scholars familiar with mathematical complex systems models reduce social phenomena to very simple patterns, irrelevant to reality. Reference to nonlinearity, self-organization and chaos allows deepening the understanding of all social phenomena. But they are of a special significance in security-oriented research where they provide some response to the need for prediction and normative, policy oriented studies.

The significance of complex systems models is especially visible in deepening the knowledge of prediction and of its limitations in the social sciences. The traditional security studies, represented by realism and neo-realism, were built upon (neo)-positivism and rational choice theory, which included expectations towards increased predictive capabilities achievable in security studies. The constructivist approach denies the role of prediction in security discourse – how to predict categories constructed in the discourse. Therefore, the ideas drawn from complex systems research may have a special twofold function in security theory. On the one hand they teach rational choice advocates about the limits of prediction, but at the same time they enrich the discourse of constructivists with the terms which in an implicit form assume a certain degree of prediction.

The discussion in the chapter shows that more attention must be paid to efficiency, if not legitimacy of applications of complex systems in security theory and policy. Thanks to the ideas associated with the variously defined systems approach, including complexity research, the epistemology of security studies has been enriched with instruments helpful for description and explanation. New social phenomena in the information society have received the names facilitating their understanding and the processes of social communication about them. Some causal relations could have been also better described with the conceptual apparatus of complex systems research, e.g. consequences of nonlinearity. At the same time, the language, if not the 'jargon', of complexity, by permeating the language of security policy has a strong impact on policy measures. The examples of such terms as stability, turbulence, nonlinearity, self-organization,

chaos, edge of chaos, etc. used in the language and in practice of policy making strengthen the argument favouring the use of complexity ideas for explaining and shaping security.

Although complex systems research provided the final argument of the impossibility of any far reaching predictions in security research, at the same time it showed the methods of enriching predictive capabilities either with the use of mathematical models, or with applications of heuristically stimulating analogies and metaphors.

Studies of applications of complex systems in security-related studies allow also for formulating directions of further research. The most important ones are as follows:

- comprehensive studies of the links between security-related research and systems thinking in the 20th and 21st centuries,
- development of advanced methods of modelling enabling the study of more complex behaviour of individual elements of Complex Adaptive Systems (complex behaviour along with simulation of cognitive processes of actors),
- development of applications of complex learning systems in security-oriented research,
- use of complex systems methodology as a new instrument of studying widened and deepened security concepts, including environmental security and human security.

3 Conceptual Quartet: Security and its Linkages with Peace, Development, and Environment

Hans Günter Brauch

3.1 Introduction¹

As a political term and as a scientific concept ‘security’ has been closely related to ‘peace’, the combined goals in the UN Charter. The other two concepts ‘development’ and ‘environment’ have been added to the national and international agenda in the 1950’s and since the 1970’s. In colloquial language, and in national and international politics, as well as in the scientific analysis of international relations these four concepts form a conceptual quartet and with each of these basic concepts a specialized research programme is associated: of security studies, peace, development, and environmental research. While these concepts have been widely used in the social sciences (sociology, psychology, economics, political science, international relations) systematic conceptual analyses of these four terms have been rare in international relations and in the four policy-oriented research programmes (Wæver 2006).

In the scientific literature ‘objective’ and ‘subjective’ (Wolfers 1962; Art 1993) as well as ‘inter-subjective’ (Wendt 1992; chap. 51 by Hintermeier) concepts of security have been distinguished. From a constructivist approach ‘securitization’ has been referred to as a ‘speech act’ (Wæver 1995, 1997) by which an individual, or representatives of the state (government, parliament, courts), of political parties, interest groups, non-governmental organizations, of civil society, social movements, and the media attribute to a specific danger or concern ‘utmost importance’ (chap. 1 by Brauch, 2 by Mesjasz, and 4 by Wæver) that require extraordinary efforts for coping with and overcoming a specific threat, challenge, vulnerability, and risk (Brauch 2007a). Speech acts con-

sist of terms and concepts with multiple meanings and in most cases they can be analysed in historical written documents as well as oral expressions in the recorded media. In politics these four basic concepts have been used to describe and explain the positions and activities of social groups and parties to express basic values and goals, and to legitimize past actions and future oriented programmes in the name of security, peace, development, and the environment.

This chapter develops a conceptual framework (3.2) by analysing the meaning and evolution of these basic terms (3.3) and scientific concepts as well as their six dyadic linkages (3.4) and the four pillars of a *widened, deepened, and sectorialized* security concept (3.5.) as a conceptual contribution for a fourth phase of research on human and environmental security and peace (HESP) where gender issues are also considered (3.6).

3.2 Methods: Conceptual History and Context

The analysis of colloquial terms and concepts requires a combined methodological approach of etymology (3.2.1), concept formation (3.2.2), conceptual history (3.2.3), and a systematic conceptual mapping (3.2.4).

3.2.1 Etymology of Terms

Etymology, derived from the Greek ‘*étymos*’, refers to the ‘original meaning of a word’ that has become a major research field of comparative linguistics analysing the origins, basic meaning, historical evolution of words, and its relationship with similar words (synonyms) in different languages. Etymology has a long tradition in Greek philosophy and drama that was carried over to the Middle Ages by Isidore of Seville (*Etymologiae*).

1 The author is grateful for comments and suggestions to Úrsula Oswald Spring (Mexico) and Czesaw Mesjasz (Poland) and their references to the use of these concepts in pre-Hispanic, Spanish, and Slavonic languages.

The scientifically based etymology which started in the 19th century uses methods and findings of historical and comparative linguistics. According to the *Encyclopaedia Britannica* (15. ed., 1998, vol. 4: 587) the principles in contemporary etymology are, i.a. “The earliest form of a word, or word element, must be ascertained, as well as parallel and related forms,” and “any shift in meaning that has occurred in the historical transmission of the word must also be explained.” *Internal etymology* refers to the relationship of a word family to related words, while *external etymology* includes the words in related languages (Brockhaus Enzyklopädie, 21st ed., vol. 8, 2006: 473). The etymological roots of the four concepts are discussed in 3.3.²

3.2.2 Concept Formation

There is a basic difference between ‘words’ or ‘terms’ and scientific ‘concepts’. In linguistics, a ‘word’ is the basic element of any language with a distinct meaning. A ‘term’ (from Latin ‘terminus’), in logic, is the subject or predicate of a categorical proposition or statement. The word ‘concept’ according to the *Encyclopaedia Britannica* (15. ed., 1998, vol. 31: 514) is used in the analytic school of philosophy as “logical, not mental entities.” Concept formation refers to “the process of sorting specific experiences into general rules or classes” where in a first phase “a person identifies important characteristics and in a second identifies how the characteristics are logically linked.”

The German word ‘Begriff’ combines the meaning of the English words ‘concept’, ‘term’, and ‘idea’. It is defined in the *Brockhaus Enzyklopädie* (21st ed., vol. 3, 2006: 491) as “an idea of objects, attributes and relations that have been obtained by an abstraction of unchangeable characteristics” and thus acts as a basic element of thinking and cognition. A ‘Begriff’ describes an object not in its totality but focuses on its characteristics with regard to its content (intention) and scope (extension). Thus, a concept requires a mental effort that separates the essential from the irrelevant features. Since Descartes pure (a priori) con-

cepts and those based on empirical experience have been distinguished. For Kant the interaction between concept and contemplation produces cognition and knowledge. He also distinguished between empirical concepts and categories based on reason. The modern logic of concepts analyses primarily the extensional relations between concepts. Concept formation refers to a psychological process where the essence and function of an object or situation are covered. Charles E. Osgood distinguished between perceptive, integrative, and representative concepts that involve three cognitive processes of: 1. discrimination, 2. abstraction and 3. generalization. Concept history was first used by Hegel for a historical and critical research of the development of philosophical and scientific concepts.

3.2.3 Conceptual History

The history of concepts or conceptual history as inspired by Lucien Febvre and Marc Bloch of the French school of the *Annales* (‘les choses et mots’) was instrumental for a major German editorial project on key historical concepts (Brunner/Conze/Koselleck 1972–1997) that was masterminded by Koselleck (1979, 2002, 2006) who addressed the complex interlinkages between the temporal features of events, structures, and concepts in human (societal) history but also the dualism between experience and concepts.

Schultz (1979: 43–74) pointed to four possibilities linking concepts and factual context: a) both the context and the concept remain unchanged; b) the context changes but the concepts remain unchanged; c) the meaning of concepts changes while the context remains unchanged; and d) the factual contexts (‘Sachverhalte’) and the meaning of concepts totally disintegrate. This volume deals with a fifth possibility where a contextual change triggers a conceptual innovation. In some cases, the social and economic context had fundamentally changed while the concepts (e.g. of Marxism) remained unchanged, but with the collapse of the regimes the Soviet Marxist-Leninist ideology collapsed as well in 1990. This dualism differed with regard to the state, its factual evolution and conceptual development from the 17th to the 20th century.

A major focus of Koselleck’s (2006: 86–98) work of the editorial project on historical concepts dealt with the temporal structures of conceptual change. In the introduction to his last book *Begriffsgeschichten* (histories of concepts) Koselleck (2006: 529–540) argued that it is essential for conceptual history to de-

2 The authors in this volume have been encouraged to trace the etymological development of the term security. Arends has traced the meaning of the word and concept in Greek, Latin and in English, Mesjasz pointed to the specific meanings in Polish and Russian, Okamoto, Radtke, and Lee review the meanings in Japanese, Chinese, and Korean while von Brück discusses the meaning in Buddhism and Hinduism, Eisen in Hebrew and in the Old Testament, and Hanafi in the Qur’an.

velop hypotheses with the goal to show their internal semantic structure, to develop hierarchies of conceptual fields to point to the power of some concepts to structure the context. At the same time on the semantic level concepts reflect experiences and expectations in different scientific disciplines. Thus, the language (or ‘speech act’) becomes an important tool to document conceptual changes as they are perceived, articulated, and documented at a certain moment or over a period of time. The semantic documentation of experiences is scientifically linked to contexts.

A methodological challenge is to understand the specific semantic contribution in order to understand the nonverbal phenomena (facts) as well as the challenge of the nonverbal predispositions that require a semantic or conceptual response. Conceptual history, Koselleck argued, “opens a way to empirically check these differentiations”. He pointed to the contextual nature of concepts that gain in precision from their relationship to neighbouring and opposite concepts. Furthermore, he argued that conceptual history looks for key and corner points that illustrate an innovative strength that can only be observed from a longer-term perspective.

Influenced by Koselleck, Wæver (2006) drafted a conceptual history of security for international relations relying primarily on the Western intellectual tradition from its Greek and Roman origins up to the present in which he also documented the different reconceptualizations with a special focus on launching the ‘national security’ concept in the 1940’s that was later taken up by Russia, Japan, Brazil (as a doctrine), and other countries. The chapters in part III broaden the focus to non-Western cultures, religions, and intellectual traditions.

Both the temporal evolution and systematic analysis of concepts has been a major task of philosophy, and especially of political philosophy and of the history of ideas that links one subfield of political science with broader philosophical endeavours and trends. In German there have been several philosophical efforts to document the contemporary philosophy and its concepts in its interrelationship to their historical structure and the sciences.³

3.2.4 Conceptual Mapping: Contextual and Theoretical

This book aims at a ‘conceptual mapping’ of the use of the concept of security in different countries, political systems, cultures and religions and scientific disciplines, in national political processes, within civil soci-

ety and social movements, but also as a guiding and legitimating instrument within international organizations. Any conceptual mapping has to reflect the specific context in time and space that influence the meaning and the use of concepts.

In the social sciences, especially in the debate in security studies, the meaning of the concept of security is theory-driven. For this reason all authors in this volume have been asked to define the concept of security as they use it in their respective chapter. The ‘conceptual mapping’ of security in relation to peace, development, and environment is a task of political science that requires the knowledge of other disciplines (linguistics, history, philosophy) with a specific focus on the theoretical approaches prevailing in the social and political sciences.

3.3 Four Key Concepts of International Relations: Peace, Security, Development, and Environment

Below the four key concepts of the conceptual quartet: peace, security, development, and environment will be reviewed, relying on the knowledge gained from etymology, conceptual history, and conceptual mapping to which these volumes will contribute: In a next step the six dyadic linkages between these concepts will be examined on the background of the contextual change(s) in world history and theoretical innovations (constructivism, risk society, etc.).

3.3.1 Concepts of Peace

The word ‘peace’ (3.3.1.1) is a key *term* (3.3.1.2) and a crucial religious (chap. 10 by Oswald) and scientific concept in philosophy, theology, history, international law, and in international relations as well as in peace research (3.3.1.3), and it has been a declared goal of

3 See e.g. the historical dictionary of philosophy (*Historisches Wörterbuch der Philosophie*) published first in 1899 by Rudolf Eisler, and its fourth edition (1927–1930). A different approach was pursued in the new *Historisches Wörterbuch der Philosophie*, edited by Joachim Ritter that was published in 12 volumes (1971–2004). It includes a) terminological articles, b) key concepts with minor changes in history, c) combined concepts in their systematic context (e.g. in logic), and d) historical method for more detailed articles that track the continuity and change of concepts from the classic Greek to contemporary philosophy.

national policy-making, of international diplomacy, and of the activity of many international institutions (3.3.1.4). Since 1990 the yearning for 'peace' has been replaced by an intensive discourse on a widened and deepened concept of 'security' (3.3.1.5).

3.3.1.1 Etymology of the Words 'Pax', 'Peace' and 'Frieden'

The English term peace originates from the Latin 'pax' and the French 'paix' (Italian: pace; Spanish and Portuguese: 'paz'). In common English use the term 'peace' is associated with:

1. no war, a) a situation in which there is no war between countries or in a country ..., b) a period of time where there is no war: a lasting peace; 2. agreement, an agreement that ends a war; 3. no noise, a peaceful situation with no unpleasant noise; 4. calmness, a feeling of calmness and lack of worry and problems; 5. a situation in which there is no quarrelling between people who live or work together ...; 6. disturb the peace, ... to behave in a noisy and violent way (Langenscheidt-Longman 1995: 1041).

The *Compact Oxford English Dictionary* describes 'peace' as "1. freedom from disturbance, tranquillity, 2. freedom from or ending of war, 3. an action such as a handshake, signifying unity, performed during the Eucharist" (Soanes, OUP 2002: 830). The *Shorter Oxford English Dictionary* (5th Ed., 2002, Vol. 2: 2128) offered additional meanings.⁴ The *New Collins Concise English Dictionary* (McLeod 1985: 831) defines 'peace' as: "1. the state existing during the absence of war ..., 2. a treaty marking the end of war, 3. a state of harmony between people or groups, 4. law and order within a state ..., 5. absence of mental anxiety, 6. a state of stillness, silence, or serenity". These dictionaries combine a state of no war with a positive state of harmony. There are also slight differences between

British and American dictionaries. For *Webster's* (1979: 1317) 'peace' means: "1. freedom from war or civil strife; 2. a treaty or agreement to end war; 3. freedom from public disturbance or disorder, public security, law and order; 4. freedom from disagreement or quarrels, harmony, concord; 5. an undisturbed state of mind; absence of mental conflict, serenity; 6. calm, quiet tranquillity."⁵

The German term 'Frieden' refers to a 'condition of quietness, harmony, resolution of warlike conflicts' and also a 'protected territory' (Pfeifer, ⁸2005: 375-376). The modern word 'Frieden' derives from the old German 'fridu' meaning protection and security, and is closely related to the Dutch term 'vrede' and the Swedish: 'frid'. In the Germanic and old German law 'Friede' referred to a state where a legal order prevailed as the basis for life in a community or in the whole country (of the land, of the king, in the castle or on the marketplace). In Middle High German, 'Frieden' was also used to refer to an armistice.

In Russian 'mir' refers to both 'peace' and the 'world'. In the pre-Hispanic culture 'peace' implies an equilibrium between nature and humans; gods and humans, as well as among human beings. Peace may also be linked to the Oriental concepts of harmony or equilibrium. In traditional societies the equilibrium has been very important (chap. 10 by Oswald).

While both the Latin *pax* and the German *Frieden* are rather narrow concepts, "the Greek *eirene*, the Hebrew *shalom*, and the Arab *salam* seem to approach 'peace with justice' including an absence of direct and structural violence". Galtung (1993: 688) pointed out that the Hindi *ahimsa* "no harm" adds the ecological dimension that was missing in the Occident but this was used by Gandhi as the basis for his

4 It refers to six major meanings: 1. Freedom from, or cessation of war, or hostilities, or a state of a nation or community in which it is not at war with another, ... a state or relation of concord and amity with a specified person, esp. a monarch or lord; recognition of the person's authority and acceptance of his or her protection. A ratification or treaty of peace between two nations or communities previously at war. 2. Freedom from civil disorder, public order and security, esp. as maintained by law. 3. Freedom from disturbance or perturbation, esp. as a condition of an individual; quiet, tranquillity. 4. Freedom from quarrels or dissension between individuals; a state of friendliness. An author or maintainer of concord. 5. Freedom from mental, spiritual, or emotional disturbance, calm; and 6. Absence of noise, movement, or activity, stillness.

5 For *Webster's Third New International Dictionary* (2002: 1660), peace refers to: 1. a. freedom from civil clamor and confusion; a state of public quiet; b. a state of security or order within a community provided for by law, custom, or public opinion; 2. a mental or spiritual condition marked by freedom from disquieting or oppressive thoughts or emotions: serenity of spirit; 3. a tranquil state of freedom from outside disturbance and harassment; 4. harmony in human and personal relations: mutual concord and esteem; 5. a. (1) a state of mutual concord between governments: absence of hostilities or war, (2) the period of such freedom from war; b. a pact or agreement to end hostilities or to come together in amity between those who have been at war or in a state of enmity or dissension: a formal reconciliation between contending parties; 6. absence of activity and noise: deep stillness: quietness; 7. one that makes, gives or maintains tranquillity.

non-violent struggle (chap. 10 by Oswald and 15 by Dadhich). This is a preliminary and very selective overview of a few primarily occidental once culturally dominant languages and it does not intend to cover the global diversity in languages. Different values, goals, and other concepts (law, security, justice, harmony with nature) are associated with 'peace', also in other languages and cultures not covered here.

3.3.1.2 Conceptual History of Peace

Many different scientific concepts of peace have been used in different time periods, disciplines, and within disciplines during the same time. As peace requires a minimum of order and consensus, peace is closely associated with law that presupposes freedom. Peace is no state of nature but must be created by human beings, and thus it often relies on legal agreements that are in most cases backed by power. In many cultures the internal peace corresponds closely with the defence of the territory against outside infringements.⁶

While the *Encyclopaedia Britannica* lacked any entry and thus definition of the concept of peace, and covered peace only as "disturbing the peace" and "justice of the peace", the German encyclopaedia Brockhaus (16th ed., 1954, vol. 4: 292–293) defined peace as a "condition of undisturbed order or balanced harmony that will be confused by quarrel and destroyed by battle." And it reviewed the concept in theology, law, and international law. The *Brockhaus Encyclopaedia* (19th ed., 1988, vol. 7: 660–663) defined peace as a "condition of a treaty-based and secured living together both within social unity and among groups, societies or organizations," as the opposite to war that will not last without a minimum order and consensus.⁷ After the end of the Cold War, the *Brockhaus Encyclopaedia* (21st ed., 2006, vol. 9: 774–779) defined peace as a concept that may be applied to "harmonious relations ... among peoples, groups, organizations, interest groups and states." Peace was considered as a stable process pattern of an interna-

tional system that guarantees that inter-state conflicts are being resolved without the use of organized force that requires democratization.⁸

In Greek philosophy, for Plato war and conflicts were to be avoided within the polis. Aristotle combined peace ('*eirene*') with politics and emphasized that all political goals may only be realized under conditions of peace, and war is only accepted as a means for the defence of the polis. Greek sophism distinguished among three levels of peace, a) within the polis, b) within Hellas, and c) with other peoples and barbarians. During the Roman period, 'pax' was closely tied to law and contracts, and with the emergence of the Roman Empire; the imperial *Pax Romana* relied on the contractual subjugation under the emperor in exchange for protection against external intruders.

Augustine developed a comprehensive Christian concept of peace that distinguished between the peace on earth (*pax humana*) and the peace of God (*pax divina*). Thomas Aquinas stressed the close connection of peace with justice (*iustitia*), but also with the love for other human beings (*caritas*). For him peace is a political good and the goals of the state, and a precondition for a good life. Others studied the links between internal and external peace. During the 14th and 15th centuries, several convents called for a peace among Christians (*pax Christiana*) but this also referred to a peace according to the Christian rules for others.

The Westphalian Peace of 1648 requested that all parties adhere to the '*pax Christina universalis perpetua*'. After the Peace of Utrecht (1713), Abbé de Saint-Pierre called for a federation of princes to secure a '*paix perpétuelle*' in the tradition of peace proposals from Thomas More's *Utopia* (1516) to William Penn's *Essay towards the present and future peace in Europe* (1693), and by utilitarian (Bentham) and socialist authors (Fourier, Saint-Simon).

In the tradition that emerged from the movement for a peace of the land (*Landfrieden*) the ruler was considered as the '*defensor pacis*' who was unconstrained by religious powers. The defence of the territorial peace was linked to the monopoly of force by

6 This section is based on: "Frieden", in: *Brockhaus Enzyklopädie* (vol. 7, 1988: 660–663; Schwedtfeger (2001) has reviewed the many efforts within the peace research community to define peace, he examined peace as a reflexive concept, he discussed the evolution of the peace concept in history and he assessed peace in comparison with opposite concepts of violence, power, aggression, war, security, enmity, and conflict.

7 This lead article reviewed the evolution of the concept in theology and the history of Western religions, in Greek, Roman, medieval and modern political philosophy, and state practice.

8 This second lead article published 18 years later discusses the concepts of peace in Greek and Roman thinking, the Pax Christiana, the legalization of peace, from peace utopia to peace movements, peace as a project of modern times and peace by democratization and international cooperation and by conflict prevention and non-violent conflict resolution.

the sovereign rulers. Besides the 'peace within the state' that was achieved through its monopoly of the means of force and its use, the 'peace between and among states' has become a major concern of modern international law since the 16th (de Vitoria, Suárez) and 17th century (Grotius, Pufendorf). Its authors considered war still as a legitimate means for the realization of interests among states (*ius ad bellum*) but at the same time they called for constraints during war, such as a continuation of diplomacy and of the activity of neutral organizations (*ius in bello*). In his treatise for an *eternal peace* (1795) Kant went a step further and proposed a ban on war itself and developed a legal framework for a permanent peace based on six preliminary and three definite articles that called for a democratic system of rule, an international organization (league of nations), and the respect for human rights.

While Kant's philosophical conceptualization of peace influenced many philosophers and writers during the Napoleonic period, during the age of nationalism in the 19th and early 20th centuries, Treitschke, Nietzsche, Sorel, and many other writers contributed to a glorification of war (*bellicists*) while simultaneously radical *pacifists* and the peace movement of the late 19th century requested a condemnation of war. In modern theories of hegemonic stability *Pax Americana* refers to a peace according to the rules proposed (and in some case even *imposed*) by the USA. Earlier *Pax Britannica* applied similar goals within the colonial British Empire.

During the 20th century after World War I, the liberal Kantian tradition, represented by Woodrow Wilson at the Versailles Peace Conference, was instrumental for the creation of the League of Nations, while after World War II, Hobbesian lessons were drawn from the collapse of the League of Nations. The new United Nations were added teeth, and during the Cold War a bipolar power system based on strong military alliances prevailed. But with the peaceful implosion of the Soviet Union and the end of the Cold War (1989-1991), war as a social institution was not defeated but it has returned in the form of resource, ethnic, and religious conflicts, primarily within states but also as pre-emptive wars not legitimized by the United Nations Security Council and against the expressed preferences of many state members (attack on/liberation of Iraq in 2003). During the 1990's proposals for a new international order of peace and security in the Kantian and Grotian traditions, especially for Europe and the Mediterranean region, were gradually replaced – after the failed peacekeeping missions

in the Balkans in the framework of the global (UN) and regional (OSCE) systems of collective security – by power-driven concepts of preventive wars (White House 2002, 2006).

3.3.1.3 Peace as a Scientific Concept

Peace has been defined as a basic value (Zsifkovits 1973) and as a goal of political action, as a situation of non-war, or as an utopia of a more just world. Schwerdtfeger (2001: 28-29) distinguished four alternatives to define peace: 1. a nominal definition; 2. as a result of a contemplative hermeneutic process; 3. a review of the historic evolution of the concept; 4. a determination by an analysis of opposite concepts.

In his effort to define peace, Galtung (1967, 1969, 1975, 1988) distinguished between a condition of 'negative' (absence of physical or personal violence – or a state of non-war) and positive peace (absence of structural violence, repression, and injustice). Picht (1971) defined peace as protection against internal and external violence, as protection against want, as protection of freedom as three dimensions of political action, and thus comes close to what has been defined in the 1990's as 'human security'. Senghaas (1997) pointed to the following five conditions of peace among nations. 1. positive interdependence; 2. symmetry of interdependence; 3. homology; 4. entropy; that require 5. common softly regulating institutions. In his 'civilisatory hexagon' Senghaas (1994, 1995) referred to six related aspects: 1. an efficient monopoly over the use of force; 2. effective control by an independent legal system; 3. interdependence of social groups; 4. democratic participation; 5. social justice, and 6. a political culture of constructive and peaceful conflict transformation. Among the many attempts to define peace, no consensus on a generally accepted minimal definition emerged. Defining peace as the result of a reflective process requires an understanding of its components and conditions (Schwerdtfeger 2001: 44-48).

Conceptual histories of peace have tried to reconstruct the evolution of this concept in philosophy, theology, history, and law in relationship to political and state practice (Biser 1972: III4-III5).⁹ Schwerdtfeger (2001: 49-77) interpreted the evolution of the peace concept in the Greek, Jewish and Christian traditions, the Roman concept of *pax* and its use in the Middle Ages, during the Reformation, Enlightenment and in modern times, in liberalism, socialism and bellicism with their historically contextualized and changing meanings.

3.3.1.4 Peace: A Basic Value and Goal of Peace Research

While there were pioneers of peace research in the interwar period, such as Lewis Fry Richardson (1960a) and Quincy Wright (1942, 1965), who focused on arms races and on the causes of wars, peace research as a value-oriented academic programme – primarily in the social sciences and in international relations – emerged during the Cold War in the US and in Northern Europe as an intellectual challenge to the prevailing Hobbesian perspectives in international relations and in the newly emerging programmes of war, strategic and security studies (preface essay by Oswald).

Johan Galtung (1993: 688), one of the founders of peace research, has defined peace narrowly

as the absence of warfare, i.e. organized violence, between groups defined by country, nation (culture, ethnicity), race, class or ideology. International or external peace is the absence of external wars: inter-country, inter-state, or international. ... Social or internal peace is the absence of internal wars: ethnic, racial, class, or ideological groups challenging the central government, or such groups challenging each other.

Galtung (1968; 1993: 688–689) has distinguished between direct, *personal* or institutionalized violence and *structural* violence taking the form of “economic exploitation and/or political repression in intra-country and inter-country class relations.” In his mini-theory of peace, Galtung (2007)¹⁰ argued that “peace is not a property of one party alone, but a property of the relation between parties.” He distinguished among negative (disharmonious), indifferent and positive (harmonious) relations that often coincide in the real world manifesting themselves as *negative* (absence of violence, cease-fire, indifferent relations) or *positive peace* (harmony).

Huber and Reuter (1990: 22f.) argued that a basic condition for peace is the survival of humankind, and

9 Janssen (⁴1998, vol. 2: 543–591) provided a detailed analysis of the concept ‘*Friede*’ from its Germanic roots to medieval moral theology, the positive peace concept of the late medieval period with the ‘*pax civilis*’ as a condition of order and security guaranteed by the state to an international peace as an unstable treaty-based condition, eternal peace as a proposition during the enlightenment and in the period of economic utilitarian rationalism, the doctrine of ‘*bellum iustum*’, and the division of state and peace in the peace concept of the French Revolution, he contrasted the tendencies towards bellicism with Kant’s thinking on peace and the development of the peace concept during the 19th century.

that “talking about peace does not make sense any longer, if life on the planet is destroyed.” Discord exists in those processes that threaten life on earth, e.g. by an exploitation and destruction of nature, that lead to mass hunger and to an endangerment of life by military means. “Devastation of nature, hunger and war are those processes that are incompatible with the preconditions of peace, the survival of humankind.”

Czempiel (2002: 83), a co-founder of peace research in Germany, noted that “peace research does not have a clarified peace concept.” According to Czempiel (2002: 84) the elimination of war was in the forefront of all peace concepts since prehistoric times, and more recently conceptual efforts to prevent and avoid violent conflicts have become one major research concern. In his understanding, peace exists in an international system where the allocation and creation of values in the issue areas of security, welfare, and rule are institutionalized and can be realized without the use of organized military force. This refers to three causes of war that must be replaced by ‘negative peace’ at a) the level of the international system and its structure, b) in the system of rule, especially between the political system and its societal environment, and c) in the interactions between the political systems and the societal environments in the international system.

One shortcoming of the anarchic international system has been the realist’s security dilemma, while liberals believe that international organizations and regimes can foster international cooperation. For decades, and prior to the US debate on the ‘democratic peace’ of the 1990’s, Czempiel has pointed to the democratic nature of systems of rule as a second precondition for peace as has also been stressed in

10 See at: <http://www.transnational.org/Resources_Treasures/2007/Galtung_MiniTheory.html>: “From this ... follow three types of peace studies: *negative peace studies*: how to reduce, eliminate negative relations; *positive peace studies*: how to build ever more harmonious relations; *violence-war-arms studies*: the intent and capability to inflict harm. ... One approach to negative peace studies opens for *peace and conflict studies*, seeing violence-war as the smoke signals from the underlying fire of a conflict. And that leads to a major approach to negative peace: remove the conflict, by solving it or, more modestly, by transforming it so that the parties can handle it in a non-violent way, with empathy for each other, and with creativity. ... That leads us to the two key tasks in search of, as a minimum, negative peace: *mediation* to resolve the incompatibility, and *conciliation*, healing the traumas, removing them from the relation between the parties, and closure.

Kant's first definitive article. Interaction as a third cause of violence may be overcome by institutionalized forms of cooperation by an increase of mutual information, confidence building measures, arms control and verification efforts, as well as by new forms of learning and training of the foreign policy elites. According to Czempiel, peace as an institutionalized patterned process of no-war has to comply with six preconditions:

- a) the anarchy of the international system must be changed by cooperation of the states in system-wide international organizations;
- b) the dominance of power must become more equal due to a higher distributive justice of societal opportunities for development;
- c) the systems of rule must be democratized to permit that the demands of society will be better reflected in the decisions of a society;
- d) interest groups must become more transparent and their access to the decision-making process must be better controlled;
- e) the opportunities to steer complex interactions with a regional and global scope must be improved by new forms of governance in which the societies should participate;
- f) the strategic competence of the actors must be improved, their education must be modernized and become more professional.

To contribute to the realization of these goals, peace research should advance them in the public conscience and prevailing opinions. Brock (2002: 104f.) reviewed that peace should be more than the absence of war in the framework of five dimensions: a) of time (eternal peace), b) space (peace on earth), c) society (domestic intra-societal peace), and d) procedure (peace as peaceful dispute on peace), and e) a heuristic dimension to move from the study of the causes of war to the conditions of peace. However, both authors left nature and the human-nature interactions as a cause of conflict outside of their scope of analysis.

Ho-Won Jeong (1999: 6-7) has defined the field of peace research as a: "methodologically pluralist community with emancipatory interest in transformative possibilities for the improvement of human well-being as well as the prevention of violence." He argues that peace research, in contrast to strategic studies, "take a critical view of traditional international relations theories" that interpret the world in the "power politics framework of realist and neorealist paradigms", and he notes that "peace research was influenced by the

idealist tradition of functional cooperation", as well as by the "non-violent traditions of Tolstoy and Gandhi."

The new agenda of peace research focuses on both *negative* peace "as absence of wars and other types of physical violence" and on *positive* peace, he defines as "social progress" but also as "the elimination of poverty and injustice" and he added that "the symbiotic relationship between positive and negative peace would not be understood without having a broad notion of human security." Ho-Won Jeong (1999: 8) argues that the:

Concept of security binds together individuals, states and the international system so closely that the conditions of peace can be treated in an integrative manner. It includes non-military sources of threats such as environmental degradation, migration and poverty. The concept of security for the global community is needed to articulate the concerns with global ecology. The visualization of collective existence on the planet can be made possible by understanding a new set of spatial, metaphysical and doctrinal constructs. Since the underlying premise of ecology is holism and mutual dependence of parts, ecological security defies the traditional boundaries of modern territoriality.

He considered among the integrating themes of future peace research "a critical examination of state centric paradigms in the areas of alternative military security, the environment, and human rights." Among the policy-relevant issues remain efforts to prevent and control violence as "the emancipatory goal of peace research" and as its "normative core".

Chadwick F. Alger (1999: 13-42) provided a map of 24 peace tools that can be derived from efforts of peacebuilding during the 19th century (2 tools) and the 20th century (22 tools) which he associated both with the negative (II) and the positive (I3) peace concept and which he grouped into six drawers: I: diplomacy, balance of power); of the League's Covenant (II), including collective security, peaceful settlement, disarmament and arms control; of the UN Charter (III) of 1945 (functionalism, self-determination, human rights); with UN practice between 1950-1989 (IV) on the negative side: peacekeeping and on the side of positive peace: 5 tools of economic development, economic equity, communication equity, ecological balance and governance for commons; with the UN practice since 1990 (V) with the new tools of humanitarian intervention and preventive diplomacy; and finally with NGOs and people movements (VI) with whom he associated for negative peace three tools: track II diplomacy, conversion and defensive defence, and on the positive side five: non-violence, citizen defence, self reliance, feminist per-

spectives and peace education, of which only one deals with nature and the environment (ecological balance) that has gradually become a dimension of peace since 1972, viewed from two perspectives:

One perspective achieved widespread visibility during the UNCED Conference when disputes erupted about (1) who is responsible for global pollution, (2) which ecological problems should receive priority and (3) who should pay 'to clean up the mess'. ... a second perspective on the peace-ecological balance is that by disrupting normal relationships between specific human beings and their environment, pollution directly produce peacelessness for these people. In some cases, as with the destruction of the habitats of people in rain forests with bulldozers and explosives, it is as quick and devastating as war.

In a final step, Alger (1999: 40-42) filed the 24 peace tools into nine categories based on their essential characteristics and instruments: "(1) words, (2) limited military power, (3) deterrent military power, (4) reducing weapons, (5) alternatives to weapons, (6) protecting rights of individuals and groups, (7) collaboration in solving common economic and social problems, (8) equitable sharing of economic, communications and ecological systems, and (9) involvement of the population at large through peace education and organized participation."

Alger grouped the peace tool "ecological balance" in category VIII (international communications, equity, ecological balance, governance for commons) and associated them with three instruments: to overcome one-way international communication, to overcome destruction of the habitat, and to share equity in use for the commons that "seek to attain equitable international economic, communications and ecological systems" which requires "collaborative problem solving in governance for the global commons (oceans, space, Antarctica) and equitable sharing in the use of the commons."

However, in neither of these two recent representative American and German reviews of the state of the art on the peace concept and on the peace research agenda, problems of global environmental change and their extreme or fatal outcomes were perceived as issues of peace research. This is also reflected in the conceptualization of peace in the United Nations Charter.

3.3.1.5 Peace: Goal of Policy, Diplomacy, and International Institutions

In the United Nations' Charter of 1945, the 'concept of peace' has been mentioned among the purposes of

the UN in Art. 1,1: "to maintain international peace and security", and "to take effective collective measures for the prevention and the removal of the threats to the peace, and for the suppression of acts of aggression or other breaches of the peace", as well as peaceful conflict settlements. Wolfrum (1994: 50) pointed to both narrow and wide interpretations of peace in the Charter:

If 'peace' is narrowly defined as the mere absence of a threat or use of force against the territorial integrity or political independence of any states (Art. 2(4)) ('negative peace'), the term 'security' will contain parts of what is usually referred to as the notion of 'positive peace'. This latter notion is generally understood as encompassing the activity which is necessary for maintaining the conditions of peace. The preamble and Art. 1(1), (2), and (3) indicate that peace is more than the absence of war. These provisions refer to an evolutionary development in the state of international relations which is meant to lead to the diminution of those issues likely to cause war.

In Art. 1(2) and 1(3) the UN Charter uses a wider and positive peace concept when it calls for developing "friendly relations among nations" and for achieving "international cooperation in solving international problems of an economic, social, cultural, or humanitarian character."

In 1945, the protection of the environment was not yet recognized as a specific goal for the UN. In chapter IX on international economic and social cooperation, Art. 55 (a), (b) and (c), without specifically mentioning environmental issues but its reference to "development", and "related problems" on which the UN based its activities in the area of environmental protection in its GA Res. 2994 (XXVII) of 15 December 1972 which endorsed the *Action Plan for the Human Environment* that had been adopted at the Stockholm Conference (1972). In res. 2997 (XXVII), on the same day the GA established the Governing Council of UNEP with the task to promote international cooperation in the environment area. In subsequent years, the GA adopted resolutions on a wide range of environmental and global change issues:

on cooperation in environmental protection, on the interdependence of resources, on environmental protection, population, and development, on the preparation of environmental prospects for the Year 2000 and beyond, and on the clean-up of war debris, and desertification (Wolfrum 1994a: 775).

A wider concept of peace was the basis for the "Proclamation of the International Year of Peace" in GA Res. 40/3 of 3 October 1985 that stated that the promotion of international peace and security required

continuing and positive action by peoples and states on these goals:

The prevention of war; the removal of various threats to peace (including the nuclear threat); respect for the principle of the non-use of force; the resolution of conflicts and the peaceful settlement of disputes; the development of confidence-building measures; agreement on disarmament; the maintenance of outer space for peaceful purposes; respect for the economic development of states; the promotion and exercise of human rights and freedoms; decolonization in accordance with the principle of self-determination; the elimination of racial discrimination and apartheid; the enhancement of the quality of life; the satisfaction of human needs; and the protection of the environment (Wolfrum 1994: 51).

In chapter VI on the Pacific Settlement of Disputes, Art. 33 uses a 'negative' concept of peace that is "ensured through prohibitions of intervention and the use of force" (Tomuschat 1994: 508). In Chapter VII of the UN Charter dealing with "Action with Respect to Threats to the Peace, Breaches of the Peace, and Acts of Aggression", in Art. 39, a 'negative' concept of peace prevails, referring to "the absence of the organized use of force between states." But in a SC meeting of the Heads of States and Government on 31 January 1992 they "recognized that the absence of war and military conflicts amongst states does not in itself ensure international peace and security" (Frowein 1994: 608). But according to Art. 2(7), Art. 39 does not include the use of force in internal situations, and in this understanding a civil war is "not in itself a breach of international peace" but it can lead to a threat of international peace. Thus, most cases of the low level of violence that may result from the fatal outcomes of global environmental change are outside of the focus of Chapter VI and VII of the UN Charter. However, since 1990 a significant change could be observed in state practice as documented in tUN SC resolutions (see chap. 35 by Bothe in this vol.)

In the framework of Chapter IX on "International Economic and Social Cooperation", Art. 55 (3) refers to the "universal respect for, and observance of, human rights and fundamental freedoms." It has been suggested, to include "the right of self-determination, to peace, development, and to a sound environment" (Partsch 1994: 779) as "human rights of the third generation" (Vasak 1984: 837).

In the UN Charter of June 1945, a narrow or a 'negative' concept of peace has been in the centre with a few direct references to 'positive' aspects to be achieved by 'friendly relations among nations', and by 'international cooperation'. No reference is included in the Charter that refers to 'peace with nature', nor

can extreme outcomes emerging from global environmental change be conceptualized as 'threats to the peace'.

However, since 1972 environmental protection has become an increasing task for UN activities (Meier 2002: 125-129) and a significant body of international environmental law has evolved that deals with many aspects of global environmental change (Beyerlin 2002: 119-125).

Art. 24 of the UN Charter mentions as the responsibility of the UNSC "the maintenance of international peace and security", two goals that have been closely linked both in the preamble, among the purposes and principles (Art, 1), the functions of the GA and the SC, and in the framework of the pacific settlement of disputes (chap. VII), and with threats to the peace, breaches of the peace, and acts of aggression (chap. VIII), and the regional arrangements (chap. VIII). Thus, the related concept of 'security' is crucial for understanding the UN Charter and its peace concept (chap. 35 by Bothe).

3.3.2 Concepts of Security

The word and concept of 'security' is closely related to peace, and has also become a value and goal of activity by nation states and supra and sub-state actors that require 'extraordinary measures', and has thus also been used to legitimize major public spending. The word has many different roots and meanings in different cultures. In the Western tradition the Roman and Christian thinking had a lasting impact on contemporary security concepts (4.3.2.1).

The political and scientific concept of security has changed with the modifications in international orders. With the Covenant (1919) the concept of 'collective security' was introduced, after World War II the concept of 'national security' was launched to legitimize the global US role and after 1990 the security concept widened and new concepts such as 'human', 'environmental', and many sectoral security concepts were added to the policy agenda (3.3.2.2).

3.3.2.1 Etymology of the Words 'Securitas', 'Security', and 'Sicherheit'

The term 'security' is associated in recent British¹¹ (2002) and American¹² (2002) dictionaries with many different meanings that refer to frameworks and dimensions, apply to individuals, issue areas, societal conventions, and changing historical conditions and circumstances. Thus, security as an individual or societal political value has no independent meaning and is

always related to a context and a specific individual or societal value system and its realization.

In the Western tradition, as a term 'security' (lat.: *securus* and *se cura*; it. *sicurezza*, fr.: *sécurité*, sp.: *seguridad*, p.: *segurança*, g: *Sicherheit*) was coined by Cicero and Lucretius as '*securitas*' referring initially to a philosophical and psychological status of mind, and it was used since the 1st century as a key political concept in the context of 'Pax Romana'. As Arends argues (in chap. 17 of this vol.) there has been a second intellectual origin, starting with Thomas Hobbes, where

'security' became associated with the genesis of the authoritarian 'super state' - Hobbes' '*Leviathan*' - committed to the prevention of civil war. Surprisingly, in this phase an ancient Greek concept was revived functioning during Athenian imperialism of the fifth century B.C.; especially Thucydides, Hobbes' favourite classical historian, influenced its modern 'Hobbesian' meaning. The contemporary concept of 'security' therefore proves to be a 'chimeric' combination of a) the ancient Athenians' intention to prevent the destruction of their empire, b) the religious connotations of Roman '*securitas*', and c) the Hobbesian intention to prevent civil war.

The German words '*sicher*' (secure) and '*Sicherheit*' (security) evolved from Latin and meant in Old High German (*sibhurheit*, 9th century) being protected, protection of dangers, but also carelessness, certainty,

firmness, to be trained, and in Middle High German (*sicherheit*) also decisiveness, being unconcerned, without worry, vow (Pfeifer 2005: 1287).¹³

3.3.2.2 Conceptual History of 'Securitas', 'Security', and 'Sicherheit'

Conze (1984: 831-862) has reviewed and analysed the evolution and change of the meaning of the German concepts security ('*Sicherheit*') and protection ('*Schutz*') that evolved, based on Roman and Medieval sources since the 17th century with the dynastic state. Conze argued that the origin and development of the security concept has been closely linked to an intensification of the modern state. As a political concept of the medieval period, '*securitas*' was closely linked to *Pax Romana* and *Pax Christiana* (e.g. to the making and maintenance of peace) while it later also applied to persons and goods as the object of protection.

Since the mid 17th century internal security was distinguished from external security, and during the mid 17th century external security has become a key concept of foreign and military policy and of international law. During the 17th and 18th centuries internal security was stressed by Hobbes and Pufendorf as the main task of the sovereignty towards its people. In the American constitution, safety is linked to liberty, thus violating liberty of a government directly affects its safety.

During the French Revolution the declaration of citizens' rights has declared security as one of its four basic human rights (*la sûreté et la résistance à l'op-*

11 See e.g.: for a previous review: Brauch (2003: 52-53); and for the most recent use in British English: *Shorter Oxford English Dictionary*, 52002, vol. II: 2734: I 1: "The condition of being protected from or not exposed to danger, safety; spec. the condition of being protected from espionage, attack, or theft. Also, the condition of being kept in safe custody; the provision or exercise of measures to ensure such safety. Also a government, department or other organization responsible for ensuring security. 2 Freedom from care, anxiety, or apprehension, a feeling of safety or freedom from danger. Formerly also, overconfidence, carelessness. 3 Freedom from doubt, confidence assurance. Now chiefly spec. well-founded confidence, certainty. 4. The quality of being securely fixed or attached, stability. II 5 property etc. deposited or pledged by or on behalf of a person as a guarantee of the fulfilment of an obligation and liable of forfeit in the event of default. 6 A thing which protects or makes safe a thing to a person; a protection, a guard, a defence. 7 A person who stands surety for another. 8 Grounds for regarding something as secure, safe, or certain; an assurance, guarantee. 9 A document held by a creditor of his or her right to payment ... 10 A means of securing or fixing something in position." The same dictionary defines "securitize" as a term used in commerce: "Convert (an asset, esp. a loan) into securities, usu. for the purpose of raising cash and selling them to other investors.

12 See: *Webster's Third New International Dictionary*, 2002: 2053-2054 does not yet mention the verb: "securitize"). Security is defined as: "1: the quality or state of being secure: a: freedom from danger: safety (from famine, against aggression), b archaic: carefree of cocky overconfidence; c. freedom from fear, anxiety, or care; d: freedom from uncertainty or doubt, confidence, assurance; e: basis for confidence; f: firmness: dependability, firmness; 2 a, something given, deposited or pledged to make certain the fulfilment of an obligation ...; b: one who becomes surety for another ...; 3: a written obligation, evidence or ownership or co-editorship ...; 4: something that secures: defense, protection, guard ... a: measures taken to ensure against surprise attack; b: measures taken to guard against espionage, observation, sabotage and surprise; c: protection against economic vicissitudes; d: penal custody ...; 5: the resistance of a cryptogram."

13 For different interpretations of *se curus* in the French literature and for the etymology of the Polish and Russian concepts of security see chap. 2 by Mesjasz.

pression). For Wilhelm von Humboldt the state became a major actor to guarantee internal and external security while Fichte stressed the concept of mutuality where the state as the granter of security and the citizen interact. Influenced by Kant, Humboldt, and Fichte the concept of the *'Rechtsstaat'* (legally composed state) and *'Rechtssicherheit'* (legal predictability of the state) became key features of the thinking on security in the early 19th century (Conze 1984).

On the background of the new social questions the concept of 'social security' gradually evolved in the 19th and 20th centuries, and became a *terminus technicus* during F.D. Roosevelt's New Deal when he addressed on 8 June 1934 as a key goal of his administration to advance the security of the citizens: "the security of the home, the security of the livelihood, and the security of the social insurance." This goal was also contained in the *Atlantic Charter* of 1941 as "securing, for all, improved labour standards, economic advancement and social security." In 1948 social security became a key human right in Art. 22 of the General Declaration on Human Rights.

Conze (1984) ignored another key element of the emerging post war security concept in the US that resulted between 1945 and 1949 in the emergence of the "American security system" (Czempiel 1966), or of a national security state (Yergin 1977). This concept of national security became an important political concept for the legitimization of the competing public funding priorities for 'national security' and 'social security'.

While the Democratic Presidents (Roosevelt, Truman, Kennedy, Johnson) pleaded for a big state to deal with both security challenges, the US Republicans in the 1940's first opposed the big state and its two security agendas, and Eisenhower warned in his farewell address of the unlimited power of the military-industrial complex. During the end of the Cold War and in the post-Cold War period, US Republican presidents called for maintaining a big security apparatus with a strong industrial and economic basis, and a powerful intelligence and police force.

The 'national security' concept emerged as a key concept in the US during World War II and became a key post war concept during the evolution of the American security system (Czempiel 1966). In the US, this concept was used to legitimize the major shift in the mind-set between the interwar and post-war years from a fundamental criticism of military armaments during the 1930's to a legitimization of an unprecedented military and arms build-up and militarization of the prevailing mind-set of the foreign policy elites.

3.3.2.3 Efforts for a Systematic Conceptual Mapping of Security

Thus, the changes in the thinking on security and their embodiment in security concepts are also a semantic reflection of the fundamental changes as they have been perceived in different parts of the world and conceptually articulated in alternative or new and totally different security concepts. The success or failure in the credibility of securitization efforts (of terrorism or climate change) as two opposite contemporary security dangers and concerns has been behind the transatlantic security debate and the global scientific conceptual discourse. The meaning of the security concept has significantly changed since it was first widely used after 1945.¹⁴

While the *Encyclopaedia Britannica* lacks an entry on the 'security' concept and on 'security policy', the German *Brockhaus Encyclopaedia*¹⁵ (1993) reviewed security as a key term from its Roman origins, pointing to its many meanings due to the different contexts and dimensions, as a societal value or symbol (Kaufmann 1970, 1973) that is used in relation to protection, lack of risks, certainty, reliability, trust and confidence, predictability in contrast with danger, risk, disorder, and fear. It summarized its historical dimensions, its different meanings during the medieval period and its modern meaning with the evolution of the modern territorial state since the 17th century and of the nation state since the 19th century, and the evolution of the concept of social security. It discussed social and anthropological aspects of the changes in the perception and use of the security concept in the sociological debates on new values and on risks (Beck

14 "Security", in: *The New Encyclopaedia Britannica*, vol. 10 (Chicago: Encyclopædia Britannica, 1998): 595 refers only to *securities*, such as stocks.

15 In three editions of the German 'Brockhaus' encyclopaedia the concept gradually evolved. In its 16th edition (Wiesbaden: Brockhaus, 1956, vol. 10: 688) security was defined as "a need, especially of the civilized society, to be precise, security of the individual as well as of societal groups, peoples, states (personal, economic, social, political security)". In its 19th edition (Mannheim: Brockhaus, 1993, vol. 20: 227-229) security was introduced as a key term (*Schlüsselbegriff*) while in its 21st edition (Leipzig-Mannheim: Brockhaus, 2006, vol. 25: 177-179) it was downgraded to a regular term and only slightly modified, while "security policy" (vol. 25: 182-185) had now become a key term focusing on the basic patterns of security policy, especially in Germany during and after the Cold War and to the new challenges since 11 September 2001.

1986, 1992, 1999, 2007). The 21st edition of the *Brockhaus Encyclopaedia* (2006) made only minor revisions, adding a paragraph on security of IT systems.

From a philosophical perspective Makropoulos (1995: 745–750) analysed the concept ‘Sicherheit’ from its Latin and Greek origins, its evolution during the medieval period and since the reformation as a concept in theology, philosophy, politics and law, with a special focus on Hobbes, Locke, Wolff, Rousseau, Kant and in the 20th century on its dual focus on prevention and compensation of genuinely social and technical insecurity as well as new social risks. It noted ‘social security’ but the concepts of ‘national’ or ‘human security’ were not mentioned.

3.3.2.4 Security as a Concept in the Social Sciences

In *The Oxford Companion to Politics of the World* (Krieger 1993; Art 1993: 821) claimed that security as a social science concept “is ambiguous and elastic in its meaning”. Referring to Wolfer’s (1962: 150) definition: “Security, in an objective sense, measures the absence of threats to acquired values, in a subjective sense, the absence of fear that such values will be attacked,” for Art (1993: 820–22) its subjective aspect implies: “to feel free from threats, anxiety or danger. Security is therefore a state of the mind in which an individual ... feels safe from harm by others.” While objective factors in the security perception are necessary they are not sufficient. Subjective factors to a large extent have influenced security perceptions in many countries. Due to the anarchic nature of international relations, “a concern for survival breeds a preoccupation for security.” For a state to feel secure requires “either that it can dissuade others from attacking it or that it can successfully defend itself if attacked.” Thus, security demands sufficient military power but also many “non-military elements ... to generate effective military power.” Art noted a widening of security that involves “protection of the environment from irreversible degradation by combating among other things, acid rain, desertification, forest destruction, ozone pollution, and global warming,” while the second implied a revival of the UN and better prospects for collective security. “Environmental security has impelled states to find cooperative rather than competitive solutions” (Art 1993: 821).

The German *Lexikon der Politik* (Rausch 1998: 582–583) defined security as the absence or avoidance of insecurity. The security concept is limited to the state, and is discussed at length in its relationship to *internal security* (extremism, crime, terrorism) and

external national security as well as *social security*. ‘Security policy’ is discussed in relation to the arms control agenda of the early 1990’s.¹⁶ The discourse on reconceptualization of security since 1990 remained unnoted in most dictionaries and in the encyclopaedias in the social sciences.

During the interwar period (1919–1939) in the social sciences’ references to defence, national survival, national interests and sovereignty (Meinicke 1924) or power (Carr 1939) prevailed, when the security concept was hardly used. Since the Covenant (1919) ‘collective security’ had become an established term (Claude 1962, 1984: 247). The ‘national security’ concept emerged during World War II in the United States “to explain America’s relationship to the rest of the world” (Yergin 1977: 193). It was widely used by the first US Defence Minister Forrestal to legitimize a strong military establishment and this is reflected in the National Security Act (1947) that created its legal and institutional basis (Czempiel 1966; Brauch 1977; Yergin 1978). It was criticized by Wolfers (1952, 1962) and Herz (1959: 236f.).

The ‘security concept’ has gradually widened since the 1980’s, as have the objects and means of security policy in the framework of three security systems in the UN Charter, and within the UN framework several sector-specific security concepts have emerged. For Krell (1981) the security concept has been “one of the most complex concepts, comparable to values and symbols” that has been used “as one of the most important terms of everyday political speech, and one of the most significant values in political culture” (chap. 38 by Albrecht/Brauch).

For the constructivists, security is *intersubjective* (Wendt 1992). It depends on a normative core that can not simply be taken for granted. Its political constructions have real world effects by guiding action of policy-makers and exerting constitutive effects on political order (chap. 51 by Hintermeier, chap. 37 by Baylis). For Wæver (1997 and chap. 4, 44) security is the result of a ‘speech act’ (‘securitization’), according to which an issue is treated as: “an existential threat to a valued referent object” to allow “a call for urgent and exceptional measures to deal with the threat”. Thus, the ‘securitizing actor’ points “to an existential threat” and thereby legitimizes “extraordinary measures”. For Wæver:

the central idea of the theory is, that it is not up to analysts to try to settle the ‘what is security?’ but is may be

16 The *Political Dictionary* by Schmidt (1995: 864; 2004: 638) is limited to an abbreviated definition by Wolfers.

studied as an open, empirical, political and historical question: who manages to securitize what under what conditions and how? And not least: what are the effects of this? How does the politics of a given issue change when it shifts from being a normal political issue to becoming ascribed the urgency, priority and drama of 'a matter of security' (Wæver in chap. 44 in this vol.).

Wæver (1997: 26–68, 2006), tracked the emergence of security as a scientific concept in international relations, in security studies (Buzan 1991: 12–14, 1997) and in peace research (chap. 4 by Wæver; 38 by Albrecht/Brauch), and he noted a paradox that the IR discipline has to a large extent ignored to reflect "on what 'security' might be" (Wæver 1997: 28).

Security is often discussed in relation to 'threats and defence'. In Wæver's (1997: 30) view: "security is that which one wants to preserve, threat that which questions one's ability to preserve this, and defence is what is done to counter (or forestall) the threat", but what a 'threat' is has often been defined as the result of a political discussion or activity which developments pose 'threats' and are treated as 'security issues', and which do not. He divided threats by their source (external vs. internal), time (short vs. long-term) and motivation (intentional vs. non-intentional, see Brauch 2007, 2007a, 2007b, 2007c). Wæver (1997: 31) distinguished positive and negative as well as change and accommodation strategies, while the distinction between 'national' vs. 'international security strategies' (Wiberg 1987, 1988; Buzan 1991) refers to different choices on the preferred means to achieve the goal 'security'.

Several security concepts imply different approaches on how to achieve its goals, as e.g. 'common' (Palme 1982; Bahr/Lutz 1986, 1987); 'collective' (Wolfrum 1995, Doehring 1991; Delbrück), 'comprehensive' (Westing 1989, 1989a), 'equal' (NATO 1999), 'cooperative' (Carter/Perry/Steinbruner 1992; Steinbruner 2000; Zartman/Kremenuk 1995), 'mutual' (McGwire 1988; Smoke/Kortunov 1991) and 'universal' (Nikitin n.y.) security.

The *perception* of security threats, challenges, vulnerabilities, and risks (Brauch 2003, 2005) depends on the worldviews or traditions of the analyst and on the mind-set of policy-makers. The English School (Bull 1977, Wight 1991) distinguished three approaches to the security concept where the *realist* (Thucydides, Machiavelli, Hobbes, Morgenthau) points to the interests and power of his own state, while the *rationalist* or *pragmatist* (Grotius) points to an international society (not humankind) where the subjects are states as the decisive units that by cooperation can build institutions, norms, diplomacy and international law,

and thus build "a society of states, an international society". The *idealist* or for Wight the *revolutionist* (e.g. Kant) believes that the "ultimate solutions only exist when we get the states and their state system off the scene and allow for the unfolding of dynamics based on individuals and a community of mankind, world society (where the subjects in contrast to international society are individuals, not states)."

With regard to the security concept, for the realist, security refers to "the security of my own state," the revolutionist "will opt for a concept of individual or global security," while for the Grotian security is relational, resting on the relationship between the states that may build durable patterns that generate vicious circles (security dilemmas) or positive circles (security regimes; Wæver 1997: 51–52).¹⁷ These three European or Western traditions stand for three 'ideal type' (Max Weber) approaches to international relations and security that also exist in non-Western cultures and philosophies. Snyder (2004) distinguished among three rival theories of *realism*, *liberalism*, and *idealism* (constructivism).

Booth (1979, 1987: 39–66) argued that old mind-sets often have distorted the assessment of new challenges. These mind-sets include "ethnocentrism, realism, ideological fundamentalism and strategic reductionism", and they "freeze international relations into crude images, portray its processes as mechanistic responses of power and characterize other nations as stereotypes" (1987: 44). Many mind-sets have survived the global turn (Booth 1998: 28).

Influenced by these worldviews and mind-sets, the perception of security is a key concept of a) *war, military, strategic* or *security studies* from a Hobbesian perspective, and b) *peace and conflict research* that has focused on negative (war prevention) or positive peace. Since 1990 the distance between both schools has narrowed and an intensive theoretical debate has taken place within security studies (chap. 38 by Albrecht/Brauch). While in 'security studies' (Walt 1991) and in peace research (Brock 2004, 2004a) some authors prefer a narrow concept of security, many specialists have used concepts of 'environmental' and 'human' security. Environmental security challenges expose the societal vulnerability; this may lead to a 'survival dilemma' (Brauch 2002, 2004; chap. 40) for those with a high degree of societal vulnerability

17 Wæver argues that Herz, Jervis, and Buzan stand in the Grotian security tradition. He considered Haftendorn's classification of 'national' (Hobbesian), 'international' (Grotian) and 'global security' (Kantian) as misleading.

who may be most seriously affected by natural (or man-made) environmental hazards.

Since the late 1970's, an expanded security concept has been used in the academic debate (Krell 1981; Buzan 1983; Buzan/Wæver/de Wilde 1998; Møller 2001, 2003). Ullman (1983), Mathews (1989) and Myers (1989, 1994) put environmental concerns on the US national security agenda. Since the end of the Cold War, many European governments and defence ministries have adopted an extended security concept. Thus, within the UN and NATO, different security concepts coexist, namely a narrow state-centred military security concept and an extended concept that includes economic, societal, and environmental dimensions.

Buzan, Wæver and de Wilde (1998) have distinguished between the *wideners*¹⁸ that included an economic¹⁹ and environmental dimension and the *traditionalists* focusing on the primacy of a narrow military security concept (Walt 1991; Chipman 1992; Gray 1992, 1994; Dorff 1994). Buzan, Wæver and de Wilde (1998) distinguished among five levels of analysis of: *international systems, international subsystems, units, subunits, and individuals*. Others referred to five vertical levels (Møller 2003) of security analysis: a) global or planetary (Steinbruner 2000), b) regional (Mouritzen 1995, 1997; Buzan/Wæver 2003), c) national (Tickner 1995), d) societal (Møller 2003) and e) human security (UNDP 1994; Newman 2001, CHS 2003).

Some suggested expanding the human security discourse to the environmental dimension, especially to interactions between the individual and humankind as the cause and victim of global environmental change (Bogardi/Brauch 2005; Brauch 2003, 2005, 2005a). The consumption of fossil fuel has increased global warming and extreme weather events, major victims thereof are the poorest and most vulnerable people in developing countries (table 1.1).

While since the 17th century the key 'actor' has been the state, it has not necessarily been a major 'referent object' of security which has often been referred to as 'the people' or often 'our people' whose survival is at stake, but the survival of the state or regime has often been achieved with a high cost for the people.

A major ongoing debate (Wiberg 1987: 340; Walker 1990, 1993; Shaw 1994) has evolved since the late 1980's whether the state as the key referent object ('national security') should be extended to the people (individuals and humankind as 'human security'). Walker (1988) pointed to the complexity of a non-state centred redefinition of security towards 'individual' or 'global peoples' security while Buzan (1991) following Waltz's (1959, 2001) man, state and war, distinguished between the international, state and individual level of analysis and the inherent tension especially among the latter two.

While security has always been gendered (Burgess 2004: 403), gender security has become an evolving issue in international relations (Enloe 1989; Sylvester 1994, 2002; Tickner 1992, 2001; Hansen/Olsson 2004: 405-410). It refers both to a gender (or feminist) approach to security as well as to the manifold gender dimensions of societal, environmental, human, social, food, water, health and livelihood security (Mies 1998; Bennholdt-Thomsen/Faraclos/Werlhof 2001; Shiva 1988) that have been widely used also in the UN context (e.g. by the Inter-Agency Committee on Women and Gender Equality (IACWGE) or International Fund for Agricultural Development (IFAD). Wilkinson (2007: 27) contextualized the security approach with field research on Kyrgyzstan, addressing critically the Westphalian straitjacket. From a Southern eco-anthropological perspective Oswald (2001, 2007a, 2008) relying on a wide gender concept that includes besides women, also other vulnerable groups (children, old and indigenous people, homeless) has suggested a composite concept of human, gender, and environmental security (HUGE). This concept analyses the potential of technical, financial, and human support for reducing this vulnerability, enabling women and other exposed groups to reinforce their own resilience through bottom-up organization combined with top-down policies and tools able to guarantee livelihood and a holistic social representation-building.

Whether a security threat, challenge, vulnerability, and risk (Brauch 2005a, 2006) becomes an 'objective security danger' or a 'subjective security concern' also depends on the political context. While in the European security discourse climate change has become a major security issue, in the US the urgency of this problem was downgraded. Thus, labelling or ignoring climate change as a security problem, implies different degrees of urgency and means for coping with it. This *self-referential* practice of 'securitization' can also be illustrated for the claimed threat posed by the WMD

18 Proponents of a widened security concept are: Ullman 1983; Jahn, Lemaitre, Wæver 1987; Nye, Lynn-Jones, 1988; Mathews 1989, 1991, 1992, 1997; Brown 1989; Nye 1989, *Survival* (31:6) 1989, Haftendorn 1991, Buzan 1983, 1987, 1991, 1997; Tickner 1992.

19 Economic security issues were discussed by Gilpin 1981; Luciani 1989; Crawford 1993, 1995; Gowa 1994; Mansfield 1994.

of Iraq that was used to legitimize the use of extraordinary means (military intervention) and expenses in a war of liberation.

Harald Müller (2002: 369) argued that the traditional understanding of security “as the absence of existential threats to the state emerging from another state” (Baldwin 1995; Betts 1997; Gray 1992; Kolodziej 1992; Prins 1998; Walt 1991) has been challenged both with regard to the key subject (the state), and carrier of security needs, and its exclusive focus on the “physical – or political – dimension of security of territorial entities” that are behind the suggestions for a horizontal and vertical (Suhre 1999; Klare 1994, 1996; Klare/Thomas 1991, 1994, 1998) widening of the security concept. The meaning of security was also interpreted as a reaction to globalization (Cha 2000; Mesjasz 2003). Müller (2002) opted for a “conventional understanding of security: security between states, and related mainly to the organized instruments for applying force – the military in the first instance (Betts 1997; Buzan 1987)”.

The security concept combines its domestic roots and politics (lobbies, strategic doctrines) with international affairs (Gourevitch 2002: 315). Security is examined for security ‘communities’ (Deutsch 1957; Herrmann 2002: 131–132; Väyrynen n.d.), ‘regimes’ (Rittberger/Mayer 1993), ‘cultures’ (Katzenstein 1996; Müller 2002: 381–382) or ‘complexes’ (Kostecki 1996) and as a ‘security dilemma’ (Herz 1950, 1959; Müller 2002: 381–382). New methodological approaches and inter-paradigm debates relevant for security have emerged (Meyers 2000: 416–448):

- a) prevailing *traditional* methodological approaches (e.g. geopolitics²⁰, English School);
- b) *critical security studies* (Klein 1994; Jones 1999; Ralph 2001);
- c) *constructivist* and *deconstructivist* approaches.²¹

H. Müller (2002) disentangled the puzzle of security cooperation from the perspective of the realist (371–374), neoinstitutionalist (374–376), liberal (376–379), constructivist (379–382) and postmodernist (382–384) accounts, opting himself for “constructivism, with its emphasis on ideas and the cultural grounding of be-

haviour, its treatment of the interplay between structure and agency, may be best fitted to explain security cooperation.” But he noted that “the theory is much too indeterminate at present to allow for the development of distinct hypotheses, let alone prediction” (385). Primarily from a *traditional* approach, different cooperative security concepts have emerged since the early 1980’s: a) *common security* (Palme 1982; Väyrynen 1985; Butfoy 1997; Liotta 2003); b) *mutual security* (Smoke/Kortunov 1991); c) *cooperative security* (Carter/Perry/Steinbruner 1992; Nolan 1994; Zartman/Kremenunk 1995; Carter/Perry 1999; Cohen/Mihalka 2001); and d) *security partnership* (Bahr 1982; Marquina 2003).

With regard to its ‘spatial’ context, the classical goals of security policy to defend national sovereignty, in terms of its territory, people, and system of rule²² has also been changing due to the trends of globalization and regional integration. In Europe, close economic interdependence, sometimes competing trans-Atlantic and European political goals but also changes in technology, have replaced these classical security goals. During the 1990’s in many parts of the world two processes (Brauch 2001a: 109–110) have coexisted:

- A process of *globalization* in the economic world of finance, production, and trade, and in the societal world of information, media, but also of political and economic with a progressing *de-borderization* of exchanges for people, capital, and goods among its member states, and a *de-territorialization* of international relations that has permeated the boundaries of the modern ‘Westphalian’ state system.
- A process of partly violent *territorial disintegration* and *fragmentation* of multi-ethnic states combined with a *re-borderization* of space along ethnic and religious lines and disputes on territorial control of areas.

In the scientific discourses on territory two schools have coexisted: a) the debate on *geopolitique* and *new* or *critical geopolitics* (Amineh/Grin 2003); and b) the debate on *globalization* (Mesjasz 2003). In the North, national security has partly been replaced by *alliance security*, in the South security has remained nation-oriented with a strong role of military thinking in the security and political elites.

20 For a survey of recent publications with relevance to the Mediterranean, see Brauch 2001, chap 22.

21 Representatives of constructivist approaches to international relations are: Adler 1997, 2002; Berger/Luckmann 1966; Buzan/Wæver/de Wilde 1998; Checkel 1998; Fearon/Wendt 2002; Krell 2000; Müller 1994, 1994a; Ruggie 1998; Wendt 1999; Møller 2003 and Mesjasz 2003.

22 See for legal perspectives of the state: Bleckmann, 1975: 125–136; Ipsen 1990: 56–57; Zippelius 1991: 81–88.

In an objective sense security refers to an absence of *threats* that is to be achieved – at the national and alliance level – by deterrence and defence. Due to the widening security concept since the 1990's, the objects of security policy have also increased. In the security discourses different concepts are being used, often without clear demarcations: *threats*, *vulnerabilities*, *challenges*, *uncertainties*, and *risks* dealing with both *hard* (military) and *soft* security issues (drugs, human trafficking, migration). In Europe, *alliance* or *national* (NATO, EU) and *internal security* issues (justice and home affairs) are distinguished due to an increasing securitization of asylum, illegal migration, and citizenship. The de-borderization has been complemented with two securitization strategies based on *intergovernmental* structures in contrast to the *communization* of other issues.

While the classical means and instruments of security policy have remained the military and diplomacy, in the EU this classical *domaine réservé* of the nation state has entered a process of fundamental transformation with close consultations, common policies and strategies, and increased common voting in international institutions (UN, OSCE). In many international regimes (food, climate, desertification) the EU has become a full member besides its 27 member states. The evolving common *European Foreign and Security* (CFSP) as well as a *Security and Defence Policy* (ESDP) of the EU has affected the traditional national military and diplomatic leverage.

Within international organizations (UN, FAO, UNDP, UNEP, OECD, IEA), sector-specific security concepts are now widely used, such as 'environmental security' (Toepfer 2003: 139–140; El-Ashry 2003: 140–143), 'food security' (FAO 1996; Collomb 2003), 'global health security' (WHO 2002a), 'energy security' (IEA), and 'livelihood security' (OECD 2002).

In addition to these two classic concepts of the UN Charter, two new concepts and policy areas of development and environment and of sustainable development have gradually emerged since the 1950's, 1970's, and late 1980's.

3.3.3 Concepts of Development

Development is a key term (3.3.3.1) and a major scientific concept in the social sciences (3.3.3.2), but also a key policy goal (3.3.3.3) and policy area (3.3.3.4) for national and international policy making and thus a topic of scientific specialization of development studies (3.3.3.5). The impact of global environmental change on extreme outcomes is closely linked with

the stage of economic development that determines the available resources for adaptation and mitigation measures to enhance resilience.

3.3.3.1 Defining the Term Development

The English term 'development' (French: *développement*; Spanish: *desarrollo*; Portuguese: *desenvolvimento*; Italian: *svolgimento*; German: *Entwicklung*) refers to "1. the act or process of growing or developing; 2. the product of developing; 3. a fact or event, especially one that changes a situation; 4. an area of land that has been developed" (McLeod 1985: 305).²³ The *Shorter Oxford English Dictionary* (52002: 662) lists additional meanings: "9. Economic advancement or industrialization." Only the last refers to the concept as it evolved in the biological and social sciences since the 18th century. The German term 'Entwicklung' is used since the 17th century for creation and display, exposition and presentation (Pfeifer 82005: 289).

3.3.3.2 Development: Definitions of a Scientific Concept

The New Encyclopædia Britannica only refers to 'development' as a concept in biology as "the progressive changes in size, shape, and function during the life of an organism by which its genetic potentials are translated into functioning adult systems" (Chicago 1998, vol. 4: 45). The German encyclopaedia (*Der Große*

23 See also for similar definitions: *The Compact Oxford English Dictionary* refers to four meanings: "1. the action of developing or state of being developed; 2. a new product or idea; 3. a new stage in a changing situation; 4. an area with new buildings on it" (Soanes 2002: 297). The *Concise Oxford Dictionary* defines the term as: "1. gradual unfolding, fuller working out; developing of land and etc.; ..., growth evolution (of animal and plant races); full-grown state; stage of advancement; ... 2. product; more elaborate form; developed land." (Sykes 1985: 262). In a similar vein the *Chambers Universal Learners' Dictionary* distinguishes between "1. the profess or act of developing... [and] 2. something new which is the result of developing" (Kirkpatrick 1980: 180). The *Webster Unabridged Dictionary* points to the French term: *développement* and to the French and English verbs and distinguishes these meanings: "1. a developing or being developed; 2. a step or stage in growth and advancement; 3. an event or happening; 4. a thing that is developed; result of developing." (McKechnie 1983: 499). The *Langenscheidt-Longman Dictionary of Contemporary English* (1995: 374) lists five meanings for development that are all included in the other definitions with a slightly different wording.

Brockhaus (Wiesbaden ¹⁶1953, vol. 3: 587–591) reviewed the concept for a) the philosophy of science (evolution); b) biology and c) the cultural sciences. Thirty-five years later, the *Brockhaus Enzyklopädie* (Mannheim ¹⁹1988, vol. 6: 437) refers to development in five disciplinary contexts in biology, philosophy, photography, politics and economics and in psychology. In politics and economics development is defined as:

the building-up, expansion and working to full capacity of the production potential for the population with goods and services in the context of a social and political order that relies on human and citizens rights as well as other basic values such as freedom, social justice, domestic and external peace, and that preserves the cultural heritage in national independence and that protects the natural conditions for life. Thus, the term development has an economic, a social and a political dimension.

The most recent *Brockhaus Enzyklopädie* (Mannheim ²¹2006, vol. 8: 150–153) refers to UNDP's *Human Development Index* (since 1990), to 'sustainable development' and competing theories of development of modernization, to *dependencia* and more recent models of underdevelopment. In economics, development is defined as a synonym for economic growth. The term is also used for the improvement of the living conditions that includes besides the standard of living also social indicators (conditions of work, individual freedom, social security), and aspects of distribution (of income, public goods, and infrastructure).

The *Dictionary on Basic Historical Terms* (Brunner/Conze/Koselleck, 1975, vol. 2: 199–228) traced the historical development of the German term "Entwicklung" to the sphere outside the political and social world that was first used in the philosophy of history and in historiography. It was gradually introduced into the political language and used by the public at large since 1770. Wieland (1975: 201) pointed to these common features of the development concept in philosophy and history:

a) development of an irreversible, gradual, longer-term change in time; b) this change may not exclusively be understood as an object of deliberate action and planning, but it follows its own laws; c) the change is based on an identical and insisting subject ...; d) no sensible use of development can neglect the use of teleological concepts.

Wieland reviewed its early use by the philosophers Möser, Herder and Kant, by the poets Schiller and Goethe, since 1800 by Romantic authors, by Savigny and the historicists, by Adam Müller and Hegel prior

to 1848, and by Marx who introduced many features that are still used today. Based on Darwin and Haeckel, the German concept of 'Entwicklung' was widely used in the late 19th century and in the 20th century often synonymously for the biological concept of 'evolution'. However, the meaning of 'development' in historiography (Bayer 1965: 116–117) is hardly relevant for the concept as it is presently used in economics, sociology and in political science, especially with regard to a political goal and policy area.

According to Hillmann (1994: 186) in sociology development refers to "processes and forms of movement and change of social structures to other or higher relatively stable conditions". Furthermore, continuous, abrupt, evolutionary or revolutionary quantitative and qualitative developments are distinguished whose causes can be endogenous or exogenous to structures and systems. Grüske and Recktenwald (1995: 159–162) in their economic dictionary avoided a definition but introduced instead several applied concepts of the secular development of the state, of development assistance, policy and theories as well as of developing countries.

In political science, Manfred Schmidt (1995: 267–268) referred to development "for events or results of societal, economic, and political change directed at a level of progress and public welfare often with regard to economic resources of Western industrial countries. Political development is a technical term for the analysis of developing countries in comparative government focusing on the institutional conditions and the process of the evolution of differentiated, pluralist political systems compared with Western democracies."

Nohlen and Nuscheler (1992: 56) acknowledged that the concept and its contents are the result of continuous change. They suggest an empirical concept that aims at satisfying basic human needs focusing on a magic pentagram consisting of a) economic growth, b) work, c) equality and justice, d) participation, and e) independence and self-reliance (64–73). For Nohlen (1998, vol 7: 148) development is a normative concept that incorporates perspectives on societal change, theories on causes of underdevelopment, on social actors and processes of socio-economic transformation, decisions on instruments of its initiation and continuation.

Ake (1993: 239–243) stated that after World War II, during decolonization development theory emerged as a variant of modernization theory, but these theories "were at best heuristic devices" that were "too general and too vague to be taken seriously

as scientific theories and paradigms” because “their major concepts could not be operationalized and their empirical referents were unclear”. Toye (1996: 212–215) argued that by 1965 “prolonged and steady increase of national income” was identified as an indicator of economic development. It is accompanied by rapid population growth due to declining mortality, longer life expectancy, rapid urbanization, and improved standards of literacy and education. These processes have been criticized if the distribution of income remains unequal and if the population majority remains impoverished. Some claimed that “indicators of economic growth and structural change must be complemented by indicators of improvement in the quality of every day life for most people”. Sen (1981, 1984, 1994, 1999) argued that distribution of income should be complemented by a fair distribution of entitlements to food, shelter, clean water, clothing and household utensils.

These definitions excluded environmental factors contributing to and constraining economic development, especially natural hazards and disasters. The concept of ‘sustainable development’ was introduced by the Brundtland Report (1987: 8) that defined sustainability “to ensure that it meets the needs of the present without compromising the ability of future generations to meet their own needs.” Sustainable development was understood as “a process of change in which the exploitation of resources, the direction of investments, the orientation of technological development, and institutional change are made consistent with future as well as present needs” (Brundtland 1987: 9). ‘Sustainable development’ contains two key concepts:

- the concept of needs, in particular the essential needs of the world’s poor, to which overriding priority should be given; and
- the idea of limitation imposed by the state of technology and social organization on the environment’s ability to meet present and future needs (Brundtland Report 1987: 43).

This concept calls for a ‘sustainable development’ path that implies “a concern for social equity between generations, a concern that must logically be extended to equity within each generation”. The concept has become a key policy goal of environment and development.

3.3.3.3 Development: A Key Political Goal

The policy goals of development have been as varied as its definitions. The goals differed among the indus-

trial (OECD, G 7, G 8) or developing countries (Group of 77 and China) or between those who supply or receive development aid. During the Cold War these goals were closely associated with the economic systems in a bipolar world. The goals differed on import-substitution or export-led industrialization, capital or labour intensive strategies.

Stallings (1995) used this concept primarily for economic development, i.e. for growth and equity of distribution. He pointed to five new elements in the new international context for development since 1990: “the end of the Cold War, new relations among advanced capitalist powers, increased globalization of trade and production, shifting patterns of international finance, and new ideological currents” (Stallings 1995: 2).

3.3.3.4 Development: A Key Policy Area

Decolonization and global competition between rival systems and modes of production prevailed during the Cold War where development aid was also an instrument of global strategic policy where the geo-strategic and geo-economic importance of developing countries was rewarded with economic and military assistance. Development assistance was supplied by national governments, the EU (Menck 1996: 51–54), multilateral international organizations (OECD, UNCTAD, UNIDO), financial institutions (e.g. World Bank Group, EIB, EBRD) and development banks (Asian, African and Latin American development banks), by non-governmental economic, societal, and humanitarian (ICRC-RCS) organizations.

Since 1990, the overall development assistance from OECD countries as a percentage of their GDP dropped from 0.37 per cent (1980) to 0.33 per cent (1990) to 0.23 per cent (2002).²⁴ Thus, there was neither a peace nor a development dividend after the end of the Cold War. Rather, with the end of the bipolar global order, the geo-strategic importance of several developing countries (e.g. of Somalia) de-

²⁴ This trend applies especially for the five large OECD countries: US (1980: 0.27 per cent; 1990: 0.21; 2002: 0.13 per cent), Japan (1980: 0.32 per cent; 1990: 0.31; 2002: 0.23 per cent), Germany (1980: 0.44 per cent; 1990: 0.42; 2002: 0.27 per cent), France (1980: 0.63 per cent; 1990: 0.60; 2002: 0.38 per cent) and UK (1980: 0.35 per cent; 1990: 0.27; 2002: 0.31 per cent). In 2003, only five countries complied with their declared commitment of 0.7%: Norway (0.92 per cent); Denmark (0.84 per cent), Luxembourg (0.81 per cent); the Netherlands (0.80 per cent) and Sweden (0.79 per cent); (Brockhaus Enzyklopädie ²¹2006, vol. 8: 155–157).

clined, as did the security-motivated economic and military aid which contributed in some cases to weak, failing or failed states.

3.3.3.5 Development: Object of Social Science Research and Theories

Development research emerged after World War II as an objective of social and political science. Before, it was a domain of anthropological and ethnological research. The initial focus was on preconditions and features of development processes, especially on the economic, social, political and cultural factors that enhance or restrain development. Later the goals of development and the causes of underdevelopment were added (Boeck 1994, vol. 2: 100–105). Two main theories emerged: of modernization, used by scientists in OECD countries, and critical approaches, influenced by theories of imperialism, *dependencia*, self-reliance, or autocentric development.

With the end of the Cold War a crisis of development theories was noted (Boeck 1995, vol. 1: 69–80). Scientific concepts are influenced by development theories and strategies for poverty eradication, social and sustainable development that are linked to the state, market, community, and civil society (Kothari/Minougue 2002: 1–15). The concept of development has undergone major change since the Bretton Woods Conference in 1944. According to Reményi (2004: 22) during these 60 years four ‘false’ assumptions prevailed:

1. blind faith in the belief that Western ‘scientific’ methods are superior to traditional practices;
2. the belief that there is no gender dimension to development;
3. the proposition that the elimination of poverty can be achieved by realizing sustained economic growth, poverty targeting notwithstanding;
4. the priority of economic development over all else, so that governance issues are incidental to economic development.

During the 1950’s and 1960’s most development experts emphasized ‘economics first’ through investment driven economic development strategies with a focus on industrialization. Since 1980, the focus shifted to poverty and development and a basic human needs approach (Boserup 1970; Sen 1981; McNamara 1981). This was reflected in an upgrading of poverty eradication programmes but until 1985 there was no emphasis on governance issues, social capital development, institution building and capacity building for self-reliance. During the 1990’s there was a gradual

shift to agriculture, gender issues, and participatory community development to put people first as reflected in the Human Development Reports that introduced ‘human security’ (UNDP 1994) as a complement to ‘human development’.

3.3.4 Concepts of Environment and Ecology

As peace, security, and development, the ‘environment’ or ‘ecology’ is a fourth intensively used but often undefined concept in politics and in the social sciences. Not until the late 20th century have environmental and climate concerns been perceived as security dangers and concerns or as threats that may undermine the survival of individuals.²⁵ ‘Environment’ and ‘ecology’ as basic *terms* (3.3.4.1) and *key concepts* in the natural and social sciences (3.3.4.2) have been used in different schools, conceptual frameworks and approaches (3.3.4.3), and as guiding concepts for national and international governance (3.3.4.4).

3.3.4.1 Defining the Key Terms: Environment and Ecology

Two terms are used to define the object ‘environment’ (fr.: *environnement*; sp.: *medio ambiente*; it: *ambiente*; p.: *meio ambiente*; g: *Umwelt*) and ‘ecology’ (fr.: *ecologie*; sp: *ecología*; p: *ecologia*; g: *Ökologie*). In English dictionaries ‘environment’²⁶ and ‘ecology’²⁷ were given many different meanings.²⁸ *Webster’s Third New International Dictionary* (2002: 760) is more specific by pointing to:

2. the surrounding conditions, influences or forces that influence or modify, as a: the whole complex of climatic, edaphic, and biotic factors that act upon an organism or an ecological community and ultimately determine its form and survival; b: the aggregate of social and cultural conditions (as customs, laws. lan-

25 Brauch 2002; Randall/Schwartz (2004). On 17 April 2007, the UK put climate change on the UNSC agenda.

26 See e.g.: a) a surrounding or being surrounded, something that surrounds (objects, regions, conditions, circumstances), surroundings; b) all the conditions circumstances, and influences surrounding, and affecting the development of organism or group of organism; c) all the situations, events, people, etc. that influence the way in which people live or work; d) the air, water, and land in which people, animals and plants live; e) synonyms: atmosphere, background, conditions, context, domain, element, habitat, locale, medium milieu, scene, setting, situation, surroundings, territory, in: Langenscheidt-Longman 1995: 455; McKechnie 1983: 609; McLeod 1986: 372; McLeod 1985: 219; Sykes 1985: 323.

guage, religion, and economic and political organization) that influence the life of an individual or community.

The definitions of ecology in the *Shorter Oxford English Dictionary* (⁵2002: 789) are more pertinent: “1. The branch of biology that deals with organisms’ relations to one another and to the physical environment in which they live; (the study of) such relations as they pertain to a particular habitat or a particular species; also human ecology; 2. The political movement that seeks to protect the environment, esp. from pollution.” According to *Webster’s Third New International Dictionary* (2002: 720) ecology is: “1. a branch of science concerned with the interrelationship of organisms and their environments especially as manifested by natural cycles and rhythms, community development and structure, interaction between different kinds of organisms, geographic distributions, and population alterations; 2. the totality or pattern of relations between organisms and their environment; 3. human ecology.” While the term ‘environment’ has many meanings, the scientific concept has been more specific.

3.3.4.2 Defining the Scientific Concepts: Environment and Ecology

The *Encyclopaedia Britannica* (1998, IV: 512) has defined ‘environment’ as: “the complex of physical,

chemical, and biotic factors that act upon an organism or an ecological community and ultimately determine its form and survival”. Aspects of the natural environment of human beings are covered under *atmosphere, hydrosphere, biosphere, geosphere*. The *Brockhaus Encyclopaedia* (1993, XXII: 601) distinguished among different environments of an organism: a) psychological, b) physiological, c) ecological, and d) cosmic. For humans, physical (natural), technical (manmade), and societal factors are of importance. According to *Brockhaus Encyclopaedia* (²¹2006, vol. 28: 286) the concept ‘environment’ was introduced by von Uexküll (1921) as the key concept of ecology referring to the vital surrounding for animals. It distinguishes five features: a) biological, b) minimal, c) physiological, d) ecological, and e) cosmic. For human beings the physical, technical, and social environments are essential. ‘Ecology’ – according to the *Encyclopaedia Britannica* (1998, IV: 354) – refer to:

study of the relationship between organisms and their environment. ... Ecological studies may focus on the relationship between individual organisms and the physical and chemical features of their environment (*physiological ecology*). ... Among the characteristics studied would be the food-gathering techniques of individuals, the survival adaptations against predations, and mating ... (*behavioural ecology*). ... *Population ecology* is the study of the processes that affect the distribution and abundance of animal and plant populations. ... *Community ecology* is the study of the organization and functioning of communities. ... *Paleoecology* – the study of the ecology of fossil organisms. ... In *applied ecology*, basic ecological principles are applied to the management of populations of crops and animals, so that the yields can be increased and the impact of pests reduced. ... *Theoretical ecologists* provide simulations of particular practical problems ... and develop models of general ecological relevance [emphasis added, HGB].²⁹

The concept of *ecology* was used by Ernst Haeckel (1834–1919) for the study of living species and their physical and biotic surroundings. A modern definition includes a) the interactions between organisms (individuals, populations, biocoenosis), b) in their abiotic and biotic environment and c) the links in the energy, material and information flow.

According to Ellen (1996: 207), the ecology concept “has been centrally concerned with the concept of adaptation and with all properties having a direct

27 See e.g.: a) (from Gr. *oikos*, house and *logos*, study); b) study of interaction of persons (living organisms) and their environment; c) the set of relationships of a particular organism with its environment; d) the branch of *biology* that deals with the relations between living organisms and their environment; e) in *sociology* the relationship between the distribution of human groups with reference to material resources, and the consequences of social and cultural patterns; f) the way in which plants, animals, and people are related to each other and to their environment, or the scientific study of this, in: Langenscheidt-Longman 1995: 435; McKechnie 1983: 574; McLeod 1985: 352; Sykes 1985: 306.

28 The *Shorter Oxford English Dictionary* (⁵2002: 840) offers four meanings of environment “1. The action of enviroing; the state of being enviroined; 2. The set of circumstances and conditions, especially physical conditions, in which a person or community lives, works, develops, etc. or a thing exists or operates; the external conditions affecting the life of a plant or animal. Also, physical conditions viewed in relation to the possibility of life; 3. The region surrounding a place; 4. Context, setting that of a speech sound; 5. A large artistic creation intended to be experienced with several senses while one is surrounded by it.”

29 The *Brockhaus Encyclopaedia* (1991, XVI: 148–151) distinguished between *populations, aut* and *syn ecology* as well as *system ecology* with a natural science focus and *human ecology* that includes philosophical, psychological, theological, legal and social science dimensions.

and measurable effect on demography, development, behaviour and spatio-temporal position of an organism.” *Biological ecology* has been concerned “with population dynamics, energy transfer, systems modelling, nutrient cycles, environmental degradation and conservation; and since the 1970’s, especially with the application of neo-Darwinian thinking of socio-ecology.” *Human ecology* is used in human geography, urban sociology and anthropology. Advances in *biological ecology*: “linked to the ... ecosystem ... led during the 1960’s to a new formulation of ecological problems in the social sciences: in archaeology, geography, and also in anthropology.” Ellen argued that “the other major impact of ecological concepts in the social sciences has been in the relation of political environmentalism, and to environment and development. ... Increasing attention is also being paid to the cultural construction of nature, indigenous technological knowledge, the management of collectively owned resources, and environment history” (Ellen 1996: 208).

Many different concepts of the *environment* and *ecology* are used in the natural and social sciences. For O’Riordan (1996: 250) ‘environment’ is: “a metaphor for the enduring contradictions in the human condition; the power of domination yet the obligation of responsibility; the drive for betterment tempered by the sensitivity of humility; the manipulation of nature to improve the chances of survival, yet the universal appeal of sustainable development; the individualism of consumerism and the social solidarity of global citizenship.” In the *Encyclopedia of Global Environmental Change*³⁰, Munn (2002, I: xi, xiv) wrote:

In the 1960’s, the scientific community began to use the word *environment* in this new non-specialist sense. ... In the ensuing decades, the world community has come to see the ‘environment’ in many different ways, as a life-support system, as a fragile sphere hanging in space, as a problem, a threat and a home. ... In the 1970’s and 1980’s; ... *global environmental change* acquired a popular currency. ... Another vital insight began to emerge about 1980: the inescapably interlinked nature of these many environmental changes. ... Thus, the term *global environmental change* has come to encompass a full range of globally significant issues relating to both

nature and human-induced changes in the Earth’s environment, as well as their socio-economic drivers.

For Fleming (2002, II: 290) “*environment* refers to the physical, chemical, and biotic factors that affect an organism or an ecosystem and ultimately determine its form or structure and survival.” He distinguishes between *abiotic* (climate, minerals, soil, sunlight, water) and *biotic* (organisms) factors that are linked by “the flow of energy and the cycling of nutrients”.

The major components of the Earth’s physical environment include the atmosphere, climate, weather, continental landforms, hydrosphere, cryosphere, and oceans. The relationship between the principal physical components of the environment and the major ecosystems of the earth is mediated through the biosphere. Human interference in the global environment is widespread and accelerating. Most of this interference derives from three basic contributing factors: human population growth, pollution, and misuse of resources and natural ecosystems. ... Environmental gains from better policies and improved technology are being outstripped by the pace and scale of human population growth and economic development.

Lovelock (1975, 1986, 1992) in cooperation with Margulis (1974, 1974a) expressed the complicated physical, chemical, and biological processes that maintain life on earth in the *Gaia* hypothesis. The *Gaia* hypothesis claims “that the entire range of living matter on Earth defines the material conditions needed for its survival, functioning as a vast organism ... capable of modifying the biosphere, atmosphere, oceans, and soil to produce the physical and chemical environment that suits its needs” (Oxford 1998). For Douglas, Huggett and Robinson (1996: 5) the *Gaia* hypothesis is

the latest recasting of the ancient, holistic belief that there exists interconnectedness and harmony among the phenomena of Nature. ... At least two versions of the *Gaia* hypothesis have evolved: weak *Gaia* and strong *Gaia* (Kirchner 1991). Weak *Gaia* is the assertion that life wields a substantial influence over some features of the abiotic world, notably the temperature and composition of the atmosphere. In other words, it makes the simple proposal that the earth’s climate and surface environment are actively regulated by animals, plants, and micro-organisms. Strong *Gaia* is the unashamedly teleological idea that the earth is a superorganism which controls the terrestrial environment to suit its own ends. ... Lovelock [1988: 10] seems to favour strong *Gaia*. ... Lynn Margulis ... appears to prefer a weak version of *Gaia*. ... Margulis chooses to restrict *Gaia* to the surface features of the Earth, simply because they can be observed [Margulis/Hinkle 1991: 11].

30 The *Encyclopedia of Global Environmental Change* focuses on: a) *Physical and Chemical Dimensions of Global Environmental Change* (Vol. 1), b) *Biological and Ecological Dimensions of Global Environmental Change* (vol. 2) and *Causes and Consequences of Global Environmental Change* (vol. 3) while vol. 4 deals with political aspects: *Responding to Global Environmental Change*, and vol. 5 examines *Social and Economic Dimensions of Global Environmental Change*.

O’Riordan (1996: 251) defined and interpreted the Gaia hypothesis:

as a self-regulating system that emerges from the tightly coupled evolution of biota and the material elements and fluxes that circulate substances and energy around the globe. In an important sense, Gaia is a very special scientific concept. It utilizes traditional scientific enquiry to reveal how the totality of physics, chemical and biological process interact to retain the conditions vital for the survival of the earth. Gaia has no morality, nor a purpose. It has no special place for humans. ... If Gaia tells us anything, it is that humans must adapt to survive, and that the process of adjustment is part of the totality of self-regulation. Otherwise the earth will do it for us.

According to Williams (2002, V: 287–290) the *Gaia* hypothesis is intriguing and has provoked much scientific debate. In the context of Earth systems analyses “the Gaian contribution has been an enhanced recognition of the role of the biosphere” (290).

From an international relations perspective Ronald Mitchell (2002: 500–516) reviewed the history, the causes of international environmental problems with a special focus on: a) agenda setting, b) policy formulation, c) policy implementation and effectiveness and policy evolution and social learning. Mitchell (2002: 512) concluded:

Theoretically, we need a framework to make sense, for each stage of the policy process, of which factors are influential under a wide range of circumstances, which are influential only in limited circumstances, and which are simply not influential despite earlier theorizing. *Methodologically* we need to supplement the almost exclusive use of case studies with quantitative methods, formal modelling and simulation. ... *Empirically*, we need to develop data for quantitative and large-n quantitative comparisons across issues (emphasis added, HGB).

Mitchell (2002: 512) argued that scholars who want to contribute to global environmental management “must begin developing contingent knowledge that identifies how the choices actors make promote environmental protection, the structural constraints on their ability to do so, and the conditions under which the former can help us overcome the latter. For the analysis of national and international environmental governance and regime formation all three stages of the policy process are relevant.

3.3.4.3 Scientific Traditions, Schools, Approaches, and Frameworks

On environmental issues, especially on population growth and resource constraints, two opposite traditions have evolved (Kennedy 1992):

- a *pessimist* or *Neo-Malthusian view* stimulated by Malthus’ *Essay on Population* (1798) that stressed the limited carrying-capacity of the Earth to feed the growing population;
- an *optimist* or *Cornucopian view* that believed an increase in knowledge, human progress, and breakthroughs in science and technology could cope with these challenges.

These two *ideal type* positions have dominated the environmental debate since the Club of Rome’s *Limits of Growth* (Meadows/Meadows/Randers/Behrens 1972), and Lomborg’s (2001) *Skeptical Environmentalist* (Gleditsch 2003). O’Riordan (1996: 250–252) distinguished among three environmentalist world views: technocentric, eco-centric and deep green. The *technocentric* perspective (Hays 1959; Mies/Shiva 1993; Simon/Kahn 1984) believes in the betterment of both people and nature and calls for “environmentally benign technology, environmentally friendly product substitution, and the wealth creating engine that will allow the poor to be emancipated from their prisons of enforced environmental and social debasement.” In contrast, the *ecocentric* view (Dobson 1990; O’Riordan 1981; Pepper 1986) incorporates “the costs of altering the natural world. ... This ... has spawned a host of manipulative middle ground, accommodationist mechanisms aimed at making economic development more socially tolerable and environmentally sustainable.” O’Riordan associated five concepts with the *ecocentric* view: a) sustainable development, b) the precautionary principle, c) ecological economics, d) environmental impact assessment, and e) eco-auditing or environmental burden analysis to make economic progress environmentally tolerable. The *deep green* interpretation promotes small-scale self-reliant and politically empowered communities.

For Nazli Choucri (1993: 267–271) *environmentalism* is based “on a view of humanity as integral to nature, of nature as empowering humans and of the relationship between both as uneasy at best, and perhaps even threatening to the integrity and viability of nature and hence of humans.” Environmentalism calls for a “coherence of environmental and social processes”. Environmentalism “evolves ideas of nature, ecological balances, and ecological growth as central to the survival of the human species”.

Rayner and Malone (2002, V: 109–123) pointed to a descriptive vs. interpretative tradition in social science analyses dealing with global environmental change. While the *descriptive tradition* relies on quantitative methods “of tracing stocks and flows of social

data through time and space” using natural science methods and models, the interpretive tradition tries “to understand motivations, ideas, and values” (109). But both are essential for research, e.g. descriptive approaches “have revealed much what would happen under various scenarios of climate change” while “interpretive approaches can provide value-oriented parameters as a basis for choosing among candidate policies”. Social science research can both describe:

the human activities that give rise to environmental concerns, identify possible mitigation actions, indicate where adaptations will be necessary, and illuminate how institutional and cultural structures and abilities to change will both constrain and open up possibilities to make and implement policy. Social science research demonstrates that the process through which choices articulate across scales is not a linear mechanism. ... Rather, it is a social as well as a knowledge process that requires a high level of trust and agreement ... to gain recognition at another scale (119).

In the social sciences, the analysis of issues of global environmental changes and human-nature relationships (Glaeser 2002, V: 11–24) are polarized between epistemological idealism and realism, or between *social constructivism* and an orientation “that presupposes a material world independent of percipient human actors” (Rosa/Dietz 1998) – *neo-realism*.

The neo-realism guides the social and scientific analysis of environmental changes as well as the political economy interactions between environment and society. A famous example is the still influential IPAT model which was proposed in the early 1970’s and assumed that environmental impact I is a function of population size P, affluence per capita A and technological development T. The systems approach in world modelling simulates similar relationships on the basis that there are crucial driving forces that regulate the system and that are probably influenced by policy and politics. Social scientists have often criticized such concepts as being too simplistic ... (Glaeser 1995).

The opposite *neo-idealist orientation* has highlighted two aspects: a) the uncertainty of scientific knowledge and claims; and b) the attempt to explain the scientific and public recognition of environmental change influenced by political and historical forces (Rosa/Dietz 1998).

In this approach, the emergence of scientific concerns and the rise of public awareness are scrutinized; these issues eventually become more important than the environmental problem under dispute. Environmental threats to the global ecosystem or human health are perceived only to the extent that they attract media attention and are publicized accordingly. To a great extent the social constructivist approach is reflexive, and it is

applied as a science of science-meta-theory. ... Social constructivism ... has been criticized for neglecting real world problems and concerns in that human-nature relations and environmental change issues are constructed or conceptualized, that is, ‘produced’ or ‘created’ rather than ‘extracted’ or ‘mapped’ (Glaeser 2002: 20).

Glaeser calls for a combination of the strongholds of both positions, i.e. for a critical analysis of the assumptions and models of the natural scientists and of their inherent interests.

Within the scientific discipline of international relations the analysis of problems of global environmental change has been pursued from different theoretical or practical orientations. Paterson (2000: 5) distinguished among six basic positions of a) *liberal institutionalism*, b) *realism*, c) *eco-authoritarianism*, d) *eco-socialism* (Pepper 2002, V: 224–225), e) *social ecology* (Pepper 2002a, V: 484) and f) *deep ecology* (Pepper 2002b, V: 211), and one may add g) *ecofeminism* (Warren 2002, V: 218–224) that differ both with regard to the perceived causes and responses. In addition, several ideologies have been distinguished: *eco-centrism* “that centres on and prioritizes the whole planetary ecosystem”, that is synonymous with *bio-centric* centring on the biosphere and *Gaiacentric* that focuses on the Earth as one living system. Homer-Dixon (1999: 28–46) distinguished among *neo-Malthusians* (biologists, ecologists); *economic optimists* (economic historians, neoclassic economists, agricultural economists) and *distributionists* (poverty, inequality, misdistribution of resources) while Gleditsch (2003) referred to Neo-Malthusian and Cornucopian perspectives.

3.3.4.4 Environment Policies and International Governance

The United Nations Charter lacks a reference to environmental protection and ecological concerns. In chap. IX on ‘International Economic and Social Cooperation’, Art. 55 (c) that deals with “human rights and fundamental freedoms”, some authors considered a “sound environment” (Partsch 1994: 779) among the “human rights of the third generation” (Vasak 1984: 837).

Major steps in the political agenda-setting were the Stockholm Conference (1972), the *Brundtland* Report (1987), the Earth Summit in Rio de Janeiro (1992) and in Johannesburg (2002). On 15 December 1972 GA Res. 2994 (XXVIII) “endorsed the Action Plan for the Human Environment adopted by the UN Conference on the Human Environment (1972)” (Wolfrum 1994a: 775) and GA Res. 2997 (XXVIII) set up the

Governing Council for UNEP, which began its work in the spring of 1973, developing the guidelines for the establishment and the coordination of UNEP. In Res. 44/228 of 22 December 1989, the GA convened the UN Conference on Environment and Development (UNCED) in Rio de Janeiro in June 1992. (Göttelmann 1994: 1089-1090).

Paelke (2002, V: 49-61) distinguished two waves in the establishment and institutionalization of environmental politics: a) the early environmental movement with an often apocalyptic and apolitical dimension that focused on pollution and global sustainability concerns, b) a second wave with “the re-emergence of conservationist and biodiversity concerns”.

Mostafa Tolba (2002, IV: 1-13), a former executive director of UNEP, noted eight trends in national and international responses of industrialized countries to environmental problems: a) inclusion of environmental impacts into sectoral policies; b) increase in cross-sectoral policies; c) replacement of a reactive approach to pollution control with a preventive one; d) growing interests in economic instruments as incentives to energy and pollution control; e) promotion of energy efficiency, energy conservation, and environmentally sound processes in industry, transport and domestic environments; d) recognition of the international, and often regional nature of many environmental problems; e) increased public information and participation; f) more public information and participation; and g) better environmental science and monitoring (Tolba 2002, IV: 5).

Since the 1960's and 1970's many new governmental and non-governmental institutions were set up, and an increasing number of environmental laws and regulations were adopted in OECD countries. The developing countries have followed this pattern “but with a different range of concerns and on a different time-scale” (Tolba 2002, IV: 8), with a primary focus on land and fresh water management and food production. While for them development is crucial “to improve the quality of life, eliminate poverty and support the infrastructure needed in order to deliver the health care, education and other institutions essential to the national future”, many countries have prepared national conservation strategies.

International environmental regimes and institutions have gradually evolved since the end of World War II in the framework of the UN institutional family (FAO, WHO, UNESCO, IMO, ILO). In 1948 the IUCN (World Conservation Union) was founded by state and non-governmental members to protect natural areas and species. The decision at the Stockholm

Conference (1972) to set up the UN Environment Programme (UNEP) in Nairobi and the adoption of the Agenda 21 and of several environmental regimes at the Earth Summit (UNCED) in Rio (1992) were major steps towards international responses. The Brundtland Report (WCED, 1987) and a UNEP (1998) report stimulated new thinking and fostered an integrated global approach that was supported by regional efforts of the five economic commissions (ECE, ECA, ESCWA, ESCAP, ECLA) under the ECOSOC and by UNEP's regional seas programme, which has “produced as much sectorialization and fragmentation as synthesis”. From an Egyptian perspective, Tolba (2002, IV: 12) stressed that

development strategies need substantial adjustment, and that this must go far beyond the technology of environmental management to incorporate trade debt, and social infrastructure. It is also evident that environmental costs and benefits must be incorporated into the technologies and processes of development, from the initial planning stages.

The progressing awareness and commitment for international environmental problems requires a management of national environmental adjustments. In some cases, resource scarcities may evolve the use of force to limit dissent. On the global level, Choucri pointed to five underlying principles that should guide the international community's strategy for managing environmental issues: a) legitimacy, b) equity, c) volition, d) universality, and e) efficacy.

3.3.5 Linkages: Peace, Security, Environment, and Development

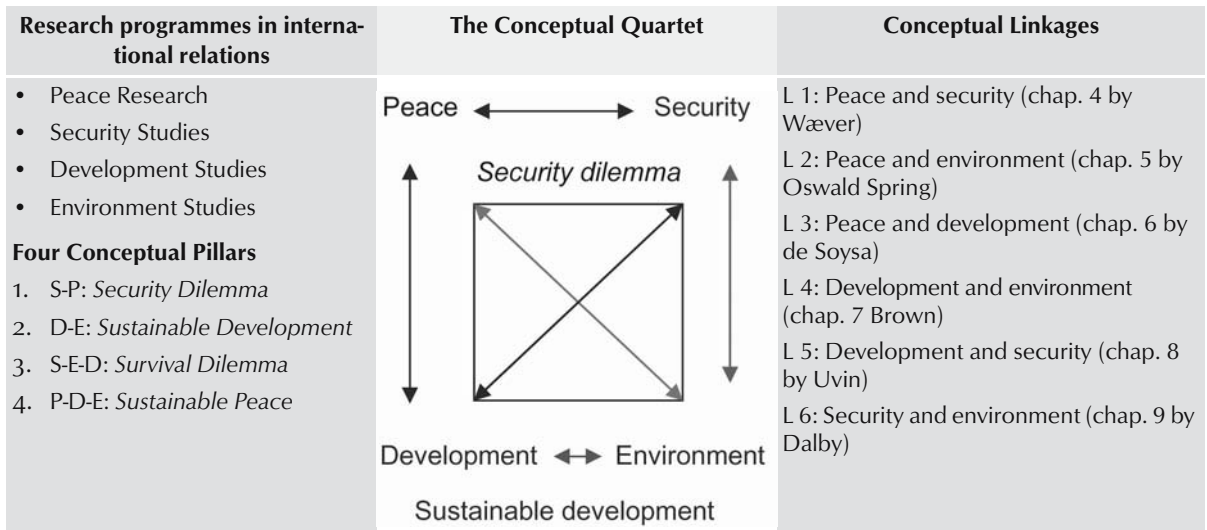

These four basic social science concepts of peace, security, environment, and development refer to four research areas and programmes in political science and international relations:

- a) peace research, science or studies as a value-oriented research programme;
- b) security, strategic or war studies as a theory and policy-oriented research field;
- c) environmental studies and international environment policy;
- d) development studies.

Each of these programmes provides experts with qualifications in different areas of international politics:

- a) specialists for dealing with conflicts, conflict prevention, and avoidance in foreign and development ministries but also in international organizations;

Figure 3.1: Research Programmes and Linkages within the Conceptual Quartet

- b) *security specialists* in foreign and defence ministries, intelligence agencies;
- c) *environment specialists* in ministries, agencies, consultancies, and with international organizations and NGOs; and
- d) *development specialists* in ministries, agencies, and with international organizations and NGOs.

Global environmental change is not only an issue for the natural sciences and for environmental specialists in international relations. Its extreme and in some cases fatal outcomes and its sometimes violent societal consequences affect the activities of foreign, security and development specialists and many of their respective institutions as well. Thus, global environmental change should be analysed from all four specialized perspectives in international relations with a focus on the six unique linkages within the conceptual quartet (figure 3.1).

The UN Charter focuses only on the classical ‘agenda’ of peace and security and on the many linkages between both (L1). With the start of the decolonization process ‘development’ was added as a new concept on the UN agenda since the 1950’s. Not until the first UN Summit on Environment in Stockholm in 1972 was the ‘environment’ put on the international agenda that later required a focus on ‘sustainable’ development and environment linkages (L5). Since the 1990’s, three phases of research have analysed the linkages between security and environment (L 6). A primary focus of this book series is to contribute to a fourth phase of research on environment and security linkages that will take the other key concepts (peace and development) and five linkages into account, as

far as they are relevant for the analysis of the factors of global environmental change, its extreme outcomes, and violent societal consequences.

For the four key concepts nine different positions can be distinguished: For the classical peace and security agenda the three ideal type worldviews of a) Hobbesian realists, b) Grotian pragmatists, and c) Kantian optimists have been distinguished. With regard to development three ideal type approaches have emerged that have been the focus of theoretical controversies between: d) the classical and more recent modernization theories, e) the critical theories (imperialism, dependencia, peripheral capitalism, etc.) that challenged the modernization mainstream, and f) the many sustainable development concepts. Finally on environmental issues, three ideal type positions emerged: a) the pessimist Neo-Malthusians b) the pragmatic equity-oriented distributionists, and c) the optimist Cornucopians. These nine ideal type positions point to a total of 27 possible theory guided linkage concepts.

Of these 27 linkages only six conceptual linkages (figure 3.1) will be discussed (3.4.). Four linkage concepts will be developed (3.5) as conceptual pillars for a fourth phase of research on human and environmental security and peace: Two are widely used in security and environmental studies:

1. *Security dilemma* for the classical peace and security interaction (L1);
2. *Sustainable development* for the link between environment and development (L5).

Table 3.1: Linkages among Concepts: Peace, Security, Development, and Environment

	Peace	Security	Development	Environment
Peace	x	(L 1)	(L 2)	(L3)
Security	(L 1)	x	(L4)	(L5)
Development	(L-2)	(L4)	x	(L-6)
Environment	(L-3)	(L5)	(L6)	x

In addition, two new concepts will be introduced and discussed below:

3. *Sustainable peace* that has been used as a semantic construct in the UN context and by action-oriented researchers who combined peace with sustainable development (PED).
4. *Survival dilemma* as a new concept reflecting the security, environment, and development linkages caused by human and nature induced factors of global environmental change (SED).

From a Northern view (figure 3.2) the three concepts of peace, security, and environment and the linkages (L1, L3, L6) are crucial, while from a Southern view (figure 3.3) the concept of development is in the centre as well as the linkages (L2, L4, L5, L6). But so far little research exists on the linkages between peace and environment (L3). The linkages between the factors contributing to global environmental change, its fatal outcomes and violent societal repercussions have not been discussed from these perspectives, and they have not yet been an issue of intensive theoretical reflection and empirical research.

3.4 Six Linkage Concepts of Security in Relation to Peace, Environment, and Development

For centuries and in many cultures, peace has been a major concept of philosophical reflection, of policy declarations, and of social science research (see chap. 10 by Oswald). Below six conceptual linkages between the four key concepts of peace, security, environment, and development will be briefly introduced and discussed in more detail.

3.4.1 Linkage 1: Peace and Security in the Three Traditions

This linkage between peace and security has been analysed from three ideal type perspectives or intellectual traditions (table 3.2), and it is the key goal of the UN Charter (chap. 35 by Bothe).

The English School (Bull 1977, Wight 1991, Buzan 2001, 2004, 2006) has distinguished three basic traditions in the thinking on international relations they associated with *realism* based on power (Machiavelli, Hobbes), *rationalism* relying on cooperation (Grotius), and *idealism* relying on international legal norms (Kant). These three traditions reflect basic ideal type thinking that may have also existed in other traditions of political philosophy in the East (India, China, Japan), but also in the Muslim (Arab, Persian and other), the African and pre-Columbian Mesoamerican traditions that are unknown and thus ignored in the Western discourses on international relations, and especially on peace and security .

Wæver (chap. 4 below) reviews the origins of both concepts and their complex interplay prior to 1945, during the Cold War (1947–1989), and since its end (1990–), and he concluded that during the Cold War ‘peace research’ and ‘security studies’ were opposite approaches, while in the post-Cold War era ‘security’ has become intellectually more challenging (chap. 38 by Albrecht/Brauch). Bothe noted a major shift in the state behaviour on peace and security as reflected in many resolutions of the UNSC with regard to reasons that justify its involvement. During the Canadian UNSC presidency in February 1999 (chap. 46 by Dending) ‘human security’ was introduced, while during the British presidency in April 2007 climate change was debated as a security issue (chap. 40 by Brauch).

3.4.2 Linkage 2: Concepts of Peace and Environment

Several conceptual linkages have evolved in the social scientists between ‘peace’ and ‘environment’. In the intellectual history of ideas and concepts, there has been a debate on ‘peace with nature’ going back to Bacon in the 17th century up to ‘peace with creation’ in the ecumenical movement of the 20th and 21st century, and in the context of the debates on earth ethics or on ethical approaches to global environmental change. Three basic standpoints on environmental issues may be distinguished between:

Figure 3.2: A Northern View on Linkages between Peace, Security and Environment

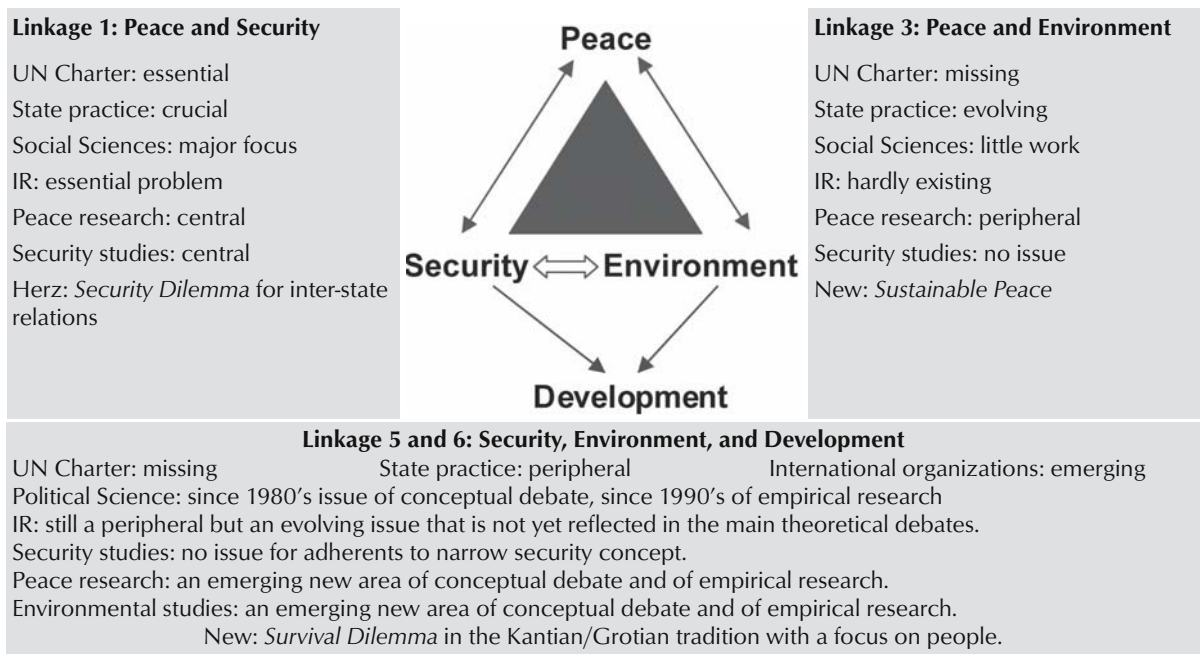

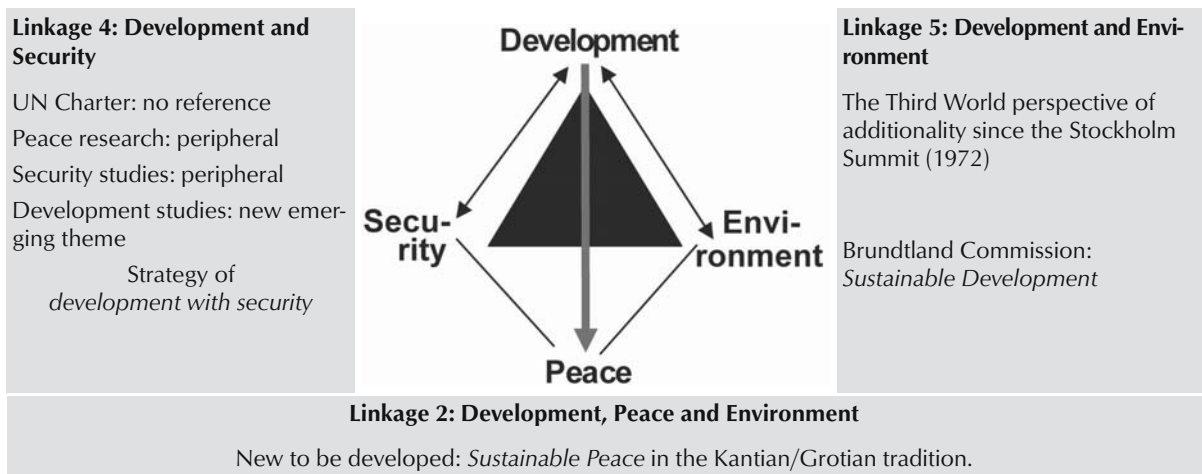

Figure 3.3: Southern View on Linkages between Development, Security, Environment, and Peace

- a *pessimist* or *Neo-Malthusian view* stimulated by Malthus' *Essay on Population* (1798) that stressed the limited carrying-capacity of the Earth to feed the growing population (Meadows/Meadows/Randers/Behrens 1972; Meadows/Meadows/Randers 1992; Brown 1977);
- an *optimist* or *Cornucopian view* that believed an increase in knowledge, human progress, and breakthroughs in science and technology could cope with these challenges (Lomborg 2001, 2001a, 2001b, 2002);
- an *equity oriented pragmatist* (Homer-Dixon 1999; Brauch 2003, 2005).

Table 3.3 combines the three traditions on peace and security with these three standpoints on the environment. This leads to nine positions on peace and security and environmental issues.

Wars cause a loss of life of soldiers and civilians, destroy economic values and infrastructure, and damage the environment. Peace shifts the environmental impact of human behaviour to consumption, unequal distribution, and use of resources, e.g. food surplus in the industrial North and its insufficient supply and distribution in developing countries that are also more vulnerable to environmental hazards and social disasters. Droughts often lead to famine and hazard-

Table 3.2: Peace and Security as Seen from Three Ideal Type Worldviews.

Worldviews	Realists	Rationalists, Pragmatists	Idealists, Constructivists
Eastern tradition	Tzun Tse,	Confucius	Lao Tse, Gandhi
Western tradition	Thucydides, Machiavelli, Hobbes, Clausewitz, Lenin	Grotius, Pufendorf, Locke, Burke	Kant, Woodrow Wilson
Arab, Muslim tradition		Ibn Khaldun, Anwar Al Sadat	
African	Idi Amin	Nkruma, Mandela	Nyerere
Mesoamerican	Pachacuti, Topa Inca, Itzcóatl, Moctezuma I, Axayacatl, Tizoc, Ahuizot	Nezahualcōyotl, Nezahualpilli	Moctezuma II
USA	F.D. Roosevelt	Washington, Jefferson	Martin Luther King
Schools of International Relations	structural or (neo)realists old or critical geopolitics	liberal neoinstitutionalists	Social constructivists
Research programmes	War, strategic or security studies		peace research (polemologie)
International Relations specialists	Carr, Morgenthau, Waltz, Kindermann	Wight, Bull, Buzan	Boulding, Alger, Albrecht Czempiel, Senghaas
Key categories	Power, alliances	Cooperation	International law, human rights
Goals and concepts of peace	<i>Negative peace</i> : lack of direct personal violence	Both <i>negative</i> and <i>positive</i> peace	<i>Positive peace</i> : lack of (structural) violence, peace with social justice
Goals and concepts of security	External, domestic, national, international security reaction: armament	Widened security concept (military, political, economic, social, environmental)	'human security' 'human survival'
Pattern of security 19 th and 20 th century	John Herz: <i>Security Dilemma</i> (1950) (state focused: action-reaction processes)	Kant: 3 rd preliminary article in his <i>Eternal Peace</i> (1795)	
21 st century		<i>Survival Dilemma</i> ('people centred')	
Principles of security	Superiority and general balance of power	Balance of power	Limited inferiority (Self defence)
Referent object	Nation state	State, international organization	Human being, transnational actors, states, IGOs
Explanation model (for arms, armed forces)	External factors: action-reaction process	Mixture of external and internal factors	Domestic factors: <i>autodynamic process</i>
'Mind-sets'		Worldviews of policy-makers ^a	
Order of Vienna (1815)	Metternich, Talleyrand	Castlereagh	Tsar Alexander (?)
Order of Versailles (1919)	Clemenceau	Lloyd George	Wilson
Order of Yalta (1945)	Stalin	Churchill, Roosevelt	
Order of Paris (1990)	Bush, Thatcher	Mitterrand, Kohl	Gorbachev (?)

a.) This list categorizes these conceptual architects relative to the others that participated in setting up the international orders of Vienna (1815), Versailles (1919), and Yalta (1945). This categorization does not necessarily imply e.g. that Tsar Alexander (1815) and Gorbachev were acting as 'idealists' (e.g. on domestic or foreign politics), but they used 'idealist' arguments during the debate on the new international order. This categorization was inspired by Holsti (1991) and Osiander (1994), and was published first in Brauch (1996a).

induced internal displacement. Neo-Malthusians stressed the linkage between environmental scarcity and violent conflict.

From a *Cornucopian view* Lomborg (2001: 317) challenged the Neo-Malthusian pessimism that global warming would decrease food production and increase extreme weather events, but he acknowledged

Table 3.3: Worldviews and Standpoints on Security and Environmental Issues. **Source:** Brauch (2003, 2005).

Worldviews/Traditions on peace and security (→)	Realism (Tzun Tze, Thucydides, Machiavelli, Hobbes)	Rationalism, pragmatism (Confucius, Grotius)	Idealism, constructivism (Kant, Gandhi)
Standpoints on environmental issues (↓)	Power matters	Cooperation matters	International law matters and prevails
Neomalthusian <i>Resource scarcity</i>	I. Military, economic power solves resource scarcity	II. International cooperation will solve resource scarcity	III. International law and cooperation solves resource scarcity
Equity-oriented pragmatist <i>Cooperation will solve problems</i>	IV. Military, economic power and cooperation will cope with environmental issues	V. International organizations and regimes will address/contribute to adaptation/mitigation	VI. International law and environmental cooperation can cope with global environmental change
Cornucopian neo-liberal <i>Technological ingenuity will solve problems</i>	VII. Military, economic power and technological innovation avoids resource scarcity	VIII. International cooperation, organizations and regimes and technological innovation can cope with global environmental change	IX. International law and cooperation as well as technological innovation cope with global environmental change

the high cost of global warming and that developing countries are hit most due to poverty and lesser adaptive capacity. From the third perspective peace improves the conditions for environmental policies. Resource scarcity is often a result of unequal domestic distribution and of a lack of equity in the international division of labour.

Below Úrsula Oswald Spring (chap. 5) reviews the linkages between peace and environment and the conceptual and policy-oriented contributions on sustainable peace as seen from the South. She explores the physical, structural, cultural and gender violence, the positive and negative peace concept, as well as feminist peace. On the environment she discusses the Gaia approach, deep and social ecology, ecofeminism and the possibility of an ecofeminist peace, before she explores the challenge of the concept of ‘sustainable peace’ and the potential for linking it with sustainable development and gender equity. Southern countries and their vulnerable social groups are particularly affected by wars and complex emergencies where the effects of global environmental change and their impact on hydro-meteorological hazards often lead to social disasters. She concludes with a discussion of the future of ‘sustainable peace’ for Southern countries, its potential, limits, and capacity to increase equality and equity for women and the socially vulnerable.

3.4.3 Linkage 3: Concepts of Peace and Development

While the peace research programme emerged during the Cold War as a critical response to cold war policies and to prevailing realist approaches in security or strategic studies, development studies evolved with the decolonization process in economics and political science as a field of study that focused on the processes of economic and human development and on causes of underdevelopment. What conceptual linkages have evolved between both concepts and research fields, and how has the global turn of 1990 impacted on both?

While in peace and security studies three traditions have been distinguished (table 3.2), on development issues three basic theoretical schools can be identified: a) modernization theorists, b) critical theorists, and c) since the 1980’s a third perspective evolved that stressed environmental issues and inter-generational justice (sustainable development). Between the three scientific approaches on peace (realists, rationalists, and idealists) and three approaches to development (modernization, critical theories, and sustainable development) nine positions emerge of which three are most pertinent, that of a) *realist modernization theorists*, b) *idealist critical theorists*, and c) *pragmatic supporters of sustainable development*.

During the Cold War period, the position of realist modernization theorists and professionals in national development agencies and international organi-

zations reflected the mainstream that influenced development policy that was often an instrument in the Cold War competition. Within international relations, some critical theorists analysed problems of (under) development from a peace research perspective critiquing both realist security concepts and dominant modernization theories by incorporating the thinking of Third World scholars (*dependencia*, peripheral capitalism), and supporting conceptually self-reliance.

But in both perspectives the environment played hardly any role. The Brundtland Report induced a conceptual reassessment towards 'sustainable development' and after the Chernobyl accident in April 1986, Soviet President Gorbachev (in 1987, 1988) was the first head of state who referred to the global ecological crisis, and as president of the Green Cross he has become a major spokesman for global sustainable development strategies. Stimulated by the Brundtland Report (1987), the concept of 'sustainable development' has been a primary focus of environmental diplomacy since the late 1980's, especially at UNCED in Rio de Janeiro (1992) and at UNSSD in Johannesburg (2002). This third position has been strong among theorists and development professionals in international organizations after the Cold War.

On the relationship between war and peace and development, two main political arguments coexist. The negative economic impact of war on development have been human fatalities, destruction of infrastructure, wealth and capital, devastation of the environment, as well as high indebtedness of the state and high interest rates as a constraint for economic activity. As a result of wars, in post-war periods the economic demand for reconstruction has been in many industrialized countries a stimulus for economic growth, high consumption of fossil energy, and technological innovation. In the South periods of peace, security, and domestic stability have been a major precondition for economic and social development. Since 1990, the developing countries did not experience a peace dividend. Rather, some of the weapons to be disarmed in the North were sold or smuggled to the South where violent internal conflicts have occurred in Africa, Asia, in south-eastern Europe, and in Central America primarily due to greed (drugs, diamonds, timber, etc.) rather than to scarcity of natural resources (SIPRI, PRIO, HIIK, Human Security Centre 2005, 2006), involving warlords and criminal gangs.

In chap. 6, Indra De Soysa assesses the relationship between development and armed conflict and

outlines the beneficial impacts of increasing globalization for peace and security. Contrary to popular opinion, he demonstrates that poverty and conflict are part of a natural resource trap and that the relative abundance of natural wealth affects economic and governance outcomes. He challenges the view that conflicts have increased since the end of the Cold War, and that civil violence within states has decreased quite dramatically in the past decade. Organized violence that was enduring and persistent during the Cold War has given way to what some term the 'residue' of warfare, opportunistic, criminalized violence that is easily addressed with concerted efforts of peace enforcement and traditional policing. He demonstrates that systemic factors underlie the promise for the future, while internal factors related largely to governance and underdevelopment still pose risks. The pre-eminent threat to human security is violent civil conflict, which remains a high impact, high probability around the world, contrary to the low probability, high impact of natural disasters that most human security studies dwell on. In conclusion he identifies policies for mitigating these risks.

3.4.4 Linkage 4: Concepts of Development and Environment

The linkage between development and environment has been stressed by developing countries since the environment summit in Stockholm when many of their representatives called for 'additional' efforts and funding by the North to deal with global environmental issues that were to a large extent caused by industrialized nations since the industrial revolution with the tremendous growth in consumption of scarce resources and fossil energy that resulted in a human induced global warming. The controversy between modernization and critical theories of development since the 1960's was not about the environment. Since the late 1980's the controversies have increased between proponents of sustainable development and those of the neoclassical modernization theory and critical theories on development.

In chapter 7 on 'emergent sustainability' Casey Brown discussed 'the concept of sustainable development in a complex world'. He argues that the preoccupation of the developed world with 'sustainable development' and the lack thereof is perceived by some as a threat to the security of the developed world, in particular global warming is being seen as the most prominent transnational environmental security threat. Brown explores the concept of sustainable de-

velopment and the linkages between economic growth, the environment, and society. Given the uncertainties regarding the future and the complexity of the human-nature system, a new scientific and policy framework is needed. Relying on complexity science he argues that top-down approaches yield unreliable results. He points to a need to provide the conditions that the human-nature system manifests sustainability as an emergent trait that contribute to economic growth and good governance. His chapter begins with a brief review of the concept of sustainable development, followed by an introduction to complexity science. Then, the three key tenets of sustainable development, economic growth, environmental protection, and social justice are evaluated critically for their relevance to the concept of sustainable development and prospects for implementation.

3.4.5 Linkage 5: Concepts of Development and Security

Peter Uvin (chap. 8) reviews the link between development and security: with a special focus on the genealogy and typology of an evolving international policy area. He presents a broad overview of the evolving paradigms of thinking and action at the intersection between development and security. He focuses primarily on major rich countries and on the World Bank and OECD that provide most of development assistance and define the practical terms on which it is given.

From the perspective of development professionals, the chapter analyses when and why they became concerned with matters of security, including the impact of the end of the Cold War and of 11 September 2001 on development policy and practice (genealogy), and what they do (typology) by presenting an overview of operational and policy approaches to the development/security nexus. In the conclusions, the author points to the shrinking intellectual and operational gap between development and security since the early 1990's. This theme is discussed from other perspectives by Katseli (chap. 54), Sending (chap. 48), and by Klingebiel and Roehder (chap. 58).

3.4.6 Linkage 6: Concepts of Security and Environment

The debate on linkages between security and environment has also evolved since the Brundtland Report (1987). Since then, three linkages between 'security' and 'environment' have been discussed: a) impact of

wars on the environment, b) peacetime impact of military activities on nature, and c) environmental problems leading to environmental stress that could, under specific socio-economic conditions, either cause or contribute to natural hazards, distress migration, domestic, bilateral, regional or interregional crises and conflicts that may involve the use of violence and force. Three phases of the debate have been reviewed elsewhere (Brauch 2003, 2005, 2005a), and several proposals for a fourth phase have been made (Dalby 2002, 2002a; Brauch 2003a; Dalby/Brauch/Oswald 2008; Oswald/Brauch/Dalby 2008).

In chapter 9 Dalby focuses on the innovations in the thinking in the early 21st century. He argues that the linkages of scarcity leading to violence are more complicated than was assumed in the 1980's, and that these relationships must be understood in a broader context. The links between violence and environment in conflicts over resources are often matters of political struggles over the control of abundant resources in poor economies. Global climate disruptions may cause more damage to poor peoples than any locally caused environmental disturbances.

The linkages between security and environment are sometimes formulated as a basis for policy initiatives, ignoring the critiques frequently directed at such thinking. Much of the early literature took security for granted and it was closely linked to private property and the protection of the social order that was causing many of the disruptions. The focus of the discussion has shifted and new perspectives emerged. This chapter suggests that political economy and political ecology insights about connections between peoples and places are connecting with analyses of global environmental change so that human vulnerabilities and their causes get a better emphasis. Policy recommendations now focus more on human security and vulnerability, and on the multiple implications of resource wars, rather than on the potential of environmental degradation for causing overt large-scale violence.

3.5 The Four Pillars of a Widened Security Concept

Four conceptual pillars were introduced above emerging from the linkages among the four key components of the conceptual quartet: the classic state-centred 'security dilemma' (3.5.1), and the new people-centred 'survival dilemma' (3.5.2), as well as the concept of 'sustainable development' (see chap. 7 by Brown), and

the related concept of ‘sustainable peace’ (see chap. 5 by Oswald Spring) that were discussed above.

3.5.1 Security and Peace: The State-Centred Security Dilemma

Elements of the ‘security dilemma’ concept can be traced to Kant in his *Treatise on Eternal Peace* (1795). The term was first coined by John Herz (1950, 1959) to interpret the linkage between fear and armament during the bipolar Cold War. After the end of the Cold War, the concept has been used as a key term of security analysis (chap. 40 by Brauch). With this concept John Herz (1950, 1959) referred to the propensity of countries “to acquire more and more power to escape the impact of power of others”, a tendency that has resulted in a vicious circle of mutual arms build-up. Herbert Butterfield (1951) referred to it as a ‘predicament of Hobbesian fear’ or as the ‘Hobbesian’ dilemma. But Herz disagreed with the thesis that mutual suspicion and the security dilemma have resulted in a continual race for power and armaments resulting in unending wars. Herz (1996: 231) defined it as

a social constellation in which units of power (states or nations) find themselves whenever they exist side by side without higher authority that might impose standards of behaviour upon them and thus protect them from attacking each other. In such a condition, a feeling of insecurity, deriving from mutual suspicion and mutual fear, compels these units to compete for ever more power in order to find more security, an effort which proves self-defeating because complete security remains ultimately unobtainable.

Alan Collins (1995: 11–15) pointed to “four characteristics of a security dilemma: uncertainty of intentions, no appropriate policies, decrease in the security of others, and decrease on the security of all”. Jervis (1976: 66) wrote that “the unintended and undesired consequences of actions meant to be defensive constitutes of the ‘security dilemma’”, while Wheeler and Booth (1992) labelled them a “security paradox”, and they considered “insecurity as the central characteristic of the security dilemma” (Ralph 2001: 17–19). In Jervis’ (1982: 361) view “the security dilemma cannot be abolished, it can only be ameliorated,” while Wheeler and Booth (1992: 29) claim that “the theory of security communities and the practice of international politics among liberal-democratic states suggests that the security dilemma can be escaped, even in a setting of sovereign states.”

Wheeler and Booth (1992: 54) argued that with the emerging post Cold War security community “peace is

predictable; the security dilemma has been escaped.” For Czempiel (2002: 31) the security dilemma is no objective result of analysis but a societal and group determined phenomenon that is created by self, world, and enemy images in the tradition of the political culture of the respective country that may reflect both ethnocentrism and ideological fundamentalism. For Czempiel, the security dilemma is no exogenously existing factor in an anarchic international system but the result of “deliberate choices of particular governments” (Wheeler/Booth 1992: 43). For the constructivists the security dilemma is also influenced by domestic politics (Wendt 1992: 402, 1995: 71–81). Czempiel challenges the use of the ‘security dilemma’ by realists as an ahistoric theorem derived from the uncertainty of international anarchy. He also redefined the concept as the product of domestic politics.

3.5.2 Towards a People-centred Survival Dilemma

Brauch has conceptualized a ‘survival dilemma’ from two perspectives: as a state and human-centred concept. Initially he argued that while the three global orders (1815–1989) were primarily based on power legitimized in terms of the *security dilemma*, the emerging new global challenges of the 21st century (Renner 1997: 25–6) may require a new international order based on a Grotian *survival dilemma* (Brauch 1996, 2000) that may necessitate additional multilateral cooperation in international security (arms control, terrorism) and environmental regimes (climate, desertification, water), and in international and supranational organizations. Coping with the new challenges, he argued that the zero-sum games of realist approaches of the 19th and 20th century must be replaced – from a Grotian or Kantian perspective – by non-zero-sum games where all major players should aim at the creation of conditions for the survival of humankind (Axelrod 1984).

Since 2004, he conceptualized the ‘survival dilemma’ within the discourse on environmental and human security as a ‘people-centred’ and ‘bottom-up’ concept where both the old (violence, conflicts, complex emergencies and wars) and new non-military security threats, challenges, vulnerabilities, and risks posed by the causes of global environmental change (climate change, deforestation, soil erosion and desertification, water scarcity and degradation), their impacts (hazards, disasters), and societal outcomes (forced migration, crises, complex emergencies and wars as well as conflict avoidance, prevention and res-

olution) have confronted individuals, families, communities with several unpleasant alternatives (or a dilemma) to stay in their threatened livelihoods and possibly to die from starvation and thirst, or to flee to refugee camps or migrate to the urban centres or overseas to gain better prospects for themselves and to support their families. These two facets of the emerging concept of a 'survival dilemma' try to combine both a top-down state-centred perspective with that of a people-centred human security approach (chap. 40 by Brauch).

3.6 Conclusion: Relevance of the Conceptual Quartet, Six Linkages and Four Pillars for the Analysis of Security

From a European perspective this chapter reviewed the four concepts of the conceptual quartet of peace, security, development, and environment by combining three scientific methods of a) etymology, b) conceptual history, and c) systematic conceptual mapping with an overview of the use of these concepts primarily in the four related research fields or programmes as they have been published in the English language and used in Western political science discourses. Complementary analyses from other cultural backgrounds, intellectual traditions, and disciplines and in other languages are needed to diversify this perspective. These four concepts are used in different contexts in common English language, in policy declarations, and in scientific analyses, and they often may mean different things to different authors, scientific schools and disciplines, which has sometimes complicated the scientific discourse.

The underlying epistemological interest (*'erkenntnisleitendes Interesse'*) and research question has been to try a conceptual mapping to which extent the global contextual change with the end of the Cold War (chap. 1 by Brauch) has triggered conceptual innovations primarily in the concept of security and its three other related concepts of the quartet (peace, development, environment) as they have been analysed by the four research programmes and can be observed for six dyadic conceptual linkages and for four conceptual pillars.

This analysis did not intend nor has it been able to offer simple answers. Rather, this book and the two related volumes on reconceptualizing security all attempt to contribute to an intellectual mosaic of a multi-disciplinary and multicultural mapping of the re-

thinking of security since the global turn of 1989–1990. The changes have been significant as the widening, deepening, and the sectorialization of the security concept illustrate. As this is an ongoing process, where the securitization has shifted from the narrow military focus of the Cold War to many newly perceived security concerns posed by global environmental change, and most particularly by climate change.

Awarding the Nobel peace prize of 2005 to Wangari Maathai, an environmental activist of the Greenbelt movement and in 2007 a deputy environment minister of Kenya, and putting 'human security' and 'climate change' on the agenda of the UNSC in 1999 and in 17 April 2007, are all indications of an ongoing change in the thinking on and use of the 'security' concept in its relationship to peace, development, and the environment. With the securitization of 'climate change' the threat is posed not by 'them' (the other, the enemy) but by 'us' (human beings and humankind alike), by those who have posed the threat by the consumption of fossil fuels that have contributed to anthropogenic climate change (Oswald/Brauch/Dalby 2008).

This requires a fundamental new policy of peace and security where sustainable development and sustainable peace are two strategic components to deal both with the 'security dilemma' among nations (top-down perspective) and with the 'survival dilemma' posed for the most vulnerable and poor people (bottom-up perspective) in the developing countries.

4 Peace and Security: Two Evolving Concepts and Their Changing Relationship

Ole Wæver¹

At least one thing about security seems to be agreed on by most authors – it is something good. In other words, the very term ‘security’ is positively value-loaded. And precisely for this reason much less agreement exists on what clear meaning to attach to that word (Wiberg 1987: 340).

[P]eace researchers and security researchers are relatively close to each other, sharing important dimensions in their analysis or the whole language of the analysis for that matter, only disagreeing on some basic points right at the beginning. There is mutual understanding, but also a feeling that the other party is simply wrong when it comes to those basic assumptions (Galtung 1988 [1987]: 61).

For when they shall say, peace and safety; then sudden destruction cometh upon them, as travail upon a woman with child; and they shall not escape (I Thessalonians 5:3).

4.1 Introduction

‘Peace’ and ‘security’ are closely related concepts. Yet there is strikingly systematic variation in the usage of one or the other. One chapter in this story is also a major element in the histories of ‘peace research’ and ‘security studies’ as intellectual disciplines. During the Cold War, it was widely assumed that mainstream policy research was guided by the concepts of power and security. It was crucial to the self-conception of peace

research to take ‘peace’ as the aim in contrast to that traditional interest. Similarly, there were ‘peace movements’ in the street, rarely ‘security movements’, while governments worried about ‘security problems’, not ‘peace problems’.

During the 1980’s, the re-orientation of much peace research, especially in Europe, was largely a move towards ‘security’ and a rapprochement with strategic studies under this guiding theme. Similarly, strategic studies became re-labelled security studies in many places. ‘Security’ became a meeting point for creative scholarly debates during the last years of the Cold War and the first post-Cold War years. Ironically, peace emerged during the 1990’s as a powerful policy term – this time from the West in the shape of ‘democratic peace’. The politics of ‘power’ and ‘security’ has not stopped creating surprises. In parallel to all of this, the tandem of ‘peace *and* security’ has its own trajectory mostly within the politics of the UN Security Council.

This chapter places this history of peace and security *research* in the larger context of a dual conceptual history of peace and security. The chapter proceeds by asking the following questions: Peace has a long conceptual history (as explored by several peace researchers), but what has been the particular meaning of ‘peace’ in different phases of the 20th century? When could it be invoked for what purposes? Similarly, and much less studied: what has been the historical meaning of ‘security’ and how should we understand the particular 20th century centrality of this concept? Finally: how did the two concepts relate to each other in different periods and contexts, e.g. why is it that the magic formula of the UN Security Council with which it can turn an issue into a Chapter VII matter (and thereby grab extraordinary powers) is to label it a matter of ‘international peace and security’? Many hear this as a typical UN pleonasm, but in the light of the continuous and complex relationship between the two concepts, it is more likely that sense

1 This chapter is an extended remix of “Peace and Security: two concepts and their relationship”, published in the *Festschrift* for Haakan Wiberg; Stefano Guzzini and Dietrich Jung (Eds.): *Contemporary Security Analysis and Copenhagen Peace Research* (London: Routledge 2004b): 53–65. The author appreciates the permission of the editors and the publisher to use parts of the initial text and to develop this chapter further. The new enlarged version is greatly influenced by the unusually penetrating, knowledgeable and inspiring comments from three anonymous reviewers and the series’ main editor.

could be made out of this. Most importantly, such a stereophonic conceptual history can alert us to post-Cold War conceptual shifts and emerging patterns.

The chapter will not be heavily loaded with theory and methodology in relation to the analysis of concepts, but a hint for the particularly interested is 'Skinner-contextualized-by-Koselleck'. Both of these main theories within conceptual history agree that political and social concepts can not be approached as purely analytical questions enabling linguistic 'precision' and thereby better empirical analysis (the role of traditional 'conceptual analysis'), because politics often happens *through language*. Therefore, conceptual history has to be approached as important in itself and as a powerful way to read broader changes, not as something to be 'defined away' by conceptual clarification. The so-called Cambridge school of Pocock, Skinner, and others then focuses on particular 'speech acts' where the importance of a given historical text can be understood by re-constructing its context, that is: by understanding what was changed by a given *move* within the conceptual universe (Pocock 1985, 1996; Skinner 1978, 1988, 1989, 1996, 2002). In contrast, the German school of 'Begriffsgeschichte' led by Reinhart Koselleck, Werner Conze, and Rolf Reichardt has more emphasis on the integration of social and political history, and looks at larger, more gradual changes in contrast to the more point-oriented studies in the Cambridge tradition (Koselleck 1967, 1972, 1979, 2002). There are additional differences – including their privileged historical period and the relationship between synchronic and diachronic studies – and possible synergies, but this will do for now (Richter 1995; Palonen 2002, 2003; Wæver 2006).

As a final methodological note of introduction, it should be emphasized that this chapter focuses on the European/Western history of the concepts. The rationale for this is dual. First, that to do conceptual history, one should focus on *trajectories with actual connections*. Therefore, it is methodologically a very different – and difficult – thing to start saying that there is a concept in say Bengali or Vietnamese for 'the same thing' as security, because this entails to operate with a 'concept-free', de-textualized and free-floating 'idea' that in abstraction can be carried to different places; otherwise it is not possible to talk about 'the same'. Conceptual historians like Skinner, Pocock, and Koselleck have delivered elaborate arguments against this kind of study of 'ideas'. Any assumption of 'the same idea' can be avoided, when the study is organized around the continuous transforma-

tions of a specific concept, where the later concepts evolve out of the earlier.

Obviously, it is extremely interesting to study how different cultures and regions have thought and today think about 'security' and 'peace' (see the very inspiring chapters 11–22 below), but to combine and integrate multiple analyses like this in a methodologically sound way probably demands that one anchors them in the present. That is: *today* these local concepts have all become interpenetrated, because they have influenced each other, and it will therefore be possible in concrete studies to link traditions that emerged independently.

As it will be shown below, the mid-20th century history of 'security' is to a large extent driven by the USA selecting this as key concept, and given the political position of the USA, it spread. However, as argued generally by post-colonial theory, such processes are never simple mimicking, but always more in the form of hybridity. Thus, it might be inexplicable without the US factor, why shifts happened in say Japan (Sato 2000) and Germany (Kaufmann 1970: 71f) to concepts, we translate as 'national security', but these local concepts remained shaped by the imprint on them by local histories and previous conceptual moves.

The second part of the rationale is, that the *purpose* of this chapter is not to provide a comparative overview of different concepts of security and peace, but to show how the history of these concepts shapes current concepts and present politics – and how current politics can be understood in terms of textual moves in the landscape of concepts. Therefore, I need first of all to reconstruct the history that is most important to the main players I focus on for the present due to my own political possibilities and limitations, i.e. debates over theory and policy in Europe and North America. Although, surely politics will be understood better, when we give due attention to non-Western actors even within issues and stories usually presented as played out solely among actors in the North/West (Barkawi/Laffey 2006).

4.2 History of the Concept of Security until 1945

Security seems to be a straightforward concept, and therefore most of the discussion claiming to problematize it² has assumed that the critical part resided in its specifications such as 'national security' vs. 'common security' or 'human security', thereby not necessarily

historicizing the meaning of ‘security’ as such. Simultaneously, the ‘uncritical’ (mainstream, establishment, traditional) literature argued that there is no need to dissect the concept of security as used in international affairs, because it is a concept we know from our everyday experience, where we value it and accordingly should do so internationally (as a state) too.³ However, security as an idea, concept or aspiration is far from stable or simple.

Enter conceptual history. It is often surprisingly revealing to look back at the history of seemingly familiar concepts because they have changed more often and more radically than usually assumed, and at a minimum this should alert us to the specificity, contingency, and political content of contemporary usage. Potentially, it can in addition offer some clues to imprints and linkages still present in current concepts. The history of ‘security’ has been written a number of times – mostly in other contexts than international relations, but always of relevance to it (Winkler 1939; Kaufman 1970; Conze 1984; Delumeau 1986; Schrimm-Heins 1991–92; Rothschild 1995; Osiander 1998; Möstl 2002; Stoll 2003; Wæver 2006; Neocleous 2006).

The words used in English and the Romance languages derive from Roman ‘securus’, ‘se’ meaning without and ‘cura’ worry. When introduced in the 1st

century BC probably by Epicureans and Stoics, it was primarily a *state of mind*, ‘the absence of distress upon which happy life depends’ (Cicero 1971 [45BC]: V. 14, 42 / 466–67; for a helpful discussion of this formative period, see chap. 17 by Arends). It was visibly a negation. Today we tend to think of security as ‘something’ (and its absence as ‘insecurity’), but to Romans a word for insecurity would be a meaningless double negative (Instinsky 1952). Since then, the concept has gone through a number of changes and mutations. Some of the most important are outlined in the following pages thematically along three dimensions (for a detailed chronological survey, see Wæver 2006).

Security has not always been a clearly positive term. Especially to Christians, it was highly ambiguous – only God knows with certainty about your salvation, and for you, human, to be ‘secure’ is presumptuous. Already in ancient Rome, it was more common to find *securitas* on non-Christian than Christian tombstones. The potentially negative meaning was present throughout medieval theological discourse, only to break into the open with Luther and Calvin (Winkler 1939; Delumeau 1986; Schrimm-Heins 1991–92). Mostly, however, this negative meaning did not get attached to *securitas* as such, but to related concepts which made for a complex story of mutual delineation and shifting boundaries of security and its family of concepts. The concept of *certitudo* in particular became a vehicle for gradually developing a modern, unashamedly positive attitude to security.

Another important dimension of change relates to subjective and objective senses of security. Today, we tend to interpret this through a perceptual model, i.e. subjective means perception of the objective. Objective security is how threatened you actually are, and subjective is how you perceive (and misperceive) this. However, the original Roman concept of security does not fit this at all, because especially in Stoic thinking, the state of mind is the crucial level of reality not reductively derivative of or secondary to something more real. It takes a mental effort of most of us moderns to think of objective and subjective in this way. Throughout its conceptual history, security has changed on this axis several times. For two centuries, the concept split into two separate concepts (*sûreté* vs. *sécurité*; safety vs. surety/security; Delumeau 1986: 11–4) only to merge again. This strange ‘episode’ introduced objective security and the subjective/objective complexity led the way to probabilism. A conception of security as future-oriented and defined in terms of probability has been central to the concept ever since.

2 This statement refers to the whole literature starting out in the large 1970’s and gaining momentum in the 1980’s, arguing for new or widened concepts of security – from the ‘common security’ of the Palme Commission (Palme 1982) to various articles “Redefining Security” (Ullman 1983; Mathews 1989) mostly with reference to the environment. This 1980’s literature mostly argued straightforward and in empirical terms for ‘widening’ in order to get a more ‘correct’ security concept, without much reflection on the politics and the sociology of science hereof. The ‘wideners’ (so labelled and discussed in Buzan/Wæver/de Wilde 1998) transmuted in the 1990’s – especially in Europe – into a more theoretical literature organized around various new ‘schools’: Critical Security Studies, Copenhagen School, Paris School, feminism, etc., which sometimes meant more attention to ‘security’ as such, but often stayed at the level of *using* security in discussions between different applications of security. A notable exception, already reflecting on the concept of security as such was *People, States and Fear* by Barry Buzan (1983).

3 This is implicit in most mainstream writings, where it is assumed that we all know what is security is from our everyday experience, and now we discuss how to attain the same at the level of states. This becomes most explicit in some of the more conceptual pieces from within the mainstream: Baldwin (1997).

A final dimension to draw attention to is what we today call the 'levels of analysis' question, or 'security for whom?'. Many would grant that security in pre-modern times meant different (and irrelevant) things – with the birth of the modern state, security started to appear in ways that we can assimilate to 20th century ideas of 'national security', they would say. Yes, the state becomes the centre of security thinking (in the political realm) – but far from the way it is commonly assumed! To Hobbes and other key early modern thinkers, including notably the early liberals, the state is at the centre all right, but security – also to the state – is ultimately *individual security* (Rotschild 1995; Wæver 2006). The right of the individual to self-preservation is the starting point of Hobbes's Leviathan argument. The ultimate meaning and measure of security is individual security, but it is procured through vesting authority in the state.

Before the 20th century, security was not at all a key concept or the organizing centre of international thought. A first step in this direction came with collective security of the inter-war period. The status quo powers used 'security' as their 'watchword' (Carr 1981 [1946]: 105) exactly because it blurred the distinction between national and international. It served to proclaim "an identity of interest between the dominant group and the world as a whole in the maintenance of peace" (Carr 1981 [1946]: 82). Thus, the rhetoric of security in Britain and especially France, used security both at the collective level, where it meant status quo, peace, and anti-revisionism and at the national level, where it meant no compromising with national interests. No wonder that the first (and critical) conceptual history of security was written in the 1930's and by a German (Winkler 1939, published by the Prussian Academy of Sciences).

Today the general image of the historical development is that one always had a policy in the name of national security, and at some point it was argued: the national approach is deficient, let's have collective security. It is rather the other way round: '(in-) security' in some vague sense was a general concern, one word among many to use together with fear, danger, safety, etc, but the politically operative concepts were peace, war, order, and interest; then 'collective security' became a slogan and approach; and 'national security' got established, drawing meaning from the then already established 'collective security'. The conceptual pair 'national security' is more of a reaction to 'collective security' than the reverse.

In the 1940's the concept of 'national security' made a spectacular entrance in the USA and gained

surprising centrality (Yergin 1977). Among the reasons for this swift terminological change were the difficulties of civil-military coordination during World War II, partly reflecting the difficulty of mobilizing the USA for enduring militarized efforts given the US suspicion of 'standing armies'. To handle a long-term geopolitical rivalry with the Soviet Union, the US needed a concept to express an effort with both military and non-military components and justify a policy above normal political vacillations.

The concept entrenched itself in the USA and spread globally – very soon it seemed to have been always with us – probably because it 'borrowed' content from another concept, which had been undermined. The traditional idea that the state in extreme situations had a right to call on necessity and *Raison d'État* (Meinecke 1976 [1923]; Schnur 1975) had become less and less viable in modern democracies. 'Security' took over much of this idea of radical challenges justifying extreme measures. A state has to do what a state has to do – that used to be a valid argument in itself, but with the rise of the rule of law, liberalism, and democracy, this logic of necessity was compressed from a general right to a special case of 'the exception' or 'state of emergency'. It found a new place in general politics in the form of 'national security'.

In the post-war period, security has a particular international-affairs meaning distinct from its everyday sense (and certainly not the product of simply combining 'national' with a trans-contextual 'security'). This is the core of the theory of 'securitization' (Wæver 1995, 1997; Buzan/Wæver/de Wilde 1998; Wæver/Buzan/de Wilde 2008). Internationally (and increasingly in other contexts), the meaning of 'security' is what it does: someone (a securitizing actor) points to a development or potentiality claiming that something or somebody (the referent object) with an inherent right to survive is existentially threatened, and therefore extraordinary measures (most likely to be wielded by the securitizing actor himself) are justified, measures such as secrecy, violence and conscription, appropriate for 'matters of security' only. By this move, an issue is lifted above normal politics and attains urgency and precedence. This facilitates easier action but also de-politicization domestically and an increased risk of vicious circles (security dilemmas) internationally, because the actor freed from constraints becomes more threatening to others, not least to the one that is assigned the quality of threat. That something is a security issue means it is too urgent and dangerous to be left to normal politics – it needs to be ad-

dressed through the logic of necessity and extraordinary measures.

4.3 History of the Concept of Peace until 1945

If we follow the same trajectory as for ‘security’, i.e. from Rome through West and Central European history to include North America and eventually a Westernized world, we again have to focus on first the interplay between Roman and Christian ideas and then the impact of the modern state. The Roman *pax* was a concept of absence of violence through order and unity based on the power of the centre (Galtung 1981: 187). *Pax Romana* included no *accommodation* with others; it was based on acceptance of hegemony (Oslander 1998).

In the Middle Ages, most developments took the form of modifications of a set of Augustinian differentiations within peace. True ‘peace and justice’ entailed an orderly world with everything in its proper place – and after the Fall this was not possible on Earth. Here we could only aspire for *pax temporalis* in distinction to *pax aeterna* in the hereafter (Janssen 1975: 548ff). (In one of the later moves, *pax temporalis* would be contrasted primarily to *pax spiritualis* as two worldly forms representing roughly political and church matters and thereby shifting attention increasingly to inter-human affairs; Janssen 1975: 551.) Among earthly peaces, one should distinguish between *pax vera* and *pax falsa*, because *Christians* after all would and should aspire for a better peace than the heathens – a just peace.

For the remaining part of the period until 1945, I will mention only the two most important shifts.

First, internal peace was ‘assured’ with the Hobbesian Leviathan. Civil war had been the dominant peace question for centuries, and when this concern retreated, peace became a domestic reality in terms of ‘public quiet and security’. The core meaning of peace accordingly moved towards external security during the 18th century (Janssen 1975: 564f., 586).

Second, the enlightenment introduced a systematic hope for peace in the sense of ruling out war from the social order. Michael Howard’s *The Invention of Peace* (2000) starts off with a mid-nineteenth century quote from Sir Henry Maine: “War appears to be as old as mankind, but peace is a modern invention” (2000: 1). Howard argues:

The peace invented by the thinkers of the Enlightenment, an international order in which war plays no part,

had been a common enough aspiration for visionaries throughout history, but it has been regarded by political leaders as a practicable or indeed desirable goal only during the past two hundred years (Howard 2000: 2).

Reason both demanded peace and promised the means for its realization. A realm of law and reason would exclude its antithesis, war. In most peace plans, it was not enough to ask gradualistically for increasingly sensible policies: a once-and-for-all switch had to be found if peace should be credible and stable. A correctable error in human society had to be located. The political order was a prime candidate with the expectations that republics (later: democracies) would produce peace, and some would emphasize the economic order where a shift from mercantilism to free trade would ensure peace. Peace through perfection became an aspiration for centuries to follow.

The ‘ceasefire’ of negative peace⁴ could not be the central object of the thinkers of the Enlightenment and liberalism. Although valuable as such, an unstable vacillation between war and peace was still an affront to reason. With their optimism about progress, they naturally set ‘perpetual peace’ as the important – and realizable – aim (Janssen 1975: 586f).

This vision of *pax aeterna* on earth became possible only when secularization had freed political thought from the remaining constraints of the Augustinian categories. Yet in another sense, secularization far from implied a departure from these ideas, but rather their rearticulation as categories internal, not external, to this world (Janssen 1975: 544f, 567ff).

The French Revolution showed how possession of the key to peace naturally leads to a thinking in terms of just war and interventionism along transnational political lines (oppressed vs. oppressor) (Janssen 1975: 573–5; Herz 1950). Self-righteous ideas about our side having or being the key to peace while the opponent

4 The terms ‘negative peace’ and ‘positive peace’ stem from the Norwegian peace research pioneer Johan Galtung. It does not mean ‘bad’ and ‘good’; the idea is basically, that negative peace is defined purely negatively, by what it is not, i.e. the absence of violence. Positive peace is social justice. Positive peace eliminates the root causes of war and violence. They were hardly present as two separate concepts much earlier, and therefore it is a consciously anachronistic observation to ask here whether a concept like ‘negative peace’ could be thought at that time. As the history here shows, the concept of peace emerged out of a quite ambitious basically ‘positive peace’-like concept of general order into an increasingly narrow concept of non-war, and this enabled the Galtungian clarification of the two concepts (Galtung 1964, 1969).

is inherently incompatible with peace leads straight into the 'nationalistic universalisms' which Morgenthau (1948) deemed a main cause of conflicts and diplomatic inflexibility. In policy talk, peace often ends up as an argument saying "We are peace; they are war" - and as a result, 'peace' is often the most violent concept.

Both negative and positive peace *can* de-politicize similarly to the securitization act. Negative peace did so when war (partly as a consequence of technological developments) became defined as absolute evil. Positive peace did so when it was tied to a model of the perfect society (democracy, free market or socialism) fixed through extra-political (scientific?) means (Wæver 1996). In practice, peace discourse often worked to *politicize* because of the intricate multiplicity of meanings and the affinity between the establishment and war.

4.4 Interim Conclusion: Interplay of Security and Peace Prior to 1945

- Security and peace have usually been linked positively but often distantly, and their hierarchy has changed several times. Only with the modern state did they become closely tied together in one coherent package (Oslander 1998).
- During the Middle Ages, security was not a key concept, and when it slowly emerged as a political concept, this happened under the ascendancy of the concepts of peace and justice.
- With the modern state, however, the realization of domestic peace - often conceptualized as security - transformed the concept of peace towards an international problematique. To some extent 'security' (although not in our mid-20th century meaning) came to define peace.
- A distinct international concept of security took shape in the first half of the 20th Century, first as collective security, then national security. Peace during this period took on an air of desperation - at once more codified than ever culminating in war being ruled illegal, and simultaneously out of touch with troubled times in great power politics. Security became the operational concept, and gained momentum from the 1940s when it picked up the exceptionalist logic orphaned by the death of explicit 'raison d'Etat' justifications.
- Both peace and security hold histories far richer than what became tied into the modern package. Each had connections to other spheres and mean-

ings, but when they met, they were usually seen as constructively connected. The Cold War was different, because peace and security were played *against* each other to an unusual extent.

4.5 'Peace' and 'Security' during the Cold War

The Cold War section will focus on three elements: understanding the formula of 'peace and security' and its prominence in the UN system (and consequently in international law), looking at the East-West configuration in relation to peace *versus* security, and finally understanding what happened in the 1980's (which has a special self-reflexive meaning to the present author, the context he used to work in: the *Copenhagen Peace Research Institute* (COPRI), and to a considerable extent to the new critical theories of security in general).

The Cold War constellation is confusing because, on the one hand, a formula of 'peace and security' is prominent in international law and the UN, and on the other hand, the concepts of peace and security politically were far from interchangeable because only peace *or* security would be meaningful in the political language of one Cold War party.

4.5.1 'International Peace and Security' at the UN i

The charter of the UN uses the term 'international peace and security' frequently - probably adopted from the preamble of the Covenant of the League of Nations. "Nowhere in the Charter is the term 'international security' used alone, whereas the terms 'peace' or 'universal peace' can be found separately" (Wolfrum 1994: 50). 'Negative peace' is central because the main aim of the UN is to avoid (international) war. However, the broader aims of human rights, friendly relations among states and economic development, can be seen as a broad-based view of the causes of war or as 'positive peace'. 'Security' in turn is not used in terms of 'national security' but as 'international security'. International security does not negate national security; rather, it contains the assumption that true national security can only be realized as international security, while international security aims not at securing something international but at providing national security in a healthy way. This is a usage of the term 'security' largely in the inter-war meaning.

In one important respect, the UN construct does draw on the Cold War era meaning of security, its speech act function, even if not its national focus. The central operational mechanism of the collective security system is the ability of the Security Council to transform issues by enunciating the magic formula of “a threat to international peace and security” (Art. 24; Art 39 speaks of the obligation of the SC to “determine the existence of any threat to the peace, breach of the peace, or act of aggression”). The SC is openly given extraordinary powers here. Firstly, the consequences of ‘determining’ the existence of such a threat are momentous, truly transforming a given crisis. Not only can punitive actions be enabled, they can be made obligatory for states, and the ‘target state’ for these actions (‘the aggressor’) is deprived of the instrument of decrying interference in internal affairs and violations of its sovereignty, because in such chapter 7 actions, the Security Council acts with the authority invested in it by the collective exercise of states’ sovereignty and thus expresses the sovereignty of the state. Secondly, because most legal scholars agree that the formulation ‘threat to international peace’ is open to a dynamic interpretation, i.e. to include civil wars or even grave violations of human rights, even though traditionally it was quite clear that the notion presupposed “the objective existence of a threat of aggression by one state against another or a real risk of international armed conflict in some other form” (DUPI 1999: 62). Thirdly, the exercise of this labelling power by the SC is not to be scrutinized by any other organ. Legal scholars have contemplated whether the International Court of Justice should have some kind of overseer’s function of gauging the ‘constitutionality’ of such acts by the SC – usually concluding that this is not a viable road (Fassbender 2000). Because the capacity is self-referential, widening security implies strengthening of the SC (Koskeniemi 1995).¹

In conclusion, the anomalies of the UN compared to other discourses stem partly from importing inter-war language, partly from establishing ‘speech act powered’ security in parallel to the dominant function for the states, but centred on the Security Council. In this context, peace and security operate as a formulaic joint set.

4.5.2 Peace in the East, Security in the West

Otherwise, the concepts of peace and security were increasingly torn apart by the East-West split. Probably, a precondition for this was a weakening of the,

until then, seemingly simple concept of negative peace. The Cold War blurred the concepts of war and peace as famously captured by Raymond Aron: ‘peace impossible, war unlikely’ (Hassner 1997 [1995]: 14; Stephanson 1996).

Increasingly, security came to take the place of peace in the traditional sense of war prevention (Jahn/Lemaitre/Wæver 1987: 39). Security settled in between peace and peace, between negative and positive peace (Jahn/Lemaitre/Wæver 1987: 43f.).

However, as the Cold War unfolded, a split emerged between the terminology of ‘East’ (and Western critics) and ‘West’.⁵ The East was more inclined than the West to use the concept of peace, which consequently gained a ‘communist’ ring. The Eastern side was both comparatively less inclined to use ‘security’, which had no foundation in the theories of Marxism-Leninism (e.g. the authoritative *Reference Index to V.I. Lenin, Collected Works* contained several pages of references to ‘war’ and ‘peace’ but none for ‘security’; Jahn/Lemaitre/Wæver 1987: 71, note 63)⁶ and more inclined to use ‘peace’, paradoxically both positive and negative peace. Positive peace came natural to the East, which had more openly a philosophy of history and thus a basis for a vision about long-term

5 Seen from the third world and mobilized mostly through the non-aligned movement, both concepts were useful strategically as part of a ‘third party positioning’: peace as the larger, more programmatic basis for principled arguments and thereby useful in the recurrent pattern of cooperation of the Soviet bloc with the third world for instance in UN organs; and security was useful mostly at the ‘unit level’, i.e. pointing to the kind of security problems relevant to third world situations (Ayooob 1995). Both slogans could be adopted by the South and to some extent played back at its senders in respectively the East and the West. Most characteristic of third world approaches was probably a ‘positive peace’-like logic of development as precondition for long term stability and security. During their heydays of ‘New International Economic Order’ in the 1970s, the issue of *development and disarmament* became established in the UN system. The 1980 report from the Brandt Commission (Brandt 1980) aimed at showing the self-interest of the North in development for the South, and consequently development was cast as an issue of ultimate security interest - in a wider sense - thus paving the way for the new security theories of the 1980s.

6 Nor - as we saw above (cf. Wæver 2006) - was ‘security’ in its Cold War meaning actually a well established theoretical term in the West (although it was believed to be), but this was less of a problem in a less text-based political culture.

full peace. At the same time, the East was diplomatically more conservative and thus inclined to support negative peace. In relation to the political situation in Europe, the East aimed at a stabilization of the status quo to sanctify the outcome of World War II, especially the division of Germany and the re-drawing of borders around Poland and the Soviet Union.

The West was much more inclined to talk 'security', because of problems with both positive and negative peace. Positive peace was difficult because the West during the Cold War toned down its philosophy of history and its evolutionism, and thus removed the basis for a concept of eternal peace. As we see now after the end of the Cold War (cf. the next section), the West certainly *has* a theory of positive peace (primarily democratic peace, but also other strands of liberal and enlightenment thought), but so-called 'Cold War liberalism' stressed that in opposition to the dogmatism of totalitarianism, liberalism was without ideology, ultimate meaning of history, and excessive societal voluntarism based on scientific certainty (Arblaster 1984: 299–332). Such scepticist liberalism was not well equipped to embrace an idea of ultimate, complete peace. The West also had problems with negative peace, because, more vulnerable than the East to domestic opposition, Western elites feared that the nuclear threat would lead to appeasement à la 'better red than dead'. Therefore, the West tried to fight the idea that negative peace should be an absolute aim.

Security became the watchword of the establishment in the West. In the world of academe and not least policy research, this split reproduced itself as one between strategic studies (security) and peace research.

4.5.3 The 1980's: Redefining and Repositioning

This pattern changed in the 1980's. During what was then called the 'second Cold War' with the rise of peace movements especially in Western Europe aimed at preventing the deployment of new intermediate nuclear missiles, the intellectuals of and around the peace movements – including much of North European and especially German peace research – tried to adopt the term 'security', which had previously been a monopoly of the mainstream. This was controversial within peace research, because, being associated with the autistic syndrome of deterrence and arms racing (Senghaas 1969, 1972a; Guzzini 2004), security had been seen as part of the problem, not the solution, by 'orthodox, critical peace research' since the 1970's.

'Real peace researchers' worked under the banner of peace, not security, the Third World and not Europe, and ultimately saw the solution in the fields of development or cosmology, not security policy. But both social-democratic intellectuals and many peace researchers linked to the peace movements tried to avoid the radicalism of 'peace' and 'disarmament'. This probably stemmed in part from that fact that these reformists actually believed in their own securitization of the nuclear danger, and therefore it seemed irresponsible to abstain from all partial change with the argument that only by leaving the track of Western, exploitative, patriarchal, growth-oriented, materialistic capitalism all together could peace be achieved in a decentralized, autarchic, green, gender-balanced, Buddhist alternative society based on holistic, spiritual values. Although the relationship between the peace movement and peace research was never an easy or harmonious one (Jahn 1983), the fact that a powerful peace movement existed at the time, meant that peace research faced questions of 'policy relevance' largely parallel to those often debated within mainstream scholarship in relation to policymakers of the state. Individual scholars can choose more or less close or distanced relationship to policy as such, but the fact that the situation was open to critical ideas transformed the intellectual game, making it more difficult to take exclusively extremist positions of despair and total transformation.⁷

The reformists, in contrast, tried to move closer to the mainstream by picking up the term security, but redefining it. Much of the 'redefining security' business stems from this move. New concepts like 'common security' and 'security partnership' (and non-offensive defence⁸) were introduced, and security itself was to be widened beyond its military constraints. Some of the radicals occasionally took to the task of redefining security too (partly as a reaction to the re-

7 It might even be argued that the dynamic of movements like the peace movement demands a dualism of radical activists and reformist scholars or policymakers (Wæver 1989, 1997: ch. 6). The movement creates rupture from without through forms of politics (marching in the street) and languages (peace instead of security) that ultimate play on the metaphors of revolution and people power. However, this ability to challenge and frighten the meaning system of the establishment by transgression, also makes the movement mute on the inside of the system – it speaks the street speak of peace. It is therefore crucial that the direction of its impetus is guided by reinterpretation within the language of security – thus the dualism.

formists?) and this led to some of most extreme widenings in the history of security thinking (Galtung, Øberg).

Security became a battleground. The so-called 'widening security' debate is often referred to as an academic debate – whether the wide or the narrow concept is 'correct', and whether widening spoils the analytical usefulness of the concept by making it blunted (Walt 1991). However, the debate was first of all a political struggle. Should e.g. environmental issues attain the prominence and urgency implied by 'environmental security'?

Still, the peace movement was a *peace* movement – even in the 1980's. This conceptual non-accommodation (i.e. not becoming a security movement) befitted radical opposition. The word from the street was 'peace' exactly because it was shocking in its meaninglessness within Western mainstream thinking on international affairs, just as the form of the movement – masses in the street – was threatening in the political culture of Western liberal democracy. Both constituted metaphorical violence, with the advantage of shaking the edifice of the security state, but with the disadvantage of not being able to talk with it, and thus a tension-ridden dualism emerged with a movement talking peace and its intellectuals talking (reformed) security (Wæver 1989).

This mood of the early 1980's was well captured by Barry Buzan in a 1984 *Journal of Peace Research* article arguing that security was the inclusive middle-

ground avoiding the extremism of peace (peace research) and power (IR realism and parts of strategic studies).

My own thinking was shaped by working for 13 years at the Copenhagen Peace Research Institute, COPRI. It was created in the mid-1980's against the background outlined here. It was a child of the 1980's. Most other peace research institutes in Northern Europe had been set up in the 1960's and 1970's, but Denmark being a latecomer to this, COPRI so to say avoided the 'conservatism' of old school peace research and the suspicion against the 'new realism' of security oriented peace research. It was set up, revealingly, with two projects aimed squarely at the 'rethinking security' agenda, one on non-offensive defence in Europe, and one on 'non-military aspects of security in Europe'. Through the work of mostly Anders Bose-rup and Bjørn Møller, the Institute made major contributions to the non-offensive defence literature, and the other main project can roughly be said to have evolved – under the leadership of first Egbert Jahn, then Barry Buzan – into what is now known as 'the Copenhagen School' within security studies (cf. chapters 1, 3, 22 by Brauch, chap. 41 by Buzan, chap. 45 by de Wilde and chap. 44 by Wæver)⁹. While COPRI was never very 'peace research'-like as prejudices go, it was not only because it got a tolerant and non-sectarian first director in Håkan Wiberg, but it was also because it was formed at the height of this neo-security wave within peace research. It therefore came to epitomize this pattern more than most other institutes. Or the causality is in the opposite direction: I tell the story the way I do in this chapter because I am a child of COPRI.

8 In the 1980's, peace researchers especially in Germany but also in e.g. Denmark, Sweden, and the UK worked on devising 'alternative defence', 'non-aggressive defence' or 'non-offensive defence'. Although the focal concept here was not security but defence, the *organizing* concept was in many cases security, typically in the form of common security and the theory of the security dilemma (Herz 1950; Jervis 1976). The idea was to break the typical pattern of insecurity, arms races, and deterrence, by ensuring that both parties felt secure with a defence strong enough compared to the offence of the other side, but in a form that did not create insecurity for the other, i.e. a defence tailored truly as defence. By ensuring stability at the conventional level, much of the impetus would be removed also from the nuclear system which was partly driven by at least rhetoric of propping up insufficient Western defences against Soviet conventional superiority (Boserup 1986, 1988). The best overviews of this whole literature are found in Møller 1991, 1992. Through networks like Pugwash, these ideas entered the Soviet 'think tank' circles (the institutes) and it is often claimed that they had decisive influence on the formation of Gorbachev's 'new thinking' (Risse-Kapen 1994; English 2005)

9 Beyond these two original projects, many other significant developments took place at the institute including the work around Pertti Joenniemi on Baltic regionalism, Hans Mouritzen's theories of small state adaptation, work by Ulla Holm, Lene Hansen and others on national identity and foreign policy, etc. COPRI was de facto closed, technically merged into the larger semi-official DIIS, the Danish Institute of International Studies, a think tank with closer ties to the foreign ministry. About COPRI, see: Guzzini/Jung 2004 and the cumulative publication lists on http://www.diis.dk/graphics/COPRI_publications/COPRI_publications/publications/wor kingpapers.htm; http://www.diis.dk/graphics/COPRI_publications/COPRI_publications/publications/14-2000.doc.

4.6 'Peace' and 'Security' after the Cold War

After the end of the Cold War, peace reappeared as a Western concept. The 'absolute' concept was revalued when it seemed closer to realization. With the 'end of history' in sight, liberalism mutated back from scepticist, Popperian Cold War liberalism to the more evolutionary and optimistic belief in its own truth. When the task of the West changed from fighting a Cold War to building a 'new world order', it suddenly remembered that it actually had a long-term vision of peace as democracy (and/or liberalism) (Rasmussen 2001a; Williams 2001).

President Bush senior declared in 1989 'Once again, it is a time for peace' (quoted by Rasmussen 2001a: 341). The famous 'New World Order' speech at the end of the Gulf War (6 March 1991) was phrased mostly in terms of peace - 'enduring peace must be our mission'. President Bill Clinton made the theory of 'democratic peace' a guideline for policy. NATO enlargement is so hard for Russia to oppose because it is presented apolitically as the mere expansion of the democratic peace community, i.e. as something apolitical and inherently 'good' (peace), thereby pre-framing any critic as self-exposing old-fashioned 'power politics' (Williams 2001)¹⁰. The 'war on terror' after 11 September 2001 has surprisingly few references to either peace or security - note the name 'Operation Enduring Freedom' - but President George W. Bush's address on 7 October 2001 ended with 'Peace and freedom will prevail', and the (in)famous 'axis of evil' was presented (29 January 2002) in terms of a 'threat to peace'. Peace has become the overarching concept within our duo.

At the level of policy, 'security' in turn is possibly being transformed by an increasing interaction with the concept of 'risk'. Society's reflections on itself are increasingly in terms of risk (risk society). More and more dangers are the product of our own actions, and fewer and fewer attributable to forces completely external to us - thus threats become risks (Luhmann

1990; Beck 1992; Bauman 2001; Giddens 1991; Evers/Nowotny 1987; Douglas/Wildawski 1984). This goes for forms of production and their effects on the environment and different social groups, and it goes for international affairs where it is hard to see the war on terrorism as a pure reaction to something coming to the West from elsewhere. Western actions in relation to Middle East peace processes, religion, migration, and global economic policy are part of what might produce future terrorism. The short-term reaction to the 11 September attacks on the US in 2001 might be a re-assertion of single-minded aspirations for absolute security with little concern for liberty and for boomerang effects on future security (Bigo 2002), but in general debates the 'risk' way of thinking about international affairs is making itself increasingly felt (Coker 2002; Rasmussen 2001a, 2001b, 2002, 2006; Beck 2002; Spence 2005; Aradau/van Munster 2007; Petersen 2006; Heng/McDonagh 2007; Williams 2007). We have seen during the last 20 years a spread of the originally specifically international concept of security in its securitization function to more and more spheres of 'domestic' life, and now society takes its revenge by transforming the concept of security along lines of risk thinking (Wæver 2006).

While it is tempting to tell this novelty in terms of a *shift* from security to risk, it is worth noting that 'security' simultaneously has gained in standing and reach. In the shadow of the falling twin towers in 2001 and the ensuing 'global war on terror', 'security' has risen to a new centrality in public policymaking. Projections of possible global epidemics and environmental mishap are among a number of issues now framed as security concerns. With the increased 'demand for security', the practice field escapes its classical confines (Bigo 1996, 2000, 2001, 2002, forthcoming). Military security increasingly focuses on terrorism, which does not respect the traditional distinction between a state's external and internal security. Military operations often turn into policing abroad. Intelligence agencies oriented towards domestic and foreign challenges overlap more and more. Migration is often cast as a security issue, equally conflating internal and external: police, border control, the fight against international organized crime and in some cases inter-civilizational conflict. Issues like the environment, food safety, pandemics, bring in areas of expertise far beyond the traditional security studies field. Risk-assessment in relation to energy, industry, transportation, and health enter national security under the heading of 'critical infrastructure protection'. Economists analyse risk at different levels of analysis,

10 This blackmail against Russia was re-played in 2006-7, when Russian opposition to US unilateralism in general (Putin's big Munich speech in February 2007) and to American missile defence plans in particular were handled in the Western press almost uniformly in terms of what silliness or bad habits led Russia to re-create the Cold War, not in terms of possibly legitimate objections to a US world order strategy that increasingly floated as military practice void of political legitimization since the decline of neo-conservatism (Wæver 2007a).

but face challenges e.g. in relation to terror to the relationship among the categories of uncertainty, economic risk, and political risk. Each of these areas assesses, measures, and compares something like risk, danger or threat, but they do it in different ways. All of them are based on or closely tied in with academic disciplines, and they are no longer separate. Notable about this whole development is, that from policy-makers and research planners, all of this is increasingly dealt with under the rubric of 'security' (see for instance the agenda for research in 'security' under the EU's 7th Framework Programme to begin in 2007).

Multi-disciplinarity will be the heart of the next phase of theory in security studies (Wæver 2007b). Multi-disciplinarity not as a nod of political correctness questioning all disciplinarity as limiting, but as a necessary translation exercise among disciplines which are already placed together as elements of an expanded security field. *'Security' is today a thoroughly inter-disciplinary challenge, where different academic fields already are co-constitutive of different parts of security as a practice field.* Rationalities and theories from different disciplines are built into the way society handles different challenges: from economic risk analysis over technical system assessments to military threat analysis. Inter-disciplinary work is needed to keep up with actually ongoing transformations in the social construction and handling of threats, risks and security, and even if the different disciplines tried, they could not protect the purity of their independent objects of analysis, because the different rationalities are already intermingled.

While risk theory certainly seems to have a lot to offer in terms of understanding both bureaucratic issue management and the nature of issues, from a policy perspective it seems that much is still integrated into an expanded security agenda. To what extent this means a basic change of the underlying 'security rationality' (Huysmans 2006) that carries the securitization speech act function of security, remains to be seen, but it seems that security will remain the dominant concept for discussion and prioritizing of dramatic challenges, including the possibly more and more pressing issue of how to mediate and measure the two main areas of terrorism and climate change.

Another, and partly related, development in relation to 'security' is the consolidation of the concept of 'human security' especially in UN-related diplomacy (Alkire 2002; Suhrke 1999; Khong 2001; Burgess/Owen 2004; de Wilde 2007). The concept as such is introduced and discussed elsewhere (see

Brauch/Oswald Spring/Grin/Mesjasz/Kameri-Mbote/Behera/Chourou/Krummenacher 2008), so suffice it to notice here that the heart of this conceptual innovation is a close linkage between development and security (For an excellent critical analysis of 'human security' as practice, see Duffield/Waddell 2004). While at first the concept appears – and usually is meant to be – a progressive shift from security in the interest of states towards caring for real people, the effect of the slogan might well be to feed into the above discussed general formation of an ever wider remit of 'security' as a form of governance, and thus a foundation for addressing more and more aspects of global life through the problematic lens of security.

Where 'peace' has returned to the West as a grand ideological framing concept of world order policy and ultimate solutions, 'security' has become the organizing concept for an ever growing part of social life organized through emergency policy and extra-ordinary measures.¹¹ Possibly, it could be argued that the third concept, 'risk', is increasingly important for the *mode* of thinking about threats and dangers.

To round off the policy level, it is also necessary to look at the practices in the UN system in relation to 'peace and security', but this can be done briefly due to the meticulous chapter 35 by Bothe in this volume: It corresponds to the development in the concept of security in general, because the UN Security Council has expanded the area of applicability for 'threats to international peace and security' and thereby increased the number of global situations that poten-

11 In contrast to the political theory literature on 'permanent state of exception', the securitization perspective has the advantage of looking at issue specific exceptionalism. Although the US from 2001 to ca. 2006 was in a situation where a general climate of vague and general danger enabled violation of normal procedures in area after area (torture, wire tapping, etc.), the legitimacy of this has clearly been worn down (at least as long as a new attack like 9-11 does not happen), and other Western societies have been far more careful. Therefore, to focus on 'state of emergency' or general exceptionalism is problematic and leads into an unhelpful trap, where either one argues that this has been introduced and thereby loses a critical edge against specific measures (all is already lost anyway), or it is argued that we do not have this emergency and this plays down the very real infringements. Therefore, securitization is in most cases a more helpful perspective than 'permanent state of emergency', since it alerts us to the political struggle at each particular step as well as the very real dilemmas about whether to securitize or desecuritize for instance climate change.

tially come under the particular management though security of UNSC action through Chapter VII authority. Threats as direct inter-state conflicts have been expanded to include predominantly internal conflicts and humanitarian crises as threats per se (see chap. 35 by Bothe). AIDS has been labelled a security threat too, without however implying – so far – enforcement under Chapter VII. The fight against terrorism, in contrast, has moved after 11 September 2001 into the area where not only the terrorists and direct support of them are condemned, but specific actions against terrorism are mandated through Security Council decisions. Most recently, climate change was placed (by the British presidency) on the UNSC agenda for a first discussion on 17 April 2007, and although this was very far from creating support for any Security Council action, it is worth noting that in principle there is nothing that prevents the UNSC from in the future designating climate change ‘a threat to international peace and security’ and then enforcing e.g. global rules for CO₂ emissions (Penny 2005).

Academically, this general picture of what happens to peace and security helps to understand the development of peace research and security studies.

‘Security studies’ and ‘peace research’ were shaped in important ways by the particular Cold War context, though not the way it is often implied in fast politicians’ statements about the post-Cold War irrelevance of peace research. ‘Peace research’ and ‘security studies’ (or rather ‘strategic studies’) meant respectively to oppose or to accept the official Western policy problematique. Today, it is the other way round. ‘Peace research’ might be dated because peace is so apologetic as to be intellectually uninteresting, while ‘security’ is potentially the name of a radical, subversive agenda.

Peace research has run into something of a crisis for a number of reasons. One has to do with its association with positions and debates from the Cold War, and another with its meta-theoretical problems. Peace research was predominantly sceptical to new post-structuralist and constructivist approaches in the 1980’s, where they started to find their way to the International Relations discipline. This was somewhat ironic, given the implicit constructivism in both much of the early to middle Galtungian conflict theory and the parallels in German peace research à la Senghaas with later constructivism (Guzzini 2004), but in the situation the disciplinary leaders in peace researchers generally rejected the new radical approaches for much the same reasons as the old guard tried to do it in IR (alleged relativism, over-focus on language at the

price of ‘reality’, etc). The result was that much of the theoretical innovation that partly came out of peace research ultimately came to be seen more as International Relations and/or Security Studies than peace research. Even innovative work on peace and violence coming from the new approaches, such as Vivienne Jabri’s book *Discourses on Violence* (1996), were not given as much attention in Peace Research as in IR. As often is the case, creativity happened at the inter-disciplinary interstices of disciplines, but the more rigid gate-keeping in peace research made it less dynamic as a field than it had deserved, due to what it actually generated. Finally, the fate of peace research probably had a lot to do with the evolution of peace:

Peace was clearly an oppositional term in the West – and South – where most of the peace research took place during the Cold War. After the Cold War, peace became a much more problematic term because the establishment in the West suddenly claimed to represent the supreme policy of peace. This tended to drive peace research in the direction of either partaking in mainstream research like quantitative studies on the democratic peace theory (reinforcing thereby the meta-theoretical traditionalism mentioned above), or into accelerating radicalism and alternativism pointing towards culturalistic negation of Western society. In principle, this situation could allow also the possibly more promising strategy to exploit the inner paradoxes of the democratic peace (see Geis/Brock/Müller 2006), but so far the new concept of peace has mostly caught peace research off guard and contributed to a generally difficult situation.

Security studies in contrast went into a relatively productive period from the mid-1990’s and the following decade. The issue is too large to cover here – and has been treated elsewhere (Wæver 2004; Wæver/Buzan 2007; Buzan/Hansen forthcoming), but security studies entered a theoretically productive phase, which took the form of two relatively unconnected tracks. Mainstream security studies anchored in the US had a set of industrious debates, where general International Relations theories with security focus were tested on historical case studies oriented towards relevant knowledge about current policy challenges for especially the US. Simultaneously, a more critical type of security studies evolved primarily in European journals and mostly European research institutes. For reasons partly explicable through a combination of sociology of science (Wæver 2007c; Wæver/Buzan 2007) and the different world political perspectives from the US and Europe (Buzan/Wæver

2003), these two streams diverged to the degree that many participants in one form of security studies are unaware of the other kind.¹²

The European part is probably most relevant to introduce here, because it most clearly links to the debates on the concept as such. As nicely captured by Jef Huysmans (2006), the ‘widening’ debate of the 1980’s to 1990’s had really been two kinds of debate. On the one hand were those who were concerned for the effect on the concept of security if say ‘environmental security’ and ‘societal security’ were included as security (Walt 1991). On the other hand were those who pointed to the possible detrimental effects on the environment, migrants, and ethnic identity issues if these were being dealt with in the perspective of security (Deudney 1990; Wæver 1995). It was the former that structured most of the debate for and against widening, but as this debate evolved into new theories and perspectives of a more constructive nature – Critical Security Studies, Copenhagen School, Paris School, etc. (see Krause/Williams 1997; Buzan/Wæver/de Wilde 1998; Bigo 2001, 2002, forthcoming; Huysmans 2006) – the second debate became more central: What is it we are doing to issues when we turn them into security issues? Who do this and how? What is the role of the public political process versus specialized security agencies like police, military, intelligence, and customs (Bigo 2002, forthcoming; Huysmans 2006; Diez/Huysmans forthcoming)? What is our own role as security analysts in the light of this understanding of the nature of ‘doing security’?

This evolving theoretical field of family-related ‘schools’ in productive exchange (and with numerous individual studies drawing on elements from two or three different schools/theories) corresponds well to the evolution of the practice fields as a growing governance of still more issues through security.

Currently the theoretical landscape is made up of several schools, but this should not be taken as a battleground between incompatible perspectives with clear and fixed boundaries, but rather as a general intellectual space with discernable social nodes as well as some distinct theories. Probably the previous triangle of “CSS, Copenhagen and Paris” has gradually changed, because CSS has failed *as theory*, has proven unable to generate much of helpful analytical instruments, and in its place is a general ethical obligation

to think about political responsibility, and in the policy world ‘human security’ largely fills the place of CSS. In the theory debates, a triangle has rather emerged of Copenhagen, Paris, and political theory about the nature of the political (inspired partly by R.B.J. Walker partly by neo- or post-Schmittians reflecting on exceptionalism). Jef Huysman’s recent book *The Politics of Insecurity* as well as the ‘manifesto’ by a group of mostly young security scholars under the name ‘C.A.S.E.’ Collective’ (CASE 2006) represents a kind of dynamic synthesis of these three schools.

As suggested above, another likely tendency for the evolution of security theory ‘European style’ is an increased emphasis on inter-disciplinarity. As the new field of security practice increasingly integrates forms of knowledge and rationality coming out of economists’ risk analysis, safety analysis in fields like traffic, health and infrastructure, sociologists’ risk theory, lawyers reflecting on emergency and exceptionalism, anthropologists analysing local/global security and cooperation with sociology of religion, for instance, the next phase of security theory is likely to be defined by the challenge of mediating these different rationalities and understanding the different modes of assessing danger/risk/threat as well as the implied concepts of peace and security in the different disciplines (Wæver 2007b).

Peace and security are likely to remain powerful political categories, and therefore it is important to stay attuned to often subtle changes in their meaning and thereby in the practices imbedded in speaking and doing peace and security.

12 A revealing way to see the two disciplines is to compare two recent textbooks, such as Kolodziej 2005 and Collins 2007, not to take cases with an even larger distance like Jordan/Taylor/Mazarr 1998 and Huysmans 2006.

5 Peace and Environment: Towards a Sustainable Peace as Seen From the South

Úrsula Oswald Spring

5.1 Introduction¹

This chapter links analyses on environmental deterioration with peace efforts in a wider cultural context where an economic model based on wasteful fossil energy use, social inequality, consumerism, fashion, and growth concentrated within small elites has brought both the planet and society as a whole to its limits of survival. This has affected regions, cultures, and social classes differently; especially Southern countries and vulnerable groups have been the major victims. Since the late 1980's, due to increasingly adverse socio-economic, political and natural environments, women, indigenous peoples, the poor and marginalized urban grass root movements (Schteingart 2006) have increasingly been confronted with a 'survival dilemma' (see Brauch 2004 and chap. 42 in this vol.) which has forced them to develop specific 'survival strategies' (Oswald 1991).

These socially vulnerable and often marginalized groups have collectively organized (Larrain 2005), and developed a model of life for everybody (MST 2005, 2003; Le Bot 1997, see chap. 27 by Oswald in this vol.) and not only for small and wealthy elites. Confronted with the concentration of wealth, environmental deterioration, cultural homogeneity and personal uncertainty, increased by drug consumption and a loss of trust, several UN agencies have developed the new concept of 'sustainable peace' (Peck 1998), in analogy to 'sustainable development'.

This raises the question whether a focus on 'sustainable peace' will be able, in a context of cultural diversity, to conceptualize the present socio-physical, psychological, cultural, and environmental destruction. Are these conceptual and policy efforts capable of constraining the centripetal forces of destruction within an increasing violent context? They increas-

ingly rely on traditional values of non-violence and consensus-building that emerged in diverse cultures (Salinas/Oswald 2002; Rupesinghe 1998; Mandela 1994; King 1998) during millennia. Can these new processes and the recognition of the active role of women in peace-building and environmental protection offer practical alternatives for a peaceful resolution of antagonisms without destroying environmental and social networks further?

This chapter briefly reviews conceptual reflections on peace by exploring physical, structural, cultural, and gender violence, the positive and negative peace concept as well as feminist peace (5.2). It then offers reflections on the environment focusing on the Gaia approach, deep ecology, social ecology, ecofeminism and eco-Marxism, and it explores the possibility of an ecofeminist peace (5.3). Thereafter the chapter discusses the theoretical and political challenge of the concept of 'sustainable peace' (5.4) and it reviews the potential of linking sustainable peace with gender equity from a historical and regional perspective (5.5). Southern countries and their vulnerable social groups are particularly affected. Also, the majority of wars occur there. This complex situation gets further aggravated by the effects of global environmental and climate change and their increasing impact on hydro-meteorological hazards that often lead to social disasters. Finally, the future of sustainable peace for Southern countries will be explored, its potential, limits and capacity to increase equality and equity for women and the socially vulnerable (5.6).

5.2 Conceptual Reflections on Peace

The term peace is related to the well-being of any person. It is a generally accepted value. In most cultures it is a type of desideratum linked to harmony, tranquility, cooperation, alliance, well-being, and agreement. As any socially constructed concept peace has been

1 I am deeply grateful to Hans Günter Brauch for his constructive criticisms.

historically transformed and many new elements have been integrated. From a way to resolve conflicts violently through war, initial negotiation processes were designed, finding their legal expression in 1648 in the Westphalian Peace Agreements² where the foundations of modern international law were laid and the principles guiding the relations among sovereign states were adopted. This 'negative peace' that ended the Thirty Years War in Europe was later widened – in many peace proposals – with concepts and proposals for a 'positive peace' and complemented with a state-centred focus on security that prevailed until the end of the Cold War, some 341 years later. Since the 1990's gradually a deepened and multidimensional understanding of security has evolved, taking besides military also human, societal, environmental, and gender security into account (Brauch 2003, 2005, 2005a, 2007, 2007a, 2007b, 2007c).

This chapter links dominant peace theories with the destruction of the environment and the discrimination through gender relations (Muthien/Combrinck 2003; Muthien/Taylor 2002, Serrano 2004). As peace is a central part of personal and social identity in a world where the value systems, ideas, and practices are changing rapidly, it explores the new concept of 'sustainable peace'.

It started with 'preventive diplomacy', a term developed by Dag Hammarskjöld, later adopted by Boutros Boutros-Ghali, and today used in different governmental discourses and practices in interna-

2 This agreement ended the bloody Thirty Years War (1618–1648) in Central Europe. Due to the complexity of the conflict and the power interests of Emperor Ferdinand II and his son Ferdinand III, and his allies on the one side and the kings of France and Sweden on the other side, the negotiation process changed the existing European power structure. Besides a general and unlimited amnesty, the consequences were the end of the community of nations under the control of the pope and the emperor, and the birth of a modern system of states. As the Habsburgs were defeated, they expanded their imperial interests into the Balkans. As religious unity under the pope had now become unfeasible (what undoubtedly was a victory for the Protestants) a new international norm, understood as the principle of equilibrium, was developed. The Peace of Westphalia (1648) opened the way for political, ideological and religious tolerance, thus avoiding that imperial forces could intervene into the internal affairs of a constituted state or monarchy. But since 1648 it became soon evident that the powerful dictate, the fulfillment or failure of agreements were substituting the ideological fight of the 16th century with territorial ambitions in the 17th and 18th centuries (López 2004: 892).

tional relations. This strategy tries in a preventive way to avoid the escalation of conflicts into violence and to avoid violent conflicts from spreading. Prevention is based on political solutions and was widely employed in the African context to support peacefully the emancipation of these peoples to a dignified life. Nevertheless, the results in form of violent conflicts and civil wars, e.g. in Cote d'Ivoire, Liberia, Sierra Leone, in the Democratic Republic of Congo (DRC), as well as the coup in the Central African Republic require a more active diplomacy in Africa, involving a Pan-African perspective and an African Security Corps (Saruchera 2004; Goucha/Cilliers 2001).

5.2.1 Physical, Structural, Cultural and Gender Violence

Johan Galtung, a Norwegian peace researcher, analysed first the 'physical violence' as a cause of war and the process to avoid and stop this inhuman behaviour after World War II. He defined 'negative peace' as the absence of direct or 'physical violence'. In the 1970's, inspired by the theory of 'dependencia' in Latin America, he developed the concept of 'structural violence' where people die or suffer as a result of injustice and economic underdevelopment. To counter these structural dangers, Galtung suggested the concept of a 'positive peace' where discrimination and exploitation was substituted by justice and solidarity. Finally, during the 1980's he added 'cultural peace', as a process of acquired behaviour able to respect all differences and to be tolerant with other cultures through a learning process from their historical and present experiences of peace (Galtung 1971, 1982, 2007).

These concepts were enriched by multiple peace reflections worldwide. Since the 1960's, the consolidation of post-war global capitalism threatened the development and peace efforts in Latin America, where often direct and covert interventions from the Northern neighbour generated coups, civil wars, and massacres. 'Dependencia' theory evolved (Marini 1973; Dos Santos 1978) in the 1970's in Latin America and was developed further by scholars elsewhere, such as Galtung (1971), who transformed it into his theory of 'structural imperialism' and Senghaas (1973) into 'auto-centric development'.

The Orient contributed the concept and practice of non-violence with other humans and nature to world knowledge (see chap. 11 by this author and the chap. by Dadhich in this vol.). From the Indian tradition the '*ahimsa*' concept (Parmar 2003; Gandhi 1984, 1993, 1966) signifies not to do harm to any living or-

ganism as all forms of life are successive forms of re-incarnation and development of the spirit. China's Taoism proposed a harmony among sky, earth, and humans generating cosmic energy which is the way to intelligence and fruitful life (Kongfuzi 551–479 BCE; on Lao Tse, Watkin-Kolb/Quing 2000; Durant 1956; Paper 1997). In Mesoamerica indigenous societies, living in difficult environmental conditions, have also developed a deep respect and unity with nature and a profound knowledge on environment management (see chap. by Sánchez in this vol.).

Finally, the dark history of gender discrimination, intra-familial violence, feminicides, rape, trafficking of women and girls, aggression against women and children have created higher vulnerability of women (Söderberg 2004). This is reflected in the unanimous acceptance on 31 October 2000 of UN Security Council Resolution 1325 that reinforced the ongoing gender mainstreaming in the UN bodies, and has tried to transform gender equity into a guiding principle for Member States' commitments. The crucial role of women in development (Collin 2005; Oswald 2001; Shiva 1988), environmental protection (Pickup 2001), knowledge transmission (Harding 1991; Haraway 1988; Lagarde 2000; García 2004), gift-economy (Vaughan 1997) and in peace-building (Boulding 1992, 2000) came up, when the Beijing Platform was articulated in Agenda XXI (Rio de Janeiro 2002) as well as sustainable development efforts (Oswald 1999). Therefore, the reinforcement of civil society with active participation of women (Valenzuela 1991; Tomasevski 1993) is crucial for the future of a sustainable planet with a quality of life and peace. In synthesis a peaceful world has simultaneously to overcome physical, structural, cultural, and gender violence (Muthien/Taylor 2002).

5.2.2 Positive and Negative Peace

Based on Galtung's work on violence and peace, since the 1970's the study of peace has distinguished between 'negative' and 'positive' peace. The first focus on 'negative peace' addressed the process on how to reduce or eliminate the negative relations which led to violence and destruction, including also arms control and disarmament (Brauch/Clarke 1983). It also means absence of war and physical violence. In a peace process the first step to peace-building is stopping the armed confrontation and most of the reflections on pacifism are linked to this negative peace (David 1999). The Roman tradition systematized the absence of war (*si vis pacem para bellum*), however, it also in-

troduced a notion of positive peace, where agreements have to be respected (López 2004).

Meanwhile, the concept of a 'positive peace' suggests eliminating the structural and cultural violence which creates or maintains directly or indirectly unjust structures in social, economic, cultural or political terms. It refers to a culturally diverse process which permits to analyse in different nations and cultures behavioural patterns that are able to consolidate a harmonious coexistence. It recognizes the possibility of violence, war, and discrimination, but promotes institutions for justice, democracy, tolerance, care, and solidarity (Galtung 1982; Salinas/Oswald 2002; Oswald 2000a).

The concept of 'positive peace' focuses its object of study on building more harmonious relations among humans (De la Rúa 2004; Ameglio 2002, 2004). In business relations the mediation process was developed to resolve the incompatibility and conflict of interests. In the post-war region the reconciliation concept was introduced (Reychler/Paffenholz 2001). It has been trying to heal traumata inflicted during war and open violence. Different strategies were developed such as the complex peace process in South Africa (Mandela 1994); research on rape and war crimes (Denov 2005), forgiveness through collective historical recuperation, e.g. of war horrors in Guatemala (Cabrera 2002; Padilla 2002); the '*kriiss romaní*' in the Romany culture (Armendáriz 2004; Rojas Venegas 2004); and '*gacaca*' a type of grass-root tribunal to compensate for the damages inflicted during the civil war in Burundi.

But no reconciliation process alone is able to progress when the structural elements of the conflict situation were not consciously removed and the root causes of the contradiction and their incompatibility taken into account. Then the processes of negotiation are able to consolidate and the behaviour can be changed in such a way that both parts could find a win-win situation to resolve the problems and to live in a more harmonious way together improving the situation of both. In this sense 'positive peace' means practices and changes towards a harmony of mind, spirit, and behaviour. As a general attitude cooperation is required, supported by positive expressions, emotions, and thinking to create a situation of greater equity that will be able to eliminate exploitation and discrimination (Oswald 2007).

'Social peace' was developed in the Occident, based on human development which offers people and individuals human, social, political, economic, and social rights (Kant 1965, 1981). These rights were

systematized in the *Universal Declaration of Human Rights* of the UN in 1948. In social and personal terms it includes a process of peace-building oriented at a process of reciprocal caring which permits the integration of opposed elements and a positive effort to eliminate former negative feelings and exclusions, consolidating existing friendship, neighbourhood, good family, gender links (Tomasevki 1993) and worship. In this phase of awareness raising not only the physical and structural violence is eliminated, but also the cultural and social discriminations are surmounted.

'Positive peace' was initially proposed by Lao Tse and Kongfuzi (Tucker 1997), later reformulated by Kant (1965, 1981) in his 'eternal peace' and finally modernized by Senghaas (2004) in his 'earthly peace'. In their vision this concept also regulates the relations among states creating communities of nations able to cooperate and live peacefully together for their mutual benefit (Oswald 2007, see chap. II in this vol.).

The term 'international peace and security' is used both in the Covenant of the League of Nations (1919) and frequently in the UN Charter (1945). According to Wolfrum (1994: 50) the meaning of peace in the UN Charter depends on whether it is narrowly or broadly defined:

If 'peace' is narrowly defined as the mere absence of a threat or use of force against the territorial integrity or political independence of any state (Art. 2(4); 'negative peace'), the term 'security' will contain parts of what is usually referred to as the notion of 'positive peace'. This latter notion is generally understood as encompassing the activities, which are necessary for maintaining the conditions of peace.

After the horror of World War II, Europe decided to resolve the conflicts among states through negotiation processes and cooperation. Symbolically this started during the Korean War in 1951 with an integration agreement on coal and steel between France, Germany, Italy, and the three Benelux countries. Based on the treaties of Rome (1957), Maastricht (1992), and Amsterdam (1997), a process of European integration gradually emerged by reducing the disparities and gaps with compensation mechanisms among nations which facilitated the integration into the European Union.

Thus, structural and cultural discrimination was gradually lessened, economic and political cooperation has steadily become more intense, what has given this group of 27 countries (since 2007) an opportunity to consolidate its model of peaceful conflict resolution through negotiation as a model for the rest of

the world that has made war as a means of conflict resolution among its members unthinkable.

5.2.3 Feminist Peace

Systematic analyses of peace processes have shown that women were hardly involved in the peace-building and negotiation process (Boulding 1992; 2002; Reardon 1999; Reardon/Nordland 1994; Muthien/Taylor 2002). They have been directly affected by violence, oppression, and discrimination. But these have also had negative effects on men through civil war (Reardon 1966), economic crises, and a lack of physical, structural or human security (UNDP 1996–2005) as well as cultural security (Tickner/Mason 2002). Gender equity and equal political and social participation of women is still an objective (Fuentes/Rojas 2005; Harding 1991, 1988; Helfrich 2001) and different cultures have created diverse ways to reduce the gender imbalance, most of them through quota systems in work and political representation (Serrano 2004; Lagarde 1990). Undoubtedly nations with wider women participation are more peaceful. Conflict-prone areas or authoritarian governments have not yet included gender balance in their development agenda (World Bank 1992, 2006). An initial difference among concepts of feminist peace and gender security are their different objectives. While the first focus is on the essence of peace with its attributes, the second concept centres on mechanisms, asking for gender security of what and of whom, what are the values at risk, and from whom and from what the threats are emerging (see Oswald 2007, 2008).

Ecofeminism established a parallel relationship between male domination over women and environmental exploitation as a result of patriarchal undemocratic institutions which are maintaining privileges for small elites (Bennholdt-Thomsen 1994; Bennholdt-Thomsen/Mies 1999; Mies 1998, 1982) and social differentiation for the people, but creating at the same time also violence and injustice (Strahm/Oswald 1990). This process destroys internal and external peace, but affects also a peaceful coexistence with nature. The inclusion of feminist peace components obeys a new perception of holistic thinking where social ecology brought an innovative perception of the planet: the Gaia theory and deep ecology (Menke-Glückert 1994).

5.3 Some Conceptual Reflections on the Environment

Global and climate change (IPCC 1990, 1996, 2001, 2007; Crasswell 2005), desertification, water scarcity and pollution (Pérez 2006), urbanization (Scheingart 2006; Oswald 2006), biodiversity loss (UNEP 2001, 2004), and irrational resource exploitation (Meadows/Randers/Behrens 1972) have worldwide effects, threatening both industrial and post-industrial development and humanity. The Group of Rome pointed to the limits of growth and the scarcity of natural resources (Meadows/Randers/Behrens 1972). Later, more integral socio-environmental approaches have linked economic and environmental behaviour to its origin: *oikos* or home, proposing complex productive, biological, and philosophical paradigms (*Gaia*), where also social movements (Larrain 2005) and feminists proposed alternative subsistence models (Shiva 1988, 1993, 2003; Bennholdt-Thomsen/Mies 1999) to create a new relationship between nature and humankind (Shiva/Mies 1997).

5.3.1 Gaia Approach

As a result of the increasing destruction of the environment (Haavisto 2003; UNEP/PCAU 2004) more than half of the tropical rainforest is gone (UNEP 2004). Accelerated processes of urbanization (UNFPA 2003), unequal terms of trade in the world market (Calva 2007, 2003), and a widening and deepening in the conceptualization of security have made it necessary to consider the planet as one holistic world. The 21st century should be considered as the ecological century (von Weizsäcker 1995), where humankind as a whole is working together for international and local peace and security through a common and just policy of development. Technological power is no more in the hands of transnational enterprises for their own benefit (Kaplan 2002, 2003); instead it is oriented towards sustainable development with peace for everybody.

The origin of 'deep ecology' goes back to the post-war situation. Leopoldo (1949) understood land management with ethical concerns and Lovelock (1979) opened with his *Gaia. A new look at life on Earth* a fruitful discussion, followed by hundreds of environmental concerns. The Club of Rome discussed the limits of growth (Meadows/Randers/Behrens III 1972; McKie 1992) and the fallacy of the exploitation model of natural resources. The conflict between anthropocentric points of views related to cornucopian

answers (Gleditsch 2003), and the Jewish and Christian religious background was questioned (Brown 1995; Drengson 1989). A critical approach with multiple links was established with socialism (Barry 1995; Pepper 1993, 1996; Peper/ Voisey 1996), human wellbeing (Bragg 1996); Taoism (Bennet/Sylvan 1988); education (Bowers 1993); mysticism (Elkins 1989; Gottlieb 1995); ethics and values (Fox; 1989; Elliot 1995; Engel/Engel 1990; Fox 1993), and policy (Conley 1997; Eckersley 1992). A fruitful debate started among 'deep ecology' and 'ecofeminism' (D'Eaubonne 1974; Cheney 1987; Zimmerman 1987; Fox 1989; Kheel 1991; Salleh 1984, 1992) and the debate on a widening and deepening of the conceptual approach to security.

Menke-Glückert (1994) systematized ten commandments to re-establish a Gaia equilibrium: respect for the laws of nature; learning from the wisdom of nature; never reduce diversity and plurality; do not pollute; take daily the responsibility to leave a clean planet for your children; maintain in economic activities the sustainable principle; act with responsibility and reduce the environmental strain; prefer simple technology and small-scale solutions (Schumacher 1973); denounce environmental damages and pollution; listen to your own body and understand its early warning, remembering that we all are part of nature (Gandhi 1993, n.d.).

5.3.2 Deep Ecology

Rachel Carson's book *Silent Spring* in 1962 roughly marks the beginning of the international long-range deep ecology movement³. It is a branch of philosophy: 'ecosophy' (Naess 1972: 1989), considering humankind as an integral part of nature, developing an environmental ethic (García 1988). The name 'deep' comes from the fundamental philosophical question: does human life form part of the ecosphere or is the anthroposphere dominating nature (chap. 10 by Dalby)? Naess (1972), questioned value judgments such as an animal has an eternal soul, a reason, and is conscious about its acts and its relation to other animals. By including the science of ecology, Deval and Sessions (1985: 85-88) discovered that "everything is connected to everything else," looking beyond humans as the centre of the universe. Gaining more understanding of the wonders of the natural world, this current induced to practical involvement in defending

3 See David Orton's 2006 campaign "Make Peace with 'Nature' for voting green in Canada", at: <<http://home.ca.inter.net/~greenweb/GW63-Path.html>>.

the Earth, and opened one's eyes to a more biocentric world view. The shift in individual consciousness from a human-centred world view to that of the non human-centred deep ecology philosophy is always highly personal (Chapple 1997).

The relationship with Mother Earth opened a line to mysticism (Elkins 1989; Gottlieb 1995), ethics and values (Fox 1989, 1990, 1993; Elliot 1995; Engel/Engel 1990). Several spiritual currents based on Chinese Taoism and Indian Buddhism (also Zen Buddhism in Japan) permitted to re-evaluate nature and its living system, questioning the extreme anthropocentric and alienating culture (Lao Tse; Confucius; García 1988; Preiswerk 1984; Bennet/Sylvan 1988). The ethics of deep ecology forbids the exploitation of humans, giving values also to the non-human life on Earth, its biodiversity, and the obligation of people to respect this variety where the enrichment of human culture can be parallel with the flourishing of other living organisms. This means to change the present relationship with nature, and policy has to be developed and technical, social, and ideological structures have to be changed to appreciate the diversity of all living forms together with an obligation to care for this biodiversity and non-human values.

Politically both, the Gaia and the deep ecology movements, brought up the idea of decentralization, small is beautiful (Schumacher 1973), commitment to peace and nonviolent conflict resolution (Glasl 1994; Martinelli 2000; Ikeda 1981; Jahn 1994), green parties and environmentalists, which challenged the anthropocentric bias of the present globalized world (Maathai 2003, 2006). In practical terms a Malthusian approach (1798) insisted on birth control and some extreme currents were criticized by its enemies as a type of 'ecofascism'. In response, the criticisms of exploitive, utilitarian, and materialistic behaviour in contemporary consumer society was opposed to a responsible and sustainable living on this Earth without leaving a lasting footprint (Naess 1989). Mother Earth brought feminism to link up with the environmental movement (D'Eaubonne 1974). 'Left' was used in left biocentrism, meaning to be anti-industrial and anti-capitalist, but not necessarily socialist (Leopoldo 1949; Dobson, 2007; Devall/Sessions 1985; Sarkar 1994; Livingston 2007).

5.3.3 Social Ecology and Eco-Marxism

The proponents of these approaches criticized the deep ecology beliefs that the world does exist only as a resource with proper intrinsic values (Fox 1989,

1990, 1993; Brown 1995; Barnhill 1997; Bowers 1993; Bragg 1996; Chapple 1997; Deval/Sessions 1985; Paper 1997; Tucker 1997), but that the human and non human lives have values in themselves and that natural resources are sustaining human lives (Barry 1995; Bookchin 1988; Gottlieb 1995; Pepper 1996, 1993). This emphasis on inequality and on social class stratification of society is permitting an uneven appropriation of natural resources and resulting in destruction and pollution. From the perspective of the critics of deep ecology they are considered as being human-centred, believing that human relations within society are more important and determine society's relationship with nature. They were also fighting against what they considered 'ecofascism' and the misanthropic approach of deep ecology. Bookchin (1988) claimed that deep ecology fails to link environmental crises with authoritarianism and hierarchy; both phenomena have been reinforced by ecofeminism. Therefore, the priorities for these positions are social, not environmental, clearly expressed also by the left biocentrism (Wan Ho 1989), where an egalitarian, non-sexist, non-discriminating society is proposed as a desirable goal, up to the costs of an exploitive relation with Earth. Nevertheless, all these approaches are more holistic, trying to find a long-term equilibrium between human development, mitigation processes, and recovery of pollution and environmental destruction, instead of environmental security (Dalby/Brauch/Oswald 2008).

On the contrary, the cornucopian paradigm is proposing an unlimited growth and consumerism for everybody, where science and technology will resolve all the present and future problems between nature and society (Lomborg 2001). This approach forgets that conflictive relations are socially constructed and have to be politically negotiated. Technology can only offer feasible solutions, but not induce processes of social representations and peace-building (Lederach 2001; Oswald 2001). Furthermore, there is no doubt that the present model of neoliberalism is not only destroying nature but creating structural imbalances between regions, social classes, gender, and races, which requires a new equilibrium for peaceful coexistence (OECD/DAC 1997, 2000; Stiglitz 2002; ILO 1989). Peace movements and environmental concerns were linked together in the ecofeminist approach, promoting different relations with humans and nature (Persram 1994; Pickup 2001; Plumwood 1991; Meentzen/Gomáriz 2003; Meyers 1997).

5.3.4 Ecofeminism and Ecofeminist Peace

Ecofeminism started as a social and political movement against exclusive globalization and the neoliberal model. The main argument was that a similar relationship exists between the oppression and violence against women as well as against nature (Mies 1998; Skjelsbaek 1997). Both are victims of a patriarchal dominated land ownership (Kenya 2000) where overgrazing, deforestation, and food crops are destroying soils (Shiva/Jafri/Bhutani 1999). This behaviour is also taking away from women and the commons, the collectively handled land, water and other natural resources (Saruchera 2004). Cash crops are destroying the subsistence economy. Agribusiness has displaced a formerly biodiverse sustainable agriculture by substituting it with mono-cultures, relying on the green revolution, today also with genetic modified organisms and seeds. Françoise d'Eaubonne (1974), a founder of ecofeminism insists that alienating technology is destroying nature and human relations (Cheney 1987). Similar to Gandhi and supported by other ecofeminists (Zimmerman 1987; Kheel 1991; Salleh 1992), she proposed to go back to appropriate technology, solar power, establishing again a sacred relationship with Mother Earth.

Vandana Shiva, a co-founder of Diverse Women for Diversity, argued that modern technology is marginalizing still more women and poor people in the South by transforming all natural resources into commodities in the hands of a small transnational elite (CLOC/Via Campesina/Anamuri 2002; Shiva 1988, 1993, 2003; Shiva/Mies 1997; Shiva/Jafri/Bhutani 1999; CLOC 2004; Oswald 2000, 2002a, 2002b).

Women in subsistence economies, producing and reproducing wealth in partnership with nature, have been experts in their own right of holistic and ecological knowledge of nature's processes. But these alternative modes of knowing, which are oriented to the social benefits and sustenance needs are not recognized by the reductionist paradigm, because it fails to perceive the interconnectedness of nature, or the connection of women's lives, work and knowledge with the creation of wealth (Shiva 1988: 24).

Ecofeminism linked up the sustainable subsistence practice in the hands of women for food and wealth of their families with the non violent management of nature and society, promoting a peaceful and non violent conflict resolving society (Bennholdt-Thomsen 1994; Bennholdt-Thomsen/Mies 1999; Bennholdt-Thomsen/Faraclas/Werlhof 2001). Confronted with globalization and rape capitalism, organized crime, and destruction and depletion of natural resources,

the promoters of ecofeminism have allied themselves with other social movements and have promoted together complex and inclusive peace behaviour. The new approach starts from daily life and includes the micro-level, beginning to fight against daily intrafamilial violence and social exclusions (Reardon 1996; Boulding 2000; Oswald 1990; Campos 1995).

These propositions have challenged the established patriarchal hierarchy, where social organization, patriarchal organized states, and male dominated governments are the source of conflicts. Normally, traditional peace researchers work on the macro-levels and top-down institutional peace-building with an occidental vision, where strong arbiters are intervening (e.g. President Clinton in the Israeli-Palestine conflict; Glasl 1994). This kind of peace improvement is questioned due to its exclusivity, male dominance, and hierarchical thinking on maintaining the status quo (Muthien/Combrinck 2003). The ecofeminist alternative is deeply rooted in community wisdom and on experience within the families, by challenging the imposition of patriarchal dominance through education and training women to promote their own empowerment (Menchú 2004; Freire 1970, Rojas 2004; Ríos 2001).

As the ecofeminist approach challenges the root causes of violence, indigenous people are also threatened by this thinking, and multiple indigenous organizations have limited women's participation by insisting on traditional values (Kameri/Anyango 2007). Also within this society, women do not only care for extended families through gathering wild fruits, berries, roots, herbs, bark, and orchards for food and medicine cultivation, but they own very little land – only an average of 2 per cent in Africa (FAO 2000; Kenya 2000) and 18 per cent in Mexico (INEGI 2004). Further, they are exposed to female genital mutilation; early marriage and rape covered often as a traditional initiation rite (Mensch/Grant/Blanc 2005). Patricia Kameri-Mbote has cooperated in an *Optional Protocol to the African Charter on Human and Peoples' Rights of Women in Africa* that was accepted in July 2003.

Primarily in Northern countries, there has been an ongoing theoretical discussion, trying to reduce the political character of Southern ecofeminists by inducing collective change, democratization, and social movements. They emphasized ethical behaviour (Fox 1984, 1993; Elliot 1995; Engel/Engel 1990) and political alternatives (Conley 1997; Eckersley 1992). All over the world, green parties were founded and quota systems have allowed an important number of women,

mostly of the trained middle class, to enter into policy and institution building (Cheney 1987; Zimmerman 1987; Fox 1989; Kheel 1991; Salleh 1984, 1992). This evolution has limited the change of root causes and multiple social movements have reorganized their proper capacity of empowerment through consciousness building. They have created bottom-up training workshops and formal education schemes (peasant universities, teacher colleges) that first democratized their organizations internally and later proposed and developed societal alternatives (see experience of MST, Dos Santos 2005; CLOC/Via Campesina/Anamuri 2002).

In general the feminist approach, and in particular the ecofeminist one, has shown that security, peace, and the environment are today still subsumed in a militarized (or police) capitalist society that has been unable to guarantee individual or family security (World Bank 2004, 2005) and creating new and more serious risks (Beck 1998, 2000). Furthermore, history is proving that global environmental and climate change are affecting nature and society in a way they have never done during the last 400,000 or more years. Scientific evidence is contained in the ice shield in the Antarctic (MunichRe 2006). Similar concerns of systemic change of requirements are exposed against the Charter of the UN, where citizens and governments from the South join these collective doubts about Eurocentric origins of human rights which are able to maintain the status quo of the rich western society (Berlowitz 2000), creating greater poverty and environmental destruction in the South (Strahm/Oswald 1990; Arroyo/Villamar 2002; Arguedas 1998).

Traditional and globally accepted paradigms such as private property (Richards 2000; Richards/Schwanger 2004), militarism (Sancinetti 1988; Elwert 1999; Arendt 1969, Amnesty International 1980), and the arms race (SIPRI 2004), sexual and organized violence (Interamerican Development Bank 2006; World Bank 1998) against women (Denov 2005) and indigenous people (Gaitan 2002, 2004; García 2004; Lenkersdorf 1999; León Portilla 2003, 1959), loans, interests (CADTM 2004), top-down global approaches (Santos de Morais 2002), development (Solis/Díaz/Sevilla 2002), social evolution (Sen 1995; Senghaas 1973), superiority of capitalist countries, exploitation of nature (Worldwatch Institute 1994, 1999) and other humans, cultural discrimination (Bonfil 1987; Arizpe 2004), pollution and social stratification (WHO 1999) are all challenged by this ecofeminist peace thinking (Warren 1997, 1998). The deep impact caused was aggressively answered by male scientists and some

women were threatened by these critics. They manipulated the proposals and opposed a kind of feminist essentialism, where women were considered more peaceful and as having better environmental practices (Barnhill 1997). Representatives of ecofeminism could not accept this tangential deviation. Starting with a constructive approach of peace practices, they insisted that the main cause of the structural social and institutional discriminatory system is patriarchy, where values such as objectivity, reason, aggression, and dominance are opposed to emotions, care, and pacifism. The UN Security Council took up the concerns of women, above all in African conflicts, and used resolution 1325 that was adopted in the year 2000 to annually review the achievements and difficulties.

A new masculinity (Jiménez/Tena 2007) and femininity in a culturally diverse and cooperative world can be realized where bottom-up changes (Cadena 2005, 2003) and challenges transform existing institutions and privileges (Wan Ho 1989) without destroying the care for other humans and nature (Santos de Morais 2002). As Genevieve Vaughan (1997) correctly stated in her gift economy, the challenge is to transform the “homo sapiens into homo donans”, where mothering is need-oriented and not profit driven.

5.4 Sustainable Peace: A Theoretical and Political Challenge

The new concept of ‘sustainable peace’ emerged from combining ideas from different theoretical schools on the link between peace and sustainability. Gilman (1983: 58–59) argued that building a planetary peace with sustainability requires to overcome three forms of ignorance: a) a mechanism for nonviolent conflict resolution; b) ignorance about the ‘other’, leading to distortion and mistrust; and c) an emotional insecurity on behalf of leaders or the populace. He proposed three basic elements to change this ignorance: ‘nurturing’, ‘empowerment’ and ‘communication’.

Peck defined sustainable peace as “sustainable development (which) involves the institutionalization of participatory processes in order to provide civil and political rights to all peoples. The building blocks of sustainable peace and security are well-functioning local, state, regional and international systems of governance, which are responsive to basic human needs” (Peck 1998: 45).

In most definitions and articles sustainable peace is linking environmental protection and resource management to nonviolent conflict resolution (Gilman 1983; Ameglio 2002, 2004; Adelphi Research 2004), to long-term development policies and post-conflict situations (UN 2000) and increasingly to gender equality, equity and empowerment (Dankelman 2002; Salaya 2004; Oswald 2000a, 2001, 2004, 2007; CHS 2003; Whitehead/ Lockwood 1999; King 2003; Moser/Clark 2001)

The relationship among dominant peace theories, destruction of the environment and discrimination through gender relations (Muthien/Combrinck 2003; Muthien/Taylor 2002, Serrano 2004), has been conceptually discussed for some time. As peace is a central part of personal and social identity in a world where major processes of unification and diversification are occurring faster than ever in history (Moscovici 1984: 31), persons have a basic necessity to simplify and to categorize their social environment through social comparisons, improving their self-esteem positively (Hogg/Abrams 1988: 78). The value systems, ideas, and practices that have simultaneously created a system of order could offer a person or group a possibility to get familiar with the social and material world being confronted with conflictive messages and behaviour. The communication within a community offers a code of common social interchange, where several aspects of life, personal and collective history are classified unambiguously (Moscovici 1976: xiii), overcoming the daily contradictions and insecurities and offering also possibilities for cooperation being able to deal with new fears, resulting from the violent appropriation of scarce resources, hazards, and disasters.

Sustainable peace can also be traced back to 'preventive diplomacy', a term that was developed by Dag Hammarskjöld, later adopted by Boutros Boutros-Ghali, and is now used in different governmental discourses and practices in international relations. This strategy tries in a preventive way to avoid that conflicts escalate into violence and it is to avoid violent conflicts from spreading. Prevention is based on political solutions and it was widely employed in the African context to support peacefully the emancipation of these peoples to a dignified life (Miall/Ramsbotham/Woodhouse 1999; Lake/Rothchild 1996). Nevertheless, the violent conflicts and civil wars, e.g. in Cote d'Ivoire, Liberia, Sierra Leone, in the Democratic Republic of Congo (DRC), as well as the coup in the Central African Republic, require a more active diplomacy in Africa involving a Pan-African perspec-

tive and African Security Corps (Saruchera 2004, Kameri/Anyango 2007; Goucha/Cilliers 2001).

Many diplomatic efforts, including those of the European Union (EU), are geared towards bringing peace to Africa by stabilizing vast countries as a result of colonial and post-colonial interests, such as the Democratic Republic of Congo (DRC). These countries need more than an encompassing peace and security; they require conditions permitting sustainable development. To achieve this goal, the underlying causes of regional instability should be identified by the proper social groups involved in the conflict and tackled in a holistic manner without the direct and indirect intervention of former colonial and neoliberal interests.

International conferences on security and cooperation⁴ in the region may help to understand the long-standing ethnic conflicts in Rwanda and Burundi, which resulted in different waves of genocide, similar to Columbia (Gaitan 2002, 2004). Peace-keeping, arbitration, and mediation that have occasionally been reinforced by sanctions of the Security Council and also by direct intervention, as in the case of Afghanistan (2001-) and Iraq (2003-), have so far produced poor results (Díaz Muller 1982).

Nevertheless, several African countries achieved peace as a result of a bottom-up internal peace management. The non-violent transition from the Apartheid system to a democratic government in South Africa is the best example of an internal conflict resolution. Specifying concrete steps and having in mind a model of a country with plural cultures and races, the obstacles were overthrown step by step, thanks to day to day negotiations, involving mass media, churches, political parties, intellectuals, social leaders and policy-makers to construct a new country and to find peacefully a way to create a new govern-

4 Before the genocide, both the size and mandate of the UN peacekeeping force were inappropriate for the complex tasks, and the messages of the force commander of the UN peacekeeping operation were ignored, alerting the international community that preparations for genocide were underway and had happened in the past. When the atrocities started, the Security Council decided to pull out most of its troops, giving the perpetrators the opportunity to execute their plans, exterminating an important number of an ethnic group. The defeated Rwandan Army (FAR) and the Interahamwe militias, mainly responsible for the genocide, were afterwards allowed to settle with *bona fide* refugees in refugee camps together. As they were still armed, they were bases for recruitment and training also in Congo, generating threats and violence in the camps.

ment (Mandela 1994). Another example is the 'gacaca' tribunal in Burundi where all the antagonist groups (also the mass murderers) are sitting together and working for one goal: to create a new country and to overcome the threats and fears from the former civil war.

In Central America the South African process was taken up during the peace negotiations in Guatemala and partly also in El Salvador. After the peace agreements were signed these three countries had a delicate task. How to deal with the victims of this state violence? In Guatemala the Report '*Nunca Más*' counted on the support of the Catholic Church, and a day before this report was presented publicly the directly involved bishop was killed. The armed forces tried to avoid a public condemnation of ethnocide and genocide (Cabrera 2002; Padilla 2002). Global or partial amnesty (when soldiers or policemen had committed atrocities under orders from superiors) in South Africa and different changes of laws (in Chile, Argentina, Guatemala, El Salvador) are still trying to heal the wounds (in Argentina: *Comisión Nacional sobre la Desaparición de Personas* 1984; Sancinetti 1988; Amnesty International 1980; and in Chile: Díaz Muller 1982; Letelier 1980, Valenzuela 1991).

In addition, organized crime⁵, human and drug trafficking, pornography, and violence in the mass media are other challenges for peace that has been increasingly aggravated by environmental threats. There is a theoretical discussion if chronic malnutrition, food scarcity, and extreme poverty induce political instability and internal conflicts. There is evidence (World Bank 1998) that countries with democratic governments affected by severe desertification did not experience famine, as their responsible governments implement food distribution mechanisms and obtained international food aid. But there have been several other cases (see in Ethiopia, Sudan, Biafra and others) where an undemocratic government when it was confronted with a severe food scarcity did not take any caution. When famine appeared this government was often overthrown by a military coup. The scientific discussion establishes a link between the loss of environmental and political security, but it could not show a direct relationship that the loss of

both induces violent responses. Nevertheless, it is possible to claim that in Africa both are mutually reinforcing themselves in a civil war situation (Oswald/Brauch 2006; Muthien/Taylor 2002; Saruchera 2004).

Finally there are proofs that the intervention of international or national communities can undermine local efforts for peace-building (see the military control in Chiapas avoiding the support and development of highly marginal regions), especially when interests of hydrocarbons, diamonds, and precious metals are intervening (in Nigeria, Iran, Angola). There is also sufficient evidence that neither the UN nor the international community wanted to address the case of Rwanda, because they considered it too risky and difficult to send enough Blue Helmets to control the guerrilla groups. Something similar is occurring today in Sudan. As a preliminary conclusion: without addressing the core problems of violence, the environmental, structural and cultural reinforcing factors, 'sustainable peace' and 'sustainable development' and a dignified future are impossible. Furthermore, several international organizations are more interested in maintaining a status quo due to their interests in natural resources. For this reason an internal war or its maintenance or reinforcement has in some cases been convenient for their imperial interests.

5.5 Negotiating Sustainable Peace with Gender Equity

The overall aim of international sustainable peace has been to achieve security, structural stability, sustainable development in the region affected by conflict, and equality and equity together with the empowerment of women. More specifically, it should address four interrelated processes:

- medium- and long-term problems related to security and cooperation in the region;
- improvement of regional capacity and mechanisms to prevent, manage, and resolve crises through political and not military means;
- creation of the development of democratic institutions with representative governments, where the protection of human rights and fundamental freedoms is guaranteed;
- promotion of sustainable growth and poverty alleviation through direct involvement and empowerment of women.

To be successful, parties directly involved in the conflict and who have been indirectly influencing it

5 There is a direct link between money laundering during the dirty war in Argentina and Chile and women trafficking and pornography in which a wide group of politicians is involved. Similar criminal cases have been reported in Mexico where governors and politicians have been accused of pederasty (Cacho 2006).

should first agree on an agenda where basic principles are expressed. These items should overcome the widely used (sometimes misused) principles (respect for sovereignty, territorial integrity, the inviolability of international borders, democracy, respect for human rights and private property rights of transnational enterprises, privatization contracts and debt services).

A second important issue are the legal and illegal (small) arms control programmes and the disarmament of the civil population by offering working tools against arms. In the early 21st century, the US has been exporting more than 65 per cent of the world's arms and in all war situations their illegal entrance is guaranteed by different media (SIPRI 2006), thus avoiding confidence-building measures and protection of minorities and national reconciliation.

A third point is to avoid the involvement of different levels of international institutions which intervene in the preparative process with diverse, sometimes contradictory necessities and interests (UN, AU, OSCE, EU).

A fourth factor has been the careful selection of the negotiating parties in the conflicts which has to include a wide range of interests and persons. In the case of South Africa it was possible to negotiate with a wide spectrum of leaders from social movements, mass media, policy, academic, traditional authorities, young people, regional authorities, women's bodies, etc., an inclusive social representation that was able to transmit the agreed points to their social groups, which were interested and directly concerned with the peace agreements.

Once a process of peace agreements has started, independent financial support is required and security conditions for the negotiators and the negotiation place must be granted. These can be offered by international organizations (Blue Helmets, OAU, and OSCE), neighbouring countries or international NGOs (INGOs). As this phase is very sensitive and several groups are more interested in the failure of the peace process, it is necessary to avoid aggressions and violence during this stage. Partial armistice, negotiations in a third neutral country, and strong armed control by third parties have been some of the useful mechanisms.

A sixth factor is the management of the mass media which can reinforce or destroy the process, depending on the transmission of transparent peace agreements and negotiation points or the creation of imbalances and new local violence (as in the case of Rwanda and Burundi where the people were incited through radio to commit violence and massacres).

Once an initial peace agreement is achieved, the first phase in the transition process is to create a minimum of physical security for people, especially the most vulnerable such as children and women (Resolution 1325 of UNSC). David (1999) introduced the cease fire and the reduction of violence as a transitory element towards security, which should be to promote a definitive cease of hostilities, control of weapons, and their destruction. An immediate removal of anti-personnel landmines, explosives, and other war objects threatening the life of the civil population, is undertaken. In all Central American cases the struggle against organized and eventual crime had to be reinforced by civil society. Child soldiers and guerrilla members, who are returning to their homes, should be actively included in the reconstruction process and getting an alternative income. In this phase, it is necessary to train and restructure police, public ministry, justice and political institutions (Höffe 2003). All these processes are necessary before refugees are permitted to return. A positive experience in this phase was the involvement of women in the interchange of arms for domestic and working tools, their involvement in local tribunals for judging war crimes (*gacaca* in Burundi), their collective healing process from massacres and war atrocities (Cabrera 2002), and their needs and capacities for reorganizing the post-war society.

The second phase of peace is the transition to institution-building that is able to guarantee some basic levels of security and political participation, such as free elections and democratic political campaigns. The initial forces in charge of security (Blue Helmet, AU, NATO) should avoid further interventions of foreign and internal interests (warlords, arms, human traffickers, and forced labour; ILO 2005), that are often trying to destroy the ongoing process, due to the prospective loss of benefits they obtained from the war (arm trafficking⁶, hydrocarbons, diamonds, metals and drugs). During this phase a 'zero tolerance policy' is needed.

6 Angola had multiple peace efforts but the illegal market with diamonds, the oil interests with private armies and illegal arm trafficking reactivated the hostilities. The arms came from the US, Russia, Great Britain, France and others using the illegal triangle after the Security Council had declared an arms embargo. The Iran-Iraq war (1980–1988) is another case where the Reagan Administration supported Saddam Hussein against Iran with satellite images and objected to sanctions by the US Congress (Brauch 2003b).

Reychler and Paffenholz (2001) insist that during the transition to democracy a specific training of civil society (Rood 2005) in free elections, political campaigns, and nonviolent political discussions are needed. To achieve greater democracy, minorities and weak political parties require reinforcement to get a voice and to promote their own interests, often through plurinominal systems⁷. Women are usually excluded in this phase and a special quota system can induce a better and long-standing peace behaviour, especially when women are also involved in governmental, judicial and the penal apparatus. Several countries appointed women in the defence ministry (Chile, Colombia).

During this second phase the Commissions of Truth are not only starting to heal the wounds of massacres and torture, but also helping to reduce the existing terror among the civil population. Persons who have been accused of crimes against humanity, of forced disappearance, rape, and other abuses against civilians have to be brought to the courts, thus re-establishing confidence in new institutions. Collective research of massacres and other war crimes undertaken by trained persons, including women, can serve as collective catharsis of war trauma, as was shown in indigenous societies in Guatemala (Cabrera 2002).

All these peace efforts tend to achieve the third stage of transition, where the reconstruction of the economy, basic services, and civil infrastructure is rebuilt. Clean water, health, food, markets, electricity, roads, bridges, education and jobs, seriously affected by war, have to be reorganized. Socially agreed priorities avoid regional and social inequalities. Once basic necessities are re-established, complex networks of transportation, energy, public administration and environmental re-establishment can be undertaken, reflecting the greater confidence of the population and international organizations into the peace process and the possible future. Often, the cleaning-up of war pollution, mines, explosives, munitions depots, barracks and other objects, requires professional support, avoiding longstanding illnesses. In Vietnam, remnants of Agent Orange are still causing cancer and other degenerative illnesses today due to genetic malformations (Stone 2007).

⁷ Minorities get a seat or more in the Parliament through special agreements with dominant parties, to guarantee the expression of minority interests.

5.6 Future of Sustainable Peace in the South: Some Conclusions

With regard to the concept 'sustainable peace' and its effect on peaceful behaviour the main arguments of this chapter are briefly summarized. First, in analogy to sustainable development (Brundtland Commission 1987, 1987a), the United Nations have tried to launch a new peace effort with preventive diplomacy and the reinforcement of human rights, both central to the UN Charter (Art. 33 and Preamble), its former Secretary-General Kofi Annan has associated with the concept 'sustainable peace'.

Second, in its strategy, peacekeeping became a major goal for containing conflicts. In these efforts the UN has been supported by the International Court of Justice and four regional arrangements and agencies (under Chap. VIII of the UN Charter): the Arab League (1945), the Organization of American States (OAS, 1945), the Organization of African Unity (OAU, since 9 July 2002 AU), and the Conference (CSCE, 1945) or Organization for Security and Co-operation in Europe (OSCE, 1994).

Third, after the Cold War was over, the great powers were not willing to rapidly convert their arms industries and to resolve existing military alliances. Therefore, they required massive arms exports to partly compensate for declining national procurements, what has increased the conflict potentials by selling weapons to warlords and unstable countries. Some of the weapons to be disarmed in Europe were smuggled to Africa and elsewhere, where they were used in civil wars by warlords and rival ethnic groups.

Fourth, the excessive emphasis on the Cold War and the failure to develop an effective collective security system due to the veto right of the five permanent members of the Security Council, downgraded urgent issues such as poverty alleviation and environmental concerns (UNCED Conference in Rio de Janeiro in 1992, and UNSSD in Johannesburg in 2002). During these nearly five lost decades of development, the gap between poor and rich countries widened, inducing increased social injustice within underprivileged countries, often triggered by ethnic tensions, poor governance, and despotic power exercise.

Fifth, resource extraction and economic growth, based on cheap fossil hydrocarbons (oil, gas, carbon) has contributed to anthropogenic global environmental and climate change, that has been exasperated by a major population growth in the South. Both global and climate change and lacking environmental mitigation processes have aggravated biodiversity losses, and

poverty has increased migration, bringing up unsustainable urban growth with slums, international illegal migration, and new threats of disasters (Bogardi/Brauch 2005).

Sixth, the legacy of the Cold War also induced and permitted practices of governmental abuse, massacres, military coups, paramilitary groups, ethnocide, discrimination, forced labour (ILO 2005), and neglect with negative results on human rights and the legal system: almost half of the world population is malnourished, undereducated, and unhealthy, counting on the deprived infrastructure often triggered by corrupt and weak governments (Welsh 1993).

Seventh, the inheritance of colonialism and struggles for independence, and current practices of political and economic actions, permitted the North to maintain control of the most important financial organizations (WB, IMF, WTO) and due to their military force, the political power. They are able to impose on weaker Southern countries their rules and procedures (SAP by IMF; unjust terms of trade; TRIPs; GATS), thus creating various forms of neo-colonialism, an increase in the social gap, and new processes of misery.

Eighth, the fragmentation, inconsistency, and gaps in the poverty assessments and the MDG and above all a missing gender-sensitive poverty and participation profile, has limited the potential of women. As during the last five millennia, women are still invisible, nonetheless ideas on gender issues and economic growth and poverty alleviation have changed (Söderberg 2004). Many international organizations still fail to meet the targets of social networks by establishing links between the level of female education and the rates of economic growth and poverty (Whitehead/Lockwood 1999). Policy requires targeting this dynamic process of related impoverishment and accumulation, to offer the South and the majority of its population conditions of sustainable peace with a dignified livelihood.

Ninth and finally, the precarious financial situation of the UN has prevented the organization from dealing in an integrated way with all complex problems. It also avoided development projects that are oriented to reduce social gaps and to include actively more women in peace processes and development. Therefore, social injustice was widened and even increased both within and among countries.

In these complex and contradictory situations the UN, together with the four regional arrangements and agencies, has tried to strengthen peace and security through sustainable peace efforts. However, the

empirical studies cited above have shown that globally the root causes of conflict have been linked to poor governance, underdevelopment, environmental destruction, famine, an unjust world economic system, organized transnational crime, and gender discrimination. To promote sustainable peace and security, military actions are inadequate and insufficient. Blue Helmets could only limit the ongoing wars and reinforce peace arrangements, but they have often been unable to guarantee the protection of lives of vulnerable people in refugee camps (in Rwanda, Darfur, etc). There is no doubt, sustainable development requires sustainable peace, and both together could be able to induce not only an agenda for conflict prevention, but also for nonviolent conflict resolution and a sustainable future. Efforts for confidence building, legitimate governments, reduction of social income gaps, and global cooperation, have been reinforced regionally and linked with cultural sensibility. These activities should focus on training electoral, judicial, executive and legislative bodies, and civil society. Further, the dynamic identification of people and processes at risk, the reduction of the vulnerable by participative resilience building, the systematization of conflict-prone activities, and peace inducing processes should be able to reduce armed conflicts. Nevertheless, arms trade, elite interests (TNE, corruption, military industry), and organized crime are threatening these peace efforts. Furthermore, above all in the South, they are hampered by legal constraints, population growth, environmental destruction, and by the effects of global change.

Confronted with these limits, and above all with new threats and risks, sustainable peace requires a world consensus where a new pact of common actions and laws must be adopted that have to be able to be implemented locally. In such a pact, international and local institutions, along with social movements, women's organization, environmentalists and child protection groups, can develop new learning processes, resilience-building, and preventive behaviour both in the North and the South (CLOC/Via Campesina/Anamuri 2002). Such a dynamic understanding of impoverishment processes is able to improve the livelihood through subsistence agriculture (Bennholdt-Thomsen/Faraclas/Werlhof 2001), micro-credits (Muhammad Yunus in Bangladesh; Lópezllera 2003), local and regional marketing; horizontal and vertical integration of productive processes (Cadena 2003, 2005); an economy of solidarity (Collin 2005; Parrilla/Bianchi/Sudgen 2005), and dignified live strategies of solidarity (Oswald 1991).

In summary, the concept and goal of 'sustainable peace' contains theoretical elements that may be able to create an integral model of society where environmental protection and recovery; sustainable energy resource management with resource efficiency and alternative energies; use of science and technology for reducing effects of global and climate change and efficient poverty alleviation and self-reliance; education for democratic reforms, economic improvement and conflict prevention; legal and social learning to care about the vulnerable and to overcome gender discrimination (IFRC-RCS 2007; Ariyabandu/Fonseka 2008); a culture of peace with tolerance and integration of minorities and women; and training for political administration and governance for citizens, civil society, politicians and public functionaries. Top-down transparent legal norms and treaties combined with bottom-up collective knowledge and wisdoms transmitted through motherhood, traditions, social movements and a gift economy (Vaughan 1997), has resulted in a widening of the conceptualization of sustainable peace, creating a post-modern utopia (Frankel 1987; Habermas 1975, 2001, 2000, 1998, 2002) that is serving humanity, nature, and the future for an inclusive, sustainable and diverse civilization.

6 Underdevelopment and Human Insecurity: Overcoming Systemic, Natural, and Policy Risk

Indra de Soya

6.1 Introduction

This chapter assesses the relationship between development and armed conflict and outlines the beneficial impacts of increasing globalization for peace¹ and security². It will also tie the continuing problems in several poor countries to their poverty-related debilities, which in turn raises the significance of changing the global policy priorities for inducing better economic growth and governance. Contrary to popular opinion, this chapter also seeks to demonstrate that poverty and conflict are part of a natural resource trap – not from scarcity of natural resources as is often claimed by neo-Malthusian scholars, some of whom are represented in this volume. In fact, the analysis here will show that it is the relative abundance of natural wealth, which affects economic and governance outcomes – the so-called ‘resource curse’. Despite several high profile conflicts involving the US after the September 11, 2001 attacks in New York and Washington, global media coverage suggests that the incidence of conflict since the end of the Cold War has increased, leading to a heightened sense of insecurity, but as I claim below, a false one, and one that detracts from more ‘real’ problems, such as poverty-related threats that affect us all.

The facts about threats to global security will show that things are actually improving. The most worrisome human security problem, civil violence within states, has decreased quite dramatically in the

past decade. Organized violence that was enduring and persistent during the Cold War has given way to what some term the ‘residue’ of warfare, opportunistic, criminalized violence that is easily addressed with concerted efforts of peace enforcement and traditional policing (Mueller 2000). In short, I demonstrate that systemic factors underlie the promise for the future, while internal factors related largely to governance and underdevelopment still pose risks.³ The pre-eminent threat to human security⁴ is violent civil conflict, which remains a high impact, high probability event for many around the world, quite unlike the low probability, high impact of natural disasters that most human security studies dwell on (Dilley/Chen/Deichmann/Lerner-Lam/Arnold 2005; Wisner/Blaikie/Cannon/Davis 2004). Finally, I conclude by identifying relevant policy for mitigating some of these risks.

6.2 The Post-Cold War Security Scene

At the end of the Cold War, there were two sharply contrasting predictions for the future of armed violence. The realist school in international relations expected that the collapse of the Soviet empire would unsettle balance of power relations and eliminate the nuclear deterrence that had allegedly provided stability after World War II – the period some have referred to as the “long peace” (Gaddis 1989). Some realists likened the ending of the Cold War to taking

1 Peace is defined as the absence of organized armed violence between and within territorial states.

2 Security is defined as the absence of threat to mind and body through either fear and/or deprivation. Security is a more encompassing concept than the absence of violence, because Iraq during Saddam may have been more peaceful but arguably less secure. No doubt, many in Iraq and the West possibly struggle with this balance.

3 I use the term risk to mean ‘human security risk’ related synergistically to underdevelopment (deprivation) and violence (armed conflict).

4 The most commonly used concepts of ‘human security’ are rather broad, encompassing security from natural hazards to security from want. I use the term in the narrower sense of security as ‘freedom from fear’ or as freedom from violent threats from states or/and private agents.

the lid off a pressure cooker at full power. They expected that the pot would spill over (Mearsheimer 1990). Old conflicts that had been held in check by nuclear deterrence would re-emerge and take Europe back to its conflict-ridden past. These realists even argued that Germany and Ukraine needed nuclear forces to balance their nuclear neighbours, France and Russia respectively (Mearsheimer 1993). In a somewhat different, but also highly pessimistic vein, others argued that conflict in the post-Cold War world would follow age-old fault lines of civilizations, with the Muslim world versus the West as a particularly unhealthy combination (Huntington 1997).

Neo-Marxists, sometimes referred to as structuralists, have also tended towards the pessimistic view. These views focus on the ills that befall the world in the absence of a counterweight to Western economic and military power. They claim that exploitation of the Third World by the rich capitalist states will be exacerbated, because Third World countries can no longer play the Soviet card to obtain concessions from the West, development assistance will decline, capitalism will run rampant, inequality will increase along with environmental quality - and the net result will be increased turmoil and armed conflict. Globalization, they argue, is already a concrete manifestation of these ominous trends, the acceleration of exploitation of the weak by the strong (Chua 2003; Cox 1997; Falk 1999; Gill 1997; Hardt/Negri 2000; Martin/Schumann 1997; Mittelman 2000).

This chapter will dismiss such views by exploring hard statistics on trends in violent conflict and present alternative views that demonstrate that the end of the Cold War and increasing globalization are forces for good in terms of both development and security, not apparent in the popular discourse spawned by the media, activists, and the motley coalition of anti-globalization groups containing economic nationalists, environmentalists, and organized labour that has taken the battle to the streets.⁵ Despite the bad news, since 1989, the world has moved from the very real possibility of thermo-nuclear war to confronting a terrorist organization - if this is insecurity, then it is a 'false sense' indeed (Gambetta 2004; Mueller 2004).

There is little reason to miss the Cold War. In fact, the current malaise that remains is a lingering

legacy of an old geopolitical structure that may have prevented great power war directly (the long peace) but one that spawned much misery among everyone else (the hot peace). It is in this light that this article also views the 'residue' of warfare that we now call terror - would Al Qaeda exist without Soviet-US enmity in Afghanistan and the subsequent US 'invasion' and partial occupation of the Middle East after the first Gulf War? Would Central Asian Islamic fundamentalism exist without US-USSR enmity and subsequent war between Russia and the Chechens, particularly if the US had not sought to destabilize the 'soft underbelly' of the USSR with Saudi money?

The hard data on civil and interstate conflicts that are presented below will show that the general trends are that the world is getting better after the end of the Cold War and that the residue of conflict that remains is an insignificant threat comparatively, one that can be traced back to the old system of geopolitical struggle, not a new phenomenon spawned by a globalizing world. Terrorism and the kinds of threats to peace we see today are insignificant by historic standards, perhaps unworthy of the overreactions we have seen in recent years (Gambetta 2004).

Unlike the realist and structuralist views of the future under conditions of globalization, the liberal perspective on the post-Cold War world is much more optimistic. It views the passing of the Cold War as an opportunity for ending ideological rivalry, settling military conflict, building peace on a firm basis of democracy and prosperity, strengthening the role of the United Nations in the world order, and reducing military expenditure due to costly arms races between the superpowers (Russett/Oneal 2000). A huge peace dividend is potentially realisable. Liberals view growing interdependence through trade and investment facilitated by the end of the geopolitical struggle between superpowers, growing cooperation between former Third World countries and the rich world, a growing consensus around a global economic order based on liberal principles of free trade and investment, and rising levels of democracy across the globe as propitious for increasing prosperity and peace (Bhagwati 2004). Interdependence not only increases the chance of reducing poverty, a major cause of misery in the world, but also for promoting concerted international action to end conflict where they start, thereby reducing prolonged misery.⁶

On the face of it, popular opinion in the post-Cold War world was shaped by realist pessimism given the outbreak of genocidal violence in former Yugoslavia, the Caucasus, and genocide and state fail-

5 The anti-globalization movement seems to have galvanized since the 'battle in Seattle' and demonstrate against globalization in almost every gathering devoted to addressing global issues.

ure in many African countries, most notably Rwanda and Somalia. Moreover, the invasion of Kuwait by Iraq galvanized a coalition of US and Western troops that were used abroad in large-scale action not seen since the end of the Vietnam War. However, much of the increase in conflict in the early 1990's was fleeting, an exception, largely due to the end of empire and adjustment to new circumstances. The 'long peace' of the Cold War of course is really a misnomer when applied to the rest of the world - true there was no superpower war, but people died in good numbers in the various proxy wars that were part of the superpower geopolitical struggle.

The removal of a repressive overlay in 1989 or so resulted in violence, broadcast around the world by a globalized media. The fact that many of these conflicts were also closer to home - read the 'rich countries' - heightened the sense of threat and the degree of media coverage. In general, the lack of a reason for war among the powerful states of the system and the relatively peaceful end to bloc politics has led some to even claim that war has become anachronistic (Mueller 1995). Indeed, the most pervasive form of violence around the world is civil war, a type of conflict that results in great loss of life, destruction of property, and leaves a lasting legacy of suffering. In the words of some, it is 'development in reverse' (Collier/Elliott/Hegre/Hoeffler/Reynal-Querol/Sambanis 2003). The relative peace between states is encouraging, but what is the long-term trend?

Figure 6.1 shows the development of all types of armed conflict (measured at a threshold of 25 battle-deaths) after World War II. The figure includes interstate as well as internal conflicts. The data show clearly that in the aftermath of the great changes in 1989 conflict increased briefly, mainly due to the new conflicts in former Yugoslavia and the Soviet Union. Soon, however, the post-war trend has been reversed, largely due to the new potential for settling conflicts, which in turn must be due to the end of superpower confrontation, particularly in Central America and South America, East and South East Asia, and elsewhere. Figure 6.1 shows the risk that any given state will be experiencing armed violence (civil war, or international war with 25 deaths and above). Since

the figures are computed at the monadic (country year) level, the risk is exaggerated for international (interstate) war because by definition it takes at least two states to fight.⁷

As figure 6.1 demonstrates, most conflicts in the post-Cold War world, as is the case during the entire post-war years, are internal conflicts. There have always been very few interstate conflicts at any time, and in the last few years there have been almost none. Keeping in mind the magnification of interstate war risk relative to civil wars, the figure shows clearly the effects of the Korean War, the Vietnam War, and to a lesser degree the 1991 Gulf War, where the risk of interstate war is a function of the number of states participating relative to all states in the system and reflects the nature of bandwagoning and collective security in action (being allied with one of the protagonists and coalitions of the willing). Notice that the peaks for interstate wars are higher and the time spent in war (thickness) longer. This is clearly an effect of the Cold War nature of these conflicts and indicates the potential they posed for becoming internationalised.

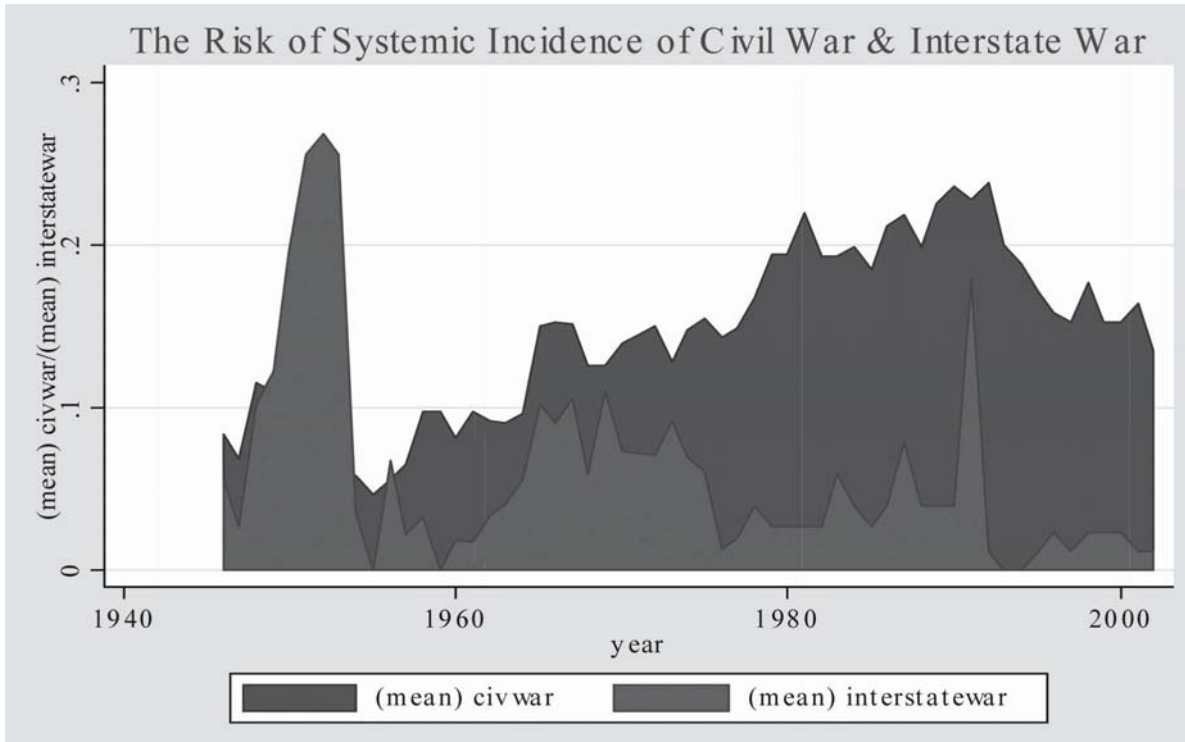

Many of the conflicts classified as interstate in recent years (Yugoslavia, Eritrea-Ethiopia) have been borderline cases where the warring parties have recently been part of the same national state. There have been a couple of large wars in terms of the number of countries involved and the amount of military materiel and the number of combat troops (notably the Gulf War of 1991, the Kosovo War of 1999, the ousting of the Taliban government in Kabul by coalition troops in 2001, and the ousting of Saddam Hussein by the Anglo-American coalition in 2003), but all of these conflicts were small scale when compared historically. Consider that the Iran-Iraq war killed over million combatants. The new wars, on the other hand, contain an element of great power willingness to enforce international law and police 'rogue' states, albeit when it is in their interests to do so.⁸ Collective security actions sanctioned by the United Nations were unthinkable during the Cold

6 Civil wars, for example, last longer than international wars and kill people through disease and poverty long after fighting has stopped. The costs are estimated at 50 billion US\$ per year, which is roughly equal to total ODA (Collier/Elliott/Hegre/Hoeffler/Reynal-Querol/Sambanis 2003).

7 Since by definition international war is war between at least two states, interstate wars will proportionally make up a larger risk (2:1) relative to a civil war.

8 Of course, growing interdependence will make even the farthest conflict 'interesting' for the major powers to try to moderate. Nobody is immune from events far away as the September 11th impact on Afghanistan suggests, or that a crisis in faraway Darfur will elicit a visit there from the US Secretary of State and the British Foreign Secretary.

Figure 6.1: The Risk of Systemic Incidence of Civil War and Interstate War. The civil war and interstate war are conflicts that have reached 25 deaths or more in the Uppsala-PRIO Armed Conflicts dataset. The risk is computed at the monadic level. **Source:** Gleditsch/Wallensteen/Eriksson/Sollenberg/Strand 2002.

War because it might have led to general war and nuclear holocaust if the superpowers opposed each other. The bottom line is that of 116 conflicts on record since 1989, only 7 are recorded as having been interstate wars, 111 of all organized instances of violence involving a state have been internal war (civil war), which accounts for a full 96 per cent of armed violence (Eriksson/Wallensteen 2004).

The large number of internal conflicts is closely linked to the state formation process in the decolonization period, with shifting governance structures and power coalitions, and with numerous unsettled claims for secession. During the Cold War, any such local conflict could become a globally-significant issue if the superpowers allied themselves with the warring parties, as they did in Korea, Cuba, Angola, Nicaragua, Vietnam, the Middle East, and elsewhere. Because of the strategic nature of the superpower struggle and the barriers this posed for international action, these wars were likely to last. This was particularly true when it came to resource-wealthy Africa and Latin America where conflicts were often proxy wars funded and aided both morally and materially by the superpowers.⁹ As we argue below, the proxy

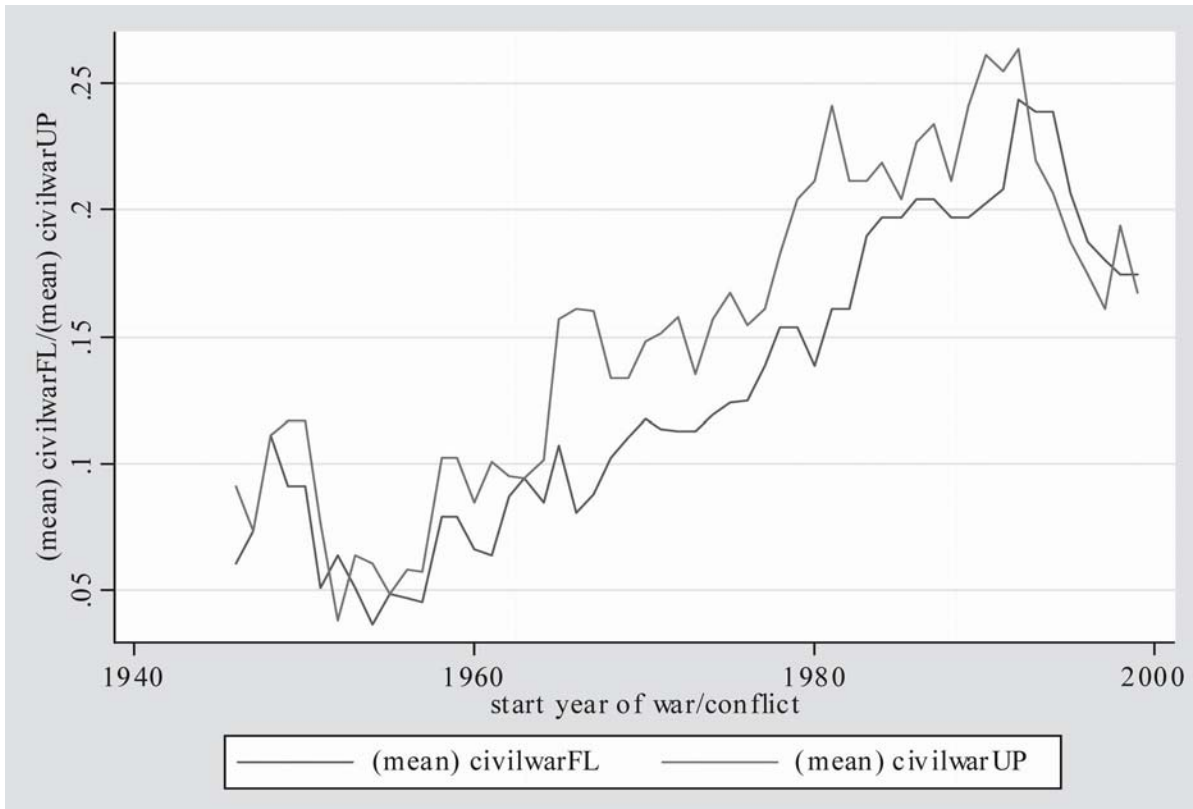

wars that were fought as a result of superpower politics still account for a large number of lingering wars, such as Angola, Ethiopia-Eritrea, Colombia etc, and account directly for the 'residue' of warfare in the form of terrorism, an issue to be discussed further below. In the post-Cold War world, the major powers have to an unprecedented extent worked together to contain the conflicts rather than exploit them in wars fought by proxy. This simple fact is often forgotten, given the magnification of some conflicts over others by 24-hour news, amplified even more today because of terrorist attacks against the US and the subsequent 'war on terror'. As figure 6.2 demonstrates, the incidence of civil war is declining, not increasing as the popular media and 'common' wisdom often suggests.

We examine two data sets largely independently constructed and using two different battle-death thresholds for inclusion.¹⁰ As seen there, both data-

9 In fact, in two Middle East crises, the US nuclear forces prepared to launch nuclear attacks against the Soviets.

10 For details of the coding rules, see: Gleditsch/Wallensteen/Eriksson/Sollenberg/Strand (2002) and Fearon/Laitin (2003).

Figure 6.2: The annual average risk of civil war measured at two levels of intensity, 1946–1999. **Source:** CivilwarUP is the annual average risk of civil war at the threshold of 25 battle deaths and above taken from the Uppsala-PRIO dataset on armed conflicts (Gleditsch/Wallensteen/Eriksson/Sollenberg/Strand 2002). sets on civil war confirm liberal expectations. The risk of conflict (the annual average incidence of civil war) increased throughout the Cold War period, peaking in 1992 because of the end of empire conflicts with the break-up of Yugoslavia and the USSR. This peak seems to have been only momentary in the wake of an increasing trend of accumulating conflicts since the period of decolonization begun after World War II. This trend has dramatically declined since the end of the Cold War. The decline seems to be a steady trend over a decade rather than a temporary shift. Our figure ends in 1999, but the latest figures show even further declines since (Eriksson/Wallensteen 2004; Tierney 2005). The regional trend in civil war is also illustrative of the post-Cold War shift, namely the end of bipolar conflict.¹¹

Many of the dire predictions for the post-Cold War world have been based on a projected increase

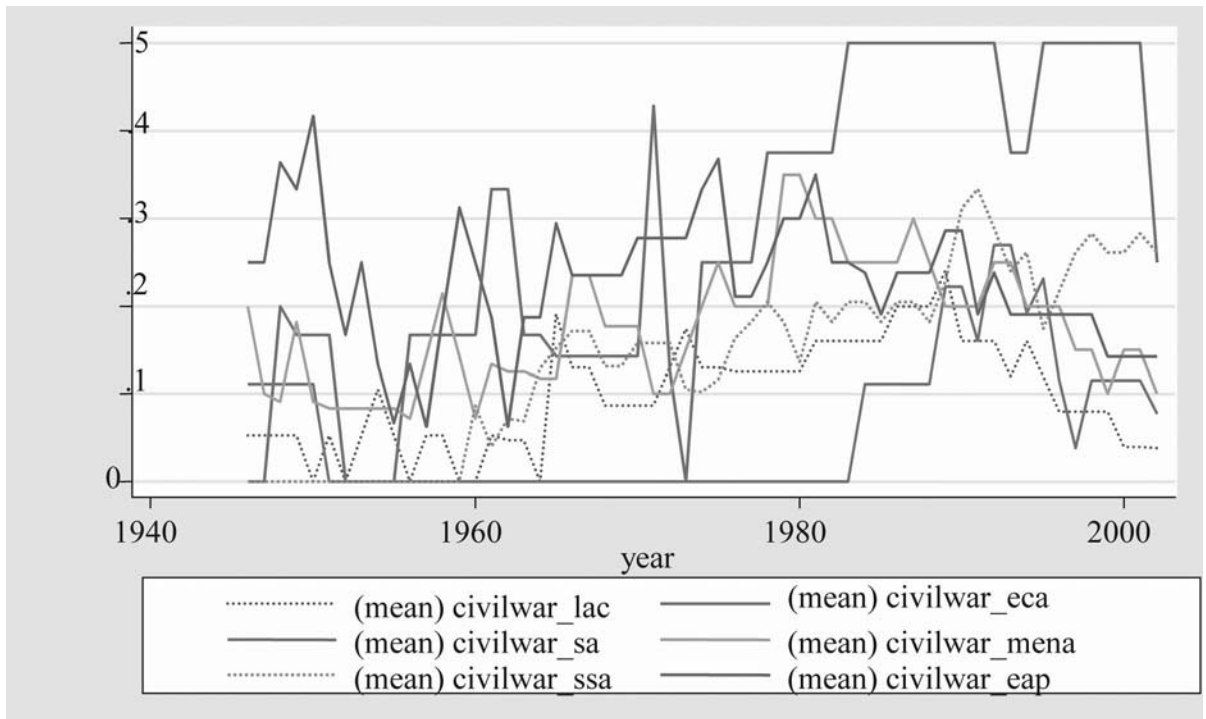

in so-called ethnic conflict. Indeed, many of the new states have been ethnically divided and the state-formation conflicts have frequently been fought along ethnic lines, exemplified most clearly in the Balkans and the former Soviet states. However, most countries are ethnically divided without suffering from state collapse or armed struggle (Fearon/Laitin 2003; Varshney 2001).

Recent data indicate that those conflicts with a heavy ethnic component are now on the wane, along with other forms of armed conflict, but the figure for the regional risk of conflict above hints at why we might get the impression that identity conflicts may be on the increase - they might be the only ones that remain, i.e. the harder ones to solve. Moreover, the two regions with high average levels of conflict remain the poorest regions of Sub-Saharan Africa and South Asia, both regions with high ethnic fractionalization and ethnicized politics.

As figure 6.3 demonstrates, the trend in civil war reflects the general downward swing in Latin Amer-

Figure 6.3: The regional risk of civil war, 1940–2002. **Source:** Civil War data from the Uppsala-PRIO data set. Wars are those with over 25 battle-related deaths. The regional classifications are from (Easterly/Sewadeh 2001).

ica, East and South East Asia and the Pacific region – which had the highest risk of civil war at the height of the Cold War period (the falling dominoes!). Surprisingly, the Middle East is also on a downward curve after highs in the late 1970's to the mid-1980's. This is presumably due to the reduction of violence involving Israel and her neighbours, such as Lebanon and Egypt, the wars between the North and South Yemen, revolution in Iran etc. Notice that the only region with a sharp upward swing is Central Asia immediately following the break-up of the USSR, but the risk there has declined now to a level slightly above Latin America. Despite a rapid decline in the risk of violence in South Asia as a region, both it and Africa remain the most seriously problematic regions as a whole, with little indication that these trends are reversing any time soon.

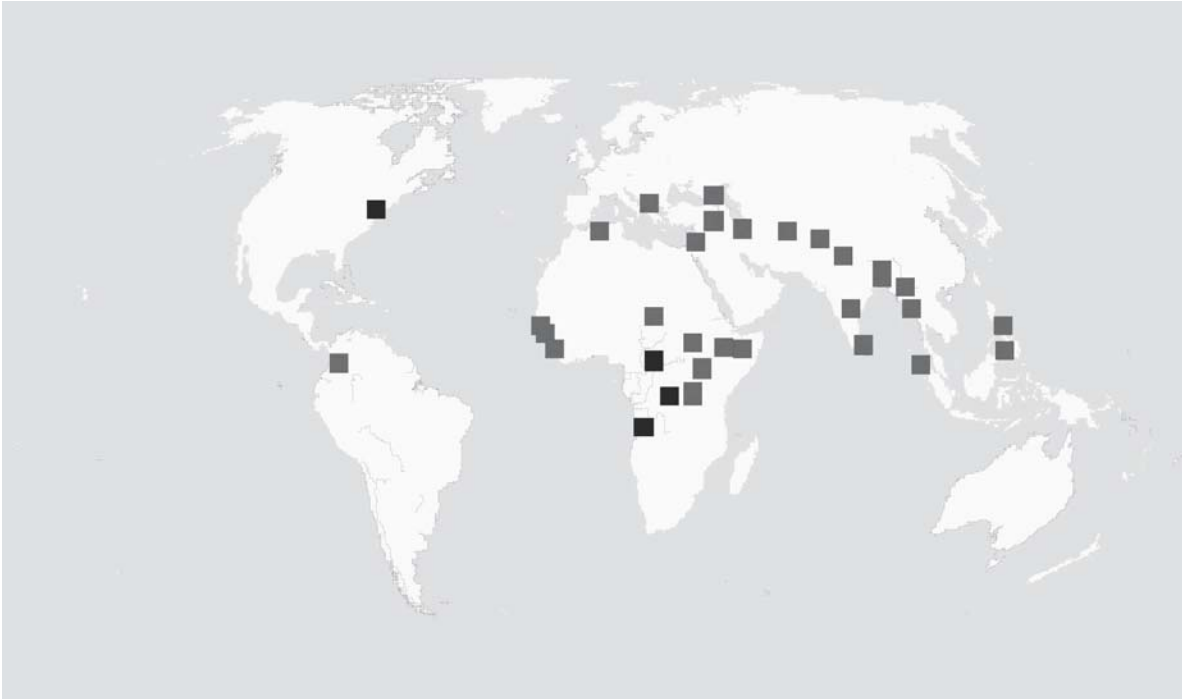

The perception that identity-based conflicts are on the rise probably has something to do with the flare up of end-of-empire conflicts, and that the majority of civil conflicts that remain are in regions where ethnic or religious cleavages, such as in Sri Lanka, Pakistan, India, and Bangladesh are easy to exploit because of poverty and weak government. Bangladesh and Nepal's violence are explicitly politically motivated, also because of weak governments and conditions that allow insurgency to flourish. The gen-

eral reduction of conflicts deemed ethnic and the lack of support that civilizational categories matter for explaining their outbreak is evidence against yet another pessimistic scenario on future world security, particularly Samuel Huntington's celebrated thesis about the clash of civilizations (de Soya 2002; Marshall/Gurr 2003; Mueller 2000; Russett/Oneal 2000; Sadowsky 1998; Tuscisny 2004; Weede 2004).¹² A glance at the location of where civil conflicts exist geographically in 2002 is illustrative (see figure 6.4).

There is a line of civil wars that stretch from the Balkans down through Central Asia into South and South East Asia, a line of conflicts that look suspiciously like the line of containment held by the United States in its fight against the Soviets. The rest of the conflicts cluster in Sub-Saharan Africa, and there is one remaining conflict in Latin America (Colombia).¹³ The reason for the perceptions, again, seems to be based largely on the fact that the only conflicts that remain are those in parts of the world

¹² My own recent work demonstrates that higher ethnic, religious, and cultural fractionalization reduces state militarization, measured as military spending, size of militaries, and arms imports. If difference is dangerous, why do governments not act like it is? (de Soya/Neumayer 2005a).

Figure 6.4: The geographical location of civil conflicts that have reached at least 25 deaths in 2002. The map is generated using the programme: ViewConflicts 2.2 developed jointly by the Norwegian University of Science and Technology's Department of Geography and the 'Armed Conflicts' Data Project, a result of cooperation between the Peace Research Institute Oslo (PRIO) and Uppsala University's Department of Peace and Conflict Research. The program to generate the maps can be downloaded at: <<http://www.svt.ntnu.no/geo/forskning/konflikt/viewConflicts/>>.

where ethnicity, particularly in the form of Islamic fundamentalism, is a ready resource for exploitation due to conditions that raise the opportunities to organize violence against states, such as poverty, lack of development, and the resultant state capacity required in turn for peace and prosperity. The terrorist attacks against Russia and the USA and the subsequent war against Al Qaeda have fuelled the perception that cultural fanaticism motivates violence. Notice the striking absence of conflicts in Latin America, a region that had been plagued by violence during the Cold War period.

The 'war on terror', currently dominating the news, indicates how superfluous the reasons are for thinking that it manifests emerging civilizational struggles, in this case one between the Christian West led by the USA and an Islamic Middle East, repre-

sented by Al Qaeda. Terrorist activity around the world, relative to other forms of violence, such as random crime, gang activity, and drug-related violence, or even death because of a traffic accident or aids, is far less likely to kill someone. A terrorist, however, tries to create a cognitive bias by killing at random and gruesomely. It is the picture that matters! In achieving this objective, Al Qaeda seems to have succeeded. The September 11th attacks have generated a mindset of a 'war on terror' generally read a war on 'Islamic terror'. The United States is not about to invade Northern Ireland or the Basque region of Spain because the Irish Republican Army (IRA) and the Basque terrorist group (ETA) are known to be connected to 'terrorism' at home and terrorist groups abroad.¹⁴ Yet, the man on the street views recent terrorist events as a simple battle between those who claim to represent a religious strug-

13 The September 11, 2001 attacks against the US are recorded as an outbreak of civil violence in the US due to coding rules. This arguably does not fit the bill as a traditional civil war fought within the territorial confines of a state.

14 The cynical way in which the former Spanish government tried to manipulate the Madrid train bombings was precisely to gain advantage in its own fight at home.

gle (Jihad) against infidels, a view often pushed by governments in the West and by Al Qaeda. In fact, any terrorist act, usually committed for a variety of reasons by fragmented groups such as nationalists, separatists, anarchists, and psychopaths of various sorts working without coordination are likely to be seen monolithically – if you are not with us you are against us. This works in Al Qaeda's favour and possibly encourages many disparate groups from the Islamic world to carry them out against Western targets.

For its own reasons, the present government of the United States has exaggerated the threat from terrorism, which remains a low-probability threat, assigning all acts of terror to Al Qaeda. As some argue, however, the September 11th attacks are a highly unusual event compared with the norm of terrorist activity – even compared with other Al Qaeda activity in the past. This low-probability event was carried out by a handful of people who do not fit the usual terrorist profile – a mentally unbalanced individual. But as the sociologist Diego Gambetta has written, “when thinking about low-probability bad events we are easily trapped between two undesirable extremes – before, we do not worry about them; after, we worry about them too much” (Gambetta 2004; Mueller 2004). Al Qaeda seems to have achieved its intended psychological effect of organizing a high impact, low probability terrorist act, and this overreaction promises to be more costly. As Gambetta concludes from his analysis, “the questionable rationality of the post-9/11 mindset and the strategic approach it has induced which may well outlast the Bush administration-poses far more serious and consequential problems for all of us than the propaganda or low-level conspiracies” (Gambetta 2004).

We reject the notion, based on all empirical evidence examined here and elsewhere, that there is an emerging clash of civilizations, of which the ‘war against terror’ is the first shot. Overreaction to terrorism, rather than cautious vigilance, is likely to be counterproductive for the ‘war against terror’ and extremely dangerous for international stability. The actual danger from terrorist attacks, on the other hand, is minuscule compared to other events, including poverty and the spread of diseases, such as aids. Moreover, traditional forms of organized violence, such as civil wars tend to continue to kill much larger numbers of people on a daily basis than does terrorism. While we discuss next the ways in which country-level characteristics generate and perpetuate civil violence, it is instructive also to bear in mind that

dependencies exist between international war, civil wars, and terrorism. As mentioned above, whether one thinks of Chechen groups active in Russia, or Al Qaeda's origins, international wars have contributed to the spread of civil war, and vice versa, and this fact is also certainly true of international terrorism.¹⁵

Indeed, it would be utter folly to understand the origins of current terrorism without examining the international wars, particularly those during and immediately following the Cold War, such as the Arab-Israeli Wars, the Soviet-Afghan War, Chechen War, 1991 Gulf War, the Balkan Wars, etc). The civil wars that remain and the terrorism that continues are residual security threats that are low probability but high visibility events in a world that is much improved in terms of violent conflict and a costly balance of terror. On all indicators, interstate war, civil war, and the long, bloody regional conflicts involving the superpowers that perhaps account for the current terrorist activity, are on the wane.

It is fair to say then that the risk of internal conflict peaked right after the Cold War but has declined to a lower level today than what it was in the early 1960's. The popular view is probably heavily driven by what some term the ‘progress paradox’, where people believe that they have it bad precisely when things are improving (Easterbrook 2003). The one region, where the risk of conflict has been steadily rising is Africa, which of course is also the region that has benefited the least from the advantages of globalization since the 1980's and where economic modernisation has been slowest. Much earlier analyses based on the structuralist tradition had tried to demonstrate that global capitalist forces were responsible for internal conflict within the developing world by arguing that the structure of the world system was exploitative, and drove income inequality, which in turn led to ‘relative deprivation’ and conflict (Boswell/Dixon 1990; Rothgeb 1996). In a later section we shall demonstrate new understanding of internal conflict and the supporting empirical evidence, which demonstrates the benefits of growth, trade, and open markets for international and civil peace. In hind-

15 One might claim that suicide bombings are a particularly Islamic form of terrorism, or religious zealotry (Jihad). Scholars have spent little systematic effort on understanding how suicide is organized with a few exceptions (Gambetta 2005). In 1994, 24 members of a Swiss cult committed mass suicide. The difference between religious zealotry and the availability of recruits for suicide might simply be how and why it is organized, not the mindsets created by religion.

sight, much of the burden of debt, disease, commodity dependence, and poor governance may be traced to Africa's desire to 'go it alone', recommended most ardently by these dependency theorists and economic nationalists (Amin 1990). The result has been a 'lost decade', compared to relatively open East and South East Asia that have adapted to international markets.

6.3 Nurture, not Nature!

Before I discuss how globalization promises poor countries an avenue for reducing risk, relative to the bipolar period, what about nature? According to many, poor countries are poor and insecure because nature has been unkind to some (Homer-Dixon 2000; Meadows/Meadows/Randers 1993). Many empirical studies find that developed states are resilient to shocks. People are resilient to natural disasters as well as short-term economic shocks. Wealth is good beyond simply allowing higher consumption. Development also may mean that risks are mitigated with the application of capital and technology and superior organization (Wisner/Blaikie/Cannon/Davis 2004). Consider the fact that the same hurricane that hits Florida and Haiti has far different consequences for the two societies inhabiting these two territorial entities.¹⁶ Thus, wealth is insurance that increases human welfare far beyond simple consumption. The usual way of gauging the level of development is per capita income. Recently, neo-Malthusian views that link poverty to the unkindness of nature suggests that poor countries are trapped in a vicious cycle of poverty, underdevelopment, and insecurity because they lack resources from their physical environments to overcome the risks. Moreover, much of the blame could also be placed on global processes of environmental change, rising consumption, and growing scarcity (see Dalby in chap. 9). If, as I have outlined above, the systemic factors hold promise for a better world, then what about the Malthusian trap?

Contrary to the globalization (or increasing markets) perspective, neo-Malthusians connect poverty in developing countries to the lack of environmental resources (see also discussion in this vol.: chap. 7 by Brown; chap. 8 by Uvin). Poverty, a degraded planet, and environmental scarcity are supposedly mirroring

poor countries in a conflict-poverty trap. Thus, with increased global climate change, poor countries are likely to suffer increased vulnerabilities (Homer-Dixon/Blitt 1998; Homer-Dixon 1991). The weight of the evidence, however, is exactly the opposite. Environmental wealth is wasted as part of the resource curse, thereby costing current and future generations the benefits of using resources wisely for diversifying away from dependence on the natural environment for creating wealth. Moreover, there is little evidence to suggest, apart from petroleum, that natural resources are becoming increasingly scarce globally, and that various forms of technology are not displacing them. Figure 6.5 shows the long-term trend of prices for various sorts of resources. As seen there, all resources have steadily dropped in value per unit over time.

Nor does it seem that poor countries lack 'stocks' of natural wealth relative to the richest countries. The World Bank recently estimated the contribution of natural, human, and physical capital to the total wealth of about 100 countries as part of its Green Accounting programme.¹⁷ These estimates allow us to see what it is that the poorest countries lack, defined by the World Bank's 'low income' group, relative to the high income countries. As figure 6.6 shows, what the poor countries lack relative to the richest are clearly human and physical capital, not natural capital.¹⁸ Despite having only 2 per cent of the income per capita of the richest countries, the poorest countries have more than 60 per cent of natural capital. In other words, what Angola or the DRC lacks relative to Belgium or Portugal is not nature's gifts, quite the opposite.

While natural resource scarcity, thus, might be viewed with some caution as an explanatory factor in civil war, scholars find recently that 'greed-driven' factors are more powerful than 'grievance-driven' factors for explaining the outbreak and continuation of violence (Collier/Hoeffler 2004; Collier/Elliott/Hegre/Hoeffler/Reynal-Querol/Sambanis 2003; de Soysa 2002; Fearon/Laitin 2003). Several key findings within this literature point to state and social capacity as crucial for preventing 'greed-driven' forces from causing conflict. The main assertions of this literature

16 The devastation of New Orleans by Hurricane Katrina shows that even relatively wealthy places are not immune if governments have been lax and where preparation has been weak. Floridians have learnt the hard way over time, as I am sure Louisianians have today.

are based on the key finding that extractable wealth in terms of large natural resources (relative abundance) provide the payoff for organizing large-scale violence (Berdal/Malone 2000; Collier 2000b; de Soysa 2002; Ross 2004). As some argue, conflict is not universally harmful, but a few can 'do well' out of organizing civil war (Collier 2000a). Since the provision of justice is a 'public good' altruistic individuals rarely spring up to serve justice by bearing all the costs of organizing rebellion. Groups organize for violence because of private gain. Likewise, peace is a public good, which often prevents the majority from organizing for peace, which can be very costly. Ac-

ording to the theory of collective action larger groups are harder to organize than smaller groups because the payoffs/costs are more concentrated the smaller the size and because free riding can be monitored more effectively (Olson 1965). However, given the destruction caused by conflict, people who are productive in society have the necessary incentive to organize for peace, yet they cannot because of free riding. The more society stands to lose the easier will be the organization for solving collective action problems - this is the main message in the burgeoning literature on social capital and perhaps also explains why developed societies are resilient to shocks

Figure 6.7: Food Production Index for year 2002. **Source:** Data from WDI CD-Rom (World Bank 2004). Index: 100 = 1989-1991. Blue shaded area = 150 & greater, Red shaded area = below 90.

(Putnam 1993; Varshney 2001). Higher levels of development raise the pay-off for maintaining peace and strengthen social and state capacities for providing the public force necessary to check socially harmful behaviour (Bates 2001; Fearon/Laitin 2003). Yet, this is difficult if indeed the pay-off to organizing violence is high and finance for it is available – where concentrated benefits for a few exist!

As seen above, wealth reduces risk. However, some resource-wealthy states are prone to conflict despite higher levels of per capita income, generally speaking (such as some Middle Eastern states, i.e. Saudi Arabia). We argue that the evidence within the recent empirical work on civil conflict, which demonstrates that natural resources and weak institutions are intimately related to the ways in which social technologies of peace erode, supports the argument that globalization should work towards supporting civil peace. In this sense, trade and investment and continued globalization will allow state (institutional) and social capacities (informal institutions) for developing, creating the webs of interdependence required for stable peace between states, within regions, and within states (Russett/Oneal 2000; Weede 2004). We view this both as supply driven through state institutions and demand driven by organizational abilities of social forces from below.

The finding that resource wealth is related to greed-driven conflict is key. Resource wealth does

not only provide lootable income to private actors, but it leads to semi-private states, or what some call ‘shadow states’ (Bates 2001; Karl 1997; Reno 2000). Shadow states, by their very nature, are states that are captured by a few private interests. Moreover, the nature of the economic pay-off, or viability of the state, provides the rationale for institutional development and strength. A convenient resource stream, such as extractable mineral wealth, leads to withering of institutions around the collection of taxes, thereby weakening the social contract necessary for building a tax base from society. Moreover, a convenient resource stream renders social bases of taxation superfluous, which leads to semi-privatized states that will be disinterested in providing the optimal level of public goods, which will ultimately erode social and human capital (Woolcock/Pritchett/Isham 2001). Resource wealth also allows states to close their economies and practise industrial substitution policies, which some have referred to as ‘precocious Keynesianism’ for state-building along nationalist lines (Waldner 1999). This according to others is the ‘natural resource curse’ that seems to be at the heart of some of the social ills facing many poor countries (Auty 2001; Ross 1999). Moreover, all these pernicious effects form a powerful cocktail that leads often to state and social disarray, violent civil wars, and continued marginalization. There is, however, nothing automatic about resource wealth that leads to disarray as Bot-

swana, Norway, or Canada might attest. The problems can often be corrected by policy (Auty 2000). In an age of globalization, the technology and capital required for diversification of economies away from dependence on monoculture development is available to a greater extent than ever before, which is promising. Thus, systemic factors are right, but internal policy factors have not adjusted equally.

The conditions of globalization are ostensibly driven by increased trade between states and across regions. Growing trade is also supplemented, supplanted, and complemented by foreign investment (FDI).¹⁹ These aspects are generally seen as the hard drivers of globalization (de Soysa 2003; Keohane/Nye 2000; Simmons/Dobbins/Garrett 2004). Today, poor countries, which were once against global liberalism, have changed their minds (Krasner 1985), a point exemplified most clearly, in the economic realm at least, by the Chinese reversal, Vietnam, or even Cuba (Clapham 1995). What poor countries lack is capital and technology for improving their trading position, diversifying away from primary commodity dependence, and creating the necessary economic growth. Globalization helps since trade and investment benefits poor country growth (Bhagwati 1999; Collier/Gunning 1999; de Soysa/Oneal 1999; Dollar/Kraay 2000; Srinivasan/Baghwati 1999). Trade dependence and FDI may improve conditions of human rights (Apodaca 2001; Busse 2004; Richards/Gelley/Sacko 2001), social conditions facing labour (Garrett 1998; Neumayer/de Soysa 2004, 2005), environmental conditions and economic sustainability (de Soysa/Neumayer 2005b; Garrett 1999; Yu 1994), and even internal peace (Barbieri/Reuveny 2005; Bussmann/Scheuthle/Schneider 2005; de Soysa 2002; Krause/Suzuki 2005; Weede 2004). In fact, of several variables explaining peace between states, trade, joint democracy, and joint membership in international organizations have strong statistically significant effects on peace that are substantively large, supporting theories of peace and cooperation going back to Montesquieu, Immanuel Kant, and the Manchester School. Interdependence promotes peace (Russett/Oneal 2000). Gaining interdependence is a policy problem, allowing human agency in building a better world.

We have contended that conflict and development are consequences largely of policy. Thus, better policy environments locally and globally promise to make a difference. Better governance does not easily come about, however. It has to be affected through incentives. The end of the Cold War and all the attendant political, ideological, and strategic considerations no longer exist. In this era of globalization, the opportunity for building a better environment for development and peace exists. Most countries around the world seek to be more globalized, although as some suggest, Sub-Saharan African countries may still suffer from internal biases against open markets and domestic rent-seeking coalitions that prevent better policies that would move many of these countries away from resource dependence and insecurity (Moss/Ramachandran/Kedia Shah 2004). Moreover, several parts of the world that enjoy nature's gifts may in fact be cursed, but yet again, the resource curse may be overcome with conscious effort.

6.4 Conclusions

Underdevelopment and human insecurity are inextricably linked. Although most of the world's people are increasingly facing better prospects for security – both social and physical – the opportunities afforded by the end of the Cold War and the current age of globalization are not being realized equally by all, despite steady improvements (Kenny 2005). The incidence of organized armed violence is declining rapidly since the end of the Cold War, and the risk of organized civil war today is somewhere near what it was at the beginning of the 1960's, this despite the fact that there are far more countries and less repression; i.e. 'garrison states'. Globalization promises security and development. Contrary to neo-Malthusian arguments that see a bleak future for security and development based on natural limits to growth and consumption, policy matters. However, natural resource abundance, not its scarcity, hampers both good policy-making and civil peace required for ensuring long-term development and human security. Unfortunately, however, some parts of the globe, such as Africa and South Asia, may lag behind.

One of the primary reasons increasing the risks for Africa is natural resource dependence. The crucial task for global policy would be to direct aid, trade, and investment policies towards diversifying African economies away from extractive activity. The problem, as some pessimists on globalization claim, is not

¹⁹ I focus below on direct investment (FDI) rather than portfolio capital, which is a tiny part of capital flows to the poorest countries because of underdeveloped capital markets.

that Africa is captured by global markets hungry for resources, but that policies in these countries prevent resource rents from being translated into sustainable development. In fact, resources are being wasted rather than being deployed for productive investment. Angola, Nigeria, and the DRC could be some of the richest places on the planet if wealth were properly managed. Overcoming the 'resource curse' might be a worthy challenge for global policy to address. Unfortunately, while governments pay lip service to the issue, very little is done. The private sector initiatives, such as Corporate Social Responsibility (CSR), are a start, but the incentives to shirk (cheat) are so great that only time can judge their success. Besides these initiatives, institutions of global governance, such as the International Financial Institutions (IFIs), could step in to devise programmes that help states manage their wealth better, such as the management of rents from the Chad oil pipeline.

Poor countries, such as many in Sub-Saharan Africa, lack physical and human capital necessary to join the globalized economies of the world. Many fall behind the rest of the world. Trade and investment could lift these countries out of this trap. However, domestic factors, such as rent-seeking and attitudes of governments and elites against open markets and foreign capital, may still be hindering the rate of convergence with others (Moss/Ramachandran/Kedia Shah 2004). The international policy community, and perhaps also the academic communities, could work to increase transparency and awareness around how globalization can benefit these countries. The empowerment of civil society with increased levels of democracy goes some distance towards creating greater transparency and preventing rent-seeking, leading to greater openness of these countries to trade (Milner/Kubota 2005).

The onus is not purely on the poor world. Rich countries should also do their part. Paradoxically, when the former colonies are becoming more open to global markets, the rich are cutting them off with tariff and non-tariff barriers (Bhagwati 1997). Apparently, jobs are being lost to the South, but consider that the rich world spends over 600 billion per annum on defence, 300 billion dollars on agricultural subsidies, and only 60 billion on aid. One is forced to ask how this allocation improves the security for the rich. Clearly, local and global rent-seeking hinders proper management of wealth, increases inefficient allocation, and perhaps hinders the prospects for development and peace. It is quite right that the 'international community' focuses more and more on hu-

man security. It might be that future acts of global governance adjust the rich countries' policies that violate the 'human security' of the poor, the most odious kind of exploitation. Concerted global governance that addresses these imbalances is now more imperative than ever.²⁰ The question, however, comes down to political will, but despite goodwill, politicians will not act given imprecise advice. Perhaps consensus should be sought first among epistemic communities who can then bring sharply-focused knowledge to bear that raises the costs of self-serving politics. My hope is that this chapter is a small part of the larger debate that this book generates in the wider arena in academia that dares to address policy relevance and forge the discussion that makes the comfortable somewhat uncomfortable.

20 Institutes such as the Center for Global Development measure the commitment of the rich countries to helping the poor. See <www.cgdev.org> for their index.

7 Emergent Sustainability: The Concept of Sustainable Development in a Complex World

Casey Brown

7.1 Introduction

The concept of sustainable development derives from the fundamental concern of human society and its need for security.¹ The popularity of the term and the attention it receives signal a general dissatisfaction with the direction of things on planet earth. The most vociferous calls for development that is ‘sustainable’ (as opposed to ‘business as usual’ development) come from the developed world. Some have interpreted this as an affluent society focusing on the luxury of environmental quality. More likely, the developed world senses that its way of life is threatened. We need to look no further than the typical tenets of ‘sustainable development’², i.e. economic development, environmental protection, and social systems, to find at their root a threat to the security of the developed world. Economic development is necessary for any society to maintain its current standard of living while undergoing population growth. Environmental protection is less a luxury and more a requirement to preserve the earth’s life support system. Increasingly, the developed world realizes unfettered economic growth by the undeveloped countries endangers their environmental security. Global warming is the most prominent example of a transnational environmental security threat. Finally, social unrest and inequality foment acts of violence against civilization, including terrorism. In this way, sustainable development is motivated by the basic need for security.

The links between security and poverty, environmental quality and social systems, are addressed in other chapters in this volume. This chapter explores

the concept of sustainable development and the linkages between economic growth, the environment, and society. The great uncertainties regarding the future and the complexity of the human-nature system that characterizes the “Anthropocene” (Clark/Crutzen/Schellnhuber 2005) overwhelm traditional decision analytic approaches to the question of sustainability. A new scientific and policy framework is needed. Complexity science may offer guidance in how to influence the direction of a complex system like the interwoven social, economic, and ecological systems that comprise our environment. From this “new kind of science” (Wolfram 2002) we learn that top down approaches yield unreliable results. Instead, the combined impact of the actions and decisions of individual agents spawn macro-level ‘emergent traits’ that dominate the direction of the human-nature system. The result is the need to provide the conditions such that the human-nature system manifests sustainability as an emergent trait. Assessing sustainable development from a complex viewpoint motivates a conclusion that the necessary conditions include economic growth and good governance.

This chapter begins with a brief review of the concept of sustainable development. An introduction to complexity science follows. This section will present the concepts relevant to the later discussion of achieving sustainable development only, and the interested reader should refer to the references included for a proper introduction to the subject. Finally, the three key tenets of sustainable development, as usually conceived, namely economic growth, environmental protection, and social justice, are evaluated critically for their relevance to the concept of sustainable development and prospects for implementation. Insights from complexity science are drawn to inform this assessment.

1 In this chapter security is defined as being free from threats that prevent one from pursuing that which they value in life.

2 This term will here be used as economic development that includes environmental and social goals as explicit objectives in addition to economic growth.

7.2 Fundamentals of Sustainable Development

Many have defined sustainable development. Rogers, Jalal, and Boyd (2005) provide a basic primer in the various ways in which sustainability and sustainable development have been defined and Dasgupta and Maler (1995) offers a more technical treatise. This chapter defines sustainable development as development that satisfies the 'triple bottom line' of providing economic benefit while also enhancing the environment and society, in terms of social and cultural systems, (or at least not degrading either). The triple bottom line is an expansion of the traditional bottom line, which includes simply the net economic benefits of a project. The additional bottom lines are for the environmental net benefits and social net benefits (Elkington 1998).³ This is also an extension of the Pareto criterion, which is the accepted test for optimality in economics. For an initiative such as a development project, say the construction of a large dam, to satisfy the Pareto criterion, it must make at least one person better off without making anyone else worse off. Thus a project that satisfied the triple bottom line would be one that improved one of the criteria (economic, environmental, or social) while not degrading either of the other criteria. This seems to be a sensible approach for achieving a sustainable development that improves the welfare of the world's population and allows the following generations the opportunity to do the same.

It may be optimal to achieve sustainable development through policy initiatives or projects that satisfy the triple bottom line. However, the real world presents limited opportunities to do so. This is known in economics to be true for the Pareto criterion, so it is no surprise to find the same to be true for the triple bottom line. It is the nature of the world that there are limited possibilities for projects that meet this strict criterion. Perhaps such projects are so obviously

beneficial that they have already been done. On the other hand, there are many projects that have very large potential benefits but do not satisfy Pareto, because at least one person would be made worse off. If we consider the construction of a large dam from an economic standpoint only, we can envision a project that could provide benefits to a large number of people, for example electricity and drinking water for an urban area or irrigation water for an agricultural area. However, inevitably the construction of the dam would make some people worse off, such as those who would lose their land and livelihoods to the inundation of the river valley. The need to utilize tradeoffs between those receiving the benefits and those incurring the costs of projects in the real world gave rise to a modification of the original Pareto criterion. A project satisfies the modified Pareto criterion if it makes at least one person better off and there are sufficient benefits such that if they were redistributed everyone else could be no worse off. In the case of the dam, a portion of the benefits realized through hydroelectricity production could be used to compensate those in the river valley for the loss of their land and livelihoods.

The flexibility gained with the modified Pareto criterion is accompanied by caveats. The first is the actual redistribution of the benefits. It should not be acceptable that redistribution is a thought exercise only. The historical record of actual development projects, such as large dams, is filled with claims of promised compensation that was never provided. In other cases, redistribution is simply assumed to happen as a trickle down effect of enhanced consumption. There is little evidence that such approaches ever serve to improve the well-being of those made worse off. However, in developed market economies, there is belief in creative destruction, the idea that innovation will displace those employed in the old ways by the new products that bring a general improvement in well-being (Schumpeter 1942). For example, the advent of e-mail has been a major loss for those in the stationary business but we certainly don't believe that they are due compensation. Still, developed economies typically provide some form of social safety net including unemployment compensation and retraining for workers in distressed industries. In less developed economies, it is not likely that a dynamic economy can be counted on to provide new opportunities for the displaced, and social safety nets are often lacking.

These issues bring to light the importance of evaluating projects in terms of the triple bottom line. Eco-

3 For further reading on sustainable development, in addition to the text by Rogers/Jalal/Boyd (2005) and the economic analysis presented by Dasgupta/Maler (1995), the reader is referred to Arrow/Dasgupta/ Goulder/Daily/Ehrlich/Heal/Levin/Maler/Schneider/Starret/Walker (2004) which provides a succinct introduction to the literature, to World Bank (1997) for a treatise on quantifying the concept, and to the World Commission on Environment and Development (1987), commonly referred to as the Brundtland Commission, which is the report that instigated the modern exploration of this topic.

conomic approaches have proven ineffective at valuing environmental services and social capital. As a result, neither is protected in a manner consistent with our preferences for them. Specific consideration of the environmental and social benefits and costs, along with the usual economic cost-benefit analysis, is needed. This is the fundamental requirement for sustainable development. Still, estimating costs and benefits and accounting for costs that are displaced in space and time remain great challenges. Already, there have been many alarmist warnings of imminent doom based on trend projections from Malthus to Ehrlich (1971) and none have come to pass. In part, it may be that these clarion calls are so effective they serve to change the trends and prove themselves wrong. Clearly trend projections are fraught with danger in a complex world. Given the innumerable uncertainties, the triple bottom line approach is necessary but not sufficient for sustainable development. Acknowledging the complexity of the human-nature system, we turn to the science of complex systems for guidance in achieving sustainable development in an uncertain world.

7.3 Complex Systems and the Implications for Sustainable Development

A significant obstacle to deciding how sustainable development be achieved is our lack of understanding of the implications of actions taken now for the future. That is, we face the challenge of decision-making under great uncertainty. This makes the implementation of many seemingly wise and straightforward concepts of sustainability difficult and impossible (Ludwig/Hilborn/Walters 1993). A look at some typical principles of sustainability makes this clear. Some examples are (taken from Gladwin/Kennelly/Krause 1995, but repeated elsewhere) waste emissions not exceeding the natural assimilative capacity, harvest rates not exceeding regeneration rates, and biodiversity loss not exceeding the rate of biodiversity preservation. These are certainly good ideas, but attempting to enforce them is prohibitive. Simply estimating the rates is problematic, enforcement and monitoring across the globe is beyond feasible. For example, many sustainability viewpoints express a need to control population growth. However, an accepted estimate of the earth's carrying capacity, upon which the need for such a control would rest, has not been found. Cohen (1995) cites various calculations of carrying capacity

ranging from 1 billion to 1 trillion people. Furthermore, uncertainty regarding the future precludes radical actions in the present. The classic example of the peril of long time scale prediction in a dynamic world is provided by the "Horse Manure Crisis of 1894" (Davies 2004). Urban areas were overflowing with manure generated by the primary means of transportation of the day: horses. In 1898, an international urban planning conference, in fact the first such conference, convened in New York City to find solutions to the pressing crisis. It is reported that in 1900 the horses in New York City produced 2.5 million pounds of manure per day. The conference was not successful and ended early due to lack of hope for finding a solution. The solution, of course, was provided by the invention and popularity of the automobile.

And so it goes in the art of anticipating the future. The world is complex and a great deal of understanding is needed to anticipate all the consequences of major interventions. However, it is likely that we will never have enough understanding to make accurate predictions (Ludwig/Hilborn/Walters 1993). Weather defies prediction because of its chaotic characteristics, which are, by definition, unpredictable.⁴ While much of the world appears chaotic and unpredictable, some have found patterns in the confusion. These patterns that emerge from the chaos are termed 'complexity' and the systems that create them, 'complex systems'. An accessible entrée to the science of complex systems is provided by Waldrop (1992; see also Wolfram 2002). Much of the systems that are relevant to this discussion, the ecosystems that make up the natural environment and the social-ecological-systems that comprise the human world, are complex systems (Holling 2001; Walker/Carpenter/Anderies/Abel/Cumming/Janssen/Lebel/Norberg/Peterson/Pritchard 2002).

Complexity is not the same as being complicated.⁵ Complex systems are characterized by nonlinear responses to perturbations. Another characteristic is a threshold effect. When threshold effects are present

4 Chaos is here defined as the unpredictable behaviour of a complex system. One form of chaos is sensitivity to initial conditions, known as the "butterfly effect," as presented by Edward Lorenz (1979). For further reading on the subject, see Lorenz (1993), Prigogine/Stengers (1984) and Alligood/Sauer/Yorke (1997).

5 Complexity implies some degree of order, yet the order defies characterization or prediction using linear approaches. See Gell-Mann (1994) on development of complexity theory from a physics framework or Kaufman's (1995) approach from a biological viewpoint. For more on emergence, see Holland (1998).

there may be no response to minor perturbations but radical system changes when perturbations exceed a threshold. Complex systems often exhibit self-organization and emergent traits. An emergent trait is a feature that arises unplanned from the interactions of the individual actions of agents within a system. The most famous emergent trait may be Adam Smith's 'invisible hand' whereby the multitudinous decisions of individual agents seeking to maximize their own utility results in unintended collective action that yields a welfare maximizing equilibrium between market quantities and prices for an economy as a whole. Emergence and self-organization provide hope for some predictability in complex systems.

Understanding the earth and human-nature interactions as a complex system provides important guidance for sustainability. The first is the need to relinquish the common reactionary reliance on command and control strategies and reductionist approaches. There is simply too much uncertainty and variety in the world to implement and monitor such methods. Key drivers, such as technology, are difficult to predict⁶, human action responds to projections in unanticipated ways, and linear projections are incapable of reproducing the nonlinear dynamics that are most important in determining future outcomes (Walker/Carpenter/Anderies/Abel/Cumming/Janssen/Lebel/Norberg/Peterson/Pritchard 2002). This does not mean, however, that we should attempt nothing, wading in the manure and waiting for the arrival of the automobile. Complexity theory provides both the hope of identifying possible outcomes in the form of "attractors" and the means of intervention. With this view, the focus should be to understand the means to influence the direction of a complex system from within, rather than attempting to control it. The locations where the system is amenable to change are termed "points of intervention" (Walker/Carpenter/Anderies/Abel/Cumming/Janssen/Lebel/Norberg/Peterson/Pritchard 2002).

Second, we must distinguish between attempting to preserve the current state of the planet and preserving the functioning system that determines the state. The state of a complex system is determined by the value of the state variables that make up the system. Many treatises on sustainability are dedicated toward maintaining the current state of the world. While we may prefer the current state of a system, such as our world, unless the system is at a stable configuration, it

is ultimately hopeless to resist change. A stable configuration is termed an 'attractor'. An attractor is a configuration to which the system commonly returns after small perturbations. Many studies have examined the means of increasing the resilience of the current configuration of the human-nature system to perturbation (e.g., Walker/Carpenter/Anderies/Abel/Cumming/Janssen/Lebel/Norberg/Peterson/Pritchard 2002). However, this may be confusing the current state of the system with the attractor to which the system is ultimately moving. We may enjoy the current level of air and land quality, biodiversity, and ecosystem integrity. As a result we would like to preserve their current state. However, the current configuration of the human-nature complex system may be moving us toward greater and greater degradation of the environment, as many measures of the environment indicate (e.g. rising atmospheric CO₂ concentrations, decreasing biodiversity). If this is true, it is not resilience we desire but rather a change of configuration to a human-nature system that maintains environmental quality. From this viewpoint, the relevant questions are, 1) are we in a desirable configuration now and if not, 2) how do we change to a more desirable configuration?

Much has been stated regarding the need to change our evaluation of development to reflect more than economic growth. The growth of the global economy and the increasing accumulation of income indicate that the current system successfully satisfies the economic bottom line. Simply put, net benefits, as they are currently measured are increasing, flawed though that measurement may be. However, the summary statements of past publications and summits on development, including the World Commission on Environment and Development (1987), the UN Conference on Environment and Development (Rio de Janeiro, 1992) and the World Summit on Sustainable Development (Johannesburg, 2002) indicate that current development is not doing well enough in terms of environmental and societal benefits. As we have seen, the emergent trait of ideal market economies is economically efficient use of resources and welfare maximization. However, the emergent trait of real economies appears to be economic growth with high economic and social costs. In regard to our first question, the evidence indicates that we are not in a desirable configuration. Change appears necessary.

But how does one change a complex system if command and control are ruled out? The direction of this complex system is determined by the individual, uncoordinated actions of self-interested agents that comprise the system. For the human-nature system

6 Notwithstanding progress made in the prediction of technological change, see Aric/Kemp (1998: 327-399).

that is of interest to sustainable development, the points of intervention are the people of the world. Thus to 'redesign' the human-nature system so that it gravitates toward a configuration we deem desirable, one needs to influence the decisions and actions of the individual agents. In other words, one needs to provide the conditions or make interventions so that the emergent trait of the human-nature system is sustainable development. Ultimately, this requires interplay between the agents making up the system, and the structures that define how the system reacts to their actions. For example, for the people of the world to transform our trajectory toward sustainability, they must be motivated to take the correct actions and have the means to influence the trajectory with their actions. Motivation and the identification of correct actions are presumably achieved through government and science. Yet both government and science must be responsive to individual agents' responses. Based on this shared agency, and referencing empirical evidence, we assess economic growth and good governance as necessary conditions for sustainable development.

7.4 Economic Growth: A Condition for Sustainable Development?

Economic growth is a presumed condition of sustainable development. In fact, it may be the primary driver. The adjective 'sustainable' is necessary to differentiate this endeavour from purely economic development, which is presumed to be unsustainable. Too many of the Earth's population face lives of depravation in a material sense. For these people, an increase in income is surely needed. However, does this necessitate an increase in global production? It is apparent that a small percentage of the earth's population leads lives of material excess. Notwithstanding the immovable opposition to such an approach, might it be possible, in theory, to reallocate the consumption from those in excess to those in deficit to achieve an acceptable living standard for the Earth's population? The answer is yes. According to the World Bank (2005) the per capita *Gross National Income* (GNI) of the world is approximately US \$ 5,500. For comparison, countries with a similar per capita GNI were Chile (US \$ 4,360) and Poland (US \$ 5,280). Thus, in theory the GNI of the world could be reallocated to provide each person with a per capita income (as indicated by GNI) roughly equivalent to two nations the World Bank ranks as 'Upper Middle Income'. For the

vast majority of people in China (US \$ 1,100), Indonesia (US \$ 810) and India (US \$ 540), and in fact, most of the world, a per capita GNI of this value would mark a significant and life-changing improvement in welfare. A reallocation of income without a change in production would also, in theory, require no further degradation of the environment.

Alas, we cannot achieve sustainable development so easily (even theoretically). Besides the aforementioned inevitable, and quite justified, opposition to the requisite reduction in income for the privileged few, several factors conspire against the reallocation concept. The first is population growth. While the estimates of global population growth have been rapidly decreasing, the peak population is still expected to reach 8 to 11 billion people (Cohen 2005) by mid century. That reduces our per capita GNI to around \$ 3,500 or about the same as that of Venezuela in 2005. The second reason is the shortcoming of the income indicator used, GNI. It does not account for the depreciation of human-made or environmental capital. The level of income indicated by the GNI does not reflect the consumption of non-renewable resources and the exhaustion of the pollution assimilation capacity of air, water, and land resources. A better indicator of actual income is the Net National Income. It would be almost certainly less than GNI. Finally, income implies more than material satisfaction. Income is intimately connected with security (see chapter by Uvin in this vol.). A baseline of income is necessary for security, and it is apparent that too many in the world live below this level. For these reasons, it appears that further economic growth is necessary to produce the increase in net income needed to improve welfare.

Do we require better promotion of economic development? For the most part, the human-nature system is successful at producing economic growth. While the environmental and social implications of the system require further attention, in general, it appears that economic growth emerges from the human-nature system. This may be considered a crowning achievement of efforts of economists through the years dedicated to finding policies that maximize economic growth as measured typically by Gross National Income. As we have seen, it may also be considered the emergent trait of the human-nature system that results from these policies and the actions of individual producers and consumers. The challenge remains in finding a configuration of the human-nature system that preserves environmental quality and social equality in addition to producing economic growth.

7.5 Economic Growth and the Environment

The preceding discussion argues that our current configuration of the human-nature system is producing economic development, and that economic development itself is necessary (see Dasgupta/Maler 2001). The next consideration is how the system performs in terms of the environment. The most prominent theory of economy and environment is summarized in the concept of the environmental Kuznets curve⁷ (Grossman/Krueger 1995). The curve represents the relationship between per capita income (x-axis) and environmental damage (y-axis) as an inverted 'U'. At low levels of income, the populace is primarily concerned with increasing their consumption and environmental quality is a lower priority. In a successfully growing economy production increases, and with it income and environmental degradation. The factories of North America and Europe darkened the skies and polluted the waters of their respective countries during the years of the Industrial Revolution, and this process is continuing in China. In fact, the movement of factories from North America and Europe to developing economies like China is attributed to lower production costs, which are at least partly due to the lack of stringent environmental regulations common in the industrialized world. Once a sufficient level of income is reached environmental degradation appears to peak and then fall as the populace begins to become more concerned with the state of the environment. Interestingly, the turning point in environmental degradation occurs at approximately US\$ 5,000, which is, coincidentally, the current global per capita GNI.

The complex system viewpoint offers an interesting deduction from the Kuznets curve for sustainable development. One could conclude that environmental quality and high income is an attractor for human-nature systems. That is, given the time for economies to grow to a GNI of, say, US\$ 5,000 per capita, the current configuration of the human-nature system will lead to wealth and environmental quality for all. If Kuznets curves result from a causal effect between economic development and environmental quality, it

would imply that the complex systems that are these economies reach stable configurations with environmental quality as an emerging trait. However, considering an array of global statistics (see Clark/Crutzen/Schellnhuber 2005: 3; Musser 2005), one might conclude something quite opposite, namely that the human-nature system is descending to a configuration of ever greater environmental degradation and social inequities. The emergent trait is growth, pollution, and inequality.

Which viewpoint is correct? There are several reasons for misgivings regarding the Kuznets curve theory. The first is it assumes environmental resilience. Resilience is the ability of a system to return to its original state after a perturbation. In this case the perturbation is the environmental damage that accompanies development, and the magnitude of the perturbation is the height of the 'U'. The data supporting the Kuznets curve is largely based on air pollution. The atmosphere is a particularly resilient system, especially on a local scale where large-scale currents continually deliver air from elsewhere. However, systems subject to thresholds beyond which damage is irreversible will not improve despite a populace's new-found interest in environmental quality. The extinction of a species cannot be reversed. A complex tropical rainforest ecosystem is unlikely to return to its original form after a clear cut. Furthermore, the issue of substitutability, which may work well when considering the consumption of energy resources, becomes problematic in the case of the environment. For example, in the United States, regulations require that projects that destroy wetlands must create double the area destroyed of new wetlands. Wetlands may or may not be substitutable, depending especially on the location of the new wetlands. If they are located in another watershed, for example, the watershed that loses the wetlands will gain nothing to replace the storage and filtering that a typical wetland provides. That watershed remains degraded. Individual species are certainly not substitutable. Such considerations are incorporated in the approach of environmental regulation in the United States. The Endangered Species Act protects individual species that are threatened with extinction, including their habitat. Thus there is explicit acknowledgment of limited substitutability of the environment. Faith in economic development alone delivering environmental quality risks an accumulation of irreversible environmental damage that perturbs the global environment beyond its resilience, resulting in a degraded state as the new equilibrium.

⁷ Simon Kuznets, a Nobel laureate economist, did not produce the environmental Kuznets curve. The original relationship presented by Kuznets was between economic growth and economic inequality (Kuznets 1955). The environmental version of the theory was developed by Grossman/Krueger (1995); see Stern (2004) for a review.

Furthermore, the Kuznets curve theory assumes that environmental quality is a luxury. This seems to reflect an urban view of the world, where the environment is simply something to enjoy, often at a safe distance. However, for much of the rural poor, the environment provides a significant fraction of their livelihood (Dasgupta/Maler 1995). For them, environmental degradation implies a reduction in income. Environmental quality is not a luxury, but a source of security in itself.

The lesson of the Kuznets curve theory should be that if we minimize the magnitude of the environmental damage, and the height of the 'U', we stand the best chance of minimizing these concerns, namely of irreversible environmental damage and the impact that environmental damage has on the rural poor. Economic theory tells us that an effective way to do this is by 'getting the prices right'. The idea is that prices communicate information about the costs of production. Typically, environmental damage is not included as a cost of production since the producers rarely pay for it (or pay to avoid it). As a result, prices are lower than they would be if they included the environmental costs and we consume more resources and produce more environmental damage than we would if we faced the true costs. Getting the prices right means including the costs to society ('social costs' including environmental damage) in the price that consumers face. It is a way to 'internalize the externalities', or to include in the market the costs that the market normally fails to incorporate. In practice this can be difficult to implement, especially if the externalities are not understood, or displaced in space and time. However, this is consistent with a complex systems approach to sustainability. Policy would not dictate outcomes, but rather it would influence the actions of billions of decision-makers who determine the configuration of the system. The points of intervention are the prices. By getting the prices right, we facilitate the agents of the system making environmentally responsible decisions. In doing so, the emergent trait of the system would be economic growth that minimizes environmental damage in proportion to its economic cost.

7.6 Incorporating Social Justice

The 'social bottom line' refers to an evaluation of the impact that a project has on vulnerable members of society. As we have seen, development projects often involve costs for some. Rawls (1971) argues that any

inequalities should be arranged to benefit the least advantaged. However, without an explicit social bottom line, it is likely that the opposite would be true. The issue of redistribution of benefits from economic development projects that displaces some people, as in the case of the dam project mentioned earlier, highlights the importance of the social aspect of the triple bottom line. Without a specific requirement to provide for those who are displaced, whether geographically or economically, there is a grave danger of good-intentioned development doing harm to groups of people⁸. Past development projects have often adversely impacted groups that already faced significant hurdles to development, such as lack of representation in the governing system. Even in a democratic society, if the development project beneficiaries are of the majority people of a society and those who stand to be hurt are of an underrepresented group, the prospects for an equitable redistribution of benefits are slim. Indigenous people throughout the world have repeatedly suffered from this kind of situation. The work of Amartya Sen on social choice demonstrates the existence of pitfalls in decision-making by democracies (see Sen 1999a). Yet, in democracies the judicial system protects the rights of the minority when infringed upon by the majority. A human right to compensation, recognized by the judicial system, when livelihood or home is taken by the actions of the government appears necessary to achieve the social tenet of the triple bottom line. Ultimately, the complex system view of sustainable development returns us to the point of intervention: the individual agents that comprise the judiciary and government of a nation, its citizens. Their acceptance of a human right to compensation leads the system toward socially responsible development. However, this presumes that the opinions and decisions of individual agents influence the actions of a nation's government. This leads us to the second condition for sustainable government: good governance and an engaged civil society.

Complex systems theory supports the importance of good governance and engaged civil society. Effective governing systems imply that the voices of the multitudinous individual citizens have influence in the

8 Justice, as agreed by a range of scholars, prohibits taking without compensation, whether of goods or means of livelihood. In addition to Rawls (1971) cited above, the libertarian views of Nozick (1974) require that any acquisition must be just, while Dworkin (1981) argues that justice requires compensation to those who suffer for things for which they are not responsible.

decisions made by the heads of government. It acknowledges that within a complex system it is too difficult for the heads of government to monitor and predict the impacts of government actions on their own. If government is accountable to the people, they will receive constant feedback on the state of the system. Actions by an effective government that influence the direction of the system are in turn influenced by those individuals who make up the system. Complex systems theory also implies that the most effective means for influencing the direction of the system is through impacting the actions of individuals.

Empirical evidence offers further support. Much has been written on the importance of good governance for economic development (see Rodrik/Subramanian/Trebbi 2004). There is also evidence that good governance engenders environmental quality (Barrett/Graddy 2000). If we revisit the Kuznets curve theory, it is often interpreted as the effect of increasing levels of wealth allowing society to turn its attention to environmental quality. And it is assumed that the attention of society is then reflected in environmental policy that leads to improved environmental quality. Grossman and Krueger (1995) cited induced policy as the likely cause of the effect. This entails a governing system that effectively translates public sentiment into action. The analysis of Barrett and Graddy (2000) finds that indices of civil and political freedoms are correlated with lower levels of pollution for many (but not all) media. This is not surprising since an important role of government is reconciling market failures, such environmental externalities (Torras/ Boyce 1998). The analysis by Torras and Boyce (1998) assessed the relation between environmental quality and several characteristics of society, namely, income inequality, literacy, political rights, and liberties. Literacy, income inequality, and political rights were found to have greater influence than per capita income on the environment. Importantly, the evidence of government policy as causal agent in the improved environmental quality that accompanies growth is not alone sufficient to attain improved environmental quality. Good governance that empowers the knowledge and experience of civil society is the best means for guiding the complex human-nature system in a desirable direction.

Rogers, Jalal, and Boyd (2005) describe the important role that civil society (i.e. neither the private sector nor government) must play in sustainable development. This role includes demanding human rights, access to natural resources, and mobilizing to defend their environmental, economic, and societal security.

In this complex world, it is impossible for any single institution to adequately monitor or anticipate the impacts of development on the environment and society. However, there is an existing and vibrant monitoring system spread throughout the world, namely civil society. Too often, the institutions making development decisions are deaf to this observation network. Yet, only under autocratic regimes do these voices go unheard for long. An illustrative example is the Narmada Bachao Andolan (NBA; Struggle to Save the Narmada River), which began as a committed group of social activists and those facing displacement by the construction of the Sardar Sarovar dam project. Although unsuccessful at stopping the construction of the Sardar Sarovar, the movement instigated a complete reappraisal of development policies by the World Bank and the formation of the World Commission on Dams, with the NBA leader Medha Patkar sitting as a commissioner. The movement represented an indicator that there were significant problems with traditional development approaches. Alternately, the autocratic Soviet Union lacked the ability to utilize 'grass roots' information, yielding repeated environmental disasters (Aral Sea, Chernobyl), a restless populace, and economic stagnation. This serves as a cautionary tale for attempts to use command and control strategies on a complex system.

The city of Porto Alegre, Brazil, provides an example of an engaged civil society and good governance. The municipal level government is characterized by citizen involvement, prioritization of public objectives by the citizens, and a participatory approach to allocating the municipal government (Menegat 2002). Participatory budgeting was introduced in 1989 and consists of decentralized public fora where communities meet to prioritize budget needs. The leading priorities have repeatedly been sanitation, land tenure regularization, and street paving. In other words, basic public health, domicile, and transportation are concerns of the people. While implementation is complicated, it appears to be effective as Porto Alegre enjoys steady improvement in development indicators, outperforming the rest of Brazil (Menegat 2002).

The build-up of greenhouse gases in the earth's atmosphere and their role in climate change is another example of the effectiveness of good governance and economic development. A very large research effort has yielded a fair degree of understanding of the earth's climate and some confidence in temperature projections. Although uncertainty persists, there is also relatively good understanding of the incentives that continue to drive the global economic system to-

ward greater production of carbon emissions. Technological innovation again will likely solve this problem; however, the conditions for a solution need to be created. And in fact, those conditions are being created. There is growing belief among many people of the world that the accumulation of greenhouse gases presents a worrisome and irreversible threat to our way of life. This belief is developing into pressure on policymakers to take action and incentives for innovators to create alternative energy technology. For example, carbon taxes are promoted as a means to getting the prices right. Although to many the pace of action appears too slow, it is not inconsistent with the timescale of global change and the rate at which our knowledge of climate change has been growing. The projected impacts of climate have only recently reduced uncertainty enough to gain traction with the policymakers and the public. The major impacts are not even expected within the lifetime of those living today. However, with economic growth providing the engine for solving the challenge, and an engaged civil society pushing public policy toward action through responsive governing systems, progress is being made.

7.7 Conclusion

Sustainable development has been described as development that satisfies the triple bottom line of economic growth, environmental protection, and social justice. This is a succinct concept and one that appears amenable to operationalizing. Yet, the complexity of the human-nature system requires special consideration for implementing the triple bottom line. This is achieved by viewing sustainable development as the desirable emergent trait of the human-nature complex system. From complex systems theory we learn that the direction of the system is determined by the multitudinous actions of the individual agents who constitute the system. Points of intervention are the opportunities to influence the direction of the system. For the human-nature system, key points of interaction are prices and citizens. Since sustainable development is closely tied to security, we are confident that given the correct conditions, society will eventually progress toward sustainability. Economic development and good governance are proposed as necessary conditions for achieving a human-nature system from which sustainability will emerge. Sustainability science, not addressed here, may be another good candidate (Clark/Crutzen/Schellnhuber 2005).⁹ With these conditions in place, and perhaps a little luck, sustain-

able development will become the emergent trait of the human-nature system.

⁹ In the anthropocene, where the cumulative effect of human actions is significant force of nature, it may be critical that policy is informed by science inquiries into the ramifications of future actions. For science to be effective in this endeavour, it must be informed by policy and society, which may require changes to its traditional practice (Grunwald 2004).

8 Development and Security: Genealogy and Typology of an Evolving International Policy Area

Peter Uvin

8.1 Introduction

This chapter presents a broad overview of the evolving paradigms of thinking and action at the intersection between development and security. This chapter will focus primarily on the major rich countries and the institutions they control, such as the World Bank and the OECD. It is these rich countries, after all, that provide the overwhelming majority of the development assistance and defines the practical terms on which it is given. Recipient countries surely do have a capacity to subvert donor agendas, but they do not set it.

It is written from the perspective of development professionals, analysing when and why they became concerned with matters of security (genealogy section, 8.2), and what sorts of things they do when they work at the nexus between development and security (typology section, 8.3). In the former section, there is a particular emphasis on teasing out the impact of the end of the Cold War and of 9/11 on development policy and practice. The latter section presents a brief overview of different operational and policy approaches to the development/security nexus. In the conclusions, the author points to the shrinking intellectual and operational gap between development and security since the early 1990's (8.4).

8.2 Genealogy

During its first three decades, the development enterprise was totally agnostic towards matters of internal conflict and security. When violent conflict occurred, it was treated as an unfortunate occurrence, forcing development workers out and bringing humanitarians in – an order to be reversed when the conflict was over and normal development work could resume. The common dynamics leading up to conflict – intergroup resentment, social polarization, rising intoler-

ance and extremism, militarization of society, human rights violations, and widespread impunity, to name but a few – were emphatically *not* part of the development mandate. Development practitioners might have deplored these matters in private, but did not believe they had to consider the implications of their own work on these dynamics, or explicitly seek to address them (Uvin 1998).

Of course, in our complicated world and a fortiori for a field of human endeavour as broad and diverse as development, any statement such as the one just made is always partially wrong. Indeed, development aid was from its very birth and foremost so for the United States, part of the security calculus of the Cold War. The precursor of modern development aid was the Marshall Plan following World War II, designed to reconstruct Europe and keep it out of the hands of communism – both of which it was successful at. Later, development assistance to developing countries was at least in part motivated by Cold War concerns. This link of aid to security was of a very different nature than what emerged from the 1990's onwards. Before, the link was global and geo-strategic, and the mechanism by which the link operated was exclusively the allocation of development aid resources; it did not seek to affect conflict dynamics *within* the countries concerned.¹

During the Cold War, countries that were at the frontline of the fight against communism (to mention but some, each reflecting different stages in the Cold War: South Korea and Vietnam; Zaire and Somalia; Egypt and Jordan; El Salvador and Guatemala) received massive and disproportionate amounts of development aid, as well as often military assistance, diplomatic support, preferential trade access, and intelligence support. But what was being done with those development aid funds had usually little to do

1 On development aid as an economic security tool in the global ideological competition, see Radelet (2003a).

with domestic internal dynamics of conflict, and indeed quite a few of these countries were falling apart under the eyes of their sponsors, without the latter doing anything through their development programmes to halt this disintegration.² The way the money was used was largely motivated by the standard schools of development thinking: investments in economic and social infrastructure; education and training; basic needs (basic health, primary education, and housing); structural adjustment and liberalization of the economy, among others.³

This situation has changed dramatically. Nowadays, the nexus between development and conflict within recipient countries (and even regions) is a central focus of almost all development thinking and practice. This metamorphosis reflects a number of major trends, some of which are related to the end of the Cold War and later to 9/11, and others which are internal to the development enterprise and independent of these outside factors.

8.2.1 1989 and the End of the Cold War

The main impact of the end of the Cold War on the development enterprise was indirect: it created a larger need for a change in approach and opened up a space in which it could emerge, but it did not dictate its content.

First, civil war and insecurity became much more prevalent and visible in the South after 1990, forcing development practitioners to come to grips with questions of (in)security. This often happened in countries that were until recently clients of the superpowers and whose models of political and economic (ill)-governance were quickly falling apart. This was most visible in sub-Saharan Africa, of course, where way too many countries descended into a spiral of violence, destroying whatever tenuous improvements to which development aid might have contributed. At the same time, a large number of new recipients of development assistance emerged in the former Soviet Union and Eastern European bloc, many of which rapidly became theatres of violent insecurity. The overwhelming majority of these cases of violence were civil wars. As

a result, the development community soon found that as much as one-third of all countries in which it worked were close to, engaged in, or just coming out of civil war.⁴

Second, the intellectual and political hegemony of the Western 'liberal peace model' became greatly strengthened, ideologically justifying much wider interventions in the internal dynamics of low-status countries, the list of which grew dramatically (Duffield 2001). Most of the Cold War-induced need to make friends with unsavoury regimes throughout the world had vanished. Especially in Africa, this led to disastrous results for the likes of Siad Barre of Somalia; Mobutu Sese Seko of the former Zaire; and Jonas Savimbi of Angola (admittedly not a head of state). This trend had already started under the Reagan administration (and its allies in Thatcher and Kohl), with an increasingly assertive adherence to free markets, minimal states, and elections, and a concomitant and decreased willingness to engage in talk about new international economic orders, rights to development, and other reformist agendas. When capitalism won, all competing ideologies were de-legitimized, and the willingness and capacity to intervene in third world countries' domestic issues grew dramatically. This willingness to act on issues considered hitherto too political, too domestic, or too sensitive, is one of the factors that set the new development/security agenda apart from the preceding thirty years.

The prime reasons for the emergence of the development/security nexus in the 1990's, however, lie in dynamics internal to the development community. First, there was the rise to prominence of the 'good governance' agenda. This agenda, whose appearance slightly precedes and totally mirrors the ascendancy of the conflict agenda, was an answer to the failure of structural adjustment. Adjustment policies were being only partly implemented in many countries, thus failing to produce their evident benefits. The World Bank and the main bilaterals concluded that there must be something wrong with the political system from which these policies emerged: it was not accountable and transparent enough, hence allowing self-serving elites to get away with inefficient and detrimental policies from which only they benefited. Starting from this economic rationale, the field of 'good govern-

2 An exception to this is US aid to Central America in the 1980's, when some of the internal use of aid was linked more directly than usual to anti-guerrilla strategies. Note that such use was typically decried in the strongest terms by leftist, critical scholars and practitioners.

3 For good overviews of changing development thinking, see Arndt (1987) and Peet (1999).

4 According to the World Bank website: "80% of the world's 20 poorest countries have suffered a major war in the past 15 years" (<www.worldbank.org>). Bank lending to post-conflict countries increased by 800% between 1980 and 1995 (World Bank 1998a, 2005a).

ance' was born in the late 1980's; it mixed with human rights and democracy agendas that precisely resulted from the triumphalism of the end of the Cold War, and marked the first significant move away from the political neutrality and respect for sovereignty that had characterized the development community thus far (Uvin 1996; Doornbos 2003; Hewitt de Alcantara 1998).

The governance agenda laid the groundwork for, and is an important part of, the "development and security" agenda: both start from the same willingness to intervene domestically and from the same ideological assumptions about the benefits of liberal peace.⁵ These ideas are not born of ignorance: after all, many countries are characterized by exclusionary, inefficient, corrupt systems of governance, and these systems not only seem to bring about economic implosion, but also more often than not violent conflict. At the same time, the presently rich countries do combine economically and politically liberal models, albeit with significant variation.⁶ The triangle between development, peace, and democracy thus makes intuitive sense, and has become the basis of the international community's involvement in these matters. By far the most important text here is the 1995 Supplement to the 1992 Secretary-General's Agenda for Peace, which constituted a policy milestone and a departure from standard development practice (Boutros-Ghali 1992, 1995a).⁷

The second factor is the 1994 Rwanda tragedy, which demonstrated to both the development and hu-

manitarian community that 'normal professionalism,' even if implemented successfully, could lead to disaster if conflict dynamics were not understood. As a result, the Rwanda case fundamentally challenged the status quo. For development professionals, Rwanda had been a rather successful developing country, performing well on traditional indicators of economic growth until well into the 1980's: it was in the top three in terms of vaccinations and other more human development centred indicators, and possessed a dense and seemingly vibrant civil society like few other African countries. Yet this model pupil turned out to be a serial killer, forcing everyone to reflect on what they had missed and how their ignorance and their money interacted with the dynamics that led to genocide (Uvin 1998; Andersen 2000).⁸ The same profound challenge occurred with the massive humanitarian operation in then Zaire after the end of the genocide. From a purely logistical and public health perspective, it was a stunning achievement: in only a few weeks, cholera epidemics were halted and high quality systems of food distribution and health care were established for as many as two million persons in the middle of nowhere! However, the camps became breeding grounds for regional destabilization and eventually ended up as theatres of mass violent death and forced return (Terry 2002). In both cases, then, successful work done without consideration of dynamics of conflict led to untold death and destruction under the eyes of the international community. For the humanitarian community, this led to debates about 'do no harm' (Anderson 1999) and rights-based humanitarianism (Slim 2002; Macrae/Leader 2000); for the development community, it put the development/security nexus at the centre of the table. From the second half of the 1990's, the OECD took leadership of this agenda with a series of technocratic yet pushing-the-edge declarations and studies on aid and conflict prevention (OECD 1997; 2001; Uvin 1999).

In short, the development/conflict agenda came to maturity in the post-Cold War climate, but was not directly tributary to the security ideologues or politics of the new unipolar system⁹ - indeed, many have

5 For a perfect example, see Boutros-Ghali (1994); for fine discussions, see Paris (2002; 2004).

6 The basic problem with this reasoning, which underlies much development thinking, is that it is ahistorical and apolitical. It neglects to analyse how rich countries became rich (which may have been in ways that were not particularly free-market based, nor friendly to the Third World). As a result, it misunderstands how Third World countries could make the same voyage, if they so desired. Prichett and Woolcock (2004) call this "skipping straight to Weber," or the 'Denmark' model (given that Denmark is peaceful, rich and democratic, let's just import Danish institutions into the rest of the world and all will be fine). See also IDS (2005) for good work on this.

7 Other important documents include Carnegie Commission (1997) and OECD (1997). The relationship between democracy, development, and peace so clearly made in this agenda - and in the accompanying *Agenda for Development* (1994) - has been contested by many scholars: Paris (2002); Ottaway (2002) and Baker (2001).

8 The first major book to make a similar argument was probably by Susan Woodward (1995) about the dissolution of the former Yugoslavia.

9 Duffield (2001) contradicts this to some extent, arguing that what he calls the securitization of development was then already related to desires to contain the spread of refugees and other conflict spillovers into rich countries.

argued that there was no clear security ideology during this time in any case.

Throughout this period there was also resistance to this shift. For most of the older generation, accustomed to an apolitical and technical self-definition, the whole new agenda was too political to be palatable. Officials in nongovernmental organizations and bilateral aid agencies feared that they would become instruments of, and subservient to, foreign policy and defence establishments should they assume security and peace-building concerns (as they blatantly ended up doing in Afghanistan and Iraq). Multilateral agencies were under pressure from their Third World members to abstain from what was perceived to be a deeply interventionist and ideological agenda. Senior aid managers everywhere feared that they lacked the competencies and personnel to perform the new security agenda well and worried about the safety of their staff. Still, these were resistances against an overwhelming tide favouring the engagement of development agencies in peace-building work.

8.2.2 2001 and the post-9/11 world

In contrast to the fall of the Berlin Wall, the response to 9/11 *did* lead to the creation of explicit new security frameworks, within which the development/conflict nexus was clearly identified. This is foremost the case for the US and the UK, who organized much of their new security thinking around the concepts of failed states and instability respectively (UK Prime Minister's Strategy Unit 2005; USAID 2004; Weinstein/Porter/Eizenstat 2004; Krasner/Pascual 2005; Milliken 2003). Thus, the UK Prime Minister's Office released in 2005 its *International Strategy to Manage Risks of Instability and Improve Crisis Response*. The core concept of this strategy is instability, defined as “*inter alia*, coups d'état and other types of illegal or unpredictable political succession; breakdown of political, economic, and social institutions; systemic corruption; widespread organized crime; loss of territorial control; economic crisis; large-scale public unrest; involuntary mass population displacement; and violent internal or international conflict.” A country's capacity to manage effectively and peacefully and adapt to change is at the centre of creating stability. However, addressing other factors including structural risks such as poverty and economic decline, natural resource dependence, and a bad regional neighbourhood, as well as external stabilizers such as security guarantees and strong political associations, are also critical to fostering stability. To work on these varia-

bles, integrated and coherent approaches involving foreign policy, peacekeeping support, development assistance and broader economic support (e.g. trade, debt) are required.

The United States' new 2002 *National Security Strategy* focuses on weak states as breeding havens of terrorism. These weak states are largely poor countries suffering from the effects of civil war – the exact countries with which the development community had begun working on security and conflict a decade earlier. As a major D.C. think tank sees it:

weak and failed states pose a 21st century threat that requires institutions and engagement renewed for the 21st century. (...) But, the security challenge they present cannot be met through security means alone. The roots of this challenge – and long-term hope for its resolution – lie in development, broadly understood as progress toward stable, accountable national institutions that can meet citizens' needs and take full part in the workings of the international community (Weinstein/Porter/Eizenstat 2004: 2).

This, then, finally brings us to an equation of development with nation/state-building, the ultimate result in the most extreme cases. To quote the same report:

The roots of this challenge – and long-term hope for its resolution – lie in development, broadly understood as progress toward stable, accountable national institutions that can meet the needs of their citizens and take full part in the workings of the international community. (...) With the threat to the United States now coming not from an established state power but from dispersed forces that flourish where authority is illegitimate or non-existent, the state-building challenge can no longer be ignored (Weinstein/Porter/Eizenstat 2004: 8; see also Cragin/Chalk 2003).

A term that has become very popular in DC is LICUS: *Low-Income Country Under Stress*, an ugly acronym developed by the World Bank a few years earlier independently of 9/11 concerns. Much work takes place in both USAID and the Bank on the difficult issues of providing services, rebuilding bureaucracies, and kick-starting economies of such failed/failing states (Rondinelli 2006).

This theme is a further variation of an old Cold War theme: the security to be defended here is foremost *US* or *Western* security. One of the means of doing so is to assure poor countries' stability, which includes military security, but also economic well-being and democratic governance – for these countries can export terrorism, drugs, illegal money, and arms, etc.¹⁰

In a way, then, what is seen in this post 9/11 phase is, from the perspective of the large western coun-

tries, not only an increasing securitization of development issues (Duffield 2001), but also a newer development focus in security policies: for the first time, development plays a serious role in US security policy.¹¹ This differs from the Cold War: then, as said, development aid was often allocated to friendly Third World regimes, in the hopes that this would keep them pro-Western and in power (this still happens, of course). Now, the entire toolbox of development aid is brought to bear on countries in Central Asia, sub-Saharan Africa, and elsewhere in order to change their internal politics in ways that are more stable and friendly to US interests. As always, there are divergences between countries. Some European countries, for example, while collaborating in second fiddle roles in the US agenda in Afghanistan and Iraq, maintain distinct profiles in their conflict/development programmes. The Norwegians, for example, using their freedom of not being members of the EU, continue to specialize in an active mediating role in protracted conflicts worldwide, whereas the Danes, after a historic shift to the right in 2004, use new 'region of origin' aid funds – specifically designed to maintain potential refugees at home – in countries with civil war (Baare 2006). As always, too, actual policy lags seriously behind rhetoric, even in the US. Thus, the real on the ground picture is more complicated than the previous remarks suggested: a mixture between ideologies and practices from before 1989, the 1990's, and the current situation prevails.

8.2.3 Genealogy: Conclusion

There have been three major phases in the relation between security and development. In the first phase lasting for three decades, part of development assistance was used and abused, according to many critics, to support strategically important states in the fight against communism. The aid itself, however, was used largely for non-conflict related purposes: its use followed the constantly changing visions of how to promote standard socio-economic development. This phase ended at about the same time as the conclusion of the Cold War.

A second phase began from 1989 onwards, occurring in the context of the end of the Cold War but pri-

marily based on dynamics internal to the development enterprise. During this phase, the political nature of aid became acknowledged and the willingness of aid agencies to engage in domestic processes related to governance and conflict increased enormously. During this period, first the post-conflict agenda and then the conflict prevention agenda were born (see below). The fields of justice, security *sensu strictu* (soldiers, police, private defence contractors), broader conflict resolution (ethnic division and exclusionary attitudes; breakdowns of social capital, etc.), human rights, and governance all grew into major new areas of funding and action. All this happened largely because of a desire to do good, to promote development, and to help create a better life for the world's poor¹².

Another change has been occurring since 9/11 and marks the third phase of the nexus between security and development. The previous agenda is becoming instrumentalized in order to assure the security of the rich countries in what some have labelled the war on terrorism. For those countries on the top of the list of this agenda – Pakistan, Afghanistan, Iraq, Egypt, Jordan, Turkey, and some African and Central-Asian oil producers – a mixture of the two previous approaches prevails: they receive an enormous amount of aid designed to keep them stable and friendly to the US and to promote overall economic well-being (phase 1), *and* they are often subject to the increasingly interventionist machinery of state-building, governance, and anti-terrorism (phase 2).¹³ For the other countries sliding into and out of conflict, phase two continues, albeit possibly with less funds as some are diverted to the former group.¹⁴

One final note: this chapter focuses on the development/security nexus, but that is of course not the only change that has taken place in the development community in the last fifteen years; other conceptual and policy shifts are ongoing as well. On a theoretical level, development thinking has changed moderately

10 There are other means as well, of course, ranging from anti-terrorism measures (intelligence, money laundering control) and homeland defence, to military campaigns.

11 I owe this insight to Hans Günter Brauch (personal conversation).

12 As defined by the powerful, admittedly, and limited by what the powerful are not willing to consider, of course – but this has always been the case with aid, and is unavoidable.

13 Note that at the political level these two dynamics contradict each other: the very need to maintain excellent political relations with the governments of countries such as Pakistan, for example, makes it hard to intervene in their domestic politics. Thus it is really only in countries fully 'owned' by donors – foremost Iraq and Afghanistan – that the nation-building agenda can be truly implemented.

during this period. Neo-liberal thought continues to provide the basic framework for policy, albeit in a less extreme manner than in the 1980's. The state has been brought back in and more explicit attention is devoted to the poor and excluded (World Bank 2000). These are departures from the initial radical structural adjustment ideology in which less state and trickle down were the two basic concepts; however, there is no doubt that the basic structural adjustment ideology continues to be the foundation for all development policy. The two major intellectual milestones over the past fifteen years have been Amartya Sen's work defining development as freedom (1999), and new research on poverty and deprivation as seen by the poor and deprived, which demonstrated that powerlessness and voicelessness, but also insecurity and violence, were crucial dimensions of how they defined their situation (Narayan/Patel/Schafft/Rademacher/Koch-Schulte 2000; Chambers 1995). Both these strands of work create a much more holistic and politicized view of what 'development' means, and they thus easily support the growing work at the development/security nexus.

At the policy level, the major change in the development community over the past decade consists of the growing self-critique in the development community, arguing that its *modus operandi* disempowers recipient countries (foremost their governments but also their civil societies) by institutionally weakening them and by not providing enough space for them to be in the driver's seat. As usual, the World Bank (through the Poverty Reduction Strategy Papers, PRSPs) and the OECD (through the 'good donorship' work on harmonization and alignment) have been the two key institutions in developing the acceptable policy alternatives (OECD 2003; Rogerson/de Renzio 2005; Elikana/Mapunjo 2004).¹⁵ A new category of

research and discussion has even come into being on harmonization in 'fragile countries' or 'difficult partnerships', referring precisely to the sort of countries where the development/security nexus is on the agenda: countries with weak government, divided populations, and/or long periods of negative economic growth (OECD 2004; OECD 2005a, 2005b; DfID 2005; McGillivray 2005; ODI 2005; Macrae/Shepherd/Morrissey/Harmer/Anderson/Piron/McKay/Cammack/Kyegombe 2004; Chauvet/Collier 2004). Policy-makers are caught between opposed values and aims here: the harmonization agenda puts a heavy premium on work through governments so as to reduce the burdens imposed by aid, whereas the conflict agenda is cognizant of the fact that governments are often causes of or parties to violent conflicts, and are consequently worried about putting all their eggs in the government basket.

Another major policy trend, based on research conducted at the World Bank, argues that aid is only effective in countries with good policy environments – and it should thus be given only to those countries that can use it well (Burnside/Dollar 2000; Collier/Dollar 2002; Kanbur 2006; Dalgaard/Hansen/Tarp 2004; MacGillivray 2003). Aid selectivity has indeed increased in recent years (DfID 2004; Levin/Dollar 2005). This trend runs too counter to the conflict agenda, for clearly most of the countries where the development/security agenda is being implemented do not belong to the category of good performers. In the US, for example, official rhetoric repeats that aid shall go to good performers only (and a new mechanism, the Millennium Challenge Account, was established for that purpose) while at the same time funds for strategically important countries (such as Central Asian ex-Soviet republics) that are emphatically *not* good performers are increasing as well (Radelet 2003a; 2003b). Of course, this is not new: development aid has always had multiple functions, and it has always been subject to contradictory intellectual and political pressures (Browne 1982).

A final policy trend has been the emergence of the Millennium Development Goals as a central mobilizing framework for much development aid. The Goals were born in the OECD in the mid-1990's, in an attempt to recapture a moral vision for development assistance; they were enshrined in a major 2002 UN conference in Monterrey, Mexico (United Nations 2002; Millennium Project 2005). They are essentially

14 It is hard to say. The past few years have seen a dramatic growth in development assistance, mainly due to the US investments in Afghanistan and Iraq, but also to the establishment of the Millennium Development Corporation: this aid has been largely additional to previous aid flows. The other donors, while substantially providing to these countries as well, are nowhere near the level of US involvement. At the same time, the UK has been in recent years on a much more general mission to increase the flow of concessional resources to the poorest countries through development assistance and debt relief, and this has begun paying off since 2005 as well. All in all, then, most of the new security-motivated aid seems to have been supplemental to traditional aid, a conclusion also arrived at by Woods and Research Team (2004).

15 For many important official documents, see at: <www.oecd.org/harmonization>.

a basic needs framework for development, a move away from economic growth as the end-all of development assistance.¹⁶ There is no security/peace goal among them, nor for that matter is there a governance one. However, in its latest report on the MDGs, the UN does devote a chapter to conflict prevention (United Nations 2005; Stewart 2003). The MDGs neither contradict nor particularly strengthen the development/conflict agenda.

8.3 Typology

The remaining pages will provide a brief sketch of the specific ways in which the development enterprise has managed its impact on dynamics of conflict and security.¹⁷ The previous section described the context within which the broad conceptual changes occurred; this section discusses the concrete types of actions undertaken. Beneath this taxonomy run two variables: the first is the extent to which conflict matters are incorporated into the development paradigm, i.e., considered not an external objective that development aid can occasionally be (ab)used for, but residing at the very core of the notion of development itself. Second is the extent to which the development enterprise engages explicitly in the political realm, running counter to the norm of sovereignty and the practice of ‘a-politicalness’ that historically underlie its work. It goes without saying that these categories bleed into each other and their ranking is artificial: their separation serves analytical purposes; it is not a descriptive fact.

8.3.1 Conditionality

The first major move toward conditionality came from the IMF, which at its 1991 annual meeting announced the desirability of reducing military spending. A few bilateral donors – foremost those who lost

World War II (Japan and Germany) and who are formally forbidden to have standing armies – soon joined the IMF in taking the lead on this issue. This constituted a major innovation. In the past, when confronted with this issue – as when critics argued that the IMF imposed harsh social cuts but accepted continued high military spending by countries implementing structural adjustment – the standard answer was always that the level of military spending was a political decision of sovereign states and thus beyond the reach of the IMF. Mysteriously, after the Cold War ended and Third World dictators suddenly became less necessary allies of the US, it was discovered that military spending patterns were actually a *financial* matter, related to productive resource allocation and budgeting, thus falling within the competence of the IMF¹⁸. Still, this is politically very dangerous for the Bretton Woods institutions, and so they must engage in a great deal of verbal gymnastics: “The World Bank position is that a country should govern how it uses its resources, including for military expenditure. Security is essential for growth, but development partners need to be convinced that the pattern of resource allocation is appropriate and well-managed.”

The German and Japanese aid agencies rapidly abandoned their formal policies on the issue: it was too difficult to measure and monitor and too sensitive to impose. The IMF and the European Union, however, have persisted. Since 1993, the IMF includes a section in its World Economic Outlook reports on military expenditures as a problem of resource misallocation. In some cases, such as Cambodia, Pakistan, Romania, and Ukraine, this matter has become a central element in IMF negotiations for stand-by agreements (Jones 1998). Article II of the 2000 Cotonou agreement requires a political dialogue between the EU and recipient countries around issues of excessive military spending. This has led to cutbacks and suspensions in aid to countries such as the Ivory Coast and Kenya. Similarly, in some strong case like Burundi, the Bretton Woods institutions tried to ensure that adjustment loans or debt relief are not diverted for military spending by providing foreign exchange directly to the private sector. In addition, Jim Boyce documents a new but inconsistent practice of making

16 They too contradict the selectivity argument, for the countries with most need for support to achieve the MDGs are often not the good performers. Indeed, the arguments of Jeffrey Sachs (2004), the economist most associated with the MDGs, run entirely counter to those advanced by Collier and Dollar (2004).

17 This section of the chapter builds on Uvin (2002). With the permission of the *Journal of Peacebuilding and Development*, the original copyright holder, the ideas have been developed further by taking the specific interests and goals of this book into account, as well as the most recent literature.

18 While the UN General Assembly had a history of declaring that military spending was an outrage for development, this (“anti-imperialist”) statement was not taken seriously by anyone. In Boutros-Ghali’s revolutionary 1994 Agenda for Development, however, entire pages were taken up by this subject (par. 17–40).

aid conditional to governments' implementation of peace agreements in those cases where such agreements exist (2002).

In short, an ad hoc practice of threatening to reduce development aid to countries engaged in war, or spending too much on the military, has now persisted for over a decade. Yet, the practice has been very inconsistent and partial; it also seems, a priori, not to have dissuaded any country from doing as it pleased in the security realm. As with human rights conditionality, then, the development community has started looking to "positive conditionality" (collaborative action) rather than "negative conditionality" (arm-twisting).

8.3.2 DDR and SSR

Demobilization, Disarmament, and Reintegration (DDR), as well as Security Sector Reform (SSR), are perfect examples of such positive engagements that have emerged in the last decade (and would have been largely inconceivable for development actors before). They both consist of using development resources in fields that are at the core of conflict and security in recipient countries, and in a collaborative manner. The former consists of international support to the cantonment and disarmament of soldiers from the national army as well as from rebel groups and paramilitaries. Some of these will join the newly integrated army (this falls under SSR), and most will rejoin civilian life. The latter receive training and medium-term financial support to facilitate that transition.

SSR consists of a new field of action that includes international support for projects and programmes in democratic policing, security sector governance, defence review boards, regional security programmes, and human rights training for the army and police (Brzoska 2003; Wulf 2005; Rupiya 2004; GTZ 2000; Netherlands Institute of International Relations 2002). Ideally, it supports the emergence of a locally owned, externally supported strategy for efficient, 'right-sized,' accountable and rights-conforming national defence (Hendrickson 2002).

Both DDR and SSR are mainly done in post-conflict countries. They are also very politically sensitive (especially SSR), both in the countries concerned and in donor countries. For that reason, many donors fear to go there. However, a few like DFID have acquired significant competence in this area (DfID 2002).

8.3.3 Post-Conflict Assistance

The international community has begun codifying and implementing an agenda of using development assistance to promote peace and reconciliation in countries coming out of violent conflict. While the first cases occurred before 1989 – Cambodia, for example – it is really only in the mid-1990's that a fully-fledged field with new institutions and documents emerged. The two most important documents may well be the 1997 OECD Guidelines on Peace, Conflict and Development Cooperation and the 1992 UN Secretary-General Report, *Agenda for Peace* (Boutros-Ghali 1992). These documents give priority to areas that until a few years ago were either marginally or totally outside the development agenda: governance and representation; justice and security; prejudice, trauma, and reconciliation¹⁹.

In effect, the post-conflict domain is at the heart of the entire enterprise of integrating development and peace-building: it is here that most action takes place, and from here that most lessons have been learned.²⁰ Its domain is vast, covering fields as diverse as demobilization and transitional justice, and countries ranging from Indonesia (Aceh now) to East Timor. Following a 1999 OECD study (Uvin 1999), we can distinguish two types of innovations: brand-new sectors that have been added to the development agenda, such as security sector reform, and new approaches to be used in both the new and the old sectors (conflict sensitivity). Mary Anderson's early work was the first major and deeply influential statement on the latter by addressing the question: how should aid agencies behave differently in zones of violent conflict?

On a more methodological level, see also: Church/Shouldice 2003; International Alert 2004; Barton/Crocker 2004; Menkhaus 2003.

8.3.4 Do No Harm

Synthesizing a decade of participatory research, Anderson (1999: 39) writes:

Experience shows that aid's economic and political resources affect conflict in five predictable ways:

- aid resources are often stolen by warriors and used to support armies and buy weapons;
- aid affects markets by reinforcing either the war economy or the peace economy;
- the distributional impacts of aid affect inter-group relationships, either feeding tensions or reinforcing connections;
- aid substitutes for local resources required to meet civilian needs, freeing them to support conflict;
- aid legitimizes people and their actions or agendas, supporting the pursuit of either war or peace.

Anderson's aims are eminently practical. She presents innovative practices that can make a difference by allowing agencies to 'do no harm', avoiding unintended negative impacts on conflict dynamics. This line of work has proven to be extremely useful and widely adopted. It is a prime example of how the development community has sought to think differently about how it impacts the dynamics of conflict, regardless of the sector. It applies not only to what one might label conflict programming as such, but also to *all* sectors, whether feeding programmes, education, or community development (Anderson 2000; Anderson/Olson 2001). In so doing, it helps lay the groundwork for the next level: conflict prevention.

8.3.5 Conflict Prevention

From the post-conflict agenda, it was but a small intellectual step to conflict prevention, and this step was taken in the late 1990's. The longer one waits to do something about the dynamics of conflict, documents and declarations asserted, the more difficult and costly it becomes to succeed (Carnegie Commission on Preventing Deadly Conflict 1997; Brown/Rosecrance 1999). Hence, acting earlier, preferably before conflicts become violent and widespread, makes eminent sense (Annan 2001; OECD 2001; European Centre for Conflict Prevention 2004)²¹.

Natural and spontaneous as the step from post-conflict to conflict prevention work may be, it does

constitute an enormous further extension of the development mandate. As every country in the world is by definition a potential pre-conflict country, the new mandate applies axiomatically to *all* developing countries, instead of only the 25 or so that are post-conflict. In addition, the conflict prevention paradigm requires the official acceptance and mainstreaming of the hardest truth in the development community, namely that *all* aid – and not only aid specifically and consciously designed for that purpose – has an impact on the political dynamics of conflict. To quote the first lines of a recent OECD report on the matter:

All aid, at all times, creates incentives and disincentives for peace or for war, regardless of whether these effects are deliberate, recognized or not, before, during or after war. The issue is then not whether or not to create incentives but, rather, how to manage them so as to promote conditions and dynamics propitious to non-violent conflict resolution. (...) This involves recognizing that perceptions matter as much as facts in aid impacts; that who gets which piece of the cake is usually as important as the total size of the cake; that efficiency may sometimes need to be traded for stability and peace; that the development discourse can be used for many political purposes; and, broadly, that process is as important as product (Uvin 1999).

Here we begin approaching an entire rethinking of the development paradigm and associated practice, using an explicitly political lens.

At the level of implementation, much of the conflict prevention agenda is identical to the post-conflict one. There are no magical tools and new insights that are only valid for one but not the other (Lund 1997). There are two main differences between conflict prevention and post-conflict work. First, conflict prevention evidently is done earlier and hence requires early warning, the focus of much work in the last decade (International Alert 2004; van de Goor 1999; Harff 2003; DfID 2002a; Fisher 2000). Second, conflict prevention requires a stronger diplomatic framework to be feasible and successful. This closer integration between development and diplomacy is often couched in terms of coherence (European Commission 2000; Brachet/Wolpe 2004). From the perspective of development practitioners, coherence is at once desirable and dangerous: desirable because it reduces policy conflicts, and dangerous for it may leave the development community in a subservient role to military and foreign policy interests (Lund 2002). The UK is an interesting case in point: in 2001, it integrated funds from the Department for International Development (DFID), the Foreign and Commonwealth Office, and the Ministry of Defence to create

21 See also "European Commission Checklist for Root Causes of Conflict", at: <http://europa.eu.int/comm/external_relations/cpcm/cp/list.htm>, 8 March 2006.

not one but two Conflict Prevention Pools: one for unimportant Africa, under the leadership of DfID, and one for the rest of the world, under the direction of the FCO.²²

True conflict prevention is nearly impossible to achieve: neither international organizations, nor donor governments, nor Third World countries are capable or willing to engage in the sort of political engineering that is required for conflict prevention; hence, it usually occurs *after* major violence has taken place, trying to avoid further flare-ups or escalation (Stedman 1995; Hampson/Malone 2002; Mack/Furlong 2004; Griffin 2003). It remains the current cutting-edge of the development business.

8.3.6 Human Security

In the late 1990's, the term 'human security' came into vogue as a way to capture the interdependence between development, security, and peace. The term is rather vague, constituting a mobilizing device favouring the departure from the status quo over an agreed upon definition with specific policy aims. In *In Larger Freedom*, Kofi Annan (2005) refers to three pillars of human security: a) 'freedom from fear'; b) 'freedom from want'; and c) 'freedom to live in dignity'. All this allows various players to define human security very differently. Schematically, one can say that two basic visions exist, one much broader than the other (Ball 2001).²³

Canada represents the narrower, security-oriented definition of 'freedom from fear'. Starting from the general point that "a people-centred approach to foreign policy ... recognizes that lasting stability cannot be achieved until people are protected from violent threats to their rights, safety, or lives," it focuses exclusively on what can be called the human dimensions of security, which includes small arms trade, landmines, and child soldiers (King/Murray 2001).

Japan's approach represents the broader, more development-oriented approach of 'freedom from want'. The late Prime Minister Obuchi said in 1998 that human security is "the keyword to comprehensively seizing all of the menaces that threaten the survival, daily life, and dignity of human beings and to strengthening the efforts to confront these threats." The Japanese Ministry of Foreign Affairs (2000) goes

on to list "threats to human lives, livelihoods and dignity [such] as poverty, environmental degradation, illicit drugs, transnational organized crime, infectious diseases such as HIV/AIDS, the outflow of refugees and anti-personnel land mines..." It is in this definition that human security amounts to a reconceptualization of the development enterprise, with 'freedom from fear' and 'freedom from want' becoming two inseparable faces of the same coin.²⁴

The relative popularity of the human security agenda is *not* the result of the enthusiasm of the military/security establishment, but rather of the development community. The debates about human needs in the 1970's, human development in the 1990's, and human security now, all result from the fact that part of the development community has always resisted what it perceives to be overly narrow and 'economistic' approaches to development; thus using the adjective 'human' as an identifying tag setting it apart from its intellectual competitors. For them, the human security concept holds the promise of achieving two goals: the first is to more firmly embed concerns with insecurity and violence in development work, and the second is to add more attention to poverty and empowerment in high politics (security typically being a far more powerful establishment and policy concern than development).

The Human Security Network (HSN, Fuentes 2007), the Human Security Commission (CHS 2003) as well as UNESCO (see chapter of Goucha in this volume) have promoted this concept globally. Thailand is the only country that has created a 'Ministry on Social Development and Human Security'; it has also launched a 'human security index' to compare the development achievements of its 77 provinces. At the 8th ministerial meeting of the Human security network, the Thai Foreign Minister, Kantathi Suphamongkhon stated:

We should encourage a balanced approach towards both freedom from want and freedom from fear. The two freedoms are linked.... We should broaden the scope of our focus into non-traditional threats to human security. This includes the need to address the problem of environmental degradation as well as life threatening diseases and natural disasters. ... Human security is about human empowerment. We must put even more energy into human resource development. This is the best way to prepare people to effectively address human

23 Burgess and Owen (2004) present definitions by 21 authors.

24 See also Nef (1999); Leaning/Arie (2001), paying more attention to psycho-social factors and Brauch (2005, 2005a), focusing on 'freedom from hazard impacts.'

security issues at all levels. ... This is the top-down plus bottom-up approach.²⁵

The 13 member states of the HSN²⁶, with South Africa as an observer and Japan and Mexico as friends, have launched many policy initiatives to translate the evolving human security concept into policy, including: landmine clearance, marking and tracing of small arms and light weapons; protection of civilians in armed conflict; human trafficking; human rights education; and work on women, peace and security; people-centred development; and HIV/AIDS.

These are rather low key efforts: they by and large consist of safe policies that are being funded by a wide range of agencies since years in any case. The Commission that wrote the UN Secretary-General's 2005 *In Larger Freedom* report tried to go further and develop a basic equivalence or new compact between traditional security and human security: UN members would help each other in their traditional security concerns (the war against terrorism, for example) and in return seriously promote each other's human security as well. The final report contains enough lip service to all these fine concepts, but deep resistance from among others the US has made sure all this has little to no practical implications. In short, the human security strategy has by and large failed: although it has led to interesting and relevant intellectual work, human security has either become very narrowly defined or it is slowly being dropped from the policy agenda altogether.

8.4 Conclusion

The intellectual and operational gap between development and security has shrunk significantly since the early 1990's. Currently there exists a rapidly growing literature, often of the grey kind, on the relationship between development and conflict. Meanwhile policy declarations focused on the need for further mainstreaming and coherence are commonplace. Most of this new work is what conflict resolution professionals would call 'track II' work that is promoting and strengthening dynamics of peace at the level of individuals and communities. However, some of it - in-

cluding military conditionality, security sector reform, or the calls for coherence - falls squarely within the 'track I' government-to-government approach. Other parts of it - DDR, for example, or parts of the post-conflict agenda - seem to constitute new hybrid fields.

Most aid agencies - whether bilateral, multilateral or NGO - are now firmly anchored in the 3rd and 4th levels described above: they try to design their projects and programmes in such a way as to do no harm, and they spend significant resources on a variety of new post-conflict sectors, such as reconciliation, transitional justice, and demobilization, disarmament and reintegration. They have hired new specialists, started new projects, and created new desks, divisions, and funds to deal with conflict prevention, management, or mitigation; more recently, they have created inter-agency coordination mechanisms to increase the coherence between their development/conflict resolution and foreign and military policies. There are of course significant differences in the importance they attach to these matters, the degree of explicit political analysis they bring to this work, the sectors, countries, and approaches they tend to privilege, and the specific aims they have.

Unsurprisingly, the post-conflict prevention agenda is strongly resisted by many. There are those in the aid community who long for the "good old days" of technical, apolitical, simplicity: a clear mandate, a specialized technical assistant to execute it, and a nice photo of a new piece of infrastructure. But the strongest dislike comes from Third World governments who may be subject to a wide range of novel and interventionist uses of aid. The conflict prevention agenda is the one that has most suffered from that resistance. Every time the Security Council, or the Governing Board of any UN specialized organization discusses conflict prevention, it encounters resistance from its Third World members. When in the late 1990's the World Bank floated the idea of creating an Operational Directive on conflict prevention, for example, the Chinese and Indian governments successfully demanded that all references in the larger document relating to this part be removed (although a directive was eventually approved in 2001). In addition, a large number of critical scholars consider this agenda - and the associated good governance one - to be a neo-colonialist move, legitimizing social engineering in the South and failing to shine a light on complicity in the North (Gordon 1997; Oberg 2002; Paris 2002; Rieff 2002).

25 See Address by H.E. Dr. Kantathi Suphamongkhon, Minister of Foreign Affairs of Thailand, at the Opening Ceremony of The 8th Human Security Network Ministerial Meeting, 1 June 2006, Dusit Thani Hotel, Bangkok; at: <<http://www.mfa.go.th/web/200.php?id=16523>>.

26 See for details at: <<http://www.humansecuritynetwork.org/meeting-e.php>>.

Given this resistance, the development/security agenda in practice is mainly implemented in states too weak to object, and the weaker they are the more complete the approach. Thus, in states under foreign military control (Kosovo or Iraq, for example) or extremely poor and weak (East Timor or Burundi), the agenda is implemented more purely and completely than in richer and stronger states; in the strongest ones (Russia and China come to mind), it is not even a remote possibility. It is important to note that just because it is being implemented fully does not guarantee a successful outcome²⁷: clearly, the degree of success depends on a range of factors including the history of the conflict and the political dynamics involved, the extent to which the local powers-that-be share the agenda or seek to subvert it, the degree to which the international community acts with one voice, and so on. Elites in even the weakest of countries continue to possess a significant capacity to resist the successful implementation of the new conflict agenda: they may not be able to autonomously define an agenda that fully conforms to their interests and preferences, but they are sufficiently powerful to reappropriate and sabotage as much as possible.

At the intellectual level, many questions remain. Indeed, after ten years practitioners have fallen into a routine of more or less the same programmes in every country: reconstruction of health and education facilities; the standard macroeconomic framework, with some initial allowances for the sequels of war²⁸; a large DDR programme if there is a peace agreement (but with an underfunded R component), including a special programme for child soldiers; a major decentralized block grant programme typically run by the World Bank²⁹; some general programmes of financial and technical support to decentralization, to the justice sector, and for elections; a smattering of dialogue,

media, reconciliation, and counselling projects; and lots of funding for all kinds of NGOs.

What impact did all this have on peace? What are the factors that determine this impact? What are the risks and costs of these various approaches? We still have precious little serious knowledge about these issues. Policy-makers and practitioners basically improvise, follow some fads, go with the flow of what is politically feasible, apply what seems to have worked elsewhere, and throw expensive consultancy missions at the problem. Part of the difficulty lies in the fact that we do not have clear and consensual concepts – even what peace means is rather elusive – so systematic comparison is hard (Lund 2003); another difficulty is that measurement and attribution are of course stunningly hard when it comes to multi-dimensional and complicated social processes such as the ones that bring about peace³⁰.

A deeper problem is that the whole agenda has become too large, interventionist, and devoid of priorities. The post-conflict mandate is enormous and amorphous, basically encompassing the entire political, economic, and social make-up of post-conflict societies. The breadth of the post-conflict mandate and the absence of prioritization mechanisms, together with the paucity of resources, result in donors funding a bit of everything. The outcome is a situation of small, scattered, underfunded, short-term, un-coordinated projects, with large aims and small budgets. This is not to say that many of these projects do not produce some positive impacts on their own terms, nor that they are all necessarily bad ideas. Rather, it is that they are too small, scattered, and isolated to make a fundamental difference on almost anything. The end result is a disturbing absence of checkpoints for change, and a lack of accountability to make a real difference.

Related to that, the post-conflict agenda amounts to an unconstrained and, as usual, totally un-self-critical license to intervene on the part of the international community. Its aims are highly politically sensitive and intrusive, and it is devoid of tools for making choices about priorities or under conditions of scarce resources or conflict – the true art of politics³¹. As a matter of fact, with the exception of Bernard Wood's (2001) report for UNDP, none of the policy statements even mentions that there *are* choices to be

27 For fascinating case studies of Rwanda, see Jones (2001) and Klinghoffer (1998).

28 Collier/Elliott/Hegre/Hoeffler/Reynal-Querol/Sambanis (2003), for example, describe such a macro-economic agenda, but fails to note how few pieces of it are actually implemented; Paris (2004) criticizes it, as does Boyce (2002b) but on different grounds; Addison (2003) has fine case studies.

29 These so-called Community Driven Reconstruction programmes have become very popular staples. See Cliffe/Guggenheim/Kostner (2003) for a description of the aims, and Lund/Wanchek (2004); Mansuri/Rao (2004) and Strand/Toje/Jerve/Samset (2003) for the main evaluations so far.

30 See Church/Shouldice (2003) and Anderson/Olson (2001) for outlines of methodology for evaluation.

31 See Chopra (2002) for a fine case study.

made, or discusses the thorny issue of who will make these choices and on what basis.

The key question of the post-conflict agenda will remain how to define an approach that minimizes the reach of the international community, leaving as much as possible to local actors, while being principled and providing a real added value. The trend until now has been to add new fields of action – an understandable dynamic given the failure of past conflict-blind development assistance. Now it is time to reflect on how to do less rather than more, how to minimize our reach while maximizing our impact. This means making explicit choices and living by them, ensuring maximum participation and (a necessary corollary) transparency, being flexible and yet principled, and being learning oriented – all things that are hard to achieve even under the best of circumstances³².

9 Security and Environment Linkages Revisited

Simon Dalby

9.1 Introduction

The debate over the linkages between security and environment has evolved since its high profile articulation as a factor in the case for sustainable development in the World Commission on Environment and Development in the 1980's (WCED 1987). Sceptics and advocates have tangled repeatedly on conceptual, methodological, and political grounds while simultaneously the context for the discussion has evolved both as geopolitical events occurred and as science, and particularly research on climate change, has progressed (Brauch 2002, 2003). This chapter focuses on the innovations in thinking in the early years of the 21st century, suggesting that the linkages between security and environment are now understood in a number of ways, all of which show that matters are much more complicated than early assumptions in the 1980's about scarcity leading to violence (Hagmann 2005).

The suggestions in recent literature also make it clear that relationships of environment and security need to be understood in much broader conceptualizations than were usually included in the narrow empirical studies of the relationships of violence and scarcity which dominated much of the discussion in the 1990's. It is now clear that the links between violence and environment in the case of conflict over resources are often matters of political struggles over the control of relatively abundant resources in poor economies. In so far as humanity does face a common future, it is one in which global climate disruptions may well cause much more damage to poor peoples than any locally caused environmental disturbances. In addition, it is now understood that development, and the rapid incorporation of the remaining rural areas into the circuits of the global economy, is also frequently a violent process involving environmental change.

It is important to note that the linkages between security and environment continue to be formulated

as the basis for advocacy and for policy initiatives, apparently in ignorance of some of the most trenchant critiques frequently directed at such thinking (Deudney 1999; Nucleous 2000). Much of the early literature, at least, took security for granted without troubling to trace its intellectual lineage to the emergence of modernity where it was closely linked to private property and the protection of the social order that promoted property's extension (Rothschild 1995). As a result much of the initial thinking assumed that its task was to perpetuate a social order that was in fact, as later thinking made abundantly clear, causing many of the disruptions in the first place (Dalby 2002; 2000a). Even so, when it comes to reconsidering the role of the American military in particular, these conceptual difficulties remain in the literature despite repeated critiques (Foster 2001, 2005).

The focus of the discussion about environment and its links to security has shifted as a result of criticism, but also as research has made its findings public and as new perspectives have been added into the discussion. This chapter emphasizes the recent discussions, and the importance of how both the terms of discussion and the research findings are placed in appropriate contexts. Overall it suggests that political economy and political ecology insights about connections between peoples and places are usefully connecting with analyses of global environmental change so that human vulnerabilities and the causes thereof now get a more appropriate emphasis than in the earlier literature. Policy recommendations too now focus more on human security and vulnerability, and on the multiple implications of resource wars, rather than on the potential of environmental degradation for causing overt largescale violence.

9.2 The Early Stages of the Environment-Security Debate

In the early stages of the discussion the contention that environmental degradation would cause misery, and probably conflict, in many situations, was frequently taken as axiomatic. What was far from clear, however, was precisely how insecurity would manifest itself and who would be the victims. Much of this discussion was shaped from within a Northern security studies perspective which assumed a perspective that surveyed the whole world as though from afar. The important points that follow from noting this important point about who asked these questions in the 1990's is that the knowledges that are constructed, especially the knowledges that look to universal explanations of the relationships between environment and conflict, are usually urban and modern knowledges, ones that take an imperial view of matters for granted (Barnett 2000, 2001). Combined with satellite imagery and modes of monitoring statistics compiled by states and international agencies, and the assumptions of the inevitability of economic development in terms of the expansion of carboniferous capitalism, these formulations of the resource and environment problematique inevitably downplayed the rural, the contextual, and the disruptions inflicted on traditional peoples by expanding modernity. They did so also within a state cartography, one that draws lines between places, ensuring that civil wars "over there" are not usually a matter of responsibility "in here" in the metropolises (Dalby 2002a).

Thomas Homer-Dixon's initial work questioned the early premises and posed the question of where and in what circumstances conflict was likely as a result of environmental degradation. Homer-Dixon's early work, which included canvassing the contributions of many scholars in a variety of disciplines, suggested clearly that what violence was in some way related to environmental matters was likely to be diffuse and subnational rather than taking the form of inter-state warfare (Homer-Dixon 1994). This work suggested that while conflict might happen in specific circumstances, many of the more alarmist suggestions that war between North and South over specific resources or over largescale phenomena such as climate change and ozone depletion, were unlikely. None of the more recent literature has seriously challenged this finding. His subsequent detailed case studies tried to specify the conditions and circumstances in which violence was likely (Homer-Dixon/Blitt 1998). When the overall framework for analysis

is studied carefully, it is clear that one can posit connections between scarcity and violence, but the intervening conditions which lead to violence are usually key determinants of where and when violence occurs (Homer-Dixon 1999).

Critics charged that this empirical work did not proceed on appropriate methodological lines and that the causes of war were not well explored by assuming that environment did in fact cause conflict (Levy 1995; Gleditsch 1998; Diehl/Gleditsch 2001). But the calls for comparative quantitative studies and the insistence of the importance of null hypotheses frequently overlooked the earlier careful evaluation of various scholarly evidence that had dismissed much of the alarmist thinking about proclivities to warfare among marginal peoples suffering environmental stress. The focus on war or the implications for the national security of Northern states frequently obscured the important point that the insecurity under discussion was a matter of poor and marginal people in the South, whose insecurity needed attention as a research issue in its own right, separate from the discussions of the causes of inter-state wars.

The initial assumptions about scarcity causing conflict quickly came to be understood as highly constrained by numerous political, economic, and social factors. The supposed causal link between environmental scarcity and political conflict is exemplified in the debate over water. It is especially important when linked to concerns about global climate change and disruptions of rainfall patterns and evaporation rates. Supposedly in the face of scarcities and disruptions, states vying for control over specific rivers will fight to secure access to supplies of fresh water. But empirical research into the matter suggests that, 'water wars' have been very rare and are generally unlikely (Toset/Wollebæk/Gleditsch/Hegre 2000). Few states are so tied to the waters of a river that the extreme dynamics of interstate warfare unfold when water shortages happen. The pitfalls of conflict that might destroy shared infrastructure essential to both sides are much greater than any possible benefits of going to war. The water wars debate has made it clear that vulnerabilities are a complex matter, but also that environmental change presents numerous possibilities for cooperation (Lonergan 2002).

9.3 Environment-Security Linkages and Development

Meanwhile other research in the 1990's, in particular the large number of case studies encompassed in the ENCOP project directed by Günther Bächler (1998), emphasized the likelihood of violence in the context of marginal peoples in the face of rapid change tied into strategies of development and the spread of commercial economies into subsistence based societies. Maldevelopment and the disruptions caused by modern states and economies were understood to be the sources of many insecurities in developing states. ENCOP studies suggested that environmental conflict was most likely to occur where poverty ridden marginal lands in mountainous areas, and remote parts on the margins of major ecological areas in Africa, were being integrated into the global economy. But there were other dimensions to the relation of environment and conflict too, not least the damage done to specific environments and local peoples by the dislocations of major development projects. The struggles by indigenous peoples to protect rainforests and other lands from oil wells and mining corporations are part of this larger pattern (Gedicks 2001).

This research links to the literature in "political ecology", drawing from anthropology, development studies, geography and political economy, which focuses much more on the political economy of resources and in particular the complexity of local resources intersecting with the global commercial economy (Peluso/Watts 2001). Showing how local power structures, gendered access to farm land, traditional modes of subsistence agriculture and fishing were overlain with new modes of resource extraction, this literature challenges the arguments about scarcity in the neo-Malthusian formulations, while not denying that some environments were indeed violent. This critical literature has made very clear that the complexities of the global economy have to be factored into local vulnerabilities, and that this has to be done with considerable care to ensure that the specifics of local circumstances are appropriately incorporated into the analysis. In explaining local vulnerabilities, both global environmental change and economic change matter.

Another theme that quickly emerged in the early literature on environmental security was the importance of recognizing that in a global sense resource prices of most commodities were in long-term decline. A combination of improved technologies and expanding global trade has ensured that the supplies

of most essential minerals are not an issue for the future of the global economy. In some cases technological innovation has produced spectacular decreases in the use of metals; copper has been rendered much less important than previously by the introduction of satellite communications, fibre optic cables and the increasingly ubiquitous use of cell phones. But while the materials needed to make these items are not in short supply, they are nonetheless valuable enough to be worth fighting for in poor parts of the world economy where other economic options are not available. Petroleum appears to be an exception to this generalization, one that may yet involve the world in yet further geopolitical conflicts (Klare 2004).

This discussion parallels a fifth literature which in the late 1990's suggested that resource shortages were rarely correlated with conflict (Berdal/Malone 2000). The converse, it was suggested, was the case. The "new wars" of the 1990's in the South were tied into the struggle to control the rents from resource streams that were being exported to the global economy. Controlling resources, whether timber, diamonds or oil, was the way to get rich quick, rather than follow the painful and slow routes of economic development (de Soysa 2002). Elite rivalries and the promise of wealth are, so the argument goes, powerful incentives to initiate hostilities, especially where tribal or other sectoral loyalties can be mobilized (Bannon/Collier 2003). But these wars were not largely about either subsistence lands or the politics of agriculture (Ross 2004). The extraction of diamonds, oil, and other minerals frequently has environmental consequences, but apart from tropical timber, most of these are not technically "renewable resources". Nonetheless, their inclusion within a discussion of "environmental security" is a useful addition to the debate because it emphasizes the importance of globalization's resource extractions as a factor in contemporary violence and insecurity, although it is important to remember that the geographies and the material qualities of resources do not make it easy to draw lessons from one that may be directly applicable to others (Williams 2003).

9.4 Global Environmental Change and Vulnerability

Some of these themes link to the approach in the Global Environmental Change and Human Security (GECHS) literature which in many ways offers a syn-

thesis of the lessons learned in the other approaches. Vulnerabilities of populations to changing environments, and specifically concerns with the impact of global change, is the driving force in many of these studies (Renner 1996). The welfare and survival of people and their environments is the key focus of research in contrast to the earlier focus on states and potential wars (Mathew 2001, 2002). This overlaps in part with the ENCOP concerns with human development and its focus on the juxtaposition of violence with the parts of the world that have the worst scores on the UN human development indices (Bächler 1998). It emphasizes the importance of understanding the complexity of both environmental and social processes in specific contexts, and the obvious point that the poor in rural areas are frequently most vulnerable to both environmental change and the disruptions caused by political violence.

In parallel with the focus on the complex sources of vulnerability for poor and marginal peoples, the early years of the twenty-first century have returned matters to consideration of the largest scale disruptions of the biosphere, principally as a consequence of climate disruptions driven by fossil fuel consumption. Early in 2004 American media attention was drawn to a scenario exercise prepared on the part of Global Business Associates (GBA) (Schwartz/Randall 2003) for the U.S. Department of Defence that focused attention on the importance of abrupt climate change as a possible security threat. Subsequent discussion on these themes focused on the 2004 Hollywood disaster movie "The Day After Tomorrow" in which rapid climate change caused instant disaster, flooding, and flash freezing across much of North America. The science on this theme is inconclusive in terms of what precise scenario is most likely, but there is growing reason for concern (Alley 2004, Schneider 2004). The GBA scenario however reproduced the assumptions in the earlier literature that scarcity would induce conflict rather than trading, and disruptions would thus present a security threat. In doing so it ignored other research into matters of future scenarios and the potential for warfare in the face of climate change which in summary has once again suggested that the potential for inter-state warfare is low: "In this assessment, *no militarily relevant security threat* presently exists resulting from environmental stress but there are severe short- and long-term *non-military challenges* confronting many countries that have been victims of natural disasters that may put at risk both the *governability* of several states and the *survivability* of regions" (Brauch 2002:

103). Nonetheless, the GBA scenario exercise did represent an interesting extension of the discussions of security in Washington in that it explicitly dealt with climate change as a threat in a context in which this was not congruent with the administration's priorities.

Even the 2002 National Security Strategy of the United States of America document, which set out the priorities for American policy in the aftermath of the 11 September 2001 attacks, does include a brief discussion of the importance of limiting greenhouse gas emissions from the American economy, despite the rejection of the Kyoto protocol by the Bush administration. However, closer inspection of this document suggests that it is unlikely to lead to reductions of emissions. Specifically the Security Strategy states that (NSS 2002): "Economic growth should be accompanied by global efforts to stabilize greenhouse gas concentrations associated with this growth, containing them at a level that prevents dangerous human interference with the global climate. Our overall objective is to reduce America's greenhouse gas emissions relative to the size of our economy, cutting such emissions per unit of economic activity by 18 percent over the next 10 years, by the year 2012." But given the enthusiasm for economic growth expressed in the rest of the document it is clear that its authors expect the economy to grow by more than 18% over this period, hence ensuring that the overall emissions will continue to grow. Hence the great distance between rhetoric and policy outcomes that might address the real needs to reduce greenhouse gases only emphasize the need for an ecological understanding of security that focuses on the throughputs of materials rather than more abstract notions of environmental scarcity. This is especially important because climate change may well be most dangerous for poor vulnerable populations in the global South, precisely those who have done the least to cause the phenomenon in the first place (Barnett 2003).

9.5 Ecological Footprints and Environmental Peacemaking

This perspective, using an ecological viewpoint of what constitutes security, is taken furthest by the ongoing research at the Wuppertal Institute in Germany where researchers have been tracking the material dimensions of production and transportation in the global system. The overall ecological footprint of developed states includes accounting for the import of

materials and the use of sinks beyond their borders to absorb the waste products of metropolitan life. Specific activities can be described by looking at their “ecological rucksacks”, the term used to describe the ecological impact of a particular process or product, and which includes material waste and erosion caused by the production and shipping of a resource or commodity. Frequently resources are extracted from poorer parts of the global economy and much of the rucksack resides there, while the benefits are gained by investors and consumers elsewhere (Schütz/Moll/Bringezu 2004). Individual products also require specific materials, mineral and agricultural, to be imported from specific places, effectively carrying an ecological rucksack made up of damage done at a great distance.¹

Connected directly to the discussion of resource wars it becomes clear that consumption in the metropolises of the global economy has direct environmental impacts in numerous parts of the periphery, as well as indirectly through such things as ozone depletion and climate change. These categories make it possible to calculate very roughly the overall impact of various modes of economic activity, the overarching result is, when viewed in global terms, the unavoidable conclusion that it is the wealthy of this world who have the largest footprints and are thus causing the largest disruptions of environmental systems (WWF 2004). Hence globalization is now increasingly understood in terms of environmental change (Pirages/DeGeest 2004). But the assumptions that scarcity in the periphery are the problem is now overtaken by discussions of the importance of the consequences of consumption. But this too emphasizes the importance of thinking about security in terms of distant consequences and interconnections that might be amenable to cooperative action rather than necessarily a cause of conflict. It also requires further attention to matters of global forests, a topic in need of further study in relation to both conflict and ecological integrity (Klubnikin/Causey 2002).

In parallel with the focus on human security as a necessity in the face of both natural and artificial forms of vulnerability, recent literature has emphasized the opportunities that environmental management presents for political cooperation between states and other political actors, on both largescale infrastructure projects as well as more traditional matters of wildlife and new concerns with biodiversity preservation (Matthew/Halle/Switzer 2002). Simultaneously, the discussion on water wars, and in particular the key finding the shared resources frequently stimulate cooperation rather than conflict, shifted focus from conflict to the possibilities of environmental action as a mode of peacemaking. Both at the international level in terms of environmental diplomacy and institution building, there is considerable evidence of cooperative action on the part of many states (Conca/Dabelko 2002). Case studies from many parts of the world suggest that cooperation and diplomatic arrangements can facilitate peaceful responses to the environmental difficulties in contrast to the pessimism of the 1990’s where the focus was on the potential for conflicts. One recent example of the attempts to resolve difficulties in the case of Lake Victoria suggests a dramatic alternative to the resource war scenarios. The need to curtail over-fishing in the lake and the importance of remediation has encouraged cooperation; scarcities leading to conflict arguments have not been common in the region, and they have not influenced policy prescriptions (Canter/Ndegwa 2002). Many conflicts over the allocations of water use rights continue around the world but most of them are within states and international disputes simply do not have a history of leading to wars.

Some of these efforts on building cooperative mechanisms are directly related to efforts to enhance conservation efforts in conflict regions as a deliberate strategy to facilitate conflict resolution. Some such projects fall under the auspices of the International Union Conservation of Nature and their collaborative volume *Conserving the Peace* (Mathews/Halle/Switzer 2002) suggests clearly the diversity of geographical and cultural contexts within which such efforts might be applicable. It is worth noting that this particular project is also supported by the “environmental security team” of the Foreign and Commonwealth Office of the United Kingdom government which is involved in environmental aid projects in Asia and Africa, suggesting very clearly that conservation and peacemaking are now understood as matters of environmental security.

1 “The *ecological footprint* refers to land use, to the space that a country’s citizens need for erecting houses, growing/raising food on fields and pastures, building traffic links, etc. The *ecological rucksack* describes the ecological impact of an individual product or process ... They are mostly “filled” in developing countries, and can be calculated to express the environmental impacts of individual products, economies, or human beings. See <http://www.wupperinst.org/FactorFour/FactorFour_FAQ.html>.

Both international diplomacy and conservation efforts are involved in the establishment of so called "Peace Parks" on the borders of a number of Southern African states. But it is important to note that these are also tied into matters of economic development connected to tourist industry strategies to provide "eco-tourism" experiences to international clients. Here the local population is not always rendered more secure in their daily livelihoods which may not be enhanced by such modes of "development" (Singh/van Houtum 2002). But the intention behind these initiatives is to simultaneously build trust and cooperation in areas where international tension might otherwise occur, although the complicated agendas and conflicting state priorities suggest caution in assuming these are going to be much of a panacea (van Amerom 2002). Using environmental initiatives to gain both ecological and political benefits is at the heart of other similar initiatives, such as the United Nations Environmental Programme's efforts to improve understanding of environment and conflict and to investigate the policy options to meet the United Nations Millennium Development Goals (UNDP 2004).

In some ways the discussion has come back to where it started in the 1980's, focusing on the vulnerable populations in the South and their need for a broadly understood human security. But what has changed is that simple assumptions of environmental degradation or resource scarcity leading to conflict are no longer accepted. Vulnerability is now understood as a complex problem; cooperation is understood as more likely than violent conflict in the face of environmental change. The importance of understanding the specific circumstances of human vulnerability in different places is also now part of the discussion; environment, development and human security are understood as parts of the same issue. But while it is clear that solutions have to be tailored to fit local circumstances, it is also now understood that neither global change nor globalization can be ignored. Environmental changes are not strictly "local" phenomena triggering "local" social responses. Human insecurity is context dependent, but context is not simply a matter of local phenomena.

9.6 Environment, Development and Resource Wars

More generally the historical pattern of development and the appropriation of resources is one connected

to the rapid urbanization of humanity; modernity and industrialization have accelerated the imperial pattern of appropriation of resources from distant places to feed the metropolises; globalization studies linking environmental stresses to these processes are now increasingly common (Sachs/Loske/Linz 1998). The twentieth century, whatever designations it might be given in terms of the nuclear age or the growth of the number of post-colonial nation states, was notable for the huge expansion of population and its movement into urban areas. We are now an urban species and have wired and paved the planet to move food, timber, oil, electricity, minerals and all sorts of commodities from the rural areas into these burgeoning cities (Dalby, 2003a; 2003b).

In a way loosely analogous to earlier imperial arrangements the flow of commodities inevitably disrupts traditional forms of economic life. Just as wheat flowed from Africa to Rome so now does oil flow from the Mid East to other parts of the new imperium (Dalby 2003c; 2003d; 2004). Materials policy is a matter of improving sustainability by reducing ecological throughputs and increasing recycling; it is also a matter of industrial innovation which works ecological design into production (Geiser 2001). But to think in these terms requires a focus on consumption and a recognition that "environmental protection", understood as something "out there", is replaced by a conceptualisation that materials and energy to support consumption cultures "in here" are at the heart of ecological disruptions where producers and consumers are connected by complex commodity chains that now span the globe (Hughes/Reimer 2004).

The Roman Empire built roads to facilitate communications and so too do modern states. Indeed, it is possible to argue that such infrastructure provision is a key part both of state structures and the commercial culture of the automobile. Promotion of the privately owned automobile is a major part of the function of states (Paterson 2000). Car ownership is understood as a matter of status in numerous developing states while the pollution and congestion problems that result are ignored much of the time. The latest gas guzzlers in North America, the rather inaptly named Sports Utility Vehicles, are presented to would be buyers in tropes of conquering nature, of "civilizing nature" in Nissan corporation's advertizing slogan terms, a matter of being able to go anywhere regardless of obstacles (Paterson/Dalby 2006). But these vehicles are frequently understood as the causes of many problems of environmental degradation due

to their size and fuel consumption. Other automobiles, including hybrid vehicles that use innovative electrical systems in conjunction with gasoline engines, are explicitly marketed as part of the answer to environmental disruptions; the drivers encouraged to save fuel costs while being more environmentally responsible.

But as the literature on resource wars now makes clear, the consequences of modes of extraction in distant places is tied into violence, dispossession, and environmental destruction in many places (Watts 2004). And many of these links can be traced and acted upon politically as numerous campaigns for boycotting corporations, and ethical investment strategies have made clear in the last decade. To think in these terms is to challenge the conventional geographies of security and the geopolitical assumptions that underlie the assumptions that democracies are peaceful because they do not go to war with each other, and that they provide the appropriate vision of a sustainable and non-violent future. Putting the geography of resource extractions back explicitly into the picture changes the terms in which it is possible to construct both “resources” and “conflict” (Le Billon 2004). It also suggests the possibilities of innovation to facilitate less ecologically destructive modes of living. Above all, it challenges the taken for granted geography of danger as external to the modern spaces of prosperity (Jung 2003). In short, it requires a shift away from an understanding of environment as the external context of humanity to a recognition of life within a changing biosphere.

9.7 Environment and Human Security

In stark contrast to the early literature suggesting that environmental change would cause violence, much of the literature on human security has suggested that the sources of human insecurity are a necessary place to start for more effective understanding (Najam 2003). Although some of the literature on Human Security in the early twentyfirst century has dropped environmental security as a theme in their formulations, the logic of putting vulnerable people at the centre of analysis, rather than seeing them as a subsequent variable in an analysis focused on other matters, follows from human security thinking (O’Riordan/Stoll-Kleemann 2002; Chen et al. 2003). As the United Nations Institute for Environment and Human Security (UNU-EHS) suggests “Instead of starting with a fo-

cus on natural hazards and their quantification, the assessment and ranking of the vulnerability of affected groups should serve as the starting point in defining priorities and means of remedial interventions.”²

Putting human needs forward as the primary concern, and then thinking through the contextual dangers to their provision, reverses the managerial assumptions of state centred security thinking and suggests clearly that security is now understood as much more than either state policy or technological intervention in some external domain. Linking this directly to the science of global environmental change suggests clearly that environmental security thinking in the twenty-first century will look rather different from what preoccupied it in the latter stages of the twentieth (Brauch 2005). It will do so because both the global context for discussing security, and the ecological sensibility which takes the flows of materials within the biosphere as the starting point for thinking, make it increasingly difficult to construct arguments which focus on the poor and marginal peoples of the world as an external threat to a supposedly benign modernity.

9.8 Conclusions: Towards a Fourth Stage of Research on Environment and Security

Refocusing security thinking on the factors that render humans insecure in specific places means taking the geographical dimensions of insecurity seriously. While the local disruptions in particular places remain the focus of much analysis, in light of the discussions of resource wars and globalization now the distant consequences of both resource extractions and subsequent pollution and consequent atmospheric change also have to be included. An ecological approach is now essential in which human activities are understood as part of the biophysical processes of global change; global environmental change and economic globalization are effectively two ways of looking at the same process of change. Thus, in future environmental security research will have to conceptualize its research agenda in awareness of the potential disruptions of climate change and myriad other ecological factors in an increasingly artificial global “environment” (Dalby/Brauch/Oswald 2008).

² See <http://www.ehs.unu.edu/PDF/PresentationEHS-general.ppt>

These changes in humanity's habitat are perhaps clearest - if we understand contemporary local changes and global connections as taking place in an urbanizing planetary biosphere where insecurity of many kinds frequently appears in the rapidly growing urban slums of the new Southern megacities (Davis 2004). These are in some ways connected into the global consumer economy, as vehicle sales and the presence of internet cafes attest, and in others as informal food markets demonstrate, remain primarily connected to local food and water supply systems. The future of environment and security research will have to come to terms with the resource flows and health consequences of these burgeoning places in addition to its traditional focus on the rural regions of the South. This chapter has clearly suggested the importance of how these interconnections are conceptualized in the formulation of both international and state policy, and also in the development of practical survival strategies for the poor, struggling to provide their own security in the new increasingly urban realities of the twentyfirst century (Oswald/Brauch/Dalby 2008).

10 Oriental, European, and Indigenous Thinking on Peace in Latin America

Úrsula Oswald Spring

10.1 Introduction¹

This chapter reviews the global thought on peace, starting with the thinking in China and India, continuing with pre-Hispanic indigenous reflections, integrating European contributions and finally perspectives on contemporary globalization. Historically, in all cultures besides violent power interests thinking on peace evolved to mitigate the hegemonic impulses and to deal with conflicts by consensus. The desire of human beings has always been to live together in harmony, with mutual understanding, dialogue, tolerance, respect, and cooperation. Women play a special role in peace-building. They use their own tools to achieve their goals, e.g. they tried to convince their husbands, sons and friends to avoid wars and reduce dominance and exploitation, sometimes with a sexual boycott as documented in the Greek comedy 'Lysistrata' of Aristophanes: 'without peace, no sex'.

This chapter explores the historical evolution and similarities in the thinking on peace-building processes, influenced by Hindu, Buddhist, Muslim, Christian, indigenous and modern values. In all these cultures and traditions a general tendency may be found with regard to an equilibrium and harmony with ourselves, with the other, and with nature. Thousands of years ago, Chinese thinking linked personal well-being to a hierarchical political order where subjects and rulers were mutually responsible. This resulted in the political system of Mandarins bringing China cultural and social development and knowledge on human nature, psychology, and power ambitions. In India, Hinduism, Buddhism and Jainism developed a nonviolent model of social coexistence, where the respect

for nature and other humans created a model for active conflict resolution from the local to the international level.

In Latin America, the Incas, Mayas, and Mexicas (great kingdoms that were influenced by other indigenous cultures of the Olmeca, Teotihuacan, Aymara, Ketchua, Cuiba, Taino, Mapuche, Kuna, Guarani, Asanimi, Wayuu, etc.) developed hierarchical structured empires that controlled large territories, enforced tributes from the subdued and developed science, astronomy, medicine, urbanization, and technologies of irrigation. Their peace processes were linked to the concept of equilibrium of human behaviour and nature. The military and ideological conquest of these civilizations by Spain and Portugal, and the Catholic church, imposed a colonial order that fostered economic underdevelopment (Campos 1995; Strahm/Oswald 1990) and subordination to other regions outside of Latin America (Kaplan 2003). Natural resources – food commodities, gold, silver, minerals, medicinal and therapeutic plants, later also oil and gas – were systematically looted. Forced labour and new diseases decimated the indigenous population. To replace the native work force in mines and agriculture, the colonial powers brought African slaves to the Americas (Diamond 1998). This violent displacement and exploitation created social fragmentation and destruction in Africa and Latin America. Global European interests and ideologies were introduced by authoritarian colonial and military regimes, as well as by a rape capitalism, characterized by unsustainable exploitation of human forces and natural resources, together with occidental patriarchal dominance. After revolutions and independence of most colonies in Latin America and in the Caribbean, the US enforced its neo-imperial interests in the hemisphere with its Monroe Doctrine.

Through the exchange of goods and ideas across the 'Silk Road', the Greek, Roman, and Persian empires and civilizations were informed about Asian cul-

1 This chapter partly relies on Oswald Spring (2006a), where some ideas were presented in more detail. These ideas have been developed further in response to comments and suggestions of two reviewers and suggestions by Hans Günter Brauch.

tures and thinking. The Christian churches preached Jesus' message of peace but they also supported and legitimated the often violent expansion of their faith and thus created a dominant doctrine with political consequences throughout the world. The ancient process of state consolidation interacted with the modern European model of political division of power and democracy. The process of social representation resulted in internalized Eurocentric ideals that produced a unique model of development for the whole world. European thinkers, like Grotius and Kant, created an idealist worldview where agreements based on cooperation, human rights, international laws, and personal responsibility tried to achieve peace, solidarity, and human well-being. The modern international law evolving from the Westphalia order (1648), the division of power within the state and an independent system of justice, were main achievements to oppose despotic kings and governors. Regional and religious wars, resource competition, colonization, two World Wars, and the Cold War hampered peace and development in most parts of the world.

In 1945 the Charter of United Nations was adopted with a mandate to overcome the 'scourges of war'. Since 1991, Secretary-Generals Boutros Boutros-Ghali (1991–1996) and Kofi Annan (1997–2006) failed to replace the obsolete UN structure of 1945 due to the opposition of several permanent members of the Security Council and their hegemonic interests. Thus, the global European world order gradually declined after World Wars I and II and was replaced by a bipolar power and ideological competition. After millennia of local, regional and later two world wars, Europe finally achieved a peaceful coexistence after the 'global turn of 1990', within an expanded European Union. After the end of the Cold War, and since 2001, the unipolar superpower (Fukuyama 1992, chap. 26 by Saxe Fernández) created new threats to peace with its 'war on terror'. As these core values apply globally, these occidental social representations have created conflicts elsewhere by replacing traditional beliefs.

Despite different value systems in the Orient and Occident, during several millennia patriarchy emerged as a common social practice and the underlying factor of violence (Reardon 1985). As a cross-cultural phenomenon, the resulting social representations and personal identity processes (Oswald 2008) have consolidated a status quo in beliefs, rules, and habits, where male hierarchy dominates gender. Therefore, peace movements, activities, and education must

transform the patriarchal mindset. Active nonviolence was developed in India since the 1930's (Gandhi 1984, 1982, 1996, n.d.), practised in the United States during the 1960's (civil rights movement, Martin Luther King Junior 1998) and developed further in the struggle for independence in South Africa (Mandela 1994). It produced new inputs for feminist and social movements², thus encouraging bottom-up alternatives for a post-modern world where nonviolent practices, peace-building, gender equity, and sustainable development including grass-root movements, women, indigenous, poor, unemployed and other marginal groups enhance a diverse and decentralized future (Vaughan 1997; Oswald 2001, 2006a, 2008).

This chapter is organized in seven parts, It will contrast key factors of violence, war, discrimination, exploitation, and environmental destruction with nonviolence and peace-building. First, the Indian origins of nonviolence (10.2) are compared with Chinese thinking on peace (10.3). Then the search for peace in European and American worldviews (10.4) are related to concepts of equilibrium and development in Latin America (10.5), and these three experiences are compared (10.6). In the conclusions a few ideas are systematized to stimulate peace thinking and nonviolent conflict resolution (10.7).

10.2 Indian Origins of Nonviolence

From a historical perspective Indian philosophers introduced important concepts of peace-building such as nonviolence, respect for parents, elders and authorities, self-control, personal disputes, tolerance, freedom, participative democracy, karma and sustainable coexistence with the environment. Diverse belief systems and practices have made this region into a seed-bed for alternatives in the past and present world order.

10.2.1 Hinduism, Jainism, and Buddhism: Indian Origins of Nonviolence

Hinduism, Buddhism, and Jainism have influenced not only Gandhian thinking on nonviolence and

2 Peace researchers, educators, and activists such as Elise Boulding (1992, 2000), Betty Reardon (1985, 1999), Vandana Shiva (1988), Sara Rosenbaum de Horowitz (1998), Rigoberta Menchú (2004), Wangari Maathai (2003, 2006) and other grassroot women have shifted the focus from war and armament to the root causes of violence in daily and public life.

brought India to independence, but after centuries of colonial exploitation they have offered a potential for growth and dignity, where 'ahimsa' represents an effective model for conflict resolution from the intrapersonal to the global level (Parmar 2003). The Economist (3 February 2007: 69–71) and Elliott (2006) have reviewed the potential of India as a new world power.

10.2.1.1 Hinduism

Peace values in Hinduism³ are related to religious beliefs, which are practised by the majority of the Indian population. As one of the oldest religions in the world, it grew in syncretism during the past 5,000 years⁴, creating numerous sects and cultural movements⁵, but also tolerance for new thinking and integration of dissidents, creating new gods and religious practices. Hinduism developed the doctrine of 'karma' where the individual reaps the results of his good and bad actions through different lives. The liberation from suffering and from the compulsion of rebirth is attainable through the elimination of pas-

sions, the comprehension and respect of the other, and through the knowledge of reality, finally the union with god. As a theological system Hinduism differs fundamentally from other religions, not having a single founder without a single model of morality or a central religious organization but with hundreds of different religious groups.

Thus, Hinduism never developed an exclusive doctrine and integrated other beliefs, avoiding that exclusion got converted into a core element of violence. Security is linked to the safety of authorities (king), who guarantee the security of the people (chap. 16 by Dadhich). This syncretistic tendency stressed tolerance, mutual understanding and coexistence, and a permanent renovation, which was enriched with positive elements of existing practices of peaceful behaviour. But this religious tradition also reinforced the caste system, anchoring social differences (Brahman caste vs. untouchable or Dalits) and potential conflicts for resource appropriation, where the social cohesion is linked to birth, thus maintaining the status quo (chap. 12 by Brück).

10.2.1.2 Jainism

According to mythology the first Jaina was a giant living 8.4 million years ago, but the first records of Mahavir are traced to 559 BCE in east India, as a child of Siddhartha. His severe asceticism, his deep knowledge, and his search for eternal truth provided the bases for the reorganization of Jainism. He conciliates the inner world with the realm of reason through ideals of freedom, transmigration, and relativism as spiritual and moral guiding principles. Mahavir eradicated from human thinking the conception of God as creator and protector, and with his ideal of the supremacy of human life he developed positive messages of life: nonviolence (ahimsa); truth (satya); non-stealing (acharya); celibacy (brahmacharya) and non-possessiveness (aparigraha), which opened the infinite potential of humans in perception, knowledge, power, and bliss for freedom and spiritual joy of the soul.

This religion is based on eternal cosmic principles of a colossal machinery running without error and cessation, in absolute harmony. In their ideology the Jainians propose a perfect system of democracy and an emphasis on equality of opportunities to achieve absolute freedom and spiritual perfection.

They opposed the caste system in Indian society as a core system of injustice and social violence. Their ways to achieve the truth was relativism with a dialectical approach of multiple viewpoints; entity where the complex nature is permanent through a process of

3 Hinduism is the world's third largest religion (after Christianity and Islam), representing about 13 per cent of the world population. The most general feature is the 'caste' system and the acceptance of the 'Veda and Upanishad' as sacred scriptures. The *Veda* comprises the liturgy and interpretation of the sacrifices and culminates in the mystical and speculative works of *Upanishad*, which contain the Brahman doctrine. This consists in that the self of all things and its identity with the individual soul or '*atman*' is the absolute reality. Later theistic elements were developed in the '*Bhagavad Gita*'. For more details see also the chapters by Brück and Dadhich in this volume.

4 The earliest evidence of the Hindu faith dates back to 3,000 BCE. Archaeological excavation in the Punjab and Indus valleys revealed the existence of urban cultures at Harappa (Pakistan) and Mohenjo-daro on the Indus, where ritual baths were found as early evidence of purification rites. Phallic symbols and a large number of discovered goddesses refer to early fertility rites.

5 Some Indo-Aryan theories claimed that the Aryans (noble) were nomadic people coming probably from southern Russia and the Baltic to India, bringing with them their language and culture. Archaeological evidence concluded that the Aryan invasion may never have happened and that the traditional Indo-Aryans were the original population. They gathered around the fire for their rituals and gods were represented by the forces of nature (sun, moon, and storms) and the communities in the Indus valley gathered along rivers for their purification and regarded rivers as sacred, such as a diversity of male and female gods.

origination, destruction and permanence, where substance is transformed either naturally or artificially. The third principle is a structural view of the universe with non-conscious living (atoms) and conscious living, where souls are liberated through the karma theory by proper conduct and austerity, rituals and prayers; the human excellence through yoga and the complexity of knowledge through sensory cognition, literal knowledge, clairvoyance, telepathy and omniscience or absolute knowledge attained by complete self-retaliation. The seventh element is Jain's ethics, a basic element for peace consolidation such as religious tolerance, ethical purity, spiritual contentment and harmony between self, others, and the environment through proper perception, knowledge, and conduct (Majumdar 1968; Shree Chand Rampuria 1947).

The practice of the principles of self-creation, self-rule, and self-regulation offer the world a prospect for a lasting peace and prosperity, because all souls possess an infinite knowledge, cognition, and power. As souls are prisoners of their 'karma', they must be liberated by self-discipline from earthly necessities to achieve a higher state of self-consciousness, all humans are pilgrims of peace. *Jainism* preaches the purest form of sincerity, forgiveness, and creating friendship with all beings, avoiding any violence and accepting a multiplicity of viewpoints, without privileging anyone. Nonviolence and truth is based on love for all living beings, and for this reason Jaina monks cover their mouth and clean their ways before walking in order not to destroy any living being. *Jainism* recognizes the natural phenomena as symbioses of mutual interdependence, which has created the bases for modern ecology and nonviolence or 'ahimsa', as a practical moral principle for daily life (Radhakrishnan 1952; Radhakrishnan/Moore 1957; Radhakrishnan/Muirhead 1958).

10.2.1.3 Buddhism

Buddhism⁶ developed in Northern India a 'way of the middle' (*Bodh-Gaya*) through meditation taught by Buddha. He transmitted the Buddhist maxims within a 'quadruple community' consisting of monks (*bhikkhu*), nuns (*bhikkhuni*), male (*Upasaka*) and female lay persons (*Upasika*). From the beginning his teachings were based on tolerance for other religions, races, social groups, and a peaceful living together.

He did not recognize a god, a soul, a caste, social difference or any other discrimination against humans and nature (in opposition to Brahmanism). Buddha taught with his life how to find freedom and peace on earth. His beliefs, similar to Jainism's, challenged the existing rigid social structure where the 'impure' or without caste were exploited. His thought can be understood as a philosophy of life (Jaspers 1919) because the basic maxims do not refer to supernatural authorities.

Only later did his followers transform in Buddhist schools his philosophical teaching into a system of beliefs and a religion. The main goals of Buddhism are to develop a feeling of compassion and knowledge through ethical behaviour and the cultivation of virtues by daily praxis of meditation. This frees each person from suffering and permits to enter into a state of '*nirvana*' understood as peace and paradise on earth. For this reason deep knowledge and self-control is attainable for everybody not due to a godly revelation, but through self-discipline and meditative contemplation and active ahimsa.

The further syncretism of Hinduism, Jainism, and Buddhism with other philosophical and moral currents created the known elements of Indian religions, but its influence spread to China, other Eastern countries, and later to the whole world. It linked philosophy, religion, and *Weltanschauung*. Until today it influenced deeply policies in Bhutan, Sri Lanka, and Thailand, but it is also present in parliamentary practices in Japan. In 1995, China's Communist Party tried to use Buddhism politically. Concerned about an increasing spirituality of its citizens and a worldwide opposition to the invasion of Tibet, China's authorities tried to exchange the 'Panchen Lama' with a child whose parents were party members.

Geographical diversity, cultural interlinkages, syncretism, political consolidation, and ethical performance slowly transformed these religious beliefs into daily habits, training people for practical life. The development of human compassion and truth helped to free the people from pain on earth and through self-discipline to free them from karma and to find the '*nirvana*'. The freedom from *dukkha* (pain, egoism, and suffering) through rebirth is only defeated by overcoming the egoistic 'me' impulses through meditation, self-observation, and moral behaviour. The four truths are named *dukkha*, life means suffering; *samuday*, the origin of suffering is hate, greed, and excess; *nirodha*, when the root causes are overthrown suffering is over. *Magga* to defeat suffering opens eight complementary ways of perfection which are im-

6 As a 35-year-old prince, Siddhartha Gautama (563–483 BC) was illuminated and was renamed 'Buddha', the illuminated.

portant and trace a moral for a happy life. It includes truth with the right for recognition and intention; morals with correct speaking, doing and living; and deepness where training and correct efforts, attentiveness, and the ability for contemplative meditation creates happiness for human beings and peace. *Samsara*, the continuing walking to perfection represents the circle of life, death, and rebirth. Growth and decline happen to everybody: to humans, to gods and goddesses, but also to devils and nature. All beings are prisoners of the cycle of life, fixed by the 'karma', which register facts, thinking, emotions, necessities, pulsations, and excesses. Only through a deepening of life, knowledge, and the daily fight against egotism and abuse, is it possible to overcome these karmic forces and to leave this circle of violence and abuse.

Compared with Jainism, the Buddhist ahimsa is not passive and absolute or fatalist, but reactive and flexible and community-learning oriented (chap. 12 by Brück). There is a second difference with Jainism. For the Jain all creations have an equally minded position. Their vision is strict egalitarianism of every life unites with an equal value. Therefore ahimsa is based on equality and universal kinship of all souls. Buddhism considers a hierarchy and distinguishes higher 'minded' creatures, which have priority for life over lower ones. There is a second difference, linked to the philosophy of absolute independence of the liberated soul in Jainism, which is losing the capacity to be truly sympathetic with one another (Tahtinen 1976). In Buddhism, the interdependence and relatedness are essential to their reality, which permits a match between ontology and ethic. The repercussion on ahimsa is a passive or an active nonviolence. Similar to Gandhi, Buddhism believed that ahimsa without compassion is nothing, which means that it is enabling a virtue in a context of social ethic. In contrast to the Jain position, both accepted that "all killing is not *himsa*" (violence; Gandhi 1924: vol. 13: 232), and Gandhi postulated that it is better to fight an aggressor, than to be a coward. This marks a difference with the Jain position of absolute nonviolence against any living unit, independent of hierarchy or circumstances.

10.2.2 Mohandas K. Gandhi's Thinking

Mohandas K. Gandhi's thinking was deeply influenced by these Indian philosophical, religious, and moral traditions. He believed in Hinduism. By learning through mistakes he understood also that people are resistant to change and he worked on himself to find the truth (*satya*). In contrast to Greek philoso-

phers with their ontological search, his concern was oriented 'to exist', which means doing the right things, guided by the universal forces of samsara. His 'drop in the ocean' analogy suggests that individual self-realization is prior to the salvation of the world. The concept of nonviolence (*ahimsa*) or non-resistance (truth meaning also god) – represented by the little voice inside guiding oneself to do the right things – is at the same time also the guiding force for the eternal universal forces. His exercises with truth challenged his personal life, but also the British colonial forces (Gandhi 1982, 1996).

During World War II he said to the British people "I would like you to lay down the arms you have as being useless for saving you or humanity. You will invite Herr Hitler and Signor Mussolini to take what they want of the countries you call your possessions. ... If they do not give you free passage out, you will allow yourselves, man, women, and child, to be slaughtered, but you will refuse to owe the allegiance to them" (Gandhi 1942: 40–41). These beliefs go far behind the accepted self-defence doctrine within the UN Charter and included in most constitutions of the world (Wolfrum 1994). For this reason nonviolence brings a "force infinitely superior to the one they had" (Gandhi 1942: 47) than possessing arms.

There is a general idea that meat creates violence and there is a fact that vegetable calories can be assimilated with their own value, thus chicken meat requires 12 vegetable calories and beef seven for one animal (Strahm/Oswald 1990: 60–61). Many Hindus are vegetarians⁷ and this food intake reflects the existing conditions of availability to feed everybody. By being vegetarian Gandhi gained more than a diet, he consolidated his personal philosophy of life, using fasting as one of the most powerful tools for his personal growth. The philosophy of '*brahmacharya*' as spiritual and practical purity is associated with asceticism and celibacy.⁸

Together with his simple lifestyle he found inner peace ('*shanti*') and compassion for others, overcoming religious barriers⁹ and social exclusivity which im-

7 As a young child Gandhi experimented meat-eating, partially for his curiosity and his friend Sheikh Mehtab. When he left for his studies in England he promised his mother he would abstain from eating meat, drinking alcohol, and engaging in promiscuity.

8 Gandhi's personal struggle to remain celibate was linked to the process of learning to love without limits, rather than lust. The '*brahmacharya*' means for him "control of the senses in thought, word and deed" (Gandhi 1996: 176).

plicity lead to violence (Dimock 2003). Apartheid in South Africa forced him to develop several ideas of equality and justice, when he experienced daily race discrimination, injustice, and segregation. His personal example and sacrifice helped India not only to gain its independence, but after centuries of colonial exploitation it created for his country a future for growth and dignity, and with *ahimsa* also a new model of conflict resolution.

Gandhi also rejected to convert from Hinduism to another faith, however, he read extensively about other religions. Nonetheless, he questioned the *one god religions* as hypocritical, dogmatic, violent, and with bad religious practices, by imposing their greatness worldwide and pretending to represent the full and exclusive truth. He also understood that part of Hinduism was promoting inequality (Brahman, Dalits or untouchables) and the caste system should be rotten. He found in every religion core messages of truth, peace, and love being trained in daily life. He analyzed Muhammad as “a treasure of wisdom, not only for Muslims but for all mankind” and proposed to interpret ‘jihad’¹⁰ as nonviolent struggle or ‘*satyagraha*’ (Gandhi 1982: 203). His main interest was to find in any religion core elements for peace and non-violent coexistence that facilitate the daily living together based on moral behaviour of any individual.

10.3 Chinese Thinking on Peace

In China the ideas of Hinduism and later Buddhism influenced the teachings of Confucius and Lao Tse¹¹. Their doctrines consolidated political theories and institutions, strengthening a value system that is able to promote peace for human beings and to care for the environment. The accumulation political system consolidated the longlasting social system (*mandarins*), based on a structure of dominance but also of inter-

9 “Yes I am a Hindu. I am a Christian, a Muslim, a Buddhist and a Jew”. He also stated “An eye for an eye makes the whole world blind” (Gandhi 1996).

10 Today, the interpretation of jihad as “holy war” is used by suicide bombers to promote the doctrine of Islam.

11 There are numerous influences documented by Buddhism into Chinese society five centuries later. However, the spiritual goal of Hinduism such as devotional service; accumulation of knowledge and amassing of good karma are moral guidelines, which could be found in Lao Tse’s idea of simplicity and acceptance of situation, and in the Confucian mode of life, human honesty, upright faithful and obedience to authority, together with stress upon social services.

dependence, social co-responsibility and respect for the environment. Their philosophies and Indian religions created in Asia a multiculturalism and religious pluralism without asking for the ultimate truth (Kant 1788), but a way to live in peace and harmony within society and nature.

10.3.1 Confucius and Lao Tse: Chinese Origins of Peaceful Co-habitation

10.3.1.1 Kongfuzi or Confucius’ Impacts on the Thinking on Peace

Kongfuzi (551-479 BCE), born as a poor villager, developed some principal philosophical and moral concepts that are still valid in contemporary China, Korea (chap. 14 by Lee), and in other Asian countries. As one of the most prominent representatives of Chinese history he consolidated political theories and institutions and created a value system for living in peace within an organized society and caring about nature. Reflecting on human beings, he put in the centre of human behaviour five virtues: humanity, uprightness, morals, wisdom and sincerity and three social obligations: loyalty, respect for parents and ancestors, and courtesy substituting violence, conquest, and exploitation promoted by hegemonic interests.

10.3.1.2 Lao Tse and his Impact on the Thinking on Peace

It is assumed that Lao Tse lived in the same period (6th century BCE), but his physical existence is not guaranteed. However, the book ‘*Tao-te King*’ or ‘*Dao De Jing*’ has influenced the society and policy in China and overseas. As a metaphysician Lao Tse has developed the ‘*tao*’ (way), representing the origin of the world order and the knowledge for guiding society through moral behaviour by peaceful means¹². Similar to Hinduism ‘*tao*’ is the eternal source understood as the origin of earth, the law of the laws, the rationality, and the absolute. Looking with humility to nature it is possible to live the ‘*tao*’ and empirical knowledge brings deepness into understanding and behaviour. The guiding principle of life related to human relations and to nature is that humans should live and act

12 Watkin-Kolb and Chao (2000: 39) analyzed ‘*tao*’ and ‘*ren*’ and defined ‘Easternization’ as an emerging force of the non-West, including other Southern countries. They thought that China symbolizes by its population size, material capacity, and cultural and spiritual civilization an alternative to occidental hegemony.

on earth respecting other beings and allowing a minimal footprint.

'*Ren*' (humanity, love for others) and learning during the whole life represents the second pillar of his metaphysics. With his reflections he created some main principles and actualized philosophical theories and moral maxims of Confucius still valid in present society. Due to his rejection of excessive laws and norms, several researchers interpreted him as an anarchist (Durant 1956; Carrington Goodrich 1954). His ideal was a small country where a king was able to know his people who lives in a peasant community, away from power and ambitions (Waley 1953: 102). He called for the abolition of the army and was against any war, not precisely for moral reasons, but because any conquest is always insignificant and trivial compared with the unlimited internal resources of a person.

10.3.1.3 Tzun Tzu and his Impact on the Thinking on Peace

These ideas influenced the maxims of Tzun Tzu, a famous precursor of Clausewitz. His book *The Art of War* was written in almost the same time period. As a general, his vision of the military integrated social concerns, postulating that "armies are instruments of bad predictions which should only be used when there was no other solution" or "the supreme art of war is to subject the enemy without fighting". Understanding also the economic costs of a war he postulated "where an army stays, prices are expensive. When prices rise, the wealth of a community shrinks" (Tzun Tzu 2000).

In the thinking of early China war and army endangered the wealth of the people, and destroyed the economy and the environment. Humans had to care about nature to get enough food and water for a long life. Their moral thinking is summarized in the 'absolute' and may become concrete only through congruent acting. Both are interrelated parts of moral obligations for subjects and rulers, because they depend on each other. Their common well-being through '*ren*' and '*tao*' offered the whole society an opportunity to live in peace with neighbour countries and nature. Within this complex Chinese cosmovision, the Mandarins, the longest lasting socio-political system in the world was consolidated, where the people contributed towards the maintenance of their ruling class, and this elite was equally responsible for their subjects. The resulting political stability favoured a long-term scientific and cultural progress and without

doubt the Occident was influenced by Chinese wisdom (García 1988).

The long period of thinking and experimentation in China permitted the development of highly controversial theories.¹³ Metaphysics was transformed into a moral behaviour, sustained by religious doctrines. Basic concepts of democracy, responsibility, duty, truth, peace, social and personal well-being, responsible behaviour, karma, reinforcement of rules, and rationalism were consolidated. These also influenced European philosophers (Descartes 1637; Kant 1787, 1788 [1956a, 1956b], 1981; Rousseau 1737; Nietzsche 1883–1885 [1961]; Hobbes 1658; Marx and Engels 1845 [1966]; Rosa Luxemburg 1977).

When Buddhism linked up with Confucianism, the disequilibrium originally created by the monster *Kung-Lung* (Taoism) who destroyed one of the pillars of the sky, was getting permanent due to the badness in the world. It explained and justified the destruction of the harmony between 'yin' and 'yang', and the tension between the female and the male element. Chinese wisdom and beliefs aimed at achieving a perfect equilibrium. It thus differed from the patriarchal and monotheistic – one male god – religions (Christianity, Islam, and Judaism) that postulated exclusivity and the absolute uniqueness of their truth which fostered competition, conflicts, violence, and religious wars.

In peace terms, the small countries learnt through *shih-ta* (chap. 14 by Lee) to serve the big one and to find in this dependency an equilibrium and protection. There love and integration with nature spread over all Asia and is one of the core principle of harmony with other human beings and with nature (chap. 15 by the Okamoto).

13 The Neo-taoists (Zhuang Zhou and others) insisted on the relativity of personal experiences for building up value systems, and they created a pragmatic utilitarianism (Mo Tse ca. 500–396 BC). The Sophists developed logic in such a way that it went into absurdity. Psychological explanations (Meng Tse 371–289 BCE) gave any human pulsations and needs; humankind is essentially bad and for this reason nature has to be dominated and controlled. In the Middle Ages, an active male principle 'Yang' was linked to the opposed female 'Yin', bringing up a kind of dialectical thinking, but maintaining the patriarchal worldview. During the Sung time Zhu Xi (1130–1200) developed 'Li' representing the global rationality of the world and 'Ki' the material one, both intrinsically related, because reason cannot be separated from material and material without reason has no fixed point (similar to Aristotle's rationalist theory of form and substance).

10.3.2 Impact of both Traditions on the Thinking in East Asia

Religions have played a crucial role in the history of civilizations and are still doing so to surmount dangerous threats such as terrorisms and global injustice. However, the expansion of West European culture in the world and its imposition on non-European cultural behaviours transformed the pluralistic nature of human cultures and thinking into a monolithic Eurocentric and later Occidental imposition due to global ideological drivers (Preiswerk 1984; Syamsuddin 2005). Potential clashes among civilizations could emerge, e.g. between Islam and the West (Huntington 1996), and as German Chancellor Helmut Schmidt mentioned between Western civil rights fundamentalism and Confucians or Chinese socialists. But there is also a new process of Eastern spirituality renewing Western society and its spiritual loss. These processes are visible in yoga and meditation groups, Buddhist churches and socialization of Eastern values such as ahimsa, satyagraha and self-discipline. The economic achievements in China and India and a substantial reduction of poverty are other indicators of different values opening a hope for a new globalization with a human face. Peace talks with North Korea are based on Chinese advice, and the recent peace agreement was the result of this ability to establish a new equilibrium (chap. 14 by Lee) in a very complex Asian context.

10.3.3 Impact of Oriental Thinking on Peace in the Occident

Oriental religions were based on a deep metaphysical background with the goal to balance the internal and social life in such a way that citizens and elites were mutually co-responsible for their life and well-being in this world. Principles of satisfaction, modesty, and love for knowledge, wisdom and nonviolence were values which have influenced the demilitarization of armies and maintained centuries without war, inducing peace processes able to avoid longstanding social and religious conflicts as in Europe. The consolidation of a positive 'Weltbild' was able to mobilize society and individuals to improve their personal life within a collective order to overcome their *karma* and to find the eternal truth and peace (*nirvana*).

The old concept of *ahimsa* is a powerful support for any peace-building, that have recently also been employed by social movements in the West (Reychler/Pfaffenholz 2001), Latin America, and Africa.

There is archaeological and historical evidence of trade between China and the Mediterranean, through the Silk Road, at least 2,000 years BCE. With commodities also ideas could have crossed and enriched the Occident.

When Gandhi synthesized the Vedic and the ascetic view of nonviolence, his *ahimsa* concept became a political tool of Realpolitik, which permits a world struggle against imperial powers beyond India. For him *ahimsa* is not "a resignation from all real fighting ... On the contrary ... nonviolence ... is more active and more real fighting wickedness than retaliation whose very nature is to increase wickedness" (Gandhi 1946: 48). When he combined *ahimsa* with '*satyagraha*' (his soul force with contention), this force, oriented to action, will win in the end over any brutal force and in all possible conditions in the world. His flexibility, his personal lifestyle and his deep knowledge of other faiths and philosophies¹⁴ gave him the inner force to find the finite truth, making *ahimsa* a disposition of acting as an essential element of freedom. As a pantheist, Gandhi constantly identified God, the world, and life, and he understood that the world is in continuous change and his social engagement obliged him to control the animal nature and to improve the spiritual side. He understood that political activism without individual involvement is not possible and that his political struggle for independence, peace, and *ahimsa* obliged him to prioritize his struggle within a world of greater equality and global justice.

Gandhi's teaching started in South Africa within a dramatic situation of Apartheid and racial discrimination (Mandela 1994). His teachings reached also Ghana where Nkruma was inspired by his ideas when he created the utopia of an African socialism. Nyerere used in Tanzania the traditional '*ujamaa*' for developing a livelihood approach and food sovereignty with nonviolence, and the '*ubunto*' development of South Africa recreated traditional communitarian roots of self-development with Gandhi's *ahimsa*, to reconcile a country divided by decades of racial conflicts and atrocities. Recently, in Burundi and Rwanda the '*gacaca*' (grass-root tribunals in villages) was used, a type of bottom-up *ahimsa* movement, tried to close some of the wounds of the previous civil war, bringing war criminals and prisoners to rebuild those disintegrated and destroyed villages where they were the former murderers. Gandhi influenced Martin Luther King's Civil Right Movement, where the main idea of

14 Gandhi translated Plato's Apology into Gujarati.

true peace is not the absence of tensions, but the daily presence of justice and equality (Beck 2007). There is no doubt that the West had and can still learn much from the peaceful spirituality and actions from the East (Flis 2002).

In theoretical terms the three Chinese thinkers Confucius, Lao Tse, and Tzun Tzu could somewhere stand for the three ideal type traditions mentioned in the goal paper of this book (Brauch 2003; chap. 4 by Brauch). Confucius could be understood as a kind of oriental rationalist or pragmatist, similar to the position taken later by Grotius. Lao Tse probably is more representative of an Eastern idealism or radicalism. Similar to Kant, he is trying through laws and agreements with smaller countries to establish a peaceful co-existence, where the smaller countries corresponded to the protection of the bigger one with respect and fulfilment of the agreed tributes (chap. 14 by Lee). Finally, the most complex comparison is the case of Tzun Tzu. As a general, his thinking on war could be initially compared with Hobbes and classified as a representative of realism. However, his vision of avoiding at any cost a war and interpreting armed struggle as a primary defeat also makes him a pragmatist. While this comparison of Chinese and Occidental philosophical and political thinking and praxis is perhaps overdrawn, it gives the teachers a possibility to show that two thousand years earlier non-European cultures have developed philosophical concepts, which were proposed – with or without specific knowledge – in the Occident since the 16th century AD by Hobbes, Grotius, and Kant. In general terms, the Chinese integration of humans and nature and the self-limiting and educating processes of teaching of all three masters converted them into forerunner and models of their society, that are able to overcome the evolutionary constraints of rational or idealistic¹⁵ cultures of peace that have existed in other cultures and religions.

10.4 Occidental Greek, Roman, and Christian Thinking on Peace

In Europe, peace thinking emerged from early Greek and Roman concepts of democracy, citizens' rights,

and from *Pax Romana*. During the Thirty Years War (1618–1648), Grotius (1625) challenged the power-oriented approaches from Thucydides to Machiavelli with a more cooperative pragmatism promoting an international legal framework for cooperation among states that emerged two decades later with the Westphalian order and with modern international law (Sanahuja 2004).

After the French Revolution, Kant (1795, 1981) in his 'eternal peace' developed the legal basis for an idealist 'eternal world' based on a republican order (democracy, domestic order), an international organization (a new international order with a league of nations), and human rights (rights of world citizens, individual rights and obligations), and personal responsibility (Kant's categorical imperative, 1788 [1956a/b]). In the 19th century, Marx (1966) addressed the economic processes and their societal repercussions and he fought against the inhuman conditions of capitalism by creating a socialist utopia for workers through class struggle and Rosa Luxemburg (1977) fought for international solidarity.

10.4.1 Greek, Rome, Christianity, and the Evolution of Institutions in Europe

10.4.1.1 Greek Origins of the Thinking on Peace ('eirene')

With Socrates¹⁶ (470–399 BC); Plato (427–347 BC); and Aristotle ([384 BC] 1968, 2004) systematic occidental thinking started. Socrates' dialectical method postulated that it is possible through education and knowledge to transform a human being into a moral one. Plato founded 'transcendental idealism' searching for the foundation of eternal ideas or 'forms', representing the universal, unique or absolute. He characterized "the idea of being in the sense of abiding or steadfast reality" (Coplestone 1960: 31). "Man appears as a being set between two worlds, the full immaterial world of reality above him and the merely material limits below him" (Coplestone 1960: 234). In the Platonic tradition, where the idea is understood as pure, as virtue and as moral good, peace achievement is understood as the superior value, justifying all means to attain it. Therefore, war or peace is an act of

15 Still today in Latin America, the idealistic approach of laws and their enforcement is very weak: In Paraguay 94.3 per cent of prisoners have no legal verdicts; in Bolivia ca. 89.7 per cent, and in El Salvador some 82.7 per cent (Arellano 2000: 18).

16 Greek pre-classic thought started with the questions of changes and being. Heraclites analysed the intrinsic principles (dynamism) and Empedocles and Anaxagoras the extrinsic principles (mechanism) of change. The sophist school explored later the relativism and skepticism of thinking and acting.

will and a result of the 'logistic psyche' (today understood as the part of the human brain associated with language), able to guide human conducts.

Aristotle started by arguing that 'all men by nature desire to know', however, there are different degrees of knowledge, one based on 'mere experience', the other on 'art', where the reason of an event is ascertained, establishing logical processes. In his broad ontology he established a theory of nature and its relationship with being in which substances interact in various ways producing objects with different properties or attributes. He related epistemology with metaphysics and ethics, but also with physics, biology, zoology, psychology, and politics. A descriptive approach of wide empirical data in natural sciences permitted him to link nature and the natural environment to humans and their ethical behaviour. In his ethics he distinguished between an ontological dimension of 'goodness and badness' and an axiological one with 'deficiency, badness and excess'.

In this sense Aristotle understood virtue between two vices, cowardice and rashness, and therefore peace is not an absolute good or virtue, but a process between different vices and virtues. Thus people do not act on the basis of the facts, but what they believe the facts to be (chap. 17 by Arends). All three Greek thinkers insisted on the creation of democratic control of power and proposed an ethical behaviour to overcome the despotic power game, transforming humans into responsible beings, able to deal constructively with peace. In their logic peace-building has to emphasize beliefs and belief-systems, which creates the intentionality of human beings and which later through phenomenology were defined by Husserl (1973: 268) as "an objectivity of the human, cultural world". In social psychology today these processes are related to identity building and the construction of social representations.

10.4.1.2 From 'Pax Romana' to 'Pax Augusta'

The Roman Empire was interested in launching its own civilization that heavily relied on Greek wisdom and civilization. With its 'Pax Romana' the empire offered peace and well-being for all citizens inside its boundaries, once conquest is accomplished. It was also understood as the 'king's peace' once the ruled submits to the will of the ruler and his norms. It is a contradictory concept and was supported by different interests and persons: generals wanted victories for power and glory; governors more citizens and land for tax collection. Only peasants opposed war because they had to abandon their activities and war re-

sulted in poverty, destruction of their fields, in misery, diseases and death. 'Pax Augusta'¹⁷ was a desideratum of thinkers and writers (Cicero, Livio, Virgilio), but also of persons, determining that there is no just war, and peace is the highest value for a human being. The European idea of peace was always linked with internal security, well-being, and prosperity. It was considered an instrument to mediate between private and public relations among citizens and states. Finally, it was an ideology present in any political programme, represented in writings, paintings, monuments, and statues.

Augustine's Neo-Platonism facilitated the acceptance of the Christian doctrine and the belief in divine providence, of one God, and the pope as his representative on earth. He promoted the purification of the soul by self-control, moral education, and submission to the 'divine will' (expressed on earth by the Church). The result was a hierarchical male-dominated structure of the Catholic church, which permitted its rapid expansion, increased power, and influence beyond the Roman Empire ('Pax Augusta').

10.4.2 A Millennium of Christian Thinking on Peace of Land and Soul

During the development of Christianity, besides ethical needs of humans, there were also unsatisfied religious requests, not covered by the state cult. The imminent *logos* and divine providence or the mystery of the Holy Trinity and the sacraments covered this satisfaction. These were also reinforced by philosophical concepts. The historical influence of Judaism and the dialectic instruments and metaphysic concepts from Greek philosophy facilitated a rapid acceptance of Christianity. Through the sacraments, in memory of Jesus, and the doctrine of salvation, all human beings could find eternity, irrespective of knowledge or ignorance. Saint Thomas Aquinas (2001) in the 13th century linked peace with joy (*gaudium*) and related it to love (*caritas*). His inner peace represented the rule of God over the world and in the soul, and since God is love he is also the divine word (John 1:1, New Testament). In this sense peace is very similar to oriental beliefs and therefore peace meant in multiple cultures the key for a desirable life with joy. These cross-cultural connections globally link together physical acts

17 The period of Augustus was considered as an idyllic time of peace. In 13 BC the 'Ara Pacis' was erected in the Campus Martius to commemorate peace.

and intentional spirituality, opening the way for peaceful behaviour.

Nevertheless, the Christian Church, similar to the biblical God (chap. 16 by Eisen), was violent, persecuting other religions, organizing Crusades, committing genocides against indigenous tribes who resisted evangelization (Prussia, Slavic Polabians, Mesoamericans, Incas, etc.), and killing millions through the Inquisition. The tensions between two evils where cowardice and nastiness were confronted with the virtue and love of Christ gave a contradictory image of peace-keeping in the Christian belief system (chap. 17 by Arends).

10.4.3 Peace and Modern European Thought

In Europe as in some other parts of the world, the process of peace based on early Greek and Roman thinking developed a military logic with a 'tooth for tooth' pragmatism, aggravated by population growth (Malthus 1798). Peace was understood in its negative sense as 'absence of war'. However, in conquered territories, women as goods (the highest valued object in a patriarchal society) were always threatened by attacks from other empires or nomadic tribes with superior military strategies and tactics.

With the adoption of non-intervention into the internal affairs of established states (Westphalia Peace, 1648) and moral codes, a legal system based on monotheist religious values was established. In order to secure these goods, besides the military protection, a new paradigm emerged: the legal protection of *private property* (Richards 2000). The property rights of elites were better protected. According to Richard and Schwanger (2004) the *state of law* was introduced in ancient Greece and consolidated later, thus offering society a possibility for a peaceful use of conquered goods and territories.

A second paradigm against peace, also consolidated by religious control, is *patriarchy*.¹⁸ Its mythological origin goes back to the consolidation of the irrigation societies and the social differentiation in rulers, soldiers, artisans, and slaves. Within this division of labour and incipient social stratification, women were increasingly subjugated under a hierarchical male power and confined to their houses. They were made invisible. Until today (see the war in Yugoslavia) they are the most appreciated goods to be conquered and also objects of war. The mythological and religious justifications emerged when a secondary Greek male half-god took power over earth and the sky by controlling lightning and thunder. Thus, Zeus

consolidated through the possession and use of new arms and absolute male domination, both over goddesses, other gods, and over humans on earth, transmitting and justifying a hierarchical, violent, and patriarchal dominance. The Christian Church, Islam, and Judaism based their religious control on the same symbolic elements. The consolidation of their system of power and division of gender and social classes was based on discrimination, subjection, and exploitation.

10.4.3.1 The State, Division of Power, and Democracy

The primitive accumulation and the division of labour resulted in a specialization and soon in a *division of power*. Excessive hegemonic interests and exploitation obliged elites to legitimize the exercise of power, war, and violence. Nevertheless, until the decline of the *ancien régime* at the end of the 18th century, the divine rights of monarchs were unquestioned until the *American Declaration of Independence* (1776) and the *French Revolution* (1789), which reclaimed the *sovereignty for the people*. The influence of the French Revolution spread the 'rights of the citizens' to prosperous colonies ruled by Britain, Spain and Portugal, where independence movements emerged.

In the 19th century, the disintegration of great empires (e.g. the Napoleonic and the Ottoman) began, followed by the collapse of the Austro-Hungarian, Tsarist, as well as the German, Chinese and Iranian empires. In the 19th and 20th centuries, capitalism, based on the extraction of raw materials from the colonies and the exploitation of the work force, brought wealth to colonial powers and increasing poverty to colonized countries.

Wars and religious and ideological confrontation inspired liberal thinkers (Montesquieu [1721] 1984;

18 The historic consolidation of patriarchy can be linked to the invasion of the oracle of Delphi by the Dorians. The priestesses were captured and became their wives. Child bearing was no more of holy origin (water, trees, and oceans: Graves 1985; Oswald 2003) but directly attributed to man. It is noteworthy that this patriarchal thinking permeated also the medical schools where until the 19th century only men were responsible to procreate children; nevertheless the female ovule is much bigger than the spermatozoid and could have been seen without any help of microscope during an autopsy. This kind of ideological blindness guided also the scientific objective observation and experimentation, creating gender discrimination and submission of women, and later the negation of female epistemology.

Rousseau [1762] 1973; Locke [1704] 1998; Hume [1739–40] 1975) to question the hegemonic interests. During the French Revolution, the *division of power* emerged and weights and counter-weights were established to minimize power abuse.

These achievements could not avoid two World Wars with torture, concentration camps, forced labour, genocide, ethnocide, purges, mass murder, terror, discrimination, and prosecution. In some countries, corruption in the judiciary, legislative, and executive branches also undermined peace efforts that aimed at reinforcing the democratic and balanced exercise of power, democracy, and control mechanisms by citizens.

10.4.4 From Kant to Marx

10.4.4.1 Kant's 'Eternal Peace'

Based on the Greek and Roman tradition of democracy, Grotius (1625), Montesquieu [1721] 1984; Rousseau [1762] 1973, and Kant [1787, 1788] 1956a, 1956b) with other thinkers of the *Age of Enlightenment* developed a more cooperative paradigm to challenge the bellicose pragmatism of Machiavelli ([1513, 1532] 1959) and Hobbes (1658). They established the legal basis for an idealist world based on human rights and personal responsibility. Kant [1787] examined the limits of reason itself, named transcendental or critical. His method explored the nature and the limits of knowledge.¹⁹ In his treatise on 'eternal peace' he distinguished in a tautological way between hostilities and other forms of violence able to initiate war. Based on the equality of all citizens Kant called in his first definitive article for an eternal peace for a republican constitution with democratic and representative organs. According to his second definitive article, within a 'League of Nation' it is possible to reduce the danger of wars, and in his third definitive article the right of a world citizen is granted by the hospitality principle. Being aware that relations with neighbour countries are conflictive, he developed the philosophical maxims obliging war-prone states to reflect on the possibility of taking peace and development agreements into account. His concern with the differences between morale and policy in relation to peace made him transfer into the hands of the people the adop-

tion of laws to control the violence of powerful monarchs and statesmen.

10.4.4.2 From Rousseau to Marx's Social Classes

During *The Enlightenment*, Jean-Jacques Rousseau (1712–1778) proposed a general access to education as a mean to improve the social conditions and creating greater equality. Until the 18th century, European societies and colonies were restricted to a feudal system of kings, landlords, clerics, small-scale artisans, merchants and peasants, similar to the pre-colonial empires in America and Asia. Living in little towns and in the countryside, work was close to the households and men and women worked together in order to sustain their families.

Industrialization pushed peasants out of their land, transforming them into agricultural workers, landless labourers or factory workers. In urban regions, a new class emerged, linked to services and the ownership of factories and capital, called 'bourgeoisie'. The new *social class* configuration (Marx/Engels [1844] 1945) caused different insecurities for workers and an intensive process of exploitation of the work force. Intellectuals and workers fought together for securing new rights²⁰ (Montesquieu [1721] 1984; Voltaire 1759; Locke [1704] 1998; Jefferson [1784] 1984) and *social struggles* gained in forcefulness.

Karl Marx ([1818–1881] 1966) did not only become the core theorist of socialism, but, inspired by Hegel ([1812–1816] 1975); Feuerbach ([1841, 1843] 1986); and the French socialists, in *Das Kapital* (Marx 1966), he denounced the inhuman reality of British capitalism. Together with Friedrich Engels (1902) he created the First International, a movement for economic and intellectual liberation where they united the struggle of the working classes against exploitation. In her humanitarian Marxism Rosa Luxemburg stressed the need for democracy. She believed that only through

19 Kant's work influenced different schools. His critical idealism immediately provoked opposition from rationalists and empiricists, while some idealists reinterpreted his thought.

20 Distinct human rights were created. They apply to any human being and are inalienable and recognized by law. The *Declaration of the Rights of Citizens and Individuals* formulated by the French National Assembly and redefined in the Constitution of Independence of the United States, focused on individual rights such as the freedom for property acquisition and the right to resist any oppression. But it took more than 80 years until slavery was abolished in the US, after a civil war. And another 100 years later, the civil rights movement, led by Martin Luther King Junior (1998), in a nonviolent struggle fought for formal equality of the black and other ethnic minorities.

revolutionary mass action of the proletariat was it possible to achieve international socialism. However, colonization, the structure of the family, and the discrimination of women was not challenged.²¹

In the name of Christianity, Europe exploited entire continents. The colonial powers lived at the expense of their colonies and they imposed *Eurocentrism* (Preiswerk 1984) as the superior way of thinking over ‘the primitives’, justifying slavery and contemporary sweat-workers in *maquilas* as progress. Industrialization allowed the developed nations to liberate their slaves and peasants, and to transform them into a work force. The society analysed by Marx (1966), Weber (1987) and Durkheim (1938) is an account of the 15th to 18th century as a matrix of medieval Christendom, amplified geographically through colonies and instituted more and more by secular institutions (science, democracy, nation-state, capitalism; Giddens 1971).

10.4.4.3 Social Contract and Social Struggles

Peace efforts were linked since the 17th century to the creation of a *social contract*, clearly expressed by Thomas Hobbes (1658) and John Locke (1704). This concept reinforced Grotius’ (1625) cooperative approach and it was developed further with Kant’s ([1788] 1956a, 1956b) ‘categorical imperative’. Despite its profound modification, the social contract is a product of the convergence of the individual will and rights within a social context. Individual rights should be restrained through negotiation and agreements by collective rights, avoiding conflicts and armed confrontations (Rupesinghe 1998). A permanent tension exists between both realms. Keynes (1935) proposed a welfare state, providing support for needy citizens, when economic circumstances disenabled them from caring for themselves.

Neoliberalism substituted this paradigm arguing that from the free market the benefits will automatically trickle down. The result has been a regressive globalization process (see chap. 27 by Oswald) that

created a relatively wealthy northern society and a poor southern one, where only the elites can link up to the modern system of consumerism. In the early 21st century, more than three billion human beings live in poverty, are marginalized from basic services, rely on a minimal well-being similar to the situation in the 18th century when rape capitalism (McGregor 1989) created an exploited and peaceless society, full of tensions.

Furthermore, due to the global competition based on wage differences, the transnational capital has increasingly transferred jobs from the North to the South, what has resulted in relatively high unemployment rates despite a progressing ageing population and decline in the North. This has brought about a new ‘precarious’ lower class on the periphery of economic prosperity in the North.

After at least five centuries of colonial exploitation and two World Wars, the founding members of the United Nations agreed in its Charter on the goal “to maintain international peace and security, and to that end: to take effective collective measures for the prevention and removal of threats to peace, and for the suppression of acts of aggression or other breaches of the peace” (UN Charter, Preamble). Since 1945, the UN was supposed to promote an era of development and well-being for the whole world. The scientific and technological progress, e.g. the informatics and communication revolution of the past 60 years have significantly changed the relationship between the micro and macro environments, contributing to integration through a globalized world society.

The idea of peace changed from a static state of no-war to a more dynamic process of enabling social change. The basic idea of Freire’s *Pedagogy of the Oppressed* (1998) admitted that the oppressed have been deprived of their voices and therefore, denied their role as active co-creators of culture, and thus would permit them to transform the situation of oppression into cultural liberation (Arizpe 2004).

10.5 Latin America in its Search for Peace

Latin America has merged two traditions: a Pre-Hispanic tradition of indigenous high cultures of the Maya (Lenkersdorf 1999), Mexica²², Inca (Niles 1999) and multiple small civilizations with a colonial Euro-

21 The industrial revolution with its growing cities introduced a new division of labour and created a false dichotomy of a male ‘bread winner’ and an economically dependent ‘housewife’, looking after the family. In neoliberal times, this dichotomy is formally maintained, women still care and look after their families, but often, due to lower salaries and higher efficiency, they are also working, obtaining part or the full income of the family, especially when the husband is unemployed or had to migrate and the remittances for the survival of the family are not arriving.

22 Instead of using the colonial term of Aztecs, in this chapter the Mexican term Mexica is used.

pean tradition, influenced by Spain and Portugal. The Catholic Church as an ideological transmitter tried to suppress and even eradicate the non-Christian indigenous cosmivision, still reflected by the syncretic 'mestizo' society even today. The result is an ideological tension created by the 'white' European elites and the indigenous population where Pre-Hispanic and Hispanic traditions, Christian, and indigenous religious rites have merged. This duality influenced the thinking on peace within the countries.

The political elites established a hierarchical political order, supported by the Catholic hierarchy, both often came from the same families. The accumulation in the hands of these elites institutionalized the impoverishment of the majorities, the limits for creation of a middle class and permanent tensions, rebellions, revolutions, guerrillas, coups (Valenzuela 1991). The new elites in power normally use ideological controls in form of messianism to maintain the power and to continue to exploit the dominated.

Therefore, Latin America is the region with the highest income gap and after 200 years of independence the dramatic situation of poverty and urban slums is getting worse. Peace and violence characterized the history of Latin America, where local and regional violence among states created several empires with high cultural achievements (Inca, Maya, Mexica), whose science, technology and food innovations spread from the subcontinent globally (chap. 21 by Sánchez), but where European colonization and independence created a highly stratified society.

10.5.1 Pre-Hispanic Cosmivision

Environmental decline, social disintegration, and the human struggle for survival has been no new experience in Latin America and for its high cultures, such as the Maya (León Portilla 1959a, 1959b, 2003) who lost their splendour due to an overexploitation of natural resources and difficult climate situations together with local conflicts for regional hegemony. Two powerful empires emerged during the 14th century in Mexico and in Peru (Pizarro 1978). For strategic purposes in the high plateau of Mexico a triple alliance developed between the rulers of *Mexica* (Itzcóatl, Moctezuma I, Axayacatl, Tizoc, Ahuizotl and Moctezuma II); of *Texcoco* (Nezahualcóyotl and Nezahualpilli), and *Tlacopan* that had succeeded to control a vast territory, obtaining tributes, slaves and pawns to create a splendid capital named *Tenochtitlán* (León Portilla 1959b).

The main concept of Pre-Hispanic religions was the concept of equilibrium. In Tenochtitlán, the capital of the Mexica empire, a tension rose between two ideologies. There was a religious idea of elected people by gods and goddesses and empowered to dominate through war and to maintain the life of the sun through sacrifices. On the other side, there were priests who wanted to give new ideas coming from the Toltecs, where Quetzalcoatl is the supreme god, which can be found through meditation and symbols (León Portilla 1959a; 2001). These tensions were maintained during the expansion of the reign until the arrival of the Spaniards.

The intimate relationship between caring for and fearing nature²³ was part of the Mexica cosmogony and beliefs, which established a harmony between humans, nature, gods and goddesses. Destruction or offence of gods/goddesses could only bring disaster and devastation, and to re-establish equilibrium human beings and animals were sacrificed by priests. The victims were captured through 'flowered wars', creating fear and discipline for the capital. People were educated to love and respect this intimate relationship, but also the existing political system. The highest values such as cooperation, dignity, freedom, love, solidarity, respect and peace were taught, together with a hierarchical system of power. Military force, science, and technology permitted to improve the quality of life and to maintain a growing population in very different ecosystems. Their life quality, political stability, and expansion of the empire were dependant on agricultural techniques and good harvests.²⁴ Mesoamerica's base for development of their great cultures and cosmivision was related to the domestication of three plants - corn (maize), bean, and squash - enabling its people to capture the food energy inside the plants, offering these societies an economic basis for a rapid expansion in population, land, culture, medicine, and productive techniques permitting the establishment of well-planned

23 The fragile ecosystem on a lake and a rapid growing urban system with more than one million inhabitants motivated the king and poet Netzahualacóyotl to protect the environment by developing laws which protected trees, animals and fishes, establishing serious punishment, including the death penalty for ecocide (León Portilla 1959b). He was also a brilliant urban planner ordering the rapid urbanization of Tenochtitlán, located on islands and surrounded by lakes on the high plateau of 2,300 metres. He also developed the arts, the economy, and social behaviour to improve the quality of life of his subjects.

cities with magnificent temples and palaces (Coe 1993; Coe/Koontz 1997).

Like Mexica, the Incas appeared late on the historical scene. The rapid expansion (1463–1493) of the Inca Empire by Viracocha's²⁵ son, Pachacuti, and by the Topa Inca was consolidated by the planning of cities, environmental management, and political and religious control. Their integrated and efficient knowledge of the extremely difficult environment gave them an opportunity to produce enough food during the summer months to avoid starvation during the cold winter. Two parallel highways permitted large interchange of products between the mountains and the coastal areas (Niles 1999), serving also for military control.

The religious beliefs of the Inca's were similar to those of the Mexica. This was a mixture of complex ceremonies, rites, practices, animistic beliefs, and worship. The sun is also the centre of the cosmovision and the god of creation of the earth, humankind, animals and flowers is Viracocha. He was also a cultural hero. As the Incas conquered new territories, they erected temples there and tried to attract the good will of gods/goddesses with sacrifices. Crime, mismanagement of communal land, and other behaviours against the social code had to be confessed. Sacrifices of animals, in severe cases also of human be-

ings (sometimes even children²⁶), were offered to establish again the harmony between divinities, humans, and nature. Pestilence, severe earthquakes, volcanoes eruptions, famine and defeat asked for human sacrifices (Cieza 1883). When rain did not fall or a water line broke, people believed that the cause was a failure in the observation of the ceremony, giving priests a parallel power to the emperor.²⁷

Within their cosmogonist genesis of the Earth in both empires humans established a system of communication with gods and goddesses creating a dynamic process of control, obedience and negotiation, above all of equilibrium. Authorities were divided between the Inca (emperor), the civil and military leaders. The priests and military control were inducing death and fear in the subjugated regions. The hierarchical rule based on power and a brutal control over large parts of the empire introduced a feeling of suffering and fatality among the subjugated people, reducing their capacity of preventive peace-building and conflict resolution.

10.5.2 The Colonial and Catholic Heritage

This Pre-Columbian authoritarian structure, cruel exploitation by tributes, and human sacrifices enabled Spain and Portugal to establish local alliances against both empires, permitting Spain²⁸ to conquer the whole territory very fast (Pizarro 1541; León Portilla, 1959). Ideological concerns facilitated the military action, as most of the indigenous people thought that the sun god was returning and punishing the loss of ceremonies and sacrifices. The Conquest imposed Catholicism and the indigenous beliefs were totally abolished by the Spaniards and by Catholic priests.

However, these pre-Colombian traditions of religious practices and political thought undergo a process of syncretism and the decimation of indigenous population was taken as a divine punishment for the loss of the cosmic equilibrium. E.g. the goddess Tonantzin (Mother Earth) was transformed into Virgin

24 Fertility goddesses gave birth to the gods of corn (Centéotl), of flowers (Xochipilli), and Mother Earth (Tonantzin) is still represented today in the Virgin of Guadalupe and their cult of syncretism and in *Marianism*. Their ritual calendar and astronomy were two basic religious and scientific achievements, facilitating the orientation for the agricultural cycle. A ritual calendar of 260 days ran parallel to the calendar of 365 days, divided into 18 months of 20 days, helping peasants to optimize the agrarian cycle of the year for good harvests (Broda 1997; Broda/Good 2004), introducing sophisticated systems of irrigation and natural fertilizers to obtain up to five harvests in the floating gardens of Xochimilco.

25 Due to climate change and the loss of glaciers in the Andes, several child mummies were found in an excellent status of conservation. Their clothes, food, and manner of burial suggest that they were children from the highest society. There is a hypothesis that one of them could have been the daughter of the main Inca. They were carried over more than 5,500 metres, drugged during the way with coca leaves, and then carefully scarified by priests through brain traumatism. The beliefs were that with these children's sacrifices the harmony between the sun god and the earth could be re-established and existing epidemics, earthquakes, and droughts could thus be overcome.

26 During the assumption of the new Inca ruler, 200 children were immolated. Several came from conquered territories and the term 'blood money' was more than a metaphor.

27 The Incas lived in temples and were learning complex ceremonial practices since their childhood. Such as in the Meso-American region, prediction and oracle were a prerequisite of any action and a drink based on coca leaves '*ayahuasca*' with narcotic effects was used to predict the future of any political or military action (Cieza 1883).

Guadalupe and at the same place where indigenous offered former sacrifices, a centre of pilgrimage was build. The virgin is still admired and Mexicans, Catholics or others, believe in the virgin. They have prayed to her for good harvests, health, birth, etc., even the flag during independence and the revolution represented here image.

10.5.3 Impact of Both Traditions on Contemporary Thinking on Peace in Latin America

But the conquest did not bring peace to the region and half a millennium of colonial domination, post-colonial exploitation, and foreign interventions created in Latin America a highly stratified social structure and dependency that helped small political, military, and economic elites to accumulate power and wealth. However, the history of Latin American invasions, exploitation, ethnocide, and neo-colonial threats resulted in the legal principle of non-intervention. As active partners in drafting the United Nations Charter, many Latin American states proposed mechanisms for conflict resolution within regional bodies prior to involving the Security Council, such as the OAS. As neighbours of a new superpower, the sub-continent tried to protect the rest of the world through the UN Charter from interventions it had experienced that were justified with the Monroe Doctrine (1823).

10.6 Comparison of the Thinking on Peace in the Oriental, Occidental, and Latin American Traditions

Colonial conquest, globalization, and exclusion brought both challenges and opportunities of peace-building for philosophy, religions, UN institutions, governments, social movements and individuals. The present stage of world development and globalization are using the accumulation of knowledge to concentrate wealth in a few hands, contributing to new insecurities, violence, environmental destruction, and also terrorism. Internal wealth gaps and extreme exploitation often foster opposition by the excluded, which also affected those in power.

The tensions among individual responsibility, free-market ideology, and socio-political domination have created further social tensions, and the geographically division of the world in North and South. The social stratification in rich and poor has increased social vulnerability and marginalization that have been aggravated by race, ethnic, and gender discriminations. New threats linked to global and climate change are affecting both hemispheres, and preventive behaviour and remediation requires global cooperation for mitigation, affecting present productive processes and technological development. In addition, as world society is closely linked, peace efforts, violence or war in one part often systemically affect wider regions (see the effects of the wars in Afghanistan and Iraq on increasing terrorism, but also the global learning process from Gandhi's ahimsa).

Equal and respectful cooperation can reduce old and new risks, violence, ethnic conflicts, internal wars, and terror. The accumulation of ethical and moral knowledge in traditional (Oswald 2004; De la Rúa 2004) and modern societies presents a new platform for dialogue, understanding, and cooperation. Nevertheless, it is necessary that the wisdom of the people emerges not as a silent majority, but as an active movement to promote the goals of ahimsa by challenging present manipulations and divisions.

Further, the world population in East and West, North and South, has similar dreams of well-being, stable livelihoods, a green and healthy world, where humans live together in harmony and collectively mitigate the increasing threats posed by human interference in the environment. The peoples of the earth are also conscious that a world with increasing scarce and polluted resources requires new models of dialogue, cooperation, agreements, and above all new negotia-

28 Both cultures had a vast agricultural knowledge but they did not have domestic animals, one of the explanations for the decimation of the indigenous population when the Spaniards brought new illnesses, because their immune system was unable to cope efficiently with new viruses and bacteria (Diamond 1998). The conquest brought also an important destruction of nature and a different management of water (Escobar 2004; Oswald 1991), which had catastrophic effects on the high plateau of Mexico City, where today the complete lagoon ecosystem is dried up and a city of 25 million inhabitants is getting half of its water supply from outside of the basin (Oswald 2006b). In the Andean region deforestation, overgrazing of the highland, population growth, and rapid urbanization produced one of the most serious desertification processes in the world, due to erosion and water scarcity.

tion goals and strategies. The new ways that may adapt to the changing situations are tolerance, mutual understanding, and respect for diversity, co-existence and cooperation. Without being naive, the different analyses of world civilizations and development strategies have shown that the interfaith dialogue and cooperation should involve besides social dialogues, also ethical concerns, where different traditions coincide, thus contributing to the wisdom of peaceful co-existence.

10.7 Summary and Conclusions

Given the new complexities, the former empires in East and West and the new players of globalization should focus on an integral development including bottom-up participation. During the past five centuries, the West has dominated world thinking on peace through conquest, the Christian religion, its transnational economy combined with its instant communications, and its cultural homogeneity that has created for minorities a consumerist world model. In the past, the Occident has benefited from multiple ideas coming from the Orient and also from traditional Eastern societies. They were consciously or practically integrated and transformed into the present world model of legal norms and social habits (Bourdieu 2002). Western ideas have been spread by processes of globalization, multilateral organizations, and by the media (TV, radio, films, etc.). The results have been an unprecedented scientific and technological innovation, secularism, but also social inequity, poverty, violence linked to organized crime, and growing intercultural tensions often expressed by fundamentalist (Muslim, Christian, Jewish, et al.) thinkers and movements.²⁹

The conclusions may be summarized in four basic contradictions, which point to these tensions between the following trends: 1) cooperation with solidarity vs. isolationism and elite behaviour; 2) cultural diversity vs. economic monopoly; 3) peace or ahimsa vs. himsa; and 4) spirituality vs. secularity.

10.7.1 Cooperation with Solidarity vs. Isolationism and Elite Behaviour

Undoubtedly the most important tension is related to the process of present exclusion. The basic structure of modernity is the market and the exchange of money. There is an increasing social gap which requires social reconciliation and wealth distribution³⁰.

Van Ginkel (2000) proposed a resumption of economic growth, to combat traditional sources of inequality, to be able to achieve a better distribution of this growth, where institutions such as the WTO and the unfinished Millennium Round should centre on true development, where legal norms and conventions could avoid abuses, and social norms (e.g. progressive taxes) could improve equity and promote ethical business.

As exclusion and poverty are social products, they can also be resolved by new social activities. Complex problems require multifaceted analyses and answers within a comprehensive framework. All policies should reduce structural inequality through democratic land reforms, agriculture, and labour intensive mini-industries. Severe adjustment policies as the former SAP of IMF should be avoided. Strong distributional finances, and policies that are able to avoid

29 In this complex and violent world, Senghaas's (2004) 'earthly peace', in analogy to Kant's 'eternal peace' ([1795] 1981), analyses the interdependencies and the dilemmas in a divided world, characterized by economic, political, cultural, and social globalization. Most of the conflicts are linked to highly segregated societies involved in secular processes of development, not only tending to be conflictive but violent, above all at most of the inter-state and sub-regional levels. At the local level they are expressed by public insecurity and transnational crime. In his 'civilization hexagon' he asked "how and what means constitute peace - understood as the constructive and nonviolent creation of inevitable collective conflicts in each relevant open space, characterized today through a wide spreading politization" (Senghaas 2004: 136). These objective conditions create new and complex processes not only for particular regions such as the US, the EU, and OECD states, but increasingly also in Asia, Latin America, and the poor countries in Africa where wide experiences of conflict resolution were developed in indigenous societies (Gil 2004; Gaitán 2004; Armendáriz 2004; Menchú 2004; Martínez 2003; Claudia Rojas 2004; Oscar Rojas 2004; García 2004).

30 In the USA, 90 per cent of population owned only 27 per cent of all wealth (US Census Bureau 2003). The World Bank (1990, 2000a) proposed to reduce by 2000 poverty from 1.1 to 0.8 billion people, but the goals were not achieved, rather poverty rose to 1.2 billion prior and after the Asian crises. The World Income Inequality Database (WIID) analysed that inequality has risen since the early 1980's and was triggered by a set of economic policies in countries without adequate institutional capacity. Therefore, economic growth is necessary but not sufficient due to social inequality. In the former USSR the poverty level rose from 14 million in 1989 to 147 million persons in 1996 (Van Ginkel 2000).

the volatility in finance and to control wage inequities will improve social equality (Van Ginkel 2000: 8–9). Women’s empowerment and the avoidance of the privatization of basic services that follow only the logic of profit could lessen the gap with the least developed countries. Combined with social reconciliation, what has been a basic goal of many churches, increases in social inclusion and economic development could promote peace-building processes and contribute to a new social consensus. The efforts in China and India for poverty alleviation are interesting, whenever the internal gap had increased and rural development was severely limited.

10.7.2 Cultural Diversity vs. Economic Monopoly

Historical links to colonialism, self-defying inferiority, uncritical acceptance of thoughts and theories from the Occident has created a world of ‘uni-dimensional’ human beings and a sole free market ideology. Cultural power has been limited to the economic system due to the control of the mass media, fashion, and the ‘American way of life’. Freire understood that oppression signifies being deprived of the ‘other voices’, which were taking their active role in creating diverse and regional cultures. This process enabled the socially marginalized to undergo different processes of social improvement, first through the consolidation of social meanings and later through the process of identity-building and the creation of social representations (Serrano 2008, Oswald 2008). Returning to this process, with conscious-building it is possible to reconstruct the basic understanding of humanity through collective agreements and their concrete implementations, but also by developing mechanisms which take care of this consensus. Once this cultural liberation process is accepted, where people’s minds focus on real world issues of today and not on images created by advertisement and fashion promoted by Western transnational mass media, it may then also be possible to foster and spread a peaceful mindset in a diverse cultural background that uses the potential for peace-building and conservation.

Thus, peace and peace-making require first a mental transformation, later changes of the rules, new moral agreements, and social conventions and a consensus which understands the impact of hormones and the nature of violence, but also the capacity of a cortical and conscious learning process. Through a combination of secular institutions and conventions (science and technology, democracy, laws, state and

multilateral organizations) with spiritual elements (positive thinking, ahimsa practices, cultural interchanges, immaterial goods, religions) a world based on cultural diversity and mutual respect could be constructed.

10.7.3 Peace vs. Violence or ‘ahimsa’ vs. ‘himsa’

Betty Reardon (1985) argued that the world relies on patriarchal institutions and therefore constitutes a war system. Freud’s reflections on human impulses and desires (*‘Triebe’*) gave the theoretical bases for this claim. Recent studies on the effects of the hormone testosterone on human behaviour confirm the violent and aggressive character of human beings. Thus, uncritical pacifism can undermine peace-building. But post-war scientific analyses in IR have also impeded progress in peace thinking. Focusing primarily on Anglo-American realist scientific schools has often contributed to political opportunism and a justification of war. From this realist mindset some have rationalized the death of civilians from weapons of mass destruction as ‘collateral damage’. Some insisted on maintaining national sovereignty and the nation-state despite the ongoing globalization process. In Latin America in the 1970’s, these dominant scientific rationales were challenged by the ‘dependencia’ theory (Marini 1973, Dos Santos 1978, Furtado 1965), by Liberation Theology, as well as by the political use of ‘ahimsa’ by Gandhi, Luther King, and Mandela.

The chapter argued that peace has always been a constructive concept based on collective social efforts and thus, it has also been highly fragile. In Buddhism, in the teachings of Confucius, Lao Tse, of Jainism, in the Greek classics, the teachings of Christian churches, as well as by European philosophers since The Enlightenment, and more recently by Latin American thinkers, peace was yearned for as a key value and belief for a changed human behaviour.

Plato’s *‘eirene’* implies harmony when collective actions concur. This harmony was reinforced by the Christian *‘agape’* or *‘caritas’*, where God is love and the possible guiding principle. Pre-Hispanic cultures promoted the concept of equilibrium among humans, nature and gods, similar to the care for society and nature developed in the Orient. One of the grandmothers of peace research, Elise Boulding (2000) called for a global civic culture, as a result of positive globalization, and the first indigenous Mexican president Benito Juárez (1858–1871) postulated that “The respect of alien rights is peace (*el respecto al derecho ajeno es la*

paz”). The respect for agreed rights combined with a collective obligation to aid by these agreements creates a base for peace. “Peace is perhaps best thought of as a fragile, complex ongoing, collective social achievement” (Richards 1999: 25), therefore war has always been a failure in a negotiation process, what was well understood by Tzun Tzu in China some 2,500 years ago.

Kenneth Boulding (1978) proposed to learn how to make peace by studying past peace and peace-building processes (David 1999). He understood this as part of networks of trusting relationships creating strengths that are able enough not to be threatened. Only then is peace stable (Lederach 2001). Huntington (1996) lacked an understanding of these cross-cultural connections and he underestimated the intentional acts of a dominant country to impose a new world order, without respecting the wide diversity of experience with peace in other civilizations. He ignored the legal norms and conventions developed by Kant who suggested global maxims with his categorical imperative as a framework for an emerging international legal regime and a human behaviour that is oriented to live together in harmony and without conflict.

10.7.4 Spirituality vs. Secularity

Spirituality may be a solution to some aspects of the present identity crisis of humankind. This process could be linked to religiosity, motivating the believers not only to perform individual piety, but understanding that social piety is a driving factor for love, coexistence and peace. Spirituality could help overcome the exclusiveness of some religious credos, based on patriarchal fundamentalism by promoting a meeting point of people from different faiths. They share common values where God and love is the source of their spiritual approach. These shared ethical values provide some basic criteria and attitudes for a common human ethics that may contribute creating a different world order with a people-oriented global responsible praxis. This new thinking and acting may address upcoming tensions in a nonviolent way where more equitable agreements to share scarce resources give the most vulnerable an opportunity to experience a dignified livelihood. Such a common platform could lead communities and countries to aim at the goal of *ahimsa*, based on mutual respect, coexistence, respect for differences, and a beneficial mutual cooperation (Sen 1995). Thus, accepting and caring for the ‘other’

is the first step to mutual understanding and peaceful living together.

Many countries are built on a pluricultural and religious diversity (Senghaas 2003). Switzerland accepted in its Constitution four languages and avoided religious wars by consensual agreements. In many countries minorities are given ‘voice’ and their concerns are taken into account by governments through a system of plurinomial representation. Indonesia is a pluralist country with a diversity of religions, ethnic groups, and languages. Indonesia’s ‘Pancasila’ doctrine or five principles (oneness of God, humanity, unity, democracy and social justice) has been a gentlemen’s agreement and became a common platform for all religious communities, ethnicities, and groups to live together in the archipelago in one nation with a joint future. The ethical implications of this state ideology and philosophy were further strengthened by the imperative in the Constitution (1945) that grants religious freedom and pluralism. This led to the national motto: “*Bhineka Tunggal Ika*, meaning diversity in unity” (Syamsuddin 2005: 10).

Traditional (De la Rúa 2004) and modern societies are searching for new platforms of social representation that may defeat present stereotypes of modernity with exclusion. New peace paradigms from Asia, Africa, and Latin America based on nonviolent conflict resolution experiences are focusing on sustainable peace and solidarity. Promoting dialogue, respect, understanding and cooperation, the present process is searching for a “globalization of ethics” (Küng/Senghaas 2004), where people’s cultural wisdom emerges not as a silent majority, but as a process of active *ahimsa* to challenge the present division and manipulation and irresponsible action, but also the threats from hazards and global change ideologies and actions. An equilibrium between occidental dominant ‘orthodoxy’ can be established with the oriental ‘orthopraxis’, able to link spiritual teaching with humanized ethical behaviour.

11 Security in Hinduism and Buddhism

Michael von Brück

11.1 General Remarks and Definition

In Indian traditions there is no equivalent for the concept of security in the modern sense of the term. However, the background of the Western concept in Latin tradition calls for a significant distinction to be made. On the one hand there is *securitas* as a concept that is concerned with provisions being made for encountering the ambiguities and contingencies of life, on the other hand there is *certitudo* as a result of convictions and experiences which provide a firm position for cognitive, emotional, as well as social stability over against and in face of the changing experiences in time. Both concepts influence each other as aspects of a wider framework in which humans look for stability and/or security in view of the unexpected and unwanted. Thus, security is a value as well as a strategy for individual as well as social action. As such it is dependent on mental dispositions (expectations, wishes, fears, avoidance, etc.), which again are culturally conditioned. Individual and social security as well as emotional, cognitive, and political aspects of the problem are deeply interwoven. In other words: the term and concept of security is historically conditioned in most complex ways.

11.2 Basic Concepts of Hindu Culture Establishing 'security'

A probe and study into Hindu and Buddhist concepts on the Indian Subcontinent which might show typological equivalents to the Western debate cannot expect to find conceptual equivalents, but needs to start with a mapping of mental structures that have been constructed in order to face the contingency of human life experience as mentioned above. The most comprehensive term in this regard is the notion of *dharma*, which we shall interpret now in its dimensions concerning the social experience of life and the individual framework for any appropriate behaviour.

The term, however, has a history and is not a static symbol which would design certain Indian values once and for all. Moreover, there is a remarkable difference in the spectrum of connotations concerning its usage in Hindu and Buddhist traditions respectively.

The Hindu concept of *dharma* evokes the trust in an unchanging universal order which is reflected in all universal as well as individual occurrences that on the surface seem to be chaotic and not understandable, i.e. *dharma* is happening on the macrocosmic as well as microcosmic plane of reality. *Dharma* is the universal law that sustains the world order in its coming and going of events, both in the field of physical events as well as in the moral realm of human behaviour and action. *Dharma* is interconnectivity. Security means to be in accordance with *dharma* in all respects because the individual as well as the group would be in correspondence with the universal and unchanging law of reality.

In the most ancient Indian tradition, the *Rig Veda*, the concept of *dharma* is prefigured by the concept of *rita*. This is a cosmic order that already expresses itself in macro- and microcosmic correspondences, i.e. events in the heavenly sphere reflect on the human sphere and vice versa – as on earth so in heaven. Gods sanction human actions, and humans influence gods. This mutuality of give-and-take is celebrated in the central rite of ancient Indian culture, the sacrifice (*yajna* or *homa*). By sacrifice, the balance of the cosmic order as well as of the human order is maintained: if the sun gives light and life so it needs to be “fed” by sacrifice; as the king protects the worldly order so he needs to be strengthened by brahmanic ritual sacrifice. Security not only of society, but also of the cosmic order depends on the proper balance between all forces which is renewed again and again by individual sacrifice and collective state sacrifice. The ritual action which performs as it were this balancing out is called *karman*.

Karman is a central concept of Indian life which has shaped the value system of nearly all Indian traditions in a most comprehensive way. Though not yet developed in the earliest times, it has been formulated in the classical time (first half of the 1st millennium BC) which saw the rise of Buddhism, the classical philosophical and social systems, and the doctrines on arts, politics, and social life. As already stated; all benefit, welfare, stability and growth depended upon proper sacrifice. This was the basis for later considerations about *karman*. *Karman* now became the universal law of reciprocal causality not only in the field of physical events, but also in the moral realm of human behaviour and action. That is to say; that every mental impulse, every thought, and action has a result in the external world, but it also makes an imprint on the subject of thought and action. It coins his/her consciousness and conditions further thought and action. It shapes gradually all structures of thinking and behaviour which finally form into habits. Those structures do bind human beings not only from birth to death, but also onwards into the next incarnations according to the cycle of rebirths. They condition the new material existence as a kind of formal principle. How this continuity over several births cycles can be understood is being answered differently in different Indian traditions. But nearly all of them share the idea that human life experience is being continued in the next incarnations. That is why the goal of life in most Indian cultures is to be liberated (*moksha*) from this nexus of birth, karmic impressions, and rebirth according to the structures and demands of these impressions. Some would argue that this liberation might be attained by giving up all action, and consequently they would fast to death. But most Indian schools of thought and the vast majority of the people would hold the view that action cannot be abandoned completely; on the contrary, it is necessary to develop the right action on the basis of the right motivation. For it is not the action as such which binds and conditions, but the thought process before it, i.e. the motivation. What is to be cultivated, therefore, is action without desire, because desire is selfish and isolates humans from the dharmic order. The proper action would be the one which sustains the dharmic order, and the right motivation is dedication of all thought and action to God or – in impersonal systems – the dharmic law.

Again, an Indian concept of security cannot be mapped without this background, even if today in certain secularized circles the religious background

may not be any more so consciously ascertained: security is interconnectivity in the dharmic law, and security which would have in view only the benefits in this life would not be enough. The Indian value system is, as a discussion on the four *purusharthas* (classical goals of life) would show, deeply oriented toward the trans-historical liberation process, though worldly values such as wealth, good family life, and physical sexual satisfaction are values that shall be cultivated in accordance with *dharma*. Peace, however, is basically peace of mind, *shanti*. Therefore, security is fundamentally a mental problem and not merely a political or social demand.

In Buddhism the concept of *dharma* is similar to the other Indian traditions which are subsumed under the term “Hinduism”, but there are also some remarkable traits to the idea that cannot be found outside the Buddhist developments. *Dharma* here is the teaching of the Buddha which needs to be understood rationally as well as by deeper meditative experience. That is to say, *dharma* requires an educational process, and that is why security of a society depends on insight of the individuals which needs to be established by social institutions. Further, *dharma* in Buddhism is a term which denotes the irreducible building blocks of reality, both in the material world and in the sphere of consciousness. Those factors of existence (*dharmas*) occur in limited numbers, at least in early Buddhist philosophy. They mingle and form clusters which are subject to degeneration yet again. Thus, all these processes of a formation of reality are impermanent (*anitya*). Therefore, all human experience is impermanent and there is nothing that humans could and should cling to. Whereas in Hinduism the central goal is to acknowledge the one *unchanging reality* behind the forms of existence, in Buddhism the final goal is to gain insight into the *impermanence* of everything. Most likely, the Buddhist view leads to an easier handling of the contingencies of life in terms of adaptation to changing realities. Concerning our subject one could argue that Buddhist security is always fragile, relative, depending on circumstances. Of course, the Buddhist community (*samgha*) has given itself a law and order (*vinaya*) that includes both changeable and unchangeable rules. Those unchangeable ones are linked directly with the Buddha and the *dharma* in so far as they follow consistently from the central teaching of Buddhism; such as non-violence, impermanence, basic equality of living beings, etc. And to the Theravada tradition the monastic rule has been the source of stability of the social order: monks with different

Figure 11.1: God Krishna as driver in Arjuna's chariot just before the decisive battle. **Source:** Copyright: Michael von Brück

views and philosophical persuasion could live under one roof if only the common morality and monastic rule was strictly observed, because this gave enough stability and security. In Mahayana, however, the idea of impermanence was extended also to the so-called unchangeable *dharmas*: here, reality is empty (*shun-ya*) of self-existence; all things are interrelated and depending on each other in ever new created formations. This view allows for greater adaptation to circumstances, flow, and acceptance of instability. Security would depend on the insight that everything is insecure.

11.3 Dharma and Svadharma in Hindu Culture – The Overcoming of Fear and the Framework for Proper Behaviour

The concept of *dharma* focuses on an all-encompassing reality. Cosmic events as well as microcosmic human fate are determined by the dharmic order, and so is the social level of human action. Dharmic behaviour results in social harmony, whereas un-dharmic action leads to disaster either immediately or later on, in this life or the next. In terms of the concept of security one could say that following the *dharma* provides for the maximum of a secure life both on the social as well as the individual level. Hindu texts again and again outline the benefits of moral i.e. dharmic action in terms of material benefit, social prosperity, and individual enlightenment. The social and the spiritual consequences are not to be separated. But what happens when conflicts of dif-

fering dharmic obligations occur? If there is an answer it should provide us with an insight into the Hindu idea of maximizing security in a situation of conflict of interests. Indeed, this is the case, and the most outstanding and widely influential example is given in the *Bhagavad Gita*, one of the root texts of Hinduism and a kind of unsurpassed gospel of many different Hindu traditions.

The *Bhagavad Gita* ("Song of the Lord") is an integral part of the large Hindu epos *Mahabharata*, composed probably between the 4th and 2nd century B.C. This epos reports early Indian history mixed with myths, fictional genealogies, stories of gods, descriptions of life in early India, discourses on law, and so on. It is divided into 18 books, and the *Gita* comprises 700 verses in the 6th book (*Bhishmaparvan*). In a commentary by Yamunacarya (10th century) it is said that the *Gita* presents a philosophy of life in view of the contradictions human beings have to go through because of contradictions which different demands make on human action. Arjuna, the princely hero, turns to god, because he is in a serious dilemma and conflict. His duty as a warrior prince (*svadharma*) compels him to fight a battle for a righteous cause, but his duty as a member of the clan (*kuladharmā*) hinders him from doing so, because on the other side of the battle line are all his relatives. It is not necessary to tell the story in detail, but it suffices to mention that the war to be fought is not only just in any regard, but necessary to uphold the *dharmā*. Arjuna, however, begins to doubt a world order which makes him face such a conflict of duties. God Krishna appears as Arjuna's charioteer, and in the midst of the battlefield enters into a discourse with Arjuna on the basics of proper life and action. We could transpose this dialogue into the framework of our question of how security may be established, both for the wellbeing of the individual, and the prosperity of society and the common good.

God Krishna uses various arguments to convince Arjuna to go to war. Thus, the *Gita* does not teach non-violence (in order) to reach (the) maximum (of) security (as Mahatma Gandhi interpreted the text) but openly calls for military action. The arguments may be summarized under three basic figures of thought:

1. *The distinction between matter and mind.* God Krishna declares that Arjuna fighting the war would and could not kill the eternal (*nitya*), unborn (*aja*) and therefore immortal (*anashina*) spirit (*atman*) of human beings, but only the material body which would be subject to decay and death in any case (chapter 2, 18).
2. *Action without selfish purpose.* Any action according to the *dharmā* should not be motivated by selfish interests. Thus, fighting a just war for the cause of *dharmā* should not aim at results (*phala*) which might bring personal gain such as an increase of territory or material wealth for the king, or the kingdom for a possible usurper etc (2, 47 et al.). Therefore, it is not by balancing out the possible results of war, but by the motivation to correspond with *dharmā* that violence may be justified. Arjuna's duty as a warrior, his *svadharma*, is to defend the *dharmā*, i.e. law and universal values, so he has to fight (2, 38).
3. *Participation in the divine action which establishes harmony, security, and peace.* Salvation cannot be attained by asceticism or by the attempt not to act at all. What is required is the dedication of all volition and action to god, who in the final consideration is the actor of all actions, for he is the creator and sustainer of life without whom nothing would happen at all. The highest creator himself is present in all actions of human beings, because through them he creates, sustains, and destroys the world (3, 15). In killing people during the war Arjuna would not be the actor but the divine power himself would be (3, 24ff.). The divine will is beyond time, so that Krishna argues: even if Arjuna would kill somebody right now it only appears as a killing in time, whereas in the trans-temporal divine perspective those beings would have been killed already (11, 26f. and 34). This argument, however, could be easily misunderstood, and that is why qualification is necessary: even the destructive action of God is subsumed under his all-encompassing love, which is the subject of the last two chapters of the *Gita*. However, it is clear: in order to protect the divine order (*dharmā*) violence might be necessary, and it is god himself who is finally the subject of all human action, that fosters harmony and security among beings.

No doubt the *Gita* and its concepts provide a framework for Hindu culture to deal with peace and war, security and uncertainty of life, the final goal of all human desire, etc. Again and again, from age to age and situation to new situation, these concepts have been creatively interpreted in order to raise the issue of a proper and good life in changing contexts. Most likely the *Gita* consciously and/or unconsciously plays a leading part in shaping social and individual

values in India today which exert influence on political life and action. However, the *Gita* is not a clear theory of political action but a religious worldview which tries to reconcile different historical experiences and normative tendencies. There are certain contradictions which need to be taken into account:

1. On the one hand the *Gita* sustains the classical system of brahmanical values; on the other hand it is based on the values of the moral order as acted out by the Kshatriya caste which explicitly questions the brahmanical rituals of sacrifice.
2. On the one hand the *Gita* praises asceticism; on the other hand it urges humans to act in history and shape politics actively.
3. On the one hand it is *moksha*, the liberation from the circle of life and suffering, which is declared as the highest aim of human life; on the other hand *sanatana dharma* (the eternal law) is being interpreted as *varna dharma*, i.e. the fulfilment of duties one has in belonging to a certain caste and/or social group. Of course, the *Gita* reconciles this contradiction in its characteristic understanding of acting, which asks neither for reward nor result. But the question remains: who is finally accountable and responsible for human actions, if god is the actual and real subject in all acting?
4. On the one hand the *Gita* holds the view that a person (*purusha*) may act and not produce *karman* if the action does not follow an ego-centred motivation. On the other hand the *Gita* follows the philosophy of Samkhya which holds that all action is only a self-movement of the *prakriti*-nature, whereas the *purusha* (the True Self or the Spirit) is not at all involved in it.

And so on. Security, it seems, is possible when the individual as representative of society is in accordance with god or the *dharma*. Nothing which could cause imbalance or fear would be thinkable in such a situation. However, what god or the *dharma* actually is in a given situation is not only open to interpretation but subject to the caste-*dharma*, i.e. depending on social status. Accordingly, individuals have different obligations and rights. If the caste structure were violated disorder would follow, as it is argued in the *Gita* (I, 40ff.) and elsewhere in the *Mahabharata*: by transgressing the order of the family-system the caste-system would be violated. If this order were destroyed, a general lawlessness would follow. If lawlessness were to exist/reign women would become permissive. If women were to transgress morality a

mix of castes would be the result, and a mix of castes would be the direct route to hell. This precisely is that situation of uncertainty, instability, and insecurity.

One final point needs to be added: Hindu non-dualistic thinking (*advaita*) culminates in identifying the real Self of humans (*atman*) with the ultimate ground of reality. Thus, in the deepest sense there is finally no otherness. What is real is the one reality (*tad ekam*) behind all appearances. Since there is no other, there is no need or reason for fear. If there is no fear, the main cause for aggression has been abolished. If there is no aggression, humans can live in security.

11.4 Security by Political Action in the Arthashastra

One has to understand that the common term “Hinduism” is a designation for a variety of cultures and religions given by outsiders (early Greeks, Muslims, later Western colonial powers). Hinduism in itself is a complex reality which comprises differences and contradiction, and this holds true for the construction of notions of security. Next to the religious texts which are concerned with *moksha* or the liberation from the cycle of life and rebirth ancient India has produced a vast amount of literature which is concerned with theories on social life, politics, arts, love, etc. The division cannot be explained by attributing “religious” texts which have an otherworldly orientation to Brahmin authors, and “worldly” texts which are interested in material gain, exercise of power, and satisfaction of physical desires to authors of other castes, particularly the ruling Kshatriya elite, for we also find texts which are “materialistic” or this-worldly oriented which clearly are authored by Brahmins. “Worldly” and “other-worldly” concerns are not as/obviously? different as Western interpreters would have them be, for it is in the different aspects of material and social reality that the one divine order (*dharma*) reflects itself in different and even contradictory ways. It is especially Kautilya’s *Arthashastra* (AS), the book on politics, state, and proper governance which concerns us here. It might be a brahmanical work due to its style and format, because its worldly interests and advice for ruthless power politics could be interpreted as an integral aspect of the lifestyle which had been classified in the religious works: worldly gains are necessary and follow a dharmic course if they are seen in a relative perspective.

Certainly, the final aim of life is *moksha* (liberation from the cycle of rebirth), but the immediate task is liberation from enemies which requires money for armies, spies, advisors, bribery, etc., for otherwise a secure life in a world of conflict could not be established. The *AS* is not only a treatise on the subject but “a whole old-Indian library” (J.J. Meyer 1977, XI) which is based on many other texts, notably the highly influential epic *Mahabharata*. For centuries these ideas have shaped the Indian value system of the upper classes, and it would be a surprise (if we were not to find) more than mere traces of these ideas in today’s Indian political thinking.

Whether Kautilya (alias Canakya), the chancellor of Maurya emperor Chandragupta (4th century BC), was really the author of this great and large work, or whether it is a compilation of several works in a rather extensive school of thought, is disputed, but it is clear that the text is authored by a political class that had developed a style of life and thought that was in tension with the other side of old Indian civilization, the dharmic concept of reality and *moksha* as the final goal to be sought for. Though the *AS* as a text had disappeared for centuries (newly found and reedited in 1909), it was and is present in political thinking all the time. It teaches power politics: the ruler who enlarges his territory by force is as praiseworthy as the one who rules his kingdom well. And the royal goal is to find its fulfilment in oppression of the ruler’s adversaries (Meyer 1977, XIX). The basic human situation is that of conflict and power struggle. Stability is never secure. Thus, the rulers have to use proper means to stay in power and to increase their influence and wealth in domestic as well as foreign affairs. Traces in the *Mahabharata* prove that Kautilya’s position was not isolated at all. For him what counts is only temporal gain and advantage. Good is what furthers material gains and power. The ideal ruler is the *vijigishu*, an imperialistic hero who has conquered as many countries as possible and thus has established a rule that is not threatened. This, one could say, is the fulfilment of security according to this outlook.

Let us consider some details which are also present in the theories on good governance in the great epics *Mahabharata* (especially book 1, 140, and 12, 103, further on 12, 140) and *Ramayana*. Important quotes have been collected by J.J. Meyer in his introduction to the *AS*. The book itself explains in detail the *rajadharma*, the duties of the ruler, and the final aim is the same as in the *Bhagavad Gita*: to encourage the king to perform his duty in defending

the country at all costs. The power politics of the *AS*, however, is embedded in the function of the king as upholder of the *dharm*a, thus taking on an obligation as the gods have. It is not for his personal gain, but for the prosperity of the country that the king has to act ruthlessly. On the contrary, only a man who is able to rule himself will be able to rule the country. Ruling himself by austerity (*tapas*) means to overcome one’s personal passion as well as one’s personal sentiments. The ruler has to stay in power by all means to guarantee stability and security for his country and his subjects. For this, he has to do everything to benefit his own subjects and to overpower the enemies. Security (stability of the king’s rule) within the country and with regard to possible enemies in foreign affairs is to be maintained by a cleverly organized system of spies and informers, which is one of the fundamental techniques of a successful politics (*AS* 1, 11 et al.). Every kingdom is surrounded by a concentric circle of states which need to be interpreted as enemies and possible allies. The first circle bordering a state is defined as enemies, because they are competing for power, wealth, and territory. The next circle surrounding these enemies consists of potential allies, because they have the same interest in containing the power of the second circle. And so on. Kautilya’s imperialistic king (*vijigishu*) is a power politician par excellence. Everything which may lead to success is not only allowed but commanded by the law, including lies, bribery, espionage, etc. A treaty of peace might be useful in case the two opposing powers are equally strong, but it is not an end in itself. As soon as the king can get an advantage in breaking the treaty, he may do so (*AS* 6, 1). Against other authorities Kautilya argues that the fortune of a king would not so much depend on his own intelligence and vigour (*virya*) but on his financial strength which would allow him to buy allies and perhaps employ people who could provide better advice. Thus, security of the state depends very much on financial resources. On the other hand, on that basis, it would also be useful to use reason and treason in order to gain the maximum result with a minimum of financial expenses (*AS* 9, 1). Kautilya advises the king to use treason, bribery, mimicry of the military forces, special forms of battle arrangement such as circular battle orders, etc. (*AS* 10, 3).

Were human beings to realize the great insight of the *Upanishads*, that each individual being is but an aspect of the one reality, so that everybody has his/her identity in the one divine Self (*atman*), the world would be at peace, for there is no other who could

Figure 11.2: Avalokiteshvara, the Buddhist Bodhisattva of Compassion who with his 1000 arms interferes benevolently into history and engages evil in all forms with his 11 heads, ten of them peaceful and one wrathful. **Source:** Copyright: Michael von Brück

be a danger to one's own being. Security would be no problem, and non-violence would be a natural state of the world. But we live in degenerated times (*Kali-yuga*) and that is why only power and the rationally organized use of fear and might can contain the evil forces. The non-violent gospel (*ahimsa*) of religious texts might be practised by some ascetics who have left the world for a life of contemplation, but the Kshatriya in general and the king in particular should never indulge in this non-violent illusion, but rather rule by execution of power and violence (*danda*). Fear of possible execution of violence makes people respect the royal power and order on which security of the state rests. This, however, should be administered on the basis of rational conclusion and not in rage or passion, for undue violence does not lead to the goal of attaining as much wealth and power as possible, rather it is a sign of weakness. Security can be achieved only by balancing out the forces of political action, and adjustment has to take place again and again not with regard to obligations one has due

to treaties, but in view of the actual strength of the actors in the political, economic, and military field.

11.5 'Security' in Buddhism

Buddhism in its history is not a world-denying religion, as many Western interpreters have claimed, but a world-shaping force. As such it forms and legitimizes politics, value systems, and institutions. Buddhism has been entangled in power politics and violence, but has also created a new basis and a new rhetoric for the problem of security as a high value of the common good. In this way Buddhism provides a new paradigm and a new rhetoric for the political code over against the views we have discussed so far with regard to the Hindu *dharma*.

The Buddhist focus on mental development, as the only means to cope with the ever changing events of reality (*anitya*) forms a direct antagonism to the power politics as displayed in the *Arthashastra*, the epics and also the brahmanic *Laws of Manu*, etc. (Gandhi's non-violence is influenced by Buddhism and Jainism, and less by this aspect of the Hindu tradition.) Buddhism emphasizes virtue irrespective of caste and social condition, and this means speaking the truth and acting with non-violence as a universal principle. It is not the caste system which is the backbone of social order and its security, but the mental and moral education of all classes and castes. In this sense, Buddhism has an idealistic tendency, though in extreme cases (especially in Mahayana) acts of violence may be permitted so that greater evil can be avoided.

The normative code of Theravada-Buddhism is the *Pali Canon*. It antagonizes both physical violence and mental coercion in any case. Mahayana, however, allows the killing of an evildoer if the actor is really rightly motivated (*Mahaparinirvana Sutra*), but this only in extreme cases as a skilful means (*upaya*) in order to protect the *dharma*. This is the case only when security for a larger group of people is at stake. Mahayana substitutes the strictly casuistic ethics of normative rules by an ethics that stresses the motivation of the actor.

Both in Theravada and in Mahayana the *dharma* in this sense of a universal order of stability and welfare for all (insiders as well as strangers) is the same for all groups of society, and this is the basic difference to the Hindu ideology described above. The classical example for Buddhist kingship (which was spread to Sri Lanka, Burma and Thailand) was the

rule of king Ashoka (273/265-238/232 B.C.) who tried to overcome the politics and security of the state based on military power (*danda*) by basing his rule on education and justice (*dharma*). This, of course, has had influence on later Hinduism, and the modern Hindu views on a corporate social system of justice (Ramakrishna movement) and non-violence (Gandhi) has much to do with this influence.

11.6 Conclusion

Obviously, Hinduism and Buddhism construct different paradigms of security. Hinduism is based on a society of clan and caste, i.e. cohesion by natural birth. The basic cell for a secure life is the family and its extension. Security means to uphold the value of life, to cling together in inherited structures and defend the established system. Thus, security is based on belonging defined by birth, all values are conservative, i.e. preserving the established order. The ideal for security is the paradigm of the past.

Buddhism is based on a society of the *samgha*, i.e. a conscious congregation of people who have a common goal. The *samgha* is open to everybody who shares the educational programme. The basic cell for a secure life is not the family, but the learning community which strives for an insight which is not yet realized. Security means to create a new human being, to cling together not in inherited, but in acquired structures. Thus, security is based on belong-

ing defined by intention and programme, all values are progressive, i.e. established on an order to come. The ideal for security is the paradigm of the future.

These two types intermingle, of course. Thus, the Buddha is a figure of the past and a model for the monk's life in the present which will be fulfilled in the future. And in Hinduism, a better life in the future may be obtained by recreating the past, which is more than just reciting it. In India Buddhism substantially contributed in reshaping ancient Indian culture, and the result is what we today call Hinduism. Nevertheless, we can observe two different types of establishing social coherence which would be fundamental to security.

It is assumed that these concepts form direct or indirect presuppositions for a rational construction of security-policies today. Notably, it is the basic insight of interconnectivity as a foundation for identity in personal, social, and political fields. Thus, partnership in security matters is mutual, for it is based on the more fundamental partnership or mutuality in identity formation. Asian states tend to think in alliances overarching national interests which might be based on cultural clusters. Security cannot be gained at the expenses of the other (potential enemy) but in realizing mutual dependency. At least, this basic principle, which has even a metaphysical grounding in Indian cultures, might be evoked as a normative insight so as to conscientize actors in the present political and military scene to develop strategies of mutuality.

12 Security in Chinese, Korean, and Japanese Philosophy and Ethics

Kurt W. Radtke

12.1 Introduction

This chapter explores the relationship between concepts of security and social norms expressed in the written and oral traditions of China, Korea, and Japan. It focuses on observable behaviour and related internalized notions of security without assuming an a priori definition for 'ethics', 'religion' and 'philosophy' and their links to concepts of 'security' in East Asia (see chapter by Arends). The change of the relation between religion, society and state during the Renaissance deeply influenced the development of European concepts of security, but East Asia developed differently. This also applies to the link between 'law', the state, and security, so important in Hobbes' seminal works on security. East Asian practice of law left little room for ordinary people to protect themselves against the state, fostered by the strong tendency to emphasize 'rule by man' rather than 'rule by law'. Globalization has not facilitated consensus on common concepts of security and international law by East Asian governments. Territories of pre-modern Europe were part of transborder communities that included European nobility, and easy exchange among cultural and intellectual elites largely absent in East Asian history. The discourse on security studies ought eventually to develop its own meta-language, transcending the concepts of any particular country, culture or scholarly icon.

Between the 17th and 19th centuries the Chinese and Japanese Empires were led by minority groups, the Manchus in China, and the Tokugawa clan and its allies in Japan. Maintaining power domestically was a priority of both governments, making national mobilization more difficult. Discourse on external and internal security until recently has been the virtually exclusive preserve of the elites, inhibiting informed public debate on external and economic security. By the 18th and 19th centuries economic interaction between regions in Europe was intense despite deep political divisions. The Chinese Empire maintained overall polit-

ical unity not reflected in China's divided economic regions. The central governments of China and Japan had only limited capacity to control the economic security of the realm, and both countries started displaying dangerous signs of economic decay from the beginning of the 18th century.

Like Greece (see the chapter by Arends) China, Japan and Korea each boast a considerable lore on the formation of alliances and their contribution to the unification of the respective empires or countries. These different historical memories shaped thinking on security and stratagems whose discourse was often quite removed from officially sanctioned social and political norms. Thinking on alliances, and the interpretation of Chinese military classics such as Sunzi, and Chinese strategic thinkers such as Cao Cao and Zhuge Liang (depicted in the lore of the 'Three Kingdoms') were adapted to different national traditions, conducive to a syncretistic approach as in the following quotation from Korea. The 'Hwarang Spirit' refers to a martial arts corps, and was described by the famous scholar Ch'oe Ik-hyon in the following words:

Our country had a profound truth refinement. The origins of this teaching were detailed in the History of Immortals. Containing Confucianism, Buddhism and Taoism, it makes a deep impression on all living things. The Hwarang, when at home, were filial to their parents and when outside were loyal to the kind just as in the teachings of Confucius. They did not force matters but allowed them to unfold naturally as in the teaching of Lao Tzu. They did not commit evil acts, only good ones, as prescribed by Buddha (Korean Moral Philosophy).

As elsewhere the conceptualization of 'death' left a deep impact on the formation of martial values, particularly in Korea (*Hwarang*) and Japan (*bushidoo*). Unlike in China, the Zen school of Buddhist thinking has been used in Japan until the end of WWII to inculcate fearlessness in the face of death different from Christian and Islamic concepts of consolation after death. In East Asia we do not find epic discussions of moral dilemmas faced in war so important to the Indian tradition (*Bhagavadgita*, see the chapter by von

Brueck). The period of the Warring States (480–221 BCE) gave rise to numerous different views on human nature, state and society. Various ‘Confucian’ thinkers and schools differed widely on the link between ethic imperatives and metaphysical beings such as gods and/or the supranatural cosmos. Recent archaeological findings have also helped us to improve our understanding of ancient Chinese popular views on the creation of the cosmos (Hirase 2005). Rather than assuming an immutable truth, the search for the underlying true nature of change became a shared concern. Instability and threats to stability were widely interpreted in terms of skewed systemic balance, and the restoration of harmony (*hexie*) became a main focus of Confucian philosophy.

Most philosophical foundations of East Asian (political) society favour fairly complex notions of systemic balance inherent in the cosmos as well as in human society reminiscent of the concept of *dharma* in India (see the chapter by von Brueck), but Chinese concepts antedate the introduction of Indian concepts through Buddhism in China by several centuries. As levels of technology and economic complexity progress we often observe a concomitant centralization of political power, and an evolution towards greater unification of beliefs, exemplified in evolution and repeated reinterpretation of Confucian texts in China leading towards the imposition of orthodoxy. Notwithstanding, the resilience of patterns of power distribution between regions and the centre continue to have an impact until today. In the past elements of (local or ‘high’) religion and magic were at times included in official doctrines supported by the central government, tending to develop into a secularized public religion (Taylor 1998). The conscious use of anxieties and imagined threats fed by superstition also has an important function as means to maintain or restore security at the level of micro-society. Deceased people may turn into avenging ghosts, and ancestors may become forces of protection, depending on proper individual and group behaviour. Addressing oneself to ancestors (‘ancestor worship’) and deceased persons is therefore immediately linked to notions of security at all levels of society. They were usually not sufficient to create common notions of ethics needed to build ‘public morality’ (*gongde* in Chinese, *kootoku* in Japanese). In modern times political or ideological norms may also transform into highly emotional or even religious values and concepts. The development towards the Japanese emperor system since the foundation of the modern Japanese state in 1868, the elevation to quasi-religious status of Mao Ze-

dong in China during the Cultural Revolution (1966–1976), and the religious adulation of North Korean dictators Kim Il-sung and Kim Jong-il are instances of this phenomenon.

A common thread in East Asian thinking on security is formed by the concept of ‘disorder’ (*luan* in Chinese), which we may posit as the antonym for the concept “security” for which there was no shared concept. The different histories of unification and division meant that Chinese thinking on alliances deriving from the period of the Warring States (480–221 BCE) could not (easily) be adapted to Korea and Japan. ‘Disorder’ (*luan*) was formative in security thinking as it was for Hobbes, but the different relations between religion, law and the state are the cause of conceptual differences with Europe that continue in the age of globalization. East Asia also had its share of peasant unrest and civil war, sometimes linked to religious symbols. Governments reacted by strengthening controls over religious organizations to prevent them from interfering with ‘politics’. For discussions of a comprehensive framework for a comparative study of East Asian civilizations the reader is advised to consult Eisenstadt (1996) and Elias (1939).

The main division in East Asian society is between ‘officials’ and ‘ordinary people’, rather than between ‘state’ and ‘society’. Their behaviour is not necessarily “guided by socially shared and transmitted ideas and beliefs” (Berger 1996), partly because East Asian societies are not united in allegiance to one ethical and religious system, as is the pretence of monotheistic Islamic or Christian societies. Notions of security may best be observed when physical security is threatened. Besides physical threats, threats to identity are also frequently perceived as security threats. Notions of security can not simply be derived from canons of texts on ethics and philosophy, partly due to new challenges not predicted or predictable in ancient canons. In agricultural societies risk sharing enhances chances for physical survival of both the individual and groups. The way risks are distributed has a deep impact on the social, economic and political structure, best expressed in concepts of land use and ownership. Throughout most of East Asian history possession of land has always been subject to intervention by officials as a means to improve chances for survival of the community as a whole. Limited capacity for the exercise of power in pre-modern societies means that central governments are keenly aware of the need for politics of ‘divide and rule’, granting a fairly large amount of de facto local and regional autonomy while main-

taining the pretence of a government that unifies the country not only physically, but spiritually as well.

East Asian societies have many pluriform religions and (philosophical) traditions that made it advisable for officials to accept flexible notions of an overarching order, admitting different beliefs and philosophies as long as they did not threaten overall stability of the system of state and its economic foundation. This concerns the maintenance of the dividing line between officials as representatives of central government and local elites, and 'ordinary people'. There were only few attempts to impose one particular ideological or religious school on society as a whole.

The contribution to overall security is also a major criterion applied to political ethics usually identified with elites and the officials, such as Confucianism. If Confucian advisers, or members of Buddhist groups entrusted with spiritual protection of the state are found wanting in protecting state security, they may also suffer suppression and persecution. Numerous examples from Chinese, Korean and Japanese history demonstrate that in the long term maintenance of stability and security were more important than political correctness.

'Absolute truth' thus becomes ephemeral. Apart from a few minor schools of thought, history is not seen as developing towards a final goal, but is usually conceptualized in terms of alternations between 'disorder' and 'balanced order', and in China identified with notions of 'dynastic cycle'.¹ There was no dynastic change in Japan, but a succession of different political systems that ruled virtually independent of the (political) preferences of the emperor. Even though Korea may formally boast long-term dynasties, the power of regions and struggle for dominance continued throughout its history, and continues to be reflected in the politics of the twentieth and twenty-first centuries.

The Chinese examination system served as access mechanism to the governing elite, but also enforced rigorous conformity within that elite. Religiously informed notions of good and bad were usually related to a specific social context. In the absence of a shared set of religious norms history, in particular official his-

tory became a major source for moral standards especially in China and Korea. The relationship between popular culture in micro-society and 'official' norms for elites remains an understudied subject. Any particularistic philosophy or religion claiming possession of exclusive 'truth' would easily be termed 'evil teaching' and suffer suppression, not only in pre-modern times but also in modernizing Japan and in present day China (Falungong).

Different periods display different levels of ethical quality, waxing and waning with the degree of order and disorder. Concepts of order and change in the ancient Chinese classic *Yijing*, well known throughout East Asia, focus on factors damaging or contributing to the maintenance of balance (Smith 2003). They became easily attached to the major philosophical currents in East Asia, Confucianism, Buddhism, Daoism, Shintoism and Shamanism, and were interpreted in the context of Chinese, Korean and Japanese traditions. Syncretism was widespread in East Asia, and gave rise to local traditions based on different combinations. The term 'Confucianism' as observed in Chinese politics and society can therefore not be simply identified with the writings of the philosopher Confucius (in Chinese, Kongzi) or later philosophers such as Mengzi and Xunzi.

As mentioned above, countries and regions in East Asia share concepts of a clear division between rulers (officials, public realm) and ruled (ordinary people), even as society and social structure keep changing (Weintraub 1997; Bailey 2002; Huang 1993). From the beginning of the Chinese Empire in the third century BCE. Confucian values were gradually reinterpreted by the state for political purposes. Neo-Confucianism, especially the school of Zhu Xi (1130–1200) was used to legitimize an increasingly hierarchical social and political order with limited regard for concepts such as innate equality of all human beings (Li Wen 2005). In contrast to Korea and Japan, the Chinese state developed notions of loyalty to the state rather than to individual rulers, notions that were propagated since the Song Dynasty (960–1279). Regional and central elites in Korea and Japan were largely hereditary, but not in China. Throughout the second millennium tensions continued between loyalty to 'persons' and the 'state', especially after the Song Dynasty when China was ruled by non-Chinese dynasties except for the Ming Dynasty (1368–1644). These rulers – Mongols and Manchus – belonged to a tiny ethnic group compared to the Chinese population, and this may have contributed to the weakening of abstract notions of loyalty. As a result, the importance of personal rela-

1 This term refers to the notion that the history of a dynasty proceeds in four phases: the foundation of the dynasty relies mainly on military power, the second phase lays the foundation of economic strength, in the third phase the dynasty reaches full maturity and the zenith of its power, followed by decay both at the level of power and moral quality.

tions with and among officials both at the regional and central level increased (Shibata 1990). This made it more difficult to mobilize the country as a whole in times of internal unrest and rebellion or external invasion, characteristic for the decades of instability between the Ming and Qing Dynasties. Thus, the borders between abstract notions of 'loyalty' and 'betrayal' become blurred. In East Asia there are numerous examples of self-sacrifice in the name of loyalty, but the object, content, and meaning of loyalty differ widely according to country, region, and historical period. Elites in East Asia regularly faced dilemmas of loyalty to maintain security (internal and external) or loyalty to central leaders, whenever the policies of the central government did not serve this purpose. There are numerous examples in China, Korea and Japan of political advisers who wished to contribute to the security of their country or kingdom by advising against the policies of their rulers and were prepared to pay with their own lives, praised as a symbol of individual ethical behaviour for the common good.

Since security and ethics are perceived as intrinsically linked, officials also act as 'guardians' of social norms. Contrary to some other civilizations they are usually not representatives of a particular religious creed. Their social and political norms are more akin to notions of a 'public religion'. In China the political elite had usually close links to local elites, the *shi* (or *shenshi*, 'gentry'), but government positions could only be obtained by succeeding in the official examination system. It must be added though that corruption in the form of bribing one's way through the exams was not unknown.² This reduced the chance of a hereditary nobility usurping power, but in fact was normally accompanied by a kind of symbiosis between political elites (officials) and economic elites. Korea tried to reconcile the Chinese system with principles of hereditary elites (*Yangban*), whereas Japan never adopted the Chinese system.

This also affects notions of security even if there exists a common ethical and philosophical vocabulary mostly derived from the classical Chinese tradition. Although no particular religion was able to gain con-

trol over elites and the state in the long run, this does not mean that religious notions were excluded. Local concepts of the supernatural influenced both ordinary people, and elites:

Dazai Shundai asserted that the sages themselves did not believe in Shintoism, and that they used it as a means to educate the foolish and superstitious people of primitive times. The [early] rulers knew the truth. The ordinary people were very foolish and had doubts about everything. If gods and ghosts were not used as a means to teach them, the heart of the people would not settle (Ng 1998).

Long before Buddhism became a creed of ordinary people, Buddhist priests and temples were called upon to assist in protecting the security of rulers and the country in East Asia. Elaborate 'magic' schemes to enhance security are physically expressed in the layout of the architecture of capital cities of all East Asian dynasties and empires. Local traditions of diverse origins (e.g., Daoism or Shamanism) also found their way into official rituals. The current insistence by some Japanese leading politicians to visit the Shinto Yasukuni Shrine, a major cause of friction between Japan and its neighbours, may also be seen in this light.

Prior to the upheavals of the 19th century, economic and technological progress in East Asia had created complex societies, China being considerably more advanced than Europe until the 16th century, not only technologically but also in its complex bureaucratic organization. Progressive division of labour moved elites to promote universal social norms valid for people whose daily lives and work ethics may differ considerably, as expressed in family teachings (*jiaxun* in Chinese, *kakun* in Japanese). Governments remained extremely cautious towards universal ideologies that might have allowed ordinary people to appeal to common moral standards that would undermine the authority of officials. Confucian ethical norms are usually linked to a person's status in life, and did not result in effective demands for equality of citizens before the law. Notwithstanding, notions of 'common justice' (*tsuuzoku dootoku* in Japanese) were widespread at the grass roots level of micro-society.

When East Asia became destabilized in the 19th century mainly due to European and US colonialism in various forms and shapes, the loss of security and feelings of despair and injustice became a major element of revolutionary movements. Rebel movements in China, Korea and Japan attempted to overthrow traditional forms of government in search of 'national' security, including the mobilization of the

2 It would be interesting to compare (partly hereditary) socio-political elites in Korea and Japan with the function of social 'estates' (Stände) in pre-modern Europe (Ehlers 1991: 77ff.), but Chinese elites selected based on the examination system fall outside such definitions. On the transition to civil society in continental Europe, see Gall 1993.

'masses' in China and Korea. Even before the arrival of Western notions of 'equality' they opposed the traditional boundaries between 'officials' and 'ordinary people'. This search for security had a major impact on ethical notions. East Asian rebel movements in the past had sought to correct injustice and restore (human) security, but did not aim to overthrow the bipolar structure of society (officials vs. ordinary people). Mass movements in 19th century East Asia did display 'xenophobia', but also contained active attempts to rebuild security based on deeply restructured societies. Leaders of movements such as the *Taiping* in China (mid 19th century) and the *Tonghak* in Korea (late 19th century) were influenced by notions of survival similar to those of Social Darwinism. East Asia did not have to wait for Darwin's Theory of Evolution to realize that the arrival of the West was a challenge to the survival of East Asian civilizations.³ In the early 1860's the Japanese *Sakuma Shozan* stressed that Japan had to throw its traditions overboard for the survival of the empire. The figure of Napoleon also exerted his pull on minds in East Asia, as he combined revolution at home with the restructuring of the European continent.

The attempted revolutions failed first in China and then in Korea, but succeeded in Japan. The establishment of a Japanese nation state – a new concept in East Asia – was linked to the creation of a public religion to enhance cohesion and security of the young Japanese nation. Within a few decades this public religion assumed increasingly heavy religious connotations in the emperor system. Developments in China and Korea were more complicated, due to the long history of semi-colonialization of China and the annexation of Korea by Japan in 1910. After 1945 new nation states arose in Korea and China. Notions of security fundamentally changed, including the peace constitution in Japan, anti-communist ideology in South Korea and Taiwan (see chapters by Okamoto/Okamoto in this volume), and various brands of Communist regimes. Asian varieties of Marxist-Leninist ideology combined utopian internationalism and class struggle with a revolutionary approach towards domestic and international security.

The collapse of the Soviet Union initiated changes in the thinking on security in the context of globalization. This author analyses the function of 'globalization' as a model for restructuring in terms of the 'fran-

chise model' applied to international (security) relations. The 'franchise owner' superpower US seeks to impose a variety of global standards on the global community. While China and Vietnam have cautiously embraced this model with some alterations, North Korea has so far reacted negatively. Embracing similar models of economic and social development seems to promise greater economic and military security. Western nations have accepted notions of interference into the internal affairs of other countries to prevent threats to human security, but some countries – particularly socialist countries like China – argue that it is national interest more than ethical considerations that generate conflicts, and threats to domestic and external security. Even more than Putin's Russia, China regularly suspects that the activities of NGOs reduce government authority, and may lead to greater influence by foreign states in domestic affairs.

Irrespective of the promises of globalization we are still far removed from an international acceptance of notions of security rooted in similar ethical and philosophical norms. The presence is the child of a complex set of ancestors. Contemporary security identity and concepts of stable security vary considerably not only among countries and regions in East Asia. Most noteworthy are concepts of balance that are central to most major conceptualizations of security.

(Neo)realism, the major school of thought in international (security) relations in the US and its allies, assumes anarchy as the basis for thinking on 'balance of power'. It is indebted to pre-war thinking on united front strategies that aimed to balance against the most dangerous common enemy. This is hardly acknowledged by (neo)-realists (Kang 2003; Zhu 2001; Radtke 2000). United Front thinking still influences Chinese security strategy, and so do memories of periods of chaos, wars between alliances of Chinese (city)states that eventually resulted in the unification of the Chinese empire (Hirase 2005).

Throughout East Asia we find notions similar to 'balance of power thinking', not only influenced by traditional East Asian notions of systemic balance, rooted in visions of order of the cosmic and human world, but also by the historic experience of alliance politics during periods of national disintegration. The neo-realist assumption of anarchy linked to Hobbes' experience of confessional wars is rooted in specific European historical experience and is not shared universally. The concept of 'functional region' does not require the assumption of anarchy (Vaeyrynen 2003: 27).

3 Social Darwinism was introduced to China and Korea through Liang Qichao, after the concept had become known in Japan.

The driving force in functional regions is the economy (production networks), the environment (for example, acid rain), or culture (identity communities). ... Indeed, the transition from physical to functional regionalism is due to the increase in the interaction capacity of the system (Vaeyrynen 2003: 27).

David A. Lake and Patrick M. Morgan (1997) added further insights by formulating an approach that presumes the existence of a number of regional orders instead of a single international order in the post-Soviet world (Takahashi 1997: 103; Kang 2003).

Research on security in East Asia forms a vital part of the search for a more comprehensive, disciplinary approach in international (security) studies that includes culture and strategy, communication theory, and interpersonal behaviour across cultures. They are an important contribution to go beyond 'US-style neo-realism', including variants such as constructivism (Buzan 2000; Jervis 2002; Johnston 1994; Pye 1999; Radtke 2005). Research on East Asia should also transcend area studies. It can play a valuable role in creating a metalanguage for security issues no longer confined to the boundaries of one particular civilization.

12.2 History, Security, and Crises of Identity

When physical survival is threatened governments and individuals need to consider whether their convictions – ethic, philosophical or religious – are a positive contribution to security, or may possibly have negative effects as well. Invasions, or threat of invasions were fairly common throughout East Asian history (Li Wen 2005), and the inability of Buddhist or Confucian oriented officials, governments, and rulers to defend the physical security of their country repeatedly resulted in the repression of (the influence of) those who were found wanting. This happened particularly to organized Buddhism in Korea and Japan, and to a lesser extent in China, also due to the anti-hierarchical streaks in Buddhist thinking.

East Asia has its own share of martyrs who sacrificed themselves for the sake of their expression of unswerving loyalty to their rulers or dynasty, convictions related to the core of their identity. Threats to identity are of a different category, since they may affect or destroy self-esteem, and the ability to act of one's own will – a basic factor in the subjective perception of security and freedom. The Mongol conquest of China and Korea in the 13th and 14th centuries, the Manchu conquest of China in the 17th century, and the intrusion of highly organized West-

ern nation states in East Asia that led to the collapse of the social, political, and economic organizations, all contributed to crises of identity lasting for many decades.

The inability of China to ensure its own security in face of the onslaught of external aggression often resulted in attempts to cover up the reality of defeat by invoking pretence of cultural or moral superiority. The glaring gap between many decades of injured security and artificial feelings of moral superiority in defeat was depicted with undisguised sarcasm in short stories by one of China's greatest novelists, Lu Xun. Self-deception cannot replace the need for a thorough rebuilding of civilization in defeat: physical security is essential, and its maintenance may require deep changes in the composition of spiritual civilization – as also demanded by globalization. The current re-emphasis of tradition and nationalism in East Asia is not merely a countermove, but also serves to create the illusion of greater historical consistency even as tradition is further weakened. Cycles of destruction and rebuilding of security are accompanied by the cyclical development of behaviour and underlying norms. External invasion or domestic rebellions may lead to the (temporary) destruction of organization at the macro-level, periods sometimes lasting decades or even centuries during which the resilience of micro-society proves essential to provide a minimum of security for survival until new, more secure forms of macro-organizations are found. In East Asia, a unified central government repeatedly ceased to function for decades, if not longer, and the survivability and security was basically decided at the level of regional or even micro-society.

Understanding East Asian civilization means grasping the basic features of these dynamics of development, including links with changing ethics and philosophy. The attempt to find simple keys to Asia by referring to some eternal Asian values is an obstacle to serious analysis. East Asia cannot be reduced to sets of 'Confucian' values compiled by self-appointed gurus. Some observers identify Chinese thinking on security with China's well-known military classic Sunzi. Such an approach resembles the attempt to explain European medieval and modern warfare in terms of Greek and Roman classics. When combined with the apparent Confucian emphasis on harmony such an approach becomes dangerously misleading.⁴ Modern thinking on security in East Asia generally prefers a comprehensive approach that includes traditional concepts of military security and non-traditional security (Radtke 2005). This tendency is linked to idealis-

tic visions of world order in terms of a system, rather than stressing the role of independent actors.

Values do not operate like software that can be implanted in the human mind at the behest of leaders and rulers (Viehoff 1999: 9, 56). In his study on frontier areas in China, Skaff (2004) noted that “Postmodernist scholars have made strong claims about the power of ideological ‘discourse’ to affect loyalties and identities” (Viehoff 1999: 57). Contrary to what some postmodernists argue, concepts of order and security are much more likely to arise from the needs of specific circumstances (Saeki 2004: 131), and are frequently tested as to their efficacy during periods of threat. Not seldom they were found wanting. Feudal and other types of pre-modern government were based on more or less stable mechanisms of domestic ‘divide and rule’ that weakened the ability to face external threats.

During the rule of the Tokugawa central government in Japan (the *Bakufu*, 1600–1868) that exercised strict control over hundreds of local and regional domains, external defence relied in the first instance on geographically scattered, complicated systems for the mobilization of resistance. This was intended to avoid the gathering of military forces that might turn against the central government, which also developed sophisticated intelligence organizations to prevent challenges by domains (Fukai 1995).

The structure of the huge Chinese Empire during the *Qing Dynasty* (1644–1912) and the relatively small kingdom of the *Yi Dynasty* in Korea (1392–1910) differed completely from that of their Japanese neighbour, but as the 19th century showed, no government was able or willing to engage in efficient mass mobilization against incursions and invasions by forces from Europe and the US. Reflecting divided societies, people in East Asia did not share a unified set of values, neither within their own countries, nor at the level of Northeast Asia as a whole. The destruction of East Asian security engendered a new search for values, each nation following different approaches.

In the early decades of the modern Japanese state (*Meiji* government, 1868–1912) attempts were made to create a kind of ‘public religion’ to strengthen the nation-wide cohesion of society. It did not take long be-

fore it assumed characteristics of extremist ideology with religious connotations, the creation of the emperor as a ‘divine’ leader. The Japanese defeat in 1945 seemed to have put an end to ‘nationalism’ as a component of the Japanese security identity. But despite the embrace of ‘Western’ values, recent years have seen attempts to reinvent a new Japanese nationalism whose content and direction remain vague.

Continuing divisions within China, including changing politics in the People’s Republic (1949–), on the Chinese island of Taiwan, and in the Koreas resulted in conspicuous changes in (security) identity since 1945. During the Cultural Revolution in China (1966–1976) the Confucian heritage was actively destroyed, leading the government on Taiwan to strengthen emphasis on Confucianism. More recently PRC authorities have emphasized Confucianism as the core of Chinese civilization (see above), as separatists on Taiwan claim independence from a common cultural Chinese tradition. Wang Huning (Wang 1991) remarked that the socialist government of the PRC completely revamped and modernized political institutions also at the local level. It is still too early to assess the impact of tradition on modernizing China, but the long-term impact of China’s 1949 revolution may be less than is usually assumed. As an example one may refer to clans attempting to reassert some of their traditional power at the local level, especially in the countryside (Xiao 2002). As Luo Houli pointed out, nationalism as an ‘ism’ in its modern meaning developed under the impact of Japanese and Western thinking, and pre-modern nationalist group loyalty has to be linked with China’s ethnic-clan structure (*zulei sixiang*, Luo 2004: 280).⁵ Other scholars blame the long history of authoritarian government for the lack of healthy nationalism (*aiguo*).

12.3 Defining ‘Security’ in the Context of East Asian Civilization

A meaningful treatment of the ethical and philosophical context of security in the history of East Asian civilization and contemporary East Asia cannot be limited to analysing the major philosophical and ethical canons. By tracing selected security issues and their links to characteristic features of East Asian society, politics, and economics this author also hopes to raise

4 Major Goh Kong Yong avoids some of these pitfalls (Goh 1999). His explanation of the dynamics of strategic thinking in terms of tension between a ‘Confucian-Mencian moral-hierarchical worldview’ and the ‘China-among-equals realpolitik worldview’ underestimates the complexity of Chinese thinking on war.

5 For a comparative approach to nationalism in China and India, see Duara 1999.

questions on the meaning of 'ethics' and 'philosophy' in these non-Western traditions.

It is argued that patterns of thought and behavioural norms classified as 'Confucian' function in a similar way to Weber's concept of 'public religion'. It must be added immediately that 'public' in pre-modern Asia does not refer to a realm accessible to most 'citizens' (Mizoguchi 1994b), but refers to the privileged world of 'officials' who are permanently engaged in *preventing* ordinary citizens from gaining access to political and bureaucratic power (Mizoguchi 1994; Radtke 2005).⁶ The function of political Confucianism may nevertheless be described as similar to a *public* religion since it maintains the pretence of norms that need not be legitimated by any particular religion, even if it incorporates elements from various traditions, including religious and philosophical ones. Confucianism also provides the pretence of universal norms for a society that remains deeply divided between 'officials' as formal members of the ruling establishment, to be distinguished from the more general Chinese concept of 'gentry' (*shenshi* in Chinese). Recent research on pre-modern Japanese sociopolitical structure has challenged the view of the strict division of society in four hereditary categories of Samurai, peasants, artisans, and trading people or merchants (Tanaka 2005), and emphasized the gap between moral codes preached by the elites, and the moral norms prevalent in society in general (Saeki 2004).⁷ Economic difficulties, unequal distribution of wealth, and other factors such as external invasions threaten the survival of the government and order at the macro-level. At the micro-level disorder they may endanger physical survival. Breakdown of order at the centre, coupled with blatant injustice against weaker sections of society frequently result in local unrest, possibly expanding to rebellions (especially in China, less so in Korea and Japan). Micro society develops norms essential to survival that also demonstrate the limits to the power of the central bureaucracy and officialdom. Officialdom is usually wise enough not

to enforce Confucian (and other) norms that might easily provoke resistance (Nosco 1997). The political balancing act is accompanied by a complex ethical order answering to the needs of both micro- and macrosociety. The norms and culture of both sections of society need not be related along the lines of 'great' and 'little' tradition; case studies are required to trace behavioural norms that may differ widely in time and place. Thus, we cannot rely merely on notions of 'security' deduced from written canons and official sources. Government law was basically limited to criminal law, whose imperfections led to numerous complaints about injustice and hardly served as a source for positive moral standards. It also formally and blatantly favoured officials whose merits could serve to reduce the degree of punishment, compared to the level of punishment meted out to ordinary people. The weakness of the formal (criminal) system of justice was one of the factors stimulating revenge and retribution in society – an issue frequently denied by advocates of Confucianism.

Historical records were a prime source for norms of public religion. Official, non-official, and local histories are primary records for ethical behaviour in specific situations. The rise and fall of empires, dynasties or ruling families was directly linked to the waxing and waning of morality. History was not evolving towards an end, a utopia with well-defined characteristics. In China the cycle of rising and decaying dynasties was not an inevitable mechanism, but caused by the changing quality of morality described in terms of a cyclical evolution. Improving moral standards promised security and stability, cohesion of society and welfare.

12.3.1 The Impact of Physical Geography

The physical geography of China, the subcontinent, the Korean peninsula, and the three main islands of Japan (*Honshu* with Tokyo (Edo), Kyoto and Osaka, *Kyushu* and the smaller *Shikoku*) differ considerably, but geopolitical concepts are insufficient to explain national security culture. Some scholars attempted to find a constant factor of Japanese thinking on security in Japan's geographical position as an island nation, as did Kasa Shintaro who argued, "Japanese and Jews benefit from their natural environment, and don't have a natural concept of security" (Zhuge 2003: 254). Jiang Lifeng, in contrast, maintained that because Japan is an island state it has a very strong awareness of vulnerability (*youhuan*) (Jiang 2004). The closed off territory of Japan, and to a lesser degree Korea, easily

6 The assumption that 'civil society' is a term with universal applicability is fairly widespread in contemporary social and political sciences. This term is useful as long as there is a meaningful division between 'public' and 'private' in their standard Western definitions. If this is not the case the concept of a 'civil society' must be redefined to such an extent that it loses its usefulness for analysis. For an analysis of 'public sphere' and 'civil society' in China, see Huang 1993.

7 Among the many recent studies, see Sasaki 1993; Zhang 1998; Wang 1995; Mizoguchi 1994b.

gives rise to notions of the sanctity of territory given to its people by the god(s), and myths of creation and links between gods that created the Korean and the Japanese people play a much larger role than in the Chinese tradition. From the concept of territory under divine protection it is only a small step to notions of a chosen people, as is the case in pre-modern Japan (*kami no kuni*) (Tsushiro 2005: 178, 231; Blacker 1995). Natural conditions specific to the territory, such as unpredictable earthquakes and typhoons in Japan, or flooding and drought in China and Korea, have an impact on the perception of threat and concepts of security even if the Confucian-derived language of ethics and security is virtually identical in all three countries.

12.3.2 Security Aspects of Land Holding and their Ethical Context

The history of land management and concepts of property differ widely in the three countries, reflecting the need to adapt to differing physical environments. Governments in East Asia share common notions of the right of government to interfere with property and management rights for the sake of ensuring common survival. Strengthening individual property rights could not readily ensure the security of the individual against the claims of micro- and macrosociety. Examples can be found in pre-modern Japan (Edo period, 1600–1868) that prohibited the free disposal (sale) of land by private individuals (Tanaka 2005: 29), but are also present in the communist ideology in the People's Republic of China (Oi 1999). The ideological reasoning differs fundamentally, but it is tempting to link this tendency to older traditions. Both in pre-modern Japan and post-1949 China simple and widely available subterfuge was available, enabling the buying and selling of land. Despite official ethics and prohibitions, domain rulers of pre-modern Japan attracted settlers from neighbouring and other domains in order to strengthen their own domains economically, in contravention of official ideology. One important reason behind the apparent 'tolerance' displayed by officialdom is related to the need to ensure the production and distribution of food. Pre-modern East Asian governments and the contemporary Chinese reform government would not and still will not insist hard-handed on enforcing their 'ideologies' when this would lead to endanger economic security. This is not to deny that the imposition of socialist ethics in China and North Korea based on an ideology imported from the West made a deep impact

on ethical thinking lasting for several decades. The tragedies of the 'Great Leap Forward' and the 'Cultural Revolution' were a basic attack on humane ethics. Traditional common wisdom that sought to balance the norms of East Asian public religion against the demands for policies of survival were temporarily sacrificed, preparing the way for political opportunism that was elevated to the rank of highest moral value.

At the height of the Japanese Emperor System lasting from the beginning of the 20th century to Japan's defeat in August 1945 ideological norms that violated individual human security had also destroyed traditional values. Invented traditions, such as *bushidoo*, the Japanese way of the warrior (*samurai*), and modern ideology clad in quasi-religious terms replaced pre-modern public religion in Japan – not to speak of the compulsory religious veneration of North Korea's dictators.

12.3.3 Symbiosis of Political Elites in China, Japan, and South Korea

East Asian political culture is also characterized by a deeply engrained tendency towards symbiosis between political and economic elites, which further encumbers the development of clear distinctions between the private and the public realm in East Asia, notions that have a direct bearing on the strength or fragility of human security versus officials, bureaucracy, and the state (Radtke 2006; Rocca 2004; Mizoguchi 1994), a tendency also observable in Western 'corporatism', one of the social roots of pre-war fascism. It weakens the position of genuine privatization that may lead to undermining the assumed moral superiority of the state. Oi (1999) emphasized that it was not so much the state, but local (village) cadres that took the lead in local economic and enterprise reforms, characteristic for symbiotic relations between political and economic elites. In a recent comparative study on privatization of state-owned enterprises in China and Japan during the past decade, this author stressed (Radtke 2006) that opposition to privatization is directly related to different conceptualizations of economic and human security (Rocca 2004; Mizoguchi 1994). The attempted privatization of postal services in Japan, legitimated by its advocates on the basis of ideology-tinted economic rationalism, seeks to *increase* individual economic *insecurity* to improve market mechanisms (Radtke 2006). Opponents to privatization in East Asia usually refer to the need to maintain, or even strengthen the role of government

in maintaining social stability. For them privatization is thus not merely an item in an economic argument. It is debated in ethical and moral terms that put the human security of the individual and social cohesion first. The long tradition of symbiosis between political and economic elites promoted tendencies towards a culture of *modus vivendi*, compromise, and coexistence accompanied by tacit understandings that critics identify as corruption. The increasingly autocratic state also strengthened the formal ideological and moral underpinnings of its rule, but differing from modern totalitarian states was not yet in a position to rebuild micro-society along the lines of Confucian scholars in the service of government.⁸ Nevertheless, Ogyu Sorai, a 17th century Japanese administrator confronted with the task to restore social order and security of the million-city Edo (=Tokyo) developed concepts akin to those of modern Western totalitarianism.

In China Neo-Confucian orthodoxy was used to justify a frequently violent system perceived by many members of micro-society as unjust. The moral quality of East Asian governments during the past few centuries might be conceptualized in terms of its ability to achieve a sound compromise between its ideological pretence, 'Confucian' morality, and the need to build and maintain security and social cohesion at home. There was a keen awareness that weakening social cohesion went together with deterioration of the moral quality of society as a whole, possibly leading to local resistance or wider rebel movements, which in turn made the state more vulnerable to external threats. Micro-society developed secret societies (*mimi she-hui*) in China and their equivalents in Korea and Japan, which possessed their own rituals and moral standards.⁹ Pre-modern governments countered by maintaining highly developed 'internal security services' (*Tokugawa onmitsu soshiki*). Confucian scholars would preach harmony – but there were widely differing interpretations of harmony, depending on the implications for security and feelings of justice in various sections of society.

12.3.4 External Threats within Northeast Asia

There was less harmony in the relations among governments in East Asia than some modern politicians suggest. The adoption of Confucian style discourse among elites and officials did not lead to an international community of values. How deep the differences were and still are is apparent from the fact that there were no attempts in pre-modern times to compile histories of East Asia (including Vietnam) that were acceptable to historians and the public in each country. Despite some efforts after World War II to build an atmosphere of reconciliation, in recent years mutual suspicion increased. This author is not impressed by the record of some governmental attempts to create common history textbooks by committee – most likely to result in negotiations on political compromise.

During the past thousand years of its history East Asia repeatedly suffered major periods of foreign conquest and external threats to its security that had a deep, long-lasting impact on the structure of domestic society and politics. China was under non-Chinese rule (1276–1386), and from the mid-17th century until 1911. The Mongols also invaded Korea, which subsequently suffered repeated invasions from China and Japan, not to forget the frequent minor Japanese incursions into coastal areas of Korea that increased with the new Meiji state in 1868. Japan was also severely threatened by the Mongol fleet but escaped 'miraculously' thanks to the storms sent by the gods (*kamikaze*). During this period Nichiren, the founder of a Japanese Buddhist group, had predicted disaster for Japan should it not return to proper moral behaviour (as defined by Nichiren). He demanded commitment to purely religious values with claims of exclusive possession of truth. As in Korea and China, officialdom suppressed religious and other groups that placed commitment to pure religious values over allegiance to officials and the state. Nichiren and his followers suffered severe persecution, and suppression of Christian activities in East Asia must be interpreted in this context (Frank 2004; Zhang 2004).

The Manchu Conquest of China in the 17th century was observed with deep anxiety and fear in Korea and Japan, the latter fearing a possible attack through northern Hokkaido and southern Kyushu during the 17th century. The Manchus were called 'North Korea' in (confidential) Japanese government documents of the time (Kamiya 1997: 195ff). When the Russians appeared on the northern horizon of Japan from the late 18th century onwards, this was not the beginning

8 For research on the relationship between micro-society, elites officials, and government organizations in China, see Sasaki 1993; Zhang 1998; Wang 1995.

9 For a brief introduction to '*Fujufuse*' and '*Ikki*', see Nosco 1997.

of foreign threats from the North, but a continuation. The British victory in the Opium War (1839–1842) was perceived as a threat to the security of Korea, and in Japan, one decade before the US Admiral Perry threatened to use cannons if Japan would not open its markets for US goods (1853). This forced Japan to sign unequal treaties that impaired its sovereignty for several decades. Within two decades Japan used the same tactics to force an ‘opening’ of Korea through the Treaty of Kanghwa (1876). The issue of foreign ownership of railways in China became a constant focus of popular protests against what was perceived as a security threat both at the national and local level, and the movement for the Protection of the Railways (*Baolu yundong*) was an important factor in the eventual overthrow of the Manchu Dynasty, even if that had not been one of the original aims.

The inroads by European powers and the US in East Asia since the first half of the 19th century did not provoke a common reaction; neither race (Dikotter 1992, 1997) nor a common shared value system was sufficient to lead to a united defence of East Asian security. Japanese efforts at the private and official level to propagate an invented common identity to suit its political ambitions were largely unsuccessful (Radtke 2003). The contemporary European dream of the re-establishment of the unity of Europe was also inspired by a sense of cultural unity linked to memories of a Holy Roman Empire (Pfetsch 1996). It is extremely unlikely that memories of shared Confucian ethics would ever suffice to establish viable political bonds in East Asia during the 21st century. The so-called ‘Asianists’ pleading for Asian unity in Japan and China at the turn of the 19th and 20th century could not overcome mutual distrust. Most Asian and Western historians refer to Japan’s choice in its modernization efforts called ‘leave Asia and join the West’ (*Datsu-Aron*)¹⁰. This term is highly misleading, since it only refers to Japan’s adoption of some Western institutions at the same time as competing with Western powers in gaining influence in Asia. It was Japan that ‘opened’ Korea to trade even before the US did. It is not surprising that Koreans “sometimes saw Japan as acting in concert with Westerners” (Choi 2001: 13), and Japan’s acquisition of control over the Ryukyus and its successful attempts to wrest control over Korea from China, followed by the annexation of Taiwan (1895) and Korea (formally from 1910) seemed

only a prelude to further aggression against China (Babicz 1998). The historical experience of Korea, China, and Japan in their relations with Western powers differed considerably. Suspicion against Catholicism can be traced to Portuguese and Spanish colonial expansionism in Asia, memories that still played a role in the 19th century when Koreans were more willing to get in touch with the US and its culture because the US was perceived as a protestant nation (Choi 2001: 13). This also contributed to the growth of Protestant groups (mainly of US origin) in Korea.

The lack of a common history and fairly divergent patterns of economic, political, and social development implied that the relationship between ethical and philosophical norms, security and threat perception continued to differ throughout East Asian history, both in pre-modern and modern times.

12.3.5 The Tributary System and its Relation to Security Perception

The authoritarianism of East Asian governments increased during the second millennium. Officials remained wary of any outside interference that might link up with domestic opposition. This also contributed to the growth of the Chinese-led system of international relations in East Asia labelled (inappropriately) the ‘tributary system’ (*chaogong*), in which China’s relations with its neighbours were formally and ritually conducted in terms of China (‘mother’ of civilization) as the ‘elder brother’, for which the ‘younger brothers’ expressed gratitude and respect.¹¹ Rather than *encouraging* genuine exchange it can be interpreted as a way to channel and *control* contact between China and its Asian neighbours to prevent mutual interference in internal affairs, especially since the Ming Dynasty in China, and the Tokugawa period in Japan. The tributary system was *not* conceived in terms of a power hierarchy from a neo-realist perspective (Yan/Zhou 2004: 339ff.; Li Wen 2005). I doubt whether it is appropriate to conceptualize the tributary system as an East Asian counterpart of the pre-modern European state system (Hamashita 2004).

This lasting historical experience, coupled with different memories of external threats, is an important factor to explain why East Asia still finds it difficult to work towards regionalism, including cooperation on security.

10 Fukuzawa Yukichi coined this term, but such policies had commenced before he wrote his essay: “Datsu-Aron” published in 1885.

11 Koreans and Japanese were usually not classified as barbarians (Luo 2004: 286).

12.3.6 Security Concerns often prevail over Ideological Purity or Religious Values

The selection of Neo-Confucianism (*Zhu Xi*) and its system of values as the major form of discourse for purposes of government was mainly contingent on its usefulness in enhancing domestic and external security. Adopting an official discourse would normally imply a strengthening of the political position and power of the guardians of this discourse, officials, and scholars trained in Neo-Confucian orthodoxy. The relationship between beliefs and those in power is complex in all civilizations, and East Asia is no exception. Governments were not only wary of the potential of certain religious and other groups (secret societies, resistance among peasants) to destabilize domestic order; they also needed to prevent Confucian orthodoxy from establishing itself as a political power in its own right.¹² The efficacy of Confucians to contribute to security was also under frequent, if not constant scrutiny by pre-modern governments in East Asia.

Following Korea's liberation from the Mongols Buddhist religious organizations were blamed for Korea's inability to defend itself. This led to suppression of Buddhism in Korea that lasted into modern times. The *Yi Dynasty* (1392–1910) so heavily stressed Confucian institutions and rituals that China praised Korea as a highly civilized follower of Chinese civilization (Callahan 1999). The institutions of the Yi Dynasty were however poorly geared to the security of the country, and it did not take long before conservative Confucian officials were blamed for neglecting national defence. They were opposed by 'reform Confucians' (*Shirhak* 'Practical Learning') who stressed the importance of combining practical expertise and scholarly learning with its main focus on social, political, and economic organization. Yi Ih (Yulgok, 16th century) emphasized the need to strengthen social cohesion effectively through non-violent means by fostering 'harmony of public opinion' (*min'i*) (Korean

Moral Philosophy). Public opinion was also more influential in Tokugawa Japan than the ruling government discourse would have it (Tanaka 2005). This is reminiscent of the opposition to the Neo-Confucian orthodoxy in China, such as the traditions of 'practice-oriented' Confucianism in the Hunan province, and sections of the Wang Yangming school (Zhang 2004). Despite the formal adoption of (Neo-) Confucian orthodoxy especially during the early years of Tokugawa Japan (17th century), its ideological and political influence never reached the level that Confucianism had achieved on the Asian mainland. Thus, Confucianism was not a belief and value system that would have made it comparatively easy for China to interfere in the internal (security) politics of Japan.

This was underlined in the 19th century when Korea and Japan pointed to the inability of China to defend itself, leading some Koreans and Japanese to claim that the centre of civilization had now moved to Korea or Japan. The very moment China proved unable to resist Western incursions the tributary system broke down – it could no longer function as a vehicle for non-intervention. There was no attempt by Japan and Korea to rush to the joint defence of a shared civilization. Each country was fully engaged in dealing with its own domestic unrest and rebellions. Different from the past, the 19th century saw the rise of indigenous mass movements that did not only seek 'power' within the traditional framework, but genuinely attempted to overthrow the division of society in officials and ordinary people, in search of a new system able to provide domestic stability and external security. Even if these movements failed, the *Taiiping* in China and the *Tonghak* in Korea, their character as a mass movement attempting to fundamentally restructure the socio-political order demonstrated a kind of modernity. They did not shy away from incorporating some 'Western' values to rebuild security. These mass movements also incorporated religious elements from indigenous and Western religions, but this did not protect them from Western powers that collaborated with traditional governments in China and Korea in the bloody repression, once more repeated in the senseless massacres conducted against the anti-foreign Boxer Uprising (*Yibetuan*) in China in 1900. The governor of the Canton province Lin Zexu had attempted to resist British criminals trading large amounts of opium, thus endangering domestic security, but was removed from office when he tried to use mass mobilization to counter the threat. Eventually and ironically it was a large-scale movement to protect Chinese own-

12 It is admittedly difficult to neatly distinguish between carriers of political and ideological power. This author's working definition is: Politics is the business of those who set up, transform, and manage the institutional framework necessary to provide the link between economic elites (not just the rich, but those leading/managing economic production) and those engaged in providing military security both at the domestic level and in external security. Civilizations may be defined in terms of mechanisms that solve these tasks in similar fashion, although it is customary to associate specific religions with areas of civilizations.

ership of railways (*Baolu*) that spawned events leading to the downfall of the Qing Dynasty in 1911.

These movements also relied on widespread feelings of injustice within Chinese and Korean society. The legal system in 'Confucian' societies was notoriously weak (Radtke 2000; Liang 1996, 1997; Fan 1999). Although it was often argued that Confucian ethics preach 'harmony' a modern legal scholar, Huo Cunfu pointed out that the absence of access to a reliable criminal system explains why values such as revenge and retribution occupy a far larger role in the ethics of East Asian micro-society than official sources and documents would admit (Huo 2005).¹³ They do form a major theme in popular literature, such as the novel 'Water Margin' (*Shuihuzhuan*), which was also translated into Korean and Japanese, and became the model for numerous local adaptations. But different from the mass movements of the 19th century, the novel ends with the rebels returning into the fold of government, thus symbolizing the restoration of (traditional) order, functioning similar to a 'cautionary tale' in its ultimate rejection of rebellion - while allowing the reader to revel in detailed description of vice.

12.4 Post-Confucian 'Public Religion' in East Asia? Case of Japan

Even if East Asian countries failed to establish a common front against Western invasion, the notion of a 'clash of civilization' (*wenhua chongtu* in Chinese) was a widespread and popular topic in Japan, China, and Korea for about two decades since the late 19th century (Radtke 1993; Allen 2001; Stegewerns 2003).¹⁴

Each country opted for different attempts to rebuild its societies as a first step to strengthen security. The different social, political, and economic structures required different approaches, but most agreed that traditional ethics, including Confucianism in all its varieties, were not up to the task. Virtually all efforts at modernization in 20th century East Asia also involved a fundamental restructuring of ethical and philosophical notions not suited for attempts to estab-

lish a viable modern nation state. Japan was the first country to succeed. The revival and revitalization of popular religions in the 1840's culminated in the effort by followers of Shinto to establish Shintoism as a state religion, accusing Buddhists of causing difficulties for Japan (Kuroda 1981; Fitzgerald 2003; Reader 2004; O'Sullivan 2004). One group, *Yoshida Shinto* went to extremes in declaring the Japanese religion as the origin of all world religions and called for spreading Japanese ethics to the world (Tsushiro 2005: 231, 178). When rebels from Japan's south-western island of Kyushu usurped the central government and erected the foundations of a modern Japanese state in 1868 they first supported the strengthening of religious Shintoism, including violence against Buddhists and the destruction of Buddhist cemeteries. They soon took measures to control religions in ways reminiscent of 16th and 17th century Japan. The early Meiji government tried to counter the general moral crisis in Japanese society by consciously attempting to create something similar to 'public religion' (Tsushiro 2005: 125ff., esp. 128-129). Meiji leaders such as Ito Hirobumi and Ookubo Toshimichi had emphasized the need for a new system of values functionally similar to a 'public religion' (Tsushiro 2005: 131). Soon the new values propagated in the name of the emperor shifted rapidly into the direction of radical and even religious beliefs that eventually destabilized not only attempts to secure democracy in Japan, but were also used to justify and legitimize Japanese aggression against Asia.

During the modern history of Japan's intrusion on the Asian mainland there were many attempts to construct visions of Asian commonality, with the aim of establishing a security order under Japanese leadership acceptable to Chinese, Mongols, Manchus, and others. Sometimes emphasizing common ethics and identity between Japan and China, sometimes linking up with Mongols and Manchus (as defined by Japan), they were often self-contradictory and doomed to failure in the long run (Radtke 2003: 183ff; Stegewerns 2003).

Part of the new belief system was an emphasis on the 'way of the samurai' (*bushido*) that was propagated as an authentic reflection of ancient Japanese ethical codes. This was largely the creation of 19th century scholars, led by Nitobe Inazo (Saeki 2004: 266; Tanaka 2005: 35-36, 17).¹⁵ Religious overtones can be observed in the remark by a leading Japanese politi-

13 The topic is highly sensitive in many religions and civilization. As an example, see the different interpretations of revenge by the ancient people of Israel against the Midianites.

14 Okuma Shigenobu's famous book *Toozai bunmei no choouwa* [Reconciling Civilization East and West] points out the reality and danger of division. On the use of history and historical concepts in the age of globalization, see Radtke 2001.

15 This topic is related to cultural and ethnic nationalism; see Pitelka 2001 and Oguma 2002.

cian who mentioned that “the harvest was successful thanks to our emperor” (Radtke 1995). These words evoke the adulation of Mao Zedong during the (Great Proletarian) Cultural Revolution. The impact of Japan’s newly created emperor system on Japanese identity, ethics, and philosophy, and Japanese security perceptions are a topic that has not yet been sufficiently explored.

The subsequent emphasis on the uniqueness of the Japanese political order (*kokutai*) obviously conflicted with the active introduction of ‘capitalism’ as an ideology. Japanese nationalists working for reform used the concept of a native ‘emperor system’ to provide for legitimacy, simultaneously pushing for the introduction of concepts of private property and other elements of a capitalist order. Decades later there were lively discussions in the secret committee of the Upper House centring on the question whether the emperor system and the capitalist order were compatible. It was admitted that the two were incompatible, but this conclusion was kept secret since it might undermine state ideology (Tsushiro 2005: 127, 216). New and old religions (including Shamanism) had a major impact on rightist leading figures and politicians such as Ishiwaru Kanji, the initiator of the Manchurian Incident of 1931 (Tsushiro 2005: 227; Fukuda 2001) and Kita Ikki, ideologue of rightist statism in the 1930’s (Fujimaki 2005). The revival of religion was particularly strong in the Japanese navy of the 1920’s and 1930’s (Tsushiro 2005: 221, 139). Fascism as an imported foreign creed was opposed, and even formally suppressed when it appeared to conflict with the elevated status of the emperor, but discourse on ethics, philosophy, history and values in the 1930’s draws on elements from the Japanese past as well as Western civilization, including its totalitarian traditions. Interestingly enough Chinese and Japanese fascists did not join hands (Chang 1985).

The potential for conflicting uses of the past was evident in Tanaka Chigaku who founded a religious school supporting the emperor state, whereas ‘*Nichirenism*’ had usually placed commitment to religious commands above political demands. Other new religions, such as *Oomoto* that put religious commitment above loyalty to the state faced persecution (Tsushiro 2005: 209, 238). Buddhism played a significant role in stimulating modernizers, not only in Japan (Tokoro 1972), but also in Korea and China (including Mao Zedong). The Mencius school in Confucianism seemingly put human security and security of the empire above the *raison d’etat*, and was frequently cited as indicating a more liberal interpretation of Confu-

cianism (Paul 2005), but its influence was often severely circumscribed by watchful rulers.

12.4.1 Japan’s Defeat, Revolution in China and North Korea, and Impact of the Cold War on Norms and Security Thinking in East Asia

When belief systems collapse as they did in fascist countries, the Soviet Union or with Japan’s defeat in 1945, individuals are challenged to re-examine the way they were bonded and linked to society and its past (Radtke 2000: 181ff.). The vast majority of ordinary citizens were not directly involved in determining the character of states or government systems newly created in East Asia since 1949. The domestic situation in the People’s Republic of China, the Democratic People’s Republic of Korea (North Korea), the Republic of Korea (South Korea) and the government on Taiwan changed repeatedly, and sometimes dramatically, during the subsequent decades. Developments in Japan since regaining sovereignty in 1952 took place more slowly and incrementally. The People’s Republic of China marked the first occasion in more than a century when the Chinese state – or the Chinese Communist Party operating through the state – attempted to impose ethical values on individuals and society throughout the country. In the eyes of many, including the leader of the Republican Revolution, Chinese society had never displayed solid cohesion (Qi 2004, 149).¹⁶ ‘Private’ and ‘individualism’ were regarded with suspicion; ‘public’ and ‘collective’ were praised. It appears that this attempt built on previous traditions where freedom (*ziyou*) was usually seen as detrimental to the positive value of unselfishness (*gong*), concepts that had existed in pre-modern Chinese society (Mizoguchi 1994).

Elsewhere this author suggested the application of the franchise system as a paradigm for describing characteristics of a globalizing order. It compares the main members of the triad (US, EU, and Japan) to headquarters of a franchise system that provides models for economic, social and political order to other countries, and builds international networks with important implications for the structure of international relations (Radtke 2005). During the height of the Cold War security relations were often likened to a hub-and-spoke model with the US as the hub of a system of bilateral alliances directed against the main po-

16 Similar attempts by KMT governments were of limited scale and intensity and confined to relatively small areas.

tential enemies – the PRC, the Soviet Union and their allies, since the early 1970's the main target was the Soviet Union. Following a brief transitional period (1991–1993) North Korea became a central focus of US and Japanese security policy.

In recent years discussions in the US about China as a potential 'strategic competitor' of the US have changed the nature of the security framework in the West Pacific once more. When the globalizing order is seen threatened, members of core alliances (NATO, US, Japan) assume leadership to reinvigorate order as they perceive it, aided by more or less loose coalitions with the largest possible number of countries. Such coalitions have a remarkable similarity to united front tactics as applied by communist parties. If the United Nations is unwilling to support policies of the core states, it is the international community of core alliances, and not the members of the United Nations that seek to secure threats to established order. Shifts in security perspectives of governments of East Asian countries must be placed in a broad framework. Social, political, and economic changes since 1945 have deeply impacted behavioural norms related to philosophy and ethics, which this author proposed to conceptualize as part of long-term historical developments. The attempts during the French Revolution to establish rational management of society through the state, first in France, then in Prussia were first steps towards greater rationality.

12.4.2 The Impact of Globalization on Visions of Security

Since modernization got under way in East Asia in the 19th century it was first the state that was considered the prime vehicle for modernization (Yangwu movement in China in the 1860's). Japan also stressed the importance of the state, but from the early 1870's emphasized the role of private property of land and means of production in general, even if the state maintained a large role in the overall management of modernization. The rise of Marxist-Leninist states in East Asia had a deep impact not only on ethics and philosophy as part of state propaganda, but also on concepts of security as experienced by individuals in daily life. From the 1960's, and accelerating since the 1980's, the 'market' and its main actors, companies, were widely considered as the main pillars of a more rational and efficient management of all aspects of society.

Despite the vast differences of state systems in East Asia, it is remarkable that the social security of

the individual was not settled in the framework of the relationship between individuals and the state, but rather at the level of micro-society. In the PRC virtually all individuals were until recently embedded in 'units' (*danwei*) that were identical with the work place (Lu 1993, 1997; Zhang 2005). In Japan, employees of large companies relied mostly on their place of work for security and social benefits, and not so much on the state. Recent attempts throughout East Asia to rebuild labour markets and employment conditions according to ideals of a globalized market economy, mainly supported by the US, its allies, and some international institutions such as the IMF, World Bank and WTO have already affected basic notions of security at the level of the individual. The trend towards flexible labour markets contributed to an increase in feelings of personal *insecurity*, frequently coupled with notions of injustice (Zhang 2004: 39, 101) whose long-term effects are still difficult to assess. At such turning points the relationship between the citizen, society, and the state is likely to undergo important qualitative changes difficult to catch in simple or quantitative analysis.

However, economic 'privatization' is not coterminous with the retreat of the state. At one level, the tradition of symbiosis between political and economic elites continues to shape the character of 'privatization'. On another level, the state seeks new functions especially in the field of maintaining domestic and external security. In an interesting analysis of Dutch colonial administration towards the end of the 19th century Romain Bertrand has shown that the privatization of enterprises caused the colonial administration to shift its attention from direct control over enterprises, to an increasing 'snooping' of the government administration into the personal lives of workers in enterprises (Bertrand 2004). The 9/11 incident, and various 'wars against terror' have provided new rationales to strengthen the intrusiveness of states in the private lives of individuals on a global scale.

'Globalization' may also be interpreted as a universal phenomenon that occurs whenever hitherto fairly autonomous regions (countries, nation states) are forced to stabilize their own domestic system by engaging in the institutionalization of transborder interaction (political, economic, attraction of FDI and others). The increasing dependence on the import and export of (raw) materials and capital, has forced the newly rising powers of China, India, Brazil (BRICs) to overhaul and revamp their traditional security concepts to adapt to a more comprehensive approach to

wards security. The end of socialism as a global force accelerated changes in all aspects of China's institutional framework, and growing global interdependence has forced China to abandon its traditional socialist conceptualization of security ('struggle against (social) imperialism'). China's one-Party rule does not permit her to simply abandon core terms of its post-1949 security discourse, leading to a mixture of concepts in which growing demands for China's naval security in the West Pacific, the Malacca Straits, and the Indian Ocean are combined with vintage concepts of 'peaceful coexistence' that also echo Soviet discourse from the Brezhnev era. At the same time China's elite universities are teaching US mainstream security theories diametrically opposed to geopolitical theories prevalent in all former socialist countries, and continue to exercise their impact in former socialist countries of Eurasia.

'Globalization' does not only refer to the inevitable processes of increasing interaction, but is also widely interpreted as a US-led attempt to impose political and economic standards on a global scale, and was given further impetus by the break down of the Soviet Union and Comecon. This includes the conscious spread of US-based theories of international (security) relations. They claim an ancestry that goes back to Hobbes and further to the system of alliances built by the naval empire of ancient Athens. Japan's modern pre-war security concepts catering to the demands of its fast-growing naval empire were largely borrowed from the English and US naval empires. Japan's defeat in WWII, coupled with the gradual deepening of the US-Japan security cooperation, further strengthened the conceptual dependence on imported security concepts, creating an emotional tension between memories and dreams of Asia under Japanese leadership, and the reality of U.S. hegemony whose dominance may be threatened by the rise of China and India. This demands a reconceptualization of Japan's traditional role in Asia as a member of the 'West' opposing socialist states. Japan's inability to 'check' the 'rise of China' on its own, or even exert effective pressure on North Korea on issues such as the return of Japanese abductees, missile development, and nuclear armament has caused considerable frustration, and should be seen as one of the reasons for the rise of neo-nationalism in Japan's domestic and foreign politics.

Is there a possibility of a future convergence of basic philosophical and ethical norms in East Asia? Ideologically influenced notions of confrontation between capitalism and communism are giving way to a

revival of the concept of international order largely determined by the interaction of great powers. In Asia it is mainly China, Japan and India that cherish dreams of (global) great power status and regional leadership. One of the hallmarks of a great power is the possession not just of sheer power, but also the creation of independent visions of ideas and principles for international order.¹⁷ This is a sea change from China's position in the mid-1960's when there were attempts to establish a second United Nations led by the cooperation of China and Indonesia (under Sukarno) that put the Third World against the rich countries. Similar to its conceptualizations of international order in the 19th and early 20th centuries, Japan emphasizes the leading role of sovereign states as such, whereas Chinese commentators – at least in statements for public consumptions – focus on the need of major states to shape the character of the international system in the desired direction (Pang 2003). Koreans tend to stress the potential of Korea to act as a mediator.

This raises the question of leadership in East Asia. The future seems to harbour two major scenarios: one results in a long drawn competition for leadership. The other is managed competition whose shape is determined by governments and large economic actors, a new kind of globalized corporatism at the international level, with major ramifications for domestic society and politics.

12.5 Notions of Security and the Reappearance of Nationalism in East Asia in the Twenty-first Century

The heritage of the Second World War and the Cold War is not limited to fading memories. New nationalism is also linked to perceptions of injustice and its causes in the age of globalization. The global modernization of ethics leaves little room for the expression of basic human emotions such as 'revenge' and atavistic desire for 'retribution', and instead prefers perceptions of the 'self' in terms of victims that have the right to claim apologies, excuses, and indemnities (Le 2004: 276; Lind 2003). No Asian country was directly involved in the occupation of Japan, the main aggressor in Asia between 1910 and 1945. The recent strengthening of nationalism in East Asia, not just in

17 On the importance of building up maritime power in long-term Chinese strategy, see Hong/Zhang 2004: 316.

Korea, seems linked to the inability to engage openly in revenge. Citizens of countries occupied by Japan often perceive post-war settlement of claims conducted between the governments of Japan and neighbouring countries as completely insufficient. Popular dissatisfaction with their own governments for reasons unrelated to Japan may combine with repressed feelings of revenge for past damages and insults, contributing to nationalist currents and politics that may have a large negative impact on international security in East Asia.

The division of Korea, cemented by the Korean War (1950–53), is largely portrayed in all of Korea as a result of great power interference that caused the victimization of all Koreans. Seeking to avoid international polarization that would lead to a devastating conflict between the US and North Korea the Roh Moo-hyun (No Muhyon) government has embarked on diplomatic strategies and contacts with the PRC and the DPRK that are viewed with suspicion in Japan and in the US. For its government the survival of Korea is of greater importance than the overall security requirements of other great powers. Korea's nationalism also feeds on a perceived lack of international justice, and is linked to other security issues over which South Korea has little control, such as the nuclearization of the Korean peninsula, proliferation, conflicts over the demarcation of maritime boundaries (EEZ), instability in the Taiwan Straits, and the possibility of strategic competition between the US and China that may involve other countries as well (Zhu 2004: 58).

Neither the past nor the present contain sufficient elements of philosophical, ethical, and other norms to form the basis for similar perceptions of security in Northeast Asia. Current tensions dividing the subcontinent cannot be reconciled with simple notions of a 'clash of civilization' in terms of Samuel Huntington's works. Philosophy and ethics shape security concepts, but primary issues of security and survival also shape philosophical and ethical concepts. The modern reconceptualization of major East Asian currents such as Daoism, Confucianism, Shintoism, Shamanism in all its variants and Buddhism has been deeply affected by the demands of a modernizing Asia, but also by notions of philosophy, ethics and religions imported from the West. Since Holtom's publications on Japanese Shintoism it has often been argued that Shintoism is not a religion in the Western sense at all (Holtom 1963; Tsushiro 2005: 147, 221). These categories are genres of thought germane to Western civilization, and not necessarily applicable to East Asia. Hidden underneath lie basic differences in the conceptualization of cosmic order, change, and truth which still ex-

ert a pull on thinking, even if modern contemporaries are not consciously aware of them. It is difficult for both individuals and groups to admit that ethics and conceptualization of identity are themselves subject to evolution. In his work on globalization Guehenno takes his perception of contemporary Japan as a model for the future world, the imperial age, in which formal rules, rather than specific ethical codes, and values are uniting the globe (Guehenno 1993). His approach seems to be highly premature. For the foreseeable future we must take divergent ethics and philosophy seriously: "Much more just than military actions must form the equation of operational net assessment: the enemy's culture, his political system, and his economic structure" (Murray 2003).¹

12.6 Security Identity: Cases of Japan and China

It seems unlikely for the foreseeable future that Northeast Asia is ready to embark on building a community of values to form the basis for a common approach to security. Behavioural norms in China, Japan and Korea derive from diverse sources which makes it very difficult to establish a catalogue of well-defined common 'values' governing choice and legitimization of actions. The fragmentation of individual religious/ethic convictions and their uncertain position versus behavioural norms demanded by the state at least in the shape of outward conformity complicates the task of defining different categories of behavioural norms. Although all regions of East Asia saw periods of totalitarianism the attempt to enforce a particular ideology and its norms permanently ended in failure. The dictates of 'globalization' (market democracy) are not sufficient for reshaping East Asian societies based on the individual's internalized ethic system. It is easier to outline the security identity of states based on definitions of national interest.

In the long term it is the attempt of the PRC to build up for itself a position as a global maritime power that will encounter increasing opposition from Japan and the United States, for more than a century the main maritime powers in the Pacific (Hong/Zhang 2004: 316; Zhu 2004: 455). Related to this is the possibility of China increasing its influence in the Greater Middle East, including in South Asia and in the Indian Ocean as areas that complement the importance of the continental Eurasian heartland, the stage of the 'Great Game' in the 19th century. In the words of a Chinese strategist, Zhu Tingchang:

To ensure security for China, first China's territorial integrity (Taiwan), second, China must weaken the ability of the US-Japan alliance to restrain China (*zhibeng*), and in general weaken the security threat emanating from the alliance. Thirdly, the strengthening and protection of maritime interests has already become China's future important strategy - a lifeline for China's attempt to become a maritime great power. Fourth, China must strive to achieve benign (*liangxing*) dynamics within China-US and China-Japan relations, the kind of relations among great powers that will allow for a true rise of China to great power status (Zhu 2004: 349).

It is difficult to ascertain to what extent security perceptions found in contemporary sources from the PRC are rooted in visions of global order related to perceptions based on the thinking of Marx-Lenin-Mao Zedong (Li 2004: 3).¹⁸ China has become much less attached to utopian ideas, and its middle-class society less warlike (Hong/Zhang 2004: 54). New concepts of China as a great power with its own ideals and rationales for the international order are linked to wider changes in contemporary Chinese thinking. We may perhaps detect a preference for conceptual frameworks of 'balanced order' that echoes ancient visions of 'universal order' rather than emanating from Western concepts of 'balance of power'. Concepts of a 'balanced global order' rest on ethical and philosophical assumptions. Both socialism and capitalism share a utopian sense of establishing a social, economic and political order facilitating transnational cooperation, but in recent years the PRC has avoided adopting clear positions on this issue. As the PRC strenuously de-emphasizes the role of ideology in international relations in the post-Cold War era, the US has embarked on an opposite course, preaching 'regime change' as part of establishing a new global order based on cooperation of market democracies.

The background to Japan's position on security can be summarized by references to Japan's alliance with the US, the United Nations, and Japan's Constitution. As long as the United Nations is unable to guarantee Japan's security, Japanese security will be ensured by security cooperation with the US. An incremental reinterpretation of the Japanese constitution has enabled the Japanese government to build up its armed forces beyond the letter of the constitution, and bypass restrictions on collective defence. Beginning in the 1970's, Japanese governments have increasingly portrayed themselves as a member of the West.¹⁹ This, however, does not necessarily mean that

Japan has adopted full-scale domestic reforms along the lines of market democracy as demanded by the US. Surprisingly similar to contemporary China the government of Japan has remained vague on spelling out the philosophical foundations of its long-term strategies. Japan customarily denies that it has any strategy at all,²⁰ and prefers to reconfirm its basic solidarity with the US. One of the reasons may be that voicing an independent strategy might be taken as a challenge to the US and give rise to (unnecessary) friction in US-Japan relations.

South Korea under its current President No Muhyon is deeply divided over its future (security) relationship with China, North Korea, the US, and Japan. The lack of progress of the Six Party Talks on North Korea is not merely due to North Korean intransigence, it also illustrates the vast differences among these countries over finding a common ground to rebuild security in East Asia.

18 For a current interpretation of the global trend, see Shi 2004: 124.

19 Both for legal reasons (the Japanese constitution prohibits collective defence) and a complex domestic political situation, Japanese governments maintained until the 1970's a policy of formal equidistance towards the Soviet Union and China. For a treatment of the transition towards an openly expressed system of cooperation with the West, see Radtke 2005.

20 For an opposite view, see Zhang 2004: 380: "The dismemberment of China has always been Japan's strategy."

13 Security in Confucian Thought: Case of Korea

Eun-Jeung Lee

13.1 Introduction

This chapter deals with peace and security in Confucian philosophy. By and large, the author will limit this exposition to the case of Korea. The main reason is that Confucianism is not one body of thought, but instead evolved historically in manifold ways through the interaction of numerous philosophers and schools. There are significant differences in the thought of *Confucius*¹ or *Mencius*² and, for instance, between these and Chu Hsi's Neo-Confucianism³, which further develops their teachings. Similarly, Confucian philosophy in Korea and Japan took different paths than in China. Unsurprisingly, the reception of

Confucian thought took place under specific circumstances in space and time. Therefore, when one discusses Confucius, it is advisable to say clearly, just as in the case of, say, ancient Greek philosophy, to which philosopher or philosophical school one refers. Otherwise, one is in danger of merely repeating clichés and prejudices – a ubiquitous danger, as East Asian society is being seen quite commonly as having been formed by the Confucian tradition.

In fact, there already exists a long tradition to instrumentalize Confucius and Confucianism for ideological and political purposes. Therefore it is necessary to examine carefully what supposedly was created in the name of Confucianism or what is described as 'Confucian'. In what sense can certain thinkers be considered 'Confucianist', and if so, to which school or philosophers are they related? Similarly, when the security concept in Confucian philosophy is discussed, the different origins and traditions should be distinguished and discussed.

In this chapter, security concepts in Confucian philosophy are introduced, as they were developed in Korea within the Neo-Confucian tradition of Chu Hsi

1 Confucius is the latinized name of Kong Fuzi or K'ung-fu-tzu, lit. 'Master Kong', but most frequently referred to simply as Kongzi who had lived in China around the 5th century (551–479?) BC. He was a philosopher, political figure, educator, and the most important member of the Ru School of Chinese thought, which is known as Confucianism in the West. His teachings, preserved in the *Lunyu* or *Analects*, form the foundation of much of subsequent Chinese speculation on the education and comportment of the ideal man, how such an individual should live his life and interact with others, and the forms of society and government in which he should participate. Confucius' influence in Chinese history is compared with that of Socrates in the West. A large number of books about his thought have been published in English. Among them, Ames/Hall (1987); Creel (1949); Fingarette (1972); Schwartz (1985); see also at: <<http://plato.stanford.edu/entries/confucius/>> and at: <<http://www.iep.utm.edu/c/confuciu.htm>>.

2 Mencius, in Chinese Meng Tzu, 372–289 B.C., is together with Confucius the most important thinker in Confucian philosophy. Like Confucius, Mencius concerned himself entirely with political theory and political practice, and spent his life bouncing from one feudal court to another trying to find some ruler who would follow his teachings. See: Ames (2002: 72–90); Lau (1993: 331–335); Legge (1970); Shun (1997); see also at: <<http://www.iep.utm.edu/m/mencius.htm>> and at: <<http://plato.stanford.edu/entries/mencius/>>.

3 Chu Hsi (1130–1200) was a late Song Dynasty (960–1279) Confucian scholar. He edited the *Four Books* and defined what was later to be accepted as the standard interpretation of Confucian learning in the imperial examinations. He is a representative of the systematic and theoretical wing of Neo-Confucianism, which combined the traditional values of Confucianism with a metaphysical theory of humanity's relation to the universe. In his thought he absorbed many elements from Taoist and Buddhist teachings, but battled against the other-worldly tendencies of both teachings. This Neo-Confucianism became Confucian orthodoxy for several hundred years. In the 18th century Confucian scholars challenged this orthodoxy and wanted to return to the Confucian classics, before they were abridged into the *Four Books*. See: Chan (1987); Hoyt (1992); see also at: <<http://homepage.mac.com/haroldsjursen/ChuHsi.htm>> and at: <<http://www.asiawind.com/pub/forum/fhakka/mhonarc/msg00538.html>>.

and on the basis of classical texts like ‘*Ch’un-ch’ui*’ (Spring and Autumn)⁴ and ‘*Mencius*’⁵. Security in this tradition is considered as a moral problem, which, within the Sino-centric world order, is based on ‘*li*’, i.e. the rules of moral propriety among states. The politically highly unstable conditions during the *Ch’un-ch’iu Chan-kuo* period (722–221 BC)⁶ played a decisive part in the emergence of Confucian philosophy. Chu Hsi (1130–1200) refined and extended this philosophy.

In Korea the Chosôn-Dynastie (1392–1910) adopted Chu Hsi’s Neo-Confucianism as its ruling ideology. Thus, the view that the safety of the country within the Sino-centric world system was directly related to a moral principle became established in Korea. It replaced the pragmatic understanding of *shih-ta* (serving of the great by the small), *sadae* in Korean, which had been prevalent during the Koryô-Dynastie (918–1392).⁷ This pragmatic approach meant that the small states on the Korean peninsula, in view of the vast military superiority of the Chinese state, had to cultivate amicable relations with it. In contrast, the interpretation of *sadae* as a moral principle stood for the moral obligation to accept the Chinese state as eternally superior and to perform the corresponding rituals. This view became so deeply engrained into the thinking of the Korean political and scholarly class that some, at the end of the Chosôn Dynasty, would earnestly demand to guaranty the safety of the country by performing *shih-ta* toward China as prescribed by tradition.⁸

Particularly during the final stage of the Chosôn Dynasty, there were some scholars who insisted that Korea needed her own military strength. Nevertheless, there can be no doubt that *shih-ta/sadae* as a moral principle – *sadaejjuûi* (*shih-ta*-ism) – was at the

centre of all considerations of security during the Chosôn Dynasty in Korea.

This chapter will analyse, first, how *shih-ta* as a system of relations among states was philosophically rationalized in the political thought of Mencius and Chu Hsi, second, how their security concepts became the ruling ideology of Chosôn in the 14th century, and, third, how the effects of this historical experience can still be felt today. Security concepts in the variants of Confucian philosophy discussed in this chapter are quite distinct from traditional security concepts in the West. At least in South Korea, they continue to play a certain role up to the present.

13.2 Security in Confucian Philosophy in Ancient China

During the *Ch’un-ch’iu Chan-kuo* (722–221 BC) period, in which Confucius and Mencius lived, the Chou feudal order collapsed and states of the holders of dependencies had begun to conquest other states. These states developed bureaucratic systems, pursued diplomatic activities, and possessed strong standing armies. They concluded treaties among themselves on a basis of equality. Unfortunately, this well-ordered world became subject to numerous wars. During the 258 years of the *Ch’un-ch’iu* period (722–453 BC) there were no less than 1,212 of them, while there were only 38 years without war. The number of states was reduced from 100–180 at the beginning of the *Ch’un-ch’iu* period to just 10 toward its end. A sort of law of the jungle had taken possession of the land (Lee 1997: 200). The stronger states fought for hegemon-

4 This is one of the earliest Chinese written documents and might have been edited by Confucius to record major historical events from 722–480 BC. See: Kennedy 1942: 40–48; Cheng 1993, 67–76.

5 This book bears the name of Mencius; see: Legge 1970.

6 The beginnings of feudalism reach back to the Chou Dynasty. It led to disunity and its latter destruction. This was the time when the Classical Age of Philosophy developed. Chou was the longest dynasty in Chinese history. It consisted of Western Chou (1127–771 BC) and Eastern Chou (771–256 BC). It is further divided into 2 sub-periods of decentralized rule, disunity and chaos: “Spring and Autumn” [Ch’un-ch’iu] (771–481 BC) and “Warring States” [Chan-Kuo] (463–221 BC).

7 On the History of Korea, see: Eckert/Lee 1990; Hong 2003; see also at: <<http://www.stockton.edu/~gilmorew/consorti/1deasia.htm>>.

8 There are differences in the traditional and the modern meaning of the term ‘security’ in China and Korea. The modern term in Chinese is ‘an-quan’ which is usually used for military security. Terms like ‘bao-an’ or ‘gong-an’ are used for public security. The modern term in Korean is ‘anbo’. It is composed of the Chinese characters for ‘comfort’ and ‘protection’. These terms are translations of the Western concept of security. They appeared in the late 19th century and early 20th century, when the region was confronted with Western imperial power. Traditionally the security was expressed with words like ‘ping’ and ‘an’ in Chinese, and ‘p’yôngan’ in Korean, using the same Chinese characters. ‘Ping’ means peace and ‘an’ comfort. The meaning was wider than that of the Western concept of security. It bears some similarity with the concept of human security, which recently has gained popularity in academic discourses.

ony, while the weaker states struggled to survive and to retain certain degrees of self-reliance.

During the course of these wars the treatment based on equality between the stronger and the weaker states eroded and was replaced by a hierarchical order among them. Lee Choon Sik writes:

The survival of small states depended upon their ability to find allies or to pick the winning side and join it. State security and protection were the exclusive concerns of the day, and this led to the formation of leagues or alliances of states. ... The small states acknowledged the supremacy of the leading power and followed their commands. In return for protection and security, the allied small states were responsible for making certain contributions, paying tribute to the allied leading power (Lee 1997: 353).

In the book *Ch'un-ch'iu of Tso-chuan* (Ch'un-ch'iu tso-chuan) the terms '*hsiao shih ta*' and '*ta tzu hsiao*' were used for these new inter-state relationships (Book X, 30TH year, par. 2.3; Legge, Vol. V, 1960: 734). They mean 'the serving of the great by the small' and, respectively, 'the cherishing of the small by the great'.

It is necessary to be clear on the meaning of *shih-ta* und *tzu-hsiao* in ancient China. James Legge translates '*shih-ta*' as serving and '*tzu-hsiao*' as cherishing (Legge, Vol. 5, 1969: 734). The origin of these terms can be traced back to the Chou Dynasty. In *Chou-li* (Rites of Chou) it says that when the state was properly ordered, the lords, the holders of dependency, did not attack each other and could live in peace, as the small state served the great and the great state cherished the small state (Duke of Chou 1999: Chou-li 33: 14b, 15b). A similar expression can be found in *Chou-li* (55: 3a) of the same book. Yet, as *Chou-li* is generally not counted among the Confucian classic texts, one hesitates to accept this text as the source of *shih-ta* und *tzu-hsiao*. On the other hand, the number of states in Western Chou, as already mentioned, was around 100 to 180 (around the 9th century BC) while the stability and prosperity of Chou depended on the harmony and solidarity of the small and the large dependencies. It had been Chou's political and military strategy to attribute the small to the large dependencies (Lee 1997: 249). Therefore, it would have been quite fitting for Chou to cultivate *shih-ta* und *tzu-hsiao*. The aforementioned quote of the *Ch'un-ch'iu* continues: "the reason why the States acknowledge the supremacy of the ruler of Tsin lies in the rules of propriety, by which are (here) to be understood the service of a great State by a small one, and the cherishing of the small State by the great one" (translation Legge, Vol. 5, 1960: 734).

In this sense *shih-ta* and *tzu-hsiao* belong to *li* (rules of propriety). The observance of *li* in Chou Dynasty (1046–771 BC) was facilitated by the fact that society was based on a common blood relationship. Because all rulers in Chou were related, there was little need to control the realm through physical force and punishment. Instead *li*, which was followed voluntarily, in Chou, became as binding as laws. As *shih-ta* und *tzu-hsiao* were part of *li*, the holders of dependencies were obliged to observe them too (Lee 1997: 249).

Figure 13.1: Map of the Chou Dynasty. **Source:** Printed with permission of The Minneapolis Institute of Arts; at: <<http://www.artsmia.org/art-of-asia/history/dynastychou.cfm>>.

In *Ch'un-ch'iu tso-chuan* (chapter Duke Gae, 7th year) it says: "It is by good faith that a small State serves a great one, and benevolence is seen in a great State's protecting a small one. If we violate [our covenant with] a great State, it will be a want of good faith; and if we attack a small State, it will be a want of good faith; and if we attack a small State, it will be a want of benevolence. The people are protected by the walls of cities, and the walls of the cities are preserved by virtue, but if we lose those virtues, our wall will totter; - how will it be possible to preserve them?" (Legge, Vol. 5, 1960: 814). What Legge translated as 'good faith', is in Chinese *hsin*, while 'benevolence' is *jen*. This shows that, on the one hand, the basis of *shih-ta* and *tzu-hsiao* rests on the moral value of *jen* and *hsin* and, on the other, that the security of the country was intertwined with it in a direct manner.

However, the *Ch'un-ch'iu Chan-kuo* period, in which Confucius and Mencius lived, was not ruled through *li*; instead those were lawless times, where the 'law of jungle' reigned. It is simply unimaginable that the small states would, when they barely could defend their existence against their stronger neighbours, ask the latter to exercise power within the limits posed by *li*. Ch'un-ch'iu tso-chuan refers to this when it says: "When Yu assembled the States on mount T'oo, there were 10,000 States whose princes bore their symbols of jade and offerings of silk. Of those there are not many tens which now remain; "through the great States not cherishing the small, and the small States not serving the great" (Legge, Vol. 5, 1960: 814).

Mencius thought that the restoration of the old order, of *li*, would open a way out of those chaotic times. When he was asked if there existed any way to regulate one's maintenance of intercourse with neighbouring kingdoms, he answered: "There is. But it requires a perfectly virtuous prince (*jentsu*) to be able, with a great country, to serve a small one - as for instance, T'ang served Ko, and king W'än served barbarians. And it requires a wise prince (*chihitsu*) to be able, with small country, to serve large one, - as the king T'ai served the Hsun-yu, and Kau-ch'ien served Wu" (Mencius 1a3, translated by Legge, Vol. 2, 1960: 155). When Mencius lived, the *li*-based political order of Chou had already collapsed. When he puts emphasis on *li*, he does not mean literally to restore the old order as such. Instead *li* with *jen* (virtuous, benevolence) and *chih* (wise) as the moral basis is a philosophically sublimated concept (Feng 1947: 253).

To readers unfamiliar with Confucian thought, the proposal that the security of a country depends on *li*, *jen*, *hsin* and *chih* may sound strange. Mencius explains it as follows: "It is not the exterior and interior walls being incomplete, and the supply of weapons offensive and defensive not being large, which constitutes the calamity of a kingdom. It is not the cultivated area not being extended, and stores and wealth not being accumulated, which occasions the ruin of a State. When superiors do not observe the rules of propriety, and inferiors do not learn, then seditious people spring up, and that State will perish in no time" (Mencius 4a1 translated by Legge, Vol. 2, 1960: 291). He continues: "if the prince of a State loves benevolence (*jen*), he will have no opponent in all the kingdom (*tienhsia* - in the world, EJJ)" (Mencius 4a7, translated by Legge, Vol. 2, 1960: 298). If a regent takes *jen* as a guiding principle of his policy, he will guard against any kind of violence and war, which en-

danger human beings. This holds for the domestic realm and for external relations. When the duke W'än of T'äng asked Mencius what he could do against the constant threats of a powerful neighbour, Mencius answered, that a good lord would even give up his land in order not to endanger lives through war (Mencius 1b, 15). The humanist character of Mencius' political thought becomes obvious here. In this, his thought is quite similar to modern concepts of human security.

For Mencius *jen* was the only realistic way to peace in the Ch'un-ch'iu Chan-kuo period, where public order was in almost complete disarray and human misery pervasive. Because the horrors of war were a permanent feature of his time, his philosophical endeavour was centred on the conditions of peace. In *jen* he discovered a central principle on how to guarantee the peaceful coexistence of the general population and of states and he sublimated *jen* into a philosophical concept.⁹

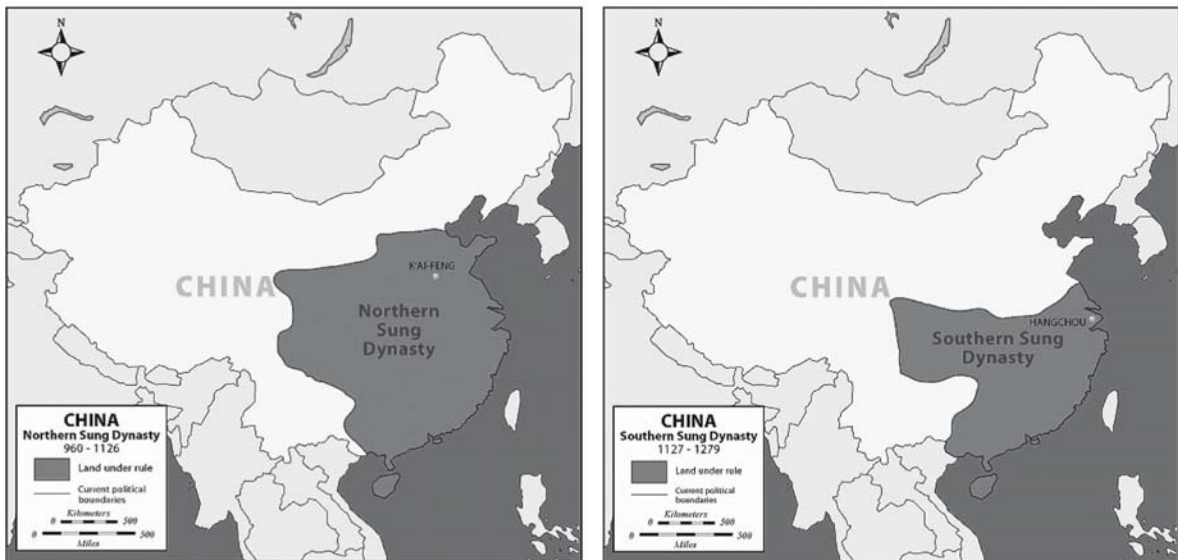

In reality, however, inter-state relations during the Ch'un-ch'iu Chan-kuo period were governed by military power and violence. The *shih-ta* relationship was not based anymore on *li*, but instead on 'realist' calculi of power. Therefore the *shih-ta* relationships changed according to military power and strategy. As none of the states of the Chan-kuo period was militarily strong enough to unify the whole Chinese realm, large states like Chin and Ch'u had to be content with the *shih-ta* of the smaller states. However, *shih-ta* alone was no guaranty for security and survival. Even the smaller states had to be strong enough to defend themselves (Lee 1997: 296).

After the formation of a unified empire in China by Chin in 221 BC the relation of China with her neighbours continued to be a power relationship. One should note that it was not necessarily only China which received tribute and *shih-ta*. Even though China in her Sino-centric world-view considered her neighbours as barbarians (*i*) and herself as cultivated (*hua*), there were times when the Chinese dynasties paid tribute to the mighty peoples in the north, who neither Chin (221-202 BC) nor Han (202 BC - 220 AD) had been able to subdue.¹⁰

In the 12th century, when the Sung Dynasty (960-1279) was under threat from peoples in the north, Chu Hsi, an important Neo-Confucian scholar, philosophically deepened the difference between the *hua*

9 As it is, it is not possible to identify any typological similarities between Confucian thought and the European traditions of, for instance, realists, idealists and pragmatists.

Figure 13.2: Map of the Sung Empire. **Source:** Printed with permission of The Minneapolis Institute of Arts; at: <<http://www.artsmia.org/art-of-asia/history/north-sung-dynasty-map.cfm>>.

and the *i* in the Sino-centric world-view. He did not define the difference between his own people, the *Han*, and other peoples in terms of relative military strength, but instead by means of the cultural superiority of the Han people. He declared that the barbarians in the North were creatures between human beings and animals. Therefore it was not possible to change their nature and to coexist with them in an orderly manner (Chu-tsu yü-lei: 4-1). Such a view was possible because Chu Hsi rejected all autonomy and subjectivity of other peoples (Kim T. 2000: 7). For him the hierarchical order of *hua* and *i* was an eternal law, just like hierarchies among people. Therefore, it could not be that barbarians conquered China: “when a common man (*hsiao-jen*) tries to overpower a gen-

tleman (*chün-tsu*) and when the barbarians attack China, this has to be seen as an abnormal phenomenon of nature, similar to the eclipse of the sun” (Chu Hsi 1962, Chu Wen-kung wen-chi, Literary Collection of Chu Hsi, Vol. II, quoted after Yu 2004: 96). In other words, what Chu Hsi tried was to strengthen Han nationalism in order to resist the real threat from the north. Han nationalism for him was based on the outstanding qualities of Chinese culture, on the idea of a *Kulturnation*.

All the same, Sung eventually succumbed to the northern barbarians and was replaced by Yuan (1271-1368). During the 100 years of the Mongols’ reign, Chu Hsi’s Sino-centrism could not pervade political order in China. Only with Ming (1368-1644), the Han gained predominance over the peoples in the North again and the Sino-centric world-view, the payment of tribute and *shih-ta* held sway again.

To recapitulate, unlike the Chou period the system of tribute of *shih-ta* during the Ch’un-ch’iu Chan-kuo period was not based anymore on *li* alone. It became a system, in which military and political strength also played a role. But even during the latter period *li* remained a diplomatic means to reduce military expenditure and to maintain peace, as it involved the mutual acceptance of the hierarchical order of the stronger and the weaker states. It was a system that could react to changes and challenges and find new balances. Yet, when the *shih-ta* system became integrated with Chu Hsi’s Sino-centrism, it became dogmatic and rigid. Chu Hsi refused to ascribe human

10 Kao-tsu, the founder of Han, for example, had to promise to pay tribute in a peace agreement with the Huns. In 141 BC the emperor Wu broke this agreement and attacked them. He sent his troops to their centre of power in the West of the Gobi Desert. The Huns escaped toward the west and became the cause of enormous migration (*Völkerwanderung*). As they arrived in Central Asia the people there were pushed south and became the founders of the Kushan Dynasty in India. Another group of Huns reached Europe through the Balkans and pushed the Germanic tribes to move elsewhere. These migratory movements in the 4th century heavily influenced European history - a long-distance effect of emperor Wu’s decision. Interestingly, Hegel in his Eurocentric views maintains that China became a part of world history only after the arrival of the Europeans in China in the 16th century (cf. Lee 2003).

Table 13.1: Chinese and Korean Dynasties and Philosophers, Key events and Philosophers in Europe

	China	Korea	Europe
1000 BC	Chou Dynasty	Ko-Chosôn (2333 BC founded?)	Socrates, Plato, Aristotle Ancient times
500 BC	Ch'un-ch'iu Chan-kuo (722-221 BC) Confucius, Mencius

Qing (1644-1911)	Yi I, Song Si-yôl		

qualities to barbarians, even in cases where they had, like Koryô (918-1392) on the Korean peninsula, successfully developed their culture through cultural exchange with China. In an interesting twist of history Chu Hsi's Neo-Confucianism with its rigid Sino-centrism was disseminated in the 14th century, toward the end of the Koryô Dynasty, to the Korean peninsula and became the ruling ideology of Chosôn Dynasty (1392-1910).

13.3 Neo-Confucianism in Chosôn and Security

13.3.1 Neo-Confucianism in Chosôn

Chu Hsi's Neo-Confucianism first was introduced to Koryô¹¹ at the end of the 13th century (Kim 2003: 2).¹² But for scholars like Yi Saek¹³ (1328-1396) and Chông To-jôn¹⁴ (1337-1398), unlike Chu Hsi, the Mongol

Yuan Dynasty in China was not considered a dynasty of barbarians, but just another dynasty within the tradition of Chinese culture. For these scholars not ethnicity, but culture was the criterion to distinguish between *hua* and *i*. This point of view had been developed in Kung-yang's Ch'un-ch'iu, a text written

11 The Koryô Dynasty was established in 918 and ruled the Korean peninsula from the fall of United Silla in 918 until it was replaced by Chosôn in 1392. The name 'Koryô' is a shortened form of 'Koguryô', one of the Three Kingdoms that were united by Silla in 668. The Portuguese explorers adopted the Japanese pronunciation of 'Koryô' (Korei); thus the Western name for 'Korea' appeared. In 1231 the Mongols invaded Koryô and it became a vassal state of the Yuan Dynasty, until, in turn, the Mongols were driven out of the Korean peninsula in 1336. Koryô had adopted Buddhism as the state religion.

12 On the history of Confucian thought in Korea see: Deuchler (1992) and DeBary (1985).

in the Han Dynasty. According to this text the barbarians could become part of *hua*, if they assimilated culture and became civilized (Do 2005; Sin 2004). It is easily understood that such an interpretation of *hua* and *i* was preferred by non-Han peoples. Even more, the Yuan Dynasty made Neo-Confucianism its ruling ideology and in order to improve its legitimacy it adopted this culture-based interpretation: Yes, the Mongols had conquered China by force, but they had absorbed Confucian culture and consequently had become real *hua*.¹⁵

Thus, the Neo-Confucian scholars in Koryô had no objection to enter a *sadae* relationship with Yuan. Too, it greatly helped that Shih-tsu (Kublai Khan) with the assistance of Hsu Heng, a Neo-Confucian scholar, became an emperor of high repute (Kim T. 2000: 21; compare Ma 2004). Hence, Yi Saek (2000) wrote in *Sônjabjibso* (Mogûnjip mungo Vol. 9), that Confucian thought was conveyed by Han Yü, Ch'eng I, and Ch'eng Hao to Hsu Heng, who in turn was an advisor to Kublai Khan (Yi Saek 1993: 72).

However, the Koryô scholars did not promote Neo-Confucianism for purely philosophical reasons. The situation of Koryô at the end of the 13th and early 14th centuries was quite precarious. Because of the long reign of the military, the invasion of Yuan and the political interventions of Yuan, political and social order had almost vanished. The exploitation by public

Figure 13.3: Historic map of Korea (Koryô). **Source:** Printed with permission of Henny Savenije; at: <<http://www.hendrick-hamel.henny-savenije.pe.kr/oldtonew.htm>>.

officials and nobles was so severe that many people had fled their villages. Furthermore, the farming population suffered from Japanese pirates and incursions of marauding groups from further north. The royal family was only interested to stay in power with the help of Yuan (Kim Y. 2006). In this situation, some scholars who wanted to overcome the social and political crisis turned to Chu Hsi's Neo-Confucianism (Mun 1982; Yi 2002; Ch'oe 2000).

Chông To-jôn complained about these conditions in *Bulssijabbyôn* (Sambongjip, vol. 9): "A son does not respect his father as his father, a subject does not respect the king as his king. Because people lack sincerity, they look at their parents as mere passers-by" (Chông To-jôn 1990: 452). The general crisis had sharpened the senses of the scholars and made them receptive for Neo-Confucian thought, which, apart from its culturalist and ethnic underpinnings, was practical philosophy, in particular when seen in contrast to prevailing Buddhism. While the latter only knows the suffering of the individual, Confucianism is about the well-being of society and the innate power and intelligence of human beings to organize society accordingly. The scholars wanted to use Chu Hsi's Neo-Confucianism in order to overcome the general crisis at the end of Koryô (Kim Y. 2006a). Therefore, they showed little interest for his Sino-centric worldview of *hua* and *i*, and for his principles of righteousness and virtue (Mun 1982: 117).

Thus, the reception of Neo-Confucianism in Korea was selective. This was also true of *sadae*. The scholars looked at the security of the country primarily in terms of situations of real power. It had always been essential for the Korean kingdoms and dynasties

13 Yi Saek was a philosopher, writer and poet, and played a crucial role in the introduction of Chu Hi's Neo-Confucian philosophy in Koryô. He had studied Neo-Confucianism in China (Yuan Dynasty) and on his return to Koryô opened a Confucian academy. Among his disciples were the founders of Chosôn, among them Chông To-jôn and Kwôn Kûn, who used Neo-Confucian as the ideological basis for overthrowing Buddhism, the state religion of Koryô. Yi Saek himself, however, remained loyal to Koryô and resigned from all political positions after the founding of Chosôn.

14 Chông To-jôn, with the pen name Sambong, was a student of Yi Saek and a major opponent of Buddhism at the end of Koryô. His family had emerged from commoner status, and slowly reached ever higher ranks of government service. His close relationship to Yi Sônggye was of extreme importance for the foundation of Chosôn. His political ideas had a strong impact on the politics of early Chosôn. He was a founding member of the Sônggyungwan, the royal Confucian academy, and one of its early faculty members. See: Deuchler (1992); Han Yeong-u. (1974); reprinted in Korean National Committee of UNESCO (2004): 55-74.

15 The same arguments were advanced in the 17th and 18th centuries, when the Manchu conquered China and founded Qing Dynasty. See: Hamashita (1997).

to have good relations to China and the peoples in the North and to accept *sadae* with them (Park 2005: 198; Kim I. 1999a). It was a flexible instrument of diplomacy. Thus, for example, Kongmin-wang (1330–1374), a king in the last period of Koryô, did not hesitate when he realized that Yuan would lose against Ming to enter a *sadae* relation with the new masters of China.

This sort of pragmatism was criticized by Yulgok Yi I (1536–1584), a famous Neo-Confucian scholar in the middle of the Chosôn¹⁶ Dynasty: “If the Three Kingdoms and Koryô, even when they practised *sadae*, were sufficiently earnest and sincere, I do not know. ... When *li* was followed properly, but insincerely, and when the ceremonies were magnificent, but insincerely done, how could one compare such an exercise of *sadae* with the earnest and sincere *sadae* of our country?” (Yulgok chônso, Habyu Vol. 4, Kongnoch’aek; Yi I 1989a: 536). From the point of view of a fundamentalist Neo-Confucian scholar, the behaviour of Kongmin-wang was not sincere. In fact, he had, out of concern for his country, even killed an envoy of Yuan and occupied the Liaodong peninsula, as he feared this area to fall into chaos during the transition from Yuan to Ming.

Thus, when Chu-Hsi’s Neo-Confucianism was introduced to Koryô, his Sino-centrism and the dogmatic distinction of *hua* and *i* along ethnic lines was largely neglected. To the contrary, Koryô was proud that the history of the Korean peninsula reached as far back as that of China, and that it already had become civilized in the times of the Chou Dynasty by Kija (Kitsu) (Han 1982).¹⁷ This pride was clearly expressed by king Kongmin-wang, when he addressed the inhabitants Liaodong after his invasion of 1371: “Our country was founded at the same time as Yao. Wudi of Chou sent Kija as our lord. Over generations we have defended our territory toward the west up to Liaodong. After Yuan unified China, it sent its princesses to Koryô. ... The inhabitants and leaders of this area ought to submit themselves voluntarily and accept their titles.” If they did not, that would be punished militarily (Annal Koryô, Yôljôn 27, Chiyongsu).

16 Chosôn, sometimes called the Yi Dynasty, after the name of its ruling family, was founded by a Koryô general named Yi Sông-gye in 1392. Chosôn established Neo-Confucianism as its state ideology. Its society was characterized by strict social divisions according to status (*yangban*) and occupation, and by the close observance of Confucian rituals.

17 Claims to ancientité is a common feature in Asia and elsewhere; see: Amelung/Koch/Kurz/Saaler/Lee 2003.

Kongmin-wang did not hesitate either to perform rituals for heaven (Annal Koryô, Sega 42, Kongmin-wang 21, Juni Ūlju), which were a prerogative of the ‘son of heaven’, i.e. the emperor in Peking. This shows that he aspired to be equal to China, even though he had accepted a *sadae* relationship and had formally subjected himself.

Yet, with the end of Koryô and with the adoption of Chu-Hsi’s Neo-Confucianism as state ideology by Chosôn (1392–1910), the dogmatic and rigid aspects of his philosophy came to gain ever more prominence. In the end, security was not any more a matter of a pragmatic evaluation of power relations, but had become a question of moral principle.

13.3.2 Neo-Confucianism as a Ruling Ideology

An important reason why Neo-Confucianism became more dogmatic during the Chosôn Dynasty is due to its foundation. While earlier dynasties were established as a result of conquest, Yi Sông-gye (1335–1408), the founder of Chosôn, inherited the throne. Formally, he inherited it from king Ch’ang-wang, but, in fact, he usurped it. Therefore, from the beginning Chosôn had a problem of legitimacy (Jin 2002: 444). The founders tried to solve this problem by a programme of reforms and by gaining the recognition of the Ming. To achieve the latter, they subjugated themselves to the Sino-centric world system.

Chông To-jôn, an important follower of Yi Sông-gye, went as far as to negate the historical importance of the previous Korean dynasties and traced the origins of Chosôn back to Kija, when Chou supposedly brought Confucian civilization to Korea. He spoke of Kija-Chosôn because, as can be read in his book *Chosôn Kyônggukjôn*, Sang, Kukho, the establishment of Chosôn a resurrection of Kija, the realization of the ‘Eastern Chou’ of which Confucius had dreamed (Chông To-jôn 1990: 414). Toward the middle of the Chosôn Dynasty this view had become so prevalent that Yulgok Yi I’s Confucianism made it the sole criterion of civilization. In Tongho mundap (Yulgokjônso, Vol. 15, Chabjô) he maintains that solely on the Korean peninsula only Chosôn had made Confucianism into its ruling ideology (Yi I 1989: 316–317).

Sin Ch’ae-ho, a historian who had fought against Japan during the colonial period (1910–1945) criticizes this sort of understanding history as a slavish glorification of *sadae*. In contrast, Kim Yông Su, a present-day historian, writes that Sin overlooks the fact that all dynasties since the period of the Three Kingdoms aspired to perfectly absorb Chinese civilization. One

ought to consider Chông To-jôn's views against this background. Hence, with the foundation of Chosôn a long-cherished wish of the people on the Korean peninsula had become true (Kim Y. 2006: 766).

Modern scholarship is divided on the issue whether, with the arrival of Chosôn, the old system of Koryô was maintained or was thoroughly changed by Neo-Confucianism (Kim I. 1999a; Sin 2000; Sim 2004). Martina Deuchler takes the latter view:

With the advent of Neo-Confucianism in Korea, an ideology emerged that was addressing itself in a comprehensive and compelling way to social problems. It stimulated an unprecedented clear percept of social political renovation and anchored the guarantee of their workability in the exemplary world of the sage-kings of Chinese antiquity. Moreover, the reformatory thrust of Neo-Confucianism turned its practitioners into activists and demanded their full commitment to its programme of social change. The Neo-Confucians of early Chosôn became infected with this call to action and strove to determine and implement a reform programme that would confucianize Korean society. After the failure of Wang An-shihís (1021–1086) reforms in eleventh-century China, their programme was to become the most ambitious and creative reform experiment in the East Asian world (Deuchler 1992: 27).

In contrast, Jin Duk-kyu, a Korean political scientist, holds that Yi Sông-gye and his followers basically adopted Neo-Confucianism in order to give legitimacy to their usurpation of power. Yet, this ought not to be understood as a serious effort to transform medieval society. There were some partial, even dramatic changes, yet they ought to be seen primarily as secondary reactions to ongoing social change. Thus, Chosôn is little more than the continuation of Koryô, except that it reorganized the chaotic system of government at the end of Koryô (Jin 2002: 397–445). The medieval power structure was not changed.

Whatever the case, Chosôn entered into a *sadae* relationship with Ming and within this framework established relations to neighbouring countries. In other words, Ming was at the apex of this hierarchically structured system, while the other countries were on par at the second level. However, at the beginning of Chosôn, *sadae* did not involve unconditional submission yet, but was, on the Korean side, still based on pragmatic considerations of relative power and influence. Thus, Chông To-jôn could argue that a small state does not have to follow *li*, when the large state does not follow it. This was his justification of his conquest of the Liaodong peninsula (Han 2000: 305).

During the reign of Sejong (1397–1450), the fourth king of Chosôn, the understanding of *sadae* became

more dogmatic. From a means to adapt to changing security conditions, *sadae* became a matter of “obedience and submission to hierarchical relations between king and subject”. At the same time the reception of Chu Hsi's neglected ethnic view of *hua* and *i* was set in motion and the rituals of *sadae* were carried out with great care. Similarly, the rituals directed toward heaven, which had been performed in the Koryô Dynasty, were abolished, because in the dogmatic worldview of *hua* and *i*, they clearly were a prerogative of the Chinese emperor. There were some protests against this course of events, arguing that in no point in history, state formation in Korea was done by the Chinese emperor and, to the contrary, that the Korean states had always enjoyed independence and had communicated with heaven directly (Kim T. 2000: 31). As one can see, in Chosôn too, there were conflicts about the right use of *sadae*. Interestingly, although the term ‘*sadae*’ is not in use anymore, nowadays, as we shall see, the same sort of debate can still be observed in Korea with respect to security policy (Kim Ch. 2003).

The dispute about the ritual for heaven was decided by King Sejong himself who said: “According to *li* it is unequivocal that the king is not allowed to perform the ritual for heaven. Even if he had a large domain, how could he observe *li*?” (Annals of Sejong, 1st year June, Kyôngjin). By this decision Chosôn had accepted to be a kingdom within the Sino-centric world system. A deeper reason for Sejong's decision could have been that he wanted to give an example of unconditional submission to his subjects and thus strengthen the formation of Chosôn as a Confucian state (Han 2000: 306). In King Sejong's understanding *li* was a principle to be applied to international relations as well as to the relations between the lord and his subjects.

Three times a year Sejong sent officials to Ming for court visits and for paying tribute. Besides, he repeatedly sent envoys and was most eager to learn about the more advanced Ming culture and to import its refined products. Ming in return considered Chosôn an obedient and exemplary prototype among the territories under its sway (Han 2000: 306). The relations between Ming and Chosôn were harmonious and peaceful until the end of the 16th century. One could say, Chosôn enjoyed a long period of external (and, as we shall see, internal) peace, because it strictly observed *li* within the *sadae* system.

Because Ming did not pose any serious military danger, Chosôn could develop a political system that was dominated by the literati. Furthermore, the mili-

tary was relegated to a subordinated position. The rulers of Chosŏ had learned a lesson from late Koryŏ, which the generals had wrecked. Then the nobles had their own armies and the state practically had disappeared. Therefore, the foremost aim of the early kings of Chosŏn was to destroy the private armies, to prevent an excessive centralization of military command, and to organize the state in such a manner that the military had no influence upon government (Lee 2003: 43).

Because Ming did not pose any serious military danger, Chosŏn could develop a political system that was dominated by the literati. Furthermore, the military was relegated into a subordinated position. In the control of the military Chosŏn was very successful – to the point that the military was practically unable to defend the country when it was under serious military attack. That happened when Toyotomi Hideyoshi attacked Korea in 1591.

Several decades earlier, Yulgok Yi I had warned that Chosŏn should train 100,000 soldiers to be prepared for an external attack, chiefly from Japan (Yi 1994). Yet, the Neo-Confucian literati of Chosŏn, which had enjoyed peace for almost two hundred years, did not pay much attention. In their obsession to build the perfect Confucian state, they did not show any interest in the preparation of an army. In their eyes Chosŏn was a great place of Neo-Confucian learning, in which *li* was at the centre of the hierarchical order among humans and states.

Chosŏn had found, in the sense of Foucault, a unitary and effective mechanism to reproduce its Neo-Confucian ruling ideology. Within the political unity called Chosŏn, all the literati were brought up with the same texts, shared the same interpretation of these texts, and acted accordingly. They followed the same laws and rules. Thus the reigning ideology and public order reproduced themselves almost automatically and formed the consciousness and everyday life not only of the elites but through time, also of the commoners. According to Jin Duk-kyu, the spiritual dependency on China in military, cultural, economic, and social matters became so widespread and so deeply engrained that it became an all-comprehensive and exceedingly rigid form of *sadae* (Jin 2002: 612).

The central question is whether *sadae* that relies entirely on *li* is a sufficient condition to guaranty peace, i.e. without an own defence capability. Historically, Ch'un-ch'iu Chan-kuo had shown that this was not the case. A small state had to practise *li* within a *shih-ta* relationship, yet it also needed sufficient military prowess to at least defend itself. Otherwise, it

was in danger of being conquered or swallowed up by more powerful states. When Mencius had emphasized peaceful relations based on *shih-ta*, *tzu-hsiao* and *li*, he was concerned about the sufferings brought upon his contemporaries by war and disorder, and their hopes for peace. But the literati of Chosŏn were naïve, even after two hundred years of external and internal peace, in their belief that only the proper observance of *li* would save them forever from disaster. For this mistake the country was punished heavily in 1591.

Surprisingly, after the Japanese invasion, the *sadae* relationship between Ming and Chosŏn became even more moralistic and dogmatic. Chosŏn held course unwaveringly when the Ming was replaced by the Qing Dynasty. Under the menace of the new Manchu rulers neo-Confucian scholars like Song Si-yŏl (1607-1689) turned even more to Chu Hsi's writings (Cho 2004). For them Chu Hsi had developed his views on *hua* and *i* at a time when Sung was in serious decline, and he had done this in order to motivate the Chinese people to fight against the invaders. Furthermore, the Neo-Confucian literati maintained that Chosŏn had to practise *li* faithfully, because the Ming had helped Chosŏn against the Japanese invaders.

It is true that Ming had sent troops to Korea, yet this was done because Toyotomi Hideyoshi had made public his ambitions to conquer China. A defeat of Chosŏn therefore would have endangered China. All the same, the Chinese generals repeatedly said that they had come out of compassion for the Korean people – and the literati apparently took the assertions at face value.

When the Japanese invasion had begun, King Sŏnjo (1552-1608) and the reigning elite fled to the north of the country, while the mostly rural population organized resistance and was partially remarkably successful. Naturally, the reputation of the king and his entourage suffered. After the war, the king gave merit to the Chinese troops. This he did to justify his and the court's behaviour. However, he was not ready to recognize the efforts of the people (Han 2000: 311). Furthermore, he ignored that the people not only suffered from the Japanese, but even more so from the Chinese army. Instead King Sŏnjo presented Ming as the saviour of the country and committed himself and the country to be grateful forever to China. As a result there was a huge discrepancy in the perceptions of the elite and the commoners.

How deeply this gratitude was rooted, became apparent at the coup of King Injo in 1623. It happened at a time when the Ming and Qing still battled for pre-

eminence. Kwanghaegun (1575–1641), the successor of Sônjo, observed the conflict in China from the distance and tried to be neutral and pragmatic. Precisely for that the conservative Neo-Confucian scholars declared him morally bankrupt and dethroned him eventually. Chosôn returned to its former position of absolute *sadae* loyalty to the Ming, while it despised the Manchu usurpers. Therefore the Qing attacked it in 1627. Chosôn asked the Ming for help again, but the Ming was not even able to protect itself, let alone to send troops. All this was the result of Neo-Confucian indoctrination of the Chosôn elite, who wanted to be ‘sincere’ and not betray the Ming, which for them remained at the centre of the Sino-centric world system of *hua* and *i*, while the Manchu clearly were in the camp of the barbarians.

13.3.3 ‘Small-Sino Centrism (sojunghwa)’ and Security

In 1633 Chosôn had to surrender to the Qing Dynasty. The king personally had to promise that he would enter a *sadae* relationship as a subject of the Qing. From now on Chosôn was obliged to obtain the recognition of its kings by Qing and to base *sadae* on *li*, as had been the case with the Ming. This was a terrible humiliation for the Chosôn elite, which had despised the Manchu as barbarians. In spite of their new *sadae* relationship, the ruling elite secretly continued to count the years as the Ming years (Yu 2004: 89). Because it continued to feel obliged to be sincere to the Ming, even certain rituals proper for the Ming ruler were performed in Chosôn. Thus the *sadae* relationship with China, which initially was based on pragmatic considerations, had become, under the auspices of the Neo-Confucians of Chosôn, a matter of sincerity and eternal loyalty toward the Ming, even after the latter’s disappearance, as well as, through the same *li*, a matter of loyalty of the commoner toward the legitimate ruler (Kim T. 2000: 67).

Song Si-yôl was one of those Neo-Confucian scholars, and for that one of the most influential ones. He was so stubborn in his regard for Ming and his repudiation of Qing that he asked, just before his death, one of his pupils to build a grave for the last Ming emperor, so that the required rituals could be carried out properly. This implied, of course, that Chosôn had become the inheritor of the Sino-centric world order from the Ming. Indeed, Song Si-yôl considered the Chosôn to be a small China and he believed that this state could be salvaged on the basis of Chu Hsi’s philosophy.

Song is quite explicit on these issues: “Since Confucius wrote *Ch’unch’iu* and thus had made clear the importance of the great unity of the world, the policy of reverence of *hua* and of fighting *i* (*chonhwayangi*) has become an immutable truth” (Songjadaejôn Vol. 5, Bongsa 27). “Ming, which was founded at the same time as Chosôn, is a country of mercy (*ûn*) and of *jaso* (*tzu-hsiao*) and cultivates the spirit of loyalty (*chungi*) and the sincere relationship between master and subject, whereas Qing is a thief, who stole this country with its *li*” (Bongsa 28, Song Si-yôl 1993: 199–200). For Song international relations were not a matter of circumstances and power, but an immutable normative order on the basis of his Sino-centric world view.

Of course, Song Si-yôl must have realized that Chosôn had to enter a *sadae* relationship with the Qing dynasty because of the latter’s military superiority. Yet, he believed that Chosôn had gotten into this situation only because of the decayed morality of its elites, which had reduced politics to power politics. It would therefore be of paramount importance to restore the moral order of the country and to establish ‘sincere’ relations with its neighbours on the basis of *li*. For *sadae* toward the Ming was in accordance with the heavenly order, while *sadae* toward Qing was motivated merely by human needs and avarice. “Reverence toward Ming and rejection of Qing” (*sungmyông panch’ông*) followed the heavenly order and was the result of moral education (Bongsa 9, Song Si-yôl 1993: 191). Thus, for Song Si-yôl all problems of the country – matters of political rule, international relations and of internal and external security – were directly related to the moral education of the individual and of society.

Moral education involved for Song Si-yôl the assiduous study of the teaching of the great Confucian scholars like Chu Hsi. This was an obligation not only of the commoners, but also of the rulers. If one came to understand through meticulous study the laws of heaven and learned to control human avarice, the world were to be well ordered and peaceful. In Song’s idealistic worldview, the best way to protect Chosôn from attacks by the Qing Dynasty and to preserve its autonomy was to return to the old Sino-centric world order. For him, the only valid way out of this crisis was the moral teachings of Chu Hsi.

Song Si-yôl’s worldview of Chosôn as a “small centre of the Sino-centric world” was elevated after his death to the rank of a state ideology (Yu 2004: 104; Roh 2003). More than 200 years later, when Chosôn came under pressure by Western and neighbouring countries, the same arguments were put forward.

Confucian literati, called *wijôngch'òksap'a*, argued that this crisis too could be overcome by strengthening the Neo-Confucian moral education along the lines of Chu Hsi and Song Si-yôl (Chông 2004). Neo-Confucianism again played the role of an ideology to protect the country. The Mandongmyo, which the disciples of Song Si-yôl had built to honour the Ming emperors, became a symbolic place for the protection of the Chosôn.

The protection of the country against its enemies was not primarily a military matter. All the way through Chosôn the literati were honoured and the military despised. The "protection of the country" (*hoguk*) was for Song Si-yôl and the Neo-Confucian elite something that could only be achieved within the framework of Neo-Confucian sincerity and virtue. Such a view was of little help against European and Japanese imperialism in the 19th and 20th centuries. Yet, for Neo-Confucians in Chosôn the maintenance of sincerity and virtue was more important than their own lives, and for these noble causes even the security of the country could be sacrificed.

13.4 Security through *sadae* and Security through one's own Strength

Summarizing, one could say that Chosôn (1392-1910) was a literati society, which could safeguard its existence and its external security through Neo-Confucianism as its ruling ideology and through the observance of a *sadae* relationship with China. The *sadae* relationship had existed long before the Ming and Qing Dynasties, yet, under the impact of Chu Hsi's philosophy, it took increasingly rigid, moralistic traits. The dependency on China became even stronger, not to say bizarre, after Ming had sent her troops to help Chosôn against the Japanese invaders in 1591. In any case, the *sadae* system gave legitimacy to Chosôn, especially in its founding years, while it was afterwards the central force that held Chosôn together (Jin 2002: 612).

During the last century of Chosôn the ruling elite had become unable to overcome the resistance of the general populace. As the Tonghak peasant movement had shown, the ruling elite asked the Qing Dynasty and even Japan for help to fight against the peasants. The country suffered a deep crisis because of a conflict between the farming population, who had tried to protect themselves with their own power, and the ruling elites, who had tried with the help of strong

foreign states to defend their privileges. Interestingly this kind of conflict is to be observed still today, especially in South Korea - after 35 years of colonization (1910-1945), three years of the Korean War (1950-1953), 27 years of dictatorships, and since democratization in 1987.

Certainly, the tributary system has disappeared. The relationship between China and South Korea is based - historically without precedent - on more or less equal relationship, at least at the formal level. There are no more rituals to be performed in order to reassure each other of the *sadae* relationship. Yet, it could well be that the *sadae* consciousness is so deeply engrained in the Korean psyche that one shows an almost instinctive reaction against situations of non-dependence. Not to be in a steady and safe external relationship would give rise to fear and insecurity.

This is, at least, an impression one can get from an emotionally very charged debate around the agreement between the Pentagon and the South Korean government to hand over wartime military control to South Korea by 2009 or 2012. The country is divided on this issue. The Grand National Party (GNP) and among others, the South Korean association of former military commanders, are violently opposed to this plan, because they fear that the security of the country could only be guaranteed by a strong external power like the US. The other camp says that it is the prerogative of a sovereign state to be in command of its own military. Hence, a debate has been raging over 'pro-American *sadae*-ism', i.e. dependence versus self-reliance.

The self-reliance camp argues that it is quite natural to assume this control, in particular, since the country's democratization after 1987. This camp would also think of South Korea as an independent player and partner of the countries in East Asia and favour economic and even political integration with the neighbouring countries. The conservative camp fears that such an independent course will endanger the good relations with the US and that Korea should not risk irritating or angering the sole superpower upon which the country depends for its prosperity and security. Yi Han-gu, a columnist, is quite explicit on this:

Since independence and up to the present time, the USA has been our most reliable ally and as long as we want liberal democracy it will remain our strongest partner. The prosperity we enjoy today has become possible because the cooperation with the world superpower has worked so well. If the alliance with the USA breaks down and, as a consequence, a power vacuum appears,

how shall we be able to enjoy the fruits of economic growth in safety? (Yi 2006)

On the other hand, critical journalists, politicians, and civil movements reproach the conservative camp for its obsessive 'pro-American *sadae*-ism'. They say, whenever the US is involved, this camp loses all sense of standards of 'normalcy and common sense'. Because of its unbridled *sadae*-ism people in this camp would believe that nothing was possible and everything was in danger without America (Kim Hy. 2006b).

In view of this debate, one cannot avoid the impression that the Chinese-Korean and the US-Korean relationship bear a certain similarity. The behaviour of the conservative camp is not so different from the one of the Neo-Confucian literati, in particular after Ming had helped Chosôn during the Japanese invasion in 1591. The Korean War and the US help would be the matching ideogram. As in the case of the assistance by the Ming Dynasty, it is of little avail to the people in this camp that the helpers possibly had other motives than altruism and humanism when they extended their help.

For many years now the presence of US troops is gratefully seen as essential for the security of the country. A certain anti-Americanism only emerged in the 1980's when the US supported, against the expectations of the citizens who waged the battle for democracy, the dictatorship of Chun Doo Hwan (r.1980-1987). Until then it was taken for granted that the alliance with the US was signed in blood and that it had saved the country. This way of thinking in reality has not changed much, as is shown by the recent debate about the military war command. Hence, Jin Duk-kyu maintains that the *sadae* consciousness, through centuries of Neo-Confucian training, has become so deeply rooted in Korean society and in the minds of the people that there exists a sort of psychological need to be under the protective umbrella of a stronger country, be that China or America (Jin 2002: 612).

13.5 Conclusion

Throughout Korean history, the external security on the Korean peninsula depended foremost on the relationship with a militarily much superior China. Therefore, the Korean states entered *sadae* relations of dependency and subordination with the dynasties in China to guarantee their safety. Historically, *shih-ta* emerged as a system during the Chou Dynasty in China as a means to regulate the relations between

larger and smaller feudal territories. During the chaotic times of Ch'un-ch'iu Chan-kuo, *shih-ta* became a matter of survival and was used pragmatically as a diplomatic instrument.

Confucian philosophy, as can be seen in the text *Ch'un-ch'iu of Tso-chuan* and in Mencius' writings, elaborated *shih-ta* (serving the great by the small), recurring on *li* (propriety, sincerity) of Chou and combining it with *tzu-hsiao* (cherishing the small by the great). Thus, the real differences in power of large and small territories were recognized, yet the maintenance of *shih-ta* relationships became a matter of moral and virtue. The moral principles of cultivating *shih-ta* and *tzu-hsiao* within *li* were *jen* (benevolence), *hsin* (trust) and *chih* (knowledge). These moral principles were instilled in and cultivated by each individual and were the basis of correct behaviour within the family, within the political system, and between states. In this sense, from the point of view of *hsiu-shen chichia chih-kuo p'ing-t'ein-hsia*, the security of a territory or country was philosophically sublimated into a matter of moral and virtuous behaviour. Chu Hsi, a Confucian scholar in the 12th century and the founder of the so-called Neo-Confucian School, extended this concept to *hua* (the Han people) and *i* (barbarians) and turned it into a hierarchical relationship within an immutable order.

From the times of the Three Kingdoms until Koryô Dynasty, even until early Chosôn (1392-1910), the Korean kingdoms had used the *sadae* relationship pragmatically. Yet, with Chosôn Neo-Confucianism took hold in Korea and became the ruling ideology. Through time, a dogmatic and moralistic understanding of *sadae* replaced the pragmatic use of the concept. For the ruling elite of Chosôn, the Neo-Confucian literati, this system became an immutable world system. The belief in this immutable system became even stronger after Ming had helped Chosôn to fend off the Japanese invasion of 1591. Ming had become the saviour of the country. Thus, the *sadae* relationship with the Ming Dynasty became absolute and a moral imperative without any strings. At one time, when Qing succeeded Ming, Chosôn remained steadfast in its absolute loyalty toward Ming - until Qing actually sent its armies. The dogmatic and rigid Neo-Confucian understanding of *sadae* had put the country in serious danger. Because of the vast superiority of the Qing Dynasty, Chosôn had to formally accept a *sadae* relationship, whereas it secretly performed the rituals befitting Ming, even after the latter's disappearance. The Chosôn literati even thought of themselves as the legitimate heirs of the Ming Dynasty and

considered Chosôn to be the small civilizing centre of the Sino-centric world.

The Neo-Confucian *sadae* philosophy was very effective in giving legitimacy to Chosôn and it pervaded the whole of its society over 5 centuries. A generalized consciousness of dependency became deeply engrained in all spheres of state and society. It can still be discovered in modern South Korean society. The US has taken the place of China. At least until the 1980's America was perceived as the saviour, the country that had shed its blood in and for Korea, and as the guarantor of South Korean security. After a certain recess due to America's support for the dictator Chun Doo Hwan during the battle for democracy, at present, possibly induced by the imminent transfer of the military war command to South Korea, apparently the number of people who desperately want to stay under the protective American umbrella is increasing. Correspondingly, President Roh Moo Hyun's (r. 2003-2007) modest policy of self-reliance has been violently attacked by the media and the opposition parties. They argue that a policy of self-reliance endangers the achievements of the past 50 years. It is not uncommon to read and hear about the need to be grateful, sincere, obedient, etc. toward the saviour and protector of the nation. Surely, there is reason to suspect that Chu Hsi's Neo-Confucianism is still alive and well.

14 Security in Japanese History, Philosophy and Ethics: Impact on Contemporary Security Policy

Mitsuo and Tamayo Okamoto

14.1 Introduction

The Japanese term for security is '*anzen-hosho*', a highly politically-charged term employed usually only in national or international policy and diplomacy. '*Anzen*' by itself means safety or freedom from damage, while '*hosho*' means guarantee, and accordingly *anzen-hosho* is not used about people's security, thus the expression '*ningen-no*' (human) '*anzen-hosho*' (security) sounds a little strange. Real security should belong to the people rather than to the state, but for human security a certain discrepancy exists between the interest of the state and that of the people. In Japanese politics, major political decisions are made by the triad of political party, bureaucracy, and business circles where people are often out of sight. Thus, human security is a reminder of the importance of 'people'-centred national and world politics.

The end of the Cold War in 1989 did not bring lasting peace to the world. It has become increasingly unsafe, especially after 11 September when the U.S. Government decided to retaliate against the terrorist attacks by bombing Afghanistan and attacking Iraq. Japan's self defence forces are still stationed in Iraq in the summer of 2006 to the dismay of many Japanese.

For ordinary Japanese the last war was the 15-year Asia Pacific War (1931-45) whose end brought about a major change in Japan's security concept. However, the military government did not protect the people, and with the U.S. use of two atomic bombs against the residents of Hiroshima and Nagasaki the world has been placed under the threat of total annihilation. 'Article 9' of the new Japanese constitution that renounced the right of the belligerency of the state has prevented Japan from engagements in war-making efforts.

The authors believe that Japan as the first nation irradiated by nuclear weapons, should work for the abolition of nuclear weapons and other WMD and aim for the realization of a peaceful world order with

nonviolent means such as through communication, dialogue, diplomacy, exchange of people, and cultural heritages. But the Japanese government seems to be headed in the opposite direction toward the coalition of war-makers by changing the 'Peace Constitution' and transforming the Self Defence Forces to a real army for war-making by enacting emergency defence laws.

This chapter analyses the decision-making process of the Japanese political leaders by tracing the modern history of Japan, its nationalism and the major turning point in 1945 (14.2), reviews the post-war nuclear conscious diplomacy (14.3), and discusses the nature of nuclear weapons (14.4), the efforts to revise the so-called peace constitution (14.5) and Japan's domestic conflicts on security (14.6) and it ends with brief conclusions (14.7).

14.2 Japan's Tendency to Nationalism

Japan owes much to the cultures of the Asian continent in forming its identity. Nevertheless, Japan often invaded and colonized neighbouring countries, with the exception of the times of self-imposed seclusion. In the new millennium, conflicts with neighbouring nations on the possession of small islands remain unresolved. Japan is still unwilling to make genuine apologies and compensations with regard to its aggression in Korea, China, the Philippines, and in other South-east Asian countries during the Asia-Pacific War. Since ancient periods and especially since the process of westernization, these problems arise from a nationalistic tendency that has led the Japanese and their governments to look at themselves and to deal with other nations. The Japanese believe that they have developed a unique culture, especially during the closed periode of their country.

However, uniqueness and nationalism are two different things. Being unique, Japan can contribute to

world peace by showing how nature and culture have merged in the creation of cultural products that can be enjoyed by anybody on earth, but by being nationalistic Japan isolates itself from the rest of the world that needs and wants cooperation from Japan in satisfying basic needs for human life. This tendency to nationalism is problematic from the perspective of global ethics where all nations should be united to gain and sustain global security against nuclear or ecological self-destruction.

Japan's nationalistic tendency was embraced in the 6th century or earlier when powerful clans fought for hegemony and had some contact with the continent. The race for hegemony in Japan ended with the victory of Yamato Clan that ruled for a relatively long period. The Yamato Clan established a legal and political system based on the Chinese models, which was only possible by sending official envoys to highly civilized China. But one official message from the Japanese chief to the Chinese leader betrayed his 'superiority complex' as the chief of the land where the sun rises.

The relatively long reign of the emperor was taken over by the rise of the warrior class that was in control of the country until the end of the 19th century. The business of the warrior, *the bushi/samurai*, was to resolve conflicts by the use of violence. Killing and being killed were everyday matters during the warring period. But when the first Tokugawa Shogun gained power, Japan was calmed down for nearly 260 years.

Japan has been to some extent politically peaceful during three periods in its history of 2000 years, first for about 300 years when the imperial court culture flourished in the *Heian Period* (794-1185), secondly, for about 200 years in the 17th and 18th centuries when the people in the towns developed their culture in literature, fine arts, and performing arts, while the country was closed to the rest of the world. Finally, the past six decades of peace after the end of the Asia-Pacific War in 1945 are notable as the state has refrained from displaying aggressive behaviour towards foreign countries except for occasional irritation that the prime minister has caused to the neighbouring countries by frequently visiting the Shinto shrine where the war criminals are enshrined who were executed by the Far East Military Tribunal of the Allied Forces immediately after WW II.

Although both Confucianism and Buddhism that have been introduced to Japan via the Korean Peninsula respected peace of mind and peaceful social order, they were powerless in preventing severe struggles in different periods of Japanese history. But

overall success of a long-standing administration is based on the establishment of a legal and bureaucratic system. At the same time the administrators were concerned about the legitimation of their reign by creating texts, often with recourse to Chinese texts.

In the 12th century the newly-risen warrior class took over the substantial power throughout the land. But most of the warrior class leaders sought the imperial court title of the grand minister while unifying the entire land, even though they lived far from the capital of Kyoto. The *bushi/samurai* rule lasted until 1868 when the Meiji Restoration took place in which no bloodshed was caused in the transfer of the power of the *shogun* back to the emperors who had resided in the former Edo Castle of the *shoguns*.

The Tokugawa Shogunate government employed Neo-Confucian philosophy as their guiding principle and soon closed doors to the external world except for trade with Dutch merchants. The Catholic missionaries from Portugal and Spain were expelled as they were suspected of taking over Japan religiously, and later politically. As the Dutch merchants lacked such religious and political ambition they were allowed to do business, albeit through a trade house in Nagasaki. The policy of banning Catholic Christianity and national seclusion seems to have helped Japan to evade the European push for colonization of several regions of the world during the 16th and 17th centuries.

The bureaucratic system of the Edo government was vertically structured but not merely despotic. Human security is not simply immunity from physical violence with basic human needs being satisfied, but also the desire of people to have freedom to develop artistic, creative capacities without fear of external threat or interference. The national seclusion policy was probably a thought-out option of feudal leaders in the age of colonialism or imperialism that reflected what the external world looked like in the eyes of the national leaders and the scholars who had the privilege of obtaining information about the outside world at Nagasaki from Dutch traders and physicians. When the feudal system finally broke up Japanese intellectuals recognized the need to learn from the West.

Toward the end of the feudal rule, there was much turmoil in the government's response to the revolts in various domains, especially by young warriors who wanted to overthrow the Shogunate government and restore the emperor's reign. The government was also threatened by visits of the fleets of the US, the UK, Russia and France, all of which demanded the ports to be opened to them.

The high regard for learning is an important part of the project to strengthen the state that was threatened by militarily stronger Western states. To strengthen its state power the Meiji government considered it essential to establish a military system based on European models. “Enrich the nation and strengthen the military” became the slogan of the Meiji government. The basic stance was to maintain Japanese tradition while employing Western technology. Hence the slogan: “Japanese spirit with Western knowledge.”

For modern Japan to obtain an equal status with Western nations the Meiji government embarked on a rapid economic development and emulated the colonial policy of the West. Japan’s adventurous yet successful wars first with Xing-China (1894–95) and then with Imperial Russia (1904–1905) were waged to reduce the influences of both powers for the grand design of colonizing the Korean Peninsula.

Japan’s military victory over Russia (1905) was a turning point in modern history. It dispelled the myth of the invincibility of the white race and brightened the hopes for India, Turkey and many other ethnicities that were under the colonial rule of Western powers. However, the price was a heavy militarization with a with a nationalistic fervour, and the military was eventually to overrule the civilian government.

The Meiji Constitution that emerged 21 years after the Charter Oath in 1889 was based not on the Oath but on the Prussian monarchical model bestowing supreme power to the emperor who had legislative superiority over the two-house Diet (the House of Peers and the House of Representatives), and the army and navy were directly responsible only to the emperor who was described as ‘divine and inviolable’. People were referred to as ‘the subjects to the emperor’ and obligated to serve in the military.

Fundamental rights of the people such as property ownership, freedom of religion, assembly, and petition were acknowledged in the Imperial Constitution as long as they did not disturb security or the social order. In this constitution the mythological origins of the emperor system were given supreme legitimacy. In 1870 Shinto was made the state religion. One of the first policies of the Meiji government was to separate Shinto from Buddhism, and for a time many Buddhist temples and texts were destroyed.

Shinto, the historically most important but problematic Japanese indigenous religion, is a mixture of animistic folk beliefs that everything has a soul, and a mythological narrative on the origin of the land, the emperor, and the people. The latter part was crafted in the early 8th century by the compilation of two

partly mythological, partly historical accounts of early Japan called *Kojiki* or *Records of Ancient Matters* and *Nihonshoki* or *Chronicles of Japan*. They were later utilized by the government of the Meiji period as the source for the state religion. In these texts the emperor was regarded as a deity, representing the legitimate lineage of the offspring of the female deity *Amaterasu* (heaven-shining) who was depicted in the mythologies to be in charge of the management of deities in heaven. She was born when *Izanagi* (a male deity) purified himself and washed his left eye, after he returned from Hades. He went there to get back his wife *Izanami* who had died accidentally from the injury that her son the god of thunder caused. *Izanami* said she would return to heaven if *Izanagi* would never look at her while she consulted with the king of Hades about her return to her husband. But like *Orpheus* in Greek mythology *Izanagi* forgot his promise and had to glimpse at his wife smeared with maggots. *Izanagi* escaped from his pursuers and came to a stream where the purification rite was performed.

As this story illuminates, for the Japanese people the act of purification, the *misogi*, most commonly enacted by using fresh clean water, is supposed to cleanse the dirt and sins of the external world. The purification rites are taken seriously even among present-day politicians, both at the state and local level. Politics here, unlike in the Greek origin, is closer to religious rites than to the equal people’s open debate and discussion in a civil society. In fact, an older Japanese term for politics was *matsurigoto*, which meant both religious festival and politics. The emperor’s official denial of his godhood came only after the end of the Asia-Pacific War in 1945.

In the early Meiji period, the emperor was given absolute powers that were displayed externally in the wars against China and Russia in establishing hegemony in the region, particularly in the Korean Peninsula. After winning both wars, the Japanese government strengthened its tendency toward militarism and the suppression of the rights of the people. Externally, Japan colonized Korea in 1910 and intervened in the matters of Xing China. Internally, progressive activists such as anarchists, socialists, and communists, were arrested, tortured, and some even executed for treason.

In the second decade of the 20th century, there was a movement called “*Taisho* Democracy” in which liberal thinkers discussed the importance of democracy. They did not call for equal participatory democracy but for a people-centred approach in politics. They demanded universal suffrage that was realized

after Japan lost the Asia-Pacific War, although male suffrage was granted already in 1925. While the emperor was no powerful figure, the government was ready to suppress various rights of the people as well as the liberal labour and farmers' movements by enforcing the *chian-ijibo*, or the Peace Preservation Act immediately after the adoption of male suffrage. Under this Act several liberals and left-wing activists were arrested and tortured. One well-known proletarian novelist, Kobayashi Takiji (1903-1933), was tortured to death by the thought-police.

All Japanese were involved in the 'Fifteen-Year Asia-Pacific War' either as soldiers or as Red Cross nurses on the front, or as family members of soldiers back home. Even middle school children were mobilized to tear down empty houses to block the spread of fire in preparation for the impending American air raids.

14.3 Nuclear-conscious Diplomacy

In order to guarantee its security and prosperity, it is essential for Japan to establish and maintain regional peace, stability, and prosperity. The Japanese government has derived three basic principles to this end. First, Japan will continue to ensure deterrence against destabilizing elements in the region in close cooperation with the United States. Second, Japan will actively promote regional cooperation and take the initiative in the modernization of the entire region, no matter what the cost. Third, Japan will continue to strengthen dialogue and cooperation with major countries outside the region.

This observation represents more or less the *official* Japanese viewpoint. The half-hidden agenda of the declared viewpoints resides in the primacy of the US military presence in the region. People in Okinawa, for example, feel very much the continuation of the Cold War configuration of world politics due to the overwhelming US military presence there. The Japanese government, despite its progressive constitution with a unique pacifist philosophy of nonviolence, seeks to consolidate a strong military alliance with the United States, which intends to exert its political, economic, and military control in the region. There is no doubt that the American military-industrial complex feeds on a Northeast Asian situation of this kind.

While in Europe NATO plays a central role for the security in the region, there is no such arrangement in the Far East. In Northeast Asia the US has a separate

dyadic military alliance with Japan, Korea, and Taiwan. No nations comparable to Great Britain and France exist in this region that can negotiate with the US as historically equal partners. Nor is there an international city like Geneva where diplomats from different countries exchange opinions on political and economic implications. And yet the region is surrounded by three major nuclear powers, Russia, China, and the United States.

There exists a deep-seated suspicion between China and Japan, primarily due to Japan's aggression against China (1931-1945) and Japan's strong military alliance with the US. The lack of a sincere apology by Japanese leaders for this aggression, coupled with some impertinent yet provocative remarks made by leading Japanese politicians on Japan's military aggression during the first half of the 20th century, reinforces China's suspicion. The Japanese people, especially the conservative politicians, should cultivate greater sensitivity on how the history of Japan's military invasion in China has remained a traumatic experience for the Chinese, even some sixty years after the end of WW II.

The frequent visits to the war-related Yasukuni Shrine by Prime Minister Junichiro Koizumi since taking office in 2001 understandably stirred up considerable indignation in neighbouring countries in general but in China and Korea in particular. He does not seem to worry much about hurting international relations due to his personal perception of modern history. His behaviour is supported by like-minded Japanese who consider the Asia-Pacific War (1931-1945) as a just war to defend Japan's political and economic lifeline and survival vis-à-vis Western colonialism and aggression.

The relation between Japan and the Republic of Korea (ROK) has considerably improved since the 1980's. The so-called 'Sunshine Policy' of President Kim Dae-Jung, which has been usually evaluated only in the context of his discreet and peace-minded overtures to North Korea, was also directed to Japan, and contributed to a significant improvement of political, economic, and cultural relations between the ROK and Japan.

With regard to the proliferation of nuclear weapons in the region, the joint project of Japan and the US to develop a theatre missile defence (TMD) is far more worrisome as it might destabilize the East Asian political and military situation and give rise to a new nuclear arms race in the region. North Korea's withdrawal from the Non-Proliferation Treaty (NPT) has generated widespread concern about its further nu-

clear development, which may also lead to a possible confrontation between the Democratic People's Republic of Korea (DPRK) and the US.

The incentives to defend against short- and medium-range missiles have become strong due to the increased missile potential in the region. The joint US-Japanese regional TMD project is regarded by some experts as an alarming element that may destabilize the political situation in Northeast Asia. While Taiwan has a strategic interest to join the TMD project with limited capabilities, China and the DPRK expressed their concern that the deployment of the TMD will trigger regional arms competition and give the US a free hand to dominate the area.

Although the gap between North Korea and the US is still wide, the six-party talks on the Korean nuclear issue may offer hope for peace and security in Northeast Asia. It would be a unique opportunity for Japan with its historic experience of Hiroshima and Nagasaki to demilitarize the mind of politicians, for they and not the people start war. But unless demilitarization goes hand in hand with denuclearization, its significance will diminish. As the Russell-Einstein Manifesto (1955) rightly points out, unless war is prohibited, leaders of any nation would seek to resort to nuclear weapons in times of war. Before going further, the nature of nuclear weapons will be examined.

14.4 Nature of Nuclear Weapons

A visit to the world's first irradiated cities of Hiroshima and Nagasaki helps understand the inhuman nature of nuclear bombs (figure 14.1). One nuclear bomb can kill the same number of people as those killed in a carpet bombing with 10,000 of incendiary bombs used simultaneously. It releases three different kinds of energy, namely blast, heat rays, and radiation that can be initial and/or residual. People near the hypocentre at the time of explosion could be just evaporated without any trace of their existence being left. Those who survive the initial blast or heat rays may get severe burns that can leave the body disfigured and painful. But the worst effect that exposure to the bomb leaves on the human body is the effect of radiation that slowly encroaches as cancer, leukaemia, cancers of the thyroid, breast, lung and other organs. After over 60 years, A-bomb survivors, called *Hibakusha*, still suffer from and die of cancer. The Government's treatment of their health problems was inadequate, and initially they were not medically treated at all.

The purpose of the Atomic Bomb Casualty Commission (ABCC), established by the US military government in Hiroshima and Nagasaki in 1947, was to collect data on the effects of the bombs on human bodies. It was established by the US National Academy of Sciences (NAS), with funding from the US Atomic Energy Commission that emerged from the Manhattan District Project to develop, produce, and test nuclear weapons during the Second World War. The establishment of the ABCC implemented President Harry Truman's directive "to undertake a long-range, continuing study of the biological and medical effects of the atomic bombs on men".¹ This directive was a response to the request by US generals in preparing for nuclear warfare with the USSR.

As a joint product of the US medical and military establishments, the ABCC was not engaged in health-care activities, nor was it assigned to give medical treatment to A-bomb victims when it was direly needed. The ABCC conducted the research in the early years of operation treating the *Hibakusha* as a huge group of 'guinea pigs'. This fact remained unknown to the world due to strict censorship imposed by the Supreme Commander of Allied Forces (SCAP). This early behaviour, especially from 1947 until the end of the occupation in 1952, would never be justified by their later conciliatory policies towards the Japanese public. There was a serious violation of the irradiated people's rights to humane treatment, even during military occupation.

Some medical scientists at the ABCC station were trying to determine the genetic influences of radiation on the offspring of the *Hibakusha*. From this perspective, medical intervention was considered an obstacle in the observation of the causal processes of irradiation (Lindee 1994). One example is their genetic studies, which included the collection of data through midwives; whose reports of each birth of a child from irradiated parents was remunerated with ten *yen* (cents). The accuracy of the study of abnormal births was questioned within the ABCC with regard to the grouping of the parents. There was a debate about how to categorize the subjects by the distance from the hypocentre or by reports of symptoms (Lindee 1994: 202). They also failed to include the father in determining the effect of radiation. The study design was defective and the results were inconclusive.

1 This statement is displayed at the entrance of the Radiation Effects Research Foundation (the ABCC's successor) in Hiroshima, Japan.

Figure 14.1: TMiyukibashi, 2.2 km from the hypocenter. A picture taken 3 hours after the explosion on August 6, 1945 by Yoshito Matsushige. **Source:** Permission has been granted by the copyright holder Ittetsu Morishita Art Studio.

Medical scientists at the ABCC used control groups to make their study look like a genuine scientific endeavour. But the study did not get the conclusive results they wanted. The policy only put unpleasant pressure on the non-irradiated people used as control subjects. In this study, there was a mother of a stillborn abnormal child, who never got her baby's body back after it had been taken by the ABCC for autopsy (Sagara 1995: 45). The incident only contributed to the mother's resentment and unwillingness to cooperate.

Since the ABCC's greatest interest was in the immediate effect of the nuclear bombs, medical scientists were much less interested in the slow after-effect of direct irradiation and residual radiation. Lindee (1994: 8) describes the ABCC's downplay of long-term radiation effects on the *Hibakusha*. Keloids were explained as the result of bad burn therapy (Lindee 1994: 61). Researchers had difficulty making sense of the births of microcephalic babies who had been in utero less than four months and within one mile or so from the hypocentre. There were 15 such cases (Sagara 1995: 51). The ABCC chased after the children for examinations while explaining to the mothers that there was no causality between their irradiation and the ab-

normality, and that malnutrition was the only cause for the children's problem.

The causal relationship between radiation and cancer or other health hazard is undeniable, but the US Government ignored it and continued to create radiation victims by nuclear experiments both at home and in the South Pacific regions. The horrendous acts harmed the lives of a great number of innocent people and also the natural environment. Yet they have neither apologized nor compensated for the damages they inflicted so devastatingly. According to a report by the US National Research Council (2006) health risks exist when people are exposed to low levels of ionizing radiation, e.g. due to the medical use of radiation. Thus, people should also be more cautious about the so-called peaceful use of radiation, especially in nuclear power plants.

Japan's 'three non-nuclear principles' not to possess, produce nor permit the introduction into Japan of nuclear weapons were officially adopted by the ministerial cabinet in 1971. They have been observed so far to ward off US pressures on nuclear weapons. But the US is pushing Japan to change its constitution so that Japan's Self-Defence Forces (SDF) can become a

full-fledged military power, which may go nuclear regardless of the US policy of keeping Japan under its nuclear umbrella.

14.5 The Peace Constitution of 1947

Since 1947 all human rights are protected by the new constitution that also prohibits waging war. Wars have been destructive, and WWII brought nothing beneficial except ending militarism and imperialism Japan had practised against neighbouring countries, and it demanded cooperation from the Japanese people. The new constitution has provisions for people's basic human rights, including welfare rights, and above all for the renunciation of war. Article 9 of the Peace Constitution states:

Aspiring sincerely to an international peace based on justice and order, the Japanese people forever renounce war as a sovereign right of the nation and the threat or use of force as means of settling international disputes.

In order to accomplish the aim of the preceding paragraph, land, sea, and air forces, as well as other war potential, will never be maintained. The right of belligerency of the state will not be recognized.

This peace constitution of 1947 is under threat of revision by the present government with the support of the US Government that wants Japan to become a full-fledged military power. Keeping this constitution and sharing with other nations the memories of war and of nuclear bombs are two issues the Japanese should maintain as ethical imperatives.

Since its formation in 1955, the Liberal Democratic Party (LDP) had aspired to change the constitution, especially Article 9, and they consider the time as ripe as the influence of the opposition parties in the Parliament has significantly decreased. According to a publicized draft of the revised constitution (published on 22 November 2005), Paragraph one of Article 9 is to remain the same, whereas Paragraph two will be changed so that Self-Defence Forces can become a full-fledged army. With a change of Article 9, arms export would not be constrained any longer.

The Japanese public have a different perception of the status of Japan's Peace Constitution. According to an opinion poll conducted by *The Asahi Shimbun* (3 May 2006) in April 2006, the majority of Japanese believe that over half a century Japan has not been directly involved in war primarily due to the constitution. As the only nation that suffered from atomic bombs, Japan could continue to play an important role in communicating to the world the necessity of

abolishing nuclear weapons. Contrary to this poll in which 43 per cent of the Japanese are in favour of changing Article 9 whereas 42 per cent are opposed, a national opinion poll by citizens shows a marked difference.

Seventy-seven per cent of the public is against revising the constitution's war-renouncing Article 9, according to the results of a street survey released Wednesday by a citizens group. Of the 28,169 people polled, 21,652, or 77 per cent, opposed revision, 3,270, or 12 per cent, supported revision, and 3,247, or 11 per cent, had no opinion, the group said (*The Japan Times*, 4 May 4 2006).

But Japanese political leaders have no vision to fulfil an international role as a neutral mediator in resolving conflicts that often arise between different religions and ethnicities. They ignore the true sentiment of the people about peace. The major mass media lack an independent stance and do not report what the majority of Japanese think about peace. To assume the role of a neutral mediator in world politics, the Japanese should overhaul their own value system also in a historical context, because there is an unfortunate trend in contemporary Japan to regard security as a 'national matter' instead of 'common security' which concerns everyone. In the ongoing security debate two schools compete.

14.6 Japan's Domestic Conflicts on Security

On security issues Japan is deeply divided between two camps of thought, one is represented by the ruling Liberal Democratic Party (LDP), holding power for more than fifty years, while the other group is supported by leftist parties, social democrats and communists, and numerous grass-root activists. But there are grey areas and variations in each camp and between both groups. There are also a vast number of especially young, non-political people. Those belonging to the mainstream advocate capitalist market economy that is involved in economic globalization manoeuvres in developing countries, want to make the self-defence forces to a full-fledged army by changing the peace constitution, and tend to downplay Japan's aggression against the Asia-Pacific countries during World War II, while the latter camp opposes these perspectives. Nonetheless, there are still some LDP members who are opposed to the revision of the peace constitution.

Both camps have different perceptions of the recent history of Japan, especially on Japan's wartime

involvement. The fifteen-year Asia-Pacific War killed more than 2.5 million Japanese, it killed and injured more than 20 million Chinese, and 4.25 million Chinese people were killed during Japan's invasion in China. The Japanese army also invaded and occupied the Philippines, Indonesia, Malaysia, etc. and many Japanese soldiers committed war crimes such as vandalism, rape, and murder. In Okinawa a considerable number of residents were killed by the Japanese army for reasons of military manoeuvre, although the islanders were judicially recognized as Japanese. The end of the war came only after the US atomic bombing of Hiroshima and Nagasaki that irradiated more than 600,000 people, killing more than 200,000 instantly or slowly by the end of 1945.

In presenting the above figures, Ienaga Saburo (1979) points out that the Great Japan Empire and the post-war government as its successor should take the whole responsibility for causing the war and for making compensation for the damages that the war efforts brought forth. He also argues that the Japanese, both during the war and now, have been responsible for this war. The present generation inherits this responsibility as we live in the same space though at different times. This view is shared by those who regard Japan's militarism and invasion in foreign countries as unjustifiable and the post-war democracy as a major progress, even though it was imposed by the occupation army.

In 1965 Professor Ienaga filed a lawsuit against the government with regard to a history textbook screening. He launched three suits that reached to the Supreme Court and he won a partial victory. The Ministry of Education, Culture, Sports, Science and Technology (MEXT) tends to avoid themes such as 'comfort women' used by the Japanese army and Japan's various aggressions in Korea, China, and South-east Asian countries during the Asia-Pacific War. In 2002 a history textbook was published that obscures the nature of Japan's war of aggression and the MEXT was eager to have it adopted by as many schools as possible as it suits the government's stance, but as of September 2005 only a few schools have adopted it. In Japan the superintendent and members of the Board of Education are appointed by the local government and they can decide on the textbooks to be used. The history textbook controversy still goes on and the number of the schools adopting it may eventually increase. Thus, those children using the textbook will nurture a false image of Japan's recent history and indulge themselves in the 'glory' of Japan's military advances with the victories over Russia and China. Many young Japanese do not understand

why, when they are confronted with occasional outburst of rage by Chinese and Koreans.

The present Japanese administration wants to make compulsory the raising of the national flag and the singing of the national anthem that is titled 'To the reign of the emperor'. In 1999 it enacted a law to enforce it, ignoring those who feel ill at ease with the flag and the anthem primarily because both were identified with aggression and conquest during the war days as symbols of Japanese imperialism. In some cases, the local educational board observes each school ceremony, thus the offenders (who do not stand up when they are supposed to do so) will be punished.

14.7 Conclusion

As the above review indicates, no uniquely Japanese philosophy and ethics can contribute to the idea of human security other than the love of the Japanese people for nature and harmony despite the political aggressiveness to the outside world. While some Japanese politicians are responsible for initiating the UN human security programmes, the conceptual ideas expressed by the Human Security Commission (CHS 2003) came mainly from Professor Amartya Sen. But it is more important to implement the universal values that are expressed in this report in various sectors of national and international politics, and not just in the official ODA efforts.²

People as well as nations can agree at the level of ethics, namely when they need to work for peace and security as global values while they can differ in their philosophical views of nature and culture. Japan could contribute to world peace and security when the Japanese people and the government cease to be self-centred, self-righteous, and aggressive. Even if we avoid destruction by nuclear weapons and/or radioactive pollution, ecological destruction may be imminent and the earth may become uninhabitable. No nation can afford to remain self-centred or nationalistic. Thus, Japan should now act as a reminder to the former forerunner of democracy who promoted the values of equality and freedom in the past, but who is now apparently indulged in pursuing unilaterally the dreams of a holy empire, and become so anachronistic and harmful for the rest of the global community.

2 Scholarly contributions to the human security discussion include: Mushakoji (2003), Katsumata (2001) and research programmes and symposia on human security held at various institutes and universities.

15 Thinking on Security in Hinduism: Contemporary Political Philosophy and Ethics in India

Naresh Dadhich

15.1 Concept of Security

The concept of security is as old as human civilization. The search for security for oneself from death and bodily harm is innate in human nature as part of its biological self which is common to all living beings. In the beginning it was intuitionist but gradually rational measures were sought to safeguard oneself. Thus began the thinking on security. The term security became popular during the Roman Empire (see the chapter by Arends in this volume.). In Latin, *securus* represents a state of psychological status of mind to secure oneself against enemies. It was used more for the emperor and his family than for the public. Security of the emperor was considered as security of his empire.

In Indian thought this meaning is also reflected in ancient texts. The term 'security' means to be without sorrow or anxiety, confident, free from danger, safe, stable; to ensure and 'secure' refers to the state, feeling, or means of being secure, the protection from espionage, a surety, etc. In contemporary social sciences security is considered an ambiguous concept. It is used not only for understanding international relations, a very important area of study, but its application is extended to civil society where it is also used both with a normative as well as pragmatic meaning. Security in the international arena is concerned with a state's sense of safety which is essential for the well-being of its citizens. It is essential but not a sufficient condition for welfarism of citizens. It is not merely the power of defending oneself in the wake of an attack from another state, but to have military or non-military power to dissuade other states from even thinking of attacking. This requires not simply brutal force but also diplomatic skills, propaganda, alliances, and a normative moral stature. The welfare schemes for citizens provided by the state are also a form of security for its citizens if we broaden the scope of security.

In the twenty-first century security involves not only security from enemies of the state but also 'human security' and 'environmental security'. Global warming, changing climatic conditions, tsunamis, and the thinning forestry have become security concerns. Security also has a philosophical dimension which centres on man's quest for eternity and this forces man to think beyond the immediate future and even beyond life. The philosophical or spiritual quest for eternity is also a part of security thinking.

The traditional concept of security is confined to 'real threats' to the state emerging from another state. This traditional notion of security is analysed through many approaches including idealism, realism, rationalism and others. But for the purpose of an exhaustive analysis, a wider notion of security has to be accepted, which includes not merely military aspects but also economic, social, and environmental security aspects. Security in this sense is a part of policy within the state. The welfare state is a type of state which stresses 'social security' issues.

15.2 Security in Hinduism

In the ancient Hindu texts, the security of the citizens is considered to be maintained when the state functions according to *dharma* (the law of the social order) or maintains *rta* (the rigvedic notion of *dharma*). But elaborate precautions are mentioned in *dharma-shastras* (a branch of Brahmanical sacred literature dealing with civil and religious law, a source of law of the social order) about security of the king and his family. The security of the king was considered to be of primary importance as the security of the state and its citizens were directly connected with it.

15.2.1 Kautilya

After the Vedic *samhitas* and *bramanas* were composed in the early period (600–325 BC), *dharmashastras* were written and continued to be written well up to AD 1000. The earliest of them was *Arthashastra* which was a special branch of *dharmashastra* and was written by many scholars but with the exception of Kautilya's *Arthashastra*, no complete work of this class has been handed down to us. The only surviving parts are references and quotations by later authors. Kautilya himself has frequently quoted his predecessors either for support or for criticism.¹ Later Kautilya's follower Kamandaka in his text *Nitisara* repeats citations from earlier writers of *Arthashastra*. The branch of knowledge manifested by *Arthashastra* introduced for the first time the rigorous scrutiny of the king's administration, of interstate relation, and of the security of the king and the state. Kautilya defines *Arthashastra* as "The source of the livelihood of men is *artha* (wealth); that is to say, the territory (and the inhabitants following various professions) is the wealth (of a nation). The science by which territory is acquired and maintained is *Arthashastra* - the science of wealth and welfare" (Kautilya 1992: 100). The same definition was applied by Kautilya in his own work when he stated that his work summarizes extensively all other *Arthashastra* works prepared by early masters on the subject of the acquisition and preservation of the dominion (*prithvi*).² Kautilya emphasized that the king is the centre of society and the power behind the state.³ It is thus necessary to provide adequate security to the king in order to prevent the state from collapsing and to prevent resultant chaos in society. Regarding the security of the king, Kautilya discussed the problem and the importance of the king's protection against his own sons. This problem was discussed by many scholars before him and he provides interesting solutions for the king's safety (Ghoshal 1966: 92–93).

1 Kautilya, also known as Chanakya and Vishnugupta, wrote *Arthashastra*, which was the most comprehensive treatise of statecraft of classical times. He destroyed the Nanda dynasty and installed Chandragupta Maurya as the King of Magadha.

2 Dominion means acquisition and rule over a geographical territory. It is not a system of rule of political regime. It is hegemony over geographical territory.

3 Kautilya has been frequently compared with Machiavelli who also centred his thought around the Prince and who among others introduced *realpolitik* into Western political thought.

Figure 15.1: Chanakya: Also known as Kautilya, the Writer of Artha-Shastra, the first known treatise on the government and economy in the 3rd Century B.C. **Source:** <<http://www.kamat.com/kalranga/ancient/3335.htm>>. Copyright © 1996-2007 has been granted by Kamat's Potpourri on September 2007

Bharadwaj declares that the princes for whom their father feels no affection at their birth should be killed in secret.⁴ Vatavyadhi advised that the princes should be deliberately lured to sensual indulgence so that they would not develop hate for their father.⁵ Other writers suggest different methods of keeping the prince under restraint, indicating a total distrust of the prince. All of them agree that the greatest danger to the king lies in the unprincipled ambitions of his sons, and therefore, the security of the king's person

4 Bharadwaj was an ancient Indian philosopher. He was radical, materialist, and refused to adhere to the notion of a soul substance. He found no evidence for any sensitive substantial self after the extinction of the body.

5 Vatavyadhi was an early *Arthashastra* authority of whom little is known. Fragments of his commentary on *Arthashastra* are cited by others.

against them should be a fundamental objective of state policy. The king whose safety is ensured from those far and near is capable of protecting his kingdom.

Kautilya rejected the view that sons of the king should be treated as his potential enemies. He rejected Vatavyadhi's view that princes should be lured to sensual indulgence in the interest of the king's safety. He rather advocated that the prince should be given a good education under the guidance of experts that prepares him for being a future ruler. While a prince without respect for his father may be put into prison or banned from the state, a self-controlled prince should be appointed as Crown Prince. Kautilya in two chapters of his book *Arthashastra* describes in detail how the king should secure his safety in his palace, particularly during the acts of visiting his queen, taking his meals and attending to his bodily needs, witnessing shows, visiting gardens, hunting, granting interviews, joining fairs and festivals.

Kautilya also suggests that the king should watch the behaviour of his own officials as well as those of his enemies. This certainly requires an elaborate system of espionage. Kautilya enumerates nine different classes of spies and explains how the first five classes should be stationary and the remaining four should be peripatetic. He was also concerned about the enemies' deceitful behaviour in luring the king's own loyal and disloyal subjects, and wanted the king to seduce loyal servants of the enemy. He assigned duties to spies to look after such dangers to the king and he elaborated strategies of how to counter such manipulations by enemies. In this strategy, the role of masses is very important and all efforts should be made to mobilize public opinion in the king's favour.

Kautilya believes that the judgment of the masses is based on popular slogans and not on reasoned convictions. Masses have no principles but only passions. It is the task of the statesman to take advantage of such situations to win mass opinion in favour of the king. In the chapter entitled "Extirpation of Thorns" Kautilya advises the king to crush his enemies completely for his own security. The king should apply against the chief officers (*mukhyas*) defying his authority or aligning with the enemy the weapon of espionage and official propaganda. In conclusion, Kautilya attributed sufficient importance to the safety of the king, which to his mind was a prerequisite of the safety of the kingdom and therefore of its citizens.

15.2.2 Manu

Manu in his *smriti* (a source of state law from the period of 200 BC to AD 300.) elaborated the policy of public security which a king should follow.⁶ Public security is threatened by two classes of thieves, one is the *open thieves* and the other the *secret thieves*. The open thieves consist of those who live by *dishonest* means like, gamblers, physicians guilty of improper conduct, rogues, cheaters, etc. The secret thieves comprise of burglars, inhabitants of the forest, etc. The King should get these thieves caught and punish them severely. The punishments are also mentioned by Manu for damaging public property and thus threatening public security like breaking down dams of tanks, cutting off the water supply, adulterating commodities, dishonest dealing with patients or customers, etc. Manu, like Kautilya, is concerned with public security and prescribes drastic measures to protect the public from the anti-social elements. Manu's methods of implementation of this policy which are almost as drastic as those of Kautilya comprise, besides the posting of armed guards and spies at public places as a preventive measure, the punishment of offenders through agents, the arrest of thieves through their treacherous associates, and their wholesale extermination as well as punishments for various other offences (including the negligence of duties by government servants and the indifference shown by the people in cases of breach of peace (Ghoshal 1966: 181).

15.2.3 Kamandaka

Kamandaka's *Nitisara* follows the *Arthashastra* tradition in its instruction to the king to acquire land and for the preservation of dominance.⁷ As was the practice in ancient India, the political system revolved around the king and the political analysis is concentrated on the role of the king and his strategies to safeguard himself and to enhance the power of his kingdom. Like older *Arthashastras*, a full chapter is de-

6 Manu was the first thinker who drew on jurisprudence, philosophy, and religion to create an extraordinary, encyclopaedic model of how life should be lived, in public and private. He wrote *Manusmriti*, which was later modified by others but it became a standard source of authority in the orthodox tradition for Hinduism.

7 Kamandak is the true follower of Kautilya. His work belongs to AD 300–800. He addressed his book to the king and elaborated the role of the army and inter-state relations.

voted to political expediency as well as to a branch of policy called extirpation of thorns (*Kantakasodhan*). Kamandaka says that the king should direct all his energies towards improving the state territory (*rashtra*) and should protect his person, as that will ensure security of the people of his kingdom. He further states that slaying the wicked for the sake of *dharm*a is not a sin and should protect his subjects with all means and punish all those who oppress the subjects. Enemies of the state from within (those favourites of the king who oppress the kingdom) should be put to death either in an exemplary manner or in secrecy. The king was also warned against greedy and haughty princes, and measures to be adopted by the king were prescribed accordingly. The king should raise his son in a virtuous and disciplined manner, and a disciplined son should be declared as Crown Prince. On the other hand, an undisciplined son should be tamed like a rogue elephant.

Kamandaka follows Kautilya's policy towards security measures in the public interest as well as in the interest of the king. The king's security is held to be the means of ensuring public security. The suppression of public enemies is a sound policy, both politically and morally. He also devoted a full chapter on inter-state relations where he elaborated on peace, war, attack, and neutrality.

Several works from this ancient period up to the tenth century AD were lost but have been referred to and cited by later writers. Among the authorities cited by the fourteenth century *Smriti* writer Chandesvara⁸ in his *Rajnitiratnakara* are fragments of Vyasa, Narada, Harita, Brihaspati and Padma, Sukra, Srikara and Gopala. Most of these thinkers wrote about security in the sense of the king's security as that alone can give security to the subjects of his kingdom. The distinctive duty of the king according to this 'ancient school' consists in protecting the people, ensuring their security, not retreating from battle, and honouring the Brahmins. Sukra with Kamandaka believes that a king's behaviour and values should be different from those of an ordinary man as son and father turn against each other out of greed for the kingdom. Vasishtha comments that a state deprived of its ruler is like a woman bereft of her husband.

15.2.4 Somadeva

In the period extending from the ninth to the thirteenth century A D. Jaina writers flourished. Of these, two wrote on polity in the same class of the previous commentators from Kautilya onward. In the tenth century Somadeva wrote a work on polity known as *Nitivakyamitram* (The nectar of sayings on polity).⁹ In the eleventh century Hemchandra wrote *Laghvarhanniti* (abridgement of the science of polity of the blessed one).¹⁰

Somadeva on the one hand is more versatile and defining *niti* in its wider sense covered general morality, poetry, music and dancing, etc. along with prescription for the king and his kingdom, while Hemchandra devoted his four chapters on the king and his offices, war, punishment, the law, and legal procedure and penance. Somadeva followed the *Arthasastra-Smriti* tradition in formulating his ideas regarding polity especially represented by Kautilya and Manu. He warns the king to be constantly on vigil against his own and his enemy's people, for with his own security everything is secure. Without the king the state has no centre to hold it in the same manner as without a backbone a human being cannot hold all his bone structure. He prescribes reasons for allowing some groups to be kept near the king and some to be kept at a distance. A king may allow nearness to his women, his kinsmen, and his sons. After analysing the complex nature of women, he warns the king not to trust them completely and keep them in good humour. The kinsmen may be given power according to their ability and loyalty but the king's loyal servants should constantly watch them. The sons of the king should be given a good education, which may save the fortune of the king's family. The king's security is considered as the key to the security of the state.

Sukra in his *Nitisara* also followed his predecessors Kamandaka and Kautilya in describing the king's security as the key to the security of the people. He elaborated on the dangers for the life of the king and how to overcome them, especially from his own sons.

The ancient Hindu concept of security of the people and of the state was thus confined to the security of the king in that almost all ancient texts give elabo-

8 Along with Vachaspati Mishra and Upamanyu Upadhyaya, Chandesvara was a well-known commentator on Dharmasashastras who belongs to the Mithila region of Bihar.

9 Not much is known about Somadeva's life except that he was a Jain saint and author of a literary work 'Yasatilaka'. His famous book on political science is called 'Nitivakyanmiritam'. It was composed in AD 992.

10 Hemchandra (1088-1172) was a Jain saint and a Sanskrit scholar. He wrote many treatises including biographies of saints, dictionaries, philosophy, and yoga.

rate measures to prevent the king from being killed by his own sons, kinsmen and friends, along with his enemies.

15.3 Contemporary Indian Thought

Raja Ram Mohan Roy, who wrote in the early nineteenth century, is widely acknowledged as the first modern thinker of India.¹¹ He is known for his rational thinking and acclaimed as a crusader for radical social reforms, including the ban on *sati* (the burning of the widow). In the nineteenth century Indian thought, the important questions were related to socio-religious reform and to growing nationalism. Not much was written on the questions of state policies, inter-state relations or welfare schemes.

In the early twentieth century when the national movement against the British started making an impact, scholars like Gopal Krishna Gokhale¹² and Bal Gangadhar Tilak¹³ wrote about the duties of the state and demanded political reforms. The nature and methods to fulfil their demands were different, and on that basis they were broadly divided into two groups, namely moderates and extremists. Gokhale believed that for developing a sense of security in the citizens, the British Government should gradually associate Indians with the governmental work and eventually give self-government to Indians. Tilak believed that only *Swaraj* could give Indians a sense of security. *Swaraj* is complete independence, and is both a spiritual and a political concept. Most thinkers of that time were concerned with India's independence and their thought revolves only around this question. M.K. Gandhi known as *Mahatma* (The Great Soul) Gandhi was among the exceptions who gave transcendental thought while leading the national movement for more than a quarter of a century.

11 Raja Ram Mohan Roy (22 May 1772–27 Dec. 1833) was the first Indian thinker who introduced modern ideas in Indian thinking. He was a rationalist and well acquainted with western ideas of his time and also influenced by them. Among other treatises, he wrote, *Tahfal-ul-Muwabhidin* (a gift to Deists) in 1803–1804.

12 Krishna Gokhale (9 May 1866–19 Feb. 1915) was an important political leader who held moderate ideas, and Mahatma Gandhi acknowledged him as his political mentor. He wrote many treatises.

13 Bal Gangadhar Tilak (23 July 1856–1 Aug. 1920) was a radical political leader who introduced mass politics in India and used religious festivals to propagate ideas of nationalism. Among many treatises he wrote, his commentary on Gita (*Gitarahasya*) was the most popular.

Figure 15.2: Gandhi dressed as a satyagrahi (non-violent activist) in 1913. **Source:** Internet at: <http://commons.wikimedia.org/wiki/Image:Gandhi_satyagrahi.jpg>. A South African work that is in the public domain in South Africa according to this rule is in the public domain in the U.S. only if it was in the public domain in South Africa in 1996, e.g. if it was published before 1946 and no copyright was registered in the U.S.

15.3.1 M. K. Gandhi: Non-violence and Security

Gandhi was no systematic thinker in the sense of a professionally trained philosopher. He wrote extensively and his collection of writings runs into more than 100 published volumes comprising about fifteen million words. He wrote on diverse subjects including food habits, nature cure, truth, non-violence, British rule, religious commentary, social problems, etc. Gandhi's writings sometimes lead to contradictory interpretations but there is a common essential thread combining all his diverse views into one coherent philosophical outlook that has certain characteristics.

First, Gandhi believed that human history includes a constant struggle between evil and good as human beings combine both elements of good and bad. This is also constant struggle within one's soul and it is a duty to promote the good or divine elements within oneself.

Second, non-violence is the basis of all existence. Non-violence or *ahimsa* (which conveys positive love) is the ultimate value. Gandhi believed that in its positive form, *ahimsa* means the largest love, the greatest charity that binds us to one another and to God, *ahimsa* and love are one and the same thing. Although both violence and non-violence are part of life and values of human life, non-violence is a higher value. He says, "I have found that life persists in the midst of destruction. Only under that law would a well-ordered society be intelligible and life worth living" (Gandhi 1931: 1). Gandhi has been correctly described as a prophet of non-violence. It is he who successfully demonstrated that non-violence could be used as a potent weapon of protest and conflict resolution.

Third, for Gandhi every human activity is directed towards realizing truth. Truth is objective but its manifestation is subjective. To realize this truth, non-violence is the only means. One can only pursue this path successfully when one constantly purifies oneself by abiding by certain vows including no possession, no stealing, and celibacy. Gandhi's political movement was thus called *Satyagraha*, meaning clinging to truth or to the force of the soul. Gandhi's thought was comprehensive and revolved around concepts which were popular during the freedom struggle in India. These concepts such as: *Satyagraha*, *Swadeshi*, *Swaraj*, *Sarvodaya*, *Ramrajya*, *Trusteeship*, *Bread labour*, *Ahimsa*, *Satya*, etc. were used by Gandhi to explain his thought that was not limited to these concepts only. The important political concepts used in Western political thought like freedom, justice, equality, rights, political obligation, state, democracy have also been analysed by Gandhi directly or indirectly.

Gandhi treats the concept of security in a different way. At the individual level Gandhi favoured spiritual or religious (his religion was not confined to rituals only) solutions for fearlessness. At a societal level, he supported community associations to secure the life and belongings of citizens. Gandhi was a philosophical anarchist and thus had no faith in the state. He believed that evil lies in the concentration of power. The state is only an extreme example of the concentration of power. The state thus cannot provide security to its citizens. Gandhi did not have any faith in the military,

which he thought was not necessary for the security of a state. At a meeting of the Congress Working Committee in September 1938, Gandhi wanted that the Congress should declare that a free India would not have any army to defend itself. In other meetings in 1939 and 1940 Gandhi also reiterated his demand for abolishing the military in an independent India. For providing security to the citizens, war was objected to by Gandhi. He was a pacifist who believed that war itself was a crime against God and humanity. During World War II, while sympathizing with the Jews, he said, "If there ever could be a justifiable war in the name of and for humanity, a war against Germany, to prevent the wanton persecution of a whole race, would be completely justified. But I do not believe in any war" (Gandhi 1994: 156-57).

In ancient Indian political thought war was considered necessary for the security of citizens and the protection of the state, but Gandhi did not believe in it. During his formative years, Gandhi participated in war as a medical volunteer. In 1899, Gandhi supported the British in the Boer War as he felt that as a citizen of the British Empire, it was his duty to support it if he wanted rights from it. But later on he changed his opinion on the British Empire. The Zulu rebellion in South Africa in 1906 was an eye-opener for him as he witnessed atrocities and violence committed during that war. During the First World War Gandhi helped raising recruits in India and an ambulance corps in London. Gandhi's participation in the Boer and Zulu wars as well as in World War I invited criticism from pacifists. The Dutch pacifist, the Rev. B. De Light, even asked him to explain his conduct in public in light of his commitment to *ahimsa*. Gandhi explained his conduct in many articles he wrote, especially in 1928 and 1929, by asserting that non-violence was not simply a philosophical principle for him but was the rule and the breath of his life. He reminded that he was uncompromisingly against all war and strongly convinced that war can neither provide security to anyone nor can it provide a lasting peace. His participation in wars was peripheral and propelled by a sense of duty towards justice and citizenship. Time and again he emphasized that his energy was devoted to prevent violence and war, and as an unconditional pacifist and war resister he held that participation in war is neither righteous nor fruitful and nothing positive has ever come out of an armed conflict.

Gandhi had doubts about the state's intention and its capacity to provide protection to its citizens. He believed that the state represents violence in a concentrated and organized form and has no soul, and so it

can never be weaned from violence to which it owes its very existence. Even the political sovereignty of the state could not escape his scrutiny. Gandhi questioned the legitimacy of the theory of absolute sovereignty, and like T. H. Green he believed that politics is an expression of the moral life. Sovereignty of the state was a challenge to the moral right of man to shape his own destiny. The state thus was not considered a prime institution to provide security to its people. Gandhi's disbelief in the state and its instruments of protection was based on a fundamental understanding of human beings, their goals, nature and historical experiences. Gandhi emphasized the importance of the individual. He asked, "If the individual ceases to count, what is left of society?" (Gandhi 1994c: 254-255) Individual is the centre of any authority and value system. If the individual is the supreme consideration then the law which governs his behaviour should be of supreme importance. This law is the law of non-violence.

It is because of Gandhi's firm belief in ultimate superiority of non-violence in philosophical and practical terms that he linked the question of security with non-violence. No external institution can provide an adequate sense of security to the individual, as violence can never guarantee safety and security to anybody. When the life is given by God and is governed by the eternal law of non-violence, the individual can have a sense of security in non-violence and truth. Gandhi's theory of non-violence is not a simple theory. It has its own philosophical implications. He believed that non-violence (*ahimsa*) is synonymous with love, God and truth, and in fact there is no other means to achieve truth than *ahimsa*. He says, "Without *ahimsa* it is not possible to seek and find truth. *Ahimsa* and truth are so interlinked that it is practically impossible to disentangle and separate them. They are like the two sides of a coin, or rather of a smooth unstamped metallic disc who can say, which is the obverse and which is the reverse? Nevertheless, *ahimsa* is the means, truth is the end" (Gandhi 1961: 27). Gandhi did not take a narrow view of *ahimsa* equating it only with non-killing and non-injury. For him violence also means being hurt by evil thought, by undue haste, by lying, by hatred, by wishing ill to anybody, or by holding on to what the world needs. For Gandhi *ahimsa* means infinite love, unbounded charity, voluntary self-suffering, non-attachment, fearlessness, strength and innocence. Gandhi distinguished among three types of *ahimsa* based on nature and practice.

The highest type of *ahimsa* is what Gandhi calls the enlightened non-violence or resourcefulness or the non-violence of the brave. It follows from one's firm convictions and becomes a law or habit of life because one is incapable of engaging oneself in violence after reaching a particular level of being after self purification. This perfect stage is utopian in nature and useful only as an ideal to be followed by human beings. Gandhi did not include himself in the list of those persons who practice such *ahimsa* as he was aware of his own shortcomings and was not hesitant to confess them.

The second type of *ahimsa* is that which is adopted as a measure of expediency and sound policy in a certain sphere of life. Gandhi calls it the non-violence of the weak or the passive non-violence of the helpless. Although it is not as effective as the first type it is easier to cultivate also in groups.

The third type is the non-violence by mistake, or the passive non-violence of the coward. This is the non-violence of the coward who cannot face challenges and takes recourse to non-violence out of fear. Gandhi did not accept this type of non-violence as "cowardice and *ahimsa* do not go together anymore than water and fire" (Gandhi 1994b: 296). He even advocated violence instead of adopting this type of false non-violence. He says, "It is better to be violent if there is violence in our breasts than to put on the cloak of non-violence to cover impotence" (Gandhi 1994a: 301-302). Gandhi would prefer a violent man to a coward preaching non-violence, as a coward does not have faith in God or even in himself, while a violent man is courageous and can accept the challenge of self-suffering by accepting *ahimsa* as a way of life after transformation.

Gandhi believed that *ahimsa* being superior to violence requires a higher kind of courage, that is, the courage of dying without killing. Gandhi argued that *ahimsa* is the greatest force at the disposal of mankind and acknowledging its importance, should be used by human beings to fight evil. Gandhi's understanding of and immense faith in *ahimsa* leaves little space for any other institutional arrangement or policy to provide protection to citizens in the wake of danger from other states or from internal enemies.

This faith in *ahimsa* makes Gandhi a spiritual man but he also presented rational practices and arrangements based on a utilitarian application of *ahimsa* in political and social matters and that makes him a unique man in the history of human society. His instinctual suspicion of the state and rulers ruled out any possibility of protection from them towards their

Figure 15.3: A studio photograph of Gandhi taken in London at the request of Lord Irwin in 1931. **Source:** at: <http://commons.wikimedia.org/wiki/Image:Gandhi_studio_1931.jpg>. The photographer is unknown and the photo is more than 70 years old. According to the Bern Convention and the law of most countries, this photo is in the public domain.

subjects. Gandhi's ideal society *Ramrajya* (which is a utopia) is a stateless society governed by mutual respect and sustained by non-violent conflict resolution. In it, sovereignty resides in people and rules and regulations derive their strength from moral authority. Gandhi's second best state is the welfare state, which is democratic in nature and committed to the welfare of the people. Gandhi supported democratic decentralization, autonomous village economy, strengthening of *gram sabha* (village council), and a comprehensive developmental theory incorporating various aspects of human life including the moral dimension.

Gandhi's critique of modernity and his attempts of retaining a reformed tradition with unique definitions and interpretations of religion, *dharma*, non-violence, truth, social reforms, spiritualization of politics, and a village self-sufficient economy also effected his notion of security which in his thinking is not merely security of the human body but of securing one's soul and

mind, values and understanding, culture and humanness. This broad interpretation of security goes beyond even the concept of human security, which is how security is defined nowadays. Gandhi was thus ahead of his time in conceptualizing many new phenomena, including that of security. Gandhi drew his strength from his spiritual convictions and single-mindedly applied himself in practical affairs including political and social reforms. His was a moral vision which included a moral foundation of society as well as of the individual. If an individual has strength derived from his moral and spiritual conviction, especially his belief in effectiveness of non-violence, then he can take care of his security and the same law is applied to society also. The institutions of society should be based on moral foundations and non-violent structures be encouraged so that 'structural violence' does not threaten security of members of society.

Gandhi was the only contemporary political thinker who is well recognized universally and whose contribution in conflict resolution theories and practice in the form of *Satyagraha* is accepted as a unique contribution. After Gandhi, in contemporary Indian political thinking not much is written about security. Indian thinkers like M. N. Roy (1952) tried to indianize Marxism whereas Vinoba Bhave (1973) and Jaiprakash Narain (1959) carried forward Gandhian messages in their own way, B. R. Ambedkar (1948) wrote primarily on the plight of lower castes in India and Aurobindo Ghosh (1951) tried to combine western evolutionary theory with Indian cyclic theory of development. Jawahar Lal Nehru (1961) wanted to develop India on modern lines by establishing big industries, constructing big dams, establishing scientific laboratories and centres of research. Security in Nehru's vision was linked to modernization and industrialization. A modern industrial society will make the Indian citizen more secure and a democratically elected government, which follows the rule of law, is a necessary condition for any type of security.

15.4 Conclusion

Indian political thought is rich in describing various aspects of politics, although the description is at times in different conceptual framework than used by western political thinkers. Security is also such an issue which has been given adequate attention by Indian thinkers, but in their own way. In ancient times, security was primarily that of the king who was the centre of every kingdom and on whose security and safety

lay the security and safety of the people. There are various ways suggested by ancient writers to provide security to the kings.

In the modern era, security was linked with political freedom as most writings during this period belonged to the Indian freedom struggle, and until and unless Indians get freedom from British rule security of Indians could not be guaranteed. Gandhi successfully linked the question of security with non-violence.

In the contemporary world where security is being redefined daily and is being dissociated with military and linked with questions of human rights, democracy and good governance, the Indian idea of security is also changing with the times and the rise of civil society in India is an indication in this direction.

The Human Development Report defined human security as people's "safety from chronic threats and protection from sudden hurtful disruptions in the patterns of daily life" (UNDP 1994) and listed seven components of human security economic security, food security, health security environmental security, personal (physical) security, community security, and political security (see this vol. and vol. IX in this Hexagon series). Contemporary Indian thinking represented by Amartya Sen and others has taken these issues seriously.

16 Human Security in Jewish Philosophy and Ethics

Robert Eisen

16.1 Introduction

The subject of security has undergone significant changes in recent years. For the better part of the past century, security studies had as its goal the examination of international affairs with the hope of finding ways to minimize armed conflict between nations. However, in the past decade or two, security specialists have recognized that security defined in this fashion is of little utility. Human beings may live in a world devoid of war but still be miserable if their lives are endangered by a host of factors in other realms, such as the economy, the environment, and politics. The focus of recent explorations of security has therefore shifted away from the security of states to the security of individuals, with an interest in examining the nexus of factors that affect the individual's physical well-being.

To my knowledge, the present chapter is the first attempt to explore this new conception of security from a Jewish standpoint. My goal here will therefore be to establish whether Judaism even has such a conception. In the first portion of my analysis, I will examine this question from a broad theological perspective by evaluating the extent to which Judaism values the physical well-being of the individual. I will argue that Judaism not only has concern for this issue, but that it is basic to its world-view. I will then discuss how Jewish sources grapple with specific topics in human security. It is beyond the scope of this chapter to conduct a comprehensive discussion of all such topics because of the large volume of Jewish material on these issues. I will therefore concentrate my efforts on three major topics: war and peace, human rights, and poverty. My hope is that a discussion of these themes will give a sense of the richness of Jewish sources regarding human security. Finally, I will address the role the State of Israel has to play in Jewish conceptions of human security in the modern period.

My analysis will be based on a reading of Jewish religious sources that is admittedly selective. First, I

will focus mainly on biblical and rabbinic texts since biblical and rabbinic Judaism are the twin pillars upon which all later Jewish thought and ethics are based.¹ Secondly, even my citations of biblical and rabbinic texts will be selective because those texts present a wide range of views on any given topic. Therefore, one can speak only of a preponderance of opinion in biblical and rabbinic sources with respect to the issues discussed here. Nonetheless, the sources present enough of a consensus on those issues that conclusions can be drawn about what constitutes mainstream Judaism.²

16.2 General Theological Considerations

One might expect that Judaism would offer a paucity of material on the subject of human security, given that this topic is so closely tied to the political realm. Throughout their history, Jews have had relatively little opportunity to deal with political matters. Jews have spent almost two-thirds of their three-thousand year history governed by others, and thus a large portion of their sacred texts were written when they did not have political sovereignty—most notably, the entire corpus of rabbinic Judaism which includes the Talmud.

However, Judaism has a great deal to say about human security and this is so for several reasons. First, Jews did have sovereignty for many centuries in ancient Israel and therefore the Hebrew Bible furnishes

1 The following primary texts have been used: a) *Babylonian Talmud*: Standard edition; b) *Jerusalem Talmud*: Standard edition; c) Maimonides, *Moses: Mishneh Torah*, Standard edition; d) *Midrash Rabbah*: Standard edition.

2 This is a problem that afflicts all religions with a long history, such as Judaism. In such religion, there is rarely unanimity on any given issue, but rather tendencies and emphases in one direction or another.

much material on political issues. Second, the later rabbis often reflect on political matters even though their discussions are mostly theoretical in nature, seeing as they could not implement them in practice. Third, when Jews lived under the sovereignty of others in the medieval period, they were often allowed to govern their own communities and they therefore evolved an extensive body of legal literature concerning politics as applicable to this local form of government, limited as it was. Fourth, in the past several decades Jews have once again gained sovereignty with the establishment of the State of Israel and this has thrust new attention on the question of the political in Judaism and has revived interest in developing this area. Fifth, Jewish sources often have an acute sensitivity to issues related to human security because Jews have had an extensive history of persecution and suffering. In fact, in the biblical text Jewish nationhood is forged in the bonds of the Egyptian slavery. This sensitivity has inspired Jews to place great value on human physical well-being.

Yet, perhaps the most important reason that Judaism has a lot to say about human security lies in the very nature of Judaism itself. One of the hallmarks of Jewish religion is its highly positive view of the mundane world. One is supposed to enjoy God's earth in all its materiality and physicality – though within limits set by God's commandments. Striving for physical well-being is therefore not only permitted but a divine imperative.

16.2.1 The Hebrew Bible

This insight is borne out by a selective perusal of Jewish sources. In the Hebrew Bible, Adam and Eve are initially placed in the Garden of Eden where all of their physical needs are taken care of. Idyllic human existence is therefore characterized by human security. When Adam and Eve sin and are expelled from Eden, their punishment is that their security is effectively taken away. They lose their economic security in that they must now produce bread by the sweat of their brow, and their security is further compromised when violence and murder are introduced into the world with Cain's killing of Abel (Gen. 3:17-8, 4:1-16). That violence only grows over the next few generations so that finally God decides to destroy the world in the Flood Story (Gen. 6:5-12). The stories about the Patriarchs also reflect a concern for physical well-being. The relationships that the Patriarchs develop with God are inextricably tied in with such mundane issues as health, wealth, and family dynamics. In

fact, one reason why the stories in Genesis have had timeless appeal is that their characters are so human in their involvement with mundane concerns.

The central theme of the Torah and a key theme in the Hebrew Bible as a whole is the covenantal relationship between God and the Israelites, and that relationship is very much centred on this-worldly concerns. According to the terms of the covenant, the Israelites will merit reward if they obey God's will and will be punished if they do not. Obedience here is the strict adherence to God's laws which specify not only the proper worship of God through ritual but also the construction of a just civil society that allows the Israelites to thrive both as a nation and as individuals. Therefore, human security is central to God's plan for the Israelites.

Even more important, the concern for human security is evident in the nature of the rewards and punishments which according to the Bible come as a consequence of obedience or disobedience to the covenant. These are defined entirely in physical terms; there is no mention of spiritual rewards in an afterlife. Reward consists of residing in the land of Israel which is characterized by its economic wealth; it is a land flowing with milk and honey. Reward is also equated with ample rainfall, physical health, abundant crops and livestock, and peace with Israel's neighbours. Punishment is the opposite of these: famine, disease, poverty, war, and exile (Lev. 26; Deut. 28).

Also relevant here are the eschatological passages in the books of the Prophets which imagine a period free from material want and violence from Israel's enemies. The prophet Micah, for instance, predicts that in this period "nation shall not take up sword against nation; never again shall they know war. But every man shall sit under his grapevine or fig tree with no one to disturb him" (Mic. 4:4; Is. 2:1-4). Thus, when the prophet envisions the messianic era, he describes a society in which the nation and its individual members are physically secure. Eden is re-created.

One can, of course, question the relevance of this conception of human security for our own time, given that in the biblical text physical well-being is a consequence of obedience to God – not political, economic, or social policies. Still, it is noteworthy that the Hebrew Bible places such a high premium on physical well-being when one considers the fact that the sacred texts in many other religions denigrate life in this world and place greater value on a spiritual existence detached from physical needs both in this world and the next.

16.2.2 Rabbinic Judaism

If an argument can be made that human security is a central concern in the Hebrew Bible, perhaps an even stronger case can be made with respect to rabbinic Judaism. The major accomplishment of the rabbis was building a comprehensive system of Jewish law, or Halakhah, in the wake of the destruction of the second Temple in the first century, a project that continued throughout the Middle Ages and for observant Jews today is still ongoing. The rabbis constructed Halakhah through extensive interpretation of biblical laws and with the help of oral traditions. Ultimately, Halakhah governed every aspect of Jewish life, ritual and ethical.

It is, of course, the ethical dimension of rabbinic law that is of greatest interest to us here. The rabbis conducted detailed legal discussions that gave much sharper definition to the features of the just civil society envisioned by the Bible. The Babylonian Talmud, the primary legal compendium of the early rabbis, thus has treatments of such minute matters as the damages one must pay when one's ox gores another person's cow or how to return lost property. Biblical injunctions relating to human security are therefore further refined.

Moreover, an important principle underlying the rabbinic world-view that supports human security is that life in this world is to be celebrated. Thus, it is a divine mandate for all Jews, including the rabbis themselves, to marry, have children, be employed, and participate in the life of the community. One is supposed to enjoy God's world - though once again within the limits set by divine law.³ The rabbis generally reject extreme forms of asceticism. The notion that one achieves closeness to God by retreating from society or by depriving oneself of life's basic needs is generally frowned upon by the rabbis (Urbach 1960).⁴

The rabbinic concern for human security is especially evident in the value the rabbis placed on the

preservation of human life in both their homiletical and legal discourses. For instance, according to a well-known Talmudic statement, preserving one life is like preserving a whole world and destroying one life is like destroying a whole world (*M. Sanhedrin* 4:5). The value placed on human life is also evident in scores of rabbinic legal prescriptions. For example, all divine commandments are suspended for the sake of saving a life - except the gravest prohibitions, such as those against murder, incest, adultery, and idolatry (*B.T. Sanhedrin* 74a-b). The concern for life also underlies the rabbinic view that suicide is a grave sin. In fact, any physical harm that one inflicts upon oneself intentionally is considered sinful (Herring 1984: 74-8). Strict limitations are placed on euthanasia for the same reason (Herring 1984: 78-88). The value for life also comes out in rabbinic restrictions placed on martyrdom, which is justified only in extreme circumstances (*B.T. Sanhedrin* 74b; *M.T. Yesodey ha-Torah* 5).

The focus of rabbinic Judaism on matters of this world led medieval Christians—and Muslims to some extent - to accuse Jews of being 'carnal', of adhering to a religion that lacked spirituality, of focusing on the letter rather than the spirit of the law. But it is precisely this mundane focus that is responsible for the fact that Judaism has so much to say about human security. Moreover, the critics of rabbinic Judaism misunderstood its premises and badly underestimated its spiritual power. Jews did not neglect the realm of the spiritual; rather they defined it in their own way. The spiritual realm was indissolubly linked with the physical. That is, God was to be found in the details of obeying His will and observing His commandments regarding life as lived in this world, not in some nether realm detached from the here and now. Jews did not see a distinction between letter and spirit. Therefore, in Judaism the pursuit of human security is charged with religious meaning.

16.3 Jewish Views on Aspects of Human Security

16.3.1 War and Peace

The field of human security began with the insight that human well-being requires more than freedom from the scourge of war. For decades, it was assumed that this condition was the only one necessary for human security, when in fact much more is required in the economic, environmental, and political spheres. Still, freedom from the hardships of war is an impor-

3 For the imperative to marry, see *B.T. Kiddushin* 29b; *Yevamot* 63a; to have children, see *M. Yevamot* 6:6; *B.T. Yevamot* 61a-64a; to be employed, see *Mekhilta de-R. Shimon bar Yohai* 20:9; *Genesis Rabbah* 16:8.

4 This mundane focus also explains why there is relatively little interest in rabbinic literature in metaphysical speculations on such issues as the nature of God or the afterlife. Interest is placed primarily on life as lived in the everyday world. In the medieval period, however, schools of thought arose in philosophy and Kabbalah that placed greater emphasis on the life of the spirit and the afterlife while denigrating the life of this world.

tant prerequisite for human security and it therefore behoves us to begin by looking at how Judaism deals with this issue.

It might seem that the Hebrew Bible is a poor source for this aspect of human security, because in various passages war is depicted as a divine mandate. In a central passage in Deuteronomy 20, the Israelites are commanded by God to utterly destroy the seven nations that inhabit the land of Canaan so that they can occupy it in fulfilment of the covenantal promise. In wars waged against other nations, inhabitants must first be offered terms of peace. If they surrender they are required to perform forced labour; if they do not, the Israelites are commanded to kill all the males and take the women and children as booty (Deut. 20:10–18). In other passages in the Hebrew Bible, God commands the Israelites to wage perpetual war against the Amalekites as revenge for attacking them after their departure from Egypt (Ex. 17:14–6; Deut. 25:17–19).

There are, however, passages in the biblical text which have a negative view of war. In a lengthy exposition in the first chapters of Amos, the prophet rails not only against Israel's enemies waging war on her, but against non-Jewish nations waging war on each other (Amos 1–2:4). The eschatological passages mentioned earlier also imply an opposition to warfare by painting the idyllic messianic existence as one of peace. Scholars have also noted that I and II Chronicles contain a subtle critique of war (Niditch 1993: 139–49).

Opposition to warfare becomes more pronounced in rabbinic Judaism. There are dozens of rabbinic passages extolling the value of peace. Thus, for instance, the rabbis inform us that “Great is peace for all blessings are contained in it...Great is peace for God's name is peace” (*Num. Rabbah* 11:7). The rabbis interpret the biblical commandment that an altar for sacrifices not be built with stones cut with metal as a symbolic rejection of the implements of war (*M. Middot* 4:3). Even the destruction of one's enemy is not cause for joy. In one Talmudic source, the angels express the desire to praise God in the wake of the destruction of the Egyptian army at the Red Sea, but God rejects them saying: “My creatures are drowning in the sea, and you sing songs of praise?” (*B.T. Megillah* 10b). The opposition to war in rabbinic Judaism is also manifest in how the rabbis dealt with the catastrophic rebellion against Rome in 66–70. The rabbis led by R. Johanan ben Zakai preferred to surrender rather than fight, a view sharply at odds with that of the Zealots (*B.T. Gittin* 55b–56b).⁵

The rabbis do not provide an extensive treatment of the actual laws of war, which is no surprise given that most rabbinic texts were composed when the Jews did not have an army. Nonetheless, their discussions of war reflect their reservations about this issue. According to the rabbis, there are two types of war: wars that are commanded by God and discretionary wars. Wars commanded by God include Israel's war against the seven nations in the conquest of Canaan, the war against the Amalekites, and wars waged in self-defence. Discretionary wars are those meant to increase the prestige and power of Israel (*B.T. Sotah* 44b; Shapiro 1975: 80–3; Gendler 1978: 197–200; Dorff 2002: 164–71).

What is significant here is that, according to these definitions, there is no justification for war in the post-biblical period – with the exception of defensive wars. In the category of commanded wars, the conquest of Canaan is a one-time event. The war against the Amalekites, according to most rabbinic authorities, is not binding in the post-biblical era, at least not in any literal sense (Kimelman 1991: 266). Discretionary wars require consultation with the *urim ve-tumim*, an oracle used in ancient Israel by the High Priest that no longer existed in the rabbinic period. This type of war also required the approval of the Sanhedrin, the major rabbinic court that had been disbanded by the time the Talmud was redacted (*B.T. Berakhot* 3a; *Sanhedrin* 2a, 16a, 20a). Therefore, in effect, the only type of war that can still be waged by Jews is defensive.⁶

Accompanying rabbinic reservations about war and violence is an interesting psychological shift regarding their notions of manhood. Recently, scholars have taken great interest in the fact that the rabbis

5 See Kimelman 1968 for a discussion of third and fourth-century rabbinic sources supporting non-violence.

6 Kimelman argues that discretionary wars are still applicable in the modern era (Kimelman 1991: 265, 282–3). His opinion, however, appears to be in the minority. There is a debate in rabbinic sources about how one classifies a pre-emptive war against an enemy that one fears will attack but has not done so yet. According to one opinion, pre-emptive war is essentially defensive and is therefore permitted. According to another opinion, it is discretionary because the enemy has not yet struck and war cannot be defensive until the threat is actual. Therefore, it is not permitted. Yet, even though rabbinic sources discuss pre-emptive war as a separate category, its permissibility is still dependent on the question of whether or not it is defensive. See *B.T. Sotah* 44b; Gendler 1978: 198–9; Bleich 1989: 251–92; Kimelman 1991: 267–8; Dorff 2002, 167.

tend to exalt those virtues which in many cultures are associated with the feminine, such as modesty, humility, meekness, compassion. At the same time, the rabbis completely redefine the typically male virtues of physical power and bravery in terms of rabbinic ethics. Thus, the rabbis refer to themselves as ‘warriors’ but not in the literal sense; instead, they are warriors of Torah battling each other in intellectual combat to give the best interpretation of God’s laws. Similarly, in numerous rabbinic sources, the great warriors of the biblical tradition, such as Joshua and David, are depicted as pious rabbinic scholars. These observations again attest to rabbinic reservations about violence and war (Boyarin 1997: 1–186).

That the rabbis should have a negative attitude toward war falls in line with what we said earlier about their overall agenda. The rabbis value life in this world in all its mundane aspects and war is clearly inimical to that ideal. It should be emphasized, however, that the rabbis do not seek to repress violence entirely. Violence is mandated to defend the sanctity of life, which is of higher value for the rabbis than non-violence. An individual is allowed to kill in self-defence and a nation is allowed to wage war for the same purpose, as we have already noted. Therefore, the rabbis are not pacifists, if pacifism means non-violence at all costs (Lamm 1978).

The soberness of rabbinic attitudes to war resonates well with present-day discussions of human security. Like the rabbis, theorists of human security generally recognize that states need armies to protect their citizens. However, they also strive to limit war to defensive purposes and to contain its deleterious effects.

16.3.2 Human Rights

If the absence of war is an important condition of human security, human rights are another. Therefore it is imperative that we look at how Judaism has dealt with this issue. There has been a lively debate among modern Jewish thinkers whether from a theoretical standpoint a conception of human rights in Judaism is even possible. Many deny that possibility. One problem, for example, is that in Judaism moral imperatives are defined primarily as duties requiring the performance of specific actions. Human rights, however, are natural and ideally require no action whatsoever; all human beings are born with them automatically. A second problem is that in Judaism duties are commanded by a personal God and He can therefore implement or rescind those norms at will. Human

rights, by contrast, are inalienable and therefore cannot be nullified. A third difficulty is that the Jewish God seems to privilege one group over another by making the Jews His chosen people. Human rights, by contrast, are premised on the notion that all people are equal and that human rights are universal (Breslauer 1993: 3, 8–9; Mittleman 2000: 107–43).⁷

Others claim that Judaism supports human rights. A philosophical argument for this position is that human rights make sense only if their source is a personal and omnipotent God of the kind that Judaism upholds. The whole conception of human rights assumes absolute moral standards and these have to be grounded in a single, all-powerful deity to have universal meaning (Breslauer 1993: 9).

One can also point to Jewish texts as support for the notion of human rights. The Bible informs us in its first chapter that all human beings are created in the image of God. The context of this idea suggests that human beings are divine in the sense that they are given dominion over the earth. They are God-like in that they share His power (Gen. 1:26–28). What this implies is that human beings naturally possess a high degree of dignity and freedom, features essential to a theory of human rights. In fact, the biblical text itself invokes the notion that humans are created in the image of God to explain the prohibition of murder, a prohibition that is in effect a positive formulation of the right to life (Gen. 9:6). These observations provide a response to the argument that Judaism has no conception of human rights because its moral imperatives are dependent on the arbitrary will of God. The divine aspect of human beings is an essential feature of God’s creation which therefore cannot be rescinded (Breslauer 1993: 11–12).

The concern that Judaism speaks only in terms of duties and not rights can be parried by noting that many of those duties *entail* rights. For instance, one cannot be expected to perform duties unless one has the right to act freely. Also, many specific duties in Judaism imply concomitant rights. For example, as just noted, the duty not to murder implies a right to life. The duty not to steal or to return lost objects implies that human beings have a right to property. Thus, while Jewish sources do not use the language of rights, they take positions that often amount to a defence of rights.⁸ Some thinkers concede that Judaism

⁷ This is just a sampling of the difficulties which the notion of human rights raises for Judaism. For a fuller discussion of these and other difficulties, see Breslauer 1993: 3–21.

supports only duties and not rights, but claim that this focus has advantages. Rights alone are only protective of people's interests, while duties go further by demanding that human beings actively seek the good of others (Breslauer 1993: 3, 5, 10, 12; Cohn 1984: 17-9).

In response to the concern that God privileges the Jews over other nations, one can point out that in rabbinic Judaism non-Jews are required to adhere to a series of seven commandments known as the Noahide code given by God to human beings shortly after creation. These commandments, which overlap a great deal with the Ten Commandments, indicate that Judaism believes in moral norms applicable to all humanity (*B.T. Sanhedrin* 56a-60a; Novak 1983; Breslauer 1993: 5).⁹ Moreover, even if many of the other laws of Judaism were not originally meant to be treated as universal, there is no reason why the values which underlie those laws cannot be universalized. If Jews believe that these are divine norms, why should they not be shared with others? After all, Jews view themselves as "priests among nations" (Ex. 19:6), a metaphor implying that Jews are to serve as models of living in accordance with God's dictates.

A historical factor also has to be considered here. We mentioned earlier that Jews seem to have been particularly sensitive to human security because of their long history of persecution and suffering. This would explain the fact that in the last two hundred years Jews have been involved in human rights causes. Jews were at the forefront of the civil rights movement in the United States in the 1960's and the movement to defeat apartheid in South Africa in the 1970's and 1980's. Therefore, regardless of whether Jewish sources speak explicitly about human rights, Jews have taken up that cause on account of their history (Breslauer 1993: 5, 13).

A treatment of how Judaism supports specific human rights is well beyond the parameters of our discussion here.¹⁰ However, it is instructive to look briefly at how Judaism developed safeguards against tyrannical government because such protections are basic to human rights in our own day and age.

On the one hand, many Jewish sources seem to encourage the potential for tyranny by investing hereditary kingship with great power. The central legal source in the Hebrew Bible that discusses government is Deuteronomy 17:14-20, and it assumes that kingship is the only legitimate form of government for the Israelites. Later rabbinic and medieval authorities also endorse monarchy as the preferred form of government. Some authorities give Jewish kings substantial powers - legislative, judicial, and executive - even though kingship technically did not exist in the post-biblical era and rabbinic discussions of this institution are therefore only theoretical. According to some medieval authorities, kings are even allowed to amend Jewish civil law. For some, that authority applies to criminal law as well (*M. Sanhedrin* 14:12, 18:6; *M.T. Melakhim* 3:1, 5:1-3, *Rotseah* 2:4; Elon 1974a: 30; Kimelman 1995:199-201; Walzer/Lorberbaum/Zohar 2000:108-65).¹¹

On the other hand, there is a strong countervailing tendency in Jewish sources which seems to recognize the dangers of one-man rule. In the same passage in Deuteronomy that identifies kingship as the only form of government for the Israelites, several restrictions are put on the king to check his despotic tendencies. He is limited in the number of horses he may own, the number of wives he can marry, and the amount of gold and silver he may acquire. He must also commission the writing of a Torah scroll and study its contents thereby demonstrating his subservience to God (Deut. 17:15-20). Such restrictions are impressive in light of the widespread view in the Ancient Near East that kings were gods. In I Samuel, when the Israelites ask the prophet Samuel for permission to appoint a king over them for the first time, they are warned explicitly about the tyranny that accompanies monarchic rule (I Sam. 8:10-18). Reservations about monarchy and its tyrannical potential are also expressed by rabbinic and medieval authorities (*Sifre Deut.* 156; *Deut. Rabbah* 5:11; Kimelman 1995: 199-201; Walzer/Lorberbaum/Zohar 2000:108-65).

Most interesting is that Jews in the medieval period often opted for a quasi-democratic form of government. As mentioned earlier, Jewish communities in this period were generally allowed to install their own governments and run their own internal affairs. Rabbinic authorities justified the authority of these governments by claiming that Jewish communities

8 This issue is also dealt with extensively by Novak (2000) who proposes his own solution.

9 There are disagreements as to which commandments are included in the list of seven. One common list includes the prohibitions against idolatry, blasphemy, bloodshed, sexual sins, theft, and eating from a living animal, as well as the positive injunction to establish a legal system.

10 See Cohn 1984 who attempts to do this.

11 However, Jewish law involving ritual, family laws, marriage, and divorce were always under the exclusive jurisdiction of the rabbis

possessed the legal status of kings. That is, the authority held by the monarchy in biblical times was now transferred to the Jewish communities as a whole. In many instances, medieval Jewish communities elected their leaders, so that the powers of the king now resided effectively in those representatives. Thus, monarchy was replaced by democracy. Some rabbis even allowed elected leaders to make amendments to Jewish civil law just as in former days a Jewish king could (Elon 1974a: 31, 1974c: 645, 1983: 188–91; Walzer/Lorberbaum/Zohar 2000: 379–439).¹²

One should not exaggerate the democratic element in medieval Jewish government. In many communities, Jewish communal leaders were not elected but appointed. In those communities in which leaders were elected, communal amendments had to meet the approval of established local rabbinic authorities so that there was no notion here of a clean separation between church and state as one finds in a modern liberal democracy (Elon 1974b: 659–60). Practices also varied as to who could vote. Some rabbinic authorities argued that all members of the community had an equal vote, while others claimed that only members with wealth, prestige, and learning could vote or that the vote of such members should have greater weight (Elon 1983: 196–99). Still, it is impressive that many medieval rabbinic authorities supported democratic elements in Jewish governance.

Biblical and rabbinic literature do not support a theory of political rights in the modern sense, nor should we expect them to, seeing as they are written before such rights were conceived of. Nonetheless, the Jewish tradition contains a strong and consistent voice recognizing the dangers of tyrannical government, and medieval authorities even encouraged a limited form of democracy. Thus, if Jewish sources do not explicitly support a modern conception of political rights, they certainly contain ingredients essential to that conception.

16.3.3 Poverty

If there is any test of a society's commitment to human security, it is in the treatment of its most impoverished members, and it is therefore to this issue that we turn in the final portion of our discussion. Judaism has a great deal to say about the treatment of the poor. Interest in this question is tied in with a larger concern in Judaism for society's oppressed and underprivileged, a sensitivity that has its source in the foundational events of Jewish history. As noted earlier, the beginning of Jewish nationhood is marked by the slavery of the Israelites in Egypt, an experience that leaves an indelible imprint on Jewish consciousness. Jewish texts from the Bible onward constantly invoke this experience as the source of numerous imperatives to care for society's needy on the premise that Jews should be sensitive to suffering on account of the hardships they themselves endured. The importance of these imperatives is underscored by the fact that in a number of biblical passages, God Himself is depicted as the defender of the poor and the oppressed, and He will lash out at the Israelites with severe punishments if they are callous to them (Deut 10:17–8, 24:15; Ps. 145:15–16, 132:15).

In the Hebrew Bible, caring for the poor is mandated by an extensive series of divine laws formulated specifically for an agricultural society. Farmers are required to refrain from harvesting the corners of their fields so that the produce in those areas can be claimed by the poor (*pe'ah*). Sheaves or fruit forgotten while harvesting also go to the poor (*shikhehah*), as do sheaves that fall from the farmer's sickle (*leket*) (Deut. 24:10–21). A tithe is designated for the poor every third and sixth year of the sabbatical cycle (*ma'aser 'ani*) (Deut. 26:12). In the sabbatical year, farmers are required to let their fields lie fallow and all produce that grows naturally on the land is to be gathered by the needy (Lev. 25:9–15). Care for the poor is not just for fellow Israelites. Numerous statements mandate proper treatment of 'the stranger'. Here too the memory of the Egyptian slavery is key. Israelites must not mistreat the stranger, because the Israelites themselves were strangers in Egypt (Ex. 23:19).

In the books of the Prophets, concern for the poor takes centre stage. The prophets were primarily social reformers who railed against the moral injustices of Israelite society. A chief concern of theirs was injustice that victimized the impoverished. Here there is no new legislation, only an attempt to enforce the old laws and the spirit of justice and compassion that underlies them.¹³

12 According to another approach, some Halakhic authorities recognized the community as having the status of a rabbinic court. Communal amendments were therefore justified because the community as a whole effectively had rabbinic authority. Another important precedent for conferring authority on communal leaders in matters of Halakhah is found in Talmudic sources which recognize that "the townspeople" (*benei ha-'ir*) could impose legislation on themselves regarding monetary matters (Elon 1974c: 645, 1983: 188–91; Walzer/Lorberbaum/Zohar: 378–439).

The importance of charity is carried over in rabbinic and medieval Judaism. According to one Talmudic passage, for example, charity is as important as all other commandments combined (*B.T. Bava Batra* 9a). The theological justification for charitable giving is that all wealth ultimately belongs to God and that human beings are only the stewards or guardians of that wealth. Therefore, God has every right to command us to give charity since our possessions really belong to Him in the first place and He has the right to determine who should have them. Some Jewish thinkers infer from this logic that a person who does not give charity is a thief (*M. Avot* 3:8; *B.T. Ketubot* 67b, *Sanhedrin* 39a; Sherwin 2000: 140–3).

The challenge for rabbinic authorities was to adapt the laws of charity to a commercial rather than agrarian economy. Rabbinic law specifies that the amount one should give to charity is ten percent of one's income (*B.T. Ketubot* 50a; *M.T. Matenot Aniyyim* 7:5). Furthermore, people at all economic levels are included in the imperative to give charity. Even the poor person who is dependent on charity is required to give a portion of his income to others (*B.T. Gittin* 7a). Rabbinic authorities recognize the fact that in charitable giving, choices need to be made given the volume of need and the limitations on resources. Rabbinic sources therefore establish a number of priorities. One is first required to support the needy in one's family, then those in one's city, and finally those outside one's city (*M.T. Matenot Aniyyim* 7:13). Another premise is that those who are most vulnerable must be cared for first. Thus, women take priority over men, and orphans take priority over people with family.

The rabbis have a good deal to say about the manner of giving. A common refrain running through a number of rabbinic texts is that charitable giving should be done in a way that is mindful of the dignity of the recipient (*J.T. Pe'ah* 8:9, 21b; *B.T. Hagigah* 5a). For this reason, it is preferable to give anonymously so as to avoid any potential embarrassment for the recipient (*B.T. Bava Batra* 9a, 10a; *Ketubot* 67b; *Ta'anit* 21b–22a). The same reasoning underlies a number of opinions which claim that the greatest form of charity is in the form of a loan or entering into a partnership with an individual. Here the dignity of the recipient is preserved through a façade of self-sufficiency (*B.T. Shabbat* 63a, 66a; *M.T. Matenot Aniyyim* 10:5).

One of the most remarkable accomplishments of medieval Judaism with respect to the treatment of the

poor is the welfare system that Jewish communities set up to deal with those in need. Most medieval Jewish communities had communal funds for charity supported by a compulsory tax that was levied by Jewish communities on all their members (*kupah*) (*M.T. Matenot Aniyyim* 10:5). Many communities also had soup kitchens (*tambuy*) (*M.T. Matenot Aniyyim* 9:13).

Finally, it should be mentioned that early rabbinic sources recognize the need to support the non-Jewish poor in addition to supporting Jews. While technically, rabbinic laws of charity do not apply to the support of non-Jews, a Talmudic source decrees that one must do so "for the sake of peace" (*mipney darkhey shalom*) (*B.T. Gittin* 61a).

The sources summarized here provide a rich body of material that can be applied in any number of ways to human security in the modern era. Most obviously, Judaism's overall concern for the poor is right in line with human security in that Judaism clearly obligates a society to provide basic needs for its poor and most vulnerable members. Judaism also exhibits a balanced and nuanced perspective on how that help is delivered. The Jewish model for dealing with poverty is neither socialist nor capitalist in orientation but something in between. Some degree of state or communal participation is necessary to ensure that the poor are cared for. Thus, taxes are levied to support a welfare system. On the other hand, it is not the goal of Jewish law to redistribute and equalize wealth. Rather, society provides the poor with their basic needs so that they can be empowered to succeed on their own. As we saw, the highest form of charity is not to dole out money to the poor, but to form a business partnership with them (Tamari 1987: 277).

One may also speculate on how the priorities of charitable giving in Judaism would be applied in the modern world. As we noted, one is required to give to local charities before supporting those in other cities. This would suggest that foreign aid be given a much lower priority than aid to those in one's own locale or country. Yet, in a world of mass communications, international travel, and globalization, one could argue that the distinction between local and foreign communities is harder to make and that therefore we should give a relatively high priority to international aid. One could also ask how the highest form of charitable giving in Judaism could be implemented on a global scale. If the best type of charity is to enter into business partnerships with the poor, this would mean that richer nations should help poorer nations not by giving them money but by cultivating shared economic

13 This theme permeates prophetic writings. See, for instance, Isaiah 1:10–16.

interests and developing industries from which both can benefit.¹⁴

16.4 The State of Israel

A final question that needs to be considered is that of the State of Israel. Israel is at the centre of tensions between the Muslim world and the West, and many see Israel as a danger to human security not just in the Middle East but elsewhere. However, it is questionable whether a discussion of Israel is relevant here. The focus of the present discussion is conceptions of human security in Jewish religion, and Israel is a mostly secular state. The majority of those who founded Israel were secular Zionists motivated more by nationalistic than by religious motives. Today, the law-system and government of Israel are mostly secular. Eighty per cent of the Israeli population is not only secular but tend to be hostile to the influence of religion in public affairs. This is not to say that religion has no influence in Israel. The Israeli parliament contains religious parties that have exerted significant influence in recent decades. Rabbinic courts also govern on personal status issues, such as marriage, divorce, and child custody. However, the religious parties in Israel are relatively small, and the power of the rabbinic courts over personal status issues, while certainly relevant to issues of human security, is of limited significance for our topics. One could also argue that when Judaism does play a role in Israeli politics, in most cases it is in more of a cultural sense than a strictly religious one. Most important, Israel's policies on the major issues we have discussed – war and peace, human rights, and poverty – are not determined by Jewish religious sources.¹⁵

The one group in Israel that has brought politics together with religion in a manner relevant to our concerns is the religious Zionist movement. According to many of its adherents, the founding of the State of Israel is the beginning of the messianic redemption that will eventually result in a state governed by Jewish law. This philosophy has spawned the settler movement which believes that Israel must expand its borders to include the territories captured in the 1967 War since,

according to rabbinic sources; these lands are designated to be part of the future messianic kingdom. The most extreme members of this group support an aggressive policy toward the surrounding Arab states and the denial of rights to Palestinians in Israel and the West Bank. Some even advocate their expulsion altogether so as to create a purely Jewish State in preparation for the Messiah.¹⁶

This viewpoint is clearly inimical to conclusions drawn earlier in this discussion. It is an approach that is religious in its origins but far more bellicose and far less generous on the issue of human rights than the positions I have identified with mainstream Judaism. This should occasion no surprise. As I pointed out at the beginning of this discussion, Judaism is an ancient and complex religion that speaks with many voices, and therefore the settlers can find justification for their viewpoint with their own peculiar understanding of Jewish sources. Still, I stand by my analysis as the one I believe to be most in agreement with mainstream Judaism. Furthermore, the number of Jews in Israel who represent the position of the settlers is relatively small and therefore not representative of Jews either in Israel or in the Jewish Diaspora. It is only because of their strategic importance in the contentious relationship between Israelis and Arabs that they often appear to outsiders as more representative of Judaism than they actually are.

16.5 Summary and Conclusions

In conclusion, Judaism is supportive of human security in its overall orientation and in the specific topics we have analyzed. Biblical and rabbinic sources express a mostly positive, even zesty attitude toward life in this world. It is a divine gift that we are invited to enjoy. Human physical well-being is therefore nothing less than a religious ideal. That viewpoint is embodied in Jewish approaches to war and peace, human rights, and poverty. This does not mean that Judaism speaks with one voice. Much depends on how the sources of Judaism are interpreted, and for this reason some religious Zionists in Israel take positions that in key respects are at odds with those I have sketched out. Still, I believe that the evidence adduced here supports the conclusion that mainstream Judaism sees human security as an exalted religious ideal and values human security in its many facets.

14 A number of studies attempt to apply the laws of charity in Judaism to modern social and international policies: see, for example, Tamari 1987; Levine 1993; Dorff 2002: 126–59.

15 There is an extensive literature on the relationship between religion and state in Israel. Some of the more recent studies include Sharkansky 2005, 2000; Efron 2003; Cohen/Susser 2000.

16 Studies of religious Zionism include Sprinzak 1991; Ravitzky 1996.

17 From Homer to Hobbes and Beyond – Aspects of ‘Security’ in the European Tradition

J. Frederik M. Arends

*‘prosthe leôn, opithen de drakôn,
messê de chimaira¹
deinon apopneiousa puros menos
aithomenoio’ (Homer)*

17.1 Introduction²

To study the history of concepts seems the innocent pastime of philological hobbyists. At least in the case of the concept of ‘security’ that judgment might prove to be a misunderstanding. The history of ‘security’ has two phases: the first, in which the word coined by the Romans as ‘securitas’ and accompanied from the beginning by ambivalence and religious connotations at the end of the Middle Ages had conceded most of its territory to ‘certitudo’; the second, starting in the times of Thomas Hobbes in which the word became one of the paradigmatic ‘great words’ of the modern state. In this second phase, ‘security’ became associated with the genesis of the authoritarian ‘super state’ – Hobbes’ *Leviathan* – committed to the prevention of civil war. Surprisingly, in this phase an ancient Greek concept was revived, functioning during Athenian imperialism of the fifth century B.C.; especially Thucydides, Hobbes’ favourite classical historian, influenced its modern, ‘Hobbesian’ meaning. The contemporary concept of ‘security’ therefore proves to be a ‘chimeric’ combination of a) the ancient Athe-

nians’ intention to prevent the destruction of their empire, b) the religious connotations of Roman ‘securitas’, and c) the Hobbesian intention to prevent civil war.

When writing about ‘security’ in the European tradition, one is confronted with the long history of this concept and with the relevance of its contribution to European and even contemporary global political philosophy.³ This chapter accentuates the connection between Thomas Hobbes and the ancient Greek historian Thucydides (fifth century B.C.) making necessary an *excursus* beyond Latin ‘securitas’ to the Greek precursor of ‘security’: ‘asphaleia’.

17.2 ‘Securitas’: Evolution of the Term and the Concept

17.2.1 Latin Roots

‘Security’ is derived from Latin ‘securitas’, a word itself composed from the elements ‘se-’ (‘without’) and ‘cura’ (‘care, carefulness, concern’).⁴ Translated care-

1 Homer (1924–1925), *Iliad* VI, 181–182; “in the fore part a lion, in the hinder a serpent, and in the midst a goat, / breathing forth in terrible wise the might of blazing fire” (translation S. Butler); English ‘chimera’ is derived from these lines in Homer, where the *chimaira* – initially simply meaning ‘goat’ – appears as a composite monster.

2 In the following the author uses ‘securitas’ and ‘security’ where the word itself is meant, as ‘signifiant’, i.e. as combination of sounds/letters; we will however write securitas and security where the ‘signifié’ is meant, the ‘object’ intended and denoted by the word.

3 For this study we make frequent use of the works by Kaufmann (1973) and Schrimm-Heins (1991, 1992). As both wrote in German, quotations will be given in English. Hobbes will be quoted according to the Molesworth Edition (1839–1845); where clarifying, Thucydides will be quoted in Hobbes’ translation (Molesworth Edition, English Works, vol. 8 and 9).

4 See Lewis/Short (1958). Latin has more comparable words: *secessio*, *secretio*, *secubatio*, *seditio*, *seductio*, etc.

fully, 'securitas' means 'freedom from care, unconcern, composure'. 'Freedom from care' may or may not have a basis in 'objective reality'; where that basis is given, 'securitas' already for the ancient Romans means 'freedom from danger, safety, security'; where that basis fails, 'securitas' means 'carelessness, heedlessness, negligence'. These possibilities make that from the beginning 'securitas' has in the European tradition been appreciated both positively and negatively.

With 'cura' or 'care' and 'securitas' or 'freedom from care' not just an arbitrary aspect of human life is mentioned; 'securitas' refers to a group of emotions – and corresponding words – to which also belong 'fear', 'fear of death', and their complement: 'trust', 'confidence' etc. Religion also is involved in these kinds of emotions. That explains why already in the earliest phase of the history of 'securitas' an intense – if negative – connection of the adjective 'securus' with religion may be observed: in the philosophical poem *De Rerum Natura* by Lucretius (c. 94–55 B.C.; Hammond/ Scullard 1970: 622). The connection with religion and the semantic influence of religion on the concept of 'securitas' is found also in later periods of European history, long after the Roman Empire. Because of this longstanding connection, the history of 'security' cannot be written without considering its meaning in the context of ancient Roman religion, and Christian religion and theology.

It is usual to connect 'securitas' with the name of the Roman statesman and philosopher Cicero (106–43 B.C.), the first author in whose work the word occurs; it is further usual to connect 'securitas' with Greek 'ataraksia' (Makropoulos 1995: 745 ff.). *Ataraksia* had an important place in the ethics of the hellenistic philosopher Epicurus (341–270 B.C.; Hammond/Scullard 1970: 390–392), who considered *ataraksia* ('impassiveness, calmness')⁵ as the necessary condition for attaining 'the ultimate good' of *eudaimonia* (true, full happiness); in scholarship it is generally supposed that centuries after Epicurus the Romans starting from 'ataraksia' coined 'securitas', as analogy of 'ataraksia'.⁶

So we have to go back to the pre-Roman roots of 'securitas'. The following might help us to recognize the importance of this: Epicurus' most important Roman 'disciple' was Lucretius, who based on Epicurus' materialist theory of atoms argues in his *De Rerum Natura* that it is irrational to be afraid of death. Epicurus' and Lucretius' atomism, all too easily interpreted as atheism, was not appreciated in the Christian Europe following Roman Antiquity. However, in the 17th century a renaissance of the study of Lucretius took place; central in that renaissance was Gassendi (1592–1655 A.D.) who during the eleven years of Hobbes' exile in Paris was his intellectual *intimus*. With Hobbes starts the second phase in the history of 'securitas', its 'renaissance', during which 'securitas' – developing into English 'security' – became the central goal and standard of the modern state. Considering the intense intellectual contacts of Gassendi, as the initiator of the revival of Greek atomism, with Hobbes searching a scientific foundation for his anthropology and political theory, a foundation independent of party strife, it seems inevitable to go back beyond Cicero to the ancient Greek atomistic tradition as received by Hobbes.

17.2.2 Greek Roots

There however is still a better reason to go back to the Greeks. In the time before his Parisian exile, Hobbes as a man of 40 years published his translation of the Greek historian Thucydides (c.460–c.400 B.C.). For Hobbes' intellectual genesis no classical author was of greater importance than Thucydides, *the* historian of Athenian imperialism of the 5th century B.C.⁷ Athens' empire in Thucydides' opinion perished from inner causes, as Athens was afflicted by civil war. Thucydides characterizes the imperialist Athenians as men who – when confronted with the threat of rebellion and revenge coming from their subjects – do everything required to avert that Athens will be *overthrown*. In the final phase of Athenian imperialism, not *glory* but *security* is the central goal of Athenian politics.⁸ The Greek word used to denote 'security' is '*asphaleia*': "security against stumbling or falling"

5 See Liddell/Scott (1961), s.v. *ataraksia*; cf. *ataraktos*: 'not disturbed, without confusion, steady'.

6 '*Ataraksia*' and 'securitas' are both composites beginning with a negation: the Greek word with an 'alpha privans', the Latin with 'se' ('without'); 'taraksia' is derived from Greek 'tarassein' (Little/Scott 1843, 1961): "to stir, trouble the mind, agitate, disturb".

7 On Thucydides and Athenian imperialism, see the classical monograph by de Romilly (1947); on Hobbes and Thucydides, see Tönnies (1925: 6 ff.); Strauss (2001: 51 ff.); Martinich (1995: 224–228). For a recent discussion, see Podunavac (2000–2001).

8 Thucydides (I, 75–76) mentions three motives for Athenian imperialism: honour, fear, and advantage.

(Liddell/Scott 1843, 1961), the capacity to prevent that one will be overthrown – a term originating from wrestling.

In this chapter our hypothesis will be that the renaissance – and even triumph – of ‘security’ since Hobbes was caused by Hobbes’ intertwining Greek ‘*asphaleia*’ – as understood in the context of Thucydides’ anthropological and political views – with Democritean-Epicurean atomism and with Lucretian ‘anti-clericalism’, as mediated to Hobbes by Gassendi. To understand the triumph of ‘security’ since Hobbes, we have to go back – beyond ‘*securitas*’ and even beyond Epicurean ‘*ataraksia*’ – to classical Greek ‘*asphaleia*’ from the 5th century B.C.

‘*Asphaleia*’ is composed from *a-* (a negation) and the root *sphal-* also occurring in the verb ‘*sphallô*’ that means “make to fall, overthrow, *properly* by tripping up, trip up in wrestling” (Liddell/Scott 1843, 1961); primarily associated with wrestling, ‘*sphallô*’ is also used metaphorically: Liddell and Scott (1843, 1961) mention *sphallousi tas poleis* as “they make to fall their city-states” (Thucydides (1919-1923), III. 37).

17.2.3 ‘Security’ in Homer and Thucydides

In Homer, some three centuries before Thucydides, the connexion of ‘*sphallô*’ with wrestling still is clear (*Ilias* XXIII, 719); the adjective ‘*asphalês*’, derived from ‘*sphallô*’, here also is found as meaning “not liable to fall, immovable, steadfast”; it is said about Mount Olympos, that “there is the always *asphales* seat of the gods” (Homer 1919, *Odyssey* 6. 42); in fact, looking beyond the superficial translation of ‘*asphalês*’ as ‘immovable’, it is said there that the Olympos “may never be tripped up”.

The substantive ‘*asphaleia*’ becoming so important in Thucydides does not occur before the 5th century B.C., meaning “security against stumbling or falling” (Thuc. III 22), “steadfastness, stability, assurance from danger, personal safety”; its opposite is *kindunos* or “danger” (Liddell/Scott 1961).

So ‘*sphallô*’ originally is associated with wrestling, and from here additional meanings develop. ‘*Asphalês*’, derived from ‘*sphallô*’, already in Homer and Hesiod (1999, *Theogony*: 137) has more ‘solemn’ connotations than just ‘trip up’, as it refers to the ‘steadfast abode’ of the gods. In Sophocles’ *Oedipus Tyrannus* (51) from the middle of the 5th century B.C., ‘*asphaleia*’ refers to the ‘stability’ of the city-state. In the course of time the prestige of ‘*asphaleia*’ apparently increases.

Forms of ‘*sphallô*’, ‘*asphalês*’ and ‘*asphaleia*’ are frequent in Thucydides.⁹ This chapter just focuses on one characteristic example, which requires a sketch of its political and historical context. The basis of fifth century Athenian imperialism was its thalassocracy over the eastern part of the Aegean Sea; after the victorious naval battle of Salamis (480 B.C.), a Greek maritime alliance under the hegemony of Athens soon developed into an organization in which initial allies became tributary subjects. The formula of Athens’ empire was surprisingly simple: a few years after the expulsion of the Persians from the Aegean, the smaller city-states substituted their laborious *in natura* contribution (ships-plus-crew) by paying an amount of money, in order to finance the building of new ships built in Athens and manned by Athenian citizens; here the basis was laid for Athenian *democratic* imperialism; democracy and imperialism proved compatible.

As the reluctance of the allies against their membership increased, the Athenians started using the ships co-financed by the allies to compel unwilling allies to continue the payment of their contributions. In this way Athens’ former allies became its subjects, who however continued to be called ‘allies’. All this happened in the years 480-430 B.C., known as the ‘Pentekontaëtia’ or the ‘The Fifty Years’ which with good reason are considered as the culmination of Athenian culture.

In the course of these years, Athens’ motives for developing and maintaining its empire changed: from initial *freedom of the Hellenes* (from the Persians) to *glory* (of Athens) to *the desire to maintain and consolidate power*; in the final phase, as the repugnance of the ‘allies’ developed into hatred, the *need to protect Athens against the revenge from the side of the ‘allies’* became the paramount motive. It is at this point that ‘*asphaleia*’ or ‘security’ appears in Thucydides’ history of the decline and fall of the Athenian Empire during the ‘Peloponnesian War’ (431-404 B.C.).

The necessity of *asphaleia* compelled Athenian imperialism to radicalization: Athens could only defend itself if it might pay ships and crews; the money required for that had to come from the ‘allies’. As these became more rebellious and dangerous, Athens had to impose higher tributes for building and manning a fleet mainly used for repressing the ‘allies’

9 Tufts University website, at: <www.perseus.org>, mentions 29 occurrences in Thucydides of *asphaleia*, 58 of *asphalês* and 52 of *sphallô*.

financing this fleet: the allies were trapped. Their sole hope was Sparta, not – as fifty years before – to ‘liberate the Hellenes from the Persians’, but to liberate them from the Athenians. That liberation was the goal of the Peloponnesian War.

As an effect of this war, the Athenians developed an amoral and practically atheistic view of man, gods, and world; as a consequence, we owe to Thucydides the first description of ‘Realpolitik’ and of a notion which in the course of time proved to be essential to Hobbes’ interpretation of ‘security’: the *bellum omnium contra omnes*, the ‘war of all against all’, as civil war leaves no room whatsoever for neutrality; and the insight so important to Hobbes that civil war perverts our speaking and thinking, so that in civil war intellectual impartiality becomes impossible; and finally the argument of the irrelevance of the gods, as these either do not exist or have made the world as it is, so that we are justified to do whatever we do.

In the ‘dialogue between Athenians and Melians’ (Thucydides 1919–1928, *Histories*, V, 87–111), one of the great texts of world literature, *asphaleia* plays an important role. Although the Athenians in the course of years have gained control over the islands in the Aegean, the islet of Melos remained independent and neutral in the conflict between Athens and Sparta. But neutrality of an islet situated in their ‘backyard’ is something which the Athenians consider not to be permissible, as it might be a precedent for Athens’ subjects; if neutrality is allowed at all, Athens’ subjects also will claim neutrality, and so will stop financing the Athenian fleet; in that case Athens will be exposed to revenge from the subjects. Melos therefore has to resign its neutrality. In this context *asphaleia* appears as an argument.

The Athenians argue (Thucydides 1919–1928, V: 91) that they fear less the subjection by Sparta than revenge from their own ‘allies’. As the ‘allies’ would interpret Melos’ neutrality as a sign of weakness of Athens, the Athenians see no possibility furthermore to allow Melos its independence: “the ‘allies’ think that it is from fear if we do not attack you; so by your subjection you would not only contribute to the expansion of our empire, but also to its *security* (to *asphales*)” (Thucydides 1919–1928, V: 97).¹⁰ The

Athenians make no effort to ‘justify’ their attack on Melos’ neutrality. So the Melians conclude that the Athenians will attack because they consider this to be *advantageous* (*ksumpheron*; Thucydides 1919–1928, V: 90). In that case however, the Melians have another argument: for Athens it is rather advantageous to maintain the existing rules of conduct between city-states, just in case the Athenian empire should ever be ‘tripped up’ and its subjects were to take revenge: “maintaining law is also in your interest, because, if ever you are tripped up (*sphalentes*), you would be for the others a warning example of most bitter revenge” (Thucydides 1919–1928, V: 90).¹¹ The Melians here allude to the consciousness of the Athenians that in their case ‘*asphaleia*’ means to prevent that the ‘allies’ take revenge and ‘trip up’ Athens and its empire; by using ‘*sphalentes*’ the Melians in passing allude to the etymological background of ‘*asphaleia*’: derived from ‘*sphallō*’ or “trip up, bring to fall”.

The Athenians do not adopt the Melian argument: the hatred of the ‘allies’ and the warning coming from the Melians only are arguments for further radicalization of Athenian imperialism (Thucydides 1919–1928, I: 75–76). The Melians continue to argue about *security* (*asphaleian*, Thucydides 1919–1928, V: 98): it is in the interest of the *security* of the Athenians, argue the Melians, to keep the number of Athens’ future enemies as small as possible (Thucydides 1919–1928, V: 99). Finally, the Athenians conclude that the Melians do not want to understand that advantage (*ksumpheron*) and security (*asphaleia*) may well be combined (Thucydides 1919–1928, V: 107): “So you do not believe that advantage is closely connected with security.”¹²

Twenty centuries later, Hobbes will write that in the *bellum omnium contra omnes* language also is misused, as an instrument in political strife. Thucydides’ clearest description of the political instrumentalization of language is to be found when he writes on civil war at Corcyra (Hobbes 1839–1845, III, 82–83); but in the “dialogue with the Melians” too the political manipulation of language appears, e.g. in the Athenian ‘re-interpretation’ of ‘justice’: to the argument of the Melians that because of the justice of their cause they feel entitled to support from the gods, the Athenians answer that their own behaviour

10 Hobbes (1839–1845a) translates: “So that by subduing you, besides the extending of our dominion over so many more subjects, we shall *assure* it the more over those we had before” (vol. 9, p. 101). As Kaufmann (1973: 72, n. 22) remarks, Hobbes in his early work alternates between ‘safety’ and ‘security’.

11 Hobbes (1839–1845a): “you shall else give an example unto others of the greatest revenge that can be taken, if you chance to *miscarry*” (vol. 9: 100).

12 Hobbes (1839–1845a): “You think not then, that what is profitable must also be safe” (vol. 9, 105).

also is in harmony with human nature, and therefore ... just (Thucydides 1919–1928, V: 104–105). The Athenians give a new meaning to ‘honour’ and ‘dishonour’: real ‘dishonour’ is to cause one’s own destruction; therefore the Melians will behave in a ‘dishonourable’ manner if out of ambition they make the wrong choice between war and their own *security* / *asphaleia* and if they do not subject themselves to Athens (Thucydides 1919–1928, V: 111, §4); only that behaviour is *honourable* which contributes to the *survival* of one’s city-state; a fool is he who, when confronted with a more powerful adversary, hopes for divine support (Thucydides 1919–1928, VIII: 27, § 2–3). If confronted with a more powerful adversary, one has to subject oneself, in order not to jeopardize the survival of one’s city-state. The security/*asphaleia* – understood here as ‘survival’ – of one’s city-state is the ultimate criterium of politics; so Athenian imperialism however violent is *eo ipso* honourable, contributing as it does to Athens’ survival: ‘right or wrong, my Athens’. Morality is deduced here from politics which itself gets its standard from *asphaleia* understood as a polis’ ‘not being tripped up’, not being a loser in the ‘catch as catch can’ of inter-polis politics.

This sketch of ‘*asphaleia*’ in Thucydides could show us that young Hobbes, when developing his concept of ‘security’, adopted the disillusioned view of human nature characteristic of late-democratic imperialistic Athenians in their ‘dialogue’ with the Melians. The concept of ‘security’ or ‘*asphaleia*’ applied in Thucydides to the external relations between Greek city-states was adapted by Hobbes to the internal relations of a state: ‘Interpret the wars between sovereign Greek mini-states as one and the same conflict *involving all Hellenes*, and you witness a civil war between Hellenes bound to go on and on, until finally an omnipotent sovereign appears: Philip of Macedon’. As Thucydides went through the school of Greek sophistics (Guthrie 1969, III: 84 ff.), one finds in his work an illusionless view of reality which, when reappearing twenty centuries later in the work of Hobbes, is welcomed by those less familiar with Greek Antiquity as the ‘starting point of modernity’. In fact Hobbes’ intellectual attitude might with equal right be understood as renaissance of the Greek ‘Enlightenment’ connected with the ‘First Sophistic Movement’.

When one considers the frequency of ‘*sphallô*’, ‘*asphalês*’ and ‘*asphaleia*’ in Thucydides, and considers that the link of ‘*asphaleia*’/‘*asphalês*’ with ‘*sphallô*’ / ‘to trip up’ (Liddell/Scott 1961) is alluded to by the author himself, it seems clear that for Thucydides the leading metaphor for the security of a state is derived

from wrestling. By doing so, he continues a tradition originating from Homer. For the Athenian politicians portrayed in Thucydides, ‘*asphaleia*’ means to prevent that Athenian thalassocracy is ‘tripped up’ by lack of ships to defend Athens against its rebellious subjects. Greek ‘*asphaleia*’ lacks the ambivalence (‘objective security’ *versus* ‘illusion of security’) which until Hobbes will remain characteristic of Latin ‘*securitas*’.

Before we pass to ‘*securitas*’, some remarks still have to be made about the Greek notions of ‘*ataraksia*’ and ‘*apatheia*’,¹³ the first of which generally is thought to have been inspiring Latin ‘*securitas*’.¹⁴ Speaking generally one might say that Greek philosophy until Aristotle (384–322 B.C.) started from and returned to the *polis* (city-state), as it was the *polis* within which *eudaimonia* – as focus of philosophical thinking about man – eventually was possible. During Hellenism however, after the death of Alexander the Great (356–323 B.C.), things changed: previously responsible citizens of small city-states became apolitical subjects of big monarchies.

The notion ‘*apatheia*’ (‘freedom from emotion’, Liddell/Scott 1961), central in Stoic philosophy, may be understood as ultimately inspired by Socrates (469–399 B.C.), the Athenian *philosopher* who considered himself to be the only true *statesman* of contemporary Athens (see Plato 1961, *Gorgias*, 521d7–8); in the Stoa a certain concern of philosophy with the state remains discernible. Quite different however the philosophy of Epicurus (341–270 B.C.), where an apolitical tradition starts which silently assumes that the general interest has been managed well enough by the state at large, so that individual man – and certainly the philosopher – has no responsibility for his *polis*; the privatized individual may spend his life pursuing his particular *eudaimonia*. Revealing is the famous dictum *lathe biôsas* or “live inconspicuously” attributed to Epicurus. Previous philosophical theory now was ‘reorganized’, from an almost imperialistic conquering the structures of knowing and being, and applying them to the *polis*, to acquiring such concepts about world, gods, and man as may most contribute to one’s private happiness. Democritus’ theory of at-

13 On ‘*ataraksia*’, see Reiner (1971); on ‘*apatheia*’, see Engelmeier (1971).

14 According to Winkler (1939) ‘*securitas*’, having its philosophical origins in Epicurus (1993), for the first time occurs in Cicero and Lucretius, meaning the same as ‘*ataraksia*’: ‘freedom from pain, pleasure in tranquillity’; see Kaufmann (1973: 65, n. 4). ‘*Securus*’ occurs 5 times in Lucretius (III, 208, 935, 976; V, 82; VI, 62), ‘*securitas*’ however does not; see at: <www.perseus.org>.

oms by Epicurus was ‘tailored to measure’, not from theoretical interest but because here a theory was offered which might serve as a foundation for ‘tranquility of mind’: if essentially ‘there are only atoms and vacuum’ (Democritus), either gods do not exist or they too have to be explained on this basis. In that case however, the reason for our fear of the gods – and of death – disappears, and we may free ourselves from the power religion exercises over our life; such was the conclusion of Epicurus’ famous disciple, the Roman Lucretius – and ultimately of his most famous disciple, the German Karl Marx.¹⁵

In this apolitical climate, Epicurean ‘*ataraksia*’ has its place. The word is a composite, like ‘*asphaleia*’ and ‘*securitas*’: in the case of ‘*a-taraksia*’ (‘impassiveness, calmness’, Liddell/Scott 1961) one wants to avoid ‘*tarattesthai*’ (“being brought into a state of disorder”, Liddell/Scott 1961); its opposite is ‘*galênê*’: “tranquility of mind, equanimity, serenity”, comparable to the surface of the sea during a complete absence of wind.

17.2.4 ‘*Securitas*’ in Roman Philosophy

There are several reasons to wonder at the ‘success-story’ of Latin ‘*securitas*’.¹⁶ ‘*Securitas*’ for the first time occurs in the work of Cicero (106–43 B.C.); that does not necessarily mean that Cicero himself coined the word, as neologism from the Greek. ‘*Securitas*’ generally is considered as the Latin equivalent of Greek *ataraksia* but from an etymological point of view is far removed from it. ‘*Securitas*’ (properly: ‘*securitas*’) rather is the exact ‘latinization’ of Greek *akê-deia* (*a-kêd-eia*, “carelessness, indifference”, Liddell/Scott 1961), a word with still a great future in Christian tradition. If Latinized more exactly, ‘*ataraksia*’ should rather – hardly elegantly – have been rendered as ‘*imperturbabilitas*’. Possibly ‘*securitas*’ also owes its existence to the fact that Latin, *mirabile dictu*, had not yet available a word fit to express what we mean when we speak about ‘security’.¹⁷ And the fact that – as far as we know – it was Cicero who introduced the word into literature may not have harmed its career.

There is still a better reason for amazement: ‘*ataraksia*’ originates from the apolitical Epicurean tradition; and, as they say, it was Cicero who Latinized it into ‘*securitas*’. If however during that first century B.C. one Roman was not apolitical it was Cicero, the man for whom the idealized Roman Republic was the centre of the universe. And out of all people exactly this *homo politicus* is supposed to have adopted a word originating from an apolitical philosophical school, to coin as its equivalent a Latin word which – many centuries later – in its English version would become a key notion of political life.

‘*Securitas*’ appears late in the history of Latin (Conze 1984: 832). As a substantive it probably is derived from the adjective ‘*securus*’, “free from care, careless, unconcerned, untroubled” (Liddell/Scott 1961), which in authors from the end of the first century B.C. appears as synonymous with traditional ‘*tutus*’: “safe, secure, out of danger” (Liddell/Scott 1961). ‘*Securus*’ already appears in the middle of the first century B.C., in the philosophical poem of Lucretius (ca. 94–55 B.C.), a contemporary – but hardly a philosophical friend – of Cicero; in Lucretius, ‘*securus*’ means “free from care, untroubled, tranquil, serene, cheerful, bright” (Liddell/Scott 1961).

‘*Securitas*’ itself first occurs in Cicero, as a philosophical term meaning “absence from grief, sorrow and care” (Liddell/Scott 1961).¹⁸ Cicero connects ‘*securitas*’ with ‘*vita beata*’ or “blissful life”, i.e. with the traditional philosophical question of *eudaimonia*. Cicero elsewhere connects ‘*securitas*’ with *Democritean* ‘*euthumia*’ (“cheerfulness”, Liddell/Scott 1961).¹⁹ An explicit link of ‘*securitas*’ with *Epicurean ataraksia* is not to be found in Cicero, as little as with Stoic *apatheia*.

In scholarly literature it is a received opinion since Winkler (1939; Kaufmann 1973: 65, n. 4) that ‘*securitas*’ was formed as analogy to Epicurean ‘*ataraksia*’; it might however also, in our opinion, have been formed as analogy to Stoic ‘*apatheia*’ (“freedom from emotion”, Liddell/Scott 1961), which as an ideal is cognate with and as a word – composite beginning

15 Karl Marx wrote his doctoral dissertation about the difference between Democritus’ and Epicurus’ philosophies of nature. Characteristic of Marx’s own ‘interest’ in this theme is his motto taken from Aeschylus (1956), *Prometheus Bound*, 975: “In one word, I hate all the gods” (Marx 1975, I 1, p. 14). Philosophical atomism in history served as a vehicle for freedom from religion.

16 For our discussion of Latin ‘*securitas*’, our most important source of information is the erudite study by Schrimm-Heins (1991, 1992).

17 Latin ‘*salus*’, coming near to ‘*securitas*’, should be translated as “sound and whole condition, health, welfare, prosperity, preservation” (Liddell/Scott 1961).

18 “*Securitatem appello vacuitatem aegritudinis, in qua vita beata posita est*”, Cicero (1927) *Tusc.*, V. 42.

19 “Democritus’ notion of ‘*securitas*’ which so to say is ‘tranquility of mind’, which he called ‘*euthumia*’” (Cicero 1914, *De Fin.*, V.23). ‘*Euthumia*’ too is a composite (*eu-* or ‘well’; *thumos* or ‘soul, spirit’), but with another structure than ‘*ataraksia*’ and ‘*securitas*’.

with *alpha privans* – has the same structure as ‘*ataraksia*’. Considering the eclectic character of Cicero’s philosophy, it seems wiser to us to leave both options open. That not exclusively Epicurean associations may be at work even becomes plausible, if one considers that Cicero connects ‘*securitas*’ with ‘*dignitas*’, a word associated in Roman ‘shame culture’ with someone’s prestige in society: whoever has *tranquillitas animi* and *securitas*, says Cicero, also acquires *dignitas* (Cicero 1913, *Off.* I, 69; Schrimm-Heins 1991: 134). ‘*Securitas*’ if understood from Epicurean – and apolitical! – ‘*ataraksia*’, could for the *homo politicus* Cicero impossibly have been a cause of *dignitas*.²⁰ To summarize: the meaning of ‘*securitas*’ as used by Cicero is ‘tranquillity of mind, absence of care and fear’;²¹ *securitas* is a prerequisite for someone’s personal happiness (*vita beata*) and his prestige (*dignitas*) in society.

For Seneca (4 B.C. – 65 A.D.) also, two generations later, whose mainly Stoic philosophy contains Epicurean elements, ‘*securitas*’ is connected with the question of a life in happiness, the *vita beata*: *Quid est vita beata? Securitas et perpetua tranquillitas*.²² *Securitas*, here almost identical with *eudaimonia*,²³ is thought – ultimately inspired by Socrates – to be “the characteristic good of the wise” (*proprium bonum sapientis*, *Dial.* II 13.5); *securitas* makes the wise come close to God, as only (a) God has no need to be afraid of death (*securitatem dei*).²⁴ We perceive here, which central region of human life and culture is affected by ‘*securitas*’. In Greek tradition, only the gods had no reason to be afraid of death. Considered that way, the ambition of philosophers (visible in e.g. Plato, but paramount in Lucretius) to overcome the fear of death is tantamount to the attempt to become equal to God. Seneca’s connection of ‘*securitas*’ with the divine would explain, why precisely during the reign of his

former pupil Nero (emperor 54–68 A.D.) unmistakably suffering from megalomania, ‘*securitas*’ for the first time appears on Roman coins, with inscriptions alluding to the divinity of the Emperor: ‘*Securitas Augusti*’, ‘*Securitas Caesaris*’.²⁵

In addition to its initial and positive meaning, ‘*securitas*’ also soon gets a negative meaning, possibly because it is no longer understood – as in Cicero and Lucretius – before the background of Greek philosophical notions as ‘*ataraksia*’ and ‘*apatheia*’, but etymologically, just as the Latin word it is: when literal ‘freedom from care’ is understood as “carelessness, recklessness, levity”. This negative meaning also is found in Seneca (*Benef.* V 12.2; Schrimm-Heins I, 136); – inspired by his disappointing pupil Nero? – ‘*securitas*’ is understood here as ‘*segnitia*’ or ‘slowness, inactivity’ (Liddell/Scott 1961). Another generation later, the rhetorician Quintilianus (c. 30–100 A.D.) – again from the expertise of an educator – writes that students should not be praised too much, because immoderate praise causes indifference (*securitatem parit*) (*Inst. Orat.* II 2.6; Schrimm-Heins 1991: 136). This negative interpretation reappears in Augustinus (354–430 A.D.), one of the intellectual ‘fathers’ of the Christian West, who warns of a ‘lethal indifference’ (*mortifera securitas*) at the question of one’s own sal-

20 Cicero (1913) speaks in *De Officiis* (II 2) about *voluptatibus indignis homine docto* or “pleasures unworthy of a man of learning”. If to Cicero ‘*securitas*’ would have had Epicurean connotations, he would not have qualified it as causing *dignitas*.

21 Exactly *this* concept of ‘*securitas*’ is rejected by Hobbes (1839–1845): “we should however know that the happiness of present life does not consist in tranquillity of the mind” (“*vitae praesentis felicitatem non consistere in tranquillitate ... animi*”; *Leviathan, De Homine*, Cap. XI, p. 77).

22 “What is a happy life? *Securitas* and a perpetual tranquillity of mind” (*Ep. Luc.* 92.3).

23 “Security here is the essence of a happy life” (Schrimm-Heins 1991: 135).

24 “Ecce res magna, habere imbecillitatem hominis, securitatem dei” (Seneca 1917, *Ep. ad Lucilium*, Lib. 6, 53.12).

25 The first representations of ‘*securitas*’ on coins are from the time of Nero; ‘*securitas*’ continues to be represented until the time of Constantine (285–337 A.D.); see Schrimm-Heins 1991: 139. ‘*Securitas*’ is represented allegorically as a sitting female person, often with sceptre, horn of affluence or wreath, and with inscriptions like ‘*securitas Augusti*’, ‘*securitas Augusti nostri*’, ‘*securitas rei publicae*’, ‘*securitas populi Romani*’, ‘*securitas imperii*’, ‘*securitas saeculi*’ etc. These coins according to Schrimm-Heins 1991: 139 document the expectation that the Caesar will take care of public and private, interior and exterior security: ‘*securitas*’ is the personification of absolute political stability; Schrimm-Heins (1991) also draws attention to the deification of ‘*securitas*’, as recognizable in its allegorization and personification, and to the interweaving of religion and politics in Rome. Nevertheless, a critical remark seems at place here: in the literature on ‘*securitas*’ there is an inclination to overestimate the relevance of ‘*securitas*’ during the Roman Empire (e.g. “a central concept of the Roman Empire”, Schrimm-Heins 1991: 137). ‘*Securitas*’ however is only one of the several ‘slogans’ and personifications on coins from the Roman Empire; comparable are ‘*Aeternitas Imperii*’, ‘*Felicitas*’, ‘*Pax*’, ‘*Tranquillitas*’, ‘*Laetitia*’, ‘*Indulgentia*’, ‘*Beatitudo*’; see Kaufmann (1973: 63 ff.). Possibly the political key notion-character of ‘security’ since Hobbes has been retrojected on Roman ‘*securitas*’.

vation (*Virg.* 49, 50; Schrimm-Heins 1991: 137); within the Church of Rome this negative meaning will lead to the interpretation of ‘*securitas*’ as ‘*akêdia*’, a ‘mortal sin’ (Cross/Livingstone 1997: 10; Conze 1984: 832); it reappears with the reformer Luther (1483–1546); apparently, this negative meaning is a constant factor in Christian thought about ‘*securitas*’.

Additionally to these original, ‘subject-centred’ meanings, ‘*securitas*’ after some time also is used to refer to the world surrounding these ‘careless subjects’, as offering them ‘real security’ and as the objective cause of subjective ‘freedom from care’. This meaning first appears in the literature in the first century A.D. ‘*Securitas*’ now denotes the ‘atmosphere of peace and tranquillity’ entering Rome during Augustus (27 B.C.–14 A.D.), founder of the Caesarean phase of Roman history;²⁶ Augustus’ contemporary Velleius Paterculus (c. 19 B.C.–30 A.D.) speaks about the “hope for the uninterrupted security and eternity of the Roman Empire” (*spem ... perpetuae securitatis aeternitatisque Romani imperii*):²⁷ the *Imperium Romanum* itself here is the ‘subject’ which has no reason to be afraid of its own ‘death’, as it may hope for ‘eternity’ (*aeternitas*); the *securitas* of the *Imperium Romanum* henceforth is the basis of the personal *securitas* of its subjects.

In order to understand the use of ‘*securitas*’ in imperial Roman propaganda, we have to remember what the century previous to Augustus had been like: since the Gracchi-brothers († 132 and 121 B.C.), Rome had suffered the horrors of civil war, to which only Augustus made an end; that explains why Augustus’ era was applauded as a new ‘Golden Age’. *Securitas* – understood as ‘freedom from care’ – previously to be found only in the sphere of private life and philosophy, with Augustus got a basis in political reality. The positive connection of ‘public security’ and philosophical ideals is expressed, a generation later, by Seneca: ‘public security contributes to the project of living well’, i.e. of living according to virtue.²⁸ Seneca however also mentions the possibility of friction between public order, dependent as it is of the emperor, and the private sphere of living according to philosophy; in a treatise written for Nero, Seneca presents *securi-*

tas as based on mutual trust between ruler and ruled: “security has to be acquired by mutual security; clemency in public will contribute to the safety of a king”;²⁹ it would be a mistake, continues Seneca, to think that ‘then only a ruler is safe when nothing is safe from the ruler’;³⁰ ‘*tutus*’ and ‘*securus*’ are synonyms here.

Another generation later, the historian Tacitus (c. 56–115 A.D.) refers to the *antagonism* between the old Republican ideal of *libertas* and the new Caesarean value of *securitas*; when ascribing to Nerva and Traianus (emperors respectively 96–98 A.D. and 98–117 A.D.) the restoration of *pax* and *libertas*, Tacitus reminds of the incompatibility of *principate* (a euphemism for Caesarean autocracy) and *libertas*;³¹ their predecessors had accentuated the connection of *principate* and *securitas*. Tacitus, impressed as he is by the restoration of *pax* and *libertas* after the death of Domitianus (emperor 81–96 A.D.), understands the new *securitas publica* as the confidence of the citizens that they will no more be threatened by the state.

17.2.5 ‘*Securitas*’ as ‘*Pax Romana*’

For these Romans from the end of the first century A.D., ‘*securitas*’ had become a key notion to designate the *Pax Romana*, the ‘Roman Peace’, understood as security of public and private life under the protection of the emperors (Schrimm-Heins 1991: 139). But even in this Rome-centric perception of ‘*securitas*’, differences may be recognized: Augustus, at the beginning of the century, brought *securitas* – and order – after an age of *civil war*; Nerva and Traianus on the other hand, at the end of this century, after the terror exercised by Domitianus, while maintaining *securitas* re-introduced *libertas* and confidence in something like a state under the rule of law.

17.2.6 From Roman ‘*Securitas*’ to Christian ‘*Certitudo*’

In later Roman Antiquity, Christian authors like Tertullianus (160–240 A.D.) and Augustinus use ‘*securitas*’ in the new meaning of ‘assurance of faith’, as con-

26 Hartmann (1921): “Schlagwort aus der Zeitstimmung des ersten nachchristlichen Jahrhunderts”; see Schrimm-Heins (1991: 137).

27 Velleius Paterculus (1924), *Res Gestae*, II 103, 3 f.; the suffix *-que* ‘intertwines’ *securitas* and *aeternitas*.

28 “*Ad propositum bene vivendi confert securitas publica*” (Seneca 1917, *Ep. Ad Luc.*, 73,2); see Schrimm-Heins (1991: 138).

29 *Clem.* I 19, 5; see Schrimm-Heins (1991: 138).

30 Schrimm-Heins (1991: 138); Seneca is referring here to a *topos* from Greek philosophy: ‘Excellent people are threatened by tyrants, because tyrants feel threatened by excellent people.’

31 *Res olim dissociabiles* (Tacitus 1914, *Agricola* 3, 5); see Schrimm-Heins (1991: 138).

trast to ‘dubitatio’ or ‘doubt’. This new meaning gradually passes on to a new word created by Christian authors and emerging between the 4th and the 7th century: ‘certitudo’, a “cognitive notion describing a state of knowledge”.³² In matters of religion – and only there – ‘certitudo’ substitutes ‘securitas’; according to Schrimm-Heins (1991) this substitution is connected with the importance of the ‘assurance of salvation and belief’ in Judaeo-Christian religion: “Not until the appearance of Judaeo-Christian religion the relation of the individual to a God intervening into history is at stake” (Schrimm-Heins 1991: 141–145). ‘Certitudo’ functions in a situation in which the (Christian) individual asks a question unusual in traditional Roman religion: the question of her/his own individual salvation.

The substitution of ‘securitas’ (henceforth understood as “assurance of faith”) by ‘certitudo’ becomes definitive with Pope Gregorius the Great (540–604 A.D.) who makes ‘certitudo’ into a central concept of Christian theology (Schrimm-Heins 1991: 144); for Gregorius, ‘certitudo’ is directed at the contents of creed, as the persuasion that certain contents of the Gospel are absolutely true (Schrimm-Heins 1991: 147); ‘securitas’ on the other hand, understood as ‘assurance of one’s personal salvation’, is now considered to be the ‘mother of negligence’, as it threatens to slacken one’s struggle against sin.³³

At the end of the Roman Empire in the West (end of the 5th century) ‘securitas’ no longer appears in connection with the state, but it ‘survives’ in the liturgy of the Church of Rome, where already during the 4th century a fusion of *Imperium Romanum* and *Imperium Christianum* had taken place. In liturgical prayers, the formula ‘pax et securitas nominis Romani’ (“Peace and security of whoever bears the name of ‘Roman’”) appears, as well as ‘Romana securitas et devotio Christiana’; as Schrimm-Heins comments, the “‘Roman security’, understood as peaceful and well-ordered domination of the world by the Roman Empire, was considered as a divine gift to Christianity”.³⁴

17.2.7 ‘Securitas’ from Middle Ages to Reformation

Outside of liturgy, ‘securitas’ in the Middle Ages is reduced to a ‘verbal formula’ in juridical language.³⁵ The end of the Roman Empire in the West also brought the end of ‘securitas’ as a synonym of ‘pax’ or ‘peace’. When peace is guaranteed, the only word used to denote it from the 12th to the 15th century is ‘pax’. In the Middle Ages, ‘securitas’ – in striking contrast to the first century A.D. – is “neither central notion nor slogan” (Schrimm-Heins 1991: 151).

In the field of theology and religion, ‘securitas’ continues to be used as a synonym of ‘certitudo’, with ‘territorial loss’ however caused by its negative connotation of ‘superbia’ or ‘haughtiness, pride’; ‘securitas’ now gradually is substituted by ‘certitudo’ which begins to be used even there, where previously ‘securitas’ had been used: as “oath, guarantee, pledge, charter” (Schrimm-Heins 1991: 152). In non-liturgical – especially juridical – meanings of ‘securitas’, ‘certitudo’ becomes the equivalent of ‘securitas’. The substitution by ‘certitudo’ however is not total; two meanings of ‘securitas’ are not assumed by ‘certitudo’: as religious ‘indifference’ (*akêdia*), and as ‘pax’.

One must conclude that since Christian Roman Antiquity ‘securitas’ increasingly is a ‘loser’. It is ‘certitudo’ – as “assurance of faith” – and not ‘securitas’ which ascends to a central notion of scholastic theology and philosophy (Schrimm-Heins 1991: 171); the synthesis of the three relevant forms of *certitudo* as “certitude of faith, knowledge and action” takes place in the theological-philosophical system of Thomas Aquinas (1225–1274) (Schrimm-Heins 1991: 169).

This additional ‘territorial loss’ of ‘securitas’ to ‘certitudo’ is confirmed when Luther (1483–1546) in his negative interpretation of ‘securitas’ revives Augustinus’ interpretation of ‘securitas’ as ‘*akêdia*’ (‘inability either to work or pray’), one of the deadly sins in the lists of the spiritual writers of Antiquity and the Middle Ages (Cross/Livingstone 1997: 10); in Luther’s opinion, ‘die Sicherer’ (the ‘secure people’) are those who do not put their trust in God. The reformer Calvin (1509–1564) too understands ‘securitas’ (“carelessness”) as a state of mind dangerous to the Christian; positive ‘assurance of faith’ is denoted by Calvin not as ‘securitas’ (or ‘certitudo’) but as ‘*fiducia*’ or ‘*confidentia*’ (Kaufmann 1973: 65; Schrimm-Heins 1991: 212).

32 *Certitudo* is derived from *cernere* (“to distinguish by the senses”); see Liddell/Scott (1961); Schrimm-Heins (1991: 141–145).

33 *Mater neglegentiae solet esse securitas* (*Moral.* XXIV, XI, 62); Schrimm-Heins (1991: 147).

34 Schrimm-Heins (1991: 148); see: Tellenbach (1934: 11).

35 See Conze (1984: 834 f.).

The German and French Reformation affected the intellectual monopoly of the Church of Rome and undermined the medieval feeling of security caused by feeling oneself part of a theologically established transcendent order (Schrimm-Heins 1992, 115 f.). In northern Europe, in the 16th and 17th century a transition to an anthropocentric world view took place. Henceforth Man – and no more God – stood in the centre of thought (Kaufmann 1973: 164; Schrimm-Heins 1992, 115). The loss of medieval security may have caused the need for a new type of safety; now began a “renaissance of the concept of security in the ancient Roman meaning of a condition of tranquillity and peace guaranteed by the state” (Schrimm-Heins 1992, 171). Connected with this renaissance is the name of Thomas Hobbes (Schrimm-Heins 1992, 171).

17.3 Hobbes' Concept of Security

The success however of ‘securitas’ and ‘security’ since Hobbes should not make us oversee that, considering the continuous territorial loss of ‘securitas’ since later Roman Antiquity, the rebirth of ‘securitas’ as ‘security’ hardly was to be expected.

The philosopher Thomas Hobbes (1588–1679) made ‘security’ to the central notion of the modern state.³⁶ Hobbes’ work has to be understood before the background of the confessional civil wars in the England of the 17th century. However the influence also of the ancient historian Thucydides on Hobbes’ view of man, society, and politics should be considered. After a ‘Grand Tour’, as educator of a young nobleman, Hobbes devoted himself to the study of classical Greek and Roman authors, as ‘source of true knowledge’;³⁷ Thucydides became his favorite author, and in 1628 Hobbes published an English translation of Thucydides’ *History of the Peloponnesian War*.

Apart from the agony of Athenian imperialism, Thucydides also described the moral degeneration of the Athenians caused by civil war and pestilence, and their cynical, post-religious, ‘modern’ view of man, state, and world. Thucydides’ description gave to Hobbes the basis for his own anthropology and political philosophy; Hobbes probably perceived contemporary civil wars with the conceptual ‘filter’ offered by Thucydides.³⁸

36 Schrimm-Heins (1992: 172); Conze (1984: 832) recognizes a *caesura* in the history of the concept and links the concept of ‘security’ with the genesis of the modern state.

37 For Hobbes’ biography we follow Tönnies (1925: 4 ff.).

Freund mentions as an unusual fact for Hobbes’ time that his political theory is based on an anthropology (Freund 1982: 107–108); Macchiavelli had done so before, in an attempt to abstract from divine or metaphysical authority (Freund 1982: 113). Here however Freund should more deservedly have mentioned Lucretius who, 1500 years before Macchiavelli, in Book V of his *De Rerum Natura* sketched the genesis of world, man, society, and culture without any recurrence whatsoever to a divine contribution. Why Lucretius? In 1634, the 46-year old Hobbes was admitted to Mersenne’s circle to which the famous Gassendi also belonged (Tönnies 1925: 15); with Gassendi, Hobbes’ closest intellectual friend for many years, started the renaissance not only of the study of Lucretius, but also of atomism. For Lucretius, the fear of death – Hobbes’ ‘lifelong twinbrother’³⁹ – plays a paramount role in human culture, causing the genesis of religion; atomism offers a philosophical possibility to escape from fear of death, and so from the power of the priests – motives recurring in Hobbes.⁴⁰

It seems plausible that Hobbes, when seeking a scientific basis for his anthropology as an instrument to escape from civil war perverting language and thought, *via* Gassendi found his way to Lucretian atomism and philosophical ‘materialism’. In descriptions of Hobbes’ ‘project’ to find a *fundamentum inconcussum* for his anthropology and political theory, Hobbes’ intention (deduction from a mathematical foundation independent of party strife) and what in fact does take place easily is confused:⁴¹ what in fact takes place is induction starting from a Thucydidean anthropology, to a physical and mathematical ‘foundation’ far from civil war; a model for such a ‘foundation’ was offered in the philosophical atomism of Lucretius (1975) and Gassendi (1972).⁴²

38 The influence of Thucydides on Hobbes has been recognized long ago; see Tönnies (1925: 277, n. 4) and supra, note 7. As far as we know, the Thucydidean notion of *asphaleia* in its relevance for Hobbes’ notion of ‘security’ so far has not yet been discussed in scholarship.

39 As Hobbes (1839–1845) wrote in the distichs of his autobiographic *Vita Carmine Expressa*: “*Atque metum tantum concepit tunc mea mater, / ut pareret geminos, meque metumque simul*” (“At that time my mother became so afraid / that she gave life to twins, to me and at the same time to fear”), *Latin Works*, Vol. I, p. LXXXVI, ll. 26–7.

40 On Epicureanism as source of inspiration for Hobbes, see: Ludwig (1998).

41 For an example of such confusion, see Schrimm-Heins (1992: 174).

The *bellum omnium contra omnes* or “war of all against all”, i.e. the ‘state of nature’ previous to and leading to the genesis of a state, for Hobbes is characterized negatively by a) the ‘war of everybody against his neighbour’, b) ‘the impossibility to transmit one’s possessions to one’s children as heirs’, c) the total absence of security (*nulla securitas*)⁴³ and – positively (see *sed libertas*) – by a ‘for every man complete and absolute freedom’; the cause of all this is the absence of law and political power (*Inter homines sine lege, sine imperio*).⁴⁴

What during this *bellum* passingly is considered as ‘peace’, in truth only is a pause in a permanent war, as Hobbes writes in a passage inspired by Thucydides (1919–1928, III, 82–83): “neither if they cease from fighting, is it therefore to be called Peace, but rather a breathing time, in which one enemy observing the motion and countenance of the other, values his security not according to the Pacts, but the forces and counsels of his adversary” (*De Cive*, XIII 7). In this ‘state of nature’ people have mutual fear: all are inclined to harm each other (*mutua laedendi voluntas*). That makes that ‘we’ (writes Hobbes, in the first person plural) neither are able to produce our own security nor may expect it from others (*De Cive*, I 3). The opposite of *securitas* is *metus*, ‘fear’, not – as in Lucretius – fear of death in general, but – more precisely – fear of a violent death: *metus mortis violentae*.⁴⁵ As Freund writes, this fear is a decisive pre-condition of

Hobbes’ political theory (Freund 1982: 115; Schrimm-Heins 1992: 184).

Men are evil by nature, and only the threat by a state powerful enough to execute punishments in case of transgression of the law, makes people willing to obey the law, and so to make an end to the ‘war of all against all’. *Securitas* is not produced by agreements, but by *punishments* for not keeping agreements (*De Cive*, VI 4). For the execution of sanctions a sovereign is required; for the genesis of a sovereign, a ‘treaty of subjection’ (*subiectio*) is required, simultaneously with a ‘treaty of consent’ (*consensio*): “*Quoniam ... requiri ad securitatem hominum diximus non modo consensionem sed etiam subiectionem voluntatum ... et in ea unione sive subiectione consistere naturam civitatis*” (Hobbes 1983: *De Cive*, VI 3).⁴⁶

Without a sovereign able to enforce the observance of laws and treaties, these are ‘mere words’, and unfit as instruments to *securitas*. In *De Cive*, V 3 *securitas* appears to be a link in a *causal* chain aiming at the genesis and maintenance of peace; the necessary instrument to peace is the exercise of the law of nature (*Cum ergo ad pacem conservandam necessarium sit legis naturalis exercitium*); as for the exercise of the law of nature *securitas* is a prerequisite, it has to be ‘considered what might provide such a security’ (*considerandum est quid sit quod talem securitatem praestare possit*). In other words: what in the causal chain precedes *securitas*?

Hobbes writes that no other answer to that question is possible, than that everyone provides himself with allies, thus making it dangerous for everybody else to attack others; in order to arrive at this mutually enforced self-control, someone (‘A’) has to acquire so many allies that it becomes evident to ‘B’ (and/or ‘C’, ‘D’ etc.), that it is wiser not to attack ‘A’ (and his allies); at this point, the emerging state is not yet more than the collection of ‘A’ and his allies, discouraging ‘B’, ‘C’ (and their respective allies) to attack ‘A’. The causal chain so far has become: the joining together of individual men → *securitas* → exercise of the law of nature → peace.

And still the causal chain is not yet complete: the genesis of a state requires two additional acts which for Hobbes coincide: the *consensio* or agreement of individuals to join together, and their *subiectio* under

42 Hobbes is already 40 years old when he is ‘struck’ by Euclides and the cogent character of mathematical deduction; see Tönnies (1925: 12–13).

43 In the English text of *Leviathan* – as well as in Hobbes’ translation of Thucydides – the terminology is not yet ‘crystallized’: Hobbes alternates between ‘safety’ and ‘security’, between ‘to secure’ and ‘to caution’. According to Kaufmann (1973: 72), one cannot yet speak here about ‘security’ as a ‘word symbol’. Kaufmann does not use Kuhn’s (1962) *Structure of Scientific Revolutions*, and especially not Kuhn’s notion of ‘paradigm’.

44 “*Inter homines sine lege, sine imperio, bellum unicuique contra vicinum est, nulla autem haereditas filiis transmittenda, nulla proprietates bonorum, nulla securitas, sed libertas unicuique plena et absoluta*” (Hobbes (1839–1845): *Leviathan, De Civitate*, XXI, p. 162); see Schrimm-Heins (1992: 180).

45 Hobbes (1839–1845): *Leviathan, De Homine*, X, 78. ‘Hobbesian’ sounds Thucydides’ *asphaleiai de to epibouleusasthai aprotropês prophasis eulogos* (III, 82, § 4, 15–16), translated by Hobbes as “To re-advise for the better security was held for a fair pretext of tergiversation” (Hobbes (1839–1845), VIII, 348).

46 “Because we said ... that there was requir’d to the security of men, not onely their Consent but also the Subjection of their wills ... and that in that *Union* and *Subjection*, the nature of a *City* consisted” (Warrender 1983).

the state which for Hobbes in principle has already come into being by their *consensio*. So the complete causal chain is: *consensio subiectioque*⁴⁷ -> *genesis of the state* -> *securitas* -> *exercise of natural law* -> *pax or peace*.

In order to attain peace – as *causa finalis* of this chain – a state powerful enough to exercise sanctions against transgression of the law is an absolute prerequisite. To this power of the state everything else has to be subordinated, including cultural and religious traditions. Questions of good and evil, of ethics and religion are subordinated to and deduced from the self-preservation of the state as necessary instrument for maintaining security, and finally peace; no longer, as in the Aristotelian tradition, politics is subordinated to ethics (Schrimm-Heins 1992: 179).

As the state is not the *final* cause of this teleological chain, even the seemingly omnipotent state for Hobbes is an instrument, owing its *raison d'être* to its function within the causal chain, and having to legitimate itself by exercising its function: the production of *securitas*; if and when a state stops to produce *securitas* it loses its *raison d'être* (Kaufmann 1973: 68). This is why Hobbes recognizes the right of subjects to rebel against the state: subjects do not have the duty of obedience to a state impotent to provide its subjects with *securitas* (Schrimm-Heins 1992: 187).

17.4 Critics of the Hobbesian Concept

Hobbes' work seems characterized by an obsession with *securitas*, based on his post-religious anthropology biographically going back to his traumatizing experience of civil war. The one-sidedness of Hobbes' approach did not remain unremarked by a socially more successful contemporary as the German-Swedish Samuel Baron von Pufendorf (1632–1694). For Pufendorf, *securitas* – as to be provided by the state – implies: “Interior and exterior security, peace (*pax*), protection of property, common prosperity (*salus communis*) and a pleasant and comfortable life (*commoditas*)” (Schrimm-Heins 1992: 196). Pufendorf ties in with Hobbes, but starts from an anthropology presupposing not only Hobbes' ‘instinct of self-preservation’ and ‘self-love’ but also the fact that man is too weak not to occasionally need help from others (*imbecillitas*) and therefore needs companions (*socialitas*), a need even constitutive for the anthropology of

Grotius (Schrimm-Heins 1992: 157, n. 17). Hobbes, though having broken with the Aristotelian tradition of political philosophy, is so to speak reintegrated into that tradition by Pufendorf (Schrimm-Heins 1992: 178, n. 28).

Whereas for Hobbes, during the genesis of a state, the treaty of consensus (*consensio voluntatum*) and that of subjection (*subiectio voluntatum*) coincide (Schrimm-Heins 1992: 184, n. 58), Pufendorf (1995) discerns two different steps: first the *pactum unionis*, by which the voluntary gathering into a society is declared, and then the *pactum subiunctionis*, by which a society transfers the power of ruling it to a sovereign (Schrimm-Heins 1992: 193).

For Pufendorf, the treaty of *consensio* does not automatically lead to the treaty of *subiectio*; in the time between, people may deliberate about their desirable future constitution (Pufendorf 1995, *De Jure Naturae et Gentium*: vii 2.8; Schrimm-Heins 1992: 193). The obligation entered into by the treaty of subjection is bilateral: the ruler obliges himself to take care of common *securitas* and welfare (*salus*), the subjects oblige themselves to obedience to the sovereign who is guaranteeing their *securitas* and *salus*.

For Hobbes the genesis of law is simultaneous with that of the state. For Pufendorf however, man already previously to the genesis of the state possesses natural rights (equality and freedom) and is a ‘moral person’, a *persona moralis* (Schrimm-Heins 1992: 194); if therefore such ‘moral persons’ possessing natural rights conclude a treaty, they have to explicitly renounce their previously possessed natural rights. So the state too coming into existence by the union of these ‘moral persons’ becomes itself a kind of ‘moral person’: a ‘composite moral person’ (*persona moralis composita*) (Pufendorf 1995, *De Jure Naturae et Gentium*, VII 2, 13; Schrimm-Heins 1992: 195). That means that according to Pufendorf – in contrast to Hobbes – politics has to be subordinated to ethics. And nevertheless Pufendorf too – as Hobbes – holds that the intellectual and religious freedom of citizens should be restricted when the security of the state is jeopardized (Schrimm-Heins 1992: 195).

17.5 Emergence of Social Security in the 20th Century

The 20th century brought the triumph both of ‘social security’ and of ‘(political) security’, henceforth increasingly understood globally.⁴⁸ Considered historically, the success of the notion ‘social security’ served

47 In *consensio subiectioque* the suffix *-que* suggests near-identity of *consensio* and *subiectio*; *supra*, note 27.

as ‘launching site’ for the global success of ‘(political) security’. The triumph of ‘social security’ began under F.D. Roosevelt (US president 1933–1945); as Kaufmann (1973) however points out, the notion ‘social security’ itself has its roots in Hobbes: “Man is jeopardized primarily by man himself; and that means that already for Hobbes the problem of security genuinely is a problem of *social* security; security is the state of mutual trustworthiness to be produced between men” (Kaufmann 1973: 68–9; *italics* by the author).

The success of ‘social security’ is connected with the global economic crisis of 1929 (Kaufmann 1973: 13). The concept got its historical form in Roosevelt’s Social Security Act (1935), became a collective and global goal with the Atlantic Charter (1941) and in 1948 became embedded in the Declaration of Human Rights; since 1950 there was such a consensus about the content of the concept – “legal measures directed at securing the income of persons with reduced or lacking possibilities to acquire an income, or directed at securing their health” (Kaufmann 1973: 1) – that henceforth discussions about ‘social security’ chiefly dealt with technical aspects (Kaufmann 1973: 13).

According to Winkler (1939: 16 ff.) however, the 20th century career of *political* security already started earlier, with the ‘14-Points Declaration’ (1918) by US president Wilson (1913–1921), at the end of W.W. I; in Wilson’s ‘Principles of a Peace Order after the War’, ‘safety’ and ‘security’ alternated (Kaufmann 1973: 72, n. 22). In the 1919 ‘Statute of the League of Nations’, inspired by Wilson, one finds in the Preambles the combination “peace and security”, but in Art. 8 “national safety”; Kaufmann concludes that the “crystallization” of ‘security’ – and not: ‘safety’ – to a political keyword had not yet been completed during the presidency of Wilson. Even during the presidency of Roosevelt (†1945), ‘safety’ and ‘security’ with regards to exterior policy still were used as synonyms; it is only after W.W. II that the scale tipped in favour of ‘security’.

The notion of ‘security’ – as an instrument to characterize the paramount goal of US foreign policy – was part indeed of Roosevelt’s design of postwar policy, but Roosevelt himself in connection with foreign policy preferred ‘safety’, not ‘security’ (Czempiel 1966: 60; Kaufmann 1973: 71, n. 21). After W.W. II a development in the use of ‘security’ took place, as the problem of ‘external security’ began to play a prominent role; ‘security’ uncontroversially became con-

nected with questions of *external* security. ‘Security’ proved more successful than ‘safety’, also in the domain of exterior policy (Kaufmann 1973: 71, n. 21; Czempiel 1966: 243).

The years 1945 and 1949 have been landmarks in US foreign policy: 1945 by the victory in W.W. II, 1949 by the genesis of the ‘Cold War’. Czempiel distinguishes two connected models of US ‘security policy’: a) in 1945 the “ ‘model of collective security’, which according to US postwar policy should cover the whole world”, and b) in 1949 “the system of mutual security’ of the states allied with the US, after the crystallization of the contrast with the Soviet Union”; the element connecting both concepts was – according to Czempiel – the paramount character of US hegemony, which however should not be enforced by military instruments but should be implemented under the conditions of cooperation with – and not subjection of – other states (Czempiel (1966: 200 ff.). Said in terms of the Hobbes-Pufendorf controversy, the aim of US policy was to persuade to *consensio* in order to make *subiectio* superfluous. Here reappears the relevance of ancient Thucydides, especially when Czempiel observes: “Only in the case of small states security is identical with being protected against possible and actual attacks. Simultaneously with the size of a country the range of fields increases where its security may be at stake indirectly ... In 1945 it was generally recognized that the range of US security comprised the whole world” (Czempiel 1966: 61; Kaufmann 1973: 73, n. 24). This also was the core of the problem in Thucydides’ dialogue between Athenians and Melians: if the Athenians allow neutrality to the Melians, that means a security risk to the Athenians, as this suggests to their ‘allies’: ‘There is a possibility to escape from Athenian imperialism!’ The parallel between ancient Athenian and modern US policy and between the Thucydidean-Athenian and the Hobbesian-American approach both trying to avoid crude *subiectio* by making *consensio* attractive is remarkable.

It is Kaufmann’s merit not only to have made a historical study of the concept of the ‘*signifiant*’ ‘security’, but also to have tried a systematic study of the ‘*signifié*’, the phenomenon intended by the word. At the end of our historical sketch, a short discussion of Kaufmann’s systematic contribution seems appropriate. The sociologist Kaufmann uses different methodical approaches related to different disciplines; a minor disadvantage of his work is that the German word ‘Sicherheit’ – etymologically derived from ‘*securitas*’ and influenced, in the 20th century, by ‘security’ –

48 The following pages mainly rely on Kaufmann (1970, 1973).

plays an important role in his work. Nevertheless, most of what Kaufmann writes also seems relevant for 'security'.

Kaufmann observes that the German 'Sicherheit' frequently is used as equivocation; the word seems to become more univocal, the more in fact it becomes multivocal (Kaufmann 1973: 36; Conze 1984: 831). The emotional content of the word always is positive – this is also a recent phenomenon in the history of the word – making “that the content of the notion seems to become wider and wider, and less definite ... that simply hearing or seeing the word is enough to cause a certain excitement, giving the word in the realm of man a comparable function as the trigger stimulus has for animal instincts” (Kaufmann 1973: 37).

As the “inner structure of the contemporary problem of security” Kaufmann (1973: 16ff.) considers: a) “need of a guarantee for the absence of danger coming from the outside”; b) “need of order c.q. of orientation”; c) “need of psychical equilibrium”. Kaufmann (1973: 16ff.) analyzes 1) ‘economic insecurity’, 2) ‘political insecurity’, 3) ‘insecurity of orientation’ and 4) ‘personal insecurity’.

The cause of ‘economic insecurity’ is not *factual* existing poverty or need, but the *risk* to become poor or needy; the more prosperous people become, the more they wish for economic security (Kaufmann 1973: 17–18). “Political insecurity” is aiming at “occasions for crystallization of anxiousness”: “it is tranquilizing to know what it is that one has to be afraid of, and the anxious consciousness is therefore looking for objects appropriate to transform its undetermined anxiousness into fear of a seemingly determined danger” (Kaufmann 1973: 20). Kaufmann relativizes contemporary growth – in the seventies of the 20th century – of feeling ‘political insecurity’: seen from the outside, contemporary insecurity in those years was not greater than in previous times (Kaufmann 1973: 21). About ‘insecurity of orientation’, Kaufmann following Luhmann writes that this kind of insecurity is the effect of the loss of an order offering security; efforts aim at regaining this order, ‘order’ meaning here “reduction of the complexity of the world” (Luhmann 1968).⁴⁹

Concerning ‘personal insecurity’ Kaufmann following Riesman’s *The Lonely Crowd* distinguishes

between ‘inner directed’ (and ‘secure’) and ‘other directed’ (and ‘insecure’); security leads to goal-oriented, insecurity to threat-orientated behaviour; in the neo-analytic school of psychiatry “the pursuit of security is regarded as an expression of the pathological nature of man” (Kaufmann 1973: 24–27).

Illuminating is Kaufmann’s discussion of ‘security’ as a ‘societal word symbol’ (“gesellschaftliches Wort-symbol”): ‘security’ has acquired the same status as other ‘big words’ like ‘freedom’, ‘democracy’, ‘justice’, etc. ‘Security’ likewise expresses an “idea of value transcending every goal which might possibly be implemented” (Kaufmann 1973: 33); that does not mean however that ‘word symbols’ are useless: their function is, to make more concrete cultural standards which otherwise would have remained abstract, and to mediate between standards and concrete reality, by materializing the standards via corresponding ways of behaviour; a symbol ‘ties down’ complex contents of meaning which transcend possibilities of expression in behaviour or words (Kaufmann 1973: 39).

Kaufmann considers ‘big words’ as “idées directrices [or] leading concepts of institutions”, a notion which has to be understood as “meaning of the whole, becoming increasingly clear during a process of institutionalization”. At the end of such a process, an ‘idée directrice’ retro-acts on the further development of that institution; in more complex cultures an ‘idée directrice’ not only transcends the functions of the corresponding institution, but also the objects and concepts in which it is symbolized and made explicit. Kaufmann concludes that ‘social security’, being such an ‘idée directrice’, cannot possibly be concretized; at best it functions as the standard to judge concrete actions.⁵⁰ If Kaufmann is right, the same argument might hold in the case of ‘(political) security’: the ‘idée directrice’ of an institution, a standard to judge actions, but not itself to be completely and finally concretized. A historian of western philosophy might comment that Kaufmann’s argument leads to the conclusion that ‘security’ has to remain a ‘Platonic idea’, never itself finally to be made concrete; the return of ‘big words’ in politics is a return to political Platonism.⁵¹

49 N. Luhmann, as cited by Kaufmann (1973: 23); Schrimm-Heins (1992: 115) shows that a loss of *ordo* also occurred at the transition from Middle Ages to ‘modern times’, causing an increasing need of *certitudo* in all domains of life.

50 Kaufmann (1973: 33; 40–41) gives ‘justice’ as an example of an ‘idée directrice’: “justice ‘has to happen’, independently of whether the idea of severity or the idea of benevolence is connected with it”. Another example might be ‘truth’, as ‘idée directrice’ of the institution science/academy/university.

51 On political Platonism, see Hentschke-Neske (1995).

17.6 Conclusions

By Hobbes’ removal of ‘metaphysical rests’ – in fact by removing God – from anthropology, new room was created for Man. In Hobbesian anthropology, the ‘highest good’ is security and the prolongation of physical existence on earth (Schrimm-Heins 1992: 178). Two forms of fear play a role here: fear of violent death and fear of the future (Freund 1982: 116). In this view, man – as Schelsky (1981: 33; Schrimm-Heins 1992: 177, n. 25) wrote – has to create his own future and his own fate, without support from Nature and without guidance by something Eternal in him. Kaufmann even more profoundly interpreted the Hobbesian attitude as aiming at the destruction of the temporality of the future (Kaufmann 1973: 118; Schrimm-Heins 1992: 176). But is there an alternative to such ‘destruction’, in an age of nuclear weapons and all the other threats to mankind?

Schrimm-Heins characterized the intellectual process leading to Descartes’ emancipation of philosophy from theology as *secularization of certitudo*. The other way round however, we might since Hobbes speak of the *sacralization of security*. This is easily to be recognized in Hobbes’ aphoristic *Extra civitatem nulla securitas* (“Outside of the State there is no Security”),⁵² as paganistic alternative to traditional Roman Catholic *Extra ecclesiam nulla salus* (“Outside of the Church there is no Salvation”). Schrimm Heins concluded her study with the words: “Security, the goddess of the Romans, has survived the Roman Empire” (Schrimm-Heins 1992, 204). The religious dimension indeed accompanies ‘*securitas*’ since the poem of Lucretius, and *a fortiori* since an allegorized ‘*Securitas*’ appeared on coins from the Roman Empire. The millennia-old connection of ‘*securitas*’ with religion makes it probable that in a globalizing world, with its religious and post-religious diversity – from fundamentalism to atheism and paganism – ‘security’ will remain a controversial concept. What a fundamentalist ‘true believer’ condemns as detestable, at the same time for a paganized ‘modern’ is a question of responsibility for her or his own future.

In Hobbes’ ‘Thucydidean’ anthropology, the pursuit of security proves to be a constant; this requires a social treaty (*consensio*) coinciding with a political treaty of subjection (*subiectio*); both treaties together lead to the creation of an omnipotent sovereign (‘Leviathan’) punishing transgressions of the law. Applied

to the contemporary globalizing world, one might by analogy say that an unreflected process of making ‘security’ to an absolute and ‘highest good’ not only prepares us for the necessity of global *consensio* – as Pufendorf would say – but also for that of global *subiectio* to a Hobbesian ‘Leviathan’ identifying *consensio* and *subiectio*.

Ancient Greek philosophy might be helpful here. In Platonic philosophy, where the ‘idea’ of a virtue is understood as the ‘pure’ and absolute standard of that virtue, the attempt to implement this ‘idea’ is to be applauded more in the same measure as the ‘idea’ is approximated more; absolute approximation of the ‘idea’ – if possible – would deserve absolute applause. Platonizing contemporary statesmen seem to conclude from such a view on moral ‘goods’, that the more ‘security’ they implement, the more applause they deserve. Aristotle, however, against Plato pointed out that virtue is a good to be found in the middle between two vices, as e.g. courage is found in the middle between cowardice and rashness.⁵³ If we apply Aristotle’s analysis to the complex *chimera* of contemporary ‘security’, we become aware that ‘security’ – in order to be a ‘good’ at all – should not be seen as a Platonic ‘idea’, as an absolute ‘good’ to be approximated absolutely, but rather as an Aristotelian ‘middle’ between two evils: between the evil of absolute fear and the evil of absolute security which, in the words of Immanuel Kant, is to be found only at the cemetery.⁵⁴

54 See: Immanuel Kant, 1795: *Zum Ewigen Frieden*, preface. Kant of course wrote on ‘eternal peace’, not on ‘absolute security’; the line of argument might however be the same; Kaufmann (1973: I, n. 1).

18 Security Conceptualization in Arab Philosophy and Ethics and Muslim Perspectives

Hassan Hanafi

18.1 Primary Remarks

The term 'security' is a new term in Arabic/Islamic thinking. It is used in political science and in the contemporary political discourse in Western political science, and translated as *Amn*, from the same Arabic root which means faith *Iman*, the verb *Aman* means to believe. Another derivative *Aman* means peace treaty.

The term 'security' is not used with this meaning in contemporary Arabic/Islamic discourses. It is used with the adjective 'national' as 'national security' and the institution is called 'National Security Council', and an eminent position is called 'National Security Advisor'. Security is here linked to defence. It is no philosophical or ethical concept but a military one, how to defend the nation against external threats in the present or future. Lessons from the past can also be drawn.

The term 'security' is also generally linked with 'peace', in the common expression as 'peace and security'. Peace precedes security as if there is no peace without security and there is no security without peace. The question is: which is the condition for the other? Is peace the prerequisite of security or is security the prerequisite of peace? A dialectical relation can also be conceived. Both peace and security are mutually conditioned (chap. 4 by Wæver).

18.2 Security in Classical Arab/Islamic Thinking.

The term 'security', *Amn* means quietude or peace of the soul. It is used in the holy Koran with different meanings. Regarding the linguistic forms of the term 'security':

a) The term is mentioned 20 times in different forms. All of them are verbal forms which mean

that security is an act and a process, not a given situation.

- b) The term is used 15 times with pronouns, which means that security is related to human and social relations, not to individual positions.
- c) The term is also used 15 times addressing pronouns to the group, which means that security is always a perception of the other, not of the self, and may be an illusion and not a reality.

Concerning the meaning of the term 'security':

- a) Security is a *state of mind* or a *feeling* that those who commit unjust acts cannot achieve or have security. More than half of the usages in the Koran refer to this meaning. It is almost a law of history that the feeling of insecurity usually results from violating the rights of others. It is due to power without justice. Unexpected punishment will come for those who committed injustices and feel insecure. The wrongdoers will never feel safe from an earthquake which shakes the earth beneath their feet, or a blowing wind which destroys their towns. There is no power without a superpower. An unjust superpower is a weak power. A just power is a superpower. This is the collective insecurity resulting from collective injustices of hegemonic nations and big powers invading small nations and exploiting their natural resources.¹
- b) *Mutual feeling of a group* resulting from peace between neighbouring communities.²
- c) *Mutual security* vis-à-vis each other, *trust and trustworthiness*. This is the case of Joseph and his brothers who were unworthy of trust.³
- d) *Mutual security* vis-à-vis things as deposits and trusts, loans, etc. Ethics prevails on interests. Honesty is the law of transactions. This mutual honesty is applicable irrespective of creed.⁴
- e) *Individual security* for oneself, internal feeling of quietude once there is a sincere commitment to

the universal code of ethics and the realm of universal norms.⁵

The verb *Itma'anna* is from the same root which means to be sure without fear, to be quiet without anxiety and to acquire the peaceful soul, *al-Nafs al-Mutma'innah*.

- a) The verb with its derivatives is mentioned 13 times, 9 times as verb and 4 times as adjective, which indicates also that quietude, namely peace in the soul, is an act not a thing, from the subject side not from the object one. All verbal forms refer to the third person as an impersonal reality, an objective truth with indicative statements.
- b) The principal meaning in 7 verses that quietude is in the heart not on the ground, a state of the mind, not physical boundaries. Revelation represents a certain kind of universal code of ethics and norms of conduct. It gives quietude in the heart.
- c) Quietude in the heart requires proofs, rational or natural. Abraham believed but he needed more

rational or natural proofs to combine feeling and reason, intuition and demonstration.⁶

- d) Quietude comes from the essence of truth not from the utility of the fact. It is related to the ideal not to the benefit.⁷ Compulsion does not disturb internal conviction of truth. Quietude in the soul is the only source of acts of piety.⁸ It is the only saved soul. Quiet souls are like angels on Earth.
- e) A peaceful village, living in quietude and affluence was not thankful to God. It deserves hunger and fear. Modesty is a pre-requisite for security.⁽⁹⁾

In the prophetic tradition the term *Amina* is mentioned over 70 times. All of them mean individual security not group or security of nations. The risk for the security of a society comes from the individual. The evil individual may threaten people in their lives and belongings. The good individual gives security to the community. Security must be given from the

- 1 "Did the people of the towns feel secure against the coming of our wrath by night while they were asleep?" (7: 97); "Or else did they feel secure against its coming in broad daylight while they played about?" (7: 98). "Do then those who devise evil feel secure that God will not cause the wrath to swallow them up, or that the wrath will not seize them from directions the little perceive?" (16: 45); "Do ye then feel secure that He will not cause you to be swallowed up beneath the Earth when you are on land, or that He will not send against you a violent tornado so that ye find no one to carry out your affairs for you?" (17: 68); "Or do ye feel secure that He will not send you back a second time to sea and send against you a heavy gale to drown you because of your ingratitude so that ye find no helper therein against Us?" (17: 69); "Do ye feel secure that He Who is in Heaven will not cause you to be swallowed up by the earth when it shakes?" (67: 16); "Or do ye feel secure that He Who is in Heaven will not send against you a violent tornado so that ye shall know how was my warning?" (17: 17); "Did they then feel secure from the plan of God? But no one can feel secure from the plan of God except those doomed to ruin" (7: 99); "Do they then feel secure from the coming against them of the covering veil of the wrath of God, or the coming against them of the hour all of a sudden while they perceive not?" (12: 107).
- 2 "Others you will find that wish to gain your confidence as well as that of their people. Every time they are sent back to temptation they succumb thereto" (4: 91).
- 3 "He said: Shall I trust you with him with any result other than when I trusted you with his brother aforetime?" (12: 64); "They said: O our father why dost thou not trust us with Joseph, seeing we are indeed his sincere well-wishers?" (12: 11).

- 4 "And if one of you deposits a thing on trust with another let the trustee discharge his trust and let him fear his Lord" (2: 283); "Among the people of the Book are some who if entrusted with a hoard of gold will pay it back. Others who if entrusted with a single silver coin will not repay it unless thou constantly stooped demanding because they say: There is no call on us with these ignorant pagans" (3: 75).
- 5 "And when you are in peaceful conditions, if any one wishes to continue the *Umra* or the *Hajj*, he must make an offering such as he can afford" (2: 196); "If ye fear pray on foot or riding but when ye are in security celebrate God's praises in the manner he has taught you" (2: 239).
- 6 "God made it but a message of hope for you, and an assurance to your hearts" (3: 126), (8: 10); "Those who believe and whose hearts find satisfaction in the remembrance of God" (13: 28); "He said: does thou not then believe? He said: Yea, but to satisfy my own understanding" (2: 260).
- 7 "Some who serve God, as it were on the verge. If good befalls them they are therewith well content. But if a trial comes to them they turn on their faces" (22: 11); "Those who rest not their hope on their meeting with us, but are pleased and satisfied with the life of the present..." (10: 7); "Anyone who, after accepting faith in God, utters unbelief except under compulsion his heart remaining firm in faith..." (16: 106).
- 8 "But when ye are free from danger set up regular prayer" (4: 103); "To the righteous soul will be said: O soul, in rest and satisfaction" (89: 27); "If there were settled on earth angels walking about in peace and quiet" (17: 95).
- 9 "God sets forth a parable: A city enjoying security and quiet, abundantly supplied with sustenance from every place. Yet was it ungrateful for the favours of God. So God made it taste of hunger and terror like a garment because which wrought" (16: 112).

neighbour to his neighbour. Once security is given to everyone, it has to be preserved and respected. Only a few times is collective security mentioned. Security is mentioned between nations such as between Arabs and Romans by treaties of reconciliation, *Sulh* (Wensinck 1988: 105-107).

The four classical Islamic disciplines: theology, philosophy, jurisprudence and mysticism dealt with the notion of security differently and with different degrees of importance. Ethics is no independent science but infiltrates all other disciplines.

- a) In *theology*, the term *Iman* which means faith is derived from the same root as *Amn* which means security, because faith brings security. Faith is internal in thoughts and feelings as well as external in sayings and doings.
- b) In *philosophy*, peace in the mind results from the communication of the human intellect with the intellect-agent, not from sensations or experimentations. Islamic ethics is oscillating between Aristotelian and Platonic ethics. Neither of them is based on the notion of security. Muskaweh defended Platonic ethics based on the tripartite divisions of the faculties of the soul: Continence for volition, courage for passion, and wisdom for reason. Justice balances the three other virtues. Al-Farabi¹⁰, Avicenna¹¹ defended a theory of communication between the human intellect and the active intellect. Virtue is the centre between two extremes, as for Aristotle. Happiness is in knowledge and goodness. Only al-Farabi in his description of the 'virtuous city' describes the city based on power (*Taghleeb*) as a perishable city such as other cities based on ignorance and pleasure. Only the virtuous city is based on reason. Security meant only in-

ternal security of the state not external security between nations.

- c) In *mysticism*, the term security is no mystical technical terms such as fear, hope, awareness, drunkenness, absence, presence, reliance, resignation, patience, acceptance, satisfaction, etc.
- d) In *jurisprudence*, the term *Aman* which means treaty of peace, non-belligerence is used to indicate the state of peace between two nations after signing a peace treaty of non-aggression. *Dar al-Aman* means literally the home of security, by opposition of *Dar al-Kufr*, place of non-belief is related to the old jurisprudence in early Islam for the sake of expansion. Islam would offer three choices: Islam, *Jizyah* which means taxes, or war. Islam means the realm of reason and public welfare. *Jizyah* is a tax to the state in return for defence and protection. War as a third alternative is unconceivable because it means antagonism to the new wave in history. The holy war is not an offensive war but only a defensive war, a legitimate self-defence in case of external aggression. No coercion in religion is the Islamic dictum for individual and state behaviour.

18.3 Security in Contemporary Arabic/ Islamic Thinking

As the Arab and Muslim world was nearly totally occupied by foreign powers, and as Palestine, the Golan Heights in Syria, and the Shab'a Farms in Lebanon are still occupied, contemporary Arabic/ Islamic thinking on security perceives threats from the outside. Sayed Qutb's (1951) *World Peace and Islam* is an example of modern writings, not on security but on peace, since both are linked together as 'peace and security', where priority is given to peace. Its main goal is based on four steps in the vision of peace: Peace in the consciousness *Dhamir*, peace at home *Bayt*, peace in society *al Mujtama'*, and finally peace in the world *al-Alam*.

- a) *Peace begins in the consciousness (Dhamir)* as the centre of the world. Individual consciousness is free from all hegemonic religious or political powers. Individual needs, material and spiritual, are both to be fulfilled, and there is no tension arising among them having to sacrifice one for the other. Man does not carry any original sin legitimizing his errors. He commits only ethical mistakes following his inclinations or misjudgements and then he repents afterwards and begins again. His duties

10 Ab Nasr Muhammad ibn al-Farakh al-Frbi or Ab Nasr al-Frbi (also known as Muhammad ibn Muhammad ibn Tarkhan ibn Uzalagh al-Farabi, in the West as Alpharabius, Al-Farabi, Farabi, and Abunaser (870-950) was one of the greatest scientists and philosophers of his time. See at: <<http://en.wikipedia.org/wiki/Al-Farabi>>.

11 Ibn Sina, Abu 'Ali al-Husayn ibn 'Abd Allah ibn Sina, Abu Ali Sina often referred to as Avicenna was a Persian physician, philosopher, and scientist (980-1037). He was the author of 450 books. many on philosophy and medicine. He was one of the Islamic world's leading writers in medicine and his most famous works are: *The Book of Healing* and *The Canon of Medicine*; see at: <<http://en.wikipedia.org/wiki/Avicenna>>.

are proportional to his capacities, no less and no more. The affiliation to a universal code of ethics gives him internal assurances and a peaceful state of mind. Assurances and guarantees make him secure.

- b) *Peace at home (Bayt)* is the second larger circle after the individual smaller circle. The home is the miniature of society. It is a holy link between two bodies and souls in a well-balanced life between indoor and outdoor. Divorce is the exception to the rule, like war is the exception to peace. Polygamy is also an exception to monogamy. Family solidarity is a reduced image of social solidarity.
- c) *Peace in society (al Mujtama')* is the third larger circle after the individual circle and family circle. Society is based on social solidarity not on social polarity between rich and poor, on social cohesion not social contradiction. The common cause preserves society from disintegration and lethargy. The Islamic political system is similar to social democracy. The legal system is independent from the executive power. Security guarantees are given to all members of society on equal terms. Everyone is entitled to various forms of social security including medical care and education. Social balance prevents society from dislocation. Islam is against all monopoly of economic power, i.e. capital, defends public welfare, preventing any social damage. For Islam labour is the only source of value, it prohibits monopoly, protects public property, requires the fulfilment of basic needs, and rejects wasteful spending. Islam also prohibits accumulation without spending, has a system of checks and balances, has a fiscal system of gradual taxation proportional to earnings, and calls for the supremacy of the law.
- d) Once these three circles live in harmony the fourth circle crowns the *harmony in the world (al-Alam)* stemming from the principle of unity. Free citizens and nations lead to a humankind without wars of aggression motivated by race or interest. Tolerance between nations precedes revenge. Politics yields to ethics. These four concentric circles are in the view of Sayed Qutb (1951) the basis of global security.

Security has been discussed by modern thinkers from a scholarly rather than a political reformist perspective. World security is based on justice and the equality of all nations before the natural and rational law. Revelation, reason, and nature are identical. The Islamic *Umma* is not only made up of Muslims but of all communities. Each one has its own autonomy and

its legal system, language, manners and customs, confederated with other communities by a pact of non-aggression and equality of rights and duties. The Covenant of Medina in early Islam during the time of the prophet is a model. The United Nations Charter is another modern model without the right to veto since all nations are equal *de jure* irrespective of the *de facto* cleavage between small or large nations. Some scholars tried to modernize classical notions of peace and security in Islam to cope with the modern situation and new international conventions, but many argued that Islamic international law preceded the modern one. They also refer to the limitations of the modern one by the misuse of the UN Charter by big powers and the double standard in its application which creates frustration in the Arab and Muslim world.

18.4 The Realities of the Muslim World Today

It may be argued that the present realities of the Muslim world: violence, civil wars, kidnappings, hijackings, torture, and assassinations are far from the preceding ideal image of Islam as a religion of peace and as a universal code of ethics. If this ideal is not practised by the Muslims themselves, how can it be applied by non-Muslims in the rest of the world? Indeed, such an argument could be valid if the Muslims had tried to apply the ideal and failed. But the realities of the Muslim world are as such due to the absence of this ideal. Muslim societies are not yet prepared for life in peace. Peace exists neither in the external, nor in the internal world, neither on earth, nor in the soul. Muslim societies are suffering from the most horrible forms of social, economic, and political injustices. As long as this situation persists, Muslim societies will not be prepared for life in peace. But once it is changed for the better, peace would prevail. The intention of the gradual revelation in history was to prepare peoples, societies, and nations for life in peace and security. Once the purpose of revelation is fulfilled, the distance between the ideal and the reality would disappear.

In the present Muslim world there are seven forms of injustice which are behind all kinds of violence and disturbance of public order, on the international as well as on the national levels. They are everywhere, motivating individuals and dissident groups for action and inviting peoples to revolt.

First, the occupation of the land as a remnant of the colonial era. In spite of the huge process of decolonization, parts of the Muslim world are still occupied: Palestine, Iraq, and Afghanistan. Occupation can also be indirect, such as the presence of foreign military bases in many parts of the Muslim world (Saudi Arabia, Turkey). In Islam, the 'kingdom of god' is in heaven and on earth, not only a kingdom in heaven (Christianity) or a kingdom on earth (Judaism). War against decolonization is a just war, and Jihad is legitimate for those expelled from their homes and expatriated.¹² As interpreted, the Jihad is a defensive war to re-establish justice and order. Occupation occurs through aggressive wars and ends with liberation wars.

Second, internal oppression and dictatorial regimes are causing much internal violence in the Muslim world. The rule of the Muslim majority by a secular minority, in the name of secular political ideologies, liberalism, socialism, nationalism, and Marxism is a usurpation of power. The source of authority in Islam is neither heredity (kingdoms), nor coups d'état by free officers (people's republics), nor referenda (parliamentary systems), but Islamic law. The political power is only an executive power, neither a legislative nor a judiciary power. In Islamic rule, freedom of expression is the duty of every Muslim knowing the law. Each must order the good to be done and prevent the evil from being done.¹³ He has to begin with peaceful advice, then by appealing to the judiciary, and finally by a revolt against the despot who does not apply the rule of law. Although the high judge is nominated by the head of state, he cannot be dismissed by him. On the contrary, the head of state can be dismissed by the high judge if the former does not hear and obey the advise of the knowledgeable people, and before a revolt against him occurs. As long as political regimes in the Muslim world continue to rule in the name of secular ideologies, practising the most horrible forms of oppression and dictatorship, violence will always continue to destabilize these regimes, supported by for-

eign powers. Muslim societies can be prepared for life in peace, once freedom of expression stipulated in Islam is implemented in practice.

Third, the polarity between rich and poor inside Muslim societies has reached a stage where a few people own almost all the wealth, and the majority is starving. The distribution of wealth between those unequal who have and those who have not, between oil rich countries and poor countries, between royal families and the populace, between multimillionaires and the majority living under the poverty line, is a major cause of social unrest. As a result, national capital has flown to foreign capitals, and national sovereignty has yielded to multinational corporations. In Islam, wealth cannot be in the hands of a minority ruling over the majority. It has to be divided and given to all social classes in the whole nation.¹⁴

Wealth and the whole world belong to God. Man is only a depository. He has the right to use, to invest, and to spend according to his needs. But he has no right to misuse, to monopolize, or to exploit. If he does, the state, representing mass interests, intervenes. The state has the right to nationalize, to confiscate, and to own. General interests cannot be owned individually; such as grass (agriculture), fire (industry), and salt (big trade). God in Islam is defined in terms of human needs: food against hunger, as well as security against fear.¹⁵ A society would collapse, and the state would be destroyed, if we had a high palace, looking over a closed well, that means the domination by the wealthy minority of the poor majority.¹⁶ As long as a few are dying from satiety and over-filled stomachs, while millions are dying from drought, hunger and poverty, Muslim societies will not be prepared for life in peace.

Fourth, the dismantling of the Muslim world, the breaking of its indestructible tie, the dismemberment of one organic body, continue to be one major cause of violence, border clashes, and civil wars. Before the era of colonization, the Muslim world was one united

12 "To those against whom war is made, permission is given (to fight) because they are wronged, and verily, God is most powerful for their aid. (They are) those who have been expelled from their homes in defiance of what is right (for no cause), except that they say, Our Lord is God" (22: 39).

13 "Let there arise out of you a band of people, inviting to all that is good, enjoying what is right, and forbidding what is wrong" (3: 104); "Ye are the best of Peoples, evolved for mankind, enjoying what is right, forbidding what is wrong" (3: 110).

14 "What God has bestowed on His Apostle (and taken away) from the people of the township, belongs to God, to his Apostle, to Kindred and Orphans, the needy and the wayfarer, in order that it may not (merely) make a circuit between the wealthy among you" (59: 7).

15 "Let them adore the Lord of this House, who provides them with food against hunger and with security against fear (of danger)" (56: 3-4).

16 "How many populations have We destroyed, which were given to wrong-doing? They tumbled down on their roofs. And how many wells are lying idle and castles lofty and well-built?" (22: 45).

world. Every Muslim could travel from one corner to the other, looking for knowledge, without barriers or frontiers. After decolonization, new nationstates were created against the will of the people and contrary to their long traditions. With ignorance, backwardness, and foreign conspiracies to strengthen ethnic and religious differences, wars began between or inside countries.¹⁷ The old Roman dictum, *'divide et impera'*, was successfully implemented by big powers to divide the Muslim world and to swallow it piecemeal. As long as the dismantling of the Muslim world continues, border clashes and civil wars will also continue. Once the Muslim world returns to its unity, as the image of god's unity, there will be no more violence and bloodshed.¹⁸ The desire for unity is as deeply felt now as it has been in the past. The Muslim world aspires for unity, but big powers oppose any form of unity, even the partial unity between neighbouring states, in the name of Arab or African unity, Afro-Asian solidarity, or non-alignment.

Fifth, the backwardness of Muslim countries (as 'underdeveloped' or 'developing'), is another cause of disturbance. The lack of infrastructure at all levels, especially public services, makes the whole society live in distress and constant depression. All forms of underdevelopment such as dependency for food and nutrition, foreign aid, increasing imports and falling exports, lack of heavy industry, widespread consumerism, deficit in balance of payments, foreign debt, open door policies, tax evasion, the rise of new middle classes, corruption, foreign banks draining money from inside to outside, black markets, brain drain, lack of planning, these create frustration among those who cannot compete in the new lifestyle. Therefore, crime increases, and security declines. As long as Muslim societies continue with this social disorder, neither peace nor security will exist. It is quite easy through Islam to prepare Muslim societies for life in peace by asserting the sense of vocation of a Muslim in particular and a human being in general, as God's 'assistant manager' on earth, fulfilling His message and realizing His word.¹⁹ The struggle against underdevelopment is a struggle for peace.

Sixth, Westernization of Muslim societies and the threats to cultural identity are behind the upsurge of Islamic fundamentalism and the violence against the symbols of Western imitation and pro-Western policies. As long as the process of Westernization continues, a counter-reaction will always be generated in defence of indigenous tradition. The polarity between the 'self and the other' will reach a point of no return. Development does not necessarily mean adoption of the Western model of growth, modernization, and consumerism. An indigenous development rather than an exogenous one would protect cultural identity. As long as the relationship between centre and periphery continues as it is now between trainer and trainee, master and disciple, teacher and pupil, knowledgeable and ignorant, a one-way transfer from those who have to those who have not, and a dissemination of knowledge from the centre to the periphery - the superiority complex in the other, and the inferiority complex within oneself will continue as a major source of violence and revolt. Once all nations become equal partners, having an equal share in the making of humanity; once the process of knowledge and learning becomes a two-way process; once the history of humankind is not reduced to the European modern era, then Muslim societies will be better prepared for life in peace.²⁰

Seventh, the lack of mass-mobilization in the Muslim world, for a huge project of a global Renaissance, leaves the masses an easy target for all kinds of underground movements. Violence, bloodshed, and wars are not inherent in human nature. They are an exception to the rule. Violence is usually committed either by secret organizations (for instance Jihad groups and) Hizballah in Lebanon or by a big power (US invasion of Grenada, bombing of Libya, Russian invasion of Afghanistan). But the global commoners are peaceful. The abolition of all political parties, the oppression of the opposition by the ruling party, or the

17 Wars between two countries such as Iran and Iraq, Egypt and Libya. Wars inside the same country such as in Sudan (North-South), Morocco (Polisario), Lebanon (civil war), the Philippines (Muslims in Mindanao).

18 "Verily, this Brotherhood of yours is a single Brotherhood, and I am your Lord and cherisher" (21: 92; 23: 52).

19 "Behold, The Lord said to the angels: I will create a Vice-Regent on Earth..." (2: 30); "O David! We did indeed make thee an assistant manager on Earth..." (38: 26). "It is he who hath made you (His) agents, inheritors of the Earth..." (6: 165; 10: 14; 10: 73; 35: 39; 7: 09; 7: 74-27.62).

20 "To each among you have We prescribed a Law and an Open Way. If God had so willed, he would have made you a single people but (His plan is) to test you in what he hath given you: so strive as in a race in all virtues..." (5: 51); "If thy Lord had so willed, he could have made mankind one people, but they will not cease to differ" (9: 118. 16: 93).

acceptance of a multi-party system without a level playing field create a façade democracy where ruling parties win elections by 99.99% of the votes. This encourages the emergence of unrecognized, secret and militant Islamic parties which are highly attractive to the Muslim youth. It is astonishing that in the whole Muslim world there is no legal and popular Islamic party which would fill the gap in the political life, despite the complaint expressed by all political leaders about the political vacuum in their respective societies. The idea of a militant Islamic party is crucial for every Muslim society.²¹ Once such a party is allowed, the Muslim masses will have an open forum to express their grievances against the status quo and their hopes for their ideal societies.

As long as these actual dramas of the Muslim world are not resolved, Muslim societies will be unprepared for life in peace, and remain the victims of the most horrible forms of violence and war. Nuclear arms, star wars, and problems of disarmament are more linked to Western societies. If it is easy to find solutions for nuclear threats through bilateral agreements between nuclear powers and through East-West summits, it is very difficult to solve the seven dramas of the Muslim world.

The threats to the Western world are recent, only since the Second World War, and created by actions of the Western powers themselves. The dramas of the Muslim world are the heritage of a long history since its decadence, and caused mostly by outsiders. The preparation of Western societies for life in peace requires political treaties on the non-proliferation of nuclear weapons. The preparation of Muslim societies for life in peace requires a change in the course of history.

21 In the Qur'n there is a duality between the party of the devil, applied to actual secular parties, and the party of God, which is usually a secret militant Islamic group. The party of the devil, "The Evil One", has got the better of them. So the devil has made them forget God. They are the party of the Evil One. Truly it is the Party of the Evil One that will perish" (58: 19); "But people have cut off their affair (of unity) between them into sects; Each party rejoices in that which is with itself..." (23: 63, 30: 32); the party of God, such as: "As to those who turn (for friendship) to God, His Apostle and the (Fellowship of) believers. It is the fellowship of God that must certainly Triumph" (5: 26); "They are the party of God. Truly, it is the Party of God that will achieve felicity" (58: 22).

18.5 Confronting Common Challenges in Today's Environment

To think is not a purely intellectual exercise limited to resolving mathematical equations, or counting facts, or numerating events. Thinking is a self-commitment of the thinker. Formalism is void of content, quantity without quality, form without matter. Experimentalism is without significance, matter without form, facts free of values, the world without its soul. The thinker is in the world, confronting its challenges. Thinking is committing, meditating is positing. The world is not silent or stagnant but an utterance, an *αλετια* in Heidegger's term, an intention towards the thinker countered by another intention from the thinker towards the world. This double way from the object to the subject and from the subject to the object on the level of knowing is also called intentionality on the level of being, namely behaving. The thinker is a phenomenologist by nature, perceiving the world as a living experience and acting in it as a field of action.

The phenomenological analysis is capable of describing the linkage between civilizations and harmony from one side, and a political dimension on the other. Therefore, the environment does not mean only natural environment as understood by the Greeks and modern environmentalists and to be protected against pollution, desertification, etc. It also includes the human and social environment, called in French 'milieu' and in German 'Umwelt'.

There are seven common challenges the world is confronting today.

- The *first* is what has been labelled as the *clash of civilizations*, Huntington's (1993, 1996) famous thesis, spelling out what has always been spelt in, making explicit what was previously implicit. The clash of civilizations has always been practised parallel to colonialism in the name of acculturation, erasing indigenous cultures of the colonized for the benefit of the Western one, that of the colonizer. Languages and cultures of the Western Hemisphere became 'Indian Reservations' for Hollywood for the benefit of the English in the North, Spaniards in the Centre and South, and the Portuguese in the South. Africa is split between Francophone and Anglophone. English is spoken in India, the language of unity of the subcontinent. Spanish is spoken in the Philippines. In Algeria the slogan during the colonial period was *L'Algérie Française*. Paris was the metropole and France

and Africa were the *Communauté*. Great Britain and its colonies formed the 'commonwealth'.

Subduing cultures was a permanent guarantee to subdue peoples. The cover-up was modernization as Westernization, Europeanization, and now as Americanization. The 'clash of civilizations' is used now as a cover-up for a new economic, political, and cultural hegemony since the periphery is still linked to its tradition, and eager to struggle against the hegemony of the centre as a continuation of the decolonization process. While in reality the intention is to defend globalization and to hide the economic domination of the centre over the periphery.

- The *second challenge* is the one-polar system called *globalization* after the collapse of socialist regimes in Eastern Europe and in the former Soviet Union. It is an unhealthy phenomenon given the absence of competition, of another alternative for a real choice. A one-polar system is a sort of a unilateral oppression. Capitalism is the end of history.

In spite of depression and the economic crises, capitalism is the peak of development, the accomplishment of prophecy, and the end of time without resurrection. Each economic system has to cope with capitalism. Globalization is a cover-up of capitalism. The world as one village, not mutual and regional cooperation, or humanitarianism fighting disease, drought, hunger, desertification, ignorance, illiteracy, etc. Globalization is the consolidation of the power of the centre and the dismantling of the periphery. It is not a one way direction, the unity of the centre, but a two-ways direction, the fragmentation of the periphery. Each nation has to relinquish its national sovereignty, open its borders, lift custom barriers, sign the WTO Charter, accept competition, open its markets for imports, accept the multinational corporations, and digest the results of the information revolution including the global value-systems of consumption, profit, modernity, Western lifestyle including double-standard norms, one for the overdeveloped and another for the underdeveloped.

Since the periphery cannot compete with the centre, and as there is no other bloc which can support the periphery against the monopoly of the centre, as was the case with the previous socialist bloc headed by the former Soviet Union, violence erupts: Demonstrations within the centre in Seattle, Prague, Paris, London, Davos and Geneva, and violent attacks from the periphery against the symbols of power in the centre: the World Trade Center, the Pentagon, the White

House. Symbolic violence means the revolt of the self against the other, the affirmation of identity against alienation, the explosion of an inferiority complex against a superiority complex.

- The *third challenge* is *power without justice*, economic power based on market economy and profit with a huge disparity between the rich and poor, political power based on the military-industrial complex, and the use of the UN system to legitimize a military intervention (as in the case of Yugoslavia), or over and above the UN mandate (like the invasion of Afghanistan).

In the Arab and Muslim world there is a huge sense of injustice and frustration vis-à-vis the Palestinian people, another example of power without justice. Israel has denied the legitimate rights of the Palestinian people for self-determination, refused the application of UN resolutions requiring the withdrawal from the occupied territories, and rejected the implementation of the Madrid Accords and Oslo Agreements. These double-standards are manifestations of power without justice. The Palestinian resistance is labeled as terrorism while the Israeli action is self-defence. The Palestinian Authority is not considered as a partner in the peace process while Israel is. Quid pro quo or 'horse trading' is also practised, the Americans consent to the Russian invasion of Chechnya, and in return the Russians consent to the American invasion of Afghanistan.

- The *fourth challenge* is violence, lately called *terrorism*. A 'war against terror' was launched after the events of 11 September 2001. In fact, these events are a result of something else, a conclusion not a premise, a reaction, not an action. The silence and the incapacity of the Arab and Muslim world increased the sense of frustration. The events of 11 September 2001 - in the perception on the street in many Arab and Muslim countries - is a reaction to 29 September 2000.

According to some in the West, violence is only related to religious violence, and religious violence is only due to Islam. But this perception is erroneous. ETA, a non-religious group, is practicing violence in Spain for an independent Basque state. In Ireland, the terrorism of Catholics against Protestants is also religiously based. The war in Sri Lanka between the Tamils and the Hindus has also been religiously motivated. The Sikhs in Punjab, the Hindus in Kashmir, Zionism in Palestine, American liquidation of the Weco cult and the Japanese arrest of the *Om* sect all were

religiously motivated. Yet, only Islam has been linked to terrorism, and only Arabs to violence. *Jihad* is seen as an aggressive war, although it is only a form of self-defence to which an individual or a community resorts if he/it is under attack. It is often forgotten that Islam is also linked to reason, nature, human rights, equality, progress, and urbanism; one only has to recall classical Islam and the Andalusian symbiosis in Granada, Seville, Cordoba, and Toledo.

The fifth challenge is settling colonialism and the occupation of territories. Palestine is the last spot of modern colonialism created by the British in 1948, just one year after they created Kashmir. Ceuta and Melilla on the northern shore of Morocco are still occupied by Spain as a leftover of the medieval fall of Andalusia. Chechnya is still under Soviet occupation and the Soviet invasion of Afghanistan was followed by the American invasion. Occupation is a crime against humanity because it is the negation of the right of people for self-determination. It is a leftover of the European 19th century model going beyond the borders of Europe to Africa and Asia looking for raw materials, markets, and cheap labour. Political Zionism found in religion a better ideological justification at a time when secularism was presented as a universal value for all.

Liberation wars and national resistance movements are among the most honorable phenomena in the 20th century. They were able in two decades to put an end to a colonial movement that had lasted for more than two centuries. The American revolution against the British, Simon Bolivar's resistance against Spanish settlers in Mesoamerica, the Vietnamese resistance against American aggression, and the Algerian struggle against French occupation are but few examples illustrating the fact that history is the story of liberty, and that the national struggle of the Palestinian people is part of such a historical process.

- The *sixth challenge* is *poverty* and *unequal resource distribution*, not only inside states but also among states. Poverty on the national level is common in both developed and underdeveloped countries. Discrepancy between rich and poor is growing, unemployment is increasing, and foreign debts in Third World countries is rising. The prices of major commodities were and are still unproportional to local wages. The poor and oppressed are easily recruited by radical religious movements that protest against the *status quo*. Salvation in the future generates simultaneously a yearning for the golden age and the lost paradise,

and the messianism of utopian thought and the virtuous city.

At the international level there are rich and poor nations. A huge discrepancy between the lowest and the highest national income reaches 1 to 1,000. The wealth of the centre came partly from the raw materials in the periphery. Five per cent of the world is consuming 75 per cent of world production. The population and the brain drain from the South to the North and from the East to the West is a result of such an imbalance in the world's distribution of wealth.

- The *seventh challenge* is not only *human rights* but also *people's rights*, the right to self-determination and self-rule. Two declarations on human rights were issued in the West, one in the aftermath of the French Revolution in 1789, and the other in 1948 following the end of the Second World War. The latter – the *Universal Declaration of Human Rights* – is based on an individualistic concept of rights but is void of any responsibility or duty. It is applicable only within Western European geographical borders, not outside where most human rights violations were practised. Human rights violation files are used as a whip against any political regime disobedient to the big powers. The *Universal Declaration of people's rights*, proclaimed in Algiers 1971, is based on the communitarian and a universal concept of self-determination as a right that all peoples, irrespective of race, religion and colour, can exercise. Only when this right is respected can independent states live in harmony in an interdependent world.

Gender and minority issues can be solved within global communities. In a society where the concept of citizenship is still obscure the gender issue risks splitting the nation into a male-female dichotomy, one antagonizing the other, while both males and females are the victims of common enemies, internal oppression and external domination. A pluralistic society in which the right to differ is a natural right is based on the equality of rights and duties, not only for individuals but also for sub-groups within global citizenship.

The common challenges in today's environment may differ in perspective, depending on the human condition which varies from one region to another, one continent to another, one culture to another, perhaps even from one historical phase to another. Peoples and cultures may live in the same chronological time but they do not live in the same historical and cultural time.

Modern times feature mostly Western Europe, not even the whole of Europe and much less America, whose history is relatively short. From an American perspective the major challenge in today's environment is terrorism, while from an Arab and Muslim perspective it is the continuation of the decolonization processes and the right of the Palestinians, Kashmiris, and Chechens for self-determination. From a Western perspective globalization is a necessary law of history with which the world must cope, while from a Third-World perspective a regional cooperation in an interdependent world preserves the periphery from being absorbed by the centre. Common challenges are conditioned by the socio-cultural and historical condition of every community. The common is relatively common. The global is the dominant local. The free world may be the oppressive world. Every human being in the depth of his heart is looking for a lesson of modesty, a Christ washing the feet of His disciples.

19 Security in African Philosophy and Historical Ideas

Jacob Emmanuel Mabe

19.1 Introduction

Security is a political principle with the primary function to guarantee national and international peace. As a philosophical concept security is an ancient human ideal to which individuals as well as communities have constantly aspired. Thus, the concept of security assumes a metaphysical and ethical meaning. This chapter focuses on the security thinking in Africa by reviewing the perspectives of a few thinkers in the written records without ignoring the oral tradition, to which a high value is still attributed in African philosophy (Mabe 2001, 2005; Hountondji 1983, 1995, 2002).

19.2 Vital Force and Security in the Oral Tradition

Security is given much attention in African societies, especially in their oral traditions. Security can be satisfied less by material goods than by a spiritual energy that counters negative intrusions on human life. This energy, also called 'vital force', embodies all constantly active immaterial forces in human beings providing not only good health, a balanced nature, satisfaction and thus security, but also transmitting the inner confidence that one does not have to be afraid of anything. There are people in Africa who believe in the existence of such forces, which can protect them from unnatural death and incurable diseases as well as from witchcraft and magical attacks, which can cause mental and physical suffering (Hallen/Sodipo 1986; Oluwole 1992; Hebga 1982). They believe that these forces make them immune. Along with the faith in the positive effect of vital force, there is an almost boundless dominance of the spiritual self over the possession of material goods (money, wealth, food, accommodation, clothes, etc.).

This view of security relying primarily on oral traditions has a large influence both on ethno-philoso-

phy as well as on other scientific disciplines dealing with traditional myths and rules of life. As far as vitality is concerned, its effect is interpreted in the oral-traditional metaphysics as a transcendent moment, whereby the soul moves between the sensory and extra-sensory sphere and between this and the next world. This association of vital force and security may appear mystical, but it must not be attributed to superstition, rather it has a rational basis.

Beyond its rationality, the security concept proves that the feeling of need in traditional Africa was no simple projection of emotions on social and cultural life, but has rather been connected with intellectual life. The ensuing ideas have an integrating function, merging the demand for security into one's life process that the protection of the individual includes the community.

Furthermore, the claims for the rationality of the oral-traditional consciousness of security explains itself, stating that security is not understood as a need based only on sensations such as fear, isolation, mourning, powerlessness, and desperation, etc., but rather as a necessity in thinking reasonably in order to preserve one's life. It is precisely the confrontation with the circumstances of a mundane existence which forces human beings with a talent for common sense to use their vital force (and not magic powers) as well as their extrasensory or transcendent ability. Reason thereby has the function of increasing the sensitivity of a human being in such a way that he senses his vital force and can use it accordingly.

However, there is also the belief that man's intrinsic sensitivity is neither sufficient for recognizing the measure of his vital force nor finding compensatory forces to strengthen mental and physical efficiency in the case of low vital force. It may be that one can attain security-autarchy by rescinding or compensating for one's insufficiency in spiritual energy. There is unfortunately not a single oral-traditional teaching that rationally explains what vital force is and how one obtains it.

It would be correct to say that one can make the connection to the other world by exact knowledge of the laws of nature, which one acquires by the methods of initiation, inspiration, and mediation. In the oral tradition one speaks of contact with immaterial essences, i.e. the ancestors, who allegedly determine the interrelation between the other world and this one. By so doing, the ancestors are regarded as intermediaries between the visible and the invisible world, between the living and dead. In all likelihood, memorial celebrations for the ancestors probably developed from the need to call for the assistance of the deceased.

Other peoples in Africa practice no ancestral cult but nevertheless regard their deceased relatives as companions of fate who are always present despite their invisibility, not only with them, but protecting them against any curse. Some who often visit fortune-tellers, oracles, clairvoyants, and visionaries wish to re-establish an interrupted link with the ancestors through them. Carrying talismans, amulets, pieces of bark and other jewellery made out of gold, silver or diamonds is linked, however, to the intention of preventing the entrance of evil and thus achieving a life in absence of suffering without the direct effect of vital force.

During ancestral memorial celebrations, which symbolize the meeting between deceased and living persons and are still practised in many parts of Africa, the dead are called upon to be constantly present in their living descendants, as well as to provide for their security. But the ancestral faith in Africa owes its lasting meaning to the various malaises in all cultural and social areas connected to the modern trend. There individualism, egoism, greed for money, power and fame, luxury, personal prestige, etc. caused the decay of traditional customs and morals. From this, two almost irreconcilable antagonistic developments resulted: on the one hand, a return of superstition at an explosive rate due to the moral erosion, and on the other hand, a rapid return of the spiritual for some, as well as a passionate striving towards it, for others. It is precisely this dominance of the spiritual which proves that not all Africans are victims of moral perversion, but rather that many remained faithful to their ethical and metaphysical traditions. Indeed, spirituality indicates a nostalgic striving both for the proximity of the ancestors and for harmony. Security for most Africans is reached only if people live in harmony with themselves as well as with their environment and with fellow men.

Among the spiritual inheritances of the oral tradition lie the rituals, the customs, as well as the living norms documented in the various languages, which for generations have been the basis for the metaphysical, ethical, cosmological, logical, and aesthetic thinking and behaviour of the African peoples. They are the most important indications of the African spirituality, which show that life for the previous generations was understood not simply as a random process, but rather as a conscious act connected with a decision based on free will. The oral-traditional inheritance may be based on unwritten theories; nonetheless, it represents a substantial source without which a complete or adequate development of security consciousness cannot be possible in Africa.

Although the following security concepts have been passed on verbally from generation to generation, they still influence the thinking and behaviour of most African peoples:

- *Old age security* by one's own child-bearing or by a close family bond and family loyalty;
- *Protection of the home* (mystical safety of house and property);
- *Physical and personal protection* (use of vitality for protection from unnatural death, voodoo, illnesses and suffering caused by witchcraft, accidents and other handicaps);
- *Protection of the soil* (spiritual safety of the soil or fields from infertility and possible harvest failures, which could be caused by others through envy, disfavour or jealousy);
- *Food-security or security of food resources.*

If these concepts are indications of times which remind one of the intellectual achievements of the earlier generations, they nevertheless make it clear how people dealt with their existential fears in the past (fear of hunger, death, suffering, loneliness, etc.). This is because they thereby could also cultivate positive emotions (joy, peace, well-being, solidarity, love, compassion, etc.), in order to overwhelm negative emotions (mourning, rage, aggression, hate, egoism, envy, jealousy, etc.), which usually created uncertainty or insecurity in people.

In Africa's present societies most scholars no longer think only in categories of oral traditions. Rather they rely almost exclusively on philosophical methods and theories. Thus, they understand security as a term which one can interpret as metaphysical, ethical, hermeneutic, etc. But for the overwhelming majority of African sociologists, security is above all about protection from

- political or religious persecution,
- social inequality,
- racial and sexual discrimination,
- hunger and poverty,
- hate, envy, and war.

19.3 Security in Written Philosophy and Historical Ideas

19.3.1 Introduction

The written intellectual history of Africa goes back to Egyptian antiquity. The characteristics of this form of diffusion and articulation of knowledge is the individual philosopher's claim of finding truth, from *Imhotep* (c.2800 BC), *Ptahhotep* (c.2750 BC) and *Akhenaton* or *Amenophis IV.*(1372-1354 BC) through *Apuleius* (c.125-180), *Plotin* (c.204-270), *Aurelius Augustine* (354-430), *Averroes* (1126-1198), *Ibn Chaldun* (1337-1466), *Anton Amo* (c.1700-c.1759) and up to *Alexis Kagame* (1912-1981), *Cheikh Anta Diop* (1999), *Abmadou Hampate Bâ* (1901-1991), *Samir Amin* (*1931); *Ebenezer Njoh-Mouelle* (*1938) and others.

Each philosopher thereby strives through subjective concepts to make a conclusive break with verbalism, however, without having to put the entire tradition of culture into question. Although all major African scholars have grappled with the general problems of existence, only a few of them have concerned themselves with the question of security regarding the political, economic, and social requirements of their respective age. Among the most frequently discussed security questions of the last centuries are, among other things: slavery and the slave trade, colonial conquest and violence, the political emancipation movements, the formation of new states, as well as general development problems.

19.3.2 Security and State in the Philosophy of Ancient Egypt

As in other oral and intellectual traditions in Africa, different terms for security are used: protection, safe keeping, conservation, defence, etc. Regardless of their high estimation of the metaphysical, African philosophers are nevertheless conscious that the principle of the rhythm of nature, or the observance of the holy directives, does not always affect social life directly. Due to this knowledge they endorse the creation of artificial means, in order to secure the com-

mon survival of the population. At the very centre of African security thought is the question: How can the respective societies of Africa be organized politically and economically in such a way that all those living within them (young and old, ill and healthy, weak and strong, etc.) can satisfy their most elementary needs for security (a healthy home, food and clothes, etc.)?

Regardless of its divergent opinions, one thing is common to all African philosophers since antiquity, namely that they regard the preservation of human existence not only as a task of God, of nature, of the village community or only of the family, but also as a task of the state. Already in Egyptian antiquity, philosophers considered a theoretical as well as practical application of the *Maât*, which they interpreted as a political way of life and order, wisdom, truth and justice.

In the opinion of the philosopher *Ptahhotep* (approx. 2,700 B.C.), the observance of the *Maât*, as an eternal rule of life, is the only path to security.¹ Moreover, he denotes the *Maât* as a law reconcilable with the order of the universe, whose neglect entails war, chaos, and uncertainty. *Ptahhotep* assigns to its *Sebayt* (wisdom doctrine) the task of freeing the mind of the reader so that he always recognizes and follows the correct path to the *Maât*. The *Maât* itself should help each individual to find harmony within himself and with the universe, and help him to achieve a peaceful coexistence with his fellow beings. *Ptahhotep* appeals to the rulers to always make their political concepts in writing, and to make them public in order to facilitate governing for its successors or thereby show them how they could avoid unnecessary errors in governing. Only by good governance does a nation achieve good fortune, and according to *Ptahhotep* correct rule consists of acting and governing according to the *Maât*.

Moreover, *Ptahhotep* names the assured supply of food as one of the most important state functions apart from peacekeeping measures and the promotion of education. In Egypt it was in fact the obligation of the state and the temple priests to distribute food in such a way that each citizen had a sufficient supply. *Ptahhotep* explains the right to food, which today one could call a basic or human right as: "He who has an empty stomach is a plaintiff"; and he adds that a fair and thus safe country is one which has a "well-nourished population".

1 *Ptahhotep* was an adviser to King *Isesi* of the Fifth Dynasty and the first known philosopher in world history (Jacq 1993; Diop 1974, 1999).

Education and security go hand in hand, because security presupposes confidence in the social order just as it does in knowledge. But according to Ptahhotep, without education there is no trust. Thus, he recommends that highly respected personalities in the country formulate their opinions on education in such a way that they apply indefinitely, i.e. that they can also be accepted by all following generations as general principles and yardsticks of the truth or of wisdom. According to Ptahhotep, human beings always need noble role models whose moral actions and behaviour, as well as perception of order, they can aspire to emulate.

Before Ptahhotep, the architect and philosopher *Imhotep* (approx. 2,800 B.C.) produced different writings, among these “the Protection of the Weak and the Minorities,” which could not be found.² As an inventor of stone architecture, Imhotep established the first Mer (pyramid) in Sakkâra for King Djoser. Aside from their aesthetic (tomb art), chemical (mummifying), and scientific-mathematical meaning (astronomical computations, time calculation, conservation of writings and knowledge), pyramids also had a religious function, to the extent that they served as a cult area (temple) for honouring the dead.

The establishment of the first pyramid was accompanied by a spiritual transformation of the traditional cult of death. From then on the dead king or pharaoh was no longer present only in spirit but also as a tangible thing: the mummy being present during sacrificial and memorial ceremonies. Moreover, the pyramid temples pointed the path to the heavenly god Rê and made communication with god possible in the presence of the dead king whose authority was therefore affirmed. Hereby each individual was allowed the opportunity to ask god directly for his protection or to seek harmony with him. Apart from this, pyramids served as a safe haven for people who honoured their dead kings.

With *Echnaton* the Egyptian intellectual life took on a new form. *Akhenaton* identified himself as a servant of the god Aton and thereby ended the traditional belief in the direct influence of god on the world. The new faith which he established was di-

rected towards the recognition of god as well as a trust in him. Echnaton’s teaching was that one arrives at this knowledge only through the belief that the sun is a symbol of the existence of god. Also the confidence in god, which brings security, results solely from the contemplation and perception of the sun. With this thesis, Echnaton claimed not only to know the Maât, but also to adequately apply it in a practical way to optimize political rule and the pacification of communal life (Obenga 1990).

19.3.3 Security and Belief in God in the Middle Ages

What security and faith have in common is the problem of suffering and death, because there is nothing which causes people more hopelessness and uncertainty as the fear of suffering and death. Even the old Egyptians already had a negative attitude towards dying. In particular they regarded early death and the associated suffering as humiliation. Thus, they regarded life without suffering as the only redemption. But also in the still extant traditional societies of Africa, the concept prevails that death belongs to the grey-haired, in particular if the person can no longer bear his age-related suffering. Therefore, every form of dying at an early and middle age is deemed to be unnatural.

From this perspective, several efforts were made (since the beginning of the history of the Christian church in Africa with Tertullian) to counter the negative attitude towards death. The African church scholars, from *Tertullian* (c.160–220) and *Origen* (c.185–254) through *Aurelius Augustine* (354–430), *Marcus Cornelius Fronto* (100–170), *Apianus* (90–160), *Cyprian* (200–258), *Arnobius* (250–310), *Cyrril* (350–444) up to *Philopones* (490–575), had again and again striven to convey the belief in a blessed death in order to relieve people of their fear of death. Because death, from a Christian point of view, is not primarily considered to be punishment for one’s sins, but rather it is considered as a time of predetermined ‘homecoming’ to God. Faith should therefore bring redemption as well as protection from the power of sin, suffering, and death. Moreover, suffering and fear of death are deemed to stem from a state of personal insecurity as well as from a lack of self-confidence, which can only be overcome by a confession and confidence in God.

If faith protects against sin, then this implies, from *Augustine’s* point of view, that sin is not the work of God, but of human beings. Thus, sinners cannot attain redemption from evil, not even through their

2 *Imhotep* lived during the *Old Kingdom* and was born a commoner during the *Third Dynasty*. He was a thinker, poet, chemist, and architect. He wrote many medical and didactic texts. He is best known as the chief architect of the first pyramid at Saqqara, one of the most brilliant architectural wonders of the ancient world (Wildung 1977; Assante 2000).

own strength. In his predestination doctrine, Augustine makes clear that according to the will of God men are destined either to receive His mercy or perish. Are sinners therefore condemned to eternal suffering? Although Augustine does not expressly maintain this, his theory of suffering differs from that of the oral-traditional views, according to which suffering is considered something negative. With Augustine and his Christian contemporaries, however, suffering is viewed positively, in as much as it is portrayed as a force which helps to give insight into human finiteness on the one hand as well as divine infinity on the other.

With regard to the contemplation of death, parallels can be drawn between Christian and Islamic thinking in Africa, in as much as both traditions of faith do not consider death as being the end of life. Although this belief goes back to the Jewish tradition before Moses, this chapter is limited to the two script religions which affect the African spiritual life in the present as in the past. While Christians interpret death as a simple 'coming home' to God and at the same time connect life without sin to the entrance into the realm of God, the Muslims argue that the dying are called from this life in order to live on beyond death. From the viewpoint of the Islamic scholars of Africa such as *Ibn Ishaq* († 873), *Al-Farabi* († 950), *Averroes* (1126–1198), etc. death therefore means nothing other than the return of human beings to their original life. The Qur'n itself is for them a spiritual book which indicates the path to happiness. This view of security has hardly changed up to the present time.

According to *Ibn Chaldun* (1337–1466) it is, however, not faith as such, but rather the state, which provides for the security of the population required to co-exist (Fischer 1992). However, such a state requires power in order to exercise its authority. Without power it is not possible to secure and sustain a peaceful coexistence. Chaldun assigns to the rulers the task of finding an adequate method of action (*siyâsa*, or politics) for the implementation of its goals. In so doing he differentiates between three forms of power:

- *pure power*, which determines or represents the interests and objectives of the government and to which all inhabitants are subjected;
- *political power*, which governs in accordance with the yardstick of reason and for the purpose of safeguarding the public welfare;
- the *power of the Caliphs*, who govern as a successor to the prophet only in accordance with the

Shariah, and which represents the interests of the Muslim community in this life and the next.

Moreover, Chaldun differentiates between:

- a *civilized state*, which is created by a sage,
- a *barbarically* (founded in a uncivilized manner) state,
- and a *religious* state.

From Chaldun's point of view the practice of politics is necessary and indispensable, as long as it not only provides for the security of individuals and the community, but also places everyone under a common authority which at the same time controls the limits of their individuality and their liberty. If politics are applied in accordance with the Shariah, then they can contribute to the liberation and the illumination of the human soul. Chaldun calls the Shariah a law of enlightenment, which assures eternal bliss. As to the question of the extent to which a secular state and the Shariah can be reconciled without conflict, Ibn Chaldun no longer deals with it on a purely philosophical level, but rather on a religiously neutral one, by only recommending that either the state subjects itself to the Shariah and to Islam or that it separates itself from both.

Present-day Muslim philosophy and theology have been in this dilemma for centuries. Even today it is represented by two rival currents between which a common position cannot be agreed upon. On the one side there are the traditionalists who energetically commit themselves to the inseparability of religion and state and who see in the Qur'n a universal remedy for all of life's problems. On the other side there are dedicated modernists, for whom Islam is nothing but a religion of enlightenment which is not responsible for the organization of human coexistence.

19.4 Security in Modern Philosophy and Historical Ideas

19.4.1 Security and Self-preservation in the Philosophy of the Enlightenment

William Anton Amo (c.1700–c.1759) was the only African philosopher of the Enlightenment who dealt intensively with the question of security.³ To elucidate his thesis he uses two essential terms for security: self-preservation and perfection. Amo argues abstractly, proceeding thereby from the assumption that philosophy is always related to knowledge. In addition, he states that each philosophical knowledge must be di-

rected toward perfection because perfection has its own destiny regarding the purpose of knowledge; i.e. it refers only to knowledge which is applied for a specific purpose.

According to Amo, a finding is only perfect if it is also useful. The purpose therefore of philosophy, in accordance with its usefulness, consists of the preservation and perfecting of the human species. By perfecting, Amo means natural as well as moral perfection. Natural perfection aims at self-preservation and safeguarding a basic existence as well the just and intelligent actions which are associated with it, i.e. intellectual exercises for the sake of truth. Moral perfection, however, refers to wisdom in the sense of conformity of knowledge with the divine Being and has eternal bliss as its goal.

19.4.2 Security and the State in Contemporary African Thought

The development of the contemporary security thought goes hand in hand with the developments of the natural sciences – from medicine through biotechnology and ecology up to energy technology which,

with ever new finding – assert the claim of helping people to have a more contented life. The African intellectual culture did achieve new weight as a result of scientific innovations, but did not, however, gain moral and cognitive quality.

For most political philosophers of Africa the term ‘security’ represents a principle underlying all national actions, which pursues the goal of promoting economic and political development. This has led to African states always associating their familial, social, and economic policy with the protection of families and human rights, the safeguarding of the right to work, the protection of the rights of mothers, women, and children by acknowledging their dignity, with consolidation of peace outwardly by the military and inwardly by the police, with social safeguards, with the guarantee of good healthcare, etc. If one translates the traditional behaviour and rules of thought into the current reality, then one can observe that the attitudes of the African in matters of security have changed somewhat less socially and culturally than economically and politically.

The fact that the post-colonial states have so far not succeeded in fulfilling the desires of their citizens for security can be explained by the following line of argument: it is undeniable that those in the West, with the use of economic, developmental, and security policies, have for decades restricted the freedom of action of the elite African leadership. However, since the independence of their countries, the latter have also made the error of exercising their authority for power instead of developing it through the acceptance of the population. Unfortunately, even some young rulers continued this wrong strategy by continuing to rely on measures of intimidation of the population by the judicial authorities, the police, and the military. They thereby hope to promote the adjustment of their fellow citizens to the requirements of modern democracy and development. And thus, they find themselves in a dilemma: On the one hand they want to take care of everything themselves, including the citizen’s individual security. On the other hand they demand more self-initiative from their people, although they do not grant them any rights of liberty. In this way no durable positive effect has resulted from more than 40 years of synergy of state and development in the fight against the substantial number of infant deaths, malnutrition, insufficient medical treatment, low life-expectancy, etc.

Moreover, the failure of the old idea of authority with the associated expansion of the national power monopolies led to a troubling depoliticizing of the cit-

3 Amo was the most important African philosopher in the Enlightenment in Europe. He was born in Ghana. As a child, Amo was brought to the Netherlands. Soon he was turned over to the German Duke Anton Ulrich Brunswick-Wolfenbüttel. In addition to mastering German, Latin, Greek, Hebrew, and French, Amo also spoke fluent English, and Dutch. In 1727 Amo entered the University of Halle where he studied philosophy and law. In Halle, he became acquainted with the thoughts of Christian Thomasius, Christian Wolff, and René Descartes. Amo received his doctorate in philosophy in 1730. He then studied physiology, medicine, and pneumatology (psychology today) at the University of Wittenberg, receiving a degree in medicine and science in 1733. In his address, the Rector of the University emphasized the high regard Amo held in academic circles and said that the work proved that Amo’s intellectual ability was as great as his powers of teaching. Amo was the first black professor in Germany. He taught at the universities in Halle, Wittenberg, and Jena. His first work, *Dissertatio Inauguralis De Jure Maurorum in Europa* (1729), concerned the rights of Africans in Europe. In 1734 Amo published his second doctoral dissertation, *De Humanae Mentis “Apatheia”* (On the Absence of Sensation in the Human Mind). Amo’s third major publication was: *De Arte Sobrie et Accurate Philosophandi* (1736, Treatise on the Art of Philosophizing Soberly and Accurately). Amo moved in 1739 to Jena, where he taught at the university. Amo sailed probably in 1747 to his native Gold Coast (today Ghana).

izens. The displacement of the inhabitants has had many consequences, not the least of which being that the traditional authorities (sages, healers, fortune-tellers, etc.), which in the past embodied the familial and ethnical entity and with whom people once sought protection, have almost lost their importance. But for some Africans the real problem of their countries lies primarily in their confidence in the state and the modernism of its political and university leadership elites, which for years have been destroying the oral along with all other cultural traditions in favour of a modernistic development. The actual danger thereby exists in the neglect of verbal forms of predictions, foretelling, prophecy, and sapience, which in the past served the organization and the cooperation of the community.

For Africa's contemporary state theoreticians security has a direct relation to dignity, liberty, and well-being. Until 1960, colonial violence, oppression, and exploitation stood at the centre of state-theoretical considerations. Aimé Césaire (*1913), Léopold Sédar Senghor (1906–2002), Kwame Nkruma (1909–1972), Frantz Fanon (1925–1961), etc. as well as the pan-African civil rights activists from America were unanimous in their opinion that the Africans' uncertainty is to be attributed to the degrading of cultures as well as the destabilization of the African societies caused by colonization. Because Africa in their opinion had been condemned to liberty, one had to undertake everything possible to end the colonial subjugation and thus help Africans to restore their lost dignity.

From this assumption, Léopold Sédar Senghor and Aimé Césaire used poetry to try to communicate to Africans a new sense of self-value and security. They believed to thereby overcome the sense of shame and inferiority developed from racist discrimination which, in their opinion, made Africans feel insecure in their thoughts and acts. Frantz Fanon for his part recommended the use of force in order to counteract colonial oppression. It remains unclear however whether or not in so doing, he preferred military operations exclusively. In contrast to this, Amílcar Cabral (1924–1973) postulated the use of magic, witchcraft, gris-gris, voodoo, amulets, etc. in the fight for independence, in order to blind and weaken the attacking enemies.

Apart from his untiring commitment to African unity, Nkrumah, with his *Consciencism*, tried to develop a society of equality on the basis of socialism. With his Ujamaa doctrine, Julius Nyerere (1922–1984) strived towards a socialism based on a fair distribution of goods. Being firmly convinced of the fact that only

labour could ensure individual and collective security and liberty, Nyerere pursued the goal of not only removing the gap between rich and poor but by using Tanzania as an example, he showed how one could assure the right to work for each citizen of the state. Up to today, Samir Amin (1996) still struggles for the substitution of the existing metropolitan world market order which promotes the pauperization of the African and South American countries as well as some parts of Asia, to a capitalism-free and safe world.

All states which have become independent since 1960 have let themselves be influenced directly or indirectly by totalitarian ideologies, which declare the solution of all security questions including 'humanitarian security' (the protection of children, civilians, the disabled, the elderly, land, property, etc.) to be the exclusive task of the state. According to Fabien Eboussi Boulaga (1977), the fact that all political strategies have so far failed can only be attributed to the ethical retardation of Africa. Without founded ethical bases, neither politics nor its different ideologies can meet the challenges of modern society.

The other contemporary philosophers such as Marcien Towa, Georges Ngal (*1933), Theophile Obenga (*1936), Paulin Hountondji (*1942), Henry Odera Oruka (1944–1993), Kwame Gyekye, Olusegun Oladipo, Mogobe Ramose, Phambu Ngoma Binda, Rabia Mimoune, Hassan Hafani, Jean-Godefroy Bidima (*1958), Marie Pauline Eboh, Laila Abdel-Wahab, Albertine Tshibilondi Ngoyi, etc. all demand a new ethical start in Africa.

19.4.3 Security and Vitality in Ethnophilosophy

The term 'vital force' was introduced to African ethno-philosophy by the Belgian priest Placide Tempels (1906–1977) in order to emphasize the special ontological quality of African thinking. By vital force Tempels means an energy inherent to all creatures, predetermined by god, and which serves the preservation of life as well as assuring survival. As creator of the universe, god not only bestows life, but also steers the worldly powers according to his own will. Tempels is, however, of the opinion that vital force comes to the living just as it does to the dead and varies according to age, social rank and category of species. He speaks of a hierarchy of power, at the summit of which stands god as creator of the worldly powers. In his opinion, the deceased possess more vital force than the living, the older persons more than the younger, and the healers, fortune-tellers and village guardians more vital force than any others. Vital force

can moreover decrease or increase, regenerate or degenerate. From this it is clear that Tempels (1959) considers security only to be possible under the direct divine influence on life.

In contrast, *Alexis Kagame* (1912–1981) argues that in accordance to their human nature and independent of their culture, biological origin or age, all human beings possess the same measure of vital force (Kagame 1976). He is also of the opinion that the term ‘vital force’ cannot be applied to immaterial entities such as god and the deceased. In this regard, Kagame consciously disassociates himself both from the Christian belief in the eternal effect of the spirit of god on terrestrial lives as well as from the oral-traditional spiritual faith. Apart from this, he assigns human beings worldwide with the ability to increase their energy, which Tempels limits only to Africans. According to Kagame all organisms (human beings and animals) possess a vital force. But while that of animals is of physical nature, the vitality of human beings is characterized by its intellectual valence. It is, however, common to the two categories of organisms that due to their vitality they both strive for perfection and unity in life. In other words, vital force helps to bring a secure life to the world.

Meinrad Hebga (1995, 1998) believes likewise that something like vital force can exist. He warns, however, against witches and magicians who manipulate and abuse natural forces in order to intimidate and control others. According to Hebga, the fact that an overwhelming majority of Africans south of the Sahara today feel insecure in their countries or do not dare to visit their homeland in fear of witchcraft and magic, indicates how great the seduction of sin and superstition is in these places. As a philosopher of religion he considers redemption from the power of superstition only possible if confidence in the natural forces is exceeded by reverence for god. In his opinion, belief in God helps to accept his omnipotence regarding perfection and security.

A closer look reveals that the belief in the existence of demons and spirits, which harm more than they help, is an age-old phenomenon in Africa. Even the ancient Egyptians were convinced of the existence of invisible spirits who had access to all areas of life and to living individuals. Like the Egyptians, Hebga also has great doubts about a permanent link between living persons and dead ones outside of certain sacred places. He argues that an uncontrolled contact with the other world can bring the person more harm than good. As a solution to this problem the ancient Egyptians built temples and pyramids in order to celebrate

the cult of their ancestors or their dead. In traditional Africa there are still similar mysterious sites in which the living can honour and contact their dead. In addition, these meeting places serve either as religious and ritual educational facilities or as places of refuge for those who, out of fear of magic and witchcraft or political, ethnical, familial, and religious oppression, yearn for or can find protection, peace, and security.

19.4.4 Security and Life-Unity

According to *Abmadou Hampate Bâ* (1972), security is the feeling of being associated with the unity of life, and that one is not cut off from his environment and fellow beings. But this feeling only develops in those who maintain a certain bond of trust with nature and society and who are careful not to violate the basic rules which govern them. According to Bâ, neglecting this rule results in both the imbalance between the natural forces and in social and cultural chaos. Moreover, Hampate Bâ attributes each disturbance in nature and society to the failure of human beings, which he calls Maa (master of oneself). Because of their characteristic as Maa, human beings possess the ability to live in harmony with Mother Earth and at the same time are able to fulfil their task as preservers of creation and of the natural as well as communal equilibrium.

19.4.5 Security and Well-being

Hardly another modern occupational philosopher has dealt as intensively with the term ‘security’ as *Eben-ezer Njoh-Mouelle* (*1938). In his book: *De la médiocrité à l'excellence* (1988) he draws a close correlation between security and poverty. By this he means the impoverishment of existence by avarice and excessive greed for wealth. Njoh makes ignorance, which he calls the real obstacle to liberty and security, responsible for this poverty. The fact that most Africans strive solely for consumption instead of well-being is, according to Njoh-Mouelle, a logical consequence of post-colonial politics. Because, after their independence, the African governments limited their development policies to securing material prosperity, and by so doing oversaw the fact that real security is based less on material than on moral and intellectual aspects. Instead of promoting moral behaviour, local customs, and spirituality, the post-colonial state continued fighting for its own survival and that of its power-holders.

Njoh-Mouelle differentiated between two forms of security: Security as a life-preservation and security as an accomplishment and preservation of humanity. In the first case, security concerns the preservation and safe-guarding of earned life. In the second case it aims at the realization of humanity in mankind, i.e. well-being for all. What then is well-being exactly? Njoh calls it a condition of the balanced and healthy body and spirit with the exclusion of the satisfying or consumption of subjective and individual desires for security based on luxury and abundance, for which today all human beings worldwide strive.

Moreover, according to Njoh, well-being is synonymous with qualitative and objective security. Thus one should not confuse it with greed or both quantifiable and insatiable material security needs. Objective security, which is at the same time well-being, goes beyond the material fortune of human beings and includes physical, emotional, and spiritual contentment by healthy living, healthy food, and a healthy way of life. According to Njoh, the realization of well-being presupposes above all the use of intellectual means (by education and instruction), which helps people to become creative beings, humans who can secure their biological and spiritual existence through their own strength. This means that the striving for well-being accompanies the spiritual emancipation of human beings towards liberty and bliss.

If security needs are an instinct of self-preservation, then human beings who follow the law of nature create artificial means which can serve their preservation and the perpetuation of human kind. In opposition to this, Njoh-Mouelle believes that human beings, due to their ability to reason, are condemned to invent technical and other artificial means and to use them in such a way that they do not stand in contradiction to nature or run contrary to their existence. In this regard, security makes a demand for objectivity only if the human lifestyle corresponds to a large extent to the natural order as well as to the social harmony. Self-preservation thus includes not only life-preservation and self-realization, but also the preservation of the species and the achievement of the goals of mankind. Njoh-Mouelle therefore pleads that both well-being, as an ideal condition in life and the goal of security, should be attained in dignity.

19.5 Epilogue

The conclusion of this chapter depends upon the awareness that security is not a culturally inevitable

phenomenon, but rather that it is a cultural invariant as well as a universal value, and one that African thinkers want to preserve absolutely. It is nonetheless noteworthy that traditional beliefs, disregarded in the waves of modernization, have not forfeited their timelessness. Whereas oral-based thinkers see security as an ideal attainable through confidence in tradition, text-based theoreticians strive to delineate a rational awareness from faith-based beliefs. In this pursuit they want to prevent security from becoming a closed matter and to assure that it instead remains an open venture. The future of security will remain open as long as people are constantly confronted with the following questions of sustenance:

- *Old age security* by one's own child-bearing or by a close family bond and family loyalty;
- *Protection of the home* (mystical safety of house and property);
- *Physical and personal protection* (use of vitality for protection from unnatural death, voodoo, illnesses and suffering caused by witchcraft, accidents and other handicaps);
- *Protection of the soil* (spiritual safety of the soil or fields from infertility and possible harvest failures, which could be caused by envy, disfavour or jealousy by others);
- *Food-security or security of food resources.*

20 Security in Latin American Philosophy, Ethics, and History of Ideas

Georgina Sánchez

20.1 Introduction

Life in ancient Latin American civilizations was dominated by cosmogonies based on the principle of harmony between humankind and nature. The threats and conflicts of daily life were seen in this general framework which gave precedence to collective interests. Community was thus a lighthouse which organized the present and cared for the future in which individuals had to contribute to the unending cycle of social and natural life. In the Aztecs homeland, in the central valley of Mexico, Nahuatl philosophy inspired the doctrine of ‘the face and the heart’ at the basis of the education system. Cooperation, dignity, and freedom were the highest values, as well as the values of the heart – solidarity, love, and peace. Security was thus conceived as the capacity to live in harmony and to assure sustainability for future generations.

As civilization developed and some form of wealth appeared, the concepts of political power and of particular interests had to be thought within the original cosmogony. From the emergence of the Aztec and Inca Empires and their posterior territorial expansion, and later the arrival of Europeans, security in Latin America became a lot more complex and had to integrate the influence and power of external actors and the constant tension between openness and inertia towards them. There never existed a common Latin American identity that would be able to erase social, economic, and political tensions between political actors, and no specific Latin American philosophy emerged to reflect on the challenge of building a region around shared interests.

For the past 3,000 years, security visions in the Americas have been the product of cultural transformations which did not have a linear evolution, because of the extension of the region and the major shock of the colonization: it is rather a complex layering of old indigenous cosmogonies that still pervade cultural life, with new regimes and rapidly changing social patterns. With strong external interferences,

cultural cross-fertilization coexisted with the ebb-and-flow of imported ideologies and a cultural synthesis was formed from a variety of interests and power resources. However, during the past centuries, ‘security of the state’ has been invoked in order to legitimize the powers in place. More recently, emerging new threats to security led to new proposals and actions that reflected the elaboration of new security concepts.

On the threshold of the 21st century, the main challenge appears to be the search for a common identity that would recognize the basic heterogeneity of the region. Without the development of the positive aspects this heterogeneity entails, nationalism, security schemes without direct relationship to the local and regional environment, and pressures from globalization, the vulnerability of Latin America may increase. At this juncture, the concept known as ‘human security’ appears as the one most compatible with the aspirations for development and democratization that are shared by Latin American people, and would help level out the obstacles of nationalism that have prevented Latin American nations from setting up a regional security framework which would reflect the common features and interests at the root of their identity. In so far as ‘sustainable development’ concepts and centuries are concerned, old cosmogonies share a common preoccupation with the environment. For the first time maybe in the history of Modern Latin America, the focus is on reconciliation rather than the clash of civilizations.

20.2 Pre-Columbian Period: Cosmogonies and Religion

The complex working of cosmic cycles constituted the main referent for the life, security, and development of ancient American civilizations. Recently discovered prints¹ show that there were already human settlements in Mexico some 40,000 years ago, but

organization into rural communities can be traced back to 5,000 years ago. The first cosmogonies to appear, long before religious cults were institutionalized, were based on the vision of humankind as an integral part of nature. Harmony and the balance of the universe depended on the adequate working of the cosmic clock, and human beings would be safe as long as they integrated in the natural cycle without interfering.

Three major civilizations developed in America: the Nahuas (Mexico), the Mayas and Quiches (in Yucatan and Central America), and the Incas (Peru). The Tolteques, the first Nahuatl group to arrive in Mexico's central valley, documented precisely the history of the universe: it took 2,628 years of constant fighting between the gods of light and dark. The god Quetzalcoatl was in charge of the creation of humankind, which would be allowed to transform nature in order to develop into better human beings. The cosmos was perfect and harmonic, and humankind was the conscious being of the world.

The Mayas, exceptional mathematicians and astronomers, had a cosmogony of the creation of the world as an ordered place, divided by the cardinal points, where the sky and earth were formed and distributed evenly by a measuring cord. It was thus possible to reach a rational understanding of the world.

The Inca Empire had its probable origin in the upper Amazon valley. At its apogee in the 10th century AD, the empire extended from Ecuador and Peru, to Bolivia, Chile, and northwest Argentina. The Incas formed the dominant ethnic group, the empire of the Quechua-Aymara language, which subjugated cultures from the Pacific to the Andes. Their cosmogony linked the fate of individuals to the gods of nature, as shown at Cuzco where the astronomical centre of the empire was represented in an impressive architectural complex based on 41 lines (ceques) connected with sacred natural places (huacas) with precise astronomic functions.

In these cosmogonies the concept of individuality, and therefore individual consciousness, did not matter because the emphasis was put on the link of all beings with the universe. Shamans and priests gave representations of nature in which human beings were assimilated to other natural beings or elements. The

first traces of civilization in Mexico – such as a social structure, work specialization, full participation of the communities in the rituals and sophisticated artistic expressions, ceramics, dance, poetry and singing – date back to 1,500 BC in Tlatilco. Nature representations testify to the praying rituals to nature performed in order to demand the satisfaction of the needs of the community. At this early point it is thought that humankind had not yet elaborated the intellectual formulation of synthesis and therefore the structure of religion (Séjourné 1975: 58–62). Security was still viewed as depending on uncertain situations governed by the laws of nature, and that could only be obtained through efficient rituals performed by skilful magicians.

As in all other major cultures and civilizations, the Nahuas, Mayas, and Quiches possessed genesis myths characterized by the power of the verb as a force of creation, and a symbol of consciousness and rationality (De la Garza 1978: 40–41). The meaning of life was to worship the gods of nature, to nourish and maintain them, which created a complex interdependence between humankind and these divinities. After them, humans were the most perfect beings, and human life was conceived as the life of the spirit, the understanding. The Nahuas, Mayas, and Quiches coincided on the conception of original wars, wars between the forces of light and darkness that were the source of the dynamics of the natural life cycle: plants nourished the animals, which fed the humans who nourished the gods of nature with their blood in ritual sacrifices. The existence of gods of nature responded to the necessities of the life of human beings, very conscious of their lack of self-sufficiency (De la Garza 1978: 49). Symmetrically, the gods of nature themselves were not self-sufficient, but had to be acknowledged, worshipped, and nourished by human beings. In the end the harmony of the cosmos depended on the smooth working of this relationship between the gods and mankind.

The god Quetzalcoatl created the spiritual principle of faith, as well as the sense of a centre, a unity and a rationale in human existence. The emergence of the idea of the absolute is thus identified with the god of creation Quetzalcoatl in the Nahuas (Mexico) and Mayan traditions (Yucatan). This absolute was the 'breath of life' which gave the first impulse to movement and time, nature and the world, and engendered the divinities. As the basis of the Nahuatl religion, it fostered a solid spiritual life oriented towards the liberation of the soul. Whereas local and tribal wars took place, often in order to capture people for

1 In July 2005, these prints were discovered by a team of British scientists from the universities of Liverpool, Bournemouth, and Oxford. In: *El Universal*, 5 July 2005.

sacrifices, the most feared wars were those that opposed the gods. The existence of such wars reinforced adherence and compliance to the law of nature, and collective cooperation in order to increase survival became a major cementing social bond in these cultures.

In the 11th century AD, the Aztecs, a tribe of warriors and hunters arrived from the north to the Mexican valley. They reinterpreted the Nahuatl religion and converted the spiritual rituals into actual death and war. When extending the power of the Aztec Empire took central stage, the pillar of the original Nahuatl cosmogony – integration between mankind and nature – became secondary.

Towards AD 1440, the Aztec Empire had extended its power from northern Mexico into Central America through military conquest, becoming a brilliant and fearful civilization. From northern Mexico to Panama, Aztecs subjected hundreds of communities and cultures by force and cunning under a military power.

Pre-Hispanic cosmologies were very complex structures of thought in which intervened an acute knowledge of mathematics, astronomy, physics, biology, arts and religion, all put to the service of strengthening the imperial power. Quetzalcoatl was no longer the keystone of the world order; he was turned into lightning as source of development and the legitimizer of the world order and the dominance of the Aztecs over the other ethnic groups. Emperors and the military became his agents on earth. Use of force was legitimate in order to cause the submission of other groups. State-like institutions were established on a complex structure, organized in a vertical and highly hierarchical way. Bureaucrats, military officers, priests, and noble classes dominated by force, fear, and wealth. In religion, the oneness represented by Quetzalcoatl was imposed over other gods of nature, justifying the impossibility of ever contesting Aztec supremacy.

Until recently, Western thought considered pre-Columbian thinking from the perspective of anthropology, history or archaeology. It has rarely studied the Nahuatl philosophy that the Aztecs inherited from the ancient Nahuas. Beside Aztec militarism, sacrifices, and imperial wars, humanism of the origins subsisted and was quite developed too. The Tlamatinime were intellectuals, poets, and philosophers who were concerned with fundamental questions about mankind and the inherent truth of the universe, life, and death. This humanism considered that life was only a transitory period from which they inferred that truth was not to be found in the here and now of life, but

elsewhere in a different dimension. It was therefore necessary to look beyond the palpable and visible towards what surpasses mankind. The Tlamatinime worked on numerous hypotheses, but did not base their answers on religious rituals, seen as a harmful and useless way of transformation of the gods. Neither was rational thinking the answer, because adaptation of thinking to the reality was worthless under a constantly changing reality, the universe being where ‘everything changes, dies and seems like a dream’. Indeed, for these Nahuatl philosophers, contingency and fragility were the dominant features of the universe, as if to reflect the power of nature expressed in times of natural disasters, hurricanes (from a Caribbean word), and earthquakes.

Tlamatinime created the ‘flower and song’ philosophical thought meant to explain duality, where everything is itself and its contrary in a continual fecundation process. Ometéotl was the blow of life², the origin which allows us to explore the soul – lightning energy – creating humankind with ‘face and heart’ (Séjourné 1975: 83). This philosophy was not only meant to serve as an explanation, and they elaborated a doctrine to be put into practice through teaching. They gained responsibility for educating wise people with solid hearts where lying, egoism, violence, and power ambition would have no place. Wisdom was then will, good judgment, prudence, discretion, imagination and thinking, affection, rationality and responsibility (De la Garza 1978: 74). The core values of human life were to defend and foster life combating anything which ventured against it; to maintain the social cohesion of the community by the accomplishment of the contingent destiny of man, to give birth to the truth and the meaning of all things on earth, and to the universe (León-Portilla 1979: 320). Beauty of flowers and songs could transform fragile mankind by becoming the truth itself and the truth was the keystone of security, harmonization between mankind, nature, and the universe. Nevertheless, this humanist approach never gained enough strength to contain the extreme militarism of Aztec elites, built on the alliance of political and military leaders with priests and magicians. In the Aztec Empire security of the state prevailed over the notion of human security of the ancient Nahuatl cosmogony and religion.

2 Interestingly enough, this concept of ‘breath of original life’ has some similarities with the Chinese one of ‘chi’, blow of vital energy, just as the ying and yang harmony by complementation and opposition as source of life in a universal vision.

20.3 The Conquest: Cosmogonies and Religion

A similar concept prevailed among Spanish conquistadores. They acted in the name of the God of the Roman Catholics and the Crown³. Catholicism disembarked with them and was consolidated during the colonization of America. Inca, Aztec, and Mayan liturgical calendars coincided on the arrival of conquerors and the demise of the existing regimes. The Aztecs even confused the arrival of the conquerors with the return of Quetzalcoatl and they presented little opposition to Hernán Cortés. Also, as the empires were always confronted with the uneasy compliance of vassal ethnic groups and with the power ambitions of aspiring elites, the Spanish were able to forge alliances against the central powers. Nevertheless, the native groups who rebelled against the Spaniards were punished in a brutal and severe way⁴. The internal opposition did not rebelled fiercely, they still do not nowadays, they would be sacrificed by the emperors. If natives did not embrace the Catholic faith, they were forced to, militarily and politically (Todorov 2003: 53). Even more important, conquerors did not understand the Amerindian cosmogonies, religion, and philosophy, but they understood that their power would not be established if they did not first destroy and take possession of the local holy places, this being the reason why they built their churches over the pyramids. The demise of the world order they had always known increased the fear of natives; combined with threat, it was often enough to produce compliance and collaboration. Wild punishments and new pathologies arriving from Europe also contributed to the reduction of America's population, which decreased from 80 million in 1500 to only 10 million 50 years later (Todorov 2003: 28, 144).

In terms of security, the conquest was marked by the personal power and wealth of the conquerors by the appropriation of territories and noble titles, personal wealth and private business, rapes and slavery.⁵

The conquest of the new territories was not financed by the Crown, which did not have the means to do it, but by private funds. The Crown had to refund the financing in exchange for territories, recogni-

tion of its sovereignty, and a tax over the benefits. The wildness of the conquest is then explained by the need to refund this private financing and somehow the 'permission' given to conquerors to act 'freely' and personally, over the local populations and territories, to the detriment of the monitoring and governance of the Spanish state.⁶ Whereas conquerors participated in massive destruction, wildness of domination, and conquest of wide territories and peoples, only 4% participated in the concentration of wealth (Moreno Toscano 1974: 50).

Spanish military strategies and the use of force derived from this context, but their success was determined by another factor. The Aztec Empire was relatively young; it grew between 1420 and 1500, when it reached its conquest's summit over the peoples and cultures of Mesoamerica. Cultures dominated by the Aztecs turned out to become good allies of the conquerors. So, internal divisions explain the asymmetrical forces at play against the Aztecs, where the Spanish controlled the chain of command but Indians formed the real army, in proportions that go from 1 to 50 (Moreno Toscano 1974: 52) to 1 to 1,000 (Todorov 2003: 69).

In Peru, the Inca Empire was also divided: after the death of the leader Inca Huáscar Cápac, his sons disputed violently the legitimacy of the heritage of the Inca Empire, which was about one million square kilometres, extending from Colombia to Chile and Argentina. Spanish conquerors arrived from Panama just in time to take advantage of the brothers' war. Notwithstanding the revolts launched against the violence of the Spanish conquerors, internal divisions were the source of the fall of the Inca Empire (León-Portilla 2004: 113, 120). As in the case of the Mayas, internal divisions split this civilization, which fell under Spanish control by 1546.

3 Major references for this period are: De Sahagún 1956; de las Casas 1951; Cortés 1963.

4 In 1550, Pedro de Valdivia informs the king that Araucans, inhabitants of Chile, did not accept submission, so he declared war and after winning, he punished them "cutting 200 hands and noses ..." (Todorov 2003: 53).

5 This is crucial for the theme of the book and you should elaborate this a bit more and add sources. Do you have sources for this clear argument? Is this a Machiavellian or Hobbesian notion of the security where the power of the conquerors and colonial power as well as of the Catholic Church prevailed? Who were the referents of securitization: the colonial rulers and the Catholic hierarchy? You may also consider adding a simple map in black and white of the colonial period, e.g. of Colonial America 1535 to 1783 (p. 164) based on the Times Atlas of World History. This may take one column in the final print.

6 In some regions, such as the Caribbean, Indian Taínos and Arawacs were practically eliminated; Indians of the Southern Cone - namely in Argentina and Uruguay - had the same destiny.

A second determinant factor that facilitated the conquest was, in the three civilizations, the prophecies of catastrophes which were predicted by the fortune-tellers and pre-Hispanic priests close to the emperors and kings.⁷

A third factor common to these dominant civilizations which assisted the conquest was the element of surprise. All over the continent, the foreigners took the Indians by surprise. The latter, paralysed in face of the Spanish and their apparent attitude of friendship and negotiation, confused their foes with the gods. The role of priests and noble classes which preferred to negotiate with the conquerors rather than fight also had an influence on people's beliefs.

In sum, many internal differences in pre-Hispanic Latin America, urgent economic private interests, religious domination, prophecies of catastrophe and surprise, counted for more in the Spanish Conquest than the guns or the strategic or philosophical thinking of the conquistadores. For over 200 years, the colonial state prevailed, founded on medieval philosophy and Catholic religion.

Whereas the colonial period was less wild than the conquest, it was also imposed by compulsory means, frequently wild. But the native gods and practices were hard to forget, so after the initial violence period, the Church accepted some religious syncretism and mixed marriages between the Spanish and the Indians. These facts contributed to control power, minds and hearts.

20.4 Security in the Pre-Columbian and Colonial Periods

In terms of security, two visions were to be confronted in Latin America. The first one was guided by the cosmogonies founded in the harmony, balance, and integration of humankind with nature, a collective security in which the social cohesion was sustained by collective needs. Whereas there were wars and conflict, societies had a strong driving force towards a humanitarian vision and responsibility in face of nature, the collective belonging, and the future.

7 "Taken together, these stories astonish by their uniformity: the arrival of the Spanish always is preceded by prophecies, their victory is always announced as certain. Moreover, from one extreme to the other of the American continent, they present weird similar features: a comet, a thunder, a fire ..." (Todorov 2003: 82).

The second one represented quite the opposite: the 'reason of the state' based on political power, the individual interest of private groups, and the economic and religious power from pre-Hispanic Latin America to colonization. The will to impose and keep power turned out to be the driving force of hierarchical societies; ambitious individual interests and power with a short-term vision, ready to subjugate peoples and destroy nature contrary to the Tlamatinime conception, acting 'as if the universe was permanent, not contingent, and strong, not fragile'. Material interests, violence, militarism, and hegemonies of the pre-Hispanic and Hispanic Empires contributed to erase the security understood as safety of the human being in harmony with nature and the universe which Nahuatl philosophy proposed.⁸ Latin American modern political systems have their roots in this depredatory vision of the power, centered in individual interests and power not as a mean, but as an objective. From here derives the extended corruption and clientelism practices and some of the difficulties associated to the consolidation of democracy.

20.5 Independence and Consolidation of the Modern State: Philosophy and Democracy

Philosophy, as known in the Occident, only arrived in Latin America 500 years ago with the European conquest. From the 16th to the 18th centuries, state and religion were closely linked by the diffusion of the Scholastics, a pre-modern form of thinking which became the major philosophical trend in the New World.⁹ In the name of Catholicism and Spain, the 'spiritual conquest' took as its task the Christianization and Hispanization of the new territories; this 'Occidentalization' was also done in order to justify and legitimize the European imperial expansion (Moreno Toscano 1974: 54). Catholicism was consolidated during the period of colonization, less wild and more effective, through the conquest of the spirits, a matter of security not only for Catholicism, but also for the Spanish Empire. However, since then and in spite of several

8 Miguel León-Portilla (1979, 2004) is undoubtedly the most important interpreter of Nahuatl philosophy.

9 Among scholastics major representatives are Francisco Suárez (1548-1617), a Jesuit Spanish philosopher and theologian and Francisco Gamboa, or better known as Francisco de Vitoria (1483-1546), one of several founders of pre-modern international law and a philosopher of the conquerors' political thinking.

major re-forms, the Catholic Church in America has displayed a clear division between the high clergy and low clergy which remains until today: the first one linked to the power of the Pope, and the second one identified with the local needs and beliefs. When the politically organized low clergy launched Liberation Theology in the 20th century, they were fiercely attacked by those governments that fought Communism, as well as by the Vatican. Since his arrival in the Vatican, Pope Jean Paul II launched a successful strategy of containment, dispersion, and dissuasion of the low clergy linked to Latin American social demands. Historically, the Catholic Church has had an important role in Latin American politics, sustaining coups d'état, negotiating, mediating, and financing political forces. Latin America is the region in the world with the largest Catholic population. There was a short period of questioning about the Spanish right to dominate and conquer America, about the justice of the war, the real nature of the Indians as human beings, and the legitimacy of the domination of Christianity by the elimination of the Indians and their culture.¹⁰ Nevertheless, once the colonial regime was clearly hegemonic, these questions were no longer asked. In the meantime, second generation Spaniards began to mix with the Indians in the largest cultural fusion of history.¹¹ However, philosophical debates, political, religious, and economic structures emerged, based on Spanish thinking and interests, excluding the participation of local peoples and their cosmogonies, culture or religion, and possibly leaving behind the best opportunity to lay the basis for a Latin American philosophy.

During the conquest and colonization, philosophy, religion, power, and security became one and the same unity: a Hobbesian view oriented to benefit colonial interests, and only marginally to contribute to the well-being of local peoples.

During the 18th century, new influences from Europe, namely from France, arrived in the Americas: the French Revolution, the British Industrial Revolution and the independence of the US from the UK provoked criticism of the pre-modern philosophy.¹² The search for an American and national identity turned these changes into a cultural revolution, which

sowed the seed of the Latin American independence movements from Spain in the early 19th century (Salar Bondy 2001: 13). All over the continent, new ideas of freedom emerged with brilliant leaders as Bolívar (in the Andean area), San Martín (in Southern America), and the priests Miguel Hidalgo and Morelos (in Mexico); they all revolted against Spanish tyranny, hunger, and social polarization.¹³

In philosophical terms, "inside the independence movements fight two opposite trends: one, of European origin, liberal and utopian, which conceive Spanish America as a unit, an assembly of free nations; other, traditional, which breaks linkages with the Crown only to accelerate the process of dispersion of the (Spanish) Empire" (Paz 1994: 131). Nevertheless, contrary to the birth of the United States, which gave place to a new modern nation, in Latin America independence movements resulted in the transfer of the same old power structures, but this time under the hands of the elites of these new countries. "The novelty of these new Hispano-American societies is tricking; in fact they are societies in decline or under forced immobility, survival or fragments of a destroyed unit" (Paz 1994: 132). Latin America was born on the foundations of the declining medieval world.

New European philosophies had an important influence: positivism was adopted all over the continent, the need to be 'scientific' became a fashion, Auguste Comte and Spencer were the thinking guides; refusal of religion in political power, laicism of the state and education systems were stated by important legal reforms such as the Mexican one carried by Benito Juárez; positivism and liberalism in Argentina, Brazil, Cuba (by Sarmiento, Rosas, Martí) coexisted with currents defending Catholicism. Debates between conservatives and liberals tended to prefigure the 20th century political and military structures. Nonetheless, in spite of political debates and modern ideas, the cultural seed of Scholastics and monarchical power structures were at the basis of many of the Latin America and the Caribbean authoritarian regimes of the 19th and 20th centuries.

10 Scholastics, conquest, and colonization have been profusely documented by Todorov (2003).

11 One major symbol of this mixture of population, values, rules and beliefs is the Virgin of Guadalupe in Mexico that combines the Catholic Virgin María and Tonantzín, the Indian goddess of fertility and soil.

12 The Renaissance and the illustration had an important impact on intellectuals represented by the ideas of Newton, Galileo, Descartes, Locke, Rousseau, Montesquieu, Benjamin Constant, Adam Smith and Alexis de Tocqueville. Nonetheless, these debates could hardly reach the common citizen.

13 "In 1800, Mexico has turned to be one of the richest countries of the world, a country of extreme wealth and maximum poverty" (González 1974: 75).

Security in the 19th century was then centred on the defence of the nation-state (not any longer in religious or theocratic political structures) and consolidation of the new local elites through power in politics and economy, avoiding foreign military interventions from Europe.

The emergence of new countries was the result of the disintegration process of the Spanish Empire in the continent and the emergence of new oligarchies, charismatic leaders, and nationalistic ideologies to legitimize their power. Even if the new countries presented new liberal and democratic constitutions, actually they hid the pervasion of feudal political systems and the failed construction of a Latin American political identity. Whereas on the one hand national constitutions were liberal and democratic, on the other political and social practices were frequently authoritarian, corrupt, and guided by private interests.

In spite of a regional positivist movement in order to limit the political power of the clergy, the Catholic Church continued to favour undemocratic governments, dictatorships and political parties, even if formally things should have happened differently. By the end of the 19th century, local fights for power, the consolidation of the United States as an emerging power, and the birth of new intellectuals and academic sectors resulted in criticism of positivism.¹⁴ During the 20th century, Bergson, Croce, Boutroux and Marx became guiding lights of the Hispano-American philosophers of the first half of the 20th century. The second half has been influenced by Camus, Merleau-Ponty, Sartre, Heidegger, Bachelard, Breton, Wittgenstein, Russell and G.E. Moore, among many others.

By adopting, adapting, and associating these philosophies with their own countries, Latin American philosophers were searching in two senses: is there a Latin American philosophy? Is there a Latin American identity? As Salazar Bondy (2001) has argued, there can be no Latin American philosophy, as well as there is no German, French or Spanish philosophy. Philosophy is about universal questions of humankind, not a nationalistic statement – with the exception of Nazism, that attempted to be universal. It is after-

wards, once the discussions attain a deep and complex level of thinking, that these become identified with a national philosophy. Also, the history of ideas in Latin America presented interesting debates on the Latin American identity; however, in spite of these debates, most of Latin American thinking has been imported from elsewhere, namely Europe.

Some of the reasons for this development have been the difficulties associated with the development of abstract thinking, the lack of cultural interests in philosophy, which is substituted by pragmatism, and short-term thinking. In any case, there has been an imitation or adaptation of European philosophy rather than an original production, and there is no authenticity. “Because it is certain that Hispano-Americans are clearly the case of this inauthentic existence: we live around a pretended being, we pretend to be something else than what we are or what we could be or may be, we live alienated in respect to our own reality, which is presented as a defective instance, with multiple shortages, without integration and thus, without spiritual energy” (Salazar Bondy 2001: 82). Latin American philosophers share the same need to build a philosophy based on the search for their own identity, and this should certainly rescue pre-Hispanic philosophy and or from the cultural syncretism of the last 500 years. But in the early 21st century, Latin America is still searching for its own philosophy.

20.6 Security Thinking in Post-Colonial Latin America

Whereas there has been philosophical criticism concerning political and military practices in Latin America, philosophy did not have a direct cause-effect relation with Latin American security. On the contrary, nationalism has been by far the strongest ideology in Latin America which has had an impact on security. Nationalism was born in order to legitimize the local regimes and the division of countries after independence from Europe. The main threat was considered to be European invasion, so nationalism established sovereign powers, geographical definitions, and self-determination of the nation-state, building an ideology against foreign intervention. The ‘reason of national state’ provoked wars against Europe and among Latin American countries.

Latin America integration in new independent states was characterized by suspicious, indifference, and unwillingness: “Americanism was unable to overcome the physical obstacles, internal differences, and

14 The movement “The Founders” – of the nation – like Alejandro Korn (1860–1936), Carlos Vaz Ferreira (1872–1958), Enrique Molina (1910–1997), José Vasconcelos (1882–1959), Alejandro O. Deustua (1849–1945), Enrique Rodó (1871–1917), Alfonso Reyes (1889–1959), Pedro Henríquez Ureña (1884–1946) had and important influence in the fields of education, art, literature, politics, and philosophy.

nationalism” (Atkins 1980: 307). Moreover, nationalism has been the keystone for legitimizing civil and military authoritarian regimes which could not be justified by democracy, and in consequence cultivated differences among peoples in order to create fear, uncertainty, and obedience to undemocratic leaders and governments. In the 20th century the region was already independent but political leaders continued to nourish nationalistic feelings among countries and social groups.¹⁵ Most of the region had nationalistic fearful dictators¹⁶ and military dictatorships, where the national security state in the Southern Cone has been the most fearful and repressive.¹⁷ Also, nationalism has been a platform for internal repression against internal political opposition and civil society by the police and the army. The weakness of political institutions, including the rule of law, allowed for power excesses during the 20th century. Sometimes the rule of law was authoritarian, so the security forces acted against society within the legitimacy of the law. Also, nationalism has been at the origin of the policy of non-intervention and defence of the sovereignty, needed in order to give international legitimacy to these regimes.

Nationalism and security in Latin America have been closely linked since the end of the 19th century to the policies of the United States. The Monroe Doctrine, an influence on Latin America’s security fate since 1823, stated that the US “would consider any attempt from your part (Europe) to extend your system anywhere in the hemisphere, dangerous for our peace and security”. This doctrine has been fundamental for Latin America as it gave enough security for recent independent states to consolidate in the face of interventions from European countries. The U.S. was founding its quest for continental hegemony which derived from cooperation agreements until the 20th century. The influence of the Second World War resulted in regional institutional building that originated in the Rio Treaty (or TIAR 1948); this collective security system gave legal, whereas not legitimate, chart to US military intervention in Latin America and the Caribbean. Another institution that structured the US

influence and control over the region was the OAS, which gave political coverage and legitimacy to US foreign intervention. In face of the increasing American intervention, Mexico organized the Chapultepec Conference in 1945 in order to propose the non-intervention legal principle, which was adopted by the UN Charter.¹⁸

Whereas there have been many ideologies which have had an influence in Latin America, not all had a regional scope. Regional unity through the ideology of Americanism – an integration process – at the independence era quickly declined because it was founded on fear of Europe and not in regional common interests; subsequent initiatives to create full regional integration have failed, while sub-regionalism has been more successful.

Socialism had a real regional influence in the emergence of opposition movements against capitalism, which was at the source of increased conflict (wars for territory and natural resources) and social and economic polarization. Socialism, as an alternative to capitalism, was extremely attractive against political repression practised by authoritarian regimes, populations working within inhuman conditions, and extreme poverty as well as the spread of corruption. The Cuban Revolution became emblematic for social and political movements in their capabilities to change history and to challenge the US: guerrilla wars penetrated most of the continent from the 60’s to the 80’s, and confrontation between governments and guerrillas (namely in Central America) caused a significant loss of human lives. Socialism was also violently fought by the US, by means of foreign intervention (the Dominican Republic, Cuba, Guatemala, Grenada) or by the support of coups d’état (Chile, Guatemala) and of dictatorships (all over the region). Socialism also had a regional force as long as it frequently recovered the old Bolivarian dream: Latinoamericanismo, the union in a fraternal region, of the social revolutionary movements with the support of Cuba and the Soviet Union. But this dream remained a utopia.¹⁹

Civil and military authoritarian regimes in Latin America experienced a setback during the 1980’s, the

15 For instance, in Mexico nationalism drove a revolution against the dictator Porfirio Díaz, only to arrive at a much more complex authoritarian system by which one party governed for more than 70 years under a nationalistic discourse.

16 In Mexico, Central America, the Dominican Republic, Cuba, Haiti, Venezuela, Bolivia, Panama, and Paraguay.

17 In Argentina, Chile, Uruguay, Brazil, Bolivia, and Paraguay.

18 See Article 2,7 UN Charter.

19 The only country that sustained revolutionary policies was Cuba with the support of the USSR. The missile crisis in 1962 has been a major international crisis but the negotiations between the USSR and the US established the rules of the game to avoid a war. While Castro has stayed in power, creating a permanent tension among Latin American countries, the cold war did not result in a nuclear conflict.

“exception regimes” dictatorships of the Southern Cone arrived to fight communism,²⁰ proved to be inefficient concerning the modernization of the economy,²¹ the state and the governance. Both the lack of internal legitimacy and the emergence of new generations that called for democratic regimes as well as changes in US political priorities had fatal consequences for dictators. In the Southern Cone, differences in the ways and means to prevent dictatorships regaining legitimacy resulted in a negotiation of rules for political transition (Jouineau 1993: 157). On the other hand, the lack of success of revolutionary movements resulted in peace agreement negotiations between revolutionaries and governments. In the 1990’s a new wave of democratization evolved in Latin America sowing the seed of new hopes against social exclusion, economic disparity, and lack of participation.

Paradoxically, this region that is still searching for its own philosophy, ended the 20th century building an important feature of its identity by finding its own ways and means to live together in democracy. However, how far and how deep can democracy advance if new cosmo-visions are still lacking, if humankind is not in harmony with nature and society?

20.7 The Global Turn of 1989 and New Security Challenges after 9/11: Impact on Security Conceptualization

Towards the end of the 20th century globalization in Latin America was already an international confirmed trend. Latin America saw in this new wave a way to combine security and certainty for development and sustainable democracies. Free markets and investment promised a new era of growth, sub-regionalism boosted. NAFTA (Mexico, US and Canada), Mercosur (Brazil, Argentina, Uruguay, Paraguay), CARICOM (Caribbean) and SICA (Central America) adopted dynamic free trade, benefiting countries, which were ready to compete globally. Others less equipped with an economy able to export more than

primary goods, stayed behind. Pressures towards globalization, coming from the ruling governments and also from the international community, launched Latin American countries into the world of competition, but under asymmetrical terms. Apparent democratic principles like free markets turned then to be at the origin of social, political, and economic conflict. In the early 21st century, the chance to close the asymmetries – like the European Union has integrated Spain, Greece, and Portugal by asymmetrical agreements allowing their development – between the US and Latin America, seems almost impossible.

Latin American threats to security were deepened by growing organized crime, drug trafficking, money laundering, corruption, devastation of natural resources, and increased insecurity of local populations, threatening the stability of democratically elected governments and opening a complex paradox. Taking away the power from military and security forces took many years and lives, but now Latin America was lacking new philosophical, institutional, military, organizational, and bureaucratic frameworks to fight insecurity. Only the Southern Cone has a wide cooperation framework, Mercosur, which includes trade, but also military, social, and political cooperation adapted to fight new threats. Transforming civil-military relations has been at the core of military reform in South America, a reform still pending in many other countries.

However, the end of the cold war led to a hegemony of the US security vision around the world, and Latin America was no exception. The new agenda, namely after 9/11, implied a new world conflict era where terrorism was the main threat to fight against.

In Latin America the new agenda provokes conflict. Firstly, the democratization wave which has been developing since the late 80’s has tried to change the role of the armed forces by cultivating their submission to civilian and democratic processes, and therefore, lowering their role in internal politics. Under the influence of the post 9/11 agenda, the temptation could emerge for security forces to fight terrorism ‘inside’ by launching, once again, repressive policies against social and political opposition movements.

Secondly, this agenda is the security agenda of the US, rather than a Latin American one: whereas regional governments are establishing cooperation agreements in order to fight terrorism, in fact terrorism is important in international terms, but it is not the main threat to the region (see Rojas Aravena in this volume). Latin America is not at the source of local terrorist groups which pose a real national or international threat. Drug trafficking, organized crime,

20 Prior to the height of anticommunism in Latin America, between 1930 and 1945, there were 47 coups d’état. Brazil had 21 years of military presidencies before elected governments re-emerged.

21 Even if in some cases the opening of the economy had begun (Chile). International enterprises exerted considerable pressure towards the opening of the economies and increased certainty for investments.

social unrest, inequity, fragile elected governments, corruption, natural disasters, internal security, low and slow development, weak democratic culture, asymmetrical and distinct regional needs, capabilities and resources, interests and strategies, together reveal more significant challenges than the fight against terrorism and weapons of mass destruction (in a region free of WMD). With the exception of Colombia and Bolivia, Latin America is in relative peace.

Thirdly, Latin America is forced to subscribe to an extra-regional vision of international security and its threats: this is already causing internal discomfort and growing governmental difficulty to manage and conciliate both agendas in terms of resources, strategies, and needs in face of populations opposed to the imposition of the US agenda. Old forms of nationalism are resurging with haste against this imposition. The spread of social anti-Americanism risks therefore to turn into a spread of anti-Latin American elected government. Moreover, the Latin American experience shows that adopting extra-regional threats can increase intra-regional conflict and internal insecurity.²²

Latin American history shows that adopting extra-regional security and power schemes has resulted in political inadequacies between politics and society, increasing confusion and opposition, lack of social cohesion, and increased insecurity of local populations.

Latin American security proposals have pointed into two directions. The first by regional governments states that democracy and free markets should guarantee better social justice, but they are subject to economic and political international pressure which render difficult major social reforms. Thus, the new social-centrist political wave of new governments points at a society increasingly disappointed with neoliberalism. The successful annual summit in Porto Alegre (Brazil) against economic exclusion and disparity is an example of this growing discomfort.

The second is the human security agenda. The world has experienced major transformations since the end of the cold war. Nevertheless, security structures did not adapt at the same pace; new actors, new threats, trends, and problems appear to challenge the security and well-being of states and societies. These growing and diversifying international insecurities present increased vulnerabilities and risks, as new

threats by non-static actors, increased poverty, environmental devastation, asymmetrical societies, and globalization of the new insecurities keep growing. Whereas proposals of this agenda are numerous and therefore difficult to adopt by Latin American governments lacking economic development and growth, human security points at really strategic long-term issues which will define the quality of life, security, and feasibility of Latin American societies under human conditions. One major challenge is an increasing environmental insecurity, as long as Latin America loses yearly an area equivalent to Germany due to deforestation. Another challenge is a persistent social justice: the region still has the highest social disparity in the world. Around 50% of the region lives in poverty, and issues like food security, health, and asymmetrical development became major preoccupations of societies and governments. Moreover, drug trafficking and organized crime have transcended political and economic structures while political institutions have remained unable to compete with the resources of delinquencies. Building human security to take care of the well-being, sustainability, and peace of individuals and societies is a challenging task; however, the human security agenda appears to be fundamental for Latin America if increased conflict and devastation are to be avoided.²³

20.8 Conclusion

Apparently, each time that the 'security of the state' was invoked to fight conflict in Latin America, new conflicts arose. There are several determinant features associated with the sources of conflict in the region.

- In the past, institutional security frameworks and practices have been more an expression of power interests and will, than a contribution to the solution of real regional or local threats. One explanation for this situation is associated with the extended confusion between morality and ethics. Equally for the Aztecs, Catholicism, authoritarianism or dictatorships, Latin American history has been a history of the power in place, and the imposition of particular world-views, values, principles, and moral attitudes over the others, even if the 'others' have been in the majority. In the name of justice, religion, independence or equality, in security discourses, from Sepúlveda in 1550²⁴ to the

22 The Rio Treaty is still in force. It has been applied almost 20 times to fight "threats to the hemisphere", but "in all the cases involved inter-American conflicts and no one from extra-regional powers" (Atkins, 1980: 359-360)

23 For a key analysis on human security in Latin America, see Rojas Aravena and Goucha (2002).

post 9/11 policies, security has been justified to free the people. Thus, particular moral principles of the powers in place have been hegemonic, despite and independently of the universal ethics of the public service, the social well-being or the national republican state.²⁵

- Two major difficulties in knitting together social internal cohesion inside the states and among them have been the lack of confidence between power and society and the lack of economic, political, and social integration of heterogeneous societies. From the Incas to the policies after 9/11, security has been understood and exerted more against the local social demands than against extra-regional real threats. Nationalism became, in this sense, a way not to develop the nation but to deepen the internal and external divisions among countries.²⁶ Whereas many features unite Latin Americans, it is also true that multiculturalism has been a regional common denominator. Historically, refusal to recognize differences led to authoritarian regimes, which imposed homogenizing ideologies, morals, and doctrines.
- Paradoxically, these countries, profoundly nationalistic, tended to adopt throughout their history, philosophical, political, social, economic, and security models that were not theirs.²⁷ Whereas more than half of the Latin American peoples live in poverty, the more conflicting problem in the 21st century is widespread and extreme economic disparity that provokes security problems, such as internal violence and weak governance.
- The thinking on security has been focused on the nation-state, but many Latin American states have been authoritarian. This poses two major challenges for Latin America: building solid republican states inclusive of the whole society and new secu-

rity policies – not necessarily military ones – which are oriented towards sustainable social cohesion, development, democracy, and peace. In order to do so, Latin America also requires new institutions and the reform of old ones.

- In spite of a long debate, Latin American philosophy has achieved modest results in re-orienting security thinking, but the ethics debate seems to be more promising. “Contrary to the ideologies, which are motivated by the will of power, ethics is motivated by the values... ideology serves to the domination of a group, ethics, to the realization of the common well being” (Villoro 1997: 192).

After a long period of Hobbesian authoritarian regimes, weak democracies, internal division and conflict, armed movements and military intervention to fight opposition, social change is driving Latin America towards democracy and cooperation. Seen in the short term, democracies still present a high degree of uncertainty and some small steps backwards have been taken to move forwards. Seen in the long term, Latin American democracies have made significant advances over the last 20 years: the use of the armed forces for internal repression is rather a history of the past, elected democracies gain their legitimacy, the resort to violence – from authoritarian governments or social movements – is on the decline, and nationalism as an ideology is increasingly questioned in order to build new nations founded in republican states.

However, the lack of coincidence between Latin American and US security challenges does not mean that Latin America must be unprepared to fight insecurity, but threats have a different nature and therefore, require different strategies, resources, and approaches to security. One of the most significant problems deals with the security of society and the human being: to guarantee the population’s human rights, environmental, food, health and shelter security, social economic justice and social cohesion, among others. But ‘militarization’ of these sensible topics would be rather risky as long as armed forces played an important role in internal repression. Other issues, like people’s physical security in the face of violence derived from the drug trafficking, organized crime, kidnapping, and robbery requires the intervention of internal public security forces, but this has to be done in the framework of solid democracies. Hence, one of the priorities is to assist states, governments, and societies to build sustainable democratic practices.

This is where new trends in Latin American ethics are evolving. More and more, social movements are

24 “It is legitimate to dominate by the force of the arms to beings which natural condition is such that they must obey the others” (quoted by Todorov 2003: 165)

25 There has been a defence of the Latin American state in two key moments: against the intervention of Europe and the US and to favour military ruled states, but the republican state is in many states still weak.

26 For the political, economic, and philosophical foundations of the social division in Latin America, see the excellent analysis of Todorov 2003.

27 One of the most recent ones was the Washington Consensus. Whereas countries that adopted this doctrine without criticism have been formally globalized but face huge development challenges (Mexico), others that put forward their local needs, possibilities and rhythms for global integration, have been more successful (Chile).

demanding strong republican states that are able to include the common well-being and a long-term vision of social, not governments' power, and interests.²⁸ This means also that philosophy is advancing towards new security concepts and practices by way of a pragmatic search for a Latin American identity which refuses violence and demands social participation, inclusion, and acceptance of the differences of culturally heterogeneous populations.²⁹ Another issue is the growing interest in the defence of the Latin America strategic future, opening the way to the defence of long-term interests, such as more equal societies (Chile could diminish poverty by more than half in only 15 years); defence of the environmental sustainability and sovereignty (such as the Brazilian defence of the Amazonian in spite of the interventionist voices which attempt to weaken Brazilian sovereignty under the argument of 'global public interest') and the search of new ways of creating new social and ethical values in order to create sustainable civilizations.³⁰

Relations with the US are also underway towards more cooperation and less intervention.³¹ On the side of institutions, during the special OAS Conference on Security new concepts arose, such as multidimensional security (see Rojas Aravena in this volume). Each state faces different risks to its security and even

if many threats are transnational, solutions are national or sub-regional, as security policy is still formulated at state level.³² This aimed to clear the new rules of the game for a real advance in the creation of a Latin American security community. "Clearly, in the concept of Hemispheric Security that is presently under construction there are links between security, development, democracy, human rights, free trade and defence" (Benítez-Manaut 2004: 27) turning security into a complex, elastic but also precise concept which puts aside the militarization and securitization of these subjects,³³ a new security architecture founded on ethical principles, namely on democracy.

In Latin America a change in the conceptualization of security is underway, but more important, Latin America seems to be on the path towards the search for and reconciliation with its true original true identity: the universal belonging in harmony, world integration from a Latin American standpoint, the relation and dialogue between the individual and collective needs and values and the pragmatic search of a sustainable peace, democracy, development and civilization. Latin America is recovering its "face and heart", a conscious being of the world, in harmony with humankind, nature, and social cohesion based on values and peaceful civilized rules to live together, such as the Tlamatinime's proposed to do, some 600 years ago.

28 Foreign intervention has negatively marked the Latin American region and is the "other side of the coin" of closed nationalism. Building solid nations under processes of internal and external peaceful integration means the acceptance of multilateral action and a deep restructuring of the OAS and the Rio Treaty. When regional social and political interests were put forward, peace and democracy could advance; such is the case for the peace agreements in Central America, the non-proliferation measures in Mercosur, the money laundering agreements in the Caribbean, and the 2003 OAS Special Conference on Security.

29 One of the major advances in this sense has been the submission of the military to the civil power and the consolidation of peace trends by means of inter-institutional and cultural change among the armed forces in order to cooperate for peace, such as the agreements in the Southern Cone.

30 With regard to the societies, there are new political and social actors participating in the new ethical debates and research based on an education for democracy, civilization and citizenship (Cullen 1996; Dallera 1997), linking politics and ethics (Nieto Montesinos 1999), conflict resolution in Indian societies and minorities (Oswald 2004), science and ethics (Bunge 1996), ethics and power (Villoro 1997), ethics and political culture (Sánchez 2001), ethics and institutions (Prats I Catalá 2005) or ethics and empowerment (Garzón 1997).

31 "Nations of the region have matured and are attempting to position themselves as interlocutors with the superpower, not only as rule-takers but also as rule-makers. We take this as the beginning of a process, not the end...so long as the US insists on imposing its own security agenda on the hemisphere, there will be crisis points defined by the US that undermine the concept of community. Furthermore, looking to the future, because US unilateralism weakens the hemisphere potential of the OAS, it is by no means clear that the OAS, and not some other regional institution, will be the key element in the architecture of hemispheric security" (Tulchin 2004: 2).

32 "In a major step forward, the OAS agreed that every existing state resource (military, intelligence, judiciary, diplomacy) should be used to confront threats, but that those responses should not necessarily be military." (Benítez-Manaut 2004, 27).

33 The military foreign intervention has been replaced by new concepts of Latin American cooperation, such as humanitarian intervention (Haiti). The logic of intervention and security are restructuring, for example, conflicts that are decreasingly linked to the defence instruments and increasingly based on a solution of social, political or environmental sources of the problem.

21 The Brazilian View on the Conceptualization of Security: Philosophical, Ethical and Cultural Contexts and Issues

Domício Proença Júnior and Eugenio Diniz

21.1 Introduction¹

The chapter focuses on a critical assessment of the latest declaratory policy of the Brazilian government as expressed in the 2005 *Brazilian Defence Policy Document*. This does not correspond to a white paper or to a national security policy but, as it results from an extensive process of political bargaining, it does express contemporary Brazilian conceptualizations of security authoritatively. We speak of ‘conceptualizations’, in the plural form, since it does not express a single, or even a dominant, conception. Its appreciation sets the stage for the historical consideration of the trajectory that can explain its nature, introducing the presentation of the philosophical, ethical, and cultural contexts and issues of the Brazilian conceptualization of security.

To the extent that it simply juxtaposes such conceptualizations, never resolving them, the first impression from the contents of the 2005 Document would be that of simple incoherence. This should not disguise the fact that it faithfully includes the contending perspectives of Brazilian security-related agencies and, through them, to a substantial extent, the indirect impact of national, scientific, academic discourse on security (on these, Brigagão/Proença Jr. 2004; Pinto/Rocha/Silva 2004). It appends several new conceptualizations of security to a core, arguably a potentially dominant core for nothing else if not for inertia, of traditional military and diplomatic concerns. While one might speak of ‘reconceptualization’ on the evidence of those additions, the fact of the matter is that

this Document never resolves the divergent aspects of such conceptions: it simply juxtaposes them (21.2). The chapter then addresses the historical roots (21.3), the participation in multilateral *forums* (21.4), and the National Security Doctrine (21.5) as the principal intellectual trajectories that lead to this diversity of perspectives on security. Such a reconstruction does not dwell extensively on the various intellectual strands in terms of explicit philosophical, ethical or cultural aspects. Rather, it addresses those issues through the outcome of their influence and change in terms of the major security concerns of each period and the way they were dealt with.

In conclusion, it discusses how the use of force itself has little, if any role in Brazilian official security conceptualizations, exemplifying this reluctance to deal with enforcement or coercion by a summary review of the Brazilian participation in the ongoing UN Mission to Haiti (MINUSTAH). Rather than presenting an unsolvable puzzle, this appreciation of Brazil’s historical trajectory of security concerns and conceptualizations serves to illuminate the main sources of Brazilian officially-adopted security concepts. It allows the appreciation of how some strands came into existence, and how they endure, with little if any substantive exchange among them. On the contrary, it argues that further juxtaposition is not only to be expected, but is coherent with this trajectory. It also supports an explanatory hypothesis for both the Brazilian tolerance with divergent conceptions of security and the lack of explicit consideration of the use of force in its highest-level statement for Defence. Brazil is in such a position that it can afford to act as a free rider in security affairs, juxtaposing previously existing discourse with the various other considerations borne out of its own democratization (1988), the end of the Cold War (1990), the creation of a civilian Minister of Defence (1998) or the Attacks of 9.11.2001 (21.6).

1 This chapter benefits from research projects being developed under the sponsorship of the Brazilian National Research Council (CNPq) and the Minas Gerais Research Foundation (FAPEMIG). The authors are grateful for the comments and suggestions of the anonymous reviewers to previous drafts of the text. The final responsibility for any errors or omissions remains ours.

21.2 The Brazilian 2005 Defence Policy Document

The Brazilian 2005 Defence Policy Document (Brazil 2005), like the one that preceded it in 1996, defies easy categorization. It is neither a defence white paper nor a national security policy. It is a broad statement of understanding that declines to be, despite its name, a policy. Rather, it expresses a compromise of the agencies involved in its formulation, a letter of authority outlining what belongs to Brazilian Defence concerns. It brings together those items that one or more agencies would like to have in such a high level statement, and that are not vetoed by another agency. The whole of the document and each of its passages is written cooperatively, in such a way that it is agreeable to all agencies involved. As might be expected, it offers no prioritization or trade-offs among them. Instead, it offers statements of principle, topics of concern, and lists of definitions, guidelines, and directives that are general enough to allow each agency to find its own interpretation. (Proença Jr/Diniz 1998).

However, precisely because it is the result of the collective bargain of Brazilian agencies, it contains a representative panorama of Brazilian security concepts. Its substantive text has two parts: a *political* part, which “contemplates the concepts, the international and national environments and the defence objectives”, which is of primary interest to this chapter; and a *strategy* part, which “comprehends guidelines and directives”, the analysis of which belongs elsewhere (Brasil 2005: Preamble).

There are five items in the political part. The first two juxtapose general considerations and offer definitions on the nature of the state and of security. Tashkent’s 1990 definition of security (UN 1990 apud Brasil 2005), quoted in full in the text, leads to a definition of security as “the condition that allows a country to preserve its sovereignty and territorial integrity [and] the pursuit of its national interests, free from threats or pressures of any nature [whatsoever], and the guarantee to its citizens of their constitutional rights and duties”, and of (national) defence, “the set of measures and actions of the state, with an emphasis on the military expression [see below, item 5], for the defence of the territory, the sovereignty and national interests against preponderantly external threats, potential or actual” (Brasil 2005: Part I).

Summary presentations of a few strands of contemporary international relations theory follow, each circumscribing one or more policy objects. The text draws from Realism to tackle unipolarity and asym-

metries of power; from Complex Interdependence to acknowledge non-state actors; from Institutionalism to address multilateralism and International Law; from Democratic Peace Theory to address the increasing regional confidence and negotiated settlement of disputes; and from Constructivism to describe an expanded conceptualization of security that comes to include environmental issues. That force might be used against or by Brazil in the pursuit of any of these objects is left unmentioned.

The third item declares that South America and the West Coast of Africa are the areas of Brazil’s strategic interest. The fourth refers to the Amazon and the South Atlantic as the primary concerns of Brazilian defence planning; expresses Brazil’s commitment to an international order based on democracy, multilateralism, cooperation, the prohibition of chemical, biological and nuclear weapons, and the quest for peace among nations; affirms the need of constant improvement of the armed forces and the development of a national defence industrial base.

The fifth item of the political part lists Brazil’s six defence objectives:

1. the guarantee of sovereignty, national properties and territorial integrity;
2. the defence of Brazilian interests, property, resources and persons abroad;
3. the enhancement and preservation of national unity and cohesion;
4. the advancement of regional stability;
5. the advancement to the maintenance of international peace and security;
6. the furtherance of Brazil’s role in the concert of nations and its increased participation in international decision-making processes.

This complex and unresolved mix of different levels, approaches, directions, and alternatives juxtaposes incompatible if not contradictory elements. It does mirror the influence of Brazilian writers, intellectuals, and scholars in the security field, but it does so indirectly, by the inclusion of one or more strands that have been brought into light by one or another work by individual writers and adopted by an agency or its representative in the writing process. This limitation on external influence and the tolerance with divergent, incompatible propositions confirms what some have described as Brazil’s peculiar security perspective (Bittencourt 2003; Cruz 2005; Bustamante 1993). For all of that, the *2005 Defence Policy Document* cannot be taken by itself and adjudicated as simply misconstrued. It can be understood by an appreciation of

the contextual components and issues that shape Brazil's security thinking and strategic culture (Booth 1979; Gray 1984; Johnston 1995).

21.3 Historical Roots

Geography explains the ease with which Portugal violated the terms of the Treaty of Tordesillas (1494), which established a division of the New World between Spain and Portugal. Spain and Portugal occupied the coastlines of the Pacific and the Atlantic respectively. The Andes and the discovery of exploitable sources of wealth kept Spain near the coast, while Portugal moved inland in the wake of cattle raising, agriculture, and the quest for minerals and slaves all along the coast from the Amazon to the River Plate. The wealth of the South had most of Portugal's attention. The few who ventured into the Amazon built forts and outposts, the missionaries who worked with the native populations and those who sought mythical riches (Chevalier 1977; Burns 1993). While this move inland was almost irrelevant during the Union of Portugal and Spain (1580–1640), this became a problem for Portuguese-Spanish relations afterwards.

In the Amazon, Portugal found little of economic interest. The region was indefensible without some measure of support from the native populations. This led Portugal to argue for the native ownership of the land which, in turn, led to a huge expansion of the area under nominal Portuguese control well past the Tordesillas line. In the River Plate, Portugal established many colonies, which also infringed on Spanish territory (Prado Jr 1983; Teixeira Soares 1973). The head of the Portuguese Overseas Council, Alexandre de Gusmão, negotiated the Treaty of Madrid in 1750 and settled Portuguese ownership in South America on the principle of *uti possidetis*, that is to say, whoever occupies the land *de facto* is also *de jure* its legitimate owner (Cortêsão 1953; see also Lopez 2007).

The Treaty of Madrid (1750) defined the broad contours of Brazil's territory and put a premium on expansion that would translate into possession. The Portuguese staunchly defended the Sacramento colony south of the River Plate, bargaining its surrender in exchange for what became the southern parts of Brazil and later Uruguay. By skilful negotiation, which included outright distortion of information, Portugal was awarded ownership of its expanded territory beyond the original Tordesillas partition (Cortêsão 1953).

The Treaty of Madrid could not settle the issue of control over the River Plate or anticipate the tensions

of minorities across the border. These required urgent adjustments after independence. For most of their history, Brazil, Argentina, Uruguay, and Paraguay would have these issues as their main foreign policy problems, with lingering fears that occupation of the border by one or the other might lead to claims of trans-border rights. In 1825–1828, Brazil and Argentina fought over the control of the north bank, that became, as a result, Uruguay (Fausto 1999). The War of the Triple Alliance of Uruguay, Argentina, and Brazil against Paraguay (1865–1870) settled the border over the river midpoint in its current, and admitted an informal flow between territories that would become a hallmark of the region (Graham 1989). For all the concerns, fears, and designs of one over the other for the ensuing century, there the matter proved to rest. A general settlement that would remove the prospect of a potential war came late, in the last two decades of the 20th century. Settling the River Plate issue in the 1990's led to the cooperative use of all of its resources and removed the single most important defence problem of Brazil, and arguably the most pressing for Argentina. In retrospect, the matter stood where it had been left a century before. But it was only when the principals in Buenos Aires and Brasília set seal to a formal settlement which addressed the concerns of all parties that the matter ceased to be the primary focus of their military contingency plans. That settlement brought about a fast-pace, positive *rapprochement* that would eventually give birth to *Mercosur*.

The Treaty of Madrid could not solve the fundamental problem of the defence of the Amazon either: the weak demographic and political foundations of Portuguese control. Even considering the very special relationship between the Church and the Portuguese Crown, there were neither enough populations nor political bonds to bind the Amazon to Portugal. Although the Crown chose bishops under the *Padroado* system, the Jesuits, who formed most of the missionaries in the Amazon, were not subject to the Crown at all. The defence of the Amazon had to rely on isolated settlements and forts (many of which doubled as prisons) to stake its claim and presume to control its vast rivers and territories (Burns 1993). Even a major outburst in economic activity and corresponding migration proved incapable of changing the basics of the situation. In 1839, the discovery of vulcanization led to an intense and growing demand for rubber, which was then an Amazonian monopoly. This led to a massive and continued inflow of people to the Amazonian region, particularly from the Brazilian Northeast. However, the Amazon remained vulnerable. The eco-

nomics of rubber exploitation did not lead to the settlement of large areas, but was confined to a handful of cities (Santos 1976).

This frailty of actual control is at the root of the Brazilian susceptibility to cyclical waves of fear of 'international greed' for the Amazon. Each cycle finds its own motives, attuned to the issues of the day, and often brings to the fore Brazilian readings of the European or World political literature and concerns. The first such scare in 1850 had to do with the navigation in the Amazon basin. Brazilian restrictions on the sailing of foreign ships were seen to lead to claims towards the internationalization of the whole basin, with grave consequences for Brazilian control, a mirror image of the various European concerns with international rivers, notably the Danube, and the way the free navigation of the Mississippi-Missouri had undermined French control of the American Louisiana long before Bonaparte chose to sell it in 1803. Authorizing innocent passage by Brazil did away with that fear on that particular occasion without ill effect. Later cycles argued the motivation of foreign needs of land, of energy, of a hidden agenda by research institutions, each expressing then current concerns elsewhere, realized in the Amazon. Foreign needs of particular mineral resources of the time, the untold potential of the biotechnological riches of the Amazonian biota or the scarcity of drinkable water, international environmental and human rights concerns related to the Amazon rain forest and its Indian peoples are often read as camouflage for (renewed) attempts against Brazilian sovereignty (Reis 1967; Durham/Goldemberg 1990; Martins Filho/Zacker 2000; Lopez 2007). The lack of substantial economic development in the present suggests the hopeful view that, once fully developed, the Amazon would guarantee Brazil's future as a major power.

The rubber boom did push Brazilian borders over the lines of the Treaty of Madrid, leading to armed conflict, and potential war. By the end of the 19th century, Brazilian rubber tappers following the rivers reached Bolivian territory. Bolivian authorities then granted to a private Anglo-American company, *the Bolivian Syndicate*, broad authority – including police powers – in that area. There was uproar in Brazil and clashes between the company's men and private Brazilian citizens in 1902. The matter came to be settled by negotiations carried out by the Brazilian Minister of Foreign Relations, the legendary Baron of Rio Branco, and that territory became part of Brazil with Bolivia accepting payment and benefits for its loss (Santos 1976; Teixeira Soares 1973).

For extra-continental security issues Brazil, like Portugal, relied almost completely on Britain. This made Brazil secure against any European power. This also gave Britain some leverage in furthering its demands on Brazil (Bethel 1989). As British power declined, Brazil began to reconsider how to deal with a European power on its own (Skidmore 1999) for, like the 1823 Monroe Doctrine, Brazil's security against European powers had depended on the Royal Navy's control of the Atlantic.

In order to be able to count on the support of at least one European power against the advances of another, Brazil had to reposition itself in the international arena. As US power increased, Brazil also had to consider how close it could be with any European power without risking US displeasure. For a little while, in the early years of the 20th century, British absence was already expected, and US preponderance not yet certain. Chile, Argentina, and Brazil found themselves in a naval arms race, with one after the other acquiring modern *Dreadnought*-type battleships capable either against a European power or against one another. The perception of functional US naval supremacy after the First World War restored the previous situation and led to the collapse of those efforts.

The Baron of Rio Branco's tenure in the Foreign Relations Ministry (1902–1912) came to solidify the Brazilian diplomatic approach to security issues. Rio Branco, with a keen eye on comparable European developments on the last decades of the 19th century, took up the task of settling every outstanding border issue once and for all. Further, he chose to do so following in the footsteps of Gusmão by arguing on legal grounds for *uti possidetis de facto* and by choosing to settle all issues by arbitration. The reliance on arbitration and the legal criteria of *uti possidetis* aimed at a stable solution. Arbitration also allowed Brazil to deepen relations with prospective, and particularly with chosen, arbitrators. It allowed Brazilian issues of security to become live topics in Brazilian relations with major powers, further involving some of them as guarantors of the terms of the settlement they accepted to arbitrate. Rio Branco accepted arbitration even when it went against his expectations of a reasonable outcome, with the sole proviso of impartially addressing the matter anew should one of the other parties ever challenge it (Teixeira Soares 1973). None of these settlements has so far been challenged.

Brazil settled all of its borders (invariably sharing the control of bordering rivers) and outstanding issues where economic development had pushed Brazilians into neighbouring territory. That so much could

be achieved diplomatically, with recourse to international law, serving to involve major powers as prospective or actual arbitrators to guarantee settlements at little political cost, stood out starkly against the conflicts and disputes in Spanish South America. Rio Branco's figure towers over the Brazilian understanding of what diplomacy should be, of how to deal with the most delicate issues of security: sovereignty over territory, relations with neighbours and the involvement of major powers. Brazilian foreign and security policy lies in the shadow of his achievement (Barros 1986).

21.4 Brazil and Multilateral Forums

In 1822, when Brazil seceded from the United Kingdom of Portugal, Brazil, and Algarves, it faced several issues. First and foremost, it had to decide whether it would include the Portuguese African and Asian colonies. This was the consequence of the Portuguese Crown's flight to Brazil in 1807, which had moved the capital to Rio de Janeiro in 1808 and brought along the whole apparatus of the Portuguese Empire – all files, libraries, presses, functionaries. Portuguese ambassadors in Europe reported to Rio, and foreign ambassadors to Portugal lived in Rio. This meant the Brazilian independence included the imperial capital in its territory and thus the whole foreign policy apparatus and actual administrative control of all Portuguese territory outside of Europe (Bethel 1989).

The bargaining process among Brazil, Portugal, and Britain through which the King left Rio de Janeiro to Lisbon and granted Brazil's independence still waits for a definitive study. The three parties agreed to an amicable independence, which paid Portugal compensation for the loss of Brazil and ensured Portugal that Brazil would not then or in the future challenge Lisbon's control of all non-American colonies. Brazil agreed in turn to incorporate all of Portugal's territory in South America, overcame rogue Portuguese efforts to hold on to some parts of it with the support of British Admiral Cochrane, and carried on diplomatic relations with foreign powers as the Empire of Brazil.

The diplomatic issues of recognition, credit, and trade were easy in stark contrast to the difficulties of other independent South American countries. As a result, Brazil began its history by having to consider its position in the concert of nations. The issues that occupied Brazilian relations were primarily commercial, accompanied by political and cultural exchanges. France, through various Bonapartist expatriates, came to play a capital role in Brazilian cultural develop-

ment, the most visible influence being the modelling of the new flag of the Empire of Brazil on Bonaparte's regimental colours. But cultural adherence to France also served to please Brazilian inclinations for a Latin foil against the overbearing presence of Britain. French was commonly spoken by the Brazilian upper classes of the Empire, and French books, newspapers, and *causes celebres* faithfully mirrored a Brazilian inclination towards Paris as the centre of civilization. English, in turn, was the language of a few, and important English works, most famously Adam Smith's and those of the American Founding Fathers, kept in the hands of very few as private assets. The first steps of closer cultural ties to Germany, particularly in the Army and in some Ministries, were curtailed by World War I (Bethel 1989; Barman 1988; Skidmore 1999).

The waning of British power in the early years of the 20th century demanded an enlargement of Brazil's international room for manoeuvre. Brazil expanded its relations with and presence among all major powers, but avoided alliances or bilateral pacts, subscribing to international law instead. Brazil began its perfect attendance record at international conferences championing the ideals of the equality of nations, the right of self-determination, the peaceful settlement of international disputes, disarmament, and a more equitable and progressive international agenda (Skidmore 1999). After US hemispheric pre-eminence became incontrovertible, this enhanced position served as a foil against US dominance, but not so much to provoke US suspicion.

After the First World War, in which Brazil joined the allies, Brazilian diplomats used the opportunity of belonging to the League of Nations. It offered them a space in which to keep in constant contact with all powers with a security agenda. This corresponded to its own cultural preference of producing security through international law and negotiation. In 1919, Brazil requested an observer status in the League, but in 1926, it was the first country to leave it. This departure can illuminate both the nature and the limitations of Brazil's most cherished approach to security, that of diplomacy. Brazil felt that having belonged to the League from its inception and endured the status of an observer, it should be granted a permanent seat. During the 1920's, Brazil had invited French military and American naval missions to modernize its army and navy, which had vast consequences in terms of bringing in their considerable military traditions. Brazil also expanded and formalized its diplomatic corps, making itself present in many capitals and larger cities. For all that, Brazil would not accept that Germany

be invited for a permanent seat whilst Brazil be required to remain an observer. That behaviour, according to Brazil's departure statement, doomed the League of Nations. It betrayed its purpose, making it another tool of the strong, forswearing its role as defender of the law (Garcia 2000).

Brazil joined the combatant United Nations in 1942. It provided raw materials, bases, naval and air forces for the antisubmarine war. Unique among Latin American nations, it sent an expeditionary force to fight in Europe. It is no surprise that Brazil was among the most vocal supporters of the establishment of the United Nations Organization in the 1945 San Francisco Conference, or that it was considered for a permanent seat in the Security Council, which did not come to pass.

For the reasons explained above Brazil has been firmly committed to the idea, even the ideal, of the United Nations. That does not prevent it from recognizing that the organization may not always act in accordance with its purpose. Brazil's participation in the Security Council can be taken as an index of the Brazilian assessment of the UN's loyalty to its goals, if one contrasts the frequent acceptance of a temporary seat in 1946–1968 and 1989–2005 (on average, every 34 months) with the long absence of 228 months from 1968–1989, when it was deemed that the UN was working towards the 'freezing' of world power, which suited well with the "Big Power Brazil" ambitions of the Military Regime (Araújo Castro 1982).

Brazil was among the first countries to make its forces available to the UN Emergency Force of Suez of 1956 (UNEF I), and supported a battalion in Sinai until 1967. Brazil has always been one of the top 10 troop-contributing countries to UN peacekeeping missions, except for the period 1968–1989, when it boycotted UN security initiatives (Fontoura 1999). With the benefit of the elements presented above, it can be readily seen how peacekeeping accords with Brazilian conceptions of the way security affairs should be framed by international law and how it provides opportunities for relations among all countries on equal terms.

However, it is important to distinguish between peacekeeping with the consent of the affected parties 'under Chapter VI' of the UN Charter; and peacekeeping imposed on the affected parties by the Security Council 'under Chapter VII'. For Brazil Chapter VII operations represent an interference into internal affairs (Art. 2,7 UN Charter). Brazil's participation in the United Nations Stabilization Mission in Haiti

(MINUSTAH) was only possible after the mission itself was not based on Chapter VII (Diniz 2005).

21.5 Security and Development

At the beginning of the 20th century, Brazil was divided over the priority of conscription or a *Dreadnought*-type navy. In 1909 there existed many civic organizations that argued for the need for the incorporation of the Brazilian masses into a modern army, both for defence and for the opportunity it would afford for the education of conscripts. This called for large quantities of *materiel* and a robust economy that would either purchase foreign arms or manufacture them. Others held that a navy was more urgent. However, the expense of a *Dreadnought*-type battle fleet and modern naval yard to support and repair it would seem to preclude raising a modern mass army. By the 1920's, as the lessons of the French Military Mission of 1922 and the US Naval Mission of 1924 took root, it became clear that Brazil lacked fundamental infrastructure in industrial and human resources to pursue either course of action.

An all-inclusive notion of national security became the common ground for what had been up to that time a divided debate for army or navy priority. The French and US missions of the early 1920's led to an appreciation of the needs of industry for materiel and education for officers. The 1937 Constitution established a National Security Council to survey all matters of defence: raw materials, personnel, weapons procurement and production, military deployment, training and employment, hand in hand with Brazilian commercial and political diplomatic priorities (Martins 1976).

The vastness of civil-military links required by the logistics of World War II left a deep impression on those who had had the opportunity of extensive training or work in the US. Only a comprehensive logistical approach could hope to sustain modern armed forces in peace or war. For a country like Brazil, this went beyond mobilization. It called for a broader appreciation that acknowledged it would be necessary to start from scratch in many fields. This required balancing security and development needs, clarifying the trade-offs between them, setting up priorities that would cut across ministerial lines and different administrations. This required a space that would gather far more than just the military, but that should involve all that could contribute to the effort of securing the nation. The *Escola Superior de Guerra* (ESG) – usually

translated as the Brazilian National War College – was the result (Miyamoto 1988).

ESG quickly came into operation, its first class graduating in 1950. This class, made up of politicians, scholars, senior civil servants, diplomats and military officers, took advantage of one of the few spaces for graduate studies then available in Brazil to formulate a common language for Brazilian thinking in national security. In its tolerant juxtaposition of the readings of each of its members one can already see the seed of what would become the particular Brazilian brand of tolerance of divergent concepts. But the ensuing classes were never allowed to move on, or even to question the results of the first class. The ESG experience became the repetition of the first class' achievements, making their results the basis of a dogmatic indoctrination, paralysing at its very first step the very process it created. What had been but a first attempt at a common language became the irredeemable "National Security Doctrine" (Proença Jr 2000).

The centre of the doctrine can be found in the binomial (as in Newton's mathematical binomials) of security and development. Proper harmonization of priorities and the balance of their mutual influences is the recipe of national power, providing both development and security. Development is defined as the increase of national power. Security, as the ability to make use of national power without facing hindrance. National power is defined as the panoply of all means available to mobilization by the national will in order to achieve internal or external objectives, a deliberately open, all-inclusive definition. Power would be composed of five (originally four) co-equal, autonomous and interdependent *expressions*: the political, economic, military, psychosocial and, later, the scientific-technological.

Activities in each of the expressions serve the pursuit of 'current national objectives', themselves the circumstantial steps to achieve 'permanent national objectives'. According to the doctrine, there would be perfect identity between the goals of society and state, both subsumed as the nation. Permanent objectives emanate from the nation itself, and result from the acceptance of two supreme values: the pursuit of the 'common good' and the 'national interest'. The development of these values is, to that extent, closed to inquiry: the 'permanent national objectives' of independence, sovereignty, territorial integrity, national cohesion, democracy, among others. As objectives derive unequivocally from the fundamental values of seeking the 'common good' and pursuing 'national in-

terests', so do the means, approaches, and programmes needed to achieve them.

Since goals and means, approaches and programmes are derived logically and uncontroversially from fundamental values as expressed by national objectives, then opposition to them is tantamount to betrayal of the Homeland. Though democracy is one of the doctrine's 'permanent national objectives', the doctrine as such abhors dissent. This idea of democracy can only be apprehended if one realizes that it stands for 'the form of government that is not communism', which makes anticommunism its unstated defining characteristic. As a result, the doctrine is particularly concerned with the 'internal enemy': that is, those who oppose the 'permanent national objectives', or the 'current national objectives', or the plans, programmes, and initiatives that seek to achieve them. For, in the terms of the 'national security doctrine', they cannot do so out of honest disagreement or as an expression of legitimate dissent, but only as allies or tools of foreign powers (Proença Jr/Diniz 1998; Proença Jr 2000).

In part because of its association with the military regime of 1964–1988; in part because of its constant drive towards a de facto doctrinal monopoly over Brazilian thinking on security; in part because of its relentless bureaucratic militancy against alternative approaches, the doctrine, deprived of its anticommunist drive after 1991, ended as the sole conceptual framework that can claim longevity or breadth comparable to that of Brazilian diplomatic traditions. Some of its terms and concepts recur throughout Brazil's legislation, official documents, and statements on security issues by political parties, academics, and journalists from the whole political spectrum. The seeming pervasiveness of the *National Security Doctrine* can be misleading: as it claims and seeks to hold the authoritative definition of all the vocabulary of government, power, security, and defence, any mention of any term can be perceived as echoing the doctrine. ESG definitions can be occasionally be found on discourses and official documents. But this rarely expresses a commitment to ESG's doctrine or conceptualization. Rather, it shows how they are taken uncritically, as ordinary language. Conversely, ESG doctrine can, and does, absorb the bon mot of the day without batting an eyelid: much of the new conceptualization of security of the 1990's has been added to the ESG's all-inclusive definitions.

21.6 Conclusions

Because the 2005 Defence Policy Document expresses a particular compromise among agencies, it contains the many strands of Brazil's security understandings set side by side with no other criteria than its acceptability by all agencies. It offers a window of the sweeping mixture of philosophical and theoretical concepts that are juxtaposed to legitimize the formulations of agencies as official Brazilian security terminology, and thus capture ethical and cultural biases as well. The origin and nature of these strands results from history, conforming cultural and ethical contexts and issues: the problems and solutions of the differing security needs of the River Plate and Amazon regions (as well as fears of 'international greed'), and the way international law became a defining characteristic of security to Brazilian diplomacy.

It was insecurity concerning actions of major powers in the context of the transition from British to US supremacy in the Atlantic that led to a change in Brazil's international position, and when taken with its predilection for international law, explained Brazil's presence and action in multilateral *forums*, as well as its reluctance to form a permanent alliance with any major power. This suited well with the cultural underpinnings of its diplomats. The same passage had ulterior consequences for the linkage between security and development, establishing a connection that found its most enduring expression in the *National Security Doctrine*.

And to those, one can add the more contemporary conceptualizations or reconceptualizations of security. That some of those can fit without problem with previous Brazilian conceptions is good evidence of how inclusive and tolerant their original terms were. The environment or education could become a new 'expression' in ESG's National Security Doctrine by a simple act of will any day. There is no real conceptual barrier to prevent such an addition, and the tradition of conceptual tolerance, if not indifference, ensures that it would simply be set side by side with the others, as science and technology were a decade ago. This is not a matter of paying lip service to such conceptions, neither a case of paying lip service to previous additions to the mixture of concepts present in Brazilian discourse. Their addition is simply a juxtaposition, that does not disguise or excuse some ulterior conception, and that does not resolve their eventual divergences or contradictions.

There is one element left out: the actual consideration of the use of force, which is nowhere to be

found in the *2005 Defence Policy Document*. Brazil's different traditions and approaches to security are so disconnected and divergent from each other that whenever the issue of the use of force arises it falls between the cracks – except in self-defence and extraordinary situations like the two World Wars. Diplomatic tradition would rather not use force at all, or rather use it with the consent of those affected by it, that is to say, to use force as a symbol of agreement and resolve among quiescent states, as in peacekeeping based on chapter VI. The *National Security Doctrine* claims to establish terms, concepts, planning systems, and the recipe to make Brazil a major power. But it has very, very little to say about actual use of force for defence or war, as a tool of coercion or enforcement. To that extent, this omission can explain the inclination by diplomats and the ESG-associated military for an all-encompassing concept of security that allows one to speak of security without mentioning or considering the use of force. Should this be the case, then it would be a logical and natural development that expanded concepts of security incorporated in Brazil's *2005 Defence Policy Document*. One would expect that the broader the scope of security, the more welcome and suited to Brazilian agencies' conceptions it would be. So long as one remembers that such additions are in the nature of juxtapositions, and not of substantive contributions, then it is simple to see that their incorporation is a matter of opportunity.

Expanded concepts have little, if any room for actual fighting. This might pose some issues for a *National Security Doctrine*, regardless of how inclusive it might be. If force is not at stake at all, what then would security be? However, there would seem to be a measure of behind-the-scenes automatism in the binomial foundation of the doctrine: further development means enhanced security, which in turn brings about increased development, and so on. The explicit consideration of the material aspects of the use of force as a means for securing this or that against a given opponent can be, and in fact was, removed from this scheme. Besides self-defence, only a small role needs to be found for force, once again in the abstract, in deterrence. On the other hand, Brazilian authorities do not as yet endorse concepts such as 'human security'. They are not alone in perceiving such a notion as "part of the same interventionist framework of the right of inference and of the responsibility to protect", and inconsistent with the chapters on peace and security of the UN Charter (Amorim 2004: 142; 152).

When actual use of force becomes unavoidable, then Brazil is placed in a conceptual quandary. Find-

ing legitimacy for such an action invariably becomes a major effort, and requires considerable accommodation. The MINUSTAH Mission to Haiti offers a recent and compelling example. A regional peacekeeping exercise to the benefit of a troubled neighbour under the auspices of the UN fulfilled all the political and legal requisites Brazil could wish to have in order to act. The distinction of being asked to lead it had meaning both in the recognition of Brazil's eminence and as part of the long-standing ambition, and current foreign policy priority, of getting Brazil a permanent seat on the Security Council. Brazil, with its reputation of fair dealing and its aspiration to leadership, was expected to rouse itself to the task. This would unmistakably benefit its priorities in South America, reinforcing its commitment to multilateral security solutions. But to accept MINUSTAH as originally proposed would have compromised the Brazilian commitment to the cherished principle of non-intervention. For all the legality of a UN Security Council resolution, Brazil's participation was contingent on the reference to Chapter VII being confined to chosen paragraphs, and not the legal basis for the mission as a whole (Diniz 2005). The present authors concede that this is a matter of form, but argue that it expresses an underlying essence that brings about the concluding considerations of this chapter.

Brazil's security concepts remain hostage to the particular traditions of the agencies involved, which in turn express long standing intellectual and bureaucratic trajectories. They are the accumulation of previous conceptualizations, to which successive layers have been added. Sometimes they have a clear source, as was the case of impacts of diplomatic or military activities in the early 20th century. Sometimes they reflect the internalization of conceptions developed elsewhere, as was the case of Rio Branco's commitment to international mediation, and might be the case of contemporary notions of expanded security concepts. There is no real substantive, authoritative conception that could be taken to express a Brazilian perspective on security. There are as many conceptions as one might wish to find. To that extent, reconceptualization is, in the Brazilian case, a misnomer. One can recognize a number of the elements of the contemporary discourse on expanded security concept as additional layers, but as no more than this. This situation is faithfully expressed in the contents of the *2005 Brazilian Defence Policy Document*.

How is it possible for Brazil to actually lack a guiding security concept? This is the topic that remains to be addressed, and its clarification serves further to ex-

plain the reasons for such a situation. Security assumptions and benefits are taken for granted, without the necessary political, and hence philosophical and contextual appreciation of their significance. This is the result of an open conception of security which fails to ensure that the various perspectives do address all that should be addressed. Each agency is free to interpret its own mandate supported by high-level statements because such statements are indeed open to interpretation, and are written so as to allow different interpretations by different agencies. Interagency bargaining rewards a shared concept of security that remains an infinitely (re)definable, expandable abstraction, that incorporates but does not necessarily exercise ethical or cultural preferences. This, in turn, makes the materiality of the use of force unwelcome, precisely because it admits no compromise. This explains its near elimination from discourse and its absence from the *Brazilian 2005 Defence Policy Document*.

To return to the beginning with renewed eyes: the *2005 Defence Policy Document* does incorporate and thus legitimize all admissible alternatives. It gives evidence of the tolerant conviviality between the divergent conceptions of the various interested Brazilian agencies. It does serve a purpose: for each agency, that which is not in the document is not admissible in principle. That some agency might pursue an alternative agenda, in practice, does make it vulnerable in inter-agency infighting. With that proviso, any one version of the Document faithfully expresses the diversity of Brazil's security conceptions. This tolerance and diversity can only be understood as a result of Brazil's security context, with the benefit of the historical perspective just presented.

Brazil has little to fear from its neighbours and benefits from the shade of the US umbrella in its region. For one that benefits so much from the overall security status quo, and who has benefited from the status quo for almost two centuries, it is perhaps no more than natural to adhere so intensely to something as conservative as international law. Given Brazilian conditions and assets, it is understandable that security and defence should not be at the centre of Brazilian political debates, nor figure prominently in, say, presidential elections. Defence and security issues are treated complacently, parochially, and even arrogantly by agencies, scholars, and news people whose jobs would require a more balanced appreciation of the matter. Even taken one by one, the various strands of security conceptualization rarely lead to coherent conceptually-based appreciation by bureaucracies or the media. Conceptually-based efforts are almost exclu-

sively the province of a small number of scholarly endeavours which risk misinterpretation and discrimination precisely because they confront the expectation of loose conceptualization.

As a result, Brazilian analysis of international affairs can be very parochial, taking Brazilian policy choices as a universal standard, and on occasion as a universal prescription. It is as if any country in any situation could always choose to act in accordance with every single disposition of current international law; or could always wait for a consensus in the UN; or could afford to fail to act should that consensus never come. It could be said that it is very easy for a country with secure borders, strategic depth, and wealth of resources which benefits so much from US predominance in the Western Hemisphere to lecture others on the strict adherence to international law and on the value of waiting for SUN decision, come when it may. This is indeed so and there is the rub.

As an example, it is self-evident that Brazil benefits tremendously from US supremacy at sea and the guarantees that this supremacy offers to maritime trade and navigation, in fact as it benefited from British supremacy in the 19th century. During the Cold War, the Brazilian navy had a role in supporting this supremacy and enforcing security and safety in the South Atlantic. In the post-Cold War world, it is as if this enormously beneficial situation has somehow become a fact of nature, an environmental parameter. All the various agencies that are called to consider the use of the safe seas that Brazil enjoys take the security of the seas for granted, and give it no place in their considerations.

Therefore, it is simply natural that both the Brazilian President and the Minister of Foreign Relations, in their inaugural speeches, stress the need to “stimulate” or “reinforce” the “elements of multipolarity of contemporary international life”, without even considering that real multipolarity might bring about an actual increase in risks and costs to maritime trade and navigation. Although both contend that Brazilian diplomatic activity is supposed to be, first and foremost, “a tool of national development”, the possibility that true multipolarity might hinder Brazilian trade and development is never factored in their calculus (Silva/Amorim/Guimarães 2003: 42, 57).

For starters, multipolarity would require Brazil to consider the safety of its maritime trade routes. “Protecting the maritime lines of communication of vital importance to the country” is one of the 26 directives of the 2005 *Brazilian Defence Policy Document*. Once US supremacy becomes contested, it would have to redistribute its resources to meet challengers.

Brazil would have to find means to protect its maritime routes on its own. This would rob resources from investment and impair “national development”. Further, multipolarity means increase security expenses everywhere, cutting into imports and damaging Brazilian exports. In all probability, multipolarity would mean *more expenses, less resources* for Brazil. What is striking is that such issues are not perceived to be connected. Brazilian authorities wish for, and actively strive for, an outcome that might contradict one of their major objectives. As this is not a topic in political debates, it stands as yet uncontested.

What does it matter what Brazilian authorities wish for? The international system is what it is. Brazilian wishes change nothing except Brazilian actions. For the time being, while the system does not become multipolar, Brazilian trade and development benefit from the protection afforded by the US navy. Brazil is in such a position that it can afford to act as a free-rider in security affairs.

This might be the key to understanding both its conceptual tolerance and its declaratory irreflectiveness. As Brazil can afford to act as a security free rider, it can juxtapose conceptions resulting from its own democratization, the end of the Cold War or of the attacks of 9.11.2001 to previously existing concepts. Again, this is not a matter of paying lip service to such conceptions: their adherence is, to that extent, sincere. They do increase the inclusiveness of Brazilian discourses, even if they do not bring substantive change. As Brazil can afford to act as a security free-rider, it can allow itself the luxury of discourses without the mature reflection of its consequences. This is hardly a unique characteristic of Brazil, but in what concerns security it is distinctive. As long as its security is not tested, Brazil can choose to live with such an open-ended conceptualization, postponing the resolution of the problems of the mix of concepts it claims to adopt. It can afford to propose political security goals that might, if realized, hurt its own interests.

The point then becomes that it is precisely because Brazil benefits so much from the current situation that the connection of its secure status with US hegemony in the Western Hemisphere goes unquestioned and, thus, underappreciated. Even anticipating potential troubles that could be brought about by policy or systemic change is difficult. But this hegemony is the strategic and political foundation of Brazil’s security free-riding, the ground in which its tolerance to a diversity of security concepts is ultimately rooted.

22 Securitization of Space and Referent Objects

Hans Günter Brauch

22.1 Introduction¹

In the contextualization of security *temporal* (e.g. change in global international orders, chap. 1 and 3 by Brauch) and *spatial* features (this chapter) play a significant role besides *language* considerations (linkages with concepts of peace, development and environment, see chap. 3 to 9 in part II), expressed by ‘speech acts’, verbal utterances (chap. 2 by Mesjasz), or historical documents by the ‘securitizing actor’. According to Wæver (chap. 44)

securitization is the discursive and political process through which an intersubjective understanding is constructed within a political community to treat something as an existential threat to a valued referent object, and to enable a call for urgent and exceptional measures to deal with the threat.

However, this scientific definition is not shared by policy-makers, national and international institutions that have used extended concepts of security to legitimate urgent policy programmes and to obtain funding for their implementation. Thus, in the political discourse, the securitization of dangers and concerns to security and survival often reflects a ‘politicization’.

The widening and deepening of the security concept (Buzan/Wæver/de Wilde 1998) – both in policy practice and scientific discourse – had spatial implications since 1990. The shift from a *narrow* national (space, territory) military security concept guaranteed by the nation state (or military alliance) for its people against manifold ‘existential’ dangers posed by other states (countries, nations, alliances) to a *widened* and *extended security concept* implies a vertical widening of referent objects of both actors and their spatial contexts: from an individual human being to human-

kind or from ‘local’ to ‘global’ or ‘glocal’ communities.

The vertical *deepening* of security (table 1.1) implies further that security threats, challenges, vulnerabilities, and risks are not any longer posed exclusively by other nations but from within (sub-state actors, e.g. ethnic, political or religious groups, organized crime, criminal gangs) or across nations (transnational actors, e.g. corporations, hedge funds but also by criminals and terrorists) but increasingly by us, the ‘human beings’ as causes of a new ‘existential’ threat due to our cumulative energy and other consumption patterns, but also as ‘victims’ of our own or of the action of other individuals in other parts of the world with different coping capacities for adaptation and mitigation.

These new emerging dangers to survival that require ‘exceptional measures’ have only partly been triggered by the change in the international order since 1990, but to a large extent by the impacts of the industrial revolution since 1750, and especially since 1945 due to technological innovations and the intensive use of relatively cheap ‘fossil’ energy resources. This emerging shift in earth history from the ‘holocene’ to an ‘anthropocene’ (Crutzen/Stoermer 2000; Clark/Crutzen/Schellnhuber 2005) also implies a fundamental shift in the objective security dangers and subjective concerns as well as significant changes in policy areas and tools to achieve security for the people (human security) and to assist them to cope with the ‘survival dilemma’ (chap. 40 by Brauch) confronting the most vulnerable and poor people in the South.

For them ‘security’ is not the security of their state but often their individual security and survival in sometimes weak, failing or corrupt states that are unable to provide their human security. One cannot fight these dangers posed by global environmental change (GEC) and climate change and the perceived security concerns with military means (armies, weapons), but only by proactive and reactive changes in consumptive behaviour and by scientific innovation (e.g. in energy technology and policy, IPCC 2007, 2007a, 2007b).

1 The author is very grateful for detailed comments and inspiring suggestions by Úrsula Oswald Spring (Mexico), John Grin (The Netherlands), and Czesław Mesjasz (Poland) that are reflected in this chapter.

This chapter reviews the spatial contextualization and implications of the reconceptualization of security for its manifold referent objects or the spatial component of the questions of the security ‘by whom?’ (spatialized or deterritorialized security provider), ‘for whom?’ (recipient of these security services) and ‘against what?’ (dangers posed by other nations or sub-state or transnational actors that challenge the ‘social security’ of workers in industrialized countries but also ‘us’ (humankind) who have created the ‘anthropocene’ by our unsustainable production and consumption patterns. These qualitatively new existential security dangers and concerns posed by global environmental and climate change in the 21st century that require ‘urgent and exceptional measures’ to avoid the consequences of business as usual scenarios. This requires fundamental changes in the mind-sets of political and military strategic thinkers, policy-makers, and policy advisers with regard to strategies, goals, and means.

This chapter addresses the question of the spatial implications of a widening of the security agenda since 1990 and the spatial referent objects? The chapter is structured in four parts. After a brief discussion of the spatial dimension of security (22.2); political science approaches on security and space (22.3) are reviewed and the spatial referent objects of security are assessed (22.4) before a few general conclusions will be drawn (22.5) that will be discussed below (in chap. 75 by Oswald/Brauch) and in the subsequent volumes with regard to the more dramatic and evolving turning point compared with the change in international order of 1990 from ‘holocene’ to ‘anthropocene’ (Oswald/Brauch/Dalby 2008).

22.2 Security and Space: Spatial Dimension of Security

22.2.1 Concepts of Space, Territory, and Borders

Since the Westphalian system sovereign states may be defined – in state and international law – in terms of a) territory, b) people, and c) government (system of rule).² Thus, the territorial category of ‘space’ (*espace*, *espacio*, *Gebiet* or *Raum*) has been a constituent of modern international politics.³ Space has many meanings and refers to the

2 See the definitions of the state in international law dictionaries and analyses, e.g.: Bleckmann, 1975: 125–136; Ipsen 1990: 56–57; Zippelius 1991: 81–88.

three-dimensional extent of the physical Universe. ... The Universe is associated with the fourth dimension of time, making up a four-dimensional space – time. Space also refers to any region of the Universe that is empty of matter, such as interplanetary space, interstellar space or intergalactic space (Oxford Reference 1998: 1260).

Sack (1996: 830) introduces ‘space’ as a key concept of human geography:

Space is everywhere. ... The effects of space stem from its role in causality, which assumes that spatial contact must be made between and among interacting objects. ... The effect of space depends on how the spatial arrangement of these objects influences their interactions. Isolating this effect for social systems is extremely difficult. ...

The effects “resulting from humanly created boundaries ... are associated with each and every territorial unit in the world, from the nation-state to rights of property. ... The ... boundaries to a nation are opened or closed to constrain and enable specific spatial interactions” (Sack 1996: 830). How a society organizes territories and develops mechanisms for interaction are all examples of the *social construction of space* (Harvey 1985).

‘Spatiality’ is the term used to describe the dynamic and interdependent relationship between society’s construction of space on society (Soja 1985). [This] concept applies not only to the social level, but also to the individual, for it draws attention to the fact that this relationship takes place through individual human actions, and also constrains and enables these actions (Giddens 1984a).

According to R.J. Johnston (1991, 1991a, 1996: 831–832, 1996a) ‘spatial analysis’ is an approach within

3 The *New Collins Concise English Dictionary* (McLeod 1985: 1109) defined ‘space’: “1. the unlimited three-dimensional expanse in which all material objectives are located, related adj. spatial; 2. an interval of distance or time between two points, objects or events; 3. a blank portion or area; 4. an unoccupied area or room; 5. a region beyond the earth’s atmosphere containing other planets, stars, galaxies, etc. universe; 6. a seat or place, as on a train, aircraft etc. ...”. However, neither dictionary defines space in terms of territory of states. The *New Collins Dictionary* (McLeod 1985: 1209) defined ‘territory’ as: “1. any tract of land, district; 2. the geographical domain under the jurisdiction of a political unit, esp. of a sovereign state; 3. the district for which an agent etc. is responsible; ... 5. an area of knowledge; ... 7. a region of a country, esp. of a federal state, that enjoys less autonomy and a lower status than most constituent parts of the state; 8. a protectorate or other dependency of a country.”

geography “which uses statistical methods to generalize about spatial patterns.” During the 1960’s and 1970’s, spatial science was widely used in geography and it attracted practitioners interested in ‘spatial order’ and in related policies (Schmidt 1995: 798–799). In international relations (IR) the concept of ‘*territoriality*’ is often used as:

A strategy which uses bounded spaces in the exercise of power and influence. ... Most social scientists ... focus on the efficiency of territoriality as a strategy, in a large variety of circumstances, involving the exercise of power, influence and domination. ... Within its territory, the state apparatus assumes sovereign power: all residents are required to ‘obey the laws of the land’ in order for the state to undertake its central roles within society; boundaries are policed to control people and things entering and leaving (Johnston 1996: 871, 1991; Mann 1984).

The notion of the ‘*territoriality*’ of the state was challenged by IR specialists. Since 1950 the sovereignty of the nation state over its territory has gradually eroded, due to the increasing *vulnerability* of the national space (Herz 1959) to new weapons systems (ABC weapons of mass destruction; missiles with short, medium, and intercontinental range; aircraft and submarines). During the Cold War the two superpowers and alliances deterred each other against the first use of the new weapons of the nuclear age, as no effective missile defence system could be deployed after 60 years of technology development (Brauch 2003b).

In the era of globalization (Knox/Agnew ³1998, 2002; Held/McGrew 2000, 2003; Robertson 2003; Bhagwati 2003) national borders have increasingly been penetrated by financial flows, services and goods (Gilpin 2002; Armijo 1999; Schirm 2002), by the new electronic media (Sassen 1998: 177–194; Castells 2000, 2003), and the increasing exchange of people and ideas through modern systems of communication (Thompson 2003; Herman/McChesney 2003) and transportation (Rodrigue/Slack 2006).⁴ Also

4 In a personal comment to the author, Czeslaw Mesjasz argued that among the reasons for “the decreasing role of the state as the basic unit of political organization is economics and agriculture. ... In the past territory was important as a source of food and minerals. Now, due to increased efficiency of agriculture and international trade this fundamental cause of territoriality is losing importance. ... Territoriality is associated also with economics – food and natural resources. ... Legal demands, for example the protection of property rights and contract enforcement, as the key issues of the market have remained in the hands of the state.”

‘governance without government’ (Rosenau/Czempiel 1992) through trans- and international regimes (Krasner 1982) and networks has grown since the 1970’s, and especially after the global turn.

In the 1970’s, some globalists (Cooper 1968; Keohane/Nye 1970, 1977) pointed to the growing interdependence and transnational cooperation, and since the 1990’s some analysts of *globalization* proclaimed a weakening or the end of the nation state (Ohmae 1990, 1995; Strange ²1994, 1996, 2003: 148–155). A progressing deborderization and deterritorialization have become key issues of analysis (Albert 1999; Lyons/Mastanduno 1995) from two opposite and competing perspectives of *globalization* and *géopolitique*, but also from critical geopolitics. For the deborderized territories a new form of *raison d’état* may be needed.

With the change of the global economic, political and cultural context, the spatial dimension for security dangers and concerns has been changing (Allison 2000; Amineh/Grin 2003; Mesjasz 2003). Against the manifold new security relevant dangers of globalization⁵ (e.g. terrorism, organized crime, human trafficking, drug trade by sub-state and transnational actors and networks) no comprehensive and effective military defence seems to be possible, nor may an absolute internal security be achieved in a democratic society.

22.2.2 Spatial Dimension of Politics: Pre-modern, Modern, Post-modern

In some parts of the world, as for example in the ‘Mediterranean space’ (Brauch 2001, 2003), three notions of *territory* and national *sovereignty* have coexisted (Menzel 1998: 58–59):

- The belated *formation of nation states* along ethnic, religious or historical boundaries in the Balkans and in the Black Sea regions partly based on *pre-modern* thinking;
- the forceful *defence of national sovereignty* against outside intrusion (e.g. criticisms of human rights violations and requests for democratization), penetration, and intervention in most

5 The CIA (2000: 15) in: *Global Trends 2015* noted that globalization “has emerged as a more powerful driver” by 2015 than portrayed in GT 2010 and in: *Mapping the Global Future*, the CIA (2004: 27–46) pointed to the “Contradictions of Globalization” arguing that “by 2020 globalization is likely to take much more of a ‘non-Western’ face.”

Arab states (Selim 2003), but also in Israel (Kam 2003) and Turkey (Aydin 2003); and

- the progressing *erosion of the territorial principle of sovereignty* and the emergence of inter- and transnational political, economic, societal, and electronic spaces beyond the control of nation states and of elected bodies that has provoked scientific debates and requests for democratization and democratic governance in *de-territorialized* spaces often based on *late modern* and in some cases *post-modern* thinking.

In *pre-modern* periods, as during the Middle Ages, the system of rule relied on a stratified feudal system with spatially differentiated rights and obligations governing tasks for guaranteeing the internal security of the land (*Landfrieden*) by local knights, counts, dukes, etc. who had to provide troops and food to the king or emperor in wars against external enemies. In modern weak, failing or failed states (or in regions and local communities) where a central state (effective urban government) has ceased to exist to guarantee internal and external security for its people, new security providers have emerged: security firms, mercenaries, warlords, drug cartels or bosses, criminal gangs or organized crime. In large urban centres in the North and South, local security services are increasingly privatized (Holmqvist 2005).

The *modern* Westphalian state that gradually emerged after the end of the Thirty Years War in Central Europe, the state functions, tasks, and revenues from taxation gradually expanded. With the emergence of standing armies in the aftermath of the Napoleonic wars in Europe, the power of the state and of its government grew. Providing security both internally (by the police, judiciary) and externally (by diplomacy and the military) became essential state functions. This model of a potential powerful state that has a monopoly over the use of force (Max Weber) could not be applied in many parts of the world (see chap. 65 by Behera), not only in failed states.

In the *late modern* (Wallerstein 1974; Giddens 1990, 1999), a *new modern* (Beck 1992) or *post-modern* (Best/Kellner 1991) period or in the 'postnational constellation' (Habermas 1998a) a dual change can be observed: a progressing deborderization or deterritorialization, e.g. among the 27 EU countries, but simultaneously also a tightening of the external borders of OECD countries against illegal migrants and asylum seekers (within the EU by the Schengen regime, Frontex etc., and within NAFTA by the triple fence between the US and Mexico). These theoretical approaches are reflected in the spatial debate on security.

22.2.3 Transition of Security from the National to the Postnational Constellation

For Hobbes (1984: 96) the major task of the state was to overcome the 'war of all against all' (*bellum omnium contra omnes*), thus coping with internal anarchy, while for Max Weber (1972: 29) the state controlled "the monopoly of legitimate physical power". Comprehensive security is foundational for the internal and foreign policy conception of the state ('national security'). In its modern meaning security policy as a fundamental policy area of any state is defined as "the totality of political goals, strategies and instruments that serve external security, the sovereignty and self-determination of the state" (Hauser 2004: 15; Buchbender/Bühl/Kujat 1992: 134). This 'national constellation' of security has been challenged in the early 21st century.

Zürn (1998: 97ff.) used a narrow concept of security with regard to the continued physical existence and intactness of a social actor whose security is big if the continuation and intactness of this social actor is certain. A major security goal of governing is to reduce dangers and risks. Both the state and the individual are not only confronted with insecurity, both can also be a cause of the impairment of security. The goal of providing security refers to four tasks: a) defence of the state against attack by other states; b) legal protection of the individual against threats by the state; c) protection of the state against terrorist or revolutionary threats; and d) protection of the individual against the risk of damage by other societal actors (figure 22.1)

Zürn (1998: 99) argued that within the OECD world the nation state can achieve its *defence* and *legal task* better in an era of societal denationalization while the implementation of its *governing* and *protective task* may decline. He also noted a decline in state-induced threats while society-induced threats and risks have increased. Zangl and Zürn (2003: 176) summarized their observations on the shifting security tasks during the transformation from the 'national' to the 'post-national constellation' in two hypotheses on transboundary security threats: a) a decline in the relative importance of inter-state wars; and b) an increase of threats where the boundaries between civil wars, terrorism, state terror, and crime erode.

They conclude that the transnational security problems have been increasing and thus pose new tasks for supranational governance on security issues. However, the resources for dealing with these new threats are still controlled by the nation states and not

Figure 22.1: Security tasks and threats for the state and society. **Source:** Developed further based on Zürn (1998: 99).

Threats, challenges, vulnerabilities and risks are posed	State is object	Society is object
by the nation state	War among nation states (<i>external defence task</i>)	State terror, violation of human rights (<i>legal task</i>)
by society (sub-state and transnational actors)	Terrorism, organized crime, human and drug trafficking (<i>internal governing task</i>)	Violent crime, environmental deterioration (<i>protective task</i>)

by supranational institutions, which implies that the UN relies in its security tasks on a few powerful and rich states. In the emerging post-national constellation, Zangl and Zürn (2003: 272) argue that (i) the central security problems exist on the transnational level, (ii) security policy occurs in international security institutions increasingly on the supranational level; (iii) the resources that are decisive for security policy remain on the national level; and (iv) the legitimating processes for security decisions have increasingly shifted to the transnational level.

During the 19th century the state and nation merged to the national constellation (Leibfried/Zürn 2006: 22). During the 20th century the four dimensions of the modern intervention state evolved: a) control over *resources* (financial, military), b) *legality* (law and judiciary), c) *legitimacy* (public, democracy) and d) *welfare* (including health) were all concentrated on the national level. A precondition of the modern state is “the complete control of material resources within a territory” (taxation and use of force). The congruence of the territory, population, and the system of rule of the national constellation gradually eroded due to manifold impacts of globalization from global markets and corporations beyond the control of the nation state which resulted in a gradual despatialization of increasing policy fields in an emerging post-national constellation (Habermas 1998a). Leibfried and Zürn (2005: 39) observed a dual territorial and functional transformation of the state in the 21st century (figure 22.2).

The classic resource dimension (security policy) of the modern territorial state has remained its *domaine réservé* in the OECD world – among the 27 EU countries with limited interventions by the Commission but with increasing intergovernmental coordination by the Council where a strong and efficient state exists (see chap. 50–53 by Moschini, Hintermeier, Maurer/Parkes, Ekengren). However, in weak and failing states that are unable to provide internal security, the security task has been usurped by sub-state actors (warlords, private guards).

Jachtenfuchs (2005) discussed to which extent the transformation of the modern state has affected its security function (monopoly of force) of the military and the police. While for the key states of the OECD world, *internationalization* has become a major challenge, outside, especially in weak states in the South the *sub-nationalization* of security has become a key challenge that is reflected in the ‘new wars’ (Kaldor/Vashee 1997; Kaldor 1999; Münkler 2002, 2005) where non-state actors have played an increasing role controlling the monopoly over the use of force in sub-regions by private armies, mercenaries, and guerrilla groups. Another new feature has been the increasing transnationalization of organized crime, such as drug cartels, human trafficking etc. (Edwards/Gills 2003); and terrorism (see chap. 31 by Hoogensen).

These changes have increasingly resulted in changes in state practice within the Security Council (chap. 35 by Bothe) pertaining to both the principle of non-use of force (Art. 2,4 UN Charter) non-intervention (Art. 2,7) resulting in new concepts of ‘humanitarian intervention’. With regard to state functions, the process of intergovernmental cooperation has intensified in the context of Interpol, and within the European Union (EU) of Europol and Frontex.

Features of the emerging post-national constellation are the transformations of the understanding and practice of the United Nations, of the OSCE, OAS, AU, and the Arab League as regional arrangements and agencies, as well as of NATO and the European Union that have changed their tasks and increased their involvements as security providers both within but also increasingly outside their territory (e.g. NATO’s ‘out of area’ ISAF operations in Afghanistan) where the states have collectively implemented their monopoly of physical force.

Jachtenfuchs (2005: 89–90) concluded that for the OECD world there is no institutional alternative to the state as the holder of the monopoly to use force that has not been delegated to international institutions, but rather the states have coordinated the implementation of this monopoly more closely and the criteria for the use of force (by the military or police)

Figure 22.2: Changes of the democratic, judicial, and intervention state during the transformation from a national to a post-national constellation, and its relevance for security. **Source:** Adapted and modified based on Leibfried/Zürn 2005: 39.

		Territorial change and impacts on security		
		Subnationalization (weak, failed or failing states)	Status quo ante	Institutionalization (OECD world, especially EU, NAFTA)
Functional change: impacts on security	Privatization	Localization (<i>security firms, warlords</i>)	Liberalization (Deregulation)	Transnationalization (<i>multinational corporations</i>)
	Status quo ante	Regionalization - intact Northern states (<i>federalism</i> in some EU members vs. centralism) - weak Southern states (e.g. <i>warlords, drug cartels</i>)	<p>▲ ◀ Status quo ante: modern state with a monopoly of use of physical force ▶ ▼</p>	Internationalization - UN: <i>peacekeeping</i> - NATO: <i>intervention</i> (Afghanistan) - EU: <i>protectorate</i> Kosovo, Bosnia - Coalition: <i>intervention</i> (Iraq)
	Expansion of the state	Fragmentation	Socialization, nationalization (<i>military rule after a coups d'état</i>)	Supranationalization - EU intergovernmental cooperation (<i>Schengen, Frontex</i>)

has been progressively regulated by international law or intergovernmental agreements. Among the EU member states this monopoly is partly jointly managed.

Zangl (2005: 159–187) argued that since 9 November 1989 a significant change in international security policy has occurred and that since 11 September 2001 a fundamental change in global security structures has taken place. He claims that the modern Westphalian system has been replaced by a postmodern or post Westphalian system where the national constellation is being overcome by a postnational constellation. He pointed to four trends leading to this change in security policy: a) a transnationalization of security problems; b) a supranationalization of governance in the security area; c) a continued national control over national resources for the implementation of security policies; and d) a transnationalization of legitimizing processes.

Behind this reasoning on the emerging shift to a post-national constellation by Zürn (1998), Zangl and Zürn (2003), Leibfried and Zürn (2005), Jachtenfuchs (2005) and Zangl (2005) remains a narrow understanding of the concept of security (by whom?) where the state is still the major referent object. While among OECD countries the monopoly over the use

of force is increasingly implemented collectively, among weak, failing or failing states this monopoly has eroded and proliferated to sub-national actors or referent objects. These authors observed a widening of the security dangers (against what?) from nation states to transnational sub-state actors and (for whom?) from the state to the national and transnational society.

But they ignored the discussion on the horizontal widening, vertical deepening, and sectorialization of security, and did not distinguish between objective, subjective, and intersubjective security concepts. The discussion is limited to deliberate security threats and excludes the manifold environmental and societal security challenges, vulnerabilities, and risks. Nevertheless, these deliberations refer to basic changes in the spatialization of security concepts and policies from the nation state to sub-, supra- and transnational actors and policy issues.

The gradual transformation from a national to a post-national constellation has implications for the territoriality of the nation state and its sovereignty. Developments in military technologies (missiles, submarines, and aircraft) during the nuclear age increased the military vulnerability and made an absolute defence against these threats unachievable. The

process of economic and cultural globalization through financial and economic transactions and global communication (radio, TV, internet) that have been promoted by transnational corporations and networks have permeated state boundaries, contributing to a progressing deborderization and deterritorialization of international economic policies. This process has also been exploited by organized crime, drug cartels, and by terrorist networks.

After the Cold War invisible non-state actors (terrorist networks) have exploited the opportunities created by globalization processes and intensified the societal and economic vulnerability of open societies and highly developed democracies. The freedom of financial flows, trade, and services was accompanied by a significant increase in migration from 2.1 per cent of the world population in 1975 or 86.8 million to 3.0 per cent or 190 million people in 2005. The percentage of refugees of international migrants grew from 2.9 per cent (or 2,163,992 persons) in 1960 to 11.90 per cent (or 18,497,223 persons) in 1990 and has since then fallen to 7.1 per cent (to 13,471,181 persons) in 2005 (UN, Population Division, at: <<http://esa.un.org/migration/>>; Brauch 2003, 2006). The freedom of movement of citizens and most residents within EU member states and among most OECD countries has been accompanied by a tightening of the external borders, between EU and non-EU countries, as well as between the US and Mexico (Oswald 2006, 2007), but also between India and Bangladesh where walls or fences have been constructed to impede illegal migration trends (Ahmed 2008).

As part of the transformation towards a post-national constellation, both related processes of deborderization and tightening of external borders to cope with migration have created manifold new national, societal, and human security issues. Security dangers and concerns posed by global environmental (desertification, drought, water scarcity) and climate change (temperature and sea level rise, extreme weather events, such as storms, floods, heat and cold waves) have contributed to the push factors of forced migration.

How have the two competing spatial approaches to international politics and relations: 'geopolitics' and 'globalization' conceptualized the new security dangers and concerns, and to which extent do they reflect the widening, deepening of security concepts and the gradual transformation from a national to a postnational constellation, but also from a dominant 'national security' to a supplementary 'human security' concept?

22.3 Political Science Approaches to Security and Space

During the 1990's, a narrow and wider concept of political, economic, and environmental space experienced two fundamentally different processes (Clark 1997; Menzel 1998):

- A process of intensified *globalization* in the economic world of finance, production, and trade, and in the societal world of information (cyberspace), media (Fox/Turner, Rupert Murdoch, CNN) but also of political and economic *integration* in the framework of the European Union with a progressing *deborderization* of exchanges for people, capital, and goods among its member states and a *deterritorialization* of international relations that has permeated the boundaries of the modern 'Westphalian' state system.
- A process of partly violent *territorial disintegration* and *fragmentation* of multi-ethnic states (former Yugoslavia and Soviet Union) due to a belated formation of nation states combined with a *reborderization* of space along ethnic, religious and poverty lines and a persistent competition on territorial control of disputed spaces.

Within the scientific discourses in geography, political science, and international relations two schools of thought have coexisted: a) the debate on *globalization* (22.3.1), b) the debate on the new regionalism and on regional security complexes (22.3.2); c) the debate on *geopolitique* and *new* or *critical geopolitics* (22.3.3); and on the spatialization of the security aspects of GEC and climate change (22.3.4).

22.3.1 Globalization vs. Global Environmental Change

The term 'globalization' has been used by journalists since the 1960's and in the academic literature since the 1990's (Robertson 2003; Osterhammel/Petersson 2003; Steger 2004). Robins (1996: 345-346) pointed to four aspects of globalization: a) the process of production by transnational corporations, b) the establishment of global information and communication networks (Harvey 1989; McLuhan 1964); c) the emergence of truly 'world cities' (Friedmann 1986) or 'global cities' (Sassen 1991) as the command centres in the global economy, and d) the development of elements of a global commercial culture (film, TV, music, fashion) that is associated with increased flows of tourists, migrants, and refugees. However, tendencies towards

a cultural homogenization have been contrasted with a revitalization of particularist cultures and identities (e.g. Basque Country, Corsica). For Robins,

globalization occurs as a contradictory and uneven process, involving new kinds of polarization (economic, social, and cultural) at a range of geographical scales. The encounter and possible confrontation of social and cultural values is an inevitable consequence. We have a global economy and global culture: we do not, however, have global political institutions that could mediate this encounter and confrontation.

Malcolm Waters (1995: 3) defined 'globalization' as: "A social process in which the constraints of geography on social and cultural arrangements recede and in which people become increasingly aware that they are receding." For Walters (1995: 3)

globalization is the direct consequence of the expansion of European culture across the planet via settlement, colonization, and cultural mimesis. It is also bound up intrinsically with the pattern of capitalist development as it has ramified through political and cultural arenas. However, it does not imply that every corner of the planet must become Westernized and capitalist but rather that every set of social arrangements must establish its position in relation to the capitalist West.

In Walter's (1995: 4) definition "globalization is also highly Europeanized in another sense. The deterritorialization of social and especially of political arrangements has proceeded most rapidly ... borders are becoming deemphasized and varieties of supra- and infranationalism are proliferating. This means that the model of globalization is itself a European model." But this model does not apply to NAFTA, especially to the border between the US and Mexico.

Anthony Giddens (1990, 1997: 87-101) distinguished between two groups of literature dealing with globalization: a) from the perspective of international relations theory (Rosenau 1980) with the states as key actors; and b) from the perspective of the world system (Wallerstein 1974, 1979). Giddens relied on four dimensions of globalization: a) of the system of nation states; b) of the capitalist world economy, c) of the international division of labour, and d) of the world military order.

For Ulrich Beck (1998c: 29-33) eight reasons made the process of globalization irreversible: 1) the increasing interaction density of international trade and the global financial networks that have increased the power of transnational corporations; 2) the permanent revolution in information and communication technologies; 3) the universally proclaimed request for implementing human rights and democracy; 4) the visual products of the global cultural industries; 5) the

post-international, polycentric world politics with a growing influence of transnational economic and societal actors (NGOs); 6) questions of global poverty; 7) global environmental degradation, and 8) local trans-cultural conflicts. For Beck (1998, 2007), globalization implies the emergence of a contradictory world society without a world state and without a world government.

Beck (1998c: 42-114) distinguished among different competing logics of the driving forces of globalization (unicausal vs. multi-causal explanations) and several dimensions due to information technology, ecology, economy, labour organization, culture, and civil society that contribute to a pluralist sociology of globalization:

- a. the capitalist world system (Wallerstein 1983); b. the post-international politics (Rosenau 1990; Gilpin 1987; Held 1995; Perraton/Goldblatt/Held/McGrew 1998: 134-168); c. the emergence of a world risk society (Beck 1986, 1988, 1996); d. contradictions of a cultural globalization (Robins 1991); e. the linkage between globalization and localization: glocalization (Robertson 1992, 1995); f. relative autonomy of 'glocal' cultures (Appadurai 1998); g. global wealth vs. local poverty (Bauman 1997); h. capitalism without work (Kapstein 1998).

Beck (1998c: 218-258) suggests several responses to deal with these developments: international cooperation, the establishment of transnational states, a new orientation in education policies, new networks for work of citizens, new cultural, political and economic goals, new forms of labour, and a societal contract against exclusion. As a consequence of this process to which no national response exists, Beck discusses a new role of Europe, e.g. a *European world citizenry* and new forms of transnational governance.

In the early theoretical literature on globalization, Waters (1995: 4) pointed to three different possibilities: a) globalization as a permanent process of world history that has been recently accelerated; b) as a recent version of modernization in the development of capitalism, and c) as a new phenomenon that is associated with social processes of post-industrialization, post-modernization or the disorganization of capitalism. In many theoretical analyses globalization processes have been discussed for a) the *economy* (production, exchange, distribution, consumption), b) the *polity* (concentration of power, coercion, and surveillance), and c) for *culture* (production, exchange, and expression of symbols). For these arenas according to Waters (1995: 8) different types of exchanges apply:

- *material exchanges* including trade, tenancy, wage-labour, fee-for-service, and capital accumulation;
- *political exchanges* of support, security, coercion, authority, force, surveillance, legitimacy, and obedience;
- *symbolic exchanges* by means of oral communications, publication, performance, teaching, oratory, ritual, display, entertainment, propaganda, advertisement, public demonstration, data accumulation and transfer, exhibition and spectacle.

Waters (1996: 9-10) argues that each type of exchange has its special relationship with space: while *material exchanges* are rooted in local markets, *political exchanges* “culminate in the establishment of territorial boundaries that are coterminous with nation-state societies” and thus “tend to confirm their territorial sovereignty”, and *symbolic exchanges* are free “from spatial referents” and can often “claim universal significance”.

Among the precursor theories Waters (1996: 11-37) pointed to a) modernization and convergence (Parsons 1977; Bell 1976); b) world capitalism (Amin 1980; Wallerstein 1974, 1979, 1980, 1990); c) transnational connections (Burton 1972, Bull 1977, Rosenau 1980, 1990); and d) the global village (McLuhan 1964; McLuhan/Fiore 1968). Among the recent theories Waters (38-64) refers to those: a) analysing the world as ‘one place’ (Robertson 1992, 1995); b) reflexivity and time-space distancing (Giddens 1985, 1991); c) post-modernity and time-space compression (Harvey 1989); and d) risk and ecological appropriation (Beck 1992). From these Waters (1995: 62-64) points to six features of a “new sociology of globalization”:

- Globalization is at least contemporary with modernization and has therefore been proceeding since the sixteenth century. ...
- Globalization involves the systematic interrelationship of all the individual societal ties that are established on the planet.
- Globalization involves a phenomenology of contraction. ... Globalization implies the phenomenological elimination of space and the generalization of time.
- The phenomenology of globalization is reflexive.
- Globalization involves a collapse of universalism and particularism.
- Globalization involves a Janus-faced mix of risk and trust.

Waters (1995: 65-159) reviewed the theoretical debate on economic, political and cultural globalization, and the path of globalization from the 16th to the 21st cen-

tury. However, this debate did hardly reflect the debate on a reconceptualization of security and its three features.

22.3.2 Regionalism, Regionalization, and Security Complexes

Between the nation state and processes of globalization, manifold efforts and strategies of regional cooperation and integration as well as processes of regionalism and regionalization have occurred since the end of World War II. According to the Chapter VIII (Art. 52-54) of the UN Charter “regional arrangements or agencies” play a special role in “the maintenance of international peace and security” (Art. 52,1) and they have been given the task to “make every effort to achieve pacific settlement of local disputes through such regional arrangements or by such regional agencies before referring them to the Security Council” (Art. 52,2).

During the Cold War, the *Arab League*, the *Organization of American States* (OAS), and *Organization of African Unity* (OAU) were considered as such agencies. In 1992, the *Conference for Security and Cooperation in Europe* (CSCE), since 1994 the *Organization for Security and Cooperation in Europe* (OSCE) was treated as the fourth regional body even though it did not become a regional organization, and in 1999, the *African Unity* (AU) replaced the OAU. Since 1990, other regional organizations have taken up security tasks that are no Chapter VIII institutions.

However, during the Cold War, organizations of collective self-defence (military alliances) under Art. 51 of the UN Charter, e.g. in Europe the *West European Union* (WEU: 1948-2000), the *North Atlantic Treaty Organization* (NATO: 1949-present), the *Warsaw Treaty Organization* (WTO or WP: 1955-1991); in Asia the *Central Treaty Organization* (CENTO) or *Baghdad Pact* (1955-1979), *Southeast Asia Treaty Organization* (SEATO: 1954-1977) and in the Pacific: the *Australian, New Zealand and US* (ANZUS) pact (1952-present) were major security organizations after the regional arrangements under Chap. VIII were paralyzed.

With the end of the Cold War efforts of regional cooperation and integration have intensified in some areas of the globe that have been divided by the Cold War, especially in Europe with the enlargement of the *European Union* (EU) from the EU of 12 member countries to the EU-15 (Austria, Sweden, Finland joined on 1 January 1995), to the EU-25 (Poland, Czech Republic, Slovak Republic, Slovenia, Hungary,

Lithuania, Latvia, Estonia, Cyprus, and Malta joined on 1 May 2004) and to the EU-27 (Bulgaria and Romania became members on 1 January 2007) and in South-East Asia with the enlargement of the *Association of South East Asian Nations* (ASEAN) from six to 10 members after Vietnam (1995), Laos, Myanmar (1997), and Cambodia (1999) joined.

The *North American Free Trade Association* (NAFTA) consisting of Canada, the USA, and Mexico entered into force on 1 June 1994. In South America, the *Mercosur* (Argentina, Brazil, Paraguay, Uruguay) increased to five members in July 2006 when Venezuela joined and left the *Andean Community of Nations* (*Comunidad Andina de Naciones*, CAN). Its four remaining members (Colombia, Ecuador, Peru, Bolivia) and Chile became associate members of Mercosur in 2006. The creation of a *Free Trade Area of the Americas* (FTAA) has been opposed by Cuba, Venezuela, Bolivia, Ecuador, and Nicaragua that formed the *Bolivarian Alternative for the Americas* as well as by most social movements. In the security realm, the OAS (see chap. 69 by Rojas) remained the major regional security arrangement in the Western Hemisphere.

In Africa, the *Economic Community of West African States* (ECOWAS, see chap. 62 by Ogwu) and the *Southern African Development Community* (SADC, see chap. 64 Ngomo/le Roux) acquired some security functions while the *Intergovernmental Authority on Development* (IGAD, see chap. 63 by Nhema/Rupiya) and the *Arab Maghreb Union* (AMU, chap. 61 by Chourou) lacked an effective implementation of security declarations. In Asia, the ASEAN benefited from the end of the Cold War while in South Asia the eight member countries of *South Asian Association for Regional Cooperation* (SAARC) representing 1.5 billion people have failed to implement its goals and to become a regional security organization. In the Asia-Pacific, the *Asia-Pacific Economic Cooperation* (APEC) started in 1989 as an informal Ministerial-level dialogue group of 12 countries; in 2007 its 21 member economies created about 70 per cent of the global economic growth.

From an academic perspective, Amineh and Grin (2003: 272) pointed to major shortcomings of traditional approaches to regionalization and regional cooperation:

they generally hardly take into account globalization; and, second, they mainly depart from a much narrower, economic perspective. The old regionalism is very much influenced by the 'orthodox theory of regional economic integration' and by the (neo-)functionalist para-

digms of regional integration based on the experiences with integration in the European Community (EC).

They preferred the *New Regionalism Approach* (NRA) developed as part of the UNU-WIDER project⁶ by Hettne and Söderbaum (1998; see chap. 28 by Hettne) that recognizes

the link between regionalization/regional cooperation and globalization and can therefore not be understood merely from the point of view of the single region. Rather it should be defined as a world order concept, since any particular process of regionalization in any part of the world has systemic repercussions on other regions, thus shaping the way in which the new world order is being organized. The new global power structure will thus be defined by world regions – regions of different types that, moreover, may overlap. Thus in an NRA approach, ... regionalism should be seen as an additional process that offers an alternative for tendencies towards a more fragmented type of regionalization of world society, such as the 'hegemonic stability theory' of the neo-realist and neo-liberal schools of international relations and international political economy.

According to Amineh and Grin (2003: 272) the new regionalism goes beyond the Westphalian paradigm,

fundamentally taking into account non-state actors, transnational processes and new fora in addition to the traditional actors, processes and fora of the state system. New regionalism deals with the region as a viable economic, cultural, and ecological unit; regionalization is a pluralist and multifaceted process that is explainable through comparative, historical and multilevel perspectives (Hettne 1997). ... *New regionalism* is not a matter of region formation as not merely an economic, trade promotion strategy. Rather it is a *political* strategy that is as much exclusive as it is inclusive.

6 This concept was developed in a series of five books by UNU/Wider co-edited by: Hettne/Inotai/Sunkel (1999, 2000, 2000a, 2000b, 2001). The UNU/Wider approach defined the new regionalism "as a comprehensive, multidimensional, political phenomenon including economics, security, environment and other issues which challenge the nation state today" (Cornia 1999: xiii). According to Hettne (1999: xxvii) "the issues of security, development, and ecological sustainability form an integrated complex, at the same time as they constitute as many imperatives for deepening regional cooperation, if not regional integration." Where the balance between regionalization and globalization will be struck will depend on the political will and action. In 48 chapters, these five volumes provided a comprehensive review of the global thinking on regionalization. The Mexican academic journal: *Regiones y Desarrollo Sustentable* offers a good overview of the debate on regions and regionalization in Latin America; see: de Mattos (2003: 39–80)

Amineh and Grin (2003: 273) interpreted the new regionalism “as a process of shaping a multitude of interrelated structural transformations of the global system such that a geographical region is transformed into an active subject, contributing to integration and mitigating disintegrating tendencies.” With Hettne and Söderbaum (1998: 10) they see regions as “social construct[s] constantly created and recreated in the process of global transformation.” They developed their theoretical argument in a new regionalist conceptualization of regionalization (linking the global level, interregional relations with regions) and of security they discussed for the Mediterranean.

Hettne (1999a, 2001: 13–14) used the term ‘security regionalism’ by which he meant:

attempts of states and other actors in a particular geographical area – a region in the making – to transform a security complex with conflict-generating inter-state and intra-state relations towards a security community with cooperative external relations and domestic peace.

So far the Nordic Countries and the EU have come closest to a ‘security community’ (Deutsch 1957) where the ‘security dilemma’ (Herz 1950, chap. 40 by Brauch) among its member states has been escaped. In many peripheral regions a positive cooperation has been lacking “that could lay the foundation for a regional security community”. Rather, in most cases “a tense security complex, prone to both inter-state and intra-state conflicts” (Hettne 2001: 14) prevailed. He argued for an increased ‘regionness’ where the region is being transformed from object to subject and becomes an “actor in its own right”, and he suggested as an important criterion of ‘regionness’ the “institutionalized capacity for autonomous conflict management and conflict resolution at the regional level.” Hettne (2001: 14) suggested five key elements of such a regional security approach:

1. development of regionalism and the prevention, or rather ‘provention’ of conflict;
2. the nature and dynamics of the conflict;
3. modes of external intervention;
4. patterns of peace settlement and conflict resolution, and
5. post-conflict reconstruction.

In the fifth UNU-WIDER volume, Hettne discussed these five criteria in a comparative overview for Europe, for the Post-Soviet space, for the Americas in the grip of North Americanization, for Asia’s growth amidst poverty, for the Middle East, and Africa that seems to oscillate between regionalization and recolonization. Hettne (2001: 48) claimed that during the

1990’s international conflict “has become regionalized in the more negative sense of conflict-widening” and that this regionalization of security will continue for conflict resolution (Kanet 1998). Since the global turn regionalism has been an emergent phenomenon whose ultimate role in the formation of a new world order has remained unclear. Hettne’s (2001: 50–51) concluding remark still applies, that regionalism “can only be studied in the context of global structural change, and as the combined outcome of different types of actors transcending national spaces.” Schulz, Söderbaum and Öjendal (2001: 270–272) suggested a detailed post-WIDER research agenda that included moving beyond the top-down regionalism of intergovernmental regional organizations by assessing the role, strategies, and impacts of external actors, “such as donors, TNCs and IFIs, in their ongoing attempts to ‘push’ regionalization in various directions.” They also suggested more research on “the consolidation of security complexes/communities” with a specific focus on “trust, learning, norms, identity and socio-cultural institutions for increasing regional security.”

While the UNU-WIDER avoided a discussion of the specific security concept for the new regionalism, Buzan and Wæver (2003) have developed the idea further that regional patterns of security have become prominent in international politics for the post-cold War period in case studies for Africa, the Balkans, the CIS-Europe, East Asia, the EU, the Middle East, North and South America, and on South Asia avoiding both “the extreme oversimplifications of the unipolar view, and the extreme deterritorializations of many global visions of a new world disorder.” With their *regional security complex theory* (RSCT) Buzan and Wæver (2003: 40–89) argued for a middle level of analysis of practical security analysis between the studies focusing on ‘national’ and ‘global’ security. In a previous book, Buzan, Wæver, and de Wilde (1998: 201) redefined Buzan’s (1983: 106) initial definition of a ‘security complex’ reflecting both the widening and deepening of their debate on the security concept as: “a set of units whose major processes of securitization, desecuritization, or both are so interlinked that their security problems cannot reasonably be analysed or resolved from one another.”

Thus, Buzan’s initial state-centric approach has shifted in the joint study with Wæver (2003: 45) to a “multi-sectoral, multi-actor securitization perspective.” With their RSCT they offered a matrix for area studies that combined four levels: a) their domestic vulnerabilities, b) their state-to-state relations, c) the region’s interactions, and d) the role of global powers within

the region. They use four variables: 1) boundary, 2) anarchic structure, 3) polarity, and 4) social construction. They point to three possible evolutions for an RSC: a) the maintenance of the status quo, b) an internal transformation, and c) an external transformation. The RSCT claims to predict “when RSCs are expected to emerge and when not;” it develops specific hypotheses to different situations; and it “enables construction of a restricted set of scenarios and thus narrows down the zone of predictions” (Buzan/Wæver 2003: 84). *r*

In their case studies, RSCs are analysed with regard to: 1. the historical legacy of its units; 2. the principal security actors, issues, and referent objects; 3. the essential structure; 4. the interregional dynamics; 5. the global dynamics; 6. the relative weight of domestic, regional, interregional, and global levels; 7. and the most likely future scenarios.

The legal normative approach to regional collective security regimes and the theoretically guided debate on the new regionalism (UNU-WIDER) did not reflect the reconceptualization of security, while the RSCT (Buzan/Wæver 2003) incorporates the authors' previous work on securitization and on the widening and deepening of the security complex.

22.3.3 Revival of the Geopolitical Approaches and Discourses

While globalization theories have focused on a *despatialization*, a *deterritorialization* and a *deborderization* of international relations, both the old and the new approaches of geopolitics and the related issue areas of geostrategy, geo-economics, and geo-culture have addressed issues of international politics from a perspective of political geography where spatial categories are essential. After the end of the Cold War, geopolitical considerations experienced a renaissance with the publication of many books⁷ and several new journals⁸.

Two phases of geopolitical thinking can be distinguished: the old primarily German and Swedish school of *Geopolitik*⁹ and the British and American

approaches to *geopolitics* and *geostrategy*¹⁰, and the revival of geopolitics in the UK and the US¹¹, of *géopolitique* in France¹² and its impact on the renewed thinking on *Geopolitica* in Italy¹³, Spain, and in Latin America¹⁴ in the 1990's, of *Geopolitik* in Germany¹⁵, and in Israel¹⁶ the post-modern approaches to *critical geopolitics*¹⁷ in the tradition of the deconstructivist schools and other *new* approaches on *political geography* and *geopolitics* partly provoked as a geopolitical response to the globalization challenge on territorial and spatial categories.

The debate on global environmental change (GEC) and climate change (Issar/Zohar 2004, 2007, 2008) triggered new proposals for a spatialization of environmental issues with concepts such as: *ecological geopolitics* (Dalby 2000, 2002, 2002a) and a *political geocology* (Brauch 2003, 2003a, 2005) that require further development.

22.3.3.1 Classic Geopolitics: European and American Roots

After World War II, in many German and English language political dictionaries and international relations textbooks, *geopolitics* did not exist.¹⁸ The term ‘*Geopolitik*’ (1899) was originally coined by the Swede Rudolf Kjellén (1864–1922) while the related concepts of a political geography were fully developed in Ger-

many by Friedrich Ratzel (1844–1904) and Karl Haushofer (1869–1945).

Geopolitik refers to a scientific approach between geography, law, history and the social sciences that analyses interdependencies between political factors and space focusing on the impact of geographical or spatial factors on political phenomena. Prior to World War II, this school of thought had some impact on Japan, Italy, Spain but also on the US, Brazil, Chile and Argentina.¹⁹

Ratzel's laws on the 'spatial growth of states' were highly deterministic while Haushofer's concept of 'Lebensraum' (living space and movable borders) was adopted by the Nazis to justify German expansionism. After 1945, these concepts were outlawed or fell in disuse among professional geographers "because of its association with Nazi policies and ideas of environmental determinism from which geographers were in retreat" (Agnew 1993: 349).

In Great Britain in the early 20th century, *geopolitics* was popularized by Halford Mackinder (1861–1947)²⁰ who focused on the *heartland* as the seat of power and the *inner* (running across the Mediterranean region) and *outer crescent*. In the United States Alfred Mahan (1840–1914)²¹ in his writings on naval power became an early proponent of geopolitical and geostrategic thinking while Nicholas Spykman (1893–1943) was influenced by both.²² According to Agnew (1993: 349) Mackinder used the term:

As part of his effort to promote the field of geography as an aid to British statecraft. It was intended to signify the impact of geographical factors such as the spatial disposition of the continents and oceans and the distribution of natural and human resources upon international politics at a time when the whole world was finally available for state territorial and economic expansion. During the 1920's and 1930's Mackinder's formal model of a Eurasian 'heartland' rising to global dominance if not checked by the cohesive reaction from the encircling 'outer or insular crescent' was adopted by certain Nazi apologists to justify German expansionism.

These old conceptual and political debates in Germany, in the UK and in the US influenced the political and strategic debates in the US since World War II when realist notions gradually replaced the idealist and Wilsonian worldview that was influential after World War I.

22.3.3.2 From Geopolitics to US Geostrategy

In the postwar period Mackinder's heartland model fell into disrepute, and geopolitics, without an explicit continuity, acquired two new meanings²³:

1) as a synonym for geostrategy in the pursuit of particular diplomatic and military goals and 2) as the equivalent of political geography, in the sense of a real variation in political phenomena at all scales, including the global. The more classical usage returned to prominence in US debates over international politics in the late 1970's and early 1980's. Interest groups such as the Committee on the Present Danger and ideological elements in the first Reagan administration ... used explicit geopolitical language about the 'domino effect' of revolutions in Central America, Soviet desire for warm-water ports and oil deposits in the Middle East, and the key role of the US Navy in denying the world's sea-lanes to the Soviet Union. From this perspective the United States and the Soviet Union were seen as successor states to, respectively, Britain's nineteenth century maritime empire and French and German attempts to assemble an overwhelming 'continental bloc' (Agnew 1993: 349).

Since the late 1970's, and especially during the 1980's, there was a renaissance of geo-strategic and geopolitical thinking among US and UK civilian and military strategists (Gray 1977, 1986, 1988) that were influenced by Mahan, and in 1990's, there was a revival of political geography with a focus on nuclear geopolitics and on geo-economics. Influenced by Mackinder and Spykman, Cohen (1963, 1991, 1991a, 1993) applied geopolitical categories for the analysis of world politics and zones of influence, and the basic differences between conservative *continental* and liberal trade oriented *maritime* powers. After the Cold War he introduced the term of 'gateway regions' that link up the economic and political transfer between neighbouring geopolitical and geo-strategic regions. Cohen (1991: 552) argued:

Geographers today have an unparalleled opportunity to dispel geopolitical illiteracy by focusing on the 'geo' of geopolitics. ... while the 'geo' accounts for the spatial dimension, the 'politics' in geopolitics is the exercise of

23 See Agnew/Corbridge 1989: 266–288; Dalby 1990: 171–188.

power that derives from and seeks to control economic, social and cultural forces. ... The 'geo' in geopolitical analysis starts with spatial structure. ... The structure is hierarchical.

From a different perspective, O'Loughlin and Heske (1991: 37) argued: "It is time to reclaim the geopolitical theme from the hijackers in the strategic community" and - influenced by the new French school - suggested to convert "a discipline for war to a discipline for peace."²⁴ However, the renewed attractiveness of geo-political thinking in Europe and North America after the end of the Cold War has only partly been influenced by the old German and Anglo-Saxon roots, it was rather stimulated by a completely distinct school of political thinking on *geopolitique* in France influenced by Yves Lacoste, his centre for geopolitical research and analysis (CRAG) at Paris University VIII, and the journal *Hérodote*.²⁵

22.3.3.3 From Traditional to Critical Geopolitics

The work of Lacoste was a result of analysing problems of the violent process of decolonization. For him geography is a social discourse "a mode representing the world", and a strategic form of knowledge that by "the structuring of knowledge relating to space, is a strategic knowledge, a power" that is needed both for warfare but also for territorial administration and government (Ó Tuathail 1996: 162-163). For Lacoste (1984: 214) the theses of Mackinder and Mahan "rest more on historical evocations than on rigorous strategic thinking, based as they are on grandiose geographical metaphors of Land and the Sea" lacking scientific value. He called for a repolitization of the geographic discipline and he stressed the necessity

to exhaustively document the complex spatial relationships that are to be found in international relations. Geographers must think of space as something that is 'textured, extremely varied and very complex'. Only ... a 'sensitive analysis of the articulation between them will make geographical reasoning worthwhile and enable geographers to arm themselves better against the influence of ideological assumptions' (Ó Tuathail 1996: 166).

Nevertheless, Ó Tuathail (1996: 167-168) - from the perspective of critical geopolitics - argued that Lacoste's work falls "back into the very ideological system of epistemology he wished to challenge" and that

it is "a polemical argument against its (ab)use by the military", that he leaves "the epistemological infrastructure of geography/geopolitics intact", and that it "ultimately fails to specify a detailed way how geographical knowledge functions strategically as a form of power/knowledge". For Lacoste (1997), the state and nation remain the key actors and concepts of politics and international relations.

In a review of the new attractiveness of *géopolitique* in France, Dsouy (2000: 507-519) distinguished between: a) the geopolitics of the state, and b) of the international system.

Lacoste (1996: 3-8) has applied a wide concept of *géopolitique* that covers everything "what refers to rivalries between different types of power on territories that may be of different dimensions", thus focusing not only on inter-state but also on intra-state conflicts. For Dussouy (2000: 515-519, 1998) the geopolitical space "is a system of material and immaterial or symbolic spaces in which each space has its own organizational logic, its own structure" (515-6). He argues that the analysis of different spaces and that the structuring of each space often reflects a dialectics of homogenization and fragmentation with respect to heterogeneities. For example, the geo-economic space and the diplomatic international space produces both a global homogenization and (market, production, consumption patterns) and a dual polarization between North and South and an internal polarization within multinational enterprises. He defines the international system as a configuration of spaces and actors that act in the pursuit of their interests under the influence of the socially imaginary. For Dussouy, *géopolitique* rests on three sources:

- a *topographic* source (geographical situation of the actors);
- a *topological* source (the position of the actor in different issue areas);
- a *praxiological* source (configuration by strategic actions).

He sees the main problem in a semantic synthesis of the different spaces and he points to three alternative solutions for a geopolitical analysis:

- an *assimilated* homogenization;
- a *heterogeneity* of the antagonisms; and
- an *adaptive* homogenization.

Dussouy distinguishes among three geopolitical movements with these focal points:

24 O'Loughlin 1994; Nester 1995; Wiarda 1996; Simon/Dodds 1998; Dodds/Atkinson 2000.

25 Hérodote 1976ff.; Gallois 1990; Lacoste 1990, 1993, 1997; Raffestin 1995; Chauprade 1999; Claval 1996; Vigarie 1995; Defarges 1994; Laidi 1998.

- a *world integration after a global homogenization* (market democracy, communication) and a reduction of heterogeneities (smaller role of the states) with the goal of a world society in which the geopolitical space has become transparent;
- *disorder, conflicts resulting* in a global civil war;
- a configuration of big spaces of zones of influence by the major powers, confederations of states or of societal groups within macro systems.

In conclusion, Dussouy argues that interdependencies of territories and networks in a regional framework may be best suited to permit a coexistence of the unsolvable problems of geography and history with the forces of a homogenization within macro systems.

Many French studies have analysed in detail the German and Anglo-Saxon roots of geopolitics (Defarges 1994; Claval 1996; Raffestin 1995; Chauprade 1999) by contrasting the geopolitics of maritime and continental powers, discussing the relations between geopolitics and war and geo-economy and the specific *géopolitique* of France (Defarges 1994), the evolution of geopolitical thought in history, especially during fascism in Germany, Italy, and Spain (Raffestin 1995), focusing on the methods, and on permanent and changing geopolitical factors (Chauprade 1999) or dealing with the relationship between geopolitics and (nuclear) geo-strategy (Claval 1996).

In Italy, in the 1990's the renaissance of *geopolitica*²⁶ (Petersen 2000: 481–505, 1993) was very much influenced by the French debate, especially by Lacoste (1993), Defarges (1996), Claval (1996a), and Lorot (1997) whose books were translated into Italian. Since 1993, the journal *Limes*, and Carlo Jean (1995)²⁷, a retired general, played a leading role in spreading geopolitical concepts in Italy.²⁸

26 The first debate in the late 1930's was nearly exclusively influenced by the German debate by Haushofer, Ratzel, Maull et al., see Petersen (2000: 486–487). From 1939–42 the journal *Geopolitica* was published in Milan by G. Roletto. From the mid 1940's until the 1980's, geopolitics had virtually disappeared.

27 Based on French and Anglo-Saxon publications, Carlo Jean analysed world politics from geopolitical, geostrategic and geo-economic perspectives. See also the conference volume edited by Ferro (1993).

28 Among the challenges are: disintegration of Italy, the emergence of a Franco-German community, a stop to European unity and a Balkanization of Europe while among the opportunities are: the dynamics and vitality of the Italian economic system, the cultural heritage, the role of the Catholic Church and the role of Italian emigration around the globe.

Until the 1990's, in Germany geopolitical approaches were ignored after efforts in the 1950's to reintroduce the pre-Nazi geopolitical thought failed.²⁹ In the early 1990's, a few experts called for new geopolitical considerations (Palaschewski 1989, 1992; Brill 1993, 1994) while others focused on Haushofer (Ebeling 1994). In 1994, a conference in Hannover reviewed theoretical designs on the political space and the Potsdam journal *WeltTrends* devoted an issue on *Geopolitik* with contributions by Lacoste and Taylor.³⁰ In autumn 1997 and 1998, two conferences in Potsdam reviewed the old thinking on *Geopolitik* from 1890–1945 and new approaches since 1945.³¹

In this context, von Bredow in analysing 'international politics as a 'spatial order', briefly addresses the impact of globalization on the loss of the spatial dimension and argues that it is not the spatial aspect of international relations that is being challenged but the territorial principle and national sovereignty due to the removal of the boundaries between the domestic and foreign space. Only few authors (Clark 1997; Menzel 1998) have addressed the opposite tendencies of globalization and fragmentation in the post-Cold War world. Since the global turn, the theoretical approaches in the social sciences and in IR had an impact on critical geopolitics.

22.3.3.4 New Approaches to Critical Geopolitics

In the Anglo-Saxon world, some geographers questioned whether a geopolitical ordering of the world into 'strategic regions', 'spheres of influence', 'buffer zones', and 'strategic locations' existed (Agnew 1993: 349).

29 See: Grabowsky 1960; Schöller 1961; Matern 1978; Kost 1988; Schultz 1989; Sandner 1994: 12–14; Buck 1996; Sprengel 1996; Faßler 1996; Brill 1998.

30 See: *WeltTrends* No. 4 (1994); on the Hannover conference: 177–181; and the articles by Lacoste (1994: 21–24); by Taylor (1994: 25–38); on *Hérodote* (1994: 150–152).

31 See Diekmann/Krüger/Schoeps 2000, 2 volumes with a review of the debates on political geography in Germany and since 1990 also in France and Italy. Only two specialists of international relations are represented: von Bredow (2000: 433–452) and Fröhlich (2000: 559–590). The volumes ignore the new debate on *critical geopolitics* while the US geo-strategic debate is covered. Among the 26 contributions one focuses on imperial, cultural and political borders, on frontiers and on anthropogenic research on political borders, border conflicts and border regions in the context of globalization and regionalization (Heller 2000: 325–350).

Rather, geopolitics could be viewed as any discourse about geographically defined interests including particular models privileging fixed geographical 'facts' about the world. From this point of view geopolitics did not disappear after World War II or when moral rhetoric replaced *Realpolitik* in the pronouncements of politicians. It is implicit in the practice of foreign policy. In line with this dynamic conception of geopolitics, as the world political economy changes the criteria used for ordering the world geographically change.

Beyond the geo-strategic and geopolitical reasoning in the realist tradition of power politics, a new school of '*critical geopolitics*' evolved in the framework of late modern or post-modern and deconstructivist approaches to international relations (Ashley 1984, 1988, Derrida 1981; Der Derian 1992) influenced by Hartshorne (1950), Foucault (1980), and Lacoste (1976) that focused on geopolitics as a discourse and as a form of power and knowledge interpreting hegemonial power as rule writers. Critical geopolitics focused on geopolitics of capitalism, environmentalism, race, and urban zoning politics (Ó Tuathail 1989, 1996; Ó Tuathail/Agnew 1992; Ó Tuathail/Dalby/Routledge 1998; Dalby 1991). On Ó Tuathail's version of *critical geopolitics* (1996), Agnew (2000: 96–98) noted:

From the outset, the terms of geopolitics are situated in a set of discourses about statehood, state sovereignty, and the geographical divisions of the world upon which the practices of international relations depend for their meaning and significance. ... Ó Tuathail sees the mapping of the world by academic theorists and political practitioners as involving a 'geo-graphing' in which meaning is never completely mapped, even as this is the claim all make. The goal of the book is to analyse the ways in which conventional geopolitical writing can be called into question or 'displaced' from its intellectual and political pedestal. Three main approaches ... are taken to task. The first is to open up traditional terminology of geopolitics by exposing it as anything other than self-evident and innocent. ... a second approach is to define geopolitics as a type of 'governmentability'. ... The third and most important approach explores the techniques of 'seeing' that make global political mapping possible. ... Overall, the three-pronged attack displaces the logic of geopolitics by pointing how it is discursively produced. Geopolitics does not simply 'happen'.

Other authors have focused on issues of economics, identity, and nationalism in global cities (Scott 1998; Agnew 1998; Herb/Kaplan 1999). David Newman (1999: 1) described the return of political geography as "a tortuous experience." For him these factors contributed to its renaissance (1–2):

The collapse of the Soviet Union and the territorial re-ordering of Central and Eastern Europe, together with

the impact of globalization and supra-national processes on what is traditionally seen as the Westphalian compartmentalization of the world into sovereign states, has raised a host of new questions concerning the nature of the world political map. The study of these topics has assisted in the re-legitimization of Geopolitics as an academic sub-discipline.

On the international scene, a reassessment of geopolitical writings of Ratzel occurred at a meeting held in Trieste in December 1997 on 'Europe between Political Geography and Geopolitics' and a subsequent meeting in Israel in January 1998 focused on 'Geopolitics and Globalization in a Postmodern World' when the journal '*Geopolitics*' was launched.³² Newman (1999: 3–5) identified as key themes of the contemporary study of geopolitics:

- Globalization and the changing function of state sovereignty. ...
- The deterritorialization of the state and the associated changing roles and functions of international boundaries. ...
- The study of geographical texts, narratives and traditions. ...
- The geopolitical imagination. The relative location of a state in the global system. ...
- The 'reterritorialization' of the state and the emergence of new ethnic national and territorial identities. As globalization and boundary permeability affect the state at one end of the spectrum, so too do the emergence of new states and the associated creation of new boundaries affect the lower end of the system. Globalization itself is partly responsible for a parallel increase in ethnic identities at local and regional levels, with the demand for autonomy, self-government, secession and independence becoming stronger, rather than weaker. ... Territorial ideologies remain strong at both the concrete and symbolic levels. ... Geopolitics should focus on the geographic differentiation of these processes, along a continuum from deterritorialization to reterritorialization and the way in which globalization affects different state activities unevenly.

The fifth point in Newman's agenda is of particular relevance for the Mediterranean where processes of globalization and fragmentation of deterritorialization (establishment of a Common Market in EU countries in 1992) and reterritorialization, of a shift from na-

32 Newman 1998; Kimmerling 1983; Biger 1990; Sucharow 1999; Bernstein 2000; Shilhav 1985.

tional to communal sovereignty and of a vigorous defence of national sovereignty, have coexisted and have produced many of the obstacles that have impeded progress in the Euro-Mediterranean space of the Barcelona process since 1995 (Brauch 2000, 2000a, 2001, 2003).

Geopolitics or 'politics within a space' and globalization 'politics beyond space and borders' point to two extremes that are of relevance for the analysis of the referent objects of security. Through both theoretical perspectives of 'géopolitique' and 'globalization' different features of the present political reality may be perceived and evaluated.

22.3.4 Ecological Geopolitics vs. Political Geocology

The effects of climate change do not distinguish national borders but the specific impacts differ due to the socio-economic status of the affected countries and the degree of social vulnerability of its affected people (IPCC 1990, 1990a, 1996, 1996a, 1998, 2001, 2001a, 2007, 2007a). The securitization of climate change started in the early 21st century (see WBGU 2007; 2007b; 2008, chap. 40 by Brauch).

Climate change has been discussed as an issue of environmental security (Brauch 2002), of US national security (Schwartz/Randall 2003/2004; CNA 2007), of international security (WBGU 2007; 2007b; 2008), and of human security (GECHS 2005; Barnett/Adger 2005; Bothe/O' Brien 2007; Wisner/Fordham/Kelman/Johnston/Simon/Lavel/Brauch/Oswald/Wilches-Chaux/ Moench/Weiner 2007)³³ concerns. On 17 April 2007, the UN Security Council considered for the first time climate change as a new security issue. During its presidency of the Human Security Network, Greece will address this topic in 2007 and 2008.³⁴

The German Advisory Council on Global Change (WBGU 2007; 2007b; 2008) in a report on *World in Transition: Climate Change as a Security Risk* discussed "Climate change as a threat to international security" due to four climate-induced conflict constella-

tions (typical causal linkages between environment and society): a) degradation of freshwater resources; b) decline in food production, c) increase in storm and flood disasters, and d) environmentally-induced migration that may lead to social destabilization and violence. The WBGU (2007: 19–24) used an extended security concept that included the securitization of environmental dangers including the risks associated with climate change, however, with regard to the referent object of security the WBGU rejected the human security concept and confined its analysis to the nation state as the major referent object of securitization.

In the framework of a NATO scientific conference on desertification in Valencia in 2003, desertification has been securitized as a national, international as well as human, water, food, and health security concern (Brauch 2003c, 2006; Kepner/Rubio/Mouat/Pedrazzini 2006). During the International Year to Combat Desertification in 2006 several events have addressed the security implications of desertification (e.g. the Spanish Symposium in October 2006 that addressed the impact of desertification on migration that has become a new security issue).³⁵

The three major spatial approaches to international relations – reviewed above – of globalization, new regionalism, and geopolitics have ignored both the environmental dimension and the securitization of climate change and desertification. According to Alker and Haas (1993) thinking on global environmental change and politics could develop in *geopolitics* or *ecopolitics*. For Dalby (2000: 90) the analysis of the global environment requires thinking beyond "the state and the conceptual tools of contemporary neoliberal scholarship (Keohane/Levy 1996)", but also beyond the spatializations of political processes (globalization, regionalism, geopolitics) with the state or non-state economic actors as major points of reference. To understand "politics and ecology as processes in motion, rather than as stable entities", requires according to Dalby (2000: 98), "a more sophisticated political ecology that understands environmental change as a series of complex social processes in specific geographical contexts". Dalby (2000: 99) concludes that the post-Cold War context permits a discussion of environmental security issues beyond geopolitical rivalry. In his view environmental

change should be incorporated into models of conflicts, geopolitical assumptions must be debated, and “ecopolitical considerations require that ecology and environmental history be taken seriously” (Dalby 1998b). While Dalby (2000: 84–100) approached *ecogeopolitics* from critical geopolitics (1998), Brauch (2003) suggests a *political geoeology* that combines the geoeological approach in the geosciences with socio-economic effects of global environmental change.

Geoeology was introduced as an interdisciplinary natural science by Huggett (1995) and Blumenstein, Schachtzabel, Barsch, Bork, and Küppers (2000). They raised long-term questions from a retrospective and prognostic perspective: Which economic, social, and cultural developments determined (or: will determine) in a specific space at a certain time which specific environmental situation? Huggett (1995) has defined geoeology as the study of the structure and function of geosystems in different scales. For Blumenstein, Schachtzabel, and Bork (2000: 9) geoeology is “an environmentally-oriented, interdisciplinary natural science that defines structures, functions and modes of action within geosystems or between them and their environment.” Geoeology draws both on the spatial sciences (geography, cartography, landscape and regional planning) and on the natural sciences, but it excludes the effects of environmental degradation on environmental stress and their outcomes. Since the 1990’s, institutes and courses on geoeology have been set up using different definitions.³⁶

Brauch (2003a) argued that a political geoeology is needed that combines the regional implications of global change and its potential outcomes: disasters, environmentally-induced migration, crises, and conflicts from a human security perspective for the environmental security dimension. Such a political geoeology must combine the complex causes and interactions of key factors of regional environmental

change with environmental stress, natural disasters, distress migration, crises, and conflicts. Relying on the results of the natural sciences, *political geoeology* uses the methods of international relations. This new approach requires an interdisciplinary discourse on global change and its regional impacts for environmental security and conflict avoidance.

All four approaches of globalization, new regionalism, geopolitics, and ecological geopolitics or political geoeology have nearly exclusively been delinked from the discourse on a reconceptualization of security. However, these discussions offer the spatial links to the vertical deepening of the security concepts as reflected in the referent objects and levels of analysis in the discourse on security concepts.

22.4 Spatial Referent Objects of Security

22.4.1 Spatial Referents in Securitizing Theory

Buzan, Wæver, and de Wilde (1998: 5–7, 9–10) used three different spatial references on analysing security: a) levels of analysis, and b) regions, and c) referent objects. As levels of analysis they defined “a range of spatial scales” where “outcomes and sources of explanation” can be located, or as “ontological referents for where things happen rather than the sources of explanation themselves.” They distinguished among five spatial levels of analyses: 1. international systems (planet); 2. international subsystems or macro regions (OSCE, OAS, AU), 3. units (states, nations, transnational firms); 4. subunits (organized groups of individuals, bureaucracies); and 5. individuals. A major focus of their interest has been macro regions or regional inter-state organizations like ASEAN, NAFTA, etc. In their speech-act approach they distinguish further between three types of units in security analysis:

1. *Referent objects*: things that are seen to be existentially threatened and that have a legitimate claim to survival;
2. *Securitizing actors*: actors who securitize issues by declaring something – a referent object – existentially threatened.
3. *Functional actors*: actors who affect the dynamics of a sector. ... This is an actor who significantly influences decisions in the field of security (Buzan/Wæver/de Wilde 1998: 36).

The *referent object* for security has traditionally been the ‘state’ that has the monopoly over the use of phys-

36 For an Australian course, “geoeology embraces soil science, geomorphology and land management”; a seminar at the University of Georgia announced to “touch all aspects of global change, both scientific and human”, with an “integrative approach, looking at disciplines which normally do not interact regularly;” while a seminar at Heidelberg University suggested: “Geoeology is understood as a comprehensive approach to the study of environments with a strong focus on environmental problems caused by humans,” that “includes fundamentals of ecology, a concise history of landscape ecology and ... an analysis of selected case studies.” But no definition referred to international relations.

Figure 22.3: Expanded concepts of security. **Sources:** Møller (2003); Oswald Spring (2001, 2007).

Label	Reference object	Value at risk	Source(s) of threat
	Security for and by whom?	Security against what?	Security from what?
National security	The State	Territorial integrity	State, substate actors
Societal security	Societal groups	National identity	Nations, migrants
Human security	Individual, mankind	Survival	Nature, state, global.
Environmental security	Ecosystem	Sustainability	Humankind
Gender security (Oswald Spring 2001, 2007, 2008)	Gender relations, indige- nous people, minorities socially vulnerable	Equality, identity, solidarity	Patriarchy, totalitarian in-sti- tutions (governments, churches, elites) intolerance

ical force both within the state (police, judiciary) and beyond its territory (diplomacy, military). This state-centred focus has been expressed in concepts of national, but also regional and international security where states – cooperating in alliances, regional or global organizations – have remained the major actors.

With the deepening and widening of the security concept this *referent object* has shifted to societal groups (societal security), individuals and humankind (human security), the environment (environmental security) or gender relations and socially vulnerable groups (gender security). Some of the *values at risk* have direct spatial connotations (territorial integrity, national identity) while others have not (sustainability, equality, identity, solidarity). The sources of threat may be states and nations with spatial characteristics or substate actors, migrants, humankind, patriarchy without (figure 22.3).

With the globalization concepts complex global processes of change that pose new threats have been conceptualized that have direct spatial impacts on states and international organizations that are often beyond the control and coping capacity of states.

In the ‘anthropocene’, global environmental change poses manifold new dangers whose extreme impacts (e.g. via extreme weather events) do not respect national boundaries nor do they discriminate between poor and rich countries. Nevertheless, due to the different levels of social vulnerability and coping capacity the number of victims and affected people have significantly differed. These new security dangers existentially threaten the survival of people and countries, especially the small island states and low lying coastal regions whose territory may disappear due to sea level rise (IPCC 2007a; Kinnas 2008).

Those who have caused the anthropogenic climate change (e.g. the people in countries that have contributed most to global warming since 1750) and those who will be affected most (e.g. people in coastal re-

gions, small island states, and those affected most by drought, storms, floods, heat waves, famine, etc.) are not identical and cannot be easily identified nor do they live simultaneously (Beck 2007). These new security dangers and concerns are beyond the classic ‘security dilemma’ posed by states and affecting primarily other states (chap. 40 by Brauch).

Rather, these new objective security dangers and subjective security concerns pose a new ‘survival dilemma’ that affects both human individuals and humankind. They also create new global equity problems that can only be solved by global and regional cooperation and not by military force. Interregional ‘survival pacts’, e.g. between the countries of Europe and North Africa where both regions exploit their comparative advantages as energy and food providers, could offer longer-term cooperative answers (Brauch 2002; 2002a; see chap. 40 by Brauch).

22.4.2 Contributions on the Spatialization and Referent Objects

The following chapters in part IV address the linkage between space and security from different perspectives. The first four chapters offer approaches of geopolitics, of global environmental change, and globalization (22.4.2.1), followed by two chapters on world regions as referents and on identity-based security threats (22.4.2.2), and by one chapter that discusses the role of the nation state as a referent object of national security (22.4.2.3), while three chapters deal with sub-national actors (society, ethnic, religious groups) and referent objects (terrorists and criminal narco-traffic groups) of security analysis (22.4.2.4).

22.4.2.1 Global Referent Objects: GEC and Globalization

Vilho Harle and *Sami Moio* provide a geopolitical view on the structural setting for global environmen-

tal politics in a hierarchic international system (chap. 23). They claim that the US role in the hierarchizing the international system has put the traditional military security above all other elements of security through the utilization of the security political mindset that emerged after the 9/11 terrorist attacks. Based on an elaboration of the critical research of geopolitics they develop a theory of the hierarchical international system that evaluates the military basis of American political power and outlines the transformation of the international system from anarchic to hierarchic. They apply this theory on global environmental politics as a case of 'hard' and 'soft' US power before they return to security as a political issue and an element of US soft power.

Jon Barnett, Richard A. Matthew and Karen O'Brien (chap. 24) trace the thinking on the relationship between people, the environment, and security. They describe the shifting concerns from environmental to human security and discuss how global environmental change challenges human security and why this relationship has neither been prioritized neither in global environmental change nor in human security research and policy agendas. They offer the *Global Environmental Change and Human Security* (GECHS) project's definition of human security, and show how this research can contribute to the *Millennium Development Goals* (MDG). Then two authors from Mexico analyse the linkages between globalization and security.

John Saxe-Fernández (chap. 25) approaches globalization and security from a theoretical and historical perspective, focusing on the centrifugal processes in the development and on the impact of US capitalism in the international scene and in Mexico. The chapter addresses how the centrifugal and centripetal forces relate to each other in the 'imperial presidency' and its modus operandi in the international scene as well as in Mexico where the export of weapons and military training to Mexico are illustrated. It focuses on the impacts of US imperial power on international security (occupation of Iraq), and its power projections in Mexico.

In "globalization from below" *Úrsula Oswald Spring* (chap. 26) focuses on "social movements and altermundism" and on the impact of these developments on reconceptualizing security from a Latin American perspective. She reviews the rise of social movements in response to an exclusive or regressive globalization offering bottom-up alternatives and raising collective consciousness. Latin America has developed self-organizing experiences, trying to reduce so-

cial inequality and poverty within their countries with limited success. This is illustrated in a case study on the uprising of the Zapatista movement in Mexico in 1994 when NAFTA entered into force. Social movements, alternative thinkers and actors exchanged their experiences during the *World Social Fora* (WSF), and established a world agenda for common activities opposing the Davos paradigm (WEF). She discusses how social movements have reconceptualized security in a wider sense, taking human, gender, and environmental concerns for a plural, peaceful, sustainable, and diverse world model into account.

22.4.2.2 Regionalism as Referent Objects and Identity-based Threats

Below the planetary or global level of analysis, the next two chapters offer two snapshots on the concept of regionalism and on identity based security threats in relation to Islam. *Björn Hettne* (chap. 27) reviews the "security regionalism in theory and practice," clarifying the meaning of 'security regionalism' or the regional dimensions of security. The 'new regionalism' focuses on emerging formations rather than seeing regions as subsystems of international order. *Regionalism* is a tendency and a political commitment to organize the world in terms of regions. *Regionalization* refers to the more complex process of forming regions. The concept of *regional organization* is unclear, as some are recognized by the UN; while others developed more spontaneously. Since the late 1980's a new 'regionalism' focused on conditions related to globalization. This chapter offers in four parts (i) a presentation of the dimensions of security regionalism, (ii) an overview of the global pattern of regional conflict, (iii) a framework for the analysis of particularly regional conflict resolution, and (iv) a discussion of future prospects for regional versus global security management.

Mustafa Aydın and Sinem Açikmese (chap. 28) analyse "identity-based security threats in a globalized world" with a focus on Islam. They interpret the connection claimed by some authors between the use of terror and Islam by "focusing solely on the deeds of extremists and generalizing them to the whole Islamic world" as misguided. They "look critically at the connection between Islam as a religion and Islam as a threat in the globalized world where peoples' resort to deeper religious and ethnic identities came to the fore." After a *tour d'horizon* on the concept and formation of identities; ethnic, religious, and civilizational versions of identity-based security threats, they argue that ethnic-based threats are more applicable to

current regional and global security dynamics. They analyse how Islam appears as a threat in the Western world and why Islam as a civilization cannot be a genuine source for identity-based threats. While Huntington's version of a civilizational identity is rejected as a myth, they acknowledge that some extremist groups, imagining identities based on Islam as a religion, might pose threats to the security of wider international society and they discuss under what conditions Islamic identities could be associated with threats to a wider world.

22.4.2.3 The Nation State as the Referent: Security and Sovereignty

Bharat Karnad (chap. 29) reviewed the linkage between "security and sovereignty" arguing that presently "the sovereignty of weak states ... is most in peril." As states in an anarchic international system have to rely on themselves for protection, a minimum criterion of sovereignty is defined as the ability of a state to take care of its own security, thus defining the *de jure* status of a nation-state, not its *de facto* condition. He analyses from a realist perspective the three principal interlinked threats to sovereignty, namely, intervention, globalization, and insurgent sub-nationalism. He argues "that the ability of a nation state fully to protect itself by its own means has to do with whether, to what extent, and how well a state prevents encroachment of its national security space by powerful foreign countries and external forces, like globalization, and preserves its internal authority in the face of violent activities by armed secessionist groups catalyzing around distinct ethnic, religious, and regional identities." *Differential* sovereignty is a consequence that poor and less developed countries are being denied the freedom (from outside interference) to use whatever means, including violence, to forge a nation out of masses of disparate and often resisting peoples, a freedom the post-industrial societies and states of the First World enjoyed during their often bloody nation-building stage. He concludes that 'sovereignty' is meaningfully exercised only by strong states.

22.4.2.4 Sub-state Actors as Referents

Varun Sahni (chap. 30) discussed the role of the "sub-ordinate, subsumed and subversive" for sub-national actors as referents of security. He focuses on how the state deals with the threat of difference *within* itself, and how sub-national actors position themselves *vis-à-vis* the threat posed by the state. After a brief analysis

of the complex interrelationship between the state, society, and security he argues that "sovereign territoriality continues to remain intact in much of the world," what implies "that identity politics ... is the assertion of difference *vis-à-vis* the state and its hegemonic definition of 'national' identity." He explores the notion of subordination (to the state), and explains why sub-national actors are seen by the state as perpetually presenting themselves with the threat of insubordination. The trans-border character of sub-national actors is often seen by the state as a threat. Sub-national actors can be actively subversive of the state, resorting either to covert subversion 'from below' or overt subversion 'from above'. Sahni investigates "how the threat perception of the state *vis-à-vis* sub-national actors can be mitigated or eliminated through a broad and inclusive process of political engagement" and he suggests inclusive answers for politics.

Gunhild Hoogensen (chap. 31) addresses a specific group of sub-state and transnational actors by reviewing the literature on "non-state based terrorism and security" that was dominated "by state and international security perspectives." Despite the revival of a state-based political and military security approach after 9/11, she adheres to a broadened security agenda and suggests including for the analysis of terrorism other security referents beyond the state by examining "the relations between individual, and societal (identity-based) security dynamics, or non-state referent perspectives." In examining some possible roots of terrorism, with a focus on human and societal security we might be able to say something about terrorist networks and more importantly about how people may be attracted to or recruited into terrorist networks. Identities are multiple and changing over time, they are not solely ethnic in nature, but also rooted in gender, class, race. As subjects of politicization and securitization, however, at a given moment in history an identity or set of given identities may be manipulated and ahistoricized for political purposes, and in a few cases, employ the act of terrorism.

Arlene B. Tickner and Ann C. Mason (chap. 32) analyse the role of transregional crime as "agents of insecurity in the Andes," arguing that many new socio-spatial developments are "incompatible with the territorial principle of sovereignty," due to "the deterritorialization of security in the post-Cold War era." They argue that "security domains are not only located above, below, and alongside the territorial state, but they also are intertwined with and superimposed upon other such spaces, presenting a global security matrix at odds with state-centric epistemologies." The

Andean security dynamics illustrates this global security paradigm: “Security interdependence, regional overlay, transnational flows, and the prevalence of non-state actors are the defining characteristics of the security landscape in the Andes”, why security cannot exclusively be analysed at the national level.” This involves “transregional dynamics and region-wide networks of actors.” Likewise, the most acute threats are “transborder in nature, as epitomized by the movement of drugs and arms that crisscross the region irrespective of political boundaries, and in many cases spill out of the region.” In the Andes both “transnational criminal organizations and armed groups operate beyond the control of national governments and manage these illicit trafficking activities.”

These three chapters illustrate well that a narrow state-centred analysis cannot any longer answer the key questions of security by whom, for whom, against what and with which means, nor can it cope with the complexity of the security paradox in the post-Cold War era. This mapping of the rethinking of the spatial dimension of security in the emerging ‘anthropocene’ requires complex and diversified conceptual approaches to socially reconstruct the complex security mosaic in the 21st century.

The answer to the question of the security for whom has gradually shifted from the ‘nation state’ to the ‘people’, as referred to in the preamble of the UN Charter: “We the peoples of the United Nations determined to save succeeding generations from the scourge of war” which referred to a much wider policy agenda by referring to “fundamental human rights”, “justice and respect for the obligations arising from treaties” and promoting “social progress.” Since the 1990’s (UNDP 1994), the ‘state-centred’ approach to security has been complemented with a ‘people-centred’ approach addressing dangers and concerns for human security (see vol. IV in the Hexagon series by Brauch et al. 2008).

22.5 Conclusions and Outlook

The ‘spatial dimension of security’, the levels of analyses and the spatial referent objects of widened, deepened, and sectorialized security concepts has been mapped in this chapter with regards to the spatial dimension of politics and the competing spatial approaches in political science, geography, and international relations. Global environmental and climate change have evolved since the 1980’s and 1990’s as new scientific areas of analysis whose linkages to the

security debate are just emerging and require a multi-disciplinary conceptual approach.

The reviewed literature on the securitization of space refers to several deficits. The discourse on the shift from a national to a postnational constellation (22.2.3) is still based on a narrow security concept that does only partially reflect the global discourse on a reconceptualization of security (Buzan/Wæver/de Wilde 1998). It refers to a limited deepening by addressing society as an object of security dangers as well as sub-state and transnational actors (figures 22.1, 22.2). However, it does not discuss the horizontal widening to new security dimensions nor does it discuss the human security concept and the dual role of human beings and humankind in posing new environmental security dangers but also as victims of the impacts of GEC and climate change. This approach overstressed the processes of deterritorialization and deborderization that does not even apply to all OECD countries (US fence, visa requirements).

Most debates on globalization (22.3.1), on traditional and on new regionalism (22.3.2) as well as on geopolitics (22.3.3), have so far ignored the implications of the discourse on reconceptualization of security. Only the revised regional security complex theory (RSCT) by Buzan and Wæver (2003) integrates both the widening and deepening of security without taking note of the sectorialization of security concepts. In the discourses on geopolitics (22.3.3.4) the environmental dimension has been either totally lacking or has so far hardly been developed.

In two chapters Dalby, Brauch and Oswald (2008) and Oswald, Brauch and Dalby (2008) – from the perspectives of human geography, social anthropology and international relations – develop a comprehensive research agenda for environmental and human security in the ‘anthropocene’ (Crutzen/Stoermer 2000; Clark/Crutzen/Schellnhuber 2005) that addresses the new security dangers and concerns of a human-centred ‘survival dilemma’ (Brauch, chap. 40) that require new ‘survival strategies’ that link top-down global strategies of international organizations with ‘bottom-up’ local initiatives of social movements to protect and empower the victims of GEC and to enhance their resilience (chap. 26 by Oswald).

23 Structural Setting for Global Environmental Politics in a Hierarchic International System: A Geopolitical View

Vilho Harle and Sami Moisio

23.1 Introduction

According to the state-centric image of world politics, foreign and security policy is a field of action on which states practice diplomacy and wage wars, struggle for relative power, and maximize their power resources by appropriating territories of great strategic importance and natural richness. In this image, foreign and security policy is based on state sovereignty coupled with sharply demarcated territorial containers that exist in the space of anarchy (Schmitt 2003¹). The beginning of the Cold War gave the final blow to this anarchical international system of Westphalian states, where states had been free to form alliances against *any* aggressor or in order to check and balance the power of any state pursuing hegemonic supremacy over the others. The Cold War established instead two hierarchical blocs: the Western and the Eastern.

The end of the Cold War did not re-establish the Westphalian anarchy of states; just to the contrary, the process towards a more general hierarchization of the international system became a practical reality. While some observers took this as a temporary change towards unipolarity, with predictions of the return of a new multipolar international (anarchical) system (Waltz 2000), unipolarity won the stage, becoming hierarchy after September 2001.

This chapter seeks to schematize the new geographical order of world politics by taking into consideration the suggested hierarchization of the inter-

national system. We focus on U.S. military power as one of its most important constituents. While giving a key role to military power, our basic thesis is that in order to understand the current state of world affairs both “soft power” (Nye 1990, 2004) and “hard power” of the U.S. should be taken into consideration. However, we do not maintain that soft power de-hierarchises the international system or raises the others equal partners to the U.S. Just to the contrary, we maintain that the U.S. is the leading state of the hierarchized international system both militarily and in other ways.

This is nowhere as obvious as in the issue and (re)conceptualization of security: we claim that the U.S. role in the hierarchizing international system gives the traditional military security a new birth by raising it above all other elements of security through utilization of the security political mindset that emerged after the 9/11 terrorist attacks. In order to understand this return of the military security, we will analyse the basis and nature of the structural change of international system. The point is to document how the suggested re-emergence of traditional military security is a key element in the soft power the U.S. applies in order to achieve the leading role in the changing international system. In other words, we suggest that conceptualization and reconceptualization of security are not academic exercises, but represent the essence of current world politics by both the U.S. and its opponents.

In order to justify our argument, the chapter formulates a theory of the hierarchical international system in four sections. The introduction is followed by an elaboration of the critical research of geopolitics as connected to the basic idea of the hierarchical international system (23.2). The distribution of capabilities, and the ordering principle together with the division of labour (functions) are discussed in the next sections (23.3 and 23.4) respectively. Section 23.2 evaluates the military basis of American political power

1 This spatial and state-centric image of world politics was best articulated by Carl Schmitt, who introduced the concept of *nomos* as the immediate form in which the political and social order of a people becomes spatially visible. *Nomos* is the measure by which the land in a particular order is divided and situated; it is also the form of social and political order determined by this process.

focusing on different spatial strategies of security. Section 23.4 outlines the transformation of the international system from anarchic to hierarchic. By calling attention to geopolitical elements and spatial structures we seek to enrich the political-economic perspective which clearly has a hegemonic position in explaining the changing geographies of the international system. We claim that this theory can be applied to the analysis of any specific issues in world politics. In order to illustrate this, we apply the suggested theory to a discussion of global environmental politics as a case of both “hard” and “soft” U.S. power (23.5). While the issues of security is discussed or at least implicated in the four sections (23.2 through 23.5), we will return explicitly back to security as a political issue and an element of U.S. soft power in the final section (23.6).

23.2 Critical Geopolitics of the Hierarchic International System

Critical geopolitics has focused on global governance and “earth writing” attached to it. Geopolitics has been linked to the knowledge generated by the “counsellors of princes” – in effect, the production of a conservative form of spatial knowledge designed to perpetuate existing power structures (Ó Tuathail 1996). In doing so, critical geopolitical analysis has both widened the state-centred approach in geopolitics and added new research themes. Post-colonialism (Power 2000), popular culture (Dodds 2003), gender issues (Dalby 1994), environment (Dalby 2002a), and identity formation (Paasi 1996; Sharp 2000), are now considered geopolitical phenomena. Critical geopoliticians concern the study of geopolitics “as a series of cultures developed within and shared across an inter-state society” (Ó Tuathail 2004: 76).

Critical geopolitics argues that up to the end of the Cold War, the geopolitical approach was often centred on the superpowers and was associated with a very special, masculine way of visualizing a world of nations, together with aspects of colonialism, imperialism and, at least indirectly, racism, through the medium of maps, speeches and written works. Representations of a geopolitical nature were employed to describe strategically, economically, and culturally significant places, locations, boundaries, and regional distinctions (Sidaway 2001: 225–226). Thus classical geopolitics and realist reasoning is now seen as a special form of space ordering. The object of criticism in critical geopolitics is not realism as such, but the status

of the absolute truth acquired by realism and knowledge production supported by it in the explanation of the international spatial system and the establishment of cultural divisions (Moisio 2005). The core of the criticism is that geopolitical realism is in itself a manifestation of identity politics, and, thus of culture.

Despite the fact that critical geopolitics has shed new light on the connection of geographical knowledge and world politics, it has said virtually nothing on the geographical patterns of international system, even though the systems of hierarchy or anarchy are inherently spatial in nature. This clearly indicates that the examination of geographical forms and patterns of world politics has been treated as neo-realist reasoning which tends to reconstruct the basis of world politics rather than deconstruct or understand its basic features. In fact, as John Agnew (2001a) has argued, the result is that the conception of the political in critical geopolitics is paradoxically both “international” – focused on the inter-state scale – yet usually associated with sites of knowledge in one particular country, almost invariably the U.S., without explaining either the international bias or why the U.S. is so important in the contemporary world system.

While critical geopolitics tends to emphasise the discursive basis of world politics, some other geopolitical perspectives pay attention to the geopolitical orders, that is, for example, “the conditioning effects of informational and military technologies upon spatial interaction” (Agnew/Corbridge 1995: 15). The geographical study of global political orders is not, however, of recent origin. In fact, the materialist world system political geography (Taylor 1982, 1996), along with studies on geopolitical economy (Agnew/Corbridge 1989, 1995; Agnew 2005), has contributed to the geographical study of world politics for over two decades. The geographical study of global politics has paid a lot of attention to the change in global power structures as they follow the cyclical nature of the world economy. There are several similarities in these structural approaches as they share an idea of economic cycles and hegemonies. However, the key difference between the structuralists is the meaning and current form of hegemony. The “world system” scholars take the idea of hegemony from Wallerstein, while geopolitical economists share the Gramscian theory of hegemony. The question of hegemony has been in a central place in analyses of geopolitical economy (Agnew 2005), while questions of anarchy and hierarchy have remained rather untouched in geographic studies.

Even though we leave the economic basis of the U.S. power untouched, we in no way underestimate its importance in the context of hierarchic international system. In fact, we agree with Hardt and Negri (2000) in that the new economic empire is a decentred and decentralized apparatus of rule. It is a world of networks that has no centre and no edges, but is orchestrated by the U.S. together with any number of “willing states” and other international actors such as economic and financial managers and neo-liberal bureaucrats (Agnew/Corbridge 1995). As Agnew (2001b: 150–151) reminds us, the economic empire is not organized territorially as were the old European empires. The new economic empire has a hegemonic political leader, the U.S.

Thus, we tend to see the American structural power – the combination of soft and hard power – and transnational liberal economic order, as major constituents of American leading position in a hierarchic international system. The U.S. is a hegemonic political leader in the globalized transnational economic order precisely because it has the capability to set the “rules of the game” (Agnew 2003: 874–880) by using both soft (tempting allies) and hard power (using coercive force). The hierarchic international system not only requires a truly international global economy, a structure of power that may be labelled as an “empire” because of its scope and pervasiveness, but also a leading power which dominates this empire politically whether it is called a hegemony or an empire.

After the U.S. pre-emptive military invasion of Iraq in 2003, an increasing number of international relations (IR) scholars and geographers have debated the international position of the U.S. Many scholars disagree on how to name the American power – superpower, empire, hegemony, hyperpower, or what? Most scholars apply the reductionist approach suggested by Waltz (1979). But the nature and potential change of the international system has remained practically ignored in the debate.

The realist school of international relations, especially structural realists (Waltz 1979), perceives the international system as anarchical. They have had no reason to speculate about the hierarchical international system: both the world state and the world government have been rather unlikely options. The current hegemony of the U.S. in the international system, however, justifies asking *whether the international system is changing from an anarchical system towards a hierarchical one*. Wendt (2003) has suggested a teleological model according to which the

world state is inevitable, while Dunne (2003) maintains that hierarchy already exists alongside the anarchical international society.

Waltz (1979: 81–82; cf. Kaplan 1957 and Rosenau 1990) defined the structure and nature of systems by recognizing “first ... the *principle* by which it is ordered; second ... specification of the *functions* of formally differentiated units; and third ... the distribution of *capabilities* across those units” (italics added).² Therefore, anarchical and hierarchical systems can be analytically distinguished by illustrating that the three defining elements in the two cases are diametrically opposed to each other (Waltz 1979: 97).

Waltz introduces the anarchy-hierarchy distinction not to compare different international systems, but to distinguish between the international (anarchical) and the domestic (hierarchical). Waltz’s distinction is definitional; he only says what the international system is *not*. For Waltz, domestic politics is hierarchically ordered (Waltz 1979: 81), but the international system represents “anarchy, or the absence of government.” (Waltz 1979: 88, 102.) Because of this, Waltz does not invite us to investigate whether some *international* systems differ from each other in respect to the ordering principle, functional differentiation, and distribution of capabilities across the units of the systems.

Many other scholars do not agree with Waltz upon his claim on the eternity of the anarchical international system (e.g. Holsti et al. 1980), neither do we. Indeed, unlike Waltz, we treat the international system as a changing one, and we wish to compare *international* systems along the three criteria suggested in Waltz’s definition of the system, that is, without extending our discussion too much to such issues like polarities. Ours is best to start with capabilities. Only if the distribution of capabilities reveals that a hierarchical structure of the international system is either existent or emerging, can we consider

2 Our theory is based on Waltz’s definition of the social (and international) system presented in this sentence. We do emphasize the analytical and theoretical role of not only capabilities, but especially ‘ordering principle’ and ‘functions’ in this definition. We do that – understanding ‘system’ and its definition in the sense suggested by Waltz – for analytical purposes only, not in order to share the neorealist doctrine as such. Furthermore, this short paper is not written in order to discuss various concepts and theories of international system (see, for comparison, e.g. Kaplan 1957; Rosenau 1990; Wendt 1995; Dunne 2003; and Buzan 2004. See also the geopolitical discussion above).

the more demanding element of the functional differentiation of the actors, and, finally, discuss the ordering principle of the new international system.

23.3 Capabilities in the Hierarchical International System: Territorial Spaces of U.S. Military Power

As far as the U.S. position in the contemporary world is concerned, scholars seem to disagree on one minor point only (Hollander/Rector 2003): how to categorize the U.S. (Cox 2003: 5, 14; Dunne 2003). Otherwise they share the view that the U.S. is now at the top of the international power hierarchy (Dunne 2003: 304, 307; Anderson 2003: 52) based on its overwhelming military power. According to Posen (2003: 7–9, 19, 22–24), the U.S. enjoys command of the so called commons: the sea, space, and air.

The hegemonic position of the U.S. in military affairs, its influence in world economic decision-making, and many correlates of American coercive power have raised the U.S. to an international position never before achieved by any state (Cox 2003: 4). Compared to preceding empires or “world states” like Rome, the U.S. has become a unique *global world state* (figure 23.1). Furthermore, the U.S. operates currently on the basis of the only purely global geopolitical doctrine that has a credible military potential behind it. Furthermore, this hegemony is not based on military capacity alone, but also on the “strategic doctrine that is prepared to use it” (Dunne 2003: 309). Due to this overwhelming military power and strong will to win any wars, the U.S. fundamentally differs from other powers (the EU, Russia, and China) whose official geopolitical codes may be global in scope but the lack of military capabilities seriously undermines the credibility of their geostrategic intentions. In practical terms, the relative lack of conventional military capability together with the U.S. dominance makes it impossible for the “regional powers” to practice interventionist foreign policy globally. As Posen (2003: 9) puts it, command of the commons provides the U.S. with more useful military potential for a hegemonic foreign policy than any other offshore power has ever had.

The contemporary geopolitical code of the U.S. is presented in the *National Security Strategy* of September 2002 (U.S. White House 2002). It contains the principles and strategies of how the U.S. prevents itself from the dangers of the 21st century. The docu-

ment carefully explains how the U.S. is leading its “war against terror”. Even though the document emphasizes the use of soft power – via expanding the circle of development by opening societies, destroying tyrannies, liberating people, offering economic assets, *providing military security*, securing human rights, developing agendas for cooperative action, and igniting a new era of global economic growth through free markets and free trade – the importance of the use of conventional military power nevertheless dominates the pages of the NSS report.

In terms of coercive power, two highly interlinked military practices exist, both unfolding the logic of commanding not only the commons but also foreign state territories. The first, *expansion*, characterizes the proliferation of American military power, while the second, *hedging*, tries to isolate the U.S. from the rest of the inter-state system. In 2003, the maintenance of these two military practices required some 400 billion US\$ – nearly 50% of the global military expenditures (SIPRI 2004).

There has been a massive restructuring of the geography of American military bases since 1990. Currently the U.S. relies more on a flexible network of “lily pad” bases located closer to potential trouble areas than was the case during the Cold War. This change in military geography of the U.S. reflects the changing function of military power in the international system, stressing the importance of speed, flexibility, and effectiveness of *conventional military power* (DOD 2004). In 2004, the U.S. owned or rented 700 bases in over 146 countries, 473,881 troops and civilians were overseas both afloat and ashore, and Americans operated in every time zone and climate, except in Antarctica (Figure 23.1). Indeed, the American military forces are able to operate from more than 6,000 locations and consist of five commands, which together cover the globe.

According to the 2004 *Base Structure Report* (DOD 2004), hundreds of *active* American military bases are located in 40 countries outside the U.S. territory. Even though the report does not mention some wellknown garrisons (Kosovo, Qatar, Uzbekistan, Kuwait, Iraq, Israel, Pakistan etc.), it is striking to note that in terms of classical geopolitical terminology the spatial distribution of bases underpins the very fact that the U.S. is both a sea and a land power. This dual nature is due to a combination of geographical locations of the bases and technological innovations in the field of military industry.

The vast network of American bases not only provides a rapid capability to strike militarily, but also

Figure 23.1: States hosting U.S. military bases. Drawn by Sami Moio

creates a new geopolitical setting in the global empire of transnational liberalism. One might argue that the proliferation of American military power offers a setting for a foreign policy practice similar to the “gun boat diplomacy” of Great Britain in the nineteenth century. The American techno-territorial military complex is more profound in nature than the military systems of its predecessors. The system is not only based on long range B-2 bombers supported by thirteen naval task forces built around aircraft carriers, but also a flexible system of gathering, representing, and distributing of knowledge. The satellite systems provide a missing link between global military governance and geographical scale. These satellites form the backbone of the proliferation of American military power, for the reason that they operate as global eyes (global panopticon) connected to the conventional warfare, intelligence gathering, and ballistic WMD.

The proliferation of American conventional military power is now treated as an everyday practice in the international system. This vast network of American military bases and forces together with an active use of power was called “banal geopolitics” by Sidaway (2003: 645–647). This is to a large extent created by means of the growing media network closely interlinked to the banalization of the use of American military force, the principles of “just war”, new enemies, and, so, the new *nomos* of the earth (Schmitt 2003).

But this overwhelming proliferation of American conventional military power alone cannot make the U.S. a completely new class in the international system. A truly interventionist foreign policy also requires a real possibility of geographic isolationism. The “Bush Doctrine” clearly demonstrates this need. Pre-emptive strikes and securing the homeland are attached to the need for a missile defence system to deter attacks on America and its allies. Indeed, it is unclear whether this missile defence system is intended to support the use of American conventional military force throughout the world.

Even though there is a strong political opposition in the U.S. the political logic the missile defence system in itself both underpins and reflects is highly popular in the U.S. The American political elite seem to know extremely well that no country is able to create a class of its own within the international system of states without a capability of avoiding the use of political sanctions by other states. In the long term this is first and foremost the political *raison d'être* of the missile defence system.

The techno-territorial military formations of the U.S. are both fundamentally material and discursive for they are inextricably linked to portraying danger, threat, and potential enemies. The development of security technologies which aims at providing “national security” is impregnated by identity political rhetoric of “us” and “them” as is seen in the Bush

Doctrine. The threats portrayed in the 2002 NSS report – terrorists, failed states and rogue states – are clearly externalized and connected to American identity. Referring to both national identity and national exceptionalism legitimises the missile defence system. It is to provide shelter against attacks from “rogue nations”. The security of U.S. identity is therefore closely linked to military security to gain legitimacy for the interventionist foreign policy, the aim of which is to secure the lifestyle of Americans. Non-territorial threats are spatialized by using geographical concepts such as networks, havens, cells and governments harbouring terrorists.

23.4 The Ordering Principle and Functions of Units in the Hierarchical International System

The overwhelming military capacity of the U.S. is not a sufficient condition to make the system hierarchical. Waltz (2000: 27, 29) recognized the unipolarity of the post-Cold War world, but yet called this unipolar system anarchical, not hierarchical. We speak of the hierarchical system only if we can recognize a functional division of labour, i.e. to specify the functions of formally differentiated units based on a principle on which those units stand in relation to each other (Waltz 1979: 82). What is required is an actor’s ability to “lay down the law to others” (Vattel quoted in: Dunne 2003: 314-315, see also p. 308).

In the hierarchical system, other actors follow the will of the leading power actively or passively. They either support the policy of the lead state taking their own advantages from it to the extent they can, or they refrain from challenging this state with military force. The power of the leading state is based on advantages the other states derive from the hierarchical system (Waltz 2000: 26). Cox (2003: 19, 22) emphasizes that “the more successful [empires] have lasted not just because they were feared, but because they performed a series of broader political and economic functions which no other state ...was willing or able to undertake”.

The term “law” should be understood in a rather flexible sense. To a minor extent, it refers to international law, to which the U.S. has a special relationship. The U.S. respects and demands others to respect international law only to the extent that it serves its hegemonic interests by controlling the behaviour of its potential rivals and minor members of the hierarchical international system. It would be a

gross exaggeration to say that the American greater space (Schmitt: “*Grossraum*”) is or will soon be extending all over the globe through a U.S. international law.³ The new international “law” must still be understood in the political, not judicial, sense. U.S. leadership in the emerging hegemonic system is and will be based on the U.S. position in the “war on terror”.

The U.S. was able to use the 9/11 terrorist attacks as a major justification for its position as lead state. No one can speak of the emergence of a hierarchical system without considering the impact of the terrorist attacks (Cox 2003; Dunne 2003; Leffler 2003: 1047). As Dunne (2003: 308) puts it, “the months after 9/11 crystallized the image of U.S. capability to enforce its will, with or without the help of allies”. And as Anderson (2003: 35) adds, “11 September was a defining moment for American hegemony.” On September 11, 2001, the U.S. became a state in permanent war (Leffler 2003: 1048-49, 1063; Dunne 2003: 311.) that established a state of emergency, or better, provided an undisputed basis for, in Schmittian terms, the “state of exception” (Schmitt 1985). In this permanent state of (international) exception the U.S. became sovereign in absolute terms. Demonstrating U.S. sovereignty, the president of the U.S. took his responsibility as the sovereign of his nation declaring that a state of exception now existed.

This permanent state of exception tends to make a single state sovereign and the others less sovereign in the sense suggested by Carl Schmitt (1976) in his conception of “the political” (Schmitt 1976: 28; Harle 2000: 137; Sartori 1989). This Schmittian conception of the political and the decision of the friend/enemy dichotomy can be understood as a definition of sovereignty. Taking the assumption of the state’s willingness to defend itself against the attacking power –

3 Carl Schmitt (2003) maintained that classical international law (still existing today) represented European public law, a law established by the European great powers for the control of their mutual interaction and the domination of the non-European lands. This “European” international law was first challenged by the U.S. in the formulation of the Monroe Doctrine in 1823. While denying the right of European states to intervention in the Western Hemisphere, the U.S. otherwise found the “European” international law useful up to the end of WWII. Since then, and especially after September 2001, the U.S. has been inclined to challenge the validity of the “European” international law and to introduce the “American” (that is U.S.) international law to replace it.

and to build up military capacity in order to do so – as given, the Schmittian definition of the political (and sovereignty) implies the state's willingness to define who the enemy is. The state can do so if and only if it has the sufficient military capability to act in the name of the definition, that is, to defend itself against the state it has defined as the enemy. If the state is not willing to define its enemy, or if it lacks the military capability required for the implementation of the decision, another state makes the definition on behalf of the weak state and provides protection for that state. The protected state, then, is no longer sovereign – or has not yet achieved its sovereignty. The protecting state does not just provide protection but also wields power over the protected state. This power may include any aspects of power, but it is the power to define the enemy for the protected state (Harle 2000: 154–57).

The exclusivity of U.S. sovereignty is based on the U.S. role in defining terrorism what is a highly contested issue. The definition is always political: it is to legally prohibit actions of those who are declared terrorists, while keeping all options open for “our” actions (Petman 2002). The “international community” (e.g. UN), failed to reach an agreement on the definition, and no shared definitions exist in dictionaries. The U.S. does not consult UN resolutions in order to find what terrorism is and who is a terrorist. In justifying its political decision on the basis of the tragic experience of 9/11, the U.S. defines terrorism as anything that terrorists do. All others who are *not* declared terrorists, particularly the U.S., act in defence against terrorism and are thus justified to use any type of violence to overcome terrorists. Who is a terrorist is the exclusive and sovereign right of the U.S. This terrorist is the enemy of the U.S. This enemy has become an *evil enemy*, and war against this enemy, the “war on terror”, has become a *just war*. Therefore, this enemy is not the enemy of the U.S. alone but has become the enemy of humanity, that is, the evil in the struggle between good and evil. In this war, god fights the final battle against the devil (Harle 2000; Petman 2002).

Due to this power in the world of words, married with its overwhelming military and other power resources, the U.S. has achieved a role where the international system is not just unipolar but truly hierarchical. The sovereignty of other nations in the definition of the enemy disappears, and only one sovereign remains in the system. The international system, and politics, is transformed but not in the idealistic sense strongly criticized by Waltz (2000). What is tak-

ing place can be best recognized in Schmitt's (1976: 67; see also Schmitt 1987) famous warning:

Where a state fights its enemy in the name of humanity, it is not a war for the sake of humanity, but a war wherein a particular state seeks to usurp a universal concept against its military opponent. At the expense of its opponent, it tries to identify itself with humanity in the same way as one can misuse peace, justice, progress, and civilization in order to claim these as one's own and to deny the same to the enemy.

In the hierarchical system the transformation of the enemy is not the only aspect of the transformation of politics. Even in the strictest hierarchical system war recurs, but mainly as the pre-determined war on terrorism – not as attacks and defence between any states (as was the case in the anarchical Westphalian system). Wars typical to the anarchical system are gradually disappearing. In the hierarchical system, unlike in the anarchical one, there is no war by all against all: there is one single war going on, not as a potential option, but as the actual and present war on terrorism. Thus, if you wish to make war, you must first find terrorists to attack; that is, you must declare your enemy a terrorist. And for this, you will need at least indirect support from the U.S. Otherwise you must challenge the U.S., and therefore locate yourself on “the axis of evil.” If your interests and those of America clash, yours must be removed from the stage.

Thus, even if the hierarchical system is emerging, military capabilities are not becoming obsolete. However, military force is not required so much for defence against *any* (all) potential enemies. In the new system, the other states – outside “the axis of evil” – are no longer potential enemies. *Military force is required for the war on terrorism*. Indeed, instead of disarmament, more and more efforts are required to build up common defence against terrorists and the states supporting terrorism (Leffler 2003: 1050).

23.5 Global Environmental Politics in a Hierarchic International System

The environmental politics of the U.S. perfectly unfolds the structural position the state has in the hierarchic international system. The U.S. is using its hard power to secure the interests of its energy sector by intervening militarily in parts of the world with large supplies of petroleum. In this respect, the U.S. is returning to the basic conceptions of classical geopolitics; it aspires to control regions of great strategic im-

portance and vast natural resources. But, the U.S. is not only occupying regions or financially controlling the producers (like Russia⁴) in order to champion its natural resources; it is also practicing elements of soft power to further strengthen its geopolitical power in classical terms.

Indeed, the techno-territorial military formations together with a notable capability to use “soft power” – as we have seen in the humanitarian aid needed on the shores of Asia after the deadly tsunami of 26 December 2004 – enable the U.S. to practice both interventionist and isolationist foreign policies. This structural setting increases the “game space” of the U.S. and makes it possible to use flexible political strategies from one issue arena to the other. By using isolationist policies the U.S. distances itself from the institutional structures of the inter-state system, while at the same time securing its own strategic and economic interests by using interventionist strategies.

In the context of this dual capability of the U.S., it is important to notice that there is a crucial constituent that should be taken into account: the international law and, more precisely, the meaning and function of sanctions which hold any international “law” together and make it a useful body in the field of international affairs. Any international agreement or regime is an example of “soft law”, which is not only based on mutual agreement of states as far as the agenda is concerned, but also a system of sanctions that aims at securing the operationalization of the regime. Our basic argument is that the recent political practices of the U.S. indicate that there are no real possibilities to create political or economic sanctions against the U.S. if it decides to act unilaterally against the “will” of the international community – upon which certain regimes are reflecting. This is exactly because the U.S. has the potential to use both soft and hard power.

The U.S. accounts for about 25% of the world’s greenhouse gas emissions. From the perspective of the success of regimes connected to global climate change, the U.S. is a crucial player. For this reason, a widespread confusion on how to make the Kyoto Protocol work has surfaced, especially in Europe (Metz/Gupta 2001). In global environmental politics the U.S. refusal of the Kyoto Protocol is explained with practical needs of its businesses that have had the capability and connections to pressure the politi-

cal elite. Therefore, it is common to stress that “industry had been more influential in the U.S.A. than internationally” (Litfin 2003: 479). This may be true in practical terms, but business is a powerful pressure group elsewhere. It is also questionable whether President Bush has been crucial for U.S. participation in Kyoto Protocol (Bomberg 2001).

The U.S. refusal of the Kyoto Protocol is a perfect example of the hierarchization of the international system. A striking feature is that the other states seem to capitulate and accept the fact that the U.S. Senate will not ratify the Kyoto Protocol. The refusal to participate is not weakening the positions of the U.S. but rather strengthening it as the Protocol forces other economies to follow its regulations. The U.S. benefits from the self-restrictive actions of others. In this context the U.S. is not acting against the protection of the global environment; it rather sets its own rules of the game – as in the Bush Doctrine. The U.S. is using various means of soft power in order to become a leader of re-organizing international institutions, including environmental regimes.

Environmental regimes are always based on scientific knowledge produced by various national and international institutions. These epistemic communities that often play a crucial role in the formation and maintenance of international regimes may well become highly disputed arenas in the context of global environmental condition. The U.S. stance in global environmental politics does not result solely from its dominance over others in terms of coercive power. At least in some cases the position of the U.S. results from scientific ideas contradicting the reasons for extraordinary environment-oriented actions, e.g. criticism against global warming as an exaggerated idea. The exploitation of scientific knowledge by the U.S. may well be regarded as a specific use of soft power.

There is now a new international system which questions and undermines the institutional structures created during the Cold War. Given the fact that most of the global political regimes concerning the environment are based on the UN led multilateral institutions and practices, the “old” international environmental politics should be separated from the “new” as far as the context and structural setting beyond these political institutions are concerned. This structural setting has received little attention in international environmental politics (Young 2003).

The hierarchic international system is also a new setting for the production and maintenance of global environmental regimes. Given the importance of scientific knowledge in the process of creating these in-

4 In the case of Russia the U.S. does not use military power but its strong financial position to make its entry into Russian oil sources.

stitutions, the competition in the field of environmental sciences may further intensify between the U.S. and others. Indeed, production of scientific knowledge on global issues may well become a new field of political action where new spatial referents of security are formed. Whether environmental threats will be considered in the future as fundamental as military threats, is not yet clear. The U.S. emphasis is on spatial referents of security which reflect the condition of globalization, but which are nevertheless based on classical geopolitical reasoning to secure the homeland on one hand and to dominate the areas of great natural richness on the other. There is a growing danger that global environmental change is left outside high political agenda in the U.S. in the era of the war on terrorism.

23.6 Implications for the Reconceptualization of Security

We have maintained that in the post-Cold War hierarchical international system the leading state (the U.S.) is standing alone above all others. The other states have lost or are losing their sovereignty, defined in the ability and willingness to form alliances against any other nation. In other words, no state is able to define its enemy independently of the definition given to all others by the U.S. This re-emergence of military security with pre-emptive strikes has not made the world safer, but rather a chaotically insecure place. Excluding potential attacks by 'rogue' states or more likely against 'rogue' states, war between states has become less likely than they were in the anarchical international system. But war and violence are still there: not the states but other actors are willing to challenge the U.S. and the group of 'non-rogue' states it now leads. In James N. Rosenau's (1990) terms this challenge to the state-centric world comes from the "multi-centric world."

One type of challenge is mainly non-violent (or violent in a controllable form). This comes from various new social movements often called the anti-globalization movement or the global civil society (see Oswald, chap. 26; Hoogensen, chap. 31). The second type is much more important in the present world politics: terrorists are, unfortunately, the major representatives of the "multi-centric world." The two actors represent totally different "ideologies," but share at least some anti-statist views. Surely, the anti-globalization movements have become, since 9/11, a less visible arena of theoretical debates instead of previous

street demonstrations not only in the U.S. and elsewhere. Consequently, the present line of contention goes between the states and "terrorists." This line is actually the basic ordering principle of the present international system: it leads to both hierarchization of and cooperation between the states. Hierarchization, the rise of the U.S. above the others, is based on cooperation between the states - anarchical wars between the states, therefore, are becoming an exception, not the rule: the states, in order to maintain their role in world politics, form an "alliance" around the U.S. in the "war on terror".

This gives the major role to traditional military security; indeed, we should now speak of re-emergence of that traditional security concept in international politics instead of reconceptualization of security in other senses. However, this does not imply any uncritical justification for the U.S. hard line foreign policy. On the contrary, our approach is based on critical and not traditional geopolitics: we have attempted to reveal what is taking place, not to justify it.

In other words, we claim that one must pay attention now to the re-emergence of traditional military security because such a re-emergence has been taking place in the structural changes. But, we have added, this re-emergence is not limited to military power alone. In addition to the (military) capabilities of the U.S., the re-emergence of military security covers the other key elements of the international system defined by Kenneth Waltz: the ordering principle and the functions of the units of the system. In that sense narrow military security is generalized by the U.S. to the area of soft power such as the power to define terrorism and terrorists, as well as issues like environmental politics; in brief, the soft power of the right to conceptualize 'security' in the light of the U.S. power political and domestic needs.

In other words, we have described politics where securitization concerns anything that can be connected to the war on terrorism. This securitization (and de-securitization) is not an academic but a political process, where anything can be securitized/militarized and therefore politicized or de-securitized, de-politicized or de-militarized through reconceptualization of security. In the present structural change it is the U.S., not its rivals ('rogue states' and terrorists' or the like) *or* scholars, who use the major power in this field.

24 Global Environmental Change and Human Security

Jon Barnett, Richard A. Matthew and Karen O'Brien

24.1 Introduction

Throughout most of human history the constraints imposed by local environmental conditions and their natural variability were powerful determinants of the security of individuals and societies: animals, droughts, floods, frosts, pathogens, storms, and other environmental perturbations were significant causes of mortality, morbidity and social disruption. In today's most modern societies, technology, trade, industrialization, the use of fossil fuels, occupational specialization, and higher levels of social organization have all weakened many of the constraints that the local environment places on people's needs, rights, and values (human security). Since the Industrial Revolution and the consolidation of the modern trading nation state, there have been thousand-fold increases in the production of goods and the use of energy, and hundred-fold increases in international trade in goods and services. Over the same period, the global population has increased from 1 billion to over 6 billion people, and most people now live longer, consume more, and are better educated than in previous generations.

Yet the risks that environmental changes pose to human security have not been eliminated. The scale of consumption and pollution in modern, high-energy societies has caused large decreases in primary forest cover, biodiversity losses, depletion of fish stocks, land degradation, water pollution and scarcity, coastal and marine degradation, the contamination of people, plants and animals by chemicals and radioactive substances, and climate change and sea-level rise. These environmental changes are 'global' because they are ubiquitous and because some pollutants such as greenhouse gases and radioactive wastes have global consequences. They are also 'global' in as much as their origins lie in the consumption of resources in markets that are often very distant from the sites of resource extraction. For example, the wealthiest 20 per cent of the world's population consumes 84 per cent of all paper, 45 per cent of all meat and fish, and

owns 87 per cent of the world's vehicles (UNDP 1998); and the United States and the European Union countries emitted 52.4 per cent of all CO₂ between 1900-1999 (Baumert/Kete 2001). 'Global' in this sense does not mean that responsibility for environmental change is shared equally among all people, or that the impacts of these changes are uniformly distributed amongst all places. Instead, 'global' refers to the interlinkages between environmental changes and social consequences across distant places and groups.

Across the world, the prospects for human security are deeply affected by local and global processes of environmental change.¹ The complex links between processes of environmental change and their outcomes across both space and time add a new dimension to the concept of human security - a dimension that raises important questions about both equity and sustainability. In particular, global environmental change challenges human security in ways that transcend the North-South binary and the 'rich-poor' dichotomy. Environmental change reveals the connections - as well as the frictions - between the security of individuals and communities and the security and sustainability of ecosystems and species, including humanity.

In this chapter we trace the evolution of recent thinking about the relationship between people, the environment, and security. In particular, we describe the transition from concerns about environmental security to concerns about human security. We then discuss some of the many ways that global environmental change challenges human security, and consider why this relationship has not been prioritized in global environmental change research, or in human security research and policy agendas. Finally, we present the *Global Environmental Change and Human Security*

1 Environmental change refers to short and long-term changes in the biological, physical and chemical components and systems that sustain human life, which result from both human activities and natural processes.

ity (GECHS) project's definition of human security, and discuss how this type of research can contribute to initiatives such as the *Millennium Development Goals* (MDG).

24.2 Environmental Security

There is a long tradition of concern over the relationship between humans, the environment, and the potential for conflict. Over 200 years ago Thomas Malthus (1798) wrote *An Essay on the Principle of Population*, in which he argued "that the power of population is indefinitely greater than the power of the earth to produce subsistence for man". The imbalance between human needs and food availability, Malthus predicted, would lead to famine, disease and war. Writing 150 years later, Fairfield Osborn reiterated this concern: "When will it be openly recognized that one of the principal causes of the aggressive attitudes of individual nations and of much of the present discord among groups of nations is traceable to diminishing productive lands and to increasing population pressures?" (Osborn 1948: 200-201). As the scale of global change has increased since Malthus' time, the link between environment change and conflict gained more attention.

The relationship between environmental change and conflict became a major theme of security studies only after 1989, when at least ten articles on the subject were published. The year 1989 was significant in both international security and global environmental politics. It was the year when the Berlin Wall fell, creating a 'vertigo' in international security studies and policy in which conventional understandings of security were no longer so obviously politically relevant (Ó Tuathail 1996). It was also two years after the publication of the influential World Commission on Environment and Development's report *Our Common Future*, when planning for the landmark 1992 United Nations Conference on Environment and Development (UNCED) in Rio was well under way. This led to a flood of information about climate change, biodiversity loss, deforestation, and land degradation, with much of it channelled into preparatory studies and reports. These initiatives resulted in considerable political and societal attention to issues of environmental change in the early 1990's. This confluence of moments in global security and environmental politics perhaps explains the sudden swell in writing about environmental security and in particular about environmental causes of violent conflicts (Dalby 1992: 503-

522). The Malthusian perspective, enriched by the Canadian scholar Thomas Homer-Dixon (1999) and others, became a significant part of this rethinking exercise and quickly attracted government and foundation interest. Flush with new resources, the sub-field of environmental conflicts expanded rapidly.

Determining the relative contribution of environmental factors in generating violent conflicts is difficult. Clearly, the insecurities to which environmental stress contributes often have long social and political histories. In places such as Cambodia, Indonesia, Nepal, Pakistan, Liberia and Rwanda, for example, conflict is grounded in patterns of insecurity based on long-standing political and economic practices of exclusion and exploitation which reshaped the natural environment. The new and more virulent forms of environmental degradation characteristic of the twentieth century have arguably aggravated practices of violence and insecurity that have long histories.

Throughout human history social factors have interacted with population growth and environmental change to generate conflict. A sufficient body of data is now available to clarify the conditions under which conflict is likely to occur. The work of Paul Collier (2000), Wenche Hauge and Tanja Ellingsen (1998), and the *State Failure Task Force Report: Phase II Findings* (1999), suggests a typical scenario that is highly conflict prone: it includes an economy dependent on a lucrative natural resource (gold or oil rather than water or biodiversity) to which access can be controlled; a fractious ethnic cleavage that the dominant group has been unable to resolve; low education and high infant mortality rates; inadequate dispute resolution mechanisms and corrupt governance institutions; a history of violent conflict; and a diaspora community of angry emigrants and refugees forced to leave and willing to back one side in a civil war. The work of Thomas Homer-Dixon makes a very similar argument but focuses instead on the adverse social effects of scarcity of water, cropland, and pasture. The general point for all researchers linking the environment and conflict is that, under certain conditions, individuals may be motivated by greed or scarcity to take up - or continue to use - arms. Conflict may be most likely where a range of motivations converge to persuade sufficiently large numbers of people that a resort to violence is justified, profitable, inevitable or transformational. Environmental stress of one kind or another will figure in some, but not all, of these motivations, and hence it will be an elusive but at times significant element of the causal network that generates conflict.

Of course, as extensive research on conflict makes clear, the outcome of any cluster of variables is never assured. Why this is the case is explained, at least partially, by those environmental security researchers who study the capacity of communities at all scales to adjust and adapt to many forms of stress, including those related to environmental change. Both the simplified, Malthusian-inspired, scarcity-conflict story and the resource curse story tend to down-play and, in some cases, explicitly deny this capacity (Homer-Dixon 1999). But recent human history identifies few Easter Islands – states confronted with severe environmental stress that have collapsed into violence and subsequently disappeared – and many Rwandas – states confronted with severe environmental stress that have experienced great violence and then begun to recover. In fact, many of the cases used to demonstrate the validity of the scarcity-conflict thesis are not nearly as straightforward as has been suggested. More recent research has pointed to the environment as a source of cooperation and peace, more than a source of conflict and war. For example, Wolf and Delli Priscoli (2006) point out that international cooperation around water has a long and successful history, with water serving as a greater pathway to peace than to conflict in international river basins.

There has also emerged an alternative approach to studying environmental conflicts that is firmly grounded in long-standing environment-society studies conducted by geographers, anthropologists, and sociologists that is now sometimes called ‘political ecology’. This work offers detailed, contextualized and more nuanced insights into environmental problems and violence. The importance of unequal outcomes of social and environmental changes is highlighted in a number of these case studies. For example, inadequate distribution of the returns from resource extraction activities has been a factor in violence in West Kalimantan (Peluso/Harwel 2001: 83–116) and the Niger Delta (Mochizuki 2004: 207–228). In his analysis of land invasions in a district of Chiapas, Bobrow-Swain (2001: 155–188) shows that declining agricultural production due to economic and political forces (rather than environmental scarcity), and the unequal distribution of returns from production, was an important factor in land conflicts. Timura also shows that unequal access to economic and political resources was an important factor in the Zapatista rebellion, the ‘Guinea Fowl’ war in Ghana, and conflict in Pará, Brazil (Timura 2001: 104–113). Suliman compares the different responses of people in the Fur and Boran regions to drought and shows that land rights

was an important variable in determining whether drought results in violent or peaceful outcomes, as well as the role of leaders, and institutions for resource sharing (Suliman 1999: 286–290).

There is a discernable message in these studies that individual and group’s perceptions of the distribution of material and social power is important in the generation of violence. For example, groups may respond to a perception that other groups are faring better or may be threatening, and act to get their share, or to defend themselves in ways that make violent outcomes more likely. The role of leaders in generating or mitigating these cycles of antipathy is critical (David 1997: 552–576). This emphasis on perceptions contrasts with the somewhat more functionalist accounts of the earlier studies that suggest that material changes translate directly into observable social actions.

These studies are contributing to a more nuanced understanding of the connections between environment and violence. In none of them is ‘environmental scarcity’ or ‘resource abundance’ seen to be a simple causal factor in conflict. Instead, a range of economic, political, and cultural processes that structure both material and institutional forms of power are seen to be more important than scarcity or abundance *per se*. Their insights do not give rise to a generalized model in the manner of Homer-Dixon’s results (1999), but may instead be seen as a reflection of the plurality of responses to environmental change and the plurality of ways in which violent conflict arises. One theme that does, however, emerge repeatedly from these studies is that equity, as well as perceptions of equity, do matter when it comes to environmental security.

24.3 Human Security

At the same time as environmental security studies were elaborating on the links between environment and conflict, a parallel development on human security was emerging within international relations and development theory and practice. The concept of human security, and the larger discourse that is associated with it, unites a number of disparate strands of thought that have become increasingly influential in the international policy community. From the international relations side, the end of the cold war, advances in communication technologies, increasing economic interdependence, and environmental change, among other factors, has meant that the meaning and practice of ‘security’ has becoming increasingly elusive

(Walker 1987: 171–190). These changes give rise to the question: Whose security? This question alone undermines the hegemonic discourse of security as 'national security' by opening space to consider alternative meanings and referents of security, as well as alternative strategies for achieving security. Decentralizing security away from states in this way, and focusing on the myriad local, national, global, and 'glocal' (Rosenau 1990) interactions that create security and insecurity, invites consideration of the way some people's security occurs at the expense of others (Booth 1991a: 313–326). It also invites consideration of the myriad processes that can undermine security, including poverty, energy shortages, trade imbalances, environmental changes, and changes in access to food. Security has become more pluralized in this way, moving away from states and an emphasis on military force and war, and towards people and the multitudinous risks they must manage. As such, human security has increasingly become a general concept of social science (Shaw 1993: 159–175).

As well as contesting and recasting international relations theory and practice, human security synthesizes concerns in development theory and practice for basic needs, human development, and human rights (Gasper 2005: 221–245). The concept of human security came to prominence through the 1994 *Human Development Report*, which defined human security as a "concern with human life and dignity" and which adopted a comprehensive approach by identifying economic, food, health, environmental, personal, community, and political components to human security (UNDP 1994). The orientation is therefore firmly on human beings, and, in this early formulation, on basic needs ('human life') as well as psychosocial elements of being ('dignity'). Through the use of the word 'security', this and later formulations of human security also point to the need for the things that are important to human life and dignity to be maintained despite sudden and incremental changes in the social and environmental milieu that determine (and so may undermine) their provision.

There has been a wide range of definitions of human security since the 1994 *Human Development Report*. Notable among these is the international Commission on Human Security's definition of human security as "to protect the vital core of all human lives in ways that enhance human freedoms and human fulfilment" (CHS 2003: 4). This definition continues the focus on human dignity ('fulfilment'), and builds on Amartya Sen's (2000) ground-breaking work on the importance of freedoms to human development. Sen

argues that development is not so much something that can be done to others, but is instead something that people do *for themselves* given sufficient "economic opportunities, political liberties, social powers, and the enabling conditions of good health, basic education, and the encouragement and cultivation of initiatives" (Sen 2000a: 4). These opportunities are, in Sen's words, 'freedoms', and it is freedom, he argues, that should be both the means (how to attain) as well as the ends (the goal) of development. The idea of a 'vital core' in the Commission's definition recognizes that there are many different kinds of valued lives within a population, and seeks to avoid the problem of value homogenization that arises when prescribing a universal policy goal such as 'increasing income'.

24.4 Global Environmental Change

The expansion of research on environmental security, along with the rise of human security as both a concept and a discourse, has created a wide opening for interrogation of the links between global environmental change and human security. Surprisingly, there has been very little direct attention to this area of research. While there has been some discussion on the relationship between climate change and conflict (Barnet 2001; Brauch 2002), and on the relationship between biodiversity conservation and violence (Matthew/Halle/Switzer 2002), there has been little emphasis on the broader implications of global environmental change for human security, including how increased human security can potentially mitigate environmental change. Perhaps more surprising is the absence of global environmental change on international human security agendas (Brauch 2005, 2005a). Priority topics for human security research and policy amount to a long list that includes human rights; HIV/AIDS and health; gender and security; terrorism; armed conflict; armies, paramilitaries and non-state armed groups; humanitarian intervention; conflict resolution and peacemaking; small arms, light weapons and landmines; and poverty and people-centred development. Despite growing international concern about climate change, biodiversity loss, and other environmental changes, these issues have not been identified as priority areas for human security research.

There are several explanations as to why the relationship between global environmental change and human security has been overlooked or underestimated, and we focus here on two. The first is that global environmental change has been largely framed as

an issue of science, with a focus on understanding the processes of the earth system, and not as an issue of human security (O'Brien 2006: 1-3). The identification of global scale environmental changes has long been the domain of earth systems scientists who focuses on the interactions between large scale geosphere-biosphere systems, and the natural and human-induced changes in them. This research has been invaluable in identifying global and regional scale environmental changes such as ozone depletion, climate change, and biodiversity loss, and increasingly it is identifying the cascading effects of these macro changes on smaller biophysical systems and phenomena such as the coastal zone, water resources, agriculture, and species distribution. The sequence of assessment is along an assumed and often linear chain of causality: from the bench sciences through to the biological and earth sciences, ending with the social sciences (and at that largely with economics); and correspondingly from global, to regional and finally to more local scales of assessment (Proctor 1998: 227-248; Redclift 1998: 177-182; Taylor/Buttel 1992: 405-416). The emphasis remains on the higher-order and larger scales of this assessment sequence. There remains very little effort - as may be measured in terms of funding, personnel, or publications - to examine what these changes in turn mean for local social systems, and for individuals and communities who will be differentially affected by them (Demeritt 2001: 307-337; Shackley/Young/Parkinson/Wynne 1998: 159-205). Instead, much effort is directed towards resolving the uncertainties in the science of environmental change, arguably at the expense of focusing on the social drivers that are known to generate both environmental change and vulnerability to environmental change.

The second explanation is that there has been a tendency to downplay issues of development, equity, ethics, power relations, and social justice in global change research, prioritizing instead a general, aggregated notion of human security. Although social drivers of change are well recognized in global environmental change research, analyses have historically tended to focus on the absolute numbers of people, and talks of amorphous and aggregated social categories such as 'humanity', 'society', 'Africa', 'small islands' and so on. Consequently, the potential contributions of social sciences to global change research have been undervalued, despite the fact that global environmental change is a social problem, as much as it is a natural system phenomenon. Almost all environmental change problems are the by-products of mod-

ern development practices and the social disparities they produce. For example, climate change is caused by the emissions of gases from fossil fuel use and land use changes; forests are cleared to meet the demand for paper, timber, and new land for agriculture and grazing; biodiversity is lost through land clearing for agriculture and infrastructure; rivers are dammed and diverted to control flooding, for hydropower and to secure the supply of water to irrigators; coasts and reefs are modified to support human settlements and are then polluted or destroyed by those settlements; fisheries are depleted by more intense applications of more efficient fishing techniques; and land is degraded by unsustainable farming practices.

Global environmental change is thus an inherently social problem, and one that has the potential to undermine human security - i.e. the needs, rights, and values of people and communities. Human insecurity from environmental change is a function of many social processes that cause some people to be more sensitive and less able to prepare for and respond to sudden and incremental environmental changes. People who are most dependent on natural resources and ecosystem services for their livelihoods are often the most sensitive to environmental change (Adger 1999: 249-269; Blaikie/Cannon/Davies/Wisner 1994; Bohle/Downing/Watts 1994: 37-48). For example, in terms of needs, a change in soil moisture can undermine nutrition in subsistence farming households, a decline in fish abundance can undermine nutrition and income for fishers, and a decline in surface or groundwater quality can undermine maternal and child health in communities without reticulated water supply. Just as important as sensitivity is people's capacity to anticipate, plan for, and adapt to environmental changes. These response strategies are functions of various social factors, including institutions, information, health, education, and access to food and nutrition, money and resources, and social support networks. Underlying many of these determinants of adaptive capacity is the effectiveness of the state. States that consciously or unconsciously, actively (through violence) or passively (through denial of entitlements), discriminate against social groups on the basis of political opposition, class, ethnicity, and/or location, create vulnerable groups.

These factors of sensitivity and adaptive capacity mean that human security from environmental change is by no means equally distributed. There are differences in the human security of people within every scale of analysis: between regions, countries, cities, villages, and households. In many cases the differences

can be explained by the dependence on natural resources and ecosystem services, coupled with the degree of social power in relation to economic, political, and cultural processes. However, global environmental changes also introduce new threats that potentially influence the security of much wider and diverse groups of people. Sea level rise, a higher frequency or magnitude of storms and extreme weather, the melting of glaciers, the spread of invasive species, and changes in water quality and availability are likely to threaten the human security in new and unexpected ways. The impacts of the Chicago and Paris heat waves on elderly citizens in 1995 and 2003, for example, revealed some of the new challenges posed by global environmental change.

24.5 Global Environmental Change and Human Security

The Global Environmental Change and Human Security (GECHS) project began as a core project of the International Human Dimensions Programme on Global Environmental Change (IHDP) in 1999. The GECHS project defines human security as something that is achieved when and where individuals and communities have the options necessary to end, mitigate or adapt to threats to their human, environmental and social rights; have the capacity and freedom to exercise these options; and actively participate in pursuing these options (GECHS Science Plan 1999). In other words, human security is a variable condition where people and communities have the capacity to manage stresses to their needs, rights, and values.

This definition gives attention to values, and recognizes that human security concerns both needs and human rights. The characterization of human security as 'variable' highlights the ways in which it varies over space and across time: not all people are equally secure, and people are not equally secure throughout the course of their lifetimes. This points to the need for analysis of the asymmetries and interdependencies in human security strategies such that the security of some can come at the expense of others, and to the possibility that in both ethical and practical terms strategies for human security may ultimately only be successful if they do not generate insecurity elsewhere or for later generations. Further, 'variable' identifies that human security is not about static lives, but about flourishing lives where people pursue their legitimate aspirations for a good life, pointing to the nature of

human security as a *process* towards self-articulated goals.

The GECHS definition of human security also explicitly includes communities, and not just individuals. This is of course implied in other definitions, but explicit mention of communities is nevertheless important, as in many cultures the collective social group is of more value than the individual, and decisions and strategies are determined by the group, in the interests of the group, rather than by individuals. It is somewhat ethnocentric to assume, as Western social science often does, that the individual is the most important element of a society.

A focus on 'the capacity to manage stresses' builds on the capabilities and freedoms approaches of Sen, in that it considers people and communities not as passive victims, but as agents of their own human security, whose actions to manage stresses to their needs, rights, and values are most effective given certain freedoms and opportunities. Sen (2000) lists five important freedoms: economic opportunities, political freedoms, social opportunities, transparency guarantees, and protective security. One can add to this list freedom from direct violence, and the equitable allocation of freedoms within and between generations as important additional freedoms that enhance people and communities' capacities to make and maintain their lives in the face of social and environmental changes (Barnett 2008).

The GECHS definition also offers a slightly different articulation of what the UNDP referred to as 'human life and dignity' and what the Commission on Human Security referred to as the 'vital core'. The GECHS definition considers 'needs, rights and values' as a means to highlight the need for some stability in the provision of the basic needs required to function as an equal member of a society, the fundamental rights to which people are entitled, and the unique things that people and communities value for themselves. In doing so, the definition (like Sen and the Commission on Human Security) seeks to avoid prescribing in much detail what is good for people and communities. However, it does acknowledge that there are basic needs such as access to nutritious food and clean drinking water, and basic rights such as the freedom from personal injury and forced migration, that are essential to every life.

The GECHS definition of human security is consistent with a larger discourse on human security that includes: prioritizing the well-being of people and communities ahead of States, analytical integration of multiple drivers of human security, an insistence on

basic human needs, rights and responsibilities, and a concern for justice (Gaspar 2005). Also, like others, it considers human security to be a 'boundary object' that facilitates interfaces between diverse and often otherwise disconnected intellectual and policy communities (St. Clair 2004). As Gaspar argues, human security has forged a confluence of various groups within the field of development studies and policy, who now also interface with some sections of the security research and policy communities (Gaspar 2005). It therefore helps to bridge a number of the interests of the UN system.

However, despite the inclusion of environment as one of the UNDP's (1994) seven components of human security, there has thus far been little interface between this expanded human security community and the global environmental change research and policy community - including those within the UN system. The United Nations has been pushing for more interaction between the global environmental

change and human security communities. Although both human security and environmental considerations are central to the Millennium Development Goals (MDG), there is no explicit recognition of the implications of global environmental change for these goals. For example, efforts and initiatives to eradicate extreme poverty and hunger are likely to be negatively affected by climate change, as many of the people that are most vulnerable to climate variability and change are also poor and hungry right now. Likewise, efforts to reduce child mortality, combat HIV/AIDS, malaria, and other diseases, and promote gender equality are likely to be affected - and potentially offset - by global environmental change. The one MDG that addresses the environment (Goal 7: ensure environmental sustainability) does not consider the challenges posed by environmental change. Consequently, there is substantial potential for global environmental change and human security research to contribute to a wide range of other human security concerns.

GECHS
GLOBAL ENVIRONMENTAL CHANGE
AND HUMAN SECURITY

The Global Environmental Change and Human Security (GECHS) project is a core project of the International Human Dimensions Programme on Global Environmental Change (IHDP). The goal of GECHS is to conduct research into, and promote a recognition of, environmental change as an issue of equity, sustainability, and human security. We situate environmental changes within the larger socioeconomic and political contexts that cause them, and that shape the capacity of communities to cope with and respond to change.

Our research focuses on the way diverse social processes, such as globalization, poverty, disease, and conflict, combine with global environmental change to affect human security. Current topics include climate change, water,

gender, poverty and human health with investigations exploring the following themes:

- multiple, interacting processes of change;
- conflict, cooperation, and governance;
- vulnerability, resilience, and adaptation;
- knowledge and power.

GECHS is overseen by a scientific steering committee, enriched by the contributions of associates, and coordinated from an international project office (IPO) located in the Department of Sociology and Human Geography at the University of Oslo. The IPO is supported financially by the Research Council of Norway and the Norwegian Agency for Development Cooperation. For more information, please contact:

25 Globalization and Security: The US 'Imperial Presidency': Global Impacts in Iraq and Mexico

John Saxe-Fernández

25.1 Introduction¹

This chapter approaches globalization and security from a theoretical and a historical perspective, making reference to the centrifugal processes observed in the development and impact of US capitalism in the international strategic scene as well as in Mexico. It also focuses on the centripetal forces involved in this process; forces derived from a historically observed centralization of police-military and intelligence power in the US executive branch over the last two centuries. This is a power used to deal with the propensity of capital, in its search for opportunities and profits, to tear and destabilize the social milieu within which it acts. As described below, this presidential power is projected domestically and internationally. The impact of expansionism and Manifest Destiny in the US political and constitutional system has been enormous. In fact, in the view of some analysts, it has led the 'Imperial Presidency' to usurp legislative and judicial functions, eroding democracy in the process.²

From the *Louisiana Purchase* (1803) to the present, many US presidents have simply ignored Congress when it opposed the interests which they directly represent. Through their control over foreign policy, and usually through covert actions, they have tended to draw power out of both the judicial and legislative branches and into the executive. War (and the Civil War) – as well as secret diplomacy and what today is known as black operations – to manipulate the

US Congress and the public have been used frequently. As for example, by President Polk (1845–1849) in the process that led to the war against Mexico; by Abraham Lincoln (1861–1865) who, as commander in chief of the military during the Civil War “raised and committed an army to oppose secession without even consulting Congress”³ (and more significantly, authorized the head of the military to suspend the writ of habeas corpus when necessary (LaFeber 1989; Agamben 2004); by Franklin Roosevelt, in his use of various executive-legislative agreements to circumvent constitutional restrictions in the formalization of treaties; by Lyndon Johnson, in his secret operations to obtain the war powers via the Bay of Tonkin Resolution of August 1964 (LaFeber 1989).

Since World War II, it has been the US that has generated a worldwide corporate and military-industrial structure: its repercussions and interrelationships with the economic sphere require greater elucidation but because of its very nature, the phenomenon represents one of the most daunting challenges to conceptualization and, especially, to explanation (Saxe-Fernández 1994: 283). This is especially the case since following – and as a result of – World War II, military ‘globalization’ came to mean that a ‘superpower’ in the Western Hemisphere located in an area historically ‘conquered’ by European colonial and imperial powers, has been ‘occupying’ militarily the most highly developed economic poles of Eurasia, and is now projecting its “national military might” as an occupying power at the sites of the main oil reserves of the world located in the Middle East (Klare 2004; Saxe-Fernández 2006), generating an unprece-

1 The first draft of this paper was presented to the Canadian Social Science Congress, in Toronto, Canada, 29 May–1 June 2002, and published as: Saxe-Fernández (2002). The author wishes to express his gratitude to Dr. Gian Carlo Delgado Ramos for his technical help and his substantive observations on this work.

2 For a description of the use by the Executive of secret operations to manipulate and undermine Congressional prerogative in foreign relations see Schlesinger (1973), Zinn (1990) and LaFeber (1987).

3 Walter LaFeber (1995: 6): Lincoln did that on 15 April 1861, in contradiction to Article I of the Constitution, and during the next 10 weeks after 4 July “acted as a de facto absolute dictator”. Giorgio Agamben (2004: 54) citing Carl Schmitt (1965) refers to Lincoln’s dictates as a classical example of ‘*dictadura comisarial*’.

dented local and regional resistance and destabilizing the whole strategic equation.

The chapter addresses how these two forces – the centrifugal and the centripetal (that is, the economic and police-military) – relate to each other in what Arthur Schlesinger conceptualized as the ‘imperial presidency’ and its *modus operandi* in the international scene as well as in Mexico. Passing reference is made to the Porfiriato – for the Mexican case –, but the focus is mainly on a description of some of the traumatic and disruptive consequences of the World Bank’s *Structural Adjustment Programmes* (SAP) on the Mexican peasantry and their socio-political impacts as reflected since the Chiapas rebellion (1994).

The impacts of such an ‘imperial presidency’ in the US domestic milieu, particularly in the constitutional arena, are addressed in the context of the war on terrorism at home, through a *régime d’exception* formalized in the *Patriot Act*, *The Military Commissions Act* which carries with it the abrogation of “habeas corpus” and a new Martial Law, *The John Warner Defense Authorization Act of 2007*, signed on 17 October 2006, which allows the president to involve the military in domestic law enforcement (Morales 2006).⁴ The ‘American Gulag’, as experienced in Abu Ghraib, in Guantánamo, and in a global prison camp infrastructure holding – at this point in time –, 14 thousand persons, is interpreted as a testing ground for a “new legal system” (Saxe-Fernández 2006a, 2006b; Delgado 2007). George W. Bush’s has used ‘anti-terrorist’ war powers granted after 11 September 2001 to undermine civil liberties, establish secret military tribunals, and destabilize civil-military relations as exemplified by his request to US Congress to modify the *1878 Posse Comitatus Act* and the *Insurrection Act*, which does not permit the military to act within the United States. Since earlier 2007, the power granted to the Executive by the John Warner Defense Authorization Act, according to Senator Patrick Leahy, encourages the President to declare federal martial law as it allows the ‘commander-in-chief’ to declare a ‘public emergency’ and station

4 The 1878 *Posse Comitatus Act* indicated that “Whoever, except in cases and under circumstances expressly authorized by the Constitution or Act of Congress, willfully uses any part of the Army or Air Force as a posse comitatus or otherwise to execute the laws shall be fined under this title or imprisoned not more than two years, or both”. This is the only US criminal statute that outlaws military operations directed against the American people under the cover of “law enforcement” (Morales 2006: 2).

troops anywhere in the United States and take control of state-based National Guard units without the consent of the governor or local authorities, in order to “suppress public disorder”.⁵

Some crucial impacts of the US national security regime in Mexico such as the export of weapons and military training to Mexico are illustrated. The paper concludes with a general assessment of the relationship between the ‘contradictions’ of capital, in its monopolistic stage, and the etiology and prospects for a general war.

The chapter focuses on the impacts of the imperial power of the United States on international security (the occupation of oil-rich Iraq), and its power projections in Mexico. A historical analysis will show that there is a clear imperialist pattern that emerges in a review of developments from the early 19th century to the most recent turn of US imperialism in the wake of 11 September 2001. At issue in these developments is the need for, and efforts of, the US Executive branch (the ‘imperial presidency’) to reconcile conflicting imperatives of economic power, projected by US-based multinational corporations, and the political imperative to foster stability and order. Some of the implications of the efforts of the US imperial presidency to ‘resolve’ this problem *manu militari* are analysed.

25.2 The US Imperial Presidency and Monopoly Capital: Then and Now

Advanced initially by LaFeber (1995), the main thesis centres on the notion that:

Americans, often viewed as ardently anti-revolutionary, acted as catalysts for revolution as they searched for economic and missionary opportunities around the world; then as they willingly sacrificed order for the sake of opportunity, they supported a new presidency that emerged with this imperialism. Indeed, the President’s chief function in foreign affairs became his use of constitutional commander-in-chief powers to use force, when necessary, to restore enough order so opportunities could again be pursued. (LaFeber 1995: xiii)

The ways through which US imperialism has tried to solve what appears an irreconcilable contradiction be-

5 See for details at: <Leahy.senate.senate.gov/press/200609/092906/html>; <http://leahy.senate.gov/press/200609/092906abgovs>; Jeniffer K. Elsea, Legislative Attorney (2006). A synthesis and analysis is offered by Frank Morales (2006).

tween the destabilizing thrust of its economic agents (the big monopolies and oligopolistic sectors)⁶ and the advocacy of its foreign policy to foster stability and order, centre on the recourse to police military interventions to face repeated socio-political explosions. This pattern increased in frequency with the spectacular growth of US capital after the Civil War when, in many industries, monopoly – and managerial – capitalism had already replaced family enterprises. Large monopolies grew and dominated major sectors of the US economy. As Alfred Chandler points out, these growing monopolies altered the basic structure of these sectors and of the economy as a whole taking over:

From the market the coordination and integration of the flow of goods and services, from the production of the raw materials through the several processes of production to the sale to the ultimate consumer. Where they did so, production and distribution came to be concentrated in the hands of a few large enterprises (Chandler 1995: 11).

Thus, the visible hand of monopoly power, through its ownership and management structures, denied any credibility to the notion of the invisible hand of the market forces, the very notion upon which US corporate expansionism, following the British imperial rhetoric of free trade, was launched. As Prince Bismarck, the Iron Chancellor, pointed out in reference to England: “Free trade is the favourite doctrine of the dominant power, afraid others might follow its example.”

Its most basic imperialistic expression is to be found in an increased symbiosis of state power and corporate interests. By the end of the 19th century, the coordination of American foreign policy and national private interests became more intense and extensive. The US overseas expansion was entirely focused on markets and moved along many routes to all corners of the world and under the impulses stemming from the relationship of its foreign policy and the dynamics and needs of monopoly capitalism.

From a general theoretical and global perspective, Paul Sweezy (1997), Baran and Sweezy (1968), Harry Magdoff (1992), and István Mészáros (1995), have identified capitalism's contradictory tendencies to greatly overreach itself with regard to one of its most important dimensions that directly affects the relationship between its economic and political command structures. According to Mészáros:

The contradiction between the rival national states of the capital system and the problematical drive of its most powerful economic units – the giant corporations – towards transnational monopolism is the clear manifestation of this overreaching (Mészáros 1995: 170).

This theoretical proposition is crucial, taking into account that at the beginning of the 1960's and of the war in Vietnam, Herbert Marcuse, Baran and Sweezy insisted on the centrality of the 'warfare state' in the dynamics of US monopoly capital and its 'Pax Americana'⁷. By the 'warfare state' Marcuse (1964) meant, a social construct distilled from US capitalist experience, based on a massive mobilization of human and material resources, for the eventuality of war, internal or external, against an enemy, internal or external, real or imaginary. Baran and Sweezy (1968) described and analysed the political economy and the basic power mechanisms utilized in favour of powerful corporate interests by dealing with the deep-seated and indeed 'systematic' modus operandi of what US political science calls 'the iron triangle'.⁸ In its dynamics the role of the 'imperial presidency' is crucial: the 'iron triangle' concept is used to portray a politically interdependent relationship between the Executive branch – the imperial presidency⁹ – and its Federal bu-

6 By *multinational corporation*, I refer to national (in this case, US-based) enterprises that operate internationally.

7 Marcuse did so in a seminar devoted to 'The Warfare State' at Brandeis University (1964) as well as Baran/Sweezy (1968). See also: Sweezy (1978); on the 'political sociology' see C. Wright Mills (1957). For a critique of Mills' work see Sweezy (1968) and Aptheker (1968). In his *Power Elite* Mills (1957) de-emphasizes the notion of a 'ruling class', remaining firmly influenced by the Machiavellian and Weberian mold – with great reliance on notions of bureaucratic elites – but the Marxian influence is undeniably there in his strong rejection of those works that do not take into account the fundamental importance of class and property and the control of and possession of property and stock. See Mills/Gerth (1942, 1965). For further theoretical integration, development and analysis see Milliband (1978).

8 On the 'iron triangle' see: Adams (1977); Salomon/Siegried (1977). For a good study on the 'iron triangle' in the military-industrial sector, see Adams (1982), and for the same regarding oil and gas industry; see Engler's classic (1966). The author's description of the oil lobby's operations and symbiotic relations with US Congress and the White House is one of the best and most systematic studies of the iron triangle's 'pork and barrel' and 'revolving door' dynamics in the oil sector. For a well researched and politically vital study of the operations of the iron triangle in the aerospace industry see Nimroody (1988). An important recent study is offered by Briody (2003).

9 On the imperial presidency in addition to Schlesinger (1973) and LaFeber (1995), see: Saxe-Fernández (2005).

reaucracy (Departments of Defense, Energy, Homeland Security, NASA, etc.), the private interests of giant corporations, particularly in the defence, aerospace and the oil and gas sectors, including labs, research institutes, trade associations and trade unions in the industry itself, and the key committees and members of US Congress, the House and Senate Committees on Energy and Natural Resources, the Armed Services Committees and Defense Appropriations Subcommittee, as well as Congressional members from defence-related districts and states. As special interests, the Federal bureaucracy and Congress develop business relations and interpenetrate each other, so does their effort to defend their interests not only from outsiders but also from ‘insiders’ (‘whistle blowers’) and alternative perspectives (and after 9-11 through drastic restriction of public access to governmental documents and other ‘State of exception’ police and ‘intelligence’ regulations, as indicated, now formalized as part of the ‘anti-terrorist’ clauses of the Patriot Act and other laws).

To shed light on the dynamics of the Iron Triangle’s machinery¹⁰, which is centred in the generation of profits – through the use and manipulation of information and influence – there are two related concepts. The first, ‘pork-barrel politics’ describes the use of this interdependency to boost and protect the private interests.¹¹ At its very core US economy is centred on military Keynesianism involving a sort of ‘military-industrial’ populism (pork and barrel) used by politicians, presidential candidates, senators and congressmen in their efforts to obtain public support through obtaining ‘contracts’ that favour employment and business in their districts and states, irrespective of any economic or military efficiency (Engler 1966; Adams 1982; Briody 2003) All these three components (hence the expression iron ‘triangle’), usually carried out their transactions under the umbrella of the ‘national security’ rhetoric.

The second notion is the ‘revolving door’ practice that is the on-going traffic of personnel (and with it, of information, contacts and influence), from the private to the public sector, and vice versa. This is crucial in the area of governmental contracts:

¹⁰ Geared at the appropriation of surplus value.

¹¹ And this includes a sort of “military-industrial” populism used by politicians, presidential candidates, senators and congressmen in their efforts to obtain public support through obtaining “contracts” that favor employment and business in their districts and states.

A contractor seeks information from Congress and the Executive in answer to many questions: What programs are forthcoming and where and how are they being defined; What are Federal procurement plans and regulations going to look like; Where do bureaucrats and members of Congress stand on particular systems; When will legislation be considered and what form will it take? The company reworks this information, which flows in vast quantities, to focus on company needs and possibilities ... it becomes intelligence (Adams 1982: 23).

This conceptual framework briefly sketched, shades light on current trends towards the formation of economic, monetary and geopolitical blocs, as well as the increased reliance by Washington, not on multilateralism or ‘market-friendly policies’ to obtain access to key raw materials, but on political-military unilateralism and economic nationalism. Within the US ‘power elite’ there is a deep-embedded mistrust of the ‘invisible hand’ to deal with key geo-strategic issues such as access to oil and other key resources. Instead they rely on the Pentagon’s iron fist as it can be observed in Iraq or the constant intelligence community’s black operations practices.

As in Middle East, Mexico and other Caribbean and Latin American nations, what it is involved is the material base and thus the survival of our civilization since it carries with it the big decisions on war or peace. Needless to say, an understanding of the *modus operandi* of the imperial presidency under monopoly capital is crucial in any attempt to elicit a ‘non-terminal’ resolution of the current deep crisis of ‘Pax Americana’, a central feature in the era of intercontinental ballistic missiles and thermonuclear weapons. As Richard Barnet foresaw these issues in the late 1970’s:

A global struggle over resource distribution is already underway. A key political question is whether the holders of power over the present resource system will control the next. War has been a favourite way for great nations to meet their resource needs. If there is another world war, the conflict will most likely be over what the industrial states have come to regard as the elements of survival. Oil, of course, but also iron, copper, uranium, cobalt, wheat, and water (Barnet 1980: 19).

25.3 The Imperial Presidency in Iraq and Mexico

25.3.1 The Case of Iraq

While the ‘iron triangle’ is a social construct at the core of the relationship between ‘state violence’ in Iraq and corporate behaviour and profits, both the

'pork and barrel' and the 'revolving door' practices are at the centre of any attempt to analyse current US involvement not only in that oil-rich country but also in Mexico's political and economic life and most directly in *Petróleos Mexicanos* (Pemex); the country's most important corporation, public or private. A good example is provided by the activities and political-economic forces – and actors – surrounding Halliburton's participation in Iraq and in Mexico's Pemex.

In the case of Iraq, the main Federal contracts of Halliburton, the giant oil services company based in Houston Texas, and its subsidiary, Brown and Root, now *Kellogg, Brown and Root* (KBR) are implemented through the Department of Defense's (DoD) Army Corps of Engineers (ACE), through a modality known as the *Logistics Civilian Augmentation Program* (LOGCAP). I

Initiated by the Pentagon in 1985, during the Reagan administration, the LOGCAP intended to use hundreds of private contractors to supply the DoD and the troops stationed abroad, with support services ranging from food services to latrine cleaning, trucks to cots and tents, gymnasiums and showers, to generators and air conditioners, transportation, housing, construction of jails, distribution of gasoline, cleaning and maintenance of installations and barracks, etc. By this 'outsourcing' of many of its non-war-fighting functions, it was argued that thousands of troops would be freed to serve in battle.

The LOGCAP did not get momentum until 1992, when Dick Cheney, as Defense Secretary of President George Bush, gave it a push through a multi-million dollar classified investigation his office granted to KBR, to assess the costs and benefits of an extended LOGCAP, that is, to all logistics including not only basic services but also 'security' functions such as 'interrogation of prisoners', use of death squads and other paramilitary and illegal operations. The main conclusion of the study stresses the advantages to the Federal Government from an 'expanded LOGCAP', since private contractors could carry on questionable clandestine and security operations that would not fall under the military code or the US international commitments on human rights violations such as genocide and torture.¹²

In August 1992 Cheney awarded KBR, Halliburton's subsidiary, the first extended LOGCAP. Soon afterwards, in 1995, he was appointed CEO of Halliburton. The Cheney-Halliburton 'pork and barrel' and 'revolving door' practices are part and parcel of the

'modus operandi' of monopoly capital. In 1997 the US Governmental Accountings Office (GAO) detected significant irregularities and Halliburton was substituted by DynCorp, another service contractor founded and staffed by former CIA directors and corporate personnel. Nonetheless Halliburton was awarded a non-bid 5 year contract for the reconstruction of Iraq's oil fields destroyed during the first Gulf War. Halliburton's role as the main contractor in Iraq illustrates the way substantial profits can be made through the destruction of entire countries. Lancet, the British medical journal, had estimated Iraq's civilian toll by 2006 in the hundreds of thousands (Roberts 2007). By 2007, more than 3,000 US soldiers have been killed and the seriously wounded and mutilated young men run in the 22,000 figure. But thanks to the 'modus operandi' of monopoly capital in the US, as the human tragedy and costs of the war in Iraq escalate, so do the profits to the corporations (Saxe-Fernández 2003, 2005, 2005a).

Since KBR received more money from the US involvement in Iraq than any other contractor, naturally many analysts think Halliburton's high level connections may have given it undue influence in winning sole-source business. Halliburton's shares in the stock market have soared as the price tag of Iraq's military occupation increases (Witte 2005). At the beginning of the aggression in March 2003, the White House estimated the war would cost 60 billion dollars. Information provided by the New York Times (2005) indicates that since then 137.5 billion dollars have been used just on military operations, out of a total of 250 billion.¹³ The cost of the war in Iraq for the period from 2006 to 2010 has been estimated at over 1.3 trillion dollars.

The wide use of hundreds of contractors that operate under 'cost-plus' contracts is at the root of this price escalation and mounting abuses. During the late 1950's and mid-1960's, government contracts for the military and space agencies were assigned to companies on a 'cost-plus basis', a 'device' engineered under the American oligarchy's exorbitant ambition for higher profits that gave the contracting firms a strong incentive to run up costs. Thus, as Melman pointed out, cost overruns were actually encouraged by the Pentagon's managers and the Federal government's

13 According to the US based National Priorities Project, on 20 February 2007, US War costs in Iraq were about: 368 billion US\$; for topical data see at: <http://national-priorities.org/index.php?option=com_wrapper&Itemid=182>.

12 Such as in the Plan Colombia.

economics, on the grounds of “bolstering the economy” and “getting America moving again”. Thus, “cost maximizing” became an institutionalized practice among the Pentagon’s 37,000 industrial firms and over 100,000 subcontractors – including the “military divisions” of US 500 most important corporations (Melman 1987). According to the trade journal *Defense Week*, by the 1980’s, the prices of the military-serving goods produced by this network of firms were rising 20 per cent annually (Melman 1987: 4).

In 1991, prior to the terrorist attacks of 11 September 2001, and with Cheney as vice-president, KBR got a 10-year LOGCAP. As a result Halliburton is the largest contractor of the Pentagon in Iraq, in charge of 90 per cent of the LOGCAP. In June 2003 KBR got 320 million dollars in contracts. By September of that year the company was awarded 2 billion. According to Associated Press’ Lolita Baldor from 2003 to 2004 KBR contracts in Iraq were estimated at 10.7 billion, but Halliburton’s Iraq-related contracts in the Middle East could reach the 18 billion mark, not including operations in many countries – such as the construction of jails in Guantánamo and Afghanistan.¹⁴ The Army has ordered nearly 5 billion in work from Halliburton to provide logistic support to the US troops in Iraq over the next year, 1 billion above what the Army paid for similar services the previous year. This was happening while Halliburton is being audited for irregular practices (Witte 2005).¹

It occurs within the context of what Murray Weidenbaum (cited in: Adams 1982: 26) perceives as a convergence between the Executive – such as the DoD’s ACE, or its Air Force, and its major suppliers, which blurs and reduces much of the distinction between public and private activities in key branches of the US economy, such as aircraft and aerospace, defence, and oil and gas (Adams 1982: 26). Weidenbaum’s assessment is corroborated almost daily.

The involvement of Halliburton and KBR, and the Vice-president, in the decision-making process that led to this ‘petro-war’ is clarified by the events surrounding these ‘irregularities’. For example, in late 2002, KBR was deployed to Kuwait to support the 150,000 or so Army troops pouring into the country in preparation for the March 2003 invasion of Iraq.

According to information gathered by <www.corpwatch.org>, KBR took up residence in villas paying 200 dollars per person with a total hotel tab soon reaching 1.5 million per month. The work was part of the above-mentioned weeping ten-year LOGCAP, and the decision to attack Iraq, strenuously fostered by Cheney, Rumsfeld, Rice and Wolfowitz at Bush’s National Security Council, meant billions of dollars in contracts and profits.

The demotion of key military officers and civilian employees of the Federal Government reporting accounting irregularities is part of a vast – and indeed extreme – ‘damage control’ effort by the Bush/Cheney administration (and its related private sector and Congressional allies and partners), which is reaching dictatorial proportions for its ‘state of exception’ mechanisms in the crucial area of accountability and official auditing practices. This case illustrates the fact that, as Adams points out, once moulded, the triangle sets with the rigidity of iron. Its key participants exert strenuous efforts to keep it isolated and protected from outside scrutiny (Adams 1982: 25).

Halliburton’s ‘pork and barrel’ scandals and ‘revolving door’ features are far from being the exception, as virtually all major corporations (like Boeing, Bechtel, Lockheed Martin, Northrop Grumman, General Dynamics, Raytheon, United Technologies, General Electric, Science Applications International Corporations and CSC/Dyn Corp, to name but a few), and tens of thousands of subcontractors spread all over the US are involved in the ‘iron triangle’ dynamics¹⁵. For the past three years, for instance, and due to the Pentagon’s need for fuel for its global involvement, which includes prominently the war in Iraq, the Air Force sponsored a 30 billion dollar proposal to convert passenger planes into military refuelling tankers and lease them from Boeing, “as an efficient way to obtain aircraft the military urgently needs” (Smith 2005: A01).

But according to Ronald Garant, an official at the Pentagon comptroller’s office, the scheme “is a bailout for Boeing” and information gathered by Jeffrey Smith of the Washington Post indicate that the prevailing opinion at the Pentagon is that the proposed

14 Since Cheney was appointed Vice-president of the US, Halliburton worldwide operations have multiplied. For example, just in Mexico, from January 2001 to may 2005 Pemex, the Mexican state oil enterprise, now under a World Bank “divestiture” scheme, awarded 1.22 billion to Halliburton in non-bid contracts.

15 Professional up-dated profiles on these corporations are provided by www.corpwatch.org Design by Tumis.com 1611 Telegraphn Ave, N. 702, Oakland, Ca, 94612, USA. Current developments in the military industrial complex are provided on line, among others, by the NYT, Washington Post, San Francisco Chronicle, St. Louis Post Dispatch, Christian Science Monitor, and the Los Angeles Times.

lease of Boeing's 767 would cost too much for a plane with serious shortcomings. To senators John McCain, John Warner and Carl Levin of the Armed Services Committee, this is "one of the most significant military contracting abuses in several decades" (quoted in Smith, 2005). The incident provides an extraordinary glimpse of how the 'Iron triangle' and the 'imperial presidency' operate.¹⁶ It shows the US Air Force working hand-in-glove with one of its chief contractors, the financially ailing Boeing, to help it try to obtain the most costly government lease ever.

By February 2007, the three top auditors overseeing work in Iraq told a US House of Representatives Committee their review of 57 billion dollars in Iraq contracts found that Defense and State Department officials condoned or allowed repeated work delays, and bloated expenses and payments for shoddy work or work never done:

About 10 billion has been squandered by the US government on Iraq reconstruction aid because of contractor overcharges and unsupported expenses, and federal investigators warned ... that significantly more taxpayer money is at risk (Yen 2007: AP 1)

The warning is important since after the November 2006 elections, 'resistance' to the war for oil in Iraq is also widespread in the US Congress and, so far, the Bush administration has spent more than 350 billion dollars on the Iraq 'reconstruction and stabilization' effort.¹

The 'iron' dimension of the 'triangle' is fully illustrated by a new inspector general's report detailing the US Air Force's vigorous efforts on Boeing's behalf and also showing how Air Force leaders and Boeing officials jointly manipulated legislation to authorize the deal, and later sought to suppress dissenting opinion throughout the Pentagon (Blustein 2005: PED 1).

There is an ongoing persecution and punishment of federal workers including military and intelligence officers who object to the doctoring of facts that clash with policy and business: an Army general sidelined for questioning the administration's projections about needed troop strength in Iraq; a former intelligence officer and journalist whose credibility is being questioned because he has written about the Pentagon's efforts to expand covert capabilities within the US, and provides documental evidence that former Defense Secretary Rumsfeld was building up 'an elite secret army'; a Medicare expert muted when he tried to inform Congress about the true cost of the new

prescription subsidies and a White House Specialist on climate change, who was punished after complaining that global warming statistics were being manipulated by White House political tacticians.

In addition to the hounding and bullying of 'whistle blowers' (NYT 2007), the White House, at the close of the second Bush presidency and in the face of a democratic victory in the 2008 presidential elections, behaves like an embassy in foreign territory getting ready for war, - or as a band of crooks facing an imminent inspection by the Internal Revenue Service: it is 'burning evidence' on a colossal scale. It is removing all embarrassing documents and data from public scrutiny. According to the New York Times this is being implemented at the unprecedented rate of '125 documents a minute':

The move toward greater secrecy has nearly doubled the number of documents annually hidden from public view - to well more than 15 million last year, nearly twice the number classified in 2001 - as bureaucrats have invented more amorphous categories like 'sensitive security information'. At the same time, the declassification of documents required under the Freedom of Information Act has been choked down to a fraction of what it was a decade ago, leaving the government working behind an ever darker, ever denser screen (NYT 2005).

25.3.2 The Case of Mexico

Since the *North American Free Trade Agreement* (NAFTA) came into operation, the imperial presidency's centrifugal-centripetal dynamics is increasing in Mexico. While the 'free market' economic scheme boosts social and political frustrations, police-military initiatives led by the White House become more pronounced. It is worth taking into account that this country's massive concessions in deregulating foreign trade - without reciprocity - and direct investment, formalized in the NAFTA were the basis for setting up an area of 'hemispheric commercial, monetary, investment and military annexationism' through the *Free Trade Area of the Americas* (FTAA) and related programmes such as *Plan Puebla Panama* (PPP) and *Plan Colombia* (PC) now euphemistically called *Plan Patriota*, The FTAA, PPP and PC are backed by an elaborate public relations structure that barely conceals their real intention, namely, to justify the absorption of cheap labour, markets and strategic raw materials such as oil, natural gas, minerals, water and the control of huge biodiverse areas from Latin America (Delgado 2004; 2005), as part of an arsenal of instruments (including those of military and 'security projection')

16 For details on how the iron triangle currently impacts transatlantic relations see Blustein (2005).

used by the US government to face an increasingly fragmented and competitive world economy.

Over the last 140 years, in the Americas the enforcement of the Monroe Doctrine (1823) has been geared to providing state protection to US investment and trade. The needs of the fast-developing US industrial and agricultural system – based on protectionism and plagued by overproduction – were and are at the root of the US promotion of free trade agreements. This key structural feature was central in the 19th century and in the late 20th century: NAFTA and FTAA, as well as hemispheric and indeed US global economic and military diplomacy.

Former US Secretary of State, James G. Blaine (1889–1892)¹⁷, spelled out the US economic policy toward Latin America as follows:

I wish to declare the opinion that the United States has reached a point where one of its highest duties is to enlarge the area of its foreign trade. Under the beneficent policy of (tariff) protection we have developed a volume of manufactures which, in many departments, overruns the demands of the home market. In the field of agriculture, with the immense propulsion given in it by agricultural implements, we can do far more than produce breadstuffs and provisions for our own people. ... Our great demand is expansion. I mean expansion of trade with countries where we can find profitable exchanges. We are not seeking annexation of territory. At the same time I think we should be unwisely content if we did not seek to engage in what the younger Pitt so well termed annexation of trade (cited in LaFeber 1995: 165).

Blaine's interest in Latin America, and his idea to persuade US hemispheric neighbours to accept a kind of 'older sister' relationship, was influenced by economic motives. Blaine was a Republican representing big business interests. Naturally, he was aggrieved by the US's adverse balance of trade with Latin America, a region which at that time was shipping huge quantities of raw materials to the US and which bought the bulk of its manufactured goods from Europe (Bailey 1980: 399). Like today, inter-capitalist rivalry was at the core of hemispheric free trade agreements. "Blaine's aim," writes Thomas Bailey:

was to elbow aside foreign competitors by forming closer commercial ties south of the border. And since economic relationships could not flourish amid whistling bullets, Washington would use its good offices to terminate wars in Latin America (Bailey 1980: 399).

This is of particular relevance when analysing the ways in which the centrifugal forces of US capitalism relate to the centripetal powers vested in the 'imperial presidency' and how they have related to each other in the past and at present – for example, through granting the President 'fast track' power to negotiate 'trade agreements'.

In the 1870's, for example, Mexican dictator Porfirio Díaz opened the country to free trade and foreign investment, making Mexico a dependent of the US. In the years 1903–1910, investments skyrocketed to three times those of 1876–1900.¹⁸ By 1910, 43 per cent of Mexico's prosperity is owned by US investors, 33 per cent by 15 million Mexicans, and 24 per cent by other foreign capitalists (LaFeber 1995). The investment was put into oil concessions, silver and other mining operations and huge plantations for export agriculture. In 1905 James Speyer, a prominent US banker, told the German ambassador to Mexico that "In the US there [was] a pervasive feeling that Mexico [was] no longer anything but a dependency of the American economy" (cited in LaFeber 1995: 221).

As massive foreign investments transformed Mexico and haciendas shifted to export crops, landless peasants proliferated and the production of staple food dropped. In 1910 Mexico was more modernized than in 1876, but had less corn and beans for domestic consumption than in 1876. Under the government of Porfirio Díaz the centrifugal forces of US capitalism had torn the social fabric. Americans built railroads to carry the goods to the ports, but also penetrated and threatened communal life. There had been discontented peasants here and there in the country, but by 1910 they swelled over the country, as never before in Mexican history. In 1910, the country exploded into cycles of civil wars, lasting seven years and costing 1.2 million lives, out of a population of 15 million. By 1916 there had been frequent US military incursions into Mexico. President Wilson even ordered the naval bombardment of Veracruz. The centripetal forces of the imperial presidency played different instruments of military, intelligence and diplomatic nature.

The social and political consequences of the Porfirian laissez-faire policies were traumatic. Trade, investment and banking deregulations, similar to today's economic agenda, collapsed under both internal and external forces. At that time – as is increasingly the case today, as demonstrated by the financial collapse

17 Blaine had also served as Secretary of State in 1881 during the brief presidency of James A. Garfield,

18 The data on the Porfiriato is provided by LaFeber (1995).

of December 1994 - Mexican dependence on the liquidity of the international system created serious vulnerabilities:

The US panic of 1907 demonstrated the price of dependence on the giant northern neighbour. As New York capital dried up, Mexican exports dropped, investment disappeared, thousands of Mexican immigrants to the United States suddenly began to return home and unrest spread (LaFeber 1995: 222).

The historical experience of the Porfiriato with US corporate greed and its destabilizing thrust is an important precedent when dealing with current trends, impacted by Mexico's 'neo-oligarchs' (Saxe-Fernández, Eduardo 1999) and foreign interests articulated under the umbrella of the Bretton Woods arrangements. Under Washington's initiative the Bretton Woods conference celebrated in mid-1944 aimed at providing the US with a "new world economic order" that "could keep the nation's economy pumping away so that the war shocked world could be rebuilt and the US system saved from a possibly fatal shock of another 1930's like depression" (LaFeber 1989: 410, Kolko/Kolko 1972: 16; Hudson 2004: 179-216) To solve these problems the meeting established two new organizations: the International Monetary Fund (IMF) and the International Bank for Reconstruction and Development (IBRD) or the World Bank (WB).

Since the US at that time controlled two-thirds of the world's gold, the Roosevelt administration insisted that the post-war economic system rest on gold and the US dollar. Thus, both institutions were designed, as Gabriel and Joyce Kolko agreed, not merely to implement disinterested principles, "but to reflect the US' control of the world's monetary gold and its ability to provide a large part of its future capital. The WB was tailored to give a governmental framework for future private investment, much of which would be American" (Kolko/Kolko 1972: 16).

The US dominated the WB and the IMF, and these institutions, and the powerful dollar, were used by Roosevelt, first of all, "to force the British Empire to open up to the American goods and investment" (LaFeber 1989: 411), and soon after, as a powerful tools to do the same to the rest of the world, and most particularly to the Latin American and Caribbean region (Saxe-Fernández/Delgado 2004).

According to Dean Acheson (1969) who was 'present at the creation' of this new international economic architecture, the aim was to create not just an American dominated international marketplace, but one that did not need excessive state interference or high tariffs. The GATT arrangement later on the

World Trade Organization, was central to these goals (Kolko/Kolko 1972). As both the IMF and the WB were designed to prevent or solve key international problems of the US - and later on of its associates (and competitors) in Europe and Japan -, in this chapter they are treated as state instruments of US national private interests and not as 'international financial institutions' or as 'multilateral instruments', as Roosevelt, not without sarcasm, liked, and seriously demanded, to label them.

Like the dollar, they have been vital tools of '*Pax Americana*' and bringing about agricultural and industrial productivity in the capitalist periphery were not - and have never been - part of its agenda. Nor is it bringing about a social restructuring of any kind. The aim has never been to set into motion a cumulative process of development south of the Río Bravo, of the type which has characterized the performance of 'advanced' economies such as the US, British, Japanese or European economies. The East Asian 'new industrial economies' have developed by not following WB-IMF recipes. South Korea, Taiwan and Japan, during the crucial period of 1950 to 1973 used a wide array of interventionist instruments including

import controls; control over foreign exchange allocations; provision of subsidized credit, -often at negative real interest rates- to favour firms and industries; control over multinational investment and foreign equity ownership; heavy subsidization and coercion of exports, particularly in South Korea; a highly active state technology policy; restrictions on domestic competition and government encouragement of a variety of cartel arrangements in the products markets; promotion of conglomerate enterprises through mergers and other government measures; and wide use of 'administrative guidance' indicating non-transparency of government interventions (Singh 1998: 70).

As Singh points out, the economic history in South-East Asia "is unequivocally an argument for adopting an industrial strategy, for guiding the market, and not following the hands-off 'market friendly' approach recommended by the World Bank" (Singh 1998: 71).

The World Bank was specifically designed to promote primarily US national private interests and exports, not foreign development and resources. As a matter of fact, the WB operations are biased to aid the US, and in the case of WB's agricultural modernization loans in Mexico, US agricultural exports. It is true that during the 1946 to 1952 period it helped US industrial exports and the position of its oil companies in the Middle East by financing the reconstruction of Europe and not primarily to aid the US. But from 1952 onward its lending activities concentrated

in developing mechanism for the extraction of surplus from so-called 'developing' economies. It financed nearly 10 billion dollars of exports from the industrial nations to these 'imperialized' economies, about one-third were US exports (Hudson 2004: 196-197).

The aggregate return to this country, on its total net investment position in the Bank, had exceeded 100 per cent from the Bank's inception of through 1969. ...On balance-of-payments accounts, US receipts from Bank operations approximated 2.1 times its investments in the institution. The Bank thus was not exactly an instrument of altruistic American generosity (Hudson 2004: 197).

When it comes to the 'modernizing of Mexican agriculture the 'laissez faire' policies in Mexico ended up protecting US industrial and agricultural exports and investors against Mexican commercial, agricultural, and industrial nationalism.

In both, the Porfirian and in the 'NAFTA periods' what we have is a classic form of free trade imperialism, and in both cases the economic strategy pushed social and political stability to the limits (and beyond!). While the US government lavished enormous subsidies on its domestic agriculture, aerospace, and other industries in order to assure a strong position in world markets, in Mexico the WB's *Agricultural Sector Loans* and NAFTA's free trade impositions in the agricultural sector have stimulated an unprecedented collapse of public expenditure and investment in the rural and industrial sector, generating an equally unprecedented exodus of untrained migrants into the cities and into the US. The social, political and military consequences of SAPs, and privatization and deregulation packages sponsored in Mexico by the IMF and the WB have been, and are being, implemented with the acquiescence of the Mexican government, dominated as it is by a powerful oligarchy.¹⁹ Under this policy, the so-called '*neoporfirato*',²⁰ the government of Mexico, is being treated almost as if it were a part of the US.

Neoporfirato's basic features centre on the unilateral opening of Mexico's domestic market, the privatization of some of the most important sectors of the Mexican economy - through a process designed to socialize costs and privatize benefits - all sorts of constitutional modifications designed to suit foreign in-

terests, the transformation of Mexico into an exclusive paradise for US and Canadian investors by means of NAFTA, and the application of SAPs in the countryside. After listening to a major presentation on the privatization programme and the new Law of Foreign Privatization and Foreign Investment, sponsored by the World Bank during the government of President Salinas (1988-1994), a US entrepreneur expressed his satisfaction by calling the Salinas regime "the best thing that has happened to us since López de Santana delivered more than half of the Mexican territory to the United States" (Esteves 1994: 44).

The SAPs sponsored by the IMF and the WB are at the centre of *neoporfirato* policies that were the major immediate cause of the insurrection in Chiapas. There is a virtual consensus among Mexican and many foreign analysts that the SAPs were a major precipitant of internal war, not in Chiapas but also in the case of other rural and urban sociopolitical explosions in the other states of Mexico, as well as elsewhere (for example, in Caracas, Santiago del Estero in Northern Argentina, and again [in 2002] in Buenos Aires and Montevideo). Social upheaval in Chiapas has deep roots in a colonial history of violence, dispossession, and indignities suffered by the native Indians, and such grievances were not addressed or even affected in any vital way by the Mexican Revolution. As is well known, the revolutionary government's economic and political policies favoured landowners, cattle-ranchers, and those whose interests depend on the exploitation of the forests.

A crude coalition of these groups based on the political exploitation and inequities of caciquismo, the power structure of local bosses, was and still is the order of dominance in Chiapas. The agrarian and social structures derived from capitalist modernization benefited a small group and proletarianized a vast numbers of peasants in Chiapas and throughout Mexico (Calva 1993). According to research carried out by the *Centro de Investigaciones Ecológicas del Sureste* in where, by 1989, 64.7 per cent of the Chiapas peasants were *jornaleros* (day workers), 28.4 per cent were ab-

19 The World Bank and the IMF are treated in this paper as state and class instruments of US national private interests and not as international financial institutions or as financial multilateral instruments, and thus, as vital tools of *Pax Americana*. For a precise historical analysis, see Kolko and Kolko (1972).

20 *Neoporfirato* is a concept that defines more clearly current features of economic and political policies in contrast to the more popular label of neo-liberal. The Mexican XIX liberal tradition fostered important positive trends in vital areas such as state-church relations and in promoting the secularization of education. Thus the concept of neo-liberal is not as historically adequate as the neoporfirato. This text is based on a previous research paper (Saxe-Fernández 1994, 2002, 2005, 2006).

jectly poor, and a mere 6.9 per cent were relatively well off. It was during the 1960's and 1970's that *jornalizacion* mainly occurred, but during that period peasants rejected the use of armed conflict to solve their grievances (Saxe-Fernández 1994).

The general conditions for social frustration have been present for a long time, but the events that actually triggered the Chiapas rebellion must be traced to the SAPs of the WB and IMF, particularly their 'modernization' schemes for the agricultural sector in Mexico. The adjustment package of reductions in public spending, channelling government and private resources toward the payment of foreign debts, and the control of wages to reduce inflation and increase the international competitiveness of Mexican products had devastating effects on the Mexican people.

The IMF and WB policies initiated a steep decline in real incomes. WB sources corroborate that real wages fell substantially in Mexico throughout the 1980's and 1990's and that the decline was greatest in the agricultural sector. By 1989 it was estimated that 60 to 80 per cent of the population suffered a situation approaching the despair of sub-Saharan Africa or Bangladesh. Declining real incomes have afflicted both low-income and middle classes. The 'proletarianization' of the Mexican middle class has become even more acute, evoking ominous reminders of Crane Brinton's findings in his famous *Anatomy of Revolution* that a serious deterioration of the position of the middle class seems to be a recurring theme in the English (Cromwellian), American, French and Russian revolutions. This development is clearly not restricted to Mexico as it has already pushed the middle classes of Argentina and Uruguay to join the peasants and workers in their struggle against this economic model.

In the case of Chiapas (Saxe-Fernández 1994, 2002), the decline in real wages was even more devastating due to the high proportion of *jornaleros* (salaried peasant). When the minimum salary was dramatically reduced, it represented an unacceptable decrease in the standard of living of 64.7 per cent for the Chiapas peasants. In relation to the living standards of 1979, the IMF-WB's SAPs reduced real wages by 60 per cent. According to an analysis by Calva (1993), the highly recessive policies implemented from 1983 onward, the collapse of coffee prices in the international market, and the unilateral opening of the domestic market reduced employment and greatly increased underemployment (Calva 1993: 30). As a result of these trends, a large portion (38.8 per cent) of the agricultural population of Chiapas saw its income reduced to

50 per cent of the minimum wage, or less than US \$1.74 a day; another 36.6 per cent of those employed in the *agropecuario* (agrarian sector) earned between US \$1.74 and TJS \$3.48 a day (Calva 1993: 30).

In contrast to the highly subsidized agriculture in the US, the WB's agricultural sector loans, through conditioned programmes implemented by the Mexican government, opened the way to US grain exports and agribusiness by eliminating subsidies to peasants and small farmers, as well as price control mechanisms and price guarantees for the crops, creating the biggest crisis in Mexican agriculture since the 1910 revolution. Small-scale producers throughout Mexico now face competition from cheap US imports of massively subsidized staples like maize, while domestic public investment has been cut drastically. In 1982, public investment in agriculture (in the form of credit subsidies, fiscal transfers, and other public investments) was 2.5 per cent of the GDP. By 1991, under heavy World Bank pressure and loans, it had fallen to 0.7 per cent (Calva 1993).

Chiapas is a symptom of a generalized condition that now affects the very fabric of Mexican society, because the main factors that led to the Zapatista Rebellion are now present everywhere in the country. Carlos Montemayor (1998), a noted analyst of guerrilla movements in Mexico and the author of *La Guerra del Paraíso*, which analyses some of the most important anthropological features of the Chiapas social structure, pointed out that the *Ejército Zapatista de Liberación Nacional* (EZLN) was only the tip of the iceberg of popular unrest and rebellion. He is right, for this type of social movement does not appear spontaneously. Montemayor argues that there is a long period of incubation that makes such movements resistant to violent repression. They are also strongly resistant to actions imposed from outside the community of struggle, and, of course, are not themselves products of 'foreign' or 'external' forces, as official explanations have tried to characterize the Zapatistas.

The preconditions for internal war are not restricted to Chiapas - because the frustration of social, economic, and political aspirations is a general feature of the current Mexican landscape, and the so-called 'economic modernization' being implemented under the impact of all sorts of loans from the WB and the Inter-American Development Bank, have served as major precipitants of social conflict throughout the country. The concept of relative deprivation is an essential tool for any diagnosis of the national, and cer-

tainly the bilateral, origins of the Zapatista insurrection. That is, it is not absolute poverty that is the main precipitant of internal war but social perceptions regarding the discrepancy between the community's value expectations and its value capabilities. As expressed by Gurr:

Value expectations are the goods and conditions of life to which people believe they are rightfully entitled. Value capabilities are the goods and conditions they think they are capable of getting, and keeping (Gurr 1970: 24).

It is in this sense that the situation in Chiapas indicates a much deeper problem: relative deprivation might even be greater in states such as Chihuahua or Coahuila, which have higher standards of living and therefore face even greater relative inequities. There are growing indications that this is the case. There is a widespread perception that regressive distribution of income is an essential feature of current economic policies. The programme to combat 'extreme poverty', basically designed by the WB, has led to results that contradict what was expected to accomplish. This is mainly a consequence of the fact that it was unable to counteract the widespread effects of its wage control policy. The contraction of wages has been brutal. In the 1970-1982 period, wages were 37.1 per cent of the GDP, whereas in the 1990's they were under 25 per cent. It is estimated that between 1983 and 1993, Mexican wage earners lost US\$ 46.9 billion. From 1989 to 1993 the loss was estimated at US\$ 160.9 billion.

Analysts often classify developmental policies as belonging to one of two types. Fragmenting development tends to concentrate wealth. Integral development tends to promote economic equity. *Neoporfiriano* economic policy has been decidedly of the former type. That it has served to concentrate wealth in the midst of increased absolute poverty is a major recipe for social violence, as it was during Don Porfirio's tenure. The actual concentration of wealth has reached levels that are difficult to imagine: 0.2 per cent of the population - the very top of the Mexican plutocracy - holds 51.1 per cent of the country's assets.²¹

Social expenditures have been cut drastically. In 1980 such expenditures amounted to US\$ 3.2 billion, and in 1981, the last year of the López Portillo administration, they increased to US\$ 3.5 billion. From 1989 to 1993, under IMF-World Bank economic 'guidance', social spending was reduced to US\$ 1.96 billion while the regional anti-poverty programmes in Chiapas amounted to US\$ 527.5 million, and the losses of

wage earners in the state, according to Calva's (1993: 4) calculations, were over US\$ 3 billion.²²

It is no accident that the Chiapas insurrection coincided with the official inauguration of NAFTA on 1 January 1994. The linkage between both events is associated with several other factors. In addition to the problems caused by the wage-control policy of IMF and World Bank, Calva underscores the importance of the crisis of the coffee market, which affected about 60,000 small producers across the state. The crisis resulted from the Salinas government's rejection - in compliance with US presidential trade policies - of the International Coffee Agreement (Calva 1993: app. 702.3), thus meeting the requirements of NAFTA, that Mexico would not act in coalition with other producers to restrict exports and thereby affect international prices:

But the coffee clause, was not the only reason why the Indians rejected NAFTA, for peasants had already been suffering the effects of trade liberalization on the prices of other items such as the collapse in the prices of meat, soybeans, sorghum, bananas, and cocoa, which further reduced the peasants' income and threw the whole agricultural sector of the country into disarray (Calva 1993).

Global public investment in Mexico from 1981 to 1992 declined by 60.4 per cent. Public investment in *agropecuario* was especially hard hit by the WB's economic policies, showing a decline of 79.04 per cent during the period.²³ The IMF-WB's SAP has caused a

21 In 1984 the income of the lowest 10 per cent of Mexican families accounted for 1.72 per cent of the GDP. By 1989 this figure had declined to 1.58 per cent, and by 1992, to a mere 1.55 per cent. By contrast, the incomes of the richest 10 per cent of the population increased as a proportion of GDP from 32.77 per cent in 1984 to 37.93 per cent in 1989, and to 38.16 per cent in 1992 based on data from INEGI and the Banco Nacional de México. See: Elvia Gutiérrez, "Retrosos en la distribución de la riqueza durante la actual administración", in: *El Financiero*, 11 February 1994: 3. Data on the concentration of wealth by the Mexican plutocracy are from Banco de México and Bolsa Mexicana de Valores, See: *La Jornada*, 14 February 1994: 1.

22 This type of inequity is also observed in the way the State of Chiapas, Mexico's richest state in terms of water and forest resources as well as in the generation of electricity, is physically discriminated against by the Federal Government.

23 These estimates were kindly provided by Calva as of 1 March 1994. The figures are based on official data from the Federal budgets of 1980-1992, and all estimates are made in 1980 pesos.

major social trauma for Mexican rural and urban society. It has precipitated the biggest crisis in Mexican agriculture since the 1910 revolution. Only the historical record can fully explain the enormous social, political, and military implications of current *neoporfirian* regression fostered by the Mexican oligarchs and the presidency through the IMF-World Bank agricultural SAP.

In a synthesis of the historical record on this vital experience, the editors of the *New Internationalist* recall that Emiliano Zapata's main concern during the Mexican Revolution was the restoration of lands seized from the peasantry under Porfirio Díaz. After the resignation of Díaz in 1911, Zapata refused to demobilize his army until this demand had been met. In November he promulgated the *Plan de Ayala* which spelled out the demand for agrarian reform.

The lands, woods and water that have been usurped ... will be immediately restored to the villages or citizens who have title to them. ... Because the great majority of Mexicans own nothing more than the land they walk on. ... A third of these properties will be expropriated, with prior indemnification, so that the villages and citizens of Mexico may obtain *ejidos*, sites for town and fields. During the next chaotic and violent years Zapata remained in opposition to every head of state that emerged. In March 1919 he directed an open letter to President Venustiano Carranza denouncing his policies which turned the revolutionary struggle to your own advantage and to serve the interests of those who helped you rise, then shared the spoils. ... The old land holdings have been taken over by new landlords. ... and the people mocked in their hopes (1994: 21).

Carranza devised an elaborate scheme to get rid of Zapata. A Federal Colonel, Jesus Guajardo, feigned a mutiny and offered to join Zapata with 500 men, their arms and ammunition. As proof of good faith several Zapatista defectors were tried by court-martial and executed, and the town of Jonacatepec was 'captured' in Zapata's name. A conference was set for 10 April 1919 at the Hacienda de Chinameca in Zapata's home territory. Zapata rode into the hacienda with just ten men: the ceremonial guard turned their guns on him and he died in a hail of bullets (*New Internationalist*, January 1994: 21).

25.4 The US 'Imperial Presidency' and the World Bank's Rural Modernization

Since NAFTA, small-scale producers all over Mexico have faced competition from cheap US imports of sta-

ples like maize, while government support for corn prices has been cut drastically. In other words, with other parameters used for comparison, public investment in agriculture (in the form of credit subsidies, fiscal transfers and other public investments), which was 2.5 per cent of the GDP in 1982, fell down to 0.7 per cent by 1991.

What happened in Mexico in the last two decades was properly labelled by a widely read US weekly magazine as 'Don Porfirio's Revenge' not only because of the World Bank's massive privatization programme but also because of what appears to be a full-fledged agrarian counter-reform. Salinas' modification of Article 27 of the Mexican Constitution, considered by the World Bank as one of its most important successes, formally ended agrarian reform and the process of land redistribution by eliminating the concept of 'social property', and it left the *ejidatarios* and small farmers at the mercy of 'market forces'. As a consequence of new legal loopholes, a substantial increase in latifundia and in the holding of transnational - mostly US based - agribusiness has taken place.

The elimination of the *ejido* system of Mexican agriculture and the large-scale substitution of capital-intensive, export-oriented commercial farming in Mexico for the near-subsistence agriculture still practised in the countryside is clear evidence of the destabilizing forces unleashed by US capitalist centrifugation. The rapid displacement of the rural population has swelled the urban labour market, further depressing wage levels. Millions of peasants are crowding the cities or moving north, increasing immigration pressures. These socially disruptive policies place enormous strain on public sector services, while undermining the traditional social patterns. The social explosiveness created conditions for rural insurgencies, like those in Chiapas. This led the WB, through the Salinas, Zedillo and Fox governments, to implement *Procampo* (now combined with a similar scheme called *Connigo*) an emergency programme designed in part to address the plight of beleaguered peasants, but operated more to neutralize the electoral costs of these regressive policies to the PRI and now to the PAN.²⁴

According to a confidential document prepared by economic analysts working for the US embassy in

24 PRI (*Partido Revolucionario Institucional*) is the official party that dominated Mexican politics. PAN (*Partido Acción Nacional*) is the opposition right-wing party that won the 2000 and the controversial elections in 2006.

Mexico and leaked to the local press, “Procampo was designed to alleviate the pain of the peasantry in its transition to an open market. ... the privatization of the rural sector has had abrupt and catastrophic consequences for the Mexican rural population,” which, according to the Ambassador’s analysts, “has little chance to modernize in a way that would enable them to compete within the framework of NAFTA” (Domville 1994: 20). The dynamics of the imperial presidency are evident in this case, for while the document recognizes that the WB’s rural policies carried out by Salinas “have contributed to social instability and thus fostered the Zapatista guerrilla movement,” it notes that,

in an electoral year the government has an obligation to at least temporarily alleviate rural problems in order to keep the electoral advantage it traditionally enjoys in the rural areas (Saxe-Fernández/Delgado 2005).

Speaking to an assistant to Representative Richard Gephardt, who visited Chiapas in late 1994, an Indian woman summarized the prevailing sense of despair among the Mexican rural population: “They never gave us anything, but now, with the Constitutional changes, they left us without hope.” This claim echoes those recorded during the regime of Porfirio Díaz. But the foreign policy of the US imperial presidency, carried out through the *neoporfiriato*, centres on short-run corporate and regional interests. For example, US embassy analysts point out that US grain exporters will greatly benefit from the WB’s agricultural programmes since the inability of these schemes to promote local production tends to favour “more imports of US corn and beans in the short run.” And since the limitations of the WB’s agricultural programmes will not enable Mexico to meet future demands for wheat, sorghum, soybeans, rice and cotton, it is estimated that “In medium and long-run terms the increased demand for such items will be greater than the national capacity to produce them, and thus imports [from the United States] will increase correspondingly” (confidential text cited in Domville 1994: 20).

The national security implications of a policy that tends to push millions of Mexican peasants into cities north and south of the US border are now being addressed by an unprecedented – in Mexican history – increase in military and police budgets, and an equally unprecedented US projection of military assistance, training and technology, appropriate for the control of the rural and the urban population. In terms of this technology, I refer, for instance, to the Textron water cannon vehicle weighing 25 thousand pounds and

shooting 400 gallons of water at sufficient pressure to knock down crowds of people, and to the Cobra crowd control vehicle manufactured by Customs Armouring of Pittsfield, as well as to thousands of machine guns, helicopters, and other weapons and training used in both the war against drugs and the war against people – indisputably a class war. With the SAPs of IMF and WB an unprecedented purchase of military goods and services from the US under all categories of assistance (Foreign Military Sales/FMS, Commercial Sales, Excess Defense Sales and International Military Education and Training programme (IMET) are under way (Willson 1997). A report from the Federation of American Scientists indicates that between 1984 and 1993 Mexico obtained 10 times more US arms than it accumulated between 1950 and 1983.

Since NAFTA was formalized in 1994 there have been new demands for an increased US participation in Mexico’s military dynamics. During the Zedillo and Fox administrations and now with Calderón, the emphasis has been to echo the Department of Defense call for a ‘secure, stable, and friendly’ ‘vecino’ who would look increasingly to the US for directions and dependency relating to military and international policies. In 1996 the Mexican press cited from a US Department of Defense report describing the intention of US military programmes to Mexico as “expanding US influence in the Mexican military” (Willson 1997: 6). Thus, while the IMF-WB and *neoporfiriato* economic schemes further destabilize Mexican society (the centrifugal forces), an increased US role in the militarization and repression in Mexico can be observed, the centripetal side of the coin. Here we have the imperial presidency and the *neoporfiriato* in full operation.

25.5 Concluding remarks

In an interview published in the Mexican press in May 1994, General James R. Harding anticipated many of the scenarios regarding the ‘home land’ strategies of the ‘imperial presidency’ after the terrorist attacks of 11 September 2001 when he stated that “illegal Mexican migration to the US now ranks with drug trafficking and international terrorism as a major threat to national security.”²⁵

Using the war against terrorism as an excuse, the US Justice Department, then under John Ashcroft, asked the US Immigration and Naturalization Service to dust off and enforce a 50-year-old law that requires

non-citizens to report any change of address within 10 days of moving. Failure to do so could result in penalties ranging from fines to deportation. This policy applies to all non-citizens, whether they are in the US legally or illegally, implying that foreigners are more predisposed to commit terrorism than natives are (Navarette 2002: 13). According to Navarette, the deporting of people who fail to report a change of address is a blatant overkill, and by singling out non-citizens, the policy only reinforces prejudices and pushes immigrants to the margins of society. The Bush administration insists that the new policy will 'enhance border security', but nobody knows how this will be accomplished by harassing people who have already crossed the border.

In the post-September 11 environment, the destabilizing of IMF and World Bank programmes combined to the pursuit of US vested interests in corporate and national security have profound negative implications for civil liberties and civic-military relations in both Mexico and the US. As pointed out above, President Bush's request to Congress to abrogate the 1878 Posse Comitatus Act is an invitation of the imperial presidency to military authoritarianism and to an erosion of democratic, human, and constitutional rights. According to the White House team headed by President George W. Bush, "the threat of catastrophic terrorism requires a thorough review of the laws permitting the military to act within the United States" (cited in Navarette 2002).

The laws now give the 'imperial presidency' unprecedented powers for the establishment of unconstitutional and police-state-like 'anti-terrorist' structures in the US now being fostered in Canada and Mexico through the *Partnership for Prosperity and Security* (but in Mexico also through the refunctionalization of troops by converting them into police bodies). This policy is having profound repercussions in Mexico and Canada, since the US new anti-terrorist strategy claims that homeland security can only be achieved by locating US security and intelligence units in Mexican and Canadian ports, seaports, railways, and highways.

The economic and political well-being of American society is intertwined with the economic and national security trap that is generated by Washington's

covert financial and military endorsement of Mexico's *neoporfirismo*. US economic policies and miscalculations are causing turmoil not in faraway lands such as Vietnam, Chile or Argentina, but next door to the US itself.

Streets in the US are the other end of a transmission belt that is eroding the structure of work and income, as well as the very foundations of democracy and constitutional rights in the context of the authoritarian excesses being promoted by the 'imperial presidency', under the excuse that the US is a nation 'currently' at war against 'world terrorism'. It is a war in which anybody can be a terrorist at any time, a difficult scenario to all legitimate social and political opposition. US imperial authoritarianism and militarism occurs in a context in which there is a deepening of the structural capitalist crisis while both the World Bank and IMF insist in irresponsibly advocating the recessive deindustrialization policies that were applied in Latin America in the 1980's with devastating consequences for productivity, and the well-being of the population. These grave miscalculations 'globalize' the problem, by aggravating the risks of worldwide recession and in the case of Mexico turning into a time bomb that, unless immediately defused, will have devastating consequences (Saxe-Fernández 1997), a situation that is 'already' generating unbearable social and economic costs. In this context, strength of social movements against the capitalist system should increase, as they place severe limits to the capacity of the US 'imperial presidency' to contain social change on a global scale.

The dangers to international security are further aggravated by the increased 'politization' and 'militarization' of international economic exchanges, particularly in the vital energy and other strategic natural resources sector. It should be noted that, in contrast to most Cold War operations, now the 'imperial presidency' sponsors not only political-military espionage against its enemies, but also 'economic' espionage. This trend is especially disturbing for those nations which, in the view of the US national security establishment, are perceived as "commercially, industrially or financially" hostile to the aims, purposes, and needs of US civilian and military enterprises (Saxe-Fernández 1994: 241). The extension of the US 'national security' structure to Mexico and Canada and subsequently throughout the hemisphere, using clandestine plans and personnel, hardly foreshadows a world of stability and international security.

The use of a 'preventive war' strategy to obtain control of oil and gas deposits creates unprecedented

25 In an interview with Mexican reporter Dolia Estévez, General Hardin pointed to the need "to prepare the Armed Forces in Latin America to deal with any threats to [national and regional, that is, US] security", in: *El Financiero*, 20 May 1994: 44.

risks of general war. In Iraq, Bush's military advisors have failed to anticipate the consequences of the unprecedented resistance to military occupation. They estimated that by 2006 'only' 5 to 6 thousand troops would remain and Iraq was supposed to be run by a popular, democratic government capable of keeping order, while US oil monopolies profited from Iraq's vast hydrocarbon resources. Now the White House is contemplating an escalation of the war into Iran, in scenarios that involve the use of tactical nuclear weapons, sowing the seeds of more wars, and consequently, transforming the United States in a principal threat to international law and security. Military analysts such as Edward Luttwak considered the 'first' Gulf War, with its devastating human, financial, environmental and political consequences as a 'battle' in World War Three. By 2007 the 'battle', pursued by George W. Bush, involves a human holocaust costing around one million civilian casualties in Iraq (Roberts 2007). This 'battle' is already, as pointed out by Zbigniew Brzezinski on 1 February 2007 before the US Senate Foreign Relations Committee, "a historical, strategic and moral calamity" (Grey 2007). But most significant was Brzezinski's suggestion that the Bush administration might 'manufacture' a pretext to justify a military attack on Iran by "some provocation in Iraq or a terrorist act in the US blamed on Iran, culminating in 'defensive' US military action against Iran..." (emphasis added as the allusion to the attacks of 11 September against the WTC and the Pentagon is more than 'significant', coming from a former national security advisor) (Grey 2007; Saxe-Fernández 2006a, 2007; Delgado 2007).

The temptation to resurrect the old US and German geopolitical concepts of 'large areas' is already apparent in 'North America' and in the use of the 'blitzkrieg' worldwide. The war in Iraq and the destabilization of the Middle East, in the midst of massive corporate corruption, and the WB and IMF scenarios of domination for the Americas by economic and coercive means, once again illustrate the tendency of monopoly capital (basically the military-industrial and oil and gas sectors) in the US to manipulate external economic, diplomatic and military factors, as well as domestic politics in order to offset their economic and geo-strategic difficulties (access to cheap oil). The centrifugal-centripetal dynamics of the 'imperial presidency' is already exacerbating an already critical situation in the Middle East of unprecedented proportions (Saxe-Fernández 1980, 1979, 2007; Chossudovsky 2006a; 2006b; Delgado 2007). According to Richard

Falk, this is, indeed, a core region for a World War Three scenario:

... general wars in the past have always occurred when a great power tries to compensate for economic and political decline by recourse to decisive military means. At the present time, I believe that the American leadership is increasingly trying to offset a reality created and expressed by the weakness of the dollar in economic terms and by the loss of control over the Third World in resource terms. The United States is ... trying to offset that weakness by relying on military superiority, and it is in that contest of offsetting political and economic disadvantage with the pursuit of military advantage that the most horrible wars ... have occurred (Falk 1979: 21).

26 Globalization from Below: Social Movements and Altermundism – Reconceptualizing Security from a Latin American Perspective

Úrsula Oswald Spring

26.1 Introduction

This chapter analyses the rise of social movements with a special emphasis on Latin America, in response to the ongoing process of exclusive (Stiglitz 2002; Salazar 2003), named also regressive globalization (Kaldor/Anheier/Glasius 2003) or globalization of organized violence (Held/Mc Grew 2007). As a result, more than three billion persons, mostly in Third World countries, are living in poverty, lacking basic services, with poor health conditions and few opportunities for dignified jobs and a reduced future. With a greater integration into the world market the gap within and among the countries is growing, above all in Africa and Latin America.

To counter this process, social movements have constructed bottom-up alternatives, not to disturb the social peace, but to raise collective consciousness and livelihood (26.2). Latin America is reviewed as one of the most dynamic regions struggling first against imposed colonialism and later against neoliberalism (26.3). The region has developed self-organizing experiences (MST, the Landless Peasant Movement in Brazil, indigenous organizations in Bolivia, Ecuador, Peru, Central America, and Mexico; Dos Santos 2004, 2005). Recently, leftist Presidents were elected in Venezuela, Brazil, Chile, Argentina, Uruguay, Bolivia, Nicaragua and Ecuador (Boron 2005; Barrera 2005), trying to reduce social inequality and poverty within their countries. However, their success is limited due to complex economic structures of regressive globalization (26.4).

This is illustrated in a case study on the uprising of the Zapatista movement in Mexico after the *North American Free Trade Agreement of America* (NAFTA) was signed by the United States of America, Canada, and Mexico. They have transformed their armed struggle into a Neo-Zapatista civilian experience, where they are building in autonomous territories an alternative model of socio-political organiza-

tion (so-called ‘Caracoles’, Juntas de Buen Gobierno; Diverse Authors 2007), promoting economic justice, cultural dignity, social and political participation, sustainable development, and global solidarity. They have used the internet to communicate and to protect their experience, threatened by opposed landlords, paramilitary, military and governmental forces. The Zapatista movement has also been using the traditional mobilization in the streets combined with public discussion to promote their political model (Juntas de Buen Gobierno), and to reinforce national and international solidarity (26.5).

As globalization is a worldwide process, social movements have been struggling collectively against the imposed exclusive world model, represented by the World Economic Forum in Davos and the G-8. Simultaneously, alternative thinkers and actors have been interchanging theoretical reflections and bottom-up experiences during the *World Social Fora* (WSF) in Porto Alegre (2001, 2002, and 2004), Mumbai (2003), and Nairobi (2007) and in different sub-regions (26.6). During the first WSF, popular movements organized themselves in the *Assembly of Social Movements* (ASM), and were able to establish a world agenda for common activities. During an intensive interchange of experiences, they also were exploring alternatives for dignified livelihoods in societies, characterized by enormous social gaps. Their vision of solidarity and justice has opposed the Davos’ paradigm of the world economic elite and its model of exploitation and consumerism that has often been insensitive to social and environmental destruction. Finally, the question will be discussed how social movements have reconceptualized security in a wider sense, taking into account human, gender, and environmental concerns for a plural, peaceful, sustainable and diverse world model (26.7) before the results will be summarized in the concluding section (26.8).

Figure 26.1: Well-being by Regions (Growth of regional GDP from 1820 to 1998). **Source:** Elaborated from data by OECD 2005; at: <www.oecd.org/dataoecd/34/6/34711139.pdf>.

26.2 Globalization, Civil Society, Social Movements, and Altermundism

The history of the economy during the last two centuries offered different opportunities for development (see figure 26.1) among regions and social groups. During this time period, the U.S., Canada, and Oceania increased their GDP more than 25 times, while Europe, due to two world wars and regional conflicts, could not achieve the same results. As the second largest national economy, Japan took off from a lower original accumulation, but through a process of industrialization, education, and high technology was able to increase its initial GDP 40 times. This country has demonstrated the most intensive development process.

Latin America (LA), the Soviet Union, and the rest of Asia started from a lower economic potential. The former Soviet Union had a poor performance, increasing its wealth only six times. Recently, Russia has improved its economic situation, thanks to the extensive hydrocarbon reserves and its well trained population. Due to liberation struggles, neo-colonialism and neoliberalism, LA had a limited development. Using its good years during both world wars, Latin America could multiply its development ten times. During the past three decades of lost development it got stuck and lost part of its previous consolidation, partly due

to prevailing neoliberal policies that have been imposed on their governments by IMF, WB, multinational corporations, and globally operating business elites. Only Asia has achieved high economic growth rates that have been supported by high increases in productivity and exports, as well as major investments in education, and have thus opened bright perspectives for this region. Africa is situated in the worst outlook, not only due to its present situation of armed struggles, but also due to longstanding colonial rule, late independence (in most cases after 1960), and neo-colonial control over its natural resources. Today, internal conflicts in multiple countries, desertification processes, famine, and HIV-AIDS are affecting the population in the most productive age, mortgaging the future of Sub-Saharan Africa (Oswald 2005).

These unequal development processes are results of complex factors related to colonial and neocolonial mechanisms that have been expressed by unequal terms of trade, monopolies and oligopolies, which pursued the extraction of surplus from less developed countries. Independence brought for many Third World countries new threats: their governments and economic elites were often closely allied with multinational business (see *dependencia* theory: Marini 1973; Dos Santos 1978). In many cases, they passed laws favouring these economic interests, often against those of the majority of their population.

After World War II, globalization accelerated the process of concentration of wealth. For International Labour Organization (ILO 1999: 6) “Globalization has economic, political and cultural dimensions, all of which can have a social impact. The Task Force restricted its analysis largely to the effects of economic globalization. Economic globalization can be simply defined as a process of rapid economic integration between countries. It has been driven by the increasing liberalization of international trade and foreign direct investment, and by freer capital flows. The process manifests itself mainly through an intensification of activities in the following areas: international trade in goods and services; capital flows (FDI and short-term speculation); the role of multinational enterprises (MNE); the reorganization of production networks on an international scale; the adoption of new technology, including information technology.”

Globalization has to be understood as a historic process that has been consolidated by the procedures of deregulation in the 1970’s (Kaplan 2003). It generated a process of increasing interdependence among national economies during the 1980’s that are linked to urbanization (Klein/Fontan/Tremblay 2003). It was also called *mundialization* (Aguirre 1995: 62), and with the emergence of a global market in the 1990’s (Martínez Peinado 2001: 4), it was named *globalization*. “The culmination of the internationalization as a universal historic tendency is constituted by the convergent, interweaving and mutual effort and accumulation of forces and processes, which includes most parts of the planet and operates worldwide” (Kaplan 2003: 42–43). This globalization is used in a double sense: referring to the global system of trade where liberation and governmental trade policies are at the centre of the focus; and considering a micro-economic process, inducing strategies and behaviours in corporations and consumers but also affecting the environment (López/Díaz 2003).

The world is structured as one unit, permanently being rebuilt and adapted by several main factors, such as the displacement of local and national corporations in favour of TNE. The market economy was integrated into a sole economic system that has removed many trade barriers and national restrictions through processes of deregulation and intensified global competition. The liberalization of commercial flows aims at the maximization of profit through trade of commodities, finances, and services using a global system of marketing and publicity, thus fostering global patterns of consumption. Since the 1990’s, unlimited financial flows and capital movements be-

came globalized. Technological innovation in information and communication has transformed the economic, social, cultural, and political life. The world is now covered by nodes and networks.

26.2.1 Regressive Globalization

To support and accelerate economic globalization,¹ several multilateral economic and financial bodies were set up in 1944 in Bretton Woods: the International Monetary Fund (IMF), International Bank for Reconstruction and Development (IBRD, see World Bank), and later General Agreement on Tariffs and Trade (GATT). In the 1990’s the World Trade Organization (WTO) replaced GATT. Based on Western interests and legal frameworks, the WTO has reinforced the global trade system favouring the interests of international economic elites. With their market power, industrialized countries have organized trade blocks. The resulting policies have increased the economic gap through unequal terms of trade, subsidies, trade restrictions, and dumping of excessive production to the world market. As a result domestic prices dropped and ruined the livelihoods of many poor and forced them to migrate to the North (Bellen 2006; Arroyo/Villamar 2002). WTO resolves conflicts among nations, entities, and transnational enterprises (TNEs) through arbitration. The protection of patents is regulated by the so-called TRIPs (trade-related aspects of intellectual property rights).

The *World Bank* (WB) and the *International Monetary Fund* (IMF) were established to maintain the smooth functioning of the post-war world econ-

1 Globalization is used in a double sense: referring to the global system of trade where liberation and governmental trade policies are at the centre of focus; and considering a microeconomic process, inducing strategies and behaviors in corporation ... “it is conducted by micro-economic forces which try de facto to promote the regional integration and de jure regional agreements among governments” (Sánchez Daza 2001: 154). Globalization resulted in a “growth of economic activity with political limits, which are defined regional and nationally, and expressed by an increase of movements of commodities and services crossing borders through trade and investments, and frequently by people through migration.” This process has been “conducted by actions of economic individuals – enterprises, banks, persons – usually in the persecution of profits and frequently stimulated by the pressure of competition.” This process “could be characterized as a centrifuge process, as a process of economic *outreach* and microeconomic phenomena” (Omán 1994: 33).

omy. The WB offers less developed countries credits for developing its infrastructure. These modernization processes are oriented to favour the trade and service sector in industrialized countries. Therefore, many mega-development projects have failed. In some cases administrative inefficiency and corruption have created expensive and inefficient public works. When these credits had to be repaid, this often led to economic crises (Calva, 2003, 2007; CEPAL 1992–2006; Cordera 2003; Dos Santos 2005; Campos 1995; Kaplan 2002, 2003).

For those poor countries that were unable to repay the debt services, IMF has imposed draconic *Structural Adjustment Programmes* (SAP)². This is a prerequisite for restructuring their debts with the international financial sector. These SAPs have resulted in a reduction of poverty alleviation, subsidies, salaries, technical support, and infrastructural investments. For IMF a priority has been the punctual repayment of debt services, often at the cost of hunger and marginalization of the most affected poor population (Strahm/Oswald 1990; Stiglitz 2002; Held/McGrew 2007; Estay/Girón/Martínez 2001).

Both institutions promote the privatization of public services (water, health, education, roads, telephone, etc) with negative effects on the well-being of the vulnerable. Nation states lose their possibilities to compensate harmful effects of exclusive globalization, while consumerism is homogenizing a transnational culture of consumption. The new labour force must be flexible, highly technically trained and able to deal without governmental support with the requirements of global capitalism. Corruption and legal impunity are other mechanisms to transfer wealth from the society to small elites. This has often been aggravated by the banks and failed business rescues, generating periodic economic crises. As a global logic: debts get socialized and profits privatized. These mechanisms have increased the internal social gap.

As the national economy depends increasingly on the world economy, trade is regulated by agreements among economic blocs within WTO. Regional integration (EU, NAFTA, ASEAN) permitted economies of scale and greater market protection, which has ben-

efited TNEs. In the global economy, TNEs, with headquarters in few countries, have become the motors of growth. They are competing for the control of the world economy, using the global financial market, trade agreements, instantaneous communication, propaganda, mass media and political power of their countries. TNEs are regionally integrated (EU, ASEAN, APEC, NAFTA, FTAA, Mercosur) in larger economic units that guarantee internal protection and trade restrictions for foreign competitors. Capital intensive investments due to technological innovation, high efficiency and productivity, have often destroyed jobs and resulted in unemployment, precarious labour conditions, social insecurity, as well as a technological and financial dependence of the South.

Transnational oligopolies and a concentration of wealth in the hand of small elites have created a process of *regressive globalization* (Kaldor/Anheier/Glasius 2003). It is characterized by a strategy of monopolies and governments favouring a globalization process to serve their interests. They are competing with small- and medium-sized industries and services absorbing them through processes of temporal dumping, propaganda, fashion, merging, and organized campaigns which has often destroyed local productive processes (Strahm/Oswald 1990: 182–183). Investments by TNEs have promoted a division of labour, creating unemployment in the North and exploiting the cheap manpower in the South. This has also affected food sovereignty of poor countries due to agricultural subsidies, barriers, restrictions, and dumping of cheap products from industrialized countries, which has changed international commodity prices.

The macroeconomic effects of this globalization process differed for Asia, Africa, and LA. China and India with their socialist capitalism and, as a complementary economy, Japan³ are commercially interlinking. Michael Elliott speaks of the 'Chinese Century' and asks whether this commercial giant will be the next great power and if this will lead to a confrontation with the U.S.⁴ Increasing social and regional gaps between rural and urban areas are a constant in all affected countries (Ruiz 2003) due to this regressive globalization (Ramírez 1991). Productive structures are transformed and globalization has created metropolitan areas that are linked globally with world networks (Villareal 2003).

2 During 2006, Argentina and Brazil liquidated their debts with IMF in advance, thus avoiding an imposition of structural reforms and achieving sovereignty of their monetary policy. In February 2007, Argentina rejected offers from IMF for new credits with binding conditions, in order to be able to restructure its debts with other private and multilateral bodies.

It is well known that the Middle East has acquired an increasing geopolitical importance due to its reserves of high quality oil and gas, which has made the region extremely vulnerable for wars and insecurity. The Latin American oil and gas-producing countries (Venezuela, Mexico⁵, Ecuador, Colombia, and Bolivia) represent the second largest source of oil reserves for the U.S. Their reserves are insufficient to meet the needs of the major consumer of fossil hydrocarbon and the U.S. is maintaining the second place in the refinery of gasoline (table 26.1). Therefore, the U.S. closely mon-

itors and controls with all kind of means its oil and other hegemonic interests within the region, trying to avoid alliances, cooperation, and a common policy of Venezuela, Bolivia, and Ecuador.

The control over cheap oil reserves (see Saxe Fernández in this vol.) to consolidate the productive processes in industrialized countries was a major driver for the war against Iraq (2003-). The administration of George W. Bush and its allies have implemented strategies of pre-emption putting their national interests over other needs (Sanahuja 2004). These unilateral policies have been reinforced by the unethical behaviour of some TNEs (see Halliburton, Enron, Worldcom).

On the cultural side⁶, the creation of a global ideology of consumption guided by stereotypes of occidental social representation (Serrano 2004; Oswald 2006) has created shared emotions (e.g. the soccer euphoria). Mass media and instant communication glo-

5 From 2000 to 2007, Mexico has reduced its strategic oil reserves from 20 to only 9 years, and it has been exporting basically crude oil to the USA and importing refined gasoline. The government depends for its administration basically on oil, missing long-term investments in the exploration and maintenance of the oil industry, but also investing in alternative energy sources once the fossil reserves are exhausted.

balize fashion and promote a world consumer society which uses the same trademarks. Types of compulsive consumption patterns are transmitted to southern countries: sport, fashion, tourism, internet, artists and cinema, but also sexual behaviour, drugs, consumption, along with HIV/AIDS became globalized. Culture is getting uniform by a global consciousness of modernity and progress that is reinforced by international, multilateral, and transnational organizations and institutions in economy, finance, science, environment, society, policy, ideology, culture, and the military. Politically, the UN system tries to mitigate the increasing polarization rising from this exclusive way of economic progress. The Security Council has adopted sanctions against countries that challenged these globally adopted norms, however it failed to prevent the Iraq War of 2003 by two of its permanent members.

The negative effects of this exclusive globalization can be summarized with four burdens: 1. a greater physical, social, and cultural violence; 2. an increasing poverty and marginalization not only in the poor but also in industrialized countries; 3. an environmental destruction and resource depletion generating global and climate change; 4. gender discrimination and interfamilial violence linked to family disintegration (Oswald 2003a). Confronted with these realities different social movements organized globally, and are trying together with civil society to limit through collective actions and pressures the abuses that have been committed in the name of regressive globalization, free-market and occidental democracy.

6 Ideologically, there is an argument of the inevitable and exhaustive process of globalization which can only be undertaken through competence and improvements of productivity, which requires a united model of world behaviour. Models such as 'the end of ideology'; 'the end of history' (Fukuyama 1992); 'postmodernism' (Giddens 1991) and the acceptance of capitalism as the sole existing 'common patrimony of humanity' sustain the progress of the model. The policies of neoliberalism that have been promoted by multilateral organizations and the centre of power reinforce the model of expansion of globalization through the indiscriminate access to national markets, and elimination of frontiers for goods (but not for people) together with privatization processes. For the southern countries this new model of development has forced them to reduce protectionism against international markets, while they are confronted with increasing pressures for protection in industrialized countries.

26.2.2 Civil Society, Social Movements, and Altermundism

The process of exclusion due to regressive globalization has opened the way for new movements focusing on human rights as well as citizens' movements working on international laws against transnational crime, and on global norms and taxes with transparent financial flows. They are inducing new capabilities-building, global governance, and international solidarity that are able to mitigate the negative effects and to create a different process of globalization.

After centuries of unequal development (figure 26.1) and five decades of failed development in poor countries, the United Nations (UN) has adopted the Millennium Development Goals (MDGs) to reduce poverty and to foster sustainable development. As part of an ongoing reform process, the UN has called for a plural and culturally diverse democratic world that should be able to reinforce social justice, environmental protection, citizen participation, full employment, and the reduction of social gaps within and among countries. As they do not touch the existing structures and oligopolies, these activities are constrained by a bureaucracy that has been unable to respond efficiently to new threats and challenges. Thus, many citizens do not believe in the impartiality of the UN and of the adopted international rules. The *International Court of Justice* (ICJ) and the *International Criminal Court* (ICC) in The Hague may slowly improve the confidence, but at present some countries do not accept the validity of these institutions.

Organizations of global civil society have responded to the growing distrust in multilateral organizations. According to a working definition they are defined

as a sphere of ideas, values, organizations, networks, and individuals located primarily outside the institutional complexes of the family, market, and state, and beyond the confines of national societies, politics, and economies. ... Global society is about people, organizations, and the values and ideas they represent, but with the major difference that these are, at least in part, located in some transnational arena and not bound or limited by nation-states or local societies (Kaldor/Anheier/Glasius 2003: 4).

These social movements have gone beyond conventional political parties and fostered a broader mobilization. Worldwide, the demonstrations against the Iraq War mobilized more than 15 million people. They want to realize globally selected basic rights. This civil society has operated globally and outside the national context to achieve their goal (Stolowics 2005). They

promote cross-national agreements. Many different social movements have allied themselves temporarily for common issues, e.g. in a campaign ‘against WTO’, for ‘debt relief for poor countries’ and for achieving values such as equality, democracy, equity, peace, women’s rights, indigenous autonomy, environmental sustainability, justice, and political participation.

More than one third of the world’s major economic actors are transnational enterprises (TNEs) or corporations (TNCs). A similar trend exists for some large non-governmental organizations (NGOs), to become international NGOs (INGOs). They use their non-profit services to professionally mitigate effects of exclusive and regressive globalization. The emerging civil society represents transnational, social, and ideological plural and ethnic diverse groups, which share common values or goals for a broader mobilization worldwide. They do not link up with political parties. They want to increase basic human rights by limiting oligarchic behaviour of TNEs. These civil society groups (Via Campesina; March of Women 2005; Jubilee 2000; ATTAC) have opposed national policies consolidating globalization, and they promote international agreements to contain major abuses with non-violent opposition (Ameglio 2002, 2004).

Further, in the socio-political arena besides TNEs, multilateral bodies and civil society, a fourth major player exists, the organized social movements. They focus on specific economic, social or political issues with the goal to achieve social changes. They define their identity through collective struggles. They represent a complex social mosaic including peasants, workers, women, indigenous, ethnic minority and gay right groups, environmental as well as civic and political movements. Their main resource is collective social mobilization for achieving specific political goals, which are partly based on a common ideology.

Their scheme of struggle has been widening and includes economic, social, cultural identity, as well as political and environmental elements. Their growing number and visibility in the media and their organized pressure has influenced the policies of a few governments within international organizations and negotiation processes, e.g. within WTO the original mandate for the Doha round on agriculture and services has been refined during the negotiations at Cancún in 2003, Geneva in 2004, and Hong Kong in 2005. They have established temporary alliances with other social movements, civil society, NGOs or sectors with solidarity groups, as in the case against the negotiations conducted by the WTO. Their tools have included active nonviolence, challenge in elections, struggles

against hegemonic behaviour, achievement of concrete public demands, change of political power relations, resistance, and sometimes also violent opposition. Often a dynamic balance exists between spontaneity and a flexible strategy, which distinguishes these activities from other mass protests and riots.

During the recent historic process of globalization, different phases of social and civil movements can be distinguished:

- 1970: cosmopolitan values are associated with new social movements to overcome poverty by developing a *social agenda*;
- 1980: resource scarcity and pollution, urbanization and deforestation have launched a consciousness for nature and its material and immaterial value for humans, e.g. the Earth Summit (1992) and the Agenda XXI have created an *environmental agenda*;
- 1990: political openness is related to the abolition of military regimes and the rise of democratic forms of government in Asia, Africa, and Latin America which has favoured the institutional expansion of global civil society and contributed to a *political agenda*;
- 2000: values have been changing due to the consolidation of civil society; promotion of a global code of conduct for TNEs, transparency for governments, preference for diversity, human rights, tolerance, and traditional knowledge are summarized in an *ethical agenda*.

These new social movements are promoting complex sets of values and a policy agenda in the transnational space, where tolerance, equality (also for children) and democratization – especially in the South – are linked to issues of development, nonviolence, racial and gender equity; peace and environment in Africa; the fight against corruption and transparency of governments. Violation of human rights infliction and torture are denounced globally. The call for environmental protection combined with sustainable development and mitigation processes for Third World countries are based on community actions, green agriculture, fair trade, solidarity campaigns, and disaster risk reduction (Wisner/Walker 2005; Beck 1998) as well as non-discriminative relief support activities (IFRC-RCS 2007).

These campaigns opposed Thatcher’s TINA (There Is No Alternative; Mies 1998) and promoted instead TAMA (There Are Many Alternatives; Oswald 2006). They often represent an intermediary step between activities of international NGOs (INGOs) and

internet anonymity. Initially the World Social Forum (WSF) combined anti-globalization and anti-capitalistic movements. Later, new agendas were added, e.g. that of *Via Campesina* struggling for food sovereignty; of indigenous movements against trade agreements (against TRIPs, GATS, NAFTA, FTAA, CAFTA, etc.); organized women against privatization of water, health, and education; *ATTAC* for restructuring financial networks, abolishment of tax havens, and taxation of speculative money; and *Jubilee 2000* for debt relief in the poorest countries.

These new social movements can be divided into those who propose alternatives (TAMA; Porto Alegre 2001) and traditional rejectionists (anarchists). A main player has been *Via Campesina*, which has created a global alliance of small farmers in the North and South, calling for food sovereignty, democratic land reforms, for seeds as a 'community patrimony of humanity' (against genetically modified seeds) and for sustainable agriculture. Locally grown food production reinforces cultural and social links and avoids carbon dioxide (CO₂) in the air due to a reduction in transportation. Their slogan is 'agriculture out of WTO'; 'life is not for sale (no TRIPs)'. *Via Campesina* has created new networks and as a political actor it is organized internationally with new knowledge, solidarity, and tools for global struggle. Their main concern has been equity, livelihood, and creative participation. The feminization of agriculture (Bennholdt/Faraclas/Werlhof) due to the loss of survival opportunities is reflected in the composition of its Coordinating Council where half of its members are women, and one third represents the youth.

During the long history of social movements, their political strategy has changed since the civil rights movements and campaign for female vote to the new threats, created by regressive globalization and social exclusion. Traditional solidarity processes such as the commune, the kibbutzim, the interchange of equivalents, have been reinvented. These activities have been supported by sections of the Catholic Church in the South and other religious groups, by public universities, and a middle class which is loosing in the South its protagonist role and getting rapidly impoverished. These new alliances resulted in a stronger articulation of the interests of the productive, commercial, and consumption sectors, including mechanisms of micro-finance and popular banks.

In Latin America most of these efforts may be summarized as 'economy of solidarity' (Cadena 2003), 'solidarity support economy' (Collin 2005), or as the 'other money', the 'other stock market' (Lo-

pezllera 2003). This process to link up with other micro-business (Oswald 2000) represents productive niches in each community, where TNEs are unable to compete. Ideologically, they are based on values of solidarity and mutual social care. The vertical and horizontal integration of mini-enterprises, micro-credits and cooperatives is reducing cost, permits recycling, green agriculture, orchards, small livestock. Above all it is promoting dignity through labour opportunities for young people. The social collaboration has reduced productive costs, permitted collective selling and control of the goods, and strengthened green agriculture and non-toxic transformations of these products (MST 2005a). The production is primarily destined for local markets and through 'fair trade' and green products also for the national and international market. Today, the former organization of landless peasants in Brazil (MST), with more than a million affiliated micro-enterprises (Santos de Morais 2002) supplies three of the five basic food products in Brazil. Besides analytical interests in innovation, their efforts can also be observed in the macro-economy of LA. During the 1990's their contribution to the GDP increased from 5.2 to 33.6 per cent. Verano (1997) estimates a growth of 60,000 enterprises to 60 million micro-businesses, which integrates nearly half of the population in LA. The lack of employment and income has obliged increasing groups to get organized within this economy. Most new jobs created in the Third World are linked to this economy of solidarity (Cadena 2005; Parrilli/Bianchi/Sugden 2005), and more than one third of the economy in poor countries depends on it. This has created one of the most important movements worldwide, which offers real alternatives in the present globalized world.

So far, for socially discriminated and marginalized groups, the response to extreme poverty, environmental destruction, and social anomie has created a bottom-up approach for realizing social alternatives or another world, named *Altermundism*. Globally, new social movements were created and existing ones were reinforced. They have evolved and are now collectively mobilizing against the neoliberal imposition. They come from the traditional movements for peace, gender equality, indigenous and Afro-American dignity, religious movements, transnational peasant organizations, unemployed, impoverished middle classes, and critical intellectuals. The new set of values in this global space is equity, justice, sustainability, equality, dignity, cultural diversity, and solidarity with the most vulnerable (normally girls from poor countries) promoting poverty alleviation and job creation.

Due to global and climate change, these groups have reinforced environmental security (see chap. by Dalby in this vol. and Dalby/Brauch/Oswald 2008) through mitigation processes against disasters, sustainable development for environmental protection, environmental services (Urquidi 1999), food sovereignty, nature conservation, re-use and recycling of waste. They have promoted human rights and struggled to abolish torture, discriminatory labour, and to improve social conditions. They requested governmental transparency in public affairs, elections, an improved state of law, and legal equality for everybody. Their process of democratization includes citizen's participation through popular budgets, and civil supervision of public work and planning. Tolerance and social consensus are trained and basic collective interests are negotiated. In the economic sphere, the consolidation of local and regional markets, free trade combined with fair trade, is complemented with solidarity campaigns to sustain the most affected of neoliberalism, and to mitigate the effects of disasters and extreme poverty (Sader 2005).

A characteristic of social movements is their independence from traditional parties and governmental organizations, which gives them greater freedom for struggle. Although no worldwide "anti-globalization or anti-capitalist movement" (Wood/Kees 2001) exists yet, their demands and struggles are clearly oriented in this direction. There is another important aspect. These diverse movements are not organized against something, but in favour of another world. For this reason, besides the organized struggle, there are manifold and culturally diverse activities to maintain and recreate a dignified livelihood for everybody. These goals endanger the status quo created by the world economic elites who have launched activities far beyond Davos. They are supported by the transnational mass media. But the understanding of the increasing manipulation in the mass media has reinforced the struggle of the social movements, giving them an opportunity to understand the lack of ethics and the underlying interests (León/Bruch/Tamayo 2005). Further, confronted with greater nonconformity and conflicts, the social movements are also occupying a place in the negotiation process between the market and the state. Finally, they are also serving as a shield for progressive governments to limit the interventions of elites and to permit structural changes in favour of the people and not only of capital (see MST in Brazil pressuring for a democratic land reform and against landlords and the destruction of the Amazon).

In some poor countries with limited public education facilities, fanatic religious leaders train nationalistic and religious fundamentalist groups which spawned a new geopolitical terrorism (Kaldor/Anheier/Glasius 2004). These new social movements are global and depend on modern infrastructure such as internet, global funding, a worldwide financial system, religious solidarity and high technology for arms construction, terrorist artefacts and attacks (Thieux 2004; Beck 2000; Held/McGrew/Goldblatt/Perraton 1999; see chap. by Saxe Fernández in this vol.). Their number has increased as a response to the 'war on terror', which should apparently protect citizens from threats. However, it brought wider insecurity not only for the countries affected by pre-emptive wars (Afghanistan, Iraq), but also through new terrorist attacks against civilians, by reducing the rights of citizens by anti-terrorist legislation (U.S. Patriot Act). This has created a legal dilemma where laws that are aimed to protect citizens from terrorism are weakening the rights of these citizens.

The rise of terrorist groups has created contradictions within the solidarity of social movements, where on one side bottom-up self-reliant processes are reinforced by world solidarity and non-violent actions. On the other side, paramilitary, undercover agents and white guards are protecting violently TNE installations, mega-development projects, and forcing displacement of the indigenous and peasants from their land, etc. killing with impunity the innocent poor who are unable to experience justice in the existing legal framework. The interests the elite are promoting through the 'war on terror' have created new insecurities, which are reinforced by the narrow military security and a reduction of national security items (Gaitán 2004; Oswald 2004). In some regions social movements have turned to organized armed struggle, as liberation armies and guerrillas.

However, peaceful conflict resolution and nonviolent opposition have dominated among the social movements, who struggle through bottom-up organization to challenge the regressive globalization. These activities may increase human, gender, and environmental security (HUGE; see Oswald 2008), and offer opportunities for dignified livelihoods for the poorest.

26.3 Latin America: Indigenous Roots, Repression, and Social Movements

Latin America has a long history in social organization and movements in response to conquest, wars, conflicts, confrontations and U.S. policies. They are deeply rooted in the indigenous cosmo-vision that goes back to the giant Mesoamerican empires, like the Mexica⁷ and Maya, and the South America Inca culture, which were destroyed by the Spanish Conquest (see chap. 20 by Sánchez; Caso 1953). They are still feeding present social struggles in Bolivia, Ecuador, and Mexico. The huge biodiversity of the subcontinent (Halffter 1994) is increasingly being threatened by resource depletion and pollution of water, land, forests, and air (Oswald 1999). In addition, climate change affects the coasts, ecosystems, productive processes, and livelihoods. Population growth, urbanization, and the need of more food are pressuring the scarce and often contaminated resources, provoking new social inconformity and demands from bottom-up.

During its painful history Latin America had to overcome two main problems. The identity process as an indigenous society was abruptly altered by European conquest and the import of African slaves. Since 1492 the integration into a foreign colonial and later capitalist productive system changed their social relations and loyalties. A globalization process and neoliberal policies have continued to extract commodities (Saxe-Fernández 1999). Military and ideological conquest by Spain and Portugal, as well as the influence of the Roman Catholic Church, led to the imposition of a colonial order, the subordination to foreign requirements, and contributed to economic underdevelopment. A plethora of natural resources – foodstuffs, gold, silver, minerals, medicinal and therapeutic plants – were systematically looted. Forced labour under the *encomienda* system⁸ and high taxes, as well as new illnesses, decimated the native population within a few decades, obliging the Spanish conquerors to replace the indigenous work force in mines and agriculture with African slaves (León Portilla 1959, 1961, 1967, 1974).

The twentieth century started with the Mexican Revolution, the first indigenous and peasant move-

ment (led by Emiliano Zapata and Francisco Villa) that resisted the early transnational capital in the hands of sugar-cane industry owners and extensive livestock areas, but above all against the neo-colonial land concentration. It was increasingly led by an emerging middle class, generals and commercial farmers, most of them originating from the northern and central states (Fundación CEDHIM 1999). The Mexican Revolution (1910–1919) created a socialist utopia seeking to redistribute political and economic power to workers and peasants. But the process was blocked internally by a power struggle between the old bourgeoisie and new capitalist forces, and externally by an increasing integration into the North American economic model.

Latin America, like many parts of Asia and Africa, enjoyed some independence and genuine development during war times. After World War II, the Cold War divided the world into capitalist and communist blocs for forty-four years, and the South often became a battleground for conflicts by proxy and a space for representative wars. Both blocs struggled to expand their influence promoting alliances and economic support, as well as imposing embargoes, and exacerbating internal and ethnic conflicts. The U.S. used the *Organization of American States* (OAS) – parallel to NATO in Europe and the *South East Asian Treaty Organization* (SEATO) in Asia – as barriers to the spread of communism. Under the pretext of stopping a communist ‘domino effect’ after the Cuban Revolution that would allegedly lead Latin American and later the world to communism, the U.S. justified internal repression through agencies, like the School of the Americas. It was involved in military coups in Chile in 1973 (Díaz Muller 2002), genocide in Colombia, El Salvador, Brazil, and Mexico (Gaitán 2002, 2004, Dos Santos 2005), and ethnic repression in Guatemala (Cabrera 2002) in its so-called backyard.⁹ Furthermore, alliances between the armed forces and the rising bourgeoisie soon imposed autocratic and repressive regimes throughout the subcontinent. The U.S. participated in selling arms, advising and supporting rightist governments to facilitate a rapid expansion of U.S.-controlled TNEs.

7 Instead of using the colonial term of Aztecs, in this chapter the Mexican term Mexica is utilized.

8 The *encomienda* system was the land tenure introduced by the Spanish conquerors.

9 When Aguilar Zinser referred to the U.S. backyard in a conference at Autonomous Technological Institute of Mexico (ITAM) in 2005 he was forced to resign as the Mexican ambassador to the UN and as the Mexican representative in the United Nations Security Council (UNSC).

Since the 1970's, repeated economic crises, the growing debt burdens, but also corruption and political elites working for personal and foreign interests, prevented the Latin American governments from improving the infrastructure and living conditions within their countries. The policies of SAP imposed by the IMF (1980-2006), and global capital have defined economic priorities (debt repayments and privatization of public basic services, such as electricity, telephone, education, water, sewage, health and pensions, Strahm/Oswald 1990; Calva 2007). These policies have worsened the living conditions for the majority of the population, especially for peasants in remote rural areas and the marginalized urban poor (figure 26.2).

Figure 26.2: Most important problems in LA. What do you consider to be the country's most important problem? Percentage of respondents in 2004. **Source:** Latinobarómetro (2004).

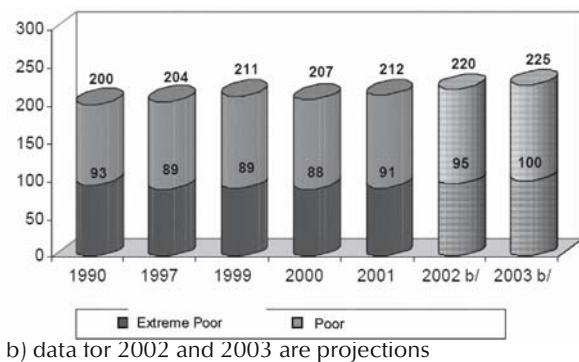

Figure 26.3: Evolution of Poverty in Latin America (million of persons). **Source:** CEPAL (2004).

Other effects are rapidly growing cities with increasing urban chaos (Scheingart 2006; Oswald 2007; Celcia 1998; Girardet 1996), and a highly segmented space (sophisticated developed areas next to dreadful slums, see: Cantú 2003). In rural areas, abandoned fields and empty communities have led to migrant flows partly caused by trans-national agribusiness. Migration to urban areas has become the sole alternative for many peasants facing the loss of food sover-

eignty and livelihood (Rosiques 2003). Soil erosion, water pollution, governmental abandonment and scarcity together with unequal competition due to the indiscriminate agricultural subsidies for basic foodstuffs in industrialized countries, have increased inequality between social groups, and thus hindered further development (CEPAL 2004)

The most important policy problems in Latin America in the early third millennium are unemployment, poverty (figure 26.3), low wages, inflation, organized crime, urban violence, loss of public security and weak implementation of the laws, with corruption and environmental destruction, affecting vulnerable groups such as women, children, and elders.

The 1980's and 1990's became two lost decades for development in Latin America (CEPAL 1992). This poverty has concrete faces and affects special social classes and ethnic groups (Strahm/Oswald 1990; Boltvinik/Hernández Laos 1999; Campos 1995). Extreme poverty, better defined as perverse poverty (Oswald 1989), relates above all to rural and indigenous infants, depriving them before being born from a dignified opportunity of life due to brain damages resulting from chronic maternal-infant undernourishment (Álvarez/Oswald 1993; Chávez/Ávila/Shamah 2007). Figure 26.4 indicates that still 55 million of the Latin American and Caribbean population suffer from hunger,¹⁰ above all infants under five years. The differences between countries in LA are abysmal, where Haiti is threatened by civil war, corrupt government,

10 Malnutrition and hunger are both parts of a complex and interrelated system of social, agricultural, economic, political, and ecological realities (WHO/FAO 2003). In the poor countries, developments is limited due to the current policies of high indebtedness with its debt service; the substitution of local food cultivation with export commodities, such as vegetables, tropical fruits and flowers, in order to get foreign currency for debt services; the exploitation of livestock instead of subsistence crops; the submission of local and regional markets to the interests of international monopolies; the forced bankruptcy of small farmers and peasants facing high interest rates, constant increases in agrochemical and other products; the falling prices of their agricultural products due to international artificial cheap prices (dumping) and to subsidies in industrialized countries, of the green revolution and genetically modified organism imposed by national and transnational agricultural policies. In addition, natural disasters and global warming, and sometimes food aid to countries south of the Sahara has prolonged the situation of dependency and often even expelled peasants from their lands.

and an environmentally destroyed island. It offers few possibilities to overcome the internal conflicts by starting a genuine process of development. On the other extreme are Chile, Uruguay, and Argentina with low levels of undernourishment. In general terms, the

Latin American society with a higher indigenous population has also higher levels of malnourishment (figure 26.4).

However, there is no doubt that the extreme poverty is in rural and indigenous areas (Chávez/Álvarez/

Figure 26.6: Total work, paid and unpaid labour by gender and urban-rural differences. **Source:** CEPAL (2004), *Unity or Women and Development*.

Shamah 2007). The critical situation in these regions (Barkin 1998) has forced millions of peasants to abandon their plot of land and unique inheritance, and to migrate to urban slums or risking their life by crossing illegally the U.S. border. They settled in hazard prone areas in the suburbs of big cities. Adverse urban conditions have obliged women to develop specific survival strategies (Duque/Patrana 1973; Oswald 1991; 2007). They are complementing the income of their partners with any other alternative than to survive in precarious conditions. There is no doubt the traditional division of labour where women care for the families and men provide the income did never function in dependent societies and even less during crises situations as those that have affected Latin America. As figure 26.5 indicates, with a greater level of poverty, a higher economic participation of women in the income can be found. In all these very poor countries, women are an important part of the labour force to sustain their families and compensate the low wages of their partners that were affected by chronic unemployment (González 2000).

Nevertheless, this financial support comes in addition to their traditional non-paid domestic work, producing an important *poverty of time* related to gender differences (Damian 2002; Dore/Molyneux 2000; Lagarde 1990). In Latin America deep differences exist between rural and urban areas (De Mattos 2003), but also a similar social behaviour. In both areas women work longer and get a lower pay, due to their domestic work without remuneration and the social discrimination of female labour. In the rural area the situation of women is even more critical, nonetheless in

the whole region men do a minimum of domestic work and family help (figure 26.6).

These processes of growing poverty have created in Latin America a highly stratified society: small elites linked to global capitalism and the rest of the society remaining in misery (Rojas/Goucha 2002; Goucha/Rojas 2003). This model of development started with the expansion of the indigenous empires and the exploitation of labour and the environment through tributes and slaves. It got consolidated during the Spanish Conquest and is deepened within the present neoliberal model. Table 26.1 is representative for the whole subcontinent, explaining the social differences and access to wealth and financial opportunity in Mexico. Two different indicators show a similar situation; ca. 23 per cent of the population owns 40.3 per cent of national wealth and 78 per cent of all financial savings (table 26.2). In terms of bank savings 0.07 per cent of Mexicans own 63 per cent of national savings (table 26.3).

Table 26.2: Social Gap in Mexico. **Source:** INEGI (2004) and Bank of Mexico (2004).

Concept	Percentage of Population	Percentage of National Wealth	Percentage of Financial Savings
Very Rich	0.23	40.3	78.0
Workers	52.7	18.4	10.0

The recent publication of the biggest fortunes in the world, Forbes (2007) indicates that Mexico has the third richest man in the world with a fortune of US \$49 billion, only US \$7 billion less than the richest

Table 26.3: Bank Savings in Mexico. **Source:** Bank of Mexico (2004).

Account	Number of bank accounts	Per cent of Mexican population	Per cent of National Saving
More than 1 million pesos	73,481	0.07	63
More than 1,000 pesos	16,027,000	14.6	no data
Less than 1,000 pesos	15,700,000	14.2	no data

one (US \$56 billion), and his net annual profit in 2006 was US \$18 billion. These data are similar for the rest of the subcontinent; and Brazil and Ecuador are considered countries with still higher social inequality (CEPAL 2006). Thirty three billionaires in LA accumulated in 2006 US \$155 billion, while 225 million persons have survived in extreme poverty.¹¹ According to FAO 40 per cent of the total income in LA is obtained by 10 per cent, and only 5 per cent of the richest get 25 per cent; while 30 per cent of the poorest get 7.5 per cent (compared with 14 per cent in the rest of the world). According to the Inter-American Development Bank (IDB), Mexico could reduce its poverty rate from 20 per cent to 13 per cent with a sustained 5 per cent economic growth rate during the next 10 years. However, “if the distribution of income would reach the level of 1980, the reduction of extreme poverty would be not from 20 per cent to 13 per cent, but from 20 per cent to 5 per cent.” Without any modification of social gaps, the same poverty reduction would take 30 years (Lora 2007).

Since the 1960’s, survival strategies and dependence theory evolved from Latin America (Marini 1973; Dos Santos 1978). They were introduced by scholars to other parts of the world; they inspired Galtung’s (1971) theory of ‘structural imperialism’ and they influenced Senghaas’ (1973) theory of auto-centric development. However, the process of concentration of wealth in few hands continued till today and regressive globalization has reinforced it.

The concentration of wealth in LA has created a small, but very powerful elite that maintains close links with the business community in industrialized countries. This has resulted in an increase of physical

Figure 26.7: Leading global risk factors and contributions to the burden of disease (per cent of disability-adjusted life years lost). **Source:** United System Standing Committee on Nutrition/The Lancet (2006).

and structural violence (Galtung 1972; Senghaas 1973). This situation of social inequality has created structural problems of poverty with malnourishment, low paid labour, and bad health conditions (WHO 1999, 2003; WHO/FAO 2003), reducing their human and social security. This major global risk factor contributes to disability and child-birth abnormalities, reducing life expectancy (figures 26.2, 26.4, 26.6, 26.7) all over the Third World (World Bank 1993).

The social tension resulting from these stress factors of life often represent survival conditions that are expressed by traditional illnesses (underweight, iron deficiency, anaemia), but due to the introduction of fast foods and excess of sugar and fat in the diet, a combination with the modern epidemiological picture emerges including high blood pressure, diabetes, and bad cholesterol that have aggravated the health situation of most LA countries. The dependency on drugs and alcohol is another sign of disproportionate social pressure. These variables offer a complex and difficult panorama for Latin America. The costs of the traditional and modern exploitation, inequality, and poverty are left with women who have to struggle with survival strategies to raise their children, and often they have also to take care of an alcoholic man. These severe structural conditions have induced in LA a high diversity of social movements which are all struggling for greater equality and dignified livelihood.

26.4 Social Movements in Latin America

The origins of social movements in LA are linked to its history (Eckstein 2001; Escobar/Álvarez 1992). The increasing gap between social classes, regions, and ethnic groups provoked unrest and armed move-

¹¹ See: Forbes Billionaires List, 2007: “Review of the world’s billionaires according to the Forbes business magazine”; at: <<http://www.woopidoo.com/reviews/news/rich-list/richest-people-2007.htm>>.

ments. In 1958, the Cuban Revolution replaced Batista's dictatorship. Facing repressive political scenarios and mounting poverty, *guerrilla movements* emerged since the 1950's; while peasant, urban-popular, and middle-class-led movements allied to voice their opposition.

A *second* strand of opposition came from the committed Catholics that were influenced by the new ideas of the 'theology of liberation', whose radical priests and spokespersons believed that the church should side actively with the dispossessed, rather than with the elites. Until today the difference between progressive clerics and the church hierarchy represented by conservative priests has created tension on questions of belief. In many countries, military coups and authoritarian regimes together with the Catholic elite brutally repressed these social movements, and often students, trade union, and peasant leaders disappeared in clandestine jails. Women had also been involved in these social movements (CLOC/Via Campesina/ANAMURI 2002).

After decades of extra-judicial disappearances, torture, and murders, known as the 'dirty war', the U.S. government withdrew some of its military aid for Latin America (with the exception of Colombia and Mexico). As many European agencies and governments, the U.S. also demanded respect for human rights. Thus, dictatorial governments¹² were forced to undergo a process of transition that led to the third wave of democratization. During the 1980's and 1990's, many Latin American countries returned to democratic political systems with elected governments. The electoral system empowered popular voters to decide on national issues and to lobby for their interests. Nevertheless, the human and political debts of the 'dirty war' have not yet been compensated for the thousands of young citizens who disappeared during the military coups and dictatorships. For instance, there are still hundreds of children (today young people) in Argentina who were born in jails then taken away from their biological parents, who were murdered, and given in adoption to military and other families favoured by the repressive regimes. Residual pain and anger is apparent in peaceful

demonstrations by their grandmothers in the 'Plaza de Mayo' in Argentina and by other citizens (Rivière/Cominges 2001).

The *third* root is linked to the uprising of indigenous movements, which decided to take a more protagonist way and to leave their centuries of resistance. They articulated their demands together with peasants and the urban poor. In the early 21st century in several countries they achieved an electoral democratization (Eckstein 2001). Besides the discriminated indigenous populations, the urban slum poor and the abandoned peasants, but also young people without any opportunity to get a job have contributed to this electoral transformation.

Despite these sometime contradictory liberation processes the social movements could not prevent the consolidation of the dominant economic and social system that has been benefiting only a few. The increasing social exploitation through neoliberalism and critical gender analyses motivated eco-feminists to link patriarchy and environmental exploitation with gender discrimination and the exploitation of ethnic and social groups. The alliance of the indigenous with environmentalists helped to understand the new threats posed by transnational criminals and paramilitary groups. They demanded territorial sovereignty, absolute respect for their cultural traditions, control over the natural resources in their communal land, food sovereignty, and an end to all forms of repression. Some examples are the struggles for water, gas, and oil rights in Bolivia, Mexico, and Ecuador (Oswald/Hernández 2005). The convergence of such multiple currents, with gender, ethnic, environmental, and ideological-religious elements, made social movements in Latin America more flexible in their efforts to overcome five hundred years of conquest, exploitation, and internal discrimination and repression, using mechanisms of cultural resistance through their language, beliefs, and traditional clothes to identify enemies and to protect themselves better against infiltration (Gaitán 2002, 2004).

In summary, in recent decades three important roots for dissident movements have been:

- The *guerrilla movements* and ideals (Che Guevara, Castro, Cabañas, FARC, Shining Path, EZLN (Comandante Ester 2001; Kaldor/Anheier/Glasius 2003; Le Bot 1997);
- *Christian groups*, strengthened by liberation theology and active grass-roots nonviolent practices, who directly oppose government-led neoliberal policies and an elite interested in modernization, promoting an economy of solidarity and inte-

12 In Mexico a more sophisticated system of selective repression was adopted: leaders were either corrupted or eliminated. Intellectuals were severely repressed under the pretext of their alleged communist affiliation. Student massacre in Tlatelolco, Mexico (1968, 1972) and military coups in Chile (1973), Argentina (1976) and in Central America testify this repression.

grated chains of productive processes and trade within a framework of a parallel or solidarity economy (Cadena 2005, 2003; Ameglio 2002, 2004; Calva 2003; Cordera 2003; Polevnsky 2003; Martínez 2003; Lopezllera 2003);

- *Indigenous and peasant groups* which call on resistance and survival strategies developed during the past 500 years of conquest and subjugation (Gaitán 2004; Gil 2004; Menchú 2004; De la Rúa 2004; Armendáriz 2004; Rojas 2004; García 2003; Stavenhagen 2004) linking up with the March of Women, environmental protests against dams, modernization projects (golf clubs, malls), and biopiracy (Foyer 2005, Oswald 2002c; Altieri 1999).

Following this convergence of peasants, workers, urban sectors, and indigenous groups, reinforced by the middle classes and unemployed, they have launched a creative scope of alternatives. In elections, citizens have attempted to oust their neoliberal governments that have been close to the ‘Washington Consensus’ promoting popular candidates in Brazil, Venezuela, Chile, Argentina, Bolivia, Uruguay, Ecuador, Nicaragua, and with a difference of 0.5 per cent in Mexico. However, foreign debts, international agreements, the dictates of the SAP of IMF, the royalties of TNEs, U.S. homeland security, and the interests of ruling elites who seek wealth at any price, corruption and mismanagement have prevented major changes. The mounting despair has been evident in marches, manifestations, and national strikes, forcing the resignation of the presidents in Ecuador, Argentina, Bolivia, Brazil, and Peru (Stolowicz 2005).

These nonconformities are reflected in recent studies about confidence in Latin American institutions. Figure 26.8 indicates that traditional institutions such as churches, schools, and personal clubs are increasing their confidence rate. The military are still important and the ‘dirty war’ is not yet investigated, and victims have not been compensated. People have little confidence in television and mass media, serving normally elites and TNEs. Corruption in the police and judiciary sector prevent the implementation of laws, leading to impunity, violence, and an inefficient legal system. The parliament and the parties have low legitimacy even though they are the only legal institution able to change the present situation of abuses. Civil society is still very weak in LA, often badly organized and an easy prey of interests, because their leaders are often more interested in personal benefits than in political change.

Low confidence in institutions and the ambiguous role of the military all over Latin America indicates

Figure 26.8: Confidence in Institutions in Latin America (in per cent). **Source:** Latinobarómetro (2005).

also a low trust in democracy. Not only electoral frauds, very long and expensive election campaigns, favouring television companies, but also corrupt governments, have destroyed the well-being of entire nations. Probably the most dramatic case is Argentina, a world economic power in the early 19th century. During the crisis at the end of the 1990’s half of its population became impoverished. Similar processes occurred in all other countries of the subcontinent by transferring wealth from the majority to a tiny minority (tables 26.2, 26.3).

Figure 26.9: Satisfaction with the government and democracy. Question: How satisfied are you with the way democracy works in your country? (per cent responding 'not very satisfied' and 'not at all satisfied'). **Source:** Latinobarómetro (2005).

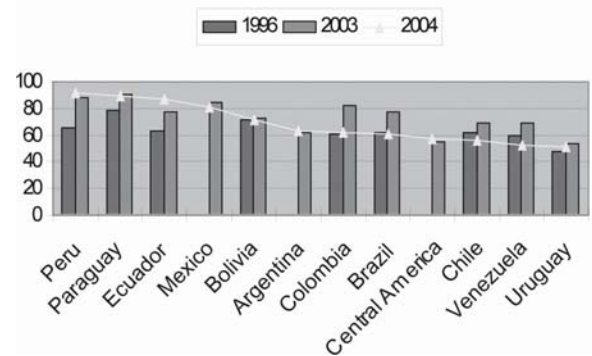

Figure 26.9 expresses this lack of confidence and a mixed feeling with democracy. Debates, collective decision-making, and solidarity belong to their own system of traditional ruling (Olvera 2002). For a neoliberal world of monopolized mass media and centralized decision-making these traditions are too slow. On the other side, the imposition of a world market, global capital flows, instant communications, social vulnerability, imposition of the SAP by IMF, have reduced hope in democracy and livelihood. In 2005, a study by the *Latinobarómetro* showed that a great

majority would again prefer a military dictatorship to an economic crisis. These results can be explained by two decades of loosing income and well-being. Furthermore, in many countries in LA the trust in a democratic government, transparent elections or changes in the conditions of life through election processes were disappointed, especially in Paraguay, Peru, Colombia, and Mexico with high degree of distrust (figure 26.9). A social reaction has been a renewed political radicalization in most countries of LA (MST, piqueteros¹³, Zapatistas; Ouviaña 2005). This has created a complicated political and institutional situation, but has offered LA an enormous potential for growth, investment and well-being, and for civil society to organize better.

26.5 The Zapatista Rebellion in Chiapas, Mexico (1994)

Mexico, having a border of more than 3,000 km with the U.S., was not exempt from these processes of regressive globalization. The first economic crisis and the first SAP agreement imposed by IMF started in 1976. In 1994, Mexico started with a severe economic crisis in the era of neoliberalism and globalization. Similar crises occurred a few years later in Asia, Russia, Brazil, and Argentina. However, the crisis of the peasants started earlier, due to the exhaustion of the model of stable development (CEPAL 1978; IMF 1977), but primarily due to the interests of the na-

tional elite to link up with globalization. The excessive bureaucracy and an inefficient bourgeoisie controlling the government were unable to cope with a new phase of globalization (Kaplan 2002). The substitution of the import-based modernization process and the rapid urbanization were reducing the rural accumulation, and major financial resources were drained into the urban and industrial sectors. As a result, the rural development was subsumed under the urban and since the 1950's an important process of urbanization was underway, making Mexico City the biggest city in the Third World (Negrete/Ruiz 1991).

Since the 1960's, peasants started to migrate to the U.S., later also to Canada with legal permissions and in the 1980's, when U.S. migration policy changed, they became illegal (figure 26.10). Environmental destruction, aggravated by climate change, highly subsidized world basic food prices, and since 1982 a rapid opening of the domestic to the global market had drastically worsened the situation of peasants and indigenous people. This process of exclusive globalization was reinforced with the signing of NAFTA (Arroyo/Villamar 2002), which reconfigured traditional alliances and opposition along non-national lines. Unequal terms of trade in the world market obliged producers to associate themselves within product lines: coffee, pineapple, and fair trade was an alternative for organized peasants to mitigate the negative affects of dumping and overproduction in the world market.

In this context, the *Ejército Zapatista de Liberación Nacional* (EZLN: Zapatistas) in Chiapas¹⁴ surprised the Mexican government and the festivities of the bourgeoisie on 1 January 1994 with a declaration of war. The military response was directly monitored by foreign governments and social groups due to a new internet channel controlled by the Catholic Church (laneta.com), which was at the service of the uprisings. After ten days of intensive repression, international pressure forced the Mexican government to declare an armistice. Simultaneously, the public exposition of indigenous discrimination and poverty con-

¹³ MST is the movement of landless peasants in Brazil; *piqueteros* are the organized unemployed urban workers in Argentina.

¹⁴ Chiapas is the reservation of blue, black, and green gold of Mexico. 62 per cent of its hydro electricity is generated in this state, seven millions hectares permits a solid agriculture, gas, oil, uranium, sulphur, and rainfall over 5,000 mm/year created an important cultural and natural diversity. Nonetheless, together with Oaxaca, Chiapas belongs to the poorest states in Mexico due to the resource and human exploitation, paramilitary groups conserving an illegal land tenure, corrupt governments, and a systematic neglect of infrastructure (Oswald 2002c: 92-131).

fronted the country with the 'other Mexico' (Bonfil 1987) of the poor, ill, abandoned, and exploited. The apparently modern nation (last under the OECD countries) showed the world how regions and social groups live in absolute poverty and underdevelopment similar to Haiti and Ethiopia, due to the unequal development and resource exploitation. International and national solidarity started, forcing a peace agreement; but both the chamber of deputies and senators objected to the agreed modification of the Constitution, leaving the indigenous population in the same marginal situation.

The Zapatistas experienced this act of treason and decided to reorganize locally, based on traditional customs, laws, and a proper governmental system (*caracoles*, later *Junta de Buen Gobierno*) and Neo-Zapatistas laid down their arms. Thus, a nation-wide protest march, international solidarity, and new political alternatives created sensitivity within civil society (Lee 2002). Their model of bottom-up organization, a judicial system functioning locally¹⁵ without corruption, offered health and educational services also to persons who did not sympathize with their movement. It gave them legitimacy, and the possibility to articulate social alternatives. They were supported by new municipalities, but its expansion was limited due to the massive presence of the army, the impossibility to get public funds for an autonomous development, and their rejection to accept them from the repressive government. Most communities depend for their development on internal resources, and some infrastructure has been created with external solidarity funds (González Casanova 2006).

Globally, the EZLN brought not only Chiapas and its indigenous community dignity, but opened a solidarity process which influenced social movements worldwide, showing that global cooperation is possible and able to challenge authoritarian governments and repressive and corrupt structures (Zibechi 2006). Finally, it opened a bottom-up alternative for micro-industry, micro-credit and service integration, food sovereignty, livelihood consolidation, and increasing control over strategic resources such as water and biodiversity. Sustainable rural development with urban integral planning and cultural diversity is achievable

and has been experimented in Chiapas. This case is threatening elites, corrupt governments, and traditional landlords which are organizing paramilitary groups to induce conflicts for land among local communities (Subcomandante Marcos 2006). On the other side, it has created confidence within civil society involved in this struggle (Olvera 2002) and it triggered a global discussion on the unjust system of globalization.

The example of Chiapas is not unique. In many Third World places the affected urban marginal population and also peasants in industrialized countries have been organizing against the world elites. The agrarian crises aggravated worldwide due to the green revolution and genetically modified seeds (GMO). It forces millions of small producers from their plot of land and livelihood (CLOC 2004). The ongoing process of agribusiness and the new food and health cluster in the hands of a few TNEs has been controlling not only the production and trade of agrarian products, but recently also the model of food consumption and health (Oswald 2007; WHO 2003; WHO/FAO 2003; Tansey/Worsley 1995).

Politically, the repercussions of the Zapatistas have been complex in Mexico. After the disputed presidential election of July 2006, the Supreme Electoral Tribunal had to decide the winner of the presidential elections. The post-electoral process in 2006 and the alliance of the former ruling party (PRI) with the conservative PAN, who took power from 2000 on, has reinforced the regressive globalization based on an alliance of the bourgeoisie. This forced the left parties to organize in four ways: 1. in the electoral process, the PRD (Party of Democratic Revolution) cooperated with other left parties; 2. the alliance of social, peasant, and urban movements outside of party; 3. the integration of traditional leftists, intellectuals, and former PRI persons, due to the loss of identity and social concerns of the present governmental coalition.

There were also more than three million citizens supporting the EZLN and its process of democratization. This bottom-up alternative threatens the traditional corrupt political system, but their territorial autonomy is limiting tourist and economic interests of global elites. The army encircled the Zapatista region with a low intensity war (López/Rivas 2002; Benítez 2002) and threatened the population, thus hampering this genuine process of development. 4. A minority of orthodox Marxists decided to maintain an armed struggle (EPR; ERPI), being confined in some states of Mexico where poverty and marginalization allows them to count on popular support (López/Rivas

15 The Inter-American Bank for Development (2006a) found out that only 1.8 per cent of the crimes were punished in Mexico and the loss due to the non-implementation of the law costs the country around 15 per cent of GDP each year. It increases inequity and creates social distrust.

2005: 190–195). 5. The sole reality that an alternative is maintained after 13 years of aggressions gives other social movements in the country and outside hope for change and force for struggle.

26.6 The World Social Forum: A Response to the World Economic Forum

There are two main visions of how the World Social Forum (WSF) started, reflecting not only the existing tension within the social movements, but also ideological and political underlying factors. The first position, mainly explained in European books and by Western scientists (most of them men) starts with the World Women's March for gender equity, the campaign of ATTAC for a Tobin tax, and *Le Monde diplomatique* for democratic popular participation. Together they organized with representatives of Brazilian MST, other peasant movements and the *World Forum of Alternatives* an 'anti-Davos' event. Due to the geographical difficulty of this little town in the mountains, the limited communication facilities, and the well organized police, they decided after a meeting in Zurich to find an adequate place to organize not only an anti-Davos meeting, but one proposing another possible world.

There is another explanation, shared in the South, which links up the structural poverty and regressive globalization with the upsurge of social movements, struggling against the hegemonic centres and the imposition of their neoliberal model, the exploitation of natural resources and the destruction of social networks, and cultural and immaterial goods. This explanation is related to Latin America, where during 1968 students started revolutions for wider political participation and democratization. In 1971 the peasant centre Túpac Katari was founded in Ecuador, and in 1974 the first indigenous congress took place in San Cristóbal de las Casas in Chiapas, Mexico. The progress of social exclusion led in Mexico to the first economic crisis in 1976, followed by other countries in LA, Asia, and Africa. They aggravated the survival of the poor and induced a massive migration process from the rural areas to the towns, which is still underway, above all in India and China. Later, as a result of several military coups, in 1977 a long campaign of the Mothers of the Plaza de Mayo in Buenos Aires started, and in 1979 together with the foundation of the MST the first land occupation occurred in Brazil in the Fazenda Malai in Rio Grande do Sul. In the

same year the *Trade Union of Workers and Peasants* (CSUT-CB) was founded in Bolivia, later transformed into *Central Obrera Boliviana* (COB), and in Mexico the *Independent National Peasant Movement Plan de Ayala* (CNPA). All these social movements of the indigenous, peasants, workers, and women, relied on their internal resources coming from communities able to create their proper and independent space of struggle.

The consolidation of alternative processes was brutally repressed, e.g. in the 1968 student massacre in Tlatelolco, Mexico; in 1954 by a military coup and dictatorship¹⁶ in Guatemala and Paraguay; later in 1964 in Brazil; 1968 in Panama; 1970 in Bolivia; 1973 in Chile and Uruguay; 1976 in Ecuador and Argentina, 1991 in Haiti and 1992 in Venezuela. In addition there were civil and guerrilla wars in Central America, in Colombia, Peru, Brazil, Argentina, Ecuador, Mexico and in other countries. The massacres against the indigenous people and ethnocide in Colombia, Guatemala, Bolivia, Ecuador, and Peru reinforced repression (Tlatelolco, Mexico; Uruguay, Guatemala, El Salvador, and Paraguay). In different parts of Latin America the movements understood during the 1980's that it was necessary to train and educate their members in order to create stable organizations able to transform society from the inside. Health and education together with food sovereignty was picked up by most movements. MST consolidated its organization with 4 million members and it is supported by additional 480,000 families. MST set up 3,000 camps for landless peasants and established 1,500 schools,

16 Worldwide, military coups were a common tool to gain power and most of these dictatorships are still in power: Muammar al-Qaddafi, leader of Libya (1969–); Teodoro Obiang Nguema Mbasogo, President of Equatorial Guinea (1979–); Lansana Conté, President of Guinea (1984–); Blaise Compaoré, President of Burkina Faso (1987–); Zine El Abidine Ben Ali, President of Tunisia (1987–); Than Shwe, Military General, Head of Junta, Myanmar (Burma) (1988–); Omar Hassan Ahmad al-Bashir, President of Sudan (1989–); Yahya Jammeh, President of The Gambia (1994–); Pervez Musharraf, Chief of Army Staff and President of Pakistan (1999–); François Bozizé, President of the Central African Republic (2003–); Ely Ould Mohamed Vall, Chairman of the Military Council for Justice and Democracy in Mauritania (2005–); Sonthi Boonyaratglin, Chairman of the Council for Democratic Reform under Constitutional Monarchy in Thailand, Present President of the Council for National Security (2006–); Commodore Josaia Voreqe Bainimarama, Head of the Fijian Army, Acting Prime Minister of Fiji (2006–) (Luttwak 1980).

teacher training colleges and the peasant university Florestan Fernandes. Their philosophy which influenced deeply *Via Campesina* (2005) and the WSF is “the question of power can not be resolved by the occupation of the palest, which is the easiest thing, but by creating new social relations” according to Pedro Stédile, a leader of MST. Transformation of the society is not like a reality show, that are often transmitted on television, but a transformation of daily life in the place where the people live, work, and meet; the public space where the system of domination and exploitation is understood in any action and imposition.

In this complex socio-economic situation the EZLN (that was represented in the WSF by neo-Zapatistas and solidarity movements) – armed groups were not allowed to participate – initiated a dialogue. They referred to the fact that as indigenous they were conquered, and as indigenous they would liberate themselves. Convinced that a collapsing system will require a new one, all these forces met at the WSF to strengthen a collective alternative interpretation of reality and possibility of change.

The concrete history for the final organization could be summarized with these facts: The first decision was to hold it in the South, where the neoliberalism was affecting seriously and where the majority of people were poor. Second, Latin America had better conditions, organizational capacity and political circumstances of popular organizations. Oded Grajew the coordinator of the *Associação Brasileira de Empresários pela Cidadania* proposed Brazil, the government of the state of Rio Grande do Sul and the mayor of Porto Alegre, in the hands of the worker’s party PT, were interested to support it. For the leader of PT, Luiz Ignacio Lula da Silva, it was an opportunity to promote his candidature as president of Brazil, and the Jesuit University offered its installations. Finally, after diverse meetings between Grajew and Francisco Whitaker (2006) the idea crystallized. Together with Le Monde Diplomatique, PT, Via Campesina and representatives of diverse other social movements, an International Committee was created. The name agreed on was WSF and it took place at the same time as the World Economic Forum in Davos, to reinforce the anti-meeting character and to symbolize a real alternative.

Confronted with a worsening of life conditions for a majority, increasing poverty, and unemployment in the North and South, intellectuals and social leaders have tried to find alternatives to exclusive globalization promoted by the *World Economic Forum* (WEF) in Davos, Switzerland. ‘Another world is possi-

ble’ and ‘globalize the struggle, globalize the hope’ were some of the mottos used during the first *World Social Forum* (WSF) in Porto Alegre in 2001 that was organized as an alternative movement against neoliberalism. In addition to intellectual proposals a solid coordination of social movements started as the *Assembly of Social Movements* (ASM). They were able to adopt a common agenda of world action that respected diverse ideologies and struggles. During the second WSF also in Porto Alegre, Brazil (2002) a unanimous campaign against the war in Iraq was launched and 15 million participants went on the streets on 15 February 2003 in 800 cities protesting against this aggression, and obliging some of their governments to withdraw from this bellicose act.

A huge alliance with church leaders (the Pope, archbishops, Islamic, Buddhist, Hinduism and Jaina religious leaders), Hollywood and sport stars, managers, social leaders, and political parties were not able to stop the war of the U.S. government and its allies, but it lacked an endorsement of the UN Security Council. Each participant of the WSF used his own network, and wider and looser networks supported by internet allowed a better coordination, avoiding an extreme monopolization or an easily corruptible leadership. This resulted in political initiatives in many countries to counter the disillusionment with state-led multilateralism, and the reduced costs of communication created a geopolitical environment for massive civil organizations and the consolidation of the ASM, also for people unable to participate physically in the WSF in Porto Alegre, Mumbai or elsewhere.

Other effects were the interchange of empiric experiences with lawless and unfair globalization in economy and technology strengthening the links and permitting to develop diverse regionally adapted strategies of struggle, combined with international denunciations of neoliberal abuses through the internet. A third achievement was the development of alternatives. *Via Campesina* launched the campaign for food sovereignty and ‘seeds as sacred goods of earth and patrimony of humanity for communities’ as a model of dignified livelihood for rural small producers. The Zapatistas interchanged experiences of democratic self-government, increasing solidarity with the dispossessed. The municipal government discussed the popular budget assignation and direct democracy instead of an electoral one. Progressive deputies analysed different styles of law creation and reinforcement. Popular education was promoted with the participative liberation pedagogy of Paulo Freire, and the MST inaugurated its National School Florestan Fernandes

on 23 January 2005, a university built by 1,115 workers belonging to their organization, able to train peasants technically with their own ideology of solidarity.¹⁷

26.7 Social Movements Against Globalization and for Altermundism: A Platform for Reconceptualizing Security?

Confronted with these worsening social conditions, the excluded organized themselves to increase their human, gender, and environmental security (HUGE, Oswald 2007). This represents a response to the underlying structural factor of global capitalism linked to the system of international division of labour and the appropriation of the surplus by a small elite. The neoliberal doctrine linked to pragmatic technocrats in multilateral and national governments are under pressure from their citizens. Particularly, LA is not only suffering the strong impacts from their SAP, but got also organized in favour of a model of an economy achieving both human security (Ogata/Sen 2003; Annan 2005; Brauch 2005, 2005a) and environmental security (chap. by Dalby in this vol.; Olivier 1981).

In Brazil, Argentina, Uruguay, Ecuador, Venezuela, Bolivia, Chile and Nicaragua, governors from left parties and social or indigenous movements were elected (Barrera 2005). Argentina obliged bondholders to accept only 25 cents for each dollar Argentina owed them, sharing the mismanagement under the Menem government. Chávez is launching the *Bolivarian Alternative from the Americas* (ALBA), an ambitious economic plan which uses their regional money in commercial interchange instead of the dollar. Bolivia, one of the poorest countries in the world under the leadership of his indigenous president Evo Morales is nationalizing its energy resources with the goal to overcome hunger, extreme poverty, insufficient health services and undernourishment with the earnings (Murray/López 1996). Finally, the organized pressure against the Free Trade Agreements of the America proposed by U.S. President G.W. Bush derailed and the U.S. now signs bilateral trade agreements with

each country. South America is also reinforcing its Mercosur and is creating the Bank of the South.

Moreover the protest movements against regressive globalization have spread globally, including opposition against the WTO in Seattle (1999), Cancún (2003) and Hong Kong (2005). It is reflected in the protest meetings against the WEF in Davos, in the alternative summits of the G-7, G-8, the WB, IMF, and wherever the global economic elite met. It was also present in the recent coup in Thailand, where 10,000 protesters were opposed to the U.S.-Thai trade negotiations and the new military government stopped these trade talks. The world protest against the Iraq War exposed clearly the crisis of multilateralism and the limits of the UN system to maintain peace and economic stability. The difficulties within the WTO due to the refusal of the U.S. and the EU to reduce subsidies for agriculture, inspired Fred Bergsten (2004), a supporter of free trade during the meeting in Cancun in 2003 to compare the WTO “to a bicycle: they collapse when they are not moving forward.” Their double standard in trade policy, preaching free trade, and practising protectionism, has been rejected by Southern governments and social movements.

Furthermore, the improvement of human security and poverty alleviation in China and India are not the results of a rigorous application of the SAP of IMF, but of a genuine state intervention in their economic policy. Also, Malaysia refused to accept the IMF recommendations and was less affected by the Asian economic crises. The decline of a naïve globalization, promoting within the present system of world power a sustainable livelihood, is evident with a growing opposition and social pressure (Shaw 2003) and worldwide economy of solidarity sometimes linked with environmental services (Martínez 1995). Better communications shows that the South transfers annually US\$200 billion (World Bank 2005) to wealthy countries. Additionally poor nations are obliged to pay for debt services, patents, and royalties against their own interests.

Finally, the obsession with economic growth at any costs, promoted by the WB, IMF and WTO, and based on oil intensive production and transportation, brought the world to the limits of global and environmental change (Crasswell 2005). Another geopolitical factor threatening *environmental security* (see chap. by Dalby in this vol.; Brauch 2003, 2005, 2007) is water with its surface reserves in the Amazon region, in Venezuela, and Argentina and its underground water in the Guarani aquifers in South America. Water transformed into food is traded worldwide as virtual water

17 Symbolically, the building of 30,000 m² used a sustainable model of construction of bricks developed on the university campus reducing iron, steel, and cement. This university is open for students from other organizations and countries promoting a democratic land reform, social justice, and the right to land and food sovereignty.

and could increase the food power of these countries, especially when global warming is threatening the food security in the U.S., Canada, and Australia (Oki/et al 2002, 2003; UNESCO-IHE 2004), today's most important food exporters, due to drought and extreme weather events (Alcamo/Endejan 2002). Will the need for alternative energy be able to destroy the last remaining huge tropical forest - the Amazon - to grow sugar cane for ethanol production? Will irresponsibility and interests be able to create further irreversible damage?

The present crisis of legitimacy within the multilateral UN organizations obliged the World Bank to take social movements and gender equity seriously into account. Popular resistance and active opposition to regressive globalization are not only expressed by anti-globalization and protests against the WTO, IMF, WB, and the G-8, but increasingly also by positive alternatives, as expressed by an increasing *altermundo* worldwide.

The World Social Fora started in Porto Alegre in 2001 to adopt a collective political agenda. The third WSF in Mumbai (2003) started symbolically with a massive demonstration of Dalit women and men, asking for equality and inclusiveness in India. Nairobi (2007) focussed on poverty, violence and HIV/AIDS. The clarion theme 'peoples struggle, peoples' alternatives' reinforced cultural resistance. From 2004, the WSF have spread globally and regionally, bringing together social groups and persons who are developing alternatives in their daily life. Exchanging experiences, learning from the success and failure of others, and supporting groups with difficulties multiple social movements, have emerged. These bottom-up activities have increasingly been taken into account by some governments. In some LA countries top-down governmental policies responded to these goals, which led to new laws. However, the protest marches and the declining support for President Lula in Brazil have also shown that social movements and citizens are critically evaluating the impact of economic policies on their pockets. They put pressure on their governments to move away from regressive policies. For these reason Brazil, Argentina, Indonesia, and Thailand repaid their debts to the IMF, knowing that their economic crises had been aggravated by their required implementation of the imposed SAPs.

With regard to gender insecurity, registers of intra-familial and interfamilial violence, rape, feminicide, and women as war objectives are growing. This insecurity relates to structural, physical, and cultural violence, where women were and are discriminated dur-

ing thousands of years within patriarchal, violent, and exclusive structures of families and society. An integrated *gender security* approach is considering first a wider concept of gender, including all vulnerable groups, and second, focus on livelihood, food security, health care, public security, education and cultural diversity, as concrete tools to reduce the present insecurity. Further, it is questioning the existing process of social representation-building and traditional role assignment between genders, including environmental and human security (HUGE) concerns¹⁸. An integrated approach of HUGE focuses on overcoming the consolidated gender discrimination by reorienting '*human security*' to defeat discrimination through specific governmental policies, institution building, and legal reinforcements by stimulating political and social participation of women, the young, and the elderly.

Gender sensible Islamic countries have shown a one per cent higher GDP growth rate than countries which are discriminating against women (World Bank 2005). Nevertheless, in Africa women own only 2 per cent of the land, where they contribute 33 per cent of the paid labour force; 70 per cent of agricultural labour days; 60-80 per cent of the subsistence production; 100 per cent of food transformation; 80 per cent of food storing; 90 per cent of spinning and weaving; 60 per cent of harvesting and market activities (FAO, 2002). Due to permanent socio-economic crises they are trained and have developed survival strategies in coping with short and long-term disasters such as economic crises and famine.

In synthesis, since the fall of the Berlin Wall, the democratization process in LA, the death of Mao in China and the modernization process in India, a new scientific debate has emerged focusing on new threats to security. The security concept has widened (Buzan/Wæver/de Wilde 1998) and deepened, shifting from nation-states to other referent objects from the individual to the global level (Brauch 2003). Some multilateral organizations have introduced sectoral security concepts, such as food (FAO 1996a, 2000a, 2006, 2005a, 2005b; FAO/IFAD/WFP 2005), health (WHO 1999, 2003), labour (ILO 2005), and water security

18 In this chapter the security term is widened and deepened, overcoming the narrow approach of military security. The author is convinced that human, gender, and environmental security (Oswald 2001, 2004, 2006a, 2006b) is a 'HUGE' security concept that is able to deal with the new risks and threats (Beck 2001, 1998) from global and climate change (Crasswell 2005).

(UNEP 2004, 2001). Confronted with poverty, increasing inequality, resource scarcity, population growth, technological threats (genetics, cloning, nanotechnology), increasing vulnerabilities and risks from natural disasters are frequently aggravated by human activities (Beck 2001, 2007). This can be observed in the different effects hurricanes had in Cuba, Haiti, Mexico, and the U.S. (Wisner 2004).

The concept of security was widened from the narrow military dimension to additional societal (Touraine 2006), economic (Stiglitz 2002a/b; Sen 1995; Calva 2003, 2007; Fuentes/Rojas 2005), human (UNDP 1994, 1996, 1998, 2000, 2003; UNCTAD 1994), environmental dimensions (Brauch 2003, 2004a, 2004b, 2005, 2005a; Homer-Dixon 1991, 1994, 1999, 2000; Homer-Dixon/Blitt 1998; Baechler/Böge/Klötzli/Libiszewski/Spillmann 1996; Bächler 1999; Bächler/Spillmann/Suliman 2002), and to gender perspective (Reardon 1996; Mies 1998; Shiva 1988; Oswald 2001; 2007).

Recently and as a result of the complex globalization process, combined security patterns are relating human, gender, and environmental security: HUGE (Oswald 2007, 2008) with peace-building (Boulding 1992; 2000) and nonviolent conflict resolution, where the humans are located in their Anthroposphere, responsible to care about nature as part of the complex Earth system, and to live with leaving few footprints and destruction. Undoubtedly, a widened concept of security shows that *altermundism* has already induced changes, by re-establishing a 'HUGE' solidarity, sustainability, and dignity for the most vulnerable.

26.8 Summary and Conclusions

The initial question posed in the introduction was whether WSF has been a platform to increase security in a wider sense? The experience after the six WSF and the regional meetings in Caracas, Bamako, and Karachi, are complex and it is too early to evaluate their possible success and impact as well as limitations. Therefore no simple answer is possible. The crystallization of different currents within the WSF was symbolic at the Nairobi meeting, remembering that Africa is the birth place of humanity and therefore humanity as a whole has to explore and open ways to confront the present impasse of neoliberal and regressive globalization. There is no single way possible and the survival of multiple ethnic groups was possible thanks to their strategy of resilience-building and resistance.

First: the WSF is neither a movement, nor an organization; it is an *open space* to mobilize horizontally collective and diverse forces from bottom-up. It is clear that social movements have not yet developed an integral answer and a coordinated strategy of articulation against neoliberalism. The most important question is whether this is desirable and feasible? Is it possible to combat with few tools the economic, military, political, and ideological concentration of world power?

Second: The evolution of the WSF in Nairobi (2007) has shown that some participants were benefiting or are trying to benefit. First of all, Lula and Chávez were re-elected as presidents of Brazil and Venezuela, and José Bové tried to be elected in France in spring 2007. International ATTAC wanted to lead a world movement supported with the Tobin tax on speculative money. Samir Amin and other prominent intellectuals insisted that the book of Whitaker (2006) is ingenious and without any social class analyses. Furthermore, it is impossible that free decisions and consensus decision-making could not be reached within the present structure of social exclusion. Finally, in this group there is a wide spectrum of INGOs and NGO, which depend on financing from multilateral, governmental or private subsidies, and which were convenient for understanding and sometimes dividing the efforts agreed upon during the WSF. Their agenda was excluded from the beginning on from the ASM. Their often personal interests (former Marxist, Leninists and Trotskyites) is also called *realism*. For them the previous WSF and noticeably Nairobi has been a debacle. They wanted to create an Anti-Liberalism World Organization with an organized and hierarchical structure, reproducing the present model of the patriarchal system.

Third: There is a *idealist* group (former Marxists influenced by Gramsci) who are supported by a wide coalition of religious leaders ranging from the theology of liberation and Buddhism to religious pluralism. Together with some Nobel peace prize winners, they are promoting a spiritual approach and a theology of intercultural and inter-religious liberation against hegemonic and neoliberal efforts of society and churches. Their combination of psychoanalysis, African and Asian spirituality, and feminist gift-identity, tries to rescue with genuine spirituality and ethical behaviour the deep values inside any human being. They hope to be able to control religious fundamentalism and terrorism, but also neoliberal exploitation and destruction.

Fourth: There are the *utopians*, also excluded, some of them are identified with Maoist ideologies. They have a self-reliant and bottom-up background (Ubuntu, Ujamaa, ejido, ahimsa, economy of solidarity, caracol, the other money, the other stock market, etc.). They are represented in the WSF as the ASM and the *Social Movements World Network*. For them the WSF is an open space, where primarily social movements interchange experiences of struggles and create a global agenda to coordinate the opposition against neoliberal events (WTO, G-8, IMF's ministerial sessions). But more important, the World Social Fora have created space where the social experiences of the excluded are analysed, their failures understood, and their practices improved. In this space, global themes such as genetic modified organisms, peasants' seeds patrimony of humanity, economy of solidarity, livelihood improvement, political struggle for local sustainable development, democratic land reform, etc. were discussed and mutually reinforced.

These groups have created a transnational space of solidarity and struggle, able to promote a new platform of security where existing power relations have not been frontally attacked, but an alternative world model has been created, where the excluded could find a dignified live. Together with spiritual reflections and sessions, dance and song, they have created a new working space and labour creation beside the formal job markets, and often also besides the formal political system. These isolated groups were always victims of repression and exploitation. Today, their force has created a counterbalance to the power excess from dominant governments and elites (see MST). In these social movements, integrated e.g. in Via Campesina, Freire's alternative and liberation education, a world solidarity economy, ecofeminism and gift economy, some democratic trade unions and millions of local self-reliant efforts have become the hope for an alternative future for the three billion people who have been excluded from the benefits of globalization. They are creating their opportunity for a dignified and sustainable livelihood, related to food sovereignty, traditional medicine, resistance, and social solidarity networks. This is a utopia based on spirituality, ethics, sustainability, and solidarity. It may be a future for the majority of the world population - many of them have been victims of the globalization process.

27 Security Regionalism in Theory and Practice

Björn Hettne

27.1 Introduction: Conceptualization and Previous Debates

The aim of this chapter is to clarify the meaning of 'security regionalism' or the regional dimensions of security. Due to globalization and the end of the Cold War the world order is moving beyond national sovereignty. Post-sovereign political rationality assumes that solutions to problems of security must be found in transnational structures. Security itself is becoming increasingly complex, even if the threat to physical security remains in focus. Mortal threats can come from different sources and levels of society, domestic as well as international. The purpose of regional peacekeeping is precisely to prevent the spread of local conflicts. Conflict management is consequently getting internationalized, whether on a global or regional level. From having been seen as a rival approach to universalism or globalism the regional level has become increasingly important, judging from recent literature. In case of 'complex humanitarian emergencies' caused by serious human rights violations, this includes external intervention in what was called 'domestic' affairs; perhaps the most dramatic and controversial aspect of post-sovereignty. An increasing number of interventions are regional rather than multilateral and this chapter tries to explain why this is the case. In this introduction some crucial concepts are first defined and the previous debate on regionalism and security is briefly summarized. As far as the concept of *security* is concerned the general introduction to this volume has already put the concept in context. What is of importance for this analysis is the increasing importance of intra-state conflicts and how domestic crises influence *regional security*, making the traditional distinction between domestic and international less relevant. Human rights and other internal security matters are thus treated as important security problems in international relations (Lake/Morgan 1997: 23).

There is after decades of academic discussion still no consensus about what is to be meant by *region*, except that we must go beyond geography but nevertheless retain a territorial dimension to make sense of the concept. The 'new regionalism', furthermore, focuses on emerging formations rather than seeing regions as given subsystems of the international order. *Regionalism* is a key aspect in the post-cold war situation. It refers to a tendency and a political commitment to organize the world in terms of regions; more narrowly the concept refers to a specific regional project. In some definitions the actors behind this political commitment are states; in other definitions actors are not confined to states. *Regionalization* refers to the more complex process of forming regions; whether these are consciously planned or caused by spontaneous processes is not agreed upon by all authors. A region can be more or less coherent, referred to as level of *regionness*. A higher degree of regionness and regional identity also implies capacity to act, or *actorness*, most importantly in security management. Lower regionness consequently implies greater impact from the outside. The level of actorness can best be assessed in the security field. A high level of actorness also means that security policy may reach outside the particular region and even influence world order. This is so far the case only with the EU. The often-used concept of *regional organization* is also rather unclear. Some regional organizations are explicitly recognized by the UN as a particular organizational level of world order; others are developing more spontaneously, raising intricate problems of legitimacy. This will be discussed in the last section.

The first generation of regional integration studies in the 1950's and 1960's were immediately concerned with economics, but more fundamentally they were in fact concerned with peace and security. They tended to see the nation-state as the problem rather than as the solution. The relevant theories were federalism and functionalism/neofunctionalism. *Federalism*, which inspired the pioneers of European integra-

tion, was not really a theory but rather a political programme; it was sceptical to the nation-state, although what was to be created was rather a new kind of state. There was no obvious theorist associated with federalism. In contrast, *functionalism* has been much identified with one particular name: David Mitrany (1966). This was also an approach to peace-building rather than a theory. The question for functionalists was on which political level various human needs (often defined in a rather technical way) best could be met. Usually the best way was found to be going beyond the nation-state, but not necessarily going regional (Mitrany 1966). Thus both federalism and functionalism wanted the nation-state to go, but through different routes and by different means. Neofunctionalism more explicitly discussed integration as a region-building process, and the positive implications as far as security was concerned were taken for granted. Neofunctionalism was essentially the theory of European region-building authored by Ernst Haas (1958). What was created in Europe was according to Karl Deutsch a 'regional security community' defined as "the attainment of institutions and practices strong enough and widespread enough to assure, for a long time, dependable expectations of peaceful change among its population" (Deutsch 1968: 194).

Today it has become commonplace to distinguish between an older wave or generation of regionalism and a more recent, new 'generation' of regionalism ('the new regionalism') starting in the latter half of the 1980's and now being a prevalent phenomenon throughout the world. The studies in the new regionalism considered new aspects, particularly those focused on conditions related to what was called globalization (Hettne/Inotai/Sunkel 1999-2001, 2000; Hettne/Söderbaum 2000; Telò 2001). In the more recent theorizing, security concerns are still relevant but these are often seen as causal factors forcing countries to cooperate, due to the risk of *regionalization of conflict*. By this is meant both the outward spread or spill-over of a local conflict into neighbouring countries, and the inward impact from the region, in the form of more or less diplomatic interference, military intervention and, preferably, conflict resolution, carried out by some kind of regional body. Security regionalism has now become a genre in itself (Lake/Morgan 1997; Adler/Barnett 1998; Buzan/Wæver 2003).

The focus of the rest of this chapter will be on the regional dimensions of conflict management, both the tendency of domestic conflicts to be regionalized, and the need for conflict resolution to be em-

bedded in regional security arrangements. The chapter contains four parts: a presentation of the dimensions of security regionalism, an overview of the global pattern of regional conflict, a framework for the analysis of particularly regional conflict resolution, and a discussion of future prospects for regional versus global security management.

27.2 Dimensions of Security Regionalism

Regionalism and security can be related in many different ways. One has to do with the choice of unit for investigation, e.g. a regional security complex, defined by Barry Buzan as "a group of states whose primary security concerns link together sufficiently closely that their national security cannot realistically be considered apart from one another" (Buzan 1991: 190). The concept has later been rethought in a multi-sectoral and social constructivist direction, making the actual delimitation of the unit more nuanced, but not easier since different security sectors (economic, environmental, societal) may define different regions (Buzan 2003). In an alternative approach developed by Lake and Morgan (1997) regions are defined in terms of the mode of security management or "regional order". Regional orders can shift from simple balance of power systems or concert to more comprehensive communities or integrated polities. The authors also suggest an alternative definition of regional security complex: "the states affected by at least one transborder but local security externality" (Lake/Morgan 1997: 46). The region is nevertheless also here primarily a level of analysis.

Another link between regionalism and security concerns the regional implications of a local conflict. These depend on the nature of the security complex and the way various security problems are vertically and horizontally linked in particular regions, which can be highly varying.

A third link has to do with the conflict management role of the organized region (if there is one) for internal regional security, or 'regional order', for the immediate environment (e.g. the neighbourhood policy of the EU) of the region, and for world order (to the extent that there is actorness enough to influence the shape of world order). Conflict management with regard to immediate environment (but outside the region) can refer to an acute conflict or aim at preventively transforming the situation, either by stabilization or by integration (enlargement of the regional

organization). No clear-cut distinctions can be made. The region can thus be cause (the regional complex), means (regional security management), and solution (regional development).

Development regionalism means concerted efforts from a group of countries within a geographical region to enhance the economic complementarity of the constituent political units and capacity of the total regional economy. *Security regionalism* refers to attempts by states and other actors in a particular geographical area - a region in the making - to transform a security complex with conflict-generating interstate and intrastate relations towards a security community characterized by cooperative external (interregional) relations and domestic (intraregional) peace. The concept also includes more acute interventions in humanitarian crises (complex humanitarian emergencies) often the result of human rights violations, either between societal groups or by a repressive state.

In the globalized world there has emerged, as a result of the spread of disorder, a qualitatively new discourse on intervention called 'humanitarian intervention': a coercive involvement by external powers in a 'domestic conflict' with the purpose of preventing anarchy, punishing human rights abuses, and promoting democracy and 'good governance'. The recent focus upon human security rather than state security is significant for understanding the change of the security and development discourse and the fundamental challenge to sovereignty. Implied in concepts such as 'human security', 'human development', 'human emergency', and 'humanitarian intervention' is the idea of a transnational responsibility for human welfare. *Complex humanitarian emergencies* thus refer to serious multidimensional crises in which the issue of coercive intervention from outside naturally arises. There are three dimensions: Socio-economic crisis, political crisis, and a pressure for external involvement, due to regionalization of conflict.

The level of regionness can be purposively changed. For instance, security cooperation within a region would lead to improved stability, making the region more attractive for international investment and trade, and development regionalism would mean a more efficient use of available resources. There are of course, in terms of *political stability* and *economic dynamics*, different types of regions in the world where these approaches apply differently: core regions, intermediate regions, and peripheral regions.

27.3 The Global Pattern of Regional Conflict

This is not the place for going into the details of regional conflicts, but in order to pinpoint the significant differences among regional orders a brief overview with a few concrete examples is called for. There is consensus that regional dynamics has been increasingly important after the Cold War and that security problems more often tend to be handled within a particular region in a more or less institutionalized way. This is still a trend, not an established fact.

The regional security frameworks created so far in the different world regions are embryonic, with the exception of Europe that has been transformed through regional cooperation from a *security complex*, largely defined by the historical tense and war prone conflict between Germany and France, into a *security community*, where war is no longer an option in resolving conflicts. There is, however, still a number of old and new instances of intrastate conflicts representing mixtures of different forms of political rationality and different types of conflicts, as well as gang wars in the great cities, neo-fascist violence against immigrants, and fundamentalist sectarianism providing a climate for terrorism.

The very existence of the EU makes it unlikely that conflicts close to the core could be permitted to escalate. Other institutions in the security field are OSCE (Organization for Security and Cooperation in Europe) and NATO (North Atlantic Treaty Organization), both with a much wider geographical coverage. The most comprehensive approach to security has been developed by OSCE (Adler 1998). In the post-Soviet space (except the Baltic) the CIS (Commonwealth of Independent States) has a security role but this organization, more or less imposed, is seen with great scepticism by most members, and in reality the stabilizing role is played by Russia (Robinson 2004).

The 'near abroad' of the EU and that of Russia coincide to a large degree. Russia has claimed the role as stabilizer in this area but seems to lack a coherent security policy, except the simple policy of control which has some neo-imperialist overtones, strengthened by the post 9/11 anti-terrorist objective. The neighbourhood also plays a most important role in the EU's more coherent and comprehensive security strategy with the ambitious purpose of transforming the security complex (Charillon 2004). The large EU neighbourhood is constituted by parts of the

post-Soviet area (European part and Southern Caucasian) and the Mediterranean area.

The security concerns of Europe can thus be understood in terms of concentric circles where the security strategy differs with the distance. In the closest circle *enlargement* is the preferred security policy. The success story is the transformation and integration of Central and Eastern Europe, which in fact implied a large number of resolved and thus prevented conflicts. The Balkan region has proved to be a more difficult challenge for European crisis management; we are still not able to assess the outcome of conflict management here.

The general method involved in the policy towards the neighbourhood is *stabilization*. The Barcelona process is for instance a strategy of cooperation between the EU and its Mediterranean neighbours where, in accordance with the basic concern for stability, security is the first priority. The stabilization option in the 'soft power' arsenal forming part of the neighbourhood policy presupposes a strong economy and effective diplomatic instruments.

This is even more the case regarding the peace building effects of *interregionalist* partnerships with more far away regions such as ASEAN and Mercosur. The EU ambition is here to formalize the partnership relations as being between two regional bodies rather than bilateral contacts between countries, but for pragmatic reasons, the forms of agreement show a bewildering variety. The emphasis on interregionalism by the European Union may in the longer run prove to be important in the reconstruction of a multilateral world order in a regionalized form, here called *multiregionalism*, meaning a horizontalized, institutionalized structure formed by organized regions, linked to each other through multidimensional partnership agreements.

The regional order in Latin America is shaped by the hegemonic/dominant role of the USA (also the most obvious security threat), an influence diminishing towards the south, organized in the Mercosur, where there is competition between the USA and Europe. Against Mercosur, the USA promotes the project of the FTAA (Free Trade Area of the Americas). The security problems are of the non-traditional type. The Andean states are often ruled by populism, which has made regional cooperation difficult and increased external leverage. Domestic conflicts are concentrated to these countries (Colombia being a particularly severe case) but rarely affect inter-state relations (Phillips 2004). In the Southern Cone the traditional rivalry between Brazil and Argentina has

been transformed into institutionalized cooperation, creating a security community which even serves as a bulwark for democracy in the region (Hurrell 1998). But even this case has been disputed (Mares 1997).

In Asia there are several regions with different regional problems, and consequently different solutions to regional crises. East Asia, where interstate relations are always tense and sometimes hostile can be described as a potential 'concert', which would mean that the relevant regional powers informally consult each other on a more or less regular basis and if necessary intervene collectively in crises. Southeast Asia, with a rather effective regional organization, has been seen as a security community since all interstate conflicts implying the use of force have been prevented (Acharya 1998). South Asia is considered as an explosive security complex where security threats to a large degree emerge from domestic tension and sometimes have resulted in war. Regional solutions have been prevented by the Indian preference for bilateralism. This does not, however, contradict the enormous potential advantages of regional cooperation, which more recently seems to have been realized in the region. Central Asia with almost no regional cooperation is becoming part of a new Great Game, with the USA competing with Russia and China. Southwest Asia, or the Middle East, is dominated by the USA. This is an artificial region named from the outside and so far also lacking in capacity for regional conflict resolution.

In peripheral regions, e.g. in Africa, there is a conspicuous lack of cooperation that could lay the foundation for a regional security community at the same time as borders are porous due to the unfinished state of nation-building projects. Their normal situation is a tense security complex, prone to both interstate and intrastate conflicts, creating a pressure on external actors to intervene in 'failed states', which threaten to give rise to regional security crises, as in West Africa and in the DRC. The continental regional organization (AU) is assuming a larger role in security management, but both SADC and ECOWAS have played an operational (albeit controversial) role, based on regional security mechanisms. In the case of Liberia the crisis took place in the shadow of the first Gulf War. The imperative to intervene was expressed by Nigeria's president in the context of the Liberian crisis: "When certain events occur in the sub region depending on their intensity and magnitude, which are bound to affect Nigeria's politico-military and socio-economic environment, we should not stand by as helpless and hapless spectators" (Francis 2001: 42).

This is the rationale behind Pax Nigeriana (Adebajo 2002a: 111). When the global community finally acted by the establishment of UNOMIL, the response was too weak, undertaken for the wrong reasons, as well as with a malfunctioning relationship to ECOMOG. The international community seems to be able to deal with only one crisis at a time, which is one comparative advantage of regional crisis management. The wars following the 1994 genocide in Rwanda show the linkage between domestic conflict and regional security. The many unresolved problems associated with humanitarian intervention are shown in Darfur, seen by many as another genocide case.

27.4 The Analysis of Conflict Management

There are six crucial elements in a framework for the analysis of external (including regional) involvement in conflicts: (1) the early prevention, or 'provention' of conflict; (2) confidence building measures and preventive diplomacy; (3) modes of external intervention; (4) peace settlement; (5) conflict resolution; and (6) post-conflict reconstruction.

The framework uses the idea of a 'conflict circle' as a simplified way of understanding conflict dynamics on an analytical level, but it must be emphasized that there is no 'natural history of conflict' in the real world. The 'conflict cycle' could be short, if conflict resolution takes place before the conflict turns violent, or long, if conflict prevention fails. There are examples of both. It is important to maintain a comprehensive view of the full circle: the holistic approach.

27.4.1 Provention

The first 'stage' precedes the 'conflict' even in its potential or latent form. Economic-historical analysis shows that the pattern of development chosen at one point in time can result in structural imbalances, social tension, and political conflict much later. In the early stages of a potential, i.e. still not initiated, conflict cycle, the type of development strategy is therefore crucial for conflict prevention, or to use John Burton's term, *provention*, combining the promotion of conditions conducive to peace and the prevention of conditions conducive to violence. Provention implies "the promotion of an environment conducive to harmonious relationship" and thus "prevention of an undesirable event by removing its causes" (Burton 1990: 2-3). In discussing regional crisis management

in the longer perspective beyond intervention, it is thus important to link security regionalism and development regionalism. These two aspects of regionalism are complementary and mutually supportive. This is implied in the concept of regional security community discussed above.

In this context we are particularly interested in a regional approach, where 'provention' would imply an effort to remove the very root causes of conflicts inherent in the development process. Development regionalism was defined above as efforts from a group of countries to increase the productive capacity of the regional economy. The approach promotes the interests of the region as a whole as well as taking advantage of complementarities within the region, seen as a coherent economic system, rather than a group of competing national economies. This cannot be done without some degree of actorness on the part of the region.

Development regionalism is thus a way to break vicious circles; it is also an important 'preventive' factor by which conflict-generating development processes can be eliminated at an early stage. International development assistance also has a preventive role to play here to the extent that a conflict-consciousness is 'mainstreamed' into international development cooperation. This is reflected in the current praxis of making peace and conflict impact assessments (PCIA) in development work. In this approach it is implicitly recognized that such considerations would be much more effective if applied at an early stage, rather than when the conflict already is a fact.

27.4.2 Preventive Diplomacy

Provention is problematic in the sense of being counterfactual. The conflict that never takes place is not the source of satisfaction that it should be. Prevention, on the other hand, attracts a lot more of interest, since everybody can see the difference in terms of material costs and the amount of suffering between a conflict subdued at an early stage and a conflict that is fully developed, not to speak of the costs of post-conflict reconstruction. In spite of that, prevention is also usually coming too late, because the mechanisms for early management of emerging conflicts are at best embryonic.

One source of the current interest in prevention has been Boutros-Ghali's (1992) *Agenda for Peace*, which called for early warning systems, fact-finding missions and confidence-building measures. The idea caught on and a number of regional associations now

have some conflict prevention body (or 'organ') at least on paper. The first really preventive intervention was carried out by the EU in Macedonia (2003). Unfortunately no preventive measures were taken in this case, which shows the bias towards focusing on one conflict-resolution method at the time. Boutros-Ghali's (1992: 11) definition is by itself a stage approach as he understands preventive diplomacy as "action to prevent disputes from arising between parties, to prevent existing disputes from escalating into conflicts and to limit the spread of the latter when they occur." In this definition the first stage seems to coincide with what above was called prevention, and the third stage implies that the conflict has already turned violent.

Here the concept of conflict prevention is confined to the period (or stage of the conflict cycle) after it has become manifest, but before it has turned violent. To prevent an ongoing conflict from escalating is discussed below as 'intervention'. Intervention presupposes a 'complex humanitarian emergency' in order not to fall under the illegal action of 'intervening in the domestic affairs of another country'. In this stage the conflict reaches a dangerous stage of a political vacuum. Black holes constitute a danger, not only to a particular region, but ultimately to the states-system as a whole. Therefore they provoke international counteraction of some sort. This may take many different forms.

27.4.3 Modes of External Intervention

Provention (in terms of development) and prevention (in terms of diplomatic action) are early forms of civil intervention, but by intervention is mostly meant military intervention in order to put an end to a violent conflict. Distinctions can be made among five different modes of intervention in acute regional security crises: *unilateral*, *bilateral*, *plurilateral*, *regional*, and *multilateral*.

- The *unilateral* carried out by one intervener without asking for permission;
- The *bilateral* where there is some kind of (more or less voluntary) agreement between the intervener and the regime in the country in which the intervention is made;
- The *plurilateral* by an ad hoc group of countries or some more permanent form of non-territorial security alliance;
- The *regional* carried out by a territorially defined regional organization;
- The *multilateral*, finally, implying the involvement of the whole 'international community'.

A unilateral intervention can either be carried out by a concerned neighbour trying to avoid a wave of refugees into its own territory, or by a regional super-power having strategic or economic interests in the region. A bilateral intervention is a rather rare phenomenon and cannot be described as intervention in a strictly legal sense, since there is no (manifest) coercion. Intervention implies imposition. There may, however, be an element of imposition in a bilateral arrangement as in the Indian peacekeeping mission in Sri Lanka 1987. In contrast to a plurilateral intervention by a more or less ad hoc grouping of countries (typically a 'concert'), the regional has a territorial orientation and the right as well as the duty to intervene may be agreed upon in a regional treaty. The multilateral intervention normally means an UN-led or at least UN-sanctioned operation,

One much discussed issue is whether the operation is coercive or not. A lot of confusion is associated with this distinction, relating to different kinds of peace-missions, for instance peacekeeping vs. peace-enforcement. Due to the principle of non-intervention embraced in the UN Charter, it is only the first that is generally accepted; but as an effect of the changing nature of conflict, there is normally an escalation from peacekeeping over 'extended peace-keeping' to peace-enforcement. Generally one would assume that regional interventions are more coercive and more enduring, since the regional mission is not simply a task to be performed within a limited time period, but a serious crisis to be permanently solved in the long-term interest of the whole region.

27.4.4 Peace Settlement

The peace agreement is the formal ending of a conflict. There are endings which are not formalized in a peace agreement, for instance a military victory of one side, or when fighting reaches a stalemate (Miall/Rambotham/Woodhouse 1999). In the latter cases long-term peace building is usually not considered. This may, or may not, be the case in a formal agreement.

The idea of a 'hurting stalemate' is based on the strategy of separating the conflict, presumably having a logic of its own, and social change in general (Zartman 1985). In accordance with the holistic approach it is, on the contrary, essential that the terms of the peace agreement, in order to be sustainable, should also address the root causes and to be preventive.

The fact that so many peace agreements do not hold is the main argument to focus on root causes. There are also more ‘superficial’ reasons for the parties to continue a war, namely the many vested interests, what is referred to as the ‘greed factor’, which develops in the course of warfare. It is, however, reasonable to assume that the large majority of the population living in a situation of war would prefer peace, if given a chance to make its voice heard.

27.4.5 Conflict Resolution

Conflict resolution may of course take place before a conflict turns violent. Here we discuss post-conflict resolutions. A peace settlement may include principles of conflict resolution to be applied, or simply be confined to conditions of cease-fire. In any case the way out of the conflict goes through political restructuring of some kind, i.e. a new political relationship between the contending groups, typically ethnic groups. Ethno-national mobilization may have the historical function of modifying the nation-state project, and the pattern of development inherent in it. The question is how? If we exclude coercive assimilation of ethnic or other minorities in the mainstream nation-building project, a method which usually forms part of the problem rather than of the solution, there are in principle three political ways out of such domestic crises:

First, *constitutional change*, modifying a skewed power structure and establishing a power-sharing arrangement within a particular state formation. A political constitution can itself be seen as an instrument of conflict resolution in a multiethnic state. This is why ethnic demands, at least in an early stage, often include constitutional reform; for instance decentralization of political power to ethnically more or less distinct provinces, internal self-determination referring to societal groups rather than to administrative territorial units, and ‘consociational democracy’ where democracy functions as a human rights regime rather than as a formal political model of transfer of political power. This solution, if applied at an early stage of the conflict cycle, might prevent it from deteriorating into a security problem. Its logic, however, remains within Westphalianism. The accommodation of cultural diversity is a complex process, if culture is itself defined as process rather than inherent qualities embodied in social groups. Against ‘a state-defined, enforced difference’ (Young 1999: 7), it is important to develop a non-primordial concept of multiculturalism (interculturalism).

Second, *the dismemberment of the state*, sometimes accompanied by an organized ‘ethnic cleansing’, is an option that remains open when the preferred solution – constitutional reform – has failed. This unfortunate solution has actually been seriously discussed in the context of the Balkan crisis (Kaufmann 1999). Partition is rarely a good solution, since the old inter-ethnic conflict simply is redened as an interstate conflict (‘pathological Westphalianism’), but in some cases it may nevertheless be necessary in order to prevent massacres and massive human rights violations by the drawing of frontier lines. The independent International Kosovo Commission (2000) has taken that line of argument by making a distinction between legality and legitimacy. However, an increase in the number of states with unsettled grievances among themselves implies a decreasing level of regionness and increasing level of international anarchy.

Third, a completely reversed process is the *integration* of neighbouring states into a regional formation, a process, providing solutions to ethnic tensions simply by downplaying the role of borders, so central to the old Westphalian order based on national sovereignty. Ethnic conflicts often spill over into nearby countries where they are perceived as threats to national security. Conflicts among states are therefore more easily solved within an appropriate regional framework. A regional organization can better than the immediately concerned states take the role of mediator in ethnic conflicts, and in terms of culture and values still be closer to the parties than international, extra-regional mediators. In addition, regionalism is the relevant line of protection, the defensive bulwark against the anarchy of the world market and the global forces of homogenization, and the implied cultural ethnocide stimulating dangerous politics of identity. A comprehensive security is created by building a regional community.

27.4.6 Post-Conflict Reconstruction

Post-conflict reconstruction is a new experience of massive social engineering, completely different from the physical rebuilding of war-torn societies (for instance in post Second World War Europe) in which the inner societal coherence is still intact. The black hole syndrome or a humanitarian emergency includes not only physical destruction but also social exclusion, depletion of ‘social capital’, erosion of civil society, decay of institutions and decline of civility. It is a destruction of the social and moral substance of society. In view of the fact that the pre-conflict structure

generated tensions that led to conflict, 'post conflict reconstruction' is of course a most inappropriate term.

The complex rebuilding (or rather the creation of a new equilibrium) cannot be done by outside actors alone, but normally not without them either. Local actors have become paralysed by mutual hostility and fear, apart from lacking necessary resources. There is thus no alternative but to build on the combined efforts of external interveners and remaining "islands of civility" (Kaldor 1999) to combat hate, suspicion, corruption, and criminality. In the process of normalization it is of utmost importance that the destroyed society is reintegrated in the regional economy, communication network, and system of resources in a supportive way through regional cooperation, which in some cases may not have existed at all before. This cooperation must pro-actively avert tensions that may lead to renewed violence, i.e. what was above described as provention. Thus provention is a fundamental principle of post-conflict reconstruction, if another complex humanitarian emergency shall be avoided.

27.5 The Future of Regional Conflict Management

There is still some distance to travel before an effective regional conflict management regime is established. All dimensions of security regionalism are not equally relevant for all regions. In some cases there is regionalization of conflict but no regionalization of conflict management; in some there is a capacity to deal with the conflicts within a particular region but not outside. Only for Europe all dimensions of security are relevant. The European experience is, however, usually recapitulated in negative terms, because of the failure to manage the Bosnian crisis with the use of hard power. The comparison is with the more 'Marsian' US forcing the Dayton Agreement (1995) upon the warring parties. The EU conflict management from prevention and onwards was surely no success. However, the experience can be understood in other terms by looking at the potential of the European approach to conflict management, i.e. soft or civil power. It has to be recognized that much of this approach developed after the event and thus had little effect. Its relevance for the future is a function of the coherence of the European integration project.

In the European Union security has been a most sensitive issue and its further institutionalization

blocked by the constitutional crisis erupting in 2005 which has lowered the level of actorness, i.e. the capacity to shape the security environment. Undoubtedly integration (i.e. the process of enlargement) has until now improved the regional security situation in Europe, but this particular way of security management has an uncertain future as there are obvious political limits to enlargement.

Regionalism and security are multifaceted phenomena that relate to each other in widely different ways as we look beyond Europe. A basic distinction can be made between the classic, neo-functional thesis of regional integration as a peace-promoter (the ASEAN model), and the more recent perspective - associated with the new regionalism (Söderbaum/Shaw 2000) - of the regionalization of conflict as a reason for region-building (the ECOWAS model). These approaches are different but not contradictory; they belong to different stages in the conflict circle. A different situation, but with conflict playing the stimulus role, is when the region organizes against a common enemy. In fact this also applies to the ASEAN case, and to the early development of SADC (Kivimäki 2002).

Development regionalism and security regionalism constitute a package which may differ in content but is relevant in all emerging regions in spite of their different types of problems. Both are equally important in a long-term perspective but since we are dealing with 'high' and 'low' politics or 'hard' and 'soft' security, there is an unavoidable asymmetry between them. There is thus a risk of what is called securitization of the development discourse. This is a matter of focus and to some extent of perspective, but it seems that development concerns today, particularly in the light of September 11, are being subordinated under security concerns. Development becomes a tool rather than a goal in itself. With the right type of development as a goal, i.e. provention as discussed above, there should be fewer conflicts (and less terrorism) in the first place.

Another point is that the first option for engagement in a particular regional conflict must be given to the region itself, possibly supported by an inter-regional arrangement. The reason is that most conflicts tend to become regionalized, while the immediately concerned state may lose control over the escalating crisis and even face collapse. Distinctions between external and internal, as well as state actors and other actors (such as warlords) quickly lose their significance. Furthermore, the conflict resolution must be regional in order to be sustainable. National disinte-

gration must be replaced by region-building: the creation of security communities.

Experiences from most regions (far from being security communities) indicate that security regionalism is a serious option, sometimes imperative, if there is a stable core within the region and a reasonable level of institutionalization can be established. Otherwise, there is not much alternative anyway, since multilateral humanitarian intervention is a highly selective strategy. The main problem is to bridge the gap between the short-term 'imperative' intervention, and the long-term preventive strategy to avoid what later may result in a return to violent conflict. For this a comprehensive institutionalization of regional conflict management is needed.

In a positive circle regional cooperation for development reduces the level of conflict and the peace dividend facilitates further development cooperation. This circle can also be turned into a vicious circle, where conflicts and underdevelopment feed on each other and grow to become regional crises. Development regionalism is a way to break vicious circles, and contains an important preventive factor by which conflict generating processes can be 'prevented' before they occur. Secondly, it is a necessary framework for a post-conflict reconstruction phase.

Regionalization has structural consequences beyond the particular region. *Transregionalism* refers to structures mediating between regions, if in a formal way one can use the word *interregionalism*; and if constituting a form of world order: *multiregionalism*. Like the new regionalism, transregional arrangements are voluntary and cooperative. The interregional agreements designed by the EU usually contain the issues of trade, development, political dialogue, human rights, conflict prevention and security arrangements. They have an impact on world order. This raises the issue of regionalism versus globalism, which has been controversial ever since the establishment of the UN (Henrikson 1995). The UN charter was made compatible with so called 'regional arrangements or agencies' and this idea has unsurprisingly surfaced again as the number of failed states has multiplied. The dominant view has been the need for a multilateral sanction for regional interventions to be legal and legitimate. The reality is however very different from an idealized hierarchical order in which the regional level intermediates between a global space, occupied by multilateral organizations such as the UN, on the one hand, and a national 'floor' of sovereign states, on the other.

Whereas the 'old regionalism', marked by the Cold War divisions, was an arrangement that prevented the UN from interfering in a constructive way in regional conflicts, the 'new regionalism' seems to herald a world order in which the UN and regional organizations will have to resume a shared responsibility for resolving regional security crises, rather than the UN delegating authority and distributing mandates. One reason for a continued need for this shared responsibility is the exhaustion of UN power, the decline in its authority, and the still rather embryonic character of emerging regional formations, particularly obvious in the African case. Here the main concern is with regional and multilateral engagement as the two modes which, in some kind of combination, should be the predominant form of humanitarian intervention in the future, to the extent that legality and legitimacy continue to play a role in international relations after the war against Iraq. Unilateral and even plurilateral interventions lack legality but may on some occasions appear legitimate, and the bilateral case is rare and, furthermore, not an intervention in the strict sense of the word since it presupposes some kind of agreement.

A discussion of the comparative advantage of regional cooperation cannot deal with ideals, must consider the realistic alternatives, the level of regionalization, and the effectiveness of relevant regional organizations. An explicit discussion of this issue focusing on (i) consensus building, (ii) support structure, (iii) engagement in conflict resolution, and (iv) restraint of third parties can be found in Diehl (1994). Furthermore, there are distinct problems such as resource constraints, organizational weaknesses, lack of neutrality, and the role of the regional hegemon. Diehl's (1994: 131) conclusion is thus rather negative for regional as compared to multilateral peacekeeping. However, one has to admit that multilateral peacekeeping is not always forthcoming, and if it comes it usually comes late and for the wrong reasons.

Regionalization of conflict may have such dire consequences for a region with weak institutions that intervention has to be improvised as an emergency. Such interventions are often suboptimal, but we have to recognize that most international interventions in domestic conflicts so far have been failures, mainly because of the extreme complexity of intervening in, not to speak of trying to transform, a society in conflict. What is stressed here are rather the emerging regional formations from below, assuming a degree of legitimacy and actor capacity that the traditional formal, typically continental, organizations lack. They

do not get their mandate from above, but (1) from the cooperating states, pooling their sovereignty in order to better manage global challenges, (2) from an emerging regional civil society, and (3) from an inter-regional agreement containing political dialogue and mutual assistance.

Multilateral and regional (plurilateral) actors represent different types of potentially competing authority structures. It seems unrealistic to think of intermediate regional security organizations that are at the same time subordinated to the Security Council and representative of the states in the region, also because the state-centric approach is becoming increasingly irrelevant, as the world enters the post-sovereign stage. It is true that security can only be pooled or transferred by states, but in the process the states are being locked into a larger regional and interregional framework, shaping their behaviour. In the future, the UN may have to operate in a new political landscape of regional and interregional formations which define themselves as they evolve out of shared interests and perceived threats among a large number of actors, state actors, and others.

The resulting regional and interregional order will be structurally different from the Westphalian order, and an alternative to unilateralism. This can be called 'regional multilateralism', a world order based on institutionalized constructive relations between moderately introverted and rather self-sustained world-regions, capable of managing their own regional crises. However, it is essential that these world regions engage in inter-civilizational dialogues with the purpose of developing an inter-subjective understanding of the conditions for planetary co-existence. September 11 did not facilitate such a world order, the necessity of which becomes all the clearer as the current war against international terrorism shows its inherent deficiencies in terms of legality and legitimacy.

28 Identity-based Security Threats in a Globalized World: Focus on Islam

Mustafa Aydin and Sinem Acikmese

28.1 Introduction

Ethnic and religious issues have gained renewed attention with the spread of globalization. Their divisive character and potential to create conflicts between different groups have been extensively studied since the end of the Cold War, through the lenses of *international relations* and/or *comparative politics*, most of which incorporate historical analysis (Petersen 1979; Silva/May 1991; Brown 1993; Appleby 1994; Janke 1994; Ryan 1995; Ganguly/Taras 1998; Seul 1999; Wiberg/Scherrer 1999; Fox 2001b, 2004; Gurr/Harff 2003; Lobell/Mauceri 2004), *political science* (Lake/Rothchild 1998), *anthropology* (Eller 1999), *sociology* (Gelfand/Lee 1973; Francis 1976; Williams 1994), *social psychology* (Ashmore/Jussim/Wilder 2001), *psychology* (Volkan/Harris 1995; Volkan 1997; Volkan 1999; Lee/McCauley/Moghaddam/Worchel 2004), as well as from a *multidisciplinary* approach (Horowitz 2000).

Among discussions regarding various sources of 'identity' and 'threat' to the rest of the world, Islam has attracted particular attention from Huntington's now (in)famous work (1993, 1996) on the 'clash of civilizations' to George W. Bush's flashbacks to a 'crusade' against terrorists¹. We live in a world where names like *al-Jihad*, *Islamic Jihad*, *Gamaa Islamiyya*, *Hizb-ut Tabrir*, *Army of God*, *Islamic Liberation Front*, *Armed Islamic Group*, *Hizballah*, *Hamas*, and *al-Qaeda*, make the headlights almost daily in connection with terrorism. However, is the picture offered by such analyses and rather superficial presentation of news reporters with regard to Islam as a threat to the world correct? Could there be a link between what is in its essence an 'abstract' formulation, i.e. identity,

and the very 'real' existence of threat to humanity from identity-based conflicts and its close relative, international terrorism?

When we think about the violent events leading to the deaths of many civilians [such as the attack on the World Trade Centre (1993), massacre of tourists in Luxor-Egypt (1997), bombings of American embassies in Tanzania and Kenya (1998), 9/11 attacks (2001), as well as bombings in Madrid (2004), Istanbul (2004), and London (2005)] and their perpetrators, a connection is established rather unavoidably and all-too-easily between the use of terror and Islam. Although this shallow analysis focusing solely on the deeds of extremists and generalizing them to the whole Islamic world is misguided at best, it nevertheless has its attraction in many parts of the world.

However, without denying that the Islam is sometimes used as a self-identification tool and psychological booster for extremist religious groups associated with threats directed at political, societal, economic, and human security at the national, regional or global levels, it is clearly wrong to suggest that there exists a unified-monolithic Islamic civilization threatening the world. Accordingly, this chapter will look critically at the connection between Islam as a religion and Islam as a threat in the globalized world where peoples' resort to deeper religious and ethnic identities came to the fore.

The first part is a *tour d'horizon* on the concept and formation of identities; ethnic, religious, and civilizational versions of identity-based security threats and their link with globalization. Although group identities are mostly shaped by ethnicity, thus ethnic-based threats are more applicable to current regional and global security dynamics, there also exist religious extremists who pose direct threats to regional and/or global security for the sake of their identity. In line with this assertion, the second part analyses how Islam appears as a threat on the mindset of the Western world and why Islam as a civilization cannot be a

1 On 16 September 2001, President Bush told to press that "this crusade, this war on terrorism is going to take a while". For his speech see <<http://www.whitehouse.gov/news/releases/2001/09/20010916-2.html>>.

genuine source for identity-based threats. It is the contention of this chapter that an 'Islamic threat' based on a Huntingtonian version of a civilizational identity is a myth. Nevertheless, it is also accepted that some radical and extremist groups, imagining identities based on Islam as a religion, might pose threats to the security of wider international society. Thus, the last part of this chapter focuses on under what conditions the Islamic identities could be associated with threats to wider world.

28.2 Identity-Based Threats and Link to Globalization

Identity, rather than a given-natural phenomenon,² can simply be defined as the "sense of self" or "enduring aspects of a person's or group's self-definition" (Seul 1999: 554). Within the context of *individuals*, identity is a by-product of self-identification whereby people group themselves along "different axes - class, language, religion, sex, income, occupation, residence, ideological, political party preference, etc." (Bush/Keyman 1997: 317). Apart from these memberships, given or selected, "one's values, emotions, feelings, attitudes, thoughts and goals" are also part and parcel of psychological "individual identity cards". Individuals strive to construct identities to meet their existential needs such as "psychological security, self-locatedness and belonging"; and "failure to form identities produces psychological discomfort which may be experienced by the individual as a threat to survival" (Seul 1999: 554). *Groups*, which can be depicted as the "self-defining collection of individuals", also construct their own identities for physical and moral survival (Seul 1999: 556). Individual and group identities are so intertwined that individuals might form their identities according to their group memberships (such as membership to an ethnic group), whereas groups are a manifestation of the individuals' gathering around certain features - such as people having same ideological preferences forming an ideology-based group identity.

When an individual's or group's existential needs (dignity, safety, recognition, control, etc.) or values are

threatened by another individual or group, identity-based threats come to the fore (Rothman 1997: 7). Within the context of individuals, those threats are a subject of social psychology, whereas the threats associated with collectivity of groups fall within the purview of International Relations. As this chapter focuses on the identity-based security threats experienced in international relations, it will employ identity as it is understood in terms of groups. In this general perspective, identity-based threats are defined as the threats directed at the existential needs and values of groups which affect their physical or moral survival (Rothman 1997: 9). When a threat is directed at a group's identity by another group, the former responds by producing a counter-threat to the challenger. This is described with the concept of "identity competition/struggle" by Seul (1999: 557) in a reference to Tajfel and Turner (1986: 23):

"When a group's action for positive distinctiveness is frustrated, impeded or in any way actively prevented by an out-group, this will promote overt conflict and hostility between groups." In other words, when a group is not evaluated positively and not favoured by an out-group, it might respond to this negative stance by threatening or challenging that group. Although many intellectuals contend that the root cause for identity-based threats/conflicts is this identity struggle which derives from a complex combination of psychological, historical and cultural factors, they also argue that these threats are "manifested in conventional ways such as rivalries over territory or competition for scarce material or social resources" (Rothman 1997: 7; Seul 1999: 564; Brown 1993: 5). Otherwise stated, all identity-based threats are generated by identity struggle between groups, but fuelled by and manifested through material factors and social dynamics.

Intellectuals are divided over which marker of identity is most associated with threat, and thus with conflict. Some argue that *ethnic identity* is the primary marker drawing the lines between groups, and therefore issues related with ethnic identity serve as a prototype for all identity-based threats (Horowitz 2000; Brown 1993; Rothman 1997; Bush/Keyman 1997; Ganguly/Taras 1998). Smith's (1993: 50-51) definition of ethnic identity as deriving from a "myth of common ancestry, shared memories and cultural elements, link with historic territory or homeland and measure of solidarity", explicitly covers all aspects of culture. Bush/Keyman's (1997: 319) argument that "[w]hen ethnic identity comes to the fore, all other dimensions of identity do not disappear, but they are subordinated to a cultural unity defined in terms of

2 The intellectuals are divided over the formation of identities. *Primordialists* argue that identity is a naturally given phenomenon, which can not be subject to self-formation. *Constructivists* on the other hand claim that identity is a social construction by human choice and actions rather than biologically given ideas dictated by nature (Bush/Keyman 1997 and Ganguly/Taras 1998).

ethnicity”, on the other hand, presents primacy of ethnic identity among all other identity-distinguishers.

In any case, the preponderance of ethnicity as an identity-marker since the 19th century leads us to the conclusion that ethnic conflicts have been the most widespread form of identity-based threats in the modern era. The conflicts in Northern Ireland, the Balkans, Sri Lanka, and in the Middle East were and are a forceful manifestation of rivalry in terms of ethnicity, fuelled by the lack of material and/or social resources. The fact that the ethnic-identity threats have mushroomed since the end of the Cold War also adds value to this argument (Ganguly/Taras, 1998: 4-5).

In explaining which dimension of identity is most associated with threat, some focus on the role of *religious identity* as the primary dividing factor between groups, suggesting that the intergroup conflicts occur mostly along religious lines: “Other elements of one’s identity – ethnic, linguistic, etc. – do not meet the psychological needs of people as comprehensively as religion does” (Seul 1999: 562). Seul argues that religious doctrines and belief systems explain every aspect of human existence, thereby meeting the necessity for self-locatedness not only in past and present but also in future; however ethnicity reflected as a belief in a common ancestry does not locate individuals or groups eternally (Seul 1999: 561-562). Since, religion lies at the heart of group identities; he suggests that the most significant type of identity-based threats should have a religious character. Events of 9/11 carried out by militant fundamentalists who identify themselves along religious lines or the demographic/societal threats posed by Muslim populations in Europe can be considered as examples of religious identity-based threats. However, this argument is misguided to the extent that it fails to explain the widespread ethnic conflicts surrounding the globe, such as the struggle driven by the claims of Basques for a national identity which led to a perennial conflict between Basques and Spain, who should have been unified on religious grounds in accordance with Seul’s arguments.

Counter to the arguments whether ethnicity or religion lie at the centre of group identities, Huntington with his ‘Clash of Civilizations’ theory posits civilizations as the main determinants of group identities; thus he argues that a clash between *civilizational identities* will form the next pattern of conflict at the global level (Huntington 1993, 1996). In this theory, civilization is defined as the highest cultural grouping of people which are distinguished by common objective elements – language, history, religion, customs,

and institutions – on the basis of subjective self-identification (Huntington 1993: 24).³ Huntington (1993: 25) argues that the differences between civilizations “are far more fundamental than differences among political ideologies and regimes” that they inevitably lead to clashes. In line with this hypothesis, he assumes that the most intense type of identity-based threat will originate from Islam directly to Western civilization. Wars in Afghanistan and Iraq following al-Qaeda’s attacks in 2001 seem to correspond with this ‘clash of civilizations’ argument (Tusicisny 2004: 485). This line of reasoning, giving primacy to civilizational identity and perceiving clashes between civilizations as the major threats to global security, is also misguided. Huntington’s hypothesis necessitates the existence of unified and monolithic civilizations. However, “in reality civilizations are complex, encompassing diverse and often contradictory beliefs, values, and forces that belie facile generalizations” (Esposito 1999: 229). In this sense, he fails to explain the diversity and differences as well as the clashes for instance within the Muslim civilization. “The Iran-Iraq War, divisions within the Muslim world over support for the Gulf War of 1991, the conflicts among Muslim countries belie the existence of Huntington’s monolithic threat” (Esposito 1999: 229).

As illustrated above through various justifications, it can be argued that identity-based threats associated with ethnicity are more applicable to current regional and global security dynamics; whereas threats emanating from religious or civilizational differences alone are less likely to explain today’s panorama of international relations. However, this assumption does not exclude the fact that there are extremists and fanatics who pose direct threats to regional and/or global security for the sake of their religious identity, acting supposedly on behalf of all their co-religionists, disregarding whether or not this is their will. This argument also does not dismiss the religious dimension of ethnic identity-based threats; in which religion plays its part alongside other markers of ethnicity, as in the case of the struggle between Bosnians and Serbians.

Whether identified along ethnic or religious – or even Huntington’s so-called civilizational – lines, all

3 In 1993, Huntington divided the world into eight civilizations: Western, Confucian, Japanese, Islam, Hindu, Latin American, Slavic and Orthodox, and African. He revised this division in his book of 1996, firstly by dividing Confucian civilization into Buddhist and Sinic, and secondly by eliminating the Slavic from Slavic and Orthodox civilization.

identity-based threats manifest themselves in three ways: Firstly, if a group aims at overthrowing governing elites in a country, thereby diminishing their authority and sovereignty by democratic or anti-democratic means, then it constitutes a threat to domestic political security. Secondly, the existence of these groups in other societies forces the governing elites of those societies to deal with their issues of identity, such as wearing the *hijab*⁴ at French universities, which poses a threat to the domestic or regional societal security. Finally, when these groups refer to the use of force to achieve their aims, they are then subjects of military security either at the national, regional or global level.⁵

Globalization – the rising interdependence of citizens and nations across the world – resulted in an increase of identity-based threats, mainly associated with ethnicity and religion. Firstly, “the materialistic and superficially universalistic set of western values imposed on the rest of the world intensified nationalistic and religious sentiments elsewhere,” and secondly the global spread of capitalism, the prospects for free movement of people, and the expectations for better jobs with an expanding set of material desires created disappointments and resentments since people could not get what they expected (Ishiyama 2004: 3). As a response to the homogenization of culture by globalization and resentments created by the spread of capitalism, people drew themselves closer to their ethnic and religious identities. To put it differently, search for a combination of religious and ethnic identities was regarded as a powerful response to the destructive forces of globalization (Kinnvall 2004: 741).

It is beyond doubt that globalization has produced ethnic and religious awakening. However, the role of globalization in the transformation of this awakening to threats should not be exaggerated. In other words, globalization has not directly led to the resurgence of identity-based threats; rather it acted as a contributing factor. The root cause for the rise of the threats associated with ethnic and religious identities was a combination of economic, political, and social variables (Ishiyama 2004: 5). When ethnic or religious groups had access to the political and socio-economic resources such as “sufficient income levels, voting rights, presence in commerce, access to political power, equal legal protection”, their ethnic or religious awak-

ening that stemmed from the dynamics of globalization did not easily transform into threats or conflicts (Ishiyama 2004: 14).

28.3 The Myth of the Islamic Threat

The dynamics of globalization that culminated in the resurgence of religion as a social and political phenomenon, the decline of the long-demonized communist threat with the end of the Cold War, and finally the tragic events of 9/11 have led many to re-question Islam’s relationship with the above-mentioned identity-based threats. Throughout history, Islam as a civilization in Huntingtonian terms has always been viewed as a threat by the Christian West, even well before the exposition of Huntington’s polemics on inter-civilizational affairs. This view necessarily and superficially has assumed the existence of a monolithic, unified Islamic Empire equipped with a radical ideology that ultimately aimed at destroying Western civilization. In other words, Islam has been perceived as an identity-based threat to the extent that it provided the basis for a civilizational identity.

This myth of an Islamic threat is *firstly* embedded in the depths of history. As argued by Halliday, “history of conflict between the world of the West[ern] Christianity and the world of Islam stretching back over a millennium contributes to the image of an Islamic threat” (Halliday 2003: 109). By the end of the 7th century, a united Muslim community first formed by the Prophet Mohammed and then ruled by his caliphs expanded its borders from North Africa to India. During subsequent centuries and under various rulers,⁶ Muslim rule and faith spread across much of the world either by peaceful means or by *jihad*. When the Muslims appeared in Christian lands, they were considered as a part of “hosts of pagans and infidels inhabiting the Western Christian world” (Mastnak 2003: 206). That was how the Muslim threat was originally constructed. The crusades between the 11th and 13th centuries were the first fully-fledged response of Christendom/West to the so-called ‘Islamic threat’. Both the subsequent waves of crusades and the capture of Jerusalem initially by Christians (1099 and 1229) and finally by Muslims “left lasting imprints of distrust and residual enmity” between adherents of both religions (Saikal 2003: 31). When the Byzantine capital was conquered in 1453 by Sultan Mehmet the

4 Headscarf worn by Muslim women.

5 For a sectoral analysis of security and different types of security threats see Buzan/Wæver/de Wilde 1998.

6 For a brief history of Islam see Armstrong (2000) and Yunus (2003).

Conqueror of the Ottomans, or later the same power forced its way into the heart of Europe, the so-called 'threat of Islam' became part of daily life and of the cultural heritage (such as songs, plays, sayings, tales, etc.) of European societies. This brief history from a Western perspective partly explains the roots of the current perception of Islam as a threat.

The second factor rendering Islam as a threat derives directly from the actions of Muslim governments and from the declarations of Muslim leaders. Although a cursory glance might present an impression that the existence of an 'Islamic threat' argument emanates from the West, this may not totally be true when one carefully looks at the speeches of Khomeini, or of other Islamic figures such as the exiled Ghannouchi of Tunisia, al-Turabi of Sudan, al-Madani of Algeria or lately Osama bin Laden, who frequently refer to the idea of *jihad* against the West or even the ideal of converting the whole world under Islamic rule (Halliday 2003: 110-111). Moreover, the Muslim governments in general use this rhetoric for controlling and suppressing Islamic movements challenging their authority such as the ones in Algeria, Turkey, Tunisia, Egypt, Pakistan, and in the former Soviet regimes of Central Asia, as well as for guaranteeing financial and military aid from the Western powers in their struggle with those Islamic groups (Hadar 1993: 29-30).

Another factor that visualizes Islam - as a civilization - as a threat is closely linked to the growing number of Islamic communities that have been established throughout Europe, mostly in Britain, France, Germany, Holland, and Switzerland as a result of waves of immigration since the 1950's, as well as in the US. Today, the total number of Muslims in Western Europe is estimated around six to eight million (Li 2002: 401; Halliday 2003: 120); whereas there are over 1,000 mosques and Islamic centres in the US accommodating approximately six million Muslims. These Islamic-oriented identities become a source of concern for Western states - with predominantly Christian societies - when they are challenged to deal with social issues such as "the availability of *halal* meat, the provision of places of worship, respect for Islamic practices in education, the clothing and segregation of Muslim women" (Halliday 2003: 121). In this sense, Muslim communities especially in Europe by "putting strains on the social fabric of European societies" pose threats to their societal security (Esposito 1999: 234). The synonym for this threat is known as "Islamophobia"⁷, or lately as "Eurabia" that "represents an ever-growing Muslim Europe - within Europe".⁸ This

general negative stance of the Western world towards Islamic societies mainly stems from the vision of Islam as being anti-modern and the myth of Islam as a long-standing threat.

Finally, the tragic events of the last two decades helped to shape the vision of Islam as a threat. The attacks on New York's World Trade Centre in 1993 with the alleged international support from Iran and Sudan, embassy bombings in Kenya and Tanzania in 1998, the events of 9/11 coupled with bombings in Madrid and London respectively in 2004 and 2005 reminds the world of a unified, monolithic threat that originates from the civilization of Islam.

Islamic civilization as a whole has been regarded by the West and surprisingly by the Muslim world itself as a 'threat'; and in this sense Islam has been labelled as a "civilizational-identity based threat" to the rest of the world. Thus, Islam has been presented as a monolithic threat emanating from a unified civilization. Jonathan Paris refers to this unified and monolithic character of the Islamic threat by stating "all that is needed ... a charismatic Sunni Arab fundamentalist, a Nasser with a beard to unite Muslims into a pan-Islamic political force, which would eventually usher in a unified conquering army of Muslims ready and willing to battle with the West" (from Gerges 1999: 25). Within this context, Paris contends that the one-fifth of the world population that is Islamic is ready to launch a jihad against the four-fifths of the world (Gerges 1999: 25). Newspaper headlines and articles maintain the existence of such a 'monolithic Islamistan'.⁹

However, this uniform character of the Islamic world as well as the monolithic dimension of the Islamic threat is a myth. The reality, however, is the divisions and fractions within the Arab and Muslim world. First, "a multiplicity of contrasting interpretations and claims defines the Islamic vision," and thus Islam cannot be represented as a "monolithic, monotonous and undifferentiated religious order" (Pasha 2003: 116-117). Second, in the face of a common enemy, the Muslim world may unite; though, once the threat or the enemy demans, the solidarity among the Arab or the Muslim world dissipates as quickly as it was formed; since national interests and regional

7 For a detailed account of literature on Islamophobia see Halliday 1999.

8 "Tales from Eurabia", in: *The Economist*, 24 June 2006, p. 11.

9 The concept of a 'Monolithic Islamistan' has been used by Hadar 1993: 31.

politics rather than ideology or religion remain the primary determinants of Muslim politics, like elsewhere (Esposito 1999: 225–226). Moreover, “the military threat posed by unified Islam forces under the Ottoman Empire has long since disappeared” (Halliday 2003: 113).

The most important evidence of the diversity of positions within the Muslim world was revealed with the Gulf Crisis of 1990–1991. At first, Saddam’s invasion of Kuwait was condemned by nearly the entire Arab world. However, Saddam was very successful in providing a popular support for his actions “by appealing to Islam to enhance his image as the champion of the Palestinians, of the poor and oppressed, and the liberator of holy places”. Moreover, when Western forces presented themselves in the Gulf, Saddam quickly gained support of those who would oppose the occupation/intervention of the region by foreigners, such as the Islamic activists in Egypt, Pakistan, Jordan, Tunisia, Morocco, and Algeria. For them, “defending Saudi Arabia and liberating Kuwait was one thing, attacking Iraq quite another” (Esposito 1999: 253–254). While these activists alongside Iran’s Ayatollah Khomeini were supporting Saddam in his call for a jihad against the West, some Muslim countries and religious leaders such as the official *ulama* of Egypt and Saudi Arabia were completely on the other side. Clearly, the Islamic world was fragmented then, and still is with regard to many issues.

The heterogeneous character of Islam is also evident in the case of Europe’s and the West’s Muslim communities. As indicated by the cover story of *The Economist*, “Britain’s mainly South Asian Muslims have far less in common with France’s North African migrants or Germany’s Turks than they do with other Britons.”¹⁰ In other words, so-called Islamic communities in Europe do not primarily construct their identities based upon their religion; but upon their ethnicities in which religion only plays a part alongside other markers. Thus, identity-based threats posed by these groups can only be a by-product of their all-encompassing ethnic identifications.

Clearly, the contention that there exists a unified, monolithic Islamic threat in any version is nothing but a myth. Titles like “The Muslims are Coming” (Pipes 1990), “The Roots of Muslim Rage” (Lewis 2001/2002), “Militant Islam Real Threat” (Pipes 2002), and a growing literature involving the cliché of *Islamophobia* mirror this imaginative discourse.¹¹ The proclivity

to domesticate Islam is very fashionable in large sections of the academy, “evidenced in part by the belligerence directed at Muslims in a fast proliferating cottage industry of experts with direct lineage to the corridors of policy making and state power” (Pasha 2003: 112). Academic and political visualization of Islam as a threat is mostly embedded in ideological and material considerations of the Western world. Ideologically, “the ontological persistence of Islam as the generalized Other of Western modernity and its socialized and materialized forms” explains why the Islamic world is perceived as menacing in the West (Pasha 2003: 113). This vision of Islam as an alternative to Western liberal-modernist ideology stretches back to the depths of history, and is accelerated with the recent terrorist incidents associated with militant Islamic groups.¹²

The end of the Cold War and the disappearance of the communist threat also contributed to the perception of Islam as a threat to the West. The belief that Western society needed a “menacing subordinated other” filled the gap left by communism with the Islamic threat (Halliday 2003: 113). In this sense, “the end of the Cold War led to claims that the spread of political Islam marks the onset of a new cold war where the West’s liberal democratic values are pitted against the religious revivalist norms of political Islam” (Salla 1997: 729). In materialistic terms, experts with direct lineage to the corridors of policy-making and state power in the West are well aware of the fact that creating an enemy is the best tool for legitimizing offensive foreign policies. In other words, viewing the Soviet Union as an enemy had justified “expensive and extensive military apparatuses” and “offensive military policies”, thus the loss of the communist threat left no choice for the West to search for a new one (Hippler/Lueg 1995: 4).

28.4 From Myth to Reality: Islamic Identity-Based Groups and Security Threats

When Islam as a religion lies at the heart of a group’s identity, then these groups might pose threats to security under certain conditions. Even though religion re-

10 “Tales from Eurabia”, in: *The Economist*, 24 June 2006, p. 11.

11 For a short review of some recent books on the Islamic threat, see “Muslims and the West: First, Know Thyself”, in: *The Economist*, 24 June 2006, p. 97.

12 For a link between Islam and terrorism see Weyland 2004.

mains the major marker of those groups' identities, the threats associated with those groups might not result directly and solely from their religious motivations, but from a combination of social, economic or political factors. Those groups can be *organizations* such as Muslim Brotherhood in Egypt or al-Qaeda in Afghanistan, or even *states* like Iran and Libya.

With the end of the Second World War, when the newly independent states in the Middle East (such as Egypt, Syria, and Iraq) began to abandon 'Islamic principles and rule', *Islamic identity-based organizations or parties* became actors of regional and international politics. Islam was regarded by the new governing elites of the region as an "impediment to modernity, progress and development" (Milton-Edwards 2005: 32). However, it was soon recognized that Western-built secular regimes failed in providing political and economic order to these societies. In an environment of bad governance, ongoing conflicts, weak economies and corruption, Islamic identity-based organizations and parties flourished with a similar motto of transforming their societies into ones ruled according to Islamic values. It should be noted that their intention was not necessarily or always derived from the fact that they wanted to create a world living under an Islamist rule, but to respond to the corrupt and unpopular regimes in the Middle East (Hadar 1993: 35).

These Islamic-identity-based groups are divided as 'liberals' and 'fundamentalists' depending on their interpretation of the extent in applying the core Islamic values to modern social and political life. Liberal Islamic organizations or parties, through the processes of *ijtihad* (interpretation) and *fitrah* (natural sense of right or wrong), opt for a modern way of life within the context of Islamic values such as a society where complete gender equality prevails; whereas fundamentalists,¹³ by resisting modernity, restrict themselves to the literal interpretation of their sacred texts. Whether liberal or fundamentalist, to the extent that these Islamic-identity-based groups try to achieve their aims through democratic means they can only constitute threats to the political security of the governing

regimes by challenging their authorities and sovereignties. For example, many Islamist groups "working together with secular parties and using the language of political liberalization, have pressed for political reforms that have led to the elections in Egypt, Tunisia, Algeria, Jordan and Kuwait, and to the establishment of a consultative assembly in Saudi Arabia" (Hadar 1993: 3). However, from a Western point of view this identity-based threat directed at the political security of the governing elites has more comprehensive repercussions for Western interests. The fear is very simple: By overthrowing the states or governing regimes, these groups will destroy the *status quo* in the Middle East region particularly and thus will jeopardize Western access to oil. In other words, with the Islamist movements gaining strength, the West fears the "transformation of old and reliable friends into more independent and less predictable nations that might make Western access to oil less secure" (Esposito 1999: 241). In this sense, Islamic-identity-based groups threaten the economic security of the West when they advocate the overthrow of the governing regimes in the region.

It is a commonplace in the media as well as among politicians and intellectuals to associate these groups with radical, violent, and extremist fundamentalists who have caused the execution of hundreds in suicide bombing attacks across the globe, including the tragic events of 9 September 2001. In this context, it is beyond any doubt that when fundamentalists refer to the use of force, terrorism, and violence rather than using democratic means, they pose security threats understood in the traditional sense. These *radical fundamentalists* aim at the "ultimate construction of a universal Islamic state"; and argue that "jihad is sanctioned by God and it is the only means to resurrect the Islamic state". Their final aim is to "spread the word of *Allah* throughout the world" (Khashan 1997: 12, 20). The *Armed Islamic Group* in Algeria, *Gamaa Islamiyya* and *Islamic Jihad* in Egypt are clear examples of such violent revolutionaries as well as *Hamas* and *Hizballah* which also posit political dynamics in their movements alongside armed struggle. Osama bin Laden and his *al-Qaeda* have been perceived as the major threat lately. Apart from the 9/11 attacks, he is "suspected of funding groups involved in the bombing of the World Trade Centre in 1993, bombings in Riyadh in 1995, and of the Khobar Towers in 1996, the killing of fifty-eight tourists at Luxor as well as the bombings in Tanzania and Kenya" (Esposito 1999: 278).

13 Fundamentalism is defined as the "strict maintenance of the ancient or fundamental doctrines of any religion or ideology". Another definition would suggest that "fundamentalism indicates a certain intellectual stance that claims to derive political principles from a timeless divine text". It is also defined as a "rejection of modernity and its secular variant in both democratic and non-democratic societies". For all these definitions see Milton-Edwards 2005: 3.

In addition to organizations such as al-Qaeda or Islamic Jihad, states constructing their identities along the fundamentalist version of Islam might also cause this type of traditional security threat in the military sense. Iran is a typical case for state-sponsored militant fundamentalism. Since Khomeini's seizure of power in Iran, military Islamic fundamentalism has dramatically increased within and without the Muslim world (Hoveyda 1998: 1, 194). One of the pillars of Khomeini's rule was to export the Iranian Islamic Revolution abroad, and use of force as well as terrorism were the justified tools towards this *holy* aim (Mohaddessin 1993: 114). Thus, only nine months after the Shah's downfall, the American Embassy in Tehran was occupied and fifty-two hostages were held for more than 400 days by the 'militants' under the watchful eyes of the Khomeini regime (Mohaddessin 1993: 20–22). Moreover, attacks on the US Marine Barracks and French troops in Beirut on 23 October 1983 were also linked to Iranian-backed radical groups in Lebanon (Khashan 1997: 7).¹⁴ State-supported violent fundamentalism also manifested itself in the explosion of Pan Am Flight 103 over Lockerbie, Scotland in 1988 killing 270 people on board which was linked to the Libyan government (Hoveyda 1998: 1).

The state-based Islamic militarism is mostly associated with terrorist activities (Mohaddessin 1993; Hoveyda 1998). In this sense, this is not very much different from the threats posed by the Islamic-identity based fundamentalist groups. However, the threats posed by those states are far more serious, since they have all types of political, economic, and military power which is not the case for the small and limited-power groups. When Islamist militant groups cooperate with those states, such as *Islamic Jihad* cooperating with Iran, the repercussions would obviously be much more severe.

28.5 Conclusion

With the events of 9/11, the world has witnessed the tragic character of identity-based threats. As argued by

Rothman (1997: xii), "one of the reasons identity-based conflicts are so engaging is that it is so visceral; it comes from – and hits us – in our gut". Even though the attacks of 9/11 were carried out by some marginal extremists, the main identifier of that group's sense of self was Islam as a religion and way of life. It was more than true that "Bin Laden and his followers drew on a variety of traditions within political Islam to justify their actions aimed at challenging the Western presence in the Middle East" (Halliday 2003: x).

This suggests that Islamic-identity-based security threats may only derive from the violent terrorist actions of radicals and extremists who construct their identities along Islamic lines. Since their identities are constructed alongside their understanding of so-called 'Islamic traditions', they constantly refer to Islamic concepts such as 'jihad' to justify their militant and terrorist actions. Although they usually corrupt and twist the meanings of such concepts, nevertheless, their frequent usage of Islamic terminology encourages association of Islam with fundamentalism and even radicalism or terrorism. Thus the perception of many Islamic groups in the West as "bearded clerics, gun-wielding and masked supporters of Islam, arms dealers, secret world of covert operations and international terrorism" (Milton-Edwards 2005: 9) emerges and recreates itself with every new terrorist attack in the name of 'Islam'.

However, equating fundamentalists totally with radicals and terrorists is misguided at the outset, and Islam as a religion should not be seen as a threat in itself. This was the logic that forced President Bush to apologize when he inaccurately used the word 'crusade' to describe the anti-terrorism campaign that directly connoted a war between the forces of Christendom and Islam. Therefore, a distinction should be made between Islam as a religion and militant Islam as a threat. If not, the Medieval spectre of the religious wars might come back to haunt the international order. The caricature crisis of early 2006 attests how easily ridicule could get out of proportion in today's distrustful world to start a much dreaded clash between civilizations. In such a case, the theory would become a sad self-fulfilling prophecy.

14 Even though the responsibility for the bombings remains uncertain, *Hizballah* backed by Iran and Syria has been associated with the Beirut attacks. Though Iranian elements were not directly involved in the incident, the US District Court declared in May 2003 that the Islamic Republic of Iran was responsible for the bombings, on grounds that Iran had originally founded and financed Hizballah. See <<http://www.cnn.com/2003/LAW/05/30/iran.barracks.bombing>>.

29 Security and Sovereignty

Bharat Karnad

29.1 Introduction

In the prevailing international system of sovereign states, it is the sovereignty of weak states that is most in peril. The concept of sovereignty is not absolute – there never having existed an isolated, autarchic, state surviving entirely on its own and by itself. The exercise of sovereignty is limited by international law and by the differential in the power of states (Schlichtmann 2000). States have always treated sovereignty, according to Robert Keohane, as a bargainable resource (Wood 2001: 2) – compromising it under duress or surrendering portions of it in return for substantial benefits.

Assuming the international system is an anarchy hovering between being “benign” and “of a belligerent kind” (Brown 1992: 20–21) and states have ultimately to rely on themselves for protection (Waltz 1959: 188), an irreducible minimum criterion of sovereignty, defined as the ability of a state to take care of its security by itself (Mearsheimer 1991: 148), is met only by a few countries because the requisite will, wherewithal, and resources are not easily mustered. Thus sovereignty is reduced to an abstraction defining the *de jure* status of a nation-state, not its *de facto* condition.

This chapter will take a snapshot of the post-cold war world before analysing from a realist perspective the three principal interlinked threats to sovereignty, namely, intervention, globalization, and insurgent subnationalism. Notwithstanding ‘the complex interdependence’ obtaining in many aspects of international life, security continues to be perceived in national terms and is so tackled (Prins/Sellwood 1998: 254). The central argument is that the litmus test of sovereignty – the ability of a nation-state fully to protect itself by its own means – has to do with whether, to what extent, and how well a state prevents encroachment of its national security space by powerful foreign countries and external forces, like globalization, and preserves its internal authority in the face of violent activities by armed secessionist groups catalysing

around distinct ethnic, religious, and regional identities. A basic taxonomy of countries is drawn up on the basis of the ability of states to protect their sovereign rights and prerogatives. Differential sovereignty, it will be argued, is the consequence of the bulk of the countries in the system – mostly poor and less developed – being denied the freedom (from outside interference) to use whatever means, including violence, to forge a nation out of masses of disparate and often resisting peoples, freedom that the post-industrial societies and states of the First World enjoyed when passing through the invariably bloody nation-building stage earlier in their individual histories. In the event, the chapter will conclude that while ‘sovereignty’ is increasingly an elastic notion, in practice it is meaningfully exercised – no surprise this – only by the strong states. The analytic approach adopted here is driven chiefly by concerns of policy, not international relations theory.

29.2 The Post-Cold War World

The ending of the great bloc rivalry and the passing of ideology as conflict-driver has resulted in the ‘victor’ in the cold war – the United States – gaining primacy along with its main system characteristics, namely, democratic form of government and open economy whose logic has set loose the forces of globalization. But US ‘maximalist’ policy stressing preemption and preventive war in an age rife with fear and uncertainty (Sestanovich 2005) has exposed the tendency of powerful countries to expand their sovereign space at the expense of the weaker states. As it is, the weak countries are having their sovereignty eroded by globalization and, because of the breakdown of social cohesion and domestic political consensus, the inability of the regimes to meet the aspirations of the people or just bad governance, by the rise of violent sub-nationalist movements. Extreme internal disorder in these post-colonial states, in turn, prompts ‘humanitarian’ intervention (Sorensen 2001: 116–120).

The emerging world order, in the event, features the United States as the Leviathan – Thomas Hobbes’ construct gone international – intent on imposing an international order conforming to its national interests in what it supposes is an increasingly unmanageable and anarchic world; a clutch of great powers and would-be great powers – China, the European Union, Russia, India, and Japan – forming the second tier, seeking to maximize their leverage and manoeuvring space *vis-à-vis* each other and the Leviathan (the universal hegemon) with a mix of confrontationalist and bandwagoning policies, and bolstering their respective power and influence especially in the proximal regions. Issue-based cooperation is solicited by the Leviathan and frequently given by the second tier countries to advance their common interest (Huntington 1999: 12–13). Except that the perceived commonality is specific issue-based. Such hierarchy observes Ian Clark, “collectivizes decision-making within the ranks of the Great Powers while retaining the anarchical form of politics as between that rank and others” (Clark 1989: 3). And then there is the multitude of countries in the lowest tier marked by their varying incapacity to escape victimization.

29.3 Intervention and its Perils

Whatever sovereignty may mean in the case of Third World countries, many of whom neither fulfil the criteria of ‘civil states’ where citizens enjoy security (Jorgensen, no year: 110–111) nor meet the widely-accepted, albeit First World, normative standards¹ because of clashing native concepts of tribal/ethnic or religious solidarity and regime security (Jorgensen, no year: 97–98), they provide soft targets for international intervention, for regime change, and for political and social re-engineering. By one reckoning, over two billion people inhabit some 60 states mostly in Africa and Asia, which are in different stages of ‘failure’ (The Fund for Peace/Carnegie Endowment for International Peace 2005: 56–65).

Other than outright military invasion or pre-emptive action, overt external intervention may involve map-changing proposed by friendly countries or by multilateral bodies like the UN to resolve enduring territorial disputes and ‘neo-trusteeship’ schemes that

are “indistinguishable from colonialism and paternalism” (Jackson 1998: 12) and smack of the Versailles solution permitting powerful countries to take over resource-rich but internally unsettled states (Macmillan 2001: 107–116). In the future, it may become the means of not only reforming “war-torn territories” (Caplan 2002) into ‘protectorates’ but as has been claimed, of adding to ‘the policy repertoire’ of ‘targeted countries’, like Iraq and Afghanistan, where sovereignty is ‘shared’ and ‘governance assistance’ offered requiring “individuals chosen by international organizations, powerful states, or ad hoc entities [to] share authority with nationals over some aspects of domestic sovereignty” (Krasner 2004: 85–94).

While neo-trusteeship is still only an idea gestating in Western policy circles, military intervention, starting in the Balkans in the early 1990’s, has highlighted issues relating to contested sovereignty and security (Thomas 2003). Intervention has always been a feature of the ‘Westphalian’ system negotiated by European princes circa 1648, which territorialized the notion of sovereignty (James 1986; Philpott 2001). According to one analysis, in the period 1815–1975 some 45 military interventions took place (Krasner 1995: 245–246). About two dozen more have occurred since then. The reasons have ranged from abolition of slave trade, protection of one’s citizens in a foreign country, and of minority populations to changes in the religious and social character of a state to seeking natural resources abroad, and protecting one’s national assets, investments, and positions of political and economic advantage (Krasner 1995: 233–234).

In the new millennium, the reasons for intervention have increased to include regime change, and imposition of democratic form of government and free market norms. It was contextualized by a hard-boiled school of thought originating in the United States, which conceived of future tensions, turmoil, and conflict on a grand scale on the basis of ‘clash of civilizations’ and telescoped it as a conflict between democratic governance and authoritarianism and, for good measure, conflated it with the tensions between the free market philosophy and closed economies. It created in its wake not just an entirely new demonology in the United States and the West, but gave the impetus for shaping a new international system based on a Manichean view of the world. Threats to the Judeo-Christian West were seen as emanating from two quarters – extremist Islam and a disciplined and aggressively expansive Confucian Chinese culture, both of which, owing to their supposedly illiberal, authoritarian, nature were perceived as being on a collision

1 For the case that sovereign states are accorded legitimacy on the basis of their ‘Europeanization’ in terms of norms of governance, governmental institutions; see: Suzuki undated, at: <<http://rspas.edu.au/ir/Oceanic/OCISPaper/Suzuki.pdf>>.

course with the West (Huntington 1997). After 9/11 the thesis about the threat centred on the Muslim world gained credence.

To tackle terrorism – designated the principal scourge – sourced to Islamic states (Iraq, Taliban-ruled Afghanistan) and organizations, like al-Qaeda, direct action strategies of military pre-emption and intervention and preventive war against stateless terrorist organizations and their hosts, the so-called ‘failed/failing states’ and ‘rogue’ or ‘crazy’ states, have been mooted by the United States. Despotic regimes are sought to be replaced by force if necessary with democratic rule in the hope that freely elected governments will be less tolerant of terrorist activities aimed at the US, Western institutions, and liberal values (Bush 2002; for theoretical and historical bases see: von Hippel 2000). Trying to defeat the purveyors of terror by spreading good governance through democracy may be a “Pollyannaish” effort (Rosenau 1998: 51) but it has not deterred the US from making this its principal policy plank. The basic problem here is that the targeted people(s) may view the current ‘global war on terror’ as a Western crusade against Islam and the system may end up, willy-nilly, with a Huntingtonian ‘clash of civilizations’ on its hands.² The sustained anti-terror measures by the US and by the UK after 7/7 (when suicide bombers attacked the London underground railway system on 7 July 2005) have led to even more extreme reaction in the Muslim world.³ In the circumstances, affecting a democratic makeover of Iraq or Afghanistan, in the manner of Japan and Germany after the Second World War (von Hippel 2000), is unlikely to be smooth, painless or easy, as the US is beginning to realize. Such forced democratic transition and liberalization of Islamic states is problematic also because the host culture predisposes the people to oppose alien, and especially, Western norms and thinking of any kind (Lewis 2005: 36–51). But Western liberalism can be tackled in one of two

ways. A politically canny Mahatma Gandhi was able, for instance, to turn the liberal pretensions of the British against the colonial overlords and by peaceful means hasten the end of empire in India, which is a composite multi-religious, multi-ethnic society (Karnad 2005: 29–51). Or, it can be forcefully resisted, a path now being adopted by peoples mostly in Muslim countries spawning terrorism and insurgencies, which are the bane of the modern era. Obviously, there is, in the main, a disconnect between the Islamic World and the US and European states exacerbated by the scant respect the latter accord the structure and norms of Islamic society, which are wholly defined by Islam. This is in contrast to the secular slant of Western liberalism which sets few limits on individual liberty and freedom of expression. Inevitably, it leads to mutual incomprehension and alienation and a head-on clash over the dos and don’ts in Islam, the manner in which this religion is practised, and over Islamic values perceived as antithetical to Western-qua-modern sensibilities.⁴ Worse, combined with the truncated sovereignty the US is promoting, especially in West Asia, it mocks the concept,⁵ prompting outcries.⁶ The American approach has nevertheless won hesitant support from its European allies and regional partners, not all of whom are equally motivated or convinced about the propriety or even the sustainability of such course of action, but who find the emotional clamour for promoting freedom, human rights and democracy emanating, among other sources, from

2 The meeting of the Organization of Islamic Countries (OIC) Information Ministers, for instance, in its “Second Cairo Declaration” of 12 March 2003 referred to the US and Allied actions in invading Iraq as “challenges that imperil the security, peace and stability of our Ummah (Muslim community at-large)”; see at: <<http://www.oic-oci.org/english/info/6/6iim-ciro-dec-e.htm>>.

3 Al-Qaeda in an internet statement talked of such attacks as a response to “the global evil powers which are spilling the blood of Muslims in Iraq, Afghanistan, Palestine, Chechnya.” See: Ali Khalil: “Muslim world urged to unite”, in: *The Asian Age* (New Delhi: Agence France-Presse, 25 July 2005).

4 Thus cartoon depictions of the Prophet Mohammad in a Copenhagen newspaper not only had the Muslim population of Denmark livid with rage, it sparked demonstrations in distant Kashmir province in India. See: Dan Bilefsky, “Cartoons ignite cultural combat” in: *International Herald Tribune* (31 December 2005/1 January 2006)

5 The then US Secretary of State Colin Powell asked Iraq to ‘give up’ some of its sovereignty in order, he said, to better protect itself and then followed up with a statement that whether Iraq did so or not, the US-led multinational force would retain final jurisdiction over Iraqi ‘security’; see at: <www.globalpolicy.org/security/issues/iraq/election/2004/0427powell.htm> and <www.historiansagainstawar.org/resources/eisenberg2.html>.

6 West Asia is a “victim of a huge scam, a monstrous lie couched in doublespeak”, wrote Arab columnist Mohammad Sid-Ahmed referring to the situation in Iraq and Palestine: “The deception is...in endowing sovereignty with a meaning that is the exact opposite of what it stands for, namely, occupation and subordination.” See: Mohammad Sid-Ahmed: “Deficient Sovereignty”, in: *Al-Ahram Weekly Online*, at: <<http://weekly.ahram.org.eg/2004/692/op.5.htm>>.

East European leaders, like Vaclav Havel and his Helsinki Citizen's Assembly, hard to ignore. In any case, given the marked superiority of US arms and confronted by what amounts to *force majeure*, the rest of the world seems reconciled to American activism even when, like the operations in Iraq or Kosovo, it lacks UN approval and, hence, international legitimacy.

Indeed, since the early 1990's several Secretary-Generals of the United Nations, perhaps taking their cue from Washington - its largest financial provider - have warned that apart from the absence of democracy, good governance, respect for human rights and protection of minorities, states responsible for terrorist activities or hosting terrorist organizations or illegally acquiring weapons of mass destruction can reasonably expect to face external intervention. The contradictory aspects of the UN Charter may be partly to blame for enabling intervention (Lyons/Mastanduno 1995: 2-3).

Whatever the legality of it, justifications for interventionism have not been lacking. Sovereignty, it is contended, is like property in that it burdens the state with certain responsibilities toward the community and the common good, which if not met can attract punitive actions (Kratchowil 1995: 21-42). And that it is linked to 'responsible' behaviour by the state and, depending on how egregiously irresponsible it chooses to be on any issue, can face punishment and forcible course correction (Onuf 1995: 43-58). And, because sovereignty is 'organized hypocrisy' any way that violating it is no big challenge, especially if larger issues like regional and international order and stability are at stake. In this reading, intervention is said to be mandated by "the logics of consequences" which, it is argued, supercede "the logics of appropriateness" (Krasner 1999: 6). Presumably, this means that considerations about the consequences of non-intervention, strained through the filter of the potential intervener's national interest, outweigh the concerns pertaining to the legality of such action. The US government has articulated just such an interpretation of sovereignty.⁷ It is a line endorsed by Western policy establishments

with calls for international instruments to implement a "duty to prevent" (human rights abuses) and 'Responsibility to Protect' people.⁸ UN Secretary-General Kofi Annan, anticipating this trend, had in 1998 defined the international organization's "cardinal mission" as promoting "human security and human development" (Jorgensen, no year: 98). But these are onerous objectives fulfilled by only a few advanced countries of the world, leaving the bulk of the states exposed on one or both of these counts to threats of multilateral or unilateral intervention. This only proves the point that international law and organizations have singularly failed to spread liberal values and norms (Crawford/Marks, 1998: 85). Notwithstanding such failures, the US and the western countries continue trying to reform the allegedly problem states with some 'tough liberalism'⁹ - a variant, no doubt, of 'tough love' urged on Western parents to deal with their wayward adolescent children.

In this situation, international relations, it is rightly feared, can quickly degenerate to resemble the law of the jungle. It prompted the premier theorist of 'just war', Michael Walzer, to say that while it is easier to justify intervention on humanitarian grounds (like preventing genocide in Kosovo) than as liberation (like in Iraq), if the mission is nevertheless the latter, three criteria of reasonableness should be met before armed intervention is ordered, namely, that (1) the people in the targeted state are materially involved in their own liberation activities and seen to be taking grave risks by doing so, (2) without outside military intervention the indigenous liberation movement would die, and (3) there is little possibility of collateral damage with respect to the people or the neighbouring states (Walzer 2005). None of these conditions were met by any of the recent interventions in Kosovo, Bosnia, Iraq or Afghanistan.

But rhetoric apart, powerful states are seen to embark on intervention only if it is practically feasible, meaning, as Krasner put it bluntly, when "the threat is high and invasion ... easy."¹⁰ Weak countries, in the event, have an incentive to acquire by hook or by crook nuclear weapons of mass destruction (Speed/May 2005: 39-49), notwithstanding the US' threaten-

7 The US Under-Secretary of Defense Douglas J. Feith, in fact, declared that this concept "means not just a country's right to command respect for its independence, but also the duty to take responsibility for what occurs on one's territory, and, in particular, to do what it takes to prevent one's territory from being used as a base for attacks against others." See Douglas J. Feith: "Freedom, Safety and Sovereignty" (2001), at: <<http://www.defenselink.mil/cgi-bin/dlprint.cgi?>> and: <<http://www.defenselink.mil/speeches/2005>>.

ing stance,¹¹ and the possibility of an “apocalypse” (McNamara 2005). Despite being signatories to the Non-Proliferation Treaty, the manner in which North Korea and Iran have manoeuvred to revive their nuclear weapons option in the face of international opposition orchestrated by the US and the West provides evidence of just how threatened they feel and what they consider would credibly deter any kind of interference in their domestic affairs and sovereign decision-making. This thrust toward proliferation of nuclear and other weapons of mass destruction is the flip side of America’s chimerical search for absolute security for itself. It is reflected in the US policy of projecting power, imposing democracy, continually upgrading its conventional military forces, and enhancing its nuclear security posture and mission profile (Payne 2005: 136–151).

But intervention may be easier than the follow-on policies to install pliant and pliable ‘democratic’ governments, which efforts are proving difficult and costly to realize, as the Western experience in Iraq and Afghanistan indicates. The ‘limits’ of the Western policy of intervention and ‘regime change’ are now being debated (Haass 2005) and the advisability of replacing the ruler or the ruling clique, not the native system of governance, pondered (Mills 2005: 34–38). The crux of the problem is that American policies to reform despotic political systems and open up ‘closed’ economies on the one hand and to sanitize various countries across the globe suspected of hosting extremist organizations and encouraging terrorist activities on the other hand cannot be divorced from the hard-headed assessments of the US national interest.¹² This has given a new impetus to the *raison d’etat* doctrine (Meinecke 1998: 146–195) and regional powerhouses may be tempted to emulate the US, justifying their belligerence on the basis of ‘national interest’.

Moreover, the post-cold war international system featuring the three tiers of states is being reinforced by globalization with the advanced countries better able to deal with the effects of the transnational flow of capital and manufactured goods, skilled labour and services, in part, because they are in a stronger posi-

tion to dictate the terms of engagement. Where valuable natural resources are involved, this trend has several odious features of 19th century colonialism, featuring conflicts to control resource-rich territories. In the last decade and more the ongoing indigenous resource wars in Africa (Le Billon 2005) are in essence not unlike the Western intervention in Iraq (Prestowitz 2003: 138, 289, 291) which has vested the US with effective control of the largest reserves of oil outside of Saudi Arabia and, should Washington decide on an Iraq-type denouement for Iran, of the vast Iranian oil and gas wealth as well. It has enormously complicated the efforts at terminating resource-related conflicts because while international pressures and UN sanctions can be brought to bear on the local warring parties in Africa (Le Billon 2005: 58–64), no such police actions are possible against the US and its allies in Iraq. Moreover, the sovereignty-sapping programme of a powerful congeries of Western countries led by the United States to change other countries in their own liberal, democratic, image reflects the colonial-era hubris of the ‘civilizing mission’. It does not, apparently, matter that democratic rule so imposed subverts its chances of success and its utilitarian value by devaluing it in the eyes of the people of the targeted state who, whatever its potential for doing good, may reject it as an alien imposition.

Many countries in the bottom tier are ‘failed states’ or potential ‘failed states’ where governments either give surreptitious help to, or are unable to prevent their territory from becoming incubators and exporters of, international terror. By design or disability, they may also host drug cartels and gun-running syndicates and pose, perhaps, the gravest threat to systemic stability and peace, whence great power intervention or multilateral action of some kind becomes inevitable. Alas, there is no guarantee that multilateral interventions will work any more than unilateral ones. Thus, the UN peacemaking/peacekeeping mission in the Democratic Republic of Congo, for instance, has not worked well (The Fund for Peace/Carnegie Endowment for International Peace 2005: 57–58). Other than forgiving debt and mounting multilateral efforts to contain the various dangers emanating from them, the unwillingness of the US and the big powers to get involved in any meaningful way means that these states – a large number of them in sub-Saharan Africa and very sensitive about preserving and protecting their sovereignty (Jorgensen no year) – will be left to manage the best they can on their own, unless some new critically important natural resources are discovered and their

11 “(E)ven a small and poor state ... in a position to produce the means to cause devastation to other people – damage far beyond the ability of such a state ever to remedy or recompense”, Under-Secretary Feith, “will face preemptive or preventive military action.”

12 See: US State Department/US AID: *Security, Democracy, Prosperity, Strategic Plan FY 2004-2009*, at: <http://www.revisitaforum.com.english/pdf_en/24299.pdf>.

control becomes an issue, or a genocide on the Rwanda-Burundi scale, or some other calamity catapult them into international consciousness. Intervention is, nevertheless, in danger of becoming an all-purpose panacea for the ills of, and shortcomings in, the nation-building process.¹³ But such interventionism, as a Union of Concerned Scientists Task Force Report concluded, “lowers the barriers to war [for every country] by creating new grounds for military action which could be easier to meet than the normal standards for self-defence” (Union of Concerned Scientists 2003: 18).

29.4 Globalization and its Dangers

The discussion about what is ‘globalization’ is less important, for practical policy reasons, than the means – the transnational flow of labour and capital and the spread of enabling technology (optical fibre and satellite-based communications and information disseminating networks, exponentially advancing computing speeds, etc.), and their effects – uneven distribution of benefits, empowerment of non-state actors like multinational corporations and NGOs (non-government organizations), and economic interdependence. It has led to more transnational companies and business firms taking advantage of lower labour costs and deciding to relocate their manufacturing and processing units from the developed world to the second tier states with the requisite skilled manpower resources and even passable infrastructure. China and India in the second tier have most benefited from these globalizing trends. Indeed, behaving verily like countries of the top tier, these two states are now engaged in aggressively cornering natural resources, like oil, in distant turmoil-ridden countries.¹⁴ In the security sphere, it has resulted in ‘military deglobalization’ with potential strife limited mostly to intra-state conflicts and localized crises spawned by the ‘strategies of

the discontented’ arising out of the uneven distribution of benefits of globalization (Coker 2002). If the free market is assumed to be at the core of globalization, then the antecedent conditions – a democratic form of government and an open society – that have enabled Western countries to progress, would have to be replicated in other countries as well before globalization becomes a phenomenon in which all states have a substantive stake. It is with this requirement in mind that historian Niall Ferguson (2003) posed a pertinent question about whether globalization is possible “without gunboats?” Or, to put it differently, whether democratization of “Fallujah” can be achieved without “the Abrams tank?” (Ferguson 2005:).

Globalization is international politics by another name. Consequently, the most globalized states also happen to be the most powerful politically (A.T. Kearney 2005). But politics cannot be divorced from the changing distribution of soft and hard power of the dominant states. It may be, as Robert Keohane and Joseph Nye claim, that in the present day where “countries are connected by multiple social and political relationships ... security and force matter less” (Keohane/Nye 1998). But this observation holds only in the case of the Leviathan and the states in the second tier. This leaves the majority of the countries of the world out of the reckoning unless, like Iraq, Iran, Arab West Asia and sub-Saharan Africa, they sit on vast reserves of oil, gas and minerals, whereupon the Western motivation to acquire, control or hold on to these significant natural resources also kicks in. It is marginalized countries and regions, traditionally hostile to Western norms and values that are at the receiving end of American policies to eliminate terror and seed democracy where resentment of the US and the West is the greatest. Their need to ensure uninterrupted supply of energy, minerals and other natural resources, require the investment of time, financial resources, and political and military effort to ‘pacify’ the host people before democratic institutions, ideology, and values can take root, and these societies can be plugged into the globalized milieu. That democratization and globalization are akin to bitter medicine a

13 India’s Foreign Secretary Shyam Saran voiced just such a suspicion: “Could a right or responsibility of humanitarian intervention and limits on national sovereignty, even if well intentioned,” he wondered, “inadvertently lead to a proliferation of such catastrophes, since in principle, such a course of action would be based on the promise that external forces can resolve all problems, in all parts of the world?” see: speech by Foreign Secretary at the International Conference on: “State sovereignty in the 21st Century: Concept, Relevance and Limits” (New Delhi, India Habitat Centre, 23 July 2001); at: <<http://meaindia.nic.in/speech/2001/07/23spcor.htm>>.

14 There have been numerous analyses and financial intelligence reports on-line and in newspapers examining the growing India-China rivalry in unstable parts of the world. As illustration, see Joe Duarte, 2005: “India, China and the Oil Markets, Part 1”, in: *Financial Sense Online* at: <www.financialsense.com/editorials/2005/03.13.html>.

patient may have to be forced to ingest is the underlying premise of US thinking on intervention. But even among Western countries, leave alone in the international community at large, shared values and interdependence have not created the consensus for such action (Krasner 1995: 249).

Given that the enhanced capacity to impose and enforce on the part of the hegemonic set of states and the desire to deter and resist such impositions on the part of the vast majority of countries fearing loss of sovereignty are the defining characteristic of the international order in the new millennium, the renewed premium and emphasis on military prowess is not surprising. But because maintaining a technologically in-date conventional military deterrent is cost-prohibitive, nuclear and other weapons of mass destruction that strategically even out the risks of confrontation even with great powers, are increasingly prized. This is apparent in North Korea's and Iran's attempts to obtain the nuclear bomb. To a considerable extent, it immunizes a country against bullying and use of force against it and permits the state to accept as much or as little globalization, liberalization and democratization as it deems safe and appropriate for itself from the point of view of protecting its cultural and social identity and cohesion and systemic order and stability.

Despite all the evidence to the contrary, globalization is nevertheless perceived by some as a process that is generally fair and involving no compulsion or coercion – direct or indirect, imminent or immanent, immediate or latent. It is seen as comprising a dynamic that is, by and large, benign with the logic of global capital and marketplace deciding, “what goods and services should be produced”, “how, and where to produce them”, and how the benefits should be distributed in order to advance the interests of the less well-off countries (Dunning 2003: 13–18).

Shorn of the unexceptionable liberal intent, what such thinking amounts to is intervention by economic means. ‘Global capital’ necessary for such purpose is not a free good freely available to developing states, but something the powerful and prosperous countries chiefly produce and control and dole out directly or through lending agencies (like the World Bank) as development grants and aid for reasons of self-interest. It is the donor states with the financial clout that wield coercive power and decide what and how much goods and services to produce, how and where to produce them, and how to distribute the benefits (Stevenson 2005; Krasner 1999: 225–226). The economically strong states also configure the tariff structure to suit their particular interests.¹⁵ As aid-receivers and,

excepting the oil-producing countries, exporters of other natural resources and commodities, these by and large supplicant states have little say and no means of challenging the unequal terms of exchange. Financial aid and trade concessions, in any case, are grossly inadequate for a thorough and effective liberal makeover of the Third World. In this situation, the coercion a donor state can bring to bear cannot be disconnected from its interest in donating unless, as some neo-Marxists contend, the US (and by extension the prosperous West) are themselves victims of oppressive international capital (Hardt/Negri 2003: 219–350). The empirical record of progressive globalization, however, is dismal. The number of Least Developed Countries, as determined by economic indices, has actually increased from 24 in 1971 to 50 odd states today, even as the concentration of wealth has grown until now when 20 % of the world's population account for 82 % of the world's Gross Domestic Product. Understandably, there are few enthusiasts for globalization in poor countries. As Shamshad Ahmad Khan, former Foreign Secretary of Pakistan, has put it, far from helping poor states better their lot, market-driven globalization “has actually aggravated global economic disparities” ensuring “some winners but many losers.”¹⁶

Technology is a supposed facilitator of globalization but, like capital, it serves the interests of its owners/producers – mainly the US and the states of the second tier. As a valued good, technology and its dissemination is tightly controlled. Moreover, because advanced technology breeds technical competence and because this results in autonomy in the economic and security fields, the sale and transfer of sophisticated ‘dual use’ technologies with civilian as well as military uses, in particular, are even denied to states belonging in the second tier, like India. Access is prevented by technology-denial regimes, like the Nuclear Suppliers Group and the Missile Technology Control Regime. Self-sufficiency particularly in high-value, advanced military technology presupposes an effective scientific, technological, economic, and industrial infrastructure and human resources base, which enables a country to achieve freedom from politico-military

15 As a powerful trading nation, China complains that the US has abused the Special Restrictive Measures allowed by WTO to impose textile quotas. Reuters: “China asks U.S. not to misuse WTO”, in: *The Economic Times*, 4 August 2005.

16 Shamshad Ahmad Khan: “Redefining NAM's role” in: *Dawn*, 4 January 2006: at: <www.dawn.com/2006/01/04/op.htm>.

pressure and to better assert its sovereign rights. But the astonishing increases in the scale and capacity of technology means that an “asymmetry of scope is emerging between political and economic geography”, resulting in the expansion of markets to global size and in “strategic alliances” even between states who may be proto-rivals in the military sphere.¹⁷ Generally though the principle the Haves have adopted in the technology sphere is to sell poor nations fish, not teach them how to fish. This is reflected in the stretching out of the phase in which poor countries rely on the West for their technological requirements. It is an aim furthered by policies emphasizing sales of finished products, not technology and, at most, the assembly of whole items from breakdown kits supplied by the supplier state. Developing countries bracketed in a higher category may be allowed licensed manufacture-deals. Only developing states in the second tier are now in a position to leverage full-value added production of sophisticated goods and systems – a level reached by China and, to an extent, India. It is a recipe for the vast majority of states of the Third World to remain locked as technological dependencies.

The trouble with globalization though is not that technology availability is in a trickle-down mode, but rather that it implicitly means ordering polities premised on the Western principle of self-determination. For the vast majority of socially, religiously, and culturally heterogeneous countries in the developing world this is tantamount to acquiescing in their own break-up in case any minority community chooses to exercise its right of self-determination and secession and, if thwarted in this “nationalist” enterprise, seeks moral support and material assistance from the West, and resorts to violent insurgency, when earlier these groups would have sought to work things out.

29.5 Insurgent Nationalism and its Problems

In 1914 there were 59 sovereign states, by 1946 there were 74, by 1950 a total of 89, and by 1993 their number had grown to 192 (Ferguson 2003: 372). A fallout of the U.S. policy of promoting ‘freedom’, ‘democracy’ and ‘representative government’ in the world may birth more states. These concepts fuel se-

cessionist passions, sow social strife, and initiate political conflict in already unstable countries. States caught in the cross hairs of this policy are mostly Third World societies susceptible to socio-political fissioning with discontented and rebellious peoples seeking self-determination and separate homelands based on their clan, tribal, ethnic or religious group affiliation. This is an ironic *outcome* – a proliferation of sovereignties – in a supposedly ‘post-sovereign world’. Full-blown sub-nationalism could mean a Russia fragmenting into some 89 ethnically distinct semi-autonomous republics, Indonesia into 250 different ethnically homogeneous island-states, and Africa into 2,000-odd sovereign entities along tribal lines (Rabkin 2004). This fearful prospect is why Algerian President Abdelaziz Bouteflika in his address to the UN General Assembly in October 1999 lamented that “Sovereignty [is] our final defence against the rules of an unequal world” (Emmerson 2001).

Most newly founded countries were carved out from the vast European empires in Asia and Africa post-1945 with little regard for factors that make for strong nation-states like ethnic and religious homogeneity. It provoked the former President of Tanzania Julius Nyrere into calling African states, for example, ‘artificial creations’ (Jorgensen, no year: 106: quotation in the FN 41) – a label that could apply to other ex-European colonies as well. Composite or heterogeneous states containing a mix of peoples and cultures are particularly vulnerable to the threat from sub-nationalist sentiments, with external machinations stoking accumulated grievance against the existing state and apparatus of government, until the opposition transmogrifies into violent insurgencies and ‘freedom’ movements. The sub-nationalist tendencies let loose by the unresolved differences between majority and minority communities, tribes and groups constituting these new, still immature, nation-states were held in check during the US-Soviet Union bloc rivalry due to the overarching tensions of the bipolar system. But the end of the cold war and the onset of globalization has weakened state sovereignty and changed the dynamics of insurgency (Rosenau 1995: 193). Modern communications have at once widened the support base of insurgents and complicated their tactics, as well as those of the regimes fighting them. Insurgent movements are seen to be empowered in cases where states have not coped well with globalization but find it hard to survive when facing militarily strong and effectively globalized countries (Mackinlay 2002).

17 Stephen J. Korbin: “Beyond Symmetry: State Sovereignty in a Networked Global Economy” (1995): 2; at: <http://cbi.gsia.cmu.edu/papers/cbi_workingpaper-1995-08.html>.

But, worryingly, globalization has failed to address the symbiotic relationship between the nationalist belief in the right of self-determination and the democratic principle resulting in the problem of 'infinite regress'. This problem obtains, write Philip Spenser and Howard Wollman, when the "principle of self-determination is taken to be an absolute right" because then, they argue, "it can lead to an almost infinite number of claims, as the number of potential nations in the world (however we define nations) is bound to exceed considerably the present number of states" (Spenser/Wollman 2002: 142-143). It is a problem accentuated by the US policy of spreading democracy. Minority groups seek 'recognition' for their 'nationalist' cause from Washington and otherwise try to assert their unique identities rejecting, along the way, the assimilationist impulses inherent in nation building (Taylor 1994). At the military-tactical level, however, it is difficult to distinguish insurgent groups from terrorist outfits. They are often plugged into the same clandestine transnational financial and logistics support networks and, in their common desire to make a large public impact, subscribe to the same kind of terror tactics.

Because statehood, as Immanuel Wallerstein maintains, has always preceded nationhood (Wallerstein/Balibar 1991: 81) and no nation-state, according to Charles Tilly, has come into being by democratic consent (Spenser/Wollman 2002: 144) and, indeed, as Tilly has contended elsewhere that wars, in fact, make nation-states (Tilly 1984), at the core the problem concerns the unavoidably violent processes of nation building that seek to merge many minority and group interests and identities into a singular national consciousness. Except for some newly industrializing countries, like the 'little dragons' in Asia who are ethnically homogeneous and have achieved living standards in 40 years that European states took two or three centuries to attain (Harris-White 2002: 6), the rest of the developing states - hit by intervention, globalization and insurgencies - are not being afforded the time or the latitude to sculpt unhindered viable nation-states out of disparate peoples, as was the case of the countries of the First World. They are, to use the weak state/strong state-weak society/strong society paradigm (Katzenstein 1976), weak states with weak societies. They are no more able to fend off external threats than they are to control internal dissent. Historically, nation-building in Europe and America was a bloody exercise in which ethnic and religious minorities were violently assimilated and attempts at secession ruthlessly quelled. Far from obviating strong

states, such nation-building processes helped their emergence. Like, for example, the United States, whose path to nationhood was marked, other than the waves of violent struggles between newer immigrants and the more settled lot differentiated by religion and their European country origin, by slavery, genocide of the native Indians, and a long and horrific Civil War.

The international campaigns for Human Rights and religious and political freedoms that new states are hounded by, in effect, are instruments for coercion which, if they do not prevent, then hinder the evolution of viable nation-states. Mohammad Ayooob has argued that no external pressure should be put on African states driven by feuds and bloodletting, because they are behaving no differently than America and European countries did in the period of their national consolidation (Ayooob 2002). It is the main reason for the leaders in the developing world insisting on respect for the principles of sovereignty and non-interference.¹⁸ And why the member-states of the Organization of African Unity, in particular, are most committed to the sanctity of the colonial borders, however irrationally they may have been drawn, and vociferously reject outside intervention in their domestic affairs. And why, similarly motivated South American countries in the 19th century strongly opposed US interference in their internal affairs and adopted the Drago and Calvo Doctrines, described as "an almost obdurate interpretation of the principle of non-intervention" (Lyons/Mastanduno 1995: 11), which the US government accepted only in 1933 (Krasner 1999: 21). South American states have matured since then and in time so will the states in Africa, West Asia, and elsewhere in the world struggling to achieve nationhood. The requirement is for these countries to be left well enough alone to evolve at their own pace and in their own fashion, for the West to overlook the corruptions and minor excesses of tyrants and uni-party systems short of genocides and massive dislocation of peoples with the potential for spilling over into neighbouring states and threatening regional stability, and for the US to desist from taking action to rectify the situation which will only derail

18 Rudolfo C. Severino, Secretary-General of the Association of South East Asian Nations (ASEAN) at a round table in July 2000 referred to these two principles as "the bulwarks protecting the small and the weak from domination by the powerful." See: Rudolf Severino: "Sovereignty, Intervention and the ASEAN Way", 3 July 2000; at: <<http://www.aseansec.org/3270.htm>>.

the traditional processes of nation-building at work. But even genocide may not be sufficient reason for Western intervention if it is “intentionally provoked” to attract such intervention as was done, according to Alan Kuperman (2003), by the Albanians in Kosovo. If the West, moreover, is unwilling “to deploy its armed forces preventively, it must temper its use of coercive diplomacy aimed at compelling rulers or rebels to surrender power because”, Kuperman argues, “of the risk of inadvertently triggering massive violence” (Kuperman 2004). Nevertheless, in the 21st century international public opinion will not countenance states and tyrannical regimes unleashing extreme and systematic violence against their own people. Such countries and governments need to be dissuaded. But between the imperatives of just and reasonable humanitarian intervention and the necessity to respect the sovereignty of nations lies a golden mean. It has to do with building a consensus in the UN General Assembly about ‘good housekeeping’ standards that all states pledge to observe. Any gross and sustained violation of these standards should automatically activate multilateral intervention. This will at once safeguard the sovereignty of states, obviate arbitrary use of force by great powers, and permit the taking of corrective measures that have international sanction.

29.6 Conclusion

Advanced technology reflected in the digitization of weaponry and in network-centric warfare may have eventuated, as Michael Dillon suggests, in “intensive and extensive hyperbolicization of security” (Dillon 2004: 82) evident in the war against terrorism. There has been a matching hyperbolicization of sovereignty by the strong states that, ironically, have the least to fear from the weakening of sovereignty. This is evident in the US withdrawal from the Kyoto Protocol and in its unwillingness to subject its troops to the jurisdiction of the International Criminal Court. It highlights the fact that sovereignty and security are relative concepts. While both principles have in practice lost ground in a globalized and interdependent world with technology and the logic of the marketplace making nonsense of man-made borders and autarchic national units, strong countries are, nevertheless, better placed to cope with the assaults on their sovereignty by having hard power in reserve. Post-colonial countries in the process of becoming nation-states have no such capability. Owing to the sensitivities of the “globalized space” (Rosenau 1998: 38–43) they are, in fact, denied

the historically legitimate instruments, including violence, and a conducive milieu for state-building, like freedom from outside interference, thereby flattening out their options. They are expected in short order to become functioning democratic systems without transiting through the mandatory disorderly stages or to face external intervention to ensure that they do. Considering the evidence, what may obtain in the third tier is a collection of ramshackle, potemkinized ‘democracies’. But even the hopeless states need to be reassured that, within limits, normal eruptions in the processes of nation-building will be tolerated. The fast industrializing societies (of the second tier, especially China and India) boasting of the traditional power characteristics, like location, size, population, and natural and human resources, are at the tipping point at which their gain in stature and substance renders their sovereignty relatively unassailable. It is a threshold comprising sustained economic growth backed by acquisition of comprehensive military power, including strategic nuclear reach and punch. When the bulk of the countries attain this tipping level is the point at which, in theory at least, the international system will achieve *homo stasis* and the sovereignty and security of individual states will become safe. But, realistically speaking, because this state of grace is unlikely to be attained any time soon, if ever, the sovereignty of poor, politically and militarily weak and marginalized states will, as in the past, continue to be at the sufferance of rich and powerful countries.

30 Subordinate, Subsumed and Subversive: Sub-national Actors as Referents of Security

Varun Sahni

30.1 Introduction

Identity politics, the politics of difference, is always intrinsically and intensely relational. We define who we are, and who we are not, by either linking ourselves with, or differentiating ourselves from, those around us.¹ Coping with difference has always been an important aspect of human and social life. Sometimes difference is enriching, at other times merely functional; often, however, it is ominous and menacing. When difference seems to be, or indeed becomes, threatening, what emerges is a securitization of difference. It is this dimension of security – how the state deals with the threat of difference *within* itself, and how sub-national actors position themselves *vis-à-vis* the threat posed by the state – that is the principal theme of this chapter.

The chapter is organized into the following seven sections. In section 30.2, the ground is prepared for the subsequent sections by analyzing the complex interrelationship between state, society, and security in the historical moment of political modernity. While the concept of security has been reworked in recent years to bring society and social forces into the picture, the modernist project of sovereign territoriality continues to remain intact in much of the world. This implies that identity politics necessarily is the assertion of difference *vis-à-vis* the state and its hegemonic definition of ‘national’ identity. In Section 30.3, we explore the ambiguity in the Copenhagen School concept of securitization and explain why we nevertheless use the concept in this chapter. Section 30.4 explores the notion of subordination (to the state) that is inherent in the idea of the sub-national, and explains why sub-national actors are seen by the state as per-

petually presenting themselves with the threat of in-subordination. In Section 30.5, the focus is on the trans-border character of sub-national actors. Presumed by the state to be subsumed within it, sub-national actors often transcend sovereign borders in terms of their ethno-cultural affiliations and external links. Insistence of difference within or evidence of links outside are therefore seen by the state as a threat. Section 30.6 shows how sub-national actors can be actively subversive of the state, resorting either to covert subversion ‘from below’ or overt subversion ‘from above’. Section 30.7 investigates how the threat perception of the state *vis-à-vis* sub-national actors can be mitigated or eliminated through a broad and inclusive process of political engagement. Section 30.8 concludes the chapter, suggesting the sorts of inclusive answers that politics ought to throw up.

30.2 State, Society, Security, and Modernity

Over the last fifteen years, a great deal of conceptual and theoretical effort has been expended in transcending ‘traditional’ security studies, which had for half a century focused largely on the state and its external security concerns. The expansion of the intellectual focus of security studies has involved, minimally, the adding of non-state actors and the internal security realm to the traditional statist and militarist concerns of security studies. This intellectual effort can be seen in the emergence of new ‘schools’ of security studies, of which *Critical Security Studies* (Krause/Williams 1997) and the *Copenhagen School* (Buzan/Waever/de Wilde 1998) are perhaps the most prominent.² Through a broad redefinition of ‘security’ in terms of existential threats to *any* ‘referent object’, scholars of security studies have been able to come up with novel and exciting answers to three basic questions: security for whom, from what, and at what cost? From being

1 As Charles Taylor (1992: 32–33) would put it, “We define our identity always in dialogue with, sometimes in struggle against, the things our significant others want to see in us.”

the obvious and only answer to the first question (security for whom?), the state has moved in many cases to being the answer to the second question (security from what?); in other words, the state has come to be viewed not only as the sole referent object of security, but also as a frequent threat to the security of other referent objects.

A more expansive understanding of security and securitization therefore requires us to push the boundaries of security studies simultaneously in two seemingly contradictory directions. Firstly, we obviously need to go *beyond* the state, which involves our paying attention to non-state referents of security at varying levels of analysis, ranging from the individual human being to the planetary ecosystem. Secondly, and perhaps less obviously, we need to insert security studies *within* the state, which requires us to stop treating the state only as a unitary rational actor in the neorealist tradition (Waltz 1979), and to also view it in relation to society and social forces. For the plain truth is that the state does not exist anywhere in splendid isolation: "States are parts of societies. States may help mold, but they are also continually molded by, the societies in which they are embedded" (Migdal/Kohli/Shue 1994: 2).

However, recognizing that the state is 'socially embedded' does not mean that we can escape the state, or indeed its aspirations and pretensions of omnipresence and omnipotence. This reality needs to be heard above the bewitching siren call of European postmodernity. The inspired experiment that has resulted in the impressive institutional, policy and even cultural architecture of the European Union is not, and perhaps never will be, the political norm for organizing social life at local, national, regional or global levels. Most of the world is still in the throes of modernity: the state retains the lead role in the social drama. The

project of political modernity is about the state perfecting its sovereign territoriality,³ which Europe alone has seemingly transcended. Thus, in the light of the European experience, we could almost say that different continents are currently passing through very different historical moments. The logic of politics across Asia and the Americas remains the logic of modernity. Africa appears to be mimicking European postmodernity at the discursive level, but the logic of politics in Africa seems to be sliding back to pre-modernity:⁴ we need only contrast the bloodshed over Biafra in the late 1960's - an unambiguous moment of political modernity - with the contemporary disaster of state failure and social chaos in Darfur. Indeed, the future of European postmodernity should itself be problematized. The failure of the European experiment would surely imply the re-emergence of the logic of sovereign territoriality on the continent. However, even if the European experiment were to succeed, what will emerge at the end of the protracted process will probably be a European *state*; a large, continent-wide, federalist, pluralist state in all likelihood, but nevertheless recognizably a state. Thus, in the fullness of time we may come to regard European postmodernity as an essential artifice, a carefully designed and constructed bridge that connected Europe's past - a Europe of states - to the European state of the future. The basic point being made here is that the project of political modernity, though increasingly frayed, remains essentially intact: the sovereign territorial state is not going to wither away any time soon.

Driven by the logic of political modernity, the statist conception of 'national identity' is therefore both the hegemonic core and the Archimedean point around which all other conceptions of identity in society have perforce to cluster. To put it more simply, all other identities in society - with the possible exception to gender identity - must necessarily relate themselves to, and be related to, the national identity as designed and defined by the state. Thus, identity politics is inevitably the politics of asserting difference from

2 While both schools support a widening of the concept of security, there is little else that they do coincide on. For instance, they disagree on as basic an issue as the conceptualization of security itself. According to the *Copenhagen School*, security is "a self-referential practice, because it is in this practice that the issue becomes a security issue - not necessarily because a real existential threat exists but because the issue is presented as a threat." (Buzan/Waever/de Wilde 1998: 24). The *Critical Security Studies* perspective holds that "security is a derivative concept; it is in itself meaningless. To have any meaning, *security* necessarily presupposes something to be secured; as a realm of study it cannot be self-referential." (Williams/Krause 1997: ix; emphasis in the original.)

3 Mohammed Ayoob labels this historical process as "state making" - attempts by the state "to extend and consolidate its control over contested demographic and territorial space" (Ayoob 1997: 133) - to attain "effective statehood", which he defines as "a balanced combination of coercive capacity, infrastructural power, and unconditional legitimacy" (Ayoob 1997: 140).

4 The term 'pre-modern', implying in this context the re-emergence of pre-state political formations, should not be confused with 'primordial', which has the connotation of primeval or primitive.

the hegemonic (national) identity of the state. We must, however, qualify this statement in two important ways.

Our first qualification relates to the interrelationship between various sub-national identities themselves. Why must we insist on seeing the politics of difference only in relation to the state, and not in terms of the mutual interaction of diverse social groups unmediated by the state? Surely, relations between Catholics and Protestants in Northern Ireland, Anglophones and Francophones in Canada, Sinhalese and Tamils in Sri Lanka, Hausas, Ibos and Yorubas in Nigeria, Turks and Kurds in Turkey, Russians and Chechens in Russia, or Malays and Chinese in Malaysia, to give only a few examples, do exist independent of the respective states? It is undeniably true that different ethno-cultural identities are collocated and therefore coexist in most parts of the world; ethno-cultural homogeneity is a rarity, diversity the norm. However, the logic of political modernity implies that the state cannot be written out of the sub-national (ethno-cultural) equation, for two reasons. Usually the state, and the resources and capabilities that it enjoys and commands, is captured by one or several ethno-cultural groups: often the numerical majority, sometimes a historically privileged minority. Thus, the politics of difference for the Québécois, Ulster Catholics, Jaffna Tamils, Ibos, Kurds, Chechens and Malacca Straits Chinese implies either acquiescing to or contesting the manner in which their respective states are (ethno-culturally) constituted; these sub-national minorities simply cannot afford to treat the state as neutral. However, even when the state is able to maintain its critical autonomy *vis-à-vis* various sub-national identities, its insistence on a particular synthetic formulation of national identity makes it a party to the politics of difference.⁵ This is, of course, particularly true when identity politics itself is securitized. Thus, for instance, the Indian state, avowedly secular, had nonetheless internalized many ceremonial Hindu practices on supposedly 'neutral' cultural grounds, well before Indian politics took a majoritarian turn in the mid-1990's (Misra 2004).

Our second qualification would be to remind ourselves that not all non-national identities are sub-na-

tional in character. On the contrary, the state in contemporary times has been forced to relate to several distinct types of non-national identities that are *not* sub-national in character. To mention only three of the most obvious, the contemporary state must relate to supra-national identities (such as the European Union), macro-cultural identities (like the Muslim Ummah) and diasporas of a wide variety of shapes and sizes. There is, nevertheless, one significant difference between these non-national identities and sub-national identities: it is only with the latter that the state often chooses to *securitize* its relations.
