who advocate that a state's disconnectedness from globalization is inversely proportional to the likelihood of military (read, U.S.) intervention fail to recognize unfolding realities (Barnett 2003: 174-181). Both middle-power and major-power states, as well as the international community, must increasingly focus on long-term creeping vulnerabilities in order to avoid crises response to conditions of extreme vulnerability. Admittedly, some human security proponents have recently soured on the viability of the concept in the face of recent "either with us or against us" power politics (Suhrke 2004: 365). At the same time, and in a bit more positive light, some have clearly recognized the sheer impossibility of international power politics continuing to feign indifference in the face of moral categories. As Burgess notes, "for all its evils, one of the promises of globalization is the unmasking of the intertwined nature of ethics and politics in the complex landscape of social, economic, political and environmental security" (Burgess 2004a: 278).

It is still not feasible to establish a threshold definition for security that neatly fits all concerns and arguments and it would be a mistake to even assume that national security and human security and environmental security are ultimately harmonious. They may not be under prevailing perceptions of and assumptions about the factors that affect states, groups, and individuals. Too often the policies that traditional national security objectives call for conflict with sound human and environmental security policies or else cause human and environmental concerns to be ignored. This should not surprise, as there are also contradictions between the policies that human security and environmental security may call for, notably in the area of economic development. What is good for the security of individuals (jobs, construction of housing, office building and roads) may be bad for the environment. Thus articulating an ethical framework for security is presently a bridge too far.

Yet, these contradictions are not the crucial recognition here. To the contrary, rather than focusing on the security issues themselves, we should be focusing on the best multi-dimensional approaches to confronting and solving them. One approach, which might avoid the massive tidal impact of creeping vulnerabilities, is to sharply make a rudder shift from constant crisis intervention toward strategic planning, strategic investment, and strategic attention. Clearly, the time is now to re-order our entire approach to how we address - or fail to address - an ethical framework for security.

71 Prediction in Security Theory and Policy

Czeslaw Mesjasz

71.1 Introduction

In religious writings and prophecies, legends, oracles and more or less rational considerations, the desire to reckon the future and eventually to possess capabilities to influence the future course of events has always been a fundamental human need resulting from the survival imperative. History of science is the history of human efforts to learn from the past and to test whether that knowledge could help in creating plausible expectations towards the future. This approach is especially important in any action-oriented social science – economics, management and particularly, due to the stakes involved, in any security-oriented considerations. In all international or internal considerations on security and in the ‘securitization’ approach two elements are crucial – prediction of threats (risk, dangers, disturbances) and designing of actions necessary to respond to those threats.

In the early 21st century the challenge of predictability has acquired a new significance in security theory and policy. Growing complexity of the world (whatever that complexity might mean) stirs a dramatic question: Are we living in a *Risk Society* (Beck 1986, 1992, 1999)?

From a widened and deepened security concept – associated not only with international relations (IR) – it could be observed that after the ‘prediction failure’ of the unexpected and unpredicted collapse of the Soviet empire, less attention has been paid to ‘technical’, policy-oriented considerations on security, including prediction of threats. Instead, stress has been put on more doctrinal considerations like, security for whom, how, and according to which norms.

The key question on what security is about was somehow lost from sight. However, newly emerging security challenges, including environmental security and threats of terrorism, have forced scholars and policy-makers to pay attention to prediction, sometimes with the use of sophisticated methods, like computer modelling of cognitive and decision-making processes

by would-be-terrorists and operations of their networks (Popp/Yen 2006).

This chapter provides a survey of most important challenges associated with prediction and risk in contemporary security theory and policy. Reflecting the deepening and widening of security, the survey also refers to fundamental problems of prediction in mathematics and physics, as well as in economics and other social sciences. An answer is sought for the question whether contemporary security theory can deliver better instruments of prediction in a ‘complex world’, or whether, despite new methods and lessons from the past, capabilities of prediction of instruments of contemporary security theory have decreased. Security policy in the contemporary, multi- or unipolar world is facing greater challenges than during bipolarity. In addition to prediction, the meaning of such terms as (un)predictability, predictive power, certainty, risk, and uncertainty are defined that are often neglected, and they are applied like ‘buzz words’. Such an approach is unacceptable in rigorous research and it could be even counterproductive in policy-making and in the process of societal communication.

The level of generalization or abstraction of the chapter is chosen purposively. It allows for more linguistically-oriented discussion. The discussed terms are applied as ‘central metaphors’ determining intellectual search and actions. It concerns both the utterance of ‘security’ discussed at length in other chapters as well as, for example, risk and uncertainty. They are just two examples of central metaphors being then subjects of discourse and operationalizations in terms of verbally defined cognitive procedures for thinking and action supported with mathematical models.

71.2 Risk and Uncertainty

The terms uncertainty and risk reflect relations between the past, the present, and the future. Uncertainty is the basic concept mirroring the future as unknown and unpredictable. In logical terms uncertainty

Table 71.1: Theoretical approaches to risk. **Source:** Author's research based on Bernstein (1996); Douglas/Wildavsky (1982); Gregersen (2004: 24); (Luhmann 1991, 1993).

	Epistemology	Type of theory	Key questions
Realism	Risk is an objective negatively assessed disturbance that can be measured independently of social definitions, but may be biased by subjective perceptions in the public realm	Technical sciences Economics and finance	What risks exist? How to measure (calculate) and manage risks?
Weak constructivism	Risk builds on objective dangers that are perceived and mediated through personal, social, cultural, or self-observing processes	Phenomenology 'Risk society' theory (Beck) Symbolic theory (Douglas) Attribution theory (Luhmann)	What is our attitude to dangers? How do we understand risk in today's society? How and why do we select risks among the multiple dangers? How do we observe our own risk-decisions?
Strong constructivism (Radical constructivism)	Nothing is a risk, but risks are fabricated by social decisions and negotiations	Governmentalist theory (Foucault)	Why and how do we fabricate particular risks?

means the state of not knowing whether a proposition is true or false. Risk, hazard, danger, and threat are normative terms, usually linked to negative consequences of possible future events.

There is no commonly accepted definition of risk. As for other concepts of social sciences, the divide between objective and subjective (probabilistic and contextualist) can be made in the discourse on risk. According to Kelman (2003: 6-7):

Physical scientists sought to quantify, to measure, to objectify, to calculate, to scientificify, to nail down risk. Risk can, and more importantly should, be made precise, exact, and accurate. Social scientists viewed risk as contextual and as a cultural construction. The act of measuring, thinking about, and seeking to understand and manage risk changes the risk. Risk definition depends on who defines. ... Risk becomes objective and exact within the culture which defines it. But that axiom, that fundamental geometry of risk, may be challenged and redefined. Risk is thus contextual and cultural, dependant upon the initial assumptions which can never be proved or disproved.

Problems arising from the objectivity vs. subjectivity of risk have been discussed by other authors. Shrader-Frechette (1991) distinguished three philosophies about risk evaluation: cultural relativism, naive positivism, and scientific proceduralism. The cultural roots of interpretation of risk have been also exposed by Douglas and Wildavsky (1982) who proved that statements about risk are as much (and often more) a reflection of deep social structure as they represent the world. It is worthwhile to underline that in most

cases, and in this chapter as well, the subjectivist (constructivist) views do not deny facts about risks in general, and certainly do not entail relativism with respect to specific well-characterized elements of risk, such as, for example, the statistical probability of events. Doubts about the very sense of probability are connected with deeper epistemological interpretations.

Differences in defining risks are not the only obstacle in describing relations between the past, the present, and the future. Semantic discrepancies between risk and uncertainty may be different in various cultures. Due to the size and scope of the chapter, analysis of their differences will be conducted solely in reference to the cultures where this discrepancy is congruent to 'risk' and 'uncertainty' in the English language. The first and most influential distinction between risk and uncertainty was established by Frank Knight (1921: I.I.26):

Uncertainty must be taken in a sense radically distinct from the familiar notion of risk, from which it has never been properly separated. ... It will appear that a measurable uncertainty, or 'risk' proper, as we shall use the term, is so far different from an unmeasurable one that it is not in effect an uncertainty at all. We ... accordingly restrict the term 'uncertainty' to cases of the non-quantitative type.

The above excerpt from Knight's work is very frequently quoted, but his economic interpretation of risk went deeper:

If risk were exclusively of the nature of a known chance or mathematical probability, there could be no reward

of risk-taking; the fact of risk could exert no considerable influence on the distribution of income in any way. For if the actuarial chance of gain or loss in any transaction is ascertainable, either by calculation *a priori* or by the application of statistical methods to past experience, the burden of bearing the risk can be avoided by the payment of a small fixed cost limited to the administrative expense of providing insurance (1921, I. II. 41).

Using the distinction proposed by Frank Knight it is necessary to remember that probability measures only perceived uncertainty. Therefore other attempts have been made to describe risk and uncertainty in a more rigorous manner. This idea of perceived and non-perceived (to know what we do not know, was reinforced by Keynes (1937), who pointed out:

By 'uncertain' knowledge, let me explain, I do not mean merely to distinguish what is known for certain from what is only probable. The game of roulette is not subject, in this sense, to uncertainty. ... The sense in which I am using the term is that in which the prospect of a European war is uncertain, or the price of copper and the rate of interest twenty years hence. ... About these matters there is no scientific basis on which to form any calculable probability whatever. We simply do not know (Keynes 1937: 213 ff).

The *formal* incorporation of risk and uncertainty into economic theory was accomplished in John von Neumann and Oskar Morgenstern's (1944) *Theory of Games and Economic Behavior* that gave a rational foundation for decision-making under risk according to expected utility rules with objective probabilities. Another view on risk was introduced into economic literature by Friedman and Savage (1948), who argued that any choice of options with multiple outcomes, each of which can be assigned a conditional probability contingent upon selecting a given option, is made under conditions of risk. Luce and Raiffa (1957) further clarified this approach, and many economists adopted the practice of treating risk not as a quantity but as a class of decisions. Although convincing at the first glance, the possibility of measurement of values of parameters describing a situation is not the only difference between the meanings of risk and uncertainty. Risk and uncertainty as well as differences between them can be analysed at five levels.

At the first basic, epistemological level, the difference between risk and uncertainty is non-existing. Bearing in mind all limitations of measurement and probability theory, scrutinized in the dispute about subjective and objective character of probability (Ramsey 1931; Holton 2004) paradoxes of probability¹ and fundamental barriers of computability (Chaitin 2001), uncertainty and risk seem impossible to distinguish.

This argument can be only strengthened when problems of uncertainty are associated with fundamental physical considerations taken from thermodynamics or upon time and space. The same conclusion can be drawn when a postmodernist or a radical constructivist approach is applied. At this level risk and uncertainty have the same validity and differences between them emerge solely in result if intersubjective discourse in which uncertainty describes situations where the outcome is partially or completely unforeseeable, with some possible outcomes involving potentially negative consequences – as perceived in the moment of utterance.

The second level of analysis exposes the intersubjective approaches to risk and uncertainty. Interpretations of present processes are the result of social discourse. In such a case a distinction between objective probability and Bayesian probability should be taken into account. Risk can also be determined by culture (Douglas/Wildavsky 1982), or as it is described in table 7.1.1, risk can be even 'fabricated' due to the power game within the society. Empirical research on heuristic biases and cognitive aspects of risk perception can also be included into considerations at this level (Slovic 2000).

The third level of comparison is determined by measurability. However, in addition to measurable risky states, two kinds of uncertainty can be distinguished. The first kind of uncertainty occurs when in theory approximation of probability is possible, but due to the absence of mathematical models, or absence of data, or insufficient computing power, the estimation of probability is limited. Such a situation can be illustrated with weather forecasting. Even if all consequences of a simplified 'chaos theory' are taken into account, it seems reasonable to expect that weather forecasting can be made more precise but, of course, never certain. The second kind of uncertainty occurs when it is not possible to make predictions with the use of any probability assessment, when the future states cannot be predicted due to their number, complexity, inter-relatedness, e. g. forecast of the fate of a unit – individual, state, company, etc. Sometimes such a situation is called "genuine uncertainty" (Lövkvist-Andersen/Olsson/Ritchey/Stenström 2004).

At the fourth level, differences between risk and uncertainty are stemming from additional valuation between those terms. Risk is treated as negatively valued expected state of the future events, while uncer-

1 See at: <http://en.wikipedia.org/wiki/Category:Probability_theory_paradoxes>; retrieved on 10 March 2007.

tainty is neutral, or at least more neutral than risk. To feel uncertain about the future is neither positive nor neutral, but at least not as negative as feeling in a risky position. The only positive or neutral stance towards the future may occur when an experiencing actor feels certain about the future course of events. In the intersubjective discourse such a course of events can be assessed positively, or negatively. In this case, however, an interesting paradox can be observed. What about the situation when a threat (danger) is, or better to say, seems to be certain (predictable). This paradox would require further analysis, but the declaration of certainty can be interpreted in such a case that expectation of a threat allows at least to make some preparations, or to resign. Unpredictable, or worse, unthinkable threats frequently seem as most dangerous and damaging.

At the fifth level of analysis differences between the use of the terms risk and uncertainty are defined in a purely arbitrary way. Risk does not always only refer to the avoidance of negative outcomes. For example in game theory and finance, risk is only a measure of the variance of possible outcomes and uncertainty in measurement is equivalent to acceptable error.

71.3 Prediction in Social Theory

71.3.1 Prediction and Human Knowledge

71.3.1.1 Prediction, Forecast, and Predictability

Leaving for further analysis the sense of causality and explanation, it may be initially stated that prediction is the key element of scientific reasoning (Popper 1974). Prediction is associated with forecast, predictability, and prophecy. In the basic meaning prediction is a statement or claim that a particular event will occur in the future. Narrowing the sense of prediction it may be added that the place and time of the event are known as well. The etymology of the word is Latin (from *præ*- 'before' and *dicere* 'to say'). A difference can be made between informal, or common sense prediction, and scientific prediction.²

Scientific prediction is a rigorous (often quantitative) statement about what will happen under specific conditions, typically expressed in the form *If A is true, then B will be also true*. The scientific method is built on testing predictions which are logical consequences

of scientific theories. Theories, in turn, are designed to allow for prediction of phenomena from underlying principles.

In some scholarly texts a difference is made between prediction and forecast with the latter being closer connected with a scientific base, namely a probability calculus. A distinction can be made between the contingent and non-contingent prediction or forecast. Contingent prediction, or conditional prediction, is based upon an 'if, then' assumption. In the non-contingent prediction the future events are depicted in a straightforward manner (Singer 1999).

Another typology allows distinguishing two types of prediction, an 'intentional' prediction and an 'outcome' prediction. The former concerns actions of an actor while the latter relates to the states independent from the actions of the predicting subject, so it is closer to forecasting.

Prediction can be also interpreted as a selection of one world from an infinite number of 'potential worlds' which can emerge from any given set of circumstances. This interpretation immediately brings about a question of causality. First of all it must be underlined that causality may be interpreted as objective when proved with logical or empirical evidence. At the same time causality has also an intersubjective character. Observers (participants) agree that a specific course of events has led to a specific outcome although it is not certain whether both cause and effect are unique and cannot be replaced.

Prediction is also associated with anticipation, i.e. expectation or making decision upon the predicted states of the future, beliefs, etc. Predictive power of a scientific theory is its ability to generate testable predictions. Theories with strong predictive power are heavily valued, because these predictions can often encourage the falsification of the theory. It is different from explanatory or descriptive power, by which already-known phenomena are explained by a given theory, in that it presents a new and novel test of theoretical understanding. Scientific ideas without *any* predictive power are known as 'conjectures', or, at worst, 'pseudoscience'. Because they cannot be tested or falsified in any way, there is no way to determine whether they are true or false, and so they are not afforded the label of 'scientific theory'.

Predictability is enhanced when some structural constraints exist. They could be of a static character (conditions, barriers) or they can take the shape of patterns in dynamics of a system (individual). It is especially valid for cyclical behaviour - assuming that the cause for circularity is known, evolutionary behav-

2 The definitions of prediction and associate notions were collected from internet encyclopedic sources, e.g. <<http://en.wikipedia.org>>.

our – assuming that the mechanisms of evolution are identifiable, which is not frequently the case, and path dependency – assuming that the impact of the past events on the future is known. Prediction is associated with explanation of the links between phenomena. Being aware of the differences between causal links and correlations it must be emphasized that causality is not necessarily associated with prediction. Causality may also be identified *ex post factum* and in such a case two situations may be identified:

- *retrospection*, i.e. an explanation of the links between the past events which not necessarily would be repeated in the future,
- *retrodition*, i.e. prediction based upon an assumption, ‘what, if’ in which the present knowledge of the developments in the past and of the actual state are used for predictions of different courses of events.

Predictability, meaning a capability of predicting, refers to the links between the observer and the observed. Making predictions depends on the capabilities of an observer to describe the phenomenon with the variables which can be observed and given appropriate meaning, including measurement. Any disturbance of this cognitive interaction, dependent on an observer or not, leads to the occurrence of uncertainty and risk.

Predictability is also related to contingency, especially in social sciences and policy. In contingency thinking it is assumed that we cannot plan since all is dependent on present, sometimes very small causes. However, it must be also recalled that even if the events are contingent, the humans must plan. Actions cannot be completely spontaneous (contingent). “We could not live and remain sane in a world that was totally composed of contingent factorsand while we adapt and modify our behaviour when contingency does occur, on a day-to-day basis we work on the (correct) assumption that all is not contingent (Webb 1995).

71.3.1.2 Certainty, Uncertainty, Risk, Determinism, and Indeterminism

While prediction can be associated with an observer (predictor) it is also necessary to refer to the state of environment, or of himself/herself he/she is relating in the cognitive processes. Here it is worthwhile to recall a well-known typology taken from decision theory and economics. According to already mentioned ideas of Knight (1921) uncertainty is randomness with un-

knowable probabilities, and risk is randomness with knowable probabilities.

If full knowledge regarding options, outcomes, and the various states of the world is available, the task of making a decision becomes a straightforward process of selecting the action whose outcome maximizes the decision criteria “decision-making under certainty conditions” (Luce/Raiffa 1957: 13). Certainty and predictability are frequently confused with determinism. As it was put by Sokal and Bricmont (1998: 140): “Determinism depends on what Nature does (independently of us), while predictability depends in part on Nature and in part on us.” So certainty of the observers may mean determinism, but not always. Deterministic phenomena are not always certain to the observers. The point is that we simply do not know the difference.

71.3.1.3 Limits of Prediction and Predictability

Since prediction can be viewed as a striving to achieve an ‘objective’ reality in an intersubjective discourse, therefore the limits of prediction can be also divided into two groups: objective barriers and constraints resulted from subjectivity.

In the case of objective barriers of predictability, the main argument concerns the use of mathematics. The most reliable prediction is always resulting from logical coherence of mathematical models of random (deterministic) and non-random phenomena. It also brings about an issue of computability. Recent discoveries show that computability has its limits – the world is infinitely complex so relying on mathematics, and especially on probability calculus in prediction has its limitations (Chaitin 2001).

Subjective limitations of prediction and predictability can result from limits existing at the level of individual and from social constraints. A closer look allows concluding that most if not all subjective barriers of prediction refer to social systems. It is obviously worthwhile to remember that the limits of prediction by individuals are frequently indiscernible from the social constraints

From numerous subjective constraints of prediction (predictability) the following ones should be mentioned:

- *natural limitations of observer* – physiological capability to identify and analyse variables representing phenomenon (phenomena) under scrutiny,

- *cognitive limitations* - framing and prospect theory (Kahneman and Tversky 1979),
- *socio-political influence* (external pressure, political correctness),
- *path dependency*,
- *self-defeating* and *self-fulfilling prophecies* - the impact of an observer/participant/predictor,
- *zebra principle* - the reasons are known afterwards, but could not have been predicted beforehand; it particularly concerns the cognitive and decision-making processes of political leaders (Webb 1995),
- *good prediction from false theories* (Singer 1974, 1999),
- *scope and time horizon* - broad long-term predictions are more susceptible for emergence of other unpredicted (unpredictable changes), - *bounded rationality* (Simon 1997),
- *inherent limitations of intersubjectivity* in post-modernist and constructivist approaches.

71.3.2 Prediction in Economics and in the Social Sciences

Similarly as risk and uncertainty, as a matter of fact, any category relating to thought and action is also determined by its context. Being aware of more universal determinants of the discourse on relations between humans and their future (Patomäki 2006), it is necessary to narrow the discussion on those aspects of prediction which link it to its role in security-oriented research.

Prediction in economics and in social sciences has some specific characteristics which make them different from other disciplines. There is also one important distinction between economics and social sciences which should be taken into account in a discussion on prediction and widened security agenda where economic security is considered.³ Prediction in economics of a positive (description and interpretation) and normative nature is directly associated with the epistemological paradigm of the discipline. Usually two or three of them are distinguished: a) neoclassical, b) historical, and c) institutionalist.

In the *neoclassical* paradigm economics is regarded as a kind of exact science which can be even become deductive and built upon axiomatic assump-

tions. Von Neumann and Morgenstern (1953: 7-8) argue that economists must start with the “very simplest facts of economic life and try to establish theories which explain them and which really conform to rigorous scientific standards”. They continue:

This preliminary stage is necessarily *heuristic*, i.e. the phase of transition from unmathematical plausibility considerations to the formal procedure of mathematics. The theory finally obtained must be mathematically rigorous and conceptually general. ... Beyond this lies the field of real success: genuine prediction by theory. It is well known that all mathematized sciences have gone through these successive phases.

Should economics achieve such a stage of development then prediction would be achievable in the same way as in other disciplines, e.g. physics. As we know after the almost 60 years of development of science, even in mathematized disciplines absolutely reliable prediction is unachievable. Therefore the above can be viewed as one of the trends of economic thought. Based on these assumption predictability in economics is guaranteed because of the rationality of actors - individuals and collectives. In a theoretical sense a rational actor is always able to optimize his/her choices. Both limitations stem from the concept of “bounded rationality” of Simon (1997) along with the prospect theory of Kahneman and Tversky (1979).

When economics is treated as a *historical* or *institutionalist* discipline then it shares all obstacles of prediction with other social sciences, where mathematical models are but only one of the methods of predicting future events. Prediction and behaviour of economic and social systems are also determined by the fact that their elements, i.e. individuals can make predictions and that there exists something that can be called a collective knowledge. A distinction can thus be made between causal systems and anticipatory systems.

In a causal systems there is an idea inherited from the behaviour of the mechanical systems of physics that imposes a high restriction degree to the analysis of the dynamic behaviour of a system. This idea is that the dynamical behaviour of a system is completely determined by its past. Such systems may even expose stochastic behaviour but it is still depending on past events in a system and in its environment.

In economic and social systems the basic elements (individuals) are endowed with consciousness. Although we know very little about its mysteries yet it is possible to built models which at least partly may mirror the behaviour of conscious individuals or social systems treated as learning systems. They are called

³ Economics is understood in the classical educational sense. There are also other fields where prediction plays an important role which are close to economics finance and management.

anticipatory agents and they constitute anticipatory systems. According to Rosen (1985: 339) an anticipatory agent is “a system containing a predictive model of itself and/or of its environment, which allows it to change [its] state at an instant in accord with the model’s predictions pertaining to a latter instant”. That is, anticipatory agents will act according to the past states of the system and according to the desirable and possible future states. Anticipatory systems can be then defined as systems that contain a representation of the system itself. An anticipatory system is a system which contains a model of itself and/or of its environment in view of computing its present state as a function of the prediction of the model. With the concepts of incursion and hyper incursion, anticipatory discrete systems can be modelled, simulated, and controlled (Dubois 1998).

Although social systems are also affected by the universal limits of predictability of ‘hard’ sciences, yet prediction of the future course of events in such systems is much more complex than in economics, at least in the neoclassical meaning. The main reason is quite simple. Social systems are not only tangible, physical, and/or measurable in a traditional sense but they also embody communication between individuals and collectives whose behaviour, in the final resort must be viewed as a manifestation of the unknown factor – human consciousness. That provides an additional factor to the complexity of social systems. It can then be proposed that as to understand better the systemic attributes of social systems, including of course, prediction, they should be treated as ‘complexity of complexities’. Predictability of behaviour of economic (social) systems can also be enhanced by two factors:

- *constraints* such as: systemic properties, psychological features of the involved actors (cognitive consistency), inertia of systems, path dependency⁴,
- *expectations* of rational behaviour of social actors although limited by bounded rationality.

71.4 Security and Prediction: A Conceptual Framework

71.4.1 Prediction and the Core Concept of Security

The need for prediction has always constituted an essential element of security-oriented considerations. A closer look at any theoretical attempts in IR and in related areas, of course with contemporary discourse based on postmodernism, shows that the need for prediction was either spelled out openly or was concealed in normative declarations. Because of an eclectic character of security studies, in the attempts to provide new insights on prediction and such associated terms as risk and threat, the following questions have to be raised:

1. What is the role of prediction in social theory?
2. Are there any specific features of prediction in security theory and policy?
3. What could be the sources of inspiration for investigation into possibilities and limits of prediction in security theory?
4. What methods of prediction drawn from other disciplines are particularly relevant to the needs of security theory and policy?

Disputes over the meaning of security put in doubt the search for any universal categories that could be used in all studies on security. The essence of the concept of prediction is, however, to a large extent universal and refers to all social systems and individuals. Therefore it can be proposed that as a point of departure for analysis of the role of prediction in security-oriented considerations the core concept of security can be applied (chap. 2 by Mesjasz).

71.4.2 Prediction in Security Discourse

71.4.2.1 Key Issues

By its very nature the need for prediction was always an inherent part of any considerations on international security, internal security, safety, etc. In the early writings, in a proto-theory of security in international relations, a successful prediction of threats, or limits of prediction, and resulting from them the possibility of counteractions, i.e. possibility of control of one’s own actions and potential actions of an enemy was always the key issue: Hobbes, Clausewitz, Sun Tzu, etc. In security theory, understood as a policy science, non-contingent predictability plays only a lim-

4 The constraints allowing for increased predictability are described in management by van der Heijden (1996).

ited role and contingent prediction (if, then) is dominating.

Development of security theory in a substantial extent can be reduced to the elaboration of methods of enhancement of capabilities of prediction of negatively valued disturbances – threats (risks, dangers), and improvement of understanding the reasons for their unpredictability. It concerns both warning against emergence of those threats, including long- and short-term predictions (early warning) as well as prediction of actions (policy-making) and reactions. It is worthwhile to remember that in some considerations on security the disturbance (of equilibrium) is equivalent to discontinuity, more or less abrupt but unpredicted (or unpredictable) termination of the present status quo.

The strive for improvement of predictability in IR and in security-related research, including also peace research, a scientific movement remaining for some time in opposition to 'orthodox' security studies, was expressed in the mathematization of theory and turn to empirical research based on statistical methods (Singer/Diehl 1990). It was also reflected in applications of early systems thinking and first order cybernetics since the late 1940's until the mid-1980's (Mesjasz 1988).

A broad survey of literature on prediction in security-related research during the Cold War would likely include hundreds of entries, but from the wealth of the topics some were of greatest importance. The main challenge in that period was associated with prediction and prevention of international conflicts in a bipolar and multipolar world, power transition, early warning systems, cyclical development in international systems.

The relatively simple international order during the Cold War allowing for applications of more or less mechanistic models of prediction has been replaced by a new world order after the collapse of the Soviet Union. Until the early 1990's the new order looked more benign than the Cold War world living under nuclear threat. It occurred later that the new world order has brought about new challenges weakening already limited capabilities of prediction of phenomena in international relations. The threat of terrorism, which by its very sense must remain almost unpredictable, added to obstacles to prediction in security theory and, of course, in security policy.

It may be summarized that in the early 21st century prediction in security-oriented studies is determined by the two groups of determinants. The socio-political factors are associated with the very character of

the social systems and the second ones, which can be called methodological, partly associated with the first group, which stem from the development of science in the recent 30–40 years.

71.4.2.2 Socio-political Determinants

Discussion on the limits of prediction in security-related social sciences can be conducted at several levels, beginning with epistemological and ontological considerations, e.g. Bernstein, Lebow, Stein and Weber (2000), and Patomäki (2006), and ending with specific examples of self-delusion in politics (Tuchman 1992). At the level of abstraction considered in the chapter, three broadly defined socio-political determinants of predictability can be taken into account.

First and foremost, it is the increased complexity of the world adding new constraints to the already well-known epistemological barriers of predictability. This new factor is well-defined in strategic management where mechanistic and rationalist expectations towards the possibility of strategic planning have been replaced by the visions of learning organization in the turbulent environment. Similarly, an unpredicted end of the Cold War has been widely analysed in many studies and is recalled herein solely as an example of a growing unpredictability of social and political phenomena. With regard to security it may be argued that growing complexity of the links between human activities and the natural environment makes prediction a key issue in the discourse on environmental security.

The term complexity has a large number of meanings (chap. 2 by Mesjasz), but for the use in analysis of prediction of social phenomena at various levels of social systems hierarchy, it can be depicted with such attributes as an increasing number of interacting units, increased flows of information, volatility of processes, acceleration of changes, increased intensity and scope of changes. These factors significantly undermine two traditional pillars of prediction – the possibility of reducing the relations to more or less simple causal and separable links, and the possibility of applying inductive reasoning based upon extrapolation of earlier trends. In a complex world with an overwhelming amount of information, it is becoming less plausible to expect that the past events will be continued according to the same patterns. This incapability of humanity to deal not only with prediction, but with comprehending the complex world, has received a catchy term, 'the ingenuity gap' (Homer-Dixon 2002).

The second socio-political factor, an unexpected and to a large extent unpredicted collapse of the Soviet empire, is putting in doubt prediction capabilities

not only of the security studies as a scientific domain. It also cast a shadow on the intellectual qualities of people involved in that field as well as on social credibility and legitimacy of institutions dealing professionally with prediction of security threats. After the end of the Cold War representatives of all areas of security-related disciplines have found themselves in a very discomforting intellectual position. Thousands of 'sovietologists' and 'kremlinologists' were faced by a fact that their analyses, or better discourse, proved almost useless in making at least partly successful long-term and medium-term predictions.

Only a few authors, a Soviet dissident, Andrei Amalrik (1970) and a sociologist, Randall Collins (1986) heralded the imminent collapse of the Soviet system. Amalrik's visions were based on intuitions while Collins' prediction was more rigorous, deriving from analysis of geopolitical forces standing behind the dynamic of change in the USSR. A majority of theoreticians and policy planners in economics and in politics, both in the East and in the West, were unable to make predictions increasing their readiness to implement new solutions after the collapse of the USSR. The reasons for such a course of events were assessed by several leading IR scholars (Gaddis 1992; Hopf 1993; Singer 1999).

Obviously, it was not the first time when security theory and policy were confronted with a surprising course of events. While not trivializing Angell's (1910) "Great Illusion", it must be underlined that his vision of the cost of war as a discouraging factor for wars presented almost on the eve of the World War was at least partly erroneous. And many similar examples can be found in ancient and in modern history as well, e.g. the vision of the year 2000 elaborated by Kahn and Weiner (1967).

The case of the unexpected and unpredicted peaceful demise of the Soviet Union can be connected with the third socio-political factor determining predictability in security theory and policy which results from psychological and social mechanisms distorting the processes of prediction by individuals and institutions. These mechanisms are associated with psychological, social, and political constraints. It frequently happens that some of the predictions are suppressed due to various mechanisms of inhibition at the level of individuals, e.g. routine or excessive self-confidence and lack of self-criticism. There are also numerous social mechanisms inhibiting prediction, various forms of more or less open censorship – political correctness, political and cultural constraints, institutional inertia, etc.

The above socio-political constraints are perfectly reflected in a comment made by Hopf in the discussion on the reasons for failures of prediction of an unexpected end of the Cold War. "Can anyone imagine a senior international relations scholar applying to the Carnegie Endowment in 1972 for a research grant to investigate the conditions under which Moscow would most likely voluntarily relinquish control over Eastern Europe?" (Hopf 1993: 207).

In an extreme form it may lead to a situation when some security scholars would refrain from elaborating scenarios since they might be afraid of preparing a 'politically incorrect worst case scenario'. Some more recent cases, e.g. confusion around the existence of the WMD in Iraq may only raise doubts if the institutions professionally involved in gathering information are not subdued to the mechanisms of political influence distorting validity of their data.

Emergence of global terrorism, sometimes on a mass-scale, is the fourth socio-political factor having an impact on prediction in contemporary security theory and subsequently, on security policy. Limited predictability or complete unpredictability are the essential parts of the methods of terrorist warfare. Due to its scale and increased complexity of social systems making them highly vulnerable to unsophisticated yet damaging threats, low predictability of terrorist attacks increases their social impact.

The fifth socio-political factor determining prediction in security theory and policy results from a kind of 'information asymmetry' existing in any social research and in any security-oriented research in particular. It is easy to come to the conclusion when reading the works in IR that the so-called empirical basis of research, and alas, theoretical generalizations, is in most cases based upon openly available sources – media, reports, etc. Even in not so much security sensitive considerations there are always the distortions resulting from natural barriers of social communication. However, in security discourse the barrier of secrecy is an inherent factor. Therefore any critically thinking analyst may feel discomfort realizing that his/her research on security sensitive issues may be put in doubt or even ridiculed when a true state of affairs is disclosed, say, in twenty or more years.

71.4.2.3 Epistemological Determinants

Prediction of social and natural phenomena in security theory has also been influenced by a rank of factors associated with the development of modern science. The first epistemological determinant influencing prediction not only in security theory as well as in

social sciences and in virtually all human knowledge, are the discoveries in mathematics, physics, and chemistry made in the 1970's and in the 1980's, which were labelled as science of complexity, chaos theory, far-from-equilibrium systems, etc. Although they are predominantly applicable in rigorous mathematical models which can hardly be directly transferred to the social sciences, they contributed to many writings on chaos, complexity, and non-linearity in the social sciences, including IR and security studies. In the discourse on security theory the concepts drawn from 'complexity science', chaos theory, and non-linearity were used not only as mathematical models, but they have become a source field for metaphors and analogies.

Complexity and chaos theory, particularly the latter, show that the concepts of equilibrium (typical for economics) and stability - used initially in the discussions on polarity, cannot be fine tuned so as to enhance possibilities of prediction. The impact of those ideas on security research has been and still is broadly discussed, although numerous simplifications in their applications often require further elucidation (Rose-nau 1990, 1997, 2002; chap 2 by Mesjasz).

Mathematical models based upon 'complexity science' and 'chaos theory' have undermined intuitional expectations of social scientists that more data and more sophisticated mathematical models could improve predictability of social phenomena. Numerous examples of references to complexity, non-linearity, chaos, some of them used correctly and many trivialized and simplified, can be found in the contemporary discourse on security (Alberts/Czerwinski 2002).⁵

Several widely popularized examples showing the consequences of non-linearity in various mathematical models of conflicts and arms races models were presented by Saperstein (1984, 1991, 2002). Another interesting example of applications of non-linear systems was presented by Alan D. Beyerchen (1992), who identified non-linearity in the theories of war developed by Clausewitz. In this work and in the similar ones, Newtonian, simple, coordinated classical war is viewed as an opposition of war treated as a non-linear phenomenon.

It is also worthwhile to underline that chaos theory by exposing sensitivity of changes to the initial

conditions (small cause-big effect), the famous 'butterfly effect', has allowed to reaffirm 'scientifically' a phenomenon which is self-evident, i.e. that frequently big changes are completely dependent on very small initial impulses (the 'Cleopatra's nose' idea of history).

The essence of the links between security discourse, predictability, and chaos theory is perfectly reflected in the following quotation drawn from a book published after a conference on the links between security and theories of complexity and chaos held at the US National Defense Academy in 1997 (Mann: 65):

The converse of this is that we perceive the chaotic as at heart threatening. For proof of this, we need not look at the upheavals of this century, but let's go back to the fundamental level of dynamical systems theory, the mathematical. Mandelbrot, in his wonderful book, *The Fractal Geometry of Nature*, describes the Cantor dust and terms it 'another awful mathematical object ordinarily viewed as pathological'. Further, he notes that 'many writers refer to [the graph of the Cantor function] as the Devil's Staircase'. We find this same genre of mathematical objects referred to as 'a gallery of monsters'; Mandelbrot himself creates a 'fractal dragon'. The irregular, the discontinuous, the extraordinary is threatening (see also chap. 2 by Mesjasz).

When presenting inspiration from chaos theory and complexity theory, or better, complexity theories on prediction-oriented security analyses, it is worthwhile remembering that already in the 1960's in sociology the first doubts on prediction in the social sciences were cast due to the Heisenberg Principle which was used to illustrate the impact of observer upon the subject of the study, and which was to a large extent frequently abused afterwards in the social sciences. Even at present works are appearing in which reference to the links between security issues, the first Gulf War, and quantum mechanics are made at a metaphorical level (Glynn 1995).

The second epistemological factor influencing prediction-oriented discourse in security studies was associated with the development of postmodernist and post-structuralist approaches. Taken in a simplified way, by putting stress on subjectivity, intersubjectivity and discourse, postmodernism denies any possibility of prediction (Hopf 1998; Der Derian/Shapiro 1989; Webb 1995). This research approach developed in several so-called critical writings on security rejects the possibility of prediction, even with the use of mathematical models, since mathematics is also regarded not as an objective instrument of identification of in-

5 In social sciences it is frequently forgotten that non-linearity may have three interpretations and that a non-linear system is not necessarily chaotic (Sokal/Bricmont 1998: 140-145).

variants in the social phenomena, but as a social construct (Albert/Hilkermeier 2003).

In one of the most influential books on security (Buzan/Waeber/de Wilde 1998) postmodernism, in not an orthodox form, is the foundation of security as an 'act of speech' and of 'securitization'. These authors do not deny possibilities of prediction, they simply do not express their views on that topic. The fact that security is becoming a subjective category moves attention from traditional approaches to enhance predictability to the investigations into cognitive processes, social communication, and decision-making processes. This makes prediction even less feasible, since it becomes dependent on the studies of mental processes of individuals, not only on key decision-makers but also on all actors involved in the securitization processes.

There were also several attempts to make a synthesis of the concepts of complexity and chaos with the ideas of postmodernism. Some of them referred to the limits of prediction in non-linear or chaotic discourse, yet they cannot be treated as a useful contribution to security theory. On the contrary, in some cases they were based on superficial, simplified, and scientific speculations (Sokal/Bricmont 1998).

Herewith associated is the third factor - the broadening and deepening of the meaning of security. While for a narrowly defined state military security predictions based on more or less advanced mathematical modelling including, for example, game theory or statistical research, seem legitimate, for numerous interpretations of security in different sectors any universal methods of prediction do not seem relevant. In such a case only specific methods applied to more or less precisely defined issues may help in identification of the future states of the world. It should be taken into account that broadening and deepening of the sense of security is frequently associated with 'securitization'. Thus the aforementioned limitations of prediction in intersubjectivity must be taken into consideration.

The fourth epistemological factor influencing prediction in security study is also associated with its broadening and deepening. Inclusion of environmental issues into security concerns creates necessity to elaborate methods allowing for prediction of those natural phenomena - spontaneous, or human-induced. Here traditional instruments of prediction in social sciences must be supplemented by knowledge from natural sciences.

71.5 Conclusions: Could We Better See Future Threats, Risks, and Vulnerabilities?

Many studies and ideas on prediction may raise hopes that in the 21st century enhanced predictive capabilities of modern science could improve theory and policy of security, but the predictability of threats and risks may be rather moderate (Glenn/Gordon 2006). When discussing the reasons for the failure to predict the collapse of the Soviet Union, Gaddis (1992) exposed the methodological constraints - insufficient attention paid to some methods, while Hopf (1993), and to a lesser extent Singer (1999), referred to social constraints. Excluding critical studies that doubt any possibilities of prediction in security theory and policy, it is worthwhile to review methodological and socio-political factors of predictability.

71.5.1 Increased Social Complexity and Theory of Dynamic Systems (Complexity, Chaos and Associated Methods)

Although social complexity is difficult to define even in its intuitive form as a large number of elements with many interactions, it definitely influences negatively any predictions. Similarly as in other normative domains of social theory, e.g. management theory, stress is being shifted from classical methods of prediction to the studies of learning systems, analysis of cognitive phenomena, and applications of methods from some domains of complex systems studies (anticipatory systems and the like) in modelling cognitive processes and decision processes of decision-makers. Although they do not give exact models, they provide good approximations of some processes, and what is more important, they can be used as a very inspiring source of metaphors and analogies. The prediction of unpredictability, i.e. undermining any expectations for significantly improved methods of prediction in studying inter-state security, can be seen as one of the most significant contributions of chaos and complexity theories to the development of theory and policy of security.

The impact of metaphors and analogies drawn from chaos and complexity has now permeated the language of such terms like bifurcation, chaos, non-linearity, etc. Paradoxically, it may be concluded that it is not important if they are always applied in a correct manner. It is important that they sensitize policy-makers to unexpected consequences of their decisions. Computer simulation models using intensive

war gaming may permit more reliable and plausible predictions. Based on available data any of the contemporary models provides an opportunity to assure a high level of exactness of probability of future threats.

There may be some models of dynamic systems used in secrecy for military and political purposes, especially in the USA. Such models could be fed with more accurate data than models for civilian or academic purposes. Looking at the political problems in Iraq, the differences between promises, declarations, expectations and reality, those models do not have too high predictive power, unless the goals of the war are different from those declared beforehand. There might have been correct predictions of the situation in Iraq resulting from those models, but they were ignored in the political process.

The dynamic systems models can be useful in 'medium-level' war games used in training, for instance of pilots. The relatively low aircraft casualties during the Gulf Wars on the US side shows that the methods of coordination based on computer modelling permitted the improvement of the processes of prediction, and eventually the coordination of flights.

71.5.2 Prediction, Broadening, and Deepening of the Security Concept

A broader and deeper meaning of security is undoubtedly changing the potential for prediction. Due to the growing complexity of the world it is impossible to expect unified methods and approaches to prediction in security studies. While for inter-state relations older paradigms – realist (neorealist), liberal and/or pluralist – may provide new insights for prediction, for societal and environmental security other approaches may be more relevant for prediction.

For societal security an approach based on learning systems seems particularly relevant. For environmental security methods from natural sciences may provide necessary support. Here long-term scenarios on threats and vulnerabilities are frequently being used as a strong countervailing argument for 'thrill-mongering', or 'in the long run we all will be dead'. The concept of human security creates even more challenges for prediction. Due to its vagueness and universality, prediction in case of human security embodies most factors limiting security in other sectors, and therefore requires a separate study.

71.5.3 Socio-political Barriers to Predictions

An introductory survey of the main determinants of prediction in security-related research was used as a point of departure for answering a question on the role of limitations of prediction. Two interrelated categories of limitations have been identified – the socio-political factors and the epistemological factors.

In conclusion, epistemological factors, arising predominantly from a better understanding of the sense of complexity of social systems, are relatively well known. The discoveries in mathematical complexity theory and in thermodynamics permitted a decrease in expectations towards a better prediction achieved due to more data and refined mathematical modelling and/or computer simulation.

The second conclusion is that, in addition to these well-known epistemological barriers, prediction in the contemporary security discourse is still predominantly hampered by socio-political constraints. Despite the spread of democracy and freedom of speech, such barriers as secrecy, political correctness, influence of politicians on the media, sometimes self-censoring by the media, culture-based cognitive limits, make too many predictable threats, risks, and vulnerabilities unpredictable, or even unthinkable. As the case of 11 September 2001 has shown, a terrorist attack by one airplane was treated as predictable, but an attack committed at the same time by four groups of suicide hijackers was considered unthinkable. Not because of technical impossibility of prediction of such an event, but due to socio-political constraints, including inefficiency of operations of relevant US Government agencies and carelessness in exercising already existing procedures of pre-emptive control.

The sense of socio-political barriers in prediction in security-related theory and policy can be reflected in the term 'politically correct worst case scenarios'. Due to the above constraints, scholars – perhaps to a lesser extent, but policy advisors, policy-makers, and journalists, are frequently tempted and/or forced to present the visions which have to conform with the norms of their superiors/co-workers/clients/general public. This chapter offers a preliminary warning against preparing 'politically correct worst case scenarios'.

72 Climate Change and Security in the 21st Century

Heinz-Dieter Jopp and Roland Kaestner

72.1 Introduction

Based on a workshop on *Climate Change and Security*¹ this chapter addresses the following scientific questions that are relevant for the planning of the *Bundeswehr* (German Armed Forces) until 2040: Does climate research allow the identification of highly affected regions due to specific impacts? Do other scientific disciplines offer indications for possible major regional impacts for population change, settlements, use of resources, food production, etc.? Can models and theories refer to possible implications for economic, social, and political developments? Do major interactions between the identified factors result in further findings on climate change? Can the risks involved be assessed, and what are the implications that may be concluded for global and regional security for Germany and Europe? Can the findings obtained be used for conceptual ideas for the preparation of the *Strategic Future Analysis* of the Study on Capabilities

and Technology in the 21st Century (SFT 21) of the *Bundeswehr*?

The dialogue during the workshop took place in an open, constructive, and creative atmosphere. This was owed mainly to the fact that the participants either had a scientific background in the fields of climate research, the social, geographical, political, and economic sciences, or in the practical application of business, political consultancy, the military, and futurology, and that they were looking for a coherent approach to finding solutions.

This chapter is organized in seven parts. After a brief review of the relevance of climate change for 'Strategic Future Analysis' (72.2) the global and regional climate change impacts for communities are discussed (72.3), including the geographic framework of climate change and its consequences (72.4) and the security impacts of the transformation of global regions (72.5), especially the projected climate change impacts for European Security (72.6), and finally a few conclusions are made (72.7).

1 This chapter is based on a workshop on *Climate Change and Security* organized by the Command and Staff College in cooperation with the Centre for Transformation of the German Armed Forces (*Bundeswehr*) and the German Development Institute (GDI) in Hamburg, 30 October to 1 November 2006. The workshop had two purposes: 1. to examine whether the previous scientific findings on climate research would allow the Strategic Future Analysis of the *Bundeswehr* to be scientifically based; 2. to examine, in relation to the previous analysis of the studies on the Armed Forces, Capabilities and Technology in the 21st Century (SFT 21), for the years 2030 and 2035 whether the previous findings would be confirmed, and additional findings could be obtained from the workshop. New findings on methodology and content would be used for the 2040 SFT 21 follow-on study to be prepared by 2010. This workshop was to examine - as part of an interdisciplinary approach - the regional impacts of climate research for economic, social, and political developments, and to discuss their implications for global and regional security, but also for the security of Germany and Europe.

72.2 Strategic Future Analysis and Climate Change

Security Scenarios: a planning tool for armed forces and society. The *Strategic Future Analysis* of the *Bundeswehr* uses scientific findings as guidance for decision-makers in political, military, and defence industry. Part of the analysis relies on the experience and insights provided by external and internal studies. The results of the *Strategic Future Analysis* should sensitize decision-makers for possible actions and alternatives and provide them with options for shaping the future on capabilities of the armed forces. But they are advised not to anticipate solutions. The objective of enhancing the long-term planning of the armed forces can only be achieved when they are conceived as a product of the role they will play at the international level, taking the relevant social conditions into

account. Therefore, the analysis on which the findings are based must embrace more than the efficient options of warfare under military considerations. In this context the basic assumption is that the armed forces mirror their respective social environment.

The term '*Strategic Future Analysis*', raises the question of what we can know about the future. This chapter assumes that, contrary to the natural sciences, the social sciences cannot make projections of future events based on general laws. Thus, the analysis of future trends – as commonly used in the social sciences – is no substitute for fundamental laws. The shortcomings of sociological projections are due mainly to the complexity of these events, their interlocking nature, and the qualitative character of sociological terms. It is impossible to forecast events with the same precision as in classical physics (Popper 1979: 30). Since we are very much a part of social events and can use projections to influence future events, there is no scientific basis on which to make detailed social projections (Popper 1979: 11). The future is unknown, and all players involved help in shaping it. Yet this future will also be determined by the laws, basic parameters, and also by evolutionary options in cosmology, biology, and civilization. Although future developments can be projected through a greater differentiation of the processes involved, none of these processes can violate the laws and basic parameters that are associated with the three evolutionary processes mentioned previously. This means that the number of perceivable futures is finite, since not everything that may be foreseen is realistic. Considering the evolutionary processes as foreseeable futures enables the defence planner to draw up an action map and to examine why certain developments, contrary to our expectations, will have followed a different course.

Collective human action can, where there is a consistent repetition, be subsumed as trends. Trends are developments which move in recognizable directions that are defined through the analysis and experience of past events. They allow statements to be made on an unknown, insecure future environment clearly defined in terms of time, space and relevance, and they may describe potential events, spaces, and structures. Trends allow reducing the complexity of the world to a few essential features. Yet the evaluation of the comprehensive literature that deals with security issues has revealed a rather large number of trends and trend projections, something that initially ran counter to the intention of reducing the complexity of the world, and that coexisted in a state of disarray in terms of quality and quantity. Trends and trend projections require to

be given a structure and hierarchy so that they could be applied to the conclusions that had to be drawn and to the trend interactions that had to be defined.

The previously mentioned civilization process may offer an explanation by linking trends in different fields. Scientific analyses contain manifold explanations of the civilization process (e.g. Adam Smith, Immanuel Kant, etc.). In this chapter a definition by Norbert Elias (1991) will be used. He defines the process as the “plans and actions, emotional and rational impulses of the individual that consistently interlock in a friendly or hostile fashion. The fundamental interlocking of all individual plans and actions can lead to changes and designs that are neither planned nor created by one individual alone. The interdependence of the individuals results in a specific order, an order that is more forceful and stronger than the will-power and reason of all individuals that make up the order” (Elias 1991: 314). This civilization process will change the behaviour and feelings of the individual towards a specific direction.

With this in mind, the instrument of the *Strategic Future Analysis* analyses a broad spectrum of trends and their relevance for security and the armed forces derived from scientific research in different disciplines and the fields of their application. The ‘civilization development’ model helps assessing the trends and organizing them into trend fields (Part III of FSA, chap. 2). This is done by defining these seven trend fields that cover all trends and trend projections:

1. demographic developments,
2. development of the resources and the environment,
3. development of sciences and technology,
4. cultural developments,
5. social developments,
6. economic developments,
7. political developments.

These trend projections result in an analysis that shows how individual trends, but also their effects may impact on future warfare and security scenarios. The trends and their theoretical explanations will be deduced from publications from various disciplines, databases, and studies of national and international establishments, as well as from other publications. They offer an inexhaustible potential for the Strategic Future Analysis at different levels of abstraction and with highly differentiated options to reduce complexity as defined by Luhmann (1968, 1973).

The results obtained from the trend analysis will be translated into security scenarios and descriptions

of a fictitious security-relevant environment of the future with a time horizon that goes beyond the Bundeswehr planning process of approximately 15 years. Some trends are long-term in nature (e.g. demographic trends), where abrupt changes are unlikely to occur. Other trends may have a shorter range and can change relatively fast when fresh trends emerge. The latter is particularly true for complex trends such as globalization which makes their assessment more difficult. Moreover, there are only few findings concerning the relations and interaction between the various trends. These deficits can be removed only by long-term empirical research. The permanent monitoring of complex trend-setting factors and their impact that define a specific development will create the necessary prerequisites for conducting the relevant research. This means that the process of the Strategic Future Analysis must be continuous in nature.

The scenario technique that is being used for the Strategic Future Analysis is a method that will help to systematically develop and subsume isolated conceptions of possible changes in individual or linked development factors in order to create detailed scenarios and models, i.e. possible and probable 'futures' that are comprehensible for others as they are being shaped. This reduces the complexity of the matter and at the same time counters the danger of reducing the future to merely one single development aspect (the pitfall of the monocausal link).

Hence, scenarios are neither projections that revert to quantitative information from the present or the past and that by forward projection of current structures and behavioural assumptions estimate future developments, nor are they utopia and fantasy. In fact, the scenario technique links quantitative data and information with qualitative information, assessments and opinions so that the result offers a sufficient number of detailed descriptions of one or several possible future situations from a holistic perspective that allow a verifiable assessment and evaluation of any given issue. The scenario technique helps develop a well-defined *event space* for the future with regard to specific issues and the resulting number of possible events that can be expected and in turn indicate options for action.

72.3 Global and Regional Climate Change and Its Challenge for Local Communities

As a contribution to the 2040 SFT 2I future analysis, selected scientific results are discussed with regard to

the link between climate change and social developments (72.3.1), and model of causal links between climate change and security (72.3.2).

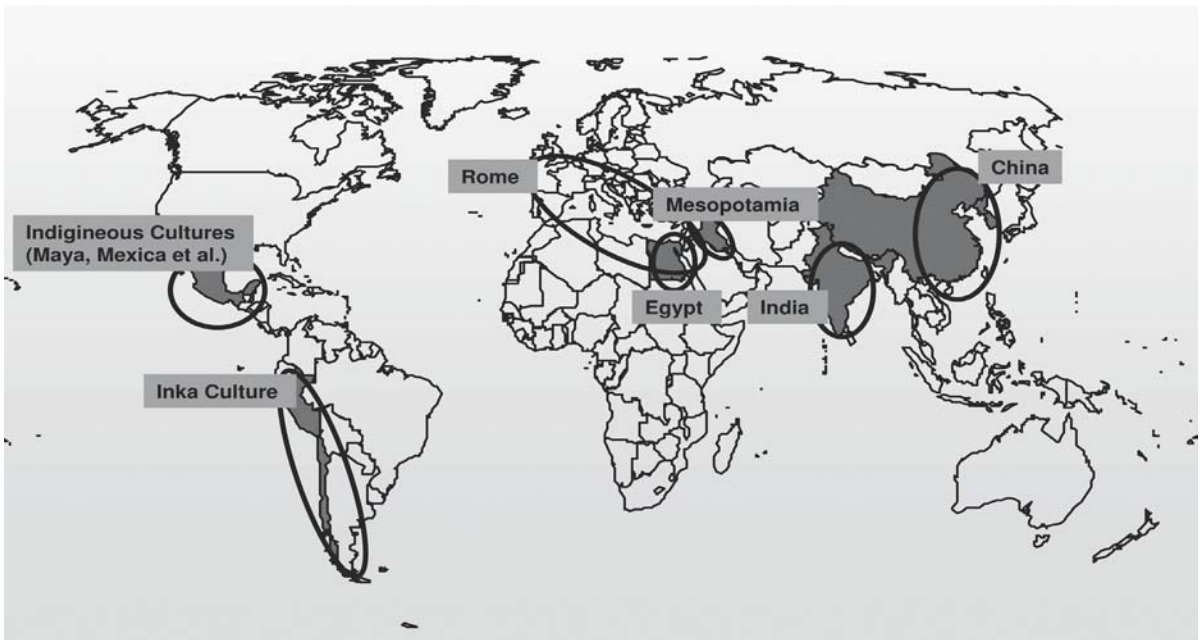

72.3.1 Link Between Climate Change and Social Developments

According to the IPCC (2001, 2001a, 2001b, 2007) during the 20th century the average temperature rose by 0.6 °C. For the 21st century climate researchers have projected a global temperature rise of between 1.5 and 5.8 °C, should conditions remain unchanged (IPCC 2007, Summary WG I: 14). The temperature rise of the 20th century and the temperature average for the 21st century is the result of an anthropogenic climate change that will impact on many parts of the world. The main effects will be (Max-Planck-Institut für Meteorologie 2006: 5):

- projected temperature rise until 2100 in the northern regions in Europe, in Siberia, North America, specifically in Canada;
- regional changes in rainfall patterns with consequences for the water table;
- melting of glaciers and arctic regions, causing rising sea levels and effects on oceanic circulations;
- rise in the number and intensity of extreme weather events (e.g. storms, floods, drought, heat waves, etc.) that will be typical for certain regions;
- a further rise in the sea temperature with consequences for ecosystems (e.g. coral reefs, changes in regional flora and fauna, etc.);
- a sea level rise of 30 to 40 cm by the end of the century (Max-Planck-Institut für Meteorologie 2006; WBGU 2007: 38 refers to a sea level rise 2.5–5.1 m by 2300).

Climate change and extreme weather events will have major consequences for the affected regions. The general assumption is that climate change and changes in the weather affect natural and anthropogenic ecosystems. Warm and humid climate periods in prehistoric and historic times favoured cultural developments and human settlements (Blümel 2002, 2008), while periods of a climate pessimum led to unstable weather and seasonal patterns, and a high variability of the climate and low temperatures resulted in regionally aggravated aridity. At lower latitudes the drop in temperature and less rainfall resulted in drought periods and desertification, as well as the degeneration of savannah areas used for hunting and pasturing (Blümel 2002, 2006, 2008).

Figure 72.1: Cultures and areas of high density population. **Source:** own design by authors.

Favourable climates (particularly in medium latitudes) implied:

- very good conditions for agricultural societies in thermal hygric terms;
- reliable and predictable seasons, also multiple harvests;
- establishment of villages and towns, rise in trade and commerce, and the introduction of the division of labour;
- vertical social structures;
- architecture as a sign of prosperity;
- cultural exchanges and foreign trade relations (Blümel 2008).

Periods of climate pessima or 'unfavourable' climate periods (medium latitudes) caused:

- bad harvests, supply crises, famines and epidemics;
- population losses;
- break up of social structures, social unrest, wars;
- withdrawal from habitable areas, increase in desertification;
- migration, large-scale population movements ('vandalism');
- few major achievements in architecture (Blümel 2008).

A palaeographic retrospective is not generally suitable for drawing analogous conclusions, but it may be quite useful for discussing deficiency analysis, climate

models, geographic differentiation, the assessment of space potentials in order to arrive at regional theorems with regard to the consequences that climate change is likely to have on societies, and for developing complex adaptation strategies that take all these aspects into account.

Modern societies are not any longer agricultural, but rather industrial or post-industrial societies with a highly aggregated agricultural sector. This means that the latter is rather vulnerable when affected, yet rather efficient when not affected. However, the current overall population (above 6 billion) and the rapidly increasing population growth (of about 9 billion by 2050) have led and will continue to lead to a drain of land resources. The latter is accompanied by surface changes (e.g. forest losses, larger agricultural areas, expansion of urban and industrial areas, etc.) and high energy and water consumption. These factors intensify the degradation of the countryside. The areas of interest for civilization settlements are coastal regions and flood plains. Here the first advanced civilizations (figure 72.1) developed and even today countries with such settlement patterns are the most powerful or are candidates for growth.

The population growth commencing during the 19th century meant that these areas became densely populated (see figure 72.2). At the same time, they were always at risk from natural disasters such as flooding, storms, etc., and human settlements therefore rather vulnerable.

Figure 72.2: Current Population Density. **Source:** CIESIN, Columbia University (permission from the copyright holder was obtained).

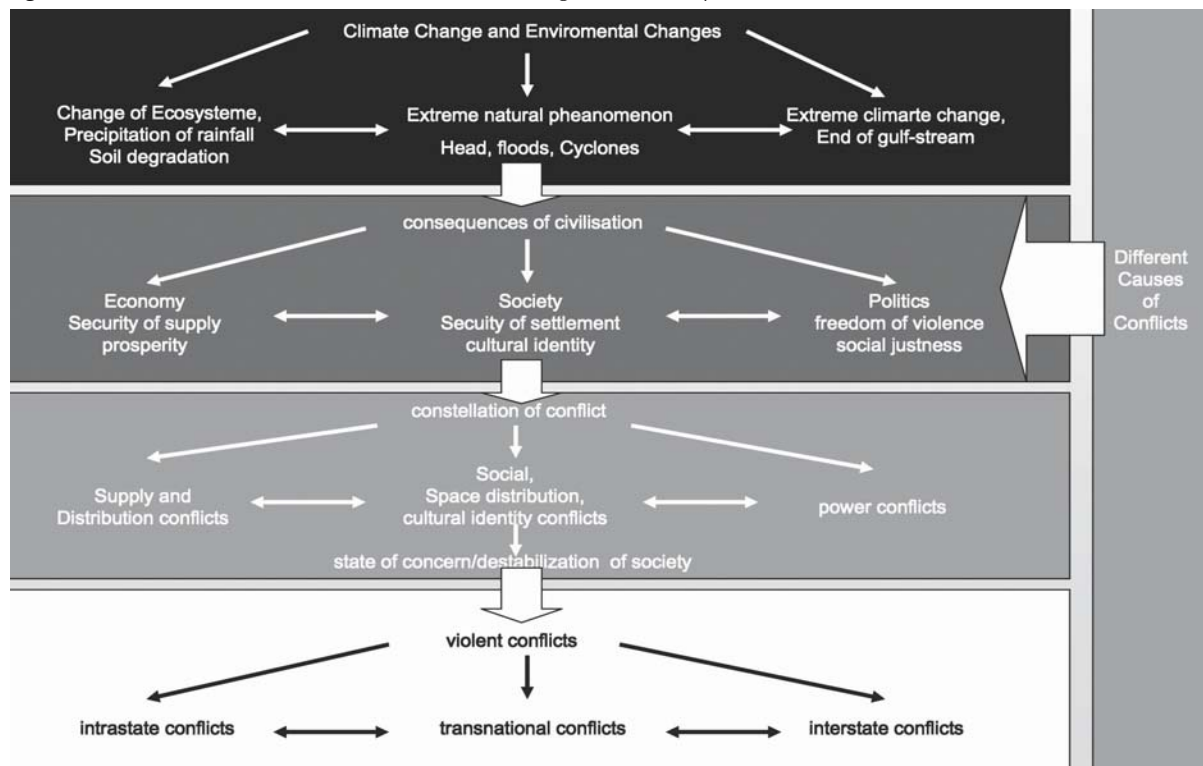

Figure 72.3: Model on the Link between Climate Change and Security. **Source:** the authors.

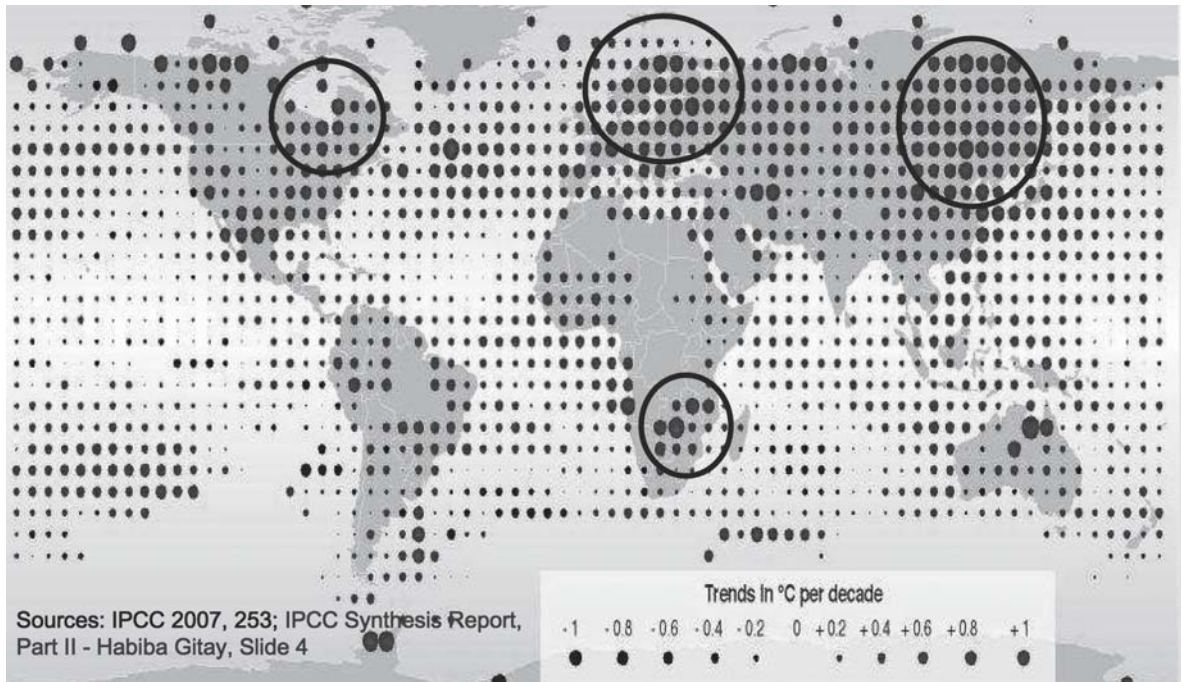

72.3.2 Causal Link between Climate Change and Security

These climate change impacts for central areas of human societies will be discussed based on an enhanced basic model of the German Development Institute

(WBGU 2007: 104; figure 72.3) that can be described as follows: Climate change and its associated environmental changes impact on the ecosystem, cause extreme weather events and natural disasters, and may enhance the potential for abrupt climate change that may trigger a cessation of the Gulf Stream (Schellnhu-

Figure 72.4: Geographic Distribution of the Warming Process. **Source:** IPCC 2007, 253; IPCC Synthesis Report, Part II - Habiba Gitay, Slide 4.

ber 2006), or regional glacial periods (Blümel 2002). Such events impact on civilizations in the form of climate optima or pessima (see above). They challenge the security within societies, leading to conflicts that may result in violence. Extreme changes in the utilization of space may, in addition to poverty-related migration and qualitative changes within populations, also push marginalization and eventually social and political disintegration.

On the background for these claimed linkages, the following question must be asked: Who in what form will be affected by climate change and what are the consequences for the economic, social, and political developments? The geographic framework offers clues as to potential future areas of conflict or triggers of conflict, e.g. for environment-related migration.

72.4 The Geographic Framework of Climate Change and Its Consequences

Climate change impacts affect regions differently. Figure 72.4 suggests that temperature increases will be most severe in Central Europe, Eastern Siberia, in the eastern parts of the US and Canada, and in the southeast of Africa. Northern latitudes will be more affected than southern latitudes.

The distribution of the expected precipitation suggest that “in humid climate zones (tropical areas and geographical areas at medium to high latitudes) precipitation will be on the increase, in dry climate zones (subtropical areas) on the decrease, and the precipitation intensity and the resulting threat of flooding will rise worldwide” (Max-Planck-Institut für Meteorologie 2006: 5; IPCC 2007, WG I Summary: 13), with the consequence that certain regions will be endangered by droughts (figure 72.5), with a direct impact on agriculture and water reservoirs.

A comparison of the potential drought zones with the current agricultural areas (figure 72.6) shows that there are considerable shifts in the areas previously used for agriculture.

Hence, large parts of North America that are the granaries of today’s world will no longer be able to deliver (e.g. Alcamo/Endejean 2002; Alexandrov/Hoogenboom 2000). Parts of Southern Europe (Spain, parts of France, Italy and Greece) and Eastern Europe will cease to be used as extensively utilized agricultural areas (M. Parry, co-chair of WG II of IPCC, 2002-2007). The areas in North Africa, the Near and Middle East that are used for cultivation will no longer be sufficient to feed the rapidly increasing populations in this region (Brauch 2006). But also major cultivation areas in India and China will lose their previous importance for agriculture and suffer massive

water problems (IPCC Special Report 1997: 14-15; IPCC 2007: 8-9). By contrast, there could be addi-

tional agricultural potentials for parts of North America, Europe, and the eastern parts of Siberia.

Risk of Tropical Cyclones for urban Environment

However, there is a need to analyse whether food that nowadays is simply a ‘distribution’ problem may become scarce, given the global population growth to 9 billion by 2050 (e.g. UN 2001, 2007). Similarly to the time after the great glacial period some 30,000 years ago, South America may see a massive retreat of the rainforest and the Amazon region may become a steppe (Schellnhuber 2006). Some highly fertile agricultural areas may be lost, and South America would have to secure its food through imports (Jones/Thornton 2005; Robledo 2003; IPCC Special Report 1997: 11) Large sections of the Central African rainforest may also be lost (IPCC 1997). With the rapidly increasing population in Sub-Saharan Africa and chronically bad governance, favourable conditions for positive growth scenarios are unlikely to occur despite, or because of the richness in natural resources in several Sub-Saharan countries.

Extreme weather conditions such as heavy rainfall, storms, and heat waves carry further risks for densely populated regions as Hurricane Katrina (The White House 2006a) has shown, and even our modern complex societies with their ‘just-in-time’ supply mechanisms may suffer severe crises. Such a process could

undermine the trust the society has in the state as a problem solver. This could result in a temporary or permanent loss of law and order.

While the storm intensity in the Mediterranean Sea may decline, the study of the Max-Planck-Institute of Meteorology expects an increase in winter storms in Central Europe (Max-Planck-Institut für Meteorologie 2006: 5). In the summer, heat waves and resulting forest fires may be a major threat for the affected populations and highly detrimental to national economies. Hurricanes will threaten the densely populated regions of the US east coast and the southern west coast, the European conurbations, and the densely populated coastal areas of East and Southeast Asia. Natural disasters (see figure 72.7) and the associated costs for national economies will increase considerably (Stern 2006: 122–127).

The frequency and intensity of extreme weather may affect also post-industrial nations with their complex mechanisms and result in a loss of law and order. Less developed nations will, to a varying degree, be hampered in their attempts to cope with the effects. If one assumes an increase in extreme weather events such as drought, water scarcity, and tropical cyclones,

and takes their impact on agricultural and settlement areas into account, severe regional threats caused by climate change may be expected within the next 30 years (see figure 72.9)

India and China that are already seriously affected by soil degradation, drought, and water shortage will face serious additional challenges due to their projected population growth (by 2050: for India ca. 1.6 billion, and China ca. 1.4 to 1.5 billion, UNPP Database 2007) and the consequences of climate change. Whether the currently projected economic growth will be sufficient or can be sustained, and whether the implications of the serious environmental challenges may threaten social cohesion, are vital not only for these two countries since if adverse developments with a decline of law and order should occur, this may have far-reaching consequences for the OECD world, leading to increased migration, loss of export and import markets (collapse and regionalization of globalization).

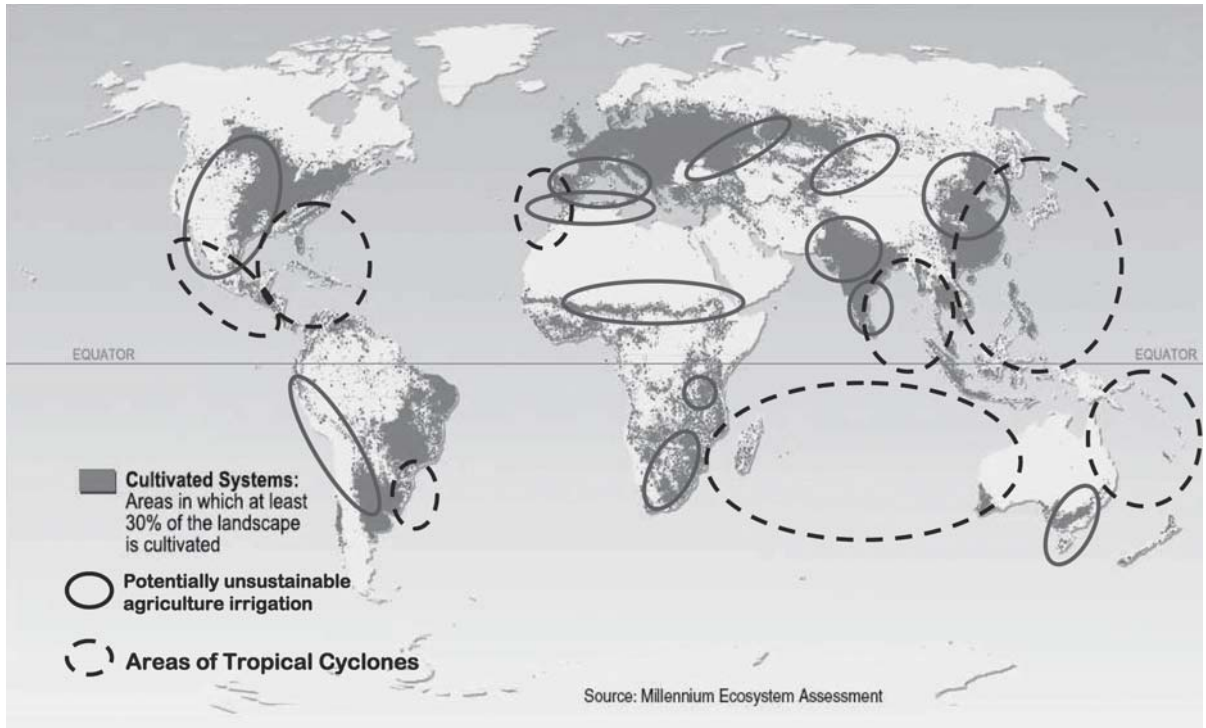

While the role of the US, Southern Europe, and parts of South America as leading suppliers of agricultural products worldwide is likely to significantly decline, there are no recognizable successor countries.

Although the agricultural prerequisites in Central and Northern Europe as well as in Canada and Eastern Siberia may improve, there is currently a lack of interest (Europe) or a lack of basic parameters (Siberia: population, know how). Moreover, it is unclear whether this would balance any possible losses and achieve the economic growth that is required to sustain a worldwide population of about 9 billion in 2050. .

72.5 Security Impacts on the Transformation of Global Regions

Given the security challenges already identifiable in the various regions, climate change has become an additional burden of considerable magnitude. The loss in significance projected for the US as the world's granary may contribute to a further decline in influence that has already occurred for several reasons (Alcamo/Endejean 2002; Alexandrov/Hoogenboom, 2000). Canada, Europe, and Siberia may in this field gain in importance, particularly for the new major food importing countries such as India and China. However, this would also mean that the food import-

Figure 72.9: Geographic Distribution of Drought, Water Shortages, and Tropical Cyclones. **Source:** Millennium Ecosystem Assessment with own Informations Written permission of copyright holder has been obtained.

ing countries would be exporting their water related problems. For security policy this means that both countries rely on a worldwide functioning of the agricultural market which may increase their willingness to cooperate in the field of security policy in the long run.

For several South American threshold countries the following scenario is foreseeable if the massive and rapid retreat of the rainforest both due to deforestation and as a consequence of climate change should continue in Brazil, the current challenges posed by the economies of violence and social decline may be aggravated by an insecure food situation This would make the two previously mentioned problems worse.

Europe does not present a uniform picture. Southern Europe will see a significant loss in food production and will be in need of subsidies. The failure to meet that demand could mean that further European integration may be severely hampered. The problem is aggravated further by the fact that the EU population will experience foreseeable qualitative changes as by 2025 some 20 per cent of its population may be Muslims (CIA 2004: 83). This figure may increase if the migratory pressure from the Greater Middle East continues to rise. To accomplish the needed integration,

the EU will have to achieve an outcome unique in history since the epoch of the migration of peoples.

The possible economic marginalization of several regions in Europe and the marginalization of certain sections of its national populations could push the EU to its limits in terms of political integration. This may be exacerbated by immigration and a failed integration of Muslims into the European society. Should the EU fail to achieve this internal integration, it may no longer be a security-producing global factor. The loss of the EU Europe as a global anchor of stability would have a dramatic impact: one of the richest regions worldwide with the financial potential to support a stable world order and one that appears to benefit rather than suffer from climate change would no longer be an effective global actor.

In the Russian Federation the previously harsh climate of Siberia, in particular of Eastern Siberia, is likely to change in such a manner that in addition to its raw materials the region may also become a new area for human settlements. Whether the population in this region will exploit the situation in cooperation with Moscow or independently will depend on the internal cohesion of the Russian Federation. This could either lead to Russia becoming again a global power with an increased focus on Asia, or to the independ-

ence of the rich Siberian region with considerable potential for growth due to the improved conditions for regional settlement. A prerequisite for either scenario would be a large number of immigrants in search of personal opportunities. Currently Asia has no shortage in well-trained people.

The Greater Middle East region with all its problems described in detail in the *Arab Human Development Report* (UNDP 2003) make the region even more susceptible for the consequences that are to be expected from climate change. These are likely to aggravate the social, economic, and political problems of the region. The political systems characterized by their low degree of stability and the absence of their willingness to ensure good governance will, as a consequence of climate change, further intensify the intra-societal and economic antagonisms with a tendency to showing strong signs of disintegration. This will further contribute to making the region one of the most unstable regions worldwide. The projected increase in the number of young people (youth bulge) and the almost absent capability of the political systems to offer a perspective for their young people will lead to more emigration and more internal and/or exported violence (government controlled or non-government controlled economies of violence). This may also be a likely scenario for countries in Sub-Saharan Africa, thus intensifying the present tendencies to migrate to Europe.

China and India will experience rising problems such as water shortage, drought, soil degradation, and extreme weather situations which means that the availability of food will increasingly depend on imports. This also means that a large number of jobs in the subsidized agricultural sectors could be lost. As a result, the ranks of the unemployed could swell, constituting a further threat to the internal stability of the two countries. Despite the fact that both countries had experienced economic growth in recent years, offering hope for self-sufficient economic and social developments, the pressure emanating from climate change may lead to a rapid social transformation, but this also carries the risk of destabilizing the political systems. The effects would be a major turbulence in Asia, but also for the rest of the world. In a world defined by high mobility, the migration from both countries (in particular as brain drain) may confront the affected regions with the burden to adapt to a degree that would be impossible to achieve. By contrast, regions like Siberia due to climate change may offer new settlement areas and thus this region could benefit from immigration.

72.6 Projected Impacts of Climate Change for European Security

What does this mean for Europe? The overview of the security challenges (Figure 72.9) with which various regions of the world will likely be faced with suggestions that the security of Europe may be affected sooner and more intensely than anticipated.

From the Middle East and North Africa (MENA) many causes that are likely to impact on the security of Europe may originate (Brauch 2006). The youth bulge projected for the region will markedly intensify the pressure of migration on Europe and require Europe to accomplish large-scale integration. Thus, the Muslim populations within the EU may be expected to increase significantly in the near future.

A further disintegration of the Russian Federation would affect Europe's energy supply and the security of its strategic nuclear weapons and their unintended proliferation would be raised again. A smaller Russia would have fewer energy resources and raw materials and a population of only 60 to 80 million people. If the current trend of de-industrialization continues, Russia could have considerable problems to meet the needs of its population. Organized crime, migration of the well educated, and an economy of violence could be possible consequences. All these possible developments would also affect Europe.

The integration of the Russian Federation into the international economy through the reconstruction of parts of its industry and the introduction of information technology and other modern commercial sectors would create ideal conditions and make Russia an interesting partner for the EU.

The recent high economic growth experienced by China and India could, as a result of climate change and its associated impacts, slow down markedly and thus intensify the will of parts of their population to emigrate. Should its strategy of achieving internal stability through economic growth be unsuccessful, China could pursue, albeit temporarily, a strategy of confrontation in order to sustain cohesion on the domestic front. This would have far-reaching implications for the global order. The EU could be faced with having to choose between security and economic interests.

The consequences of climate change for Sub-Saharan Africa could mean that the political leaders of the region that are already overburdened, are faced with additional problems that would make their failure even more probable. Economies of violence at a re-

Figure 72.10: Political Developments in Geographic Regions. **Source:** the authors.

gional level and migration as a consequence thereof would be a major challenge for Europe.

The consequences of climate change could dramatically affect the prospects of South America to catch up with OECD nations. Political institutions are already competing with criminal, but also with the political and social organizations for the societally and economically deprived. Should the consequences of climate change reveal the inability of the political class to provide prospects for their populations, these will look for alternatives. The likely implication would be a rising migration pressure for North America, particularly towards the US.

Over the next thirty years the latter may lose its previous cohesion. This would have significant implications for its role as a global political player. The discussion of its imperial power politics may become obsolete, due to its internal problems. The US will be seeking partners in all parts of the world that could help decrease its financial burden as a regulatory global power. This suggests a new form of hegemonic power that is forced to accept the rise of other regions in order to be relieved of its financial and additional burdens. The other regions could include Europe (EU), China, and India. The result could be a multi-polar world order that deals with the world's problems (scenarios) in a climate of either coopera-

tion or confrontation. A significantly weakened role of the US as a global power would mainly affect the European Union that would then be required to spend more money on world order (development) or world disorder (security).

The overall difficulties that the political systems (community of states) will experience in exercising their control function as a result of climate change and the associated consequences will be aggravated further by the projected migration pressure due to poverty, famine, and epidemics caused by water shortage, drought, and soil degradation. Migration movements could reach the scale of the population movements of the 4th, 5th, and 6th centuries. Migration in combination with economies of violence, international organized crime, and the tendency towards a diminishing feeling of solidarity between the poor and the rich could - through the privatization of violence - create regions characterized by the absence of the state's monopoly on the use of force.

72.7 Conclusions

The primary objectives and results of this chapter - based on a workshop on climate change and security - are highlighted with regard to their relevance for the

Strategic Future Analysis. The intention of the workshop was to present the current status of long-run analyses in the field of climate research in order to derive possible security implications. An important objective is the advancement of the applied methods and the enhancing of the tools used for the Future Analysis. The issue to be examined was whether climate change has previously been sufficiently reflected in the Strategic Future Analysis. With this in mind, the intention is to show the major corridors that can be used for future development paths with a time horizon of up to 30 years. They will then have to be applied to potential war scenarios.

War and its instruments are understood as a mirror of social developments, that is, the transition from post-industrial societies to information and knowledge societies will be the starting point for the analysis. The model 'social changes and the sociological processes' will be the basis that generates not only linear developments, but also allows retrograde developments. The overall process has produced an ever increasing complexity, with the latter entailing susceptibility to conflict and, in the shape of interaction, the vulnerability of societies.

It may be concluded that the results of climate research, in conjunction with historic findings on the experiences of societies where such phenomena have occurred, give rise to the hope that valid explanations for future development potentials can also be found in the field of security. Therefore the results should be used not only to answer the question of how they might affect certain regions and impact on local conflicts, but also of how they might help identify the type of conflict and possibilities to prevent it.

In security terms, climate change offers a number of corridors showing how strategic resources can be used. The security phenomena will be analysed at various levels including specific countries and regions. Such regions are the EU, the Greater Middle East (controlling about 70 per cent of fossil energy resources), East Asia, Southeast Asia, the Sub-Saharan region, and Central and South America. The projected climate change should therefore initiate intense discussions on the security scenarios that have been developed so far. These offer lessons learned for the *Future Analysis* of regions, types of conflicts, and of the direct and indirect implications for the security of the affected societies.

Heikki Patomäki

73.1 Introduction¹

What are the conditions of, and possibilities for, global security in the 21st century? Have we learnt anything from the late 20th century peace and security studies? In the aftermath of the end of the Cold War, two main lessons suggest themselves.² The first lesson is liberal democracies do not fight each other (Doyle 1986; Russett 1993a; MacMillan 2004). Perhaps the liberal democratic zone of peace could be further expanded? Perhaps democratization of states will eventually lead to planetary peace? On the other hand, the second lesson seems to be that security is not solely about the objective absence of threats of political violence and war, but also involves politics of securitization and desecuritization (Wæver 1989a, 1995, 1996a).

1 I would like to thank Hayward Alker, Kari Laitinen, Katarina Sehm-Patomäki and Teivo Teivainen for very helpful comments on the first draft of this paper, and for Robyn Milburn for editing the final version. They bear no responsibility for the final outcome.

2 The hypothesis of democratic peace was widely acclaimed in the West (and up to an extent also elsewhere) after the end of the Cold War. Since that point, it has been accepted perhaps by most European and North-American policy-makers, while being widely discussed and also debated among scholars. The theory of securitization has, in turn, been highly influential in European critical security studies since the early 1990's even if less well-known in the US or elsewhere in the world. I have obviously learnt something from both. However, the approach of this paper owes perhaps more (i) to the tradition of peace research as exemplified by the works of Hayward Alker (1988, 1996) and Johan Galtung (1977, 1996) and (ii) to critical realism both as a philosophy of science and as a social and political theory (for an introduction, see Bhaskar 1989; Collier 1994). From a critical realist perspective, I have elsewhere discussed and assessed the four methodological and theoretical lessons of Alker's long learning process (Patomäki 1997, 2002: chapter 2); and analysed the development and, also, methodological problems of Galtungian peace research (Patomäki 2001a).

Actors can bring about securitization by presenting something as an existential threat and by dramatizing an issue as being an absolute priority.³ By revealing the politics of security, the post-structuralist theory of securitization stresses the responsibility of actors for their speeches and actions. The moral seems to be that it is only by resisting the temptations of securitization that the political conditions for a security community can be created and maintained.

Perhaps the key to global security lies in furthering the process of democratization of states and reversing processes of securitization within states? However, over the years, many scholars who have adopted a long-term perspective have argued for a major structural transformation of the international system. Given the destructive powers of nuclear weapons and other weapons of mass destruction, John Herz (1957), Hans Morgenthau (1961), Daniel Deudney (1999a, 2000), and Alexander Wendt (2003), among others, all have argued for a global monopoly of legitimate violence. In their view, it is inconceivable that a few nation-states could legitimately retain the exclusive right over possession of nuclear weapons for the next 50, 100 to 200 years; moreover, as long as a few separate states possess and control nuclear weapons (while simultaneously some others are trying to acquire them), it is possible that these weapons will eventually be

3 For instance, the post-9/11/2001 US-led 'war against terrorism' involves wide-scale securitization both in the US and globally. In fact, the wars against terrorism and drugs were first initiated in the 1980's, during Reagan's administration. At that time, they led to military actions in Latin America (Colombia, Panama, Peru) and Middle East (Libya), among other things. From a post-structuralist perspective, David Campbell (1992) has argued that after the end of the Cold War, a strong quest, if not functional necessity (for identity-political reasons), emerged to replace the USSR with new enemies such as other civilizations and Islam in particular, failed states, rogue states, international terrorism and drug trafficking.

used. The future of humanity may thus depend upon the transformation of the international or world system into something akin to a Weberian world state.

Consider the scenario of the next 200 years told by Warren S. Wagar. Wagar's book, *A Short History of the Future*, relies in part, on the concepts and contentions of the world systems analysis. Wagar does not claim to be able to predict the future; rather, his project is about writing a plausible and fully fledged, single-path scenario of a possible future based largely on extrapolating from the past future trends. Wagar (1999: 9–95) envisages a world economy where capital is concentrated in an ever fewer number of global megacorporations. Inequalities continue to rise. The Global Trade Consortium (a future version of the WTO) becomes even stronger, to a point where it is preparing most of the regulation and planning on the planet while most citizens appear rather ignorant about its real powers. The sustenance of formal (*polyarchic*) liberal democracies takes increasingly repressive forms. Crime becomes a continuously acute problem particularly in the biggest megacities. The world's population continues to grow at a fast rate and most of humanity lives in big cities. Ecological problems – global warming in particular – are rapidly getting worse. The states at the centre of the world economy make a number of large-scale military interventions in the peripheries.

In Wagar's narrative, after a long-wave of economic growth in the first decades of the 21st century, a downward wave will begin in 2032. Within the first two years of the depression, the world GDP dramatically falls 25 per cent (in comparison, the Asian crisis of 1997–98 meant 'only' a loss of 6 per cent of potential world output). At the low point, reached in 2038 and again in 2043, the depression results in unemployment for half of the workers in the centre, and more than half in the peripheries. In Wagar's scenario, the low point of 2038 is followed by a weak and short-lived recovery, which quickly turns into a new deep downturn. This contributes to the sharpening and escalation of a number of deep-seated conflicts, particularly in the US. By this time, the US has become a society that is deeply divided into classes, races, and ethnic groups. A populist leftist woman, Mary Chávez, is elected President of the US in 2040. Her attempts to raise taxes to fund new social programmes cause an aggressive attack from the white conservatives. Her struggles also concern foreign policy. Chávez wants the US to refrain from the Confederated States of the Earth (replaced the UN in 2026) and disassociate the US from the hierarchical system

of global governance. The conflict between the President and Congress escalates and leads to an insurrection.

The EU recognizes Senator Ruggles as the legitimate leader of the US, yet Chávez crushes the armed rebellion. Chávez aligns the US with the poor nations. The EU, along with the Pacific Community, terrified by the spectre of collapse of the global order, makes a surprise nuclear attack against the US and its semi-peripheral allies. However, two US nuclear submarines and some US planes in the air escape attention and rounds of retaliation ensue. Moreover, as soon as the Indians realized that no world authority remains to stop them, they initiate a nuclear war against Pakistan. Most of the Northern Hemisphere and the Indian Subcontinent are devastated. Out of 9 billion people, only 2 billion survive, most of them in the southernmost regions. Both the nuclear winter and collapse of world trade make life miserable for most survivors for many years to come.

The surviving countries begin to build a new world order, but on the basis of the old system at first. However, the World Party – secretly founded well before the Catastrophe – starts to gain ground. Gradually, countries and regions start to join the new democratic and socialist Commonwealth, occasionally through a violent struggle. The final skirmishes between Commonwealth militias and local resistance groups take place in 2068. The new world state is governed by a democratically elected world parliament, and it is built on a more sustainable ecological basis than its predecessor. In Wagar's story, the socialist world state is transitory, lasting about 100 years; it will eventually be replaced by a community of smaller political communities, some of them living outside planet Earth and reaching further into space by 2300.

Should anything like the catastrophe of 2044 ever happen, in retrospect, what will be said about the most popular security theory of the late 20th and early 21st century? The theory of democratic peace would have failed for two reasons. *First*, although most states, including the EU, remained formally democratic in Wagar's story, in the first decades of the 21st century democracy did not exist (anymore) as a reality of political choice. Global free trade, global finance, and related non-democratic systems of global governance dominated the world and regulated the states. A one-sided focus from the existence of periodical two- or multiparty elections, and a few basic rights within separate states thus misled the theorists of democratic peace. *Secondly*, the theory of democratic peace failed to recognize the political economic conditions

of a security community. In the early decades of the 21st century, conflicts and wars occurred only in the global south, gradually the structural conditions for a major conflict evolved to include the centres of the world economy. The Great Depression of the 2030's and the subsequent ups and downs suddenly transformed the US identity – by means of democratic elections. Finally, it appeared the voters were experimenting with some reality of choice. In search of support for its leftist-populist economic policies, the new US Government became an ally for many of the transformative movements and states of the global south. This triggered a process of securitization. The EU leaders started to present the US developments as an existential threat. The Europeans argued that if we do not tackle the challenge of President Mary Chávez and her policies, everything else will be irrelevant; thus they sided with the conservative part of the Congress in the armed conflict in the US. However, this alliance initially led to a strong reaction by the Chávez regime – that survived the violent challenge – and soon led to the dramatic escalation of the conflict.

What follows below is an attempt to outline a better way of studying possible futures of global peace and security. *First*, I will explain in more detail what is wrong with the theory of democratic peace, particularly as a guide to a more peaceful world (73.2). Next, I will discuss the role of time and future in social sciences (73.3). Further on, I will analyze how causal complexes – including prevailing narratives, relations of power, political economic developments, and organizational responses to them – can be systematically modelled and how these models can be used as a basis for scenarios of possible futures (73.4). Securitization is only one component of a complex process. A scenario is always conditional on the actions of relevant actors. Actors and actions are structured at many levels. I will conclude by analysing the arguments for a world state (73.5). In the end, must humanity construct a world state to survive, for the sake of global security? Is a world state as 'inevitable' as Wendt (2003) claims and as Wagar (1999) seems to assume?

73.2 What is Wrong with the Theory of Democratic Peace?

The theory of democratic peace is reliant on the identification of what appears to be a strong and enduring constant conjunction: liberal-democracies do not fight each other.⁴ The argument is that X (liberal-democratic regimes) explains the absence of Y (war, organ-

ized violence between two states). A background assumption must be that Y is a normal thing to occur,

4 In the late 18th century, soon after the French Revolution, Immanuel Kant (1983 [1795]) argued that the republican constitution of states would guarantee their freedom and peacefulness (although republicanism was for him only one of several necessary conditions for a perpetual peace). By constitutional republicanism Kant meant basically liberal-democratic rule by the capable and free, i.e. property-owning, males, conceived as rational citizens who are not willing to bear the consequences of wars, such as loss of life, property, and money. Famously, President Woodrow Wilson took over the idea and advocated it during – and also in the immediate aftermath of – the First World War. However, it seems that he did this also in reaction to the war, since Germany was at this time redefined negatively as 'autocratic' (see Oren 1995). The Kantian hypothesis existed in the collective memory of the discipline of International Relations throughout the 20th century (it was strongly criticized for instance by Kenneth Waltz, 1959). Yet it was only in the 1980's, during the "third wave of democratization" (Huntington 1993), that it re-emerged as a major point of reference. Although Michael Doyle's (1986) path-breaking article discussed the Kantian hypothesis of democratic peace less empirically and more in terms of political theory, the bulk of scholarship has been devoted to testing the general correlation by means of empirical-statistical means. For instance, R.J. Rummel (1985) maintains that the more liberal freedom individuals have within a state, the less the state engages in foreign violence. This claim is based on quantitative and allegedly unequivocal empirical evidence (see also e.g. Gleditsch 1992). However, it is worth stressing that, ethico-politically, the theory of democratic peace has also resonated well with the ideological Neoliberalism of the regimes of Ronald Reagan, Margaret Thatcher, and their followers since the early 1980's. Particularly after the end of the Cold War, the democratic peace theory became the basis of both celebrating the inherent peacefulness of the West and, simultaneously, justified NATO-countries' attempts to spread liberal-democracy and free-market economics elsewhere in the world, also by means of violence. Thus, former US President Bill Clinton (1994) maintained shortly after the end of the Cold War: "Ultimately, the best strategy to ensure our security and to build a durable peace is to support the advance of democracy elsewhere. Democracies don't attack each other." Current (from 2001 to 2008) US President George W. Bush (2005) is even stronger on 'promoting democracy' on these grounds: "And the reason why I'm so strong on democracy is democracies don't go to war with each other. And the reason why is the people of most societies don't like war, and they understand what war means.... I've got great faith in democracies to promote peace. And that's why I'm such a strong believer that the way forward in the Middle East, the broader Middle East, is to promote democracy."

and that X is the mechanism or thing that explains why it does not occur in this special situation. Moreover, statistical demonstrations of the democratic peace theory are dependent on the particular theoretical categories adopted and the related data coding procedures (Alker 1996: 338–353). The democratic peace hypothesis assumes statist and legalist categories of significant violence; such as, defining ‘war’ in a way that does not count the United States’ covert operations to overthrow democratically elected regimes or the use of transnationally constituted military force within countries (Barkawi/Laffey 1999: 414–415). It is also inclined to code ‘democracy’ in a way that excludes, for example, Milosevic’s Yugoslavia (Serbia) of the 1990’s from the list of allegedly democratic countries (Serbia was bombed by liberal-democratic NATO-countries in 1999). Moreover, a cross-sectional correlation does not translate into a universal causal push in the desired direction. As Jack Snyder (2000) has argued, in some contexts democratization may actually increase the risk of nationalist violence.

Although the correlation is not as pure as some advocates of the theory would like us to believe, and although liberal democratization may sometimes contribute to increasing violence, the cross-sectional correlation does exist (Goenner 2004, accounting for some but not all aspects of theory-dependency of democratic peace data). Various mechanisms to explain this correlation have been suggested, often boiling down to: (i) constraints on political leaders imposed by democratic mechanisms of checks and balances and public opinion, and (ii) an ideology implying a liberal-democratic distinction between friends and enemies. From a critical realist perspective, it is the very idea of a constant conjunction that is problematic (Patomäki/Wight 2000; Patomäki 2002). Constant regularities are only obtained in a closed system; as will be explained below, the world is anything but closed. This suggests that it cannot simply be factors internal to democracies that are responsible for this apparent constant conjunction. Here the *explanans* and, up to an extent, the *explanandum* of the theory changes. For instance, what has been the role of the shared beliefs in the ‘invisible hand’ of free trade and markets, particularly in the core areas of the world economy (the OECD world), and the related Kantian civilizing effect of commerce? What is the overall and possibly changing causal complex that tends to make the 20th (and perhaps also 21st century?) relations between capitalist, Western-minded liberal-democracies peaceful?

Even if a mechanism (perhaps of a Kantian form) or a structured complex were identified, it would still only be transfactorially operative in an open system. This means that there must have been something about the other relevant complexes and processes that were also playing a causal role. Hence, the real tendency of the causal complex may have more to do with something else, which may or may not be internally related to liberal democratic procedures per se. Thus, an adequate analysis must also focus on relations and processes other than the mere presence of liberal-democrat procedures and characteristics, to form a whole picture using the relevant parts of the geo-historical whole in question. If there is anything to explain, it must be explained in terms of real tendencies and real workings of spatio-temporal causal complexes in open and therefore changing systems.

What is an open system? Bhaskar (1978: 76–85) defines an open system negatively in terms of the absence of a closure. Without a closure, there can be no constant conjunctions. In a closed system, extrinsic and intrinsic conditions remain constant. That is, although extrinsic influences into the system or complex under study are possible, they remain constant, and although the constitutive units are not strictly speaking atomistic (intrinsic changes may also occur in principle), their structure can be taken as a given or constant or always isomorphic. In laboratory experimentation, scientists can create artificial closures in order to identify the causally powerful mechanisms that work transfactorially, due to their causal powers, in open systems outside laboratory as well, where no regular associations or constant conjunctions occur.

Social scientists cannot create artificial closures in the same way. Plus, the rate of intrinsic change seems to exceed anything found in nature. Already by the mid-1970’s, even the most dedicated positivists had to admit that the project of finding universal invariances – or constant conjunctions – in society was loaded with difficulties. By elaborating upon the implications of the *ceteris paribus* clause, Johan Galtung used this as an opportunity to bring in the critical theoretical or dialectical idea that society can also be transformed by human activities. He started by declaring that there are no iron laws in social science:

A conception of science that does not conceive of data as the final arbiter in scientific controversy is at the same time a science conception that sees empirical reality as flexible, ‘laws’ as rubber laws rather than iron laws, and sees potential reality as relatively easily brought into being; transformed into empirical reality. But that makes prediction problematic, to say the least, and the basic thesis of this chapter is that absolute pre-

diction in social sciences is meaningless: there are no absolute invariances valid for the future. Formulated briefly: there are no laws in social science. (Galtung 1975b: 72)

What Galtung fails to do here is to spell out more generally the essential ontological qualities of society. Social systems are open; in general, neither the intrinsic nor the extrinsic conditions of closure are applicable. Social entities – including socio-historically formed social actors plus their understandings and relations – can and do change, and any social whole, specified in whatever manner, is susceptible to extrinsic influences, including influences from non-social layers of reality (physical, biological, ecological etc.). In the sense that every event has a real (structured and complex) cause, ubiquitous determinism holds, but causation does not have anything to do with constant conjunctions. Causation is about the production of outcomes by means of reflective social actions. Socio-historically formed human/social beings and their contextual reasons for action are also causally efficacious.

However, what we could call contrastive demi-regularities, or demi-regs, are pervasive in society (Lawson 1997: 204–213). ‘An increasing portion of the world’s population lives in cities,’ ‘since the late 19th century, wars between liberal-democratic countries have been much less frequent than inter-state wars between them and others, or inter-state wars between others,’ ‘the global economic growth has been steadily slowing down since the 1960’s,’ ‘average unemployment rates in western industrial countries were higher in the 1990’s than the 1960’s,’ ‘measured in incomes in constant dollar-terms, global disparities have been growing rapidly since the early 1960’s,’ and so on. This would seem to indicate that the clear-cut dichotomy between open and closed systems is not plausible. In fact, almost all systems can arguably be somewhere in-between absolutely open and absolutely closed systems, i.e. they are also closed to a varying degree (Töttö 2004: 269–84).

It is not however sufficient to find the contrastive demi-regularities, and then, specify the conditions of their continuation. Rather, these empirical facts and their meaning and implications should, *first*, be critically examined. For instance, what are the definitions of ‘democracy’ and ‘war’ in the theory of democratic peace? *Secondly*, and even more importantly, there should be a movement towards analysing the deeper social structures and causal complexes that generate these manifest phenomena. It is thus necessary to explicate the causal powers and liabilities of social ac-

tors (as pre-formed, complex, intra- and interrelated systems) and structures (as internal and external social relations) that are often organized as systems. A system should perhaps be given an autopoietic and processual definition. While social systems and organizations are open in many important regards, they tend to be reflectively self-producing. Their own operations, through external feedback, as well, ensure, within limits, their future continuation (Mingers 1995). A large-scale demi-reg can be indicative of a widespread pattern of unintended consequences of social actions. Autopoietically, it can also result from active and reflective self-regulation and self-production – memory-based reactions to external feedback by means of responding and internal restructuring – against the widely prevailing tendencies of decay, forgetting, irregularity or disorder (entropy).

In the social worlds, human memory and social communication are the mechanisms capable of producing the outcome that rule practices and systems that transcend time, place, and the biological existence of human beings. However, rules, regulations, and organizing principles cannot be more exact and clear than the meanings circulated, stored, and transformed within the practical social world, and in embodied in actors and social practices. Shared meanings can also be contradictory. Actors also hold conflicting theories about social meanings, practices, and institutions, and these are connected to differentiated horizons and horizon-constituted interests in human societies. Autopoiesis is therefore always ambiguous and at least potentially political.

73.3 Time and Future in Peace and Security Studies

Conventionally, studies in social science have focused on examining the past. Given this temporal orientation, it is no wonder that hardly anyone anticipated the end of the Cold War before it actually happened. Even though the Cold War was at the centre of attention for decades, its end came as a total surprise to most researchers. This raised the question of whether social sciences should also be able to say something about the future. Most often, this question was conceived merely in terms of testing the validity of existing theories, for example, whether theories of Political Science or International Relations predicted the end of the Cold War.⁵

Contrafactually however, consider the possibility that we had knowledge of a large number of relevant

and stable law-like social regularities, perhaps also comprising laws of development and change, in addition to simple regularities. Suppose further that we had good reasons to be confident that the thus identified causally determinist system will continue to prevail unchanged into the (distant) future. We should thus be in a position to predict the future. Largely for these reasons, many of the 19th century social scientists, such as, Thomas Malthus, Auguste Comte, Karl Marx or Max Weber thought that they could anticipate the future, yet they did not articulate the idea of studying the future in its own right. However, at the dawn of the 20th century, H.G. Wells argued that the future of humankind is no less a suitable subject for scientific inquiry than the past and the present. Wells proposed a new field of study, what is now known as 'futures studies'. Both for Wells, and later, for the pioneers of futures studies in the 1960's, the basis for confidence was in the idea that causal regularities are universal. As Wells maintained in 1902 (at the time when he became a socialist and started to advocate world government):

Suppose the laws of social and political development, for example, were given as many brains, were given as much attention, criticism, and discussion as we have given to the laws of chemical combination during the last fifty years, what might we not expect. (Cited in Wagar 2004: 38)

A century later we know not only that this project failed, but also why it had to fail. Prediction is fundamentally problematic because there are no truly constant conjunctions. As explained above, at best we can have knowledge of a restricted number of spatio-temporally bounded, contrastive demi-regs. Notwithstanding the lack of stable regularities, the whole point behind peace and security studies is that they should contribute to the better understanding of the conditions of future peace and security. Prediction is not possible, no conjunction is eternally constant, and the most apparent regularities tend to be unstable (either misidentified or liable to a change). Hence, our knowledge of one is limited, even if relatively stable, demi-reg, such as the democratic peace hypothesis, cannot be relied upon as the foundation for thinking about the conditions for a future, peaceful global order. Moreover, albeit for different reasons, the post-structuralist theory of securitization is of limited value: although it can illuminate the constitutive effects of security-talk and thereby some aspects of the

process of escalation of conflicts, it does not have much to say about the wider context, causes, and consequences of securitization.

Building upon "the systematic possibilism" of Hayward Alker's "Orwellian Lasswell" (1996: 257-263), my argument is, instead of trying to predict the future, peace and security studies should be concerned with the conditions of generating possible futures and modelling them in terms of scenarios and stories. The point of systematic modelling of possible futures is to reveal various - particularly unintended - consequences of social actions and their potentially cumulative or transformative effects. Social actions presuppose and reproduce or transform social structures.

Since I have developed closely related ontological and methodological ideas elsewhere (Patomäki 2002: chap. 2-5; Patomäki 2005b), I will proceed to outlining the basic notions of future-oriented global peace and security studies. First, both politics and organized violence require organized social systems. I will adopt the metaphor of organizations as complex responsive processes of relating: "the relations processes of communication, within which people accomplish joint action, are actively constructing the future as the living present and that future is unknown in advance" (Stacey/Griffin/Shaw 2000: 188).

Organizations that are actively constructing the future do not usually - depending on their organizing principles - have any clear boundaries and can be intra-, trans-, and interrelated (however closed they sometimes try to make themselves). Modern sovereign nation-states are organizations, but so are for instance their ministries. Other relevant organizations include international organizations such as the OECD, multinational corporations and banks, secret associations of radical Islam, the Brazilian movement of landless farmers, or members of the International Council of the World Social Forum. Organizations - as complex responsive processes - are not only responding but also learning. Learning processes may also lead them to revise their identity, goals, and strategies.

What is particularly interesting for social scientists are the limits of self-production of organizations and systems, and the conditions of continuation of contemporary demi-regs. These limits and conditions may also have to do with impediments to, and pathologies of, learning. Interests and power tend to interfere in communication and learning processes. Bhaskar distinguishes three ways in which interference between a subject's interest in an object and his knowledge of it could operate (1979: 74). It could operate consciously,

5 See for instance Allan and Goldmann 1992, including also Patomäki 1992; and Gaddis 1993.

as in lying, semi-consciously, as in the wishful thinking of the incurable optimist or the special pleading of a pressure group, or unconsciously, whether or not it may subsequently become accessible to consciousness. The conclusions of the unconscious mode of interference can be either rationalizations of motivation; or they can constitute mystifications or reifications of social structure (ideologies). Bhaskar's schema can be seen as an articulation of Marxist ideology-critique.

We do not have to assume that only one mode of action – strategic action – prevails, or that interests can be defined narrowly in terms of money or property ownership or anything similar. More generally, interests can be layered – surface level interests are justified in terms of deeper background discourses – and are explainable in terms of geo-historical processes. For instance, repression and violence stemming from defending a particular established interest can be an outcome of a pathological learning process. For Karl Deutsch a learning process is pathological if it leads to 'a change in the inner structure that will reduce rather than increase the future learning capacity of the person or organization'. He goes on to argue that:

[...] will and power may easily lead [...even] to self-destructive learning, for they may imply the overvaluation of the past against the present and the future, the overvaluation of the experiences acquired in a limited environment against the vastness of the universe around us; and the overvaluation of present expectations against all possibilities of surprise, discovery, and change (Deutsch 1963: 248).

Also various fallacies and illusions play an important role in the construction of social and economic realities. As Jon Elster puts it, "to explain the economy, one must also explain how the economic agents – and, following them, the political economists – arrive at incorrect beliefs about how it works" (1985: 127). The same thing applies to politics. There are structurally-induced illusions about how the world works, and these play a key role in economic and political processes. These illusions, as sub-varieties of ideological thinking, include illusions as local and particular knowledge in contrast to understanding the totality of social relations and processes. Things may appear to one actor in a particular position in a way that reflects the essence only from the actor's limited point of view; this may be distorted, or one-sided.

- An important case is the *narcissism of collective memory*: actors only see themselves and their

own unique suffering in the mirror of history (Chandhoke 2003: 161–165).

- A closely related case is that of a symmetric situation of *Manichean dualism of good and evil*, and the related concrete struggles, where the involved actors are incapable of seeing how their conception of the other mirrors images of the other's conception of them; furthermore, Manichean dualism generates strategic actions, yet actors often remain incapable of seeing how their actions contribute to sustaining the other's conception (Aho 1990).
- Moreover, a typical strategic illusion induced by a particular position, and its limited point of view, is that of the *fallacy of composition*: what is possible for one actor in a given moment is not possible for all or many simultaneously. For instance, a state may try to keep a 'security margin' by keeping itself somewhat better armed than its (potential) military competitors. However, if all relevant states – or even two of them – tried the same the result would be an arms race.⁶

These illusions, as sub-varieties of ideological thinking, include also reification and naturalization of embodied and culturally varying mental processes or of historical social processes, in contrast to understanding their geo-historical essence, including one's own role in contributing to the relevant social outcome. Three subcategories can be distinguished:

- First, an actor may *fail to see the particular image schemas, categorical structures, prototypes, frames, or metaphors* that give rise to particular forms of reasoning and social relations (including self-other relations). Human thought is mostly unconscious, abstract concepts are largely metaphorical, and embodied reason is emotionally engaged. Many of the reasons generated by the embodied mind, often inconspicuously, are efficient causes of actions (Lakoff/Johnson 1999).
- Second, the *effects of social processes may be presented as being outside the reach of human influence*. Although the precise definition of reification is theory-laden and contested, the basic idea is that the human mind, social relations, and processes are presented independently of actors and actions, and thereby thing-like or natural, due to ontological miscategorization (Archer 1995: 136,

6 On the fallacy of composition, see: Elster (1978: 97–106); for Richardson's arms race model, see: Rapoport (1960: 15–30).

148, 198). Reification may also stem from sweeping generalizations made on the basis of relatively short-term and/or spatially limited trends. Trends can also be seen as external things because their underlying social causes are not properly understood. Underlying causes of trends may also include one's own role in bringing them about. Many claims about 'globalization', for instance, fall into this subcategory of illusions as reification of social processes.

- Third, even when actors' awareness develops and they stop seeing the social context in mere parametric terms (as an 'external thing-like environment') and become aware of the strategic interactions and game-like situations between actors, they may still *reify their own and others' interests and options* (Elster 1978: 159). For instance, governments may recognize that 'globalization' is a Prisoner's Dilemma game, where states compete in attracting investors through means of neoliberal reforms and future commitments; however, because of the reifications of interests and strategic options, they still do not know how to resolve the contradiction between individual and collective rationality (and this reification may also be the result of other interests playing a role in the communication and learning processes).

Given the interference of power and interests in the social learning processes; the tendency towards pathological learning, which may involve processes of securitization and social construction of enemies; and given also the role of various illusions and ideological discourses; it is possible that the complex responsive processes to a variety of economic and political developments may lead to an increasingly counterfactual, and thereby possibly, destructive outcomes.

From this perspective, we can see the point and significance of the study of possible global futures. The point is to build analytical scenarios, grounded on explanatory modelling of contemporary demi-regions and trends in terms of actors (either embodied or corporate, the latter being reflectively organized social systems), modes of action, rules and regulations, practices, and resources, all in terms of social wholes often organized into social systems. With well-grounded analytical scenarios we can study possible and likely consequences of various learning processes and their consequent actions. Actions may have unintended consequences, possibly with systematic cumulative effects. Scenarios are also conditional stories, or temporal narratives. Relevant conditions include:

(C₁) *Conditions imposed by two 'orders of constraint' which shape and select policies of organizations*, including states or regional federations (Patomäki 2002, 55–56 partly based on Alker 1996):

- (a) The first comprises factors which set a boundary on the scope and diversity of the narratives (or scenarios) the organization is capable of generating. In Foucauldian terminology, discourses are bound by the way they characterize the field of possible objects, establish the way language functions with respect to objects, and the position of the speaking and acting subject. These in turn are shaped by the available set of key image schemas, categorical structures, prototypes, frames, metaphors, and narrative structures embodied in the actors that are positioned within the relational organization.
- (b) The second involves the mechanisms of choice, which select and amalgamate the narratives under consideration. This is a matter of the form and the method of localization and circulation of discourse(s) within the organizations. Prevailing official discourses are often adopted from other organizations, frequently by mimicking apparent successes, but practices usually reflect more specific geo-historical and cultural understandings as well. Dimensions of power, including the Weberian capacity of an actor positioned within a social relationship to carry out his/her own will despite resistance, and organizational structures come into the picture here.

(C₂) *Conditions that stem from the socially framed and defined day-to-day problems of the relevant actors*. Usually these have to do with the political economy of production or destruction, and, perhaps increasingly more often, with the ecological consequences of production and destruction. Problems faced by modern citizens – civil society is also a space of communication – and organizations typically concern contrastive trends of growth or decline, such as: the availability and legitimate distribution of employment and resources, relative power and control over forces of production and destruction, and (the lack of or potential for) freedom of self-expression, self-realization, and self-determination in the confines of prevailing forces and relations of production and destruction. Problems defined and faced by actors are discussed in terms of collective memories, prevailing ideologies, and available stories that may implicate vari-

ous illusions. In order to analyse conditions C_2 , it is necessary to first grasp both the underlying economic processes, and then, the communicative process of representing (aspects of) them as problems. The latter is of course closely related to conditions C_1 .

(C_3) *Conditions created by the responses of other organizations related to 'us'*. These can also be modelled in terms of C_1 and C_2 of the particular organizations and consequent learning processes that may be pathological and involve various illusions. Consider securitization as a communicative process of relating. In contrast to the post-structuralist theories of securitization, security talk is not solely self-referential. Security statements are usually related to external realities; therefore, their rhetorical success is not only dependent on the meanings, fears, and hopes they can evoke but also on their capacity to interpret external situations and circumstances in a culturally meaningful way. Particularly, developments in the political economy are important in the formation of temporal relational contexts of action. Moreover, authority's, asymmetric access to security-information and privileged access to mass media, i.e. relations of power between the speaker and his/her audience, play a key role in determining the success of securitization (Balzacq 2005: 182-184). Another limitation of the post-structuralist theory of securitization is that it has thus far focused only on one isolated organization in time instead of the geo-historical processes of interactions between organizations, seen as complex responding processes of relating. Other organizations' forms of responses and relating are part and parcel to the external circumstances. Conditions C_3 bring this dynamic to the forefront.

(C_4) *Conditions of structural power*. By structural power I mean the reproductive and transformative effects of contextual social action on internal and external relations of positioned practices, thus affecting the capacity of actors to produce effects. Unintentional consequences and impersonal effects of action are playing an important role in this structuration (Patomäki 2002: 113-17; Guzzini 1993; Barnett/Duvall 2005). Although conditions of structural power should also be analysed in terms of C_1 - C_3 , it is important to emphasize that the reproduction or transformation of the conditions of social action always presupposes structures and implies power. The specification of rele-

vant C_4 is also a matter of concrete empirical research. A few examples should suffice to illustrate the way these conditions work. For instance, political parties, political opinions, and politicians require some popularity among citizens in democratic welfare states, yet the capacity of states to transform social contexts by means of taxation and regulation is constrained by the potential responses by domestic and transnational corporations (e.g. in terms of investment strikes). On the other hand, corporations, political parties, and states may be intra- or trans-related through, for instance simultaneous or successive positioning of individual actors, or interrelated through relations of financial (inter)dependency, or through systems of industrial and technological planning, as seen in the military segment. In turn, the responses (C_3) of corporations to the talks and actions of states-actors depend on the everyday problems they are facing (C_2) and on the stories that they are telling (C_1). On the other hand, possible corporate stories are constrained by relevant internal and external relations of power. These are liable to geo-historical changes. To illustrate further, in the late 20th century, both states and corporations have increasingly been conditioned by globalizing finance. Financial capital tends to be allocated collectively, in accordance with the expectations generated by the investors' shared frameworks of interpretation ($C_3 \rightarrow C_1$). Many of the financial actors are positioned where they cannot avoid affecting the outcomes, independently of their will. The dealers and fund-managers make their far-reaching investment decisions on the basis of their largely shared discursive understandings of the world, which usually presuppose the essentials of orthodox economic theory and the so-called Washington consensus (C_1). Similarly, the credit-rating agencies - Moody's and Standards & Poor in particular - base their assessments on models which presuppose the validity of the basic tenets of orthodox economics and Washington consensus. Because of the level indebtedness, competition to attract investments, and the widespread fear of sudden financial capital flight, the discourses of financial actors have non-intentional power effects over both states and other economic actors (through C_3 to C_2). On the other hand, relations of financial dependency may, in some ways, be translated into bargaining resources in the negotiations between states, as done in the context of the WTO. There are various feedback

effects, for example, conditions C_4 through C_2 (responding to the day-to-day problems) and C_3 (relating to the responses of other organizations) – can play an important role in the selection conditions of C_{1b} , thus co-generating self-understandings, self-other relations, and collective learning that may also amount to various illusions and pathological learning processes.

With this analysis, we can explicate the assumptions of Wagar's story of the events and processes that led to the Catastrophe of 2044. What exactly are the conditions C_1 - C_4 assumed by Wagar? Wagar presupposed that the illusions of local and particular knowledge, in contrast to understanding the totality of social relations and processes, prevail among the key decision-makers both before and at the time of the deep economic depression of the late 2030's. These one-sided and short-sighted illusions combined with structurally induced ideological understandings of how the capitalist world economy and its governance work, determine the counterfactual responses to the economic slump. Furthermore, reification of socio-economic processes play a part in the processes of securitization and construction of enemies. Moreover, Wagar assumed that struggles over the distribution of resources within the US, where inequalities have been on the rise for decades and conflicts over class- and identity-based self-expression and self-realization abound, eventually leads, under the stressed economic circumstances of the late 2030's, to new self-understandings and redefinition of the US identity. Elsewhere in the core of the world economy, the prevailing global order of economic liberalism is equated both with the preconditions of growth and security. Hence, President Chavez's populist-leftist redefinition generates novel Manichean self-other relations and dramatic processes of securitization. In the context of economic depression and widespread unemployment, the armed conflict within the US heightens the actors' emotions and existential concerns, both in the US and elsewhere. In this temporal context, fear, suspicion, and miscalculation ground the European decision to attack.

On the other hand, by analysing C_1 - C_4 in terms of contemporary realities, we can also see that Wagar's narrative is only a possibility among many, and may lack plausibility in some important regards. For instance, Wagar's assumptions concerning prevailing trends in world economy may be false, since there is no long-term upward swing (fifth Kondratieff-cycle) in sight in the early 2000's; therefore, it may well be that instead of populist-leftist redefinition of the US, the

contemporary problem lies rather in the dialectics of securitization and oligarchization in the US, stemming largely from responses to its political economy dependencies, competitive positioning, and financial problems. Moreover, depending on other organizations' response to the early 21st century, the US project of achieving total global military dominance, its growing frequency to resort to neo-imperial unilateralism, and depending on a number of political economy contingencies such as the possibility of the collapse of US dollar, new tensions, and a possible arms race, may emerge between the US and other (possibly evolving) superpowers such as the EU and/or China, with Brazil, India, Japan, Russia, and a few others such as some Islamic states playing some role, possibly as allies. Based on a scrutiny of contemporary conditions C_1 - C_4 , consequents possible, and likely developments should be modelled systematically in order to learn from possible futures.

73.4 Is a World State Necessary?

In his story about the Catastrophe of 2044 and its aftermath, Wagar underlines that the post-1945 era, the late global or planetary-nuclear era of jet airplanes, rockets and missiles, satellites and nuclear explosives, may continue until its destructive powers are finally actualized in a nuclear war (cf. Deudney 2000: 90). Indeed, in Wagar's story, it is only after the huge catastrophe that humanity finally comes to its senses and establishes, even if only after years of further struggles, a democratic socialist world state⁷. Wagar in fact thinks that his key point is not dependent on any specific turn in the story depicted in *A Short History of the Future*:

the world has had more than half a century to get it right. After what appeared to many observers as the greatest catastrophe in human history – the Second World War – humankind may have enjoyed an unprecedented opportunity to build a stable, just, and integrated world order. It did not. The catastrophe was apparently not great enough. Too much had survived intact. For the most part, although certainly not entirely, we went back to business as usual. Capitalism, which had already begun to globalize in earlier centuries, resumed its globalizing ways, and every nation went back to pursuing its 'vital national interests.' Now the last and only chance for humankind – in all likelihood – is a catastrophe that will shake civilization to its foundations. (Forthcoming)

This is, of course a theme that has occupied many great minds in peace and security studies particularly

since the 1940's (in 1913, H.G. Wells imagined in *The World Set Free* a planetary nuclear war in 1958–59 between regional powers⁸) (see Wagar 2004: 143–147).

7 The idea of a federalist world state is sometimes falsely associated with Immanuel Kant (as is the idea of collective security). Kant advocated republican institutions within the state, worldwide free trade, and a loose system of international contracts and multilateral negotiations that he called the League of Nations. There may have been precedents in other times and places, but in modern Europe the idea emerged basically in the mid-19th century (and simultaneously in the Middle East between 1852 and his death at 1892, Bahá'u'lláh, founder of the Bahá'í Faith, set the establishment of global unity, obtained via a global commonwealth of nations, as a key principle of his new religion). While it is possible to find scattered remarks on the will-be world state by 19th century poets, novelists, religious leaders and philosophers, it really came up as a major political idea only immediately before and during the First World War. One of the key advocates of the world state during the early decades of the 20th century was H.G. Wells (1866–1946). Wells was a popular British author of numerous essays and books in science fiction, drama, politics, and various scholarly fields. In 1902, in his non-fictional *Anticipations of the Reaction of Mechanical and Scientific Progress upon Human Life and Thought*, Wells proposed a world republic, an idea which he started to cultivate in many of his writings that appeared before the First World War. Some of his later books developed the idea to various degrees, including *A Short History of the World* (1922), *The Open Conspiracy* (1928) and *The Shape of Things to Come* (1933), and sold hundreds of thousands, or even millions of copies. Wells was also responsible for giving the idea of a nuclear chain reaction to Leo Szilard, a physicist, who also wrote Albert Einstein's famous summer of 1939 letter to President Roosevelt about the urgency of developing an atomic bomb. However, Szilard was strongly moved by Wells' horrifying vision of a future nuclear war and advocacy of a worldwide movement to create a world state. After the Second World War, Szilard became a key organizer of the emerging transnational peace movement. Moreover, Szilard was well networked and he knew both Hans Morgenthau, with whom he worked at the University of Chicago, and Raymond Aron, with whom he exchanged ideas. It is likely that Aron's and Morgenthau's discussions on the world state were, at least in part and indirectly, responses to Wells, although Aron and Morgenthau do not spell this clearly out in the references of their major works. On the other hand, in the US of the late 1940's, Emery Reves' *The Anatomy of Peace* was probably better known than Wells' works. In his bestselling book, Reves argued that only "a common sovereign order of law" and "a world government" would secure mankind from self-destruction (1947: 242–244).

Morgenthau (1948/1961) argued in his *Politics Among Nations* that a world state is eventually necessary: "the experience of two world wars within a quarter of a century and the prospects of a third one to be fought with nuclear weapons have imparted the idea of a world state an unprecedented urgency" (Morgenthau 1961: 501). Continuing, "there is no shirking the conclusion that international peace cannot be permanent without a world state" (Morgenthau 1961: 513). His conclusion was to advocate the Mitranyan functionalist path to "the creation of an international community as a foundation for a world state" (Morgenthau 1961: 536). Similarly, John Herz (1957) concluded that because both increasing economic interdependence and the emergence of massive air power and nuclear weapons, territorially sovereign states had become dysfunctional; "[t]he meaning and function of the basic protective unit, the "sovereign" nation-state itself, have become doubtful" (Herz 1957: 473). Further on he states, "one radical conclusion to be drawn from the new condition of permeability would seem to be that nothing short of global rule can ultimately satisfy the security interest of any one power, and particularly any superpower" (Herz 1957: 491).

In the immediate aftermath of and Western euphoria over the end of the Cold War, these discussions were almost forgotten for a while. However, approximately ten years and a number of limited-scale conventional wars later, the problem resurfaced in IR literature. Wendt has now gone so far as to argue "that a global monopoly of violence – a world state – is inevitable" (Wendt 2003: 491). Leaving aside his mechanistic, organistic, Darwinistic, and systems-theoretical metaphors and analogies, Wendt's argument is essentially about the tendency for military technology and war to become increasingly destructive, and about learning from the consequent experiences and vulnerabilities: "the scale of surviving states may have been efficient for many centuries, but ballistic missiles and nuclear weapons are now making them obsolete as well" (Wendt 2003: 508). However, on par with security concerns, is the Hegelian logic of recognition:

This reflects Hegel's teleological view that the end of the state is not just to protect its members' physical security, but to make their subjectivity possible, which

8 "Certainly it seems now that nothing could have been more obvious to the people of the early twentieth century than the rapidity with which war was becoming impossible. And as certainly they did not see it. They did not see it until the atomic bombs burst in their fumbling hands" (Wells 1913: 117; cited in Wagar 2004: 147).

cannot be fully realized until all are recognized as equal and an impartial judge exists to enforce this status against criminals" (Wendt 2003: 513).

In my opinion, arguments concerning the (urgent) need for a world state should be presented in terms of a systematic futures studies, based also on empirical research, rather than in terms of – at least in some regards anachronistic – philosophies of history. For instance, is it possible to construct a plausible, systematic scenario, grounded on empirical evidence and explanatory models of contemporary demi-regis, structures, mechanisms, and systems of developments leading towards a large-scale nuclear war in the foreseeable future? If the answer is yes, then the arguments of Morgenthau, Herz, Wendt and many others assume acute and immense importance. Indeed, it seems that although Wagar's scenario may fall short of being plausible in its entirety, parts of his story can be revised without changing the main conclusion, i.e. that the planetary-nuclear era is likely to continue (only) until its destructive powers are actualized in a nuclear war within the next 10–50 years.

Under some plausible assumptions, a catastrophe could be rather close. For instance, there are good reasons to think that the world economy has been locked in a long downward phase; since the 1960's, decade after decade, there has been less growth globally, and more unemployment and under-employment in industrial and human capacities. More 'globalization' seems to mean less economic growth; therefore, various further crises and slumps are possible in the near future (Patomäki 2001: chap. 1–3; Patomäki 2005). Simultaneously – given the contemporary hierarchies, divisions, and inequalities – interests of positioned actors and asymmetric power relations tend to shape the communication and learning processes of many organizations, including states and regional political formations. Although this can be shown in detail only through systematic empirical research, it seems that pathological learning processes and various illusions prevail in a number of key contexts. Moreover, there are also other possible paths towards a nuclear war other than the one depicted by Wagar. Just consider the role of China, and India, Japan and Russia, plus the possibility of a new fragile power-balancing system of regional superpowers in the Americas, Europe, and Asia. In the contemporary nuclear-planetary era, a war of mass destruction seems to be a real possibility, and it may prove even more destructive than Wagar's story.

Even under these circumstances, a Weberian world state is neither inevitable nor (necessarily) de-

sirable. I think Wendt is right in prioritizing the emergence of a universal security community before taking any further steps towards a world state, "[m]embers of the system must no longer routinely perceive each other as physical threats, and expect to settle their disputes peacefully" (2003: 505). Indeed, as many political analysts have argued over the years, a world state, as such, is no guarantee for peace. Without a pre-existing and underlying political security community, a world state could easily become either a totalitarian monster, sustained largely by massive violence, and/or precipitate a global civil war with no less detrimental consequences (Aron 1962: 725–766; Morgenthau 1961: 514–518). Raymond Aron warned also about the dangers of believing in a strict logic of history leading inevitably towards the final stage of human development:

The fanaticism I oppose [...] is of the ideologists of [the 20th] century, simplifiers and 'perfectionists', who believe themselves to possess an infallible formula for prosperity and justice [and peace] and who will accept any violence in order to attain this luminous goal. To doubt these models has nothing to do with vulgar scepticism. It is, on the contrary, to rely on reasoning that confirms the imperfection of all social orders, accepts the impossibility of knowing the future, condemns the vain pretension of drawing up the schema of an ideal society (Aron 1962: 757).

Therefore, in his search of the potential political foundations for a world state, Morgenthau stressed the gradual development of a world community of moral judgements and political actions, and stressed the importance of mechanisms of peaceful changes for resolving political conflicts (Morgenthau 1961: 521–536). To take Morgenthau's cautiously presented idea a little further, and to use it in terms of the theory of securitization, it can be argued that desecuritization entails an opening out of peaceful politics. Furthermore, as I elaborated earlier, the process of establishing mechanisms of peaceful change and opening up shared world political spaces amounts, by and large, to the democratic transformations of systems of global governance (Patomäki 2003: 366–71; Patomäki/Teivainen 2004). Democratic world politics also presupposes the prospect of (some agreements over) redistributive justice since political struggles and attempts to change the rules and principles may concern not only recognition of equality and difference but also substantial (re)distribution of socio-economic opportunities and resources (Patomäki 2001: chap. 4). Moreover, apart from concrete strategies for democratizing systems of global governance, it is equally important to find functional and non-central-

ized ways to reflectively and democratically regulate, steer, and plan the world economy in order to preclude economic collapses, crises, and depressions that may trigger, among other things, processes of securitization, enemy-construction and large-scale (possibly catastrophic) violence (see Patomäki 2005).

73.5 Conclusion

The democratic peace hypothesis does not provide a firm or fixed ground for global security. Moreover, the concept of securitization, although helpful in analysing some aspects of the processes that are relevant to global security, is of limited applicability. The idea of a world state has thus re-emerged as a key reference point in scholarly discussions about global security. However, I have argued in this paper that instead of hasty and potentially dangerous visions of a unified world state, it is better to ground one's response to problems of global security on concrete scenarios as narratives about possible developments of temporal relational contexts – as conditional stories – that are based on explanatory models of contemporary realities. Future-oriented peace and conflict research should also be seen as a pluralist and politically reflective early warning system, based on long-term analysis of social processes and structures. We, however defined, and others can and should learn from possible future catastrophes. It is equally vital to develop realist strategies for concrete future transformations in order to avoid paths that are likely to lead towards a catastrophe – i.e. visions of other possible futures.

Avoidance of a major catastrophe is obviously not the only aim. In general, it is the task of peace and security research to show how the trends and real tendencies of history can be overturned to act consistently in a way that will prevent the transformation of peaceful politics into violence and will promote the transformation of potentially, or actually violent situations into peaceful and democratic politics.

Despite the real possibility that a war of mass destruction will end the planetary-nuclear era, it must remain an open question for the time being whether a world state (in some sense) could become a meaningful and desirable option at a later world historical point (and not only for reasons of global security). As public time unfolds and new vantage points open up, we and others may be able to imagine possibilities that are not seen now. One thing is certain, Wagar was right in his story when he made the world state last only for 100 years. There is no end to history, nei-

ther now, nor in the year 2250 – or in the year 10000 for that matter – unless humanity succeeds in destroying itself (excluding for now other less likely contingencies). History of the human species must remain open-ended, no matter how stable the underpinnings of any particular set of institutional arrangements may appear to a given observer. Furthermore, also depicted in Wagar's *A Short History of the Future*, even the biological constitution of our species-being will gradually change, also by our own making.

74 Role of Prediction in Sustainable Development and Disaster Management

G.A. McBean

74.1 Introduction¹

The concept of sustainable development that “humanity has the ability to make development sustainable – to ensure that it meets the needs of the present without compromising the ability of future generations to meet their own needs” (World Commission on Environment and Development 1987) brings together social, environmental, and economic considerations. In practice it means that societies need to look to the future and make investments now that will allow future generations to meet their needs consistent with those of present generations. Meeting the needs of future generations implies prediction – being able to foretell what will or might happen and how actions and decisions taken now result in differences in the future.

Prediction is used across the natural, environmental, social, and economic sciences. “Prediction is a statement or claim that a particular event will occur in the future. Narrowing the sense of prediction it may be added that the place and time of event are known as well” (Mesjasz 2005). The Oxford Dictionary defines the verb to predict as to “foretell, prophesy”. The noun *forecast* is defined as: “conjectural estimate of something future, especially, of coming weather”. *Conjecture* is the “formation of opinion on incomplete grounds”. The sense of estimate, future and incomplete information is certainly consistent with the sense of prediction of natural and human systems. Prediction is the process of looking ahead on the basis of incomplete knowledge of the present and with incomplete understanding of how the system works.

1 This research has benefited from discussions with Paul Kovacs, Dan Henstra and others at ICLR, Reid Basher of ISDR and members of the ICSU ad hoc Scoping Group on a natural hazards research programme. Research support was provided by the Institute for Catastrophic Loss Reduction and the Canadian Foundation for Climate and Atmospheric Sciences.

The theme of this chapter is that prediction can play a role in better planning for the future to make sustainable development a possibility. Natural disasters are part of that future and must be considered. Hence, the focus is on the role of prediction in the intersection of the disaster management and sustainable development. Natural disasters and their impacts on development are the topics of the next two sections. The approaches towards management of natural hazards and the role governments can or should play in that are the topics of the following two sections. Climate change and its stresses on development are considered next. The chapter ends with a discussion of types of prediction and the need to bring together predictions of both natural and social systems.

74.2 Natural Disasters

The recent devastating effects of the Indian Ocean tsunami, hurricanes Katrina, Rita and Wilma, and the earthquake in Kashmir are vivid reminders that natural disasters² are a global issue which result in great loss of human lives, livelihoods, and economic assets in both developed and developing countries. While very large events are, fortunately, fairly rare, the frequency of recorded natural disasters has been rising rapidly. From a global average total of about 10 per year in the period 1900–1940, to 65 per year in the

2 A disaster is defined by the International Strategy for Disaster Reduction (ISDR) as a serious disruption of the functioning of a community or a society causing widespread human, material, economic or environmental losses which exceed the ability of the affected community or society to cope using its own resources. A disaster is a function of the risk process. It results from the combination of hazards, conditions of vulnerability and insufficient capacity or measures to reduce the potential negative consequences of risk. See at: <www.unisdr.org>.

Table 74.1: Trigger events of natural disasters based on EM-Dat and MunichRe analyses. **Sources:** EM-DAT: *The OFDA/CRED International Disaster Database* (Louvain: Université Catholique de Louvain); MunichRe 2006: 2; see at : <www.munichre.com >.

EM-Dat		MunichRe	Cat. 1-2	Cat. 3-4	Cat. 5-6
Storms	23%	Windstorms	42%	42%	42%
Floods	33%	Flood	28%	34%	28%
Droughts	15%				
		Temperature and mass movements	14%	17%	18%
Landslides	4.5%				
Avalanches	0.7%				
		Earthquake-tsunami-volcanoes	16%	7%	12%
Earthquakes and tsunamis	7%				
Volcanoes	1.4%				

Category 1-2: small-scale to moderate loss (1-19 deaths; some damage)

Category 3-4: Severe to Major Catastrophe (20-500 deaths; damage range US\$50 m - 500 m based on period 2000-2005)

Category 5-6: Devastating to Great Natural Catastrophe (> 500 deaths; damage > US\$500 m).

1960's, to 200 per year in the 1980's, to almost 280 per year in the 1990's, it reached 470 per year for the period 2000-2003. Millions of people are killed, injured or displaced each year because of natural disasters (EM-DAT: OFDA/CRED, *International Disaster Database*, see at: <<http://www.em-dat.net/>>). The impacts of natural hazards have been increasing around the globe. In economic costs, the average annual amounts over a 10 year period have increased from US \$4 billion per year in the 1950's, to US \$13 billion per year in the 1970's and to US \$65 billion per year in the 1990's (see at: <www.munichre.com/>) and the costs are continuing to escalate in first years of this decade. Natural disasters in 2004 and 2005 are estimated to have caused economic losses totalling US \$145 billion and US \$185 billion respectively (MunichRe 2005: 11-12, 2006: 2; at: <www.munichre.com>).

Most disaster losses, whether measured in terms of the number of events, the lives lost or material destruction, stem from extreme weather-related events such as hurricanes, cyclones, other major storms, floods, landslides, wildfires, and drought (Berz/Kron/Loster/Rauch/Schimetschek/Schmieder/Siebert/Smolka/Wirtz 2001), although the statistics of natural disasters depend somewhat on the categorization criteria (Tschogl/Below/Guha-Sapir 2006). Both the EM-Data³ and MunichRe summaries (see table 74.1) show

that weather and weather-related events (including: floods; storms, which includes hurricanes, typhoons, tornadoes, mid-latitude winter storms; droughts and most avalanches and many landslides) trigger about ¾ of all natural disaster events. Earthquakes, tsunamis, and volcanoes comprise only between 8 and 16 per cent of all events but make a much higher percentage of major natural hazards and their impacts are a much greater fraction in terms of lives lost.

What is the explanation for these escalating costs? There are social and demographic factors. Global population has been increasing and there has generally been more exposure of people to hazards, meaning more people and communities are at risk. People are also living by choice or circumstances in more hazardous zones, along coasts, river banks, and mountain slopes. There has also been a growing inequality between poorer and wealthier sectors of society, and the poorer sectors are more vulnerable. There is more expensive infrastructure being damaged. In urban regions (and particularly in very large cities), the complex infrastructure systems that make life and economic activity possible, increase the vulnerability of populations to disruptions caused by natural haz-

3 See: EM-DAT: *The OFDA/CRED International Disaster Database*, Université Catholique de Louvain, Belgium, see at: <www.em-dat.net>.

ards. Commercial activities have become more interdependent and vulnerable, including relying more on the transportation of people and goods. Vulnerability to natural hazards is increased through human interventions, such as changes in land cover increasing risks of landslides or flooding, destruction of mangroves reducing protection of coastal areas to storm damage, and emissions of greenhouse gases into the atmosphere that change the climate. The increasing risks due to climate change will be discussed later.

74.3 Natural Disasters and Development

Although all countries have been impacted by natural disasters, the relative impacts usually are larger in human lives in developing countries and larger in economic costs in developed countries (Mileti 1999). In highly developed countries, the average number of deaths per disaster is 23, while the number increases dramatically to about 150 deaths per disasters in medium and to over 1,000 deaths per disaster in less developed countries (Mutter 2005). While the absolute dollar costs of disasters in highly-developed countries are large, the damage as a percentage of Gross Domestic Production (GDP) is much larger in the developing country (Handmer 2003). Development is then not sustainable. Part of sustainable development needs to be consideration of decisions being made now, including decisions to invest or not, and how they will alter societies' exposure to the risk and occurrence of natural hazards.

The 2000 Millennium Summit formally established a series of Millennium Development Goals (MDG) as a comprehensive and multi-dimensional development framework with clear, quantifiable targets to be achieved in all countries by 2015.⁴ In 2002, participants of the World Summit on Sustainable Development (WSSD) in Johannesburg (South Africa) adopted a Summit Plan of Implementation as part of the strategy to meet the Millennium Development Goals⁵ which drew strong connections between international development and natural hazards. The 2005 World Conference on Disaster Reduction in Kobe,

Hyogo (Japan) noted the intrinsic relationship between disaster reduction, sustainable development, and poverty eradication, and called on governments to strengthen global disaster reduction activities⁶.

74.4 Disaster Management

Disaster management is defined by the *International Strategy for Disaster Reduction* (ISDR, at: <www.unisdr.org>) as the

systematic process of using administrative decisions, organization, operational skills and capacities to implement policies, strategies and coping capacities of the society and communities to lessen the impacts of natural hazards and related environmental and technological disasters. This comprises all forms of activities, including structural and non-structural measures to avoid (prevention) or to limit (mitigation and preparedness) adverse effects of hazards [<http://www.unisdr.org/eng/library/lib-terminology.home.htm>].

Since natural hazards occur and will continue to occur but their exact timing and location will always be uncertain, dealing with them will always be a case of risk management (see Leiss 2001 for discussion of risk in general). The objective of society is to reduce the probability that the occurrence of a natural hazard leads to a natural disaster. Policies and strategies addressing all natural hazards result in sustained, deliberate measures, implemented well in advance of the event to avoid or reduce the impact of hazards.

There are different approaches (Godschalk 1991; Mileti 1999) to disaster risk management. *Mitigation* is the adoption and implementation of structural and non-structural measures to limit the adverse impact of natural hazards, environmental degradation, and technological hazards. This includes standards and codes to protect infrastructure, people, etc., from extreme events, based on an analysis of probabilities of events, which implies being able to predict the probabilities of future events, and the costs of implementation. It should be noted that mitigation in the climate change community has the meaning of reducing emissions to reduce the hazard, and is very different in meaning to climate change adaptation (which is essentially hazard mitigation).

Preparedness reflects the activities and measures taken in advance to ensure effective response to the

6 See: *Hyogo Declaration*, World Conference on Disaster Reduction 18-22 January 2005, Kobe, Hyogo, Japan.; extract from its final report, A/CONF.206/6; see at: <www.unisdr.org/wcdr>.

impact of hazards, including the issuance of timely and effective early warnings, based on predictions. Warnings (McBean 2000, 2002) advise people about impending events (e.g., tornado or flood). Predictions or scenarios identify anticipated climate events such as seasonal drought or long-term climate changes, respectively. Appropriate preparedness strategies will vary with the event. In the case of a tornado within the next 10 minutes, people should seek safe cover. For a river cresting within the next five days, preparations for evacuation and implementation of emergency actions can be taken. If a prediction or scenario predicts more tornadoes over the next year, decade or century, building codes can be changed and educational programmes and warning systems improved.

Response is the provision of assistance or intervention during or immediately after a disaster to meet the life preservation and basic subsistence needs of those people affected. *Recovery* is decisions and actions taken after a disaster with a view to restoring or improving the pre-disaster living conditions of the stricken community, while encouraging and facilitating necessary adjustments to reduce disaster risk.

Prediction of impending hazards will contribute to societal actions before (*mitigation and preparedness*) and during the events (*response*). Prediction can also make response and recovery more effective and lower the risk to the interveners. Prediction should also be seen as a key basis for disaster management through reducing the impacts of hazards by providing information for effective decision-making, for increasing awareness of the impacts of hazards, and by demonstrating how disasters are affected by collective societal activities.

74.5 Role of Government and Approaches to Disaster Management

In the Report of the UN Secretary-General's *High-Level Panel on Threats, Challenges and Change* (2004), it is noted that "... it cannot be assumed that every State will always be able, or willing, to meet its responsibility to protect its own peoples and not to harm its neighbours."⁷ A fundamental and basic role

for government is the protection of its citizens, which has long been the basis for protective services like national defence, law enforcement, and fire protection. The relationships between human security and the natural environment are being reconceptualized (Brauch 2005). In discussions of human security concepts, Bogardi and Brauch (2005) have proposed that a pillar of sustainable development "freedom from hazard impacts" be added to the traditional visions of "freedom from want" and "freedom from fear" (Krause 2004: 43-46). Warning citizens of impending dangers of natural hazards makes prediction central to the role of government. It is recognized that the capacity for governments to provide warnings of impending dangers varies considerably, as does the social vulnerability to events.

Although response is an unavoidable reaction for governments, the emphasis in disaster management should be on prevention (mitigation and preparedness) since it has been shown (e.g., Mileti 1999) that investments in prevention can greatly reduce or eliminate the need for investments later in response and recovery. Thus, although investments in disaster mitigation-preparedness are consistent with sustainable development, most governments still make their major investments in response and recovery. Failure to take action on mitigation stems from a variety of economic, political, and societal reasons (Henstra/McBean 2005). Investments in mitigation where the benefits are only gained later if there is a disaster (which is uncertain for any location), compete for political priority with items of more certain and immediate political return. In federal government systems or where insurance or international assistance are major factors, the benefits of mitigation expenses, i.e., reduced costs for response and recovery, may not come to the government that makes the mitigation investment. The recent incident of Hurricane Katrina impacting on the city of New Orleans and surrounding areas demonstrates the possible impact of failure to invest (McBean 2006). An important part of sustainable development in the context of resilient communities and mitigation of the impact of natural disasters is the analysis of risk, since there will always be imperfect knowledge of the state of present and future environments and the potential for disasters.

7 Report of the UN, Secretary General (2004): *High-Level Panel on Threats, Challenges and Change*; see at: <<http://www.un.org/secureworld/>>; see also the chapter by von Einsiedel, Nitzschke and Chhabra in this volume.

74.6 Climate Change and Sustainable Development

In the broad scope of public policy discussions, two issues, sustainable development and climate change, are intrinsically linked, as noted by Runnalls⁸, President of the International Institute for Sustainable Development in Canada, "...climate change, [is] the greatest problem facing sustainable development today." This connection was also recognized in the *United Nations Framework Convention on Climate Change* (UNFCCC) with its objective of "stabilization of greenhouse gas concentrations ... to enable *economic development to proceed in a sustainable manner*" (emphasis added by McBean; see at: <www.unfccc.int>).

It has been decadal-to-century predictions of a changing climate resulting from anthropogenic emissions of greenhouse gases that led to nations working together to reduce emissions and change that future through the UNFCCC.

In 2005, the Presidents of the academies of science of all G8 countries, as well as by those of China, India, and Brazil stated⁹ that "climate change is real" and that actions must be taken to "reduce the causes [and] prepare for the consequences of climate change". The Gleneagles G-8 Summit communiqué of 2005 stated "Climate change is a serious and long-term challenge that has the potential to affect every part of the globe."¹⁰ Although there are uncertainties, some extreme events are predicted to change with the climate with increased severity of their impacts (IPCC 2001b: 225).

74.7 Prediction and Predictability

As discussed in the earlier sections, prediction is a fundamental role for governments and needs to be used to reduce the impacts of natural hazards and to move towards sustainable development. Sarewitz,

Pielke, and Byerly (2000) have reviewed the role of science in decision-making.

74.7.1 Predictions in the Natural and Social Sciences

It is possible to differentiate, to some extent, between prediction of natural and social systems. For natural physical systems, there are sets of physical 'laws' such as those of Newton that are well tested and provide a basis for prediction. For example, highly accurate predictions can be made with high skill for long periods ahead in the orbits of the planets and, to a lesser extent, oceanic tides on earth¹¹. Tidal predictions (Lorenz 1993: 78-79) focus on the highly predictable response to regular forcing (the gravitational pull of the sun and moon) with superimposed small and unimportant irregularities. In contrast, for weather forecasting, the focus is on the irregularities, the day-to-day weather deviations, and not the highly predictable annual cycle, with the result of reduced skill. Despite difficulties, "[P]rogress in understanding and predicting weather is one of the great success stories of twentieth century science."¹² The skill of weather forecasts on all scales has been improving (Jolliffe/Stephenson 2003; Nichols 2001) and progress can be reviewed through the Joint Working Group on Verification¹³. Weather forecasting is now a major activity of all governments¹⁴ and for a substantial private sector. Predictions of the occurrence of earthquakes, also based on sets of physical 'laws', show increasing skill but due to the complexities of the relationships and the difficulties in observing the details of the present state, it is not yet possible to make predictions of the timing and magnitude of an event with high skill (Nigg 2000: 135-156). For biological, the skill is also low again due to

the complex interrelations and difficulties in observation. In both areas, there are major international scientific efforts to increase understanding, leading to improved predictability¹⁵.

Conversely, to quote Galtung (1975c) “there are no laws in social science.” To develop the optimum disaster management strategy requires predictions of: the influence of human systems on natural (both physical and biological) systems; the occurrence and impacts of natural hazards as they may occur fully naturally or as a result of human influences; how humans will respond to the information that the hazard might or will occur; and how their actions will have consequences for the resultant impacts. Hence, predictions in the realms of natural and social systems are needed. This has been well recognized for some time in the natural hazards field. The title of the book “Disasters by Design” (Mileti 1999) stresses how much the impacts of natural hazards are due to choices or actions of humans.

74.7.2 Natural Hazard Predictions

The World Summit on Sustainable Development (WSSD)¹⁶ recommended:

“37. An integrated, multi-hazard, inclusive approach to address vulnerability, risk assessment and disaster management... is an essential element of a safer world in the twenty-first century. Actions ... (h) Develop and strengthen early warning systems ...”.

In its action plan¹⁷, the World Conference on Disaster Reduction called for “people-centred early warning systems” to be a key part of the response to the tragedies of natural hazards. The international community has clearly identified early-warning systems, which must be based on predictions, as a key response to global concerns.

Prediction of future states of the environment, including a range of hazards, requires predictions across a wide range of natural and social sciences. The accuracy of the prediction will be dependent on the cumulative uncertainties in each component of the predic-

tion system; this has been referred to as the “cascade of uncertainty”¹⁸. Accurate prediction, both of their natural occurrence and of their response to human influences, provides a new relationship with the future. A smog forecast for today allows individuals to respond in limited ways by adapting to reduce their exposure. A smog forecast for a few days allows individuals, industry, and governments to adapt by reducing emissions and, hence, reducing the smog level. These predictions of future states can or should lead to actions that change the outcome; fate can become a choice and choices can make the prediction wrong.

There are several types of predictions of hazardous natural events. Deterministic prediction uses information on the observed state of the system at an initial time t_0 to predict future successive states to some future time t_0+T . The sequence event is ‘determined’, to the extent the predictive model has skill. The atmosphere is what mathematicians call a dynamic, non-linear, chaotic system in which small differences in the initial state, time t_0 , amplify with time (Lorenz 1993: 102-110). Two initial states that seem very similar may become very different in time. This sets the limit of system predictability since the initial state cannot be known exactly.

A method of reducing the influence of the initial state is to make many predictions or simulations with slightly varying initial conditions. If there is high coherence among the simulations, higher confidence can be given to the prediction than when there is low coherence. This ‘ensemble’ prediction technique is now being widely used in weather predictions, for days through seasons, to improve skill and also to provide the user with information on the probable skill of the prediction.

Natural hazards can be generally put in two groups: geophysical (volcano and earthquake related) and hydrometeorological (weather related). Volcanoes and earthquakes are relatively sudden events, and at present skill in making deterministic predictions is limited. However, techniques to predict the likelihood of an event happening sometime in a forthcoming period for a given region are improving and can be used for risk mapping and alerting populations. Monitoring systems can detect when they occur and their further consequences can then be predicted.

For example, when a volcano erupts, the resulting spread of dangerous ash plumes can be predicted; when an earthquake occurs, the creation and propagation of a tsunami can be predicted¹⁹. Hydrometeorological (weather-related) events can occur on time scales from minutes to decades to centuries. There is a general relationship between physical and temporal scales of the events. Small physical-scale events generally have short lifetimes and larger events last longer. Thus a tornado, very small-scale event, is formed, travels over a short distance, and then disappears in less than a few hours. Weather storms that generate high winds and precipitation amounts leading to flash floods, mud slides and the like, typically cover a region and last for days. Long-term issues include depletion of the ozone layer and climate change with global implications and century time scales. Weather-related natural hazards thus cover the scope from minutes to days and from seasons to centuries.

Meteorologists examine predictions over a large number of cases, comparing with observed future states (Murphy 1997), to give a measure of skill or as a function of the length of the prediction and the variables being predicted. The skill depends on the characteristics of the phenomenon. For small-scale, short-lived phenomena like tornadoes and thunderstorms, skilful deterministic predictions are only for minutes to hours. However, for major weather systems, there is skill for several days although it decreases as the length of the forecast increases. Lorenz (1993) has demonstrated that the theoretical limit for deterministic weather predictions is about two weeks. For floods, the skill depends on first the skill of the weather forecast and then of the hydrological prediction system. The impacts then depend further on the response of humans.

Beyond the deterministic limit, predictions of statistical quantities or probabilities are possible using statistical approaches based on the longer deterministic prediction time scales of the components of the coupled atmosphere-ocean system that naturally change more slowly than others. Since tornadoes are embedded in and largely determined by the large-scale weather system, a probabilistic forecast can be made that gives an increased risk of a tornado for the next day, then clarifies and refines the forecast as the risk becomes clearer and eventually a deterministic

forecast can be made. Prediction of these small-scale phenomena and their possible changing characteristics with climate must be approached by risk management techniques (McBean 2005). The large-scale features of the atmosphere adjust more slowly than the smaller-scale cloud-weather systems and the oceans, due to its large thermal capacity, adjust much more slowly than the atmosphere. Thus, one can use this information to extend beyond the atmospheric deterministic limit to provide predictions of the statistical occurrence of events. The ensemble approach, discussed above, is now widely used in seasonal predictions. These could be that a region will be warmer or colder than 'normal' or wetter with risk of floods, or drier with risk of drought. This provides useful information but does not predict the sequence of events over the prediction period, just that more warm days will occur, for example. Some skill in predictions for several seasons is possible for some events. This approach of cascading forecasts and increasing clarity of the risk of a hazardous event needs to be part of the prediction system for reducing the impacts of natural hazards.

Internationally coordinated research programmes in atmospheric-climate science are now underway to improve prediction skill in these areas. THORPEX, with its objective of reducing and mitigating "natural disasters by transforming timely and accurate weather forecasts into specific and definite information in support of decisions that produce the desired societal and economic outcomes" is aimed at one day to two week high-impact weather forecasts for the benefits of society (<<http://www.wmo.int/thorpex/about.html>>), and the World Climate Research Programme has as an objective determining to what extent climate can be predicted and the extent of human influence on climate (<<http://www.wmo.ch/web/wcrp/wcrp-home.html>>).

74.7.3 Predictions of Human and Weather and Climate Interactions

The role of prediction is to provide warnings, information, and advice on the future occurrence of a natural hazard, its impacts, and possible responses (figure 74.1). This information needs to be timely, accurate, and communicated such that it reaches the targeted audience. Responses to the information can include to do nothing, which may invite a disaster or to adapt behaviour and activities to reduce or eliminate the danger. Thus, adaptation is focused on reducing the impacts. The possible responses will depend on the

19 The GeoRisk Commission of the International Union of Geodesy and Geophysics provides updated reviews of the science and predictability of these hazards (<www.iugg-georisk.org>).

time and resources available that may be applied towards adaptation. For a tornado the time may only be minutes whereas for climate change, it is decades. Another approach is to try and change the hazard. This could be a smoggy day (as discussed above) or a changing climate over the next decades. Changing the hazard, called mitigation in the climate change community, also depends on the resources and time available. Further, it probably requires joint action by several or all states. Part of the ongoing process is the feedback on what actually happened (the hazard and its impacts and responses) which can lead to improved prediction and response systems.

Figure 74.1: Role of prediction in providing warnings, information, and advice on the impacts and possible responses.

Responses can include: adaptation - to reduce the impacts; mitigation - to change the hazard; and no response - failure to respond - increasing the likelihood of a disaster. If time permits and as part of the ongoing process, there should be feedback on what actually happens and the responses, leading to improved prediction systems.

These types of predictions require understanding and predictive skill for social systems and their interactions with natural systems. In considerations of global security, Patomäki (previous chap. in this volume) states that social system “[p]rediction is fundamentally problematic because there are no truly constant conjunctions.” Instead he suggests the focus be with the conditions of generating possible futures and modeling them in terms of scenarios and stories. Through this approach, the consequences of social actions can be assessed through contingent predictions where contingent or conditional predictions are based upon ‘if, then’ assumptions (Mesjacz 2005).

It is useful to consider various approaches of predicting the future, based on the present. For some natural systems, the human system can be ignored or assumed unimportant, leading to a natural system prediction A1. For systems of significant human-natural interactions, an approach can be to use a series of scenarios, ‘if’ statements, to generate a series of predicted future human states and use those in the ‘if, then’ mode to predict the future natural states A2, A3, A4, ... Comparison of these predicted natural states provides a measure of the influence of the range of future human systems. In this sense, the human systems are considered independent of but influencing the natural system.

For air pollution, the approach can be: for all ‘if’ assumed values and spatial distribution of pollutant emissions, ‘then’ the air pollution concentrations can be calculated based on an atmospheric-chemistry model. One can also take the ‘if, then’ approach further, based on health-pollutant relationships, to project the impacts on human health. Then the prediction process can be, in a sense, reversed to work backwards to relate human health impacts (at some accepted level of risk) to atmospheric pollution concentrations to allowable emissions. This is a regulatory approach using prediction to limit emissions to meet human health and resulting air quality standards.

For other natural hazards, such as a flood, an “if, then” approach can also be used. The prediction system (figure 74.1) can be used to compare the impacts of various adaptation and mitigation options and to ascertain which is preferred. This information can not only inform governments but also the citizens to gain their support in actions to reduce impacts.

For climate change, it is recognized that there are a “broad range of future environmental trajectories” (Munn 2002: xii) and these must be mapped out to see the range of possible futures. The importance of human activities has been assessed through a series of ‘if, then’ scenarios constructed through the Intergovernmental Panel on Climate Change (IPCC 2001). Using assumptions on population growth, industrial transformation, degrees of internationalization, and other factors, national and global emissions of greenhouse gases were predicted for many different socio-economic scenarios (IPCC 2000; Swart/Mitchell/Morita/Raper 2002). Each emission scenario was then used with several different natural-system climate models to produce an envelope of possible future global temperature changes (figure 74.2). The spread of the envelope is due to uncertainty in both the emission scenario (a social sciences prediction) and in the

Figure 74.2: Scenarios of global climate change over this century.

These are based on socio-economic scenarios of future emissions. Each emission scenario is used with several different natural-system climate models and an envelope of possible future global temperature changes is produced, with the spread due to both uncertainty in the emission scenario (a social sciences prediction) and uncertainty in the climate models (natural science prediction). Corresponding to the range of possible temperature changes are estimated 'reasons for concern'. The risk for extreme events, those weather-related hazards that can cause disasters, rises from an small increase (relative to the recent climate) to large increase and the risk of irreversible change rises from low risk to higher risk as the global temperature change increases from 1.5C to 6C. **Source:** A schematic based on Figure SPM-2 of the IPCC Climate Change 2001 Synthesis Report (IPCC 2001b)

climate models (natural science prediction). Corresponding to the range of possible temperature changes are estimated "reasons for concern". The risk for extreme events rises from an increase (relative to the recent climate) to large increase as the global temperature change increases from 1.5°C to 5.8°C.

Whereas the natural cycles of greenhouse gases had previously been considered separately from the physical climate system, new results have shown that the changing climate leads to alterations of the natural greenhouse gas cycles such as to amplify the rate of climate change (Cox/Betts/ Jones/Spall/Totterdell 2000). There is additional uncertainty in scaling from the global to regional and local results and further to implications from extreme events.²⁰ Communicating uncertainty can be in terms of likelihood or the chance of a defined outcome or in terms of level of understanding, and there are important differences that need to be clarified (and understood) by the sci-

entific community and understood in terms of the influence on decision-making by the political and public communities.²¹

With further understanding, predictions of coupled human-natural states, say C₁, C₂, C₃ ... may be possible, with the provisos for the difficulties in predicting human systems. A role of the scientific community will be to provide risk assessments that provide expert judgement on the relative likelihood of these scenarios, A_i through C_i, being realized.

74.8 Discussion and Summary

To make development sustainable, there is need for informed decision-making. Based on analyses of present and future consequences of decisions, governments and societies in general need to take ap-

20 See: Beniston/Stephenson/Christensen/Ferro/Freij/Goyette/Halsnaes/Holt/Jylha/Koffi/Palutikof/Schott/Semmler/Woth 2006 (in press).

21 See: IPCC Workshop on Describing Scientific Uncertainties in Climate Change to Support Analysis of Risk and of Options. Workshop Report; at: <http://ipcc-wg1.ucar.edu/meeting/URW/product/URW_Report_v2.pdf>.

proaches regarding human activities. When social and economic actions are unacceptable, governments need to decide whether to regulate (including forbidding some actions) or to provide incentives to change behaviour. Another approach is 'education - engagement', providing the rationale and/or information through which people will make an informed choice of which actions are undesirable. A third approach is to 'warn and inform', providing information so that people can make informed choices. Predictions of integrated natural-human systems are a major part of determining which activities are unacceptable, which are undesirable, and which need to be modified. Hence, prediction or information on the future, linking action and effect, is a central basis for sustainable development.

In this sense, prediction's role in sustainable development and disaster management is analogous to its role in future-oriented peace and conflict research with its research leading to a "pluralist and politically reflective early-warning system, based on long-term analysis of social processes and structures" (see chapter by Patomäki in this volume). By learning from possible future catastrophes, it may be possible to develop strategies that avoid paths leading towards catastrophe.

For sustainable development and disaster management, there is need for an integrated all-hazards information and warning system that will predict future states of the environment and occurrences of natural hazards for today, tomorrow, next season and next decade, as they will naturally occur and how human influence are or may change the event. These systems must also include information to guide citizens in how they should respond to the information. This is the ultimate public good role of government - to protect its citizens. Through this approach disaster management will be effective and societies can move towards sustainable development.

Part X Summary and Conclusions

Chapter 75 Reconceptualizing Security in the 21st Century: Conclusions for Research and Policy-making

*Úrsula Oswald Spring and
Hans Günter Brauch*

75 Reconceptualizing Security in the 21st Century: Conclusions for Research and Policy-making

Úrsula Oswald Spring and Hans Günter Brauch

75.1 Introduction¹

A key assumption of this book is that the fundamental global contextual change in the international order caused by the end of the Cold War in 1989 triggered a reconceptualization of security that was deeply influenced by two processes of *globalization* and *global environmental change* (GEC). The scientific security discourse also benefited from new approaches in the social sciences (e.g. constructivism, post modernism, complexity studies, learning social systems, risk society, solidarity society, altermundism, etc.). Both the contextual change and the scientific innovation did not result in a scientific revolution (Kuhn 1962).

- With the *end of the Cold War* the bipolar international order and its prevailing military strategies and deterrence doctrines became obsolete, as did the justifications of high security expenditures (arms competition) due to the disappearance of the danger posed by the rival superpower and competing social, economic, and political system (systemic rivalry).
- This global change in the international order resulted in a geographical widening and intensification of existing political, economic, and cultural *globalization processes* (due to a rapid increase of financial flows, trade, services, information, and cultural exchanges) that benefited from modern transportation, information and communication technologies, and cheap fossil energy.
- With the Rio Earth Summit of 1992, the dangers posed by *global environmental change* due to human production and consumption patterns for the survival of humankind and for global and

human security were added to the international political and security agenda.

These changes have posed manifold new opportunities but also dangers and concerns for international and national institutions as well as for humankind and individual human beings. Since 1990, this threefold contextual change has gradually been ‘securitized’ by government and international organization officials as well as by academic security experts with the introduction of new concepts of security. This process has and will contribute to an ongoing reconceptualization of security in policy declarations and scientific discourses. This volume has conceptually mapped security from different scientific disciplines, societal and political perspectives with regard to its scope (*widening*), the actors, referent objects, and institutions (*deepening*) and sectors (*sectorialization*).

In many languages the term ‘security’ has been a ‘buzzword’, a value and goal of individual and collective action that has been used to address large objective dangers and subjective concerns, and to legitimize ‘extraordinary measures’ and the allocation of major resources (for police, military) as well as infringements of basic human and citizens’ rights. To provide and maintain *internal* (police, justice), *social* (welfare), and *external* (foreign policy, defence) security a major function and budgetary component of the modern Westphalian and interventionary state was based on its ‘monopoly to use force’ (Max Weber 1972). This ‘state-centred’ and narrow focus of security that prevailed in the ‘national constellation’ (Habermas 1998) and during the Cold War era has been challenged since 1990 and has contributed to three features of the reconceptualization of security and its social and scientific constructions:

- *Horizontal widening*: from political and military security to five dimensions (political, military, economic; social, environmental);

1 The authors are grateful for constructive and helpful comments to Patricia Kameri-Mbote (Kenya), Czesław Mesjasz (Poland) and Pál Dunay (Hungary).

- *Vertical deepening*: from 'state' to 'human' and 'gender' security as well as from 'national' upward to 'regional', 'global' and downward to 'local' security;
- *Sectoralization*: to energy, food, health, water, climate, and livelihood security (tables I.1., I.2).

These features are partly referred to in the declared extended security concepts of nation states as expressed in their national defence postures, white papers, and strategies. This is also reflected in shifts of the *securitizing actor* within the state (from defence to foreign, development, and environmental ministries) and from the 'state' to 'international organizations' and regimes (sectoral concepts) to 'epistemic communities', such as the IPCC whose third (2001) and fourth (2007) assessment reports addressed new dangers confronting humankind due to its interaction with nature. This shift in the securitizing actor, scope, referent objects, and sectoral applications of the security concept has already had and will have even more impact on the goals and means as well as on the institutions and strategies for achieving security.

This reconceptualizing of security has been both a political, societal, and scientific process where governments (executive, legislative), interest groups, lobbies, the media, and citizens are involved, but also a key topic of the scientific discourse where three approaches may be distinguished by focusing on a) *objective* security dangers; b) *subjective* security concerns (perception and interpretation of security dangers); and c) their *intersubjective* social constructions.

As the first of three volumes, this book focuses on *recognizing* and interpreting these changes and how they have been reflected in security concepts. The second volume on *Facing Global Environmental Change* will address the global and regional debates on environmental and human security as well as energy, water, food (FDA 2003), health, and livelihood security, while the third on *Coping with Global Environmental Change* will specify conceptually the nature of the security dangers and concerns posed by threats, challenges, vulnerabilities, and risks.

In this volume the term and the political and scientific concept of security has been reviewed in its relationship with three related concepts of peace, development, and environment (part II), in its manifold philosophical, ethical, and religious contexts (part III), with its spatial context and referent objects (part IV), and how the conceptual debate since the change in the global order in 1989/1990 has affected the scientific disciplines (part V) and dimensions (part VI),

as well as how this reconceptualization has affected international security institutions (part VII) and regional security debates (part VIII) and alternative security futures (part IX).

As any attempt to summarize the scientific arguments and assessments of the previous chapters would do injustice to its authors and their analytic capacity, these concluding remarks address the changes of the contextual factors (end of the Cold War, globalization, global environmental change) and how they influence the reconceptualization of security (75.2) and why this reconceptualization matters scientifically and politically (75.3). Then the major scientific messages of this book (75.4) are summarized, and desiderata for future research are outlined (75.5).

75.2 Contextual Changes as Determinants of Security Reconceptualization in Political and Scientific Debates

The perceptions and interpretations of the three contextual changes of international order (75.2.2), of globalization (75.2.3) and global environmental change (75.2.4) as well as their impacts on security dangers and concerns (75.2.5) and their conceptualization have differed between North (industrialized countries) and South (threshold and developing countries), but also within the Northern triad (North America, Europe, Asia-Pacific) and the four sub-regions of the South (Asia, Latin America and Caribbean; Sub-Saharan Africa and the Arab World).

75.2.1 Different Perceptions of the Changes in North and South

The interpretation of the three processes of a widening, deepening, and sectorialization of security are not shared by governments and scholars in North and South. Rather, pre-modern, modern, and post-modern concepts of sovereignty and security have coexisted (Brauch 2001). The political debates and the scientific discourses on the reconceptualization of security have differed among the OECD world representing the North, the BRIC countries (Brazil, Russia, India, China) and the threshold and developing countries in the South, but also among countries where democratic systems of rule existed and a political and scientific debate was possible, and authoritarian regimes that did not encourage such a public debate on security. Besides, a redefinition of the security inter-

ests has occurred in many states and in regional political and economic organizations in different parts of the world.

Within the OECD world, that is among its 30 member countries and the European Commission, differences in the assessment of these three changes and on the reconceptualization of security can be observed within the triad:

- *North America* (USA, Canada, and Mexico as a threshold country);
- *Europe* (EU: European Commission and Austria, Belgium, Czech Republic, Denmark, Finland, France, Germany, Greece, Hungary, Ireland, Italy, Luxembourg, Netherlands, Poland, Portugal, Slovak Republic, Spain, Sweden, UK and four non EU-countries: Iceland, Norway, Switzerland, Turkey);
- *Asia Pacific* (Japan, South Korea, Australia, New Zealand).

The differences among the three NAFTA countries are significant. The US, as the sole remaining superpower, has been a pace-setter in the formulation of security policies and of the political and scientific conceptual debate. During the 1990's the concept of 'environmental security' proliferated from the US to North and Central Europe and gradually globalized at a stage when the administration of G.W. Bush had returned to a narrow national military security concept prior to the events of 11 September 2001. In contrast, Canada became a major proponent of human security and was a founding member of the *Human Security Network* (HSN). As the only Latin American OECD and NAFTA member, Mexico is highly dependent on the US but - for language reasons - its cultural cooperation has also focused on Latin America and the Caribbean.

Within the Asia Pacific, the Japanese government has promoted the 'human security' concept, while simultaneously strengthening its 'national security' perspective. Among the Asian-Pacific OECD countries the reconceptualization and redefinition of national security interests differed.

Within Europe, especially in the EU (19 of its 27 states are OECD members), in four non-EU OECD states and eight non-OECD EU countries: Slovenia, Bulgaria, Romania, Lithuania, Latvia, Estonia, Malta, Cyprus) as well as in the post Soviet and Yugoslav countries and in Albania the reconceptualization of security and of its national security interests differed.

The four BRIC countries (Brazil, Russia, India, and China) representing almost half of the world pop-

ulation with large natural and human resources are major regional economic and political powers with diverse security interests that are partly reflected in their respective national security doctrines.

For the large group of developing countries the security impacts of the three contextual changes have also differed significantly for the countries in:

- Latin America and the Caribbean and among OAS members;
- in North Africa and the Middle East (MENA) and of the Arab League;
- Sub-Saharan Africa (African Union) in West (ECOWAS), Central, East (IGAD), and Southern Africa (SADC) as well as Eastern and Southern (COMESA: Common Market of Eastern and Southern Africa); and
- Central, Southwest, South (SAARC), South East (ASEAN), and Eastern Asia and Oceania.

7.5.2.2 First Change: Towards a Post Cold War International Order

With the end of the Cold War (1989) the first peaceful change of modern global international order has taken place that was neither predicted nor foreseen by governments, intelligence services, nor by academic international relations experts (Gaddis 1992/1993). This global 'turn' had significant impacts on the security architecture and geopolitical map of Europe:

- With the end of bipolarity (of the East-West arms competition and systemic rivalry), the threat posed by the 'enemy' (communism or imperialism) dissolved, as did the Warsaw Treaty Organization and COMECON. Two multi-ethnic states dissolved without violence (e.g. the USSR during 1991, the division of the CSSR in 1993) and one with the most violent war in Europe since 1945 (in Yugoslavia 1991/1992, 1995, 1998). With this turn the arms competition, the dominant military strategies and doctrines, as well as nuclear targeting schemes between the blocs became obsolete.
- With the unification of Germany in 1990, and the two EU enlargements in May 2004 (10 new countries) and in January 2007 (Bulgaria, Romania), the geopolitical map of Europe changed. Many security tasks of CSCE/OSCE as a new regional arrangement under Chapter VIII of the UN Charter were shifted to NATO that extended its activities out of area and to the EU that took over some of the NATO tasks in South-Eastern Europe.

Thus, Europe as the continent where the Cold War started benefited most from its end, what is also reflected in governmental and scientific efforts for a reconceptualization of security. Here the *widening* and *deepening* of security is revealed in many regional and national security documents (strategies, white papers, policy statements). Nevertheless, as the case of the Iraq War has shown, many EU member countries differed significantly in the definition of their national security interests and relations with the US.

The political impact of the end of the Cold War for the two former superpowers was significant, facilitating in the early 1990's major bilateral (SNF of 1991, START I of 1991, START II of 1993/2000, the US does not want to extend START I beyond 2009), regional (CFE 1990) and global (CWC 1993) arms control and disarmament agreements, a reduction of military manpower and at least temporary defence expenditures. However, the peace dividend did not occur and since 1997 any progress within the Conference on Disarmament (CD) was blocked, and since then global military expenditure has again increased significantly (SIPRI 2007, chap. 8):

World military expenditure in 2006 is estimated to have reached \$1,204 billion in current dollars. This represents a 3.5 per cent increase in real terms since 2005 and a 37 per cent increase over the 10-year period since 1997. ... World military expenditure is extremely unevenly distributed. In 2006 the 15 countries with the highest spending accounted for 83 per cent of the world total. The large increase in the USA's military spending is to a great extent due to the costly military operations in Afghanistan and Iraq. ... Between September 2001 and June 2006, the US Government provided a total of \$432 billion in annual and supplemental appropriations under the heading 'global war on terrorism'. ... The overall past and future costs until the year 2016 to the USA for the war in Iraq have been estimated at \$2,267 billion.

The US national security and defence expenditures were rising and reached about 48 percent of global expenditures in 2005 (SIPRI 2006: 301). During the early 1990's, in the US the proportion of military expenditure for R&D rose proportionally compared with military procurement whose decline was partly compensated by increasing arms exports. The realist or Hobbesian mindset of the neoconservative Cold War security elite returned to power with the administration of George W. Bush, and thus the widening of the security concept during the Clinton Administration was replaced by a narrow national military security concept to which a new homeland security component was added after 11 September 2001. In June

2002, the Bush administration withdrew from the ABM Treaty of 1972. With the war in Iraq, issues of 'energy security' moved into the centre.

In 1991, the USSR dissolved into 15 sovereign states, of whom the Russian Federation remained the only nuclear power. During a partly chaotic transformation process, the old Communist system and its institutions were abolished and the economy privatized. Violent internal conflicts in the Caucasus (Chechnya) and a severe economic crisis occurred during the 1990's. In 1997, Russia joined the G-8 and due to huge oil and gas reserves, it strengthened its security position and reformulated its military and regional security interests. The Russian government announced in July 2007 to withdraw from the CFE treaty, and it previously indicated to terminate the INF treaty of 1987.

The impact of the turn in East Asia and in the Pacific was minor: the Korean division remained and with the self-announced nuclear status of North Korea, the Abe government in Japan has tried since 2007 to delete those articles in the Japanese peace constitution of 1951 that constrained its military build-up.²

After the Asian economic crises of 1997, the Japanese government adopted a human security concept focusing on 'freedom from want' to legitimize its development policy and to broaden its global influence.

The direct impact of the end of the Cold War on Latin America and on the Caribbean was limited. However, during the Cold War several leftist governments were toppled in military coups, often with direct or indirect outside encouragement to prevent an expansion of Soviet influence beyond Cuba (chap. 26 by Oswald). During the 1980's, the Latin American countries abolished their military and repressive regimes, and the neoliberal economic model constrained development. After three lost decades, Latin America has experienced a significant shift towards the left (Venezuela, Brazil, Argentina, Chile, Uruguay, Bolivia, Ecuador, Peru and Nicaragua). Within OAS, a conceptual regional security debate evolved and UNESCO encouraged an academic debate on human security in the Western hemisphere (Goucha/Rojas 2003; Rojas 2008 and chap. 69; Fuentes 2008).

In the Arab world, the global turn of 1989 facilitated two Iraq wars that may not have occurred during the East-West conflict when both superpowers

2 See a personal communication by Mitsuo Okamoto, Director, Hiroshima Center for Nonviolence and Peace of 17 May 2007: "So That Never Again Shall We Be Visited With The Horrors Of War".

competed for influence in the region and especially in Iraq and Iran, and respected the zones of influence of the other. With the end of the Cold War Russia discontinued the former Soviet support for some Arab regimes. As the major Middle East conflict remained unresolved and no democratization of existing regimes occurred, the security dialogue remained state-centred with a predominant narrow national and military security approach. In most Arab countries a narrow military and regime security concept prevailed. Due to its oil and gas exports and reserves, issues of energy security have played an increasing role. There has been only a minor scientific discourse on environmental (Selim 2008), energy (Selim/Sahar 2008), water (Adly/Ahmed 2008), and human security (Chourou 2005, 2008) within this region.

In Sub-Sahara Africa, with the end of the Cold War, the competition for influence by both superpowers with military and economic aid disappeared. As a consequence, e.g. the Barre regime collapsed and Somalia became a 'failed states'. This was initially a national security issue that has regional security implications due to the weapons proliferations resulting from the porosity of borders. With the disarmament in Europe, surplus weapons were illegally exported to regimes and warlords, and paid by income from precious natural resources (e.g. diamonds) resulting in many new armed conflicts. A positive change was the peaceful transformation of South Africa from apartheid to a multicultural democracy. In several other African states the security concepts and interests widened. Within the AU and ECOWAS, a continental and sub-regional security discourse emerged, including the establishment of multinational African forces for specific conflicts (Goucha/Cilliers 2001).

In Central Asia the former Soviet Republics became independent (Azerbaijan, Turkmenistan, Kazakhstan, Uzbekistan, Tajikistan, Kyrgyzstan) and the Russian Federation and the US competed for geo-strategic influence in the region. Since 2003, the ENVSEC initiative of OSCE, UNEP, UNDP, with NATO as an observer, evolved in the Caucasus and Central Asia.

In the Cold War Afghanistan was contested by both superpowers. During the Soviet intervention, US intelligence services and some Gulf countries supported the Islamic opposition with money and modern weapons, thus laying the foundation for the Taliban. Since 2001 they have become the major opponent in the US 'war on terror' (Enduring Freedom) and the UN-mandated International Security Assistance Force (ISAF) led by NATO. Afghanistan has become another 'failed state' where neither the government nor

the foreign troops control the whole territory, and drug production and heroin exports have become a major source of income for warlords and Islamic rebels, often exchanged illegally for weapons.

In South Asia during the 1990's, India and Pakistan became two new nuclear powers. Different security debates and scientific discourses emerged, a realist security discourse focusing on key geo-strategic and military issues, but also a debate on environmental, human, energy, water, food, health, and livelihood security. In South East Asia, with the end of the Cold War, the division of the region was overcome when Vietnam, Laos, Cambodia, and Myanmar became ASEAN members. Besides national security, a debate on regional and energy security issues has gained in importance. In some countries a regional scientific discourse on human security linked to cultural diversity has evolved.³ In East Asia, China and Japan, as well as North and South Korea, with a strong US presence, the security debate has focused both on narrow concepts of national and military security that was supplemented with a discourse on human security in Japan and South Korea.

While in Australia and New Zealand differences in the security interests and concepts have existed, for many small island developing states in the Pacific region, issues of environmental and human security (due to climate change) have become key issues of national and human survival (Kinnas 2008).

75.2.3 Second Change: Widening of Globalization since 1990

With the end of the Cold War, the processes of globalization that emerged since colonialism and imperialism, and that intensified since the end of the World War II, when the US promoted a global economic space based on the Bretton Woods institutions (World Bank, IMF). The General Agreement on Tariff and Trade (GATT) fostered the liberalization of financial flows and free trade. During the Cold War, embargoes on selected strategic goods as well as on science and technology were applied to East-West trade. The freedom of movement of people was limited for political and economic reasons.

With the end of the Cold War, the economic process of globalization widened, deepened, and glo-

3 As the only ASEAN country, Thailand joined the HSN where a scientific discourse on human security has prospered prior to the military coups in summer of 2006 (see Wun'gaeo 2003, 2004, 2008).

balized, with most countries joining as major global political and economic institutions. In June 2007, the United Nations had 192 member states, and the World Bank represented 185 member governments. As by January 2007, 150 countries had joined the WTO, among them three BRIC countries, while Russia became an observer. The 30 member states of OECD have a relationship with 70 countries.

The widening of the political, economic and cultural globalization was accompanied by a tightening of border controls and immigration policies in most OECD countries against citizens from developing countries. While the absolute number of migrants and refugees significantly increased from 75.5 million in 1960 to 190.6 millions in 2005, the percentage of migrants and refugees compared with the world population remained stable since 1990 (2.9 per cent).

As 120 out of a total 190 million international migrants moved to the more developed regions in North America, Europe, and to Australia, many OECD countries tightened their immigration policies and border controls. The US has even built a triple fence to prevent the immigration from and via Mexico. While the economic deterritorialization has grown significantly for economic transactions since 1990, the freedom of movements for human beings has been restricted between developing and developed countries, posing many new 'soft' security and human rights issues.

The widening of economic and cultural globalization processes has created new opportunities and security dangers. While financial transactions and trade has increased rapidly in China, India, and in many ASEAN countries that benefited from rapid economic growth and exports, other developing countries in Latin America, in Sub-Saharan Africa, and in the Arab world and in other parts of Asia have stagnated. The North-South gap has grown along with internal disparity, and it is unlikely that the Millennium Development Goals will be met by 2015 by many developing countries. With privatization, deregulation, and the intensification of economic competition, job and social security has also declined in many developed countries, thus contributing to a new poverty in the North.

Furthermore, globalization has contributed significantly to other new security dangers posed by organized crime and terrorist networks globally that have become invisible and deterritorialized actors exploiting the modern means of communication and transportation. They have in some countries partly penetrated the domestic security institutions (police, militias, military) and intimidated others (government, parliament, justice, people).

Despite different warning signals (The 9/11 Commission Report 2004; Strasser 2004a) many security institutions due to their traditional narrow focus on the threats posed by other states and their military have underestimated these new dangers. The US response to the events of 11 September 2001, by declaring a 'war on terror' and trying to globalize their vision and practice of homeland security, have been used to legitimize and to enforce new control measures that infringe human and citizen rights, and in some cases have openly disregarded and violated international humanitarian law. Thus, globalization has acquired a Janus-like quality that has become a focus of additional efforts to reconceptualize security since 2001.

75.2.4 Third Change: Coping with Global Environmental Change

Global environmental change (GEC) has increasingly become an issue of research in the natural sciences since the 1970's, and since the late 1980's also in the social sciences (Munn 2001). GEC includes the ecosystemic and anthropogenic factors and the interrelationship among water, soil (degradation and erosion, desertification and drought) and air (climate change, extreme weather events) with population growth. The analysis of the determinants of GEC requires a transdisciplinary approach with quantitative models or scenarios and qualitative case studies. The analysis of long time scales (start from photosynthetic life) and shorter cycles (Niño/Niña) showed that human activities based on a fossil energy fostered anthropogenic climate change (IPCC 2001, 2007).

The accumulation of greenhouse gases in the atmosphere gradually changed since the industrial revolution (1750 AD) and especially since 1945 when the global population grew rapidly, as did the consumption of fossil fuels (coal, oil, gas) for production, transportation, electricity, and heating that has impacted on an anthropogenic climate change with a significant increase of greenhouse gases in the atmosphere from 280 ppm in 1750 to 379 ppm in 2005 (IPCC WG I 2007: 2), what has resulted in a total increase of average global temperature by 0.76 °C between 1850–1899 and 2001–2005, and a rise of the sea level during the 20th century of 17 cm (IPCC WG I 2007: 5 and 7). Another danger has been the retreat of the ozone layer due to chlorofluorocarbon (CFF) and other gases from the 1970's onwards.

While these new dangers for human livelihoods have gradually grown, their perception (or social con-

struction) has been relatively recent, when the Reagan administration put climate change on the agenda of the G-7 in the autumn of 1988 and the IPCC was established in 1990 by the UN General Assembly as an advisory body for the WMO/UNEP and the climate change regime. The 'securitization' of climate change⁴, as a key issue area of GEC, has gradually emerged since 2000, and the IPCC, as a high level scientific epistemic community, has become a major new 'securitizing actor' that has addressed since 1990 in its four assessment reports (IPCC 1990a, 1996, 1996a, 2001, 2001a, 2007, 2007a, 2007b) a major new danger for the well-being, security, and survival of humankind as a whole.

The fourth IPCC Assessment Report (2007) dealt with the danger posed by climate change as an issue that requires 'extra-ordinary measures' to counter the severe dangers for humankind during the 21st century, although without any direct reference to security. In April 2007, the UN Security Council debated for the first time on climate change as a security issue. Several reports have 'securitized' it as an environmental, human, national, and international security issue.

75.3 Reconceptualization Matters

This volume has addressed primarily the impact of the global contextual change with the end of the Cold War, and to a lesser extent the impact of globalization and the shift towards a postnational constellation on the reconceptualization of security. The third contextual change that has been termed by Nobel laureate Paul Crutzen (2002; Crutzen/Stoermer 2000; Clark/Crutzen/Schellnhuber 2005) and others as the shift in earth history from the 'Holocene' to the 'Anthropocene', may be more severe than all previous changes in international order since 1648. This emerging challenge differs fundamentally from previous turning points in human history:

- It is commonly accepted that these changes cannot be predicted by linear extrapolations of past trends. It has become obvious for analysts and policy-makers that the interactions among its key determinants (e.g. climate change, soil erosion, water scarcity and degradation; population change, envi-

ronmental problems associated with urban and rural systems) are non-linear, dissipative, or chaotic both at the level of natural language considerations (analogies and metaphors) as well as in more rigorous approaches (mathematical modelling and/or computer simulations).

- As the countries that have contributed most to climate change with their accumulated greenhouse gas emissions since 1750 and are projected to contribute most until 2025, 2050 or 2100, and those countries that may be the primary victims of hydro-meteorological extreme weather events due to their high degree of environmental and social vulnerability are not identical, this poses new global equity problems and confronts humankind with a world risk society (Beck 1986, 1992, 1999, 2007).
- Neither the realist (Hobbesian) mindsets of the past that rely on military force and economic and political power nor the military as a key instrument can cope with this new security danger but may rather intensify it, a fundamental paradigmatic shift in security thinking is needed during the 21st century that requires a continuing process of reconceptualizing security, and of rethinking security strategies and tools and a redefinition of security interests.
- This new set of security dangers and concerns requires a change in the security mindset and in the security institutions, from a 'state'-focused security dilemma' to a human-centred 'survival dilemma' (chap. 40 by Brauch). To cope with this new dilemma for human beings new complex survival strategies are needed that require a simultaneous approach that links bottom-up with top-down policy strategies.
- The debate between those who address 'climate change' as a danger for US national security and those who have addressed it as an issue for international and human security refer to different securitizing actors and instruments: the role of the military establishment vs. the role of international organizations and regimes as well as social movements and epistemic communities (see chap. 40 by Brauch with detailed references).

The securitization of climate change is just one of the several GEC determinants that have become objects of the rethinking on security, as for example desertification (Adeel et al. 2006; Diallo 2008); water (World Water Forum in 1997 in Marrakesh; 2000 in The Hague; 2003 in Kyoto; 2006 in Mexico City), popula-

4 See: Brauch 2002, 2004c; Schwartz/Randall 2003; Purvis/Busby 2004; Barnett/Adger 2005; Bohle/O'Brien 2007; Gilman/Randall/Schwartz 2007; CNA 2007; Wisner/Fordham/Kelman/Johnston/Simon/Lavell/Brauch/Oswald Spring/Wilches-Chaux/Moench/Weiner 2007.

tion (Worldwatch Institute 2005; Polunin 1998), food (FAO 2005), and urbanization (UN Habitat 2002).

75.4 Key Messages of this Book

The chapters in this book address the linkages between the natural and social sciences from multidisciplinary perspectives. In epistemological terms, Prigogine and Stengers (1984, Prigogine 1997) applied thermodynamic and mathematical models to open, self-regulating and dissipative systems. Their approach stimulated complexity studies in the social sciences permitting to grasp complexity as an outcome of interactions of often invisible dynamics (Adams 2001: 25).

The narrow military and national security approach has been unable to cope with these complex phenomena and therefore a comprehensive methodological approach is needed where quantitative and qualitative methodologies reinforce each other, including quantitative surveys relying on databases, geographic information system (GIS) tools, on experiments and participative observations and practice of social movements, on conflict evaluations, on policy analyses, and on structured and focused comparative case studies (George/Bennett 2005). In addition, the analysis of the manifold positive, negative, and complex outcomes can offer a scientific base for developing policies and measures for dealing with future insecurities and uncertainty.

75.4.1 Cultural, Philosophical, Ethical, and Religious Diversity in Security Thinking

During the past three millennia of thinking the oriental civilizations in India and China developed highly controversial theories where metaphysics was transformed into moral codes of behaviour and sustained by religious doctrines. Despite different value systems in East and West, for several thousand years patriarchy has emerged as a dominant social practice linked with underlying factors of violence (Reardon 1985). The patriarchal and monotheistic religions (Christianity, Islam, Judaism) claiming absolute truth fostered competition, conflicts, violence, and religious wars.

The concepts of peace and security (chap. 4 by Wæver) have gradually evolved in different cultural and philosophical traditions (part III of the book). In the UN Charter (1945) both concepts were applied to the international domain (chap. 35 by Bothe). While Oswald (chap. 10) compared and interpreted the evo-

lution of the peace concept in the Indian, Chinese, the European, and indigenous American traditions, the subsequent eleven chapters reviewed the evolution and use of the security concept focusing on the religious and philosophical traditions in East Asia, in the three monotheistic religions, and in the Greek, Roman European traditions, as well as in Africa in pre-Colombian America and in contemporary Brazil.

Five chapters analysed in detail the evolution of the security concept in South and East Asia during the past two to three millennia, specifically in Buddhism and Hinduism (chap. 11 by von Brück) and in contemporary political philosophy in India (chap. 15 by Dadhich), in Chinese, Korean, and Japanese philosophy and ethics (chap. 12 by Radtke), in Confucianism in China and its influence on Korean (chap. 13 by Lee) and Japanese thinking (chap. 14 by Okamoto/Okamoto).

This eastern tradition that has influenced the contemporary thinking on security of nearly half of humankind is contrasted with the monotheistic traditions in the thinking on security in Jewish theology (chap. 16 by Eisen), in the Greek, Roman, and European or Western philosophy and Christian ethics (chap. 17 by Arends), and in Arab and Muslim thought (Hanafi chap. 18).

Jacob Emmanuel Mabe (chap. 19) traced the influence of old Egyptian thinking on security, the oral tradition in different parts of Africa, and of contemporary African philosophers. Georgina Sánchez (chap. 20) reviewed the emergence of the history in Mesoamerica while Domicio Proença and Eugenio Diniz offered an analysis of contemporary security in Brazil.

The diverse roots of security concepts that influence contemporary thinking of more than five billion people living outside of Europe and North America are mostly unknown and ignored in the dominant security discourses in political science, international relations, and strategic studies that has been used to legitimize the policy agenda of the sole remaining superpower (chap. 23 by Harle/Moisio).

The cultural richness of the diverse roots of contemporary thinking on security, reviewed in the twelve chapters above, contrasts with Huntington's (1993, 1996) misreading of the cultural dimension that has been used by authors in the strategic debate to replace the old enemy image of the Cold War with a new claimed threat posed by the Confucian and Islamic cultures against the West (see critique by Aydin/Acikmese in chap. 28).

Confronted with new security dangers and concerns (posed by the second and third contextual

changes of globalization and GEC), the different philosophical roots have contributed to different response strategies: Western striving for efficiency, Eastern spirituality, Muslim religiosity, emerging societies of solidarity in Latin America, and renewed Pan-African cooperation schemes are all contributing to culturally diverse security concepts and coping strategies.

Recent economic achievements of China and India and their increasing capacity for poverty alleviation as well as their strategy to secure access to strategic resources through investments and loans in Africa, Latin America, and in the Arab world are both complementing and partly challenging occidental development schemes (OECD, G-8). Therefore, manifold new security concerns are forcing humankind, states, and international organizations to establish a new equilibrium in response to rapidly changing complex global contexts.

75.4.2 Spatial Context and Diverse Social Actors

The spatial contextualization of security is related to its manifold referent objects ‘by whom?’ (a spatialized or increasingly deterritorialized security provider), ‘for whom?’ (the recipient of these security services), and ‘against what?’ (the dangers posed by other nations, by sub-state or transnational actors and by GEC). The gradual transformation from a national to a post-national constellation has implications for the territoriality of the nation state and its sovereignty. The process of economic and cultural globalization through financial and economic transactions and global communication controlled by transnational corporations and networks has permeated state boundaries contributing to a progressing deborderization and deterritorialization of international policies.

Transnational crime (chap. 32 by Tickner/Mason) is threatening public security and the judicial system, similar to the ‘invisible’ terrorist networks and human traffickers. All of them have exploited the opportunities created by globalization processes and intensified the societal and economic vulnerability of open societies and democracies. Security dangers, economic crises, and conditions posed by GEC have contributed to the ‘push’ factors of forced migration. These massive population displacements, crime, and terror have created manifold new national, societal, and human security issues and concerns.

Since the global turn of 1989 and 1990, and reinforced by the process of globalization (chap. 25 by Saxe Fernández), the referent objects of security have

expanded from the nation state and concepts of national security (chap. 29 by Karnad), to sub-state actors, such as society, ethnic and religious groups (chap. 30 by Sahni), and to terrorist networks (chap. 31 by Hoogensen). Between the conceptualization of ‘international’ and ‘national’ security, many complex concepts of regionalism, regionalization, and regional security have been developed in the scientific discourse and in the security policy debate (chap. 27 by Hettne). Since the late 1990’s, the scientific programme of *Global Environmental Change and Human Security* (GECHS) has linked the emerging new security dangers and concerns (GEC) with a people-centred concept of security (chap. 24 by Barnett/Matthew/O’Brien; chap. 26 by Oswald). The reconceptualization of security will also benefit from the integration of individual level data as suggested by Kugler (chap. 33).

75.4.3 Reconceptualization of Security in Scientific Disciplines

The scientific discourse on the reconceptualization of security has been mapped in this book in detail for philosophy (chap. 34 by Coicaud), international law (chap. 35 by Bothe), economics (chap. 36 by Mureshed), in political science, especially in international relations (chap. 37 by Baylis), and in the two competing research programmes of peace and security studies (chap. 38 by Albrecht/Brauch).

These six disciplinary approaches to security reflect the multidisciplinary approach pursued in this book. While they offered many new insights for the policy debate on the impacts of the triple contextual change referred to above, the complexity of the new security dangers and concerns will benefit even more from inter- and even transdisciplinary approaches.

75.4.4 Reconceptualizing Dimensions of Security

A key area of the reconceptualization of security has been the widening of the concept from a narrow military security concept (chap. 41 by Buzan), to include the political (chap. 42 by da Costa), the economic (chap. 43 by Mesjasz), the social or societal (chap. 44 by Wæver) and the environmental (chap. 45 by de Wilde, chap. 9 by Dalby) security dimension.

This part is introduced by a discussion by Shepherd and Weldes (chap. 39) who argue that different theoretical approaches conceive ‘security’ differently, that different conceptions of security entail different

understandings of threats, of insecurity, and of the referent objects of security, and that the scientific effort should be relevant for policy. In chap. 40 Brauch reviewed the debate on the security dilemma since 1990 and contrasted it with his own concept of a survival dilemma. He first suggested a 'state centred' and more recently a 'human centred' security concept to cope with the specific challenges posed by GEC.

75.4.5 Institutional Challenges for New Security Concepts

During the 20th century international organizations have acquired new coordinating policy tasks of relevance for security policy, primarily based on intergovernmental processes (UN, FAO, WHO; Arab League, OAS, (O)AU, CSCE/OSCE; OECD, IEA; NATO) and on transfers of specific tasks to a supranational body (EU Commission).

The widening of the security dimensions is reflected in the changing security policy agendas of the UN (chap. 46 by Dedring; chap. 47 by Einsiedel/Nitzschke/Chhabra; chap. 48 by Sending); of the OSCE (chap. 49 by Wohlfeld); of the EU (chap. 50 by Moschini; chap. 51 by Hintermeier; chap. 52 by Maurer/Parkes; and chap. 53 by Ekengren), of OECD (chap. 54 by Katseli), of NATO (chap. 55 by Dunay; chap. 56 by Bin), and in national schemes for civilian crisis prevention (chap. 57 by Henning/Elges) as well as in policies dealing with the interfaces between development and security policy (chap. 58 by Klingebiel/Roehder).

75.4.6 Reconceptualizing Regional Security for the 21st Century

During the Cold War an ideological regionalism emerged that considered allied countries in the South as the 'backyard' of both superpowers that could not be sustained in the post Cold War era. Since 1990, the systemic conflict ceased to be an artificial impediment for regional cooperation.

Hettne, Inotai, and Sunkel (1999–2001) proposed an evolutionary conceptualization of regions in different stages. They started with a 'regional space', delimited by physical barriers (rivers, mountains). Conquest and occupations created 'regional complexes' where relations among communities were deepened (Spain and Portugal with Latin America). In a third phase, 'regional societies' are cooperating formally in cultural, social, economic, political or military terms, and the relations among communities consolidate. Re-

gional alliances emerged (EU, NAFTA) as 'regional communities' (Telo 2001), characterized by stable and consistent systems of cooperation, which are legally binding.

The increasing complexity of interaction permitted a 'regional institutionalized system' where collective and democratic decision-making processes were approved by their citizens (EU). A widened and deepened security concept offered its members protection, conflict resolution and compensation mechanisms where weaker countries were supported to reduce the disparity with the rest (Oswald 2002d: 5–11). This last type of regionalism goes far behind the narrow security concept and includes development, peace, environment, and cultural security factors.

Within Europe, the EU widened by extending its membership from 15 to 27 countries and entering in enlargement negotiations started in 2005 with Croatia (2004), Macedonia (2005), and Turkey (chap. 59 by Biscop). From a Turkish perspective, three regional concepts of security competed and partly overlapped: the US concept of the larger Middle East, the Russian concept of the Near Abroad, and the EU-sponsored neighbourhood policy (chap. 60 by Aydin/Kaptanoğlu). In a regional Arab security perspective, Chourou (chap. 61) pointed to a probable increase of violence due to the competition on the region's oil and gas resources; the stalled Middle East peace process; authoritarianism; and the division among Arab states.

Since the early 1990's, in West Africa conflicts and violence have resulted in the death, injury, and mutilation of several hundred thousands and the displacement of millions of people across the sub-region (chap. 62 by Ogwu). In response, the Economic Community of West African States (ECOWAS) has created active structures and frameworks to achieve security in West Africa. Since 2002 the sustained efforts of ECOWAS, the African Union (AU), and the United Nations (UN) have calmed some of the war-torn countries of West Africa (e.g. Liberia, Sierra Leone, and Guinea).

While in East Africa (chap. 63 by Nhema/Rupiya), especially in the Horn of Africa, regional efforts for security cooperation were not promising, due to manifold unresolved national and regional conflicts, for Southern Africa Ngoma and Len le Roux (chap. 66) identified as crucial security issues sub-regional conflicts, democracy and governance, and regional institutional structures, which are charged with resolving conflicts, as well as 'new' security challenges, such

as environmental and water issues, HIV/AIDS, and security sector reform.

In South-East Asia, with the end of the Cold War, ASEAN reunited the region by including Vietnam, Laos, and Cambodia. The security policies in South Asia were influenced by the unresolved Kashmir conflict (chap. 65 by Behera) and by the conflicts in Afghanistan that had affected its neighbouring countries (Pakistan, Iran, Central Asian states). Besides the 'realist' security paradigm used within the regional security elite, environmental (Ramakrishnan 2008), human (Najam 2003a), food, water (Shiva 2008), and livelihood security (Bohle 2008), dangers and concerns have widely been debated within the region.

An extensive discussion on regional security issues in the South Pacific (chap. 70 by Clements/Foley) has taken place prior to and since 1990. While no specific sub-regional security organization or regime exists that includes China, both Koreas and Japan, except North Korea and Taiwan all countries in the region have cooperated in several regional organizations and dialogue (chap. 66 by Lee and chap. 67 by Cheng and Hunter). In Latin America (chap. 69 by Rojas) the new security threats are transnational and part of 'parallel globalization' involving actors and agents who do not represent governments.

75.4.7 Alternative Security Concepts for the Future

The four chapters in part IX addressed the temporal dimension of security. Mesjasz (chap. 71) surveyed major challenges associated with prediction and risk in contemporary security theory and policy that is facing greater challenges in the contemporary, multi- or unipolar world than during bipolarity. Jopp and Kaestner (chap. 72) discussed the potential impact of climate change for the planning of the German Armed Forces until 2040 with a special focus on the consequences of global and regional climate change and the impacts of the transformation of global regions due to climate change for European security. Based on Wagar's (1999) hypothetical political scenario, Patomäki (chap. 73) discussed potential lessons to be learned from possible futures. McBean (chap. 74) addressed the role of prediction in sustainable development and disaster management. He argues that it can play a role in better future planning that requires bringing natural and social systems together.

75.5 Need for Scientific Research on Security

The conceptual mapping in this volume focused primarily on the widening and deepening of the security concept due to three contextual changes of the end of the Cold War, the globalization process, and of GEC. This volume has tried to overcome the exclusive focus on the occidental thinking that has dominated the discourse in both traditional and critical security studies. The editors are aware that more research is needed to conceptually map the cultural and theoretical diversity of the thinking on security in its relationship to peace, development, and the environment in all parts of the world.

75.5.1 Scientific Relevance of New Security Concepts

The widening, deepening, and sectorialization of security implies a major shift in the securitizing actor from the nation state to international organizations and regimes as well as non-state actors, societal and business networks, and epistemic communities. By securitizing global dangers and concerns, such as climate change, desertification and water, the new actors have challenged the monopoly of the departments of defence and interior, as well as that of the many intelligence agencies and the threat industry in consulting firms.

Both the work of independent scientists and of the media can contribute to a pluralist and diverse conceptualization of security. With the adoption of the human security concept UNDP (1994) introduced a functional equivalent to human development. While the mapping of the global reconceptualization of security is a purely academic effort guided by scientific criteria, the use of security concepts and the securitization of major threats, challenges, vulnerabilities, and risks has been a highly contested political issue. Thus, the reconceptualization of security matters both scientifically and politically.

75.5.2 Methodological Considerations for Security Research

The conceptualization of new security dangers and concerns is a creative process where multiple sectors intervene and only transdisciplinary approaches that focus on essential elements are able to understand future uncertain risky situations. Therefore, in a *transdisciplinary* process⁵ the participants of a complex

interdisciplinary research team first consolidate a research framework capable to deal with the new dangers and inherent uncertainties. Then, such a global scientific network should combine the natural and social sciences and humanities for analysing and interpreting the ongoing trends and contradictions in security thinking. This network should be able to advise policy-makers and the people on potential security dangers and concerns. It starts with an understanding of the multi-causal and deep roots within an intercultural framework producing complex scenarios of possible outcomes and preventing future ruptures and triggering situations. In this sense it contributes to anticipatory learning processes where knowledge is not only integrated, but also structured and merged in a way that technological and political expertise can be understood and applied to the benefit of the people. It includes analyses of human activities in space and time at the local, meso, and mega level, where possible conflicts and impacts may be anticipated and mitigated within a highly complex and dissipative system constellation.

With regard to security research, several methodological postulates may be appropriate:

- The analysis of GEC as a security issue requires a transition from a *multi-* to a *transdisciplinary approach* (Flinterman/Teclerian-Mesbah/Bro-

erse/Bunders 2001) that uses both quantitative (simulations, scenarios on the causes and their interactions) and qualitative methods (comparative case studies on its manifold regional and societal impacts) as well as approaches of earth system analysis and syndromes of global change and their linear, nonlinear, and chaotic or dissipative linkages.

- Applications of broadly defined complex systems studies, only briefly referred to in this volume, analyses the linkages between resource scarcity and degradation of water, soil, and food; between environmental pollution and health security; social problems of urbanization and their respective socio-economic and cultural context.

Security research should specifically address the extreme outcomes of GEC, among them extreme weather events leading to hazards and disasters, environmentally triggered migration, and the particular conditions and causes that have contributed to violent escalation resulting in national and in a few cases even international crises and conflicts.⁶ Furthermore, it should assess the interaction between environmental and social vulnerability that contribute to a transformation of natural hazards into social and political disasters.

75.5.3 A Shift from a Security to a Survival Dilemma

A major proposal of this book is to empower decision-makers and societal actors to cope with possible dilemmas (see chap. 40 by Brauch) in a globalized world. Based on its Greek roots, a dilemma refers to a choice among two uncomfortable alternatives. In international relations the 'security dilemma' refers to a set of complex choices states are confronted with in an anarchic world, where competing states and alliances respond to uncertainty on the actions or intentions of the other with military arms, thus instigating a process that resulted in an arms competition. With the implosion of the Soviet Union and communism as a declared 'security danger' and perceived 'security concern', the logic of the security dilemma would

5 A transdisciplinary approach should respond to four central questions related to causation, ontogeny, adaptation and phylogeny (Tinbergen 1963). It is a scientific construction based on daily practice, a kind of a co-foundation generating a fragile equilibrium (Piaget/Garcia 1997). It is dynamic, self-regulating, dissipative and organized with interlinked nodes and clusters. This approach was originally inspired by thermodynamic models (Prigogine/Stengers 1984) and it was later transferred as analogies and metaphors to the social sciences. It relates transversally objects with subjects that are able to create new methods, languages and behaviours (Oswald 1992a; 2005), and that are used for analyzing new disciplines (Genovés 1995). It is dialogic and permanently creates new knowledge through deeper questioning (Adelman 2000). It also restructures scientific disciplines and creates new research fields. It works simultaneously with experts (top down) and empowers people (bottom up). Freire (1998) and many representatives of the theology of liberation as well as the participants of the economy of solidarity (see chap. 26 by Oswald) were inspired by this transdisciplinary praxis for consolidating their liberation process. This approach helps to resolve complex theoretical and often not yet understandable problems. Araiz (1999) affirms that it tends to be transcendent with indissoluble ties.

6 The need for a missing cooperation between the disaster research and the peace research community is addressed by Wisner (2008). The insights of both research fields may benefit empirical research and policy oriented strategies of conflict avoidance (addressing long-term structural factors escalating into violence) as well as conflict prevention and resolution.

have implied a major disarmament process and a peace dividend that did not occur after 1990.

Already during the Cold War the rationale of the security dilemma was challenged by Senghaas (1972a) but also by Gray (1976) and later also by Buzan (1983), Krell (1976) and Brauch (1977) who argued for different reasons that internal policy factors and not action-reaction processes were the major stimulants of the Cold War arms competition between the US and USSR as well as between NATO and the Warsaw Pact. Among IR specialists it is contested whether the 'security dilemma' has been overcome in the security community represented by the EU.

Brauch (1998, 2000, 2003) first applied the 'survival dilemma' to a widened security concept, especially to the environmental dimension, that requires cooperative and not conflictive solutions from the states and international organizations and regimes where the military logic and means are irrelevant. In a second conceptualization, as part of the deepening of security, he replaced the state with the environmentally and socially vulnerable human being (or humankind) as the referent object that is confronted with several unpleasant choices in the effort to survive (Brauch 2005, 2005a, 2007a, chap. 40).

Two goals of extended security policies by states and international organizations are to escape the *security dilemma* by cooperative policies that overcome the urgency of military conflicts over fossil resources (coal, oil, gas) by energy efficiency and renewables that increasingly reduce the dependence on fossil energy for political, economic, military and environmental reasons, and as part of a national and international climate mitigation strategy.

Furthermore, human security strategies are to assist the socially and environmentally vulnerable to cope with the *survival dilemma*. This requires complex non-military cooperative strategies that address the manifold causes of internal societal vulnerability by poverty eradication programmes and the realization of the Millennium Development Goals. This requires both improved 'protection' for the poor who are affected most by extreme weather events and other natural hazards, but also 'empowerment' relying on a combination of bottom-up and top-down strategies.

The latter will become more urgent as a result of the third global contextual transformation in the 'Anthropocene'. Thus, the reconceptualization of security that was triggered by the global turn of 1989/1990 and intensified by the new opportunities and

dangers posed by globalization processes is an ongoing process.

The securitization of many determinants, effects, impacts, and societal and political consequences of the GEC has just started with the 'securitization' of climate, soil, deforestation and desertification, water, population, urbanization, as well as food and health, that will all be discussed in detail in vol. IV of this series.

During the emerging transition of earth history from the 'Holocene' to the 'Anthropocene', international and national security strategies, policies, and measures by international and national policy actors as well as by transnational, and sub-state actors require a continuous fundamental reconceptualization and an adaptation of policies.

Linear projections of past policy experience - often proposed by policy-advisers and policy-makers relying on realist mindsets (irrespective of whether they are influenced by Tzun Tzu, Thucydides, Machiavelli, Hobbes or Morgenthau) will become increasingly irrelevant to understand, address, and to solve the newly emerging security dangers and concerns.

This implies for both poor countries in the South and industrialized countries in the North the reinforcing of resilience-building of large sections of the population. This must be closely linked with improved early warning measures for natural hazards, political conflicts, and complex emergences where both affect each other. This requires an active participation of the people in the process, including the protection of their lives and wealth. The preventive strategies must reflect the cultural backgrounds that creates confidence and could increase the participation of the people by guaranteeing them equal and just solutions. Traditional knowledge combined with modern science and technology and above all - in the environmental field - with recovery and mitigation processes and strict land planning could reduce further environmental dangers.

However, there remains an 'ethical dilemma' where those who are responsible for present and future destruction could avoid damage for non-involved forced consumers exposed to dangers by changing their processes of production, consumption, and services.⁷ However, narrow short-term profit interests prevent this option. Thus, only longer-term oriented ethical business and governance from the global to the local level can redefine the existing power relations and assume the responsibility for the 'world risk society', where exploitation and insecurity are triggered by challenges of 'organized irresponsibility' (Beck 2007:

334ff.). Only a radically different process of a liberating consciousness-building (Freire 1998) will be capable of guaranteeing for the world population and the especially affected regions a future in the framework of coping strategies that build on a widening, deepening, sectorialization and extension of security concerns.

7 Beck 2007: 348: "Risiken sind Risikokonflikte, in denen die Welten auseinanderfallen zwischen den Entscheidern, die die Risiken letztlich vermeiden könnten, und den an diesen Entscheidungen nicht beteiligten Zwangskonsumenten der Gefahren, die als 'ungewollte nicht-gesehene Nebenfolgen' auf diese abgewälzt werden."

Abbreviations

AA	Auswärtiges Amt [Federal Ministry for Foreign Affairs, Germany]	BMI	Bundesministerium des Inneren [Federal Ministry of the Interior, Germany]

Úrsula Oswald Spring (Mexico), full time professor/researcher at the National University of Mexico (UNAM) in the Regional Multidisciplinary Research Center (CRIM) and first MunichRe Foundation Chair on Social Vulnerability at the United National University Institute for Environment and Human Security (UNU-EHS) for 2005-2009. She was the first Secretary General of the Colegio de Tlaxcala; General Attorney of Ecology in the State of Morelos (1992-1994) and National Delegate of the Federal General Attorney of Environment from 1994-1995. As Minister of Ecological Development in the State of Morelos (1994-1998) she planted over 30 million trees, promoted environmental education from childhood on and produced drinking water for the whole population with a reduction of 65% in infant mortality due to water-born illnesses. Between 1998 and 2000, she was President of the International Peace Research Association, and later General Secretary of the Latin-American Council for Peace Research (2002-2006). She studied medicine, clinical psychology, anthropology, ecology, classical and modern languages and obtained her Ph.D from the University of Zürich (1978). For her scientific work she received the *Price Sor Juana Inés de la Cruz* (2005), the *Environmental Merit in Tlaxcala*, Mexico (2005, 2006); the *Price of Development of the UN* in Geneva. She was recognized as *Women Academic in UNAM* in 1990 and 2000; *Women of the Year 2000*. She works on non-violence and sustainable agriculture with groups of peasants and women and is the representative for Latin American of *Diverse Women for Diversity*.

She has written 45 books and more than 315 scientific articles and book chapters on sustainability, water, gender, development, poverty, drug consumption, brain damage due to under-nourishment, peasantry, social vulnerability, genet-

ic modified organisms, bioethics and human, gender and environmental security, peace and conflict resolution, democracy and conflict negotiation. Among her major publications are: (Co-author with Rudolf Strahm): *Why we are so poor?* (translated into 17 languages, 1.5 million copies); *Unterentwicklung als Folge von Abhängigkeit* (Berne: Lang, 1978); *Mercado y Dependencia* (México, D.F.: Ed. Nueva Imagen, 1979); *Piedras en el Surco* (México, D.F.: UAM-X, 1983); *Campesinos Protagonistas de su Historia: la Coalición de los Ejidos Colectivos de los Valles del Yaqui y Mayo, una Salida a la Cultura de la Pobreza* (México, D.F.: UAM-X, 1986); *Estrategias de Supervivencia en la Ciudad de México* (Cuernavaca: CRIM/UNAM, 1991); *Fuenteovejuna o Caos Ecológico* (Cuernavaca: CRIM/UNAM, 1999); (Ed.): *Peace Studies from a Global Perspective: Human Needs in a Cooperative World* (New Delhi: Mbooks, 2000); (Co-author with Mario Salinas): *Gestión de Paz, Democracia y Seguridad en América Latina* (México, D.F.: UNAM-CRIM/Coltlax, Böll, 2002); (Ed.): *El recurso agua en el Alto Balsas* (México, D.F.: IGF, CRIM/UNAM, 2003); (Ed.): *Soberanía y Desarrollo Regional. El México que queremos* (México, D.F.: UNAM, 2003); (Ed.): *Resolución no violenta de conflictos en sociedades indígenas y minorías* (México, D.F.: CLAIP, IPRA & Böll Foundation, COLTLAX, 2004); *El valor del agua: una visión socioeconómica de un Conflicto Ambiental* (COLTLAX, CONACYT, 2005); (Ed.): *International Security, Peace, Development, and Environment*, Book 39: *Encyclopaedia on Life Support Systems* (Paris: UNESCO - EOLSS, UK, online); *Gender and Disasters* (Bonn: UNU-EHS, 2007).

Address: Prof. Dr. Úrsula Oswald Spring, Priv. Río Bravo Núm.1, Col Vistahermosa, Cuernavaca, Morelos, 62290 México.

John Grin (Netherlands) is professor at the Department of Political Science of the University of Amsterdam and scientific director of the Amsterdam School for Social science Research (ASSR; www.assr.nl). A physicist by training, his main interest throughout his career has been political judgment of and governance over socio-technological development, empirically focusing on military technology and security policy; agriculture, water management and biomedical technology. He co-established and is co-director of the transdisciplinary Dutch Knowledge network for System Innovations and Transitions (KSI; <www.ksinetwork.nl>), in which some hundred researchers of ten different universities co-operate on major changes towards a sustainable society. His books include: *Military-technological choices and political implications. Command and control in established NATO posture and a non-provocative defence* (Amsterdam: VU University Press; New York: St. Martin's Press, 1990); (Co-ed. with Wim A. Smit, Lev Voronkov): *Military-technological innovation and stability in a changing world. Politically assessing and influencing weapon innovation and military research and development* (Amsterdam: VU University Press, 1992); (Co-ed. with Hans Günter Brauch, Henny van der Graaf, Wim Smit): *Controlling the Development and Spread of Military Technology* (Amsterdam: VU University Press, 1992); (Co-author with Hans Günter Brauch, Henk van de Graaf, Wim Smit): *Militärtechnikfolgenabschätzung und Präventive Rüstungskontrolle. Institutionen, Verfahren und Instrumente* (Münster: LIT, 1997); (Co-author with Henk van de Graaf, Rob Hoppe): *Technology assessment through interaction: A guide* (Den Haag: SDU, 1997); (Co-ed. with Armin Grunwald): *Vision Assessment: Shaping Technology in 21st century society. Towards a repertoire for Technology Assessment* (Heidelberg: Springer, 2000); (Co-edited with Wytse Versteeg and Maarten Hajer: *Meervoudige democratie -*

ervaringen met vernieuwend bestuur (Amsterdam: Aksant, 2006) and (Co-author Arienne van Staveren) *Werken aan systeeminnovaties* (Assen: van Groenou, 2007).

Address: Prof. Dr. John Grin, Dept. of Political Science, University of Amsterdam OZ Achterburgwal 237, 1012 DL Amsterdam, Netherlands.

Hans van Ginkel (The Netherlands) was Rector of the United Nations University and Under Secretary General of the United Nations (1997–2007). He was born in Kota Radjah (Bandar Aceh, Indonesia) in 1940. He obtained a M.Sc. from Utrecht University in human and physical geography, anthropology and history (1966) with a thesis on the morphology and functions of Southeast Asian cities in the early 17th century. His Ph.D. thesis was on “Suburbanization and recent residential environments, with a case-study of the Green Heart of the Randstad”. He taught geography and history at the Thomas à Kempis College, Arnhem (1965–1968). From 1968–1985, he worked at Utrecht University in the Faculty of Geographical Sciences, since 1980, as full professor in human geography and planning; as Dean of the Faculty (1981–1985), as a member of the Executive Board (1985), as Rector Magnificus (1986–1997). He was a member (now an honorary member) of the Commission on the History of Geographical Thought of the International Geographical Union (IGU), chair of the organizing committee of the 28th International Geographical Congress (The Hague, 1996: “Land, Sea and the Human Effort”), a Board Chair of the Netherlands Interdisciplinary Demographic Institute (1986–2000). He also chaired the *National Science and Technology Week* (1988–1998). He is interested in the application of geographical knowledge in society, urban and regional plan-

ning, public housing and housing markets, and public administration. He was chairman of the Regional Council of Utrecht (1988–1993); a board member of the Utrecht Network for Innovation and Economy (UNIE) (1994–1997); Chair of the Coordinating Committee of Advisory Councils on Science Policy (COS) (1991–1997) and a member of the National Foresight Committee on Science Policy (1993). From 1994 to 1998, he has been a member of the European Science and Technology Assembly (Bruxelles) and in 1997–1998 member of the National Council for Science and Technology Policy (AWT).

Hans van Ginkel has contributed to numerous international organizations: the governing board of the International Institute for Geo-Information Science and Earth Observation at Enschede (President 1990–1998), the Board of the European Association of Universities (CRE, Vice-president 1994–1998), the Board of the International Association of Universities (IAU, Vice-president, 1995–2000, President, 2000–2004). He was Treasurer of the Netherlands Foundation for International Cooperation in Higher Education (NUFFIC) from 1986–1997. He also extended the cooperative links of Utrecht University towards Latin America (Costa Rica, Bolivia), Southern Africa and South-East Asia. In 1992, he became a member of the Governing Council of the United Nations University; in 1994 also of Unesco's Advisory Group for Higher Education and in 1996, member of the Steering Committee for Unesco's World Conference on Higher Education (Paris, 1998); Vice-chair of the Board of Trustees of the Asian Institute of Technology, AIT, Bangkok (1997–2006). He has chaired the advisory board of the German Centre for Development Research (Zentrum für Entwicklungsforschung, ZEF, in Bonn) since 2006 and became the chair of the Board of Supervisors of the Institute of Social Studies, The Hague in 2007.

He was appointed to the Social Sciences Council of the Royal Netherlands Academy of Arts and Sciences (KNAW); Knighthood in the Order of the Netherlands' Lion from Queen Beatrix (1994); highest medals of distinction of the City of Utrecht, the Chamber of Commerce and Utrecht University. He received honorary doctorates from the Universitatea Babeş-Bolyai of Cluj in Romania (1997); State University of California (Sacramento, 2003); University of Ghana, Legon, Ghana (2005), Technical University of Zvolen, Slovakia (2006), and McMaster University, Ontario, Canada (2007). In 2001 he was appointed a member of the *Academia Europaea* (Social Sciences); and in 2005 he became associate fellow of TWAS (The Academy of Science of the Developing Countries).

Email: <vanginkel2@hq.unu.edu>.

Klaus Töpfer (Germany) has been professor for environment and sustainable development at the Tongji University in Shanghai, PRC since 2 May 2007; he was Executive Director of the United Nations Environment Programme (UNEP) and Director-General of the United Nations Office at Nairobi (UNON) from February 1998 until June 2006;

Acting Executive Director of the United Nations Centre for Human Settlements (formerly UNCHS/Habitat, now UN Habitat) from July 1998 to August 2000; from 1994–1995 he was chairman of the UN Commission on Sustainable Development (CSD).

Before joining the UN, he held several posts in the Federal Government of Germany as Federal Minister of Regional Planning, Building and Urban Development as well as Co-ordinator of the Transfer of the Parliament and Federal Government to Berlin (1994–1998); as Federal Minister of the Environment, Nature Conservation and Nuclear Safety (1987–1994). Before he was State Minister of Environment and Health in Rhineland-Palatine (1985–1987) and State Secretary at the Ministry of Social Affairs, Health and Environment (1978–1985).

He studied economics at the universities of Mainz, Frankfurt and Münster where he graduated as an economist (1964) and completed his Ph.D. in political science (1968). From 1965–1971 he was an Assistant at the Central Institute for Regional Research and Planning at the University of Münster, a teaching assistant at the Economic Academy Hagen and at the University of Bielefeld; he headed the department of economics at the Münster Central Institute for Regional Planning (1970–1971) and the department of planning and information at the chancellery of State of Saar (1971–1978), he was a lecturer at the University of Administrative Science in Speyer and an expert in developmental policy in Egypt, Malawi, Brazil and Jordan. Before his political career he was full professor at the University of Hannover where he directed the Institute of Regional Research and Development (1978–1979) and a member in the Council of Experts on Environmental Issues.

He is the recipient of several honours including the Order of Merit (1986), the Commander's Cross of the Order of Merit (1989), and the Grand Cross of the Order of Merit all of the Federal Republic of Germany. In 1997–1998 he was Honorary Professor of Tongji University, Shanghai, People's Republic of China; he received honorary doctorates of the Technical University of Brandenburg, Cottbus; Free University of Berlin and University of Essen (2002); University of Hannover (2003); Technical University Lausanne (2005); and of the Technical University Freiberg (2007). He was awarded the Bruno H. Schubert Environment Prize and the German Environment Prize (2002); the Theodor Heuss Prize and the Dag-Hammarskjöld Honorary Medal of the German Society for the United Nations (2005).

He spearheaded environmental policy as Minister of Environment in Germany where he introduced many environmental regulations and laws such as the law on the life-cycle economy and the packaging recycling system 'Green dot', to ban the use of environmentally harmful substances such as SO₂ and ozone depleting substances. He actively contributed to the success of the Earth Summit in Rio de Janeiro (1992) as a forerunner in the negotiations for the United Nations Framework Convention on Climate Change (UNFCCC) and the establishment of the Global

Environment Facility (GEF). As Executive Director of UNEP he promoted the environment and sustainable development, and fought for the developing world. He restructured UNEP under five priority areas (environmental assessment and early warning, development of policy instruments, enhanced coordination with environmental conventions, technology transfer and industry, support to Africa). His vision is to make environment work to improve the lives of present and future generations. The environment should not be seen as an impediment for economic development. Protection of natural resources and regulations on the use of harmful substances trigger technology development and create new markets and jobs. He believes that environment policy is the peace policy of the future and he argued that it is crucial that "we create a culture of cooperation and mutual respect between north and south, rich and poor if we want to avoid ever growing tensions in a world where water and other vital resources can no longer be taken for granted."

Address: Prof. Dr. Klaus Töpfer, Grüne Mühle 52, 37671 Hötter, Germany.

Email: <klaus.toepfer@gmail.com>.

Jonathan Dean (United States of America): a former ambassador, is now adviser on Global Security Issues, Union of Concerned Scientists (UCS), one of the largest public interest organizations in the United States working on questions of environmental and international security. A graduate of the National War College, he holds a PhD in political science from George Washington University. During World War II, he saw combat infantry service from Normandy to the Elbe, before he joined the U.S. Foreign Service in 1949. In the Foreign Service, he worked mainly on issues of East-West relations, disarmament, and international peacekeeping. In 1950 in Bonn he was liaison officer between the US High Commission and the Federal German government. Later he served as desk officer for East Germany in the Department of State and as first secretary at the American Embassy in Prague. In the early 1960's, he was principal officer in Elisabethville, Katanga, during the Tshombe secession and the subsequent UN peacekeeping intervention, and deputy director of the Office of United Nations Political Affairs, Department of State, where he worked on peacekeeping and economic sanctions. In 1968 he returned to the American embassy in Bonn as deputy US negotiator for the 1971 quadripartite agreement on Berlin. He joined UCS in 1984, and now works on issues related to national and European security, arms control, and international peacekeeping. He is the author of *Watershed in Europe* (1987), *Meeting Gorbachev's Challenge* (1989), *Ending Europe's Wars* (1994), and co-author of *The Nuclear Turning Point* (Brookings, 1999). His views have also been published in the *New York Times*, *Los Angeles Times*, *Boston Globe*, *Christian Science Monitor*, *Washington Post* and *Baltimore Sun*, as well as in journals such as *Foreign Policy*, *International Security* and *Foreign Affairs*. Since 1990, he has served as chairman of the Advisory Board of AFES-PRESS.

Address: Amb. Jonathan Dean, Union of Concerned Scientists, 1707 H Street, NW, Suite 600, Washington, DC 20006-3962, USA.

Úrsula Oswald Spring (Mexico), research professor at the National University of Mexico (UNAM), in the Regional Multidisciplinary Research Center (CRIM). See: *Biographies of Editors*.

Vandana Shiva (India) is a physicist, ecofeminist, environmental activist and author of over 300 papers in scientific and technical journals. She was trained as a physicist and received her Ph.D. in physics at the University of Western Ontario in 1978. She later went on to interdisciplinary research in science, technology and environmental policy, at the *Indian Institute of Science and the Indian Institute of Management* in Bangalore. In 1982, she founded the *Research Foundation for Science, Technology and Ecology*. She has fought for sustainable agriculture and local food culture. In 1995 she co-founded *Diverse Women for Diversity*. She has contributed intellectually and through campaigns to the understanding of intellectual property rights, biodiversity, biotechnology, bioethics, and genetic engineering. She has assisted green grassroots organizations with campaigns against genetic engineering. She advised governments and NGOs and in 1970 she participated in the nonviolent *Chipko movement* and established *Navdanya*, a movement for biodiversity conservation and farmers' rights. She is a leader of the *International Forum on Globalization* and of the *alter-globalization movement*. She has argued for the wisdom of traditional practices in her book *Vedic Ecology*.

In 1993, she received the *Right Livelihood Award* (Alternative Nobel Prize) "for placing women and ecology at the heart of modern development discourse" and the *Global 500 Award* of UNEP; the *Earth Day International Award* of the UN; the *Order of the Golden Ark* by his Royal Highness Prince Bernhard of the Netherlands; *VIDA SANA International Award* in Spain; in 1995 the *Pride of the Doon Award* from Doon Citizen Council, Dehra Dun, India; in 1997 *The Golden Plant Award* in Denmark and the *Alfonso Comin Award*, Barcelona, Spain; in 1998 the *Commemorative Medal* by Her Royal Highness Princess Maha Chakri Sirindhorn of Thailand in Bangkok; *Medal of the Presidency of the Italian Republic* from the International Scientific Committee of the Pio Manzu Centre at Rimini, Italy and in 2000 the *Pellegrino Artusi Award*, Italy; in 2001 the *HORIZON 3000 Award* of Austria. All awards were for defending human rights, preservation of peace and sustainable development with a gender perspective for the vision of a world wide fair development.

Among her major publications are: (Co-authored with): H.C. Sharatchandra, J. Banyopadhyay: *Social Economic and Ecological Impact of Social Forestry in Kolar* (Bangalore: Indian Institute of Management, 1981); *Staying Alive: Women, Ecology and Survival in India* (New Delhi: Zed Press, 1988); *Ecology and the Politics of Survival: Conflicts Over Natural Resources in India* (Thousand Oaks, CA: Sage, 1991); *The Violence of the Green Revolution: Ecological degradation and political conflict in Punjab* (New Del-

hi: Zed, 1992); (Ed.): *Biodiversity: Social and Ecological Perspectives* (London: Zed, 1992); (Ed.): *Women, Ecology and Health: Rebuilding Connections* (New Delhi: Dag Hammarskjöld Foundation and Kali for Women, 1993); *Monocultures of the Mind: Biodiversity, Biotechnology and Agriculture* (New Delhi: Zed, 1993); (Co-author with Maria Mies): *Ecofeminism* (Halifax, Nova Scotia, Canada, Fernwood Publications, 1993); *Close to Home: Women Reconnect Ecology, Health and Development Worldwide* (London: Earthscan, 1994); (Co-author with Ingunn Møser): *Biopolitics* (London: Zed, 1995); *Biopiracy: the Plunder of Nature and Knowledge* (Cambridge, MA: South End Press, 1997); *Stolen Harvest: The Hijacking of the Global Food Supply* (Cambridge, MA: South End Press, 1999); *Tomorrow's Biodiversity* (London: Thames and Hudson, 2000); *Patents, Myths and Reality* (Penguin India, 2001); *Water Wars* (Boston: South End Press, 2001); *Vedic Ecology: Practical Wisdom for Surviving the 21st Century* (Novato, CA: Mandala Publishing Group, 2002); *Water Wars; Privatization, Pollution, and Profit* (Cambridge, MA: South End Press, 2002); *Globalization's New Wars: Seed, Water and Life Forms* (New Delhi: Women Unlimited, 2005); *Breakfast of Biodiversity: the Political Ecology of Rain Forest Destruction* (2005); *Earth Democracy; Justice, Sustainability, and Peace* (Cambridge, MA: South End Press, 2005).

Address: Dr. Vandana Shiva, A-60, Hauz Khas, New Delhi-110016, India; Tel.: 91-11-26535422, 26968077.

Website: <<http://www.navdanya.org/about/founder-message.htm>>.

Narcís Serra (Spain) has been the President of the CIDOB Foundation since 2000. During this time, he has been the driving force behind the creation of the Barcelona Institute for International Studies (IBEI), which was founded with the desire to make Barcelona a centre of reference in the study of this discipline and where he is a Lecturer in International Peace and Security. Currently, he is also the President of Caixa Catalunya and Chairman of the Board of the National Museum of Art of Catalonia (MNAC). In 1977 he was named Catalan Minister of Town and Country Planning and Public Works and in April 1979, he was elected Mayor of Barcelona. In 1982, he was named Spanish Minister of Defence in the Government of Felipe González, and in 1991, he was named Vice President of the Spanish Government. From 1986 until 2004, he was a Deputy for Barcelona in the Spanish Congress. He earned a B.A. in Economics from the University of Barcelona, where he held the position of Teaching Assistant in the College of Economics. Between 1970 and 1972, he studied Monetary Economics as a Research Fellow at the London School of Economics. In 1973, he earned a Ph.D. in Economics from the Autonomous University of Barcelona (UAB), and in 1976, he became a Senior Lecturer in Economic Theory, first at the University of Seville and then at the UAB.

He has given numerous keynote addresses and lectures on issues of war and peace, defence, human security and on the democratic control of armed forces. On this issue, he has written the book: *El Control Democrático de las Fuer-*

zas Armadas [Democratic Control of the Armed Forces] (Barcelona: Random House Mondadori, forthcoming). He is also co-editor with José Luis Machinea: *Visiones sobre el Desarrollo en América Latina* [Views on Development in Latin America] (Barcelona: CIDOB Foundation - Santiago de Chile: ECLAC, 2007); co-editor with Joseph Stiglitz: *From the Washington Consensus Towards a New Global Governance* (Oxford: Oxford University Press, forthcoming); co-editor with Manuel Castells: *Europa en construcción. Integración, identidades y seguridad* [Europe Under Construction. Integration, Identities and Security] (Barcelona: CIDOB Foundation, 2004); co-editor with Manuel Castells: *Guerra y paz en el siglo XXI. Una perspectiva Europea* [War and Peace in the 21st Century. A European Perspective] (Barcelona: Kriterios Tusquets Editores, 2003).

Among his major recent articles are “The Debate on Globalization: Two New Contributions”, in: David Held et al. (Eds.): *Debating Globalization* (Cambridge: Polity Press, 2005): 118-125; and “One Year On: Lessons from Iraq”, in: *Chaillot Paper* 68 (Paris: European Institute for Security Studies, March 2004): 113-120. Among his most remarkable lectures and interventions in 2005-2007 are: “Seguridad

Ciudadana y Gobierno Local en América Latina. Amenazas y Desafíos” [Citizen Security and Local Government in Latin America. Threats and Challenges], intervention in the 2nd Inter-American Forum on Security and Citizen Coexistence, Cities for Peace, Lima, 2 March 2007; “War and Peace in the 21st Century. Geopolitics of Energy”, intervention in the War & Peace Seminar, Barcelona, 20 January 2007; “Europa y el Nuevo Orden Internacional” [Europe and the New International Order], inaugural lecture for the 2006-2007 academic year at the Technical University of Catalonia, Barcelona, 20 September 2006; and “Del diálogo a la acción” [“From Dialogue to Action”], intervention in the seminar, “The ESDP and the Mediterranean. Prospects for Dialogue in the Area of Security and Defence in the Barcelona Process”, EU Institute for Strategic Studies, Paris, 10 May 2005. For a complete list of publications and interventions: see at: <http://www.cidob.org/en/content/download/1353/29191/file/cv_nserra_eng.pdf>.

Address: Dr. Narcís Serra, President of the CIDOB Foundation, Fundació CIDOB. C/ Elisabets, 12, 08001 Barcelona, Spain.

Naresh Dadhich (India), Ph.D. is a Professor of Political Science at the University of Rajasthan, Jaipur, where he has been teaching post graduate classes since 1978. Since October 2006 he is Vice Chancellor of Vardhaman Mahaveer Open University at Kota (Rajasthan). He has worked on Gandhism and Peace Studies. His Ph.D. comparing Gandhi and existentialism is one of the earliest studies in comparative literature on Gandhi. He authored six books and numerous articles in scholarly journals, among them: *Nonviolence, Peace and Politics: Understanding Gandhi* (2003). His is the first book in Hindi on John Rawls's theory of Justice. He is a popular speaker and has travelled extensively in India and abroad for invited lectures. He is a referee for prestigious professional journals in the UK and in Australia and sits on the editorial board of the *Journal of Peace Education* (Taylor & Francis). He was the first Convener from Asia of the Peace Education Commission of the International Peace Research Association (2002–2006) and he published its newsletter: *Peace Building*. He received a prestigious Pell Fellowship of Salve Regina University (USA) in 2005. Prof. Dadhich was Director of the Center for Gandhian Studies at Rajasthan University (1996–2000) where he launched the publication of *Gandhian Studies* and organized national and international seminars and conferences. He has popularized Peace Studies and Peace Education in India through conferences, lectures and seminars. At Vardhaman Mahaveer Open University he has introduced a six month certificate one year diploma course on 'Gandhian Theory of Nonviolent Conflict Resolution' or *Gandhigiri*.

Richard A. Matthew (USA), PhD from Princeton University, is Director of the Center for Unconventional Security Af-

fairs (www.cusa.uci.edu) and Associate Professor of International and Environmental Politics in the Schools of Social Ecology and Social Science at the University of California at Irvine. He is also the Senior Fellow for Security at the International Institute for Sustainable Development (IISD); a member of the World Conservation Union's Commission on Environmental, Economic and Social Policy; and a member of the Homeland Security Advisory Council (Region 1). His research focuses on four themes: (1) the structure and dynamics of transnational threat systems such as global terrorism; (2) the relationship between demographic change and new security challenges in democracies; (3) the relationships among microfinance, security and sustainable development; and (4) the environmental dimensions of conflict, human security and peace-building in war-torn societies of the developing world, especially in South Asia and East Africa. He has collaborated with IISD to study environmental change in relation to the causes of conflict, conflict resolution and post-conflict reconstruction in Bangladesh, India, Nepal, Pakistan and Sudan. His research explores ways in which conservation and sustainable development can be designed and implemented to reduce violence and insecurity in different settings. Recent books and co-edited volumes include: *Contested Grounds: Security and Conflict in the New Environmental Politics* (SUNY Press, 1999); *Dichotomy of Power: Nation versus State in World Politics* (Lexington, 2002); *Conserving the Peace: Resources, Livelihoods, and Security* (IISD: 2002); *Reframing the Agenda: The Impact of NGO and Middle Power Cooperation in International Security Policy* (Praeger, 2003); *Landmines and Human Security: International Relations and War's Hidden Legacy* (SUNY Press, 2004).

Address: Prof. Dr. Richard A. Matthew, School of Social Ecology, University of California, Irvine, CA, USA 92697-7075.

Kurt Werner Radtke (Japan, Netherlands, Germany) has been Professor of Chinese and Japanese studies at the Institute of Asia-Pacific Studies at Waseda University, Tokyo since 1998. Between 1974 and 1978 he was Senior Lecturer in charge of the Department of Japanese at Waikato University (Hamilton, New Zealand). From 1978 to 1998 he occupied various positions at Leiden University (Netherlands) in the Chinese and Japanese Departments, since 1987 as Professor in the Faculty of Letters. Since 1979 he had visiting positions in Japan (Institute of Developing Economies, Tokyo), China (Beijing University, Beijing Normal University, and the IIR in Taipei), and taught summer courses on Chinese politics at Sophia University, Tokyo (1988–1997). He has widely published mainly in English, Chinese and Japanese on international (security) relations in East Asia, the history and current state of Sino-Japanese relations, as well as (comparative) culture and the literature of China and Japan. Books: *Poetry of the Yuan Dynasty* (Canberra: ANU, Faculty of Asian Studies Monographs, 1984); *China's Relations with Japan, 1945–83: The role of Liao Chengzhi* (1990); (Co-ed. with Tony Saich): *China's Modernisation. Westernisation and Acculturation* (1993); (Co-ed. with: J. Stam, J. Groenewegen, L.M. van der Mey): *Dynamics in Pacific Asia: Conflict, Competition and Cooperation* (1998); (Co-editor with Gert Teitler): *The Reports on the Sino-Japanese War by De Fremery 1937–1939* (1999); (Co-ed. with R. Feddema): *Comprehensive Security in Asia, views from Asia and the West on the changing Security Environment* (2000); (Co-ed. with M.L. Wiesebron): *Competing for Integration. Japan, Europe, Latin America, and Their Strategic Partners* (2002). He is currently writing a book that deals with East Asia society, economics, politics and security in the general framework of neo-geopolitics, presenting a theory of globalization in East Asia.

Address: Prof. Dr. Kurt Werner Radtke, Parelstraat 18, 2332 JK Leiden, The Netherlands.

Monika Wohlfeld (Germany), Dr., has been the Deputy Director of the OSCE Conflict Prevention Centre and Head of the Policy Support Service since September 2004. She previously served as the Head of External Co-operation in the Office of the OSCE Secretary General. Prior to joining the OSCE, initially as Senior Diplomatic Adviser, she has been a Senior Research Fellow at the Institute for Security Studies of the Western European Union, and researcher at the Department for War Studies, King's College London. Dr. Wohlfeld holds a B.A. (Honours) in Political Science and Soviet and East European Studies and a M.A. in Political Science and Strategic Studies from the University of Calgary, Canada, and a Ph.D. in War Studies from King's College London. She has published widely on Central and Eastern Europe, European security, European integration, subregional co-operation, conflict prevention, conflict management and post-conflict rehabilitation, and on European organizations, inter alia in the *Helsinki Monitor*, *OSCE Yearbook*, *Brassey's Defence Yearbook*, *Chaillot Papers* and *Clingendael Papers*.

Address: OSCE Secretariat, Conflict Prevention Centre, Kaerntnerring 5-7, 1010, Vienna, Austria.

Email: <Monika.Wohlfeld@osce.org>.
