Why are relations between the state and sub-national actors the subject of security? We suggest in this chapter that this is so for three closely interlocked reasons. Sub-national actors are *below*, *within*, and hence *against* the state. It does not particularly matter whether a particular sub-national group is against the state or not. From the totalizing perspective of the sovereign territorial state, sub-national actors, precisely because they are supposedly subordinate and subsumed, are *always* potentially subversive. Later in the chapter, we will sequentially conceptualize these three dynamics with the ultimate objective of re-conceptualizing and de-securitizing the relationship between the state and sub-national actors. However, before doing so we will make a detour through Copenhagen to visit the concepts of securitization and de-securitization.

30.3 Copenhagen Quandary: Security as High Political or Apolitical?

What exactly does the verb 'to securitize' mean? The *Copenhagen School* has presented security as a move that "takes politics beyond the established rules of the game", by framing a public issue as either involving a "special kind of politics" or as being "above politics" (Buzan/Waever/de Wilde 1998: 23). In order to be securitized, an issue has to be presented as an existential threat demanding "absolute priority" and extraordinary treatment in the form of "emergency measures and ... actions outside the normal bounds of political procedure" (Buzan/Waever/de Wilde 1998: 23-24). Securitization, from this perspective, can be viewed as an *extreme version* of politicization, whereby a public issue is presented as requiring total or exclusive political attention. Alternately, securitization can be seen as being *opposed to* politicization, inasmuch as a public issue is removed from the normal political bargaining processes. Securitization is therefore a very slip-

5 The general apprehension in this regard is captured well by Charles Taylor: "The claim is that the supposedly neutral set of difference-blind principles ... is in fact a reflection of one hegemonic culture.... [Only] the minority or suppressed cultures are being forced to take alien form" (Taylor 1992: 43).

pery concept, containing within itself the diametrically opposed notions of ‘total politics’ (or hyper-politics/super-politics) and ‘no politics’ (or trans-politics/supra-politics).

If the Copenhagen School concept of securitization is so ambiguous, why is it used in this chapter? We do so because the concept of *de-securitization* – “the shifting of issues out of the emergency mode and into the normal bargaining processes of the political sphere” (Buzan/ Waever/de Wilde 1998: 4) – is of crucial importance in mitigating the threat that the state perceives from sub-national actors. Irrespective of whether securitization involves hyper-politics or trans-politics, de-securitization is about a return to ‘normal politics’, politics without qualifications. In Section 30.7 it will be argued that sub-national actors will cease to be the referents of security only when they become ‘normal’ political actors in the eyes of the state. But what makes sub-national actors a threat to the state in the first place? That is what the next three sections will explore and explicate.

30.4 Below: The Perpetual Possibility of Insubordination

Sub-national identities – as is implied by the nomenclature of the concept itself – are required by the state to lie *below* the national identity at all times. However, far from being unambiguously located at a subordinate level of analysis and consciousness, sub-national identities often emerge, both in analysis and in practice, as being coordinate with national identity. That a sub-national identity could be regarded as co-equal to the national identity transforms the former into a problem, and often into a threat, for the state. To give a prime example, to posit the Kashmiri identity at the same level as the Indian identity, instead of subordinating the former to the latter, is to immediately pose a challenge to the Indian state and its carefully constructed edifice of Indian nationalism (Ganguly 1999; Varshney 1993). The promise of internal autonomy for Kashmir must therefore be balanced against the potential threat of Kashmiri *azadi* (independence). The persistence of a Timorese identity, often on co-equal terms with the Indonesian identity, was a lingering thorn in the flesh of the Indonesian state (Barata 1998).

Even apparent exceptions to the notion of sub-national subordination, impressive though they may seem at first glance, are considerably less so upon close examination. The Canadian policy of bilingual-

ism has sought to give equal status to the French language in all aspects of social life, but especially in the official business of state (Schmid 2001: 101–122). However, even in Canada the sub-national Francophone identity cannot be placed at par with Canadian national identity. A telling example comes from Canada’s membership in the *Organisation internationale de la Francophonie* (International Francophone Organization): while Canada is a member, the Canadian provinces of Québec and Nouveau-Brunswick (New Brunswick) are classified only as participating governments in the organization.⁶

Thus, sub-national actors become the referents of security because they are *below but not always beneath the state*. It is the prior insistence of subordination that gives rise to the constant spectre of insubordination.

30.5 Within: The Cancer or the Virus

Sub-national identities are not only expected by the state to remain below the national identity, they are also required to stay *within* the boundaries constructed by sovereign territoriality. However, this insistence of the state becomes highly problematic for two very different reasons. In the first place, most sub-national boundaries *do in fact transcend* sovereign borders, particularly in the case of postcolonial states, most of which have emerged out of a messy historical process of unplanned colonization and unorganized decolonization. Thus, the fact that there are Hausa populations that straddle a number of sovereign boundaries in West Africa becomes a problem for the states of that region. The ‘Tamil problem’ is made more acute for the Sri Lankan state by the fact that there is a large Tamil population in southern India separated from the Tamils of northern Sri Lanka only by the narrow waters of the Palk Straits. Sub-national identities that transcend the sovereign border are often treated by states as a potential fifth column, ready and waiting to serve the interests of the foreign (and neighbouring) state.⁷

However, there is another problem that also arises when it is assumed that sub-national identities are sub-

6 On this point, see at: <<http://www.francophonie.org/membres/etats/>>, accessed 1 September 2005.

7 The classic treatment of this problem is Myron Weiner’s “Macedonian Syndrome” model, which is based on “the transnational character of ethnic groups and the disputes over boundaries [between states]” (Weiner 1971: 667).

sumed by the larger national identity. The expectation that sub-national identities can exist cosily within the national identity often converts even an innocent act of sub-national assertion into an act of treachery and deceit. The relatively mild assertion of indigenous identity in Chiapas by the *Ejército Zapatista de Liberación Nacional* or *Zapatista Army of National Liberation* (EZLN) uprising was viewed by the Mexican state as a major challenge to Mexico's carefully crafted national identity of *mestizaje* (the mixing of pre-Hispanic and European blood and culture);⁸ fortunately, the Mexican state has used minimal force to confine the uprising to the Selva Lacandona (Reygadas/Gómezcesar/Kravzov 1994).

In contrast, the assertion of Shia identity in Iraq was dealt with far more brutally by the Ba'athist regime of Saddam Hussein (Makiya 1998). To summarize, sub-national identities often end up being seen by the state either as a virus that brings an alien infection into the body, or as a cancer that eats up the body from within; in either case, the medicine is strong and the surgery drastic. Thus, sub-national actors become referents of security because they are *subsumed by the state but not submerged within it*.

30.6 Against: Sub-nationalism as Subversion

Thus, the sovereign territorial state regards sub-national actors, often imperfectly subordinated and subsumed, as potentially subversive. However, our analytical treatment of sub-national actors in the preceding sections has been to view them as essentially passive objects of securitization by the state. In reality, sub-national actors have agency: they actively protect and promote their interests, which are often at complete odds with those of the state. In this section we will analyse how sub-national actors subvert the state by contesting its aspirations and pretensions and weakening it from within and without.

There are two radically different ways in which sub-national actors subvert the state. We will call these divergent strategies 'subversion from above' and 'subversion from below', and use the examples of two

contemporary Islamist groups that do not advocate violence to illustrate these respective strategies.⁹ The *Hizb ut-Tahrir al-Islami* (The Party of Islamic Liberation), a group that has been in existence since the 1950's, has become the most important Islamist force in Central Asia after the implosion of the Soviet Union. *Hizb ut-Tahrir* is subversive from above because it advocates "the overthrow of governments throughout the Muslim world and their replacement by an Islamic state in the form of a recreated Caliphate" (ICG 2003). Thus, subversion from above can also be regarded as overt subversion, taking the state head on. The *Tablighi Jama'at* (Preaching Party), on the other hand, is "a movement both translocal and postnational", that "finds a tangible manifestation in Islam today" in the "Islamic notion of Ummah, a community of believers unhindered by geographical or national boundaries" (Mandaville 1999). As has been pointed out, "the immediate concern of the *Tablighi Jama'at* is not the capture of state power and the establishment of an Islamic state, but rather the moral reform of individuals, often described as 'making Muslims true Muslims'" (Sikand 2002: 2). The strategy of the *Tablighi Jama'at* can be regarded as subversion from below or covert subversion: challenging the state by transforming the individual citizen.

There are several similarities between the *Hizb ut-Tahrir* and the *Tablighi Jama'at*. Neither is, strictly speaking, a sub-national actor, in that both groups are transnational in terms of ideology, membership and strategy. Both groups, ostensibly, are non-violent in terms of their methods. Both are Islamist in the sense that they seek a return to early pristine Islamic practices in public life. Both follow similar tactics of proselytizing individual Muslims exclusively. Both have faced brutal repression from the Uzbek state. Yet the two groups differ starkly in terms of their basic strategy: while the *Hizb ut-Tahrir* is a political party that aims at overthrowing apostate states in the Muslim world in order to recreate the Caliphate, the *Tablighi Jama'at* is a religious movement that aims to trans-

8 On *mestizaje*, see Basave Benítez (1992). The conception of *México mestizo* (mixed race Mexico) has in recent years been contested by the diametrically opposed conception of *México profundo* (deep 'hinterland' Mexico), with strong indigenous overtones. On the latter, see Bonfil Batalla (1996).

9 The term 'Islamist' is used here in deliberate contradistinction to the term 'Islamic', the adjective that is traditionally used in English to characterize all aspects of social and human life that are derived from, inspired by or connected to the religion of Islam. The distinction that is made here is between 'Islam as belief/faith' and 'Islam as political ideology'. It is critically important to draw this analytical distinction, since only a minority of Muslims worldwide can be accurately characterized as Islamist.

form Islamic societies through the transformation of millions of individual Muslims.

The most robust sub-national actor in recent years to follow a strategy of subversion from above or overt subversion is the *Liberation Tigers of Tamil Eelam* (LTTE), which has waged a relentless guerrilla war with a terrorist campaign against the Sri Lankan state for over two decades (Richardson 2005). The LTTE has also been able to establish a quasi-state in the northern part of Sri Lanka, and has taken on the Sri Lankan armed forces in pitched battles that have resembled an interstate war more than a civil war or an armed uprising. The LTTE is easily the most successful sub-national actor in contemporary times; it is only the implacable hostility of the Indian state – which ironically had a major role to play in establishing the group – that can impede the LTTE's aim of setting up a state called Tamil Eelam in northern and eastern Sri Lanka.

Falun Gong in China is perhaps the most fascinating example of sub-nationalism to have emerged in recent years (Chang 2004). It is also a prime example of subversion from below or covert subversion. Established in 1992, *Falun Gong* is an admixture of Buddhism, Taoism, and Qigong exercise routines. The most remarkable aspect of *Falun Gong* has been its explosive growth: in its heyday, the group had over 60 million adherents, the same size as the Chinese Communist Party itself. The group has also shown incredible resilience in the face of fierce repression by the Chinese state, which clearly regards *Falun Gong* as subversive in its organization and intent (Forney 2001; Spiegel 2002).

Thus, sub-national actors become the referents of security not just because the paranoid state wills it. Many sub-national actors *actively work to subvert the state*, either overtly by taking on the state, or covertly by converting the individual citizen against the state.

30.7 De-securitizing the Sub-national through Political Engagement

How can the sub-national be de-securitized? The sub-national, as we have seen, is subversive: we live in times when the whiff of self-determination is once again in the air. As Alexis Heraclides remarks, “one can detect a weakening in the existing taboo against secession, indeed the signs of an emerging paradigm shift whereby secession will no longer be treated as unthinkable by the international system” (Heraclides 1992: 399). The increasing spread of democratization

has had a paradoxical impact upon the doctrine of self-determination. On the one hand, Daniel Philpott (1995: 353) insists that “Self-determination is inextricable from democracy; our ideals commit us to it.” Amitai Etzioni, however, strongly dissents, arguing instead that “with rare exceptions self-determination movements now undermine the potential for democratic development in non-democratic countries and threaten the foundation of democracy in the democratic ones. It is time to withdraw moral approval from most of the movements and see them for what they mainly are – destructive.” (Etzioni 1992: 21) Philpott does take the democratic “intuition” to an extreme by advocating that “any group of individuals within a defined territory which desires to govern itself more independently enjoys a prima facie right to self-determination—a legal arrangement which gives it independent statehood or greater autonomy within a federal state” (Philpott 1995: 353). This focus on the possibility of “independent statehood” is important because, as Allen Buchanan reminds us, “It would be a mistake to assume ... that developing new forms and degrees of self-determination will eliminate entirely the need to come to grips with the problem of secession” (Buchanan 1992: 352). In other words, despite significant social engineering, the subversive potential of the sub-national remains intact.

Is it possible to de-securitize the sub-national? As we have seen, de-securitization is a process through which a security issue – an existential threat to a referent object requiring extraordinary responses – gets converted into a political issue, subject to the normal bargaining of politics (Buzan/Waever/de Wilde 1998: 4). Politics, in Harold Lasswell's memorable formulation, is about “who gets what, when, how” (Lasswell 1936); or, as David Easton put it less elegantly a generation later, “the authoritative allocation of values for a society.” (Easton 1963: 129) Of Lasswell's classic questions, the “who” question is undoubtedly the most important: Who governs? Who is excluded? Who benefits? At whose expense? Throughout human history, from society to society, these four questions have been fiercely contested. Every few generations, in every human society, these questions are reopened and new answers sought. Self-determination and secession flow out of inadequate answers to these basic questions.

In a fascinating study of four sub-nationalisms in Pakistan, Adeel Khan comes to the conclusion that there is a “direct link” between the strength of the sub-nationalisms and “their distance from or proxim-

ity to state power” (Khan 2005: 189). Khan elaborates:¹⁰

The Pakhtun nationalists’ journey from separatism to integrationism has been a journey from Pakhtuns’ exclusion from state institutions to their present over-representation. Likewise, Mohajirs’ journey from ardent support for state nationalism to separatist rhetoric is rather too obviously linked with their downslide from their position of dominance in the state structure. On the other hand, the two most marginalized groups, Sindhis and Baloch, have been as consistently nationalistic as their distance from the state has been unchanging. (Khan 2005: 189)

There are a couple of other findings of general importance that emerge from Khan’s work. He links the power of sub-nationalisms in Pakistan to “their social, economic, and political location in the state system” rather than culture, history and language; the latter “have been part of the symbolic and rhetorical armoury of these movements but not of their actual political agendas” (Khan 2005: 189). Furthermore, while the sub-nationalisms in Pakistan “have always been centred around provincial autonomy and a share in the central government”, the Pakistani state has “labelled them secessionist and thus forced them into that role” (Khan 2005: 190).

Obviously, not all the findings that emerge from the Pakistan case have universal relevance. Sub-nationalisms elsewhere have been more ambitious in their aims, and states elsewhere have not been as crude as the Pakistani state in responding to sub-nationalist challenges. Nevertheless, it is clear that access to state power is the most efficacious route – other than outright repression, which works in some instances, goes disastrously wrong in others – to contend with the threat posed by sub-national actors.

30.8 Conclusions

Ultimately, securitization is a political decision. De-securitization, similarly, must necessarily rest on a political decision to give ever more inclusive answers to the cardinal questions of politics. Who governs? Each of us may end up governing one day. Who is excluded? None will be wantonly or deliberately excluded. Who benefits? The benefits will be shared in a manner that is fair and just. At whose expense? Since all of us will benefit, we will also share the costs in a just and fair

manner. Only when these become the normal responses of normal politics will the state and the sub-national actor be at peace with each other.

10 Khan uses the term ‘nationalism’ to denote the identities that we are labelling as ‘sub-nationalism’ in this chapter.

31 Non-state Based Terrorism and Security

Gunhild Hoogensen

“Of course I support blowing up, it is our right. Maybe no one will sympathize with us when they hear that children blow themselves up, but that, that’s called heroism” (Sabrine, 19 years old interviewed on PA TV).¹

“They respect us and they resent us. But they want what we have.” Colin Powell, U.S. Secretary of State (*Atlantic Monthly*, 21 June 2004).

“Security is what you make of it” (Buzan/Wæver 2003: 48).

31.1 Introduction

The act of terrorism is as ‘old as human history’ and has been a focus of policy and research for centuries (Czech National Alliance (Great Britain). 1916; Kurth-Cronin 2002/2003: 34). Earlier work on terrorism largely focused on definitions (Bergesen/Han 2005). As the literature addressing terrorism continues to expand however, so have the various methods of analysis from statistical and criminal networks analyses, to sociological analyses, among others (Enders/Sandler 2005; Xu/Chen 2005; Turk 2004). The phenomenon of terrorism has been widely examined from a security analysis standpoint as well, albeit significantly dominated by state and international security perspectives, examining in what ways states are currently threatened by terrorism, and how they can and ought to respond (Tan 2004; Carpenter/Wiencek 2005). These approaches usually address the legal and military measures to ‘combat’ the threat so as to first maintain state integrity and second to protect the primary or first level targets of terrorist acts (such as ‘innocents’). In many respects the dominance of the state-based security approach to terrorism can be interpreted as a move against wider conceptions of security, particularly after the events of 11 September 2001 and the reinigorated military and political secu-

urity policy in the United States. One of the primary objectives of this book is to determine the extent to which security approaches have, or have not, altered due to the historic moments ending the Cold War and the attacks on the USA on 11 September 2001. As such, this chapter will argue that the moves towards a broadened security agenda after the Cold War need to retain their power and influence, and the setbacks towards a state-based political and military security after 9/11 need to be strongly reconsidered. As the act of terrorism demonstrates, a disjuncture occurs between the state, society and individual, whereby the focus on the state and state-based responses may not be adequate when dealing with non-state actors such as terrorists and terrorist networks (Beeson/Bellamy 2003; Kurth-Cronin 2002/2003).

To begin to understand terrorism from a securities perspective we need to recognize and include the existence of security referents in addition to the state. We must examine the relationship between terrorism and state security, as well as the relations between individual, and societal (identity-based) security dynamics, or non-state referent perspectives. Although state-based terrorism is important (not least the relationships between state terrorism and non-state terrorism), this chapter will concentrate on non-state actors. In examining some possible roots of terrorism (which, in the arguments to follow, focus on human and societal security and essentialist hyper-identities), we might be able to say something about terrorist networks and more importantly about how people may be attracted to or recruited into terrorist networks. As argued by Walter Laqueur however, terrorism is such a complex phenomenon that it is meaningless to attempt to find an overarching framework that accounts for all terrorist activities over time (Laqueur 2003). Keeping this advice in mind, we can look at notions of identity and the creation of hyper-identities and their relation to terrorism. This does not mean that acts of terrorism become reified, ahistorical foci of analysis (as Laqueur fears); quite the opposite in fact.

1 Itamar Marcus: “Promoting Women Terrorists”, in: *Jerusalem Post* (9 October 2003), at: <<http://www.pmw.org.il/index.html>>.

Identities are multiple and changing over time, including ethnicity, but also gender, class, race and so forth. As subjects of politicization and securitization however, at a given moment in history an identity or set of given identities may be manipulated and ahistoricized for political purposes, and in a few cases, employ the act of terrorism.

31.2 Relations of Security

Human and societal security have a great deal to offer an analysis of terrorism. They are both non-state based security perspectives which can inform analyses of non-state actor activities like terrorism. Simply stated, human security roots itself in the security of individuals, and societal security in the security of community/group identities. Despite their non-state based orientation, human and societal security are not often discussed as complementary and relational units, but as one versus the other. Barry Buzan and Ole Wæver have played an instrumental role in the development of societal security over the past decade, and more recently Buzan (2004a) has argued against the efficacy of human security, claiming that the only way to study security at the non-state level is through societal security. As Buzan (2004a) notes, human beings are always interacting with others, and take their meaning from the societies in which they live. A focus on the individual has the potential to 'remove' the individual from his or her surroundings. The current debates on human security have not, in fact, adequately addressed the relationship between the individual and her social surroundings (see: "Special Section: What is Human Security?" in: *Security Dialogue*, 2004: 345–387). There appears to be some agreement among scholars that human security is not a replacement of state security, but that the state does not automatically imply security for its people, and nor does the notion of security automatically imply the state (Shinoda 2004a: 23; Shinoda 2004b: 6–7; Thakur 2004: 347; Acharya 2004: 355). Otherwise there is little to no agreement on a definition, and the parameters of human security move from state/military friendly definitions that seek to ensure security of 'people' who are in the throws of traditional war, to a broad development/security orientation that includes a wide range of security issues from physical and political to economic and environmental securities. The former retains the narrow cohesiveness policy-makers enjoy, but it does not really address the issues that human security was created to highlight, namely security from

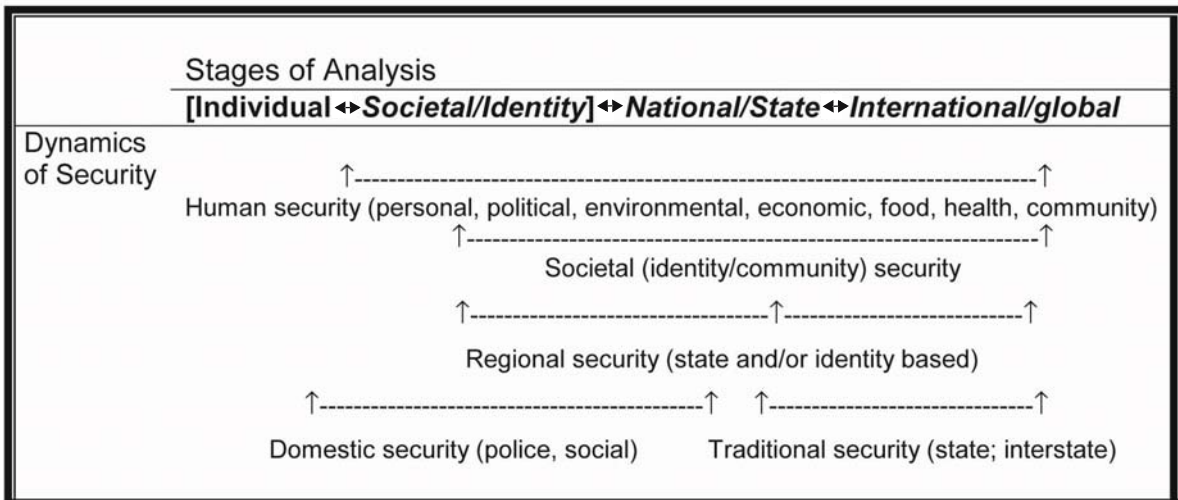

'below', the bottom-up, or rather, from the people. Security of people is not always synonymous with security of states; just as 'trickle-down' economics is riddled with pitfalls, so is 'trickle-down' security.

Part of the difficulty lies with the apparent determination to keep different 'levels' of analysis separate (whereby levels also imply a hierarchy or prioritization of state and international levels over lower, 'sub-state' levels), as well as a lacking recognition of the interrelationships and dependencies of these levels upon one another. Figure 31.1 attempts to provide a simple visualization of these relationships, referring to 'stages' instead of levels. The dynamics of security are then seen to span across and flow through the stages, demonstrating the complexity of security dynamics rather than reducing the concept of security to one dominant and hierarchically prioritized 'level' (the state) and one dominant approach (state security). For example, human security is shown to span from the individual through to societal, the state, and even international as human in/securities can transcend state boundaries connecting people across states as well as within them.

With so many dynamics and stages of security (and more, such as a separate dynamic of environmental security), the spectre of hyper-securitization is raised (Hoogensen 2005b). If security can be theorized from so many positions, from individual to international, we become enveloped within a straightjacket of security, immobilized by the presence of so many possible threats. This is not the case when it is recognized that security, like power, has a positive and negative side (Hoogensen 2005b; Bleiker 2000). Security exposes vulnerabilities and sources of fear (negative security), but it also speaks to capabilities and enabling (positive security) – people, societies, groups have been able to ensure their security by a variety of means, to ensure that life continues, to even make sure a good life can be found (Bajpai 2004).

Capabilities and enabling are expressed in diverse ways however. If certain needs are constructed as very important to the individual or community, unfulfilled human needs (or insecurity) could cause frustration, resistance, and, eventually, violent conflict (Saikal/Schnabel 2003: 25). Resistance is a form of enabling that is often employed in relation to dominant paradigms that enforce or perpetuate inequalities such as patriarchy, imperialism, state security, and so forth. Such resistance, or dissent, can be exemplified by civil rights, women's or gay and lesbian movements; social movements in general (Bleiker 2000). Resistance comes in many forms, however, and does not always

Figure 31.1: Relations of Security²

manifest itself in benign disobedience; resistance can be violent (Hollander 2002; Gentry 2004).

Non-state based approaches to security make visible not only alternative security referents, but also how power and resistance play an important role in the security dynamic. Traditional and domestic security, both of which are state-centric (the state, through its domestic and foreign policies, determines security needs internally through policing and/or economic and social policy, as well as externally through military and defence policy) are integral features of the security dynamic. The attraction to these approaches, both academically and politically, are clear due to their seemingly neat and tightly packaged parameters, where the one does and will not interfere with the other (therefore domestic security interests such as social security are not the purview of, nor have any rela-

tion to, the external security of the state and vice versa). These neat packages tend to become somewhat unglued however when seen in relation to the other security approaches.

Regional security demonstrates the ways in which the simple distinctions between internal and external become blurred, and where the primacy of the state comes into question. The region as a security referent acknowledges security interests beyond the state, but 'below' the international system (Buzan/Wæver 2003; Hentz/Bøås 2003). Although argued as a 'new' security referent, the region has often been theorized as nothing more than the sum of its parts - a group of states. Thus regional security can be understood as very state-based, whereby a group of states find that their security interests merge and/or integrate (Buzan/Wæver 2003). However, regional security can also become blurred by identity, whereby other affiliations besides state boundaries may reign. These regions may be still territorially contiguous but cut across state borders, such as Kurdistan or the Blackfoot Nation (crossing the Canadian/American border). A region might refer to territorial proximity but not include full state territories, such as the Arctic. On the other hand, regions may take on a wholly different character, defining areas such as the 'democratic world' (dominated by, but not exclusively contained within North America and Europe), 'zones of peace and turmoil', the 'core' and 'periphery', or the 'Muslim world' which includes areas of the Middle East, Central and South East Asia, and Europe (Beeson/Bellamy 2003; Rhodes 2004; Agathangelou/Ling 2004). Traditional territorial boundaries are increasingly breached, recently demonstrated by the Belgian

2 The following discussion is a further development of an earlier work which has appeared in Hoogensen, 2005b. This discussion is also taken up by Hoogensen in Brauch, et al 2008. The stages of analysis are indicated in bold script as individual, societal/identity, national/state, and international/global. The stages are presented horizontally in an attempt to avoid a prioritization of one stage over another. The arrows between the stages indicate relationships, where many of the stages have overlapping relationships. The individual and societal/identity stages are bracketed together to indicate an additional strength in their relationship, while societal/identity, national/state, and international/global are italicized to indicate a recognized additional interconnectivity between them. The dynamics of security are indicated by dotted lines and arrows spanning across those stages to which they most relate.

woman turned suicide bomber in Iraq. Thus, regional security interacts with societal security, or the security of identity. Societal security is about “identity, the self-conception of communities, and those individuals who identify themselves as members of a particular community” (Buzan/Wæver/de Wilde 1998: 119). Societal security is most often portrayed as ethnic identity (McSweeney 1999: 77; Buzan/Wæver/de Wilde 1998: 119–140). Like regional security, societal security may well be confined within, if not defined by, a state (making state and societal security somewhat similar or supportive of each other). However, more often than not, the social constructs of state boundaries either contain more than one identity, or cut through identities/communities.

Regional security merges with societal security to demonstrate the scope and range identities can take, while human security tugs on this dynamic from the other end – from the local, the individual. Human security’s perceived unmanageability (so many different voices defining security) is in fact its asset in the security dynamic. The role of the individual in determining security needs is akin to the role of human agency in the agent-structure debate. It is the individual’s claim to security. Of course, this suggests that human in/security is more than just a condition – it is an act itself, an expression of insecurity. Denying human security denies the element of human agency, both the individual ability to define security as well as to cope, adapt, and resist. If security is only defined from above, either from the state or from societal/identity categories (self-defined or imposed), the individual is subject to the structures from above and denied a voice, denied agency. Precisely because identity plays such a significant role in non-state based security we need to acknowledge societal security’s relationship to human security, the latter identifying security both within but also outside of identity attachments. Human security allows for resistance, seeking and establishing security that may lie outside the recognized parameters of states and societies.

The nexus between societal and human security is crucial to understanding non-state based security. A primary weakness of societal security is hyper-identity, which can be understood as a fear of positive, democratic social change and a narrow view as to whose societal security is actually threatened (Suhrke 2003: 96, 98). The focus on one identity can lead to essentialism, ethnic cleansing, terrorist acts in the name of an essentialist/fundamentalist identity, and a drive to a ‘pure’ one-identity community (Green 2003: 8–12; Gleditsch 2001: 105). It can also lead to what Anna M.

Agathangelou and L.H.M. Ling call the militarization of daily life – tightening the grip on the local in the name of a national/communal security (2004: 530). The tendency to create hyper-identities clashes with a more complex reality – that we have many identities rising and subsiding according to context (Maalouf 2003: 10, 26). These multiple identities are not always reflected in the societies we live in and the securities these societies articulate. Hyper-identity may arise from an already dominant group, or in response and resistance, from a previously non-dominant group. The insights provided by a societal security perspective are nevertheless important, particularly from the point of view of “the other” (Suhrke 2003; Crawford/Lipschutz 2003; Bigo 1997, in: Crelinsten 2002). We need to become more aware of how societal security might be articulated and manipulated. Through the example of terrorism, which creates and manipulates hyper-identities, it becomes clear that hyper-identities in the name of societal security do not lead to security at all – they create another insecurity. Taken together, human and societal security are both capable of resistance towards a dominant state security (they may be expressions of compatible insecurities), but there is also the potential for resistance between human and societal security, whereby articulations of human security resist dominating/threatening articulations of societal security (such as resisting essentialist, hyper-identities of what it means to be an Islamic man, or an American woman).

31.2.1 Human Security and Resistance

“Power and resistance always coexist”
(Foucault 1981: 95).

“Is this a happy life? Can this be called living? ... What condition is more miserable than to live such that nothing is one’s own, such that one derives from someone else one’s entire well-being, one’s freedom, one’s body, and one’s life?”

(Étienne de la Boétie 1967/1552, in: Bleiker 2000: 54)

Resistance is linked to identity and margins-informed security. Resistance pertains and reacts to the social construction of identities in a given society or within and between societies. “To understand resistance to ... expectations, we must therefore focus on social relations and interaction” (Hollander 2002: 490). It speaks to the dominance/non-dominance relationship as it demonstrates resistance to that relationship. The relationships are intricate, particularly when we speak of resistance to not only identities imposed by our own cultures, but by others as well (Hoogensen/

Rottem 2004: 165). Hyper-identities can either be the target of resistance (resisting an essentialist identity about manhood) or a resistance response to the dominant identity (resisting Western identities by wearing a head scarf). The discipline of gender studies brings decades of experience and analysis to the discussion of power and resistance, and relations between dominant and non-dominant. As such, these discussions are very useful here.

Gender theories argue for a reconceptualization of security based on the insecurities of civilian society, the marginalized, and the depoliticized (Peterson 1992; Tickner 1992; Peterson/Runyan 1999; Hooper 2001; Cohn/Enloe 2003; Green 2003; Wibben 2004; Tickner 2005; Peterson 2004). J. Ann Tickner (2001: 62) states: “since women have been marginal to the power structures of most states, and since feminist perspectives on security take human security as their central concern, most of these definitions start at the bottom, with the individual or community rather than the state or the international system.” Common essentialist gender-based hyper-identities reduce “women to symbols of either fundamentalist traditionalism or Western hypermodernity” (Runyan 2002: 362) or use “gender essentialisms ... to reproduce the traditional notion that ‘women and children’ (but not adult men) are ‘innocent’ and ‘vulnerable’” (Carpenter 2005: 296). Therefore, many gender analyses warn us of the dangers of essentialism and hyper-identity. Without these insights, we remain blind to the various power relations that influence in/security. Security ‘from below’ is not merely an examination of security needs from the individual level, but also how insecurities from below are often the result of the maintenance of security ‘from above’; elite and/or state security creates and perpetuates insecurities on the margins.

Jocelyn Hollander describes the links between relationships of dominance, non-dominance, and resistance, using gender as the context:

To understand gender, we must examine both power and resistance: ‘not only how dominant groups and institutions attempt to impose particular ... meanings, but also how subordinate groups contest dominant conceptions and construct alternative meanings’. Studying moments of gender resistance can help us understand how gender can change, which in turn can aid us in reconstructing gender more equitably (Hollander 2002: 475).

This is applicable to the power relations of other cases of identity resistance where subordinate groups contest dominant structures (for example, Western cultures, superpower states). Dominance and non-dominance have been applied to other relationships

of power based on identity categories such as ethnicity (Secretariat of the Permanent Forum on Indigenous Issues 2004; Green 2003). Since relations of power exist the world over (MacKay 2004: 153), it is vital that these power relations are acknowledged by and reflected within security approaches.

Resistance by a non-dominant group can, as Caron Gentry argues, be thought of as a social movement, including resistance by terrorist networks. “New social movements use sexual, personal, and cultural identity as stakes in conflict” (Gentry 2004: 277). Although Bleiker and Hollander focus largely on resistance as an act towards positive transformation, it is not exclusively so. Terrorism is an act of contestation and resistance; it is violent, illegal, shocking, abhorrent to many, but nevertheless a contestation of dominance. Gentry argues that terrorism studies has focused more so on the violence of the group and less so on the social phenomenon that is the terrorist network (Gentry 2004: 279). Recognizing these networks as types of social movements brings the notion of resistance and the importance of identity into greater light. It also demonstrates the use of identity, creating a hyper-identity as the resistance rallying point, as the movement requires a “solid, centralized identity” (Gentry 2004: 277). Michael Mazarr (2004: 44) argues a similar case by noting that hyper-identity offers a solution to those “alienated individuals in search of authentic identity amid a debased mass society that has forgotten or destroyed its virtues.” This search for identity, particularly amongst communities “full of pent-up frustration” (Cronin 2002/2003: 52) creates the resistance, and therefore the motivation behind the acts of resistance movements, or social movements. Resistance, in whatever form, is always a product of power struggles between dominance and non-dominance, and needs to be recognized by a securities approach. Local insecurities developed through relations of dominance and non-dominance can and do ‘spill over’ into the international realm, crossing borders, resisting and rejecting the claims of the state that security is only ‘state business’.

31.3 Terrorism

Terrorism is an act of resistance. It is an act, however, that has been and continues to be hotly debated, largely due to its emotional impact. It is a term that is evolutionary and “designed to be subjective” (Cronin 2002/2003: 32). It is a term that is dependent upon the perspective of the observer, further complicated

by the fact that in attempting to understand the term, “misunderstandings abound, especially between genders and persons of differing status, culture, occupation, education, and the like” (Cooper 2001: 882).

Whether the violent behaviour is seen as heroic or abhorrent, its use as a form of resistance against norms of one’s own society or a dominating society must be recognized. Identities are manipulated to serve “the cause”, illustrated in the example of veiling and unveiling by women in the Algerian resistance: women terrorists masquerade first as ‘pure’ Muslim women to allow them to pass through checkpoints untouched, and then dress as Western women to plant bombs: “in taking off their veils they assume a disguise” (Mahoney 1995: 616). The role of identity is relevant to cause as well as how the act itself is interpreted.

A central dilemma in the pursuit of a definition of terrorism is the notion that “one person’s terrorist will ever remain another’s freedom fighter”. Terrorism links heinous acts (causing terror) with a perception of justice that some but not all may sympathize with. Peter Weiss (2002) asks: “What do Nelson Mandela, Menachem Begin, Gerry Adams, and Yasser Arafat, have in common? They all made the transition from being regarded as terrorists to being recognized as statesmen and peacemakers.” James D. Kiras (2002) explains terrorism alongside “irregular warfare”, to a degree uniting revolutionary and insurgency groups with terrorist groups. By doing so he illustrates the problem well – he describes a context where the state is pitted against revolutionaries ranging from Mao Zedong and Ernesto Che Guevara to Osama Bin Laden. These are groups claiming a cause, defining themselves in some way as ‘the other’ in relation to the state and its power. As Kiras (2002) notes, the ways in which we assign labels to, or endow identities upon, these individuals and groups, the language that we use, plays a large role in the confusion surrounding the definition and nature of terrorism and the ways in which we can understand it.

Thus the cause, how these actors identify themselves, and how they are identified by others, all play roles in the definition of terrorism. Most definitions of terrorism reflect some sort of connection to identity, moving from rather vague and open-ended definitions:

Terrorism is the intentional generation of massive fear by human beings for the purpose of security or maintaining control over other human beings (Cooper 2001: 883).

(a hint of identity and security is embedded within this simple definition regarding the *why* one would want to exert control over others, but it is not explicitly explored), to a slightly more open connection to identity through ‘political grievances’ and more implicitly *why* one would want to provoke a draconian or unsustainable response:

Terrorism is ... the sustained use, or threat of use, of violence by a small group, for political purposes such as inspiring fear, drawing widespread attention to a political grievance and/or provoking a draconian or unsustainable response (Kiras 2002: 211).

To an explicit connection to identity:

Four general variables shape the potential for group political action: (1) the *salience of ethno cultural identity* for members and leaders of the group, (2) the extent to which the group has *collective incentives* for political action, (3) the extent of the group’s *capabilities* for collective action, and (4) the availability of *opportunities* in the groups political environment that increase its chances of attaining group objectives through political action (Gurr 2005: 143).

Terrorism is an act connected to a distinct cause; it is political, social (Weiss 2002: 11; it creates a sense of belonging, particularly through alienation) and thereby relational. This relationship shapes a part of the terrorist’s identity. Audrey Kurth Cronin (2002/2003) endows terrorism with the following four significant features: 1. terrorism always has a political nature: “At its root, terrorism is about justice, or at least someone’s perception of it, whether man-made or divine”; 2. it “is distinguished by its non-state character”; 3. “deliberately targets the innocent” and finally, “terrorists do not abide by international laws or norms and, to maximize the psychological effect of an attack, their activities have a deliberately unpredictable quality” (Cronin 2002/2003: 33). Cronin (2002/2003: 36, 38) also notes that terrorism is an act linked to popular movements, and is more than ever linked to identity and alienation.

The terrorist act is committed on behalf of the group to which the terrorist has a sense of belonging (Weiss 2002: 11). This group shapes part of the terrorist’s identity, as well as takes its identity from the political cause it claims. In other words, we see hyper-identity in action, reaffirming itself at both the individual and societal level. It is never permanent because individuals can resist against the hyper-identity as well. However, in situations where identities are understood to be under threat in some way, shape, or form, the hyper-identity gains salience across security stages, from the individual to the state and beyond.

But identity is not just relevant to the cause of terrorism itself, it is imposed by the 'target'. A number of years ago, the IRA dominated the largely Western discourses on terrorism. Being Irish was becoming synonymous with being a terrorist, and the 1974 controversy over identity cards demonstrated how ordinary Irish citizens would and could be penalized for their identity.³ Today, the suspect is Muslim, Middle Eastern. Terrorism today is largely presented as synonymous with Islamic fundamentalism, Muslims in general, Arabs, or to almost anyone of seemingly similar origin (Said 2002). Edward Said notes this when evaluating terrorism and suicide bombing: "Suicide bombing is reprehensible but it is a direct and, in my opinion, a consciously programmed result of years of abuse, powerlessness, and despair. It has as little to do with the Arab or Muslim supposed propensity for violence as the man in the moon" (Said 2002: 24). He recognizes that 'terrorist' has become an imposed identity upon a particular people on the basis of their identity: "Palestinians are all 'terrorist suspects'" (Said 2002: 27). What he claims in addition, however, is the extent to which this group of people is desperate, alienated, and devoid of opportunities to express their identities with pride: "Gaza is surrounded by an electrified wire fence on three sides; imprisoned like animals, Gazans are unable to move, unable to work, unable to sell their vegetables or fruit, unable to go to school ... Palestinian schools, libraries, and universities have ceased normal functioning ..." (Said 2002: 26, 28). The despair of the Palestinian people described by Said is not solely based on socio-economic conditions (Haddad/Khashan 2002: 814). Socio-economic conditions play a significant role, but as argued by Simon Haddad and Hilal Khashan, identity cannot be ignored:

The unfavourable social and economic conditions that frequently invite Western scholars to interpret Islamic radicalism in their light fail to account for the anti-Western agenda of political Islam. In our opinion, the destruction of the Islamic Caliphate some 80 years ago, the inception of European colonialism in Muslim and Arab lands, and Western endorsement of the creation of a Jewish state in Palestine seem to better explain political Islam's grudge against the West than the simplistic socioeconomic argument (Haddad/Khashan 2002: 814).

Westernization, globalization, Europeanization, and Americanization – these are not merely identities to which 'others' react with mere envy (as Colin Powell would suggest in the opening quote). A desire to have the benefits of 'Westerners' may play a role, but equally so does a recognition of the legitimacy of identity claims and societal security. An increased rejection of whole societies based on their identity is not and cannot be any solution to terrorism. No allowance is made for understanding the basis of the hyper-identities upon which terrorist acts rely, nor understanding the expressions of resistance, based on human insecurity, against terrorist actions by those who belong to the same or similar communities.

This blindness to identity and the relations between societal and human in/securities describes well the state-based security responses to terrorism. In his 2004 State of the Union address, President George Bush created identities for the terrorists and their networks in such ways that necessitated their losing a human quality: "We're tracking al-Qaeda around the world, and nearly two-thirds of their known leaders have now been captured or killed. Thousands of very skilled and determined military personnel are on the manhunt, going after the remaining killers who hide in cities and caves, and one by one, we will bring these terrorists to justice".⁴ These terrorists are cowardly, hiding, akin to neither human nor animal but 'killers'. This affects the ways in which their criminal behaviour will be treated. They are therefore not deserving of the ordinary judicial processes accorded to human beings, particularly Americans, and therefore the open admission to killing them is not condemnatory. This was also applied to Iraq:

Having broken the Baathist regime, we face a remnant of violent Saddam supporters. Men who ran away from our troops in battle are now dispersed and attacked from the shadows. These killers, joined by foreign terrorists, are a serious, continuing danger. Yet we're making progress against them. . . . Of the top 55 officials of the former regime, we have captured or killed 45 (Bush 2004).

Iraqi men who opposed the American war in Iraq are equated with terrorists and are also demonized and de-humanized.

This approach informs the state-based security perspective, as opposed to a societal or human security perspective. Anti-terror legislation is rooted in

3 See: *BBC News*, 1 January 2005: "Labour dismissed ID cards in 1974"; at: <<http://news.bbc.co.uk/1/hi/uk/4139049.stm>>.

4 George W. Bush: "United States State of the Union Address" (Washington, D.C.: White House, 2004), at: <<http://www.whitehouse.gov/stateoftheunion/2004/>>.

state security rhetoric and is focused more upon the act than on the cause. The result is the use of identity to create laws allowing for new surveillance (e.g. of mosques), stop and search policies, and the detaining of prisoners for extended periods without due process. Migration and immigration of particular peoples (Muslims? Turks? The dark other?) become security risks to the state. These state-based security actions respond to the hyper-identities created by the terrorist organizations, but equally create hyper-identities about whom the possible and suspect terrorists could be.

The slippery slope towards hyper-identity becomes visible through the relationship of human and societal security. Hyper-identity becomes the tool of terrorist networks, but the attraction to the network could be partly attributed to individual expression of human insecurity. Terrorist networks reflect as well as create the insecurities contained within the communities they claim to represent. Terrorist networks cannot create societal and human insecurity from nothing – certainly not to the extent that they can convince members of the community to follow and/or give their lives to the cause the network claims to represent. Thus, they reflect pre-existing human and societal insecurities, but have to constantly re-create the insecurities to ensure that their cause stays alive within the hearts and minds of their potential recruits:

The current war on terrorism, conducted by the United States in response to the terrorist attacks of September 11, 2001, does not address the underlying sense of alienation among the Middle East's unemployed youths, who provide support for terrorist networks. Sustainable human development in the region thus represents the ultimate solution to regional instability and to swelling support for terrorism. Policies pursued by the United States under the administrations of US Presidents Bill Clinton and George Bush adversely impacted regional conditions; even if the countries in the region achieve self-sustainable human development, continued US confrontations with Iraq and support for Israel at the expense of the Palestinians will surely aggravate the underlying conditions for terrorism (Henry 2003: 60).

Former participants in political causes, many of which have been labelled as terrorists, believe such struggles are important and should continue, including Loyola Guzman, former guerrilla fighter who fought with Che Guevara in his last battle, Leila Khaled who fought for the Palestinian cause in the 1970's, and Mairead Farrell, an IRA volunteer (Brunstad 2004). In interviews with incarcerated Middle Eastern terrorists, Jerrold M. Post, Ehud Sprinzak, and Laurita M. Denny (2003: 171) wanted to find out "what makes terrorists and extremist tick." Identity again was a

strong feature in these interviews. The prison experience itself further reified their identity with the group or organizational membership (Post/Sprinzak/Denny 2003: 174). This fusion of personal with social group occurred from the beginning according to the interview data, whereby "the feelings of victimization, of being evicted from their family lands, and the sense of despair concerning their people's destiny ... contributed to the readiness to merge their individual identity with that of the organization in pursuit of their cause. Once recruited, there is a clear fusing of the individual identity and group identity ..." (Post/Sprinzak/Denny 2003: 175). These individuals were able to establish themselves as part of a group that was valued by their social community (Post/Sprinzak/Denny 2003: 176). The status and experience of refugee life exacerbated the desire to enter into an accepted and socially admired group. As one interviewee stated:

I belong to the generation of occupation. My family are refugees from the 1967 war. The war and my refugee status were the seminal events that formed my political consciousness, and provided the incentive for doing all I could to help regain our legitimate rights in our occupied country (Post/Sprinzak/Denny 2003: 182).

There is no doubt that security studies need to account for and address sources of insecurity outside of, or due to, the state, and recognize causes of oppression and alienation. The powerlessness of being on the margins, being oppressed, removed from family origins, and devalued on the basis of identities, both assumed and imposed, was cited as a motivation towards resistance. Armed attacks gave power back to those who felt they had none.

31.4 Discussion and Conclusion

It is an interesting exercise to examine the insecurities of actors who cause insecurities themselves, in this case, individuals who are part of non-dominant communities, and even those who play non-dominant roles within those communities, such as women. By committing a terrorist act, the actors, male and female, move beyond their position of non-dominance in their own community, and seek to actively cause insecurities to other communities. Is human and societal security meant for these individuals? Not if we do not want to examine the social relationships between referents. Individuals and groups do cause threats however, while simultaneously articulating security needs.

Terrorism is one act of violence that can be seen as an imbalance in the relationship to dominance and non-dominance. It is an act connected to hyper-identity. On behalf of the essentialist claim, terrorist acts are committed, and its message is often as alienating to the recipients as the alienation expressed by the terrorists. Essentialism within these groups is necessary, since vague or broadly defined and compound identities do not provide the adequate rallying point (Green 2003: 7). Whether these acts are praised as the work of freedom fighters or condemned as terrorist acts has as much to do with the identity of the observer and her or his relationship to the act and actor as it does with the actor committing the terrorist act itself. Does the observer identify with the dominant or non-dominant group or position?

Figure 31.2: Security Interactions

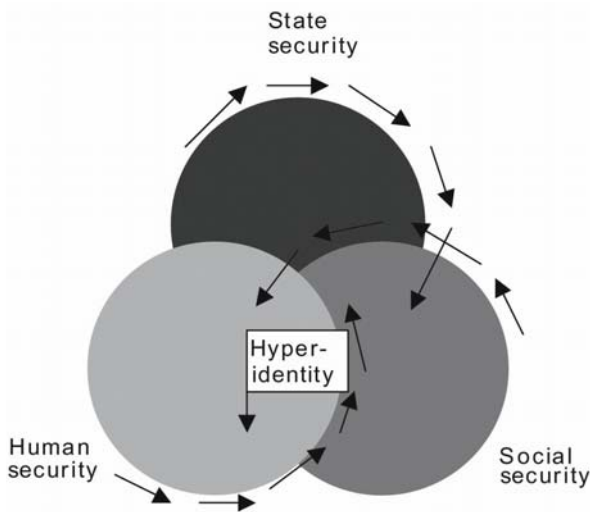

Figure 31.2 attempts to illustrate the relationships between the primary variables discussed. The state security approach revolves from the top-down towards societal security, interacting primarily with societal security (figure 31.1). Societal and human security interact, societal security revolving from the top down, and human security revolving upwards from below. The articulations of these various securities can meet at a point which can lead to the creation of hyper-identity, and provide the ignition point for extremist acts. However, these in/securities are in flux; in this case always revolving. We see the potential for expressions of human and societal insecurities to meet, but they can also revolve away from one another. They can simultaneously express resistance to the dominant discourses (e.g. state) as well as resist each other, particularly human security articulations resisting the

threats imposed by hyper-identity based societal security articulations. In other words, we need to be very aware of all attempts of resistance, acts of human security if you will, emanating from communities (both dominant as well as non-dominant). How aware are state apparatuses of societal and human insecurities and the acts of resistance that respond to these insecurities?

The act of terrorism represents many insecurities (Crelinsten 2002: 78). Can policy reflect the awareness of power dynamics, or is it blind to marginalization and power? There needs to be a juridical response to the act, responding to the crime. But what role has policy played in creating the background for the crime? It would be disadvantageous to create policy that may in fact be bad policy. As Peter Weiss states, “hard cases [such as terrorism] make not only bad law, they also make for bad and dangerous policies” (Weiss 2002: 17). Counter or anti-terrorism policies can lead either to a reduced incidence of terrorism or possibly prevention, or lead to increased incidences: “If counter-terrorism infringes on the rights of too many citizens, spreading the net of targeting too wide, then it risks providing both a justification for terrorism or even revolution, as well as an incentive for recruitment to violent opposition groups” (Crelinsten 2002: 80). The social movement does not justify the violence, but by the same token, the violence does not negate the social movement. In addition to responding to the criminal act, should policy be informed by any other issues or factors, such as responding to the imbalances between dominant and non-dominant groups? Is there a way to avoid or prevent ‘bad policy’?

Security understood on the basis of context and relations of dominance and non-dominance means in large part using security (human/societal) as a measure for a diverse range of policy, from issues of domestic homelessness, poverty and race relations, to issues of intra- and international violent conflict. What it additionally requires however is a constant examination of policy’s own complicity in the creation of dominant discourses, and perpetuating spaces of insecurity which will be ultimately met with resistance (hence, bad policy, and resistance to it). Security policy can not only respond to the threat of terrorism as something that emanates from the ‘other’ and therefore create policies of protection for the potential victims. It must also respond to the insecurities that give rise to the violence in the first place. How have these hyper-identities been created, what has been our role in the creation and reification of dominance that this resistance purports to respond to?

32 Agents of Insecurity in the Andes: Transregional Crime and Strategic Relations

Arlene B. Tickner and Ann C. Mason

32.1 Introduction¹

Current processes of globalization are transforming the world's social and political geography. Many new socio-spatial arrangements are discontinuous with state jurisdictions and increasingly incompatible with the territorial principle of sovereignty (Inayatullah/Blaney 2004; Mason 2005). This spatial reconfiguration is vividly illustrated by the deterritorialization of security in the post-Cold War era. Security domains are not only located above, below, and alongside the territorial state, but they also are intertwined with and superimposed upon other such spaces, presenting a global security matrix at odds with state-centric epistemologies (Walker 1993; Agnew 1994; Brenner 1999). This multiplicity of security sites that characterizes contemporary global order encompasses a wide range of values, actors, and dynamics that transcend the conventional national security model.

Andean security dynamics typify this global security paradigm. Security interdependence, regional overlay, transnational flows, and the prevalence of non-state actors are the defining characteristics of the security landscape in the Andes, making it problematic to analyse security exclusively at the national level. Although it is commonly argued that the Colombian conflict is the vortex of regional insecurity, we find this interpretation to be partial at best (Rabasa/Chalk 2001; Millett 2002). Not only does it obviate the extent to which transnational security geographies have superseded state-based approaches, but it also fails to recognize how the Colombian conflict is both fuelled by and feeds back into transregional activities.

Of particular relevance in the Pan-Andean security context are processes involving transregional dynamics and region-wide networks of actors. The most

acute threats to Andean security are transborder in nature, as epitomized by the movement of drugs and arms that crisscross the region irrespective of political boundaries, and in many cases spill out of the region altogether. Strategic relationships involving both transnational criminal organizations and armed groups operate beyond the control of national governments and manage these illicit trafficking activities.

This chapter looks at the role played by these non-state agents in constructing the threat dimension of an Andean-wide security configuration. We use as a point of departure our transregional framework, which is based on a regional security geography (Tickner/Mason 2003; Mason/Tickner 2006). After specifying this theoretical approach to security we lay out the contours of the model (32.2). The chapter proceeds with a discussion of Andean security (32.3), with particular emphasis on the core security problem of the region, namely illicit flows and networks (32.4). We identify those non-state actors that perpetuate this transregional dynamic, as well as the strategic relations that exist among them (32.5). The text concludes with an analysis of the contributions of the Andean case to current debates on security thinking (32.6)

32.2 Transregional Security Approach

Security has been virtually reconceptualized since the end of the Cold War (Matthews 1989; Buzan 1991; Lipschutz 1995; Buzan/Wæver/de Wilde 1998). This concept has been broadened to include multiple referents, and non-military processes and threats, both of which illustrate how new security principles transcend conventional categories. Most central to new security thinking, however, has been the transformation in security's spatial and territorial context. The most elementary manifestation of this has been the blurring of the internal/external dichotomy that defined previous security studies. Domestic and international domains

1 This paper is part of an ongoing research project on Andean transregional security, financed by the Ford Foundation.

are enmeshed: security risks can be wholly contained at the local level, internal dynamics may become regional, transnational or even global threats and global processes may in turn exacerbate insecurity conditions for certain regions, states or subnational groups. The provision of security has also been globalized. Along with the effacement of the internal/external divide has also come new thinking on the role of the international community in protecting civilian populations and establishing order within state jurisdictions (Walter/Snyder 1999). Security conditions within sovereign states are increasingly considered part of transnational processes and a legitimate concern of a broader global polity.

The deterritorialization of security links up a multiplicity of state and non-state actors at all levels of socio-political activity to form a complex web of interacting dynamics. Indeed, in the Andean context, the defining feature of the security problematic is the existence of region-wide processes that span nation-state boundaries. At the same time, these processes interact with a host of political and socio-economic problems within the region's individual countries. A transregional security approach incorporates both of these dimensions: problems shared by the area's states and societies, and security issues that permeate the regional constellation, and transcend individual state units (Tickner/Mason 2003).

As in most geographic regions, Bolivia, Colombia, Ecuador, Peru, and Venezuela are bound together in part by the similarity of the political, socio-economic, and security difficulties they share. Democratic fragility, institutional weakness, poor articulation between state and society, socio-economic exclusion, and multiple forms of violence are common to all states of the region, even though they may manifest themselves uniquely in each national context (Gutiérrez 2003; Drake/Hershberg 2006; Mason/Tickner 2006).

What most stands out about the current security climate, however, is its intermestic and transborder nature. What we denote as transregionalism involves security logics that diffuse the entire region and the primary agents of which are non-state actors that either operate at the regional level, or whose activities are somehow articulated with regional processes. In the Andean context, the most salient transregional security issue is the illicit trade of drugs and arms, and the networks they produce.

Both the national and regional components of transregionalism are highly interdependent: shared problems are both mutually reinforcing and nurture transregional processes. Regional level dynamics

themselves overlap and exacerbate each other, at the same time that they feed back into domestic developments. For example, the tendency toward institutional weakening and democratic deconsolidation in the Andes has provided fertile ground for burgeoning levels of criminality and the formation of illicit transnational networks. These activities both depend on and deepen corruption at all levels of government, leading to further deterioration of public institutions and practices. In addition to links between the regional and national levels, horizontal interactions, both political and criminal, also take place among a wide variety of non-state actors throughout the region.

The centrality of domestic level problems in transregional security dynamics warrants a brief overview of the most critical issues faced by the five Andean nations. First, each has a persistently mediocre economic record. Not only do they share minimal, and in some cases regressive, growth, but they are marked by persistent poverty, cycles of stagnation, and entrenched inequality. Crushing poverty is a way of life in the Andes, with roughly half the population in Bolivia, Ecuador, Colombia, Peru, and Venezuela living below the poverty line. The regional average of those living in conditions of indigence is approximately 25 per cent (CEPAL 2005). The Andean subsystem also registers the highest levels of inequality in Latin America (Munck 2003; Portes/Hoffman 2003), as indicated by their respective Gini indexes: Bolivia 44.7; Colombia 57.6; Ecuador 43.7; Peru 49.8; and Venezuela 49.1 (United Nations 2005). Both poverty and inequality are highly correlated with rising social discontent and increasing levels of violence and criminality.

Weak administrative and political institutions also aggravate insecurity at the regional level. On the one hand, democracy in the Andes has undergone a marked process of deterioration (Mainwaring/Scully 1995; Gutiérrez 2003). Congressional and party weakening, and excessive strengthening of the executive branch, have seriously undermined democracy's foundations and efficacy. Elected governments have been less than successful at guaranteeing the rule of law, and at protecting basic civil rights and freedoms. Democracy's credibility has been further eroded by deeply entrenched official corruption, which is itself highly correlated with weak government institutions. Indeed, the Andean countries rank among the most corrupt in Latin America and the world, according to the Transparency International Corruption Perceptions Index (2005, figure 32.1).²

Figure 32.1: Transparency International Corruption Perceptions Index 2005. May 2005. **Source:** <http://www.transparency.org/cpi/2005/cpi2005_infocus.html#worldmap>. Prof. Dr J. Graf Lambsdorff of the University of Passau produced the CPI table. See: <www.transparency.org/surveys/#cpi> or: <www.icgg.org>.

In addition, Andean countries all receive low marks for their empirical attributes of statehood: the exercise of exclusive authority over territory and populations, the provision of essential public goods, and sufficient coercive power to maintain order and extract resources. Vast areas of national territory are devoid of state presence and administrative infrastructure, giving rise to illegality as well as privatized systems of conflict resolution, security, and justice. Armed insurgencies, violent social movements, criminal organizations, and common delinquency are part of the landscape in all Andean countries, and to a large degree beyond effective government control.

32.3 Andean Security Scenario

Today, the Andean region is commonly viewed as the epicentre of hemispheric instability, attributable to two primary factors. First, it is reduced to the above-mentioned domestic political, institutional, and socio-

economic factors (Council on Foreign Relations 2004; Shifter 2004). Secondly, regional turmoil is associated with the Colombian armed conflict and its 'spill over' effects. Admittedly, with the exception of Colombia's high profile war, there are few acute security problems in or between the other countries of the region. Peru and Ecuador's territorial dispute continues to simmer, following the 1995 armed confrontation. Colombia and Venezuela also have longstanding border disagreements that predate the current Colombian internal conflict. Likewise, the externalities produced by Colombia's internal conflict have led to increasing tensions with neighbours.

Contrary to this reading, however, we argue that there are important region-wide security dynamics that have been crowded out by excessive concentration upon the Colombian conflict and by failure to take into account its regional dimension. Many of the most visible risks to Andean security neither originate within, nor are confined to, a single national territory. Indeed, the second dimension of our transregional model consists of security processes that, while highly associated with internal instability, are more transnational than domestic in nature. Drugs and arms, and the violence and criminality they spawn, crisscross the region irrespective of national boundaries. At the same time, the illegal groups that control these activities form transnational alliances both within the re-

2 On a scale from zero (highly corrupt) to ten (highly clean), in 2005 Peru was classified with a 3.5 corruption index, placing it 65th out of 159 on the country rank. Colombia at 4.0 was ranked 55th, Venezuela at 2.3 was ranked 130th; and both Ecuador and Bolivia were classified 2.5, coming both in 117th.

gion and in conjunction with hemispheric and global organizations. To the extent that Colombian armed groups participate in illicit arms and drug trafficking activities, operate in neighbouring territories and form political relationships with non-Colombian actors, this conflict also takes on an explicitly regional component. Although Colombia's internal conflict clearly generates security externalities, as will be discussed subsequently, the war itself is enmeshed with complex regional and global processes. For example, global drug markets provide a major source of funding for the conflict's primary players, and in turn finance the acquisition of illegal arms. These transactions occur within complex transnational criminal associations inside and at the edges of the Andean region, which are also involved in global financial, criminal, and even terrorist networks. Indeed, seen from this perspective, Colombia's war is more international than normally assumed, actively involving dense trans-border networks composed of an array of global actors (Mason 2003).

32.4 Transnational Criminal Flows and Networks

Transformations in the global political economy have significantly altered the spaces in which illegal activities take place. Namely, the high mobility and volume of goods, people and money, the speed of communication and travel, and the porousness of national borders have facilitated the expansion and consolidation of illicit networks around the world (Van Schendel/Abraham 2006; Williams 1998: 250). Transnational criminal organizations related to the drug trade alone have amassed tremendous amounts of power due to the lucrative nature of the business. According to the 2005 World Drug Report of the United Nations Office on Drugs and Crime (UNODOC 2005), the global narcotics market generates earnings of approximately US\$ 320 billion per year, and the size of this trade is larger than the GDP of 88 per cent of the world's nations. Drug income is used to influence the political and economic system in those countries in which transnational organizations operate, primarily to keep in check initiatives that seek to restrict illegal activities. Transnational crime particularly targets third world states as venues for their operations due to the fact that weaker countries are not only more vulnerable to corrupting influences but also are less able to combat organized criminal activities effectively (Lee 1999; Serrano 2000).

Not surprisingly, criminal flows and networks pervade the Andean region. A major portion of the global cultivation, processing, and trafficking of cocaine (and to a lesser extent, heroin) is concentrated in the Andes. A traditional crop cultivated and ingested in Bolivia and Peru, by the 1980's coca took on a global dimension as cocaine consumption skyrocketed in the United States and Europe (Tokatlian 1995; Clawson/Lee 1996). An informal division of labour emerged in the Andean region in which Peru and Bolivia provided the raw material which was then processed and exported by Colombian drug cartels. All countries came to be involved in the diverse array of activities that make up the cocaine chain of production, including coca leaf cultivation, coca paste transportation, chemical processing, transshipment, distribution, and money laundering.

This production structure changed dramatically in the 1990's as coca cultivation shifted to Colombia, in large measure due to successful eradication campaigns and aerial interdiction operations in Peru and Bolivia. Developments in Colombia also played a role in the regional reshuffling of the drug business. The demise of the Cali and Medellín cartels in the middle of the decade opened up a power vacuum which was rapidly filled not only by micro cartels, but more relevant for our discussion, by Colombian armed actors. The fragmentation of centralized management had regional implications as well, as different criminal actors throughout the Andes and the rest of the hemisphere assumed control over key aspects of the trade (Lee 2004). With Colombia producing over 80 per cent of the cocaine sold on the global market, and Brazil, Ecuador, Panama, Peru, and Venezuela operating as transit routes for the illegal passage of chemical precursors, cocaine and heroin, and currency, the entire region has emerged as a key site of this transnational network.

Parallel to drug trafficking, the illegal arms trade constitutes another dimension of transregional illicit flows in the Andes. Although it has been fuelled primarily by insurgent-related activities in Colombia, it also furnishes weapons to common criminal organizations throughout the region, creating complex associations that incorporate a wide variety of agents in highly interdependent, multi-dimensional relations. The principal transit routes for arms entering the region are Central America, particularly Panama, Venezuela, Ecuador, Brazil, and Suriname (Cragin/Hoffman 2003). Many of these weapons, stockpiles from the Cold War, originate in Central America, the ex-Soviet republics, and Eastern Europe. Commercial arms

from the United States and Europe also end up on the black market and are channelled into the region. The arms trafficked throughout the Andes include pistols, semi-automatic weapons, sub-machine guns, assault rifles, rockets, mortars, grenades, and ground-to-air missiles.³

The arms trade is highly articulated with drug trafficking. In large measure, this is due to the fact that both arms and drug dealers make use of the same transit routes (Cragin/ Hoffman 2003). Increasingly, however, these commodities also form part of an integrated black market, as criminal groups traffic in both arms and drugs. The enmeshment of drugs and arms networks has been deepened as arms-for-drugs swaps become more commonplace. These complex barter arrangements are made up of countless regional and extra regional participants.

Although Colombia epitomizes this dynamic, Brazil also offers a striking example of how drug and arms flows and networks interact. In addition to being a major cocaine distribution and transshipment area for drugs sent to Europe, the virtual absence of the state in the Amazon has converted this part of Brazil into a haven for criminal activities. The country's role in the drug traffic chain has also allowed for the emergence of drug gangs that control the *favelas* of cities such as Rio de Janeiro and São Paulo (Leeds 1996; Bagley 2003). The transposing of drug- and arms-related transactions has allowed favela-based groups to increase both the scope of their operations and their relative power (Leeds 1996; Martins 2005). In addition to aggravating existing levels of violence in the favelas, drug-related corruption in Brazil has skyrocketed, while parallel power and security patterns have emerged in areas controlled by criminal organizations.

32.5 Non-state Agents of Insecurity in the Andes

Although illicit flows and networks of drugs and arms draw in a wide array of state and non-state actors throughout the Andean region, the Colombian conflict and its participants are the centre of gravity for these dynamics. As the principal actors in Colombia's internal war, the *Revolutionary Armed Forces of Colombia* (FARC) and *United Self-Defence Forces of Colombia* (AUC) have also emerged as key agents of

transregional insecurity. Proponents of the spill-over thesis rightly stress that illegal armed activities have led to a marked deterioration in public order in border zones with neighbouring countries (Millett 2002). However, it is Colombian armed groups' involvement in illicit transactions and relationships that is the driving force behind the transregional facet of Andean insecurity.

Established in the 1960's as a self-defence organization in response to a period of countrywide violence, the FARC is the most important insurgent movement in Colombia today. Following a strategy of military growth and territorial expansion that began in the 1980's, at present, the group has as many as 18,000 members and operates in 40–60 per cent of Colombian national territory. The growth of private right-wing self-defence groups coincided with the expansion of the drug trade in Colombia during the 1980's. These private armies, originally financed by the Medellín and Cali cartels to defend their landholdings from the guerrillas, evolved into independent organizations with offensive strategies and autonomous political aspirations. In 1997, the AUC was created as an umbrella organization to join disparate paramilitary groups operating throughout Colombia. The group is present in at least 35 per cent of the country and has approximately 13,500 members⁴.

In conjunction with a multiplicity of smaller, independent criminal organizations, both the FARC and the AUC are central actors in the region's drug and arms trade. The AUC's criminal origins are such that they have always been involved in drug-related activities. However, upon stepping into the void left by the dismantling of the Medellín and Cali cartels, paramilitaries won control over trafficking operations that offered a crucial source of income for their rapidly expanding movement (Romero 2004). In 1982, the FARC leadership's approval of illegal taxation of the cocaine industry as a legitimate means of financing its revolutionary agenda also contributed to the transformation of the political economy of the Colombian conflict (Richani 2002). During the 1990's, the country experienced an explosion in domestic coca production. Between the mid-1980's and the early 2000's, coca cultivation mushroomed nearly tenfold, and drug-related activities became a key source of income

3 Confidential authors' interview for Andean transregional security project, Bogotá, August 2005.

4 In July 2003, the government and the paramilitaries signed a settlement whereby the AUC agreed to demobilize its forces gradually and lay down its weapons by the end of 2005. As of December of that year, over 20 AUC groups had demobilized.

for both the AUC and the FARC. Initially involved in production, processing, transportation, and taxation, the FARC had diversified into trafficking by the early 2000's. The AUC, for its part, is estimated to directly manage 40 per cent of the trafficking business (Romero 2004). Territorial wars between the AUC and the FARC to control regions dominated by coca cultivation and transit routes are a key feature of the Colombian conflict, although there are increasing incidents of pragmatic, strategic cooperation between them in narcotics operations.⁵

Dependence upon the drug business as a source of income for financing their operations and arms acquisitions has inserted both the AUC and the FARC into a web of criminal networks throughout the Andes and beyond. Although most of the cocaine consumed in the United States and Europe originates in Colombia, it is nearly always channelled through multiple nodes located within the network. Latin American organizations that traffic in drugs and/or arms are located in Peru, Bolivia, Ecuador, Brazil, Venezuela, Chile, and Mexico.

Brazilian drug lord Luiz Fernando Da Costa (alias Fernandinho) ran a vast crime ring that engaged in systematic cocaine-arms transactions with the 16th Front of the FARC in southern Colombia. Following Fernandinho's 2001 capture, new criminal elements replaced him. Since the late 1980's, Mexican drug cartels have maintained alliances with different Colombian actors in order to channel drugs into the United States. In addition to this intermediary role, increasingly drug traffickers from Mexico operate in Peruvian territory and control the Pacific Ocean transit routes (Soberón 2005: 236–237). In Central America, another key transshipment point for drugs leaving the Andean region, drug trafficking organizations that operate in Guatemala and the Mara Salvatrucha gang, based mainly in El Salvador, also maintain direct relations with Colombian actors.

Guerrilla and paramilitary operations in un-governed frontier regions and their unhampered movement across all of Colombia's international borders facilitate such interactions (International Crisis Group 2003a). In the Venezuelan and Ecuadorian border zones, for example, Colombian armed actors maintain routine relationships with local criminal organizations. Likewise, Colombian insurgents move freely in the Darien region of Panama. This situation provides a permissive environment for illegal drugs

and arms transactions as well as a variety of other criminal activities, including kidnapping, extortion, and smuggling.

Corrupt government officials also commonly permit and/or participate in these illegal transactions. Although official figures are not available, arms, munitions, and explosives belonging to the armed forces of Ecuador and Venezuela have been confiscated periodically from illegal Colombian armed actors. In mid-2002, it was also revealed that a year earlier the AUC had received a shipment of 3,000 AK-47 rifles and 2.5 million rounds of ammunition left over from Nicaraguan government stocks. With the assistance of a private Guatemalan arms dealer, the Nicaraguan National Police sold the rifles to an Israeli arms dealer who purportedly represented the Panamanian National Police. Once the arms ended up in the hands of the AUC, it was determined that the Nicaraguan Police had been suspiciously lax in complying with established international norms regulating arms transactions (Schroeder 2004).

Criminal organizations that operate on all five continents are also directly or indirectly involved in illegal trafficking networks based out of the Andes. The mafias in Russia and the former Soviet Republics, Eastern Europe, China, Korea, Japan, Israel, Nigeria, and Italy, among others, are known to maintain a presence in the region, and have direct and indirect relationships with Andean illegal groups.⁶ Arms left over from the Cold War era are routinely trafficked on world markets, with the ex-Soviet Republics being one of the primary sources of illegal arms that end up in the hands of Colombian non-state actors. Likewise, many of these same criminal organizations trade in cocaine that originates in Colombia and is trafficked by regional criminal gangs out of the region.

The now infamous Peruvian-Jordanian arms scandal of 2000 vividly illustrates both the global scope of these networks, as well as the linkages that illicit flows build between distinct legal and illegal actors (Schroeder 2004; Bagley 2004). This case involved corrupt officials from the Jordanian government, European arms traffickers, the Russian mafia and corrupt military officials, the FARC, Brazilian drug lord Luiz Fernando Da Costa (alias Fernandinho), and Peru's National Intelligence Director Vladimiro Montesinos. In mid-2000 it was discovered that since 1999 approximately 10,000 AK-47 rifles had been delivered to the FARC in Colombia in four separate shipments.

5 Confidential authors' interview for Andean transregional security project, Bogotá, December 2005.

6 Confidential authors' interview for Andean transregional security project, Bogotá, in October 2005.

These weapons were collected in Russia and the Ukraine and shipped by air from several geographic sites. In Jordan, utilized for refuelling on both routes, corrupt governmental officials were bribed with cocaine. The weapons entered the Western Hemisphere via Trinidad and Tobago and Suriname, and were thrown by air into southern Colombian territory. Following the delivery of the weapons, the planes landed in the vicinity of Iquitos, Peru, to refuel and load up with cocaine provided by the FARC in exchange for the arms (Cragin/Hoffman 2003; Bagley 2003; Schroeder 2004). While Fernandinho played a key role as intermediary in these transactions (Bagley 2003: 124-126), Montesinos provided legal cover by purchasing the arms in the name of the Peruvian military, and then permitting them to be rerouted to the FARC.

Instrumental criminal relations are perhaps the most obvious type of association maintained among the Andean region's illicit non-state actors that bypass state controls and generate insecurity. However, the agenda of the FARC in particular is such that this group also cultivates relationships with regional and global counterparts that are more political than criminal in nature. Such efforts have been geared towards gaining international recognition as well as assuring logistical support.

The FARC has also sought to acquire and disseminate technical expertise and know-how through these ties. For example, Vietnamese military experts and ex-FMLN guerrillas have provided training in Colombia in Special Forces techniques as recently as the late 1990's. The arrest of three representatives of the IRA in Colombia in August 2001, two of them experts in urban warfare training and explosives, revealed that between 1998 and that year this group too had trained FARC members. Subsequent military actions made explicit use of this newly gained knowledge. Palestinians have also visited FARC bases for the purpose of providing technical expertise in bomb design. To a lesser extent, the FARC are also believed to engage in knowledge-sharing with other likeminded organizations in the region. The Colombian guerrilla movement is reported to provide tactical assistance to the Peruvian Sendero Luminoso organization.⁷ The high-profile 2004 kidnapping of the daughter of ex-Paraguayan president Raúl Cubas was also widely believed to have been carried out with FARC training.

In addition to links with non-state agents, the FARC maintains informal relationships with regional state actors, particularly in Venezuela and Ecuador. Although neither government provides direct material support, members of the military forces and government officials in each have extra-officially provided sanctuary and freedom of movement within these countries (International Crisis Group 2003). In what turned into a bilateral diplomatic row, in early 2005 a high-level FARC leader was discovered to have been living openly in Venezuela with governmental complacency in spite of an international arrest warrant. The Ecuadorian government, for its part, maintains an unofficial *laissez-faire* policy toward the FARC and its longstanding presence in Ecuadorian national territory.

32.6 Conclusions

In the Andes, the existence of transregional processes linking up distinct actors, problems, and spaces in relational and interdependent ways suggests to us the possibility of a new security cartography. Not only is the Andean security problematic far more than the sum of five domestic situations, but it is also a highly fluid and changing scenario that is not synchronized with a static, territorial map of the region.

The principal transregional security dynamics in the Andes contradict a standard geographical representation in two aspects. First, the primary risks posed to regional security transcend national spaces. As discussed previously, while all the countries share a series of domestic problems, the primordial motor of Andean security is processes that cannot be reduced to the state level. Arms and drug trafficking, by their very nature, are transnational in scope. Although illicit flows may not adhere to the entire region uniformly, the ways in which they traverse and transcend national territories underscore the extent to which alternative security sites have replaced the traditional state paradigm.

Second, these dynamics involve a diverse array of sub-state, transnational, and global actors. While the FARC, the AUC, and other criminal organizations in the region are the principal agents of insecurity in the Andes, extra regional non-state actors are also increasingly a part of the Andean security matrix. Brazilian drug lords and the Russian mafia, for example, can be considered important players in the Andean security game in that their activities link up with regional processes and actors. Indeed, illicit drug and

⁷ Confidential authors' interview for Andean transregional security project, Bogotá, December 2005.

arms flows not only involve non-Andean actors, but also spill out of the region altogether, highlighting the disconnect between the Andean region in its conventional usage and our call for a transregional approach to the area's security problems.

Both features of our transregional security framework – non-state actors and transnational processes – not only establish new parameters for thinking about security in this specific region, but may also provide insights into the use of alternative security cartographies. Remapping geographic spaces according to specific security interactions, threats, and processes is an interesting heuristic device for theorists and policy-makers alike. Such exercises would provide important empirical foundations for illustrating contemporary conceptualizations of global security.

Perhaps more importantly, the policy implications of transregional thinking are potentially significant. Visual imaging of transnational security processes should impress upon policy-makers the importance of multilateral solutions to problems that necessarily extend beyond the state. Notwithstanding the abundance of evidence that the most critical security problems in the Andes are region-wide, regional security cooperation has been in short supply. To date, the region's nations have adhered to a narrow, uncoordinated public policy agenda in their efforts to combat drug and arms trafficking, and transnational crime. Not surprisingly, these strategies have been less than successful in making headway against such problems. This disjuncture reflects the contradiction between a global political order based upon the territorial state and security dynamics that are largely deterritorialized in nature. While certain world regions have evolved toward a more multilateral scheme in which global governance mechanisms are prevalent, the Andean region continues to adhere to a traditional state-based structure which is particularly ill-suited to address the transnational security threats that pose the greatest risks to regional stability.

33 Re-conceptualizing Security Research with Individual Level Data

Jacek Kugler

33.1 Introduction

A half-century ago Kenneth Organski proposed that in the hierarchy of nations, a balance of power among dissatisfied challengers is the precondition for global war (Organski 1958). To support this 'Power Transition' proposal he used a *single* point of evidence: the relative gross output of Prussia and France prior to the 1870 conflict. The discovery that a balance in overall capabilities led to war was path breaking and challenged the prevailing theory that a balance among major contenders leads to peace. What made Organski's claim unusual is that, instead of asserting this relation and relying on previous authority for support, he provided evidence to sustain his contention that nations wage serious war when there is a power transition.

Organski's insight is remembered today because the propositions advanced have since been empirically supported, expanded, and generalized (Organski/Kugler 1980; Kugler/Lemke 1996; Tammen/Kugler/Lemke/Stam III/Abdollahian/Alsharabati/Efird/Organski 2000; Lemke 2002). Numerous replications and extensions now show that major powers wage severe war when their capabilities are at parity, their preferences diverge, and alliance commitments are weak. The policy implications of these arguments have been explored for the coming transition by Asian nations led by China and India (Tammen/Kugler/Lemke/Stam III/Abdollahian/Alsharabati/Efird/Organski 2000; Kim 2002). These arguments have been formalized and extended to conflicts among minor nations (Lemke 2002; Efird/Kugler/Genna 2003). We now know that Organski overreached when he implied that serious war is *always* waged even when the rare power parity conditions are present, but we also now know that when a balance of power is reached serious war is likely. Major wars are waged only when contending parties fundamentally disagree about the rules that ensure a *status quo* in world politics but do not when

they agree on fundamental principles (Werner/Kugler 1996).

Consider recent evidence. Britain was overtaken by the United States in the later part of the 19th century and, despite past conflicts, accepted and supported the transfer of leadership to the United States. British policy created the 'special relationship' that still binds these two powers. At the same time, however, Britain failed to find an accommodation with the rising German state after the 1870 unification. When these nations reached power parity they waged two devastating World Wars to determine who would dominate world politics. In the end both failed. The United States and the USSR emerged as the dominant powers following World War II. This case is excellent because it is now clear that the mere overtaking of Britain by Germany did not cause the two World Wars. Following World War II the recovery and unification of Germany led to the cooperation between Germany, France, Italy, and England. The European Union is peaceful because member nations agree on the status quo and support it.

The concern with power transitions did not stop with the settlement of disputes within Europe. Today the rise of China and India forecasts the possibility of a confrontation with the United States and the Western World. Mearsheimer (2001) for example, disregarding the more current empirical literature on power transition adopting the early parity argument made by Organski (1958), forecasts an inevitable confrontation between the United States and China as the latter overtakes the United States and achieves dominance during this century. The "tragedy of the great powers" presumably leads anarchical nations to seek preponderance, and immolate each other in the process.

The empirical studies of power transition supported by evidence differ from this apocalyptic prediction (Kugler/Tammen 2004). Power overtakings are as dangerous as they are inevitable. These rare conditions set the necessary but not sufficient condi-

tions for major wars to erupt among contending powers. However, and this is a big however, in order to generate a major conflict nations must be dissatisfied with the rules and norms that regulate world politics.

A conflict between China or India and the United States as the Asian giants emerge from the shadows of underdevelopment is far from inevitable. Rather, it is the behaviour of national decision makers in each of the contender nations that will determine if they are satisfied or dissatisfied with the rules and norms governing world politics. If during the overtaking period a pair of these nations sees each other as devastating competitors whose presence impedes their progress - major war - that today includes nuclear exchanges - cannot be excluded. If on the other hand these nations join - as did Europe in the EU - in stable arrangements that provide legal means to resolve disputes, the preservation of peace is likely (Tammen/Kugler/Lemke/Stam III/Abdollahian/Alsharabati/Efird/Organski 2000).

Why do I contend that the new transition perspective is superior to the previous well-established principles of a balance of power or more recent plausible arguments about the tragedy of great power? The simple answer is that the empirical record supports the conditional inferences made by power transition. Clearly empirical correlations do not imply causation. Relying on flimsy ground may be dangerous as the consequences of another World War could be devastating for humanity.

Reason for optimism rises because the transition patterns proposed by Organski that relate power parity and dissatisfaction to severe conflict have been formally deduced from a number of perspectives. Using game theory, expected utility, and most recently structural equations and dynamic stakeholder models, the conditions for conflict and cooperation have been identified and found consistent with the original transition logic at the conventional and nuclear level. Similar patterns have emerged at the conventional and the nuclear levels (Kugler/Zagare 1987; Bueno de Mesquita/Lalman 1992; Zagare/Kilgour 2001; Abdollahian 1996; Alsharabati 1997). Our state of research is not such as to declare power transition as the theory of major war, but it is now a major contender because of the multiple support from inductive persuasiveness, deductive consistency, and empirical support.

The point I wish to make is that powerful insight based on strong logic can - even with a single point - produce theoretical insights that when tested exten-

sively can challenge and overtake previous entrenched paradigmatic propositions. The insights gained from single case studies or a few observations are, of course, simply preconditions to knowledge. Only after the patterns are formalized and corroborated by empirical replications can we argue that, given our knowledge at a point in time, the underlying propositions are robust and their results may be used to generalize and explain the underlying phenomenon. Falsification always looms large, but policy recommendations based on theoretically and empirically grounded propositions may then be useful additions to the decision maker's common-sense analysis.

To achieve these goals we must have effective models for the phenomena under considerations, agree on testing and data collections procedures, and provide clear guidelines for future replication and validation of results. I start with data collection because a frequently undervalued effort is the key to growth as a discipline.

33.2 Data Construction

Attaining useful theoretical propositions, therefore, requires replication - and replication requires effective data collection. This is no easy task. In academia, intellectual rewards are still much higher for theoretical innovation than replication, or empirical testing and certainly data collection. Thus, much effort is devoted to formulating alternate theoretical perspectives, paradigms, or programmes that may be used to explain a given phenomenon. Proportionally much less time and effort is devoted to construct reliable and valid indicators that can substantiate or reject these theoretical formulations. In my view this equation should be rectified, for discovery is the sum of both.

Einstein was a superb theorist who in a brilliant few years restated the rules governing our physical environment in relative terms. His ideas are now well known, if not yet fully understood.¹ Empirical support for his main theoretical propositions came only grudgingly. It took decades before predictions about time and space distortions were confirmed by observing minute disparities in the position of a star during a solar eclipse. Few outside of the close net community of physicists know the names of the observers

1 For extensive commentary on Einstein's work and access to archived materials, see the online official archive available from <<http://www.albert-einstein.org>>.

whose critical experiments address Einstein's theory. Even fewer know the identity of the designers of instruments that generated these observations. We all know however that the results supported Einstein's theoretical predictions. Yet, without that evidence Einstein's insights would be relegated to plausible science fiction - and would still be passionately debated only among physicists.

My point is that without external empirical verification, even superb insights are mere precursors to knowledge. As a field matures many intelligent alternatives emerge to account for the same phenomenon, and most are plausible but simply wrong. In physics, string theory, for example, is theoretically persuasive but empirically untested. Schwarz and Green calculations show that a single equation could explain all the forces of nature and connect all the laws of physics - the proverbial 'theory of everything' (Green/Schwarz/Witten 1987). After 20 years of formal development, few physicists question the theoretical elegance of string theory. Yet, the acceptance of string logic is delayed because plausible experiments based on observable variations have not been devised. The insights advanced cannot be supported or rejected. Meanwhile, theorists have produced over twenty internally consistent formal variants that await empirical tests that could corroborate the insights of any given version of string theory. Given this empirical deficiency string theory must, for the time being, adjust to the status of science fiction. In our field the development of formal models of deterrence have similar limitations since the anticipated event has only, mercifully, occurred once when the nuclear warheads deployed were far different and far fewer than those held in current arsenals of the nuclear nations (Tammen/Kugler/Lemke/StamII/Abdollahian/Alsharabati/Efird/Organski 2000).

World politics, unlike physics, has suffered because of the failure to demand critical tests to support or reject alternate propositions. For that reason - among others - a vast number of theoretical perspectives still compete to account for similar phenomena. Very seldom are empirics used to distinguish between proposed alternate propositions - and when this is done the 'rejected' proposition challenges the measures or even dismisses the notion of falsification outright. It is not difficult to demonstrate, as Waltz argued to create the basis for balance of power theory, for example, that under anarchy where the difference between war and peace is measured in costs, a pair of nations preserves peace when a balance of power is achieved because costs are

high. This fundamental deduction is far more explicitly at the heart of classical nuclear deterrence. Consider: This simple argument is at the core of deterrence and Mutual Assured Destruction (MAD) that assures devastating retaliation against a nuclear attack. As the costs of war increase, the likelihood of war decreases. Since nuclear weapons are devastating, as more are deployed the costs of war also increases. Thus, the deployment and proliferation of nuclear weapons reduces the likelihood of war (Waltz 1981; Intriligator/Brito 1981; Bueno de Mesquita/Riker 1982).

There is ample evidence that this attractive deduction is inconsistent with empirical reality. All devastating wars of long duration that resulted in immense casualties occurred under power parity. Indeed, the most serious wars in the 20th century, World War I, World War II, and the Iraq-Iran war were all waged when the contenders approached parity - the very condition that the balance of power was most stable and with the advent of nuclear weapons under MAD it is theoretically the ultra-stable condition. Even in anarchy, neither side can afford to initiate an attack in the face of an overwhelming second strike.

Leaders of all nuclear nations seem to agree that deterrence is stable under MAD, but concurrently and inconsistently the same leaders argue that nuclear proliferation must be prevented to preserve peace. Consider the current debate in the Middle East. Preventing proliferation of nuclear weapons to Iran is a major goal shared by Europe and the United States. Yet, it eliminates the possibility of nuclear parity between Iran and Israel, reduces the possibility that MAD can be achieved in that region, and potentially increasing the likelihood of war.

Theory and policy are at odds. The lack of empirical support for the deductions that a balance of power leads to peace is insufficient to dislodge the established proposition from its central hold over the theory of world politics. The logical deduction that MAD leads to peace does not affect demands for nuclear non-proliferation. Indeed, in world politics well-established perspectives seem immune to change and unaffected by logical inconsistencies or empirical flaws. By itself, empirical or logical challenges to existing well-established deductions are insufficient, one must have alternate explanations that account for reality more accurately - as does Power Transition that views MAD as unstable and challenges the virtues of proliferation (Zagare/Kilgour 2001). To provide means of altering the theoretical structure, an agreement on the rules for falsification would improve the

importance and utilization of data resources in the study of world politics.

33.2.1 Empirical Promise

Recall that Organski in the mid 1950's had to rely on a single data point to suggest support for his proposition about the relation between parity and war. This paucity of data has been remedied as data at the national level have proliferated. Richardson (1960a) and Sorokin (1937), Maddison (1995), and Bairoch (1993) are among those giants who pioneered the construction of long-term estimates of economic performance of societies, the level of conflict, and the size and composition of its labour force. Russett (1964), who made a major breakthrough with his early compilation in the *Handbook of Political and Social Indicators*, originally expanded the data collection to a large number of socio-economic indicators. Banks (1993) has continued this tradition. The Freedom House (2000) and Marshall/Jagers (2001) in the Polity project provide measures of democracy along a number of indicators that reflect the structure of societies (Munck/ Verkuilen 2002; Sarkees 2000; Woldendorp/Keman/Budge 1998). Following Richardson (1960a) and Sorokin (1937) the innovative and persistent work by Singer and Small (1963) and Singer (1979) and now with Diehl (1990) on the Correlates of War Project (COW) provides ever-expanding global information for the study of war (Sarkees 2000). The collection and selection of data expanded, ranging from the classical antiquity to the global assessments initiated by Modelski/Thompson (1989) and now Thompson's (1988) regarding global cycles. Furthermore, in recent decades' estimates by the IMF, World Bank, UN, EU and a number of specialized groups like SIPRI now provide very broad coverage across demographic, social, economic, and military indicators. Increasingly these supra-governmental organizations are devoting resources to the collection of information about the political system.

Before we bask in the easy glory of data collection let us consider the difficulty of constructing an appropriate indicator for a well-established concept. The evolution of indicators of power illustrates these difficulties. Most analysts may agree that power is the ability of actor *i* to sway actor *j* to change his/her behaviour. The means to achieve *i*'s ends may range from force to persuasion. Signalling to elicit the change can be explicit or implicit. Actor *i* may be powerful, but unwilling to exercise his/her capability to influence *j*. Conversely, actor *i* may be powerless

but highly motivated and vocal in his/her demands on *j*. Perceptions, risk propensity, trust, importance, and expectation of alliances are all elements that need to be accounted for before one can understand whether actor *i* has the ability to sway actor *j* to change his/her behaviour.

In the early stages of measuring power Raymond Aron (1966) suggested over 30 elements - most very difficult to measure - to approximate the concept of power. One way of dealing with such complexity is to limiting the scope of what is included in power. Following that insight, Knorr (1970) argued that potential and passive power could be distinguished using the level of military mobilization. His active power measure was useful in anticipating success in an ongoing conflict, but failed to anticipate the outcome of wars before they were waged. Singer and Small (1963) realizing that Knorr's conception of power was too simple reverted to the more complex arguments proposed by Aron, but concentrated on elements that could be measured. They chose three components - industrial, demographic, and military - to describe the base components of power. Each component in turn was approximated by two indexes. The National capabilities estimator, the percentages each nation held of the total across nations assuming all indexes were equal. Despite its limitations the COW measure is now a standard estimate of capabilities used in empirical analysis of conflict and cooperation. Of course there are critics. Stall and Ward (1989) explore what the effects are of weighting each index differently and considering alternate operational constructs. Boulding (1962) and Bueno de Mesquita (1981) suggest that controls for distance should be imposed to account for the decline in capabilities across space and time. Lemke (2002) proposed adjustments that include the differential ability of military forces to transverse space across time. Kadera/Sorotkin (2001) argue that a geometric mean is a more effective form to aggregate power. Many of these points are well taken. Clearly the speed that today's airplanes can deliver deadly forces, or missiles can deliver their conventional or nuclear cargos with precision to distant targets, is a fraction of what could be attained in the past. Note that this debate is over capabilities, no longer over power. Fuchs (1965) contends that energy consumption is a far more effective and unobtrusive measure of capabilities. Organski (1958) argues that to capture capabilities one does not need a combination of factors, but the overall product of a society that interactively reflects the size and productivity of populations. This insight was imple-

mented twenty years later and evolved substantially with the development of a measure of relative political capacity that weighted the degree of governmental effectiveness given basic resources and proved to be an effective predictor of war outcomes and economic implementation (Organski/Kugler 1980; Arbetman/Kugler 1997). There is no lack of measures of capabilities. Yet, there is no theoretical consensus that capabilities are captured by the indicators proposed, or that these measures indeed capture the more complex concept of power accurately. Yet the large majority of research on war now uses one of these indicators, and forecasts based on them are increasingly accurate. We should not dismiss the difficulties but improve on existing notions to advance the field.

With the advent of the Internet, the number of specialized collections at the national level has exploded. Searching the web allows increased access to information collected by dedicated researchers following well-defined assessments across the international academic community. Organski would be pleased and overwhelmed by the abundance of data now available to test his propositions. Macro analysis is clearly enhanced by such advances.

Prospects for progress at the micro level are equally bright. Much of the systematic theoretical development in the last few decades has been made at the individual level, but data to support this work has been lacking. Whether the propositions are inductive – as in many electoral theories – or deductive as in actor-based models; the key unit of analysis in the most robust theoretical structures is the individual.

In the electoral field, survey data provides individual level information from which statistical inferences about individual voting preferences can be made. As techniques of analysis have improved the many early inferences have been challenged (as is the case with socialization arguments) and replaced by more formal deductive arguments.

Early inroads were made by survey analysis whose goal was to understand and predict electoral behaviour (Campbell /Converse/Miller/Stokes 1960; Verba/Nie 1987). The measure of their possibly unintended success is that no political leader would be caught today during an electoral campaign without the aid of surveys of attitudes that indicate voter preferences. Candidates pursue such information to determine if positions they selected are compatible with the goal of maximizing voter acquisition. Reliance on survey information has gone far beyond elections. Surveys are now used to market all kind of merchandise, antici-

pate reactions to new products, assess the population's attitudes towards the economy or forecast consumer spending to anticipate monetary adjustments. Random samples of whole and sub populations allow investigations to explore any topic that can be conceptualized.

There are limits. True random samples are difficult to design for specific environments. Distrust between the subject and the interviewer can lead to serious respondent distortion. The respondent unwillingness to contribute a response or avoidance of key questions can affect inferences. Again, a large literature has been developed to overcome such limitations with some success. Moreover, major archives including the Inter-University Consortium for Political and Social Research, and its European counterpart in Cologne, and the private holdings by Gallop or Jankovitz, provide vast access to raw survey data. At the same time commercial surveys are increasingly restricted by those who collected the information in the first place, with respondents becoming increasingly reluctant to answer questions about their behaviour without compensation. These limitations do not negate the fact that data at the individual level has been compiled over the last half century providing a major boost to our understanding of domestic political behaviour and consumer preferences.

Individual data in world politics lags behind. Many scholars have used productive shortcuts. Bueno de Mesquita (1981), for example, provided a pioneering assessment of how wars are waged. Many extended applications of rational choice logic based on individual maximization use national and stakeholder data to accurately anticipate when international crises diffuse or escalate into outright war (Bueno de Mesquita/Lalman 1992). Game theoretical approaches pioneered by Brams (1976) and Zagare and Kilgour (2001) established the contours of deterrence by assuming choices that will be made by decision-makers, but again apply their insights to national decisions. Even data collections provide increasingly voluminous material on events that are sometimes linked to individuals. The promise of future enhancements is very encouraging.

As the use of individual data expands, we may be at the verge of predictive politics. Politics initiatives originate in diverse, multi-disciplinary domains. Predictive politics is the systematic analysis of events that anticipates outcomes affected by policy. This emerging field owes much to Edward O. Wilson's (1998a) notion of *Consilience* – a common groundwork of

Figure 33.1: Predictive Politics. **Source:** Adapted from Strategic Decisions Group (2002)

explanation that crosses all great branches of learning.

The argument is that explanation and prediction need be accurate, timely, specific, non obvious, and applicable. Conceptual means to achieve this objective have varied and are rapidly expanding. Below is a sketchy summary of developments in the last half-century.

The decision theory that has dominated world politics in recent years is but one of the many potential strands that can be used to analyse actor based models. Political science faces the same dilemma that confronts string or deterrence theorists. Actor-based theories require data at the individual level, but frequently available information has been restricted to the national or even at the global level. Comprehensive information about preferences of groups within a nation, or key political stakeholders is rarely available and seldom collected. More importantly, such information is transitory as stakeholders change jobs and policy positions affecting their political influence. This incompatibility between the theoretical demands of actor-based models and the empirical reality that they purport to anticipate hampers progress. Not unlike string or deterrence theorists whose empirical requirements have not been captured by experimental physicists or empirical tests, the data requirements and thus the theoretical promise of actor-based models have not yet been fulfilled.

Advances in technology have improved the ability to collect and compile data compatible with theoretical requirements. As we approach individual responses category, game theoretical, decision theory, and a multitude of new actor-based solutions that

compete for the claim to anticipate individual behaviour can be compared and tested. There are still severe limitations. Many of these limitations can be overcome when the instrument used to obtain individual level data is non-obtrusive. Tracing consumer patterns can be far more effectively achieved by information obtained from credit cards than by information gained by survey interviews. Indeed, electronic tracing of purchasing patterns allows large retail stores, like Wal-Mart, to monitor the price of thousands of commodities and relate minute changes to movement of merchandise. Merchandise price, production, and distribution are now driven to a large degree by purchase counts, not merchandising insight.

In a very different arena battlefield information has been altered by the ability to identify individual soldiers, their location, and activity. In the Iraq or Afghanistan conflict communication is almost instantaneous among units allowing centralized reassignment of support even at the patrol level. Major data collection enterprises like ChoicePoint or Lexis/Nexis obtain individual data across a very large number of indicators political and economic from a variety of sources and compile not only academic but individual level information for analytical use. These data compilers are but the top of a large data iceberg of the future.

It is now possible for the more prosperous nations to acquire information on individual behaviour including political preferences, areas of financial support, expenditure patterns, and individual movement. Satellite data gathering is now providing information of phone communication, financial transfers, disaster

details, troop movements, and trade statistics almost instantaneously. If we put aside for now the very serious concerns with privacy – and they should not be discounted – the availability of such data can potentially open new research horizons far brighter than those open to past generations.

Consider the potential of tools like content analysis that provide means to summarize large amounts of written material. McClelland (1968) and Azar (1970) pioneered the technique to extract systematic information from written material. In its early version this process relied on coders that read selected information and consolidated the material following pre-set rules. The process was laborious. Schrodtt (2000) developed the Kansas Event Data System (KEDS) at the University of Kansas that moved human to machine reading of information. This process aided by scanning technology allowed for far more rapid scrutiny of material. Recent innovations expand machine-reading capabilities exponentially. By connecting each word with a number computers can ‘read’ material in different languages at astonishing speed. Of course major obstacles must still be overcome. The most obvious is that grammar differs across languages, and multiple meanings of similar words can only be extracted from their context. However, we are now capable of analysing individual written communication and of course with the use of satellites, phone, and web electronic transmissions. Thus far what prevented us from analysing these sources was the scope of the inquiry. The massive data already collected still lacks effective tools to summarize and order the information. Even though date extraction is in its infancy, future promise is bright. The communication revolution is in many ways the same as genetic sequencing – once you understood how the sequence could be read, massive unexpected discovery is next.

33.3 Conclusions

What does the future hold? The horizon for a revolutionary expansion of social research is bright. Individual level information is now being acquired. The promise is vast because the most powerful theoretical structures have been developed to account for the behaviour of individuals – but data at that level was always lacking. Despite the promise there are limits to the rewards and major obstacles. First the limited rewards. It is difficult to develop a comprehensive collection and classification of information without well-established theory that drive the inquiry. We are

deficient in theory and this deficiency hampers the specification of concepts. Even after the desired information is identified and gathered, the measures must have a direct link to the concept under scrutiny. This is no minor task.

We have yet to overcome the challenges of data collection at the national level, and as we move to the individual level it will be increasingly difficult to capture impartially human preference. The challenge is to capture real positions, real influence, real trust, real risk and so on, and not the perception of positions attributed to an actor or their assumed influence. I am convinced that the individual’s perception of reality affects their behaviour. Thus, like at the aggregate level when nations are seen as weak – as was the case of North Vietnam at the onset of the war with the United States – actions will be taken because perceptions are distorted. Despite such limitations, much progress has been achieved with less than robust measures. As reliability increases with improved data and the acquisition of aggregate and individual level components expands, I believe our discipline will make a major breakthrough.

Individuals are in the end responsible for the behaviour we attempt to understand in world politics. Yet, only sketchy data about individual preferences, individual interactions are available – and frequently such data is provided after the event has taken place. Aggregate analysis would not have been very helpful in understanding the dynamics of the Cuban Missile Crisis of 1962. Allison (1971) shows that only after the crisis was over the world found out that President Kennedy had two letters, that he decided to overlook the second one, drawing back the blockade to allow ships that may have carried nuclear devices to turn around. President Kennedy took serious risks. A limited blockade could produce serious naval losses but, to achieve his goal of extracting nuclear weapons from Cuba, President Kennedy had to alter existing standard operating procedures on the fly. He succeeded because he was both willing and able to alter precedents to maximize his goals. His actions succeeded. What if they had failed?

His final option was an outright invasion of Cuba. President Kennedy was working under the presupposition that no nuclear devices were already deployed and ready. That presumption was false. Recent disclosures show that that functioning nuclear weapons were deployed in Cuba, that the Russian general in charge had the authority to use them in case of a US invasion, and declared that Mr. Castro supported fully his decision to use them in case of an invasion.

What we do not know is the final choice had the blockade been challenged. Would the US have invaded? Would the Russian general have used nuclear warheads in Cuba? Would the US have retaliated on the USSR? Would the outcome have been different if another President had been in power? Answers to such questions are now mere speculation, but individual level analysis now provides the means to reliably anticipate outcomes.

The promise of individual level analysis is enormous and should change the study of world politics and social science profoundly. The most serious drawback is reliable data on individual preferences, capabilities, and commitment. Satellite feeds could provide detailed information of the movement of commodities, troops, and activities in installations that analysts may wish to explore. Financial transactions could be traced electronically across societies identifying the flow of money that frequently follows resources from legal transactions in the sale of merchandise to illegal transactions of drugs or diamonds. Phone communications could provide mountains of information from business to government to military transactions. Automatic translations combined with content analysis promise to provide summaries of massive information that could be utilized in individual level analysis. For the first time in our history it is possible to conceive of analysis based on the changes in individual preferences rather than aggregate assessments based on national level information that disregard domestic politics and its implications on world politics. With the new tools we hope to anticipate the actions of opponents before they actually take place and forecast actions that may forestall undesirable outcomes and enhance desirable ones.

A major concern is that the new technologies require individual data which are increasingly in the hands of governments or business. In many instances those who collect such information see no advantage in sharing this resource for analytical purposes. Major collections from satellites and communication transfers are classified. Fiscal transactions are confidential. Communication transfers are available to web providers but not to scholars. Much of the data produced by content analysis tracing in great detail policy inter-

actions remains confidential. Satellite information ranging from crop performance to ecological damage is restricted. Increasingly, survey information is used for marketing purposes and is restricted. Even surveys of political preferences now used by electoral analysts to advance a candidate's electoral prospects or to decide on policy options frequently remain the property of the collectors. Because of such restrictions, many questions that are not central to the holders of that information will not be asked or published. A change in rules of data acquisition is needed before we can act intellectually to analyse this new bonanza. Political science could establish the equivalent of the 'Human Genome' project - that has controls but access. We must be cautious. Interference with the right of individuals to maintain a sense of dignity and privacy is a requirement of a free society - yet the lack of analysis of important data deprives us of knowledge, and in the longer run ignorance affects us all.

The revolution that followed the acquisition of reliably aggregate information for economics in the 1950's was matched by similar acquisition in the 1960's in world politics. No longer were researchers like Organski relegated to compare individual points to argue their case, nor were the collections of data to be performed by the researcher himself. It is now time to face the challenging prospects of extending our knowledge with individual level information that matches so much better with our theoretical expectations.

I look forward to this new revolution in world politics. Aggregate indicators still determine the timing and potential impact of international interactions, but these analyses tell very little about the policy decisions to escalate or resolve disputes. Individual level analysis promises to provide us with theoretical structures rather than with analytical means to alter policy outcomes. To achieve these goals we need to devote substantial resources to the construction of empirical measures that can test our theoretical propositions. The next generation will undoubtedly do so and produce major breakthroughs, advancing our understanding of the dynamics of world politics.

34 Quest for International Security: Benefits of Justice *versus* the Trappings of Paranoia

Jean-Marc Coicaud

34.1 Introduction¹

Since 1990 much has happened in international security. Following the collapse of the Soviet Union, the end of the strategic competition between the communist bloc and the West seemed to offer relatively good prospects for international peace. However, as the 1990's went by, expectations of a more gentle time ahead progressively faded away. The multiplication of local conflicts and the millions of civilians killed as a result showed that history was still a 'bloody mess'. During the 2000's, the terrorist attacks and the Bush administration's foreign policy brought back on a grand scale a sense of insecurity.

What do the past fifteen years or so imply for the state of international security, its strengths and weaknesses? How should international security issues be approached in the future? Should the prevailing model be extended, or to be innovative, should a better international security regime be aimed at? These are the questions this chapter examines.

The chapter proceeds in three steps: *first*, it defines security from a generic point of view, as a primary right², and touches upon the difficulties that come with this understanding, especially at the international level. This includes pinpointing the shortcomings of the traditional view and implementation of international security (34.2). *Second*, moving beyond the narrow conception of security, it calls for anchoring international security in the demands of justice³. For such demands, far from being external and marginal to security, are internal and central to it.

While dovetailing the quest for justice and security may seem naïve, at least from a realist perspective, and is certainly a demanding task at the international level, as a whole it helps contain the dangers associated with the loss of legitimacy of the international system and the intertwining of geopolitics and negative passions (34.3). *Third*, the chapter reviews some changes in the attitude of actors as well as in the conception and use of the democratic framework required for tackling the challenge of bridging international justice with security and enhancing the establishment of the international rule of law (34.4).

34.2 Limits of the Prevailing Model of International Security

Security is not simply one of the primary rights. It is the primary right of actors from which all others derive (Rothschild 1995). Short of benefiting from security, actors are impeded in their existence, in their ability to subsist, develop, and flourish. While simplifying the question of security, the primacy of security as a right throws it into a host of difficulties. The problems fall into two main categories: the first category concerns the tension between the 'self' and the 'other', and the question of the beneficiaries of security; the second entails the scope and depth of security requirements. In both categories, order of priority is an issue.

If security is first and foremost about ensuring the ability to sustain oneself, it calls for securing this right in the setting in which one evolves. To be sure, protection from environmental hazards (natural disasters for instance) is becoming increasingly important. But it is

1 This chapter is dedicated to Susie. I thank Jibecke Jönsson and Didier Louvel for their comments.

2 The understanding of security in this chapter departs more from philosophy and political science in general than from the various schools of international relations. For a review of the philosophical roots of the security concept see the chapter by Arends in this volume.

3 Justice is conceived here in connection with recognizing and acting upon the rights with which individuals identify.

still in the social dimension of the actor's existence that achieving security has to be principally pursued. In this regard, the search for security is fundamentally shaped by the 'self' versus 'other' divide, with the other seen as a source of uneasiness, if not a possible threat. The difficulties associated with this divide are threefold. First, where to draw the line between the self and the other, between who is included and who is excluded, and therefore between who is seeking security and who is a (potential or real) source of insecurity? As there is a continuum from the self to the other (it can be argued that, although separate, the self and the other are not only connected but also intertwined), this is not an easy task. Second, how to establish an order of priority among actors whose security is vital and those whose security is not (for example, given the choice to be killed or have my father killed, what choice do I make?), and among actors who are the least threatening and those who are the most? How to best tame the insecurity that may stem from interacting with the other is a third difficulty. From cooperation to conflict there is a whole range of possibilities and combinations.

The other category of problems that springs from the understanding of security as a primary right has to do with security requirements. What is needed to achieve security? Here three issues surface, which engage the very meaning of security. First, is security essentially limited to the protection against physical threats, or does it extend to involve other rights? Is security simply about securing what is required to subsist or does it also include what is needed to live a meaningful (dignity) human existence? And, if this is so, what are these other rights which enter into security? Second, how does one calculate the threshold of scope and depth for security requirement at any given time? Assuming that security calls for a plurality of requirements, a third difficulty is the question of the order of priority among these.

Already extremely complex to address at the local and national level, these challenges take their full impact at the international level. Traditionally, in the international realm the conceptualization and implementation of security has been based on three considerations and the priorities associated with them: the 'we' versus 'them' divide, with priority given to the national community over the international community; the dualism between the state and the individual, with priority given to the former over the latter; and the tendency to dissociate protection against physical threats from 'softer' needs or rights, with priority given to physical protection. This had led the

mainstream understanding of security at the international level to be particularist (or exclusionary), state and defence-driven, with national interest and military concerns at the centre of preoccupations.

Surely, in the aftermath of the Cold War the semi-alternative model of collective security (semi-alternative because it aims to overcome the traditional view of security while resting and building upon it) gained attention. A more human rights-inclined version of security, with the emergence of notions such as human security⁴ and the 'responsibility to protect'⁵, made some headway. Nevertheless, the chronic limitations of the United Nations and of the most progressive aspects of its policies, and the Bush administration's war against terror as a way to address September 11, made things crystal clear. They showed that confrontation and might continue to play a major role in international security.

That such a path achieves security is far from obvious. It is even tempting to think the contrary. It may contain violence for a while, but it does not put an end to it. It invites those actors eager to settle scores to simply be prudent and wait for the right moment to strike. Moreover, since the way "one" approaches the "other" shapes its reaction, a confrontational attitude of "one" is likely to only trigger a similar one in the "other". Interaction is put on a dangerous course where actors rely on arms race and the possibility of pre-emptive attacks for protection. This illustrates perhaps more than anything how security, when narrowly understood, leads to overall insecurity.

This does not mean, however, that we should abandon altogether the traditional conception of international security. Because of the accumulation over time of grievances and tensions among actors, a totally open and defence-free existence would give room for too much vulnerability. A certain level of caution and protection is therefore still a *must* for a sense of security to prevail.

Ultimately we are left with the need to seek a middle ground, keeping the following questions in mind: How to ensure that caution and protection do not end up being captives of paranoia? How to envision

4 See: the special issues of: *Security Dialogue*, 35,3 (September 2004) and, for a comprehensive account of what Human Security entails, see Andrew Mack (2006).

5 The document adopted on 16 September 2005 at the UN World Summit in New York, endorsed the acceptance of collective responsibility to protect civilians against genocide and other crimes against humanity. See the chapter by von Einsiedel, Nitzschke and Chhabra in this volume.

and implement a policy of security that does not undermine itself? The answer lies in grounding the search for security into acknowledging and responding to the demands of justice.

34.3 Justice: Best Guarantee for International Security

What makes acknowledging and responding to the demands of justice so important to the quest for security? It amounts to a simple fact. As Rousseau once said, “(t)he strongest is never strong enough to be always the master, unless he transforms strength into right, and obedience into duty” (Rousseau 1968: 53). For, if an actor feels that the environment in which he/she operates and interacts with others does not reasonably well uphold his/her rights as well as what is right, he/she is likely to feel that he/she does not owe more to other actors, or to the social arrangements and political institutions that preside over their relations, than what prudence commands for his/her own survival. The feeling that hardly anything is owed will deepen if the social and political setting appears to unduly favour others. No “tranquillity of spirit” (Montesquieu 1989: 157), so to speak, can be expected for each and everyone. Not even the powerful are immune from this state of affairs. As power assigns responsibility for the shortcomings (unfairness) of the political and social arrangements, the powerful are prone to be a target of resentment and acts of violence from those who feel cheated by the system. The abusive concentration of power tends to become self-defeating for the power holder(s). Take for example a dictator’s fate: more often than not he ends up being himself the victim of his own rule. As his way of governing encourages people to dispose of him when the possibility arises, he is condemned to be in constant fear for his life. Being on the run in his ‘kingdom’ becomes his reality. In this perspective, it has been said that long before the summer and autumn of 2003, when American troops in their search forced him to go from one hiding place to another, Saddam Hussein, while still the master of Iraq, had made a habit of not sleeping two nights in a row in the same bed.

More specifically, there are four main reasons which suggest that seriously considering the demands of justice strengthens security.

First, as long as their rights are factored in, actors have no vital incentive to not respect the rights of others. The sense of relative contentment that settles in makes it possible for an individual to translate respect

for others’ rights into a duty-bound feeling and, in turn, helps others to feel equally duty-bound towards his or her rights. The mutual dependency associated with the intertwining of rights and duties creates a social dynamics of cooperation, i.e. of cooperative solidarity among actors which is essential to the structure and climate of security.

Second, the sense of predictability that a functioning system of rights and duties brings about fortifies security in two ways. It minimizes the feeling of uncertainty and the worries associated with it, which often push people to think and act in pre-emptive ways vis-à-vis possible threats and heighten insecurity. In addition, predictability, by creating confidence, enhances security. When people know what to expect from interactions with others in normal but also extraordinary circumstances (such as when a crime has been committed and is assured to be followed by prosecution and punishment), faith in the system reinforces it as well as the security that it provides.

Taking into account the demands of justice supports security in a *third* way: by moving people away from a victim mentality and culture, it helps to avoid the collapse of the societal and individual fabrics and the insecurity that can accompany it. When injustice is perceived as systemic, the social organization of society and the political institutions that guarantee it loose legitimacy. In the process, it is also their control over people’s spirit and behaviour which disintegrates. The end result is a decriminalization of crime that is apt to generalize insecurity. At the societal level, the loss of social and political legitimacy blurs the normative line between what is permitted and what is not, between what is a crime and what is not, and undercuts the power to enforce it. ‘Anything goes’ emerges as a distinct possibility, spreading to all sectors of society and life. This is reinforced by and gets particularly damaging at the individual level. Having grievances and no recognized mechanisms to address them and be vindicated can lead one to develop a permanent victim identity, with the risk down the road to adopt perpetrator behaviour. By offering reparations, a functioning system of justice (in a functioning society) allows victims to, as much as possible, isolate their grievances and unlock themselves from them, reconcile with themselves and their environment, and be at peace with themselves and the world. In removing the sense of victimization, justice has the empowering effect of enabling the past to be left behind, retaking possession of one’s life, and becoming an active agent again while freeing oneself from the (self)-destructive danger of turning violent outwards.

By contrast, not taking care of, let alone healing, the wounds, disconnects the victims from themselves, which usually translates into a diminished empathy for others. At times what follows is more than a simple desire for revenge; it is a spirit of resentment. Colouring in pathological terms the interpretation of reality as a whole, such spirit induces to have people lashing out against who is viewed as the never condemned guilty party and opens also the gate to broader targets.⁶ The terrorized can very well become a terrorist. When this has become the prevailing climate, when victimization has proliferated to the point of being the defining character of a society and its members, victim and perpetrator come to collide, widening and deepening the trauma even further (Bauman 2000: 236–237). Insecurity (physical as well as psychological) turns into a morbid way of life.

Fourthly, considering the various benefits that they get from a justice-minded society, people tend to have much to lose if it unravels. By the same token, the more vested interests they have in satisfying the demands of justice, the less society is challenged in a negative way at the systemic level, and the more the security that it offers is strengthened. For this to happen calls for making a justice-minded society a work-in-progress, that is to say one which, among other things, is open to adopt and adapt to changes when enough individuals identify with them. As people are prone to stick to the *status quo*, especially if it is to their profit, this is not something that comes easily.⁷ At the same time, there is more security to be achieved in accepting the instability that comes from embracing change than in hanging on to an order out-run by reality (Coicaud 2001).

This being said, it is more difficult to establish a bridge between justice and security, and therefore to secure security at the international level than it is at the national level. But due to the fact that with this greater difficulty comes greater insecurity, it is all the more imperative to try to do so.

The deep sense of disconnect between the search for security and the pursuit of justice at the global level, and the problems associated with it, spring from the national bent, from the national tendencies, of international life (Coicaud 2007: chapter 3). Indeed, international socialization is shaped by and around national society. This bent limits fundamentally the projection (in conceptual and practical terms) of justice and security at the global level. The wall built be-

tween the national and the international realm leads to dissociating security from justice, favouring the former over the latter. In the process it encourages an exclusive and confrontational approach to international security. Hence the realist logic of pursuing security independently from justice by paying more attention to defence and military needs (to defend oneself from the outside) than to the inclusive demands of global justice.

Multilateralism seeks to tame the divide and order of priority between the national and international realms and the effects that they have on the capacity to bridge security with justice. Nevertheless it far from eliminates these problems. In the multilateral context states tend to find more good reasons to pursue narrowly their interest than to cooperate for the public good. The result is a marginalization of the United Nations. As such, it is left to being only a weak global justice provider. This weakness is illustrated by the relatively poor track record of the UN in human rights protection on the ground. As states remain focused on their narrow national interests and concerns, the United Nations, more often than not, fails to convince them of the benefits associated with the global public good, including the global protection of human rights. Another consequence is the inability of the UN to provide global security. For in this area too, historically the attitude of the United Nations has been more the one of a bystander than the one of an

6 Revenge and resentment, although connected at some level, are not identical.

7 In his theory of justice, John Rawls tries to solve part of this problem by calling upon the notion of 'veil of ignorance': "In the original position, the parties are not allowed to know the social positions or the particular comprehensive doctrines of the persons they represent. They also do not know persons' race and ethnic group, sex, or various native endowments such as strength and intelligence, all within the normal range. We express these limits on information figuratively by saying the parties are behind a veil of ignorance. One reason why the original position must abstract from the contingencies - the particular features and circumstances of persons - within the basic structure is that the conditions for a fair agreement for free and equal persons... must eliminate the bargaining advantages that inevitably arise over time within society as a result of cumulative social and historical tendencies. 'To persons according to their threat advantage' (or their de facto political power, or wealth, or native endowments) is not the basis for political justice." (Rawls 2001: 15–16, 97–100). The notion of 'veil of ignorance' is closely linked to Rawls' second principle of justice: "social and economic inequalities... are to be to the greatest benefit of the least-advantaged members of society (the difference principle)" (Rawls 2001: 42–43).

enforcer, rarely acting, or only acting reluctantly, to provide security to people and states under attack. This indicates how the self-centred attitude of member states, with the self-help philosophy that accompanies it, translates not only into hampering global justice, but also into limiting global security. Achieving real global security requires not being the captive of the particularist approach, something which precisely calls for dovetailing security with justice at the international level. Short of this, the deficiency of global justice becomes the deficiency of global security.

In this perspective, the danger of disconnecting security from justice in the international realm could not be graver. By tending to undermine political legitimacy at all levels and fuel the geopolitics of passions (Hassner 2005), it runs the risk of pushing international security even more out of reach.

Why does the undermining of the legitimacy of the international system further weaken security as a whole? It amounts to the fact that, eventually, the discredit of mainstream political institutions and leaders, at the global and national levels, makes the world less secure. To begin with, it is not wise for states to look down on the United Nations for its shortcomings and, true to their biased dual identity (being states and member states, but, ultimately, being more states than member states), speak and act as if, beyond the UN share of responsibility, they had nothing to do with the situation. They have no reason to rejoice because although it can be assumed that states benefit from the incapacitation of the United Nations that is partly their own making, they also suffer from it. The fact that the UN is, despite all, one of the eminent actors of international life, means that when its legitimacy is damaged, the legitimacy of the international system as a whole is weakened. In the process, it is the credibility of member states which is affected. Considering that on them rests principally the international system, major states have here a particular stake. This is especially true for the current hegemon – the United States. Its overwhelming power gives it overwhelming responsibility. It also makes it a prime target for disenfranchised actors. The war in which America and terrorism are locked is an aspect of this story. But less powerful states are not immune either. Being part and parcel of the international system, they cannot dissociate themselves entirely from its limitations. In other words, although political leaders are to this day first and foremost accountable for their policies at the national level, the unravelling of legitimacy at the international level adds to the scepticism that characterizes the general mood vis-à-vis established

politics. Surely, disengagement and cynicism do not necessarily lead to open violence. It is nevertheless always an indication of the lessening of good will and of cooperative behaviour regarding relations among and within states. With living on the edge being the end-result of this state of affairs, the world becomes all the more uncertain and insecure.

The Osama Bin Laden video pronouncement broadcasted by Al-Jazeera on 3 November 2001, challenged the legitimacy of the international system on the basis of ‘the unfair, barbaric campaign’ led in Afghanistan, as well as the many examples of inaction leaving masses of people to die such as Bosnia-Herzegovina, Somalia, etc.⁸ This illustrates how giving reasons for international legitimacy to be contested can deepen international insecurity, especially when it converges with the deadly effects of the geopolitics of passions. Such intertwining of geopolitics and passions is not new. Over the centuries, relations among nations and people have made psychology a key dimension of international life. Because competition, tension, conflict, defeat and victory, decline and rise, feelings of superiority and inferiority have tended to be prominent, this dimension led violent (or negative) passions to take a significant place. In international relations, love for peace may have been identified as the ideal. Yet distrust, resentment, envy, jealousy, hatred, revenge and other passions often get the lion’s share. Modernity and its central actor, the West (with initially key European powers, and then the United States), have only fuelled this intertwining of geopolitics and passions. Despite all their humanist values and achievements, modernity and the West have contributed to the intensification of the intertwining of geopolitics and negative passions. The following major developments account for this situation.

The bringing together of the world that is one of the trade marks of modernity owes much to the domination of Western power. The advance of technology and economy, the increase of interactions beyond borders, the structuring of social organizations along liberal public and private norms, discourses and practices, are defining aspects of a modern culture resulting from the relentless pushes of the West. But what has made it possible for the West to bring the world together is also what tears the world apart. Each uniting factor (technological, political, economic and nor-

8 “Bin Laden rails against Crusaders and UN”, in: *BBC News*, World Monitoring Media reports, 3 November 2001, <http://news.bbc.co.uk/2/hi/world/monitoring/media_reports/1636782.stm>.

mative) has generated dividing tendencies. In this regard, in the 20th century, non-Western societies hijacked the Western norms of universality and equality to make their case as independent nations, in a movement somewhat reminiscent of how continental European nationalism emerged both out of borrowing from, and combating, French universalism (Coicaud 2002: 114–122). Ultimately, the difficulty of non-Western societies to reconcile with themselves (including finding a balance between tradition and modernity), and of the West and the non-West, as well as of the developed and developing countries to come to terms with each other, has made tensions and conflicts more a rule than an exception. Violent passions have developed all the more as a feature of international relations considering that the intensification of global interaction and global communication, by giving them maximum resonance and impact, has favoured their escalation.

34.4 Embedding International Security in International Justice, and the Challenge Ahead

Security was introduced above as a primary right; and, as a primary right, security is at the centre of the problematic of justice. To take justice seriously, to look after people's rights, is essential to ensuring security. Although at the national level, especially in democracies, the relation between security and justice has long been identified as an internal one, and one which, as such, has been epitomized in the value and institutions of the rule of law, this reality has still to sink in to the international realm. At the international level, the dominating realist paradigm dissociates security from justice, by and large limiting justice to simply an idealist and moral matter marginal to the hard-core actuality of international politics. As we have also shown, there is an urgent need to go beyond this approach to allow the world to move away from the overall insecurity trap in which it is now caught. There is an urgent need to move away from terrorized people terrorizing all around, each according to their own ideology and means. How could this be achieved? In conclusion, a very modest answer to this question is offered. To better embed security into justice, and moreover strengthen security by strengthening justice, two types of change are recommended: first, a change of attitude regarding fear and democratic values; second, a policy change as a way to enhance the international rule of law.

It is understandable that fear is at the heart of the search for security. Desiring to protect oneself and being afraid to be hurt are one and the same thing. Yet, fear does not have to turn into paranoia. Ensuring that it does not, is essential to a healthy and efficient quest for security. When the line holds between the two, search for security has a better chance to connect with and achieve greater security. It has a better chance also to not become part of a self-defeating 'sécuritaire', or police-state approach of security.⁹ Paranoiac fear, isolating oneself from others while eager to control them, invites all to adopt a similar attitude. In the absence of channels of communication, a sense of community, let alone of social intimacy, dissolves among actors. Consequently, to keep fear under check, to have a cautious behaviour not turning into paranoia, fear has to be understood and handled in a positive manner. This is not impossible. Fear can have a positive value when motivating people to embrace life and each other. After all, is it not the sense of finitude which instinctively urges human beings to live to the fullest and connect with others? In contrast, a non-reasonable defensive attitude is when a pathological dimension prevails over a healthy prudent attitude and denies the need of the other. In times of weakness, keeping others at arms length is a sensible temporary measure. But as soon as it becomes a structural behaviour, by eliminating the advantages of being engaged with and engaging others, pathology wins. Since states are made up of and, to a certain extent, by and for human beings, it does not come as a surprise that this logic is at work in international politics as well. As illustrated by modern totalitarianisms, the politics of paranoia backfires, leaving a trail of destruction behind, both at home and abroad.

How to open oneself, and therefore make oneself vulnerable, and yet be strengthened? This is the challenge faced by a search for security which refuses to give in to paranoia. It is also the predicament of modern democratic culture. Rousseau's overall intellectual quest is exemplary in this regard. One question runs through his writings: under which conditions am I going to open to the other, so that the exposure resulting from it does not diminish me, but makes me stronger and more present, to myself, others, and the world in general.¹⁰ Rousseau's answer resides in seek-

9 In this regard, it can be argued that a 'sécuritaire' approach of security seeks less to achieve security than to sustain a certain sense of insecurity. The continued sense of insecurity is the best justification for the 'sécuritaire' approach of security.

ing to fulfil the promising character of democratic values (Starobinski 1988). He sees them as a key to both individual and social responsibility, to acceptance of, and duty towards, oneself as well as others.

This does not mean that any attitude towards, or interpretation of, democratic values will do. Earlier, in pinpointing the uniting and divisive effects of modernity, we alluded to the fact that democratic values can themselves be a source of insecurity. A possible remedy is to ensure that democratic values are neither instrumentalized nor under-utilized. This requires that democratic values abide as much as possible by their progressive character and that their critical approach of reality not only be geared towards non-democratic regimes but also towards democratic regimes, and even the idea of democracy itself as a way to always seek self-improvement. In this perspective, because it rests on their inclusive nature, springing from universality and equality, the critical power of democratic values elevates the existence of efficient mechanisms of fairness to a central benchmark of democratic legitimacy, allowing for instance a certain amount of inequalities only as long as competition is fair.

The transformation of attitude vis-à-vis fear and democratic values calls for a policy change, i.e. an improvement of the current international rule of law. The chance for this to take place depends upon four considerations.

To begin with, there is the need to go beyond a mere moral approach of global justice (which, disconnecting justice from security and reducing it to a distant second concern dependent on the whims of states to be looked after or not, undermines international security, Coicaud 2007: chapter 3). This means adopting an international public policy of global justice. Dovetailing justice with security through integrating moral considerations into a public policy approach expressed and defended by law, would strengthen international security.

In addition, a system of international security embedded in justice has to be built around addressing powerlessness wherever it is (beyond borders). This should be done without altogether abandoning national demands and overlooking the responsibility

that even the powerless hold (in fact, the goal is to restore it).

Also, the relations of the international rule of law with democratic values have to be revisited. This entails recognizing that, although international life encompasses great discrepancies of power, the principle of equality among nations and people is a key aspect of *de jure* international relations. The international rule of law cannot amount to the universalization of a one-sided view of the world. In this regard, rather than giving way to a narrow and absolutist search for security, its ability to socialize uncertainty and instability rests, to a certain extent, on being pluralist and an open-ended process.

Finally, enough resources have to be allocated to implement the strategic services to be delivered by an international rule of law that is taken seriously. The reasons called upon to limit redistribution (including scarcity of resources, corruption of governments at the receiving end, and competition leaving even the most powerful nations nervous about the future and consequently eager to preserve their edge) do not justify inaction or poor action. There is no alternative to working on identifying a structure of (international) justice that is able to create an overall synergy between social justice and efficiency, so to not, as the saying goes, rob Peter to pay Paul (Pogge 2003: chapter 8).

Considering that the national bent and the divides (normative, mental, political, social, economic and knowledge divides) that it introduces among countries are going to remain a given of international life for the foreseeable future, a gap between justice and security will persist in the international realm. This is a formidable challenge, especially since those (Western) developed countries that have been historically committed to intertwining social solidarity and security policies and are among the most active internationalist actors, are increasingly moving away from a 'social state' approach at home (Castel 2002). Giving in to the pressures of economic liberalism and global competition, embedding the political and legal dimensions of the rule of law in welfare policies meant to tame individual mischance, is less and less their policy of choice (Bauman 2005: 51-53). How could then a philosophy of order and justice aiming to dovetail security and justice be endorsed in the international realm while it is being dismantled at the domestic level?

Yet, with democratic values increasingly shaping modern identity, nationally and internationally, the

10 In Jean-Jacques Rousseau's (1953, 1979, 1997) writings, the search for an enhanced presence is conducted in relation with the autobiographical, and objectified, self in *The Confessions*, the teacher in *Emile: or on Education*, nature in *Reveries of the Solitary Walker*, the lover in *Julie, or the New Heloise*, and fellow citizens in *The Social Contract*.

structures of international security and justice are becoming more co-dependent and complementary, both in normative and practical terms, than perhaps ever. As a result, pushing the line of inclusiveness as far as possible, within and beyond borders, is essential to security.

There cannot be inclusiveness without exclusiveness. The counterpoint that the 'other' represents is necessary for people to come together. Tomorrow, if humankind were to be under attack from an extra-terrestrial world, humans, united to ensure their survival, would extend their solidarity beyond borders. We should not wait for this to happen. As we run the risk of being morally and physically bankrupt due to our own incapacity to see the human 'other' as an intrinsic part of ourselves and of our responsibility, we are already under attack from within.

35 Security in International Law Since 1990

Michael Bothe

35.1 Legal Relevance of 'Security'

The term security has different meanings in several social science disciplines. For political science and sociology, the term is used as a tool to better understand and explain political and societal processes and problems. For national and international law, it is by definition a normative concept. Like any legal concept or notion, it is an element of composite norms which are to induce a certain human behaviour, and hereby also the behaviour of legal persons or collectivities. Despite this fundamental difference, the international legal notion of security and the political and political science debate on security are closely related (chap. 4 by Wæver; chap. 37 by Baylis, chap. 38 by Albrecht/Brauch). The law is made, developed, and applied by political actors. Thus, the application and the creation of norms are part of political processes, and the law is an element of steering political processes – the very subject political science tries to explain.

Law provides security of expectations, which seems to be a static concept. But it is not static. It has to fulfil this function meeting societal and political needs which keep changing. Therefore, a fundamental tension exists in the application of the law, a tension between preservation of the existing situation and innovation to meet new demands. This tension inspires a constant discourse between actors which have a role in applying and shaping the law. It is through this discourse that the law becomes concrete in a particular situation which it has to regulate.

The debate about security which is documented in this chapter is a reaction to changing political realities and perceptions. International law cannot but react to these changes. Yet the law cannot fulfil its function without the lawyer abiding by the rules of the profession, by the *lex artis*. Thus, this chapter takes as a point of departure certain fundamental international legal norms of which the notion of 'security' is an essential component. It will then try to show how the interpretation and application of these norms have

changed as a result of changed political realities, or rather of the realities as perceived by the relevant actors.

'Peace and security' is a key notion of the Charter of the United Nations (UN). The preamble and Art. 1(1) of the Charter declare as a goal of the UN "to maintain international peace and security". The same term is then repeated in the provisions of the Charter dealing with the powers of the organs of the UN (Art. 11, 24, 33(1), 36(1), 39 (see box 35.1).

Thus, the essential purpose and the powers of the main organs of the UN depend, from a legal point of view, on the meaning of this crucial notion: 'peace and security'. This applies, in particular, in two respects: First, where there is a danger to international peace and security, or a threat to the peace, UN organs are entitled to act. Second, as action is to be taken to maintain or restore international peace and security, the type of measure which may be adopted also depends on the definition of these terms. If and to the extent that the meaning of this notion changes, the activities of the UN are bound to change as well. This raises the fundamental question of possible modifications of that interpretation, or in other words, of static or dynamic interpretation (Bernhardt 1995: 1419).

Legal interpretation, first of all, has to approach a text with precision. Precision requires recognizing the fact that two terms, namely peace *and* security, are combined in the provision just quoted (see chap. 4 by Wæver). It is, thus, the interpretation of both terms which allows an answer to the question whether a certain course of action is lawful or not. This chapter will deal with both terms as they cannot really be separated. This is true, in particular, for Article 39 of the UN Charter which is the basis for the far reaching powers of the Security Council. It uses, first, the term 'peace' alone in describing the situation which triggers the enforcement powers of the Council ('threat to the peace', 'breach of the peace'), but when the measures to be taken are circumscribed, the term

Box 35.1: References to ‘Peace and Security’ in the UN Charter Provisions (emphasis added by Michael Bothe).

Chapter IV: The General Assembly, Art. 11

(1) The General Assembly may consider the general principles of cooperation in the maintenance of *international peace and security*....

(2) The General Assembly may discuss any questions relating to the maintenance of *international peace and security* ...

(3) The General Assembly may call the attention of the Security Council to situations which are likely to endanger *international peace and security*.

Chapter V: The Security Council, Art. 24

(1) In order to ensure prompt and effective action of the UN, its members confer on the Security Council the primary responsibility for the maintenance of *international peace and security* ...

Chapter VI: Pacific Settlements of Disputes, Art. 33

(1) The parties to any dispute, the continuance of which is likely to endanger the maintenance of *international peace and security*, shall, first of all, seek a solution by ... peaceful means ...

Chapter VI: Action with Respect to the Peace, Breaches of the Peace, and Acts of Aggression, Art. 36

(1) The Security Council may, at any stage of a dispute referred to in Article 33 ... recommend appropriate procedures or methods of adjustment ...

Art. 39

The Security Council shall determine the existence of any *threat to the peace, breach of the peace*, or act of aggression and shall make recommendations, or decide what measures shall be taken in accordance with Articles 41 and 42, *to maintain or restore international peace and security*.

“peace and security” is used. Thus, the purpose of enforcement measures is to maintain or restore a situation where peace and security prevails. Therefore, the Council may act in situations where *this* situation is put into question, and the term “peace” in the first part of the provision must be interpreted accordingly.

The concept of security depends on political and military perceptions. Where a security problem induces political or military action, the essential factor is not the ‘objective’ security situation, it is the perception of the relevant actors which really matters (chap. 1 and 3 by Brauch; chap. 4 by Wæver). Thus, where these perceptions change, the interpretation of the relevant legal norms of the provisions of the Charter may tend to do the same (Hafner 2005: 56). The perception of the threat which may affect ‘security’ will determine the meaning of security and the type of measures designed to maintain security.

The term peace seems to be more objective, which does not exclude that there are many different concepts of this term.

With the UN the international community reacted to two world wars. This type of major wars was the perceived security problem the new organization was meant to address. This was, according to the ideas of the Charter’s drafters, the common intent of the parties. And indeed, the central security problem which confronted the world after the creation of the UN was again the danger of an international war. For 45 years since the establishment of the UN, the major security problem was the East-West confrontation, the so-called Cold War. It ended in 1990. The result, however, has not been a secure world. It is a world which felt (and still feels) exposed to ‘new threats’. There are, thus, still threat perceptions, but these perceptions are different from what they used to be in the preceding decades. A debate on new conceptions of security (or insecurity) followed, in the political arena as well as in political science analysis. These developments are described elsewhere in this work.

This chapter tries to show how this change in security (or rather: insecurity) perceptions has modified relevant legal rules, that is composite norms where the notion of security or related notions constitute essential elements of the normative content. In particular, it tries to elucidate whether and how this change has had an impact on the interpretation of the relevant provisions of the Charter of the United Nations and, thus, on the extent the legal powers of their organs and the scope of activities of the organization, with an emphasis on the practice of the most relevant collective actor, the Security Council. Actions of the Security Council have always been based on the assumption, made by the decision-makers, that a certain course of action was lawful (or not). In arriving at this conclusion, decision-makers had to, and did, interpret the provisions of the Charter granting certain powers to the Security Council. It is in this way that legal interpretation finds its way into political reality. It goes without saying that this interpretation has often been controversial (chap. 47 by von Einsiedel/Nitzschke/Chhabra). Thus, political controversies are fought through legal argument, a fact which is then reflected in academic doctrinal debates.

Law changes through a political discourse – while the legal technicalities of this process are controversial. This means that the question whether or not a certain modification of a norm has or has not taken place cannot always be answered with certainty. This chapter concentrates on a crucial element of this dis-

course, namely the practice of the Security Council. Where this practice is well established, it is hard to contest that this is the actual law at a given time.

35.2 The 'Peace and Security' Concept in the UN Charter

The Charter of the UN establishes a system of 'collective security', which is the corollary of the prohibition of the use of force. As unilateral military measures to safeguard a state's security interests are forbidden (prohibition of the use of force, Art. 2(4)), measures to maintain and restore 'peace and security' are reserved to the UN, with the only exceptions of self-defence in the case of an armed attack (Art. 51). Thus, the scope of this prohibition and the concept of 'peace and security' are related. Art. 2(4) prohibits the use of force by states 'in their international relations'. The problem to be addressed, thus, is inter-state military violence. The notions of 'threat to the peace' and 'breach of the peace' are wider than that of the 'use of force' in international relations. But it is only natural that these notions are interpreted in accordance with that fundamental concept of security. Thus, 'threat to the peace' would mean a situation of actual or actually threatening inter-state armed conflict (Frowein/Krisch 2002: 720).

It is in this sense that the terms were, indeed, used for decades in the practice of the Security Council. The problem of Palestine originated from a conflict which could have been characterized as non-international, namely that between the Jewish and the Arab community in Palestine. But it soon grew into a conflict between the Jewish community and then the new Jewish State and their Arab neighbours. The first Security Council resolution of 1 April 1948 addressed an internal conflict as a matter of international peace and security.

The Security Council,

In the exercise of its primary responsibility for the maintenance of international peace and security;

Notes the increasing violence and disorder in Palestine and believes it is of the utmost urgency that an immediate truce be effected in Palestine;

Calls upon the Jewish Agency for Palestine and Arab Higher Committee to...

Calls upon the Arab and Jewish armed groups to cease acts of violence immediately.

All later Security Council (SC) decisions concerning Palestine clearly referred to a situation of international conflict.

The next conflict on the agenda of the Security Council was Korea. By resolution 82 of 25 June 1950, the SC, in the absence of the Soviet Union, determined the North Korean attack on South Korea to be a 'breach of the peace'. Before its absence, the Soviet Union had claimed that the conflict was not an international one and the SC therefore not competent to deal with it (Frowein/Krisch 2002: 720). Much later, the Argentine attack on the Falkland Islands was also characterized as a 'breach of the peace' (SC Res. 502 of 4 April 1982). The same was true for the Iraqi invasion in Kuwait in 1990 (SC Res. 660 of 2 August 1990).

When the SC considered internal situations for the purpose of determining whether a situation corresponded to Art. 39, it appears that the external ramifications were decisive for determining that there was a 'threat to the peace'. A typical case of this approach was the treatment of the apartheid regime in South Africa. Although the SC condemned South Africa in strong terms, the resolution where the SC declares that there is a 'threat to the peace', with the consequence that it adopts economic sanctions (SC Res. 418 of 4 November 1977), deals with the military threat that South Africa constituted for its neighbours:

The Security Council,

... *Recognizing* that the military build-up by South Africa and its persistent acts of aggression against the neighbouring States seriously disturb the security of those States;

... 1. *Determines*, having regard to the policies and acts of the South African Government, that the acquisition by South Africa of arms and related *matériel* constitutes a threat to the maintenance of international peace and security;

Earlier resolutions on Southern Rhodesia are less explicit in saying that it was the external aspect of the crisis which enabled the Security Council to state that there was a 'threat to the peace', but the relevant resolution clearly referred to an external aspect of the conflict, namely the delivery of oil to the illegal regime (SC Res. 221 of 9 April 1966):

The Security Council,

... *Gravely concerned* at reports that substantial supplies of oil may reach Southern Rhodesia ...

Considering that such supplies will afford great assistance and encouragement to the illegal regime in South-

ern Rhodesia, thereby enabling it to remain longer in being,

1. *Determines* that the resulting situation constitutes a threat to the peace;

Another crisis, where the question whether an internal, or essentially internal, conflict constituted a threat to the peace, was the Congo crisis after 1960. The point of departure for the resolution which contained an express statement on the existence of a 'threat to the peace' was the murder of Patrice Lumumba and other Congolese politicians:

The Security Council,

... *Deeply concerned* at the grave repercussions of these crimes and the danger of widespread civil war and bloodshed in the Congo and the threat to international peace and security;

But the security problem, as reflected in that resolution, was of a double nature, it was both internal and international. This becomes clear from the first two operative paragraphs. First, the internal aspect:

1. *Urges* that the United Nations take immediately all appropriate measures to prevent the occurrence of civil war in the Congo, including arrangements for cease-fires, the halting of all military operations, the prevention of clashes, and the use of force, if necessary, in the last resort;

Then follows the international aspect:

2. *Urges* that measures be taken for the *immediate withdrawal and evacuation from the Congo of all Belgian and other foreign military and paramilitary personnel and political advisers not under United Nations command, and mercenaries.*

The overall picture of the concept of 'peace and security' which inspires the practice of the UN for the first four and a half decades is thus essentially characterized by the international nature of the security problem and a concept of peace as the absence of military violence between states. Where the SC acted in cases of internal violence, it justified its measures by referring to the external security implications of the situations.

That concept was uncontroversial in the practice of the UN. Diverging concepts of 'peace and security' remained a matter of academic discussion only and did not have any influence on the practice of the Security Council. This is in particular true for what is the most radical critique of the UN concept of 'negative peace', namely that of 'positive peace', a theory put forward in particular by Johan Galtung (1971a: 55-104). According to this concept, peace is more than the absence of physical violence. It is the presence of

social justice through equal opportunity, a fair distribution of power and resources, equal protection, and impartial enforcement of the law. This concept has rightly been criticized as loading on the concept of peace all criteria of a good internal and international order, a concept that in the current discourse is rather discussed as 'good governance'. Undeniably these elements of 'positive' peace are at least an essential precondition of the 'negative' peace. While this recognition remained without any impact on the SC practice during the East-West conflict, the concept of 'peace and security' underlying the practice of the UN came closer to the concept of 'positive peace' after the fundamental changes of the year 1990 - although it has never fully adhered to it.

35.3 New Developments after the End of the East-West Conflict: The New Vitality of the Security Council

This chapter will now show how this 'traditional' interpretation has given room to a much broader concept of 'security' and, as a consequence, of the term 'threat to the peace' which is the essential trigger of the enforcement powers of the Security Council under Chapter VII of the UN Charter.

35.3.1 A New Start with a Classical Theme: Iraq/Kuwait

The new era started with a classical inter-state conflict: The Iraqi invasion into Kuwait constituted an armed attack within the meaning of Article 51 of the Charter and triggered the corresponding right of individual and collective self-defence. No Security Council resolution would have been needed, as a matter of law, to justify the action undertaken by a coalition of states to expel Iraqi forces from Kuwait.

But the SC did act. It declared that there was a 'breach of the peace' (SC Res. 660 of 2 August 1990), it adopted non-military enforcement measures against Iraq (SC Res. 661 of 6 August 1990), and then backed the exercise of the right of collective self-defence by a resolution authorizing the use of force (SC Res. 678 of 29 November 1990). What was new in this situation was the fact that the SC was no longer prevented from acting due to the existence of the East-West conflict. In addition, however, the SC created the practice of authorizing or mandating the use of force by states instead of itself conducting an enforcement opera-

tion. That practice later was used also in other cases of a 'threat to the peace' where there was no armed attack and therefore no such right of collective self-defence. It is in this ensuing practice that a completely new and much broader concept of 'international peace and security' emerges in state practice (Neuhold 2005: 33ff.).

This broader concept is divided in two different elements:

- a much broader recognition of internal situations as being 'threats to the peace', which include in particular gross violations of human rights and other humanitarian disasters;
- threats originating from non-state actors and so called rogue states.

The latter element is subdivided into two problem areas: a) international terrorism, and b) the proliferation of weapons of mass destruction (WMD).

35.3.2 Internal Situations as 'Threat to the Peace' – Cautious or Less Cautious Approaches

Since 1990, several SC resolutions characterized situations of internal disorder or oppression as a threat to the peace. The following cases can be quoted as typical examples. The development started with a resolution on Iraq, namely with the repression of the Kurdish population in Northern Iraq (SC Res. 688 of 5 April 1991):

The Security Council,

Gravely concerned by the repression of the Iraqi civilian population in many parts of Iraq, including most recently in Kurdish-populated areas, which led to a massive flow of refugees towards and across international frontiers and to cross-border incursions which threaten international peace and security in the region,

Deeply disturbed by the magnitude of the human suffering involved,

... Reaffirming the commitment of all member States to respect the sovereignty, territorial integrity and political independence of Iraq and of all States in the region,

... 1. Condemns the repression of the Iraqi civilian population in many parts of Iraq, including most recently in Kurdish populated areas, the consequences of which threaten international peace and security in the region;

That formulation still is in line with the classical formulations used by the Security Council where the characterization of an internal situation of violence rather stressed the international implications thereof. It also reflects a concern for state sovereignty and in-

tegrity. But it already shows an element of the new approach to the notion of 'threat to the peace' by emphasizing the human suffering.

In relation to Somalia, the Security Council rather stresses the humanitarian aspect of the internal violence which occurred in that country (SC Res. 794 of 3 December 1992):

The Security Council,

... Determining that the magnitude of the human tragedy caused by the conflict in Somalia, further exacerbated by the obstacles being created to the distribution of humanitarian assistance, constitutes a threat to international peace and security;

... Expressing grave alarm at continuing reports of widespread violations of international humanitarian law occurring in Somalia ...

... 10. Acting under Chapter VII ..., *authorizes* the Secretary General and Member States cooperating ... to use all necessary means at their disposal to establish as soon as possible a secure environment for relief operations in Somalia;

In this resolution, the international aspects of the 'threat to the peace' seem to become irrelevant.

In relation to Rwanda, the resolution authorizing the intervention led by France to end the killing and protect certain parts of the population points in the same direction, with somewhat different nuances (SC Res. 929 of 22 June 1994):

The Security Council,

... Deeply concerned by the continuation of systematic and widespread killings of the civilian population in Rwanda,

... Determining that the magnitude of the humanitarian crisis in Rwanda constitutes a threat to the peace and security in the region,

... Acting under Chapter VII ... *authorizes* the Member States ... to conduct the operation ... using all necessary means to achieve the humanitarian objectives ...

Although this resolution alludes to the consequences "in the region", there is, as in the case of Somalia, a strong emphasis on the internal, the humanitarian aspect.

The conflict in Yugoslavia, beginning in 1991, presented a somewhat confusing mixture of traditional international security considerations and of human rights and humanitarian law aspects. This can be deduced not so much from the text of the determinations declaring a situation to constitute a 'threat to the peace', but more so from the measures taken in respect to the various problems related to the Yugoslavian crisis. A specific measure taken to restore peace

and security presupposes a concept of what peace and security means. A long series of Security Council resolutions started with resolution 713 of 25 September 1991:

The Security Council,

... *Deeply concerned* by the fighting in Yugoslavia, which is causing a heavy loss of human life and material damage, and by the consequences for the countries in the region, in particular in the border areas of neighbouring countries,

Concerned that the continuation of this situation constitutes a threat to international peace and security,

... 6. *Decides*, under Chapter VII of the Charter of the United Nations, that all States shall, for the purposes of establishing peace and security in Yugoslavia, immediately implement a general and complete embargo on all deliveries of weapons and military equipment to Yugoslavia ...

The determination contains the traditional reference to the external consequences of the internal (as it was then considered) crisis and the measure taken is a traditional one addressing the international implications, but there is also the humanitarian aspect of the situation which prompts action by the Security Council. The latter one becomes more and more important in the course of the crisis, in two respects: there is on the one hand the humanitarian situation, in the sense of the living conditions of the population which is addressed by the SC, there are on the other hand serious violations of international humanitarian law. The first aspect requires access to the population for relief actions (SC Res. 770 of 13 August 1992):

The Security Council,

... *Recognizing* that the situation in Bosnia and Herzegovina constitutes a threat to international peace and security and that the provision of humanitarian assistance in Bosnia and Herzegovina is an important element in the Council's effort to restore international peace and security in the area;¹

... *Dismayed* by the continuation of conditions that impede the delivery of humanitarian supplies to destinations within Bosnia and Herzegovina and the consequent suffering of the people of that country;

...2. *Calls upon* States to take ... all necessary measures to facilitate ... the delivery ... of humanitarian assistance to Sarajevo and wherever needed in other parts of Bosnia and Herzegovina;² ...

The second aspect finally led to the establishment of the International Tribunal for the (former) Yugoslavia (SC Res. 827 of 25 May 1993):

The Security Council,

... *Expressing once again* its grave alarm at continuing reports of widespread and flagrant violations of international humanitarian law occurring within the territory of the former Yugoslavia, and especially in the Republic of Bosnia and Herzegovina ...

Determining that this situation continues to constitute a threat to international peace and security;

Determined to put an end to such crimes and to take effective measures to bring to justice the persons who are responsible for them;

Convinced that in the particular circumstances of the former Yugoslavia the establishment as an ad hoc measure by the Council of an international tribunal and the prosecution of persons responsible for serious violations of international humanitarian law would enable this aim to be achieved and would contribute to the restoration and maintenance of peace;

... 2. *Decides* hereby to establish an international tribunal for the sole purpose of prosecuting persons responsible for serious violations of international humanitarian law committed in the territory of the former Yugoslavia ...

In East Timor in 1999, the conflict had a clear international dimension, as it followed international attempts to solve the existing tensions which had led to two international agreements relating to the situation, one between Portugal and Indonesia, the other between the UN and Indonesia. Nevertheless, the SC, in its resolution authorizing the use of force, stressed the internal, humanitarian aspect of the violence (SC Res. 1264 of 15 September 1999):

The Security Council,

...*Deeply concerned* by the deterioration in the security situation in East Timor, and in particular by the continuing violence against and large-scale displacement and relocation of East-Timorese civilians;

Deeply concerned also at the attacks on the staff and premises of the United Nations Mission in East Timor (UNAMET), on other officials and on international and national humanitarian personnel;

... *Appalled* by the worsening humanitarian situation in East Timor, particularly as it affects women, children and other vulnerable groups;

... *Determining* that the present situation in East Timor constitutes a threat to peace and security;

... 3. *Authorizes* the establishment of a multinational force... and *authorizes* the States participating in the

1 The same formulation is used in SC Res. 787 of 16 November 1992.

2 See also SC Res. 819 of 16 April 1993, para. 8.

multinational force to take all necessary measures to fulfil this mandate;

In the Kosovo crisis, it is not so clear which elements the SC considered as decisive for its characterization of the situation. The humanitarian element at least contributes to that assessment of the situation (SC Res. 1203 of 24 October 1998):

The Security Council,

... *Condemning* all acts of violence by any party, as well as terrorism in pursuit of political goals by any group or individual, and all external support for such activities in Kosovo, including the supply of arms and training for terrorist activities in Kosovo ...

... *Deeply alarmed* and concerned at the continuing grave humanitarian situation throughout Kosovo and the impending humanitarian catastrophe, and *re-emphasizing* the need to prevent this from happening:

...*Affirming* that the unresolved situation in Kosovo, Federal Republic of Yugoslavia, constitutes a continuing threat to peace and security in the region;

This resolution, once again, stresses the humanitarian component of the definition of the 'threat to the peace', but nevertheless also puts some weight on the international aspect by mentioning terrorist activities and the training of terrorists coming from outside.

In relation to the Darfur crisis in Sudan, the SC Res. 1556 of 30 July 2004, determined that "the situation in Sudan constitutes a threat to international peace and security and to stability in the region," and, consequently, expressly states that it acts under Chapter VII. These are the last two paragraphs of the preamble. It must be assumed that the description of the situation given in the preceding paragraphs taken as a whole contains the constitutive elements of what the SC regarded as constituting a 'threat to the peace':

- the humanitarian crisis, implying an urgent need of humanitarian assistance for a large part of the population;
- the continued violations of human rights and international humanitarian law;
- the plight of the refugees;
- the move of refugees into neighbouring Chad;
- the incursions into Chad by Sudanese militias.

The situation, thus, contains elements of the traditional concepts of a 'threat to international peace', i.e. the fact that a third country is affected both by the refugee flow and by armed incursions. But there is also the modern concept according to which the violation of norms of fundamental importance, of human rights and international humanitarian law and

possibly also the deprivation of a sizeable part of the population of the minimum means of subsistence constitute a 'threat to the peace'.

Haiti is a somewhat special case in this connection. The relevant resolutions contain elements of the practice just reported, but they go further in more than one aspect. The situation which, seen as a whole, the Council regards as a 'threat to the peace' contains numerous violations of human rights and international humanitarian law:

The Security Council,

... *Strongly condemning* the numerous instances of extra-judicial killings, arbitrary arrests, illegal detentions, abductions, rape and enforced disappearances, the continued denial of freedom of expression, and the impunity with which armed civilians have been able to operate and continue operating (UN Res. 940 of 31 July 1994);

This goes beyond condemnations contained in other relevant resolutions in that it expressly includes violations of the rule of law and of an important political right, namely freedom of expression. But the resolution goes even further when it recognizes a failure to respect the principle of democracy as an element of the definition of a 'threat to the peace'. This is expressed in two other paragraphs of the preamble of the same resolution:

Reaffirming that the goal of the international community remains the restoration of democracy in Haiti and the prompt return of the legitimately elected President, Jean-Bertrand Aristide, under the framework of the Governors Island Agreement;

Reaffirming its determination that, in these unique and exceptional circumstances, the situation created by the failure of the military authorities in Haiti to fulfil their obligations under the Governors Island Agreement and to comply with relevant Security Council resolutions constitute a threat to peace and security in the region;

It is a new and broader concept of 'peace and security' which emerges from this practice, which despite a few variations can by now be considered as coherent. 'International peace and security' is more than the absence of physical military violence in inter-state relations. It has a humanitarian and human rights dimension. There is no 'peace and security' where the fundamental values of international humanitarian law and human rights are grossly violated. The core of this new concept has become uncontroversial (Neuhold 2005: 38).

35.3.3 'New' Threats: Violence by Private Actors ('Terrorism') – State Sponsored or not

The resolutions relating to 'new threats' created by international terrorism first addressed Libya and Iraq. Regarding Iraq, the armistice resolution of 3 April 1991 mentioned the problem *en passant* by formulating (or referring to) an obligation of Iraq not to support international terrorism.

The Security Council,

...32. *Requires* Iraq to inform the Council that it will not commit or support any act of international terrorism ...

In a series of resolutions concerning different countries (Libya, Sudan, Afghanistan), the SC pinpointed the non-extradition of suspected terrorists as the decisive criterion of the existence of a 'threat to the peace' which triggered the adoption of enforcement measures under Article 41 of the Charter.

In relation to the controversy between the Western powers and Libya concerning the refusal of Libya to extradite persons alleged to be involved in terrorist acts, the resolutions of the Security Council constitute the decisive point of departure for a series of UN resolutions concerning international terrorism (SC Res. 748 of 31 March 1992):

The Security Council,

... *Determining* ... that the failure by the Libyan Government to demonstrate by concrete actions its renunciation of terrorism and in particular its continued failure to respond fully and effectively to the requests in resolution 731 (1992) constitute a threat to international peace and security;

The same question, with greater vigour, constituted a major element of SC resolutions relating to Sudan and Afghanistan which were (or were alleged to be) harbouring terrorists, in particular the Al Qaeda network. In the case of Sudan, the problem was the non-extradition of persons allegedly involved in an attempt to assassinate the President of Egypt while visiting Ethiopia. First, without clarifying the legal basis of its action, the SC (Res. 1044 of 31 January 1996):

4. *Calls upon* the Government of Sudan to comply with the requests of the Organization of African Unity without further delay to:

(a) Undertake immediate action to extradite to Ethiopia for prosecution the three suspects sheltering in Sudan and wanted in connection with the assassination attempt ...;

(b) Desist from engaging in activities of assisting, supporting and facilitating terrorist activities and from giving shelter and sanctuaries to terrorist elements ...;

Finally, the resolution concerning Afghanistan also started with the issue of non-extradition and sanctuaries, in particular relating to terrorists allegedly involved in the bombing of the American embassies in Nairobi and Dar es Salaam. As in the previous case, the Council, without clarifying the basis of its action (SC Res. 1214 of 8 December 1998),

Deeply disturbed by the continuing use of Afghan territory, especially areas controlled by the Taliban, for the sheltering and training of terrorists and planning of terrorist acts, and *reiterating* that the suppression of international terrorism is essential for the maintenance of international peace and security;

...13. *Demands also* that the Taliban stop providing sanctuary and training for international terrorists and their organizations, and that all Afghan factions cooperate with efforts to bring indicted terrorists to justice;

This is followed by a more precise SC resolution in 1999 (1267 of 15 October 1999 and SC Res. 1333 of 19 December 2000):

The Security Council,

... *Deploring* the fact that the Taliban continues to provide safe haven to Osama bin Laden and to allow him and others associated with him to operate a network of terrorist training camps from Taliban-controlled territory and to use Afghanistan as a base from which to sponsor international terrorist operations;

... *Determining* that the failure of the Taliban authorities to respond to the demands in paragraph 13 of resolution 1214 (1998) constitutes a threat to international peace and security;

After the attacks by Al-Qaeda terrorists against the WTC and the Pentagon on 11 September 2001, the SC went a step further. It determined that acts of international terrorism constitute *per se* a threat to 'international peace and security' (SC Res. 1368 of 12 September 2001; 1373 of 28 September 2001). A culminating point of the resolution practice of the SC is the Declaration (SC Res. 1377) on the global effort to combat terrorism of 12 November 2001:

The Security Council,

... *Declares* that acts of international terrorism constitute one of the most serious threats to international peace and security in the twenty-first century;

An additional element is added to the practice of the SC by resolution 1373 (2001). This resolution no longer relates to a specific situation as constituting a threat to the peace, it rather treats the phenomenon

of international terrorism as such and uses this determination as the basis for a number of general measures, clad in abstract and general normative terms, to combat terrorism (financial measures, criminal prosecution, and police cooperation).

35.3.4 New Threats and the Problem of Proliferation – Rogue States and Private Actors

Another element of the broadened concept of 'international peace and security' is the proliferation of weapons of mass destruction. This has been the object of a lengthy series of SC resolutions. The original purpose of the Non-Proliferation Treaty (NPT) was to ensure that the balance of military power existing between the two superpowers should not be destabilized by third parties acquiring nuclear weapons. The concern for the nuclear balance between the superpowers and their allies has gone, but the problem of nuclear proliferation has remained. The major current fear is that such weapons get into the hands of 'irresponsible' governments or private actors. This is the background of a number of SC resolutions on the possession or acquisition of WMDs by certain states.

That development started with the armistice resolution concerning Iraq (SC Res. 687 of 3 April 1991). Apparently assuming that despite the end of the actual fighting and the conclusion of an armistice, there still existed a threat to the peace, the Security Council imposed upon Iraq a number of measures addressing that threat, including arms control and disarmament measures designed to ensure the discontinuation of existing, or prevention of any future, Iraqi possession of WMD or certain means of their delivery. The monitoring system thus established has become and remained a matter of constant controversy (between the United Nations and Iraq as well as between members of the Security Council) until the American-British intervention in Iraq in 2003. This is reflected in a number of Security Council resolutions and the substitution of the original UN supervisory body UNSCOM by UNMOVIC based on Security Council resolution 1284 of 17 December 1999.

Nuclear armament or an alleged intention of nuclear armament has also been on the agenda of the Security Council in two other cases. In relation to North Korea, the Council (resolution 1718 of 14 December 2006):

Expressing profound concern that the test claimed by the DPRK has generated increased tension in the region

and beyond, and *determining* therefore that there is a clear threat to international peace and security

took, on that basis, non-military enforcement measures against that country.

In the case of Iran, the alleged irregularities stated by the IAEA in monitoring nuclear activities in Iraq lead to a report by the IAEA Executive Council to the Security Council, which on that basis took action under Chapter VII of the UN Charter, first provisional measures (Article 40; see SC Res. 1696 of 31 July 2006) and then non-military enforcement measures (Article 41; see SC Res. 1737 of 23 December 2006). The SC apparently assumes that there is a 'threat to the peace', but does not really make clear why. The SC notes:

with serious concern that the IAEA Director General's report of 27 February 2006 ... lists a number of outstanding issues and concerns on Iran's nuclear programme, including topics which could have a military nuclear dimension, and that the IAEA is unable to conclude that there are no undeclared nuclear materials of activities in Iran,

and furthermore

... that the IAEA is unable to make progress in its efforts to provide assurances about the absence of undeclared nuclear material and activities in Iran, ...

This, it is submitted, constitutes a construction of what is a threat to the peace which is, to say the least, problematic even if one accepts the interpretation formulated in resolution 1540 of 28 April 2004 in which the SC affirms

that proliferation of nuclear, chemical and biological weapons, as well as their means of delivery, constitute a threat to international peace and security.

35.3.5 Impact of Broader Security Concepts of 'Human' and 'Environmental Security'

The changes in the legal concepts of 'security' and 'threat to the peace' so far presented in this chapter are limited to those where it is safe to say that they constitute indeed an established and generally accepted practice. To that extent, the change constitutes positive law. But there is a continuing debate on considerably broader security concepts, not only in the academic, but also in the political arena. These discourses go in different directions. The first two are concerned with fundamental values of the international community, namely 'human security' and 'environmental security'. The third one is security of access to vital raw materials.

'Human security' (chap. 46 by Dedring; Brauch 2005, 2005a) is indeed a key notion in the current international debate. Human security means that elements of welfare for all as a precondition of a lasting peace are integrated into the security concept. Undeniably economic stability is an important precondition of peace. Yet, although this concept is part of a political debate in the United Nations, its practical consequences for the law of the UN, in particular the functioning of their system of collective security cannot be shown so far. Despite a debate in the Council, these concepts have not been the basis for any Security Council decision (chap. 46 by Dedring; Benedek 2005: 32ff.).

A different but related concept is that of 'environmental security' (Brauch 2003, 2005, 2005a). It is well known that environmental degradation often plays a role as a factor of political destabilization. A case in point is the discussion about the conflict over water resources. Important as they are, they are nevertheless sometimes overestimated. Their impact on the practice of the SC has so far been insignificant.

Secure access to vital raw materials adds an economic dimension (chap. 36 by Murshed, chap. 43) to the security debate (Brock 2004: 338). It has been formulated as an important security consideration of the Western alliance, for instance in the New Strategic Concept of NATO. There is no denying the fact that a cut in supplies of vital raw materials could in concrete circumstances constitute a threat to the peace, there is, however, no general recognition of this type of vital interest as part of the concept of security under the UN Charter.

35.3.6 An Extended Concept of Peace and Security – Consequences for Permissible Unilateral Use of Force?

This broadened concept of 'international peace and security', to the extent it has found a broad acceptance in international practice, only relates to the functioning of the system of collective security established by the UN. In particular, it adds to the powers of the Security Council. It does not relate to the unilateral use of force by states, in the sense that in situations which, under the new concept, would justify enforcement measures to be taken by the SC, the use of an expanded right of unilateral intervention, similar to the right of individual and collective self-defence, would also be permissible (Bothe 2004: 605 ff.). This limitation must be stressed in the light of the fact that there have been attempts, both in actual political prac-

tice and in academic comment, to also expand the right of unilateral action. This is the temptation or ambivalence involved in the broadened security concepts (Brock 2004: 325, 329ff.).

The two major cases in point are an alleged right of humanitarian intervention and the doctrine of pre-emption. Both approaches have so far been rejected in actual practice and have not become part of a new customary international law (Weller 2005: 277–333).

In the case of humanitarian intervention, there has not even been a serious attempt by the states conducting the campaign against Yugoslavia in the case of the Kosovo crisis in 1999 to claim that there was such a right of humanitarian intervention and that this intervention should constitute a precedent (Weller 2005: 309, 313). Favourable comments have rather remained in the realm of academia (Weller 2005: 316). The report *The Responsibility to Protect* (ICISS 2001: 54ff.) which has attracted a widespread attention for its thesis that there was a duty of the international community to take action in case of massive violations of human rights, expressly refrains from advocating unilateral action for this purpose, but rather a duty of the UN to take the appropriate measures.

Before the coalition intervention in Iraq in March 2003, there was a lot of debate whether the United States and its allies would use the doctrine of pre-emptive strikes, i.e. an expanded version of the concept of anticipatory self-defence, in order to legally justify their action. But this was not done (Greenwood 2005: 387–399; Bothe 2005: 417–423). The official justification for the intervention was the alleged continued validity of the authorization given by the Security Council in 1990 when Iraq had invaded Kuwait. This chapter cannot go into a detailed analysis of this justification strategy, but the very fact that this strategy was used and not another one is significant for the conclusion that the doctrine of pre-emptive strikes has not become a new legal justification for the use of force.

35.3.7 Impact of the Debate on Peace and Security Concepts for Reality – Conclusions

The foregoing analysis has shown that there has been a modification of the international legal concept of security from what can be said to be a formal concept of 'peace and security' (the absence of inter-state military violence) to a more value-oriented concept which encompasses, in particular, the respect of fundamental human rights, but also the behaviour of cer-

tain non-state actors (terrorism). This conclusion has mainly been based on what can be called verbal practice, in particular on the utterances of the SC. But how far is this practice conclusive? Should the actual concepts prevailing in the international system as to 'international peace and security' not be based on actual policy, on deeds, not on words?

The cases of NATO's Kosovo campaign and of Iraq suggest indeed that there is a certain tension between actual state behaviour and the statements of the law as they have been developed. It is suggested, however, that the true meaning of a certain physical behaviour of states cannot be ascertained without having recourse to the verbal discourse which accompanies them. Words matter in international relations, for a number of reasons. It is therefore worthwhile to formulate and read them carefully. In addition, these conclusions are not only based on purely 'verbal' practice. Security Council resolutions have triggered actions. It is the changing realities of world politics which have shaped an international legal discourse. This discourse has had a definite impact on the behaviour of relevant international actors. Where this discourse shows less and less divergence and more and more agreement, one can conclude that the law has changed. Because this change is achieved through international agreement building, it has, in turn, a practical impact. It has also been shown that this development has taken place case by case. The challenge for the legal science and legal practice is to conceptualize this development and to determine how far it reaches in future cases.

36 Human Security from the Standpoint of an Economist

S. Mansoob Murshed¹

36.1 Introduction

The concept of human security is wide-ranging (Gasper 2005a). It extends from notions of personal security, during conflict say, to broader definitions of economic well-being as encompassed in the notion of human development (Streeten 1993). One of the hallmarks of the economics discipline is its concern with measurement. Consequently, we have the human development index, at both the national and regional levels, which is an unweighted average of real income per-capita, longevity, and educational attainment. As yet, there are few quantifiable human security indices, because of the difficulty in devising an objective measure of insecurity under conditions of conflict.²

Two dimensions of human security can be addressed by the economist: 'freedom from want' and 'freedom from fear' (Brauch 2005; Brauch/Oswald/Grin/Mesjasz/Kameri-Mbote/Behera/Chourou/Krummenacher 2008).³ The first refers to the quality of life, and economics is rich in approaches to this, many of which go beyond the simple utilitarian paradigm; making the epithet economics is associated with for being 'the gospel of Mammon' rather unfair. The crudest form of the utilitarian approach states that (cardinally immeasurable) utility emanates from consumption. One can, of course, incorporate non-

hedonistic components into an individual utility function, such as the utility of one's children, which would amount to altruism, as well as solidarity with a cause. Societal welfare is maximized when the sum of individual utilities are maximized. This, in turn, leads to the two fundamental welfare theorems in mainstream economics which are associated with the concept of *efficiency*. A competitive equilibrium is Pareto efficient, and secondly that a Pareto optimal allocation is also a competitive equilibrium. Pareto efficiency, in the strictest sense, implies that one person cannot be made better off by re-allocation without making at least another person worse off. It also means that changes that make some better off without making any others worse off should be implemented. But it raises problems of equity. In a two-person society, for example, Pareto efficiency is compatible with one person having everything and another person nothing; something that is repugnant to most sensibilities. Consequently, in economics, we are used to separating issues relating to efficiency from normative matters pertaining to *equity*.

Besides utilitarianism we also have Sen's (1985) capability approach which states that well-being emerges from capability, examples of which could be the twin freedoms from want and fear. Capabilities are related to entitlements, that could include security; but exchange entitlements or participation in the market are very much part and parcel of 'entitlement'. Rawls's (1971) Maximin principle is, perhaps, less well known. Maximin means the maximization of the minimum. Thus, allocation and choice under this rule maximizes the utility of the least fortunate member (or group) in society. Maximin allocations are not necessarily Pareto efficient, except by serendipity.

Section 36.2 of this chapter examines 'freedom from want' by focussing on economic growth. Differences in growth rates, particularly over the last two centuries, have produced the present disparities between rich and poor countries, which in turn constitute the problem of development. By choosing to fo-

1 I am grateful to Des Gasper, Hans Günter Brauch and two reviewers of this volume for thoughtful insights into earlier versions of this chapter.

2 Subjective measures with numerical codes do exist, e.g. the Minorities at Risk database (MAR 2004). See also Lonergan/Gustavson/Carter (forthcoming) and Lonergan/Gustavson/Carter (2000).

3 The original expressions are from President Franklin Delano Roosevelt's address to Congress on 6th January 1941, see at: <<http://www.Fdrlibrary.marist.edu/od4frees.html>>, accessed on 29 June 2005. President Roosevelt was concerned with security threats where nation states threaten one another. For that we had the United Nations founded in 1945. Most wars, nowadays, are internal wars.

Table 36.1: GDP Per Capita (1995 Constant US\$) Growth Rates. **Source:** World Development Indicators 2002, World Bank (2002).

Area	Annual average GDP growth % 1960–1970	Annual average GDP growth % 1970–1980	Annual average GDP growth % 1980–1990	Annual average GDP growth % 1990–2000
Low & middle income countries	3.1	3.3	1.2	1.9
East Asia & Pacific	2.9	4.5	5.9	6.0
South Asia	1.8	0.7	3.5	3.2
Latin America & Caribbean	2.6	3.4	-0.8	1.7
Sub-Saharan Africa	2.6	0.8	-1.1	-0.4

cus on growth I am being unapologetically utilitarian. Growth creates possibilities for greater happiness. Without growth citizens cannot exercise capabilities. Growth also constitutes the principal avenue for poverty reduction. In poor countries mere acts of income or asset distribution can only serve to make all people equally poor. This does not mean, however, that no attention should be paid to distribution, as perceptions about unfair distribution across groups can promote conflict, as will be discussed in section 36.3. Section 36.2 also analyses the role of institutional functioning in explaining the deep determinants of long-term growth and growth failure. As the opening lines of Tolstoy's (1877, 2000) novel *Anna Karenina* pithily points out: "Happy families are all alike; every unhappy family is unhappy in its own way."

Section 36.3 concentrates on the 'freedom from fear'. It begins by looking at violence as an alternative economic activity to peaceful production. It then examines what economics can contribute to the understanding of the causes of war, the most common form of which is intra-state civil war at present. The problem of transnational terrorism is also analysed, as will be the reasons why peace agreements are so notoriously fragile, and the difficulties in achieving a durable peace due to the indivisibility of the objectives of warring parties. Section 36.4 provides a synthesis with conclusions.

36.2 The Lack of Economic Growth and Freedom from Want

'Freedom from want' in low-income countries, where poverty is endemic, can only ensue in the long run from economic growth. This is because growth enlarges the economic pie and creates the necessary

pre-conditions for economic wellbeing. Granted, this is not sufficient for the freedom from want, which also depends on other mechanisms, including the distribution of income. As far as growth is concerned table 36.1 suggests that recent growth rates of real income per-capita have been low, and even negative, for many developing countries, particularly in sub-Saharan Africa and Latin America in the post-1980 period. In Africa, in particular, the era of globalization is associated with huge development failure. Not only have incomes declined, but also other indicators of inclusion and wellbeing have deteriorated. This includes the return of old diseases such as tuberculosis, the AIDS pandemic, stagnating maternal mortality, and literacy rates. On the other hand, developing countries in East Asia, and more recently in South Asia, have been doing well. Historically also, disparities between rich and poor countries have been growing in the last two centuries. UNDP (1999) reproduces figures to show that the gap in average income between the richest and poorest nations was only 3:1 during the dawn of the industrial revolution in 1820, rising to 11:1 by 1913. More recently, it grew to 35:1 in 1950, rising slightly to 44:1 by 1973. After the commencement of the present round of globalization, this figure has acquired a staggering magnitude of 72:1. The lack of economic growth, and the increasing disparity between rich and poor nations, undermines human security from the standpoint of freedom from want and other human capabilities.

What are the long-term determinants of growth? The new growth theory suggests that many factors can raise the productivity of the inputs (capital and labour) that enter the production process, see Romer (1990). Initially, the stress was put on the development of human resources or human capital. Lately, consideration is also being given to other over-arching factors that might help explain long-term growth, or

more importantly, growth failure. These include geographical location, the adoption of bad policies, the type of resources the economy is endowed with, as well as institutional functioning and governance; see Murshed (2004) for a survey.⁴ In this section I shall consider the last two factors, which will turn out to be interconnected.

Murshed (2004) presents evidence that developing countries with a large mineral-type natural resource endowment have tended to have low growth rates since the 1970's, notwithstanding a handful of success stories like *Botswana. The traditional macroeconomic effect associated with natural resource booms is known in the literature as 'Dutch Disease' (Neary/Wijnbergen 1986). The problem is associated with a sudden windfall gain. This may be due to a rapid, but temporary, increase in the price of oil and other primary commodities, as in the 1970's. Alternatively it can also be associated with natural resource discoveries, increases in worker remittances, or other unrequited international transfers. Irrespective of the cause, a resource boom crowds out the leading sector of the economy. A shift in domestic output from traded goods to non-traded goods takes place. There is empirical evidence suggesting that countries rich in natural resources tend to have higher price levels, and as a result their non-natural resource based goods are uncompetitive and cannot be exported. They, therefore, miss out on the benefits of export-led growth that many other developing countries poorly endowed with natural resources have gained from.

Then there are political economy arguments as to why resource booms or a substantial reliance on mineral resource exports can retard long-run growth (Murshed 2004). Natural resource rents can make corruption, predation, and rent-seeking a more attractive option. This incentive is greater the weaker the environment of law and contract enforcement following societal upheavals. A related problem concerns the allocation of entrepreneurial talent, as analysed in Murphy, Shleifer, and Vishny (1991). The idea being that talent can focus either on production or predation. This decision is a function of the relative returns to these two activities.

A rich mineral type natural resource endowment, where ownership and production is concentrated, may therefore produce poor institutions. Malfunctioning institutions may then retard growth. The importance of institutions has been emphasized by au-

thors such as North (1990) and Platteau (1994). Recent empirical studies also confirm the independent importance of institutions in determining economic performance as measured by the levels of per-capita income. We have currently rich data on government capacity (Kaufmann/Kraay/Zoido-Lóbaton 2002). The rankings are for voice and accountability, political stability, government effectiveness, regulatory quality, rule of law, and control of corruption. They extend from -2.5 at the lower end of the spectrum, to 2.5 at the upper end. The implication also is that a positive score is good and a negative score is below average. The scores are correlated with per-capita income. Most developing countries, particularly low-income nations score negatively in these areas. Easterly and Levine (2003) present evidence based on cross-country econometrics that a mineral natural resource endowment, a poor geographical (tropical) location, and an excessive mortality rate (disease burden) does retard economic development but via *institutions* as measured by Kaufmann, Kraay and Zoido-Lóbaton (2002). Similarly, bad economic policies and choices also hinder economic development via institutions. Consequently, institutions and institutional functioning are the crucial link between resource endowments, geography, policies on the one hand, and economic outcomes on the other hand. A similar line of reasoning is presented in Rodrik, Subramanian, and Trebbi (2004).

What determines these all-important institutions of governance? There is now a consensus that the framework of governance, including respect for property rights, contract and law enforcement, the rule of law, and administrative capacity, matter a great deal if a country is to be successful in its quest for growth and development. The current economic literature points out to several sources of institutional determination, some of which may be related to natural resource endowment.

Authors such as Acemoglu, Johnson and Robinson (2001) date back poor (or good) institutional determination to at least a century ago, to the pattern of colonialization. They distinguish between two types of colonies. The first group corresponds to parts of the New World settled by European migrants, as in North America and Australasia. The second group refers to tropical developing countries, today's Third World. The idea is that better institutions, especially property rights and the rule of law, were embedded into the first group.⁵ In the second category of colonial countries, an extractive pattern of production was set up. This extractive and exploita-

4 Culture is arguably another explanation, see Cuesta (2004).

tive pattern of production is also the legacy of colonialization, malign colonialization in these cases. Clearly, this pattern was more prevalent in some parts of the world, particularly in Africa and Latin America, the Belgian Congo is cited as the worst example. The latter's contemporary counterpart, the Democratic Republic of Congo (DRC) has probably the worst growth experience on record. As the extractive state is expropriatory and predatory, bad institutions emerge and become entrenched even after independence, and a predatory equilibrium emerges. The important question that remains unanswered is why does de-colonialization, and the opportunities it provides for policy changes, not alter the destiny of an extractive economy? It does in some, but not in others. Secondly, despite the saliency of the colonial phase in history, many developing nations have had a collective experience prior to, and after, colonialization that must have also shaped institutions. In East Asia, South Asia, the Middle East, and North African regions of the developing world, well functioning institutions of good governance existed well before the advent of colonialization, and European colonial powers merely adapted pre-existing administrative institutions. The work of Acemoglu, Johnson, and Robinson (2001) is therefore mostly applicable to sub-Saharan Africa, Latin America, and the Caribbean.

Another strand of the literature builds on the link between inequality and mineral-type resource endowment, see the work of Sokoloff and Engerman (2000), as well as Easterly (2001). Commodity endowments of the mineral or plantation variety tend to depress the middle-class share of income in favour of elites, as in Latin America. The idea being that these elites in turn use their power, identical with the forces of the state, to coerce and extract rents. When different groups compete with another for these rents, the rent-seeking contest can lead to even more perverse and wasteful outcomes than when elites collude. The important point made by Easterly (2001) is that small elite-based societies do not have a stake in the long-term development of the land. Unlike in middle-class dominated societies, publicly financed human capital formation and infrastructural development falls by the wayside, hence depressing growth prospects. The reason is that mass education promotes growth, although it eventually leads to power shifting away from elite groups. Education is costly,

but it results in a private benefit for the educated (higher life-time income), as well as an all-important growth enhancing public benefit. The benefits from the latter effect also accrue to oligarchs. This may induce the selfish elite to redistribute income as it allows the capital-constrained poor to obtain an education and contribute to rapid national economic development, even though this means the eventual loss of power for the oligarchy through democracy. The important point is that a tiny oligarchy may be the most disinclined to redistribute income. A smaller and extremely wealthy elite group is most likely in mineral and plantation rich economies. ⁱ

36.3 Violent Internal Conflict and Freedom from Fear

In the early 21st century most wars occur between groups within the same country, and in the *developing* world. Conflict is also a major cause for the persistence of poverty, which in turn is also a cause of conflict (Collier/Elliott/Hegre/Hoeffler/Reynal-Querol/Sambanis 2003).

Are these civil wars fundamentally irrational, and couldn't the differences underlying these disputes be settled peacefully? Sadly, conflict may be the product of rational decisions, even if it is only of a bounded or myopic rational choice variety. It is important to understand that violence is an alternative to peaceful production as a form of economic activity. Francis Edgeworth, writing in the late 19th century, distinguished between consent – and its absence – in human economic interaction:

The first principle of Economics is that every agent is actuated only by self-interest. The workings of this principle may be viewed under two aspects, according as the agent acts *without*, or *with*, the consent of others affected by his actions. In wide senses, the first species of action may be called *war*; the second, contract (Edgeworth 1881: 16-17).

In securing an income, humanity has a choice between production and predation, the relative returns being in part determined by the cost of 'swords' relative to 'ploughshares'. The institutional environment, the quality of law, and contract enforcement also determines this choice. Criminal activity, whether taking the form of extortion or theft, is only one aspect of the economics of violence. War, especially civil war, also has an economic dimension. Hirshleifer (1995) models anarchic inter-group warfare using non-cooperative game theory, in a setting reminiscent of the

⁵ The authors argue that the mortality rate amongst Europeans is what determined whether Europeans settled a colony or not.

primitive conflict over resources between neighbouring communities. Similarly, Grossman (1991) models rebellion against a tax-farming state, where individual choices are predicated upon the relative returns to farming or working for the state or rebelling against it. The main characteristic of these rational choice approaches is the notion of expected utility; the returns (sometimes negative) are the sum of the pecuniary value of various activities weighted by their subjective probability.

In the new rational choice literature on conflict, a distinction is often made between *grievance*, a motivation based on a sense of injustice in the way a social group is or has been treated; and *greed*, an acquisitive desire similar to crime, albeit on a much larger scale.⁶ In many ways the former refers to intrinsic motivation, and the latter to an extrinsic or pecuniary incentive to go to war. These motives are not entirely separate in practice, and change as conflict progresses. Addison, Le Billon, and Murshed (2002) present an analytical game-theoretic model of civil war where greed and grievance exist simultaneously in the midst of poverty.

Grievances include the systematic economic discrimination against groups based on ethno-linguistic or religious differences. Extreme poverty and poor social conditions, including refugee camps, also facilitate conflict by making soldiering less unattractive. Many of today's civil wars have an ethnic or nationalist dimension and ethnicity, whether based on language, religion or other distinctions, often a superior basis for collective action in poor countries than other social divisions such as class. In coalescing groups, therefore, current and historical grievances play a crucial part in resolving Olson's (1965) collective action problem. This is all the more possible when there are inequalities across a small number of clearly identifiable groups, something which is known as *horizontal* inequality, as opposed to the social class-based notion of vertical inequality (Stewart 2000). More often than not, these take the form of high asset inequality, discriminatory public spending across groups and unequal access to the benefits of state patronage, such as government jobs. Furthermore, state failure in providing security and a minimal level of public goods often forces individuals to rely on kinship ties for support and security.

Discussion of greed as a motive for conflict arises mainly in the context of natural resource endow-

ments in Africa, and has been popularized for example by the work of Collier and Hoeffler (2004). Capturable natural resource rents, such as alluvial diamonds in Angola and Sierra Leone, can result in contests over the right to control these, some of which takes the form of warfare, but also criminality and corruption in other instances. Ross (2004) points out that lootable gemstones and illegal narcotics help to finance and perpetuate civil war, as they are a major source of profit for some of the competing groups. Their presence does not, however, robustly explain why civil wars begin in the first place. Ross (2004) also finds that oil and gas revenues significantly contribute to secessionist wars.

The greed versus grievance dichotomy can provide a useful beginning to the discussion of the causes of conflict. But for these forces to take the form of large-scale violence there must be other factors at work, specifically a failing "social contract" and conflict triggers. A functioning social contract, and the concomitant institutions that distribute income and resolve disputes, can prevent the violent expression of greed or grievance (Murshed 2002). Furthermore, the outbreak of conflict always requires triggers, both internal and external. External triggers involve support and succour from an outside power; internal triggers refer to events that induce parties to abandon peaceful negotiation in favour of outright war.

Transnational terrorism, and the strategy of war on terrorism to combat it, is a form of 'new' war. Here intrinsic motivation, which often takes the form of the collective sense of humiliation, plays a greater role; therefore deterrence against terrorists may backfire if it hardens their resolve to resist, as modelled by Addison and Murshed (2005). Perpetrators of terrorist acts are not often uneducated and poor, unlike in the case of civil wars where the soldiery is often drawn from the ranks of the impoverished whose alternative gainful employment prospects are scant. In fact, education can act as an indicator of reliability in acts such as suicide bombing. Terrorism requires individuals to express solidarity with an intrinsic cause or value, where the notion of pecuniary gain associated with greed in the case of civil wars is totally irrelevant. From the viewpoint of individual choice, suicide bombing may be a rational act as explained by Winthrop (2002). This is because the individual has made an all or nothing choice between solidarity to a cause and individual autonomy. An all or nothing choice involves a 'corner solution' to a utility maximization problem. In this situation changing relative prices (in-

6 The expression "greed disguised as grievance" was coined by Paul Collier (Collier/Hoeffler 2004).

creasing deterrence) has little impact on individual choice, which is another way of saying that deterring terrorism will not succeed in preventing people from committing to their cause, even if the success rate of individual acts of terrorism diminishes.

Conflict resolution is more difficult when the intrinsic motivation to fight is strong, as is the case in secessionist wars and certain forms of terrorism. It is also difficult to sustain peace when parties feel tempted to resume warfare so as to enable them to continue looting valuable resources. The commitment problem to an agreed peace treaty is also a serious problem. This difficulty arises when it is in the interest of one or either side to renege on the promise of peace, and the actions that peace involves. In that situation, commitments lack credibility. Sometimes agents or groups cannot commit credibly because there are no institutions or mechanisms upon which to anchor promises. For governments, this is more likely in the context of weak state capacity, as it is difficult for a state to guarantee pledges when its own legitimacy and power base is fragile.

An important aspect of the commitment problem is the very high discount rates, or the short time horizons of the parties involved (Addison/Murshed 2002). In situations of poverty and high uncertainty, agents strongly prefer a dollar today to a dollar tomorrow. Although the absolute value of future peace may be much higher than that of continued warfare, the present value may be much lower when the discount rate is high and there is an impatience to consume. The same argument can be applied to reputation, a factor that is key to the credibility of peacemaking. Breaking an agreement damages *future* reputation, but with a high enough discount rate it might pay to renege because the cost comes in the future. Each failure of the peace process raises the discount rates of the belligerents, thereby increasing the difficulty of making peace. Given the tarnished reputations of belligerents it is even harder to establish credible peace. The problem is particularly apparent in Africa where most indicators of political risk are substantially greater than elsewhere in the world. Solutions lie in directly increasing the cost of reneging on peace agreements, devising commitment technologies through institutional innovation and improving the quality of peacekeeping forces.

The indivisibility of war aims, symbols, or land can also make solutions to certain civil wars intractable. Wood (2003) highlights *indivisibility* as a major impediment to peace deals. This arises when territory, symbols, or revenue in a post-conflict situation

cannot be divided up so as to achieve peace. The problem can be most acute when religious sites such as Har'm El Sharif or Temple Mount in Jerusalem are involved. Also, considerable difficulties arise when it is problematic to achieve compromise over a war aim such as land reform (Nepal and Colombia), or deep constitutional change (monarchy in Nepal). There can also be seemingly irresolvable disputes over post-war power sharing, and the allocation of offices in a post-conflict government.

The theoretical literature on sharing and division offers us several insights into conflict resolution. For example, Brams (2005) points out several allocation rules for a single divisible good, many divisible goods, and several indivisible goods. All of these have implications for durable peacemaking, involving compromises over issues and post-war economic stakes. If a peace agreement, and the divisions and compromises it entails are perceived to be unfair then the deal itself will not be robust. Sharing in this regard must be equitable as well as efficient. That is why envy-free allocative outcomes are so important. In an envy-free outcome each participant does not regard the allocation achieved by another player to be superior to what he/she has achieved. All the various allocative mechanisms considered by Brams (2005) require monitoring or intervention by an outside agency, a mediator, and/or external power. To be successful, however, peacemaking must reconstitute and refashion the social contract. That means broad-based reconstruction, and a solution that does not leave any of the belligerents worse off than they were prior to war.

36.4 Conclusions

In this chapter I have attempted to argue that human security as broadly understood in economics could encompass elements of the freedoms from want and fear. What I have discussed are inputs in to these freedoms, which emanate respectively from growth and the prevention or conclusion of violent internal conflict. "Freedom from want" has been the traditional subject matter of economics, and includes a wide-ranging understanding of utility and welfare. 'Freedom from fear' or insecurity is something development economists have been increasingly paying attention to, as it is recognized that economic policy cannot be formulated or conducted independent of the political and security environment. Furthermore,

the potential for conflict and civil war in retarding growth and development are equally accepted.

Development and human security imply the maximization of growth and the minimization of conflict, see figure 36.1 below. The latter objective also requires that growth be not too unequally distributed. Institutions and institutional functioning are central to both these goals, as they promote growth and prevent conflict. As Rodrik (1999) emphasizes, countries with weak institutions of conflict management, as well as high-income inequality are less able to withstand economic shocks and experience growth failure. Thus, not only do good institutions promote growth, but growth also prevents conflict. Moreover, growth and conflict are related in other ways. Countries with low per-capita income are more prone to conflict (Collier/Elliot/Hegre/Hoeffler/Reynal-Querol/Sambanis 2003), and nations in conflict have their growth potential curtailed. Although poor institutional quality can both retard growth and promote violent internal conflict, its effect on these two phenomena is not symmetric. Not all countries that are growth failures descend into large-scale internal violence. Similarly, although most nations experiencing conflict do have a poor record in terms of economic growth, several others do not, such as in East Asia (Indonesia), South Asia (Nepal, Sri Lanka) and Latin America (Colombia). History is not bereft of examples of growth and conflict prevention success via good institutions against the odds, when the wrong kind of endowment and geography had existed, such as in Botswana (rich in mineral resources) and Singapore (tropical location with a high initial settler mortality rate).

Institutions may be all important in determining a country's fate and the level of human security, but I have argued that institutions are not exogenously and immovably given. They may be related to historical factors such as endowments of mineral type natural resources, a poor tropical location, and the extractive institutions imbedded through a rapacious colonial past. But this does not constitute destiny. Institutions in the future can be improved via the accumulation of benevolent current and past policies. For example, Glaeser, La Porta, Lopez-de-Silanes and Shleifer (2004) point out that most developing countries were dictatorships in 1960. Some of these dictatorships voluntarily pursued good policies such as respect for contracts, the rule of law, and promoted the accumulation of human and physical capital. This reduced economic uncertainty and promoted growth, and in most instances these countries also avoided large-

Figure 36.1: The Institutions–Conflict Prevention–Growth Nexus

scale conflict. Along with economic development came the simultaneous accumulation of high quality human capital. In the end, that made the dictatorship untenable, as a highly educated and affluent population clamoured for more voice and democracy. We have thus the narrative of endogenous democracy, as applied not only to late nineteenth and early twentieth century Western Europe, but also to contemporary South Korea and Taiwan. An important lesson in this regard is that the imposition of *exogenous* Western democratic models following civil war, state failure, and economic collapse (Somalia and Afghanistan for example), as well as military conquest (Iraq) is likely to be fragile and precarious.

37 The Concept of Security in International Relations

John Baylis

37.1 Introduction

In his classic study of *Man, the State and War*, Kenneth Waltz (1954) charts the disagreements between classical philosophers about the causes of war. Some see it resulting from imperfections in human nature. Others regard the structure of the state as being a crucial determinant of war. And yet other writers focus their attention on the anarchical nature of the international system in which individuals and states have to operate. In this ongoing debate throughout history, Waltz points out that there is a fundamental difference between political philosophers over whether conflict can be transcended or mitigated. This reflects a fundamental difference between 'Realist' and 'Idealist' thinkers, who have been respectively pessimistic and optimistic in their response to the central question of whether war is an inevitable part of human existence.

These two schools of thought, in turn, reflect the distinctive 'Hobbesian' and 'Kantian' traditions in classical philosophy. There has also been a third, 'Grotian', tradition in the international relations literature which takes issue with both Hobbesian and Kantian approaches. Hobbesians see no possibility of moving beyond the essentially violent world in which we live. Kantians, on the other hand, argue that it is possible to 'transcend' violent conflict and move on to a more peaceful existence. Grotian scholars, in contrast, accept that violence and war are extremely difficult, if not impossible, to eradicate completely but argue that it is possible to develop rules and norms which help to 'mitigate' the worst excesses of violence and war. In this sense, Grotians are more optimistic than Hobbesians, and more pessimistic than Kantians. (Wight 1979)

This perennial question of whether war and violence can be eradicated has been very much at the heart of the study of international relations from the time it first became a systematic academic discipline after the First World War. Initially Idealism claimed

widespread support as the League of Nations seemed to offer some hope for greater international order. Later, however, after 1945 during the Cold War, Realism became the dominant school of thought. War and violent conflict were seen by many writers in this confrontational era as perennial features of interstate relations stretching back through human history. With the end of the Cold War, however, the debate began again. For some, the end of the intense ideological conflict between East and West was a major turning point in international history, ushering in a new paradigm in which interstate violence would gradually become a thing of the past and new communitarian values would bring greater cooperation between individuals and human collectivities of various kinds (including states). This, 'new' Idealism, reflected more optimistic views about the development of a peaceful global civic society. For others, however, 'old' Realism remained the best approach to thinking about international security. Cooperation was temporary and the harsh realities of national and international insecurity would soon reappear. This perspective was reinforced after the events of 9/11.

Nevertheless, what this new post-Cold War era brought was a fresh approach to thinking about the nature of security in general which has had a significant impact on the international relations literature. This chapter focuses on the development of thinking about 'security' from its traditional origins to the newer perspectives which have emerged in the post-Cold War period. We begin by looking at traditional views of the relationship between national security and international security and the influence which these ideas have had on contemporary thinking (37.2-37.5). This will be followed by a discussion of the meaning of the term 'security' and a survey of 'new thinking', involving a re-conceptualization of security in recent years (37.6). The conclusion provides an assessment of the contribution of this 'new thinking' to a contemporary understanding of the world we live in today (37.7). In particular, it is argued that while Real-

ism has been justifiably challenged in recent years and alternative approaches have been developed (that provide important new insights), Realism remains a powerful approach to both the study and the practice of international relations.

37.2 Traditional 'Realist' Views about Security

From the Treaty of Westphalia in 1648 onwards states have been regarded as by far the most powerful actors in the international system. They have been the universal standard of political legitimacy with no higher authority to regulate their relations with each other. This has meant that security has been seen as the priority obligation of state governments. They have taken the view that there is no alternative but to seek their own protection in what has been described as a self-help world.

In the historical debate about how best to achieve national security writers like Hobbes, Machiavelli, and Rousseau tended to paint a rather pessimistic picture of the implications of state sovereignty (see chap. by Arends and Coicaud in this vol.). The international system was viewed as a rather brutal arena in which states would seek to achieve their own security at the expense of their neighbours. Interstate relations were seen as a struggle for power as states constantly attempted to take advantage of each other. According to this view permanent peace, in a Kantian sense, was unlikely to be achieved. All that states could do was to try and balance the power of other states to prevent any one from achieving overall hegemony. This was a view which was shared by writers like Edward H. Carr (1946) and Hans Morgenthau (1948, 1960, and 1985), who developed what became known as the realist (or 'classical' realist) school of thought in the aftermath of World War II.

This largely pessimistic view of international relations was shared by more contemporary writers like Kenneth Waltz (1979) and John Mearsheimer (1990). According to these 'neo-realist' writers, security, or insecurity, is largely the result of the structure of the international system ('structural realists'). The structure of anarchy is seen as being highly durable. The implication of this is that international politics in the future is likely to be as violent as international politics in the past. In 'Back to the Future' John Mearsheimer (1990) argued that the end of the Cold War was likely to usher in a return to the traditional multilateral balance of power politics of the past in which extreme

nationalism and ethnic rivalries would lead to widespread instability and conflict. Mearsheimer viewed the Cold War as a period of peace and stability brought about by the bipolar structure of power which prevailed. With the collapse of this system, he predicted that there would be a return to the kind of great power rivalries which had blighted international relations since the seventeenth century.

For neo-realist writers, like Mearsheimer (1994), international politics involves a relentless process of competition, with war, like rain, always a possibility. It is accepted that cooperation among states can and does occur, but such cooperation has its limits. It is "constrained by the dominating logic of security competition, which no amount of cooperation can eliminate." Genuine long-lasting peace, or a world where states do not compete for power, therefore, is very unlikely to be achieved.

The aim of realists, both classical and neo-realists is to 'explain' the world as they see it. In a positivist sense, they claim to develop generically valid, universal concepts and laws which provide a basis for predicting the future. Because the world has been largely violent in the past this is how it is likely to continue. The lessons of the past suggest that the best way to achieve security is to seek power.

37.3 Security as a Contested Concept

Traditionally most writers have agreed that security is a 'contested concept'. Most would also agree that it implies freedom from threats to core values (for both individuals and groups) but there remains a major disagreement about whether the primary focus of enquiry should be on 'individual', 'national', or 'international' security. Historically, the literature has been dominated by *national* security, largely defined in militarized terms. The main area of interest tended to be on the military capabilities their states should develop to deal with threats facing them. More recently, however, this idea of security has been criticized and many international relations experts have proposed an expanded concept of security by widening the limits of parochial national security to include other considerations. Barry Buzan (1983: 214–242) has included political, economic, societal, environmental as well as military aspects. He defined security in broader international terms. This involves states overcoming "excessively self-referenced security policies" and thinking on the security interests of their neighbours. Buzan's work raised questions whether national and international se-

curity considerations could be compatible and whether states were capable of thinking in more cooperative terms.

This focus on the tension between national and international security, however, has not been accepted by all security experts. Others argue that the emphasis on the state and interstate relations ignores the fundamental changes which have been taking place in world politics especially in the aftermath of the Cold War. For some, the dual processes of integration and fragmentation requires more attention for 'societal security'. Accordingly, growing integration in Europe is undermining the classical political order based on nation-states, leaving nations exposed within larger political frameworks (EU). The fragmentation of the Soviet Union and Yugoslavia has created new problems of boundaries, minorities, and organizing ideologies causing regional instability (Kaldor 1999). Thus, ethno-national groups, rather than states, should become the focus for security analysts.

Other commentators argue that the stress on national and international security is less appropriate because of the emergence of an embryonic global society in the post-Cold War era (Shaw 1994). Like the 'societal security' theorists they point to the fragmentation of the nation-state but they argue that more attention should be given, not to society at the ethno-national level, but to global society. They argue that the most important contemporary trend is globalization which brings new risks and dangers, including risks associated with such things as international terrorism, a breakdown of the global monetary system, global warming, and the dangers of nuclear accidents. These threats to security, on a planetary level, are viewed as being largely outside the control of nation-states. Only the development of a global community could deal with this adequately.

37.4 'Realists' and 'Neo-Realists' as Pessimists

Despite the debate on a narrow or wide security concept, differences continue between those who are pessimistic and those who are optimistic on a more secure future world. For most contemporary realist or neo-realist writers there is little prospect of a significant change in the nature of security in the post-Cold War world. Pointing to the Gulf War in 1991, the violent disintegration of the former Yugoslavia and parts of the former Soviet Union, continuing violence in the Middle East, the Iraq War in 2003, and the 'war on

terror', it is argued that we continue to live in a world of mistrust and constant security competition. Cooperation between states occurs, but it is difficult to achieve and even more difficult to sustain. There are two main factors which make cooperation difficult. The first is the prospect of cheating; the second is the concern which states have on relative gains.

Writers like Waltz and Mearsheimer do not deny that states often cooperate or that in the post-Cold War era there are greater opportunities for states to work together. They argue that there are distinct limits to cooperation because states have remained fearful that others will cheat on any agreements reached and attempt to gain advantages over them. This risk is particularly important, given the nature of modern military technology which can bring about very rapid shifts in the balance of power between states. "Such a development", Mearsheimer (1994: 20) has argued, "could create a window of opportunity for the cheating side to inflict a decisive defeat on the victim state." States realize that this is the case and although they join alliances and sign arms control agreements, they remain cautious and aware of the need to provide for their own national security in the last resort. This is one of the reasons why, despite the Strategic Arms Reduction Agreements of the early 1990's and the extension of the Non-Proliferation Treaty in 1995, the nuclear powers maintained their nuclear weapons. The unilateralism of the Bush administration has also indicated a determination, especially since 9/11, to put national security at the forefront of its strategic agenda.

Cooperation is also inhibited, according to many neo-realist writers, because states are concerned with 'relative', rather than 'absolute gains'. Instead of being interested in cooperation because it will benefit both partners, states always have to be aware of how much they are gaining compared with the state they are cooperating with. Because all states will be attempting to maximize their gains in a competitive, mistrustful, and uncertain international environment, cooperation will always be very difficult to achieve and hard to maintain. The shifting alliances since 9/11 are said to confirm this.

This view of cooperation in the post-Cold War world is not shared by all neo-realist writers. Some scholars argue that the traditional neo-realist view of international relations should be modified or even replaced. To illustrate alternative ways of thinking on international security, several contemporary approaches will be considered. Despite their differences they share the view that greater future international security is possible through cooperation. Many have ar-

gued that international security has been undergoing significant changes which could enhance opportunities for peace. But this is no universal view.

37.5 'Realists' and 'Neo-Realists' as Optimists

Contrary to the neo-realists (Waltz, Mearsheimer) who remain pessimistic about cooperation between states in the post-Cold War world, other neo-realists were more optimistic. According to Charles Glaser (1994–1995: 51), “contrary to the conventional wisdom, the strong general propensity of adversaries to compete is not an inevitable logical consequence of structural realism’s basic assumptions.” Glaser accepted many assumptions of structural realism, but he argued that there are many conditions in which adversaries can best achieve their security goals through cooperative policies, rather than competitive ones. Security is seen as ‘contingent’ on the prevailing circumstances. These ‘contingent realists’ argue that standard structural realism is flawed for three reasons.

Firstly, they reject the competition-bias inherent in the theory. Because international relations are characterized by self-help behaviour does not necessarily mean that states are damned to perpetual competition resulting in war. Faced with the uncertainties associated with being involved in an arms race, like that of the 1970’s and 1980’s, states preferred to cooperate. There were distinct advantages in working together to reduce the risks and uncertainty rather than engaging in relentless competition which characterized most of the Cold War.

A *second* argument is that standard structural realism is flawed because of its emphasis on ‘relative gains’. States often pursue cooperation precisely because of the dangers of seeking relative advantages. As the security dilemma literature suggests, it is often best in security terms to accept rough parity rather than seek maximum gains which will spark off another round of the arms race leading to less security for all in the longer term.

The *third* flaw in the standard argument is that the emphasis on cheating is overdone. Cheating is a problem which poses risks, but so does arms racing. Schelling and Halperin (1961) argued that it cannot be assumed that an agreement that leaves some possibility of cheating is unacceptable or that cheating would necessarily result in strategically important gains. The risks involved in arms control may be preferable to the risks involved in arms racing. Contingent realists

argue that this is often ignored by Waltz and Mearsheimer. This was the view of the superpowers in the late 1980’s and early 1990’s when many agreements were signed (INF, START I and II). The main thrust of the argument was that there is no need to be overly pessimistic about international security after the Cold War.

The view that, despite the anarchy of the international order, there are opportunities for cooperation between states is also shared by other self-declared ‘neo-realists’ or ‘structural realists’. Barry Buzan, and other members of what has become known as ‘the Copenhagen School’, have argued that one of the interesting and important features of the 1980’s and 1990’s was the gradual emergence of a rather more ‘mature anarchy’ in which states recognized the intense dangers of continuing to compete aggressively in a nuclear world. While accepting the tendency of states to focus on their own narrow parochial security interests, Buzan argued that there was a growing recognition amongst the more ‘mature’ states in the international system that there were good (security) reasons for taking into account the interests of their neighbours when making their own policies. States are increasingly internalizing “the understanding that national securities are interdependent and that excessively self-referenced security policies, whatever their jingoistic attractions, are ultimately self-defeating” (Buzan 1983: 208). He cites the Nordic countries as providing an example of a group of states that have moved, through ‘a maturing process’, from fierce military rivalry to a security community. Buzan accepted that such an evolutionary process for international society as a whole was likely to be slow and uneven. In his view a change away from national security towards a greater emphasis on international security was at least possible, and certainly desirable.

These authors argue that this has happened in Western Europe over the past fifty years. After centuries of hostile relations between France and Germany and other Western European states, a new sense of ‘community’ was established with the Treaty of Rome which turned former enemies into close allies. These states no longer consider using violence or coercion to resolve their differences. Disagreements still occur, but within the European Union these will always be resolved peacefully by political means. Supporters of the concept of ‘mature anarchy’ argue that this ongoing ‘civilizing’ process in Europe can be extended further to achieve a wider security community by embracing other regions with whom economic and political cooperation is increasingly taking place.

One of the main characteristics of the standard neo-realist approach to international security is the belief that international institutions play a minor part in war prevention. Institutions are seen as the product of state interests and the constraints which are imposed by the international system itself (Mearsheimer 1994). It is these interests and constraints which shape the decisions on whether to cooperate or compete, rather than the institutions to which they belong. Such views have been challenged by both statesmen and international relations specialists, particularly after the Cold War. The British Foreign Secretary, Douglas Hurd, stated in June 1992 that institutions themselves have continued to play a crucial role in enhancing security, particularly in Europe. The West had developed “a set of international institutions which have proved their worth for one set of problems”, and he has argued that the great challenge of the post-Cold War era was to adapt these institutions to deal with the new prevailing circumstances.

This view reflected a belief, widely shared among Western statesmen, that a framework of complementary, mutually reinforcing institutions – EU, NATO, WEU, and the Organization for Security and Cooperation in Europe (OSCE) – could be developed to promote a more durable and stable European security system. For many observers such an approach has considerable potential in achieving peace in other regions of the world as well. ASEAN is often cited as an institution which has an important role to play in helping to maintain stability in South-East Asia. Similarly the African Union (AU) plays a part in helping to resolve differences between African states.

This view was shared by many academic writers during the 1980's and early 1990's who were convinced that the pattern of institutionalized cooperation between states opens up unprecedented opportunities to achieve greater international security. Although the past may have been characterized by constant wars and conflict, important changes are taking place in international relations in the early twenty-first century which creates the opportunity to dampen down the traditional security competition between states.

This approach of ‘liberal institutionalism’, operates largely within the realist framework, but argues that international institutions are much more important in helping to achieve cooperation and stability than ‘structural realists’ acknowledge. According to Keohane and Martin (1995: 42): “institutions can provide information, reduce transaction costs, make commitments more credible, establish focal points for coordination

and, in general, facilitate the operation of reciprocity.” Thus, in a world constrained by state power and divergent interests, international institutions operating on the basis of reciprocity can be a component of any lasting peace. Following the Grotian tradition, ‘liberal institutionalists’ argue that although international institutions are unlikely to eradicate war they can help to achieve greater cooperation between states.

37.6 Alternative Approaches

The so-called ‘global turn’ between 1989 and 1991 encouraged some writers who opposed realist and neo-realist approaches from both a Kantian and Grotian perspective to develop alternative security theories. According to ‘social constructivist’ writers, the fundamental structures of international politics are social rather than strictly material. As a result they argued that changing the way we think about international relations can bring a fundamental shift towards greater international security. The aim was less to ‘explain’ than to offer an ‘understanding’ of the world in which we live. Constructivists tend to reject the positivist approach of realist theorist with its emphasis on universal laws, certainty, and prediction. This reflected an important epistemological divide which emerged in the international relations literature from the early 1990's between positivist and what became known as ‘post-positivist’ positions (Booth/Zalewski 1996).

Post-positivist, social constructivists, like Alexander Wendt (1992), think about international politics in a very different way to neo-realists. The latter tend to view structure as being made up only of a distribution of material capabilities. Social constructivists think that structure is the product of social relationships. Social structures are made up shared knowledge, material resources and practices. Thus, social structures are defined, in part, by shared understandings, expectations, or knowledge. Alexander Wendt argues that the security dilemma is a social structure composed of inter-subjective understandings in which states are so distrustful that they make worst-case assumptions about each other's intentions, and, as a result, define their interests in ‘self-help’ terms. In contrast, a security community is a rather different social structure, composed of shared knowledge in which states trust one another to resolve disputes without war.

The emphasis on the structure of shared knowledge is important in social constructivist thinking. Social structures include material things, like tanks and economic resources, but these only acquire meaning

through the structure of shared knowledge in which they are embedded. The idea of power politics, or *realpolitik*, has meaning to the extent that states accept the idea as a basic rule of international politics. According to social constructivist writers, power politics is an idea which does affect the way states behave, but it does not describe all interstate behaviour. States are also influenced by other ideas, such as the rule of law and the importance of institutional cooperation and restraint. In his study, *Anarchy is What States Make of it*, Wendt argues that security dilemmas and wars are the result of self-fulfilling prophecies. The “logic of reciprocity” means that states acquire a shared knowledge about the meaning of power and act accordingly. Equally, policies of reassurance can also help to bring about a structure of shared knowledge which can help to move states towards a more peaceful security community.

Although social constructivists argue that security dilemmas are not acts of god, they differ over whether they can be escaped. Some are optimists, while others are more pessimistic. For Wendt the fact that structures are socially constructed does not necessarily mean that they can be changed. This is reflected in his comment that “sometimes social structures so constrain action that transformative strategies are impossible” (Wendt 1995a: 80). Other social constructivists are more optimistic. They point to the changes in ideas introduced by Gorbachev during the second half of the 1980’s which led to a shared knowledge about the end of the Cold War. Once both sides accepted the Cold War was over, it really was over. According to this view, understanding the crucial role of social structure is important in developing policies and processes of interaction which will lead towards cooperation rather than conflict. For the optimists, there is sufficient ‘slack’ in the international system which allows states to pursue policies of peaceful social change rather than engage in a perpetual competitive struggle for power. If there are opportunities for promoting social change, some social constructivists believe, it would be irresponsible not to pursue such policies (Adler/Barnett 1998). It is important to note, however, that constructivists argue that ‘to the extent that pessimists and optimists differ among themselves concerning the nature of existing structure the degree to which their analyses are relevant should be decided upon the basis of an analysis of the strategies conceivable for transforming structure, (including, for example, the state system, nation states, and transnational markets).’¹

Realists are often criticized for the central role given to the state in their writings. This is particularly true of the approach adopted by critical security theorists like Robert Cox. In his work Cox (1981) distinguishes between problem-solving and critical theories. Problem-solving theorists take “the existing social and political relations and institutions as starting points” (Smith 1999). Critical theorists focus on how these existing relationships and institutions emerged and what might be done to change them.

For them, states should not be the centre of analysis due to their diverse character, being often part of the problem (rather than the solution) of insecurity. They can be providers of security and a source of threat to their own people. Thus, attention should be focused on the individual rather than the state. Security can best be assured through human emancipation, defined in terms of freeing individuals and groups from the social, physical, economic, political, and other constraints that prevent them from doing what they would normally do. This focus on emancipation is designed to provide ‘a theory of progress’, ‘a politics of hope’, and a guide to ‘a politics of resistance’.

Feminist writers also challenge the traditional emphasis on the state in international security. While there are significant differences among feminist theorists, all agree that the literature on international security has been written from a ‘masculine’ perspective. Tickner argues that women have “seldom been recognized by the security literature” even though conflicts affect women, as much, if not more, than men (Tickner 1992). The vast majority of casualties and refugees in war are women and children and, as the recent war in Bosnia confirms, the rape of women is often used as a tool of war.

In *Bananas, Beaches and Bombs*, Enloe (1989) points to the patriarchal structure of privilege and control at all levels which effectively legitimizes all forms of violence. She highlights the traditional exclusion of women from international relations suggesting “that they are in fact crucial to it in practice and that nowhere is the state more gendered in the sense of how power is dispersed than in the security apparatus” (Terriff/Croft/James/Morgan 1999: 91). Enloe also challenges the concept of ‘national security’ arguing that this term often preserves the prevailing male-dominated order rather than protect the state from external attack. Feminist writers argue that if gender is brought more explicitly into the study of security, not only will new issues and alternative perspectives be added to the security agenda, but also the result will be a fundamentally different view of international security.

1 The author is grateful to an anonymous reviewer for pointing this out.

Recent years have also seen the emergence of other normative approaches to international relations which have produced a different and distinctive perspective towards international security. These writers often combine constructivist ontology with a critical normative stance, which on the use of language and discourse analysis. These theorists are sometime labelled 'post-modernists' (George 1994). Post-modernists agree that ideas discourse and 'the logic of interpretation' are crucial in understanding international politics and security. Like other proponents of the 'critical security studies' approach, post-modernists see 'realism' as a central problem of international insecurity because realism is a 'discourse of power and rule' which has been dominant in international politics in the past and which has encouraged security competition between states. Power politics is seen as an image of the world that encourages behaviour that helps bring about war. The attempt to balance power is itself part of this very behaviour leading to war. Alliances do not produce peace, but lead to war. Many post-modernists want to replace the discourse of realism or power with a different discourse and alternative interpretations of concepts such as 'danger' and what counts as a threat to 'national security'. The idea is that once the 'software' programme of realism that people carry around in their heads has been replaced by a new 'software' programme based on cooperative norms, individuals, states, and regions will learn to work with each other, and global politics will become more peaceful. For post-modern writers, security and subjectivity are closely connected. According to David Campbell:

Traditional discourses of international relations maintain that alliance is one where security is a goal to be achieved by a number of instrumentalities deployed by the state (defence and foreign policy, for example). But the linkage between the two can be understood in a different light, for just as Foreign Policy works to constitute the identity in whose name it operates, security functions to instantiate the subjectivity it purports to serve. Indeed, security (of which foreign policy is a part) is first and foremost a performance discourse constitutive of political order: after all 'Securing something requires its differentiation, classification and definition. It has, in short, to be identified' (Campbell 1992).

One central difference between realism and post-modernism concerns their epistemologies (ideas about knowledge). Post-modernists argue that there are no secure, timeless, and uncontested foundations for making choices about interpretations. This leads back to the view of theory as ideology, and as such there is no such thing as value-free enquiry. Realism is

also viewed not only as a statist ideology, largely out of touch with the globalizing tendencies which are occurring in world politics, but also as a dangerous discourse which is the main obstacle to efforts to establish a new and more peaceful hegemonic discourse. This is because it purports to provide a universal view of how the world is organized and what states have to do to survive. Post-modernists reject what they see as the 'preposterous certainty' of realism. In their view the enormous complexity and indeterminacy of human behaviour, across all its cultural, religious, historical, and linguistic variations means that there can be no single interpretation of global reality. The problem with realism according to this view is that by reducing the complexities of world politics to a single rigidly ordered framework of understanding, alternative interpretations and approaches to international security are ruled out. If the world is thought of in terms of anarchy, then 'power politics' will be seen as the solution to the problem of insecurity. On the other hand, if anarchy and power politics are not seen as being an endemic feature of global history then other more peaceful approaches to security might be tried. This has led post-modernist writers to try and reconceptualize the debate about global security by opening up new questions which have been ignored or marginalized. Jim George has argued that in the new post-Cold War strategic discourse

"attention ... has been focused on the growing sense of insecurity concerning state involvement in military-industrial affairs and the perilous state of the global economy. Questioned, too, has been the fate of those around the world rendered insecure by lives lived at the margins of existence yet unaccounted for in the statistics on military spending and strategic calculation" (George 1994).

George argues that such questions require a new communitarian discourse about security. Post-modernists believe that it is not only essential to replace realism with a communitarian discourse but it is an achievable objective. Because experts, and especially academic writers, have an important role to play in influencing 'the flow of ideas about world politics', it is vital for them to play their part in the process of transforming language and discourse about international politics. The whole nature of global politics can be transformed, and the traditional security dilemma can be overcome, if post-modern epistemic communities play their part in spreading communitarian ideals.

37.7 Conclusion

This chapter suggests that approaches to the study of security in the international relations literature have changed significantly from the days when realist views were both pre-eminent and unchallenged. Positivist approaches have been challenged by post-positivist theorists. The central role of the state in realist thinking has been challenged by those who feel that the state has been unnecessarily privileged. Also, the traditional narrow largely military definition of security has given way to a broader understanding of what it means to be 'secure' or 'insecure'. At the same time, however, fundamental differences between those who claim to be optimistic and pessimistic about the possibilities for future security remain. Both approaches provide useful insights and as constructivists point out, such claims themselves can have an impact on international security. It is also important to note that the optimistic and pessimistic traditions in the international relations literature tend to reflect the prevailing conditions in world politics: idealism in the early days of the League of Nations, realism during much of the Cold War period, followed by a new period of idealism after the Cold War ended and then back to realism after the events connected with the 9/11 attacks on the United States. In all of these phases, however, periods of conflict and peace have resulted in challenges to the dominant, prevailing approach to international security. In the early twenty-first century, despite important changes which have been taking place in world politics, this traditional ambiguity towards international security remains. In many ways the world is a much safer place as a result of the end of the Cold War and the removal of nuclear confrontation in East-West relations. The spread of democratic and communitarian values, some of the processes of globalization, and the generally cooperative effects of international institutions have played an important part in dampening down the competitive aspects of the security dilemma between states. This is reflected in some of the contemporary Grotian writings on international relations (Brauch 2004).

These trends have been offset by the September 11 attacks, the war in Afghanistan, the Iraq War, and the 'war on terror'. These conflicts demonstrate the continuing importance of military force as an arbiter of disputes both between, and particularly within, states, as well as the perceived importance of violence by terrorist groups as a weapon to alter the status quo. Conventional arms races continue in different regions of the world; nuclear, chemical, and biological weapons

still provide a powerful influence on the security calculations of many states; crazy and ambitious politicians remain at the head of some governments; and cultural differences, as well as diverse values and the tensions inherent in globalization itself prevent the emergence of global agreement on a wide range of important issues. This has resulted in 'the return of realism' in some of the literature on international relations, especially in the period since 9/11 (Gray 2005).

It remains much too soon to conclude that a paradigmatic shift is taking place in international politics in favour of either the optimistic or pessimistic perspectives. It is possible to identify some new and positive developments which are taking place in the contemporary world (in terms of EU expansion) which suggest that the future of world politics may differ from the past. But the empirical historical evidence, as well as contemporary events (associated with global terrorism), suggest caution. Periods of more cooperative interstate (and inter-group) relations have often in the past led to a false dawn and an unwarranted euphoria that 'perpetual peace' was about to break out. Given the events since 9/11, realism or the Hobbesian tradition, is once again, if not the centre of the stage, then at least a dominant perspective in the contemporary literature and indeed amongst world statesmen. (Meyer 2005: 61). But the alternative approaches, especially constructivism, which became more significant in the early days of the post-Cold War period, remain an important part of the contemporary discourse on international security. Changes in thinking about international security may not have led to a fundamental reconceptualization of security but alternative approaches have provided not only a broader view of what constitutes 'security' and a questioning of the traditional preoccupation with the central role of the state, but also an important challenge to some of the certainties of the traditional assumptions associated with realism. As such, there is now a much healthier and more vibrant debate about international security than existed during the Cold War period between 1945 and 1989. Whether war remains a perennial feature of the world in which we live, or whether it can be transcended or only mitigated, remains one of the central questions that face mankind.

38 Security in Peace Research and Security Studies

Ulrich Albrecht and Hans Günter Brauch

38.1 Introduction¹

In the Covenant of the *League of Nations* (1919) and in the *United Nations Charter* (1945), ‘international peace and security’ have been used together as the key purposes of both international organizations to be achieved by global (chap. VI and VII of UN Charter) and regional systems (chap. VIII of UN Charter) of collective security, as well as by collective and national self defence (Art. 51 UN Charter; chap. 4 by Wæver; chap. 35 by Bothe).

International relations as a social science discipline (chap. 37 by Baylis) has emerged after the Peace Conference in Versailles (1919), relying on knowledge in political philosophy, diplomatic and military history and international law, and it was influenced by the three ideal type traditions the English school has identified with realism (Hobbes), rationalism or pragmatism (Grotius 1625, 1975), and idealism (Kant), that have also existed in other intellectual traditions (Chinese, Indian, Arabic, pre-Columbian) and may be associated with many other thinkers unknown to the Western debate (chap. 3 by Brauch; chap. 10 by Oswald; and chap. 11–21).

Peace research and security studies are two distinct research programmes within the sub-discipline of international relations (IR) and also beyond, due to their multidisciplinary approaches that combine knowledge from philosophy, sociology, psychology, anthropology, and law. Both research programmes are identified with one of the two common goals and purposes of the League of Nations and of the United Nations. While peace research has evolved primarily in the idealist and security studies in the realist tradi-

tion, the Grotian tradition has offered a common middle ground for both programmes.

This chapter addresses two questions: How have the concepts of security evolved in both schools during the 20th century? Did the three global changes: a) the global contextual change in 1990, b) globalization, and c) the emerging ‘anthropocene’ (Crutzen/Stoermer 2000; Crutzen 2000) trigger a reconceptualization of security? To answer these questions, books surveying the evolution and results in both schools will be reviewed in the next five parts.

However, much of the conceptual debate on security and on its reconceptualization has taken place in scientific journals: for peace research especially in the *Journal of Peace Research* and *Security Dialogue* published by the International Peace Research Institute in Oslo (PRIO), and for security studies in *Survival* (IISS) that has been interested more in issues of the changing security agenda and *International Security* (Kennedy School of Government, Harvard University), the leading journal in the US, where many of the new global dangers for US national security have been addressed.²

The evolution of both schools since 1919 will be reviewed (38.2) and the key conceptual disputes between both schools prior to, during, and after the Cold War will be listed (38.3) that provided the framework for the evolution of the security concept in security, strategic, and war studies (38.4) as well as in peace research (38.5) and for the post Cold War dispute between those who adhere to a narrow primarily military and diplomatic security concept and the ‘wideners’ who have combined five dimensions and sectors with five different referent objects and levels of analysis (38.6).

1 The authors appreciate the critical and constructive comments and stimulating suggestions by Úrsula Oswald Spring (Mexico) who commented on two text versions, and by Czesaw Mesjasz (Poland) and Pál Dunay (Hungary) who reviewed the second revised text. Their comments are reflected in this text.

2 See: Lynn-Jones/Miller 1995; Ullman 1983, Homer-Dixon 1991, 1994; Lowi 1993, 1995, 1998; Lowi/Shaw 2000; Gleick 1990, 1991, 1993, 1993a, 1994, 1998, 2000.

38.2 The Two Schools and Three Traditions

The discipline of international relations was born on 30 May 1919 at the Peace Conference in Versailles (Paris) when policy advisers of US President W. Wilson and British Prime Minister L. George agreed to establish scientific institutes for the study of international relations in their countries that should focus on the causes, conditions, and forms of war and peace, and on the approaches and results of international conflict resolution as its conceptual core (Meyers 1979, 1984, 1993, 1994, 1994a). Meyers (2000) saw this new discipline as a science interpreting and resolving crises. According to this interpretation the study of international relations may be understood as an answer of the scientific community to extra-scientific, socio-economic, and political crises that could not be satisfied by the traditional approaches of diplomatic history, political philosophy, and international law (Meyers 1994a: 231).

In the two decades between the World Wars (1919–1939), in the new discipline of international relations an idealist approach focusing on international organizations and institutions prevailed that was being challenged from a realist perspective (e.g. by Carr 1939; Spykman 1942; Morgenthau 1948, 1960; Waltz 1959, 1979).

During the Cold War period (1947–1989) international relations in the West was dominated by theoretical approaches and concepts developed by and disputes among different schools of American scholars that influenced this emerging field in Europe, in the Asia Pacific, as well as in many Third World countries in Africa, Latin America, and in the Arab world whose IR experts were primarily trained in American, British, Canadian, and French universities and graduate schools. During the period of state socialism (1917–1991), the theoretical and conceptual debate in the East was influenced by the Marxist-Leninist ideology, and in China by Maoist thinking that was gradually revised by Deng Xia Ping during the 1980's. In the Socialist world many scholars and political leaders from liberation movements and progressive governments were trained in Marxist approaches to international politics. In the South, in Asia, Africa, and Latin America different regional and national traditions prevailed that were often inspired by the political leaders of liberation movements (Nasser, Nkruma, Nyere) and by third world intellectuals (e.g. Abdel Malek, Samir Amin). From the 1960's to the 1980's, in Latin Ame-

rica, the school of '*dependencia*' influenced the thinking on international relations and on development.

With the end of the Cold War the US intellectual dominance in the IR discipline has declined, and the Soviet influence disappeared with the implosion of the USSR. Since then an increasing theoretical and conceptual diversity has emerged and many new centres of conceptual innovation are blossoming in all parts of the world (Albrecht 1987, 1997, 1999; Crawford/Jarvis 2001). Despite the many schemes and approaches in IR, three scientific traditions are crucial.

38.2.1 Scientific Traditions and Schools of International Relations

Three intellectual traditions of thought, macro theories, or images of the world on IR have been distinguished by the English school (Wight 1991; Bull 1977; Buzan 2001, 2004, 2006):

- the *Hobbesian* or *Machiavellian* pessimist or *realist* with the primary focus on power politics and with a specific emphasis on military strategy (Malnes 1993);
- the *Kantian* optimist or *idealist* focusing on international law and human rights (Covell 1998);
- the *Grotian* pragmatic internationalist or *rationalist* pursuing opportunities for cooperation irrespective of the power difference and the democratic deficit (Bull/Kingsbury/Roberts 1992; Onuma 1993).

While in the early years of international relations during the inter-war period, legal perspectives in the Wilsonian tradition prevailed in the UK and US (Alger 1968; Meyers 1979, 1994a), since 1945 scholars working in the US have dominated and influenced the thinking and writing on international relations. Since then, at least five debates (Maghooori 1982; Baldwin 1993) between two opposite schools of thought occurred first in the US and later within the 'OECD world':

- 1st debate in the late 1940's and 1950's between supporters of realism (Carr 1939; Morgenthau 1948, 1969; Herz 1959; Niebuhr 1949) that called for power politics and the so-called *idealists* in the Wilsonian tradition who stressed international law and institutions (Claude 1962; Clark/Sohn 1966). Realist notions and concepts dominated the teaching of undergraduates, in graduate schools, and in

research programmes that trained the Western foreign policy and security elites.

- 2nd debate during the 1950's between *traditionalists* (both realists and idealists of the 1st debate) that often relied on common sense based on historical evidence and the *behaviourists* (Bill/Hardgrave 1973; Rosenau 1969; Snyder/Paige 1978) that called for rigorous quantitative methods. Many early peace researchers of the 1950's and 1960's were in the behaviouralist tradition and heavily relied on quantitative methods.
- 3rd debate (Sullivan 1978) between the adherents of a state-centric approach (*realists*: Waltz 1970, 1979) and proponents of global interdependence (*globalists* or transnationalists: Cooper 1968; Kaiser 1969; Morse 1969; Keohane/Nye 1970, 1977) that focused on the objects and actors of analysis: the state vs. transnational economic (e.g. transnational corporations) or societal actors, or between the 'state world' and the 'economic' or 'societal' worlds (Czempiel 1991, 1993). The shift from state to non-state actors was taken up in the 1990's in the debate on deepening of security and in the human security concepts.
- 4th debate (Baldwin 1993: 3–28) in the 1980's and early 1990's between the *neoliberal* challenge (Stein 1993; Lipson 1993; Milner 1993) and the *neorealist* response (Keohane 1986, 1993; Grieco 1993, 1993a).
- Since the end of the Cold War two parallel debates have taken place among analysts of *globalization* (primarily in OECD countries) focusing on processes of deterritorialization and deborderization and proponents of new 'spatial' approaches to international relations (*geo-strategy, traditional and critical geopolitics, geo-economics, geo-ecology*).

These three ideal type traditions and at least five fundamental debates have affected the research in the two schools of peace and conflict research as well as in security, strategic, and war studies.

38.2.2 School of Peace and Conflict Research

Peace research as an independent research programme focusing on wars and weapons was established in the inter-war period. Among the intellectual founders were Quincy Wright (1942) on causes of war in the US and Lewis Frye Richardson (1960a) on mathematical models of arms races in the UK. Since the beginning of the Cold War, in response to the prevailing realist paradigm in International Relations

(IR), peace research centres, academic programmes at universities, and private institutes were established starting in 1945 with the *Peace Research Laboratory* (Theodore Lentz in St. Louis, Missouri), in 1951 the *Institute of War and Peace Studies* (Columbia University) that were influenced by studies by Kenneth and Elise Boulding, Herbert C. Kelman, David Singer, in Canada (Canadian Peace Research Institute (CPRI), 1961, founded by Norman Alcock, Alan and Hanna Newcombe), and in Norway (PRIO, 1959 by Johan Galtung), during the 1960's in Sweden (SIPRI, 1966 by Gunnar Myrdal), in Denmark (PCRI, 1967 by Rasmussen, Herman Schmid), in the Netherlands (Polemological Institute, by Bert Röling in Groningen), the UK (Richardson Institute), in the 1970's in Finland (TAPRI), Germany (HSFK, ISFH), Japan (Hiroshima Univ.), and since the 1980's in many other countries around the globe (preface essay by Oswald; Brauch 1979; Jahn 1994; Kodama 2004; Koppe 2006).

During the Cold War period, peace research focused both on the militarized East-West conflict and on the issues of underdevelopment and North-South relations that was aimed both at the scientific community (basic research) but also at the government elites (policy advice) and as alternative expertise at critical social (peace, environment, development, human rights) movements. Since 1990, peace and conflict research has been confronted with many new political and conceptual challenges after the collapse of the Soviet Union and the Warsaw Pact, and their transformation from one party to multi-party systems, with new wars, problems of nationalism and ethnicity, and with a rethinking on concepts of security. While during the Cold War the major focus of peace research were critiques of the security and armament policies in West and East³, since the 1990's many peace researchers have shifted to a widened (Krell 1981) and deepened security concept, especially to societal (Wæver chap. 44), environmental⁴, and human security⁵ issues.

3 See e.g. for the German debate: Albrecht 1972, 1972a, 1974, 1975a, 1976a, 1980, 1982, 1983, 1984; Brauch 1982, 1983, 1984, 1986, 1986a, 1987, 1987a, 1989, 1989a; Jahn 1991; Jahn/Lemaître/Wæver 1987; Senghaas 1969, 1970, 1972a.

4 Gleditsch 1996, 1997, 1997a, 1998, 1998a, 2001, 2001a, 2001b, 2001c, 2002, 2003; Brock 1991, 1992, 1997, 1999.

5 See the "Human Security Doctrine for Europe" co-authored by: Albrecht/Chinkin/Dervis/Dwan/Giddens/Gnesotto/Kaldor/Licht/Pronk/Reinhardt/Schméder/Seifert/Serra 2004.

In 2007, the most influential peace research institutes with a focus on basic social science research are PRIO (Oslo), PRIF (Frankfurt, Germany), the Institute for Peace Science, Hiroshima University (Japan) and many others, and with a policy focus SIPRI (Stockholm, Sweden), the US Institute of Peace (Washington, D.C.), IFSH (Hamburg, Germany), Swisspeace (Berne, Switzerland) and others.⁶ Since 1964, many peace researchers and peace and conflict research institutes have cooperated in the framework of the *International Peace Research Association* (IPRA)⁷, of the *Peace Science Society* (International)⁸, and within the *Peace Studies Section* of the *International Studies Association*, and the *Peace and Justice Studies Association* (PJSJA)⁹ in the US that formed in 2001 as a result of a merger of the Consortium on Peace Research, Education and Development (CO-PRED) and the Peace Studies Association (PSA). For those within the peace research community who have focused on ‘negative peace’ (Galtung 1969, 1975), security issues, and conceptual approaches have been a major concern.

Since the late 1960’s, many scholars from the peace and conflict research community critiqued the approaches and analyses of the security studies community both from theory-guided as well as policy perspectives (Krippendorff 1968; Senghaas 1969, 1972, 1973; Albrecht 1971, 1972, 1974, 1975; Albrecht/Eide/Kaldor 1976). During the 1980’s, critical peace researchers and security specialists focusing on ‘alterna-

tive’ security (Weston 1990) and ‘non-offensive’ (Møller 1991, 1992, 1995), ‘non-provocative’ (Boeker), ‘defensive’ (Brauch/Kennedy 1990, 1992, 1993) or ‘confidence building’ defence (SAS 1984, 1989) emerged as alternative experts to advise political parties, social movements and the media, and thus contributed to a conceptual debate that mobilized millions of people in Europe against the deployment of new nuclear weapons and missiles in East and West, but also for the realization of disarmament and human rights in all parts of Europe.¹⁰ During the Cold War period a narrow security concept prevailed that focused on the political and military dimension in most studies from a peace research perspective.

38.2.3 School of Security, Strategic, and War Studies

International and national security, strategic, and war studies are often used synonymously, while others have defined ‘security studies’ as a broader and ‘strategic’ and ‘war studies’ as a more narrow research programme in the realist and primarily Hobbesian but also in the pragmatic Grotian tradition (Buzan 1991, Betts 1997). According to Wæver and Buzan (2007), strategic studies was used from the 1940’s to the 1980’s for dealing with military affairs, while since the 1980’s they were often relabelled as security studies. The term ‘war studies’ has been used in the UK (King’s College, Department of War Studies) and in Canada (Royal Military College).

Security or strategic studies emerged in the US after World War II with the Cold War when the new US global military role, innovation in military technology, and the role of nuclear weapons created a need of the national security, military, and intelligence community for secret policy advice, but also a political interest in an intensive national security debate to sustain high military expenditures. In 1948, the RAND (Research and Development) Corp. was set up to improve policy and decision-making through research and analysis.

During the 1950’s and 1960’s, security studies developed and applied systems analysis contributed to the development of doctrines and to the debate on theories of nuclear deterrence, and focused on arms control, strategic decision-making, alliance policy, counter-insurgency, and economics of defence. In the

6 See for lists of peace research centres around the globe: <http://www.priub.org/afb_pri/pri.htm>; for surveys of peace research history and research results, e.g. in Germany, see: Krippendorff (1968); Eberwein/Reichel (1976); Brauch (1979); Graf/Horn/Macho (1989); Hauswedell (1997); Wasmuth (1998); Eckern/Herwartz-Emden/Schultze (2004); Koppe (2006).

7 IPRA was founded in 1964. See the Preface Essay by Oswald and for more information of IPRA’s history and activities see at: <<http://soc.kuleuven.be/pol/ipra/about/history.html>>.

8 The Peace Research Society (International) was established in 1963 by Walter Isard. In 1973, the Society became the Peace Science Society (International). Stuart A. Bremer served as the Executive Secretary of the Society from 1989–2002 and Glenn Palmer since 2002. The PSS(I) as a “scientific association of individuals developing theory and methods for the study of peace” has been a US based association. For the history and activities see at: <<http://pss.la.psu.edu/2007-History.htm>>.

9 See for details at: <<http://www.peacejusticestudies.org/index.php>>.

10 See: Albrecht 1980, 1985, 1986, 1988, 1989, 1989a; Albrecht/Krasemann 1989; Albrecht/Nikutta 1989; Brauch 1982, 1984, 1986, 1986a, 1987, 1989.

1970's area studies, arms race theory, proliferation of weapons of mass destruction and advanced technology, and intelligence were added. Since the 1960's security studies increasingly became also an academic undertaking distinct from the approach of think tanks and consultancy firms, and research programmes were set up at several of the leading US universities (e.g. at: Harvard, Stanford, Yale, Pittsburgh and SAIS), and in the late 1970's and early 1980's sections on international security studies were formed within ISA and APSA (Wæver/Buzan 2007).

According to Wæver and Buzan (2007: 383-402), security studies "emerged in the US and was exported to Europe". In Europe, security studies were conducted in foreign policy institutes, in military academies, and military staff colleges that aimed at policy advice and training of military officers. In Europe, leading military strategic thinkers were P.M.S. Blackett, Basil Liddle Hart, Michael Howard and Laurence Freedman in the UK, Raymond Aron and Pierre Hassner in academe and several generals in the military in France, and Christoph Bertram and Lothar Rühl, two journalists, decision-makers, and policy advisers in Germany.

In the Soviet Union and in Russia, the two major foreign policy think tanks within the Academy of Science, IMEMO and the Institute of US and Canada Studies, became major centres of conceptual and policy innovation during the Gorbachev era, and their concepts - partly adapted from the arguments of alternative security experts in the West - contributed to many Soviet foreign policy and arms control initiatives in the late 1980's.

The main global security studies institution is the *International Institute of Strategic Studies* (IISS) that was founded in 1958 in London and initially focused on problems posed by nuclear weapons. During the 1960's and 1970's, the IISS contributed to concepts of nuclear deterrence and arms control, and in the 1970's and 1980's it set up a regional security programme that focused on conflicts. In the 1990's, after the Cold War the IISS dealt with problems of ethnic conflict, dramatic political change, peacekeeping, and local arms control. As a policy institute, the IISS tries to innovate and influence and to facilitate contacts between government leaders, business people, and analysts on international security. IISS publishes the journal *Survival*, the *Adelphi Papers*, as well as the annual *Strategic Survey* and *Military Balance*, and on occasion books and dossiers.¹¹

Since the end of the Cold War, 'critical security studies' emerged in the US (Klein 1994), Canada

(Krause 1999; Macleod 2004), and in the UK (Booth 2005). In Canada¹², in the US¹³, in the UK¹⁴ and within UNU¹⁵, research centres and programmes were set up that have focused on human security issues. In Europe, three new intellectual schools of security studies developed that may be associated with Aberystwyth, Paris, and Copenhagen (Wæver 2004).

38.3 Disputes Between Two Research Programmes

Between these two research programmes of peace and conflict research and security, strategic or war studies, many scientific disputes existed on theoretical assumptions, methodological approaches, and on policy issues where the different concepts of security on which both schools based their analyses were mostly ignored. Below these disputes are briefly listed before the different security concepts are reviewed and discussed in parts 38.4 and 38.5 (table 38.1).

38.4 Evolution of Security Concepts in Security Studies

With the end of the Second World War two new concepts of 'international peace and security' in the UN Charter (1945) and 'national security' in the US National Security Act (1947) entered the vocabulary of international politics and of the scientific discipline of

international relations (Wæver 2006; chap. 1 by Brauch, chap. 4 by Wæver, chap. 35 by Bothe).

Between 1945 and 1949 the US national 'security system' gradually evolved. While in 1939, President Roosevelt still defined the Western hemisphere as the zone of American security, this zone had become global by 1945. Czempiel (1966) distinguished between direct and indirect, ideological and strategic, universal and ubiquitous dimensions of this new US security system without defining the meaning of the concept of security itself. In his *peace strategies* Czempiel (1986) distinguished among three means to achieve peace, by collective security, by changes of the societal structures (system of rule), and by achieving welfare, thus pointing to three problem areas for the analysis of international relations: security, system of rule, and welfare where security prevails over welfare.

In the UK, E.H. Carr (1939), an early realist critic of the idealism in international relations in the inter-war years, in his *The Twenty Years Crisis* focused extensively on military and economic power, but not on security (Tickner 1995: 175-177). In *Nationalism and After*, Carr (1945) called for a 'pooled' or 'common' security based on a world security organization with standing international force which was dismissed by many American realists as 'unrealistic' who claimed the lack of pursuing 'national security' interests in the 1930's was responsible for WW II (Morgenthau 1973). Thus, during the Cold War period (1947-1989), for the realist mainstream in IR, the 'national security' concept focused on the state as the referent object that prevailed over other security concepts both in the political debate and in the emerging research programmes on 'strategic' and 'security studies'. But what did the key value and goal of this analysis, the concept of 'security', mean for this research programme?

During the Cold War, Arnold Wolfers (1952, 1962: 147-165) noted for the US a shift from a welfare to a national security interpretation of the 'national interest' where the latter has become synonymous with national security. However, he cautioned that "security covers a range of goals so wide that highly divergent policies can be interpreted as policies of security." With Lippmann he argues that "a nation is secure to the extent to which it is not in danger of having to sacrifice core values, if it wishes to avoid war, and is able, if challenged, to maintain them by victory in such a war." Like power and wealth, security is a core value of a nation, then follows what has become a classic definition of the security concept in IR:

But while wealth measures the amount of a nation's material possessions, and power its ability to control the

actions of others, security, in an objective sense, measures the absence of threats to acquired values, in a subjective sense, the absence of fear that such values will be attacked (Wolfers 1962: 150).

Wolfers acknowledged that security dangers cannot be measured objectively but are always the result of subjective evaluation and speculation. National efforts to achieve greater security are also a function of their power and opportunity to reduce dangers through their own efforts. Besides the extent of the external threats, "numerous domestic factors such as national character, tradition, preferences, and prejudices will influence the level of security that a nation chooses to make its target" (Wolfers 1962: 153).

For Frei and Gaupp (1976, 1978: 3-16) security is both a "value symbol" but often it is used as an empty formula that has been associated by Kaufmann (1970) with a lack of dangers or by Nye with a lack of dangers or threats. But which values are to be protected against which dangers? Among them are a minimal economic welfare, a certain political and social autonomy, and status as a group, or the survival of the system. However, the latter must be put in a specific context with types of actors and situations. The more the intended values are above the desired level, the higher the degree of security achieved will be. State security as the realization of state values at a desired level is being endangered at three levels of conflict and uncertainty: a) within society (*internal security*); b) within political and non-political relations of the state and society towards its context and to international organizations (*relational security*); c) within the context in other states and societies and in international organizations (*contextual security*). This pointed to four functional levels of state security of reproduction, production, steering, and integration.

Frei and Gaupp (1978) interpreted insecurity as a consequence of conflict and uncertainty where values are being threatened by scarcity and or inconsistency, and by an uncertainty whether they can be reached in the future. Achieving security (i.e. the probability of the desired value configuration and level of realization) depends on whether, a) both value scarcity (conflict on distribution) and value inconsistency (due to ideological conflict) may endanger values; and b) incomplete information and a missing coordination of action lead to uncertainty. The degree of security depends on the externally determined uncertainty of conflict and on the self-determined strategies for reducing insecurity. They distinguish among these four dimensions of security political strategies: a) the approach of dealing with the conflict and uncertainty; b)

self-determined and context-oriented strategies; c) strategies of power and confidence; d) individual or collective self-interested strategies (Frei 1977; Gaupp 1978),

The basic works by Kaufmann (1970) and Frei (1977, 1990) and by Frei and Gaupp (1978), as well as many studies in French, Spanish, Japanese, and in many other languages remained unnoticed in the dominating Anglo-Saxon security studies literature.

Buzan (1983: 1) correctly argued that “one needs to understand the concept of security in order to have a proper understanding of the national security problem, and secondly, that in its prevailing usage the concept is so weakly developed as to be inadequate to the task.” For Buzan (1983: 3–9) security is an underdeveloped concept both in IR and in strategic studies that has been both ‘ambiguous’ (Wolfers 1962) and ‘contested’ (Gallie 1955–1956) due to its partial overlap with the concept of power, to the reactions to the realist orthodoxy from peace research, to the nature of strategic studies, and to the interest of policy-makers to maintain its ‘symbolic ambiguity’. While Buzan (1983: 11) does not offer a definition of security, rather his objective is “to develop a holistic concept of security which can serve as a framework for those wishing to apply the concept to particular cases.” In his conceptual introduction to strategic studies, Buzan centres on two questions: “What is the referent object for security?” and “What are the necessary conditions for security?”

Inspired by Waltz (1959) Buzan (1983) analysed as referent objects individuals (18–35), states (36–72), and the international system (73–92). Individual security is seen as a social problem (e.g. ‘social security’) with two faces of the state as a protector and as a source of threat. National security is analysed as an object of the interrelationship between the idea of the state, its physical base, and its institutional expression. The nation state is confronted with manifold threats and vulnerabilities. Within the international political system the state is confronted with both international anarchy, a specific system structure, and security complexes that pose a defence as well as a *power-security dilemma*¹⁶ for the state. Buzan (1983: 245–258) concluded his analysis with a plea for a holistic view of security that discusses national security in relation to the individual, the state, and the international system.

In the immediate aftermath of the Cold War, Lynn-Jones (1991/1992: 53–63; 1992) conducted a review of international security studies (ISS) for the ISS section of ISA that raised three questions: How will the end of the Cold War affect ISS? Should the field

adopt a new agenda? Does it have the analytical tools to answer new questions? He defined as the object of ISS: “international violence and threats to the security of states” with two key themes: “1) the causes and prevention of war, and 2) strategy – how military forces are used for political purposes” while “the effects of wars” received less attention. ISS “has always been a multidisciplinary enterprise, embracing the approaches of political science, history, psychology, economics, sociology, and the physical sciences.”

He defined ‘national security’ as “defending a particular state against external threats,” for ‘international security’ “security interdependence renders the unilateral pursuit of security impossible,” while ‘global security’ refers to “institutions to deal with ecological, economic, military and other threats to the global community or even the survival of the planet.” Within ISS, its scope of analysis from a narrow focus of ‘national security’ on violence and war to a wide focus of ‘global security’ remained controversial, but a consensus emerged that the traditional war and peace issues remained important but that the nature of threats should be broadened when they became a cause of conflict, and economic threats that may undermine the state’s industrial base should be included.

Lynn-Jones (1991/1992: 56–58) added to the agenda for future security studies: regional security issues in the developing world, the proliferation of weapons of mass destruction, issues of US defence policy, US grand strategy, problems of nationalism, the causes of peace and cooperation and economics and security, but not environmental security issues that have been

16 Buzan (1983: 157–158) distinguished between a *defence* and a *power-security dilemma*. According to his definition the defence dilemma arises from “the nature and dynamics of military means as they are developed and deployed by states.” Buzan (1983: 159) further argued that the most serious *defence dilemma* occurs “when military measures actually contradict security, in that military preparations in the name of defence themselves pose serious threats to the state.” In contrast the *power-security dilemma* (Buzan 1983: 173–213) deals with political problems, which he explained for revisionism and the arms dynamic. For Buzan (1983: 207) the *power-security dilemma* is sustained “not only by the tensions between status quo and revisionist interests, but also by the massive momentum of the arms dynamic”. These two dilemmas refer to the dichotomy of the two rival interpretations of the armaments dynamics: an *external* (threat based) vs. an *internal* (autodynamic) causation. For a review of the debate on the *security dilemma* (Herz 1950) see chap. 40 by Brauch.

suggested by Ullman (1983), Myers (1989) and Mathews (1989) in the US debate.

One of the leading American neo-realists, Stephen Walt (1991: 211–239), observed a “Renaissance of Security Studies” since the mid 1970’s when security studies started to become “more rigorous, methodologically sophisticated, and theoretically inclined”. According to Walt (1991: 212) the main focus of security studies is “the phenomenon of war.” They may be defined as “the study of the threat, use, and control of military force” (Nye/Lynn-Jones 1988) by exploring the conditions “that make the use of force more likely, the way the use of force affects individuals, states, and societies, and the specific policies that states adopt in order to prepare for, prevent, or engage in war” (Walt 1991: 212). Security studies also include “statecraft – arms control, diplomacy, crisis management,” Walt argued against a widened security agenda because this would destroy its intellectual coherence. He argues that much work of consultants and think tanks supported by defence contractors and the US Department of Defense (DoD) is rather political than scientific and that it should often be treated as propaganda instead of serious scholarship.

In his review of the different phases of security studies, from the Golden Age (1955–1965), to the decline in the 1960’s, and the renaissance since the mid 1970’s, Walt avoided a detailed definition and discussion of his own neo-realist security concept. Walt acknowledged that peace researchers rather than civilian strategists and the behavioural revolution in the social sciences “made a major contribution to the methodological self-consciousness of the international relations profession” (Walt 1991: 215). Methodological weaknesses, the lack of training of junior scholars, the political debate on the Vietnam War, but also détente with the USSR and the declining economic status of the US, shifted the interest from international security to international political economy.

In the US the renaissance of security studies as an academic field started in the mid 1970’s when the Ford Foundation sponsored several strategic centres in security studies, e.g. at Harvard, MIT, Stanford, Cornell and UCLA, and when the journal of *International Security* (1976) and the *Journal of Strategic Studies* (1978) were founded. During this second phase, several new developments emerged, such as the use of history with the method of ‘structured focused comparison’ (George 1979, 1988), the challenge to rational deterrence theory, case studies on strategic weapons projects (Brauch 1990), a new focus on conventional warfare and on US grand strategy and the

relationship of security studies and IR theory, as well as the political events of the end of the Vietnam War and the collapse of détente. For the security studies in academe theory creation, testing became preconditions for theory applications. Walt saw the major challenge for security studies in the post Cold War era to steer “between the Scylla of political opportunism and the Charybdis of academic irrelevance.”

Walt (1991: 225ff.) cautioned against the claims of the postmodern approaches, the use of formal models and an overemphasis on short-term policy applications. He added to the agenda of future security studies: the role of domestic politics, the causes of peace and cooperation, the power of ideas, the end of the Cold War, questions of economics and security, refining of theories, and a protection of the database. He called for a steady research support to enable an evolution of knowledge.

In a critical response to Walt, Edward A. Kolodziej (1992: 421) called for “analytic, normative and methodological perspectives ... for a richer conceptual, broader, interdisciplinary, theoretically more inclusive, and ... a more policy-relevant understanding of security studies.” Instead of an exclusive focus on ‘American national security’ based on a narrow notion of realism, he proposed to analyse “international security or security per se” including the “threats posed by states to groups and individuals” and those posed by “non-state actors” such as guerrilla, terrorism, and low-intensity warfare, and the dual nature of the state as an object of these movements and as a “major source of international insecurity” (Kolodziej 1992: 422–423). This critical response reflected a call of a deepening of the security actors, away from the narrow state-centred focus, for both security by whom and for whom.

Kolodziej proposed a set of guidelines, including 1) a broader scope of ‘reality’ to be covered; 2) the behavioural and normative assumptions on which the research is based should be states; 3) the disciplinary and interdisciplinary scope should be widened; 4) the historical and empirical bases for generalizations should be widened beyond the Western or exclusively American context; 5) the problem to be solved should determine the scope and parameters of normative theory; and 6) “resist the temptation to consign security studies to a ghetto within the academy” (Kolodziej 1992: 435–437).

The dispute between Walt (1991) and Kolodziej (1992) is partly reflected in what Buzan, Wæver, and de Wilde (1998) have described as the debate between the adherents of state-centred traditionalists and a

wider concept of security with different referent objects and sectors or dimensions of analysis. However, both have avoided defining the very concept of security as the key value and goal of security studies.

Buzan (1991, 1997) and the Copenhagen school (Buzan/Wæver/de Wilde 1998; Wæver/Buzan/de Wilde 2008), whose members have come both from an unorthodox realism and strategic studies (Buzan) as well as from pragmatic peace research (Wæver and de Wilde) and have sometimes perceived themselves as Grotians, have opted for the wideners and combined five levels of analysis (international system, international subsystem, units, subunits, individuals) with five security sectors (military, environmental, economic, societal, political). The key question of their conceptual security analysis is: "what quality makes something a security issue in international relations?" In their view security is about survival:

It is when an issue is presented as posing an existential threat to a designated referent object (traditionally, but not necessarily, the state, incorporating government, territory, and society). The special nature of security threats justifies the use of extraordinary measures to handle them. The invocation of security has been the key to legitimizing the use of force, but more generally it has opened the way for the state to mobilize, or to take special powers, to handle existing threats (Buzan/Wæver/de Wilde 1998: 21).

The key innovation of the Copenhagen school has been Wæver's theory of securitization that is defined as an intersubjective process that is socially constructed. Wæver (1995, 1997; chap. 4 and 44) has discussed the concept of security as the first of two other related concepts of threat and defence. While the traditional referent object of security has been the state whose defence should be given priority and because of the nature of the international system. But while the state may be the main actor the primary referent object of security are the people who may be threatened by another state.

Terrif, Croft, James, and Morgan (1999: 1-9) in their introduction to 'security studies' noted "that there is no agreement what constitutes security", partly because its core "contain normative elements that mean that analysts and policy-makers cannot agree upon a definition through an examination of empirical data." In the post Cold War era there exists neither an agreement on the concept of security nor on the threats and who the enemy is. In the view of these authors this "is a product not only of the collapse of the Cold War structures but also ... of the collapse of the hegemony of the realist paradigm in international relations." They note that many national pol-

icy-makers and international relations officials, e.g. of the UN, OSCE, NATO, and EU (see part VII) have re-defined security concepts and agendas since 1990.

In their review of the security concepts in IR, these authors argued that there is disagreement on the referent point, be it the state or the individual, or as Job (1992) distinguished: "the security of the individual citizen, the security of the nation, the security of the regime and the security of the state." Similarly, there has been no agreement on the nature of the threat, and as the post-positivists argue "constructing 'threats' is part of constructing the 'other'". But for Ken Booth (1995: 344) "the enemy is us, Western consumerist democracy ... is the problem."

According to Terrif, Croft, James, and Morgan (1999: 185-189) the study of security studies as a subfield of IR has been influenced by the dispute between positivist, post-positivist, and critical approaches to theory whose epistemological bases are different, as well as the definition of security from the perspectives of postmodern, critical, feminist theory or from the vantage point of 'social constructivism:

Positivism assumes that international and security phenomena are materially based and have material explanations; relativists argue that international and security phenomena are ideationally based and can only be understood through examining discourse; and epistemological realism assumes that there is a material basis to the world, but that this can only be understood through the interaction of social forces that operate on the ideational level.

In the perspective of these authors "security and security studies at the end of the twentieth century seem disaggregated and bewildering." This is due both to the end of the Cold War, but also due to the "intellectual vibrancy of the subfield of security studies." Croft (2000: vii-xi) reviewed the changes in security policy and studies from 1980 to 2000, noting a widened discourse since 1990 which has resulted in a securitization of new areas of public policy as well as new threats, challenges, and risks.

Steve Smith (1991, 1995, 2000: 72-101) reviewed the changing conceptualization of security between 1980 and 2000 when "the concept of security was both widened and deepened." Based on his own experience of teaching security studies for 25 years, he noted: "Security studies is no longer something to be explained: it is also something to be understood, and this is a massive change of focus." In addition to the fundamental change in international politics, international relations and security studies have changed, "neo-realism is no longer dominant," and "the state is

no longer the only or core actor, and as a result it is less privileged than before.”

Within security studies, he distinguished between *traditional security studies* represented by Walt (1991), Baldwin (1995) and Betts (1997) in the US, Freedman (1987, 1993, 1998) in the UK, and Haftendorn (1991) in Germany. Most of them adhered to the state as the key referent object, and the *non-traditional literature* on a) *alternative defence and common security* (Palme Report 1982; Väyrynen 1985); b) the *Third World security school* (Thomas 1987; Walker 1988; Ayooob 1984, 1989, 1991, 1995), c) Buzan (1983) and the *Copenhagen school* (1998), d) *constructivist* (Adler/Barnett 1998; Katzenstein 1996), e) *critical* (Krause/Williams 1996, 1997; Booth 1991a, 1991d, 1995, 1997, 1998, 1999, 1999a; Wyn Jones 1995, 1995a, 1999), f) *feminist* (Tickner 1992, 1995; Steans 1998; Cohn 1987; Cooke/Woollacott 1993; Elshtain 1987, 1997; Enloe 1990, 1993; Brock-Utne 1985), and g) *poststructural* (Klein 1994; Campbell 1992, 1998; Dillon 1996; Campbell/Dillon 1993) security studies. For Smith and Booth security is “essentially a derivative term” that “refers to issues embedded within the deep structure of politics and economics, issues that emerge through the zones of conflict and become components of security policies.”

In light of 11 September 2001, Smith (2005: 27–62) returned to the review of the different schools within security studies on “the contested concept of security” interpreted all concepts of security as theory-dependent what makes a neutral definition of the concept impossible.¹⁷ Within the traditional literature on security, Smith distinguished among the rational choice, the neoclassic realism with its theories that focus on domestic policies, and offensive and defensive realist theories. While repeating most arguments and sources of his previous review in 2000, Smith notes in the conclusions the arguments of those who warn of an overextension of the security concept, and concludes that in his view “the events of September 11 support those who wish to widen and deepen the concept of security,” although this event has been used to streng-

then the position of the state and of military security. Smith concludes:

The concept of security is therefore a battleground in and of itself. There are those who wish to broaden and deepen it ...; and there is now a reinvigorated neoclassical realist school focusing on the traditional meaning of the term: the military security of nation states. To those working within the traditional area of the subject, broadening and deepening only threaten to undermine the utility of the concept and render it useless for analysis. If the concept of security refers to *any* threat, then it becomes meaningless. Broadening and deepening also carry the risk of undermining the important practices of state security, it is claimed by undermining the core activity of state security.

Based on the critical theory of the Frankfurt school, and stimulated by Ken Booth (1991, 1991a, 1991c, 1994, 1995, 1997a), Steve Smith and Michael Sheehan, Richard Wyn Jones (1999) developed an emancipation paradigm for security theory and practice. After developing his theoretical approach, he discussed theory and reconceptualizing security; technology and strategy; as well as emancipation and reconceptualizing practice.

Wyn Jones (1999: 93–123) argued that with the end of the Cold War the concepts and theories “lost whatever limited relevance they once enjoyed” and critical reassessments have emerged.¹⁸ He based his argument on the failure of realist and neo-realist approaches to predict the end of the Cold War and the peaceful transition¹⁹ partly on the overemphasis on the state. “Statism appears to be one of the main sources of insecurity” and has acted as “an ideological justification of the prevailing status quo in which the vast majority of the world’s population are rendered chronically insecure.”

He argues that traditional security studies has tended “to abstract military issues from their broader context by making a series of often implicit assumptions about that context based on realist premises, for example, those concerning the role and value of the state” (Wyn Jones 1999: 100, 102). He distinguishes between *deepening* (by understanding security as a derivative concept that reflects deeper assumptions on the nature of politics), *broadening* (the security agenda beyond military threats), and *extending* security (by overcoming state-centrism and moving to-

17 Developing his previous categorization of 2000 further, Smith (2005) reviewed six schools that were involved in the discussion of broadening and deepening the definition of the concept of security: a) the traditional literature, b) the Copenhagen school, c) constructivist security studies, d) critical security studies, e) feminist, and f) poststructuralist security studies, as well as on g) human security by looking at their methods and objects of analysis and not on their respective concepts of security on which these are based.

wards identity analysis and emancipation). Wyn Jones (1999: 117) suggests that security analysts should concentrate on “real people in real places” (Booth 1995: 123), “making individual human beings the ultimate referents” of analysis, what will create a new complexity that must be understood as “a prerequisite for bringing about comprehensive security.” Wyn Jones (1999: 118) argues that “theories of security must be for those who are made insecure by the prevailing order, and their purpose must be to aid their emancipation.” Building on Booth (1991a: 319, 1999) he argues:

‘Security’ means the absence of threats. Emancipation is the freeing of people (as individuals and groups) from those physical and human constraints which stop them carrying out what they would freely choose to do: War and threat to war is one of these constraints, together with poverty, poor education, political oppression and so on. Security and emancipation are two sides of the same coin, emancipation, not power or order, produces true security.

Such a deeper, broader, and extended reconceptualized security concept should be in the centre “of a new critical security studies capable not only of mapping out the contours of the present but of plotting a course for the future” (Wyn Jones 1999: 166).

Ken Booth (2005: 2), a self-proclaimed ‘fallen realist’ and one of the conceptual leaders of *critical security studies* (CSS) and of the *school of Aberystwyth* called for a bottom-up critique of the orthodoxy in security studies during the Cold War and for a rethinking security debate, especially after the US response to 11 September 2001 with its ‘war on terror’. In his view the ideas that shaped the mainstream realism during the Cold War:

derived from a combination of Anglo-American, statist, militarized, masculinized, top-down, methodologically positivist, and philosophically realist thinking, all shaped by the experiences and memories of the inter-war years and World War II and the perceived necessities of the Cold War (Booth 2005: 13).

Booth (2005: 5–9) pointed to nine flaws of realism as being: 1. “not realistic,” 2. “a misnomer,” 3. a “static theory,” 4. with an “unsophisticated methodology,” 5. that “fails the test of practice,” 6. whose “unspoken assumptions are regressive,” 7. with a “narrow agenda,” 8. whose “ethics are hostile to the human interest,” and 9. that is “intellectually rigid.” Booth (2005: 9) argues that this worldview: “continues to survive and flourish because the approach is congenial for those who prosper from the intellectual hegemony” of this approach.

Critical theorists of security have challenged the positivist orthodoxy in Western social science from

post-positivist and post naturalist perspectives that are not self-replicating. According to Booth (2005: 11–12), CSS should be based on the following premises by being “more self-conscious and sophisticated”, “self-reflective ... and open to change”, that “seeks to expose the problems of contemporary social and political life” from a distance. It should avoid “static interest”, should be “ethically progressive”, aim at “emancipation” based on a “broader agenda”, and offer a “better understanding of the relationship between theory and practice”.

Booth (2005: 14–15) called for a *deepening* of the analysis by “uncovering and exploring the implications of the idea that attitudes and behaviour in relation to security are derivative of underlying and contested theories about the nature of the world politics.” CSS should be based on *ontology* by including other referents than the state, from individuals to humankind (‘human security’), *epistemology* and an orientation towards *praxis* (relationship between ideas and action). In addition, he supported a *broadening* of the security agenda, by trying “to turn every security issue into a question of political theory (i.e. *politicizing* security). He proposes to go beyond the five sectors or dimensions within a neo-realist perspective and of the different levels of analysis of the Copenhagen school. He defined critical security studies:

as an issue-area study, developed within the academic discipline of international politics, concerned with the pursuit of critical knowledge about security in world politics. Security is conceived comprehensively, embracing theories and practices at multiple levels of society, from the individual to the whole human species. ‘Critical’ implies a perspective that seeks to stand outside prevailing structures, processes, ideologies, and orthodoxies while recognizing that all conceptualizations of security derive from particular political/theoretical positions; critical perspectives do not make a claim to objective truth but rather seek to provide deeper understandings of prevailing attitudes and behaviour with a view to developing more promising ideas by which to overcome structural and contingent wrongs (Booth 2005: 15–16).

Michael Sheehan (2005: 1–2) has observed that Buzan’s (1991: 7) reference to security as an “essentially contested concept” that was characterized by “unsolvable debates on its meaning and application” was often used as an excuse for not even trying to define what the key concept of the strategic and security studies means for the authors in the respective schools of thought. While both the security problems, agendas and policies, as well as the focus of the competing schools addressing security studies have signifi-

cantly changed since 1990, the question remained unanswered as to how this has affected the meaning of the key concept of security, and how such a reconceptualization of security has occurred.

In the reviews of the security concept in strategic and security studies, the concept itself and its Greek and Roman origins has hardly been defined in the Anglo-Saxon literature, with the exception of the early definition offered by Wolfers (1952, 1962). The work by Kaufmann (1970), Frei and Gaupp (1978), has been overlooked in the trendsetting conceptual debates. Richard Smoke (1975) argued that the field had “paid quite inadequate attention to the range of meanings of security.” During the 1960’s and 1970’s the focus increasingly shifted from ‘national’ to ‘international security’. Sheehan (2005) reviewed the thinking on security in realism, the work on security communities and democratic peace, the Copenhagen school, the approaches of gender and security, postmodernism, and security and critical security. Sheehan (2005: 178) concluded that how security is defined is vital

because it is a crucial factor in determining how societies choose to allocate their scarce resources, and what is deemed to be legitimate political discourse. ... Dominant ideas and concepts are part of the constructed consensus that provides the superstructure for the existing distribution of power and authority in society. When a set of assumptions, definitions, and beliefs achieve the status of being regarded as common sense, they become what Foucault called ‘discourses of truth’ marking the limits of what is deemed to be ‘true knowledge’. For this reason, the definition of what is and what is not ‘security’ is likely to continue to be an intellectual and political battleground. This is only right, for it is at the heart of what politics is, or should be, all about.

One of the intellectual framers of the Copenhagen school, Ole Wæver (2004), noted an increasing split in the debates on security studies in the US between offensive, defensive, neo- and post-classical realism, as well as constructivists, and neoliberal institutionalists and the emergence of distinct theories on security in

Europe that in his classification are associated with *Aberystwyth* (CSS represented by Booth, Wyn Jones, Williams, and partly Steve Smith), *Paris* (Bigo’s Bourdieu-inspired work) and *Copenhagen* (Wæver’s theory of securitization, Buzan’s security sectors and their joint work on regional security complexes) besides the *traditionalists* (common sense and policy realism), radical postmodernists and feminists (table 38.2).

The *Paris school* has been distinct from the American, the Aberystwyth, and Copenhagen schools: It has been inspired by Bourdieu, Foucault, and other French sociologists. Its intellectual leader has been Didier Bigo and his journal *Cultures & Conflicts* has become a major platform. Bigo’s empirical work has shown:

how internal and external security merge as agencies compete for the gradually deterritorialized tasks of traditional police, military and customs. Also they jointly produce a new threat image by constantly connecting immigration, organized crime and terror. Insecurity is largely a product of security discourses and security policy (Wæver 2004: 11).

The contextual change as a result of the first global peaceful change of the modern international order has triggered manifold changes in the thinking on security in security, strategic, and war studies since 1990 in the Western debates. So far no systematic assessment of the theoretical thinking on security and on the centres of theoretical and conceptual innovations in Asia (China, India, Japan), in Western, Eastern and Southern Africa, and in Latin America, and in the Caribbean as well as in the Arab world exist (table 38.3).

The debate on reconceptualization of security has remained self-centred, often due to the lack of knowledge on the ongoing theoretical debates in other parts of the world and the lack of funding of their representatives to participate in global conferences and debates. However, these debates have also been going on at the meetings of the *World Social Fora* and of

Table 38.3: Reconceptualizing of Security in the US, Europe, and the Rest of the World. **Source:** Adapted from and inspired by Wæver 2004: 16,

	United States	Europe	Rest of the World Africa/Asia/Americas
Security concept	Lack of interest, undefined	Centre of reflection	No generalization is possible (diversity)

the scientific programmes of the *global environmental change community* (IHDP). For the policy oriented elites the annual and regional conferences of the IISS have offered a platform to discuss security policy issues. Except ISA and the first World Conference on IR in Istanbul and efforts supported by UNESCO, so far no platform exists for a global debate on reconceptualizing, rethinking, and redefining security.

While most authors would agree that a widening and a deepening of security has occurred the changes in the security concept itself were hardly defined, while on the basic changes in the theoretical approaches, the security problems, agendas and policies since 1990, a consensus emerged, but a discussion of the deeper meanings of the concept was in most cases avoided. No single contribution of the reviewed literature referred to the sectorialization of security such as energy, food, water, health or livelihood security, even the human security conceptualization as well as the extensive human security debate in the peace and development community. The literature reviewed and cited relied nearly exclusively on literature in English and by Anglo-Saxon authors. The thinking of the other five billion people and of the security experts, thinkers, and debates taking place outside the Western world was in most cases insufficiently treated. This self-centred Western security dialogue has remained unchanged. Often the rest of the world does

not exist as centres of conceptual innovation and theoretical debate. This has been a continuity that has remained unchanged by the end of the Cold War.

38.5 Evolution of Security Concepts in Peace Research

The UN Charter in chapter VII referred to “action with respect to threats to the peace, breaches to the peace and acts of aggression” and not to violations of human, national, international, and global security. This debate has been extensively covered in international law.

The key value and goal of the peace research community has focused on the ‘peace’ concept, while the ‘security’ concept was often discussed only as an antidote to ‘peace’. Galtung’s (1967, 1968, 1969, 1975, 1988, 1993) classic distinction between ‘positive’ and ‘negative’ peace was stimulated by the conceptual debates in Latin American during the 1960’s (Frank 1966; possibly by the early work of Marini 1973; Dos Santos 1978; for a survey: Bornschier 1981). He defined positive peace as the absence of ‘structural violence’, and negative peace as the absence of ‘physical violence’. While the goal of ‘positive peace’ is closely connected with other basic goals of social justice, overcoming exploitation and granting of social, economic, and individual human rights, the goal of ‘negative peace’ fo-

cused on research that dealt with wars, conflicts, armaments, arms control and disarmament measures, policies and strategies.

While the concept of 'security' affects both positive and negative peace, it was primarily discussed by those peace researchers that worked on military and state-centred security issues during the Cold War era but from a primarily critical theoretical and policy perspective.

Schwerdtfeger (2001: 97-99), who reviewed the conceptualization and theoretical status of peace research, discussed security as an opposite term like violence, power, aggression, war, "organized peacelessness" (Senghaas 1969), enmity, and conflict. While during *pax romana* peace was dependent on security, during the Middle Ages security was subordinated to peace. This changed in the 18th century with the strengthening of the modern nation state when the 'pax civilis' of the early modern period was replaced by 'public order and security'. With the development of the modern nation state the original understanding of peace was replaced by the security concerns of the state, which was reflected in both the state sciences and in political science. With the development of peace research, the thinking on peace returned to political science and international relations but associated with it was a dispute between the traditional peace researchers who understood peace within the security realm and those critical peace researchers who saw peace as a potential for development among people (Senghaas 1971). How have peace researchers conceptualized security during and after the Cold War?

As no comprehensive survey and assessment of the use of the security concept in peace research exists, the following review will be selective, based on a review of several IPRA Proceedings and introductory texts or assessments of peace research results. At the seventh IPRA conference in Oaxtepec (1977) when CLAIP was established (Oswald 2006), only two contributions focused on security dealing with "The Doctrine of National Security" in Brazil (Cavalla 1979: 90-102) and on "Security policy options for the 1980's - new perspectives for a policy of détente and arms reduction in Central Europe" (Brauch 1979: 104-123). Both chapters reflect totally different policy concerns and research agendas.

Cavalla, a former minister from Chile, then in exile in Mexico (n.y., 1978, 1979a, 1979b, 1979: 90), critiqued the concepts of national security as the ideologies of the nation state, many of them were then ruled by military dictatorships "which implement new types

of states of exception, constituting the expression of the bourgeois counterrevolution in dependent countries." In his view this "doctrine [is] for the military who execute centralized government functions" and it is "related to other bourgeois counterrevolutionary theories" that were used to legitimize the "national security states" and their actions.

The contribution by Brauch (1979: 104-121) was more limited in focus and scope dealing with arms control theory and practice pertaining to Europe with the goal "to decrease the possibility and probability of any military conflict in Central Europe by military and non-military means" (104), and it argued that "security should not be seen only in terms of a military balance of power. Other elements: economic potential and ideological attractiveness and stability should be included in any power equation" (Brauch 1979: 105). It proposed "unilateral measures that do not endanger the national security" as well as guidelines for future security policy options (structures, means, processes), and it stressed the importance of alternative security policy options in Central Europe, leading to a "denuclearization, arms reduction and to an European security system" (Brauch 1979: 112-117), some of them were realized with the end of the Cold War.

These two contributions were somewhat symptomatic for the security-related discussions within IPRA: a fundamental critique of a concept that was used by the military elites to legitimize their rule and repression, and a reformist attempt to look for ways out of the doctrines of mutual assured destruction. While both were in a way prophetic (the military dictatorships are gone and the system of deterrence is overcome at least for the time being in Europe), neither author conceptualized what they meant with security and the specific concepts they used.

At the eighth IPRA conference in Königstein (Germany) in 1979, Gert Krell (1981: 238-254) offered a first analysis from a peace research perspective of "the development of the concept of security" in which he introduced security as a "value and symbol." For Krell (1981), the security concept has been "one of the most complex concepts, comparable to values and symbols" that has been used "as one of the most important terms of everyday political speech, and one of the most significant values in political culture." In Krell's (1981: 238) definition "security means first absence of danger and protection against danger, - or positively stated - the presence of desired values." He pointed to the object of protection (territorial inviolability of the state, citizen, physical survival and autonomy) and referred to a threefold dilemma "of secur-

ing peace with military means in the Nuclear Age”, a deterrence, a defence and an arms race dilemma, and to the “precarious balance of defence and détente”. Krell also noted an extension of the concept to new dimensions (‘economic’, individual non-military dimensions of security: globalization and interdependence), and he observed new developments for security policy, such as resource scarcity, interdependence among actors and issues, new patterns of military, political and economic conflict; a reduced utility of the military instrument in the pursuit of security goals, an increase in complexity of decision-making, and unprecedented problems of adjustment and global responsibility (Krell 1981: 251).

With the end of the Cold War, many of these early reflections on the security concept were applied by governments in their broadened or extended security concepts as reflected for example in two German defence white papers since the turn (BMVg 1994, 2006). These conceptual considerations were developed further in the first *Copenhagen Paper* by Jahn, Lemaitre and Wæver (1987) and by Wæver, Lemaitre and Tromer (1989) and later by the Copenhagen school (Buzan/Wæver/de Wilde 1998; Wæver/Buzan/de Wilde 2008).

During the 10th IPRA conference in 1983 in Győr in Hungary, two of the eight commissions dealt with security issues: commission 1 focused on “arms race, strategic doctrines and alternative security,” and Commission 2 on: “politics and economy of militarization and demilitarization,” but only two of the ten chapters by Marek Thee (1986: 48–63) dealt with “conceptual issues related to European security, arms control and confidence building measures” and by Ulrich Albrecht (1986: 165–175) focused on the “military use of research and development”, but neither discussed the concept of security.

In the proceedings of the 13th International Conference of IPRA – its 25th anniversary – in Groningen in July 1990, one of three parts dealt with “Reconceptualizing Security” with contributions by Randall Forsberg, Lothar Brock, Patricia Mische and Úrsula Oswald. In her introduction, Elise Boulding (1992: 65) referred to the emerging debate between adherents to a narrow and wider concept:

If the term security is to be stretched to mean everything, it is in danger of meaning nothing? In part the debate in this section is a semantic one. Neither of the two authors who are using the narrower definition of security – as security from attack – would deny that there are many threats to human well-being besides military threats. What is important is to separate the strategy of warfare from the multitude of threats facing

humans today, including those of ecological destruction and economic devastation. The authors arguing for the wider definition are basing their analysis on a model of interconnectedness of social and physical variables in a whole-system framework that their colleagues do not deny, and all agree that the real task is to eliminate destructiveness in all its forms and increase the level of human cooperation and environmental awareness as far as possible.

Forsberg (US) and Brock (Germany) adhered to a narrow military security concept, while Mische (US) and Oswald (Mexico) reconceptualized security by addressing environmental security dangers.

Forsberg (1992: 67–78) argued for an alternative security system based on non-offensive defence and peacekeeping, she pointed to positive conditions for demilitarization but referred also to dangers on how a new arms race could emerge due to inertia, vested interests of military officers and defence industries, a possible turnabout in the USSR and a potential rearmament of Germany and Japan.

Lothar Brock (1992: 79–102) pointed out that the fear of a global nuclear holocaust was replaced by a

widespread fear that the natural basis of human civilization may be destroyed through the dynamic of this very civilization; that the biosphere may be thrown out of balance, with unforeseeable consequences for all existing social systems; that non-deliberate environmental destruction will darken the expectations of present and future generations just as much as the prospect of any deliberate war. Thus, one looming disaster has been replaced by another – with little time for relief in between.

Brock reviewed four linkages between peace and the environment, discussed manifold causal linkages (war over natural resources, environmental impact of war and the military, environmental pressures to avoid war and reduce ‘structural violence’), reviewed the *instrumental* linkage (environmental warfare, environmental cooperation as a means to build peace), the *definitional* linkage (environmental degradation as war, peace with nature), and the *normative* linkage (concept of environmental security and sustainable development, rationalization of traditional security thinking, environmental and comprehensive security). Brock cautioned (1992: 98): “defining environmental issues in terms of security risks is in itself a risky operation,” and he warned “we may end up contributing more to the militarization of environmental politics than to a demilitarization of security politics.”

While Brock warned of the need to widen the security concept to the environment, Patricia Mische (1992: 103–119), who coined the concept of ‘eco-

logical security' in 1986, argued why environmental threats require a need to redefine security. Mische (1992: 106-107) distinguished three phases in the evolution of concepts and systems of security, arguing that during '

the first and longest period of human history, concepts of security centred primarily on nature, including (a) the life-giving, nurturing, aspects of nature; (b) the life-threatening capabilities of nature in the form of earthquakes, volcanoes, hurricanes, tornadoes, floods, droughts, blizzards, and changing food and water supplies; and (c) the sense of mystery, awe, surprise, power and beauty aroused by nature. ... In the second period, the primary locus of threats shifted from nature or the biosphere to the sociosphere. In the meantime, a new class of threats is emerging that requires a whole new way of thinking and organizing for human security. Once more the threats have to do with nature, but this time not what nature can do to humans, but rather how human activities may be damaging nature can do to humans, but rather how human activities may be damaging nature, and in turn, the way this damage may distinguish the prospects for future human survival, security, and peace.

Mische saw in past military activities an obstacle to new systems of security and argued that the advancement of world peace is essential to ecological security. She suggested an increased focus on the linkages between the environment, peace, and security. Towards that end she proposed both intergovernmental and citizen initiatives aiming toward a global culture of ecological responsibility via the Earth Covenant and the Project Global 2000 that aimed at a "redefinition of security and sovereignty."

From a third world perspective, Úrsula Oswald (1992: 121-126) reflected on the achievements of "the past three decades of development in terms of peace and active non-violent conflict resolution." In the first part on development and ecology she contrasted the initial proclaimed aims of development policy that after three decades (1960-1990) were overshadowed by the undeniable realities of poverty, hunger, ecological destruction, and other conflicts when "development had become a myth" (Oswald 1992: 121). Oswald argued that the modernization of agriculture and livestock production "have brought about desertification and salinization," and she pointed to eight major mechanisms for extraction from the South as a backyard market providing cheap labour force, as a source of cheap raw materials, a backyard for tourism and exotic sex, an ecological reserve, a backyard for human, technological and military experimentation, for depositing exotic/toxic waste, and "for extracting money through interests, patents, royalties, regalia, unequal

terms of trade, multinationalization, and poorly paid labour forces" (Oswald 1992: 123).

In the second part, Oswald outlined strategies to overcome the development myth and enter peaceful postdevelopment ecotopia by critiquing three strategies of, a) the integration of liberal and neoliberal economies and the formation of huge economic blocs with their respective backyards; b) a new economic order, and c) an "autonomous development with some temporary, sectoral, or regional delinking from the world economy" based on forces "from below and based on ecological and non-violent criteria." Oswald concludes "there is no chance to achieve a peaceful and ecologically sound future" with the first two approaches, and with regard to the third she suggested seven basic propositions: 1) by shifting from the capitalist logic of maximization of profits to a productive logic of use; 2) by recycling waste, abolishing toxic materials and adopting a rational process of horizontal and vertical productive integration; 3) by replacing individual profit-making ideas with an individual and collective self-sufficiency logic; 4) by a peace development oriented at conflict resolution; 5) "there is no peaceful, ecologically sound postdevelopment without personal, family, social and national security;" 6) by integral education and collective conscious practices, and 7) by an integration "of women and ethnic, social and religious minorities into the total life of a society." Oswald concluded (1992: 125-126) that these ideas "point the way to a peaceful, sustainable green alternative path that could change the nature-society relationship, permit a future for our children, and produce an ecologically viable, non-violent beginning of the next century: a post-development era of peace."

These four conceptual assessments, presented during the global turn in July 1990, pre-empted the debate between the adherents of a narrow security concept - even though for different reasons - and the proponents of a widened, deepened, and extended security concept that has been in the centre of the debate in international security studies and peace research since the early 1990's. Jahn (1988: 105, 1991) had previously cautioned that international peace research should not shift to national security research where security needs replace a yearning for peace, and he called for a reassessment of the role of security policy in the framework of a comprehensive peace policy.

Lothar Brock (1991, 1999, 2001, 2002, 2004) has been a persistent sceptic of an extension of the security concept. While a widened security concept would overcome the territorial fixation of security by a functional approach (Zangl/Zürn 1997), a widened con-

cept would extend the categories of military thinking to non-military issue areas and thus potentially contribute to their militarization (Jahn 1988; Deudney 1990; Lipshutz 1995; Müller 2002, 2004). Brock (2001: 184) suggested as an alternative of the fragmentation of security problem areas a return to a comprehensive discourse on peace. Brock (2004: 324) argued that a transformation of security policy towards demilitarization could better be achieved with a narrow rather than with a widened security concept. Furthermore, Brock (2004a, 2006) pointed to the ambivalence of the extended security concept that can be used both to emphasize the need of a civil conflict transformation and to legitimize a limitation of civil rights and freedoms domestically. He preferred a narrow concept of security as a protection against illegal violence.

One of the founding fathers of and most prolific writers on peace research, Johan Galtung, during the first 30 years of his writings (1951–1980) seems to have avoided in his early work a conceptualization of security (Gleditsch/Leine/Holm/Hoivik/Klausen/Rudeg/Wiberg 1980), but in 1982 he suggested alternative security doctrines (Galtung 1982). Twenty years later, in the mission statement of Transcend, a network for peace and development which Galtung helped to establish, among its 20 research programmes security was mentioned once under XI. *Non-military Approaches to Security and War Abolition*. In June 2005, in a “ten point peace studies primer”, Johan Galtung argued:

In security studies, violence is seen as caused by evil forces, like dangerous classes and inferior races/religions/ideologies ‘out to get us’ and the remedy is to have enough strength to deter or destroy those forces. ... We have something of the same in today’s struggle between peaceful conflict transformation and the reliance on court systems, governments and the UN Security (not Peace) Council. This security discourse stands in the way of a rational approach to peace. The remedies offered are two: to be strong enough to deter, and/or to crush those forces of evil, as we see it all over the world in the Anglo-American effort to deal with terrorism or tyranny. The net result is a security state like a fortress, and much, much killing, all over.²⁰

While Galtung (2005) repeatedly criticized the security concept he did not offer any systematic analysis of his notion of security similar to his definition of peace.

In a volume by Transcend, Brand-Jacobsen and Jacobsen (2000: 142–150) discussed new approaches, perspectives, and actors beyond security. They argued that traditional state-centred notions of security focusing on “freedom from the threat or use of force” are unable to address the new challenges facing the world community. “Group security, human security, environmental security and security from fear and want are only a few of the concepts and approaches necessary to broaden the understanding of the meaning of the word.” Furthermore, challenges to security cannot be limited to the military, “but must be extended to include economic, political, social, cultural and ecological factors as well” (Brand-Jacobsen/Jacobsen 2000: 143). This raises questions of security *from* whom or what, *by* whom or what, and *for* whom or what. One major danger to security they see in the persistence of Cold War mindsets of “zero-sum, win/lose, competitive and conflict-provoking thinking” (Brand-Jacobsen/Jacobsen 2000: 145). They see in “security itself, and the worldview it endorses, one of the key dynamics and causes which must be transcended in order for any real ‘security’ to exist” (Brand-Jacobsen/Jacobsen 2000: 149). But they lack any discussion of the theoretical foundations of the security concept and to which extent this concept has changed since 1989–1991.

The SIPRI director Alyson Bailes (2006: 1–30), on the occasion of SIPRI’s 40th anniversary, reviewed “the world of security and peace research in a 40-year perspective.” She noted three processes of change for the conceptions of danger and security in the post Cold War era: “a) diversification of the security agenda, b) diversity of actors, and c) the preference for solutions involving action rather than restraint” (Bailes 2006: 11). The forms of violence have broadened from intra-state conflicts to transnational opponents (terrorists, lawlessness, and criminality) and interpersonal violence. Thus, the security goal of governments has widened to the “protection of people and their rights against the whole range of such disorders” with an increasing focus on internal security and no division between external and internal security. In addition non-military risks of climate change, desertification and disasters to the state and people have increased. While the Westphalian system of nation states dominated the security analysis during the Cold War, since 1990 new actors both below (insurgents, ethnic and regional communities) and above the nation state (multinational corporations and multilateral institutions) as well as transnational

20 See: TFF: Meeting Point: Johan Galtung: “Peace Studies: A Ten Point Primer”, at: <http://www.transnational.org/SAJT/forum/meet/2005/Galtung_PR_Primer.html>.

actors (terrorists, criminal networks) have been objects of security concerns and analysis.

Paul Rogers, a former director of the Bradford School of Peace Studies, saw at the heart of a new evolving post Cold War security paradigm three drivers: “the widening wealth-poverty divide, environmental constraints on development, and the vulnerability of elite societies to paramilitary action. The paradigm ... has been evolving largely unnoticed for at least a couple of decades, and there have already been numerous indicators” (Rogers/Dando 2000; Rogers 2002: 79). Rogers (2002: 119) argued that the persisting socio-economic divide, environmental constraints, and the spread of military technologies are most likely leading to conflicts what requires “to develop a new paradigm around the policies likely to enhance peace and limit conflict.” That should focus on a) arms control, b) closing the wealth-poverty divide, and c) responding to environmental constraints.

Ernst-Otto Czempiel (1966, 2002), one of the founding fathers of theory-guided peace research in Germany, in an analysis of the “New Security in Europe” provided a critique of neo-realism and ‘realpolitik’. However, neither Rogers nor Czempiel analysed the theoretical and empirical aspects of the reconceptualization of security that has taken place since 1990.

In a two volume project on the future of peace, where the first volume (Sahm/Sapper/Weichsel 2002, 2006) offers an assessment of peace and conflict research of the first generation of German peace researchers, and the second volume (Jahn/Fischer/Sahm 2005) offers assessments of contemporary peace and conflict research from the perspective of the younger generation, only two contributions by Brauch (2002b) and Zangl (2005) discussed security related issues.

Brauch (2002b: 305–309) argued that disarmament should not be addressed any longer within a narrow concept of national security, but should use a broader security concept. He distinguished with regard to the goal and concept of security among three schools of realists, structural realists, and geopolitics experts that analysed external, internal, national, and international security, pragmatists or liberal neoinstitutionalists that used a broadened security concept consisting of a military, political, economic, societal and environmental dimension, and so-called ‘idealists’ in peace research that addressed human security and human survival.

Bernhard Zangl (2005: 159–187) discussed to which extent the postnational constellation of international security policy has differed from the national

constellation that has evolved since the 1990’s, a shift that has occurred in international economic, environment, and communication policy since the 1970’s. Since the 1990’s in international security policy there has been a shift in security dangers from national (other states) to transnational (terrorists, crime networks) actors that is reflected in the significant increase of new types of internal conflicts and civil wars. Zangl argued that the supranationalization of governance gradually set in since the 1990’s with the significant increase in UN peacekeeping operations, most of them dealing with civil war situations where the participation and the use of force was accompanied by an increasing ‘international’ legitimization through international security concerns and not solely of national security interests. This implies in Zangl’s interpretation that international security policy has to be analysed as a multi-level policy that differs significantly from the security policy of the national constellation where the national level prevails. Zangl, however, did not discuss whether this shift implied a reconceptualization of the prevailing security concepts (see chap 22 by Brauch).

Due to this functional widening of the security agenda, the strategies and means needed to cope with the new dangers have also changed. This was a concern of the UN SG’s High Level Panel on Threats (UN 2004; chap. 47 by Einsiedel/Nitzschke/Chhabra). Accordingly the scope of security concerns and the security agenda of international organizations (UN, OSCE, NATO, EU) have widened significantly since 1990 “towards fields where economic, social and other functional processes (and competences) prevail” (Bailes 2006: 20). However, this review of the changes in the security agenda and actors during and after the Cold War has avoided a discussion of the security concept and to which extent a reconceptualization has taken place.

From this review of selected writings on security by authors associated with peace research globally and regionally in the Western world, it may be concluded that security issues and especially the analysis of conceptual issues of security has not been a major preoccupation within peace research – compared with security studies. While peace researchers have already referred to the need for a widening of the security concept since the late 1970’s, and discussed the need for a widening and deepening of the concept, so far no systematic assessment seems to exist that traces the manifold changes of the use of this concept, e.g. in the major international journals, such as the in the

Journal of Peace Research, the *Bulletin of Peace Proposals* that became *Security Dialogue* in 1992.

While a reconceptualization of security could be observed based on the selective review of prominent authors with regard to the discussion of the security issues, agendas, actors, and institutions since 1990, this was rarely linked to the fundamental contextual change of 1989, only partially to globalization, and not yet to the shift towards a new phase in earth history (anthropocene).

38.6 Conclusions: New Post Cold War Conceptual Disputes and Efforts for an Integration of Critical Approaches

A lively debate on the reconceptualization of security was triggered by the fourth and peaceful global change of the Northern dominated international order in modern history with the end of the Cold War. The major turning point – at least from a European perspective – has been 9 November 1989 and not 11 September 2001 (Risse 2004; Kupchan 2004; Müller 2004a; Guzzini 2004; Moravcsik 2006).²¹ Several conceptual innovations were evolving prior to the global turn of 1989–1991 suggesting:

- A peace and security policy ‘beyond deterrence’ in the nuclear era (Senghaas 1969);
- a *widening* of the agenda (of what and for whom?) of US national security during the 1980’s (Ullman 1983, Myers 1989, Matthews 1989);
- a *broadening* of the scope from ‘national’ to ‘common’ (Palme 1982; Bahr/Lutz 1986, 1987) ‘mutual’ (Smoke 1991; Smoke/Kortunov 1991) and ‘comprehensive’ (Westing 1989, 1989a, 1989b) security;
- a *deepening* of the concept of security from ‘national’ to ‘international’, ‘global’ (Steinbruner

2000) and ‘world’ security (Klare 1994, 1996; Klare/Thomas 1991, 1994, 1998);

- a *sectorialization* of security from national and international to ‘ecological’ (Mische 1989, 1992, 1992a, 1998; Gorbachev 1987, 1988; Stein 1994) environmental security (Myers 1989; Brundtland Commission report (WCED 1987)); and
- an *alternative focus* and *goal* from an offensive towards a ‘defensive’ (Brauch/Kennedy 1990, 1992, 1993), ‘non-offensive’ (Møller 1991, 1992, 1995), ‘non-provocative’ (Boeker 1984, 1985, 1987) or ‘confidence-building’ (SAS 1984, 1989) defence or ‘alternative security’ (Weston 1990) since the late 1970’s and during the 1980’s and 1990’s;

With the end of the Cold War, the contextual change has triggered several additional conceptual innovations suggesting:

- a *widening* of the scope (*of what*) to at least five ‘sectors’ (Buzan 1991; Buzan/Wæver/de Wilde 1998) or ‘dimensions’ (Brauch 2003, 2005, 2005a);
- a *deepening* of the actors, referent objects (*for whom and by whom*) and levels of analysis from the nation ‘state’ *upward* to ‘international’ (UNSC, NATO) – both macro regional and global – or supra-state (EU) actors and *downward* to sub-state actors, such as micro regions, communities, ethnic groups, clans, families, and individuals (Buzan/Wæver/de Wilde 1998);
- a *reorientation* from a ‘state-centred’ to a ‘people’s centred’ approach suggested by UNDP (1994) and UNESCO (1997, 1998, 1999, 2001, 2001, 2003), the Commission on Human Security (CHS 2003) and by the Study Group on Europe’s Security Capabilities (Albrecht/Chinkin/Dervis/Dwan/Giddens/Gnesotto/Kaldor/Licht/Pronk/Reinhardt/Schmèder/Seifter/ Serra 2004);
- and a *further development* of people-centred human security concepts from human to gender security (Hoogensen 2006; Tasneem/Jayawardena/Shrestha/Siddiq/Khasrul Alam Quddusi/Prakash Bhatt/Anarkoly n.y.) and to a combined concept of human, gender, and environmental (HUGE) security concept (Oswald 2001, 2007, 2008);
- a *sectorialization* of security as reflected in energy (IEA), food (FAO, WFP), water (UNEP, UNU), health (WHO), and other sectoral concepts as climate security (Beckett 2006, 2007);
- a *shift* from a ‘national constellation’ to a ‘post-national constellation’ (Habermas 1998a, Zangl 2005; chap. 22 by Brauch);

21 This view was shared by Moravcsik (2006: 3) of Princeton University who wrote: “For Europe, in the realist and neo-conservative understandings, the defining moment of the contemporary era is not 9/11 but 11/9: the collapse of the Soviet empire, symbolized by the fall of the Berlin Wall on November 9, 1989. Without major direct threats to their security, Europeans have felt free to disarm, cultivate their unique postmodern polity, and criticize the United States. Thus, many argue, Europeans and Americans disagree about not only power and threats, but also means.”

- a *diversification* of the theoretical approaches within international relations and security studies from positivism to (social) constructivism (Wendt 1992, 1995, 1999), and postmodern, postpositivist, post structuralist, feminist and critical security studies (Krause/Williams 1996, 1997; Wyn Jones 1999; Booth 2005);
- a renewed *shrinking* towards a narrow national military security concept within the policy-oriented strategic community primarily in the US and some think tanks in Europe that are involved in consultancies for the military and for defence companies;
- an emerging *integration* of the manifold critical approaches with the emergence of a 'New European Security Theory'.

The controversies between security studies and peace research that have been very heated from the late 1960's to the late 1980's have mostly disappeared after the end of the Cold War. Rather, the debates on the widening and deepening of the security concept have occurred primarily within the two research programmes:

- primarily within the *security studies* community between the neo-realist proponents of a narrow security agenda (Walt 1991; Lynn Jones 1991/1992) and those that have proposed a widening and deepening of the security concept both from realist (Kolodziej 1992), critical realist (Booth 2005), or Grotian realist (Buzan 2001, 2004, 2006) and many other postmodernist and poststructuralist approaches (Wæver 1997);
- and to a much lesser extent within the *peace research* community where some of the founding fathers (Jahn 1975, 1991, 2005, Brock 1991, 1998, 2001, 2004) have cautioned against a militarization of widened security concepts, while others have pointed to a shift in the urgency of non-military human security dangers and concerns that require utmost efforts (e.g. climate change) where the military tools and logic are irrelevant.

The three schools that have developed in European security studies (Wæver 2004) have stimulated the emergence of a 'New European Security Theory' (NEST) which reflects these divergent critical theoretical approaches to security in Europe, prefers qualitative interpretative methods, and which have partly integrated themes previously addressed in peace research (Bürger/Stritzel 2005: 437-445). During a conference in Paris in June 2005, Ph.D. candidates addressed the possibility of theoretically linking ele-

ments of these three theoretical trends, e.g. by a concept of "positive securitization" (Taureck 2005) that introduces emancipation into the Copenhagen school.

Stimulated by this workshop a Collective on *Critical Approaches to Security in Europe* (CASE) that published its first "networked manifesto" in late 2006 (CASE 2006) encouraging dialogue among these schools to explore new paths for critical approaches to security in Europe that also build on the early work of Johan Galtung (1967) and Dieter Senghaas (1969, 1971, 1972) in 'critical peace research' (Patomäki 2001).²²

According to Booth (1997: 86-87), the end of the Cold War "provoked an intellectual crisis for strategists adopting an orthodox approach to security", while this rupture was less severe for those who had previously challenged this orthodoxy. COPRI (1985-2004), one of the conceptually oriented peace research institutes in Europe, had combined the innovative elements in the Scandinavian, British, German and Dutch discussions and with its theory of securitization (Wæver 1995; Buzan/Wæver/de Wilde 1998; Wæver/Buzan/de Wilde 2008), while the Welsh school introduced the critical approach of the Frankfurt school with the goal to replace "realism's military-focused, state-centred and zero-sum understanding of security" (CASE 2006: 448). The authors have pointed to four directions of future research:

the implications of expanding security to other fields ... ('security traps'); the question of exceptionalism; risk analysis; and the 'politics of belonging'. These four lines of research engage with several of the impasses and tensions in critical studies, and propose different modalities of tackling 'security' critically (CASE 2006: 460).

Security traps refer to a potential misuse of securitized policy problems by security bureaucracies that may counteract the initial intentions. CASE claims that critical security studies (CSS) has "taken over the critical role in the field of 'peace and security'". The collective suggests that peace researchers should develop a deeper understanding of their key concepts and "reflect on the normative dilemmas of writing, speaking and practicing peace" (CASE 2006: 462). The authors suggest a critical approach to the merging of the concepts of security and development (chap. 8 by Uvin; chap. 54 by Katseli; chap. 58 by Klingebiel/Roeder). CASE authors also reflect on Carl Schmitt's concept of exceptionnalism for security studies. The relationship of risk, risk management and security are ad-

22 The CASE Manifesto (2006) triggered three replies by Walker (2007), Behnke (2007) and Salter (2007).

dressed as a third major task for future research taking Beck's (1986, 1992, 1999, 2007) risk theory into account (Rasmussen 2002, 2004; Jarvis/Griffith, 2007, 2007a; Jarvis 2007; Carment/Gazo/Prest 2007; Handmer/James 2007) with the goal "to engender a debate between risk-based and threat-based interpretations of "insecurity that will widen the traditional critical security agenda concerned with the mutual constitution of threats and identity" (CASE 2006: 468-469). In the final part, the CASE (2006: 472-477) collective addressed the issue of policy relevance of critical knowledge on security within a pragmatic relationship between policy-maker and scientist in contrast to technocratic or decisionist models (Habermas 1968).

The CASE manifesto brought together a team of young, theoretically minded, and promising scholars that try to overcome the dichotomies of the US debates in IR and security studies. This effort to integrate the critical approaches in both peace research of the 1970's and 1980's with the critical approaches in security studies and by bringing different disciplines (IR and sociology) but also different language cultures of the English and French-writing scholars together into an emerging new integrated European theoretical approach that is fundamentally distinct from the American versions of structural, classical, or neo-classical realism, or neo-realism, is also a signal of a scientific emancipation of a new generation of European scholars working on security issues that have returned to the creative roots of the diverse European intellectual traditions. This vibrant intellectual debate challenges the often self-centred American scientific debates (chap. 1 by Brauch).

However, this new European centred security discourse and theory development must broaden its scope to include the critical conceptual security debates outside Europe and North America. This is both a challenge and an opportunity of a theoretically trained new generation of security scholars to engage in scientific discussions with young scholars from Asia, Africa, the Arab World, as well as from Latin America and the Caribbean.

While the dispute between representatives of traditional, neo-realist, and narrowly focused security studies on the one hand, and policy-oriented peace researchers of the older generation has re-emerged especially since 2000 especially due to the policies legitimized by the events of 11 September 2001, there seems to have been a lesser debate between peace researchers and critical security studies - at least in Germany. In the security studies and peace research liter-

ature, human security concepts were hardly discussed and sectoral security concepts were ignored.

Much of the vitality of the vibrant theoretical and conceptual debate on security seems to have taken place since 1990 within security studies in Europe, and especially as a result of the new approach of the Copenhagen school and the critiques of the school of CSS. However, in nearly all contributions to the Western or North American and European debates, the contributions of scholars in Asia, Africa, in the Arab World, and in Latin America were only in a few cases noted, but mostly ignored. Much research is needed to fill these gaps in knowledge. The mapping of the reconceptualization of security should not remain a purely inter Western effort; the work of scientists representing the other 5 billion people should be analysed more closely to overcome both Eurocentric and US self-centred perspectives.

The following conclusions may be drawn from the debates in both schools:

- The *security agenda* has horizontally widened from a narrow military and political security perspective to a more comprehensive one that includes the economic, the societal, and the environmental sectors or dimensions.
- The *actors (from whom, by whom and for whom)* of security policy have also widened and are no longer (with the exception of some US traditional realists) limited to the state, increasingly sub-national, supranational, and transnational non-state actors must be included.
- So far the *human and gender security* debate and the *sectoral security concepts* have not been systematically integrated by the different approaches of security studies and peace research.

In summer 2007, eighteen years after the end of the East-West conflict, both the security concept and security policies remain highly contested, but - at least in Europe - the debate has been less polarized between two opposing scientific poles of peace research and security studies. Rather, both schools seem to have focused nearly exclusively on their in-group debates, and there has been a lesser debate and controversies between representatives of both schools that have dominated the 1970's and 1980's during the periods of the first (1969-1974/1979) and second *détente* (1987-1989) and the second Cold War (1979-1987).

Based on the achievements of these debates, the author suggests with regard to the future:

- a critical *reflection* and deeper understanding on the concept of security, its etymological and his-

torical evolution, and contemporary use in different cultures and religions in all parts of the world and not only in Europe, North America, and in the OECD world;

- a *progressive integration* of the components of a new critical theory of security, including a deepening of the actor and referent objects, a widening of the sectors (Buzan), dimensions (Brauch), and fields (Bigo 1992, 1996);
- an *internationalization* of the new thinking on security by overcoming its Northern (European and North American) focus and Western theoretical resource base.

This book and the two subsequent volumes intend to contribute to the first and third goal to reflect the intellectual and cultural richness of a diverse world where security is addressing the basic human needs of human beings in their struggle for survival, and not the interests of self-perpetuating national security states and their military-industrial complexes and their rationalizing and legitimizing threat industry.

This is partly expressed in: “A Human Security Doctrine for Europe” (Albrecht/Chinkin/Dervis/Dwan/Giddens/Gnesotto/Kaldor/Licht/Pronk/Reinhardt/Schméder/Seifter/Serra 2004), according to which “civilians should play a significant role in a new EU force designed to combat global insecurity and protect citizens in conflict zones.” This report “argues for a fundamental rethink of Europe’s approach to security – not only within its borders, but beyond. In the 21st century, when no country or region is immune from terrorism, regional wars, organized crime, failing states or the proliferation of weapons of mass destruction, Europe cannot ignore the growing insecurity around the globe.” This report further suggests:

Human rather than nation-state security should be at the heart of European policy. Instead of defeating enemies or pacifying warring parties, EU missions should focus on protecting civilians, through law enforcement with the occasional use of force. Europeans cannot be secure while millions of people live in intolerable insecurity. Where people live with lawlessness, poverty, exclusivist ideologies and daily violence, there is fertile ground for human rights violations, criminal networks and terrorism. That is why a contribution to global human security is now the most realistic security policy for Europe. The Study Group has developed seven principles for Europe’s security policy that apply to prevention, conflict and post-conflict contexts alike and which are intended to guide the actions of high-level EU officials, politicians in the member states, diplomats, and soldiers and civilians (Albrecht/Chinkin/Dervis/Dwan/Giddens/Gnesotto/Kaldor/Licht/Pronk/Reinhardt/Schméder/Seifter/Serra 2004).

However; such a regional strategy must be embedded in a global strategy towards international and human security, as has been suggested in the recommendations of the *High Level Panel on Threats* of the UN Secretary-General in December 2004 and in the Report of former UN Secretary-General Kofi Annan: *In Larger Freedom* in March 2005 to realize the goals of the “peoples of the United Nations” as expressed in the Preamble of the UN Charter (1945):

to save succeeding generations from the scourge of war, ... to reaffirm faith in fundamental human rights, in the dignity and worth of the human person, in the equal rights of men and women and of nations large and small, and to establish conditions under which justice and respect for the obligations arising from treaties and other sources of international law can be obtained, and to promote social progress and better standards of life in larger freedom.

‘Security’ has been and will remain a ‘contested concept’ in international relations, in strategic studies, and in peace research in the decades to come due to both contextual political challenges (transition to the anthropocene), diverse cultural impacts, and scientific innovations.

39 Security: The State (of) Being Free From Danger?

Laura Shepherd and Jutta Weldes

39.1 Introduction

With the demise of the Cold War, policy-makers claimed to recognize a plethora of new security threats – a veritable ‘dysplasia’ of the global body politic (Manning 2000: 195). In the face of rogue states, loose nukes, international organized crime and global terrorism, among other menaces, government and non-government organizations devoted considerable time and resources to addressing new insecurities. Academics too have tried to rework the concept of security. As David Baldwin wrote in 1997, in the fields of International Relations (IR) and Security Studies, “[r]edefining ‘security’ has recently become something of a cottage industry” (Baldwin 1997: 5), although the difficulty in defining ‘security’ had already exercised the minds of scholars over several decades.¹

This chapter addresses three central issues regarding the conceptualization of security. The first is that different theoretical approaches conceive of ‘security’ differently, depending on their basic ontological and epistemological commitments. The second and related issue is that different conceptions of security, in turn, entail different understandings of threats, of insecurity, and of the referent objects of security, those entities in need of being secured. We seek in this chapter to illuminate these differences. Third, we address the persistent claim that IR and Security Studies should be “relevant to contemporary [policy] concerns” (Krause/Williams 1996: 40). For each approach we draw out the relationship between academic theorizing of security and policy debates. In particular, we highlight the fact that policy-making and academic discussions are, as Stanley Hoffman (1977) famously argued, always already intimately related.

The first section (39.2) presents the conventional rationalist conceptualization of security, one that pre-

dates the end of the Cold War and is prominent in policy discourse. The authority of this vision of security demands that we trace the development of approaches to security from it, despite claims that the post-Cold War era is fundamentally different from those preceding it.

In the second section (39.3), we discuss attempts to broaden and deepen the analysis of security by including a wider array of policy issues under the heading ‘security’ and expanding its referent objects. We draw attention to the differences, and also the similarities, between these reconceptualizations and the rationalist model.

Finally, we offer a third conceptualization of security as discourse (39.4). In this approach, the construction of *insecurity* is investigated in more detail, as are the mutual constitution of threats and threatened identities. Throughout, we use the contemporary security threat posed by immigration as an example. We conclude by emphasizing that these academic concerns about conceptualization – themselves already influenced by policy debates – are of central importance to policy-making, and indeed constitutive of security policy.

39.2 Security As Power

The mainstream rationalist approaches² dominant in IR and Security Studies are fundamentally state-centric.³ They treat security, defined in relation to the

1 See, *inter alia*, Wolfers 1962; Krell 1979; Buzan 1983; Ullman 1983; Ayooob 1983/4; Wiberg/Øberg 1984; Varas 1986; Bay 1987; Mathews 1989; Walt 1991; Huysmans 1995.

2 Despite their internecine disputes over issues like relative versus absolute gains and the extent of cooperation under anarchy (e.g. Baldwin 1993a), we include realism, neo-realism and neo-liberal institutionalism under the single rubric ‘rationalism’ because they share the same substantive and meta-theoretical assumptions (e.g. Keohane 1988; Katzenstein/Keohane/Krasner 1998).

3 States are generally defined in Weberian terms, as administrative organizations issuing binding decisions for a population and territory, and the ultimate repository for the legitimate use of force (e.g. Weber 1947: 156).

state, as intimately related to power, understood primarily, if not exclusively, in military terms. The reason is straightforward. On rationalist accounts, which draw substantively on a realist vision of world politics, the international differs from the domestic primarily in its anarchic character. This anarchy – defined by the sovereignty of the state and the concomitant absence of a supra-state Leviathan – places states in inevitable and perpetual competition, the so-called “security dilemma” (Herz 1951). States are thus always insecure and necessarily concerned with their own survival: “In anarchy,” Kenneth Waltz has stated, “security is the highest end” (Waltz 1979: 126).

The fundamental interest of any state must therefore be to “protect [its] physical, political, and cultural identity against encroachments by other nations” (Morgenthau 1952: 972). ‘High politics’ – the arena of diplomacy and security, war and peace (e.g. Viner 1949) – is thus central for states and “each state must guarantee its own survival since no other will provide its security” (Mearsheimer 1990: 12). Security is conceptualized as an objective state of affairs, ultimately defined by state survival in the face of external threats, and states seek to provide for their security by “maximizing their power relative to other states” (Mearsheimer 1990: 12).⁴ Although the threats need not always be military, the response to insecurity is calculated in terms of power, and generally military power. ‘Threats’ are treated as external and objective such that it is a “*fact* that security is being sought against external violence” (Wolfers 1962: 490, emphasis added). Security becomes “nothing but the absence of the evil of insecurity, a negative value so to speak” (Wolfers 1962: 488).

This rationalist understanding of security, threat, and insecurity rests upon at least two important assumptions. First, it assumes that an independent reality is directly accessible both to state officials and to analysts. The distribution of power can be assessed ‘realistically’ or objectively and, consequently, threats to a state’s security can accurately be recognized. Hence, Morgenthau’s injunction that state officials overcome their “aversion to seeing problems of international politics as they are” (Morgenthau 1951: 7).

4 Military power is not the only relevant form of power, even for rationalists. It is recognized that “what is sometimes termed ‘statecraft’ – arms control, diplomacy, crisis management, for example” (Walt 1991: 213) – can also provide security, and that economic power is necessary for military power. Nonetheless, military threats constitute the ultimate insecurity and military power is the ultimate resort.

Second, this rationalist account posits the existence of certain entities – specifically states – within an environment in which they experience objective threat(s). The nature of states is given and fixed, at least for all practical purposes, and security requires securing states against objective and external threats. These basic assumptions naturalize states and their insecurities, while rendering contingent and problematic their actions and strategies for coping with the insecurities. States and their insecurities are naturalized in the sense that they are treated as unproblematical facts: states thus become the foundational objects that ground security analysis. Rationalist accounts, then, treat states and their insecurities as natural facts while problematizing, and consequently focusing attention onto, the acquisition of security for the state.

On this view, immigration, for example, is represented primarily as a threat to the integrity – the ‘physical, political and cultural identity’ – of the sovereign state. Noticeably, after the events of 11 September 2001, “a number of countries have revisited their asylum systems from a security angle and have in the process tightened procedures and introduced substantial modifications” (Türk 2003: 115). This increase in border control, and the surveillance and enforcement mechanisms such control entails, is premised on a rationalist view of the state and security that sees sovereignty and territoriality as the markers of statehood. Because the state, with its defining territorial borders, is taken as objectively given, border transgressions are potentially threatening: “The dangers of mobility can be described as vectors of threat: security and crime, political and cultural difference, health and disease” (Salter 2004: 72). Immigration, when considered a security threat, thus requires responses that prioritize controlling borders and monitoring human traffic across them.

On this view, in short, the object of security is the state and threats, and therefore insecurities, are objective, external, and fundamentally related to the use of power, and ultimately force. Security is always fragile and relative to the power of other states. The security problematic of any particular state is to develop policies that minimize objective threats, ultimately to the very survival of the state itself.

39.3 Extending Security: Proliferating Referent Objects and Threats

The rationalist preoccupation with the physical security of the state has of course excited extensive criti-

cism. Over the last several decades, critics have argued that both the concern with military security and the concentration on the state as the object of security are dangerously and unnecessarily narrow.⁵ Alternative conceptions of security abound. Analytically, they highlight two arguments.⁶ First, the category of security has been expanded to include threats outside of the traditional arena of 'high politics'. Thus, we have been encouraged to see economic crises, global warming, underdevelopment, epidemics, human trafficking, and so on, as security threats. Second, and as a corollary, the object of security has been extended to include a variety of non-state actors, among them individuals, civil society, the international community, and humanity as a whole. We briefly discuss each of these analytical commitments.

The threats against which the referent object of security can be secured, according to this view, range from conventional 'security' concerns like armed conflict to economic deprivation, environmental disasters, and gender violence. For example, drawing on policy discourses, a 'development/security nexus' has recently been posited.⁷ On this view, as World Bank President James Wolfenson noted: "If we want to prevent violent conflict, we need a comprehensive, equitable and inclusive approach to development" (cited in Thomas 2001: 160). Development, conventionally seen as an economic and social problem, and violent conflict, conventionally the security concern, thus become inextricably linked, substantially broadening the traditional notion of 'security'.

Expanding the policy issues encompassed by the category 'security,' in turn, alters the objects of security. As threats - and responses to those threats - are no longer assumed to be primarily military, security is no longer solely the concern of the sovereign state (Bilgin 2003: 203). Instead, it becomes clear that individuals, communities, regions, and sometimes humanity as a whole,⁸ have a stake in 'security' and can thus potentially work to achieve it (although their interests may not be compatible). The referent object of secu-

rity is thus expanded and security becomes a "single continuum ... protected and enhanced by a series of interlocking instruments and policies" (McRae 2001: 22). For instance, 'human security' has recently received considerable attention,⁹ "broaden[ing] our view of what is meant by peace and security",¹⁰ notably in the policy discourses of international institutions like the United Nations. As the Final Report of the Commission on Human Security asserts, human security is 'people' rather than state centred (CHS 2003: 2) and designed to "protect the vital core of all human lives in ways that enhance human freedom and human fulfilment. ... It means creating ... systems that together give people the building blocks of survival, livelihood and dignity" (CHS 2003: 4). Emphasizing the 'human' referent of security highlights the diverse ways in which threats are experienced, again demonstrating that in/security applies to agents larger and smaller than the state.

Immigration provides a further example of the complexity of the category of 'security' and its referent objects. On the one hand, immigration can be seen as a threat to the state, as it is in the rationalist approach. "The first action that governments typically take when faced with a crisis is to close their borders. States seem intent on gaining security by stopping the world from moving" (Bach 2003: 227). On the other hand, however, individuals often choose to cross borders precisely to overcome insecurities, whether physical, economic, or otherwise. For individuals, barriers to immigration can be threatening, a source of insecurity, while immigration itself offers a (possible) road to security. Put simply, political issues affect different objects of security differently. On this view, we thus need to look at "security issues ... from both [or more] sides of the coin" (Türk 2003: 121), broadening the conceptualization of threat and of the referent objects of security.

Reframing as 'security' issues those previously considered under other rubrics reveals the power of the concept of 'security'. Harnessing this power - which traditionally recognizes that it may be necessary to use force or whatever other measures "necessity dictates" (Waltz 1967: 206) - magnifies the severity of problems,

5 Challenges to the rationalist perspective on security vary enormously in their philosophical and methodological approaches. However, they are minimally united in their desire to reconceptualize security by broadening its scope. Examples include Krell 1979; Buzan 1983; Barnett 1988; Matthews 1989; Boutros-Ghali 1992; Kupchan/Kupchan 1995.

6 Many analysts of course make both at once. We separate them out for analytical purposes.

7 Examples include Martinussen 1997; Duffield 2000, 2001; Dewitt/Hernandez 2003.

8 Early examples include Independent Commission on Disarmament and Security Issues 1982; Buzan 1983; Bay 1987; Tickner 1992.

9 See, for example, Thomas 2001; McRae 2001; Paris 2001.

10 Kofi Annan, 1999: "Letters to Future Generations: Towards a Culture of Peace", at: <<http://www.unesco.org/opiz/lettres/TextAnglais/AnnanE.html>>.

inscribing them with a level of necessity and urgency generally accorded to dire crises, such as war.¹¹ Thus, articulating immigration as a threat to security enables the imposition of stronger border controls, the exercise of surveillance, and the construction of detention camps, among other measures. As a result, it allows for the violation of civil rights and the expenditure of vast resources. Especially in the face of concerns about transnational ‘terrorist networks’, popular support for such measures can be gained by linking immigration to terrorist threats that may “endanger the survival of vast numbers of vulnerable people” (Bach 2003: 242). There is thus a clear political motive for expanding the concept of security. Claims to ‘security’, and particularly ‘national security’, function to leapfrog policy issues up the political agenda, to facilitate speedy responses, to make resistance more difficult, and to make money flow.

These expanded approaches improve on the rationalist focus on military threats to state security by allowing us to recognize a wider diversity of threats that engender insecurity not just for states but also for individuals and the whole of humanity. Nonetheless, their approach to security remains unaltered in fundamental ways. As with rationalism, states and other objects of security are simply assumed to exist, as do objectively given threats to the security of those objects. The analytical and political task thus remains the same: to make the referent objects more secure in the face of these threats.

39.4 Security As Discourse¹²

The difficulty with the preceding approaches is that objects and events do not in fact present themselves unproblematically to the observer, however ‘realistic’ he or she may be. Determining what the particular situation confronting a state or other actor is, what, if any, threat to security it faces, and what the ‘correct’ response might be always requires interpretation. Threats, then, are fundamentally interpretative, not objectively given facts. Immigration, for instance, can be represented as a major threat to the security of a sovereign state, as discussed above. But it can also be represented as a solution to individual insecurities or as a component of the free movement of labour nec-

essary to a successful neoliberal order. All three representations require significant interpretative labour. Rationalist theories and their extensions, assuming as they do that threats are external and objective, cannot explain how a particular situation comes to be understood as a threat to begin with. Understanding security as discourse allows this fundamental question to be addressed. To challenge conventional understandings of security, then, one can focus on *insecurity* and its discursive production.

A discourse is a set of capabilities – a set of “socio-cultural resources used by people in the construction of meaning about their world and their activities” (Ó Tuathail/Agnew 1992: 192–193) – and a structure of meaning-in-use – “a language or system of representation that has developed socially in order to make and circulate a coherent set of meanings” (Fiske 1987: 14). Discourses, that is, are sets of rules for ordering and relating discursive elements (subjects, objects, their characteristics, tropes, narratives, and so on) in such a way that some meanings rather than others are constituted.¹³ Conversely, we have reached the boundaries of a discourse when representations fail to be meaningful, when they seem “unintelligible” or “irrational” (Muppidi 1999: 124–5) from within it.

Understanding security as discourse recognizes that insecurities are discursive constructions rather than natural facts. One way to get at the constructed nature of insecurities is to examine the ways in which insecurities and the objects that suffer from them are mutually constituted. That is, in contrast to approaches that treat the objects of insecurity and their insecurities as given, a discursive approach treats them as inextricably intertwined: insecurity becomes the product of processes of identity construction in which the ‘self’ and the ‘other’, or multiple ‘others’, are constituted.¹⁴ The object of analysis then becomes those states and other referent objects of security and their insecurities generally taken for granted in IR and Se-

11 Wæver’s concept of ‘securitization’ (1995) discusses this idea more comprehensively.

12 This section and the next draw on Weldes/Laffey/Gusterson/Duvall 1999.

13 Relations of constitution differ from causal relations. The process of constitution is definitional: it explains how “a particular phenomenon is that phenomenon and not something else.” It delineates the “possibility conditions for the existence of phenomena”; how, within a discourse, some phenomena are possible such that they are defined in that discourse as those phenomena (Majeski/Sylvan 1991: 8).

14 For approaches to the constitution of self and other in a variety of cultural processes, see, *inter alia*, Campbell 1994, 1998a; Connolly 1991; Doty 1993; Drinnon 1990; Greenblatt 1991; Neumann 1996; Spurr 1993; Todorov 1982.

curity Studies. Insecurities and their objects are denaturalized, in particular by demonstrating how both insecurities *and* actors such as states are discursively produced in relation to one another.

A conception of security as discourse assumes that the identities of actors are constructed through acts of representation, or ‘discursive practices’. This means that security discourses function to construct the identities of various subjects, for example states and migrants, and to position these subjects in relation to each other. The identities thus constructed in turn function to prescribe some behaviours, while rendering others unthinkable. Identities are therefore central to this conceptualization, as how we think of ‘ourselves’ is constructed in relation to how we conceive of the ‘others’ (and vice versa). “The face of the other,” as Dutta (2004) argues, is fundamental to our understanding of our own being-in-the-world. These identities, in turn, are part of the condition for action.

It is, of course, perfectly reasonable for some purposes to take the common sense interpretative categories of subjects for granted for analytical purposes. However, if one is interested in going beyond the agent’s point of view to examine security as discourse, to examine those discursive practices that are the conditions of possibility for the agent’s self-understandings in the first place, then one needs to subject that common sense to critical scrutiny. This common sense is not truth: rather, it is what Stuart Hall has called the “categories of practical consciousness” (Hall 1986: 30). Critical scrutiny seeks to defamiliarize – literally to make strange – common sense understandings and so to make their constructedness apparent. It denaturalizes the putatively given agents, such as states; it denaturalizes the relations among subjects; and it denaturalizes the insecurities faced by those subjects as apparently objective threats.

In the following two sections, we highlight two distinct approaches to the analysis of security as discourse: a critical constructivist approach that focuses on the intersubjective practices of in/security production, and a post-structural approach that emphasizes the performative effects of security discourse.

39.4.1 Critical Constructivism: The Intersubjectivity of In/Security

The claim that insecurities are discursive constructions derives from the recognition of a deceptively simple fact: that people “act towards objects, including other actors, on the basis of the meanings that the objects have for them” (Wendt 1992: 396–7). Critical

constructivism assumes that the world is constituted in part through the meaningful practices of social subjects, and that people act on the basis of the meanings that things have for them. These meanings are fundamentally discursive: they are made possible by particular discourses that provide the categories through which the world is understood. Meaning is thus *intersubjective*: it is a social rather than an individual or collective phenomenon. Meaning inheres in the practices and categories through which people engage with the world. Intersubjective meanings constitute the world as we know it and function in it: they tell us “what the world is and how it works, for all practical purposes” (Hall 1988: 44).

According to this view, identities – both of self and of others – and in/securities, rather than being given, emerge out of a process of representation through which individuals – whether state officials or internet surfers – describe to themselves and others the world in which they live. These representations define, and so constitute, the world. They populate it with subjects, endow them with interests, and define the relations among them. In so doing, they create insecurities, threats to the identities, and thus the interests, of these socially constructed subjects.

Of course, discourses abound and the world is represented in different, and often competing, ways. This means that any representation can potentially be contested and so must actively be reproduced. Meanings, in other words, are neither static nor final; rather, they are always in process and always provisional. The contemporary ‘immigration crisis’ in the United Kingdom (UK), for instance – like its many predecessors¹⁵ – is constituted as a problem in a security discourse that constructs the British national community in opposition to ‘bogus asylum seekers’ and ‘economic migrants’ as well as to immigrant communities that fail to adapt to and adopt a ‘British’ way of life.¹⁶ The production of in/securities thus requires considerable discursive work, as can be seen in the lively debates over what counts as ‘Britishness’ and whether ‘native’, white Britons could actually pass the Britishness test required of those seeking UK citizenship.¹⁷ Dominant discourses – relentlessly construct-

15 See Winder’s (2004) interesting history of immigration into the territories now called ‘Britain’.

16 Gerri Peev: “Test Ignites Questions of Britishness”, in: *The Scotsman*, 1 November 2005; at: <<http://news.scotsman.com/topics.cfm?tid=16&id=2176262005>>; “Test of Britishness for Immigrants”, CNN.com, 31 October 2005; at: <<http://edition.cnn.com/2005/WORLD/europe/10/31/uk.citizen.test.reut/>>.

ing immigration as a national security threat, for instance – must constantly reproduce themselves to answer challenges to their identification of threats worthy of a claim to ‘security’. Contesting discourses, in turn, attempt to rearticulate in/securities in ways that challenge the dominant representations – for example, by constructing immigration as providing a necessary economic resource in the face of declining population growth.¹⁸

Constructions of in/security provide both conditions of and limits on possibility. They make it possible to act in the world while simultaneously defining the “horizon of the taken-for-granted” (Hall 1988: 44) that marks the boundaries of common sense. Such constructions become common sense when they have successfully defined their relationship to reality as one of correspondence. That is, they are successful to the extent that they are treated as if they transparently reflect ‘the real world’. In this way discursive constructions are naturalized, and both their constructed nature and their particular discursive origins are obscured. The creation of common sense is thus “the moment of extreme ideological closure” (Hall 1985: 105). By authoritatively defining ‘the real’, dominant representations of in/security (try to) remove from critical analysis and political debate what are in fact particular, interested constructions. Within the UK immigration crisis discourse, for example, it is not possible intelligibly to argue that refugees and asylum seekers should be viewed as an economic, social or cultural asset. On the other hand, it is possible, indeed common sense, to argue that they need to prove ‘Britishness’.

A corollary of this argument is that discourses are sites of social power. Some discourses are powerful because they are located in powerful institutions. All else being equal, representations by state officials have prima facie plausibility as these officials are constituted as speaking for the state, and ultimately for ‘us’. Such representations are regarded as legitimate not because they are accurate, but because they emanate from the institutional power matrix that is the state. In their representations of in/security, for exam-

ple, state officials can claim access to information produced by the state and denied to most outsiders. They also have privileged access to the media to disseminate their representations (e.g. Herman/Chomsky 1989). And, crucially, their representations have constitutional legitimacy, especially in the construction of insecurity. After all, ‘national security’ is quintessentially the business of the state and the identification of insecurities is a task understood rightly to belong to its officials (e.g. Weldes 1999: 11–12). Dominant discourses, especially those of the state, thus become and remain dominant in part because of the power relations sustaining them.

A critical constructivist approach to security as discourse highlights the intersubjective nature of knowledge claims, the importance of discursive practices, and their construction of the state and other objects of security and their respective in/securities. It denaturalizes those representations taken for granted in conventional approaches, and draws attention to the institutional relations of power that sustain some representations over others.

39.4.2 Post-Structuralism: States Performing Security, Security Performing States

Post-structuralist security theorizing is largely compatible with the analytical approach explored in the previous section, but explicitly highlights the performance of “the social or symbolic order and the subject” (Edkins 2002: 71) as “[n]either subjects nor social order *exists* at a particular point in time. Both are only ever in a process of becoming” (Edkins 2002: 71). Where the previous critical constructivist approach highlights the intersubjectivity of in/security, a post-structural approach interrogates the ways in which these in/securities, and responses to them, are performative of particular configurations of political identity. As Butler explains, “performativity must be understood not as a singular or deliberate ‘act’, but, rather, as the reiterative and citational practice by which discourse produces the effects that it names” (Butler 1993: 2; 1999). In the study of security, the discursive power of the concept ‘security’ is integral to this understanding. That is, the ‘reiterative and citational practice’ of an elected government declaring something – such as immigration – a ‘security threat’ enables certain political processes and policies, as described above. This act “is a performative one which brings a contemporary configuration of sovereignty into being” (Butler 2004: 61) and, in doing so, pro-

duces the effect of the state – or the institution or network performing the security policy.

On this view, states, acting as unitary authoritative entities, perform violence, but violences, in the name of security, also perform states.¹⁹ In contrast to Steven Walt's charge – levelled against post-structural approaches to IR and Security Studies – that “issues of war and peace are too important for the field to be diverted into a prolix and self-indulgent discourse that is divorced from the real world” (Walt 1991: 223), post-structuralist analysis of in/security in fact problematizes the ways in which ‘the real world’ comes to be recognized as such, and argues that “security ... is first and foremost a performative discourse constitutive of political order” (Campbell 1998a: 199). This approach investigates the ways in which discourses of security reproduce narratives of identity and ontology – a sense of being in the world – and, in the discipline of IR, explores the performance not only of sovereign states as bounded territorial entities, but also of international institutions and the ‘international community’. The (re)production of these identities is often violent, through policies that permit acts of physical violence, or through the discursive violence of marginalization. For example, while security policies that govern immigration might not endorse or permit acts of physical violence directly and explicitly, the construction in popular discourse of the migrant vis-à-vis the inhabitant of the host state may permit the inhabitant to think of the migrant as an outsider, as different, as fundamentally *less than* her/himself. This is a form of discursive violence that creates the conditions of possibility for physical violence, as the hate crimes directed against non-Caucasian's in the UK and US immediately after 11 September 2001 demonstrate.²⁰

Krause and Williams (1997: 51–52) argue that “the question of violence in its direct and brutal form cannot be avoided in security studies.” According to this view, violence encompasses not just acts of interstate war, but also instances of civil conflict and oppressive practices within and between states, as well as the legal structures, policy practice and the research that guides them. Problematizing discourse on ‘security threats’ illustrates not only the ways in which the notion of a co-

herent agential ‘state’ is one that requires constant reproduction, but also the ways in which violence extends beyond the ‘direct and brutal’ to the discursive formations that enable certain actions to be undertaken in the name of security and proscribe other responses. A post-structural approach allows one to investigate the ways in which these acts of violence articulated through discourses of security function to posit the existence of states as boundaries of the domestic realm, to (re)produce state identity, to (re)affirm security as the concern of states, and to (re)produce sovereignty as the organizational matrix of the ‘international’ system.²¹

For example, in August 2005, ten “foreign nationals” were detained pending deportation by the UK immigration service.²² The news report identified one of the individuals as a “radical Jordanian cleric” and all ten were represented by the Home Secretary as “pos[ing] a threat to national security” (*ibid.*). The actions, the media representations of the actions, and the policies that allowed for those actions to be considered a reasonable, ‘thinkable’ way to proceed, are instances of the UK performing its identity – as a sovereign state that is concerned about national security and willing to detain foreign nationals “without charge” as they are deemed as a threat to that security – and also specific components of the state performing their role in the securitization of immigration.

This post-structural approach “rests on the assumption that representations of the world make a difference and that there is no natural or neutral arbiter of a true representation” (Huysmans 2002: 50). Violences and threats, as much as states and in/security, are interpreted through the practices that enable individuals to make sense of their social locations and identities. Primarily, this approach displays “a preference for emphasizing a theorization of the power-knowledge nexus” which conceives of all knowledge as intrinsically related to power and power as productive of certain types of knowledge (e.g. Foucault

19 Examples of this approach include Campbell 1998a; Butler 2004; Ling/Agathangelou 2004; Shepherd 2006.

20 Kevin Anderson: “US Muslims Suffer Backlash”, in: BBC News, 19 November 2002; at: <<http://news.bbc.co.uk/1/hi/world/americas/2488829.stm>>; Islamic Human Rights Commission, 2002: “The Hidden Victims of September 11: The Backlash Against Muslims in the UK”; at: <<http://www.ihrc.org.uk/file/report02sepo6backlash.pdf>>.

21 As mentioned above, this notion draws heavily on Butler's theorizing of gender as performative. Butler sees gender as the organizational matrix that orders the emergence of the subject “within and as the matrix of gender relations themselves” (Butler 1993: 7), just as this perspective sees security discourses as ordering the identity framework of sovereignty. Both regulatory ideals – gender and sovereignty – are premised on a system of binary logic that this approach seeks to problematize.

22 “Threats to UK Security’ Detained”, in: BBC News, 8 August 2005; at: <<http://news.bbc.co.uk/go/pr/fr/-/1/hi/uk/4141000.stm>>.

1980). For Security Studies, “it has the advantage that the research slides directly into the key area of the governing work of security utterances” (Huysmans 2002: 60). That is, in light of the dominance of a rationalist vision of security in contemporary policy discourse, and the ways in which this dominance functions to reproduce a discursive link between security and priority in the representation of policy issues, theorizing security as performative and investigating the identities being performed at any given moment draws attention to the types of knowledge that are (re)produced and the practices of power immanent in the processes of (re)production.

By interrogating representations of security and threat, post-structuralist security analysis problematizes the notion that security maps directly onto a pre-determined understanding of the state (of) being free from danger. Policies pursued in the name of ‘security’ and the threats to which these policies purport to respond are performative of a particular socio-political order and the identities of the subjects and objects within that order.

39.5 Conclusion

Throughout this chapter we have indicated ways in which security policies not only impact on the lives of individuals everywhere, but also function to construct the lived experiences of those individuals and limit the conditions of possibility of their lives. We have emphasized the ways in which policy discourses about in/security resonate closely with very conventional conceptualizations of security and that these links serve to prescribe certain policy responses and proscribe others. At the same time, we have drawn attention to the ways in which the political process of securitization produces resources that can be used to implement the policy responses that are implicated in the performance of a particular configuration of political identity.

An expressly critical analysis of security will, minimally, challenge the naturalized assumptions of the rationalist representations of the world, and its extensions. A critical analysis of security refuses to take the world as it finds it, “with the prevailing social and power relationships and the institutions into which they are organized, as the given framework for action,” nor does it see as its general aim “to make those relationships and institutions work smoothly by dealing effectively with particular sources of trouble” (Cox 1986: 208).

A critical theory, in contrast, allows us to disturb “comfortable” understandings of the world, thus opening up the possibility that we can “make the world anew” (Gusterson 1993: 8). Reconceptualizing security as discourse not only attempts to contest privileged constructions of the world but also attempts to re-imagine the world. As Jennifer Milliken (1999: 244) argues, “[c]oncretizing other possibilities is surely the best way to enable people to imagine how their being-in-the-world is not only changeable, but perhaps, ought to be changed.”

These are not simply academic concerns without significance in ‘the real world’. It matters deeply for a host of social relations whether one is more afraid of, say, bombs owned by the United States and based in Britain, or the possibility that a ‘transnational terrorist network’ might get hold of a bomb. It matters for everyone whether immigration is represented as a threat to security, a necessary source of cheap and willing labour, or the exercise of a human right to freedom of movement. Furthermore, conceptualizing security as discourse draws attention to the politics of representation, and pays critical attention to the ways in which ‘we’ as subjects are positioned, and can enjoy privilege, through their practice.

A discursive approach to security assumes that one’s legitimacy as a knowing subject is constructed through discursive practices that privilege some forms of being over others. In the context of ‘security’, because of the concrete social power of the concept, these considerations are particularly important. As Simon Dalby (1997: 19–20) comments, “seen in these critical terms, the whole political preoccupation with security is less a matter of a pre-given political reality and more a matter of the social construction of political orders.” The example of immigration has been used to illustrate the various ways in which it can be represented, and the impact of the different conceptions of security on its representation as a policy issue. In the context of claims that, since 11 September 2001, we live in a world that has somehow fundamentally changed, immigration and the connotations of border control, mechanisms of surveillance, and the violence that accompanies it are of particular relevance. Problematizing immigration – problematizing *security* – entails the recognition that there are no easy answers, that even “falsely obvious” (Barthes 1972: 11) answers need to be challenged. As security scholars, we must take this challenge seriously.

40 From a Security towards a Survival Dilemma

Hans Günter Brauch

40.1 Introduction: Shifting Perceptions of Security Dangers¹

The perception of *security dangers* – of multiple threats, challenges, vulnerabilities, and risks (Brauch 2005a, 2007) – and thus the *security concerns* of nation states and their people has significantly changed in many but not all parts of the world with the end of the East-West conflict. The security concept has widened, deepened and sectorialized, and the classic linkage between ‘peace and security’ – both in the Covenant (1919) and in the UN Charter (1945) – has turned to a conceptual quartet of peace, security, development, and environment (chap. 1 and 3 by Brauch, chap. 4 by Wæver; chap. 10 by Oswald, chap 35 by Bothe).

This chapter will discuss the impact of the manifold conceptual innovation pertaining to security on the classic linkage concept of a ‘security dilemma’. This concept has been widely used for inter-state relations in a bipolar world. It reflected a high degree of uncertainty on the military and economic potential, but also with regard to the intentions of the ‘other’. It also discusses new concepts linking security with development and environment or sustainable development. This is the goal of the new concept of a ‘survival dilemma’ that has gradually emerged during the past decade:

- First, as a Grotian concept focusing on the need for cooperation in ‘facing’ (responding) and ‘coping’ (adapting, mitigating) with manifold new environmental and societal challenges that do not respect state boundaries. This Grotian ‘state-centred’ concept reflects the disappearance of bipolarity and the overcoming of the ‘Hobbesian fear’ (Butterfield 1950, 1950a, 1952) with the end of the Cold War, but also the increase of non-military soft security dangers that require primarily non-military, economic, societal, and environmental mitigation strategies.
- Second, as a human-centred concept that focuses on the causes of *global environmental change* (GEC) and its impacts on humankind and human beings, especially on the poor, the marginalized and the environmentally and socially highly vulnerable people whose personal ‘survival’ and that of their families and communities has been put at risk and who have been confronted with several unpleasant choices.

The ‘survival dilemma’ links a widened and deepened security concept with issues that are caused by unsustainable development and human-induced GEC. The other new concept of ‘sustainable peace’ requires efficient survival strategies for coping with this new challenge (Brauch chap. 3; Oswald chap. 5).

The following four parts of this chapter review the use of the concept ‘dilemma’ in the social and political sciences and in four specialized research programmes (40.2), discuss the evolution, use, and controversy on the ‘security dilemma’ (40.3), offer the first systematic attempt to conceptualize the state- and human-centred concept of a ‘survival dilemma’ (40.4), and conclude with ideas for coping with this dilemma through specific survival strategies (40.5) that combine top-down and bottom-up policies and strategies.

1 The author would like to thank Úrsula Oswald Spring (Mexico) and Béchir Chourou (Tunisia) for valuable suggestions and comments on an earlier draft of this chapter. He also thanks Ben Wisner and the co-authors of the Policy Memorandum on Climate Change and Human Security that was released on 15 April 2007 for permission to use material from this collaborative study. For the full text and the affiliations of all eleven co-authors, see at: <http://www.afes-press.de/pdf/ClimateChange_and_HumanSecurity.pdf>. On April 17 2007 during the British presidency the UN Security Council for the first time addressed climate change as a security issue.

40.2 Dilemmas in the Social Sciences: Security vs. Survival

40.2.1 The Dilemma Concept: Origins and Applications

In a literal sense, the term 'dilemma' refers to "an argument which presents two or more alternatives; *di-*, two, and *lemma*, a proposition or assumption ...; 1. in logic, an argument which presents an antagonist with a choice between equally unfavourable or disagreeable alternatives. 2. any situation necessitating a choice between unpleasant alternatives; a perplexing or awkward situation" (McKechnie 1983: 511).² For Skeat (1946: 169; Collins 1997: 25) a dilemma is "an argument in which one is caught between two difficulties" that are being interpreted "as being equally unfavourable" (Collins 1997: 10).

As a scientific concept, 'dilemma' is used in philosophy and logic and as a prisoner's dilemma in game

2 *The Compact English Dictionary* gave this definition: "1. a situation in which a difficult choice has to be made between two alternatives, especially when a decision either way will bring undesirable consequences; 2. a difficult situation or problem" (Soanes 2002: 304). *The New Collins Concise English Dictionary* defines dilemma as: "1. a situation necessitating a choice between two equally undesirable alternatives; 2. a problem that seems incapable of a solution; 3. on the horns of a dilemma, a. faced with the choice between two equal alternatives; b. in an awkward situation" (McLeod 1985: 313). *The Concise Oxford Dictionary* sees a dilemma as an "argument forcing an opponent to choose one of two alternatives both unfavourable to him; position that leaves only a choice between equally unwelcome possibilities; difficult situation" (Sykes 1985: 268). *Chambers Universal Learning Dictionary* defines dilemma as "a position or situation giving a choice of two causes of action, both equally unpleasant" (Kirkpatrick 1980: 184). *The Longman Dictionary of Contemporary English* offers this definition: "a situation in which it is very difficult to decide what to do, because all the choices seem equally good or equally bad.... On the horns of a dilemma (be unable to decide between two unpleasant choices)" (Langenscheidt-Longman 1995: 380). *The Shorter Oxford English Dictionary* ²⁰⁰², Vol.1: 680 defined dilemma: 1. In *rhetoric*, a form of argument involving an opponent in choice between two (or more) alternatives, both equally unfavourable. In *logic*, a syllogism with two conditional major premises and a disjunctive minor premise. 2. A choice between two (or several) alternatives which are equally unfavourable; a position of doubt or perplexity; a difficult situation."

theory in both political science and in economics (*Brockhaus Enzyklopädie* ²¹2006, vol. 7: 29). *The New Encyclopaedia Britannica* (Vol. 4: 1998: 94) offered this explanation of a 'dilemma':

in syllogistic, or traditional, logic any of several forms of inference in which there are two major premises or hypothetical form and a disjunctive ('either ..or') minor premise. ... In logic \supset signifies 'if ...then'; \vee signifies 'either ...or'. Symbolically, therefore, a dilemma is an argument of the form $A \supset C, B \supset C, A \vee B$, therefore C. It is not necessary that a dilemma should have an unwelcome conclusion; but from its use in rhetoric the word has come to mean a situation in which each of the alternative courses of action (presented as the only ones open) leads to some unsatisfactory consequences. ... In [a] more complicated version of the dilemma, however, two unwelcome results are presented instead of one (C, above) (Mau 1972: 247-248; Thiel 1995/2004: 482-483).

In political science and in international relations, the 'dilemma' concept has been used with regard to the security of states, "where the policy by a state to achieve security proves to be an unsatisfactory one." If all alternatives open to a state are unsatisfactory, "the state is in a paradox" (Collins 1997: 10):

By falling foul of the security dilemma, any solution the state chooses is unsatisfactory and is thus not a solution at all. The result of the security dilemma is that security cannot be realized. This has led Wheeler and Booth to assert that: 'in an ordinary sense, a security dilemma would seem simply to refer to situations which present governments, on matters affecting their security, with a choice between two equal and undesirable alternatives.' However, when the concept has been used by writers of international relations, this has not always been the meaning they have attributed to the security dilemma. 'In the literature on international politics', Wheeler and Booth (1992: 30) argue, 'the term has come to have a special meaning'.

Before the scientific debate on the security dilemma will be assessed, a review of the use of the dilemma concept for the other three concepts of peace, development, and the environment is appropriate.

40.2.2 Other Dilemmas in the Social Sciences

The term 'dilemma' has also been used as 'peace dilemma', 'development dilemma', and 'environmental dilemma' in the media and by NGOs, but so far it has hardly been conceptualized scientifically.

40.2.2.1 Peace and Peace-Enforcement Dilemma

The term 'peace dilemma' has been used with regard to the nuclear debate on North Korea and the civil war in Sri Lanka, and as a 'peace-enforcement di-

lemma' for Somalia (Frank Crigler: at: <http://www.dtic.mil/doctrine/jel/jfq_pubs/jfq1002.pdf>), as a 'justice-peace dilemma' for the implementation of human rights, or as a 'dilemma of peace-seekers' (Schuman 1945: 12–30) and as a dilemma of specific countries or political leaders with regard to peace. However, no concept of a 'peace dilemma' has been used in the social sciences.

40.2.2.2 Development Dilemma

Senghaas (1982, 2004: 188–191) referred to several dilemmas determined by the structure of the contemporary world, among them the classic 'security dilemma' and a 'development dilemma' that develops in a relatively open world economy between societies and economies that exchange goods and services where major gaps with regard to know-how, organizational capabilities, technological and organizational innovations of its partners exist. He argued that such a development dilemma exists not only between industrialized and developing economies, but also within each group of states, e.g. within the triad of OECD countries in North America, Europe, and in the Far East that leads in different stages to different coping strategies between protectionism and free trade. It is uncertain whether this 'development dilemma' will lead to a 'security dilemma' or even to violent conflicts within and between states.

The term 'development dilemma' has been used in recent books titles (Ostergard 2002; Franke 1980; Behera 2004; Ndikumana 1998), but so far the term has not become a widely used scientific concept within a specific theoretical context.

40.2.2.3 Environmental Dilemma

The term 'environmental dilemma' has also been used in several publications but it has not yet become a specific scientific concept. For these three terms of a peace, development, and environmental dilemma it is unclear what poses the dilemma and what the unfavourable alternatives are for states or human beings. This is different for the 'security dilemma' that triggered a debate in political science, international relations, and in security and peace studies.

40.3 Security Dilemma: Genealogy, Use, Controversy

The idea of a 'security dilemma' has already been alluded to in Kant's treatise on eternal peace (40.3.1), 155 years before John H. Herz⁸ (1950) first referred to

this concept (40.3.2) that has been widely discussed during and after the end of the Cold War (40.3.3).

40.3.1 Kant's Third Preliminary Article in *Eternal Peaces*

With the emergence of the modern nation state and its system of rule, since the 18th century, the state bureaucracy expanded and standing armies were set up. In the third preliminary article of his *Eternal Peace* Kant (1795) referred to linkages between armed forces and arms, and the relations among states that pointed to a 'security dilemma'. Kant concluded that "standing armies (*miles perpetuus*) shall be gradually abolished", because

they constantly threaten other nations with war by giving the appearance that they are prepared for it, which goads nations into competing with one another in the number of men under arms, and this practice knows no bounds. And since the costs related to maintaining peace will in this way finally become greater than those of a short war, standing armies are the cause of wars of aggression that are intended to end burdensome expenditures (Kant, in: Humphrey 1992: 108).

He contrasted them with the role of militias "the voluntary, periodic military training of citizens so that they can secure their homeland against external aggression" (Kant, in: Humphrey 1992: 168). Different interpretations thereof were offered by contemporary philosophers.

According to Kersting (1996: 175) Kant's six preliminary articles outline the negative conditions of a peace among nations or of a negative peace without war. Saner (1995: 49) interpreted them "not as analytic legal deductions but as interventions of reason against political practice." For Lutz-Bachmann (1997: 63) they also "criticize the politics of all absolutistic states, and especially those of Prussia."

With the third preliminary article, according to Saner (1995: 49), Kant describes the armament dynamics, the interaction between armament, its autodynamics, and war. Gerhardt (1995: 58) interpreted this article as an expression of a "strategy of political action." Lutz-Bachmann (1997: 63) stated that Kant "explicitly contradicts ... the military doctrine prevailing since the time of Venetius – 'Si vis pacem, para bellum'."

Cavallar (1992: 116–123) argued that the mere existence of standing armies implies an element of threat that can cause a war, a *security dilemma*, Kant tries to escape by a gradual troop reduction in order not to undermine the military balance. Kant preferred a mi-

litia army with a defensive mission without obligatory service, as suggested in the American Bill of Rights (1776).

However, the interpretation of this preliminary article changed. While in the late 19th century several German writers (Rühl 1892, Pfeleiderer 1895, Stein 1896) considered Kant's preference for militia armies as obsolete, during and after World War I several authors, such as Kobler (1917), argued that both standing armies and conscription should be abolished. In Germany, the interpretations of Kant's treatise in the late 20th century were influenced by the critiques of armament policies and dynamics by contemporary peace research (Senghaas 1972).

In the 1930's, the British meteorologist Lewis F. Richardson (1960a) developed the theorem of an 'action-reaction process' of armaments where fear was referred to as a major motivating force for military build-up. This action-reaction theorem was later challenged by peace researchers in the 1970's (Senghaas 1972a; Buzan 1983: 207-209) who argued that the arms process is to a large extent domestically driven, and that threat perceptions and the action-reaction theorem were used to legitimate decisions to develop and procure armaments that were driven by military interests, national economic interests in profits, and local economic interests to maintain jobs and a technological impulse (Brauch 1977, 1990a).

40.3.2 Conceptualization of the Security Dilemma by Herz (1950)

Without any reference to Kant or Richardson, John Herz (1950, 1959) coined the term of a *security dilemma* with which he referred to the propensity of countries "to acquire more and more power to escape the impact of power of others," a tendency that has resulted in a vicious circle of mutual arms build-up. Herbert Butterfield (1950, 1950a, 1951, 1952) referred to it as a "predicament of Hobbesian fear" or as the "Hobbesian" dilemma.

Herz disagreed with the thesis that mutual suspicion and the security dilemma have resulted in a continual race for power and armaments, and in unending wars. Herz (1959, ²1962, ³1966: 12) saw the newness in the 'nuclear age' as a revolutionary process of weapons innovation (fission, fusion weapons, jet aircraft, rockets and missiles with nuclear warheads). Herz (1966: 19) pointed to the "apparent absence of an effective defence against the new weapon," and to nuclear developments that make military superiority obsolete, that have resulted in a vicious cir-

cle where armed forces with ever more nuclear weapons produce less and less security. As a consequence of the progressing penetrability of the state, its vulnerability against nuclear attacks has increased. Herz (1996: 231) defined 'security dilemma' as

a social constellation in which units of power (such as states or nations in international relations) find themselves whenever they exist side by side without higher authority that might impose standards of behaviour upon them and thus protect them from attacking each other. In such a condition, a feeling of insecurity, deriving from mutual suspicion and mutual fear, compels these units to compete for ever more power in order to find more security, an effort which proves self-defeating because complete security remains ultimately unobtainable. I believe that this dilemma, and not such (possibly additional) factors as 'aggressiveness', or desire to acquire the wealth of others, or general depravity of human nature, constitutes the basic cause of what is commonly referred to as the 'urge for power' and resulting 'power politics'.

Herz argued that this "fundamental social constellation" leads to "a mutual suspicion and a mutual dilemma of 'kill or perish', of attacking or running the risk of being destroyed." He refers to a social condition of men's "uncertainty and anxiety on his neighbours' intentions" that drives people in a situation of international anarchy to acquire more power to escape the superior power of others. Contrary to Butterfield (1950, 1952), Herz (1966: 235) argued that this situation did not lead to a permanent race for power, armaments and preventive wars due to different mitigation strategies, such as "commonly accepted standards of behaviour and 'law' [that] provide for mitigation of the fears and distrusts which the dilemma provoked," or security systems, like the balance of power (1815-1914) or systems of collective security of the League of Nations and the United Nations. Herz' security dilemma concept refers to the subjective level of security, to fears and concerns about encirclement, imperialism, world conquest that often had tragic implications "that mutual fear of what initially may never have existed may subsequently bring about exactly that which is feared most: actual 'encirclement'. Thus bipolarity has given the security dilemma its utmost poignancy."

During the Cold War, the security dilemma became most compelling "in the sphere of armaments" where "no moral, religious, humanitarian, economic, or other considerations could prevail against the brutal impact of a 'they or us'" (Herz 1966: 242). As a preventive war to achieve world government in the nuclear age is not feasible, and the means (mutual

annihilation in nuclear war) would destroy the end (survival), Herz concludes that the aim must be mutual accommodation in the Grotian tradition. Herz developed several mitigation options, some of which have become obsolete with the end of the Cold War. Herz's concept builds on Kant's third preliminary article. In a review of this concept Bruce Russett (1993: 822) states:

The security dilemma operates only under particular conditions of international relations. It stems primarily from leaders' perceptions of the military circumstances, specifically whether the offence has substantial advantages over the defence and whether defensive capabilities can be distinguished from offensive ones.

Russett (1993: 822) argued that

neither threats nor concessions are likely to ease a security dilemma. Threats will enhance the adversary's sense of insecurity; concessions will probably enhance one's own. Changes of strategic postures and weapons procurement in favour of the defence can help, as can better means to monitor the adversary's intentions and capabilities - if the adversary likewise has largely defensive aims.

Alan Collins (1995: 11-15) pointed to "four characteristics of a security dilemma: uncertainty of intentions, no appropriate policies, decrease in the security of others, and decrease on the security of all". Jervis (1976: 66) wrote that "the unintended and undesired consequences of actions meant to be defensive constitutes the 'security dilemma'," while Wheeler and Booth (1992) labelled them a "security paradox" and they considered "insecurity as the central characteristic of the security dilemma" (Ralph 2001: 17-19). In Jervis' view "the security dilemma cannot be abolished, it can only be ameliorated" (Jervis 1982: 361), while Wheeler and Booth (1992: 29) claim that "the theory of security communities and the practice of international politics among liberal-democratic states suggests that the security dilemma can be escaped, even in a setting of sovereign states."

Collins (1997: 1) referred to controversies on this concept whether it exists at all or is a pure academic construct; or whether the outcome was the result of an accurate assessment of the situation. For Collins (1997: 1) "the security dilemma arises when states inadvertently create insecurity in one another as they seek to gain security." He further argues that the security dilemma is "part of the action-reaction explanation of an arms race" (Wheeler/Booth 1992: 55) but that both concepts are not synonymous. Collins stated (1997: 4) that the security dilemma has not disappeared with the end of the Cold War. For Alexan-

der Wendt (1995: 77) "security dilemmas are not acts of God: they are effects of practice. This does not mean that once created they can necessarily be escaped (they are, after all, 'dilemmas'), but it puts the causal locus in the right place." Collins (1997: 11) distinguishes among five definitions of this dilemma:

decrease in the security of others; decrease in the security of all; uncertainty of intention; no appropriate policies; required insecurity. The first four relate to one another and form a coherent explanation of a traditional security dilemma.

After an extensive review of the first four definitions in the international relations literature, Collins (1997: 23) summarized three characteristic features of the concept: a) "the participants must have benign intent [where] neither actually intends to initiate an attack," b) "the unresolvable uncertainty that statesmen face when trying to determine the intentions of other states;" and c) "the options available to the statesmen while in the security dilemma." Thus, according to the traditional definition "the security dilemma should be seen as representing a process in which state actions, far from increasing security, actually fuel their own insecurity" (Collins 1997: 24). Jack Snyder (1985: 153) defined a security dilemma as "a situation in which each state believed that its security required the insecurity of others."

Collins discusses this fifth definition in light of his three criteria of "benign intent, irresolvable uncertainty, and self-defeating or paradoxical policies" for two types of state-induced security dilemmas: revisionist/revolutionary and militaristic status quo. In his interpretation, a security dilemma does not occur "where malign intent exists" (1997: 41), and he further concludes that "in addition to the anarchical system creating the security dilemma, a security dilemma can also arise from state action" (Collins 1997: 42). Within International Relations (IR) it has remained controversial whether the security dilemma can be escaped and whether it has done so in Europe with the end of the Cold War.

40.3.3 Debate on Security Dilemma since End of Cold War

With the end of the Cold War the 'poignant bipolarity' disappeared, what eased the security dilemma in Europe as did other mitigation strategies during the East-West conflict, such as arms control and disarmament agreements, and confidence and security building measures.

With the global turn of 1989/1990 and the events of 11 September 2001, the perception of security threats, challenges, vulnerabilities, and risks has changed, as has the conceptualization of security and of the security dilemma that has differed among analysts and policy-makers in Europe and in the United States (Czempiel 2002), but also among governments and security elites in Arab countries (Selim 2003), in Turkey (Aydin 2003), and in Israel (Kam 2003).

Wheeler and Booth (1992: 54) argued that with the emerging post Cold War security community “peace is predictable; the security dilemma has been escaped.” Collins (1997: 233–235) noted “that the process of mitigation begun by Gorbachev has slowed significantly, and the uncertainty of intent caused by suspicion and mistrust has grown steadily” with the Russian opposition to NATO enlargement.

Czempiel (2002: 21) argues that both structural realists (Waltz) and classical neo-realists have made the security dilemma the central theorem of their theory of international politics. For Czempiel (2002: 31) the security dilemma is no objective result of analysis but a societal and group determined phenomenon that is created by self, world, and enemy images in the tradition of the political culture of the respective country that may reflect both ethnocentrism and ideological fundamentalism. In Czempiel’s interpretation, the security dilemma is no exogenously existing factor in an anarchic international system, but the result of “deliberate choices of particular governments” (Wheeler/Booth 1992: 43). For the constructivists the security dilemma is a socially constructed concept and a phenomenon that is also influenced by respective domestic politics (Wendt 1992: 402, 1995: 71–81).

In his critical review, Jason Ralph (2001: vi) argues that “the concept of the security dilemma has been used by the discipline of Strategic Studies to explain why security competition is an inherent feature of the international system.” He proposed to redefine the concept “to account for the social and political contingency of reality and thereby reveal the immanent possibility of mitigating uncertainty between states and even constructing security communities.” While he does not deny the existence of security dilemmas, he challenges the realist view “that security dilemmas are a structural feature of anarchy.”

In his conclusions, Ralph (2001: 176–195) argued that at the centre of the classical definition of the security dilemma “are unwarranted ontological and epistemological assumptions,” and that the concept used by traditional security studies is “intrinsically conservative” and that it “can only be mitigated by co-

operation by statist elites”. To transcend this traditional concept of a security dilemma, Ralph suggested focusing on the societal level, and especially on the individual, but he failed to reconceptualize this dilemma from a human security perspective.

Both Czempiel’s and Ralph’s criticisms of the use of the security dilemma concept by realist schools challenges the concept as an ahistoric theorem derived from the uncertainty of international anarchy. Czempiel redefines the concept as the product of domestic politics, while Ralph argues that it should focus on the societal or human level. Their arguments reflect the horizontal widening and vertical deepening of the security concept since 1989.

The security dilemma focuses on inter-state relations in an anarchic world. Its major referent object has thus been the nation state or military alliances consisting of nation states. Thus, this concept has been used during and after the Cold War primarily for a narrow political and military state-centred security concept.

40.4 Survival Dilemma

The new concept of a ‘survival dilemma’ differs from the state-centred narrow ‘security dilemma’, it is wider in its focus by linking a widened and deepened security concept that includes the economic, societal, and environmental dimensions, and the human being and humankind as referent objects with the two new concepts of development and the environment or the linkage concept of sustainable development.

After a definition of the ‘survival’ concept, the question will be discussed with regard to survival for whom and against what? (40.4.1), before the survival dilemma will be introduced as a Grotian concept for dealing with non-military environmental challenges, vulnerabilities and risks (40.4.2), and as a people-centred or human security concept (40.4.3).

40.4.1 Survival for Whom Against What?

In contemporary general usage, the ‘survival’ concept implies: “1. the state of continuing to live or exist: ... *Our disregard for the environment threatens the long-term survival of the planet.* [fight for survival = struggle or work in order to continue to exist] ... 2. survival of the fittest: a situation in which only the strongest and most successful people or things continue to exist. 3. a survival from: *especially BrE* something that

has continued to exist from a much earlier period, especially when similar things have disappeared; relic.”³

The New Encyclopaedia Britannica (Vol. 11: 1998: 414–415) refers to two concepts of ‘survival’ in cultural anthropology as “a cultural phenomenon that originates under one set of conditions and persists in a period when those conditions no longer obtain,” and “survival training” as “teaching people to survive in the wilderness, using essentially Stone Age skills.”

Influenced by Charles Darwin’s (1859, 2006) ‘natural selection’ and Herbert Spencer (1864) the ‘survival of the fittest’ is used in biology “as a shorthand for a concept relating to competition for survival or predominance,” that has become a metaphor, not generally used by biologists, who prefer to use the phrase ‘natural selection’.⁴

Thayer (2004) in his *Darwin and International Relations: On the Evolutionary Origins of War and Ethnic Conflict* linked theories of human social behaviour to evolutionary biology as a basis “for both ‘realist’ theories of international relations and ‘rational choice’ approaches throughout the social sciences”. He applies an

3 *Learning Dictionary* defines survival as “1. the state of surviving ...; 2. a custom. Belief etc. that remains from earlier times: *This custom is a survival from the 13th century*” (Kirkpatrick 1980: 759): *Webster’s Unabridged Dictionary* defined survival as: “1. a living beyond the life of or continuing longer than another person, thing or event; an outliving; the act, state, or fact of surviving. 2. something that survives, as a habit, usage, or belief remaining from ancient times” (McKechnie 1983: 1837). *The Concise Oxford Dictionary* gives this definition of survival: “1. surviving (of the fittest, process or result of natural selection); kit, emergency rations etc. carried by airmen. 2. person or thing that has remained as a relic of an earlier time” (Sykes 1985: 1075). *The New Collins Concise English Dictionary* defines survival as: “1. a person or thing that survives, such as a custom. 2a. the act or fact of surviving or condition of having survived, b. *survival kit*.” (McLeod 1985: 1175). *The Shorter Oxford English Dictionary*, 2005, vol. 2: 3127 defines survival as the “1. action or fact to live after some event; 2. a thing that continues to exist after the cessation of something else, or of other things of a kind; a surviving remnant; a surviving custom, observation etc.”

4 For a discussion of Darwin’s concepts and a detailed biography see: “Darwin”, in: *The New Encyclopaedia Britannica* (Vol. 16: 1998: 977–981); for a discussion of the theories of human evolution, see at: *The New Encyclopaedia Britannica* (Vol. 18: 1998: 803–883) and for a brief discussion of the concept: ‘survival of the fittest’ on the web, see at: <http://en.wikipedia.org/wiki/Survival_of_the_fittest>.

interactionist approach of biologists to the phenomena of war as a consequence of both ecology and human nature. Thayer tests the theory by exploring warfare and inter-group violence prior to the emergence of the modern nation state, with a special emphasis on conflicts in ‘stateless societies’. This discussion ... expands the database for theoretical consideration to many human societies whose experiences provide context and challenge for a generalized theory of international relations ... Thayer shows how war, ethnocentrism, and ethnic conflict can be understood as responses to varied configurations of environmental and demographic factors that need to be considered in a broader, interdisciplinary framework (Master 2004).

The German sociologist Hillmann (1994: 885–886, 1997) coined the concept of a ‘survival society’ as a “constructing task of a visionary sociology” (Hillmann 1993). Such a ‘survival society’ should be established as a new type of society with a global extension whose culture, structure, institutions, actions, and development processes are directed at the longer-term guarantee of the survival of humankind and of its living nature. The cultural basis of the survival society is determined by an ecologically based worldview, and a value system that gives highest priority to a guarantee for survival besides the protection of human dignity and of a free societal order. In Hillmann’s view this requires overcoming the present *affluent* and *risk society* (Beck 1992, 1999, 2007), and its resulting environmental crises. This presupposes a global environmental movement that relies on all societal strata, a permanent elucidation and enlightenment with a high acceptance of environmental norms and policies.

Hillmann (1998: 125ff.) argues that the establishment of a survival society would require a fundamental shift (as fundamental as the emergence of the agricultural and industrial society). This presupposes a multi- and interdisciplinary cooperation of sociologists, social psychologists, ecologists, philosophers, political scientists, economists, and futurologists to analyse the preconditions and possibilities for protecting the survival of humankind. This survival society would require a new value system consisting of terminal values (survival, human dignity, protection of nature, peace, health, tolerance, freedom, justice, solidarity, welfare, and responsibility for future generations), as well as instrumental values (readiness to learn, work and yearning for success, creativity, and readiness to take risks, flexibility, mobility, initiative, self discipline, reliability, exactness, efficiency, modesty, thriftiness, public spirit, cooperation, involvement, participation, and courage of one’s convictions).

The *Interaction Council*, an organization of former heads of governments and states, has used the 'survival' concept in many official reports, e.g. by a High-level Expert Group on "*The interrelated problems of environment, population and development*" chaired by former Japanese Prime Minister Mr. Takeo Fukuda on 2 and 3 December 1985 in Tokyo who stated that the new global environmental challenges "cannot be dealt with through national action alone. Effective international cooperation is a prerequisite for *human survival*". In *The Search for Global Order* (D'Orville 1993) the InterAction Council pointed to the new dangers in the post Cold War era:

Although the old order is gone; a coherently structured new order offering a predictable framework for international intercourse is not yet in place. ... The new era is inconceivable without a redefinition of the inter-relationship between national and global interests, without new institutions, mechanisms and instruments.

The high-level group concluded that leaders must "realize that ultimately no facet of national security can be protected any longer without the assurance of global security in the widest sense." And in their "terms of reference" they noted: "The population explosion plus the greenhouse effect, coupled with other environmental degradation, are likely to cause massive migration flows, in the main from tropical and sub-tropical regions towards more moderate regions, or in other words towards highly developed countries. All these trends endanger the *survival of humankind* (D'Orville 1993: 39-40)." In June 2003, the Interaction Council (1993) called for collective action for sustainable development noting that

12. ... a world in which some states are rich and growing in affluence, and others are marginalized, is unsustainable. The lure of wealthy countries to people of poor countries is irresistible and will continue unless the causes of poverty are addressed by richer nations. International economic refugee movements lead to tensions among states and races. Global environmental degradation adds to the stress created by population pressure. Given the relationship in some developing countries between *environmental insecurity and political instability*, leaders of industrialized states should regard global environmental protection as essential on both moral and pragmatic grounds, and many environmental problems are insoluble without collective action.

In *Fighting for Survival*, Michael Renner (1997) analysed the transformation of security by focusing on "environmental decline, social conflict and the new age of insecurity," and he suggested for the security in the 21st century "a human security policy" that would require "enhancing international peace capacity," a

"human security budget" and "a global partnership for human security," but he did not conceptualize 'survival', the key term of his analysis.

The focus of the 'survival dilemma' is neither the 'survival of the fittest' nor a 'survival society', but rather the dilemma that often confronts the poor, the environmentally and socially highly vulnerable people with several unpleasant choices in response to both war, hazards, disasters, and complex emergencies that fundamentally challenge the survival in their traditional livelihoods. The key question is who is to survive: states or human beings and against what: wars, hazards, and disasters on the background of the changing perception of emerging new security concerns in the 'anthropocene' (Crutzen/Stoermer 2000; Crutzen 2002; Clark/Crutzen/Schelnhuber 2005, Oswald/Brauch/Dalby 2008). Next the two facets of a 'survival dilemma' of states in an anarchic international system and of human beings and humankind will be discussed.

40.4.2 Environmental and Climate Change and Security

Since the early 21st century climate change has increasingly been perceived as a threat to 'national', 'international', and 'human security'. Climate change has gradually been securitized in government reports and in statements of government officials in the United Kingdom, in Germany (BMU 2002; Brauch 2002, 2003e, 2004, 2006a; WBGU 2007, 2007a, 2007b, 2008), and in the US (Schwartz/Randall 2003, 2004; Purvis/Busby 2004; O'Keefe 2005; CNA 2007).

On 9 January 2004, David King, the UK Government's chief scientific adviser was quoted as saying that climate change is a far greater threat to the world than international terrorism.⁵ In February 2004, John Reid MP, then British Secretary of State for Defence and later Home Secretary, argued that climate change may spark conflict between nations. He forecasted that violence and political conflict would become more likely in the next 20 to 30 years with climate change, he listed among the major threats in future

5 See: Goklany and King: "Climate Change and Malaria", in: *Science*, 1 October 2004: 55-57; BBC (2007): "Global Warming 'Biggest Threat'", at: <<http://news.bbc.co.uk/1/hi/sci/tech/3381425.stm>>; see also BBC: "Scientist urges US climate help" on 10 March 2004, at: <<http://news.bbc.co.uk/1/hi/sci/tech/3498830.stm>> and on 31 March 2004, at: <http://news.bbc.co.uk/1/hi/uk_politics/3584679.stm>.

decades, including terrorism, demographic changes, and global energy demand.

As we look beyond the next decade, we see uncertainty growing; uncertainty about the geopolitical and human consequences of climate change. ... Impacts such as flooding, melting permafrost and desertification could lead to loss of agricultural land, poisoning of water supplies and destruction of economic infrastructure. ... More than 300 million people in Africa currently lack access to safe water; climate change will worsen this dire situation.⁶

John Ashton, a Special Representative for Climate Change of UK Foreign Secretary Beckett, said on 24 January 2007: "There is every reason to believe that as the 21st century unfolds, the security story will be bound together with climate change."⁷ He concluded: "Climate change is a security issue because if we don't deal with it, people will die and states will fail." In his view defence and security planners must face a paradox when assessing their responses to the problem. Most security threats in today's world are amenable to some extent to a "hard power" or conventional reaction, he said, and demand will rise for such responses to climate change-related security problems. "But there is no hard power solution to climate change – you cannot force your neighbour to change its carbon emissions at the barrel of a gun."⁸ Sir Crispin Tickell (2003), the former UK Permanent Representative to the UN, highlighted the environmental factors behind societal collapse. Professor John Mitchell, the chief scientist at the UK Met Office, forecasted that the coming decades will see a 30 per cent increase in severe drought and that Africa will experience increased desertification, water stress, and disease.

Besides the UK, other nations have begun to assess the security implication of climate change. In 2002, the German Ministry for the Environment, Nature Conservation, and Nuclear Safety published a commissioned report on climate change and conflicts which raised the question whether climate change im-

pacts can increase conflict potentials (BMU 2002; Brauch 2002). In June 2007, the German Advisory Council on Global Change (WBGU 2007b, 2008) released a study on *World in Transition – Climate Change as a Security Risk*. The German Military Staff College (Führungsakademie) is including climate change issues in its longer-term security scenarios until 2040 (chap. 72 by Jopp/Kaestner; Brauch 2006a).

In spring 2004 an internal report by Randall and Schwartz (2004; Brauch 2004c) for the US Department of Defense on the impact of Abrupt Climate Change on US national security was leaked to the press. Gilman, Randall, and Schwartz (2007) discussed the Impacts of Climate Change on US national security as did a report by the US Center of Naval Analysis (CNA 2007) on 16 April 2007. This study addressed three questions: a) on the conditions climate change is likely to produce globally that represent security risks for the US; b) how may they affect the US national security interests; and c) what actions should the US launch to address its national security consequences. The study concluded that the predicted consequences of climate change include: "extreme weather events, drought, flooding, sea level rise, retreating glaciers, habitat shifts, and the increased spread of life-threatening diseases," that may add "new hostile and stressing factors" and that have the potential "to create sustained natural and humanitarian disasters" whose consequences "will likely foster political instability where societal demands exceed the capacity of governments to cope" and it "will add to the tensions even in stable regions of the world." The CNA's Military Advisory Board drew five policy recommendations from its analysis:

1. The national security consequences of climate change should be fully integrated into national security and national defense strategies.
2. The US should commit to a stronger national and international role to help stabilize climate change at levels that will avoid significant disruption to global security and stability.
3. The US should commit to global partnerships that help less developed nations build the capacity and resiliency to better manage climate impacts.
4. The Department of Defense should enhance its operational capability by accelerating the adoption of improved business processes and innovative technologies that result in improved US combat power through energy efficiency.
5. The Department of Defense should conduct an assessment of the impact on US military installations worldwide of rising sea levels, extreme

Table 40.1: Matrix of Possible Climate Change and Security Interactions over Time. **Source:** Policy Memorandum: *Climate Change and Human Security*, 15 April 2007. Written permission by group's coordinator Ben Wisner was received.

	Direct impact		Indirect Consequences				Slow-onset
	Water	Food	Health	Mega-projects	Disasters	Biofuel	Sea level
Short term (2007-2020)	Local conflict over water	Failure to meet MDGs	Failure to meet MDGs	Long history of development-induced displacement from 1950's	Nation states begin to lose credibility due to inability to prevent large disasters	Isolated food – fuel competition and price spikes	Small number of displacements
Medium term (2021-2050)	Increased local and some international conflict over water	Significant displacement due to famine	Interacts with food production problems	Displacement of rural poor due to CDM, large scale dams, other state based mitigation and adaptation projects	Significant political unrest due to failure of DRR and inadequate recovery in many countries	Food-fuel competition increases and biodiversity erosion	Increasing displacement and national/ international tension
Long term (2051-2100)	Major international conflict over water	Major displacement and political upheaval	Major displacement due to epidemics	Major urban upheaval and other political fallout from mega-project displacement	Major upheaval with international implications due to unattended weather catastrophes	Major discontent due to food-fuel competition	Major international tensions due to population displacement
All of these processes strongly interact with each other							

weather events and other projected climate change impacts over the next 30 to 40 years.

Climate change also poses severe security impacts for human security and its referent objects: human beings and humankind. From a human security perspective, climate change has been addressed by the GECHS programme of IHDP in June 2005⁹ and it is the focus of the Greek Presidency of the Human Security Network (2007–2008).¹⁰

A 'Policy Memorandum' on '*Climate Change and Human Security*'¹¹ released on the eve of the first debate of the UN Security Council on climate change on

17 April 2007, pointed to manifold impacts for international, national, and human security for selected direct, indirect, and slow-onset linkages.

Some effects are already evident and will become very clear in the short run (2007–2020). They will increase and others will manifest themselves in the medium term (2021–2050); whilst in the long run (2051–2100), they will all be active and interacting strongly with other major trends. Africa is very likely to suffer very damaging impacts and has the least resources for coping and adapting to these stresses.

New studies confirm that Africa is one of the most vulnerable continents to climate variability and change

9 On 21–23 June 2005, *The Global Environmental Change and Human Security* (GECHS) project of IHDP organized a workshop in Oslo on 'climate change and human security'; at: <<http://www.cicero.uio.no/humsec/>>; papers at: http://www.cicero.uio.no/humsec/list_participants.html>. Six papers have been published in a special issue on "Climate Change and Human Security", of: *Erde*, 137, 3: 155–270.

10 See the Greek concept paper on: "Human Security and the Climate Change Impact on Vulnerable Groups" of 8 May 2007, at: <<http://www.humansecuritynetwork.org/docs/2007-ministerial-meeting-04-greek%20paper.doc>>.

11 See the memorandum written by: Wisner, Fordham, Kelman, Rose Johnston, Simon, Lavell, Brauch, Oswald Spring, Wilches-Chaux, Moench and Weiner (2007).

because of multiple stresses and low adaptive capacity. Some adaptation to current climate variability is taking place, however, this may be insufficient for future changes in climate (IPCC 2007c: 10).

Livelihood security (Bohle 2008) and other aspects of human security interact with 'hard' security issues because of the national and regional upheavals that climate stress may put on livelihood systems already vulnerable and incapable of adapting.¹² The rural and urban poor are already under stress, and for some groups such as women-headed households in Africa, adaptation to climate-induced stress will be very difficult indeed. Some major climate changes may actually occur rapidly.

On 17 April 2007 the UN Security Council for the first time addressed climate change as a security issue. The British initiative during its Security Council presidency to put climate change on its agenda for 17 April 2007 has been a recent attempt to 'securitize' climate change.¹³ In her opening statement, UK Foreign Secretary Margaret Beckett stressed that "what makes wars start - fights over water, changing patterns of rainfall, fights over food production, land use. There are few greater potential threats."¹⁴ She argued that "an unstable climate will exacerbate some of the core drivers of conflict, such as migratory pressures and competition for resources." Japan's Ambassador Kenzo Oshima said that "it is clear that climate change can pose threats to national security ... [and] in the foreseeable future climate change may well create conditions or induce circumstances that could precipitate or aggravate international conflicts."

However, the representatives of China, Russia, Qatar, Indonesia, and South Africa argued that "the Security Council was not the place to take concrete action." While Pakistan opposed the debate, Peru, Panama, Papua New Guinea, and small island states agreed with the UK. For UN Secretary General Ban Ki-moon "projected changes in the earth's climate are thus not only an environmental concern. ... Issues of energy and climate change can have implications for peace and security."¹⁵

The climate change issue has been discussed at the G-8 meetings in August 2005 in Gleneagles¹⁶ in the UK and in June 2007 in Heiligendamm in Germany where the heads of states and/or governments of the G 8 agreed ... "in setting a global goal for emissions reductions" that they will "consider seriously the decisions made by the European Union, Canada and Japan which include at least a halving of global emission by 2050¹⁷." In a joint statement of the German G 8 presidency with the heads of states and/or governments of Brazil, China, India, Mexico and South Africa, the goal of fighting climate change was endorsed, including the "crucial role of economic incentives," investments in "climate friendly investments in large scale", and improved means of adaptation for developing countries "with enhanced technology cooperation and financing."

A high-level meeting on climate change of the UN General Assembly was scheduled for September 2007, prior to the COP13/MOP3 meeting in Bali on 3-14 December 2007, and a possible summit on climate change in 2008 was discussed.

UNDP will also take up the relationship between human development and climate change in its *Human Development Report 2007* (HDR) in November, suggesting that climate change poses major obstacles to progress in meeting MDGs and maintaining progress raising the HDI: "There is a clear and present danger that climate change will roll back human development for a large section of humanity, undermining international cooperation aimed at achieving the Millennium Development Goals (MDGs) in the process."¹⁸

12 On the definition of "vulnerability" at the scale of household livelihoods and its linkage with macro-scale processes, see Wisner/Blaikie/Cannon/Davis (2004).

Global environmental and climate change, as well as hydro-meteorological hazards, affect primarily the individual or humankind whose perception of 'insecurity' therefore change. Climate change has become a new objective security danger and – in many parts of the world – a new subjective security concern. Anthropogenic climate change and its two key features of temperature increase and sea level rise, as well as weather-induced hydro-meteorological hazards, pose manifold new threats, challenges, vulnerabilities, and risks for the security on the earth, for nation states, as well as for human beings and humankind (table 40.2).

For many of the poor, marginalized, and highly environmentally and socially vulnerable people, climate change poses a new 'survival dilemma' that differs fundamentally from the state-centred 'security dilemma' in international relations and security studies.

40.4.3 The Survival Dilemma as a State-centred Concept

A key goal of the United Nations has been "to maintain international peace and security" and the security and survival of its member states, its territory, people, and system of rule. Thus, the referent object of security policy is both the state and its people, but also the international community and humankind. With the end of the Cold War the climate-induced threats, challenges, vulnerabilities, and risks that pose security dangers and concerns have emerged.

While in Europe the 'security dilemma' has been largely escaped, in many other parts of the world it still prevails. While the Security Council was originally constrained to deal with inter-state conflicts as threats to the peace, its practice since 1990 has gradually changed (chap. 35 by Bothe) to include intra-state conflicts and genocide as 'threats to the peace, breaches of peace, or acts of aggression'. In February 1999, the UNSC for the first time took up human security and in April 2007 it addressed climate change. The UNGA asked Mexico and Switzerland to propose how environmental protection could be enhanced within the UN system.¹⁹

Thus, the survival of whom not any longer refers only to states or their peoples but increasingly also to

human beings, societal and ethnic groups, as well as to international society and humankind. The survival against what refers not any longer only against the threats posed by other states, but also by the own state, by warlords, organized crime, and increasingly also by environmental factors triggered by global environmental change among them climate change, water scarcity, drought, and the impacts of increasingly human-induced natural hazards (tables 40.2, 40.3).

This author has argued that while the last three global orders (1815–1989) were primarily based on power categories legitimized in terms of the *security dilemma*, the emerging new global challenges of the 21st century (Renner 1997: 25–6) may require a new international order based on a Grotian *survival dilemma* (Brauch 1996, 2000a) that may necessitate additional multilateral cooperation on international security (arms control, terrorism) and environmental regimes (climate, desertification, water), in international and supranational organizations. Thus, the zero-sum games of many realist approaches in the Hobbesian tradition of the 19th and 20th centuries must be replaced – from a Grotian or Kantian perspective – by non-zero-sum games where all major players should aim at the creation of conditions for the survival of humankind (Axelrod 1984).

Brauch (2000a: 281–318) argued that the root causes of global environmental change could become "severe challenges for the survival of governments", and he stated that the environmental conditions for human life may be fundamentally challenged as a result of a complex process of incremental change caused by soil erosion and desertification leading to more frequent and intensive droughts and water scarcity and lack of food that will force people to migrate, what sometimes may lead to violent conflicts.

The severe droughts in the Sahel zone in the 1960's and 1980's put the survivability of this region at risk and have contributed to several failed states (e.g. Somalia). A complex interaction among environmental, societal, and political factors occurred that resulted in several Sahel countries engaging in violent conflicts (Mainguet 1994, 2003; Mensching 1990; Garenne 1994: 167–86; WBGU 2007a, 2007b, 2008). The Mediterranean region will be extremely volatile to the interaction of long-term non-military challenges that cannot be solved by military means neither domestically (repression) nor internationally (intervention). The challenge of survivability will increase the pressure for migration while Northern efforts to contain it may intensify the problems of governability in the

Environmental causes, stressors, effects and natural hazards pose	Natural and economic factors		Societal impact factors (exposure)	
	Substantial threats for	Challenges affecting	Vulnerabilities for	Risks for
	Security objects (for what or whom?)			
Climate change – temperature increase (creeping, long-term)	– human health – agriculture (yield decline) – biodiversity – desertification	– tourism – food security – fisheries – government action – economic action	– infectious diseases – damage to crops – natural systems – water scarcity – forest fires	– human populations – the poor, old people and children due to heatwaves
Climate change – sea level rise (creeping, long-term)	– small island states – marine ecosystems, – indigenous communities, – industry, energy	– deltas – coastal zones – marine, freshwater ecosystems	– coastal cities, habitats, infrastructure, jobs – cities, homes, jobs	– livelihood – poor people, – insurance, – financial services
Abrupt climate change – e.g. cooling in Central and Northern Europe, in North America (USA)	– countries and people in Northern Europe, benefiting from Gulf Stream	– livelihood – survival	– agriculture – habitat – people	– human life and animals, property – forced migration of people
Climate change – extreme weather events: storms (hurricanes, cyclones, winter storms)	– habitat, technical infrastructure, transportation, etc	– forests (health of trees) – food security	– coastal ecosystems – forests, settlements – electricity transmission	– human life and property – insurance – financial services
Climate change – extreme weather events: floods	– habitat, technical infrastructure, and people	– vulnerable, flood-prone areas	– persons living in flood-prone areas	– human life and property
Climate change – extreme weather events: drought	– availability of water and food, survival of people	– decreased crop yield and water quality and quantity	– arid and semi-arid zones, agriculture – forests (tree health)	– human life and animals, property
Soil erosion, desertification, drought	– water scarcity – agriculture – habitats	– food security – human livelihood (forced migration)	– livelihoods – rural areas – specific crops	– people and livestock in rural areas – people in slums
Deforestation	– landscape, cities, habitat	– water availability	– landslides	– informal housing (slums)
Water scarcity and degradation	– agriculture, food security, people	– econ. behaviour – human health	– poor in slums	– old people, children, poor
Forced Migration	– resident population, clash on water and food	– overgrazing on marginal soils, – environment	– fragile ecosystems – people on the move	– migrants and their animals

South (El-Hinnawi, 1985; Myers, 1993: 752–61, 1995; Brauch 1997, 1998; 2003, 2006a, 2006b, 2007d).

This and other new global challenges may require in the 21st century new forms of *global governance* (Commission on Global Governance 1995; Diehl

1997) and new international institutions (regimes and organizations) that may be influenced more by the intellectual traditions of Grotius and Kant. These new challenges require a new international order that necessitate additional multilateral cooperation in inter-

national regimes (climate, desertification), international (UN, OSCE) and supranational organizations (EU). Thus, the zero-sum games of the 19th and 20th centuries may be replaced by non-zero-sum games where all major players aim at the creation of conditions for the survival of humankind (Axelrod 1984).

If such a “*survival dilemma* is more than an idealist construct of good intentions, effective mechanisms for an efficient implementation of adopted norms and goals and a comprehensive verification regime for effective sanctions against violators are needed” (Brauch 2000a: 286). This poses for these non-military global challenges the question of a legitimate use of force. Thus, earth policy (*Erdpolitik*) requires an increase in the effectiveness of international organizations, which is a fundamental reform of the United Nations system (von Weizsäcker 1993; Brauch 1996; Rechkemmer 2005). However, with the many unresolved national, ethnic, and religious conflicts around the globe, distrust and arms competition still prevail in many regions. Thus, the *security dilemma* has not been overcome.

But in the 21st century simultaneously new global and regional challenges will grow in intensity beyond the coping capacity of most states that will be the first victims. Here *survivability* requires the gradual realization of “*sustainable development*”, especially of an agricultural policy within environmental constraints. This *survival dilemma* implies for many ecologically sensitive and conflict-prone regions, as for example the Mediterranean (Brauch 2003), a mutual effort to define and to address present and future *root causes* that could lead to new conflicts and environmental victims (Williams 1998). Such policies require a widening of the scope and an increase in the competence and effectiveness of multilateral international organizations and regimes both in the security and environmental realm.

40.4.4 The Survival Dilemma as a Human-centred Concept

The most likely implication of the ‘threats, challenges, vulnerabilities, and risks’ posed by global environmental and climate change for small island states may be a ‘survival dilemma’ (Brauch 2000a, 2004, 2005a: 69) confronting the poor and highly vulnerable population with unattractive alternatives: to stay at home and be exposed to an increasing number of and more intensive tropical hurricanes and cyclones, or to be forced to migrate from the Caribbean to North America, and from the small islands in the Indian and

Pacific Ocean to countries that offer their families better prospects for survival and economic well-being. In other regions and circumstances the survival option may be further reduced:

- To stay at home, to suffer from hunger, and, as the worst alternative to, die;
- To wait for governmental help and to survive in bad conditions;
- To migrate and to face elsewhere conflicts for water, land, food and jobs; or
- To migrate from the villages to urban slums with a low quality of life in a dangerous environment with the lack of jobs;
- To separate, with the young and the men emigrating where there are jobs and prospects for a better life, and the women, children, and the old staying at home and living from the remittances of emigrated family members;
- Or to develop local resilience, adaptation, and coping mechanisms, as well as survival strategies (Oswald 1991, 2007b).

In contemporary English the terms ‘survival’ and ‘dilemma’ are imprecise, and the concepts of a ‘survival society’ or a ‘survival dilemma’ have so far not rigorously been defined as a social science concept for the analysis of global environmental change, its extreme and fatal outcomes and potential violent societal repercussions. What is the *dilemma* about and what are the choices for whom? Whose *survival* is at stake: of humankind, the state, an own ethnic group, of the family or an individual? What is the *referent* of such a ‘survival dilemma’: international anarchy, the nation state, society, the own ethnic or religious group, clan, village, family or the individual? What are the *reasons* that necessitate a choice between *survival* or forced migration or even *death* (decline, disintegration)? Are they socially or environmentally driven, or both?

A dilemma requires a choice between two often unattractive options, e.g. between *survival* or death of an individual, or loss of his/her home and livelihood. Thus, first of all the *survival of the individual human being* is at stake, but also of the dwellers on marginal land or in vulnerable housing. Often the poor as well as minority ethnic or religious groups or clans with limited capabilities for adaptation and mitigation are among the first victims of hazards and disasters partly caused by human- and nature-induced global environmental change.

But in ecologically sensitive arid and semi-arid regions, as in the Sahel and in other deserts in the global sunbelt, but also in earthquake-prone regions, the

Table 40.3: Expanded Concepts of Survival and Security

Whose survival?	Referent (actor)	Dilemma or choices	Cause	Outcome	Security concept
Individual	family	Starve or leave the home to next city or humanitarian camp	Poverty, natural hazards/disasters	Internal displacement, urbanization, migration. conflict	Human security
Family			Societal and environmental vulnerability		
Village, tribe/ clan	Ethnic and religious group	Protest or leave and fight for water	Systems of rule and forms of governance, government decisions,	State failure, rapid assistance or repression	Societal security
Province	State	Assist or repress			Economic and military
Government		Fall or stay in power			
Region (e.g. Sahel)	Regional organization (OAS, AU, ECOWAS)	Do nothing, ignore or respond and prepare (adaptation and mitigation)	Extreme weather events (drought and desertification)	Migration or forms of violence and conflict	Political. economic, military
Mankind	United Nations, states, NGOs etc.	Ignore or adapt, mitigate, enhance resilience	Climate change, desertification, hydrological cycle	Major catastrophe	Human and global security

survival of individuals, tribes, regional or national governments in failed or disintegrated states is at stake (Somalia, Afghanistan). Global environmental change and especially climate change can also become an additional challenge to humankind, but its impacts will be unequal due to the different degrees of societal (poor vs. rich) and environmental (tropical, subtropical vs. moderate regions) vulnerability. Rapid population growth increases the demand for water, food and housing, and contributes to rapid urbanization that has negative repercussions on the environment (pollution of soil, water, air, table 40.3).

A *survival dilemma* exists if the livelihood of human beings (individuals, families, clans, tribes or ethnic or religious groups) is severely challenged by the extreme or fatal outcomes of global environmental change (hydro-meteorological hazards due to extreme weather events) and by extreme poverty. The *survival dilemma* is the highest where poverty is high and the adaptive and mitigation capacity and resilience is low (*high societal vulnerability*), and where the probability and impact of natural disasters is most severe (*high environmental vulnerability*).

Initially, the referent for the *survival dilemma* is the family and the ethnic and religious group (e.g. tribe or clan), but also the state. If the impact of a severe drought results in a major famine (as was the case in the Sahel during the 1980's), then the states and the sub-regional, regional, and global organizations, as well as nongovernmental aid organizations, become a major referent. The referent for major causes of glo-

bal environmental change: climate change, desertification, and either water scarcity or flooding is the international community (states, regional and universal organizations, and regimes).

The *survival dilemma* confronts its victims with a vicious circle (stay and starve or leave and lose own identity) that requires fundamental and difficult choices by the people (individuals, families, tribes, clans) in the affected regions, primarily in the developing countries, that often imply to leave their home, tribe, clan, to lose their livelihood and identity, and to give up their inherited customs and culture. The *survival dilemma* poses a major challenge to the individual and the society in states and regions where there is a high personal and societal vulnerability due to poverty, and a high environmental vulnerability due to extreme weather events and natural hazards, where the impact is high, but the resilience is low.

Until recently, this *survival dilemma* has hardly been a concern for strategists in industrialized countries because in their countries the societal vulnerability is relatively low and even in case of a high environmental vulnerability the resources and coping capacities exist to reduce human fatalities. For example, in 2002 the worst flood in Germany for more than a century caused 10 billion euros in damages but less than 100 fatalities, while a flash flood that hit Algiers in November 2001 caused economic damages of 300 million euros but more than 920 fatalities (Brauch 2003d). On 29 August 2005, Hurricane Katrina caused 1,833 reported deaths, affected about

500,000 people, and caused an estimated economic damage of 125 billion US dollars.²⁰ All three floods in the US, Algeria, and Germany confronted many victims with a survival dilemma, however the specific impact on persons and economic damage differed, as did the specific 'survival dilemma' the hazard victims had to face and cope with.

While the *security dilemma* confronts the state and its national security elites and decision-makers with tough strategic choices, the *survival dilemma* initially confronts the individual victim and his family, community, ethnic or religious group with tough choices that affect the future of their community and society. While military considerations and means are crucial to cope with the *security dilemma*, they are in most cases irrelevant for coping with the *survival dilemma*.

While the *security dilemma* is closely linked with a narrow political and military security concept, and is often associated with Hobbesian or Grotian security perspectives, the *survival dilemma* is primarily linked with *human* and *environmental security* concepts, and with Grotian and Kantian security worldviews as well as with Neomalthusian and equity-oriented distributionist environmental standpoints, and less with optimistic Cornucopian perspectives. While the *security dilemma* has been in the centre of the *classical security agenda* since ancient times and since the modern territorial state emerged in the Westphalian order, the *survival dilemma* addresses the *new agenda* where solutions become more urgent during the 21st century and where the old and still dominant Machiavellian and Hobbesian mindset of strategists is bound to fail. The *survival dilemma* requires a combined mitigation strategy that aims at "peace with the environment" and "development with security", or a combination of sustainable peace with sustainable development (chap. 3 by Brauch, chap. 5 by Oswald).

40.5 From a Survival Dilemma to Survival Strategies

The political strategies for coping with the 'security' and the 'survival dilemma' differ in the post Cold War era, taking the specific geopolitical context and status of socio-economic development of states and regions into account.

Efforts to cope with the 'security dilemma' of states require national, regional or international multi-lateral diplomatic initiatives to deal with the perceived threats by other states through cooperative efforts to address the structural root causes that may cause, contribute to or trigger conflicts within and between states, to resolve conflicts and to prevent that they escalate into violence as well as to prevent that natural hazards turn into complex emergencies.

Initiatives to cope with the manifold political, societal, economic and environmental threats, challenges, vulnerabilities, and risks – most of a non-military nature – that cause, contribute to, intensify or trigger a 'survival dilemma' for states, e.g. drought-stricken regions, and the human beings forced to leave their homes and livelihoods, require different coping strategies. Where the enemy is 'us', the consumers of fossil fuels, it is impossible to use the military to deter or to combat that threat, rather, the tools provided by international development and environment policies aiming at sustainable development and peace are needed. As these new security dangers are of a global or regional transboundary nature, only inter- and transnational coping strategies involving the states but also the societies and the national and transnational business communities will enable humankind to adapt to and mitigate against these security concerns.

While top-down initiatives to relieve or overcome the 'survival dilemma' of the most affected poor, marginalized, socially and environmentally vulnerable with the least capability to adapt and mitigate are necessary, they nevertheless have often failed. They must be complemented by bottom-up survival strategies that involve and empower these people in actively creating new livelihoods instead of waiting solely for relief aid in refugee camps. Such 'survival strategies' of individuals and of the marginalized poor in urban centres have been successfully developed. These initiatives that rely on the dignity and ingenuity of the affected victims need encouragement, national, trans- and international support (Oswald 1991, 2007b)²¹.

41 The Changing Agenda of Military Security

Barry Buzan

41.1 Introduction

This chapter looks at the changing agenda of military security through the analytical lens of securitization theory (Buzan/Wæver/de Wilde 1998; Wæver/Buzan/de Wilde 2008). Its concern is not to construct some objective assessment of what military threats actually were during a given period, but to survey what was successfully socially constructed as a threat, and how the main patterns of this construction in the military sector have changed. Securitization is when something is successfully constructed as an existential threat to a valued referent object, and that construction is then used to support exceptional measures in response. Attempts at securitization may have widespread success and be quite durable (e.g. the communist/Soviet threat in the West after 1947), or they may have limited success (the recent U.S. attempt to construct Iraq as a threat), or even fail (the erosion of support for the Vietnam War in the U.S.). Desecuritization is when something previously accepted as a threat is no longer constructed as one (e.g. the ending of the Cold War). Looked at in this theoretical perspective, what is surprising is just how sharply and frequently the main patterns of securitization in the military sector have changed in recent decades.

It is worth noting that, contrary to the traditionalist position, not everything in the military sector is necessarily about security. Since the early 1990's, most Western European states have not faced much in the way of existential military threats. But they maintain substantial armed forces and often use those forces in roles that have more to do with political and economic relations than with military ones. If Danish, British or Japanese troops participate in peacekeeping operations (PKOs) in Asia or Africa, this has nothing to do with existential threats to those countries, and everything to do with the normal politics of their international roles. For states living in security communities, such as those in the EU, rather substantial parts of their military activities may

fall into the political rather than the security sphere. European forces serving in parts of former Yugoslavia are hardly related at all to traditional conceptions of German or Italian national security, but are serving a political function within a larger project to bring the Balkans into the EU. This delinking of the military from national security functions is much more pronounced in Europe (and increasingly Japan), than it is in the U.S., and constitutes part of the *Venus versus Mars* characterization that some writers see as increasingly, and deeply, differentiating Europe from the U.S. (Kagan 2002, 2003).

When securitization is focused on external threats, military security is primarily about the two-level interplay between the actual armed offensive and defensive capabilities of actors on the one hand and their perceptions of each other's capabilities and intentions on the other. It thus includes everything from war at one end of the spectrum, through military rivalry, to arms control and disarmament. Crude forms of realist theory notwithstanding, there is no absolute correlation between the existence of external military capability and its securitization. The literature on democracy and peace, for example, builds on the idea that democratic states do not fear each other's military capabilities (e.g. Doyle 1986; Oneal/Russett 1999; Chan 1997; Cohen 1994). Desecuritization is possible even in the presence of separate military capabilities.

But separate military capabilities do create the potential for securitization. When elites and populations begin to treat the armed capabilities of other states as threatening, inter-state relations generate the classic military security dilemma involving on the one hand the proliferation of military technologies, arms racing, and the interplay of national policies for defence and deterrence, and on the other the array of policies aimed at muting the security dilemma, such as arms control, arms reduction, nonoffensive defence, and at times alliances (Jervis 1978; Buzan/Herring 1998; Møller 1991). This logic remains true when some or

all of the actors concerned are not states. Once military relations become securitized, this agenda is heavily shaped by the instruments of force possessed by the actors concerned, their strategies for using those instruments, and the pace and direction of changes in relative capability. The military agenda then has its own distinctive logic and technological imperative, but it does not operate in isolation. The entire interplay of military capabilities between states is deeply conditioned by political relations, and the same is true where states and nonstate actors face each other.

In order to trace the changeability of the military agenda over the past few decades, the rest of this chapter will examine the dominant patterns of securitization within and across four distinct periods: the classical European great power era ending in 1945, the Cold War, the post-Cold War period, and post September 11 2001. These periodizations are fairly standard within Realist thinking about international relations. The first three represent shifts in polarity – from several, to two, to one great power – and the last one a seeming benchmark representing a change from state to non-state actors as the main source of threat. I will argue that these periodizations can also be supported by significant changes in the patterns of securitization. These patterns can also be tracked across a spectrum from macro to micro, with some securitizations bidding to structure relations globally, others operating mainly locally, and yet others arrayed in between on the middle levels (often regional). Taking this approach enables one to look more easily at the way in which dominant securitizations are contested, at how they rise and fall, and at how securitizations at different levels (and across different eras of securitization) interact with each other.

41.2 The European Classical Great Power Era 1648 to 1945

During this era of classical balance of power, by far the dominant pattern of securitization was that of the great powers against each other. By the end of the nineteenth century, almost all of the rest of the world was under the direct or indirect colonial control of the European powers, the U.S., and Japan, which meant that for Africa, the Middle East, and South and Southeast Asia, the regional level was largely overlaid. Only in South America (from the early nineteenth century) and Northeast Asia (late nineteenth century) were independent regional military security dynamics beginning to operate. The European bal-

ance of power was a region in one sense, but because of the extent of European empires, and the global dominance of the European great powers, it was also in another sense the world. The local level was active mainly in the form of colonial wars, where the metropolitan powers sought to extend or consolidate their control against local resistance. When these local conflicts occurred at the meeting points of great power spheres of influence, as in the ‘Great Game’ between Britain and Russia in South and Southwest Asia, they could and did play into great power securitizations. But in this era, local resistance to colonialism was mainly a local affair, with little sign of any generalized or coordinated securitization within the periphery of anti-colonialism as such.

A feature of this era was that war amongst the great powers was a key institution of international society (Bull 1977: 184–99) and was therefore both legitimate and expected. This meant, at least until after the First World War, that, apart from pacifists, there was not much securitization of war as such, though there was, of course, instrumental opposition to particular wars. The primacy of national identity, often with racist and social Darwinist foundations, provided a robust support for war. It also meant that the relatively autonomous logic of military threats and vulnerabilities was always near to the surface. The classic military securitizations leading up to the First World War provide exemplary cases of this dynamic, with the British counting German battleships (and battleship production capacities), and the French, Germans, and Russians calculating the size and mobilization rates of their armies. Arms competitions and races were typical features of this era, as were alliances.

What is striking in retrospect about this era in contrast to later ones is the absence or only weak presence of much attempt to construct universalist macro-securitizations. Great power rivalries generated mainly particularist securitizations that were global only in the sense that they had global effects (on alliances, on colonies), but not in the sense that they attempted to construct a globally accepted securitization. The main candidate for a universalist referent object was the balance of power when understood as an institution of international society aimed at collective maintenance of a pluralist political structure, and opposition to attempts at world hegemony or world empire. The fortunes of the balance of power as a referent object were prone to considerable fluctuation, with some high points (the Concert of Europe during the nineteenth century, the collective security

provisions in the League of Nations after the First World War), and some low ones (the run-ups to the First and Second World Wars).

Ideology is an obvious key variable in considering the issue of universalist securitizations, though by no means a determining one. In a monarchist balance of power world such as eighteenth century Europe, the only universalizing pressure was collective fear of losing independence to a hegemon. From the French Revolution onwards, ideology became available as a way of constructing wider securitizations (initially republican versus monarchist), and this aspect certainly played into some nineteenth century alliance-making. In retrospect, one might have expected ideology, especially fear of fascism, to have played a greater role in shaping the securitizations of the 1930's. That it mainly did not has something to do with the ideological tripolarity of that time, with liberal-democracy, fascism, and communism all in play and all deeply ambivalent about which 'Other' was the most threatening.

41.3 The Cold War

The Cold War represented a sharp break from this classical pattern of securitization. Some things carried through. War remained an ever-present possibility amongst the great powers, and with decolonization gained more possibilities among the newly independent states at the regional level. Because strong patterns of enmity took root early, the autonomous dynamic of military insecurity also remained as clear between the U.S. and the Soviet Union as it was between Britain and Germany during their pre-First World War naval race. Only the core weapons changed, with the superpowers counting each other's nuclear warheads, bombers, and missiles, as well as army divisions and fleets. The big difference after 1945 was in the rise of universalist modes of securitization aimed (quite successfully) at transcending the particularist positions of great power balancing and local resistance, and imposing instead ideologically defined securitizations that invited (and in part compelled) the whole world to take sides in a zero-sum game about the social future of humankind.

Four big material and political shifts underpinned the changes in the levels and patterns of securitization that differentiated the Cold War from the classical great power era.

- First was the change in power structure from multipolar to bipolar. As has been much ob-

served, this created a relatively rigid structure in which balancing became mostly internal within the two superpowers, alliances became long-term and institutionalized, and the dynamics of rivalry became concentrated mainly around a single axis (Waltz 1979).

- Second, and closely complementing the bipolar distribution of power, was the ideological bipolarization between the two universalist visions of the human future that had triumphed over fascism: liberal democracy and communism. The fact that the two triumphant superpowers represented such opposed universalist ideologies made the securitization of their military relations extremely easy.
- Third was the invention of nuclear weapons and their rapid adoption as the defining standard of military power. Since nuclear weapons were a new, and initially rather crude, technology, they also made the early decades of the Cold War hostage to an intense process of competitive technological development. Rapid changes in technology could and sometimes did seem to offer one side or the other incentive to mount a pre-emptive attack, and this problem provided a major component of military securitization between East and West during the Cold War.
- Fourth was the process of decolonization that was broadly coterminous with the Cold War, and at many points bound up with it, and which by the late 1960's left most of Africa and Asia populated by independent states. Decolonization, however, did not prevent the extensive securitization of third world affairs by both superpowers as part of their global rivalry. Indeed, the military and ideological imperatives of containment and counter-containment meant that many parts of the third world functioned as prizes in the superpower rivalry, measuring how well or badly each of them was doing in pursuing its claim to own the future of humankind.

The patterns of securitization that unfolded around these four shifts can be usefully viewed in terms of levels. At the global level, much more happened than just a narrowing down of the classical great power balancing to two superpowers. Although there was an element of classical balancing in the mutual securitizations of the U.S. and the Soviet Union, there was a distinctive departure in the move up to a universalist framing for securitization. No longer was it just about the fate of one great power (or set of great powers) in relation to another, but it was phrased as being

about the fate of humankind as a whole: would the future of industrial civilization be set by communist or liberal-democratic ideology? As an act of securitization, this universalist framing was remarkably successful, and represents the first globalization of securitization. It came to be broadly believed across most of North America, Western Europe, Japan and Australia, and provided a crucial foundation for building a coherent, stable, and quite deeply institutionalized, U.S.-led Western bloc. Its counterpart similarly provided the foundations for the Soviet bloc, and for a time even kept the Soviet Union and China together.

Many elites in the third world countries were prepared to align themselves with the Cold War, some out of belief, others out of instrumental calculation. Even the non-aligned played their part in universalizing the Cold War securitization by carving out their political niche within it. Realists would see this universalization of the dominant securitization as a simple function of U.S. and Soviet power, but I would argue that it has more to do with the domestic character of the two superpowers with each seeing itself as representing a universal truth. Bipolarity without ideological bipolarization would have been less intense, and in the light of liberal-democratic peace theory it is interesting to ask what the securitization of Cold War bipolarity would have looked like if both the U.S. and the Soviet Union had been liberal democracies – or if there would have been any military securitization at all (Buzan 2004b).

The move up to a universalist framing for securitization was most successfully represented by the superpower rivalry, but there were two other successful securitizations of a global character. One of these was the securitization of nuclear weapons particularly, and the danger of war inherent in the superpower confrontation more generally. This built on foundations laid by the First World War, after which there were real fears that another world war fought with aircraft and poison gases would destroy European civilization. This has elsewhere been set up as the *defence dilemma*, in which fear of war begins to outweigh the classical *security dilemma* fear of defeat (Buzan 1991: 270–93). In the event, the Second World War did not realize this fear, but it did generate nuclear weapons, and these made the defence dilemma an immediate and realistic concern, marked in the West by such slogans as “better Red than dead”.

The securitization of nuclear weapons was a counterpoint to the securitization of the other side embodied in deterrence theory, the two coming together at crucial points such as the Cuban missile

crisis of 1962. Compared to the dominant securitization pattern of the Cold War, securitization of nuclear weapons was much less widely held. Its main form was oppositional civil society groups within Western states, and the transnational networks that they built. But it nevertheless represented a durable and in some ways influential position with an active global following. At the interstate level, it was paralleled by the significant and fairly successful moves to establish an international regime against the proliferation of nuclear weapons. Nonproliferation also represented efforts by the two superpowers to maintain their status and military dominance, but genuine fear that the spread of such weapons would increase the chance of their being used was also a significant factor (Buzan/Herring 1998: 53–71). Combined with the Cold War securitization and the technological drivers of deterrence, fear of nuclear weapons underlined the high salience of the military sector throughout the Cold War.

The other successful global securitization was the anti-colonial movement, which not only made the securitization against foreign rule coordinated on a worldwide basis, but also quite quickly delegitimized colonialism as a valid use of military power (Keene 2002), thereby making obsolete what had been one of the central institutions of international society (Holsti 2004: 239–74). This success played a huge role in opening up the independent dynamics of regional security which had largely been suppressed during the colonial era. This is a story told in detail elsewhere (Buzan/Wæver 2003). In many regions (most obviously the Middle East, South Asia, and Southeast Asia) decolonization generated conflict formations where local patterns of securitization (e.g. Arab-Israel, India-Pakistan, ASEAN-Vietnam) interplayed with the global level securitization of the Cold War. This interplay between the newly liberated regional processes of securitization, and the newly universalized securitization at the global level, was in many ways the other main Cold War story in the military sector. This story generated most of the hot wars during these decades, and linked to the nuclear confrontation through the fear that rival local interventions could escalate to direct superpower confrontation. At the same time, Western Europe embarked on a unique process of desecuritization, constructing its own past as its feared “Other” and in the EU, building the institutions of an advanced security community.

Decolonization also opened up the local level. As more and more countries achieved independence,

the emphasis at the local level shifted away from opposition to foreign rule, and towards domestic insurgencies against the new indigenous rulers. Many third world countries featured such insurgencies, and these often got caught up in the higher levels of securitization, both regional and global.

41.4 Post-Cold War

The ending of the Cold War was a massive act of desecuritization that brought to an end two of the defining features of the Cold War. The unravelling of communism terminated ideological bipolarization, and the unravelling of the Soviet Union did the same for the bipolar power structure. The combined effect of this was to cause the intense universalist securitization of the Cold War to evaporate, leaving nothing comparable in its place. For a decade, the military sector moved into the background as the prime sector for securitization. So profound was this shift that it even undermined one of the longstanding continuities linking the classical era and the Cold War: that war among the great powers was considered a real possibility. From around 1990 onwards, all but the most extreme realists moved to the understanding that while wars in the periphery would remain possible, even likely, wars amongst the great powers had become highly improbable (Goldgeier/McFaul 1992; Singer/Wildavsky 1993). Oddly, under these conditions the U.S. maintained a huge military budget, which quickly became larger than the combined expenditures of the next dozen military powers. So while the classical and Cold War pattern of intense inter-state competition in military technology became very muted at the global level (though not at the regional one), the U.S. nonetheless continued to throw money at the leading edge of military technology even though it had no competitor.

With the rollback of the threat of nuclear war, much of the steam also went out of the counter-securitization to the Cold War from civil society. Nuclear weapons, and the fear that they would be used in a great power war, largely ceased to be a prominent matter of public concern, though on the state level there was not much change from the Cold War in the degree of commitment to prevent, or at least slow down, the spread of nuclear weapons and the technology to make them.

The post-Cold War period, then, was marked by an absence of successful macro-securitizations in the military sector, and at least at the global level, a sharp

drop in the salience of the military sector. At the regional level, many of the post-colonial securitizations continued as before (most notably in Africa, the Middle East, and South Asia), albeit with a unipolar, rather than a bipolar, pattern of intervention from above. Some regions, most notably Southeast Asia, and more briefly Southern Africa, underwent significant desecuritizations. Following the implosion of the Soviet Union, a final round of decolonization transformed Europe and created a new region in the former Soviet sphere (Buzan/Wæver 2003). There was widespread acceptance that the power structure was now unipolar, and as the decade progressed, a growing realization that this would be a durable rather than a transitory condition, notwithstanding the rapid growth in China's economy and its relative empowerment by the demise of the Soviet Union.

While there were significant Western military interventions in the Former Republic of Yugoslavia and against Iraq's invasion of Kuwait, these represented specific and quite local securitizations, almost like the colonial wars of old, only with the great power rivalry largely removed. There was much debate in the West about the legality, practicality, and morality of using military force in pursuit of human rights (Roberts 1993, 1996; Wheeler 2000), and a rather patchy record of practice, with disasters in Somalia and Rwanda. In the U.S., Washington seemed to be experiencing a threat deficit, and there was a long string of attempted securitizations in what looked like an effort to find a replacement for the Soviet Union as a focus for U.S. foreign and military policy. Japan came into focus as a peer competitor (though not mainly in a military sense), but then gave way to a rising China once the Japanese economy went into stagnation. Huntington's (1993, 1996) famous 'clash of civilizations' thesis was a clear attempt to securitize Islam and East Asia as rivals to American power and values. Eventually, this process deteriorated to the point where a massively armed U.S. could find nothing better to securitize than a handful of 'rogue state' - Iran, Iraq, and North Korea - whose main crime was refusing to kow-tow to American interests. None of these attempts really took root, however, and during the 1990's the most successful macro-securitizations were in other sectors: economic and societal particularly. Except for the continuous possibility of a clash between the U.S. and China over Taiwan, the great powers had little fear of war amongst themselves, and little interest (except the U.S.) in military competition. Huge U.S. military spending seemed to represent the elevation to referent object status of its posi-

tion as the sole-superpower, with high-tech military power as the key to differentiating the U.S. from any potential challenger.

At the local level the main development was a rising number of domestic insurgencies and/or civil wars, including: Afghanistan, Algeria, Angola, Bosnia, Burundi, Chad, Colombia, Congo, Georgia, Indonesia, Lebanon, Liberia, Macedonia, Nepal, Philippines, Peru, Russia, Rwanda, Serbia, Sierra Leone, Somalia, Sri Lanka, Sudan, Tajikistan, and Turkey. This was accompanied by concern amongst the powers over the problem of failed states tearing holes in the fabric of international society, a scenario captured powerfully by Robert Kaplan (1994; de Wilde 1995; Buzan/Wæver 2003: esp. 219–53) in which failed states open the way for gangs, clans, tribes and mafias. For the peoples involved in such situations military (in)security becomes a paramount feature of daily life, which takes on many features of a Hobbesian anarchy. Such political failures are extremely difficult and costly to remedy from outside, and they can gain support from the internationally organized mafias that are the dark side of increasing economic liberalization. Both criminals and terrorists can make good use of areas that lack effective state control.

This concern about failed states could be seen as part of a wider process in which increasing liberalization (often discussed as ‘globalization’) weakens state structures everywhere, pushing individuals toward more “tribalist” forms of association, and raising the prominence of non-state actors as wielders of military capability (Horsman/Marshall 1995; Van Creveld 1993, 1999; Cerny 2000). But for the most part the great powers during this period were not much interested in intervening in the Third World. The U.S.-led invasion of Iraq in the early 1990’s did not turn out to be a model for the ‘new world order’, but an exception against the rule that, in line both with their domestic political dispositions and the continuing legitimacy of anti-colonialism, the great powers were reluctant to use force abroad unless the situation involved an immediate threat to their core interests.

41.5 Post September 11

The al-Qaeda attacks on the U.S. on 11 September 2001 brought the post-Cold War period to an abrupt end, and triggered another substantial shift in the military agenda. Most obviously, September 11 solved the threat deficit problem for the U.S., with the WoT providing a dominant securitization around which

U.S. foreign policy could be organized. It also exposed the universalizing propensities seen in the Cold War, though now under unipolarity more clearly exemplifying what might be thought of as the American way of securitization. It is a well-recognized feature of American exceptionalism that the U.S. polity sees itself as owning, or at least representing, the future of humankind, and as therefore having the right and the duty to speak and act for humankind (Buzan 2004b: 153–82). A propensity to appeal to principles and U.S. interests as if they were universal is thus deeply embedded in American political life, giving the country’s security policy an unusually moralistic and Manichean tone. This propensity came across very clearly in President Bush’s much quoted ultimatum to the rest of international society than in the WoT “Either you are with us, or you are with the terrorists”¹. It is also clear in his statement that: ‘our responsibility to history is already clear: to answer these attacks and rid the world of evil.’ (Bush 2002: 5).

Although it is too early to judge the durability of this shift in the military agenda, it certainly represents a radical departure from the previous situation. In some ways it reasserted the traditional security primacy of the military sector, and even brought war back to centre stage. It revived the willingness of the powers to intervene at the regional and local levels in pursuit of WoT objectives, a willingness dramatically expressed in president Bush’s “axis of evil” speech pointing the finger at Iraq, Iran, and North Korea. It also underlined the concern about failed states that had built up during the 1990’s. But the WoT was not war as previously understood, and although the U.S. seemed determined to take a primarily military approach to it, it was far from clear that the main action would be in traditional military form. In a general sense, the WoT has so far been a rather successful macro-securitization.

NATO invoked article 5 for the first time, and Japan, Russia, China and India have all accepted it (the latter three all with their own particular “terrorist” problems in mind). That al-Qaeda and its ideology are a threat to civilization, is widely accepted outside the Islamic world, and also within the Islamic world, though there opinion is divided as to whether or not this is a good and legitimate thing. The U.S.-led war against the Taleban and al-Qaeda in Afghanistan shortly after September 11 was widely supported at the time, and NATO is still playing the leading role

1 See: BBC News, 25 August 2002, at: < <http://news.bbc.co.uk/1/hi/world/americas/2212647.stm> >.

in the (so far not very successful) attempt to stabilize and rebuild that country. The WoT has also breathed new life into the ongoing securitization of nuclear weapons (and WMD more generally), though now with the twist that the main fear is of WMD falling into the hands of terrorists. In addition, it has created a substantial consensus on the need to improve “homeland security”, most conspicuously in the U.S., but also in many other states. The homeland security agenda is mostly not military in a strict sense, involving mainly an increase of the state’s rights and powers to increase surveillance over everything from trade and finance, to individual travel and civil liberties.

One interesting sub-theme to this overall pattern is the moves taken by many Western leaders to stop the general securitization of the WoT from taking the form predicted by Huntington, of a clash of civilizations between the Islamic world and the West. There were certainly political constituencies on both sides that would have welcomed such an outcome (most obviously al-Qaeda itself), and it could easily have happened by accident given the prominence of Islamists in “terrorist” attacks not just in the U.S. and the Middle East, but also in Russia, Indonesia, India, Kenya, and Spain. The idea that “all terrorists are Islamists” had to be countered by the strong assertion that this did not mean that all followers of Islam were therefore terrorists. Preventing the WoT’s securitization from spilling over to the Islamic world as a whole was crucial to any political hope of isolating the extremists from the community of the faithful in whose name they claimed to speak and act. This desecuritizing counter-move is an ongoing feature of the WoT, and has so far been reasonably successful.

Yet while the WoT has been generally successful as a durable macro-securitization, U.S. policy has resulted in major controversies over some of the particular securitizations attempted within the WoT. The most obvious, widespread, and deepest dispute of this kind has been over the invasion of Iraq. The U.S. and British governments attempted to justify the invasion by linking Saddam Hussein’s regime to both terrorists and WMD. This securitizing move was successful within the U.S., but vigorously contested in many other places, resulting in major and damaging splits in both the EU and NATO. The ill-prepared occupation that followed the successful blitzkrieg against Iraq only deepened the splits with many opponents of the war agreeing with Allin’s (2004: 652) assessment that “Iraq was probably the war that bin Laden wanted the United States to fight”, and that it

was both a tactical and strategic blunder of epic proportions in relation to the problem of global terrorism represented by al Qaeda. Whether or not the quagmire in Iraq will blunt the willingness to intervene expressed in the “axis of evil” speech remains to be seen. Linked to this was Israel’s attempt to link its own war against the Arabs to America’s WoT. This move was largely successful in the U.S., where it increased the already strong U.S. tilt towards Israel, and largely rejected everywhere else (where Israel’s problems were seen to be largely of its own making because of its expansionist settlements policy). As with Iraq, this particular securitization divided the U.S. from many of its allies in the WoT generally, and so weakened the consensus of the overall securitization of the WoT.

The WoT pushed into the background, but did not eliminate, other, more traditionally state-centric, U.S. securitizations. The National Security Strategy of 2002 pointedly reasserted the U.S. intention to retain military superiority over all others: “We must build and maintain our defences beyond challenge ... Our forces will be strong enough to dissuade potential adversaries from pursuing a military build-up in hopes of surpassing, or equalling, the power of the United States” (Bush 2002: 29–30).

41.6 Conclusion

The WoT, and more broadly the globalization of securitization discussed above, point strongly to a move away from classical, state-centric frameworks for securitization and towards a much more mixed set of actors and referent objects for the military security agenda: not just states, but also nonstate actors representing both the civil and uncivil sides of society. In this expanded domain, there are four distinct structures of violence (Buzan 2003a):

- *State vs. state.* The traditional concern of Westphalian international relations about the disorders of a second order form of anarchy in which sovereign states play balance of power and regularly end up at war with each other. This concern has declined overall with the end of the Cold War and the rise of a zone of democratic peace at the core of the international system. It still remains active in the periphery, especially in the Middle East and Asia, where increasing numbers of states are equipped with weapons of mass destruction. Whether it will become active in the form of military threats from the periphery to the core

remains to be seen, but the potential is indicated by the willingness of the U.S. to securitize North Korea, Iraq, and Iran.

- *State vs. uncivil society.* This is the traditional Hobbesian agenda where the state is the solution to civil disorder typical of primary anarchy. The state protects its citizens against each other by creating a legal framework and enforcing a monopoly of legitimate violence against warlords, terrorists, organized crime, and whatever uncivil elements seek to disrupt the peace or deploy force against the citizenry. But under globalization a wider dimension gets added. The openness of a liberalized economy provides opportunities for transnational criminals and terrorists and extremists of all sorts to operate on a global scale. As a consequence, the traditional Hobbesian domestic security agenda gets pushed up to the international level, becoming a problem for international society against global uncivil society. This is largely the structure of the WoT, and along with the fear of WMD can be conjured into an argument for world government (Wendt 2003).
- *State vs. civil society.* This is the core concern of those who see the state more as an agent of repression, and a vehicle for elite interests, than as a Hobbesian ring holder. In the present international system it exposes a large agenda of state elites abusing their political primacy and their control of police, law, and military, to suppress civil society in pursuit of their own interests, whether self-enrichment or hanging on to power. Of the many current examples one might note the military junta in Burma; Robert Mugabe's reign of terror in Zimbabwe; the North's wars against the south and the west in Sudan; the regime of dynastic communism in North Korea, the massacre of Tutsis in Rwanda; and the Indonesian attempt to prevent the secession of East Timor. Such repression becomes a concern both for international society and for global civil society elements such as the human rights movement.
- *Civil vs. uncivil society.* This is where the state more or less ceases to exist, thereby removing the previous three options and leaving the civil and uncivil aspects of society in an unmediated "state of nature" relationship with each other and the rest of the world. This is most easily illustrated by the uncivil wars and failed states common in Africa, where, as in Congo, Liberia, Sierra Leone, Somalia, and Angola, the state structures fail, leaving various warlords, "big men" and suchlike, to

battle out their territorial and political claims. Some of these will claim to be the state, but in practice control only part of its territory and exercise few if any of its functions. State failure poses problems for international society in how to react politically to the holes torn in its fabric. It poses problems for global civil society in terms of how to deal with humanitarian and human rights consequences of chaos. It poses opportunities for global uncivil society in terms of providing safe-havens for all sorts of illegal and/or anti-social activities.

42 Political Security, an Uncertain Concept with Expanding Concerns

Thomaz Guedes da Costa

42.1 Introduction¹

The absence of *political security* as a key concept in social science encyclopaedias makes a (re)conceptualization of the term not easy.² Although the concept is widely used in the rhetoric of decision-makers or in compilations of a variety of subjects on security problems, political security is not an unequivocal label.³

One major global source from the UN system, the Human Development Report 1994 of the United Nations Development Programme (UNDP) uses *political security* as one of seven main categories of threats to *human security*.⁴ This report was produced

after the collapse of the Soviet Union and during a new wave of democratization in Central and South America, Eastern Europe, and a few African countries, notably in Southern Africa. The UNDP definition narrowed the scope to mainly observing the sub-categories of human rights and the repression of citizens by military regimes. Using data from Amnesty International, UNDP (1994: 32) pointed out that “political repression, systematic torture, ill treatment or disappearance [of individuals] was still practiced in 110 countries.” The report also called attention to widespread political unrest in countries that resulted in detention or imprisonment by authorities. Finally, it briefly referred to abuses of government control over ideas and information and to the priority of some regimes in spending to enable the military to repress their people. This definition is not sufficient for guiding empirical research and to close the triangle with the richness of solid arguments for valid, general clarifying conclusions.

In light of developments since the end of the Cold War, the UNDP report (1994) reflects a very narrow definition of *political security* if the new global security challenges are included that have since emerged. Thus, for defining the concept, I asked some of my students: “What is political security?” Asking this question to a particular class of students, I thought, would be a great opportunity to identify the various connotations of the term, since the group represented a sample of outstanding professionals, military and civilian officials, as well as journalists, academics, and political advisors in national security affairs, at that moment undertaking graduate-level education. In the continuation of their public service or private careers, I was certain that they would be familiar with reports such as the UNDP’s human security study.

1 The author is a political scientist and educator. The ideas expressed here do not necessarily reflect those of the National Defense University, Department of Defense of the United States, or of any other organization with which he is associated.

2 The author uses the classical assertion that “security, in an objective sense, measures the absence of threats to acquired values, in a subjective sense, the absence of fear that such values will be attacked,” by Wolfers (1962a): 150. Buzan and Kelstrup (1991: 4) pose that *political security* “concerns the organizational stability of states systems of government and the ideologies that give them legitimacy.” Although this definition is an important and rich component of the conceptualization of human security, due to the ambiguity of terms it lacks rigor for academic reproduction of the concept thereafter. For an excellent review of the concept of security (and all the adjectives needed to establish context), see Möller, Björn (2000): *The Concept of Security: The Pros and Cons of Expansion and Contraction* (Copenhagen: Copenhagen Peace Research Institute), at: <<http://www.ciaonet.org/wps/mob01/#note0>>. In his professional experience, the author consults literature in Portuguese and Spanish. In both languages, reflecting the Ibero-American political culture and discourse, the verbatim translation does not correspond to the concept.

3 For a wide range of issues and country reviews, from international border disputes and arms control to drug trafficking; see: Carpenter and Wiencek (1996).

4 The seven categories of human security are: economic, food, health, environment, personal, community, and political, see: UNDP (1994: 22-40).

I gave the students a sheet of paper with the question, “What is political security?” I instructed them to select and record any four ideas that came to their minds related to the concept. But immediately upon reading the sentence, the barrage of questions began: What do you mean? Is it at the individual or at the national level? What should I consider? Can you give an example? Their moaning and body language signalled to me that they had encountered a significant amount of frustration and were struggling with the task. I was not essentially concerned with the validity of the test in and of itself. I was trying to assure myself that I was not the only one who was finding it difficult to clarify and to think of the concept as a valid brick in the political analysis construct.

After collecting and tabulating the answers, I concluded that there were two general convergences of ideas. One was the notion that a degree of participation by all in legitimate decision-making processes of a society, under and protected by the rules of stable laws, would result in *political security* (a dependent variable in a desired state of affairs). Another convergence pointed out by the students indicated that there was a broad scope of governing activities, or features, to be considered as associated with the concept, from voting and separation of powers to the accountability of elected individuals and bureaucrats; from the protection of human rights and government stability to access to economic benefits.

It is obvious that democracy, or the installation of democratic regimes, is a component of political security, if security is defined as a state of affairs to be achieved for the benefit of the individual and groups. On the one hand, the UNDP concept did not explicitly integrate democracy as a component of *political security*. Thus, the question remains of the value and breadth needed for a conceptual evaluation of the term. I assume that others are contributing with reflections on social, societal, and state security under other labels.

The issue of democracy in the Westphalian State is central to the notion of security as well as to elevating the legitimacy of a regulated international system. Many scholars in political science address the concerns on democracy and security in different fashions, beyond the public opinion polls that report on the satisfaction of newly democratized regimes (Adams 2003; Burkhart/Lewis-Beck 1994; Campbell 2003; Gutmann 2003; Inglehart 2003; Lipset/Lakin 2004). Therefore, while recognizing the importance of the evolution of democratization or of experiences both during the transition to and retrocession from

democratic regimes; this aspect will not be discussed in this chapter. Rather, this chapter points to new elements that are shaping political concerns and that demand further understanding. Democracy remains a relevant and integral part, even if a considerable degree of academic rigor is needed (Putman 1993; Norris 1999).

The doubts of the students correlate with the insipid use of the concept in the social sciences. This gave me a certain degree of cognitive comfort – I was not alone in my uncertainty about the meaning of the concept, as I struggled for substance to reveal its connotation with valid applicability. The experiment with my students provided me with additional evidence to add to the search through library catalogues and compendia, that the term *political security* does not avail itself of a clear operational definition. The concept broadly indicates the relevance or the richness of the phenomena hidden behind the label, especially if it can serve as an all-inclusive category of problems related to security, such as inter-state conflict, drug trafficking, civil war, etc. Seeking for rigor and striving to exclude the core of this subject, I assume that *political security* addresses the nature of government, the set of relationships between individual and groups on the one hand, and the state on the other, for the exercise of rights and obligations in the distribution of power. While many approaches could illustrate these elements, I prefer to manoeuvre the juxtaposition of rigor with thematic relevance. Retaining the focus of attention to human rights abuse in non-democratic governments, the following discussion addresses the novelty of a drive for the universal application of judicial norms and the protection of individuals. In addition, it points out that new challenges to the state beyond politics, as seen until the end of the Cold War, such as those posed by technology advances that have given rise to the virtual world of the Internet and other issues of privacy, may be the cornerstone of understanding and for shaping policy under the term *political security*.

42.2 In Search for the Application of Universal Rule of Law

If human rights, as presented in the UNDP report, is at the core of *political security*, and if this relevance remains unchanged, then some related features should be included. For instance, genocide and rendition⁵ are two new dominant topics of political security that need clarification. They are additional com-

ponents that do not minimize the significance of human rights protection as observed during the Cold War. The massacres and the ethnic clashes in several civil wars in Africa, as well as the growing consequences of terrorism and state response, both prior and after the attacks of 9/11, including those observed in Southeast Asia, in the Caucasus, or in the jungles of Colombia, have confronted populations and governments with new insecurities in national and global politics.

How governments and polities respond to human rights violations remains a general concern (Ishay 2004). The evidence is provided in periodic reports of the United Nations evaluating the state-of-the-art, with many indications of continuing violations, as well as improvements in how governments and international regimes are enhancing the observance of codes and declarations and supporting changes in political attitudes. Nevertheless, the notion is new that the spread of democracy in the internal politics of countries and the evolution of international regimes are forming a shared set of values that are increasingly being observed and protected by transnational initiatives. In many cases, these universal appeals also clash with the efforts of actors in protecting the prerogative of sovereignty. The uncertainties in dealing with genocide, international trials, and rendition are illustrative for some of the contents in the conceptual evolution of *political security*.

“Never again” has been repeated frequently in the shadow of conflicts or civil wars. Ethnic, tribal, religious, and national cleavages, intertwined with violence, crimes, and atrocities, are resulting in thousands of collective murders, especially in Africa (Migdal 2005; Dunn 2003). Eventually, the hesitant international community did intervene in the conflicts to save thousands of victims in Bosnia, Sierra Leone, Rwanda, and the Sudan. The understanding of these atrocities is not simply clouded by a lack of information, but also by the complexity of economic, social, environmental, and health conditions involved in each case. Genocide may again be a vivid revelation of *political security*, with legacies of doubts on international responsibility in the applicability of values, norms, and the commitment of foreign intervention, as well as fears of recurring violence (Dallaire

2005). Ethnic and religious divisions will not necessarily result in this type of violence, but there are uncertainties. In terms of human rights and wellbeing, the shocking development of this political violence in the post-Cold War period may have been exacerbated by the failure of national authorities associated with a greater fragmentation and insecurity in social, ethnic, or religious disputes. Thus, what gives substance to the concept of *political security* provides an expansion in scope to a subject that deserves more attention.

With regard to combating terrorism, there are many political and legal concerns as governments try to reduce the vulnerability of countries with preventive, defensive, and offensive strategies against organized groups. In such a conflict, an underlying preoccupation, in particular, addresses the risks of political and human rights, as legal boundaries are challenged by needs or practices. Decisions and measures taken by authorities may cause a violation or abuse of detainees and prisoners as governments seek information to prevent attacks or dismantle groups and networks of accomplices. Conceptually, both oversight of authorities and academic research will function as a source of logic and legitimacy for establishing the boundaries of legality. In the era of the “war on terror”, the doubts on measures and the allegations and concerns with government abuse revive similar struggles of the past, when, for instance, human and political rights violations and protection were a significant issue under the military dictatorship that dominated Latin America and in many countries during Asia’s dirty wars. The concept of *political security*, both from the perspective of governing authorities and the population subjected to violence, as well as from the standpoint of groups that use terrorist tactics, is confronted with the same phenomena that occurred prior to and after the Cold War. At first glance, the concept seems unchanged. What has expanded is the debate about the legitimacy (and legality) of States to act with questionable logic in ethical terms, especially in the environment of the dominance of the rule of law and democracy (Etzioni 2005; Strasser 2004). But the conceptualization does not appear to differ significantly.

The effort for the universal application of accountability for human rights violations has evolved, including developing of new instruments that could respond to the challenge of atrocities, such as genocide, terrorism, or mass murder in political conflicts. A main illustrative development has been the Rome Statute (signed in 1998, entered into force in 2002)

5 Rendition is the act of a country arresting an individual in one country and bringing the person to justice (in the country ordering the arrest) without a court process taking place in the country where he or she was seized.

and the creation of the International Criminal Court (ICC). The Rome Statute influences the shaping of political conduct and the use of force, and aims to pursue individuals accused of crimes against humanity, including war crimes, genocide, and other crimes of aggression. This new international institution will investigate and persecute the criminal responsibility of individuals involved in violence and abuse, as representatives of states. As the ICC reinforces the international regime to protect human rights, it functions also as a fall-back to bring forth the accountability of individuals where countries are either unable or unwilling to conduct a legal prosecution. These are clearly intended for universal applicability. In terms of consolidating an international regime, the ICC seemed to be a substantive instrument. Nevertheless, a major controversy evolved when the United States withdrew from the convention, fearing that the Statute did not have sufficient safeguards against politically-motivated investigations and prosecutions. Other reasons for the American pull-out referred to the ICC's claims of jurisdiction over nationals of non-party states and what appeared to be a lack of supervision over the UN Security Council.⁶

Another variation on the applicability of this transnational arm of justice refers to a legal process (or actions without judicial ruling) against individuals somewhat protected by the extra-territoriality of their residence (or newly acquired citizenship). In many cases, criminals have received such protection. The most famous case is that of Ronald Biggs, involved in the Great Train Robbery in Britain in the 1960's, who remained free in Brazil until his voluntary return to England. In other cases, corrupt officials have been able to hide their money overseas or even flee to other countries with their accounts. The question to ask is not if this kind of disjunction between the individual and the rule of law has evolved, but rather, if the acceptability of such behaviour is still prevalent. A case in point was the change in the universal applicability of law in 1999, when Spanish courts sought to extradite former Chilean President Augusto Pinochet on charges of genocide. Spain also has begun penal processes against several Argentinians accused of human rights violations during the military regime that took over the country in the late 1970's. Other former high officials have found their past actions

subject to allegations of wrongdoing in other countries. As a partial conclusion to this topic, one has a sense that a strong wave of shared international values is slowly transforming attitudes and reinforcing the value of international law and agreements to seek justice.

The global war on terror, waged by the United States and its allies, has also advanced other challenges to the contents of *political security* in terms of what matters for individuals and their transnational movements. One aspect is the applicability of the Law of Armed Conflict in the war against terrorism. Exercising self-defence under Article 51 of the UN Charter, detainees captured overseas have been held without conviction in a court of law to prevent them from re-entering combat. The United States has determined that the Geneva Convention is not the instrument guiding the treatment of these prisoners. Although Washington argues that humanitarian treatment is provided to the detainees, legal challenges in the United States and overseas will expand and further redefine this segment of *political security*, both from the perspective of countries seeking their own, and of those individuals accused of terrorism for their acts or associations.

Another innovative instrument in the effort of transnational investigation and the capture of terrorist suspects is the United Nations Security Council committee established pursuant to resolution 1267 (1999), concerning Al-Qaeda and the Taliban. This is the first instrument that guides UN members to direct their efforts against individuals, groups, and supporting entities, not countries, suspected of terrorism. Again, this decision reinforces the attention on non-government actors as part of the concept of *political security*.

Another aspect pushing the concept of *political security* in relation to individuals, and not just countries, is that of rendition.⁷ Rendition is the act of a country arresting an individual in one country and bringing the person to justice (in the country ordering the arrest) without a court process taking place in the country where he or she was seized. It could be interpreted as a way to avoid or to short-cut legal impediments in cases where extradition treaties do not exist between the two countries. Another charac-

6 On the position of the U.S. Government, see: U.S. Department of State, Bureau of Political-Military Affairs: *Fact Sheet*, Washington, DC, 30 July 2003; at: <<http://www.state.gov/t/pm/rls/fs/23428.htm>>.

7 On the controversies and legal fragility, see: Spencer Ackerman: "Suspect Policy", in: *New Republican* (14 March 2005), 232,9: 14; David Ignatius: "Rendition Realities", in: *The Washington Post* (9 March 2005): A21.

teristic of rendition could be a government also transferring a defendant to another country without legal formalities. One could also include in this variation of the concept the transfer of a detainee to another country for interrogation and investigation without legal process. As Daniel Byman points out, "There is more than one side to the rendition story."⁸ Central to the problem is the situation where countries and justice systems do not achieve a level of judicial collaboration that can meet the political demands of respective constituencies. Therefore, unilateral action substitutes for collaboration in the search for justice, even if there are risks of violating sovereignty or of eventual challenges by third parties or detainees in the sense of demanding a legal review and reparation at some point in the future.⁹

42.3 Failed States

The use of the term *failed states* provokes one to think of *political security* under the notion that there are increasing geographic areas without legitimate, internationally recognized political authority, or weak public governance that results in an authoritative ruling that does not resemble formal, effective government structures. As a consequence, this failure can be associated with the issues of abuses to the human and political rights of individuals, along with unchecked violence and conflicts. This perspective certainly incorporates many points already discussed above.

From the governance perspective, Jean-Germain Gros (1996: 456) suggests that the conceptualization of *failed states* has in its essence the inability or unwillingness of public authorities "to carry out their

end of what Hobbes long ago called the social contract" and to deliver public services on a wide range of issues related to welfare. Failed states as a new aspect of *political security* may include many countries, to varying degrees that are unable to provide the minimum conditions for the economic survival of their population.¹⁰ "Distension zones" or "liberated areas" have been characterized, both geographically and politically, as territories without formal government authorities or public services. Typically, many urban areas, such as the "favelas" of Rio de Janeiro, cities in Africa, or rural lands, such as the border areas between Pakistan and Afghanistan or guerrilla-run valleys in Colombia, are localities where insurgents or organized crime rule are beyond justice and adjudicating of conflict.

Besides the notion of *failed states*, there is also a *selective governance failure*. Unlike the direct link that one may make between *failed states* and *un-governed spaces*, *weak governance* abandons the geographic assumption and surges by the systematic corruption that selectively encroaches into many governments and judicial systems.¹¹ In *weak governance*

11 "Ungoverned space" is a term initially used by the United States Government, see the statement by Secretary of Defense Donald Rumsfeld at the Defense Ministerial in Santiago, 19 November 2002 (at: <<http://ciponline.org/colombia/02111904.htm>>). It is defined as "geographic areas where governments do not exercise effective control." Its important is to reveal that "Terrorist groups and narco-traffickers use these areas as sanctuaries to train, plan, and organize, relatively free from interference. There are numerous 'ungoverned spaces' around the world, such as the western provinces of Pakistan, portions of the southern Philippines, Indonesia, Chechnya, rural areas of Burma, several areas in Africa, and areas in South America. Ungoverned spaces include densely populated cities where terrorists can congregate and prepare for operations with relative impunity. I believe these areas will play an increasingly important role in the War on Terrorism as Al-Qaeda, its associated groups and other terrorist organizations use these areas as bases for operations." Citations from: *Current and Projected National Security Threats to the United States*, Vice Admiral Lowell E. Jacoby, U.S. Navy, Director, Defense Intelligence Agency, Statement for the Record, U.S. Senate Select Committee on Intelligence, 24 February 2004 (at: <<http://www.iwar.org.uk/homesecc/resources/threats-2004/jacoby.htm>>).

situations, states provide many services and may geographically control the population by authority. But, due to incapacity of means, corruption, or incompetence, it does not act against organized groups, which results in a parallel system of social and political command. In many places, the confrontation between these pockets of friction between the illegitimate/illegal ruling authority and the legitimate authority creates *sink holes of illegality*, or spaces or hubs where individuals involved in illicit or unlawful political activities use corruption to transition from one dimension to another, by transferring resources, changing identities, seeking refuge or plainly disappearing from the pursuit of legitimate authorities. In Eastern Europe and Central Asia, after the collapse of the Soviet Empire, as well as in Latin America, organized crime clung to individuals or structures in government in order to exercise influence and power to advance facilitation and the turning of a blind eye toward illicit economic and trafficking activities. Although many political systems have subsisted with organized crime, the coercion of expanded violence, especially in urban areas, is the novelty that impacts the *political insecurity* of many that may not have experienced it as such before. The addition of perennial anomic violence of individual criminals, organized crime, and illegal vigilantes results in societies where the fear of violence dominates the effort to combat crime. Some countries are lesser *failed states* than others, but many are examples of *weak governance* when organized crime and gangs persist in their illicit activities, and the sense of insecurity is real. As an example, the ‘*maras*’ or organized gangs of Central America, extend their activities, not just in Honduras and El Salvador, but from California to the suburbs of Washington, DC.

If corruption is a perennial characteristic in weakening governments, then the quest to understand the consequences of *failed states* or those with selective weak governance seems to be as important to learn about as the reasons why states fail in the first time and what can be done to rescue, or build them to achieve stable, legitimate governance. Here, the conceptualization of *political security* may induce some contradictions. Is one to assume that until the wave of democracy promotion of the 1980’s, totalitarian regimes, dictatorships, and feudal rulers were the reason to negate *failed states*? After the Cold War, with the drive towards democracy and collapse of dictatorships, as well as the expansion of global markets, one observes a surge in the impact of “ungoverned spaces” in many regions. There is no clear evidence

about causal relationships regarding the emergence of these areas; in fact, they may have been ungoverned before. Nevertheless, the non-existence or the collapse of law and government, and the widespread surge of rebellions, violence, sink holes, and anarchy in societies promoted a shift in the rhetoric from concerns with *weak governance* to a system-wide impact of *failed states*. The concern is not just with the promotion of development but to pay attention to those under the stress of failing.¹²

While from the conceptual point of view, one can affirm that weak states have not disappeared, the empirical test of current political fragility of countries seeking to establish standing democracies or in transition to democracy still causes weak state recognition, even if under a different label other than stressed. In Latin America for instance, Peru, Paraguay, Bolivia, and Venezuela are examples of states where national debates and confrontation reveals unsettled conflicts regarding constitutional ruling. As in many African and Asian states, the meta-rules – the rules about how to change the rules – are not accepted by all. This condition in a democratic advance can be a reason of weakening in the state and authorities. In addition, many developing countries have economies so fragile and under stress that their viability to secure minimum living conditions threatens their own existence as political entities, as recognized up to the end of the Cold War (Simpson 2004).

42.4 Ungoverned Privacy and Sense of Political Insecurity

I would like to argue that the concept of political security might also have evolved in the direction of integrating other elements that will be shown as different in this new century. For several reasons – from the globalization of markets, mobility of the labour force, and faster and larger volumes of data communication through the Internet, to the need to identify terrorists, criminals and their associates – individuals are increasingly vulnerable and at risk of suffering unwarned intrusion into their privacy for reasons of politics or financial fraud.

12 The World Bank has set the “Task Force on Low Income Countries Under Stress”; see at: <<http://web.worldbank.org/WBSITE/EXTERNAL/PROJECTS/STRATEGIES/EXTLICUS/0,,menuPK:511784~pagePK:64171540~piPK:64171528~theSitePK:511778,00.html>>.

With digital communication the world is experiencing different forms of commerce today that demands an exchange of identifying information and authorization for transactions. These characteristics have increased the risk of misuse or misrepresentation of one's identity for fraudulent endeavours, when most systems lack secure control and remedial measures. Furthermore, the campaigns and efforts in the war on terror and organized crime have expanded the possibilities for the misuse of data and abuse against individual interests with the intrusion into the privacy and the lives of citizens. Under absent, outdated and confusing regulations and new practices, *political security* also now means the resulting conditions that can provide a new degree of protection of individual data and preferences in the marketplace and in politics from non-authorized intrusion.

This new equation is not restricted to the geographic space of one's country. With expanding transnational communications, and the establishment of communities of knowledge, markets and culture, the exchange of information has opened up new questions regarding regulation, management, and oversight. The degree of control, protection, and effectiveness in the accessibility to and utilization of such data vary from country to country, with a variety of local and national standards and expectations. Furthermore, this problem is not restricted to private or public transactions. For instance, governance and public security, with preventive and offensive strategies and measures in combating terrorism and illegal activities, have also produced situations where the need for government intelligence clashes with the need for the protection of individual identity and preferences.

If countries were formerly prone to eavesdropping on each other during the classical struggles of the Westphalian international system, individuals now must be concerned about the "big brother" consequences of government actions, and that of non-state actors that may use their public-held records and information for fraud or extortion (Radden Keefe 2005; Bamford 2001; O'Harrow Jr. 2005). The explosion of global communication with the use of the digitalization of data, instantaneous communication, the Internet, cellular phones, compact data processors, genetic mapping and other forms of identification and processing of information has changed the processes, the value, and the forms of verifying personal, institutional, commercial, corporate, government, and public information. Both the government's

need to know in enforcing law and the enduring belief that the individual right to privacy is one of the main principles in democratic societies are challenged by the abusive or illegal intrusiveness of storage sites or data flows.

The control and protection of identity, the confidentiality of individual health and financial records, and the recording and dissemination of individual consumer preferences, religious beliefs, political support, sexual preferences, financial situation, or cultural values are at the centre of public concern, as non-authorized access and misuse of information increasingly takes place at the speed of the Internet.¹³ Besides the legal infringements of identity theft, at issue is the civil responsibility of entities that store or direct the traffic of information about individuals and entities. National regulation and the compatibility of international norms create gaps for negligence or incompetence that facilitate misuse and increase the probability that individuals may be at risk of suffering financial losses, defamation, or discrimination.

In terms of privacy and intrusion by the state, many other technological advances are permitting the expansion of 'transpondering' - a situation when an individual leaves behind a trace of his or her identify for others to control their whereabouts and choices made. In the 1970's, the development of electronics provided equipment that airplanes could carry onboard - a transponder - to signal their position to the ground using radio frequencies, in routine air traffic control and in emergencies. This system increased its accuracy and reliability with the passing of time and with new possibilities permitted by global positioning systems. With new technological advances, there are similar "transponder effects" tracking individuals. Along with fingerprints, individuals can leave traces of their DNA on utensils or in rooms from their blood, sweat, hair, skin, hairbrush, or tears. Individuals can even provide samples to law enforcement databanks as an advanced mode of identifying or eliminating suspects from a crime scene.¹⁴ Recording and recognition by sensors of biometric data can tell the identity and location of individuals; if one

adds a chip to communicate with a global positioning system, movement monitoring is added.¹⁵

Another transponder, RFID (radio frequency identification device), tracks the transit of goods everywhere, as it serves the logistical functions in production and service, or consumer choices.¹⁶ RFID can eventually correlate product and object information with customers and users. This direct association of an object with individuals permits the generation of information about preferences, choices, and habits. Digital presence and processing take place in many ways, some of them with increasing pervasiveness.¹⁷ Credit card purchase records, clientele listings, or “cookies” from sites visited through the Internet produce traces of where individuals have been physically, where they have surfed the web, or have assigned a consumer preference through contact with other individuals or institutions, including what one is researching in a library.¹⁸

For democracies striving to provide political security, the regulation of information management is a major challenge, since the protection of this ‘commodity’ demands a review, not just of legislation and regulations, but a new debate (and certainly conflicts) over the ‘spirit of the law’ in terms of public goods, private, corporate, and individual rights, civil rights, property rights, etc. The search for preventive measures and for restoring the confidence and reputation of those who found their identity violated by unauthorized access must yield adjusted national regulation and international regimes to provide a renewed sense of ‘security’. Building this trust in the uncertainty of these new transaction modes is essential for securing democratic rule and the protection of each and every individual in a political society.¹⁹

42.5 Conclusion

This chapter explored the re-conceptualization of *political security*. It departed with the fragility of a concept that is not widely used or accepted in social studies. The analysis limited its development to tracing the relevance of phenomena associated with those that would refer directly to individuals and their relationships to politics in search of democratic development. It also assumed that the relevance of democratization, the protection of human and political rights, and the rule of law have not diminished or weakened their presence in the core of the concept. The analytical effort was not to find or clarify the meaning of political security. Nevertheless, it points to new contending issues of individuals and groups liberties and rights, which come under the concern of the polity, that thinkers may wish to include under the concept.

From human rights abuse by government authorities to the omission, negligence or incompetence of governments to provide for the rule of law, one observes a clear expansion in the concept of *political security*, in the spirit of the UNDP’s 1994 Report, as the point of departure for this reflection. If at one point the individual found himself opposed by the State in the search for rights in the political game, now both the absence and the intrusion of the State have added complexity to the concept of political security. The lack of governance of geographic areas, the weaknesses of governance under the pressures of corruption, and unregulated governance in protecting the privacy of individuals in the digital world project new realms and challenges to insecurity. As globalization challenges the structures of governments, new relationship causes new sense of threat to individuals’ welfare and engagement in defending their interests. In many ways, the instruments of the State seem to be deficient in providing for the sense of physical and psychological security in the spaces of human relations of all kinds. Is political security a valid concept for guiding the discovery and consolidation of knowledge for social science? Perhaps not, if one wishes to trace the rigor and applicability in the academic concerns to expand knowledge to result in ever increasing awareness for policy proposals and the search for truth. Is political security a relevant concept for gathering concerns in the political action? It seems it will always be current, even with its imprecision, because thinkers know it when they feel it.

43 Economic Security

Czeslaw Mesjasz

43.1 Introduction

Broadening and deepening interpretations of the concept of security has brought about theoretical implications, which in many instances also translate into policy-making. Fuzzy or simplified interpretations, sometimes without any logical rigour, frequently lead to situations when scholars and policy-makers use the utterances of 'adjective security', but their interpretations are of very limited theoretical and practical applicability.

An idea of economic security is especially difficult to grasp, both in theory and in policy-making. On the one hand it is always seen as closely interlinked with other security sectors. On the other, however, it is commonly agreed that it is pointless to search for any economically secure reference object since a certain degree of insecurity is an inherent attribute of almost any market-related activities.

Attempts to define economic security in a more detailed manner differ from similar efforts in other security sectors. The reasons for differences are four-fold.

- *Firstly*, insecurity in economic activities must not always be viewed as negative. Competition at all levels of societal hierarchy creates insecurity, but at the same time it is the source of dynamics, and as such may not be *a priori* negatively assessed.
- *Secondly*, such ideas as economic aspects of military security, economics of defence and the like, not always can be directly linked with the concept of economic security. They remain outside of this study although they cannot be completely neglected.
- *Thirdly*, the broadened concept of security implicitly refers to dependence of economic activities and security in other sectors.¹
- *Fourthly*, after the introduction of the concept of economic security into *International Relations* (IR), and into related areas, security studies, and peace research, discussions about that sector have

been extended from state-oriented economic security to the level of individuals, e.g. conditions of living as an essential component of human security.

These determinants of specificity of economic security have been already intensively discussed elsewhere (Luciani 1989; Kapstein 1991; Cable 1995; Buzan/Wæver/de Wilde 1998; Kahler 2003; Nesadurai 2005). However, the discourse on economic security cannot be focused solely on macroeconomic and institutional issues, but must also include systemic interpretations of circumstances in which economic security is considered. Such attributes of security as threat, risk, vulnerability, securitization and the like, must be analysed with the use of ideas drawn from systems thinking and from more advanced analytical apparatus of economic theory drawn both from macroeconomics and microeconomics (chap. 2 and 71 by Mesjasz),

Similarly as elsewhere in this book, the utterance 'economic security' and its meaning is treated with a deeper semantic reflection resulting from a discussion on widening and deepening of the meaning of security. This is reflected in an assumption that economic security is not just another fancy buzzword useful in policy-making, in the media and in propaganda, but attention is paid to the question: what is extraordinary in the circumstances described with the notion 'economic security'.

The aim of the chapter is to show how the discourse on economic security can be put in a broader

1 Traditional collection of security sectors can be supplemented with information security covering a very broad area, beginning from security of computer systems and data transfers, and ending with political, social, economic, and military consequences of disruptions of information systems in the world scale - see Ross Anderson, Economics and Security Resource Page, <http://www.cl.cam.ac.uk/~rja14/econsec.html>, 20 May 2007.

framework of contemporary economic theory and of systemic aspects of security developed in other parts of this book (chap. 1, 3 by Brauch; chap. 2 by Mesjasz).

The chapter is designed as an introduction to the study of the links between economic security, modern economic theory, and systems approach in security discourse. In addition the size and scope of the chapter imposed obvious necessity for selection. Therefore several topics such as economic causes and consequences of wars and conflicts, defence economics, economic security and sustainable development, economic security and ethics, links between economic security and other security sectors, are left for further considerations.

In the first part (43.2) a conceptual clarification of concepts associated with economic security is presented. Challenges of securitization in the economic sector are depicted in 43.3. Main areas of theoretical discussion on economic security are surveyed in 43.4. The last part focuses on the impact of globalization on theory and policy relating to economic security.

43.2 Economic Security: Approaches and Definitions

43.2.1 Security and Economic Aspects of Human Activity: Conceptual Clarification

Deepening and broadening interpretations of security can be viewed as adding adjectives to that utterance and creating various kinds of 'adjective security'. Therefore the discussion on deepening and broadening can be reduced to the considerations of a new meaning of utterance – security + adjective. The sense of security in various contexts has been thoroughly discussed in this book. This specific 'linguistic' approach has been also helpful in better understanding of security as a frozen metaphor (chap. 2 by Mesjasz).

Due to difficulties with interpretations of the adjective 'economic', a brief semantic reflection can also be useful in deeper comprehending the concept of economic security. In that case several questions concerning the use of the utterance 'economic security' are arising. First and foremost, the terms 'economy', 'economics', and 'economic' can be used with reference to human activities and intellectual efforts helping to understand those activities. Additionally, it must be also remembered that 'economic' has two meanings.

In the first general sense, 'economic' refers to the human activities related to the production, distribution, exchange, and consumption of goods and services. Subsequently, economic may mean almost any aspect of those activities. Linking security with unusual threatening circumstance, it may be thus concluded that economic security should embody all cases in which extraordinary situations emerge in the above human activities and in their context.

As it is stressed in many writings on economic security, dynamics of all the above 'economic' processes, perhaps with the exception of consumption, is dependent on an inherent risk and situations which are not usual, e.g. acceleration of a country's economic development, a success of a new export expansion or of a new product, or a failure of an established company caused by a managerial error.

This observation leads to another conclusion that economic security must have different interpretations for production, exchange, distribution, and for consumption. It also has another sense in finance where risk is openly viewed as an indispensable component. An insufficient level of consumption of basic goods can be directly linked to economic security of individuals, understood as guaranteed provision of a certain level of goods and services, and to the widely discussed idea of human security.

Economy viewed in this sense is inseparable from civilization's history and social organization, and from the Earth's geography and ecology. Thus, economic security is closely linked with other security sectors through mutual relations in which it is frequently difficult or impossible to distinguish causal links.

The second meaning of the adjective 'economic' is deriving from the sciences of 'economy' and 'economics'. In a historic perspective it was initially *Political Economy* and later *International Political Economy*, which linked security issues with economic activities at the state and international levels.

The term economics was proposed as to reflect on a more scientific understanding of the discipline. In such an approach economics is commonly understood as the scientific study of the choices made by individuals and societies with regard to the alternative uses of scarce resources which are employed to satisfy needs. From the point of view of normative security considerations the divide into positive economics ('what is') and normative economics ('what ought to be') is of a special importance.

If economics as science is involved in the discourse on security, two situations should be borne in mind. The first, when general normative economic

considerations are taken into account with such categories as utility, rationality, efficiency, optimization, etc. In this case, security threats may emerge when some of those criteria are not fulfilled. In the second situation, economic mathematical models are applied in solving specific problems which can be associated with security, conflicts, threats, etc. (Hirshleifer 1997, 2001).

43.2.2 The Concept of Security and Economic Thinking .

It is difficult to trace all direct and indirect references to economic security in the history of the development of economic theory. Usually, since the onset of the contemporary discussions on economic security, the interpretations of economic security ideas are made *ex post*.

Two levels of analysis can be distinguished. *First*, the global, the state, and inter-state level, where economy is treated as a factor determining state security, and the impact of state security on economic prosperity is taken into account in economic considerations. At the *second* level, development of economic theory is confronted with economic security of non-state social entities (institutions, regions, companies, individuals).

In the area of state-oriented economic security, the main challenge has been defined by Buzan (1991: 230): "The idea of economic security is located in the unresolved and highly political debates ... concerning the nature of the relationship between the political structure of anarchy and the economic structure of the market."

In a more advanced language this relationship can be reduced to the issues of governance – politics vs. market forces, and furthermore, to the relationship between pure economic rationality and security-oriented rationality of state leaders². Although the first scientific reference to economic security is usually associated with Aristotle, the genuine practical and theoretical problems in that area emerged in the 17th and 18th centuries.

In mercantilism and neo-mercantilism politics goes as the first. Trade is the source of wealth and economic security is viewed as an indispensable part of 'national' security, although this term has not been

used until the 1940's. Since all countries cannot run trade surpluses simultaneously, widespread pursuit of mercantilist policies tends to produce an unstable and conflict-ridden international trading system.

In a broadly defined liberalism, the economy obtains priority since the free market is treated as the foundation of economic order. Intervention of the state should be limited, and it only provides law and politico-military security necessary to guard and to facilitate the functioning of market mechanisms within countries and on the international scale.

The socialist interpretation of economic security mixes both above approaches. Economy is a dominant factor determining social and political relations. The state should protect the weak against the strong, and protect the 'national' economic interests against external interference.

The collapse of the Soviet empire has finally contributed to recognition of the dominance of liberal economic ideology. More recently, this has also been proven by the economic development in China and India, although in both cases the political infrastructure for economic prosperity is different. In China a non-democratic system gives ground for an aggressive but partly state-controlled free market, while in India the liberalization of the economy is supported by political democracy. Of course, this tendency is hampered by symptoms of economic nationalism and temptations for state interventionism, but an overwhelming trend towards economic liberalization and dominance of market mechanisms is evident.

Under such circumstances, the basic challenge is associated with the consequences of the potentially unlimited 'marketization' of social relations which was described by Karl Polanyi (1944) as a nightmare where all social values will be subdued to market values. Buzan/Wæver/de Wilde (1988: 99) make an observation that it is often difficult to securitize economic issues from the more general political contest between liberal and nationalist approaches to economic policy. This observation seems somewhat misleading. The opposition between the liberal economic approach versus economic nationalism does not seem appropriate in this case. The contradiction is determined by the patterns of governance, i.e. the opposition of the free market vs. the intervention by influential actors, not always the states.

The dichotomy of fundamentals of economic security – state intervention vs. market forces or mercantilism and economic nationalism vs. economic liberalism, has been recently enhanced at an advanced theoretical level. Liberal, or as Joseph Stiglitz states,

2 In the realist school of political economy the inter-state wars can be analysed with the conceptual apparatus drawn from economic theory – utility and rational choice (Bueno de Mesquita/Lalman 1992).

conservative understanding of markets as spontaneously emerging in result of pursuit of self-interest controlled by an invisible hand is contested by the application of new ideas of economic theory. Stiglitz (2006: xiv) puts it as follows:

In this conservative view, economics is about efficiency, and issues of equity ... should be left to politics. Today, the intellectual defence of market fundamentalism has largely disappeared. My research on the economics of information showed that whenever information is imperfect, in particular when there are information asymmetries - where some individuals know something that others do not (in other words, always) - the reason that the invisible hand seems invisible is that it is not there. Without appropriate government regulation and intervention, markets do not lead to economic efficiency.

A technical explanation of information asymmetry can help in better understanding its role in contemporary economic theory, and eventually in economic security discourse.

In a traditional approach in economic theory, it was assumed that all parts of transaction had access to the same information, or can easily, and without any additional costs, obtain that information.³ It was proven that such an assumption was too simple and superficial. A more realist assumption is that in transactions and subsequently in bargaining (negotiation), information is not distributed equally and information asymmetry affects the process before commencement and after completion.

Information asymmetry occurs when one party to a transaction has more or better information than the other party. This information is called private and usually it refers to aspects critical to reaching agreement, such as a party's reservation price.

Information asymmetry was introduced by Arrow (1963) and later developed by Akerlof (1970) in his influential pioneering work "The Market for Lemons", and Rothschild and Stiglitz (1976). It may result both from imperfect and incomplete information.

Asymmetry of information may occur before the transaction is accomplished, in the moment of signing a contract - a situation *ex ante* and after the transaction (contract signed) - a situation *ex post*. In the *ex ante* situation (hidden information) the main consequence is adverse selection, while moral hazard may appear after the transaction (*ex post*) (hidden action).

In adverse selection models the ignorant party lacks information while negotiating an agreed understanding of or contract to the transaction, whereas in a moral hazard the ignorant party lacks information about performance of the agreed-upon transaction or lacks the ability to retaliate to a breach of the agreement.

An example of a moral hazard is when people are more likely to behave recklessly if insured, either because the insurer cannot observe this behaviour or cannot effectively retaliate against it, for example by failing to renew the insurance. An example of adverse selection is when people who are high risk are more likely to buy insurance, because the insurance company cannot effectively discriminate against them, usually due to a lack of information about the particular individual's risk, but also sometimes by force of law or other constraints.

Acceptance of the phenomenon of asymmetric information in economics and in finance allows for a more realistic description of uncertainty and risk. What is even more important, the existence of asymmetric information contributes to the development of various mechanisms of gathering additional information before contracting, and mechanisms of monitoring after contracting. In security-related disputes on the dilemma of free market vs. state intervention, necessity for monitoring by non-market mechanisms to some extent favours various forms of limitations of the free market. The opinions of Stiglitz are not isolated. In other considerations on the issues related to economic security, e.g. financial stability, information asymmetry is also regarded as a source of explanation of disturbances on financial markets (Mishkin 1999, 2000).

Under such circumstances the discussion on economic security cannot be focused solely on the improvement of market mechanisms and their protection. Economic security is strongly politicized, and the above intellectual arguments of Stiglitz add new impulses to the dispute - pure market vs. intervention by non-market institutions - not necessarily states. This observation can be extended since the politicization of securitization in the economic sector can also be projected to the dilemma of globalization vs. alternatives ('alter-globalization'). In this case the following ideological economic security-related issues are taken into account:

- liberal economic approach and alternative ideas, mainly various trends labelled as non-orthodox economics and heterodox economics;

3 Due to the scope of this chapter any discussion of the sense of information and communication in negotiation is left to further considerations.

- liberal economic ideology and sustainable economic growth;
- consequences of globalization;
- globalization and distribution of wealth across regions, countries, and individuals (poverty, social polarization);
- challenges of economic and political governance (international corporations, international economic and financial institutions, states, transnational institutions, NGOs);
- corporate governance and management – shareholders wealth versus socially-oriented company.

Functioning of the market system, with or without any external intervention, is associated with the following potential threats to economic security at the international and national level:

- vulnerabilities and threats resulting from dependence on supplies of natural resources;
- threats of overall instability of world trade, and the financial markets (system) in particular (unpredicted and/or unpredictable economic crises of various scale and scope);
- revival of protectionism and economic nationalism;
- military security and economics (political economy of defence, defence economics),
- economic security and security in other sectors;
- the impact of market mechanisms upon well-being of groups and individuals (human security).

The above ‘classical’ or almost classical issues should be supplemented with theoretical considerations linked with the securitization of economic mechanisms. In this case, the following issues have to be considered:

- threats, risk, vulnerabilities;
- prediction and anticipation of threats;
- securitization, desecuritization, marketization, and economic security;
- crisis management at various levels of the market hierarchy.

43.3 Challenges of Securitization in the Discourse on Economic Security

43.3.1 Economic Security and Stability of Market Conditions

Under the influence of universalization of interpretation of security, economic security is becoming another very broad idea embodying almost all aspects of life of individuals and various social collectivities. As is shown in preceding parts of this chapter, economic security can be associated with a very wide scope of issues, beginning from the very existence of the state and ending with decent standards of living of citizens.

Discussion of securitization in the economic sector requires providing an answer to the question which has been already put in several parts of this book. What are the reasons causing that some aspects of social life which have existed for centuries – poverty, economic misfortunes resulting from wars and conflicts, or even some well-known market imperfections and externalities associated with state intervention, can be labelled as related to economic security. Maintaining an approach in which the use of the notion security is a result of the process of securitization requires a further elucidation in the case of economic security.

As discussed elsewhere (e.g. chap: 41 by Buzan; chap. 2 and 44 by Wæver; chap. 1, 3, 22 and 40 by Brauch), in all uses of the concept of security a common denominator can be found allowing to introduce threats, risks etc. and subsequently, extraordinary actions. This common denominator can be depicted with the core security concept in chapter 2. Application of the term ‘security’ without any reference to the extraordinary character of the situation would make the use of the term security almost purposeless, and can be treated solely as a linguistic abuse.

It is underlined in most writings on economic security that in some cases an extraordinary character of the situation is an inherent aspect of the context, e.g. risk for the companies, or even for the state when the shape of the state’s economic policy is taken into account.

Therefore in securitization in the economic sector first and foremost the standards allowing treating a given situation as unusual should be described in a more precise way. Securitization of the situation of individuals seems simpler – insufficient level of fulfilling the needs measured by an actual potential of the world economy, or local economy. In the case of

other areas of economic activity, the extraordinary circumstances must be a subject of greater attention when the utterance 'security' is used in the language of description and analysis.

Securitization in the economic sector requires two levels of analysis. The first one includes the entire systemic (political, social, economic, and cultural) context of economic activities of various actors – institutions and individuals. The second level of analysis, obviously to some extent associated with the first one, is focused on threats and vulnerabilities which can be associated with all actors (objects of reference).

At the overall systemic level security is usually identified with stability of functioning of the market, in spite of its ideological and political interpretations. The concept of stability, taken from systems thinking, requires further attention since this term is probably one of most frequently used and abused concepts of security theory. For the use in defining economic security Buzan, Wæver and de Wilde (1998: 107) proposes the following definition:

... the key issue is stability in the global traffic of goods, money, services and people. Stability means changes occur only within known limits – that is, that the misfortunes of individual actors or relations does not trigger damaging chain reaction that threaten the system. 'Known limits' can be interpreted as socially accepted risk of economic enterprise or as calculated risk.

The above definition of stability put in systemic terms provides only an explanation of 'known limits' and a kind of resilience of a system which cannot be threatened by a chain reaction caused by a failure of its single element. It is obvious that such a definition is too superficial, but knowing the limits of defining stability of social systems (Mesjasz 1999a), it seems more reasonable not to look for a single definition of stability but to study how the market mechanisms operate at all levels.

The first challenge which is emerging is whether the already described dichotomy – market vs. intervention and its impact on 'stability' of functioning of the market, which is politicized, can be also securitized. In such case securitization can concern three levels.

At the *first*, doctrinal level, theoretical 'scientific' considerations of a free market vs. a market with intervention, which are already politicized, can be securitized as well. Attempts to limit the free market mechanism resulting from theoretical considerations can be perceived as creating threats to the very foundations of all activities, not only the economic ones. In this case two kinds of more rigorous considerations have to be taken into account. The first one resulting from

more descriptive economic approaches (Polanyi 1944), and the second one, promoted recently by Stiglitz (2006: xii) who uses the neoclassical (orthodox) economic theory and the concept of information asymmetry to put in doubt the 'liberal' interpretation of the market, or as he calls it, "market fundamentalism: ... My earlier academic work on the consequences of imperfect and limited information and imperfect competition led me to an awareness of the limitations of markets."

The *second* level of politicization, and subsequently securitization, concerns the ideological dispute – intervention vs. free market, that is not based on rigorous academic reasoning but only on experiences built upon historic examples and comparisons, like for example, are the US financial markets truly liberal? Do the rich countries truly support free and fair trade? At this level of discourse two issues are raised – an old issue of the scope of intervention by the state and a new issue, intervention by trans-governmental international organizations lifting barriers of the free market mechanisms, e. g. World Trade Organizations (WTO) or organizations creating regimes imposing limits onto free market operations, e.g. opposition of the EU to genetically modified food.

At the two above levels patterns of securitization can derive from politicization. For example, increasing the level of state intervention may result in internal and external criticism, and in the emergence of interpretations ('securitizing moves') in which such a step could be viewed by internal/external actors/observers as creating threats to that particular state. A similar situation may occur if a group of states, e.g. implementation of protective measures which can be perceived by the others as a threat to economic security, both of those states and of their partners.

The *third* level of the securitizing discourse of economic activities is directly linked to a smooth functioning of the market mechanisms at all stages of economic activities – extraction, manufacturing, allocation, and consumption. At this level a 'securitization dilemma' typical for economic security is clearly visible. On the one hand, the market creates uncertainty for competing institutions. On the other, main actors, and especially companies, call for a certain degree of 'stability', translated usually into absence of crises, predictability, etc.

Bearing in mind the above considerations, a new proposal for securitization at the systemic level can be proposed. In addition to the search for vaguely defined stability of the market environment, praised by liberal doctrine, which can be interpreted as securiti-

zation of various forms of disturbances of the functioning of the market mechanisms, a new issue of securitization can be defined in a more comprehensive way.

In such a case not only the disturbances of the market mechanisms are a subject of securitization, but also the patterns of eliminating those disturbances. If it is agreed that orthodox market mechanisms are not a universal solution, then depending on circumstances a political decision which can be securitized must be made – either to limit the intervention, or to increase its scope. Obviously all that depends on the circumstances, but it gives a new inspiration for securitization in the economic sector.

In more simple terms, it means that securitization relates to the dilemma – what is more secure for the economic situation at the systemic level, or at a country level. Is it better to have more intervention (state and/or non-state), or to leave all to spontaneous market forces. It can be also associated, although it is not identical, with the public vs. private dilemma.

The above overall determinants of securitization moves relating to the context of economic activities can be translated into risks, threats, and vulnerabilities which have to be precisely identified in each situation.

43.3.2 The Core Concept of Economic Security

Due to its universal character, the core concept of security presented in chapter 2 above can also be applied in the discourse on economic security. All elements included in that scheme can be found in typical circumstances, when economic security is a result of securitization (of a ‘securitizing move’).

It can be modified and developed into a more extended form including possible systemic aspects of economic security. As an introduction some specific features of economic security objects and context are outlined below:

1. Reference object:

- social entity (subsystem) and individual as an element of a system: global economic system, country, international economic/financial institutions, companies, public institutions, individuals;
- levels of security: survival of a country, company, individual, development and growth, conditions of living of collectivities and individuals.

2. Disturbance (threat, risk):

- unexpected and unusual disturbance undermining either the normal functioning of a system, an

organization or an individual; in the latter case the disturbance not necessarily means total collapse, but a threat to the already achieved level of development or standards of living;

- securitization of social phenomena interpreted as risks: main obstacle – identification of difference between acceptable (non-securitized) and unacceptable risks in reference to all market-oriented activities of an organization or individual.

3. Vulnerabilities:

- vulnerability as a systemic property which can be involved in securitization with economic criteria: vulnerability in extraction, manufacturing, trade (allocation), and possibilities of consumption;
- vulnerability as a result of inefficient governance and/or management, risks, and dangers.

4. Prediction (identification) of threat (risk, danger):

- classical economic approach to risk and uncertainty;
- subjective approaches to risk;
- threat, risk, and uncertainty, and methods and limits of their prediction and anticipation;
- known threat (risk, danger): known consequences and unknown consequences;
- social and political barriers of prediction and anticipation.

5. Actions:

- prevention, pre-emption, securitization, desecuritization: dilemma uncontrolled market vs. various scopes of intervention;
- negligence – either conscious liberalism (*laissez faire*), negligence resulting from incompetence or from unlimited greed leading to crises.

6. Structural aspects of security of social systems:

- links between economic and military, political, environmental, societal and informational sectors of security (relations between sectors);
- links between security of elements and economic security of collectivities (security of individuals and of collectivities).

7. Attributes of a ‘secure’ reference object (system of reference objects):

- minimization of uncertainty, continuity, survival, increased capabilities of prediction;

- fulfilment of needs of individuals and collectivities at a specifically determined level (free from (what level of?) fear and free from (what level of?) want);
- stability at the systemic level as synonymous to a desired status with predictable future states which should allow for anticipatory (pre-emptive) actions.

43.4 Economic Security: Main Areas of the Theoretical Discourse

The term security appears in economic considerations in various contexts and with various meanings. The typology of areas of theoretical discourse, including definitions of economic security proposed below, derives from the following assumptions:

- reference to a widening and deepening of the concept of security;
- securitization as the factor determining the emergence of security concerns;
- reference to the 'core' security concept - developed in chapter 2 above.

Due to the size and scope of this chapter, several topics such as economic causes and consequences of wars and conflicts, defence economics, economic security and sustainable development, economic security and ethics, and links between economic security and other security sectors are left for further considerations.

43.4.1 Economic Security of a Country or State

Economic activities of any kind of actors (reference objects), and country/state security are linked in a threefold way. *Firstly*, a pure economic security relates to threats to economy which may endanger prosperity and functioning of a country. *Secondly*, a prosperous economy is treated as a background for military power, and *thirdly*, military efforts (military spending, involvement in wars and conflicts) may endanger a secure functioning of a country.

The first group of interpretations and definitions of economic security is linked to state security and prosperity. Economic instruments have long been part of the toolkit of statecraft, a means to influence other states and their policies (Hirschman 1980; Baldwin 1985). Economic security in a traditional view was security from manipulation by other governments that wielded these instruments. Insecurity was vulnerability to other states. Economic interdependence was

viewed with wariness, particularly among developing countries, because it risked an increase in such vulnerability (Kahler 2003).

Economic security as a part of state security thinking is a common idea in contemporary policy. Several examples can be quoted. In the USA, in 1952 the Materials Policy Commission, headed by William Paley, issued the report which laid ground for establishing *Resources for the Future* (RFF) as a non-profit corporation to carry out research on reserves available in the US. In its report direct links between security and economic development were presented:

First, we share the belief of the American people in the principle of Growth. Granting that we cannot find any absolute reason for this belief, we admit that to our Western minds it seems preferable to any opposite, which to us implies stagnation and decay. ... Second, we believe in private enterprise as the most efficacious way of performing industrial tasks in the US. With this belief, a belief in the spur of the profit motive and what is called 'the price system' obviously goes hand in hand. ... Third, ... security and economic growth for the United States and the rest of the free world must be the essential aim of any policy worth the name (*Resources for Freedom* 1972: 3).

State institutions usually link economic security with prosperity and increasing standards of living. In an official document of the Canadian Security Intelligence Service (2002) "Economic security is the maintenance of those conditions necessary to encourage sustained long-term relative improvements in labour and capital productivity and thus a high and rising standard of living for a nation's citizens, including the maintenance of a fair, secure and dynamic business environment conducive to innovation, domestic and foreign investment and sustainable economic growth. This is a broad goal sought by all governments."

Economic security of a country or state could also be narrowed to protection against economic espionage, as in the US Economic Security Act of 1 February 1996.

43.4.2 Systemic Definitions of Economic Security

Systemic definitions of economic security refer predominantly to the context of economic activities, including the functioning of market mechanisms, availability of resources, and the levels of consumption. Considerations on economic security by the 'Copenhagen school' do not include any universally accepted definition of economic security. They concentrate predominantly upon a smooth functioning of the mar-

ket at the global and local level. Buzan (1991: 19–20) states that:

economic security concerns access to the resources, finances and markets necessary to sustain acceptable levels of welfare and state power. ... The economic sector is about relationships of trade, production, and finance (Buzan/Wæver/de Wilde 1998: 7).

Contemporary discourse on economic security centres on concerns about instability and inequality (Buzan/Wæver/de Wilde 1998: 97).

Drawing on theoretical insights from International Political Economy, Development Economics and Economic Sociology, Nesadurai (2005) proposed an alternative conceptualization of economic security defined as ensuring a low probability of damage to a set of three key economic values: (a) streams of income and consumption necessary for minimal human/family needs; (b) market integrity; and (c) distributive equity.

Nesadurai does not reject neo-realist-based frameworks that emphasize the securing of national economic power. Instead, she supports calls for an open-ended or eclectic approach to conceptualizing economic security, a methodological stand that acknowledges that a range of understandings, concerns, and responses to the problem of economic security exist depending on the historical, political, and social contexts of states and their societies, as well as the strategic environment in which they find themselves.

Systemic challenges of economic security have gained in importance in the process of globalization, and will be discussed below along with links between economic security and globalization.

43.4.3 Economic Security of Individuals

Another group of definitions of economic security refers directly to the living conditions of various social groups and individuals, and to the protection against poverty. These interpretations of economic security are close to the traditional concept of social security and to human security. These definitions reflect the emphasis put on the standards of living of individuals.

Economic security refers to an assured and stable standard of living that provides individuals and families with the necessary level of resources to participate economically, politically, socially, culturally, and with dignity in their communities. Security goes beyond mere physical survival to encompass a level of resources that promotes social inclusion (Economic Security Project 2005).

The *International Labour Organization* (ILO) and its Social Security Department (2006) have proposed an 'economic security index'. It is proposed as the com-

bination of securities that make up economic security, and that this constitutes a decent work environment. It contains a series of eight security indexes, one for each of the seven forms of security and one which is a synthesis of all these seven particular indexes: i) labour market security, ii) employment protection security, iii) job security, iv) skills security, v) work security, vi) representation security, and vii) income security. In addition an 'old age pension security index' has been calculated to take into account the income security of the elderly.

Economic security treated as fulfilment of basic human needs is regarded as an indispensable element of human security. Using the UNDP's 1994 Human Development Report definition of human security, economic security can be defined as a state requiring an assured basic income for individuals – usually from productive and remunerative work or, as a last resort, from a publicly financed safety net.

This definition places economic security with other security-related factors influencing the life of individuals – food security, health security, community and political security. The chief metaphor of human security – 'freedom from want' and 'freedom from fear', has been measured as to permit a comparison among countries and to facilitate studies of trends in change. A basic measure of human security: the *Human Development Index* (HDI) is annually published in the Human Development Reports prepared by the United Nations Development Programme.

The Human Development Index was developed in 1990 by Indian Nobel prize winner Amartya Sen, Pakistani economist Mahbub ul Haq, with help from Gustav Ranis of Yale University and Lord Meghnad Desai of the London School of Economics (Anand/Sen 1994). The Human Development Index (HDI) is a comparative measure of life expectancy, literacy, education, and standard of living for countries worldwide. It is a standard means of measuring well-being, especially child welfare. It is used to determine and indicate whether a country is a developed, developing, or underdeveloped country, and also to measure the impact of economic policies on quality of life.

Several other attempts are made to express human security in a more rigorous manner, e.g. the Human Security Report (2005). Economic indicators of economic aspects of life constitute a significant portion of all indicators of human security.

43.4.4 Security and Stability in Finance; Domestic and International

The economic understanding of security including securitization is becoming especially complex in finance, beginning from a corporate level through the state, and ending with the international level. In finance it is risk which is the key factor of dynamics, both in a positive and in a negative sense. The concept of risk is discussed thoroughly in several chapters in the book, so only a few remarks on risk in the financial markets should be made.

In finance risk and prosperity are just two sides of the same coin. What kind of events and processes in finance may be included in the discourse on economic security? At the macro level economic security is identified with the absence of big crises. In the financial literature this desired situation is called 'financial stability'. It is worthwhile to mention that till recently no definition of financial stability has been proposed (Mesjasz/Rogowski 1995; Schinasi 2006).

The paradox goes even further. How is it possible that in finance based on mathematics and rigorous reasoning, vaguely described categories such as financial stability or a 'healthy financial system' has become a foundation for normative considerations? As a consequence of such a situation, financial stability has a limited value not only as a theoretical idea and policy-making concept, but also as an instrument of social communication.

Despite the absence of a definition of financial stability, several institutions are actively involved in developing more or less advanced policy tools at the national and international level which could be instrumental in preventing breakdowns of the financial system.

The Financial Stability Forum was established by the G-7 in April 1999, after the Asian and Russian financial crises, to provide a means for cooperation in the supervision of financial markets among national governments, international financial authorities, regulatory groups, and other experts. The first widely disseminated interpretations of financial stability were proposed by the managers of financial institutions, the BIS, the ECB, the IMF, and the newly established Financial Stability Forum.

The interpretations of financial stability can be divided into the following five groups (Mesjasz/Rogowski 1995):

- stability as absence of instability and crisis;
- explicit and descriptive definitions;
- stability of the financial system;

- international financial stability;
- financial stability as a global public good.

Two recent attempts at defining financial stability should be mentioned. The first one was proposed by Mishkin (1999, 2000), who linked the concept of information asymmetry, already applied by Stiglitz (2006), to the discourse on systemic aspects of economic security. The second attempt is more comprehensive, allowing the identification of major threats for financial stability at the country level and at the international level.

Leaving apart the discussion of stability conducted in the financial literature, it is necessary to remember what the symptoms of a financial crisis are. Catastrophic visions of the world financial markets usually refer to a potential world-scale financial crisis similar to the Great Depression of 1929 which could hypothetically undermine the functioning of the world financial system. In this case the basic dilemma is rather simple to depict but not so easy for making any far-reaching predictions. The more greedy and risky the participants of the financial markets are, the more profits they can gain, but at the same time, the higher is the probability of the collapse of those markets.

There are also local financial crises affecting countries of the regions, as in the second half of the 1990's. In that case the dispute is also polarized according to the views of the market mechanisms.

Such issues as the 'Washington Consensus' adjustment programmes proposed by the IMF and their disadvantages have been a topic of discontent among economists (chap. 25 by Saxe-Fernández). One of the negative characteristics of contemporary local financial crises is that they predominantly affect poorer countries undermining their overall economic security as well as the already low conditions of living of their population. An attempt made by Stiglitz (2006) in his recent book on globalization shows only the directions how to develop new solutions that are helpful in avoiding financial crises (instabilities) at the international level and at the state level.

43.5 Globalization and Economic Security

Globalization defined in various ways and affecting all areas of modern human life, beginning from development and ending with standards of living of individuals, has become one of the hottest issues of discourse concerning all security sectors (Mesjasz 2003). The links between globalization and economic security re-

fer to three intermingled areas: a) the functioning of the globalized market, b) economic security of the states, and c) the influence of globalization on the standards of living.

The opinions on the impact of globalization on each sphere of life all over the world are strongly divided. Globalization is simultaneously viewed as a basic vehicle of development and as a source of numerous misfortunes, especially in the developing countries.

Literature on globalization is abundant and the term by itself has become just another 'buzzword' of world politics, economy, and business.

A synthetic view on advantages and disadvantages of economic globalization has been recently presented by Stiglitz (2006: 9) who has identified five areas of concern:

- unfair rules of the game governing globalization which are designed to benefit advanced industrial countries, rules which have even impoverished the poorest countries;
- globalization advances material values over other values, such as a concern for the environment, or for life itself;
- globalization has undermined sovereignty and democracy of developing countries and in consequence it limits their ability to improve standards of living of their citizens;
- globalization is not a winning enterprise for all, there are also the losers both in developed and in developing countries;
- globalization is imposing on developing countries solutions which are damaging for them.

In focusing on economic security it is worthwhile to show the phenomena that could be directly linked with economic security and which could be securitized in the social discourse. At the level of the systemic context of economic activities, three issues seem to be most important.

- The *first* one is the answer to the dilemma of the free market vs. the level of interference, not necessarily by the states. As it was already quoted, Stiglitz (2000, 2006) doubted the efficiency of the market by recalling its inherent inefficiencies caused by deficiencies of distribution of information.
- The *second* subject of securitization in a globalized market is trade which, despite all declarations, still favours the developed countries at the cost of the developing world – free trade vs. fair

trade (chap. 25 by Saxe-Fernández and chap. 26 by Oswald).

- The *third* issue of securitization at the level of overall context of economic activities is the functioning of world finance, which is under a strong influence of market-oriented rules – the Washington Consensus, the IMF adjustment policies. Recalling once again Stiglitz, it is also necessary to stress a negative role of the free flow of finance – e.g. the “unfettered flows of speculative capital are extremely risky” (Stiglitz 2006: xiii).

Another threat to economic security resulting from the dilemma of the private sector vs. the public sector at the systemic level and at the state level has been identified by Rodrik (2002):

The soft underbelly of globalization is the imbalance between the national scope of governments and the global nature of markets. A healthy global economic system necessitates a necessarily delicate compromise between these two. Go too much in one direction, and you have protectionism and autarky. Go too much in the other direction, and you have an unstable world economy with little social and political support from those it is supposed to help.

At the level of states, in addition to the consequences of the above potential challenges to economic security, globalization results in increasing interdependence. Two security-related questions can be recalled. The first, traditional one refers to the links between globalization, economic interdependence, and possible inter-state conflicts already discussed in the International Political Economy (Rosecrance 1986; Crawford 1995; Copeland 1996). The second question relates to new characteristics of interdependence that are typical for modern globalization, which include:

- the degree and character of interdependence (chaotic globalization and/or chaotic interdependence);⁴
- disputes over trade liberalization;
- the increasing role of financial interdependence and its positive and negative effects on security of states and of the entire financial system (financial stability).

The general conclusion that emerges from the actual level of economic interdependence shows that un-

4 Although many commentators say we are living in a time of unprecedented global integration, the world economy was actually more integrated at the end of the 19th century. Despite increasing integration in some respects, the contemporary world is in many ways fragmented and lacks coordination (Streeten 2001).

doubtedly it has contributed to a decline or even absence of conflicts among the major powers warring in the past. The number of armed conflicts (wars and civil wars) in developing countries may recently also have declined (Human Security Report 2005).

On the other hand, however, increasing interdependence of countries makes them more vulnerable to remote disturbances in trade and in finance – e.g. due to a contagion effect – and it is rather evident that the weak are more vulnerable. Growing interdependence and interconnectedness is also influencing the functioning of non-state units – of the market, public institutions, and as a consequence, of the standards of living of individuals (Conflict Prevention and Reconstruction Unit 2004).

The impact of globalization on the economic security of individuals is usually linked to ambiguous approaches. On the one hand a positive impact of globalization is claimed by advocates of liberal markets. On the other, such negative phenomena as hegemony of financial gains by the rich, and poverty and its consequences – exclusion, insecurity, and powerlessness – are stressed, especially affecting the developing world. In this case an approach based on security-oriented thinking seems most relevant, especially with regard to the use of the concept of human security and proposals of making improvement of standards of living a key issue of reorienting globalization more towards basic human needs (Stiglitz 2006).

43.6 Conclusions

The aim of this chapter was to argue how the discourse on economic security can be placed in a broader framework of contemporary economic theory and of systemic aspects of security developed elsewhere in this book. The key conclusions of this chapter may be summarized as follows:

1. Contemporary economic theory and systems thinking provide a sufficient conceptual apparatus allowing a better understanding of various approaches and definitions of economic security;
2. Securitization associated with various levels and areas of study is the key issue in defining and understanding economic security. Due to the role of risk in all economic activities, it is always necessary to expose what is extraordinary in any circumstances depicted with the utterance ‘economic security’. Any considerations on economic security in which the issue of extraordinary character of the situation (context, action) is omitted can be treated

solely as a specific void and perhaps abusive linguistic exercise;

3. Economic security plays a special role in the period of globalization when new phenomena in economy and finance affect all areas of social life;
4. The end of the Cold War and subsequent accelerated globalization can also be viewed as one of the causes for an increased role of the concept of human security which has strong links with economic aspects of the living of individuals, especially in developing countries.

Further research on economic security should consider the following issues:

1. The meaning of securitization in the economic sector;
2. Specificity of the links between risks, threats, and vulnerabilities in the economic sector;
3. Security at all levels of finance – international, domestic, corporate.
4. Relations between economic security and security in other sectors with a special emphasis on human security.

44 The Changing Agenda of Societal Security

Ole Wæver

44.1 Introduction

Security dynamics have some shared features irrespective of their referent object or 'sector', and 'different kinds of security' often interact so that one actor's fear for military security triggers countermeasures that make another state worried about its economic security, which in turn triggers countermeasures that let a security dilemma loose operating across 'kinds' of security. For these two reasons, it is useful to study economic security, military security, political security, environmental security and other forms together, side by side. But there are also significant differences between, for instance security against military threats and against migration (when viewed as a threat), or between economic security and environmental security. This makes it useful to look systematically at the security of what might be called 'sectors' (economic, military, etc) and draw out the particularities regarding what are the main objects defended, who typically acts in this sector, and not least, what dynamics of security and insecurity are characteristic of this sector. One instance of such examination is to look at security issues cast in terms of 'identity' – fear for the survival of culture, community, nation, and (with some qualifications) also gender and religion, fears often related to immigration or rivalling identities seen as undermining one's own. These issues are here addressed under the heading of 'societal security' and the chapter examines the particular features of this kind of security issues, recent and current trends in this sector, and the recurrent question of this book about the interrelationship between events, processes, and changing conceptualizations.¹

This chapter presents the status and trends in the societal sector of security as seen through securitization theory (Wæver 1995; Buzan/Wæver/de Wilde 1998; Wæver/Buzan/de Wilde 2008) briefly presented in the chapter by Buzan (in this volume)². The first part discusses the concept of 'societal security', its definition, and relationship to traditional state

security (44.2). The next parts present the main issues that make up the agenda of societal security (44.3), discuss gender and religion as closely related issues that could either merit a part each of their own or be discussed within the context of societal security, but with attention to their peculiar features that are not comprehended well by fully subsuming them under 'standard' societal security logic (44.4). The chapter finally assesses trends in the societal sector – the effects of the end of the Cold War and of 9-11 respectively, as well as the prospects for both the relative importance of and the main dynamics within this sector (44.5) before it offers some conclusions (44.6).

44.2 The Concept of Societal Security

'National security' has been the established key concept for the entire area of security affairs, but, paradoxically, there has been little reflection on *the nation* as a security unit. The focus has been on the political, institutional unit – the state – and accordingly on the political and military sectors. If one zooms in on the nation, another sector enters the picture – the societal one. Societal security is closely related to, but nonetheless distinct from, political security, which is about the organizational stability of states, systems of government, and the ideologies that give governments and states their legitimacy. Societal security is defined as the *defence of an identity* against a perceived threat, or more precisely, the *defence of a community against a perceived threat to its identity*.

1 Major parts of the present chapter are made up of a much abbreviated version of a chapter in: Wæver/Buzan/de Wilde 2008. Permission has been granted by Lynne Rienner Publishers. For meticulous work on the references the author is grateful to Simon Sylvest Wæver. The novel parts of the present chapter compared to the one in Wæver/Buzan/de Wilde 2008 are mostly due to the proficient prodding by the lead editor and an anonymous referee.

Only rarely are state and societal boundaries coterminous. This provides a first motive for taking societal security seriously (for example, in thinking about the security of the Kurds), and to limit oneself to state security effectively means to repress and misunderstand the security concerns of stateless people and minorities. Second, even the state and society 'of the same people' are two different things – and when they are referent objects for security, they generate two different logics. For instance, 'Serb security' raises different demands dependent on whether defined as the security of the Serb state or the – in this case more expansive – notion of the Serbian nation or people as found across several states and sometimes more in historical links than current presence. Even in the rare cases where geographical boundaries of state and nation largely coincide, a securitization in terms of the nation has implications different from one in terms of the state, because they are part of different language games and therefore different instructions appear compelling. If phrased as a threat to identity, a reply

-
- 2 Definition: Securitization is the discursive and political process through which an intersubjective understanding is constructed within a political community to treat something as an existential threat to a valued referent object, and to enable a call for urgent and exceptional measures to deal with the threat. Other central concepts in the theory are 'referent object' (that which is deemed threatened and holds a general claim on 'having to survive', e.g. the state, the environment or liberal values), 'securitizing actor' (the one who makes the claim – speech act – of pointing to an existential threat to this referent object and thereby legitimizing extraordinary measures, often but not necessarily to be carried out by the actor itself), and 'audience' (those who have to be convinced in order for the speech act to be successful in the sense of opening the door to extraordinary measures, otherwise not available). The central idea of the theory is, that it is not up to analysts to try to settle the 'what is security?' question – widening to include the environment or narrowing to only military security – but more usefully one can study this as an open, empirical, political and historical question: who manages to securitize what under what conditions and how? And not least: what are the effects of this? How does the politics of a given issue change when it shifts from being a normal political issue to becoming ascribed the urgency, priority and drama of 'a matter of security'. Much of the elaboration of this theory (Wæver/Buzan/Kelstrup/Lemaitre 1993; Buzan/Wæver/de Wilde 1998; Wæver/Buzan/de Wilde 2008) has taken place through exploring the particular dynamics and characteristics of security within the different 'sectors' of security: economic, environmental, political, military and – as in this chapter – societal.

in areas like language policy, educational reform or cultural endeavours is meaningful, whereas this will seem absurd if the threat is seen through the lens of state sovereignty. Third, other identity-based groups not related to nations or nation-like communities – such as racially defined minorities within a multi-cultural state and subcultures defined in terms of life style – make claims about threats to survival and act upon these. Fourth, identity groups can form as a derivative from security concerns that are originally formed in other terms, i.e. not in defence of identity but say religion (more on this in the next sub-section) or originated in one of the other sectors as for instance economic actors who generate a community feeling based on action originally in terms of economic security. This fourth way to societal security starts outside the sector but takes on a separate dynamic of societal security, the third is societal in nature but not nation-based and the two first are about nations, either because they are geographically conflicting with the state map, or because societal dynamics have distinct effects even when the societal units parallel states.

State is based on fixed territory and formal membership, whereas societal integration is a much more varied phenomenon – occurring at both smaller and larger scales and sometimes even transcending the spatial dimension altogether. Society is about identity, the self-conception of communities and of individuals identifying themselves as members of a community. These identities are distinct from, although often entangled with, the explicitly political organizations concerned with government.

The rise of societal security within security studies had intra-scientific roots in the general turn towards identity, culture, and constructivism and extra-scientifically in the post-Cold War prominence of ethnic conflicts (especially in Europe) that presented security studies with the embarrassment of lacking categories for the issues that all non-specialists would assume the experts could pronounce about (Lapid/Kratochwil 1996). Not least the wars in former Yugoslavia and the widespread fear of 'ethnic conflicts' in various part of the post-Soviet world conditioned the elaboration and exploration of the concept by the 'Copenhagen School' (Wæver/Buzan/Kelstrup/Lemaitre 1993) as well as related efforts within other security theories (Posen 1993; Panic 1998; McSweeney 1999).

The organizing concept in the societal sector is identity. Societal insecurity exists when communities of whatever kind define a development or potentiality as a threat to their survival as a community. The *defi-*

nition is not in terms of nations. By definition, societal security is about large, self-sustaining identity groups capable of reproducing themselves independently from the state; what these are empirically varies in both time and place. In contemporary Europe (for which the concept was originally elaborated; see Wæver/Buzan/Kelstrup/Lemaitre 1993), these groups are mainly national, but in other regions religious or racial groups have equal relevance. The concept could also be understood as ‘identity security’.

Societal security is not the same as *social* security. Social security is about individuals and is largely economic. Societal security is about collectives and their identity. Empirical links will often exist when the social conditions for individual life influence processes of collective identification (Wæver/Buzan/Kelstrup/Lemaitre 1993, ch. 2; Kelstrup 2000). The concept of *societal security*, however, refers not to this individual level and mainly economic phenomena but to the level of collective identities and action taken to defend such ‘we identities’.

To ‘defend’ an identity is a paradoxical business. Identities are ever-changing and processual, never stable and objective. But when they are securitized, they become constructed as given, primordial and deep – you defend some *thing* (Wæver 1997, 1998; Buzan/Wæver 1997). It is not an analytical error of the concept of societal security to treat identities as fixed and ‘thing like’ (McSweeney 1996) – it is a (dangerous) feature of actors’ practice when they defend identities, i.e. when they conduct societal security policies.³ Similarly, we all have multiple identities (Buzan/Kelstrup/Lemaitre/Tromer/Wæver 1990: 56–57; 220–223) but in instances of securitization, the situation gets defined in terms of totalizing identity constructs. ‘Who am I?’ will usually get a number of different answers depending on the situation and context: carpenter, fa-

ther, husband, from ‘this village’, FC Bayern München fan, model train enthusiast, Bavarian or German, the different answers will come naturally in different situations. When national identity is the one that most often has motivated collective killings and other radical action, this derives on the one hand from its role the last 200 years as source of political authority, and on the other hand from the slightly younger (romanticist) link between nation, culture, and meaning. The former makes national identity more consequential than other identities, because it is widely assumed that you can build political super-structures on top of it, in ways you do not with other identities, and the latter is seen as crucial to individual identity, because culture is widely seen as ultimately national and culture is simultaneously understood as a system of codes through which you interpret and make meaning, and therefore national identity is in contrast to other identities not only content but also context, not only an object but (through the dominant view of culture) the framework in which everything else is understood (Wæver/Buzan/Kelstrup/Lemaitre 1993: 27–40). Therefore, national identity most easily becomes securitized and in such conflictual situations, this will tend to subsume all other identities.

Identity is in some sense basically an individual level concept, and this is one more reason some analysts will be wary of an approach focused on (the defence of) collective identity. However, it is important to be careful and precise in the specification of the relationship between individual and collective identity. Some critics see the focus on collective identity – again – as reification and possibly a mystification of something ultimately about individuals. Theories from social psychology can help to explain *why* humans generally have an inclination to divide the world into categories and maximize self-esteem through privileging one’s own group (Theiler 2003; Kinnvall 2004). While I think it is actually here that the risk is highest of naturalizing identity and making it an almost biological need (where in contrast, one can actually study the genealogy of ‘identity’ and see that the idea of individuals and communities holding ‘identity’ is not a constant one, but has been accentuated strongly during the 20th century and especially the post-War period), this individual level argument is generally a helpful addition to the theory of societal security. It supplies a kind of underpinning, an explanation of why identity dynamics operate in the first instance. But, this does not mean that one should take a second step of basing the explanation of specific cases of societal security in individual level dynamics. To explain

3 In addition to the sources referenced in the text (most importantly the 1998 and 2007 books by Buzan, Wæver and de Wilde), useful introductions to the theory, especially for those with more difficult access to these publications, can be found on the web at <http://polforsk.dk/download/securitytheory2006/homepage> (notably the paper “Securitization: Taking Stock of a Research Programme”). It is therefore wrong to accuse the concept or theory of societal security of reification – it *studies* reification. To do this helps exactly to fight and de-naturalize reification. When it is shown how something *is made to* function as a thing, this implies that it *is not inherently* so, and the possibility of acting differently is defended. The ‘thing’ approach is therefore not theoretical reification but the contrary, the precondition for de-reification.

e.g. nationalist movements or defence of a particular faith or group identity from individual level processes would be reductionist and underestimate the emergent properties at the level of society. To simplify slightly: individual level dynamics explain the 'quantitative' dimension of how prone a group is to *some* form of identity politics. The more social dislocation, status change, and individual insecurity, the more likely is politicization or securitization of identity. But this does not explain what kind of identity politics applies, in what name, and thereby in what political direction (radicalization to the right, to the left, religious, nationalist, secessionist, etc) it goes. The *qualitative* question, of which identity gets played, can only be understood by analysing the universe of interrelated collective categories at the social level. A political, discursive analysis can therefore never be replaced by social psychological explanation.

The primacy of the individual is however correct in the important sense, that one should in all identity analysis avoid the image of the collective existing and individuals being in the collective as the elements that sum up to the whole. The main dynamics have to do with the way *the collective is in the individual*: Collective identity gets into play politically, because of moves at the level of politics, but this is ultimately only possible because individuals usually crave individual identity, and collective categories help to answer questions at the individual level. Who am I? That individual level question can be answered with the help of collective categories like 'a Russian', 'a Muslim' or 'a woman'. Thus, the collective is in the individual, and collective identities are only real and effective to the extent that they do work at this level - they do not exist as such as actual 'identities' collectively where all Russians, Muslims or women share some distinctive social feature making them 'identical'.

44.3 The Societal Security Agenda

The societal security agenda has been set by different actors in different eras and regions. The most common issues that have been viewed as threats to societal security are outlined here:

1. *Migration* - X people are being overrun or diluted by influxes of Y people; the X community will not be what it used to be, because others will make up the population; X identity is being changed by a shift in the composition of the population (e.g.

Chinese migration into Tibet, Russian migration into Latvia).

2. *Horizontal competition* - although it is still X people living here, they will change their ways because of the overriding cultural and linguistic influence from neighbouring culture Y (e.g. Canadian fears of Americanization).
3. *Vertical competition* - people will stop seeing themselves as X , because there is either an integrating project (e.g. Yugoslavia, the EU) or a secessionist-'regionalist' project (e.g. Quebec, Catalonia, Kurdistan) that pulls them toward either wider or narrower identities. Whereas one of these projects is centripetal and the other centrifugal, they are both instances of vertical competition in the sense that the struggle is over how wide the circles should be drawn or rather - since there are always numerous concentric circles of identity - to which to give the main emphasis.

Vertical and horizontal competition is not always easy to separate. Seen from Latvia for instance, the supra national project of the Soviet Union was seen as Russian horizontal competition. In Quebec, you can horizontally focus on the cultural competition from Anglophone Canada, or if the political carriers of cultural influence are emphasized you can see the threat as more vertical, i.e. from Canada as an inclusive project. Globalization raises the horizontal/vertical issue in its starkest form by presenting a universalism, which many nevertheless view as Western or US particularism.

4. A possible fourth issue is *depopulation*, whether by plague, war, famine, natural catastrophe, or policies of extermination.

Depopulation threatens identity by threatening its carriers, but it is not specifically a part of the societal sector's logic of identity, except primarily in cases where extermination policies are motivated by the desire to eliminate an identity or a group, as in the Holocaust or policies of ethnic cleansing. In other situations like plague, famine or war not intentionally aimed at the killing of civilians, the collective survival of an identity category might actually be threatened, but this is unlikely to be the immediate focus, or the way of interpreting the death of individuals. When losing one's life, the loss of identity will not normally be the main lens, unless death happens in combination with a perceived rivalry from another identity as in the three first issues. Most people will worry more about losing their life than about the risk that their disappearance contributes to the disappearance of the identity of the

collective. That is unless their life is threatened *because of* the effect on the collective identity, which means: because there is some sort of extermination policy in action. Ironically, less dramatic – i.e. more gradual – negative developments in demographics are more likely to be cast as a collective security problem (because they are not overlaid by the issue of individual survival), and therefore do not need an external ‘aggressor’ to become securitized. Birth rates have been a worry either because they are comparatively lower than relevant ‘competitors’ (France turn of the last century; Japan, Russia, and Europe today), which was seen as a military security problem in the past and today primarily as an economic and possibly political security problem, or because they threaten to upset socio-economic stability and produce either difficulties of upholding social security schemes (potentially securitized as economic security) or creating pressure for increased immigration (exacerbating societal security concerns; see Lutz 2007 on demographics). History exhibits many cases of combined threats, especially where imperial policies aim at changing the ethnic balance through a combination of military campaign, migration-in, pushing for migration-out, some killings, and competing identities for instance Pakistan in Baluchistan, China in Tibet and Singkiang, Indonesia in Papua, Saddam’s Iraq in Kurdistan.

It is easy to imagine forms of societal security problems that lack the clear focal threat of each of the four issues. A confluence of developments could lead to the dissolution of a community with for instance the gradual giving up of the language (more on language death later) and/or emigration, and this could happen without getting securitized if this development was not attributed to any distinct actor or social process – the x-people, globalization, neo-liberal competition, or some other ‘threat’. This is a central reason why identity should not be objectified as something given and normally not threatened and defended, so that articulation of threats correlates objectively with the probability of a culture disappearing or changing (Wæver 1997: 328). Cultures and identities can disappear without this being securitized (and securitization can contribute to the production or reproduction of an identity), so the main forms of societal security are those issues that are most easily articulated in terms of existential threat and necessary defence, and these happen to be the four above.

Although analytically distinct, in practice these four types of threats to identity can easily be combined. They can also be placed on a spectrum running from intentional, programmatic, and political at one

end to unintended and structural at the other. Migration, for example, is an old human story. People may make individual decisions to move for reasons varying from economic opportunity to environmental pressure to religious freedom. But they may also move as part of a political programme to homogenize the population of the state, as in the Sinification of Tibet and the Russification of Central Asia and the Baltic states. Horizontal competition may simply reflect the unintended effects of interplay between large, dynamic cultures on the one hand and small, anachronistic ones on the other. But it can also become intentional, as in the remaking of occupied enemies (e.g. the Americanization of Japan and Germany) and in the increasing role of ‘cultural barriers’ in contemporary trade policy, where countries invoke traditions to justify protectionism and the exporter therefore tries to weaken the status of these cultural particularities. Most visibly in the case of Japanese-US relations, an interesting dynamic occurs at the boundary of the economic and societal sectors, where Japanese distinctiveness is used as an argument in trade disputes (to defend against import of rice with reference to health, skis for safety connected to different snow, etc.), while on the other side US arguments about how one must organize to produce truly fair trade come very close to a demand for everybody to adopt a US socioeconomic and cultural model (Pape 1998; Baldwin 2000). Vertical competition is more likely to be found at the intentional end of the spectrum.

Integration projects, whether democratic or imperial, that seek to shape a common culture to match the state may attempt to control some or all of the *machineries of cultural reproduction* (e.g. schools, churches, language rights). In more repressive instances, minorities may lose the ability to reproduce their cultures because the majority uses the state to structure educational, media, and other systems to favour the majority culture. Thus, some types of societal security issues are fought in the hearts and minds of individuals, whereas others are expressed in struggles over more tangible matters that influence identity. In the first case, the threat is about conversion – people start to think of themselves as something else. In the second, political decisions will influence identity, such as using migration or political structures to compromise the reproduction of a culture that lacks control of the institutions required for cultural reproduction. Societal security issues are always ultimately about identity; in some cases, the medium in which they are fought is also identity (horizontal and vertical

competition), whereas in others it is not (migration, infrastructure of reproduction).

Society can be defended against such threats in two ways: through activities carried out by the community itself or by trying to move the issue to the political (and potentially the military) sector by having the threat placed on the state agenda. At the state level, the threat of immigration, for example, can be addressed through legislation and border controls. State-oriented responses are fairly common, which makes the societal sector difficult to analyse because it often merges gradually with the political sector. Especially, some of the most important and intense cases of conflicts with societal roots, ethnic wars, by definition *end up* in other sectors, first political then military.

In some cases, however, the decision in and on behalf of societies is to handle what is perceived as identity threats through non-state means. For example, an increasing exposure to foreign influence (globalization) can be met by increased cultural efforts, a more self-centred reflection on culture as part of national identity, and maybe increased attention to the protection and preservation of the national language. While state (or sub-state) policies will often be a part of this, a policy of 'cultural self-defence' also has a strong element of leaving the battle to cultural actors in civil society, and to increased self-reflection in the media and society about 'our identity' ('What is Danishness?' etc.; Wæver/Buzan/Kelstrup/Lemaitre 1993: 70). Thus, the instrument of protection against a foreign culture is ultimately not the quintessential state one of force or exclusion, but the one of cultural efforts only partly defined by the support systems provided by the state. Society can conduct security policy through non-state institutions or by cultural praxis as such.

The choice of whether to see societal threats as a task for society itself, as one for an existing state or as an argument for gaining or regaining statehood, can have a decisive impact on regional dynamics. In our terminology, that choice can be seen as a question of what actor to turn to and whether to forge close ties between the societal and political sectors. We have shown in a previous analysis of Europe how a strong link between these two sectors and thus remobilization of the state on identity issues would constitute a major threat to European integration, whereas - probably counter-intuitively - a more separate securitization in terms of societal security could be more compatible with further integration - which, in turn, stimulates this increasing differentiation of society from state (Wæver/Buzan/Kelstrup/Lemaitre 1993,

chap. 4; Wæver 1998). To build political unity with cultural differences is easier the more culture and politics are seen as separable. Today, a vision of European political integration with national cultural differences competes with one where culture and identity are closely connected and the relationship between Europe and nation-states comes closer to being zero-sum.

Different societies have different vulnerabilities depending upon how their identity is constructed. If one's identity is based on separateness, on being remote and alone, even a very small admixture of foreigners will be seen as problematic (e.g. in Finland). Nations that control a state but only with a small numeric margin (e.g. Latvia, Macedonia) or only through repression of a majority (e.g. Serbs in Kosovo until 1999) will be vulnerable to an influx or superior fertility rate of the competing population (e.g. Russians in Latvia, Albanians in Macedonia and Kosovo). If national identity is tied to specific cultural habits, a homogenizing 'global' culture, such as the US-Western imperialism of Coca-Cola and McDonalds, will be threatening (e.g. Bhutan, Iran, Saudi Arabia). If language is central to national identity, the contemporary global victory of English combined with an increasing interpenetration of societies will be problematic (e.g. France). If a state-nation is built on the integration of a number of ethnic groups with mobilizable histories of distinct national lives, a general spread of nationalism and ideas of self-determination can be fatal (e.g. the Soviet Union, Yugoslavia, Czechoslovakia, the United Kingdom, India, Nigeria, South Africa); if a state-nation is built on a melting-pot ideology of different groups blending into one new group, the existing national identity will be vulnerable to a reassertion of racial and cultural distinctiveness and incommensurability (e.g. multiculturalism in the United States).⁴ If the nation is tied closely to the state, it will be more vulnerable to a process of supra-national political integration (e.g. Denmark, France) than will be the case if the nation has a tradition of operating independent of the state and of having multiple political layers simultaneously (e.g. Germany). Some - typically 'small' - nations have deeply institutionalized worries about their continued existence in contrast to nations like

4 The term *state-nation* is used differently by different authors, but it is commonly taken to refer to nations being constructed by the states - cases in which state comes 'before' nation - in contrast to at least the self-understanding of the classical nation-states, in which nation was assumed to come first (Buzan 1991: 73-74).

the Americans that cannot image that they will not own the future. Conversely, some larger nations like, again, the US (or an emerging European identity) might be marred by continuing doubts about its ultimate basis and exact definition and thus need to re-assert for instance self-other mechanisms of self-definition (Campbell 1992), whereas smaller nations take their roots and delineation more for given, but worry about their capacity to uphold it. This makes for different (perceived) vulnerabilities and thus different inclinations to securitize different kinds of threats.

44.4 Gender and Religion: Societal Security as Strong Secondary Dynamic

A set-up with a given set of sectors – such as the five in ‘the framework book’ (Buzan/Wæver/ de Wilde 1998; Wæver/Buzan/deWilde 2007) and in this book – is inconclusive; the world does not divide neatly into five distinct, complementary and comprehensive dynamics. It is an empirically contingent observation that these five are the most important today, that a division this way works reasonably well, and that they each have distinct dynamics. Still, there are candidates for additional sectors, and the three best cases can be made for gender, religion, and what might be called ‘functional security’ (vital societal support systems and infrastructure; Sundelius 2005; Boin/Ekengren/Rhinard 2005; see chap. by Ekengren in this volume). The latter can be dealt with under political security (Wæver/Buzan/deWilde 2007: ch. 7), whereas the two first will be covered in the present chapter despite the fact that they are not fully explained by the dynamics distinctive of societal security. Both gender and religion have distinct features and core concerns that are sufficiently original that they could in principle be defined as separate sectors (see Johansen 2000 for gender and religion by Laustsen/Wæver 2000; Sloth 2003; Madsen/Ottesen 2003; Kjølberg 2003; Sheikh 2005). However, they also generate societal sector dynamics as a secondary and often more powerful feature, and therefore we will cover these proto-sectors under the societal heading in the present case. In this section, we will explain the distinct dynamics that include non-societal dynamics (i.e. not driven by direct reference to collective identity) and in the subsection on ‘the logic of threats and vulnerabilities’, their dynamics will be further explored in relation to individual identity.

44.4.1 Religion

Religious communities can be the referent object for societal security, because they are important self-sustaining we-identities, collectivities, groups. To varying degrees religions even have institutional structures, including formalized authority and rule-making, and thus become in some respects state-like and thereby relevant in the political sector too. However, to focus on these group-related features runs the risk of missing the distinctly religious about religion. When security action is taken on behalf of a religion, a threat is presented as endangering the survival not of the community in the first instance, but the survival of the *faith* (Laustsen/Wæver 2000).⁵ What differs is the basic question of what is at stake, what it is that is deemed threatened. This has consequences for the logic of threats and counter-moves, the rationality of different moves, and thus the likelihood of success for one or another securitizing move.

A conspicuous example is the phenomenon of suicide bombers. As noted by David C. Rapoport (2002), “‘suicide bombing’ was the most striking and deadly tactical innovation” in the distinct fourth wave in the history of terrorism, the religious one that started in the 1980’s. Although the technique was adopted by secular groups – most notably the Tamil Tigers – it is characteristic of religious groups, which

5 To define religion is a controversial and problematic affair, because the generic concept of religion evolved out of secularizing Protestantism (Asad 1993, 2003). Religion had not been a distinct category in most societies, but interwoven with social and political affairs. The emerging modern state claimed sovereignty and cultivated a secular rationality and subjectivity, where ‘religion’ was removed from the public sphere and located inside people as a subjective matter of personal faith. The history and sociology of religion has gradually become aware of and self-critical about the way conceptualizations of ‘religion’ in general operated through a Western, Christian prism interpreting and labelling practices in other parts of the world in problematic ways with a concept of ‘religion’. For the present purposes it is fortunately not necessary to present an intensive definition that captures the essence or inner structure of religion, only a minimalist, formal definition according to which we see securitization as religion-related if it involves ideas of human communication or interaction with supernatural beings or objects – either because actors defend practices related to such assumptions, or because they fight other groups on the understanding that these other groups are religious in the sense of acting on the basis of some conception of super-natural beings.

makes quite a lot of sense. Suicide is easier to fit rationally into a means-ends calculation, if the frame of reference is other-worldly rather than this-worldly (Bloom 2005: 98; Elster 2005: 242–247; Hafez 2006).

This seemingly pedantic distinction (between religious security as defence of faith and the defence of the religious community) is important for both theory and practice, not least because of the nature of so-called ‘fundamentalism’. The study of fundamentalisms (across all major religions) has discovered some crucial common and distinct features (Marty/Appleby 1995; Riesebrøt 1998; Juergensmeyer 2000; Almond/Appleby/Sivan 2003), and what is defended is not the community as community, but a threat to faith. The religious community is often a large one in terms of adherents, and the concern of the fundamentalist is typically not about the quantitative continuity of the religion at large, or the possibility to be able to declare oneself as Christian or Moslem in general, as is the case of outright persecutions of religion and the ensuing defensive measures, often of a more moderate nature. The worry by the fundamentalist is typically that the *true* version of the religion is diluted not least by (alleged) members of the community. So the community as such survives, but it happens to be going astray! This is particularly important, because ‘fundamentalism’ to a large extent *is* security action. A striking similarity among fundamentalisms across religions is how their proponents define the situation as so threatening that mere traditionalism will not do – the attack on faith is so serious, that it amounts to treason to take only religious counter-measures (Marty/Appleby 1995; Juergensmeyer 2000; Wæver 2004a, 2007; Sheikh 2005). The strongest means have to be adopted for defence, and therefore fundamentalism typically becomes an amalgam of modernity and alleged traditionalism. Also, the argument of fundamentalist groups typically involves an element of distinguishing between the large group of misguided adherents to the faith, and the necessity of dramatic action to save the true version (Marty/Appleby 1995; Almond/Appleby/Sivan 2003). Thus, it is clear that a strong logic of *securitization* is involved, but it is not with reference to the community and its identity – it is about defending faith. However, it is equally clear that when an actual conflict gets rolling, dynamics similar to those of societal (and military) security issues will start to operate, groups will act in terms of ‘us’ and ‘them’, protect members against the threat from enemies, and worry about the coherence of the social group. To emphasize only this element would amount to yet another version of functionalist theory of reli-

gion. Religious practice *entails* the formation of social groups, of a community of believers, but this is not what is religious about religion – it is an effect, not the essence of religion – and to study *only* the societal security dynamics would reduce religion to community and exclude the transcendental element. Religious security practices are thus societal *and* something more.

It is also important to distinguish ‘the other way round’ – not to mislabel ethnic conflicts as religious. With the increased attention to religion, some might see the conflicts in former Yugoslavia as instances of religious conflict. True, Croats are mostly Catholics, Serbs Orthodox and Bosniaks and Kosovo-Albanians Muslims. Given how hard it otherwise is to distinguish Croats, Serbs and Bosniaks – where only now the different states try to cultivate distinct languages (versions of what used to be Serbo-Croat) – it is tempting to say that the conflicts were over religion. This, however, would be misleading. People rarely said: you have to die because you have the wrong faith, or more distinctly because I want to defend or spread the true faith. No, they said you have to die because you are a Serb/Croat/Bosniak, and I know what you people are up to, because you already killed my people before in history – and by the way, I can see that you are a Serb/Croat/Bosniak from your religious practice. Thus, religion served here as an *ethnic marker* rather than as an issue in its own right. (For the opposite interpretation, see Goody 2001. In the case of Kosovo, a predominantly ethnic conflict had distinct elements of fighting for religion as such; Duizings 2000).

This example points us towards a way to scrutinize religious security concerns in the present context. In each instance, one might perform the thought experiment: if we treat this as an ethnic conflict, with the logic of identity groups, would that explain it fully, or is something left out?

In conclusion, there is a distinct dynamic associated with religion, making it a kind of proto-sector (possibly the strongest candidate for an additional sector, but in cases of conflict, the typical dynamics of societal security (see the following sections) are triggered, and religious security will almost always be *also* societal security, and often even *mainly* societal. Therefore, we treat it as part of the societal sector in this chapter, but with a caveat for drawing the not-strictly identity driven dynamics into this chapter too.

44.4.2 Gender

Gender, the other main example of an also-but-not-only-societal category, has a different relation to the

societal sector. Where religion has distinct features related to a different referent object (faith), but also follows societal logic (as a social community), gender is intermingled with societal sector dynamics in more complex and indirect ways.

The first form of importance of gender is 'normal' societal security that is as social group. For gender to register as societal security in this form, action has to be taken in the defence of a 'we' that is defined in gender terms. This does happen, but not too often for a number of reasons. The first is that the relationship between men and women is usually not purely confrontational and external. Within the ordinary binary code of man/woman it is not immediately plausible to construct the relationship in terms of mortal threat, because the predominant understanding of the sexes defines them as mutually dependent. Problems usually do not get defined through an understanding where 'men' are out to eradicate either physically 'women' or socially the category of 'women'. Therefore, securitization tends to become available only when this traditional understanding of gender is replaced by a more nuanced one, either through inclusion of other forms of sexuality, where – as we will see below – homosexuals is the centre of much securitization⁶, or when 'men' and 'women' are viewed in terms of competing gender roles. In the latter case, what is threatened is a specific way to be a woman or non-hegemonic forms of masculinity (Connell 1995).

The few examples where gender gets articulated as referent object in a close-to-standard societal way, i.e. as a threatened group, include first of all Brownmiller style feminism where 'men' are more or less depicted as a collective threat to 'women', e.g. rape "is a conscious process of intimidation by which *all men* keep *all women* in a state of fear" (Brownmiller 1975: 15). The other main example is homosexuals, where securitization goes both ways. Homosexuals feel threatened – and homosexuals/homosexuality is depicted as a threat to society, decency, faith or nature in probably a majority of societies in the world today.

To notice that gender relatively rarely operates as a social group in its own right in this direct societal security manner is not to deny that gender is an important structuration of society, and crucial for understanding power relations and social dynamics. Only, the first question in a securitization analysis is to ask what security action is on behalf of or in the name of.

Gender is important in international affairs because of its mediating role, as a way to construct other community categories. This is among the most powerful gender effects in international relations in general.

Most well documented is how conceptions of nations – both in general and the particular one – are deeply coloured by gendered metaphors and ideals (Yuval-Davis 1997). This operates not only at the abstract level of 'motherland', 'fatherland' and so forth, but also more concretely by implicating gendered subjectivities in the constitution of the state system (Elshtain 1987; Enloe 2000) – crucial roles of soldiers, innocent civilians to be protected, diplomats, diplomats' wives, statesmen, etc., are performed in ways that simultaneously function for the individuals as part of their gender production. Therefore, when a threat is articulated against the nation, this will lead to different demands on men and women – e.g. 'hero mother' medals for large families and decreased tolerance for pacifist men.

Often power relations related to gender are at stake in securitizations, but this is articulated in other terms. If patriarchy is threatened, this is hardly the way a defence will be phrased. Often, security action will use tradition and religion (cf. Riesebröt 1998). Religious traditionalism especially in the Middle East obviously helps to justify male privileges, and it is a plausible explanation for its increasing political mobilization, that the globalization of Western values threat-

6 Within security studies, the concept of gender security is occasionally widened through special attention to particularly vulnerable groups like small children and old people, drawn into the gender category through the linkage that these are typically attended to and cared for by women. This is a slightly odd way to include basically social and age defined issues as gender. The definition of gender in the context of the present chapter is the social or cultural categories categorizing individuals as male, female or some third, fourth or fifth category placed in-between or beyond these categories. As conventionally practised, gender is used in contrast to biological sex to emphasize the social roles and identities at play in a given society. When I mention the classical dichotomous male/female categorization in the text, this is not meant as a limitation of the analytical framework, only a discussion of those cases where a society enforces this categorization. Characteristically for the discursive approach of securitization theory, definitions of e.g. security, society, nation, religion and gender are minimalist and open (in some sense formal or structural), because it is not the task of theory to prescribe correct terminology but to analyse the politics being enacted through different conceptualizations, and therefore the framework shall be open to investigating such variation. The 'definitions' are needed only to know what to 'file' under what heading, not to inject additional import into each term and anchor specific interpretations or connections within the definitions.

ens to upset local relations of power and privilege between the sexes. Another example is homosexuals who are depicted as a great threat which helps to defend the dominant masculinity or rather: build it through defence against this Other (Connell 1995). Also here, the issue is not presented clearly in terms of gender security. What is threatened? 'The family!' As with the centrality of 'gay marriage' in the US election 2004 action will be taken in the name of these identity categories or religion, although much of what is at stake relates to gender. Often, there is more gender talk in the threats than in the alleged referent objects ('gay marriage threatens the family' and 'feminism attacks our traditional life style').

The potential for articulating threats in terms of *class* is to a large extent parallel to gender. It has been difficult to depict total and mortal threats, because the classes are defined relationally, and in most people's view are different, competing segments of a joint operation. Therefore, class is mostly experienced as a structural bias, as relations of power that distributes rewards and risks unevenly, but not as a security issue at the collective level. Communists tried to mobilize according to class but largely failed in this. There might be more potential for securitization in the currently emerging global divide between a post-national cosmopolitan class of 'symbolic analysts' and unskilled segments, who with some justification can fear to be seen as collectively dispensable and no longer covered by national(ist) solidarity. After fading from fashion for a while, the issue of class under globalized conditions needs to be re-visited from a securitization angle.

44.5 Changes and Trends

The referent objects in the societal sector proper are whatever larger groups carry the loyalties and devotion of subjects in a form and to a degree that can create a socially powerful argument that this 'we' is threatened. In the societal sector, this 'we' has to be seen as threatened *as to its identity*. Historically, such referent objects have been rather narrow. For most people, they have been local or family based: the village, a clan, a region (in the local rather than international sense), or a city-state. In some eras, these objects were closely tied to political structures (city-states, clans, and the like). In others, political loyalties operated distinct from societal forms, as in classical empires in which political loyalties were to kings or

emperors, and people's 'we' loyalties were mainly tied to families and religion.

In the present world system, the most important referent objects in the societal sector are tribes, clans, nations (and nation-like ethnic units, which others call minorities, as well as non-contiguous ethnic politics around diasporas), civilizations, religions, and race.

The end of the Cold War propelled ethno-national security issues onto the general security agenda. A combination of weakened political structures and individual insecurity in society made securitization in societal/identity terms comparatively easy. This became during the 1990's self-reinforcing as the press and others came to see the world in ethnic categories. For instance, there was a spill-over from (the depiction of) conflicts in 'Eastern Europe' to problems for European integration in Western Europe. Ethno-nationalism gradually lost some of its hegemonic hold on the world political imagination towards the end of the 1990's, partly as a product of its obviously disastrous political effects.

The terrorist attacks in the USA on 11 September 2001 amongst other things sent a slowly maturing image of religious conflicts into general prominence. Wrongly, this is often interpreted as 'religious war' (or 'clash of civilizations'), i.e. as religion against religion, whereas the structure of most conflicts around religion are religious politics vs. the secular state (Jürgensmeyer 1993; Wæver 2007). Religious referent objects are likely to remain central for many years to come, often intermingling with ethnic and national(ist) policies as in Iraq and Palestine.

The effects of first the end of the Cold War, then of 11 September 2001 have been strong in relation to migration. Here, economic and societal dynamics intersect, because mobility is generally assumed in a capitalist context to maximize collective gains, but on the other hand is often the most tangible and emotionally powerful trigger of societal security concerns. Christopher Rudolph (2003) has investigated this more systematically in terms of three dimensions of security: geopolitical interests, material production, and internal security. Among the partly counter-intuitive but ultimately convincing elements of this interaction is a tendency toward open migration policies in situations of external threat, where economic maximization is needed to counter a geopolitical threat, and rally-around-the-flag dynamics reduces the focus on internal differences. This thesis is confirmed by the changes both in Europe and the US from Cold War to post-Cold War policies. The increased concern about migration in the 1990's was strictly societal, i.e. as a

threat to identity and economic worries by less-privileged groups. These were mostly driven ‘from below’ and reactions to the impression of increased immigration. Therefore, policy changes were aimed first of all at producing an image of ‘regaining control’ over borders. Due to the continued economic (and even material sources of security) related need for at least some forms of openness, it is important that “states need to *appear* responsive, not necessarily to *be* responsive” (Rudolph 2003: 613; as shown by Andreas 2000). Actual policy revisions in the 1990’s largely fit this interpretation – not much actual reduction of numbers, but appearance of toughness and control, acting at the most symbolic points. This “out of sight, out of mind” policy was “politically successful during the 1990’s”, but it was “challenged after 9/11” (Rudolph 2003: 615). Effective control of migration achieved a new kind of security importance, and especially internal and external (or societal and military) security was linked differently. The policy of decreased visibility of migration suddenly turned into a need for visibility, for transparency and actual control. The likely effect will be increased monitoring and surveillance in general, but legitimized by the need to follow migrants and other dangerous elements.

A research project led by Jef Huysmans and Thomas Diez currently investigates the changes in securitization of migration in selected European countries under the impact of terrorism since 2001. Among the preliminary findings (Diez 2006; Huysmans/Buonfino 2006) are, that in the UK a re-articulation of migration as closely linked to anti-terrorism has largely come and gone – it peaked in the period immediately after 11 September 2001 but did not return even after the London bombings in July 2005.

Only during the brief period in 2001 (when the Anti-Terrorism, Crime and Security Act was passed), an immigration/terror link was phrased in securitization terms and demanding extraordinary and exceptional measures – a debate conducted often around the theme of a trade-off between security and liberty (Huysmans/Buonfino 2006). After this, the framing was less a ‘politics of exception’ and more in line with a ‘politics of unease’ (as emphasized in general by the ‘Paris School’, Bigo 2002a, 2006), which is more technocratic and focuses on governmental technologies like ID-cards. Dramatic links between migrants and terror are generally resisted and warned against, but governmental practices and technologies which are aimed at specific ‘dangerous’ groups are introduced. In Germany, in contrast, a quite dramatic securitization of migration is built up by extending previous dis-

courses along classical societal security lines – threat to identity (always with good resonance in Germany due to the nature of the national conception) – into a new form of danger from migrants, this time linked to terrorism and undemocratic practices (Diez 2006). In the German case, the politics of exception prevails over politics of unease, and migrants are securitized. Still, in line with the pre-9/11 practices (Andreas 1999), the actual policies do not change much, and tightening is largely symbolic when it comes to overall aggregate migration policies. The main changes happen in relation to select groups. Instead of justifying a general rationale for exceptional measures in accordance with the logic of ‘state of emergency’ or ‘exceptionalism’ – or a general securitization of immigration – which could lead to a general tightening or even total exclusion or expulsion of immigrants, a focus on terrorism as such has justified increased surveillance, biometric identification, and infringement of rights for specific targeted groups. This has led some writers on ‘emergency measures’ to conclude that what has been developed is “an emergency regime that operates alongside the normal one” (Ferejohn/Pasquino 2004: 228; Macleod 2006; Boswell 2006).

Migration operates most intensely as intraregional and neighbouring region dynamics, as in the flow of Hispanics into the United States and concerns in Western Europe about immigration from North Africa, the Middle East and the former Soviet empire. But long-distance migration also exists and it has as a rough trend been growing over the last two decades (Schuerkens 2005; Castels/Miller 2003). Some echoes former colonial overlay, such as patterns of intercontinental migration into erstwhile metropolises (e.g. South Asia and the Caribbean to Britain, North Africa to France, Indonesia to the Netherlands). But much long-distance migration simply responds to patterns of economic incentive, as in South and Southeast Asian migrations to the Gulf and Latin American and Chinese migration to the United States, to which is added the generally increasing flow of political refugees. (Most refugees in the world are to be found in their own or neighbouring countries and the number coming to especially Europe has gone down compared to the 1990’s, but the general pattern still seems to be upwards as a general, long-term trend (Castels/Miller 2003).

This raises the question, to what extent the societal sector is global, regional or local. Just as military threats – other things being equal – travel more easily over short than over long distances, there is also a spatial dimension to the societal sector. It is easier to mi-

grate over a short distance than over a long one, and for cultural impulses to travel to neighbours than to faraway places. Competing ideas of who 'we' are will usually be regional in the sense that the same person can be seen as Hindu, Indian, or South Asian or as European, British, and Scottish but only with some difficulty as Swede, Australian, and Muslim and not likely as simultaneously Russian, Latin American, and Buddhist.

Regional dynamics are therefore strong, but some globalizing trends and factors are important too. Interregional migrants and interregional cultural, religious, and civilizational competition is important. Globalization exerts a worldwide pressure, especially where it is perceived as Westernization, and the results vary between cultural homogenization, reactions against it, and a huge spectrum of mixed accommodations and hybridizations (Berger 2002, 2005). Only as a special case does globalization become the explicit terms of securitization – either as defence *against* globalization by anti-globalization activists or leftist parties notably in Latin America, or as a defence *of* globalization and especially of the ability of one's own country to accommodate to the rules of competition under globalization, which then makes the anti-globalization/anti-liberalization forces a problem, and potentially even a security problem, if one sees the risk of 'missing the train' in sufficiently dramatic terms (Buzan/Wæver 2003: 322, 464f). These cases of securitization directly in terms of globalization are usually political and economic sector phenomena, while in the societal sector, globalization operates mostly as a more underlying unsettling force. In some cases, actors almost posit globalization as the threat (as in the case of some traditionalist and fundamentalist ethno-cultural or religious movements), but they will typically conceptualize the threat as 'Americanization' or 'Westernization' (or 'decadence'). As a general pressure conditioning or aggravating societal security concerns, globalization has a number of effects, but probably the most important is the one put forward by Arjun Appadurai in *Fear of Small Numbers* (2006): The prevalence of 'large-scale, culturally motivated violence' during the period of 'high globalization' is a product of the cultural dimension of globalization. Social uncertainty and doubts increase, categories get blurred, flows traverse boundaries, and the dominant idea of the homogeneous nation-state becomes more and more desperate. Violence serves to create certainty and is often driven by aspirations for cultural purification or worries about the vulnerability of majority status in a world where everybody is be-

coming global minorities. Globalization, thus, is one important 'real world' development that has influenced the amount and form of conflicts in the societal security sector, and it has influenced scholarship and security conceptualizations in a number of ways (too complex to go deeply into here⁷), of which the most important probably is, that state-centric conceptions are no longer seen as exhaustive. In a world presumed to be made up of homogeneous and closed states as the sole actors, it seemed meaningful to concentrate security studies on state security and the main state-to-state threats (military ones being the most prominent), but if the world no longer can be fitted into such categories, because of flows, leaks, and overlapping actors of many kinds, it follows that security studies starts to take other referent objects serious, leading to among other things 'societal security'. Probably, globalization should be added as a third to the two main 'events' that this book looks for the conceptual and theoretical effects of: end of the Cold War and 9-II.

In relation to the question pursued throughout this book about the interaction between political events and practices on the one hand and academic conceptualizations on the other hand, it is clear that the 1990's generally was marked by an increasing attention to 'identity' in both spheres. This parallelism and general *Zeitgeist* makes it mandatory to avoid an easy conclusion about identity oriented theories 'following' or 'mirroring' real-world developments. Equally important is the possibility that a discursive valorization and often reification of 'identity' contributed to a channelling of social processes through 'identity patterns' and made the world more 'identity driven'. This is an important reason to be wary of theoretical approaches that reify 'identity' and treat it as a given and simple basic substratum of human reality (as the theory and concept of societal security is often – wrongly – accused of doing). One should observe instead how human complexity *becomes* organized around the defence of allegedly endangered 'identities' and how the ever-changing landscapes of identities become conceived exactly through such processes of securitization in terms of objects and origins. The

7 The literature on 'risk' and 'risk society' is one noticeable place, where scholars explore possible ways to let globalization more fundamentally set the terms for (post-)security studies. New conceptualizations might be in the making, which derive from globalization and 9/II, but it is too early to say what status these will gain within security studies and political practice.

very idea that people have (collective) and that this is important, indeed crucial, became more powerful in the 1990's than it had been in e.g. the 1970's with their predominance of socio-economic interpretations or the cultural revolutions of the 1960's. The study of 'societal security' - and more generally the inclusion of culture, identity, and ethnicity into security studies under various names - during the 1990's, consequently has to be interpreted very carefully as a complex balancing act that simultaneously tries to assist in the interpretation and handling of this increasing 'identity making' of the world, and on the other hand is part of this process. Similarly, the turn towards 'religion' in the first decade of the 21st century should be introduced into security studies with equal caution, where religion should not become reified or vilified as a particular, static thing with specific essential attributes and consequences, while on the other hand security studies should be flexible and innovative enough to develop its conceptual apparatus so that it is attentive to changes in referent object, actors, dynamics, processes, and conflict pattern that relate to the increasing invocation of religion as the object of conflict.

44.6 Conclusion

Societal security dynamics are strong in all parts of the world, and they are often at the root of particularly vicious conflicts, which among other things stem from the inherently paradoxical nature of any project aimed at 'securing' an identity. Identity is an impossible human longing that tends to trigger self-destructive political projects, when one tries to defend it. Often the insecurity becomes self-propelling by becoming the object of increased attention and worry. Therefore, the political agenda of dealing with societal security has to be - even more than the other sectors - about prevention and pre-emption, about managing identity constellations so that panic reactions are not triggered, because once unleashed, these security dynamics are hard to alleviate (Wæver 1997: 306-46, 1998). Normal politics in the societal sectors is to live with change and complexity, but whenever securitized, one defends a frozen and allegedly stable identity, and sometimes the only way to de-escalate a conflict is then to reaffirm this ultimately unviable project in order to make it stable enough to (dare to) change.

Among the different forms of societal security dynamic, there is probably a partial shift from a predominantly ethno-national format to an increased atten-

tion to religion in some parts of the world. This raises important theoretical and conceptual challenges, because religion is only partly a 'normal' societal security object, i.e. another form of community, it also entails distinct forms of security action aimed at defending faith as such (i.e. vertical, not horizontal loyalties).

45 Environmental Security Deconstructed

Jaap H. de Wilde

45.1 Introduction

The basic logic of the environmental security discourse is that humankind is living beyond the carrying capacity of the earth's local, regional, and global ecosystems. Essence is how to evaluate environmental stress in relation to political stability: is this a matter of ordinary politics or a matter of exceptional politics, i.e. security politics? The debate is dominated by an intriguing paradox: in order to preserve the political-economic and social-cultural structures of local, national, and world societies it is necessary to change them fundamentally, given their un-sustainability. The warning reads that either the structures are changed voluntarily and in a controlled manner, or structural change will be enforced violently and randomly by environmental crises. Much of the debate boils down to the question 'who is to pay a price today to avoid that others have to pay a higher price tomorrow?'

In order to understand this debate it is necessary to distinguish its main components: a) tracing securitizations of risks (45.2); b) tracing referent objects of environmental security (45.3); and c) tracing the development of the security discourse (45.4). It will be concluded that the agenda is too comprehensive, and involves too many clashes of interest to keep a comprehensive environmental security discourse alive. Instead, the concerns have fragmented into issue-specific securitizations (45.5).

45.2 From Risk Assessment to Securitization

Security analysis begins with risk assessment. Whether a risk will be securitized depends on its perception. Risks are hard to define in abstraction (Brauch 2005; Thywissen 2006). They range from being deadly to mere nuisances, can be perceived as exciting (alpinists climbing the Matterhorn), as fact of life (pedestrians crossing crowded streets) or as unacceptable (govern-

ments facing foreign invasions). In the unacceptable cases, a risk is perceived as a threat. Threat is securitized risk. It would be too simple, however, to treat 'risk' as the objective part of the equation, and its perception as the subjective part. Risk analysis itself may focus on 'material facts', like the chance of a natural hazard, but it is embedded in a wider social context (cultivated in Ulrich Beck's (1986, 1992) *Risk Society*). The simple logic of 'Risk = Chance x Damage' has an objective ring to it. Yet, it implies a negative chance for a referent object. Referent objects and (negative) perceptions of chances are socially constructed, i.e. *intersubjective* by nature. The issue of determining referent objects will be discussed below. This section looks at the importance in distinguishing risk assessment from its securitization.

Security is the absence of threat. In a security discourse, however, the word 'security' is used for exactly the opposite purpose: it points at the *presence* of a threat. A risk is securitized, i.e. turned into a *security* issue, rather than merely a political issue. Securitization theory has been launched by Ole Wæver (1993) and further developed in Buzan, Wæver and De Wilde (1998). The approach originates in social constructivist theories, and focuses on the social-political functions of labelling something a security issue. Using the word security dramatizes the risk, and presents it as a threat of supreme urgency. "In theory, any public issue can be located on the spectrum ranging from non-politicized (meaning the state does not deal with it and it is not in any other way made an issue of public debate and decision) through politicized (meaning the issue is part of public policy, requiring government decision and resource allocations or, more rarely, some other form of communal governance) to securitized (meaning the issue is presented as an existential threat, requiring emergency measures and justifying actions outside the normal bounds of political procedure)" (Buzan/Wæver/De Wilde 1998: 23-24). If an issue becomes a security issue, dealing with it legitimates extra-ordinary measures. This makes it a

stronger form of politicization. Politicization merely means that a specific issue enters the political agenda – securitization gives it top priority on that agenda; it defines ‘high politics’ for the actors involved.

This political or even supra-political nature of securitization implies that the ‘securitizing actor’ (someone who pulls attention to specific risk assessments) also presents a *security policy* to answer the threat. Risks that are beyond grasp can hardly be securitized: there is simply nothing one can do. For understanding the fluctuations in the securitization of environmental issues this is quite crucial: Alarming reports about climate change will lose political relevance (and attraction) when they show that action to reverse the trend comes too late anyway. In that case only securitization of its effects makes sense. Securitization therefore triggers two debates: one about the underlying risk assessment, one about the strategic answer to it. These security policies may range from a plea for collective praying to the build-up of a standing army or from putting farmers and fishermen out of their traditional business to the drafting of international treaties. Their societal impact is enormous: state building and nation building – i.e. processes of organizing collective action and identity – is strongly focused on shared threat perceptions. So far, securitization of environmental risks has resulted in a fragmented community only, consisting of green parties, environmental social movements, and NGOs, academic environmentalists and ecologists, and civil servants in environmental organizations (ministries, IGOs).

If a security discourse persists it will result in community-building and institutionalization, often involving enmity/amity patterns with dissenting or competing groups and organizations. A paradox of security discourses is that, in time, they come to dominate politics and social life so strongly that they develop into ordinary politics. Communities and societies are built on security discourses. To add to the complexity: Non-governmental institutionalization intensifies the security discourse as long as they are not hospitalized by elitist pliability, whereas governmental and intergovernmental institutionalization moves ‘the environment’ into the realm of ordinary politics – a process of desecuritization.

Security discourse begins with a securitizing actor. Other participants in the discourse are irrelevant for detecting the discourse even though they are crucial for understanding its proceedings and political consequences. Securitizing actors can be found anywhere, but it is useful to follow the classic divide into public actors (state governments, their departments and rep-

resentatives, intergovernmental organizations, and local level governments) and private actors (political parties, national and transnational NGOs, movements, firms and corporations, scientists, the media, and unorganized individual activists).

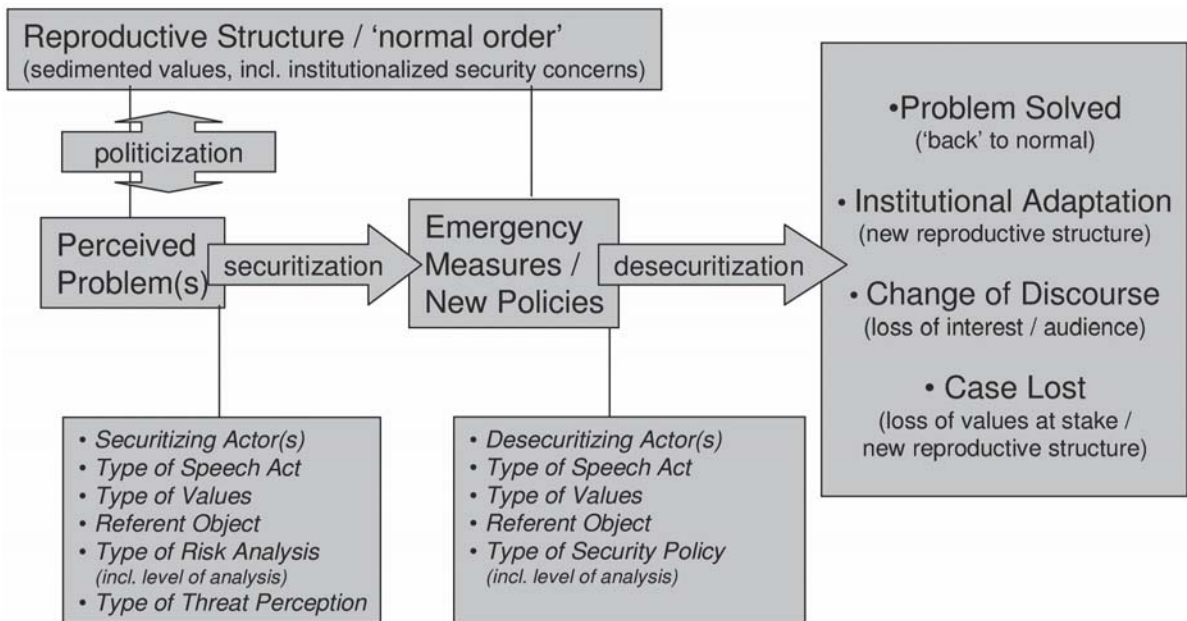

Securitizing moves (i.e. attempts to turn something into a security issue) by private actors differ from those by public actors. The actions by private actors are attempts to pull public attention to the perceived threats – which generally requires media attention. The aim is to change societal and governmental priorities. Securitizing moves by public actors are either legitimizing extra-ordinary measures, for example to cope with specific crises such as droughts or floods, or they are setting priorities among competing issues on the agenda, for example debates about the ‘national interest’ (Deudney 1990).

Public actors have an advantage over private ones – even if the latter profit from transnational mobility. Taxation and societal dominance allow them to set the political agenda and to determine ‘emergency situations’. Public actors can be dominant securitizing actors (e.g., the US government in the early 21st century in its ‘war against terror’), but in general they simply, reflect, and reproduce institutionalized security discourses: the national interest begins and ends in military security, law, and order. ‘Sustainability’ in environmental terms at best functions as a national interest in developing countries to secure foreign funding. In the absence of a public legacy, environmental concerns have to fight for their prominence against vested economic and cultural practices.

Given the lack of direct access for private actors to governmental resources and policy-making, securitizing environmental issues can be a strategy to achieve politicization. The actions by Greenpeace are a good example of getting issues, like whaling, politicized in public discourse. These securitizing moves of activists are directed against Japanese and Norwegian fishing industries, defined by Greenpeace as an existential threat to the future of a species. Whether it is really the whales or the underlying economic and cultural logic that is at stake is not clear from the securitizing move as such. The search for real and symbolic referent objects requires separate attention.

The securitizing actors are also called *lead actors*, since they trigger the discourse. *Lead actors* take the initiative to put environmental issues on the policy agendas of governments, international organizations, the media, and firms. In addition, other actors who are socially linked to the issues at stake construct the security discourse. These are *functional actors*, i.e. ac-

Figure 45.1: Securitization Theory. **Source:** based on Buzan/Wæver/De Wilde (1998) and Wæver/Buzan/De Wilde (forthcoming).

tors whose behaviour is involved in the issues raised by the securitizing actors. If they directly oppose them, they contribute to the environmental security discourse by adding to its polemic nature: attracting media attention, which intensifies the salience of the issues. Often they cannot escape this role: they have their own existential worries. If they (can afford to) acquiesce in, evade, circumvent or indirectly oppose securitizing moves they are *desecuritizing actors*. Emphasizing competing threats can also be a strategy to counter securitizing moves. In case of a lasting stalemate among securitizing moves a second paradox in security discourses appears: the battle about extraordinary measures becomes ordinary politics. Manifest crises may help to tilt the balance, but in the case of long-term disaster scenarios environmentalists have a hard time to show the urgency of their concerns. And when they are proven right, it is too late (figure 45.1).

If successful, securitization leads to security policies (e.g., emergency measures). Security policies aim to eliminate threats by reducing risks or managing their effects. An existential threat can be defined as an event that would create an emergency situation for or even destroy the referent object of the securitization. Securitization spells out the emergency situation; the subsequent security policy aims at *desecuritization*. This can be defined as an attempt to preserve the status quo or to go back to normal (restore the status quo ante) as soon as possible. Note, however, that

desecuritization can occur also independent of a security policy, due to shifts in the security discourse: even when risk assessments remain unchanged, priorities may change. This seems to be the case in the environmental security discourse.

Institutionalization of security discourses makes these discourses subjects of ordinary politics. Governments and societies develop rules that allocate the means allowed to master emergency situations. Fire brigades, ambulances, police forces, intelligence services, and armies are standard examples of institutions with specific extra-ordinary rights to prevent threats to various referent objects or to limit their effects. But as long as the sirens do not howl, the debates about their place in society (about budgets, personnel, working hours, etc.) are part of ordinary politics. Hence, security organizations and security policies function mainly in the realm of politicization rather than securitization – even though their reports and budgetary claims will be cast in securitizing words.

45.3 Referent Objects of Environmental Security

Whose security and what kind of threats are we talking about? Environmental security is a catchall for a wide variety of issues. In the literature several overlapping key issues reappear.¹ The reason to talk about en-

environmental security is that the process of human civilization involves a manipulation of the rest of nature that in several respects has achieved self-defeating proportions. This is mainly the result of two developments: the explosive growth of the world population and the explosive growth of economic activity, both in the second half of the twentieth century. It is not a problem of humankind's struggle with nature, but a problem of humankind's struggle with the dynamics of its own culture(s) – a civilizational issue, which expresses itself mainly in economic and demographic dimensions, and potentially affects the level of anarchy in world politics.

The basic logic of environmental security is that, in a global perspective, humankind is living beyond the carrying capacity of the earth. The exact meaning of this is disputed, but carrying capacity can be defined as the total patterns of consumption that the earth's natural systems can support without undergoing degradation (Ehrlich 1994). These patterns of consumption involve several variables, such as total population, production modes, and gross per capita consumption levels. In short, *carrying capacity* depends on *numbers*, *technology*, and *lifestyle*. Compare the famous IPAT equation (environmental Impact = Population x Affluence x type of Technology) designed by Paul Ehrlich and John Holdren (1971), which, despite the criticism about its operational value, still catches the three main elements of the environmental security agenda (Chertow 2000). One billion Westerners is enough to tilt the system; some five billion people in low-income economies will do the same. This culminates in the following widest formulation of the environmental agenda:

- *Disruption of ecosystems*. This includes climate change; loss of biodiversity; deforestation, desertification, and other forms of erosion; depletion of the ozone layer; and various forms of pollution.
- *Energy-related problems*. These include the depletion of natural resources, especially fuel wood; various forms of pollution, including management disasters (related in particular to nuclear energy,

oil transportation, and chemical industries); scarcities and uneven distribution.

- *Population-related problems*. These include: population growth and consumption beyond the earth's carrying capacity; epidemics and poor health conditions in general; and social-political uncontrollable migrations, including unmanageable urbanization.
- *Food-related problems*. These include poverty, famines, over-consumption, and diseases related to these extremes; loss of fertile soils and water resources; epidemics and poor health conditions in general; and scarcities and uneven distribution.
- *Economic problems*. These include the protection of unsustainable production modes, societal instability inherent in the growth imperative (which leads to cyclical and hegemonic breakdowns), structural asymmetries and inequity.
- *Violent conflict-related problems*. This includes war-related environmental damage on the one hand and violence related to environmental degradation on the other.

A first feature of this list is that it shows a distinction between threats *to* the environment, leading to securitization of the environment itself, and threats *from* the environment, leading to securitization of the people and societies that depend on it (see for a similar distinction the "Survival hexagon of six resources and social factors" in Brauch 2005: 15). In all cases the environment as such is the explicit referent object in 'environmental security', but in a large part of the debate also another concern figures prominently: the preservation of existing levels of civilization.

Useful in this respect is Barry Buzan's definition, saying that "environmental security concerns the maintenance of the local and the planetary biosphere as the essential support system on which all other human enterprises depend" (Buzan 1991: 19–20). Implicitly, this concern forms also the deeper motive behind many of the 'purely' environmental debates – be it not behind all of them. In particular debates about endangered species, like whales and rhinos, or the protection of the natural beauty, as well as some of the Gaia-ideologies are purely inspired by concern about the environment. Hence, strictly speaking, there are two different referent objects: environment and civilization. But in general, both are mixed-up, with an emphasis on the latter.

The emphasis on 'human enterprise' as the referent object of environmental security is of crucial importance: those of us able to perceive and be concerned about threats (for many a luxury) want to

1 See, e.g., the agenda presented in MacNeill/Winsemius/Yakushiji (1991: 131), Böge (1992); Brauch (2005: 64), and on websites of organizations like *Earth System Science Partnership*, <<http://www.essp.org>>; Global Environmental Change, <<http://www.gecko.ac.uk>>; and the *Worldwatch Institute*, <<http://www.worldwatch.org>>

continue and improve life as we know it. Despite its appearance, most environmental security debates are *not* about threats to nature, as such - and with good reason so. From a geological point of view there is not even a problem: the earth has been in its place for billions of years, and what is happening on its crust since, say the Industrial Revolution, is rather unimportant. Also for the crust itself a nuclear winter, global warming, a hole in the ozone layer, the disappearance of dinosaurs or the future marginalization of human beings are relatively meaningless events. The ultimate referent object of environmental security is the risk of losing achieved levels of civilization - a return to 'raw anarchy' and forms of societal barbarism - while being able (or having the illusion so) to prevent this.

This focus implies a paradox for primarily the 'West', but also for the 'less developed' world. The paradox is that in order to guarantee future reproduction of the present levels of civilization in terms of wealth, power, and culture, it is necessary to fundamentally change much of the present global structures, in terms of world economy, international system, and cosmopolitan values. How much change and how to achieve it, is at the centre of the politicization and securitization of environmental issues.

At first sight, this debate involves a powerful agenda for the South against the West, and many studies treat it as such.² But on closer look it is far from clear how the poverty-affluence dichotomy can be broken in such a way that this will help to solve environmental problems. Despite all the rhetoric about sustainability much of the debate is still about giving 'developing' countries the chance to copy the 'developed' ones. Third World elites show the way. Making the poor more affluent in the Western sense of the word (by promoting industrialization, oversupply and over-consumption) will merely aggravate the environmental problems caused by affluence. In a world consisting of only the present affluent people (roughly twenty per cent of the world population), most of the ongoing and expected ecological problems would remain the same, both in nature and in scale (Amalric/Banuri 1994).

The economic growth of China is indicative of the environmental problems that result from successful economic development. In the 1990's, the Worldwatch Institute has warned against the enthusiasm over China's economic growth (L. Brown 1995; Smil

1993: 190-194). Rising incomes generally lead to changes in the diet, meaning more consumption of meat, milk and eggs, meaning that more grain is used for animal feed. Meanwhile China's food production capacity is eroding (due to soil exhaustion and land clearance for industrial purposes) and its population is growing (up to 1.6 billion in 2030). Even if new types of 'super rice', leading to a harvest increase of some 20 per cent, are introduced successfully this demand will put tremendous pressure on the international grain and rice markets. Additionally, it is expected that Africa's need for importing grain will rise from 25 million tons now to 250 million tons in 2030. "It will probably not be in the devastation of Somalia, Haiti or Rwanda, but in the booming economy of China that we will see the inevitable collision between expanding human demand for food and the limits of some of Earth's basic systems," Brown concludes. This might be too pessimistic; in many parts of Africa grain production is not yet profitable due to low world market prices. Nevertheless, looking at environmental costs, one line of reasoning argues that "the poor are not the problem, they are the solution" (Adams 1990: 201, quoting R. Chambers).

Yet, making the affluent more poor is, within the existing economic parameters, meaningless too. Its immediate effect would be an even faster deterioration of conditions in the Third World, enhancing the likelihood of negative spill over to political and military conflicts: politically weak states will grow even weaker, and the number of failed states will grow. The causes of population growth will go unsolved, and more people may get trapped in them. The necessity of reducing Western consumption patterns to sustainable proportions is evident according to virtually all specialists, but this involves adjustments of production, supply and demand structures, rather than an impoverishment of lifestyles.

In concepts like sustainable development (WCED 1987) part of this dilemma has been politicized: structural change of both affluent and poor lifestyles is advocated. But what this means is treated rather superficially. Also the report of the Club of Rome by Wouter van Dieren (1995, 1995a) triggers the proper debate without solving it: how to redefine GDP calculations in such a way that environmental degradation is not mistaken for economic growth? 'Human security' is the latest buzz word repeating the same diagnosis without offering the cure (De Wilde 2008). In absence of answers this means that, as long as the North-South polarity in the world economy is in place, concepts like 'global burden sharing', 'common

2 See: WCED 1987; Adams 1990; MacNeill/Winsemius/Yakushiji 1991; Myers 1993, 1993a, 1993b; Williams 1993; Smith/Okoye/de Wilde/Deshingkar 1994; Najam 2003.

security', 'global challenges', and 'human security' are hollow rhetoric in the worst case, and idle attempts to bridge asymmetrical interdependence in the best case.

Environmental problems will bear unevenly across the world: some regions are affected more directly and severely than others. Environmental disaster scenarios boil down to quite different priorities, depending on the geopolitical and social conditions one is in. This is aggravated by the fact that the distribution of 'causes' follows a different pattern than that of the 'effects'. The controversies about the Kyoto protocol, e.g. show the discrepancy between those who will suffer from global warming and those who will suffer from preventive policies. Ultimately the whole international system and the entire world economy may be disrupted, but in the short run the long list of environmental problems is more likely to sharpen the structural cleavage between haves and have-nots, both on a regional basis and within societies, with structural conflict at its territorial and its societal edges.

This shows the importance of paying central attention to the various referent objects in environmental security. The securitizing moves point at an entity that is threatened (referent object 1) but also at an entity that is causing the threat (referent object 2). To preserve the quality of referent object 1, referent object 2 is requested to pay a price. This results in conflict. The environmental security discourse therefore always implies a struggle between groups in society.

This is even so in the case of natural hazards, when it seems to be humankind against nature. Many societies are structurally exposed to recurring extreme natural events, like earthquakes, volcano outbursts, cyclones, floods, droughts, and epidemics. They are vulnerable to them, and much of their history is about this continuous struggle with nature. The risks involved are often explicitly securitized. In the Netherlands 'protection against the sea' is a high-ranking national interest; the same goes for protection against earthquakes and tsunamis in Japan. But, as soon as some form of securitization occurs - when some measure of human responsibility replaces 'fate' or the 'hand of God' - even this group of conflicts tends to develop a human versus human character: following the river floods in the Low Countries in 1995, the debate was about political responsibilities for the dykes: who's to blame, and what to do? In Japan, following the Kobe earthquake early 1995, designers of seismological early warning systems, house building construction techniques, and contingency plans were under fire. In 2005, the flooding of New Orleans stirred opposition against the failing environmental policies

in the Mississippi delta. Moreover, the distinction between natural and man-made hazards is getting blurred.

Therefore, except for cases where people undergo natural hazards without questioning, the logic that environmental security is about 'threats without enemies' (Prins 1993) is misleading. Though it is not about good versus bad guys (as in the cartoon series Captain Planet) the political debate does ultimately focus on specific groups (humans in certain professions and industries) who have to change their behaviour. Not everyone in every society is expected to pay the same price, and enforcement of specific measures is clearly needed. This explains why environmentalists count few captains of industry among their members (retired ones excluded, of course).

The contradiction within environmental security is that in order to secure civilization from environmental threats, much of civilization has to be reformed drastically or even be pulled down. Environmental protection goes far beyond the technological challenge of finding the right solution and implementing it in time; but one can hardly blame specific interest groups for desperately hanging onto the hopes of a techno-fix: their jobs and lives are involved.³

45.4 Development of the Discourse

There are two ways in which the environmental security agenda is being constructed. Roughly speaking they resemble the divide between a traditional natural science approach and a social science approach. The first agenda is a natural science one. The academic discourse is about risk assessments and scenarios (see, e.g. the first two volumes of Munn 2002). The reports are at the basis of the political discourse. Hence there is a tendency to treat scientific facts as material facts rather social ones. It is important to point this out, since other security discourses, most notably the military security discourse, show a reverse order: there is political anxiety about perceived threats, and the academic world responds to this by investigating the grounds for this perception. In the environmental realm alarming reports often preceded the actual hazards. Partly this is the result of the time dimension involved in environmental threats: hazards can occur immediately, but their causes will be located way in the

3 About the fallacy of the techno-fix see: Porter/Brown (1991: 28-29); Myers (1993: 227, 245); Williams (1993: 15); Okoye/Smith (1994: 5-6) and Homer-Dixon (1999).

past. The academic agenda offers a list of environmental problems which already or potentially hamper the evolution of present civilizations and societies.

The second agenda is a political one. At stake here is not whether specific threats to the environment (and thus to the people who depend on it) are real or imaginary, but whether their presumed urgency is a political issue or not. It shows the development of the *cognitive dimension* of environmental security. This dimension is about 'internalizing externalities'; a process of social learning. The political agenda is about: a) the awareness of the issues on the scientific agenda; b) the acceptance of responsibility for dealing with these issues; and c) the political management questions related to them: problems of international cooperation and institutionalization, the effectiveness of unilateral initiatives, distribution of costs and benefits, free-rider dilemmas, and problems of enforcement.⁴

45.4.1 Fatalistic Utopian Literature

Environmental concerns are age-old, but the environmental security discourse as we know it today originated in the late 1950's, in the scientific agenda. Much of the early literature on environmental security misses awareness of the political clashes of interests between the victims of "business as usual" and the victims of structural change (see previous part). This makes them idealistic in political terms: they are based on the presumption that harmful practices are mainly the result of a lack of knowledge; an information gap. These early studies can be labelled the 'global challenges' literature: publications that deal with the problems humanity has in common. They bear holistic overtones, and emphasize the overarching nature of global problems. The message is that these problems ought to render obsolete the political, military, cultural, and economic conflicts that divide the 'members of the human race'. Book titles, like *Spaceship Earth* (Ward 1966), *This Endangered Planet* (Falk 1970), *Living on the Third Planet* (Alfvén/Alfvén 1972), *Mankind at the Turning Point* (Mesarovic/Pestel 1975), *Securing Our Planet* (Carlson/Comstock 1986), *Making Peace with the Planet* (Commoner 1990), *Healing the Planet* (Ehrlich/Ehrlich 1991), or *Ultimate Security* (Myers 1993) are illustrative. Most of the authors have their roots in natural sciences.

The essence of the global challenges literature is simple: because of the huge common challenges for humankind states have to cooperate and forget about their narrow, short-sighted, short-term egocentric interests. It is the automatic expectation of cooperation which turns this type of literature into utopianism. It would be wrong, however, to dismiss its analyses on this ground. The bulk of what the global challenge literature is about is far from utopian; it is closer to being fatalistic. 'Ecological conditions deteriorate seriously, unless ...' is the main message. It would be unfair to judge these warnings only by what is written in the 'unless ...' parts. The true purpose of this literature is to change politics, not to analyse it.

A remarkable aspect of this literature is its top-down nature. The environmental agenda was originally conceived as a global one. Its emergence is not the result of the globalization of local developments but of the discovery of global consequences of seemingly harmless individual or local practices. This contrasts with the development of other security agenda, which evolved out of the gradual globalization of problems that originally had a local character. It took military security, for example, centuries to develop on a global scale. The bulk of the literature argues that, to use the words of Hurrell and Kingsbury (1992: 2), "Humanity is now faced by a range of environmental problems that are global in the strong sense that they affect everyone and can only be effectively managed on the basis of cooperation between all, or at least a very high percentage, of the states of the world: controlling climate change and the emission of greenhouse gases, the protection of the ozone layer, safeguarding biodiversity, protecting special regions such as Antarctica or the Amazon, the management of the sea-bed, and the protection of the high seas are among the principal examples." This sounds good, but it is not true. The concern is global, but most pollution-related problems require first and foremost action by individual highly industrialized states only; protection of Antarctica, except for the hole in the ozone layer, could be left to the seven states that have legal rights there. The Amazon region would be protected best by leaving it alone, a decision that rests essentially with the Brazilian government and a few business enterprises. The global dimension is present, but not as overwhelmingly as is often suggested.

Environmental threats and vulnerabilities are issue specific and seldom universal. Global events seldom have the total character of a potential nuclear winter. Most global events, including climate change and massive migrations, can be compared to events such

4 The overlap between them is obvious: the community who draws up the scientific agenda is also a political actor, and politics and economics are clearly present in academic life.

as the two world wars and the Great Depression: Every corner of the earth is affected but not to the same degree. World War I, for instance, caused more Australian than Swiss casualties, even though Switzerland lies a few hundred kilometres from the main front. Most global environmental crises have similar uneven effects and involvements. This makes it very hard – and utopian – to unite people in face of fatal developments.

45.4.2 Limited Institutionalization

Nevertheless, the global take-off of the environmental security discourse was matched by an institutional response. Universal acceptance of the environment as a *security* concern was acknowledged at the United Nations Conference on the Human Environment (UNCHE or Stockholm Conference) in 1972. The Stockholm Conference was more than a symbolic turning point. Here, the 114 participating states adopted twenty-six broad principles on the management of the global environment, an Action Plan with 109 recommendations, and the United Nations Environmental Programme (UNEP) was initiated. Moreover, “over half of the 140 multilateral environmental treaties that have been adopted since 1921 were concluded since 1973,” Keohane, Haas, and Levy (1993: 6) report. Many countries established ministries of environmental affairs in response to UNCHE.

Close to this event was the appearance, in 1972, of *Limits to Growth*, the first report of the Club of Rome. It signalled the progressive scarcity of natural resources, and the presumed political vulnerability of the North over against the South. Publications like Rachel Carson’s *Silent Spring* (1962) formed another trace that made a public impact. Carson made a strong case against uncontrolled use of synthetic pesticides. Global non-governmental organizations were then also formed, such as *Friends of the Earth* (1969) and *Greenpeace* (1972).

Another trace comes from the debate on nuclear energy and nuclear weapons. The Limited Test Ban Treaty (1963) would have been unthinkable were it not for the clear disasters caused by above ground testing. Studies on a nuclear winter, and accidents in nuclear power stations made people think – including many ambitious nuclear physicists.

In this process of *politicization* and *securitization* it makes sense to distinguish *Silent Spring*-type and *Chernobyl*-type lessons – the first referring to rational risk assessments, the latter to dramatic disasters (De Wilde 1994). The dissemination of scientific insights

(*Silent Spring* lessons) and media coverage of man-made disasters (*Chernobyl* lessons) are the two main forces behind environmental awareness. There *are* *Chernobyl*’s, *Bhopal*’s and *Exxon*’s *Valdez*, and there *are* scientific studies that spell out the risks.

Nevertheless, the obvious did not happen. One would expect that the environmental security discourse would gain strength over the years, culminating in a greening of politics and structural change in economic practices. This is not the case. After the initial excitement in the 1970’s and the subsequent institutionalization of environmental concerns, public and political attention decreased. At the end of the Cold War and in the early 1990’s there was a revival of the interest, but this was mainly due to concerns in military circles about their future mission. In the late 1990’s and especially since 9/11, the military lost their interest. In the antiglobalist movements the original environmental concerns are very much alive, but mainly as an aspect of their overall aversion of the dominant power structures.

45.5 Conclusion

In theory, one explanation for the declining interest in the environmental security discourse could be successful treatment of the issues – which is the best route to *desecuritization*. But the scientific agenda has hardly changed since the 1970’s. Some of the analyses proved wrong, but even if say 20 per cent of the present disaster scenarios come true, coming generations will be born in harsh circumstances worldwide.

A better explanation is that the overall agenda simply is unmanageable. The kind and scale of change necessary to alter the economic and demographical roots of environmental risks are probably beyond the world society’s capacity – merely anarchical ‘solutions’ (catch as catch can) are to be expected. The immediate price of sophisticated action is too high to stand a chance in politics.

Instead and perhaps as a result, the environmental security discourse has fragmented into issue-specific concerns. The man-made contribution to natural hazards is discussed each time a hurricane hits the land or when an earthquake destroys the housing of millions. Accidents with oil tankers and in chemical industries lead to new *Chernobyl*-type lessons time and again. But comprehensive global programmes to deal with the risk scenarios and their structural underpinnings are unlikely to leave the drawing tables.

46 Human Security and the UN Security Council

Jürgen Deding

46.1 Introduction

The UN Security Council (UNSC) is the principal organ under the UN Charter for the maintenance of international peace and security. Since 1945 the UNSC has taken up inter-state items in fulfilment of its mandated task. During the cold war only the UNSC rarely turned to matters focusing on the well-being of individuals rather than on political communities. Between 1945 and 1990 this practice was fully in line with the predominant orientation of international politics as practised by the principal foes and their allies. Since 1990 multilateralism experienced a sea change. The increase in internal conflicts resulted in a shift in the agendas of global and regional organs, primarily of the UNSC, but also of the UN General Assembly (UNGA).¹

With growing interdependence where the market economy, modern technological progress, information and media developments, and mass migration flows have changed the world, an irreversible rise of individual concerns has set in. This change also was reflected in the shift of the UNSC towards aspects of individual human security, such as human rights and humanitarian concerns. Thus, human security has become an integral part of the UNSC's contemporary agenda.

While this historic change became evident in the late 1990's, the term 'human security' was introduced with the Human Development Report of 1994.² Its ready acceptance by some policymakers in the Western World left its terminological and conceptual validity unresolved. The discrepancy between analytical

weakness and policy relevance remains. This will be reviewed for the prevailing theoretical positions. The scholarly debate on 'human security' did not abandon a meaningful policy norm. This chapter focuses on how the 'human security' concept was introduced into the UNSC work. Special attention will be paid to a Canadian initiative and to the response of the UNSC and of UN members. 'Human security' concerns in UNSC debates will be analysed, illustrating the transformation of an idea into a practical policy guideline for UN operations.

After a brief review on the 'human security' concept (50.2), a Canadian initiative in the UNSC during 1999 and 2000 is studied that resulted in setting up the *Human Security Network* (50.3) and led the UNSC to adopting the 'Protection of Civilians in Armed Conflict' as a new agenda item. While this did not lead to a paradigm shift, the UNSC has significantly changed direction.

46.2 The Origins of the Human Security Concept

Growing scholarly attention to the 'human security' concept has brought much ambiguity (Paris 2001). But there is little disagreement on the genesis of this norm. Several descriptive accounts (Bajpai 2000: 9–17) have analysed its origins within the UNDP (see chap. by Kaul). Mahbub ul Haq, the principal author of the *Human Development Report* of 1994, introduced 'human security', thus shaping the direction of subsequent reports. Ul Haq suggested that human security would be achieved through development, not through arms. This multilateral credo has shaped the instruments of global governance in recent years.

The Canadian Foreign Minister Lloyd Axworthy (2001) called for a new foreign policy paradigm after the cold war emphasizing protection of individuals. Accordingly, "human security means freedom from pervasive threats to people's rights, safety or lives."

1 On the conceptual security debate since 1990 see i.a.: Cousins/Kumar/Wermester (2001); Hammerstad (2000); Hurrell (1999); Patman (1999); Rothschild (1995); Terriff/Croft/James/Morgan (1999); Tuchman Mathews (1989); Väyrynen (1999).

2 On the human security debate see i.a.: *Human Security Network News Bulletin* (2001ff.); Newman/Richmond, (2001); Tehranian (1999); UNDP 1993, 1994, 2001.

Canada formulated five foreign policy priorities for advancing human security:

1. *Protection of civilians*, concerned with building international will and strengthening norms and capacity to reduce the human costs of armed conflict.
2. *Peace support operations*, concerned with building UN capacities and addressing the demanding and increasingly complex requirements for deployment of skilled personnel to these missions.
3. *Conflict prevention*, concerned with strengthening the capacity of the international community to prevent or resolve conflict, and building local indigenous capacity to manage conflict without violence.
4. *Governance and accountability*, concerned with fostering improved accountability of public and private sector institutions in terms of established norms of democracy and human rights.
5. *Public safety*, concerned with building international expertise, capacities and instruments to counter the growing threats posed by the rise of transnational organized crime.³

The Government of Japan proposed a broader concept: "Human security may be defined as the preservation and protection of the life and dignity of individual human beings. Japan holds the view, as do many other countries, that human security can be ensured only when the individual is confident of a life free of fear and free of want."⁴ Japan emphasizes

'human security' from the perspective of strengthening efforts to cope with threats to human lives, livelihoods and dignity, such as poverty, environmental degradation, illicit drugs, transnational organized crime, infectious diseases, e.g. HIV/AIDS, the outflow of refugees and anti-personnel land mines, and has taken various initiatives in this context. To ensure 'human freedom and potential', a range of issues needs to be addressed from the perspective of 'human security' of individuals, requiring cooperation among the various actors in the international community, including governments, international organizations and civil society.⁵

Between these two positions, the definition of the *Human Security Network* foreshadows central concern with human security matters in the UNSC:

A humane world where people can live in security and dignity, free from poverty and despair, is still a dream for many and should be enjoyed by all. In such a world, every individual would be guaranteed freedom from fear and freedom from want, with an equal opportunity to fully develop their human potential. In essence, human security means freedom from pervasive threats to people's rights, their safety or even their lives.⁶

While Canada focuses on 'freedom from fear', the Japanese and Network's norms include both 'freedom from fear' and 'freedom from want'. These definitions are policy-oriented and do not claim theoretical or terminological purity. For the debates in the UNSC, priority is given to the policy debate.

From an academic perspective Bajpai suggested: "Human security relates to the protection of the individual's personal safety and freedom from direct and indirect threats of violence. The promotion of human development and good governance, and when necessary, the collective use of sanctions and force are central to managing human security..." (Bajpai 2000: 1-4). For Chen (1995: 139): "The term human security focuses the concept of security on human survival, well-being and freedom.... Human security is conceptualized as the objective - the ultimate end - of all security concerns." Graham and Poku (2000: 17) argued: "Rather than viewing security as being concerned with 'individuals qua citizens' (that is, toward their states), our approach views security as being concerned with 'individuals qua persons'. ... Human security is concerned with transcending the dominant paradigmatic orthodoxy that views critical concerns of migration - recognitions (i.e. citizenship), basic needs (i.e. sustenance), protection (i.e. refugee status), or human rights (legal standing) - as problems of inter-state politics and consequently beyond the realm of the ethical and moral." King and Murray (2001/2002: 585) introduced a simple, rigorous and measurable definition of human security: namely the number of years of future life spent outside a state of 'generalized poverty'. Their suggestion for a parsimonious set of domains for measuring human security would be income,

health, education, political freedom, and democracy (King/Murray 2001/2002: 598). Their list of subjects embraces much of the basic needs catalogue.

From a medical background, Leaning and Arie (2000: 37) argued: "Human security is an underlying condition for sustainable development. It results from the social, psychological, economic, and political aspects of human life that in times of acute crisis or chronic deprivation protect the survival of individuals, support individual and group capacities to attain minimally adequate standards of living, and promote constructive group attachment and continuity through time." MacLean opined: "Human security recognizes that an individual's personal protection and preservation comes not just from the safeguarding of the state as a political unit, but also from access to individual welfare and quality of life. Human security, in short, involves the security of the individual in their personal surroundings, their community, and in their environment."⁷ Suhrke (1999) argued: "Whether the threat is economic or physical violence, immediate protective measures are necessary if longer-term investments to improve conditions can be relevant at all. It follows that the core of human insecurity can be seen as extreme vulnerability. The central task of a policy inspired by human security concerns would therefore be to protect those who are most vulnerable. ... Those exposed to immediate physical threats to life or deprivation of life-sustaining resources are extremely vulnerable. ... Other persons can be placed in equally life-threatening positions for reasons of deep poverty or natural disasters." Caroline Thomas (2000: 6-7) narrowed its key components and offered her concept of human security stating:

1. Human security describes a condition of existence in which basic material needs are met, and in which human dignity, including meaningful participation in the life of the community, can be realized. Such human security is indivisible; it cannot be pursued by one group at the expense of another.
2. While material sufficiency lies at the core of human security, in addition the concept encom-

passes non-material dimensions to form a qualitative whole... The pursuit of human security must have at its core the satisfaction of basic material needs of all mankind. At the most basic level, food, shelter, education, and health care are essential for the survival of human beings... The qualitative aspect of human security is about the achievement of human dignity incorporating personal autonomy, control over one's life, and unhindered participation in the life of the community. Human security is oriented towards an active and substantive notion of democracy, one that ensures the opportunity of all for participation in the decisions that affect their lives. Therefore it is engaged directly with discussions of democracy at all levels, from the local to the global (Thomas 1991: 3; 1991: 267-289; 2002: 113-131).

Many academic authors reflect the range and ambiguity of concepts employed without arriving at crucial commonalities. Recent writings discuss human security in a wider context, trying to measure the state of human security (Paris 2001; Bilgin 2003: 203-222; Pathania 2003; Rubin 2001).

Suhrke (1999) focused the attention on insecurity and what should be on the active agenda from local to global levels. Her list of extremely vulnerable persons: victims of war and internal conflict; those who live close to the subsistence level and thus are structurally positioned at the edge of socioeconomic disaster; and victims of natural disasters, assists in establishing parameters for effective international aid. Such criteria are eminently useful for international organizations that have been searching for guidelines for appropriate multilateral assistance.

With the UNDP 1994 Report seven dimensions (economic, food, health, environmental, personal, community, political) of human security were established, based on the premise that the end of the cold war shifted the traditional 'national security' thinking to a 'human-centred' emphasis. "Human security is a child who did not die, a disease that did not spread, a job that was not cut, an ethnic tension that did not explode in violence, a dissident who was not silenced. Human security is not a concern with weapons - it is a concern with human life and dignity" (UNDP 1994: 22).

Under "global human security", the UNDP (1994: 34-37) report listed as threats to human security: a) unchecked population growth; b) disparities in economic opportunities; c) excessive international migration; d) environmental degradation; e) drug production and trafficking; and f) international terrorism.

7 See: George MacLean: "Comparison of human security definitions", at: <http://66.249.93.104/search?q=cache:irfWJj3M-zYJ:www.globalgrn.org/featured/comparison_definitions.pdf+MacLean,+Human+security&chl=en>; MacLean: "The Changing Perception of Human Security: Coordinating National and Multilateral Responses!", at: <http://www.unac.org/en/link_learn/canada/security/perception.asp>.

'Human security' is comprehensive, salient, and urgent, embracing both 'freedom from want' and 'freedom from fear'. The 'human security' concept of the UNDP does not claim a special theoretical status but has sought to address the policy implications of serving the purposes of 'human security' in the practical world of global and regional governance.

46.3 Canada in the UN Security Council

Canada promoted 'human security' during 1999 and 2000 as a non-permanent member in the UNSC (McRae/Hubert 2001) by demonstrating its relevance for practical international politics. The notion of human security had been largely alien to the traditional practices of the UNSC where the principles of sovereignty and territorial integrity were paramount, overshadowing the impact of human rights. It was only in the late 1990's that the work of the UNSC had begun to shift noticeably toward a more humanistic perspective. In UNSC meetings in 1997 and 1998, concerns about the protection for humanitarian assistance to refugees and other civilians in conflict situations had occupied the attention of its members. On 21 May 1997, the UNHCR spokesman addressing the UNSC on behalf of Mrs. Sadako Ogata, then UN High Commissioner for Refugees, pointed to the "interface between human security on the one hand, and national and international security on the other" (S/PV. 3778, p. 5).

In their agenda-setting of 'human security' Canadian policy-makers saw the most effective lever for catching the attention of the other UNSC members regarding the protection of civilians in situations of armed conflict. This initiative could clearly be tied to the responsibilities of the Council and to the more inclusive definitions of 'threats to international peace and security' shaping the Council's work since the early 1990's (McRae/Hubert 2001; Lloyd Axworthy 2001; Goldberg/Hubert 2001).

Since the 1990's, the UNSC had increasingly dealt with humanitarian crises. The impact of non-military sources of instability had been acknowledged in its declaration of 31 January 1992, establishing the link to the Council's core mandate. Most operations in the subsequent years had humanitarian ramifications, such as in Northern Iraq, Cambodia, Somalia, Rwanda, Bosnia, or Haiti. The failures in Rwanda, Bosnia, Eastern Zaire, and the paralysis over the Kosovo crisis depict the UNSC's uneven response to

delivering humanitarian assistance incapable of ensuring physical safety of the affected people.

During its two-year mandate, Canada's strategy combined a case-by-case approach with a thematic one. This was enacted by seeking 'operational entry points' for promoting human security in the Council's numerous decisions on key security issues, peacekeeping mandates, and sanctions regimes. Canada also advanced a comprehensive approach to human security through its thematic initiative on the protection of civilians in armed conflict. This proposal was presented in February 1999 to the other Council members and to humanitarian agencies in preparation of the first Canadian UNSC presidency. The item "Protection of Civilians in Armed Conflict" offered an umbrella for several concerns to Canada, including the humanitarian impact of economic sanctions, children and armed conflict, strengthening peacekeeping mandates, and peacebuilding and conflict prevention, while building on existing UNSC activity. It was Canada's purpose to shift the Council's attention away from humanitarian assistance to the legal and physical protection of civilians in violent conflicts.

On 12 February 1999, the Canadian UN delegation scheduled a public debate on 'Protection of Civilians in Armed Conflict' chaired by the Canadian Foreign Minister Lloyd Axworthy as UNSC president (Goldberg/Hubert 2001) with the goal that the UNSC should request the Secretary-General to prepare a report with concrete policy proposals. As part of careful preparation, Canadian diplomats carried out necessary consultations to gain active support of fellow diplomats, senior secretariat and agency officials, in particular also of the Secretary-General and his immediate aides.⁸ The theme introduced by the Canadians on 21 January 1999 at the 3968th UNSC meeting under agenda item 'Promoting peace and security: Humanitarian activities relevant to the Security Council' (UN S/PV.3968: 13-14), was taken up by Axworthy and then further elaborated by Mr. Sommaruga, the president of the ICRC, Ms. Bellamy, Executive Director of UNICEF, and Mr. Olara Otunnu, the SG's Representative on Children and Armed Conflict (UN S/PV.3977: 2-11). They endorsed the Canadian view that the UNSC should take up this matter of humanitarian protection for the victims of armed conflicts. They made detailed proposals for the imple-

8 See the 3977th meeting of the UNSC on 12 February 1999, especially the opening words by Axworthy as UNSC president and his statement as Representative of Canada, S/PV.3977, pp. 30-33.

mentation of this protection function and of what the UNSC could do to advance this urgent relief agenda.

The direct link between the protection item and the norm of human security was spelled out at the 3977th meeting by the Representative of Slovenia who pointed to human security understood not in legal but physical terms as the basic aim of UN humanitarian action, and referred to the initiative of like-minded states, headed by Canada and Norway, which was determined to give full meaning and specific practical expression to the concept of 'human security' (UN S/PV.3977: 11-13). Minister Axworthy spoke at the end as representative of Canada and outlined his Government's conception for effective physical protection by the UNSC of the weakest victims at risk in conflict zones. He appealed to UNSC members to support the Canadian Government in its endeavour and underlined that the protection of individuals should be a primary consideration in the UNSC operations. He reminded the Council that the protection of all citizens was the fundamental public good the state should provide. The responsibility of the Council to protect civilians was therefore compelling from a human security perspective, in fulfilling the Council's own mandate (UN S/PV.3977: 31-32).

In the afternoon of 12 February 1999, the UNSC adopted a presidential statement that offered a summary of its agreed views and requested the Secretary-General to submit a detailed report with recommendations to the Council by September 1999 on civilians in situations of armed conflict.⁹ Reflecting the consensus of all Council members, the statement deplored the growing civilian toll of armed conflict, the large-scale human suffering inflicted upon innocent people, especially children, condemned the deliberate targeting by combatants of civilians in zones of conflict, and appealed to all states and political forces to ensure full compliance with the relevant legal norms inscribed in the Geneva Conventions and other statutes of humanitarian law.

The strong support by UN members became evident in the public meeting of the UNSC on 22 February 1999, allowing non-Council members to state their views on the new agenda item (UN S/PV. 3980; S/PV. 3980/Resumption 1). During this meeting twenty-three delegations acclaimed the Canadian initiative. Several delegations used the term 'human security' and its role in recent endeavours to maximize the UNSC's effectiveness in its crucial peace and security

function applied to internal conflicts and civil wars. Norway, Japan, South Korea, the Dominican Republic and Azerbaijan¹⁰ noted a worldwide spread of the new paradigm, clearly related to the norm proposed by Canada. The main exception was a statement by the representative of Japan who proposed a broader understanding of human security while emphasizing its importance. He argued that human security should be ensured against menaces threatening the survival, daily life, and dignity of human beings. Japan joined in endorsing the significance of measures to protect civilians in conflict situations. Other delegates viewed its application as including the physical dimensions of protection and not merely a legal or political connotation.

The only dissenting voice came from the Indian delegate who remarked that civilians had always been targets of armed conflict even before the era of colonialism, and that this pattern had never changed. He recalled the cataclysmic horrors of Hiroshima and Nagasaki and urged the international community to address the burning question of outlawing the use of nuclear weapons. In view of the close link between international events and media attention, the protection of civilians had become an excuse for asserting political will and waging war. Legitimate concern for the well-being of civilians should not serve as a cover for intervention by powerful states (S/PV/3980: 16-19).

The opening debate offered many useful ideas for preparation of the draft report by the UN Secretary-General. Canada and partner delegations interacted with the secretariat during the months when the report was prepared. Many SG reports are issued every year, but this document was carefully prepared and constituted a courageous move by the Office of the Secretary-General. The report issued on 8 September 1999 (S/1999/957) submitted forty recommendations ranging from traditional diplomatic and political initiatives to more innovative peacekeeping and enforcement measures. Its central theme was the urgency to create a 'climate of compliance' with existing legal norms, already in place but still lacking adherence. These principles in international human rights, humanitarian law, and refugee law required only few additions relating to the specific needs of the internally displaced persons, war-affected children, and humanitarian personnel.

9 UN S/PV. 3978. The presidential statement was issued as UNSC document S/PRST/1999/6.

10 UN S/PV. 3980, Norway, pp. 7-8; Japan, pp. 10-11; Republic of Korea, pp. 20-22; Dominican Republic, pp. 24-26; S/PV. 3980/Resumption 1, Azerbaijan, pp. 2-3.

The recommendations focused on improving UN conflict prevention mechanisms emphasizing preventive peacekeeping deployments; sanctions should be carefully applied to minimize humanitarian impact, and the illegal trafficking in small arms should be stopped. Other proposals addressed measures to improve the ability of UN peacekeepers to protect affected civilian populations. Hate media should be curbed, and adequate training for troops in humanitarian law and human rights should be offered. The civilian and humanitarian character of refugee camps should be ensured, and safe corridors and humanitarian zones could be potentially helpful for the protection of civilians in armed conflict.

The last recommendations were most controversial. Criteria were introduced for when and how to intervene militarily in promoting humanitarian objectives. Five criteria were suggested: i) the scope of the breaches; ii) the inability of local authorities to protect affected populations; iii) the exhaustion of alternative mechanisms; iv) the ability of the UNSC to monitor the actions undertaken; and v) the need to guarantee proportionality in the use of force.

Important debates in the last fifteen years illustrate why these proposals would disturb many developing and small states looking with great misgivings at the juggernaut of military force ready to be deployed at will by the main military powers. Much of what the Indian delegate had invoked already at the 3980th meeting mirrored perfectly the deep scepticism in the Third World regarding acceptance of the report's farsighted proposals. Substantial opposition emerged in subsequent months.

During its 4046th meeting on 16 and 17 September 1999 the UNSC discussed the SG report in an open debate. Its special nature was demonstrated by the active engagement of the Secretary-General at the outset of the debate and in the declaration by the UN High Commissioner for Human Rights, Mrs. Mary Robinson (UN S/PV.4046: 4-6). The Secretary-General stated that the essence of the UN's work was "to establish human security where it is no longer present, where it is under threat or where it never existed" and called this task the UN's humanitarian imperative. He further proposed a UNSC mechanism to seek advice on specific issues dealing with legal protection, prevention of conflicts, and physical protection.

Mrs. Robinson highlighted the massive violations of international humanitarian law and international human rights law, and underlined the UNSC obligation to act, referring to the process leading to the independence of East Timor. Sharing the SG's view-

point, she pointed out that human security had become synonymous with international security and that it could be guaranteed through respect for all fundamental rights. It was up to the UNSC to enforce accountability for war crimes and put an end to impunity. She urged the Council to develop an enforceable mechanism for the protection of civilians in armed conflict, ensuring for them respect, dignity, and human rights.

Canada shared the concerns spelled out by the SG trying to enhance human security and looked to the UNSC as paramount actor in this area. The Canadian delegation emphasized that the protection of civilians must be a primary imperative for collective international action. It wanted to realize many specific suggestions. Such concerted action could bring an end to the culture of impunity employing legal and political means.

While the representative of Slovenia echoed the Canadian emphasis on human security, the remaining debate dwelt mostly on normative and operational aspects of a new energetic promotion of civilian protection in violent conflicts. Besides the public meetings of the UNSC, informal consultations took place, sorting out which of the Secretary-General's proposals should be accepted, postponed, or possibly rejected completely. This multi-track dialogue led to a draft resolution on the SG report and its follow-up. Many non-Council member states returned to the second great debate and expressed their views on the normative importance of the agenda item and the potential implementation by the UNSC itself and by the Secretary-General.

The conduct of these general public debates gained in frequency in the late 1990's and restored the Council's standing as a central forum in which to entertain ways and means to use the tools of the Charter in the maintenance of international peace.

On 17 September 1999, the UNSC unanimously adopted an amended Canadian draft resolution 1265 (1999) that responded to the SG report's recommendations which focused on legal protection, but without prejudicing further consideration by the Council. Although traditional concerns about inviolability of state sovereignty had been raised, they were mitigated by the acknowledgement of atrocious events in Sierra Leone and Kosovo, the ongoing crisis in East Timor, and the impending issuance of reports about the UN's failure in Rwanda in 1994 and in Srebrenica in 1995. The resolution still put the UNSC on record regarding its commitment to respond where "civilians

are being targeted or humanitarian assistance to civilians is being deliberately obstructed”.

This first push to put a core aspect of human security on the UNSC agenda and to obtain an accord on pursuing the matter actively in the future was a limited victory for the Canadian initiators. When the Canadian tenure on the UNSC ended in December 2000, the item “Protection of Civilians in Armed Conflict” had gained a firm place on the Council’s agenda. Whether the human security concept had been accepted by the UNSC and the wider UN membership cannot yet be assessed. The norm of human security has found much acclaim among UN members, but much traditional resistance remains against raising this norm to the rank of fundamental Charter values. This mixed record is traceable in other UNSC debates on humanitarian and human rights matters. But the UNSC has been very open in listening to the new arguments and in translating acceptable parts of those initiatives into actionable features in the UNSC’s peace and security armour.

Canada has provided an excellent account of its 1999 operation ‘human security’. They show the manifold endeavours to maintain the focus on the civilian protection item and ensure tracking UN actions in this respect through formal and informal mechanisms, including an informal working group set up in December 1999 tasked with reviewing the SG report’s recommendations and reporting to the Council on further action during Canada’s presidency in April 2000. To express the undiminished commitment of the Canadian Government, Foreign Minister Axworthy presided over the UNSC on 19 April 2000, reviewed the whole process, and concluded with the adoption of the Canadian draft resolution. The follow-up was extremely contentious, although the record of the 4130th meeting does not reflect this. The issue of legal protection was eventually taken up by the General Assembly, whereas the theme of physical protection was developed in the Canadian UNSC draft resolution. Due to disputes on sovereignty in relation to human rights and humanitarian access in earlier UNSC discussions on humanitarian action, the outcome was uncertain. But the Canadian draft was unanimously adopted as resolution 1296 (2000), reaffirming the commitments of resolution 1265 (1999), thus assuring strengthening procedures for effective civilian protection by the UNSC (S/RES/1296 (2000)).

46.4 Security Council’s Focus on Human Security Concerns

To place the civilian protection campaign into a wider context of global political and social changes, a ‘*Human Security Network*’ was set up by Canada and Norway as principal partners prior to the UN campaign. This network emerged during the negotiation of the Antipersonnel Landmines Convention, which was signed in Ottawa in December 1997. Foreign Ministers Axworthy and Vollebæk agreed to apply this success to other international issues. Vollebæk invited Axworthy to a retreat in Bergen in May 1998 that resulted in the so-called *Lysøen Declaration for a joint Partnership for Action*. In the opening section “Norway and Canada share common values and approaches to foreign policy. With the evolution of international affairs, particularly with regard to emerging *human security* issues, we have agreed to establish a framework for consultation and concerted action.” (italics JD) Among the shared objectives were: a) enhancing human security; b) promoting human rights; c) strengthening humanitarian law; d) preventing conflict; and e) fostering democracy and good governance. To achieve these objectives, both agreed to establish a framework for cooperation, including: 1) ministerial meetings to review progress, set priorities and impart direction; 2) bilateral teams to develop and implement joint ministerial initiatives; 3) meetings in Norway and Canada or at international bodies. The declaration ended with a ‘partnership agenda’ on these issues: Landmines, International Criminal Court, human rights, international humanitarian law, gender dimensions in peace-building, small arms proliferation, children in armed conflict, including child soldiers, child labour, and Arctic and Northern cooperation.

For Canadian officials the *Lysøen Declaration* reveals: “an entire agenda emerging around the idea of human security, rather than a disparate set of issues”. Minister Axworthy launched a diplomatic process he labelled ‘the Humanitarian Eight or H-8’, juxtaposed it with the G-8, and compared the different agendas for both groups. The efforts to attract other states succeeded and brought about a geographically balanced group comprising Austria, Ireland, Switzerland, Thailand, the Netherlands, Slovenia, Jordan, Chile, and South Africa as an observer. This partnership was formalized in Bergen, Norway in May 1999 with the establishment of the ‘Human Security Network’. The network established viable relations with international NGOs and collaborated in global and regional meet-

ings, including the UN system. This network closely followed the developments in the UNSC on 'human security' and civilian protection (McRae/Hubert 2001: 231-235).

Since late 2000, the UNSC has debated the 'Protection of Civilians in Armed Conflict' on numerous occasions, and several new reports were issued by the Secretary General on related aspects. The achievements will be summarized below resulting in changed procedures of UN agencies.

The next step came with the SG's report of 30 March 2001 on the protection of civilians in armed conflict (S/2001/331). He mentioned the civilians caught in armed conflicts and in need of protection and assistance. He felt that the breach of human rights and widespread impunity for cruelty and brutality had not been reduced. He reminded the UNSC of the large percentage of civilians among war victims and stressed that they were a target of irregular forces in intra-state wars. Given the discrepancy between commitments in the UN Millennium Declaration (GA res. 55/2) and the lack of implementation, the SG suggested that UN members should create a culture of protection.

Protection constituted a major task for governments although they have to rely on non-governmental groups for assistance in these crises. But the primary responsibility for the protection of civilians rests with governments (GA res. 46/182 of 19 December 1991), whereas armed groups were directly obligated, according to the Geneva Conventions of 1949 and common international humanitarian law, to protect civilians in armed conflict. Protection efforts must be directed towards the individual rather than the security interests of the state, whose principal task was ensuring the security of its population.

The SG reviewed measures to enhance protection and recommended action dealing with a) prosecutions of violations of international criminal law; b) access to vulnerable populations; c) separation of civilians and armed elements; and d) media and information in conflict situations. The report suggested review processes on the implementation of previous recommendations. Two annexes presented recommendations and an accounting of their implementation.

On 23 April 2001 the UNSC discussed the SG report (UN S/PV.4312; S/PV. 4312/Resumption 1). While the Canadian initiative stressed 'human security' concerns with the protection of civilians, the diplomatic representatives dealt only with the SG report and refrained from exploring the wider context. The UN High Commissioner for Human Rights, Mary

Robinson, emphasized many human rights and humanitarian law provisions and clarified questions on suitable tools to deal with the impunity problem. (UN S/PV.4312: 4-7). Norway suggested that the international fight against impunity would have to contact also armed groups, a major factor in the violation of international legal norms. The British Representative focused on procedural and operational details in line with reasoning introduced by the SG emphasizing need for coordination and the regional context (UN S/PV.4312: Res. 1: 39-40). Mr. Oshima, the USG for Humanitarian Affairs (OCHA), stressed the fundamental humanitarian principles that were negatively affected in many emergency situations. He mentioned organizational measures instructing OCHA and the humanitarian field operations to improve their own efforts (S/PV.4312/Res. 1: 2-3).

The Canadian representative emphasized the linkage between human security and the protection of civilians in armed conflict, underlining that the safety of people had moved from the periphery of the Council's preoccupations to its centre. He noted the inclusion of specific civilian protection provisions in the mandates of three peacekeeping operations. He mentioned the Canadian sponsorship of an international independent commission to examine the issue of humanitarian intervention and state sovereignty, hoping that this body would synthesize the irreconcilable principles. Existing recommendations in resolution 1296 (2000) needed implementation. He requested from the SG observations on the protection of civilians in armed conflict in his regular reports to the Council. Another SG report should be requested, and the annual audit idea proposed by the representative of Singapore could also be implemented (S/PV.4312/Res. 1: 4-5). Thus, Canada was decisive for the promotion of this cause in the UNSC.

While endorsing the SG report and its recommendations, the Japanese representative reminded the UNSC that Japan had favoured a wider concept of human security entailing the protection of the life and dignity of peoples, and considered poverty and environmental degradation, terrorism and infectious diseases, such as HIV/AIDS, as falling within the meaning of human security (S/PV.4312/Res. 1: 6-7).

The representative of Korea noted that UNSC activities had previously addressed the protection of humanitarian assistance to refugees, and that human security was intricately linked to international peace and security. Human security concerns engaged not only the UNSC but also other UN organs, i.e. the GA and ECOSOC, and some ECOSOC entities dealt with

root causes of conflict often related to poverty, through the promotion of economic growth, poverty eradication, sustainable development, good governance, and democracy (S/PV.4312/Res. 1: 9–10).

Despite Canada's admonition that the UNSC should show its commitment by another formal resolution, the meeting ended with a statement by the UNSC president from the UK that the Council would decide in informal consultations on the follow-up. This reticence was not welcomed by many non-Council delegations and outside actors. However, the introduction of the new agenda item on civilian protection had been fully integrated into the very extensive political agenda of the UNSC. This may be taken as a sign of the UNSC's ability to become aware of changing political circumstances and to redirect its own list of priorities. Subsequently, the UNSC president from Bangladesh contacted the SG on 21 June 2001¹¹ seeking further advice of the SG in the Council's consideration of his report of 30 March 2001. The Council suggested that the report should be transmitted as an official document to the GA. Furthermore, the Council proposed:

1. The recommendations on the protection of civilians contained in the first SG report (S/1999/957) should be reorganized by the secretariat into different groups to clarify responsibilities, enhance cooperation, and facilitate their implementation by the Council. The recommendations in the second report (S/2001/331) should be reorganized based on SC resolutions 1265 (1999) and 1296 (2000), taking into account the different responsibilities and mandates of UN organs and the need to further strengthen coordination among UN organizations to facilitate future deliberation by the UNSC.
2. The UNSC encouraged the SG to ensure closer cooperation between OCHA and DPKO to facilitate consideration of civilian protection needs in the design, planning, and implementation of peacekeeping operations.
3. To facilitate, whenever appropriate, UNSC consideration of issues relating to protection of civilians in its deliberations on the establishment, change or closing of peacekeeping mandates, an aide-memoire listing the relevant issues should be prepared in cooperation with the UNSC.
4. The Council members would welcome a briefing by the secretariat on these initiatives by November

2001 to finalize them as soon as possible thereafter. Expert-level seminars were also suggested to ensure the necessary interaction between Council and secretariat. The Council members requested the SG to present a report by November 2002 on the status of implementation of the relevant recommendations regarding the protection of civilians in armed conflict, and any other matter he wished to bring to the Council's attention on this subject matter.

With this letter the UNSC gave detailed instructions on what it wanted from the SG. It demanded two major submissions, an aide-memoire in November 2001 and a full report in November 2002, thus establishing a long-term schedule for its own consideration of the agenda item. It was furthermore notable that in the UNSC letter a desire for close Council-secretariat collaboration was expressed and instructions were directly issued to two secretariat units, OCHA and DPKO, for improvements in their collaboration. Such instructions are quite unusual, as the UNSC has always respected the official rank and status of the SG as Head of the UN Secretariat. The UNSC committed itself thereby to a prolonged consideration of the civilian protection question.

On 21 November 2001, Mr. Oshima, USG for Humanitarian Affairs and Emergency Relief Coordinator, presented the requested briefing to the Council highlighting i.a. the issue of humanitarian access to vulnerable populations; the special protection needs of women and children; safety, protection and security in camps for internally displaced persons; engagement with armed groups for access negotiations; civil and military relations in the delivery of humanitarian aid; separation of civilians and combatants in camps for internally displaced persons and refugees; and the security and safety of humanitarian personnel. In the reorganization of the 54 recommendations of the SG reports, the secretariat had developed a matrix on all proposals and had consulted with other offices and the UNSC. On the aide-memoire, a checklist to ensure that the civilian protection concerns were systematically considered in establishing, changing or closing peacekeeping mandates, OCHA worked closely with DPKO and humanitarian and human rights agencies. The secretariat had prepared a list of issues for the Council's consideration and had sent the draft informally to interested member states for comment. An expert-level discussion with SC members could be organized to review the aide-memoire in January or February 2002. On the closer coordination between OCHA and DPKO, the SG welcomed the idea of a

11 The letter was issued as UNSC document S/2001/614.

team composed of both units to facilitate due consideration of issues on the protection of civilians in the design, planning, and implementation of peacekeeping operations. OCHA was developing a strategic paper for the attention of the members of the Executive Committee on Humanitarian Affairs and the Inter-Agency Standing Committee for further development and action. Mr. Oshima committed his office to providing within a few months additional information on the status of these initiatives (S/PV. 4424: 2-4).

The representative of Singapore asked whether the efforts on the protection of civilians, children, and women had made a difference on the ground and requested concrete information on trends. He also suggested that the recommendations in four agenda items before the Council be clustered. He raised the issue of how the norms created by the Council could be applied to non-state actors without coercion. For him, this raised the whole problem of the humanitarian intervention (S/PV.4424: 4-5). The UNSC president reaffirmed the direct link between the protection of civilians in armed conflict and the Council mandate to maintain international peace and security, and stressed the follow-up on this question (S/PV. 4424: 13).

The dialogue resumed on 15 March 2002 with an update by Mr. Oshima. Reviewing field situations in Palestine, the Sudan, Angola, Liberia, Sierra Leone, Guinea, and the Democratic Republic of Congo, he stressed how seriously endangered civilians were in these locations. He pointed to the completion of the aide-memoire and provided details on close inter-departmental and inter-agency collaboration on issues shared in terms of mandates and ongoing activities (S/PV.4492: 2-5). The UNSC president from Norway emphasized the focus on the protection of civilians as part of the Council's peace work, and noted more than 40 references in previous SC resolutions and presidential statements reflecting the enormous progress made in the issue of civilian protection and the tremendous work still to be done (S/PV.4492: 19-20).

In the next UNSC meeting (S/PV.4493), the president read a statement (S/PRST/2002/6) in which the UNSC reaffirmed its concern for the hardships borne by civilians during armed conflict and recognized the impact this had on durable peace, reconciliation and development, and underlining the importance of taking measures aimed at conflict prevention and resolution. The UNSC adopted the aide-memoire in the annex to the presidential statement (S/PV.4493) with thirteen objectives (S/PRST/2002/6/

Annex), including critical human security issues in violent conflict. It put civilian protection into the centre of the UNSC's Charter-based work on peace and security.

On 26 November 2002 the SG submitted his third report on the protection of civilians in armed conflict (S/2002/1300) that reviewed the progress since 1999. All parties assimilated the thinking on human security into the vocabulary of the UNSC and its partners in most field operations under UN auspices. The report equipped the Council members with the tools necessary to carry the process further. Placing escalating human casualties due to armed conflict and many other known ills as background to his arguments, the SG presented a highly structured account of the state of affairs challenging the UNSC and its partners, and removed all excuses for the Council collectively or for individual members to shirk their responsibility towards human survival and well-being.

The SG stressed the changing environment for the protection of civilians, arguing that the durability of peace was dependent on a commitment to protect civilians from its inception. The report outlined practical measures in three key areas relating to transitional peace processes. The SG called for a collective will to address new threats to civilian protection posed by commercial exploitation of conflicts, by sexual exploitation of civilians in conflict, and by the global threat of terrorism.

The SG warmly recommended several practical initiatives that should guide the UN in its daily work on civilian protection. Regional workshops could help in identifying threats to regional peace and security. The Council should consider adopting and using the aide-memoire to develop frameworks and more structured approaches to the protection of civilians by UN country teams in conflict areas. He recalled the review of new tools in a UNSC workshop on 18 July 2002 on the Mano River region in the DRC. Such reviews should be undertaken periodically to improve key mandates and resolutions where the protection of civilians remained an important challenge.

In the annex to the SG report, a draft 'roadmap' was set out in response to UNSC requests in resolutions 1265 (1999) and 1296 (2000). It contained a tabulation of the recommendations along the action-oriented themes of the aide-memoire. Further work was scheduled in early 2003 to make the instrument more useful for the work of the UNSC itself as well as numerous partners in and outside the UN system. This involved concrete steps taken by ECOSOC suggesting to member states participation in workshops

on the protection of civilians. These workshops introduced fundamental concepts concerning civilian protection, provided participants with experience in using diagnostic tools, and brought a regional perspective to the security threats and the protection of civilians.

On 10 December 2002 the UNSC (S/PV.4660; S/PV.4660/Res. 1) discussed this report on the Human Rights Day with the Secretary-General. He complimented the Council for formulating within less than three years a conceptual framework, and he added that the knowledge gained should be translated from policy to implementation. Given the huge number of civilians in conflict situations, the protection needs did not end with a ceasefire, but must extend into the post-conflict period to build an effective peace. He related this work on protecting civilian victims to the fundamental aim of the UN, namely to save succeeding generations from the scourge of war (S/PV.4660: 1).

The USG for Humanitarian Affairs, Mr. Oshima, shared with the Council members a detailed action-oriented overview of the recent activities within the secretariat and with associated outside partners creating a toolbox for political organs and international personnel. He measured the progress in conceptual and programming work against the unacceptably high toll in human life and livelihood, and spelt out the dire need for protection and assistance in crisis situations around the world. He mentioned that Norway had taken the lead in establishing a support group of member states to create a broader support base for the protection of civilians in armed conflict, and praised this step in burden-sharing between the membership and the secretariat. He saw as the three core tasks of the agenda of protection of civilians, to advocate, to educate, and to implement, and he promised that his office would report on further progress (S/PV.4660: 1-6).

The head of the ICRC commented on the field reports put forward by the SG and his aide. Mr. Gnaediger agreed with the SG's three reports and pointed out that the ICRC attested the suffering of civilian populations who were frequently the prime targets of violent conflicts. This suffering included acts of genocide, ethnic cleansing, indiscriminate attacks by regular armies or other armed elements, terrorist acts, starving populations, women falling victim to sexual violence, child soldiers, families separated without any news of their loved ones, and forced disappearances. Such situations were the subject of international humanitarian law, one of its pillars was the protection of civilian populations. The main task was not

the formulation of new legal principles but instead a concerted international effort to reach full compliance with existing conventions (S/PV.4660: 6-8).

In the subsequent debate, many non-Council members addressed the UNSC, some pointing to the core link between the protection of civilians and human security. The statement by Austria for the Human Security Network was endorsed by Norway, Canada, Chile, Ireland, and Switzerland associated itself with the Austrian statement (S/PV.4660: 8-10, 13-15; S/PV.4660/Res. 1: 7-13).

The Austrian representative argued that the protection of civilians was at the core of the Network's endeavours to ensure the security and the rights of the individual. The group aimed at concrete actions to make the world a place where everybody could live in security and dignity, free from fear and want, with equal opportunities to develop their human potential. These efforts were directly related to what the SG had termed the humanitarian imperative. The reality diverged dramatically from this powerful vision. But the Network joined the SG in embracing the goal of a culture of protection within and beyond the UN. Austria proposed to raise the awareness of all parties in conflict, including non-state actors, of their responsibilities and of relevant legal norms. Regarding displacement of populations, the Austrian delegate pointed to the ongoing work of the GA and the Commission on Human Rights to formulate legal norms in support of protection and assistance to internally displaced persons, building upon the crucial efforts of the SG's representative on Internally Displaced Persons. The members of the Network shared the view that sustainable peace could only be achieved on the foundation of an effective and fair administration of justice ensuring accountability for past grave human rights violations, and welcomed the entry into force of the Rome Statute of the International Criminal Court, an important contribution to ending impunity. For the Network, Austria pledged to promote the protection of civilians in armed conflict as an indispensable foundation for peace, security, and stability (S/PV.4660/Res. 1: 16-18).

On 20 December 2002 the UNSC held a brief evening meeting (S/PV.4679) where the president read a consensus statement of the Council (S/PRST/2002/41). It summarized the main points of the previous debate and put the Council and its members on record in support of fundamental norms and values of civilian protection and to what they committed themselves, individually and as a collective, to do in situations constituting a massive and immediate threat to

civilian populations. The UNSC strongly endorsed the urgency to improve the protection of refugees and internally displaced persons, and to maintain the security and civilian character of camps for these groups in flight. The Council requested another SG report by June 2004 and invited the secretariat to continue its oral briefings every six months to report on progress with the roadmap (S/2002/1300).

With the deliberations of the 4660th meeting and thereafter, a process had reached an important milestone in the evolution from an idea to a central norm in the Council's work. The next occasion where the protection of civilians in armed conflict was put on the UNSC agenda was during an interlude. Nobody questioned any more the salience of the concept, although differences have remained on the understanding of 'human security' as a new paradigm and the civilian protection item as the core of that basic norm.

On 20 June 2003 Mr. Oshima, the USG for Humanitarian Affairs, updated the Council members on new activities and bid farewell as his tenure was ending. The president of the UNSC honoured the USG, while Mr. Oshima offered an overview on the conceptualization and follow-up work carried out in his office: He warmly endorsed the movement towards the culture of protection, the goal coined by the SG (S/PV.4777: 3-8).

A new phase of the Council's involvement with the issue was reflected in the strong recommendation by the UK representative who favoured 'mainstreaming' these issues into the focus of the UNSC (S/PV.4777: 9-10). The near-unanimous appreciation by the Council members of the steady efforts and results by Mr. Oshima's office shaped the atmosphere of his farewell. Speaking for the Human Security Network, Chile stressed that protecting civilians was at the heart of UN credibility. Its purpose was to change the focus of security, from state-centred, to emphasize its human dimension. For his delegation, the concept of human security was directly related to the humanitarian efforts outlined by Mr. Oshima (S/PV.4777: 14-15). The meeting concluded without any formal UNSC action.

On 28 May 2004 the SG submitted his fourth report on the protection of civilians in armed conflict (S/2004/431). Recalling the tenth anniversary of the 1994 Rwanda genocide and the fifth anniversary of his initiating the agenda on the protection of civilians in armed conflict, the SG acknowledged these important milestones which compelled the world to assess the collective achievements in the protection of vulnerable civilian populations, but they also warranted

sober reflection on shortfalls in the new endeavours. Raising the spectre of current armed conflicts in the Darfur region, in Cote d'Ivoire, Iraq, and Nepal, not to mention the transition situations in Afghanistan, the Congo and Liberia, the SG expressed his dismay that a prevailing culture of impunity continued to spur cycles of violence and criminality in many conflict zones. In response to these harsh new realities, the international community had been galvanized to intensify efforts to protect these civilians under threat and to eliminate impunity.

The report had been organized following the ten-point platform adopted by the UNSC on 15 December 2003. It presented suggestions to improve performance in the following protection areas: the deliberate targeting of civilians, sexual and other forms of violence, the recruitment and use of child soldiers, and ensuring humanitarian access to facilitate the delivery of assistance and the safety of UN and associated personnel.

In his report the SG reviewed the performance on protection and continuing shortfalls since the last reports. He stated that the public international order had been under strain, and stressed that fundamental human rights had to be respected, especially in times of war and fear. Mentioning new perils, including excesses in counter-terrorism and new actors in armed conflict, he warned that accountability and responsibility had become diffuse, and emphasized that acceptance and implicit support by the civilian community was required for effective humanitarian assistance.

The SG's report was taken up by the UNSC on 14 June 2004 and on 14 December 2004, giving many non-SC representatives an opportunity to join the debate. Both sessions reflected the semi-annual schedule for periodic reviews and enabled the UNSC to dialogue with the new USG for Humanitarian Affairs, Mr. Jan Egeland, who introduced the SG report conveying to the UNSC the hope for a new resolution on this subject. The USG declared that the commitment of the UNSC to protect civilians in armed conflict was needed, since progress in the protection of civilians would remain insufficient and the establishment of a culture of protection a distant goal as long as civilians continued to constitute the majority of victims in armed conflicts. The extensive deliberations in June and December 2004 displayed solid support in the UNSC and among member states for increased efforts to augment needed support for endangered civilian populations in armed conflict.

The December review resulted in a forceful presidential statement (S/PRST/2004/46), in which the UNSC reaffirmed its condemnation of violence against civilians in situations of armed conflict. The statement called for a further report of the SG on the item by 28 November 2005, including information on the implementation of SC resolutions previously adopted, as well as additional recommendations to further improve the protection of civilians in armed conflict.

The UNSC reviewed this agenda item on 21 June 2005 during the French presidency. The tone was set by the grim sentiments of the UN USG for Humanitarian Affairs and Emergency Relief Coordinator, Mr. Jan Egeland, who argued that the trend for civilians in many armed conflicts was negative and that a tremendous effort was required to change the direction on this humanitarian emergency (S/PV.5209, 2-6). This was reflected in the presidential statement (S/PRST/2005/25), condemning the deliberate targeting of civilians or other protected persons in armed conflict, and calling on all parties to end such practices; it expressed its concerns on the use of sexual violence as a weapon of war. The UNSC announced to take further action "including ... a possible resolution".

The sequence on the protection of civilians in armed conflict has strengthened the Council's policy-making posture. Opening the Council to important humanitarian organizations and UN offices and agencies constitutes a tremendous step forward. Getting involved in informal sessions with secretariat staff and joining in deliberation and drafting strengthens the bonds between the different elements on the multilateral stage and improves its outcomes. Drafting help becomes more focused and sensitive to the political needs of Council members and presents opportunities to open up to more substantive help from UN officials and staff, thus lowering the barriers between senior diplomats and international staff. The Council has become a more efficient decision-maker while improving transparency and thereby remaining well connected with member states and numerous regional groupings with an interest in UN policy-making. The outcome of these efforts for the promotion of the civilian protection agenda item was remarkable as all participants praised the close collaboration and its effects on the issue and on the Council's standing.

46.5 Conclusion

The review of the UNSC treatment of protection of civilians in armed conflict has brought some clarity on the policy notion of 'human security' as promoted by Canada, Japan and other states and intergovernmental organizations, compared to a carefully defined theoretical term meeting the standards of scholarly examination. The prevailing mix of different understandings cannot yet be settled by some definitive analysis of a philosopher or social scientist. To reject the notion is neither desirable nor necessary. The review of current uses of the term 'human security' has exposed a major dichotomy between one group which prefers a narrow meaning of 'personal' and 'group security', and another group that uses human security in a wider context comprising all threats to human well-being. The tension between 'freedom of fear' and 'freedom of want' should be resolved.

The Canadian undertaking to publish annually all data on threats to human security,¹² while excluding massive data on the huge gap of inequality in the global system and the immense poverty afflicting the majority of the world population, is in itself a debatable restriction.¹³ For a global perspective of the contemporary world, it is absolutely essential to depict the human community in its painful division between the 'haves' and the 'have-nots'.

The scope of human misery is often reproduced in annual reports of the UN system and of many NGOs. Only a global perspective will be sufficient to expose the level of inequality and injustice and recommend measures to remedy this dreadful situation. The 'human security' concepts in the UNDP terminology, in Caroline Thomas' writings, and as defined by the Japanese Government, include the human misery component. Undoubtedly human survival is the prime factor of 'human security'. If critics claim that the concept is

12 See the annual *Human Security Report* by the Liu Institute for Global Issues at the University of British Columbia. Its definition of 'human security' comprises the protection of communities and individuals from internal violence, as well as the defence of borders against external threats, i.e. it refers to 'freedom from fear' (Mack 2003). On the first Human Security Report of October 2005, see at: <http://www.humansecurityreport.info/>, and for a free download see at: <http://www.humansecurityreport.info/index.php?option=content&task=view&cid=28&Itemid=63>.

not viable because there are no clear empirical measures for that state of affairs, it may be argued that such stringent criteria need not be met by a policy norm.

This chapter has focused on a policy standard that will allow operational decisions to be taken and to be carried out as instructed. The Canadian initiative of reducing the paradigm debate to a practical guide for relevant political action in crisis-ridden locations globally has fully succeeded. Had the sponsor insisted on an absolute standard, the pragmatic actors in the UNSC forum would have refused joining such a futile engagement. Since the shift to human security is presented as a paradigm shift, the shift to pragmatic goals emerges from an absolute departure point. The developments from 1999 to 2005 in the UNSC made it possible that new difficulties on the protection front would be taken up more quickly.

In December 2005, one can identify three major strands of international involvement coming together and joining the principal platform of the UNSC legitimacy and mandate. The main trend is the development reviewed above, namely the transformation of the new international human security concept into a concrete policy norm revolving around a key concern, the threat by armed conflict against civilians. The second strand is represented by the intergovernmental *Human Security Network* that has played a significant role in garnering the increased responsibility and impact of the UN system as a central pillar of global governance. The third strand that ultimately has provided critical support for the relevance of the issue of

civilian protection in armed conflict on the global agenda is the December 2004 report of the *High-level Panel on Threats, Challenges and Change*, which discusses 'Protecting Civilians' in detail and offers several policy recommendations to support UN recommendations and actions in this area. Its judgement on the timeliness of the new policy norm offers a last building block completing the global acceptance of the 'human security' norm and its operational application.

With all the reservations about the current role of the UN and the UNSC, this case study of how the Council was challenged to take up a new and difficult task going far beyond the range of the cold war period and how it managed to rise to the level of practical policies and effective decisions in many emergencies while establishing a new dimension in its widening agenda for a world in turmoil, is convincing evidence of the impressive vitality and dynamic of the Council. The specific examples of the Council's flexibility and openness have been assessed. Also the contributions by numerous member states, many of them serving on a non-permanent basis, must be noted. Several members of the informal *Human Security Network* have been involved in the UNSC work. The new evidence furthermore strengthens the viewpoint that initiative and guidance in the UNSC often come from non-permanent members. This condition in the working of the Council serves as reaffirmation of the continuing viability of the instrument of the UNSC for purposes relating to peace and security, including the central obligation to ensure the security of the individual in the changing world of today and tomorrow.

47 Evolution of the United Nations Security Concept: Role of the High-Level Panel on Threats, Challenges, and Change

Sebastian von Einsiedel, Heiko Nitzschke and Tarun Chhabra

47.1 Introduction¹

Over the past decades, the concept of 'security' has evolved significantly in academic and policy discourse. Traditionally, discussion of national, international, and collective security focused primarily on military threats to the integrity of states. Since the end of the Cold War, the concept of security has broadened to include non-military threats to states as well as non-military and military threats to groups and individuals. The latter came to be known as 'human security', a concept with little analytic precision but nevertheless discernible impact on advocacy and policy formulation (see chapter by Dedring in this volume).

This chapter focuses on the evolution of the concept of security at the United Nations.² Specifically, it traces the role of the UN in initiating and sustaining this evolution, and in reacting to new developments in a post-Cold War security environment. Section 47.2 argues that although human security concerns feature prominently in the UN Charter, the policy and institutional architecture created in the aftermath of the Second World War was naturally framed in politico-military terms and based on a traditional understanding of state sovereignty.

Section 47.3 highlights how the end of the Cold War confronted the UN with a range of new challenges and opportunities and dramatically altered the role of the organization in peace and security. First, UN engagement in civil wars and post-conflict peacebuilding broadened the understanding of threats to

international peace to encompass socio-economic factors. The UN dichotomized but stressed linkages between so-called 'hard' security threats such as armed conflict, terrorism, and weapons of mass destruction, and 'soft' threats, such as poverty, infectious disease, and environmental degradation. Second, the focus of security policy and discourse, particularly in the UN Security Council, shifted from the integrity of the state to the protection and well-being of groups and individuals within states. This shift was mirrored in academic and policy circles of the 'human security' concept. The inevitable implication was a qualification of sovereignty, including the concept of a 'responsibility to protect'.

However, the UN never achieved consensus around a sound doctrinal framework for its range of activities in a post-Cold War security environment. In the UN Secretariat and among member states, different visions of the UN's new role in peace and security have coexisted uneasily, hampering effective approaches to new threats and challenges.

Section 47.4 argues that the UN's failure to produce such a consensus is rooted in dramatically divergent understandings of what constitutes a threat to peace and security among its member states. The UN has remained torn between concepts of human security and state security. UN Secretary-General Kofi Annan, in a September 2003 speech before the General Assembly, focused on the need for an overarching framework to guide UN work in the area of peace and security. He established the *High-level Panel on Threats, Challenges, and Change* to address this question through research and consultations within the UN community and beyond.

Section 47.5 shows how the subsequent release of the Panel's report in December 2004 triggered an intense debate on the UN's role in international peace and security. While public interest in the report focused on its recommendations for reform of the Security Council, the primary and most noteworthy ambi-

1 The views expressed in this article do not necessarily reflect the views of the United Nations Secretariat or the German Ministry of Foreign Affairs. The authors would like to thank Dr. Catherine Guicherd, Sir Adam Roberts, and Dr. Peter Wittig for their valuable comments on an earlier version of this text.

2 If not specified, the term 'United Nations' refers to the UN Secretariat and member states as one entity.

tion of the Panel was to propose a new and comprehensive vision of collective security which attempts to reconcile concepts of 'state' and 'human security'.

As highlighted in section 47.6 this new security concept was adopted by the Secretary-General in his own report, *In larger freedom*, and has enjoyed significant rhetorical support among member states. However, states have faltered in translating this abstract endorsement into concrete and meaningful agreement. This is hardly an unfamiliar pattern. As Mats Berdal has pointed out, "the discussion of how to conceive of security is not merely academic." It goes to the heart of how the UN sets priorities and allocates resources— in essence, its purpose and mission (Berdal 2004: 95).

47.2 Collective Security, the UN Charter and the Cold War Era

Traditionally, the primary unit of analysis in international relations is the state. 'Security' is thus perceived as 'national security', concerned with military threats to the territorial integrity and political independence of a state. Collective security entails commitment by participating states to consider military aggression against one member as aggression against all, and, in the event, to respond collectively against the aggressor.³

This understanding of collective security is at the core of the UN Charter. Conceived by the Allies during the Second World War, and founded in its immediate aftermath, the UN's main purpose was to prevent another world war. To that end, member states commit themselves in Art. 1(1) of the UN Charter to "take effective collective measures for the prevention and removal of threats to the peace." The Charter does not contain the term 'collective security'; in the words of Michael Howard, "it smelled of the failures of the 1930's" (Howard 2003: 64). But the concept is nevertheless firmly enshrined in chapters I, V, and VII of the Charter. As the primary UN organ concerned with the maintenance of international peace and security, the Security Council can invoke the collective coercive measures of Chapter VII when it determines the existence of a threat to international peace and security.

3 For a brief discussion of collective security and its differentiation from balance of power and alliances, see: Betts 1992.

The Charter also contains core elements of the contemporary 'human security' concept that are noteworthy in their breadth and ambition. In clear contrast to the preamble of the 1919 Charter of the League of Nations, which is addressed to the "High Contracting Parties" (i.e. the League's member states), the preamble of the UN Charter starts with the sentence: "We the peoples of the United Nations".⁴ Unlike the League Covenant, the UN Charter also emphasizes human rights and the dignity and worth of the human person. The framers of the UN Charter were prescient in insisting that true peace is dependent on economic and social development. Indeed, Franklin Delano Roosevelt argued in 1941 that global peace would prevail only if four intrinsically interlinked 'freedoms' were achieved in parallel: freedom of speech and expression, freedom of religion, freedom from want, and freedom from fear.⁵ This interdependence between development and security is also reflected in Article 55⁶ of the Charter as well as in the establishment of the Economic and Social Council (ECOSOC) as a principal organ, with Article 65 providing for its cooperation with the Security Council.

Nevertheless, despite rhetoric and nods, what today is called 'human security' was rendered fundamentally ancillary to state security. The Cold War security environment, characterized by superpower confrontation, sustained and reinforced a focus on military threats. This was starkly manifested in the nuclear doctrines of mutually assured destruction. The state-centric outlook was further strengthened by the robust assertion of sovereignty by dozens of new states emerging from decolonization. To this day,

4 On the history of the UN Charter see; Russell (1950); Grewe (1994); for an analysis of the use and legal interpretations of the 'security' concepts used in the UN Charter see: Simma 2002; on 'international security', see: Verosta (1971); Wolfrum (2002); on 'collective security', see: Delbrück (1982); Doehring (1991);

5 President Franklin Delano Roosevelt, "State of the Union Address to Congress", 6 January 1941, at: <<http://www.libertynet.org/~edcivic/fdr.html>>.

6 Article 55 reads: "With a view to the creation of conditions of stability and well-being which are necessary for peaceful and friendly relations among nations ... the United Nations shall promote: a. higher standards of living, full employment, and conditions of economic and social progress and development; b. solutions of international economic, social, health, and related problems; and international cultural and educational cooperation; and c. universal respect for, and observance of, human rights and fundamental freedoms for all without distinction as to race, sex, language, or religion."

many of these states remain the most vocal proponents of non-interference in internal affairs.

At the same time, the dynamics of the Cold War ensured collective security would not operate as intended by the framers of the UN Charter. Before 1989, the Security Council authorized military action under chapter VII only in one instance (in 1950, to reverse a North Korean invasion into South Korea), and only then because the Soviet Union boycotted the Security Council. Although many internal violent conflicts erupted during this period, they were widely seen as proxy wars. UN intervention – with the notable exception of the UN mission to Congo in the early 1960's – was ruled out by either the United States or the Soviet Union.

47.3 End of Cold War: A New Security Environment

The end of the Cold War gave collective security a new, if brief, lease on life. The decisive Security Council response to the Iraqi invasion of Kuwait in 1991 inspired grand invocations of a 'new world order' in which the UN could finally fulfil its promised role as guardian of international peace and security. With the existential threat of nuclear war significantly reduced, debate about the ultimate objectives of state security flourished. Greater attention was given to the notion that the ultimate objective of state security is to promote the well-being of groups and individuals within states. The understanding of what constitutes a threat to international peace and security was broadened to include socio-economic threats to states.⁷ The *Human Development Report 1994* (UNDP 1994), which defined 'human security', argued that:

(t)he concept [of security] has for too long been interpreted narrowly: as security of territory from external aggression, or as protection of national interests in foreign policy or as global security from the threat of nuclear holocaust. It has been related more to nation states than to people. ... Forgotten were the legitimate concerns of ordinary people who sought security in their daily lives. For many of them security symbolized protection from the threat of disease, hunger, unemployment, crime, social conflict, political repression and environmental hazards (UNDP 1994: 22).

This advent of 'human security' in scholarly and policy discourse had important implications. Most notably,

7 On the changing perceptions and use of the concepts of 'peace and security' as well as 'collective security' in recent legal literature see Weiss/Forsythe/Coate 2004.

the principle of state sovereignty has been increasingly qualified, evidenced by a decade of UN interventions in cases that not long ago would have been considered strictly 'internal affairs'

Violent state implosion, bloody civil wars, humanitarian catastrophes including genocide and ethnic cleansing, nuclear proliferation, and, ultimately, the terrorist attacks of 11 September 2001, cast the relevance of collective security into doubt. However, the broadening of the security concept continued, even if by default rather than by design. The UN played a central if unwitting role in instigating and sanctioning this conceptual shift, and in reacting to policy changes among its member states. Yet development and consensus around doctrine always lagged behind changes in practice, and much of the new UN role in peace and security remained controversial.

47.3.1 Changes in the Understanding of Threats and their Interrelationship

In the late 1970's and early 1980's, an increasing number of academics called for a new security paradigm and argued for a broadening of the definition of security to include non-military threats (Brown 1977; Ullman 1983; Buzan 1983, 1991; Gurr 1985; Westing 1986). Soon after the collapse of the Soviet Union, many other scholars had followed their lead (Pirages 1991; Myers 1993). Prominently among those, Jessica Tuchman Mathews endorsed "broadening [the] definition of national security to include resource, environmental and demographic issues" (Tuchman Mathews 1989: 162). Sceptics, particularly those in 'classic' security studies, argued that expanding the concept of security would risk diluting, if not depleting, its analytical utility (Deudney 1990; Dalby 1992a; Freedman 1998a).

Nevertheless, a wider notion of what constitutes a threat to 'national security' continued to make slow inroads. The national security strategies of the United States in the 1990's and NATO's subsequent strategic concepts, for instance, placed increasing emphasis on issues such as instabilities arising from acute socio-economic challenges, ethnic rivalries, environmental degradation, drug trade, and refugees (NATO 1991; White House 1991).

For the UN, the main impetus came through increased involvement in internal conflicts. In the early 1990's, the UN played a key role in bringing protracted conflicts in Namibia, El Salvador, Nicaragua, Cambodia, and Mozambique to an end.

Against this background, then UN Secretary-General, Boutros Boutros-Ghali was asked by the Security Council to help define the role of the UN in a new security environment. Advocating an “integrated approach to human security,” the resulting *Agenda for Peace* stresses that “[t]he sources of conflict and war are pervasive and deep. To reach them will require our utmost effort to enhance respect for human rights and fundamental freedoms, to promote sustainable economic and social development for wider prosperity, to alleviate distress and to curtail the existence and use of massively destructive weapons” (United Nations 1992: paras. 16,5). The *Agenda* identifies poverty, environmental degradation, disease, and organized crime as root causes of violent conflicts (United Nations 1992: para. 13), although this assertion was not supported by any analysis (Mack/Furlong 2004: 3). The report came at a time when member states and the Secretariat were reluctant to address socio-economic issues in the context of conflict, “for fear of being accused of interfering in the internal affairs of member states” (Mack/Furlong 2004: 3).

Subsequent years, however, made clear that ending civil wars and bringing peace to post-conflict countries was a far greater and longer-term challenge than the early success of the 1990's had suggested. The release of the *Agenda for Peace* was followed by severe setbacks for UN peacekeeping and peace-building, most prominently in the Balkans, Angola, and Rwanda. ‘Failing’ or ‘failed’ states became of increasing concern, first for humanitarian reasons, as evidenced in the intervention in Somalia, and later for fear of regional destabilization, as seen in the turmoils engulfing much of the Great Lakes Region and Western Africa (Zartman 1995).

It became increasingly evident that bringing lasting peace to post-conflict societies required addressing a host of socio-economic factors, first and foremost among them the immense challenge of demobilizing, disarming, and reintegrating former combatants. Partly as a result of this understanding came a dramatic increase in both number and complexity of UN-led and -authorized peace operations. What started in the 1950's as lightly armed blue helmets as a buffer between state armies observing armistices or peace agreements (ONUC, the 1960–64 UN Operation in Congo being an important exception), became increasingly ‘complex’ or ‘multidimensional’, and the UN found itself tasked with the economic and political reconstruction of war-torn states. In Kosovo (UNMIK) and East Timor (UNTAET), the UN effectively took over the function of the state (Chesterman

2004). By the end of the 1990's, ‘state-building’ had become the new mantra for some in the UN community, and an anathema for others.

Advancing research on the underlying causes of violent conflict suggested that in order to prevent conflict, such complex matters as the equitable distribution of extractable resources, poverty alleviation, and youth employment would need to be addressed (Collier/Elliott/Hegre/Hoeffler/Reynal-Querol/Sambanis 2003: 53–88). As a result, towards the end of the 1990's the UN formally adopted – at least rhetorically – a policy of ‘structural prevention’, to address the underlying socio-economic causes of armed conflict (Mack/Furlong 2004: 9–10). Developing world countries welcomed an increasing focus on socio-economic threats to peace. However, they did not subscribe to the interference into internal matters that came with it.

During the 1990's, the Security Council, too, proved increasingly willing to interpret dangers to international peace and security more broadly. It repeatedly turned its attention to socio-economic issues and their interrelationship to security. The Council adopted resolutions on, inter alia, the illicit flow of small arms and light weapons to Africa (SCR 1209, 19 November 1998), civilians in armed conflict (SCR 1296, 19 April 2000), HIV/AIDS (SCR 1308, 17 July 2000) and gender in post-conflict peace-building (SCR 1325, 31 October 2000). However, this change in Council deliberations was not driven by any new formal doctrine or procedures. Instead, many non-permanent members tended to use their two-year tenure on the Council in order to spotlight non-traditional security threats (see Dedring above on Canada's role). In spite of critics who argued that the Council had become a ‘theme park’, the trend has proved enduring.

The terrorist attacks of 11 September 2001 reinforced the expansion of the Council's agenda, but in new directions. On 12 September, the Council passed Res. 1368, condemning the attacks and recognizing “the inherent and collective right of self-defence in accordance with the charter.” For the first time, the Security Council invoked Art. 51 against an attack from a non-state entity, al-Qaeda. While growing attention had been given to so-called ‘soft’ security threats, 11 September encouraged the Council to be more proactive in addressing new ‘hard’ threats: particularly, international terrorism and the proliferation of weapons of mass destruction (WMD) to terrorist groups (in particular with SCRs 1373 and 1540, which imposed binding obligations on all 191 UN member states to take concrete steps to prevent terrorism and

access by non-state actors to WMD). Furthermore, 'state failure' came to be seen as a threat to peace not only in its humanitarian and regional dimensions, but also because failed states could – as demonstrated by al-Qaeda in Sudan and Afghanistan – serve as bases to shelter and train terrorist recruits (Rotberg 2003).

Yet these developments obscured the fact that the UN had still not developed a sound doctrine or consensus on how to address a panoply of new challenges. In the aftermath of the 2003 Iraq war, this failure yielded a searing indictment of the UN's effectiveness – even its relevance – in the post-Cold War era.

47.3.2 Advent of Human Security

In parallel with the broadening of the security concept to include non-military threats against states, the focus of security policy and discourse shifted from the integrity of the state to the protection and well-being of groups and individuals. This shift in emphasis was at first the result of the relative prominence civil wars assumed after the end of the Cold War, and the humanitarian catastrophes that inevitably followed suit. It was reinforced by the role of non-state actors in terrorism and weapons proliferation.

International attention to the security of individuals was also a function of the expanding influence of non-governmental organizations (NGOs) in world politics, particularly in the realm of human rights and humanitarian affairs (Risse-Kappen 1995; Tuchman Mathews 1997). Often organized in loosely-structured "policy networks", NGOs increasingly participated in global agenda-setting and became regular participants in policy deliberations (Reinicke/Deng/Benner/Witte 2000; Florini 2001). By exploiting rapid growth in media and information technology, NGOs became effective in steering world attention to the plight of civilians suffering under brutal regimes and armed conflict (Keck/Sikkink 1998).

Focus on the individual as victim was accompanied by focus on the individual as perpetrator, reflected in what Anne-Marie Slaughter has termed the progressive "individualization of international law", that is "the process by which we have taken the black box of the state and made it gradually transparent to focus on individuals rather than states as unitary political entities" (Slaughter 2003: 815). This development is most striking in the development of international criminal law in the course of the last fifteen years – the major milestones of which are the establishment by the Security Council of the International Tribunals on

Rwanda and Yugoslavia and the more recent creation of the International Criminal Court.

The end of superpower patronage in developing countries also permitted previously taboo issues to come to the development agenda. Human rights, corruption, democracy, and rule of law became part of mainstream development discourse, programmes and, most importantly, aid conditionality. The World Bank (1992a), the IMF (1997) and UNDP (1997) have become major proponents of this good governance paradigm. The focus of development policy shifted from macroeconomic growth to the role of the state and public institutions in guaranteeing the well-being of their citizens (Sen 1999). This 'people-focused' approach to development was best captured by the term 'human development', which was popularized by the UNDP *Human Development Report*. Against this backdrop, the development and humanitarian communities also advocated 'human security' as the security equivalent to human development.

Attempts to conceptualize human security and its implications for the international community became a veritable cottage industry. One leading author claims with some justification that "[e]xisting definitions of human security tend to be extraordinarily expansive and vague, encompassing everything from physical security to psychological well-being, which provides policy-makers with little guidance in the prioritization of competing policy goals and academics with little sense of what, exactly, is to be studied" (Paris 2001: 88). An important outcome, however, was the growing acknowledgement of the interrelationship between security and development. It is in its broad definition, writes Peter Uvin, "that human security amounts to a re-conceptualization of the development enterprise, with 'freedom from fear' and 'freedom from want' becoming two inseparable faces of the same coin" (Uvin 2002: 18; see also in this volume). Other influential actors, however, saw human security confined not only to non-military threats. The Canadians⁸ and Norwegian governments, in particular, focused on military/violent threats to groups and individuals. In stressing the 'human dimension of security', both countries are sponsors of the Human Security Network (Fuentes 2007), an international policy network comprised of academics, policy-makers, and NGO practitioners, to advance their foreign and development policy goals: ban of anti-personnel

8 Within the Canadian government, the driving force behind the human security approach was former Minister of Foreign Affairs, Lloyd Axworthy (2001a).

mines, control of small arms and light weapons, and advancement of the International Criminal Court. While core aspects of human security are not new – and are already contained in the UN Charter – the concept found traction with member states, and thus came to significantly influence the UN agenda.

47.3.3 Qualification of Sovereignty and the Responsibility to Protect

In the course of the 1990's this shift of attention to the well-being of the individual created inevitable tension between the traditional cornerstones of the UN: collective security, sovereignty, and non-interference. In his *Agenda for Peace*, the Secretary-General acknowledged that a new security environment forced the UN to look inside states. Reiterating that “[r]espect for [the state’s] fundamental sovereignty and integrity are crucial to any common international progress”, he cautions that “[t]he time of absolute and exclusive sovereignty, however, has passed: its theory was never matched by reality” (United Nations 1992: para 17).

Among the main drivers to qualify sovereignty was the Security Council. With a broadened understanding of ‘threats to peace’, the Council increasingly invoked collective security measures under Chapter VII of the UN Charter in response to developments that had traditionally fallen outside the realm of collective action (Chesterman 2001). The first such case was Resolution 688 of 5 April 1991, in which the Council implicitly invoked Chapter VII, stating that massive cross-border flows of Kurdish refugees from northern Iraq posed a threat to international peace and security in the region.⁹ Other instances of Chapter VII action in response to largely internal developments include the 1992–1993 intervention during a humanitarian catastrophe in Somalia, the UN’s efforts from 1992–1995 to end the civil war in Bosnia-Herzegovina, the authorization of a multinational force in 1994 to restore the democratically elected regime of President Aristide in Haiti, and the mandate for Italian-led operation ‘Alba’ in 1997 to stabilize the situation in Albania, where the state had been dissolving into chaos.

The UN’s expanded role in peace and security was accepted only reluctantly by many member states, in particular by the developing world. The states were highly critical of UN interference, in the name of in-

ternational peace and security, in what had traditionally been internal matters. ‘Humanitarian intervention’ and the limits of sovereignty remained highly controversial issues in the Security Council, often inducing paralysis rather than action vis-à-vis armed conflicts and humanitarian crises.

The failure of the Security Council in 1994 to prevent genocide in Rwanda highlighted that states with the military capacities to intervene maintained a narrow conception of security, tied to a circumscribed nation of their national interests. However, the watershed event was the 1999 Kosovo war. NATO’s bombing campaign against Serbia, in the absence of a Security Council authorization, was hugely controversial not only among UN member states but also among international lawyers and humanitarian experts (Chesterman 2001; Weiss 2004). When the Secretary-General, in his speech before the General Assembly that same year, welcomed the “developing international norm in favour of intervention to protect civilians from wholesale slaughter,”¹⁰ the reaction among many countries from the G-77 was cool if not hostile. This highlighted the urgent need to establish consensus on this question and to provide intellectual underpinning.

An answer to the key question, “when is it right to fight?” was attempted in an influential report, commissioned by the Canadian government in 2000. *The Responsibility to Protect* interprets sovereignty not just as a shield against outside interference but also as an obligation of states to shield their respective populations from humanitarian disasters. If states fail to live up to this responsibility, it shifts to the international community, including, in the last instance, a responsibility to intervene (ICISS 2001: para 4.20). The emerging norm of a ‘responsibility to protect’ has subsequently been acknowledged – at least rhetorically – by many policy-makers, as exemplified by President Clinton’s speech at the 2000 UN Millennium Summit stressing the need to “find ways to protect *people* as well as *borders*” (Clinton 2000).¹¹ Nevertheless, the willingness of the Security Council to bypass the principle of non-intervention and mandate action under Chapter VII of the UN Charter continued to material-

9 The question whether SCR 688 is indeed a Chapter VII resolution is debated among international lawyers. See Chesterman 2001: 124–133 and 196–201.

ize only in cases of near or total state collapse and humanitarian catastrophes

47.3.4 Collective Security in Crisis

Despite agreement that traditional security concepts did not adequately capture the breadth and nature of contemporary threats, human security as a concept remained too fuzzy to translate into operational policy. Apart from the larger question on how to reconcile 'state' and 'human' security, the UN never developed a concept of how to position itself vis-à-vis the challenges of counterterrorism and the proliferation of weapons of mass destruction. The Security Council actively addressed these issues after 9/11, but its responses remained ad hoc, and the Secretariat offered little leadership.

There was a growing sense that collective security was yet again in crisis. Bringing the simmering crisis to a boiling point was the US-led invasion of Iraq, which led some governments and observers to declare the irrelevance of the United Nations. Supporters of the invasion lamented an inability of the UN to enforce its own resolutions and address today's most salient threats. Opponents of the invasion criticized the United Nations for failing to prevent the US from waging what they saw as an illegal war (Malone 2006).

However, the shared sense of crisis went well beyond the question of whether international rules guiding the use of force are still adequate for today's security threats. Indeed, many countries and peoples question whether a multilateral system shaped in the aftermath of World War II is still adequate for addressing their twenty-first century security concerns. Partly, this reflects the inability of the UN to assemble a comprehensive doctrinal framework underpinning its role in international peace and security after the Cold War. Fundamental questions – such as: What are the world's most pressing threats to international peace and security? What are the basic frameworks for addressing these threats? What are the responsibilities of states in addressing these threats? How should we interpret state sovereignty in today's world? – remain highly controversial at the United Nations.

Against this background Kofi Annan told the General Assembly in September 2003 that the UN should analyse, self-critically, how to address 'new and old' threats more effectively and announced the creation of a *High-level Panel on Threats, Challenges, and Change*, a blue ribbon commission of sixteen eminent persons from all six continents,¹² many of them

former prime ministers and foreign ministers, to undertake this task.

47.4 UN High-level Panel on Threats, Challenges and Change: Towards a New Security Consensus?

On 2 December 2004, the High-level Panel on Threats, Challenges, and Change submitted its report, *A more secure world: our shared responsibility*, to the UN Secretary-General. While much of the public interest focused on its recommendations for reform of the Security Council, its primary ambition was to propose a comprehensive vision of collective security that effectively and equitably addresses the most pressing security concerns of all regions. The Panel's terms of reference asked it to:

- a.) Examine today's global threats and provide an analysis of future challenges to international peace and security. Whilst there may continue to exist a diversity of perception on the relative importance of the various threats facing particular Member States on an individual basis, it is important to find an appropriate balance at a global level and

12 *Anand Panyarachun* (Thailand), former Prime Minister; *Robert Badinter* (France), former Minister of Justice; *Joao Clemente Baena Soares* (Brazil), former Secretary-General of the Organization of American States; *Gro Harlem Brundtland* (Norway), former Prime Minister, former Director-General of the World Health Organization; *Mary Chinery-Hesse* (Ghana), Vice-Chairman, National Development Planning Commission of Ghana, former Deputy Director-General, International Labour Organization; *Gareth Evans* (Australia), President of the International Crisis Group, former Minister for Foreign Affairs; *David Hannay* (United Kingdom), former Permanent Representative of the UK to the UN and UK Special Envoy to Cyprus; *Enrique Iglesias* (Uruguay), President of the Inter-American Development Bank; *Amre Moussa* (Egypt), Secretary-General of the League of Arab States; *Satish Nambiar* (India), former Lt. General in the Indian Army, Force Commander of UNPROFOR; *Sadako Ogata* (Japan), former United Nations High Commissioner for Refugees; *Yevgenii Primakov* (Russia), former Prime Minister; *Qian Qichen* (China), former Vice Prime Minister, Minister for Foreign Affairs; *Nafis Sadik* (Pakistan), former Executive Director of the United Nations Population Fund; *Salim Ahmed Salim* (United Republic of Tanzania), former Secretary-General of the Organization of African Unity; and *Brent Scowcroft* (United States), Lt. General in the United States Air Force, former US National Security Adviser.

to understand the connections between different threats.

- b.) Identify clearly the contribution that collective action can make in addressing these challenges.
- c.) Recommend the changes necessary to ensure effective collective action, including but not limited to a review of the principal organs of the United Nations (UN Secretary-General 2003b).

47.4.1 Defining the Threats

At the outset of its work in December 2003, the Panel's main challenge was thus to determine how broadly to interpret 'threats and challenges to international peace and security'. In his September 2003 speech, the Secretary-General referred to 'hard' and 'soft' threats - with the latter denoting "the persistence of extreme poverty, the disparity of income between and within societies, and the spread of infectious diseases, or climate change and environmental degradation" (UN Secretary-General 2003a). The Panel's terms of reference gave the Panel considerable freedom, noting that "The Panel's work is confined to the field of peace and security, broadly interpreted. That is, it should extend its analysis and recommendations to other issues and institutions, including economic and social, to the extent that they have a direct bearing on future threats to peace and security" (UN Secretary-General 2003b).

After dozens of consultations with government and civil society representatives from all over the world, the Panel members soon realized that perceptions of what constitutes a threat to one's peace and security diverge dramatically across regions - even more so than many of them had anticipated. The major fault line in threat perceptions ran between what has been termed "the perhaps most basic and fundamental division of international life" (Kingsbury/Roberts 2003: 55), namely the gap between poor countries in the developing world and rich countries in the industrialized world. In simple terms, western and industrialized countries seem to see the nexus of terrorism and weapons of mass destruction as threats requiring the most urgent attention. Many within the global South tend to downplay the threat of nuclear terrorism as one that affects only the United States, or even as a fiction fabricated by hawkish policy-makers in Washington. Many of these countries from the global South tend to see socio-economic challenges, such as poverty and infectious diseases - phenomena that are often categorized in the industrialized world as development challenges rather than security threats - as

the most imminent and pressing threats, based on the sheer number of people killed each year by them.

Agreement on what constitutes a threat to peace and security is one of the basic prerequisites of collective action. Understanding that the first step would be a mutual acknowledgement of threats - whether real or perceived - the High-level Panel defined a threat to peace and security broadly as "[a]ny event or process that leads to large-scale death or lessening of life chances and undermine States as the basic unit of the international system" (United Nations 2004: 2). This definition captures both traditional state-centred security threats as well as grave threats to human security (as threats in their own right and not only as 'root causes'), while excluding a number of social ills - such as smoking, suicides, and car accidents - that cause large scale death every year, yet are widely agreed not to be security threats.

Based on this definition the Panel identified six 'threat clusters': 1) socio-economic threats, including poverty, infectious diseases, and environmental degradation; 2) classic inter-state wars; 3) intrastate violence, including civil wars and genocide; 4) weapons of mass destruction; 5) terrorism; and 6) organized crime.

47.4.2 Bridging Collective and Human Security

Simply proposing an all-encompassing definition would not lead to a new security concept nor bridge the divide in threat perceptions. The Panel considered three paradigms for collective action: one argument emphasizes the moral imperative of collective action; a second puts forward the case for a "grand bargain" between the North and the South; and a third emphasizes the interconnectedness of threats and the self-interest of all nations in addressing all threats collectively.

According to the moral imperative, the industrialized world could not watch idly as three million people die each year of HIV/AIDS. Similarly, the failure of the Security Council and/or troop-contributing countries to prevent the slaughter of 800,000 Tutsis and moderate Hutus in Rwanda in 1994 is cited most often as a moral failure. While the moral argument is strong in many cases, it clearly would not be sufficient alone to underpin a comprehensive security concept for the United Nations. The moral imperative is mostly invoked to pressure the industrialized world to address security threats in the global South and is rarely invoked to ask for sacrifices from the developing world to address security concerns of the North.

While moral considerations have certainly influenced foreign policy decisions of powerful UN member states, costly interventions will in most cases be decided based on more restrictive considerations of 'national interest'.

According to a second argument, the gap in threat perceptions could best be bridged by a 'grand bargain' between the industrialized world and the global South. The grand bargain has in common with the moral imperative that it does not presuppose that addressing each other's threats collectively is in all states' self-interest. Otherwise, no bargain would be needed. However, the grand bargain idea implies that security threats are more efficiently addressed in a cooperative framework. In abstract terms, the bargain would thus entail 'cooperation in exchange for cooperation'. More specifically, the core of this bargain could see the 'West' to receive the support from other member states for equipping the collective security system with the 'teeth' to effectively address threats emerging from WMD proliferation and terrorism. In return, the industrialized world would commit to address poverty and infectious diseases through drastic increases in development aid and more equitable trade agreements in key commodities like agriculture and textiles. While the possibility of a grand bargain was intensely discussed within the High-level Panel and initially enjoyed some popularity among the New York diplomatic community, it was ultimately rejected by the Panel members as the main thrust of their report, primarily because the third argument seemed sufficiently strong.

This third argument for a new concept of collective security, and the one the Panel put forward, is based on its analysis of the interconnectedness and transnational impact of today's threats. This argument – if indeed true – suggests that states should address other's threats out of sheer self-interest.

47.4.3 Interconnections, Systemic Effects, and Limits of Self-protection

Indeed, the Panel found abundant evidence that threats today are more interconnected than ever before and, through porous borders and global economic interdependence, often tend to have transnational impact. Such interconnections go well beyond the link between weak or failed states and terrorism that has been invoked repeatedly in the aftermath of the 9/11 attacks. The World Bank has calculated that around 10 million additional people might have been thrown into extreme poverty¹³ (Collier/ Hegre/Hoef-

fler/Reynal-Querol/Sambanis 2003: 3) as a result of the global economic downturn that followed the 9/11 attack. Any terrorist attack against a major western city involving weapons of mass destruction would produce economic ripple effects of a much greater scale. Similarly, through international air travel, Severe Acute Respiratory Syndrome (SARS) spread from an isolated province in China to produce more than 8,000 cases and 30 countries in three months, killing almost 700.¹⁴ Organized crime serves as a threat multiplier, contributing to state weakness (by undermining the rule of law), civil conflict (through illicit trade in conflict commodities and small arms), terrorism (through trade in drugs and other illicit products), and the spread of infectious diseases (through heroin trade and human trafficking).

The fact that threats nurture each other and freely cross borders imposes limits on self protection: "No state, no matter how powerful, can by its own efforts alone make itself invulnerable to today's threats. Every state requires the cooperation of other states to make itself secure. ... Thus all states have an interest in forging a new comprehensive collective security system that will commit all of them to act cooperatively in the face of a broad array of threats" (United Nations High-level Panel 2004: paras. 24–28).

47.4.4 States as Frontline Defenders and Sovereignty as Responsibility

A world of interconnected threats also requires that states prevent these threats from emanating within their countries. Adopting and broadening an understanding of 'sovereignty as responsibility', which was popularized by the International Commission on Intervention and State Sovereignty, the Panel report argues that sovereignty "carries with it the obligation of a state to protect the welfare of its own peoples and meet its obligations to the wider international community" (para. 29). Sovereignty is thus understood as conditional. In cases where states fail to live up to their responsibility to address the manifestation of such threats, this responsibility shifts to the international community.

However, in many parts of the world, states are incapable and/or negligent in safeguarding the security and basic welfare of their citizens. This does not nec-

13 Defined as a daily income of less than US\$ 1 dollar per day.

14 See timeline at: <<http://www.npr.org/news/specials/sars/timeline.html>>.

essarily imply a need for more coercive action or armed intervention, but rather, the need for placing development at the front line of collective security and establishing a sound doctrine for state-building. Many developing countries party to international conventions and subject to Security Council resolutions which impose complex and costly obligations simply lack the resources and capacities for compliance. Placing development at the centre of collective security is further warranted by many quantitative studies that show a strong correlation between extremely low levels of per capita GDP and the occurrence of civil war.¹⁵

The High-level Panel report lacks a discussion of possible contributions of the United Nations in promoting liberal and democratic values as a means to prevent violent inter- and intrastate conflict. This is somewhat surprising inasmuch as the academic literature suggests that democratic regimes are extremely unlikely to fight wars against each other (Brown/Lynn-Jones/Miller 1996).¹⁶ A number of western governments see democratization in the Arab world as the most promising long-term strategy to prevent future jihadi terrorism. Indeed, the UN itself has been at the forefront of democracy promotion, assisting in the preparation and execution of elections in almost 100 countries over the past 15 years. However, beyond electoral assistance and capacity-building, the UN has failed to develop a broad agenda of democracy-promotion – reflecting the anxieties of non-democratic member states and, among democracies, fiercely contested views about preferred models of democratization and democratic governance. The report of the High-level Panel seems to reflect this state of affairs.

47.4.5 Tackling Terrorism and Weapons of Mass Destruction

In addition to proposing a coherent security concept, the High-level Panel drew the UN's focus to the grave threats of terrorism and weapons of mass destruction. Indeed, in the past the United Nations has not shown any leadership on these issues. The Panel report lamented that the UN had not lived up to its normative potential in delegitimizing terrorism and urged the Secretary-General to put forward a comprehensive counter-terrorism strategy (United Nations High-level Panel 2004: 48–49).¹⁷ The report also warned of a severe crisis for the nuclear non-proliferation regime and made recommendations on how to prevent the risk of its total collapse (United Nations High-level Panel 2004: 42–46).

After the release of the report, some Secretariat officials privately voiced scepticism at the Panel's attempt to raise the UN profile in counter-terrorism and non-proliferation. They argued that asking the Secretariat to develop a louder voice on these issues would divert scarce resources from the UN's core competencies in ending wars and building peace in 'second order conflicts', mostly in Africa. The Panel, agreeing that the main operational role of the UN lay in peacekeeping and peace-building, argued that the UN could not be silent on terrorism, weapons of mass destruction, and great power conflict. David Malone (2006) writes that if the United Nations "resigns itself, or is consigned by the major powers, merely to address often intractable civil wars of a geo-strategically secondary character, then the UN, in the security sphere, will recede to little more than it amounted to during the Cold War years, a far cry from the terms and ambitions of the Charter" (Malone 2006).

The Panel offered a new and comprehensive vision of collective security which was based on a broad notion of security threats, on the interconnectedness of threats, self-interest, and an understanding of sovereignty as responsibility. It also called for a new seriousness in addressing terrorism and weapons of mass destruction.

The Panel's recommendations provide a central role for the UN and its principal organs, but its concept of collective security is in fact much broader. It calls for "collective strategies, collective institutions,

15 A country with a GDP per person of just \$ 250 has a predicted probability of war onset at some point over the next five years of 15%. Doubling per capita income approximately halves the risk of rebellion. See: Collier/Hegre/Hoeffler/Reynal-Querol/Sambanis 2003: 58.

16 The data are more ambivalent as far as internal conflicts are concerned. While there are studies that suggest well-established democracies are less likely to experience civil wars than autocratic societies, this finding does not apply to sub-Saharan Africa (Esty/Goldstone/Gurr/Surko/Unger 1998). Several studies have shown that countries in democratic transition are more likely to experience civil war than democratically or autocratically governed countries (Snyder/Mansfield 1995; Esty et al. 1998).

17 The Secretary-General did implement the panel report's recommendation in his speech at the Club of Madrid summit on 10 March 2005 (UN Secretary-General 2005a)

and a sense of collective responsibility” (United Nations High-level Panel 2004: 1). In particular, the Panel’s recommendations addressing terrorism and weapons of mass destruction underscore the necessity of complementary multilateral, bilateral, and even “plurilateral” action. Given that this vision of collective security differs significantly from the traditional concept of collective security, a debate took place within the Panel on whether to use the term ‘collective security’, or to introduce a new term. Some argued a new term such as ‘cooperative security’ or ‘preventive security’ was necessary “to inspire people to think in a new way” and because ‘collective security’ had a well-established definition which the Panel could not single-handedly alter. ‘Preventive security’, was rejected by several panellists, who argued that this term was 1) too narrow; 2) misleading because the United Nations would necessarily continue to be reactive; and 3) harmful by evoking association with the 2002 US National Security Strategy (NSS), which was widely interpreted as advocating the preventive use of force against emerging threats. Another group did not want to include binding elements of chapter VII under the term ‘cooperative security’ out of fear that lumping them together with the voluntary socio-economic provisions in the charter would weaken the binding nature of Security Council action. Still others were concerned that the introduction of a new concept of security “would require a thorough conceptual examination and enormous efforts if we were to win familiarity and support”. In the end these objections prevailed and panellists decided to maintain the term collective security, redefining it along the way.¹⁸

47.5 Response to the High-level Panel Report

The report of the High-level Panel attracted significantly more attention in the UN community than any previous blue ribbon report.¹⁹ This could be attributed to a number of reasons. First, the report contained recommendations on reform of the Security Council. Second, the Secretary-General frequently alluded to his high expectations for the Panel’s deliber-

ations; the fact that he took on most of the Panel’s recommendations in his own report was equally important. Third, the diversity of the Panel’s members left many observers surprised at their substantive and viable recommendations. Finally, many recommendations in the report were not novel but reiterated the exhortations from previous reports and government proposals, or emphasized breaking deadlock in long-standing debates. Many of the Panel’s recommendations satisfied pre-existing constituencies.

By January 2005, the Secretary-General indicated that he would issue his own report. The release of the High-level Panel report in December 2004, combined with the release of the Millennium Project report (on the Millennium Development Goals) in January 2005, provided an opportunity for the Secretary-General to synthesize two substantive inputs on security and development. The release of these two reports also inspired a call among member states and senior Secretariat officials for the planned high-level review of the Millennium Development Goals preceding the 60th General Assembly to be a more ambitious event, combining security, development, and human rights in a broad agenda of renewal.

After consultations on the Panel and Millennium Project reports in the General Assembly and other fora, the Secretary-General released his report, *In Larger Freedom: toward Security, Development and Human Rights for All*, on 21 March 2005. The report contains four sections: “freedom from want”, drawing on the recommendations of the Millennium Project for achievement of the Millennium Development Goals; “freedom from fear”, endorsing the concept of collective security and other select recommendations from the High-level Panel; “freedom to live in dignity”, incorporating recommendations on human rights, the rule of law and democracy; and “strengthening the UN”, with recommendations on institutional reform, including those of the High-level Panel. The Secretary-General also offered a blueprint of priority recommendations for world leaders to consider at the 2005 World summit, scheduled for September of that year.

The report of the Secretary-General endorses the Panel’s general concept of collective security. Arguing that “we will not enjoy development without security, we will not enjoy security without development, and we will not enjoy either without respect for human rights” (United Nations Secretary-General 2005b: para. 17), it underscores interconnections among threats and interdependence among states – the Panel’s core arguments. However, the term ‘collective

18 The previous paragraph is not based on any published material but on the recollection of two of the authors of the present article who were present during the Panel deliberations.

19 For responses in the political and scientific literature, see: Prins 2005; Einsiedel 2005; Ozgercin/Steinhilber 2005; Fassbender 2005; Berdal 2005.

security' is employed only under the rubric of security, rather than as an encompassing concept for security, development, and human rights. In part, this reflects criticism from developing countries, which faulted the Panel for 'securitizing' its fundamental concerns, that is, addressing development in "a selective manner, focusing only in terms of poverty, infectious diseases and environmental degradation and only insofar as they affect or influence international peace and security" (Neil 2005). Some member states saw in an overarching concept of collective security the oft-cited potential to help mobilize resources for development and human rights. However, to the frustration of many members of the High-level Panel, which was aggressively lobbied to include socio-economic threats in its analysis, much of the developing world seemed unconvinced; conventional wisdom among these states pronounced that such a broad concept of collective security would detract from rather than increase resources for development.

Such reluctance to accept collective security as a broader concept has hindered the Panel's effort to reconcile state and human security. The Secretary-General's report does incorporate three 'freedoms', similar to those frequently articulated by advocates of human security.²⁰ It promotes human security concerns as the ultimate objective for all security concerns, 'broadening' and 'deepening' traditional, state-centric conceptions of security. The Secretary-General's report also follows the Panel's three methods of reconciling 'human' and 'state security', pointing to interconnections among threats, the imperative of international cooperation, and moral argumentation as well. However, the report does not integrate concerns associated with development, security and human rights under one, unified concept of collective security. And while acknowledging that the security of states depends on the security and well-being of sub-state groups, it is less forceful in arguing the inverse: that development and human rights are contingent on state security.

Despite efforts of the Secretary-General to address for reactions to the Panel and Millennium Project reports, criticism of *In Larger Freedom* was scarcely different. Developing countries considered a focus on the achievement of the Millennium Development Goals too narrow. Those countries which considered

the Panel report too heavily focused on the Security Council and other enforcement activity echoed their previous criticisms. Recommendations on human rights and the rule of law, being relatively new, elicited a familiar brand of scepticism.

Potentially enduring trends among country groupings have emerged. African and European states have to some extent demonstrated a shared understanding of appropriate qualifications on national sovereignty, particularly through agreement on humanitarian and peace-building measures. Attitudes on sovereignty within the Asian group (including the Middle East) were more conservative.

Ultimately, states have been content to broaden other states' concept of security, allowing that what impacts them should be of concern to others. Yet most are far less eager to accept the necessary corollary: that they must also deepen their own concept of security, accepting that threats which affect others should concern them and that their own sovereign conduct could be subject to multilateral scrutiny as well.

47.6 The 2005 World Summit Outcome and Beyond

Subsequent negotiations in the General Assembly on a summit declaration reveal a similar pattern. When over 160 heads of state and government convened in New York in September 2005, insistence on the inclusion of numerous country groupings' narrow proposals had expanded from the Secretary-General's original eight page blueprint for decisions by world leaders from to nearly forty pages. Months of intergovernmental negotiations in the UN's ideologically overcharged atmosphere had turned the document into a convoluted assemblage full of generalities. While the document reflects the widely endorsed stress on interlinkages between security, development and human rights, the fact that many of the Secretary-General's recommendations were abandoned in the negotiation process exposed the predominantly rhetorical nature of such endorsement.

Notwithstanding all its shortcomings, the summit's final outcome document nevertheless contains several important agreements reflecting a convergence of international views in a few areas relevant to international peace and security. Most significant is the agreement on a collective "Responsibility to Protect" populations from genocide, war crimes, crimes against humanity, and ethnic cleansing. Unsurpris-

20 See: Human Security Network, which calls for "freedom from fear and freedom from want, with an equal opportunity to fully develop their human potential", at: <<http://www.humansecuritynetwork.org/menue-e.asp>>.

ingly, the Security Council's response so far to the mass-killings in Darfur suggests that economic and political interests, and reluctance to commit troops will continue to stand in the way of a consistent and principled application of the Responsibility to Protect. Nevertheless, the endorsement of the principle is important insofar as die-hard "sovereignty hawks" can no longer credibly argue that crimes against humanity are an "internal affair" and therefore outside the scope of Security Council jurisdiction.

Other achievements of the summit include the strong condemnation, by all governments, of terrorism "in all its forms and manifestations, committed by whomever, wherever" and its characterization as a "threat to international peace and security". While in the past, the Secretary-General and the Security Council had repeatedly issued similar condemnations, this was the first time that the General Assembly produced such unconditional language. While this represents a step forward, the Outcome Document conceals continued disagreement among member states on whether violent attacks by groups fighting to end foreign occupation constitutes terrorism.

The most tangible outcome of the summit can be found in several institutional innovations, most significantly the creation of an intergovernmental Peacebuilding Commission. Such a Commission had been proposed by the High-Level Panel to help war-torn countries to move towards sustainable peace. However, at the summit, member states failed to agree on the new body's modalities, reporting relationships and mandate and left it to the General Assembly to negotiate the details. Agreement was finally achieved in late December on an advisory body closely tied to the Security Council, particularly during the immediate post-conflict phase, and more loosely to ECOSOC for economic reconstruction features of peacebuilding strategies.

Several commentators have lamented that the Peacebuilding Commission will not have a conflict prevention mandate, as the High-level panel had suggested. Intergovernmental negotiations have turned an originally good idea into a "Frankenstein's monster" (the Commission's Organizational Committee will have 31 members potentially condemning it to irrelevance), but the focus on prevention is misplaced: 1) Giving an organ so closely tied to the Security Council a preventive mandate would elicit strong fears among many developing countries; 2) The Commission should not be overloaded; 3) Research tells us that fully half of the countries that emerge from civil war relapse into conflict within five years, suggesting

that successful post-conflict reconstruction is the most effective conflict prevention (Collier/Elliot/Hegre/Hoeffler/Reynal-Querol /Sambanis 2004: 103-110).

In addition to significantly increasing the resources available to the office of the UN's High Commissioner for Human Rights (HCHR), the summit also decided on the establishment of a new Human Rights Council to replace the Commission on Human Rights. The old Commission was widely seen as discredited because of notorious human rights violators repeatedly serving on this body - and on occasion even chairing it. As with the Peacebuilding Commission the summit dodged many difficult questions and it was only in March 2006 that agreement was reached in the General Assembly on the Council's membership, its election mechanism, and the scope of its powers. Compared to the original proposal by the Secretary-General, the actual body is significantly weaker. In particular, the fact that members of the Council will be elected by a simple majority of the General Assembly instead of the proposed two-thirds majority might not prove a sufficiently high hurdle to keep out the worst human rights offenders. That the US, initially the council's strongest supporter, voted against the General Assembly Resolution establishing it raises an additional hurdle that the Council has to overcome.

In any case, new bodies do not necessarily reflect fresh agreement on new threats and challenges. Instead, creating new institutions can prove easier than resolving the difficult problems or poor coordination that affect existing ones (Sending in this volume). Positions on key development, security, and human rights proposals have not been approached with a spirit of compromise, or with any new recognition of burgeoning interdependence that require such an approach. The very issue which led the Secretary-General to initiate the reform process in question - perceived disagreement on rules and norms governing the use of force - has remained wholly unaddressed.

The greatest disappointment of the summit outcome document, however, is its failure to even mention the threat posed by weapons of mass destruction. This striking gap was foretold when the Non-Proliferation Treaty (NPT) Review Conference earlier that year ended without the parties having even agreed on an agenda, just ten years after a predecessor conference managed to extend the NPT indefinitely. Worryingly, this unprecedented lack of consensus on the issues of non-proliferation and disarmament emerges at a time when the nuclear non-proliferation regime is

Table 47.1: Peace and Security highlights of the 2005 World Outcome Document: Achievements and Shortfalls

Achievements ^{a)}	Shortfalls and status of implementation as of August 2006
Terrorism	
Clear and unqualified condemnation – by all governments, for the first time – of terrorism “in all its forms and manifestations, committed by whomever, wherever and for whatever purposes.”	In spite of this strong condemnation of terrorism, governments failed to agree on a definition of terrorism.
Strong political push for a comprehensive convention against terrorism within a year.	This dead-line has not been achieved and agreement on outstanding questions remains elusive.
Agreement to fashion a UN strategy to fight terrorism.	The Secretary-General in spring of 2006 has put before the GA a comprehensive counter-terrorism strategy as a basis for discussion. Negotiations among Member States on an intergovernmentally agreed strategy were still ongoing by summer 2006 with no agreement in sight.
Disarmament and Non-Proliferation	
	Because of profound disagreements among member states on the question of disarmament and non-proliferation, the Outcome Document did not contain a single paragraph on this issue.
Use of Force	
Agreement that the right of self-defense laid down in Article 51 of the UN Charter remains valid.	Member States could not agree on whether Art. 51 can be invoked, under certain conditions, in cases of anticipatory self-defense.
Peacebuilding, Peacekeeping, and Peacemaking	
Decision to create a Peacebuilding Commission (PBC) to help countries transition from war to peace, backed by a support office and a standing fund.	The PBC and a support office were up and running by the summer of 2006 with Burundi and Sierra Leone as first test cases. Whether they will succeed in making a difference on the ground remains to be seen. The standing fund is expected to be established in fall of 2006, pending Agreement of the fund’s terms of references.
New standing police capacity for UN peacekeeping operations.	A core capacity for planning and directing police operations is in the process of being set up in the UN Secretariat.
Agreement to strengthen the Secretary-Generals’ capacity for mediation and good offices.	The General Assembly granted the creation of two new posts to form the core of a new mediation support unit within the UN Secretariat.
Responsibility to Protect.	
Acceptance by all governments of a collective international responsibility to protect populations from genocide, war crimes, ethnic cleansing and crimes against humanity.	The recent international response to Darfur calls into question the seriousness of the commitment by members of the Security Council “to take timely and decisive collective action (...) when peaceful means prove inadequate and national authorities are manifestly failing to do it.”
Human Rights, Democracy, and the Rule of Law	
Decisive steps to strengthen the UN human rights machinery doubling the budget of the UN High Commissioner for Human Rights.	
Agreement to establish a UN Human Rights Council (HRC) within a year to replace the discredited UN Commission on Human Rights.	In late spring 2006 Member States agreed on the institutional framework of a HRC, which convened for the first time in June 2006.

Table 47.1: Peace and Security highlights of the 2005 World Outcome Document: Achievements and Shortfalls

Achievements ^{a)}	Shortfalls and status of implementation as of August 2006
Reaffirmation of Democracy as a universal value and welcome for a new Democracy Fund.	As of June 2006, the Democracy Fund has received contributions of over \$40mil and pledges of another \$9 mil from 17 countries.
Security Council Reform	
	No agreement on reform and expansion of the Security Council

challenged as never before by the North Korean withdrawal from the NPT and over Iran’s nuclear program.

In the final analysis, the summit made clear that proposing a broad security consensus to implement a broad set of institutional and policy reforms could be built- all in a ‘big bang’- ultimately failed. Nevertheless, the process forced member states to confront and seriously discuss security issues that would otherwise have never made it on the agenda of the General Assembly. The Peacebuilding Commission and the Human Rights Council might also prove to be important innovations, although only time will tell whether these institutions can fulfil the high hopes invested in them. Maybe most importantly, the High-level Panel process instigated a significant improvement in the relations between Washington, DC and ‘Turtle Bay’, which were at an all time low in late 2004 due to aftershocks of the Iraq crisis and the oil-for-food scandal. Since then, the reform process has led to a remarkable re-engagement of the US administration with the UN Secretariat, reinforcing what looks from the outside like a strategic re-evaluation of the relationship during the 2nd term of the Bush administration. Whether the serious deadlock on the much-expected UN management reform that emerged in April of 2006 will again seriously sour US-UN relations remains to be seen.

47.7 Conclusion

The UN’s policy and institutional architecture for addressing security threats has evolved dramatically since the end of the Cold War. Confronted with a range of new challenges and opportunities, the UN has played an expanding role in addressing civil violence, peacebuilding, countering terrorism, and preventing the proliferation of weapons of mass destruc-

tion. In so doing, the UN has demonstrated an increasing willingness to authorize and undertake military interventions in situations that had traditionally fallen into the orbit of internal affairs, and to call on states in binding resolutions to develop and implement prescribed domestic legislation. Security Council resolutions addressing problems from ethnic cleansing to nuclear proliferation have also focused on non-state actors, be it for their own protection or for their regulation to protect other member states (see chapter by Dedring).

This evolving treatment of security threats has been accompanied by a conceptual shift in the understanding of security. This understanding has more often followed rather than inspired UN action. The post-Cold War agenda of the Security Council has supported the concept of ‘human security’, which insists that safeguarding state security ultimately requires the protection of the security of groups and individuals within the borders of states. In parallel with concurrent trends in UN and state decision-making, this normative evolution has qualified the principle of absolute sovereignty that was for decades considered inextricable from the UN’s original, state-centric concept of ‘collective security’.

Yet remaining contradictions have prevented the UN from identifying a coherent security concept since the end of the Cold War. Reports such as: *An Agenda for Peace* (United Nations 1992) and the *Responsibility to Protect* (ICISS 2001) provided intellectual guidance on certain aspects of the UN’s work in this new environment. However, in the Secretariat and among member states, different visions of the UN’s new role in peace and security have uneasily coexisted, hampering effective approaches to address new threats and challenges.

In the absence of a coherent security concept, the organization has dichotomized ‘hard’ security threats to ‘state security’, such as armed conflict, terrorism,

and weapons of mass destruction, versus 'soft' threats to 'human security', such as poverty, infectious disease, and environmental degradation. Linkages between these threats have been highlighted to various degrees, but were not underscored until the attacks of 11 September. The report of the High-level Panel attempted to describe the nature and extent of those linkages, and to reconcile them with the UN's founding concept of 'collective security'. In arguing that threats to human and state security are a threat to all states, the Panel has reaffirmed the importance of sovereignty to safeguard human security, but it has also qualified sovereignty to reaffirm the objectives of the 'human security' agenda.

However, states' responses to the security concept offered and endorsed by the Panel have evinced only rhetorical support. The failure of the 2005 World Summit to agree on many proposals by the Panel and the Secretary-General reflect a much broader failure to reach consensus on a coherent security concept. States maintain dramatically divergent understandings of what constitutes a threat to peace and security, and, in practice, scepticism on the scope and extent of true interlinkages between these threats.

In the months preceding the World Summit, many observers had argued that such a climate would undermine any attempt at sweeping reform, or worse, foment "an unnecessary crisis" (See Berdal 2005). The Secretary-General himself recognized that risk, noting early in May that "there are times when multilateral forums tend merely to reflect, rather than mend, deep rifts over how to confront the threats we face" (Annan 2005a). The World Summit has consolidated some of the UN's institutional and normative achievements since the end of the Cold War. In so doing, it has also demonstrated, once again, that conceptual shifts usually follow rather than instigate policy evolutions at the UN. But until interlinkages between threats become more evident in practice, and until states' national policy doctrines reflect these more deeply, a new consensus around collective security will remain only an aspiration.

48 Security, Development and UN Coordination

Ole Jacob Sending

48.1 Introduction

Secretary-General Kofi Annan has made it a key objective to reform the United Nations (UN) from a “culture of reaction to a culture of prevention” (Annan 1997). Annan’s reform-initiative is based upon the idea that there is an inherent relationship between development and security, and that investment in development efforts is the most effective way for the UN to fulfil its goal, as stated in the Charter, of “saving coming generations from the scourge of war” (Annan 2001). The question of the prospects for conflict prevention and on the more general relationship between development and security currently receives intense scholarly and political attention.¹ Indeed, an international consensus has emerged on an inherent relationship between development and security, as has been mentioned in the final document of the 2005 World Summit in September 2005, which states that “we recognize that development, peace and security and human rights are interlinked and mutually reinforcing” (UN 2005).²

Given this high-level political consensus on the imperative to invest in conflict prevention, and to address the nexus between development and security, it is important to ask whether and how the UN’s institutional structure has been transformed accordingly. How and to what extent, for example, has the pre-existing institutional set-up of the UN been adjusted to respond to the ‘nexus’ between development and security? This chapter explores this question, pointing to key changes in the thinking on development and

security since the early 1990’s³ (53.2), exploring the emergence of ‘prevention’ as a systemic norm within the UN (53.3) and, analysing efforts within the UN aimed at integrating development and security policy (53.4).

Rather than analysing the UN merely as an arena where states meet to negotiate and formulate policy, the UN is treated as an actor – as a bureaucratic organization comprised of distinct policy fields differentiated by their mandates, forms of expertise and institutionalized, issue-specific interests (Barnett/Finnemore 2005). Within such a perspective, it is possible to combine a focus on how divergent interests of UN member states interact with the conflicting views and interests embedded in the different policy fields that make up the UN.

As shown below, the recognition of the primacy of prevention and of the need to bring development and security policy closer together has yet to materialize in significant institutional changes within the UN. Instead, coordination has emerged as a solution to increased calls for comprehensive, system-wide approaches that deal with the inter-linkages between development and security. This can be explained by the continued existence of deep-seated disagreements between different parts of the UN bureaucracy, where different organizational units jealously guard their turf, and the more fundamental issue of divergent views among UN member states about the proper role of the world organization in global politics.

1 Influential think tanks and research institutes, such as the International Peace Academy, the Center on International Cooperation, NYU and the Social Science Research Council in New York with close links to policy debates within the UN, have research programmes on peacebuilding and conflict prevention.

2 See the Report of the Secretary-General’s High-level Panel on Threats, Challenges and Change (UN 2004); Annan (2005); United Nations (2005): para 9: 2.

3 In this chapter the concepts ‘security’ and ‘development’ are analysed as they are used by official actors and institutions in the UN system. This chapter does not intend to distinguish between different meanings of security, except in those instances where different interpretations of these terms have a bearing on the institutional changes within the UN system. For more detailed analyses of these developments, see above chapters 50 by Dedring, 51 by Einsiedel/Nitzschke/Chhabra and 52 by Kaul.

48.2 Evolution in Security Thinking

The policy-field of security was confronted with a series of new challenges during the course of the 1990's. For one, the cognitive-normative framework of global politics increasingly defined state sovereignty in relative, not absolute terms. And, importantly, the end of superpower rivalry meant that the UN Security Council could play a more active role in global politics. The character of many violent conflicts that reached the UN Security Council were markedly different from those of the cold war era.

Spurred by the end of the cold war, the international community began contemplating how the UN could assume a much stronger role beyond the negotiation (or enforcement) and monitoring of peace agreements. Experiences from El Salvador and Mozambique, from Angola and Cambodia, suggested that a central challenge for the UN would be to formulate policies and strategies that focused on laying the foundations for a peaceful re-building of war-torn societies. This required more holistic approaches, well beyond the mandates and policy tools of UN peace operations. It included efforts aimed at good governance, democratization, social inclusion and poverty eradication.

The challenge for the UN was how to transform the short-term presence of peacekeepers into efforts aimed at societal transformation aiming at building peace, as opposed to providing security. It brought security thinking and practice into closer collaboration with development policy.

Underlying these changes in security thinking was not only the recognition of a new character of violent conflicts to which the UN had to respond. The gradual incorporation within security policy of a concern with human rights, democracy, and justice had much to do with the normative and political changes that took place in the 1990's. Human rights norms assumed a much stronger status. Such norms helped broaden the security-agenda, and it paved the way for the formulation of the 'human security' agenda which infused concerns within security debates about the extent to which the international community could intervene in a sovereign state to protect the security of individuals.⁴

Moreover, problems related to so-called "failed states" and the international structures of sovereign states emerged as a key concern within security policy

(Boutros-Ghali 1992, 1995). This meant, among other things, that efforts aimed at institutional reform - a key element within development policy - became an increasingly important issue in discussions about ways to address violent conflicts. It was in this context that conflict prevention and the contribution of development policy to peacebuilding strategies came to form a central focus of political and scholarly debate during the latter half of the 1990's.

48.3 Emergence of Prevention

Motivated by the different political context, after the end of the cold war, security analysts and peace researchers increasingly focused on intra-state war and the "wider cycle of conflict; the structural and short term causes of conflict..." and "the processes of conflict resolution and the substance of peacebuilding" (Dwan 2002: 98). The research partly addressed the so-called 'root causes' of violent conflict. Both research and advocacy for conflict prevention were triggered or motivated by the perception that the UN and the international community had failed to meet the high hopes for a new international order of peaceful relations in the post-cold war era. As one commentator observed, "the sobering experiences of the United Nations and the world at large in Somalia, Rwanda, and Yugoslavia gave rise from the mid-1990's onwards to the realization that there exists a clear need to reassess the role of the UN and other international entities in conflict prevention and conflict management" (Tanner 2000: 542).

Much literature emerged on the long-term aspects of 'peacebuilding' and the prospects of identifying and addressing the underlying and intermediate causes of conflict (Lund 1996; Chayes/Chayes 1996; Gurr/Davis 1998; Schmeidl/Adelman 1998; Wallenstein 1998). Linked to this policy-driven research were an increasing number of states and NGOs that approached the UN with a comprehensive preventive focus.⁵ When Kofi Annan assumed office as Secretary General in 1997, the momentum for conflict preven-

4 On the evolution of the concept of 'human security', see the chapter by Dedring above.

5 The International Crisis Group, International Alert, and the European Platform for Conflict Prevention and Transformation - a network launched in 1997 of more than 150 organizations advocating conflict prevention - were active in pushing the conflict prevention agenda. Some governments (Canada, the Netherlands, Sweden) supported actors involved in research on and advocacy for conflict prevention (Björkdahl 2002), e.g. the Swedish Ministry of Foreign Affairs (1997).

tion was growing. In his first major report on UN-reform, Annan (1997) called for a “culture of prevention”, and in 2001, he issued a report on the prevention of armed conflict (Annan 2001). For some time the emphasis on early warning and preventive action had been an essential and non-controversial feature of humanitarian work (floods, droughts, earthquake or war). However, the idea that the UN development assistance should be focused on the prevention of armed conflicts within sovereign states was far more controversial (see chapter by Dedring above).

A major input for a comprehensive focus on prevention including the role of development assistance emerged from the Report to the Commission on Global Governance (1995) which asserted that “a root cause of many conflicts is poverty and underdevelopment”, and that “clearly, the best solution to security crises is to remove or alleviate the factors that cause people, groups, and governments to resort to violence” (Commission on Global Governance 1995: 97). This report was instrumental for an increased political attention on the relationship between underdevelopment and security, and thus on the prospects for using development assistance strategically to prevent violent conflict.

Building on an expanding body of literature arguing for the feasibility and cost-effectiveness of conflict prevention, the *Carnegie Commission on Preventing Deadly Conflict* (1997) argued for a comprehensive approach to prevention. Its final report distinguished between ‘operational’ and ‘structural’ prevention. Structural prevention was defined as “strategies to address the root causes of deadly conflict, so as to ensure that crises do not arise in the first place, or that, if they do, they do not recur.”⁶ The report stressed that such strategies would include “meeting people’s basic economic, social, cultural, and humanitarian needs; and rebuilding societies that have been shattered by war or other major crises.” (Carnegie Commission on Preventing Deadly Conflict 1997. Chapter 4, p. 1). In 1998, Kofi Annan used this distinction between “operational” and “structural” prevention, noting that “The United Nation’s structural prevention strategy involves ... preventive disarmament, development and peacebuilding. Guiding and infusing all these efforts is the promotion of human rights, democratization and good governance as the foundation of peace” (Annan 1998; Luck 2002).

The UN Security Council responded to the Secretary-General’s ideas with a statement in November 1999 supporting the goal of a “culture of prevention” and recognized the need for more extensive collaboration between the UN Security Council and ECOSOC, highlighting the importance of a “coordinated international response to economic, social, cultural, or humanitarian problems” (UN Security Council 1999; 2000). Actors in the development community used this new justification for investment in development aid and they rapidly developed a set of policy concepts that addressed the nexus between development and security. The UNDP, for example, transformed its Emergency Response Division on humanitarian crises into a Bureau for Crisis Prevention and Recovery, aiming also at conflict prevention. Similar institutional developments took place in most, if not all, multilateral and bilateral development agencies in this period (Carment/Schnabel 2004, Hampson/Malone 2002).

48.4 The Politics of Coordination

During the cold war, security and development were thoroughly institutionalized as separate ‘policy fields’ with distinct objectives and means of intervention where development concerned North-South relations, while security focused on East-West relations (Lundestad 1999; Duffield 2001). These two policy fields were, moreover, supported by two different social scientific disciplines of “security studies” and “development studies”, which have contributed to a considerable cognitive division of labour (Cooper/Packard 1998, Bilgin/Morton 2002). This feature of the UN system - its organization as ‘pillars’ with distinct mandates, goals and modes of intervention - is crucial for an understanding of current efforts for creating coherence and consistency between development and security nexus. From this background the UN may be treated not only as an arena where states meet, but also as an actor in its own right with a degree of autonomy and insulation from states’ interests.

The UN is an international bureaucratic organization comprised of a host of different departments, funds, programmes and specialized agencies, each with their own mandate, expertise, and organizational culture. As bureaucracies, moreover, these different units of the UN have a not insignificant capacity for agenda-setting in global political debates, but also for engaging in turf battles (Barnett/Finnemore 2005). This forms the background for looking at the types of institutional mechanisms that have been established in

6 Carnegie Commission on Preventing Deadly Conflict (1997), see at: <<http://www.wilsoncenter.org/sub-sites/ccpdc/pubs/rept97/finfr.htm>>, chapter IV: 1.

an effort to ensure that development and security are linked within the UN.

In the past, governments have consistently postponed making major decisions bearing on the organization of the UN system. Even the fundamental problem of overlapping responsibilities has not been faced squarely, let alone addressed....Today, there is agreement on all sides that changes must be far-reaching if the UN development system is to expand effectively and the Third World is to receive the service to which it is entitled (UN 1969: 18).

This quote from the so-called 'Capacity Study' of 1969 is still valid and describes the UN as an organization characterized by a high level of institutional fragmentation, partly due to the political resistance among member states to centralize authority in international organizations, and partly due to turf battles existing in all organizations (Haas 1991).

To get a sense of how the UN has sought to respond to the challenges of bringing development and security policy closer together, it is useful to look at the discrepancy between stated goals and organizational practice in the interrelated fields of conflict prevention and peacebuilding. The UN Secretary-General has provided a definition of peacebuilding that echoes common usage: "actions undertaken at the end of a conflict to consolidate peace and prevent a recurrence of armed confrontation" (Annan 1998: para 63). Peacebuilding thus encompasses a wide range of policy tools at the disposal of the UN. The General Assembly has resolved "to make the United Nations more effective in maintaining peace and security by giving it the resources and tools it needs for conflict prevention, peaceful resolution of disputes, peacekeeping, post-conflict peacebuilding and reconstruction" (UNGA Millennium Declaration, 2000). Similarly, the Secretary-General's report on conflict prevention from 2001 states that: "An effective preventive strategy requires a comprehensive approach that encompasses both short-term and long-term political, diplomatic, humanitarian, human rights, developmental, institutional and other measures taken by the international community" (Annan 2001: 37).

The UN Department of Political Affairs (UNDPA) has been designated as the 'focal point' for conflict prevention within the UN system. It is meant to create system-wide coherence and consistency and to drive the process of infusing the UN with a 'culture of prevention'. It is doubtful whether Björkdahl is correct asserting that "UNDPA ensures mainstreaming of conflict prevention within the United Nations system" (Björkdahl 2004: 390). The reason is that the UNDPA

has few resources to instruct and guide other parts of the UN system, in particular UN development funds and programmes, which have their own board, mandates, budgets, and executives. UNDPA - being part of the UN secretariat, may develop policies in the field of 'operational prevention', but have few, if any, mechanisms by which to instruct those parts of the UN system that are engaged in 'structural prevention', such as UNDP. Meanwhile, the UNDP has established a Bureau of Conflict Prevention and Recovery (BCPR), which focuses on more structurally oriented prevention. The mechanisms in place for bringing together the work of the UNDPA and UNDP, both of which advance distinct interests and perspectives on prevention, fall in the category of 'coordination', which relies exclusively on the goodwill and convergence of interests between the two organizations. Indeed, coordination can be seen as a relatively cost-free organizational solution inasmuch as it keeps existing divisions of labour, authority, and competence in place, while simultaneously seeking to address issues that fall within the area of competence of several organizational units. Anyone who has observed debates about UN reform would recognize that any suggested changes in existing institutional structures generates opposition, as all bureaucratic organizations are adept at engineering support from a sufficient number of member states so as to halt suggestions of fundamental organizational reform (Luck 2003).

The Brahimi Report was replete with calls for more integration at UN headquarters in order to bring the full range of policy tools at the disposal of the UN (humanitarian, developmental, and security) to bear on the challenges of stabilizing, securing and developing fragile and war-torn societies. The report suggested, for example, the establishment of "Integrated Mission Task Forces" (IMTFs) to ensure joint planning and decision-making between relevant parts of the UN. However, the IMTFs were unable to forge an integrated approach. The Stimson Center's review of the implementation of the proposals in the Brahimi Report noted that "These IMTFs, ... have lacked decision authority and recourse to higher level bodies for validation or appeal, serving more as brainstorming and drafting committees" (Durch/Holt/Earle/Shanahan 2003: xix).

The experiences with the IMTFs are indicative of the inflation in coordination mechanisms within the UN. Some headway has been made with the recent attempt to establish "Integrated Missions", giving more authority to the Secretary-General's Special Representative (SRSR) to decide on the UN's different or-

ganizations in the field. The plethora of funds and programmes (UNDP, UNICEF, WHO, WFP etc.) over which the SRSG has some formal authority on the ground, nevertheless have distinct mandates and are accountable to separate executive boards at headquarters level. Against this background, there is little an SRSG can do to forge a genuinely coherent approach. Moreover, development assistance for post-conflict reconstruction is typically funded by voluntary contributions, where donors specify for which purpose their money is to be spent. The lack of integration or centralization at headquarters level thus trickles down to the field. Thus, the UN is characterized by a fragmented mode of operations (Eide et al. 2005; Dahrendorff et al. 2003). As Michele Griffin (2003: 209) has observed, success of coordinated efforts on the ground often hinges on the

relationship between the resident coordinator and the high-level special representative of the Secretary-General (SRSG) – who is usually in charge of the good offices or peacekeeping presence and also officially the lead authority over the whole UN presence on the ground, but who often enjoys little in the way of resources with which to enforce this authority.

Hence, we have case where there is agreement on the need for a coherent and consistent approach, but where there is neither a ‘head piece’ that can control and apply the wide spectrum of policy tools in a genuinely integrated manner, nor funding mechanisms that guarantee that there is funding for all the tasks that all agree must be performed (Dahrendorff et al. 2003; Tschirgi 2004). As one commentator has observed, “[W]hile there is general acceptance of the broad guidelines governing international action in post-conflict reconstruction and peacebuilding, ...relatively little has been done to create the institutional and human resource capacities necessary to effectively plan and implement the civilian components of multi-dimensional peace operations” (Foreman 2004: 2). The inflation of coordination mechanisms thus also extends to the field level, where the time and energy spent on coordination (coordination meetings in particular) is a frequent source of frustration among UN staff. A recent report on UN peacebuilding thus argued that the overall impression was summed up in the comment by an NGO-representative about how “coordination has become an end in itself” (Kaspersen/Sending 2005: 19).

In recognition of the multidimensional character of conflict prevention, the UN “Interdepartmental Framework for Coordination on Early Warning and Preventive Action” is meant to coordinate and ensure

system-wide coherence in the field of conflict prevention, including the sensitive area of early warning.⁷ It has no legal basis of operations, however, as the efforts to establish the UN with a level of ‘intelligence’ capacity has consistently been shut down by member states.⁸ As a consequence of its informal status it cannot make binding decisions for its constituting members, which makes it hard to see how the Framework Team can serve as the system-wide mechanism for ensuring that conflict prevention is infused in all of the UN’s activities.

These examples serve as an indication of how the institutional structure of the UN – both on the inter-governmental and bureaucratic side – are still heavily shaped by the institutional-political separation of development and security that emerged in the formative period of the UN. In this period, development was defined as a technical and apolitical task external to matters of security, as reflected in the different functions and powers of the UN Security Council and the Economic and Social Council (ECOSOC). Listing the innovative replies generated by the UN to respond to the challenges of globalization, Ruggie (2003: 317) notes that some “aspects of the UN system remain fundamentally constrained by its constitutional parameters.” He proceeds to observe that the “UN’s work in peace and security, which is shaped by and in turn has an impact on economic issues, still constitutes a largely self-contained domain of activity.”

The dualism between security and development that was established during the UN’s formative years is thus still in place. Thus, there is a significant discrepancy between discourse and practice on the inter-linkages between development and security. As seen above, this fact can partly be attributed to what Barnett and Finnemore, echoing Weber, call the ‘pathologies’ of bureaucracies, but it must also, as we shall see below, be seen in light of deep-seated disagreements between UN member states on the appropriate role of the UN in world politics.

The lack of an institutional home for efforts that lie at the nexus between development and security came up as a key finding in the report of the *High-*

7 Interview with Karin Hammar, Secretariat of the Framework Team, UN, New York, 24 November 2004.

8 Ibid. The so-called “Brahimi Report” on UN peace operations suggested that the UN secretariat should have a capacity for intelligence gathering to be used in the context of planning for and implementing peace operations. This proposal was not supported by a sufficient number of UN member states (Durch/Holt/Earle/Shanahan 2003).

level Panel on Threats, Challenges and Change (2004). The panel noted in its report that “Our analysis has identified a key institutional gap: there is no place in the United Nations system explicitly designed to avoid State collapse and the slide to war or to assist countries in their transition from war to peace” (UN 2004: para 261). At the inter-governmental level, the panel referred to the vacuum between the UN Security Council (UNSC) and the Economic and Social Council (ECOSOC). While the UNSC provides mandates for peace operations, it does not command the resources and organizations on the development side of the UN that are crucial for peacebuilding. The panel thus proposed that the UN establish an inter-governmental *Peacebuilding Commission*, and a *Peacebuilding Support Office* to serve as the secretariat for the Commission. As envisioned by the High-level Panel, the Commission should be established by, and serve under, the UNSC. One of the core functions of the Commission was to “identify countries which are under stress and risk sliding towards State collapse” (UN 2004: pages).

The High-level Panel’s report formed the basis for the Secretary-General’s consultation with member states as he set out to formulate his proposals for UN reform. These consultations revealed significant resistance to central features of the proposed *Peacebuilding Commission*. In particular, many member states resisted the idea that such an inter-governmental body should have the authority to perform early warning and monitoring functions. This fact can be attributed to diverging interpretations of state sovereignty between UN member states, where some states see early warning and monitoring as an infringement on what falls within ‘domestic jurisdiction’. In his report to member states – entitled *In Larger Freedom*, the Secretary-General had altered significantly the original proposal from the *High-level Panel*. He explicitly stated, “I do not believe that such a body should have an early warning or monitoring function” (Annan 2005: para 115). Moreover, many developing countries also objected to the suggestion that the Commission should be a sub-organ of the UNSC. Thus, the Secretary-General proposed that the Commission should be a sub-organ of both the UNSC and ECOSOC (Annan 2005: para 114–116).

The proposed *Peacebuilding Commission* survived the political negotiations between member states leading up to the High-level Meeting in New

York in September of 2005. The outcome document from this summit asserts that “The Peacebuilding Commission should begin its work no later than 31 December 2005,” a clear signal of UN member states’ commitment to establishing a mechanism to ensure better coherence and consistency in areas where both development and security issues are at stake (UN 2005: 25–26). As originally envisioned, the Commission was to have a certain level of authority to prioritize, disperse funds, and make decisions about issues at the interstices between development and security. Interestingly, the outcome document from the High-level Meeting defines the *Peacebuilding Commission* as an “inter-governmental *advisory body*”. It may be that despite its mere advisory function – of which there are plenty within the UN system – the Commission will be able to forge a more integrated and coherent approach to peacebuilding, not least because members of the UNSC, of the Bretton Woods Institutions, and of troop contributing countries will be represented in the Commission.

48.5 Conclusion

This chapter has analysed the ways in which new insights on the relationship between development and security have yet to be firmly institutionalized in political practice. Coordination has become something of a panacea for efforts to transcend the institutional dualism between development and security. This dynamic provides a clue to an often overlooked feature of international organizations: they are bureaucracies, defined by rules, standards, and certain types of expertise, and have vested interests in perpetuating and expanding ‘their’ definition of, and response to, new challenges. This feature of international organizations exacerbates disagreements between member states, making UN reform an inherently difficult, complex, and slow process.

In essence, the central point is this: the explanation for the focus on ‘coordination’ as a solution to the challenges of the relation between development and security resides in the fact that more and better coordination does not challenge the crucial, but much more difficult, issue of the political and institutional structures within which development and security policy are formulated and implemented.

49 Reconceptualization of Security in the CSCE and OSCE

Monika Wohlfeld

49.1 Introduction

It is significant to note that the concept of security used by the *Conference on Security and Co-operation in Europe* (CSCE), since the mid-1990's *Organization for Security and Co-operation in Europe* (OSCE), has from the inception of the process in the 1970's been a broad one. The security concept has undergone transformations along with the political changes and realities in the CSCE/OSCE region, but these have been by far more subtle than in other organizations. One major change over time has been that the concept has been turned into an operational approach following the end of the Cold War.

Nevertheless, although at the end of the Cold War the CSCE did not have to radically adjust its understanding and concept of security, with time it did not become the key international or regional organization to address new security threats and challenges. Or to put it differently: while the broad understanding of security of the CSCE gained acceptance, the significance of the CSCE/OSCE as a security framework did not entirely keep pace. This chapter argues that indeed the broad understanding of security of the CSCE/OSCE, combined with the broad membership and consensus rule, was part of the reason why the Organization did not emerge as a key security player.

This chapter focuses on the declaratory and operational understanding of security in the CSCE/OSCE (49.2). It briefly outlines the development of the security concept and the key concepts governing its approach to security and its primary dimensions (49.3), assesses the usefulness of the CSCE's/OSCE's comprehensive approach to security today (49.4), and draws a few conclusions (49.5).

49.2 Changes in the Security Concept of the CSCE/OSCE

In the early 1970's as tensions lessened between the two sides in the Cold War, the preparations for a Conference on Security and Co-operation in Europe began. It was proposed that the conference agenda would be divided into three 'baskets': questions relating to security in Europe; cooperation in the fields of economics, of science and technology, and of the environment; cooperation in humanitarian and other fields. These three 'baskets' formed the core of the Helsinki Final Act¹, which was signed by the 35 CSCE Heads of State or Government on 1 August 1975. Today, these 'baskets' are usually referred to as the three 'dimensions' of the OSCE.

In the Helsinki Final Act, the CSCE's then 35 participating states adopted fundamental principles to guide their behaviour among themselves. While other organizations or negotiation frameworks adopted at the time a narrow security perspective, the CSCE participating states have agreed on a ground-breaking common and broad understanding of security, which

1 The Final Act and all CSCE or OSCE documents that followed are not legally but rather politically binding. Thus, the Helsinki Final Act is neither a charter nor a treaty, but still it is a founding document. The CSCE/OSCE commitments are implemented on a voluntary basis. It could be argued, however, that this fact does not detract from the efficacy of decisions, because having been signed at the highest political level, they have an authority that is arguably as strong as any legal statute under international law, and there are no delays or complications resulting from the ratification process. This may encourage quick action when needed. But it is also clear that an organization based on cooperative principles and on politically binding decisions will not have many carrots and sticks to have a quick and effective impact on the behaviour of some participating states, and implementation of such commitments will not be even in all participating states and on all principles.

arguably has in various ways entered the public dialogue and academic discourse since. The reasons for such an agreement were multiple, and they accommodated diverging security and other related interests of the participating states, shaped by Cold War realities. The possibility of linkages among the various issues and baskets became an important asset for the CSCE and later for the OSCE. As Pal Dunay argues, the Helsinki Final Act “broadened the concept of security far beyond the way states and most experts thought about international security at the time” (Dunay 2006: 20).

With the end of the Cold War, as the Soviet Union and Yugoslavia disintegrated, the CSCE/OSCE grew considerably in terms of membership. The CSCE/OSCE was soon also faced with a very different and challenging set of problems than in the past – domestic conflicts, ethnic strife and problems with democratization processes. The end of the Cold War consequently also led to an operationalization and institutionalization of the CSCE/OSCE, which until then had only been a mechanism for political consultations. The secretariat and institutions were developed, and the first field operations (or missions) were dispatched².

Increasingly, small and large projects, funded from the general budget or voluntary additional donations by participating states were carried out in all dimensions of security by institutions and field operations as part of their mandated implementation. Often, these projects were implemented with partner organizations or with NGOs. This reflected the fact that the OSCE is still primarily a political organization and only secondly a project-implementation body. There are other organizations that have better funding or better technical expertise. But it was emphasized that the OSCE could galvanize the political will among participating states, identify key issues, and also function as a platform for cooperation.

Especially after the traumatic experiences of 11 September 2001, the OSCE, whose participating states had earlier agreed to some (rather theoretical) commitments on a range of non-traditional security issues, including combating terrorism, began to focus

much more on practical responses to the so-called ‘new’ threats to security, or transnational threats, and established expert units in the secretariat and institutions to have the appropriate tools to do so. This clearly implied action against terrorism, which was a common interest of the OSCE participating states, but also a number of other activities aimed at countering threats and elaborated jointly by the then 55 participating states in the document “OSCE Strategy to Address Threats to Security and Stability in the Twenty-First Century”.³ This document reflects a common understanding (while differences in emphasis among the now 56 participating states continue to exist) as to what modern security threats were and how to deal with them. It does not, however, provide a clear way of prioritizing and operationalizing responses (Zellner 2005: 23).

While other organizations and frameworks were redefining their approaches to security, adopting broader definitions in the post-Cold War era, the OSCE was considered by some to have the potential to become a key framework for addressing security matters comprehensively. “For most of its history, the OSCE was Moscow’s favorite among European organizations, praised by Gorbachev as a key structure of his ‘all-European house’ and portrayed by Yeltsin as an alternative to NATO enlargement. Russia’s most cherished idea about this all-inclusive body has always been to create a top executive body shaped after the UN Security Council with a few permanent members and veto rights” (Baev 2005: 1).

But the developments described above did not make the OSCE the key international or regional organization in the post-Cold War era (Dunay 2006). Instead, some observers claim that the OSCE is in crisis. According to Gerard Stoudmann (2005: 254) “the OSCE suffers from political marginalization as its role has significantly decreased and as it increasingly competes with more important and more effective actors (EU, NATO).” Others deny that the OSCE may be in danger of losing its relevance, while acknowledging that it could be used better (Kemp, 2004: 261).

Many factors play a role in the potential of the OSCE not being used to its fullest by the participating states. These range from the fact that indeed European countries have developed a multitude of institutions and organizations to address various security issues and the agendas of many of them have become similar to those of the CSCE/OSCE, as well as due to the preferences of those participating states that hap-

2 Missions or field activities are the Organization’s key instrument in all phases of the conflict cycle and in all three dimensions of security. The mandates, size, and activities of the various missions vary, but all have developed both a monitoring and reporting function (implying if necessary also criticizing) and are supporting the host states in implementing OSCE commitments.

3 MC(II).JOUR/2, 2 Dec 2003, Annex 3.

pened to be part of more exclusive organizations and frameworks, to the complexity of crises that followed the end of the Cold War and consequently the need for complex responses, to the sheer financial and human resources needed. But one aspect should not be underestimated: the intrusiveness of the approach to security, which increasingly jarred with some participants in the CSCE/OSCE process.

49.2.1 Key Security Concepts

What were the key security concepts used by the CSCE/OSCE? While the concept of human security was beginning to find a foothold in the policy community, the CSCE/OSCE developed its own understanding of what security is, centred on the notion of comprehensive security. Both of these concepts and their applicability in the CSCE/OSCE are discussed below.

49.2.1.1 Human Security

Although some observers and sometimes even practitioners connected the work of the OSCE with the concept of human security⁴, one will not find many references to that concept in the OSCE's official documents. A notable exception is the "OSCE Strategy to Address Threats to Security and Stability in the Twenty-First Century" adopted by the 2003 Ministerial Council in Maastricht, which as its last sentence states that OSCE participating states "seek the contribution of a strengthened OSCE to meet the threats and challenges facing the whole OSCE area, and to improve human security, thereby making a difference in the life of the individual – the aim of all our efforts."⁵

CSCE/OSCE commitments focus on transparency, cooperation and monitoring on an inter-state level, that is, of defence and possibly foreign policies, but also on an intra-state level, in particular in relation to individual security. Thus, the concept of security the OSCE uses is one that focuses on the individual as much as on the state. However, one could argue that the term human security is somewhat broader than the OSCE's understanding of security, as the latter does not focus on issues such as health care, nutrition, and social issues.

What then is the relationship of the OSCE to the Human Security Network? Although several, but not all, of the states participating in the network are in the OSCE (Canada, Greece, Ireland, the Netherlands, Norway, Slovenia, Switzerland), and the then chair of the network, Foreign Minister Ferrero-Waldner, argued in 2003 that a conceptual link existed⁶, for numerous reasons related to the respective membership and aims, it is difficult to see how it may function in practice (apart from the Network states taking particular interest in human security relevant matters in the context of the OSCE).

49.2.1.2 Comprehensive Security

Thus, while the concept of human security is not widely used in the OSCE, the concept of comprehensive security focuses both on traditional security aspects and on the human dimension, democracy-building, the economic dimension, the environment, and other fields. The OSCE assumes a direct relationship between peace and stability and the development of democratic institutions, the rule of law, respect for human rights and the rights of minority groups, and development of a market economy. From the OSCE's perspective, the protection and promotion of human rights and fundamental freedoms, along with economic and environmental cooperation, are as important for the maintenance of peace and stability as politico-security issues, and as such is an integral component of OSCE activities.

The various aspects of security are seen as interconnected and interdependent: security is regarded as indivisible. In the words of the former OSCE Secretary General Höyneck:

In a very general way the target of joint, enhanced efforts on the part of all OSCE states must progressively extend comprehensive security to all parts of the OSCE area... These efforts should address all the dimensions of OSCE values, commitments and activities.... At the same time there will be increasing agreement, that in each of the OSCE's different dimensions the response which it can offer will have a different profile (Höyneck, 2000: 26).

4 See for example the statement to the OSCE Permanent Council by Stephan M. Minikes, US Ambassador to the OSCE, "OSCE and the Human Security Network", 16 January 2003.

5 MC(II).JOUR/2, 2 Dec 2003, Annex 3.

6 Address by H.E. the Austrian Foreign Minister Ms. Benita Ferrero-Waldner at the 431st Meeting of the Permanent Council of the OSCE on the Human Security Network, 16 January 2003.

49.3 Three Security Dimensions

In order to understand the comprehensive concept of security, it is necessary to discuss the three security dimensions of the CSCE's/OSCE's work, define them, present their tools, and assess their potential.

49.3.1 Politico-Military Dimension

Definition. The commitments, activities, and mechanisms associated with this dimension are aimed at enhancing military security by promoting openness, transparency and cooperation among participating states (OSCE 2000: 117). However, the OSCE's conflict resolution efforts, related to so-called 'frozen conflicts' in its region, and some other efforts such as some conflict prevention activities, also belong to this dimension.⁷ According to Zellner:

Traditionally, the term politico-military dimension was exclusively applied to international, inter-state relations and primarily to military matters. ... Since the early 1990's, conflict prevention, crisis management, and post-conflict rehabilitation have been added, although these tasks are not limited to the politico-military dimension. More recently, the term has also been applied to efforts to address transnational threats such as terrorism, organized crime, and trafficking in weapons (Zellner 2005: 7).

Development. Already in the Helsinki Final Act of 1975, its general part on questions related to security in Europe contained a document on confidence-building measures and certain aspects of security and disarmament. Herewith rules on prior notifications of major military manoeuvres, questions relating to disarmament and other considerations were established. A comprehensive agenda for work in this dimension, the *Forum for Security Co-operation* (a negotiation and decision-making body in the politico-military dimension), the support units in the OSCE Secretariat, and the project activities followed in the 1990's.

This dimension involves a) negotiations on arms control, disarmament⁸, and confidence- and security-building⁹; b) regular consultations and intensive cooperation on matters related to security; c) further reduction of the risks of armed conflicts; and d) implementation of agreed measures.¹⁰ In some areas, the

work in this dimension has been truly ground-breaking, such as the *Code of Conduct on politico-military aspects of security* adopted at the 1994 Budapest Summit, which formulates new norms, particularly regarding the role of armed forces in democratic societies. The increasing attention paid by participating states to so-called 'new security threats', including the issue of terrorism, resulted in a practical focus on relevant activities in the politico-military activities, such as the elimination of stocks of Small Arms and Light Weapons, or surplus ammunition.

Tools. *The Forum for Security Co-operation (FSC)* serves uniquely as the decision-making body for the politico-military dimension and a number of OSCE participating states have separate delegations and arrangements drawing on defence ministries in that body. The FSC has its own rotating chairmanship, which unlike the chairmanship of the entire OSCE gives all states the possibility to chair. The OSCE Secretariat's *Conflict Prevention Centre* has a small support structure for the FSC. Furthermore, an *Annual Security Review Conference* with a fairly broad

⁷ The previous OSCE's High Commissioner on National Minorities (HCNM) has once stated that the work of his office is also to be placed in the politico-military dimension, although this may not universally be agreed.

⁸ Most documents and commitments dealing with military aspects of security concern the whole OSCE area and all OSCE participating States. However, some documents of key importance for military security in Europe were adopted by - and are valid for - only some of the OSCE participating states. This is the case of the *Treaty on Conventional Armed Forces in Europe (CFE)*, and the *Open Skies Treaty*.

⁹ *Confidence- and Security-Building Measures (CSBMs)* are provisions for the exchange and verification of information regarding the participating states' armed forces and military activities, as well as certain mechanisms promoting cooperation among participating states in regard to military matters. See: Brauch, 2000, 2000a.

¹⁰ In the *Helsinki Final Act* of 1975, the participating states agreed to develop confidence-building measures that would "contribute to reducing the dangers of armed conflict and of misunderstanding or miscalculation of military activities which could give rise to apprehension, particularly in a situation where states lack clear and timely information". The *Helsinki Document 1992* established the *Forum for Security Co-operation*, and defined its work. It included the *Programme for Immediate Action*, which mandated the FSC to conduct negotiations regarding: arms control, disarmament and confidence-building; the development of the *Vienna Document 1992*; a regime for the global exchange of military information; and cooperation in non-proliferation, defence conversion, military contacts, regional issues and force planning. See at: <<http://www.osce.org/fsc/mandate>>.

agenda has been taking place since 2003. The OSCE missions have officers devoted to the politico-military dimension (in a large understanding of that dimension), and small and large projects are implemented in the field. The conflict resolution mechanisms which are under the OSCE auspices are not explained any further here, as they do not apply to all participating states, and have restricted and differing formats (OSCE 2000: 87–91).

Assessment. Some argue that since the end of the Cold War, the politico-security dimension has lost in importance, and that this dimension has thus fallen behind the human dimension. Arguably, the time for confidence- and security-building measures and arms control in Europe has not yet passed (Dunay 2006: 37–41). Indeed, a number of OSCE participating states continue to call for a greater engagement of the OSCE in this dimension, especially in large project activities. In some areas such as small arms and light weapons, where the OSCE has developed a groundbreaking document in 2000, surplus ammunition disposal, disposal of rocket fuel and other new and valuable approaches emerged.¹¹ Mechanisms for practical support of participating states in those realms have been developed in the last years.

49.3.2 Human Dimension

Definition. According to the OSCE Handbook, “the term ‘human dimension’ refers to the commitments made by OSCE participating states to ensure full respect for human rights and fundamental freedoms, to abide by the rule of law, to promote the principles of democracy and, in this regard, to build, strengthen and protect democratic institutions, as well as to promote tolerance throughout the OSCE area” (OSCE 2000: 101). The term human dimension is also “intended to indicate that the OSCE norms in this field cover a wider area than traditional human rights.”¹²

Development. The human dimension was first conceived as a general political framework to guide the relations of states vis-à-vis their citizens. Later it has included specific politically binding commitments and mechanisms designed to ensure their implementa-

tion.¹³ The OSCE has significantly developed the principle, first articulated in the *1991 Moscow Document*, that “commitments undertaken in the field of the human dimension of the OSCE are matters of direct and legitimate concern to all participating states and do not belong exclusively to the internal affairs of the states concerned.”¹⁴ This notion was vital in defining the OSCE approach to security.

In essence, OSCE states have agreed through their human dimension commitments that pluralistic democracy based on the rule of law is the only system of government suitable to guarantee human right effectively. This explains why the OSCE human dimension has been described as a common pan-European public order (*ordre public*).¹⁵

The application of the human dimension commitments has been controversial in the recent past and often a subject of heated discussion within the OSCE, especially after the “colour revolutions” in several participating states. A number of the increasingly confident new states in Eastern Europe and Central Asia, often subject to criticism by OSCE Missions, Institutions but also fellow participating states, due to the pace and shape of democratization processes and respect for human rights, as well as the transparency of their election processes, began to fight back.

Tools. The main decision-making body in this dimension is the Permanent Council of the 56 participating states. Since 1990, the OSCE has developed institutions and mechanisms to promote respect for these commitments. The main institutions of the human dimension are the *OSCE Office for Democratic Institutions and Human Rights* (ODIHR), originally known as the *Office for Free Elections*, which supports states in practical ways in implementing their human dimension commitments, the *Representative on Freedom of the Media* (RFM), who, by observing relevant media developments, can point to problems in the application of OSCE principles that could lead to tensions and conflicts, and the *High Commissioner on National Minorities*, whose task is to provide early warning and as appropriate early action to address tensions involving national minority issues. A *Human Dimension Implementation Meeting* and related seminars and events are held regularly to assess the implementation of commitments by participating states.

11 OSCE Document on Small Arms and Light Weapons, adopted at the 308th Plenary Meeting of the OSCE Forum for Security Co-operation on 24 November 2000 (see FSC.JOUR/314).

14 Document of the Moscow Meeting of the Conference on the Human Dimension of the CSCE, Vienna 1991.

15 OSCE Human Dimension Commitments, Vol 1, p. xvii.

NGOs have an important role in this process. Increasingly, the *OSCE Parliamentary Assembly* (PA) is taking a more active role in some areas of the human dimension. Work in the human dimension has increasingly been integrated into the daily activities of OSCE field missions. Human dimension officers work in all field operations.

Assessment. The human dimension has become a core field of activity of the OSCE, with an impressive body of commitments undertaken by the participating states, substantial funds and projects, and structures to support those efforts. The substantial engagement in this dimension has been applauded by some participating states, and increasingly criticized by others. This criticism reflected two concerns, that other dimensions of security did not receive the necessary attention, and that the OSCE efforts in this dimension were not geographically balanced but focused on a few states. The discussion is ongoing.

49.3.3 Economic and Environmental Dimension

Definition. The OSCE's economic dimension aims at "preventing conflicts, encouraging dialogue and cooperation and stimulating post-conflict rehabilitation through economic and environmental activities" (OSCE 2005: 3). The OSCE is in itself not an economic organization, but as part of its comprehensive approach to security, it addresses economic and environmental issues (OSCE 2000: 133).

Development. The inclusion of the economic and environmental basket in the Helsinki Final Act in the 1970's put those issues on an equal standing with the remaining two baskets, although this appreciation was not matched in the operational realm. Attention paid to this matter increased considerably at the end of the Cold War, and is reflected in OSCE documents, and more practical ways of providing assistance were introduced. Along with economic development, the OSCE has also addressed environmental sources of conflict, such as sharing and safeguarding scarce natural resources, providing clean drinking water, preserving biodiversity, and maintaining the quality of the soil. However, there are only few references to environmental security in OSCE documents compared with the focus on economic challenges. The commitments of OSCE participating states related to the environment are subsumed and often overwhelmed by those in the economic sphere, which for a number of OSCE participating states, for example

in Central Asia, remain a substantial source of insecurity.

In the environmental sphere, the *Environment and Security Initiative* (ENVSEC), a framework for cooperation sponsored by the OSCE, UNEP and UNDP, provides analysis and builds capacity both to prevent environmental sources of political conflict and to foster co-operation through resource management. This project is conducted in Central Asia, the Southern Caucasus and the Western Balkans and maps environmental problems and develops concrete follow-up activities addressing environmental hot spots, which can be understood as confidence-building measures across borders (Cheterian 2007). Another example is that of projects encouraging inter-communal and inter-state dialogue and cooperation in water management, which aim to mitigate potential political conflict. Finally, education projects which focus on promoting environmental awareness and advocacy and thus contribute to the building of civil society also belong in this category (see for more information: OSCE 2005).

The events of 11 September 2001 have further emphasized the significance of the economic and environmental dimension for the maintenance of security, and its programmatic work was increased. At the *Maastricht Ministerial Council* meeting in 2003, an "OSCE Strategy Document for the Economic and Environmental Dimension"¹⁶ was adopted that reaffirms the substantive importance of this dimension in the OSCE concept of comprehensive security and cooperation and its role in early warning, conflict prevention, crisis management, and post-conflict rehabilitation. It outlines key priorities and pledges to strengthen the capacity, by enhancing dialogue, improving the review of the implementation of commitments, strengthening the capacity for advice and assistance, and strengthening the capacity to mobilize advice and assistance from other organizations.

Tools. The main decision-making body is the *Permanent Council*. In 2001, an *Economic and Environmental Sub-Committee of the Permanent Council* was established. The review meeting is the Economic and Environmental Forum and its preparatory events also involve NGOs and partner organizations, and focus on specific themes. The main instruments in the economic dimension are the *Co-ordinator of OSCE Economic and Environmental Activities* in the OSCE Secretariat, and the OSCE field missions which in-

16 MC(11).JOUR/2, 2 Dec 2003, Annex I.

creasingly focus on economic and environmental aspects of security, also in their project work. Field officers work in numerous OSCE Missions.

Assessment. The economic and environmental dimension so far lags behind the other two dimensions, despite repeated calls of several participating states, for example from Central Asia, for more support in the area and a better balancing of the dimensions. But the economic and environmental dimension, which is comparatively speaking under-funded and underdeveloped, has recently received a certain boost, in particular with the adoption of the OSCE Strategy Document for the Economic and Environmental Dimension at the Maastricht Ministerial Council in 2003¹⁷. Although the resources and attention devoted to environmental aspects of security are small, the trend is clearly to do more, in cooperation with other specialized organizations, to highlight the dangers, find practical ways of addressing them, and to cooperate in the implementation of such projects with NGOs and specialized organizations and agencies.

The trend for this dimension is positive, with much support from participating states from Eastern Europe and Central Asia, but its development is disappointingly slow, and much has to be done in cooperation with partner organizations to make it truly effective.

49.4 Conclusions

How useful was the broad comprehensive understanding of security for the CSCE/OSCE? Certainly it provided a useful framework for conducting a security dialogue during the Cold War. But following the operationalization of the concept and its arguably all-encompassing application, the concept became much more controversial in the post-Cold War era.

This is a rather interesting observation, given that it appears to be counter-cyclical, with other organizations developing from a much more narrow vision of security to a broad understanding. But the key to this phenomenon is the membership of the CSCE/OSCE – which includes both sides from the Cold War. The participating states are numerous, with the OSCE being the largest regional organization in the world, and they are diverse in their security concerns.

It is an important question whether the division into three dimensions continues to be valid and helpful in the OSCE context. Certainly, the concept of security should be considered as a continuum, and many aspects of security actually have to be seen as cross-dimensional and addressed in such a way. To give an example, trafficking is an issue related to border management and policing, as much as it is related to human rights and social and economic inequalities. In many if not all of the OSCE field operations, numerous activities could be seen as cross-dimensional. In addition, given that some participating states of the OSCE object to an emphasis on human dimension activities, and some states hosting field operations exercise pressure in order to limit such activities, it may be unwise to continue to separate security into the three dimensions.

However, there are more conceptual but also practical reasons why this concept of security dimensions has been maintained. One of those is that the Russian Federation and some other participating states continue to insist on the existence of two decision-making bodies – the *Forum for Security Co-operation*, which addresses classical political-military issues, and the *Permanent Council*, which addresses everything else. But measures designed to bring the work of the FSC and PC closer together have been implemented. Nevertheless, there are different working methods and approaches developed to activities in that dimension. Furthermore, the entire body of OSCE documents is based on such a division. And finally, the mandates and structure of OSCE field operations and institutions also largely corresponds to the security dimensions. Most importantly, those who call for balancing of the dimensions may not be mollified by plainly removing boundaries between them.

The second key question is whether the work in the three dimensions can be adequately balanced. With the emphasis placed on the human dimension, arguably the most intrusive aspect of the OSCE's work, a number of participating states point out in informal discussions and increasingly so also formally that the reality does not live up to the wording of the documents. In fact, the emphasis on the human dimension allegedly results in a certain geographic imbalance much criticized by some states which feel watched and criticized – with many OSCE activities being concentrated on Eastern and South-Eastern Europe, the Caucasus, as well as Central Asia. The counterargument is that there is no need for the OSCE to get involved to address potential or real threats to Eu-

17 OSCE Strategy Document for the Economic and Environmental Dimension. Maastricht Ministerial Council, 2003. http://www1.osce.org/documents/mcs/2003/12/4175_en.pdf

ropean security where there are developed and functioning mechanisms to address them.

Recently, some participating states, especially in Central Asia but also in other OSCE regions "East of Vienna", have been arguing that the economic and politico-security dimensions should be more emphasized. The activities in the economic and environmental dimension may make the involvement of the OSCE in the human dimension more palatable to some states, especially in Eastern Europe and Central Asia, which have a different tradition and possibly also understanding of democracy.

Finally, the politico-security dimension is also undergoing a transformation based on a reassessment of the value and the general conceptual framework of arms control and confidence- and security-building measures (CSBMs) in a post-Cold War world. This transformation has so far emphasized the existing agreements, which build on the notion of a bipolar world, but is adjusting its parameters.

The *Report of the Panel of Eminent Persons* from 2005 calls for a further strengthening of the comprehensive approach and discusses how to address the work in the various dimensions of security¹⁸, with a view to balancing it. But the Panel's paper remains just an input into a larger and ongoing debate.

The debate on the relative strength and relationship between the various dimensions of security continues in the OSCE, and will probably never leave its agenda. The former OSCE Secretary General Höynck has argued in 2000 that "the OSCE has come to understand that there is a certain gap between what its partners in Central Asia perceive as their key security challenge, i.e. international terrorism and related issues, and the core activities of the OSCE" (Höynck 2000: 25). Possibly in response to such concerns, paragraph 14 of the *Istanbul Summit Declaration* from 1999 actually states that all OSCE partners "share the concerns expressed by the participating states in Central Asia regarding international terrorism, violent extremism, organized crime and drug and arms trafficking". Paragraph 34 charges the Permanent Council "to address in greater depth security concerns of the participating states".¹⁹

But it is worth noting on the one hand that the OSCE's comprehensive understanding of security has

been an example for others. In fact, in the post-Cold War era, many organizations have taken on broad elements of the CSCE/OSCE cooperative and comprehensive security approach. Arguably, even the European Union follows cooperative and comprehensive security principles, for example in its relations with candidate states (Wohlfeld 1998). The cooperative and comprehensive approach to security of the CSCE and later the OSCE also generated considerable interest in other regions of the world. This interest has been expressed by countries wishing to become partner states (the OSCE has partners in the Mediterranean and in Asia and corresponding fora for dialogue and cooperation) as well as by regional organizations or frameworks especially in the Mediterranean (Wohlfeld/Abela 2000), in Africa and in Asia. In addition, observers occasionally call for a duplication of the CSCE/OSCE experience in other regions, drawing upon the notion of its comprehensive approach to security.

On the other hand, the fact that the CSCE/OSCE was the only regional security framework whose concept of security was not challenged or overturned by the end of the Cold War did not help it to become a key organization in Europe. Rather, the OSCE's now 56 participating states (with the entry of Montenegro in 2006), although all subscribed to the Moscow principle elaborated above, which makes internal matters of a state of direct concern to all participating states, the perceptions of what really is the focus of the Organization - the state or the individual, and thus also the politico-military and possibly economic-environmental dimensions versus the human dimension - differ considerably. This differing understanding certainly also reflects participating states' differing security realities, and also their membership in other organizations. Instead of moving towards a closer understanding on the matter of what the key security issues are and how to address them, the participating states seem to be drifting apart (Gnesotto 2006: 5). The discussion on the meaning and implementation of the broad and comprehensive approach to security and the correct balance of activities in the three dimensions is an expression of this situation.

50 The Comprehensive Security Concept of the European Union

Rolando Mosca Moschini

50.1 Introduction¹

The chapter addresses the key elements of the *European Security Strategy* (Council of the EU 2003) and its follow-up implementation, including its impact on the crucial area of capability development. It is not a rigorous and exhaustive coverage of official decisions, but rather an illustrative description of the innovative approach the European Union (EU) has taken on security and defence in the early 21st century.

After an overview of the EU organization in the area of security and defence (50.2), the elements of the emerging geo-strategic environment are outlined (50.3) that are instrumental for understanding the *European Security Strategy* (50.4). The review of this strategy (50.5) makes it possible to consider the scope of the problem of military capabilities and their development (50.6) from the innovative perspective of the EU (50.7), and it ends with brief conclusions (50.8).

50.2 Overview of the Organization

The policy and direction of the *European Security and Defence Policy* (ESDP), which is an integral part of the *Common Foreign and Security Policy* (CFSP), are provided by the European Council that is composed of the Heads of State or Government and of the President of the EU Commission. Below is the Council of the European Union, where member states are represented by the Ministers of Foreign Affairs, who meet monthly as the *Council for General Affairs and External Relations* (GAERC), and the decision-making body for both the CSFP and ESDP (see chapter by Hintermeier in this volume).

Political control and strategic direction of crisis management operations are provided by the *Political*

and Security Committee (PSC) that consists of ambassadors, who meet twice a week, as permanent representatives from the member states. The PSC monitors the international situation and contributes to the formulation of policies. In a crisis, it plays a central role in defining a coherent EU response and is also responsible for the political control and strategic direction of the military response.

The *European Union Military Committee* (EUMC) is a collegial body composed of the *Chiefs of Defence* (CHODs) of the member states, routinely represented in the Committee by their military representatives. The EUMC is the highest military body within the Council and is coordinated by a permanent chairman. Its mission is to provide the PSC, either on request or on its own initiative, with military advice and recommendations on all military matters. It works on the basis of consensus as the primary forum for military consultation and cooperation among the EU member states in all the fields of common interest, first of all, in those related to the development of structures and capabilities. The identification and prioritization of military requirements are fundamental responsibilities of the CHODs and they also constitute key tasks of the EUMC. As the top body of the EU's military organization, the EUMC has also a leading role and key functions in crisis management situations as well as in operations.

The Committee is supported by the *European Union Military Staff* (EUMS) that consists of approximately 200 men and women seconded by the member states. The EUMS provides military expertise to all Council bodies dealing with the ESDP, but it is also responsible for significant operational tasks. More specifically, the Military Staff has to conduct early warning, situation assessment, and strategic planning, including the identification of national and multinational forces, and to implement policies and decisions as directed by the Military Committee. The EUMS is a Directorate of the General Secretariat of the Council. The Secretariat is the overall staff organization on

1 Comments and considerations contained in this text reflect only the personal views of the author and do not necessarily convey the positions of the EU authorities and bodies concerned.

which all the Council bodies rely in implementing their tasks. These are the key elements of the CFSP and ESDP organization.

How and for which purpose they operate in the present and future world is determined by the *European Security Strategy* and its guiding assumptions.

50.3 Emerging Geo-strategic Environment

In an era of globalization the emerging geo-strategic environment is characterized by both opportunities and risks. *Opportunities* point to the favourable side of globalization resulting from the spread of democracy and market economy, which has reinforced and accelerated overall human development on the planet. *Risks*, as the threatening face of globalization, are generated by a wide range of possible negative events and situations, such as natural and man-made disasters, epidemic diseases, organized crime, proliferation of WMD, state failure, intrastate conflicts, interstate regional conflicts, terrorism, etc. Most of these risks are not new, but in the early 21st century their effects have intensified dynamically and in scale, and their impact on society has dramatically increased.

Globalization relies on new information, communications technologies (ICT), and worldwide means of transportation. Its actors are often transnational entities that are mostly organized in networks. These mechanisms, while promoting and supporting democracy and development, can easily be exploited by threats in a particularly aggressive and pervasive way, or, at least, they can function as powerful amplifiers of natural hazards and man-made disasters.

This is the new geo-strategic environment of the early 21st century within which sovereign states operate. The states are doing their best to use the opportunities and to face the risks produced by transnational entities. They are relying only on their national authority, which is limited by the borders of their physical territories. If a state decides to defend itself by closing its frontiers to globalization, it may possibly prevent some risks but it would remain marginalized from the virtuous circle of global development and prosperity. Therefore, the borders must be kept open, but this implies that both the favourable and threatening faces of globalization, and a portion of the front-line of their harsh confrontation exist inside each state and within its national sovereign space. Hence, the more democratic and open a state is, the more it will profit from the immense opportunities of globa-

lization, but also the more exposed the same state will be to these new global threats. Yet, there is little choice: openness is the only option available in practise, especially for EU member states, which are democracies, strongly interdependent, and already well integrated in the emerging globalized environment. They are 'fully connected' to this new common asset for democracy and prosperity.

Thus, it can be easily concluded that, in this new strategic environment, openness is an absolute must; and cooperation among states for collegial global governance is the only possible option for the future. As all democracies, the EU states have no interest in fighting other states and in keeping them out of the globalized environment, because this would reduce their overall level of 'connectivity' in this environment and the opportunities of development that it produces. On the contrary, the EU states should have the common goal of promoting their own model and, in any case, associate themselves with those states that progressively, through the rules of democracy and free choice, become convinced of the great reciprocal advantage of cooperation. This 'inclusive' approach has a decisive impact on the EU's perspective on security and defence.

The EU's inclusive model associates instead of excluding. A third state is not seen as a potential enemy to be kept out of the common friendly environment and from which it is needed to defend. This is the excluding principle of defence. Security should rather be inclusive. More and more states must be involved in the resolution of common security problems, becoming active parts of a common globalized environment. On these assumptions the *European Security Strategy* (ESS), "A secure Europe in a better world", relies.²

50.4 European Security Strategy

In the effort by the European Security Strategy³, the use of military force in a crisis cannot therefore be aimed at anything like the destruction of the area involved, but it should rather pursue the recovery of the

2 For the official text see at: <<http://ue.eu.int/uedocs/cmsUpload/78367.pdf>>; and for the version of the ISS-EU in Paris, at: <<http://www.iss-eu.org/solana/solanae.pdf>>. 3 See the text at: <<http://www.consilium.europa.eu/uedocs/cmsUpload/78367.pdf>>.

human and material resources to the common patrimony of the global society, so that also these resources can eventually concur, with those already at work in the rest of the planet, to the construction and consolidation of global public goods, like law and order, wealth and stability.

Besides the principle of inclusiveness, the ESS stresses the key factor of leverage due to the strong interdependence between security and development, where a decisive effort can be exercised to stimulate development through security. The essence of this interdependence is as follows: if a certain critical level of security can be achieved through a timely military deployment, then this may not only generate some spontaneous recovery from the crisis but it will also permit and support, across time and space, the deliberate local application of further components of the strategy devoted to institution and economy building, addressing local governance and participation, rule of law, as well as social and economical development. The expected result is a virtuous loop generated by security and development proceeding together (see chapters by Uvin; Katseli; Klingebiel/Roehder in this volume).

From this perspective, security is a precondition for development, while real and lasting security cannot be achieved without development. Development, especially if it is not limited to the single dimension of economic growth, produces security in the long run, but it cannot even be attempted without security. Security comes first, but only as a key component to the overall effort, the 'spearhead' of a more comprehensive multidisciplinary approach, where the military is only one of the several instruments of an integrated synergistic strategy of development. As such a virtuous loop progresses, the military commitment in the area is reduced and replaced by local institutional security structures.

Globalization acts as an accelerator for the spread of democracy and market economy facilitating human development, but it also functions as a threat multiplier working against security. These are key requirements for developing suitable military capabilities and for properly structuring intervention forces.

Another pillar of the ESS is cooperation aiming at an 'effective multilateralism', through which the EU and other international organizations, like the United Nations, NATO, the African Union, ASEAN et al., should work together for the common purpose of stabilizing and improving the global environment. This effective multilateralism should also involve other organizations representing civil society and single 'iso-

lated' states. The cooperation with NATO, with which the EU in 2006 shared 19 member states (with Bulgaria and Romania joining, this will increase to 21), is obviously the most important, especially after the *Berlin plus* agreements, the launch of operation Althea, and the establishment of permanent EU-NATO liaison elements.

Thus, key mechanisms of the ESS are: 'inclusiveness', 'security and development interdependence', 'cooperation' and 'effective multilateralism'. The implementation of the ESS in the emerging geo-strategic scenario does not imply, therefore, defending against a conventional enemy pressing at the borders as during of the Cold War. The EU does not face millions of soldiers with thousands of tanks and aircrafts supported by a huge fleet. Rather, there is a need to neutralize subtle and diffused transnational threats, organized into networks and equipped with unconventional weapons and tactics.

From this perspective, the key guiding principle for EU interventions is 'think globally and act locally.' This implies that the organization of the EU military model must be centred on knowledge, which, in military terms, is produced by the synergistic combination of information, intelligence, planning, and command and control. This will allow the EU to have a constant operational vision of the common globalized environment, in all and each of its aspects, which will permit an early identification of potential areas of crisis and the design of the multidisciplinary strategy most appropriate to tackle the crisis, with a balanced selection, tailoring, timing, and integration of its military and non-military components. Thus, the security model will enable the EU 'to act also before a crisis occurs' or deteriorates and will facilitate, in all cases, rapid response. This key point deserves further thought.

If the EU Member States want to save human lives and money and produce security and development, they must tackle a potential crisis – or an ongoing one – as early as possible, and, hopefully, before the situation deteriorates. That implies a strong requirement for rapidity; it implies rapid response. Thus, from a military perspective, the ESS requires joint and combined forces, perhaps limited in number, but of very high quality and, when necessary, responding to strict readiness requirements. In all cases, these forces should meet the principles of comprehensiveness and therefore be able to effectively operate, fully integrated and synchronized, in multidisciplinary contexts.

An adequate subset of these military assets should be capable of rapid and decisive interventions, either deploying and actuating in a preventive fashion or fighting their way through a deteriorated conflictual environment.

The 'comprehensive effects' the EU countries want to achieve with the ESS can be translated into reality through an innovative multidisciplinary implementation, which takes, nevertheless, fully into account the well-known principle of the 'single set of forces' and that of 'pooling of resources' as well as the need to exploit to the best EU-NATO synergies and all other possible non-military soft and hard means. This new overall concept requires a 'comprehensive basket of capabilities'.

50.5 Military Requirements and Capabilities

For the EU member states the ESS has dictated a new full set of military requirements which have been elaborated into a short-to-medium term objective, the *Headline Goal 2010*. By 2010, while taking into account with flexibility possible developments beyond this time horizon, the member states should be able to respond with rapid, coherent, and decisive action to the whole spectrum of crisis management operations, ranging from humanitarian and rescue missions, to peacekeeping, combat in crisis management, and peace-enforcing, but including also joint disarmament operations, support for third countries in fighting terrorism, and security sector reform. The EU should be able to act before a crisis occurs; preventive engagement can avoid a situation from deteriorating. The EU should retain the capability of conducting concurrent operations, thus sustaining several theatres simultaneously at different levels of engagement.

In accordance with such an innovative approach, a new generation of readily deployable units is emerging: the *Battle Groups*. A Battle Group is a specific form of rapid response capability, an integrated force, with a national or multinational composition, able to conduct complete missions of short duration, from 30 to 120 days, or to be committed as the entry force for operations of a longer timescale. A Battle Group is able to start its mission in the assigned operational theatre within 10 days after the political decision is taken. Battle Groups must be seen as the spearheads of full fledged *Rapid Response packages*, from which they are inseparable. In addition to rapid deployable units, each of these packages includes an appropriate

command and control organization, as well as all necessary force multipliers and enablers, up to the decision-making structure at the political level, with the relevant EU collegial institutions and those of respective member states. Each component of an *EU Rapid Response package* must match adequate requirements and be fully supportive of the *Battle Group*. In particular, as 'the other side of the Battle Group medal', the EU political decision-making system must be able to produce unambiguous and complete direction as quickly as the Battle Group can react. On 1 January 2005, an initial Battle Group capability has been activated and full operational capability will be achieved in 2007.

Among the capabilities the ESS requires, those related to sharing of information, elaboration of knowledge and devotion to planning, command and control, are particularly significant across all chains of command, from the politico-strategic to the tactical level. These capabilities should be given a multidisciplinary configuration, which should be incorporated into proper organizational structures able to translate a strategic concept into an effective operational reality.

Now security operations are not only multinational and inter-organizational (for example EU-NATO, or UN-EU-AU) but they also are multidisciplinary, with the military component being only one of several components of a complex comprehensive effort, involving all kinds of nation-building capabilities. Most of the added value for EU crisis management interventions is produced by the synergies of the different components acting together. But this depends on available capabilities. This was actuated very successfully for the first time in Operation *Althea* in Bosnia Herzegovina, where on 2 December 2004 the EU took over from NATO.⁴

In the central organizational structure of the ESDP, the first nucleus of this emerging EU peculiar multidisciplinary or comprehensive capability is the *Civil-Military Cell*, recently established as a functional component of the EUMS and the appropriate Secretariat *Directorates General* (DGs), and including elements from the Commission under the direction of the Director General of the EUMS. The Cell's main functions consists in civil-military planning at strategic and operational level, in the activation of an *EU Operation Centre*, in qualified augmentation of *Member State Operation Headquarters* (OHQs), and liaison

4 See for details at: <http://www.consilium.europa.eu/cms3_fo/showPage.asp?id=268&clang=EN&mode=g>.

with NATO command and control organization.⁵ This last function offers a significant contribution to the further improvement of the permanent cooperation agreements between the EU and NATO, as defined in 2002 through the so-called *Berlin Plus*.

The Berlin Plus agreement sets the condition, both at political and military level, for the use, in EU-led operations, of NATO common assets and capabilities, preventing unnecessary redundancy and setting the basis for a first form of integration of military structures, in accordance with the principle of the 'single set of forces'. Following the approval of the Berlin Plus agreement, in 2002, cooperation, transparency, and mutual reinforcement between the EU and NATO have been enhanced.

As for the EU Command and Control Organization, the EU concept foresees two levels of military command above the *Service Component Level* (Land, Maritime, and Air) *Headquarters*: the *Operation Headquarters*, located in a member state, and the *Force Headquarters*, deployed in the theatre. Both Headquarters are normally provided by member states, except when the EU works in cooperation with NATO and employs, under the *Berlin Plus* agreements, NATO assets and capabilities, and, in particular, the *Command and Control Organization*, which the Alliance is permanently provided with. This is the case, for instance, of operation 'Althea'. The military line of command is strategically directed by the *Operation Commander*, and, at the political level, by the collegial decisions of the *Political and Security Committee*. The *Military Committee* provides the PSC with its military advice on decisions to be taken.

50.6 Development of Military Capabilities

Since the year 2000, two processes for the development of military capabilities have been launched in a sequence, based respectively on the *Helsinki Headline Goal* and the *Headline Goal 2010*. The results achieved, though very significant, are only the first steps on the long way to build a pool of military capabilities which can match such demanding requirements as those illustrated for an effective implementation of the ESS. The capability problem for the EU is extremely complex, involving political, military, industrial, technical, and financial factors. One of the most

important issues consists in the low efficiency of defence expenditure and in the duplication of structures.⁶

The EU comprises 25 national defence organizations, each with its own institutions. Expenditure in research and technology and procurement are not specialized by member states, since each nation wants to keep, for political reasons, a complete structure of defence to be strategically autonomous, sometimes based on old fashioned territorial concepts. Given the limited budgets available, this ends up in a redundancy of basic military assets and a lack of force multipliers, enablers and, in general, high quality capabilities which are expensive but scarcely politically visible. Problems of capabilities not only deal with defence budgets and organizational structures, but they also depend on the European defence industry and the related market.

The establishment of the *European Defence Agency* will make relevant contribution to the ESDP in the area of military capabilities development. Its mission is to support the member states and the Council in their efforts to improve the EU's defence capabilities in crisis management, and to sustain the ESDP as it stands now and develops in the future. The Agency will work for the development of defence capabilities in the field of crisis management, for the promotion and enhancement of European armaments cooperation, for the strengthening of the *European Defence Technological and Industrial Base* (DTIB), for the creation of an internationally competitive *European Defence Equipment Market* (EDEM), and for the enhancement of *Research and Technology* (R&T).

Considering the issue of capabilities, at least for the near future there will be no European Armed Forces, but military capabilities made available by member states for ESDP operations. In this context, the concept of 'EU integrated forces' implies that the military capabilities of member states should be able to operate - together and with all other non-military components - in a synergistic way to achieve the objectives of the ESS, by using at best the available scarce resources.

The ESS sets the conditions for a concept of integrated capabilities to be implemented both inside the EU organizational context, with the requirements for *jointness*, *multinationality* and *multidisciplinarity*, and *outside the Union*, with the principles of *inclusion*.

5 See for details at: <http://www.consilium.europa.eu/cms3_fo/showPage.asp?id=279&lang=en&mode=g>.

6 See for details at: <http://www.consilium.europa.eu/cms3_fo/showPage.asp?id=437&lang=EN&mode=g>.

siveness, multilateralism and cooperation for security and development. This unique overall systemic approach to capability is peculiar to the EU and paves the way to an innovative and much wider concept of military capability, on which the EUMC, the member states and, of course, the Agency have started to work.

This concept is founded on the idea that an objective is achieved as the result of a synergistic combination of effects, which, in turn, are produced by means, composed of men and materiel, working together in a range of possible ways, under control and guidance of a specific organization, which provides directions according to the collegial will of the member states. A capability, therefore, consists in a specific structured set of personnel, equipment, procedures, and control assets that allows for the production of selected effects, in accordance with the concept described. Such a wide approach also reflects the problems of fragmentation and waste of resources deriving from the existence of so many national defence organizations and industries as well as defence markets. And, of course, the Agency is fully engaged in this very difficult fight for efficiency.

With this, we have entered the problem of quality and integration of capabilities and addressed some of the key principles that inspire the EU policy in its efforts to bridge the gap between strategy implementation and required resources, in a context of declining defence budgets. We said that the requirement is for joint and combined forces, perhaps limited in number, but of high quality and readiness, and capable of rapid, decisive and, if necessary, preventive interventions, in a strictly multidisciplinary context. This led to the innovative concept of integration and the consequent interoperability requirement that goes well beyond military *jointness* and *multinationality*, to embrace *multidisciplinarity* with all other non-military components of the ESS. This new *interoperability* dimension should result in enhanced synergies for the military instrument and help shape forces and assets in the most effective way, according to the overall effects both the EU as a whole and each of the member states want to achieve. Under this innovative approach, the primary force multipliers for concept development, planning, and action on the ground would be constant networking and sharing of a common base of information and knowledge, extended to all military and non-military components contributing to the EU multidisciplinary strategy.

This and any other possible concept of 'integration' are, first of all, political challenges, because they

imply a coherence of will of all participating sovereign states to produce a real common effort. When national will feels unconstrained by foreign policy, as it has been for the past few decades, it runs the risk of being conditioned exclusively by internal politics. International integration is, instead, politically much easier and more effective when it is dictated by needs, as the Cold War period demonstrated. And now this seems again to be the case, as the new globalized environment and its multifaceted challenges for the sovereign state are becoming a common immanent threat.

A concrete effort to foster among member states coherence and synergy through achievements focuses, for the short-medium term, on harmonizing existing member states' capabilities, taking into account that national defence investment programmes are difficult to re-orient. For the longer term, instead, an EU military common vision - the so called Long Term Vision - is being elaborated, addressing future military environment and operations, security requirements, and possible capability profile. This work should also help very much support the EDA Research and Technology programme, with all externalities this can provide, including civilian applications and economical returns, in line with the perspective of Europe as an innovative, knowledge-based, globally competitive economy.

50.7 A Revolution in Security and Defence of the EU?

The very 'revolution in security and defence affairs' is still to come, but it may be not too far away. The origins of this silent revolution go back to the end of the Cold War when the EU member countries started employing the military to build peace and development in cooperative scenarios quite different to war-like situations. For the past two decades or so, a number of crucial economical, political, social, technological geo-strategic factors have emerged, interacting at an ever increasing tempo and scale to produce an extremely high and still rising level of uncontrolled interdependence across the planet. This, in turn, has generated a very complex array of trans-national challenges, which states cannot avoid facing, but no single state alone is able to effectively deal with. It is, therefore, not difficult to predict that a sharp turn in the direction of a more substantial and effective international cooperation is inevitable, first of all on security, as well as on all other fundamental areas of human development. More importantly, international

cooperation is something that every single and all the 'democratic and liberal' entities together across the planet have interest in working towards. And this is exactly what the EU predicates with its European Security Strategy.

In the scenarios of a globalized world in the 21st century, a rapid and robust growth of the EU in the field of security would add a new strong pillar to the global construction and spread of democracy and free-market economy. And this is something that

every existing or emerging global actor, pursuing, either as a nation or as an organization, the values of the Western world, should very much welcome and perhaps even foster. This is particularly true for NATO. NATO and the EU are the two sides of the same coin of the Euro-Atlantic security system. Strengthening of the EU means strengthening NATO, and strengthening the international system for peace and stability.

51 Reconceptualization of External Security in the European Union since 1990

Stefan Hintermeier

51.1 Introduction¹

Since the early 1950's, European integration and security have become two sides of the same coin. From its very beginning, the West European integration process has been a structurally designed peace project. After two world wars, and following the logic of (neo)functional integration concepts (Mitrany 1943; Haas 1958, 1964), the aim was to eliminate the chance of further wars between West European states. Thus, the process of supranational integration was intended to transform the anarchic structure of the West European state system into a "working peace system" (Mitrany 1943). As a consequence, a *security community* has emerged in Western Europe that has durably excluded force as a means of conflict resolution (Adler/Barnett 1998; Deutsch/Burrell/Kann/Lee/Lichterhan/Lindgren/Loewenheim/Van Wageningen 1957). In this sense, the process of West European integration has been a process of "desecuritization" characterized by a "progressive marginalization of mutual security concerns in favour of other issues" (Wæver 1998a: 69).

At the same time, dealing with security or even defence-related issues within the EC framework was considered a taboo until the 1980's (Smith 2004). The EC defined itself as a "civilian power" (Duchêne 1972; see Foreign Ministers of the Nine 1973), not as a security actor. It was not until the 1980's that "important foreign policy questions bearing on the political aspects of security" (Foreign Ministers of the Ten 1981) gradually appeared on the agenda of the European Political Cooperation (EPC) and levelled the path for breaking the taboo to discuss matters of security. Ultimately, this break occurred after the end of the Cold War, and with the Treaty of Maastricht the Common

Foreign and Security Policy (CFSP) was established as second pillar of the European Union. Only a few years later, member states created an autonomous military dimension by establishing the European Security and Defence Policy (ESDP). Thus, within one decade, the EU has not only become a "security institution" (Kreft 2002; Wæver 2000: 260), but also an international "security actor" (Larsen 2000: 337).

Against this background, this article examines how the conceptualization of external security by the EC/EU has changed due to the transformation of world politics since the late 1980's: Have the global political upheaval of 1989/1990 and the development of the EC/EU to an institution actively engaged in international security lead to a reconceptualization of security by the EU? Can one speak of a broadening and/or deepening of the EU's understanding of security since the early 1990's? If so, in what regard? What were the effects of the 9/11 terrorist attacks in New York and Washington, DC on the European definition of security? And finally: How does the EU conceptualize security today?

In order to answer these questions a "conceptual analysis" (Baldwin 1997: 6) will be conducted on the basis of official EU documents. In a first step four central questions on the basis of social constructivist assumptions will be developed allowing for an analysis of core elements of political security conceptions, that is referent objects, values, threats, and instruments of security. Applying this analytical framework, in a second step the European understanding of security as well as its historical development will be empirically examined. The chapter covers the period between the late 1980's and the adoption of the European Security Strategy in December 2003.

1 For helpful comments on earlier versions of this chapter I thank Hans Günter Brauch, Anthony Seaboyer, as well as two anonymous reviewers.

51.2 “Security Is What Actors Make Of It”: An Analytical Concept For Studying Security Concepts

Starting point for this conceptual analysis of the European understanding of security is the fundamental ontological premise of social constructivist approaches in International Relations stating that reality is socially constructed on the basis of intersubjectively shared norms and ideas (Adler 1997; Fearon/Wendt 2002; Risse 2003b; Wendt 1992, 1999). According to this understanding, security is not just objectively given, but emerges from a process of social and political interaction, in which certain values and social norms, collective identities and cultural traditions play an essential role: Security is “what actors make of it” (Wendt 1992). Therefore, security not only has to be understood as an intersubjective construction, but also depends on a normative core, that can not be simply taken for granted. At the same time, political constructions of security have real world effects, because they guide action of policy-makers, thereby exerting constitutive effects on political order (Dalby 1997; Schneider 2002). Analysing the specific security conceptions of political actors is therefore crucial.

From an analytical point of view, the main challenge in analysing political security *conceptions* is to avail an analytical security *concept* that itself is neutral enough to not define a distinct meaning of security beforehand (Baldwin 1997: 7; Sjursen 2004a: 3; Wæver 2002: 3).² One of the most popular social constructivist approaches to security analysis in recent years – the “*securitization approach*” of the so called *Copenhagen School* (Buzan/Wæver/de Wilde 1998; Buzan 1997; Wæver 2000; see chapter by Buzan in this volume) – has partly been criticized for being based on a specific understanding of security that is closely linked to survival and the absence of existential threats. By applying their approach to different sectors of security (military, environmental, economic, societal, political), scholars of the *Copenhagen School*

examine what actors are successfully able to construct what issues for what referent objects, for what reasons, under what conditions, and with what consequences as ‘existentially threatening’ (‘securitization’).

In contrast, Felix Ciuta points out that not only *security issues*, but also the respective *definitions of security* are actor-specific constructions, that need to be analysed distinctively (Ciuta 2004: 3). Therefore, this chapter will go beyond the mere analysis of threat perceptions and examine the evolution of the EU’s political conceptualization of security more fundamentally. The aim is to gain insights on the distinct meaning that the EU attaches to the term ‘security’. This very understanding of security is what I call the EU’s *security conception*.

In order to analyse the evolution of the EU’s political security conception, an analytical security concept will be applied that David A. Baldwin (1997) has proposed for conceptual security analysis. Baldwin explicitly tries to avoid any specific security-related predefinitions. Rather, his intention is “to identify common conceptual distinctions underlying various conceptions of security” (Baldwin 1997: 5). Starting from a minimal definition of security as a “low probability of damage to acquired values” (Baldwin 1997: 13) he develops seven analytical questions that can be applied to any security conception (Baldwin 1997: 12–18).³ In a similar way, Bjørn Møller (2003: 278–79) distinguishes between six specifications of security.⁴

Following Baldwin (1997) and Møller (2003), this chapter concentrates on four analytical questions: 1) *Security for whom or what?* This question refers to the referent objects of security (e.g. states, societies, individuals). 2) *Security for which values?* This question might for example refer to political sovereignty and territorial integrity (of states), to collective identities (of societies) or to the quality of life, psychological well-being or physical survival (of individuals). 3) *Security from whom or what?* This question raises the issue of threats, dangers, risks, and challenges that are perceived as uncertainties for the respective values of referent objects. 4) *Security by what means and strategies?* Here, particularly political, economic, and

2 As Baldwin points out, concepts “should not preclude empirical investigation by making true ‘by definition’ what should be open to empirical inquiry” (Baldwin 1997: 7). Similarly, Sjursen states that the “purpose is not to provide a substantive concept of security policy, but rather a conceptual frame that enables us to theoretically account for changes to security policy without at the outset determining its normative content” (Sjursen 2004a: 3). Elsewhere Sjursen (2004b: 60) criticizes that many studies would not distinguish between empirical and normative aspects of security.

3 See: Baldwin (1997: 12–18): Security for whom? Security for which values? How much security? From what threats? By what means? At what cost? In what time period?

4 See: Møller (2003: 278–79): Security for whom? Security of what? Security from whom (or what)? Security from what? Security by whom? Security by which means?

military means may be distinguished, as well as reactive and proactive strategies (Daase 2002).

Applying this analytical framework, below core documents will be examined to reconstruct the evolution of the EU's understanding of security since the late 1980's. The intention is to *descriptively characterize* the conceptualization of external security at the level of the European Union. However, the objective is *not to explain* this conceptualization. The security conceptions of member states as well as the domain of internal security will be excluded (see the chapters by Mauter/Parkes and Ekengren in this volume).

51.3 European Union Security Conceptions Since 1990

Any analysis of the European understanding of security and its evolution since the late 1980's is confronted with the problem that the EU had not formulated a clear security conception until 2003. Instead, for a long time, the European security discourse was marked by diversity (Wæver 1998a), "ad hockery" (Politi 1997), "nebulous" or "incomplete" conceptions (Grudzinski/van Ham 1999) and "the tension between the wide and narrow approaches to security supported by the Commission in the first case and the Council in the second" (Churruca Muguruza 2004). Nevertheless, the evolution of the European understanding of security can be traced on the basis of official documents and political statements of central actors and institutions.

51.3.1 Security for Whom or What?

As Baldwin points out, "a concept of security that fails to specify a 'referent object' makes little sense" (Baldwin 1997: 13). Unfortunately, it is precisely the referent object that normally remains unspecified in the European security discourse. Instead, often certain labels are used: "European security" (European Council 2003), "security (...) in Europe"⁵, "security of the Union"⁶, security of Europe (European Council 2003), security of the "continent of Europe" (Santer 1995), "international security"⁷, "global security" (European Council 2003) or simply "our security" (WEU 1987).

5 Treaty on European Union (Maastricht), 1992, Preamble; Consolidated Version of the Treaty on European Union (Amsterdam), 1997, Preamble; Consolidated Version of the Treaty on European Union (Nice), 2001, Preamble.

However, regarding the referent objects, two main trends in the European understanding of security can be identified, that may be labelled 'Europeanization' and 'individualization': Europeanization refers to the fact that the EU itself has been more and more acknowledged as a distinct referent object of security. Individualization means that the individual has gained greater importance as a referent object in the European security discourse as well.

51.3.1.1 Europeanization of Security: The EU as a Primary Referent Object

One of the most characteristic features of the European security understanding consists of the EU itself having become the primary referent object in the institutional security discourse (Larsen 2000: 341). Today, the meaning of European security reaches beyond the mere guarantee of member state security: "Europe is more than the sum of the state-parts and the EU can act on behalf of 'Europe'. Europe does not consist of either the EU with components or member states with an added international organization: both layers are politically real and cannot be reduced to the other" (Wæver 2000: 257). This implies that "European security" no more simply describes a regional cut-out of "international security" in the traditional state-oriented sense (Wæver 1996: 120; 2000: 279).

The social construction of the EU as a referent object comprises two aspects: The first historically reaches back to the beginning of the integration process and refers to the EU as a (peace) 'project'. The second aspect has become relevant after the end of the Cold War and refers to the EU as an international security 'actor'.

The construction of the EU as a (peace) "project" (Buzan/Wæver/de Wilde 1998: 187; Churruca Muguruza 2004: 9; European Commission 2001a) refers to internal aspects, characterizing European integration as a historical achievement having made military conflicts between member states unthinkable (Aggestam

6 Treaty on European Union (Maastricht), 1992, Title V, Art. J.I, 2; Consolidated Version of the Treaty on European Union (Amsterdam), 1997, Title V, Art. II, 1; Consolidated Version of the Treaty on European Union (Nice), 2001, Title V, Art. II, 1.

7 Treaty on European Union (Maastricht), 1992, Title V, Art. J.I, 2; Consolidated Version of the Treaty on European Union (Amsterdam), 1997, Title V, Art. II, 1; Consolidated Version of the Treaty on European Union (Nice), 2001, Title V, Art. II, 1; see also Single European Act, 1986, Preamble.

2000: 88; Higashino 2004: 351; Sjursen 2004a: 17; Wæver 1998a; 2000: 259-60). This link between integration and security is expressed in partially very theatrical wordings that, for example, describe the EU as “heaven of peace” (Santer 1995), “island of peace” (Barroso 2004, 2005) or simply as “happy island”.⁸ Such characterizations refer to the EU as a “security community” (Adler/Barnett 1998; Panos 1996; Wæver 1998a), that guarantees peace internally and, at the same time, functions as an example for other regions (Bretherton/Vogler 1999: 198, 214). What is notable in this context is that although the concept ‘security through integration’ had been an essential motive for launching the integration process in the 1950’s, it was not until the 1980’s that the integration project itself has gained the quality of a distinct referent object of security. Only the ‘securitization’ of the integration process during the 1980’s has led to the construction of the European ‘project’ as a separate referent object, the basis of which is the intra-European peace guarantee of the EU as a security structure (Wæver 1998a).

The second aspect related to the EU as a referent object of security focuses on its external dimension, referring to the EU as an international ‘actor’: The more the EU has become an active player engaged in international security and fostering common values and interests on the international scene, the more the EU itself has turned into a separate referent object of security. The EU’s higher degree of actorness in international politics comes hand in hand with its increasing constitutionalization as a distinct object of European security (Grudzinski/van Ham 1999).

51.3.1.2 Individualization of Security: Growing Importance of the Individual

In addition to the Europeanization trend, a second characteristic development in the EU’s understanding of security can be noticed: the growing importance of the individual as a referent object. This tendency basically applies for both the individual security of EU citizens as well as for the security of people in third countries.

As far as EU citizens are concerned, EU security notably has gained the function of ensuring its population’s security domestically (Delcourt 2003: 11). In addition, the security of EU citizens in third countries (i.e. in conflict areas) is also more and more recog-

nized in the European security discourse.⁹ Thus, the “security of European citizens who may find themselves in countries or areas directly affected by hostilities” (European Commission 1999b) is for some years now a constantly emphasized aspect of the European crisis management strategy. Since 11 September 2001 the EU also gives special attention to the protection of its citizens against terrorist assaults abroad.¹⁰

Besides the security of EU citizens, the protection of civilians in armed conflicts in third countries as well as the link between security and human development play an increasingly important role: “security also means freedom from hunger, deprivation, and marginalization.”¹¹ This argument corresponds to the ‘human security’ conception, as it can be found in the academic security discourse (Brauch 2003, 2005; Burgess/Owen 2004) or in the framework of the United Nations (UNDP 1994). However, literally used, the term ‘human security’ appears only rarely in the EU discourse.¹² Additionally, it is remarkable that the EU conceptually links individual security and development in third countries to European security. Since from the EU’s perspective human rights violations are major ‘root causes’¹³ of violent conflicts, migration movements, transnational crime, and international terrorism, individual security in third countries is regarded as a precondition of international as well as European security: “Those who are desperate will

8 See: Giuliano Amato: Speech at the Humboldt University in Berlin, 7 May 2001. In 1995 the Foreign Ministers of the Western European Union characterized the EU as the “cornerstone of peace in Europe”; see WEU 1995: 1.

9 With the Maastricht treaty not only the EU citizenship was introduced, but also the protection of EU citizens in third countries by embassies of other member states. The so-called ‘Petersberg tasks’, which were drafted by the WEU in 1992 and integrated into the EU treaties in 1997 (Amsterdam), include military rescue operations for the protection of EU citizens. Likewise, the 1995 security strategy of the WEU gave high priority to the “security of European citizens in the world” (WEU 1995).

10 “The European Union will seek ways to improve the security of its citizens who are resident, or travelling, in third countries and exposed to a terrorist threat” (European Council 2004).

12 See, however, the “Canada-European Union Joint Statement on Statement on Human Security: Peace Building and Conflict Prevention”, Lisbon, 26 June 2000; see also: Study Group on Europe’s Security Capabilities 2004.

13 See: Council of the EU/European Commission 2000: “Poverty, and the exclusion which it creates, are the root causes of conflict and are endangering the stability and security of too many countries and regions.”

sometimes take drastic measures to ensure their survival. Often they have little to lose. *Their security and our security* depend on proper and sustainable development, founded on the respect for basic human rights” (European Commission 1995a).¹⁴

51.3.1.3 Member States as Referent Objects

Against the background of the Europeanization and individualization of security the question is how these trends impact on the nation state that traditionally constituted the sole referent object of security. There are rarely explicit references to member state security in the European discourse. The term ‘national security’ is hardly ever used at the European level. Yet this does not mean that member states had become obsolete as security referents. The broader term ‘European security’ covers not only the security of the EU, but also that of its member states and their citizens. Member state security is implicitly incorporated into the overall EU framework.

The trends towards Europeanization and individualization of security have led to the nation state no more being the sole object whose security is at stake. At the same time, the conditions of nation state security have changed: In fact, the Europeanization of member state security has brought about a situation in which the ‘national security’ of member states is based to a substantial degree on the desecuritized quality of member state relations and even more on the joint representation of manifold security interests towards the international environment. In this regard, Churruca Muguruza (2004: 5) speaks about “collectivized security”. Additionally, the increasing relevance of the individual brings about a changing understanding of the function of state security since, in the end, it is the security of the citizens which the EU as much as the member states are supposed to take care of.

In sum, the EU’s conception of security today comprises several referent objects, whose security is increasingly considered as being indivisible and interdependent. Thus, individual, national, European, international, as well as global security are perceived as being mutually determined (Biscop 2004: 9). The Europeanization of security has resulted in the EU constituting the European security conception’s core, while member state security conditions have increasingly changed during the integration process. At the same time, the individualization of security has brought about a greater awareness of individual secu-

rity as the ultimate goal of any security policy at the national as well as the European level.

As a consequence, the European Union nowadays represents something totally different to a conventional system of ‘collective security’. In fact, the EU is neither a collective security system nor a military defence alliance in the traditional sense. European politics is no longer exclusively about security cooperation of state actors in order to enhance national security interests more effectively. In contrast, over the last decades a distinct political subject has emerged at the European level. Thereby, a ‘postmodern’ understanding of security has evolved, that neither builds solely on the traditional principle of national sovereignty nor on the emphasis of national interests, but stresses the maintenance of the integration process, the enhancement of the EU’s capability to act effectively and the promotion of common values towards the outside world. Because of the pluralization of referent objects, potential goal conflicts cannot be ruled out for the future: National security is not necessarily identical with European security, while individual security of EU citizens and ‘human security’ of third state citizens cannot inevitably be reduced to a common denominator.

51.3.2 Security for Which Values?

The pluralization of referent objects corresponds with a diversification of the values that are to be secured. For instance, the well-being and physical integrity of individuals has gained greater importance due to the individualization of security. This part focuses on two corresponding developments closely linked to the Europeanization of security. From a European perspective, the principle of integration as well as the EU’s political identity are core values that have to be preserved, while at the same time the meaning of political sovereignty and territorial integrity as traditional values of state-centred security conceptions has changed.

51.3.2.1 Integration and European Identity

According to the central relevance attached to the European Union as a referent object, member states have perceived the European integration process as a crucial security-relevant value since the 1980’s (Buzan/Wæver/de Wilde 1998: 179–91; Larsen 2000: 341–42; 2002; Wæver 1996). The relevance of European integration thereby results from its twofold function as outlined earlier, that is, first, to maintain the character of the EU as a “security community” and an “island of

14 See: Solana, *op. cit.*, 20 June 2001.

peace” (Bretherton/Vogler 1999; Buzan/Wæver/de Wilde 1998: 186–88) and, second, to strengthen the EU’s ability to act effectively on the international scene (Grudzinski/van Ham 1999: 41). In this sense, Buzan, Wæver, and de Wilde point to the emphasis given to integration as follows: “Just as nations have identity and states sovereignty as their organizing principle and security focus, the different securitizations around the EU seem to converge on integration as the equivalent generalized measure” (Buzan/Wæver/de Wilde 1998: 188).

In addition, the more the EU has made progress in achieving the status of an international actor, the more a further value has gained relevance from the European perspective, namely the development of a European identity towards the international environment. Liberal values such as democracy and human rights are considered the core of this identity. As a consequence, the EU’s international promotion of these values not only supports these principles globally, but also contributes to the strengthening of the Union’s identity in world politics.

51.3.2.2 Political Sovereignty and Territorial Integrity

While integration and European identity are often described as ‘postmodern’ values of European security, traditional values such as political sovereignty or territorial integrity can be referred to as ‘modern’ objectives of conventional ‘national security’ conceptions. However, the process of European integration has not left these principles untouched. On the contrary, over the course of the past decades they have undergone observable changes in their meaning, which can at least partially be characterized as a sort of ‘post-modern’ redefinition.

Take for example the understanding of member state sovereignty. Although this value has by far not become obsolete during the integration process, its meaning has been adapted to new political conditions in the European multilevel system: “states redefine the meaning and especially the extension of sovereignty. ... A collective redefinition occurs regarding *what* a state can claim sole control over, and correspondingly what is no longer claimed. ... Sovereignty is form, the content changes over time” (Wæver 1996: 116).

This change of meaning with respect to sovereignty does not refer to the actual *autonomy* of member states, which de facto had always been subject to certain restrictions. Instead, the change of sovereignty refers foremost to a shift in the assumptions about the links between national sovereignty and *political au-*

thority. In this regard, the characteristic feature is not only expressed by the fact that the degree of political authority at member state level has decreased during the integration process without member states questioning the foundations of their sovereignty. Rather, an even more significant expression of the modified understanding of sovereignty relates to the absence of an external political authority (Wendt 1999: 208) no longer seen as an ultimate precondition of national sovereignty. Instead, due to the development of a supranational political system and the continued joint exercise of “pooled sovereignty” (Joschka Fischer, in: Krämer 2003: 172), a system of “complex sovereignty”¹⁵ has emerged, whose main feature is the sharing of sovereignty between different levels (Schubert 2000: 14; Wendt 1999: 207). This ‘postmodern’ or rather ‘European’ redefinition of sovereignty has helped generating a ‘post sovereign’ order inside the EU without member states losing their political sovereignty in a constitutive sense (Wæver 1996: 119).

Moreover, this change in the meaning of sovereignty has been accompanied by a process of de-borderization (*Entgrenzung*) inside the EU. Although this process has never challenged the territorial integrity of member states, it has in fact totally neglected the relevance of territorial integrity as a security-relevant factor in intra-European relations. While territorial defence still remains reserved to national forces and the collective defence alliances NATO and WEU, several border policies have already been transferred to community competence.

The degree to which elements of supranational statehood have emerged as a result of the European integration process, the understanding of member state sovereignty and territorial integrity has not only changed, but has been increasingly complemented by equivalent principles at the European level. The latter is expressed for instance in the European treaties with the Single European Act (1987) defining “independence”¹⁶ (Rummel 1988: 129–30) as well as with the Amsterdam Treaty (1997) additionally defining “integrity of the Union”¹⁷ as genuine EU objectives. Simi-

15 Mathias Albert: “Die Erde auf dem Weg zur Weltstaatlichkeit”, in: *Das Parlament* (26 July 2004): 18.

16 Single European Act, 1986, Preamble; Treaty on European Union (Maastricht), 1992, Title V, Art. J.1, 2.

17 Single European Act, 1986, Preamble; Treaty on European Union (Maastricht), 1992, Title V, Art. J.1, 2; Consolidated Version of the Treaty on European Union (Amsterdam), 1997, Title V, Art. 11, 1; Consolidated Version of the Treaty on European Union (Nice), 2001, Title V, Art. 11, 1 (emphasis added by the author).

larly, in 1993 the Council stated *inter alia* that the “territorial integrity” and “political independence of the Union and its member states” were important objectives of the CFSP (Council of the EU 1993). These quotations illustrate that the EU constructs itself as an independent political subject whose own ‘quasi sovereignty’ and political identity has become a more and more independent security policy objective. As a consequence, today, member states might be willing to engage militarily for protecting the Union’s security even without facing a direct threat to their ‘national’ security in a conventional sense:

We have to worry about Europe’s security in order to secure that of Denmark. The reason for this is that Denmark as a state under present conditions is more free of military security problems than ever before, but this comfortable situation depends on the current European order being upheld. Therefore, developments in Bosnia threaten us – not us as Danes, but us as Europeans (Wæver 1996: 119–20).

51.3.3 Security from Whom or What?

After the failure of the European Defence Community in 1954 (Noack 1977; Steininger 1985) security-related issues had not been discussed in the EC/EU for a long time. This changed in the early 1980’s when intensified international competition pressures and increased East-West tensions were increasingly perceived as threats to West European security (Ambrosius 1996: 151–52, Wæver 1998a: 87–88.). As a result, the EC member states concluded that the Community should play a more influential role in the international theatre. The stagnation that had characterized the integration process since the 1970’s was now considered a security-relevant problem that had to be overcome. This had two consequences: First, the EPC started dealing with economic and political aspects of security. And second, the process of integration gathered momentum with the adoption of the Single European Act and, after the end of the Cold War, with the Treaty on the European Union.

Since the creation of the Common Foreign and Security Policy (CFSP) in 1993 the EU’s security discourse has continuously intensified. Initially, risk perceptions were still quite incoherent, *ad hoc*, and reactive. But gradually patterns of joint risk perceptions have evolved that radically differ from threat perceptions in times of the Cold War. Thereby, the focus has shifted from direct military threats from other states (Bretherton/Vogler 1999: 198) to a broad variety of quite different security risks and challenges.

51.3.3.1 Slowdown or Failure of the Integration Process

Since the 1980’s, the chance of a possible failure of the European integration process is perceived as a security relevant risk. Progress in the integration process is considered a necessary condition of security in order to preserve peace internally and strengthen the capacity of joint external action. From this perspective, alternative scenarios such as a return of nationalistic rivalries or balance-of-power politics can only be prevented by taking further integration steps. Accordingly, fragmentation and a breakdown of integration have gained the quality of original security risks (Larsen 2000; Wæver 1996, 1998a).

51.3.3.2 Violent Conflicts and Regional Instability

At the beginning of the 1990’s the term ‘instability’ became a collective term for various risks and challenges virtually or potentially threatening international peace and European security from the EU’s perspective. Geographically, the EU initially concentrated mainly on its closer regional environment, giving clear priority to “peace and stability of the European continent and neighbouring regions” (European Council 1994). Particular attention was paid to conflicts and instabilities in Eastern Europe and Russia as well as in the Balkans, the Middle East, and in the Mediterranean region. Risk perceptions focused on a possible collapse of Russia’s democratization process, border and minority conflicts in Eastern Europe, the economic gap between the EU and Eastern European as well as North African states, bad governance and environmental problems in the Mediterranean, ethnic conflicts and humanitarian crises in the former Yugoslavia, and last but not least the Middle East conflict (Higashino 2004; Köhler 2003; Larsen 2000, 2002).¹⁸

In recent years the EU tends to widen the geographical scope of its risk perception. At least two reasons account for this: First, eastern enlargement has moved the Union’s borders eastwards and shifted attention to the “new neighbourhood” (European Commission 2004b). Second, the terrorist attacks of 11 September 2001 have raised the EU’s sensitivity for the global character of security problems (Hill 2004). Hence, the Union and its member states increasingly perceive conflicts and instabilities in more remote

18 Javier Solana: “Europe: Security in the Twenty-First Century”, The Olof Palme Memorial Lecture, Stockholm, 20 June 2001.

regions as potential risks for European security. As a consequence, the European security strategy of 2003 states that “problems such as those in Kashmir, the Great Lakes Region, and the Korean Peninsula impact on European interests directly and indirectly, as do conflicts nearer at home, above all in the Middle East” (European Council 2003: 4). Concrete examples of state failure mentioned in the strategy are “Somalia, Liberia, and Afghanistan under the Taliban” (European Council 2003: 4).

51.3.3.3 Transnational Threats

From the European perspective, transnational threats constitute the link between structural instability and regional conflicts in distant regions and European security. They are perceived as having the potential to import instability to Europe. Transnational threats comprise international terrorism, religious fanaticism, ethnic nationalism, international crime (drug dealing, smuggling of arms, people trafficking), and migration, as well as the proliferation of weapons of mass destruction (European Commission 2001a; European Council 2001b, 2003). Some of these threats had already been discussed in the Community before 1990.¹⁹ What has changed after the end of the Cold War was a shift “in emphasis as these issues have emerged on top of the agenda of security politics” (Sjursen 2004a: 18, 2004b).

51.3.3.4 Violation of Human Rights, Bad Governance, and Lack of Democracy

A further characteristic of the European understanding of security is an emphasis on the ‘root causes’ of regional instability, violent conflicts, and transnational threats. In particular, the disregard of human rights and democratic principles is considered a main structural cause underlying many security problems: “Countries with conflict potential are usually those where the democratic process is the least advanced” (European Commission 2001a: 13). In recent years, the EU has added bad governance and failed statehood to its list of risk factors (Churrua Muguruza 2004: 10–13; European Council 2003).

The emphasis on liberal values, democracy, and human rights is not new, but the perception of these values being relevant for European security has become a new feature. This applies not only to the

diagnosis of conflict causes, but also to the development of strategies for crisis prevention and conflict resolution. Thus, the active promotion of liberal values is increasingly seen as a contribution to international peace and, therefore, to European security (Larsen 2000: 348; see below in part 51.3.4).

51.3.3.5 Global Risks and Challenges

A range of further dangers can be summarized as ‘global risks and challenges’. Because of their global character, challenges are perceived as having the potential to *directly* affect European security. They comprise for instance diseases (HIV/AIDS) (European Council 2003), environmental problems (climate change)²⁰, risks for energy security (European Commission 2000c; European Council 2003), as well as challenges for the sustainable development of the global economy. Besides these ‘challenges’, the EU perceives several ‘risks’ that could strike European security *indirectly*. These risks include economic, social, and ecological problems that are perceived as threatening the security of individuals in third countries, thereby constituting ‘root causes’ for regional instability, violent conflicts and transnational threats. Today, many different socio-economic and ecological problems are addressed: Diseases,²¹ hunger and malnutrition, “man-made or natural disasters”, “competition over scarce natural resources”²², water and “geological resources” such as oil or minerals, but also “biological resources” such as fishery grounds or forests (European Commission 2001a: 17), landmines²³ as well as poverty.

The EU gives more attention to the causal interplay between different risks and challenges: As a consequence of global climate change, for example, the EU expects a global increase of “extreme weather events (hurricanes, floods)” (European Commission

19 For example terrorism had been discussed since the 1970’s, firstly on expert level, later within the intergovernmental “Trevi framework” (Smith 2004: 142).

20 “Climate change represents perhaps the most challenging environmental problem of all” (European Commission 2001a: 18; see also European Commission 2001e).

21 In a Communication to the Council and the European Parliament, the European Council indicates “HIV/AIDS, malaria and tuberculosis” as “major poverty diseases” and dangers to “human security and human rights” (European Commission 2004a).

22 “Canada-European Union Joint Statement on Human Security: Peace Building and Conflict Prevention”, Lisbon, 26 June 2000.

23 See “Regulation (EC) concerning action against anti-personnel landmines in third countries other than developing countries”, Regulation (EC) N°1725/2001, 23 July 2001, in: *Official Journal of the European Communities*, Brussels, 1 September 2001.

2001e: 4) as well as a shortage of natural resources (i.e. fresh water) in some areas that could foster violent conflicts and “further turbulence and migratory movements in various regions” (European Council 2003). This could again lead to further environmental degradation. “Environmental degradation, often closely linked to resource problems such as access to water, may be both a contributing factor to insecurity and conflict and the result of it” (European Commission 2001a).

A further problem seen by the EU relates to the “dark side” (European Commission 2001a) of globalization. According to this, negative effects of globalization contribute to global environmental change, the spread of poverty, and the marginalization of economies. In various developing countries they additionally affect institutional capacities that were in fact reserved to cope with these challenges (European Commission 2002). In turn, poverty, institutional deficits, and bad governance increase the vulnerability of social groups through diseases, environmental degradation, and natural disasters (European Commission 2000a). Moreover, regional conflicts, poverty, and underdevelopment form a “constant seedbed” for terrorism and religious fanaticism (European Council 2001b). In sum, the EU’s risk perception after 1990 has been marked by a diversification of security problems, a greater awareness of their interrelatedness, an emphasis on root causes, and an extended spatial scope.

51.3.4 Security by What Means and Strategies

What security policy strategies does the EU pursue to cope with the perceived dangers as outlined above? What instruments play a role in the European security conception? The European security approach, the roots of which can be traced back to the 1950’s and which has gained contour and coherency during the 1990’s, can be described as “comprehensive” and “co-operative” (Biscop 2004: 5; Churruza Muguruza 2004): These adjectives express that the EU pursues a normative and cooperative strategy resting on a broad set of means and instruments. Additionally, due to the emphasis of the root causes of security risks, the EU has more and more come to formulating a preventive-oriented policy approach. Below in a first step the normative and cooperative aims and principles of the EU’s security conception will be examined, then, the means and instruments the EU uses to achieve its goals will be analysed, and finally the Union’s response to 9/11 will be reviewed.

51.3.4.1 Objectives and Principles of the EU’s Approach to Security

The EU’s security approach is shaped by liberal institutionalist norms and ideas that are based on two core premises: First, political integration, economic interdependence, and multilateral cooperation weaken the anarchy of the international system as well as the security dilemma (Aggestam 2000: 88). Second, democracies foster peaceful relations among themselves (‘democratic peace’ assumption). Therefore, promoting integration and multilateralism and strengthening democracy and human rights worldwide might be the best way to prevent violent conflicts (Higashino 2004: 352; Hill 1990: 54). Both assumptions stem from the experience of the appeasing effects of European integration. Today, they can be interpreted as core elements of a postmodern European identity.

Additionally, in recent years the concept of ‘sustainable development’ has also gained relevance in the European security discourse, thereby complementing the normative ideas outlined above. It refers to the principles of economic development, social justice, socio-economic and ecological sustainability, which are regarded as conditions of “structural stability” (European Commission 2001a). Taken together, these assumptions form the ideal basis of a distinct European security approach, whose main imperatives are deepening and enlarging the EU, fostering liberal values and sustainable development, and promoting international cooperation and multilateralism (European Council 2003).

Integration and Enlargement. Since the mid 1980’s, deepening the European integration process, strengthening supranational institutions, improving the political capacity to act, and creating an external EC/EU identity have become central West European objectives. Besides the (internal) maintenance of the European security community, especially the enhancement of the EU as “a forceful presence in the international arena” (European Commission 1996b) has gained relevance since 1989/90. Thereby, deepening the EU has been explicitly seen as contributing to stability and security on the European continent. Accordingly “only a more politically coherent Europe will be able to cope with the inevitable strains and centrifugal tendencies generated by the global world economy and the new post-Cold War strategic environment” (Grudzinski/van Ham 1999: 41; see Larsen 2000: 353, 2002: 294). The objective of improving the Union’s capacity for international action operates as a driving force in European integration.²⁴

Immediately after the end of the Cold War the EC claimed to act as a major force in restructuring the pan-European order. The EC initially counted on its virtue as a “gravitation centre” (Lippert 2003: 8) in the first place, emphasizing West European integration (Bretherton/Vogler 1999: 198, 214). Thus, the European Council stated in 1989 that the “current changes ... in Europe demonstrate the attraction which the political and economic model of Community Europe holds for many countries” (European Council 1989). Deepening West European integration would be of interest to the European continent (European Council 1989). The accession of Central and Eastern European states to the EC was not yet considered.

During the 1990’s it was accepted that deepening West European integration would not be sufficient for guaranteeing stability in Europe. Thus, Eastern enlargement appeared on the agenda. Besides political, moral, and economic objectives, security and stability arguments played an important role (Higashino 2004; Kreile 2002: 807; Lippert 2003: 7–9). However, positions of member states differed and thus prevented a clear European policy until the second half of the 1990’s. Only due to the ongoing crises in the Balkans, stability arguments prevailed in favour of Eastern enlargement (Higashino 2004: 356; Lippert 2003: 8). As a consequence, in the second half of the 1990’s, member states officially switched to a dual strategy of both deepening and enlarging the EU. Finally, the accession of eight Central and East European states in May 2004 was the preliminary culmination of a “peace project” (Kramer 2003), that builds on an integrative approach to European security, whose core elements are the principle of inclusion, the export of supranational institutionalization (Sjursen 2004b), and the expansion of the West European security community (Grudzinski/van Ham 1999: 41; Kreile 2002: 807).

Promotion of Liberal Values. Since the 1980’s, the promotion of democracy and human rights has become a practical objective of European foreign policy. In 1983, EC governments stated their intent “to work together to promote democracy on the basis of the fundamental rights” (European Council 1983). Only a few years later, this formulation was identically incorporated into the preamble of the Single European Act.²⁵ In doing so, member states for the first time in-

cluded an explicit reference to the principles of democracy and human rights into the treaties of the European Community. Two years later, the EC was the first political actor implementing a conditionality clause in an international treaty in order to enforce democracy and human rights (Lomé-IV) (Börzel/Risse 2004: 1).

After the end of the East-West conflict, this trend towards an active human rights and democratization policy has become even stronger: The Maastricht Treaty for the first time defined the development and consolidation of ‘democracy and the rule of law’ as well as the respect for ‘human rights and fundamental freedoms’ as explicit aims of both the Common Foreign and Security Policy as well as the EU’s development policy.²⁶ During the 1990’s, the principle of conditionality has become a regularly applied instrument of the EU’s democratization and human rights policies (European Commission 1995a, 1995b; European Council 1991). Examples can be found in enlargement and association policies as well as in development, non-proliferation, and anti-terrorism policies (Börzel/Risse 2004; Bretherton/Vogler 1999: 171–72; Dembinski 2002: 9–10; Jünemann/Schörnig 2002: 13; Larsen 2000).²⁷ Additionally, the EU increasingly tries to mainstream the promotion of democracy and human rights in various policy fields, thereby integrating this objective in virtually all dimensions of its external relations. This applies particularly to the policy domains of development cooperation and conflict prevention (Council of the EU 2001a, 2001c; European Commission 2001c, 2004c).

It is notable that the EU not only increasingly links its commitment to democracy and human rights to security arguments, but that it also regards the active promotion of these values as an essential contribution to strengthening international stability in an operative manner (see Council of the EU 2001a). Accordingly, the concentration on conflict-prone regions was a major concern of the EU’s human rights policy reform in 2001/2002. The aim was to adopt a more “proactive, strategic approach” to human rights policy also contributing to crisis prevention and conflict so-

24 This accounts especially for the CFSP. Enhancing its efficiency and coherence were constant objectives of the Intergovernmental Conferences in Amsterdam (Wessels 1997) and Nice (Wessels 2001), and of the European Convention (Risse 2003a; Wessels 2004).

25 See Single European Act, February 1986, Preamble.

26 See Treaty on European Union (Maastricht), 1992, Title V, Art. J.1.

27 Javier Solana: “An intelligent war on terror”, in: *The Jordan Times*, 10 November 2004; Javier Solana: “Three ways for Europe to prevail against the terrorists”, in: *Financial Times*, 25 March 2004.

lution (Council of the EU 2001a; European Commission 2001c).

In summary, first the promotion of democracy and human rights has gained an increasing operative relevance in external EU policies since the early 1990's. Second, the EU's democratization and human rights policies are increasingly guided by security considerations. The active promotion of liberal principles such as democracy, human rights, rule of law, and good governance is not only seen as a major contribution to the improvement of the situation of right holders (*Rechteinhaber*) at individual and societal level. It is also seen as a means to fight the "root causes" of conflicts and to strengthen "structural stability" at national, regional, and international level (European Commission 2001a; European Council 2003: 10). Finally, the commitment to liberal values also plays an identity-building role: As the EU promotes these values, it strengthens and defends "the core of its political identity".²⁸

Promotion of Sustainable Development. Similar trends can be observed regarding the promotion of economic and social development in third countries. Since the adoption of the Maastricht Treaty, the support of economic and social development as well as the fight against poverty are central development policy objectives codified in primary law. During the 1990's, EU development policy has increasingly become politicized insofar as it is no more exclusively motivated by moral concerns, but also by stability objectives. Today, democracy and human rights promotion not only describes an integral element of development cooperation. Also the support of economic and social development is increasingly seen as a contribution to conflict prevention and structural peace-keeping both for European development cooperation and common foreign trade policy:

Development policy and other cooperation programmes provide the most powerful instruments at the Community's disposal for treating the root causes of conflict. There is a need to take a genuinely long-term and integrated approach, which will address all aspects of structural stability (European Commission 2001a).

Thus, the EU's development policy reform conducted from 2000 onwards aimed at shifting to a more proactive approach *inter alia* contributing to peace

and stability in third countries (Churruca Muguruza 2004: 10). The global fight against poverty (as a major cause of conflicts) has been the overall objective of European foreign aid policy (Council of the EU/ Commission 2000; European Commission 2000a), where the EU focuses on the needs of individuals, whose satisfaction is regarded as a precondition for structural stability and international security.

A further characteristic of the European approach relates to ecological factors. In the second half of the 1990's, the EU has shifted to a sustainability approach, increasingly integrating environmental aspects in development policies (European Commission 1998, 1999a, 2000b, 2001d, 2001e, 2002, European Council 2001c).

The EU pursues a "development approach centred on social and human aspects and on the sustainable management and use of natural resources and the environment" (European Commission 2000a). The EU aims at making an integrated, long-term and proactive contribution not only to eliminating economic and ecological causes of conflicts, but also to 'human' and 'environmental security' (Brauch 2005, 2005a) although these terms are not part of the common EU vocabulary. Normative guidelines of this approach are social justice, economic development, and ecological sustainability. Major elements are the strengthening of institutional capacities "to manage change without to resort to conflict" (European Commission 2001a) as well as the promotion of regional integration and international cooperation.

Cooperation, Effective Multilateralism and International Law. A further element of the European understanding of security is the assumption of a positive causal link between security and stability, and international norm setting and multilateral cooperation. As the EU pleads for the creation and strengthening of international institutions, the setting of international norms, the promotion of regional integration and the strengthening of an "effective multilateral system" (European Council 2003), it tries to transfer the European peace project model to other regions and international relations respectively. "The Community's own experience pleads for an active and leading role in this area" (European Commission 2000a).

This 'cooperative security' approach is no innovation of the post-Cold War era. Political conceptions such as 'common security' had already reflected these ideas during the East-West Conflict and had become manifested for instance in the active support of the CSCE process (Dembinski 2002: 11; Sjursen 2004b). However, during the 1990's, the EU has intensified re-

28 Javier Solana: "Where does the EU stand on Common Foreign and Security Policy?" Speech at the Forschungsinstitut der Deutschen Gesellschaft für Auswärtige Politik [Research Institute of the German Society for Foreign Policy], Berlin, 14 November 2000.

spective efforts. Since then, the EU shows a striking engagement for strengthening international law and international organizations such as the UN (Dembinski 2002: 6). The support of the Kyoto Protocol and the commitment to the International Criminal Court are the most prominent examples of this policy. The dedication to international legalization, regional integration, and international cooperation describes an integral element of several policy areas, mainly development cooperation, environmental policy, conflict prevention, combat of terrorism as well as arms control and non-proliferation policies. Simultaneously, the functional aspect of joint problem solving has become more important. Accordingly, concepts such as “global governance” and “effective multilateralism” are frequently referred to in the EU discourse (European Council 2003).²⁹

51.3.4.2 Security Policy Means and Instruments

To achieve the aims of its security policy, the EU possesses many instruments comprising political and economic means as well as military options. While during the Cold War the EC had political and economic means at its disposal, the creation of a military dimension of the EU has been a major improvement of the 1990's.

Political and Economic Instruments. The recourse to political and economic means to affect the action of political actors in third countries through positive and negative incentives as well as through triggering learning and persuasion processes has a long tradition in external policies of the EC/EU. For decades, these ‘soft’ modes of political steering had been the only means for the EU (Hill 1990), and they still prevail in the Union's present foreign policies.

Regarding the 1990's, three main trends can be observed: first, security issues have played a greater role in the EU's external relations since the end of the Cold War. Until 1990, bi- and multilateral dialogues had been dedicated almost exclusively to economic and trade issues as well as to technical and cultural questions. After 1990, new topics such as human rights protection and democracy promotion, but also the fight against transnational threats (e.g. nuclear proliferation, terrorism and international crime) have appeared on the agenda (Dembinski 2002: 8). Second, the EU's economic and development policies

have simultaneously become more and more politicized, if not even securitized. In other words: political and security objectives have gained greater impact on the formulation of foreign economic and development policies. This becomes apparent when looking, for instance, at the conditionality of foreign aid. All in all, since the early 1990's, the EU has comprehensively reviewed its political and economic relations to other countries and regions under security aspects in order to utilize these relations for also pursuing security objectives. Third, the EU has complemented its non-military toolbox by civilian instruments of conflict management within the framework of the ESDP.

But let's have a look at the traditional approaches of the EU's external policies first: here, positive and negative incentives as well as political persuasion efforts have always played a major role. The latter are, for instance, an integral part of the institutionalized political dialogues, which are important diplomatic EU instruments. Political dialogues are aimed at establishing formalized and constant diplomatic relations to certain states or groups of states. Within these frameworks, the EU focuses on the virtue of its own example and the power of the better argument in order to persuade dialogue partners of its norms, values, beliefs or positions. During the 1990's, the number of institutionalized dialogues has constantly increased. Today, the EU maintains 30 such dialogues with countries and regions all over the world (Börzel/Risse 2004: 26–27; Dembinski 2002: 7–8; Jünemann/Schörning 2002: 12–13).

Over the last two decades EU member states have increasingly managed to mutually adjust their positions on international issues and to represent them collectively in multilateral bodies. In international organizations member states vote consistently in up to 80 per cent of cases (Regelsberger/Wessels 2005). Finally, diplomatic missions of EU representatives in different compositions (troika, presidency, representatives of the European Commission, High Representative of the CFSP, EU Special Representatives) belong to the traditional means of European foreign policy and are conducted inter alia in concrete crisis situations.

Besides political persuasion, the EU has increasingly counted on political and economic incentives, thereby trying to alter cost benefit calculations of third actors by ‘carrots and sticks’ in order to achieve changes in political behaviour. Major economic incentives (*positive economic sanctions*) at the EU's disposal are economic, financial and development aid, trade concessions, and access to the European mar-

29 Javier Solana: “Europe must assume its responsibility for security as part of its international relations strategy”, in: *Irish Times*, 23 September 2003.

ket, as well as EU programmes for the development of political, administrative, and economic capacities and institutions in third countries.

The EC had in some cases imposed *negative economic sanctions* even before 1990 when negative sanctions had not only been used as foreign policy means, but also as security-related instruments. For instance, this accounts for the Iran hostage crisis or the Soviet invasion of Afghanistan (Rummel 1988: 126; Smith 2004: 142). Since 1990, the EC/EU has constantly accessed this instrument in crisis situations, e.g. the trade embargoes against Serbia and Montenegro during the Bosnian War in 1992.

Today, the EU systematically combines positive incentives with the threat of negative sanctions in case of enduring violation of political norms such as democracy, human rights, and good governance. Many association agreements with third countries contain such clauses. Examples are the Cotonou Agreement between the EU and the African, Caribbean, and Pacific (ACP) countries as well as several association agreements with Mediterranean partners and some countries in Central and South America (Börzel/Risse 2004). The conditioning of external relations has become more obvious with regard to the EU's enlargement policy: The Copenhagen criteria (democracy, human rights protection, market economy) define preconditions for accession to the EU, while the prospect of an EU membership is "by far the biggest incentive structure which the EU can offer to promote democracy and the rule of law" (Börzel/Risse 2004: 27).

A more recent innovation regarding non-military means of European security policy concerns the extension of civilian crisis management instruments as part of the ESDP (European Commission Conflict Prevention and Crisis Management Unit 2003). The experience of violent conflicts in the Balkans had not only demonstrated the importance of military crisis management capacities, but also the necessity of civilian instruments for conflict prevention, crisis management and peacekeeping. Therefore, after having taken the basic decision to launch the ESDP project in 1999, EU member states have not only strived towards creating an autonomous *military* EU capacity, but also for effective *civilian* instruments of crisis management. In doing so, they have concentrated mainly on police missions, the allocation of legal and administration experts as well as rapidly deployable emergency management teams (European Council 1999b, 2000a, 2000b, 2001c). With the *Rapid Reaction Mechanism* created in 2001 the EU aims at improving its civilian

capacities for rapid intervention in acute crisis situations (acute crisis management as well as post-crisis reconstruction). Focal points are conflict mediation, re-establishment of civil administration and the rule of law, confidence building measures, civil society development as well as certain consulting activities (Council of the EU 2001b).

In sum, when looking at the non-military toolbox of EU security policy, one can observe an obvious differentiation of these means since 1990. Positive political and economic incentives as well as capacity-building measures enjoy clear priority over negative sanctions.

Military Means. One of the most obvious innovations regarding the EU's security conception since the end of the Cold War concerns the construction of autonomous military capacities within the framework of the *European Security and Defence Policy* (ESDP). This will be reviewed for the historical development, then the motives and objectives for the creation of the ESDP will be examined, before the military means are related to the more conventional security policy instruments of the EU.

Towards an Autonomous Military Dimension of the EU. The roots of the ESDP go back to the 1980's when the intention had prevailed in Western Europe to strengthen one's role in the Atlantic Alliance. Step-by-step, the former taboo to discuss defence-related topics within the EPC had been broken (Pijpers 1988: 159; Rummel 1990: 90–91).

The foundation for a military component of the EU was then laid in the early 1990's with the Maastricht Treaty. Member states agreed that the Common Foreign and Security Policy should "include all questions related to the security of the Union, including the eventual framing of a common defence policy, which might in time lead to a common defence".³⁰ Moreover, the WEU was described as an "integral part of the development of the Union."³¹ The EU should be able to request the WEU to "elaborate and implement decisions and actions of the Union which have defence implications".³² However, the actual creation of independent military capacities of the EU failed for several years because of member state disagreements, and, last but not least, due to the continuous opposition of Great Britain.

30 Treaty on European Union (Maastricht), 1992, Title V, Art. J.1.

31 *Ibid.*, Title V, Art. J.2.

32 *Ibid.*

Against the background of so called “new wars” (Kaldor 2000; Münkler 2002, 2002a) in Europe – ethnic conflicts and civil wars like those in Bosnia and in Kosovo, which have shifted the West European focus from territorial defence towards new security tasks such as humanitarian, peacekeeping and peacebuilding missions – the so called ‘Petersberg Tasks’³³ of the WEU were integrated in the CFSP with the Amsterdam Treaty (1997). The European Council was given the competence to decide on political guidelines for military WEU missions. Thus, for the first time, the EU had military instruments for crisis management and peacekeeping tasks at its disposal.

The final breakthrough came with a change in British policy towards the EU, as the ongoing Kosovo crisis gave reason for the British government to abandon its opposition to independent military EU components (Haine 2004: 50–51). In the autumn of 1998, the British government finally argued for making the EU capable of military action and for creating appropriate decision-making structures.³⁴ Half a year later, the Cologne European Council decided to create the capacity for autonomous EU military action across the full range of ‘Petersberg Tasks’. For this reason, the European Council initiated the almost complete integration of the WEU into the EU and the launching of the ESDP (European Council 1999a).

Since then, the EU has developed and strengthened separate military capacities and corresponding decision making structures. In doing so, the EU has not only set up new political and military bodies (e.g. the EU Military Committee and the EU Military Staff), but has also developed military capability goals (see chapter by Mosca Moschini in this volume). Thus, the Helsinki European Council decided in December 1999 to create a *Rapid Reaction Force* to be able, by 2003, to deploy up to 60,000 troops within 60 days in a crisis area for at least one year. Although the EU has not managed to fully implement this decision by 2003, it has nevertheless reached a certain operational capacity as demonstrated by first military peacekeeping operations conducted under the ESDP that year.³⁵

In June 2004, the European Council decided on the so-called “Headline Goal 2010” (Council of the EU/Council 2004), which was further concretized in

November the same year by EU defence ministers (Defence Ministers of the EU 2004). A key element is the creation of 13 battle groups, consisting of around 1,500 troops each, which shall be deployable within a few days only. Until 2007, the EU intends to be able to simultaneously operate two of these battle groups up to 6,000 kilometres away (Kamp 2004; see chap. by Mosca Moschini in this vol.).

Motives and Objectives of the ESDP. The motives for setting up the ESDP comprise two main objectives: strengthening the EU as an international actor, and improving its problem solving capacity by additional (military) means. In statements and declarations these arguments are often mixed. Nevertheless, one can observe a certain shift in emphasis from the first to the second: With the advanced operational capability of the ESDP, problem-solving aspects (intervention argument) have obtained priority over more abstract reasons related to actorness (integration argument).

During the 1990’s, the necessity to enhance the EU’s international role had been the dominant argument of ESDP advocates (Larsen 2000; 2002). Thereby, the desire to improve the EU’s position vis-à-vis the US had often played a role as well (Jünemann/Schörnig 2002: 21). In principle, the intent to strengthen the EU’s international profile can be interpreted as part of broader efforts to deepen the integration process, which, in the 1990’s, had always included the improvement of the EU’s capacity for external action (European Council 1999a).

After the launching of the ESDP in 1999, problem-solving objectives have come to the fore (Larsen 2002). Since then, the European discourse on ESDP issues has been more and more dominated by the argument that the EU should possess the full range of security policy instruments (including military means) in order to be able to cope with new risks and challenges effectively. Governments as well as the High Representative for the CFSP, Javier Solana, have repeatedly emphasized that neither collective defence nor international power projection were the aims of this endeavour.³⁶ They argue the ‘Petersberg Tasks’ were at the heart of the ESDP, with a mandate of the UN Security Council being the basic precondition for

33 “Humanitarian and rescue tasks; peacekeeping tasks; tasks of combat forces in crisis management, including peacemaking” (WEU 1992).

34 See “Joint declaration on European defence”, British-French summit, St Malo, 3–4 December 1998.

35 The EU launched the first military ESDP operations in 2003: “CONCORDIA” in the Former Yugoslav Republic of Macedonia (with recourse to NATO capacities) and “ARTEMIS” in the Democratic Republic of Congo (without recourse to NATO capacities).

36 Javier Solana: “Europe: Security in the Twenty-First Century”, Stockholm 20 June 2001.

any military EU action. However, whether emphasis should be given on “peacekeeping or on more robust peacemaking operations” (Kleine 2004: 42, translation by the author) is still unclear due to differing member state positions (Missiroli 2002: 18). In any case, ESDP capacities currently rather allow for missions on the lower spectrum of the ‘Petersberg Tasks’, whereas the EU’s capability for robust peace enforcement missions is still very limited.

At the same time, one can already observe a certain conceptual realignment of ESDP compared to the original approach (Haine 2004). While as a consequence of the experience in Bosnia and Kosovo (Delcourt 2003) the EU had initially focused to a large degree on the ability to intervene in conflicts on the European periphery, it has, since 9/11, enlarged its scope to more remote regions as well (for example African ‘failed states’). In response to the terrorist attacks in the US in 2001 the EU has emphasized even more rapid military reaction capabilities (Jünemann/Schörning 2002: 14). Thus, the range of potential ESDP tasks has widened: “As indicated by the European Security Strategy this might also include joint disarmament operations, the support for third countries in combating terrorism and security sector reform” (Council of the EU/Council 2004). In fact, the ‘Battle Group’ concept can be interpreted as an expression of these new trends (Kamp 2004).

Comprehensive Security: Primacy of Diplomacy – Military Means as ‘Last Resort’. All in all, the EU has obtained an increasingly comprehensive and differentiated range of security policy instruments since 1990. Compared to the reconceptualization of security at the national level, a specific feature of this evolution has been that the relative importance of military means in the EU’s security conception has not declined, but increased. In fact, member states have assigned new security policy tasks to the EU that had formerly been reserved to other international institutions. However, the end of the Cold War accounted for this development only indirectly. Instead, it was the West European experience with the conflicts in the Balkans, which triggered member states to launch the ESDP. Both the Bosnian war and the Kosovo conflict had demonstrated the European dependence on US support to “fight fire in its backyard”.³⁷ Thus, it

was no coincidence that the ESDP was launched immediately after the Kosovo crisis.

The ESDP stands for a qualitative innovation in the EU security conception, since the West European integration process had never had a military dimension before. But this development has not caused significant changes in the normative orientation of the EU’s security policy so far. Political and economic means still enjoy preference in the Union’s understanding of security (Larsen 2002), while the ESDP is seen as a completion of existing security policy instruments: “The European Union has long had access to a wide range of tools with which to help provide security... . This has not so far included military capabilities. But this is now changing.”³⁸

It has repeatedly been argued that the EU possesses a unique combination of security policy instruments, allowing it to react to complex and “increasingly multilayered”³⁹ security risks: “The EU is the only regional organization in the world possessing such a broad range of political, humanitarian, economic, policy and military instruments”⁴⁰. The ESDP is the final component of a broad and integrative security approach, whose primacy remains the use of political and economic means, but which can also access military instruments as a “last resort” if necessary, and authorized by the UN Security Council (European Council 2003: 7).

By analysing the EU’s response to the terrorist attacks of 11 September 2001, the following section will illustrate how the EU implements its broad, cooperative, and normative security approach, and it will argue that ‘9/11’ has not led to a fundamental change in the EU’s security conception. Rather, the reaction of the EU was an expression of a distinct European understanding of security, emphasizing international cooperation, structural prevention, and civilian instruments of security policy.

51.3.4.3 Anti-terrorism Policy: The EU’s Response to 9/11

The EU perceived the terrorist attacks of 9/11 as a problem of both internal and external security. The Union’s reactions were marked by two characteristics that are of particular interest for this analysis: first, in

37 Madeleine Albright: “Die NATO muss größer und flexibler werden”, in: *Süddeutsche Zeitung*, 7 December 1998.

38 Javier Solana: “Europe: Security in the Twenty-First Century”, Stockholm 20 June 2001.

39 Solana, *op.cit.*, 20 June 2001.

40 Javier Solana: “Die Rolle Europas in der Welt”, in: *Süddeutsche Zeitung*, 20 September 2003; translation by the author.

its immediate action, the EU concentrated heavily on the domain of internal security, i.e. police and justice cooperation. This comprised the European arrest warrant, joint investigation groups, measures against money laundering, and the set-up of Eurojust to improve the fight against organized crime (Kleine 2004). Second, the EU has embedded its international anti-terrorism policy in a broad and cooperative security approach that is marked by interdisciplinary and multilateral orientation, and that targets the structural root causes with civilian instruments. Military means have played no role in the EU's fight against terrorism.

As far as risk perception is concerned, the security discourse of the EU has shown an increased threat perception stemming from international terrorism after 9/11. The European security strategy defines terrorism as a "growing strategic threat to the whole of Europe" (European Council 2003: 3). Solana even speaks of "an existential threat".⁴¹ As a consequence, the fight against terrorism has climbed significantly on the priority scale. Only a few days after 9/11, EU governments affirmed that "the fight against terrorism will, more than ever, be a priority objective of the European Union" (European Council 2001a). However, subsequent EU policy decisions have not led to a substantial change of the foreign and security policy course. In fact, 9/11 has accelerated ESDP integration (European Council 2001a, 2002; Haine 2004).⁴² But this was not because the EU intended to fight terrorism with military means. Rather, the objective was to enable the Union to conduct peacekeeping missions in the Balkans in order to relieve the US in this respect, whereas member states could not agree on expanding the "Petersberg Tasks" by including military action against terrorism (as suggested by France) (Kleine 2004: 96–98). The participation of several member states in the US-led military operations against Afghanistan and Iraq occurred outside the EU framework (Crowe 2003; Hill 2004).

Although ESDP tasks have been supplemented by the support of third countries in combating terrorism, it would be clearly exaggerated to diagnose a "militarization" of European security policy after 11 Septem-

ber 2001. Rather, the EU's response has demonstrated both the path dependency of European policy as well as the continuity of the European understanding of security. In fact, 9/11 has led to a certain modification in European risk perception: Terrorism and the proliferation of weapons of mass destruction, but also 'failed states' and migration, are more than before perceived as security risks. Additionally, the spatial scope of both risk perception and potential EU action has widened (Hill 2004). But in sum, continuity has prevailed as the EU has simply confirmed its EDSP decisions taken earlier and reinforced its integrative approach to security (Biscop 2004: 6; European Council 2001a). Core elements of this strategy are the fight against structural root causes of terrorism (elimination of poverty, development, democratization), the concentration on economic, financial, political and judicial means as well as police, justice and intelligence cooperation, the strengthening of multilateral efforts and international institutions, the containment of terrorists' access to financial and economic resources, and third state capacity building. Solana calls this approach an "intelligent war on terror: Aside from security and intelligence efforts, we must also work to deny 'oxygen' to the terrorists. ... The EU will be tough on terrorism. But it must also be tough on the causes of terrorism."⁴³ Thus, the European anti-terrorism policy again demonstrates the preference for a long-term, preventive, multidisciplinary, non-military, and multilateral approach to security.

51.4 Conclusion

The analysis of the European security discourse along the theoretical security dimensions (referent objects, values, risks, means) has shown that the initial research question was, in some respects, posed wrongly. When member states began to confer security policy competence to the EU in the early 1990's, the Union did not (yet) have a common understanding of security. Therefore, regarding the European security discourse since 1990, one actually has to talk about a "conceptualization" rather than a "reconceptualiza-

41 Javier Solana: "An intelligent war on terror", in: *The Jordan Times*, 10 November 2004.

tion" of security. Hence, the point is not that the EU had developed a *new* security conception, but rather that the EU has to some degree succeeded in defining a *common* understanding of security at all. The evolution of this security understanding is not yet completed, but its contours have become more and more visible in recent years.

Because the EC did not possess a coherent security conception in times of the Cold War, it is not easy to trace the qualitative changes since 1990. There is simply no possibility of comparison. Nevertheless, some trends can be identified that are characteristic for the EU's (re)conceptualization of security compared to more traditional security definitions. In this regard, the analysis has revealed that the evolution of the European understanding of security since 1990 has been characterized by both a widening (new threats and risks) as well as a deepening (new referent objects) of security. However, compared to other actor's redefinitions of security, one of the most obvious trends has *not* been that a military security conception had been complemented by political aspects, but rather, on the contrary, that military means have been added to a policy approach that had formerly counted exclusively on non-military instruments.

Today, the EU's security conception combines several characteristic features: first, it includes several referent objects whose security is seen as interdependent and indivisible. As far as member state and individual security are concerned, the EU itself has become the primary referent object of security. Second, one can observe a pluralization of the values that are to be secured. This trend has simultaneously changed and relativized the traditional meaning of state sovereignty in favour of individual and European values. Third, the evolution of the European understanding of security has been marked by a diversification of risk perception. Thus, the fear of a direct military threat has been replaced by various direct and indirect political, socio-economic, ecological, and military risks, threats, and challenges (Brauch 2005a). Fourth, the diversification of risk perception has corresponded with an extension of the security policy instrument by military means, and the creation of an autonomous intervention and crisis reaction capacity. Fifth, a 're-framing' of civilian power principles could be observed, i.e. a review of these principles in terms of security aspects as well as the intent to explicitly link them to security policy objectives. Sixth, the EU has enhanced its readiness to actively apply a broad range of security policy means in an increasingly coherent, but also more dif-

ferentiated manner across various policy fields and EU pillars.

The '9/11' tragedy has been less formative for these trends than the conflicts in the Balkans during the 1990's. Whereas the conflicts in the former Yugoslavia have triggered the launching of the ESDP project as one of the most characteristic innovations in the European security conception, the terrorist attacks in New York and Washington DC simply brought the EU to basically confirm its already existing security approach.

Since 1990 the European Union has gradually developed both an independent external identity as an international security actor as well as a distinct European understanding of security. This process was enabled by the upheaval of 1989/90, whereas the new international setting that came along with the end of the Cold War influenced its direction. Thus, the fundamental change of risk perception as well as the obvious trend towards 'widening and deepening' the security definition are expressions of a 'contextual change' that has in fact lead to a 'conceptual change'. At the same time, the collective construction of an increasingly coherent security conception (as well as a common security identity) has been facilitated by both the ever closer interaction between political actors at EU level and the intensification of the European (security) discourse (Checkel 2005; Lewis 2005; Zürn/Checkel 2005). The reconceptualization of security in the EU since 1990 can be described as a gradual process of incremental change in which formative security policy events have often triggered collective learning processes and the creation of political awareness. From a social constructivist perspective, such processes of socialization, learning, and persuasion represent the causal mechanisms which make 'contextual change' cause 'conceptual change' and, additionally, enhance conceptual coherence.

The EU's current understanding of security also demonstrates the fundamental relevance of traditional norms and values in European foreign and security policy. Irrespective of the changes that can be observed, common values and norms, existing for many decades, have still remained the normative core of West European foreign and security policy 'culture'. Hence, the 'new' security conception of the EU remains rooted in the Union's tradition as a "civilian power" (Duchêne 1972). In this respect, conceptual changes of the European security definition can be interpreted as a result of adjusting traditional foreign and security policy principles to new international conditions. As a consequence, both elements, the (tra-

ditional) role as a civilian power as well as the (more recent) development towards a security actor have been significant for the evolution of the European security conception since 1990. Therefore, the (re)conceptualization of security in the EU has not only been marked by change, but also by a high degree of continuity.

The continuity of the EU's civilian orientation is expressed by several characteristic features:

- First, the normative orientation to liberal values (especially democracy and human rights) as components of the European identity and as preconditions of positive peace.
- Second, the emphasis on preventive action and structural problem-solving.
- Third, the primacy of civilian (political and economic) means with an emphasis on positive incentives and moral persuasion.
- Fourth, the promotion of regional integration, international cooperation, and global norm setting, which in fact rest on the European integration experience and a Europeanized understanding of state sovereignty.

In sum, the EU today possesses a *comprehensive, normative and cooperative* security conception that combines a global orientation with the claim to actively shape international order. This approach can be characterized as *comprehensive*, because the EU tries to apply various instruments in different policy fields in an increasingly coordinated way in order to solve diverse security problems. In doing so, the Union firstly accounts for various causal linkages between different risks, threats and challenges, and secondly aims at finding a balance between proactive and reactive action. Additionally, the *normative* dimension of the European security approach bears on norms and values such as human rights, democracy, and the rule of law, but also social justice, economic development, and ecological sustainability. These values are regarded as structural conditions for security and, therefore, constitute the leading principles of European security policy. Finally, the EU's security approach can be qualified as *cooperative*, because international cooperation and multilateral action are, from a European perspective, essential for the solution of regional as well as global security problems.

Each of these three dimensions of the European security conception roots in a historically grown European identity, the core of which consists of the liberal values of the civilian power Europe as well as the "post sovereign" (Wæver 2000: 257) character of the

inner European security order. Therefore, the main characteristic is not that the EU today has military means at its disposal. What is even more decisive is that the Union has moved towards a common security understanding on the basis of liberal values and cooperative norms that come along with a grown readiness for external action and the claim to actively shape world politics. The ESDP has just as little transformed the EU into a "military power" (Bull 1982), as its evolution towards a security actor contradicts its character as a "civilian power". In contrast, the military dimension of the EU is supposed to strengthen its ability to defend universal values, while it is precisely the normative civilian power principles that constitute European "actorness" to a substantial degree (White 2001). Against this background, the dual character of the EU as both a civilian power *and* a security actor, today, becomes manifest in the Union's objective to act as a "normative power" (Manners 2001, 2004) by providing a positive example and a leading role in favour of a "better world":

Now that the Cold War is over and we are living in a globalized, yet also highly fragmented world, Europe needs to shoulder its responsibilities in the governance of globalization. The role it has to play is that of a power resolutely doing battle against all violence, all terror and all fanaticism, but which also does not turn a blind eye to the world's heartrending injustices. In short, a power wanting to change the course of world affairs in such a way as to benefit not just the rich countries but also the poorest. A power seeking to set globalization within a moral framework, in other words to anchor it in solidarity and sustainable development (European Council 2001b).

52 Democracy and European Justice and Home Affairs Policies from the Cold War to September 11

Andreas Maurer and Roderick Parkes

52.1 Introduction

European Justice and Home Affairs (JHA) integration can be characterized with reference to a number of interrelated phenomena, none of which is peculiar to the EU but all of which are defined by its unusual structure and policy-making framework. ‘Securitization’ describes the way in which security concerns have been privileged in policy-making, often to the detriment of competing social, economic and foreign policy goals. ‘Europeanization’ describes the progressive treatment of JHA issues at a European level. ‘Externalization’ is the process of the blurring of distinctions between policy areas which might formerly have been classified as almost exclusively ‘internal’ or ‘external’ to the state. A fourth trend concerns the way in which democracy and human rights have been both subverted and promoted in efforts to safeguard the EU’s security.

The end of the Cold War and the 2001 attacks on New York have had a formative effect upon all of these traits. Only by examining the interactions between them does it become possible to understand the current form of the EU’s JHA activities. These activities are often criticized for their unsuitability to the full range of socioeconomic and external challenges faced by the EU, and indeed to the very security challenges which many are specifically designed to meet. Moreover, they are considered undemocratic both in the way they are drawn up and in their effect. The cumulative effect of these developments is apparent in the EU’s emerging asylum regime.

This chapter analyses the asylum measures adopted by the European Council and the Council of Ministers since the Treaty of Amsterdam, asking whether the EU after the Cold War and September 11 is capable of drawing up a well-rounded asylum policy in a democratic manner by focusing first on the construction of a European security threat (58.2), analysing European Justice and Home Affairs (58.3), and re-

viewing the European asylum policy (58.4) before debating in the conclusions the democratization of asylum policy (58.5).

52.2 Construction of a European Security Threat: Tracing the Security Continuum

52.2.1 Laboratories of Justice and Home Affairs Policy-making

Students of European JHA cooperation have identified a ‘security continuum’ in policy-making (Bigo 1994), which conceives of various problems with a transnational dimension – cross-border criminal activity, uncontrolled immigration, terrorism, the presence of non-nationals in the member states – as part of the same security threat. The reduction of complicated and varied problems to the status of security threats means that such issues are not treated in their full complexity, but are rather dealt with in a short-term and often reactive fashion. Root causes of problems go unaddressed; challenging social problems are written off as matters of security. Moreover, multidimensional issues that were previously handled by a range of policy-makers from different national ministries have increasingly fallen within the almost exclusive remit of JHA actors. A creeping logic of ‘securitization’ has thus informed the ways in which related policy areas are drawn up.

These developments can be ascribed both to the ‘laboratories’ and ‘driving factors’ (Monar 2001) of European JHA cooperation: the predominantly inter- and transgovernmental policy-making fora (or ‘laboratories’) in which JHA cooperation has taken place have typically been characterized by the weakness of those democratic mechanisms that counter the development of overweeningly restrictive security policies at the national level. Some commentators go so far as

to attribute 'securitization' to a purposeful exploitation of the weakness of democratic mechanisms in European policy-making fora on the part of a core group of European interior ministry officials.

The 'policy-venue-shopping' thesis (Baumgartner/Jones 1993), according to which competing policy-makers seek out the venues most congenial to the realization of their preferences, has been extended to European JHA policy-making (Guiraudon 2000). It posits that securitization has been driven in large part by interior ministry officials exploiting the weakness of democratic mechanisms in European and EU policy-making fora in order to sideline impediments to their agenda. They have used the imperative of safeguarding internal security as a trump card in their dealings with other actors. Rival sections of the national executive have therefore been consciously marginalized as interior ministries have used JHA cooperation as a means to dominate or colonize policy areas.

The development of European asylum policy apparently presents the clearest example of this. At the national level, attempts to restrict access to asylum might be thwarted by judiciaries, international norms, UNHCR, and pro-migrant NGOs, all of which exert only limited influence in transgovernmental fora and at the European level. National legislatures which might harbour expansive ideas about the rights of foreigners, and could certainly damage the efficiency of policy-making, are limited in their influence. The core band of interior ministers and their officials, who have driven asylum policy cooperation since the establishment of the TREVI (*Terrorisme, Radicalisme, Extremisme et Violence Internationale*) and Schengen frameworks, have however been keen to maintain the trans- and intergovernmental character of asylum policy-making, cushioning themselves from supranational interference.

The tendency towards securitization in JHA policies which arises in the policy-making laboratories has proved to be a self-sustaining phenomenon in many respects. Critics identify, for example, the 'ritualism' of efforts to combat illegal immigration: they suggest that measures taken against illegal immigration often criminalize further categories of immigrant, thus creating higher levels of illegal immigration (Somers 2004). In this way, the construction of a security threat becomes a useful tool for policy-makers with expansive institutional ambitions. Although this observation seemingly ignores the fact that such measures can have a downward effect on the levels of unwanted immigrants coming to the EU, it does accurately suggest that once the securitization of a policy area has

begun it is often difficult to reverse. This may render the European JHA policy-making set-up ill-suited to dealing with new circumstances, to which a reactive security-based approach would ideally prove only a small part of the response.

Although European cooperation has facilitated the 'two-level games' played by interior ministers, it has not let them have it all their own way. The necessarily dynamic nature of European integration increasingly challenges the dominance of interior ministers in JHA policy-making. The coupling of JHA cooperation with the mainstream process of European integration has given the EU's supranational actors a larger degree of oversight of, and input into, JHA: modes of European cooperation formerly occurred in transgovernmental fora on the fringes of mainstream European integration. Particularly since the late 1990's, these modes of policy-making have come to resemble more closely the 'community method', whereby the supranational actors enjoy more influence and inter-state activity is less consensual. National ministries that were sidelined in the TREVI and Schengen fora of the 1970's and 1980's are now better positioned to assert themselves in JHA policy-making within the Council framework. Since the Amsterdam Treaty (1997) legal professionals like judges and prosecutors have also gained an important role in the EU's JHA activities. 'Communitarization' may therefore prove incompatible with securitization.

Similarly, the growing communitarization of JHA policy-making has increased the possibilities for cooperation between different policy areas at the European level. It has been recognized that greater interaction between policy areas may either entail the introduction of marginalized social, economic and foreign policy concerns into securitized JHA policies, or, conversely, the securitization of other policy areas (Kostakopoulou 2000). Given the way in which distinctions between internal and external security have blurred, changes to the EU's external capacity are of particular relevance to the development of its internal security policies. Considerable institutional change has occurred in the EC/EU between the end of the Cold War and the attacks on New York, empowering and restricting the actions of European JHA policy-makers in different ways.

The policy-venue-shopping thesis nevertheless regards the 'institutional creep' of national interior ministries as a prime driving factor behind European JHA cooperation - particularly in matters of asylum policy - and the construction of a European security concept. The laboratory itself is thus viewed as the motor be-

hind JHA cooperation. Yet, this analysis risks missing the relevance of those driving factors which arise outside the transgovernmental JHA policy-making laboratories. Some of these factors have a strong transnational dimension and lend themselves to treatment by states acting in concert. Others have affected all the member states in a similar way and have led to an overlap of national geopolitical agenda – as Realists would point out. Neo-functionalists and some Liberals would also argue that JHA integration can be driven by ‘spillover’ from activities in other areas of European integration, or from the actions of the supranational institutions. A combination of these factors taken together helps to explain why the response to (common) security challenges has often been to intensify cooperation between member states, rather than to withdraw from it.

52.2.2 Dealing with the Drivers of JHA Activity: Constructing the Security Threat

High profile events with negative security implications, rather than lower profile, longer-term trends, have often triggered the most fundamental changes in the kinds of initiative adopted via JHA cooperation. This is because “the characteristic of security discourse at the highest political level is to take one issue, dramatize it, and make it the most important threat confronting our societies” (Anderson/Apap 2002: 6). Given the nature of the European JHA laboratories, it is unsurprising that the prime effect of such events has been to spur on reactive securitarian (Lavenex 2001) activity, and to marginalize opponents of securitization. Yet if these high-profile driving factors also happen to reflect longer-term, underlying changes in the nature of European security, new sets of actors may be empowered in policy-making and the JHA agenda thoroughly reordered. In the past quarter century this has been the case on two notable occasions – the end of the Cold War, as symbolized by the collapse of the Berlin Wall, and the attacks on New York in 2001.

The fall of the Berlin Wall and the attacks of September 11 were followed by a typical acceleration in security policy-making at the European level. Although supranational opponents to securitization had gained a greater role in JHA policy-making, that acceleration was more marked in 2001 than in 1989: compared with the profile of European JHA policy-making at the end of the Cold War, EU JHA initiatives at the time of the 2001 attacks were relatively high-key. This meant that there was now a greater expectation

that responses to security threats would be drawn up at the European level. The speed with which measures were adopted came at the expense of their comprehensiveness. For example, the definition of terrorism which was adopted shortly after the attacks “does not have the force of a legislative act. It serves a [sic] guideline and will be translated into legislation, if it is at all, by the actions of the member States” (Anderson/Apap 2002: 7).

Although the two events spurred on European JHA cooperation, in the short term at least they reinforced the trans- and intergovernmental, rather than the supranational, elements of policy-making. Certainly, the immediate response to the 2001 attacks was to smooth the passage of those security-related measures which had been awaiting adoption for some time, and there was even a certain movement – repeated after the 2004 Madrid bombing – to set up new European level bodies operating outside the Council machinery. However, the perceived need to act quickly in the face of the renewed security threat saw member states increase activity outside the formal procedures of the EU. Democratization had apparently come at the expense of efficiency. The 2001 attacks allowed interior ministry officials to sideline rival actors by citing their greater legitimacy in dealing with security affairs.

The progressive communitarization of JHA activities that occurred between 1989 and 2001 did not, therefore, fundamentally shift policy-makers’ short-term response to September 11 away from securitization. The supranational actors are not immune to the forces which drive securitization: whilst the European Parliament is for example somewhat removed from national electorates, it remains subject to electoral pressure to provide security, even at the expense of other priorities. Under the increased public scrutiny that followed the 2001 attacks, the supranational actors – which still enjoyed at best a precarious place in JHA policy-making, as well as lacking popular legitimacy – could do little to resist. Indeed, adhering to the securitarian agenda may have appeared as a means to win popular, or ‘output oriented’, legitimacy for themselves. Moreover, the supranational actors may have their own reasons – independent of their quest for legitimacy – for pursuing securitization. The Commission has on occasions supported highly restrictive measures if it feels that European integration will be thereby furthered (Geddes 2000). Yet it is difficult to discern the effect of communitarization on the long-term responses to such events. As the immediacy of events recedes, it may be that supranational actors are

better placed to influence developments and increase their role in JHA policy-making.

Although they presented the member states with common challenges and led to a partial overlap of national agenda, the collapse of the Eastern Bloc and the 2001 attacks also affected the member states differentially. Just as the geography of the EU made certain states – particularly those with long Eastern borders – more vulnerable to the security threats associated with the end of the Cold War, the cultural nature of the attacks on New York appeared to place a different set of member states – like those with a large immigrant population – at risk.

Generally speaking, following a high profile event, those states that can show themselves to be most at risk are best placed to strengthen their position in policy-making. If the nature of the EU's security is understood to have changed, it is they who are able to perform a prime role in the construction of a 'new European security'. This kind of asymmetry has had a definitive effect on a policy area which retains a strong intergovernmental flavour. For example, European JHA policy since the fall of the Wall has been in part defined not only by Germany's geographical proximity to new security threats but also by the changes to German European policy which accompanied reunification (see for example Baumann/Boesche/Hellmann/Herborth/Wagner 2005). The fact that, by stressing the threat posed to the member state they represent, national policy-makers can strengthen their bargaining position means that the adopted remedy often bears little relation to the original problem. International and institutional competition are definitive in the construction of the security threat. However, with the growing communitarization of JHA activity, this characteristic of policy-making may fade.

The fall of the Berlin Wall and the attacks on New York heralded or highlighted a long-term shift in the nature of the EC/EU's security. This in turn required and empowered policy-makers to reorder the JHA agenda and, in particular, the security continuum. Following the end of the Cold War, European policy-makers had to come to terms with the security implications of a greater cross-border mobility at the EU's external boundaries. Issues of immigration, cross-border crime, and terrorism were already on the agenda thanks to the growing free movement between EC member states; they now needed to be rethought and reprioritized. Similarly, following the attacks on New York, these same issues were again reordered. Whereas immigration and asylum had been prime issues following the collapse of the Berlin Wall, now

terrorism rose up the JHA agenda, and asylum and immigration were increasingly treated as potential elements of a broader terrorist threat.

The reordering of the security agenda consisted not just of rethinking the importance attached to various elements which already fell within the scope of European JHA activity, but also of complementing these with newer elements which had now gained salience. In constructing their response to the perceived security threats at the beginning of the 1990's and the 21st century, European JHA policy-makers succeeded in substantially extending their range of competencies, usually at the expense of other actors. This has notably been the case in asylum and immigration policy, which in some states was formerly dominated by economic, social, and foreign ministries but which following the end of the Cold War was increasingly dealt with by interior ministers at the European level.

Yet this institutional creep has not always occurred against the wishes of other actors. They too have found that recourse to the security agenda is conducive to their own aims. After September 11, for example, security-motivated efforts to clamp down on the tax havens which apparently permit terrorist organizations to safeguard their funds chimed with initiatives undertaken by national finance ministries. The latter have become increasingly hostile to the fiscal competition from tax havens, especially in light of the constraints imposed by the Growth and Stability Pact. Again, some supranational actors may also be keen to see this kind of institutional creep where it furthers European integration.

Thus the processes of the Europeanization and securitization of JHA policies remain closely related, despite the growing influence of supranational and previously marginalized national actors in policy-making. The security continuum is multidimensional and has been extended in multiple directions. Anderson and Apap (2002: 6) predicted that following the 2001 attacks "security policies will be conceived, elaborated and analysed as a continuum, stretching from street level and activities which were formally thought to belong to ordinary criminality (such as the clandestine transfer of funds), to macro-strategic balances when punitive action is envisaged against states." The police, intelligence and immigration bodies, and the armed forces would be enlisted to deal with challenges perceived to belong together. In other words, the distinction between internal and external security would be eroded.

52.3 European JHA and the New International Relations

52.3.1 Externalizing Internal Security

The end of the Cold War and, to a lesser extent, the 2001 attacks changed the nature of international relations. This is of importance not just for the kinds of internal security threat faced by the EC/EU, but also for its range of responses. This observation is by no means self-evident. As Pastore (2001: 1) points out,

in Machiavelli's vision, internal and external threats to the power embodied by the Prince were clearly distinct. Internally, the ruler should fear conspiracy; externally, he should dread aggression by foreign powers. The Florentine also acknowledged interdependencies between these two fundamental categories of political risks: as a matter of fact, external peace would foster internal stability, and vice versa. But policy-making in the two fields was based on different sets of tools and responded to (at least partly) different logics.

Not only did the end of the Cold War and the 2001 attacks redefine international relations, they also blurred the distinction between internal and external security.

Pastore attributes this blurring to the twin processes of Europeanization and 'externalization'. In discussing Europeanization, Pastore stresses the way in which the security implications of the EC's own efforts at free movement were dealt with by policy-makers. The process of externalization is closely linked to this, and describes the way that the external dimension of internal security threats has been highlighted by policy-makers. Thanks in part to the policy-making set-up at the European level, the external dimension of internal security threats has gained an importance quite out of proportion to the danger it poses.

Prior to the end of the Cold War, the aim of removing border controls within the EC had created a pressure on member states to cooperate more thoroughly on matters of immigration and asylum. Those member states with stricter national border controls saw it as imperative to ensure that third-country immigrants could not enter the territory of the EC and legitimately travel to a state where they were unwelcome. Similarly, the aim of removing internal controls made the quality of anti-crime and terrorist activity in one state of potential relevance to all states. Some internal security threats were seen to have their roots in other member states.

The end of the Cold War removed many barriers to free movement at the EC's external borders, as well

as disrupting the forces of order in the EC's Eastern neighbours. The transnational nature of the new security threats, and the way in which they interacted with the EC's own aspirations for free movement, meant that the roots of internal security problems could now be located outside the EC/EU. European JHA cooperation had developed in order to meet threats with a cross-border element. Given the way in which they had been empowered by this cooperation, it is unsurprising that national interior ministries chose to lay particular emphasis on these new cross-border threats.

The nature of external security also altered, taking on a number of characteristics associated with internal security: the likelihood of being subject to a conventional military attack by another state diminished; however, some of the former Eastern bloc's military technology passed into private hands and the risk of being attacked by non-state actors was deemed to have grown. The collapse of the Eastern bloc meant that many of the European external security and intelligence forces, which enjoyed large budgets during the Cold War, now sought a means to justify the same levels of spending and activity. They fixed their attention on non-state actors. More fundamentally, Western states had lost an important external enemy – a potentially destabilizing development, since the modern nation state is on some level "held together by continuous communication of the threats it faces" (Cebeci 2004: 2) The generalized threat of the illegal immigrant, cross-border criminal or terrorist replaced state-actors as the prime external enemy.

The 2001 attacks shifted the focus from extra-EU immigration to terrorism. They made the generalized threat a more concrete one. The terrorist threat now had a name and an attendant organization. Moreover, the link between internal and external security was further cemented: the internal security implications arising from a state's foreign policy were increasingly clear. Moreover, members of the resident immigrant population could be members of an external terrorist organization. In the international environment, the *direct* threat from other states was still perceived to be lower than that from non-state actors. Non-state actors remained, therefore, a main focus of internal and external security efforts.

The bridging of the gap between internal and external security means that the nature of a state's external relations also defines its capacity to tackle potential internal security risks at their external source. In the post-Cold War era international relations have been defined by the existence of a sole superpower. They have been marked by a greater tendency towards

intervention in other states by dominant Western countries, especially the superpower, and an emphasis on multilateralism, in part to contain that interventionism. Whereas this kind of interventionism was formerly discouraged on each side by the existence of a rival superpower, the dread consequences of uninvited activity in other states fell away with the Soviet Union. Since the end of the Cold War the focus shifted to an emerging post-Westphalian world order.

The considerable barrier to free movement and scientific exchange which was lifted with the collapse of the Eastern bloc facilitated developments in transport and communication, such that localized problems in distant states could be seen to have security implications for the superpower and other dominant states. The 2001 attacks have reinforced this by highlighting the transnational terrorist threat and further legitimizing intervention in other states for reasons of internal security. Indeed, this and the recession of the threat of conventional military attack have arguably made intervention on grounds of internal security appear more legitimate than for more traditional external security reasons.

Interventionism has also been justified with reference to the discourse of humanitarianism – a development bound up with the Cold War and its end. There is no consensus about the place of humanitarianism in international relations. Some, like Francis Fukuyama (1992), argue that all states are eventually obliged to observe human rights – both in their internal and external policies – because this represents the highest form of legitimization for a government. Realists view this as naive, positing that human rights are a Western construct, utilized to justify underlying geopolitical/security aims in dealings with less dominant states (see Forsythe 2000).

The EU's response to the external dimension of internal security is defined by the limits of its external capacity. The EU's military capacity falls far short of its economic clout – the so-called “capability-expectations gap” (Hill 1993). It cannot be considered a power on a par with the US; yet it does enjoy a considerable external capacity. Its economic power acts as a means to sanction or to further states. Some consensus has also been achieved between the member states, and with its allies, on the EU's role as a civilian power performing humanitarian and crisis management tasks (Wivel 2005).

From a Fukuyaman perspective, it is natural that the EU – which lacks in legitimacy – should have adopted a strongly humanitarian foreign policy. However, if realists are correct in their supposition that hu-

manitarianism is simply a blind for the promotion of narrower security goals, then the development of the EU as a civilian power has manifest implications for the externalization of internal security. The bodies responsible for maintaining internal order are, after all, frequently involved in external civilian actions. Significantly, many modern security threats – from unwanted immigration to terrorism – can be shown to have roots in the non-humanitarian treatment of individuals by other states.

Internal security actors are not, of course, the only ones with a stake in the EU's external policy; however, the pillar system developed at Maastricht (1992) acted as a block to cooperation between the Union's external and internal policy actors. Following the partial communitarization of JHA at Amsterdam, the 1999 Tampere Council called for cooperation between JHA and other spheres (European Council 1999). Yet despite high profile efforts by the European Council, cooperation between national Interior and Foreign Ministries remains limited. Post-Amsterdam, Interior Ministries have succeeded in repulsing Foreign Ministries' influence over First Pillar JHA issues by ensuring that these issues are coordinated within the Council framework by the new Strategic Committee on Immigration, Frontiers and Asylum rather than Coreper (Peers 2000).

This inter-institutional competition has proven particularly intractable because, as the two security fields have merged, previously unimportant differences in the underlying principles promoted by internal and external security actors have gained salience. There is, for example, disagreement about the utility of the traditional interstate framework in efforts to combat the new transnational security threats posed by non-state actors. External policy actors are accustomed to operating within this framework, and are likely to take into account the full range of relations with another state. They prefer conventional interstate diplomatic, economic and military tools even when dealing with non-state actors. Conversely, internal security actors have considerable experience of dealing with non-state actors; however, they may take a more sceptical attitude to traditional interstate means of dealing with them.

52.3.2 Internal and External Democracy in European Integration

Nowhere is this clash of precepts more obvious than in the EU's promotion of democracy. As Anderson and Apap (2002) note, external security is based in

part on an inclusive dynamic whereby third states are drawn into a network of democratic values. The founding conception of European integration as a means of overcoming conflict, the dynamic of enlargement, as well as the Union's underdeveloped military capacity and its subsequent attempts to create a multilateral *lingua franca*, encourage this inclusive promotion of democratic values.

Of course, the degree to which these democratic values can be considered inclusive for non-Western states is questionable, as is the EU's commitment to them when competing security priorities appear jeopardized.¹ Nevertheless, particularly since the Copenhagen criteria were drawn up, the conditionality of third states' adherence to democratic values has become a central tenet of the EU's external relations. The attacks of September 11 further politicized these democratic values. Even though the attack on 'Western' values had come from non-state actors, much of the EU's response referred to a traditional conception of national relations, identifying the root of the problem in the non-democratic practices of other states.

Whilst the end of the Cold War and the attacks of September 11 have reinforced the EU's readiness to promote democracy as a means to safeguard its external security, the two events appear to have had the opposite effect upon its efforts to secure internal security. The secretive world of internal security policy-making is scarcely open to democratic input or scrutiny. Inter- and transgovernmental security policy-makers have used the end of the Cold War and the 2001 attacks to strengthen their position vis-à-vis national and supranational parliaments and courts. Moreover, there appears to be a fundamental tension between the provision of internal security and the full range of democratic values espoused by the EU and the member states. For security policy-makers, the broad aim of safeguarding a democratic EU may come at the cost of various individual democratic rights and norms. Both in their elaboration and form EU JHA policies lack democratic credentials.

This is not to deny that democratic mechanisms and actors have grown in stature in EU JHA policy-making, or that this may be in part due to the long-term effects of the end of the Cold War and the 2001 attacks: the clear disjuncture between the EU's own practices and the democratic standards expected of other states since the end of the Cold War has been cited as reason to democratize the JHA sector. The ac-

celeration in JHA cooperation that followed the two events has also led to a longer-term pressure for democratization, as the immediacy of events receded but the level of cooperation did not. Nevertheless, the reassertion of democratic actors does not necessarily imply a commensurate reinforcement of democratic norms. The European Parliament finds itself under considerable pressure to take a 'realistic' attitude towards the protection of human rights in JHA policies. In his recent meetings with MEPs, the British Home Secretary Charles Clarke made clear that the responsibility which accompanies greater influence over JHA involves adopting this realistic attitude. Moreover, democratic input may be at odds with democratic rights and norms, with security policy-makers claiming to respond to the will of the majority by compromising various categories of human rights.

Whereas the EC/EU laid ever greater emphasis on other states' adherence to democratic values in the post-Cold War era, its own internal security policies have often treated such values as unsuited to the post-Cold War world. They were drawn up in a world where the movement of persons was rather restricted. The EU is particularly open to charges of double standards where its internal and external security fields meet. The intense inclusiveness and requirements of democratic conditionality involved in the enlargement process clearly contrast with the demands that accession states adopt the EU's exclusive, internal security policies. The EU has also adapted to the new challenges posed to its own democratic commitments by drafting third states into its internal security initiatives. This is a logical response to the transnational developments which pre-1989 democratic mechanisms were not apparently drawn up to deal with. Yet in some cases, the EU has recruited third states to help it circumvent its own democratic commitments.

52.4 European Asylum Policy after the Cold War and September 11

52.4.1 Policy-making in the Changing Asylum Context

Having examined the dynamics of *Europeanization*, *securitization*, *externalization* and *democratization*, the question remains of whether the post-Cold War or September 11 EU is capable of drawing up rounded JHA policies that meet the full range of challenges facing it. Asylum provides an example of a policy area with a broad range of implications for European secu-

1 See: "Punishment Please", in: *Economist*, 27 August, 2005: 14.

city, society, economy, external relations, and democracy. Moreover, the context within which asylum policies are formulated has changed considerably since 1989 and again since 2001.

The cessation of the Cold War removed a considerable barrier to the movement of persons. The restrictions on European states' capacity to control the entrance and exit of third country nationals arising from the normative asylum framework were potentially damaging to their very legitimacy. Further, the end of the war weakened the geopolitical and symbolic grounds for maintaining a right of asylum. When establishing what form a well-rounded asylum policy should take, perhaps the most fundamental issues to address would thus concern the question of whether the EU should offer access to asylum at all; whether it should instead develop a radically new approach to the abuse of human rights in third countries, and attempt a reclassification of the forms of migration to which it is subject. In short, should the EU's asylum policy continue to respect the relevant provisions in the Geneva Convention and other national and international texts? Some member states openly advocate the revision of a framework which they view as unsuited to post-Cold War mobility and post-September 11 terrorist threats. However, if the EU were to develop – within this normative framework – a means of reducing the numbers of applicants for asylum, and of mitigating the terrorist threat and negative internal effects of asylum, this would surely be preferable to its revising the framework and backing away from its humanitarian commitments.

The international asylum system drawn up before 1989 was based on the recognition that, although states were limited in their capacity to intervene actively in other states, they had a duty to act in the face of external human rights abuses. National asylum systems reflected the disjuncture between a relatively modern understanding of the 'international community' and the nation-state's responsibility in it, and a more traditional conception of the state's capacity to meet that responsibility. The result was a policy area marked by its reactivity to external events. The high mobility of individuals in the post-Cold War era made this reactivity particularly problematic. However, the greater recourse to external interventionism that characterizes this era also offers a chance to deal proactively with the causes of migration – including human rights abuses – and terrorism at their source. In this context, asylum policies aimed at lowering the numbers claiming asylum enjoy new opportunities proactively to neutralize the root causes of migration flows.

Viewed in this way, the end of the Cold War presented a potentially fatal challenge to the normative asylum framework, but simultaneously offered a means to – at least partially – meet that challenge.

The solution to the challenge to the normative asylum framework lies primarily in dealing proactively and curatively with the external causes and the internal negative effects of migration. Where migration flows persist, despite efforts to tackle root causes, the numbers of applicants for asylum could be reduced in those member states, where they are deemed too high, by sharing the burden of hosting asylum-seekers between other members of the EU as well as those third countries with the necessary resources. Many of the precepts of securitization, particularly those that have encouraged distinctions between member state nationals and certain non-nationals, must be rolled back.

Security policies alone would prove inept in these efforts, largely because of their reactive, as opposed to curative, approach and their narrow frame of reference. Moreover, the security agenda fails to take advantage of the EU's novel capacity to repackage asylum policy so that the framework of normative democratic rights is reconciled with a democratically expressed desire for the more comprehensive control of access to asylum. The EU has tools at its disposal that are not necessarily available to member states operating alone or in other international organizations. The EU's external capacity, for example, may permit it to address the root causes of forced migration more effectively than member states acting alone. Policy harmonization is a prime means of 'soft' burden-sharing (Thielemann 2005). European cooperation can also be instrumental in engendering a sense of solidarity between states so that those receiving fewer asylum-applicants are persuaded to take more. The EU may spread best practice between states, so that applicants are dealt with swiftly and effectively. Further, these tools could be instrumental in breaking the security basis of asylum policy, using the EU's post-national traits and the low-key nature of its policy venues to blur distinctions between citizens and non-citizens.

Within the framework of their obligations and the possibilities offered by European integration, the member states must come to terms with a number of competing priorities in their asylum policy. The security risks attached to asylum after September 11 are in large part connected with the problem that potentially dangerous foreign nationals claiming asylum can enter the territory of the EU and take advantage of certain rights and liberties. Yet the full range of secu-

rity implications arising from asylum is broader. For example, the attacks of September 11 highlighted the EU's need to integrate – or at least not to alienate – resident foreigners. Unless the EU is capable of removing asylum as a means for third country nationals to remain in its territory (for example by externally processing asylum-seekers), it must find a social and economic space for asylum-seekers and refugees. There is thus a necessity to facilitate the exclusion of asylum-seekers who exploit the rights afforded them, and one to integrate – if temporarily – genuine asylum-seekers and those who cannot be removed. These dynamics of inclusion and exclusion should ideally be complementary.

The EU must also seek to place security concerns within a broader hierarchy of priorities, taking account of social, economic, external, and democratic aims. This will help it to strike a sensible balance between the inclusion and exclusion of asylum-seekers on grounds of security, and more generally. It may also unravel some of the effects of having placed security concerns almost consistently at the top of the asylum policy agenda at the European level.

There are persuasive social and economic grounds for formulating a generous asylum policy. Prime amongst these is the so-called 'demographic deficit' which threatens European economies and welfare systems. Immigration is by no means an ideal solution to these problems, and asylum-seekers are perhaps even less desirable than voluntary immigrants as a means to plug the demographic gap. Asylum policy as a normative construct is not reactive to the vagaries of host states' social and economic requirements, meaning that it is difficult to select the kinds of asylum-seeker that will come to the EU. Nevertheless, at the very least, the EU should streamline demographic concerns and ideas about how to redress the labour shortages in certain low-paid or highly qualified sectors into its treatment of asylum-seekers. Policy-makers must judge the extent to which the socio-economic benefits accruing from the respect of asylum-seekers' family unity, and their activity in national economies, are outweighed by the costs to security.

The socioeconomic grounds for strictly controlling access to asylum are also persuasive. The cohesion of European societies may be disrupted by poorly controlled migration. This threat may arise from immigrants' temporary or even illegal position in the EU. This, and immigrants' perceived effect upon wages and labour markets, helps explain hostility towards immigrants on the part of sections of the member states' societies. However, measured control,

rather than reactive restriction, of inward migration flows provides a more suitable response to these socioeconomic pressures. Indeed reactive restriction of migration flows, which have already begun, may worsen the problem, driving immigrants – voluntary or forced – into travelling illegally, excluding them once they are in the host society, and failing to take advantage of the potential social and economic benefits they offer. The official demonization of unwanted immigrants, and restrictions imposed upon their fulfilling useful functions, may fuel racism.

Just as policy-makers must juggle security concerns with socioeconomic ones, so too must the EU's broader foreign policy be taken into account. The potential clash between reactive, securitarian policy goals and the external promotion of human rights and democracy was outlined above. As in other areas of JHA, asylum policy-making at the European level has been characterized both by a lack of democratic input and a desire to circumvent the strictures of human rights obligations. There is a similar tension between those elements of external policy that envisage the liberalization of barriers to international trade, and interior ministers' efforts to limit freedom of movement into the EU. Rather than using external policy to coerce third states into sharing the burden of asylum and to act as defensive barriers against unwanted immigration, JHA policy-makers will find greater synergies with the EU's mainstream external policy if they concentrate on building the capacity of third countries to deal with asylum-seekers, and proactively treat the root causes of migration.

The policy-venue-shopping thesis indicates that the processes by which policies are drawn up are also of importance. It argues that the weakness of democratic mechanisms at the European level has been exploited in order to restrict access to asylum. Given the growing calls for the restriction of asylum particularly since the end of the Cold War, European cooperation has thus permitted national governments to ease the tension some have faced between the expressed will of the electorate and the normative protection of the democratic values and rights enjoyed by non-nationals. However, with the increased integration in this area, the EU's democratic mechanisms have been increasingly asserted in policy-making. The reassertion of democratic mechanisms in European asylum integration underlines the imperative of repackaging asylum policy. Previously excluded from asylum policy-making and its 'new realities', and somewhat removed from the electoral pressures faced by member states governments, the EU's resurgent supranational actors may

impose a more severe form of democracy than that circumvented by interior ministers at the national level.

52.4.2 The Europeanization of Asylum Policy

The Europeanization of JHA has coloured the development of those elements of European integration with a potential to extend the rights of *all* those in the member states. Distinctions made between third country nationals and migrant citizens of the member states have rendered more distant the prospect of social or economic membership of the EU grounded on anything other than national citizenship. Whilst certain rights have recently been extended to long-term resident third country nationals, asylum-seekers are still conceived of as 'uncontrolled migrants'. Europeanization has thus facilitated the securitization of asylum policies.

Yet improvements made to the status of third country nationals reflect the dynamic nature of European integration, the assertion of democratic values at the European level, as well as of supranational actors in policy-making. The EU's post-national traits may facilitate a blurring between nationals and non-nationals, something which could prove key to the member states' capacity to draw up an asylum policy suited to the post-Cold War era. The resurgence of the supranational actors alongside supranational democratic mechanisms may also herald a shift away from the securitarian approach to asylum, which often entails a reactive attempt to circumvent human rights obligations.

The 'grand theories' of European integration would ascribe different significance to the ending of the Cold War and the 2001 attacks in their explanations of asylum policy integration.

- For realists, these events are of central importance in explaining developments in an area of vital national politics. This school would highlight the – by no means permanent – overlap of member states' geopolitical priorities and asylum preferences arising from the two events. In order to take advantage of the benefits of collective action on these areas of overlap, states have empowered supranational actors and drawn up common rules of which they remain the masters.
- For neo-functionalists, who draw on liberal thinking, these events have been of less importance, except insofar as they have presented supranational actors with the opportunity to perform the political entrepreneurship that drives integration, or where they have interacted with pre-existing endogenous European developments such as efforts

towards free movement. The 'asylum crises' following the end of the Cold War have also provided a catalyst for 'social learning' amongst national policy-makers at the European level (Geddes 2003). Primarily, though, the EC/EU's asylum activities derive from 'spill-over' from initial economic integration, and in particular the free movement of workers.

- Though not a 'grand theory', the policy-venue-shopping thesis would also downplay the significance of these events, except where certain national actors exploited them in order to reinforce their own position in policy-making. It points out that European asylum cooperation began before the convergence of national asylum preferences from 1989 and outside the mainstream of European integration. It cites interior ministries' search for policy-venues in which to assert themselves and their security agenda as the impetus behind cooperation. The (limited) communitarization of asylum policy can be explained with reference to inter-institutional competition, and in particular the fact that actors other than national interior ministers have drawn up the policy-making framework (Guiraudon 2000).
- Scholars building on the precepts of historical institutionalism (Pierson 1996) might cite path dependencies arising from institutional configurations drawn up before the end of the Cold War and the 2001 attacks changed member states' asylum preferences. Following the two events, member states would be obliged to reconfigure institutional frameworks, but taking account of the ways in which previous structures had changed modes of policy-making and expectations.

In reality, it appears that more than one of these dynamics alone has been instrumental, and at times dominant, in the Europeanization of asylum policies, and that greater synthesis is required between the theories. Europeanization has spanned transgovernmental cooperation on the very limits of the EC's institutional machinery, as well as a growing communitarization after the Treaty of Amsterdam. Yet communitarization is by no means complete, and the position of the EU's supranational actors remains in many ways precarious.

When transgovernmental internal security cooperation between Western European states was formalized within the TREVI framework from the mid-1970's, the meetings between government officials often dealt with sensitive material, were geographically removed from national parliaments and courts, and

attracted little publicity. They covered most areas of JHA with a transnational dimension, increasingly including aspects of migration which had traditionally been handled by different ministries, and involved a number of policy areas and empowerments of the EC system. Attempts to restrict immigration, particularly after the oil crisis, saw a rise in irregular immigration and reinforced migration's profile as a security issue.

Since the 1980's, the free movement of persons in Europe and the definition of a European citizenship have been central themes of political discourse. However, practice has often been far removed from these vocal political objectives (Edelman 1991). Pre-emptive security measures, aimed at combating the potential problems of free movement, appeared to outweigh concrete moves towards its realization. The Schengen Agreements of 1985 and 1990 were signed between a growing band of EC states with the aim of preparing 'compensatory' measures for the fuller realization of the principles of free movement as laid out in the then EC Treaties. The control of asylum and immigration was conceived as a prerequisite for the free movement of persons. In this way, the freedoms of member states nationals could only be extended if those of third country nationals were strictly controlled.

Due to British, Danish, and Irish reservations (De Ruyt 1987; Gazzo 1985) the Single European Act (SEA) excluded freedom of movement from the then Article 100a, which provided for qualified majority voting (QMV) in the Council and the cooperation procedure with the European Parliament. Instead, the member states annexed a political declaration to the SEA, confirming the intergovernmental character of policy-making aimed at the free movement of persons. The SEA left matters regarding "the entry, movement, and residence of nationals of third countries" as well as those on "the combating of terrorism, crime, the traffic in drugs, and illicit trading in works of art and antiques" (SEA, Declaration 2 annexed to the Final Act) to inter-state cooperation outside the legal and institutional framework of the then European Communities.

The cessation of the Cold War removed a barrier to the movement of persons between Eastern and Western Europe, interacting with the negative externalities of European integration and efforts towards free movement. For the member state governments it became increasingly apparent that their lowest common denominator trans- and intergovernmental approach to asylum was unsatisfactory; they initiated a shift towards supranationalization in order to counter the problems of this kind of collective action. Moreover, asylum rose up the electoral agenda, reducing re-

sistance to the pooling of national sovereignty for both governments and electorates (Hix 1999: 318-329).

Post-Cold War international relations also widened the scope for member states to intervene in third countries and to tackle the root causes of forced and voluntary migration. However, a lack of cooperation between external policy and internal security actors meant that such efforts were seldom proactive. Instead, JHA initiatives focused on developing a system of 'remote control': third states, particularly those on the EC's Eastern and Southern borders, and non-state actors like airlines, were enlisted in the EC's battle against unwanted immigration.

The decision at Maastricht to couple JHA cooperation more directly to mainstream European integration marked an opportunity to extend to JHA the powers enjoyed by the European Parliament and Court under the EC Treaty, as well as to enhance free movement within the EC. As it happened, only the Belgian and Dutch governments pushed for JHA to be brought under the EC Treaty. Instead, the European Parliament (EP) and European Court of Justice (ECJ) remained broadly excluded.

Maastricht's Title VI confirmed the trend which had developed over the previous decade, whereby 'soft' issues like asylum and immigration policy were fused with 'hard' issues like law enforcement. Asylum was increasingly threaded to other forms of 'uncontrolled' migration, and thus to broader security issues. The extension of this security continuum threatened to set out of kilter the delicate balance between security and liberty that democratic mechanisms are designed to maintain. By contrast, infra-EU migration, particularly that involving member state nationals residing elsewhere in the EU for work purposes, continued in large part to be treated as an economic and social, rather than a security matter.

The coupling of JHA cooperation with mainstream European integration has empowered actors other than interior ministers and their officials to construct the framework for asylum policy-making. It is possible to exaggerate the degree to which interior ministers have been unwilling parties to the resulting reassertion of democratic mechanisms, but the policy-making framework constructed since Amsterdam has not always appeared the most congenial environment for the realization of their agenda.

Supranational democratization was driven on by the European Parliament, which explicitly drew attention to the disjuncture between the EU's expectations for other states' standards of democracy and its own practices. It also pointed out that national parliaments

had been sidelined in the development of European JHA cooperation, but few new channels of democratic input had been innovated (Monar 1995). The Commission, meanwhile, developed its capacity and expertise in JHA policies even though its official role in them was exceedingly limited. It created a new division in its Secretariat-General and extended a JHA portfolio to one of its Commissioners. Both actors regarded an increase in their roles in JHA policy-making as a priority for the 1996 IGC.

Compared with Maastricht, Amsterdam reflected a more 'liberal' attitude amongst member state governments as illustrated not just by the (in reality much qualified) Article 62 EC Treaty, which specified that the principle of the free movement of persons would apply to third country nationals. By bringing asylum matters under the First Pillar, Article 63(1) and (2) raised the expectations of those who judge European Commission texts 'more generous' than those of certain governments influenced by extreme right political parties (Austria, Denmark, France, Italy, Germany).

The Amsterdam Treaty introduced the European Parliament as a fully-fledged consultative body within the new Title covering the "Area of Freedom, Security and Justice". Whilst until May 2004 the EP was only consulted, Article 63 allowed the Council to introduce the co-decision procedure after the end of this transitional period. However, the move towards the application of the co-decision procedure remained subject to a unanimous decision of the Council. This unanimity reserve was put into the Treaty during the last days of the Amsterdam IGC on the insistence of the German government.

The changes to JHA elaborated during the 2000 Nice IGC indicate the ambivalence of member state governments to move essential parts of a policy field of vital national importance towards supranational rules and institutions while maintaining national reserves and optional vetoes (Wessels 2001). As regards all measures on asylum and refugees (Articles 63(1)(a), (b), (c) and (d), and 62(2)(a) EC Treaty), co-decision is only to apply after the Council has unanimously adopted a legal act laying down the common rules and principles governing these matters.

By contrast, the construction of an area of freedom, security, and justice was given new impetus by the conclusions of the 1999 Tampere European Council. The Tampere Programme was adopted following discussion with the EP's President and alongside a summit meeting organized by the NGO European Council on Refugees and Exiles (ECRE). It had input from national legislatures, particularly the Finnish Par-

liament (ECRE 2000: 43), and bore the imprints of a comparatively open process of deliberation. The Tampere 'milestones' reaffirm the centrality of democracy and the rule of law in the Union's values, and ensure that freedoms are not reserved to citizens of the Union alone. Although access to these freedoms is to be strictly regulated, the controls are to be set at the external borders of the EU rather than within society.

Setting out the aim of creating a common European asylum system, the Tampere Programme elaborates a set of 'first-wave measures' to be adopted by May 2004. In this, the EU was "fully committed to the obligations of the Geneva Refugee Convention and other relevant human rights instruments, and able to respond to humanitarian needs on the basis of solidarity." The strict control of access to the freedoms of the Union was therefore understood as compatible with continued access to asylum (ECRE 2000: 81).

The 2001 attacks served in the short term to strengthen the trans- and intergovernmental actors involved in day-to-day JHA policy-making. However, this pattern has not been reflected in efforts to formally reconfigure the overall institutional framework of asylum policy-making. The supranational actors have grown in stature. This is partly because the actors involved in these efforts are different from those that dominated day-to-day policy-making. This was particularly the case thanks to the novel means by which the Constitutional Treaty was drawn up. It may also be put down to path dependency from previous institutional change. Expectations about the form that institutional change should take arose from the Treaty of Amsterdam's clause allowing the Council to shift to co-decision from mid-2004. This clause was elaborated before the 2001 attacks altered member states' asylum preferences.

The Hague Programme, which was drawn up some three years after the 2001 attacks and shortly after the Madrid bombings (Podolski 2004), "reflects the ambitions as expressed in the Treaty establishing a Constitution for Europe" (European Council 2004a: 12). The Constitutional Treaty would extend qualified majority voting and co-decision between Council and Parliament to the Title IV measures concerned with the free movement of persons. It removes the anomalous rules restricting the European Court of Justice's jurisdiction over asylum policy, and upgrades the quality of human rights protection in the EU, enhancing the idea of the EU as a Community of (democratic) values. The Constitutional Treaty builds on the Tampere aims by calling for a 'Common Asylum System'

to be constructed. Irish, British, and Danish opt-outs remain unchanged though.

Against this background, the Commission and JHA Council elaborated the Hague Programme for the further development of the area of freedom, security, and justice. The Hague Programme clearly shifts the policy-making framework further from intergovernmentalism and introduces a greater degree of supranational democracy. The final wording adopted to announce these changes suggests that they were not as comprehensive as some member states had wished. An earlier version stated that ‘full account’ had been taken of the EP’s more expansive views of institutional change; now simple ‘account’ is taken (Peers 2004a).

Nevertheless, the programme’s substance features a widening of the European Parliament’s co-decision rights in the EU’s Asylum and Migration policy framework. According to the Hague Programme, the Council shall “adopt a decision based on Article 67(2) EC Treaty immediately after formal consultation of the European Parliament and no later than 1 April 2005 to apply the procedure provided for in Article 251 TEC to all Title IV measures to strengthen freedom, subject to the Nice Treaty, except for legal migration” (European Council 2004a: 13). For legal voluntary immigration, the veto was retained at Germany’s behest and the EP will still only be consulted in this area of decision-making. Since the QMV decision was dealt with last of all, Germany was able to threaten to block the whole programme unless its wishes were respected.

The scope of the European Court’s jurisdiction over JHA has not been expanded, and some NGOs suggest that a legal case could be brought against the Council for failure to act in this regard (Peers 2004b). By referring to the area of freedom, security, and justice here as “relatively new” (European Council 2004a: 36), the member states signal their awareness of this incongruity in a Programme which seeks to “strengthen justice”, and excuse it as a temporary phenomenon.

52.4.3 Continued Securitization of Asylum Policy after September 11

Despite the policy-making structure elaborated at Amsterdam and beyond, the twin processes of democratization and supranationalization appear to have faltered in everyday policy-making after September 11. The security agenda has reasserted itself in asylum policy-making. Evidence of this is found in the ‘first-wave’ legislation adopted under the Tampere Programme. Yet it is also evident in the measures deline-

ated by the Hague Programme and adopted by the European Council, which set out the Union’s JHA agenda for the next five years.

The concept of ‘pull-factors’ rests on the idea that the way migrants are treated within the host country may encourage or deter the arrival of unwanted migrants. With the heightening of the terrorist threat, the risk of being viewed as a ‘soft touch’ for immigrants – and thus for potential terrorists – became particularly undesirable. States’ desire to combat pull factors within society undermined the Tampere Programme’s aim to confine immigration control to the border. Compared to the provisions in place outside the EU’s south, the resulting first wave initiatives set relatively low standards for the social rights of asylum-seekers in the member states. This reduced ‘pull factors’ and simultaneously restricted asylum-seekers’ social contact, so as to make eventual removal more straightforward.

Similarly, in the reception directive, Germany was active in introducing restrictions on the freedom of movement of asylum-seekers even within its national territory, reflecting a national asylum system in which the *Länder* play a prime role, and despite resistance from the French and Swedes. This suggests a continued imbalance in the relationships between freedom and security, citizen and non-citizen, and is hardly in the spirit of the Tampere Programme. Even in a security context where the societal integration of immigrants had gained particular salience, policy-makers’ priority was to facilitate the removal of failed asylum-seekers, rather than to integrate potentially successful ones.

Asylum-seekers’ access to the labour market was treated not as a means to alleviate some of the welfare, demographic, or labour market pressures which led to the elaboration of the Lisbon agenda, but rather as an undesirable point of contact between forced and voluntary migration, whereby voluntary immigrants pose as asylum-seekers in order to gain access to the labour market. This line of thinking has persisted, then, since the end of the Cold War. The Commission proposed that the reception directive grant access to the labour market within six months of an application being made. This was acceptable to Portugal, Sweden and Greece, which offer access to the labour market to avoid overburdening their social welfare systems. Yet for Spain, Ireland, France, Britain, and Germany it was unacceptable. The UK pushed for a clause ensuring that asylum-seekers could be obliged to contribute to the costs of their care, so as not to overburden its system. Those mem-

Table 52.1: The first wave measures

Stage	EU Council Directives/Regulation	Brief description of the EU measures
Temporary Protection Directive	Council Directive 2001/55/EC on minimum standards for giving temporary protection in the event of a mass influx	The directive's adoption in mid-2001 might have affected the nature of subsequent measures: member states may be persuaded to countenance 'day-to-day' burden-sharing to ensure that future mass influxes are dealt with in concert (Thielemann 2005); this instrument assured future solidarity before measures dealing with day-to-day burden-sharing had been drawn up.
Dublin II	Council Regulation 343/2003 laying down the criteria and mechanisms for determining the member state responsible for examining an asylum application	Maintains the principle of the controversial Dublin Convention so that, broadly speaking, the state through which an applicant gains access to the EU is responsible for the asylum claim. Political agreement was reached in December 2002.
Reception Directive	Council Directive 2003/9/EC laying down minimum standards for the reception of asylum-seekers	Negotiations ran from May 2001 to January 2003. They were reopened following initial political agreement in April 2002.
Qualification Directive	Council Directive 2004/83/EC on minimum standards for the qualification of refugees	Defines those in need of protection and sets out their rights. Its passage was delayed by the concurrent passage of the German Immigration Law. Agreement occurred nine months after the June 2003 date set by the Seville European Council.
Procedures Directive	Council Directive 2004/83/EC on minimum standards on procedures for granting and withdrawing refugee status	An initial Commission proposal was negotiated during 2001 but ended in deadlock. By April 2004, the Council had agreed a general approach on the renegotiated directive, pending agreement on a legally binding list of 'safe third countries'. This was not achieved, so that the list will be discussed after the shift to QMV. This may allow a majority of member states to sideline opponents of the list. Political agreement on the rest of the directive was reached in November 2004. It has been referred to the EP whose Citizens' Rights Committee has proved critical of the measure.

ber states which could show themselves most at risk from the security threat of unwanted immigration won out, and the deadline for access to employment was extended from six to 12 months.

Formerly sidelined social and economic issues have not therefore been reintroduced into asylum policy-making in the same way as many charting the post-Amsterdam institutional reforms had expected. Where socioeconomic issues were reintroduced, they did not necessarily render asylum policy any more balanced. Unsurprisingly after September 11 and the subsequent attacks on Madrid, the social integration of third country nationals has an important place in The Hague Programme. The Programme talks of the need for "obstacles to integration ... to be actively eliminated" (European Council 2004: 19), but it has become clear that the attitudes of third country nation-

als are perceived as the obstacles: equality of opportunity will not be achieved by extending rights to migrants, without making this conditional upon some reciprocal change of attitude on their part. The special needs of asylum-seekers are not mentioned in the Programme. Many asylum-seekers are involuntary migrants, and UNHCR and some NGOs worry that the same demands will be made of them as are made of voluntary immigrants. The resurgence of the social agenda at the European level is not necessarily synonymous with the emergence of asylum as a more independent policy area.

With the sidelining of the supranational element of policy-making after September 11, narrower national interests were reasserted, and the possibilities for 'hard' burden-sharing following the establishment of the European Refugee Fund in 2000 were set back.

Forms of 'soft' burden-sharing were however realized: although a core band of member states dominated first wave negotiations, these were not the countries like Greece or Portugal which generally have the poorest provisions in place. The large member states and main receiving countries, UK and Germany, instead set the course for the European asylum system. Southern states' attempts to push for more 'porous' minimum standards – particularly under the 2002 Spanish Presidency – were generally resisted, and the leeway to maintain existing provisions cut. Policy harmonization above a lowest common level is understood as evidence of burden-sharing amongst those states with previously poor provisions. Burden-sharing is therefore compatible with securitization, however it arises not from supranational policy-making or a sense of solidarity, but from member states with higher standards exerting pressure on those with lower ones.

The reordering of the security agenda after September 11 is clear in the slothful adoption of the first wave measures. Asylum had slipped down the JHA agenda except insofar as could be understood as part of a broader terrorist threat. The aim of drawing up a 'European asylum policy' lost much of the backing it had received from the member states. The ebbing drive behind the creation of a common asylum policy was particularly apparent in the elaboration of the Hague Programme. The member states, apparently exhausted by their efforts to reach agreement on the Tampere first wave procedures directive, shied away from tying themselves to the realization of too many new measures.

The UK and Germany opposed further structural and operational harmonization, preferring instead the more ad hoc structures in place, whereby the Commission calls together member states officials when required. The same reluctance to increase the EU's powers informs the development of a common asylum procedure. UNHCR, promoting the 'EU prong' of its new asylum strategy, proposed plans for a centralized single authority to assess applications. The Commission made it clear that procedural centralization was not the aim, and that the EU's own operational power in this domain would be minimal during the five-year period. This reflected many member states' positions, particularly those of the UK and Germany.

The UK was particularly wary of the member states' producing a 'visionary' plan for the next five years (House of Lords 2005: 48). It put the emphasis on pragmatism, and met with general support. The general orientations of The Hague Programme lay

particular emphasis on the implementation and evaluation of measures. This is the first time that the Commission has been required to monitor JHA implementation during the transposition period (Peers 2004a).

UNHCR, in particular, supported the efforts to monitor implementation. The idea of the Commission drawing up yearly implementation reports was resisted by some states, but earlier experience of those states with laxer standards signing up to measures, which they then poorly transposed, was decisive. The UNHCR-Commission-UK led emphasis on evaluation and implementation chimes with national parliaments' concerns (House of Lords 2004). It arises from the understanding that migration flows can best be controlled and 'bogus' asylum-seekers excluded not by endless restrictions to access to asylum, but rather by improvements in the administration of asylum systems. It also reflects a desire to cement soft burden-sharing by ensuring that those member states with poor national provisions raise them in line with first wave standards. Again, then, the continued inter- and transgovernmental influence over asylum policy since September 11 has not proved entirely detrimental to attempts to draw up a well-rounded asylum policy that respects democratic values.

Thus, despite the growing influence of the supranational actors as the immediate impact of September 11 recedes, the security agenda still shapes the development of asylum policies. Building on initial input from the UK, proposals by the Commission for the 'external processing' of asylum applicants showed a marked concern for the resettlement of asylum-seekers in the EU and capacity-building in third countries (European Commission 2004; ECRE 2004). This suggested that external joint processing was being developed to save asylum-seekers from making dangerous journeys to the EU, rather than as a means to keep them at bay. Nevertheless, the British NGO Statewatch pointed out that the security agenda continued to set the frame of reference for new, increasingly democratized EU asylum policies: it argued that it is securitization that has closed off access to asylum, forcing 'genuine' asylum-seekers to resort to dangerous illegal means of entry to the EU (Statewatch 2004). Yet, instead of treating this central securitarian bias, new policies are being constructed according to its underlying principles. It is unclear whether communitarization will lead to the fundamental rolling back of the security agenda, or will merely fuse new elements to European asylum policy whilst maintaining its security foundation.

52.4.4 The Externalization of Asylum Policy

Post-Cold War international relations have created a challenge for asylum policy-makers by increasing mobility, but also offered a partial solution to these problems by opening up paths for the resolution of the causes of migration at their root. Since September 11, foreign and development policy instruments have been employed in dealing with root causes of migration (Niessen 2004). This attempt to repackage asylum policy, by making it less reactive, and more curative, has not been unproblematic though. Critics complain that development aid is targeted not at those areas most in need of it (for fear of making populations there more mobile), but rather at more affluent areas which produce the most illegal immigrants (Boswell 2003).

Nevertheless, attempts to infuse external policy tools with a security-oriented, reactive mentality have not always been successful. In 2002, the British and Spanish Prime Ministers Blair and Aznar argued for development aid to be made dependent on third countries' efforts to stem migration flows. Their suggestion was opposed by France, Luxembourg, and Sweden on the grounds that this kind of reactive externalization of internal security goals would be counterproductive to the EU's broader external policies.²

The British government's 2003 paper *New Vision for Refugees* suggested that military intervention would be justified in those states from which there was mass and uncontrolled emigration, because of the threat posed to security (UK Government 2003). This reflected a desire to transfer to a reactive policy area the precepts of a foreign policy that cites Britain's new responsibilities in a 'post-Westphalian' system of international relations in order to intervene more actively in other states. It also reflected a desire to use conventional interstate means to settle an internal security threat posed by non-state actors. The attempt to further link the internal and external security fields met with little enthusiasm at the European level. Whether this suggestion for better controlling access to asylum could be made compatible with the strictures of the democratic system is therefore unclear.

The Hague Programme meanwhile invites policy-makers to explore the possibilities of dealing with asylum externally. The question of the joint external processing of applications remains one of the most controversial aspects of the Programme, and states'

reactions run the gamut from outright approval to complete opposition. There is currently no consensus on what form this joint processing would take, however it may offer the EU a means to use its external capacity not as a tool for dealing curatively with the root causes of migration, but rather for acting in a fundamentally reactive manner, removing all those who apply for asylum within the EU to processing centres outside its territory. In fact, this might prove the most complete form of the reactive security-oriented approach, simultaneously dealing with the abuse of asylum by voluntary immigrants since the Cold War, and by terrorists since September 11 by clearing asylum-seekers from the EU. It would relieve the EU of the need to deal proactively with the external root causes and the initial internal social effects of asylum-seeking. Those member states worried that external processing would entirely replace the national reception of asylum-seekers stipulated that any external processing would be "in complementarity with the Common European Asylum System" (European Council 2004a: 18).

Germany and other proponents of external processing deployed humanitarian rhetoric, arguing that external processing would relieve applicants of the need to undertake dangerous journeys to the EU by processing them near to their countries of origin. Yet member states opposed to the scheme saw external processing as a means to co-opt third countries into the EU's efforts to shirk its own human rights commitments. The German conception of external processing for example foresees the establishment of facilities in Libya - a Geneva non-signatory. Belgium and Sweden thus demanded the introduction of the phrase "the European Council calls upon all third countries to accede and adhere to the Geneva Convention on Refugees" (European Council 2004a: 21). Such phrases apparently form part of a strategy to raise the profile of the member states' international obligations and to scupper the project entirely. Moreover, by promoting abroad democratic values like asylum, these member states hope to deal curatively with the causes of migration and to spread the burden of receiving applicants in a positive manner.

52.5 Conclusion: Democratization of Asylum Policy

It is by no means the case that the democratization of JHA processes that has occurred since 2001 has either rebalanced asylum policy or upheld interna-

2 See: Black, Ian; Watt, Nicholas: "Blair expects new EU asylum laws", in: *Guardian*, 19 June 2002.

tional obligations. This is in part because of the legacy of securitarian activity, and partly because democratization is not 'complete' and the position of previously sidelined actors is still precarious. Further, the course of democratization thus far may have reinforced actors like the European Parliament which bring democratic input to policy-making, but in continuing to sideline the European Court of Justice, the respect for normative democratic rights like asylum is still weak. As was noted above, democratic input is not necessarily complementary to the protection of normative democratic values, as those rights enjoyed by third country nationals are seen to exist at the expense of the electorate.

Arguably, the Parliament did not take full advantage of the means accorded it in the policy-making framework during the first wave. Party politics in the European Parliament reinforced its relative exclusion from the asylum policy-making. When asylum issues were dealt with by the 1999–2004 Parliament, a split regularly opened up between the Right on one side, and the Socialists, Liberals, and Greens on the other. The Centre-Left's expansiveness was encouraged by their exasperation at the EP's marginal position in the decision-making process, and the divergence of their priorities from the substance of the legislation emanating from the Council. The fact that the Council sidelined the EP further in the passage of some of the initial pieces of legislation by reaching political agreement before the EP had delivered its opinion, exacerbated the situation.

Despite its marginal position, the Parliament was a prime focus of lobbying on the part of even resource-strapped NGOs. Yet the potent cocktail of abstract demands from certain rights-based NGOs, and its marginal decision-making position, meant that the Parliament paid too little attention to the practical realities of asylum policy. One telling example concerned the question of asylum-seekers' access to education. ECRE had recommended that "children must be given access to the state education system at the earliest opportunity" (ECRE 2001). The Commission proposed that access to education be granted within 65 working days of an application being lodged. The British Liberal MEP Sarah Ludford shortened this to 21 working days in her proposed amendment (European Parliament 2002: 26). Since the initial 65 day period was already felt to be impractical if applicants arrived at the beginning of the summer vacation – 'working days' being held to run on during school vacations – the amendment was wholly unrealistic.

Rather than exploiting the limited consultative tools at its disposal, the EP turned to more contentious channels. It actively used the judicial tools available to it as a bargaining chip in decision-making (the asylum procedures directive), as well as reactively, to challenge legislation after its adoption (family reunification directive). In some policy areas, the EP has shown that it is willing to act 'sensibly', taking account of member states' preferences, in order to gain decision-making powers. Thereafter it has become more activist. This tactical restraint has not been the rule in asylum policy. Its strategy was born of frustration at its lack of influence, and of its understanding of its institutional and democratic role in the EU. In order to neutralize this strategy, the member states may be tempted to involve the Parliament more in policy-making, in order to draw it into the European 'establishment' (Maurer 2004).

The EP has certainly pursued non-citizens' interests in the past, and finds itself somewhat removed from the electoral pressures that member state governments cite as an *apologia* for restrictive migration policies. Yet it is unclear to what degree the reassertion of parliamentary influence at the European level will contribute to the upgrading of third country nationals' rights and interests. The Parliament structurally incorporates the same ambivalence towards non-citizens and minorities which is characteristic of domestic democratic systems. It is precisely the distance from electoral pressures that accords the EP a certain margin of manoeuvre to push for the extension of non-citizens' rights, which also denies it much of the legitimacy required to carry out such a task. By involving the Parliament more heavily in policy-making, the member states are effectively drawing it into the European 'establishment', reducing its freedom of manoeuvre. Such a move makes the EP's activities more perceptible to its electorate and renders the need for it to justify the extension of its powers more pressing. Whether an EP thus implicated in asylum policy-making will enjoy the tools necessary to roll back the effects of securitization is doubtful.

The development of European asylum policy highlights the tension between the democratically expressed will of the electorate and the sometimes-countervailing democratic mechanisms which regulate its realization. European asylum policy integration has been instrumental in realizing the perceived or expressed will of the citizens of the member states where countervailing democratic mechanisms at the national level were more robust. As justification for these developments, policy-makers have cited a desire

to safeguard democracy more broadly: when its will is constrained, the electorate may be tempted to turn to those political parties that scorn democratic mechanisms. The menace of the far right in Europe has served as justification for restrictive asylum policies.

This aspect of the EU's 'democratic deficit' is unusual because the margin of manoeuvre won by policy-makers at the expense of democracy has principally been used to respond to the narrow interests of national electorates. Only to a limited degree has it been used in a technocratic manner to meet those economic, demographic, and humanitarian aspects of asylum and immigration policy that may not appeal to voters.

Whilst the upgrading of the Parliament in policy-making signals the more direct democratic input of the European electorate, it is the reassertion of those democratic mechanisms mediating the will of the electorate and protecting individuals from the state that will prove most challenging to the security agenda. With the eventual entry into force of the Treaty establishing a Constitution for Europe, normative mechanisms would be reinforced alongside the European Court. The fact that in the aftermath of September 11 the Commission was asked to review the compatibility of the EU's international obligations - in particular under the Geneva Refugee Convention - with the provision of internal security, sheds light on the member states' disinclination to upgrade the Court's role.

The potential restraints exerted by the Court on the EU's capacity to realize the perceived or expressed wishes of the electorate raises questions about whether an elite-driven project like European integration, which lacks popular legitimacy, can deal with controversial issues in a fully democratic fashion. The Union nevertheless remains under pressure from the European Parliament, national parliaments, NGOs, and some member state governments to democratize this area of policy-making.

If these democratic pressures are as uncongenial to the realization of the security agenda as the policy-venue-shopping thesis posits, European asylum policy could move in any one of three directions:

Firstly, asylum policy could be repackaged so that measures to reduce the number of asylum applications would be compatible with the reinforced democratic mechanisms. The emphasis would shift to burden-sharing, curative, and capacity-building policies. Where this reconciliation proved impossible, the EU's incapacity to reduce the numbers of asylum-applicants could force a fundamental re-conception of asylum,

with asylum-seekers no longer being framed as a threat to the interests of citizens. National electorates would need to be educated on the rationale behind such a system.

Secondly, and alternatively, where it proved impossible to reconcile policies to reduce the number of asylum-seekers with democratic pressures, some reform of the democratic mechanisms could occur. Perhaps the weak point of the democratic system is the normative protection of third country nationals' rights. It is arguable that the only thing that has thus far relieved the pressure to reform the Geneva Refugee Convention is the fact that policy-makers have found ways to circumvent it. If the Convention is enforced with renewed zeal, its future may be put in question. Its reform is an option that has been thrown up by Austria and the UK.

Thirdly, the reassertion of democratic pressures also entails the reinforcement of international norms. This considerably reduces member states' capacity to reform the relevant human rights and refugee norms. The search for more favourable policy-making venues may therefore begin again. The UK, which enjoys an opt-out, has already signalled its reluctance to join the second wave, and its "new vision for refugees" (UK Government 2003) has encouraged it to cast around for partners outside the EU.

The end of the Cold War and the attacks of September 11 appear to have further damaged the EU's capacity to draw up a well-rounded asylum policy which is democratic both in its formulation and effect. This is explicable with reference to the two events' interaction with the processes of *securitization*, *Europeanization*, *externalization* and *democratization*. Yet the two events have not only presented challenges to the EU but also opportunities. They have accelerated Europeanization, raising the possibility of burden-sharing between member states. They have reconfigured international relations allowing the member states to tackle root causes proactively. However, the laboratories of JHA policy-making have been unable to grasp these opportunities. The predominant form of Europeanization facilitated by the two events has been trans- and intergovernmental, and has not been conducive to the realization of anything but narrow national goals. Meanwhile, a lack of coordination between internal and external policy actors has prevented the EU from meaningfully tackling root causes.

53 From a European Security Community to a Secure European Community

Tracing the New Security Identity of the EU¹

Magnus Ekengren

53.1 Searching the European Security Identity²

The new dynamics in global security in recent years have had a significant impact on European security (Duke 2000; Missiroli 2002a; Van Ham/Medvedev 2002; Carlsnaes/Sjursen/White 2004). New and broader transnational threats, such as terrorism, together with the creation of new tools to meet these, have created a fundamentally new security landscape (Kirchner 2003). At the same time the European Union has established a European Security and Defence Policy (ESDP) including military and civil crisis management capacities, internal safety and emergency preparedness measures, rapid alert systems, a solidar-

ity clause for the protection against terrorism, and a security strategy.

Two sets of developments have been of particular importance for the conceptual and policy change within the EU. Firstly, the historical change constituted by the end of the division of Europe in 1989/1990 (see chapter 1 of this book), which meant that the Union no longer was a pawn in a larger bi-polar security game based on territorial defence but instead became a driving force for a stable wider Europe. A force strengthened by the deepening and widening of the Union in the form of an economic and monetary union and the greatest enlargement process in EU history; from 12 to 15 to 25 Member States in 2004. Secondly, the EU has in the same period been challenged by a whole set of new kinds of threats and crises ranging from the mad cow disease over ethnic, intra-state conflict in Bosnia to terrorist attacks in Madrid and London. Together with the 9/11 experiences, these crises have put the need of reconceptualizing security in a flash light.

The theoretical debate has mainly been concerned with how the new trends have affected the security identity of the Union and the wider European community (Ruggie 1998; Adler/Barnett 1998; Lenzi 1998; Wæver/Buzan 2003; Brauch/Liotta/Marquina/Rogers/Selim 2003). The first step has been to define what European security is not. For example, the ESDP has been interpreted as being the end of the since long suggested idea of a territorial defence for the EU (Gärtner 2003). It has become very difficult to define European security in general terms in a post-national situation without the risk of inter-state war. The new situation has simply been characterized as a “security complex” (Buzan/Waever/de Wilde 1998: 179–193). Some observers have returned to the basic ideas of the EU for guidance. Sjursen holds that any conception of European security must include an understanding of the “communicative rationality and

1 This chapter draws on the report *The New Security Role of the European Union – Transnational crisis management and the protection of Union citizens, Acta Series B35* (2006) by Magnus Ekengren, Nina Matzén and Monica Svantesson, Swedish National Defence College (SNDC). The report is part of the research project *Creating EU Crisis Management for a Secure European Community* conducted by the Center for European Security Research (EUROSEC) at the SNDC and the Leiden University Crisis Research Center (CRC) in the Netherlands. More information about the project can be found at: <www.eucm.leidenuniv.nl>. The project is supported by generous grants from the Swedish Emergency Management Agency (SEMA) (*Krisberedskapsmyndigheten*). I also would like to thank the two anonymous reviewers for very valuable remarks and suggestions.

2 This chapter relies also on three confidential interviews of the author with a civil servant of the DG Environment, Commission Civil Protection Unit, on 11 February 2003; a civil servant of the DG Environment, Commission Civil Protection Unit, Monitoring and Information Center (MIC) on 13 February 2003, and with the head of a unit, Czech Republic Team, DG Enlargement, European Commission on 13 February 2003.

deliberation” that constitute the ground for the EU’s method of creating security through the promotion of rule and rights (Sjursen 2004b: 60). Through a related line of reasoning Manners has argued that the EU should be identified as a “normative power Europe” (Manners 2002: 235). He and others have concluded that the EU, due to its strong emphasis on international law and civil instruments as well as a lack of military means, best can be characterized as a normative or ethical power in world politics (H. Smith 2002). Kirchner has developed the concept of security governance to catch the broad notion of security, the great number of actors, the new rules, and the growing multilateralism characterizing today’s European security (Kirchner 2005). He asks if this security governance is sustainable. According to Kirchner, the main questions concern the extent to which non-state actors are acting autonomously vis-à-vis states, who are the lead actors, and how and to what degree institutions shape national interest in line with other states’ security interests. Sundelius sees the growing concern of the Union to safeguard basic functions of European society (‘critical infrastructures’) and government (‘democracy’) as an evolving ‘functional’ security identity. Functional rather than territorial integrity seems to be the aim of the Union (Sundelius 2004a, 2004b; see 59.4 below).

Four key problems are crystallizing from these early attempts to define the new security identity. Firstly, there are in the search for European security few linkages to the on-going general reconceptualization of security; whom and what is the EU suppose to secure beyond the inter-state peace it has achieved? Secondly, there is much uncertainty as to what extent the new security order can be captured in general terms. Thirdly, even though new promising concepts such as security governance are able to recognize the multitude of actors, rules and layers, they are of limited help for an explanation of how the new structures matter; how they change behaviour of actors, how they relate to new security concepts. Finally, most conceptualizations are still just the first step of a research endeavour that now also urgently needs programmes of systematic empirical investigation.

53.2 From a European Security Community to a Secure European Community

Elsewhere the assumed identity shift has been analysed in terms of a possible move from a European

security community to a ‘secure European community’. A secure community is seen as an ideal type – a hypothesis – of a new regional security order in relation to which today’s EU developments can be understood, not as a factual description of the current situation in Europe. The concept has tentatively been defined “as a group of people that is integrated to the point where there is real assurance that the members of that community will assist each other in the protection of the democratic institutions and the civilian population – the core functions of their societies and governments” (Ekengren 2004a, 2004b, 2005: below in 59.4). Because of its potential to meet the challenges recognized above this chapter will continue to elaborate on this model and its capacity to guide empirical research. The advantages are many. Firstly, the assumed new community provides a general notion by building on perhaps the most influential characterization of the European security identity so far, namely Deutsch’s (1957: 5) concept of a ‘security community’ (also an ideal type). Moreover, it develops this classical key concept in a direction beyond territorial, state security by pointing out new reference objects such as societal and democratic ‘functions’. In addition, its formula ‘assistance’ leaves open for a broad range of new methods for security creation, excluding neither hard (military) nor soft (civilian) means. Furthermore, the proposed framework investigates the sustainability and impact of a potential new order by focusing a key factor for its endurance, namely the degree of trust and willingness to assist in broader security matters that exist among European actors. Finally, the concept of a secure community has already shown its capacity to generate empirical evidence (Boin/Ekengren/Rhinard 2005).

Karl Deutsch and associates (1957: 5) defined security community as a group of people that is integrated to the point that where there is “real assurance that the members of that community will not fight each other physically, but will settle their disputes in some other way” (Deutsch/Burrell/Kann/Lee/Lichterhan/Lindgren/Loewenheim/Van Wagenen 1957: 5). Integration theory explained the creation of Europe in terms of a security community resulting from the growing interdependence between European states through economic integration and common institutions (Lindberg/Scheingold 1970; Hodges 1972; Stone Sweet/Sandholtz 1998). The next step for Europe would be, in accordance with Deutsch’s conceptualization, the integration into an amalgamated security community with “some type of common government, unitary or federal” (Deutsch/Burrell/Kann/

Lee/Lichterman/Lindgren/Loewenheim/VanWagenen 1957: 6) and “common institutions for policing and coercion” (Deutsch/Burrell/Kann/Lee/Lichterman/Lindgren/Loewenheim/ Van Wagenen 1957: 163–164). However, contrary to Deutsch’s predictions, a regional state-based order has not materialized in Europe.

The European states have established a peaceful order but “at the same time as they start to blur, merge, and fade, and numerous nonstate forms of securitization enter”. The new “security order does not take the form of a direct security system like collective security solving the security problems of the region” (Waeber/Buzan 2003: 375–376). The concept of security community was based on research on why certain regions in the world have emerged as zones of peace, free from inter-state wars. In a situation with little risk of European inter-state war but with new threats and rapidly growing security cooperation, there is a need to find new conceptualizations of regional security integration. There is a need to explain how and why a European security community develops into a secure European community. The *purpose* of this chapter is to continue the empirical tracing of an emerging secure community. The field of EU crisis management is selected as a case due to the fact that it is perhaps the best example of the new European security cooperation (Boin/Ekengren/Rhinard, 2005, 2005a). In the light of the findings, the final section discusses the possible need for a re-definition of a ‘secure community’ in the meaning presented above.

53.3 The Case of EU Crisis Management

The area of EU crisis management has come to be perceived by practitioners as almost identical to ‘Union security’ as a result of the strong crisis management focus of the new security tools. In theory, there is a growing literature linking security and crisis management (Sundelius/Stern/Bynander 1997; Boin/’t Hart/Stern/Sundelius, 2005). More specifically, these works show the strong similarity between different areas of crisis decision-making where there are perceptions of an acute threat to security, including military, economic as well as environmental security (Stern 1995).

Some observers have studied the Union as a civilian crisis manager in cases ranging from the police cooperation of EU member states that resembles

international security (Bigo 2000) over natural disaster to political stalemates (Larsson/Olsson/Ramberg 2005; Myrdal 2001). Today, the crisis management capacities, located in all three EU pillars, makes the Union responsible both for internal and external non-territorial security (Missiroli 2001; Ekengren 2005; Spence forthcoming). A sharp division between military and civilian crisis management resources does not exist for the EU (Rieker 2004: 42).

This chapter studies the case of EU crisis management as a provider of indicators of fundamental importance for the exploration of an emerging secure community: Firstly, the study of EU crisis reveals more precisely *what* ‘core functions of society and government’ the members of the community (states and other) are ready to protect in common, i.e. the security object of a secure European community.³ It is in times of threat and crisis for these particular

3 In the context of the nation state, a crisis is commonly defined as an urgent threat to core societal values that necessitates immediate action by political actors (Rosenthal/Charles/’t Hart/Kouzmin/Jarman 1989; Boin/Ekengren/Rhinard 2005, 2005a). European crises might perhaps best be defined by threats to the core values of the EU – free trade, fundamental rights, etc. However, the definition of an EU crisis can not solely be based on a pre-empirical assumption of values. In order to understand what an EU crisis is we also need to investigate how and why an event is perceived as an EU crisis by the actors concerned. We need to add ‘subjectivist’ facts (Ekengren 2002: ch. 4). A more full understanding of ‘EU crisis’ should crystallize in the process of empirical investigation, in what Bourdieu calls ‘the second break’. The researcher should try to situate himself in the position of the subject at the very moment when the act is taking place (Bourdieu 1990: 81). In order to relate the agent’s own ‘sense’ of his practice and the objective notion/structure – in our case core values – assumed by the researcher, Bourdieu uses the concept of habitus. In this way, we not only avoid assessing ‘EU crisis’ solely from the outside, with an ‘objective’ definition constructed by the researcher, but also a perspective based only on subjective or ‘visible’ (in a positivistic sense) social phenomena – a view that risks producing a-historical assumptions about ‘EU crises’. Thus, a definition of EU crisis is not supposed to be included in the premises of the study but should instead appear as a result of the investigation. The risk of leaving out any significant empirical facts – e.g. a particular EU type of crisis – due to the use of prefabricated conceptions originating from the study of nation-states or other international organizations should be minimized. This chapter derives the core European values from studying the practices and activities that the EU employs to protect them.

functions that a member of the community will expect other members to assist. Secondly, an analysis of EU crisis management also shows *how* members 'assist each other' in the protection of these core functions. This includes both the intergovernmental and community methods, as well as the growing informal crisis management capacity within the EU institutions. Finally, the crisis management practices of the community members is an excellent indicator of *whether* and *to what extent* they are 'assuring' each other of mutual assistance. What is European solidarity in the face of danger?

53.4 The evolution of functional security in the EU

The Union has essentially always been a security project. For the first forty years of the Union's existence, the main aim was to secure the member states against *each other*. The Union provided for state security against the historical threat of European inter-state wars. However, over the years new reference objects have evolved incrementally within the Union as a result of its growing field of competences. Its institutions, mainly the EU Commission, have due to the gradual expansion of tasks been forced to take on also a growing responsibility for safeguarding and protecting the EU functions and 'systems' these have created. New safety measures have often been the result of reactions to crises for the Union, not as part of any grand design. Thus, the question of *for whom*, *for what*, and *from what* EU security is aimed can be explained in the light of what the Union has considered to be a crisis throughout its history and how the list of what should be safeguarded in common has grown.

As mentioned, the EU⁴ has since the 1950's provided for *national security*. In the 1970's and 1980's, economic welfare and stability came to be perceived as a critically important object for EU members to secure in common. A crisis for the functioning of the common market and the institutional and legal measures taken to uphold the 'four freedoms' of intra-European exchange became an EU crisis (Boin/Ekengren/Rhinard 2005).

By focusing on safeguarding vital flows of resources for the welfare and identity of the EU mem-

ber states, the Union in practice took steps towards transnational *societal security* (Buzan/Waever/de Wilde 1998; Møller 2001a). In the 1990's, the outbreak of war and violence in the Balkans forced EU leaders to define also this crisis as a crisis for the Union. The value of peace and stability in the neighbourhood – the 'near abroad' – was added to the EU's core goals. The aim to protect peace and the safety of civilians was no longer limited to the EU member states.

Consequently, the reference object for the Union's endeavours became the same within and outside its borders: to secure states or ethnically based groupings against each other. A threat or event that undermines peace and stability in wider Europe thus also presents a potential crisis for the EU. In this way also the concept of *human security* (Paris 2001) could be added as a label for characterizing European security.

This development was further underlined in the following years when natural disasters increasingly became defined as EU crises. The Commission and its Humanitarian Aid Office (ECHO) gave high priority to helping Turkey when the country was hit by two earthquakes in 1999 (Ekengren/Ramberg 2003). During the floods in Central Europe in 2002, the EU level acted as a centre of coordination for parts of the assistance between the flood-stricken countries and EU member states. The aim was the protection of European (EU and candidate states) citizens (Ekengren 2004b).

In 2002, Spanish authorities requested help via the EU Commission when the *Prestige* tanker began leaking outside the Spanish and French coastline (Ekengren 2004b). The Union coordinated many civil protection operations and was also a great donor of aid during the tsunami disaster in 2004 (Ekengren/Matzén/Svantesson 2006). If the early practices will set a precedent for future EU crisis management, 'EU security' might increasingly refer to all humans in grave international crisis.⁵ This development of EU measures is perhaps best understood by the concept of human security in the meaning 'freedom from hazard impacts' (Brauch 2005: 36–44).

The 1990's also saw a new development with regard to internal EU safety. In the BSE crisis in 1996,

4 Technically speaking, the European Union only exists since 1992. However, I take into account the history of the EEC as well which began in the late 1950's.

5 "A Human Security Doctrine for Europe" was proposed in: *A Human Security Doctrine for Europe, The Barcelona Report of the Study Group on European Security*, led by Mary Kaldor at the request of Javier Solana, see at: <<http://www.lse.ac.uk/Depts/global/>>. See the chapters by Narcis Serra and Reinhardt in this volume.

several EU member states responded to the UK announcement of a potential link between the animal and human forms of BSE by closing their borders to British meat (Grönvall 2000; 2001). The event became a serious threat to the common market and at the same time to the safety of European consumers. The EU had to reconcile the protection of both aspects of the growing multidimensional character of its referent object of security (Grönvall 2000: 89). In the case of the dioxin scandal three years later the security object 'citizens' safety' had become more clear. The Commission acted quicker and with more accuracy when it ordered Belgian authorities to trace and destroy all poultry products with potential dioxin contamination (Olsson 2005). The events of 11 September 2001 started a chain of policy responses that have more unequivocally stated its object of security as 'EU citizens'. The Solidarity Clause in the draft Constitutional Treaty (adopted as a political declaration in the aftermath of the Madrid train bombings in 2004) constituted the next step by declaring that the EU aims should be to "protect democratic institutions and the civilian population" not only from terrorist attack but also to cope with natural or man-made disaster (Article I-43).⁶ The reference object of security is thus not just a matter of infrastructure or flows, but also about the ability to govern society and to articulate political goals (Sundelius 2004b). We might then speak of a crisis in and for the Union: when there is an urgent threat to the basic political and economic systems that enable European society to function (Ekengren 2004b).

At a deeper level the evolution of functional security in the EU can be explained as a result of the Union's development into a *domestic*-like system where theories of system and societal vulnerability increasingly will be applicable. There is, for instance, a growing body of social theory literature on the consequences of major disturbances on society, i.e. system effects, that could be used. Mesjasz has approached security as a property of social systems. He identifies social systems and their survival, continuity, identity, and coherence as possible reference objects to be studied more closely (Mesjasz 2004: 18-19). Jervis has examined the strengthened interconnections that makes international relations increasingly system-like

and change the condition for effective state action (Jervis 1997). Others have talked about the need to conceptualize the international system in terms of an emerging civil global society (Kaldor/Anheier/Glasius 2003a). Regional systems have been understood by Brauch (2003) as a result of the reconceptualization of security related to for example environmental conflicts in the Mediterranean area. Beck (1992) has introduced the concept of risk society as a description of today's domestic systems. According to Luhmann (1982: 288), "the horizon of the future becomes shorter and more foreboding" as a result of a new type of world society, characterized by complexity and a short-term crisis management style of politics. In this perspective, the aim of the security measures taken by the Union over the years is to secure the survival of its 'system' against new threats, but perhaps more important new vulnerability due to the growing field of Union competence in which European crises can occur. A good example of the systemic dimension are the many transgovernmental practices of European 'security actors' such as the police (Den Boer 2001: 258-272).

In the light of the historical overview, four 'core functions' of the Union can be identified as constituting the EU system. Each of these functions is thus to protect a certain fundamental value; peace and stability (both within the EU and the near abroad), the European economy, and people, and society. These are the main values the members of the community seem to be agreeing on with regard to common protection. Or phrased differently: the core functions of the EU have evolved in order to protect these fundamental values (Boin/Ekengren/Rhinard 2005: 20).⁷ Securing the four functions could be said to embrace all the other security concepts referred to above; national, societal, human. Security in this context could be defined as freedom from societal and functional disruptions and hazard impact. The particular way of organizing for functional security could be explained as a result of the Union's character between a nation-state, federation, and international organization, based on both intergovernmental and community processes.

6 European Union (2004): "Treaty establishing a Constitution for Europe", in: *Official Journal of the European Union*, C 310, 16 December 2004, p. 32. See relevant articles in their entirety included in the end of the chapter.

7 This characterization of an EU crisis builds on a classical crisis definition according to which a crisis should be understood as a "serious threat to ... fundamental values and norms of a social system" (Rosenthal/t Hart/Charles 1989).

53.5 The Organization of a Secure Community

53.5.1 EU Crisis Management Between Intergovernmental and Community Processes

The case of EU crisis management is also very telling with regard to how post-national organization secures its values and functions. Within the first pillar the EU has elaborated a new 'Rapid Reaction Mechanism' for international civil crisis management, a 'Community Mechanism' for civil protection,⁸ and adopted a whole range of security measures in a wide area of its competencies, linking Union institutions and member state ministries and agencies.⁹ Emergency preparedness became one of five areas prioritized by the EU in the fight against terrorism¹⁰. The latest development is the Commission proposal of a Rapid Response Instrument for major emergencies, as an answer to the tsunami disaster.¹¹ Within the third pillar (intergovernmental), police and judicial cooperation

in the framework of justice and home affairs (JHA)) is forming the basis for the EU's combating of terrorism (see Maurer/Parkes in this volume). The EU has adopted a European arrest warrant, common definition of terrorism, common list of terrorist organizations, and established an exchange of information between the member states and Europol, an anti-terrorist team within Europol and Eurojust (co-ordination between national prosecutors, police officers). In October 2004, the Union established a European Agency for the Management of Operational Cooperation at the External Borders of the EU member states (EU border agency).¹² The ESDP is part of the intergovernmental Common Foreign and Security Policy (CFSP). Crisis management within this second pillar includes military and civilian capacities. The EU will be able to deploy up to 5,000 policemen in international missions, and furthermore be able to strengthen the civil law system and administration and provide for civil protection. The EU's military crisis management capacities build on new Union organs, such as a Political and Security Committee and a Military Committee, and on a close cooperation with NATO (Piana 2002). In December 2003, the Union adopted the Security Strategy proposed by the CFSP High Representative Solana.

The pillars are a mixture of intergovernmental and supranational elements of decision making. (M.E. Smith 2004; Ginsberg 2001; K. Smith 2004), which has made the cross-pillar structure of EU crisis management instruments problematic. Some examples: The role of the EU Commission in the BSE crisis in 1996 was to bring the issue back into the supranational decision-making and preserve the market for agricultural produce while at the same time guaranteeing food safety, a competence lying mainly in the hands of the member states (Grönvall 2000: 89). In the case of the dioxin scandal, the Commission acted quicker. But again, EU procedures were not fully ready for the protection of this quickly emerging and legitimized security aim. In order to act effectively the Commission had to bypass the intergovernmental scientific consultation process and send its own inspec-

8 EU Council of Ministers, Council Decision of 23 October 2001/792/EC, Euroatom: Art. 1.1. The mechanism has been used on numerous occasions since its establishment. See: *Communication from the Commission to the European Parliament, the Council, the European Economic and Social Committee and the Committee of the Regions, Reinforcing the Civil Protection Capacity of the European Union*, Brussels, 25 March 2004. COM (2004) 200 final.

9 These include 'economic security'; the protection of technical infrastructure, the combating of terrorist funding (DG Internal Market and Financial Services), programmes of aviation-transport security (DG Enterprise), a Rapid Reaction Network in the field of 'health security', programmes for the control of communicable diseases, preparedness and response to biological, chemical, radiological, nuclear terrorist attacks (DG Consumer Policy and Health Protection), general vulnerability reduction, security of energy supply, diplomacy (e.g. in the UN), a Joint Research Centre (including a new security programme, policies of common risk analysis and intelligence (Jarlsvik/Castenfors 2004)). See: *Communication from the Commission to the Council and the European Parliament, Preparedness and consequence management in the fight against terrorism*, Brussels, 20.10.2004. COM(2004)701 final (p. 10) and Annex to Report (Boin/Ekengren/Rhinard 2005).

10 The other four comprises police and judicial cooperation, global fight against terrorism, air transport security and economic and financial measures, at: <<http://europa.eu.int/comm./110901/index.htm>>, 24 May 2004.

11 European Commission: *Proposal for a Council Regulation establishing a Rapid Response and Preparedness Instrument for major emergencies*, COM (2005) 113 final, 2005/0052 (CNS), Brussels, 6 April 2005.

12 *Communication from the Commission to the Council and the European Parliament, Preparedness and Consequence Management in the Fight Against Terrorism*, Brussels 20.10.2004. COM(2004)701 final (p. 10) and Annex to Report (Boin/Ekengren/Rhinard 2005).

tion teams and devise its own tracking system for Belgian foodstuffs in an ad hoc manner. It took several months for the Commission to get Belgium to agree to implement fully its measures (Olsson 2005). During the floodings in Central Europe the Commission received a request for support from the authorities of the Czech Republic which was immediately transmitted to the EU member states. Since the use of the Community mechanism for civil protection is an intergovernmental voluntary tool, the Commission could not force member states to provide assistance, nor could it control the types of resources ultimately provided (Ekengren 2004b)¹³. Furthermore, as in the case of the dioxin crisis management, the Commission and its Humanitarian Aid Office (ECHO) had to bypass formal procedures in order to act swiftly helping Turkey when the country was hit by two earthquakes in 1999 (Ramberg 2005). There were many problems of logistics, coordination, and duplication (Ekengren/Ramberg 2003).

One of the EU's most central policy concerns is currently the CFSP's ability to draw on the full range of EU instruments, including those in the first and third pillars, in order to carry out ESDP tasks. Discussions on whether or not to incorporate the capacities of the Union's third pillar into the ESDP (e.g., in the areas of personnel and threat identification), signalled early the development towards a functional security approach. For internal as well as external security reasons, many have claimed that there is an urgent need for better coordination between civilian ESDP activities, JHA, and the Commission. It has also been suggested that security thinking should be 'mainstreamed' into other areas of EU cooperation as well. The EU should, in the wording of the Solidarity Clause, make the most of its multi-sectorial character - including military instruments. Moreover, 9/11 intensified a process where the EU had begun to rethink its old lines of demarcations between all its sectors and pillars, between external and internal security; and how trade, aid, diplomacy, and the new crisis management capacities under the ESDP could best be combined. This is also the main reason why it was suggested to abolish the pillar structure in the new Union constitution.¹⁴

53.5.2 Organizational Capacities

The informal crisis management capacities in the EU institutions are also significant of how a secure community is being organized for functional security. There is growing capacity to prevent crisis in almost all the Directorate Generals of the Council Secretariat and the EU Commission. In some sectors the planning activities of the institutions are substantial, such as human health, common foreign and security policy, and justice and home affairs, and in the Commission in the DG Environment. In others the preparation capacity is weaker. The capacity to cope with European crises also varies between sectors. The Commission has set up procedures and mechanisms that enable it to coordinate and organize for decision-making in times of crises.

In the aftermath phase of crisis management - learning from crises - there are cases where the crisis experience has led to the creation of new EU agencies. Anthrax threats and the SARS epidemic prompted the EU to create a *Centre for Disease Prevention and Control*. The aftermath of the *Erika* and *Prestige* tanker accidents induced the establishment of the *European Maritime Safety Agency* (EMSA). But the efficiency of informal as well as formal agencies and structures ultimately depend to a very large extent on the willingness of member states to use these instruments for their coordination and on mutual trust in assistance in times of European crisis (Boin/Ekengren/Rhinard 2005).

53.6 The Sustainability of a Secure Community

To what extent are members of a secure community assured that their community fellows will assist them in times of threats and crises for the basic functions of their societies? One of the most central conditions for the sustainability of a community based on functional security will probably be the mutual trust of its members in common crisis management capacities. Due to the fact that there is no formal obligation of the member states to implement EU crisis decisions, national trust is ultimately dependent on the willing-

13 Most of the support was forwarded through well-established bi-lateral channels.

14 European Union (2004): "Treaty establishing a Constitution for Europe", in: *Official Journal of the European Union*, C 310, 16 December 2004. The draft Constitution implies that all articles related to physical security for the first time will be drawn together under the same chapter (chapter II, Articles I- 40-43).

ness of European partners to assist each other. The Solidarity Clause of the Draft Constitution only calls upon the member states “to act jointly in the spirit of solidarity” if a member state is a victim of a terrorist attack or natural and man-made disaster (Ekengren 2004b, see document 59.1).

In the field of international relations trust is often equated with the willingness to take risks on the behalf of others. The level of analysis is mainly inter-state relationships (Hoffman 2002). A closely connected field of research has dealt with credibility in international relations, particularly with regard to great power politics (Powell 1990). For the relations among states the perception of security has been seen in the literature as mainly based on mutual trust (Fukuyama 1995; Gambetta 1988; Bengtsson 2000). This trust was seen as a function of a sense of community or of a cultural affinity among states (Anderson 1983). Since the 1950’s, the conviction among the West European states of peaceful solutions of conflicts was based on the feeling of community and trust (Deutsch/ Burrell/Kann/Lee/Lichterman/Lindgren/Loewenheim/Van Wagenen 1957; Adler/Barnett 1998). A well-recognized trust exists in the EU capacity to handle inter-state conflict. The question for a secure community is to what extent there exists trust in the EU capacity to handle European crises.

A challenge for the study of trust in the EU crisis management capacities is that the Union has passed beyond traditional inter-state relations into a Union system. There is no longer a question of trust only among states but also *within* the evolving common and transgovernmental organization of crisis management, integrating the EU bureaucracy and national structures. It is unclear whether changes in the degree of mutual trust among member states correspond with today’s creation of a kind of domestic crisis management capacity within the EU.

Early empirical results have shown the urgent need to understand these dynamics. For example, today’s hesitation to share national intelligence for the EU prevention of terrorist attacks is for many observers due to a lack of trust among member states. Despite this fact, a European intelligence community is in the making (Müller-Wille 2004). Moreover, in the preparation phase of the EU crisis management capacities there are currently few but significant signs of a division of labour and resources between member states for a more efficient creation of common capacity. In some sectors there is an unwillingness to implement EU decisions among member states that leads to uncertainty on national expectations of Un-

ion assistance in the coping phase. In other areas the readiness to act is stronger, which presumably will result in a strengthening of the credibility and trust that will be needed to hold the secure community together (Boin/’t Hart/Stern/Sundelius 2005; Boin/Ekengren/Rhinard 2005, 2005a).

53.7 Towards a New European Security Identity

By successfully forming a basis for a standardized framework of analysis the concept of a secure community shows that today it is also fruitful to perceive of a European security identity in general terms. The concept provides a new focus for the study of ‘post-national’ regional aims and ways of creating security, beyond the security community. Furthermore, this chapter has shown the concept’s potential in revealing the functional security agenda – the new threats and crises, the complexity of EU security tools, and new constellations of actors. However, it also lays bare the shortcomings of the definition of the concept. The strong complementary character of the EU crisis management is one of the findings that stands out most clearly. The community mainly offers assistance and coordination devices to its members in support of national crisis management capacities. This two-level dimension is missing in the early definition giving associations to a community protecting its members by exclusive means. There is in the light of the empirical evidence a need to redefine a secure community.

As part of the coordination of national crisis management capacities, the EU and the member state institutions are, to an increasing extent, shaped so that they may be *complementary*, not mutually exclusive. The EU capacities adds political and technical tools for mutual assistance. A structure of complementary “action capacities” as Börzel and Risse (2000) call it, is crystallizing. Through its growing management capacity, the EU is providing a “community for security”, not above or beyond, but *in parallel* to the national security systems. The structure of transnational crisis management is a new configuration of international security, but it does not seem to supplant the states, to borrow a formulation from Nørgaard (1994: 276). Rather, EU crisis management might be an example of a “regional institutional security framework” (Jørgensen 1997: 211), existing in parallel to the state system.

EU crisis management is based on supranational coordination and supervision and national resources. The common capacity is developed as a voluntarily complement to the member states. In this parallel system, EU instruments and measures could be best perceived as ‘Extra’ rather than ‘Supra’ national, where the balance between supranational and inter-governmental elements is different from that of the binding EU decisions of pillar one. In this way, an unacceptable degree of centralization to the Union is avoided and, in the words of John Pinder, an ‘extra-national Europe’ could be created (Pinder 1981). The goal of the *extra-national community* is to strengthen the capacity of mutual assistance between EU member states in situations where Union core functions are threatened. It is in most events up to the member states to conclude at a certain point that EU instruments meet their needs for common action and that the Union should provide for the mechanism that quickly turns them into part of the broader European efforts. The system leaves open exactly how and to what extent the Union capacities should be activated. The Commission is given the role more of a promoter, supervisor, and partner of national security administrations than a controller. The definition of a secure community as an ideal type should now be attuned to the new findings. An *extra-national community for security* could thus be defined as:

A group of people that is integrated to the point where there is assurance that the members of that community expect and rely on assistance from each other in the support of their own capacities to secure democracy

and the civilian population – the core functions of societies and governments.

The policy implications of this research can be formulated in historical terms. After the end of the cold war, the Union has come to suffer the same weakness as nation-states when forming its security and defence policy. It has reacted to the latest events and created its tools for fighting ‘the last war’. The EU reacted to the Balkan wars by creating the ESDP, to the mad cow crises by being tougher in the dioxin scandal, to 9/11 by developing internal security measures, to Madrid by adopting the Solidarity Clause. And to the tsunami disaster by setting up a new corps of civil crisis managers. One of the reasons for the growing expectation-capability gap in today’s ESDP could be due to the fact that the Union has lost its lead in developing international relations for the creation of security. This is one reason why the EU today is being compared with traditional international actors and the US, where it always will come out badly with a great image problem. Historically this was not the approach that made the Union successful. The Union was originally very strongly developed on its own unique transboundary merits and comparative advantages. The challenge today is again to try to make the most of its ability to think innovatively on conflict prevention, crisis management, peace, and stability. A stronger emphasis on the development of an extra-national secure community might give the Union an opportunity to take the lead again towards post-national security systems and communities.

Document 53.1: Excerpts from the Treaty Establishing a Constitution for Europe : The Solidarity Clause

PART I

TITLE V EXERCISE OF UNION COMPETENCE

CHAPTER II SPECIFIC PROVISIONS

Article I-43 Solidarity clause

1. The Union and its Member States shall act jointly in a spirit of solidarity if a Member State is the object of a terrorist attack or the victim of a natural or man-made disaster. The Union shall mobilize all the instruments at its disposal, including the military resources made available by the Member States, to:

- (a)
 - prevent the terrorist threat in the territory of the Member States;
 - protect democratic institutions and the civilian population from any terrorist attack;
 - assist a Member State in its territory, at the request of its political authorities, in the event of a terrorist attack;
 - (b) assist a Member State in its territory, at the request of its political authorities, in the event of a natural or man-made disaster.
2. The detailed arrangements for implementing this Article are set out in Article III-329.

PART III THE POLICIES AND FUNCTIONING OF THE UNION**TITLE V THE UNION'S EXTERNAL ACTION****CHAPTER VIII IMPLEMENTATION OF THE SOLIDARITY CLAUSE****Article III-329**

1. Should a Member State be the object of a terrorist attack or the victim of a natural or man-made disaster, the other Member States shall assist it at the request of its political authorities. To that end, the Member States shall coordinate between themselves in the Council.

2. The arrangements for the implementation by the Union of the solidarity clause referred to in Article I-43

shall be defined by a European decision adopted by the Council acting on a joint proposal by the Commission and the Union Minister for Foreign Affairs. The Council shall act in accordance with Article III-300(1) where this decision has defence implications. The European Parliament shall be informed.

For the purposes of this paragraph and without prejudice to Article III-344, the Council shall be assisted by the Political and Security Committee with the support of the structures developed in the context of the common security and defence policy and by the Committee referred to in Article III-261; the two committees shall, if necessary, submit joint opinions.

3. The European Council shall regularly assess the threats facing the Union in order to enable the Union and its Member States to take effective action.

54 EU Policy Coherence on Security and Development A New Agenda for Research and Policy-making

Louka T. Katseli

54.1 Introduction¹

The inclusion of ‘security’ as a major policy vector for development is a relatively recent phenomenon even though security concerns were fundamental to the European integration project in the 1970’s and 1980’s, and, indeed, to the very foundation of the European communities. What, however, ‘security’ means is of deep significance to the direction of European policy and its influence on the international environment in which it is applied.

When policy-makers, citizens and other observers of world affairs reflect today on security and insecurity, they are usually drawn to examples of overt civil conflict or the threat of terrorist action. Certainly war and terrorism are salient, if extreme, factors of insecurity, but they hardly exhaust the list of relevant causes for concern. In order to make meaningful connections between development and security, we need a vision of the sources of insecurity that is not limited to the purely military dimensions. It is worth recalling that economic security is explicitly recognized as a basic human right, according to the United Nations’ Universal Declaration of Human Rights (1948). Article 25 declares: “Everyone has ... the right to security in the event of unemployment, sickness, disability, widowhood, old age or other loss of livelihood in circumstances beyond his control.” The link made between human rights, economic vulnerability and security, already prevalent in the UN Declaration of Human Rights, provides the intellectual foundation for the concept of ‘human security’.

The Commission on Human Security (CHS), in its 2003 Report, defines human security quite broadly as “the need to protect the vital core of all human lives in ways that enhance human freedoms and human fulfilment” (CHS 2003). Amartya Sen, on the other hand, adopted a narrower definition. He sees human security as a class of human rights “that guarantee freedom from basic insecurities – new and old – which are those that threaten human survival or the safety of daily life, imperil the natural dignity of men and women, expose human beings to the uncertainty of disease and pestilence, and subject vulnerable people to abrupt penury” (CHS 2003: 8–9).

In tracing the evolution of the concept, it is worth noting that, whereas in the UN Declaration the right to security is to be respected in the event of exposure to adverse conditions, under the more recent conceptualizations human security is identified as an intrinsic human right to be promoted both *ex ante* and *ex post* with the aim of reducing vulnerability to adverse shocks, protecting the individual from exposure to adverse circumstances, enhancing his/her resilience, and mitigating the adverse impact effects of any given shock (Dayton-Johnson 2004).

In this chapter, ‘human security’ will be taken to mean a context where “individuals and communities have the options necessary to end, mitigate, or adapt to threats to their human, environmental and social rights, have the capacity and freedom to exercise these options, and actively participate in attaining them” (Loneragan 1999a). The echo with the goals of international development should be obvious. Indeed, the Development Assistance Committee (DAC) of the Organisation for Economic Cooperation and Development (OECD) has underlined the need to tackle “one of the primary causes of poverty – violent conflict and widespread public insecurity and fear. The key principle is to treat security systems overall, including the functioning of police and justice systems, civilian control of the armed forces and protection of

1 This chapter draws on a presentation made during the 11th EADI General Conference on “Insecurity and Development” Bonn, 24 September 2005. Inputs by Jeff Dayton-Johnson and Colm Foy of the OECD Development Centre are gratefully acknowledged. The views expressed in this chapter are personal and do not necessarily reflect those of the OECD Development Centre.

human rights.”² This involves a whole-of-government approach, both in the developing country and on the donor side, in a coherent framework that engages civilian departments, the police, and the armed forces. Thus, international donors, including the European Union, have committed themselves to promote the principles of ‘human security’. If they have not actively done so, we can legitimately demand why not.

The problem is that the origins and the incidence of threats to human security are hard to identify or, to be more precise and critical, to acknowledge. The holistic approach advocated by the DAC in the extract above and in our own definition must include recognition that it is often the case that misguided or incoherent policies enhance the vulnerability of particular social groups, and this in itself leads to insecurity and conflict. Indeed, even in the relatively privileged and wealthy societies of OECD countries, adverse living conditions, inter-community tensions, and marginalization often lead to conflict and violence against property or individuals. In most cases, the poor tend to suffer the most because they do not have the skills or assets to reduce their vulnerability to sickness, to disruptions of their livelihoods or to poverty, and have the least resources to insure themselves against risks. This was the case in late 2005 when severe disturbances broke out on the peripheries of French cities and in the normally idyllic beachside suburbs of Sydney. Human security is, thus, a concern with a planetary dimension while insecurity has important distributional consequences.

This chapter will demonstrate that not only is human security a legitimate international concern but that the international community can actually do something about it. OECD countries and institutions, including the European Union, provide not only overseas development assistance (ODA) to developing countries but through various policy instruments (security, trade, investment, migration policies, etc.) influence conditions on the ground. This chapter argues that human security is influenced by such actions or inactions as well as by policies of local governments and can thus be considered as a development challenge. Positive human outcomes can most likely be brought about when coherent policies for development are pursued by all relevant stakeholders. Finally, it will emphasize the essential link between policy-

making and research, so that the former can repose on solid evidence regarding past experiences and best practices as well as a deeper understanding of the impact of policy interlinkages on human security.

54.2 Security and Development Linkages

From the perspective of the poor and vulnerable populations of the developing world there are at least four proximate sources of insecurity. European development cooperation policies can make a difference in each of these dimensions.

Human insecurity can arise because of the scarcity or inequitable distribution of strategic assets. The most notable examples of such assets are land and water in agrarian settings. Rural populations with limited access to land are constrained in their possibilities for production and consumption, but also in their ability to use land-holding assets as collateral for investment; forced to work in tenancy arrangements or as wage workers, their livelihood security is tenuous. Of course, precarious access to land can give rise to serious social instability (as recent experiences in Zimbabwe and North-eastern Brazil bear witness) or indeed civil war or revolution. As for water, in much of sub-Saharan Africa, GDP fluctuations are closely linked to variations in rainfall: that is, overall production is dominated by agricultural output, and that output in turn is critically dependent on rainfall. In years of low rainfall – or, as is often the case, in the *second* year of low rainfall, after households have drawn down their stocks – the threat of famine looms over significant swathes of the population (as in the food crisis in Niger during 2005).

Human insecurity likewise arises when there is insecure access to critical inputs to people’s well-being: food is the most important and obvious example. As the example of drought-induced food crises demonstrates, food insecurity is critically linked to scarcity of water, land and other fundamental assets. But it is important to recall that famine and chronic hunger are not solely ‘caused’ by drought; as Amartya Sen’s celebrated analysis has demonstrated (Sen 1981), many famine-struck regions (such as Bengal in the 19th century, or Ethiopia in the 1970’s) have simultaneously witnessed large-scale death from starvation and food exports. Sen correctly noted that the source of food insecurity is more frequently the breakdown of poor households’ command over resources than that of food scarcity *per se*.

2 OECD Development Assistance Committee: *Aid Ministers Note Rise in Aid Volume and Push for Aid Reform and New Approaches to Security-Development Linkages* (Paris: OECD, 16 April 2004).

A third dimension is market insecurity, a relevant example of which is swings in a nation's terms of trade. While oil-exporting poor countries have benefited from the spectacular recent increase in oil prices, many more poor countries have been hurt. Moreover, developing countries with poorly diversified export profiles are vulnerable to unfavourable movements in world prices over which they have little control (as has been the case with cotton prices, with serious consequences for West Africa).³

A fourth and final source of insecurity is that of institutional insecurity. A particularly dramatic example of this is the phenomenon of fragile or failed states in the developing world, where, to borrow from Weber's concept of the state, there may be no monopoly on the use of violence, and such violence is furthermore viewed as legitimate. But institutional insecurity can also beset people's well-being even if only some dimensions of a state's power are weak and ineffectual. A critical example of this is the problem of the definition and enforcement of property rights in many developing economies. For urban squatters or farmers with irregular title to the parcels of land they work, a constant threat of being dislodged is a continuous source of insecurity. More generally, where property rights are poorly defined and enforced, markets for assets like land are thin. As a consequence, transactions are few; such assets are not necessarily diverted to their most productive use and cannot be used as collateral for loans and investment: growth and development are slowed.

One consequence that flows from all four forms of insecurity – asset, input, market, and institutional – is that people's time horizons are shortened. Why should a sharecropper plant profitable tree crops? A switch in crops requires a substantial investment a long time before the first harvest and the landowner can evict the tenant as soon as the investment begins to yield a pay-off. Why should a moneylender make a loan to a promising entrepreneur if the latter offers some form of collateral which might be seized by the state or criminal actors in the meantime? What if the bank could not sell it in the event of default because of poorly defined property rights? In such a setting, economic contracts become very short term. Moreo-

ver, agents face incentives to engage in economic activities with a short horizon: real estate, petty trading, activities with a quick turnover so that loan repayments can be made quickly. Capital does not flow into longer-term investments which might produce higher growth, more meaningful job creation or diversified production based on a country's dynamic comparative advantage.

Insecurity is therefore a fundamental cause of the failure of economic development; international and domestic policies that seek to address the latter would do well to reduce the former. i

54.3 Which Policies to Reduce Insecurity?

Our thinking on policies to reduce insecurity is aided by a well-developed typology of addressing risks, social or otherwise. Essentially there are three strategies for managing risk: (1) *risk prevention*, that is actions intended to reduce the likelihood of adverse risks occurring at all; (2) *risk mitigation*, actions intended to reduce the damages associated with risks should they occur; and (3) *risk coping*, actions taken after the fact.⁴ Europe's development cooperation policy can pursue all three strategies; in doing so, it will promote development by means of enhancing human security. Some merely suggestive examples are indicated below.

Adverse risks can be prevented by defusing potentially explosive social situations or averting food crises arising from inequitable access to land, water, and other strategic assets. Agricultural extension programmes and the development of rational irrigation infrastructures can enhance security and thereby promote development. The adverse risks of poor property rights look less like a crisis but have insidious consequences nevertheless; international donors, Europe among them, can help prevent such risks by means of institutional capacity-building and reform, including the training of judicial-sector workers, improved procedures in the public sector and regulatory simplification, support for land titling, etc.

Two standard approaches to mitigating risks are diversification and insurance. A country with a diversified productive base, particularly with a diversified export structure, is less subject to market insecurity that derives from terms-of-trade shocks. While

3 The record-breaking rates of economic growth in Africa in 2004 were largely a result of favourable movements in these sources of insecurity – rainfall and terms of trade. The worrisome side of this is that unfavourable swings in these indicators can undo this scant progress. See: Pinaud/Wegner (2005).

4 This typology is developed in: Holzmans/Jørgensen (2001) and applied to natural disasters in: Dayton-Johnson (2004).

efforts to provide insurance against commodity price movements have proven problematic, innovative new proposals to smooth the income of commodity-producing nations over time can nevertheless provide substantial welfare gains⁵. As a partner, Europe can certainly play a role in promoting trade capacity-building, private sector development and export diversification as well as in providing seed funding for insurance and stabilization schemes. At the micro level, farmers and informal-sector producers stand to gain by diversifying their activities and by insuring themselves, both of which measures are difficult given currently available resources and policies; here, too, international donors can play a catalytic role.

When an adverse shock hits, mitigation may not be enough; that is when resilient coping mechanisms are needed. Where a food crisis occurs, pre-established food distribution plans need to be in place and enacted. A terms-of-trade shock can be better coped with where a functioning income-smoothing fund is in place.

A medium- to long-term consequence of a security-conscious development policy is that the shrunken horizons of economic actors will begin to expand. Longer-term investment activities will become feasible; productive sectors that can deliver growth and job creation will be stimulated.

54.4 A Role for Europe?

Europe, as a major force in international relations and the most important contributor for development, can play a leading role in forging a coherent agenda for 'human security', building upon its members' diverse security and development concerns. To do so, it must be able to project a clear vision for the role Europe can play in the world and to develop a European model for human security in world affairs.

Up to the present, the construction of the European Union has been driven by three competing visions of its ultimate role and place; each of these is strongly associated with a particular approach to security and development.

- *Europe as an economic and monetary union:* According to this vision, Europe is and should remain a confederation of states which, largely for economic purposes has chosen to integrate its

economies into a common market, liberalize trade, services, capital, and even labour flows as well as adopt a common currency. Such a conception would have foreign policy, security concerns, and development assistance best handled at the national level, while European institutions would aim to coordinate member-state policies in these areas and limit their competence only to those issues that, due to substantial externalities, individual countries cannot handle alone.

- *Europe as a would-be super state with a common defence and security policy:* Under this rather 'statist' vision, Europe can play a dominant geopolitical role on equal footing with the United States and other global players. EU security policy should aim at integrating and strengthening European military forces on a traditional defence model and give high priority to counter-terrorism, the neutralization of weapons of mass destruction and the fight against organized crime. This vision thus conceives European security, defence, foreign affairs, and development co-operation as essential pillars of a political union which promotes clearly defined geopolitical interests through traditional means.
- *Europe as a positive global force for peace and inclusiveness:* Acknowledging interdependence, this vision rests on a multi-level governance structure. It aims at securing peace and social cohesion in Europe and its neighbourhood area as well as promoting a more inclusive world order. This approach attaches great importance to the promotion of human security, conflict prevention and resolution, post-conflict rehabilitation, social inclusion, participatory democracy and multilateralism. It endorses the use of multiple policy instruments to engage partner countries in this process. Thus, it ceases to be solely a European initiative and is understood as a *process* rather than an *end*.

The question of whether the European Union's renewed interest in security will in fact be compatible with or undermine development aims depends fundamentally on our collective vision for Europe and its ultimate role. Indeed, it is only the third vision that could address in a comprehensive and consistent manner the various sources of human insecurity – asset, input, market or institutional – and give rise to coherent European strategies to prevent emerging risks, to mitigate their impacts and to cope successfully with their effects. If European policy-makers go down the road of prioritizing hard security concerns and risks, such as counter-terrorism and weapons of mass destruc-

5 See working paper by Daniel Cohen: "Commodity Funds: How to Fix Them?" (2006), at: <<http://www.oecd.org/dev/wp>>.

tion, then not only will development policy be neglected but European security policies will also be relatively short-sighted and ineffective. If they go instead in the direction endorsed by proponents of the third vision, i.e. prioritizing governance reform, pro-poor capacity building and coherence across diplomatic, military, trade and development cooperation instruments, then security and development cooperation can become integral components of a forward-looking European agenda for global peace and inclusiveness.

The problem is that, despite some initiatives in the right direction, European policy-making in this area has been neither sufficiently strategic nor coherent with other policy initiatives. As Mary Kaldor and her colleagues have pointed out,⁶ despite progress towards an integrated security policy under the Maastricht Treaty (Article 130v of title XVII) which incorporated provisions for a common foreign policy, it was the crises in the former Yugoslavia that prompted European policy-makers to adopt a Common Foreign and Security Policy under the 1999 Amsterdam Treaty (Articles 11 to 28). It was, however, the 11 September 2001 attacks on New York and Washington which prompted the endorsement of new provisions in the Treaty of Nice on 1 February 2003 that introduced qualified majority voting, enhanced the role of the Political and Security Committee in crisis management, and paved the way for a European Security and Defence Policy (ESDP). The latter was in fact elaborated in the draft European Constitution: it provided for conflict prevention and strengthening of international security as well as the development of military and civilian assets for peacekeeping in accordance with the principles of the United Nations (Article 40.1).

These provisions, reflecting growing underlying concerns about terrorism as an international phenomenon and security as a global challenge, emanated from the *European Security Strategy* (ESS) that was also adopted in 2003. In the ESS the link with development is explicitly made. The document states that “security is a precondition for development since conflicts not only destroy productive and social infrastructure but also encourage criminality, deter investment and make normal economic activity impossible.”⁷ More importantly, in counterpoint to the US doctrine of ‘pre-emption’, the ESS does endorse ‘pre-

ventive engagement’ as the strategic objective of the EU’s security policies.

Calling for a ‘preventive engagement’ is an important step towards the realization that causality also runs the other way: development concerns, mostly poverty and social exclusion, are indeed relevant for security since, as we have seen, security depends on the quality of institutions and governance, living standards as well as the degree of vulnerability and social cohesion both in OECD and non-OECD countries alike. The ESS, however, while certainly a forward step, does not go far enough. While touching on some of the issues contained in ‘human security’, it still largely reflects a ‘defensive’ motive to protect ‘our’ states and citizens in the European Union from outside menaces. It also fails to escape from the temptation to deny favours and aid as a first line of defence against external threat, while acknowledging the use of force from within the Union against potential enemies beyond the EU borders. It is, thus, still state-based, even while recognizing that the most recent terror tactics are the work of non-state actors whose sympathizers are not confined to national borders.

To move forward on an agenda that is inclusive of human security, Europe needs, first of all, to agree upon and forge a shared vision of its potential role in a globalizing world. The European Security Strategy, through its commitment to ‘preventive engagement’ and focus on Europe’s responsibility for global security, appears to provide a promising springboard towards the third vision of Europe, namely that of a global force for peace and inclusiveness. Practice, however, seems to serve the second vision, while policy-makers, under pressure for a more proactive approach to development and security, find it often convenient to hide behind subsidiarity principles consistent with the first vision.

As is often the case, European governments and policy-makers differ in their views. Despite the adoption of the ESS, we are still far away from developing a coherent strategy and action plan to implement an effective ‘preventive engagement’ agenda; more importantly, policies “seem to prioritize the security preoccupations of European politicians at the expense of poverty reduction and alleviation of human suffering”⁸.

6 Mary Kaldor and Marlies Glasius with assistance from Sarah Cussen (2004) “EU Security Architecture in Relation to Security and Development”, at: <http://www.cercle.lu/IMG/doc/dfid_final.doc>.

7 European Council: *A Secure Europe in a Better Europe, European Security Strategy* (Brussels: European Council, 2003) 2–3; at: <<http://ue.eu.int/uedocs/cmsUpload/78367.pdf>>.

The trends are, indeed, worrisome: between 2000 and 2003 the total share of European countries' Official Development Assistance (ODA) and Official Assistance (OA) to six countries involved in conflicts, namely FRY-Serbia and Montenegro, Afghanistan, DR Congo, Palestine, Sierra Leone and Iraq, rose from 5.3 per cent to 20.3 per cent⁹. Against this background, and despite expected scaling-up of aid, more 'aid-orphans' are likely to emerge that could potentially become security threats due to increased human insecurity derived from poverty, environmental degradation, declining rule of law or rent-seeking elites exploiting poor public and corporate governance systems.

At the same time, the EU is tightening up conditionalities on the granting of aid that could limit disbursements and impose rules on poor countries that they cannot meet. It is also:

- introducing weapons of mass destruction and terrorism clauses into partnership agreements which are hard and expensive to implement;
- initiating targeted counter-terrorism projects in a number of countries (e.g. Philippines, Indonesia and Pakistan) through its Rapid Reaction Mechanism (RRM);
- committing some EUR 250 million from the European Development Fund to support African-Union peacekeeping operations, through the Peace Facility for Africa;
- introducing security conditionality in many of its partnership agreements.

The argument, presumably, is that such conditions and actions contribute to improving global security. How effective have these really been? What are the possible trade-offs and the opportunity cost of such priorities? What have been the implications of EU security-related policies in different developing countries and regional contexts? What are or should be the interlinkages and the configuration between different regulatory areas in the European construction? These are all questions that call for research and policy analysis to highlight the positive, but also the negative consequences of these priorities.

54.5 Towards a New EU Agenda on Security and Development

If policy-makers chose to move forward in the direction of the third vision, already present in the ESS strategy, the EU would need to develop a very *different agenda*: an EU Agenda for peace, security and development, which is *coherent* across policy domains and agencies, consistent with member and partner-priorities and implemented through appropriate strategic initiatives.

The starting point could be found in the UN's communiqué at the end of the 2005 Summit that urges developing countries to adopt *comprehensive national development strategies* by 2006 so as to achieve the internationally agreed development goals; such strategies are to be pursued in partnership with OECD countries through increased development assistance, promotion of international trade, transfer of technology on mutually agreed terms, increased investment flows, and wider and deeper debt relief.¹⁰ To this list can be added, explicitly, human security. Indeed, Europe is well placed to unite the Union's member countries behind a concerted effort at policy coherence in which human security concerns would be given uppermost consideration. This would require concertation and consensus not only between departments within national governments, but equally, between sovereign nations. It would also require internal institutional coherence that would bring closer together EU Council and Commission activities related to security, trade, migration, human rights, and development on the one hand, and partner-country institutions on the other. Furthermore, most ministries, including finance, international development cooperation, trade, health, migration, environment, labour, health, industry, and education would need to take into account the 'development' and 'human security' impact of their policies. Under such an agenda, the narrow national security concerns of individual countries, focussed on 'visible' and 'popular' threats, would have to be reconsidered in the light of an overall commitment to policies consistent with risk pre-

10 "World Summit Outcome", UN/A/Res/60/1 (24 October 2005), paragraph 22(c). See '2005 World Summit' website for all related documents at: <<http://www.un.org/summit2005/documents.html>>; and the final outcome document at: <<http://daccessdds.un.org/doc/UNDOC/GEN/No5/487/60/PDF/No548760.pdf?OpenElement>>.

vention, risk mitigation, and risk coping in developing countries.

Designing such an agenda is the easy part; in the context of skills' shortfalls and capacity shortages, expecting it to be implemented is unrealistic, unless it can enjoy broad political support and be underpinned by continuous mobilization of relevant stakeholders. More importantly, such an agenda needs to take into account local needs and specificities, and to become 'home-grown' through the mobilization and participation of not only partner country governments but also non-state actors, including the local business community and civil society. Implementing such an agenda cannot be done by will-power alone. It must reside on a solid knowledge base that provides insights into the sources of potential risks as well as a solid understanding of conflicting preferences and diverse capacities of the various actors. There are still critical gaps in our knowledge as to the channels by which the systematic promotion of mutually reinforcing policies can create positive synergies and improved outcomes on the ground. What are the interlinkages, for example, between security, migration and ODA or between security, migration and trade? What is the role of ODA in promoting human security? What has been the evidence across different countries and regions? These are all policy-relevant questions which need to be answered through appropriate applied research that can enhance our collective understanding and underpin effective policy-making.

Indeed, ongoing research on policy coherence for development at the OECD Development Centre seeks to highlight the mechanisms and channels by which policy coherence can be achieved in specific national or regional contexts.¹¹ The European Association of Development Research and Training Institutes (EADI) is, likewise, promoting interdisciplinary research amongst its member institutions in all European countries to analyse the cross-cutting policy impacts and to try to anticipate policy conflicts. The EU Commission's April 2005 paper on "Policy Coherence for Development" rightly notes that "the effective improvement in the coherence of developed countries' policies would put developing countries in a much better position to achieve the MDGs."¹² It could have

added that policy coherence will also contribute to the potential for improving human security.

Evidence-based policy dialogue is also needed to underpin the effective implementation of policies and ensure ownership by partner countries. Sociologists, anthropologists, and social psychologists have a lot to say about the relevance of this concept in various social, political, and cultural environments and its interdependence with governance structures and institutions of both the traditional and modern varieties. Policies are not implemented in a vacuum. The same policies can have very different effects in different socio-political contexts, and ownership can have different meanings depending on the political system, elite structures, the organization of civil society, decentralization, and levels of participation in decision making. Thus, diverse institutional and cultural arrangements require policies that are appropriate and adapted to their specific needs. This is something well-known to social scientists. It is not always quite as evident for policy-makers, which explains the myopia of unique policy paradigms.

EU coherence in policy-making does not automatically guarantee positive outcomes on the ground. For comprehensive national development strategies to be implementable, they will have to be structured around a set of realistic, medium-term, sectoral and regional programmes consistent with national development priorities and supported by coherent domestic policies. Both conventional security concerns as well as human security considerations could be addressed under such a national agenda through programmes targeting security system reform, conflict prevention, peace-building or post-conflict rehabilitation along the lines introduced in the Cairo Plan of Action or in NEPAD's Peace and Security Initiative.¹³ Such programmes need to address the various sources of insecurity – asset, inputs, market, and institutional – as outlined above. Outcomes could then be monitored in an independent and objective manner and evaluated through agreed performance indicators, such as those decided upon in Paris in the spring of 2005 and included in the *Paris Declaration on Aid Effectiveness*.¹⁴

14 OECD document, DAC/CHAIR(2005)12; see at: <http://www.oecd.org/departement/o,2688,en_2649_3236398_1_1_1_1_1,00.html>

Finally, sectoral programmes need to be underpinned by predictable multi-year financial envelopes that pool financial resources from different sources, including ODA allocations, innovative funding mechanisms, private contributions as well as debt and/or equity financing by the private sector. Development financing is once again a coherence issue. Good policies are often frustrated and rendered ineffective by the incoherence of the development finance architecture that suffers from conflicting preferences of major actors, lack of coordination, proliferation of instruments, and inadequate monitoring and evaluation of outcomes. This is another important area where solid analysis is needed to guide policy-making. Available research (Zimmermann 2005) already sheds some light on the complexities of the diverse preferences of donors and recipients, the incompatibility of incentives across diverse policy communities, the ineffectiveness of the present system, and the costs of coordination on the ground. Researchers, however, cannot produce reforms on their own. At best they can influence and improve policy-making. There remains tremendous potential for linking research on development finance to policy development and policy-making so that adequate and sustainable financing is secured and national development strategies are turned into drivers for development and security. The research agenda necessary for this ambitious project is broad. It will comprise the mapping of available flows, a critical evaluation of existing financial instruments, analyses of diverse preferences and capacities, examinations of local and regional specificities as well as case studies that highlight the interlinkages between financial flows and development outcomes. Evidence is needed if policy dialogue is to be informed and policy-making effective.

54.6 Conclusions

We have seen that human security is intimately linked with economic and social development. It is both a prerequisite for but also an outcome of development. As such, it should become an integral component of development cooperation strategies and promoted by coherent policies including ODA. The EU is not only the largest ODA donor; it is also a major political, trading and investment partner throughout the developing world. It is, thus, in a special position to contribute to enhanced human security in developing countries. Which of the three possible approaches it

espouses will define the effectiveness of its policies and the sustainability of the outcomes.

The European Union, following its own tradition of partnership agreements - including Cotonou in 2000 for ACP countries, the Community Support Frameworks for the less-developed (objective 1) EU regions or the Action for Cooperation in the case of pre-accession countries - can take the lead in transforming its traditional agreements with its non-EU partners into partnerships for human security and development. Such national or regional partnerships, centred around the implementation of multi-annual comprehensive national agendas for human security and development, can provide the necessary policy framework for forging a collective European vision based on peace and inclusiveness. To do so in an effective manner, EU policy-makers need the support of an engaged research community.

55 From Obsession to Oblivion: Reconceptualization of Security in NATO since 1990

Pál Dunay

55.1 Introduction

Hardly any other topic of international security can be approached from so many angles as the North Atlantic Alliance. NATO has been a central player of European and Euro-Atlantic relations since 1949. It will continue to retain its importance for many years to come. One could qualify this statement and draw the preliminary conclusion: NATO will exist amidst debates as long as it lasts.

This chapter analyses how the thinking about NATO has developed over time, particularly since the end of the East-West conflict. It focuses on those main issues that shaped the agenda of the alliance since 1990. Its prime research question is to identify the prospects of the organization in light of its current evolution. As thinking is reflective of the changing security posture both in the global and regional context it is inseparable to analyse how the alliance has adapted to change over the last nearly two decades. There are a number of difficulties such an analysis has to face.

- It is necessary to cover a long period since 1949 when the security situation that has been influencing the alliance changed several times, and once fundamentally.
- NATO influences many actors of the international scene. The member states, states affected by the plans and activity of NATO, some international organizations, and some other non-state actors. The centrality of NATO means that all actors define their relations toward NATO.
- The political processes that underlie NATO are global as well as regional. Its outreach and influence has also changed although the combination of the two on its agenda has continued.
- As NATO has been central to Euro-Atlantic security since its inception, it is extremely difficult to separate an analysis of NATO's evolution from a

broad overview of Euro-Atlantic, primarily US – European, relations.

The analysis also faces methodological problems as two communities analyze NATO: Policy analysts and those who deal with international relations theory. The first group combines analysis with predictive statements. The conclusions of policy analysts have short-term relevance and this is in concord with their aspirations. When major changes occur in international security or NATO faces some important events the number of publications increases exponentially. Some attempt to influence events, the course of NATO's development; others draw conclusions from the change. Both perish not much later. The latter group tries to apply international relations theory to the organization. From a close look at their analysis it may be concluded: Whenever the reality of international politics does not fit the theoretical construct a new variant of the theory appears. In fact, one is tempted to conclude: the more cohesively the straight-jacket of theory is attempted to apply to the evolution of international politics the more likely it will face difficulty to provide accurate explanation. It is for this reason extremely interesting to study those analytical papers which were written 10–15 years ago on NATO. Their conclusions and predictions are fully irrelevant. This leads to the question: Is there any reason to assume that current analysis will be more relevant in the longer run?

55.2 Historical Sketch

55.2.1 The 'Easy' Cold War Years.

Since the end of the Cold War the first four decades of NATO were often described as the 'easy decades' of the organization. Looking to the security debates of that era it is necessary to modify this simple pic-

ture. The Cold War era had the following advantages for NATO.

1. The Atlantic Alliance had a well-founded threat perception that originated from a group of states and their alliance.
2. The main threat stemmed from the offensive plans of the Soviet Union and the alliance it formed in 1955, the Warsaw Treaty Organization. There was no hesitation in the East to use military force if and as necessary to foster their ideological objectives. Collective deterrence of the Alliance countering the threat from the East was essential.
3. The threat was directed against the territory of NATO member states both in Europe and with the inception of the missile age also in North America.
4. In order to counter the Eastern threat NATO had to demonstrate cohesion. It was an existential issue for the West.
5. The US nuclear guarantee to Europe underlined the cohesion of the alliance. Irrespective of recurrent doubts concerning its credibility it outlived the Cold War. The underlying facts created optimal conditions for the functioning of a military alliance throughout the Cold War.

There was a broad consensus among NATO members concerning the objectives of the alliance. Consensus did not always extend to the 'toolbox' application, however. Following the toughest years of the Cold War during the 1970's and the 1980's there was a series of disputes among the transatlantic partners. The moment the threat was not as apparent as during the years between the foundation of NATO and the Cuban missile crisis (1949-62) and could be subject to some interpretation, consensus somewhat weakened. During the 1960's, one dispute between the US and Europe focused on Soviet oil imports and an additional pipeline that could further increase dependence on Soviet oil supply, and in the late 1970's on the forward deployment of intermediate range US missiles in five European NATO member states. Only a retroactive interpretation may conclude that consensus was easy to achieve within NATO until 1989.

Since 1985, the Soviet Union challenged NATO's underlying consensus by depriving its enemy image¹ with a conciliatory policy that resulted in a very significant reduction of tension between both blocks. With

1 This terminology was used by Georgi Arbatov the once influential advisor of the Soviet leadership primarily during Mikhail Gorbachev's time.

the revolutions of east-central Europe, the *de facto* and then *de jure* termination of the Warsaw Treaty, and the collapse of the Soviet Union, it remained unknown what 'reserves' those 'intimately adversarial' relations had. Could the parties reduce tension further without eliminating the fundamental difference between their systems? The end of the Cold War meant an interruption of the course of history, so tragic for so many peoples. It was discontinuity that prevailed in the process. What followed had very little to do with the past.

Alliances are vulnerable to changes in underlying security situations. Once the conditions of their creation change they are dissolved or adapted to the new conditions. Different schools manifest different directions. The realists believe that an alliance should be wound up when its reason ceases to exist, with the disappearance of the adversary or enemy. For the liberals an alliance, such as NATO, may define acceptable international behaviour based on principles, norms, rules, and procedures (Kay 2005: 69-70). Thus, it is argued - especially since 1989 - that NATO has never solely been a military alliance but also a security community of western democracies.

For realists, terminating the Atlantic Alliance was an option, but no NATO member state raised this. Then Czechoslovak President, Václav Havel (2001: 9) recommended in early 1990 "to give way to a quest for a new, pan-European security organization".² The view was raised by a prominent statesman within the liberal paradigm. Instead of abolition, adaptation emerged and took the Alliance into a different direction.

55.2.2 The Post-Cold War Era

Once the Warsaw Treaty came to an end and the Soviet Union consented to withdraw its forward deployed forces from Central Europe and democracy prevailed in most former members of the Warsaw Treaty there was every reason to reconceptualize the Alliance. The organization survived the shock of help-

2 More than ten years after his raising the matter then Czech President, Václav Havel said: 'The Warsaw Pact was dissolved, and the Soviet hegemonic policy broken, NATO would also lose its *raison d'être* and should be dissolved as well ... Very soon, however ... I came to understand that something like that would be not only unrealistic, but also, for a number of reasons, very costly, impractical and, indeed, outright dangerous (Havel 2001: 9).

lessness and gave a fairly cautious, conservative response to the challenge of history.

At its London summit meeting of 1990, NATO offered neither more, nor less than to “extend ... the hand of friendship” to the new democracies and promised that the “Alliance begins a major transformation.”³ In November 1991, NATO adopted its first post-Cold War strategic concept. As the Soviet Union was still intact, the document remained extremely cautious on NATO’s future. Its approach was also a demonstration that it found difficult to assess what type of threats it would face. NATO certainly suffered some delay in adapting its defence plans and internal structures to fundamentally changed conditions. Its new strategic concept of 1999 and the attached Defence Capabilities Initiative⁴ reflected the dissatisfaction with the progress achieved since 1991. The new concept was adopted when NATO member states noted the capabilities gap and the disproportionate share of the burden between the US and the Europeans during the air war on Yugoslavia to terminate atrocities against the Kosovar Albanian population. The US seized the moment when other members felt their limited power projection capabilities created a problem for allied cooperation.

Since the late 1990’s, the adaptation of allied defence occurred without a new strategic concept through the documents adopted at summit meetings of the member states that took place annually since 2002. The Prague summit of 2002 tried to fix several shortcomings at once: reflect upon the importance of terrorism, and the growing need to improve civil preparedness against possible attacks against the civilian population, approve the new Capabilities Commitment package, create a NATO response force, and endorse the implementation of five nuclear, biological, chemical and radiological weapons defence initiatives.⁵ Among its main novelties it emphasized “role specialization and reprioritization” which meant that those capabilities that not every member of the alli-

ance is indispensable to possess would be held by one member state or a few of them.⁶ This reduces parallel structures and hence liberates resources for those projects, which are indispensable for effective national defence. It has a ‘dark side’, however. It can only be implemented if all member states are confident that these specialized capabilities will be available whenever necessary. Without certainty that NATO has a long-term prospect and will be sufficiently cohesive, its members would not move towards specialization.

The modernization of the member states’ armed forces aimed to improve their quality, adapt force structures, and focus resources on deployable forces and capabilities. Its defence structures should be flexible to respond quickly and effectively to threats and challenges. The NATO command structure has been simplified significantly, leaving only one command with operational responsibilities (Mons, Belgium) and another one dealing with transformation (Norfolk, Virginia). As the slow transformation of armed forces has been a recurrent problem, the Military Committee prioritized the requirements for transformation.⁷

Subsequent summits have partly taken stock of the achievements agreed earlier, partly adapted the agenda to changed conditions. In Istanbul in 2004, NATO recognized the need to improve intelligence sharing to effectively fight terrorism and to develop “greater ability to respond rapidly to national requests for assistance in protecting against and dealing with the consequences of terrorist attacks.”⁸ The Riga summit of 2006 reaffirmed the importance of the operation in Afghanistan. Due to the importance of that operation it was interpreted as central for NATO’s credibility. NATO passed the Comprehensive Political Guidance, a major policy document that did not replace the Strategic Concept of 1999 but rather amended it. Although it acknowledged the possibility of unpredictable events, it stated that the principal threats to the Alliance will continue to be “terrorism and proliferation, as well as failing states, regional cri-

ses, misuse of new technologies and disruption of the flow of vital resources.”⁹ This reflects an adaptation to the changes that occurred since 11 September 2001. It no longer starts out from the sweeping dominance of terrorism and proliferation of WMD but adds other major sources of threat. The Comprehensive Political Guidance underlined “the requirement for NATO’s forces to be balanced, flexible and agile, able to conduct the full range of its missions, from high to low intensity.”¹⁰ The need to have joint expeditionary forces and the capability to deploy them is emphasized. Overall it is clear that NATO is interested primarily, if not only, in forces, which can be deployed flexibly at longer distances and sustained as part of power projection. This is a correct and indirect recognition of the diminishing importance of collective defence.

The efforts to modernize allied defence have continued since. Although some results have been achieved the commitment of the member states to put reforms in practice remained uneven. It is reassuring, however, that the alliance has been able to deploy more troops at longer distances from Alliance territory than in the past. This is important in the absence of any direct threat against the territory of the alliance. In the end, a broad variety of peace missions are the main activity of NATO nowadays.

The importance of collective defence declined on the agenda and has given way to other activities, primarily to the contribution to conflict management. Although it was obvious NATO had to act in the latter field, as that was where it could make a difference, there were no conflicts in Europe ‘ripe for resolution’. It was also obvious NATO for various reasons could not give up on its basic function of collective defence which is central to a defensive alliance. Giving formally upon it would fundamentally undermine the purpose of NATO.

Furthermore, there have always been residual concerns in some member states that could only be served by preserving collective defence that contributed to NATO’s attraction for future accessions. It is a separate matter to balance collective defence against its other activities and to find the right proportion among various activities.

Some 16 years after the end of the Cold War the process of adapting NATO to changed conditions is still under way by making its structures lighter, more flexible and mobile, the command structures smaller and less hierarchically structured. A large part of adaptation is not taking place in the forces of the alliance, as NATO proper has fairly limited assets. The condition of success is to convince member states to carry out adaptation in their national capacity in order to have leaner and meaner armed forces, which are more deployable and employable. Without the pulling effect of the Alliance the armed forces of several member states would not have gone through transformation. Beyond collective efforts it is in this sense that NATO has become a major vehicle of defence reform, transformation, and modernization.

The alliance proper has gone through two major adaptations since the end of the Cold War. The first one gave way to conflict management/peace operations that complemented if not replaced collective defence on the agenda. It was first indicated in the strategic concept of 1991 and practised under the Dayton Peace Agreement in the Former Yugoslavia. This was the dilemma of ‘out of area, or out of business’, as put by Senator Lugar (1993). The second one is in reaction to the 11 September 2001 terrorist attacks and the increased role of NATO in fighting it. Although NATO officially kept a balance between fighting terrorism and other tasks of the Alliance, Senator Lugar pointed to terrorism as the unquestionable priority of the organization: “We must now turn to the difficult work ... and unite behind the cause we all share, ending the threat to our peoples from global terrorism” (Lugar 2004). Both changes had major consequences for the strategic plans, structures, and development of alliance capabilities. Although those adaptations did not represent a full break with the past, both emphasized some discontinuity. It is also true however that the agenda has always been ‘enriched’, with the addition of new functions and tasks old ones did not vanish from the agenda although their ‘ranking’ in the activity of the Alliance has changed.

Adaptations affected member states very differently. The US has not only been in the lead of both but had two major comparative advantages: 1. The US military has been operating on a full spectrum of options. Consequently, it has to be able to carry out missions under the broadest variety of scenarios on its own. 2. Ever since the US joined World War II in 1941 it has projected power at long distances overseas. Hence its adaptation to situations that required power projection capabilities of various kinds has

9 NATO press release, “NATO sets priorities for new capabilities for next 15 years”, 29 November 2006; at: <<http://www.nato.int/docu/update/2006/11-november/e1129b.htm>>.

10 *Ibid.*

been less demanding than that of many other NATO countries. It should also be mentioned that the US is the only militarily non-aligned member of NATO. Non-aligned in the sense that it is fully capable of taking care of its own defence and hence does not rely on any other country. Its prominence in military affairs also means that it is in the position to decide how it ranks security challenges.

It has to take into account as well, however, that the manpower needs of operations to seize and hold territory also limit its freedom to engage in post-conflict operations and occupations that require US ranking of overseas developments to engage. Those member states, which traditionally had power projection capabilities and relatively large military establishments, also had somewhat less difficulties than others. This applies to the UK and France. Those states, however, which for decades had been discouraged to have power projection capabilities and whose armed forces were designated primarily for defending their own territory had more troublesome times. It is apparent that Germany falls into that category. It is clear that the countries with power projection capabilities carried out military transformation more successfully than others.

The downscaling of Cold War defence structures has been partly successful. The partial success did not stem only from the fact that defence was not a priority area in many countries and was set against other matters on the agenda of governments, that most member states allocated limited resources for this purpose and there was some passive resistance of defence establishments, it was due primarily to the complex needs of fast adaptation.

55.2.3 The Broadening of NATO

Beyond the rearrangement of the core function of NATO there was a major change in NATO's role in international politics. During the Cold War NATO did not have to establish a sophisticated set of relations with other countries. Beyond the member states there were the adversaries and the rest of the world. Since the end of the East-West conflict the situation has become far more complex. With the end of the Warsaw Treaty many of its former members wanted to join NATO. The violent conflict in Yugoslavia raised the matter of alliance responsibility beyond its members' territory. It became sharper when NATO had to consider its role in extra-European conflicts. Then a new relationship had to be established with

the Soviet Union and its successor states. Thus, a proactive external policy has become necessary.

The external relations of the alliance, similarly to those of other western institutions upon the end of the Cold War, started with relatively low intensity exchanges, which had the prime purpose of mutual familiarization. It was necessary to learn what those east-central European countries, which were formally still members of a moribund Warsaw Treaty, were up to. How much they were committed to democracy, human rights, the civilian control, and the democratization and modernization of their armed forces. Exchanges started bilaterally and then moved to multilateralism in late 1991 with the establishment of the *North Atlantic Cooperation Council* (NACC), a loose forum of exchange of views that focused on political matters and mapped the concerns of NATO's new partners. It did not contribute to military exchanges. Due to its multilateral format, it had a major disadvantage that partner countries had to address their security concerns in front of others, on some occasions some of them being the source of their threat perception. Although it served a useful purpose the dynamics of the development went beyond it.

The moment it was no longer inconceivable that NATO would take new members it was insufficient to have a framework confined to multilateral exchanges between the alliance and the applicants. In 1993 it was clear that NATO could not give an answer to the question of enlargement. It was the German minister of defence who said:

I cannot see one good reason for denying future members of the European Union membership in NATO ... I am asking myself whether membership in the European Union should necessarily precede accession to NATO. In developing yardsticks for NATO membership, we should not apply rigid criteria. We need to make clear analysis of common interests, values and political aims (Rühe 1993: 135).

Germany was supportive of enlargement for reasons of history, geography, and its significant influence in the prime candidate countries. German support was important whereas the US one was indispensable. In 1994 some speeches of the US leadership gave early, though not entirely unambiguous signals of movement in support of enlargement in Washington.¹¹

In 1993 the US was aware that more should be offered to those east-central European countries with

11 For a reliable account see Solomon (1998: 37–52). A study of Asmus, Kugler and Larrabee (1995: 7–33) was one of the first signs of the changing US attitude.

the most convincing achievements during the transition process. In the autumn of 1993 the US administration was not yet ready for enlargement. Agreement was achieved within NATO to establish a new tailor-made mechanism that would focus heavily on military to military contacts, though would not necessarily be confined to it. Tailor-made meant a multi-bilateral mechanism established between NATO and individual east-central European countries. Many in east-central Europe regarded the offer to launch the Partnership for Peace programme a delaying tactic. The voicing of reservations went so far that the US leadership had to send its UN ambassador, Madeleine Albright and NATO's Supreme Allied Commander, Europe, John Shalikashvili, to tour some of the region's capitals. The programme launched by the January 1994 NATO summit proved to be a major, lasting success, however. Firstly, it fostered military to military cooperation. Secondly, due to its 'bilateral' character it gave an opportunity to those partners that wanted to press ahead with cooperation faster to be more active and committed and thus achieve more. No country had to wait for others; the programme did not provide the same treatment to every east-central European former member of the Warsaw Treaty. Thirdly, the process was open-ended. It did not preclude any outcome, including future membership.

NATO moved quickly and published its enlargement study in 1995. The alliance was relatively forthcoming and stressed: 1. it did not want to import conflicts and instability in the alliance. Therefore, countries with pending ethnic or external territorial disputes, including irredentist claims or internal jurisdictional disputes must settle them by peaceful means in accordance with OSCE principles. 2. Enlargement will be decided on a case by case basis.¹²

It took another two years until invitations to negotiate accession were extended to the Czech Republic, Hungary, and Poland. There would be no eastern enlargement without Warsaw. The Czech Republic, after the separation from Slovakia, had a straight line of development. Hungary had raised some doubts due to the conflict potential with some neighbours hosting large ethnic Hungarian communities. In 1994 the government countered all fears regarding Hungary, stressing its contribution to stability. When the IFOR/SFOR peace operation appeared, this became a clear geo-strategic matter as Hungary has long borders with Serbia, Croatia, and Slovenia. In addition, Romania

and Slovenia were considered for early accession but no consensus was rallied around their joining. The non-inclusion of Romania on the invitation list in 1997 was a simple reflection of the fact that 'those invitations' came too early due to the shortcomings of its democratic transformation during President Iliescu's first term. Slovenia would have been welcomed in addition to the three others but there were some fears of leaving Romania behind on its own.

The decision about enlarging NATO was nearly exclusively political with military considerations playing no practical role. They appeared at a late stage in the process. Although several estimates were prepared about the cost of bringing the three states up to the standard of other NATO militaries the alliance considered a different set of factors. It estimated the costs, and found them minimal for NATO proper. It checked the minimum level of interoperability, particularly the ability to host reinforcement by air and on land. NATO drew some conclusions from the first enlargement for the future immediately. At the Washington Summit of April 1999, a month after the first eastern enlargement it adopted the *Membership Action Plan* (MAP). Its aim was to complement the military-operational aspects of the Partnership for Peace for those countries that carried the prospect to join the alliance. With this the period of time to achieve interoperability could be extended. A part of the process could take place on the way to membership in MAP and thus less would remain for the post-accession phase.

With NATO's second enlargement in 2004 its membership increased from 16 in 1989 to 26 in 2005. Within 15 years every former so-called NSWP (Non-Soviet Warsaw Pact) country has become a NATO member. The major rearrangement of international security with terrorism taking centre stage among threats has also put enlargement in a different light. As it would be largely impossible to confine terrorism geographically it is necessary to build 'inclusive' structures, including alliances. Hence enlargement became attractive for the United States. There are further countries which are willing to join the alliance, and an enlargement to Croatia, Macedonia, and Albania at the 2008 NATO summit meeting is likely. Since the mid-1990's, in east-central Europe NATO admission significantly has contributed to the legitimacy of the government that succeeded to bring its country into NATO. The long line of applicants contributed to the legitimacy of the alliance. Gerhard Schröder pointed to it: "The admission of new members is proof that NATO continues to be attractive" (Schroeder 2005:

12 NATO: "Study on NATO enlargement" (Brussels: NATO, September 2005), points 6 and 7.

2). Although NATO is not in an existential crisis of legitimacy it is certainly not to its disadvantage to see the many countries contemplating their future in the alliance.

Since the end of the Cold War NATO has established relations with many neighbour states depending on their interests. It has avoided rigid divisions between members and non-members¹³ by launching programmes with countries on the western Balkans, of the former Soviet, the southern Mediterranean, the Middle East, and the Gulf.

The Russian Federation required NATO's special attention since within the post-Soviet establishment a deeply ingrained enemy image towards NATO prevailed, based on a perceived inferiority complex. As the main trend of international relations was unfavourable to its cause Russia started to cling to the status quo. Noticing that it has become a junior partner of the West, and particularly of the US, it preferred the status quo to any change of the Atlantic alliance. This view collided with those countries that aspired for membership.

Prior to the first NATO enlargement special attention and care to handle Russia was needed. In the mid-1990's Russia felt betrayed that it was not treated better for its cooperative attitude. The change of Russian attitude toward the West occurred when NATO seriously considered in its enlargement study to accept former members of the Warsaw Treaty. This was reflected in the replacement of Foreign Minister Andrei Kozyrev by Evgeny Primakov. It is uncertain whether the Russian population was afraid of NATO enlargement or was only manipulated by its establishment. Russia opposed enlargement on every level and requested a *de facto* veto right on this strategic matter. NATO responded by going ahead with the enlargement process irrespective of Russia's opposition. Russia also attempted to divide NATO, disregarding the wish of the applicant countries. This was demonstrated when Russia expressed its willingness to negotiate with a few large NATO members. NATO asked its Secretary-General Javier Solana to negotiate with the Russian leadership. The disregard to the applicants stemmed from two factors: 1. As part of its great power tradition Russia traditionally paid little attention to small and medium size countries and often made deals above their heads. 2. This applied in par-

ticular to the former Socialist countries of east-central Europe, which belonged to the outer perimeter of the Soviet empire concept just a decade ago. It took another five years when President Putin dealt with east-central Europe more seriously, though not without difficulty.

When NATO went ahead with the enlargement process Russia behaved as a rational player pursuing two major objectives: maximize the benefits and minimize the costs of NATO enlargement. It negotiated certain 'concessions', like its partial involvement in the G-7, turning it to G-8, support for its WTO membership, the adaptation of the CFE Treaty, support for its return to the world armaments markets, and the establishment of a NATO-Russia Council between the 16, later 19 NATO members and Russia, thus achieving a fair result.¹⁴ The efforts to minimize costs were less successful. It consisted of elements, like having an as small circle of countries taken as members, not 'keeping the door open', particularly not to the three Baltic states, not to deploy NATO nuclear weapons and troops on the territory of the new members. No NATO headquarters was established over there either. Although the enlargement process continued but not immediately, nukes and troops were not deployed in the new member states. While the Russian strategy was not entirely successful the agreement reflected reasonable compromise.

The new Russian leadership that came into office in 2000 was more pragmatic. Although it expressed its reservations and negotiated further compromises, it accepted NATO enlargement extending to Estonia, Latvia, and Lithuania. The adjustment of the NATO-Russia Council to turn the 19 + 1 formula into that of the Council 20 (now 27) was symbolic. Furthermore, it was not exclusively in the interest of Russia to change the structure. Namely, during the working of the Council of 16 + 1/19 + 1 a quasi 'bipolar' structure complicated cooperation. NATO had to consolidate the position of its member states before engaging in exchange with Russia. Its members had to adopt a compromise before sharing it with Russia. When Russia made proposals it led to a cumbersome process not giving the impression of a partnership.

Cooperation with Russia has become easier for NATO since President Putin took office. A contrary conclusion is also possible. While formal cooperation has become easier between Russia and NATO, the long-term strategic division has become more pro-

13 This is a delicate task as NATO members collectively decide on their collective defence commitment. With respect to other commitments, since the early 1990's NATO involved non-members.

14 This was reflected in the NATO - Russia Founding Act signed on 27 May 1997 in Paris.

nounced. Russia is building its own sphere of influence in the post-Soviet space and is extremely allergic to any attempt of outside interference, including NATO's. It is no longer only about the Atlantic Alliance. It is the West as such making efforts of westernizing those states of the post-Soviet space which have embarked upon the process of democratization. The new line Russia does not want the West to cross is the former Soviet space now confined to 12 former republics. Russia may achieve this objective inadvertently due to the inconclusive performance of states like Georgia and Ukraine, the potential frontrunners for NATO membership in the former Soviet area. This may interrupt the European unification process as a community of values as well as interests.

55.3 Problems of Analysis and Prediction

NATO has been persistently adapting to the changing security situation since the end of the East-West conflict. The underlying reason of adaptation is not confined to the change of security challenges outlined above. More importantly it stems from the fact that for the first time in 500 years Europe is neither the centre of conflict, nor of power. Europe must get accustomed that there are less conflicts on this continent than elsewhere. Despite its adaptation NATO cannot remake itself into an organization that would project soft power. There are other institutions, like the European Union that has a strong comparative advantage. NATO will be as important as much it contributes to the management of conflicts beyond Europe's boundaries. Adaptation is an ongoing process. The single most important matter in this context is the cohesion of the alliance. Beyond rhetorical problems there are major objective differences among its members. The US is a cornerstone of the current international order due to its complex power base as the leading economic and military force. As the only truly global power in the military field US preponderance is the most visible. The US intends to partly change the world favourably to itself and other democracies and consolidate its future superiority. Under the Bush administration the US is relying more on using military force to achieve its goals than European countries due to their different historical experience. The global reach and interests of the US also presents a problem for most other members that do not want to follow NATO to be a global alliance.¹⁵

Europe after the end of the Cold War and the conflicts in the former Yugoslavia is now at peace. Albeit there are some local conflicts on the fringes of Europe, they do not affect NATO's security perception. Most European security problems are thus extra-European. If NATO lacks any direct security challenge, if its deterrent capacity is regarded indispensable, and if it would ignore those problems threatening other continents its existence would be in question.

NATO's role was not confined to that of a traditional defence alliance. It was the single most important forum of transatlantic security dialogue during the Cold War. This continued in the first decade after the Cold War due to the broad variety of matters NATO had to address. There are indications that NATO has become less central to consultation in the first decade of the 21st century. Gerhard Schröder, as chancellor of Germany, argued that "it is no longer the primary venue wheret transatlantic partners discuss and coordinate strategies" (Schroeder 2005: 2).¹⁶ The chancellor was supported by the chairwoman of the CDU who stated that "we need a strengthening of NATO. We must not let it become a 'reserve' alliance. It must be the place for decisions on security policy and military action. ... NATO has already changed after the end of the Cold War though it has not found its role sufficiently. Changing coalitions of the willing must not be the replacement for a reliable security policy in a solid Alliance" (Merkel 2005: 3). The words of the chancellor resulted in an uproar in some political circles and debates among experts. It has been clear that it is subject to qualification. NATO gave recognition to the problem when it declared "We are committed to strengthening NATO's role as a forum for strategic and political consultation and coordination among Allies, while reaffirming its place as the essential forum for security consultation between Europe and North America."¹⁷ No doubt, due to the complexity of most crises, it is necessary to use a broad array of means to manage and resolve them. There are means among them, which are not at the disposal of NATO, like economic assistance, support

15 The Warsaw Treaty Organization faced a similar situation under very different conditions due to the global interests of the Soviet Union and those of no other member state.

16 Schröder meant strategies in the broad political sense and not confined to military strategies.

17 Statement issued by the Heads of State and Government participating in a meeting of the North Atlantic Council, Brussels, 22 February 2005; at: <www.nato.int/docu/pr/2005/p05-022e.htm>.

to respect for the rule of law, rebuilding state institutions. Hence, it is partly due to objective reasons that consultations moved to other structures. The EU and the US have established their regular consultation frameworks and there are signs the US administration has recognized the centrality of the Union.¹⁸ Beyond this there is no doubt that the Iraq invasion of 2003 and the deep divisions inside NATO have contributed to moving consultations away from NATO politics. The relationship between those European states which were opposed to the US invasion of Iraq has gradually returned to pragmatic cooperation, leaving the disputed matter behind them. Consultation is not only part of the parties' commitment under Article 4 of the Washington Treaty of 1949. The importance of political dialogue goes way beyond it. It is essential to maintain and enrich it as it is one of those factors that distinguish NATO from other defence alliances in history. It contributes to its survival and continuing relevance.

NATO has become an Alliance with global interest and reach. This is usually attributed to US leadership and its global interests. It would be wrong to conclude that it is exclusively due to it. A more thorough analysis could prove that there are two additional factors pointing in the same direction: 1. Security challenges to the Euro-Atlantic area are of extra-European origin. It is hence in the common interest to address security issues beyond the territory of NATO irrespective whence the threat is coming. 2. The Atlantic Alliance has lost its well-identified adversary in the end of the Cold War and it is in the best self-interest of its members to find ways to retain its longer-term relevance.

As NATO has been adding newer tasks to its agenda since 1989 it has become more complex. Collective defence, conflict and crisis management, and fighting terrorism and some other transnational threats are all present. One could rightly observe that "NATO no longer has a specific focus" (Tanner 2006: 5). Some experts argue for a more forthcoming adaptation. There are two factors mentioned in this context: 1. "Re-establish the institution as the chief strategic council room for the West", i.e. make it the centre of transatlantic security coordination. 2. NATO and its members "will have to endorse fully in purpose, structure, forces and culture, the task of military stabilization beyond the Atlantic area" (Bertram 2006: 4).

With this task in mind it is necessary to adapt NATO's toolbox. A detailed recommendation points to five critical areas: "a new NATO special operations force, the NATO Response Force, high readiness combat forces, stabilization and reconstruction forces, and assets for defence sector development" (Binnendijk/Gompert/Kugler 2005: 1). Some of them already exist, like the NATO Response Force, others are present in the armed forces of some member states. Overall, the idea is clear: Turn NATO more performing in the management of crises and carrying out stabilization in post-conflict situations. Collective defence will be a residual capability of NATO. This is understandable in light of two factors: 1. No challenge to the territory of member states by other states or their alliances. 2. Abundant capacity to carry out high intensity defence operations. Summing up, in light of sound analysis it would be desirable if NATO could have a three tier structure: 1. regain its role as the centre of transatlantic security consultation, 2. contribute to the global management of conflicts and post-conflict situations, 3. fight terrorism and to a lesser extent other transnational security phenomena.

In the absence of NATO playing a central role in transatlantic security consultations the heavy emphasis on its contribution to conflict management will continue. That is where its strength lies. Contribution to the stabilization of the international environment both in Europe and beyond its borders has been forthcoming, and it was relatively easy to build consensus for such operations in the alliance. If one takes a closer look and makes a difference between various operations the conclusion may be drawn that it has been easier to achieve consensus for operations closer to Europe than further away from it. When looking back to the decade that passed since the mid-1990's it is clear NATO was in a fortunate situation. It could start its conflict management task in Europe, in an area that was comparatively less complex than some other conflict zones. Both the IFOR/SFOR operation and KFOR demonstrated the success of the Alliance in military stabilization. A few setbacks, like the March 2004 riots in Kosovo, did not undermine this. It is more of a question whether it is possible to provide for long-term stability through military stabilization without prosperity. This is not NATO's problem, however. As the EU is gradually taking NATO's place in the Balkans, the operations of the Atlantic Alliance have extended globally. Among them is the NATO operation in Afghanistan that has become an operation of vital importance, helping to keep NATO in business. But a word of caution is needed: "NATO's

18 This was the widespread interpretation of the visit of President George W. Bush at the meeting of the European Council on 22 February 2005.

aims of state-building and reconstruction are noble and ambitious; but Afghanistan is a country larger than Iraq, with a history of impatience vis-à-vis the presence of even well-intentioned foreigners” (Heisbourg 2006: 13). It would be to NATO’s advantage if it could diversify its conflict management/state-building and reconstruction commitments in order not to depend symbolically upon the success of one large and complex operation. A few less demanding and time-limited NATO operations would be a prudent option.¹⁹ Overstretch of NATO forces remains an issue and NATO’s activity should be measured against the availability of forces. It is a dilemma of NATO that it needs symbolic, and thus large-scale, successes if it wants to gain a new lease of life. Whereas they would come at a high price as far as resources and risks of failure (are concerned), smaller ones do not give sufficient impetus to NATO. That is why the operation(s) in Afghanistan has/have gained symbolic importance for the future of the alliance.

As far as the role of fighting terrorism on NATO’s agenda is concerned, there is consensus this is the prime security threat of our time and will remain so in the foreseeable future. There is no question that an alliance which aspires to address a broad range of security issues cannot stop short of terrorism without risking irrelevance. It should take into account that addressing terrorism “requires a multi-dimensional strategy that relies not just on military force but also on new forms of diplomatic, financial, economic, intelligence, customs and police cooperation” (Hamilton 2002). If NATO intends to contribute to counter-terrorism it requires having a shared idea among the members about the approach to take. NATO’s strength is in defence or more broadly in military activity and military power projection. There are two options in front of the Alliance. Either NATO takes the position that terrorism should be addressed primarily by military means – this is certainly closer to the US than to the European approach – or NATO should fundamentally modify its approach to security and broaden its agenda so as to be able to apply military as well as non-military means. There it would have no comparative advantage for quite some time. Those who notice the contradiction between objectives and tools advocate that NATO should develop a homeland security dimension (Aznar 2006: 128).

¹⁹ Some activities, like the humanitarian delivery to northern Pakistan after a major earthquake in autumn 2005, could provide an example to broadening NATO’s operational activity.

The external relations of the Alliance will continue to be determined by two factors: The intention to build an ‘inclusive’ alliance as the fight against terrorism may require the support of various countries. It continues to engage states through accession and maintain various forms of cooperation with those ones which are not suitable for membership and/or unwilling to apply. Although alliances were historically simple structures divided into members and non-members NATO has gone beyond this and established grey zones while respecting the traditional division in its decision-making.

NATO enlargement will continue at a slower pace than between 1999 and 2004. It will not be a hot political issue for the years to come rather a logical, pragmatic continuation of the process that started in the 1990’s. A western Balkans enlargement round may begin with the invitation of three states, Albania, Croatia, and Macedonia to negotiate their membership in 2008 and to join a couple of years later.

The candidacy of two states from the former Soviet Union is more divisive and will remain pending. The prime reason for this is not that Russia is opposing this NATO expansion. Although Ukraine has declared its willingness to join it cannot demonstrate the necessary domestic support within the society and the establishment. Opinion polls run low on NATO accession and while President Yushchenko is still in favour of accession, Prime Minister Yanukovich declared his government wants to put the process on hold. The reforms proceed not without difficulty. Georgia although benefiting from the strong support of the US has a number of pending conflicts (Abkhazia, South Ossetia). It may be a cause of concern irrespective of whether the conflicts are due to the activity of Georgia or not. Furthermore, the process of political transition gives no ground to draw irreversible conclusions about the changes.

55.4 Conclusion

NATO is no longer an obsession of many in international security. It has successfully avoided going into oblivion, however. It has found its place in the international system and has become a contributor of globalization in security. Bearing in mind the enormous task of adaptation it has performed fairly well. A good part of the remaining shortcomings has nothing to do with NATO proper but are derived from the dynamics of the relationship between member states and their divergent interests.

The adaptation of NATO to the changing security posture went through two waves. Once *de facto* (and not *de jure*) it moved from the collective defence of the territory of member states to military conflict management in its European neighbourhood. Somewhat later, its focus has shifted from crisis management to countering terrorism in a broad array of matters and areas. It ranges from providing protection against NATO territory (e.g. the use of AWACS in various contingencies, the cooperation of intelligence services as far as counter-terrorism, etc.), to the collective carrying out of area operations in countries that could harbour terrorists (e.g. Afghanistan), to the support of activities by several member states that could result in the horizontal proliferation of terrorism (e.g. Iraq). Although lip service is being paid to the original core function of the alliance and formally all the three functions coexist on its agenda, there is in fact a noticeable shift from one to the other. It means that member states had to go through two (if not three) major adaptations during the last 17 years or so. The first one (the move from collective defence to extra-territorial conflict management) was demanding for countries which had no power projection capabilities as had been confined to territorial defence. (For the new members, former members of the Warsaw Treaty, this also meant a move from collective offence to collective defence.) The latter move from crisis management to countering terrorism, closely following the former, was practically demanding for every member state. This means that very few countries could perform convincingly. Most of them, due to problems with the change of mentality and scarcity of resources, have been facing difficulties to living up to demands primarily set by the lead nation of the Alliance. This was exacerbated by the reluctance of several member states to carry out reforms. These factors taken together resulted in a partial adaptation.

It is clear that NATO will have to follow up the adaptation of capabilities and institutional structures in order to catch up with the fast rearrangement of international security. This has been reflected in the adaptation of NATO defence forces, the emphasis on deployability, sustainability, and power projection. NATO has continued to be a standard setting institution in training, defence planning, and interoperability. Since the end of the East-West conflict it has projected this knowledge to like-minded non-members through cooperative programmes and in operations. NATO may not be indispensable to defend Europe or deter a nonexistent adversary any longer, however, it has a major role to guarantee that a large group of

countries, members and non-members alike, can operate together effectively in the management of crisis management and international peace missions.

56 NATO's Role in the Mediterranean and Broader Middle East Region

Alberto Bin

56.1 Introduction¹

NATO is developing closer security partnerships with countries in the Mediterranean and the broader Middle East. This marks a shift in Alliance priorities towards greater involvement in these strategically important regions of the world whose security and stability is closely linked to Euro-Atlantic security. The current drive towards increasing dialogue and cooperation with countries in these regions builds on two key decisions taken at NATO's summit meeting in Istanbul in June 2004 (see document 61.1).

Allied leaders decided – ten years after the launch of NATO's Mediterranean Dialogue² in 1994 – to invite countries participating in the Dialogue to establish a more ambitious and expanded co-operative framework. In parallel, a new, distinct but complementary initiative was launched at the Istanbul Summit to reach out to interested countries in the broader Middle East region.

There are several reasons why it is important for NATO to promote dialogue and foster stability and security in the Mediterranean and the broader Middle East. One key reason is that a number of today's security challenges – terrorism, the proliferation of weapons of mass destruction, and failed states – are common to both NATO member states and to countries in these regions and, consequently, require common responses. Moreover, in addressing these challenges,

NATO is becoming more engaged in areas beyond Europe, including a maritime counter-terrorist operation in the Mediterranean, a security assistance operation in Afghanistan, and a training mission in Iraq. It is important to discuss these developments with countries in the Mediterranean region and the broader Middle East.

56.2 The Mediterranean Dialogue

56.2.1 An Evolving Process

When NATO's Heads of State and Government met in Washington in April 1999, they approved a strategy to equip the Alliance for the security challenges and opportunities of the 21st century and to guide its future political and military development³. The 1999 Strategic Concept emphasized that in the post-cold war era the security of the Alliance remained subject to a wide variety of risks and challenges, both military and non-military, which are multidirectional and often difficult to predict, a fact tragically confirmed by the terrorist attacks of 11 September 2001. In order to effectively deal with those risks and challenges, the strategy stressed the Alliance's commitment to a broad approach to security and defined NATO's fundamental security tasks. While it retained those functions, like collective defence, that have been at the core of the Alliance since its establishment in 1949, it highlighted the new activities in the fields of crisis management and partnership that the Alliance now

1 The views expressed in this chapter are the author's own and do not necessarily represent the position of NATO or any of its member states.

2 For previous reviews, see e.g. Bin (1997, 1998, 2000, 2000a, 2002, 2003); de Santis (1998, 2003); Kamal El-Din (2001); Larrabee (1999); Larrabee/Thorson (1996); Larrabee/Green/Lesser/Zanini (1997, 1998); Lesser (1996, 1999, 1999a, 2000); Lesser/Green/Larrabee/Zanini (1999, 2000); Moya (1997, 1998); Moya/Cellino (2001); Nordan (1997); Kadry Said (2003); Rato (1995); Sanz (2003); Selim (2000); Solana (1999); Terracini (1999, 2000); Winrow (2000).

3 The Strategic Concept was first published in 1991 <<http://www.nato.int/docu/basicxt/b91108a.htm>> following the end of the cold war. The 1999 version <<http://www.nato.int/docu/pr/1999/p99-065e.htm>>, like its predecessor, is the authoritative statement of the Alliance's objectives and provides the highest political guidance on the political and military means to be used in achieving them.

performs in order to enhance the security and stability of the Euro-Atlantic area and beyond.

The 1999 Strategic Concept thus elevated partnership into a fundamental security task. The strategy emphasized the Alliance's determination to promote wide-ranging partnership, cooperation, and dialogue with other countries, with the aim of increasing transparency, mutual confidence, and the capacity of joint action with the Alliance. It pointed out that this approach is aimed at enhancing the security of all, excludes nobody, and helps to overcome divisions that could lead to conflict. It also described the principal instruments of this policy: the Euro-Atlantic Partnership Council (EAPC), the Partnership for Peace (PFP), the special relationships with Russia and Ukraine, and its Mediterranean Dialogue⁴. From a conceptual standpoint, NATO's Mediterranean Dialogue is a key instrument in support of the Alliance's overall strategy of partnership, dialogue, and cooperation.

Since the launch of the Mediterranean Dialogue in 1994, it has been an integral part of the co-operative approach to security that the Alliance has pursued since the end of the cold war.⁵ Over the years, the number of countries participating in the Mediterranean Dialogue has increased: Egypt, Israel, Mauritania, Morocco and Tunisia, which accepted the invitation to participate in the Dialogue in 1994, were joined by Jordan in 1995 and Algeria in 2000. The Dialogue has also become more ambitious in scope.

Initially, NATO wanted to create a forum for confidence building and transparency in which Allies could learn more about the security concerns of Dialogue countries, as well as dispel misperceptions about NATO's aims and policies. Regular bilateral meetings were organized at working level and between the ambassadors of individual Dialogue countries with NATO's highest decision-making body, the North Atlantic Council, to discuss relevant security issues and the development of the Dialogue. Occasionally, multilateral meetings involving all the Dialogue countries were also held.

Since then, political discussions have become more frequent and intense, and the Dialogue has been given more structure, and opportunities for more concrete cooperation have gradually opened up. An an-

nual Work Programme, established in 1997, has steadily expanded to include an increasing number of elements and activities derived from the Partnership for Peace programme including military cooperation, civil emergency planning, and scientific cooperation. At the 1999 Washington Summit, steps were taken to strengthen cooperation, particularly in the military field.

Since then, NATO Dialogue countries have been consulted more frequently, both individually and as a group, and priority has been given to strengthening and deepening relationships. This led to the adoption at the *Prague Summit* in November 2002 of a package of measures to increase the political and practical dimensions of the Dialogue, including more regular and effective consultations, more focused activities, and a tailored approach to cooperation.⁶

Building on these initiatives and after consultation with Dialogue countries, a decision was taken at the *Istanbul Summit* in June 2004 (see document 61.2) to establish a more ambitious and expanded co-operative framework which is based on a number of guiding principles:

- firstly, the Dialogue's progressive character allows its political and practical dimensions to be enhanced regularly, and the number of participating countries to grow (*Progressiveness*);
- secondly, all partners are offered the same basis for discussion and for joint activities, but the level of participation varies from country to country according to individual needs and interests (*Non-discrimination and self-differentiation*);
- thirdly, the Dialogue is not about imposing ideas on other countries, but rather about taking into account the specific regional, cultural, and political context of respective partners to build a co-operative relationship that is of mutual interest and relevance (*Joint ownership*);
- fourthly, the Dialogue complements other related but distinct international initiatives, such as those undertaken by the European Union, the Organization for Security and Cooperation in Europe, and the G-8. NATO brings added value through its experience of coordinating political and practical security cooperation among many member and partner countries (*Complementarity*).

4 The Alliance's Strategic Concept (approved by the Heads of State and Government at the North Atlantic Council in Washington DC on 23-24 April 1999), See at: <<http://www.nato.int/docu/pr/1999/p99-065e.htm>>

5 See literature in note 1, and NATO's website at: <<http://www.nato.int/med-dial/home.htm>>.

56.2.2 Upgrading the Dialogue

Following the Istanbul decision, the overriding aims of the Mediterranean Dialogue remain the same, but the future focus is on developing more practical cooperation. Specific objectives are to achieve interoperability (that is, to improve the ability of the militaries of Dialogue countries to work with NATO forces); to cooperate in the area of defence reform; and to contribute to the fight against terrorism.

Political dialogue is also being enhanced by organizing ad hoc meetings at ministerial level, over and above ongoing consultations at working and ambassadorial levels in the bilateral (NATO+1) and multilateral (NATO+7) format. A first ministerial level meeting took place in December 2004, when Allied foreign ministers met counterparts from the seven Dialogue countries in Brussels.⁷ Further reflecting the new dynamic in the Dialogue, NATO's Secretary General, Jaap de Hoop Scheffer, met heads of state and government and key ministers in a series of landmark visits to Dialogue countries in 2004 and early 2005. In addition, the first ever meeting of Defence ministers of NATO and Dialogue countries was held in Taormina in February 2006. This was followed by a landmark meeting of the North Atlantic Council with the seven Mediterranean partners in Rabat (Morocco) in April 2006, the first meeting of this kind to be held in a Mediterranean Dialogue country.⁸

As part of upgrading the Dialogue, participating countries will be able to benefit from a series of mechanisms originally developed within the framework of NATO's Partnership for Peace (PfP). This includes the development of individual cooperation programmes to allow for greater self-differentiation; the use of action plans for practical, issue-specific cooperation including the Partnership Action Plan against Terrorism; and the possibility of support through NATO Trust Funds, aimed, for example, at disposal of weapons stockpiles.⁹

56.2.3 Focus on Practical Cooperation

The Istanbul decision focuses on expanding and strengthening practical cooperation in a number of priority areas. Interoperability is one of them, with a view to improving the ability of Alliance and Mediterranean Partner forces to operate together in future NATO-led operations. In this regard, existing activities and tools under the Partnership for Peace may be used, and participation in selected military exercises and related education and training activities enhanced. Another important area is defence reform. Priorities in this area include promoting democratic control of armed forces and facilitating transparency in national defence planning and budgeting. Combating terrorism is also a priority area. More effective intelligence sharing will be promoted as well as participation in NATO's maritime Operation Active Endeavour, the Alliance's maritime operation to detect, deter, and disrupt terrorist activity in the Mediterranean. Tailored advice on border security can also be provided. Preventing the proliferation of weapons of mass destruction and their means of delivery is another key priority. In the field of Civil Emergency Planning, cooperation in disaster-preparedness will be enhanced, in particular to improve the capacity to deal with the consequences of a terrorist attack. In the case of a disaster, Dialogue countries will also be given the possibility of requesting assistance through the NATO-based Euro-Atlantic Disaster Response Coordination Centre (EADRCC).¹⁰

The decision to broaden and deepen practical cooperation build on activities developed under the annual Work Programme, which has expanded over the years to include activities in 21 areas. These include crisis management, civil emergency planning, defence policy and strategy, border security, small arms and light weapons, humanitarian mine action, defence reform and defence economics, air traffic management, research and technology, science and environmental

9 See the background documents on the PfP at: <<http://www.nato.int/issues/pfp/index.html>>, and on the Mediterranean Dialogue at: <<http://www.nato.int/med-dial/home.htm>>, and on the Istanbul Cooperation Initiative (ICI) *Reaching out to the broader Middle East*, at: <<http://www.nato.int/issues/ici/index.html>>.

10 See on EADRCC at: <<http://www.nato.int/eadrcc/home.htm>> and on a NATO seminar in Algeria on earthquake safety in 22-24 May 2005, at: <http://www.nato.int/science/newsletter/2005/NATO_70_UK.pdf> and in general on the Mediterranean Dialogue at: <http://www.nato.int/med-dial/home.htm>.

cooperation. Consultations also take place on terrorism and the proliferation of weapons of mass destruction. Information activities include invitations to opinion leaders, academics, journalists, and parliamentarians from Dialogue countries to visit the Alliance Headquarters and attend NATO-sponsored events in both NATO and Dialogue countries.

The military dimension of the annual Work Programme covers invitations to Dialogue countries to observe or participate in military exercises and to attend seminars and workshops organized by NATO's Strategic Commands, as well as courses at the NATO School in Oberammergau, Germany, and the NATO Defense College in Rome, Italy. It also includes visits of NATO's Standing Naval Forces to ports in Dialogue countries, on-site training of trainers by mobile training teams, and visits by experts to assess the possibilities for further military cooperation. Meetings between Allied Chiefs of Defence Staff and counterparts, or their representatives, from the seven Dialogue countries take place on a regular basis.

The number of participants in the annual Work Programme has substantially increased over time. From a few dozen in the late 1990s, to more than 900 military and civilian personnel from all Dialogue countries who participated in the Work Programme for 2004. In June 2005, troops and observers from some Dialogue countries participated for the first time in a NATO/PfP military exercise ('Cooperative Best Effort').

Furthermore, several Mediterranean Dialogue countries have made significant contributions to the NATO-led peacekeeping operations in the Balkans. Peacekeepers from Egypt, Jordan, and Morocco have served in Bosnia and Herzegovina; Jordan and Morocco have also contributed to the force in Kosovo.¹¹

56.2.4 The Istanbul Cooperation Initiative

The Istanbul Cooperation Initiative aims to enhance security and stability by fostering mutually beneficial bilateral relationships with interested countries in the broader Middle East region.¹² The Initiative is open

to all countries in the region which subscribe to its aims, particularly the fight against terrorism and countering the proliferation of weapons of mass destruction (see document 61.3).

In the run up to the June 2004 Istanbul Summit, before a decision was taken to launch the Initiative, NATO's Deputy Secretary General conducted high-level exploratory consultations with representatives from the countries of the Gulf Cooperation Council - Bahrain, Kuwait, Oman, Qatar, Saudi Arabia, and the United Arab Emirates - to gauge the level of interest in such an initiative. All countries consulted expressed an interest. In the months immediately following the summit meeting, the way ahead was discussed during a second round of visits to Gulf countries. By June 2005, Bahrain, Kuwait, Qatar, and the United Arab Emirates had accepted the invitation, and the Alliance hopes the other countries will also do so.

The initiative proposes tailored advice in a number of specific areas where the Alliance has developed expertise and can add value. One key area is defence reform, defence budgeting, defence planning, and civil-military relations. Another is military-to-military cooperation focused primarily on improving the ability of participating countries' forces to operate with those of the Alliance through participation in selected military exercises and related education and training activities. Important priorities for cooperation would be fighting terrorism, including through information-sharing and possibly maritime cooperation, and addressing threats posed by the proliferation of weapons of mass destruction and their means of delivery. Other priorities for potential cooperation include advice in the field of border security, and improving disaster-preparedness and disaster-response.

NATO has developed a menu of practical activities in these priority areas which forms the basis of individual work plans to be jointly developed and implemented with interested countries. Practical implementation of the Initiative will draw on activities and mechanisms developed in the framework of the Partnership for Peace and will build on experience gained in the Mediterranean Dialogue.

The development of the Initiative is guided by the same principles that apply to the Dialogue. In particular, it is clear that the success of the Initiative will depend on the development in the countries concerned of a sense of ownership for its objectives and activities. This calls for a process of regular consultation to ensure that the views of the participating countries are taken into account as the Initiative gradually develops and is implemented.

56.3 Conclusions and Outlook: NATO and the Middle East

In addition to developing closer security partnerships with countries in the Mediterranean and the broader Middle East, NATO is also involved in a training mission in Iraq. This results from yet another key decision taken at NATO's summit meeting in Istanbul in June 2004.

The scope of NATO activities includes both in and out of country training, equipment coordination, and technical assistance to the Iraqi Security Forces. This includes the establishment of a NATO Training and Doctrine Centre at Ar Rustamiya near Baghdad. Once the training mission is fully up and running it is foreseen that NATO will annually train 1,000 officers inside the country and at least 500 outside, a number

which should increase in 2006, making a major contribution to the long-term development of the Iraqi Security Forces.

The enhanced Mediterranean Dialogue, the Istanbul Cooperation Initiative, and NATO's training mission in Iraq are three major elements of the Alliance's current engagement in the Middle East. They demonstrate that NATO is involved in the region and that all the Allies realize that they have a stake in its future.

In the years to come, the evolution of the Middle East will affect Euro-Atlantic security more than the development of any other region. That is why NATO needs to explore how it can support positive change. The first steps have already been taken; more are likely to follow. They will put NATO in an even better position to help the states of the Mediterranean and the broader Middle East to enjoy peace and stability.

Document 56.1: Istanbul Summit, 2004: Istanbul Summit Communiqué Issued by the Heads of State and Government participating in the meeting of the North Atlantic Council

36. From its inception in 1994, NATO's Mediterranean Dialogue has greatly contributed to building confidence and cooperation between the Alliance and its Mediterranean partners. In the current security environment there are greater opportunities for effective cooperation with Mediterranean Dialogue partners. Following our decision at Prague to upgrade the Mediterranean Dialogue, we are today inviting our Mediterranean partners to establish a more ambitious and expanded partnership, guided by the principle of joint ownership and taking into consideration their particular interests and needs. The overall aim of this partnership will be to contribute towards regional security and stability through stronger practical cooperation, including by enhancing the existing political dialogue, achieving interoperability, developing defence reform and contributing to the fight against terrorism. Our efforts will complement and mutually reinforce other Mediterranean initiatives, including those of the EU and the OSCE.

37. We have today also decided to offer cooperation to the broader Middle East region by launching our "Istanbul Cooperation Initiative". This initiative is offered by NATO to interested countries in the region, starting with the countries of the Gulf Cooperation Council, to foster mutually beneficial bilateral relationships and thus enhance security and stability. The initiative focuses on practical cooperation where NATO can add value, notably in the defence and security fields. This initiative is distinct from, yet takes into account and complements, other initiatives involving other international actors.

38. While respecting the specificity of the Mediterranean Dialogue, the enhanced Mediterranean Dialogue and the "Istanbul Cooperation Initiative" are complementary, progressive and individualised processes. They will be developed in a spirit of joint ownership with the countries involved. Continued consultation and active engagement will be essential to their success.

Document 56.2: Istanbul Summit, 2004: A more Ambitious and Expanded Framework for the Mediterranean Dialogue

1. NATO's Mediterranean Dialogue was initiated in 1994 with the broad objectives of contributing to regional security and stability, achieving better mutual understanding and dispelling any misconceptions between NATO and its Mediterranean partners. Since then, the Dialogue has evolved at a steady pace in accordance with its progressive character. The number of participating countries has increased from the original five to today's seven while the Dialogue's political

and practical dimensions have been regularly enhanced.

2. In the current security environment, and taking into consideration the need to tackle successfully today's challenges and threats including terrorism, there are greater opportunities for effective cooperation with Mediterranean Dialogue (MD) partners. Consequently, at their December 2003 meeting in Brussels,

NATO Foreign Ministers looked for additional progress beyond that achieved since the Prague Summit in upgrading the MD. They directed the Council in Permanent Session to consider ways to further enhance NATO's relationship with all MD partners by generating, in consultation with them and by the time of the Istanbul Summit, options for establishing a more ambitious and expanded framework for the MD.

Principles, objectives and priority areas

3. In this process, the following principles should be taken into account:

- the mutually beneficial nature of the relationship;
 - the need to take forward the process in close consultation with MD countries;
 - the importance of being responsive to MD countries' interests and needs;
 - the possibility of self-differentiation, while preserving the unity of the MD and its non-discriminatory character;
 - the need to focus on practical cooperation in areas where NATO can add value;
 - the need to ensure complementarity of this effort with the Istanbul Cooperation Initiative, as well as with other international efforts, especially those of the EU, OSCE and the G-8 as appropriate;
 - the possibility of expanding the MD to other interested countries in the Mediterranean region on a case-by-case basis;

4. Based on these principles, NATO offers to elevate the MD to a genuine partnership whose overall aim will be to contribute towards regional security and stability and complement other international efforts through enhanced practical cooperation, and whose objectives would include:

- enhancing the existing political dialogue;
- achieving interoperability;
- developing defence reform;
- contributing to the fight against terrorism.

5. The above-mentioned objectives could be achieved through enhanced cooperation in the following priority areas:

- putting into action a joint effort aimed at better explaining NATO transformation and cooperative efforts;
- promoting military-to-military cooperation to achieve interoperability through active participation in selected military exercises and related education and training activities that could improve

the ability of Mediterranean partners' forces to operate with those of the Alliance in contributing to NATO-led operations consistent with the UN Charter. These could include non-Article 5 crisis response operations such as disaster relief, humanitarian relief, search and rescue, peace support operations, and others as may subsequently be decided;

- promoting democratic control of armed forces and facilitating transparency in national defence planning and defence budgeting in support of defence reform;
- combating terrorism including effective intelligence sharing and maritime cooperation including in the framework of Operation Active Endeavour;
- contributing to the work of the Alliance on threats posed by weapons of mass destruction (WMD) and their means of delivery;
- promoting cooperation as appropriate and where NATO can add value in the field of border security, particularly in connection with terrorism, small arms & light weapons, and the fight against illegal trafficking;
- enhancing cooperation in the area of civil emergency planning including the possibility for Mediterranean partners to request assistance from the Euro-Atlantic Disaster Response Coordination Centre (EADRCC).

A more ambitious and expanded framework for the MD

6. Based on the above-mentioned principles, objectives and priority areas, a more ambitious and expanded framework for the MD should be developed by building upon the current MD programme including the inventory of possible areas of cooperation established at the Prague Summit, and by making extensive use of lessons learned and, as appropriate, tools from PfP with special emphasis on enhanced practical cooperation.

7. In addition to consultations at working and Ambassadorial levels in the format 26+1 and 26+7, the political dimension should be further enhanced through the inclusion of ad-hoc ministerial/HOSG meetings. Furthermore, at the earliest appropriate time, a joint political declaration with all MD countries could be developed in support of practical cooperation in the above-mentioned priority areas.

8. The practical dimension should be further enhanced through greater emphasis on practical cooperation. In addition to existing MD tools such as the annual Work Programme, the possibility of support through NATO Trust Funds in accordance with the NATO/

PfP Trust Fund policy and participation in courses at the NATO School and the NATO Defence College, a number of PfP and PfP-like tools could apply to the new initiative. These could include:

- action plans covering a wide range of issues that would form the basis for practical, issue-specific and result-oriented cooperation available to all Mediterranean partners;
 - individual cooperation programmes allowing for self-differentiation;
 - the use of existing PfP activities and tools to improve the ability of Alliance and Mediterranean partners' forces to operate together in future NATO-led operations, including in the areas of capabilities, education and training, and exercise activities;
 - enhanced participation, on a case-by-case basis, in appropriate PfP exercises;
 - the use of existing PfP programmes and instruments aimed at cooperation in all the priority areas listed in para. 5 as well as in the area of science and the environment.
9. This should be complemented by the intensification of practical cooperation in areas currently open to EAPC/PfP countries, with special emphasis on inter-

operability, defence reform, the fight against terrorism, and other activities aimed at ensuring effective partners' participation in NATO-led operations.

Other considerations

10. Appropriate legal arrangements may be needed to facilitate full and effective participation of Mediterranean partners. Security agreements may also be needed.
11. Consideration should be given to the possible setting up of appropriate liaison at NATO HQ and the Partnership Coordination Cell (PCC) at Mons in order to enhance coordination of activities, especially in the military field.
12. Regarding the possible expansion of the MD to other interested countries in the region, the progressive character of the MD makes it possible to add new members on a case-by-case basis, as has been the case with Jordan (1995) and Algeria (2000).
 1. Interoperability requirements constitute firm prerequisites for contributing nations such as the need to communicate with each other, to operate together, to support each other, and to train together.

Document 56.3: Istanbul Summit, 2004: Istanbul Cooperation Initiative

1. With a transformed Alliance determined to respond to new challenges, NATO is ready to undertake a new initiative in the broader Middle East region to further contribute to long-term global and regional security and stability while complementing other international efforts.
2. In this context, progress towards a just, lasting, and comprehensive settlement of the Israeli-Palestinian conflict should remain a priority for the countries of the region and the international community as a whole, and for the success of the security and stability objectives of this initiative. Full and speedy implementation of the Quartet Road Map is a key element in international efforts to promote a two state solution to the Israeli-Palestinian conflict in which Israel and Palestine live side by side in peace and security. The roadmap is a vital element of international efforts to promote a comprehensive peace on all tracks, including the Syrian-Israeli and Lebanese-Israeli tracks.
3. NATO's initiative, based on a series of mutually beneficial bilateral relationships aimed at fostering security and regional stability, should take into account the following principles:
 - a.) the importance of taking into account ideas and proposals originating from the countries of the region or regional organizations;
 - b.) the need to stress that the NATO initiative is a cooperative initiative, based on joint ownership and the mutual interests of NATO and the countries of the region, taking into account their diversity and specific needs;
 - c.) the need to recognize that this process is distinct yet takes into account and complements other initiatives including by the G-8 and international organizations such as the EU and the OSCE as appropriate. The NATO initiative should also be complementary to the Alliance's Mediterranean Dialogue and could use instruments developed in this framework, while respecting its specificity. Furthermore, the new initiative could apply lessons learned and, as appropriate, mechanisms and tools derived from other NATO initiatives such as the Partnership for Peace (PfP);
 - d.) the need to focus on practical cooperation in areas where NATO can add value, particularly in the security field. Participation of countries in the region in the initiative as well as the pace and extent of their cooperation with NATO will

depend in large measure on their individual response and level of interest;

- e.) the need to avoid misunderstandings about the scope of the initiative, which is not meant to either lead to NATO/EAPC/PfP membership, provide security guarantees, or be used to create a political debate over issues more appropriately handled in other fora.
4. Taking into account other international efforts for reforms in the democracy and civil society fields in the countries of the region, NATO's offer to those countries of dialogue and cooperation will contribute to those efforts where it can have an added value: in particular, NATO could make a notable contribution in the security field as a result of its particular strengths and the experience gained with the PfP and the Mediterranean Dialogue.

Aim of the initiative

5. The aim of the initiative would be to enhance security and regional stability through a new transatlantic engagement with the region. This could be achieved by actively promoting NATO's cooperation with interested countries in the field of security, particularly through practical activities where NATO can add value to develop the ability of countries' forces to operate with those of the Alliance, including by contributing to NATO-led operations, fight against terrorism, stem the flow of WMD materials and illegal trafficking in arms, and improve countries' capabilities to address common challenges and threats with NATO.
6. Countries of the region might see benefit in cooperation with the Alliance through practical support against terrorist threats, access to training, defence reform expertise and opportunities for military cooperation, as well as through political dialogue on issues of common concern.

Content of the initiative including priority areas

7. The initiative's aim would be essentially achieved through practical cooperation and assistance in the following priority areas, and illustrative menu of specific activities:
- a.) providing tailored advice on defence reform, defence budgeting, defence planning and civil-military relations.
 - b.) promoting military-to-military cooperation to contribute to interoperability through participation in selected military exercises and related education and training activities that could improve the ability of participating countries' forces to

operate with those of the Alliance in contributing to NATO-led operations consistent with the UN Charter:

- invite interested countries to observe and/or participate in selected NATO/PfP exercise activities as appropriate and provided that the necessary arrangements are in place;
 - encourage additional participation by interested countries in NATO-led peace-support operations on a case-by-case basis;
- c.) fighting against terrorism including through information sharing and maritime cooperation:
- invite interested countries, in accordance with the procedures set out by the Council for contributory support from non-NATO nations, to join Operation Active Endeavour (OAE) in order to enhance the ability to help deter, defend, disrupt and protect against terrorism through maritime operations in the OAE Area of Operations;
 - explore other forms of cooperation against terrorism including through intelligence exchange and assessments as appropriate.
- d.) contributing to the work of the Alliance on threats posed by weapons of mass destruction (WMD) and their means of delivery:
- e.) promoting cooperation as appropriate and where NATO can add value in the field of border security, particularly in connection with terrorism, small arms & light weapons, and the fight against illegal trafficking:
- offer NATO-sponsored border security expertise and facilitate follow-up training in this respect;
 - access to appropriate PfP programmes and training centres.
- f.) promoting cooperation in the areas of civil emergency planning:
- offer NATO training courses on civil emergency planning, civil-military coordination, and crisis response to maritime, aviation, and surface threats;
 - invitations to join or observe relevant NATO/PfP exercises as appropriate and provision of information on possible disaster assistance.

57 German Action Plan: Civilian Crisis Prevention, Conflict Resolution and Peace Consolidation – A Reconceptualization of Security

Ortwin Hennig and Reinhold Elges¹

In May 2004, the Cabinet of the Federal Government of Germany approved the *Action Plan Civilian Crisis Prevention, Conflict Resolution and Post-Conflict Peace-Building* (Bundesregierung 2004).² The basis for crisis prevention,³ conflict resolution⁴ and peace-building⁵ is a broad security concept that embraces political, economic, ecological, and social stability.⁶

1 Any opinions and views expressed are those of the authors alone.

2 This Action Plan has succeeded the *Comprehensive Concept of the Federal Government on Civilian Crisis Prevention, Conflict Resolution and Post-Conflict Peace-Building* (2000). Prevention and a comprehensive security concept have long been the basis of German policy, as the *White Paper of the Federal Ministry of Defence* demonstrates (Bonn: Federal Ministry of Defence, 1994).

3 The term 'crisis prevention' covers early, planned, systematic, and coherent action at various levels of government and society to prevent violent conflicts. Crisis prevention measures aim to reduce the potential for a violent conflict and encourage the establishment of institutions to resolve conflicts peacefully before, during or after violent conflict. The Action Plan refers to civilian crisis prevention, which pursues these aims without the use of military or other means of force (Bundesregierung 2004: X).

4 In the German text of the Action Plan, the terms 'Konfliktlösung', 'Konfliktbeilegung' and 'Konfliktregelung' – despite their different connotations and slightly varying interpretations – are used synonymously for the English term 'conflict resolution.' Conflict resolution aims to achieve a workable compromise or balance of interests that will also permanently prevent a violent escalation of the conflict in question (Bundesregierung 2004: X).

5 The term 'peace-building' is used to describe the whole process of establishing or re-establishing the network of social relations that facilitate the peaceful resolution of a conflict. This can include measures to stimulate economic development or promote social justice and initiatives for the reconciliation of opposing parties and the strengthening of common loyalties as well as projects to encourage cooperation and "intercultural learning".

Thus, Germany has adopted a comprehensive approach to civilian crisis prevention that can facilitate its integration into new global security architecture. This chapter describes how the German government has institutionalized a crisis prevention infrastructure in response to a new understanding of security that is comprehensive in scope and rests on the principles of prevention, integration, and cooperation.

57.1 Introduction

With the end of the Cold War the global security environment has changed, as have the perceptions of threats and the responses to challenges (Brauch 2005, 2005a). The end of the East-West confrontation did not result in a safer world but rather in an awareness of new threats with global implications. The time is gone when each country or continent could look after its own security. In the age of globalization, security has become detached from its traditional territorial and national contexts. Security and insecurity have also been globalized. Borders no longer offer protection as threats have become too complex, diffuse, and interconnected to be addressed by any individual state alone.

6 There is no single definition of stability or instability. A country or a region is unstable when undergoing political, economic, or social upheaval that can be manifested, inter alia, in coups d'état (illegal or unpredictable political succession); breakdown of political, economic, and social institutions; systemic corruption; widespread organized crime; loss of territorial control; economic crisis; large scale public unrest; involuntary mass population displacement; violations of human rights and violent internal or international conflict. Stability, then, depends largely on a country's ability to manage and adapt to changes, which presupposes functioning formal and informal institutions.

Today's major security threats include poverty, pandemics, and environmental degradation; war and violence within rather than between states; the proliferation and possible use of weapons of mass destruction; and transnational organized crime and terrorism. These threats emanate from non-state actors as well as states, and they affect both 'human security' (UNDP 1994) and 'state security' (UN 2004). There is a growing consensus that they are threats to international peace and security due to their interconnectedness and "in a world of interconnected threats and challenges, it is in each country's self-interest that all of them are addressed effectively" (UN 2005a).

An integrated and comprehensive security concept must adequately address today's new challenges and convincingly communicate their global relevance. Only on that basis can the international community create the global security consensus former UN Secretary-General Kofi Annan has called for, and establish a genuine security partnership between industrialized and developing nations (UN 2005a). The traditional hierarchical view of security, which graded 'soft' and 'hard' threats according to either a Northern or Southern perspective, should be replaced by a single integrative security concept. A holistic perspective would replace the zero-sum game of traditional security policy with cooperation and integration and translate the inextricable link between security, development, and human rights into practical, mutually beneficial policies. This is the central political challenge of the 21st century.

This chapter explains the challenge of rooting new thinking on security in governmental agencies and translating it into practice, taking Germany as an example. It is less concerned with the academic and normative debates around the (need for) reconceptualization of security, but focuses on how the German government has answered institutionally to new thinking that has already gained theoretical currency within the academic, practitioner, and policy circles. Governmental policy does not change overnight. The challenge of governments is that despite new insights into problems, they largely depend on existing structures to solve them, both on the national, and especially the international level.

57.2 New Security Threats and International Responses

The need to rethink security and to provide for a new infrastructure of prevention is evident considering the

new threats to international peace and security. The repercussions of violent conflicts seldom come to a halt at national frontiers. Cross-border flows of refugees, smuggling, and (para-)military movements may destabilize whole regions. Armed conflicts, the so called 'new wars', take increasingly place within, and not between, states. They are marked by the privatization of violence, the globalization of the means to inflict it, and by its asymmetric use that leaves civilians as the primary victims. The actors in new wars seldom have political interests (i.e. they are not interested in the control of the state and governmental power) but rather strive for the control of territory and resources for exploitation. 'New wars' are not a phenomenon of the 1990's, but started in the 1970's. But they became visible and moved to the centre of international security concerns only after the end of the East-West divide (Kaldor 1999; Münkler 2002, 2005).

The fundamental source of this new type of conflict is the crisis of state capacity and authority. Precarious statehood is not only a problem for the societies that suffer the consequences from bad governance to even state failure. It is also detrimental to a system of collective security that is based on state sovereignty. The extent of the challenge is visible in the emerging consensus on the international security agenda: the primary global threat to human and state security is fragile and failing statehood. All concrete threats to international security, including terrorism, nuclear proliferation, mass violations of human rights, poverty, armed conflict, and refugees, are viewed, even if to varying degrees, as the primary responsibility of states and the consequence of state weakness (Woodward 2004).⁷

The re-evaluation of the role of the state has been related to two concepts that are relevant to the redefinition of security in the 21st century: the concept of 'human security' and the 'responsibility to protect' (ICISS 2001). Both concepts are referred to in the 2005 World Summit Outcome document (UN 2005b).

The human security concept is the result of the successful post-Cold War attempt of middle powers

7 These threats are either caused or exacerbated by fragile states: with their limited control over their territory they are no functioning partners of a still largely state-based system; thus even those crises, which could be contained locally, tend to have regional and even global repercussions. New security strategies recognize and try to address this problem (Council of the European Union 2003; Rice 2003). See also below, with regard to the debate on "the responsibility to protect."

like Canada and Japan, but also the United Nations Development Programme, to shift the focus of security from states to persons. While national security remains important, they convincingly argued, it cannot adequately describe a holistic view of security in a world with few interstate wars, and with more people killed by their own governments than by foreign armies.

The acknowledgment of a state's 'responsibility to protect' is a consequence of the human security debate. It should be seen in light of a rethinking of state sovereignty, which constitutes a crucial question in the debate on UN reform. 'Responsibility to protect' declares the protection of human rights as part of state sovereignty and calls for external intervention by the international community if states fail in this regard.⁸ This constitutes a redefinition of state sovereignty. 'Responsibility to protect' is developing into a norm of international law. There is, however, considerable opposition to the concept from those states which fear that it will be abused for interference in their own domestic affairs. This debate on Article 2,7 (principle of non-intervention) of the UN Charter must be seen in relation to experiences with consequences of failed statehood since the end of the Cold War.

Weak and failed states not only pose threats to their own citizens, they also cause 'black holes' in the international system. Without (legitimate) governments to approach, the international community misses a credible partner. Likewise, a state-based order cannot function when governments have only marginal control over their territory. Lacking institutional capacity, governments in weak and fragile countries are barely able to implement consistent policies to reduce poverty and provide basic social goods. State-society relations are often astray in these polities. The state is abused by rent-seeking political elites who profit from the status quo and use external resources to reinforce their own power rather than pursue a policy promoting development (Debiel 2005). Such states often menace their own society and the poor and vulnerable suffer most from incompetent, irresponsible, and arbitrary rule.

The difficulties of the international community to address the problems of weak states with the instruments for classic inter-state conflict have become apparent in the UN peacekeeping missions of the 1990's. Addressing demands that exceeded their traditional roles by far and to meet the expectations set in them, these missions fought an uphill battle.⁹ Their main goal has been to stabilize or reconstruct statehood through many political, military, humanitarian,

and development components. State-building has become the norm rather than the exception of interna-

8 Two attempts were made to codify the rights and duties of states, by the American states at the Seventh International Conference of American States in Montevideo in 1933, and by the International Law Commission in 1949. While the latter is more thorough regarding the domestic duties of states, both documents do not include sanctions – such as the “decertification” of statehood, in case of non-fulfillment of these duties (Seventh International Conference of American States 1933; ILC 1949). “Decertification” here refers to the (arguable highly theoretical) sanction of denying states their sovereign rights. This would require a definite and binding catalogue of norms for statehood and an international institution with the legitimacy and means to enforce it.

The dangers of precarious statehood that originated in states' birth and development warrant the costs of revisiting state sovereignty. Whereas the modern (European) state is the product of long and convoluted processes, often involving violence, and always ongoing negotiations among social actors about the boundaries of political community, the scope and legitimacy of the state, and the distribution of power, today's statebuilding under the auspices of international society demands a participatory and legitimate strategy based on international standards for the internal consolidation of power. Statebuilding is thus not about the rigorous consolidation of domestic sovereignty, but about establishing democracy. Historically, it is without precedent.

Today's elites not only lack the means of statebuilding available to previous generations. They may also lack the incentives. De-colonization created many states along artificial borders. These quasi states were sovereign and protected by international law (including the sanctity of borders, or prerogatives like international representation, management of international trade etc.) before establishing domestic sovereignty. This has enabled elites to live and rule fairly independently from their populations. Guarded from the outside and capitalizing on the control of the (however dysfunctional) state apparatus, these elites can protect themselves from internal challengers with policies that aim not at the consolidation of the state in a peaceful society, but rather at the maintenance of control of government. State-society relations are based on instability and uncertainty, created by nepotism, arbitrary rule and multiple armed groups that can be played-off against each other. A disorderly society often benefits elite-based extraction of resources. Precarious statehood, then, is the preferred state of affairs.

“Decertification” of statehood in the case of non-fulfillment of state duties and the development of alternatives to full sovereignty could help to break up this isolation of national elites from the broader societies. If elites would be forced to engage with society and new state-society relations could emerge over time, more stable and eventually viable states might emerge.

tional peace missions, and demand is likely to increase.

57.3 Security Concept of the German Government

The German government approved the *Action Plan Civilian Crisis Prevention, Conflict Resolution and Post-Conflict Peace-Building* in response to these new realities and challenges. With contributions from many civil society actors, the Action Plan takes stock of the Federal Government's capacities in crisis prevention and reviews its contribution to an adaptation and redefinition of security. In line with the *European Security Strategy* of December 2003, it is based on the assumption that coherent strategies are needed for the complex problems in an increasingly fragmented and yet interdependent world (Council of the European Union 2003). The Action Plan reassesses the concepts of crisis prevention, crisis management and post-conflict peace-building. It identifies and evaluates the activities undertaken by Germany as part of its preventive policy, and groups them into fields of action. Moreover, it sets out concrete proposals for governmental action over a timeframe of five to ten years.

Germany's security policy has long ceased to focus exclusively on national territory, the EU or NATO member countries. From the perspective of the Action Plan, the security concept and security policy are determined by the root causes of conflicts. The promotion of good governance and sustainable development are highly relevant for security policy.¹⁰ The Action Plan assumes that crisis prevention policy requires an integrative approach that moulds the various government policy areas into a single coherent strategy. A greater effort must be made not only to bundle foreign, security and development policy. The importance of the economic and ecologic dimensions of many conflicts requires that economic, financial, and environment policy are also enlisted for crisis pre-

vention. Germany realizes this on the national level with the *Interministerial Steering Group for Civil Crisis Prevention*, which comprises all federal ministries and coordinates governmental action in order to ensure a coherent prevention-oriented security policy.¹¹

To this end, the Action Plan provides an analysis of the new nature of conflicts, draws conclusions for the institutionalization of a crisis prevention infrastructure, and operationalizes the German government's answer to the new challenges by identifying approximately 160 actions which are to be implemented by the government. The scope of those actions includes promoting non-proliferation, disarmament and arms control, strengthening the rule of law, utilizing the aid of international financial institutions, and forging global partnerships between private industry and the public sector. They also aim to fight poverty and to ensure the sustainable management of natural resources with a view to securing the living environment as a prerequisite for peaceful coexistence.

In its main parts, the Action Plan's analysis of today's threats to our security is consistent with the human security concept. Both take not only states, but also individuals and humankind as referents of preventive engagement, and both are founded on respect for human rights, social justice, the rule of law, participatory decision-making, the protection of natural resources, development opportunities for all regions of the world, and the use of peaceful conflict resolution mechanisms.

The Action Plan recognizes 'precarious statehood'¹² as a central threat and stresses the need to secure or rebuild state structures as a major task for German crisis prevention policy: the basis for more security and development in fragile states and in post-conflict situations is the state's monopoly of legiti-

9 Within a few years, these missions underwent significant structural changes. Peacekeeping in the traditional sense, i.e. the separation of two or more conflict parties has turned into multi-dimensional peacekeeping and finally 'robust' peacekeeping based on Chapter VII of the UN Charter or even the exercise of executive authority by the UN, as in the cases of the United Nations Mission in Kosovo (UNMIK, 1999-present) or the United Nations Transitional Authority in East Timor (1999-2002).

10 This should not be misinterpreted as a re-conceptualization of development cooperation within traditional security policy. Acknowledging the security relevance of development cooperation does not entail a militarization of its planning and implementation. It recognizes the link between security and development, i.e. there can be no development without security and vice versa. Already in 1980, the Brandt Commission identified development cooperation as the peace policy of the 21st century (Independent Commission on International Development Issues 1980).

11 This work includes identifying crisis relevant aspects of government policies and sensitizing the relevant departments regarding the need for preventive, crisis mitigating planning and action.

mate power based on the principles of law. Thus, the German concept focuses on the promotion of democracy and the rule of law as priority objectives for post-conflict state-building, on promoting the potential for peace in civil society, and on securing livelihood as crisis preventing fields of action. The Action Plan represents a shift in the focus of Germany's security and development policies towards post-conflict reconstruction and peace-building. It reflects the Federal Government's belief that in the long run the only realistic way to create lasting stability is to promote better governance, which is a fundamentally prevention-centred approach.

Crisis prevention endeavours are particularly likely to be effective and ultimately successful if they focus both on the causes of conflict and on the processes and actors involved in the escalation of violence. Each course of action should be examined to determine whether it might not unintentionally do more harm than good ('do no harm' principle). It is therefore essential to create institutions and political regulatory mechanisms for permanently settling conflicts by non-violent means. Crisis prevention endeavours are not just important for the phase in which an escalation of violence is imminent, but must instead be launched earlier on and continue after the end of hostilities in order to help prevent future wars. Crisis prevention, conflict resolution, and peace consolidation should therefore be understood as different approaches within one unified strategy. From the perspective of the Action Plan, crisis prevention includes efforts to mitigate conflicts before violence erupts, as well as steps to consolidate situations after conflicts have ended. The Action Plan's approach covers those activities that are usually subsumed under state- and institution-building or post-conflict reconstruction. There is a close interconnection between crisis prevention, conflict resolution and peace consolidation, because after the conflict all too often means before the conflict: close to 50 per cent of the countries emerging from violent conflict cannot escape the conflict trap and relapse into violence within the first five years (UN 2005a).

57.4 Global Implications of a New Security Concept

Following these considerations, the Action Plan redefines security in three areas, based on: a) the development of a preventive and integrative policy, b) the strengthening of the international legal order; and c) the amplification of multilateral approaches. Germany has started this process of rethinking and realigning security policy and should actively promote it further on the international level, as a global security consensus and especially consistent actions are not yet in sight.

Development of a preventive and integrative policy: A new security concept should facilitate the development of a preventive and integrative security policy with a primary focus on civilian aspects of prevention. Such a concept can only be a multi-layered approach to security in which national and international perspectives are met and reconciled. Its aims should include overcoming poverty in the countries of the South, fighting transnational organized crime, promoting a meaningful dialogue between cultures, and finding solutions to global environmental crises. It should establish a preventive policy as a key security policy task focusing on integration by systematically coordinating all policy areas, namely foreign, defence/military, and development as well as environmental, economic, health, and justice.

In a time of scarce resources and complex challenges, security policy needs to avoid duplication and self-imposed counter-productivity. Effective coordination, both nationally and internationally, that streamlines funding and invests resources strategically according not only to national priorities but to the needs and demands on the ground is crucial for success. Although policy makers are increasingly aware of the necessity of cooperation, which is reflected by the growing number of respective venues,¹³ implementing adequate mechanisms and routines in day-to-day work remains a challenge.

Strengthening the international legal order: A modern security concept should rest on the establishment or rather strengthening of a global legal order based on the UN Charter and the Universal Declara-

12 'Precarious statehood' is not defined in the Action Plan, yet it refers to situations in which state-society relations have deteriorated, which can result in, inter alia, lack of public services provision (security, rule of law, public health, etc.), arbitrary and irresponsible rule, capture of the state by influential social factions, or state-led human rights violations.

13 Such as, on the regional level, the European Commission's *Conflict Prevention and Crisis Management Unit* and the *Common Foreign and Security Policy* of the European Union; globally, the *Peacebuilding Commission*, financial instruments like the World Bank's Post-Conflict Fund, to name but a few.

tion of Human Rights. Existing international conventions and treaties must be expanded, the ability of supranational institutions to act must be enhanced and international jurisdiction must be further developed. The aim should be to strengthen the rule of legal procedures for peaceful conflict settlement at all levels as an important aspect of institutionalized, i.e. sustainable, self-enforcing crisis prevention. Such a global order must eventually also solve the question of rebalancing the sovereignty of states and their responsibilities for their people.

Amplification of multilateral approaches: Finally, a new security approach must enable the establishment of a cooperative order to establish and secure stability in the world, based on the UN and regional organizations. North and South must work together and forge a global security alliance, founded on the understanding that security depends on security for all and cannot be realized when large parts of the world are suffering. While common sense, this 'new' thinking is far from being institutionalized in governmental action. The EU, OSCE and NATO, as well as other regional organizations, especially the African Union, must actively get involved in forging and implementing such an alliance. Lastly, International Financial Institutions (IFIs) like the IMF and the World Bank Group can contribute significantly to economic stability, development, and thus ultimately security. The latter have increased their conflict sensitivity and expertise significantly (see World Bank 2005) and should further develop their programming and monitoring skills in order to ensure implementation that is consistent with their stated goals.

German security policy, as it finds expression in the Action Plan and in the European Security Policy, is based on a prevention-oriented policy that is most effective in a multilateral framework. Crisis Prevention has de facto become the central task of the UN system and of regional organizations. There has been a growing tendency to place the burden of civilian tasks on UN missions while the military command remains with changing 'coalitions of the willing'. Considering that (traditionally defined) security aspects of UN missions are covered by mandatory financial contributions of the member states, whereas the civilian aspects rely on voluntary (i.e. additional) funding, there is a growing need to revisit the financial architecture of collective security policy alongside the reconfiguration of the roles of the key actors.

57.5 A New Infrastructure of Prevention

With the Action Plan, Germany takes an important step towards an integrated security concept combining an analysis of the challenges and opportunities of crisis prevention with an operationalization of the results for governmental action. Effective crisis prevention activities by the Federal Government require a supportive national infrastructure. Besides anchoring crisis prevention as a cross-sectoral task in national politics and improving interministerial coordination, this also involves closer cooperation with non-state actors and creating and developing specific structures for crisis prevention. Regular evaluation of these official measures of crisis prevention ensures their continuous improvement.

Recognizing the impact of political action on crises poses a challenge for the government as it involves different policy areas and constitutes a cross-sectoral task. Mastering this challenge requires not only clearly defined mandates, a division of labour, awareness-raising and training of skills for the actors involved, but also the existence of suitable structures for implementation.

As an institutional answer to the new nature of conflicts, the Action Plan envisages the appointment of *Commissioners for Civilian Crisis Prevention* in all Federal Ministries which form the *Interministerial Steering Group Civil Crisis Prevention*, chaired by the Federal Foreign Office. The Interministerial Steering Group as the central crisis prevention organ was formed in September 2004. It implements the Action Plan, furthers coordination and coherence, creates synergies, and thus enhances the Federal Government's capacity to act more coherently. It helps to foster decision-making processes between the departments, it guarantees continuity and transparency and, to some extent, also control of certain actions. It can also mitigate divergences of interest and information deficits between the Ministries. But it is not authorized to make government policy. Meetings can also be held at the level of State Secretaries to gain or maintain the necessary political momentum.

Although crisis prevention is ultimately a governmental task, non-state institutions play an important role in enhancing the Federal Government's capacity for preventive action. The Federal Government supports transparent mechanisms for the exchange of information sought by state and non-state bodies alike and, where possible, for the coordination of their respective activities and initiatives. Efforts are made to

involve not only non-governmental organizations, but also the private sector in these mechanisms to facilitate early warning, utilize synergies, and avoid undesirable developments.

The Interministerial Steering Group, therefore, also functions as a point of contact between the Federal Government and civil society. An advisory board on crisis prevention was established that is composed of representatives from civil society, including the private sector, and peace research institutes. This advisory board is supposed to provide expert advice to the Interministerial Steering Group, and is to link its activities with the broader civil society. The Interministerial Steering Group appointed the members of the advisory board in May 2005.

Germany regards civil society as an important partner in an integrated approach to crisis prevention. Especially in fragile states, civil society can promote social change, mediate in internal conflicts, and support processes of national reconciliation. One key instrument for the support of peace potentials within civil societies in conflict areas is training peacebuilders by the Civil Peace Service, which is jointly run by the Federal Government and non-state actors. Since 1999 the Federal Government funds NGOs through a special budget title for peacekeeping measures (the FEM-budget item¹⁴), thus facilitating international networking among non-state actors.

Professional and independent media are another crucial factor for effective crisis prevention and stabilization of fragile communities. Freedom of the press and the promotion of media ethics are pillars of any strategy supporting objective and conflict sensitive reporting. The *Institute for Foreign Relations* (IFA) in Stuttgart (Germany) supports independent media with governmental funding. In 2004, Germany's international broadcaster *Deutsche Welle* started to train foreign specialists and executives from the media sector. The Federal Government will strengthen its activities in this sector and add training capacities for journalists from conflict regions. It also gives technical support for the establishment of independent bodies for journalistic self-regulation, advises in the design of liberal media laws, and provides infrastructure for information and communication technology that help to overcome information monopolies.

Crisis prevention activities must be timely and forward-looking, conceived for the longer term, and carried out by qualified personnel who can be mobilized

and deployed at short notice. This is of great importance for crisis prevention activities of multilateral organizations and for bilateral conflict-related measures. The funding of crisis prevention activities must be regulated to be effective. Specific structures and measures are needed to achieve these aims.

Since the end of the 1990's, the Federal Government has created new institutions for crisis prevention measures, focusing especially on the secondment of personnel and the funding of specific projects. Budget lines and relevant non-ministerial units have also been set up. Given the needs of the European Union and of multilateral organizations, in addition to the training provided for its present and future senior security policy staff at the *Federal College for Security Policy Studies* (BAKS 2001, 2004), the Federal Government has identified two other focal areas for the preparation and deployment of personnel for civilian conflict management – the training of civilian personnel by the *Centre for International Peace Operations* (ZIF) for deployment in international peace missions and the development of the *Civil Peace Service* (ZFD) for the deployment of experts in bilateral conflict management projects. In addition, the Federal Ministry of the Interior (BMI) has, with support from the Länder, established a Permanent Office of the Bund-Länder Working Group “International Police Missions”.

The German Action Plan insists that crisis prevention should be primarily civilian in nature since armed intervention cannot replace civilian conflict management activities and their efforts to address the structural causes of crises. But not all conflicts can be settled by peaceful means alone, and crisis prevention often requires close cooperation between civilian and military components within the framework of a security concept that embraces political, diplomatic, economic, humanitarian, and military means. Such a cooperative and coherent approach of civil and military crisis prevention is particularly important for the consolidation of peace, where the (re-)establishment of stable conditions is of utmost importance. Given the complex reality of modern multidimensional peace missions, the question *if* civil and military actors should work together has become obsolete. Rather, the question should be how they can best work together to realize synergies. The Action Plan, therefore, stresses the interplay between appropriate military stabilization and effective civilian conflict transformation.

The concept of *Provincial Reconstruction Teams* (PRTs) in Afghanistan demonstrates how comprehensive crisis management can work in practice. In its

14 FEM is the abbreviation of ‘Friedenserhaltende Maßnahmen’ (Peacekeeping Measures).

two PRTs in Kunduz and Fayzabad, Germany has for the first time created a dual civilian-military command instead of a purely military one. This distinctively German PRT set-up has proved to be successful and has since served as a model for other PRT lead nations. The close link of civilian and military components of German PRTs ensures the coordination of political, military, economic development policy, and societal construction and modernization programmes. The active involvement of civilian organizations under the auspices of the PRT also ensures that sustainable reconstruction strategies can be developed at an early stage, thus making a military exit easier when it becomes viable.

57.6 Experience in Implementing the Action Plan

After almost two years of experience with the implementation of the Action Plan, the crisis prevention policy of the Federal Government has advanced in several issue areas under the authority of the Federal Ministries. The Interministerial Steering Group in particular has increased transparency and coordination in this domain. Special focus was put on the creation of the crisis prevention infrastructure. In addition to the general preventive policy of the government, the work of the Interministerial Steering Group has concentrated on so-called 'lighthouse' projects that require interministerial cooperation and that were thought to raise public awareness for Germany's contribution to crisis prevention and peace-building. The following illustrates some of the issues on its agenda:

- *Improving the link between early warning and early action:* Interministerial country panels have been established to ensure better coordination of our crisis prevention efforts and to draw up specific operational strategies for prevention. These panels include representatives of all major German actors in this area, both governmental and non-governmental.
- *Improving operational capabilities:* A working group on security sector reform has been established to draw up an interministerial framework plan for supporting such reforms in partner countries.
- *Further improving the human resources capabilities:* The Interministerial Steering Group tries to clarify legal questions relating to the deployment of civilian non-governmental experts on international peace missions and to present proposals on

ways to close any existing gaps (e.g. legal basis for deployments, social security status).

- *Improving financial resources:* The Interministerial Steering Group examined the feasibility of pooling budgetary resources for crisis prevention within German constitutional budgetary and financial realities. Britain has piloted a new model based on a common pool of funds by the Department for International Development, the Ministry of Defence, and the Foreign and Commonwealth Office (Department for International Development 2003, 2004).¹⁵ A task force concluded that the British model cannot be copied but that the interministerial cooperation and allocation of funds for crisis prevention can be improved. The German system and its budgetary regulations are too different. But the steering group implemented a proposal of the Action Plan for a clearly defined, specific pilot project on: "Security Sector Reform Indonesia" to support stability, democracy, rule of law and good governance, thus helping an ongoing reform process and complementing the European Union's role in monitoring the Aceh peace process. The project was jointly designed and financed and it encompasses instruments and measures by all relevant ministries (Foreign, Defence, Interior, Economic Cooperation). It fully implements the pooling idea: An interministerial project, a holistic, comprehensive approach, joint planning, joint financing, and joint implementation, also integrating non-governmental actors.
- *Examining the role of private business in crisis regions:* With the participation of business representatives, the Interministerial Steering Group will discuss the potential of enterprises as actors in conflict situations and draw up specific operational strategies.

The comprehensive and cross-sectoral nature of the Action Plan is a forward looking attempt to break new ground in German security policy. This strength also entails difficulties in implementation. The Federal Government is aware that implementing the Action Plan requires a learning process within the different branches of government. In the name of an integrated approach to crisis prevention and security policy, customary prerogatives and routines of the individual departments must be modified or even replaced to sup-

15 This budget-based approach is at the heart of Britain's strategy on conflict prevention, aptly coined as "Investing in Prevention" (Prime Minister's Strategy Unit 2005).

port and not hinder a goal-oriented consensus building. The Interministerial Steering Group's work is based on mechanisms of horizontal self-coordination among departments. Within the German government crisis prevention is still often dominated by individual interests of departments. The process of developing new far-reaching instruments of interministerial cooperation has not really yet begun. To move from coherence in policy shaping to operational coherence that is promoted by the Interministerial Steering Group, a culture of transparency must be established among all actors. An effort is now underway to achieve this goal.

The institutionalization of crisis prevention on an international scale is of utmost importance. In 2005, the establishment of the *Peacebuilding Commission* has set new ground (UN 2005c). So far, no single body within the UN system has the capacity or the mandate to deal with specific peace-building cases in a comprehensive way and in all phases from the initial stages of peacemaking through conflict resolution and post-conflict reconstruction and development. These new peace-building structures necessitate further concentration of German security and development policy in peace-building activities. The new commission could give an impetus to further develop the existing crisis prevention structures in Germany to equip the Interministerial Steering Group with more political and operative clout to better bundle and render more coherent the German contribution to the work of the *Peacebuilding Commission*.

57.7 Conclusions

Security in the 21st century is no longer centred on an abstract concept of 'Staatsraison', but aims at the safety and well-being of individuals and humankind ('human security'). The state, though, remains the central means for achieving comprehensive security. To achieve it, action must encompass the whole spectrum of traditional tasks of the state – on the basis of new aims, new methods, and new instruments. Thus, the central challenge of present security policy is a comprehensively understood crisis prevention policy, at a global, regional, and local level.¹⁶

Germany has responded to this challenge and recognized the need for a re-conceptualization of security. The Action Plan is Germany's first contribution to redefining and rethinking global security. It recognizes the security-development-human rights nexus, and advocates an integrated approach that brings political, military, economic, ecological, and social security into a common framework. Through the Action Plan and in particular the work of the Interministerial Steering Group, policy and decision-making have changed towards this new understanding of security.

The Action Plan's crisis prevention policy is evolutionary. It reacts to new developments and takes into account new perspectives, nationally and internationally: for example, the Federal Government is ready to actively participate in the work of the United Nations Peacebuilding Commission, to contribute – on the basis of its expertise – to the debate on the human security concept, or to use its European Union- and G8-presidencies in 2007 to further enhance the crisis prevention policy.

Germany has been engaged with its partners in conflict resolution and peace-building efforts in the past. It will also remain committed in the future: The coalition treaty between the Christian Democratic Union, the Christian Social Union, and the Social Democratic Party of November 2005 underlines the resolve of the government to continue implementing the Action Plan, to strengthen the Interministerial Steering Group, to bundle crisis prevention resources, to contribute to multilateral peace missions, and to stay engaged in peace consolidation efforts (CDU/CSU, SPD 2005).

National coherence is a precondition for a trustworthy international engagement. But the interface with European and international efforts and structures must be high on the crisis prevention agenda in the future. Ways and means must be found by which the various existing national capabilities can be strengthened and brought together at the international level in support of the objectives shared by the international community. These efforts have already borne fruit: According to the *Human Security Report 2005*, the number of armed conflicts since 1992 has decreased by 40 per cent, and the death toll of recent wars and conflicts is much lower than it used to be during Cold War times (Human Security Centre 2005). This positive development is due not least to the crisis prevention efforts of the United Nations and the international community. Thus, this proves: crisis prevention, conflict management, and post-conflict peace-building are realistic concepts.

16 This is not to say, however, that traditional security policy has become obsolete: Interstate conflicts persist, state security continues to be high on the agenda, and the political control of weapons of mass destruction will remain a key problem in the years to come (Debiel/Werthes 2005).

The international community can tackle the complex present and future security challenges. But there remain immanent problems: there is no catalogue of indicators that make conflict and crisis predictable. Above all, crisis prevention activities cannot be translated into TV images because violence and suffering that have not happened do not make news. It requires a lot of persuasion to muster the political and financial means in order to prevent something that hopefully will never occur. And it is difficult to explain that these means have been crucial for effective prevention.

Internationally, the Action Plan is considered as pioneering due to its diversity and concreteness, and due to the establishment of mechanisms to implement the possibility of cooperation and coordination offered to civil society. In Germany, however, it has not reached far beyond interested expert circles into the general public, the media or even the majority of Parliament. Hopefully, the debate over the further development of a preventive security policy in Germany will gain momentum with the Report of the Federal Government on the implementation of the Action Plan.¹⁷ This could help to further improve the framework and institutional mechanisms of civilian crisis prevention. Especially the interministerial approach of the German Government's preventive policy should be paralleled in a more coherent cooperation of the respective commissions in the Parliament. Such improvements are necessary in a time when crisis prevention gains currency as a new policy field both nationally and internationally.

Despite these successes and best intentions, German policy is not yet sufficiently coordinated and cohesive under the primacy of crisis sensitivity and prevention. Governmental policy does not change overnight. It takes time for organizational thinking and bureaucratic routines to adjust to new priorities and procedures. Implementation of internal policy change is slow and incremental, but nonetheless crucial. Germany must continue to review, adapt, and improve its policies in this regard. Yet it can only succeed if all governments shift their priorities towards preventive policies, promote good governance, and engage civil society.

¹⁷ The report of the Federal Government on the implementation of the Action Plan was approved by the Cabinet on 31 May 2006 (Die Bundesregierung 2006).

58 Interfaces between Development and Security: Converging the Role of Development Policy and Security Policy?

Stephan Klingebiel and Katja Roehder

58.1 Introduction

'No development without security' is proving more and more to be a development-policy paradigm, one that calls for new approaches in the field of development policy. The discernible distance between development and military actors and their tasks of the past, has in recent years rapidly diminished. This applies to Germany, but also to most other bilateral donors and multilateral institutions, including the United Nations (Tschirgi 2004, 2006; Griffin 2003). Thus far, however, too little reflection and discussion has been devoted to its consequences.

The relationship between development and security is not a fundamentally new conceptual issue (see chapter by Uvin above). This applies also to the practical interfaces between various outward-oriented policies – above all development, foreign, and security policies. In the past, an aspect which has at least implicitly played an essential role has been the stable and peaceful environment that has to exist if development is to be possible. Earlier debates saw this relationship primarily as abstract interdependence.¹ The current debates since the early 2000's have focused more directly on convergence in conceptual and practical policy terms.

The present debate extends beyond practical relevance due to important changes in the concept of security. The state-centred security concept has given way to an entirely new concept. Security has fundamentally evolved in the international debate from a

concept which focused on the stability of the state to a protective approach related to the individual (Duffield 2006; Thakur 2006). Basic changes have been brought about by the debates in the United Nations (ICISS 2001; UN High Level Panel on Threats, Challenges and Change 2004; UN Secretary-General 2005). Although policy conclusions have not always been drawn, there is evidence of attempts in this direction. A clear example is the transformation of the former Organization of African Unity (OAU) into the African Union (AU) that has explicitly abandoned the principle of non-interference (Klingebiel 2006). The United Nations' decision in December 2005 to establish a Peacebuilding Commission (PBC), which will above all seek improved coordination among the various actors and integrated strategies in post-conflict situations, may also serve as a guide for the future (see the chapter by von Einsiedel/Nitzschke/Chhabra in this volume).

The present text looks at development – security interfaces from the angle of a wider concept of security that includes the definition and goal of human security.² To distinguish the overall goal of human security (a concept that is used in a number of different policy fields including development policy) from 'applied security' manifested in traditional military and security institutions, the terms 'security policy' and 'military (actors)' are used. 'Development' in the present text equally refers to the respective policy field and its actors.³ When talking about 'security' at the development-security interface, the physical integ-

1 The practical aspects of the civil-military relationship in the area of humanitarian aid have long been under discussion. This is true of the military side in two respects: it sometimes takes on logistical tasks (transport of aid supplies), and it is involved in the security situation in areas receiving aid. Both tasks have led to a long debate on the relationship between humanitarian aid and military actors.

2 Human Security means "the security of people against personal threats to safety and life" (Thakur 2006: 2), building on different types of freedom: "freedom from want, freedom from fear and freedom to take action on one's own behalf" (CHS 2003: 1); at: <<http://www.humansecurity-chs.org/finalreport/Outlines/outline.pdf>>.

rity of the individual and freedom from direct violence in crisis situations is at the heart of the debate.

Afghanistan, the Balkans, Liberia, and – for some donors – Iraq are topical examples for the growing closeness between development and security policy. The World Bank analysis *Breaking the Conflict Trap* (Collier/Elliott/Hegre/Hoeffler/Reynal-Quero/Sambanis 2003) documents the close mutual relationship between development policy and military engagement. The report assumes that development policy is in a position to provide help in lessening risks in post-conflict situations that could be sufficient to permit reductions in military presence.

The boundaries defining development-military cooperation are not always clearly drawn among the group of bilateral development actors. Traditionally, for members of the OECD Development Assistance Committee (OECD/DAC 2001) one of their top ‘no-go areas’ in terms of assistance was direct support for operational capacities of military actors. Furthermore, areas that are not officially classified as eligible for ODA (Official Development Assistance) are often exempted. The lack of clarity whether activities related to security-sector reform are eligible for ODA support highlights the reluctance by some development actors to fully embrace the new development-military ‘closeness’.

There are several reasons why the changing relationship between development policy and the military has entered the focus of public attention.

First, a significant number of so-called ‘protracted crises’ are characterized de facto by trusteeship rule – and therefore involve functions that extend beyond purely military tasks (e.g. Kosovo, Afghanistan, Iraq). These situations are often marked by efforts to stabilize fragile security, to restore effective statehood, and to embark on a course of economic and social recon-

struction (Ferdowski/Matthies 2003; Debiel 2002a). Nation-building tasks, already a major element of peace missions, are taking on a growing role in this context.⁴

Second, development policy is increasingly interested in gaining more constructive influence in post-conflict situations, and in some cases even expects contributions from the field of security policy and advocates or calls for military intervention to end violent conflicts. In April 2004, the German Minister for Economic Cooperation and Development called for peacekeeping troops to be sent to Darfur/Sudan⁵; and, in a 2003 appeal, international non-governmental organizations active in Afghanistan called for an expansion of the ISAF (International Security Assistance Force) mandate there.⁶

Third, other policy fields, above all foreign and security policies, are coming more and more to expect, and call for, an active involvement of development policy in post-conflict situations. Experiences made with past military missions are cited as reasons: As the *European Security Strategy* (ESS), prepared by the High Representative of the EU *Common Foreign and Security Policy* (CFSP) and approved by the European Council in December 2003, puts it, “In almost every major intervention, military efficiency has been followed by civilian chaos.”⁷

Finally, the growing number of overseas missions directly involving the German *Bundeswehr*⁸ have

3 ‘Development’ in this context best refers to ‘human development’ as defined by the Human Development Report: “Human development ... is about building human capabilities. ... The most basic capabilities for human development are leading a long and healthy life, being educated and having adequate resources for a decent standard of living. Other capabilities include social and political participation in society” (UNDP 2005: 18–19). Human development is intrinsically linked with human security. Three ‘mega-projects’ are on the agenda of present-day international development policy: (1) The Millennium Development Goals and poverty reduction, (2) the security agenda and (3) the Rio-Agenda with its focus on sustainability and global challenges (Faust/Messner 2005: 149).

4 King’s College 2003: 14: “Peace operations in their growing complexity have increasingly included state-building functions.”

5 “UN Blue Berets should monitor cease-fire in Western Sudan. Heidmarie Wiczorek-Zeul and Gerhart Baum call for lasting peace solution for Darfur region”, in: *BMZ press release*, 29 April 2004: 1.

6 International Rescue Committee 2003: “Afghanistan: A Call for Security”, at: <http://www.care.org/newsroom/specialreports/afghanistan/06172003_afghanistan.pdf>, 10 July 2006.

7 Council of the European Union 2003: 12. Also for the operations of other countries like the US, a serious lack of civilian capacity in peace and stability operations is identified and proposals are made to strengthen civilian functions; see e.g. United States Institute of Peace 2004.

8 Currently some 6,700 *Bundeswehr* soldiers are directly involved in missions abroad, including ISAF (International Security Assistance Force), KFOR (Kosovo Force), EUFOR (European Union Force) in Bosnia and Herzegovina and EUFOR RD CONGO (European Union Force République démocratique du Congo) (at: <<http://www.bundeswehr.de>>, 10 July 2006). The costs for these missions have increased more than tenfold between 1995 and 2003 (Klingebiel/Roehder 2004: 3).

served to move the overall spectrum of German policies and their potential scopes of action into public attention.

Germany thus provides a useful case study to explore the changing relationship between military and development actors and policies.

The relationship between civil and military actors includes civil actors, e.g. from foreign and development policy, and various instruments such as democratization and equipment aid, dispatch of civil peace personnel, humanitarian aid, police aid provided by civilian actors, or support for non-governmental organizations (NGOs), etc. Looking at the case of the development-military relationship, we find that interest in the civil component tends to focus on development-policy actors and instruments. 'Relationship' refers to all forms of interaction between the two groups of actors. That is, the term may encompass targeted cooperation strategies, a deliberately complementary approach, or unintended sequences of actions carried out by actors linked by a relationship structure. The present text thus sees the terms 'interface' and 'linkage' as synonymous.

This chapter discusses current challenges this new relationship poses for development policy. A number of examples, with special focus on Germany, serve to illustrate some ongoing changes (58.2). The chapter provides an overview of the different relations between development policy and military actors (58.3) as well as security policy and categorizes development-military interfaces (58.4) with a detailed discussion (58.5). Finally, it outlines some initial strategic reference models for development policy in its relationship to military actors and other externally oriented policy fields (58.6), and draws some conclusions (58.7).

58.2 Legitimacy of Military Missions as a Precondition for Development Policy in Post-conflict Situations

The mandates, and thus the legitimacy, of military missions play an important role in the development-military relationship in the debate on post-conflict situations. This applies to the engagement of some donors in Iraq as well as for the debate in Germany on the character of the German reconstruction efforts in the Kunduz Region of Afghanistan. The need for mandated military missions has today found widespread acceptance.⁹ Pre-emptive interventions, however, and other military activities without an adequate mandate, and thus without sufficient legitimacy under

international law, have attracted considerable controversy and are widely rejected.¹⁰ In general practice three categories of military operations may be distinguished, each based on a different type of mandate (based on Bothe 2003: 24f.):

1. Use of autonomous, unilateral state power (e.g. 2003 military intervention in Iraq).
2. Military operations led by parties other than the UN, covered by a UN Security Council mandate.¹¹
3. Original UN peace missions with classic monitoring, buffering, and aid mandates geared to restoring deficient state power.

Furthermore, in connection with UN peace operations (categories 2 and 3) we speak of different types of peace missions which are legitimized either under Chapter VI or Chapter VII of the UN Charter (based on a functional differentiation) (Kühne 2003: 716ff.; Debiel 2002b: 462ff.):

- *Traditional peacekeeping*, which is based on consensus and neutrality and provides only for self-defence measures (e.g. Sinai in 1950's; Cyprus in mid-1960's).
- *Multidimensional peacekeeping*, which is geared to the dynamics of processes and provides for an expansion of non-military functions (e.g. Namibia in 1989/90; Cambodia in 1992/93).
- *Robust peacekeeping* or peace enforcement, which also provides for a possible use of military force (e.g. in Somalia).
- *Peace support* and governance operations, where the assumption of political and administrative functions plays an additional important role (e.g. in Kosovo; East Timor).

Accordingly, international military peace missions are increasingly assigned nation-building functions. The concrete shape given to UN peace operations may vary considerably in this context. This applies as well for the profile defined for non-military and civil activ-

9 For a discussion from the view of development policy, see e.g. Collier/Elliott/Hegre/Hoeffler/Reynal-Querol/Sambanis 2003: 163ff.

10 See e.g. Center for Defense Information: "The U.S. National Security Strategy: A View from Europe" (Washington: CDI, 9 October 2002), at: <www.cdi.org/friendlyversion/printversion.cfm?documentID=1905>, 10 July 2006.

11 These would include *Operation Enduring Freedom*, which was legitimized by the UN Security Council under Resolution 1368 on combating all forms of international terrorism.

ities (including reconstruction) and the extent to which a mandate covers protection of the civilian population (ICISS 2001). Apart from the mandate, though, this also depends on the capacities available to a mission, as we have seen in cases of missions that have proven problematic (Kühne 2003; Debiel 2002b). The 2000 Report of the Brahimi Commission, which was written on behalf of the UN Secretary-General, goes in detail into the experiences made by UN peace missions and calls on the UN to give greater weight to the civil component of peace missions (Brahimi-Report 2000).

The type of military engagement is also a highly relevant factor for development policy decisions. Thus, there should be no doubts as to a military mission's legitimacy and mandate under international law before development policy considers getting involved in reconstruction efforts (Federal Ministry for Economic Cooperation and Development 2004: 10f.).

58.3 Perspectives of Different Actors Involved

The development-military relationship is influenced by national factors such as the closeness, or distance, between development policy and foreign policy, the share that humanitarian aid and emergency relief account for in the work done by development co-operation, and national traditions and experiences made with military interventions (table 58.1).

Viewed from the *perspective of development policy*, closer convergence and/or cooperation with the military involves a number of risks and chances (Picciotto 2004: 1-3). It may be assumed that improved mutual understanding leads to greater coherence in reconstruction efforts in post-conflict countries. Development policy could contribute more of its specific strengths and competences for purposes of decision-making in the fields of military and foreign policy. It could tap the know-how of military actors for its own work, e.g. in the field of security-sector reform. Furthermore, a military presence could provide for a more stable security situation on the ground that would benefit development policy.

But there are also risks involved due to the possibility of military dominance and a diminished influence of development-related concepts in connection with short-term political or military missions. It is argued that development policy could share responsibility for a military strategy in cases in which such a strategy lacks sufficient legitimacy or acceptance. Develop-

ment policy actors might in this case also be faced with the risk of becoming targets of armed attacks (soft-target debate).¹²

In the framework of the new peace missions, like those in the Balkans and Afghanistan, the military is becoming increasingly involved in carrying out genuinely civil tasks. In the framework of the concept 'Civil-Military Cooperation' (CIMIC) both the Bundeswehr and NATO routinely conduct strategically conceived civil reconstruction projects (in the sense of 'force protection') that impact on development policy. While increasing the acceptance of military presence in conflict areas, military actors nevertheless see the risk of a watering down of their military mandate (so-called *mission creep*) (Braunstein 2001: 37-46; Hardegger 2003; Heinemann-Grüder/Pietz/Lipp 2003).

Development and humanitarian NGOs, taking up the debate underway in the field of humanitarian aid, have engaged in an intensive discussion over the complexities involved in the military-civil relationship. European NGOs in particular, pointing to the principles of neutrality and impartiality, largely reject cooperation with military actors and voice criticism of any blurring of the boundaries between military and civil aspects (VENRO 2003; Barry/Jefferys 2002).

In international comparison, the situation among donors varies. German development policy has had a tradition marked by a relatively distanced relationship to security policy and military actors, while in the United States (US), for instance, the examples of Afghanistan and Iraq are illustrations of the way in which development policy may assume a role immediately supportive of strategic military goals. Any clear-cut separation of the tasks of development policy and the military is difficult (Fitz-Gerald 2004: 17). The United Kingdom (UK) has been innovative in inter-ministerial action where development policy has retained, or indeed even enlarged its self-assured role. This also applies to the new mechanism of joint conflict prevention pools (DFID/FCO/MOD 2003, 2004).

58.4 Development-Military Interfaces

In recent years the interfaces and overlaps between development policy and the military or security policy

12 In recent years an increasing number of development actors (NGOs, etc.) became targets of violent actions. Staff is sometimes kidnapped or killed. Security risks are an issue for development policy.

Table 58.1: Chances and risks of development–military cooperation from the perspective of the different actors involved. **Source:** authors.

Actor	Chances	Risks
Development policy	<ul style="list-style-type: none"> - Security and stability as the <i>sine qua non</i> for the development of the country affected - Security as a condition required for the engagement of development policy - Constructive influence on security strategies - Influence on approaches adopted by military actors in areas relevant to development policy - Coherence of overall policy, including consideration of aspects relevant to development policy 	<ul style="list-style-type: none"> - Risk that development policy may find itself subordinated to a military strategy as well as to short-term political considerations - Security risk in that development policy may find itself in the position of a target of attacks - The possibility that involvement of development policy may serve to legitimize and support military interventions - Risk of public criticism along the lines: ‘Development policy providing military assistance’ - Resources may be diverted from the ‘core business’ of development policy (i.e. long-term tasks) - Resources used for non-civil tasks are not eligible for recognition as ODA - Regional reorientation of development policy - Possible inability to adhere to principles of development policy
Military	<ul style="list-style-type: none"> - Greater acceptance on the part of the local population due to better planning of civil activities - Access to additional (development policy) resources (financial, advisory, implementation) 	<ul style="list-style-type: none"> - Possibility of mission creep when the military takes on a growing number of civil tasks on the ground - Demands for more transparency/disclosure of military strategy vis-à-vis third parties - Parallel command structures and, possibly, restriction of powers of discretion on the military side
NGO	<ul style="list-style-type: none"> - Complementary and effective approach in acute crises based on purely subsidiary aid provided by the military - Depending on the concrete case, a more secure setting for the implementation of projects and programmes. 	<ul style="list-style-type: none"> - Loss of impartiality and neutrality - Security risk (NGOs as a soft target) - Diversion of funds to countries in which military missions are underway.

have grown dramatically. They can be classified in four categories.

1. Security and Stability as framework conditions: Security and stability are essential conditions for development policy. In most post-conflict situations these framework conditions, needed by development actors for their reconstruction work, rely on the stability and security provided by military measures. Ongoing conflicts are marked by the following additional aspect: as representatives of international engagement, aid organizations are increasingly becoming direct soft targets for local conflict parties. In Afghanistan and Iraq, this situation has become dramatic

because the international conflict parties are blurring the lines between military and civil activities.¹³

2. Strategic planning and conception: A second field deals with strategic planning and conception, including general concepts, individual country and regional policies. In Germany these interfaces are concerned with information-sharing and development of joint strategies.

13 See e.g.: Humanitarian Practice Network: “Iraq and the crisis of humanitarian action”, at: <<http://www.odihpn.org/report.asp?ID=2616>>, 10 July 2006; Stapleton 2003.

- *Inter-ministerial cooperation and mechanisms* serve the purpose of information-sharing and development of joint strategies in and among the various policy fields concerned. In this inter-ministerial cooperation the German Federal Ministry for Economic Cooperation and Development (BMZ) has been able to bring its influence to bear on cross-cutting government concepts and the formulation of country strategies. The BMZ has played a role in shaping the structure of the German reconstruction teams currently deployed in Kunduz and Feyzabad (Afghanistan), as well as on the formulation of the mandate for the military component involved. The mechanisms of cooperation include, among others, the Federal Security Council, ministerial consultations, and in particular inter-ministerial cooperation, e.g. coordination of the German contribution to the G8 Africa Action Plan (GAA).
 - *Deliberate integration and subordination of development policy in short-term political and military strategies* would include in particular the extensive use of instruments of development policy, but also of humanitarian aid, in the framework of military approaches, e.g. in US Provincial Reconstruction Teams (PRTs) in Afghanistan.
3. Funding: This is concerned with various situations involved in funding for non-civil measures and missions as well as civil activities conducted by the military.
- *Development policy funding for non-civil measures and missions*: There are several current examples which can be viewed as a shift of the boundaries defining the traditional practices of development policy. For instance, €5 million of un-disbursed funds were made available from the *European Development Fund* (EDF) to support the *Economic Organization of West African States* (ECOWAS) peace mission in Liberia (Klingebiel/Roehder 2004: 15). In November 2003 the decision was taken to set up a Peace Facility for Africa (an initial €250 million) that is to be financed from the EDF and used to fund non-civil peace missions in Africa.¹⁴
 - *Development-policy funding for civil activities conducted by the military*: One example is the BMZ's funding of CIMIC measures conducted by the *Bundeswehr*.
 - *Military competition for development funds*: To conduct CIMIC measures, the military competes with the *Deutsche Gesellschaft für Technische Zusammenarbeit* (GTZ) or NGOs for funds in humanitarian aid and development assistance.
4. Operational approach: This last field covers a variety of different operational approaches.
- *Interministerial projects*: The German support for the *Kofi Annan International Peacekeeping Training Centre* (KAIPTC) in Accra/Ghana is seen as a pilot project for the development of a coherent and inter-ministerial concept involving the German Foreign Office (AA), the Federal Ministry of Defence (BMVg), and the BMZ.
 - *Military conduct of typical development co-operation measures*: This may be observed above all in the framework of CIMIC (e.g. in the field of vocational training).
 - *Military provision of concrete protection functions for development policy actors and measures and benefits of an improved security situation*: Apart from the general role played by the military in the field of security, concrete forms of cooperation may also develop on the ground.
 - *Cooperation in training and capacity-building*: In various contexts military and development policy actors are involved, on a reciprocal basis, in training and capacity-building functions as well as in dialogue forums, e.g. in the framework of the German *Federal College for Security Policy* (BAKS), the *Bundeswehr Command and Staff College* (*Führungsakademie der Bundeswehr*), or the course on 'Civil-Military Cooperation Abroad' (ZMZA) offered by the *German Academy for Crisis Management, Emergency Planning and Civil Defence* (AKNZ).

58.5 Debate on Development-Military Interfaces

There are several examples of current relevance representing closer cooperation between civil and military actors.

¹⁴ Details at: <http://eur-lex.europa.eu/LexUriServ/site/en/com/2003/com2003_0638en01.pdf>, 10 July 2006>.

58.5.1 Military and Development Actors in Afghanistan

The strategy of using reconstruction teams to stabilize the security situation and accelerate reconstruction in Afghanistan is an important precedent. The PRTs of the US are an example of integrated civil-military 'units' used directly to integrate reconstruction activities within the US military strategy. In its reconstruction team in Kunduz, Germany is relying on a three-pillar concept consisting of independent but coordinated sectors (development policy, foreign policy, defence) to deliberately distinguish its approach from that pursued by the US (Klingebiel/Roehder 2004: 23ff.).

58.5.2 Proactive Inter-ministerial Cooperation in the UK

The UK has been working with a proactive cooperation model which provides for strategic cooperation between development policy and the military within the *Conflict and Humanitarian Affairs Department* (CHAD) of the *Department for International Development* (DFID) and by developing an inter-ministerial strategy and funding instrument (so-called Conflict Prevention Pools) for the government's conflict-related work abroad (Fitz-Gerald 2004: 13ff.; Klingebiel/Roehder 2004: 29ff.).

58.5.3 Intensive EU Development-Military Cooperation

The rapid pace of developments at the European level is of importance for future development-military interfaces. In the European Union there are a number of approaches that – building on the 'Programme for the Prevention of Violent Conflicts' (Gothenburg 2001) – are aimed at expanding the EU's civil and military capacities and – in particular – their combined use (Brauch 2003f: 257–258). The task facing the *Common Foreign and Security Policy* (CFSP) and the *European Security and Defence Policy* (ESDP) is to systematically integrate the whole of the EU's external relations (see chapters by Mosca Moschini; Hintermeier, Katseli in this volume), including development policy (Child 2003). One element of great importance to the EU's overall external relations is the *European Security Strategy* (ESS) adopted by the Council in December 2003. Given the new threats analysed in the document, one of its main concerns is civil-military cooperation. The Union, it states, "could add par-

ticular value by developing operations involving both military and civilian capabilities" (Council of the European Union 2003: 13).

58.5.4 Kofi Annan International Peacekeeping Training Centre

The Kofi Annan International Peacekeeping Training Centre (KA IPTC) in Ghana was set up in 1998 as a regional training centre with the aim to tap Ghana's experience in peace missions and make it available to other African countries. The training programme includes e.g. courses on military-police tasks as well as preparatory training for military observers. Germany is using various instruments to support the development of the KA IPTC in the framework of its G8 Plan for Africa:

- Development of a course model on the use of civil forces for peacekeeping; the project is being funded by the BMZ and implemented by the Berlin *Zentrum für Internationale Friedenseinsätze* (ZIF), the Centre for International Peace Missions; the GTZ is responsible for handling and implementing the project.
- The German Foreign Office funds are being used to construct and equip the Centre; the Federal Ministry of Defence is responsible for implementing the measures.
- Support for training operations is provided by a German *Bundeswehr* instructor specialized in the field of civil-military cooperation. In Germany, African training personnel are trained by the Federal Ministry of Defence and the German Foreign Office.

58.6 Defining the Position of Development Policy

58.6.1 Development Policy Engagement in Post-conflict Situations: Interest in Coherent Approaches

Due to its limited options for external actors, development policy has important and useful means to potentially contribute to addressing challenges that typify the security challenges of fragile states. It can help restore effective statehood and embark on the process of post-conflict economic and social reconstruction. This is the case given the fact that peace missions have grown increasingly complex in nature.

Against this background, development policy has a fundamental and strategic interest in shaping its interfaces with other external policy fields, including security policy. A crucial task facing development policy is to define its position on the character and shape which should and can be given to this process. This is not to rule out the possibility of tensions and occasional differences in perception regarding individual regions or countries.

Development policy not only has a fundamental interest of its own in comprehensively shaping its interfaces with foreign and security policy. Outside pressure aimed at inducing development policy to 'fall into line' and show more 'flexibility' has grown dramatically. This is clearly illustrated by the crucial cases of reconstruction efforts in Afghanistan and funding for military peace missions from development funds (e.g. in Liberia). But there are a number of possibilities for development policy by engaging in more intensive cooperation with other externally-oriented policy fields to exercise constructive influence in terms of coherence with development goals.

58.6.2 Sensitive Areas

Not all development-military interfaces are fundamentally problematic in nature. But it is possible to identify four sensitive areas from the perspective of development policy that must be taken into consideration in efforts to shape these interfaces:

1. *Subordination of development policy to a military logic*: Any subordination of development policy to military contexts or short-term action constraints that deprive development policy of its say on the 'whether' and 'how' of policy is highly problematic (examples: the embedded role of development policy in the PRTs conceived and set up by the US; the extremely narrow options of development policy after the war in Iraq in 2003).
2. *Implementation by the military of measures with a development character*: In this area development policy actors find fundamental reasons for operational criticism and call for the principle of 'subsidiarity' to continue playing a central role. As far as the field of humanitarian aid is concerned, the relevant actors have defined clearly outlined exceptions in which the military may be allowed to assume certain tasks (Barry/Jefferys 2002: 15ff.). For the spectrum of functions of develop-

ment policy there appear to be no such reasonable exceptions for the military.

3. *Development policy as a source of funding for military missions*: Taking into consideration the imbalance between development and military budgets, development policy will have to refrain from funding military missions (by partner countries and organizations) both in principle and in the individual case. While on the one hand there are legitimate funding needs in the field, and these needs are evidently – one need think here only of the EDF-Liberia debates¹⁵ – not covered by specific and suitable budget lines (above all in the framework of CFSP/ESDP), development policy on the other hand will not be able to fill this gap, since this is beyond its scope.¹⁶
4. *Development policy as a source of funding for civil activities conducted by the military*: Since civil activities of the military are generally geared to achieving higher-level goals (force protection) that have little to do with the goals of development measures, development policy does not seem to be the appropriate source of funding.¹⁷

A number of problems faced by development policy in post-conflict reconstruction – e.g. the question of whether or not it is possible to enforce development policy principles in such situations – are primarily due not to the presence of military but to difficult starting conditions encountered in the countries affected.

58.6.3 Principles of Development Policy

Any more pronounced linkage with military components may have direct implications for fundamental principles of development policy. Two sets of principles may be distinguished: (1) general principles (civil character of development policy and 'do no harm') and (2) development policy principles with impacts at the operational level (sustainability, long-term character, partner orientation and ownership). Closer con-

15 In 2003 a sum of €5 million was used from the 8th European Development Fund for support of the ECOWAS (Economic Community of West African States) military mission in Liberia.

16 The imbalance between development and military budgets is reflected in numbers: "Aid still uses only seven percent of the resources absorbed by the military worldwide (\$56 vs. \$794 billion)" (Picciotto 2004: 2).

17 This is not to say that civil measures conducted by military actors may not be legitimate or appropriate and useful in view of concrete situations on the ground.

tact between development and military actors need not necessarily mean any curtailment of these principles; but in this case three fundamental conditions must be given:

- Acceptance of the military by both the local population and conflict parties.
- Independence of development policy activities from military actors.
- Clearly outlined cooperation based on division of functions and limit in time.

58.6.4 Strategic Reference Models

There are three strategic models that are conceivable for development policy to position itself *vis-à-vis* security policy and military actors:

1. *Distance Strategy*: The aim of a distance strategy is to retain the historically and socially conditioned distance between development policy and security policy and military actors. The expected advantage would be a relatively large ministerial autonomy for decisions taken largely based on development policy considerations, i.e. involving the possibility to reach decisions without having to focus unduly on foreign policy and short-term political constraints. Development policy would be free to concentrate on longer-term tasks, including the realization of the Millennium Development Goals.

The potential risks of such a strategy would include the possibility that, given the important political challenges involved in central conflicts (e.g. Afghanistan), any pronounced distance strategy might cast doubt on the relevance of development policy. In this case development policy would lose its ability to constructively shape elementary framework conditions (security) and some of its influence on security and foreign policy strategies concerning such countries.

2. *Cooperation Strategy*: Based on far closer coordination and joint approaches with foreign and security policy actors, a cooperation strategy would seek to give more weight than in the past to the concept of 'development through security'. The expected advantage would be a strategy fully coherent with overall policy where development policy would contribute its interest and concerns to bear on security-related military thinking and approaches.

The potential risks of such a strategy would include the possibility that development policy would have to make many compromises and concessions on principles as well as on concrete approaches due to short-term and military considerations. Development policy would share greater responsibility for military

actions, and it would have to reconcile the risk that other actors might seek its cooperation not least with an eye to existing financial resources, and that these resources would thus no longer be available for the current long-term development policy.

3. *Complementary Strategy*: A complementary strategy would aim for goal conformity and, in strategically selected fields, a complementary approach involving security and foreign policy actors. This would be an interrelated and thus mutually complementary approach that would not entail any overlaps between both fields. The military would define its tasks to ensure that they do not include any development policy measures; and development would ensure that it does not take on or fund any non-civil tasks. The advantage would be an approach which, compared with a distance strategy, would be more coherent and effective without blurring the lines between different tasks and spheres of responsibility.

One potential risk of this strategy would be the possibility that development policy might find itself harnessed to overriding considerations of other policies (e.g. security and/or foreign policy) and see at least some of its interests and concerns sidelined.

The advantages and significance of these three reference models depend on the interface in question. They could seek orientation along the following lines:

- *Complementarity* for the interface 'Security and stability as framework conditions for development policy': In this area close coordination is appropriate, indeed essential in many cases, although it should focus primarily on information-sharing. One essential principle here is a clear division of tasks. Cooperation, on the other hand, would entail an overlapping approach of the kind involved in direct military protection (e.g. escorts).
- *Complementarity to cooperation* for the interface 'Strategic planning and conception': Many situations call for a complementary or even a joint strategic approach.
- *Complementarity* for the interface 'funding': A prudent approach to the funding of non-civil measures and missions as well as for the civil activities of military actors involves complementarity, but not overlapping. Approaches or individual activities can and should be planned jointly, although funding should be based on the specific tasks and areas of responsibility of the policy fields involved.
- *Case dependence* for the interface 'operational approach': Here the benefits derived from joint interfaces concerned with operational matters will

depend in very large measure on the individual case. Accordingly, action strategies should be chosen on an individual basis.

58.7 Conclusion

Development policy and military actors and/or security policy share an increasing number of indirect and direct points of contact as well as fields of possible cooperation. In the past some of these points of contact hardly even entered the minds of the actors involved. These interfaces and overlaps have grown dramatically in recent years. Development policy is on its way to defining for itself a responsibility for overall policy that goes far beyond its present tasks and competences.

While there is reason to welcome many of these points of contact, serving as they do to enhance the overall coherence of given policies, we can at the same time pinpoint some sensitive areas that pose an inherent risk of instrumentalizing development policy and blurring lines of competence.

For development policy actors, these results reflect the general predicament in the current agenda of security and development, characterized by two opposite trends: On the one hand the widening of the security concept across the disciplines to encompass all aspects of human security; on the other hand the tendency of a 'securitization' of development issues. While, for example, the discussion on backgrounds of certain crisis situations includes the whole range of social, political or economic factors, the debate on what action should be taken is dominated for the most part by rather narrow security and military aspects.

The future concern of development policy must be to define its position on shaping the interfaces with other externally-oriented policy fields. This process should accord greater weight to development policy considerations in areas of concern for security policy. As far as reconstruction efforts are concerned, legitimacy of military missions must always be a precondition when development policy engagement is considered.

Facilitating more effective action entails overcoming the gulf previously existing between development and security policy, and civil and military activities. Often fragmented approaches present a serious obstacle to more effective contributions. This applies equally to governments and international organizations both with broad mandates (relationship be-

tween UN development organizations and DPKO [Department of Peacekeeping Operations]), or comparatively 'narrow' ones (NATO in defence policy).

However, it should be noted that greater alignment and cooperation between development policy and the armed forces does not automatically lead to a resolution of potential conflicts of interests in the goals set or prevent diverging perspectives. The allocation of ODA resources varies (by country and region) depending on whether the assistance is targeting the Millennium Development Goals (poverty reduction, absorption capacity, performance, etc.) or the reduction of threats to security and stability (actions of those in power, fragility of the state, or limited monopoly on the use of force, etc.).

59 European Security in the 21st Century: An Institutional Perspective

Sven Biscop

59.1 Introduction

From an institutional perspective, the major post-Cold War development for European security is the emergence of the European Union (EU) as a security actor in its own right. This was prompted by the end of the Cold War and the disappearance of the Soviet threat, which allowed for the development of autonomous European policies, distinct from the US, and by the confrontation with Europe's own grave limitations when forced to deal with the civil war in former Yugoslavia. Starting with the creation of the Common Foreign and Security Policy (CFSP) by the Maastricht Treaty, which entered into force in 1993, the EU has set an increasingly clear, ambitious and, arguably, distinctive security agenda. This culminated in the adoption of the European Security Strategy (ESS) (European Council 2003). The first ever strategic document guiding the full range of EU external policies, it unambiguously sets forth the global vocation of the EU, including in the field of security (Bailes 2005). The ESS outlines a holistic approach, integrating security and the other dimensions of foreign policy, from aid and trade to diplomacy. 'Hard' security is included in the EU's purview, as in 1997 the so-called Petersberg Tasks were included in the Amsterdam Treaty: autonomous EU humanitarian, rescue, peacekeeping and peace enforcement or crisis management operations. In other words, the EU can legally undertake all military operations except for collective territorial defence. At the same time, the EU is continuing to build the institutions and capabilities allowing it to fulfil those ambitions. Since long a global economic power and, if the Commission and the Member States are combined, the world's largest donor of development aid, the European Security and Defence Policy (ESDP) from 1999 onwards has added deployable military and civilian capabilities to the EU toolbox. The 2003 Nice Treaty institutionalized the Political and Security Committee (PSC) as the linchpin of the CFSP. If the idea to transform the office of High Representative

for the CFSP, created in Amsterdam, into an EU Foreign Minister has been frozen by the impasse on the draft Constitutional Treaty, nevertheless the EU has since created a European Defence Agency (EDA).¹

The arrival of a new actor on the security scene has major implications for the European as well as for the global security architecture. It leads to immediate questions with regard to the division of labour between the EU and the other European security organizations, the North Atlantic Treaty Organization (NATO) and the Organization for Security and Co-operation in Europe (OSCE), and the compatibility of their security strategies.² This debate again has immediate consequences for the relationship between the EU and the United States and, as NATO has left the 'out-of-area debate' behind it and like the EU can now also operate across the globe,³ for the global security architecture. Furthermore, the ESS accords a central role to the United Nations (UN) and in particular to the Security Council (UNSC) as the core of the collective security system, to which the EU therefore aims to contribute. Starting from the objectives and principles outlined in the ESS, this chapter will assess how the European and global security architecture could accommodate this evolution. After conceptually analysing the holistic approach of the EU, the chapter will assess to which extent this approach is comple-

1 For an overview of this development see Bretherton/Vogler (2006) and Howorth/Keeler (2005).

2 Under the Maastricht Treaty, the Western European Union (WEU) functioned as the military arm of the EU, but with the creation of ESDP the EU has directly assumed that operational role. The WEU is now defunct as an operational organization but continues to exist because of the symbolic importance of the collective defence commitment in Article V of the Modified Brussels Treaty (MBT). The WEU Assembly also still convenes.

3 For the EU this has of course always been the case, in all policy fields, as the Treaties never included any geographical limit.

mentary to the general strategies of the OSCE, NATO and the UN, and how the EU could cooperate with each of these institutions in order to maximally valorize that complementarity. The approach will be institutional and political rather than legal.

59.2 The Holistic Approach of the ESS

The ESS can best be characterized as a holistic, integrated or comprehensive approach (Biscop 2005). The overall aim is 'effective multilateralism'. This amounts to effective global governance, which can be conceptualized through the notion of *global public goods* (GPG) (Kaul/Grunberg/Stern 1999). Starting point is the assumption that there are a number of 'goods' that are *global* or *universal* in the sense that it is generally felt – at least in Europe – that every individual is entitled to them.⁴ Like in the 'human security' approach, the individual is thus the point of reference. These goods are *public* in the sense that their provision cannot be left to the market but should be supervised by government at the different levels of authority (local, national, regional and global). Global governance is effective if it can ensure everyone's access to the core GPG. If to a certain extent the definition of the core GPG is a political and normative choice – Rotberg (2004) uses the term 'political goods' – many elements have been recognized as being universal beyond any doubt, notably in the field of human rights.

The core GPG can be grouped under four broad headings:

- physical security or 'freedom from fear';
- political participation, the rule of law, and respect for human rights and fundamental freedoms;
- an open and inclusive economic order that provides for the wealth of everyone or 'freedom from want';
- social well-being in all of its aspects – access to health services, to education, to a clean and hazard-free environment, etc.

These GPG are strongly interrelated: ultimately, one cannot be ensured or enjoyed without access to the

other; the four categories are therefore equally important. The most important foreign and security policy challenge is the ever growing gap between haves and have-nots in terms of access to the essential GPG, because this is a challenge of a *systemic* nature, i.e. it results from the malfunctioning of, and impacts on, the global order itself. This systemic malfunctioning has many dimensions, e.g.: continuing trade liberalization without regard for social and ecological conditionalities is unable to evenly distribute the benefits of globalization and fundamentally improve the living conditions for most people in the developing world; the system is rarely able to effectively prevent crisis and conflict; and many crises and conflicts remain unaddressed, as the will to intervene is often limited, unless economic interests are at stake, which create an impression of arbitrariness. Unless global governance can be rendered *more* effective in order to alleviate this situation, at a certain level of inequality, the resulting political upheaval, extremisms of all kinds, economic uncertainty and massive migration flows will become uncontrollable and fundamentally undermine the system. Ultimately, maintaining Europeans' access to GPG thus requires improving others' access: globalization means interdependence. The status quo should not be an option, as it denies a large share of the world's population access to the core GPG and thus contains the root causes of instability. Against this background, specific politico-military challenges do stand out. They include regions of chronic tension and long-standing disputes and conflicts, failed states and civil wars, proliferation of weapons of mass destruction (WMD) and excessive militarization, and terrorism. These challenges have to be tackled head-on, but as they are symptoms of the 'dark side of globalization', effective global governance must be pursued at the same time as the key to *preventing* such threats. From these holistic underpinnings result a number of principles of EU foreign and security policy.

The first is *integration*. Because the core GPG are inextricably linked together, action must be undertaken to address all of them simultaneously and in a coordinated fashion, by all relevant actors, in all fields of external policy, putting to use all the instruments at their disposal, including trade, development, environmental, police, intelligence and legal cooperation, diplomacy, and security and defence. Dealing with all of these dimensions, which are equally important, requires coherence within the EU system. In the words of the ESS:

4 GPG are sometimes defined more narrowly as comprising only those public goods which cannot be provided but through international cooperation, excluding public goods of which the State is or should be the main provider, such as education or political participation. See, e.g. the International Task Force on Global Public Goods, at: <<http://www.gpgtaskforce.org>>.

Spreading good governance, supporting social and political reform, dealing with corruption and abuse of power, establishing the rule of law and protecting human rights are the best means of strengthening the international order.

The second principle is that by thus addressing the root causes of conflict, a policy oriented on the core GPG emphasizes *structural conflict prevention*. This presents a formidable challenge: it implies dealing with more issues, related to the entire core GPG, at an earlier stage, before they become security threats. Effective prevention is much more than mere appeasement: it demands a proactive stance, aiming to change circumstances that induce instability and conflict. Linking aid and trade to economic, social and political reforms via conditionality mechanisms, the EU thus effectively seeks to export its own model and change whole societies (Duffield 2002). A policy oriented on GPG will thus in fact be quite intrusive, which can make it rather contentious with the target countries (Hurwitz/Peake 2004). But as it is in the very nature of GPG that pursuing them is in the mutual interest of all concerned, it is at the same time a very positive approach, contrary to other, threat-based strategies. ‘For whom’ rather than ‘against whom’ is the question that determines policy.

Thirdly, as effective action in all policy fields concerned requires the cooperation of a wide range of actors at many different levels, a GPG-oriented policy implies *multilateralism*: an intricate web of states, regimes, treaties and organizations, i.e. multi-level governance, implicating all levels of authority in a coordinated effort to improve people’s access to GPG. Next to its internal coherence, the EU must thus increase its coordination with the other elements of the system. Although in the spirit of human security the individual is taken as point of reference, the state remains a primary partner, for no effective arrangements can be made with weak and failed states. Third states are therefore seen as partners for cooperation rather than as mere subjects of EU policies; the aim is to influence rather than to coerce, to use the carrot rather than the stick. There will be cases where the use of force is inevitable, for not all actors are amenable to preventive initiatives and security threats will arise. An effective military capacity must thus be part of the EU’s toolbox. But in the framework of multilateralism, the use of force can only be a measure of last resort to be mandated by the UNSC. The UN is thus at the core of the EU approach.

These principles have now been codified by the ESS, which increasingly serves as a reference frame-

work for day-to-day policy-making (Biscop 2006), but were in fact already observable in EU policy practice since the mid 1990’s, notably in the many partnerships which the EU has built with other States, regions and organizations. Rather than widening its understanding of security therefore, the EU has deepened its foreign policy by integrating the ‘hard’ security dimension into it. For the EU, ‘9/11’ and the subsequent events confirmed the validity of its holistic approach, proving that military power alone cannot prevent nor provide a durable response to security threats.

59.3 Reluctant Partners: EU, OSCE and NATO

59.3.1 From Forgotten Actor to Strategic Partner: OSCE

Looking at the other European security organizations, it is clear that the strategic objectives and general approach of the OSCE are strikingly similar to those of the EU. The OSCE was of course one of the first to define a comprehensive and cooperative concept of security (see the chapter by Wohlfeld in this volume), which is reflected in its three-basket structure. Yet neither in the public debate nor in the Brussels policy-making scene is the OSCE a major topic. One result of the institutional developments in Europe is that the OSCE has been pushed off the stage. Partly, this is also a result of the organization’s own inability to overcome divisions within its membership, which have had a paralysing effect. Rather than seeking to profile itself vis-à-vis the OSCE, the EU often simply seems to ignore it, developing its own policies and capabilities and deploying missions in areas where the OSCE has been active for a long time. The EU is thus seen for example as the leading actor determining the political future of the Balkans, while the large OSCE presence in the field is often overlooked. In the ESS, the OSCE is mentioned only very briefly, on a par with the Council of Europe: “For the European Union, the strength and effectiveness of the OSCE and the Council of Europe has a particular significance.”

Obviously, if anywhere it is on the European continent – in its ‘neighbourhood’ – that the EU has a major role to play. It is also true that the OSCE is active in certain fields where other actors can now act more effectively and efficiently. Yet the question is whether by ignoring the OSCE, the EU does not overlook that in a number of fields the OSCE has invaluable exper-

tise that could help the EU achieving its own objectives. This is not to say that today there is no coordination: the troikas of both organizations meet twice annually, there are staff-to-staff contacts and there is concrete cooperation on specific projects in many countries. What is missing though is effective coordination at the *strategic* level, i.e. on the long-term objectives to be achieved and the main instruments to be applied to those ends.

This holds especially true for the EU's ambitions towards its near-abroad, notably the European Neighbourhood Policy (ENP), its new framework for dealing with its neighbouring states (Smith 2005). The ENP is a valuable attempt to implement the holistic approach. It operates on the basis of 'positive conditionality'. With each target State, the EU negotiates a consensual bilateral Action Plan, in which political, social, and economic reforms and security cooperation are to be linked to increased free movement of persons, goods, capital and services ('the four freedoms'). Like the OSCE, the ENP is thus also based on a cooperative approach, requiring the voluntary subscription of each partner State. It is easy to see that on the EU's continental neighbours the OSCE can bring a wealth of experience and expertise to the table which the EU has yet to acquire. In many of these countries, the OSCE has a long-established and large-scale presence, while the EU's presence in the field for the time being is limited. With its norm-setting experience, the OSCE could thus help the EU in designing realistic objectives and benchmarks and in negotiating the consensual Action Plans. Even more importantly, through its missions and delegations, it could then collaborate in a very constructive way with the target States in helping them to meet those objectives. The OSCE could thus also profit of the increased leverage resulting from an EU-provided carrot to stimulate cooperation and reform, to the benefit of both organizations' objectives.

Such constructive cooperation could further meet the criticism by some countries of the Commonwealth of Independent States (CIS) that the OSCE missions focus too exclusively on monitoring human rights and democratic institutions, to the detriment of supporting the governments of the target States (Wohlfeld/Pavlyuk 2004), although of course political participation, respect for human rights and the rule of law constitute an important dimension of the ENP Action Plans. At the same time, in the framework of the OSCE the target States are not mere recipients of aid, but sit around the table as equal partners. So do the US and Russia, which makes the OSCE into a

unique, but as the Panel of Eminent Persons (2005) has pointed out, underused forum for comprehensive and inclusive political dialogue. The OSCE has the potential to function as the multilateral complement to the bilateral ENP, in a similar manner as the Euro-Mediterranean Partnership complements bilateral relations with the EU's southern neighbours.

Such far-reaching cooperation between the EU and the OSCE demands more than limited staff-to-staff contacts and ad hoc cooperation on specific countries. Based on the fundamental similarity of their strategies, it requires alignment of their general approaches as well as the structural integration, on a country-by-country basis, of their programmes and actions in all fields covered by the Action Plans. This effectively amounts to a *strategic partnership* between the two organizations. At the same time, the OSCE itself would benefit from a refocusing of its activities on those areas where it has real added value, withdrawing from fields that are better covered by other actors. Such a partnership might be regarded as the instrumentalization of the OSCE for EU purposes, but the point is that both organizations' purposes are similar, whereas the alternative seems to be for the OSCE to just languish on. The States that are most critical of the OSCE, like Russia, must realize that continuing to block the functioning of the organization will only contribute to the centre of gravity shifting even further to organizations of which they are not a full member, notably the EU and NATO.

59.3.2 Rebalancing an Alliance: NATO and the US

A look at NATO leads to a very different picture. Of course, as a military alliance, NATO cannot pursue policies on all of the core global public goods, although it has recognized the necessity of a comprehensive approach, following the operational experiences of Afghanistan and Iraq. More fundamentally however, under the George W. Bush Presidency - although it can in fact be traced back to the end of the Cold War - a strategic divide has arisen between the EU and the dominant power in NATO, the US. The EU and the US view the world very differently - to the US the world is dangerous, to the EU the world is complex, as a European diplomat worded it - which leads to very different responses. That the ESS was adopted in itself is the clearest indication of what is seen as the dilution of the consensus on a common purpose between all NATO Allies (FAES 2005). The emergence of the EU as a security actor in its own

right, even though not – yet – a consistently united one, constitutes a new structural factor in transatlantic relations. But because this development coincided with NATO's own reorientation towards global crisis management, creating complete overlap with the ESDP,⁵ it is also the core of a permanent debate and competition between the two organizations, which haunts policy-making ever since the early 1990's (Burwell/Gompert/Lebl/Lodal/Slocombe 2006; Dobbins 2005; Moravcsik 2003). As a result, it has become increasingly difficult to find consensus on the role of the Alliance, as demonstrated by the meagre results of the last Summit of Heads of State and Government (Riga, 29 November 2006). Rather than announcing an increasing worldwide presence, the NATO operation in Afghanistan could be the exception.

Until today the way in which NATO is organized does not take into account this structural change. A rebalancing of the Alliance, acknowledging that NATO increasingly consists of two pillars, the EU and the US, is long overdue. Implicitly, the ESS says as much:

The transatlantic relationship is irreplaceable. Acting together, the European Union and the United States can be a formidable force for good in the world. Our aim should be an effective and *balanced* partnership with the USA [author's emphasis].

In a rebalanced Alliance, each pillar should have a 'right of initiative'. As global strategic actors in their own right, each equipped with the full range of foreign and security policy instruments, the EU and the US are the first-line policy-makers. If they judge a 'non-Article 5' situation or a request from the UN or another actor requires a certain military response, they should have the authority – within the bounds of international law of course – to initiate that. In view of the spirit of solidarity and transparency, they should inform and consult their Allies before taking action. But this consultation should not be considered a request for authorization. Rather if both pillars agree on the assessment of the situation and the required response, *and* if both agree to contribute substantially to the actual military operation, the mission can be implemented under the NATO flag, via the existing political and military structures of the Alliance.

If, however, they do not agree on the action to be taken, or if one pillar prefers not to contribute to the action, the other pillar simply maintains its initial authority to launch the operation autonomously under the EU or US flag.

A two-pillar constellation implies a pragmatic attitude, choosing the framework that is most suitable according to the situation at hand. The advantage would be that non-participation in a non-Article 5 operation initiated by the other pillar, e.g. because of political objections like in the case of the invasion of Iraq, would no longer need to give rise to accusations of breaching transatlantic solidarity. Each pillar could thus pursue its own strategy. At the same time, mere ad hoc coalition-making – NATO as a 'toolbox' – would be avoided. Building in the necessary flexibility would prevent divergences between Allies on issues of 'day-to-day policy' from endangering the organization as such, while the Alliance as a community of values expressed in a collective defence commitment would be preserved. Solidarity in the event of an effective Article 5 situation would naturally still be complete and unquestionable. Article 5 should be interpreted strictly though, so as not to detract from the value of this ultimate security commitment. NATO would thus remain the foundation of collective defence and the ultimate guarantor of the security of all Allies.

The EU and the US are the real policy-makers, each with a global policy of their own across the range of international relations. In the politico-military sphere, NATO is the forum at their disposal to consult and, if they agree, to act jointly. Because of its very nature, i.e. a military alliance, NATO's remit is necessarily limited. It is therefore less suitable as a forum to discuss multidimensional issues with implications way beyond the politico-military sphere, such as the role of China and India, relations with the Arab world, or Islamic fundamentalism (Flanagan 2005). NATO does not have the instruments to deal with such issues, while using NATO as the main vehicle to address them might send the wrong message to third countries, which perceive NATO strictly as a military alliance. The forum to discuss wider multidimensional issues is direct EU-US dialogue. The 'transatlantic gymnich', which informally brings together Ministers of Foreign Affairs from all EU and NATO countries and is mostly NATO-driven, is a useful supplement to that core partnership, and serves as a platform where non-EU Allies can input their views. But as the core partnership is that between Washington and Brussels, it would only be logical that at the 'transatlantic gymnich' and indeed in NATO itself the EU speaks with

5 The EU's 'Petersberg Tasks' and NATO's 'non-Article 5 Operations' cover the same thing. Only collective defence remains the exclusive prerogative of NATO, for the time being, as the draft Constitution provided at least a symbolic EU commitment to 'mutual defence', based on the WEU commitment.

one voice. Such would be the natural evolution of CFSP/ESDP. This would not require an amendment to the North Atlantic Treaty – the political will on the part of the EU Allies to speak with one voice would be sufficient.

59.4 Sub-contractor *par excellence*? EU and UN

Even more so than is the case for the OSCE, the fit between the objectives of the EU and the UN is astonishingly close. The UN was meant as a holistic project from the outset, with the Charter covering security as well as human rights and social and economic development. Following the 2003 invasion of Iraq, the viability of the collective UN system and its capacity to deal with so-called new security threats was challenged, as doctrines based on ‘pre-emption’ and unilateralism and emphasizing the military instrument were put forward (Buchanan/Keohane 2004; Feinstein/Slaughter 2004). The EU has been instrumental in having the validity of the UN and its holistic approach reconfirmed by the world community. Without a very active EU diplomacy, the September 2005 Millennium+5 Summit of the UN would probably have remained inconclusive, whereas now its Outcome Document reconfirms the centrality of the UNSC, sets out a comprehensive agenda pursuing the ‘three freedoms’ of security, development and human rights, as advocated in Secretary-General Kofi Annan’s preparatory report (Annan 2005), and decided on the principle of the ‘Responsibility to Protect’ (R2P)⁶ and the creation of a Peacebuilding Commission. Throughout this debate the EU has emerged as the prime supporter of the collective security system. The ESS expresses this clearly:

The fundamental framework for international relations is the United Nations Charter. The United Nations Security Council has the primary responsibility for the maintenance of international peace and security. Strengthening the United Nations, equipping it to fulfil its responsibilities and to act effectively, is a European priority.

⁶ R2P implies that if a State is unable or unwilling to protect its own population, or is itself the perpetrator of genocide, ethnic cleansing, war crimes or crimes against humanity, national sovereignty must give way to a responsibility to protect on the part of the international community. In such cases, the UNSC must mandate intervention, if necessary by military means.

This diplomatic commitment has naturally created high expectations on the part of the UN, notably in terms of concrete EU contributions to the maintenance of global peace and security. A close partnership has indeed been developed, with regular dialogue at the high political as well as the expert level. At the same time however, the UN fears that the development of the ESDP will detract from the availability of European forces for the UN.

This fear is unjustified, for the ongoing transformation of EU Member States’ armed forces, which the ESDP promotes, augments the available number of deployable troops for operations in *any* framework (Flournoy/Smith 2005; Quille/Gasparini/Menotti/Monaco/Valasek 2005). Since the adoption of the ESS the EU has launched several operations, military, civil and civil-military. In early 2007 no less than 12 EU operations were ongoing, which demonstrates a growing awareness on the part of the Member States of the possibilities *and* responsibilities of the EU as a global actor. It is often overlooked that if all operations are taken into account (EU as well as NATO, UN, national and coalitions of the willing), on average 50 to 60,000 troops from EU Member States have been deployed at any one time in 2003–2006, including (only) 4,000 to 5,000 for UN-commanded operations (blue helmets) but another 30,000 to 35,000 for UN-mandated operations (ISAF in Afghanistan, Althea in Bosnia and KFOR in Kosovo); the remainder are mostly in Iraq (Biscop 2004a). This number even increased when in the Autumn of 2006 EU Member States agreed to provide the core of a reinforced UNIFIL in Lebanon, deploying an additional 7,000 European blue helmets. EU Member States are thus certainly not averse to deploying their forces.

Yet the large majority is deployed in the Balkans, where the EU and its Member States logically assume responsibility, and in Afghanistan and Iraq, as a follow-up to the invasion initiated by the US and a number of EU Member States themselves. The number of European troops in sub-Saharan Africa on the contrary is marginal, certainly when set against the political and economic weight of the EU. Nevertheless, in sub-Saharan Africa except for the African Union (AU) the EU seems to be the only actor potentially willing – at least on paper – to implement peace support operations, reason why the UN is likely to appeal to Brussels, as happened in 2006 when a ‘deterrent force’ was requested to assure stability during the elections in the Democratic Republic of Congo (DRC). In view of the responsibilities of the EU as a global actor, future force planning ought to take into

account a greater contribution to peace support operations *worldwide*.

If Member States are indeed deploying their forces, there still is no consensus on deployment under the EU flag where crisis management is concerned. Although legally the Petersberg Tasks include all operations except collective defence, but including peace enforcement at the high end of the spectrum of violence, politically the Member States are still divided over the EU's level of ambition in this field. As long as in a crisis situation some Member States will look to Washington before taking a position, the EU cannot be a consistently resolute actor. Even though with Operation Artemis in the DRC in the summer of 2003 the EU has proven that it can mount high-risk operations if the political will is present, other EU-led operations are mostly low-intensity. To some extent therefore the criticism is justified that the EU takes on important but mostly 'easy' operations, in the post-conflict phase, in reaction to a settlement of a conflict. The slow reaction to events in Darfur demonstrates that this criticism can in fact be applied to the international community as a whole. The EU should work proactively towards conflict resolution, through its diplomacy, and when necessary contribute forces in earlier stages of a crisis or conflict. EU policy towards Iran is an example of such a proactive stance.

Nevertheless one must question whether in view of this lack of consensus on high-intensity operations, all Member States are willing to fully accept the implications of their strong diplomatic support for R2P. It is to be expected that to implement R2P the UN will appeal to the recently created 'battlegroups', which are configured for high intensity operations and which the EU has declared will be primarily deployed at the request of the UN. Rapid reaction and use of force can be required in other scenarios as well, notably in the event of a renewed escalation in the Balkans. Will all Member States readily accept the risks associated with such per definition high intensity operations and will they be willing to contribute the forces and command & control capability required? Even if the holistic approach aims to prevent conflict, there will always be situations in which the use of the military instrument is required.

It is a trend in recent years that the UN avails itself of 'regional organizations', including the EU and NATO but also the AU, e.g. to implement operations on its behalf, as subcontractors, rather than launching blue helmet operations. This is motivated by the desire to promote local ownership and develop regional capacities for peacekeeping and crisis management,

notably in Africa, but also by the current reluctance of European States to put their forces under UN command, which is seen as slow and cumbersome, increasing the risks for the troops in the field (if blue helmets were deployed in Lebanon, it was because the UN-framework was the only one acceptable to all parties on the ground). Even though multilateralism comes natural to the EU and Brussels sees itself as a prime contributor to the UN, relations with New York are thus not altogether clear cut. In itself, the fact that EU Member States prefer subcontracted operations under the EU-flag to contributing blue helmets to UN-commanded operations is less important as long as the boots are on the ground. What is important though is that in all cases the political authority must remain with the UNSC: the body that authorizes an operation and sets its objectives must decide when the objectives have been achieved, have to be adjusted or abandoned. In practice however the reporting lines between the UNSC and an organization implementing an operation on its behalf are not always clear and seem to be very much ad hoc. Seeing itself as a partner and not a subordinate of the UNSC, even the EU was at first reluctant to report elaborately on its 2003 operation in the DRC, 'Artemis', before High Representative for the CFSP Javier Solana turned the reporting obligation into a diplomatic success by going in person to the UNSC, thus enhancing the presence of the EU in the UNSC and of himself as 'EU civil servant' in the CFSP/ESDP. Even if - unlike the OSCE but like NATO - the EU does not explicitly see itself as a 'Chapter VIII organization' as per the UN Charter (Graham/Felício 2005), for fear of detracting from its autonomy, and does not explicitly state in the ESS that the use of force always requires a UNSC mandate, clearly its position on the centrality of the UNSC as the final arbiter *de facto* implies a relation of subordination which must be translated into clear working arrangements with the UN. The latter effectively holds true for all regional organizations to which operations are being subcontracted.

59.5 Conclusion

The emergence of the EU as an international actor in its own right has profoundly changed the institutional landscape of European security.

The EU has a much broader scope than NATO, while its basic strategic outlook differs significantly from that of the other pillar of the Alliance, the US, although NATO has come to recognize the need for a

holistic approach. If the OSCE shares its holistic strategy and broad scope, the EU has much more capacity for resolute action than the latter, in all dimensions. As a *sui generis* organization, the EU's potential to wage an effective security policy is therefore both unique and enormous. It has at its disposal a comprehensive range of instruments, from aid and trade to diplomacy and the military, allowing it to effectively pursue a holistic strategy as outlined in the ESS with the combined weight and resources of 27 Member States behind it. Admittedly, this ideal scenario does not always materialize, as all too often still Member States are divided among themselves, leaving the EU paralysed. The gap between 'Atlanticists' and 'Europeans' remains the main stumbling block for a fully effective EU foreign and security policy (Dassù/Menotti 2005). Yet the EU has proven that when it is united, it can act quickly, if necessary forcefully, and successfully. Combined with the growing awareness of Member States of their own limits in the face of an increasingly interdependent world and the need to interact with powerful new actors such as China, this means that most probably the trend towards ever deepening integration will gradually continue. The European project has suffered a serious setback with the stalemate on the draft Constitutional Treaty, but everything indicates that the Constitution's provisions on foreign and security policy are not contentious – and might thus be salvaged yet. Besides, in the area of ESDP, significant progress has been made even without the ratification of the Constitution, notably the creation of the Battlegroups and the EDA.

The other European and global security organizations must therefore take into account that the EU is there to stay. The OSCE and the EU could be very complementary strategic partners with regard to the ongoing stabilization and, ultimately, democratization of the European continent and Central Asia, if the respective members would agree to transparent cooperation between both organizations. NATO will have to come to terms with a shift of gravity towards the two main constituent pillars of the Alliance, the EU and the US, but would remain vital as the forum for implementation of military operations by both pillars jointly, and as the long-term defence guarantee of all Allies, while direct EU-US partnership on the other dimensions of the core global public goods should be deepened. The UN can rightfully expect an increased EU contribution to all dimensions of global peace and security. High expectations have indeed been created vis-à-vis the EU. The ambitious ESS has *de facto* become the benchmark by which internal and exter-

nal actors will judge EU performance. It is up to the EU and its Member States to prove that they can achieve these self-defined objectives.

60 Regionalization of Great Power Security – Near Abroad, Broader Middle East, and European Neighbourhood

Mustafa Aydın and Neslihan Kaptanoğlu

60.1 Regionalization of Security

The end of the Cold War and the 11 September 2001 (9/11) attacks had profound effects on international relations. Despite the interpretation of 9/11 by some as manifestation of the growing importance of globalization at the expense of regionalization and that the following unilateral American actions have been detrimental to regional efforts, in practice there is an expansion in regionalization, particularly in the security field.

There are different, even contradictory, meanings of ‘region’, ‘regionalism’ and ‘regionalization’. A region can be anything ranging from an area within a single state to a whole continent. It is often defined as a group of countries located in the same geographically specified area (Hettne 1991: 280). However, a region implies more than just a close proximity among the constituent states. The US and Russia are rarely considered as belonging to the same region, even though Russia’s eastern coast is very close to Alaska (Mansfield/Milner 1999: 591). A region can be a historical formation with a distinct economic, cultural, political background and a particular regional consciousness. This places little emphasis on proximity but concentrates on non-geographic criteria, such as France and Francophone countries of North-West Africa composing a regional grouping because of their linguistic similarities (Mansfield/Milner 1999: 591). From an organizational point of view, the term ‘region’ describes a group of countries that have more or less voluntarily entered into some kind of cooperation. A region or sub-region is then defined by the list of its members.

Similarly, there are various approaches to regionalization. One approach sees regionalization as part of a larger world order transformation, especially the decline of US hegemony and the end of the Cold War (Marchand/Boas/Shaw 1999: 902). Scholars such as Mansfield and Milner focus on domestic political fac-

tors and use, for example, strategic trade theory to account for the sudden keen interest on the part of policy-makers in regional projects. In the EU context, regionalization is often taken to denote a process whereby political and economic power is devolved from the centre to the local level (Bechev 2004: 77–95). It can also be conceived as the growth of societal integration within a given region, including the undirected processes of social and economic interaction among the units such as nation states (Kacowicz 1999: 527–556). In the literature of the ‘new regionalism approach’, the concept has been given a more normative meaning, intending to control access to a particular region to protect it against the process of globalization (Väyrynen 2003: 43). It sees regionalization as a complex process of change taking place simultaneously at three levels: the structure of the world system, the level of inter-regional relations, and the internal pattern of the single region (Marchand/Boas/Shaw 1999: 902). In any case, regions are invented by political actors and regional identity is what people, politicians, and states make out of it and is thus amenable to change over time (Neumann 2003: 160–178).

Regional security also refers to different things. The American and European literature differ in their approaches. While the American literature focuses on defining the existence or nature of regional security arrangements and pays little attention to the process of regionalization (a rationalist and state-centred approach), the European literature focuses on the process of building regional security with a more historical and constructivist approach (Barnathan 2005: 283). It is defined as “the attempts by the states and other actors in a particular geographical area – a region in the making – to transform a security complex with conflict generating interstate and intrastate relations to a security community with cooperative external relations and domestic peace” (Hettne 2001: 13). In this view, the Nordic countries are a good example, and

the EU was originally launched with this particular purpose in mind.

There are many reasons why the concept of regionalization has expanded in the post-Cold War era. Due to the bipolar struggle during the Cold War, regional problems were directly translated to the global competition between the two superpowers. Fearing the other might gain political advantage; superpowers were driven to assist one or the other party. Regional conflicts were restrained since each superpower tried to limit the conflicts in its sphere of influence, out of concern that open disputes might create opportunities for the other to intervene in what it regarded as its own backyard (Lake/Morgan 1997: 3–19). Since the end of the Cold War, conflicts have changed nature and large scale aggression against states has become less probable while less visible and predictable threats have emerged. Especially after 9/11, security risks no longer emanate primarily from traditional state actors but rather asymmetrical perpetrators such as terrorist groups and other non-state actors. The national security documents of the US, the EU, and the Russian Federation (RF 2000, 2000a, 2000b) refer to similar threats.¹ In all these documents, terrorism is depicted as the biggest threat creating risks, imposing large costs and posing a growing strategic problem. Each of “the three empires” (Emerson 2001: 15–25) has faced the problem of terrorism. For the US, this was the 9/11, for Europe the London (July 2005) and Madrid (March 2004) bombings, and for Russia it was the Beslan hostage crisis of September 2004.

Some argue that a shift to unipolarity created incentives for the development of regionalization of security, both by the hegemonic state and the regional states (Barnathan 2005: 285–288). A hegemonic state in a unipolar world clearly has a strong interest in maintaining its hegemony and therefore regional stabilities through multilateral frameworks of cooperation. Barnathan (2005: 287) believes that regional arrangements help the hegemonic state reduce its costs by enticing greater burden-sharing from others. There is also an incentive on the part of the regional states to invest more in regional security since the shift from bipolarity to unipolarity creates challenges for manag-

ing regional security environments. They face a situation where the hegemonic power threatens their autonomy in foreign and security policy areas, while they can no longer rely on it to come to their aid automatically in case they need it. Thus, the need to devise strategies that will mitigate the negative aspects of this dilemma encourages regional countries to invest in regional security institutions and capabilities (Barnathan 2005: 288). Aware of the fact that their security policies must be tailored to the individual circumstances of different regions, today’s big powers are formulating regional outlooks, areas of interests and responses to regional crises that might threaten their national, regional or global interests.

Three such regional outlooks, namely the ‘Near Abroad Policy’ (NAP) of the RF (60.2), the ‘Broader Middle East-North Africa Initiative’ (BMENA) of the US (60.3), and the ‘European Neighbourhood Policy’ (ENP) of the EU (60.4), are analysed below. A number of key theories in economics support the argument about the benefits derived from economic regionalization and regional integration (Lane: 333). There is no such common understanding regarding the advantages of regionalism in the security realm, where the focus on regional security issues touches big power interests and competition, which, if not managed properly, might lead to tensions and even conflicts. Since some of the countries/regions analysed in this paper are within the sphere of more than one of the initiatives of bigger powers, these areas are prone for great power competition and even confrontation. Thus this chapter, arguing that a regionalized world is not inherently a peaceful one and that regionalism does not always produce expected results in security affairs, will discuss possibilities for big power tension due to overlapping peripheries of above-mentioned initiatives in the last section of the chapter.

60.2 Near Abroad Policy of the Russian Federation

The term ‘Near Abroad’ (*blizhnee zarubezh’e*) in Russian jargon refers to the states in the non-Russian post-Soviet space, which until 1991 was part of the USSR. It implies that these countries are not as foreign as others and therefore may be subject to different rules or treatment (Kubicek 2000: 547). Russian leaders from across the political and military spectrums have regularly asserted that Russia has ‘special rights’ and responsibilities for maintaining security within this region. The former Foreign Minister An-

drei Kozyrev stated that, “The CIS and Baltic countries are the area where Russia’s primary vital interests are concentrated. We should not withdraw from these regions which have been in the sphere of Russian interests for centuries” (Zaccor 1994: 9). Former President Yeltsin reiterated in September 1993 that the external borders of the ‘near abroad’ countries, most of who are loosely grouped together with Russia in the Commonwealth of Independent States (CIS), “are essentially the border of Russia” (O’Brien 1994: 14–18). One former Yeltsin advisor flatly declared that the ‘near abroad’ was Russia’s sphere of influence and that the former republics had best not try to form alliances among themselves or with foreign powers. They would have to submit to Russia’s domination (Kubicek 2000: 547).

After the disintegration of the USSR, Russia passed through a period of reconciliation with the West advocated mainly by the so-called Atlanticists. They argued that the South Caucasus and particularly Central Asia were geographically too remote and an economic and political burden for Russia (Kubicek

2000: 547). They were eager to get rid of the neo-imperialist tendencies from Russian foreign policy with the belief that an imperialist Russia could not at the same time be a democratic one. However, the liberal Atlanticists lacked strong support for their program in the Duma, and many grew disillusioned with the hopes they had placed on the West. Thus, it did not take long for their ideas to be attacked by the Eurasianists who favoured a more active Russian role in its vicinity. They believed that “Moscow was disregarding the nation’s interests and sacrificing the historical, geographical and cultural identity of the country for the sake of obscure good relations with the West” (Tuncer 2000: 95–112). When they gained the upper hand in Russian politics, from the mid-1990’s onwards, the Russian attention shifted to the CIS, which was proclaimed by the 14 September 1995 presidential decree as an area of vital interest and a top foreign policy priority (Perovic 2005: 62). Later, both the *Foreign Policy Concept* of June 2000 and the *Military Doctrine* of April 2000² prioritized an increased Russian role in the region.

There were many reasons behind the desire to have further Russian involvement in the 'near abroad'. The Russian population of the region, up to 25 million, factored heavily (Croft 1996: 13; Buzan/Wæver 2003: 410). Their treatment by host countries is a contentious issue and cannot be ignored. Over 1.9 million ethnic Russians fled to Russia between 1990 and 1998, straining an already overburdened system (Croft 1996: 13; Ziegler 2006: 110). Reducing this figure was important, though ethnic Russians were not the only ones who emigrated to the RF, fleeing from ethnic conflicts and turmoil in the 'near abroad' in such areas as Tajikistan and Georgia (Tsygankov 1996). Should a full-scale regional conflict break out between two or more countries, as many as 8 to 12 million refugees could flee to Russia (Aron/Jensen 1994: 25), creating a burden that Russia is unable to handle (Commercio 2004: 23–32).

Russia was also fearful that regional conflicts in Nagorno-Karabakh, Abkhazia, and South Ossetia could spread into its territory. Some spoke of Russia's southern borders as its 'soft underbelly', therefore necessitating a strong Russian military presence in the region. Russian policy-makers decided in the early 1990's that no international organization or group of states should replace Russian 'peace-keepers' on the territory of the former Soviet Union.

From a strategic and military point of view, former Soviet borders in Central Asia and the Caucasus are seen as the first line of defence, both in case of a foreign invasion launched from outside the CIS and to prevent transnational security problems, such as Afghan drugs, reaching Russia. The Russian military believes that defending the southern borders of the CIS makes it easier to defend Russia. The region is viewed as a buffer between Russia and its southern neighbours, Iran, Afghanistan, and in part China (Akerman 2003: 19–31).

The region's vast hydro-carbon reserves have attracted both Russia and the West, which have a strong interest in securing their place and limiting the role of others in the region. In the Russian case, this means assuring its dominant role both in exploration and transportation of oil and gas to world markets. Losing its monopoly on pipelines and proliferation of export routes has put Russia in the position of having to

compete with other export outlets for Caspian oil. The American backed Baku-Tbilisi-Ceyhan pipeline for Azeri oil exports was commissioned in 1999 and became operational in July 2006, thus intensifying the US-Russia competition over regional energy resources.

Economic ties with the countries in its 'near abroad' are another reason for Russia to insist on an influence in the region. Many states in this region have an underdeveloped economic base and the intra-CIS economy is very integrated.³ The Russians, dependent on imports of certain raw materials from the 'near abroad' and sensitive to the possible interruptions, have chosen to elicit greater economic cooperation. With the economic features of the other CIS states closely tied to its own, Russia can hardly ignore destabilizing conditions outside its borders.

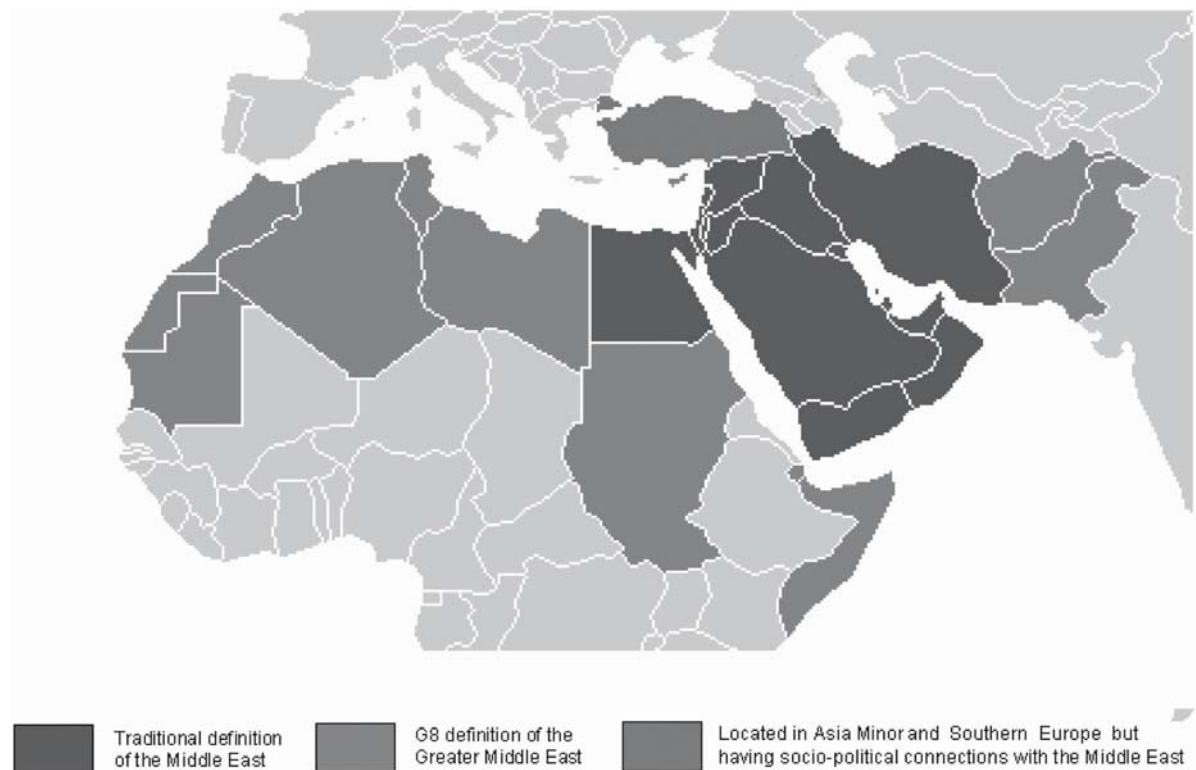

Another reason for Russian interests in the 'near abroad' is psychological. As the Tsarist Empire ruled these areas from the second half of the nineteenth century, many Russians find it natural to have some sort of a privileged role in these areas. For them, it becomes difficult to accept that these regions have total independence from the Russian core (Akerman 2003: 20). The idea of 'Russia as an empire' has been present in Russian political life for centuries, and the end of the Cold War did little to change these ideals. In fact, calls for Greater Russia, advocated by people like Aleksandr Solzhenitsyn, re-emerged shortly after the Soviet collapse (Berman 2004-05: 64). The "near abroad" is the most obvious larger geographical area that Russia might define a mission and have an influence, which makes it easier for Russia to be recognized at the global level as a great power (Buzan/Wæver 2003: 408).

Last but not the least, the instability of the region and its security problems create an incentive and excuse for outside powers, such as the US, to be active in the region. This is perceived by Russia as a security threat. All the main security documents of Russia (the *National Security Concept* of January 2000, the *Military Doctrine* of April 2000 and the *Foreign Policy Concept* of June 2000) single out dominance of the international community by Western states and unilateral power actions as destabilizing factors that pose threats to Russia. Clearly, the numbers of political, economic, and military actors that can influence the RF's southern borders have increased extensively and

2 For 'The Foreign Policy Concept of the Russian Federation', June 2000, see at: <<http://www.fas.org/nuke/guide/russia/doctrine/econcept.htm>>; and the *Russian Military Doctrine*, April 2000 can be found at: <<http://www.freerepublic.com/forum/a394aa0466bfe.htm>>.

3 Despite the integrated nature of CIS economies, the export shares of non-CIS countries such as Turkey and Iran are increasing and heating up the competition. For more on the trade figures, see Perovic 2005: 76.

Figure 60.2: Geography of the Broader Middle East and North Africa (BMENA) Region. **Source:** Wikipedia, Middle East; at: <http://en.wikipedia.org/wiki/Middle_East>.

the area has become increasingly relevant for Turkey, Iran, China, the US, and European countries. Thus, Russia wishes to keep its presence in the area and has indicated its willingness even to use force if its security is or could be threatened.

Russia has so far implemented the *Near Abroad Policy* (NAP) mainly through bilateral agreements instead of multilateral arrangements since none of the regional countries, with the possible exception of Armenia and Belarus, have been eager to create multilateral cooperation with Russia. Russia also preferred to deal with regional states through signing cooperation agreements on a wide range of issues that reflect each republic's specific characteristics, needs, and aspirations. Thus, several bilateral agreements have been signed between Russia and the newly independent states since the early 1990's. In areas where regional states have been hesitant in developing projects and processes to modify the provision of security in their region, regionalism has often provided a power platform for Russia (Allison 2004: 467). Yet, despite its interest in the 'near abroad', Russia's own serious economic problems have until Putin's rise to power hampered its efforts to restore its hegemony. Thus, while Russia has been sensitive to the growing foreign

presence and influence in the region, its influence has continued to decline in its 'near abroad'.

60.3 Broader Middle East Initiative of the United States

Defining the *Broader Middle East and North Africa* (BMENA) is more difficult than defining the 'near abroad'. In a preparatory working paper for the G8 Summit in June 2004, the US defined the region as including the Arab states, Israel, Turkey, Iran, Pakistan, and Afghanistan (Perthes 2004: 88). Analysts often refer only to the Arab countries when identifying specific problems. In its widest definition, 27 countries and areas are included in the BMENA concept: Afghanistan, Algeria, Bahrain, the Comoro Islands, Djibouti, Egypt, Iran, Iraq, Israel, Jordan, Kuwait, Lebanon, Libya, Mauritania, Morocco, Oman, Pakistan, Palestine, Qatar, Saudi Arabia, Somali, Sudan, Syria, Tunisia, Turkey, the United Arab Emirates, and Yemen.

The birth of the BMENA can be traced back to post-cold war US activism in the region manifested in the liberation of Kuwait, the long-term stationing of

US forces on the Arabian Peninsula, and an active diplomatic interest in the Arab-Israeli conflict (Haass 2006), as well as to the US's enhanced threat perception as a result of 9/11 and the understanding that many of the threats were emanating from the Middle East in general. The UNDP's first *Arab Human Development Report* (UNDP 2002) clearly presented the Middle East as one of the most problematic regions in the world with respect to the socio-economic conditions and quality of life. The report indicated that many regional countries had problems posed by internal ethnic or religious clashes, civil unrest, bilateral and multilateral armed confrontation or terrorism activities, as well as, long-lasting structural problems.

There were three considerations by the US: *First*, fundamentalism, terrorism and the spread of Weapons of Mass Destruction (WMD) were seen as the major regional threats. *Second*, the lack of democracy and human rights, poor levels of socio-economic development and low literacy were major causes for the existence of terrorist networks. *Third*, there was an expectation if these conditions should change in a positive direction, the new dynamics would lead to a better life quality for the Middle Eastern societies, thus also alleviating American security concerns (Erhan 2005: 156–157). In addition to this formal rationale of the BMENA initiative as stated in official US documents, there are also less obvious and unofficial reasons to concentrate on the Middle East. Looking at the *US National Security Document* of 2006, one can decipher the following strategic goals in the region: a) preventing the asymmetrical threat towards American or allied citizens, possessions, and interests by terrorist networks; b) deterring Syria and Iran from supporting terrorist networks; c) stopping the spread of WMD in the region; d) deterring regional countries from obtaining capabilities for middle-long range missiles; e) guaranteeing the secure flow of oil from the region; f) controlling the energy flow to China, an emerging possible challenger for US global leadership; g) forestalling the emergence of a hostile regional hegemon, and h) sustaining the survival of Israel (Erhan 2005: 156–157; Lesser/Nardulli/Arghavan 1998: 173).

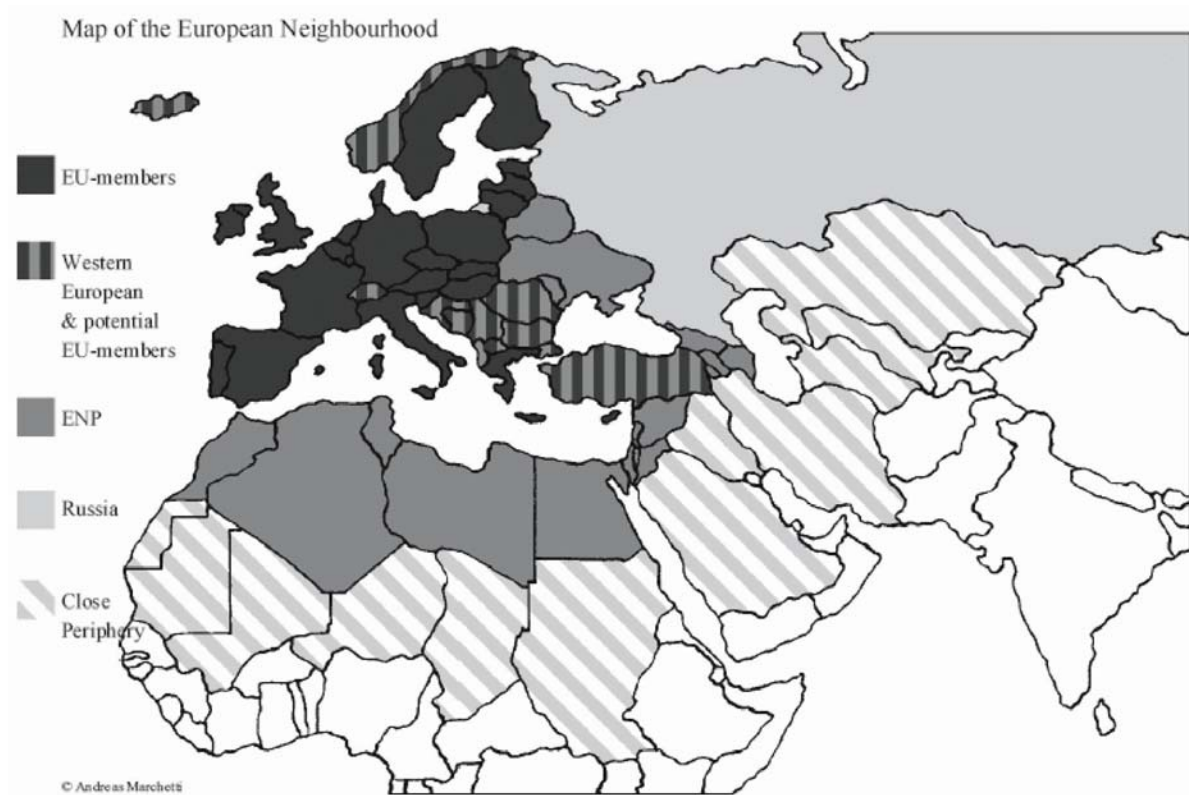

Both official and unofficial reasons, as well as US regional threat perceptions, led to the BMENA initiative that was first mentioned on 13 February 2004 in the London-based Arabic newspaper *al-Hayat* (2004) that published a draft version of the *G8 Greater Middle East Partnership Working Paper*. It triggered widespread reactions from many Middle Eastern intellectu-

als and government officials, which led to its revision. On 9 June 2004 the declaration *Partnership for Progress and a Common Future with the Region of the Broader Middle East and North Africa* was announced by the leaders of the G8 after their Sea Island meeting.

In accordance with the Sea Island Summit conclusions and the decisions taken in two follow-up meetings of the *Forum for the Future*, in November 2005 the participants of the BMENA have taken concrete steps in these areas: 1) emphasizing the role of women in public life; 2) providing regional business training, and 3) vocational training; 4) supporting the growth of small- and medium-sized enterprises; 5) improving the effectiveness of official financing and 6) working to increase literacy in the region (Forum for the Future 2005). Despite positive steps, according to the 2003 and 2004 *Arab Human Development Reports* (UNDP 2004a, 2005b), still too much must be done in the region to deal with the real problems that pose security threats. *First*, poverty remains a serious problem. *Second*, the US is still seen in a negative light by the people in the region. Widely broadcasted incidents of torture and abuse of the Iraqi prisoners and civilians by American and British soldiers as well as the Arab/Muslim anger over the continued occupation of Iraq and strong American support for Israel have decreased the level of local support for the initiative.

Though the goals presented in the 2004 Sea Island Summit were encouraging, three years later there is no consensus on the real meaning and targets of the plan, which remained mainly an American one and lacked sustained multilateral support for its implementation. The spread of WMD, terrorism, and the security of energy resources are universal problems, and trying to solve them through unilateral policies might not produce the expected results. Moreover, although US policies in the region might solve some western security problems in the short run, without the support of the Middle Eastern people, American policies to eliminate the security threats will open the way for more sophisticated threats (Erhan 2005: 168–169). Since the limits of the US capacity to work with both the Arabs and the Israelis were exposed at Camp David in 2000, American foreign policy in the region as well as the factors outside of American control, such as the weakness of Mahmud Abbas and the rise of Hamas in Palestine, and the Israeli embrace of unilateralism, have helped to decrease the role of the US (Haass 2006: 2).

Figure 60.3: European Neighbourhood Policy. **Source:** Marchetti (2006:21). Permission was granted on 17 September 2007 by Andreas Marchetti, Center for European Integration Studies (ZEI), Bonn.

At the same time, regional institutions in the Middle East are weak and will most probably remain so. Personalist regimes have obstructed both state-centric, top-down regionalism as well as informal regionalist processes from below. The region's most expanded organization, the Arab League, excludes the region's two most powerful states: Israel and Iran. The enduring Arab-Israeli rift continues to preclude the participation of Israel in any sustained regional relationship. The tension between Iran and most Arab states still frustrates the emergence of regionalism (Haass 2006: 4; Bohr 2004: 498).

60.4 European Neighbourhood Policy of the European Union

Among the three regional concepts, the borders of the ENP are clearly defined in European Commission (2003, 2004d, 2004e, 2006, 2006a) documents. As outlined by a Communication from the Commission to the Council and European Parliament (March 2003), it was originally intended to include the immediate neighbours of the EU: Algeria, Belarus, Egypt,

Israel, Jordan, Lebanon, Libya, Moldova, Morocco, the Palestinian Authority, Syria, Tunisia, and Ukraine. It was later extended by the *European Neighbourhood Policy Strategy Paper* (May 2004) to include the Southern Caucasian countries of Armenia, Azerbaijan, and Georgia.

Despite occasional disagreements over the pace and direction of its development, the European integration project and the deeply institutionalized nature of the relationship between EU members have made it by far the most successful regional arrangement (Beeson 2005: 974). It was this success that the EU wished to expand around without offering a membership option. Thus, the ENP was developed in relation to the EU's 2004 enlargement, with the objective of avoiding the emergence of new dividing lines between the enlarged EU and its neighbours, especially the RF to which the Prodi Commission wanted to offer something in 'compensation' for the eastern enlargement. The ENP instead aimed at strengthening stability, security, and well-being for all concerned by creating shades of grey between members, aspirants, and the rest.

It also tried to address the strategic objectives set out in the *European Security Strategy* (December 2003). With ENP, the EU offers its neighbours a privileged relationship in return for a commitment to common values, democracy and human rights, rule of law, good governance, market economy principles, and sustainable development. Even though the ENP goes beyond existing relationship models to offer a deeper political relationship and economic integration, it does not include enlargement and does not offer an accession perspective.

For a better understanding of the ENP, the changed threat perceptions in Europe were crucial. From 1945 until the early 1990's, most European states focused on the European integration excluding wider geo-strategic concerns (Bergeron 2003: 333). While Europe was busy dealing with increasing labour and capital mobility, competition and economic regulation, economic integration, prosperity through the market, there was little emphasis on defence and security concerns, partly due to the roles played by the US and NATO during the Cold War as the guarantors of Western defence. As plans for a European Defence Community failed in 1954, the European project was constructed without reference to hard security issues. Since the early 1990's, however, the characteristics of the European security debate changed dramatically. A series of largely unanticipated events, including the end of the Cold War, the outbreak of the war in the Balkans, 9/11, and the American decision to wage an international war against terror, as well as American unilateralism, awakened the EU as a security actor.

The end of bipolarity and the collapse of the USSR in 1991 ended the division of Europe. The bipolar security regime was replaced by a new order. The wars in the Balkans, with ethnic cleansings, large-scale deportations, and mass graves, reminded the Europeans of persistent hard security imperatives and the need to develop a European security regime (Bergeron 2003: 337). In November 1993, the member states of the European Community signed at Maastricht the Treaty on European Union, creating a European Common Foreign and Security Policy (CFSP).

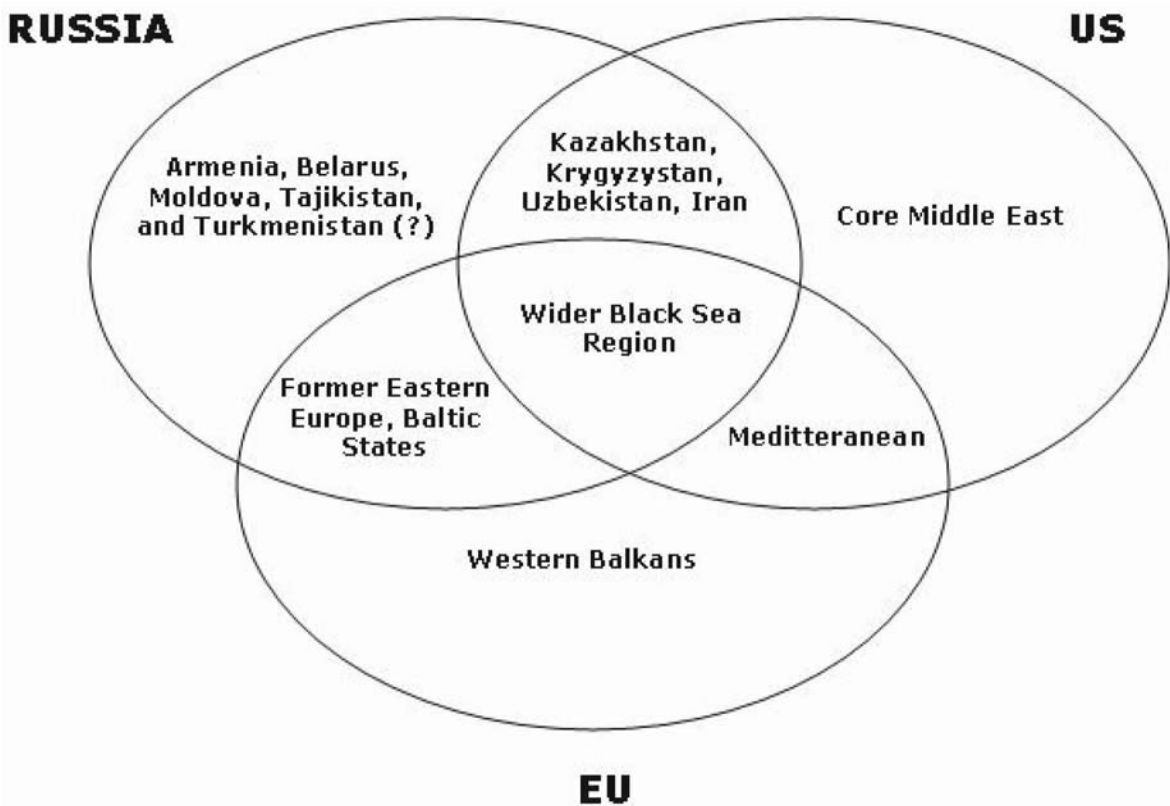

The slow development of a European strategic consciousness at the EU institutions has been accelerated in the post 9/11 world, which created challenges and opportunities. As there emerged a need for Europe to act as a global rather than a regional power, within a week of the 9/11 attack, the EU leaders committed themselves to a closer cooperation with the US on a wide range of issues from law enforcement to freezing of terrorist assets, developing secure proce-

dures for container shipping, air passenger travel and issuance of travel documents, increasing export control systems and other non-proliferation measures, and coordinating their foreign policies especially toward the wider Middle East (Jünemann 2003: 1-20).

In addition to 9/11, the Iraq War also contributed to the development of a European security consciousness. During the period leading up to the war, both the US and the EU realized that they would never be able to act jointly if they disagreed on the threats they faced. To solve the problem, Javier Solana, the Secretary General of the Council of Ministers and the High Representative for the CFSP, was asked to prepare a paper on a common EU security strategy. The European Council (2003) adopted the *European Security Strategy* (ESS) in December 2003, which set out for the first time a vision for the EU strategic policy, identifying terrorism, proliferation of WMD, regional conflicts, failed states, and organized crime as key security threats.

The principal security threats and objectives defined in the ESS generally matched those of the US; in fact, it specifically called for cooperation with the US. This marked a significant evolution from the situation before 9/11, when Europe appeared more concerned about soft security issues whereas the US was preoccupied with hard security threats. In addition to the ESS, there emerged other documents outlining Europe's perception of its security threats. As a direct result of the Madrid bombings, the European Council adopted, on 25 March 2004, a *Declaration on Combating Terrorism*, to increase internal EU cooperation and send a strong message that the EU was united in the fight against terrorism.

According to European security documents, EU bodies consider many risks and challenges as somehow related to its southern neighbourhood, i.e. the Mediterranean and the Middle East. The EU aims at improving its long-term security by shaping or reshaping its 'near abroad' through various tools and modalities, resembling the liberal democratic societal environment that corresponds to the EU model itself. The capacity, demonstrated in the transformation of Central and Eastern Europe throughout the enlargement process, shows an ability to compensate its lack of hard power by using non-military tools as mechanisms for change (Lebl 2005: 23-43).

Figure 60.4: The Intersection of Russian, European and American Regional Interests

60.5 Competing Visions for Secure Regions or Spheres of Influence

A great deal of regionalization in economic, political, and security spheres has taken place since the end of the Cold War. This has been construed as a transformation of the world political system for the better. It is hoped that ‘regionalization’, with its localized confidence building measures, can contribute to geopolitical stability by facilitating collaborative action against the contemporary problems (such as organized crime, terrorism, illicit drug and arms trafficking) that threaten regional (thus global) security and stability (Lake/Morgan 1997a).

It is expected that regionalization can “counteract the establishment of new dividing lines by creating a multi-layered, trans-boundary, cooperative networks”, and by dealing with non-military security issues in political, economical, and environmental fields, as well as the social and cultural topics, thus building a sense of common interest and to a certain extent a shared identity. By providing forums in which the state, sub-state, and non-state actors can interact on a range of issues, the regions are expected to contribute to the

enhancement of security simply by fostering dialogue, personal contacts, mutual understanding, by inducing regional countries to develop non-coercive attitudes and by reducing “the tendency to resort to non-peaceful means in pursuit of national interests” (Ozer 1997: 78–80).

However, the attacks of 9/11 have caused a great degree of ‘negative regionalization’, whereby old-type spheres of influences are being developed around the world by major powers. Although they all share a strong interest in maintaining regional stabilities, preventing proliferation of WMD, and protecting the world’s energy transportation routes, etc., nevertheless there is a tendency to securitize their ‘regions of interests’, where autonomy of regional states in making foreign and security policies are threatened by the competing images of major powers.

Three regional security concepts (NAP, BMENA, and ENP) were reviewed above. None of these policies and competing visions have been clearly defined by the proposing powers. What complicates the situation even more is that, some of the countries lie at the intersection of two or even all three visions. Several Middle Eastern countries are included in both the

ENP and the BMENA. Since 2004, Southern Caucasian countries are both a part of the ENP, NAP, and even BMENA. It is obvious that the three concepts are not mutually exclusive and political dynamics link the countries across the groups with each other.

The most problematic region situated at the intersection of the NAP, BMENA, and ENP, receiving greater attention from all the powers, is the so-called *Wider Black Sea Region* (WBSR), consisting of the Caucasus, the Black Sea, and Eastern Europe, as well as areas bordering it in the west, south, and north. Due to its position at the intersection of the interests of the great powers, the WBSR is fast becoming the scene of a new great power rivalry between the RF, the EU, and the US, as well as of regional countries. It shows all pitfalls of great power rivalry for regional cooperation.

The assessment of the WBSR's security challenges and opportunities needs to encompass an extended regional approach. The developments in this area are closely related to the security developments in the Balkans, the Caucasus, and the Middle East. The region has become the new frontline in tackling the problems of illegal immigrants, narcotics, WMD proliferation, trafficking of women, and transnational organized crime. The four 'frozen conflicts' of Transnistria, Abkhazia, South Ossetia, and Nagorno-Karabakh affect the region. As a result, the WBSR is at the epicentre of the projects to provide stability for the wider Europe and BMENA.

In addition to the WBSR, the second most focused area for great power interests is the *territories of the former USSR* where spheres of influences and a growing competition between two or three powers have emerged. The BMENA for example includes many former southern Soviet republics. Especially areas around the Caspian Sea constitute the frontline of competition between the US and the RF. Russia has always been interested in the region as a result of proximity, historical, traditional, and economic reasons. American policy-makers, however, paid only sporadic attention to it throughout the 1990's. Beginning with 9/11 and the campaign against the Taliban in late 2001, the US started to get much more interested.

The competition has also intensified in the economic sphere and in the struggle over access to the region's hydrocarbon resources as the world oil prices and the demand for natural gas have steadily increased since 2000 (Karaganov 2006: 223). The US, in order to reduce its dependency on Middle Eastern oil, has tried to diversify its sources of supply, and the

EU would like to reduce its dependency on Russian gas. While the EU has stepped up its efforts to engage the countries of the South Caucasus and Central Asia politically and economically, the US has significantly increased its economic and technical assistance to the region, as well as its military presence since 9/11.

Since 9/11, most of the Central Asian countries have built up strategic partnerships with the US, which provided them with an opportunity to establish a multiple-level security system. But some Central Asian states such as Kyrgyzstan still welcome some Russian presence to balance the power of larger neighbours, such as Uzbekistan and China. Also, Central Asian governments share a number of security concerns with Russia, including the potential threat of militant Islam, thus relying on Moscow as a guarantor for regional stability. These countries, however, appear keen on balancing their relations with the West and the US on one side, and Russia on the other. The US-led war in Afghanistan has demonstrated the extent to which Central Asian leaders have attempted to maintain this fragile balance. In October 2003, the RF opened its first foreign base since the dissolution of the Soviet Union in Kant, Kyrgyzstan, only 20 minutes from its capital and 40 kilometres from the 1,300 US soldiers based in the same country, supporting operations in Afghanistan (Menon 2003: 192; Bohr 2004: 491; Berman 2004-5: 61).

Similarly, the US provided equipment and training for Kazakh military and since the summer of 2003, has financed the construction of a military base in Atyrau by the Caspian Sea (Berman 2004-5: 62), while Russia commenced an intense diplomatic offensive with Putin's January 2004 visit resulting in a strengthening of strategic ties between the two countries. Since then, Russia and Kazakhstan unveiled a joint action plan for security cooperation, defining bilateral cooperation as well as their roles in regional security structures such as the Shanghai Cooperation Organization and the Collective Security Treaty Organization (Berman 2004-5: 65).

US-RF rivalry in Central Asia is repeated in the Caucasus, where the US assumed a military role in Georgia, launching the \$64 million *Georgia Train and Equip Program* in May 2002 to enhance the anti-terrorism capabilities of Georgia (Berman 2004-5: 62-65), whereas Moscow has embarked on a campaign designed to undercut Georgia's emerging role in the region. The US pledged \$10 million to Azerbaijan to strengthen its border security, improve the communication infrastructure, and help its government carry out security operations aimed at countering the

spread of WMD (Berman 2004-5: 62), whereas Russia's approach varied ranging from offers of military aid to cessation of gas supplies.

The US has even initiated closer relations with Russia's closest partner in the Caucasus, Armenia. In April 2004, the US presented an agreement on enhanced military cooperation with Yerevan and subsequently opened preliminary discussions about joint military exercises. The RF, in return, has taken pains to stress its long-term commitment to Armenia by signing a new military cooperation agreement in November 2003 and later announcing its plans to modernize the Armenian military forces through training programmes and weapons transfers (Berman 2004-5: 66). The friction resulting from this competition has brought the region to the centre of the RF and US strategic agendas.

There are other areas at the intersection of at least two initiatives. For the EU and the RF, this would be the former Eastern European countries and the Baltic States; for Russia and the US, it is parts of Central Asia, the Caspian Sea and perhaps Iran; and for the EU and the US, the overlapping region would be the Mediterranean.

The Mediterranean region lies at the intersection of American and European interests. Europe's security interests in the Mediterranean refer mainly to soft security threats, which were tackled with regional cooperation schemes in the form of the Barcelona Process and Euro-Med Dialogue (Brauch/Marquina/Biad 2000; Brauch/Liotta/Marquina/Rogers/Selim 2003). The main aim has been to ameliorate the political, social, and economic problems that give rise to such threats. For most non-EU Mediterranean partners, however, security interests continue to be understood in a more traditional sense, i.e. as threats emanating either from belligerent neighbours or domestic opposition forces. For them, regional cooperation is not seen as the best method against these sorts of more traditional threats. According to Heller (2003: 134), the experience of Barcelona provides another illustration of how the Middle East has not moved toward regional cooperation but instead continues to evolve in a different direction with declining confidence, rising tensions, aggravated threat perceptions, growing violence, and continuing arms build-ups.

Another region that interests two parties, the EU and the RF, is the *Baltic region* and *former Eastern Europe*. Although many countries within this grouping are much closer to Europe than Russia in terms of inclination, the area is still important for Russia as it is currently "the main locale where Russian and West-

ern circles overlap." Because of Kaliningrad, for example, the process "to move the Baltic states to the West" was difficult as "a bit of Russia" also went along (Buzan/Wæver 2003: 414, 416). Although the EU is gaining more influence in the region against the RF, mainly because of the problematic history of most of the Eastern European countries with Russia as well as the EU accession as an anchor for further democratization and reform in these countries, the RF can still exert influence, especially using its advantage over oil and gas. Russia is a huge energy exporter, whereas the EU is a net importer, thus their respective strengths and weaknesses are complete opposites (Emerson 2001: 2-3). On the other hand, the size of the EU economy is about 20 times larger than that of Russia, while Russia's nuclear ballistic missile arsenal is about ten times that of France and the UK combined (Emerson 2001: 2), though these may be largely irrelevant in the context of any foreseeable European scenario, except that it appears to sustain Russia's self-image as a great power.

All these factors point to a state of mutual dependence but also competition in the regions squeezed between the EU and the RF, currently *Ukraine, Moldova, and Belarus*. In contrast to the newly independent countries to the south, the Ukraine and Belarus especially raise identity questions for Russia. Belarus is the most pro-Russian republic with a high military strategic importance due to its location on the main East-West axis (Buzan/Wæver 2003: 416). Ukraine-Russian relations are more problematic and embrace a potential for conflict due to issues such as the Black Sea navy, naval ports, Crimea, and Russian minorities.

Finally, there are those regions that are under the domination of mainly one of the three powers. As an example, the *core Middle East* is mostly under American influence and jealously guarded by the US against the encroachment of other powers. Russia, though successfully avoids associating itself with either party to the Arab-Israeli conflict, on the whole, lacks a long-term strategy towards its major states. The EU faces similar problems in the core Middle East due to its slowness in acting and frequently conflicting agendas of the member states.

In spite of its advantages of flexibility and unilateral action in the core Middle East, the US faces problems in the region due to its mostly negative image among Arab and Muslim populations. The Arab-Israeli conflict and the peace process in particular have shown how important it is for the US, on the one hand, and the EU on the other, to coordinate their

positions, preferably with the UN and the RF, as has been the case with the *Middle East Quartet*, which needs to continue functioning possibly in an extended version to include the other important regional players.

Similar to the core Middle East, the *Western Balkans* is under total influence of the EU. In the wake of the violent conflicts that marked the recent history of this region, the EU considers it a priority to promote the development of peace, stability, and prosperity in the region. For countries in the region that have made sufficient progress in terms of political and economic reform and administrative capacity, the next step is a formal contractual relationship with the EU. This takes the form of a tailor-made *Stabilization and Association Agreements* (SAA). Until January 2007, Croatia (now an EU candidate country), Macedonia, and Albania have signed such agreements, while Serbia, Montenegro, and Bosnia and Herzegovina have launched SAA talks. Given the extensive inroads created by the EU as well as the region's geographic positioning surrounded by EU territories, neither the US nor the RF endeavour to exert influence in the region anymore.

Russia still plays an important political and economical role in parts of the former Soviet Union. For example, Belarus, having signed a Treaty of Union on 8 December 1999 and envisioning greater political and economic integration, is the country that has retained closest political ties with Russia among the former Soviet republics. Nevertheless, serious implementation of the Union Treaty has yet to take place. Tajikistan is another country of domination for Russia, where many positions in its high command are still assumed by Russians and border security is still maintained by Russia. Although Russia was actively involved in ending the civil war that plagued the country from 1992 to 1997, its inability at handling it on its own and the US's Afghan operation has brought international attention on Tajikistan. Though international economic development assistance has increased since 9/11, Tajikistan's economic and political situation is still fragile, and a possible turmoil in this country could still adversely affect the interests of the great powers in the region.

Similarly, although many Armenians prefer to see their country as a member of NATO and/or the EU, Armenia's intricate relationship with the RF as well as its existing tensions with Azerbaijan and Turkey prevents it to move away from Russia. Through a number of security partnership treaties, the RF maintains military bases and provides border guards to Armenia.

The US and the EU, on the other hand, seem to think that the time has not yet come to force Armenia to break its Russian connection and engage more seriously on a westerly direction. Moldova appears to be left to Romania to deal with the situation, and Turkmenistan, by its own choice, remains outside the influence of the US and the EU, although not as much from the RF as the successive gas deals in recent years have shown.

These competing visions have created difficult policy choices for the countries in these regions and elevated them into scenes of high stake power games, especially since 9/11. Although none of the tensions emerging from these competing visions has led to an armed conflict so far, this may change in the future. Taking into account the negative influences of regionalization in the security field, there is an urgent need to develop regional cooperation schemes with the participation of local countries as well as interested outside actors to avoid a possible regional great power conflict.

61 A Regional Security Perspective From and For the Arab World

Béchir Chourou

61.1 Introduction

A recent exhaustive review of the historical evolution of the concept of security and the emergence of the concept of human security (HS) concluded: “After ten years of debates in the social sciences the conceptual debate on human security remains inconclusive and the human security definition depends on the approach, preferences, and agenda of the respective author” (Brauch 2005a: 24).

However, it is safe to assume that this survey was based mainly on studies written in English, which is the main language of scientific communication, and that it could not include studies that may have been written in other languages such as Russian, Chinese or Arabic. This chapter is an attempt to complement the above seminal study by surveying the Arabic literature on human security with the hope of achieving two objectives: on the one hand, to determine whether and to what extent the Arab world has participated in and contributed to the debate on human security; and on the other hand, to propose a conceptualization of human security that reflects the specificities of the region, as well as policies that would be appropriate for achieving or enhancing human security in the region proper.

Concerning the mainstream conceptual debate on human security, studies by Owen (2004), Bajpai (2000) and the Oxford Research Group have been found particularly pertinent. Starting with Owen, who argued that “security carries with it a level of urgency that should only be used to address imminent disasters,” and that “threats must simply be limited using their severity and regional significance” (Owen 2004: 22). On that basis, he proposed a “threshold definition of human security” according to which “human security is the protection of the vital core of all human lives from critical and pervasive environmental, economic, food, health, personal and political threats” (Owen 2004: 20). Bajpai surveyed the various direct

and indirect threats to HS that have been identified in the literature (table 61.1).

In a similar vein Abbott, Rogers and Slodoba (2006: 28) of the Oxford Research Group argue that global insecurity will arise out of four main factors:

- adverse effects of climate change and global warming;
- competition for increasingly scarce resources, especially oil;
- increasing socio-economic divisions and the marginalization of the majority world; and
- the future spread of military technologies (including weapons of mass destruction).

Turning now to the literature on human security written in Arabic, two general observations can be made about it. First, interest in human security among Arabs appears to be rather limited and recent. On 3 February 2007 an internet search for ‘human security’ using the Arabic version of *Google* did yield more than 400,000 results, but few of them had a direct relation to the concept of human security per se. Aside from links to documents dealing with esoteric topics such as activities of the security forces of an Arab country to meet the human needs of the population, most results referred to websites, organizations, newspaper articles, etc. relating to human development, human resources, or to traditional security concerns.

Secondly, the limited debate on the issue started only after the United Nations Development Programme (UNDP) published in 2002 the first *Arab Human Development Report* (AHDR). At first, only a few newspapers in Egypt and Jordan commented on the Report. In fact, the report was more widely discussed in the West and among members of the Arab diaspora than in the Arab world (Othman 2002). Subsequent AHDRs also elicited reactions in some newspapers, but articles remained by and large descriptive rather than analytical. Furthermore, most authors seem to make no distinction between human development and human security. In fact, one writer states

Table 61.1: Direct and indirect threats to human security. **Source:** Bajpai (2000: 40).

Direct Violence	Indirect Violence
<p>Violent Death/Disablement: victims of violent crime, killing of women and children, sexual assault, terrorism, inter-group riots/pogroms/genocide, killing and torture of dissidents, killing of government officials/agents, war casualties.</p> <p>Dehumanization: slavery and trafficking in women and children; use of child soldiers; physical abuse of women and children (in households); kidnapping, abduction, unlawful detention of political opponents and rigged trials.</p> <p>Drugs: drug addiction.</p> <p>Discrimination and Domination: discriminatory laws/practices against minorities and women; banning/rigging elections; subversion of political institutions and the media.</p> <p>International Disputes: Inter-state tensions/crises (bilateral/regional) and great power tensions/crises.</p> <p>Most Destructive Weapons: the spread of weapons of mass destruction and advanced conventional, small arms, landmines.</p>	<p>Deprivation: Levels of basic needs and entitlements (food, safe drinking water, primary health care, primary education).</p> <p>Disease: Incidence of life-threatening illness (infectious, cardio-vascular, cancer).</p> <p>Natural and Man-made Disasters</p> <p>Underdevelopment: low levels of GNP/capita, low GNP growth, inflation, unemployment, inequality, population growth/decline, poverty, at the national level; and regional/global economic instability and stagnation + demographic change.</p> <p>Population Displacement (national, regional, global): refugees and migration.</p> <p>Environmental Degradation (local, national, regional, global).</p>

that the attempt by the AHDR's authors to distinguish between the two concepts is "an exercise in juggling rather than in science, creates an unnecessary confusion, distracts from the real issues, and is totally useless to people – especially the poor both in their new and old definitions" (Othman 2002: 2).

Arab interest in human security may, however, be rekindled in the near future by UNESCO. As part of its efforts to promote a new culture of peace, this organization launched in 1994 a series of projects designed to improve human security in various regions. By 2002 UNESCO formally introduced the achievement of human security in its *Medium-Term Strategy for 2002–2007*, and opted for a regional approach for implementing that strategy. In that framework, meetings were organized in Africa, Latin America, and East Asia to discuss the state of human security and make recommendations for achieving/improving human security in those regions. A similar meeting was held in March 2005 in Amman (Jordan) to discuss a study prepared by this writer at the request of UNESCO on human security in the Arab world (Chourou 2005). As was the case at other meetings, representatives from the region's governments, universities, research centres, and non-governmental organizations made presentations and participated in the debates. The proceedings showed plainly that governments perceived security in terms of state security, focusing particularly on the need to deal with 'terrorist' organizations that attempt to change the existing political order by force,

thereby threatening the security of all members of society. Academics tended to use the various definitions of human security found in the literature (Brauch 2003, 2005, Brauch/Oswald Spring/Grin/Mesjasz/Krummenacher/Behera/Chourou/Kameri-Mbote 2008).

In order to ally between the need of clearly defining the concept under study so as to make a correct diagnosis of the problems at hand, and the need to put issues in their proper setting so as to ensure that solutions proposed are appropriate and relevant, in this chapter Owen's definition of HS and the Oxford Research Group's factors of insecurity will be used as bases for identifying, among Bajpai's list of threats, those that represent a 'clear and present danger to the vital core of human lives' in the Arab world.¹ It should be noted, however, that not every one of those threats is necessarily present or is equally severe in every country of the region. Nevertheless, it will be argued that a given threat observed in one part of the Arab world may have an impact in another part where it is not observed. For example, growing poverty in Egypt

1 The term 'Arab world' is used to refer to the following 19 of the 22 members of the League of Arab States: Algeria, Bahrain, Egypt, Iraq, Jordan, Kuwait, Lebanon, Libya, Mauritania, Morocco, Oman, Qatar, Saudi Arabia, Sudan, Syria, Tunisia, United Arab Emirates, Yemen, and Palestine. The Comoros, Djibouti, and Somalia are not included because data for them are unavailable or unreliable.

may push people to migrate to the Gulf region, possibly creating social or political tensions there. This implies that meeting a particular threat may require the involvement of not just the affected country or countries, but of other Arab states as well.

Bajpai distinguishes between direct and indirect threats to human security. His list of indirect forms of violence includes natural and man-made disasters, and environmental degradation. These two elements are certainly present in the Arab world, but they will receive full treatment in two subsequent volumes.² The remaining four types of indirect violence are deprivation, disease, underdevelopment, and population displacement. They too will not be treated in this chapter, for the following two reasons. Extensive discussions of these forms of insecurity can be found elsewhere (e.g. Chourou 2005; UNDP 2004a), and hardly any part of the Arab world suffers from severe deprivation or underdevelopment. An examination of some development indicators (table 61.2) shows e.g. that the per capita income (in terms of parity purchasing power – PPP) is relatively high, and that health and educational services are available to large segments of the population. Of course, these figures are averages which may hide large variations between national situations. For example, per capita gross domestic product (GDP) for 2003 varied between US\$ 22,420 for the United Arab Emirates (UAE) and US\$ 889 for Yemen. Similarly, the value of the Human Development Index (HDI) for the same year was 0.85 for Qatar (making it 40th among the 177 ranked countries and first in the Arab region), and 0.48 for Mauritania (152nd in overall ranking, and last in the regional ranking). Nevertheless, 13 Arab states are listed by the UNDP in the category of medium human development, and 4 in the high human development category. This is why it may be considered that few Arabs are faced with immediate and severe threats resulting from deprivation, disease or underdevelopment (table 61.3).

As for natural and man-made disasters, environmental degradation, and population displacement, they do represent serious threats to human security, although their degree of severity and impact on humans are not uniform throughout the region (Brauch 2003d, 2003g).

Table 61.2: Selected social and economic indicators for the Arab world. **Source:** UNDP (2005b)

Demography (2003)	
Total population (millions)	303.90
Annual growth rate (1975-2003), in %	2.70
Population under age 15 (% of total)	36.30
Population ages 65 and above (% of total)	3.10
Total fertility rate (births per woman), 2000-2005	3.70
Life expectancy at birth (years), 2003	67.00
Infant mortality rate (per 1,000 live births), 2003	48.00
GDP per capita (PPP US\$), 2003	5 685.00
GDP per capita annual growth rate (in %), 1990-2003	1.00
Adult literacy rate (% ages 15 and above), 2003	
Total	64.10
Female	53.10
Youth literacy rate (% ages 15-24), 2003	
Total	81.30
Female	75.80
Enrolment ratio for primary, secondary, and tertiary schools (in %), 2002/03	62.00
Population with sustainable access to improved sanitation (2002), in %	66.00
Population with sustainable access to an improved water source (2002), in %	84.00
Population undernourished (2000-2002), in % of total	9.00
Human development index (HDI) value, 2003	0.68

What needs to be kept in mind is that threats are numerous whereas the means to deal with them are insufficient. Therefore, any policy seeking to promote or enhance human security needs to rank threats so as to determine which ones have to be given the highest priority. This is in keeping with the above-mentioned approach which recommends that definitions of human security and methods for meeting threats be adjusted to circumstances prevailing in a particular geographical area and a specific community..

Based on this approach this chapter focuses on Bajpai's list of forms of *direct* violence (left column of table 61.1), and geographically, on the Mashreq, considering that in the Maghreb (North Africa), it is the forms of *indirect* violence which are more prominent,

Table 61.3: Comparative Human Development Indicators. **Source:** UNDP (2005b).

	Developing countries	Least-developed countries	Arab States	East Asia and the Pacific	Latin America and the Caribbean	South Asia	Sub-Saharan Africa
Life expectancy at birth (years) 2003	65.0	52.2	67.0	70.5	71.9	63.4	46.1
Adult literacy rate (% age 15 and above) 2003	73.5	53.6	64.1	90.4	89.6	58.9	60.5
Combined primary, secondary, and tertiary gross enrolment ratio (in %) 2002-03	63	45	62	69	81	56	50
GDP per capita (PPP US\$) 2003	4 359	1 328	5 685	5 100	7 404	2 897	1 856
Life expectancy index	0.67	0.45	0.70	0.76	0.78	0.64	0.35
Education index	0.72	0.50	0.61	0.83	0.87	0.58	0.56
GDP index	0.70	0.60	0.72	0.71	0.74	0.67	0.63
HDI value (2003)	0.694	0.518	0.679	0.768	0.797	0.628	0.515

although some forms of direct violence are not totally absent. The contrast is deemed sufficiently important to warrant that a separate chapter be devoted to human security seen from a Maghrebi perspective (Chourou 2008)

Coming back to Bajpai's list of direct violence, it will be adjusted for the purposes of this chapter in the following manner. To begin with, problems related to drugs (addiction, trafficking...) are not as severe and widespread as they are in the North, although they are not totally absent. Consequently, they do not need (yet) urgent attention and will not be discussed. The remaining categories of direct violence are found, to one degree or another, in many, if not all, parts of the region, but some of them may be combined to avoid redundancies and gain greater differentiation between categories.

At the top of Bajpai's list we find 'violent death/disablement.' This is clearly the ultimate form of insecurity to which a person may be exposed, and many Arabs have already died by unnatural causes (shooting, bombing, beating...), and more are and will be exposed to this existential threat as a result of wars, insurgencies, terrorism, coups, martial rule and the like.

Another threat with which many Arabs have to contend is the curtailment or total absence of fundamental human rights other than the right to life, such as the rights to freedom and to dignity. Many instances of this threat are given by Bajpai under the categories of 'dehumanization' and 'discrimination and domination.' Those that are most frequent in the Middle East and North Africa (MENA) include unlawful

detention of political opponents, rigged trials, banning/rigging elections, subversion of political institutions and the media, and discrimination against minorities and women. For our purposes, these two categories will be merged into a single one called 'authoritarianism'.

Similarly, the two categories called 'international disputes' and 'most destructive weapons' may be combined into one called 'foreign intervention'. As it will be argued below, most crises and tensions in the region are the direct or indirect results of intervention by extra-regional powers, particularly the United States. Furthermore, the continued accumulation of conventional arms and the existence and possible proliferation of weapons of mass destruction are the consequence of policies initiated, promoted or imposed by foreign powers.

In sum, security for a large number of Arabs is protection against violence that may lead to loss of life, family, community, liberty, property, income. Such violence may be perpetrated by citizens of one's own country or by foreigners, by one's own state or by foreign powers. Assuredly, this does not mean that other components of human security such as freedom from want, from hazard impact, or from exclusion, are to be ignored; but for a person who does not know whether his house will be next to be bombed, or whether he will be next to 'disappear' or to be thrown in jail - for such a person, issues like freedom of the press or the advancing desert would be remote and irrelevant.

Figure 61.2: Natural Gas Reserves (1 January 2005). **Source:** US Energy Information Administration: in: *Annual Energy Review 2006*, based on *Oil and Gas Journal*.

Turning to the causes of global insecurity proposed by the Oxford Research Group, the first one (adverse effects of climate change and global warming) will not be discussed here, as already mentioned. The second (competition for increasingly scarce resources, especially oil) and third ones (increasing socio-economic divisions and the marginalization of the majority world) apply eminently to the Arab world and will be discussed in some detail. The last factor (the future spread of military technologies) is included under 'foreign intervention'.

To recapitulate: This chapter considers that the main value to be protected in the Arab world is the physical integrity and personal safety of the individual. It will argue that local, regional, and extra-regional actors are likely sources of direct violence, and that the probability and intensity of violence will increase with time. Four causes will be proposed to explain this situation: competition for controlling the region's oil and gas resources; the stalled Middle East peace process; authoritarianism; and the division among Arab states leading to their marginalization and ineffective participation in global political and economic processes.

61.2 Oil: A Much Coveted Commodity

The MENA contains 67 per cent and 45 per cent, respectively, of the world's oil and gas proved reserves (figures 61.1, 61.2). The main producing and exporting countries are also found in the region (tables 61.4 and 61.5). This has had positive as well as negative effects on human security in the region. The most obvious

benefit is material well-being. Arab countries with the highest per capita income are those that produce and export energy products (with the notable exception of Algeria). However, this wealth is also at the origin of many of the region's problems. Given the strategic value of oil, consuming countries have always been keen on having access to it in an unhampered manner and at what they consider as 'reasonable prices'.

In order to achieve that objective, each country used strategies that varied according to the prevailing circumstances, but their common feature was - and continues to be - to ensure that political authority in oil-supplying countries does not fall into 'unfriendly hands'. For members of the Organisation for Economic Co-operation and Development (OECD) in particular, the importance of this objective grows as their needs grow and their dependence on imports increases. Since the turn of this century, consumption growth has been declining for the US, Europe, and Japan as a result of efforts to save energy and to use alternative forms of energy (see figure 61.3).

However, the OECD dependence ratio declined on average, from about 80 per cent in the 1970's to around 60 per cent in the 1990's, but increased in the case of the US from 35 per cent in 1990 to over 50 per cent in 2002. Furthermore, imports from the Gulf continue to represent a significant share of total US imports. The share of the Gulf region in total oil imports is currently around 70 per cent for Japan, 30 per cent for Western Europe (declining), and 20 per cent for the US (increasing, figure 61.5). Another factor to be taken into consideration is the emergence of new major consumers, e.g. China and India (figure 61.3, 61.4).

Table 61.4: Top World Oil Net Exporters, 2005* (OPEC members in italics). **Source:** US Energy Information Administration: in: Annual Energy Review 2006.

	Country	Net Oil Exports (million barrels per day)
1)	<i>Saudi Arabia</i>	9.1
2)	Russia	6.7
3)	Norway	2.7
4)	<i>Iran</i>	2.6
5)	<i>United Arab Emirates</i>	2.4
6)	<i>Nigeria</i>	2.3
7)	<i>Kuwait</i>	2.3
8)	<i>Venezuela</i>	2.2
9)	<i>Algeria</i>	1.8
10)	Mexico	1.7
11)	<i>Libya</i>	1.5
12)	<i>Iraq</i>	1.3
13)	Angola	1.2
14)	Kazakhstan	1.1
15)	<i>Qatar</i>	1.0

* Table includes all countries with net exports exceeding 1 million barrels per day in 2005.

As their needs grow, and if production fails to keep up with that growth, two developments are likely to occur: there will be competition between consuming countries to secure guaranteed sources of supply. Already, China is taking bold steps to establish closer ties with various Arab and African producers, offering attractive development packages in exchange for guaranteed delivery contracts and prospecting permits, not to mention diplomatic support for various causes considered as important by those countries. Growing demand for oil is also putting pressure on prices. Of course, many factors have an impact on oil prices, but increasing demand is likely to be the most enduring. In any event, oil prices are currently breaking records, and they are not likely to ever go down to the levels they had in the mid-1970's or mid-1980's.

All of these factors are likely to have a major impact on the way the West defines its security priorities and the actions it would be willing to take should this vital interest be threatened. Of course, no nation would openly admit that it would use force for any purpose except as a last resort, but a realist should be aware that few nations would be willing to put them-

**Total Oil Production includes crude oil, natural gas liquids, condensate, refinery gain, and other liquids.

selves at risk for the sake of preserving peace. Nor should it be forgotten that colonialism was driven by economic interests (among other factors), including control over raw materials. The US in particular has a long history of intervention prompted by its perception that its economic or political or strategic interests were threatened. Most recently, the two Gulf wars and the current war in Iraq have shown America's willingness to resort to war (and to drag its allies with it) in order - among other objectives - to control an area that contains a major portion of the world's proved oil and gas resources. The possibility that similar wars could take place in MENA is not to be dismissed: if an Islamist, or 'terrorist', or unfriendly regime were to seek or gain power in any of the oil-producing Arab countries, the West is not likely to accept this passively. Therefore, the fact that oil will be more and more coveted by more and more states, combined with growing pressure in the region to utilize oil as a tool to achieve political and strategic objectives, is bound to lead to confrontations between producing and consuming states, and Arab civilians are certain

to be the primary victims of these coming approaching confrontations.

61.3 The Protracted Problem of Palestine

There is at least one issue about which there is a strong consensus in the Arab world, and that is finding a just and lasting solution to the injustice done to the Palestinian people. No one denies that Jews had been subjected to inhuman treatment inflicted by Nazi Germany and other contemporary European governments, but most Arabs believe that the solution adopted then by the international community at the behest of the victorious powers, i.e. the creation of a Jewish homeland in territories which were at the time occupied by Arabs, was politically unsound or morally unacceptable. As soon as Israel was created, Arab states have waged wars in order to liberate occupied territories and dismantle what they called the 'Zionist entity'. The Palestinians themselves launched a liberation movement for the purpose of achieving the same objectives. Eventually, Palestinians and Israelis agreed to seek a peaceful solution to the conflict. A Palestinian Authority was established in territories ceded by

Israel and the two parties agreed to continue negotiations for a just and lasting peace. Most Arab states proceeded then to grant Israel a *de facto* or *de jure* recognition and established diplomatic relation with it.

Yet no solution to the conflict has been reached or is in sight. In fact, violence in the region has increased in the last few years and Palestinians and other Arabs continue to die every day. In 2006 Israel has launched a war against Lebanon for the proclaimed purpose of neutralizing the militia of the Shiite party of Hizballah. In the Occupied Territories it has refused to recognize the Hamas-led government that came to power following elections that the international community declared to have been fair and democratic.

For Arab public opinion, the lack of progress towards a just and lasting peace in the Middle East is largely due to Israel's refusal to abide by its contractual obligations and to implement UN Security Council resolutions. Furthermore, most Arabs believe that if Israel has been able to persist in this defiant attitude, it is because it could always count on the unconditional support of the US, be it military, diplomatic, financial or economic.

As far as the ‘Arab street’ is concerned, there is no reason to expect a reversal of US policy any time soon. Support for Israel has been a feature of US foreign policy since 1948, and no US administration is going to change that. There have been a few efforts in the past to adopt a more equitable attitude towards the Palestinians, but they are not likely to be renewed in the near future, especially if the US pursues its ‘war against terrorism’ and persists in considering any opposition to its policies and those of Israel as a form of terrorism. Instead, all those who believe that international law should apply equally to all states and, more generally, who want to curtail foreign intervention in the region, those who fight US and other foreign troops occupying Iraq, those who seek to liberate Lebanese and Palestinian prisoners held in Israeli jails, those who have been elected in Palestine to govern, – all of them are likely to continue being considered by the US (and some of its allies) as terrorists to be chased and ‘brought under control’ by all means, including violence. Consequently, and from the point of view of Arabs who consider themselves as direct victims of such policies and other Arabs who share that viewpoint, resistance to occupation and oppression is not only a moral imperative, but also a legitimate means to achieve an essential element of human security: survival and physical integrity.

61.4 Authoritarianism

The Arab world is practically the only region not to be affected by the various ‘waves of democratization’ that have hit different areas of the developing world since the late 1980’s. At present, few Arab countries can claim to have a genuinely democratic political system, i.e. a system where authority is held by institutions represented by individuals who are accountable to the citizens. In this respect, Freedom House’s (2006) *Freedom in the World* ranking indicates that 12 Arab countries are considered as ‘not free’ (3 of which with a score of 7, the least free ranking), and 6 as ‘partly free’ (most of which score 5).

This situation has persisted since the Arab countries achieved independence, the colonial powers having ensured, prior to abandoning their formal political control, that the new rulers would be friendly and well-disposed towards them. A symbiotic relationship was thus established between Arab regimes and Western governments, particularly those of France and the United States. The latter could advance their economic interests (access to oil, sales of weapons and

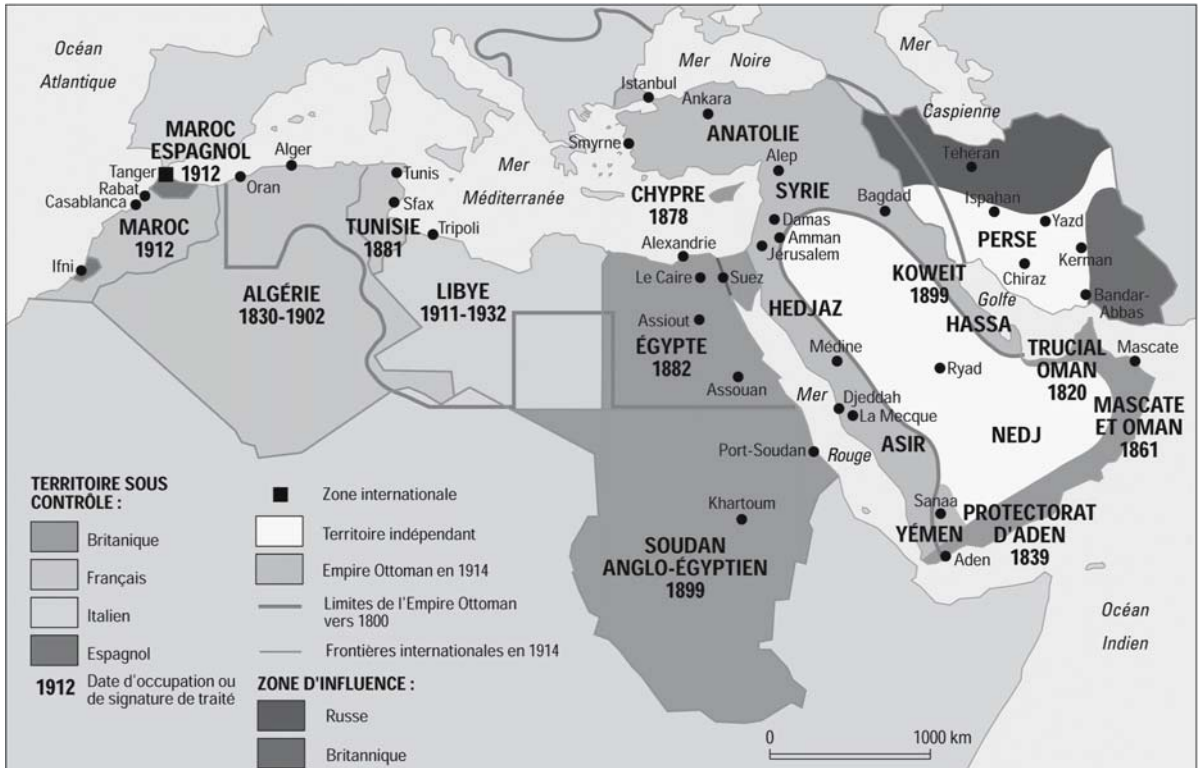

technological and industrial goods, recycling of oil revenues ...), and the former could count on diplomatic, logistical, and material support for staying in power.

At first, Arab governments ‘proposed’ to their respective populations a tacit understanding whereby the state would provide needed goods and services (employment, education, health...), and in return people would refrain from meddling in politics. This *quid pro quo* functioned for a time, but in the late 1980’s it started to come apart here and there, either because the state could no longer honour its part of the deal (for lack of will and/or resources), or the citizens were no longer willing to forego their civic rights. One way or the other, discontent began to build up in various countries, and opposition began to organize. Typically, demands were for greater democracy, respect for human rights, freedom of expression and assembly, etc. But the only way for people to express their dissatisfaction was to take to the streets. In most cases, regimes reacted not by allowing greater participation in the political process, but by increasing oppression. This set off a cycle of violence and counter-violence, violation of human rights and resistance, resort to terrorist tactics and further repression. The result was that those who were branded as terrorists became heroes and martyrs, and those who prosecuted or persecuted them confirmed their image of tyrants.

While this was taking place, Western governments failed to denounce or condemn the repression that was taking place in various parts of the Arab world, arguing that political change would bring ‘instability’ to the region. In effect, what they feared was the transfer of power to parties or movements that they did not control and that would jeopardize their interests in the region, including access to oil. The same fear continues to exist today, even though Europe and the US are now openly calling for political reforms and greater democracy in the Arab world. Arab public opinion is sceptical about their sincerity and dubious about their motives, especially in view of their reaction to the cancellation of the democratic process in Algeria in 1991, and of the methods currently being used in Iraq to institute democracy.

As the *International Commission on Intervention and State Sovereignty* (ICISS) points out, a large number of Arabs are among the millions of “ordinary people [whose] lives are at risk because their states are unwilling or unable to protect them” (ICISS 2001: 11). In fact, instead of insuring the security of their citizens, most Arab regimes have become a threat to them. As long as the economic objectives (access to

Figure 61.6: The Middle East 1914. **Source:** © Philippe Rekacewicz, *le Monde diplomatique*, Paris (<http://www.monde-diplomatique.fr/cartes>) Permission was granted by Philippe Rekacewicz on 15 September 2007.

oil, sales of arms) and political interests (preventing unfriendly governments from coming to power, allowing Israel to act freely in the region) of the West remain unchanged, and the active support of allies to achieve them remains necessary, the security of Arab citizens will remain uncertain. At present, Western need for compliant regimes in the region is stronger than ever, and the dependence of Arab rulers on Western support to fend off growing challenges to their authority has never been as critical. It is therefore to be expected that any attempts to interfere with the designs of Arab regimes and Western governments would be resisted by any means, including force.

61.5 A Divided Nation

The Arab world is often viewed as a unit or single entity. This is not totally unjustified. We are dealing with an area of some 10 million km² (more than 2½ times the size of Western Europe) that stretches from the Atlantic Ocean to the Zagros Mountains in south-west Asia. The vast majority of the people living there share the same language (Arabic) and the same reli-

gion (Islam). For extensive periods up to the beginning of the twentieth century the area has been ruled by a *de jure* single political authority.

On the other hand, there are today few reasons to justify looking at the Arab world as a single entity. Arabs have the same religion but belong to different sects; they share a language but speak different dialects; they have the same history but do not have the same vision of their future. In short, whatever centripetal forces may have been at play in the past have been eroding over the last fifty years or so, to be replaced by far stronger centrifugal forces which have become so well entrenched that many Arabs doubt they can be rolled back – much less eliminated – in the foreseeable future.

The current political configuration of the Middle East started taking shape with the dismembering of the Ottoman Empire at the end of the First World War and continued through the end of the Second World War (see figures 61.6 to 61.9). By then France and the United Kingdom, which were already present in North Africa, had completed the process of putting the Arab world under their control in the form of trust territories, protectorates or outright colonies.

Figure 61.7: Sykes-Picot Agreement of 1916. **Source:** Passia, Palestinian Maps; at: <http://www.passia.org/palestine_facts/MAPS/1916-sykes-picot-agreement.html>. Permission has been obtained from the copyright holder.

As James Zogby, President and Chief Executive Officer of the Arab American Institute, observed in a speech given in Washington, DC on 3 June 2003, by the late 1940's "the region was carved out into states, and regimes were implanted to serve British and French interests." He further points out that this was the culmination of a process that lasted 150 years during which the people of the region "ha[d] experienced a loss of control of their own history. Imperial and colonial conquests had a dramatic impact ... If anything, the roots of extremism in the region come from this loss of control, this sense of powerlessness, this sense of humiliation."³

It was also during this period that many of the problems that are currently besetting the region had been created, most particularly the Palestinian problem. Historical facts such as the Mandate system, the UN partition of Palestine, and the drawing of boundaries creating new states, are well known.

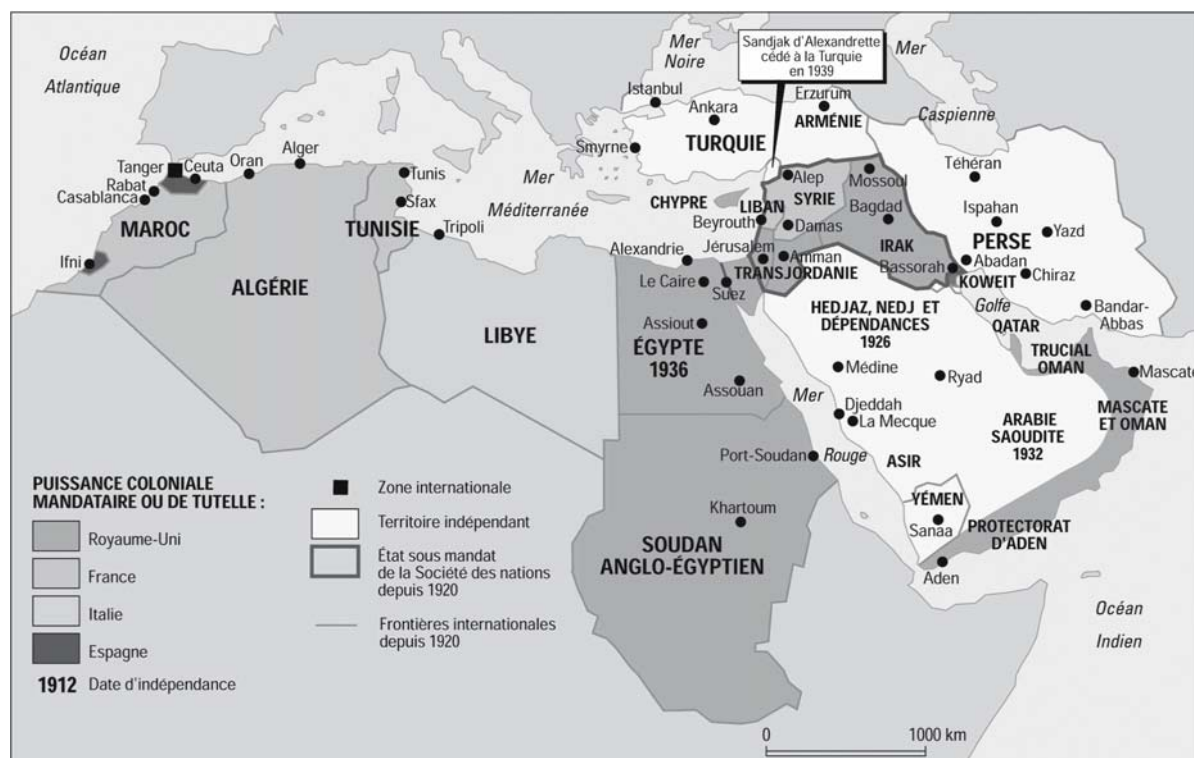

At the end of World War II and in an effort to better protect their interests through common action, six countries (Iraq, Transjordan [later Jordan], Lebanon, Saudi Arabia, Syria and Yemen) joined Egypt in 1945 to form the League of Arab States. The initial project envisioned the creation of a union, or a federation, or at least a confederation, but the prospective members proved too jealous of their newly-acquired sovereignty to abandon it in favour of a supranational state. Subsequently, other members joined the League as sovereign states not bound by any common decision that the League might take. From its early days the organization adopted a large number of charters, treaties, and agreements instituting a common market, common defence, a common industrial policy, etc. but to this day no significant degree of cooperation, not to mention unity, exists between Arab states, although everyone continues to pay lip-service to Arab unity.

One can suppose that Arab people do not oppose unity, although only a scientific survey can determine how committed they are to what form of unification. Leaders, on the other hand, have always proclaimed their belief in, and their desire for unity. A few attempts have even been made to bring it about, even though such attempts have been aborted after a few months or a few days. For example, the United Arab Republic (UAR), formed by Egypt and Syria, and the United Arab States, formed by the UAR and North Yemen, lasted from 1958 to 1961. Most other attempts at unification were initiated by Libya. The Federation of Arab States (FAR), formed by Libya, Egypt and Syria, formally came into existence on 1 January 1972 but was never implemented. Plans to achieve full political union between Libya and Egypt collapsed after Sadat's visit to Jerusalem and the signing of a peace treaty between Egypt and Israel in 1978. A merger between Libya and Tunisia was announced in early 1974 only to be denounced by the Tunisian president two days later. The Treaty of Oujda signed between Libya and Morocco in 1984 united the two countries, but the project collapsed in 1986. Syria is, in theory but not in practice, united with Libya to this day as a result of an agreement signed in 1980, and it had envisioned mergers with Jordan and Iraq.

However, there have been some regional integration projects which have managed to stay alive such as the UMA, the GCC, and the Agadir Initiative. Created in 1989, the *Union du Maghreb Arabe* (UMA) or Arab Maghreb Union (AMU) constituted by Algeria, Libya, Mauritania, Morocco and Tunisia seeks, according to Article 2 of its Charter, "to strengthen the brotherly relations that unite the member states and

Figure 61.8: Middle East in 1939. **Source:** © Philippe Rekacewicz, le Monde diplomatique, Paris (<http://www.monde-diplomatique.fr/cartes>) Permission was granted by Philippe Rekacewicz on 15 September 2007.

their peoples, contribute to the preservation of peace based on justice and equity, adopt common policies in various areas, and work progressively towards achieving the free movement of people, services, goods and capital.” However, the organization has been in a deep coma for more than a decade. Its five heads of states, who are supposed to meet annually, have not done so since 1994, and none of the summits that did take place had been attended by all of them. Furthermore, no progress has been made towards the creation of a free trade zone. This failure is due to several factors, the most important being the disagreement between Algeria and Morocco over the Western Sahara, and Libya’s displeasure with Mauritania’s decision to establish diplomatic relations with Israel.

As for the Gulf Cooperation Council (GCC), it was established in 1981 by Bahrain, Kuwait, Oman, Qatar, Saudi Arabia, and the United Arab Emirates. Among its objectives (defined in Article 4 of its Charter), the GCC seeks to achieve coordination, complementarity, integration and, ultimately, unity among the member states. Contrary to the UMA, the GCC has realized some concrete results: in 2003 it eliminated all tariffs on trade between its members and established a common external tariff wall as preliminary

steps towards creating a single market. It also plans to adopt a common currency by 2010.

Lastly, and for the sake of completeness, mention should be made at the latest effort at regional integration – the so-called Agadir Initiative. In May 2001 the foreign ministers of Egypt, Jordan, Morocco and Tunisia met in Agadir (Morocco) and issued a declaration calling for the establishment of a free trade zone among the four states (accession by other Arab-Mediterranean states being left open). In February 2004 a final agreement was signed in the same city from which the initiative was launched. The European Union, which supported the project from its inception, announced shortly after the signing of the agreement that it was setting aside €4 million to provide technical assistance to member states and to the Secretariat of the organization once it is set up. As of late 2006 the Agadir Agreement has not gone into effect, but when/if it does, it is not likely to yield major benefits given the geographical distances that separate the member states, the absence of communication infrastructure (especially land and sea transport), and the insignificant volume of trade between the contracting parties.

It may be noted that despite these failures, Arab states did show on occasion, as in the wake of the 1973 Middle East War, that they were capable of achieving a high degree of cooperation and unity of purpose when they wished to do so. But by and large, unity has been mostly an ideal and a propaganda tool rather than a political objective to be implemented through a coherent and planned process.

The fragmentation of the Arab world will have profound effects on its people's security. The world has been going through a process widely known as globalization which, in effect, is made up of four separate but interrelated processes (Scholte 2002): a) *internationalization* or the growth of transactions and interdependence between countries; b) *liberalization* or the formation of an open and borderless world economy; c) *universalization* or the spread of products, ideas, attitudes and types of behaviour across geographical areas and cultures; and d) *Westernization* which is a particular form of universalization in which the social structures of modernity (capitalism, industrialism, rationalism, urbanism...) are adopted or imposed throughout the world.

At present, the Arab world is heavily dependent on the outside world for satisfying most of its needs:

food, medicine, scientific knowledge, technical know-how, etc. Admittedly, many states depend on the Arab world for vital energy products, but the interdependence is extremely unbalanced to the detriment of the Arab world. In other words, the Arabs have not managed to make internationalization and liberalization work to their advantage. Nor have they been able to claim ownership of the process of universalization or become effective participants in it. Having claimed that universalization is a disguised form of Westernization, many regimes and segments of civil society in the region have rejected universal values as contrary to religious or cultural principles. As a result, there is widespread discrimination against women and minorities, violation of human and civic rights, sectarianism, authoritarianism, and nepotism – to name a few of the dysfunctions that beset the region.

This is not to say that Arabs are fully immune from attempts to tamper with their cultural and religious values or important components of their identity. However, resistance to such attempts cannot take the form of wholesale rejection of, or confrontation with, other cultures and civilizations. A more beneficial approach would be to try to take an active part in shaping the process of universalization and insure that it

incorporates any values that Arabs consider as important. At the same time, Arabs should re-examine practices, beliefs, and attitudes which others may find objectionable, and undertake either to convince others that these have intrinsic merits which have been overlooked or misperceived, or to recognize that they are in fact unacceptable and should therefore be abandoned. Short of this constructive dialogue, the ongoing recriminations, denunciations, and confrontations are likely to continue, to the detriment of human security in the Arab world and elsewhere.

But this dialogue with the outside world must be preceded by a dialogue among the Arabs themselves. They need to reassess the way they interact with the outside world, determine what status they have within the world community and, most importantly, evaluate the risks of being a passive observer standing on the periphery of the process of globalization. Arabs need to realize that they lack the critical mass that would allow them to be effective actors in world affairs. Even if they were to be taken as a single entity, Arab states represent a negligible quantity in terms of economic production, financial weight, trade, scientific production or technological innovation. This may not represent in the short term a threat to human security inasmuch as goods and services that are not produced locally can be purchased from the outside world, even though there is no guarantee that Arabs will always have the means to acquire what they need or that they will always find willing suppliers. Therefore, they need to ensure that they have the proper stature and the appropriate bargaining chips that would allow them to participate effectively in the negotiations that will determine the distribution of resources among the world communities.

61.6 Human Security in the Arab World

To summarize, insecurity in the Arab world has reached alarming proportions, and it is likely to become more severe in the future. Every day people are killed, maimed, imprisoned, and tortured at the hands of foreign or national soldiers, policemen, militiamen or self-appointed law enforcers. Such acts may not occur with the same frequency everywhere, but no part of the region is immune against them. Under these circumstances, people are not going to worry about climate change or desertification or about poverty, inflation or sanitation, when they are not sure if they are going to be alive on the next day.

Consequently, the most urgent task is to protect people against all forms of violence that threaten their physical integrity. The practical means for doing so will vary from country to country according to the source of the threat. In Palestine, Lebanon and Iraq, for example, people have been victims of foreign armies which invaded and occupied (and continue to occupy) their countries, and the first step to end the bloodshed is to bring foreign occupation to an end.⁴ However, in all three cases the prospects of a lasting peace are dim.

Another cause of insecurity which exists in all Arab countries is the absence of democracy. At present there is no government that can be considered as accountable to its people, attentive to their needs and aspirations, and respectful of their rights. In addition, many political leaders have been able to stay in power for decades, mainly thanks to Western support. Eventually, opposition movements started to get organized, demanding substantial political reforms. In most cases regimes reacted by starting or increasing repression against actual, potential or imagined opponents. The methods used were such that practically every opposition movement ceased to function, with the exception of Islamist/fundamentalist movements. These had the will and the means to use violence not only against the ruling regimes but also against those who aid and abet those regimes. As time went by, the degree of violence used by each side increased continuously, and it has now reached such a point that it is difficult to see how the confrontation between the fundamentalists and their opponents can be brought to an end, all the more so that neither side will accept anything short of the total defeat of the other.

The United States has declared an all-out 'war against terrorism' and has drawn a number of Western states into it. Most Arab regimes welcomed this war which, they hope, will eliminate those who threaten their hold on power. The fundamentalists, on the other hand, consider that they are fighting to protect their countries and communities against foreign political, economic, and cultural domination. With attitudes such as these, compromise becomes

4 To take Palestine as an example, figures provided by B'Tselem (the Israeli Information Centre for Human Rights in the Occupied Territories) indicate that since the second Intifada started in September 2000 nearly 3,800 Palestinians were killed by Israeli security forces, including 769 minors and 208 who were the object of a targeted killing, while the Palestinians killed 314 Israeli soldiers and 697 civilians (B'Tselem 2006).

nearly impossible. The most likely prospect is that the confrontation between entrenched regimes and radicalized (structured or unstructured) public opinion will intensify and spread across the region, contributing to instability and insecurity there.⁴

This is not the place to discuss peace in the Middle East, but the situation as it stands in mid-2007 gives little cause for optimism. Each of the protagonists considers that it is fighting a just and moral cause, proclaims that it has the necessary mental and material resources to defeat the evil enemy, and that nothing short of total victory is acceptable. It is likely, therefore, that in the foreseeable future the ultimate form and yet most easily avoided form of insecurity – death – will continue to haunt not just Arabs, but also Israelis, Americans, Europeans, and most other people who have the misfortune of living in a world that calls itself civilized.

The invasion of Iraq is continuing with no end in sight. More importantly, the Iraqi people are not likely to enjoy any form of security for decades to come as a result of the disintegration of their political and social institutions.

As for regional integration, which could provide a durable solution to the region's problems, it will remain a distant dream. This is not due to any insurmountable structural reasons but rather to the combined effect of resistance of current regimes to any reduction of their absolute power, resistance of extra-regional powers to the emergence of 'unfriendly' national or supra-national institutions that would have sufficient legitimacy to adopt more assertive policies towards other countries and regions and more independent decisions in their political, diplomatic, economic, and financial relations with the rest of the world. At a time when blocks are being formed and consolidated in various parts of the world, a divided Arab world will have little weight in international affairs and little capacity to defend its interests.

Therefore, Arabs will continue to be at the mercy of forces which are outside of their control. Some will have no choice but to accept this situation if they want to stay alive. But others, whose ranks are growing, will seek to change the situation and will be willing to put their lives at risk towards that end. In other words, the current calls that the United States and Europe are making for reforms in the Arab world will not reduce the determination of those who seek to set up a new political and social order in the region.

Where does this leave human security? A realistic assessment would provide little cause for optimism. The waves of human security, just like the waves of de-

mocracy, have failed to reach the shores of the Arab world. There is, however, one exception: Jordan. This country is a founding member of the Human Security Network, and in that capacity it has taken some initiatives to raise awareness about human security. It was also in Amman that the above-mentioned International Conference on Human Security in the Arab Region was held in 2005; it was co-organized by the Regional Human Security Centre at the Jordan Institute of Diplomacy and UNESCO.⁵

Finally, it may be pointed out that UNESCO has reached an agreement with the Arab League to jointly organize a conference in Cairo in 2007 to further discuss the state of human security and make recommendations to enhance it in the region. UNESCO plans to commission several studies dealing with theoretical issues as well as themes related to specific aspects of human security and specific countries or sub-regions of the Arab world. Should that project materialize, it could lead to a greater awareness among decision-makers, intellectuals, and public opinion at large about human security issues and, perhaps, to the adoption of action plans for enhancing human security in the region.

In the short and medium term one should not expect any major improvements in human security in the Arab world. Large segments of Arab societies will continue to face clear and present dangers to the vital core of human life. The threats will continue to emanate mostly from human agents rather than natural factors, although the latter (desertification, water scarcity, etc.) will significantly increase insecurity in many parts of the region. For those who seek to change the course of events, the major difficulty will consist in finding ways to deal with individuals and groups who have entrenched interests to defend and who will use any means to preserve their dominant position. The task may not be impossible, but it is certainly daunting.

5 In addition, a Jordanian university, Tafila Technical University, plans to organize in July 2007 a conference on "Human development and security in a changing world" and has issued a call for papers dealing with various aspects of human security; see at: <<http://www.ttu.edu.jo/hds/index.html>>.

62 ECOWAS and Regional Security Challenges

U. Joy Ogwu

62.1 Introduction

Africa is the continent that harbours the largest share of the world's conflicts and wars. West Africa is the sub-region with the greatest share of these problems. Since the beginning of the 1990's conflicts and violence have resulted in the death, injury, and mutilation of several hundred, and the displacement of millions of people across the sub-region. The death and injury tolls have made West Africa and the Economic Community of West African States (ECOWAS) synonymous with insecurity, violence, and destruction rather than cooperation and development as designed in the core objectives of ECOWAS.

However, in spite of many problems of the sub-region, ECOWAS has created active structures and frameworks for engaging effectively to achieve peace and stability in West Africa. While maintaining the larger focus on economic development, cooperation, and integration among its member states and their estimated 240 million people, ECOWAS has reviewed and realigned its structures and operations to deal with the security challenges confronting the sub-region. The ECOWAS leadership has collectively resolved that the pursuit of regional peace and security is central to the attainment of the social, economic, and political development of the sub-region.

The sustained efforts of ECOWAS and other regional and global actors like the African Union (AU) and the United Nations (UN) have resulted in some measure of calm in some of the war-torn countries of West Africa (e.g. Liberia, Sierra Leone, and Guinea) since the second half of 2002. Yet, there remain enormous challenges in the pursuit of sustainable peace and security in West Africa. It is in that regard that this paper seeks to examine the following pertinent questions: What are the security challenges confronting West Africa? What are the structures and measures that ECOWAS is devising to deal with these challenges? How much success or otherwise has been

achieved in confronting the region's security problems?

62.2 Conceptual Clarifications

The concept of regionalism is central to addressing the subject of regional security in West Africa or any geopolitical area for that matter. Essentially, a region connotes the geographical segmentation or division of a given space. The world for example is divided into continents, which are further divided into regions and sub-regions for geographical and politico-economic reasons. In international relations regionalism embodies the idea of dealing with issues concerning or peculiar to a particular region and promoting development, cooperation, and integration of the region. It is within this broad concept of regionalism that various aspects such as: regional cooperation, regional integration, regional economic development, regional security, etc. are located (Katz 2000; Tanaka/Inoguchi 1996).

62.2.1 Regional Integration

In international relations, countries that are located in the same geographical area, sharing common social, cultural, political, and historical affinities often have some sense of neighbourliness among them. This sense of common affinities and interests leads to some form of mutual cooperation. Regional integration is the formal institutionalization of this sense of neighbourliness and cooperation among states within a particular geo-political region. Regional integration seeks to pull the resources and efforts of the states concerned towards addressing and promoting common interests in a wide range of fields including, economic, social, cultural, political, military, etc. (Wallace 1994).

The UN Charter recognized the importance of regional arrangements towards the achievement of over-

all international peace and security. The Charter provides in Chapter VIII for the role of regional arrangements and institutions in the pursuit of peace and cooperation within a given geographical area. Accordingly, regional integration and arrangements are seen as a kind of 'mini united nations', acceptable frameworks for mobilizing and harnessing efforts within various geo-political regions. As in other continents of the world, regional integration is a concept that has been embraced in Africa at the continental level (through the Organization of African Unity (OAU), later the AU, and at the sub-regional level through various sub-regional arrangements like the ECOWAS, the Southern African Development Community (SADC), the Economic Community of East African States (ECAS), etc. These sub-regional organizations pursue a wide range of common regional objectives usually covering economic, social, political, and importantly peace and security spheres.

62.2.2 Regional Security

Generally security is a concept that is embraced in all facets of human life from the smallest micro level to the macro, national, and international levels. It is therefore possible to see security from a whole range of perspectives, including personal, community, national, and international. Security could also be physical security, psychological security, economic security, food security, etc. Essentially, security implies the absence or protection from a particular type of threat, which could be physical, psychological or economic in nature. Conversely, insecurity implies exposure to any of these threats. Whether at individual, national or regional levels, the importance of security according to Imobighe (2001: 39) lies in the fact that without security individuals within a state will find it difficult to engage in productive activities, while also without security, the state is bound to experience difficulty in harnessing its human and material resources towards meaningful development and the promotion of the general well-being of the people.¹ Going beyond the narrow conception of security at the national level in terms of military and physical protection of the state or regime, a seasoned security practitioner, Mohammed (2000: 5-7) defined national security in broad terms to encompass "all factors that contribute to the

safety, well being and prosperity of a country and its people."

As a concept regional security evolved from the same sense of common interests underlying regional integration and cooperation. A feeling that within a particular geopolitical region member states share common tangible and intangible interests which when threatened or indeed attacked would affect in varying degrees the enjoyment of peace and the normal conduct of life within that particular region. Therefore, just as an individual state is concerned with the maintenance of law and order and the protection of peace and security within its borders, regional arrangements are concerned or indeed created to maintain peace and security within their region. This chapter adopts this broad conception of regional security that encompasses all factors that can affect the safety, well-being, and prosperity of the countries and people of West Africa.

Accordingly, while some regional organizations are established specifically to address regional security among their members or as platforms for defence cooperation (e.g. the North Atlantic Treaty Organization (NATO)), many regional organizations are established to pursue broader objectives of social, economic, and political development. Within the broader development goals, the importance of maintaining peaceful and conducive atmosphere has often compelled such regional organizations to establish or inculcate security arrangements to deal with issues of peace and security. This is the case with ECOWAS, as the Executive Secretary has aptly pointed out that "after decades of limited success in promoting economic integration" and faced with the outbreak of conflicts, ECOWAS had to "factor in the peace and security sector which was previously downplayed" (Ibn Chambas 2005: 16).

In the post-Cold War era the concept of regional security has become an essential mechanism within the framework of regional integration and regional organizations. The fact that economic and political cooperation and development cannot be achieved in an atmosphere of conflict and insecurity dictates that regional security is factored into regional integration *ab initio* or effectively at some stage. In the spirit of the Charter, the UN has recognized the centrality of regional security towards the attainment of overall global peace and security. Thus, the UN gives its support to the efforts of regional organizations to deal with issues of conflict and security within their regions (Aning 2004: 534-535; Ate 2001b: 121-125). For instance, the UN has supported independent regional security

1 In addition to Imobighe (2001), there are other perspectives on individual, state, and regional security. Some of these scholars include Hubert (2001), Buzan (1991), Al Marshat (1985) and Hutchful (2000).

initiatives (e.g. ECOMOG in Liberia, NATO in Kosovo, etc.) and it has also collaborated with regional organizations in containing conflicts for example through the United Nations Mission in Liberia (UNMIL) and United Nations Mission in Sierra Leone (UNAMSIL) among others. Therefore, whether in Africa, Asia or America, the concept and instrumentality of regional security has been one of the acceptable ways of promoting international peace and security.

62.3 ECOWAS

The problems and priorities before West African States immediately after independence in the 1960's were essentially that of tackling political, economic, and developmental challenges. Accordingly, the need for cooperation at the sub-regional level was for the purposes of finding solutions to their common economic and development problems. Before ECOWAS was established in 1975 there were earlier attempts at sub-regional cooperation among West African States based mainly on colonial ties and interests. Against that background, the activities of the United Nations Economic Commission for Africa (UNECA) and its support for regional cooperation as from the mid 1960's created the impetus that spurred West African states into action leading to the establishment of a regional body that embraced both the Anglophone and Francophone countries of West Africa through the ECOWAS Treaty that was signed in Lagos on 28 May 1975.²

The constituent Treaty of ECOWAS presented clearly the goals and objectives of the community. It stated that the community would be concerned with the promotion of cooperation and development in all fields of industry, transport, telecommunications, energy, agriculture, natural resources, commerce, monetary, finance, and in social and cultural matters for the purpose of raising the standard of living of its peoples. The Community would also seek to foster close relations among its members and contribute to the progress and development of the African Continent. To that end the treaty also listed a range of specific objectives of the community, which focused essentially on economic integration, cooperation, and harmonization of development policies among the states in the sub-region.³

Economic cooperation and regional integration were the priorities and focus of ECOWAS until the end of the 1980's. In 1993 ECOWAS reappraised its goals and objectives and produced a Revised Treaty to further provide direction for the organization in line with the prevailing realities and problems in the sub-region. Essentially, the revised treaty of 1993 reaffirmed the overriding need to encourage, foster, and accelerate economic and social development in order to improve the living standard of West African peoples. It also set the tone for the challenges and realities before the community, which now revolve around the question of large-scale conflicts and insecurity (figure 62.1).⁴

Although the promotion of peace and security were implied rather than expressly stated as part of the core goals and objectives of the organization at its formation, by the end of the Cold War the realities of the West African cycle of conflicts have brought this aspect to the front burner, engaging as it were most of the efforts and resources of ECOWAS. While ECOWAS had been involved in mediation and conciliation missions in some disputes between member states (e.g. Mali and Burkina Faso, Togo and Ghana) during the Cold War period, the scope and nature of the threats to peace and security in the sub-region at that time were limited. However, starting with Liberia in 1989 the scale of conflicts in West Africa became more violent and complicated that ECOWAS had to deploy more of its time and resources to conflict prevention and resolution and the establishment of a mechanism that can effectively deal with the recurring problems of conflict across the sub-region (Ate 2001a: 62-66; 2001b: 115-117).

62.3.1 Challenges of Regional Security

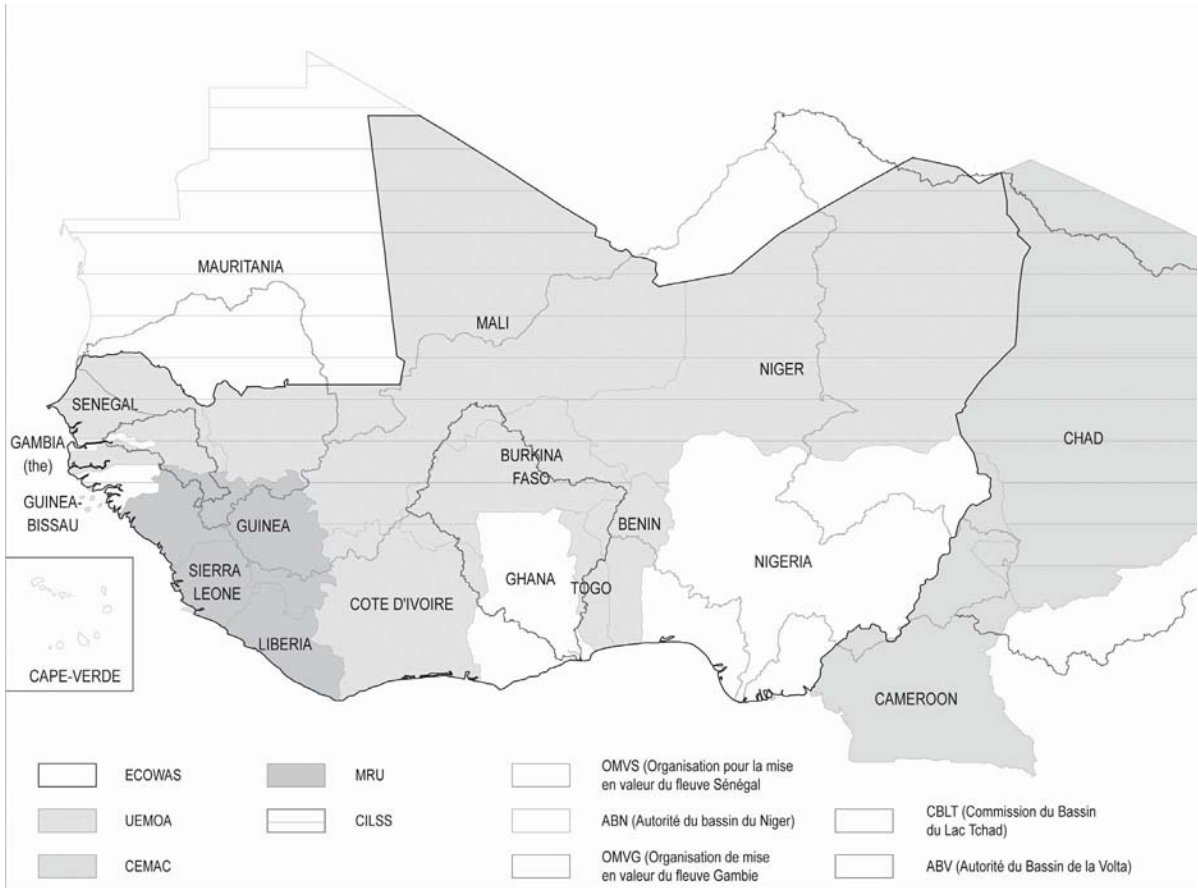

While the Cold War lasted, West African countries like the rest of Africa functioned as arenas for the West-East ideological warfare of the superpowers. The superpowers dominated political and economic developments in these countries. Of course, they were also responsible for sponsoring and supporting frequent security problems and violent power changes that occurred in the sub-region during the Cold War period. Apart from the ideological warfare, the other type of security problems experienced in the sub-region during the period was inter-state conflicts: con-

flicts involving two or more countries within the sub-region. Such conflicts and security problems were also closely linked to the ideological manoeuvrings of the Cold War. In some cases the conflicts also resulted from disputes arising from contentious colonial boundaries and other intransigencies between neighbours. For instance, between 1960 and 1989 the OAU and the sub-regional organizations contend with many boundary-related conflicts between Algeria and Morocco, Ethiopia and Somalia, Ghana and Togo, Mali and Burkina Faso, Somalia and Kenya, etc. (figure 62.2).

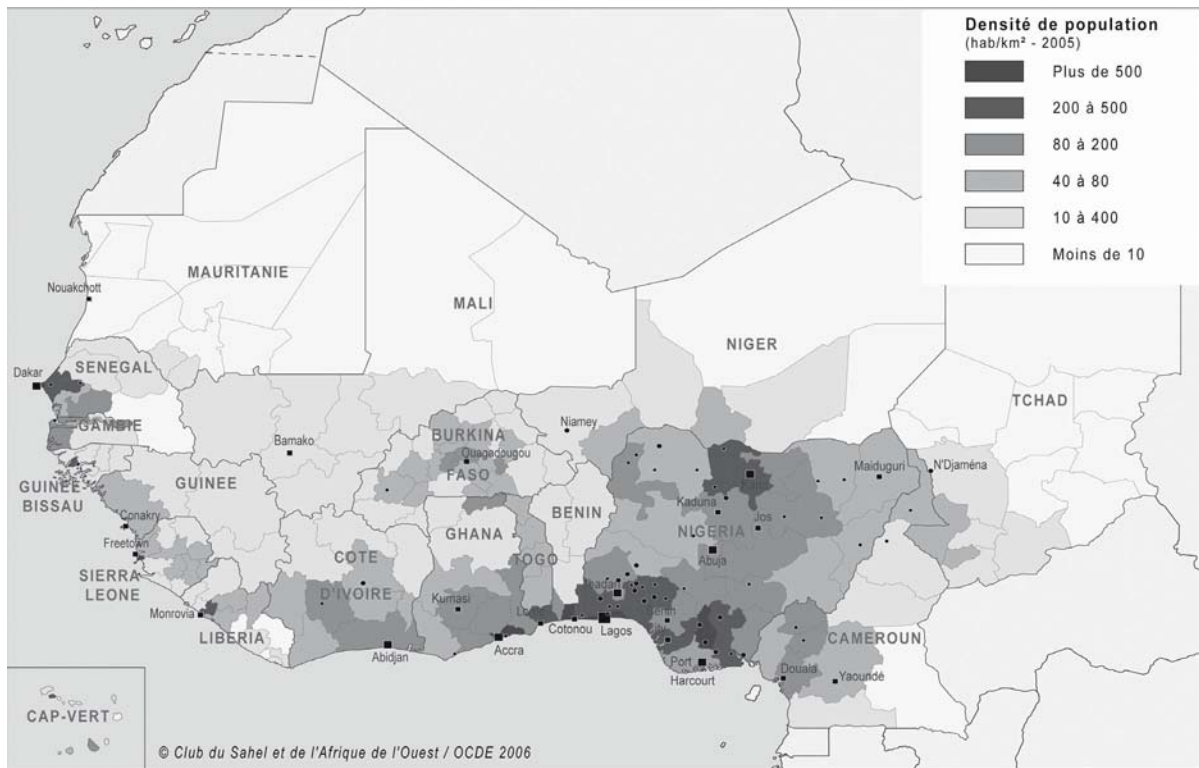

Accordingly, between 1960 and the late 1980's most African states generally perceived national and regional security concerns in terms of external threats of subversion or attack from foreign interests. Thus, the OAU and the sub-regional organizations including ECOWAS viewed national and regional security in terms of the protection of the sovereignty and territo-

rial integrity of member states, and non-interference in the internal affairs of states⁵.

However, the challenges of regional security during the Cold War period, although by no means small, were not as destructive in scope and consequence as those that have plagued West Africa since the beginning of the 1990's. The focus or preoccupation with maintenance of national security through the protection of the status quo or the regime in power which was pursued during the Cold War period laid the foundation for the new types of conflict that was unleashed across West Africa as soon as the Cold War ended. The end of the Cold War implied the end of superpower interests in protecting tyrannical governments and in propping up governments that were not

5 The OAU Treaty of 1963 and ECOWAS Treaty of 1975 variously provide for the protection of national sovereignty, territorial integrity, and non-interference in internal affairs as key objectives and fundamental principles.

Figure 62.2: Population Density in West Africa in 2005. **Source:** © Sahel and West Africa Club, OECD 2006; at: < <http://www.oecd.org/data-oecd/7/32/38506438.pdf>>. Permission to reproduce has been granted by OECD.

performing, while helping to suppress opposition by citizens and groups in those countries (Imobighe 2001: 43-45).

The exit of the superpowers and the change in the political and security equation in many West African countries led to a change in the type of conflict and security challenges facing the sub-region. Rather than the threat of external attack or inter-state conflicts, West African countries, beginning with Liberia in 1989, started to experience internally generated conflicts. These conflicts are the results of internal disconnections and discontents that have been suppressed for very long. The sources and root causes of these conflicts include: ethnic and religious disputes, violent political and factional contests, identity and self determination agitations by groups and nationalities, poverty and limited economic opportunities resulting from bad governance and political corruption among others. Invariably, the expression of widespread discontent with the political and economic status quo in many African states erupted into violent conflicts causing wanton destruction of lives and property from Liberia to Sierra Leone, Guinea Bissau, Guinea, Senegal, and Côte d'Ivoire.

The scale of violence and the attendant problems saw the OAU and ECOWAS struggling to salvage the sub-region from sustained conflagration. On the back of the intra-state or what can be described as region-wide conflicts, West Africa was held prostrate by a number of debilitating security challenges. These security challenges include:

1. The proliferation of small arms and light weapons which fuels and escalates the scale and horror of conflicts across the sub-region;
2. The problem of mercenaries and child soldiers which continues to wreak havoc on the social and moral fabric of the affected societies, while spreading conflicts and laying the foundation for future instability in the sub-region;
3. The dehumanizing problems of refugees and internally displaced persons which continue to threaten the stability of the whole sub-region as human misery and poverty spread from state to state in the sub-region;
4. The alarming spread of HIV/Aids as consequence of atrocities and exposure in the areas of conflicts;
5. Increase in the activities of cross-border criminal groups, militias, and mercenaries who continue to

pillage communities in the conflict areas as they spread criminality via trafficking in arms, precious minerals, drugs, and children and women; and

6. The duo of conflict and poverty, which hinder the realization of meaningful development. Conflict takes away resources that would have been used for economic development and the provision of essential infrastructure. This in turn means that a cycle of poverty and underdevelopment is entrenched as the endless cycle of conflict further impoverishes the people.

The foregoing depicts the spectre of security problems that plague countries across West Africa. The scale of the violence and destruction is so deplorable that the world through the UN and other international donor organizations could not but come to the aid of the suffering peoples of West Africa. However, the commendable and proactive efforts of ECOWAS as well as the experience gained in tackling these security challenges since the beginning of the 1990's have ensured that in this case Africa was not just waiting for external help.

62.3.2 The ECOWAS Mechanism for Peace and Security

ECOWAS has recently adopted a *Convention on Small Arms and Light Weapons, their Ammunition and other Related Materials*, which is aimed at addressing the small arms dimension of the sub-region's security challenges. Before now, the main security framework of ECOWAS was embodied in the *Protocol Relating to the Mechanism for Conflict Prevention, Management, Resolution Peace-Keeping and Security* adopted in December 1999. Before that protocol was adopted in response to growing conflicts across the sub-region, ECOWAS had adopted various other instruments that sought to govern questions of peace and security in the sub-region. Among these instruments were:

- The *Protocol on Non-Aggression* of 1978 which sought to create assurances that there would be no act of aggression or subversion between and among West African states and elicit a commitment to peaceful resolution of disputes. This pact was not however implemented because some members, especially the Francophone states, were not convinced that it could guarantee their protection from aggression.
- The *Protocol on Mutual Assistance in Defence* of 1981 commits member states to peaceful resolu-

tion of disputes and mutual assistance in case of external aggression. This protocol spelt out elaborate structures and procedures for joint action against aggression, but it was not also effectively implemented because, again, some members, especially the Francophone ones, were more committed to a parallel framework for mutual defence which they had established in 1977 under the aegis of the *Communauté économique de l'Afrique de l'Ouest* (CEAO). The *Accord de Non-Aggression et d'Assistance en Matière de Défense* (ANAD) committed these states to an exclusive Francophone mutual security and defence arrangement.

- The *Declaration of the Moratorium on the Importation, Exportation and Manufacture of Light Weapons* of 1998 was adopted by ECOWAS in response to the growing problem of proliferation of small arms and light weapons which was noted to be responsive to the spiralling conflicts in the sub-region.

In spite of the limitations in the implementation of the foregoing ECOWAS instruments, when confronted with the escalating and alarming violence in Liberia, the organization responded with a novel initiative under the Protocol Relating to Mutual Assistance on Defence. The initiative was the establishment and deployment of the ECOWAS Monitoring Group (ECOMOG) to intervene, save lives, and restore peace to war torn Liberia in July 1990. Although the initiative was a very dicey and difficult one, the experience and the success of ECOMOG in Liberia emboldened ECOWAS. It marked a new chapter in the ECOWAS approach to dealing with sub-regional security challenges and it set the tone for the establishment by ECOWAS of a more elaborate and robust regional mechanism for peace and security.

The *Protocol Relating to the Mechanism for Conflict Prevention, Management, Resolution, Peace-Keeping and Security* was adopted in 1999 to specifically provide a comprehensive mechanism and structure for preventing, managing, and effectively ending West Africa's seemingly endless cycle of conflicts. ECOWAS leaders were convinced that the mechanism would institute adequate and pragmatic structures for dealing with the whole gamut of conflict prevention, resolution, and peace and security in the sub-region (Ibn Chambas 2004: 32-34; 2005: 14; Aning: 2002: 534-537).

The 1999 Protocol established a mechanism for comprehensive and collective prevention, management, and resolution of conflicts in the sub-region, placing emphasis on preventive actions, including an

early warning system. The objectives of the mechanism covering the whole range of internal and external security issues include:

- The strengthening of cooperation in the areas of conflict prevention, early warning, peacekeeping operations;
- The control of cross-border crime, international terrorism, and proliferation of small arms and anti-personnel mines; and
- The maintenance and consolidation of peace, security, and stability which are the core security challenges confronting ECOWAS member states.⁶

In pursuance of these broad objectives, the mechanism is endowed with structures that would effectively address all types of conflict situations in the sub-region:

- The *Authority of Heads of State and Government of Member States* is the apex decision-making organ of the mechanism. It undertakes general oversight of the activities of the mechanism.
- Directly responsible to the Authority is the *Mediation and Security Council*. It comprises nine member states and has the powers to take decision on all issues of peace and security on behalf of the Authority of Heads of State and Government. The Council is also responsible for the implementation of all the provisions of the Protocol, including taking decisions and implementing policies on conflict prevention, management and resolution, and authorizing all forms of intervention and deciding particularly on the deployment of political and military missions among others.⁷
- The Mediation and Security Council is supported by a number of organs including, the *Defence and Security Commission*, the *Council of Elders* and the *ECOWAS Monitoring Group (ECOMOG)*:
 - The *Defence and Security Commission* is made up of representatives of member states from various armed forces and security agencies, such as: internal affairs and security; immigration; customs; drug/narcotic agencies; border guards, etc. It has responsibility for all technical and administrative issues and for

assessment of logistical requirements for peacekeeping operations.

- The *Council of Elders*, comprising eminent personalities, plays the role of mediators and conciliators in support of the Council's works.
- ECOMOG is the operational arm of the mechanism, which undertakes observation, monitoring, intervention, and peacekeeping missions. It is made up of contingents from national armed forces of member states.
- The Office of the Deputy Executive Secretary in charge of Political Affairs, Defence, and Security at the ECOWAS Secretariat assists the Mediation and Security Council by facilitating its work.⁸

Furthermore, in line with the preventive approach of the mechanism, the Protocol also provides for a *Sub-regional Peace and Security Observation System* also known as the *Early Warning System*. This system consists of the observation and monitoring centre and a number of observation and monitoring zones across the sub-region, which monitor conflicts through proactive early warning and signalling. Essentially, the ECOWAS mechanism integrates member states and their political and security institutions into a process that will monitor, cooperate, and intervene appropriately in cases of internal or external aggression or conflict, or any threat of conflict in any member state or in cases that threaten to trigger humanitarian disaster or are a threat to peace and security in the region. The Mechanism is even empowered to act in the event of serious and massive violation of human rights and the rule of law or an overthrow or attempted overthrow of a democratically elected government.⁹ The mechanism is comprehensive and can respond to and effectively stem the tide of conflicts in the sub-region. Of necessity, its early warning component relies on cooperation among member states both at the level of the Authority of Heads of State and Government and at the level of relevant national political and security institutions. This arrangement was predicated on the understanding of West Africa's security imperatives as shown by past and ongoing experiences across the sub-region. Since the 1999 Protocol entered into force ECOWAS has commenced its implementation through the establishment of its institutions and structures as well as their intervention and deployment in various conflict situations.

6 See Article 3 of the 1999 ECOWAS Protocol Relating to the Mechanism for Conflict Prevention, Management, Resolution, Peacekeeping, and Security.

7 See articles 4 to 11 Ibid.

8 See articles 17 to 22 Ibid.

9 See articles 23 to 25 Ibid.

Moreover, in furtherance of the objective of establishing an effective regional security arrangement, ECOWAS has continued to improve its frameworks and mechanisms. In this regard, the Community in December 2001 adopted a *Protocol on Democracy and Good Governance Supplementary to the Protocol Relating to the Mechanism for Conflict Prevention, Management, Resolution, Peace-Keeping and Security*. The supplementary protocol was aimed at complementing the 1999 Protocol by incorporating provisions that would govern issues relating to the prevention of internal crises and the promotion of democracy, good governance, the rule of law, and human rights. The protocol sets out various provisions for the conduct of member states in such areas as: the political process, the role of security agencies, role of women, children and the youth, economic issues and poverty alleviation, education, social, cultural and religious matters, the rule of law, human rights, etc. Its focus is to ensure good governance and free and participatory democracy that would contribute to peace-building across the sub-region.¹⁰ The protocol also includes provisions for sanctions against member states that violate its extensive provisions.¹¹

Furthermore, in recognition of the central role of the question of the proliferation of small arms and light weapons in the security of the sub-region, ECOWAS has also adopted the *Convention on Small Arms and Light Weapons, their Ammunition and other Related Materials* in June 2006. This Convention was born out of the determination of the member states to achieve the objectives enshrined in the 1998 *Declaration on the Moratorium on the Importation, Exportation and Manufacture of Light Weapons* and the subsequent *Code of Conduct for the Implementation of the Moratorium* adopted in December 1999. The Convention was also meant to strengthen the provisions of articles 3, 50, and 51 of the 1999 *Protocol Relating to the Mechanism for Conflict Prevention, Management, Resolution, Peace-Keeping and Security* which seek to control the proliferation of small arms and light weapons in the sub-region. Its provisions prohibit various types of small arms and light weapons and lay down the procedures for controlling, managing, registering, and dealing with various aspects of importation, exportation, manufacture, transportation, and possession of these arms across

the sub-region.¹² Presently, the combination of the 1999 *Protocol on the Mechanism for Conflict Prevention*, the 2001 *Supplementary Protocol on Democracy and Good Governance* and the new *Convention on Small Arms and Light Weapons* embody formidable arsenal and mechanisms that would enable ECOWAS to face and effectively stem the tide of conflicts and in security in West Africa.

62.3.3 Problems and Challenges

ECOWAS has recorded remarkable success in swiftly realigning its focus and structures to “factor in the peace and security sector” (Ibn Chambas 2005: 16) in line with the security realities of the sub-region. The adoption of the key instruments discussed in the foregoing section is clear testimony of ECOWAS preparedness to comprehensively address the complex security challenges confronting the sub-region. However, despite the efforts of ECOWAS and the strength of its mechanism and instruments, there are still problems and obstacles that have continued to impede the achievement of sustainable peace and security in the sub-region. The following are some of the pertinent problems and challenges of regional security:

- The first among these problems is the question of political will and commitment to the ideals of ECOWAS, and the pursuit of good governance and democracy by member states. It has been established that one of the major causes of intra-state conflicts in the sub-region is poor governance, which creates the conditions of extreme poverty and discontent that in turn stimulate conflicts. Logically, the failure to promote good governance and democracy in member states poses serious challenges to the security of the sub-region. Therefore, there is urgent need for member states to adhere to the ideals of good governance and democracy in order to address the root causes of conflicts in the sub-region. The adoption of the *Protocol on Democracy and Good Governance Supplementary to the Protocol Relating to the Mechanism for Conflict Prevention, Management, Resolution, Peace-Keeping and Security* is further testimony to this fact. Yet there remains

10 See the Preamble and articles 1 to 43 of the 2001 ECOWAS Protocol on Democracy and Good Governance.

11 See articles 44 to 45 Ibid.

12 See articles 1 to 28 of the Convention on Small Arms and Light Weapons, their Ammunition and other Related Materials.

the challenge for member states to apply the provisions of the protocol beyond mere lip service.

- The other challenge that is related to the question of the political will and commitment of the member states of ECOWAS, is the one arising from the continuing existence of organizations like the *Union économique et Monétaire Ouest Africaine* (UEMOA, formerly CEAO) and ANAD. These organizations have parallel objectives and focus vis-à-vis those of ECOWAS. This problem has continued to affect the attention and commitment of those Francophone member states to certain ECOWAS policies and programmes, and this has had considerable impact on the effectiveness of ECOWAS in addressing some of West Africa's security challenges.
- Another major obstacle to ECOWAS progress in tackling the sub-region's security challenges relates to availability of resources both in human and material terms. ECOWAS interventions in Liberia, Sierra Leone, and other conflicts are noted to have cost several billion dollars. This has largely been financed by a few member states with the support of the UN and some international donor organizations. This scenario places considerable burden on some member states while also leaving West Africa at the mercy of international donor and partner organizations. The other dimension to this question of resources is that available limited resources that West African states could have applied for developmental purposes have been diverted to manage and resolve conflicts across the sub-region. It is therefore pertinent to devise sustainable means of financing ECOWAS security initiatives, but even more pertinent is the need to prevent conflicts across the sub-region.
- Moreover, the efforts of ECOWAS in managing West African security have also been impeded by the problem of institutional capacity and performance of ECOWAS organs and institutions. While ECOWAS has instituted various structures (ECOWAS Parliament, ECOWAS Court of Justice, etc.), the performance of these organs within the larger goal of sustainable peace and security has remained very limited. For instance, the *ECOWAS Parliament* has not fully become operational as its members are not directly elected, as stipulated in its protocol, and it does not exercise legislative powers. Similarly, the Court of Justice's jurisdiction does not cover matters affecting citizens, rather it is limited to inter-state matters. These limitations impede the effectiveness of these organs in contribut-

ing maximally to the attainment of peace and security in the sub-region.

- Another major issue that has remained profoundly challenging in West Africa is the phenomenon of proliferation of small arms and light weapons. In spite of the adoption of the 1998 Moratorium on Small Arms and Light Weapons and the initiation of various disarmament, demobilization, and rehabilitation (DDR) efforts in all the post-conflict areas, the trafficking and circulation of these arms has remained a big challenge. They have continued to fuel conflicts as they are moved from one country to the other. An estimated 7-8 million arms are said to be in circulation in West Africa. In addition, the sub-region or indeed the international community has not been able to effectively tackle the supply side of the arms problem. It is hoped however, that the adoption of the 2006 ECOWAS Convention on Small Arms and Light Weapons which represents a determined response to the inadequacies of past efforts and frameworks would enable West Africa to deal effectively with the problem of proliferation of arms which has been a big obstacle to the realization of sustainable peace in West Africa.

62.3.4 Future Prospects

The foregoing problems and challenges notwithstanding, ECOWAS has demonstrated a clear sense of purpose and has indeed set the pace for other regional organizations in Africa in managing conflict and security challenges. From a tentative start, the organization has evolved and adapted to the realities in the sub-region, adopting various instruments and frameworks to deal with the emerging challenges. From ECOMOG as an experimental initiative to the present more comprehensive mechanism, ECOWAS has gained considerable experience and understanding of the sub-region's security dynamics. Therefore, in spite of the security challenges confronting West Africa, the following prospects can still be discerned:

- The first is that the political leadership of ECOWAS member states as well as the organization's technocrats have shown reasonable understanding of the problems. This sense of purpose together with the willingness to evolve and adapt is a good prospect for the future of ECOWAS. The Executive Secretary has stated the preparedness of the organization to build its capacity and to be the first to explore and implement effective ways of addressing West African security needs, including

the establishment of an African Standby Force (Ibn Chambas 2005: 16–20).

- The second prospect lies in the increasing democratization of countries in the sub-region. In view of the centrality of the question of democracy and good governance to the sustenance of peace and security in West Africa, the fact that many West African states are gradually embracing democratic systems of government is a welcome development. It is one that should be encouraged, nurtured, and sustained.
- Moreover, recent efforts at cooperation and harmonization of policies among national armed forces and security agencies in West Africa are also positive indications for the sub-region. For instance, the series of meetings among heads of internal security in ECOWAS member states that is focused on modalities for intra-community cooperation and the establishment of regional security information sharing is a welcome development¹³. Similarly, the progress being made in the work of the Defence and Security Commission towards the establishment of a West African Standby force is also laudable¹⁴. These efforts are testimonies to the progress of ECOWAS in addressing the security challenges of the sub-region.
- The initiatives to evolve a sustainable source of funding for ECOWAS are also signs of progress for the sub-region. The burden of financing the organization's many security initiatives is one that must be adequately met in a permanent and sustainable manner.
- Another prospect for the future in tackling West African security problems is the synergy that is being built between ECOWAS, the AU, the UN, and other strategic partners. This synergy is important to the goals and operations of ECOWAS in terms of resources, logistics support, and endorsement at the continental and global levels. These are crucial factors that would impact on ECOWAS initiatives, and on the success of these initiatives and precedents for managing conflicts in the rest of Africa. In another sense, mutual partnership and cooperation between ECOWAS and major development organizations would benefit ECOWAS by creating access for ECOWAS institutions and personnel to vital capacity building opportunities

which have the overall impact of improving the ability of ECOWAS to manage the region's security.

62.4 Conclusions

While there is no doubt that West Africa is faced with numerous security challenges, the collective experience of member states as well as that of the sub-regional organization over two decades of conflicts have been very useful. The West African experience has yielded understanding and preparedness on the part of member states and ECOWAS in tackling conflict and insecurity in the sub-region. ECOWAS has evolved frameworks and mechanisms that are being applied to manage West African security challenges. Although there remain some problems (significantly those of resources and small arms proliferation) that continue to hinder the organization's ability to manage West African security challenges, the prospects as noted in this paper are still very good. What is required is a commitment to sustain the efforts, structures, and trends already established.

63 A Regional Security Perspective from and for the Horn of Africa

Martin R. Rupiya and Alfred G. Nhema

63.1 Introduction

The international security system is structured along ideological as well as regional and zonal foundations whose authority resides in institutions supported by states, as defined in the 1945 United Nations Charter. In this global structure, states constitute the first layer of responsibility, followed by regions. In regions there is a recognized centre whose mandate seeks to harmonize and give political direction to sub-regional and state security organizations. In Africa, attention towards creating a continental security structure have been spurred after the failure of the 1993 peacekeeping mission in Somalia with the hasty withdrawal of Western forces from the continent. However, since the 1990's Africa has hosted about 50,000 United Nations peacekeeping troops and, given the cost and frequent renewals of mandates, retaining this force on the continent was not only unsustainable but subject to external decisions if not interests. Thus, assured future African security lies in the creation of capacity from within the continent, amongst the sub-regions and nation states. To this end, the African Union, through its 'Peace and Security Council' and the 'African Common Defence and Security Policy', has sought to respond to continental security challenges, by motivating for the creation of an *African Standby Force* (ASF) of about 15,000 to 20,000 to be in place by 2015 and able to execute both a chapter 6 and chapter 7 mandate under the UN Charter. In fulfilling this aspiration, the AU has sought to act through its five *Regional Economic Community and Security* pillars (RECs), inherited from the 1970's Lagos Plan of Action urging the sub-regions to establish regional and integrated brigades. The current structure of the RECs is organized along the geographical entities of the continent from the a) North - *Arab Maghreb Union* (AMU), East - *Inter-Governmental Authority for Development* (IGAD), b) West - the *Economic Communities of West African States* (ECOWAS), c) Central - the *Economic Community of Central African*

States (ECCAS), and) Southern - the *Southern African Development Community* (SADC).¹ This discussion focuses on the Horn of Africa where Kenya and Uganda have overlapping membership as they are also party to the re-emerging *East African Community* (EAC). This dual membership by states is a significant structural defect as it is a serious conundrum to the centre, the AU. The latter is challenged as to how they can influence the harmonization of security policy based on the recognized pillars and not competing entities.

Against this background, the Horn of Africa remains one of the most volatile and conflict-prone regions in the global security system. The 'Horn'², comprising the seven states of Ethiopia, Eritrea, Djibouti, Sudan, Somalia, Uganda and Kenya (figure 63.1), is characterized by severe and debilitating environmen-

- 1 The authors are aware of the current reality and debates that have sought to expand the five RECs and include the East African Community (EAC), the *Common Market of East and Southern Africa* (COMESA) and the *Economic Community of Sabelo-Saharan States* (CEN-SAD) that speaks to the recognition of economic groupings rather than security zones. The decision to recognize the expansion was suspended during the 7th African Union Summit in Banjul, Gambia, 25 June to 2 July 2006. See: author: "AU Summit: African Leaders at their wits end", in: *Africa Today*, 12,8 (2006): 10-13. However, while the latter suspended the decision on the East African Community (EAC) application to be recognized as a REC {Regional Economic and Security Community} this has since been agreed to. Source: conversations with Uganda Minister of State for Defence in Kampala at the EAC Parliamentary Conference hosted by the Institute for Security Studies (ISS) on 30 November 2006.
- 2 The 'proper Horn' comprises Ethiopia, Somalia, Djibouti, Sudan and since 1991, Eritrea. Soon afterwards this also included members of the Inter-government Authority on Drought and Development (IGADD) later to become the Inter-Governmental Authority on Development in 1996; See Cliffe (1999: 89, 96); Gebremariam (1999: 175-176).

Figure 63.1: The Horn of Africa.

tal challenges; unstable political states facing serious internal challenges; exhibits manifestations of intense ethnic, religious and racial differences; is a region in which the competition between the Africa and the Arab World is a reality; is host to 'sinister international interference' from the global ideological East, West and the Arab worlds and more recently, has been victim to oil politics and machinations. In the above realities, only Kenya has remained a relatively coherent and stable state. The result of the severe and debilitating political, ethnic, religious and environmental conflict drivers that have succeeded in creating "complex emergencies" (Cliffe year: 89) that make up the conflict system that is specific to the Horn (Deng 2005: 261-262). Political intercourse in the Horn is characterized by intense competition at national levels, a tendency that has severely weakened efforts at creating national security institutions or foster national territorial control by authorities who themselves are isolated in each of the state capitals. The characteristic national instability has by extension undermined any efforts at creating a regional security mechanism. This fractured state in collaborative and common defence and security policy, has left the Horn vulnerable to outside adverse intervention. In the most recent initiative, failure to create a regional security alliance emerged following the 'temporary détente of 1991-93' between Ethiopia, Eritrea and Sudan. Even as this was being mooted, in 1991, the region witnessed the spectacular collapse of the Somali state, thus introducing the phenomenon of a 'collapsed state'.

The impact of the conflict drivers and levels of devastation have ranged from genocide in Darfur, protracted conflicts in southern Sudan going back to 1956 and characterized by three major civil wars, a civil war in northern Uganda since 1986, the 1998-2000 interstate war between Ethiopia and Eritrea, and the series of ethnic blood-letting in Somalia. The international security system has responded to these challenges to regional instability.

Currently, there are more than half a dozen international institutions in the global security system that grapple with possible solutions to the complex and multi-layered conflicts in the Horn. In late 2006, the United Nations Security Council (UNSC), the International Criminal Court (ICC) and the African Union (AU) and its regional protégé, Intergovernmental Authority on Development (IGAD), the European Union (EU), even the North Atlantic Treaty Organization (NATO) are, in different ways, currently try to find a solution for the crises in Darfur-Sudan, southern Sudan,³ northern Uganda, Somalia, in Ethiopia's domestic politics, endemic drought and famine as well as the external factor of the country's stalemated war with Eritrea. Meanwhile, Eritrean and Ethiopian troops have been marshalled along the disputed border, raising once again the possibility of an outbreak of hostilities. As Sorenson (1993) correctly asserts, the struggle for independence of Eritrea and the Oromo people has continued to undermine the stability of the Ethiopian state. The Oromo issues and population group holds sway in Addis Ababa as well as neighbouring Western Kenya, Eritrea and Sudan. This has the effect of forcing neighbouring governments to choose between supporting the Oromos or the sitting government in Ethiopia. The same is true of the Afars, an ethnic group with significant population groups in Djibouti, Ethiopia, Eritrea and Somalia whose perceived persecution has developed into one of the linkages that reflect the conflict system in the Horn. These ethnic grievance based developments have tended to upset the security stability of the region. Meanwhile, the hype and attention on Darfur has overshadowed the still troubling roll out of the Comprehensive Peace Agreements (CPA) in the rest

3 See: UNSC Resolution, "It is time to Act" [in Darfur], Security Council, 5520th meeting, 11 September 2006, SC/8823, at: <<http://www.un.org/News/Press/docs/2006/sc8823.doc.htm>>; as well as subsequent UNSC deliberations on 21 September 2006, SC/8845, at: <<http://www.un.org/News/Press/docs/2006/sc8845.doc.htm>>.

of Sudan, signed between the Sudanese People's Liberation Movement/Army (SPLM/A) and the government of Sudan in Khartoum. Southern Sudan and neighbouring Uganda have experienced a nearly 20 year-old fratricidal conflict with the Lord's Resistance Army (LRA). This civil war has spread significant regional implications and its actors operate in southern Sudan and in northern Uganda. After the re-election of Ugandan President Yoweri Museveni for a third term, a still fragile and uncertain peace process has evolved.

The region has also experienced persistent drought during 2005 and 2006 threatening the livelihoods of over 11 million lives in Ethiopia, Kenya and northern Tanzania. In Somalia, the War on Terror has come to roost, with the Islamists organized as the Islamic Courts consolidating power in Mogadishu and other towns by beginning to implement and enforce Shariah law. In response to the success of the Islamic Courts Ethiopia sent troops across the border and deployed them in Baidoa to challenge the Islamists.⁴ The Islamic Court leader, Sheik Hassan Dahir Aweys, has also warned against a mooted idea by IIGAD and the African Union to dispatch peacekeeping troops to Somalia and act against the Transitional Federal Government (TFG) of Abdullah Yusuf. Somalia and its regional neighbours have lost complete control of the sea and coastal regions, triggering an international intervention led by the United States when a tourist ship bound for Mombasa, Kenya was attacked in early 2006.

The impact of the war has been devastating, a situation exacerbated by the harsh environmental elements that are part of the regional phenomenon. For example, while population figures have increased, reaching 180 million (for the seven states making up IGAD (Sudan, Uganda, Kenya, Ethiopia, Somalia, Djibouti and Eritrea), food production has all but stopped, culminating in levels of extreme hunger amongst population groups. According to the Food and Agricultural Organization (FAO), 40 per cent of the people in the region are undernourished with these levels reaching 70 per cent at country level in Eritrea, Somalia, and even Ethiopia.⁵ In this regard, endemic famine is found in each of the seven states at least once in every ten years. Furthermore, wars and civil wars in Sudan, Uganda and Somalia have wit-

nessed millions of casualties while forcing others into seeking refuge outside the region or in neighbouring states, and still internally displacing millions within their borders. The unsettling population displacement and dispersion left in place weak and unstable regimes with little or no capacity to deliver on national programmes, reinforcing the conflict system that has gripped the region.

Against the characterization of this protracted conflict of new military and armed manoeuvres and wars in the region, it is instructive to note that the regional security mechanism IGAD has more or less ceased to function. Stated differently, the seeds, roots, and potential for regional disintegration still exist and persist in the Horn.⁶

This chapter surveys key countries in the Horn to broaden the understanding of the regional conflict dynamics and to offer suggestions for possible solutions enhancing regional security. The analysis of each country and of the regional economic and security organization addresses similar key questions on the stability of the state or the central organ by examining dominant policies and political processes, assessing the internal security situation, the role of neighbouring states, measuring the geo-strategic position of a particular state in its relationship with the rest; questioning the country's regional commitments and finally, critiquing the position of external factors and actors since the 1990's.

63.2 Environmental Challenges in the Horn

A further debilitating dimension has been the severe environmental impact, such as floods, drought, locust swarms, and periodic epidemics such as the recent bird-flu that spread without national or regional responses. Between 1974 and 1984 the Horn had experienced a series of devastating droughts and famines. Reacting to global appeals on television screens, the international community encouraged the creation of the Inter-government Authority on Drought and Development (IGADD), responsible for coordinating re-

4 Bill Roggio, 23 August 2006: "Islamic Courts Consolidates Power in Somalia"; at: <http://counterterrorism-blog.org/2006/08/Islamic_courts_consolidates_po_1.htm>; accessed on 26 September 2006.

5 "The Scale and Impact of Food Insecurity - Food insecurity in the Horn of Africa", in: FAO, no date: *Report: The Elimination of Food Insecurity in the Horn of Africa*; at: <<http://www.fao.org/DOCREP/>>, accessed on 26 September 2005.

6 See the illuminating comparative study on Ethiopia, Somalia and Sudan by Markakis (1987); Gebremariam (2004).

lief and responses to the environmental impact. Some of the basic objectives included bringing about food security, the smooth distribution of relief and food aid across borders, and facilitating investment in infrastructure, water, and slowing down increasing desertification. For this authority, attention towards conflict resolution especially at a regional level was a major feature. However, a security and political role to IGADD resulting in IGAD was introduced in the mid-1990's after the state collapse of Somalia and in recognition of increasing regional clashes and conflicts. In retrospect, the conflict trend in the Horn has not only overshadowed the original intentions of IGADD but has since reduced regional interactions to a minimum.

In addition, the impact of environmental hazards has left nearly 40 per cent of the region's population with inadequate food supplies. In the autumn of 2006, an estimated 2.3 million Eritreans needed urgent food aid according to the Food and Agriculture Organization (FAO); there has been at least three times this number in Ethiopia, 1.6 million in northern Uganda, 2 million in Kenya, and millions in Somalia, according to a recent call by its Transitional Government. Thus, six of the seven states in the Horn were unable to feed themselves. Food insecurity has been a significant factor showing the limitations of all states that culminated in an angry and agitated populace. Finally, the Horn has little or ineffective control of the sea, an area that has since been abandoned to piracy acts from Somalia. The result is that sea lanes along the Somali coast now constitute a high-risk zone for international trade and shipping, with direct implications for regional imports, exports, and security.

63.2.1 Country Assessment to Regional Security in the Horn

63.2.1.1 Somalia: A Collapsed State

The most insecure state in the Horn in the early 21st century has been Somalia. This dire situation has manifested itself at several levels.

- *First*, Somalia has no more central government. Since the collapse of Siad Barre's regime in 1991, its political, socio-economic control has been reduced to fiefdoms ruled by warlords. More recently, competition for political control has been divided between the local warlords, organized as Islamic Courts under Sheikh Hassan Aweys, which have resisted the regional initiative that resulted in Nairobi in the Transitional Federal Government (TFG) led by designate-President, Abdullah Yusuf
- *Second*, Somalia is experiencing acute food insecurity resulting from displacement of farmers and traditional trade routes due to the unending conflict.
- *Third*, the regional security body, IGAD has launched a peace initiative that involves deploying peacekeeping forces to allow for the revival of 'normal' political intercourse leading to an elected government.

While the TFG is part of the evolving process of this initiative, the Islamic Courts have interpreted this intervention as 'interference' and publicly pledged to fight any deployed peacekeeping forces. These contradictory positions have left IGAD paralysed and effectively removed the regional body from making any meaningful contribution. The declaration by Islamists, announcing the establishment of religious and ideologically informed military training camps, has since drawn the attention of the US *War On Terror*, casting the country as one of the areas where *Al Qaeda* operatives seek refuge.

- Finally, with the Somali state in crisis, this has created an opportunity for piracy to re-emerge and threaten the whole Indian Ocean coastline and offshore international trade and tourism. More recently, a tourist ship bound for Mombasa was attacked forcing the same to divert to Mauritius, losing business for neighbouring Kenya.

Somalia has taken itself out of the stability realm of the Horn and now constitutes a regional and international security challenge. How did this occur and what suggestions can be considered to reverse the trend? Before the fall of Siad Barre in 1990, Somalia was seen as: "the most promising in its potential to construct a nation state" (Gebremariam 2004) The country exhibited the most ethnic homogeneity with common ancestry in the capital Mogadishu, speaking one language and practising one religion (Gebremariam 2004). Yet, in 1991, the Somali state imploded (Cliffe 1999). Soon afterwards, a UN and United States strategy of peace enforcement in the form of the UN International Task Force and later the UN Mission in Somalia backfired after 14 American troops were killed and their bodies unceremoniously dragged through the dusty streets of Mogadishu. Ever since, Western nations have hesitated deploying forces on the African continent, leaving external inter-

vention to the regional – IGAD and continental – AU conflict mediation efforts that so far have not resulted in any tangible peace.

The former, using military means, have successfully taken control of the capital Mogadishu and of the important ports of Harardhere, Elher and Hoyobo, as well as Beletuein on the border with Ethiopia. A religious link has emerged with the Islamic Courts receiving significant material, including arms shipments from countries in the Arabian Peninsula. States have reportedly offered further professional military training to cadres loyal to the new dominant class.⁷ In contrast, this perceived support of regimes in the Horn by Arab countries has divided the international and regional response, culminating in the ‘re-imposition’ of a Cold War aura on the country. Meanwhile, the UN appears to have exhausted any capacity as well as interest by the permanent members of the Security Council to intervene. The vacuum has shifted the burden to the regional mechanism, the AU and IGAD, who have both shown serious shortcomings in influencing the conflict dynamics in Somalia. Somalia is a country that is likely to remain one of the core problem states in the Horn in the 21st century.

63.2.1.2 Sudan

The next assessment of states in the Horn focusing on their internal security as well as an ability to provide national and regional security is Africa’s geographic giant, Sudan. The security situation in Sudan is currently subject to UN Security Council and AU interventions, seeking to expand peacekeeping missions in Darfur and southern Sudan, reached under separate agreements. Political conduct and discourse in Sudan is “characterized by exclusionary and discrimination policies adopted by ruling elite at the expense of a large majority of indigenous people from political, economic and social activities of the nation” (Deng 2005: 262).

The nearly 40 years of conflict, around ethnic groups in the Arabic and Islamic North versus the Christian dominated Africans in the South has resulted in an estimated 2 million deaths since the 30 years’ war in Sudan that started at the end of the 1950’s, massive internal displacement, and population groups fleeing into exile. New causes of conflict have

emerged as further structural elements. There has been ‘international interference’ by supporters of each faction from different ideological camps, religions and interests. Since 1999, when oil was discovered, oil politics and wealth sharing has become a significant area of competition.⁸

On 9 January 2005, the war ended after the Comprehensive Peace Agreement (CPA) –also known as the Naivasha Agreement⁹ – was signed between the National Islamic Front (NIF) in Khartoum and the Sudanese Peoples Liberation Movement/Army (SPLAM/A) in Juba in the south.¹⁰ The CPA has confirmed the two-country perception that has always characterized the political, economic, and social dimensions of the country since its independence. For example, the racial and religious divide has been confirmed with the implementation of *Shariah Law* selectively, only to Muslims residing in the north. Each territory, the north and the south, will have its own flag as part of a Transitional Government (TG) of which 55 per cent interim authorities will be drawn from the Muslim north while the remaining 45 per cent will represent the non-Muslim Africans under the SPLAM/A.¹¹ Furthermore, the TG has a limited mandate, lasting until the referendum scheduled to be held in 2011.

The CPA has also addressed the sharing of the oil revenues from the wells in the south that have produced crude oil since 1999. Of this lucrative export commodity, revenues are to be shared equally. Two separate currencies will be used in a dual banking system¹² the Sudanese pound will be retained in the north and the Sudanese dinar in the south. Finally,

12 Shariah Law outlaws the charging of interest and Muslims are expected not to take out loans under any other condition.

the CPA provides for a complex, almost idealistic arrangement of force separation and integration between north and south to allow two armies to coexist with a decision to constitute a single entity during the interim period and after the referendum. As the 37-year-old war destroyed the minimal infrastructure that was in place, there has been little economic development that can be celebrated so far. Furthermore, there are considerable challenges to be overcome, such as the establishment of an integrated national army. This new institution should be responsible for national defence and participate in regional structures. As the CPA targets have not yet been implemented, the uncertainty has made Sudan a poor partner of other IGAD member states in the regional security context. Given the uncertainty of the implementation of the CPA, the outbreak of fighting in February 2003 in Darfur has further worsened the prospects.

In the Darfur province in western Sudan violence broke out between government forces, deployed from the capital, Khartoum and the three communities of the Fur, Zaghawa and Massaleit. The Darfur crisis has a long history going back to the slave trade between Arab slave traders and Africans tribes as victims. The community in Darfur relied on traditional methods to address grievances between nomads (African tribes) and Arab traders (camel bearing traders). This has changed after the succession of NIF in Khartoum headed by Hassan al Turabi supported by Lt Gen Omar al Bashir in 1989 who decreed that Sudan would become an Islamic state. In 2003, two local rebel groups, the *Sudan Liberation Army* (SLA) and a smaller organization, the *Justice and Equality Movement* (JEM) accused Khartoum of oppressing non-Arabs in favour of Arabs. Soon afterwards, both the SLA and JEM attacked government forces and installations, catching the regime by surprise. Lacking reserves to deploy in response, the available evidence suggests that the government then responded by arming, directing, and providing air support to militia groups of the *Janjaweed*, the 'devils on horseback', thus starting a war that has since gotten out of control and been condemned by the international community. This event has reached genocidal proportions by 2006.¹³ In the interim period, an estimated half a million people have lost their lives with another two million internally displaced by the *Janjaweed*, a highly mobile and horse-riding militia supported by the government, culminating in the intervention of the AU after a lukewarm response from the international community. In the crisis, over 2 million people were

displaced while an estimated 300,000 people have lost their lives.

A ceasefire was signed in April 2004 although fighting has continued unabated. The conflict parties participate in ongoing talks in the AU framework chaired by the Nigerian President, O. Obasanjo in Abuja. Based on deliberations in the UN Security Council, the African Union deployed monitors in July 2004 and later a force of less than 5,000¹⁴ in an area requiring a minimum of 15,000 according to a *BBC News* report of 14 July 2004.

The immediate effect of the Darfur crisis where the Islamic government in Khartoum is accused of supporting the Arab militia (*Janjaweed*), has created genocidal conditions scattering the local population throughout the country. In the harsh environment of Darfur, many are now located far away from the fertile and well watered regions, resulting in famine and poverty. Finally, the crisis has also drawn neighbouring Chad into conflict with Khartoum. According to a statement from N'djamena: "The Sudanese government is using the Chad deserters in the fight against its armed opposition".¹⁵

The problems related to Darfur threaten to unhinge the delicate CPA that has remained an agreement on paper since it was signed in 2005. Despite the presence of African Union peacekeeping forces in Sudan (AMIS) major forced migration has occurred. This dispersed, insecure, impoverished, and divided community is far from becoming a democratic society, a precondition for strong states in the epoch of globalization.

This realization only dawned after the recent upsurge of piracy off its coast.¹⁶

63.2.1.3 Ethiopia and Eritrea – "No-Peace-No-War"¹⁷

Italy as the former colonial power abandoned Eritrea in 1952, which was annexed by Ethiopia in 1962. This led to a fierce guerrilla war later joined by Ethiopian

15 "Chad accuses Sudan of using its deserters to fight rebels", in: *Sudan Tribune*, 21 November 2005.

rebels against the regime of Haile Selassie and later against the coup leader, Colonel Haile Mariam, the leader of the Derg. In the early 1990's, Mariam fled as his Derg was losing on the battlefields. Thus both movements moved to the capital and claimed victory. In April 1993, in an internationally supervised referendum, 98.5 per cent voted for independence from Ethiopia and on 24 May 1993 Eritrea gained its independence.

The former allies who now governed in both Addis Ababa and Asmara soon became enemies over a territorial dispute on the 1,000 kilometre (625-mile) border. Others have also argued that on the Ethiopian side, the issue includes the access to the Red Sea. This resulted in a devastating two-and-half year war with 100,000 deaths¹⁸ that ended in May 2000 with a ceasefire. The problems emerged from decisions by international arbitration that gave Eritrea the town of Badme with an Ethiopian population of over 60 per cent. The majority of Ethiopian citizens in Badme have refused to come under Eritrean authority as the international arbitration has defined the town as part of Eritrea. Due to this intransigent position Addis Ababa refused to implement the 'forced' withdrawal of its nationals from Badme. Figure 63.2. shows the conflict zone between both countries.

This strained situation between Eritrea and Ethiopia reflects the regional security problems in the Horn as well as the neglect for internal democratic structures. Instead, each country prepares for war with its neighbour, forcing the local population to be placed under arms. Civil liberties are suspended and the maturing of democracies is delayed in this region. This conflict between Ethiopia and Eritrean repre-

sents the tendency of states in the Horn to resort to military means for advancing political objectives.

The tensions between Ethiopia and Eritrea demonstrate that strong states without democratic traditions are involved in destabilizing internal and neighbouring state competition. IGAD is one of the few Regional Economic and Security Communities (RECs) of the African Union (AU) where member states are still fighting each other. Officials of both states even refused to attend meetings convened by IGAD, thus defeating the purpose of this regional security mechanism. One of its main roles is to address conflicts between member states. These states have not adopted the suggested Common Defence and Security Policy of the AU. The forces from adversarial states are unlikely to work on the challenges of integration and coordination. An important dimension of this conflict is ethnicity affecting people on both sides of colonial boundaries. These ethnic groups pressure governments to adopt particular postures opposing regional integration and common security. This conflict involved the UNSC and culminated in the deployment of a peacekeeping mission as a first step in the monitoring of the ceasefire prior to a fundamental restructuring of the security relations between both states. In the foreseeable future this conflict will adversely influence the geo-strategic equation of the Horn.

63.2.1.4 Uganda: The Northern Conflict – Lord's Resistance Army (LRA)

The last country in this review is Uganda. Since 1986 the conflict in northern Uganda between the *Lord's Resistance Army* (LRA) led by Joseph Kony and the Ugandan government has developed into a regional crisis, involving actors from the SPLA/M in Juba in southern Sudan and the Sudanese government in Khartoum.¹⁹ This conflict caused thousands of fatalities without a response from IGAD. The conflict began in January 1986 when President Yoweri Museveni, a southerner, headed the *National Resistance Movement* (NRM) that had come to power in Kampala by force. Soon afterwards, it is claimed, the new regime marginalized former soldiers and northerners, among them the majority of the Acholi, thus creating incentives for a major rebellion that benefited from the inherent social structure, culture and regional divisions

“whereby the two regions competed for power and prestige. This divide, coupled with Uganda’s cultural acceptance of utilizing violence as a political tool created the conditions that gave rise to the insurgency of the LRA in 1986.”²⁰

With the *Lord Resistance Army* (LRA) this nascent rebellion later acquired a spiritual dimension of warlordism. This conflict acquired a regional dimension in the Horn. In the early conflict phase in northern Uganda both sides tried to enlist the support of opposing factions in the Sudanese war to strengthen their own positions. The LRA received support and rear bases from the Islamic government in Khartoum, while Uganda gave similar support to the SPLA hoping that they would destabilize the LRA’s rear bases.²¹ Uganda’s assistance for the SPLA was also briefly supported by the United States as part of its activities

against the Islamic government in Khartoum when US equipment for the SPLA flowed through northern Uganda.²² The impact of this war has been horrendous, what has hardly been noticed in the international media and community. UN Undersecretary General for Humanitarian Affairs, Jan Egeland, lamented in 2003: “I cannot find any other part of the world that is having an emergency on the scale of Uganda that is getting so little international attention.”²³

Over 90 per cent of the region’s population, 1.6 million people have been displaced with the majority huddling in refugee camps. Meanwhile an estimated half a million people have died. In a cruel war tactic adopted by the LRA, over 30,000 children have been abducted²⁴ and pressed into their ranks, including girls as sex slaves.

Which conclusions can be drawn from the security of Uganda in the Horn? The government of Uganda survived two major challenges. It partly prevailed against the civil war in the north and applied severe internal restrictions on political parties and participation outside the Movement (NRM). Due to its location on Lake Victoria, Uganda has abundant food supplies and food security. Within IGAD, the country offered to send peacekeeping forces to Somalia, a move that has been spurned by the Islamic Courts. Uganda has also overlapping membership in two RECs as a signatory of IGAD and its protocols, and of the East African Community, both with protocols on defence and security issues. This dual membership in two AU regional camps must be resolved if the AU and its African Standby Force (ASF) is to become responsible in the future for the continent's security.

63.2.1.5 Constitutional Crisis in Kenya

Based on the level of severity in both internal political, economic, and security cohesion as well as how this impacts on the Horn, the last country to be assessed is Kenya. In the past, Kenya has been considered the most stable and political cohesive country since independence in 1964. As a result, the country hosted many competing factions from all states in the Horn. For instance, the Sudan peace agreement was negotiated in the small town of Naivasha in Kenya. The recent efforts resulting in the TFG for Somalia were also negotiated in Kenya. Finally, the regional discussions on the tentative steps in 2005 towards creating structures within IGAD to complement the African Standby Force were also taken in Nairobi. Within the Horn Kenya has tried to export its stable political practice to its more conflict-ridden neighbours. While hosting refugees from almost every neighbouring state in the Horn, Kenya lacked the ability to impose a regional security umbrella, despite its relatively constitutional and institutional democratic practices and organs. These are still weak to support an aggressive external foreign policy aimed at dominating in this insecure region.

Kenya faces food insecurity and a diminishing ability to project political stability. In the autumn of 2006 over 2 million people were in urgent need of food aid and deaths from famine were reported. The association against desertification, drought and famine has failed to cope with these challenges as envisaged when it was set up in the mid 1980's. Finally, the relative prosperity in Kenya is now under serious risk from the piracy emanating from lawless Somalia threatening tourists in Mombasa and other areas in

the country. If this economic regression continues it will take Kenya back several decades of development.

63.3 IGAD as a Regional Security Zone in the Horn

The seven countries making up the Horn of Africa, Ethiopia, Eritrea, Djibouti, Somalia, Sudan, Kenya and Uganda, represent the most insecure region on the continent. Regional stability in the international security system relies on strong, politically stable and effective states whose foreign policies have largely abandoned the military option as a tool of first resort in disputes. Adhering to the principles of common and collaborative security, such a group of countries constitutes the first foundation for regional security. The above analysis has shown that most states in the Horn experience serious internal security challenges related to nation state-building. As a result of this internal strife regions have been depopulated and communities have been displaced within territorial boundaries. For instance, Uganda, Sudan, Somalia, Ethiopia and Eritrea are countries with huge internally displaced populations (IDPs) and hundreds of thousands either in exile or seeking refuge in neighbouring states. This has left regimes either with a 'collapsed' or very 'weak' state, unable to expand their influence and control over the whole territory of the country.

The absence of institutions and predictable conduct of government affairs has weakened attempts to establish a regional security mechanism. Somalia and Sudan have been unable to offer 'national' contingents to IGAD, and the forces of Ethiopia and Eritrea are preparing to resume fighting that was suspended in May 2000. In Sudan and Somalia political actors have publicly warned of dire consequences if forces from neighbouring countries should be deployed. Instead they preferred the African Union to solicit intervention and peacekeeping troops from outside the Horn. Against this background the offer of troop deployments by Uganda in Somalia were viewed as 'posturing' to the international community and not designed to serve any substantive purpose in addressing regional conflicts. There have been few concrete moves towards establishing a regional brigade of the mooted African Standby Force (ASF). Instead of coming up with an integrated brigade, states in the Horn are still suspicious of one another and, in some cases, have been actively planning to fight each other.

One conclusion for the expectations of the 21st century security is that the Horn will continue to be

an insecure area to which both the AU and the UN must pay particular attention in future. The Horn will remain a recipient of security aid until the current challenges of basic nation-state-building are overcome, including the establishment of 'national security institutions'.

as its interests begin to diverge with that of some influential international players, causing it to reduce its high profile intervention.

63.4 Conclusions

Of the seven states in the Horn of Africa at least five are countries confronted with unstable, factional, ethnically based, weak and 'collapsed' central governments. Lacking a coherent political direction from the centre manifested itself in the failures to create constituent nation states. The existing states lack national security institutions that are capable of linking and functioning under IGAD, the regional security mechanism. Furthermore, underlying the political upheavals in Ethiopia, Eritrea, Sudan, Somalia, increasing piracy along the Indian Ocean coastline, as well as the civil war in northern Uganda, the conflict system in the region has exacerbated the impact and effects of the structural environmental challenges. As we saw, these have reduced 40 per cent of the region's 180 million population to severe impoverishment, while leaving a further 30 per cent in the peri-urban areas also at the margins of survival. The environmental impact includes famine every ten years, flash floods, swarms of locusts, and increasing desertification whose impact is not being addressed in a structured manner. Third, the analysis has also shown that the reconceptualization of security in the international community does not reflect the prevailing experience and sentiments in the Horn

In fact, a major challenge has been to harmonize different peace initiatives from the international community to address the conflict in Darfur, in northern Uganda, the conflict between Ethiopia and Eritrea, and the religious bigotry that now characterizes players in Somalia and even the Sudanese conflict. Thus, in the 21st century, the Horn will still require to 'import conflict resolution and peace initiatives' from other regions, especially from other constituent parts of the AU.²⁵ Kenya, the regional island of stability, has recently shown 'mediation exhaustion' and especially

64 Regional Security in Southern Africa Development Community: Perspectives on Security Challenges

Naison Ngoma and Len Le Roux

"We face neither East nor West; we face forward"

Kwame Nkrumah

64.1 Introduction

Regional security in Southern Africa has been of enormous significance since the onset of the modern state on the African continent in general and the sub-region in particular. In Southern Africa, with the geographical boundaries of the Southern African Development Community (SADC), the overall challenges facing Africa will to a significant extent apply to SADC. With the demise of the Cold War and in 1994 the onset of a more democratic regime in South Africa, regional politics and development are no longer largely dependent on the ideological divide of the East or the West but rather a function of more nuanced dynamics.

Southern Africa and the entire continent are confronted with severe challenges that impact on the sustainability of humanity. On 27 January 2005, Prime Minister Tony Blair argued that with three million people that have died in the Democratic Republic of Congo alone; with 300 million people in Africa without access to safe drinking water, Africa should be the world's key area requiring attention.¹ Only a month after the Asian tsunami of 26 December 2004 – with 200,000 to 300,000 victims² – Blair's speech was significant. Jeffrey Sachs, an advisor to the UN Secretary General Kofi Annan, described the situation in Africa as a "silent tsunami" every month.³ Although the magnitude of the challenges facing Africa is colossal, we focus our attention only on Southern

African or more specifically to the SADC. The chapter identifies as crucial security issues: sub-regional conflicts, democracy and governance, and regional institutional structures, which are charged with resolving conflicts, as well as 'new' security challenges, such as environmental and water issues, HIV/Aids, and security sector reform.

64.2 Sub-regional Conflicts

Analysis of instability in the SADC region has three dimensions: a) inter and intra-state violence of immense proportion; b) post-conflict challenges; and c) political differences that arise out of some deficiency in democracy and governance. Although the conflicts are very much rooted in the present, the 'seeds' may be traced to an earlier era. The region's colonial history and liberation wars in Rhodesia (now Zimbabwe), South West Africa (now Namibia), Angola, Mozambique, and South Africa may explain, albeit not justify the conflicts in the region. The conflict in the Democratic Republic of Congo (DRC), a former Belgian colony and personal territory of its king, is most severely affected.

64.2.1 Intra and Inter-state Violence

The DRC has been at war from 1996 to 2000, and again since 2001, albeit at the intermediate level (Eriksson 2002: 123). In excess of 3.5 million people

1 See: "Special Address by Tony Blair, Prime Minister of the United Kingdom", at: <<http://www.weforum.org>>.

2 See: "Tsunami death toll", at: <<http://edition.cnn.com/2004/world>>.

3 Michael Vincent: "Africa's Malaria epidemic a 'silent tsunami': UN", in: *The World today*, 18 January 2005, at: <<http://www.abc.net.au/worldtoday/content/2005>>.

have so far died from the indirect effect of wars; 3.4 million internally displaced people (IDP); and 17 million people are experiencing food deficits.⁴ Although the conflict in the DRC has been of a robust overt inter-state nature, this has reduced considerably after the signing of a common security commission which was designed to remove the armed groups in their common region with Rwanda and Uganda. However, the multiplicity of actors in the country and beyond, continue to make sustainable peace unlikely in the short- or medium-term. The threat by Rwanda – soon after the progressive developments during the Great Lakes Conference meeting – that it reserved the right to intervene militarily in the DRC should the threat by the Rwandan insurgents in the eastern part of the DRC not reduce⁵, underlines the complexity of the situation.

On the domestic front, the role of political parties in both the period leading to the planned UN supervised elections and the period soon after remain fundamental for the future stability of the country. Therefore the formula likely to bring about sustainable peace and security to the country is unlikely to be a ‘winner takes all’ characteristic of most election battles in the sub-region. Major opposition organizations, amongst them the Alliance of Democratic Forces for the Liberation of Congo-Kinshasa (AFDL), the Congolese Democratic Rally (RCD), the Congolese Liberation Movement (MLC), and the Congolese Democratic Rally-Liberation Movement (RCD-ML), require a role in the function of any future DRC government. Also necessary in the formula for a peaceful DRC would be the *Mayi Mayi* and the *Banyamulenge* in the eastern part of the country. So too would individual players like Etienne Tshisekedi wa Mulumba of the Union for Democracy and Social Progress (UPDPS); Francois Lumumba of the National Congolese Lumumbist Movement (MNC), and Jean-Pierre Bemba, the onetime warlord and now one of the vice-presidents in the transitional government. To avoid a possible balkanization of the DRC, an active membership in regional groupings may contribute to its cohesiveness. Such membership would assist in strengthening the country’s vast commerce potential, contribute to the improvement of its communication infrastructure, and thus consolidate its sovereignty.

Although the June 2005 elections may have become a deciding factor whether the country will transcend its political and security problems, the nature of the DRC socio-economic and political landscape remains the major obstacle to peace and stability in the DRC and for its neighbours. Elections as a panacea for conflicts remain a rather discredited thesis. In the case of the DRC, a point was even made that all the country needed were elections, irrespective of how badly they were conducted.⁶ Elections are a tool of democracy but also the conditions under which they are conducted. Since the situation in the DRC has been highly unstable, it would be overly pessimistic to expect elections to serve as a tool of democracy at this time. The likelihood of an even more volatile political situation and consequently a further deterioration of the security situation is not just a certainty, but in the case of the DRC, it has been very real. What the country requires may be a longer time under a consortium of political actors who reasonably represent the country and offer an opportunity for democratic ideals to take root. Building a large military force of six brigades, as may be the plan by the South African and Belgian governments or building an even bigger national army of 32 brigades⁷ is unlikely to guarantee the peace the country requires. Sustainable peace in the DRC not only requires a non-violent post-election period but also a successful Disarmament, Demobilization, and Reintegration (DDR) programme which is a long-term undertaking that forms a major component of the sub-region’s post-conflict challenges.

64.2.2 Post-Conflict Challenges

While the DRC conflict has been complicated due to the existence of several armies belonging to the several political movements in the DRC, the goal is to achieve a political solution supported by an effective military that is only possible after a successful DDR and integration of the massive number of civilians who are either internally displaced persons or refugees, and a successful security sector reform (SSR). Several states in the sub-region have undergone DDR with mixed results. Namibia and Mozambique have generally achieved a relatively smooth DDR process. South Africa and Zimbabwe are experiencing some

4 CNN “Africa Focus” interview on 14 November 2004 with Ambassador Swing, the UN Representative to the Great Lakes Region.

5 See at: <IRINnews.org>, 26 November 2004.

6 CNN “Africa Focus” interview with a DRC political commentator on 14 November 2004.

7 See at: <Irinnews.org>, “South Africa: ‘No funds for training Congolese troops’”, 29 November 2004.

challenges from an incomplete reintegration of ex-combatants. While the former has been able to keep the negative effects of an insufficiently completed DDR under relative check, the latter has not, despite a rather comprehensive DDR after its independence in 1980.

The incomplete reintegration of ex-combatants in Zimbabwe contributed in part to the political challenges the country has experienced since then, resulting in the demand for a robust approach to the country's land issue. Subsequent government policies on the matter, which have since seen radical changes to the landscape of what used to be exclusive 'white' commercial farmland. Regarded as "an outpost of tyranny", Zimbabwe has contributed to the perception of Southern Africa as an unstable region in which its states are regarded as cohorts with the 'undemocratic' tendencies of President Robert Mugabe and regional structures unable (or unwilling) to meet the regional challenges.⁸ The extent to which regional institutions fail to address these security concerns will be discussed below.

Among all post-conflict states Angola provides the most current scenario on the contribution of DDR to stability in the sub-region. After forty years of civil war, Angola is undergoing a very intensive reintegration process. However, with vast oil⁹ and mineral wealth, Angola has an opportunity of succeeding in an integration assignment that is more complex than originally presumed. Nevertheless, sustainable stability is a function of continuing good relationship between the Popular Movement for the Liberation of Angola (MPLA) government and the Union for the Total Independence of Angola (UNITA).¹⁰ Such a relationship is closely linked to democracy and good governance.

64.2.3 Democracy and Governance

Democracy and governance are concepts that are prominent in the discourse in Southern Africa. While once the critical issue was the prevalence of single party systems, the present challenge is adhering to the practices of the principles of liberal democracy

arguing for plural political systems. Except for Swaziland that has remained a monarchy despite severe political opposition from within and outside of the country, all SADC countries have multiparty systems. But the level of democracy in the countries is not the same, as in the West, often considered as the custodian of democracy. While the states in the region espouse democratic ethos, they nevertheless make it fairly plain that the model they seek is not necessary domicile in a particular part of the globe. In the words of Kwame Nkrumah: "We face neither East nor West; we face forward!"

Whilst states insist on their own democracy, the challenge in the region is the manner in which non-governmental actors reflect their views. Without exception, the non-governmental organizations (NGOs) – particularly trade unions – have insisted on the application of the principles of democracy both at home and in the region, thereby exhibiting a form of solidarity that has until now been exhibited only at the state level. The robust response towards the political problems in Zimbabwe by the Congress of South African Trade Unions (COSATU) is indicative that on matters of democracy and accountability the peoples of the sub-region hold their states liable. Both governmental and non-governmental structures see some value in collaborative approaches in resolving issues.

64.3 Regional Institutional Structures

The states in Southern Africa have always acknowledged collaborative arrangements. Even at the height of the Cold War, in their opposing camps they tried to adopt collaborative approaches to the challenges facing them. Of contemporary significance are the developments of 1992 and 1996, resulting in the Southern African Development Community (SADC) and the Organ for Politics Defence and Security (OPDS) – collaborative structures that sought to address the developmental, political, and security challenges. Despite developments in these structures, often the states in Southern Africa are perceived as not responding to regional challenges. The continued existence of the Zimbabwe African Union Patriotic Front (ZANU-PF) government, despite numerous claims of undemocratic practices and bad governance, has been an indication of lethargic regional structures.¹¹

Despite the efforts of the SADC summit to operationalize the OPDS, the creation of the Strategic In-

10 The death of Jonas Savimbi in 2002 seems to have opened a new possibility for a peaceful resolution in Angola.

dicative Plan of the Organ (SIPO), the Protocol on Politics, Defence and Security Cooperation, and the Mutual Defence Pact, which have all been designed to make that possible, have not yet been implemented. Thus, the critical challenge for the region is to use these structures which should enable Southern Africa to meet regional political, security, and defence challenges.

64.4 'New' Security Challenges

There are several other challenges Southern Africa is currently experiencing, such as international migration, environmental degradation, water, mercenaries, HIV/Aids, and security sector reform. While the choice of these issues reflect the writers' bias on what is higher up on the 'food chain', the prioritization of the issues does not.

64.4.1 International and Sub-regional Migration

Given a sub-regional population of 219.5 million and a territory the size of the United States of America, the SADC region can hardly be regarded as overpopulated. Nevertheless, the disposition of regional economic growth is not equally distributed, thereby leaving a few countries such as Botswana, Namibia, and South Africa as the destination of the bulk of sub-regional migration because of their relatively higher economic performance. At this level xenophobic tendency by some nationals of these countries against migrants – legal and illegal – is in part explained by the fear (usually ill-informed) of the migrants denying the locals the benefits of the ever-shrinking labour market. The intention to have a free movement of people in the sub-region shows the desire by the states to eradicate xenophobia.

It is notable that the Protocol on Free Movement of SADC Persons, which was to “enable citizens to seek to cooperate across national boundaries”¹² has yet to be operationalized. However, the signing of the protocol is a fundamental development consider-

ing the length of time it has taken to reach consensus on the matter and the relative poverty that has continued to plague most of the region, leaving in the process a few attractive destinations for those seeking a better living standard.¹³ With South Africa, Botswana, and Namibia exhibiting better economic performance, a general fear has been of people moving from the rest of the region to these countries. South Africa already has a significant number of illegal immigrants from Zimbabwe. While the signing of the protocol indicates trust among the governments in the region, the major test will be at the ratification stage when a wider support by other political actors is needed. Despite the overwhelming parliamentary support of the governments, opposition to the protocol is likely to be superficial, albeit 'loud', in view of the independent media.

International migration as distinct from regional migration sees the movement of people from countries outside the SADC. The outflows of people, often highly qualified professionals whose skills are greatly needed in their countries and in Southern Africa, has been negative for sub-regional development.¹⁴ Migrants generally come from conflict zones, such as the DRC and Burundi, as well as from economically depressed countries in Eastern Europe.¹⁵ The Southern African states have discussed to both harmonize their approaches towards international immigrants – primarily refugees – and the loss of skilled human resources they all suffer.¹⁶

64.4.2 Environment and Water

In a region that is experiencing serious drought, the management of the environment and water are crucial. Böge and Wirkus (2004) have argued that environmental issues have directly and obliquely lead to conflicts and that environmental degradation has

16 See: International Organization for Migration: “Current Migration Themes in Southern Africa: An IOM Perspective”, December 2004.

increased (Swatuk/van der Zaag 2001). While this may well be the case for other parts of the world, these challenges facing the SADC region are not increasing.

In the past environmental degradation and management of the water resource has resulted in inter-state rivalry, such as the brief but serious differences between Namibia and Botswana in 1992 (Ngoma 2005). In the region, environmental and water challenges are of a transboundary nature, and hence may lead to serious inter-state conflicts (van Wyk 1998; Mafuta/Karuma/Chenje/Sherman 1999–2000). Environmental issues, particularly water problems, are among non-traditional sources of insecurity that may pose a threat to the Southern African region. However, the assertion of conflicts in the SADC region on transboundary water issues (van Wyk 1998) has been contested (Turton/Solomon 2000; Turton/Henwood 2002; Turton/Ashton/Cloete 2003; Ashton/Turton 2007). Several bilateral arrangements (joint water commissions and regional agreements) have been set up, such as the Limpopo and Maputo, Incomati, Pungwe, Pungwe, Umbeluzi, Kunene and Cuvelai; and the Zambezi river basin regime point to the transboundary nature (Lindemann 2008). The states have been keen to peacefully resolve all conflicts (SADC Protocol on Shared Watercourse System of August 1995). A revised Protocol was ratified in August 2000. Nevertheless, critical shortages of fresh water in South Africa experienced in 2004 and 2005 point to the ‘human security’ challenge posed by water scarcity.

There are many other environmental challenges that necessitate comprehensive rather than sectoral responses. Setting up corridors and transboundary wildlife parks have been an effective way of tackling some of these challenges. A key challenge facing the region is the need to ensure the participation of local people and to make certain that they benefit directly rather than adopting an exclusively state-centric approach.

64.4.3 HIV/Aids Pandemic

HIV/AIDS is one of the greatest threats to security and development. According to the Centre for Strategic and International Studies in the United States:

HIV/AIDS affects the institutions that guarantee national security and safeguard the international system as a whole. ... HIV/AIDS can be so pervasive that it assaults, as surely as prolonged conflict, the essence of the nation state: secure families, communities, eco-

nomics and political institutions, military and police forces (Schneider/Moodie 2002).

In the SADC region seven countries have prevalence rates above 17%¹⁷ (table 73.1); here the humanitarian crisis is particularly acute (Heineken 2003: 16).¹⁸ HIV/AIDS leads to a reduction in productivity, decreased life expectancy of professionals, increased health budgets, social dislocation and reduced capacity in the security sector, and the danger of exploitation of resulting gaps. Stigma, discrimination, and conflict over scarce resources threaten to increase political conflict and criminal behaviour (Mattes 2003: 10).

Table 64.1: HIV/Aids, prevalence of adult population and armed personnel in the SADC region

	Country	Proportion of adult population with HIV+ (2001)	Proportion of armed forces' personnel estimated to be HIV+ for year indicated
1	Angola	5.5 %*	50 % (1999)
2	Botswana	38.8 %	33 % (1999)
3	DRC	4.8 %*	50 % (1999)
4	Lesotho	31.0 %	40 % (1999)
5	Malawi	15.0 %	50 % (1999)
6	Mozambique	13.0 %	Not available
7	Namibia	22.5 %	16 % (1996)
8	South Africa	20.1 %	23 % (2002)
9	Swaziland	33.4 %	48 % (1997)
10	Zambia	21.5 %	60 % (1998)
11	Zimbabwe	33.7 %	55 % (1999)

Regarding the threat posed in Southern Africa by the diminishing capacity in the security sector due to HIV/AIDS, uniformed services are in many ways at the coalface of this pandemic, being particularly vulnerable to both contracting and serving as agents for its transmission. Reliable estimates of HIV/AIDS prevalence in Southern African armed forces are difficult to obtain, and its implications for the military are speculative.¹⁹ However, the Institute for Security

19 See: Robyn Pharoah, ISS Pretoria, unpublished paper for the project Phidisa research agenda.

Studies in Pretoria has involved representatives of the military in the SADC region in a book project on this pandemic. While it may not provide additional data, it signifies a radical shift on behalf of the military which previously had refused to discuss the matter, considering it as a sensitive internal security problem.

Preventing HIV/AIDS and political violence comprises “the two blades of the scissors required to cut the strangler’s cord choking Africa” (ICG 2004: I). Such a response should be bolstered by initiatives aimed at raising awareness on HIV/AIDS amongst military personnel. The next challenge for regional security is security sector reform.

64.4.4 Security Sector Reform

The goals of OPDS of SADC cannot be reached if the national security services of SADC countries are wrongly constituted, ill equipped, and badly managed, and if the sub-regional security mechanisms are ineffective. There is a need to examine the security sector and to initiate security sector reforms. But it is difficult to generalize the state of this reform both from a country and a sector perspective. In most countries more emphasis has been placed on defence transformation than on the reform of police and intelligence services, probably due to the greater capacity for violence inherent in the military and the corresponding possibility of disrupting the developing democratic processes in the region. South Africa has probably undergone the most comprehensive reform of the security sector that addressed transparency, accountability, effectiveness and efficiency, civil control and oversight, and the equitable representation of all within the security services. Botswana, Mauritius, Namibia, Tanzania, and Zambia have undergone substantial SSR processes but still lack the required transparency and democratic oversight.²⁰ Mozambique, Lesotho, and Malawi (Williams/Cawthra/Abrahams 2003) are all still implementing their SSR processes and must consolidate this in new policies, laws, and structures. Zimbabwe is an enigma in the sense that SSR gains of the past are currently being reversed in a state where the security services are highly involved in politics and ‘blind loyalty’ to the regime rather than to the constitution and the state²¹. Swaziland is still a monarchy where the security services are subject to the will of the King and where the fundamentals of

democratic oversight of the security services do not exist (Le Roux/Rupiya/Ngoma 2004: 23). Angola is entering the democratic era and SSR reform may soon be underway, whilst the Democratic Republic of Congo must follow after a democratic election.

SSR should improve the capacity of the security sector to render services and outputs in an efficient and cost-effective manner based on a clear definition and understanding of the desired outcomes as determined by the democratically elected representatives of the people. Two of the most important SSR issues are civil-military relations and effective governance of the military. These issues are essential for ensuring peace and stability.

64.4.5 Civil-Military Relations

Civil-military relations in the SADC region have been in a state of flux since the colonial period (Mtonga 2004). Civil society does not trust or like the military and sees them as a power unto themselves, not as serving the national interest but as wasting scarce resources that could be utilized for developmental purposes. On the other hand, the military in general perceive the civilians as ignorant on security matters and not trustworthy to share with them ‘the affairs of defence and security of the State’. These mutual misperceptions have been created and sustained mostly due to the lack of transparency and a discourse on military matters in the countries of the sub-region (Williams/Cawthra/Abrahams 2003). The essential challenges for healthy civil-military relations are:

- *Creating effective and dynamic political oversight over defence establishments* through parliamentary defence committees in the Constitution or other legislation. Their members must be able to execute their tasks with sufficient resources, access to military institutions, and programmes designed to enhance their understanding of defence and security matters. Similarly, political oversight requires civilian defence ministries responsible for political guidance and control of the military. Such ministries must be equally empowered by ci-

21 See: statement attributed to Zimbabwe’s defence force commander, General Vitalios Zvinavashe, in: *Zimbabwe Bulletin*, 1/2002: “Position of the Military”, 9 January 2002, at: <<http://www.ind.home-office.gov.uk>>; see: Peta Thornycroft: “Mugabe puts military at the centre of Zimbabwe’s election”, in: *News Telegraph*, 3 March 2005, at: <<http://portal.telegraph.co.uk/news/main.jhtml?>>.

vilian staff members with high qualifications in strategic and military studies, and public and defence management.

- *Establishing transparency and accountability in defence management* are crucial for the allocation and management of resources at all levels of planning, programming, and budgeting. If defence resource allocation and management are not transparent, defence will never be able to achieve public support or the cooperation and support of the government. If defence is not accountable to government and the people, it will not be aligned with national interests and priorities. It will easily be corrupted and decision-making will be manipulated towards self-interests. Civil involvement and control of overall budget decisions, as well as careful auditing at all levels, can help ensure that resources are actually used to accomplish policy objectives. Nevertheless, the most effective solution to this problem is a commitment at all levels to national interests and objectives, and the development of clear and transparent policy, planning, programming, and budgetary processes and systems to implement them.
- *An informed civil society.* Not everybody wants to be a defence expert or be involved in the defence debate. But if civil society is ignorant of and uninterested in defence matters, it is impossible to create healthy civil-military relations and defence would in fact have a licence to 'go its own way'. Academic institutions, non-government organizations (NGOs), and the media should develop an expertise on defence matters to inform society and to influence governments in general and parliaments in particular. Academic institutions and NGOs may offer alternative options for improved defence policy and management.

64.4.6 Defence Management

Efficiency in defence management is essential in the SADC region as countries can ill afford to waste scarce resources on inappropriate, ineffective, and unaffordable military forces. Much is required to be done in this area (Le Roux/Rupiya/Ngoma 2004). Poorly managed forces are potential sources of instability and conflict. Efficient defence management requires:

- developing the capacity of the various departments of defence for policy formulation and strategic planning concepts and processes;
- good and transparent budgeting and management of public expenditure in the defence sector;
- appropriate role and function of the development between security agencies to improve national security management and cost-reduction/optimization;
- development of appropriate civic education practices within the armed forces;
- enhanced human resource management processes and practices in defence departments with special attention to professionalism, equitable representation, and activities of integration, rationalization, demobilization, and reintegration into civil society.

64.5 Conclusion

In spite of many achievements, regional security in the SADC region must be comprehensively consolidated. Although the number of states embroiled in conflicts has declined, the past and ongoing conflicts have been so intensive that the effects for states and the sub-region have remained very negative. The DRC is the only state whose conflict has remained manifest both internally and with its neighbours. Despite vigorous regional efforts and those of the international community, as well as some indications towards a democratic path, the situation remains grave. Some states which were previously involved in conflicts are faced with challenges of bringing about normality in their societies through programmes such as DDR. This chapter has identified Angola where political stability is closely dependent on its ability to conduct a successful DDR process.

The chapter has argued that the sub-region is not only willing to achieve democracy and good governance, but is also determined on its own terms. It has been observed that the pluralistic nature of sub-regional politics has allowed non-governmental actors like trade unions to actively insist that governments adhere to the principles of democracy and good governance, especially in their stand on Zimbabwe.

It has been argued that Southern Africa has been trying to develop institutional structures designed to ensure peace by the creation of the OPDS, SIPO, the Protocol on Defence and Security Cooperation, and the Mutual Defence Pact on which additional work is required. Other security challenges include interna-

tional and sub-regional migration with xenophobia as one negative side effect. Environmental and water issues have also been identified as a potentially major source of instability because of how these countries depend on these scarce resources. The states are conscious of the need to mitigate this instability.

Amongst the greatest threats to security and development are the HIV/Aids pandemic and incomplete SSR. The seriousness of HIV/Aids in the general population and its impact on the defence and security services has become a great concern for peace and stability. SSR has been identified to mitigate both the needs of the defence and security services and the demands for development with a democratic ethos. Although several states are undertaking substantial efforts to conduct appropriate SSR, much remains to be done.

65 The Security Problematique in South Asia: Alternative Conceptualizations

Navnita Chadha Behera

The security problematique in South Asia is undergoing a metamorphosis. Old paradigms are yielding way to new conceptualizations. The fundamental questions of who is being secured? – state or people – from what threats? – external powers, forces of globalization, sub-national actors or the oppressive authority of the state itself – and, through what means? yield radically different answers.

This chapter critically analyses the discursive and policy processes involved in shaping the changing security agendas of South Asian states by examining the role of important players – states and sub-state actors as well as international forces – and, their political choices in determining which problems may be included or excluded from its purview at any given historical juncture.

It begins by examining the traditional, state-centric notion of security rooted in the realist worldview of international politics. However, in view of the qualitatively different political character of states in the South Asian context, it highlights the importance of understanding the dialectic between security and insecurity for the state as well as its people as two distinct albeit related phenomena. The chapter discusses political forces influencing the processes of redefining the security problematique in South Asia and illustrates it with reference to economic, environmental, and political security issues in the region.

65.1 Traditional Worldview: External Security Dilemmas of the State

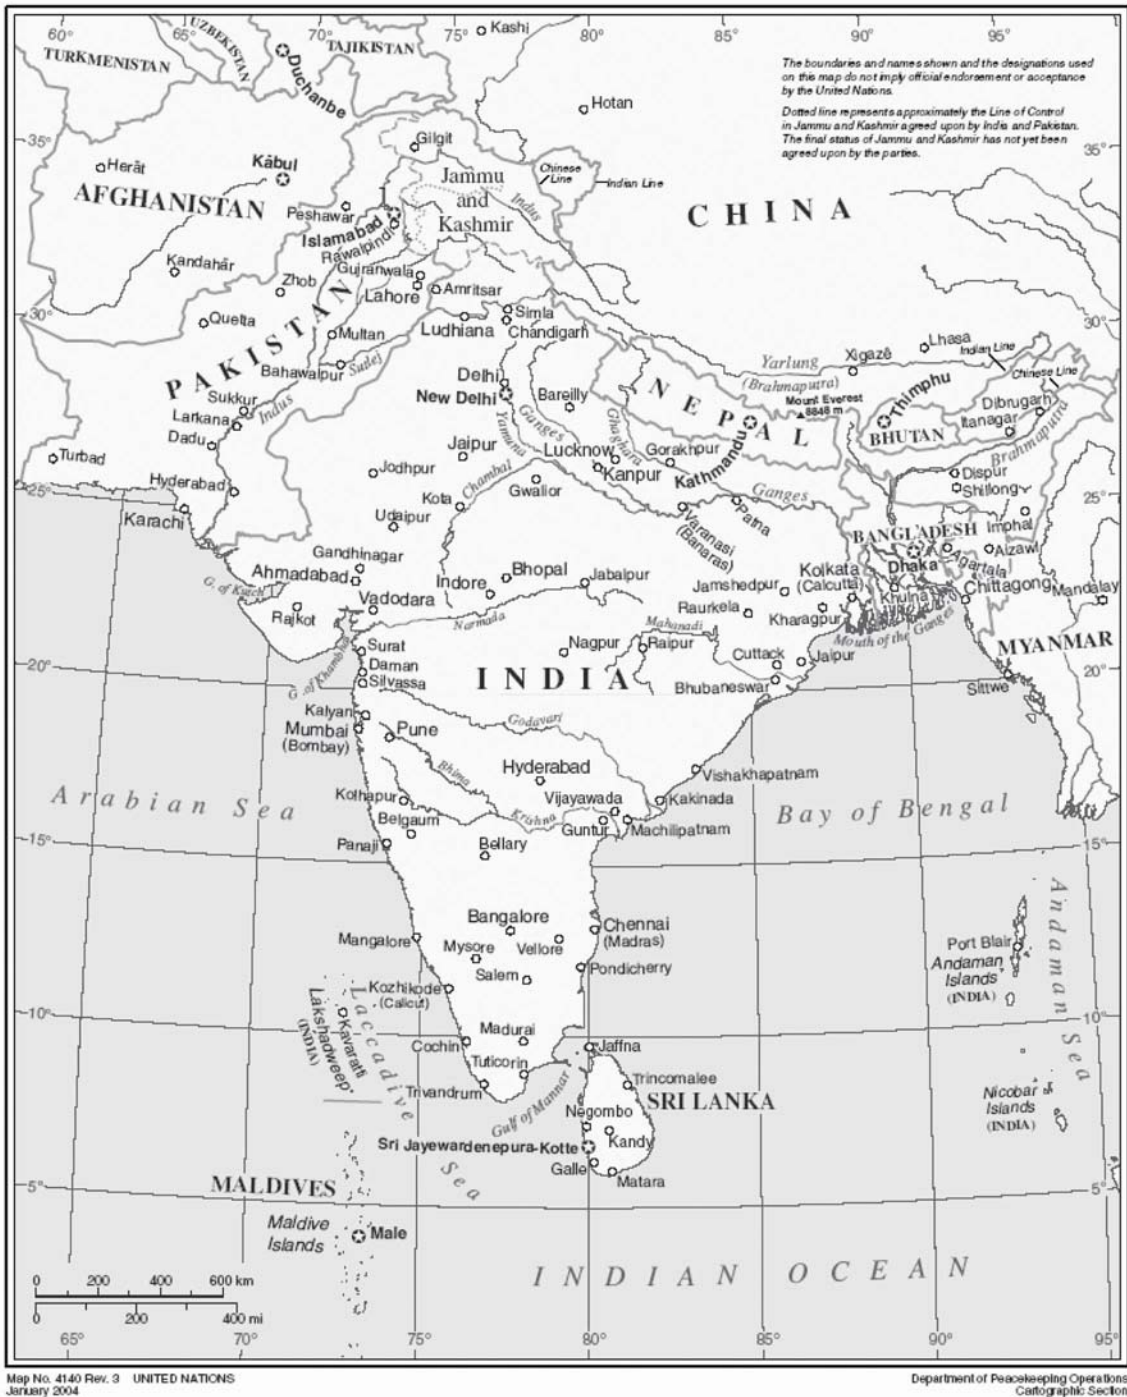

A state-centric approach has traditionally dominated the security debates in South Asia, which centred around securing sovereignty and territorial integrity of the state from external dangers and primarily through military means (chap. 29 by Khanat). This was grounded in a neo-realist worldview where power is seen as the ultimate arbiter of international relations

and a state is mainly concerned with power struggles among states and threats emanating from ‘outside’ its borders (chap. 37 by Baylis).

The balance of power within South Asia and outside; great power involvement and the security of smaller states and fears of Indian hegemony, thus, formed key areas of security studies in South Asia (Buzan/Rizvi 1986; Ayooob 1980; Singh 2000; Cheema/Bokhari 2004; Maniruzzaman 1982). These were partly a response to the Indo-centric character and asymmetrical and hierarchical power structure of the subcontinent (Muni 1980: 39). India occupies a dominant power position in terms of population, economic resource base, military strength, and the ability of its constitutional, political, and economic structures, making it the proverbial ‘Big Brother’ with all its negative connotations. Smaller states feel insecure in the company of the giant neighbour, a fear exacerbated by a number of developments over the years such as the division of Pakistan and creation of Bangladesh (1971), the annexation of Sikkim (1975), military intervention in Sri Lanka (1987), the commando operation in the Maldives to put down an attempted coup (1988), and the trade embargo against Nepal (1989). Also, Indian attempts to assert its ‘natural’ place in the power hierarchy of the subcontinent, and Pakistan’s search for military and strategic ‘parity’ with India resulted in “mutually incompatible perceptions and self-images of their power status *vis-à-vis* each other, as well as in the global context” (Muni 1980: 47). High levels of defence spending and arms procurement by India and Pakistan and a constant state of defence preparedness have created a highly militarized situation in South Asia (Figure 65.1).

South Asia is the only part of the world that has two nuclear-armed countries (also China) sharing disputed borders and locked in a political and military competition. Since the end of colonial rule in 1947, this region has been the battleground of several wars – India-Pakistan (1947–48); India-China (1962); India-

Figure 65.1: Map of South Asia. **Source:** The United Nations Cartographic Section, South Asia. 2007: <www.un.org/Depts/Cartographic/map/profile/seasia.pdf>.

Pakistan (1965 and 1971); ongoing armed confrontation between India and Pakistan in the Siachin glacier area (since 1984); the Kargil crisis (1999); and the continuing civil war in Sri Lanka. These conflicts, especially the protracted territorial dispute between India

and Pakistan over Kashmir, have intensified concerns for national security with overt military dimensions. Hence, the phenomenon of war in different variants – conventional warfare, limited war, proxy war, low-in-

tensity conflict, internal wars and so on – has been a major occupation of its security analysts.¹

Significantly, erosion of bloc politics and mitigation of ideological divisions as a result of the end of Cold War did not help de-escalate the India-Pakistan conflict because the latter had, over the years, acquired an independent logic and momentum. In this respect, South Asia has followed a different political trajectory from other parts of the Third World where the end of power games between the superpowers had radically altered their security agendas. In South Asia, on the contrary, the frequency of India-Pakistan military crises grew – the 1990 crisis in Kashmir; the confrontation in 1999, the military mobilization in December 2001, and the May 2002 military crises – and, the gap between them – from nine years between 1990 and 1999 to five months between December 2001 and May 2002 – had sharply narrowed.

Nuclearization of the subcontinent added yet another dimension to this equation. Most security analysts argue that the nuclear tests conducted in 1998 were a long-delayed consequence of India's steadily worsening security situation which owed as much to the freezing of the international nuclear order in the mid-1990's, as to the development of Chinese and Pakistani nuclear capabilities. While Indian nuclear tests were justified as a necessary move to "fill a potentially dangerous vacuum . . . [in] Asian balance of power" (Singh 1998: 42), Pakistan's decision to follow suit was explained in terms of seeking nuclear 'parity' with India, countering India's hegemonic designs, and as an attempt to restore the balance of power within South Asia.

The major concerns of such realist discourses are to explore the road map India and Pakistan might take to weaponization and induction of nuclear arsenal in their forces and, devising a nuclear strategy and a nuclear doctrine.² They also explore various ways

and means by which these states may seek to 'stabilize' and 'manage' nuclear deterrence through Confidence Building Measures and international treaties such as the *Comprehensive Test Ban Treaty* (CTBT) and the *Fissile Materials Cut-off Treaty* (FMCT).³ Others argue against the weapons of mass destruction and that the nuclearization of the subcontinent was an ill-advised and dangerous decision, with some advocating a reversal of this process. This is argued, both, on grounds of *realpolitik* and the morality at stake.⁴ Scholarly analysis that moves away from the positivist, neo-realist paradigm and draws insights from post-positivist theoretical standpoints such as post-colonial traditions of thought, feminism, and so on, remain on the margins of such security discourses (Nizamani 2001; Khattak 2002; Abraham 1998). These voices, however, acquire much more importance in understanding the internal security predicaments of the state which is discussed next.

65.2 An Alternative Paradigm: The State As a Source of Security or Insecurity?

Focusing its gaze 'inside' the state, this explores the dialectical relationship between security and insecurity (chap. 30 by Sahni). In the traditional conception, security comes from being a citizen of a state and there is "no security outside the state; no state without security" (Dillon 1996: 14). Citizens must be totally committed and show unwavering loyalty to the sovereignty and territorial integrity of the state, which, in turn, promises to provide complete security to its citizens. Scholars forging an alternative paradigm of security question this fundamental premise because the state in the South Asian region has often proved to be a source of insecurity to its citizens – a phenomenon one cannot understand or explain without critically analysing the political character of the state (Behera 2002; Ahmed 2002; Mohsin 1997; Uyanogoda 1994; Krishna 1999; Chatterjee 2005).

By understanding the state as a given and unproblematic entity that is 'prior to' all intellectual inquiries in IR, traditional security analysts refuse to contend with the possibility that their 'security dilemmas'

1 See: Khan 1970; Maxwell 1971; Ayoob/Subrahmanyam 1972; Salik 1977; Sinha 1977; Ganguly, S. 1986; Sisson/Rose 1990; Palit 1991; Sen 1994; Bajpai/Cheema/Cohen/Ganguly 1995; Singh 1999; Ali 1993; Ganguly, R. 1998; Balasingham 1983; Hellmann-Rajanayagam 1994; Jacob 1996; Niazi 1998; Tellis/Fair/Medby 2001; Kargil Review Committee Report 2000; Raghavan 2001; Qadir 2002; Bammi 2002; Koithara 2003; Chari/Cheema/Cohen 2003; Behera 2000, 2006a; Dasgupta 2002; Swami 2004, 2007.

(chap 3 and 40 by Brauch) are linked to the very character of these states in the region. This proposition demolishes the core thesis of the neo-realist paradigm, which attributes the security dilemma of the states to prevailing anarchy in the international domain. “Conceptual bifurcation of anarchy (international) and hierarchy (domestic),” in neo-realism “is based on the original Hobbesian thinking and makes no provision for internal security complexes” because the domestic is conceptualized as the sphere of freedom under the complete supervision of a legitimate authority (Chatterjee, forthcoming). Neo-realist analysis does not give an account of “how that authority is constituted, its condition of legitimacy, and the implications of the diverse contestations of identities that might conspire to fragment the state, thereby posing a threat to the state security” from within (Chatterjee, forthcoming).

65.2.1 Interrogating the State: Political Challenges from ‘Within’

South Asian states do not have the *kind* of European nation state that is assumed to be *given* in the neo-realist analyses, and the internal vulnerabilities of the state and the insecurities of its people are often rooted in the very processes of emulating a particular kind of state, a model of the Westphalian state denoting a unified, indivisible sovereign state with centralized political authority. The Western nation state had emerged within the largely homogeneous societies of Europe. A mechanical application of the nation state idea with its monolithic credo and unitary state structures, on the deeply multicultural societies of South Asia was structurally flawed. The whole process negated the diversity, humaneness, and freedom that were fundamental to their cultures. Trying to manage and enforce ideological and political conformity on the sub-nationalities in the interest of the nation-state, sought to “impose a monolithness and homogenization that were alien and alienating” (Wignaraja 1993: 27).

The modern nation state allows recognition of a single, presumably unified nation. This principle applied to a plural society, especially when governed through electoral democracy, is inherently problematic. The single nation tends to be identified with the dominant majority, with the state being the sole depository of political power, exercised by the ‘majority’, while minority communities tend to feel alienated and marginalized. Often this is despite checks and balances of a democratic system that protect individual

and group rights from the abuse of the majority (Behera 2000: 24). Those left out, therefore, seek to construct their own identity and create alternative spaces within or without existing state boundaries.

Put differently, the nation state in South Asia is not necessarily the provider of security to all its citizens, rather the state itself is the site of conflict between different nation-building enterprises and power struggles between contending social groups and elites. A more appropriate question to ask, therefore, is: Whose nation needs to be secured? and, Who controls state power?, both in terms of the dominant majority organized along religious, ethnic or linguistic lines or the elective versus non-elective institutions (Behera 1997). It is important to examine the assumptions, organization, reproduction, and dynamics of the modern nation-state in the South Asian region because this provides the key to understanding how the politics and mechanisms of these states produce *insecurity* for its *people*.

This may be illustrated with reference to the Sri Lankan conflict, whose defining characteristic has been the political incommensurability of Sinhalese and Tamil nation projects. One major reason for this is the Sinhalese nationalist commitment to maintaining the Sri Lankan state in the old centralized and unitary form (Behera 1997). The Sinhalese ideological construction of the Sri Lankan state is driven by the powerful idea of Sri Lanka being ‘our land’, *ape rata*. This “territorial possessionist idiom in the Sinhalese political discourse implies a condition of social appropriation of the state which is mediated by ideology,” and it also refers to a “collective self-understanding of a polity – a polity of ‘ours’ and not of an ‘other’” (Uyangoda 1994: 90). Sinhala nationalism, in this sense, is also an exclusionary ideology, the central question of which is: How can ‘our’ state power be shared with an ethnic ‘other’. Although there exist revisionist versions of unitarism, devolution of power for example, the hegemonic logic of mono-ethnicity has taken deep roots in the political thinking among Sinhalese as well as Tamil nationalist forces (Uyangoda forthcoming). They have struggled to exist in one nation-state, without being able to reconcile each other’s political claims to statehood. Consequently, they have found themselves locked in a self-destructive war for nearly two decades.

The case of Bangladesh makes it even clearer. The Bengalis of East Pakistan had launched a movement of secular and democratic assertion of linguistic and regional difference from Pakistan (despite a common religion), but after the creation of an independent

state of Bangladesh, its constitution imparted a distinct Bengali character to the state and declared Bangladesh to be a homogeneous and unicultural country.⁵ This proved to be deeply problematic for the forty-five different ethnic communities living in the state, and was particularly unacceptable to the hill people of the *Chittagong Hill Tracts* (CHT) who perceived their cultural identity and survival as a distinct community to be threatened by the imposition of Bengali nationalism and subsequently launched an insurgency against the Bangladeshi state, which in turn posed not just a military but a human and cultural threat as well (Mohsin 2001: 23–24).

Almost every state in South Asia has been confronted with broadly similar challenges to centralized authority, and no less important, to the hegemonic discourse revolving around the nation-state. Indeed the national question is the driving force behind most secessionist movements – those by Kashmiri, Assamese, Sikh in India; Tamils in Sri Lanka; Baloch in Pakistan; Chakmas in Bangladesh – and the Maoist insurgency in Nepal which might otherwise differ in character, support base and dynamics, but share in common an uncompromising opposition to the centralized political authority and unequivocal rejection of the legitimacy of the nation-state as presently constituted.⁶ At the core of such ethno-political conflicts are radically different claims to how the state power is organized and distributed (Uyangoda forthcoming). The task of a security analyst, therefore, is not to replicate (or copy) a Westphalian-style nation-state that has everywhere rendered its populace more *insecure* (than secure), but how to creatively experiment with new kinds of state and sub-state structures that accord more political space to its social communities, thereby enhancing peoples' security.

From a different vantage point, feminists have sought to reframe traditional constructs of state, sovereignty and political identity, and explain how mod-

ern states and the international state system depend in part on the maintenance of unequal gender relations in division of labour and power play. They question the state-centric conception of security that makes security effectively synonymous with 'citizenship' and allows no room to explore alternative answers to the question of 'who we are' and, of political identities woven around ethnicity, class or gender. Feminist analyses show that citizenship is historically and conceptually not a gender-neutral phenomenon (Menon/Bhasin 1998; Gardezi 1991; Kandiyoti 1991), nor is identity merely tied to territorial or nationalist conceptions (Hussain/Mumtaz/Saigol 1997; Thiruchandran, 1999). Unlike neo-realists who focus on threats from 'outside' the state boundaries, feminists highlight the structural violence of ethnic, class, and gender hierarchies. Taking gender seriously can, thus, yield radically different formulations of security where issues of social justice take precedence over matters of order.

In South Asia, the disciplines of anthropology, sociology, and history have integrated gender-aware analyses far better than that of international relations. The discourse on international security is also, slowly but surely, altering course from the state-centric models to taking into account the role of non-state actors and non-traditional security issues. However, the theoretical constructions of feminist analyses are only beginning to make its presence felt (Rajagopalan 2005; Chenoy 2002, 2005; Mohsin 2002; Ollapally 2004). The literature on women's involvement in conflict and peace processes have addressed several issues such as women caught in wars or internal ethnic conflicts (Goswami 1999; Banerjee 2003; de Alwis 1999; Guhathakurta 2001), especially testimonies of their experiences in conflict situations (Butalia 1998, 2002; Raychaudhury 2006; Khattak 2006; Khan 2006) and, understanding their role as fighters in militant groups (de Silva 1995; de Mel 2004). Women's role in peace negotiations (Manchanda 2001, 2004); gendered implications of conflict-induced migration and internal displacement (Behera 2006; Chakravarty 2004); and linkages between patriarchy and militarization (Chenoy 2002) have also been analysed. Feminist writings on the gendered nature of nationalism and state also debate issues that concern IR (Menon/Bhasin 1998; Butalia 1998; Thiruchandran 1999; Jayawardene 1986; Hussain/Mumtaz/Saigol 1997).

There is also a small albeit distinct tradition of neo-Marxist writings in the South Asian literature, including Dutt's formulation of "proto second tier imperialism" (1984); Vanaik's writings on globalization

5 Article 9 of the Constitution defined Bengali nationalism as "the unity and solidarity of the Bengali nation, which, deriving its identity from its language and culture, attained sovereign and independent Bangladesh through a united and determined struggle in the war of independence, shall be the basis of Bengali nationalism" (Mohsin 2001: 23).

6 Tambiah 1986, 1996; Phadnis/Ganguly 2001; Sinha 1991; Ahmad 1973; Krishna 1999; Behera 2000; Jeganathan/Quadri 1995; Chadda 1997; Dutt 1998; Bhaumik 1996; Thomas 1994; Swamy 1994; Bose 1994; Das 1992; Jahan 1973; Ponnambalam 1983; Gellner/Pfaff-Czarnecka/Whelpton 1997.

(2004); Harshe's (1997) work on imperialism that demonstrated how it has been at the centre stage of IR and critiqued several radical theories by examining their applicability to concrete empirical realities in the Third World; and, Alavi's concept of "the Muslim salariat" and "overdeveloped state" (1972, 1983; Halliday/Alavi 1988) in the context of Pakistan.

65.2.2 Economic Development, Environmental Problems, and Peoples' Insecurities

The nationalist leadership of post-colonial South Asia had envisioned the state as an agent of social change, economic progress, and transformation. Adoption of the Western models of economic development and its associated practices have, however, rendered many segments of their populace poor and insecure.

The modernization theories, for instance, eschewed any debate on the issue that development understood and practised as capital accumulation and commercialization of the economy for the generation of surplus and profit, involved the reproduction not merely of a particular form of creation of wealth, but also of the associated creation of poverty and dispossession of others. In other words, the development of the colonial masters had rested upon the impoverishment of their colonies. The replication of this model of economic development in post-colonial South Asia created new internal colonies such as East Pakistan, now Bangladesh, in Pakistan and, caused deep divisions in its societies. India, it is argued, has become effectively organized as a democracy of omnivores, for the omnivores and by the omnivores - the real beneficiaries of economic development who also have the clout of state power to ensure that the goodies come to them cheap, if not altogether free (Gadgil/Guha 1995: 45). This is a system in which the interests of the huge number of ecosystem people (4/5^{ths} of India's rural people who depend on the natural environment of their own locality to meet most of their material needs), and ecological refugees (those displaced by dams, mines, and deforestation and live on the periphery), can be safely ignored. The omnivores, who constitute only 1/6th of India's population, can capture the nation's resources by using the state apparatus, while passing on the costs of resource capture to the rest of the population (Gadgil/ Guha 1995).

Modern development has also given rise to environmental problems, which in turn have produced water, land, and food insecurities for people. The lack of water security (Shiva 2002) results from drying up of rivers and waterbeds, dams built for hydroelectric

purposes and, use of chemical fertilizers required for the *high-yielding varieties* (HYV) of crops. The fertilizers require a good deal of water to make them work, but at the same time they contaminate water, making water even scarcer, thus, creating conditions of water insecurity (Ahmed 2002: 97; Shiva 2002). The land security is related directly to the degradation of soil and its declining harvesting capacity. Farmers face an acute dilemma in using fertilizers: without chemical fertilizers, they cannot grow HYV crops; with chemical fertilizers, there is no sustainable land for a long period to grow crops! (Ahmed 2002). In the past about thirty thousand rice varieties were cultivated by the farmers in South Asia, whereas today, thanks to modern techniques and the desire for uniformity, only fifteen varieties are cultivated. The lack of food security arises partly from a combination of water and land insecurities, and partly from an excessive growth of population. The victims are either internally displaced or forced to migrate, as environmental refugees in neighbouring states often becoming a source of both intra-state and inter-state conflicts (Ahmed 2002).

Finally, imports of foreign technologies that are not suited to the local milieu have also caused environmental insecurities. While most South Asian societies have been organized around pluralistic patterns that match the diversity of hydro-ecology as well as human groupings, the mainstream water managers led by the civil engineering community have ignored the diverse social contexts of water to damage the foundations of social and community life. Nation states caught up in the 'development paradigm' have blindly adopted the modern technology of hydraulic engineering that brought with it a class of social carriers whose concept of dominating nature and controlling or harnessing waters was alien to the traditional practices that were based on actively adapting to nature (Mendis 1999: 121). This water-intensive, technology-intensive, and construction-led model of water development - the mainstay of the most South Asian states - has failed to address the basic sources of the sufferings of the people because it can not explain the social contents of water management or the institutional responses needed for just and equitable water supply. Modern hydraulic engineering, by being a top-down and expertise-based approach, relegated the farmer to a passive role, and has thus failed to deliver.

Gyawali (2001) recounts the stories of the Lunugamvehera or Udawalawe projects in southern Sri Lanka or the Eppawala Jayaganga in the northern dry zone which tell of resource manipulation that fail to

meet the stated objectives (they often fail to provide the water promised) and in the process alienate the farmers from the state itself. This dissatisfaction later erupted in the form of the *Janatha Vimukti Perumena* (JVP) uprising in Sri Lanka (Gyawali 2001: 175).

Likewise, in Bihar in India the embankment technology that “was ill-suited to the hydro-ecology of the land, was implemented with myopic ferocity and has left in its wake a peasantry impoverished and alienated from the state” (Gyawali 2001: 169-172). The Damodar Valley Project in Bengal and the tribal reaches of Bihar, the Mangla dam in the Mirpur area of Azad Kashmir (in Pakistan), and the Kaptai dam in the Chittagong Hill Tracts areas in Bangladesh have their own hidden tales about the delegitimization of the state in the eyes of those affected by dam building.

The economic worldview of development-as-material-progress has, however, come under increasing criticism. The ways in which development in South Asia has led to displacement of large masses of people, to genocide, ethnic cleansing, and conflict and struggle over resources; to environmental degradation and an end to peoples’ means of livelihood, demand a re-examination and rethinking of the whole concept of ‘development’. The uneven effects of top-down development, because of what some people gain and what others lose, calls for its reconceptualization and a critical examination of its structures in order to understand whose development it is, whom it benefits, what are its effects, and who suffers, especially in terms of the elimination of whole eco-systems, species, and indigenous knowledge and ways of being.

Unlike the traditional discourse on military security, there is much critical questioning of conventional wisdom in discourse on development and its implications for security, especially for peoples’ security. Western science and technology that did not take into account the adverse impact of development on both nature and people is now being critically evaluated in the South Asian context. Marginalized people, science, and ecology movements are now making visible the hitherto invisible costs of introducing the wrong science and technology. For example, while the big dams – the modern temples of development – totaling fifteen hundred in India alone, have brought water, irrigation facilities, and power to large parts of the country, they also have a dark side. They have displaced, according to some estimates, up to fifty-six million people; submerged millions of acres of prime forest land; led to the water-logging and salinization of vast areas; and destroyed estuarine ecosystems.

An alternative approach to water highlights “the dynamic interlinkage between physical water resource systems and the larger social economic and institutional context within which they are managed” because the “water use continues to take place within existing asymmetry of wealth, knowledge and information, conflict and struggle for power” (Ahmed/Dixit/Nandy 1999: 121). Such critical evaluation and the accompanying search for alternatives that are better suited to the local milieu in South Asia are creating epistemological and technological shifts that have enlarged the creative options for redefining development that is both sustainable and just (Gadgil/Guha 1995: 79). Advocating a *bottom-up* research strategy that would involve wide masses of people, scholars argue that if local communities are permitted to reassert control over the resource base, it would create a genuine demand for environment-friendly science and technology, lead to sustainable development, and enhance peoples’ security.

This idea of peoples’ security is somewhat different from the UNDP (United Nations Development Programme) and Canadian formulations of human security, which have inspired many writings in South Asia (Haq 1994; Human Development Centre 1999; Bajpai 2003, 2005; Chari/Gupta 2003; Basrur 2001; Abdus Sabur 2008). While these also seek to shift the focus away from state security, their fundamental parameters have mostly been set by the powers that be ‘outside’ the state and not by their own people, resulting in a flawed approach. First, in fixing their gaze on an individual’s security, these lose sight of a community or a social group’s perspective which, keeping in mind the political realities of the subcontinent, is a much more appropriate unit of analysis. Second, this continues to be ‘a donor-driven agenda’, tied to foreign aid or used selectively by the ruling elites to serve their narrow ends rather than to secure their populace from ‘freedom of want’ as proclaimed. (Khattak 2002: 173). She explains that

despite the link between foreign policy and development issues, in the context of human security, donors usually ascribe mal-development to selfish policies of particular governments, rather than to international structures. Hence, when human security issues are promoted, it is with unstated idea, that governments have failed and that at issue is governance rather than the binds in which governments find themselves upon taking over (Khattak 2002: 170).

They fail to realize that human security “cannot be completely disassociated” from state security in the South Asian context (Behera AD, forthcoming). Muni

also points to a “strategic bias” of such discourse directed “unmistakably” as they are, towards the developing countries. The implicit message being that “the developing states should focus on providing human security to their people leaving the management of global security to the major powers” (Muni 2001: 116). The debate on human security as distinct from peoples’ security must, therefore, contend with the politics of this knowledge by challenging the use of security for ideological ends.

65.3 Inclusions, Exclusions, and Redefining the Parameters of the Security Problematique

The preceding analysis shows that the way the concept of security is understood and used profoundly affects the way political life is conducted. Therefore, rethinking security requires an understanding of the power relations involved in the discursive domain as well as in the practical operation of the policy. It involves “challenging the use of security as ideology by asking ‘security specifically for whom?’ in the face of assurances of security for everyone” (Dalby 1997: 119). That is because a state-centric approach narrowly focuses on external and internal dangers to its sovereignty and territorial integrity, while a people-centric approach suggests the necessity of looking at the most vulnerable sectors of a population in terms of giving them access to food, shelter, basic human rights, and the environmental conditions that allow these things to be provided into the long-term future.

Extending this debate to the international domain, this chapter juxtaposes the voices emanating from within the South Asian region to international forces in order to understand their stakes and standpoints for including or excluding issues of economic security, environmental security, and political security within the parameters of the security problematique, and on what terms.

65.3.1 Economic Security

International forces both in terms of disciplinary influences (neo-realism) and institutional players such as the World Bank, UNDP, and other international finance institutions have always sought to exclude economic security from the security agenda by not recognizing it as a legitimate ‘security problem’ and subjecting it to ‘normal’ politics of market economy at

the national as well as international levels. During the Cold War, the

desecuritization of economic relations ... made economic penetration by the strong legitimate and threw political obstacles in the way of the weak, who viewed their security in much wider terms than just military relations did. For many states and the peoples on the periphery of the international system, the attempted liberal desecuritization of the political economy was itself a security issue. The self-serving qualities of liberal choices about defining the security agenda were seen as invidious ... but only the voices of the weak calling for a new international economic order supported it, and it was largely drowned out by the titanic military confrontation of the superpowers (Buzan/Wæver/de Wilde 1998: 210–211).

In the post-Cold War era, forces of economic globalization seek to achieve the same objective, that is, to desecuritize the issue of economic security. In the South Asian context, this becomes evident from the World Bank agenda for political reforms in the region, which as set out in its *World Development Report* (World Bank 1997a), is premised on the proposition that the state is a major barrier to economic expansion and growth. It identifies South Asia as an ‘overextended state’ which has been prone to ‘over-regulation’ of the economy and, the remedy is “to contract the role of the state’ in order to improve its ‘effectiveness” (Uyangoda 2001: 120).

This new theory of the state calls for it to focus on basic functions, that is, safeguarding the law and order, protecting property rights, managing the macro-economic fundamentals, and providing the very basic social services. This is radically different from the political economy of post-colonial South Asian states, which – shaped by the ideologies of decolonization and economic nationalism – had given rise to a broad social compact “that maintained a certain equilibrium of class interests in development strategies” through maintenance of an extensive public sector in the economy, priority allocation of public resources for social programmes that included poverty alleviation, rural development, health and education, and state-initiated generation of public employment (Uyangoda 2001: 127).

South Asia’s growing economic integration with the world economy over the past two decades⁷ has produced far-reaching changes in its “politics, social basis of the state, state-society relations, counter-state politics and inter-class relations” whereby the question of security has been reframed by “multiple insecurities engendered by the hegemonic change agent, global capital” (Uyangoda 2001: 163). The ‘reinvention of the

state' paradigm seeks to "disable the state from its social transformatory functions since the latter is being handed to global capital and the market. The removal of the state from that role of shaping social change and managing its consequences" has eroded the support base of social classes, which "cannot but feel abandoned, insecure and restive" (Uyangoda 2001: 129).

They are, however, strongly resisting such global pressures on the state to withdraw from its welfare roles. In fact, the critical inputs for new understanding of security are emerging from critical social movements, often focused on local issues but sensitive to the wider picture. They also raise fundamentally important issues concerning the possibilities of re-imagining political community and forging new 'solidarities', which act in ways that transcend the boundaries of blocs and states, working to promote international collaboration and cooperation, irrespective of state policies. This is not to argue that the states are redundant or that they are about to wither away. However, it does suggest that the creative energy for reformulating security comes from outside the entrenched bureaucratic structure of states. It also shows that security is no longer the singular preserve of security intellectuals and analysts.

65.3.2 Environmental Security

The issue of environmental security has also faced similar dilemmas, that is, whether it should be included in the security agenda and on what terms? In many ways, this has become the new battleground between the 'West' and the 'Rest' or more popularly, between the North and South over the shape of the new World Order. A key agenda of globalization, for instance, is the rapid *commodification* of every remaining aspect of life. This includes such pristine elements

of life – the commons – that have so far been outside the traditional market system: culture, fresh water, seeds, and the genetic structures of life. Most South Asian states have taken a stand that the commons have been clearly understood to be part of the cultural, spiritual, and biological inheritance of all people, and these should not be turned into commodities to be sold only to those who can pay for them. Under the World Trade Organization (WTO), however, virtually all life forms and resources are available for corporate ownership. Everything is for sale. The US and most of the developed nations find resistance from the South to the patenting of this kind of intellectual property outrageous, violative of the principles of free trade, and an inhibitor of the rights and prerogatives of global corporations. Vandana Shiva terms the bio-piracy through patents as the "second coming of Columbus," symbolizing new forms of imperialism (Shiva 1997: 5; 2008a).

By controlling living resources, the biotech industry is trying to replace the natural economy from which hundreds of millions of people have long derived their food and medicine directly, with market economy. The indigenous people, in particular, have been impacted in a particularly brutal fashion by economic liberalization and the theft of the water, food, and other resources on which they depended for their vital needs. They have been marginalized to the extreme and left to struggle for their survival in the brutally competitive 'market'. Already poor, but largely self-sufficient communities across the earth are being cast into deeper social and ecological poverty, as well as cultural dislocation, as their resources are appropriated to satisfy the seemingly insatiable demands of the world's ever-growing consumer societies (Barlow 1999: 12; Amin 1990). This perpetuation of existing international arrangements, coupled to international financing arrangements and the problems of the debt crisis, is likely to render many of the poorest of the planet even more insecure.

65.3.3 Political Security

South Asian states have experienced several insurgencies and secessionist movements waged by ethnic, linguistic, and religious mobilizations, many of which have also resorted to terrorism as a tool to achieve their political goals (Anand 1980; Sinha 1988; Joshi 1993). For years India fought a lonely battle by mobilizing support in various international fora⁸ on terrorism, but there were few takers of its concerns especially from the West. The terrorist attacks of 11

7 Pakistan and Sri Lanka were the first countries to embark on the road of economic liberalization reforms in the mid 1970's. India began the process of economic reforms in 1984 though it accelerated in 1991 with the implementation of structural adjustment programmes which began dismantling the structures and institutions of Nehruvian economic "socialism". In Bangladesh and Nepal the structural adjustment reforms were inaugurated during the latter half of the 1980's. Outside South Asia, Mexico was one of the first countries which experienced a structural adjustment programme due to the drop of the oil price and later faced a huge economic crisis in the 1990's. Then Russian, Asian, Brazilian, Hungarian and Argentinean crises followed.

September 2001 against the US fundamentally changed the political equations overnight, making terrorism the new bugbear of the 21st century. The world quickly rallied round US President George Bush's call for launching a global war against terror, and the United Nations Security Council passed resolutions, urging all countries to banish terrorism from their soil. The fact that the 11 September 2001 attacks were soon followed by an equally shocking terrorist attack against the Indian Parliament on 13 December 2001 provided an impetus to the Indian leadership's resolve to securitize the threat of terrorism to individual nations as well as the international order. With Pakistan joining the US-led 'war on terror', there was a new-found consensus among the South Asian states on the threat of terrorism.

However, in terms of responses to terrorism, South Asian perspectives differ quite radically from the US's highly militarized response in attacking the Taliban regime in Afghanistan and especially the Iraq war. Most South Asian states have learnt a hard-earned lesson on their own soil that terrorism cannot be eliminated through military means alone and, there is a need to address root causes of those conflicts that provide a political rationale for terrorism.⁹ India and Pakistan's peace process on Kashmir; Sri Lanka's experiments with democratizing and federalizing its polity; Bangladesh's accord with the Chakmas; and, redrawing of the Nepalese constitution in the aftermath of the Maoist insurgency – all point to a growing realization among South Asian states to recast the fundamental equations of new political struc-

tures, institutionalize power sharing mechanisms, and indeed, rework the associational basis of nation-state in South Asia.

65.4 Conclusions

There is no single regional discourse on conceptualization of security in South Asia though there are certain common threads in terms of issues as well as players. Reoccurring military crises between India and Pakistan and developments in the domain of nuclearization have led scholars to continue focusing on military aspects of their 'security dilemmas', though at the same time growing pressures from above – forces of globalization – and from below – ethnic groups and people themselves – have brought many political, economic, and environmental issues within the ambit of security debates. More significantly, the state in South Asia is undergoing a churning process. While imperatives of globalization are forcing the state to retrench especially in the economic domain, popular pressures from below are increasing, that is, people are making more demands on the state. This explains the growing demands for 'humanizing' the process of economic liberalization in India so that its benefits are equitably distributed among different segments of its populace, promoting economic security of all. In the political domain, securing the state from internal threats of secession and various insurgent movements calls for decentering the state in a manner that its diverse social communities and ethnic groups develop a stake in the polity by sharing political power. Recasting the state through political negotiations with Tamil rebels in Sri Lanka; regionalization of political forces in India; and constitutional measures in Nepal are providing critical inputs in not only transforming the internal security debates in the region but also tackling the growing threat of terrorism. Finally, there is a growing realization that global threats of climate change causing new environmental insecurities can best be met by local ideas, initiatives and technologies. This has led to a much better synergy between the state and sub-state actors, and their collective efforts as well as creative energies will continue to enrich the domain of security debates in South Asia with new and alternative conceptualizations.

8 India had sought to mobilize internationally in forums such as the UN, the NAM, and SAARC as well as in its bilateral dialogues with major powers. The SAARC countries had signed a SAARC Regional Convention on Suppression of Terrorism in 1987. India played a key role in evolving a NAM consensus against terrorism. The 12th NAM summit at Durban in 1998 unequivocally condemned any political, diplomatic, moral or material support to terrorism and reaffirmed that all member states have an obligation to refrain from organizing, assisting or participating in terrorist acts in the territories of other states. The Indian government actively supported the 1994 declaration adopted by the UN General Assembly on measures to eliminate international terrorism and its 1997 International Convention for Suppression of Terrorist Bombings. Most importantly, India proposed a Comprehensive Convention against International Terrorism at the 51st session of the UN General Assembly.

66 Security Debates in East Asia since the End of the Cold War

Eun-Jeung Lee

66.1 Introduction

During the Cold War era, security issues in East Asia were relatively straightforward as a result of the East-West confrontation. However, with the end of bipolarity, security issues in the East Asian region have become more diverse and complex.¹ Political order in East Asia is not just a matter of China, Japan, and Korea. Their bilateral relations with the United States, and Washington's East Asian policies exercise a strong, if not predominant influence in the region (Howe 2005: 761-792). Russia continues to be an important player in the region. Thus, the geopolitical and strategic situation of East Asia is unique and, for instance, quite different from Europe.

The end of the Cold War has prompted a particularly lively debate over the meaning of security and the purposes of security studies as a field of enquiry. In East Asia too, discourses on security differ nowadays from traditional views of security with their emphasis on the prevention of anarchy and on the provision of national security through the use of military power. Contemporary approaches take a broader perspective, often incorporating economic, social, and environmental dimensions (Kim/Hyun 2000: 33-46; Tsunekawa/Oono/Ono/Akimoto 2004: 21-51).

In recent years human security has been included on the agenda of security studies. According to the United Nations' Human Development Report 1994² (UNDP 1994: 22-40), "human security" includes safety from chronic threats such as hunger, disease, and repression, as well as protection from sudden and harmful disruptions in the patterns of daily life. As such, human security represents a radically different approach to security from that presented by the traditional security paradigm (Tow/Trood 2004: 13).

Academic experts in Japan emphasize that this concept of human security has a significant impact on their theorizing and writing. Yet, taking a closer look, it becomes readily apparent that there exists a considerable gap between the academic conceptual debate and the security policy of the Japanese government. The latter is quite uninformed by the former and to a large extent is based on traditional concepts of security. The *National Defence Program Guideline FY 2005* of the Japanese government, for example, makes reference to China and North Korea as potential enemies. The same can be said about the enunciations of other countries in the region. In other words, outside the academic debates, security policy in East Asia continues to follow the patterns set in the 19th century and during the Cold War.

Against this background Mun Chong-in said: "We had hoped that the end of the Cold War would bring peace to this region. Instead the situation became worse. As a result, insecurity in this region has increased significantly."³ Certainly, East Asia faces a 'security dilemma'. Even the danger of another war cannot be excluded, as Tang Shiping observed: "As long as Taiwan question is not resolved peacefully, there is a real possibility that the United States and China could go to war."⁴ As a result Chong Uk-sik, an activist in the peace movement in Korea, asks himself, whether East Asia's security problem can only be solved by military means.⁵ In fact, in East Asia, in particular since the financial crisis of 1997-98, the forma-

1 East Asia in this chapter covers the Korean Peninsula, China, Taiwan, and Japan.

tion of a multilateral security system is being discussed intensively.

This chapter reviews the East Asian post-Cold War discourses on peace and security focusing on the question, whether and to what extent traditional concepts of security have changed. It will be argued below that security discourses and policies in the region are still dominated by traditional concepts of security, even including the fabrication and projection of enemy concepts. Nevertheless, the debate has been extended to concepts of human security, multilateralism, and regional integration.

The chapter begins with a presentation of the traditional worldview prevalent in East Asia before modernization and its inherent security concept (66.2). Then the security situation and dilemmas that emerged with the end of the Cold War are presented (66.3). The next section (66.4) focuses on contemporary discourses on multilateral security frameworks in East Asia. Finally, the discourses on future security in the region are briefly touched upon.

66.2 Traditional Worldview in Northeast Asia

Until it collapsed under the impact of Western imperialism, China was the central pole in the East Asian international system. Therefore, one often speaks of *pax sinica*. Understood narrowly, *pax sinica* was based on the recognition and investiture of a king in each tributary state (Fairbank 1968; Nishijima 1983; Furuta 2003). However, according to Hamashita Takeshi the system is to be understood more broadly. It was “the external expression of hierarchical domestic relations of control, extending downward and outward from the imperial centre”, and in fact “an organic network of relations, between the centre and the periphery, which includes the provinces and dependencies of the empire, rulers of native tribes and districts, tributary states, and even trading partners. This tributary system in a broader sense constituted the arena in which the states and other entities of Southeast, Northeast, Central, and Northwest Asia operated in their relations with China” (Hamashita 1997: 114).

The basic idea of this tributary system is the worldview of *hua* (cultivated) and *yi* (barbarian).⁶

This worldview did not correspond to the distinction between centre and periphery or to an ethnic concept of *nation*, which excludes *others* as *yi*. Instead it is based on concepts of Confucian philosophy, that is on *lich'i* and *dechi* (to govern through morals and virtue).⁷ This involves the integration of others, i.e. of the surrounding world, into one's own world by means of morals and virtue.

This worldview of *hua-yi* is ‘self-centred’, not only for China itself, but also for other countries, which share it. As such the traditional world system in East Asia was not static, but dynamic and it shifted with the changing circumstances of *hua* and *yi*. It was quite possible that a people who were considered as *yi* by China, considered themselves not as *yi*, but as *hua* (Kim 2001; Choe 1997). This system was open for new developments, i.e. for the *other*. A member of the Korean *literati* wrote on this in the 18th century: “When the Law and the Institutions work properly, one has to accept even the barbarians as teachers” (Kang 1990: 246; translation EJL). This is in the vein of Confucius who says in Lunyu (chapter 9, 14), that he would prefer to go to the barbarians, if they are governed by more virtue. What Confucius wants to make clear is that *hua* and *yi* are not just a matter of power, but also one of culture, in this context of *li* und *dechi*.

Thus, the tributary system of the *pax sinica* regulated the power relations and the balance of power within the system through normative prescriptions of the Confucian view of good governance. As Sun Yat-sen believed, this system was based on mutual acceptance and recognition (Wang 2003: 189). When the normative and military power of *hua* was not accepted or recognized by the ones considered *yi*, war became a possibility. Yet, since the Tang Dynasty in the 8th century, interstate relations in East Asia were not dominated by military conflict. Unlike Europe the traditional world system in Asia was not based on continuing military conflict among states.

The East Asian countries were integrated into the tributary system by principles of hierarchic order. The investiture of their kings was a privilege of the Chinese emperor, yet these countries retained their sovereignty as political actors.⁸ Furthermore, the border between centre and periphery was not static. It could well happen that a peripheral state came to consider itself as the centre. That was the case of Japan and Korea in the 18th century.

6 *Hua* and *yi* are the Chinese readings of the corresponding characters. In Japan and Korea they are read as *ka* and *i*, and *hua* and *i* respectively.

7 *Toji* and *reiji* in Japanese, *tokch'i* and *yech'i* in Korean.

For such reasons Wang Hui believes that this tributary system of *pax sinica* was more complex than a simple centre-periphery relationship. It contained, for example, different forms, norms, and rights than in Europe (Wang 2003: 206–209). The international system in the West had, at least theoretically, the purpose of preserving peace through the mutual respect of the independence of states, whereby these goals were primarily achieved by reciprocal recognition of rules and norms among states. However, the emphasis of formal equality in reality could do little to reduce the inequality among states. Furthermore, “the very fact that 19th century European International Society was a hierarchical one in which states were differentiated in terms of their attainment of civilization suggests that there may have existed different modes of interaction towards uncivilized states” (Suzuki 2005: 146).

The tributary system of East Asia was built on the base of a normative-idealistic and realistic worldview at the same time, i.e. it contained Kantian and Hobbesian elements. Probably because of this, the political elite in China, Japan and Korea found it, under European pressure in the 19th century, so easy to comprehend the Social-Darwinist nature of European politics.⁹ For them the challenge was to become ‘civilized’, i.e. to become again *hua*. What it meant exactly to be ‘civilized’ gave rise to controversial discussions.¹⁰ In any case, the state was to be the principle actor. In view of the strong menace by Western states, the elites in East Asia openly pondered on the need of close cooperation among themselves. Yet, the quick

rise of Japan to the height of an imperialist power left little room for the acceptance of such ideas.

66.3 Revival of History in East Asia after 1989

The traditional tributary system finally collapsed with the defeat of China in the Sino-Japanese War of 1894–95. East Asia came fully under the sway of imperial rivalries and did not find peace even at the end of World War II. By that time civil war in China was still continuing, while in Korea a new war broke out. The colonial period finally came to an end with the armistice agreement between North Korea and the United States. Its place was taken by the dividing line of the Cold War which ran right through East and South East Asia. A new world system was established. East Asia, as far as it belonged to the Western Alliance, was incorporated into the global policies of US governments and assimilated, more willingly than not, a large dose of American culture and ideology.

With the end of the Cold War the USSR disappeared and Germany was reunited. In East Asia, however, the Cold War structure basically is still in place. Chinese Communism has not been overthrown and Korea remains divided. Nevertheless, under the impact of rapid economic growth and globalization, East Asian societies are undergoing comprehensive transformation processes. New middle classes are on the rise and have become politically increasingly more active. Democratization has come a long way since the mid 1980’s. In South Korea, the democratic movement brought long years of military rule to an end in 1987. In Taiwan too, progress has been remarkable. The confidence arising from democratization caused citizens in these countries to aspire for more independence from American influence. Remarkably, at a time when the socialist bloc lost much of its power and appeal, both South Korea and Taiwan began making efforts to escape from the dominant US influence in economic, cultural, and diplomatic matters.

The heightened self-confidence of the people possibly is one of the most significant aspects of the post-Cold War period in East Asia. It found expression in the debate on ‘Asian values’.¹¹ The political situation in East Asia has changed considerably. China develops quickly into a new world power. Japan as the second most important economy is trying to gain more weight in international politics, militarily too. The South Korean government has announced that it

8 The first Ming emperor said in 1392, when the Chosun Dynasty replaced the Koryo Dynasty, that it was no concern for China what happened in Korea, because Korea was a sovereign state. The Chinese government confirmed this in 1866 and 1871 toward France and the USA: Even though Korea (Chosun) was a tributary state, it also was a sovereign state (Chong 2005: 96).

9 The secretary of the famous Iwakura mission which toured the United States and Europe between 1871 and 1873, wrote: “The flesh of the weak is eaten by the strong. Ever since the Europeans began sailing to faraway lands, the weaker states of the tropics have been devoured by them” (Suzuki 2005: 149).

10 On the one hand, ‘civilized’ was considered to be the same as ‘westernized’, on the other hand, for many Confucian intellectuals there was just one civilization, the Confucian civilization. The struggle between these positions played an important political role in the process of modernization of the East Asian countries. See: Kang 1990.

Figure 66.1: Map of East Asia. **Source:** Perry-Castañeda Library Map Collection, The University of Texas at Austin, at: <<http://www.lib.utexas.edu/maps/asia.html>>. ought to play a more relevant role in East Asia. No doubt, questions of hegemony lurk in the background of all this.

In the early 21st century the overall political situation in East Asia is characterized more by competition and even conflict than by cooperation. In particular in the case of China and Japan historical reminiscences are easily evoked. Various nineteenth century-style border conflicts persist today, for example over the Korean peninsula, Taiwan, and the Kurile Islands. Furthermore, with respect to security matters, the frame of mind of the political elites of these countries is set in rather traditional terms: States, military power, and the *others* as potential enemies. To substantiate this, official documents and statements by members of the political elites will be reviewed.

The pointed rhetoric of Ishihara Shintaro, the popular mayor of Tokyo, sounds quite extreme. Ishihara said in November 2005 in Washington: “Wars are a war of attrition of lives. China holds no value at all

for human life and can start a war without any concerns. ... We are now in a state of tension far more dangerous than during the Cold War period when the United States and the former Soviet Union were at odds.”¹² The same is what Taniguchi wrote recently: “The United States and Japan have started preparing themselves to prevent the (Taiwan; EJL) Strait from becoming the site of an armed conflict and above all to prevent a situation from developing in which Japan and Korea would have to seek maritime protection from China. For this reason, Japan has begun to jointly manage the United States’ continuing hegemonic presence in the region. It is also for this reason that Japan-China relations have been and will continue to be in the state of a cold peace” (Taniguchi 2005: 456–457).

Yet, even the latest pronouncements of the Japanese government on security and defence are in a similar vein and depart from the principle that China is a latent danger. The *National Defense Program Guideline for FY 2005 and after* (10 December 2004), stated: “China, which has a strong influence on the security in this region, has been modernizing its nuclear and missile capabilities as well as naval and air

11 With Asia’s economy still booming in the mid-1990’s, ‘Asian values’ were eased by some politicians (Lee Kuan Yew, Mahatir, Ishihara, Mahbubani etc.) and contrasted with ‘Western values’. Soon a controversial debate within Asia ensued (for example Kim Dae Jung in 1994).

12 “Ishihara: Life respecting US no match in war against China”, in: *Asahi*, 5–6 November 2005: 24.

forces, and expanding its area of operation at sea. We have to remain attentive to its future course" (Japanese Defense Agency 2004).

This sort of characterization of China as a potential enemy may come as a surprise, particularly because the Japanese political establishment at the beginning of the 1990's parted from the assumption that the combination of Japan's economic leadership and multilateral institutions could sustain peace in the region. But the worries about the rise of the economic and military power of China and about North Korea's missile launch over Japan in 1998 have played an important role in shifting Japanese perceptions and priorities. There is a noticeable trend toward greater public acceptance of the Japanese Self Defense Forces (SDF) and of the alliance with the United States.¹³ Therefore, the *National Defense Program Guideline for FY 2005 and after* is based on this perception of a changed international security environment. It extends the 'Basic Defense Force Concept' of earlier post-war defence programmes by identifying international peacekeeping activities and counterterrorism as primary components of Japan's overall national defence strategy. Stepwise Japan would try to become a 'normal state' (Findings 2005).

These efforts of the Japanese government to become a 'normal state' are seen critically in neighbouring countries, as they perceive Japan as 'rightist-leaning' and as 'military expansionist'.¹⁴ In particular the Chinese government shows annoyance over this new positioning of Japan, which, in contrast emphasizes that the rise of China should not be seen as a threat for the region: "China's rise has generated a lot of attention, but the predication that China's rise will cause havoc in regional security has been an exaggeration of fear. While China's rise does pose significant economic challenges (and opportunities) for regional states, it has yet to cause any significant deterioration of the regional security environment."¹⁵

Even though the Chinese government emphasizes the peaceful rise of China, it says in its *White Book for China's National Defence 2000* explicitly that it does not exclude war in order to realize its aim, in particular with respect to Taiwan:

China's efforts in defence modernization are purely for self-defence. ... However, in view of the fact that hegemonism and power politics still exist and are further developing, and in particular, the basis for the country's peaceful reunification is seriously imperilled, China will have to enhance its capability to defend its sovereignty and security by military means.¹⁶

The readiness of the Chinese leadership to use military force was demonstrated recently when the *Anti-Secession Law* was enacted by the Tenth National People's Congress on 14 March 2005 in Beijing. Article 8 of this law states:

In the event that the 'Taiwan independence' secessionist forces should act under any name or by any means to cause the fact of Taiwan's secession from China, or that major incidents entailing Taiwan's secession from China should occur, or that possibilities for a peaceful reunification should be completely exhausted, the state shall employ non-peaceful means and other necessary measures to protect China's sovereignty and territorial integrity.¹⁷

Unsurprisingly, this law is seen in Taiwan as a direct menace of its security. Therefore it is of little avail that the real motive behind this law apparently was to warn President Chen Shui-bian not to declare officially the independence of Taiwan.

Prime Minister Wen Jiabao clearly stated another purpose of this law at a press conference. It ought to be seen as a reaction to "outside interference by a recent joint security declaration by the United States and Japan that listed a peaceful Taiwan Strait as a common objective." His remark "we don't want to see foreign interference, but we do not fear foreign interference" was greeted with roaring applause by the journalists, most of them Chinese.¹⁸ For many Chinese, it is a gratifying experience to hear such statements, as past humiliations suffered by Western powers and Japan are vividly remembered. At the same time their self-confidence has increased and with it

13 Whether China and North Korea actually pose a greater threat than the USSR did is another question. Chinese military capabilities still lag far behind the USSR's in 1989 (Pekkanen/ Krauss 2005: 430).

18 Jim Yardley: "China Denies 'Taiwan' Law on Secession Is a 'War Bill'", *New York Times*, 14 March 2005.

the perceived right to occupy a hegemonic position. Tang Shiping assertively states: “regional states have gradually come to accept China’s rise as a reality that they have to live with” (Tang 2003).

Obviously, the relationship between China and Japan is of paramount importance for the security of the area. Yet, China and Japan’s fears of each other’s potential military power apparently have become an element of central importance in their relationship. Wang Xiaoshu, a vice president of the Shanghai Institute for International Studies, puts the blame on Japan. It has “accelerated military modernization, which de facto led to a regional arms race” (Wang 2004: 26). In fact, in terms of military expenditure Japan and China occupied in 2004 fourth and fifth place respectively in the world. South Korea was tenth.¹⁹ Taiwan spends annually more than 2 per cent of its GDP on military expenditure.²⁰ In North Korea the size of the defence budget is not known, but it must be extremely high. East Asia nowadays is the most heavily armed region in the world.

Even though the arms race is less direct and severe than during the Cold War, opinion polls in East Asia show that large segments of the public see the ongoing build-up of arms as a threat to their own security. Instead of making efforts to dispel mutual resentments, the political establishments often foster mental constructions of the others as enemies (Roy 2005: 197). Hence uncertainty and distrust are even on the increase. What happens is that these countries push themselves into a security dilemma unless active confidence building measures and security cooperation are enforced (Hwang 2003: 104; Wang 2004: 26).

The political elites in East Asia are quite familiar with these problems, not in the least because of numerous publications dealing with them. Especially after the Asian financial and economic crises in the late 1990’s the awareness of an objective need for new types of security mechanisms has grown. These crises were a key turning point in the discourses on multilateralism and regional cooperation.

one positive result of the unanticipated aftershocks of the late 1990’s and early 2000’s throughout Asia has been a transformation in definitions of, and debates

about, security around the region towards a more comprehensive notion of human security (Shaw 2004: 40).

Hence, we can observe an interesting phenomenon in East Asia. On the one hand, the other countries are perceived as a threat to one’s own security, while on the other, the de-escalating potentials of multilateral cooperation are widely discussed. The latter involve concepts of security of much broader scope and encompass issues such as national development, economic interdependency, environmental protection, the promotion of democracy and human rights. Yet these broader security concepts have their own problems and limitations.

66.4 Discourses on Multilateral Security Frameworks

During the 1990’s multilateralism in East Asia improved slowly, but significantly. At the regional level, several multilateral mechanisms have become institutionalized (table 66.1). There is a clear trend towards multilateral international cooperation which finds expression in organizations like APEC, ASEAN 10 plus 3, the Council for Security Cooperation in Asia-Pacific (CSCAP), the Northeast Asia Security Cooperation Dialogue (NEACD), the Shanghai Cooperation Organization (SCO). In the area of Asian-Pacific security alone, in recent years more than 200 multilateral activities have taken place each year (Wang 2004: 26). An optimistic observer comments: “East Asia is taking smaller, more concrete steps towards regional political, security and economic ties” (Kurlantzick 2001: 19–28). There is a wide consensus among academic observers of international politics in East Asia that the Conference on Security and Cooperation in Europe (CSCE) played an important role in the peaceful dissolution of the Cold War. Therefore, they favour the creation of multilateral organizations in order to overcome the manifold security problems in the region (Kim 2004: 271–296; Zhang: 2001, 2002, 2004).

The role of the US is not ignored. Particularly in Japanese discourses the relationship with the US occupies such a prominent position that one can read often that Japan ought to overcome its position as an American satellite and develop its own concepts for an Asian Pacific era (Terashima 2003: 127–140; Hirose 2000; Kan 2003; Kan/Ishida 2005; Matsui 2000). Yet, the Japanese *Defence Program Guideline FY 2005* clearly states that the “close cooperative relationship between Japan and the United States, based on the Japan-US Security Arrangements, continues to play a

key role for the security of Japan as well as peace and stability in the Asia-Pacific region” (Japanese Defense Agency 2004). While the Japanese government clearly has opted to collaborate with the US in the building of a strengthened alliance, the Chinese and South Korean governments show a certain fervour for building a multilateral security framework in East Asia.

The Chinese government announced a *New Security Concept*, whereas South Korea proclaimed that it wants to play the role of a ‘balancer’ in Northeast Asia and be less dependent on Washington. The essence of China’s *New Security Concept*, which was first presented to the ASEAN Regional Forum meeting in 1996 and since then revised several times, is the pursuit of “common security through mutual benefit and cooperation” (Shanghai Institute for International Studies 2005; Yan 1999). The related *Position Paper on the New Security Concept* contains the essential elements of wider security concepts as they are discussed elsewhere (Takagi 2003: 85):

Under the new historical conditions, the meaning of the security concept has evolved to be multifold with its contents extending from military and political to economic, science and technology, environment, culture and many other areas. The means to seek security are being diversified. Strengthening dialogue and cooperation is regarded as the fundamental approach to common security. The September 11 incident has glaringly demonstrated that security threats in today’s world tend to be multi-faceted and global in scope. Countries share greater common security interests and are more interdependent on one another for security.²¹

The core of this New Security Concept consists of mutual trust, mutual benefits, equality and coordination. It is, in the view of the Chinese government, the

theoretical framework for China’s participation in regional multilateral processes like ARF, SCO, ASEAN plus 3, and, recently, the Six-Party Talks on North Korean nuclear issues.

Denny Roy, an American expert on Asia-Pacific security issues, is critical of all this saying that this concept first undermines “what the Chinese would term US ‘containment’, but Americans might understand as US leadership” and second promotes Chinese prestige. In fact, he says “the NSC is a blueprint for peaceful power transition in Asia from US dominance to establishment of a purportedly benevolent Chinese sphere of influence” (Roy 2003: 70–71).

Tagaki Seiichiro, a Japanese expert on Chinese foreign relations and security issues in the Asia-Pacific region, on the other hand, claims that China engages itself only where it can play a leading role (Takagi 2003: 88). Yi Yong-gil, a South Korean security expert, notes that the number of countries that agree with the Chinese concept of multilateral cooperation is increasing. They see in the development of China potentials for themselves (Yi 2004: 140). The assessments of these experts differ because they take the position of their respective governments. The position of the Chinese and the Korean governments ought to be quite close in security matters.

The keen interest of the South Korean government in multilateral cooperation is due to the undiminished urgency of the Korea question.²² South Korea’s strategic posture was dominated for more than

21 See: “China’s Position Paper on the New Security Concept”: at: <<http://www.china-un.org/eng/xw/t27742.htm>>.

half a century by deterring the outbreak of war with North Korea. But, since the end of the Cold War, the prevailing perception of threat vis-à-vis the North has undergone fundamental change – especially after the 2000 summit in Pyongyang. Possibly the most important aspect of the summit was a shift in the South Korean perception of the North. Post-summit assessments have focused almost exclusively on the inter-Korean dynamics, South Korea's mid-long-term policy toward Pyongyang, and prospects for wide-ranging exchange and cooperation (Lee 2005: 14). As a result most studies on security issues deal with the subject of reunification. They usually point out that a multilateral security framework is necessary for a peaceful solution of the Korea question in order to soften resistance in the neighbouring countries against reunification – which unavoidably will change the security environment in North East Asia considerably (Kim 2004: 271–296).

Already in 1993 the South Korean government had emphasized the necessity of a multilateral security regime like a mini-CSCE or OSCE and proposed in 1994 the *Northeast Asia Security Dialogue*. With respect to regional cooperation the policy of the government of South Korea has become more concrete and more comprehensive since 2000. It proclaims a new East Asian era. The economic cooperation was to be intensified and Korea to play a central role as a hub. As this presupposes peace and stability, the security dialogue and political cooperation were also strengthened. Economic and security cooperation would reinforce each other. An East Asian Union could be formed similar to the EU (Kim/Yi/Choe 2005; Kim 2004: 272–273).

This position of the South Korean government is disputed not only by the US, but also internally, in particular by conservative circles, which hold that a strong adherence to the US is essential for the survival of South Korea. South Korea's economic strength by far was not big enough to play a leading role in the region. A country could only play the role of a 'balancer', if it can impose its will on others by its own supremacy (Song 2005: 78).

Others have doubted the true intentions and commitments of the Chinese and Korean governments to multilateral cooperation. Do they in reality aim at

hegemonic positions in the region? While the critics support realist positions, the governments argue in the idealist tradition of international relations theory. Most experts, however, remain sceptical whether a multilateral security framework in East Asia can be realized.

Their scepticism is usually based on the lingering memories of history before 1945, on territorial problems, on the visit of the Japanese prime minister to the Yasukuni Shrine, and on the Japanese school textbook dispute. In the final analysis, these problems and their interpretation and evaluation emanate from the prevailing nationalisms, which continue to play an important and ever increasing role in East Asia (Wang 2003: 220). The process of nation-building in East Asia is still continuing and has a strong impact on international relations. Constructions of nations, "imagined communities" (Anderson 1991), are always accompanied by fabrications of otherness. Remi Brague (1991) called such national fabrications "excentric identities". In East Asia national fabrications are built in opposition to each other. Thus, East Asia is "the high church of realpolitik in the post-Cold War world" (Tow/Trood 2004: 26). That leaves little room for the formation of a community like the EU.

An important reason for the formation of a multilateral security framework, let alone a community, is rooted in the lack of sufficient awareness in East Asia of the mutual dependencies in security issues and beyond. Tragic occurrences like the Nanjing massacre, Hiroshima and Nagasaki and the Korean War, unlike in the formerly warring states of Europe, apparently have not induced these countries to transcend the traditional worldview of states as sovereign political actors and to invest their energies into more security through integration and transfer of sovereignty. What drives collective memories in these countries is not the communality of suffering through wars, but the ever renewed remembrances of humiliations suffered.²³ This, obviously, cannot provide a solid basis for cooperation.

66.5 Future Perspective

East Asia is an interesting, but simultaneously frustrating case to human security advocates. Those countries

22 For further Korean discussions see the publications of IFANS (Institute of Foreign Affairs and National Security), at: <http://www.ifans.go.kr/ik_a003/ik_b011/ik_c006/iko3_02_sub01.jsp> and of the Korean Institute for Defence Analysis, at: <<http://www.kida.re.kr/>>.

23 In Japan too the memories of the sufferings of war are deeply engrained in public consciousness – to the point that Japan sees itself more as a victim than as an offender. See: Buruma 1994; Kim 2001; Kittel 2004).

are the world's major success stories for development and modernization over the past three decades, but the regional security situation hardly changed. Even though broader academic and political discourses on human security continue in these countries, and their governments have proclaimed new security concepts, security issues are basically dominated by traditional concepts, including the fabrication of enemy concepts. In this sense, East Asia may be an interesting testing ground for the relevance of traditional and human security approaches to regional security politics.

In South Korea one can observe a significant change in security concepts. 'Sunshine Policy' replaced the policy of deterrence, which had been pursued for several decades. While the military expenditure in East Asian countries has increased since 1989 (table 66.2), the share of military expenditure as a percentage of GDP has been falling for South Korea and Taiwan, while it has been stable for Japan, and increasing for China (table 66.3).

Table 66.2: Military Expenditure of East Asian Countries (1989-2004) in constant US\$ equivalents for 2004. **Source:** SIPRI 1990-2005; at: <http://first.sipri.org/non_first/result_milex.php?send>. The data have been compiled by EJL and are published with permission of © SIPRI.

Country	Military expenditure in constant US\$ of 2004 based on SIPRI			
	1989	1994	1999	2004
China	11463	13665	20200	35400
Japan	36574	40053	41439	42442
Republic of Korea	9955	11884	12672	14487
North Korea	27.1	32.1	19.5	27.9
Taiwan	7746	9514	7565	7211
Russia	137145	23172	12300	19400
USA	450972	357395	310326	455304

Still, nationalism in Korea is on the rise. In China, the defence budget increases year by year (table 66.2), while Beijing seeks control of natural resources in the region and elsewhere. This is accompanied by tides of nationalism, which also serve as a useful instrument to emphasize unity and to gloss over severe problems like unemployment, inequality and pollution. The Japanese armed forces are among the most modern and sophisticated in the world – and nationalism, even to the point of xenophobia, appears to be getting stronger. They are tainted with long-standing territo-

Table 66.3: Military Expenditure of East Asian Countries (1989-2004) as percentage of GDP. **Source:** SIPRI 1990-2005; at: <http://first.sipri.org/non_first/result_milex.php?send>. The data have been compiled by EJL and are published with permission of © SIPRI.

Country	Military expenditure as percentage of GDP based on SIPRI			
	1989	1994	1999	2003
China	2.7	1.9	2.0	2.3
Japan	0.9	1.0	1.0	1.0
Republic of Korea	4.1	3.1	2.5	2.5
North Korea				
Taiwan	5.1	4.6	2.8	2.5
Russia	14.2	5.9	3.5	4.3
USA	5.5	4.1	3	3.8

Against this background, it is hard to see how realist concepts of security could be overcome. They may even become stronger. Obviously, it would be salutary to deal with issues like conflicts over territories and resources, energy, pollution, infectious diseases, poverty, human rights, etc. in a multilateral framework. This could also increase mutual trust. Yet, it is precisely the lack of mutual trust that makes it so difficult to proceed in a multilateral manner.

How could this situation of lack of trust, competing national interests and nationalisms be ameliorated? One possibility appears to be popular integration from below: Tourism among the countries in East Asia is increasing, pop culture jumps borders easily and on a large scale, trans-Asian fan clubs have become normal, translation machines are used for trans-border communication in the internet, and, of course, consumption patterns become ever more similar.

The other venue appears to be the emergence of trans-Asian intellectual discourses. East Asian intellectuals like Chen Kuan-Hsing, Kang Sang Jung, Paek Yong-s, Sakamoto Yoshikazu, Wada Haruki, and Wang Hui think in terms of a common consciousness of an East Asian identity. This identity, according to Sakamoto (2005: 270–312), has to part from the recognition of the diversity of East Asian cultures and traditions and from the idea of human dignity and equal rights. Because all are equal, they are respected. Here lies the base of a civil society that transcends the borders of states and nations. This, of course, could go hand in hand with popular integration.

It is uncertain whether the 21st century will become an age of the citizen, in contrast to the nation states of the 19th and the 20th century, as Sakamoto hopes. Yet, it is quite clear that the activities of local and national, regional and global NGOs along with more progressive think tanks and media are increasing rapidly in East Asia. Through them longer-term, non-traditional issues have been put on the political and security agenda. These include cultural, economic, ecological, personal and social issues, as well as natural and technological threats to human development and security. In view of the rebound of more exclusive and antagonistic interstate relations it will be important for the future of East Asia, to what extent citizens and civil society can have an impact on the behaviour of their governments.

67 China and the New International Security Agenda

Alan Hunter and Liu Cheng

Revolution: 1966

As the Chinese people master Mao Tse-tung's thought, China will be prosperous and ever-victorious. Once the world's people master Mao Tse-tung's thought, which is living Marxism-Leninism, they are sure to win their emancipation, bury imperialism, modern revisionism, and all reactionaries lock, stock and barrel, and realize communism throughout the world step by step.¹

Peaceful Rising: 2004

President Hu Jintao said that though China has achieved impressive results in its development, there are still many acute problems, such as overpopulation, weak economic foundation, underdeveloped productivity, highly uneven development, and a fairly sharp contradiction between the country's ecological environment and natural resources on the one hand and its economic and social development on the other. Even with China getting stronger, Chinese Premier Wen Jiabao said, China's rise "will not stand in the way of any other country, nor pose a threat to any other country, nor be at the cost of any other country."²

67.1 Introduction

In 1989, two scholars from the People's Republic of China (PRC) described China as: "a regional power with global strategic significance and political influence" (Hao/Huan 1989: xxix). A contention in this article is that the PRC should now be understood as a global power in its own right, at least in economic terms, marking an extremely significant power-shift. However, this statement does not mean that China is a military threat to the U.S.; on the contrary, it is still very far behind the U.S. in military expenditure, tech-

nology, and power-projection. Our second argument is that Chinese leaders have publicly committed to making this power-transition a peaceful one. Such commitments may be a smokescreen for an underlying orientation towards violent conflict, but we argue that the PRC leadership would much prefer to maintain regional and global peace. We also suggest that there are significant challenges to China's security aims of transiting to a global power status while preserving peace. First, relations between the PRC, Taiwan, and Japan remain tense in the early years of the millennium, a triangular relationship that is a major flashpoint and one that could embroil the U.S. Second, China's economic expansion has led to environmental damage at home and competition for resources internationally. All the above issues should be understood within the context of Beijing's non-negotiable commitment to a 'One China' policy, discussed below.

Chinese leaders categorically reject suggestions that China's new power is a threat. The transformation of outlook is clear from the second of the quotes that open this chapter, when President Hu and Premier Wen reconfirmed China's peaceful intentions at the Boao Asian Forum in 2004. Western academic and popular assessments of China's new place in the world are ambiguous. Some writers (Terrill 2003) take a negative view of the Chinese regime, considering it unreliable, fragile, tyrannical and ambitious; others (Shenkar 2004) are much more favourable, recognizing that the Chinese Communist Party (CCP) government has presided over an unparalleled improvement in welfare. But neither faction denies its critical importance, since the role of China cannot be overestimated. It has the world's largest population and largest army, thousands of kilometres of land borders, and extensive offshore territorial rights. Its economic power influences every region in the world, including South America, the former U.S. 'backyard'.³

The Chinese security concepts are analysed from several perspectives: the traditional historical/cultural

1 Editorial of: *Jiefangjun Bao* [Liberation Army Daily], 7 June 1966, translated in: *The Great Socialist Cultural Revolution in China*, vol. 3 (Beijing: Foreign Languages Press): 11.

2 See at: <<http://www.china.org.cn/english/features/93939.htm>> 19 April 2006: 1-2.

heritage of imperial China, its self-perception as Central Kingdom of the world; the chaos of the early twentieth century; a massively bloody civil war; the hard-line communist period from 1949 to 1978; the period of stability and economic growth from 1978 to the present. New phenomena are China's global economic strength, business interests, and the Chinese Diaspora; the growth of militant anti-Japanese feeling, partly expressed in a unique form of 'e-nationalism' on internet forums; and the dangers of environmental meltdown. Nevertheless, Chinese governments since 1949, despite major shifts in internal politics, have had three key objectives in their security agenda: continuity of CCP rule; territorial integrity; and economic development. They have achieved all three, combining internal security with apparently rather skilful international politics. The authors believe these priorities will remain, and they require a peaceful international environment.

The methodology of this paper is to review fundamental Chinese security concepts (67.2) and the historical tradition that informs Chinese security policy (67.3). Hunt (1984: 10) argues that various security legacies of the past "hold up many models of statecraft, from the lofty imperial style to shrewd Machiavellian cunning. They teach the use of brute force, of trade and cultural exchange, of secret diplomacy and alliances of compromise and even collaboration with conquerors." The next two sections trace events and concepts through the periods of imperialism (67.4) and Maoism (67.5); followed by a detailed analysis of the transformations under Deng Xiaoping (67.6) and of the current leadership (67.7). Finally, major security issues in 2005–2006 are reviewed, including an important new emphasis on resources and environment (67.8), and the paper ends with conclusions and an outlook (67.9).

67.2 Chinese Concepts of Security

67.2.1 Stratagems and Integrated Strategy

Sunzi's *Art of War*, possibly written in the fourth century BCE, has inspired generations of Chinese strate-

gists. Sunzi argues that military action should be only one element of an integrated approach to security. More important should be diplomatic alliances; an emphasis on stratagems including deceiving putative enemies and undermining their home fronts; secret logistical preparations; winning over enemy civilians, soldiers, and leaders; avoiding defeats and casualties; maximizing victories; and predicting the aftermath of war before engagement. Lai (2004) observes that Sunzi's phrases have passed into daily language, for example *bing yi zha li* (war is based on deception); *yi ruo ke-gang* (use gentle means to overcome the hard and strong); *bi-shi ji-xu* (avoid the enemy's strengths and strike at his weak point). After decades of guerrilla warfare the CCP top leadership were certainly familiar with all such ruses. Lai contrasts this approach with Western emphasis on overwhelming confrontational force and technological superiority.

67.2.2 World Revolution and United Front

CCP leaders were also profoundly influenced by Soviet Marxism. The CCP itself was originally founded, funded, and directed by Comintern agents reporting directly to Soviet leaders; many Chinese communists were educated in the Soviet Union, which was the major supplier of military hardware until the 1960's; and domestic and international politics were conceptualized in Marxist terms even, or especially, when the Maoist regime broke off relations with the Soviet Union in the early 1960's. Two consequences were the promulgation of world revolution, and thus support for international revolutionary movements; and united front policies. For decades after 1917, the Soviet Union and its client states were desperately hoping for communist revolutions, both in West Europe and in the developing world. Chinese support to Ho Chi Minh, among others, was partly the promotion of China's national interest, but partly revolutionary strategy.

However, 'revolution' had a counterbalance, namely the concept of the united front, developed in the early years of Soviet Marxism. According to this strategy, communists should at times forge alliances with non-communists in the interests of fighting a common enemy (for example fascism), deferring confrontation within the 'progressive' camp until an unspecified later date. The united front approach was an aspect of Deng Xiaoping's reforms, when the CCP leadership secured a national consensus to promote economic development. The theory went through various incarnations, including Mao's efforts to unite the

developing world against domination by the two superpowers, which in the 1970's went under the rubric of the 'Three Worlds': the CCP conceptualized that the Soviet Union and the U.S. were a 'first world' of imperialist aggressors; West European and other affluent countries were a 'second world' sitting on the fence; and developing countries were a 'third world' that would oppose imperialism.

67.2.3 Peaceful Coexistence

In 1953, Premier Zhou Enlai formulated what became known as 'five principles of peaceful coexistence', which China still upholds. The principles are: respect

for territorial integrity and sovereignty; non-aggression; non-interference in internal affairs; equality and mutual benefit; and peaceful coexistence. These principles were agreed between China and India in 1954, and subsequently promoted by China in many Asian countries. Yahuda (1996: 224) observes that their interpretation changed in different contexts: for example they were basically disregarded during China's revolutionary phases, but revived in the 1990's. One aspect relevant to debates on humanitarian intervention and conditionality of aid is that the PRC government generally opposes interventions even for humanitarian purposes, and also regards issues such as corruption as 'internal' and the business of national

governments rather than targets for international scrutiny.

67.2.4 One China

'One China' is perhaps the most fundamental Chinese security concept at present, and likely to remain so. Regions in or close to the nation-state now known as the PRC have experienced various forms of local government, sometimes disputed: for example Inner Mongolia, Tibet, Xinjiang (Chinese Turkestan), Manchuria and Taiwan (occupied by the Japanese), Hong Kong and Macao (British and Portuguese colonies) etc. The 'One China' policy maintains that *all* the above territories, in their entirety, are integral parts of an indivisible nation state. Foreign intervention, support for independence movements, arguments for separate mini-states, will not under any circumstances be tolerated. Once this point is conceded, the Beijing government may be willing to show flexibility in resolving issues, as shown by the successful retrocession of Macao and Hong Kong under the 'one country two systems' slogan. The 'One China' principle was in effect recognized by the U.S. during Nixon's visit in the Shanghai Communiqué of 1972: "the United States acknowledges that Chinese on either side of the Taiwan Strait maintain there is but one China and that Taiwan is a part of China. The United States does not challenge that position."⁴

67.3 Traditional Security Perceptions

A five-phase historical model helps to conceptualize China's role in international relations (table 67.1).

Two further points should be emphasized from early China. One is the philosophical heritage of Taoism and Confucianism, both of which emphasize harmony and pro-peace thinking although from different starting points and with sectarian differences. Taoists propose that nature is pervaded by an essence, Tao, that unites heaven, earth, and humans. The cosmos is a system of dynamic equilibrium, in which humans are an integral part of nature. Confucians proposed that ethics is the primary tool for management of public affairs: rulers gain legitimacy through exercising moral standards in public and private. Both Confucianism and Taoism see man as one aspect of the cosmos, not

its master, and thus they hold that even powerful humans should behave with benevolence and respect to nature. These views are deeply rooted in Chinese culture.

Conversely, a tradition of monistic political control existed from a long series of wars fought in the central Yellow River region from 2000 BCE onwards. When China was eventually unified under Qin Shihuang (221 BCE), he insisted that there would be one centre of political control despite any temporary shifts in clan or local movements. For two thousand years or more we can see a tension between an ethics-based, civilian and rather inclusive approach to governance; and a top-down, authoritarian military system. Ter Haar (2000) offers a sinological perspective, demonstrating tensions between 'peaceful' and 'violent' cultures within Chinese elites. Seminal texts like Fairbank (1992) and Gernet (1982) explain traditional Chinese concepts of the sino-centric cosmos. They can be summarized in simplistic fashion:

- China is the Central Kingdom of the known world, the locus and guardian of an immensely valuable culture.
- Power is controlled internally at elite level by the dynastic Imperial Court and a highly centralized civil service.
- Power is controlled locally by complex negotiations between imperial officials, provincial governors, local landlords, wealthy merchants, and other people with access to resources.
- Religious organizations have no political influence, and almost all legal matters are settled by custom, often within clan associations.
- Radical power transformations usually arise from one of two circumstances: invasion from across the northern borders (e.g. the Mongol and Manchu invasions); or by regional peasant uprisings that assume national dimensions.
- History moves in a cycle, alternating periods of dynastic growth and decay, followed by overthrow and renewal under a new emperor.
- Limited territorial expansion undertaken but not consolidated. Sea expansion never a major priority, although voyages made to Japan, Africa, and the Americas.

67.4 The Century of Humiliation

The period from the 1840's to 1949 was a national catastrophe, with symbolic and actual disasters of all kinds (Spence 1992). In the 18th century, China was

4 See: "Shanghai communiqué", 27 February 1972, at: <<http://www.cnn.com/SPECIALS/cold.war/episodes/15/documents/us.china/>>: 1-4.

Table 67.1: China's international relations

Reference	Typical period	Status in region	Typical armed conflicts
Traditional	<i>Han Dynasty</i> (200 BCE to 200 CE); early <i>Qing Dynasty</i> (1650–1750)	Leader	Attacks by northern 'barbarians'

Complex.	2000-	Leader	None so far; growing tension with Japan

one of the most powerful countries in the world; by the end of the 19th, a few thousand European troops could invade Beijing and rampage at will; forty years later it suffered Japanese occupation. Internal chaos and foreign pressures lay behind the collapse. Peasant movements destabilized the Qing Empire. Other internal traumas followed: the overthrow of the Qing regime in 1911, fighting between warlord armies through the 1920's, and decades of conflict between nationalists and communists. The numbers of casualties from civil conflict must run into tens of millions.

The first major foreign impact came from Great Britain which defeated the Qing military in the Opium Wars (1842 and 1860) when China was obliged to cede territory, resources, and legal rights to foreign powers. Colonial powers rushed to China, grabbing land, property, the right to impose taxes and deploy troops, and other concessions. Even these losses paled into insignificance compared to the Japanese occupation. Japan had already seized the island province of Taiwan in 1895, and gained control over parts of north-east China and other areas after 1918. In July 1937 the Japanese army launched a full-scale invasion that lasted until 1945. Far better equipped than any Chinese army, the Japanese conducted the occupation with terrifying brutality, leading to millions of casualties many of whom were civilian non-combatants. The only successful resistance was that by CCP guerrillas who tied down Japanese military units, and also used 'liberated areas' as testing grounds for radical social policies. To round off this awful period in China's history, the communist and nationalist armies then fought a civil war (1945 to 1949), again leading to millions of deaths, until the CCP eventually gained full

control of the country, except Taiwan, Hong Kong and Macao, in 1949.

Lessons taken from this period include an overwhelming conviction that China should not allow internal conflicts to weaken the country. Never again should foreign powers be allowed to carve up China into concessions; Japan would be treated with suspicion, or profound hatred, for generations to come. Strong government and unconditional defence of territory became absolute priorities. Schools and media often discuss the century or more of humiliating exploitation inflicted by imperialist powers, a view of history that is rarely questioned.

To summarize the simple but powerful security concepts arising from this period:

- Internal disruption makes China a prey for foreign powers.
- Foreign powers, especially Japan, do not hesitate to grab Chinese territory whenever and however possible.
- The communist party was the only party to fight for national pride and integrity.
- 1949 was a landmark in Chinese history, when the Chinese people stood up and put an end to the humiliation.

67.5 Maoist Security Preoccupations, 1949 to 1978

In 1949, the CCP took power under Mao Zedong. The next thirty years were the period of 'Maoism' or 'hard-line communism'; in 1978 the new leadership around Deng Xiaoping started to implement political

Table 67.2: Relations between the USA, USSR, and China

changes that had transformed the country by the 1990's.

Even before 1949, Mao Zedong had declared: “We can and should adopt the strategy of destroying the imperialist regional domination thoroughly, step by step” (Mao 1991: 1434). The early PRC diplomatic strategy was to establish close relations with friendly countries, especially the USSR and its satellites, and at times to export revolution. In military terms, China had huge numbers in the armed forces, and became an atomic power in 1964. In Mao's view, alliance with the Soviet Union would avoid international isolation, protect the revolution, provide military goods, and fight against restoration of the former regime. However, China also insisted on its own independence: no outside interference in China's domestic affairs. China emphasized a friendly attitude toward other poor countries in Asia, Africa and Latin America, following the ‘Five Principles of Peaceful Coexistence’ (see above 67.2). Domestic security was assured by a pervasive, authoritarian state regime. Military security issues were dominated by the triangle of global geopolitics between the USA, the USSR, and China (table 67.2).

The Chinese government managed to avoid full-scale armed conflict with the two superpowers, while achieving its objective of maintaining territorial integrity and CCP control, although the country was often in turmoil due to Mao's domestic policies. To do so in the Cold War period was no small achievement, when the superpowers came close to using nuclear weapons; when they fought proxy wars including Vietnam and Korea on China's borders; and when the Soviet and Chinese parties were contending for the glo-

bal communist movement. China achieved this success while being far the weakest of the superpowers. To simplify, the CCP adopted one main strategy for internal security, and two for international (table 67.3).

Table 67.3: China's internal and international security strategies 1949 to 1978

Strategies 1949 to 1978		
Internal security	One-party rule, no opposition politics	
International security	Massive conventional military forces, plus nuclear deterrent after 1964	Diplomacy to avoid war with superpowers

Key concepts from the period:

- ‘Peaceful coexistence’, emphasis on non-interference;
- Conventional military and nuclear deterrent;
- Maintain peace despite superpower rivalry.

67.6 1978 to 2000: Foundations of China as Global Power

The new leadership under Deng initiated a remarkable series of reforms in 1978. By 2000, the reforms had led to a unique hybrid: a booming market economy in a communist state. It appeared a recipe for disaster, a system full of compromises and ambiguities, but it turned out to be a great success story: China emerged as world leader in some sectors of the

global economy, and the most powerful country in Asia. In 1980, Chinese entry into the World Bank and the International Monetary Fund was a symbolic acceptance of the capitalist system and a statement of the leadership's intentions. Twenty-five years later, in 2004, China was being considered for full membership of an expanded G-8, marking acceptance as a fully-fledged leader; it had already acceded to the WTO in December 2001.

Broadly speaking, political control at home was driven by consensus-building, co-opting of talent, and incentives, rather than heavy-handed dictatorship, although the latter could still be seen, notoriously in 1989. Internationally, although China paid careful attention to relations with the USA and the USSR, it had a far wider range of diplomatic activities: with the UN, the EU, and a series of Asian and other developing countries. Nuclear and conventional military deterrent were maintained, but they were no longer the sole or even predominant factor.

Two key areas were China's relations with the U.S., and its growing Asian role as regional superpower. The perception of a resurgent China provoked a lively foreign policy debate in the U.S. Conservative commentators regarded China as a threat to global security, and called on the U.S. government to adopt a strategy of containment analogous to that applied to the USSR during the Cold War. The declared policy of the U.S. administration was, however, to engage rather than contain China; and there was also a strong pro-China lobby in Washington. Despite this, the relationship between China and the U.S. was often tense and acrimonious. Chinese leaders sometimes expressed the view that the U.S. was attempting to undermine China's revival, and to destabilize its government; while China's large trade surplus with the U.S., and its poor human rights record, were viewed as serious problems by Washington (Hunter/Sexton 1999: 188-91). The two sides also had tense relations concerning Taiwan. The Beijing government is determined to prevent a Taiwanese bid for complete independence, and seems prepared to use force if necessary. The U.S., on the other hand, remains a firm defender of Taiwanese autonomy.

On the Chinese side, top leaders recognized the need for better relations. Deng Xiaoping himself stated on his 1979 visit to the U.S. that "we want to strengthen full economic cooperation with other countries. U.S.-China economic cooperation will be to the benefit of both countries"⁵; and he repeated his

message ten years later: "to develop friendship, to find areas of mutual benefit is the basis for U.S.-China relations" (Deng 1993). In December 1989, foreign minister Qian Qichen stated: "although there are some serious issues that are divisive between us, they cannot prevent the development of mutually beneficial relations between the two countries." And in November 1991, President Jiang Zemin told journalists on the eve of his visit to the U.S., that although there were various points of dispute between China and the U.S., the two sides' mutual benefit was still most important.⁶

Meanwhile Deng Xiaoping was elaborating his thesis that "peace and development are the two main issues facing the world." When Deng met the Burmese Prime Minister in October 1984, he stated: "In international relations there are two exceptionally important issues. One is peace, the other is North-South relations. These two factors influence the whole world situation; they have global, strategic significance." Deng proposed that peace and development should be the guiding principles for the creation of a new international economic and political order (Deng 1993: 96, 105). In early December 1988, Deng told a foreign visitor:

We should formulate a theory for a new order of international relations. The international and regional domination of the superpowers should be curtailed in the new international situation, they should adopt the five principles of peaceful coexistence rather than the politics of hegemony. Whether it is one country against another or one region of a country against another, we should all adopt the five principles of peaceful coexistence to handle relations.⁷

Meanwhile, relationships among the Asian powers had become fluid, as states determined policy according to their strategic interests, rather than lining up behind the superpowers. The principal players are China, Russia, Japan, the U.S., and India with a secondary tier of countries including Taiwan, Korea, Vietnam, Indonesia, Thailand, Malaysia, the Philippines, and Singapore, many of which have significant military capability. Military spending increased dramatically across the whole region in the 1990's (Kaldor 1996: 140), and has escalated further since then (SIPRI 2005). A number of flashpoints in the region could easily lead to armed conflict if mishandled. Apart from the Beijing standoff with Taipei,

5 *Renmin ribao* [People's Daily], 4 February 1979: 1.

7 *Renmin ribao* [People's Daily], 30 December 1988: 1

Table 67.4: Overview of Chinese strategies in the Deng era

Strategies 1978 to 2000			
Internal security	One-party rule, but broadly consultative. Much improved freedom of expression and freedom of religion.	Limited tolerance for political opposition; occasional severe crackdowns, especially 1989 to 1991.	Attempts to keep the population 'on board' by economic success
International security	Conventional military forces and nuclear deterrent on standby; continuing diplomacy to avoid overt war with super-powers	Investment of top-level time and effort to ensure good relations with Asian neighbours. Integration in numerous international bodies.	No compromise on Taiwan, Tibet, Hong Kong.

there were repeated crises on the Korean peninsula, and disputes over oil in the South China Sea.

By the late 1990's, the PRC leadership had evolved a set of new security positions. They were officially unveiled in March 1997 at a meeting of the Association of Southeast Asian Nations (ASEAN) Regional Forum, and subsequently reiterated. For example, in their joint statement at an April 1997 summit, President Jiang Zemin and Russian President Yelstin called for a "new and universally applicable security concept"; and in December 1997, Foreign Minister Qian Qichen outlined a "New Concept of Security" at the 30th anniversary celebration of the ASEAN (Finkelstein 2003).

According to Avery Goldstein (2005), although details of the new concept have not been fully articulated in formal declarations, it is discernible in policy statements and practice: one can infer it from Chinese grand strategy, as the Beijing leaders had in the past decade adjusted to the realities of the post-Cold War period.⁸ Goldstein believes the Beijing leadership recognizes four central realities that affect its regional and global security. First, the end of the Cold War did not lead, as many expected, to a multi-polar world in the military sense. Instead, the U.S. has emerged as a totally hegemonic, dominant military power. Second, although the PRC is growing very fast, in military and especially technical capacity it lags far behind the U.S. and its allies. Third, China's rise to power caused international anxiety: Asian states feared a massive expansionist neighbour; Western states feared, among other things, influx of cheap manufactured goods. Fourth, tensions remained high with Taiwan and Japan.

8 See: Avery Goldstein: "China's Grand Strategy and US Foreign Policy" in: Foreign Policy Research Institute, Philadelphia, PA, USA, 27 September 2005, at: <<http://www.fpri.org/enotes/20050927.asia.goldstein.china-grandstrategy.html>>: 2-5.

The grand strategy has two strands. The first is an active multilateralism designed to reassure Asian neighbours, and by extension the rest of the world. Beijing wants to enhance its reputation as a responsible and non-aggressive player on the world stage. Examples are repeated efforts to promote good relations within Asia, partly through ASEAN; attempts to play broker in the Korean peninsula stand-off; and new alliances with Russia and Central Asian states. Incidentally the Maoist regime aligned itself with repressive dictatorships overseas in the interests of, supposedly, uniting the Third World against the two superpowers. Similar pragmatism was apparent even in 2006, for example the warm relationship cultivated with Niyazov's regime in Turkmenistan but now with the promise of oil and gas, and cooperation against 'terrorists'.

A second strand is to nurture partnerships with the major world powers, especially the U.S., Russia, and the EU, despite inevitable tensions. While China lags so far behind in military capacity, it still attempts to build a working relationship with the U.S. in trade and investment; in defusing certain flashpoints like Korea; by contributing to weapon proliferation controls; and by participating in the 'War on Terror'. China seems still committed to these strategies, which appear to be a logical way forward in the international context, where China is a rapidly growing power, where it may be perceived as a threat, and where it cannot challenge the U.S.

Top Chinese leaders promoted the concept of international peace and 'new security' in many forums over the past decade: we just offer four examples here. On 16 December 1997, President Jiang Zemin stated at a meeting of ASEAN leaders that long-standing cultural traditions and shared aspiration to preserve peace and cultivate economic prosperity were strengthening mutual confidence and friendly cooperation between China and every Asian country.

China hopes that all Asian countries will be permanently good neighbours, good comrades, good friends

... Let us make a real effort and work hard together to promote excellent neighbourly and friendly relationships in the 21st century (Pan/Zhang 2002).

In March 1999 at a UN meeting in Geneva, Jiang Zemin repeated that international security should be based on mutual confidence and benefits, with equality and cooperation as core values, emphasizing mutual respect between nations. Political leaders should maintain excellent relations with no offences against the other party, no interference in internal affairs, equality without exploitation, adopting the five principles of peaceful coexistence in addition to the internationally recognized norms of diplomatic principles, as the political basis for maintaining peace.⁹

On 27 September 2004, at the UN General Assembly, Foreign Minister Li Zhaoxing pointed out that peace, development and cooperation are preconditions for development: "Saying Yes to peace, development and cooperation and No to war, poverty and conflict have become the strong appeal of people of all countries in the world." Li continued

"Peace and development remain the overriding themes of the times. However, the light of peace has not yet reached out to every corner of the world, and traditional and non-traditional threats to security interweave with each other. The danger of war is looming, and hot issues keep cropping up. ...To cope with security issues, all countries in the world should go beyond the differences of ideology and social system, stick to the new security concept featuring mutual trust, mutual benefit, equality and cooperation, promote democracy in international relations and solve disputes through peaceful dialogue."¹⁰

Finally, Hu Jintao at the High-level Plenary Meeting of the United Nations' 60th session, New York, on 15 September 2005 summarized China's current international security policy in four key points: multilateralism; cooperation; inclusiveness; and a major role for a reformed UN.¹¹ He concluded,

I would like to reiterate here what China stands for. We will continue to hold high the banner of peace, development and cooperation, unswervingly follow the road of peaceful development, firmly pursue the independent foreign policy of peace and dedicate ourselves to developing friendly relations and cooperation with all countries on the basis of the Five Principles of Peaceful

Coexistence.... The Chinese nation loves peace. China's development, instead of hurting or threatening anyone, can only serve peace, stability and common prosperity in the world.

Key concepts of the period have been:

- Maintenance of a peaceful environment to promote economic growth;
- Active multilateralism and participation;
- Careful management of relations with the U.S. and other major powers.

67.7 The New Security Agenda in the Twenty-first Century

China's outreach as a business power; competition for natural resources; and environmental impacts are somewhat shifting its security agenda as China has become one of the most important economic players in the world.¹² In the manufacturing sector, China is overtaking almost all competitors in clothing, footwear, household goods, and electric appliances. It is also moving into the major league in automobile manufacture, and plans for the future include much bigger aerospace and construction industries, and intellectual property including media output.

Another factor, easily overlooked by standard economic analysis, is the expanded migration from China. Some estimate a Chinese Diaspora of around 35 million at the end of the twentieth century, which has since grown rapidly, up from perhaps 20 million in the mid-1980's. The majority of them are working people, business entrepreneurs, economic migrants of varying levels of skill and resources. They are now present in most countries, including in North Korea. There are substantial Chinese communities in South America and in many African countries, where they work as merchants or operate restaurants, factories, shops or farms. Chinese companies also own and/or manage mines, infrastructure projects or industrial complexes.¹³

Two other important groups are students and tourists. Chinese students now constitute a significant proportion of all university students internationally, and they form the largest or second largest number of

foreign students in Japan, the USA, the UK, Australia and Canada.¹⁴ Meanwhile, more Asian students are moving to China, usually studying Chinese language and then technical studies like computing, engineering or agricultural technology.¹⁵ This signals a growing intellectual and social bonding of elites that will increasingly include Chinese, and where Mandarin has become an international business language, especially in Asia. This phenomenon is reinforced by the growing number of tourists, both foreigners visiting China, and Chinese tourists going overseas. In 2004, more than 23 million Chinese took trips outside of China for personal reasons, overtaking Western tourism in countries like Thailand and Singapore. Chinese tourism into the EU is set to rise dramatically.¹⁶

Finally, there is the phenomenon of illegal migration. It is estimated that in South Korea alone there are about one million irregular Chinese migrants. Invisible and uncountable, there may be more millions in Japan, the EU, the USA and elsewhere. The great majority of these migrants are poorly paid, often working in construction, clothing sweatshops, or in the sex industry. A certain number of them are also in organized crime. Chinese gangs operate in the murky waters of international drugs, arms, and person-trafficking, competing for dominance with outfits from Russia, Korea, Pakistan, Latin America and elsewhere.¹⁷ Some analysts (Napoleoni 2003) have conjectured that illegal gangs generate a huge underworld of deniable transactions worth billions of dollars.

The Chinese Diaspora will surely face growing Sino-phobia. Cheap Chinese goods please consumers but threaten competitor producers. There were reports of popular outbursts of anti-Chinese sentiment, for example in Spain, Mexico, Morocco, and Roma-

nia. Incidents ranged from verbal abuse of Chinese merchants to burning of goods, police attacks, road-blocks, kidnapping and hijacks. Politicians are also cashing in on anti-Chinese sentiment by demanding quotas or high tariffs on Chinese goods. 'China-bashing' becomes an easy way for politicians in the U.S. or other countries to divert attention from structural economic problems, by focusing popular opinion on Chinese imports. If many countries become too dangerous for individual or family entrepreneurs, it may be that Chinese trade overseas will evolve into more large-scale, industrial or infra-structural programmes, perhaps in liaison with major international companies. We might then expect to see the Chinese state virtually obliged to protect them; to do so might require diplomatic pressure, international police efforts, or possibly non-conventional measures.

Such aggregation of wealth and population movement will translate into new phenomena. An obvious one already visible is the rising price of raw materials, especially steel, aluminium and oil, as China sucks in huge quantities for its manufacturing industries (Forney 2004). In the context of this new situation, Chinese security thinking can be summarized:

- A continuation of its multilateralist diplomatic orientation, while managing low intensity rivalry with the USA;
- Much greater diversification of international ties including global outreach through the Chinese Diaspora.

67.8 Key Current Issues

67.8.1 Military Expenditure

Based on basic data in the military expenditure databases of RAND and SIPRI for 2004, absolute military expenditures were estimated for selected countries (table 67.5).¹⁸

Such figures are admittedly problematic, for example official budgets do not reflect actual spending; estimates may not be accurate; and purchasing power makes comparisons difficult. Nevertheless, the U.S. military budget is probably more than ten times that of the PRC; and the U.S. and its closest allies (the UK and Japan) account for at least two-thirds of global military expenditure. Reports on China's assumed

Table 67.5: Estimated military budgets for 2004 in billions of current \$ US.

Country	Official Budget	SIPRI estimate
United States	419	455
United Kingdom	59	47
Japan	46	42
China	30	35
Russia	14	19
Republic of China (Taiwan)	8	n/a

military capabilities are publicly available from many research centres (e.g. SIPRI in Stockholm, IISS in London) but also from the website of the U.S. Department of Defense¹⁹ and in many military and strategic journals.

Moreover, the U.S. is far ahead of any conceivable competitor in military technology. Chomsky (2003: 226–237) summarizes many fields in which the U.S. can deploy offensive armaments against which other nations have no defensive or counter-attack options: weaponry includes ballistic missiles, space-based weapons systems, hypersonic missiles, IT surveillance systems, and bio-weapons. According to a Pentagon document in 2002, the U.S. could launch almost instant, immensely destructive ‘unwarned attacks’ against any target on earth. Military analyst William Arkin concurred that “no target on the planet would be immune to American attack.” Presumably to preserve its superiority on weapons of mass destruction, the U.S. has pulled out of or refused to cooperate in several arms control efforts, including the UN Conference on Disarmament since 1997; it opposed all resolutions of the General Assembly of the UN calling for the “Prevention of an Arms Race in Outer Space”.

The Chinese leadership is well aware of this U.S. military superiority, and of the U.S. readiness to use force unilaterally without a mandate of the UN Security Council. The PRC will not match the U.S. in military investment and technology in the foreseeable future. Nevertheless, its armed forces are the largest and among the best-equipped in the world, and it maintains a credible nuclear deterrent and ICBMs, although due to strict secrecy there are no official state-

ments of its capacity. In a statement in 1995 China gave the following security assurances:

1. China undertakes not to be the first to use nuclear weapons at any time or under any circumstances.
2. China undertakes not to use or threaten to use nuclear weapons against non-nuclear-weapon states or nuclear-weapon-free zones at any time or under any circumstances.²⁰

The PRC is willing to sign non-proliferation agreements for biological and chemical weapons.

67.8.2 International Multilateralism

China is now a major global power with interests on every continent. It is a permanent member of the Security Council of the UN, by far the largest trading partner of ASEAN, a leading member of the Shanghai Cooperation Organization (SCO) with Russia and five Central Asian republics; and was an invited guest of the G-8 summit in Edinburgh (2005). In these and other forums, China advocates multilateralism and international cooperation, which it contrasts with U.S. hegemony and interventionism. It contributes to UN peacekeeping efforts, and is perceived as a peace-broker in the Korean peninsula. It also improved its positioning after 2000 by negotiating better relations with India, including a new land route into West Bengal due to open in 2006, and a massive investment area near Kolkata. Some commentators refer to India as the office of the next decade, and China as the workshop.

Two particular features of Chinese foreign policy statements in 2005 were a renewed commitment to maintaining a peaceful international environment; and also a renewed emphasis on multilateral ties, especially including ties with and assistance to developing countries. For example, the China Daily reported Foreign Minister Li Zhaoxing’s commitment to ‘peace, development and cooperation – the banner of China’s diplomacy in the new period’ and a series of ideas put forward by President Hu Jintao at the UN General Assembly in September.²¹

67.8.3 Environmental Security

Recently the Chinese public and scientists have been deeply concerned about 'environmental security' (*huanjing anquan*), ensuring the survival of the natural environment against the impacts of man-made hazards. Since 2003, the public debate intensified on the loss of agricultural land, pollution, and water-shortage: all classic symptoms of rapid industrialization. Xie Zhenhua, the chief of the Environment Protection Bureau, stated that the task of environmental protection in China will become more arduous. Paper-making, brewing, electricity generation, chemistry, logging, and metallurgy are all expanding rapidly: the inevitable consequence is environmental pollution and damage to the ecosystem. Moreover, coal will be one of China's main energy sources for the foreseeable future, and the Environment Protection Bureau called for urgent efforts to solve environmental problems caused by sulphur dioxide, nitrogen oxide, carbon dioxide, soot and dust. In the process of rapid urbanization, infrastructure construction has lagged behind, leaving trash dumps and untreated polluted water. Pollution is increased by waste electrical appliances, traffic emissions, untested new chemical products, and so on. In agriculture the improper use of pesticides, unregulated stock farming, and the increasing movement of factories to the countryside have all degraded rural environments. In addition, genetically modified plants and new chemical materials brought about by advanced technology can all bring potential hazards. As the economy develops, the task of pollution control becomes more difficult, yet more urgent (Xie 2005).

Environmental contamination is one potential for instability. The shortage of resources presents an even sharper challenge to social harmony, and even to national security. Water is indispensable, so the water shortage may cause conflicts of different types; influenced by other factors. China is one of those countries facing most serious water shortages. The situation is appalling especially in the Haihe and the Luanhe River valleys where the cities of Beijing and Tianjin are located: per capita water resources are close to those of countries such as Israel and Saudi Arabia. Fourteen per cent of the population (some 180 million people) do not have access to clean drinking water. In the most important river and lake systems in China, only 37 per cent of the water meets class III (acceptable) national standard for surface water quality; up to 38 per cent does not even meet the class V standard (minimum). In addition, the large

freshwater lakes, lakes in urban areas, and city groundwater tables are all at least moderately polluted. The threat posed to national health by water pollution is one of the biggest challenges confronted by the Chinese people. Environmental security has, at last, become a major political issue in China as particularly northern cities, including Beijing, face severe water restrictions and moreover suffer health epidemics like bronchitis from airborne pollutants.

Meanwhile there have been peasant movements to protest against land seizures, while others are concerned about loss of agricultural land to encroaching industry.²² It has always been an over-simplification to characterize China as monolithic, and in fact there is a very active and well-informed environmental lobby including many top scientists. There have been major political rows over development projects, famously the giant dam on the Yangtze River. They may increase continuously as the country tries to harmonize political stability, economic growth, environmental protection, and freedom of expression.

Even ministry officials dealing with oil and water resources join the public debate through the Internet and other media.²³ A recent publication (Zhang 2005) highlights many of the issues, arguing that the environmental crises and challenges facing all countries have now become a serious threat to their continued development or even their existence. There are many varied expressions of the crisis, for example lack of available drinking water; soil erosion and degradation of soil quality; desertification; overuse of pesticides and other chemicals in the rush to maximize production; deforestation, causing run-off from bare hillsides and contributing to river floods; scarcity of water in reservoirs; flooding of river plains leading to insecurity; exhaustion of irreplaceable minerals; exhaustion of energy resources and lack of development of renewables; lack of food in some countries leading to hunger, malnutrition and deaths; degradation of environments by chemical and other problems like acid rain; climate change; rising ocean levels.²⁴

China has been a hazard-prone country, suffering heavily during the past century under climate related extreme weather events (floods, drought, and

storms). The 146 floods recorded in the CRED data base for 1906–2006 killed 6,592,976, affected 1,544,056,986 persons, and caused economic damages estimated at 123,831,234,000 \$ US in China. However, the flood of 6 August 1998 alone killed 3,656, injured 123,000, made 15,850,000 people homeless, affected a total of 238,973,000 people, and caused damages estimated at 30 billion \$ US (table 67.6).

These issues indicate that human development has had a devastating impact on the environment. As the natural disasters during the past century illustrate, the negative impacts have consequences not only for domestic politics and economics, but also for international issues. They are even more frequent than political attacks from outside, more serious, long-lasting, and more wide-ranging. They approach in an insidious way, becoming more threatening but often not noticed until they suddenly explode and cause devastation to an unprepared population.

Zhang argues that damage from environmental challenges still do not raise the same concerns as do military issues and international conflicts. But these

threats are increasing, yet before they become apparent, people often ignore them. It may be relatively easy to cope with the changes in international relations or to handle the deployment of new military techniques and weapons, but it seems almost impossible to take care of the natural environment, to shift the relationship between humans and the environment, to repair or even to improve the damage that has been done.

For future generations, a country's security will depend on its stamina, its power of endurance. And this endurance will eventually revert to its natural environment, improvement and repair of damage. The Chinese government needs to adopt effective measures to protect and improve its environment. If a government continues to overlook these threats, because they are not overt military threats, then development will suffer, the country will lose its progress, and may have to rely on food imports. 'Biological security' refers to our fundamental existence; if the environment suffers irreversible damage, it is not just one sector or one aspect of society that suffers, but the very

basis of existence of the country and its people (Yu 2002: 11–14).

67.8.4 Resource Politics and Energy Security

As the developing country with the highest population, China's need for natural resources is enormous. Among the ten countries with populations over 100 million, in terms of natural resources China was second from the bottom: only Japan is worse off. Population growth would put even further pressure on resources. Without effective political handling of resource issues, shortages could become a great risk to the future of the country. So protecting the stability of national resources and environmental security is a crucial issue as to whether or not China can continue its development trajectory through the 21st century (Zhang 2002: 26–30).

There is a growing recognition of the increasing competition from China for access to global resources, particularly to oil and gas (Downs 2000; International Energy Agency 2000; Kalicki/Goldwyn 2005). Henry Kissinger recently mooted that competition over hydrocarbon resources will be the most likely cause of international conflict in coming years.²⁵ During an Asian summit in 2005, Hu Jintao stated that a Chinese priority is to achieve balanced and orderly growth by handling its energy issue well: China would focus on energy conservation and effective use of resources, as well as on new exploration and imports.²⁶ China must explore many options, on every continent, to satisfy its demand for oil and other resources (Liu 2002). In 2002, the government announced a new policy to encourage its three major national oil corporations to 'go out' (*zouchuqu*) to ensure secure energy supplies from overseas, through direct purchases, exploring and drilling programmes, constructing refineries, and building pipelines (Leverett/Bader 2005: 193). Chinese oil demand grew by almost 90 per cent between 1993 and 2002, now reaching about six million barrels per day, of which some 40 per cent came from imports. About 40 per cent of the oil demand growth worldwide during the past four years is attributable to China.²⁷

25 See: Caroline Daniel, "Kissinger Warns of Energy Conflict", in: *Financial Times*, 2 June 2005: 2.

26 See: <<http://www.china.org.cn/english/2005/nov/149119.htm>>, 19 April 2006.

27 US Department of Energy, "China Country Analysis Brief", 12 August 2005, at: <<http://www.eia.doe.gov/emeu/cabs/china.html>>.

In November 2004 Chinese President Hu signed 39 commercial agreements with Latin American countries; investments in Argentina alone mounted to US\$ 20 billion. This visit was followed by another in 2005 by Vice-President Zeng who signed a key agreement with Venezuela for oil and gas explorations; China also announced credits to Cuba. By 2005, China had offered more than US\$ 50 billion of investment to countries within the U.S. 'backyard'. According to energy analyst Saul Landau, there are several reasons why Latin American and Chinese governments actively welcome this kind of cooperation. The Chinese need to secure energy, food, and raw material resources for the continued expansion of their economy. For Latin America, China is a good buyer for products which can help them to raise prices; moreover, many governments reject Washington's free-market economic models, especially the leaders in Venezuela, Bolivia, Brazil and elsewhere. These new political leaders may not risk overt confrontation with the U.S., but they experiment with more friendly ties with China.²⁸

China has been pursuing a similar strategy in sub-Saharan African countries. Chinese businesses are active in many projects, including major infrastructure development, while corporations invest heavily in oil production, notably in the Sudan and Nigeria.²⁹ In December 2005 a fierce competition between China and the U.S. for African 'black gold' was observed.³⁰

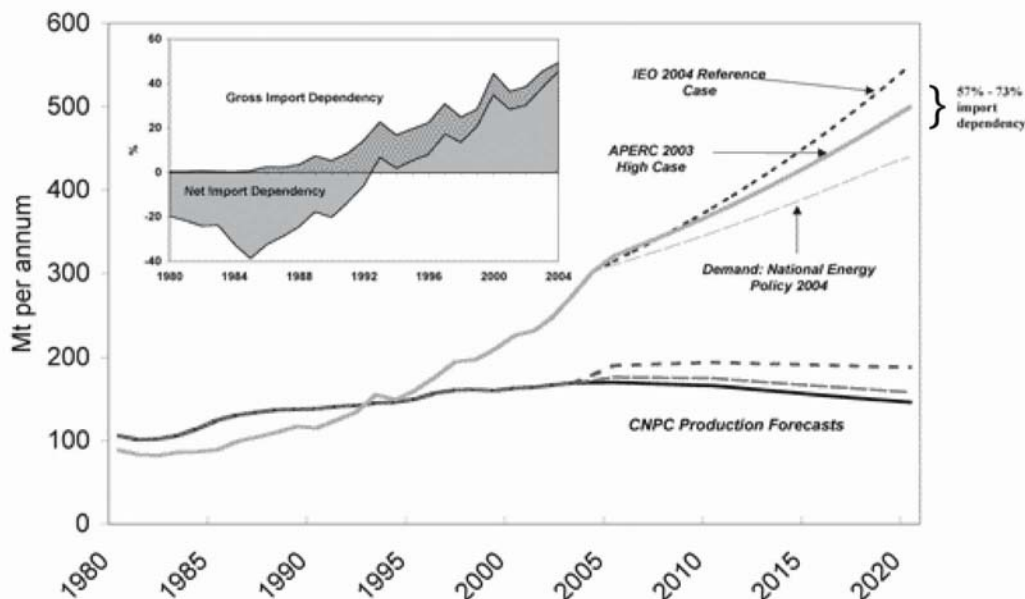

China's potential competition with the U.S. in West Asia and North Africa could be even more sensitive. According to Leverett and Bader (2005: 187) "the potentially explosive combination of a China less willing to passively accept the U.S. leadership and the prospect of competition between China and other states for control over vital energy resources poses particularly critical challenges to U.S. interests in the Middle East." China has established ties based on oil imports from, among other states, Oman, Kuwait, Algeria, Libya, and Sudan. With Iraq out of the picture

because of security concerns, China is trying to build firm relationships with Saudi Arabia, and especially with Iran. In the latter country, Chinese investments in partnerships could amount to US\$ 100 billion in the coming years.³¹ Meanwhile, Saudi Arabia had become China's leading foreign supplier of crude oil by 2002, and Saudi corporations were also investing heavily in Chinese refineries. Economic ties are backed up by frequent high-level exchange visits between Beijing and West Asian leaders (Leverett/Bader 2005: 192).

67.9 Conclusions and Outlook

China's security concepts and concerns may be summarized as follows:

- Chinese conceptualization of security is multi-dimensional, with deep imprints from the imperial past, the 'century of humiliation', and the Maoist era.
- The leap forward from 1966 to 2004, from revolution to cooperation is a political reality.
- Since China announced a 'new security concept' in 1997, a grand strategy of pro-active multilateral-

ism, regional engagement, and of negotiated positions with the U.S. can be observed.

- There is an overt, repeated commitment to a 'peaceful rising'. This may be rhetoric, but the Chinese leadership probably believes it needs decades of peace to consolidate its economic gains.
- On the other hand, it has a non-negotiable position on 'One China'.
- The Chinese military is very far behind the U.S., but strong compared to almost all other nations.
- The major flashpoint for armed conflict is with Taiwan, or Japan, or both.
- Energy security and access to resources are more important than ever before.
- Environmental security is high on the domestic agenda.
- Security is a 'sensitive' issue within the Chinese political discussion, and generally not an area with lively public debate or political controversy. On the other hand, there are lively public debates, especially on e-groups within China, about the environment, relations with Japan, and on many other issues.

The Chinese leadership has been committed to peaceful conflict management internationally over the past several decades, and there is no reason to suppose that they are looking for a major confrontation. One could foresee a few exceptions to this reasonably optimistic scenario. One is, if Western or indeed any

31 See: Jephraim Gundzik: "The Ties that Bind: China, Russia, and Iran", in: *Asia Times*, 4 June 2005; at: <<http://www.asiatimes.com/atimes/China>>.

powers attempted to use force or incite underground movements to split what the Chinese regard as national territory. Chinese leaders in the future may possibly be prepared to discuss local autonomies of various kinds, as indeed is practiced already in Macao and Hong Kong; but it is inconceivable that they would tolerate interference on Chinese soil.

A second, more probable and dangerous, is the chance of armed conflict over resources, particularly oil, between China and its neighbours. China claims the Paracel and Spratly islands in the South China Sea, and has demonstrated its willingness to use force to counter rival claims by Vietnam and the Philippines, notably when it occupied Mischief Reef in 1995. The Senkaku (Diaoyu) islands, northeast of Taiwan are also disputed between China and Japan, and there were fierce protests in both Hong Kong and Taiwan in 1996 when a right-wing group raised the Japanese flag on the islands.

Underlying the disputes over barren islands is the issue of oil. China is already a net oil importer and demand is set to grow massively: estimated to need imports of 10 million barrels per day by 2030. It is desperate to strike oil on what it regards as its own continental shelf, and determined to rebuff all counter-claims to the resources. Japan has no oil of its own, and its oil imports pass along sea-lanes which run close to the disputed island groups. Free passage along these shipping routes is a matter of vital national interest to Japan; conversely, control of these routes would allow China to exert pressure on Japan. China's friendship with Iran and other oil-rich Islamic states is a factor which could increase its leverage still further. The potential for conflict over shipping lanes in the South China Sea is an important reason for China to develop its navy.

Renewed claims to the islands by Japan in 2004 and 2005 led to outrage in China. With the long-standing hatred of Japan's wartime atrocities never far away, the Chinese population was in some ways more radical than its government in demanding military action in support of China's territorial claims.

A third danger is excessive nationalism. Large groups of Chinese – apparently quite independently of the government – have organized themselves into internet-based pressure groups which are demanding action, including military action, against Japan.³² On the one hand, it is quite heartening to observe a kind of grass-roots political movement using innovatory means to organize and express itself. On the other, it is unfortunate that its main concern at present seems to be a rather chauvinistic e-nationalism. One hopes

that the Chinese government, when it comes up against discontent at home for whatever reason, will not be tempted to divert popular anger from domestic to external enemies, something that other governments have sometimes achieved by media manipulation. In the late 1990's, a number of academics started to promote a somewhat radical nationalistic alternative to what they perceived as too rapid globalization: one of them, Professor Wang Xiaodong, has published and spoken on nationalist alternatives, including making presentations in the West. To date the government has discouraged this trend, but it remains a possible future development.³³

On the whole, we agree with Goldstein's tentative conclusions, namely that potential conflicts between China and the rest of the world (especially the U.S.) are manageable, and that common interests at present outweigh conflictive issues.³⁴ Whether this will remain the case depends on skilful security assessments in Beijing and around the world.

68 Security in the New Millennium: A Debate in the South Pacific on Peace and Security: Alternative Formulations in the Post Cold War Era

Kevin P. Clements and Wendy L. Foley

68.1 Introduction

During the Cold War, Pacific security issues were focused on the external security concerns of the larger nations that border the Pacific Ocean rather than on the small island states and territories themselves. The island populations have been characterized more often as passive victims of external international relations¹ than as the main actors in securing their region. There is, however, a growing literature focusing on security issues within the Pacific states and territories themselves.² This literature addresses regional concerns from political, economic, environmental, health, and social to military and law and order issues (Henderson 2005: 9; Lawson 2003: 7).

This chapter will first look at the present world order and how security is currently framed. It then turns to the issue of regionalism in the Pacific Islands, asking whether lessons can be learned from regions such as Europe, or whether the particular circumstances of the Pacific require different ways to address its micro and macro indigenous security concerns. A specific focus is given to the role of the Pacific Islands Forum in developing regional cooperation for security purposes.

68.2 The US Military Response to 11 September 2001

The terrorist attack of 11 September 2001 and subsequent terrorist events in different parts of Europe, the

Middle East, South Asia, and South East Asia propelled terrorism to the top of popular threat consciousness, even though the numbers of people killed in terrorist incidents (approximately 40,000) over the last fifteen years remain relatively low compared to other forms of armed conflict and of natural hazards. Terrorist acts, however, because of their randomness and arbitrariness, have provided important new justifications for political leaders all over the world to initiate new rounds of militarization, expand intelligence and surveillance capacities, and challenge many accepted assumptions about civil liberties, individual freedom, and constitutional law.

Far from advancing freedom and democracy, the war on terror (compounded by the wars in Iraq and in Afghanistan) has challenged 20th century concepts of collective, common, and cooperative security, and have also largely succeeded in marginalizing the concept of 'human security'.³ These relatively progressive concepts have been replaced in the US and in some of its allied states by a strident reassertion of 'national security' by military means.

Instead of supporting cooperative non-military solutions to problems or combining development initiatives with security in the promotion of 'human security', the United States initiated a quest for 'full spectrum dominance' on land, sea, and in the air. This has been accompanied by the promotion of uni-

1 This is particularly true in relation to nuclear testing in the Pacific.

2 See for example: Dorrance/Thakur/Wanandi/Vasey/Pfaltzgraff 1990; Polomoka 1990; Finin/Wesley-Smith 2000; Shibuya/Rolfe 2003; Henderson/Watson 2005; Dupont/Pearman 2006; Brown 2007.

3 Traditional security policy emphasizes military means for reducing the risks of war and for prevailing if deterrence fails. Human security's proponents focus to a much greater degree on holistic non-coercive approaches. These range from preventive diplomacy, conflict management, and post-conflict peace-building, to addressing the root causes of conflict by building state capacity and promoting equitable economic development. See at: <<http://www.humansecuritycentre.org/>>, 24 September 2006, p. 1 of 2.

lateral and pre-emptive exceptionalism in relation to armed conflict.

The chief casualties of these strategies have been multilateral agencies and all those interested in promoting more comprehensive approaches to security at national, regional, and global levels. At the Millennium Plus Five Summit in September 2005, for example, the attempt by the Secretary-General of the United Nations, Kofi Annan, to combine the development, security and human rights agendas, in his report *In Larger Freedom*, was effectively sabotaged by the United States when its UN Representative John Bolton tabled 750 amendments to the draft final document two weeks before the Summit in New York. This signalled a strong desire on the part of the US and its closest allies to prevent the UN combining the Security, Peace, Human Rights and Development agendas in a new conceptualization of security. The present US government has an even stronger aversion to adding environmental sustainability to this integrated agenda.

Efforts to develop more holistic analyses and prescriptions for the security problems confronting the world, therefore, seem remote at the moment as long as the US feels that it is setting the global security agenda and wishes to do so primarily through assertion of its military dominance. US military might is now greater in terms of scope and lethality than that available to any other military power in world history.⁴ In 2005, the US was responsible for about 47 per cent of the world's military spending (SIPRI 2006: 302). The US has 13 military bases in countries around Afghanistan. It has a military presence in Uzbekistan, Tajikistan, Kyrgyzstan, and Georgia, all former Soviet countries. The US Defense Department employs 1.4 million people on active duty. It is the largest employer in the US with more employees than Exxon Mobil, Ford, General Motors and the General Electric Company combined. The Defense Department owns 40,000 properties covering 18 million acres of land. It operates a fleet of more than 15,000 aircraft, including 20 stealth bombers in service. The navy operates more than 1,000 ocean going vessels. The US Defense

Department buys enough fuel every day to drive a car around the world 13,000 times. The US headquarters at the Pentagon employs 23,000 workers and has 17 miles of corridors. The US spends an average of \$28,000 on research and development for each member of its armed forces, compared to the European average of \$7,000.⁵

The challenge facing the world community, therefore (or those parts which wish to endorse moves towards the international rule of law), is how to control this formidable power and determine what mechanisms and institutions can begin integrating the development, security, peace, human rights, and environmental agendas. This is important because a holistic approach to security, which places the safety of individuals at its heart, provides policy-makers with a better way of transcending Hobbesian security dilemmas than the rather tired realist perspectives on security. Holistic concepts of security have a better chance of doing this because they are committed to ensuring that basic human needs – for identity, recognition, inclusion, freedom, and welfare are satisfied on a sustainable basis. Meeting these needs will go a long way towards removing some of the basic sources of conflict.

68.3 The 21st Century: A Century of Regionalism?

The end of the Cold War provided an excellent opportunity to advance these objectives and to reconceptualize security in a more progressive direction. The fact that this opportunity has been squandered in an overreaction to terror and terrorist threat does not mean the end of the effort. On the contrary, it simply reinforces efforts to think about what sites might be more successful in promoting these objectives than those which are dominated by the militarily powerful states. If the surviving Cold War superpower is unwilling or unable to combine these agendas, what other states or intergovernmental bodies can do so? And are they able to lead and support the United Nations in its efforts to move towards a more comprehensive concept of security?

If the 19th and 20th centuries were the centuries of nationalism and imperialism, it is the present authors'

4 If military expenditures are used in market exchange rate dollar terms, in FY 2005 the US military expenditure of US\$ 478.2 billion were above the total of the next 14 top military spenders whose joint expenditure amounted to US\$ 361.6 billion. If one uses military expenditure in purchasing power parity (PPP) dollar terms, US defence expenditure equals that of China, India, Russia, France, the UK, and Saudi Arabia (SIPRI 2006: 302).

5 See: "US military might – the facts", *The Observer* (10 March 2002), at: <<http://www.guardian.co.uk/september11/story/0,,665109,00.html>>, 20 September 2006, p. 1 of 3.

contention that the 21st century will be the century of regionalism. The United Nations will only be able to fulfil its mandate as the institution dedicated to save “succeeding generations from the scourge of war” if it can surround itself with regional organizations capable of shouldering some of the conceptual and operational burdens of long-term peace building. Such a vision may be based on Chapter VIII of the UN Charter dealing with regional arrangements and agencies.⁶ This perspective was also stressed by Boutros-Ghali in his Agenda for Peace (UN 1992).

Of all regional organizations, the European Union, with all its imperfections, remains the best model of supra national integration. It has made most progress in combining the development-security-human rights and environmental agendas. It has done this by building on areas of economic commonality and through the development of trans-national laws and institutions that have persisted for the last 50 years and have managed to contain a wide variety of political differences as well. Although it has experienced some setbacks recently in relation to popular support for a European constitution, it has made progress on the development of a common foreign and security policy (buffeted a little by division over the war in Iraq) and initiated a range of conflict sensitive development policies aimed at the elimination of structural sources of conflict, while delivering high levels of emergency relief alongside short- and long-term development initiatives.⁷

It was severely challenged by the civil wars in Yugoslavia and by efforts to develop a common foreign and security policy, but it remains a project which should capture the imagination of all the x and y generations as they struggle to come to terms with modalities for guaranteeing structural stability in other parts of the world. Starting with the horrific experience of a global war, the founders of the EU focussed on economic interests, functional cooperation, and

then the development of political and judicial institutions to give expression to the common interests of (now 25) nation states. This was and remains a very impressive achievement indeed. The question confronting the Asia Pacific region (and here especially the South Pacific) is whether and how this experiment might be translated into different geographic, socio-economic, cultural, and political contexts.

68.4 Regional Security in and for the South Pacific

The hardening of state security systems post 11 September has restricted the space for regional initiatives a little, but there is no doubt that the EU and similar organizations remain an important inspiration for those seeking alternative approaches to security through the creation of action spaces for the promotion of human security using a variety of non-military developmental and diplomatic means. Realist solutions to both terrorist threat and war (as epitomized by the wars in Afghanistan and Iraq) are proving disastrous to the generation of a stable peace in the Middle East, and far from renewing confidence in military solutions are in fact accelerating a renewed interest in world peace through world law and the rediscovery of institutions capable of promoting high levels of multi-lateral cooperation across a range of different sectors.

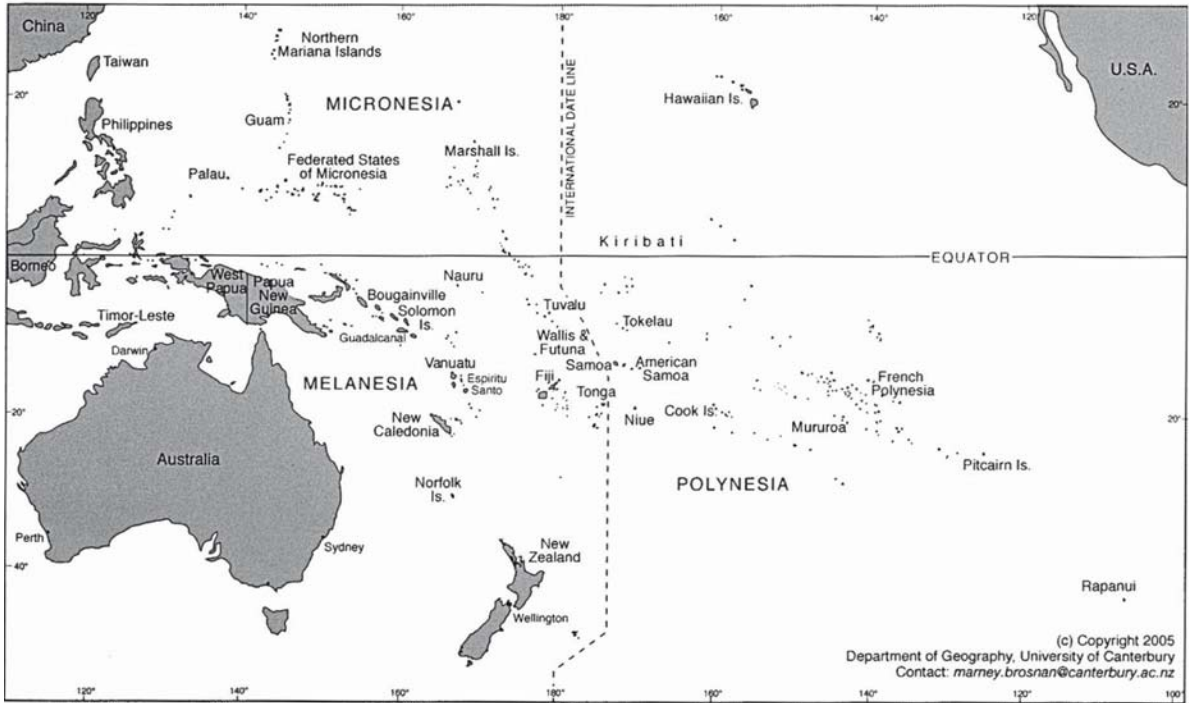

Regional organizations inevitably reflect the socio-economic, political, and cultural conditions of the state parties. This means that there are great resource differentials between all of them. But each in its own way is beginning to challenge narrow concepts of national sovereignty while expanding areas of sub-regional and regional cooperation. To be successful each regional member requires a degree of de-territorialization and de-borderization and some ceding of hard notions of national sovereignty. The more willing state parties are to move in this direction, the more likely they are to generate regional resilience and pre-emptive problem-solving capacities.

The South West Pacific is an interesting area within which to explore the role of regional organizations and alternative conceptions of security. Apart from Australia and New Zealand, (the two regional hegemon) most other countries in the region are relatively small in international terms (Crocombe 2001). The area has 28 island states and territories, covering 30 million square kilometres of ocean, of which only about 2 per cent is land.

6 See Chapter VIII of the UN Charter. There were two different concepts of regionalism considered during the planning process for the UN Charter, the regional perspective of Churchill that was to protect the British global influence and the view of regional cooperation expressed by the Latin American countries at the Chapultepec Conference in early 1945 (Russell/Muther 1958).

7 See for example: Ministry for Foreign Affairs: *Preventing Violent Conflict: A Swedish Action Plan* 1999: 24, at: <<http://www.sweden.gov.se/content/1/c6/02/01/61/aad1f9e6.pdf>>, 28 September 2006; Gomes/Sherriff/Lehtinen/Bossuyt 2001; Gaigals/Leonhardt 2001.

Figure 68.1: Map of the Pacific Region. **Source:** © Marney Brosnan, University of Canterbury, Department of Geography, reproduced with the permission of the copyright holder.

Populations in the regional states and territories range from over 5 million (for Papua New Guinea) to around 1,000 (for Niue) with a very approximate total of over 8 million for the region as a whole. The majority of the region’s population are sustained by subsistence agriculture with most people living in small communities and lineage groups. Despite its small population, the South Pacific is home to a quarter of the world’s total number of languages. The Pacific Islands are also ethnically diverse, with three sub-regional areas marked by their predominant indigenous Melanesian, Polynesian, and Micronesian populations (see figure 68.1). Melanesia, for example, includes Papua New Guinea, the Solomon Islands, Fiji, and Vanuatu as independent states, and West Papua (a province of Indonesia) and New Caledonia (shared sovereignty with France). It makes up approximately 85 per cent of the region’s population⁸ and holds most of the region’s land-based mineral and timber resources. It is culturally very different from Polynesia and Micronesia, and most of the Pacific conflicts of recent decades have occurred in Melanesia. (Dinnen/

Ley 2000; Finin/Wesley-Smith 2000; Reilly 2004: 479) as table 68.1 shows.

Table 68.1: Armed conflicts in the Pacific Islands Region 1980–2005, **Source:** Henderson/Watson (2005: 5).

Conflict	Years	Estimated deaths
West Papua independence struggle	ongoing	Over 100,000
Papua New Guinea highlands tribal fighting	ongoing	Several hundred deaths/year
New Caledonia independence struggle	1980’s	Over 50
Bougainville independence struggle	1990’s	Over 10,000
Solomon Islands conflict	2000–2003	200

The island states and territories all have some important strengths and resources which are generating a very particular type of resilience, and which make them anthropologically unique (Brown 2007). In the first place, all have important traditional subsistence sectors that sit rather uneasily with modern economic and political institutions. The clan, the village, and the

⁸ For information about Pacific regional populations, see at: <<http://www.spc.int/demog/en/stats/2004/2004%20Current%20Pacific%20population%20dynamics.doc>>, 28 September, p. 1 of 6.

province, therefore, are all much more important political units than the nation state.

The political status of the Pacific states and territories is also diverse and includes independent states, self-governing nations in free association with New Zealand or the United States, and others that are dependencies or integral parts of metropolitan powers including France, the United States, Britain, Chile, and Indonesia (Finin/Wesley-Smith 2000: 5). This heterogeneity provides some significant challenges to concepts of regionalism.⁹ Though regionalism is an ambiguous term (Hurrell 1995: 38), constructive theories of regionalism point to the central issues for Pacific regionalism – regional awareness and identity, based on a shared sense of belonging to the regional community (Hurrell 1995: 64). What is it that unites such a disparate group of states and peoples as those in the Pacific? How do people habituated to village and communal life connect to the newly independent states which sometimes sit rather uneasily on custom and tradition? How do these states and peoples deal with low economic growth rates, rising populations, pressures on natural resources, a large and youthful population which is either unemployed or underemployed, and weak governance systems (Henderson 2005: 9)? Are regional organizations – like the Pacific Islands Forum – which are essentially collections of states, able to add real value to development, peace, and the collective rights of individuals living in such environments? Can a regional organization in the South Pacific make the same sort of positive difference that the EU makes within Europe? In particular, can such institutions really help generate sustainable development, stable peace, and environmental integrity, or will they simply create another bureaucratic overlay that impedes the evolution of local and national solutions more likely to deliver these objectives?

How do politicians in the Pacific – seeking to apply Westminster principles to government – deal with the long established social and economic institutions that rely heavily on custom and tradition? This is particularly challenging when these traditional local institutions seem to provide more real security for citizens than do the institutions of the state. In the political crisis that engulfed the Solomons from 2000–2003,

for example, the capital, Honiara, was paralysed by conflict between groups from the neighbouring islands of Malaita and Guadalcanal (Moore 2004: 140), but the majority of the population (84 per cent) who live in villages managed to survive, maintain order, and deal with political and economic differences non-violently (Moore 2007). They could do so because of the strength and legitimacy of traditional institutions. This experience of high levels of communal solidarity challenges many taken-for-granted assumptions about the dependence of Pacific Island states on their larger neighbours to guarantee security in the face of adversity (Brown 2007).

Because regional organizations in the Pacific are not dealing with well-established European economic or political systems, they have to work at a different pace than those that are. Regional organizations in the Pacific are dealing with relatively emerging governance systems – some of which work well and others not so well (Brown 2007).

Most of the Melanesian states, for example, gained their independence only since the 1970s. This means that people in these states are still adjusting to what it means to be a nation and what it means to be a citizen. While they have a very clear sense of what it means to be a traditional actor in close knit communities, they are much more challenged by what it means to be a political actor within a transitional political system moving from customary to law-based rule. This dilemma makes it particularly difficult to realize both community and national interests within a regional organization. It also means that there is some bewilderment about how a regional organization can generate real security for citizens when many state institutions (especially those in Melanesia) have not demonstrated great capacity for doing so over the past 30 years. This may in fact be one of the challenges of thinking in terms of regional solutions to regional security problems. Does the effectiveness of a regional organization depend primarily on the strength of local communities, or nation state mechanisms, or a combination of both?¹⁰ If the local community is the major provider of real security, how does the regional organization connect with these fundamental building blocks of the Melanesian, Micronesian, and Polynesian communities?

9 Hettne's concept of the 'new regionalism' applies in the Pacific where the states need to cooperate in order to tackle global challenges (1996). This regionalism is multidimensional, involving trade, economic development, environmental and social concerns as well as security. See also the chapter by Hettne in this volume.

10 Narine (2005: 424), for example, indicates that in the experience of Asia, as long as states are in the process of state-building (creating a national identity from disparate local communities) they are less able to contribute to strong regional institutional structures.

68.5 Environmental, Economic, and Political Challenges for Human [and Livelihood] Security in the South Pacific

There are many issues that are common to the Pacific Island states and most of these cannot be dealt with at a national level alone. In relation to climate change, for example, countries such as Tuvalu will be inundated in a very short period of time if there is significant melting of arctic ice caps (Barnett/Adger 2003: 326; Dupont/Pearman 2006: 46–47). This is clearly not a problem that can be addressed by Tuvaluans alone. Faced with the prospect of environmental disaster they have no alternative but to (i) work with others to try and prevent the calamity from occurring and/or (ii) work to prepare for the worst case scenario which may mean the relocation of the entire population to another island state or to Australia or New Zealand. Regionalism, for Tuvalu, therefore is necessary to work through this difficult issue. The reality is that while there are many sources of optimism there are also many problems that can only be dealt with regionally and globally. Within Melanesia, for example, there is considerable political instability, significant challenges to food and economic security, and high levels of corruption which are often instigated from the highest levels of government. Most of these demand creative responses from bilateral and regional development agencies, and most require new ways of thinking about security and governance.

The powerful actors in the region, Australia and New Zealand and multilateral agencies, such as the UNDP, have focused on the strengthening of state legitimacy and effectiveness (particularly justice, security, and financial institutions). This has often been at the expense of more village level bottom-up development and security initiatives. Paradoxically this often results in a strengthened political elite and a corresponding subversion of the power of local influentials (traditional chiefs and decision-makers) who have been responsible for the protection of custom and higher levels of community well-being.

These 'traditional influentials' in Vanuatu, Fiji, the Solomon Islands, and Papua New Guinea are gradually beginning to provide some local resistance to the strengthening of corrupt political leadership and the seemingly remorseless power of an expanding global market with all of its positive and negative consequences.¹¹ This resistance manifests itself in relation to questions of communal land, land tenure, and how such arrangements can accommodate the demands of

modern capitalism without subverting and undermining the strength of local communities. Communally owned land, for example, is central to concepts of social and community well-being in the Pacific, but it is often viewed as a constraint to easy incorporation into global capitalism.¹² The demands of development, in this situation often strike at the heart of what has provided real security for citizens through time.

Individuals and politicians in the South Pacific have been forced to grapple with these two competing dynamics – one aimed at their incorporation into the global economy (often with quite disastrous consequences, e.g. Nauru's experience of having one of the highest per capita incomes in the world to now one of the poorest)¹³ and the other aimed at conserving the more fundamental sources of real communal security as manifested in the preservation of a strong sense of custom and tradition (Brown 2007).

In fact, the benefits of economic globalization and state-building have been very mixed for most Pacific Island states. Mining companies and logging companies, for example, have generated prosperity for a few but deep environmental and economic stress for many. Similarly the nationalist slogans of politicians and adversarial political parties sit uneasily on communal high context socio-cultural relationships¹⁴ and these have generated certain disillusionment with po-

11 For example, in Vanuatu, where 70 per cent of the prime land on Efate is reportedly leased to only a handful of foreign owners, the growing concern about people's future access to land for subsistence precipitated an urgent Santo Chiefs' Summit in November 2005, where all present agreed that any land that is leased to foreigners must only last 25 years instead of 75 years, which has been the practice. See: <http://www.vanuatu-daily.com/news/currentweek.php?subaction=showfull&cid=1151540545&archive=&start_from=&ucat=2&>, 28 September 2006.

12 It is argued by some development proponents that the solution to underdevelopment is to remove social formations that conflict with development understood as economic growth, and that customary land tenure is a stumbling block to development (Moore 2007), however, communal land tenure is of great importance to Pacific peoples both symbolically and also for subsistence livelihoods (see: Sullivan 2002).

13 In 1975 Nauru had the second highest per capita income in the world after Saudi Arabia, due to phosphate mining. By 1995, following the collapse of the Bank of Nauru, the country faced a serious financial crisis. Nauru continues to face serious economic and social challenges. See at: <<http://www.mfat.govt.nz/foreign/regions/pacific/country/naurupaper.html#Economic>>, 28 September 2006, p. 4–5 of 8.

litical processes and dynamics in Papua New Guinea, the Solomons, Vanuatu, and Fiji.

68.6 Regional Organizations in the South Pacific

In so far as there is a security debate in the Pacific it is now beginning to focus more on human and collaborative security rather than national security.¹⁵ It is in this context that the *Pacific Island Forum* (PIF) has endeavoured to articulate the benefits of regional solutions to national problems.

The *Pacific Islands Forum* was established in 1971, with only seven members including Australia and New Zealand. It was originally known as the South Pacific Forum but changed its name in 2004. It was established in order to promote issues of collective concern without challenging the sovereign rights of its members. By highlighting the principle of non-interference it affirmed a strong desire not to cede significant components of national sovereignty. It focused a lot of its early political attention on questions such as French nuclear testing, and was responsible for introducing and implementing the South Pacific Nuclear Weapons Free Zone. It also tried to work out how it might respond to issues such as secessionist movements in Vanuatu, the independence movement in New Caledonia, as well as signs of unrest in Papua New Guinea.

The principle of non-interference, however, often made it difficult for the Forum to intervene in these conflicts. Certainly it was rather incapacitated in relation to the Bougainville conflict¹⁶ and the different coups that have taken place in Fiji over the past 20 years (Shibuya 2004: 112). Since the beginning of the 21st century, however, there has been a growing recognition of the fact that if the PIF is to make any significant difference to some of the national and regional

challenges confronting the Pacific, then there has to be some softening of the principle of non-interference (Shibuya 2004: 112; Peebles 2005: 77). In recent years it has, for example, expanded its membership and developed a more proactive approach to intervention when confronted by instances of severe incapacity. The Forum now consists of 16 members. It has also granted observer status to a range of non-independent states and is reaching out to a wide range of civil society organizations as well. It sees its role primarily as a coordinating mechanism establishing communication and building effective relationships between a wide variety of Pan Pacific institutions such as the *Secretariat of the Pacific Community* (SPC), the *Pacific Islands Development Programme*, the *University of the South Pacific* (USP), the *Pacific Islands Conference of Leaders* (PIC), the *South Pacific Regional Environment Programme* (SPREP), the *Forum Fisheries Agency* (FFA) and the *South Pacific Applied Geoscience Commission* (SOPAC). It does this primarily through a group known as the Council of Regional Organizations in the Pacific (CROP). It also hosts the *South Pacific Chiefs of Police Conference* aimed at improving the professional development of police managers and executive leaders in order to address issues of regional crime. Table 68.2 shows the membership of various regional organizations. The different composition of each organization is influenced by historical and political alignments, and reflects the complexity of defining the exact boundaries of this region.

The Forum's inability to respond adequately to the crises in Bougainville and then in Fiji prompted Pacific Island leaders to work toward developing some strategies for dealing with these national security crises more effectively. In the Forum's 1992 *Honiara Declaration on Law Enforcement Cooperation*,¹⁷ for example, the main principles for law enforcement cooperation were developed. This was followed by the *Aitutaki Declaration on Regional Security Cooperation* (1997),¹⁸ the *Biketawa Declaration* (2000),¹⁹

14 In these small states, it is culturally problematic to publicly criticize the political elite who are often simultaneously neighbours, relatives, and chiefs (Quanchi 2007).

15 In the Pacific Islands Forum 2005 Pacific Plan, 'security' is defined (in line with the definition of the International Commission on Human Security) as the stable and safe social (or human) and political conditions necessary for, and reflective of, good governance and sustainable development for the achievement of economic growth. Issue Paper 7: Human Security and The Pacific Plan, see at: <www.pacificplan.org/tiki-download_file.php?fileId=156>, 28 September 2006, p. 1 of 2.

16 Bougainville, now an autonomous region within Papua New Guinea, suffered nine years of highly destructive civil violence from 1988 to 1997. This conflict involved a self-determination struggle against Papua New Guinea, but also attacks on mining interests and violence amongst different groups of Bougainvillians themselves (Brown 2007).

members' request for assistance for action to be taken on the basis of all members of the Forum being part of the Pacific Islands extended family" (Urwin 2005: 16-17). This was perhaps the first time that PIF leaders publicly acknowledged that the problems of one might, in certain circumstances, be the problems of all. This is a vitally important step in relation to the development of a more acute consciousness of the ways in which national and regional interests can coincide.

The *Biketawa Declaration* has provided the authority for considerable Forum intervention in recent years. It first deployed election observers to the Solomon Islands in the 2001 elections (Peebles 2005: 162). The Forum also established an *Eminent Persons Group*, of former leaders and diplomats, who travelled to the Solomon Islands in 2002 to consider a Forum response to the conflict (Peebles 2005: 63). The Forum then responded to a request from the Solomon Islands government in 2003 to intervene in the conflict. The resulting *Regional Assistance Mission to the Solomon Islands* (RAMSI)²¹ stabilized the country within three months and collected almost 4,000 weapons without a single shot being fired (Peebles 2005: 167). The mission's aims extended beyond the reestablishment of law and order to assist in the processes of emergency relief, development, and long-term nation-building. This generally positive experience suffered something of a setback in April 2006 when the unpopular election of Snyder Rini as Prime Minister precipitated violent riots in Honiara and the destruction of the largely Chinese commercial sector (Moore 2006: 4). The deployment of RAMSI has been generally positive although the limits of military intervention in the Solomons, as in Iraq, are plain to see.

The Biketawa framework was used again in 2004 in relation to a Forum intervention to design a process for dealing with Nauru's financial crisis when it realized that it was for all intents and purposes bankrupt. Although the Biketawa declaration provides criteria by which the Secretary-General (in collaboration with Forum Leaders) can initiate diplomatic and military action in response to a member country's problems, there is now widespread acknowledgement that the deployment of police and military after conflict has occurred is not where the PIF should be directing most of its efforts. On the contrary the military interventions have generated renewed momentum behind

discerning the long-term structural sources of conflict in the region and working to ensure that the underlying causes of tension are addressed.

To this end the Forum initiated, in 2000, a survey of the prospects for security in each of the Forum's member states, and developed the annual meeting of the *Forum Security Committee* as a place for conducting wide-ranging assessment of security issues affecting the region. This has resulted in a series of national and regional security assessments, all of which have stressed the necessity for a holistic approach to security combining equal attention to economic and social development, security, and good governance and human rights agendas.

Within this framework considerable attention has been dedicated to working out how traditional and modern leaders in all PIF states can govern with justice, wisdom, impartiality, and fairness – qualities which were largely taken for granted in traditional times but which have been rather subverted in modern times.

In order to ascertain how the PIF could play a critical role in relation to these objectives, Forum leaders decided to review Forum effectiveness in 2003. The *Eminent Persons Group* travelled the Pacific with a mission to find out, what sort of a Pacific member states and peoples wanted. This has given rise to the *Pacific Plan: For Strengthening Regional Cooperation and Integration*²² to promote peace, harmony, security, and economic prosperity. This has generated new momentum behind closer regional cooperation and deeper regional integration in order to advance the building of peace and the prevention of conflict. Among other things this plan is aimed at strengthening regional resistance to the more malign effects of globalization in the region. The dilemma this is highlighting is how to resist the more pernicious features of globalization without succumbing to a romantic idealization of subsistence past.

The *Pacific Plan* seeks to save the resources, harmonize the processes, and align the policies of the Forum's member states within a ten-year period from 2006. Its concept for regionalism is, "countries working together for their joint and individual benefit" (*Pacific Plan* 2005: 4) and it does not imply limitation on national sovereignty. The intention is that a regional approach should only be taken if it adds value to national efforts. The Plan's four guiding principles are

21 RAMSI was established under the Forum mandate and headed by Australia, with regional personnel staffing the mission (Moore 2004).

22 For the *Pacific Plan* and its background papers, see at: <<http://www.pacificplan.org/tiki-page.php?pageName=HomePage>>, 28 September 2006.

economic growth, sustainable development, good governance, and security.

The *Pacific Plan* is ambitious and wide-ranging and it remains to be seen how effective it will be in improving the security in the Pacific Islands region as it attempts to balance the economies of scale with the diseconomies of isolation. The Plan recognizes the need for “harmonization of traditional and modern values and structures” (Pacific Plan 2005: 7), however, it does not really begin to address the tensions at the interface of traditional and modern governance. It is recognized in the Plan’s supporting documents²³ that the current declarations and mechanisms previously introduced by the Forum to improve regional security will “need to be strengthened to ensure action plans are operationalized and monitored.” In addition, Crocombe warns that unless Pacific governments are prepared to devote a larger share of their national resources to regional activity, they will not be able to achieve the Plan’s goals.²⁴ Moreover, priority needs to be given to sharing the benefits of regional activity more equitably, as the benefits of regionalism so far have been uneven.²⁵ The top-down development of the Plan has also been criticized: regional civil society has made a statement regarding inadequate consultation, particularly with civil society in the development of the Plan.²⁶ This and the lack of a gender focus²⁷ will make it difficult to effectively realize the Plan’s human security aims. Gender equality and women’s empowerment are significant issues in the Pacific (Sepoe

2007), and require a systematic approach. Fortunately the *Pacific Plan* is designed as an evolving process (Pacific Plan 2005: 9) to be reviewed annually in the Forum meeting, so there is yet opportunity to address these weaknesses.

Ultimately the effectiveness of the Pacific Plan will depend on individual states making and implementing relevant policies. While the members each grapple with persistent issues including corruption, political and economic exclusion of large proportions of the population, tensions between traditional and modern governance, inequalities, low employment, and social service provision, their collective energies towards regionalism are likely to be drained by these domestic issues. That these issues are shared across the region, however, may also provide an impetus to address them within the regional framework.

The PIF is nowhere near as large or as elaborate as other regional organizations such as the EU, the African Union, and ASEAN, but its aspirations are similar and the gains from integration are comparable. It will be supported in this endeavour by its two strongest members, Australia and New Zealand, and by a host of other regional and multilateral players not the least of which is the EU itself and the United Nations, which acknowledges that the PIF is the organization that it wishes to connect with in relation to Pacific Affairs.

68.7 Summary and Conclusions

Although still in its infancy, the PIF is committed to ensuring that the Pacific is a zone of peace rather than one of instability. It has adopted a broad and comprehensive conception of security and it acknowledges the central importance of working with both traditional and introduced institutions in the achievement of higher levels of economic growth, long-term sustainable peace, and stability. The region is unique in that it is home to some of the world’s rarest language and cultural groups and it remains surprisingly resistant to whole scale incorporation into the global capitalist economy. The areas of subsistence agriculture, traditional rule, and customary procedure which are working to everyone’s benefit might in fact have very positive evolutionary value for other more ‘developed’ parts of the world.

If the PIF and other regional mechanisms can generate spaces for the coexistence of both subsistence and capitalist production and distribution, and legitimate traditional as well as introduced political and ju-

25 According to Crocombe, Papua New Guinea, with 65 per cent of the people of the region, has had least benefit from regional organizations. Solomon Islands and Vanuatu have also been marginalized. The main benefits have gone to the centre (i.e. Fiji). The emphasis on the Small Islands States is another example of imbalance – all Small Islands States together have fewer people than an average PNG province, yet few PNG provinces see any significant benefits from regional organizations (2005: Pacific Plan Regional Analysis, International Context and Lessons From Other Regions: A Perspective p. 299); Shibuya (2004: 108) gives the example of USP, the regional university, whose employment, scholarships and enrolments have favoured Fiji nationals.

dicial institutions, it might be able to make a major contribution towards a better understanding of security in our postmodern, post-industrial world. The prognoses of modernization theorists do not seem to have been realized in the Pacific. Tradition and custom have demonstrated considerable resilience and persistence. It seems clear, therefore, that new models for both national and regional development are 'hybrid' models combining the best of traditional and customary rule and decision-making with introduced democratic forms. In this process all member states of the PIF and the secretariat need to be strengthened so that collaborative holistic orientations to security might be conceptualized and implemented in the South Pacific.

69 Security on the American Continent: Challenges, Perceptions, and Concepts

Francisco Rojas Aravena

69.1 Introduction

The UN Security Council had to set up a peace enforcement mission in Haiti to prevent a civil war, which might spill over into neighbouring countries. The death toll is rising daily in Mexico and Central America due to cross-border fighting between rival gangs or *maras*. To establish the rule of law, the Brazilian government decided to send troops into Rio de Janeiro to stem a tide of violence associated with drug trafficking, which is using the weapons of war. In Colombia, the authorities announced that they were going to implement the 'Patriot Plan' to reclaim territories where the state lost jurisdiction decades ago from guerrilla forces. These decision-triggered fears in neighbouring countries, especially Ecuador, that conflict would spread across the border. Amid the sociopolitical polarization in Venezuela, the government arrested nearly a hundred Colombian paramilitaries accused of subverting national order. In Bolivia, against a backdrop of instability, the armed forces withdrew to barracks in protest against a military trial being transferred to a civil court. This happened during increasing mobilization against the policies of President Mesa. Bolivia's maritime claims against Chile undermined dialogue between the two countries. Argentina has been plunged into an energy crisis, which is exerting an impact on neighbouring states. For Chile, this meant launching a diplomatic and technical debate about fulfilling contracts and respecting commitments. From the perspective of the United States, threats from the region focus on the narcotics trade, which is being linked to international organized crime and thus to extremist and terrorist structures in the greater Middle East.

The scenario described above shows how, in the 35 countries of the American continent, there is a strong interplay between the security, governance, defence and development agendas, driven by a broad spectrum of stakeholders in a context heavily interlinked with international and domestic factors. The

focus of attention in Latin America and the Caribbean is the hemisphere itself, but also the sub-regional environment. Only Brazil defines itself as a global and regional player, which is why it supports initiatives such as the G3/BISA (Brazil, India, and South Africa) and the South American Strategic Area.

There are four sub-regions in Latin America and the Caribbean: in the north, the Caribbean (both Spanish and English-speaking) and Central America (7 countries) plus Mexico. Together these two sub regions make up the extensive Caribbean Basin (see fig. 69.1). South America consists of another two sub regions: the Andean nations (Bolivia, Colombia, Ecuador, Peru and Venezuela) and MERCOSUR (Argentina, Brazil, Paraguay and Uruguay); to these we must add Bolivia and Chile as associated states (see figure 69.2).

69.2 International Security: Where Does Latin America Fit In?

During the present post-Cold War and post-11 September period, there is no clear vision shared by the various international players on the essential path forward for the international order. The attacks of 11 September 2001 in the United States, combined with subsequent terrorist attacks up to 11 March 2004 in Madrid, indicate that the main threat is international terrorism with its global reach. This is most widely perceived as the prime threat by countries belonging to the United Nations. However, perceptions of just how close and/or imminent this threat actually is differ substantially from one region of the world to the next.

In structural terms, the United States is perceived to be consolidating its hegemony by creating a hard power gap of such magnitude that it has no counterweight¹. This gives it more scope to wield its essential

1 Philip Bobbitt: "Better than Empire", in: *FT Magazine*, 13 March 2004.

Figure 69.1: Map of Central America and the Caribbean. **Source:** Permission granted by University of Texas Library, Austin, map is in public domain and not copyrighted; <http://www.lib.utexas.edu/maps/americas/central_america_ref02.jpg>.

tool of influence ‘soft power’ (Nye 2004). The re-ordering of the global hierarchy is taking place outside the traditional institutional mechanisms of multilateralism. The United States is building a de-institutionalized capacity for global control based on ‘ad hoc coalitions’. This translates into a policy of *radical unilateralism* using intervention and pre-emptive strikes as its means (Rojas Aravena 2002). It is not yet apparent whether this will be long term state policy or whether it is simply the political expression of a specific administration led by George W. Bush.

Through the UN Security Council the international community, including Latin America and the Caribbean, has granted the biggest coalition of states, with the United States at the helm, broad powers to combat terrorism, authorizing the intervention in Afghanistan for this very purpose. This, however, was not enough for the Bush Jr. administration. His obsession with Iraq prompted him to break that coalition and exercise unilateral power, with serious consequences for multilateral cooperation and stability in the region, including the one of international oil prices. A year after the intervention in Iraq, it has

been effectively demonstrated that, however great the hard power of the United States may be, establishing peace and political, economic, and social stability in Iraq – as in any other conflict – calls for the kind of legitimacy derived from institutionalized multilateralism backed by material support.

The region that feels the influence of the United States most directly is the American hemisphere. Even so, it is granted scant attention or priority. Latin America plays a marginal role in world affairs. The region has sought to adopt and maintain a low key position on strategic issues. It has been defined as a ‘region of peace’,² non-proliferation, free of nuclear arms, strategic carriers or warheads, and chemical and biological weapons. For the same reason, military spending in Latin America and the Caribbean is lower than in any other region of the world.³

Latin America does not pose a threat to any international players. Quite the reverse: it contributes effectively to global stability by participating in peacekeeping missions created by the United Nations. Peace is not maintained of its own accord. One or more states

must assume the responsibility and accept the burden required to uphold it (Kegan 2003).

On the American continent, the will of Latin America will not in itself suffice to preserve stability and peace. The will of the United States is an essential

condition. The change of track in US policy as it pursued its 'multilateralism *à la carte*' combined with a process of unilateral intervention beyond the pale of UN legitimacy has strained the opportunities for cooperation in implementing peace. Moreover, the United States is promoting partnerships that divide the region. This happened over Iraq, with seven countries condemning the invasion and seven supporting it, of which four dispatched symbolic military contingents (El Salvador, Honduras, Nicaragua and the Dominican Republic). US policies towards the region are perceived as stimulating the militarization of conflicts and the 'securitization' of the agenda (Flasco-Chile 2004).

In the light of these trends, and also of the external/internal influence which the United States exerts in every country in the region, Latin America faces the option of: a) splitting further in pursuit of sporadic advantages for individual countries; or b) establishing effective mechanisms for dialogue with high standards of transparency to address questions of common interest. There is no consensus on commercial integration (American Free Trade Area) and the region is divided on whether or not to support it. Brazil has campaigned firmly against the idea.

The region does not share a common position on reforming the United Nations. Support is expressed for principles and proposals calling for 'more democracy' and more 'participation' in decision-making, especially in the Security Council. Views have been expressed that the UN should be restructured to enhance its representational balance.⁴ At least three countries - Argentina, Brazil and Mexico - have announced that they will be seeking a permanent seat on the Council if it is enlarged. Competition has paralyzed the dialogue and proposals. Faced with the emergence of new threats which are non-territorial, asymmetric and transnational - the hallmarks of global terrorism - Latin America may display a number of vulnerabilities, but it is not a logistic springboard for planning acts of global terrorism, in spite of US insinuations to this effect.⁵

All the evidence collected since the attacks of 11 September 2001 indicates that cells linked to global

terrorism are not operating from Latin America. This is one area in which it is important to continue cooperation and the exchange of information to prevent Latin American territory being used to attack the United States or the European Union and their interests.

69.3 State Security: Accelerating Change

States remain the primary actors within the international order, but are not the only actors. Today they are obliged to share arenas of power and cooperation with non-state stakeholders, civil society organizations, multi and transnational corporations, and even individuals. This has brought a fundamental change in regional and global relations.

State security has traditionally been founded on two fundamental components: a) internal cohesion in organizing domestic power relations, including the formation of a government capable of asserting the rule of law, within a set territory and for the whole population; b) relations between sovereign states, whether they are competing or cooperating. These two components have changed substantially throughout the world in general and in Latin America in particular. Frequently different players compete within the same territory, thereby fragmenting society; this is the case in Haiti, Central America, and Venezuela. In addition, when state action fails to satisfy the demands of peoples or societies, domestic security and the capacity for governance are subject to vulnerabilities. This is illustrated by the situation in Bolivia, Ecuador or Peru, and in Central America.

However, the main focus of inter-state relations is founded on the capacity for sovereign decision-making and full territorial integrity. Traditionally, this was the pivotal factor in the perception of threats to security. Peace between states is Latin America's greatest asset and one which needs to be preserved. The principal threat to state security in this region derives from domestic vulnerabilities. An inability to satisfy the demands and needs of the population makes it harder to establish effective democratic institutional-ity and to move forward from *electoral democracy* to *civil democracy*, as formulated in the UNDP Report of 2004 (UNDP 2004a).

Progress in security and defence relations was achieved during the 1990's because the major disputes over state borders - between Argentina and Chile, Peru and Ecuador, Chile and Peru, El Salvador and

4 Group of Rio: "Cuzco Consensus", 24th May 2003, in: <http://www.resdal.org/ultimos-documentos/docs-presidentes.html>.

5 Speech by General James T. Hill, Commander of the United States Southern Command, before the House Armed Services Committee in the US Congress. 24th March 2004, in: http://www.americas.irc-online.org/reports/2005/0507creep_body.html.

Honduras – were resolved and strategic military competition eased between the major players, notably between Argentina and Brazil in the nuclear field. Agreements and cooperation have consolidated this scenario of broad inter-state stability, enabling South America to declare itself a ‘peace zone’. Maintaining proactive measures designed to consolidate peace between states is an ongoing task. If existing processes of economic complementarity do not evolve into strong, intensive processes towards association and integration, there will be a need to address all the aspects associated with territorial sovereignty, border demarcation and strategic balance.

The traditional conflicts have not disappeared. In fact, there is a considerable number of disputes linked to the underlying issue of territorial sovereignty. Taking all the sub-regions as a whole, there are more than forty situations relating to border disputes coupled with territorial claims and/or demarcation problems on land or sea (Griffith 2004). The principal active controversies concern Belize-Guatemala, Bolivia-Chile, Honduras-Nicaragua, Colombia-Nicaragua, Costa Rica-Nicaragua, Colombia-Venezuela, Venezuela-Guyana, Argentina-Great Britain, and the United States-Cuba. In addition, there are many dormant conflicts. The experience of the 1990’s shows that these border issues led to a broad use of force. On more than 25 occasions force was demonstrated by means of effective military deployment or a readiness to mobilize (Mares 2003). In the case of Ecuador-Peru in 1995, there was a brief war, and active international mediation was required to end it. This involved the United States, Argentina and Chile via the Military Observer Mission to Ecuador and Peru (MOMEPE).

In the light of these facts, it is essential to establish specific mechanisms for recognizing disputes, proposing alternative solutions, and designing effective measures to promote a climate of stability and trust. Regional institutionalization – born during the Cold War – is still weak. There are no early warning systems. On the other hand, major advances have been achieved when it comes to confidence and security building measures, resulting in a range of progress from protocol initiatives to joint military exercises. This process has now been underway for ten years (Eastman 2003). Twenty-one states have announced the implementation of confidence and security building measures of this kind, above all, exchanges of information and visits to military installations.

A large number of countries in the region have specified defence and security policies in the form of Defence Papers: Argentina, Brazil, Chile, Ecuador,

Guatemala, and Peru. There is now also more transparency on military spending, founded on national sources but adopting a standardized methodology (ECLA 2001). Argentina and Chile launched an initiative, subsequently joined by Peru and with support from CEPAL, which will permit the creation of a comparative framework to express military spending. This is a field with huge potential for expansion at the regional level. Deeper knowledge mitigates the distrust that arises around military spending and procurement.

The main perception of threat – notwithstanding the above – is no longer rooted in inter-state disputes. The transnational dimension is now a central feature. Threats are affecting several states at once, and such threats cannot be resolved within national borders. Moreover, players or agents who do not represent governments or states are provoking them. Organized crime is a fundamental player in the emergence of these new threats. *Intra*-state tensions, gaps created *within* society, against a backdrop of growing access to light arms, have prepared the ground for various non-state forces, notably organized crime with its international links, to challenge the state’s legitimate monopoly of force.

There is a need in the region to address post-conflict situations in order to stem the transfer of weaponry which otherwise occurs. In other words, effective action must be taken as soon as a state and its society are pacified, to withdraw as many arms as possible from circulation, to establish strict supply-side control, and to restore the state’s monopoly on the use of force. This is one of the tasks currently posed in Haiti, which never reached its completion in Central America, and which will constitute one of the pivotal elements in Colombia.

Urban violence causes more deaths in Latin America and the Caribbean than open conflict does. The region suffers 25.10 homicides per 100,000 inhabitants, a rate higher than in any other region of the world; more than 100,000 people are murdered every year, quite apart from other crimes such as abduction and robbery. We should point out, moreover, that there is a major gender gap and big differences from one country to another. The overwhelming majority of murder victims are young men. Rates are extremely high in Central America and Colombia. In the former, this is a consequence of the wars during the 1980’s and confrontations between cross-border youth gangs, known as *maras*. In the latter, it is the result of the present conflict, which has been dragging out now for almost 50 years. Brazil has witnessed a big increase

in violence. Two countries display very low levels: Chile and Uruguay, both less than 4.6. The IDB estimates that altogether these deaths cost the region 14.2 % of its GDP.

69.4 Human Security: Individuals and Communities

The concept of human security entered the world stage in the mid-1990's in a context when new paradigms were being sought to anchor changes in the international order, with growing theoretical and practical debate about the traditional concepts of security that inspired actions taken by countries for much of the last century. The academic community, but also some international organizations and even states, promoted the concept of human security to define new security challenges more appropriately and place individuals at the focus of attention. The origins can be traced back to the UNDP (1994a) Report on: *New Dimensions to Human Security*, which argues "human security centres on the human being." Human security, the authors continue, means that people are able to exercise their options in security and freedom and that they can be relatively confident that the opportunities they have today will not vanish completely tomorrow. In 2003 the report *Human Security Now* of the Human Security Commission was published (CHS 2003). Human security clusters different types of freedoms: 'freedom from deprivation', 'freedom from fear', and 'freedom to act on one's own behalf'. The report suggests that there are two basic strategies for achieving the objective described above: *protecting individuals* or *empowering individuals*. On the one hand, human security emerges in this sense as a concept which complements the notion of the state's territorial security. On the other hand, however, the concept challenges the 'doctrine of national security' by focusing firmly on individuals and human rights. Human security integrates a multidimensional perspective, which, in contrast to the classical concept of state security, places the emphasis on non-military factors and on cooperation. Canada and Chile have promoted this human security perspective. Both are members of the *Human Security Network* set up by 14 countries on different continents: Austria, Canada, Chile, Costa Rica, Slovenia, Greece, the Netherlands, Ireland, Jordan, Mali, Norway, Switzerland and Thailand, with South Africa as an observer.

At the Special Conference on Security in the Americas, which will be discussed below, the concept

of human security was taken on board after lengthy debate as a basis for the protection of the individual and respect for human dignity. This marked some changes in structural trends up to 11 September, with the implementation of concrete policies from the Network's agenda (mines, control of small arms, child soldiers, human traffic). These initiatives complement those relating to state security and will reinforce international security.

69.5 Latin America's Prime Vulnerability: (Un)governance

If we analyse the security and defence situation in Latin America in 2004, we can conclude that the main threats are rooted in domestic conflicts. The key risk factors in Latin America and the Caribbean are associated with lack of governance, instability, and weak democratic institutionalality. The evidence of the last 15 years indicates a high level of regional instability and, in many instances, overspill from national conflicts into neighbouring countries and beyond, triggering conditions in which inter-state issues may re-emerge and escalate. The tensions between Colombia and Venezuela, or indeed between Ecuador and Brazil, are some examples. The crisis in Haiti reflects a similar scenario in the Caribbean.

Instability has become a persistent feature of Latin America and the Caribbean. Political and economic crises accompanied by social upheavals have provoked the resignation of eight heads of state, 19 military crises or states of tension and five coups d'état. During the 1990's Latin America and the Caribbean witnessed more than twenty-five institutional crises. The most striking cases were in Paraguay, Haiti, and Peru. Since 2000 new hotbeds of tension have developed in Argentina, Bolivia, Ecuador, Peru and Venezuela, quite apart from the renewed eruption of crisis in Haiti.

Instability calls for action to reinforce democratic regimes and implement support mechanisms of the kind envisaged in the Democratic Charter for the Americas signed in 2001. There are very high levels of dissatisfaction with democracy in the region: 66 per cent in 2003. National and regional alternatives must be developed in order to reduce social divisions and combat poverty. Particular importance is attributed to formulating and implementing a plan for democratic governance, paving the way for stability, growth, and human development as a foundation for national and regional security.

69.6 Regional Security: Defining the Threats and Devising New Concepts

Major efforts have been undertaken on the American continent over the last ten years to establish a common concept of security, founded on shared values, which would facilitate effective political commitments in this area. The American Presidential Summits – in Miami in 1994, in Santiago in 1998, Quebec in 2001, and Monterrey in 2004 – reflected the priorities, with specific measures expressed by means of action plans. In the field of security, this protracted process culminated in the Special Conference on Security⁶ held in the District of Mexico in October 2003, where a new, broad, and multidimensional concept of security was proposed which emphasized non-traditional threats.

69.6.1 Identifying the Threats: Sub-regional Factors

By ranking perceptions of threats in the various sub-regions we can observe strong similarities around the key themes of overarching concern. These are: drug trafficking, terrorism, arms trafficking, organized crime, the environment and natural disasters, poverty and social deprivation, and guerrilla activity and subversive groups. Analysing perceptions of threat from the perspective of the region as a whole, we will note that in all their contributions the authorities stress drug trafficking and terrorism as threats. Second place goes to poverty and social deprivation, arms trafficking and problems relating to the environment or natural disasters. There is a third category, which includes organized crime, although this might also be associated with arms trafficking or with terrorism and drug trafficking.

Guerrilla activity and subversive groups complete the list. However, if we analyse perceptions of threats sub-region by sub-region, priorities vary after the top two. Poverty emerges as a strong factor in the Andean region and the Caribbean, whereas natural disasters are a major concern in Central America. Only the Andean countries attach mid-ranging importance to guerrilla activities, while these come bottom of the list

in the other sub-regions. The Special Conference on Security defined the key threats as:

1. terrorism along with cross border crime and related offences,
2. extreme poverty and social exclusion,
3. natural disasters, HIV/AIDS and other diseases, and environmental degradation;
4. illegal human trafficking,
5. attacks on digital security,
6. potentially hazardous substances in maritime freight,
7. weapons of mass destruction and their carriers.

The Declaration on Security in the Americas lists 36 commitments. At least 50 per cent of these are aimed at solving the concerns and challenges described above.

69.6.2 Establishing a New Concept

The Declaration on Security in the Americas adopted a broad approach to conceptualizing security, rooted in a notion of multidimensionality as the interlinking factor. This places the concept on a wider footing, applying conventional methods to tackle new, unconventional threats, including their political, economic, social, health related, and environmental aspects.

This new concept of security with its broad approach facilitated consensus at the Special Conference on Security. It embraced the worries of all stakeholders, from the superpower to microstates in the Caribbean. In fact, the United States facilitated agreement by accepting two paragraphs, indicating its dissent in a footnote (landmines and climate change). A very broad concept is, however, harder to operationalize. Tackling the security, defence, environmental, health and development agendas simultaneously is such a comprehensive task that a coherent programme of activities is highly unlikely. Nevertheless, given the satisfaction felt by the states who subscribed to the concept, it is conceivable that each sub-regional structure will permit the formulation of action plans which are tailored more precisely to requirements, specific perceptions of threat and the resources available to combat them.

69.6.3 The Principal Actors

Mexico played a pivotal role in drawing the agreements, managing – after a postponement – to move the Conference on and achieve consensus around the Declaration. Chile and Canada made proposals in

6 OAS/Ser.K/XXXVIII: “Declaration on Security in the Americas”, Mexico City, October 2003; see at: <http://www.oas.org/documents/eng/DeclaracionSecurity_102803.asp>.

which the concept of human security was a fundamental factor. The United States focused strongly on development, although without suggesting any specific additions. Brazil stressed the issue of poverty. The Caribbean countries made a clear case for the concerns of small island states, and Central America promoted its model of democratic security.

In debates about security and defence in the countries of the region, there are some differences of a bureaucratic nature between government positions. The delegations participating at the Conference included representatives of foreign and defence ministries but also officers of the armed forces. It should be noted that, with the exception of Peru, all South American countries sent their Minister or Deputy Minister of Defence along with their Foreign Minister. In three cases, all from the English-speaking Caribbean, the head of delegation was a member of the military. Sixty per cent of delegations from countries with armed forces included military personnel. The participation of civil society organizations was modest, but they were given a hearing, and some of their recommendations were incorporated. There is particular significance in the recognition by states of consultation with civil society organizations in applying a multidimensional approach to security.

Considering this conceptual breadth and the constellation of actors involved, we expect cooperation to develop on a bilateral and sub-regional basis. We should be aware that pronounced bilateralism, especially between such asymmetric stakeholders as the United States and other countries in the region, will limit the scope for multilateral moves, tending to foster 'multilateralism *à la carte*' and to fragment the response. Therefore, this security architecture founded on and developed by the sub-regions will be flexible, modular, and by nature cooperative and collective.

69.6.4 A Flexible Security Architecture

This flexible character, defined in the Declaration adopted by Defence Ministers in Santiago de Chile in November 2002, has emerged because "the region has gradually shifted towards a complex system of security, constituted by a network of old and new institutions and mechanisms of security, both collective and cooperative, which is hemispherical, regional, sub-regional and bilateral in its reach."⁷

The Miami Consensus – an outcome of the expert meeting on confidence- and security-building measures in February 2003 – stated that

- the development of measures to promote confidence and security is part of the emergence of a new flexible security architecture in the Americas, as they are a substantial and irreplaceable feature of a network of bilateral, sub-regional, regional and hemispherical agreements on co-operation elaborated to complement the security institutions forged by the inter-American system.⁸

By virtue of the consensus achieved between states, the Declaration on Security in the Americas⁹ recognized and formalized a series of instruments that have instigated the construction of new security architecture for the American continent:

- The present guiding principles for security in the hemisphere are derived from the United Nations Charter and the Charter of the Organization of American States.
- The key instruments for the prevention and resolution of conflicts and the peaceful solution of disputes are the Treaty of Rio (TIAR) and the Bogotá Pact, although it is imperative to review these and adapt them to present-day security and defence needs.
- The institutions and processes with an active role in this field are the Organization of American States and its Security Commission. The Presidential Summits and Conferences of Defence Ministers provide orientation and define priority issues.
- Within the Inter-American family, the bodies operationalizing the new architecture are the Inter-American Commission on the Control of Drug Abuse (CICAD), the Inter-American Anti-Terrorism Committee (CICTE) and the Inter-American Committee for the Reduction of Natural Disasters (CIRDN). The Inter-American Court of Human Rights also plays a role. In addition, there are links with the Inter-American Defence Council (JID).

69.7 Conclusions: The Security Trilogy

In the last decade, the countries and societies of Latin America have been absorbed in a process of deep reflection and reformulation surrounding concepts of security. There has been a conceptual shift from a

7 "V Conference of Defence Ministers of the Americas", Santiago de Chile, December 2002.

Cold War perspective, with its sights set clearly on an enemy, expressed in the actions of a state and backed by powerful military weight, towards a new post-Cold War stage in which the threats are diffuse and transnational. The influence of traditional military factors has receded as a result, and many of these threats do not seem to be connected to state actors.

One of the major challenges, both intellectually and institutionally, has been to bring together the links in a conceptual chain that reaches from human to international security via state security (Rojas Aravena 2002, 2002a). The way in which this relationship is constructed will determine the ability to satisfy, operationalize, and implement at one and the same time the requirements of global and national security, as well as the security of individuals and communities. The essential nature of today's new international conflicts, centres on intra-state problems, demonstrates the need to explore a more appropriate definition of the inter-relationship between these three levels, especially given the impact of globalization. The new threats are by character transnational and they are part of the 'parallel globalization'. They involve actors and agents who for most part do not represent nations or governments, nor are they located in a clearly demarcated state territory. The risks and vulnerabilities that affect the security of one nation simultaneously - in the context of globalization and interdependence - influence the security of others, and so they cannot be exclusively resolved within the borders of one state. Wars have also changed radically. The great majority do not take place between states. Conflicts are intra-national with inter-state consequences. Their origins and driving forces are more likely to be socio-economic, ethnic, and religious or inspired by self-determination than the result of border disputes. Non-state actors have acquired a greater weight. Moreover, there are, growing calls for international inter-governmental bodies and NGOs to intervene. As a result, we are witnessing a further diminishing of state capacities in this field, especially in the case of states with relatively little power.

In this trilogy of human, national and international security, scenarios will determine which factor

has the greatest significance. By far the majority of cases where the state has power and influence, it will be under pressure to take responsibility for preventing a domestic situation from spilling across its borders into neighbouring territory, or from triggering major population displacements and, as a consequence, intra-state tensions. This reaffirms the continuing importance of states as the principal players on the international stage. In some geographical regions, especially Africa and the Caribbean, the centre of gravity will tend to lie more with international security and its key actors, those who have to respond when some states display weakness. The focus, then, is on the capacity of the international system to respond to crises in fragile or failing states, either to create stability or to initiate and promote cooperation and assistance during humanitarian disasters. In the case of Latin America, the key vulnerabilities derive from a crisis of governance throughout the region, which hampers the promotion of human security and produces, rather the opposite effect by generating opportunities for intense insecurity, reflected in a fear of violence and fear of the wide ranging dissatisfied needs.

Given the low level of conflict between states and a crisis of governance that falls short of humanitarian crisis, the international community pays little attention to the problems affecting Latin American countries. In short, Latin America and the Caribbean have enhanced global security thanks to denuclearization and their status as an inter-state Peace Zone. They weaken security because of their lack of governance. To achieve effective security, the conditions of one factor must be met at the same time as the conditions of the others. An international crisis is simultaneously a state crisis and a human security crisis, just as a crisis of human security is simultaneously a state and international crisis. Hence the need to construct a holistic, integrated perspective. For this we will need new terminology (Grabendorff 2003) and new concepts befitting this era which we cannot yet define, which is why we describe it variously as post-Cold War, post 11 September, and post-Security Conference.

Document 69.1: Excerpts from OAS: "Declaration on Security in the Americas". Source: OEA/Ser.K/ XXXVIII; CES/DEC. 1/03 rev.1 28 October 2003; Adopted at the third plenary session of October 28, 2003; full text at: <http://www.oas.org/documents/eng/DeclaracionSecurity_102803.asp>.

We, the States of the Americas represented at the Special Conference on Security, in Mexico City, committed to promoting and strengthening peace and security in the Hemisphere:

Recalling that the Inter-American Conference on Problems of War and Peace, held in Chapultepec, Mexico, in 1945, proposed a plan to respond to the security needs of the Americas; ...

Recalling that the Summit of the Americas in Santiago, Chile instructed the Organization of American States (OAS), through the Committee on Hemispheric Security to: "follow up on and expand topics relating to confidence and security building measures; analyze the meaning, scope, and implications of international security concepts in the Hemisphere, with a view to developing the most appropriate common approaches by which to manage their various aspects, including disarmament and arms control; and pinpoint ways to revitalize and strengthen the institutions of the inter-American system related to the various aspects of Hemispheric Security culminating in" a Special Conference on Security, to be held within the framework of the OAS; ...

Recognizing that the states of the Hemisphere face both traditional threats to security and new threats, concerns, and other challenges that, in view of their complex characteristics, have meant that security is multidimensional in nature; and

Firmly convinced that, in view of the profound changes that have occurred in the world and in the Americas since 1945, we have a unique opportunity to reaffirm the principles, shared values, and common approaches upon which peace and security in the Hemisphere is built,

Declare that:

I. PRINCIPLES OF THE CHARTER OF THE UNITED NATIONS AND THE CHARTER OF THE ORGANIZATION OF AMERICAN STATES

1. We reaffirm that security in the Hemisphere has as a fundamental basis the respect of the principles enshrined in the Charter of the United Nations and the Charter of the Organization of American States.

II. SHARED VALUES AND COMMON APPROACHES

2. Our new concept of security in the Hemisphere is multidimensional in scope, includes traditional and new threats, concerns, and other challenges to the security of the states of the Hemisphere, incorporates the priorities of each state, contributes to the consolidation of peace, integral development, and social justice, and is based on democratic values, respect for and promotion and defense of human rights, solidarity, cooperation, and respect for national sovereignty.

3. Peace is a value and a principle in itself, based on democracy, justice, respect for human rights, solidarity, security, and respect for international law. Our security architecture will help preserve it through the strengthening

of cooperation mechanisms among our states to address the traditional threats and the new threats, concerns, and other challenges facing our Hemisphere.

4. We affirm that our cooperation in addressing traditional threats and new threats, concerns, and other challenges to security is also based on shared values and common approaches recognized in the Hemisphere.

Salient among them are:

a. Each state has the sovereign right to identify its own national security priorities and to define strategies, plans, and actions for addressing threats to its security, in accordance with its legal system and with full respect for international law and the norms and principles of the Charter of the OAS and the Charter of the United Nations.

b. Representative democracy is an indispensable condition for the stability, peace, and development of the states of the Hemisphere. In particular, we reaffirm our commitment to the full observance of the Inter-American Democratic Charter and to its values, principles, and mechanisms.

c. Respect for human rights and fundamental freedoms, and good governance are essential for the stability, peace, and political, economic, social development of the states of the Hemisphere.

d. The constitutional subordination of all state institutions to the legally constituted civilian authority and respect for the rule of law on the part of all institutions and sectors of society are fundamental values

e. In our Hemisphere, as democratic states committed to the principles of the Charter of the United Nations and the OAS, we reaffirm that the basis and purpose of security is the protection of human beings. Security is strengthened when we deepen its human dimension. Conditions for human security are improved through full respect for people's dignity, human rights, and fundamental freedoms, as well as the promotion of social and economic development, social inclusion, and education and the fight against poverty, disease, and hunger.

f. Education for peace and the promotion of a democratic culture play a key role in the development of states, the strengthening of stability, and the consolidation of our Hemisphere as a region where understanding and mutual respect, dialogue, and cooperation prevail.

g. Social justice and human development are necessary for the stability of each state in the Hemisphere. Fostering friendly relations and inter-American cooperation for integral development strengthens security of the states of the Hemisphere.

h. The states of the Hemisphere reaffirm the importance of enhancing the participation of women in all efforts to promote peace and security, the need to increase women's decision-making role at all levels in relation to conflict prevention, management, and resolution and to integrate a gender perspective in all policies, programs,

and activities of all inter-American organs, agencies, entities, conferences, and processes that deal with matters of hemispheric security.

i. The security threats, concerns, and other challenges in the hemispheric context are of diverse nature and multi-dimensional scope, and the traditional concept and approach must be expanded to encompass new and nontraditional threats, which include political, economic, social, health, and environmental aspects.

j. Traditional threats to security and the mechanisms for addressing them remain important and may be different in nature from the new threats, concerns, and other challenges to security and from cooperation mechanisms for addressing them.

k. The new threats, concerns, and other challenges are cross-cutting problems that require multifaceted responses by different national organizations and in some cases partnerships between governments, the private sector, and civil society all acting appropriately in accordance with democratic norms and principles, and constitutional provisions of each state. Many of the new threats, concerns, and other challenges to hemispheric security are transnational in nature and may require appropriate hemispheric cooperation.

l. The states of the Hemisphere recognize different perspectives regarding security threats and priorities. The security architecture in our Hemisphere should be flexible and provide for the particular circumstances of each sub-region and each state.

m. The security of states of the Hemisphere is affected, in different ways, by traditional threats and the following new threats, concerns, and other challenges of a diverse nature:

- terrorism, transnational organized crime, the global drug problem, corruption, asset laundering, illicit trafficking in weapons, and the connections among them;
- extreme poverty and social exclusion of broad sectors of the population, which also affect stability and democracy. Extreme poverty erodes social cohesion and undermines the security of states;
- natural and man-made disasters, HIV/AIDS and other diseases, other health risks, and environmental degradation;
- trafficking in persons;
- attacks to cyber security;
- the potential for damage to arise in the event of an accident or incident during the maritime transport of potentially hazardous materials, including petroleum and radioactive materials and toxic waste; and
- the possibility of access, possession, and use of weapons of mass destruction and their means of delivery by terrorists.

It is the responsibility of the specialized fora of the OAS, and inter-American and international fora to develop cooperation mechanisms to address these new threats, con-

cerns, and other challenges, based on applicable instruments and mechanisms.

n. Subregional and regional integration processes contribute to stability and security in the Hemisphere.

o. Bilateral and subregional agreements and cooperation mechanisms in the area of security and defense are essential to strengthening security in the Hemisphere.

p. Conflict prevention and the peaceful settlement of disputes between states are essential to the stability and security of the Hemisphere.

q. States of the Hemisphere recognize the importance of dialogue and of other national efforts to achieve resolution of situations of internal conflict and attain reconciliation and a just and lasting peace. International, inter-American, and subregional institutions and mechanisms can perform, when requested by the state concerned, a valuable role in supporting national peace and reconciliation efforts.

r. Full respect for the integrity of the national territory and for the sovereignty and political independence of each state in the region constitutes an essential basis for peaceful coexistence and security in the Hemisphere. We reaffirm the inherent right of all states to individual or collective self-defense and our commitment to refrain from the threat or use of force against the territorial integrity or political independence of any state, or in any other manner inconsistent with the Charter of the United Nations and the OAS Charter.

s. The Hemisphere has made important advances towards the maintenance of peace. In order to guarantee that these are sustained, constant efforts are required to make effective use of the mechanisms agreed upon to prevent and peacefully resolve disputes or conflicts between states, in keeping with the OAS Charter and the Charter of the United Nations.

t. The states in the Hemisphere acknowledge the need to find prompt and peaceful solutions to the controversies that persist in the Hemisphere and undertake to make every effort to reach negotiated agreements based on justice and full respect for international law and treaties in force.

u. Confidence- and security- building measures and transparency in defense and security policies contribute to increasing stability, safeguarding hemispheric and international peace and security, and consolidating democracy.

v. We recognize the importance and usefulness of the inter-American instruments and agreements, such as the Inter-American Treaty of Reciprocal Assistance (Rio Treaty) and the American Treaty on Pacific Settlement (Pact of Bogotá), for states parties, recognizing the different security perspectives and commitments of the member states.

w. We reaffirm the objective of achieving an effective limitation of conventional weapons that will make it possible to devote the largest amount of resources to the economic and social development of the member states.

x. Solidarity among the American states, expressed through their economic, technical, political, legal, envi-

ronmental, social, and security and defense cooperation, contributes to the stability and security of the states and the Hemisphere as a whole.

y. The security of the Hemisphere is affected by the threats to global peace and security. At the same time, a stable and secure Hemisphere constitutes an essential component of world peace and security. Thus, the states of the Hemisphere have an important role to play in promoting international peace and stability, especially through respect for international law and support for bilateral, regional, and multilateral regimes for disarmament and non-proliferation of all weapons of mass destruction and arms control, as well as other agreements, and support for the security negotiations, mechanisms, activities, and processes within the United Nations framework.

z. We undertake to strengthen the multilateral system based on the Charter of the United Nations, the OAS Charter, and international law. We reaffirm the role of the United Nations Security Council as the organ with primary responsibility for maintaining international peace and security. We also reaffirm that the OAS, as a regional arrangement under Chapter VIII of the Charter of the United Nations, should make every effort to achieve the peaceful settlement of local disputes and should cooperate with the United Nations Security Council to maintain international peace and security in accordance with provisions of the Charter of the United Nations and the OAS Charter.

III. COMMITMENTS AND COOPERATION MEASURES ...

IV. INSTITUTIONAL ISSUES

70 Towards an Ethical Framework for Security

P. H. Liotta and James F. Miskel

70.1 The Common Meaning of Security

Although security¹ – as a basic concept – is frequently considered in the study and analysis of policy decisions, its essential meaning ought to be more widely *disagreed* than agreed on.² Commonly considered a basic concept in policy and academic debates, security is in stark reality a quantity that is not basic at *any* register. By couching emerging “non-traditional” concepts such as ‘environmental security’ and ‘human security’ solely on their relationship to potential or real threats, most often within a topology of power – and by using language that is inadequate to the often nuanced and almost always complex dynamics of such emerging identities – makes such concepts hostage to ‘traditional’ state-centred, national security paradigms. Most often such decision-makers only conceive of security concepts in power-dominant, state-centric mindset. The consequence has been that human and environmental issues tend to be ignored,

relative to national security, even when it is clear that some of the issues we ignore today will contribute to the national security issues we will face tomorrow.

There is a hazard, nevertheless, of adding the term ‘security’ to either environmental or human-centred concerns. Conflating national security, human security, and environmental security all within a distinct conceptual framework, furthermore, is not only precarious, it also entails potential hypocrisy. While admittedly a contentious claim, sure to provoke debate, the time has come to recognize some hard certainties in an increasingly complex, uncertain world.

Not all security issues involve ‘threats’; rather, the notion of ‘vulnerabilities’ is as serious to some peoples – and some regions – as the familiar ‘threat’ metaphor of armies massing at the borders. Equally, not all security issues need be directly linked to violence.

70.2 Distinguishing Security Aspects

Thus, an important acknowledgment should emerge here: those who form policy and make critical decisions on behalf of states and of peoples must, ever increasingly, focus on aspects of traditional ‘national security’, in which military forces will likely continue to play a pre-eminent role, as well as human security, in which ‘non-traditional’ security issues predominate – in which other approaches should, but do not always, take centre stage. If such premise proves true, and in a future where both ‘hard’ and ‘soft’ security will matter, those involved in policy decisions (and those affected by such decisions) will increasingly need to focus on aspects of *both* threats and vulnerabilities. There is a crucial need, then, to recognize the difference between these two categories.

A threat is *identifiable, often immediate, and requires an understandable response*. Military force, for example, has traditionally been sized against threats: to defend a state against external aggression, to protect vital national interests, and enhance state security. (The size of the US and USSR nuclear arse-

1 This chapter relies on earlier discussions by Liotta (2002, 2005) on threat and vulnerability in different contributions of *Security Dialogue*. The permission to use this material has been granted by SAGE and by the editor of the Journal.

2 In recent debates, including those in *Security Dialogue*, there has been a proliferation of descriptors added to the basic term ‘security’. Each of these descriptors lends a perhaps slightly different connotation as well. To speak of economic security, geographic security, gender security, cultural security, environmental security, ethnic security, military security, physical security, psychological security, political security, societal security, or human security, suggests specific (and probably necessary) recognitions as well as unduly privileges these recognitions with discrete identities that depend on, and often cannot exist without, other identities. Admittedly, some of these security distinctions establish important linkages to policy and security decisions. Two recent examples include Kay (2004: 9–25), and Hoogensen and Rottem (2004: 155–171).

nals during the Cold War made perhaps more sense than today because the perceived threat of global holocaust in the context of a bipolar, ideological struggle was far greater then.) A threat, in short, is either *clearly visible or commonly acknowledged*.

A vulnerability is often only *an indicator, perhaps not completely understood, linked to a complex interdependence among related issues, and not always suggestive of a correct or even adequate response*. While disease, hunger, unemployment, crime, social conflict, criminality, narco-trafficking, political repression, and environmental hazards are at least somewhat related issues and do impact security of states and individuals, the best response to these related issues, in terms of security, is not at all clear. While Canada, for example, has emphasized the relevance of 'human and environmental security' to 'high politics', and attempted to restructure its armed forces to meet these challenges, the relevance of military state-centred forces to address or 'solve' non-state-centred issues is questionable. One might reasonably argue that the Canadian option is not a practical course of action for states that have threat-based requirements for more traditionally-chartered and configured armed forces.

Moreover, vulnerability (unlike a threat) may not even be identifiable, in some circumstances. Even if it can be recognized, it may be *imperfectly perceived, often not well understood, and almost always a source of contention among conflicting views*. Compounding the problem, the *time* element in the perception of vulnerability must be recognized. Needless to say, this ambiguity can be maddeningly frustrating for decision-makers.

Some suggest that the core identity in a security response to issues involving human or environmental security is that of recognising a condition of *extreme vulnerability*. Extreme vulnerability can arise from living under conditions of severe economic depravation, to victims of natural hazards, and to those who are caught in the midst of war and internal conflicts. Efforts to long-term human *development* would thus make little to no sense and offer no direct help. The situation here, to be blunt, is not one of sustainability but of rescue. There is, admittedly, a further dilemma here that calls to mind the well-worn adage, "Don't give a man a fish to eat; instead teach him how to fish." Rescue efforts that take no action of development too often are only short-term palliatives and therefore may be repeated again and again. That the United Nations and non-governmental organizations have been dispensing relief in some countries for

more than a decade strongly suggests that there is wisdom yet in the old saw.

R. H. Tawney, describing rural China in 1931, described the extreme vulnerability among peasants through a powerful image: "There are districts in which the position of the rural population is that of a man standing permanently up to the neck in the water, so that even a ripple is sufficient to drown him" (Scott 1977: 1). In such instances, the need for intervention is immediate and the legal and ethical justification for humanitarian intervention is only questioned when the recipient state refuses to allow it.

But there are also cases of long-term vulnerability in which the best response is uncertain. We have termed these problematic conditionalities - which are most difficult for policy analysts and decision-makers, often driven by crisis response rather than the needs of long-term strategic planning - *creeping vulnerabilities*.³ Given the uncertainty, the complexity, and the sheer non-linear unpredictability of creeping vulnerabilities, the frequent - and classic - mistake of the decision-maker is to respond with the 'gut reaction': the intuitive response to situations of ambiguity is, classically, to *do nothing at all*. The more appropriate response is to take an adaptive posture; to avoid the instinct to act purely on gut instinct; and to recognize what variables, indicators, and analogies from past examples might best inform the basis of action (Courtney/Kirkland/Viguerie 1997: 66-79).

To be clear: avoiding disastrous long-term impacts of creeping vulnerabilities (which can evolve over decades) requires strategic planning, strategic investment, and strategic attention. To date, states and international institutions seem woefully unprepared for such strategic necessities. Moreover, environmental and human security, since they are contentious issues, often fall victim to the *do nothing* response because of their vulnerability-based conditions in which the clearly identifiable cause and the desired prevented effect are often ambiguous.

In essence, we have moved from the dynamic of the traditional *security dilemma* to encompass issues in the twenty-first century that will include as well a new *human dilemma*⁴ in specific geographic locations that require sustainable development and long-term investment strategies. Plausible 'creeping vulner-

3 We use the term creeping vulnerability to refer to gradually worsening conditions that continuously and progressively weaken the capacity of states as well as people in general to deal with hazards from the natural and political environments.

ability' scenarios deserving of attention thus might reasonably include:

- different levels of *population growth* in various regions, particularly between the 'developed' and the 'emerging' world – to incorporate disproportionate population growth – youth bulges – and unprecedented levels of urbanization unseen in human history;
- the outbreak and the rapid spread of *disease* among specific 'target' populations (such as HIV/AIDS) as well as the spread of new strains of emerging contagions such as SARS;
- significant *climate change* due to increased temperatures, decline in precipitation, and rising sea levels;
- the *scarcity of water and other natural resources* in specific regions for drinking and irrigation, and the compounding growth among populations dependent on transboundary water resources;
- the *decline in food production, access and availability*;
- progressing *soil erosion and desertification*;
- increased *urbanization and pollution* in "megacities" (populations of ten million or more) around the globe, with the recognition that in what we term the Lagos-Cairo-Karachi-Jakarta 'arc', over the next two decades most will migrate to urban environments that lack the infrastructure to support rapid, concentrated population growth (Brauch 2000: 283–286, 304–306);
- the *lack of warning systems* for ecological disasters in some of the same parts of the world that are most affected by urbanization, disease, and resource scarcity.

The 2004 earthquake in Indonesia and the tsunami it spawned, for example, caused enormous loss of life and created serious long-term economic consequences for the entire region. Most of the casualties and perhaps some of the property damage could have been avoided by a warning system similar to one that is already in place for the Pacific Coast of the United States. (Moreover, military forces from the United States and other nations were actively involved in the tsunami recovery effort and in the

4 We use the term human dilemma to refer to the difficult tradeoffs that must be made between actions that address near-term threats to the well-being of people and the actions that are required to remediate the gradually worsening conditions we have called creeping vulnerabilities.

United States the effort was seen as security related as most the of the areas were Muslim and improving relations with the Muslim world is seen as an objective of American foreign policy.)

These emerging vulnerabilities will not mitigate or replace more traditional hard security dilemmas. Rather, we will see the continued reality of threat-based conditions contend with the rise of various vulnerability-based urgencies. Paradoxically, creeping vulnerabilities will likely receive the least attention, even as their interdependent complexities grow increasingly difficult to address over time. Admittedly, suppositions here that insist on a distinction between threat and vulnerability become somewhat suspect in the so-called 'Age of Terror'. While no one doubts that certain states and actors are under 'threat' from Al-Qaeda and Jemaah Islamiyah, the shadowy nature of such loosely grouped networks defies the traditional sense of threat, even though there are obviously more immediate and more commonly acknowledged vulnerabilities. Loose terrorists 'networks' often display the following characteristics: the facility to operate effectively as a lateral (and noncentralized) network, the ability to learn, the capacity to anticipate, and the capability to 'self-organize' or reconstitute after they have been struck.⁵ As such, these networks operate on the fault line between threat and vulnerability, and too narrow a focus on either 'threat' or 'vulnerability' will only lead to frustration – and failure.

70.3 Security Examples

A powerful illustration of urbanization shifts as a creeping vulnerability is relevant to consider. Truly cataclysmic demographic changes will occur in the Lagos-Cairo-Karachi-Jakarta arc, where there will be astounding shifts in the global landscape that hinge on the 'flocking' of populations to urban centres. According to the National Intelligence Council's *Global Trends 2015: A Dialogue about the Future with Non-Governmental Experts*, as well as from data compiled by the National Geographic Society in its November 2002 issue, and the United Nations Population Division (in the 2001 revision), world population in 2015 will be 7.2 billion and most will tend to live longer than they do today. Ninety-five per cent of

5 For an extended discussion of this phenomenon, see: Liotta (2002: 47–56), at: <<http://carlisle-www.army.mil/usawc/Parameters/02summer/liotta.htm>>

the increase will take place in 'emerging' countries, and nearly all this population growth will happen in rapidly expanding urban areas (Central Intelligence Agency 2001).

The difference between urbanization in the emerging world and in the so-called developed world serves to remind readers that the centre of gravity of the vulnerabilities (and threats) associated with urbanization is in the Lagos-Cairo-Karachi-Jakarta arc. The real effect of urbanization, and where it will most rapidly take place, reveals itself in the projection for the year 2015, where the number of cities with population of over five million will skyrocket from eight (in 1950) to fifty-eight. Additionally, various population studies suggest that it could be possible to see more than 600 cities worldwide with populations in excess of one million inhabitants by 2015; in 1950, by contrast, there were only eighty-six such cities on the planet.

Given the extended example of urbanization as a creeping vulnerability, it should not be difficult to grasp why the other vulnerabilities listed above – youth bulges, disease outbreak, climate change and human impact, resource scarcity, soil erosion and desertification – are interconnected. As one factor tends to distort beyond control, other factors tend to follow.

These factors have contributed to the so-called 'feral city' syndrome (Norton 2003: 97–106), a phenomenon in which major sectors of a city are literally beyond the control of the government. Public safety, law enforcement, and other government services are not provided in these sectors, in some cases because the population of the city has grown too large, too fast for the government to keep pace. Feral cities will exist within states, nonetheless, clearly linked to the globalization process – with commercial, communications, and transportation links to the rest of the world. Examples include the *favelas* in Rio de Janeiro or ungovernable areas in Johannesburg and Gauteng Province in South Africa.

Violent crime and sexual offences, furthermore, now account for almost one-third of reported offences in many urban environments in the emerging world. In Rio de Janeiro, murder rates reach 60 per 100,000 residents; in Calcutta, 91 per 100,000; and in Johannesburg, 115 per 100,000 (United States Government, Interagency Working Group 2000: 58–72; United Nations Centre for Human Settlements 1996). In Rio, where the infamous Brazilian *favelas* have long been sites for criminal control and where policing actions are unable to cope or control activity within these feral zones, many *favelados* feel margin-

alized, live in a pervasive atmosphere of fear – as much afraid of police as of drug lords (Perlman 2002: 123).

In Karachi, the most violent and lawless city in Asia, 40 per cent of the population inhabit *katchi abadis* (slums), a fertile base for radical Islamism, and the city itself (Pakistan's largest and its biggest seaport as well) is a conduit for arms smuggling to the outside world. In Lagos, Nigeria, the city's population is equally expected to mushroom. Lagos suffers from high unemployment; massive youth bulges, and is the nucleus of constant turmoil. Indeed, fighting in Lagos between the Yoruba and ethnic Hausa is thought to have far more to do with poverty and lack of opportunity than ethnic hatred. Lagos is also the centre of Africa's international criminal network and pervasive crime and corruption have crippled the economy, contributed to social and political tensions, and undermined relations with major potential trading partners in North America and Europe.

A second example of creeping vulnerability, one in which outcomes do not *necessarily* lead to violence, can be found in the complex interrelationship between water use, agriculture, and the expectations of emerging societies and adapting lifestyles of the future. To briefly offer an example of this complex – yet potentially serious – creeping vulnerability, consider that in 1900, 1.6 billion people populated the earth; in 2000, that number reached 6 billion. In 1900, a male American had a life expectancy of 47 years; in 2000, that life expectancy reached 77 years. Notably, exploding water consumption from 1900 to 2000 – from roughly 500 cubic kilometres to 5,000 cubic kilometres – was not directly linked to increased population growth. Rather, the real 'explosion' in water usage, where over the past three centuries water consumption has grown by a factor of 45, suggests that the real culprit is water usage for agriculture (Montaigne 2002: 2–33). Seventy per cent of all water use accounts for agricultural purposes and accelerating demand for agricultural production is, of course, a direct function of urbanization. As cities expand, farms need to increase their output.

By the early 1960's virtually all available arable land was being exploited in one way or another. Since then, the world's population has doubled and incomes in many countries have jumped. This has caused the demand for grains – wheat, rice, corn – as other produce to surge and production has, in fact, tripled as agriculture has become more intensive, scientific, rationalized, and efficient. But a more produc-

tive agricultural sector comes at a price – greater consumption of water.

Developed states are particularly heavy consumers of water; but all urban centres cause water consumption to rise. As an example of how a ‘developed’ state uses water resources, consider these linkages: Eighty-two per cent of American cropland is not cultivated for crops that will be directly consumed by humans. Rather, these crops are grown for other food products – refined and processed foods, or for livestock feed. Indeed, eighty percent of the grain produced in the U.S. – wheat, rice, corn – goes to livestock. Much of the emerging world is following America’s example. In 1960, Mexico fed 5 per cent of its grain to livestock; today, Mexico feeds 45 per cent of its grain to livestock. Egypt went from 3 to 31 per cent over the same time period. China, with a sixth of the world’s population, has gone from 8 per cent to 26 percent (Manning 2004: 43–45).

These developments and trends argue that it is time to rethink security. For all the talk in policy centres and the academy about new world orders, networks of international dependence, and the shrinking of the nation-state’s power, the traditional definition of security has not been seriously challenged in the context of the trends that are going to shape the world in the next few decades.

70.4 Rethinking the Meaning of Security

In the classical sense, security – from the Latin *securitas* – refers to tranquillity and freedom from care, or what Cicero termed the absence of anxiety upon which the fulfilled life depends. Notably, numerous governmental and international reports that focus on the terms ‘freedom from fear’ and ‘freedom from want’ emphasize a pluralist notion that security is a basic, and elemental, need.

Yet in the once widely accepted realist understanding, the state was the sole guarantor of this anxiety absence: security extended downwards from nations to individuals; conversely, the stable state extended upwards in its relations to influence the security of the international system. Individual security, stemming from the liberal thought of the Enlightenment, was also considered both a unique and collective good. Adam Smith, for example, in *The Theory of Moral Sentiments*, mentions only the security of the sovereign, who possesses a standing army to protect him against popular discontent, and is thus ‘se-

cure’ and able to allow his subject the liberty of political ‘remonstrance’. By contrast, M. J. de Condorcet’s argument, in the late eighteenth century, suggested that the economic security of individuals was an essential condition for political society; fear – and the fear of fear – were for Condorcet the enemies of liberal politics (Rothschild 1995: 53–98).

Moreover, despite the abundance of theoretical and conceptual approaches in recent history, the right of states to protect themselves under the rubric of ‘national security’ and through traditional instruments of power (political, economic, and especially military) has never been directly challenged. The *responsibility*, however, for the guarantee of the individual good – under any security rubric – has never been obvious.

It does seem significant that aspects of ‘non-traditional’ security issues that have long plagued the so-called ‘developing’ world – issues that include environmental degradation, resource scarcity, epidemiology, transnational issues of criminality and terrorism – can increasingly affect the policy decisions and future choices for powerful states and world leaders as well. As disparate as these ‘non-traditional’ issues may be, the ‘developed’ world is now confronted with similar, human-centred vulnerabilities that had often been present previously only for developing regions. The implications of this changing security environment for the analyst and policy-maker are therefore potentially profound.

The future may well require decision-makers to focus on a broad – and broadening – understanding of the meaning of security. The 1994 *United Nations Development Programme* (UNDP) report, for example, attempted to recognize a conceptual shift that needed to take place:

The concept of security has for too long been interpreted narrowly: as security of territory from external aggression, or as protection of national interests in foreign policy or as global security from the threat of nuclear holocaust. It has been related to nation-states more than people...Forgotten were the legitimate concerns of ordinary people who sought security in their daily lives. For many of them, security symbolized protection from the threat of disease, hunger, unemployment, crime [or terrorism], social conflict, political repression and environmental hazards. With the dark shadows of the Cold War receding, one can see that many conflicts are within nations rather than between nations (UNDP 1994: 3, 22–23).

In 2003, the Commission on Human Security expanded this concept to include protection for peoples suffering through violent conflict, for those who

are on the move whether out of migration or in refugee status, for those in post-conflict situations, and for protecting and improving conditions of poverty, health, and knowledge.⁶ The Commission operated under United Nations sponsorship but was technically an independent body. Its operating expenses were defrayed by Japan (see Shinoda 2008). The dark side of this proposition, of course, is that the ‘responsibility to protect’ may under certain circumstances also mean the ‘right to intervene’. It could also even constitute a moral ‘requirement to intervene’ which is, for example, implied in the toothless international convention on genocide. In the traditional topology of power, it may be inevitable that dominant states will intervene at the time and place of their choosing. And only for the reasons of their own choosing. Thus it would be reasonable at this juncture to inquire as to whether, in the current and future security environments, serious consideration should be given to the ethics of security and its place in the actions of states and actors.

According to H. Richard Niebuhr, a responsible ethic (which would encompass an ethics of intervention) embraces the Greek concept of *themis*, the law of the community that is based on the essential principle of justice; attempts to encompass an “interaction of response”, accountability, and social solidarity; and is driven by a social process that is responsive and accountable to nothing less than an “international community” (Niebuhr 1978: 52, 61–65, 88).

70.5 Responsible Security Ethics

Admittedly, a paradigm of responsible security ethics proves difficult, although its governing principles have far-reaching implications. Yet it does seem appropriate to ask whether or not there is a need, or even a possibility, for establishing a framework for ethical security action, including when to intervene. While some have focused on establishing ‘capabilities’ to determine basic economic, social, and human needs, it might also be appropriate to consider whether or not it is possible to establish an ethical framework for security as well.⁷ The driving force of responsible security ethics entails assessment of both the sovereignty of a state and the ‘responsibility’ of external states to provide support for a state’s continued survival. The Iraq intervention in 2003, in princi-

ple at least, was partially based on the belief that “social justice, participatory freedom, and economic development” would help “liberate” the Iraqi, remove Saddam Hussein from power, and mitigate the proliferation of weapons of mass destruction.⁸ Even as Grayson emphatically stresses that treating (specifically human) security policy as an *ethos* – indeed even a *critical transformative ethos* – is essential (Grayson 2004: 337–343), it remains unclear why an ethos of national security, in principle, should be by any means markedly different from the practice of human security.

While Reinhold Niebuhr believed that disparities between states were inevitable and that states, like human beings, have an innate desire to dominate others, even Niebuhr, assented to the idea that “the goal of modern man must be a society in which there will be enough justice, and in which coercion will be sufficiently non-violent to prevent his common enterprise from issuing into common disaster” (Niebuhr 1932: 22). John Rawls adequately defined this “well-ordered society” in the broadest sense as “one designed to advance the good of its members and effectively regulated by a public conception of justice” (Rawls 1973: 453). Equally, Rawls emphasized the plurality of support for the common acceptance of the principles of justice and the essential requirement for institutions that satisfy these principles (Rawls 1973: 454). This ideal, as Timothy Garton Ash (1998: 64–65) notes, is also the essential complex tension that characterized twentieth-century Europe and ought to characterize the future order.

Oftentimes, paradoxically or not, moves toward resolution of human security dilemmas occur only after the application of force, most often national security military force. But this outcome may not prove true for some of the environmental and human security problems of the future (that are being created today). Thus, there is a true need to allow alternative

6 See: Commission on Human Security, at: <<http://www.humansecurity-chs.org/finalreport/outline.html>>.

7 For example of the ‘capabilities’ approach, see the draft report of the DAC Informal Network on Poverty Reduction. <<http://www.etcint.org/PDF/DAC%20vol%201.pdf>> (25 October 2004), as well as the UNEP report: *Exploring the Links: Human Well-Being, Poverty, & Ecosystem Services* (2004a) and Amartya Sen’s *The Standard of Living* (1987).

8 The concept that “social justice, participatory freedom, and economic development” are social and security stabilizers is taken from Ian Barbour (1993: 26). Barbour’s criteria comprise an appraisal of intervention and security as they apply to the relevant aspects of human values and social life.

perspectives to ‘corrupt’ one’s own thinking. Those who emphasize military security, most especially American analysts and policy-makers, at the expense of other security issues may fundamentally be walking into a self-fulfilling paradox: the more one seeks to avoid military intervention, the more one is driven to militarily intervene because of the failure to recognize contrary security issues and to deal with them in a pre-emptive or preventive manner. The old cliché that describes this trap is also an apt reminder: *If all you have is a hammer, then every problem begins to look like a nail*. Surely, as the interventions in Somalia, the Balkans, Afghanistan, and Iraq illustrate, traditional applications of military security may not be the best, and are certainly not the only, viable strategic instruments.

Although it is unclear how permanent or deep the damage was from the 2003 U.S.-European trans-Atlantic rift (over intervention in Iraq), there are warning signals. As Kagan notes, a crisis of legitimacy emerged in the 12 September era:

The fact remains that the Kosovo war was illegal, and not only because it lacked Security Council authorization: Serbia had not committed any aggression against another state but was slaughtering its own ethnic Albanian population. The intervention therefore violated the sovereign equality of all nations, a cardinal principle of the UN Charter and the bedrock principle of international law for centuries. During the Kosovo conflict, Henry Kissinger warned that ‘the abrupt abandonment of the concept of national sovereignty’ risked unmooring the world from any notion of order, legal or otherwise. Many Europeans rejected this complaint at the time. Back then ... before the Iraq war ... they did not seem to believe that international legitimacy resided exclusively with the Security Council, or in the UN Charter, or even in traditional principles of international law. Instead they believed in the legitimacy of their common post-modern moral values (Kagan 2004: 75).

In 2003, during the dispute over Iraq, those post-modern values did not seem to be universally shared or even understood. Moreover, if, in the future, the United States will always forego ‘international’ interests for the sake of ‘national’ interests, the rift will grow even wider.

All of these troubling outcomes are only exacerbated in the agony of those who are pushed aside, annihilated, or remain fortunate enough to flee (with nothing). In redrawing the map of the future, the focus, again, must shift to asking: What are the long-term consequences of failing to recognize creeping vulnerabilities? It seems pertinent to recall that the ‘preservation’ of displaced Arabs in refugee camps

following the 1967 Arab-Israeli War contributed to the *intifadas* of the last twenty years, the civil wars in Jordan in the 1970’s and Lebanon in the 1980’s, as well as international terrorist acts such as airline hijackings and the attack on Israeli athletes at the Munich Olympics in the 1970’s (Goldstone 2002: 3–21). The displacement of Hutus and Tutsis from the Rwanda genocide of 1994 is directly related to the ongoing humanitarian crisis in the Democratic Republic of Congo, where reasonable estimates place the death toll from conflict in excess of 3.5 million since ‘liberation’ in 1997. Indeed, the roots of a potential Balkan conflict twenty years from now can be found in the weak economic conditions, corrupt political institutions, and bands of angry young men with nowhere to go and nothing to look forward to in the streets and ruined foundations of Kosovo, Macedonia, Bosnia, and Serbia.

Thus, in considering whether such frameworks might be viable for the future, it is important to step away from applying such a template to only crisis response or conditions of extreme vulnerability. Arguably, the roots of the disasters in Bosnia-Herzegovina and Kosovo did not begin in 1998; rather, they began in the aftermath of the Second World War, and flared up, again and again, during the 1980’s – as illustrations of creeping vulnerability. Yet the consequence and the cost to the ‘West’ of not investing in the Balkans in the right way and early enough could be at least fifty years of political and military engagement – and economic assistance. In comparison, the reconstruction of Iraq is an even far more daunting task.

Although it seems attractive to insist on exclusionary concepts that insist on desecuritization, privileged referent objects, and the ‘belief’ that threats and vulnerabilities are little more than social constructions (Grayson 2004: 337–343), all these concepts work in theory but fail in practice. While true that national security paradigms can, and likely will continue to, dominate issue that involve human security vulnerabilities – and even in some instances mistakenly confuse ‘vulnerabilities’ as ‘threats’ – there are distinct linkages between these security concepts and applications. With regard to environmental security, for example, Myers recognized these linkages decades ago:

National security is not just about fighting forces and weaponry. It relates to watersheds, croplands, forests, genetic resources, climate and other factors that rarely figure in the minds of military experts and political leaders, but increasingly deserve, in their collectivity, to rank alongside military approaches as crucial in a nation’s security (Myers 1986: 251–257).

Ultimately, though, we are far from what O'Hanlon and Singer (2004: 77-99) term a global intervention capability on behalf of "humanitarian transformation." Granted, we now have the threat of mass casualty terrorism anytime, anywhere - and states and regions are responding differently to this challenge. Yet the global community today also faces many of the same problems of the 1990's: civil wars, faltering states, humanitarian crises. We are nowhere closer to addressing how best to solve these challenges, even as they impact issues of environmental, human, and national security.

Recently, there have been a number of voices that have spoken out on what the International Commission on Intervention and State Sovereignty has termed the "responsibility to protect": the responsibility of some agency or state (whether it be a superpower such as the United States or an institution such as the United Nations) to enforce the principle of security that sovereign states owe to their citizens. Yet the creation of a sense of urgency to act - *even on some issues that may not have some impact for years or even decades to come* - is perhaps the only appropriate first response. The real cost of not investing, in the right way and early enough, in the places where trends and effects are accelerating in the wrong direction is likely to be decades and decades of economic and political frustration, and, potentially, military engagement. Rather than justifying intervention (especially military), we ought to be justifying *investment*.

70.6 Building on Security and Ethics

Simply addressing the immensities of these challenges is not enough. Radical improvements in public infrastructure and the professionalism with which public services are administered, particularly in states and municipalities (particularly along the Lagos-Cairo-Karachi-Jakarta arc), will both improve security and create the conditions for shrinking the gap between expectations and opportunity. Improved governance in terms of both the quality of public services and the distributions of those services throughout urban agglomerations is, in effect, the *sine qua non* for the investment that will be required to create economic opportunity.

Post-Cold War and post-September 11, 2001 history suggests that military intervention as the first line of response to human security conditions underscores a seriously flawed approach. Moreover, those
